It bases these classifications on the classifications of the related assets or liabilities for financial reporting. For instance, a corporation reports a deferred tax liability related to the excess of tax depreciation over financial depreciation as a noncurrent liability because the depreciable assets are noncurrent assets. It classifies a deferred tax liability or asset not directly related to an asset or liability (e.g., related to an operating loss carryforward) according to the expected reversal date of the temporary difference. A valuation allowance is allocated between current and noncurrent deferred assets on a proportional basis.<sup>20</sup>

In other words, a corporation must:

- 1. separate its deferred tax liabilities into current and noncurrent groups,
- 2. separate its deferred tax assets into current and noncurrent groups,
- 3. combine (net) the amounts in the current groups, and
- 4. combine (*net*) the amounts in the noncurrent groups.<sup>21</sup>

If the net amount of the current groups is a debit balance, the corporation reports the amount as a current asset, whereas it reports a net credit amount as a current liability. The corporation reports a net debit balance for the noncurrent groups as a noncurrent asset, and reports a net credit balance as a noncurrent liability. This procedure is one of the few situations in which "offsetting" of assets and liabilities is allowed in financial reporting. The FASB requires this approach because of the close relationship between deferred tax assets and liabilities, and to avoid the detailed analyses necessary for more refined classification methods.

**9** Classify deferred tax liabilities and assets.

- 19. FASB Statement No. 109, op. cit., par. 35 (FASB Cod. # 740-25-45).
- 20. Ibid., par. 41 (FASB Cod. # 740-10-45).
- 21. This "offsetting" applies to each tax jurisdiction. Furthermore, a corporation may have some assets and liabilities (e.g., warranty liability) for which it classifies the portion due to be collected or paid in the next year as current and classifies the remainder as noncurrent. In such a case, it must also proportionally classify the related deferred tax liability or asset into current and noncurrent amounts.

### **Example: Balance Sheet Presentation**

Assume that the Anicar Company has the four deferred tax items we show in Example 19-11. In this situation, the company combines the \$6,000 credit balance of the current deferred tax liability (Item 1) with the \$3,400 debit balance of the current deferred tax asset (Item 3), and reports a \$2,600 net deferred tax liability as a *current liability* on its year-end balance sheet. Likewise, the company combines the \$12,000 credit balance of the noncurrent deferred tax liability (Item 2) with the \$2,500 debit balance of the noncurrent deferred tax asset (Item 4), and reports a \$9,500 net deferred tax liability as a *noncurrent liability* on its year-end balance sheet. •

| EXAMPLE 19-11 Schedule of Deferred Assets and Liabilities               |                            |                                     |   |  |  |  |  |  |

### **Statement of Cash Flows Presentation**

If a corporation uses the indirect method to report its operating cash flows, it adds any increase in its income taxes payable, any increase in its deferred tax liability, or any decrease in its deferred tax asset to net income in the operating activities section of its statement cash flows. It subtracts from net income any decrease in its income taxes payable, any decrease in its deferred tax liability, or any increase in its deferred tax asset. Because of the significance of income taxes, a corporation using the indirect method of reporting its operating cash flows is also required to disclose its income taxes paid. This disclosure may be made in a separate schedule, narrative description, or in the notes to its financial statements.

### **Financial Statement Disclosures**

To help users evaluate a corporation's income taxes, GAAP also requires extensive income tax disclosures in the notes to the corporation's financial statements (or directly on the statements themselves). We briefly summarize the major disclosures. For the net deferred tax liability or asset, it discloses the causes of the deferred tax assets and liabilities, the total deferred tax assets, and the total valuation allowance. For the income tax expense, it discloses the amount of income tax expense or benefit allocated to continuing operations, discontinued operations, extraordinary items, retrospective adjustments, prior period adjustments, and gains and losses included in other comprehensive income. It also discloses the significant components of income tax expense related to continuing operations for each year. These include, for instance, (1) current tax expense or benefit (i.e., income tax obligation or refund), (2) deferred tax expense or benefit, (3) tax credits, (4) benefits of operating loss carryforwards, and (5) adjustments of the valuation allowance for changes in circumstances.<sup>22</sup>

The intraperiod allocation of income taxes on the face of a corporation's income statement (and statement of retained earnings, statement of changes in stockholders' equity, or statement of comprehensive income), as we previously illustrated, partially satisfies the preceding disclosure requirements. A corporation typically discloses the

remaining information in a note to its financial statements. We show these disclosures in Real Report 19-1 later in the chapter for Emerson Radio Corp.

# MISCELLANEOUS ISSUES

The previous discussion and examples focused on the major issues involved in accounting for income taxes. For simplicity, we omitted several topics.

### **Change in Income Tax Laws or Rates**

As we discussed earlier, a corporation determines the balances of its deferred tax liabilities (or assets) at the end of a given year by applying the currently enacted income tax rate(s) and laws to its taxable (or deductible) temporary differences. Occasionally, Congress may change the income tax laws or rates so that they differ from the laws or rates a corporation previously used to calculate its deferred tax liabilities (or assets). A corporation must disclose the financial impact of this congressional action because it is an event that has economic consequences to the corporation. That is, a corporation's financial condition improves if it owes a smaller amount of future taxes (or would receive a larger refund) and its condition weakens if it owes more future taxes (or would receive a smaller refund).

When a change in the income tax laws or rates occurs, a corporation adjusts the deferred tax liabilities (and assets) for the effect of the change. It makes the adjustment to the balance of each deferred tax liability (and asset) as of the beginning of the year in which the change is made, and includes the resulting tax effect in the income tax expense related to its income from continuing operations.<sup>23</sup> The amount of the adjustment is the difference between the deferred tax liability (or asset) balance at the beginning of the year, based on the newly enacted laws or rates, and the balance that was computed under the old law or rates.

For instance, refer back to the example (page 968) for a deferred tax liability. If, in May 2011, Congress increases the income tax rate from 30% to 35%, then Track Company's deferred tax liability at the end of 2010 should be \$140 ( $$400 \times 0.35$ ) instead of \$120, as we previously computed. Therefore, the company increases the deferred tax liability and recognizes a tax effect in the amount of \$20 (\$140 - \$120). In May 2011, Track Company records the increase and recognizes the expense as follows:

The company increases the income tax expense related to income from continuing operations by \$20 on its 2011 income statement, and reports the deferred tax liability at a credit balance of \$140. At the end of 2011 the company computes its deferred taxes in the usual manner, except that it uses the newly enacted 35% income tax rate. A change in the balance of a valuation allowance—because of changes in circumstances concerning the future realization of a deferred tax asset—is recorded and reported in a similar way.

## **Compensatory Share Option Plans**

In Chapter 16, we discussed compensatory share option plans. Since we had not yet discussed deferred taxes, we did not deal with the related deferred tax journal entries. We provide you with a brief overview here.

Recall that a corporation determines the compensation cost of its compensatory share option plan using the fair value method based on an option pricing model. Under this method, it computes the total compensation cost by multiplying the estimated fair value per share option times the estimated number of share options that are expected to become vested. This compensation cost is then expensed each year over the service period. This expense reduces the corporation's pretax income for financial reporting purposes

and, hence, its income tax expense. However, for income tax purposes the corporation is not allowed to deduct any compensation expense related to the share option plan until the employees exercise the share options. Therefore, during the service period, the corporation's pretax financial accounting income is lower than its taxable income, resulting in a future deductible difference and the need to record a journal entry to increase the related deferred tax asset (and decrease income tax expense).

When the employees exercise the share options, income tax rules allow the corporation to take a tax deduction (compensation expense) for the difference between the market price of the shares on the exercise date and the exercise price. Since the exercise date will be *after* the service period, the corporation will have *no* compensation expense for financial reporting purposes at this time because it already deducted the compensation expense during the service period. Hence, the corporation's pretax accounting income will be higher than the corporation's taxable income. In other words, the previous future deductible difference has "reversed" and is now deducted for income tax purposes. This requires a journal entry to eliminate the deferred tax asset (and increase income tax expense).

If the actual market price at the time of exercise is different from the market price estimated under the option pricing model (which is likely because of the use of estimates), the deferred tax issues become more complicated. The difference is a "permanent" difference that decreases income tax expense and income taxes payable. The net tax savings is treated as an increase in additional paid-in capital in the deferred tax journal entry.

### **Alternative Minimum Tax and Other Tax Credits**

The Tax Reform Act of 1986 imposed an *alternative minimum tax* (AMT) on corporations, designed to help ensure equity in income tax payments. A corporation pays the higher of its AMT (as computed according to the income tax laws) or its regular income tax liability. Thus, the AMT may affect the corporation's income tax obligation in a given year. The AMT also may affect the corporation's deferred tax liability or asset because calculation of the AMT depends, in part, on "adjusted current earnings (ACE)" adjustments related to certain temporary differences. Also, if a corporation pays the AMT, generally it can credit the amount paid against its future income taxes. The corporation uses this credit in a given future year when the regular tax liability exceeds the AMT. It may not carry back the minimum tax credit, but may carry it forward indefinitely.

The federal tax law also allows certain other "tax credits" that a corporation may deduct from its computed income taxes to determine the income taxes it owes. Among the tax credits that are, or have been, in the tax law are credits for certain research and experimental activities, for foreign taxes paid, for hiring certain employees, and for using certain fuels. To illustrate a foreign tax credit, assume the following situation for a corporation (amounts in millions):

|                      | U.S.  | Foreign |
|----------------------|-------|---------|
| Taxable income       | \$100 | \$ 20   |
| Tax rate (assumed)   | 0.35  | 0.40    |
| Income taxes payable | \$ 35 | \$ 8    |

On its U.S. income tax return, the corporation reports a total taxable income of \$120 (\$100 + \$20), receiving a foreign tax credit based on the foreign taxes paid. However, the amount of the foreign tax credit cannot exceed an amount equal to the U.S. income tax imposed on the foreign-source income. Therefore, its foreign tax credit is the lesser of \$8, the foreign tax imposed, or \$7 (\$20  $\times$  35%), the U.S. tax imposed on foreign income. The corporation pays \$35 [(\$120  $\times$  35%) - \$7] to the U.S. government. However, it pays total income tax of \$43 (\$35 + \$8), which is also its income tax expense (assuming there are no temporary differences). In the notes to its financial statements, the corporation discloses that there is a difference between the statutory tax rate in the United States of 35% and its effective tax rate of 36% (\$43  $\div$  \$120).

As we showed, specific restrictions apply to tax credits, and sometimes a corporation cannot use all of its tax credits in a given year. In some circumstances, the corporation

may carry forward these tax credits and apply them against future taxes owed in a manner similar to operating loss carryforwards. When this arises, the steps we outlined earlier in the chapter for computing a corporation's deferred taxes must be modified to include measurement of a deferred tax asset for each type of tax credit. Because the AMT and tax credits are complex and vary across corporations, we do not discuss them further.

### **Uncertain Tax Positions**

Earlier in the chapter, we discussed various transactions involving tax deductions. The tax treatment of many transactions is not always clear-cut. The company and the Internal Revenue Service (IRS) often disagree on whether a transaction qualifies for a tax deduction, the period in which the amount can be deducted, and the amount of the deduction, if any. Because GAAP did not provide a confidence threshold that must be met for a company to recognize the benefits from a tax position (current or future tax deduction) in its financial statements, considerable diversity developed in practice for these "uncertain tax positions." Many companies recorded the tax benefits on an "as-filed" basis. That is, they recognized any current or deferred tax assets or liabilities when they took the related tax position. They frequently recorded a valuation allowance to reduce any current or deferred tax benefit if it was more likely than not that an adjustment to the tax benefit would be required. Such amounts often were significant and their resolution often took many years. For example, in its 2005 annual report, Microsoft reported an adjustment (reduction) of \$776 million to its 2005 tax provision due to the resolution of tax matters related to the 1997–1999 tax years. Because of the variety of approaches that companies used to recognize the tax benefits associated with their uncertain tax positions, the FASB issued additional GAAP which provides further guidance on (1) the recognition and (2) the measurement of all income tax positions.

The first step for a company in applying this guidance is to determine whether to recognize an uncertain tax position by evaluating whether the tax position is "more likely than not" (greater than 50% probability) of being upheld during its audit, based on the technical merits of the position. Assuming that a tax position meets the recognition criteria, the second step is for the company to measure the tax benefit as the largest dollar amount that is above the "more likely than not" threshold.<sup>24</sup>

The difference between the tax benefit recognized in the financial statements and the tax benefit reflected in the tax return would result in either an increase in the income tax liability, an increase in a deferred tax liability (if the difference relates to a taxable temporary difference), or a decrease in a deferred tax asset (if the difference is due to a deductible temporary difference). Among the required disclosures are (1) a table that reconciles the beginning and ending balances of the unrecognized tax benefits, (2) the total amount of the unrecognized tax benefits that, if recognized, would affect the effective tax rate, and (3) a discussion of the tax positions that management believes are reasonably possible to change significantly in the next 12 months.<sup>25</sup>

### **Example: Uncertain Tax Position**

To illustrate the accounting for an uncertain tax position, assume that Bocor Company claims a research and experimentation tax credit of \$1,000,000 on its tax return. Historically, the IRS has challenged whether some of the expenditures meet the definition of "qualified research expenses." Before Bocor Company can recognize the tax benefit, it must first determine if the tax position is "more likely than not" to be upheld during its audit. Based on the technical merits of the position, the company believes that all the expenditures are valid and supportable, and the majority of them will be upheld during its audit. The company has met the recognition threshold and must now determine the amount of the benefit to recognize.

See "Uncertain Tax Positions," FASB Interpretation No. 48 (Norwalk, Conn. FASB, 2006), par. 8 (FASB Cod. # 740-10-30).

<sup>25.</sup> If a company's estimate of the tax benefit changes because of new information, the subsequent recognition and measurement is based on its best estimate as of the reporting date. In the case of a decreased estimate, the company may have to "derecognize" the tax benefit which may result in accrued interest and penalties.

Bocor Company estimates the following probability distribution of possible outcomes.

| Dollar Amount of Tax Benefit<br>that Management Anticipates<br>Will Be Upheld | Probability<br>that the Tax Position<br>Will Be Upheld | Cumulative Probability<br>that the Tax Position<br>Will Be Upheld |
|---|--|---|
| \$1,000,000   | 30%  | 30%   |
| 910,000   | 30   | 60  |
| 850,000   | 40   | 100   |

Because \$910,000 is the largest dollar amount above the cumulative 50% probability threshold, the company will recognize a current tax benefit of \$910,000 in its financial statements. The \$90,000 difference between the tax credit claimed on the tax return (\$1,000,000) and the amount estimated to be ultimately upheld (\$910,000) is the "unrecognized tax benefit" and is recorded as a noncurrent liability since the company does not expect settlement within the next year. The ultimate settlement, at an amount greater or less than \$90,000, would be accounted for in the period of settlement.

# IFRS vs. U.S. GAAP

IFRS for deferred income taxes differ in certain respects from those in the United States. Both IFRS and U.S. GAAP generally require the comprehensive allocation of temporary differences using a balance sheet (or asset/liability) approach. However, there are four major differences between IFRS and U.S. GAAP with regard to the recognition and measurement of deferred tax assets and liabilities. First, IFRS allow a company to recognize a deferred tax asset when it is probable that it will have sufficient future taxable income against which to utilize the deferred tax asset. Under U.S. GAAP, the recognition threshold for deferred tax assets is defined as more likely than not. Although IFRS define "probable" as "more likely than not" for contingencies, this definition is currently not specifically included in IAS 12 for deferred taxes. Therefore, differences in application might arise, but that is unlikely to occur. Second, IFRS allow an upward revaluation of certain assets to fair value (e.g., property, plant, and equipment). The difference between the carrying amount of the revalued asset and its taxable basis is considered a temporary difference, which results in the recognition of a deferred tax amount that is reported in shareholders' interests (stockholders' equity). No such upward revaluations are allowed under U.S. GAAP. Third, under IFRS, the measurement of a company's deferred tax assets and liabilities is based on future tax rates as well as how the tax laws of the country in which it is located allow it to recover or settle the deferred tax asset or liability. Under U.S. GAAP, only enacted tax rates can be used and it is assumed that the deferred tax asset or liability will be recovered or settled in a manner consistent with its current use in the business. Finally, IFRS provide no specific guidance on the recognition of deferred tax liabilities related to uncertain tax positions.

IFRS and U.S. GAAP also differ in the classification and presentation of deferred taxes. IFRS require that the tax effects of any equity adjustments (e.g., asset revaluations) be reported directly in equity. Similar to U.S. GAAP, IFRS require that a company report its deferred tax balances as separate items on its balance sheet, with some offset of deferred tax assets and liabilities allowed. However, IFRS require that any deferred tax assets and liabilities be classified as noncurrent on the balance sheet. Under U.S. GAAP, current or noncurrent classification is allowed depending on the classification of the related asset or liability that gave rise to the temporary difference.

- If a company has an operating loss for income tax purposes (tax-deductible expenses exceed taxable revenue), it can choose to:
  - Carry the operating loss back two years (in sequential order starting with the earliest year) to offset previous taxable income and create a refund of income taxes previously paid; any remaining loss can then be carried forward sequentially for 20 years to offset future taxable income, or
  - Forgo the operating loss carryback and choose to carry forward sequentially the operating loss for 20 years to offset future taxable income.
- The income tax benefit of an operating loss carryback is recognized in the year the operating loss occurs as a current receivable on the balance sheet and as a reduction of the operating loss on the income statement.
- The income tax benefit of an operating loss carryforward is recognized in the year the operating loss occurs as a deferred tax asset (reduced by a valuation allowance, if necessary) on the balance sheet and as a reduction of the operating loss on the income statement.
- Intraperiod income tax allocation is the allocation of a corporation's total income tax
  expense for a period to the various components of its income statement (and occasionally the statement of retained earnings, statement of comprehensive income, or statement of changes in stockholders' equity).
  - Intraperiod tax allocation is based on the concept of matching income tax expense against the major components of pretax income to provide more useful information to external users.
  - Extraordinary items, the income or loss from a discontinued component, retrospective
    adjustments, prior period adjustments, and any other comprehensive income item are
    reported net of the related income tax effects where the income tax effect is based
    on the company's marginal tax rate.
- A company reports deferred tax liabilities and assets as a net current amount and a net noncurrent amount based on the classifications of the related assets or liabilities for financial reporting. Extensive disclosure in the notes to the financial statements is also required.
- A change in income tax laws or rates requires an adjustment of the deferred tax liabilities (and assets) as of the beginning of the year in which the change is made with the resulting tax effect included in income tax expense relating to income from continuing operations.
- The recording of compensation expense relating to compensatory share options (no tax deduction is allowed until the options are exercised) results in a decrease in income tax expense and an increase in the related deferred tax asset. Upon exercise of the share options, the deferred tax asset is eliminated and income tax expense is increased.
- In computing its income tax obligation, a corporation may be allowed tax credits (i.e., credits for alternative minimum tax paid in previous years, research and experimental activities) that reduce the amount of income taxes owed and create a deferred tax asset for each type of tax credit.
- For an uncertain tax position, a company completes two steps. First, it evaluates whether
  the tax position is "more likely than not" to be upheld during its audit. If so, the second
  step is to measure the tax benefit as the largest dollar amount above the more likely
  than not threshold.

# **ILLUSTRATIVE DISCLOSURES**

Real Report 19-1 shows the 2007 income tax disclosures (in part) of Emerson Radio Corp. These disclosures are representative of the type necessary under GAAP for income taxes.

| Total deferred tax assets        | \$9,804 | \$10,574 |
| Valuation allowance              |         |          |
| Net deferred tax assets          | \$9,804 | \$10,574 |
| eferred tax liabilities:         |         |          |
| Accrued expenses                 | 72      |          |
| Net deferred taxes               | \$9,732 | \$10,574 |
|                                  |         |          |

### **Questions:**

- 1. What does Emerson call its income tax expense?
- 2. How much of the income tax expense shown on the 2007 income statement is currently payable and how much is deferred?
- 3. Does the company have a federal operating loss carryback or carryforward?
- 4. Explain why Emerson reported a benefit from income taxes in a year that it had income before taxes.
- 5. Does the schedule of deferred tax assets (liabilities) shown in Note 7 reconcile to the deferred tax items shown on the balance sheet?

# SUMMARY

At the beginning of the chapter, we identified several objectives you would accomplish after reading the chapter. The objectives are listed below, each followed by a brief summary of the key points in the chapter discussion.

- 1. **Understand permanent and temporary differences.** A *permanent* difference is a difference between pretax financial income and taxable income in an accounting period that will never reverse in a later accounting period. A *temporary* difference is a difference between the tax basis of an asset (or liability) and the financial statement reported amount of the asset (or liability) that will result in taxable or deductible amounts in future years when the reported amount of the asset is recovered (or the liability is settled).
- 2. **Explain the conceptual issues regarding interperiod tax allocation.** Conceptually, there are two objectives of income tax reporting. The first is that a corporation should recognize the amount of its income tax obligation (or refund) for the current year. The second is that the corporation should recognize deferred tax liabilities and assets for the future tax consequences of all events that it has recognized in its financial statements or income tax returns.
- 3. **Record and report deferred tax liabilities.** Measure the ending deferred tax liability for each future taxable amount using the applicable tax rate. Record the increase (or decrease) in the deferred tax liability. Report the ending deferred tax liability as a current or noncurrent liability on the ending balance sheet.
- 4. **Record and report deferred tax assets.** Measure the ending deferred tax asset for each future deductible amount using the applicable tax rate. Record the increase (or decrease) in the deferred tax asset. Report the ending deferred tax asset as a current or noncurrent asset on the ending balance sheet. Reduce the deferred tax asset by a valuation allowance when appropriate.
- 5. **Explain an operating loss carryback and carryforward.** An operating loss *carryback* occurs when a corporation carries back a current year operating loss to offset any taxable income in the previous two years. An operating loss *carryforward* occurs when a corporation's taxable income for the previous two years is not enough to offset the amount of the current year operating loss, so that it carries forward the loss to offset any future taxable income over the next 20 years.

- 6. Account for an operating loss carryback. Determine the amount of pretax financial (and taxable) income, as well as the income taxes paid in the previous two years. Carry back the pretax operating loss of the current year to the previous years and offset the previous pretax financial (and taxable) income. Report the resulting income tax refund of the income taxes previously paid as a receivable on the balance sheet and subtract the income tax benefit due to the carryback from the pretax operating loss on the income statement.
- 7. **Account for an operating loss carryforward**. Recognize the tax benefit of an operating loss carryforward in the current year as a deferred tax asset. Determine the amount by multiplying the current income tax rate times the pretax operating loss. Establish a valuation allowance for the amount of the deferred tax asset that the corporation is not likely to realize
- 8. **Apply intraperiod tax allocation.** Report the income tax expense applicable to pretax income from continuing operations separately on the income statement, basing the expense on the normal income tax rates. Report any results of discontinued operations, extraordinary items, retrospective adjustments, and prior period adjustments net of the income tax effects (with each related income tax effect reported in parentheses).
- 9. **Classify deferred tax liabilities and assets.** A corporation reports its deferred tax liabilities and assets in two classifications, a *net* current amount and a *net* noncurrent amount. To do so, it separates its deferred tax liabilities and deferred tax assets into current and noncurrent groups, and then combines (nets) the amounts in the current groups and the noncurrent groups.

# Answers to Real Report Questions

### **Real Report 19-1 Answers**

- Emerson calls its income tax expense "provision (benefit) for income taxes." The provision represents income tax expense while the benefit represents income tax savings.
- 2. At the end of 2007, Emerson has current income tax payable of \$306,000 and net deferred tax assets of \$9,732,000 (\$5,737,000 current assets + \$4,067,000 noncurrent assets \$47,000 current liabilities \$25,000 noncurrent liabilities).
- The company has an operating loss carryforward of approximately \$3,819,000.
- In 2006, when Emerson reported income before income taxes of \$3,384,000, it recorded an income tax benefit of \$328,000. As disclosed in Note 7, Emerson
- had a statutory provision (expense) of \$1,534,000 (\$1,285,000 + \$249,000). However, Emerson was able to apply its significant net operating loss carryforwards against its income resulting in a decrease of its income tax expense. The use of these carrryforwards, which are reflected in Emerson's deferred tax asset, was the primary factor in the recognition of an income tax benefit in 2006.
- 5. The schedule of deferred tax assets shows net deferred tax assets of \$9,732,000 and \$10,574,000 million for 2007 and 2006, respectively. These amounts reconcile to the totals of the current and noncurrent deferred tax assets and liabilities shown on the balance sheet for the respective years.

# QUESTIONS

- **Q19-1** Distinguish between the objectives of financial reporting and the Internal Revenue Code.
- **Q19-2** Identify the five groups of possible differences between pretax financial income and taxable income (or between income tax expense and income taxes payable).
- **Q19-3** What is a permanent difference? Give two examples.
- **Q19-4** What is a temporary difference? Give two examples.
- **Q19-5** What did the FASB conclude in regard to interperiod income tax allocation?
- **Q19-6** What are the two objectives of accounting for income taxes identified by the FASB?

- **Q19-7** How does a corporation determine its deferred taxes under GAAP?
- **Q19-8** What are the three characteristics of a liability and why does a deferred tax liability of a corporation meet these characteristics?
- **Q19-9** What are the three characteristics of an asset and why does a deferred tax asset of a corporation meet these characteristics?
- **Q19-10** When does a corporation establish a valuation allowance? Give an example of positive evidence that might be used to justify that a valuation allowance is not needed.

**Q19-11** List the steps necessary to measure and record a corporation's current and deferred income taxes.

**Q19-12** Describe an operating loss carryback. List the two conceptual questions concerning accounting for a carryback.

**Q19-13** Describe an operating loss carryforward. List the two conceptual questions concerning accounting for a carryforward.

**Q19-14** Briefly summarize the GAAP for the financial reporting of operating loss carrybacks and carryforwards.

**Q19-15** What is intraperiod income tax allocation? How is income tax expense reported on a corporation's income statement and retained earnings statement?

**Q19-16** How are deferred tax liabilities and assets reported on a corporation's balance sheet?

**Q19-17** Briefly describe the adjustment of a deferred tax liability (or asset) and the related income statement disclosure for a change in the income tax rate.

**Q19-18** What are the two steps that a company must complete for an uncertain tax position?

Q19-19 If a company believes that it is more likely than not to have future taxable income against which it can use its deferred tax asset, how might the accounting treatment of this deferred tax asset differ under U.S. GAAP and IFRS?

Q19-20 Assume a corporation has a deferred tax liability relating to a current asset. Compare the presentation of this amount under U.S. GAAP and IFRS.

# MULTIPLE CHOICE

Select the best answer for each of the following.

**M19-1** A permanent difference is a difference between pretax financial income and taxable income in an accounting period that will never reverse in a later period. Which of the following is *not* an example of a permanent difference?

- a. Fine for air pollution
- Percentage depletion in excess of cost depletion on a wasting asset
- c. Interest on municipal bonds
- d. Rent received in advance

M19-2 Prior to and during 2010, the Shadrach Company reported tax depreciation at an amount higher than the amount of financial depreciation, resulting in a book value of the depreciable assets of \$24,500 for financial reporting purposes and of \$20,000 for tax purposes at the end of 2010. In addition, the company recognized a \$3,500 estimated liability for legal expenses in the financial statements during 2010; it expects to pay this liability (and deduct it for tax purposes) in 2014. The current tax rate is 30%, no change in the tax rate has been enacted, and the company expects to be profitable in future years. What is the amount of the net noncurrent deferred tax liability at the end of 2010?

a. \$300 c. \$1,050 b. \$450 d. \$1,350

**M19-3** Which of the following is an argument in favor of the asset/liability method of interperiod income tax allocation?

- a. Deferred taxes are the result of historical transactions and should be reported in a similar manner.
- b. Tax effects should be recorded in the same manner as all other revenue and expense transactions that involve changes in specific asset and liability accounts.
- c. The predictive value of future cash flows, liquidity, and financial flexibility are increased when deferred taxes are reported based on enacted tax rates that will be in effect when the temporary differences reverse.

d. Historical tax rates are more verifiable and, therefore, the deferred tax amount is more reliable.

M19-4 At the beginning of 2010, Conley Company purchased an asset at a cost of \$10,000. For financial reporting purposes, the asset has a four-year life with no residual value, and is depreciated by the straight-line method beginning in 2010. For tax purposes, the asset is depreciated under MACRS using a five-year recovery period. Prior to 2010, the company had no deferred tax liability or asset. The difference between depreciation for financial reporting purposes and income tax purposes is the only temporary difference between pretax financial income and taxable income. The current income tax rate is 30% and no change in the tax rate has been enacted for future years. In 2010 and 2011, taxable income will be higher or lower than financial income by what amount?

| 2010             | 2011   |
|------------------|--|
| Higher by \$150  | Lower by \$210                                       |
| Higher by \$500  | Lower by \$700                                       |
| Lower by \$500   | Higher by \$700                                      |
| Lower by \$1,500 | Higher by \$100                                      |
|                  | Higher by \$150<br>Higher by \$500<br>Lower by \$500 |

M19-5 Brooks Company reported a prior period adjustment of \$12,000 in pretax financial "income" and taxable income for 2011. The prior period adjustment was the result of an error in calculating bad debt expense for 2010. The current tax rate is 30% and no change in the tax rate has been enacted for future years. When the company applies intraperiod income tax allocation, the prior period adjustment will be

- a. Shown on the income statement at \$12,000
- b. Shown on the income statement at \$8,400 (net of \$3,600 income taxes)
- c. Shown on the retained earnings statement at \$12,000
- d. Shown on the retained earnings statement at \$8,400 (net of \$3,600 income taxes)

M19-6 In 2010, Swope Company reports a pretax operating loss of \$70,000 for both financial reporting and income tax purposes. Pretax financial income and taxable income for the previous three years had been: 2007—\$15,000 (tax rate 20%), 2008—\$24,000 (tax rate 25%), and 2009—\$49,000 (tax rate 30%). The current tax rate is 30% and no change in the tax rate has been enacted for future years. At the end of 2010 the journal entry recorded would contain an income tax benefit from an operating loss carryback of

a. \$0 b. \$18,300 c. \$19,800 d. \$19,950

**M19-7** The FASB came to which of the following conclusions regarding interperiod income tax allocation?

- a. The partial allocation approach should be applied.
- b. The net-of-tax method of income tax allocation should be used.
- c. Nonallocation of income tax expense is appropriate.
- d. The asset/liability method of income tax allocation should be used.

**M19-8** Which of the following is *not* a cause of a difference between pretax financial income and taxable income in a given period?

- a. Operating loss carrybacks and carryforwards
- b. Permanent differences
- c. Applicable tax rates
- d. Temporary differences

M19-9 Which component of current income is not disclosed on the income statement net of tax effects?

- a. Extraordinary loss from flood
- b. Gain on disposal of milling machine
- c. Gain from sale of discontinued segment
- d. Loss from operations of discontinued component

**M19-10** The Oliver Company earned taxable income of \$7,500 during 2010, its first year of operations. A reconciliation of pretax financial income and taxable income indicated that an additional \$2,500 of accelerated depreciation was deducted for tax purposes and that an estimated expense of \$5,800 was deducted for financial reporting purposes. The estimated expense is not expected to be deductible for tax purposes until 2013, when the liability is paid. The current tax rate is 30% and no change in the tax rate has been enacted for future years. The resulting journal entry for 2010 would be:

| a. Income Tax Expense  | 1,260 |       |
|------------------------|-------|-------|
| Deferred Tax Asset     | 1,740 |       |
| Deferred Tax Liability |       | 750   |
| Income Taxes Payable   |       | 2,250 |
| b. Income Tax Expense  | 1,260 |       |
| Deferred Tax Asset     | 990   |       |
| Income Taxes Payable   |       | 2,250 |
| c. Income Tax Expense  | 3,240 |       |
| Deferred Tax Liability |       | 990   |
| Income Taxes Payable   |       | 2,250 |
| d. Income Tax Expense  | 3,000 |       |
| Deferred Tax Liability |       | 750   |
| Income Taxes Payable   |       | 2,250 |

# REVIEW EXERCISES

**RE19-1** Frankfort Company identifies depreciation as the only difference for future taxable amounts. In Year 1, its depreciation for financial reporting purposes is \$3,500 and \$5,000 for income tax reporting purposes. Frankfort Company has an income tax rate of 35%. Explain whether this is a deferred tax asset or deferred tax liability, and calculate the amount.

**RE19-2** Refer to RE19-1. Assume that Frankfort's taxable income for Year 1 is \$300,000. Prepare the journal entry to record Frankfort Company's income tax expense.

**RE19-3** In the current year, Madison Corporation had \$50,000 of taxable income at a tax rate of 25%. During the year, Madison began offering warranties on its products and has a warranty liability for financial reporting purposes of \$5,000 at the end of the year. Warranty expenses are not deductible until paid for income tax purposes. Prepare the journal entry to record Madison Corporation's income taxes at the end of the year.

**RE19-4** Refer to RE19-3. Prepare the additional journal entry necessary for Madison Corporation assuming that the corporation decides that it is "more likely than not" that \$500 of the \$5,000 future deductible amount will not be realized.

**RE19-5** Turnip Company purchased an asset at a cost of \$10,000 with a ten-year life during the current year. The company uses differing depreciation methods for financial reporting and income tax purposes. The depreciation expense during the current year for financial reporting is \$1,000 and for income tax purposes is \$2,000. Turnip is subject to a 30% enacted future tax rate. Prepare a schedule to compute Turnip's (a) ending future taxable amount, (b) ending deferred tax liability, and (c) change in deferred tax liability (deferred tax expense) for the current year.

**RE19-6** Carrot Company has been profitable in the past and expects to remain profitable in the future. Carrot sells a product for which it provides a five-year warranty. For financial reporting purposes, Carrot estimates its future warranty costs and records a warranty expense and liability at year-end, whereas for income tax purposes the company deducts its warranty costs when paid. At the beginning of the current year, the company had a deferred tax asset of \$500 related to the warranty liability on its balance sheet. At the end of the current year the company estimates that its ending warranty liability is \$2,000.

Carrot had current year taxable income of \$10,000 and is subject to an enacted future tax rate of 30%. Prepare a schedule to compute Carrot's (a) ending future deductible amount, (b) ending deferred tax asset, and (c) change in deferred tax asset for the current year (deferred tax benefit).

**RE19-7** Compute Radish Company's taxable income given the following information:

| • | Excess of gross profit on installment sales over gross profit for taxes | \$ 6,000 |
|---|---|----------|
| • | Tax-exempt interest revenue on municipal bonds                          | 3,000    |
| • | Pretax financial income   | 55,000   |
| • | Excess of rent collected in advance over rent revenue                   | 8,000    |

**RE19-8** Sky Company reports a pretax operating loss of \$50,000 in Year 3 for both financial reporting and income tax purposes. Its reported pretax financial income and taxable income for the previous two years had been: Year 1: \$25,000 (tax rate 30%) and Year 2: \$35,000 (tax rate 35%). Calculate Sky Company's income tax refund for Year 3.

**RE19-9** Tally & Co. incurred a pretax operating loss of \$100,000 in its first year of operations for both financial reporting and income tax purposes. However, it expects to be profitable in the future. Its expected future income tax rate is 25%. Prepare Tally & Co.'s journal entry to record its operating loss carryforward.

RE19-10 Kline Company has the following items of pretax financial (and taxable) "income" for the current year:

| Income from continuing operations               | \$100,000 |
|---|-----------|
| Gain on disposal of discontinued Division B     | 23,000    |
| Loss from operations of discontinued Division B | (11,000)  |

The company is subject to income tax rates of 30% on the first \$40,000 of income and 35% on all income in excess of \$40,000. Prepare a schedule to calculate Kline's intraperiod income tax expense (and credit) amounts.

**RE19-11** Barth James, Inc., has the following deferred tax assets and liabilities: \$5,000 current deferred tax asset, \$12,000 noncurrent deferred tax asset, \$8,000 current deferred tax liability, and \$10,500 noncurrent deferred tax liability. Show how Barth James, Inc., would report these deferred tax assets and liabilities on its balance sheet.

**RE19-12** Cole Company had a deferred tax liability of \$1,000 at the end of Year 1 when the tax rate was 20%. In Year 2, Congress increases the income tax rate from 20% to 30%. Record the journal entry Cole would make to adjust for this change.

# EXERCISES

**E19-1** *Future Taxable Amount* The Durn Company began operations at the beginning of 2010. At the end of 2010 the company reported taxable income of \$9,800 and pretax financial income of \$11,200, because of a single temporary difference. The income tax rate for the current year is 30%, but Congress has enacted a 40% tax rate for 2011 and beyond.

#### Required

Prepare the income tax journal entry of the Durn Company at the end of 2010.

**E19-2** *Temporary Difference* At the end of 2010, its first year of operations, the Slater Company reported a book value for its depreciable assets of \$40,000 for financial reporting purposes and \$33,000 for income tax purposes. The company earned taxable income of \$97,000 during 2010. The company is subject to a 30% income tax rate and no change has been enacted for future years. The depreciation was the only temporary difference between taxable income and pretax financial income.

#### Required

- 1. Prepare the income tax journal entry of the Slater Company at the end of 2010.
- 2. Show how the deferred taxes would be reported on the Slater Company's December 31, 2010 balance sheet.

**E19-3** *Single Temporary Difference: Multiple Rates* At the end of 2010, Fulhage Company reported taxable income of \$9,000 and pretax financial income of \$10,600. The difference is due to depreciation for tax purposes in excess of depreciation for financial reporting purposes. The income tax rate for the current year is 40%, but Congress has enacted tax rates of 35% for 2011 and 30% for 2012 and beyond.

Fulhage Company has calculated the excess of its financial depreciation over its tax depreciation for future years as follows: 2011, \$600; 2012, \$700; and 2013, \$300. Prior to 2010, the company had no deferred tax liability or asset.

### Required

Prepare the income tax journal entry of the Fulhage Company at the end of 2010.

**E19-4** Future Deductible Amount Pito Company has been in operation for several years. During those years the company has been profitable, and it expects to continue to be profitable in the foreseeable future. At the beginning of 2010, the company has a deferred tax asset of \$360 pertaining to one future deductible amount. During 2010, the company earned taxable income of \$51,000, which was taxed at a rate of 30% (no change in the tax rate has been enacted for future years). At the end of 2010, the book value of the current liability to which the deferred tax asset relates for financial reporting purposes exceeded the book value for income tax purposes by \$6,000.

#### Required

- 1. Prepare the income tax journal entry of the Pito Company at the end of 2010.
- 2. Show how the deferred tax asset is reported on the Pito Company's December 31, 2010 balance sheet.
- 3. If the Pito Company uses IFRS, how would your answer to Requirement 2 change?

**E19-5** *Valuation Account* At the end of 2010, its first year of operations, the Beattie Company reported taxable income of \$38,000 and pretax financial income of \$34,400. The difference is due to the way the company handles its warranty costs. For tax purposes, the company deducts the warranty costs as they are paid. For financial reporting purposes, the company provides for a year-end estimated warranty liability based on future expected costs. The company is subject to a 30% tax rate for 2010 and no change in the tax rate has been enacted for future years. Based on verifiable evidence, the company decides it should establish a valuation allowance of 60% of its ending deferred tax asset.

### Required

- 1. Prepare the income tax journal entry of the Beattie Company at the end of 2010.
- 2. Prepare the lower portion of the Beattie Company's 2010 income statement.

**E19-6** *Income Taxes* Thun Company has been in operation for several years. It has both a deductible and a taxable temporary difference. At the beginning of 2010, its deferred tax asset was \$690 and its deferred tax liability was \$750. The company expects its future deductible amount to be "deductible" in 2011 and its future taxable amount to be "taxable" in 2012. In 2009, Congress enacted income tax rates for future years as follows: 2010, 30%; 2011, 34%; and 2012, 35%. At the end of 2010, the company reported income taxes payable of \$12,600, an increase in its deferred tax liability of \$300, and an ending balance in its deferred tax asset of \$860. The company has prepared the following schedule of items related to its income taxes for 2010.

| Item   | Amount |
|--|--------|
| Taxable income for 2010                          |        |
| Future taxable amount, 12/31/10                  |        |
| Increase in future deductible amount during 2010 |        |
| Income tax expense for 2010                      |        |

#### Required

Fill in the blanks in the preceding schedule. Show your calculations.

**E19-7** Originating and Reversing Difference The Tanner Corporation begins operations in 2009 and reports the following amounts of pretax financial income and taxable income for the years 2009 through 2013. The company has only one temporary difference, and only one originating or reversing difference occurs in any single year. The company is subject to a tax rate of 30% for all the years.

|      | Pretax           | Taxable   |
|------|------------------|-----------|
| Year | Financial Income | Income    |
| 2009 | \$70,000         | \$ 50,000 |
| 2010 | 85,000           | 75,000    |
| 2011 | 90,000           | 90,000    |
| 2012 | 82,000           | 92,000    |
| 2013 | 93,000           | 113,000   |

### Required

- 1. Prepare the income tax journal entry for each year.
- 2. What do you notice about the balance in the deferred taxes over the five years?

**E19-8** *Multiple Temporary Differences* Vickers Company reports taxable income of \$4,500 for 2010. The company has two temporary differences between pretax financial income and taxable income at the end of 2010. The first difference is expected to result in taxable amounts totaling \$2,470 in future years. The second difference is expected to result in deductible amounts totaling \$1,360 in future years. The company has a deferred tax asset of \$372 and a deferred tax liability of \$690 at the beginning of 2010. The current tax rate is 30% and no change in the tax rate has been enacted for future years. The company has positive, verifiable evidence of future taxable income.

### Required

Prepare the income tax journal entry of the Vickers Company at the end of 2010.

Operating Loss At the end of 2010, Keil Company reports a pretax operating loss of \$80,000 for both financial reporting and income tax purposes. Prior to 2010 the company had been successful and had reported and paid taxes on the following pretax financial income and taxable income: 2007, \$37,000; 2008, \$50,000; and 2009, \$54,000. The company had been subject to tax rates of 20% in 2007, 25% in 2008, and 30% in 2009.

### Required **E**

- 1. Prepare the income tax journal entry of the Keil Company at the end of 2010.
- 2. Prepare the lower portion of Keil's 2010 income statement.

**E19-10** Operating Loss At the end of 2010, its first year of operations, the Swelland Company reported a pretax operating loss of \$32,000 for both financial reporting and income tax purposes. At that time the company had no positive verifiable evidence that it would earn future taxable income. However, due to successful management, the company reported pretax operating income (and taxable income) of \$70,000 in 2011. During both years, the income tax rate was 30% and no change had been enacted for future years.

### Required

- 1. Prepare the income tax journal entries of the Swelland Company at the end of 2010.
- 2. Prepare the income tax journal entry of the Swelland Company at the end of 2011.
- 3. Prepare the lower portion of Swelland's 2011 income statement.

E19-11 Operating Loss Baxter Company began operations in 2006 and was profitable through 2009, during which time the tax rate was 30%. At the end of 2010, the company reported a pretax operating loss of \$135,000 for both financial reporting and income taxes. Because the tax rate was increased to 40% in 2010, the company elects to forgo any carryback of the operating loss. In 2011, the company reported pretax operating income of \$150,000.

#### Required

- 1. Prepare the income tax journal entry of the Baxter Company at the end of 2010.
- 2. Prepare the lower portion of Baxter's 2010 income statement.
- 3. Explain why Baxter Company elected to forgo any carryback in 2010.
- 4. Prepare the income tax journal entry of the Baxter Company at the end of 2011.
- 5. Prepare the lower portion of Baxter's 2011 income statement.

**E19-12** *Intraperiod Tax Allocation* The Wright Company reports the following information for the year ended December 31, 2010:

| Pretax income from continuing operations                        | \$160,000a          |
|---|---------------------|
| Pretax gain from sale of investment (extraordinary item)        | 30,000              |
| Pretax income from operations of discontinued Division M        | 27,000              |
| Pretax loss on disposal of Division M                           | (45,000)            |
| Pretax correction of error in understating depreciation in 2009 | (8,000)             |
| Retained earnings, January 1, 2010                              | 410,000             |
| Cash dividends during 2010                                      | 48,000              |
| Total income tax  | 41,000 <sup>b</sup> |

- a. Of this amount, revenues are \$400,000 and expenses are \$240,000.
- Of this amount \$7,500 relates to the extraordinary item; \$6,750 relates to the pretax income from the operations of discontinued Division M; the pretax loss on the disposal of Division M resulted in an income tax savings of \$11,250; and the pretax correction of the depreciation error resulted in an income tax savings of \$2,000.

#### Required

- 1. Prepare the year-end journal entry necessary to record the 2010 intraperiod income tax allocation in regard to the preceding information.
- 2. Prepare Wright's 2010 income statement and statement of retained earnings.

**E19-13** Calculating Intraperiod Income Taxes The Stam Corporation reports the following pretax accounting (and taxable) income items during 2010:

| Income from continuing operations                   | \$90,000a |
|---|-----------|
| Loss from operations of a discontinued division     | (10,000)  |
| Gain from the disposal of the discontinued division | 25,000    |
| Extraordinary gain                                  | 20,000    |

Of this amount, revenues are \$320,000 and expenses are \$230,000.

# Required 🔤

- 1. Prepare the journal entry necessary to record the 2010 intraperiod income tax allocation in regard to the preceding information. Assume a tax rate of 15% on the first \$40,000 of income and a rate of 30% on income in excess of \$40,000.
- 2. Prepare Stam's 2010 income statement.

**E19-14** *Disclosure of Intraperiod Tax Allocation* The Lester Corporation reports \$119,000 of both *pretax* accounting "income" and taxable income in 2010. In addition to income from continuing operations (of which revenues are \$500,000), included in this "income" is a \$25,000 extraordinary loss from a fire, a \$17,000 loss from operations of discontinued Division W, a \$15,000 gain on the disposal of Division W, and a \$14,000 correction of an error due to the understatement of bad debt expense in 2009. The company is subject to a 20% tax rate on the first \$50,000 of income and a rate of 25% on income in excess of \$50,000.

#### Required

- 1. Show how this information is disclosed on Lester's 2010 income statement.
- 2. Prepare Lester's 2010 statement of retained earnings. (Assume a beginning retained earnings balance of \$191,000 and cash dividends during 2010 amounting to \$65,000.)

**E19-15** Balance Sheet Presentation The Thiel Company reports the following deferred tax items at the end of 2010:

| Deferred Tax<br>Item # | Account<br>Balance | Related Asset<br>or Liability |
|------------------------|--------------------|-------------------------------|
| 1                      | \$ 7,200 credit    | Current asset                 |
| 2                      | 6,700 debit        | Current liability             |
| 3                      | 15,500 credit      | Noncurrent asset              |
| 4                      | 10,600 debit       | Noncurrent liability          |

### Required

Show how the preceding deferred tax items are reported on the Thiel Company's December 31, 2010 balance sheet.

**E19-16** Change in Tax Rates At the end of 2010, Rowet Company reported a deferred tax liability of \$6,120 based on an income tax rate of 30%. On June 1, 2011 Congress changed the income tax rate to 35%.

#### Required

- 1. Calculate the amount of the adjustment to Rowet Company's 2010 year-end deferred tax liability.
- 2. Prepare the journal entry to correct Rowet Company's deferred tax liability.

**E19-17** *Uncertain Tax Position* At the end of the current year, Boyd Company claims a \$200,000 tax credit on its income tax return. Boyd is uncertain whether the IRS will accept this credit. It studies the IRS regulations and determines that it is more likely than not that the IRS will accept all or some of this tax credit. Based on this research, Boyd Company estimates the following probability distribution of possible outcomes.

| Dollar Amount of Tax Benefit<br>that It Anticipates<br>Will Be Upheld | Probability<br>that the Tax Position<br>Will Be Upheld | Cumulative Probability<br>that the Tax Position<br>Will Be Upheld |
|---|--|---|
| \$200,000   | 25%  | 25%   |
| 150,000   | 45   | 70  |
| 100,000   | 30   | 100   |

### Required

For the current year, determine (1) the amount that Boyd Company will recognize as a current tax benefit and (2) the amount that it will record as the unrecognized tax benefit.

# **P**ROBLEMS

**P19-1** *Temporary and Permanent Differences* In the current year, you are calculating a diversified company's deferred taxes. Based on an analysis of the company's current taxable income and pretax financial income, you have identified the following items that create differences between the two amounts and that may result in differences between the company's future taxable income and its future pretax financial income:

- 1. Percentage depletion deducted for taxes in excess of cost depletion for financial reporting
- 2. Warranty costs to be deducted for taxes that were deducted as warranty expense for financial reporting

3. Gross profit to be recognized for taxes under the completed-contract method that was recognized for financial reporting under the percentage-of-completion method 4. Officers' life insurance premium expense deducted for financial reporting 5. Rent revenue to be recognized for financial reporting that was reported for taxes when collected in advance 6. Loss from writedown of inventory that was recognized for financial reporting but that will be deducted for taxes when the inventory is sold 7. Interest revenue on municipal bonds recognized for financial reporting 8. Loss due to contingent liability that was deducted for financial reporting that will be deducted for taxes when the liability is actually paid 9. Gross profit to be recognized under installment method for tax purposes that was recognized on accrual basis for financial reporting \_ 10. Depreciation to be recognized for financial reporting in excess of MACRS depreciation to be deducted for tax purposes \_\_ 11. Investment income that has been recognized under the equity method for financial reporting that will be recognized as fully taxable for tax purposes when dividends are collected

#### Required

For each difference, indicate whether it is a temporary difference (*T*) or a permanent difference (*P*) by placing the appropriate letter on the line provided. If the difference is a temporary difference, also indicate for the current year whether it will result in a future taxable amount (*T*) or a future deductible amount (*D*).

P19-2 Definitions The FASB has defined several terms in regard to accounting for income taxes. Below are various code letters (for terms) followed by definitions.

| Code Lettei  | Term  | Code Letter                                  | Term                                      |
|--|---|--|---|
| A  | Future deductible amount                            | Н  | Deferred tax consequences                 |
| В  | Income tax obligation (or refund)                   | I  | Future taxable amount                     |
| C  | Operating loss carryback                            | J  | Deferred tax liability                    |
| D  | Valuation allowance                                 | K  | Temporary difference                      |
| E  | Deferred tax asset                                  | L  | Income tax expense (or benefit)           |
| F  | Operating loss carryforward                         | M  | Deferred tax expense (or benefit)         |
| G  | Taxable income                                      |  |   |
| 1.   | The deferred tax consequences of future deduc       | tibles amounts and                           | operating loss carryforwards              |
|  | A difference between the tax basis of an asset or   |  |   |
|  | will result in taxable or deductible amounts in     | future years when th                         | ne reported amount of the asset or liabil |
|  | recovered or settled, respectively                  | •  | -   |
| 3. Temporary difference that results in taxable amounts in future years when the related asset or liability i                                  |   | rs when the related asset or liability is re |   |
|  | ered or settled, respectively                       | ,  | •   |
| 4. The future effects on income taxes, as measured by the applicable enacted tax rate and provisions of the                                    |   | nacted tax rate and provisions of the ena    |   |
| tax law, resulting from temporary differences and operating loss carryforwards at the end of the current ye                                    |   |  |   |
| 5. The change during the year in a corporation's deferred tax liabilities and assets   |   | es and assets                                |   |
| 6. The deferred tax consequences of future taxable amounts   |   |  |   |
| 7.   | The portion of a deferred tax asset for which it is | more likely than no                          | t that a tax benefit will not be realized |
| 8. Temporary difference that results in deductible amounts in future years when the related asset or liabil recovered or settled, respectively |   |  |   |
| 9. The sum of income tax obligation and deferred tax expense (or benefit)  |   |  |   |
| 10. The amount of income taxes paid or payable (or refundable) for the current year  |   |  |   |
| 11. An excess of tax deductible expenses over taxable revenues in a year that may be carried forward to reduct                                 |   |  |   |
|  | able income in a future year                        | ŕ  | •   |
| 12.  | The excess of taxable revenues over tax deducti     | ble expenses and ex                          | emptions for the year                     |
|  | An excess of tax deductible expenses over taxal     |  |   |
|  | income in a prior year                              | ,  | ,   |
| Doguirod   | 1 /   |  |   |

### Required

Indicate which terms belongs with each definition by inserting the corresponding code letter on the line preceding the definition.

P19-3 Multiple Temporary Differences Wilcox Company has prepared the following reconciliation of its pretax financial income with its taxable income for 2010:

| Pretax financial income   | \$3,000 |
|---|---------|
| Add: Estimated expense on one-year warranties recognized for financial reporting in excess of                   |         |
| actual warranty costs deducted for income taxes   | 100     |
| Less: MACRS depreciation deducted for income taxes in excess of depreciation recognized for financial reporting | (150)   |
| Taxable income  | \$2,950 |

At the beginning of 2010, Wilcox Company had a deferred tax liability of \$495. The current tax rate is 30% and no change in the tax rate has been enacted for future years. At the end of 2010, the company anticipates that actual warranty costs will exceed estimated warranty expense by \$100 next year and that financial depreciation will exceed tax depreciation by \$1,800 in future years. The company has earned income in all past years and expects to earn income in the future.

#### Required

- 1. Prepare the income tax journal entry of the Wilcox Company at the end of 2010.
- 2. Prepare the lower portion of Wilcox's 2010 income statement.
- 3. Show how the income tax items are reported on Wilcox's December 31, 2010 balance sheet.
- 4. If the Wilcox Company uses IFRS, how would your answer to Requirement 3 change?

**P19-4** *Interperiod Tax Allocation* Klerk Company had four temporary differences between its pretax financial income and its taxable income during 2010, as follows:

| Number | Temporary Difference  |  |
|--------|---|--|
| 1      | Gross profit on certain installment sales is recognized under the accrual method for financial reporting        |  |
|        | and under the installment method for income taxes   |  |
| 2      | MACRS depreciation is used for income taxes; a different depreciation method is used for financial reporting    |  |
| 3      | Rent receipts are included in taxable income when collected in advance; rent revenue is recognized under        |  |
|        | the accrual method for financial reporting  |  |
| 4      | Warranty expense is estimated for financial reporting; warranty costs are deducted as incurred for income taxes |  |

At the beginning of 2010, the company had a deferred tax liability of \$84,300 related to temporary difference #2 and a deferred tax asset of \$21,090 related to temporary difference #4. Based on its tax records, the company earned taxable income of \$270,000 for 2010. The company's accountant has prepared the following schedule showing the total future taxable and deductible amounts at the end of 2010 for its four temporary differences:

| Future     |                           | Futu     | ıre      |
|------------|---------------------------|----------|----------|
| Taxable Aı | able Amounts Deductible A |          | Amounts  |
| #1         | #2                        | #3       | #4       |
| \$77,900   | \$241,000                 | \$20,000 | \$55,300 |

The company has a history of earning income and expects to be profitable in the future. The income tax rate for 2010 is 40%, but in 2009 Congress enacted a 30% tax rate for 2011 and future years.

During 2010, for financial accounting purposes, the company reported revenues of \$750,000 and expenses of \$447,100. The deferred taxes related to temporary differences #1, #2, and #4 are considered to be noncurrent by the company; the deferred tax related to temporary difference #3 is considered to be current.

### Required

- 1. Prepare the income tax journal entry of the Klerk Company for 2010.
- 2. Prepare a condensed 2010 income statement for the Klerk Company.
- 3. Show how the income tax items are reported on Klerk Company's December 31, 2010 balance sheet.

**P19-5** *Interperiod Tax Allocation* Peterson Company has computed its pretax financial income to be \$66,000 in 2010 *after* including the effects of the appropriate items from the following information:

| 1. | Depreciation taken for tax purposes  | \$40,000 |
|----|--|----------|
|    | Officers' life insurance premium expense recorded on accounting records  | 15,000   |
| 3. | Interest revenue on investment in municipal bonds recorded on accounting records                               | 25,000   |
| 4. | Percentage depletion taken for tax purposes in excess of cost depletion taken for financial reporting purposes | 10,000   |
| 5. | Depreciation taken for financial reporting purposes  | 48,000   |
| 6. | Actual product warranty costs deducted for tax purposes  | 20,000   |
| 7. | Gross profit on installment sales recognized for tax purposes  | 80,000   |
| 8. | Estimated product warranty expense recorded on accounting records  | 27,000   |
| 9. | Gross profit on installment sales recognized for financial reporting purposes                                  | 91,000   |

The company's accountant has prepared the following schedule showing the future taxable and deductible amounts at the end of 2010 for its three temporary differences:

|  | Totals   |
|--|----------|
| Future Taxable Amounts                     |          |
| Depreciation difference                    | \$33,800 |
| Installment sales: gross profit difference | 26,700   |
| Future Deductible Amounts                  |          |
| Warranty difference                        | 56,500   |

At the beginning of 2010, the company had a deferred tax liability of \$12,540 related to the depreciation difference and \$4,710 related to the installment sales difference. In addition, it had a deferred tax asset of \$14,850 related to the warranty difference. The current tax rate is 30% and no change in the tax rate has been enacted for future years.

#### Required

- 1. Compute the Peterson Company's taxable income for 2010.
- 2. Prepare the income tax journal entry of the Peterson Company for 2010 (assume no valuation allowance is necessary).
- 3. Identify the permanent differences in Items 1–9 and explain why you did or did not account for them as deferred tax items in Requirement 2.

**P19-6** *Interperiod Tax Allocation* Quick Company reports the following revenues and expenses in its pretax financial income for the year ended December 31, 2010:

Revenues \$229,600 Expenses (160,100) Pretax financial income (160,100)

The revenues included in pretax financial income are the same amount as the revenues included in the company's taxable income. A reconciliation of the expenses reported for pretax financial income to the expenses reported for taxable income, however, reveals four differences:

- 1. Depreciation deducted for financial reporting exceeded depreciation deducted for income taxes by \$11,000
- 2. Percentage depletion deducted for income taxes exceeded cost depletion deducted for financial reporting by \$15,600
- 3. Warranty costs deducted for income taxes exceeded warranty expenses deducted for financial reporting by \$8,900
- 4. Legal expense of \$9,800 was deducted for financial reporting; it will be deducted for income taxes when paid in a future year

The company expects its percentage depletion to exceed its cost depletion in each of the next five years by the same amount as in 2010. At the end of 2010, the other three expenses are expected to result in total future taxable or deductible amounts as follows:

|                                 | Totals   |
|---------------------------------|----------|
| Future Taxable Amounts          |          |
| Depreciation expense difference | \$63,000 |
| Future Deductible Amounts       |          |
| Warranty expense difference     | 48,400   |
| Legal expense difference        | 9,800    |

At the beginning of 2010, the company had a deferred tax liability of \$22,200 related to the depreciation difference and a deferred tax asset of \$17,190 related to the warranty difference. The income tax rate for 2010 is 35%, but in 2009, Congress enacted a 30% rate for 2011 and future years.

# Required 🔤

- 1. Compute the Quick Company's taxable income for 2010.
- 2. Prepare the income tax journal entry of the Quick Company for 2010. Assume no valuation allowance is necessary.
- 3. Prepare a condensed 2010 income statement for the Quick Company.

**P19-7** *Deferred Tax Liability: Depreciation* At the beginning of 2010, its first year of operations, Cooke Company purchased an asset for \$100,000. This asset has an eight-year economic life with no residual value, and it is being depreciated by the straight-line method for financial reporting purposes. For tax purposes, however, the asset is being depreciated using the MACRS (200%, 5-year life) method.

During 2010, the company reported pretax financial income of \$51,500 and taxable income of \$44,000. The depreciation temporary difference caused the difference between the two income amounts. The tax rate in 2010 was 30%, and no change in the tax rate had been enacted for future years.

### Required 🔤

- 1. Prepare a schedule that shows for each year, 2010 through 2017, (a) MACRS depreciation, (b) straight-line depreciation, (c) the annual depreciation temporary difference, and (d) the accumulated temporary difference at the end of each year.
- 2. Prepare a schedule that computes for each year, 2010 through 2017, (a) the ending deferred tax liability, and (b) the change in the deferred tax liability.
- 3. Prepare the income tax journal entry at the end of 2010.
- 4. Explain what happens to the balance of the deferred tax liability at the end of 2010 through 2017.

**P19-8** *Deferred Tax Liability: Depreciation* Gire Company began operations at the beginning of 2010, at which time it purchased a depreciable asset for \$60,000. For 2010 through 2013, the asset was depreciated on the straight-line basis over a four-year life (no residual value) for financial reporting. For income tax purposes the asset was depreciated using MACRS (200%, three-year life).

For 2010 through 2013, the company reported pretax financial income and taxable income of the following amounts (the differences are due solely to the depreciation temporary differences):

|      | Pretax Financial | Taxable  |
|------|------------------|----------|
| Year | Income           | Income   |
| 2010 | \$24,998         | \$20,000 |
| 2011 | 38,670           | 27,000   |
| 2012 | 27,886           | 34,000   |
| 2013 | 29,446           | 40,000   |

Over the entire four-year period, the company was subject to an income tax of 30% and no change in the tax rate had been enacted for future years.

#### Required

- 1. Prepare a schedule that shows for each year, 2010 through 2013, the (a) MACRS depreciation, (b) straight-line depreciation, (c) annual depreciation temporary difference, and (d) accumulated temporary difference at the end of each year.
- 2. Prepare the income tax journal entry at the end of (a) 2010, (b) 2011, (c) 2012, and (d) 2013. (Round to the nearest dollar.)
- 3. Prepare the lower portion of the income statement for (a) 2010, (b) 2011, (c) 2012 and (d) 2013.

**P19-9** *Deferred Taxes: Multiple Rates* Wicks Corporation began operations on January 1, 2010. At the end of 2010, the company reported pretax financial income of \$60,000 and taxable income of \$57,700, due to two temporary differences. The income tax rate is 30% for 2010 through 2012, but Congress has enacted a tax rate of 35% for 2013 and beyond. To determine its deferred taxes, the company prepared the following schedule of expected future taxable and deductible amounts for the two temporary differences:

|                          | 2011    | 2012    | 2013     | 2014    |
|--------------------------|---------|---------|----------|---------|
| Future taxable amounts   | \$4,900 | \$4,200 | \$ 4,600 | \$4,100 |
| Future deductible amount |         |         | (15,500) |         |

### Required

- 1. Prepare the income tax journal entry of the Wicks Corporation at the end of 2010. Assume a valuation allowance is not required.
- 2. Prepare the lower portion of the 2010 income statement for the Wicks Corporation.

**P19-10** *Operating Loss* Ross Company has been in business for several years, during which time it has been profitable. For each of those years, the company reported (and paid taxes on) taxable income in the same amount as pretax financial income based on the following revenues and expenses:

|      | Revenues  | Expenses  |
|------|-----------|-----------|
| 2006 | \$182,000 | \$150,000 |
| 2007 | 220,000   | 170,000   |
| 2008 | 253,000   | 180,000   |
| 2009 | 241,000   | 196,000   |

The company was subject to the following income tax rates during this period: 2006, 20%; 2007, 25%; 2008, 30%; and 2009, 25%. During 2010 the company experienced a severe decrease in the demand for its products. The company tried to offset this decrease with an expensive marketing campaign, but was unsuccessful. Consequently, at the end of 2010 the company determined that its revenues were \$60,000 and its expenses were \$193,000 during 2010 for both income taxes and financial reporting.

The company decided to carry back its 2010 operating loss because it was not confident it could earn taxable income in the future carryforward period. The income tax rate was 30% in 2010 and no change in the tax rate had been enacted for future years.

In 2011, the company developed and introduced a new product that proved to be in high demand. On June 1, 2011 the company received a refund check from the government based on the tax information it filed at the end of 2010. For 2011 the company reported revenues of \$181,000 and expenses of \$155,000 for both income taxes and financial reporting. The applicable income tax rate was 30%.

### Required

- 1. Prepare the income tax journal entries of the Ross Company at the end of 2010.
- 2. Prepare the Ross Company's 2010 income statement. Include a note for any operating loss carryforward.
- 3. Prepare the journal entry to record the receipt of the refund check on June 1, 2011.
- 4. Prepare the income tax journal entry at the end of 2011.
- 5. Prepare the Ross Company's 2011 income statement.

**P19-11** Operating Loss Refer to the information in Problem 19-10 and modify it as follows: The company decided to carry back its 2010 operating loss. Furthermore, since the company had already begun to develop the new product at the end of 2010 and had contracts for its sale in 2011, the company was confident at the end of 2010 that it would earn sufficient taxable income in the future carryforward period.

# Required

- 1. Prepare the income tax journal entries of the Ross Company at the end of 2010.
- 2. Prepare the Ross Company's 2010 income statement. Include a note for any operating loss carryforward recognition.
- 3. Prepare the journal entry to record the receipt of the refund check on June 1, 2011.
- 4. Prepare the income tax journal entry at the end of 2011.
- 5. Prepare the Ross Company's 2011 income statement.

P19-12 Balance Sheet Reporting and Tax Rate Change At the end of 2009, Dolf Company prepared the following schedule of its deferred tax items (based on the currently enacted tax rate of 30%):

| Deferred Tax Item # | Account Balance | Related Asset or Liability |
|---------------------|-----------------|----------------------------|
| 1                   | \$ 8,400 debit  | Current asset              |
| 2                   | 10,200 debit    | Noncurrent asset           |
| 3                   | 5,700 credit    | Current liability          |
| 4                   | 17,700 credit   | Noncurrent liability       |

On April 30, 2010 Congress changed the income tax rate to 40% for 2010 and future years. At the end of 2010 the company reported taxable income of \$62,500 for 2010. At that time, the company determined that its deferred tax items should have balances as follows at the end of 2010 (based on the 40% tax rate): #1, \$10,700 debit; #2, \$15,000 debit; #3, \$7,000 credit; #4, \$25,900 credit.

# Required 🔤

- 1. Show how the deferred tax items are reported on the Dolf Company's December 31, 2009 balance sheet.
- 2. Prepare the April 30, 2010 journal entry to correct Dolf Company's deferred tax items.
- 3. Prepare the income tax journal entry of the Dolf Company at the end of 2010.
- 4. Show how the current and deferred tax items are reported on the Dolf Company's December 31, 2010 balance sheet.
- 5. Calculate the total income tax expense for 2010.

P19-13 Comprehensive Colt Company reports pretax financial "income" of \$143,000 in 2010. In addition to pretax income from continuing operations (of which revenues are \$295,000), the following items are included in this pretax "income":

| Extraordinary gain                                | \$30,000 |
|---|----------|
| Loss from disposal of Division B                  | (10,000) |
| Income from operations of discontinued Division B | 16,000   |
| Prior period adjustment                           | (8,000)  |

The taxable income of the company totals \$123,000 in 2010. The difference between the pretax financial income and the taxable income is due to the excess of tax depreciation over financial depreciation on assets used in continuing operations.

At the beginning of 2010, the company had a retained earnings balance of \$310,000 and a deferred tax liability of \$8,100. During 2010, the company declared and paid dividends of \$48,000. It is subject to tax rates of 15% on the first \$50,000 of income and 30% on income in excess of \$50,000. Based on proper interperiod tax allocation procedures, the company has determined that its 2010 ending deferred tax liability is \$14,100.

# Required

- 1. Prepare a schedule for the Colt Company to allocate the total 2010 income tax expense to the various components of pretax income.
- 2. Prepare the income tax journal entry of the Colt Company at the end of 2010.
- 3. Prepare Colt Company's 2010 income statement.
- 4. Prepare Colt Company's 2010 statement of retained earnings.
- 5. Show the related income tax disclosures on the Colt Company's December 31, 2010 balance sheet.

P19-14 Comprehensive At the beginning of 2010, Norris Company had a deferred tax liability of \$6,400, because of the use of MACRS depreciation for income tax purposes and units-of-production depreciation for financial reporting. The income tax rate is 30% for 2009 and 2010, but in 2009, Congress enacted a 40% tax rate for 2011 and future years.

The accounting records of the Norris Company show the following pretax items of financial income for 2010: income from continuing operations, \$120,000 (revenues of \$352,000 and expenses of \$232,000); gain on disposal of Division F, \$23,000; extraordinary loss, \$18,000; loss from operations of discontinued Division F, \$10,000; and prior period adjustment, \$15,000, due to an error that understated revenue in 2009. All of these items are taxable; however, financial depreciation for 2010 on assets related to continuing operations exceeds tax depreciation by \$5,000. The company had a retained earnings balance of \$161,000 on January 1, 2010 and declared and paid cash dividends of \$32,000 during 2010.

### Required

- 1. Prepare the income tax journal entry of the Norris Company at the end of 2010.
- 2. Prepare Norris Company's 2010 income statement.

- 3. Prepare Norris Company's 2010 statement of retained earnings.
- 4. Show the related income tax disclosures on the Norris Company's December 31, 2010 balance sheet.

**P19-15** *Comprehensive* Jayryan Company sells products in a volatile market. The company began operating in 2008 and reported (and paid taxes on) taxable income in 2008 and 2009. It has one taxable temporary difference (future taxable amount), and reconciled its taxable income to its pretax financial income for 2008 and 2009 as follows:

|                         | 2008     | 2009     |
|-------------------------|----------|----------|
| Taxable income          | \$25,000 | \$53,000 |
| Temporary difference    | 2,500    | 4,800    |
| Pretax financial income | \$27,500 | \$57,800 |

In 2010, because of a downturn in the market, the company reported a taxable loss of \$90,000 and it was uncertain as to future profits. A temporary difference of \$2,700 resulted in an \$87,300 pretax operating loss for financial reporting. In 2011 and 2012, the company was again profitable and reported the following items:

|                         | 2011    | 2012     |
|-------------------------|---------|----------|
| Taxable income          | \$7,000 | \$19,000 |
| Temporary difference    | 2,300   | 2,800    |
| Pretax financial income | \$9,300 | \$21,800 |

The income tax rate has been 30% since 2006 and no change in the tax rate has been enacted for future years.

### Required

- 1. Prepare a schedule that shows the Jayryan Company's income taxes payable (or receivable) for each year, 2008 through 2012.
- Prepare a schedule that shows the deferred tax information (change in temporary difference and operating loss carryforward) for each year, 2008 through 2012.
- 3. Prepare a schedule that shows the deferred taxes for each year, 2008 through 2012.
- 4. Based on the schedule prepared in Requirement 3, prepare the income tax journal entry at the end of 2010.
- 5. Prepare a partial income statement for 2010. Include a note for any operating loss carryforward.

# ${\sf C}$ ases

# COMMUNICATION

# C19-1 Asset/Liability Method and Temporary Differences

Interperiod tax allocation is necessary because there are differences in the timing of revenues and expenses between a corporation's financial statements and its federal income tax returns.

# Required

- Identify the two goals and four basic principles of accounting for income taxes.
- 2. Briefly explain interperiod income tax allocation under generally accepted accounting principles.
- 3. List the four groups of items that result in temporary differences and give examples for each group.

# **C19-2 Interperiod Tax Allocation**

A friend in a business policy class says, "I always thought the income taxes reported on a corporation's income statement were the same as the income taxes paid during that period. Now I am not so sure because some other students men-

tioned interperiod income tax allocation. Furthermore, I have heard about comprehensive and partial allocation. I am confused. Please explain this to me."

### Required

Prepare a written response for your friend. In your discussion be sure to discuss permanent and temporary differences, and to compare comprehensive allocation with partial allocation. Include the reasons for interperiod allocation and comprehensive allocation.

# C19-3 Methods of Interperiod Tax Allocation

Three methods of interperiod income tax allocation have been advocated. These include (1) the asset/liability method, (2) the deferred method, and (3) the net-of-tax method.

### Required

Define *interperiod income tax allocation* and briefly explain the three methods that have been advocated. Conclude by summarizing the generally accepted accounting principles for interperiod income tax allocation.

# C19-4 Operating Losses

The Internal Revenue Code allows a corporation to carry back or carry forward an "operating loss" for a given year.

- 1. Describe an operating loss carryback and a carryforward.
- 2. For a carryback, identify and briefly explain the two important conceptual questions.
- 3. For a carryforward, identify and briefly explain the two important conceptual questions.
- 4. Briefly summarize the generally accepted accounting principles for the financial reporting of (a) an operating loss carryback and (b) an operating loss carryforward.

# **C19-5** Intraperiod Tax Allocation

Income tax allocation is an integral part of generally accepted accounting principles. Income tax allocation

consists of both intraperiod and interperiod tax allocation.

# Required

- 1. Explain the difference between interperiod and intraperiod income tax allocation.
- 2. Explain how a corporation discloses its income tax expense (or credit) for the year under intraperiod allocation.
- Provide an example of intraperiod tax allocation on a corporation's income statement that includes income from continuing operations, a loss from the sale of a discontinued component, a gain from the operations of the discontinued component, and an extraordinary gain. Assume a 30% tax rate.

# CREATIVE AND CRITICAL THINKING

# **C19-6** Permanent and Temporary Differences

To implement interperiod income tax allocation, an accountant must be able to distinguish between permanent and temporary differences. The following is a list of three differences between a corporation's pretax financial income and taxable income:

- a. Estimated warranty costs (covering a three-year warranty) are expensed for financial reporting purposes at the time of sale but are deducted for tax purposes when incurred.
- b. MACRS depreciation for income tax purposes exceeds straight-line depreciation for financial reporting purposes.
- Percentage depletion for tax purposes exceeds cost depletion for financial reporting purposes.

- 1. Define (a) permanent difference and (b) temporary difference.
- 2. Define interperiod income tax allocation and briefly describe its application under generally accepted accounting principles.
- 3. Indicate and explain whether each of the three differences listed in this case should be treated as a temporary or permanent difference.

# **C19-7** Deferred Tax Assets and Liabilities

A friend says to you, "I don't understand how taxable temporary differences can be 'liabilities' and how deductible temporary differences can be 'assets.' It seems to me that these temporary differences relate only to the future, and that accounting is based on 'historical cost.' Furthermore, the government frequently changes the tax laws, so no one knows what the future tax laws will be."

# Required

Prepare a written response for your friend that explains why deferred tax assets and deferred tax liabilities are recognized and reported on a corporation's balance sheet. Include a discussion of a valuation allowance.

# **C19-8 Interperiod Tax Allocation**

AICPA Adapted Chris Green, CPA, is auditing Rayne Co.'s 2010 financial statements. For the year ended December 31, 2010, Rayne is applying GAAP for income taxes. Rayne's controller, Dunn, has prepared a schedule of all differences between financial statement and income tax return income. Dunn believes that as a result of pending legislation, the enacted tax rate at December 31, 2010 will be increased for 2011. Dunn is uncertain which differences to include and which rates to apply in computing deferred taxes. Dunn has requested an overview of GAAP from Green

# Required

Prepare a brief memo to Dunn from Green that identifies the objectives of accounting for income taxes, defines temporary differences, explains how to measure deferred tax assets and liabilities, and explains how to measure deferred income tax expense or benefit.

# C19-9 Analyzing Coca-Cola's Income Tax **Disclosures**

Refer to the financial statements and related notes of the Coca-Cola Company in Appendix A of this book.

- 1. What was the total income tax expense relating to income before income taxes for 2007? How much of this was current? How much was deferred?
- 2. What were the total deferred tax assets at the end of 2007? Total deferred tax liabilities? Net deferred tax liability?
- 3. How much was the noncurrent deferred tax liability at the end of 2007 and where was it reported?
- How much were the operating loss carryforwards at the end of 2007? Over what time periods must these be utilized?

# **C19-10 Ethics and Deferred Taxes**

It is the end of 2011, and the auditing firm for which you work is auditing the Weiss Company for the first time. Prior to 2011, Weiss was

audited by another firm. A substantial amount of Weiss Company's revenues for 2010 came from installment sales. Weiss has considerable property, plant, and equipment. It also has a large amount of debt outstanding, and one of the debt covenants is that the company maintain a 2.00 current ratio.

You have been reviewing the deferred taxes of Weiss at the end of 2011. On its preliminary ending balance sheet for 2011, Weiss has included a noncurrent deferred tax liability of \$45,000. On its ending 2010 balance sheet, Weiss had also reported a noncurrent deferred tax liability. Upon examining the calculations supporting the \$45,000, you find that one-third relates to the receivables from the installment sales and two-thirds relates to the depreciation on the property, plant,

and equipment. Nearly all of the 2010 deferred tax liability related to the latter.

Based on your analysis, you raise the issue with Weiss Company's controller about the possibility of reclassifying \$15,000 of the deferred taxes as a current liability. The controller responds, "We have always listed our deferred taxes as a noncurrent liability. This was okay with our previous auditor. It just isn't worth the hassle of splitting the amount into current and noncurrent portions. It is clearly not material, since our total equity is over \$400,000. Besides, if we did that it would bring our current ratio down to 1.95 and we would have our creditors on our backs. Everyone knows that deferred taxes are never really paid, so that is a good reason for not including the amount in our current liabilities."

### Required

From financial reporting and ethical perspectives, prepare a response to Weiss Company's controller.

# Accounting for Postemployment Benefits

Matt York/AP Photos

After reading this chapter, you will be able to:

- 1 Understand the characteristics of pension plans.
- **2** Explain the historical perspective of accounting for pension plans.
- **3** Explain the GAAP for defined benefit plans, including computing pension expense and recognizing pension liabilities and assets.
  - 4 Account for pension plans.
  - 5 Understand disclosures of pension plans.
  - **6** Explain the conceptual issues regarding pension plans.
- 7 Understand several additional issues related to pension plans.
  - 8 Explain other post-employment benefit plans (OPEBs).
  - 9 Account for OPEB plans.
  - **10** Explain the conceptual issues regarding OPEB plans.
  - 11 Understand present value calculations for pensions (Appendix).

# It's Never Too Early to Plan for Retirement

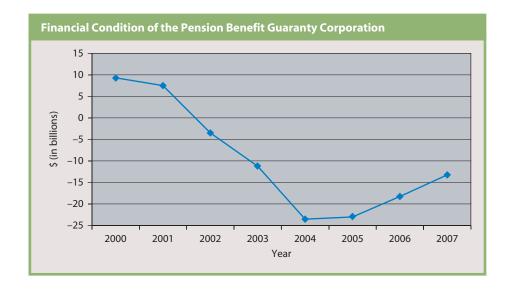

If you've picked up a newspaper lately, it is likely that you've read about the problems facing the pension plans of many companies. For fiscal year 2007, the Pension

Benefit Guaranty Corporation (PBGC), the government agency that insures the basic pension benefits of nearly 44 million workers, reported that it had a deficit of more than \$13.1 billion. In fact, as shown in the chart below, the PBGC has been running at a deficit for most of this century!

What caused this problem? First, falling stock prices and the economic recession in the early part of the decade contributed to a drop in the value of pension plan assets.

Second, record low interest rates during the

same time period led to significant increases in companies' pension liabilities. Falling asset prices and increasing liabilities left many pension plans insolvent. The resulting takeover of these insolvent plans by the PBGC left it with a record deficit of \$23.3 billion in 2004. The airline industry was responsible for much of this deficit. The takeover of United Airlines' and U.S. Airways' pension plans cost the PBGC approximately \$6.6 billion and \$3 billion, respectively. These are two of the largest claims in the history of the pension insurance program. However, the situation is improving. The robust economy experienced in 2006 and 2007, along with strong investment returns, higher interest rate factors, and no large pension plan failures, led to a \$5 billion reduction in the deficit for 2007.

In spite of the many problems facing pension plans, many companies are contributing large amounts of cash to their pension plans and recognizing sizeable financial benefits.<sup>1</sup> Of the many benefits of putting excess cash into pension plans are an increase in future earnings, reduced taxes, and freeing up future cash. For example, **Boeing Co.** contributed \$580 million into its pension plan during 2007. Because companies use an expected rate of return on pension plan assets rather than the actual return on the assets (Boeing is currently using 8.25%) in

pension calculations, this large contribution ensures Boeing an increase in income of \$47.85 million in 2008. Because the contribution is tax-deductible, Boeing is expected to receive a tax benefit of more than \$170 million. Finally, the sizeable contribution in 2007 will most likely mean that Boeing has prefunded its plan for years to come, freeing up cash flow in future years to use for other business purposes. Clearly, the accounting for pensions has far-reaching impacts—socially and financially.

<sup>.</sup> Adapted from "How Companies Make the Most of Pensions" by Karen Richardson, Wall Street Journal, January 24, 2005.

The average life expectancy of a male and female born in the United States in 1995 has increased to approximately 72 and 79 years, respectively. Consequently, most people are living long enough to retire and to become dependent on other sources of income. Both the government and companies are concerned about providing income to these individuals. In response, Congress passed the Federal Insurance Contribution Act (commonly called Social Security) in 1935. This Act requires most employers and employees to contribute to a federal retirement program. To supplement Social Security, many companies also have adopted private retirement plans. One hundred large U.S. companies have over \$1,300 billion of pension fund assets.<sup>2</sup> Because these pension plans are important, Congress passed legislation affecting their operation. This legislation includes the Employee Retirement Income Security Act of 1974 (ERISA), which often is referred to as the Pension Reform Act of 1974, as well as the Pension Protection Act of 2006.

We discussed the accounting for the cost of social security taxes in Chapter 13. In this chapter we focus on the recording, reporting, and disclosure procedures for company pension plans under GAAP and both the Pension Reform Act of 1974 and the Pension Protection Act of 2006. In addition to pensions, many employers provide other postemployment benefits to their employees. We discuss the accounting for these benefits later in the chapter.

# CHARACTERISTICS OF PENSION PLANS

A pension plan requires that a company provide income to its retired employees for the services they provided during their employment. This retirement income, normally paid monthly, usually is determined on the basis of the employee's earnings and length of service with the company. For instance, under the retirement plan of one major company, employees who retire at age 65 receive annual retirement income according to the following formula:

Average of last five years' salary  $\times$  number of years of service  $\times$  0.0257.

Thus, an individual who worked for this company for 30 years and had an average salary of \$100,000 for the last five years of service receives annual pension benefits of \$77,100  $(\$100,000 \times 30 \times 0.0257).$ 

A pension plan of this type is a **defined benefit plan** because the plan specifically states either the benefits to be received by employees after retirement or the method of determining such benefits. In contrast, a pension plan is a defined contribution plan when the employer's contribution is based on a formula, so that future benefits are limited to an amount that can be provided by the contributions and the returns earned on the investment of those contributions.

These two types of plans involve different risks to the company and the employees. With a defined benefit plan, most of the risks lie with the company because the payments to the retired employees are defined and the company has the responsibility of ensuring that those amounts are paid. In contrast, with a defined contribution plan, most of the risks lie with the employees because the company's responsibilities essentially end once the required contribution for the period has been made by the company. There are many accounting issues related to defined benefit plans. These issues are the primary focus of this chapter. We briefly discuss defined contribution plans later in the chapter.

Companies' pension plans are funded. Under a funded plan, the company makes periodic payments to a funding agency. The funding agency assumes the responsibility for both safeguarding and investing the pension assets to earn a return on the investments for the pension plan. The funding agency also makes payments to the retirees. The amounts needed to fund a pension plan are estimated by actuaries. Actuaries are individuals trained in actuarial science who use compound interest techniques, projections of future events, and actuarial funding methods to calculate required current contributions by the company.

1 Understand the characteristics of pension plans.

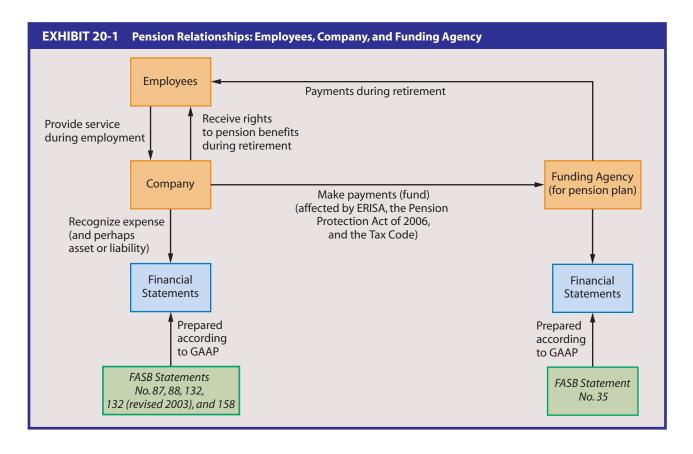

An unfunded plan is one in which no periodic payments are made to an external agency. Instead, the pension payments to retired employees are made from current resources. Although the Pension Reform Act of 1974 has eliminated unfunded plans for companies, some plans are underfunded. However, the Pension Protection Act of 2006 sets a limit on the length of time a plan can be underfunded.

Companies' pension plans are usually noncontributory. With noncontributory plans, the entire pension cost is borne by the employer (company). Under a **contributory** plan, employees bear part of the cost of the plan and make contributions from their salaries into the pension fund. We discuss noncontributory plans in this chapter.

In addition, most companies design their pension plans to meet the Internal Revenue Code rules:

- 1. There is a maximum amount of employer contributions that is deductible for income tax purposes.
- 2. Pension fund earnings are exempt from income taxes.
- 3. Employer contributions to the pension fund are not taxable to the employees until they receive their pension benefits.

Exhibit 20-1 summarizes the relationships among the employees, the company, and the funding agency for a noncontributory defined benefit pension plan.

# HISTORICAL PERSPECTIVE OF PENSION PLANS

**2** Explain the historical perspective of accounting for pension plans. Accounting for the cost of pension plans has changed over the years. In 1956, GAAP recommended recognizing pension cost on the accrual basis instead of the cash basis. That is, it recommended that pension expense be recorded by an employer during the periods of employment as benefits are earned by employees, and not delayed until the periods when retirement benefits are actually paid. The pension expense is based on the present value of the future benefits earned by employees during the current accounting period. We use

present value techniques (which we explain in the Time Value of Money Module) in this chapter for computing the amounts related to pension plans.

Despite this recommendation, most companies continued to use the cash basis of accounting for pension plans. The use of the cash basis, however, violated the accrual concept and resulted in a lack of comparability among companies in reporting pension expense. This sometimes caused wide year-to-year fluctuations in the pension expense for a single company. In an effort to solve this problem, GAAP was changed in 1966 to require the use of the accrual method for the recognition of the pension expense. However, it allowed a choice of actuarial methods in determining the amount of the pension expense, which caused a lack of comparability. Also, companies with plans for which the obligation to pay benefits greatly exceeded the plan assets available did not record a liability. As a result, in 1974 the FASB added pension accounting to its agenda, and over a long period developed and refined the accounting for pensions. The FASB first issued a Discussion Memorandum in 1975 and then issued several Exposure Drafts in subsequent years. Then, in 1980 GAAP was issued that defined the principles to be used and the disclosures required by the funding agency for a company's pension plan. This information, which we briefly discuss later in the chapter, is primarily for the benefit of the participants in the plan. However, it is also used by the employer for its pension plan accounting calculations and disclosures. In 1985, GAAP was changed again and the measurement, recognition, and disclosure principles for employers' pension plans was established. Also, in 1985 GAAP was established for ending pension plans, which we briefly discuss later in this chapter. In 1998, the disclosure requirements were modified. In 2003, the disclosure requirements were changed again. Finally, in 2006 the FASB changed the requirements for the amounts that companies report on their balance sheets. In this chapter, we discuss the current recording, reporting, and disclosure requirements.

# **ACCOUNTING PRINCIPLES FOR DEFINED BENEFIT PENSION PLANS**

GAAP for defined benefit pension plans is very complex and we include only the basic elements in the following discussion. Note that the minimum amount funded by the employer is defined by ERISA and the Pension Protection Act of 2006 (which we discuss later).

# **Key Terms Related to Pension Plans**

Before we discuss the GAAP for pension plans, you should understand the terms in Exhibit 20-2.3 You should study these terms now and carefully review them as we introduce each in the chapter. In addition, we introduce several other terms later in the chapter as they relate to specific issues. Note that actuaries often use the term accrue to refer to amounts associated with the pension plan, in contrast to the more specific meaning used by accountants.

# **Pension Expense**

In defining the annual pension cost, GAAP uses the term net periodic pension cost because a company may capitalize some of its annual pension cost as part of the cost of an asset, such as inventory. For simplicity, we will use the term pension expense and assume that none of the pension costs are capitalized. The pension expense that a company recognizes includes five components: service cost, interest cost, expected return on plan assets, amortization of prior service cost, and gain or loss.

<sup>3</sup> Explain the **GAAP** for defined benefit plans, including computing pension expense and recognizing pension liabilities and assets.

<sup>&</sup>quot;Employers' Accounting for Pensions," FASB Statement of Financial Accounting Standards No. 87 (Stamford, Conn.: FASB, 1985), Appendix D (FASB Cod. Glossary).

### **EXHIBIT 20-2** Key Terms Related to Pension Plans

Accumulated Benefit Obligation. The actuarial present value of all the benefits attributed by the pension benefit formula to employee service rendered before a specified date. The amount is based on current and past compensation levels of employees and, therefore, includes no assumptions about future pay increases.

Actual Return on Plan Assets. The difference between the fair value of the plan assets at the end of the period and the fair value at the beginning of the period, adjusted for contributions and payments of benefits during the period.

Actuarial Funding Method. Any technique that actuaries use in determining the amounts and timing of employer contributions to provide for pension benefits.

**Actuarial Present Value.** The value, on a specified date, of an amount or series of amounts payable or receivable in the future. The present value is determined by discounting the future amount or amounts at a predetermined discount rate. The future amounts are adjusted for the probability of payment (affected by factors such as death, disability, or withdrawal from the plan).

Assumptions. Estimates of the occurrence of future events affecting pension costs, such as mortality, withdrawal, disablement and retirement, changes in compensation, and discount rates. Sometimes called *actuarial* assumptions.

Discount Rate. The rate at which the pension benefits can be effectively settled (e.g., the rate implicit in current prices of annuity contracts that could be used to settle the pension obligation). The discount rate is used in computing the service cost, the projected benefit obligation, the interest cost, and the accumulated benefit obligation.

Expected Return on Plan Assets. An amount calculated by applying the expected long-term rate of return on plan assets to the fair market value of the plan assets at the beginning of the period.

Gain or Loss. A change in the value of the projected benefit obligation (or the plan assets) resulting from experience different from that assumed, or from a change in an actuarial assumption. Sometimes called actuarial or experience gain or loss.

Pension Benefit Formula. The basis for determining payments to which employees will be entitled during retirement.

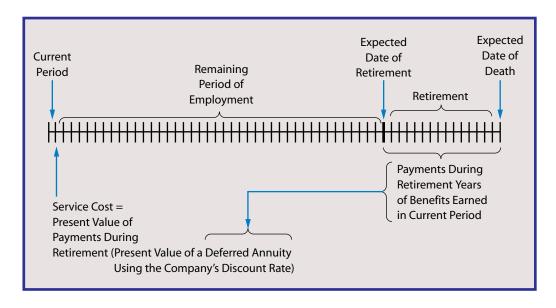

Prior Service Cost. The cost of retroactive benefits granted in a plan amendment or at the initial adoption of the plan. The cost is the present value of the additional benefits attributed by the pension benefit formula.

**Projected Benefit Obligation.** The actuarial present value, at a specified date, of all the benefits attributed by the pension benefit formula to employee service rendered prior to that date. The amount includes future increases in compensation that the company projects it will pay to employees during the remainder of their employment, provided the pension benefit formula is based on those future compensation levels. The projected benefit obligation differs from the accumulated benefit obligation because it includes anticipated future pay increases.

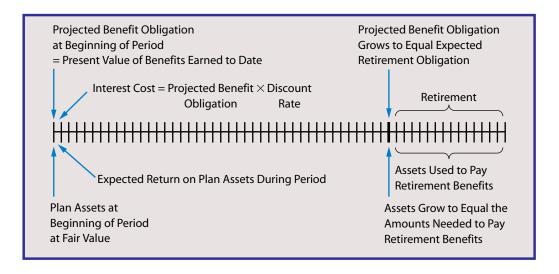

Service Cost. The actuarial present value of benefits attributed by the pension benefit formula to services of employees during the current period. If the pension benefit formula is based on future compensation levels (e.g., average of last five years' salary), the service cost is based on those future compensation levels.

**Vested Benefit Obligation.** The actuarial present value of the vested benefits, which are those benefits that the employees have the right to receive if the employee no longer works for the employer.

1. Service Cost. The service cost is the actuarial present value of the benefits attributed by the pension benefit formula to services of the employees during the current period. This amount is the present value of the deferred compensation to be paid to employees during their retirement in return for their current services. The service cost is computed using the discount rate selected by the company. The discount rate will vary as economic conditions change. If the rate increases (decreases), the present value decreases (increases). We show the nature of the service cost in the following diagram:

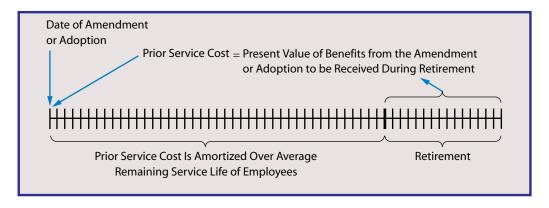

- 2. Interest Cost. The interest cost is the increase in the projected benefit obligation due to the passage of time. The projected benefit obligation is the present value of the deferred compensation earned by the employees to date (based on their expected future compensation levels). The interest cost is the projected benefit obligation at the beginning of the period multiplied by the discount rate used by the company. Since the pension plan is a deferred compensation agreement in which future payments are discounted to their present values, interest accrues because of the passage of time. The interest cost is added in the computation of pension expense.
- 3. Expected Return on Plan Assets. The expected return on plan assets is the expected increase in the plan assets due to investing activities.<sup>4</sup> Plan assets are held by the funding agency and consist of investments in securities such as stocks and bonds, as well as other investments. The expected return is calculated by multiplying the fair value of the plan assets at the beginning of the period by the expected long-term rate of return on plan assets. The rate of return reflects the average rate of earnings

Note that GAAP specifies that the third component of the pension expense is the actual return on plan assets. It then includes the difference between the actual and expected return in the computation of the fifth component (the gain or loss). Under the disclosure requirements of GAAP, a company is only required to disclose the expected return in the computation of its pension expense. Therefore, in our discussion we combine the two amounts into the expected return.

- expected on the assets invested to provide for the benefits included in the projected benefit obligation. The expected return on plan assets is subtracted because the earnings "compensate" for the interest cost on the projected benefit obligation, as we show in the diagram at the bottom of page 1017.
- 4. Amortization of Prior Service Cost. Amendments to a pension plan may include provisions that grant increased retroactive benefits to employees based on their employment in prior periods, thereby increasing the projected benefit obligation. Similar retroactive benefits may also be granted at the initial adoption of a plan. The cost of these retroactive benefits is the **prior service cost**. The prior service cost is reported as a liability and as a negative element of other comprehensive income at the date of the plan amendment. The prior service cost is then amortized each period and included in the computation of pension expense. The amount amortized is also reported as a positive element of other comprehensive income. We illustrate the required journal entries later in the chapter.

The prior service cost is amortized by assigning an equal amount to each future service period of each active employee who, at the date of the amendment, is expected to receive future benefits under the plan. Alternatively, straight-line amortization over the average remaining service life of active employees may be used for simplicity. Employees hired after the date of the amendment or the plan adoption are not included in either calculation. The plan amendment usually increases the projected benefit obligation. Therefore, the amortization is added in the computation of pension expense. However, there have been several instances in recent years where companies in financial difficulty or under pressure from competitors have amended their pension plans to reduce the projected benefit obligation. In this case, the amortization is subtracted in the computation. We show the prior service cost and its amortization in the following diagram:

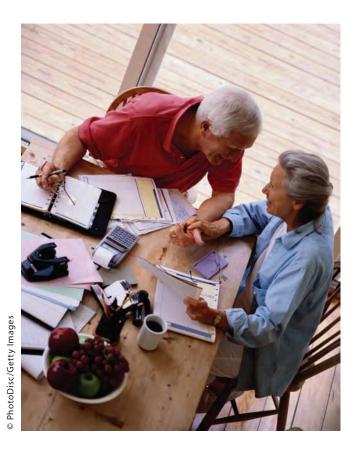

Gain or Loss. The gain or loss arises because assumptions are made about many of the items included in the computation of pension costs and benefits. These include future compensation levels, the interest (discount) rate, employee turnover, retirement rates, mortality rates and expected returns on the pension plan assets. Actual experience will not be the same as these assumptions. As a result, the actual projected benefit obligation and the actual fair value of the pension plan assets at year-end will not be equal to the *expected* projected benefit obligation and the *expected* fair value of the pension plan assets.

Therefore, gains and losses result from (a) changes in the amount of the projected benefit obligation and the fair value of the pension plan assets resulting from experience different from that assumed,<sup>5</sup> and (b) changes in the assumptions.<sup>6</sup> Gains result

In addition, gains and losses can occur because of the use of the market-related value of the plan assets, as we explain in footnote 7. These gains and losses are handled in a manner similar to those for changes in the projected benefit obligation, so for simplicity we do not discuss them further.

Although these gains and losses frequently are referred to as experience gains and losses or actuarial gains and losses, the FASB avoided using these terms.

when actual experience is more favorable than that assumed (e.g., the future compensation levels are lower than expected because of lower inflation). Losses result when the actual experience is unfavorable. It is important to distinguish between the impact on the company as compared to the impact on the employees. For example, a lower-than-expected mortality rate is obviously favorable to the employees, but it creates a loss to the company because it will have to make more pension payments than expected.

The entire gain or loss is usually not recognized in the period in which it occurs because it might create significant fluctuations in the pension expense. Any gain or loss that is not recognized in pension expense in the period it occurs is recognized as an asset or liability and as a component of other comprehensive

income, as we discussed earlier for prior service costs. Amortization of any net gain or loss is included in the pension expense of a given year if, at the beginning of the year, the cumulative net gain or loss from previous periods (included in accumulated other comprehensive income) exceeds a "corridor." The corridor is defined as 10% of the greater of the actual projected benefit obligation or the fair value of the plan assets.<sup>7</sup> If amortization is required, the minimum amortization is computed as follows:

> Cumulative net gain or loss in accumulated other comprehensive income - Corridor at beginning of year Average remaining service period of the active employees expected to receive benefits under the plan

The amortization of the net gain (loss) is subtracted (added) in the computation of pension expense.8

To summarize, the gain or loss component of pension expense generally consists of one of the following two items:

- (1) Amortization of any net loss from previous periods (added to compute pension expense), or
- (2) Amortization of any net gain from previous periods (deducted to compute pension expense).

GAAP uses the term market-related value. The market-related value of plan assets is either the fair value or a calculated value that recognizes changes in fair value in a systematic and rational manner over not more than five years. The use of the market-related value is allowed in order to reduce the volatility of the pension expense amount. For simplicity, we always use the fair value of the plan assets as the market-related

Alternatively, any systematic method of amortization may be used instead of the minimum just described, as long as it results in greater amortization. We use the minimum amount each period.

Gains and losses that arise from a single occurrence not directly related to the pension plan are recognized in the period in which they occur. For example, a gain or loss that is directly related to the disposal of a component is included in the "gain or loss on disposal," as we discussed in Chapter 5.

# **Components of Pension Expense**

In summary, the pension expense a company reports on its income statement generally includes the following components:

Service cost (Present value of benefits earned during the year using the discount rate)

- + Interest cost (Projected benefit obligation at beginning of the year × Discount rate)
- Expected return on plan assets (Fair value of plan assets at the beginning of the year × Expected long-term rate of return on plan assets)
- + Amortization of prior service cost (Present value of additional benefits granted at adoption or modification of the plan amortized over the remaining service lives of active employees)
- ∓ Gain or loss (Amortization of the cumulative net gain or loss from previous periods in excess of the corridor)
- = Pension Expense

Note that the amortization of a reduction in prior service cost would be deducted in the pension expense calculation.

# **Pension Liabilities and Assets**

The amount of a company's pension expense usually is different from the amount contributed by the company to the pension plan (the amount funded) because these amounts are defined by different sets of rules. GAAP defines the expense, whereas the funding must be consistent with the rules of ERISA and the Pension Protection Act of 2006, as we discuss later. Therefore, the company records a liability if its pension expense is greater than the amount it funded. Alternatively, the company records an asset if its pension expense is less than the amount it funded. This liability or asset is similar to the liabilities or assets that arise from using the accrual basis of accounting, and it increases or decreases every year. Since either a liability or an asset can occur (but not both at the same time), we use a single title for the account, accrued/prepaid pension cost.

To determine the total credit or debit balance of the accrued/prepaid pension cost at the end of the accounting period, a company must also consider whether its pension plan is "underfunded" or "overfunded." A company's pension plan is underfunded at the end of the period when the projected benefit obligation is more than the fair value of the pension plan assets. A company's pension plan is overfunded at the end of the period when the fair value of the pension plan assets is more than the projected benefit obligation. If the pension plan is underfunded or overfunded, the company adjusts the balance of the accrued/prepaid pension cost account so that this account shows the amount of underfunding or overfunding, as we explain below. The offsetting entry is to other comprehensive income.

The company determines whether its pension plan is underfunded or overfunded by first calculating both the projected benefit obligation and the fair value of the pension plan assets at the end of the year. The company's actuary may calculate the ending projected benefit obligation. The funding agency may calculate the ending fair value of the pension plan assets. These calculations are as follows:

**Ending Projected Benefit Obligation:** 

Beginning projected benefit obligation

- + Prior service cost
- = Adjusted beginning projected benefit obligation
- + Service cost for period
- + Interest cost on projected benefit obligation
- + Actuarial losses (or Actuarial gains)
- Payments to retirees
- = Ending projected benefit obligation

Ending Fair Value of Pension Plan Assets:

Beginning fair value of pension plan assets

- + Actual return on plan assets
- + Contributions (amount funded) by the company
- Payments to retirees
- = Ending fair value of pension plan assets

The difference between the projected benefit obligation and the fair value of the pension plan assets at the end of the period is the funded status of the pension plan. The company reports this amount as an accrued pension cost liability (in the case of an underfunded plan) or prepaid pension cost asset (in the case of an overfunded plan) on its year-end balance sheet. It is possible that this amount will be the same as the balance in the accrued/prepaid pension cost from recording its pension expense to date. However, these amounts may be different, in which case the company must adjust the balance in the accrued/prepaid pension cost to properly reflect the funded status of the pension plan. In effect, the company compares the underfunded (or overfunded) amount to the balance in the accrued/prepaid pension cost and makes a journal entry for the difference.

When a company's pension plan is underfunded (overfunded), the adjusting journal entry involves a debit (credit) to Other Comprehensive Income and a credit (debit) to Accrued/Prepaid Pension Cost. The reason for adjusting other comprehensive income instead of recording additional pension expense is that this amount represents a past change in the funded status of the plan that will be recognized in future periods as a component of pension expense.

This adjustment can be separated into two components: (1) retroactive benefits (prior service cost) that have been granted and are amortized into pension expense; and (2) gains or losses (which include the difference between the actual and expected return on plan assets, as well as any actuarial gains or losses).

First, GAAP requires that when prior service costs are incurred, they are initially recorded as a debit (decrease) to Other Comprehensive Income: Prior Service Cost (i.e., it is a "negative" component of Other Comprehensive Income) and a credit (increase) to Accrued/Prepaid Pension Cost. This journal entry is made so that the company reports a liability (accrued pension cost) due to the increased benefits. Note that the company does not record an expense at this time.

When the prior service cost is amortized to increase pension expense, the company makes a second journal entry. This journal entry is a debit (decrease) to Accrued/Prepaid Pension Cost and a credit (increase) to Other Comprehensive Income: Prior Service Cost for the amount of the prior service cost that was amortized. This second journal entry is necessary to avoid "double counting" the company's comprehensive income. Recall from Chapter 5 that a company's comprehensive income includes both its net income (loss) and its other comprehensive income (loss). As we discussed above, the company initially recorded the total amount of the prior service cost as a negative component (i.e., loss) of its other comprehensive income. Since a portion of this prior service cost is now amortized and reduces net income (by increasing pension expense), this second entry reduces the negative component of its other comprehensive income for the same amount. This entry is similar to the "reclassification adjustment" that we discussed in Chapter 15 for the sale of marketable securities.

Second, any gain or loss (including the difference between the actual and expected return on plan assets as well as any actuarial gains or losses) that was not recognized in pension expense in the period it occurred is recognized as a component of Other Comprehensive Income: Net Gain/Loss (and Accrued/Prepaid Pension Cost). Normally, this is done at the end of the year (prior to the pension expense journal entry) because that is when the company determines there is a difference between the actual and expected return on its pension plan assets. When this gain or loss is amortized to decrease (increase) pension expense [and increase (decrease) net income], the company must make a second journal entry. If the company has amortized a gain (loss), the journal entry is a debit (credit) to Other Comprehensive Income: Net Gain/Loss and a credit (debit) to Accrued/ Prepaid Pension Cost for the amount of the amortization. We will illustrate these journal entries later in the chapter.9

The company reports its other comprehensive income (net of tax), as we discussed in Chapter 5. If the accrued/prepaid pension cost has a credit balance (because the plan is underfunded), the company reports the accrued pension cost as a liability. If the accrued/prepaid pension cost has a debit balance (because the plan is overfunded), the company reports the prepaid pension cost as an asset. Typically, the amount is classified as noncurrent. The company reports the prior service cost and gains or losses not yet recognized in pension expense as accumulated other comprehensive income, an element of stockholders' equity on its year-end balance sheet.

In summary, a company may report the following pension plan asset, pension plan liability, and accumulated other comprehensive income items, depending on the circumstances, on its balance sheet:

| Assets                               | Liabilities   |
|--------------------------------------|---|
| Prepaid pension cost (debit balance) | Accrued pension cost (credit balance)   |
|                                      | Stockholders' Equity  |
|                                      | Accumulated other comprehensive income:<br>Prior service cost and/or loss not yet |
|                                      | amortized to pension expense (negative element), or gain not yet amortized        |
|                                      | to pension expense (positive element)   |

Note also that a company that has more than one postretirement plan must aggregate all overfunded plans and report one net asset amount and aggregate all underfunded plans and report one net liability amount.

# **Measurement Methods**

The pension benefit formula usually is based on future compensation levels and defines benefits similarly for all years of service. Then, in computing the service cost, a constant amount of the total estimated pension benefit, based on an estimate of final salary, usually is attributed to each period (this method is known as the benefit/years-of-service approach). Using the pension benefit formula we showed at the beginning of the chapter, the service cost would be based on the employee earning a benefit of  $1/30 \times \$77,100$  each year for 30 years.

The company uses a discount rate that reflects the rate at which the pension benefits could be effectively settled when it computes the service cost, the projected benefit obligation, and the accumulated benefit obligation. For example, if the company could settle its obligation by purchasing an annuity from an insurance company for each employee, it would use the rate on that annuity as the appropriate discount rate. The rate of return on high-quality fixed-income investments currently available and expected to be available in the future could also be used. Companies are required by the SEC to evaluate the rate each year.

On the other hand, the expected (assumed) long-term rate of return on plan assets used to compute the expected return on assets is based on the average rate of earnings expected on the funds invested (or to be invested). Actual experience is considered along with the rates of return expected to be available in the future.

A company is required to show its other comprehensive income net of taxes. Therefore, in addition to the journal entries we discussed above, a company would also record deferred taxes. For instance, suppose a company debits Other Comprehensive Income: Net Gain/Loss and credits Accrued/Prepaid Pension Cost to adjust for the underfunding of its pension plan. In this case, the company would record a second journal entry debiting Deferred Tax Asset and crediting Other Comprehensive Income: Net Gain/Loss for the amount of the tax effect. For simplicity, we do not deal with deferred taxes in this chapter. See Chapter 19 for a more complete discussion of deferred taxes.

# **Disclosures**

The disclosure requirements for defined benefit pension plans of employers are very detailed and are intended to provide users with relevant information. 10 We summarize the major required disclosures below.

- 1. A narrative description of investment policies and strategies, including target allocations for each major category of plan assets and other factors that are pertinent to an understanding of the investment goals, risk management strategies, and permitted and prohibited investments.
- 2. A narrative description of the basis used to determine the expected rate of return on plan assets.
- 3. Other information that would be useful in understanding the risk associated with each asset category and the rate of the return on plan assets.
- 4. The benefits expected to be paid in each of the next five years, and the total for the next five years.
- 5. The contributions to be made by the company to the plan in the next year.
- 6. A reconciliation of the beginning and ending balances of the projected benefit obligation, including the amounts of the service cost, interest cost, actuarial gains and losses, benefits paid, and plan amendments.
- 7. A reconciliation of the beginning and ending balances of the fair value of the plan assets, including the actual return on plan assets, contributions by the company, and benefits paid.
- 8. The funded status of the plan, and the amounts recognized on the balance sheet with the current and noncurrent portions of the liability reported separately if the company prepares a classified balance sheet.
- 9. The amount of pension expense, including the service cost, the interest cost, the expected return on plan assets, the amortization of any prior service cost, and the amortization of any net gains or losses.
- 10. The amounts of the prior service cost and the net gain or loss that remain in accumulated other comprehensive income.
- 11. The discount rate, the rate of compensation increase, and the expected long-term rate of return on the plan assets.
- 12. The amounts and types of securities included in the plan assets.

# QUICK CHECK 20-1

- A pension plan requires a company to provide income to its retired employees in return for services they provided during their employment and is classified as a:
  - Defined benefit plan that promises fixed retirement benefits determined by a formula that is usually based on the employee's earnings and length of service, or a
  - Defined contribution plan in which the employer's annual contribution is based on a formula but no commitment is made as to the future benefits to be paid to employees.
- Pension expense consists of five components:
  - Service cost—the actuarial present value of the benefits earned by employees during the year (the discount rate used is a settlement rate reflecting the rate at which the pension benefits could be effectively settled),
  - Interest cost—the increase in the projected benefit obligation (the present value of the benefits earned by employees based on their expected future compensation levels) due to the passage of time,
  - Expected return on plan assets—the expected increase in plan assets that are invested,

<sup>10. &</sup>quot;Employers' Disclosures about Pensions and Other Postemployment Benefits," FASB Statement No. 132 and 132R (Norwalk, Conn.: FASB, 1998 and 2003) (FASB Cod. # 715-20-50). There are additional disclosures beyond those we have listed.

- Amortization of prior service cost—the amortization of the cost of retroactive benefits granted to employees, and
- Amortization of gain or loss—the amortization of the change in the projected benefit obligation and the fair value of the pension plan assets resulting from actual experience being different from that which is assumed.
- Because pension expense (determined by GAAP) usually differs from the amount funded, the difference is recorded as an:
  - Asset—prepaid pension cost—if pension expense is less than the amount funded, or a
  - Liability—accrued pension cost—if pension expense is greater than the amount funded.
- The difference between the projected benefit obligation and the fair value of the pension plan assets at the end of the year is the funded status of the pension plan. The company reports it as an accrued pension cost liability (in the case of an underfunded plan) or prepaid pension cost asset (in the case of an overfunded plan) on its year-end balance sheet.

# **EXAMPLES OF ACCOUNTING FOR PENSIONS**

We show various situations related to accounting for defined benefit pension plans in this section using assumed amounts. In the Appendix to the chapter, we show the present value calculations for pension plans. In that example, we calculate the amounts of the service cost, the projected benefit obligation, the prior service cost, and the pension expense from basic information about a company's pension plan.

# **Example A: Pension Expense Equal to Pension Funding**

Assume the following facts for the Carlisle Company:

- 1. The company adopts a pension plan on January 1, 2010. No retroactive benefits were granted to employees.
- 2. The service cost each year is: 2010, \$400,000; 2011, \$420,000; and 2012, \$432,000.
- 3. The projected benefit obligation at the beginning of each year is: 2011, \$400,000; and 2012, \$840,000.
- 4. The discount rate is 10%.
- 5. The expected long-term rate of return on plan assets is 10%, which is also equal to the actual rate of return.
- The company adopts a policy of funding an amount equal to the pension expense and makes the payment to the funding agency at the end of each year. 11
- Plan assets are based on the amounts contributed each year, plus a return of 10% per year, less an assumed payment of \$20,000 at the end of each year to retired employees (beginning in 2011).

**2010** Based on the preceding information, the service cost of \$400,000 is the only component of the pension expense in 2010. This situation occurs because the company has (1) no interest cost because it has no projected benefit obligation at the beginning of the year since no employees had pension coverage before that time, (2) no expected return on plan assets because its expense recognition and funding were made at the end of the first year, (3) no prior service cost, and (4) no gain or loss. Since the company funds an amount equal to the pension expense, it records the following journal entry on December 31, 2010:

**Pension Expense** Cash

400,000

400,000

**4** Account for pension plans.

<sup>11.</sup> Companies are required by law to make payments to funding agencies on a quarterly basis. For simplicity, in all examples and homework we assume a single annual payment is made at the end of each year.

Since the projected benefit obligation and the fair value of the plan assets are the same (\$400,000) at the end of 2010, the pension plan is fully funded and the company does not report a pension asset or liability on its December 31, 2010 balance sheet. Also, no adjusting entry is needed because there are no prior service costs and no gains or losses.

**2011** The calculation of the pension expense for 2011 is more complex because it now has three components: service cost, interest cost, and expected return on plan assets. The service cost is \$420,000. Since the projected benefit obligation at January 1, 2011 is \$400,000 (the service cost for 2010), the interest cost is \$40,000 (the projected benefit obligation of \$400,000 multiplied by the discount rate of 10%). The \$40,000 expected return on the plan assets is the \$400,000 invested by the funding agency for the pension fund at the end of 2010 multiplied by the 10% expected rate of return. Therefore, the company computes its pension expense for 2011 as follows:

```
Service cost (assumed)
                                                     $420,000
Interest cost ($400,000 \times 10\%)
                                                       40,000
Expected return on plan assets ($400,000 \times 10%)
                                                       (40,000)
Pension expense
                                                     $420,000
```

Since the company funds an amount equal to the expense, it records the following journal entry on December 31, 2011:

At the end of 2011, the projected benefit obligation is \$840,000 (\$400,000 beginning projected benefit obligation + \$420,000 service cost + \$40,000 interest cost - \$20,000 payment to retired employees). The fair value of the pension plan assets is also \$840,000 (\$400,000 beginning fair value + \$40,000 actual return on plan assets + \$420,000 contribution - \$20,000 payment to retired employees). Therefore, the pension plan is fully funded and the company does not report a pension asset or liability on its December 31, 2011 balance sheet. Also, no adjusting entry is needed because there are no prior service costs and no gains or losses. Note also that the \$20,000 payment to retired employees is made by the funding agency, and not by the company.

**2012** For 2012, the service cost is \$432,000. The projected benefit obligation and the plan assets at the beginning of 2012 are both \$840,000. Therefore, the company computes its pension expense for 2012 as follows:

```
Service cost (assumed)
                                                     $432,000
Interest cost (\$840,000 \times 10\%)
                                                        84,000
Expected return on plan assets ($840,000 \times 10%)
                                                       (84,000)
Pension expense
                                                      $432,000
```

Since the company funds an amount equal to the expense, it records the following journal entry on December 31, 2012:

```
Pension Expense
                                                432,000 	
  Cash
                                                             432,000
```

At the end of 2012, the projected benefit obligation is \$1,336,000 (\$840,000 beginning projected benefit obligation + \$432,000 service cost + \$84,000 interest cost - \$20,000 payment to retired employees). The fair value of the pension plan assets is also \$1,336,000 (\$840,000 beginning fair value + \$84,000 actual return on plan assets + \$432,000 contribution – \$20,000 payment to retired employees). Therefore, the pension plan is fully

funded and the company does not report a pension asset or liability on its December 31, 2012 balance sheet. Also, no adjusting entry is needed because there are no prior service costs and no gains or losses.

Note that the interest cost and the expected return on the plan assets offset each other in this example. This situation occurs because the discount rate and the expected longterm rate of return on plan assets are both 10%, and because the company funds an amount equal to the expense. •

# **Example B: Pension Funding Greater Than Pension Expense**

Assume the same facts for the Carlisle Company as in Example A, except that instead of funding an amount equal to the pension expense, the company funds \$405,000 in 2010, \$425,000 in 2011, and \$435,000 in 2012.12 Since the company provides more assets to the pension fund, the expected return on those assets each year is higher, and therefore, the pension expense is less due to larger subtraction caused by the higher expected return.

**2010** The company's pension expense in 2010 is the \$400,000 service cost, so the journal entry on December 31, 2010 is:

| Pension Expense              | 400,000 |   |
|------------------------------|---------|---|
| Accrued/Prepaid Pension Cost | 5,000   |   |
| Cash                         | 405,000 | 0 |

Since the company funds \$405,000 in 2010 when the expense is \$400,000, it recognizes an asset, Accrued/Prepaid Pension Cost, of \$5,000.

At the end of 2010, the \$400,000 projected benefit obligation is \$5,000 less than the \$405,000 fair value of the pension plan assets so the pension plan is overfunded by \$5,000. Since there are no prior service costs or gains or losses, the \$5,000 debit balance in Accrued/Prepaid Pension Cost reflects the overfunded status of the pension plan and no adjustment is necessary. The company reports this overfunded amount as its pension plan asset, Prepaid Pension Cost, on its December 31, 2010 balance sheet.

**2011** In 2011, the only difference from the previous example in the computation of the pension expense is the increased expected return on the plan assets. Since the company contributed \$405,000 on December 31, 2010, a return of \$40,500 was expected for 2011. The company computes its pension expense for 2011 as follows:

```
Service cost
                                                      $420,000
Interest cost ($400,000 \times 10\%)
                                                         40,000
Expected return on plan assets ($405,000 \times 10%)
                                                        (40,500)
Pension expense
                                                       $419,500
```

Since the company funds \$425,000 in 2011, it records the following journal entry on December 31, 2011:

```
Pension Expense
                                                 419,500
Accrued/Prepaid Pension Cost
                                                   5,500
  Cash
                                                              425,000
```

The balance in the asset account is now \$10,500 (\$5,000 + \$5,500).

At the end of 2011, the projected benefit obligation is \$840,000 (\$400,000 beginning projected benefit obligation + \$420,000 service cost + \$40,000 interest cost - \$20,000

<sup>12.</sup> In this and future examples, the amount funded each year is at least equal to the service cost plus one-seventh of any prior service cost. This amount is in accordance with the rules established in the Pension Protection Act of 2006, as we discuss later.

payment to retired employees). The fair value of the pension plan assets is \$850,500 (\$405,000 beginning fair value + \$40,500 actual return on plan assets + \$425,000 contribution – \$20,000 payment to retired employees). Therefore, the pension plan is overfunded by \$10,500 (\$850,500 - \$840,000). No adjustment is necessary because there are no prior service costs or gains or losses, and the \$10,500 debit balance in Accrued/Prepaid Pension Cost reflects the overfunded status of the pension plan. The company reports this overfunded amount as its pension plan asset, Prepaid Pension Cost, on its December 31, 2011 balance sheet.

**2012** In 2012, the computation of the pension expense is again affected by the increased expected return on the plan assets. Therefore, the company computes its pension expense for 2012 as follows:

| Service cost   | \$432,000 |
|--|-----------|
| Interest cost ( $\$840,000 \times 10\%$ )                  | 84,000    |
| Expected return on plan assets ( $\$850,500 \times 10\%$ ) | (85,050)  |
| Pension expense  | \$430,950 |
| rension expense  | <u></u>   |

Since the company funds \$435,000 in 2012, it records the following journal entry on December 31, 2012:

The balance in the asset account is now \$14,550 (\$10,500 + \$4,050).

At the end of 2012, the projected benefit obligation is \$1,336,000 (\$840,000 beginning projected benefit obligation + \$432,000 service cost + \$84,000 interest cost -\$20,000 payment to retired employees). The fair value of the pension plan assets is \$1,350,550 (\$850,500 beginning fair value + \$85,050 actual return on plan assets + \$435,000 contribution - \$20,000 payment to retired employees). Therefore, the pension plan is overfunded by \$14,550 (\$1,350,550 - \$1,336,000). No adjustment is necessary because there are no prior service costs or gains/losses, and the \$14,550 balance in Accrued/Prepaid Pension Cost reflects the overfunded status of the pension plan. The company reports this overfunded amount as its pension plan asset, Prepaid Pension Cost, on its December 31, 2012 balance sheet. •

# **Example C: Pension Expense Less Than Pension Funding,** and Expected Return on Plan Assets Different from Both **Actual Return and Discount Rate**

Assume the same facts for the Carlisle Company as in Example A, except that (a) instead of funding an amount equal to the pension expense, the company funds \$415,000 in 2010, \$425,000 in 2011, and \$440,000 in 2012, and (b) the expected return is 11% each year, whereas the actual return is 12% each year. Since the company provides more assets to the pension fund and expects to earn a higher return on those assets, the pension expense is less to compensate for the higher return.<sup>13</sup>

**2010** The company's pension expense in 2010 is the \$400,000 service cost and the journal entry on December 31, 2010 is:

<sup>13.</sup> In this example, the higher actual return compared to the expected return creates an "unrecognized gain," as we discussed earlier in the chapter. However, as discussed, later in the chapter, the gain does not exceed the corridor, so no amortization is necessary.

Pension Expense 400,000 **Accrued/Prepaid Pension Cost** 15,000

415,000

Since the company funds \$415,000 in 2010 when the expense is \$400,000, it recognizes an asset, Accrued/Prepaid Pension Cost, of \$15,000.

At the end of 2010, the \$415,000 fair value of the pension plan assets is \$15,000 more than the \$400,000 projected benefit obligation so the pension plan is overfunded by \$15,000. No adjustment is necessary because there is no prior service cost nor gains/losses, and the \$15,000 balance in the Accrued/Prepaid Pension Cost account already reflects the overfunded status of the pension plan. The company reports this overfunded amount as its pension plan asset, Prepaid Pension Cost, on its December 31, 2010 balance sheet.

2011 Since the company contributed \$415,000 on December 31, 2010, its expected return on the plan assets is \$45,650 in 2011. The company computes the pension expense for 2011 as follows:

```
Service cost
                                                      $420,000
Interest cost ($400,000 \times 10\%)
                                                        40,000
Expected return on plan assets ($415,000 \times 11\%)
                                                        (45,650)
Pension expense
                                                      $414,350
```

Since the company funds \$425,000 in 2011, it records the following journal entry on December 31, 2011:

| Pension Expense              | 414.350 |
|------------------------------|---------|
| Accrued/Prepaid Pension Cost | 10,650  |
| Cash                         | 425.000 |

The balance in the asset account is now \$25,650 (\$15,000 + \$10,650).

At the end of 2011, the projected benefit obligation is \$840,000 (\$400,000 beginning projected benefit obligation + \$420,000 service cost + \$40,000 interest cost - \$20,000 payment to retired employees). The fair value of the pension plan assets is \$869,800 [\$415,000 beginning fair value + \$49,800 (\$415,000  $\times$  12%) actual return on plan assets +\$425,000 contribution - \$20,000 payment to retired employees]. So the pension plan is overfunded by \$29,800 (\$869,800 - \$840,000). Since the Accrued/Prepaid Pension Cost account has a debit balance of \$25,650, the account must be increased by \$4,150 (\$29,800 -\$25,650). The company records the following journal entry:

| Accrued/Prepaid Pension Cost              | 4,150 |       |
|---|-------|-------|
| Other Comprehensive Income: Net Gain/Loss |       | 4,150 |

Note that this adjustment is necessary to recognize the "gain" that results from the actual return (\$49,800) being greater than the expected return (\$45,650). After this journal entry, the Accrued/Prepaid Pension Cost account has a \$29,800 debit balance, which is the amount by which the company's pension plan is overfunded. The company reports this overfunded amount as its pension plan asset, Prepaid Pension Cost, on its December 31, 2011 balance sheet. The credit of \$4,150 is included in other comprehensive income for 2011 and is also reported as a component of accumulated other comprehensive income on its December 31, 2011 balance sheet.

**2012** As we showed in the computations at the end of 2011, the company's plan assets at the beginning of 2012 are \$869,800. Assuming the company continues to expect to earn 11% on its plan assets, its expected return for 2012 is \$95,678. Therefore, the company computes its pension expense for 2012 as follows:

```
Service cost
                                                      $432,000
Interest cost (\$840,000 \times 10\%)
                                                        84,000
Expected return on plan assets ($869,800 \times 11%)
                                                       (95,678)
Pension expense
                                                      $420,322
```

Since the company funds \$440,000 in 2012, it records the following journal entry on December 31, 2012:

**Pension Expense** 420,322 **Accrued/Prepaid Pension Cost** 19,678 Cash 440,000

The balance in the asset account is now \$49,478 (\$29,800 + \$19,678).

At the end of 2012, the projected benefit obligation is \$1,336,000 (\$840,000 beginning projected benefit obligation + \$432,000 service cost + \$84,000 interest cost -\$20,000 payment to retired employees). The fair value of the pension plan assets is 1,394,176 [\$869,800 beginning fair value + \$104,376 (\$869,800 × 12%) actual return on plan assets + \$440,000 contribution - \$20,000 payment to retired employees]. Therefore, the pension plan is *overfunded* by \$58,176 (\$1,394,176 - \$1,336,000). Since the Accrued/Prepaid Pension Cost account has a debit balance of \$49,478, the account must be increased by \$8,698 (\$58,176 - \$49,478) so the company records the following journal entry:

**Accrued/Prepaid Pension Cost** 8,698 Other Comprehensive Income: Net Gain/Loss 8,698

Note that this adjustment is necessary to recognize the "gain" that results from the actual return (\$104,376) being greater than the expected return (\$95,678). After this journal entry, the Accrued/Prepaid Pension Cost account has a \$58,176 debit balance, which is the amount by which the company's pension plan is overfunded. The company reports this overfunded amount as its pension plan asset, Prepaid Pension Cost, on its December 31, 2012 balance sheet. The credit of \$8,698 is included in other comprehensive income for 2012. The balance in accumulated other comprehensive income is \$12,848 (\$4,150 + \$8,698), which the company reports on its December 31, 2012 balance sheet.

It is important that you understand the impact of the expected and actual rates of return on plan assets. As we have discussed, a company uses the expected return to compute its pension expense for the year. However, the actual return for the year increases the value of the plan assets at the end of the year. In the next year, the company multiplies those actual plan assets by the expected return to compute the amount that it subtracts to compute its pension expense for that next year. In its pension plan disclosures, the company includes the actual return on its plan assets in the reconciliation of the beginning and ending balances of the fair value of its plan assets, as we show in Example 20-5 on page 1036. ♦

# **Example D: Pension Expense Including Amortization of Prior Service Cost**

The previous three examples showed relatively simple computations of pension expense and the related pension liability or asset. The remaining examples deal with additional issues. Recall that a company may grant increased retroactive benefits based on services performed by employees in prior periods. The cost of providing these benefits is called a prior service cost. A prior service cost also may arise when a company adopts a pension plan. A prior service cost causes an increase in the projected benefit obligation. The company initially records the prior service cost as a liability and as a negative component of other comprehensive income, and amortizes it as a component of pension expense.

Assume the same facts for the Carlisle Company as in Example C, except that the company awarded retroactive benefits to the employees when it adopted the pension plan on January 1, 2010. The company's actuary computed the prior service cost to be \$2 million. This amount is added to the projected benefit obligation on January 1, 2010. To fund this projected benefit obligation, the company decided to increase its contribution by \$290,000 per year. For simplicity, we also assume that the company amortizes the prior service cost by the straight-line method over the remaining 20-year service life of its active employees. Thus, its amortization is \$100,000 (\$2,000,000  $\div$  20) per year.

**2010** Since the company awarded retroactive pension benefits to its employees when it adopted the plan on January 1, 2010, it incurred \$2 million of prior service cost (which is its projected benefit obligation at January 1, 2010). The company records this award as follows:

Other Comprehensive Income: Prior Service Cost 2,000,000 **Accrued/Prepaid Pension Cost** 

2,000,000

705,000

This entry records the prior service cost as a liability because it is an obligation to the company's employees, and also as a negative element of other comprehensive income.

The company's pension expense in 2010 now has three components. In addition to the service cost of \$400,000, the company recognizes both the interest cost on the \$2 million projected benefit obligation and the \$100,000 amortization of the prior service cost. Therefore, it computes the pension expense for 2010 as follows:

| Service cost                               | \$400,000 |
|--|-----------|
| Interest cost ( $$2,000,000 \times 10\%$ ) | 200,000   |
| Amortization of prior service cost         | _100,000  |
| Pension expense                            | \$700,000 |
|  |           |

Since the company funds \$705,000 (\$415,000 + \$290,000) in 2010, it records the following journal entry on December 31, 2010:

700,000 Pension Expense **Accrued/Prepaid Pension Cost** 5,000 Cash

Note that the 2010 pension expense includes \$100,000 amortization of prior service cost. Since this amount is now included in pension expense, the company must record an adjusting entry as follows:

**Accrued/Prepaid Pension Cost** 100,000 Other Comprehensive Income: Prior Service Cost 100,000

This entry reduces the amount of prior service cost included in Accumulated Other Comprehensive Income from \$2,000,000 to \$1,900,000 because a portion of the prior service cost was amortized and reduced net income. The company reports \$1,900,000 as a negative element of other comprehensive income for 2010 and as a negative element of accumulated other comprehensive income on its December 31, 2010 balance sheet.

At the end of 2010, the projected benefit obligation is \$2,600,000 (\$2,000,000 beginning projected benefit obligation + \$400,000 service cost + \$200,000 interest cost). The fair value of the pension plan assets is \$705,000 (\$0 beginning fair value + \$0 actual return on plan assets + \$705,000 contribution). Therefore, the pension plan is underfunded by \$1,895,000 (\$2,600,000 - \$705,000). No adjustment is necessary because there are no gains or losses, and the \$1,895,000 (\$2,000,000 - \$5,000 - \$100,000)credit balance in Accrued/Prepaid Pension Cost is the amount by which the pension plan is underfunded. The company reports this underfunded amount as its pension plan liability, Accrued Pension Cost, on its December 31, 2010 balance sheet.

**2011** On January 1, 2011 the projected benefit obligation is \$2,600,000. Therefore, the company computes the pension expense for 2011 as follows:

| Service cost  | \$420,000 |
|---|-----------|
| Interest cost (\$2,600,000 $\times$ 10%)                | 260,000   |
| Expected return on plan assets (\$705,000 $\times$ 11%) | (77,550   |
| Amortization of prior service cost                      | 100,000   |
| Pension expense   | \$702,450 |
|   |           |

Since the company funds \$715,000 (\$425,000 + \$290,000) in 2011, it records the following journal entry on December 31, 2011:

**Pension Expense 702,450 ← Accrued/Prepaid Pension Cost** 12,550 Cash 715,000

Again, note that the 2011 pension expense includes \$100,000 amortization of prior service cost. Since this amount is now included in pension expense, the company must record an adjusting entry as follows:

**Accrued/Prepaid Pension Cost** 100,000 Other Comprehensive Income: Prior Service Cost 100,000

This entry reduces the amount of prior service cost included in Accumulated Other Comprehensive Income from \$1,900,000 to \$1,800,000 because a portion of the prior service cost was amortized and reduced net income. The company reports \$100,000 as a positive element of other comprehensive income for 2011.

At the end of 2011, the projected benefit obligation is \$3,260,000 (\$2,600,000 beginning projected benefit obligation + \$420,000 service cost + \$260,000 interest cost -\$20,000 payment to retired employees). The fair value of the pension plan assets is 1,484,600 [\$705,000 beginning fair value + \$84,600 (\$705,000 × 12%) actual return on plan assets + \$715,000 contribution - \$20,000 payment to retired employees]. So the pension plan is underfunded by 1,775,400 (3,260,000 - 1,484,600). Since the Accrued/Prepaid Pension Cost account has a credit balance of \$1,782,450 (\$1,895,000 beginning balance - \$12,550 - \$100,000), the account must be decreased by \$7,050 (\$1,775,400 - \$1,782,450). The company records the following journal entry:

Accrued/Prepaid Pension Cost 7,050 Other Comprehensive Income: Net Gain/Loss 7,050

Note that this adjustment is necessary to recognize the gain that resulted from the actual return (\$84,600) being greater than the expected return (\$77,550). After this journal entry, the Accrued/Prepaid Pension Cost account has a \$1,775,400 credit balance, which is the amount by which the company's pension plan is underfunded. The company reports this underfunded amount as its pension plan liability, Accrued Pension Cost, and \$1,792,950 as a negative element of Accumulated Other Comprehensive Income on its December 31, 2011 balance sheet.

**2012** On January 1, 2012, the projected benefit obligation is \$3,260,000, the plan assets are \$1,484,600, and the company computes the pension expense for 2012 as follows:

| Service cost                               | \$432,000                    |   |
|--|------------------------------|---|
| Interest cost (\$3,260,000 $\times$ 10%)   | 326,000                      |   |
| Expected return on plan assets (\$1,484,60 | $00 \times 11\%$ ) (163,306) |   |
| Amortization of prior service cost         | _100,000                     |   |
| Pension expense                            | \$694,694                    | _ |
|  | <del></del>                  |   |

Since the company funds \$730,000 (\$440,000 + \$290,000) in 2012, it records the following journal entry on December 31, 2012:

**Pension Expense Accrued/Prepaid Pension Cost**  694,694 35,306 730,000

Once again, the 2012 pension expense includes the \$100,000 amortization of prior service cost, and the company records an adjusting entry as follows:

**Accrued/Prepaid Pension Cost** 100,000 Other Comprehensive Income: Prior Service Cost 100,000

This entry reduces the amount of prior service cost included in Accumulated Other Comprehensive Income from \$1,800,000 to \$1,700,000 because a portion of the prior service cost was amortized and reduced net income. The company reports \$100,000 as a positive element of other comprehensive income for 2012.

At the end of 2012, the projected benefit obligation is \$3,998,000 (\$3,260,000 beginning projected benefit obligation + \$432,000 service cost + \$326,000 interest cost -\$20,000 payment to retired employees). The fair value of the pension plan assets is 2,372,752 [\$1,484,600 beginning fair value + \$178,152 (\$1,484,600 × 12%) actual return on plan assets + \$730,000 contribution - \$20,000 payment to retired employees]. So the pension plan is underfunded by \$1,625,248 (\$3,998,000 - \$2,372,752). Since the Accrued/Prepaid Pension Cost account has a credit balance of \$1,640,094 (\$1,775,400 beginning balance - \$35,306 - \$100,000), the account must be decreased by \$14,846 (\$1,625,248 - \$1,640,094) so the company records the following journal entry:

**Accrued/Prepaid Pension Cost** 14,846 Other Comprehensive Income: Net Gain/Loss 14,846

Note that this adjustment is necessary to recognize the gain that resulted from the actual return (\$178,152) being greater than the expected return (\$163,306). After this journal entry, the Accrued/Prepaid Pension Cost account has a \$1,625,248 credit balance, which is the amount by which the company's pension plan is underfunded. The company reports this underfunded amount as its pension plan liability, Accrued Pension Cost, and \$1,678,104 as a negative element of Accumulated Other Comprehensive Income on its December 31, 2012 balance sheet. •

# **Example E: Calculation of Amortization of Prior Service Cost**

In Example D, the pension expense included the amortization of a prior service cost. In that example, we used an "average life" of 20 years to determine the amount of the amortization. We explain two methods of calculating the amount of the amortization in this example. The preferred method assigns an equal amount to each future service period for each active participating employee who is expected to receive future benefits under the plan. Since the FASB did not give this method a title, we will refer to it as the "years-offuture-service" method. Alternatively, a company may use straight-line amortization over the average remaining service life of employees for simplicity.

Examples 20-1 and 20-2 show the preferred years-of-future-service method of amortization. We assume that at the beginning of 2012 the Watts Company has nine employees who are participating in its pension plan and who are expected to receive benefits. One employee (A) is expected to retire after three years, one (B) after four, two (C and D) after five, two (E and F) after six, and three (G, H, and I) after seven years. Example 20-1 shows the computation of the amortization fraction. First, the company computes the number of service years rendered by the nine employees in each calendar year. Thus, in 2010 there are nine service years rendered, while in 2014 there are only seven service years rendered because employees A and B have retired. The total number of these service years is 50. Then, the company computes the amortization fraction for each year by dividing the total service years in each calendar year by the total of 50. Thus, in 2010, 9/50 is the amortization fraction, whereas in 2014, 7/50 is the fraction.

If we assume that the company's actuary computed the total prior service cost at the beginning of 2010 to be \$400,000, the company calculates the amount of the amortization

| EXAMPLE 20-1 Computation of Amortization Fraction |                      |      |      |      |                         |        |        |                      |

| Total   |                      | 9 =  | 9 =  | 9 =  | 8 =                     | 7<br>= | 5<br>= | <u>3</u> = <u>50</u> |
| Amortization F                                    | raction              | 9/50 | 9/50 | 9/50 | 8/50                    | 7/50   | 5/50   | 3/50                 |

each year as we show in Example 20-2. For instance, the company amortizes \$72,000  $(\$400,000 \times 9/50)$  in 2010, while it amortizes \$56,000 (\\$400,000 \times 7/50) in 2014. \text{14} The company includes this amount in the total pension expense on its income statement for each year. The remaining prior service cost is the balance at the end of the previous year less the amount amortized for the year.

| Year   | Total<br>Prior Service<br>Cost <sup>a</sup> | Amortization<br>Fraction <sup>b</sup> | Amortization<br>to Increase<br>Pension<br>Expense <sup>c</sup> | Remaining<br>Prior Service<br>Cost <sup>d</sup> |  |

| 2013   | 400,000                                     | 8/50                                  | 64,000   | 120,000   |  |
| 2014   | 400,000                                     | 7/50                                  | 56,000   | 64,000  |  |
| 2015   | 400,000                                     | 5/50                                  | 40,000   | 24,000  |  |
| 2016   | 400,000                                     | 3/50                                  | 24,000   | _   |  |
| a. Computed by actuary b. From Example 20-1 c. \$400,000 × amortization fraction d. Balance from end of previous year (or initial balance) — amortization for the current year |   |                                       |  |   |  |

To compute the alternative straight-line amortization, the company calculates the average remaining service life of the participating employees. We show this method using the same employee group as we assumed earlier. The company computes the total number of service years rendered (50) by adding the expected years of service for all employees [i.e., 3(A) + 4(B) + 5(C) + 5(D) + 6(E) + 6(F) + 7(G) + 7(H) + 7(I) and dividing by the number of employees (9) to give an average service life of 5.56 years. Example 20-3 shows the computation of the straight-line amortization. Under this method, the company amortizes \$71,942 each year from 2010 through 2014 to increase the pension expense. In 2015, the amortization is only \$40,290, the amount needed to reduce the remaining prior service cost to zero. This straight-line method is also used for amortizing the net gain or

<sup>14.</sup> GAAP shows a similar schedule and an amortization table, but makes an assumption that an equal number of employees retire each year. This assumption provides a "pure" sum-of-the-years'-digits set of fractions that yield a constantly decreasing amortization amount each period. Since this is not a realistic assumption, we assume a varying number of employees retiring each period, which results in a modified sum-of-the-years'-digits set of fractions.

| EXAMBLE 30-3 | Amortization of Prior Service Cost: Straight-Line Method |
|--------------|--|
|              | Amortization of Prior Service Cost: Straignt-Line Method |

| Year | Total<br>Prior Service<br>Cost <sup>a</sup> | Amortization<br>to Increase<br>Pension<br>Expense <sup>b</sup> | Remaining<br>Prior Service<br>Cost <sup>c</sup> |
|------|---|--|---|
| 2010 | \$400,000                                   | \$71,942   | \$328,058                                       |
| 2011 | 400,000                                     | 71,942   | 256,116   |
| 2012 | 400,000                                     | 71,942   | 184,174   |
| 2013 | 400,000                                     | 71,942   | 112,232   |
| 2014 | 400,000                                     | 71,942   | 40,290  |
| 2015 | 400,000                                     | 40,290 <sup>d</sup>  | _   |

- a. Computed by actuary
- \$400,000 total prior service cost ÷ 5.56 (50 total service years ÷ 9 employees) average remaining
- Balance from end of previous year (or initial balance) amortization for the year
- To reduce the remaining prior service cost to zero

loss we discuss in the next example. Note that if an amendment caused a decrease in future benefits, the resulting "negative" prior service cost is amortized in the same manner to decrease pension expense each period. •

# Example F: Pension Expense Including Net Gain or Loss (to Extent Recognized)

A gain or loss from previous periods arises from (a) changes in the amount of the projected benefit obligation and the fair value of the plan assets from experience different from that assumed, and (b) changes in actuarial assumptions. The excess of this net gain or loss over a "corridor" amount (discussed later) is amortized over the remaining service life of active employees expected to receive benefits under the plan. A company adds any amortization of a net loss to pension expense. It subtracts any amortization of a net gain from pension expense.

Example 20-4 shows the computation of the net gain or loss included in pension expense for the years 2010 through 2013. This example is for the Bliss Company, which has had a defined benefit pension plan for its employees for several years. The amounts of the cumulative net loss (gain), the projected benefit obligation (actual), and the fair value of the plan assets are based on information provided by the company's actuary and funding agency.

| Year | Cumulative<br>Net Loss<br>(Gain) <sup>a</sup> | Projected<br>Benefit<br>Obligation:<br>Actual <sup>a</sup> | Fair<br>Value<br>of Plan<br>Assets <sup>a</sup> | Corridor <sup>b</sup> | Excess<br>Net Loss<br>(Gain) <sup>c</sup> | Amortized<br>Net Loss<br>(Gain) <sup>d</sup> |
|------|---|--|---|-----------------------|---|--|
| 2010 | \$13,000                                      | \$110,000  | \$100,000                                       | \$11,000              | \$2,000                                   | \$200  |
| 2011 | (2,300)                                       | 135,000  | 130,000   | 13,500                | е   | _  |
| 2012 | 18,700  | 168,000  | 170,000   | 17,000                | 1,700                                     | 170  |
| 2013 | 27,500  | 230,000  | 215,000   | 23,000                | 4,500                                     | 450  |

- a. At the beginning of the year
- b. 10% of the greater of the actual projected benefit obligation or the fair value of the plan assets at the beginning of the year
- Absolute value of the cumulative net loss (gain) corridor
- Excess net loss (gain) ÷ average remaining service life (10 years)
- Since the absolute value of the cumulative net loss (gain) is less than the corridor, there is no excess net loss (gain)

To compute the amortization, the first step is to determine the cumulative net gain or loss at the beginning of the year. The company calculates the amounts in the Cumulative

Net Loss (Gain) column of Example 20-4 at the beginning of the year, based on previous periods. Thus, for instance, the \$13,000 amount of cumulative net loss at the beginning of 2010 is a result of experience different from that assumed and changes in actuarial assumptions in periods prior to 2010. Note in this example that we have assumed a high volatility to better explain the calculations. Also note that we show a cumulative net loss without parentheses because the related amortization is added to pension expense, whereas we show a gain in parentheses because the amortization is deducted.

The company's actuary and funding agency also calculate the amounts in the Projected Benefit Obligation and the Fair Value of Plan Assets columns at the beginning of the year. For instance, the company has a \$110,000 projected benefit obligation and a \$100,000 fair value of the plan at the beginning of 2010. These amounts are used to determine the corridor amount. The corridor is 10% of the greater of the actual projected benefit obligation or the fair value of the plan assets at the beginning of the period. As we discussed earlier, the corridor reduces the volatility of the pension expense.

A company amortizes any cumulative net gain or loss in a given year only if, at the beginning of the year, the (absolute value of the) cumulative net gain or loss exceeds the corridor. This 10% threshold (the corridor) is intended to reduce fluctuations in pension expense. In many cases, the corridor will not be exceeded, so no amortization is recorded. Also, if a company had a large cumulative net gain (loss) at the beginning of a given year, it would reduce (increase) its pension expense only by the amortization of the cumulative net gain (loss) in excess of the corridor amount. It is unlikely that the company would have a cumulative net loss (gain) at the beginning of the next year in excess of the corridor amount. Even in such an extreme situation, the pension expense would be increased (decreased) only by the amount of the amortization of the cumulative net loss (gain) in excess of the corridor amount.

In Example 20-4 the amount in the Corridor column for a given year is 10% of the higher of the actual projected benefit obligation or the fair value of the plan assets at the beginning of that year. Thus, in 2010 the company computes the \$11,000 corridor as 10% of the \$110,000 actual projected benefit obligation because it is the higher of the two amounts. In 2012, however, it computes the \$17,000 corridor as 10% of the \$170,000 fair value of the plan assets.

The amount in the Excess Net Loss (Gain) column for a given year is the excess of the (absolute value of the) cumulative net loss (gain) over the corridor at the beginning of that year. Thus, in 2010 the \$2,000 excess net loss is the difference between the \$13,000 cumulative net loss and the \$11,000 corridor. In 2011, however, the corridor exceeds the cumulative net gain, so there is no excess.

The amount in the Amortized Net Loss (Gain) column for a given year is the adjustment to pension expense. The company computes each amortization amount by dividing the excess net loss (gain) for that year by the average remaining service life of the active employees expected to receive benefits under the plan. In this example, we assume a 10-year average service life for all years. In reality, the company may have to recompute the average service life each year for changes in its employee work force. For instance, in 2010 the \$200 amortization that the company adds to pension expense as the amortized net loss is determined by dividing the \$2,000 excess net loss by the 10-year average service life. We discussed the journal entry to record pension expense earlier in the chapter. In addition, the company would record the following:

**Accrued/Prepaid Pension Cost** 200 Other Comprehensive Income: Net Gain/Loss 200

This entry decreases the net loss reported in accumulated other comprehensive income by \$200 and is similar to the adjustment for the amortization of the prior service cost that we discussed earlier. •

# **Example G: Disclosures**

To improve the usefulness of a company's disclosures about its defined benefit pension plan, as we discussed earlier, the company must report certain information in the notes to its financial 5 Understand disclosures of pension plans. statements, in addition to the amounts contained in its financial statements. GAAP requires disclosure of, among other items, a reconciliation of the beginning and ending amounts of the projected benefit obligation, a reconciliation of the beginning and ending fair value of the plan assets, the components of the pension expense, and the discount rate used and the expected long-term rate of return on plan assets. We show these disclosures in Example 20-5 for the Carlisle Company for 2012 using the facts from Example C that we illustrated earlier in the chapter.

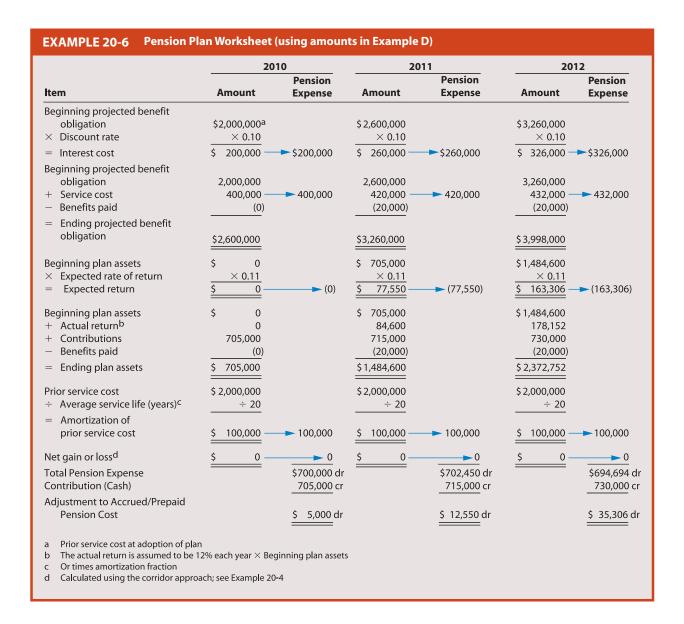

| Reconciliation of the beginning and ending amounts of the pr   | rojected benefit obligation |  |  |  |
|--|-----------------------------|--|--|--|
| Beginning projected benefit obligation                         | \$ 840,000                  |  |  |  |
| Service cost   | 432,000                     |  |  |  |
| Interest cost  | 84,000                      |  |  |  |
| Actuarial gains and losses                                     | 0                           |  |  |  |
| Benefits paid  | (20,000)                    |  |  |  |
| Plan amendments  | 0                           |  |  |  |
| Inding projected benefit obligation                            | \$1,336,000                 |  |  |  |
| teconciliation of the beginning and ending fair value of the p | lan assets                  |  |  |  |
| Beginning fair value of plan assets                            | \$ 869,800                  |  |  |  |
| Actual return on plan assets                                   | 104,376                     |  |  |  |
| Contributions  | 440,000                     |  |  |  |
| Benefits paid  | (20,000)                    |  |  |  |
| Ending fair value of plan assets                               | \$1,394,176                 |  |  |  |
| Components of the pension expense                              |                             |  |  |  |
| Service cost   | \$ 432,000                  |  |  |  |
| Interest cost  | 84,000                      |  |  |  |
| Expected return on plan assets                                 | (95,678)                    |  |  |  |
| Amortization of prior service cost                             | 0                           |  |  |  |
| Amortization of gains and losses                               | 0                           |  |  |  |
| Total pension expense  | \$ 420,322                  |  |  |  |
| tems not yet recognized as a component of pension expense      |                             |  |  |  |
| Other comprehensive income: Net gain/loss                      | \$ 12,848                   |  |  |  |
| Assumptions  |                             |  |  |  |
| Discount rate: 10%   |                             |  |  |  |
| Expected long-term rate of return on plan assets: 11%          |                             |  |  |  |

Note that in the reconciliation of the beginning and ending fair value of the plan assets, a company discloses the actual return on its pension plan assets. In the schedule listing the components of the pension expense, however, the company discloses the expected return on the pension plan assets. This aspect of the pension plan disclosures is important because it enables external users to compare the difference between the expected and actual returns to evaluate how well the pension funds are being managed. •

Real Report 20-1 on page 1038 shows the 2007 disclosures for Yum! Brands (owner of Pizza Hut, Taco Bell, and KFC). (These disclosures include information about postretirement benefit plans that we discuss later in the chapter.) Note that Yum! Brands includes the information we have shown for the Carlisle Company, as well as the additional required disclosures.

# **Pension Worksheet**

In Example 20-6, we show a worksheet that you can use to help understand the first four examples that we explained earlier in the chapter. We have completed the worksheet using the amounts in the Example D. It will be helpful for you to go back to this example and see how the amounts are included in the worksheet. Also, you should note three important aspects of this worksheet. First, the amounts at the bottom of the "Pension Expense" columns provide the information that Carlisle Company uses to determine the debit (dr) to the Pension Expense account, and the credits (cr) to the Cash and the Accrued/Prepaid Pension Cost accounts. Second, the ending projected benefit obligation and plan assets amounts for one year are the beginning amounts for the next year. Third, the calculations for the projected benefit obligation, amortization of prior service cost, and the plan assets provide much of the information that Carlisle would use to adjust its Other Comprehensive Income (and Accrued/Prepaid Pension Cost), as well as to disclose its pension plan information in the notes to its financial statements. Also, the worksheet is simplified because it does not include certain complexities, such as when the corridor needs to be used to determine the net gain or loss to be included in the pension expense.

### NOTES TO CONSOLIDATED FINANCIAL STATEMENTS

### Note 16 - Pension and Postretirement Medical Benefits

Pension Benefits. We sponsor noncontributory defined benefit pension plans covering certain full-time salaried and hourly U.S. employees. The most significant of these plans, the YUM Retirement Plan (the "Plan"), is funded while benefits from the other U.S. plans are paid by the Company as incurred. During 2001, the plans covering our U.S. salaried employees were amended such that any salaried employee hired or rehired by YUM after September 30, 2001 is not eligible to participate in those plans. Benefits are based on years of service and earnings or stated amounts for each year of service.

# Obligation and Funded Status at Measurement Date:

The following chart summarizes the balance sheet impact, as well as benefit obligations, assets, and funded status associated with our U.S. pension plans and significant International pension plans based on actuarial valuations prepared as of a measurement date of September 30, 2007 and 2006, with the exception of the Pizza Hut U.K. pension plan where such information is presented as of a measurement date of November 30, 2007 and 2006.

|  | U.S. Pens          | ion Plans      | Interna<br>Pension |         |

Amounts recognized in the Consolidated Balance Sheet:

|   | U.S. Pens | ion Plans | International<br>Pension Plans |        |  |
|---|-----------|-----------|--------------------------------|--------|--|
|   | 2007      | 2006      | 2007                           | 2006   |  |
| Accrued benefit asset – non-current     | \$ —      | \$ —      | \$ 5                           | \$ —   |  |
| Accrued benefit liability – current     | (6)       | (2)       |                                | w In-  |  |
| Accrued benefit liability – non-current | (104)     | (189)     | (27)                           | (35)   |  |
|   | \$(110)   | \$(191)   | \$(22)                         | \$(35) |  |

Amounts recognized as a loss in Accumulated Other Comprehensive Income:

|                    | U.S. Pens | U.S. Pension Plans |        |      |
|--------------------|-----------|--------------------|--------|------|
|                    | 2007      | 2006               | 2007   | 2006 |
| Actuarial net loss | \$77      | \$216              | \$13   | \$31 |
| Prior service cost | 3         |                    | MATE I |      |
|                    | \$80      | \$216              | \$13   | \$31 |

The accumulated benefit obligation for the U.S. and International pension plans was \$900 million and \$916 million at December 29, 2007 and December 30, 2006, respectively.

Fair value of plan assets 732 673 53 44

Based on current funding rules, we do not anticipate being required to make contributions to the Plan in 2008, but we may make discretionary contributions during the year based on our estimate of the Plan's expected December 27, 2008 funded status.

# Components of net periodic benefit cost:

| End of year              | \$ 80              | \$13                            |

(Continued)

- (a) Prior service costs are amortized on a straight-line basis over the average remaining service period of employees expected to receive benefits.
- (b) Curtailment losses have been recognized as refranchising losses as they have resulted primarily from refranchising activities.
- (c) Settlement loss results from benefit payments from a non-funded plan exceeding the sum of the service cost and interest cost for that plan during the year.
- (d) Excludes pension expense for the Pizza Hut U.K. pension plan of \$4 million in both 2006 and 2005 related to periods prior to our acquisition of the remaining fifty percent interest in the unconsolidated affiliate.

The estimated net loss for the U.S. and International pension plans that will be amortized from accumulated other comprehensive loss into net periodic pension cost in 2008 is \$6 million and \$1 million, respectively. The estimated prior service cost for the U.S. pension plans that will be amortized from accumulated other comprehensive loss into net periodic pension cost in 2008 is \$1 million.

Weighted-average assumptions used to determine benefit obligations at the measurement dates:

|                               | U.S. Pension Plans |       | International<br>Pension Plans |       |
|-------------------------------|--------------------|-------|--------------------------------|-------|
|                               | 2007               | 2006  | 2007                           | 2006  |
| Discount rate                 | 6.50%              | 5.95% | 5.60%                          | 5.00% |
| Rate of compensation increase | 3.75%              | 3.75% | 4.30%                          | 3.77% |

Weighted-average assumptions used to determine the net periodic benefit cost for fiscal years:

|                             | U.S.  | Pension 1 | Plans |       | ternatio<br>nsion Pl |       |
|-----------------------------|-------|-----------|-------|-------|----------------------|-------|
|                             | 2007  | 2006      | 2005  | 2007  | 2006                 | 2005  |

| Long-term rate of return on |       |           |       |       |                      |       |
| plan assets                 | 8.00% | 8.00%     | 8.50% | 7.07% | 6.70%                | 7.00% |
| Rate of compensation        |       |           |       |       |                      |       |
| increase                    | 3.75% | 3.75%     | 3.75% | 3.78% | 3.85%                | 4.00% |

Our estimated long-term rate of return on plan assets represents the weighted-average of expected future returns on the asset categories included in our target investment allocation based primarily on the historical returns for each asset category, adjusted for an assessment of current market conditions.

### **Plan Assets**

Our pension plan weighted-average asset allocations at the measurement dates, by asset category are set forth below:

|                   | U.S. Pens | U.S. Pension Plans |      |      |
|-------------------|-----------|--------------------|------|------|
| Asset Category    | 2007      | 2006               | 2007 | 2006 |
| Equity securities | 71%       | 70%                | 80%  | 80%  |
| Debt securities   | 29        | 30                 | 20   | 20   |
| Total             | 100%      | 100%               | 100% | 100% |

Our primary objectives regarding the Plan's assets, which make up 84% of total pension plan assets at the 2007 measurement dates, are to optimize return on assets subject to acceptable risk and to maintain liquidity, meet minimum funding requirements and minimize plan expenses. To achieve these objectives, we have adopted a passive investment strategy in which the asset performance is driven primarily by the investment allocation. Our target investment allocation is 70% equity securities and 30% debt

(Continued)

securities, consisting primarily of low cost index mutual funds that track several subcategories of equity and debt security performance. The investment strategy is primarily driven by our Plan's participants' ages and reflects a long-term investment horizon favoring a higher equity component in the investment allocation.

A mutual fund held as an investment by the Plan includes YUM stock in the amount of \$0.4 million at September 30, 2007 and 2006 (less than 1% of total plan assets in each instance).

### **Benefit Payments**

The benefits expected to be paid in each of the next five years and in the aggregate for the five years thereafter are set forth below:

| Year ended: | U.S. Pension Plans | Pension Plans |
|-------------|--------------------|---------------|
| 2008        | \$ 43              | \$ 2          |
| 2009        | 34                 | 2             |
| 2010        | 36                 | 2             |
| 2011        | 39                 | 2             |
| 2012        | 42                 | 2             |
| 2013-2017   | 263                | 12            |

Expected benefits are estimated based on the same assumptions used to measure our benefit obligation on the measurement date and include benefits attributable to estimated further employee service.

### Postretirement Medical Benefits

Our postretirement plan provides health care benefits, principally to U.S. salaried retirees and their dependents, and includes retiree cost sharing provisions. During 2001, the plan was amended such that any salaried employee hired or rehired by YUM after September 30, 2001 is not eligible to participate in this plan. Employees hired prior to September 30, 2001 are eligible for benefits if they meet age and service requirements and qualify for retirement benefits. We fund our postretirement plan as benefits are paid.

At the end of 2007 and 2006, the accumulated postretirement benefit obligation is \$73 million and \$68 million, respectively. The unrecognized actuarial loss recognized in Accumulated other comprehensive loss is \$9 million at the end of 2007 and \$4 million at the end of 2006. The net periodic benefit cost recorded in 2007, 2006 and 2005 was \$5 million, \$6 million and \$8 million, respectively, the majority of which is interest cost on the accumulated postretirement benefit obligation. The weighted-average assumptions used to determine benefit obligations and net periodic benefit cost for the postretirement medical plan are identical to those as shown for the U.S. pension plans. Our assumed heath care cost trend rates for the following year as of 2007 and 2006 are 8.0% and 9.0%, respectively, both with an expected ultimate trend rate of 5.5% reached in 2012.

# **Questions:**

- 1. What types of pension plans does YUM! Brands have? How are they funded?
- 2. How much was the company's pension expense (cost) for its U.S. plans for 2007?
- 3. Was the company's actual return on plan assets for its U.S. plans in 2007 greater or less than the expected return?
- 4. How much are the company's accumulated and projected benefit obligations for its U.S. plans at the end of 2007? Why are the amounts different?
- 5. Is the company in a net asset or a net liability position for its pension plans at the end of 2007?
- 6. If YUM! Brands had used a lower discount rate for its U.S. plans during 2007, what would be the effect on the amounts disclosed by the company for 2007?
- 7. Describe the investment strategy employed by the company.

### **Summary of Issues Related to Pensions**

In Example 20-7, we summarize the major issues related to accounting for the defined benefit pension plan of a company in T-account form for 2010. In this summary, the balance in the Accrued/Prepaid Pension Cost account is equal to the net balance of the Plan Assets and the Projected Benefit Obligation accounts. Thus, at the beginning of the year, 10,000 = 100,000 - 90,000. All amounts are assumed. We discuss each entry in the following sections.

| Gross amounts not included in the con   | npany's fi                                  | nancial statements:   |     |

We assume that the company started the plan in 2009, it had no prior service costs, and no employees retired during the year. Based on the actuarial computation of the service cost (the only component of pension expense for 2009), the company makes its first journal entry for the plan on December 31, 2009 as follows:

**Pension Expense Accrued/Prepaid Pension Cost** Cash

90,000 10,000 Therefore, at the beginning of 2010, the plan assets are \$100,000, the projected benefit obligation is \$90,000, and the accrued/prepaid pension cost (asset) is \$10,000. The following information is for 2010.

- (a) Service Cost. The service cost for 2010 of \$95,000 is a component of the pension expense and increases the projected benefit obligation.
- (b) Interest Cost. The interest cost for 2010 of \$7,000 is a component of the pension expense and increases the projected benefit obligation.
- (c) Expected and Actual Return on Plan Assets. The actual and expected return on plan assets for 2010 of \$9,000 increases the plan assets and reduces the pension expense. Any difference between the actual and expected return on plan assets would be a component of the net gain or loss.
- (d) Prior Service Cost. During 2010, the company provides retroactive benefits with a present value of \$40,000. This creates a prior service cost and increases the projected benefit obligation. It also increases the accrued/prepaid pension cost (liability) and reduces other comprehensive income.
- (e) Amortization of the Prior Service Cost. During 2010, the company amortizes the prior service cost by \$3,000. This increases the pension expense and decreases the prior service cost (an element of other comprehensive income). The company also records a decrease of \$3,000 in the accrued/prepaid pension cost and an increase in other comprehensive income.
- (f) Payments to Retired Employees. Payments of \$14,000 by the funding agency to retired employees in 2010 decrease the plan assets and the projected benefit obligation.
- Pension Expense and Funding by the Company. The \$96,000 pension expense consists of the \$95,000 service cost (a), plus the \$7,000 interest cost (b), minus the \$9,000 expected return on plan assets (c), plus the \$3,000 amortization of the prior service cost (e). The payment of \$101,000 by the company to the funding agency increases the plan assets. The accrued/prepaid pension cost (liability) is decreased by \$5,000, which is the difference between the payment to the funding agency (\$101,000) and the amount of the pension expense (\$96,000).

At the end of 2010, note that the balance in the Accrued/Prepaid Pension Cost account of \$22,000 is equal to the balance in the Plan Assets of \$196,000, minus the balance in the Projected Benefit Obligation of \$218,000. The company reports this underfunded amount as its pension plan liability, Accrued Pension Cost, on its December 31, 2010 balance sheet.

## FASB Plans for Revision of Postretirement Accounting

The FASB has announced plans to reconsider most, if not all, aspects of the existing standards for accounting for postretirement benefits. It will coordinate these changes with the IASB.

## CONCEPTUAL ISSUES RELATED TO DEFINED BENEFIT PENSION PLANS

In their analyses of pension accounting, the APB and the FASB considered several conceptual issues related to pension expense, prior service cost, pension liabilities, and pension assets. We briefly discuss these conceptual issues in the following sections. 15

## **Pension Expense**

# 715-60).

The first conceptual issue in accounting for pension plans involves the proper amount of pension cost that the employer-company should recognize and when it should report that amount as pension expense on its income statement. Expenses are outflows of assets or incurrences of liabilities (during a period) from delivering or producing goods, rendering services, or carrying out other activities that are the company's ongoing major or central operations. Recall also that once a company has assigned revenues to an accounting

Postemployment Benefits," FASB Discussion Memorandum (Stamford, Conn.: FASB, 1981) (FASB Cod.

**6** Explain the conceptual issues regarding pension plans.

<sup>15.</sup> This discussion is a brief summary of that presented in "Employers' Accounting for Pensions and Other

period, it matches expenses against the revenues by association of cause and effect, systematic and rational allocation, or immediate recognition.

Pension cost may include several components. The primary component of pension cost is the deferred compensation (service cost) the employer will pay to employees in the future for their current services. However, since employees' compensation is deferred until retirement, the employees are, in effect, providing a "loan" to the employer. The interest on that loan may be a component of pension cost. In addition, an employer generally invests its pension contributions in a pension fund with the intent of earning a return on these assets. A possible negative component of pension cost is the return earned on the pension fund assets. An employer that begins a pension plan or makes modifications in its existing plan may provide additional benefits to employees for services they performed in previous years. Part or all of the cost of these previously earned benefits may be a component of pension cost. Finally, unforeseen events related to a pension plan may result in (a) deviations in the current period between actual experience and the assumptions used, and (b) changes in the assumptions about the future. The resulting gains and losses may be a component of pension cost. Pension expense computed under GAAP includes all these components, although some are in a modified form.

#### **Prior Service Cost**

Five alternative methods have been suggested for an employer to account for its prior service cost. The first is to account for it prospectively. This method would require the cost to be expensed in the current and future periods, and no liability be recorded when the cost arises. It is argued that this method violates the matching concept because all the services performed by the employees were completed in previous periods. Also, the lack of recognition of a pension obligation is a violation of the concept of a liability.

The second alternative would be for an employer to recognize the total amount as an expense in the period in which it arises (i.e., the current period) and to record a liability. This procedure would also violate the matching concept because the services were performed by the employees in previous periods and not in the current period. It might also tend to dissuade companies from adopting, or changing, pension plans because of the related effect (i.e., decrease) on net income of the current period. Also, many companies would resist the recording of a liability because of the effect it would have on their debtto-equity ratios and on similar measures of financial performance.

The third alternative is for the employer to recognize the liability and reduce other comprehensive income, and then amortize the prior service cost as a component of pension expense. In addition, the liability is reduced and other comprehensive income is increased for the amount amortized. This is the approach required by GAAP. This approach has the advantage of recognizing the liability in full, but still violates the matching concept. Recording the amount in other comprehensive income postpones the impact on net income until the periods of amortization.

The fourth alternative would be for an employer to debit retained earnings (as a retrospective adjustment) and to record a liability. This procedure would violate the allinclusive income concept because the total amounts would never be included in the income statement.

The fifth alternative would be for an employer to record an intangible asset and liability of equal amounts. Although it is difficult to see how an asset would be created by recognizing pension benefits earned by employees in previous periods, the argument would be that the employer's decision to improve a pension plan is forward-looking and rational. That is, the employer would accept an increased obligation only if it expected future benefits of at least an equal amount. In this sense, the future economic benefits (intangible asset) would be recognized along with the liability and should be expensed over some future period. Similarly, gains and losses could be accounted for by the same five alternative methods.

#### **Pension Liabilities**

A second conceptual issue regarding accounting for pension plans involves identifying and recording pension plan liabilities. *Liabilities* are probable future sacrifices of economic

benefits arising from present obligations of a company to transfer assets or provide services in the future as a result of past transactions or events.

Generally, it is agreed that a pension is a form of deferred compensation. An employer's pension obligation may be viewed as an obligation to make contributions to the plan, or as an obligation to employees for pensions promised. A company cannot know the exact amount of the pension obligation for each employee until the employee (or related beneficiary) dies. Therefore, actuaries can only estimate the amount of the obligation using assumptions about employee turnover, life expectancy, and other variables.

We briefly summarize the five alternatives for meeting the recognition-measurement criteria of a liability that have been identified, as follows:

- 1. Contributions Based on an Actuarial Funding Method. Under this alternative, it would be argued that the employer has an obligation to make contributions to the plan rather than directly to employees. In this situation, the employer's liability would be based on the actuarial funding method used for funding the plan, in which case the only recorded pension liability would be for contributions due but not yet paid.
- 2. Amount Attributed to Employee Service to Date. This alternative is based on the concept that the employer's pension obligation arises as the employees work and that the transaction resulting in the obligation is the employees' service. The pension transaction is an exchange whereby employees render service for pension benefits (deferred compensation) in addition to current compensation. The resulting obligation for deferred compensation (the projected benefit obligation) is recorded in a manner similar to current compensation. This is the approach required by GAAP, except that the projected benefit obligation is netted against the pension plan assets to determine the underfunding (liability) or overfunding (asset).
- Termination Liability. This alternative would be based on the argument that the employer's obligation should be limited to the amount that it must pay when the plan is terminated. Those disagreeing believe that a company is a going concern and that an assumption of plan termination would be inappropriate unless there is clear evidence to the contrary.
- 4. Amount of Vested Benefits. Under this alternative, the employer's obligation would be based on the vested benefits earned by the employees. Nonvested benefits are contingent on and result from future services and, therefore, create a liability only as they become vested in future periods. Those disagreeing believe that vesting is a legal transaction, and that a portion of the nonvested benefits will become vested and, therefore, meet the definition of a liability.
- 5. Amount Payable to Retirees. This alternative is a form of "pay-as-you-go" accounting whereby the employer's liability arises only during the period in which pension benefits will be paid to employees. Under this alternative, the liability would be readily measurable. Those disagreeing believe that this approach is a violation of the accrual concept of accounting.

#### **Balance Sheet Presentation of Pension Plan Assets**

A third conceptual issue involves the disclosure of assets used in the pension plan. Assets are probable future economic benefits obtained or controlled by a company as a result of past transactions or events. As indicated earlier, a company having a pension plan typically makes periodic payments to a funding agency. This agency, then, assumes the responsibility for safeguarding and investing the pension assets (to earn a return on the assets), and for making benefit payments to retired employees. There are two alternative views for accounting by the employer for these pension assets.

1. Funding is a discharge of the pension liability. This alternative says that the assets of the pension plan held by the funding agency are *not* assets of the employer. The principal reasons are that: (1) the funding agency is a separate legal entity (e.g., a trust) with legal title to the plan assets; (2) the assets can be used only for the benefit of the employees and retirees, and ordinarily cannot be returned to the employer; (3) the employer's obligation is to make contributions to the funding agency, and the agency

- pays the actual pension benefits; and (4) the employer's obligation may be limited by termination of the plan.
- 2. The pension liability is not discharged until the retiree receives the pension payment. This alternative says that the pension plan assets are assets of the employer. The employer remains obligated to provide benefits defined by the plan, and the trust is a legal device controlled by the employer for funding the pension obligation. Although the funding agency holds legal title to the assets, the employer is at risk with regard to the assets and ultimately reaps the rewards of economic ownership of them. If the assets grow, the employer's future contributions will be reduced. If the assets do not grow, or if losses are sustained, future contributions will be increased. This is the approach required by GAAP, except that the projected benefit obligation is netted against the pension plan assets to determine the underfunding (liability) or overfunding (asset).

## Additional Aspects of Pension Accounting

7 Understand several additional issues related to pension plans.

Several other issues have an impact on some aspects of pension accounting. These include statement of cash flows disclosures, vested benefits, accounting for defined contribution plans, disclosures by funding agencies, the Employee Retirement Income Security Act of 1974, the Pension Protection Act of 2006, pension settlements and curtailments, termination benefits paid to employees, and multi-employer plans. We briefly discuss each of these topics, along with international accounting differences, in the following sections.

#### **Statement of Cash Flows Disclosures**

A company reports the cash it paid to fund its pension plan as a cash outflow in the operating activities section of its statement of cash flows. If a company uses the indirect method to report its operating cash flows, it adds any increase in its accrued pension cost (liability), or any decrease in its prepaid pension cost (asset) to net income in the operating activities section of its statement of cash flows. It subtracts from net income any decrease in its accrued pension cost (liability), or any increase in its prepaid pension cost (asset). Note that this adjustment is only for the amount of the accrual for the difference between the expense and the funding. It does not include the amount of the adjustment for the over- or underfunding because that amount did not affect net income.

#### **Vested Benefits**

Vested benefits are pension benefits earned by employees that are not contingent on future service with the company. That is, the employees will receive retirement benefits based on service to date, even if they terminate employment. ERISA specifies the minimum vesting requirements that companies must follow. A company must disclose the vested portion of the accumulated benefit obligation. Also, the vesting provisions affect calculations made by the company's actuary because it is necessary to estimate the number of employees who will leave before vesting of their pension benefits occurs.

## **Accounting for Defined Contribution Plans**

As we explained earlier, some pension plans are defined contribution plans because the employer determines its contribution based on a formula. Therefore, any future benefits paid to retired employees are limited to those that can be provided by the contributions and the earnings on those contributions. A common example is a 401(k) plan. Accounting for defined contribution plans is very straightforward.

A company records its pension expense at an amount equal to the contribution that it is required to make in that period. Thus, its journal entry is a debit to Pension Expense and a credit to Cash for the annual contribution. A company recognizes a liability only if the contribution for a given year has not been paid in full.

The company also is required to disclose the following two items:

- 1. A description of the plan, including employee groups covered, the basis for determining contributions, and the nature and effect of significant matters affecting the comparability of the information for all periods presented.
- 2. The amount of the pension expense recognized during the period. 16

## ETHICAL DILEMMA

Cloud Nine Airlines provides airline service to most major cities in the continental United States. Due mainly to high fuel costs and the reduced demand for air travel, Cloud Nine has been unable to generate enough cash flow to pay many of its short-term operating costs. Seeking to remedy the situation and keep the airline solvent, the CEO of Cloud Nine has been aggressively pursuing short-term loans from various creditors. However, the airline has nearly exhausted its borrowing capacity, and the CEO is finding it increasingly difficult to find a lender willing to provide the company with the needed cash. In a move to keep the airline solvent, the CEO approached the trustee of the company's defined benefit pension plan, who happened to be an old college friend, and convinced him to loan the company \$10,000,000 in cash at the market rate of interest, with the loan secured by Cloud Nine common stock. While this amount represented only 10% of the assets of the pension plan, it was enough cash to keep the airline solvent for the next 12 months.

As the accountant for Cloud Nine, you are in charge of preparing the financial statements and related note disclosures for the current year. Upon reviewing the note disclosure that you prepared related to the pension plan, the CEO is furious. Specifically, he demands that you remove the detailed explanation of the lending arrangement between the airline and the pension plan. The CEO states that the dollar amount of the loan is already reflected in the financial statements as a component of long-term debt, and any further disclosure in the notes is irrelevant to the financial statements. How would you respond to the CEO?

## **Disclosures by Funding Agencies**

A company typically makes its periodic pension plan payments to a funding agency that administers the plan. A funding agency may be a specific corporate trustee or an insurance company. These agencies issue financial statements that summarize the financial aspects of a company's pension plan, aimed primarily toward providing financial information about the pension plan's ability to pay benefits when due. GAAP requires that the annual financial statements issued by a funding agency for a company's pension plan include: (1) a financial statement (on an accrual accounting basis) presenting information about the net assets (at fair value) available for benefits at the end of the plan year, (2) a financial statement presenting information about the changes during the year in the net assets available for benefits, (3) information regarding the actuarial present value of accumulated plan benefits as of either the beginning or the end of the plan year,

and (4) information regarding the significant effects of factors affecting the year-to-year change in the actuarial present value of accumulated plan benefits. 17 Although these funding agency financial statements are beyond the scope of this book, the *company* sponsoring the pension plan discloses some of this information in the notes to its financial statements, as we discussed earlier.

### **Pension Legislation**

The primary purpose of the Employee Retirement Income Security Act of 1974 (ERISA), alternatively known as the Pension Reform Act of 1974, is to create standards for the operation and maintenance of pension funds. This Act was passed to prevent abuses in the handling of these funds. Also, it attempts to increase the protection given to employees covered by such plans. For example, at the congressional hearings, it was revealed that some companies routinely followed a policy of terminating employees at ages 60 to 62, even though service until age 65 was a requirement for pension eligibility. This practice greatly minimized the company's pension liabilities and deprived these employees of pension income on their retirement.

The Pension Reform Act of 1974 provides guidelines for employee participation in pension plans, vesting provisions, minimum funding requirements, financial statement disclosure, and the administration of the plan. In addition, the administrators of pension plans are required to file annual reports with the Department of Labor that include a description of the plan and copies of the relevant financial statements.

The Act also created the Pension Benefit Guaranty Corporation (PBGC), an organization that provides benefits to employees covered by plans that have been terminated (usually because of the bankruptcy of the sponsoring company). The PBGC receives an annual fee for every employee covered by a pension plan that is subject to the PBGC. The PBGC can also impose a lien against 30% of the net assets of the company. This lien has the status of a tax lien and, therefore, ranks above the claims of most other creditors. Since the company may be bankrupt, however, this lien may not result in the PBGC receiving many assets.

The Pension Protection Act of 2006 made many changes to the requirements that company pension plans must follow, including minimum funding requirements. A company must fund its pension plan each year at an amount that at least equals the service cost for the year plus the amount needed to amortize any underfunding over a maximum of seven vears.

#### **Pension Plan Settlements and Curtailments**

In recent years, many companies have either settled (terminated) or reduced (curtailed) their defined benefit pension plans. Some have settled their defined benefit pension plans and substituted defined contribution plans. Others have reduced the benefits to be paid to employees, while continuing the defined benefit pension plans. For example, a company may decide to terminate its pension plan and buy from an insurance company an annuity for each of its employees that provides the same expected benefits during retirement.

GAAP requires that a company include the net gain or loss from a settlement or curtailment in its net income of the period. When a plan is settled, the net gain or loss is the net gain or loss that has not been recognized as part of pension expense, as we discussed earlier. When a plan is *curtailed*, the portion of the prior service cost associated with the estimated reduced future benefits is a loss. The company combines this amount with any gain or loss from a change in the projected benefit obligation due to the curtailment in order to determine the net gain or loss.<sup>18</sup>

<sup>17. &</sup>quot;Accounting and Reporting by Defined Benefit Pension Plans," FASB Statement of Financial Accounting Standards No. 35 (Stamford, Conn.: FASB, 1980), par. 5 and 6 (FASB Cod. # 960-205-10 and 45).

<sup>&</sup>quot;Employers' Accounting for Settlements and Curtailments of Defined Benefit Pension Plans and for Termination Benefits," FASB Statement of Financial Accounting Standards No. 88 (Stamford, Conn.: FASB, 1985), par. 9-14 (FASB Cod. # 715-30-35).

### **Termination Benefits Paid to Employees**

When a company wishes to reduce the size of its work force without firing employees, it may provide special benefits for a period of time to encourage some employees to terminate voluntarily. These benefits may include lump-sum cash payments, payments over future periods, or similar inducements. GAAP requires that a company record a loss and a liability for these termination benefits when the following two conditions are met:

- 1. The employee accepts the offer, and
- 2. The amount can be reasonably estimated. 19

The amount of the loss includes the amount of any lump-sum payments and the present value of any expected future benefits.

### **Multi-Employer Plans**

In the previous discussion we assumed that the pension plan is a single-employer plan. That is, the plan is maintained by one company for its employees. In contrast, a multiemployer plan involves two or more unrelated companies in which assets contributed by each company are available to pay benefits to the employees of all the involved companies. Generally, these plans result from collective-bargaining agreements with unions. Each company recognizes as pension expense the required contribution for the period. In other words, cash-basis accounting is used for these plans. This difference in accounting principles results from the difference in the nature of the obligation of the company and the difficulty of obtaining reliable information for each separate company.

# IFRS vs. U.S. GAAP

The basic principles of accounting for defined benefit plans under IFRS are the same as U.S. GAAP. However, there are some differences. First, IFRS allow companies to report the components of pension expense in different line items on the income statement. For example, interest cost and the expected return on plan assets may be included with other interest expense and other investment income. Second, IFRS require any prior service cost that is vested immediately to be expensed in full on the income statement. If the prior service cost is not vested, IFRS do not allow the prior service cost to be recognized on the balance sheet as a component of accumulated other comprehensive income. Instead, these costs are amortized on a straight-line basis until they vest. Third, IFRS allow actuarial gains and losses to be recognized by either amortizing them into income using a "corridor" approach or in full in the period in which they occur as other comprehensive income. If a company chooses to recognize the gain or loss directly in equity, it is not permitted to amortize this amount into income. Therefore, IFRS allow recognition of gains and losses that is completely outside of the income statement. Fourth, IFRS allow defined benefit accounting for multi-employer plans, whereas U.S. GAAP requires such plans to be accounted for on a defined contribution basis. Finally, it is important to understand that it is common for foreign governments to provide significantly higher state-funded benefits to retirees. Therefore, pension benefits provided by foreign companies are less likely to have a material effect on their financial statements.

Source: IAS 19 (See Appendix C at the end of this book.)

- Service cost and interest cost (computed as the discount rate multiplied by the projected benefit obligation at the beginning of the period) increase pension expense.
- The expected return (computed as the fair value of the plan assets at the beginning of the period multiplied by the expected long-term rate of return) is a reduction in pension expense. The actual return increases the plan assets.
- The difference between pension expense and the amount funded is recorded in a liability/asset account, accrued/prepaid pension cost.
- If a company grants retroactive benefits to its employees, the prior service cost is recorded as an increase in a liability and a decrease in other comprehensive income. It is amortized into pension expense using either the straight-line method over the average remaining service life of the employees or the years-of-future-service method. The amortized amount is also recorded as a reduction in accrued/prepaid pension cost and an increase in other comprehensive income.
- The excess of the net gain or loss over a corridor amount (determined as 10% of the greater of the projected benefit obligation or the fair value of the plan assets at the beginning of the period) is amortized into pension expense on a straight-line basis over the average remaining service life of the employees.
- Several conceptual issues arise in accounting for pensions:
  - Any prior service cost is recognized as a liability and expensed in the current and future periods (arguably a violation of the matching concept).
  - The under- or overfunded amount of the pension plan is reported on the employer's balance sheet.
  - Pension plan assets are considered assets of the employer and netted against the projected benefit obligation to determine the amount of the over- or underfunding.
- Other issues that impact pension accounting include transition requirements, vested benefits, accounting for defined contribution plans, disclosures by funding agencies, pension legislation, pension settlements and curtailments, termination benefits paid to employees, and multi-employer plans.

## **OTHER POSTEMPLOYMENT BENEFITS**

In addition to providing pensions to their employees, many companies also offer two types of additional benefits. Postemployment benefits are provided to former employees after employment but before retirement. Under GAAP, a company must accrue the cost of these benefits during employment and recognize the amount as an expense and a liability if the four criteria for the recognition of compensated absences are met, as we discussed in Chapter 13. If any one of the criteria is not met, the company records the expense and liability when the liability is probable and the amount can be reasonably estimated, in accordance with accounting for contingencies.<sup>20</sup>

In the rest of this section, we discuss *postretirement* benefits, which include all forms of benefits provided to former employees after their retirement, other than pensions. For convenience, we use the widely used acronym, OPEB, for these benefits. Healthcare benefits typically are the most significant of these OPEBs, but some companies also provide dental benefits, eye care, tuition assistance, life insurance, legal services, and financial advisory services. Our discussion focuses on accounting for healthcare benefits because

8 Explain other postemployment benefit plans (OPEBs). they usually are the largest dollar amount, present the greatest measurement difficulties, and are the most controversial.

When Medicare was first created in the 1960s, many companies decided to offer an additional benefit by agreeing to pay for the medical costs of retirees who were not covered by the federal plan. At that time, healthcare costs and the retiree population were relatively small, so management believed that it was providing a valuable benefit to employees at a low cost. Companies accounted for OPEBs by recording the costs as they were paid. This cash-basis accounting was accepted because the liability was thought to be immaterial and because the benefits were considered to be revocable. However, the costs of the plans have increased significantly in recent years because (1) inflation in healthcare costs has significantly exceeded general inflation, (2) Medicare reimbursements have been decreasing, leaving a larger portion to be covered by companies, (3) the number of retired employees has increased both absolutely and relative to the number of current employees as companies have matured (and downsized) and life expectancies have increased, and (4) many companies have encouraged early retirement and their healthcare programs cover the entire healthcare costs of the retired employees until age 65, when Medicare is available.

GAAP requires that a company accrue the cost of OPEBs during the periods in which its employees earn the benefits. 21 This accounting has had a dramatic impact on the financial statements of many companies, as we discuss later.

Many companies provided OPEBs without computing the long-term costs involved. It is interesting, for example, that companies generally have refused to index pension benefits because of the inflation risk involved. However, healthcare benefits essentially are indexed because companies have committed to benefits in terms of services rather than in terms of a specific dollar amount of those services. Also, healthcare benefits are more egalitarian, because they usually are not based on length of service or salary, but rather on some minimum length of service, after which the same benefits are provided equally to every employee. Since pensions and OPEBs are both postemployment benefits, it is helpful to understand their similarities and differences in considering GAAP for OPEBs.

#### **Similarities to and Differences from Pensions**

The basic argument that accounting for OPEBs should be similar to the principles used for pensions involves the concept of a liability. Recall that a liability of a company is a probable future sacrifice of economic benefits arising from present obligations of the company to transfer assets or provide services to other entities in the future as a result of past transactions or events. The term "obligations" includes not only legal duties defined in a contract, but also equitable and constructive obligations based on promises or moral responsibility.

Some argue that a company offering OPEBs is essentially providing deferred compensation to employees because the benefits received during retirement were earned during the period of employment. Therefore, the company incurs an obligation as its employees provide services. GAAP follows this viewpoint.

Others argue that many OPEBs do not have the same explicit legal contract as a pension agreement, and the obligation of the company to continue to provide benefits is not as clear. In other words, they argue that there is no liability because the company has the right to withdraw the benefits. That is, a company has no obligation for OPEBs until its employees retire, since they must retire to obtain the benefit. However, recent court decisions have not allowed companies to withdraw rights from retired employees, and there are indications that it may be difficult to withdraw rights already earned by current employees. Therefore, the concept of a liability appears to have been satisfied.

Also, if a liability does exist prior to the employees' retirement, it can be argued that it arises only when employees become eligible for the benefits. OPEB plans typically specify a minimum number of years of active service before the employees are eligible for the benefits.

<sup>21. &</sup>quot;Employers' Accounting for Postretirement Benefits Other Than Pensions," FASB Statement of Financial Accounting Standards No. 106 (Norwalk, Conn.: FASB, 1990) (FASB Cod. # 715-10 and 60).

Vesting for these plans is "cliff" vesting, because vesting occurs when the requirements are met. A liability would be recorded then and not gradually over a period of years.

We summarize the major differences between healthcare OPEBs and pensions in Exhibit 20-3. While the beneficiary of a pension plan is generally the retired employee, a company usually provides OPEBs to the retired employee, spouse, and dependents up to, say, age 21. The pension benefit is defined as a fixed dollar amount that is paid monthly. The OPEB, however, usually is not limited in amount because benefits are paid no matter how long or serious the illness, benefits are paid as used, and the amount of benefits varies geographically. Also, the amount is difficult to predict because of the incidence of new illnesses, such as the "bird flu," and the use of new treatments. Finally, companies fund pension plans because of ERISA requirements, and the contributions are taxdeductible. On the other hand, companies often do not fund OPEBs because there are no legal requirements and the contributions are *not* tax-deductible.

| EXHIBIT 20-3 | Major Differences Between Postret<br>Healthcare Benefits and Pensions | irement  |
|--------------|---|--|
| Item         | Pensions  | Healthcare   |
| Beneficiary  | Retired employee (some residual benefit to surviving spouse)          | Retired employee, spouse, and dependents                               |
| Benefit      | Defined, fixed dollar amount, paid monthly                            | Not limited, paid as used, varies geographically                       |
| Funding      | Funding legally required and tax-deductible                           | Usually not funded because not legally required and not tax-deductible |

## **Accounting Principles**

GAAP requires that companies follow accounting principles for OPEBs that closely parallel those for pensions. (Because we assume that you have studied the discussion of accounting for pensions, this section is simplified. However, it may be helpful to review those principles as we discuss the OPEB principles.)

Two concepts also need to be understood. The expected postretirement benefit obligation (EPBO) is the actuarial present value on a specific date of the benefits a company expects to pay under the terms of the postretirement benefit plan. The amount is measured based on the benefits that employees will receive after their expected retirement dates. In contrast, the accumulated postretirement benefit obligation (APBO) is the actuarial present value of the benefits attributed to employee service rendered to a specific date. Prior to an employee's full eligibility date, the APBO is the portion of the EPBO attributed to that employee's service rendered to that date. On or after the full eligibility date, the APBO and EPBO for an employee are the same. Thus, the difference between the EPBO and APBO is that the accumulated amount is based on benefits earned to date. However, the expected amount is based on all benefits expected to be paid to employees. (In comparison, the difference between the projected and accumulated benefit obligation for pensions is the inclusion of expected salary increases in the projected amount.)

#### **OPEB Expense**

The net postretirement benefit expense<sup>22</sup> that a company recognizes includes the following components:

1. Service Cost. The service cost is the actuarial present value of the expected postretirement benefit obligation attributed to services of the employees during the current period. Typically, a company provides OPEB benefits on an

<sup>22.</sup> GAAP uses this term rather than the more commonly used term, OPEB, because other benefits such as layoff benefits may be paid after employment but before retirement.

- all-or-nothing basis. That is, benefits are generally not defined in terms of years of service. Therefore, an equal amount of the expected benefits is attributed to each year of the attribution period (discussed later). The discount (interest) rate used to calculate the service cost is the rate of return on high-quality fixed-income investments currently available.
- 2. Interest Cost. The interest cost is the increase in the accumulated postretirement benefit obligation due to the passage of time. Since the OPEB is a deferred compensation plan in which future payments are discounted to their present values, interest accrues because of the passage of time. Thus, the interest cost is the accumulated postretirement benefit obligation at the beginning of the period multiplied by the discount rate. The interest rate used to calculate the accumulated postretirement benefit obligation is the same rate as that used for the service cost. The interest cost is added to the computation of the postretirement benefit expense.
- 3. Expected Return on Plan Assets. The expected return on plan assets is the expected increase in the plan assets due to investing activities. Plan assets are held by the funding agency and include investments in securities such as stocks and bonds, as well as other investments. The expected return is calculated by multiplying the fair value of the plan assets at the beginning of the period by the expected long-term rate of return on plan assets. The rate of return reflects the average rate of earnings expected on the assets invested to provide for the benefits included in the projected benefit obligation. Since OPEBs often are *not* funded, we do not discuss this component further.
- 4. Amortization of Prior Service Cost. The prior service cost is the increase (decrease) in the accumulated postretirement benefit obligation that results from plan amendments (and at the initiation of the plan). It is recorded as a liability and as a negative element of other comprehensive income at the date of the plan amendment. The prior service cost is then amortized each period and included in the computation of the OPEB expense. The required journal entries are discussed later in the chapter. The prior service cost is amortized by assigning an equal amount to each remaining year of service until full eligibility for benefits is reached for each plan participant active at the date of amendment. If all or almost all of a plan's participants are fully eligible for benefits, the prior service cost is amortized instead, based on the remaining life expectancy of the plan participants. Straightline amortization over the average remaining years of service to full eligibility is also allowed for simplicity. The amortization amount is added (subtracted) in the computation of the postretirement benefit expense if the benefits are increased (decreased).
- 5. Amortization of the Net Gain or Loss. Gains and losses are changes in the amount of either the accumulated postretirement benefit obligation and fair value of the plan assets resulting from experience different from that assumed, or from changes in assumptions. The entire gain or loss is not recognized in the period in which it occurs. Any gain or loss that is not recognized in OPEB expense in the period it occurs is recognized as a component of other comprehensive income. Amortization of any net gain or loss included in other comprehensive income is included in the postretirement benefit expense of a given year if, at the beginning of the year, the cumulative net gain or loss from previous periods included in accumulated other comprehensive income exceeds a "corridor." The corridor is defined as 10% of the greater of the accumulated postretirement benefit obligation or the fair value of the plan assets. If amortization is required, the minimum amortization is the excess divided by the average remaining service period of active plan participants (or if most of the plan participants are retired, over their average remaining life expectancy). The total amount of any gain (loss) recognized is deducted (added) in the computation of the postretirement benefit expense.

## **Components of OPEB Expense**

In summary, the OPEB expense a company reports on its income statement generally includes the following components:

- Service cost
- + Interest cost
- Expected return on plan assets
- + Amortization of prior service cost
- ± Amortization of net gain or loss
- = OPEB Expense

### **OPEB Liability**

Since a company usually does not fund the plan, it increases a liability, accrued postretirement benefit cost, each period by an amount equal to the expense. The company decreases this account by payments made to retired employees. As with pensions, GAAP also requires that the difference between the accumulated postretirement benefit obligation and the plan assets be recognized as a liability on the balance sheet.

## **Differences from Accounting for Pensions**

You can see from the preceding discussion that GAAP requires accounting principles that closely parallel the accounting for pensions. The major differences are:

- 1. Although the attribution period is defined in the same way, the effect is different because the benefit formulas for most pension plans link benefits to years of service and salary levels. The result is that, for pension plans, the expected retirement date and date of full eligibility are the same. For many OPEBs, however, the benefit formula causes the two dates to be different. The attribution period for OPEBs generally begins with the date of hire (or the date on which credited service begins) and ends on the date the employee attains eligibility for full benefits. For example, for a plan that provides OPEBs to employees who render 15 years of service after age 35, the attribution (recognition) period is from 35 to 50 and, therefore, ceases prior to the retirement dates of the employees.
- 2. The interest component of the net postretirement benefit expense is based on the accumulated postretirement benefit obligation. However, the interest component of the pension expense is based on the projected benefit obligation.
- 3. The OPEB liability (or asset) is the difference between the accumulated postretirement benefit obligation (which is based on the benefits employees will receive for services rendered to date) and the fair value of the OPEB plan assets. However, the pension liability (or asset) is the difference between the projected benefit obligation (which is based on expected future pay increases) and the fair value of the pension plan assets.

GAAP requires disclosures for OPEBs that are similar to those we discussed earlier for pension plans. In addition, it requires disclosures not required for pensions:

- The assumed healthcare cost trend rates.
- 2. The effect of a 1% increase and a 1% decrease in the assumed healthcare cost trend rates on the aggregate of the service cost and the interest cost, as well as on the accumulated postretirement benefit obligation for healthcare benefits,
- 3. A description of the direction and pattern of change in the assumed healthcare cost trend rates, together with the ultimate trend rate(s) and when that rate is expected to be achieved.
- 4. If applicable, the amounts and types of securities included in the plan assets and the approximate amount of future benefits covered by insurance contracts,
- 5. If applicable, the cost of providing special or contractual termination benefits provided during the period and a description of the event, and
- 6. An explanation of any significant change in the benefit obligation or plan assets not otherwise apparent from the other disclosures.

GAAP also has some required disclosures in quarterly financial statements, which are beyond the scope of this book.

### **Example: Accounting for OPEBs**

We show the basic accounting for OPEBs, using the following simplified example. Assume that the Livingston Company adopts a healthcare plan for retired employees on January 1, 2010. At that time the company has two employees and one retired employee, as we show in Example 20-8. To determine eligibility for benefits, the company retroactively gives credit to the date of hire for each employee. Based on the information in the example, the company recognizes the accumulated postretirement benefit obligation on January 1, 2010, as follows:

9 Account for OPEB plans.

Other Comprehensive Income: Prior Service Cost **Accrued Postretirement Benefit Cost** 

100,000

100,000

The company makes the following three journal entries to record the OPEB items at December 31, 2010. It records the expense for the year and, since the plan is not funded, the accompanying liability as follows:

Postretirement Benefit Expense **Accrued Postretirement Benefit Cost** 

31,100

31,100

#### **EXAMPLE 20-8 Accrual of Postretirement Healthcare Benefits**

#### **Basic Information**

- The plan is started on January 1, 2010 and is not funded.
- The discount rate is 10%.
- All employees were hired at age 25.
- All employees become eligible for full benefits at age 55.
- Employee C was paid \$1,500 postretirement healthcare benefits in 2010.
- The company elects to use straight-line amortization for any prior service cost.

Additional information on January 1, 2010:

| Employee | Status   | Age | Expected<br>Retirement<br>Age | Accumulated<br>Postretirement<br>Benefit<br>Obligation <sup>a</sup> |
|----------|----------|-----|-------------------------------|---|
| A        | Employee | 47  | 65                            | \$ 15,000   |
| В        | Employee | 53  | 65                            | 60,000  |
| C        | Retired  | 70  | _                             | 25,000  |
|          |          |     |                               | \$100,000b  |

- Actuarially determined at January 1, 2010.
- This amount is the prior service cost.

#### Computation of Postretirement Benefit Expense for 2010

| 1. | Service cost                       | \$ 1,100a |
|----|------------------------------------|-----------|
| 2. | Interest cost                      | 10,000b   |
| 3. | Expected return on plan assets     | 0         |
| 4. | Amortization of prior service cost | 20,000c   |
| 5. | Gain or loss                       | 0         |
|    |                                    | \$31,100  |
|    |                                    |           |

- Actuarially determined based on expected postretirement benefit obligation. Note that there is no service cost for B and C because they have passed the date for full eligibility.
- Accumulated postretirement benefit obligation at January 1, 2010 imes Discount rate, or \$100,000 imes 10%.
- $$100,000 \div 5$ , or \$20,000. Employee C has reached eligibility for full benefits. Employees A and B have 8 and 2 years of service to reach the full eligibility date (age 55), respectively. Therefore, the average remaining service period is  $(8 + 2) \div 2 = 5$  years.

The second entry records the payment of retirement benefits:

**Accrued Postretirement Benefit Cost** 1,500 Cash

The third entry reduces the prior service cost included in Accumulated Other Comprehensive Income from \$100,000 to \$80,000 because a portion of the prior service cost was amortized and reduced net income:

1,500

**Accrued Postretirement Benefit Cost** 20,000 Other Comprehensive Income: Prior Service Cost 20,000

The balance in the accrued postretirement benefit cost is \$109,600 (\$100,000 + \$31,100 -\$1,500 - \$20,000). The accumulated postretirement benefit obligation on December 31, 2010 is also \$109,600 (\$100,000 beginning accumulated postretirement benefit obligation + \$1,100 service cost + \$10,000 interest cost - \$1,500 payment). Therefore, the credit balance in the Accrued Postretirement Benefit Cost account reflects the underfunded status of the OPEB plan and no adjustment is necessary. The company reports this underfunded amount as its OPEB plan liability on its December 31, 2010 balance sheet. •

## CONCEPTUAL EVALUATION OF ACCOUNTING FOR OPEBS

Since GAAP is based on accrual accounting, you might expect that it would not be controversial. Instead, several aspects have been questioned by critics.

## **Relevance and Reliability**

It is easy to argue that accrual accounting is more relevant than cash-basis accounting because costs are matched as expenses against revenues in the period in which the benefits are earned. For OPEBs, the benefits are earned while the employee is working, not when he or she is retired. Therefore, the relevance of a company's income statement is enhanced by inclusion of the OPEB expense. There is relatively little disagreement about the nature of the obligation because of the similarity between GAAP for pension and OPEB plans.

Opposition did arise from companies that implemented the GAAP for OPEBs. In particular, the measurement problems created considerable controversy. The biggest argument is that OPEB costs cannot be measured with sufficient reliability to offset the increased relevance because of the numerous assumptions about future events that are required. The measurement of the various amounts used in accounting for OPEBs is even more difficult than for pensions. For example, healthcare plans agree to pay for some or all of a service, the amount and cost of which are unknown. However, pension payments are tied to more predictable variables of length of service and pay levels. Also, healthcare plans require an estimate of such items as the medical-cost trend rate and marital and dependency status during retirement. Furthermore, because of the totally new information that is required, companies were concerned that the costs of implementation would be fairly high and might well exceed the benefits obtained. As a result of these concerns, the FASB for the first time included an extensive discussion of the costs and benefits.

Those who favored the new principles argued that knowledge of these costs is essential for rational decision making by management and that accounting includes many estimates. Also, they argued that this OPEB cost information is useful for lending and investment decisions and that such decisions are never based on certainty. Therefore, they argued that it is better for a company to record the information based on the best estimates and provide disclosures of the subjectivity of the amounts rather than to report only cash payments.

## **Differences in Funding**

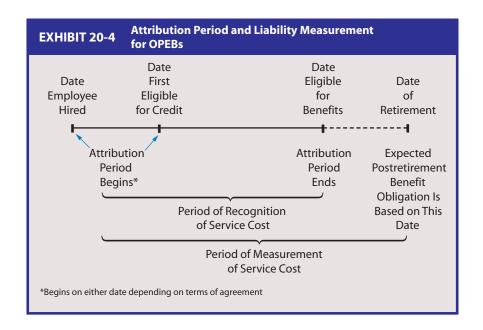

As we discussed, there are few differences between pension and OPEB accounting. However, there are some differences in the practical impacts because the OPEB plans

**10** Explain the conceptual issues regarding OPEB plans.

often are not funded. Suppose, for example, that one company has an unfunded OPEB plan that is expected to provide exactly the same cash payments to retired employees as a funded pension plan of another company. The expense for the OPEB will be higher because the expected return on plan assets is not subtracted. This difference is appropriate because the company with the unfunded OPEB will have to pay more assets in the future. However, the company with the pension plan has already paid the assets into a fund that is earning a return on those assets.

#### **Attribution Period**

Attribution is the process of assigning the cost of postretirement benefits to periods of employee service. The attribution period begins with the date of hire or the date that credit for service begins, and ends on the date that the employee is eligible for full benefits, as we show in Exhibit 20-4. Thus, the expected postretirement benefit obligation is attributed to the periods of employee service until the full eligibility date. However, the measurement of the accumulated postretirement benefit obligation at the full eligibility date is based on the benefits an employee is expected to receive and the expected retirement date. Thus, the attribution (recognition) period and the measurement period are different. Specifically, the period over which a company recognizes the service cost is based only on the period to full eligibility. However, measurement of the service cost is based on the period beyond that date to the expected retirement date.

The decision that the attribution period ends on the date the employee attains full eligibility was adopted by the FASB because it more closely follows the implicit contract between the company and the employee. Since employee service after the date of eligibility does not earn additional OPEB benefits, the FASB reasoned that a company should have recognized the expenses in full by then. However, it can be argued that this alternative follows legal form rather than economic substance, because employers expect employees to render services up to the date of expected retirement rather than only up to the date of full eligibility for the benefits.

Others argue that the attribution period should end at the expected retirement date because the company should recognize the OPEB cost over the entire employment period instead of recognizing only the interest cost after the date of eligibility. This argument is consistent with the basic exchange of retirement benefits for employee service. It follows that the use of this period is more consistent with the measurement of the expected postretirement benefit obligation, which is based on the expected retirement date. This alternative would also lower the annual expense and liability that a company accrues, thereby reducing the impact on its financial statements.

Some accountants suggest that a company should also amortize the prior service costs over the period to the expected retirement date.

#### Interaction with Deferred Income Taxes

As we discussed in Chapter 19, when a company recognizes a postretirement benefit expense for financial reporting without a related deduction for income tax reporting, it creates a temporary deductible difference. OPEBs are one of the primary causes of many companies reporting deferred tax assets.

### Impacts of the Adoption of New GAAP

Adoption of the new GAAP has had two basic effects. One is on the financial statements of companies, and the second *may* be on the retirement benefits offered by companies. As an indication of the effect on the financial statements of companies, IBM adopted the new principles in 1991 and reported a cost of \$2.26 billion on its income statement and balance sheet. The loss reduced earnings per share by about \$4 per share, and IBM recorded its first-ever quarterly loss. Note that there was no impact on its cash flows. The company's statement of cash flows included only the cash payments to retired employees (unless funding of the plan occurred). The General Accounting Office has estimated that the total liabilities of all companies to their current and retired employees for retiree health benefits is more than \$400 billion.

Although the accounting issues and their impacts on the financial statements of companies are important, the effects of GAAP on benefit plans raise some difficult social issues. These effects are more difficult to evaluate because they involve management decisions that, in turn, may be affected by the financial reporting. Many companies have cut back on their coverage of retiree healthcare benefits. For some companies, GAAP made them aware of the costs of the benefits they had promised. Others have cut back because of the rising costs of providing healthcare benefits.

You may think that it is undesirable for companies to reduce benefits. However, you must remember that GAAP does not change the benefits promised to the retirees or the cost of the healthcare involved. Most people would argue that it is desirable to force companies to realistically face the costs of their promises and to acknowledge how much they can afford. Then, if necessary, companies should reduce the benefits now rather than face financial difficulty in the future because of their inability to pay costs they have not recognized. However, any cost reductions by companies will raise the costs incurred by other entities, whether it is the individual retirees or the public through state and federal taxation.

Most companies would prefer that the funding of OPEB plans be tax-deductible, but there do not appear to be any plans to lobby Congress for this. Some people may also argue that the principles place U.S. companies at a competitive disadvantage with foreign companies.

A qualitative characteristic of accounting information is *neutrality*. Accounting information is not intended to either encourage or discourage particular decisions, such as the offering of OPEBs, their funding, their tax-deductibility, or their impact on foreign trade. Instead, its purpose is to provide useful information for those types of decisions. Accrual accounting does not change the nature, extent, or cost of the OPEB promise. However, it does require companies to report the effects of their commitments on their financial statements. This disclosure helps users understand the nature of the OPEB commitments and the ability of companies to fulfill their obligations.

There is a cost attached to implementing the accounting principles for OPEBs. Whether the benefits exceed the costs will, of course, never be known with certainty. However, the FASB, many accountants, many users of financial statements, and many company executives believe that they do.

- Postretirement benefits, or OPEBs, include all forms of benefits paid to former employees after their retirement, other than pensions. The cost of OPEBs is accrued during the periods that the employees earn the benefits by providing service.
- While the accounting for OPEBs is similar to that of pensions, two concepts should be understood:
  - The expected postretirement benefit obligation (EPBO) is the actuarial present value of the benefits a company expects to pay.
  - The accumulated postretirement benefit obligation (APBO) is the actuarial present value of the benefits attributed to employee service rendered to a specific date.
- Similar to pensions, the net postretirement benefit expense consists of service cost, interest cost (discount rate multiplied by the APBO at the beginning of the period), expected return (generally zero because the OPEB is usually not funded), amortization of prior service cost, and amortization of gain or loss.
- An OPEB liability is recorded because the amount of the postretirement benefit expense is greater than the amount funded.
- Similar to pensions, any underfunding is reported as a liability on the balance sheet.
- The cost of OPEBs is recognized over the attribution period (generally beginning with the date of hire and ending on the date the employee is eligible for full benefits). However, the APBO at the full eligibility date is measured from the date of hire to the expected retirement date.

## Appendix: Example of Present Value Calculations FOR DEFINED BENEFIT PENSION PLANS

In this chapter, we show various situations related to defined benefit pension plans in examples using assumed amounts. This Appendix explains how a company computes the amounts of several key elements. The example involves applying GAAP for the Lonetree Company, which adopted a defined benefit pension plan on January 1, 2010. The following are the relevant facts:

| 1. | Number of employees                       | 100      |
|----|---|----------|
| 2. | Years to retirement at December 31, 2010  | 30       |
| 3. | Years of life expectancy after retirement | 18       |
| 4. | Discount rate                             | 10%      |
| _  | D C. C 1                                  | A C1 . C |

5. Average of last five years' salary × Benefit formula Number of years of service  $\times$  0.02

Average of last five years' salary 6. (based on expected salary levels)

7. Annual pension benefit earned each year of service by each employee

8. Expected long-term (and actual) rate of return on plan assets

Amount funded each year 9.

Date of computation of pension expense 10. and pension funding

\$90,000 per employee

 $$90,000 \times 0.02 = $1,800$ 

8%

Equal to the annual service cost\*

December 31 each year

\*Plus one-seventh of prior service cost in 2013 and thereafter to adhere to Pension Protection Act of 2009.

Example 20-9 shows the computations of the components of pension expense for the Lonetree Company (there is no gain or loss component). Note that for simplicity we assume all employees are the same age, retire at the same time, and have the same life

11 Understand present value calculations for pensions (Appendix).

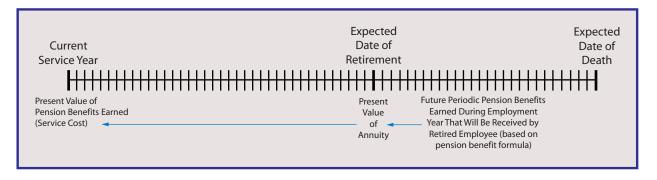

| EXAMPLE 20-9 Computation of Pension Expense |                              |   |                               |                              |                             |  |  |                                 |

- a. For current year. Annual benefits earned  $\times$  present value of annuity for period of retirement  $\times$  present value of \$1 for remaining period of employment. In 2010, \$180,000  $\times$  present value of annuity for 18 years at 10%  $\times$  present value of \$1 for 30 years at 10%. In each subsequent year, the present value of \$1 factor is reduced by 1 year. In 2013, the annual benefits earned are increased to \$189,000.
- b. At end of year. Total benefits earned to date × present value of annuity for period of retirement × present value of \$1 for remaining period of employment. In 2010, \$180,000  $\times$  present value of annuity for 18 years at 10%  $\times$  present value of \$1 for 30 years at 10%. In each subsequent year, the benefits are increased by the service cost for that year and the present value of \$1 factor is reduced by 1 year. In 2013, the benefits earned to date are increased by the prior service cost.
- c. Projected benefit obligation at end of previous year × discount rate, or 10%. In 2013, beginning projected benefit obligation is \$307,104 + \$15,355 adjustment due to amendment providing increased benefits to date.
- d. Assumed equal to the service cost; increased by \$2,194 in 2013 and 2014.
- Balance at end of previous year + actual return on plan assets + contributions payments (\$0 in this example).
- Plan assets at the end of previous year  $\times$  expected long-term rate of return (8%), rounded.
- Prior service cost  $\div$  average remaining service life of employees; \$15,355  $\div$  28 years, rounded.
- Service cost + interest cost return on plan assets + amortization of prior service cost.

expectancy after retirement, and that there are no gains or losses. The expected return on plan assets of 8% is less than the discount rate of 10% to create a liability at the time the company records the pension expense and makes the contribution. We discuss each component of the pension expense in the following sections.

## Service Cost

The service cost per employee each year is the present value of the future pension benefits earned that year by each employee. Under GAAP, a company computes this cost using the benefit/years-of-service method. We diagram the computation of the service cost for the current year as follows:

This diagram reads from right to left. Initially, the present value of the future periodic pension benefits earned during the current year is computed as of the expected date of retirement, based on the pension benefit formula, the discount rate, and the retirement period (from the expected date of retirement to the expected date of death).<sup>23</sup> Then, this present value as of the expected retirement date is discounted back to the current year (based on the discount rate and the remaining years to the date of retirement) to determine

the present value of the future pension benefits earned that year. This amount is the service cost for the current year. The equation for calculating the service cost is as follows:

```
Service Cost = Present Value of Future Pension Benefits
              Earned by Employees in the Current Period
              Annual
                          Present Value of
                                               Present Value of $1
            = Benefits × Annuity for Period × for Remaining Period
                           of Retirement
                                                 of Employment
               Earned
```

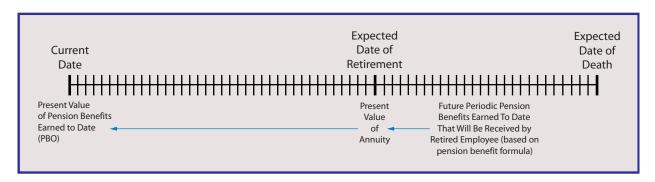

In our example, the future pension benefits earned for each year of service by each employee of the Lonetree Company under the benefit formula is \$1,800 (\$90,000  $\times$ 0.02), as we calculated earlier. These benefits are earned by each of the 100 employees and therefore the company's service cost is based on the \$180,000 ( $$1,800 \times 100$ ) of future pension benefits earned each year by the employees. The company expects each employee to receive these amounts each year during the 18 years of retirement.

At the end of 2010, we assume the remaining period of employment to be 30 years. Therefore, the Lonetree Company calculates the service cost in 2010, based on the 10% discount rate, as follows:

Each year the company makes a similar calculation, but the remaining period of employment decreases. In 2011, the present value of \$1 factor for 29 years is used, and in 2012, for 28 years, and so on.<sup>24</sup> The second column of Example 20-9 summarizes the amount of the service cost for each year resulting from this calculation process. Note that the reason for the increase in amounts is that we have assumed, for simplicity, that there is no turnover of employees at the Lonetree Company. A typical company would have employees retiring each year and would be hiring new, younger employees. Thus, the service cost might increase or decrease, depending on the characteristics of the particular employees. Note that if the Lonetree Company had selected a discount rate of 8%, the service cost in 2010 would be \$167,643 (\$180,000  $\times$  9.371887  $\times$  0.099377).

# INTEREST ON PROJECTED BENEFIT OBLIGATION

The projected benefit obligation is the actuarial present value, at a specified date, of all the benefits attributed by the pension benefit formula to employee service rendered prior to that date. We diagram the computation of the projected benefit obligation (PBO) at a particular date as follows:

<sup>24.</sup> As we discuss later, however, note that a change in the pension benefit formula in 2013 increases the annual benefits earned from \$180,000 to \$189,000. This change causes a corresponding increase (on a present value basis) in the service cost for 2013 and 2014.

This diagram also reads from right to left. The present value of the future periodic pension benefits earned to date is computed as of the expected date of the retirement, based on the pension benefit formula, the discount rate, and the retirement period. Then, this present value as of the expected retirement date is discounted back to the current date (based on the discount rate and the remaining years to the date of retirement) to determine the present value of the future pension benefits earned to date. This amount is the projected benefit obligation on the current date. Note that this diagram is similar to the one we showed for the service cost, except that it focuses on the projected pension benefits earned to date, while the service cost focuses on the future pension benefits earned in a particular year. There is a logical relationship between the two amounts, however. This is because the projected benefit obligation is the sum of the service costs to date (considering interest due to the passage of time and assuming there are no prior service costs and no employees have retired). The equation for the calculation of the projected benefit obligation is as follows:

```
Projected Benefit = Present Value of Future Pension Benefits Earned by
                    Employees to Date (based on expected salary levels)
  Obligation
                     Total
                                Present Value of
                                                      Present Value of $1
                 = Benefits × Annuity for Period × for Remaining Period
                    Earned
                                 of Retirement
                                                        of Employment
```

In our example, at December 31, 2010, the employees have earned pension benefits for one year (\$90,000  $\times$  1  $\times$  0.02  $\times$  100 employees, or \$180,000), and therefore the company calculates the projected benefit obligation as follows:

```
Projected Benefit =
                          Total
                                    Present Value of
                                                           Present Value of $1
Obligation, 12/31/10
                        Benefits ×
                                      Annuity for
                                                         for 30 Years at 10%
                                                    ×
                         Earned
                                    18 Years at 10%
                     = $180,000 \times 8.201412 \times 0.057309
                     = $84,603 (rounded)
```

At December 31, 2011, the employees have earned pension benefits for two years (\$90,000  $\times$  $2 \times 0.02 \times 100$  employees, or \$360,000), and therefore the projected benefit obligation is:

```
Present Value of
                       = $360,000 × Annuity for 18 × Present Value of $1 for 29 Years at 10%
  Projected Benefit
Obligation, 12/31/11
                                           Years at 10%
                        = \$360,000 \times 8.201412 \times 0.063039
                        = $186,123 (rounded)
```

The third column of Example 20-9 shows the amount of the projected benefit obligation at the end of each year. To determine its pension expense for each year, the Lonetree Company includes the interest cost on the projected benefit obligation. It computes this interest cost by multiplying the projected benefit obligation at the *beginning* of the year by the 10% discount rate, as we show in the fourth column of Example 20-9. Thus, in 2010 there is no interest cost included in pension expense because there was no projected benefit obligation at the beginning of the year. In 2011, the interest cost is \$8,460 (\$84,603  $\times$ 0.10), and the company includes this amount in pension expense.<sup>25</sup> Note that if any retired employees had died during the year, the projected benefit obligation would be decreased by the total of the remaining benefits no longer due the deceased employees.

## **EXPECTED RETURN ON PLAN ASSETS**

The funding of a pension plan must be within the guidelines of ERISA. Since those rules are beyond the scope of this book, in this example we assume that the company funds an amount each year that is equal to the service cost. We also assume that the company

<sup>25.</sup> As we discuss later, however, note that an amendment to the pension benefit formula in 2013 causes an increase in the projected benefit obligation. This change causes a corresponding increase in interest cost.

makes its annual contribution on December 31 of each year. Therefore, the company makes its first payment of \$84,603 to the plan on December 31, 2010, and the funding agency invests this amount in plan assets, such as bonds, stocks, and real estate. The fifth column of Example 20-9 shows the annual contribution (cash payment).

To determine its pension expense for each year, the Lonetree Company subtracts the expected return on its plan assets for that year. In 2010, no return was earned on the plan assets because the company did not make the contribution until the end of the year. In 2011, the company earns an expected return based on the plan assets available at the beginning of the year and held during the year. Thus, if we assume that the plan assets are expected to earn earn 8% per year, the expected return in 2011 is \$6,768 (\$84,603  $\times$  0.08, rounded). This amount decreases the 2011 pension expense. On December 31, 2011 (before the contribution for 2011), the total assets are \$91,371 (\$84,603 + the actual return of \$6,768). The contribution of \$93,062 on that date increases the plan assets to \$184,433. During 2012, the expected return on the assets is \$14,755 (\$184,433  $\times$  0.08), which is deducted from the 2012 pension expense. As a result, the total plan assets on December 31, 2012, after the contribution for 2012, are \$301,556 (\$184,433 +the actual return of \$14,755 + the contribution for 2012 of \$102,368). The sixth and seventh columns of Example 20-9 show the plan assets and the expected and actual return on plan assets for each year, respectively. Note that if any employees had retired, the plan assets would be reduced each year by the payments made to the retired employees.

## **AMORTIZATION OF PRIOR SERVICE COST**

Prior service cost is the cost of retroactive additional benefits granted by a company in a plan amendment or at the initial adoption of the plan. The cost causes an increase in the company's projected benefit obligation. The company recognizes the amount as a liability and a negative element of other comprehensive income. It also amortizes the prior service cost as a component of its pension expense in future years. For example, assume that on January 1, 2013, the Lonetree Company changes the factor in the benefit formula from 0.02 to 0.021, retroactive to the adoption of the plan. This action creates additional pension benefits for each employee, which the company calculates as follows:

```
Additional Benefits = Average of Last × Number of Years × Change in Formula
                     = $90,000 \times 3 \times 0.001
                     = $270
```

Since the Lonetree Company has 100 employees, the total additional benefits assigned to the employees is \$27,000 (\$270  $\times$  100 employees). It calculates the prior service cost, which is the present value of those additional benefits, as follows:

```
Prior Service Cost = Present Value of Additional Pension
Benefits Granted by Plan Amendment
                        Additional
                                         Present Value of
                                                                  Present Value of $1
                     = Benefits × Annuity for Period × for Remaining Period
                                          of Retirement
                                                                    of Employment
```

Recall that we assumed the life expectancy during retirement to be 18 years and, at the beginning of 2013, the remaining period of employment is 28 years. Therefore, the Lonetree Company calculates the prior service cost as follows:

Prior Service Cost = 
$$\frac{\text{Additional}}{\text{Benefits}} \times \frac{\text{Present Value of}}{\text{Annuity for}} \times \frac{\text{Present Value of }}{\text{for 28 Years at 10\%}}$$
  
= \$27,000 × 8.201412 × 0.069343  
= \$15,355 (rounded)

At the beginning of 2013, the company records a liability and a negative element of other comprehensive income for \$15,355. It amortizes the \$15,355 prior service cost as an element of pension expense in the current and future years, using the average remaining service life of its employees. Thus, the amortization in each year is \$548 ( $\$15,355 \div 28$ , rounded). The eighth column of Example 20-9 shows this amount for each year. The company reduces the prior service cost included in Accumulated Other Comprehensive Income by debiting the liability and crediting other comprehensive income for \$548.

### **Adjustments of Service Cost and Projected Benefit Obligation**

The amendment of the pension benefit formula at the beginning of 2013 causes not only a prior service cost, but also an increase in the projected benefit obligation and the service cost for the current and future years. The increase in the service cost causes an increase in pension expense. The increase in the projected benefit obligation also causes an increase in pension expense because of the additional interest cost. Since the company continues to fund an amount equal to the annual service cost, there is no change in the plan assets at the beginning of 2013.

The service cost in 2013 and 2014 that we show in Example 20-9 is based on annual benefits earned of \$189,000 (\$90,000  $\times$  0.021  $\times$  100 employees), instead of \$180,000. Thus, the company computes the 2013 service cost as follows:

The company makes a similar calculation in 2014 to determine the \$130,058 service cost.

The company must include the present value of the additional benefits granted in the projected benefit obligation. Since the amendment occurred on January 1, 2013, the \$307,104 projected benefit obligation on December 31, 2012 in Example 20-9 is not adjusted because it is based on the benefit formula at that time. The 2013 interest cost calculation, however, is based on the adjusted January 1, 2013 projected benefit obligation, which amounts to \$322,459 (\$307,104 + \$15,355 prior service cost). Thus, the 2013 interest cost is \$32,246 (\$322,459  $\times$  0.10).

The December 31, 2013 projected benefit obligation is based on the total benefits earned to date (after the amendment) and the company calculates it as follows:

```
Total
Benefits = $90,000 \times \text{Number of Years} \times 0.021 \times 100 \text{ Employees}
                            of Service
Earned
         = $90,000 \times 4 \times 0.021 \times 100
         = $756,000
 Projected
                              Present Value of
                                                     Present Value of $1
                Total
           = Benefits × Annuity for Period × for Remaining Period
  Benefit
Obligation
               Earned
                              of Retirement
                                                       of Employment
            = $756,000 × Present Value of Annuity × Present Value of $1
                                for 18 Years at 10%
                                                            for 27 Years at 10%
            = \$756,000 \times 8.201412 \times 0.076278
            = $472,944 (rounded)
```

The company makes a similar calculation the next year to determine the projected benefit obligation on December 31, 2014 of \$650,292.

## **JOURNAL ENTRIES**

The pension expense each year for the Lonetree Company is the service cost, plus the interest on the projected benefit obligation, minus the expected return on plan assets, plus the amortization of the prior service cost. (The gain or loss component does not occur in this example.) The company records any difference between the amount of the pension expense and the amount funded as an accrued/prepaid pension cost liability or asset. The ninth and fifth columns of Example 20-9 show the pension expense and amounts funded for the Lonetree Company, respectively. The journal entry to record the pension expense on December 31, 2010 is as follows:

| Pension Expense | 84,603 |
|-----------------|--------|
| Cash            | 84.603 |

The journal entry to record the pension expense on December 31, 2011 is as follows:

| Pension Expense              | 94,754 |
|------------------------------|--------|
| Cash                         | 93,062 |
| Accrued/Prepaid Pension Cost | 1,692  |

The company makes a similar journal entry at the end of each succeeding year, and each year the debit to Pension Expense is greater than the credit to Cash. As a result, the company's pension liability account balance at the end of each year increases as follows, before considering the effects of the prior service cost established at the beginning of 2013:

#### Accrued/Prepaid Pension Cost (Liability)

| 12/31/10 | \$ 0, or (\$84,603 - \$84,603)                |
|----------|---|
| 12/31/11 | 1,692, or $($0 + $94,754 - $93,062)$          |
| 12/31/12 | 5,549, or $($1,692 + $106,225 - $102,368)$    |
| 12/31/13 | 12,025, or (\$5,549 + \$126,906 - \$120,430)  |
| 12/31/14 | 21,984, or (\$12,025 + \$142,211 - \$132,252) |

In addition to the journal entries to record the expense and the Accrued/Prepaid Pension Cost, the Lonetree Company must also record the prior service cost on January 1, 2013, as follows:

| Other Comprehensive Income: Prior Service Cost | 15,355 |        |
|--|--------|--------|
| Accrued/Prepaid Pension Cost                   |        | 15,355 |

Each year, Lonetree Company reduces the negative element of Other Comprehensive Income as it amortizes the prior service cost, as follows:

| Accrued/Prepaid Pension Cost  | 548                   |
|-------------------------------|-----------------------|
| Other Comprehensive Income: P | rior Service Cost 548 |

The company also must determine whether the plan is underfunded as follows:

| End of<br>Year | Credit to Accrued/ Prepaid Pension Cost | Balance in<br>Accrued/<br>Prepaid<br>Pension Cost* | Projected<br>Benefit<br>Obligation | Pension<br>Plan<br>Assets | Plan Underfunding<br>(Projected Benefit<br>Obligation Minus<br>Plan Assets) |
|----------------|---|--|------------------------------------|---------------------------|---|
| 12/31/10       | \$ 0                                    | \$ 0   | \$ 84,603                          | \$ 84,603                 | \$ 0  |
| 12/31/11       | 1,692                                   | 1,692  | 186,123                            | 184,433                   | 1,690   |
| 12/31/12       | 3,857                                   | 5,549  | 307,104                            | 301,556                   | 5,548   |
| 12/31/13       | 6,476                                   | 12,025   | 472,944                            | 446,110                   | 26,834  |
| 12/31/14       | 9,959                                   | 21,984   | 650,292                            | 614,051                   | 36,241  |

<sup>\*</sup> before considering the effects of the prior service cost

At December 31, 2013, Lonetree Company has recorded \$26,832 (\$12,025 + \$15,355 -\$548) in the Accrued/Prepaid Pension Cost account. The plan is underfunded by \$26,834. Therefore, the balance in the Accrued/Prepaid Pension Cost account already reflects the underfunded status of the pension plan (the difference of \$2 is due to rounding errors). The company reports this underfunded amount as its pension plan liability, Accrued Pension Cost, on its December 31, 2013 balance sheet. The company also reports \$14,807 (\$15,355 - \$548) as a negative element of other comprehensive income for 2013 and as a negative element of accumulated other comprehensive income on its December 31, 2013 balance sheet.

On December 31, 2014, the balance in the Accrued/Prepaid Pension Cost account is \$36,243 (\$26,832 + \$9,959 - \$548), and the plan is underfunded by \$36,241 (the difference of \$2 is due to rounding errors). Therefore, the balance in Accrued/Prepaid Pension Cost account already reflects the underfunded status of the pension plan. The company reports this underfunded amount as its pension plan liability, Accrued Pension Cost, on its December 31, 2014 balance sheet. The company also reports other comprehensive income of \$548 for 2014 and \$14,259 (\$14,807 - \$548) as a negative element of accumulated other comprehensive income on its December 31, 2014 balance sheet.

## SUMMARY

At the beginning of the chapter, we identified several objectives you would accomplish after reading the chapter. The objectives are listed below, each followed by a brief summary of the key points in the chapter discussion.

- 1. **Understand the characteristics of pension plans.** A pension plan requires that a company provide income to its retired employees in return for services they provided during their employment. A defined benefit plan states the benefits to be received by employees after retirement or the method of determining such benefits. A defined contribution plan states the employer's contribution, and the future benefits are limited to the amount that can be provided by the contributions and the returns earned on the investment of those contributions.
- Explain the historical perspective of accounting for pension plans. In 1956, GAAP recommended that companies recognize pension cost on the accrual basis. These principles were changed in 1966 and required the use of the accrual method. These principles were then superceded in 1985 and again in 2006. Accounting and reporting by the funding agency administering the pension plan was established in 1985. Disclosure requirements for employers' pension plans were established in 1985, but were changed in 2003 and 2006.
- Explain the GAAP for defined benefit plans, including computing pension expense and recognizing pension liabilities and assets. Pension expense includes the service cost, plus the interest cost, minus the expected return on plan assets, plus the amortization of the prior service cost, minus or plus the amortization of the net gain or loss, which includes the effects of differences between actuarial assumptions and actual experience. The cumulative difference between the pension expense and funding is recorded as a liability or asset. The difference between the projected benefit obligation and the plan assets is recognized as a liability or asset on the year-end balance sheet.
- Account for pension plans. Record any prior service costs as an adjustment to accrued/prepaid pension cost and other comprehensive income. Compute the pension expense, given the information about the components (e.g., service cost, interest cost). Record the pension expense and funding, and record any difference as an adjustment to accrued/prepaid pension cost. Compute, record, and report any underfunding or overfunding at the end of the year. Adjust accumulated other comprehensive income for the amortization of any prior service cost.
- Understand disclosures of pension plans. The primary items a company must disclose about its pension plan(s) are listed on page 1023.
- Explain the conceptual issues regarding pension plans. The conceptual issues include the proper amount to recognize as pension expense (and when to record it), the identification and measurement of pension liabilities, and the balance sheet presentation of pension plan liabilities (or assets) by the company with the pension plan and pension plan assets by the funding agency.
- Understand several additional issues related to pension plans. Additional recording and reporting issues involve vested benefits, defined contribution plans, disclosures by funding agencies, pension legislation, pension plan settlements and curtailments, termination benefits paid to employees, multi-employer plans, and international accounting differences.
- Explain other postemployment benefit plans (OPEBs). Postemployment benefits are paid to employees after employment but before retirement. Postretirement benefits are benefits paid to employees after their retirement, other than pensions. The most important of the OPEBs is healthcare benefits.

- 9. Account for OPEB plans. Record any prior service cost as an adjustment to accrued postretirement benefit cost and other comprehensive income. Compute the postretirement benefit expense, given information about the components (e.g., service cost and interest cost). Record the postretirement benefit expense and the increase in the accrued postretirement benefit cost (liability) assuming no funding. Record the payment of retirement benefits by decreasing the accrued postretirement benefit cost. Compute, record, and report any underfunding at the end of the year. Adjust accumulated other comprehensive income for the amortization of any prior service cost.
- 10. **Explain the conceptual issues regarding OPEB plans.** The conceptual issues involve the relevance and reliability of the information, differences in funding between pensions and OPEBs, the attribution period, the interaction with deferred income taxes, and the impacts on companies of the adoption of new GAAP.
- 11. **Understand present value calculations for pensions (Appendix).** Compute the components of the pension expense based on information about the employee (e.g., expected pension benefits and years of retirement) and the funding assumptions (e.g., discount rate). Use present value of annuity and present value of \$1 calculations to determine the present values of the pension expense components.

# Answers to Real Report Questions

#### **Real Report 20-1 Answers**

- YUM! Brands has noncontributory defined benefit pension plans. These plans are funded by YUM! Brands with no contributions by the employees (noncontributory), and the retirees receive fixed benefits based on a predefined formula.
- 2. YUM! Brand's pension expense for 2007 was \$56 million (the net periodic benefit cost).
- 3. The actual return on plan assets of \$93 million was greater than the expected return of \$51 million.
- 4. At the end of 2007, the accumulated benefit obligation was \$900 million and the projected benefit obligation was \$842 million. The difference in these amounts is due to the fact that the projected benefit obligation includes projected salary increases while the accumulated benefit obligation is based on current employee salaries
- 5. YUM! Brands is in a net liability position of \$132 million for 2007. YUM! Brands reports a \$5 million noncurrent asset, a \$6 million current liability, and a \$131

- million (\$104 million + \$27 million) non-current liability on its 2007 balance sheet. This amount is equal to the unfunded projected benefit obligation: [projected benefit obligation of \$1,003 million (\$842 million + \$161 million) minus the fair value of the plan assets of \$871 million (\$732 million + \$139 million)].
- 6. The use of a lower discount rate during 2007 would increase the ending balance in the projected benefit obligation, increase the balance in the accrued pension cost, increase service cost, decrease the actuarial loss, and decrease interest cost for 2007. However, interest cost in 2008 would be higher (because of the increase in the projected benefit obligation at the end of 2007) relative to the amount that would have been reported if the discount rate were not changed.
- 7. YUM! Brands has a passive investment strategy with a targeted asset allocation of 70% equity securities and 30% debt securities, which consists primarily of investments in mutual funds.

## QUESTIONS

- **Q20-1** What is a pension plan? Explain how yearly income of retired employees is determined under a defined benefit pension plan.
- **Q20-2** Distinguish between a defined benefit pension plan and a defined contribution pension plan.
- **Q20-3** Distinguish between funded and unfunded pension plans; between contributory and noncontributory pension plans.
- **Q20-4** What is service cost? How does this differ from prior service cost?

- **Q20-5** Define *projected benefit obligation*. How does this differ from an accumulated benefit obligation?
- **Q20-6** In regard to pension plans, define *assumptions*. What is the relationship between a gain or loss and an assumption?
- **Q20-7** List and briefly define the five components of pension expense.
- **Q20-8** What is a company's accrued pension cost liability and when does it arise? What is a company's prepaid pension cost asset and when does it arise?

**Q20-9** List the disclosures a company must make for its defined benefit pension plan.

Q20-10 List the conceptual issues of importance in regard to pension expense.

**Q20-11** Conceptually, what are the five possible alternative methods for accounting for the prior service cost that arises from pension plan modifications? Which one is required by GAAP?

**Q20-12** List the conceptual issues of importance in regard to pension liabilities and pension assets.

Q20-13 List and define the potential components of pension expense.

**Q20-14** What are the five possible alternative methods of determining the extent of a company's pension plan liability? Which one is required by GAAP?

Q20-15 What is a defined contribution pension plan and what are the related accounting principles?

Q20-16 What must be included in the annual financial statements issued by a funding agency?

**Q20-17** Does GAAP specify the minimum amount that a company must pay into its pension fund each year? If not, how is the amount determined?

**Q20-18** What is a pension plan settlement? Curtailment? How should the net gain or loss from a settlement or curtailment be accounted for by a company?

Q20-19 Compare how prior service cost is treated under IFRS relative to its treatment under U.S. GAAP.

**Q20-20** What differences might one see in how defined benefit plans are reported on the balance sheet under IFRS compared to a company that uses U.S. GAAP?

**Q20-21** What are other postemployment benefits? How are they distinguished from postretirement benefits?

**Q20-22** List and briefly define the five components of OPEB expense.

Q20-23 How does accounting for other postemployment benefits differ from accounting for defined benefit pension plans?

## MULTIPLE CHOICE (AICPA Adapted)

Select the best answer for each of the following.

M20-1 The actuarial present value of all the benefits attributed by the pension benefit formula to employee service rendered before a specified date based on expected future compensation levels is the

- a. Projected benefit obligation
- b. Prior service cost
- c. Service cost
- d. Accumulated benefit obligation

Items 2, 3, and 4 are based on the following information:

Spath Company adopted a noncontributory defined benefit pension plan on January 1, 2010. Spath Company uses the benefit/years-of-service method, which results in the following information:

|                         | 2010      | 2011      |
|-------------------------|-----------|-----------|
| Service cost            | \$300,000 | \$450,000 |
| Amount funded           | 240,000   | 390,000   |
| Discount rate           | 10%       | 10%       |
| Expected rate of return | 10%       | 10%       |

The actual rate of return is equal to the expected return, and the company has not made any payments to retirees.

M20-2 What is the pension expense for the year ended December 31, 2011?

a. \$390,000 c. \$456,000 b. \$426,000 d. \$480,000 M20-3 In the journal entry to record pension expense, what is the amount of the credit entry to accrue pension cost on December 31?

|    | 2010     | 2011      |
|----|----------|-----------|
| a. | \$ 0     | \$ 60,000 |
| b. | \$60,000 | \$ 60,000 |
| c. | \$60,000 | \$ 66,000 |
| d. | \$60,000 | \$126,000 |

M20-4 As of December 31, 2011, what is the balance in the pension plan asset fund?

- a. \$456,000 b. \$630,000
- c. \$654,000 d. \$840,000

**M20-5** Which of the following is not a component of pension expense?

- a. Amount funded
- b. Service cost
- c. Expected return on plan assets
- d. Interest cost

M20-6 Davison Company has a noncontributory defined benefit pension plan for its employees. During 2010, the pension plan has a discount rate of 8%, service cost of \$98,000, plan assets as of 1/1/10 of \$432,000, and an expected return on plan assets of \$34,560. On December 31, 2010, the company contributed \$90,000 to the pension plan, resulting in a credit to Accrued/Prepaid Pension Cost of \$6,300. What is the amount of the projected benefit obligation on January 1, 2010?

- a. \$332,000
- c. \$410,750

b. \$345,600

d. \$432,000

**M20-7** On January 1, 2010, the Soloman Company changes the factor in the benefit formula from 0.02 to 0.022, retroactive to the adoption of the plan. The amendment will result in a(an)

- a. Decrease in projected benefit obligation
- b. Increase in service cost
- c. Decrease in pension expense
- d. Increase in plan assets

**M20-8** The McCollum Company amended its noncontributory defined benefit pension plan at the beginning of 2007. The prior service cost related to this amendment amounts to \$240,000. Information regarding the four participating employees is as follows:

| Employee | Expected to Retire After |
|----------|--------------------------|
| A        | Year 1                   |
| В        | Year 2                   |
| С        | Year 4                   |
| D        | Year 5                   |

Using the straight-line method, what is the amount of prior service cost to be amortized in 2010?

| a. | \$0      | c. | \$60,000 |
|----|----------|----|----------|
| b. | \$40,000 | d. | \$80,000 |

**M20-9** A company records a loss and a liability for termination benefits paid to employees when

- a. The employee accepts the offer
- b. The amount can be reasonably estimated
- c. The employee accepts the offer or the amount can be reasonably estimated
- d. The employee accepts the offer and the amount can be reasonably estimated

**M20-10** A company with a defined benefit pension plan makes all of the following disclosures except

- a. The amount of the pension expense, showing each of the components separately
- b. The estimates of contributions for the next five years
- c. The funded status of the plan
- d. The discount rate

## Review Exercises

RE20-1 Crabtree Company's pension expense for the current year is \$200,000 and the company funds \$185,000. Prepare the journal entry Crabtree Company will make on December 31.

RE20-2 Oak Company's pension expense for the current year is \$300,000 and the company funds \$327,000. Prepare the journal entry Oak Company will make on December 31.

**RE20-3** Pinecone Company has plan assets of \$500,000 at the beginning of the current year and expects to earn 12% on its plan assets during the year. Pinecone's service cost is \$230,000 and its interest cost is \$55,000. Compute Pinecone Company's pension expense for the current year.

**RE20-4** Palm Company's actuary has computed its prior service cost to be \$5,000,000. The company amortizes the prior service cost by the straight-line method over the remaining 25-year service life of its active employees. During the current year, the company also recognizes \$330,000 of service cost and \$22,000 of interest cost. Compute Palm Company's pension expense for the current year.

RE20-5 Raspberry Company's actuary has computed its prior service cost to be \$8,000,000. The company amortizes the prior service cost by the straight-line method over the remaining 20-year service life of its active employees. During the current year, the company also recognizes service cost of \$560,000 and interest cost of \$100,000. At the beginning of the year, the plan assets were \$1,500,000, and the company expects to earn 10% on its plan assets. Compute Raspberry Company's pension expense for the current year.

**RE20-6** At the end of the current year, Maple Company has a projected benefit obligation of \$439,000 for its pension plan, and the fair value of its pension plan assets is \$450,000. The company has a debit balance of \$5,000 in its Accrued/Prepaid Pension Cost account. Prepare the journal entry to adjust its Accrued/Prepaid Pension Cost account. Assume that the difference between the projected benefit obligation and the fair value of the pension plan assets is due to the actual return on plan assets being different from the expected return on plan assets. Indicate why and where (and the amount) Maple Company would report its Accrued/Prepaid Pension Cost.

RE20-7 At the end of the current year, Chelsey Company has a projected benefit obligation of \$600,000 for its pension plan, and the fair value of its pension plan assets is \$580,000. The company has a credit balance of \$32,000 in its Accrued/Prepaid Pension Cost account. Prepare the journal entry to adjust its Accrued/Prepaid Pension Cost account. Assume that the difference between the projected benefit obligation and the fair value of the pension plan assets is due to the actual return on plan assets being different from the expected return on plan assets. Indicate why and where (and the amount) Chelsey Company would report its Accrued/Prepaid Pension Cost.

**RE20-8** At the beginning of the current year, Willow Company adopts a pension plan and awards retroactive benefits to its employees. The company's actuary computes these prior service costs to be \$280,000. The company amortizes the prior service costs by the straight-line method over the remaining 14-year service life of its active employees. Prepare the journal entries to record the prior service costs and the related year-end adjusting entry for the current year.

**RE20-9** At the beginning of Year 1, Cactus Company has three employees: A, B, and C. Employee A has three expected years of future service, Employee B has four expected years of future service, and Employee C has five expected years of future serviice. Using the year-of-future-service method, compute the amortization fraction for Years 1 through 5 that Cactus Company would use to amortize its prior service cost.

RE20-10 Given the following information for Tyler Company's pension plan at the beginning of the year, calculate the corridor, excess net loss (gain), and amortized net loss (gain). Assume an average remaining service life of 15 years.

Cumulative net loss \$ 25,000 Projected benefit obligation: actual 220,000 Fair value of pension plan assets 200,000

RE20-11 Bluebird Company has an accumulated postretirement benefit obligation (prior service cost) of \$500,000 at the beginning of the year, and the average remaining service life of its employees is 20 years. The service cost for the year is \$5,000. Bluebird uses a discount rate of 8%. Given this information, calculate Bluebird Company's postretirement benefit expense for the current year.

## **E** X E R C I S E S

**E20-1** *Pension Expense* The Bailey Company has had a defined benefit pension plan for several years. At the end of 2010, the company's actuary provided the following information for 2010 regarding the pension plan: (1) service cost, \$115,000; (2) expected return on plan assets, \$14,000; (3) amortization of net loss, \$2,000; (4) interest cost on projected benefit obligation, \$16,000; and (5) amortization of prior service cost, \$4,000. The company decides to fund an amount at the end of 2010 equal to its pension expense.

#### Required

Compute the amount of Bailey Company's pension expense for 2010 and prepare the related journal entry.

**E20-2** *Pension Expense and Liability* On December 31, 2010, the Robey Company accumulated the following information for 2010 in regard to its defined benefit pension plan:

\$105,000 Service cost Interest cost on projected benefit obligation 12,000 Expected return on plan assets 11,000 Amortization of prior service cost 2,000

On its December 31, 2009 balance sheet, the company had reported an accrued/prepaid pension cost liability of \$14,000.

#### Required

- 1. Compute the amount of Robey Company's pension expense for 2010.
- 2. Prepare all the journal entries related to Robey Company's pension plan for 2010 if it funds the pension plan in the amount of: (a) \$108,000, (b) \$107,000, and (c) \$112,000.

**E20-3** Interest Cost and Return on Assets On December 31, 2010, the Palmer Company determined that the 2010 service cost on its defined benefit pension plan was \$120,000. At the beginning of 2010, Palmer Company had pension plan assets of \$520,000 and a projected benefit obligation of \$600,000. Its discount rate (and expected long-term rate of return on plan assets) for 2010 was 10%. There are no other components of Palmer Company's pension expense; the company had an accrued/prepaid pension cost liability at the end of 2009.

- 1. Compute the amount of Palmer Company's pension expense for 2010.
- 2. Prepare the journal entry to record Palmer's 2010 pension expense if it funds the pension plan in the amount of: (a) \$128,000, and (b) \$120,000.

**E20-4** Pension Expense Different Than Funding: One Year The Verna Company has had a defined benefit pension plan for several years. At the end of 2010, the company accumulated the following information: (1) service cost for 2010, \$127,000; (2) projected benefit obligation, 1/1/2010, \$634,000; (3) discount rate, 9%; (4) plan assets, 1/1/2010, \$589,000; and (5) expected long-term rate of return on plan assets, 9%. There are no other components of Verna Company's pension expense. The company had an accrued/prepaid pension cost liability at the end of 2009. The company contributed \$128,000 to the pension plan at the end of 2010.

#### Required

Compute the amount of Verna Company's pension expense for 2010 and prepare the related journal entry.

**E20-5** *Pension Expense Different Than Funding: Multiple Years* Baron Company adopted a defined benefit pension plan on January 1, 2009. The following information pertains to the pension plan for 2010 and 2011:

|                                      | 2010      | 2011      |
|--------------------------------------|-----------|-----------|
| Service cost                         | \$160,000 | \$172,000 |
| Projected benefit obligation $(1/1)$ | 120,000   | 289,600   |
| Plan assets (1/1)                    | 120,000   | 294,600   |
| Company contribution (funded 12/31)  | 165,000   | 175,000   |
| Discount rate                        | 8%        | 8%        |
| Expected long-term (and actual)      |           |           |
| rate of return on plan assets        | 8%        | 8%        |

There are no other components of Baron Company's pension expense.

#### Required

- 1. Compute the amount of Baron Company's pension expense for 2010 and 2011.
- 2. Prepare the journal entries to record the pension expense for 2010 and 2011.

**E20-6** Determination of Projected Benefit Obligation Several years ago, the Lewad Company established a defined benefit pension plan for its employees. The following information is available for 2010 in regard to its pension plan: (1) discount rate, 10%; (2) service cost, \$142,000; (3) plan assets (1/1), \$659,000; and (4) expected return on plan assets, \$65,900. There is no amortization of prior service cost, and there is no gain or loss. On December 31, 2010, the company contributed \$143,000 to the pension plan, resulting in a credit to Accrued/Prepaid Pension Cost of \$8,200.

#### Required

Compute the amount of Lewad Company's projected benefit obligation on January 1, 2010.

**E20-7** *Pension Expense Different Than Funding: Multiple Years* Carli Company adopted a defined benefit pension plan on January 1, 2009, and funded the entire amount of its 2009 pension expense. The following information pertains to the pension plan for 2010 and 2011:

|                                      | 2010      | 2011      |
|--------------------------------------|-----------|-----------|
| Service cost                         | \$200,000 | \$215,000 |
| Projected benefit obligation (1/1)   | 180,000   | 396,200   |
| Plan assets (1/1)                    | 180,000   | 406,400   |
| Company contribution (funded 12/31)  | 212,000   | 220,000   |
| Discount rate                        | 9%        | 9%        |
| Expected long-term (and actual) rate |           |           |
| of return on plan assets             | 8%        | 8%        |

There are no other components of Carli Company's pension expense.

#### Required

- 1. Compute the amount of Carli Company's pension expense for 2010 and 2011.
- 2. Prepare the journal entries to record the pension expense for 2010 and 2011.

**E20-8** *Pension Expense and Liability* Farber Company adopted a defined benefit pension plan on January 1, 2010, at which time it awarded retroactive benefits to its employees. This prior service cost amounted to \$200,000, which the company did not fund. The company planned to amortize this prior service cost in the amount of \$10,000 per year. The company determined its pension expense (which included the prior service cost amortization) to be \$75,000 for 2010, of which the company funded \$74,000. At the end of 2010, the fair value of the pension plan assets was \$74,000 and the company's projected benefit obligation was \$265,000.

#### Required

Prepare all the journal entries related to Farber Company's pension plan for 2010. Include a brief explanation for each journal entry.

**E20-9** *Pension Expense and Liability* Pitchford Company adopted a defined benefit pension plan on January 1, 2010, at which time it awarded retroactive benefits to its employees. The following information is available in regard to this plan:

Prior service cost on 1/1/10 related to retroactive benefits: \$300,000 (not funded)
Planned amortization of prior service cost: \$25,000 per year
Pension expense for 2010 (\$95,000 funded) \$105,000\*
Fair value of plan assets, end of 2010 \$95,000
Projected benefit obligation, end of 2010 \$380,000

<sup>\*</sup>Includes amortization of prior service cost

Prepare all the journal entries related to Pitchford Company's pension plan for 2010. Include a brief explanation for each journal entry.

**E20-10** *Prior Service Cost* On January 1, 2010, the Smith Company adopted a defined benefit pension plan. At that time, the company awarded retroactive benefits to its employees, resulting in a prior service cost that created a projected benefit obligation of \$1,250,000 on that date (which it did not fund). The company decided to amortize the prior service cost by the straight-line method over the 20-year average remaining service life of its active participating employees. The company's actuary has also provided the following additional information for 2010 and 2011: (1) service cost: 2010, \$147,000; 2011, \$153,000; (2) expected (and actual) return on plan assets: 2011, \$33,000; and (3) projected benefit obligation: 1/1/2011, \$1,522,000. The discount rate was 10% in both 2010 and 2011. The company contributed \$330,000 and \$350,000 to the pension fund at the end of 2010 and 2011, respectively. There are no other components of Smith Company's pension expense.

#### Required 🔤

- 1. Compute the amount of Smith Company's pension expense for 2010 and 2011.
- 2. Prepare all the journal entries related to Smith Company's pension plan for 2010 and 2011.
- 3. If the prior service cost was vested, explain how Smith Company's pension expense for 2010 would be different under IFRS

**E20-11** *Straight-Line Amortization* At the beginning of 2010, the Brent Company amended its defined benefit pension plan. The amendment entitled five active participating employees to receive increased future benefits based on their prior service. The company's actuary determined that the prior service cost for this amendment amounts to \$330,000. Employee A is expected to retire after one year, employee B after two, employee C after three, employee D after four, and employee E after five years.

#### Required

Using the straight-line method, (1) compute the average remaining service life, and (2) prepare a schedule to amortize the prior service cost.

**E20-12** Years-of-Future-Service Amortization Refer to the information provided in E20-11.

#### Required

Using the years-of-future-service method, prepare a set of schedules to determine (1) the amortization fraction for each year, and (2) the amortization of the prior service cost.

**E20-13** *Methods to Amortize Prior Service Cost* Wolz Company, a small business, has had a defined benefit pension plan for its employees for several years. At the beginning of 2010, the company amended the pension plan; this amendment provides for increased benefits based on services rendered by certain employees in prior periods. The company's actuary has determined that the related prior service cost amounts to \$140,000. The company has four participating employees who are expected to receive the increased benefits. The following is a schedule identifying the employees and their expected years of future service:

| Employee<br>Numbers | Expected Years of<br>Future Service |
|---------------------|-------------------------------------|
| 1                   | 2                                   |
| 2                   | 3                                   |
| 3                   | 4                                   |
| 4                   | 5                                   |

#### Required

- 1. Using the straight-line method, (a) compute the average remaining service life, and (b) prepare a schedule to amortize the prior service cost.
- 2. Using the years-of-future-service method instead, prepare a set of schedules to determine (a) the amortization fraction for each year, and (b) the amortization of the prior service cost.

**E20-14** *Net Gain or Loss* Lee Company has a defined benefit pension plan. During 2009, for the first time, the company experienced a difference between its expected and actual projected benefit obligation. At the beginning of 2010, the company's actuary accumulated the following information related to Lee Company's pension plan:

| Net loss $(1/1/2010)$                            | \$ 44,000 |
|--|-----------|
| Actual projected benefit obligation $(1/1/2010)$ | 228,000   |
| Fair value of plan assets $(1/1/2010)$           | 260,000   |

On December 31, 2010, the company is in the process of computing the net gain or loss to include in its pension expense for 2010. The company has determined that the average remaining service life of its employees is nine years. There was no difference between the company's expected and actual return on plan assets in 2010.

#### Required

Compute the amount of the net gain or loss to include in the pension expense for 2010. Indicate whether it is an addition to or a subtraction from pension expense.

**E20-15** *Net Gain or Loss* The actuary of the Hudson Company has provided the following information concerning the company's defined benefit pension plan at the end of 2010:

| Fair value of plan assets $(1/1/2010)$             | \$350,000 |
|--|-----------|
| Actual projected benefit obligation (1/1/2010)     | 360,000   |
| Expected projected benefit obligation $(1/1/2010)$ | 424,000   |
| Average remaining service life of employees        | 10 years  |

The difference between the actual and expected projected benefit obligation first occurred in 2009.

#### Required

- 1. Compute the amount of the gain or loss for the Hudson Company's pension plan at the beginning of 2010.
- 2. Compute the amount of the net gain or loss to include in the Hudson Company's pension expense for 2010. Indicate whether it is an addition to or a subtraction from pension expense.
- 3. If the Hudson Company is using IFRS and does not wish to use the corridor method to amortize the gain or loss, what choices does it have?

**E20-16** Accounting for an OPEB Plan On January 1, 2010, Flash and Dash Company adopted a healthcare plan for its retired employees. To determine eligibility for benefits, the company retroactively gives credit to the date of hire for each employee. The following information is available about the plan:

| Service cost Accumulated postretirement benefit obligation $(1/1/10)$      | \$ 30,000<br>100,000 |
|--|----------------------|
| Accumulated postretirement benefit obligation for employees fully eligible | 100,000              |
| to receive benefits (12/31/10)   | 40,000               |
| Expected return on plan assets   | 0                    |
| Prior service cost   | 100,000              |
| Payments to retired employees during 2010                                  | 5,000                |
| Interest rate  | 10%                  |
| Average remaining service period of active plan participants $(1/1/10)$    | 12 years             |

#### Required

- Compute the OPEB expense for 2010 if the company uses the average remaining service life to amortize the prior service cost.
- 2. Prepare all the required journal entries for 2010 if the plan is not funded.

**E20-17** *Pension Plan Present Value Calculations (Appendix)* The Ark Company adopted a defined benefit pension plan for its employees on January 1, 2010. All its employees are the same age, retire at the same time, and have the same life expectancy after retirement. The company decided to compute its pension expense on December 31 of each year; it also decided to fund an amount on that date equal to the year's service cost. The following is a listing of other relevant facts:

| Annual pension benefits earned by all employees for each year of service* | \$100,000 |
|---|-----------|
| Years to retirement (at end of 2010)                                      | 20        |
| Years of life expectancy after date of retirement                         | 15        |
| Discount rate   | 9%        |
| Expected long-term (and actual) rate of return on plan assets             | 8%        |

<sup>\*</sup>Paid at end of each year

#### Required

- 1. Prepare a schedule to compute the Ark Company's pension expense for 2010 through 2012. Round to the nearest dollar.
- 2. Prepare the year-end journal entries to record the company's pension expense for 2010 through 2012.

## **P**ROBLEMS

**P20-1** *Components of Pension Expense* The Nelson Company has a defined benefit pension plan for its employees. At the end of 2010 and 2011, the following information is available in regard to this pension plan:

|   | 2010      | 2011      |
|---|-----------|-----------|
| Expected return on plan assets                | \$ 27,000 | \$ 28,000 |
| Amortization of net gain                      | 3,000     | _         |
| Amortization of net loss                      | _         | 4,000     |
| Amortization of prior service cost            | 7,000     | 6,000     |
| Company contribution (funded 12/31)           | 220,000   | 248,000   |
| Interest cost on projected benefit obligation | 42,000    | 45,000    |
| Service cost                                  | 211,000   | 217,000   |

#### Required

- 1. Compute the amount of Nelson Company's pension expense in 2010 and 2011.
- 2. Based on the available information, prepare all the journal entries related to Nelson Company's pension plan for 2010
- 3. If the prior service cost was vested, explain how Nelson company's pension expense for 2010 would be different under IFRS.

P20-2 Pension Expense Different Than Funding On January 1, 2010, the Parkway Company adopted a defined benefit pension plan. At that time, the company awarded retroactive benefits to its employees, resulting in a prior service cost of \$2,180,000 on that date (which it did not fund). The company decided to amortize this cost by the straight-line method over the 16-year average remaining service life of its active participating employees. The company's actuary and funding agency have also provided the following additional information for 2010 and 2011:

|                                      | 2010       | 2011        |
|--------------------------------------|------------|-------------|
| Service cost                         | \$ 340,000 | \$ 348,000  |
| Projected benefit obligation (1/1)   | 2,180,000* | \$2,738,000 |
| Plan assets $(1/1)$                  | -0-        | 670,000     |
| Discount rate                        | 10%        | 10%         |
| Expected long-term (and actual) rate |            |             |
| of return on plan assets             | _          | 9%          |

<sup>\*</sup>Due to the prior service cost

The company contributed \$670,000 and \$700,000 to the pension fund at the end of 2010 and 2011, respectively. There are no other components of Parkway Company's pension expense. At the end of 2011, the projected benefit obligation was \$3,359,800 and the fair value of the pension plan assets was \$1,430,300.

- 1. Compute the amount of Parkway Company's pension expense for 2010 and 2011.
- 2. Prepare all the journal entries related to Parkway Corporation's pension plan for 2010 and 2011.
- 3. What is the total accrued/prepaid pension cost at the end of 2011? Is it an asset or a liability?

**P20-3** Pension Expense Worksheet When Turner Company adopted its defined benefit pension plan on January 1, 2010, it awarded retroactive benefits to its employees. These retroactive benefits resulted in a prior service cost of \$980,000 that created a projected benefit obligation of the same amount on that date (which it did not fund). The company decided to amortize the prior service cost using the years-of-future-service method. The company's actuary and funding agency have provided the following additional information for 2010 and 2011: (1) service cost: 2010, \$187,000; 2011, \$189,000; (2) plan assets: 1/1/2010, \$0; 1/1/2011, \$342,000; (3) expected long-term (and actual) rate of return on plan assets: 2011, 9%; (4) discount rate for both 2010 and 2011: 8%; and (5) amortization fraction for prior service cost: 2010, 80/980; 2011, 79/980. The company contributed \$342,000 and \$336,000 to the pension fund at the end of 2010 and 2011, respectively. No retirement benefits were paid in either year. There are no other components of Turner Company's pension expense. Ignore any adjustment of accumulated other comprehensive income.

#### Required **E**

Prepare a pension plan worksheet that includes the calculation of the Turner Company's pension expense for 2010 and 2011, the reconciliation of the beginning and ending projected benefit obligation for 2010 and 2011, the reconciliation of the beginning and ending plan assets for 2010 and 2011, and the journal entry to record the pension expense at the end of 2010 and 2011, indicating whether each component is a debit or credit.

**P20-4** Pension Expense Different Than Funding The Lane Company was incorporated in 2001. Because it had become successful, the company established a defined benefit pension plan for its employees on January 1, 2010. Due to the loyalty of its employees, the company granted retroactive benefits to them. These retroactive benefits resulted in \$1,240,000 of prior service cost on that date. The company decided to amortize this cost using the years-of-futureservice method. The company's actuary and funding agency have provided the following additional information for 2010 and 2011:

|   | 2010       | 2011       |
|---|------------|------------|
| Expected long-term (and actual) rate of return on plan assets | _          | 9%         |
| Amortization fraction for prior service cost                  | 48/620     | 46/620     |
| Discount rate   | 9%         | 9%         |
| Plan assets (1/1)   | \$ -0-     | \$ 690,000 |
| Projected benefit obligation (1/1)                            | 1,240,000* | 1,814,600  |
| Service cost  | 463,000    | 475,000    |

<sup>\*</sup>Due to the prior service cost

The company contributed \$690,000 and \$660,000 to the pension fund at the end of 2010 and 2011, respectively. No retirement benefits were paid in 2010 or 2011. There are no other components of Lane Company's pension expense. At the end of 2011, the projected benefit obligation was \$2,452,914 and the fair value of the pension plan assets was \$1,412,100.

#### Required

- 1. Compute the amount of Lane Company's pension expense for 2010 and 2011.
- 2. Prepare all the journal entries related to Lane Company's pension plan for 2010 and 2011.
- 3. What is the total accrued/prepaid pension cost at the end of 2011? Is it an asset or a liability?
- 4. Prepare a schedule that reconciles the beginning and ending amounts of the projected benefit obligation for 2010.

**P20-5** *Pension Expense Worksheet* The Carpenter Company adopted a defined benefit pension plan for its employees on January 1, 2010. At the time of adoption, the pension contract provided for retroactive benefits for the company's active participating employees. These retroactive benefits resulted in a prior service cost of \$1,860,000 that created a projected benefit obligation of the same amount on that date. The company decided to amortize the prior service cost by the straight-line method over the 20-year average remaining service life of the employees. The following additional information is also available for 2010 and 2011: (1) discount rate for both 2010 and 2011: 8%; (2) company contribution (funded 12/31): 2010, \$550,000; 2011, \$530,000; (3) expected long-term rate of return on plan assets: 9%; (4) actual rate of return on plan assets, 10%; (5) service cost: 2010, \$257,000; 2011, \$264,000; and (6) plan assets: 1/1/2010, \$0. The company paid pension benefits of \$30,000 each year. There are no other components of Carpenter Company's pension expense. Ignore any adjustment of accumlated other comprehensive income.

#### Required

Prepare a pension plan worksheet that includes the calculation of the Carpenter Company's pension expense for 2010 and 2011, the reconciliation of the beginning and ending projected benefit obligation for 2010 and 2011, the reconciliation of the beginning and ending plan assets for 2010 and 2011, and the journal entry to record the pension expense at the end of 2010 and 2011, indicating whether each component is a debit or credit.

**P20-6** Amortization of Prior Service Cost On January 1, 2010, the Baznik Company adopted a defined benefit pension plan. At that time, the company awarded retroactive benefits to certain employees. These retroactive benefits resulted in a prior service cost of \$1,200,000 on that date (which it did not fund). The company has six participating employees who are expected to receive the retroactive benefits. Following is a schedule that identifies the participating employees and their expected years of future service as of January 1, 2010:

| Employee | Expected Years of<br>Future Service |
|----------|-------------------------------------|
| A        | 1                                   |
| В        | 3                                   |
| C        | 4                                   |
| D        | 5                                   |
| E        | 5                                   |
| F        | 6                                   |

The company decided to amortize the prior service cost to pension expense using the years-of-future-service method. The following are the amounts of the components of Baznik Company's pension expense, in addition to the amortization of the prior service cost for 2010 and 2011:

|   | 2010      | 2011      |
|---|-----------|-----------|
| Service cost                                  | \$469,000 | \$507,000 |
| Interest cost on projected benefit obligation | 108,000   | 159,930   |
| Expected return on plan assets                | _         | 85.000    |

The company contributed \$850,000 and \$830,000 to the pension fund at the end of 2010 and 2011, respectively.

#### Required

- 1. Prepare a set of schedules for the Baznik Company to determine (a) the amortization fraction for each year, and (b) the amortization of the prior service cost.
- 2. Prepare all the journal entries related to the Baznik Company's pension plan for 2010 and 2011.

**P20-7** *Net Gain or Loss* For several years, Kent Company has had a defined benefit contribution plan for its employees. During those years, the company experienced differences between its expected and actual projected benefit obligation. These differences resulted in a cumulative net gain or loss at the beginning of each subsequent year. The following schedule summarizes the amounts related to the preceding information for the years 2010 through 2012:

| Year | Cumulative<br>Net Loss (Gain)* |
|------|--------------------------------|
| 2010 | \$25,000                       |
| 2011 | 26,000                         |
| 2012 | 36,500                         |

<sup>\*</sup> At beginning of year

The company's actuary and funding agency have also provided the following information about the company's actual projected benefit obligation and fair value of plan assets at the beginning of each year:

|      | Projected Benefit | Plan      |
|------|-------------------|-----------|
| Year | Obligation        | Assets    |
| 2010 | \$220,000         | \$200,000 |
| 2011 | 275,000           | 270,000   |
| 2012 | 320,000           | 325,000   |

The company amortizes any excess gain or loss by the straight-line method over the average remaining service life of its active participating employees. Because of a consistent pattern of employee hirings and retirements, this average service life has remained at 20 years for 2010 through 2012.

#### Required

Prepare a schedule to compute the amount of the net gain or loss to include in the Kent Company's pension expense for 2010 through 2012. Indicate whether the gain or loss is added to or subtracted from the pension expense.

P20-8 Pension Liability Adjustments In the Fisk Company's negotiations with its employees' union on January 1, 2010, the company agreed to an amendment that increased the employee benefits based on services rendered in prior periods. This resulted in an \$80,000 prior service cost that increased the projected benefit obligation of the company. Due to financial constraints, the company decided not to fund the total increase in its pension obligation at that time.

Prior to 2010, it had been the company's policy to fund only some of its pension expense each year so that the fair value of the plan assets at the end of the year was less than the year-end projected benefit obligation. As a result, the company reported an accrued/prepaid pension cost liability of \$40,000 on its December 31, 2009 balance sheet.

The company appropriately amortized the prior service cost over a 10-year service life as a component of pension expense in 2010 and 2011. The resulting pension and other information for 2010 and 2011 are as follows:

| Year | Pension<br>Expense | Company<br>Contribution <sup>a</sup> | Projected<br>Benefit Obligation <sup>b</sup> | Fair Value of<br>Plan Assets <sup>b</sup> |
|------|--------------------|--------------------------------------|--|---|
| 2010 | \$137,000          | \$125,000                            | \$579,000                                    | \$455,000                                 |
| 2011 | 152,900            | 142,000                              | 769,400                                      | 642,500                                   |

a. Funded December 31

#### Required

- 1. Prepare all the journal entries related to the Fisk Company's pension plan for 2010.
- 2. List the amounts of any accounts related to Fisk Company's pension plan to be reported on the company's December 31, 2010 balance sheet. Indicate in what sections they would be reported.
- 3. Prepare all the journal entries related to the Fisk Company's pension plan for 2011.
- 4. List the amounts of any accounts related to Fisk Company's pension plan to be reported on the company's December 31, 2011 balance sheet. Indicate in what sections they would be reported.

**P20-9** Determination of Pension Plan Amounts Various pension plan information of the Kerem Company for 2010 and 2011 is as follows:

|   | 2010      | 2011    |
|---|-----------|---------|
| Service cost                                  | \$100,000 | (j)     |
| Interest cost on projected benefit obligation | 54,000    | (g)     |
| Discount rate                                 | 9%        | 9%      |
| Amortization of prior service cost            | 4,000     | 4,000   |
| Plan assets (fair value), 1/1*                | 500,000   | 615,000 |

(Continued)

b. At year-end

| Projected benefit obligation, 1/1#<br>Expected long-term rate of return on plan assets | (a)<br>(b) | 720,000<br>11% |
|--|------------|----------------|
| Amortization of net loss   | (d)        | 700            |

\* 1/1/2012: \$762,000 #1/1/2012: \$857,800

#### Required

Fill in the blanks lettered (a) through (k). All the necessary information is listed. It is not necessary to calculate your answers in alphabetical order.

**P20-10** *Comprehensive* The Jay Company has had a defined benefit pension plan for several years. At the beginning of 2010, the company amended the plan; this amendment provided for increased benefits to employees based on services rendered in prior periods. The prior service cost related to this amendment totaled \$88,000; as a result, the projected benefit obligation increased. The company decided not to fund the increased obligation at the time of the amendment, but rather to increase its periodic year-end contributions to the pension plan.

The following information for 2010 has been provided by the company's actuary and funding agency, and obtained from a review of its accounting records:

| Projected benefit obligation (12/31)         | \$808,090 |
|--|-----------|
| Service cost                                 | 183,000   |
| Discount rate                                | 9%        |
| Cumulative net loss (1/1)                    | 64,500    |
| Company contribution to pension plan (12/31) | 200,000   |
| Projected benefit obligation $(1/1)^*$       | 513,000   |
| Plan assets, fair value (12/31)              | 698,000   |
| Accrued pension cost (liability) (1/1)       | 33,000*   |
| Expected (and actual) return on plan assets  | 48,000    |
| Plan assets, fair value $(1/1)$              | 480,000   |
| Retirement benefits paid                     | 30,000    |

<sup>\*</sup>Before the increase of \$88,000 due to the prior service cost from the amendment

The company decided to amortize the prior service cost and any excess cumulative net loss by the straight-line method over the average remaining service life of the participating employees. It has developed the following schedule concerning these 50 employees:

| Employee<br>Numbers | Expected Years of<br>Future Service* | Employee<br>Numbers | Expected Years of<br>Future Service* |
|---------------------|--------------------------------------|---------------------|--------------------------------------|
| 1-5                 | 2                                    | 26-30               | 12                                   |
| 6-10                | 4                                    | 31-35               | 14                                   |
| 11-15               | 6                                    | 36-40               | 16                                   |
| 16-20               | 8                                    | 41-45               | 18                                   |
| 21-25               | 10                                   | 46-50               | 20                                   |

\*Per employee

## Required 🔤

- 1. Compute the average remaining service life and prepare a schedule to determine the amortization of the prior service cost of the Jay Company for 2010.
- 2. Prepare a schedule to compute the net gain or loss component of pension expense for 2010.
- 3. Prepare a schedule to compute the pension expense for 2010.
- 4. Prepare all the journal entries related to Jay Company's pension plan for 2010.
- 5. What is Jay Company's total accrued/prepaid pension cost at the end of 2010? Is it an asset or liability?

**P20-11** *Comprehensive* The TAN Company has a defined benefit pension plan for its employees. The plan has been in existence for several years. During 2009, for the first time, the company experienced a difference between its expected and actual

projected benefit obligation. This resulted in a cumulative "experience" loss of \$29,000 at the end of 2009, which it recorded and which did not change during 2010. The company amortizes any excess loss by the straight-line method over the average remaining service life of its active participating employees. It has developed the following schedule concerning these 40 employees:

| Employee<br>Numbers | Expected Years of<br>Future Service* | Employee<br>Numbers | Expected Years of<br>Future Service* |
|---------------------|--------------------------------------|---------------------|--------------------------------------|
| 1-5                 | 3                                    | 21-25               | 15                                   |
| 6-10                | 6                                    | 26-30               | 18                                   |
| 11-15               | 9                                    | 31-35               | 21                                   |
| 16-20               | 12                                   | 36-40               | 24                                   |

<sup>\*</sup>Per employee

The company makes its contribution to the pension plan at the end of each year. However, it has not always funded the entire pension expense in a given year. As a result, it had an accrued pension cost liability of \$65,000 on December 31, 2009. In addition to the preceding information, the following set of facts for 2010 and 2011 has been assembled, based on infor-

mation provided by the company's actuary and funding agency, and obtained from its accounting records:

|  | 2010      | 2011      |
|--|-----------|-----------|
| Plan assets, fair value (12/31)              | \$620,500 | \$860,550 |
| Cumulative net loss $(1/1)$                  | 29,000    | 29,000    |
| Expected (and actual) return on plan assets  | 40,500    | 62,050    |
| Company contribution to pension plan (12/31) | 175,000   | 178,000   |
| Projected benefit obligation (1/1)           | 470,000*  | 686,000   |
| Discount rate                                | 10%       | 10%       |
| Service cost                                 | 169,000   | 175,000   |
| Plan assets, fair value $(1/1)$              | 405,000   | 620,500   |

<sup>\*</sup>Includes the cumulative net loss at the end of 2009.

#### Required

- 1. Calculate the average remaining service life of the TAN Company's employees. Compute to one decimal place.
- 2. Prepare a schedule to compute the net gain or loss component of pension expense for 2010 and 2011. For simplicity, assume the average remaining life calculated in Requirement 1 is applicable to both years.
- 3. Prepare a schedule to compute the pension expense for 2010 and 2011.
- 4. Prepare all the journal entries related to TAN Company's pension plan for 2010 and 2011.
- 5. What is TAN Company's total accrued/prepaid pension cost at the end of 2010? Is it an asset or liability?

**P20-12** Accounting for an OPEB Plan On January 1, 2010, the Vasby Software Company adopted a healthcare plan for its retired employees. To determine eligibility for benefits, the company retroactively gives credit to the date of hire for each employee. The service cost for 2010 is \$8,000. The plan is not funded, and the discount rate is 10%. All employees were hired at age 28 and become eligible for full benefits at age 58. Employee C was paid \$7,000 for postretirement healthcare benefits in 2010. On December 31, 2010, the accumulated postretirement benefit obligation for Employees B and C were \$77,000 and \$41,500, respectively. Additional information on January 1, 2010 is as follows:

| Employee Status | Age | Expected<br>Retirement Age | Accumulated<br>Postretirement<br>Benefit Obligation |
|-----------------|-----|----------------------------|---|
| A Employee      | 31  | 65                         | \$ 14,000   |
| B Employee      | 55  | 65                         | 70,000  |
| C Retired       | 67  | _                          | 45,000  |
|                 |     |                            | \$129,000   |

#### Required

- 1. Compute the OPEB expense for 2010 if the company uses the average remaining service life to amortize the prior ser-
- 2. Prepare all the required journal entries for 2010 if the plan is not funded.

P20-13 Pension Plan Present Value Computations (Appendix) On January 1, 2010, the Cromwell Company adopted a defined benefit plan for its employees. All the employees are the same age, retire at the same time, and have the same life expectancy after retirement. The following are the relevant facts concerning the pension plan factors and the employee characteristics:

#### **Pension Plan Factors**

#### Benefit formula

Expected average of last four years' salary

Annual pension benefit earned each year of service by each employee Date of computation of pension expense and pension funding Amount funded each year

Discount rate

Expected long-term (and actual) rate of return on plan assets

Average of last four years' salary  $\times$  Number of years of service  $\times$  0.025 \$80,000 per employee \$80,000  $\times$  0.025 = \$2,000\* December 31 Equal to annual service cost# 10% 9%

\*Paid at end of each year

#Plus one-seventh of prior service cost in 2013 and 2014

#### **Employee Characteristics**

| F ->,   |    |
|---|----|
| Number of employees                               | 60 |
| Age of employees                                  | 35 |
| Years to retirement (at end of 2010)              | 25 |
| Years of life expectancy after date of retirement | 14 |

For the years 2010 through 2014, the company experienced no net gain or loss in regard to the pension plan. On January 1, 2013, however, the company agreed to an amendment of the pension plan. This amendment changed the factor in the pension benefit formula from 0.025 to 0.03. This amendment was made retroactive to the adoption of the plan.

#### Required

- 1. Prepare a schedule to compute the Cromwell Company's pension expense for 2010 through 2014. Round to the nearest dollar.
- 2. Prepare all the journal entries related to Cromwell Company's pension plan for 2010 through 2014.
- 3. What is Cromwell Company's total accrued/prepaid pension cost at the end of 2014? Is it an asset or liability?

## CASES

## COMMUNICATION

# C20-1 Financial Reporting for a Defined Benefit Pension Plan

The Fink Company is considering establishing a defined benefit pension plan for its employees. The president of Fink Company is slightly familiar with GAAP, and understands that accounting for a defined benefit pension plan may result in certain items being included in the financial statements of the sponsoring company. The president has come to you for help in better understanding these items.

#### Required

List each item, summarize how it is calculated, and briefly explain its meaning.

#### **C20-2 Pension Cost Components**

AICPA Adapted Carson Company sponsors a single-employer defined benefit pension plan. The plan provides that pension benefits are determined by age, years of service, and compensation. Among the components that should be included in the net pension cost recognized for a period are service cost, interest cost, and expected return on plan assets.

#### Required

- 1. What two accounting issues result from the nature of the defined benefit pension plan? Why do these issues arise?
- 2. Explain how Carson should determine the service cost component of the net pension cost.

- 3. Explain how Carson should determine the interest cost component of the net pension cost.
- 4. Explain how Carson should determine the expected return on plan assets component of the net pension cost.

#### **C20-3 Pension and Future Vacation Costs**

AICPA Adapted Essex Company has a singleemployer defined benefit pension plan, and a compensation plan for future vacations for its employees.

#### Required

- 1. Define the interest cost component of net pension cost for a period. Explain how Essex should determine the interest cost component of its net pension cost for a period.
- 2. Define prior service cost. Explain how Essex should account for prior service cost.
- 3. What conditions must be met for Essex to accrue compensation for future vacations? Explain the theoretical rationale for accruing compensation for future vacations.

### **C20-4 Conceptual Issues**

In the chapter, the conceptual issues related to pension expense, pension liabilities, and pension plan assets are discussed.

#### Required

Explain how GAAP resolves each of these three conceptual issues.

#### **C20-5** Other Postemployment Benefits

Companies often provide their employees with postemployment benefits other than pensions. These benefits may include health insurance, life insurance, and disability benefits.

#### Required

Explain how the accounting for these other postemployment benefits is similar or dissimilar to accounting for pensions.

#### CREATIVE AND CRITICAL THINKING

#### C20-6 Income Smoothing

Generally, accounting principles do not support the concept of income smoothing (the avoidance of year-to-year fluctuations in the amount of income). A friend of yours, however, after studying GAAP, claims, "Pension accounting includes income smoothing."

#### Required

Describe the methods by which GAAP avoids year-to-year fluctuations in the amount of pension expense.

#### **C20-7** Pension Issues

The MacAdams Company had engaged in large amounts of R&D to develop a new product that would put the company ahead of its Japanese competition. As a result, the company's profits were severely reduced and the president was concerned about the possibility of a takeover by a European competitor. The president was discussing the situation with the controller and said, "Your accounting principles make me so mad. Here we are working hard to develop a product to beat the rest of the world and you won't let me treat any of those costs as an asset."

The controller replied, "I understand your frustration. And please remember they are not 'my' principles."

"I know," responded the president. "Do you have any suggestions?"

"Well," the controller replied, "we can't adjust R&D expense, but we can reduce our pension expense. One easy way to increase our profits would be for the board of directors to vote to increase the discount rate used for computing the present values and to increase the expected rate of return on plan assets. Both of those would have the effect of reducing the pen-

"Great idea. I will have to remember that when it is time for the year-end bonuses."

Write a short report evaluating the controller's suggestion.

#### C20-8 OPEB Issues

"Will it cost your company your company? Ready for one of the most difficult challenges ever to confront corporate America? One that is estimated to cost up to \$400 billion. New FASB regulations will force companies to measure and post as a debit their health expense obligation to current and future retirees. . . . We'll help you minimize the financial impact of these regulations and still enable you to remain responsive to the benefit needs of employees." (Excerpts from an advertisement by CIGNA, a large insurance company.)

"Forget about retiring with all-expenses-paid health care from your employer. About 65% of U.S. companies have reduced benefits. Some have asked retirees to pay more of the costs, while others have eliminated the plans altogether. Blame soaring medical expenses and a new accounting rule that requires companies to post long-term retiree medical benefits as liabilities on their balance sheets." (Adapted from Business Week, August 24, 1992, p. 39.)

#### Required

- 1. Critically evaluate the content of the advertisement.
- 2. Explain why companies may have reduced benefits when they adopted new GAAP.

#### **C20-9** Analyzing Coca-Cola's Postemployment **Benefit Disclosures**

Refer to the financial statements and related notes of the Coca-Cola Company in Appendix A of this book. Answer each of the questions for (a) the company's pension benefits and (b) the company's other benefits.

#### Required

- 1. How much is the company's expense in 2007?
- 2. How much are the company's actual and expected return on plan assets?
- 3. How much is the benefit obligation at December 31, 2007?
- 4. Is each plan in a net asset or liability position at December 31, 2007?
- 5. Conceptually, what were the effects of the increase in the discount rate in 2007 on the amounts disclosed by the company (no calculations are required)?

#### C20-10 Ethics and Pensions

You are an accountant for the Lanthier Company. The president of the company calls you into the office and says, "We have to find a way to reduce

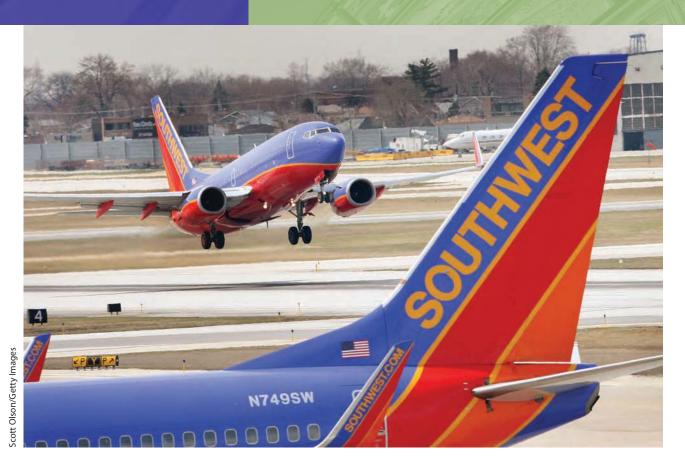

our pension costs. They are too high and they are making us uncompetitive against our foreign competitors whose employees have state-funded pensions. I think we might have to abandon our defined benefit plan, but I know the employees would not be happy about that. I was also thinking that perhaps we could raise the discount rate we use up to the high end of the acceptable range. I also think we need a trustee who will pursue a more aggressive investment strategy for the pension funds; that way we can raise our expected rate of return."

#### Required

From financial reporting and ethical perspectives, discuss the issues raised by this situation.

# Accounting for Leases

After reading this chapter, you will be able to:

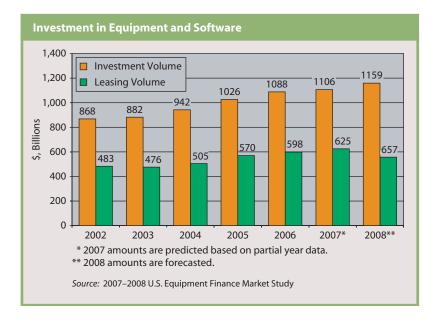

- **1** Explain the advantages of leasing.
- 2 Understand key terms related to leasing.
- **3** Explain how to classify leases.
- 4 Account for a lessee's operating and capital leases.
- **5** Understand disclosures by the lessee.
- 6 Account for a lessor's operating, direct financing, and sales-type leases.
- **7** Understand disclosures by the lessor.
- 8 Explain the conceptual issues regarding leases.
  - **9** Understand lease issues related to real estate, sale-leaseback issues, leveraged leases, and changes in lease provisions (Appendix).

# Leasing—An Important Driver of the Economy

Leasing is an increasingly popular way to acquire the use of assets. Businesses lease many different assets including office equipment, medical equipment, and manufacturing machinery. Without the ability to lease, companies would find it more difficult to acquire the necessary equipment which, in turn, would adversely affect business and economic growth. Attempting to capture the impact of equipment leasing on the U.S. economy, a 2007 study prepared for the Equipment Leasing and Finance Foundation estimates the size of the equipment lease market at \$625 billion

with growth projections of approximately 5%. Clearly, the impact of leasing on our economy is significant.

One industry which has historically used leasing to acquire assets is the airline industry. For example, **Southwest Airlines** leases approximately 20% of its aircraft through operating leases and paid over \$469 million in rental expense in 2007. Why would a company choose to enter into an operating lease? First, the leased asset and the related obligation do not appear on the balance sheet. For Southwest, this unrecorded liability related to operating leases was over \$2.3 billion. By not recording the leased property and the related obligation, Southwest was able to show a

more favorable debt ratio and return on assets than it otherwise would have shown. Second, even though Southwest had to record rental expense related to the leased airplanes, in general, companies with operating leases report less interest, higher income, and more favorable returns on equity than companies with capital leases. These financial reporting advantages are considered critical to many companies.

However, airlines are not the only industry in which leasing is popular. As many companies acquire information technology, they are faced with a decision to lease or buy. To avoid expensive, long-term commitments in an industry for which rapid obsolescence is a problem, many companies are taking a conservative approach to information technology expenditures and turning to leasing.

Many companies choose to lease an asset rather than to purchase it. GAAP defines a lease as "an agreement conveying the right to use property, plant, or equipment (land or depreciable assets or both) usually for a stated period of time." A lease involves a lessee and a lessor. A lessee acquires the right to use the property, plant, and equipment; a lessor gives up the right.

There are many kinds of leases: short-term, long-term, personal property, real property, cancelable, noncancelable, two-party, three-party, and others. Since it is a contractual agreement, the parties can include in the lease contract any provision that they desire. Many kinds of assets are leased. Among the most popular are cars, photocopiers, computers, airplanes, railroad boxcars, and buildings.

This chapter focuses on long-term noncancelable leases involving depreciable property such as equipment, machinery, and trucks. We discuss the lease of real property (land, buildings, and other items attached to the land) and certain other specialized lease issues in the Appendix to this chapter.

## ADVANTAGES OF LEASING

The primary disadvantage of leasing is that it is usually more expensive in the long run to lease than to buy. However, for many companies the advantages of leasing outweigh the disadvantages.

1 Explain the advantages of leasing.

## Advantages of Leasing from Lessee's Viewpoint

From the lessee's point of view, the advantages may include:

- 1. Financing benefits
  - a. The lease provides 100% financing, so that the lessee acquires the asset without having to make a down payment.
  - b. The lease contract contains fewer restrictive provisions and is more flexible than other debt agreements.
  - The leasing arrangement creates a claim that is against only the leased equipment and not against all assets.
- 2. Risk benefit. The lease may reduce the risk of obsolescence, so that the risk is borne by the lessor.
- 3. Tax benefit. By deducting lease payments, the lessee can write off the full cost of the asset, including the part that relates to land. Also, the tax deduction may be accelerated, because it is often spread over the period of the lease rather than the actual economic life of the property.
- 4. Financial reporting benefit. For operating leases the lease does not add a liability or asset to the lessee's balance sheet. Therefore, it does not affect certain financial ratios, such as ratios using debt, and the rate of return. As a result, these ratios tend to be "better" because the leased asset and liability are omitted from the balance sheet. In particular, omitting the liability from the balance sheet may add to the perceived borrowing capacity of the lessee.
- 5. Billing benefit. For certain contract-type work, leasing may permit the contractor to charge more because the interest element contained in the rental payments is allowed as a contract charge, whereas interest on borrowed money to purchase assets usually is not.

Advantage number 4 is critical to some companies. Some leases (called "capital leases") enable lessees to acquire substantially all the risks and benefits associated with asset ownership. If a company can, in substance, acquire an asset without recording it or the liability in its accounts (an "operating" lease), it can greatly improve certain key ratios. The company would be using "off-balance-sheet financing."

<sup>&</sup>quot;Accounting for Leases," FASB Statement No. 13 (Stamford, Conn.: FASB, 1976) par. 1 (FASB Cod. Glossary).

#### **Example: Purchasing versus Leasing**

Assume that in 2010, two identical companies, A and B, have the following financial data prior to any new acquisitions:

| Current assets         | \$2,100,000 |
|------------------------|-------------|
| Noncurrent assets      | 2,900,000   |
| Current liabilities    | 1,000,000   |
| Noncurrent liabilities | 1,600,000   |
| Stockholders' equity   | 2,400,000   |

On December 31, 2010 Company A purchases equipment with a 10-year life, at a cost of \$2,825,112. The company signs a 10-year, 12% note requiring \$500,000 to be paid at the end of each year, starting on December 31, 2011. The payments include interest at 12% on the beginning-of-year principal balance. The remainder of each annual payment reduces the principal. Since this transaction is a purchase by the issuance of debt, Company A records the asset purchased and the note payable (part of which is a current liability). Company A's financial data show these changes:

- noncurrent assets increase to 5,725,112 (2,900,000 + 2,825,112);
- current liabilities increase to \$1,446,429 (\$1,000,000 + the present value of \$500,000 discounted for one year at 12%); and
- noncurrent liabilities increase to \$3,978,683 (\$1,600,000 + \$2,825,112 current amount of \$446,429).

The remaining items do not change. Considering these changes, note the effect on two balance sheet ratios of Company A:

|                                       | Before Acquisition | After Acquisition |
|---------------------------------------|--------------------|-------------------|
| Current ratio (ratio of current       |                    |                   |
| assets to current liabilities)        | 2.10               | 1.45 <sup>a</sup> |
| Ratio of debt to stockholders' equity | 1.08               | 2.26 <sup>b</sup> |

- a. Current assets of \$2,100,000 divided by current liabilities of \$1,446,429 (\$1,000,000 + \$446,429)
- b. Debt of \$5,425,112 (\$1,446,429 + \$3,978,683) divided by stockholders' equity of \$2,400,000

The current ratio falls significantly, thus perhaps affecting the willingness of a bank to make a short-term loan. The ratio of debt to stockholders' equity more than doubles. This may affect the perceptions of long-term creditors or stockholders as to the risk of the company. These adverse changes, coupled with the impact that the purchase has on the rate of return on investment in 2011, might impair Company A's borrowing capacity or its ability to sell stock.

Next assume that at the end of 2010, Company B leases identical equipment, agreeing to pay \$500,000 rent each year for the next 10 years. If the interest rate is 12%, then the present value of 10 payments of \$500,000 discounted at 12% is \$2,825,112 (\$500,000  $\times$ 5.650223).2 If Company B classifies the lease as a capital lease, it records an asset and a liability and the effects on its balance sheet are the same as the effects of the purchase on Company A's balance sheet. However, if the lease is classified as an operating lease, Company B does not record an asset or a liability. The current ratio after the lease remains at 2.10-to-1 and the ratio of debt to stockholders' equity remains at 1.08-to-1. Also, the rate of return on investment in 2011 (assuming that plant expansion was profitable) is significantly higher than for Company A, even though Company B acquires equipment identical to that acquired by Company A.

In summary, two virtually identical economic events are reported very differently in the financial statements of the two companies. Today, many companies lease certain assets, but some prefer to structure the lease agreement to avoid capitalizing the lease payments (where required by GAAP) because of the impact that reporting the asset and liability on the balance sheet has on key ratios. ♦

<sup>2.</sup> The present value calculations in this chapter use factors from the tables in the Time Value of Money module.

The preceding discussion is based on the lessee's point of view. The opposite effect occurs in regard to the lessor. Thus, for an operating lease, the asset remains on the lessor's balance sheet. The lessor also recognizes rent revenue periodically, usually at an amount equal to the amount of the rent receipts. For a capital lease, the lessor treats the asset as "sold" and records the related receivable. These alternatives affect significant ratios of the lessor.

## Advantages of Leasing from Lessor's Viewpoint

From the lessor's point of view, the chief advantages are that leasing provides (1) a way of indirectly making a sale, and (2) an alternative means of obtaining a profit opportunity in a transaction that enables the lessor company to transfer an asset by the lease agreement. This transfer also permits the lessor to earn a rate of return in the form of interest on the selling price of the leased asset.

# **KEY TERMS RELATED TO LEASING**

GAAP defines a number of terms that are used in leasing arrangements. We list these terms in Exhibit 21-1 because they are necessary for an understanding of accounting for leases.<sup>3</sup> You should study the terms now and carefully review each one as we introduce it in the chapter.

2 Understand key terms related to leasing.

## CLASSIFICATION OF LEASES

We discuss the classification and accounting for leases using the example of equipment. We summarize the variations involving real property (land, buildings, and other property attached to the land) in the Appendix to this chapter.

The basic concept of GAAP is that a lease that transfers substantially all the risks and benefits of ownership is in substance a purchase by the lessee and a sale by the lessor and is a capital lease. A lease that does not transfer substantially all the risks and benefits of ownership is an operating lease. Using the concept of economic substance over legal form (as we discussed in Chapters 5 and 18), a transaction that transfers substantially all the risks and benefits of ownership is an asset acquisition and a liability incurrence by the lessee. For the lessor, it is either a sale of an asset and the creation of a financing instrument (a sales-type lease) or just the creation of a financing instrument (a direct financing lease). GAAP provides criteria for determining the classification of leases by both the lessee and the lessor, as we show in Exhibit 21-2. We list the criteria that relate to the transfer of the risks and benefits of ownership in Column A. We list the criteria that relate to revenue recognition in Column B.

By using the criteria we show in Exhibit 21-2, a lessee classifies a lease as one of two types: (1) capital lease, or (2) operating lease. A lease that meets any one of the four criteria listed in Column A of Exhibit 21-2 is a capital lease for the lessee. Since the transfer of substantially all the risks and benefits of ownership is considered to have occurred, the lessee treats the lease as, in substance, a purchase of an asset and the creation of an accompanying liability. If the lease meets none of the four criteria, a transfer of the risks and benefits is considered not to have occurred, making the lease an operating lease. In this case, the lessee does not recognize an asset or a liability.

By using the criteria listed in Exhibit 21-2, a lessor classifies a lease as one of three types: (1) sales-type lease, (2) direct financing lease, or (3) operating lease. A lease that meets any one of the four criteria listed in Column A and both criteria in Column B of Exhibit 21-2 is either a sales-type or a direct financing lease for the lessor. The lease is a sales-type lease if it results in a manufacturer's or dealer's profit (or loss). Otherwise, it is a direct financing lease. Since the transfer of the risks and benefits of ownership has occurred and the revenue recognition criteria are met, the lessor treats the lease as a sale of an asset and the creation of an accompanying receivable. The lease is an operating lease only if the lease meets none of the four criteria 3 Explain how to classify leases.

#### EXHIBIT 21-1 Key Terms Related to Leasing

Bargain purchase option. A provision allowing the lessee to purchase the leased property at the end of the life of the lease at a price so favorable that the exercise of the option appears, at the inception of the lease, to be reasonably assured.

**Bargain renewal option.** A provision allowing the lessee to renew the lease for a rental that is so favorable that the exercise of the option by the lessee appears, at the inception of the lease, to be reasonably assured.

Estimated economic life of leased property. Regardless of the lease term, the estimated remaining period during which the property is expected to be usable for the purpose that was intended at the inception of the lease, with normal repairs and maintenance.

**Estimated residual value of leased property.** The estimated fair value of the leased property at the end of the lease term. (Note that this value is a different concept from the estimated residual value at the end of the economic life of the property.)

Executory costs. Ownership-type costs, such as insurance, maintenance, and property taxes. These costs may be paid either by the lessor or the lessee. Normally, it is expected that the cost should be borne by the party to the contract who controls the asset essentially in the manner of an owner.

Fair value of leased property. The price that would be received to sell the property in an orderly transaction between market participants that are independent of the lessor. If the lessor is a manufacturer or dealer, the fair value of the property at the inception of the lease is normally the selling price. If the lessor is not a manufacturer or dealer, the fair value is usually the cost of the asset to the lessor.

Guaranteed residual value. The portion of the estimated residual value of the leased property that is guaranteed by the lessee or by a third party unrelated to the lessor.

Inception of the lease. The date of the lease agreement; or, if the leased property is being constructed, the date that title passes to the lessor.

**Initial direct costs.** Costs incurred by the lessor to originate a lease that (1) result directly from acquiring that lease, and (2) would not have been incurred had that leasing transaction not occurred. These costs also include costs directly related to specified activities performed by the lessor for that lease, such as evaluating the lessee's financial condition, negotiating lease terms, preparing and processing lease documents, and closing the transaction.

Interest rate implicit in the lease. The interest (discount) rate that, when applied on a present value basis to the sum of the minimum lease payments and any unquaranteed residual value accruing to the lessor, causes the resulting total present value to be equal to the fair value of the leased property to the lessor.

Lease receivable. The sum of the undiscounted (1) minimum lease payments plus (2) any unquaranteed residual value accruing to the benefit of the lessor at the end of the lease. Sometimes called *gross investment in the lease*. Lease term. The fixed, noncancelable term of the lease plus (1) any periods covered by bargain renewal options, (2) any periods for which failure to renew the lease imposes a significant penalty on the lessee, (3) any periods covered by ordinary renewal options preceding the exercise date of a bargain purchase option, and (4) any periods during which the lessor has the option to renew or to extend the lease. The lease term, however, in no case extends beyond the date a bargain purchase option becomes exercisable.

Lessee's incremental borrowing rate. The rate that, at the inception of the lease, the lessee would have incurred to borrow, over a similar term, the cash necessary to purchase the leased property.

Manufacturer's or dealer's profit or loss. This profit or loss is the difference between the following two items: (1) the fair value of the property at the inception of the lease, and (2) the cost or carrying amount of the leased asset. Minimum lease payments. These are the payments that are required to be paid by the lessee to the lessor over the life of the lease. Specifically, for a lease that contains a bargain purchase option, the minimum lease payments include (1) the minimum periodic payments required by the lease over the lease term, and (2) the payment required by the bargain purchase option. Otherwise, the minimum lease payments include (1) the minimum periodic payments plus (2) any guaranteed residual value, and (3) any payments on failure to renew or extend the lease. Executory costs are not included in minimum lease payments.

Unguaranteed residual value. The portion of the estimated residual value of the leased property that is not guaranteed by the lessee or by a third party unrelated to the lessor.

Unreimbursable cost. These costs may include commitments by the lessor to guarantee performance of the leased property that is more extensive than the typical product warranty, or to effectively protect the lessee from obsolescence of the leased property. However, estimating executory costs such as insurance, maintenance, and taxes to be paid by the lessor does not by itself constitute an important uncertainty.

> or fails one of the revenue recognition criteria. In this case, the lessor does not recognize a sale or a receivable, and the leased asset remains on its balance sheet along with the related depreciation on its income statement. We summarize the criteria and alternative classifications

in Exhibit 21-3 using a flow chart. Exhibit 21-7 includes a summary of the GAAP used by the lessee and lessor.

#### EXHIBIT 21-2 Classification of Leases Involving Personal Property

I. General criteria for classifying leases

#### Column A Criteria Applicable to Both Lessee and Lessor

- A. The lease transfers ownership of the property to the lessee by the end of the lease term.
- B. The lease contains a bargain purchase option.
- C. The lease term is equal to 75% or more of the estimated economic life of the leased property.a
- D. The present value of the minimum lease payments is equal to 90% or more of the fair value of the leased property to the lessor.a

#### Column B **Criteria Applicable to Lessor Only**

- A. The collectibility of the minimum lease payments is reasonably assured (i.e., predictable).
- B. No important uncertainties surround the amount of unreimbursable costs yet to be incurred by the lessor under the the lease.

- II. Classification by the lessee
  - A. Capital lease. Lease that meets one or more of the criteria in Column A (Part I).
  - B. Operating lease. Lease that does not meet any of the criteria in Column A (Part I). In other words, all leases other than capital leases are operating leases.
- III. Classification by the lessorb
  - A. Sales-type lease. Lease that meets these three criteria:
    - 1. One or more of the four criteria listed in Column A (Part I), and
    - 2. Both of the criteria listed in Column B (Part I), and
    - 3. It must result in a manufacturer's or dealer's profit (or loss) to the lessor. A profit (loss) exists when the fair value of the leased property at the inception of the lease is greater (less) than its cost or carrying value.
  - B. Direct financing lease. Lease that meets these three criteria:
    - 1. One or more of the four criteria listed in Column A (Part I), and
    - 2. Both of the criteria listed in Column B (Part I), and
    - 3. It must not result in a manufacturer's or dealer's profit (or loss) to the lessor.
  - C. Operating lease. Lease that meets none of the criteria in Column A (Part I) or that does not meet both of the criteria in Column B. In other words, all leases other than salestype or direct financing leases are operating leases.
- a. Items C and D do not apply if the beginning of the lease term falls within the last 25% of the total estimated economic life. This qualification was added by the FASB to prevent the possible manipulation of the kinds of leases that may result from renewal options. For example, without this qualification, for a machine having an estimated useful life of 25 years and placed under five successive 5-year leases, the first four leases would be classified as operating leases and the last lease would be classified as a capital lease.
- b. A fourth type of lease, from the lessor's viewpoint, is the leveraged lease. This type of lease is a special three-party lease which we discuss in the Appendix to this chapter.

# **OUICK CHECK 21-1**

- Compared to buying, leasing is usually more expensive in the long run; however, many companies choose to lease because of benefits related to less costly financing, reduced risk, lower taxes, off-balance-sheet financing, or higher billing rates.
- From the lessor's viewpoint, the benefits of leasing may be the ability to indirectly make a sale and earn additional profit (interest) on the leased asset.

- The underlying concept used in classifying leases is based on substance over form:
  - A lease that transfers substantially all the risks and benefits of ownership is a capital lease and is accounted for as a purchase by the lessee and as a sale by the lessor.
  - A lease that does not transfer substantially all of the risks and benefits of ownership is an operating lease and is accounted for as a rental agreement.
- If a lease meets one of the four criteria in column A of Exhibit 21-2, the lessee classifies the lease as a capital lease and records an asset and a related liability; otherwise the lessee classifies the lease as an operating lease.
- If the lease meets one of the four criteria in column A of Exhibit 21-2 and both criteria in column B of Exhibit 21-2, the lessor classifies the lease as a:
  - Sales-type lease if the fair value of the leased property at the inception of the lease differs from its cost or carrying value (profit or loss exists), or a
  - Direct financing lease if there is no manufacturer's or dealer's profit or loss at the inception of the lease.

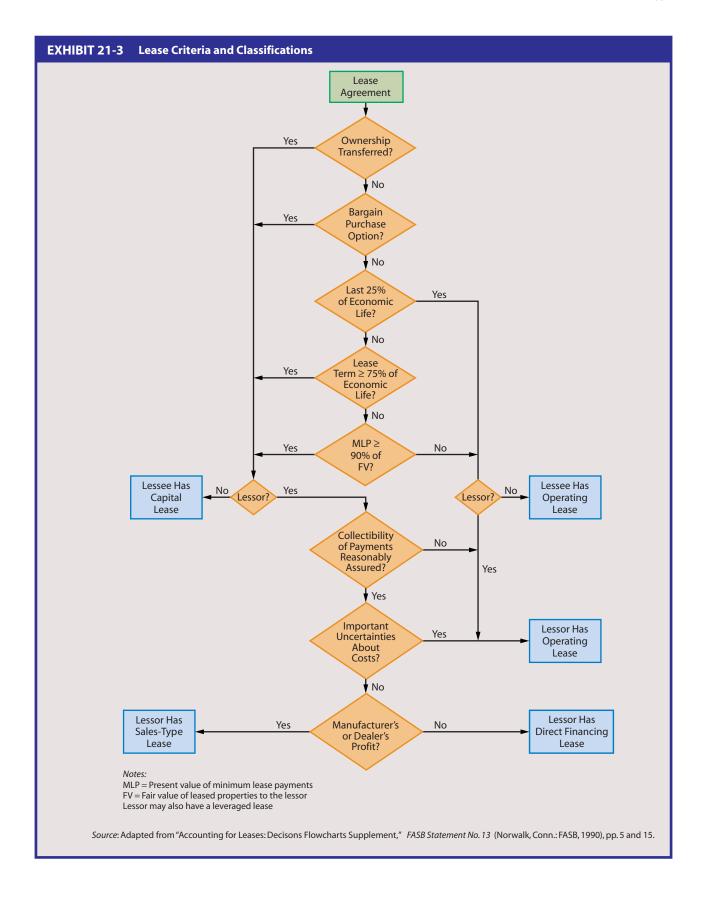

Otherwise, the lessor classifies the lease as an operating lease.

# ETHICAL DILEMMA

Save-A-Lot, Inc., is a national retailer that specializes in selling a variety of household products at low cost. As a former auditor assigned to the Save-A-Lot audit, you were recently approached to become the controller for the company. After accepting the position, you began a review of several areas of operating risk faced by the company. During this review you noted that the company made extensive use of operating leases for its 3,000 retail stores as well as the majority of its property, plant, and equipment. During a meeting with the CFO to discuss this issue, the CFO stated that the company, like many retailers, has chosen to lease many of its assets due to the advantages of leasing. In particular, the CFO stated that the financial reporting benefits are particularly attractive. If the company were forced to record an asset and liability for the assets currently under operating leases, its debt ratio would be so adversely affected that the company would face considerable difficulty in attempting to obtain debt financing, putting the future of the company in considerable doubt. While you understand these benefits, you are particularly concerned that many of Save-A-Lot's operating leases for its more profitable stores will soon expire. Based on your knowledge of the real estate markets in these areas, you question whether the company will be successful in renewing the leases. The CFO stated that the renewals will not be a problem because she has personally executed side agreements for all of the company's operating leases that will require Save-A-Lot to renew the leases indefinitely. If these side agreements were included in the original lease agreements, the company would be forced to classify the leases as capital leases. However, by having the renewal option contained in a separate contract, the company is able to classify the leases as operating leases.

You are shocked by this admission. When you audited Save-A-Lot, you personally reviewed the lease documents and were never made aware of the side agreements. If you had been aware of their existence, you certainly would have insisted that the two contracts were, in substance, one contract and demanded that the company reclassify the leases as capital leases. To insist at this point that the company reclassify the leases would most certainly cost you your current job with Save-A-Lot, and the fact that you never discovered these side agreements may lead others to perceive you as an incompetent auditor which would make finding another job extremely difficult. What course of action do you take?

**4** Account for a lessee's operating and capital leases.

## ACCOUNTING AND REPORTING BY A LESSEE

We include examples of accounting for leases by the lessee in this section. We will discuss accounting for leases by the lessor later in the chapter.

## **Example: Operating Lease (Lessee)**

Assume that a lease agreement signed between the User Company and the Owner Company contains the terms and provisions we list in Example 21-1. The lease does not transfer ownership or provide a bargain purchase option, and the lease term is 50% of the economic life. In addition, the present value of the minimum lease payments is \$201,867, which is only 67% of the fair value of the property. Therefore, this lease is an operating lease for the lessee because it does not meet any of the four criteria from Exhibit 21-2 (column A) (i.e., the risks and benefits are not transferred to the lessee), as we summarize in Example 21-2.

#### Terms and Provisions of Lease Agreement Between Owner Company **EXAMPLE 21-1** (Lessor) and User Company (Lessee) Dated January 1, 2010

- 1. The lease term is five years. The lease is noncancelable and requires equal payments of \$50,000 at the beginning of each year.
- 2. The cost, and also fair value, of the equipment to the Owner Company at the inception of the lease is \$300,000. The equipment has an estimated economic life of 10 years and has a zero estimated residual value at the end of this time.
- 3. There is no guarantee of the residual value by the User Company.
- 4. The Owner Company agrees to pay all executory costs.
- 5. The equipment reverts to the Owner Company at the end of the five years. That is, the lease contains no bargain purchase option and no agreement to transfer ownership at the end of the lease.
- 6. The User Company's incremental borrowing rate is 12.5% per year.
- 7. For the Owner Company, the interest rate implicit in the lease is 12%.
- 8. The present value of an annuity due (in advance) of five payments of \$50,000 each at 12% is  $$201,867 (4.037349 \times $50,000 = $201,867.45).$

| EXAMPLE 21-2 | Application of Lease Classification Criteria by User (Lessee) |
|--------------|---|
|              |   |

| Classification Criteria   | Criteria Met? | Remarks   |
|---|---------------|---|
| 1. Transfer of ownership at end of lease  | No            |   |
| 2. Bargain purchase option  | No            |   |
| <ul><li>3. Lease term is 75% or more of economic life</li><li>4. Present value of minimum lease payments is</li></ul> | No            | It is 50% (5 years ÷ 10 years)  |
| 90% or more of fair value   | No            | The present value is<br>\$201,867.45, or 67% of<br>the \$300.000 fair value |

Decision: A capital lease must meet one or more of the classification criteria; otherwise the lease is an operating lease.

Conclusion: The lease is an operating lease. It does not meet any of the criteria.

The only journal entry recorded by the User Company is the following, which it makes each year on January 1, 2010 through 2014.

Rent Expense 50,000

50,000 Cash

If User Company prepares monthly or quarterly interim statements, it reports the unexpired portion of the expense as an asset, Prepaid Rent. User Company does not report the rented equipment in its balance sheet; however, it discloses the future minimum

rental payments and other information in the notes to its financial statements, as we discuss at the end of this section. •

## **Capital Lease (Lessee)**

When equipment is leased under a capital lease (i.e., the risks and benefits are transferred to the lessee), the lessee records an asset and a liability equal to the sum of the present value, at the beginning of the lease term, of the minimum lease payments during the lease term.<sup>4</sup> In accounting for the asset and liability, the lessee must consider the executory costs, the discount rate, amortization of the leased asset, and reduction of the lease obligation.

#### **Executory Costs**

Ownership-type costs such as insurance, maintenance, and property taxes are called executory costs. Executory costs may be paid by either the lessee or the lessor, depending on how the lease contract is written. However, since the risks and benefits of ownership have been transferred in a capital lease, the lessee usually incurs these costs. Many capital leases provide for the lessee to pay the executory costs directly. In these cases, the lessee expenses the executory costs as incurred. The lessee computes the values of the asset and liability by discounting the minimum lease payments without including the executory costs. Each lease payment includes the interest cost and the reduction of the lease liability.

Alternatively, the lessor may pay the executory costs and add the amount to determine the periodic lease amounts. Then the lessee excludes that portion of each lease payment that covers these executory costs from the minimum lease payments, and therefore from any present value calculations. That is, the minimum lease payment is the lease payment minus the executory costs paid by the lessor. The reason is that part of the lease payment is a reimbursement by the lessee of the executory costs paid by the lessor. The remainder of the payment is the interest cost and the reduction of the lease liability. If the executory costs are not specifically stated in the lease contract, the lessee estimates the amount of the executory costs included in each lease payment in order to determine the amount to subtract from each lease payment before computing the present value. The lessee expenses the portion of the total lease payment that is for the executory costs.

#### **Discount Rate**

The lessee computes the present value of the minimum lease payments by using the *lower* of:

- 1. The lessee's incremental borrowing rate, or
- 2. The lessor's interest rate implicit in the lease, if known by the lessee (or if it is practicable for the lessee to learn).5

Since the lessee is acquiring an asset, the rate it uses to borrow money to acquire an asset (the incremental borrowing rate) is appropriate. Alternatively, if it knows the rate in the contract (the implicit rate) and this rate is lower than the incremental borrowing rate, it is a more relevant rate to use. The lessor usually will disclose its implicit rate. If it does not, the lessee can compute the implicit rate if there is a guaranteed residual value, a bargain purchase option, or if it knows the lessor's estimate of the unguaranteed residual value. If the lessee does not know any of these amounts, it does not have enough information to compute the implicit rate. If the lessor does not disclose the implicit rate and the lessee cannot compute it, the lessee would use its incremental borrowing rate.

#### **Amortization (Depreciation) of Leased Asset**

Since the lessee records an asset, it must compute amortization. GAAP uses the term amortization rather than depreciation, because the leased asset technically is an intangible asset. However, the lessee often includes the leased asset in the property, plant, and

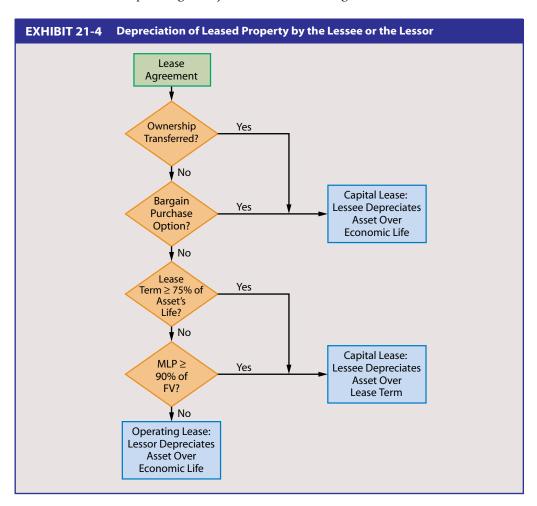

<sup>4</sup> Ibid., par. 10 (FASB Cod. # 840-30-30). Note also that the lessee must not record the asset at an amount that exceeds its fair value.

Ibid., par. 7(d) (FASB Cod. #840-10-25).

equipment section of its balance sheet. Either term can be used to name the expense. If the asset is written off over the estimated economic life of the property, the term that is usually used is depreciation. If the asset is written off over a shorter period of time (the term of the lease), the process is more often referred to as amortization. For simplicity, we use depreciation in this chapter.

Regardless of which term is used, if the capital lease agreement (1) transfers ownership of the asset to the lessee, or (2) includes a bargain purchase option, the lessee depreciates the asset over its estimated economic life to its estimated residual value. The lessee uses the estimated economic life because it expects to acquire ownership of the asset.

If the capital lease does not transfer ownership of the asset to the lessee and does not include a bargain purchase option, the lessee depreciates the leased asset over the lease life because its rights to the use of the asset cease at the end of the lease. It depreciates the leased asset down to its guaranteed residual value at the end of the lease term. The lessee uses a depreciation method that is consistent with its normal policy for similar, owned assets. We summarize the depreciation of leased property by the lessee (or the lessor if there is an operating lease) in Exhibit 21-4 using a flow chart.

#### **Reduction of the Lease Obligation**

Since the lessee records a liability, it computes interest expense and the reduction of the principal for each lease payment using the effective interest method (also called the interest method). This method produces a constant rate of interest on the outstanding balance of the lease obligation at the beginning of each period.

## **Examples of Lessee's Capital Lease Method**

We provide several examples of capital lease transactions of the lessee in the following sections.

## **Example: Equipment Is Leased and Lease Does Not Transfer Ownership and Does Not Include a Bargain Purchase Option**

Assume that the Martin Company (the lessee) and the Gardner Leasing Company (the lessor) sign a lease agreement dated January 1, 2010 in which the Martin Company leases equipment from the Gardner Leasing Company beginning January 1, 2010. The lease contains the terms and provisions we show in Example 21-3.

First, Martin Company (the lessee) determines that the lease is a capital lease, as we show in Example 21-4. Since it is a capital lease, the lessee records the leased asset at the present value of the minimum lease payments (the lessee pays the executory costs). This amount does not exceed the fair value. The discount rate is 12%, the interest rate implicit in the lease. We assume that the lessee knows this rate, and the rate is lower than its incremental borrowing rate of 12.5%.

#### Terms and Provisions of Lease Agreement Between Gardner Leasing **EXAMPLE 21-3** Company (Lessor) and Martin Company (Lessee) Dated **January 1, 2010**

- 1. The lease term is four years. The lease is noncancelable and requires equal payments of \$32,923.45 at the end of each year.
- 2. The cost, and also fair value, of the equipment to the Gardner Leasing Company at the inception of the lease is \$100,000. The equipment has an estimated economic life of four years and has a zero estimated residual value at the end of this time.
- 3. There is no guarantee of the residual value by the Martin Company.
- 4. The Martin Company agrees to pay all executory costs.
- 5. The equipment reverts to the Gardner Leasing Company at the end of the four years; that is, the lease contains no transfer of ownership or bargain purchase option.
- 6. The Martin Company's incremental borrowing rate is 12.5% per year.
- 7. The Martin Company uses the straight-line method to record depreciation on similar equipment.
- 8. For the Gardner Leasing Company, the interest rate implicit in the lease is 12%. The Martin Company knows this rate.
- 9. The present value of an ordinary annuity of four payments of \$32,923.45 each at 12% is  $100,000 (3.037349 \times 32,923.45 = 100,000)$ . (This is the only present value calculation necessary, since there is no guaranteed residual value or bargain purchase option.)

#### **EXAMPLE 21-4 Application of Lease Classification Criteria by Martin Company (Lessee)**

| Classification Criteria                       | Criteria Met? | Remarks                 |
|---|---------------|-------------------------|
| 1. Transfer of ownership at end of lease      | No            | Title reverts to lessor |
| 2. Bargain purchase option                    | No            |                         |
| 3. Lease term is 75% or more of economic life | Yes           | 100% of estimated life  |
| 4. Present value of minimum lease payments is |               |                         |
| 90% or more of fair value                     | Yes           | The present value is    |
|   |               | \$100,000, or 100% of   |
|   |               | fair value              |

Decision: A capital lease must meet one or more of the classification criteria; otherwise, the lease is an operating lease.

**Conclusion:** The lease is a capital lease. It meets two of the four criteria.

The Martin Company (the lessee) records the acquisition of the leased asset, the depreciation, and the minimum lease payments for two years as follows:

1. Initial Recording of Capital Lease on January 1, 2010

Leased Equipment **Capital Lease Obligation**  100,000.00

100,000.00

The accounting methods we use in this chapter are those recommended by GAAP. Martin Company uses the \$100,000 "net" present value for both the asset and the liability rather than the "gross" value of \$131,693.80 (4  $\times$  \$32,923.45). It is acceptable, however, for the lessee to record the liability at the gross amount with an accompanying debit to a contra-liability account, Discount on Capital Lease Obligation, for \$31,693.80. This alternative procedure may be useful when the lessee prepares the required disclosures that we discuss later.

2. First Annual Payment and Recognition of Interest Expense on Capital Lease on December 31, 2010

**Interest Expense Capital Lease Obligation** Cash

12,000.00 20,923.45

32,923,45

The annual payment is \$32,923.45. This amount is

- a payment of interest of \$12,000 (12%  $\times$  \$100,000), and
- a reduction of the lease obligation liability of 20,923.45 (32,923.45 12,000).

Note that this lease requires the payment to be made at the end of the year. Thus, the annuity is an ordinary annuity. If the lease requires the payments to be made at the beginning of the year, the annuity is an annuity due (which we show later in this chapter).

3. Recognition of Annual Depreciation of Leased Equipment on December 31, 2010

Depreciation Expense: Leased Equipment **Accumulated Depreciation:** Leased Equipment

25,000.00

25,000.00

The lessee depreciates the asset over the lease term because the lease does not include a transfer of ownership or a bargain purchase option. The lessee uses the straight-line method, and the annual depreciation is \$25,000 ( $$100,000 \div 4$ ). The lessee credits an Accumulated Depreciation account.

On the balance sheet of Martin Company (the lessee) for December 31, 2010, it includes the Leased Equipment less the Accumulated Depreciation in the property, plant, and equipment section of its assets. It divides the Capital Lease Obligation between current liabilities and long-term liabilities, as we discuss in the next section.

4. Second Annual Payment and Recognition of Interest Expense on December 31, 2011

**Interest Expense Capital Lease Obligation** Cash

9,489,19 23,434.26

32,923.45

The amount of the second payment is the same as that for 2010, but the payment for interest is the effective rate of 12% multiplied by the balance of the lease obligation at the beginning of 2011.

- The interest is  $12\% \times \$79,076.55$  (\$100,000 \$20,923.45), or \$9,489.19.
- The remainder of the annual payment is the reduction of the principal of \$23,434.26 (\$32,923.45 - \$9,489.19).

Example 21-5 shows the interest expense and the reduction of the capital lease obligation over the life of the lease.

| d. Adjusted for rounding  | <i>y</i>                |  |   |   |  |

5. Recognition of Annual Depreciation on December 31, 2011

Depreciation Expense: Leased Equipment **Accumulated Depreciation: Leased Equipment** 

25,000.00

25,000.00

Under the straight-line method, the depreciation entry for 2011 is the same as that for 2010.

The journal entries through 2013 follow a pattern similar to those presented for 2010 and 2011. For simplicity, we did not include the journal entries to record the payment of executory costs such as insurance, maintenance, and property taxes. A lessee records these types of costs in regular operating expense accounts. For example, if the Martin Company pays \$3,000 for repairs on the leased equipment during 2010, it would record the payment as a debit to Repair Expense. •

#### **Classification of Capital Lease Obligation**

When a lessee classifies its capital lease obligation on its balance sheet, it considers the usual criteria for classifying the lease as current or noncurrent.7 Since GAAP provides no guidelines to measure the respective amounts, a lessee may use two approaches to measure the amount of the current liability: (1) the present value of next year's payments, or (2) the change in the present value.8

#### **Present Value of Next Year's Payments**

Under the present value of next year's payments approach, the amount of the lessee's current liability is the payment(s) the lessee will make in the next year discounted to the balance sheet date. For the Martin Company, the current liability each year is \$29,395.93  $(0.892857 \times \$32,923.45)$ . The remaining portion of the obligation is classified as a noncurrent liability. This approach reports the same current liability each year for a given lease. It is conceptually sound and consistent with the theoretical measurement of liabilities in general. In this chapter we use the present value of next year's payments to determine the current liability portion of the lease obligation.

#### **Change in the Present Value**

The change in present value approach may be used by a lessee to measure the amount of its current liability. In this approach, the current liability is the amount by which

<sup>7.</sup> Ibid., par. 13 (FASB Cod. # 840-30-45).

R. J. Swieringa, "When Current Is Noncurrent and Vice Versa!", The Accounting Review (January 1984), pp. 123-130.

the total balance of the lease liability will decrease in the next year. For the Martin Company the current portion of the liability on December 31, 2010 is \$23,434.26 (\$79,076.55 - \$55,642.29); on December 31, 2011 it is \$26,246.38 (\$55,642.29 -\$29,395.91). Note that the current liability on December 31, 2012 (the balance sheet preceding the final year's lease payment) is the same for each approach (with minor differences for rounding).

#### **Example: Lease Payments Are Made at the Beginning of the Year**

Assume that all the lease provisions described in Example 21-3 are the same except that the Martin Company (the lessee) is required to make the lease payments in advance, on January 1 of each year, and that the cost (and also fair value) of the equipment is \$112,000. The annuity calculation is now the present value of an annuity due rather than that of an ordinary annuity. The value of the asset and the liability is different, as we show in the following calculation:

```
Present Value of Four Payments
  of $32,923.45 in Advance at 12\% = $32,923.45 \times 3.401831
                                    = $112,000 (rounded)
```

Example 21-6 shows the information for the interest expense and the reduction of the capital lease obligation for each period. The journal entries through January 1, 2011 are as follows:

1. Initial Recording of Capital Lease on January 1, 2010

**Leased Equipment** 112,000.00 **Capital Lease Obligation** 112,000.00

Martin records both the asset and the obligation at the present value.

2. First Annual Payment in Advance on January 1, 2010

**Capital Lease Obligation** 32,923.45 Cash 32,923.45

The first payment is entirely a reduction of principal, since no interest has accrued. (The preceding two journal entries could be made as one compound entry.)

| EXAMPLE 21-6 Summary of Lease Payments in Advance and Interest Expense of Martin Company (Lessee) |                         |                                      |   |  |

| January 1, 2010   | Before the initia       | Before the initial lease payment     |   |  |
| January 1, 2010   | \$32,923.45             |                                      | 79,076.55   |  |
| December 31, 2010   |                         | \$9,489.19                           | 88,565.74 <sup>d</sup>                              |  |
| January 1, 2011   | 32,923.45 <sup>c</sup>  |                                      | 55,642.29   |  |
| December 31, 2011   |                         | 6,677.07                             | 62,319.36 <sup>d</sup>                              |  |
| January 1, 2012   | 32,923.45               |                                      | 29,395.91   |  |
| December 31, 2012   |                         | 3,527.54e                            | 32,923.45 <sup>d</sup>                              |  |
| January 1, 2013   | 32,923.45               |                                      | 0   |  |

- a. Column 4 at beginning of year  $\times$  12%.
- b. Column 4 at beginning of year Column 2 + Column 3.
- c. Each lease payment, after the initial payment, includes the accrued interest for the previous year.
- d. \$32,923.45 of this amount is a current liability; it will be paid January 1 of the next year. The remaining amount is a noncurrent liability.
- e. Adjusted for \$0.03 rounding error.

3. Recognition of Annual Depreciation of Leased Equipment on December 31, 2010

Depreciation Expense: Leased Equipment 28,000.00 **Accumulated Depreciation: Leased Equipment** 

The straight-line depreciation is  $$112,000 \div 4$ years, or $28,000.$ 

4. Recognition of Interest Expense on Capital Lease on December 31, 2010

**Interest Expense Accrued Interest on Capital** Lease Obligation9

9,489.19

9,489.19

28,000.00

Even though Martin (the lessee) will not make the next payment until January 1, 2011, the accrual concept requires that the lessee recognize interest expense in the year that it is incurred. In 2010 the amount is \$9,489.19, or 12% of \$79,076.55 (\$112,000 - \$32,923.45), as we show in Example 21-6. The lessee separates the Capital Lease Obligation into its current and noncurrent portions in its year-end balance sheet. In the December 31, 2010 balance sheet, it reports \$32,923.45 as a current liability and the remaining part, \$55,642.29, as a long-term liability.

5. Second Annual Payment in Advance on January 1, 2011

**Accrued Interest on Capital Lease Obligation Capital Lease Obligation** Cash

9,489.19 23,434.26

32,923.45

The interest applicable to 2011 is \$9,489.19, as we show in Example 21-6. The remaining entries follow the pattern of those for 2011. ♦

## Other Lessee Capitalization Issues

A lessee may also sign a lease agreement that includes: (1) a bargain purchase option, or (2) a guaranteed residual value.

#### **Impact of Bargain Purchase Option**

To show the impact of a bargain purchase option, assume that Redd Company leases equipment for four years and agrees to pay \$40,000 at the end of each year. The lease also includes an option to pay \$2,000 at the end of the fourth year to purchase the asset. This amount is so much lower than the expected fair value at the end of the fourth year that Redd (the lessee) is reasonably assured of exercising the option. Therefore, it is a bargain purchase option. Redd's incremental borrowing rate is 11%, and the lessor's implicit interest rate is 10%. The cost and fair value of the equipment is \$128,160.63. This lease qualifies as a capital lease because there is a bargain purchase option. The lessee records the leased equipment at the present value of the minimum lease payments (which includes the bargain purchase option) based on the lower 10% rate, calculated as follows:

Present value of the annual payments discounted at 10%

 $($40,000 \times 3.169865)$ 

\$126,794.60

Add: Present value of the single sum of \$2,000 (the bargain purchase option) discounted at 10%  $($2,000 \times 0.683013)$ 

Present value of the minimum lease payments

1,366.03 \$128,160.63

The lessee records the leased asset as follows:

Leased Equipment **Capital Lease Obligation**  128,160.63

128,160.63

If not material, the lessee may credit this amount to the liability account, Capital Lease Obligation.

The accounting by the lessee follows the same principles as in the previous capital lease examples, except that the lessee depreciates the Leased Equipment asset amount of \$128,160.63 over its estimated economic life (not over the term of the lease) to its estimated residual value (not the bargain purchase option of \$2,000). The lessee reduces the liability account, Capital Lease Obligation, by the effective interest method, as we previously illustrated. However, at the end of the fourth year, it has a balance of \$2,000. When the lessee exercises the bargain purchase option, it debits Capital Lease Obligation and credits Cash for \$2,000.

### **Impact of Guaranteed Residual Value**

The lessee may agree to guarantee part or all of the residual value. That is, it guarantees that the value of the leased asset at the end of the lease term will be at least the stated amount of the guarantee. If the asset is not worth this guaranteed value, the lessee must pay the lessor any difference between this smaller value and the guaranteed value. A lessor would generally prefer a guaranteed residual value because it transfers the risk associated with the future value of the asset to the lessee. The guaranteed residual value is included in the minimum lease payments. Therefore, the lessee capitalizes the present value of the amount guaranteed.

#### **Example: Guaranteed Residual Value**

Assume that Karpas Company leases equipment for four years that cost the lessor \$147,284.99 (its fair value) and agrees to pay \$40,000 at the end of each year. The equipment has an estimated residual value of \$30,000 at the end of the fourth year. The Karpas Company agrees to guarantee the entire amount of this residual value (and there is no transfer of ownership or bargain purchase option). Assume an appropriate interest rate of 10%. This lease is a capital lease because the present value of the minimum lease payments (\$147,284.99), as we show in the following calculation, is equal to 90% or more of the fair value of the leased property (\$147,284.99).

| Present value of the annual lease payments discounted at 10% |              |
|--|--------------|
| $(\$40,000 \times 3.169865)$                                 | \$126,794.60 |
| Add: Present value of the single sum of \$30,000             |              |
| (the guaranteed residual value) discounted at 10%            |              |
| $(\$30,000 \times 0.683013)$                                 | 20,490.39    |
| Present value of minimum lease payments                      | \$147,284.99 |

The lessee records the leased equipment at the present value of the minimum lease payments (which includes the guaranteed residual value) as follows:

| Leased Equipment         | 147,284.99 |            |
|--------------------------|------------|------------|
| Capital Lease Obligation |            | 147,284.99 |

The accounting for the lease follows the same principles as in the previous capital lease examples. The lessee depreciates the asset by an appropriate method over the lease term down to the guaranteed residual value. It reduces the liability using the effective interest method, so that at the end of the fourth year the liability has a balance of \$30,000. The elimination of this balance depends on the condition of the leased asset at the end of the lease term and the terms of the lease agreement. •

#### **Example: Disposal Where Lease Has a Guaranteed Residual Value**

Based on the previous information, at the end of the fourth year after recording the depreciation, interest, and reduction of the liability, the Karpas Company has the following accounts and balances:

| Account                                    | Balance              |
|--|----------------------|
| Leased Equipment                           | \$147,284.99 (debit) |
| Accumulated Depreciation: Leased Equipment | 117,284.99 (credit)  |
| Capital Lease Obligation                   | 30,000.00 (credit)   |

If the fair value of the leased asset is less than \$30,000, the lessee may pay part of the liability by returning the asset to the lessor. It then pays the remaining part in cash and recognizes a loss on disposal of the asset. For example, assume that the Karpas Company returns the leased equipment to the lessor. Both the Karpas Company and the lessor agree that the equipment is worth only \$20,000. The Karpas Company pays the lessor \$10,000 in cash, and records the disposal as follows:

Accumulated Depreciation: Leased Equipment 117,284.99 **Capital Lease Obligation** 30,000.00 Loss on Disposal of Leased Equipment 10,000.00 **Leased Equipment** 147,284.99 Cash 10,000.00

If the fair value is more than \$30,000, the lessee may pay the liability in full by returning the asset to the lessor. In this case, the lessee does not recognize a gain or loss. Note that the lessee ignores any unguaranteed residual value.

Leases may be written with various provisions. For example, the lessee may be required to pay the lessor the full guaranteed residual value (in this case, \$30,000) in cash. The lessee then may choose to sell the asset or keep it to use in its operating activities. •

### **Disclosure Requirements of the Lessee**

GAAP requires certain disclosures by the lessee for both operating and capital leases. We summarize the basic disclosures in Exhibit 21-5. The lessee discloses this information in its balance sheet or in the notes to its financial statements.10 Wal-Mart Stores discloses its lease information in Note 9 of its 2008 financial statements, as we show in Real Report 21-1 on page 1103.

5 Understand disclosures by the lessee.

# OUICK CHECK 21-2

- A lessee accounts for an operating lease as a rental agreement. The lessee records rent expense each period and does not report the leased equipment nor any related obligation for future payments on the balance sheet.
- For a capital lease, the lessee records the leased asset and a liability equal to the present value of the minimum lease payments at the beginning of the lease term.
  - Executory costs (ownership costs such as insurance, maintenance, and property taxes) are not considered part of the minimum lease payment and are excluded from any present value calculations.
  - The lessee uses the lower of the lessee's incremental borrowing rate or the lessor's interest rate implicit in the lease (if it is known by the lessee) in any present value calculations.
- The lessee depreciates the leased asset over its estimated economic life if it expects to acquire the asset at the end of the lease term (e.g., the lease agreement transfers ownership to the lessee or contains a bargain purchase option), or the lease term if the lessor is expected to retain ownership of the leased asset at the end of the lease term.
- Each lease payment consists of interest expense and a reduction of the principal of the recorded liability, computed using the effective interest method.
- The lease obligation is classified as current or noncurrent on the balance sheet using either the (1) present value of next year's payments approach or the (2) change in present value approach.
- If a lease contains a bargain purchase option, the bargain purchase option is viewed as an additional lease payment and is included in the computation of the present value of the minimum lease payments.

(Continued)

• If the lessee guarantees the residual value of the leased asset, it views the guaranteed residual value as an additional payment and includes this amount in the calculation of the present value of the minimum lease payments.

#### EXHIBIT 21-5 Disclosure Requirements for Lessee: Operating and Capital Leases

- A. For operating leases having lease terms in excess of one year:
  - 1. Future minimum rental payments required as of the date of the latest balance sheet presented, for each of the five succeeding fiscal years and in total.
  - 2. The total of minimum rentals to be received in the future under noncancelable subleases.
- B. For all operating leases, rental expense for each period.
- C. For capital leases:
  - 1. The gross amount of assets recorded under capital leases by major classes according to nature or function.
  - 2. Future minimum lease payments for each of the five succeeding fiscal years and in total with separate deductions from the total (1) for the amount of executory costs included in the minimum lease payments, and (2) for the amount of the imputed interest required to reduce the net minimum lease payments to present value.
  - 3. The total of minimum sublease rentals to be received in the future under noncancelable subleases.
  - 4. Assets, accumulated depreciation, depreciation expense, and liabilities.
- D. For all leases, a general description of the lessee's leasing arrangements including the following:
  - 1. The existence and term of renewal or purchase options and escalation clauses.
  - 2. Restrictions imposed by lease agreements, such as those concerning dividends, additional debt, and further leasing.

# Accounting and Reporting by a Lessor

Recall that a lessor classifies a lease as follows:

- 1. Operating Lease. A lease that does not meet any of the criteria in Column A or does not meet both of the criteria in Column B of Exhibit 21-2.
- 2. Sales-Type Lease. A sales-type lease results in a manufacturer's or dealer's profit (or loss) and meets one or more of the criteria in Column A and both the criteria in Column B of Exhibit 21-2.
- 3. Direct Financing Lease. A direct financing lease does not result in a manufacturer's or dealer's profit (or loss) and meets one or more of the criteria in Column A and both the criteria in Column B of Exhibit 21-2.
- 4. Leveraged Lease. A leveraged lease is a special three-party lease that is always considered to be a direct financing lease. We discuss these leases briefly in the Appendix to this chapter.

We discuss the accounting method for each of the first three leases in the following sections.

# **Operating Lease (Lessor)**

Reporting

Under an operating lease, a lessor company leasing an asset to a lessee retains substantially all the risks and benefits of ownership. The lessor includes the leased asset, say equipment, on its balance sheet in a subsection of property, plant, and equipment entitled Plant and Equipment Leased to Others." It also records

lessor's operating, direct financing, and sales-type leases.

**6** Account for a

#### NOTES TO THE CONSOLIDATED FINANCIAL STATEMENTS

#### **Note 9: Commitments**

The Company and certain of its subsidiaries have long-term leases for stores and equipment. Rentals (including amounts applicable to taxes, insurance, maintenance, other operating expenses and contingent rentals) under operating leases and other short-term rental arrangements were \$1.6 billion, \$1.4 billion and \$1.0 billion in 2008, 2007 and 2006, respectively. Aggregate minimum annual rentals at January 31, 2008, under noncancelable leases are as follows:

(Amounts in millions)

| Fiscal Year   | Operating | Capital  |
|---|-----------|----------|
| 2009  | \$ 1,094  | \$ 595   |
| 2010  | 1,051     | 576      |
| 2011  | 994       | 561      |
| 2012  | 866       | 528      |
| 2013  | 788       | 494      |
| Thereafter  | 8,966     | 3,243    |
| Total minimum rentals                                     | \$ 13,759 | \$ 5,997 |
| Less estimated executory costs                            |           | 27       |
| Net minimum lease payments                                |           | 5,970    |
| Less imputed interest at rates ranging from 3.0% to 13.6% |           | 2,051    |
| Present value of minimum lease payments                   |           | \$ 3,919 |

Certain of the Company's leases provide for the payment of contingent rentals based on a percentage of sales. Such contingent rentals amounted to \$33 million, \$41 million and \$27 million in 2008, 2007 and 2006, respectively. Substantially all of the Company's store leases have renewal options, some of which may trigger an escalation in rentals.

The Company has potential future lease commitments for land and buildings for 165 future locations. These lease commitments have lease terms ranging from 2 to 39 years and provide for certain minimum rentals. If executed, payments under operating leases would increase by \$67 million for fiscal 2009, based on current cost estimates.

#### **Questions:**

- 1. Why do you think Wal-Mart has chosen to use long-term operating leases instead of buying the assets?
- 2. What is the present value of Wal-Mart's minimum lease payments? Where would this be found on its balance sheet?
- 3. If Wal-Mart's operating leases were classified as capital leases, what would the effect be on Wal-Mart's debt ratio? For simplicity, assume that lease payments are made as a single annual payment at the beginning of each year and an interest rate of 10%. (On 1/31/08, Wal-Mart's total liabilities were \$98,906 million and its total assets were \$163,514 million.)

depreciation on the leased asset and includes it on its income statement. The lessor usually pays executory costs and records the rental receipts as revenue when they are earned.

#### **Example: Operating Lease (Lessor)**

Assume that the Owner Company leases a piece of equipment to User Company for five years under the terms described in Example 21-1 on page 1092. User Company agrees to pay \$50,000 at the beginning of each year. In addition, the Owner Company purchased the equipment at a cost of \$300,000. The equipment has an estimated life of 10 years, and Owner Company uses the straight-line method of depreciation. On January 10, 2010 Owner pays the annual insurance premium of \$2,000, and on December 15, 2010 it pays for repairs of \$1,500. Assume that there are no initial direct costs involved in this lease. Owner records the preceding information as follows:

1. Purchase of Equipment to Be Leased on January 1, 2010

**Equipment Leased to Others** Cash (or Accounts Payable) 300,000 300,000

We show the purchase of the equipment to reinforce your understanding of its classification. If the company already owned the equipment, in the preceding entry it would credit the Equipment account, and also would reclassify the related Accumulated Depreciation.

2. Collection of Annual Payment on Operating Lease on January 1, 2010

Cash 50,000

Rental Revenue 50,000

Owner Company collects the annual rental payments at the beginning of each year and records them as revenue. If the amount is receivable at this date but not yet collected, Owner debits a Rent Receivable account. If Owner prepares monthly or quarterly interim statements, it reports the unearned portion of the preceding revenue as a liability, Unearned Rent.

3. Payment of Annual Insurance Premium on January 10, 2010

**Insurance Expense** Cash

2,000

2,000

1,500

Under operating leases, the lessor usually pays executory costs such as insurance. It records these costs as operating expenses and matches them against the gross rental revenue. If Owner prepares monthly or quarterly interim statements, it reports the unexpired portion of the expense as an asset, Prepaid Insurance.

4. Payment of Repairs on December 15, 2010

Repair Expense

1,500

Cash

The repair expense is another example of an executory cost paid by the lessor.

5. Recognition of Annual Depreciation Expense on December 31, 2010

**Depreciation Expense: Equipment Leased** 

to Others 30,000

Accumulated Depreciation: Equipment Leased

to Others 30,000

The lessor records depreciation on the leased equipment over its 10-year economic life. It reports the leased equipment and the accompanying accumulated depreciation on its balance sheet. •

### **Initial Direct Costs Involved in an Operating Lease**

In the preceding lease example, we assumed that there were no initial direct costs. Initial direct costs are costs that a lessor incurs directly from originating a lease that it would not have incurred if it had not entered into the lease contract. For an operating lease, the lessor records these costs as an asset and allocates them as an operating expense in proportion to the rental receipts over the term of the operating lease. This procedure results in an appropriate matching of the initial direct costs as an expense against the rental revenue.

## **Direct Financing Leases (Lessor)**

Under a direct financing lease, the lessor is usually a financial institution (or a financial subsidiary of a company). The lessor "sells" the asset at a fair value equal to its cost or carrying value and records an accompanying receivable. Since there is no manufacturer's or dealer's profit (or loss) in a direct financing lease, the net amount at which the lessor records the receivable must be equal to the cost or carrying value of the property. The net receivable is equal to the present value of the future lease payments to be received. There are, however, two components of the net receivable (net investment). These are the gross receivable (the total undiscounted cash flows) and the unearned interest (the interest to be earned over the life of the lease). The gross receivable of the lessor includes the sum of12

- 1. The undiscounted minimum lease payments to be received by the lessor, plus
- 2. Any unguaranteed residual value accruing to the benefit of the lessor.

Note that the gross receivable excludes any executory costs paid by the lessor. However, it includes the residual value, whether guaranteed or unguaranteed. If the residual value is guaranteed, it is included in the minimum lease payments. If it is unguaranteed, it is explicitly included as the second item. The lessor records the difference between the gross receivable (the Lease Receivable<sup>13</sup> account) and the cost or carrying value of the leased property as unearned revenue, with a title such as Unearned Interest: Leases. This account is a contra account and the lessor deducts this account from the Lease Receivable account to determine its net investment in the direct financing lease. The lessor reports this net investment on its balance sheet and divides the amount between the current and noncurrent asset sections. The current asset portion is determined by using the present value of next year's payments approach or by using the change in present value approach, as we explained earlier for the lessee's accounting.

Note that the lessor's accounting according to GAAP follows the "gross" method whereas, as we discussed earlier, the lessee's follows the "net" method. It is acceptable, however, for the lessor to record the asset at the "net" amount, provided it makes the appropriate disclosures, as we show later. However, the main advantage of recording the receivable at the gross (undiscounted) amounts is that this accounting provides the information for the required disclosures, as we discuss later.

The lessor determines its interest revenue each period using the effective interest method to produce a constant periodic rate of return on the net investment in the lease. At the beginning of the lease, the net investment is equal to the original cost of the asset, if it is new, or the carrying value, if it has been owned in previous periods. The interest rate implicit in the lease is the rate that, when applied to the gross receivable, will discount that amount to a present value that is equal to the net receivable. Thus, there are three variables: the present value (the net receivable), the implicit rate, and the future cash flows (the gross receivable). If the lessor knows two of these three variables, it can calculate the third. We show three examples of accounting for a direct financing lease in the following sections.

## **Example: Direct Financing Lease with No Unguaranteed Residual Value and Payments Made at End of Year**

For the first example, we show the accounting by the Gardner Leasing Company (a financial institution) that leases equipment to the Martin Company as shown earlier in Example 21-3 on page 1095. In addition to the items in Example 21-3, assume that:

- 1. The collectibility of the lease payments is reasonably assured, and there are no uncertainties involved in the lease.
- 2. There are no initial direct costs of negotiating and closing the lease transaction.

<sup>12.</sup> Ibid., par. 18 (FASB Cod. # 840-30-30).

<sup>13.</sup> The title "Minimum Lease Payments Receivable" is appropriate when there is a guaranteed residual value. The title "Gross Investment in the Lease" is most appropriate if there is an unguaranteed residual value, because then the lessor has not "sold" the residual value. For simplicity, we use the title "Lease Receivable."

The cost, and fair value, of the equipment is \$100,000. The interest rate implicit in the lease is 12% on the net investment. Though given in the data for the lessee, the lessor calculates the annual rental payments it charges the lessee as follows:

Annual Payments = 
$$\frac{\text{Present Value Equal to the Cost of Equipment}}{\text{Present Value of an Annuity for 4 Periods at 12\%}}$$
$$= \frac{\$100,000}{3.037349}$$
$$= \$32,923.45$$

As we show in Example 21-7, based on the criteria from Exhibit 21-2 (columns A and B) the lease is a direct financing rather than a sales-type lease because the fair (present) value of the property is equal to its cost.

| EXAMPLE 21-7 Gardner Leasing Company (Lesson Classification Criteria   | Criteria Met? | Remarks  |  |
|--|---------------|--|--|
|  | Criteria Met? | Kemarks  |  |
| Column A   |               |  |  |
| 1. Transfer of ownership   | No            |  |  |
| 2. Bargain purchase option   | No            |  |  |
| 3. Lease term is 75% or more of economic life  | Yes           | 100% of economic life                                      |  |
| 4. Present value of minimum lease payments is 90%  |               |  |  |
| or more of fair value  | Yes           | The present value is<br>\$100,000, or100%<br>of fair value |  |
| Column B   | V             |  |  |
| Collectibility reasonably assured  | Yes           |  |  |
| 2. No uncertainties  | Yes           |  |  |
| <b>Decision:</b> If the lease meets one or more of the Column A criteria and both of Column B criteria, and there is no manufacturer's or dealer's profit or loss, it is a direct financing lease. <b>Conclusion:</b> The lease is a direct financing lease, since appropriate criteria are met and there is no manufacturer's or dealer's profit or loss. The present (fair) value of the lease payments equals the cost of the property. |               |  |  |

Gardner Leasing Company first acquires the equipment at its fair value of \$100,000 and records it as follows:

| <b>Equipment Leased to Others</b> | 100,000 |  |
|-----------------------------------|---------|--|
| Cash                              | 100,000 |  |

The lessor records the Lease Receivable at the sum of the undiscounted annual payments to be collected from the lessee plus the undiscounted unguaranteed residual value. Since there are no executory costs or unguaranteed residual value, the Gardner Leasing Company records this asset at \$131,693.80  $\{[4 \times (\$32,923.45 - \$0)] + \$0\}$ . The beginning balance of the account, Unearned Interest: Leases, is the difference between the Lease Receivable account and the cost or carrying value of the leased asset. For the Gardner Leasing Company, this difference is \$31,693.80 (\$131,693.80 - \$100,000). Gardner records the following for 2010 and 2011:

1. Initial Recording of the Lease on January 1, 2010

| Lease Receivable                  | 131,693.80 |
|-----------------------------------|------------|
| <b>Equipment Leased to Others</b> | 100,000.00 |
| <b>Unearned Interest: Leases</b>  | 31,693.80  |

The effect of this transaction is to replace the equipment asset with a monetary asset of an equal amount. Again, note that Gardner records the receivable at the amount of the gross (undiscounted) rentals plus the estimated unguaranteed residual value of the leased asset (zero in this case). It credits the Equipment account for the cost of the item, because from an economic-substance-over-legal-form point of view it is the disposal of an asset, even though legal transfer of ownership has not occurred. Gardner records the Unearned Interest: Leases account as the difference between the cost of the equipment and the receivable; it is a contra account to the Lease Receivable account.

2. Collection of Annual Payment at End of First Year on December 31, 2010

Cash 32,923,45

Lease Receivable 32,923.45

Gardner collects and records the payment of \$32,923.45.

3. Recognition of Interest Revenue for First Year on December 31, 2010

**Unearned Interest: Leases** 12,000.00

**Interest Revenue: Leases** 12,000.00

Gardner amortizes the Unearned Interest account using the effective interest method. That is, it recognizes the interest revenue as 12% of the net investment at the beginning of the period (the January 1, 2010 balance of the Lease Receivable less the January 1, 2010 balance of the Unearned Interest: Leases) or \$12,000.00  $(12\% \times \$100,000; \text{ that is, } \$131,693.80 - \$31,693.80).$ 

Gardner (the lessor) separates the receivable into its current and noncurrent portions for reporting the lease on its balance sheet. It calculates the current and noncurrent amounts of the Net Investment that it reports on its December 31, 2010 balance sheet as follows:

|                           | Current     | Noncurrent                       |
|---------------------------|-------------|----------------------------------|
| Lease receivable          | \$32,923.45 | \$65,846.90a                     |
| Unearned interest: leases | (3,527.52)  | <u>(16,166.27</u> ) <sup>b</sup> |
| Net investment            | \$29,395.93 | \$49,680.63                      |

a. 2 × \$32,923.45

b.  $[\$32,923.45 - (\$32,923.45 \times 0.797194)] + [\$32,923.45 - (\$32,923.45 \times 0.711780)]$ 

Note that the \$29,395.93 current portion plus the \$49,680.63 noncurrent portion sum to the \$79,076.55 (with a \$0.01 rounding error) total Net Investment on December 31, 2010 shown in Example 21-8.

| EXAMPLE 21-8 Summary of Lease Payments Received in Arrears and Interest Revenue Earned by Gardner Leasing Company (Lessor) |                  |                          |                        |                         |                      |                         |
|--|------------------|--------------------------|------------------------|-------------------------|----------------------|-------------------------|
| (1)  | (2)<br>Annual    | (3)<br>Interest          | (4)<br>Amount          | (5)                     | (6)                  | (7)                     |
|  | Lease<br>Payment | Revenue at<br>12% on Net | of Net<br>Investment   | Lease                   | Unearned<br>Interest | Net                     |
| Date   | Received         | Investment <sup>a</sup>  | Recovered <sup>b</sup> | Receivable <sup>c</sup> | Leasesd              | Investment <sup>e</sup> |
| January 1, 2010  |                  |                          |                        | \$131,693.80            | \$31,693.80          | \$100,000.00            |
| December 31, 2010  | \$32,923.45      | \$12,000.00              | \$20,923.45            | 98,770.35               | 19,693.80            | 79,076.55               |
| December 31, 2011  | 32,923.45        | 9,489.19                 | 23,434.26              | 65,846.90               | 10,204.61            | 55,642.29               |
| December 31, 2012  | 32,923.45        | 6,677.07                 | 26,246.38              | 32,923.45               | 3,527.54             | 29,395.91               |
| December 31, 2013  | 32,923.45        | 3,527.54 <sup>f</sup>    | 29,395.91              | 0                       | 0                    | 0                       |

- Column 7 at beginning of year  $\times$  12%
- b. Column 2 Column 3
- c. Annual lease payment × Number of years remaining on lease, or Previous balance Column 2
- d. Previous balance Column 3
- Column 5 Column 6
- Adjusted for \$0.03 rounding error

4. Collection of Annual Payment for Second Year on December 31, 2011

Cash 32,923,45 Lease Receivable 32,923.45

Gardner records the receipt of the payment for the second period in the same way as during the first period.

5. Recognition of Interest Revenue for Second Year on December 31, 2011

**Unearned Interest: Leases** 9,489.19 **Interest Revenue: Leases** 9,489.19

The calculation of the 2011 interest revenue by the effective interest method follows the same procedure as that for 2010. The only difference is that the net investment as of January 1, 2011 is less than that of January 1, 2010. The calculation for 2011 is 12% of the January 1, 2011 balance in the Lease Receivable account less the January 1, 2011 balance of the Unearned Interest: Leases. For 2011 the interest revenue is 9,489.19 (12%  $\times$  \$79,076.55; that is, 100,000 – \$20,923.45).

Example 21-8 shows the interest revenue and the reductions in the receivable and the unearned interest over the life of the lease. The Gardner Leasing Company would use the information we show in Example 21-8 to record the journal entries for the remaining years of the lease. At the end of 2013 its net investment is zero. ♦

## **Example: Direct Financing Lease with No Unguaranteed Residual Value and Payments Received in Advance**

To show a direct financing lease with a different timing of the payments, assume that on January 1, 2010, the Watkins Finance Company leases equipment to the Hutton Company, with the terms and provisions of the lease we show in Example 21-9. This lease is a direct financing lease because the provisions of the lease agreement we show in Example 21-9 meet one or more of the Column A and both of the Column B classification criteria from Exhibit 21-2, do not include any manufacturer's or dealer's profit, and the fair (present)

#### Terms and Provisions of Lease Agreement Between Watkins Finance **EXAMPLE 21-9** Company (Lessor) and Hutton Company (Lessee) Dated January 1, 2010

- 1. The cost, and fair value, of the equipment is \$391,371.20.
- 2. The initial direct costs incurred by Watkins Finance Company are not material.
- 3. The term of the lease is five years, with annual payments of \$100,000 received in advance at the beginning of each year.
- 4. The economic useful life of the equipment is five years and the estimated residual value to the lessor is zero.
- 5. The lease receipts are determined at an amount that will yield to the Watkins Finance Company a 14% annual rate of return on net investment.
- 6. The Hutton Company pays all the executory costs.
- 7. The equipment reverts to the Watkins Finance Company at the end of the fifth year; the lease contains no bargain purchase option.
- 8. The present value of the minimum lease payments receivable for the lessor is \$391,371.20, calculated as follows:

Present value of 5 amounts of  $= 3.913712 \times \$100,000$ \$100,000 in advance at 14% = \$391,371.20

9. The collectibility of the payments is reasonably assured, and there are no uncertainties involved in the lease.

| EXAMPLE 21-10   | EXAMPLE 21-10 Summary of Lease Payments Received in Advance and Interest Revenue Earned by Watkins Finance Company (Lessor) |                        |                         |              |                             |
|---|---|------------------------|-------------------------|--------------|-----------------------------|

| <ul> <li>a. Column 6 at beginning of year × 14%</li> <li>b. Annual lease payment × Number of years remaining on lease, or Previous balance — Column 2</li> <li>c. Previous balance — Column 3</li> <li>d. Column 4 — Column 5</li> <li>e. \$100,000 of this amount is a current asset; it will be received on January 1 of the next year. The remaining amount is a noncurrent asset.</li> <li>f. Adjusted for \$0.05 rounding error</li> </ul> |   |                        |                         |              |                             |

value of the property is equal to its cost. The Watkins Finance Company first records the acquisition of the equipment as follows:

**Equipment Leased to Others** 391,371.20 Cash 391,371.20

The Watkins Finance Company records the information for this lease in 2010 using the amounts from Example 21-10.

1. Initial Recording of Lease on January 1, 2010

Lease Receivable 500,000.00 **Equipment Leased to Others** 391,371.20 **Unearned Interest: Leases** 108,628.80

Watkins (the lessor) records the Lease Receivable at the undiscounted five annual rental payments totaling \$500,000 (5  $\times$  \$100,000) plus the unguaranteed residual value (\$0 in this case). It records the Unearned Interest at \$108,628.80. Thus, the net receivable is the cost of the equipment of \$391,371.20. Because the transaction is considered a disposal of an asset, Watkins also credits Equipment Leased to Others.

2. Collection of Annual Payment for First Year on January 1, 2010

Cash 100,000.00 Lease Receivable 100,000.00

The payments are collected in advance. The first payment collected consists entirely of principal since no interest has accrued. (The two preceding journal entries could be made as one compound entry.)

3. Recognition of Interest Revenue for First Year on December 31, 2010

**Unearned Interest: Leases** 40,791.97 Interest Revenue: Leases 40,791.97

As we show in Example 21-10, the interest earned in 2010 is \$40,791.97 (14%  $\times$ \$291,371.20). Watkins would use the information we show in Example 21-10 to record the journal entries for the remaining years of the lease. At the end of the lease term, there will be a zero balance in both the Lease Receivable and Unearned Interest: Leases accounts. •

#### Example: Direct Financing Lease with an Unquaranteed Residual Value at the End of the **Lease and Payments Made in Advance**

To show a direct financing lease with additional issues, assume that on January 1, 2010 the Carlson Bank leases equipment to the Johnson Company, with the terms and provisions of the lease we show in Example 21-11.

#### Terms and Provisions of Lease Agreement Between Carlson Bank **EXAMPLE 21-11** (Lessor) and Johnson Company (Lessee) Dated January 1, 2010

- 1. The cost, and fair value, of the equipment is \$11,149.06.
- 2. The initial direct costs incurred by Carlson Bank are not material.
- 3. The term of the lease is four years, with annual payments of \$3,000 received at the beginning of each year.
- 4. The estimated economic life of the equipment is five years, the lease is for only four years, and there is an estimated residual value of \$2,000 at the end of the lease. The Johnson Company does not guarantee any of the estimated residual value.
- 5. The lease payments are determined at an amount that will yield to the Carlson Bank a 14% annual rate of return on its net investment.
- 6. The Johnson Company pays all the executory costs.
- 7. The equipment reverts to the Carlson Bank at the end of the fourth year. The lease contains no renewal or bargain purchase options.
- 8. The present value of the minimum lease payments receivable for the lessor, plus the unguaranteed residual value, is \$11,149.06, calculated as follows:

```
Present value of 4 amounts of $3,000 in
                                          = $ 9,964.90
advance at 14% (3.321632 \times $3,000)
```

Add: Present value of a single sum of \$2,000 (the unquaranteed residual value) = 1,184.16at 14% for 4 periods (0.592080  $\times$  \$2,000) Total present value = \$11,149.06

9. The collectibility of the payments is reasonably assured, and there are no uncertainties involved in the lease.

Since the provisions of the lease agreement in Example 21-11 meet one or more of the Column A and both of the Column B lease classification criteria from Exhibit 21-2, and do not include any manufacturer's or dealer's profit, this lease is a direct financing lease. The Carlson Bank records the information relevant to the acquisition of the equipment and the lease for the year 2010 using the amounts from Example 21-12.

1. Acquisition of the Equipment

| Equipment Leased to Others | 11,149.06 |      |
|----------------------------|-----------|------|
| Cash                       | 11,149    | 0.06 |

2. Initial Recording of Lease on January 1, 2010

| Lease Receivable                  | 14,000.00 |
|-----------------------------------|-----------|
| <b>Equipment Leased to Others</b> | 11,149.06 |
| <b>Unearned Interest: Leases</b>  | 2,850.94  |

Carlson (the lessor) records the Lease Receivable at \$14,000 (the undiscounted four annual rental payments totaling \$12,000, plus the \$2,000 unguaranteed residual value). Note that the discounted amount of the \$2,000 unguaranteed residual

value included in the receivable to determine the net investment must earn a return (14% in this case), as well as the remaining part of the net investment. Carlson records the Unearned Interest at \$2,850.94; thus, the net receivable is the cost of the equipment of \$11,149.06. Because the transaction is considered a disposal of an asset, Carlson also credits the Equipment account.

3. Collection of Annual Payment for First Year on January 1, 2010

Cash 3,000.00

Lease Receivable 3,000,00

The payments are collected in advance. This journal entry reduces the net investment that will earn interest.

4. Recognition of Interest Revenue for First Year on December 31, 2010

**Unearned Interest: Leases** 1,140.87

**Interest Revenue: Leases** 1,140.87

As we show in Example 21-12, the interest earned during 2010 is \$1,140.87.

The Carlson Bank would use the information we show in Example 21-12 to record the entries for the remaining years. At the end of the lease, there will be \$2,000 left in the Lease Receivable account. When Carlson receives the asset, it records it at the lowest of the cost, carrying value, or fair value. Carlson records a loss if the asset value is less than \$2,000. •

| EXAMPLE 21-12     | Summary of Lease Payments Received in Advance and Interest Revenue Earned by Carlson Bank (Lessor) |   |                                  |  |                             |
|-------------------|--|---|----------------------------------|--|-----------------------------|
| (1)               | (2)  | (3)<br>Interest                                     | (4)                              | (5)  | (6)                         |
| Date              | Annual Lease<br>Payment<br>Received  | Revenue at<br>14% on Net<br>Investment <sup>a</sup> | Lease<br>Receivable <sup>b</sup> | Unearned<br>Interest:<br>Leases <sup>c</sup> | Net Investment <sup>d</sup> |
| January 1, 2010   |  |   | \$14,000                         | \$2,850.94                                   | \$11,149.06                 |
| January 1, 2010   | \$3,000  |   | 11,000                           |  | 8,149.06e                   |
| December 31, 2010 |  | \$1,140.87  |                                  | 1,710.07                                     | 9,289.93                    |
| January 1, 2011   | 3,000  |   | 8,000                            |  | 6,289.93                    |
| December 31, 2011 |  | 880.59  |                                  | 829.48                                       | 7,170.52 <sup>e</sup>       |
| January 1, 2012   | 3,000  |   | 5,000                            |  | 4,170.52                    |
| December 31, 2012 |  | 583.87  |                                  | 245.61                                       | 4,754.39e                   |
| January 1, 2013   | 3,000  |   | 2,000 <sup>f</sup>               |  | 1,754.39                    |
| December 31, 2013 |  | 245.61  |                                  | 0  | 2,000.00 <sup>f</sup>       |

- b. Annual lease payment × Number of years remaining on lease + \$2,000 residual value, or Previous balance Column 2
- c. Previous balance Column 3
- d. Column 4 Column 5
- e. \$3,000 of each of these December 31 balances is a current asset; the remaining amount is a noncurrent asset
- The estimated unguaranteed residual value

# **Initial Direct Costs Involved in a Direct Financing Lease**

The accounting for initial direct costs incurred by the lessor is different for each of the main types of leases. Recall that for an operating lease, the lessor records these initial direct costs as an asset, allocates them as an operating expense over the term of the operating lease, and matches them against the rental revenue. For a direct financing lease, GAAP states that the *initial direct costs* of a completed lease transaction include incremental direct costs and certain other direct costs. Incremental direct costs include those costs that result directly from and are essential to the leasing transaction and would not have

been incurred by the lessor if the transaction had not occurred. The other direct costs that may be included are those costs of the lessor related to evaluating the lessee's financial condition, negotiating terms, preparing and processing lease documents, and closing the transaction.14

Since the lessor does not recognize any revenue at the time it signs a direct financing lease, it does not expense the initial direct costs at that time. Therefore, there is no effect on net income at the time it records the direct financing lease. Instead, it defers the initial direct costs. This accounting procedure requires that the lessor determine a new (lower) implicit rate that will discount the remaining future minimum lease payments to the net investment at the inception of the lease.15 It expenses all other lease-related costs, such as the costs of advertising, servicing existing leases, unsuccessful lease originations, supervision, and administration, as incurred.

For example, if a lessor incurs initial direct costs of \$5,000 on a direct financing lease, it records the costs as follows:

**Unearned Interest: Leases** Cash, etc.

5,000

5,000

This entry results in appropriate matching because the initial direct costs are deferred and recognized over the lease term. The reduction in the Unearned Interest: Leases account increases the net investment, but the future cash flows remain unchanged, thereby lowering the implicit rate. The lower rate results in less interest revenue being recognized each period. This achieves the goal of deferring the initial direct costs and including them as a reduction of income over the life of the lease.

The calculation of the new implicit rate requires the use of compound interest techniques, as we discuss in the Time Value of Money module. Since we do not show the calculation, we assume a new implicit rate and list it in the related problems at the end of the chapter.

## Sales-Type Leases (Lessor)

In a sales-type lease, like a direct financing lease, the lessor "sells" the asset and records a receivable. 16 In contrast, however, in a sales-type lease the fair value of the asset that is "sold" is greater (or less) than its cost or carrying value. Thus, the differences between a sales-type lease and a direct financing lease are the manufacturer's or dealer's (gross) profit or loss in a sales-type lease and the accounting for initial direct costs. The manufacturer's or dealer's profit or loss is the difference between the following two items: (1) the present value of the minimum lease payments computed at the interest rate implicit in the lease (i.e., the sales price), and (2) the cost or carrying value of the asset plus any initial direct costs less the present value of the unguaranteed residual value accruing to the benefit of the lessor.17

#### **Example: Sales-Type Lease**

Assume that on January 1, 2010, the York Company leases specialty equipment to the Lake Company with the terms and provisions of the lease we show in Example 21-13. The test in Example 21-14 shows that this lease qualifies as a sales-type lease.

Since the York Company is a manufacturer or dealer in the specialty equipment being leased, it records the manufacturing costs, or the purchase, of the equipment for \$120,000 in the normal manner. Then it records the information relevant to the lease for 2010 as we show at the bottom of the next page:

<sup>14. &</sup>quot;Accounting for Nonrefundable Fees and Costs Associated with Originating or Acquiring Loans and Initial Direct Costs of Leases," FASB Statement No. 91 (Stamford, Conn.: FASB, 1987), par. 5-7. (FASB Cod. # 310-20-35). This Statement was clarified by FASB Statement No. 98 (FASB Cod. # 840-40).

<sup>15.</sup> FASB Statement No. 13, op. cit., par. 18 (FASB Cod. # 840-30-35).

<sup>16.</sup> A lessor may not classify a lease involving real estate as a sales-type lease unless the lease agreement provides for the transfer of title to the lessee at or shortly after the end of the lease term.

<sup>17.</sup> FASB Statement No. 13, op. cit., par. 17 (FASB Cod. # 840-30-35).

#### Terms and Provisions of Lease Agreement Between York Company **EXAMPLE 21-13** (Lessor) and Lake Company (Lessee) Dated January 1, 2010

- 1. The cost of the equipment is \$120,000. The fair value is \$190,008.49.
- 2. No initial direct costs are incurred by the York Company.
- 3. The term of the lease is 10 years, with annual payments of \$30,000 received at the beginning of each year. The estimated economic life of the equipment is also 10 years.
- 4. The Lake Company agrees to pay all executory costs.
- 5. The Lake Company is given an option to buy the equipment for \$500 at the end of the lease term, December 31, 2019. This is a bargain purchase option.
- 6. The interest rate implicit in the lease is 12%.
- 7. The present value of 10 payments of \$30,000 at 12% on an annuity-due basis, plus the present value of the bargain purchase option, is \$190,008.49, calculated as follows:

Present value of 10 amounts in advance at 12%  $(6.328250 \times \$30,000) = \$189,847.50$ 

Plus: Present value of \$500

discounted at 12% (0.321973  $\times$  \$500) = 160.99 Total present value = \$190,008.49

8. The collectibility of the payments is reasonably assured, and there are no uncertainties involved in the lease.

#### Application of Lease Classification Criteria by York **EXAMPLE 21-14** Company (Lessor)

| Classification Criteria   | Criteria Met? | Remarks   |
|---|---------------|---|
| Column A  |               |   |
| 1. Transfer of ownership  | No            |   |
| 2. Bargain purchase option  | Yes           |   |
| 3. Lease term is 75% or more of economic life                       | Yes           | 100% of life  |
| 4. Present value of minimum lease payments is                       |               |   |
| 90% or more of fair value   | Yes           | The present value<br>is \$190,008.49, or<br>100% of estimated<br>fair value |
| Column B  1. Collectibility reasonably assured  2. No uncertainties | Yes<br>Yes    |   |

Decision: If the lease meets one or more of the Column A criteria and both of Column B criteria and there is a manufacturer's or dealer's profit or loss, it is a sales-type lease. Conclusion: The lease is a sales-type lease, since appropriate criteria are met and there is a manufacturer's or dealer's profit because the amount used as the selling price (\$190,008.49) exceeds the cost (\$120,000). That is, the present (fair) value of the lease payments is greater than the cost of the property.

1. Initial Recording of the Sales-Type Lease on January 1, 2010

Lease Receivable 300,500.00

Sales Revenue 190,008.49 Unearned Interest: Leases 110,491.51

Cost of Asset Leased 120,000.00

Merchandise Inventory (or Equipment Held for Lease)

120,000.00

The first journal entry records the "sale." Because this lease contains a bargain purchase option, York (the lessor) records the lease receivable at the sum of the undiscounted annual rental payments (\$300,000) plus the undiscounted amount of the bargain purchase option (\$500). It records the \$190,008.49 sales revenue at the present value of the minimum lease payments, which is the present value of the annual payments (\$189,847.50), plus the present value of the bargain purchase option (\$160.99). The accounting for the bargain purchase option is the same as that for a guaranteed residual value since each is included in the minimum lease payments. Thus, the present value of the bargain purchase option (or a guaranteed residual value) is included as a part of the sales price of the equipment. The Unearned Interest: Leases amount of \$110,491.51 is the difference between the receivable of \$300,500 (the gross investment) and the sales revenue of \$190,008.49. In general, however, the Unearned Interest: Leases amount is the difference between the gross investment in the lease and the sum of the present value of the two components of the gross investment; that is, the present value of the minimum lease payments and the present value of the unguaranteed residual value accruing to the lessor (none in this example because of the bargain purchase option).

The second journal entry records the cost of the asset leased as an expense at its cost (\$120,000) because there is no unguaranteed residual value. Thus the York Company reports a gross profit of \$70,008.49 (\$190,008.49 sales revenue - \$120,000 cost of asset leased) on this sales-type lease at the time of the transfer of the property.

2. Collection of Annual Payment for First Year on January 1, 2010

Cash 30,000.00 Lease Receivable 30,000.00

The lease provisions require that payments are collected in advance at the beginning of each year. Also, remember that this collection reduces the net investment

3. Recognition of Interest Revenue for First Year on December 31, 2010

**Unearned Interest: Leases** 19,201.02

(the amount on which interest revenue is calculated) by \$30,000.

**Interest Revenue: Leases** 19,201.02

York amortizes the Unearned Interest: Leases account using the effective interest method. It recognizes interest as 12% of the net investment after the collection of the first rent, or \$19,201.02, calculated as follows:

 $12\% \times [(\$300,500 - \$30,000) - \$110,491.51] = \$19,201.02$ 

As we discussed for a direct financing lease, York may prepare a schedule of the periodic interest revenue, similar to the one we show in Example 21-12.

York's journal entries for the following nine years will show a pattern similar to the preceding ones. After it records the entries for the tenth year, its net investment on December 31, 2019 will be \$500, the amount of the bargain purchase option. Also, as with a direct financing lease, since a sale is considered to have taken place, a lessor does not record any depreciation on the leased asset. The lessee typically would pay and record the executory costs. •

## **Initial Direct Costs Involved in a Sales-Type Lease**

As we indicated previously, the accounting for the lessor's initial direct costs is different for each of the three main types of leases. In the preceding example of a sales-type lease, we assumed that there are no initial direct costs. If a lessor does incur initial direct costs on a sales-type lease, it expenses them in the same period. 18 The lessor could include them in cost of asset leased, but since the initial direct costs primarily relate to a selling activity it may report them as a selling expense entitled Initial Direct Sales-Type Lease

Expense. Either procedure results in an appropriate matching of the costs against the revenue recognized.

### **Unguaranteed and Guaranteed Residual Values**

As we discussed in the introduction to sales-type leases, the lessor deducts the present value of any unguaranteed residual value from the cost or carrying value of the asset when it recognizes the expenses associated with the signing of the lease. Note that the unguaranteed residual value is *not* included in sales revenue because it represents an item that is *not* sold.

The present value of any guaranteed residual value, on the other hand, is not subtracted from the expenses (e.g., cost of asset leased) and is included in sales. Since both the expense and the revenue items contain the present value of the guaranteed residual value, the gross profit is the same as for an unguaranteed residual value of the same amount. The sales revenue and expenses for a sales-type lease with an unguaranteed residual value are both reduced by the present value of the unguaranteed residual value. This method of accounting for the guaranteed residual value in a sales-type lease indicates that there has been a transfer of the risks and benefits to the lessee usually associated with ownership of an asset. Since the unguaranteed residual value accrues to the lessor, there has been a transfer of fewer ownership risks and benefits. Note, however, as we indicated earlier, this distinction does not prohibit a lease containing an unguaranteed residual value from qualifying as a sales-type lease.

### **Review of Estimated Unguaranteed Residual Value**

A lessor reviews the estimated unguaranteed residual value annually. It ignores any upward adjustments in the estimated value, but must record any downward adjustment as a reduction in its net investment and a loss in the period. This recognition involves the calculation of a new implicit interest rate.

## **Disclosure Requirements for the Lessor**

GAAP requires the lessor to make certain disclosures in its financial statements or the related notes. Exhibit 21-6 shows the basic disclosures for operating, direct financing, and sales-type leases for a lessor whose leasing activities are a significant part of its business activities.<sup>19</sup>

7 Understand disclosures by the lessor.

#### Disclosure Requirements for Lessor: Operating, **EXHIBIT 21-6 Direct Financing, and Sales-Type Leases**

- A. For operating leases:
  - 1. The cost and carrying amount, if different, of property on lease or held for leasing by major classes of property, and the amount of the total accumulated depreciation.
  - 2. Minimum future rentals on noncancelable leases for each of the five succeeding fiscal years and in total.
  - 3. Total contingent rentals included in income for each period.
- B. For direct financing and sales-type leases:
  - 1. The components of the net investment in direct financing and sales-type leases including:
    - a. The future minimum lease payments to be received, including any profit thereon.
    - b. The unguaranteed residual values accruing to the benefit of the lessor.
    - c. For direct financing leases only, initial direct costs.
    - d. Unearned income.
  - 2. Future minimum lease payments to be received for each of the five succeeding fiscal years and in total.
  - 3. Total contingent rentals included in revenue for each period.
- C. A general description of the lessor's leasing arrangements.

## **SUMMARY OF ACCOUNTING BY** LESSEE AND LESSOR

The accounting issues involved in the various types of leases are numerous and sometimes complex. To assist in identifying the key issues involved, we include a summary of the accounting by the lessee and lessor in Exhibit 21-7.

#### **EXHIBIT 21-7** Summary of Accounting for Leases by the Lessee and the Lessor

#### **LESSEE**

#### **Operating Lease**

· Rent expense is recognized each period.

#### **Capital Lease**

- Leased property is recorded at the present value of the minimum lease payments.
- Lease obligation is recorded at the present value of the minimum lease payments. The minimum lease payments are discounted at the lessee's incremental borrowing rate unless the lessor's implicit rate is both known and lower.

The leased property cannot be recorded at an amount that exceeds its fair value.

Depreciation of the leased property

Over the economic life if the lease is capitalized under either of the following criteria:

- the lease transfers ownership of the property to the lessee by the end of the lease term
- the lease contains a bargain purchase option

Over the lease life if the lease is capitalized but does not meet either of the preceding criteria Use the normal depreciation policy

• Interest expense is recognized by use of the effective interest method.

#### **LESSOR**

#### **Operating Lease**

- · Rent revenue is recognized each period.
- Property leased to others is depreciated using the normal depreciation policy.

#### **Direct Financing Lease**

- Lease receivable is recorded at the sum of the minimum lease payments plus the unquaranteed residual value (not discounted).
- Unearned interest is recorded at an amount equal to the gross investment in the lease minus the cost or carrying value of the leased property.
- Initial direct costs are deferred and amortized over the life of the lease.
- Interest revenue is recognized by use of the effective interest method.

#### Sales-Type Lease

- · Lease receivable is recorded at the sum of the minimum lease payments plus the unquaranteed residual value (not discounted).
- · Unearned interest is recorded at an amount equal to the gross investment in the lease minus the sum of the present value of the two components of the gross investment.
- Sales revenue is recorded at the present value of the minimum lease payments.
- · Expenses that are recognized include the cost or carrying amount of the leased property, plus the initial direct costs, minus the present value of the unguaranteed residual value.
- · Interest revenue is recognized by use of the effective interest method.

## **ADDITIONAL LEASE ISSUES**

This section discusses how to report lease transactions on the statement of cash flows. It also discusses several conceptual issues regarding accounting for leases, as well as international differences.

### Statement of Cash Flows Disclosures

If a lessee records a lease as an operating lease, it classifies each lease payment as a cash outflow in the operating activities section of its statement of cash flows. If a lessee records a lease as a capital lease, it reports a noncash investing and financing activity at the signing of the lease agreement. For each lease payment, it classifies the interest portion as a cash outflow in the operating activities section, and the reduction of the lease obligation as a cash outflow in the financing activities section.

If a lessor records a lease as an operating lease, it classifies each lease receipt as a cash inflow in the operating activities section of its statement of cash flows. If a lessor records a lease as a direct financing lease, it classifies any cash paid to purchase the asset as a cash outflow in the investing activities section. Then, for each lease receipt, it classifies the interest portion as a cash inflow in the operating activities section, and the reduction of the lease receivable as a cash inflow in the investing activities section. If a lessor records a lease as a sales-type lease, it classifies any cash paid to purchase the asset as a cash outflow in the operating activities section. Then, for each lease receipt, it classifies the receipt as a cash inflow in the operating activities section.

## **Conceptual Evaluation of Accounting for Leases**

The four criteria used to determine if there is a capital lease are reasonable measures of whether the risks and benefits of ownership are transferred. Either of the first two criteria would be written into a lease agreement if both parties clearly wanted ownership of the leased property to transfer to the lessee. There is more controversy about the third and fourth criteria because they are fairly easy to avoid. For example, for the third criterion the economic life of the property may be "estimated" so that the lease life is less than 75% of that period. Note that for the fourth criterion, the inclusion of a guaranteed residual value in the lease agreement will typically result in a present value of the minimum lease payments that is equal to the fair value of the property. Therefore, companies may try to find a way to effectively protect the lessor's risk related to the residual value of the property without meeting the definition of a guaranteed residual value. This would make the present value of the minimum lease payments equal to less than 90% of the fair value of the property. For example, third-party guarantees of the residual value have been fairly widely used to ensure that the present value of the minimum lease payments is less than 90% of the fair value, while providing the lessor with an effective guarantee of the residual value.

These examples raise the issue of why the lessee and lessor may want to avoid a capital lease. The motivation usually comes from the lessee who wants to avoid reporting the liability on its balance sheet. The lessee apparently believes that a "stronger" balance sheet allows it either to borrow more money or to borrow money at a lower interest rate. However, the lessee is required to disclose in the notes to its financial statements of the future cash flows each year for the next five years and all years thereafter. This allows the user to perform a present value calculation that determines the approximate amount of the balance sheet liability (and asset) that the lessee has avoided. Therefore, it appears that the lessee must assume that users do not read (or understand) the notes.

Many users believe that both the relevance and reliability of lease accounting would be enhanced by having a simple rule that requires capitalization of all leases with, say, a life of more than one year. However, companies lobbied not to have such a rule included in GAAP. Instead, the FASB opted for the four capitalization criteria. However, GAAP also has been criticized for being very "mechanical." That is, the criteria used for capitalization are "bright-line tests" and are either met or not, thereby leaving no room for professional judgment. The FASB has announced that it plans to review the accounting for leases. It is likely that many more leases will be accounted for as capital leases by the lessee.

8 Explain the conceptual issues regarding leases.

## IFRS vs. U.S. GAAP

IFRS for leases are generally similar to U.S. GAAP. However, IFRS focus more on the substance of the agreement rather than the form as defined by the four criteria in the U.S. GAAP. For this reason, IFRS are generally less detailed and are considered more principles-based, while U.S. GAAP has more extensive form-driven requirements and is generally considered rules-based. Terminology differences exist. For example, under IFRS, a lease is classified as either a finance lease or an operating lease. Under a finance lease, capitalization is required when substantially all of the risks and rewards of ownership are transferred, as demonstrated by several examples or indicators. While the first two indicators are very similar to U.S. GAAP, the third indicator is less precise because it states that "the lease term is for the major part of the economic life of the asset," as compared to the 75% threshold used in the United States. The fourth indicator also differs from the U.S. criterion in that it states that "the present value of the lease payments amounts to at least substantially all the fair value of the asset," as compared to the 90% threshold used in the United States. Finally, IFRS contain other indicators that are not specified under U.S. standards such as if the lessor's losses due to the cancellation of the lease by the lessee are borne by the lessee and any gains or losses due to changes in the fair value of the leased asset are captured by the lessee. U.S. standards also contain more detailed disclosures related to lease maturities.

Source: IAS 17 (See Appendix C at the end of this book.)

# QUICK CHECK 21-3

- A lessor accounts for an operating lease as a rental agreement.
  - The lessor records rental revenue each period and includes the leased equipment on its balance sheet as part of property, plant, and equipment.
  - The lessor depreciates the leased equipment over its estimated economic life.
  - Executory costs paid by the lessor are recorded as operating expenses and matched against rental revenue.
  - Any initial direct costs (costs incurred from directly originating the lease) are recorded as an asset and amortized over the lease term.
- For a direct financing lease, the lessor removes the carrying value of the leased equipment and records a gross receivable equal to the undiscounted minimum lease payments plus any unquaranteed residual value. The difference between the gross receivable and the carrying value of the leased property is recorded as unearned interest revenue (a contra-account to the lease receivable).
  - The gross receivable includes the residual value, whether it is guaranteed or unguaranteed.
  - Executory costs are not included in the gross receivable or the present value calculations.
  - The lessor's net investment in the lease (the lease receivable less unearned revenue) is reported as current or noncurrent using the present value of next year's payments approach or the change in present value approach.
  - Interest revenue is recorded each period and is computed using the effective interest method based on the interest rate implicit in the lease.
  - Any initial direct costs are deferred and recognized over the lease term by reducing unearned interest revenue based on a newly computed implicit interest rate.

(Continued)

- For a sales-type lease, the lessor recognizes a manufacturer's or dealer's profit or loss at the inception of the lease in addition to interest revenue over the lease term (like in a direct financing lease).
  - The manufacturer's or dealer's profit is measured as the difference between (1) the present value of the minimum lease payments (sales revenue) and (2) the cost of the asset less the present value of the unguaranteed residual value (cost of asset leased).
  - If the residual value is guaranteed by the lessee, the present value of this amount is not subtracted from the cost of the asset and is included in sales revenue.
  - Any initial direct costs are expensed at the inception of the lease.

## Appendix: Specialized Lease Issues and **CHANGES IN LEASE PROVISIONS**

Some companies engage in specialized leases. We discuss three specialized lease issues briefly in this Appendix: (1) real estate leases, (2) sales-leaseback transactions, and (3) leveraged leases. Other companies may be involved in lease agreements whose provisions are modified. We also briefly discuss changes in lease provisions.

9 Understand lease issues related to real estate, saleleaseback issues, leveraged leases, and changes in lease provisions (Appendix).

## LEASE ISSUES RELATED TO REAL ESTATE

In the main portion of this chapter we discussed operating and capital leases of equipment. Special issues are involved in the classification of leases that include land, either alone or in combination with buildings or equipment.20 We show the differences in the classification of leases involving real estate in Exhibit 21-8.

## **Lease of Land Only**

If land is the only item of property leased, the lessee accounts for the lease as a capital lease only if the lease transfers ownership at the end of the lease, or includes a bargain purchase option. Otherwise, the lessee accounts for the lease as an operating lease. (The criteria dealing with the 75% of the estimated economic life and the 90% of the fair value of the leased property do not apply because the asset would have to be depreciated over the lease life. Such a situation would be inappropriate for land.) The lessee does not depreciate the asset, Leased Land Under Capital Leases, because title to the land is expected to be transferred, and land is not subject to depreciation. The lessor accounts for the lease of land as a sales-type lease if (1) the lease transfers ownership or contains a bargain purchase option, (2) the lease meets both the collectibility and uncertainty criteria, and (3) there is a dealer's profit or loss. If the criteria for a sales-type lease are met with the exception that there is no dealer's profit or loss, then the lease qualifies as a direct financing one. Otherwise, it is an operating lease.

## Lease of Both Land and Buildings That Transfers Title or Contains a **Bargain Purchase Option**

When both land and buildings are leased, a new issue arises as to the classification of the lease because one portion involves a depreciable asset with an estimated economic life and the other involves a nondepreciable asset. This lease is accounted for either as (1) a lease of both land and buildings that meets criteria 1 and 2 of Column A (Part I) of Exhibit 21-8, or (2) a lease of both land and buildings that does not meet either criterion 1 or 2.

#### EXHIBIT 21-8 **Classification of Leases Involving Real Property**

I. General Criteria for Classifying Leases (Brief titles are given in this exhibit; see Exhibit 21-2 for fuller titles)

### Column A **Criteria Applicable to Both Lessees and Lessors**

- 1. Transfer of ownership
- 2. Contains bargain purchase option
- 3. Lease term is 75% or more of economic life
- 4. Present value of minimum lease payments is 90% or more of fair value
- II. Lease of Land Only

#### A. Lessee

- 1. Capital lease. Lease must meet either criterion 1 or 2 in Column A (Part I). (Criteria 3 and 4 are *not* applicable.)
- 2. Operating lease. Lease must not meet either criterion 1 or 2 in Column A (Part I).

### Column B **Criteria Applicable to Lessors Only**

- 1. Collectibility reasonably assured
- 2. No uncertainties

#### B. Lessor

- 1. Sales-type lease. Lease must
  - a. Meet either criterion 1 or 2 in Column A (Part I), and
  - b. Meet both criteria in Column B (Part I), and
  - c. Result in a dealer's profit or loss.
- 2. Direct financing lease. Lease must meet
  - a. Either criterion 1 or 2 in Column A (Part I), and
  - b. Both criteria in Column B (Part I).
- 3. Operating lease. Lease that does not qualify as a sales-type or direct financing lease.

- III. Lease of Both Land and Buildings
  - A. Lease of both land and buildings that transfers ownership or contains a bargain purchase option

#### 1. Lessee

a. Capital lease. The lease is a capital lease since one or more of the criteria of Column A (Part I) are met. Land and buildings are separately capitalized.

#### 2. Lessor

- a. Sales-type lease. The two assets, land and buildings, are considered as a single unit and the lease must
  - (1) Meet either criterion 1 or 2 in Column A (Part I), and
  - (2) Meet both criteria in Column B (Part I), and
  - (3) Result in a dealer's profit or loss.
- b. *Direct financing lease*. The lease of the two assets combined must meet
  - (1) Either criterion 1 or 2 in Column A (Part I), and
  - (2) Both criteria in Column B (Part I).
- B. If lease meets neither criterion 1 nor criterion 2 in Column A (Part I), and if fair value of land is less than 25% of fair value of both land and buildings. (The land portion is ignored and the classification is determined using the characteristics of building.)
  - 1. Lessee
    - a. Capital lease. Lease must meet either criterion 3 or 4 in Column A (Part I).
    - b. Operating lease. Lease meets none of the criteria in Column A (Part I).

- a. Sales-type lease. Lease must
  - (1) Meet either criterion 3 or 4 in Column A (Part I), and
  - (2) Meet both criteria in Column B (Part I), and
  - (3) Result in a dealer's profit or loss.
- b. Direct financing lease. Lease must meet
  - (1) Either criterion 3 or 4 in Column A (Part I), and
  - (2) Both criteria in Column B (Part I).
- c. Operating Lease. Lease that does not qualify as a sales-type or direct financing lease.
- C. If lease meets neither criterion 1 nor criterion 2 in Column A (Part I), and if fair value of land is more than 25% of fair value of both land and buildings. (The lease is separated into land and building portions.)
  - - a. Land portion. Always an operating lease.
    - b. Building portion. Classified by remaining criteria of Column A (Part I).

### 2. Lessor

- a. Land portion. Always an operating lease.
- b. Building portion. Classified by remaining criteria of Columns A and B (Part I).

#### Lessee's Accounting

For a capital lease of land and buildings that transfers ownership or that contains a bargain purchase option, the lessee allocates the present value of the minimum lease payments between the two leased assets in proportion to their fair values at the inception of the lease (Exhibit 21-8, IIIA). It depreciates the amount assigned to Leased Buildings over the estimated economic life of the buildings. It does not depreciate the amount assigned to Leased Land.

### Lessor's Accounting

The lessor accounts for the lease as a single unit, either as a direct financing, a sales-type, or an operating lease. The term single unit means that for a sales-type or direct financing lease, the lessor uses one Lease Receivable account to record the appropriate values for the lease of both land and buildings. In the original lease entry, however, the lessor credits both the land and the buildings accounts.

## Lease of Land and Buildings That Does Not Transfer **Title or Include a Bargain Purchase Option**

#### Value of Land Is Less Than 25%

If a lease of land and buildings does not transfer ownership or include a bargain purchase option, it is a capital lease if it meets one of the other two criteria. If the fair value of the land is less than 25% of the total fair value of the leased property at the inception of the lease, the land is considered to be immaterial. Therefore, both the lessee and the lessor treat the land and buildings as a single unit. Note that the estimated economic life of the building is used as the economic life of the unit.

- 1. Lessee's Accounting. If either criterion 3 or 4 of Column A (Part I) of Exhibit 21-8 is met, the lessee classifies the lease as a capital lease and recognizes the leased land and buildings as a single asset. It depreciates the total amount over the term of the lease, even though it is implicitly depreciating the land portion of the asset. If the lease does not meet any of the criteria in Column A (Part I), it is an operating lease.
- 2. Lessor's Accounting. If the lease meets either criterion 3 or 4 of Column A (Part I) of Exhibit 21-8 and both of the criteria of Column B (Part I), the lessor accounts for the lease as a single unit, as either a direct financing or a sales-type lease as appropriate. Otherwise, the lease is an operating lease.

### Value of Land Is More Than 25%

On the other hand, if at the inception of the lease the land represents 25% or more of the fair value of the leased property, the amount of the land is considered to be a material amount. Then, both the lessee and the lessor must treat the land and the buildings separately for purposes of applying the criteria listed in Exhibit 21-8. In this case, the lessee and lessor separate the minimum lease payments into amounts applicable to land and to buildings. Since the lease of the land results in an operating lease, the best way to make the preceding calculation is to determine the fair value of land, and then use the appropriate interest rate to determine the periodic minimum lease payments applicable to the land portion, as follows:

The periodic minimum lease payments applicable to both land and buildings, less the amount calculated, is the amount attributed to the buildings.

1. Lessee's Accounting. Once the amount assigned to the buildings is determined, if the building portion of the lease meets either criterion 3 or 4 of Column A (Part I) of Exhibit 21-8, the lessee accounts for it as a capital lease. The lessee depreciates the present value amount assigned to the asset, Leased Buildings, over the life of the lease. It accounts for the land portion of the lease separately as an operating lease. Therefore, if the buildings portion of the lease meets neither criterion 3 nor 4 of Column A (Part I) of Exhibit 21-8, the lessee accounts for both the buildings and the land as a single operating lease.

2. Lessor's Accounting. If the buildings portion of the lease meets either criterion 3 or 4 of Column A (Part I) and both criteria of Column B of Exhibit 21-8, the lessor accounts for the lease as a direct financing or sales-type lease, depending on whether there is a manufacturer's or dealer's profit or loss. It accounts for the land portion of the lease separately as an operating lease. If the buildings portion of the lease does not meet the relevant criteria, the lessor accounts for both the buildings and land as a single operating lease.

### Lease Involving Equipment as Well as Real Estate

If a lease involves both equipment and real estate, the portion of the minimum lease payments for the equipment portion of the lease is estimated. The equipment then is treated separately when applying the criteria we list in Exhibit 21-8. It is accounted for separately according to its classification by both the lessee and lessor. The accounting for the remaining real estate portion follows the accounting standards described in the preceding section.

## **SALE-LEASEBACK ISSUES**

If a company has limited cash or decides it does not want to be responsible for owning the property, it may sell an asset (often land and buildings, but not real property exclusively) and then immediately lease it back from the buyer. This kind of transaction may be advantageous to both the lessee and lessor: The lessee receives cash from the sale that is needed for its activities, and may derive a tax advantage. The lessor acquires an asset.

The sale of the asset and the leaseback are considered to be a single transaction that is like a secured loan, with the creditor obtaining legal title to the asset. The sales price of the asset, any profit earned, and the minimum lease payments must be considered together. If the lease meets one of the criteria for treatment as a capital lease (see Exhibit 21-2), the seller-lessee accounts for the lease as a capital lease. 21 Otherwise, it accounts for the lease as an operating lease. It defers any profit on the sale. If the lease is a capital lease, the lessee amortizes the profit in proportion to the depreciation of the leased asset. If the lease is an operating lease, the lessee amortizes the profit in proportion to the payments over the period of time it expects the asset to be used. However, when the fair value of the property at the time of the transaction is less than its undepreciated cost, it recognizes a loss immediately up to the amount of the difference between the undepreciated cost and fair value.22

## **Lessor's Accounting Issues**

The purchaser-lessor follows the principles we discussed in the preceding sections to account for the purchase of the asset and the immediate lease of it back to the seller. From the lessor's point of view, no new issues are involved, so we do not show its accounting here.

## Lessee's Accounting Issues

If the lease meets at least one of the four criteria in Column A of Exhibit 21-2, the sellerlessee accounts for the lease as a capital lease. If none of the criteria are met, the sellerlessee accounts for the lease as an operating lease. The accounting for the main provisions of the lease follows the procedures we already illustrated. The primary new issue from the lessee's viewpoint is the accounting for the profit or loss on the sale of the property by the seller-lessee.

<sup>21.</sup> A sale-leaseback transaction involving real estate must qualify as a sale under the provisions of FASB Statement No. 66, "Accounting for Sales of Real Estate" (FASB Cod. # 360-20).

<sup>22.</sup> FASB Statement No. 13, op. cit., par. 33 (FASB Cod. # 840-40-25).

### **Example: Sale-Leaseback (Lessee Accounting)**

Assume that on January 1, 2010, the High Point Railroad built ten boxcars costing \$400,000. Because of a cash flow problem resulting from this new acquisition, High Point decided to sell these boxcars immediately to Landlord Company for \$600,000, and then lease them back under the conditions we show in Example 21-15.

#### Terms and Provisions of Lease Agreement Between Landlord **EXAMPLE 21-15** Company and High Point Railroad Dated January 1, 2010

- 1. The cost of the boxcars to High Point Railroad (the seller-lessee) is \$400,000. The selling price to Landlord Company (the purchaser-lessor) is \$600,000; thus, this amount becomes the new cost of the equipment to the seller-lessee.
- 2. The term of the lease is 15 years, with annual payments of \$92,771.13 in advance at the beginning of each year. The estimated economic life of the equipment is 20 years, with no expected residual value at the end of this time. (The residual value at the end of 15 years is not considered because title passes at that time.)
- 3. The High Point Railroad agrees to pay all executory costs.
- 4. Title to the boxcars will be transferred to the seller-lessee at the end of lease term.
- 5. The interest rate implicit on the lease is 16%. High Point Railroad knows this rate, and the rate equals its incremental borrowing rate.
- 6. The present value of 15 payments of \$92,771.13 at 16% on an annuity-due basis is \$600,000, calculated as follows:

Present value of 15 amounts in advance at 16% 
$$= 6.467529 \times $92,771.13$$
  
 $= $600,000 \text{ (rounded)}$ 

7. The lease qualifies as a capital lease to High Point Railroad, since it meets the criteria stated in Exhibit 21-2.

Typical journal entries to record the information related to the preceding saleleaseback for High Point Railroad (the seller-lessee) for 2010 are as follows:

1. Build ten boxcars

**Capital Lease Obligation** 

Cash

**Boxcars** 400,000.00 Cash, etc. 400,000.00

2. Sale of the Boxcars to Landlord Company on January 1, 2010

Cash 600,000.00 **Boxcars** 400,000.00 Unearned Gain on Sale-Leaseback 200,000.00

High Point includes the Unearned Gain on Sale-Leaseback in the liability section of its balance sheet.

3. Initial Recording of the Leaseback as a Capital Lease on January 1, 2010

|    | Leased Boxcars                    | 600,000.00 |            |
|----|-----------------------------------|------------|------------|
|    | Capital Lease Obligation          |            | 600,000.00 |
| 4. | Annual Payment on January 1, 2010 |            |            |

92,771.13

92,771.13

14,600.00

5. Payment of Executory Costs on Various Dates in 2010 (amounts assumed)

| Insurance Expense               | 2,600.00 |
|---------------------------------|----------|
| Repairs and Maintenance Expense | 2,300.00 |
| Property Tax Expense            | 9,700.00 |
| Cash                            |          |

6. Recording Depreciation of Boxcars on December 31, 2010

#### **Depreciation Expense: Leased Boxcars** 30,000.00

**Accumulated Depreciation: Leased Boxcars** 

30,000.00

High Point uses the straight-line method and a life of 20 years because ownership is transferred at the end of the lease. Depreciation for 2010 is \$30,000  $(\$600,000 \div 20).$ 

7. Amortization of Unearned Gain on Sale-Leaseback on December 31, 2010

**Unearned Gain on Sale-Leaseback** Gain on Sale-Leaseback (or Depreciation Expense: Leased Boxcars)

10,000.00

10,000.00

The amortization is \$10,000 (\$200,000  $\div$  20). Note that High Point amortizes the Unearned Gain on Sale-Leaseback and recognizes the gain over a 20-year period. For a capital lease, GAAP requires that a seller-lessee recognize any gain using the same rate that it used to depreciate the Leased Boxcars. For an operating lease, the sellerlessee defers such gain (or loss) and amortizes the amount in proportion to the lease payments over the period it expects to use the leased assets. A loss would be recorded by the seller-lessee if the book value or carrying amount were larger than the fair value of the asset. The seller-lessee recognizes the entire amount of this loss in the year of the sale-leaseback.

8. Recognition of Interest Expense on December 31, 2010

### **Interest Expense Capital Lease Obligation**

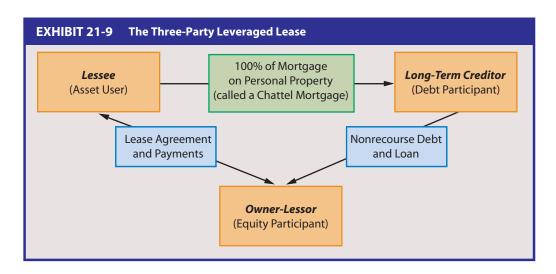

81,156.62

81,156.62

This year-end adjusting entry is the same as that made for any capital lease for which the payment is made in advance. High Point calculates the amount as \$81,156.62 [16% × (\$600,000 − \$92,771.13)]. ♦

### **Leveraged Leases**

A leveraged lease is a special arrangement involving three different participants to the agreement: (1) the equity participant (the owner-lessor), (2) the asset user (the lessee), and (3) the debt participant (the long-term creditor who provides nonrecourse financing for the leasing transaction between the lessee and lessor). Exhibit 21-9 shows the interrelated activities of the three parties to a leveraged lease. If the

owner-lessor buys the equipment from a manufacturer, a fourth party to the transaction would be involved.

The SEC estimates that public companies have approximately \$1.3 trillion of cash flow commitments for leases. Many of these leases are leveraged leases. Leveraged leasing arrangements began in the late 1960s and have grown rapidly since then. The lease is designed to provide income tax benefits to the three parties involved in the transaction. The lessor may be able to retain various tax credits, and also can immediately recognize all the cost of the asset as an income tax deduction. The lessee receives the right to income tax deductions for the rent of land, buildings, and other personal property. The creditor receives the tax protection provided for the leveraged lease contract.

From the standpoint of the lessee, no new accounting issues arise. It classifies a leveraged lease and accounts for it in the same way as a nonleveraged lease. GAAP requires that the lessor classify a leveraged lease as a direct financing lease, since no manufacturer's or dealer's profit can arise from the transaction and therefore it cannot be classified as a sales-type lease.23

The lessor records its investment in a leveraged lease net of the nonrecourse debt, which usually consists of the (1) rental receivables, net of that portion applicable to the nonrecourse debt; (2) amount of any tax credits to be realized on the transaction; (3) estimated residual value of the leased asset; and (4) reduction for the unearned revenue items. Since leveraged leases are complex financial arrangements that vary in structure, the lessor's accounting for them is also complex and is beyond the scope of this book.24

## CHANGES IN LEASE PROVISIONS

As we discussed earlier, lease contracts are written with many provisions, including renewal, extension, or purchase options, and penalties. Lessees and lessors may opt to change certain provisions that, in effect, change the classification of the lease. If at any time the lessee and lessor change a lease (other than by renewing or extending its term) so that the lease would have been classified differently had the changed terms been in effect at the beginning of the lease term, the revised agreement is considered a new agreement. The new agreement is reclassified as operating, direct financing, or sales-type, according to the criteria in Exhibit 21-2.

GAAP also addresses the issue of renewals and extensions. A change in an operating lease to a direct financing or sales-type lease presents the fewest issues, since the accounting for the new lease would be similar to that described earlier in the chapter. The most complex issue involves a change in either a sales-type or direct financing lease. We briefly discuss some of the possible lease provision changes in the following sections.

## Impact of Renewal of Lease on Guarantee of Residual Value

Suppose, for example, a lessee records a lease as a capital lease while the lessor records it as a direct financing lease, and the lease contains a guarantee of the residual value of the leased property. If at the end of the lease term the lessee elects to renew the lease, this election would cancel the guarantee of residual value. The renewal, however, is not treated as a new agreement, because there is no change in the lease classification. The lessee adjusts the remaining balances of the asset and obligation from the original lease. The amount of the adjustment is equal to the difference between the present value of the

<sup>23.</sup> Ibid., par. 41-47 (FASB Cod. # 840-30).

<sup>24.</sup> See Appendix E of FASB Statement No. 13, Appendix E (FASB Cod. # 840-33-55), for an illustration of the accounting and financial statement presentation of leveraged leases.

future minimum lease payments under the new renewal agreement and the existing present balance of the obligation.

## Changes to Sales-Type or Direct Financing Lease Prior to Lease Term **Expiration That Change the Lease to an Operating Lease**

If changes are made in either sales-type or direct financing lease provisions before the expiration of the lease, and if these changes would have caused the original agreement to be classified as an operating lease, the lessor removes the remaining net investment from its accounts. It replaces the Lease Receivable with an asset at its original cost, fair value, or carrying amount, whichever is lowest, and reports any net adjustment as an operating loss in the period of change. It then accounts for the new lease as any other operating lease.

An exception occurs when a guarantee or penalty becomes inoperative. In this case, if the renewal or extension results in an operating lease, the lessor continues to account for the existing lease as either a sales-type or direct financing lease (depending on the original classification) to the end of its original term. It then accounts for the renewal or extension as any other operating lease. The accounting by the lessee follows a similar pattern.

### Renewal of Sales-Type or Direct Financing Lease Resulting in a New Lease That Qualifies as a Sales-Type Lease

The accounting for a renewal of sales-type and direct financing leases that results in a lease that qualifies again as a sales-type lease is complex. When an existing sales-type or direct financing lease is renewed during the term of the lease, the lessor can not classify the renewal lease as a sales-type lease even though it meets the necessary criteria. This renewal lease had to be treated as a direct financing lease. If the renewal takes place at the end of the lease (or during the last few months of the existing lease), the lease change can qualify as a sales-type lease. We discuss these two renewal situations briefly.

#### **Renewal Occurring During Lease Term**

The FASB concluded that if a lessor treated a renewal of a sales-type or direct financing lease as a sales-type lease at the time of an interim renewal, a "second sale" would result in recognition of revenue before its realization. For this reason, GAAP requires that a lessor classify a renewal of an existing sales-type or direct financing lease that otherwise qualifies as a sales-type lease as a direct financing lease if the lease change occurs during the term of the lease.

### Renewal Occurring at End of Lease Term

If the renewal occurs at the end of the lease term, and if the new agreement qualified as a sales-type lease (according to criteria stated in Exhibit 21-2), GAAP requires the lessor to account for the renewal as a sales-type lease at the end of the original term of the existing lease.

Many other changes may be made in lease terms. These often involve complex changes in accounting and, thus, require careful consideration. The preceding discussion indicates the scope of the issues. An accountant faced with new changes should study carefully all current standards before taking action on a particular change.

## SUMMARY

At the beginning of the chapter, we identified several objectives you would accomplish after reading the chapter. The objectives are listed below, each followed by a brief summary of the key points in the chapter discussion.

- 1. Explain the advantages of leasing. For the lessee, a lease may involve financing benefits, a risk benefit, a tax benefit, a financial reporting benefit, and a billing benefit. For the lessor, a lease may involve the benefits of indirectly making a sale, and an alternative means of obtaining a profit opportunity.
- 2. **Understand key terms related to leasing.** The key terms related to leasing are included in Exhibit 21-1.
- 3. Explain how to classify leases. A lessee classifies a lease as a capital lease if it meets any one of the four capitalization criteria (listed in Exhibit 21-2), and as an operating lease if it meets none of the four criteria. A lessor classifies a lease as a sales-type lease if it meets any one of the four capitalization criteria, both of the additional criteria, and involves a manufacturer's or dealer's profit or loss. A lessor classifies a lease as a direct financing lease if it meets any one of the four capitalization criteria, both of the additional criteria, and does not result in a manufacturer's or dealer's profit or loss. A lessor classifies a lease as an operating lease if it meets none of the four criteria.
- 4. Account for a lessee's operating and capital leases. A lessee accounts for an operating lease by expensing the periodic lease payments. For a capital lease, the lessee records an asset and a liability equal to the present value, at the beginning of the lease term, of the minimum lease payments during the lease term. The discount rate is the lower of the lessee's incremental borrowing rate or the lessor's implicit rate if known and lower. The lessee depreciates the asset over its economic life if the lease contained a transfer of ownership or a bargain purchase option. Otherwise, the lessee uses the lease life. The lessee computes interest expense using the effective interest rate, and reduces the lease obligation for the difference between the cash paid and the interest expense.
- 5. **Understand disclosures by lessees.** The disclosure requirements of the lessee are summarized in Exhibit 21-5. Among the most important are the future minimum lease payments for each of the succeeding five years and in total, separately reported for its operating and capital leases.
- 6. Account for a lessor's operating, direct financing, and sales-type leases. A lessor accounts for an operating lease by recording the amounts of the periodic lease receipts as revenue. It also reports the asset on its balance sheet and records depreciation on the asset. For a direct financing lease, the lessor records a receivable at the undiscounted minimum lease payments plus any unguaranteed residual value. The difference between the receivable and the carrying value of the leased property is recorded as a contra-account to the receivable. The lessor computes interest revenue on a direct financing lease using its implicit interest rate. For a sales-type lease, the lessor records a receivable at the undiscounted minimum lease payments plus any unguaranteed residual value. It records a contra-account to the receivable as the difference between the gross receivable and the present value of the components of the receivable. The lessor also expenses the cost or carrying value of the property, plus any initial direct costs, minus the present value of any unguaranteed residual value. The lessor computes interest revenue on a sales-type lease using its implicit interest rate.
- 7. **Understand disclosures by lessors.** The disclosure requirements of the lessor are summarized in Exhibit 21-6. Among the most important are the future minimum lease payments for each of the succeeding five years and in total, separately for operating and capital leases.
- 8. Explain the conceptual issues regarding leases. The primary conceptual issue is whether the four capitalization criteria appropriately measure the transfer of the risks and benefits of ownership. A related issue is whether it is too easy for a lessee to avoid meeting any of the criteria and therefore not reporting the lease liability (and asset) on its balance sheet.
- 9. Understand lease issues related to real estate, sale-leaseback issues, leveraged leases, and changes in lease provisions (Appendix). Leases of real estate follow special rules that are summarized in Exhibit 21-8. The primary issue in a sale-leaseback is that the seller-lessee recognizes a loss in the period of the transaction, but defers any gain and amortizes it over the remaining life of the lease. Leveraged leases involve three parties: the lessor, the lessee, and a long-term creditor who provides nonrecourse financing for the leasing transaction. When the lease provisions are changed in such a way that the lease would have been classified differently had the changed terms been in effect at the beginning of the lease term, the revised agreement is considered a new agreement.

## NSWERS TO REAL REPORT QUESTIONS

#### **Real Report 21-1 Answers**

1. Operating leases provide many benefits to the lessee. The use of long-term operating leases for stores and equipment may provide Wal-Mart considerable flexibility. For example, the renewal options allow Wal-Mart to continue to operate profitable locations, and for less profitable locations, the company may have lower expenses due to contingent rentals while relocating these stores can be accomplished relatively easily by choosing not to exercise renewal options. Such flexibility can be a significant reduction in

- the company's risk. In addition, the use of operating leases provides a financial reporting benefit in that the lease does not add an asset or liability to Wal-Mart's balance sheet which generally results in "better" debt and return ratios.
- 2. The present value of the minimum lease payments for Wal-Mart's capital leases is \$3,919 million. This amount is included in the liability section of Wal-Mart's balance sheet with a portion classified as a current liability and a portion classified as a noncurrent liability (based on either the present value of next year's payments approach or the change in present value approach). In addition, the present value of the minimum lease payments at the inception of the lease less accumulated depreciation is included in the property, plant, and equipment section of the balance sheet.
- 3. The classification of Wal-Mart's operating leases as capital leases would result in a deterioration of Wal-Mart's debt ratio. The debt ratio is 60.5% (\$98,906 million ÷

\$163,514 million). Assuming a rate of interest of 10%, annual lease payments in advance, and a lease term of 15 years, assets and liabilities would be increased by the present value of the lease payments of approximately \$7,824 million (see calculations below). This would result in an increase in Wal-Mart's debt ratio to 62.3% (\$106,730 million ÷ \$171,338 million).

Payment Schedule (in millions)

| Year       | Payment | Present Value |
|------------|---------|---------------|
| 2009       | \$1,094 | \$1,094       |
| 2010       | 1,051   | 955           |
| 2011       | 994     | 821           |
| 2012       | 866     | 651           |
| 2013       | 788     | 538           |
| Thereafter | 897*    | 3,765         |
|            |         | \$7,824       |

\*( $\$8,966 \div 10 \text{ years}$ )

## QUESTIONS

- **Q21-1** What does GAAP provide in reference to the measuring and reporting of leases?
- Q21-2 List seven advantages to the lessee of leasing, as compared with purchasing, an asset.
- **Q21-3** Assume that a lessee leases equipment and insists on terms that qualify it as an operating lease, barely escaping the qualification as a capital lease. Discuss the impact that such an operating lease has on financial statements and related financial information as compared to the effect that a capital lease would have.
- **Q21-4** Define the following terms: (a) lease, (b) sales-type lease, (c) direct financing lease, (d) sale-leaseback transaction, (e) operating lease, (f) leveraged lease.
- **Q21-5** Define the following terms: (a) inception of lease, (b) bargain purchase option, (c) unguaranteed residual value, (d) implicit interest rate, (e) initial direct costs.
- Q21-6 What components make up the minimum lease payments of a typical capital lease?
- **Q21-7** List the four criteria used to determine if a lease is classified as a capital lease by the lessee.
- Q21-8 Describe briefly the accounting procedures followed by the lessor and by the lessee for an operating lease.
- **Q21-9** Describe briefly the procedures followed by the lessee to account for a capital lease.
- **Q21-10** From the standpoint of the lessor, a sales-type lease must meet one or more of the criteria of a capital lease as well as two additional criteria. Name these two additional
- Q21-11 What is the basic difference between the accounting procedures used by a lessor for a sales-type lease and those used for a direct financing lease?

- **Q21-12** Why are compound interest concepts appropriate and applicable in accounting for a direct financing lease?
- Q21-13 The Owens Company leased equipment for four years at \$50,000 a month, with an option to renew the lease for six years at \$2,000 per month or to purchase the equipment for \$25,000 (a price considerably less than the expected fair value) after the initial lease term of four years. How does Owens Company record this transaction?
- Q21-14 McFarland Corporation leased equipment under a lease calling for the payment of \$50,000 a year in rent. At the end of the current year, when the capital lease had a remaining term of 20 years, McFarland Company subleased the asset for a rental of \$75,000 a year for 20 years. The new lease is acceptable to the lessor, who agrees that McFarland Company has completed its primary obligation. When will McFarland Company report the gain from this transaction? Explain.
- **Q21-15** (a) What disclosures are lessees required to make? (b) What disclosures are lessors required to make for various types of leases?
- Q21-16 What are the two types of lease classifications defined by IFRS?
- **Q21-17** Discuss the similarities and differences between the indicators of finance leases under IFRS and the criteria for capitalizing leases under U.S. GAAP.
- **Q21-18 (Appendix)** From the point of view of the sellerlessee, what is the primary accounting issue involved in accounting for a sale-leaseback transaction as compared to other lessee transactions? Discuss.
- Q21-19 (Appendix) What distinguishes a leveraged lease from other leases? What, if any, is the major difference in the accounting of the lessee for a leveraged lease?

## MULTIPLE CHOICE (AICPA Adapted)

Select the best answer for each of the following.

**M21-1** The present value of the minimum lease payments should be used by the lessee in the determination of a(an)

|    | Capital         | Operating       |
|----|-----------------|-----------------|
|    | Lease Liability | Lease Liability |
| a. | Yes             | No              |
| b. | Yes             | Yes             |
| c. | No              | Yes             |
| d. | No              | No              |

M21-2 East Company leased a new machine from North Company on May 1, 2010 under a lease with the following information:

| Lease term                                | 10 years |
|---|----------|
| Annual rental payable at beginning of     | ŕ        |
| each lease year                           | \$40,000 |
| Useful life of machine                    | 12 years |
| Implicit interest rate                    | 14%      |
| Present value factor for an annuity of 1  |          |
| in advance for 10 periods at 14%          | 5.95     |
| Present value factor for 1 for 10 periods |          |
| at 14%                                    | 0.27     |

East has the option to purchase the machine on May 1, 2020 by paying \$50,000, which approximates the expected fair value of the machine on the option exercise date. On May 1, 2010 East should record a capitalized lease asset of

c. \$224,500 a. \$251,500 b. \$238,000 d. \$198,000

**M21-3** For a lease that transfers ownership of the property to the lessee by the end of the lease term, the lessee should

- a. Record the minimum lease payment as an expense
- b. Amortize the capitalizable cost of the property using the interest method
- c. Depreciate the capitalizable cost of the property in a manner consistent with the lessee's normal depreciation policy for owned assets, except that the period of depreciation should be the lease term
- d. Depreciate the capitalizable cost of the property in a manner consistent with the lessee's normal depreciation policy for owned assets

Items 4 and 5 are based on the following information:

Fox Company, a dealer in machinery and equipment, leased equipment to Tiger, Inc. on July 1, 2010. The lease is appropriately accounted for as a sale by Fox and as a purchase by Tiger. The lease is for a 10-year period (the useful life of the asset) expiring June 30, 2020. The first of 10 equal annual payments of \$500,000 was made on July 1, 2010. Fox had purchased the equipment for \$2,675,000 on January 1, 2010 and established a list selling price of \$3,375,000 on the equipment. Assume that the present value at July 1, 2010 of the rent payments over the lease term, discounted at 12% (the appropriate interest rate), was \$3,165,000.

M21-4 What is the amount of profit on the sale and the amount of interest income that Fox should record for the vear ended December 31, 2010?

- a. \$0 and \$159,900
- b. \$490,000 and \$159,900
- c. \$490,000 and \$189,900
- d. \$700,000 and \$189,900

M21-5 Assuming that Tiger uses straight-line depreciation, what is the amount of depreciation and interest expense that Tiger should record for the year ended December 31, 2010?

- a. \$158,250 and \$159,900
- b. \$158,250 and \$189,900
- c. \$168,750 and \$159,900
- d. \$168,750 and \$189,900

**M21-6** Rent received in advance by the lessor for an operating lease should be recognized as revenue

- a. When received
- b. At the lease's inception
- c. In the period specified by the lease
- d. At the lease's expiration

M21-7 For a six-year capital lease, the portion of the minimum lease payment applicable in the third year to the reduction of the obligation should be

- a. Less than in the second year
- b. More than in the second year
- c. The same as in the fourth year
- d. More than in the fourth year

M21-8 On January 2, 2010, Lafayette Machine Shops, Inc., signed a 10-year noncancelable lease for a heavy-duty drill press, stipulating annual payments of \$15,000 starting at the end of the first year, with title passing to Lafayette at the expiration of the lease. Lafavette treated this transaction as a capital lease. The drill press has an estimated useful life of 15 years, with no salvage value. Lafayette uses straight-line depreciation for all of its fixed assets. Aggregate lease payments were determined to have a present value of \$92,170, based on implicit interest of 10%. For 2010 Lafayette should record

|    | Interest | Depreciation |
|----|----------|--------------|
|    | Expense  | Expense      |
| a. | \$ 0     | \$ 0         |
| b. | \$7,717  | \$6,145      |
| c. | \$9,217  | \$6,145      |
| d. | \$9,217  | \$9,217      |

M21-9 On August 1, 2010, Kern Company leased a machine to Day Company for a six-year period requiring payments of \$10,000 at the beginning of each year. The machine cost \$48,000, which is the fair value at the lease date, and has a useful life of eight years with no residual value. Kern's implicit interest rate is 10% and present value factors are as follows:

Present value for an annuity due of \$1 at 10% for six periods

4.791

Present value for an annuity due of \$1 at 10% for eight periods

5.868

Kern appropriately recorded the lease as a direct financing lease. At the inception of the lease, the gross lease receivables account balance should be

a. \$60,000 c. \$48,000 b. \$58,680 d. \$47,910

M21-10 At its inception, the lease term of Lease G is 65% of the estimated remaining economic life of the leased property. This lease contains a bargain purchase option. The lessee should record Lease G as

- a. Neither an asset nor a liability
- b. An asset but not a liability
- c. An expense
- d. An asset and a liability

## REVIEW EXERCISES

RE21-1 Keller Corporation (the lessee) entered into an equipment lease with Dallo Company (the lessor) on January 1 of Year 1. Use the following information to decide whether this lease qualifies as an operating or capital lease for Keller, and give an explanation using the four classification criteria.

- 1. The equipment reverts back to the lessor at the end of the lease, and there is no bargain purchase option.
- 2. The lease term is eight years and requires annual payments of \$10,000 at the end of each year.
- 3. The fair value of the equipment at lease inception is \$100,000. Assume that the present value of minimum lease pay-
- 4. The equipment has an estimated economic life of 20 years and has zero residual value at the end of this time.

**RE21-2** Use the information in RE21-1. Prepare the journal entry that Keller Corporation would make each year assuming the lease is classified as an operating lease.

RE21-3 Garvey Company (the lessee) entered into an equipment lease with Richie Company (the lessor) on January 1 of Year 1. Use the following information to decide whether this lease qualifies as an operating or capital lease for Garvey, and give an explanation using the four classification criteria.

- 1. The equipment reverts back to the lessor at the end of the lease, and there is no bargain purchase option.
- 2. The lease term is five years and requires Garvey to make annual payments of \$65,949.37 at the end of each year.
- 3. The discount rate is 10%, which is implicit in the lease. Garvey knows this, and this rate is lower than its incremental borrowing rate.
- 4. The fair value of the equipment at the lease inception is \$250,000. The present value of an ordinary annuity of five payments of \$65,949.37 each at 10% is \$250,000.
- 5. The equipment has an estimated economic life of seven years and has zero residual value at the end of this time. Straight-line depreciation is used for similar assets.

RE21-4 Use the information in RE21-3. Prepare the journal entries that Garvey Company would make in the first year of the lease assuming the lease is classified as a capital lease. Assume that Garvey is required to make payments on December 31 each year.

**RE21-5** Use the information in RE21-3. Prepare the journal entries that Garvey Company company would make in the first year of the lease assuming the lease is classified as a capital lease. However, assume that Garvey is now required to make the \$65,949.37 payments on January 1 each year and that the fair value at the lease inception is now \$275,000 (\$65,949.37  $\times$ 4.169865).

RE21-6 Montevallo Corporation leased equipment from Folio Company. The lease term is 10 years, requires payments of \$25,000 at the end of each year, and contains a bargain purchase option. At the end of the lease Montevallo has an option to pay \$4,000 (which is much less than the estimated fair value at that time) to purchase the equipment. The equipment has a fair value at the inception of the lease of \$175,000 and an estimated useful life of 20 years. The lease agreement stipulates that the Folio Company receive a rate of return of 8% each year, which is lower than Montevallo's incremental borrowing rate. Calculate the present value of the minimum lease payments.

RE21-7 Use the information in RE21-6. However, assume that there is no bargain purchase option and that Montevallo guarantees the \$20,000 estimated residual value at the end of the 10-year lease. Calculate the present value of the minimum lease payments.

**RE21-8** Use the following information to decide whether this equipment lease qualifies as an operating, sales-type, or direct financing lease to a lessor.

(a) There is no transfer of ownership at the end of the lease term.

There is no bargain purchase option.

The lease term is 72% of the economic life of the leased property.

The present value of minimum lease payments is 100% of the fair value of the leased property to the lessor.

The cost of the leased property is less than the fair value.

The collectability of the minimum lease payments is reasonably assured.

No important uncertainties surround the amount of unreimbursable costs yet to be incurred by the lessor under the lease.

- (b) Same as (a), except that the cost of the leased property equals its fair value.
- (c) Same as (a), except that the present value of minimum lease payments is only 50% of the fair value of the leased asset.

The collectability of the minimum lease payments is not predictable.

There are important uncertainties surrounding the amount of unreimbursable costs yet to be incurred by the lessor.

**RE21-9** Use the information in RE21-3. Prepare the journal entries that Richie Company (the lessor) would make in the first year of the lease assuming the lease is classified as a direct financing lease. Assume that the lessee is required to make payments on December 31 each year. Also assume that Richie had purchased the equipment at a cost of \$250,000.

**RE21-10** Use the information in RE21-3. Prepare the journal entries that Richie Company (the lessor) would make in the first year of the lease assuming the lease is classified as a sales-type lease. Assume that the lessee is required to make payments on December 31 each year. Also assume that Richie had purchased the equipment at a cost of \$200,000.

### **E** X E R C I S E S

**E21-1** Determining Type of Lease and Subsequent Accounting On January 1, 2010, the Caswell Company signs a 10-year cancelable (at the option of either party) agreement to lease a storage building from the Wake Company. The following information pertains to this lease agreement:

- 1. The agreement requires rental payments of \$100,000 at the end of each year.
- 2. The cost and fair value of the building on January 1, 2010 is \$2 million.
- 3. The building has an estimated economic life of 50 years, with no residual value. The Caswell Company depreciates similar buildings according to the straight-line method.
- 4. The lease does not contain a renewable option clause. At the termination of the lease, the building reverts to the lessor.
- 5. Caswell's incremental borrowing rate is 14% per year. The Wake Company set the annual rental to ensure a 16% rate of return (the loss in service value anticipated for the term of the lease).
- 6. Executory costs of \$7,000 annually, related to taxes on the property, are paid by Wake Company.

#### Required

- 1. Determine what type of lease this is for the lessee.
- 2. Prepare appropriate journal entries on the lessee's books to reflect the signing of the lease agreement and to record the payments and expenses related to this lease for the years 2010 and 2011.

**E21-2** Lessee Accounting Issues The Sax Company signs a lease agreement dated January 1, 2010 that provides for it to lease computers from the Appleton Company beginning January 1, 2010. The lease terms, provisions, and related events are as follows:

- 1. The lease term is five years. The lease is noncancelable and requires equal rental payments to be made at the end of each year.
- 2. The computers have an estimated life of five years, a fair value of \$300,000, and a zero estimated residual value.
- 3. Sax Company agrees to pay all executory costs.
- 4. The lease contains no renewal or bargain purchase option.
- 5. The annual payment is set by Appleton at \$83,222.92 to earn a rate of return of 12% on its net investment. The Sax Company is aware of this rate, which is equal to its borrowing rate.
- 6. Sax Company uses the straight-line method to record depreciation on similar equipment.

#### Required

- 1. Determine what type of lease this is for Sax Company.
- 2. Calculate the amount of the asset and liability of the Sax Company at the inception of the lease (round to the nearest dollar).

- 3. Prepare a table summarizing the lease payments and interest expense.
- 4. Prepare journal entries for Sax Company for the years 2010 and 2011.
- 5. If the lease term is 3 years and the annual payment is \$110,000, how would Sax Company classify the lease under (a) U.S. GAAP and (b) IFRS?

**E21-3** Lessee Accounting with Payments Made at Beginning of Year The Adden Company signs a lease agreement dated January 1, 2010 that provides for it to lease heavy equipment from the Scott Rental Company beginning January 1, 2010. The lease terms, provisions, and related events are as follows:

- 1. The lease term is four years. The lease is noncancelable and requires annual rental payments of \$20,000 each to be paid in advance at the beginning of each year.
- 2. The cost, and also fair value, of the heavy equipment to Scott at the inception of the lease is \$68,036.62. The equipment has an estimated life of four years and has a zero estimated residual value at the end of this time.
- 3. Adden Company agrees to pay all executory costs.
- 4. The lease contains no renewal or bargain purchase option.
- 5. Scott's interest rate implicit in the lease is 12%. Adden Company is aware of this rate, which is equal to its borrowing rate.
- 6. Adden Company uses the straight-line method to record depreciation on similar equipment.
- 7. Executory costs paid at the end of the year by Adden Company are:

| 2010                    | 2011                    |  |
|-------------------------|-------------------------|--|
| Insurance, \$1,500      | Insurance, \$1,300      |  |
| Property taxes, \$6,000 | Property taxes, \$5,500 |  |

#### Required

- 1. Determine what type of lease this is for Adden Company.
- 2. Prepare a table summarizing the lease payments and interest expense for Adden Company.
- 3. Prepare journal entries for Adden Company for the years 2010 and 2011.

**E21-4** *Lessor Accounting Issues* The Rexon Company leases equipment to Ten-Care Company beginning January 1, 2010. The lease terms, provisions, and related events are as follows:

- 1. The lease term is eight years. The lease is noncancelable and requires equal rental payments to be made at the end of each year.
- 2. The cost, and also fair value, of the equipment is \$500,000. The equipment has an estimated life of eight years and has a zero estimated value at the end of that time.
- 3. Ten-Care Company agrees to pay all executory costs.
- 4. The lease contains no renewal or bargain purchase option.
- 5. The interest rate implicit in the lease is 14%.
- 6. The initial direct costs are insignificant and assumed to be zero.
- 7. The collectibility of the rentals is reasonably assured, and there are no important uncertainties surrounding the amount of unreimbursable costs yet to be incurred by the lessor.

#### Required

- 1. Assuming that the lease is a direct financing lease from Rexon's point of view, calculate the amount of the equal rental receipts.
- 2. Prepare a table summarizing the lease receipts and interest revenue earned by Rexon.
- 3. Prepare journal entries for Rexon for the years 2010 and 2011.

**E21-5** Lessor Accounting Issues Ramallah Company leases heavy equipment to Terrell, Inc., on January 2, 2010 on the following terms:

- 1. Forty-eight lease rentals of \$1,600 at the end of each month are to be paid by Terrell, Inc., and the lease is noncancelable.
- 2. The cost of the heavy equipment to Ramallah Company was \$60,758.
- 3. Ramallah Company will account for this lease using the direct financing method. The difference between total rental receipts ( $$1,600 \times 48 = $76,800$ ) and the cost of the equipment (\$60,758) was computed to yield a return of 1% per month over the lease term.

### Required

Prepare journal entries for Ramallah Company (the lessor) to record the lease contract and the receipt of the first lease rental on January 31, 2010. Record the part of the \$16,042 Unearned Interest that was earned during the first month and carry calculations to the nearest dollar.

**E21-6** Lessee and Lessor Accounting Issues Lessor Leasing Company agrees to provide Lessee Company with equipment under a noncancelable lease for five years. The equipment has a five-year life, cost Lessor Company \$30,000, and will have no residual value when the lease term ends. Lessee Company agrees to pay all executory costs (\$500 per year) throughout the lease period. On January 1, 2010 the equipment is delivered. Lessor expects a 14% return. The five equal annual rents are payable in advance starting January 1, 2010.

### Required

- 1. Assuming this is a direct financing lease for the lessor and a capital lease for the lessee, prepare a table summarizing the lease and interest payments suitable for use by either party.
- 2. On the assumption that both companies adjust and close books each December 31, prepare journal entries relating to the lease for both companies through December 31, 2010 based on data derived in the table. Assume that Lessee Company depreciates similar equipment by the straight-line method.

**E21-7** Lessor Accounting with Receipts at End of Year The Berne Company, the lessor, enters into a lease with Fox Company to lease equipment to Fox beginning January 1, 2010. The lease terms, provisions, and related events are as follows:

- 1. The lease term is four years. The lease is noncancelable and requires annual rental payments of \$50,000 to be made at the end of each year.
- 2. The cost of the equipment is \$130,000. The equipment has an estimated life of four years and an estimated residual value at the end of the lease term of zero.
- 3. Fox agrees to pay all executory costs.
- 4. The interest rate implicit in the lease is 12%.
- 5. The initial direct costs are insignificant and assumed to be zero.
- 6. The collectibility of the rentals is reasonably assured, and there are no important uncertainties surrounding the amount of unreimbursable costs yet to be incurred by the lessor.

### Required

- 1. Assuming that the lease is a sales-type lease from Berne's point of view, calculate the selling price and assume that this is also the fair value.
- 2. Prepare a table summarizing the lease receipts and interest revenue earned by the lessor.
- 3. Prepare journal entries for Berne Company, the lessor, for the years 2010 and 2011.

**E21-8** Lessor Accounting with Receipts at Beginning of Year The Edom Company, the lessor, enters into a lease with Jebusite Company to lease equipment to Jebusite beginning January 1, 2010. The lease terms, provisions, and related events are as follows:

- 1. The lease term is five years. The lease is noncancelable and requires annual rental receipts of \$100,000 to be made in advance at the beginning of each year.
- 2. The cost of the equipment is \$313,000. The equipment has an estimated life of six years and, at the end of the lease term, has an unguaranteed residual value of \$20,000 accruing to the benefit of Edom.
- 3. Jebusite agrees to pay all executory costs.
- 4. The interest rate implicit in the lease is 14%.
- 5. The initial direct costs are insignificant and assumed to be zero.
- 6. The collectibility of the rentals is reasonably assured, and there are no important uncertainties surrounding the amount of unreimbursable costs yet to be incurred by the lessor.

### Required 🔤

- 1. Assuming that the lease is a sales-type lease from Edom's point of view, calculate the selling price and assume that this is also the fair value.
- 2. Prepare a table summarizing the lease receipts and interest revenue earned by the lessor.
- 3. Prepare journal entries for Edom Company, the lessor, for the years 2010 and 2011.

**E21-9** Lessee and Lessor Accounting Issues The following information is available for a noncancelable lease of equipment that is classified as a sales-type lease by the lessor and as a capital lease by the lessee. Assume that the lease payments are made at the beginning of each month, interest and straight-line depreciation are recognized at the end of each month, and the residual value of the leased asset is zero at the end of a three-year life.

Cost of equipment to lessor (Anson Company) \$50,000
Initial payment by lessee (Bullard Company) at inception of lease 2,000
Present value of remaining 35 payments of \$2,000 each discounted at 1% per month 58,817

#### Required

1. Record the lease (including the initial receipt of \$2,000) and the receipt of the second and third installments of \$2,000 in the accounts of the Anson Company. Carry computations to the nearest dollar.

2. Record the lease (including the initial payment of \$2,000), the payment of the second and third installments of \$2,000, and monthly depreciation in the accounts of the Bullard Company. The lessee records the lease obligation at net present value. Carry computations to the nearest dollar.

**E21-10** Comparisons of Operating and Sales-Type Leases On January 1, 2010, Nelson Company leases certain property to Queens Company at an annual rental of \$60,000 payable in advance at the beginning of each year for eight years. The first payment is received immediately. The leased property, which is new, cost \$275,000 and has an estimated economic life of eight years and no residual value. The interest rate implicit in the lease is 12% and the lease is noncancelable. Nelson Company had no other costs associated with this lease. It should have accounted for this lease as a sales-type lease but mistakenly treated it as an operating lease.

#### Required

Compute the effect on income before income taxes during the first year of the lease as a result of Nelson Company's classification of this lease as an operating rather than a sales-type lease.

**E21-11** Lease Income and Expense Reuben Company retires a machine from active use on January 2, 2010 for the express purpose of leasing it. The machine had a carrying value of \$900,000 after 12 years of use and is expected to have 10 more years of economic life. The machine is depreciated on a straight-line basis. On March 2, 2010 Reuben Company leases the machine to Owens Company for \$180,000 a year for a five-year period ending February 28, 2015. Under the provisions of the lease, Reuben Company incurs total maintenance and other related costs of \$20,000 for the year ended December 31, 2010. Owens Company pays \$180,000 to Reuben Company on March 2, 2010. The lease was properly classified as an operating lease.

#### Required

- 1. Compute the income before income taxes derived by Reuben Company from this lease for the calendar year ended December 31, 2010.
- 2. Compute the amount of rent expense incurred by Owens Company from this lease for the calendar year ended December 31, 2010.

**E21-12** *Determining Type of Lease and Subsequent Accounting* The Ravis Rent-A-Car Company leases a car to Ira Reem, an employee, on January 1, 2010. The term of the noncancelable lease is four years. The following information about the lease is provided:

- 1. Title to the car passes to Ira Reem on the termination of the lease with no additional payment required by the lessee.
- 2. The cost and fair value of the car to the Ravis Rent-A-Car Company is \$8,400. The car has an economic life of five years.
- 3. The lease payments are determined at an amount that will yield Ravis Rent-A-Car Company a rate of return of 10% on its net investment.
- 4. Collectibility of the lease payments is reasonably assured.
- 5. There are no important uncertainties surrounding the amount of unreimbursable costs yet to be incurred by the lessor.
- 6. Equal annual lease payments are due at the end of each year.

#### Required

- 1. What type of lease is this to Ravis Rent-A-Car Company? Why?
- 2. Prepare a table summarizing the lease receipts and interest revenue earned by the Ravis Rent-A-Car Company for the four-year lease term.
- 3. Prepare the journal entries for 2010 and 2011 to record the lease agreement, the lease receipts, and the recognition of income on the books of Ravis Rent-A-Car Company.

**E21-13** *Guaranteed and Unguaranteed Residual Values* The Grygiel Company leases a machine with a fair value of \$50,000 to the Baker Company. The lease has a life of six years and requires a \$10,000 payment at the end of each year. The lease does not include a transfer of ownership, nor a bargain purchase option, and the life of the lease is less than 75% of the expected economic life of the machine. The collectibility of the lease payments is reasonably assured, and there are no uncertainties involved in the lease.

#### Required

- 1. If Grygiel requires a return of 10%, compute the expected residual value of the machine.
- 2. If the residual value is guaranteed by the Baker Company, how would each company classify the lease?
- 3. If the residual value is not guaranteed by the Baker Company, how would each company classify the lease?

**E21-14** *Sale-Leaseback (Appendix)* On January 1, 2010, the Stimpson Company sells land to Barker Company for \$2.5 million, then immediately leases it back. The relevant information is as follows:

- 1. The land was carried on Stimpson's books at a value of \$2 million.
- 2. The term of the noncancelable lease is 25 years.
- 3. The lease agreement requires equal rental payments of \$357,007 at the end of each year.

- 4. The incremental borrowing rate of Stimpson Company is 15%. Stimpson is aware that Barker Company set the annual rental to ensure a rate of return of 14%.
- 5. The land has a fair value of \$2.5 million on January 1, 2010.
- 6. Stimpson Company has the option of purchasing the land for \$150 at the end of 25 years.
- 7. Stimpson Company pays all executory costs. These costs consist of insurance and property taxes amounting to \$12,000 per year.
- 8. There are no important uncertainties surrounding the amount of unreimbursable costs yet to be incurred by the lessor, and the collectibility of the rentals is reasonably assured.

#### Required

- 1. Prepare the journal entries for the seller-lessee, Stimpson, for 2010 to reflect the sale and leaseback agreement. In calculating the present value of the lease payments, ignore the \$150 bargain purchase option as immaterial.
- 2. Describe briefly the accounting treatment of the gain by the seller-lessee.

## **P**ROBLEMS

**P21-1** Determining Type of Lease and Subsequent Accounting On January 1, 2010, the Alice Company leases equipment for five years, agreeing to pay \$70,000 annually at the beginning of each year under the noncancelable lease. Superior Equipment Company, the lessor, agrees to pay all executory costs, estimated to be \$3,450 per year. The cost and also fair value of the equipment is \$305,000. Its estimated life is 10 years. The estimated residual value at the end of five years is \$64,000 and is not guaranteed by Alice; at the end of 10 years, it is \$5,000. There is no bargain purchase option in the lease nor any agreement to transfer ownership at the end of the lease to the lessee. The implicit interest rate is 12%. During 2010, Superior Equipment pays property taxes of \$650, maintenance costs of \$1,600, and insurance of \$1,200. There are no important uncertainties surrounding the amount of unreimbursable costs yet to be incurred by the lessor. Straight-line depreciation is considered the appropriate method by both companies.

#### Required

- 1. Identify the type of lease involved for Alice Company and Superior Equipment Company and give reasons for your classifications.
- 2. Prepare appropriate journal entries for 2010 for the lessee and lessor.
- 3. If the residual value at the end of five years is guaranteed by Alice, identify the type of lease. Prepare journal entries for 2010 and 2011 for the lessee and lessor. Also prepare the journal entries for the lessee and the lessor when the lessee pays the guaranteed residual value.

**P21-2** *Determining Type of Lease and Subsequent Accounting* On January 1, 2010, the Ballieu Company leases specialty equipment with an economic life of eight years to the Anderson Company. The lease contains the following terms and provisions:

The lease is noncancelable and has a term of eight years. The annual rentals are \$35,000, payable at the beginning of each year. The interest rate implicit in the lease is 14%. The Anderson Company agrees to pay all executory costs and is given an option to buy the equipment for \$1 at the end of the lease term, December 31, 2017.

The cost of the equipment to the lessor is \$150,000 and the fair retail value is approximately \$185,100. The lessor incurs no material initial direct costs. The collectibility of the rentals is reasonably assured, and there are no important uncertainties surrounding the amount of unreimbursable costs yet to be incurred by the lessor. The lessor estimates that the fair value is expected to be significantly greater than \$1 at the end of the lease term.

The lessor calculates that the present value on January 1, 2010 of eight annual payments in advance of \$35,000 discounted at 14% is \$185,090.68 (the \$1 purchase option is ignored as immaterial).

### Required

- 1. Identify the classification of the lease transaction from the point of view of Ballieu Company. Give the reasons for your classification.
- 2. Prepare all the journal entries for Ballieu Company for the years 2010 and 2011.
- 3. Discuss the disclosure requirements for the lease transaction in the notes to the financial statements of the Ballieu Company.

**P21-3** Lessee Accounting Issues The Timmer Company signs a lease agreement dated January 1, 2010 that provides for it to lease equipment from Landau Company beginning January 1, 2010. The lease terms, provisions, and related events are as follows:

The lease is noncancelable and has a term of five years. The annual rentals are \$83,222.92, payable at the end of each year, and provide Landau with a 12% annual rate of return on its net investment. The Timmer Company agrees to pay all

executory costs at the end of each year. In 2010, these were insurance, \$3,760; property taxes, \$5,440. In 2011: insurance, \$3,100; property taxes, \$5,330. There is no renewal or bargain purchase option.

Timmer estimates that the equipment has a fair value of \$300,000, an economic life of five years, and a zero residual value. Timmer's incremental borrowing rate is 16%, it knows the rate implicit in the lease, and it uses the straight-line method to record depreciation on similar equipment.

### Required **W**

- 1. Calculate the amount of the asset and liability of the Timmer Company at the inception of the lease. (Round to the
- 2. Prepare a table summarizing the lease payments and interest expense.
- 3. Prepare journal entries on the books of Timmer for 2010 and 2011.
- 4. Prepare a partial balance sheet in regard to the lease for Timmer for December 31, 2010.
- If the lease term is three years and the annual payment is \$120,000, how would Timmer Company classify the lease under (a) U.S. GAAP and (b) IFRS?

P21-4 Direct Financing Lease Calder Company, the lessor, enters into a lease with Darwin Company, the lessee, to provide heavy equipment beginning January 1, 2010. The lease terms, provisions, and related events are as follows:

The lease is noncancelable, has a term of eight years, and has no renewal or bargain purchase option. The annual rentals are \$65,000, payable at the end of each year. The interest rate implicit in the lease is 15%. The Darwin Company agrees to pay all executory costs.

The cost and fair value of the equipment to the lessor is \$308,021.03. The lessor incurs no material initial direct costs. The collectibility of the rentals is reasonably assured, and there are no important uncertainties surrounding the amount of unreimbursable costs yet to be incurred by the lessor. The lessor estimates that the fair value at the end of the lease term will be \$50,000 and that the economic life of the equipment is nine years.

The following present value factors are relevant:

$$PV_{n=8,i=15\%} = 4.487322$$
;  $PV_{n=8,i=15\%} = 0.326902$ ;  $PV_{n=1,i=15\%} = 0.869565$ 

- 1. Prepare a table summarizing the lease receipts and interest revenue earned by the lessor for this direct financing lease.
- 2. State why the lease is a direct financing lease.
- 3. Prepare journal entries for Calder Company for the years 2010, 2011, and 2012.
- 4. Prepare partial balance sheets for December 31, 2010 and December 31, 2011 showing how the accounts should be reported.

**P21-5** Comprehensive Landlord Company and Tenant Company enter into a noncancelable, direct financing lease on January 1, 2010 for new heavy equipment that cost the Landlord Company \$300,000 (useful life is six years with no residual value). The fair value is also \$300,000. Landlord Company expects a 14% return over the six-year period of the lease. Lease provisions require six equal annual amounts payable each January 1, beginning with January 1, 2010. The Tenant Company pays all executory costs. The heavy equipment reverts to the lessor at the termination of the lease. Assume that there are no initial direct costs. The collectibility of the rentals is reasonably assured, and there are no important uncertainties surrounding the amount of unreimbursable costs yet to be incurred by the lessor.

#### Required

- 1. (a) Show how the Landlord Company should compute the annual rental amounts. (b) Discuss how the Tenant Company should compute the present value of the lease rights. What additional information would be required to make this computation?
- 2. Prepare a table summarizing the lease and interest receipts that would be suitable for the Landlord Company. Under what conditions would this table be suitable for the Tenant Company?
- 3. Assuming that the table prepared in Requirement 2 is suitable for both the lessee and the lessor, prepare the journal entries for both firms for the years 2010 and 2011. Use the straight-line depreciation method for the leased equipment. The executory costs paid by the lessee in 2010 are: insurance, \$700 and property taxes, \$800; in 2011: insurance, \$600 and property taxes, \$750.
- 4. Show the items and amounts that would be reported on the comparative 2010 and 2011 income statements and ending balance sheets for both the lessor and the lessee. Include appropriate notes to the financial statements.

P21-6 Direct Financing Lease with Unguaranteed Residual Value Lessor Company and Lessee Company enter into a fiveyear, noncancelable, direct financing lease on January 1, 2010 for a new computer that cost the Lessor Company \$400,000 (useful life is five years). The fair value is also \$400,000. Lessor Company expects a 12% return over the fiveyear period of the lease. The computer will have an estimated unguaranteed residual value of \$20,000 at the end of the fifth year of the lease. The lease provisions require five equal annual amounts, payable each January 1, beginning with January 1, 2010. The Lessee Company pays all executory costs. The computer reverts to the lessor at the termination of the lease. Assume there are no initial direct costs, no important uncertainties surrounding the amount of unreimbursable costs yet to be incurred by the lessor, and that the collectibility of rentals is reasonably assured.

#### Required

- 1. Show how the Lessor Company should compute the annual rental amounts.
- 2. Prepare a table summarizing the lease and interest receipts that would be suitable for the Lessor Company.
- 3. Prepare the journal entries for Lessor Company for the years 2010, 2011, and 2012.

**P21-7** Sales-Type Lease with Receipts at End of Year The Lamplighter Company, the lessor, agrees to lease equipment to Tilson Company, the lessee, beginning January 1, 2010. The lease terms, provisions, and related events are as follows:

The lease is noncancelable and has a term of eight years. The annual rentals are \$32,000, payable at the end of each year. The Tilson Company agrees to pay all executory costs. The interest rate implicit in the lease is 14%.

The cost of the equipment to the lessor is \$110,000. The lessor incurs no material initial direct costs. The collectibility of the rentals is reasonably assured, and there are no important uncertainties surrounding the amount of unreimbursable costs yet to be incurred by the lessor. The lessor estimates that the fair value at the end of the lease term will be \$20,000 and that the economic life of the equipment is nine years.

#### Required

- 1. Calculate the selling price implied by the lease and prepare a table summarizing the lease receipts and interest revenue earned by the lessor for this sales-type lease.
- 2. State why this is a sales-type lease.
- 3. Prepare journal entries for Lamplighter Company for the years 2010, 2011, and 2013.
- 4. Prepare partial balance sheets for Lamplighter Company for December 31, 2010 and December 31, 2011, showing how the accounts should be disclosed.

**P21-8** *Various Lease Issues for Lessor and Lessee* Lessee Company leases heavy equipment on January 1, 2010 under a capital lease from Lessor Company with the following lease provisions:

The lease is noncancelable and has a term of 10 years. The lease does not contain a renewal or bargain purchase option. The annual rentals are \$27,653.77, payable at the beginning of each year. The Lessee Company agrees to pay all executory costs. The interest rate implicit in the lease is 12%, which is known by Lessee Company. The residual value of the property at the end of 10 years is estimated to be zero.

The cost and fair value of the equipment to the lessor is \$175,000. The lessor incurs no material initial direct costs. The collectibility of the rentals is reasonably assured, and there are no important uncertainties surrounding the amount of unreimbursable costs yet to be incurred by the lessor.

Lessee's incremental borrowing rate is 15% and it uses the straight-line method to record depreciation on similar equipment. In 2010 the lessee pays insurance of \$1,900, property taxes of \$1,300, and maintenance of \$600; and in 2011 the lessee pays insurance of \$1,800, property taxes of \$1,200, and maintenance of \$500.

#### Required

- 1. Identify the type of lease involved for the lessee and the lessor, and give reasons for your classifications.
- 2. Prepare all the journal entries for both the lessee and the lessor for 2010 and 2011.

**P21-9** Various Lease Issues for Lessor and Lessee Benjamin Company has rented new equipment to Murrell Builders that cost \$50,000. This equipment has a life of four years and no residual value at the end of that time. The lease is noncancelable and is signed on January 1, 2010. Murrell Builders assumes all normal risks and executory costs of ownership. The title to the property is transferred to Murrell Builders at the end of the four years. The Benjamin Company computes the rents on the basis of a 14% return. The lessee's incremental borrowing rate is also 14%. The collectibility of rentals is reasonably assured, and there are no important uncertainties surrounding the amount of unreimbursable costs yet to be incurred by the lessor.

#### Required

- 1. Assuming the annual rentals are payable at the end of each year, complete the following:
  - a. Lessor computation of periodic rental receipts.
  - b. Lessee computation of the present value of the special property rights under the lease.
  - c. A table summarizing lease and interest payments that would be suitable for both lessor and lessee.
- 2. Assuming the annual rentals are payable at the start of each year, compute the same three items listed in Requirement 1.
- 3. Prepare the journal entries for the lessor and lessee for Requirement 2 throughout 2010. Use the straight-line depreciation method.
- 4. Indicate the asset and liability amounts that the lessor and lessee would report on their balance sheets at December 31, 2010 under Requirement 2.

**P21-10** *Initial Direct Costs and Related Issues* On January 1, 2010, the Amity Company leases a crane to Baltimore Company. The lease contains the following terms and provisions:

The lease is noncancelable and has a term of 10 years. The lease does not contain a renewal or bargain purchase option. The annual rentals are \$4,000, payable at the beginning of each year. The Baltimore Company agrees to pay all executory costs.

The cost and fair value of the equipment to the lessor is \$24,913.94. The lessor incurs initial direct costs of \$1,364.98. The interest rate implicit in the lease is 12.5%. After including the initial direct costs, the implicit rate is 12%. The collectibility of the rentals is reasonably assured, and there are no important uncertainties surrounding the amount of unreimbursable costs yet to be incurred by the lessor. The lessor estimates that the fair value at the end of the lease term will be \$3,000 and that the economic life of the crane is 12 years.

#### Required

- 1. What are initial direct costs? Discuss the accounting treatment of these costs. Are they treated in the same manner for (a) an operating lease, (b) a sales-type lease, and (c) a direct financing lease?
- 2. From the lessor's viewpoint, is the preceding lease a sales-type or direct financing lease? Give reasons to support your conclusion.
- 3. Prepare the journal entries for Amity Company for 2010.

P21-11 Various Lease Issues Farrington Company leases a computer from the Wilson Company. The lease includes the following provisions:

The lease is noncancelable and has a term of eight years. The annual rentals are \$60,000, payable at the end of each year. The Farrington Company agrees to pay all executory costs and has an option to purchase the computer for \$1,000 at the end of the life of the lease. The interest rate implicit in the lease is 12%, which is known to Farrington.

Farrington estimates that the computer has an economic life of 12 years and a value of \$70,000 at the end of eight years. Farrington's incremental borrowing rate is 16% and it uses the straight-line method to record depreciation on similar equipment.

The computer cost Wilson \$200,000 to manufacture. The lessor incurs initial direct costs of \$10,000. The collectibility of the rentals is reasonably assured, and there are no important uncertainties surrounding the amount of unreimbursable costs yet to be incurred by the lessor.

#### Required

- 1. What is the correct classification of the lease for the lessee and lessor? Explain whether the lease meets each of the required criteria.
- 2. Assuming that the lease is signed on January 1, 2010, prepare all journal entries for 2010 for the lessor.
- 3. After six years, because of changes in the technology, the lessee and lessor independently conclude that the expected residual value of the computer at the end of the life of the lease is only \$10,000. Discuss how the lessor should account for the change.

**P21-12** Accounting for Leases by Lessee and Lessor Scuppermong Farms, the lessee, and Tyrrell Equipment, the lessor, sign a lease agreement on January 1, 2010 that provides for Scuppermong Farms to lease a cultivator from Tyrrell Equipment. The lease terms, provisions, and other related events are as follows: The lease is noncancelable and has a term of six years. The annual rentals are \$56,100, payable at the beginning of each year. Tyrrell Equipment agrees to pay all executory costs, which are expected to be \$1,100 annually, including property taxes of \$500, insurance of \$350, and maintenance of \$250. Scuppermong Farms guarantees a residual value of \$60,000 at the end of six years. The interest rate implicit in the lease is 14%, which is known by Scuppermong.

Scuppermong Farms' incremental borrowing rate is 15% and it uses the sum-of-the-years'-digits method to record depreciation on similar equipment.

The cost and fair value of the cultivator to Tyrrell Equipment is \$271,154.68. The lessor incurs no material initial direct costs. The collectibility of the rentals is reasonably assured, and there are no important uncertainties surrounding the amount of unreimbursable costs yet to be incurred by the lessor.

#### Required

- 1. Identify the type of lease involved for both Scuppermong Farms and Tyrrell Equipment, and give reasons for your clas-
- 2. Prepare the journal entries for both Scuppermong Farms and Tyrrell Equipment for 2010. (Hint: Scuppermong Farms should expense executory costs when annual payments are made to Tyrrell.)

P21-13 AICPA Adapted Lessor's Income Statement The Dahlia Company has two divisions, the Astor Division, which started operating in 2008, and the Tulip Division, which started operating in 2009. The Astor Division leases medical equipment to hospitals. All of its leases are appropriately recorded as operating leases for accounting purposes, except for a major lease entered into on January 1, 2010, which is appropriately recorded as a sale-type lease for accounting purposes.

Under long-term contracts, Tulip constructs wastewater treatment plants for small communities throughout the United States. All of its long-term contracts are appropriately recorded for accounting purposes under the percentage-of-completion method, except for two contracts which are appropriately recorded for accounting purposes under the completed-contract method because of a lack of dependable estimates at the time of entering into these contracts.

For the year ended December 31, 2010 the following information is available:

#### Astor Division:

Operating Leases. Revenues from operating leases were \$800,000. The cost of the related leased equipment is \$3,700,000, which is being depreciated on a straight-line basis over a five-year period. The estimated residual value of the leased equipment at the end of the five-year period is \$200,000. No leased equipment was acquired or constructed in 2010. Maintenance and other related costs and the costs of any other services rendered under the provisions of the leases were \$70,000 in 2010.

Lease Recorded as a Sale. The January 1, 2010 lease recorded as a sale is for a six-year period expiring December 31, 2015. The cost of this leased equipment is \$3,500,000. This leased equipment is estimated to have no residual value at the end of the lease. Maintenance and other related costs, and the costs of any other services rendered under the provisions of this lease, all of which were paid by the lessee, were \$120,000 in 2010. Equal annual payments under the lease are \$750,000 and are due on January 1. The first payment was made on January 1, 2010. The present value for an annuity of \$1 in advance at 10% is as follows:

| Number of Periods | Present Value |  |
|-------------------|---------------|--|
| 5                 | 4.170         |  |
| 6                 | 4.791         |  |
| 7                 | 5.355         |  |

#### Tulip Division:

Long-Term Contracts: Percentage-of-Completion Method. Long-term contracts recorded under the percentage-of-completion method aggregate \$6,000,000. Costs incurred on these contracts were \$1,500,000 in 2009 and \$3,000,000 in 2010. Estimated additional costs of \$1,000,000 are required to complete these contracts. Revenues of \$1,740,000 were recognized in 2009 and a total of \$4,800,000 has been billed, of which \$4,600,000 has been collected. No long-term contracts recorded under the percentage-of-completion method were completed in 2010.

Long-Term Contracts: Completed-Contract Method. The two long-term contracts recorded under the completed-contract method were started in 2009. One is a \$5,000,000 contract. Costs incurred were \$1,400,000 in 2009 and \$1,600,000 in 2010. A total of \$3,100,000 has been billed and \$2,800,000 collected. Although it is difficult to estimate the additional costs required to complete this contract, indications are that this contract will prove to be profitable.

The second contract is for \$4,000,000. Costs incurred were \$1,200,000 in 2009 and \$2,600,000 in 2010. A total of \$3,300,000 has been billed and \$2,900,000 collected. Although it is difficult to estimate the additional costs required to complete this contract, indications are that there will be a loss of approximately \$550,000.

#### Dahlia Company:

Selling, general, and administrative expenses exclusive of amounts specified earlier were \$600,000 in 2010. Other income exclusive of amounts specified earlier was \$50,000 in 2010.

## Required 🔤

Prepare an income statement of the Dahlia Company for the year ended December 31, 2010, stopping at income (loss) before income taxes. Show supporting schedules and computations in good form. *Ignore income tax and deferred tax considerations*. Notes are *not* required.

**P21-14** *Determining Types of Leases (Appendix)* Rigdon Company leases 50 acres of land to Christmas Tree International on January 1, 2010. The provisions of the lease are as follows:

The lease is noncancelable and has a term of 25 years. The annual rentals are \$10,000, payable at the end of each year. The lease contains no bargain purchase option and the land reverts to Rigdon at the end of the lease. The incremental borrowing rate of Christmas Tree International is 12%.

The cost of the land to Rigdon Company is \$60,000. The fair value is \$78,431.39. The lessor incurs no material initial direct costs. The collectibility of the rentals is reasonably assured, and there are no important uncertainties surrounding the amount of unreimbursable costs yet to be incurred by the lessor.

#### Required

- 1. Determine the classification of this lease for both the lessor and the lessee.
- 2. Why are the final two criteria (lease term 75% of economic life and present value of lease payments 90% of fair value) not applicable when classifying a lease of land?

**P21-15** *Sale-Leaseback (Appendix)* On January 1, 2010, the Orr Company sells heavy equipment to Foible Company for \$3 million, then immediately leases it back. The relevant information is as follows:

The lease is noncancelable and has a term of eight years. The annual rentals are \$603,908.50, payable at the end of each year. The seller-lessee agrees to pay all executory costs. The interest rate implicit in the lease is 12%.

The cost of the heavy equipment to Orr Company is \$2,100,000. The purchaser-lessor incurs no material initial direct costs. The collectibility of the rentals is reasonably assured, and there are no important uncertainties surrounding the amount of unreimbursable costs yet to be incurred by the lessor.

Orr's incremental borrowing rate is 12% and the company estimates that the economic life of the equipment is eight years. The present value on January 1, 2010 of eight payments of \$603,908.50, discounted at 12%, is \$3 million ( $$603,908.50 \times 4.967640$ ). The executory costs for 2010 are:

Repairs and maintenance \$10,200 Property taxes 20,500 Insurance 18,000

#### Required

- 1. What type of lease is this to the seller-lessee? Discuss.
- 2. Prepare the journal entries for both the seller-lessee and the purchaser-lessor for 2010 to reflect the purchase of the heavy equipment by Orr, and the sale and leaseback agreement. Assume that Orr Company uses the straight-line depreciation method.

### CASES

### COMMUNICATION

#### **C21-1** Initial Direct Costs

The Efland Company leases equipment to Orange Company. Efland pays \$3,000 initial direct costs in negotiating the lease.

#### Required

- 1. Explain what initial direct costs are.
- Indicate precisely how Efland should account for initial direct costs if this lease is (a) an operating lease, (b) a sales-type lease, (c) a direct financing lease.
- 3. For a sales-type lease, GAAP requires that: "The cost or carrying amount, if different, of the leased property, plus any initial direct costs . . . , less the present value of the unguaranteed residual value accruing to the benefit of the lessor, computed at the interest rate implicit in the lease, shall be charged against income in the same period." Does this provision require that initial direct costs for sales-type leases be charged to cost of goods sold? Discuss the reasons for or against this accounting treatment.

### **C21-2** Sales-Type Lease Issues

Jordan Industries manufactures and leases to its customers five-ton construction dump trucks. The lease arrangements are usually as follows:

- 1. Payments on the lease are due for five years after its inception, but the present value is not greater than 90% of the fair value of the trucks at the time of sale.
- 2. The trucks revert to Jordan at the end of the lease. Estimated economic life of the trucks is 10 years.
- No substantial uncertainties exist as to future payments Jordan must make, and potential customers are thoroughly checked for creditworthiness before the trucks are leased to them.
- 4. Jordan's accountant has informed the company that there are advantages from a reporting standpoint in treating the leases as sales-type instead of operating leases.

#### Required

- 1. Discuss the reasons why Jordan would want to treat the leases as sales-type instead of operating leases.
- 2. Explain what Jordan should do to treat the leases properly as sales-type leases.

#### **C21-3 Classification of Leases**

**AICPA** Adapted *Part a.* Capital leases and operating leases are the two classifications of leases for the lessee.

#### Required

- 1. Explain how a capital lease is accounted for by the lessee, both at the inception of the lease and during the first year of the lease, assuming the lease transfers ownership of the property to the lessee by the end of the lease.
- 2. Explain how an operating lease is accounted for by the lessee, both at the inception of the lease and during the first year of the lease, assuming equal monthly payments are made by the lessee at the beginning of each month of the lease. Describe the change in accounting, if any, when rental payments are not made on a straight-line basis.

Do not discuss the criteria for distinguishing between capital leases and operating leases.

*Part b.* Sales-type leases and direct financing leases are two of the classifications of leases for the lessor.

#### Required

Write a short report that compares and contrasts a sales-type lease with a direct financing lease as follows:

- 1. Gross investment in the lease.
- 2. Amortization of unearned interest income.
- 3. Manufacturer's or dealer's profit.

Do not discuss the criteria for distinguishing between the leases described above and operating leases.

#### C21-4 Miscellaneous Lease Issues

AlCPA Adapted On January 1, 2010, Von Company entered into two noncancelable leases for new machines to be used in its manufacturing operations. The first lease does not contain a bargain purchase option. The lease term is equal to 80% of the estimated economic life of the machine. The second lease contains a bargain purchase option. The lease term is equal to 50% of the estimated economic life of the machine.

#### Required

- Explain the theoretical basis for requiring lessees to capitalize certain long-term leases. Do not discuss the specific criteria for classifying a lease as a capital lease
- 2. Explain how a lessee should account for a capital lease at its inception.
- 3. Explain how a lessee should record each minimum lease payment for a capital lease.
- 4. Explain how Von should classify each of the two leases.

#### C21-5 Sale-Leaseback

**AICPA** Adapted On January 1, 2010, Metcalf Company sold equipment for cash and leased it back. As seller-lessee, Metcalf retained the right to substantially all of the remaining use of the equipment.

The term of the lease is eight years. There is a gain on the sale portion of the transaction. The lease portion of the transaction is classified appropriately as a capital lease.

#### Required

- 1. Explain the theoretical basis for requiring lessees to capitalize certain long-term leases. Do **not** discuss the specific criteria for classifying a lease as a capital lease.
- a. Explain how Metcalf should account for the sale portion of the sale-leaseback transaction at January 1, 2010.
  - b. Explain how Metcalf should account for the lease-back portion of the sale-leaseback transaction at January 1, 2010.
- 3. Explain how Metcalf should account for the gain on the sale portion of the sale-leaseback transaction during the first year of the lease.

### CREATIVE AND CRITICAL THINKING

### **C21-6 Capitalized and Operating Leases**

AlCPA Adapted On January 1, Borman Company, a lessee, entered into three noncancelable leases for brandnew equipment, Lease J, Lease K, and Lease L. None of the three leases transfers ownership of the equipment to Borman at the end of the lease term. For each of the three leases, the present value of the minimum lease payments at the beginning of the lease term, excluding that portion of the payments representing executory costs such as insurance, maintenance, and taxes to be paid by the lessor, including any profit thereon, is 75% of the fair value of the equipment to the lessor at the inception of the lease.

The following information is peculiar to each lease:

- (a) Lease J does not contain a bargain purchase option. The lease term is equal to 80% of the estimated economic life of the equipment.
- (b) Lease K contains a bargain purchase option. The lease term is equal to 50% of the estimated economic life of the equipment.
- (c) Lease L does not contain a bargain purchase option. The lease term is equal to 50% of the estimated economic life of the equipment.

### Required

- Explain how Borman Company should classify each of the preceding three leases. Discuss the rationale for your answer.
- 2. What amount, if any, should Borman record as a liability at the inception of the lease for each of the preceding three leases?
- 3. Assuming that the minimum lease payments are made on a straight-line basis, how should Borman record the minimum lease payment for each of the preceding three leases?

#### C21-7 Disclosure of Leases and Related Issues

United Manufacturing Company manufactures and leases computers to its customers. During 2010, the following lease transactions take place:

- 1. On January 1, a computer is leased to Superior Microelectronics Industries and is guaranteed by United against obsolescence. The present value of the lease payments is greater than 90% of the fair value of the computer to both United and Superior.
- 2. Also on January 1, a computer is leased to Pitt Steel Company. Because of Pitt's unstable financial condition, its incremental borrowing rate is substantially greater than United's rate implicit in the lease (which Pitt did not know and could not estimate).

### Required

- 1. For the first transaction, explain on whose financial statements the leased computer is shown.
- 2. Explain under what conditions in the second transaction the computer could fail to be shown on either United's or Pitt Steel's balance sheets at December 31, 2010.

### **C21-8 Types of Leases and Related Issues**

Alcpa Adapted Circuit Village Company entered into a lease arrangement with Thomas Leasing Company for a certain machine. Thomas's primary business is leasing, and it is not a manufacturer or dealer. Circuit Village will lease the machine for a period of four years, which is 50% of the machine's economic life. Thomas will take possession of the machine at the end of the initial four-year lease and lease it to another smaller company that does not need the most current version of the machine. Circuit Village does not guarantee any residual value for the machine and will not purchase the machine at the end of the lease term. Circuit

Village's incremental borrowing rate is 16% and the implicit rate on the lease is 14%. Circuit Village has no way of knowing or estimating the implicit rate used by Thomas. Using either rate, the present value of the minimum lease payments is between 90% and 100% of the fair value of the machine at the time of the lease agreement. Circuit Village has agreed to pay all executory costs directly, and no allowance for these costs is included in the lease payments. Thomas is reasonably certain that Circuit Village will pay all lease payments, and because it has agreed to pay all executory costs, there are no important uncertainties regarding costs to be incurred by Thomas.

#### Required

- 1. With respect to Circuit Village (the lessee), answer the following:
  - a. What type of lease has been entered into? Explain the reason for your answer.
  - b. How should Circuit Village compute the appropriate amount to record for the lease or asset acquired?
  - c. What accounts will be created or affected by this transaction, and how will the lease or asset or other cost be matched with earnings?
- 2. With respect to Thomas (the lessor), answer the following:
  - a. What type of leasing arrangement has been entered into? Explain the reason for your answer.
  - b. How should this lease be recorded by Thomas, and how are the appropriate amounts determined?
  - c. How should Thomas determine the appropriate amount of earnings to be recognized from each lease payment?

### **C21-9 Capital Lease Issues**

AICPA Adapted On January 1, 2010, Lani Company entered into a noncancelable lease for a machine to be used in its manufacturing operations. The lease transfers ownership of the machine to Lani by the end of the lease term. The term of the lease is eight years. The minimum lease payment made by Lani on January 1, 2010 was one of eight equal annual payments. At the inception of the lease, the criteria established for classification as a capital lease by the lessee were met.

#### Required

- 1. Explain the theoretical basis for the accounting standard that requires certain long-term leases to be capitalized by the lessee. Do not discuss the specific lease as a capital lease.
- 2. Explain how Lani should account for this lease at its inception and determine the amount to be recorded.
- 3. Explain what expenses related to this lease Lani will incur during the first year of the lease, and how they will be determined.

4. Explain how Lani should report the lease transaction on its December 31, 2010 balance sheet.

### C21-10 Sale-Leaseback (Appendix)

AICPA Adapted On December 31, 2009, Port Co. sold six-month-old equipment at fair value and leased it back. There was a loss on the sale. Port pays all insurance, maintenance, and taxes on the equipment. The lease provides for eight equal annual payments, beginning December 31, 2010, with a present value equal to 85% of the equipment's fair value and sales price. The lease's term is equal to 80% of the equipment's useful life. There is no provision for Port to reacquire ownership of the equipment at the end of the lease term.

- 1. a. Explain why it is important to compare an equipment's fair value to its lease payments' present value, and its useful life to the lease term.
  - b. Evaluate Port's leaseback of the equipment in terms of each of the four criteria for determination of a capital
- 2. Explain how Port should account for the sale portion of the sale-leaseback transaction at December 31, 2009.
- 3. Explain how Port should report the leaseback portion of the sale-leaseback transaction on its December 31, 2010 balance sheet.

### C21-11 Ethics and Leasing

You are an accountant for the ABC Mining Company, and the CFO gives you a copy of a recent lease agreement to record. As you read

the agreement you discover the company has leased 12 trucks from the XYZ Finance Co. The fair value of the trucks is \$2.4 million. ABC has agreed to pay \$250,000 semiannually, in advance. The lease term is five years, and the lessor's implicit rate is 8%. There is no option or requirement to purchase the trucks. This all seems straightforward, especially when you remember that the company recently borrowed from a bank and agreed to a 10% interest rate. Also, you recall that the company owns some similar trucks and depreciates them over eight years. You are about to leave the office early to meet some friends when you notice that there is a contingent rental of \$97,592, payable by ABC Mining and starting with the seventh semiannual payment if the Consumer Price Index prevailing at the beginning of the lease increases in any one of the first three years of the lease.

#### Required

From financial reporting and ethical perspectives, discuss the issues raised by this situation.

## RESEARCH SIMULATIONS

### **R21-1 Capital Lease Issues**

#### Situation

The Cliborn Retail Company negotiated a lease for a retail store in a new shopping center that included 30 stores. The accountant for Cliborn, Gail Naugle, was given the lease agreement to analyze. She looked into whether the lease was a capital lease. The lease did not include a transfer of ownership or an option to purchase. The lease term was for 20 years and the present value of the minimum lease payments was \$100,000. Unsure of the fair market value of the property or its life, she called the lessor's controller.

"That is easy," he replied. "There is no fair value because we would never sell a single store in a shopping center. And, let's see, 20 years divided by 75% is about 27 years, so the life of the property must be at least that much. Or do you want a capital lease?"

### Directions

Assuming that you are Gail Naugle, research the generally accepted accounting principles and prepare a short memo to the controller of Cliborn that summarizes how to classify the lease. Cite your reference and applicable paragraph numbers.

### **R21-2 Capital Lease Issues**

#### Situation

The Stirbis Company was negotiating a lease for a new building that would be used as a warehouse. Stirbis' accountant, Shannon Fenimore, had been invited to join Jim Stirbis (the president) in a meeting where the lease agreement was settled. The president of the company that owned the building said, "I assume you want an operating lease."

"That is correct," replied Jim Stirbis.

The president responded, "So we will not include a transfer of ownership or an option to purchase. Anyway, I am sure you do not want to get into the real estate business."

"No, of course not."

"And we agree that the lease term is 30 years."

"Yes, but that seems to present some problems. We would have to argue that the life of the building is more than 40 years."

"You should not have any trouble persuading your auditors to agree to that."

"Maybe not. But the present value of the \$53,040 annual lease payment is \$500,000, which is the fair value of the building."

"That is a problem. But I think I have a solution. We will adjust the annual payment to \$45,000, so that the present value is only 85% of the fair value. Then we will add a clause that you also pay 1% of your total sales, up to a maximum of \$8,040 each year."

#### Directions

Assuming that you are Shannon Fenimore, research the generally accepted accounting principles and prepare a short memo to the controller of Stirbis that summarizes how to classify the lease. Cite your reference and applicable paragraph numbers.

# The Statement of Cash Flows

After reading this chapter, you will be able to:

- 1 Define operating, investing, and financing activities.
- 2 Know the categories of inflows and outflows of cash.
- 3 Classify cash flows as operating, investing, or financing.
- **4** Explain the direct and indirect methods for reporting operating cash flows.
- **5** Prepare a simple statement of cash flows.
- 6 Use a worksheet (spreadsheet) for a statement of cash flows.
- 7 Compute and disclose interest paid and income taxes paid.
- 8 Identify the operating cash inflows and outflows under the direct method (Appendix).
  - **9** Compute the operating cash flows under the direct method (Appendix).

# Cash Is King

Cash is the lifeblood of any company and is critical to its success. Cash flow information is used by both managers and analysts to understand a company's operations, assess its liquidity, gain insight into its ability to invest in new assets, and evaluate its financing decisions. While accrual accounting provides a company with a range of accounting choices as it records transactions, this same flexibility allows a company to manage its earnings. The statement of cash flows, much like a corporate bank statement, tracks the cash receipts and cash payments for a company and can be useful in exposing many of these manipulations. In light of recent earnings restatements, cash flow analysis has taken on an added importance as many users begin to question the faith they can put in a company's reported income numbers. With an increased emphasis on the analysis of cash flows when measuring a company's performance, a financial statement user should be aware of three red flags that may signal a company is not as healthy as its income statement makes it appear<sup>1</sup>:

Negative operating cash flows—If a company is paying out more cash than it is generating from operations, the company will be forced to rely on issuing debt or stock or selling its assets to fund operations. This may often force a company into

- unfavorable financing options and possibly bankruptcy.
- High income but low operating cash flow—
   An examination of the ratio of income to operating cash flow can help identify high quality, sustainable earnings. If income is significantly higher than operating cash flow, this may signal that the company is hemorrhaging cash (inventories and receivables are typical culprits) and the source of this cash drain should be investigated.
- Negative free cash flow—If a company must make continual investments in property, plant, and equipment to remain competitive, free cash flow (operating cash flow less capital expenditures) may be a more useful measure of cash flow than operating cash flow. While negative free cash flow may be a sign that a company is making large capital investments that may generate large future payoffs, it could also be a warning sign that the company is speculating as to the future payoff of these investments or that its investments are underperforming (not leading to cash generation).

Interpreting the statement of cash flows is not a straightforward, easy process. However, with a little time, patience, and diligent study, the use of cash flow information, along with information contained in the balance sheet and income statement, can help you identify many good investments and avoid many bad ones.

Users of financial statements are interested in the operating, investing, and financing activities of companies. For a particular company they ask questions such as (1) What is the relationship between net income and cash provided by operations? (2) Why are dividends not larger, in light of rising income? (3) What expansion activities took place and how were they financed? (4) Why did cash decrease even though net income was reported? (5) What happened to the proceeds received from issuing capital stock? Each of these questions relates to the cash flows of the company. The FASB recognized the importance of providing answers to these questions by stating that financial reporting should provide information about how a company obtains and spends cash, about its borrowing and repayment of borrowing, about its capital transactions including cash dividends and other distributions of resources to owners, and about other factors that may affect its liquidity or solvency.2

To satisfy these objectives, GAAP requires a company to present a statement of cash flows for the accounting period along with its income statement and balance sheet.<sup>3</sup> The statement of cash flows is an integral part of a company's financial statements and the subject of this chapter.

### CONCEPTUAL OVERVIEW AND REPORTING GUIDELINES

In Chapter 2 we noted that one of the specific objectives of financial reporting is to provide information about a company's cash flows. The FASB is concerned that a company's financial statements include information useful to external users about its cash inflows and outflows, borrowings and repayments, and capital transactions (including dividends). A company's receivables, payables, and inventory (i.e., items of working capital) are the links between its operations and its cash inflows and outflows. Information about these relationships is useful in understanding the operations of the company.

Information about a company's liquidity, financial flexibility, operating capability, and risk is related to these objectives as well. Liquidity is an indication of the company's ability to pay its bills as they come due. Financial flexibility is a measure of the company's ability to take effective actions to change the amounts and timings of its cash flows to adapt to change. Financial flexibility arises primarily from a company's ability to modify operations so as to increase net operating cash inflows. It also comes from the company's ability to raise cash from issuing new debt or equity securities or to obtain cash by disposing of assets. Operating capability is the company's ability to maintain a given physical level of operations, measured in terms of either the quantity of goods (inventory) produced and sold or the physical capacity of the company's property, plant, and equipment. Risk is the uncertainty or unpredictability of the future results of a company. The wider the range within which future results are likely to fall, the greater the risk associated with an investment in or extension of credit to the company.

The primary purpose of a company's statement of cash flows is to provide relevant information about its cash receipts and cash payments during an accounting period that is useful in evaluating the preceding items. The FASB states that the information in a statement of cash flows, if used with information in the other financial statements, helps external users assess (1) a company's ability to generate positive future net cash flows, (2) a company's ability to meet its obligations and pay dividends, (3) a company's need for external financing, (4) the reasons for differences between a company's net income and related cash receipts and payments, and (5) both the cash and noncash aspects of a company's financing and investing transactions during the accounting period.4

<sup>&</sup>quot;Objectives of Financial Reporting by Business Enterprises," FASB Statement of Financial Accounting Concepts No. 1 (Stamford, Conn.: FASB, 1978), par. 49.

<sup>&</sup>quot;Statement of Cash Flows," FASB Statement of Financial Accounting Standards No. 95 (Stamford, Conn.: FASB, 1987), par. 3 (FASB Cod. # 230-10-15).

Ibid., par. 5 (FASB Cod. # 230-10-10).

### **Reporting Guidelines and Practices**

To understand how to use and to prepare a statement of cash flows, it is important to have a definition of the statement and guidelines for preparing the statement. A statement of cash flows is a financial statement of a company that shows the cash inflows, cash outflows, and net change in cash from its operating, investing, and financing activities during an accounting period, in a manner that reconciles the beginning and ending cash balances.

1 Define operating, investing, and financing activities.

### **Operating Activities**

A company's operating activities include all its transactions and other events that are not investing and financing activities. These include transactions involving acquiring (purchasing or manufacturing), selling, and delivering goods for sale, as well as providing services. Cash inflows from operating activities include cash receipts from:

- the sale of goods or services,
- collection of accounts receivable,
- collection of interest on loans, and
- receipts of dividends on investments in equity securities.

Cash outflows for operating activities include cash payments to:

- suppliers for inventory (or raw materials),
- employees,
- the government for taxes,
- lenders for interest (unless capitalized), and
- other suppliers for various expenses.

### **Investing Activities**

A company's investing activities include its transactions involving acquiring and selling property, plant, and equipment, acquiring and selling investments (both current and noncurrent), and lending money and collecting on the loans. Cash outflows for investing activities include cash payments for:

- acquiring property, plant, and equipment,
- purchasing investments in other companies (e.g., stocks and bonds), and
- making loans to borrowers.

Cash inflows from investing activities include cash receipts from:

- sales of property, plant, and equipment,
- sales of investments in other companies, and
- principal repayments of loans by borrowers (e.g., collections of notes receivable).

How a company classifies certain items depends on its operations. For instance, if a company regularly factors its accounts receivable, then it treats the cash receipts as cash inflows from operating activities. Similarly, if a company requires its customers to sign notes for credit sales, then it treats the cash receipts from collections of these notes receivable as cash inflows from operating activities.

### **Financing Activities**

A company's financing activities include its transactions involving obtaining resources from owners and providing them with a return on, and of, their investment, as well as obtaining money and other resources from creditors and repaying the amounts borrowed. Cash inflows from financing activities include cash receipts (proceeds) from:

- issuing equity securities (i.e., common stock and preferred stock),
- issuing bonds,
- issuing mortgages,
- issuing notes, and
- other short- or long-term borrowings.

Cash outflows for financing activities include cash payments for:

- dividends,
- repurchase of the company's equity securities, and
- repayments of amounts borrowed.

Most borrowings and repayments of borrowings are financing activities. However, as we noted, the settlement of liabilities such as accounts payable incurred to acquire inventory and salaries payable are operating activities.

#### **Format**

From a conceptual standpoint, to predict the amounts, timing, and uncertainty of future cash flows, external users need financial information that is presented in homogeneous groups.<sup>5</sup> To implement these guidelines and for consistent reporting, a company's statement of cash flows for the accounting period must clearly show (1) the cash provided by or used in its operating activities, (2) the cash provided by or used in its investing activities, (3) the cash provided by or used in its financing activities, (4) the company's net increase or decrease in cash, and (5) a reconciliation of the company's beginning cash balance to the ending cash balance reported on its year-end balance sheet.

As we will see, most financing and investing activities of a company affect its cash; however, some transactions (such as buying land by issuing common stock) are "simultaneous" investing and financing activities that do not affect its cash. These transactions are important in providing an overall picture of a company's investing and financing activities. The company is required to report these items either in a separate schedule or narrative explanation (in this chapter we will always use a schedule) that accompanies the statement of cash flows. Also, if a company uses the indirect method (which we discuss later) of reporting operating cash flows, it must also disclose the amounts of interest paid and income taxes paid during the accounting period. (We discuss this disclosure later in this chapter.)

#### Cash and Cash Equivalents

As we discussed in Chapter 7, as part of its cash management procedures, a company may invest its cash in short-term, highly liquid investments, such as treasury bills, commercial paper, and money market funds. These investments are called cash equivalents. Then, instead of reporting "Cash" as a current asset on its balance sheet, the company reports "Cash and Cash Equivalents." In this case, the company's statement of cash flows explains the change during the accounting period in its cash and cash equivalents. In this chapter, for simplicity, we focus only on changes in cash.

### **Example: Typical Statement of Cash Flows**

Example 22-1 shows a typical statement of cash flows for the Ryan Corporation.

#### Content

Note that the statement of cash flows is divided into three sections, entitled (1) Net Cash Flow From Operating Activities, (2) Cash Flows From Investing Activities, and (3) Cash Flows From Financing Activities. These are the titles a company generally uses in its statement of cash flows. Note also the schedule of investing and financing activities not affecting cash.

**Operating Cash Flows** A company reports the net cash provided by or used in its operating activities in the first section of its statement of cash flows. Over the long run, a company will be successful only if it is able to obtain positive cash flows from its operations. This situation occurs when the cash received from selling goods or services exceeds the cash paid

<sup>&</sup>quot;Recognition and Measurement in Financial Statements of Business Enterprises," FASB Statement of Financial Accounting Concepts No. 5 (Stamford, Conn.: FASB, 1984), par. 20.

| EXAMPLE 22-1 Typical Statement of Cash Flows   |  |   |
|--|--|---|

| Statement of Cash Flows<br>For Year Ended December 31, 2010  |  |   |
| Net Cash Flow From Operating Activities Net income Adjustments for differences between income flows and cash flows from operating activities: Add: Depreciation expense Decrease in accounts receivable Increase in salaries payable   | \$ 14,000<br>8,000<br>2,600<br>800                       |   |
| Less: Increase in inventory Decrease in accounts payable Net cash provided by operating activities Cash Flows From Investing Activities Payment for purchase of building Payment for purchase of equipment Proceeds from sale of land, at cost Net cash used for investing activities  | \$(28,000)<br>(7,000)<br>\$(28,000)<br>(4,000)<br>10,000 | \$16,400                                |
| Cash Flows From Financing Activities Proceeds from issuance of common stock Proceeds from issuance of bonds Payment of dividends Payment of note payable Net cash provided by financing activities Net Increase in Cash (see Schedule 1) Cash, January 1, 2010 Cash, December 31, 2010 | \$ 18,000<br>12,000<br>(9,000)<br>(13,000)               | 8,000<br>\$ 2,400<br>10,900<br>\$13,300 |
| Schedule 1: Investing and Financing Activities Not Affecting Cash<br>Investing Activities<br>Acquisition of land by issuance of common stock<br>Financing Activities<br>Issuance of common stock for land  |  | \$ (6,000)                              |

to provide the goods or services. Generating cash from operations generally is the most important cash flow activity of a company. The Ryan Corporation provided a net cash inflow of \$16,400 from its operating activities during 2010, as we show in Example 22-1. The company determined this \$16,400 amount by adjusting the \$14,000 net income for several differences between the income flows and cash flows from operating activities. This procedure is called the "indirect method" and we explain this method later in the chapter. External users can compare the company's net cash flow from operating activities with the same information from previous years to detect favorable or unfavorable trends in the company's liquidity, financial flexibility, operating capability, and risk. They can compare this information with the same information from other companies for the same purposes.

**Investing Cash Flows** A company reports the cash inflows and outflows from its investing activities in the second section of the statement of cash flows. It lists each investing cash inflow and outflow and subtotals the amounts to determine the net cash used for (or provided by) investing activities. During 2010, the Ryan Corporation paid cash of \$28,000 to purchase a building and paid cash of \$4,000 to purchase equipment. It received cash of \$10,000 from the sale of land, at cost. The net result was that the company used \$22,000 cash for its investing activities.

Financing Cash Flows A company reports the cash inflows and outflows from its financing activities in the third section of the statement of cash flows. It lists each financing cash inflow and outflow and subtotals the amounts to determine the net cash provided by (or used for) financing activities. During 2010, the Ryan Corporation had cash receipts of \$18,000 and \$12,000 from issuing common stock and bonds, respectively. It had a cash payment of \$9,000 for dividends, and a \$13,000 cash payment for a note. The net result was that \$8,000 cash was provided by its financing activities.

**Net Change in Cash and Reconciliation** A company determines the net increase or decrease in cash by adding the amounts of the net cash flow from operating activities, the net cash flow from investing activities, and the net cash flow from financing activities. The \$16,400 net cash provided by operating activities, combined with the \$22,000 net cash used for investing activities, and the \$8,000 net cash provided by financing activities resulted in a \$2,400 net increase in cash for the Ryan Corporation in 2010. This \$2,400 net increase in cash reconciles the \$10,900 beginning cash balance to the \$13,300 ending cash balance.

**Noncash Items** A company reports its investing and financing activities not affecting cash in a separate schedule accompanying the statement of cash flows. It lists each investing and/or financing activity and offsets the related amounts against each other. During 2010, the Ryan Corporation engaged in a simultaneous investing and financing transaction. It acquired land costing \$6,000 by issuing common stock. The investing portion of the transaction was the acquisition of the land, while the financing portion was the issuance of common stock. Schedule 1 shows the investing activity as a \$6,000 "outflow" which is offset by the \$6,000 "inflow" from the financing activity. Although no cash was exchanged, both items are listed to show all of the Ryan Corporation's investing and financing activities during 2010. ♦

### Usefulness

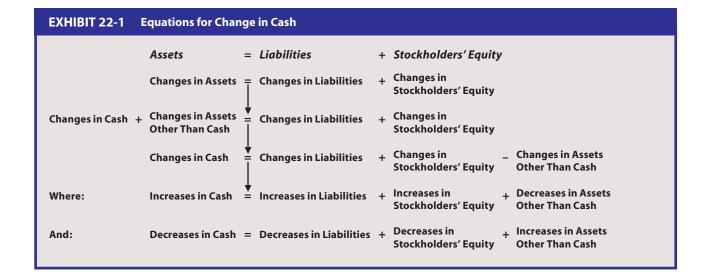

By reviewing the three sections of a company's statement of cash flows, external users can see how it obtained and used its cash. From the accompanying schedule, they can determine the types of investing and financing activities of the company that did not affect cash. They can examine the items in each section to see if important changes have occurred. For instance, the investing activities involving the acquisition of the building and equipment by the Ryan Corporation in 2010 may indicate an increase in its operating capability. In addition, the financing activities involving the issuance of both bonds and common stock by the Ryan Corporation in 2010 reveal a change in its capital structure and may indicate a change in its financial flexibility and risk.

A comparison with other companies can also show, for instance, whether the company is obtaining or using a greater proportion of its cash from financing or investing activities rather than operations. This may be important in assessing the relative risk of investing in the company. External users can evaluate the likelihood of future cash dividends, as well as the need for additional cash to finance existing operations or the expansion of operations. They also can evaluate the ability of the company to pay current obligations, make periodic interest payments, and pay off long-term debt when the debt reaches its maturity date. Thus, a company's statement of cash flows provides external users with information about its liquidity, financial flexibility, operating capability, and risk. In so doing, the statement enhances both the predictive value and feedback value and, therefore, the decision usefulness, of a company's financial statements to help fulfill the objectives of financial reporting.

## **CASH INFLOWS AND OUTFLOWS**

To understand a company's cash flows, the relationships between the *changes* in balance sheet accounts and the company's cash flows must be analyzed. A company's inflows of cash are caused by decreases in its assets (other than cash) and by increases in liabilities and in stockholders' equity during an accounting period. A company's outflows of cash are caused by increases in its assets (other than cash) and by decreases in liabilities and in

stockholders' equity during the accounting period. The difference between the inflows and outflows is the change in cash during the accounting period. We show this relationship by the equations in Exhibit 22-1, starting with the basic accounting equation. Each equation is a modification of the previous equation, to eventually show the increases and decreases in cash. With this background in mind, we can refine the relationships we show in the last two equations of Exhibit 22-1.

### Inflows of Cash

There are three categories of a company's inflows (increases) of cash:

- 1. Decreases in Assets Other Than Cash. The sale or other disposal of assets (other than cash) causes an increase in cash because cash is received in exchange for the assets.
- 2. Increases in Liabilities. The issuance or other incurrence of liabilities causes an increase in cash because cash is received in exchange for the liabilities.<sup>6</sup>
- 3. Increases in Stockholders' Equity. Stockholders' equity increases mainly because of net income and additional investments by owners. Additional investments cause an increase in cash because cash is received in exchange for the common stock issued. Net income is slightly more complicated because the inflows and outflows of cash for operations are different from the revenues and expenses included in net income (we discuss this topic later).

### **Outflows of Cash**

There are also three categories of a company's outflows (decreases) of cash:

- 1. Increases in Assets Other Than Cash. The acquisition of assets (other than cash) causes a decrease in cash because cash is paid in exchange for the assets.<sup>7</sup>
- 2. Decreases in Liabilities. The payment of liabilities causes a decrease in cash because cash is paid to satisfy the liabilities.
- 3. Decreases in Stockholders' Equity. Stockholders' equity may decrease as a result of several transactions. Two common transactions are the payment of dividends and the

2 Know the categories of inflows and outflows of cash.

Alternatively, as we discuss later, the increase in a liability such as accounts payable results, in effect, in a "savings" (i.e., increase) in cash because of a smaller cash payment.

Alternatively, as we discuss later, the increase in an asset such as accounts receivable results, in effect, in a decrease in cash because of a smaller cash receipt.

acquisition of treasury stock. In each case, a decrease in stockholders' equity is accompanied by a decrease in cash.

### Classifications of Cash Flows

We can further classify the cash inflows and outflows we just discussed into operating, investing, and financing cash flows.

### 1. Operating Cash Flows

- A. Inflows of Cash. Increases in stockholders' equity (i.e., retained earnings) because of revenues, adjusted for changes in current assets and current liabilities that are related to the operating cycle, as well as changes in certain noncurrent assets and liabilities (e.g., deferred taxes).
- B. Outflows of Cash. Decreases in stockholders' equity (i.e., retained earnings) because of expenses, adjusted for changes in current assets and current liabilities that are related to the operating cycle, as well as changes in certain noncurrent assets and liabilities (e.g., deferred taxes).

### 2. Investing Cash Flows

- A. Inflows of Cash. Decreases in noncurrent assets and certain current assets (e.g., notes receivable and temporary investments related to investing activities).
- B. Outflows of Cash. Increases in noncurrent assets and certain current assets (e.g., notes receivable and temporary investments).

### 3. Financing Cash Flows

- A. Inflows of Cash. Increases in noncurrent liabilities, stockholders' equity (other than net income), and certain current liabilities (e.g., notes payable related to financing activities).
- B. Outflows of Cash. Decreases in noncurrent liabilities, stockholders' equity (other than a net loss), and certain current liabilities (e.g., notes payable and dividends payable).

### **Noncash Simultaneous Investing/Financing Transactions**

Changes in assets (other than cash), liabilities, and stockholders' equity may be the result of investing and financing activities not affecting cash. Examples of these transactions include

- acquisitions of assets by issuing equity securities (noncash investing and financing
- acquisitions of assets by assuming liabilities such as capital lease obligations (noncash investing and financing activities),
- exchanges of debt securities for equity securities such as the conversion of bonds to common stock (noncash financing activities),
- exchanges of assets for assets (noncash investing activities),
- exchanges of liabilities for liabilities (noncash financing activities), and
- exchanges of equity securities such as the conversion of preferred stock to common stock (noncash financing activities).

Although these transactions are relatively rare, they do involve "simultaneous" investing activities and/or financing activities not affecting cash. They generally have a significant effect on the prospective cash flows of a company, so that the company reports them in a schedule (or narrative explanation) that accompanies its statement of cash flows, as we discussed earlier.

The operating cash flows involve several adjustments for items relating to the operating cycle. We further explain the net cash flow from operating activities in the next section.

3 Classify cash flows as operating, investing, or financing.

- The statement of cash flows provides relevant information about a company's cash receipts and cash payments that is useful for assessing its liquidity, financial flexibility, operating capability, and risk.
- A company's cash flows are reported as:
  - Operating activities—cash receipts and cash payments relating to the earning activities of the company (generally resulting from transactions that enter into the determination of income).
  - Investing activities—cash receipts and cash payments relating to the acquisition and disposition of assets such as property, plant, and equipment, notes receivable, and investments in other companies.
  - Financing activities—cash receipts and cash payments relating to the external financing of a company such as the issuance and repurchase of common stock, issuance and repayment of bonds, and payment of dividends.
- A company's statement of cash flows must clearly show the three categories above as well as the net increase or decrease in cash and a reconciliation of the beginning and ending cash balance reported on the balance sheet. Furthermore, the disclosure of significant noncash activities is required to be reported in either a separate schedule or narrative explanation that accompanies the statement of cash flows.
- A company's cash flow is related to the changes in its balance sheet accounts as follows:
  - Increases in cash are caused by decreases in assets (other than cash), increases in liabilities, and increases in stockholders' equity.
  - Decreases in cash are caused by increases in assets (other than cash), decreases in liabilities, and decreases in stockholders' equity.
- These cash flows can be further classified (consistent with the reporting guidelines above) as:
  - Operating activities—increases or decreases in stockholders' equity (e.g., retained earnings) because of certain revenues or expenses, adjusted for changes in the related current assets or current liabilities, and certain noncurrent assets and liabilities.
  - Investing activities—decreases or increases in noncurrent assets and certain current assets (e.g., notes receivable and marketable securities), or
  - Financing activities—increases or decreases in noncurrent liabilities, stockholders' equity, and certain current liabilities (e.g., notes payable and dividends payable).

# **NET CASH FLOW FROM OPERATING ACTIVITIES**

The calculation of a company's net cash flow from operating activities is usually the most detailed part of its statement of cash flows. To prepare this section, it is helpful to understand the relationship between sales revenues, expenses, and cash flows in a company's operating cycle.

Recall from Chapter 4 that a retail company's operating cycle is the average time it takes to spend cash for inventory, sell the inventory, collect the accounts receivable, and convert them back into cash. To begin a company's operating cycle, the company purchases inventory for cash or on credit. To make cash or credit sales, it incurs cost of goods sold and selling expenses and reduces inventory, and either pays cash, incurs current liabilities, or reduces prepaid items. In its operations, the company incurs general and administrative expenses and either pays cash, incurs current liabilities, or reduces prepaid items. Finally, the company collects its accounts receivable and converts them back into cash. This step completes the operating cycle.

# ETHICAL DILEMMA

Polaris, Inc., manufactures and sells a variety of high-end electronic devices. Its most popular product, a portable satellite radio, has been a market leader for years and helped the company amass a large amount of cash. However, Polaris' financial performance has been somewhat disappointing over the last two years. Specifically, Polaris' return on assets has decreased by two percentage points, and its stock price has been stagnant. As the accountant for Polaris, the CEO has asked you to provide an analysis of the causes of these disappointing results and provide a recommendation that would increase the company's performance measures. Your examination of the company's financial results reveals that the company's large cash balance may be a factor in the company's disappointing performance. While the large cash balance increases the company's liquidity, the majority of these funds are invested in short-term financial instruments that yield approximately 2%. This low return is a significant cause of the company's declining return on assets measure and has many investors calling for an increased dividend, which the CEO is adamantly against. Instead of paying a dividend, you suggest that Polaris use the excess cash to finance its customers' purchases of the company's products. The interest rate charged to provide this financial assistance will be much higher than the rate earned by the company's current investment strategy, and this increased return is expected to add at least one percentage point to the company's return on assets.

The CEO is very excited about this proposal, but he is concerned about how the increased receivables created by the loans to the customers will affect the company's cash flow from operating activities. You state that while this is not specifically addressed by GAAP, you feel that since customer loans relate to the sale of the company's products, the associated cash outflow should be classified as an operating activity. The CEO disagrees and decides that the cash outflow associated with the lending transaction is an investing activity. He reasons that because GAAP does not address this issue, he has an obligation to the shareholders to make the company's financial statements look as good as possible. If the company classifies the lending transaction as an operating activity, it would report declining cash flow from operations and send an incorrect signal to the market as to the company's future. Furthermore, the CEO states that because the matter is simply a classification issue that does not change the company's total cash flow, no one would be hurt by classifying the transaction as an investing activity. How do you respond to the CEO's statements?

As you can see from the previous discussion, the impact of each phase of the operating cycle is not the same on both the company's net income and its net cash flow from operating activities because of differences in when the company records revenues and expenses and when it receives and pays cash. A company "adjusts" for these differences to help calculate its net cash flow from operating activities.

There are also "noncash" changes in certain noncurrent asset (and liability) accounts that affect a company's net income but do not result in a cash inflow or outflow for operating activities. For instance, when a company records depreciation, the journal entry involves a debit to Depreciation Expense (a reduction of net income) and

\$70,000

a credit to Accumulated Depreciation (a reduction of noncurrent assets). Although depreciation expense reduces net income (and noncurrent assets), there is no cash outflow for operating activities. The recording of amortization expense for intangible assets (such as a patent) and depletion expense for natural resource assets (such as a coal mine) have the same effect. That is, there is a reduction in net income (and noncurrent assets) but no operating cash outflow. A company analyzes each of the changes in these noncurrent asset accounts to help determine the effect on its net cash flow from operating activities.

### **Direct Method**

GAAP allows a company to choose one of two ways to calculate and report its net cash flow from operating activities on its statement of cash flows. The first is called the *direct* method. Under the direct method, a company deducts its operating cash outflows from its operating cash inflows to determine its net cash flow from operating activities. Using this method, the cash inflows from operating activities are computed and reported first. A company's operating cash inflows are:

- collections from customers,
- · collections of interest and dividends, and
- other operating receipts.

For simplicity, in the following example we focus on collections from customers.

Then, the cash outflows for operating activities are computed and reported. A company's operating cash outflows are:

- payments to suppliers,
- payments to employees,
- other operating payments,
- payments for interest, and
- payments for income taxes.

For simplicity, in the following example we focus on payments to suppliers, payments to employees, and payments for income taxes.

### **Example: Direct Method**

Assume the Ryan Corporation presents the following simplified income statement information for the year ended December 31, 2010:

| Sales revenue (cash and accounts receivable)   |            | \$10,000 |
|--|------------|----------|
| Less:  |            |          |
| Cost of goods sold (cash and accounts payable) | \$(29,000) |          |
| Salaries expense (cash and salaries payable)   | (13,000)   |          |
| Depreciation expense                           | (8,000)    | (50,000) |
| Income before income taxes                     |            | \$20,000 |
| Income tax expense (cash)                      |            | (6,000)  |
| Net income                                     |            | \$14,000 |
|  |            |          |

Further analysis reveals the following changes in its current asset and current liability accounts for 2010:

- accounts receivable decreased by \$2,600,
- inventory increased by \$2,000,
- accounts payable decreased by \$7,000, and
- salaries payable increased by \$800.

Sales revenue (cash and accounts receivable)

Under the direct method, Ryan Corporation reports the cash flows from operating activities on its statement of cash flows as follows:

4 Explain the direct and indirect methods for reporting operating cash flows.

Cash Flows From Operating Activities Cash Inflows: Cash collected from customers \$ 72,600 Cash inflows from operating activities \$72,600 Cash Outflows: Cash paid to suppliers \$(38,000) Cash paid to employees (12,200)Cash paid for income taxes (6,000)Cash outflows for operating activities (56,200)Net cash provided by operating activities \$16,400

The \$72,600 cash collected from customers is computed by adding the \$2,600 decrease in accounts receivable to the \$70,000 sales revenue. This adjustment is made because the company's cash collections exceeded its sales during the year. This is the only cash receipt, so that cash inflows from operating activities are \$72,600.

The \$38,000 cash paid to suppliers is computed by adding the \$2,000 increase in inventory and the \$7,000 decrease in accounts payable to the \$29,000 cost of goods sold. These adjustments are made because the company's purchases exceeded its cost of goods sold, but some of these purchases were on credit. The \$12,200 cash paid to employees is computed by deducting the \$800 increase in salaries payable from the \$13,000 salaries expense. This adjustment is made because the cash paid for salaries was less than its salaries expense. The entire \$6,000 of income tax expense was paid in cash. These cash outflows for operating activities total \$56,200, so that the net cash provided by operating activities is \$16,400. Note that the depreciation expense is not included in the net cash flows from operating activities because it did not result in an outflow of cash. •

The direct method has the advantage of reporting a company's operating cash inflows separately from its operating cash outflows, which may be useful in estimating future cash flows. However, the direct method is criticized because it does not "tie" the net income reported on a company's income statement to the net cash provided by operating activities reported on its statement of cash flows. Also, the direct method does not show how the changes in the elements (i.e., current assets and current liabilities) of a company's operating cycle affected its operating cash flows.

### Indirect Method

Use of the *indirect* method to report a company's net cash flow from operating activities on its statement of cash flows resolves the two criticisms of the direct method. Under the indirect method, a company's net income is adjusted (reconciled) to its net cash flow from operating activities on the statement of cash flows. To do so, net income is listed first and then adjustments (additions or subtractions) are made to net income:

- 1. to eliminate certain amounts (such as depreciation expense) that are included in its net income but do not involve a cash receipt or cash payment for operating activities, and
- to include any changes in the current assets (other than cash) and current liabilities involved in the company's operating cycle that affect its cash flows differently than they affect net income.

In other words, under the indirect method, a company's income flows are converted from an accrual basis to a cash flow basis. In this manner, the indirect method shows the "quality" of a company's income by providing information about lead and lag intervals between its income flows and operating cash flows.

### **Example: Indirect Method**

Refer back to the Ryan Corporation's income statement and additional information we showed earlier. Under the indirect method, Ryan Corporation reports the net cash flow from operating activities on its statement of cash flows as follows:

| Net Cash Flow From Operating Activities         |          |          |
|---|----------|----------|
| Net income                                      | \$14,000 |          |
| Adjustments for differences between income      |          |          |
| flows and cash flows from operating activities: |          |          |
| Add: Depreciation expense                       | 8,000    |          |
| Decrease in accounts receivable                 | 2,600    |          |
| Increase in salaries payable                    | 800      |          |
| Less: Increase in inventory                     | (2,000)  |          |
| Decrease in accounts payable                    | (7,000)  |          |
| Net cash provided by operating activities       |          | \$16,400 |

It is important to understand how each adjustment is used to convert the net income to the net cash provided by operating activities. First, the \$8,000 depreciation expense is added to the \$14,000 net income because it had been deducted to determine net income even though it did not involve an outflow of cash. The \$2,600 decrease in the current asset, accounts receivable, is added to net income because it resulted in an additional cash receipt from operations. The \$800 increase in the current liability, salaries payable, resulted in an increase in expenses and a decrease in net income. It is added to net income because it did not involve a cash payment for operations. The \$2,000 increase in the current asset, inventory, and the \$7,000 decrease in the current liability, accounts payable, are both deducted from net income because they resulted in additional operating cash payments. Note that by using either the direct method or the indirect method, net cash provided by operating activities is the same amount (\$16,400). The indirect method is the method used by the Ryan Corporation in Example 22-1 at the beginning of the chapter. The Coca-Cola Company uses the indirect method in its statement of cash flows, as shown in Appendix A. •

GAAP recommends the direct method, but allows the use of either the direct method or the indirect method. However, if a company uses the direct method on its statement of cash flows, it must also include a separate schedule that reconciles its net income to its net cash flow provided by (or used in) operating activities (i.e., the indirect method). Most companies (99%) use the indirect method<sup>8</sup> because of its historical use and the extra schedule required under the direct method. However, companies that use the indirect method must report the interest paid and income taxes paid. We use the indirect method in the main part of the chapter, but discuss the direct method in the Appendix at the end of the chapter. (You should use the indirect method for all homework, unless otherwise indicated.)

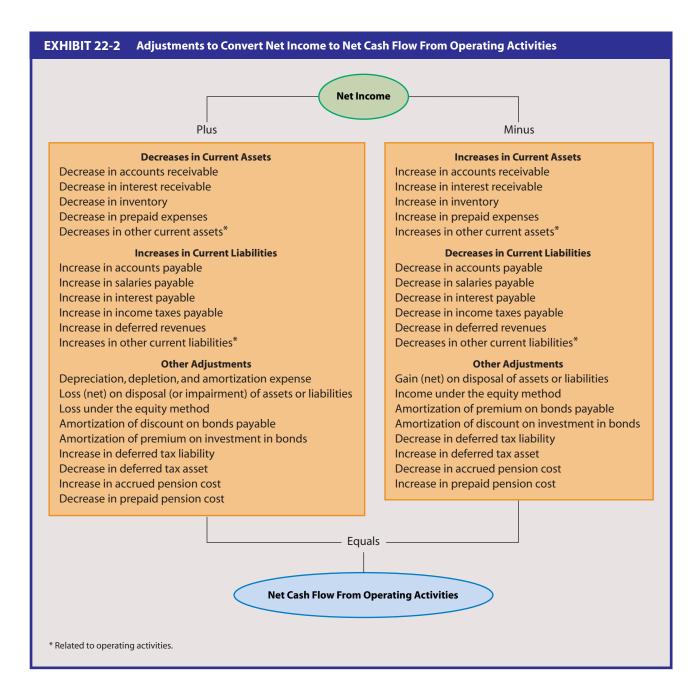

### **Major Adjustments**

In the previous example of the indirect method, we made only a few simple adjustments to convert the net income to the net cash flow from operating activities. In reality, a company may have many adjustments involving both increases and decreases in its current assets and current liabilities, as well as other noncurrent accounts. Exhibit 22-2 lists the major adjustments used to convert a company's net income to its net cash flow from operating activities. We explain these adjustments in the examples that follow.

## Information for Preparation of Statement

When a company prepares its statement of cash flows, it uses information for the accounting period from the following financial statements: (1) beginning and ending balance sheets, (2) income statement, and (3) retained earnings statement. In addition, it needs other information that explains the changes in its balance sheet accounts (other than cash). This additional information is obtained from its accounting records.

## VISUAL INSPECTION METHOD OF ANALYSIS

There are two methods that you may use to prepare a company's statement of cash flows: the visual inspection method and the worksheet method.<sup>9</sup> Under the visual inspection method, you review the company's financial statements and prepare its statement of cash flows without using a worksheet. This method may be used when a company's financial statements are simple and when the relationships between changes in account balances can be easily analyzed. There are seven steps in the visual inspection method, as we show in Exhibit 22-3.

<sup>9.</sup> Sometimes a third method involving T-accounts is used to analyze and develop the information for a company's statement of cash flows. The T-account method, however, results in cumbersome working papers when the analysis is complex. Because the worksheet method uses the same general technique as the T-account method, but in a more efficient format, we discuss only the worksheet method in this chapter.

#### **EXHIBIT 22-3 Steps in Visual Inspection Method**

- 1. Prepare the heading for the statement of cash flows and list the three major sections: (a) Net Cash Flow From Operating Activities, (b) Cash Flows From Investing Activities, and (c) Cash Flows From Financing Activities.
- Calculate the net change in cash that occurred during the accounting period. This amount is a major subtotal, or "target figure," on the statement of cash flows.
- 3. List the company's net income as the first item in the net cash flow from operating activities section.
- 4. Calculate the increase or decrease that occurred during the accounting period in each balance sheet account (except cash).
- 5. Determine whether the increase or decrease in each balance sheet account (except cash) caused an inflow or outflow of cash and, if so, whether the cash flow was related to an operating, investing, or financing activity.
- 6. If no cash flow occurred in Step 5, determine whether the increase or decrease in each balance sheet account (except cash) was (a) the result of a noncash income statement item or (b) a simultaneous investing and/or financing transaction. If (a), then determine the adjustment (addition or subtraction) to help convert net income to the net cash flow from operating activities. If (b), then identify the components of the simultaneous investing and/or financing activity.
- 7. Complete the various sections of the statement of cash flows (based on the analysis in Steps 5 and 6), and check that the subtotals of the sections sum to the net change (increase or decrease) in cash (from Step 2). Also check that the sum of the net change in cash and the beginning cash balance is equal to the ending cash balance reported on the balance sheet.

Steps 5 and 6 do not have to be completed in sequential order. What is important is a complete analysis of the relevant information. 10 The visual inspection method is rarely used because there is no supporting documentation for the statement of cash flows.

## Simple Example (Visual Inspection Method)

Knowledge of the visual inspection method is helpful in understanding the more complex worksheet method. To explain the visual inspection method, Example 22-2 shows the condensed financial information of the Leyton Company (a small service company) for 2010. Example 22-3 shows the statement of cash flows prepared from that information. After preparing the heading and listing the three sections of the statement, the \$2,600 net increase in cash is determined. This increase is computed by subtracting the \$4,000 cash balance on the beginning balance sheet from the \$6,600 cash balance on the ending balance sheet. Then, the \$7,000 net income is obtained from the income statement and listed as the first item in the net cash flow from operating activities section. The following discussion explains the remaining steps in the visual inspection method by reviewing the items in each section of the statement.

### **Net Cash Flow From Operating Activities**

In this section, there are three adjustments to convert the net income to the net cash flow from operating activities. The first adjustment involves the \$2,300 depreciation expense. This amount is obtained from the income statement in Example 22-2. It is also the \$2,300 increase (from \$12,500 to \$14,800) in the accumulated depreciation account on the balance sheets during the year. 11 Because depreciation is deducted in computing net income but does **5** Prepare a simple statement of cash flows.

<sup>10.</sup> If the company engaged in any investing and financing transactions not affecting cash, you must also prepare the heading for a schedule of Investing and Financing Activities Not Affecting Cash in Step 1 of Exhibit 22-3.

No buildings or equipment were sold during the year. If they had been sold, the accumulated depreciation account would have decreased. The related cash flow analysis would have been more complicated. We discuss this situation later in the worksheet method.

| EXAMPLE 22-2 Leyton Company: Co  | ndensed Financ                  | ial Information  |  |  |

| (a) A building was purchased for cash du<br>(b) Land was sold (at cost) for cash during                                  | ring the year.                  | nformation for 2010<br>(c) No buildings or equipment v<br>(d) A note payable was issued at   |  |  |

not cause a cash outflow, the \$2,300 depreciation expense is added to net income. The second adjustment involves the \$1,500 increase (from \$7,500 to \$9,000 in Example 22-2) in accounts payable. Accounts payable increased because other operating expenses recorded during the year exceeded the cash payments for these items. Therefore, the expenses deducted

| <b>EXAMPLE 22-3</b> Simple Statement of Cash Flows  |                      |                  |
|---|----------------------|------------------|
| LEYTON COMPANY  |                      |                  |
| Statement of Cash Flows<br>For Year Ended December 31, 2010   |                      |                  |
| Net Cash Flow From Operating Activities Net income Adjustments for differences between income flows and cash flows from operating activities: Add: Depreciation expense | \$ 7,000<br>2,300    |                  |
| Increase in accounts payable  | 1,500                |                  |
| Less: Increase in accounts receivable Net cash provided by operating activities Cash Flows From Investing Activities  | (2,700)              | \$8,100          |
| Payment for purchase of building Proceeds from sale of land, at cost Net cash used for investing activities Cash Flows From Financing Activities                        | \$(12,000)<br>       | (9,000)          |
| Proceeds from issuance of note<br>Payment of dividends<br>Net cash provided by financing activities   | \$ 7,000<br>_(3,500) | 3,500            |
| Net Increase in Cash<br>Cash, January 1, 2010   |                      | \$2,600<br>4,000 |
| Cash, December 31, 2010   |                      | <u>\$6,600</u>   |

to compute net income are greater than the related cash payments. Consequently, the \$1,500 increase in accounts payable is added to net income. The third adjustment involves the \$2,700 increase (from \$6,300 to \$9,000) in accounts receivable. Accounts receivable increased during the year because service revenues on credit exceeded the cash collections on account. Therefore, service revenues and net income are greater than the related cash receipts. Consequently, the \$2,700 increase in accounts receivable is deducted from net income.

As a result of the preceding adjustments, the net cash flow from operating activities is \$8,100 for the Leyton Company in 2010, as we show in Example 22-3. Note that, with the exception of depreciation, the adjustments to net income involve changes in current assets (except cash) and current liabilities.

### **Cash Flows From Investing Activities**

There are only two cash flows from investing activities: one cash payment and one cash receipt. During 2010, the Buildings and Equipment account increased by \$12,000, from \$48,000 to \$60,000, as we show on the balance sheets in Example 22-2. This increase is the result of the purchase of a building, an investing activity, which required a cash payment of \$12,000. This cash payment is listed as the first item in this section. During 2010, the Land account decreased by \$3,000, from \$9,000 to \$6,000. This is the result of the sale of land, an investing activity. Because the land was sold at cost, there is no gain or loss. 12 The \$3,000 cash receipt is listed as the second item in this section. As a result of these two cash flows, net cash of \$9,000 is used for investing activities by the Leyton Company in 2010, as we show in Example 22-3.

### **Cash Flows From Financing Activities**

There are also two cash flows from financing activities: one cash receipt and one cash payment. During 2010, the notes payable account increased by \$7,000, from \$14,000 to \$21,000, as we show in Example 22-2. This increase is the result of issuing a note, a financing activity, which provided a cash receipt of \$7,000 that is listed as the first item in this section. There was no change in the common stock account during the year, so there is no cash inflow or outflow related to common stock. During 2010, the company declared and paid dividends of \$3,500. The amount of the dividends is obtained from the retained earnings statement in Example 22-2. [Note also that the \$7,000 net income, offset by the \$3,500 dividends, accounts for the \$3,500 increase (from \$11,300 to \$14,800) in the retained earnings account shown on the balance sheets.] The \$3,500 cash payment of dividends, a financing activity, is listed as the second item in this section. As a result of these two cash flows, net cash of \$3,500 is provided by the financing activities of the Leyton Company during 2010, as we show in Exhibit 22-3.

### Summary

Note that in preparing the three sections of the cash flow statement in Exhibit 22-3, we account for all the changes in the assets (except cash), liabilities, and stockholders' equity accounts during 2010, as listed in Example 22-2. Note also that, with the exception of depreciation, the adjustments to net income in the net cash flow from operating activities section involve changes in current asset (except cash) and current liability accounts. On the other hand, all of the cash receipts and payments listed in the cash flows from investing activities section and the cash flows from financing activities section involve changes in noncurrent asset, noncurrent liability, and stockholders' equity accounts. The statement of cash flows in Example 22-3 is now complete. The \$8,100 net cash provided by operating activities, less the \$9,000 net cash used for investing activities, plus the \$3,500 net cash provided by financing activities, equals the \$2,600 net increase in cash. And, the \$2,600 net increase in cash, added to the \$4,000 beginning cash balance, is equal to the \$6,600 ending cash balance (as reported on the company's December 31, 2010 balance sheet). With this background in mind, we now turn to the worksheet method of analysis. •

## WORKSHEET (SPREADSHEET) METHOD OF ANALYSIS

Companies usually use the worksheet method to prepare their statements of cash flows. Under this method, a company uses a worksheet to (1) record its cash receipts and payments according to the operating, investing, and financing sections of the statement of cash flows, (2) record the investing and financing activities not affecting cash, and (3) account for the change in each asset, liability, and stockholders' equity account. This method is most often used because it enables a company to analyze its complex transactions in a concise format. A common way of preparing an electronic worksheet is to use a software package such as Microsoft Excel. Because the worksheet method is used in more complex situations, it is helpful to follow a series of steps.

## **Steps in Preparation (Worksheet Method)**

After gathering information from the financial statements and supplemental information from the accounting records, a company completes several steps to prepare the worksheet and its statement of cash flows. We list each step in Exhibit 22-4, followed by an explanation.

There are three issues related to the steps listed in Exhibit 22-4. First, other than usually starting with net income, there is no particular order in which the worksheet entries are reconstructed. You should develop a method to account for all the changes in the noncash accounts in an orderly way. Second, you may have to make more than one worksheet entry to reconcile the change in an account. For instance, the change in the Land account may be the result of both a sale and a purchase of land. In these cases, both the cash receipt and cash payment are accounted for and reported separately. Finally, remember that these worksheet entries are not posted to any accounts. They are recorded on the worksheet only to help prepare the statement of cash flows.

## **Comprehensive Example (Worksheet Method)**

To understand how to prepare a worksheet and statement of cash flows, we discuss a comprehensive example. The example is not intended to be all-inclusive. However, it provides a basis from which to develop a logical approach to using a worksheet for analyzing similar operating, investing, and financing transactions. The example includes a discussion of each step in Exhibit 22-4. As you study this example, it will be helpful to reread these steps. Example 22-4 shows the condensed financial information of the Jones Company for 2010 that we use in the example. In Example 22-4, we include letters of the alphabet in parentheses beside amounts or items of information. These letters correspond to the letters we use to explain the worksheet entries in Example 22-5.

### Steps 1, 2, and 3: Setting Up the Worksheet

Steps 1 and 2 involve setting up the worksheet, entering the account titles, their beginning and ending balances, and the changes in the account balances in the appropriate columns. The columns are totaled to check for accuracy. In Step 3, the major headings, Net Cash Flow From Operating Activities, Cash Flows From Investing Activities, Cash Flows From Financing Activities, and Investing and Financing Activities Not Affecting Cash, are then listed on the worksheet. Enough space is left under each heading so that the cash flows may be listed accordingly. Example 22-5 shows these accounts and their headings for the Jones Company. 13

### **Step 4: Completion of the Worksheet**

The worksheet entries to account for all the *changes* in the noncash accounts are entered directly on the worksheet in Step 4, as we show in Example 22-5. We explain each entry in the following discussion. Entries (a) through (j) generally affect current assets and current

<sup>6</sup> Use a worksheet (spreadsheet) for a statement of cash flows.

<sup>13.</sup> Normally, in Step 3 the major headings are listed below the account titles. However, because Example 22-5 is so long, we show the lower portion of the worksheet on the facing page.

#### EXHIBIT 22-4 **Steps in Worksheet Method**

Step 1. Prepare the column headings on a worksheet (see Example 22-5). Then enter the account title Cash on the first line of the account titles column and list the beginning balance, ending balance, and change in cash in the respective columns. Step 2. Enter the titles of all the remaining accounts from the balance sheets on the worksheet and list each beginning and ending account balance, and the change in the account balance directly below the cash information. (To simplify the worksheet, only the change in each account balance may be entered.) The accounts with debit balances are listed first, followed by the accounts with credit balances. Total the amount columns to verify that the debit totals equal the credit totals. **Step 3.** Directly below these accounts, add the following headings:

- A. Net Cash Flow From Operating Activities
- B. Cash Flows From Investing Activities
- C. Cash Flows From Financing Activities
- D. Investing and Financing Activities Not Affecting Cash

Leave sufficient room below each heading so that each type of cash flow may be listed.

- Step 4. Account for all the changes in the noncash accounts that occurred during the current period. Reconstruct the journal entries that caused the changes in the noncash accounts directly on the worksheet, making certain modifications to show the cash receipts and payments for operating, investing, and financing activities. Remember that you are preparing this worksheet at the end of the accounting period. The actual journal entries that caused the changes have already been made and posted to the accounts. In this step, you are reconstructing the entries on the worksheet to prepare the statement of cash flows. Use the following *general rules*:
- A. Start with net income. Net income is a summary of all the journal entries from operating activities that affect current assets or current liabilities (and some noncurrent) and retained earnings. Net income is adjusted on the worksheet to reconcile it to the net cash flow from operating activities. Therefore, the entry on the worksheet to list net income and to explain the impact on retained earnings is a debit to the caption Net Income under the heading Net Cash Flow From Operating Activities and a credit to Retained Earnings.<sup>a</sup>
- B. Account for the changes in the current asset (except cash) and current liability accounts. Because nearly all the changes in the current assets and current liabilities relate to the company's operating activities, the impacts of these changes on cash are listed as adjustments (additions or deductions) to net income in the Net Cash Flow From Operating Activities section of the worksheet.<sup>b</sup> Review each current asset (except cash) and current liability account. Make an entry on the worksheet to record the change (debit or credit) in that account and the adjustment [credit (deduction) or debit (addition)] to net income.
- C. Account for the changes in the noncurrent accounts. Review each noncurrent account and determine the journal entry responsible for its change. Identify whether the transaction involves an operating, investing, or financing activity. If the transaction involved an investing or financing activity, make the entry on the worksheet with the following changes:
  - 1. If the entry affects cash, replace a debit to cash with either an investing or financing cash inflow caption, and list the item as a debit (receipt) under the proper heading. Replace a credit to cash with a proper cash outflow caption, and list the item as a credit (payment) under the proper heading.
  - 2. If the entry involves an operating activity and affects a noncash income statement item (e.g., depreciation, gain, or loss), replace the debit or credit to this noncash item with an adjustment to net income under the Net Cash Flow From Operating Activities heading.
  - 3. If the entry does not affect an operating activity or cash, it is a simultaneous financing and/or investing transaction. For this type of transaction, create expanded entries to record both the financing and/or investing activities.

Step 5. Make a final worksheet entry to record the net change in cash. The worksheet entries must account for all the changes in the noncash accounts recorded in Step 2. The difference between the total cash inflows and outflows must be egual to the change in the Cash account. The final worksheet entry to record a net increase in cash is a debit to Cash and a credit to Net Increase in Cash.<sup>c</sup> Total the debit and credit worksheet entries in the upper and lower portions to verify that the respective totals are equal.

Step 6. Prepare the statement of cash flows and accompanying schedule. Use the information developed in the lower part of the worksheet (and the beginning and ending cash balances). Under the major sections of the statement, list the various cash receipts and payments. Subtotal the items under each major section and add or subtract the subtotals to determine the net change in cash. Add the net change in cash to the beginning cash balance to determine the ending cash balance. In an accompanying schedule, list the various investing and financing activities not affecting cash.

- a. The entry to show a net loss involves a debit to Retained Earnings and a credit to Net Loss. Any adjustments for noncash items included in net income, such as in Step 4C(2), are made as usual.
- b. The major exceptions to this adjustment are changes in short-term notes receivable and notes payable, changes in temporary investments (i.e.,  $marketable\ securities), and\ changes\ in\ dividends\ payable.\ These\ changes\ are\ the\ results\ of\ investing\ or\ financing\ activities\ and\ are\ handled\ like\ the\ payable\ for\ the$ changes in the noncurrent accounts discussed in Step 4(C), except that changes in temporary investments may require additional analysis as
- c. For a net decrease in cash, an opposite entry (a debit to Net Decrease in Cash and a credit to Cash) is made.

### **EXAMPLE 22-4** Jones Company: Condensed Financial Information

| Income Statement Information for 201 | 0           |              |
|--------------------------------------|-------------|--------------|

#### Supplemental Information for 2010

- (k) On December 31, 2010, the company borrowed \$2,600 from a bank by issuing a 12%, 90-day note payable.
- (I) During the year, additional land was acquired at a cost of \$10,400.
- (m) During the year, land that cost \$2,200 was sold for \$3,900, resulting in a \$1,700 gain.
- (n) During the year, a new building was acquired at a cost of \$15,000.
- (o) During the year, an earthquake completely destroyed a building that cost \$10,000 and had a book value of \$5,200. Settlement with the insurance company, combined with the tax credit, resulted in after-tax cash proceeds of \$3,100 and an extraordinary loss (net of income taxes) of \$2,100.
- (p) On December 31, 2010, the company leased equipment under a long-term capital lease, recording the lease at \$5,300.
- (g) On January 1, 2010, the company issued \$10,000 of long-term bonds at 90. The bonds pay interest semiannually on July 1 and January 1 at a 10% annual rate and mature in 10 years on January 1, 2020.
- (r) The company uses straight-line amortization for the bond discount in (q); consequently, bond discount amortization was \$100 for the year.
- (s) On January 1, 2010, 60 shares of preferred stock with a total par value of \$6,000 and book value of \$7,000 were converted into 240 shares of common stock. The required book value method was used to record the conversion.
- (t) Taxable income was less than pretax accounting income for the year, resulting in an increase in deferred taxes payable of \$180.
- (u) During the year, a small stock dividend was declared and issued. The stock dividend involved 100 shares of \$10 par common stock. The market value of the stock on the declaration date was \$31 per share.

liabilities and relate to operating activities. Entries (k) through (v) generally affect noncurrent assets, noncurrent liabilities, and stockholders' equity items and relate to investing and financing activities. Entry (w) represents the change in cash. As you study each entry, it will be helpful to review the discussion under Step 4 of Exhibit 22-4, as well as the financial information in Example 22-4.

### **Worksheet Entries for Operating Activities**

Entry (a) records net income as the first item on the worksheet under the heading Net Cash Flow From Operating Activities. Adjustments are then made for noncash expenses and for changes in current assets and current liabilities.

**Noncash Expenses** A review of the expenses on the income statement in Example 22-4 shows three "noncash" expenses: depreciation expense on equipment, depreciation expense on buildings, and patent amortization expense. Each of these is added back to net income to help reconcile it to the net cash flow from operating activities, as we show in entries (b), (c), and (d). Note that entries (b) and (d) account for the changes in Accumulated Depreciation: Equipment and Patents (net), respectively. Entry (o), which we discuss later, is also recorded to account for the change in the Accumulated Depreciation: Buildings account.

**Changes in Current Assets** A review of the changes in the current assets (except cash) reveals several additional adjustments that are made to help reconcile the net income to the net cash flow from operating activities. Accounts receivable increased by \$2,000 during the year because the company collected less cash than the credit sales it made. To adjust net income for the lower operating cash inflow, entry (e) is made. Note that, for simplicity, we ignore bad debts here. If accounts receivable (net) are affected by a provision for bad debts, then both the change in accounts receivable because of recording bad debts expense and the change because of cash collections in excess of (or less than) sales are treated as adjustments of net income.

Inventories decreased by \$300 during the year, indicating that the company purchased less inventory than it recorded as cost of goods sold. To adjust net income for the lower operating cash outflow, entry (f) is made. Prepaid expenses increased by \$200 during the year, indicating that the company paid more cash for these items than the amount of expense it included in other operating expenses. To adjust net income for the higher operating cash outflow, entry (g) is made.

**Changes in Current Liabilities** Accounts payable decreased by \$1,300 during the year. This decrease indicates that the company's cash payments for operating activities exceeded expenses. To adjust net income for the higher cash outflow, entry (h) is made. Both income taxes payable and interest payable increased during the year, indicating that the company paid less cash than it reported as the respective expenses. To adjust net income for the lower cash outflows, entries (i) and (j) are made. A few entries which we record later also affect the net cash flow from operating activities.

Note that no adjustment is made to the net cash flow from operating activities for the \$2,600 increase in the current liability, notes payable. This is because the increase was due to a financing activity, which we summarized in the supplemental information of Example 22-4. To record the cash receipt from this financing activity, entry (k) is made. At this point all the changes in the current assets (except cash) and current liabilities are accounted for.

### **Worksheet Entries for Investing and Financing Activities**

Turning to the noncurrent assets and liabilities, a review of the supplemental information is needed to identify the various investing and financing activities.

Changes in Land During the year, the company both purchased and sold land; both are investing activities. The acquisition of land resulted in a \$10,400 cash payment, which is recorded in entry (1). Land that cost \$2,200 was sold for \$3,900, which resulted in a \$1,700 gain (not extraordinary) that increased net income. Because the entire \$3,900 is reported as a cash receipt from an investing activity, the gain is subtracted from net income to avoid double counting, and because there was no cash inflow from operating activities. Therefore, entry (m) is made. 14 Note that entries (l) and (m) account for the \$8,200 increase in the Land account.

<sup>14.</sup> If the land was sold at a loss, the loss would decrease net income even though there was no outflow of cash for operating activities. In this case, the worksheet entry would be modified so that the caption Loss on Sale of Land is debited under the heading Net Cash Flow From Operating Activities to add back the loss to net income in a manner similar to depreciation expense.

(Lower portion shown on facing page)

Changes in Buildings (and Extraordinary Loss) The acquisition of a new building during the year resulted in a \$15,000 cash payment for an investing activity, which is recorded in entry (n). GAAP requires that a company report its cash flows from extraordinary items (as well as discontinued operations) as investing or financing activities and exclude them from its net cash flows from operating activities. 15 During

the year, an earthquake (extraordinary event) occurred that destroyed a building owned by the company with a cost of \$10,000 and a book value of \$5,200. Because the company received after-tax cash proceeds of \$3,100 from its insurance company, it incurred an extraordinary loss (net of taxes) of \$2,100, which it included in (and reduced) net income. The proceeds are a cash receipt from an investing activity. To record the cash receipt, eliminate the book value, and add back the extraordinary loss to net income, entry (o) is made. Because worksheet entry (o) is complex, we show it below in journal entry form to help you in your analysis:

#### **Cash Flows From Investing Activities:** (o)

Proceeds From Building Destroyed by Earthquake 3,100 **Accumulated Depreciation: Building** 4,800 Net Cash Flow From Operating Activities: **Extraordinary Loss** 2,100 **Buildings** 

Note that entries (n) and (o) account for the \$5,000 increase in the Building account, and that entries (c) and (o) account for the \$300 increase in the Accumulated Depreciation account. Note also that the Extraordinary Loss is shown on the

worksheet as an addition to net income in the usual manner, along with the other added items.

Change in Leased Equipment At the end of the year, the company leased equipment under a capital lease, recording the asset and liability at \$5,300. Although not affecting cash, this is a simultaneous investing and financing transaction, and the company reports both activities in a schedule accompanying the statement of cash flows. Entries (p-1) and (p-2) record these events.

Changes in Bonds Payable (and Related Discount) On January 1, the company issued bonds payable with a face value of \$10,000, at a discount, receiving proceeds of \$9,000. This is a financing activity, and the cash receipt is recorded in entry (q). Note that the \$1,000 debit to Discount on Bonds Payable does not equal the net change (\$900) in the account. This is because the company amortized part of the discount during the year. On the income statement in Example 22-4, note that the bond interest expense is \$1,100; however, the cash paid or owed on the bonds is 10% of \$10,000, or \$1,000. The additional \$100 of interest expense is due to the discount amortization. This amortization increased interest expense and reduced net income but did not involve a cash outflow. To adjust for the lower operating cash outflow, entry (r) is made. The \$900 increase in Discount on Bonds Payable is now accounted for. The adjustment for the amortization of a premium on bonds payable would be handled in a similar but opposite way. Bond premium amortization reduces interest expense to an amount less than the operating cash outflow. Therefore, the worksheet entry would involve a debit to Premium on Bonds Payable and a credit to Net Cash Flow From Operating Activities: Bond Premium Amortization for the amount of the premium amortization.

**Change in Preferred Stock** During the year, 60 shares of convertible preferred stock with a total par value of \$6,000 and a book value of \$7,000 were converted to 240 shares of \$10 par common stock; the company accounted for the transaction by the required book value method. Although not affecting cash, two simultaneous financing activities involving the exchange of equity securities occurred that the company reports in a schedule accompanying the statement of cash flows. Entries (s-1) and (s-2) record these events. Note that entry (s-1) did not account for all the changes in the Common Stock and Additional Paid-In Capital on Common Stock accounts. Entry (u) also affects these accounts, as we discuss below.

Change in Deferred Taxes The deferred tax liability increased by \$180 because the company's income tax expense was higher than the actual income taxes it paid or owes (because of a temporary difference between pretax financial income and taxable income). To adjust net income for the lower operating cash outflow, entry (t) is made.

**Stock Dividend** The company declared and issued a small stock dividend during the year; it recorded the transaction at the market price of the stock. Recall that stock dividends affect only stockholders' equity accounts and do not involve the transfer of assets to stockholders or the exchange of equity securities. Consequently, the issuance of a stock dividend is not considered to be a financing activity and is not reported on a company's statement of cash flows. However, to account for the \$3,100 effect on the company's stockholders' equity accounts, entry (u) is made in the *upper* part of the worksheet.

**Cash Dividends** The \$730 net decrease in retained earnings during the year has not yet been accounted for. Entry (a) increased retained earnings for the net income of \$6,370, while entry (u) decreased it for the stock dividend of \$3,100. The remaining decrease in retained earnings was due to the declaration and payment of \$4,000 in cash dividends. This payment is a financing activity and is recorded in entry (v).

### **Step 5: Final Worksheet Entry**

In Step 5, a check of the debit and credit entries in the upper portion of the worksheet shows that all the changes in the noncash accounts have been accounted for. A final worksheet entry is made to record the increase in cash and to bring the debit and credit column totals into balance. This is entry (w). The debit and credit totals in the upper portion of Example 22-5 are \$56,800 and in the lower portion are \$49,600. The worksheet for the Jones Company is now complete.

### **Step 6: Preparation of Statement**

Example 22-6 shows the statement of cash flows and the accompanying schedule of investing and financing activities not affecting cash for the Jones Company. They

were prepared from the *lower* part of the worksheet in Example 22-5, along with the beginning and ending cash balances. Note that in the Cash Flows From Investing Activities section, the company reports the payment for the purchase of land separately from the receipt from the sale of land. Similarly, it reports the payment for the purchase of the building separately from the receipt from the building destroyed by the earthquake. GAAP requires that a company report the cash inflows and cash outflows for related investing activities as well as for related financing activities separately and not "net" them against each other. 16 Note also that the reconciliation of the beginning and ending cash balances at the bottom of the statement of cash flows enables a user to trace the change in cash to related amounts on the company's balance sheets. Finally, note that the schedule of investing and financing activities not affecting cash discloses the \$5,300 noncash transaction that had both an investing and financing element, and the \$7,000 noncash transaction that involved two financing elements. •

## OUICK CHECK 22-2

- The calculation of a company's net cash flow from operating activities involves an adjustment of net income for differences in when the company records revenues and expenses and when it receives and pays cash, as well as for noncash items (e.g., depreciation expense, amortization expense for intangible assets) that affect net income but do not result in a cash receipt or payment. These adjustments are made using either the direct or indirect methods.
- The direct method calculates and reports a company's net cash flow from operating activities by computing the company's cash inflows for each operating activity and then deducting its cash outflows for each operating activity.
  - The direct method requires that each income statement account be analyzed and adjusted for changes in current assets or liabilities, certain noncurrent assets or liabilities, and any noncash items.
  - If the direct method is used, a company must include a reconciliation of net income to net cash flow from operating activities.
- The indirect method calculates a company's net cash flow from operating activities by converting its net income from an accrual basis to a cash flow basis.
  - The indirect method adjusts net income for changes in the appropriate current assets or liabilities, certain noncurrent assets or liabilities, and any noncash
  - The indirect method is the most commonly used method for the preparation of net cash flow from operating activities.
- A company's net cash flows from investing and financing activities are identified through an analysis of the changes in the balance sheet accounts (generally noncurrent assets and liabilities) and a review of any supplemental information provided.
- The statement of cash flows may be prepared by using either the visual inspection method or the worksheet method. The steps for each method are outlined in Exhibit 22-3 and Exhibit 22-4, respectively.
  - Under either method, all of the changes in the assets (except cash), liabilities, and stockholders' equity accounts during the period are explained.

# IFRS vs. U.S. GAAP

IFRS require a company to include a cash flow statement as one of its basic financial statements. These standards define operating, investing, and financing activities in a manner similar to U.S. GAAP. A company may present its operating cash flows under either the indirect or direct method. However, contrary to U.S. GAAP, IFRS do not require a company using the direct method to reconcile its net income to its operating cash flows. There are also a few differences in the way a company presents certain items under IFRS as compared to U.S. GAAP. For instance, under IFRS, a company is (1) required to report as an investing cash outflow the cash paid for any development costs (that are part of its R&D) that it capitalized as an intangible asset, (2) allowed to report dividends and interest paid as either an operating cash outflow or a financing cash outflow, (3) allowed to report dividends and interest received as either an operating cash inflow or an investing cash inflow, (4) allowed to report bank overdrafts as a financing cash inflow, (5) allowed to report payments of income taxes identified with financing or investing transactions as financing or investing cash outflows, (6) allowed to report its cash flow per share, and (7) allowed more freedom in netting cash receipts and payments. Finally, contrary to U.S. GAAP, IFRS encourage a company to disclose any undrawn borrowing facilities that may be available for future operating activities, the cash flows that represent increases in its operating capacity separately from the cash flows that are needed to maintain its operating capacity, and the operating, investing, and financing activities of each of its reported industry and geographic segments.

## **SPECIAL TOPICS**

We designed the previous examples and discussion to show the common issues involved in using the worksheet to prepare the statement of cash flows. For simplicity, we omitted several topics. We briefly discuss these topics in the following sections.

## Sale of Depreciable Asset

A company computes the gain or loss on the sale of a depreciable asset by comparing the current book value of the asset to the selling price. When the company records the transaction, it increases cash, eliminates the book value (cost and accumulated depreciation), and recognizes a gain or loss that it reports on its income statement. At the end of the year, when preparing the worksheet for the statement of cash flows, this journal entry must be properly reconstructed on the worksheet to account for the changes in the various accounts.

### **Example: Sale of Depreciable Asset**

Assume that during the year, Brandt Company sold equipment with a cost of \$2,200 and accumulated depreciation of \$700 for \$2,100. The company recorded an increase (debit) in Cash for \$2,100, a decrease (debit) in Accumulated Depreciation for \$700, and a decrease (credit) in Equipment for \$2,200. Because the \$2,100 selling price (proceeds) was more than the \$1,500 (\$2,200 - \$700) book value, the company also recorded (credited) a Gain on the Sale of Equipment for \$600.

The proceeds of \$2,100 are a cash receipt from an *investing* activity. The gain increased net income, but there was no cash inflow from *operating* activities. In preparing the worksheet entry for this transaction, two modifications are made: (1) instead of debiting cash, the caption Proceeds From Sale of Equipment under the heading Cash Flows From Investing Activities is debited for the \$2,100, and (2) the caption Gain on Sale of Equipment is credited under the heading Net Cash Flow From Operating Activities to subtract the gain from net income to avoid double counting and to correctly show the cash provided by operating activities. The worksheet entry (in journal entry format) is as follows:

**Cash Flows From Investing Activities: Proceeds From Sale of Equipment** 2,100 **Accumulated Depreciation** 700 **Equipment** 2,200 **Net Cash Flow From Operating Activities:** Gain on Sale of Equipment 600

The sale of equipment (or other depreciable assets) at a loss is handled in a similar manner, except that the caption Loss on Sale of Equipment is debited under the heading Net Cash Flow From Operating Activities to add back the loss to net income because it did not involve an operating cash outflow. •

### **Retirement of Bonds**

A company computes the gain or loss on the retirement of bonds by comparing the current book value of the bonds payable to the retirement price. When the company records the transaction, it decreases cash, eliminates the book value (face value and any related premium or discount), and recognizes a gain or loss that it reports on its income statement. At the end of the year, this journal entry must be properly reconstructed on the worksheet to account for the changes in the various accounts.

### **Example: Retirement of Bonds**

Assume that during the year, Rosen Company paid \$8,900 to retire bonds with a face value of \$10,000 and a book value of \$9,700. The company recorded a decrease (debit) to Bonds Payable for \$10,000, a decrease (credit) to Discount on Bonds Payable for \$300, and a decrease (credit) to Cash for \$8,900. Since the cash paid was less than the book value, the company also recorded (credited) an \$800 (\$9,700 - \$8,900) Gain on Retirement of Bonds.

The cash paid of \$8,900 is a cash payment for a financing activity. The gain increased net income but there was no cash inflow from operating activities. In preparing the worksheet entry for this transaction, two modifications are made: (1) instead of crediting cash, the caption Cash Flows From Financing Activities: Payment to Retire Bonds is credited for \$8,900, and (2) instead of crediting gain, the caption Net Cash Flow From Operating Activities: Gain on Retirement of Bonds is credited for \$800 to subtract the gain from net income to correctly show the cash provided by operating activities. The retirement of bonds payable at a loss is handled in a similar manner, except that the caption Net Cash Flow From Operating Activities: Loss on Retirement of Bonds is debited to add back the loss to net income because it did not involve an operating cash outflow.

### **Interest Paid and Income Taxes Paid**

GAAP requires a company using the indirect method of reporting its operating cash flows to also disclose its interest paid and income taxes paid. This disclosure may be made in a separate schedule, narrative description, or the notes to the financial statements. Interest expense is affected by the cash paid, accruals, and any premium or discount amortizations on bonds (or notes) payable. Income tax *expense* is affected by the cash paid, accruals, and changes in deferred income taxes. To convert interest expense to interest paid, and to convert income tax expense to income taxes paid, the following adjustments<sup>17</sup> are necessary:

7 Compute and disclose interest paid and income taxes paid.

<sup>17.</sup> A company may have a valuation allowance related to its deferred tax asset. Since the valuation allowance is a contra account, it handles any changes in the account in the opposite way to that of the deferred tax asset.

| Interest  | Income Taxes   |
|---|--|
| Interest expense  | Income tax expense                                     |
| + Decrease in interest payable                                | + Decrease in income taxes payable                     |
| or  | or   |
| <ul> <li>Increase in interest payable</li> </ul>              | <ul> <li>Increase in income taxes payable</li> </ul>   |
| + Amortization of premium on bonds payable                    | + Decrease in deferred tax liability                   |
| or  | or   |
| <ul> <li>Amortization of discount on bonds payable</li> </ul> | <ul> <li>Increase in deferred tax liability</li> </ul> |
| = Interest <i>paid</i>  | + Increase in deferred tax asset or                    |
|   | <ul> <li>Decrease in deferred tax asset</li> </ul>     |
|   | = Income taxes <i>paid</i>                             |

### **Example: Interest and Income Taxes**

Refer back to the Jones Company information shown in Example 22-4 and 22-5. To determine its interest paid and income taxes paid for 2010, the Jones Company prepares the following schedules:

| Bond interest expense                            | \$1,100          | Income tax expense                           | \$3,630 |
|--|------------------|--|---------|
| <ul> <li>Increase in interest payable</li> </ul> | (500)            | <ul> <li>Increase in income taxes</li> </ul> |         |
| <ul> <li>Bond discount amortization</li> </ul>   | (100)            | payable                                      | (630)   |
| Interest paid                                    | \$ 500           | <ul> <li>Increase in deferred</li> </ul>     |         |
| interest para                                    | <del>* 300</del> | tax liability                                | _(180)  |
|  |                  | Income taxes paid                            | \$2,820 |

Based on these computations, Jones Company reports interest paid of \$500 and income taxes paid of \$2,820 with its 2010 statement of cash flows shown in Example 22-6. Unless directed otherwise, you are not required to make these disclosures in the chapter homework. •

## Flexibility in Reporting

GAAP permits flexibility in reporting a company's net cash flow from operating activities under the indirect method. That is, the company may show the reconciliation of net income to the net cash provided by (or used in) operating activities in a separate schedule accompanying its statement of cash flows. Thus, for instance, if the Jones Company used this approach, the first section of Example 22-6 would appear as follows:

Then the company would report the reconciliation of the \$6,370 net income to the \$13,500 net cash provided by operating activities in Schedule 1. The rest of the statement of cash flows would remain the same. (The schedule to report the investing and financing activities not affecting cash would be numbered as Schedule 2.) The advantage of reporting the reconciliation in a separate schedule is that it reduces the amount of detail that a company shows on its statement of cash flows. The disadvantage is that it removes from the statement a key factor in assessing the quality of the company's net income and its relationship to cash flows. By relegating the reconciliation to a separate schedule, this analysis may be overlooked by external users. For this reason, we advocate that a company include the reconciliation directly on its statement of cash flows, which most companies do.

## **Partial Cash Investing and Financing Activities**

In the previous examples and discussion, we assumed that no cash was exchanged in any "noncash" transactions involving investing and financing activities. In some transactions, however, a company may exchange a small amount of cash even though most of the transaction involves a noncash exchange. In other transactions, it may exchange a large amount of cash even though some of the transaction is a noncash exchange. In these cases, there are alternative ways the company may use to disclose simultaneous investing and financing activities involving some cash.

### **Example: Small Amount of Cash**

Assume Hembrey Company acquired land for \$10,000 by paying \$1,000 down and signing a \$9,000 note payable. One method it may use to disclose the effects of this transaction is to report the cash payment on its statement of cash flows and the noncash element on the accompanying schedule of investing and financing activities not affecting cash as follows:

Statement of Cash Flows

| ,   |           |
|---|-----------|
| Cash Flows From Investing Activities                            |           |
| Payment for purchase of land                                    | \$(1,000) |
| Schedule: Investing and Financing Activities Not Affecting Cash |           |
| Investing Activities  |           |
| Purchase of land for \$10,000 by issuance of note               | \$(9,000) |
| Financing Activities  |           |
| Issuance of note to acquire land                                | 9,000     |
|   |           |

The advantage of this approach is that it keeps the significant noncash elements of the transaction separate from the cash elements. The disadvantage is that the external user cannot identify the relationships between the items. •

### **Example: Large Amount of Cash**

When the amount of cash is large in such an exchange, it may be more appropriate to report the items in the statement of cash flows. Several alternative disclosure formats are acceptable. For instance, if Lakewood Company acquired land for \$18,000 by paying \$15,000 down and signing a \$3,000 note payable, it might report the effects on its statement of cash flows as follows:

| Cash Flows From Investing Activities          |            |
|---|------------|
| Purchase of land by issuance of note and cash | \$(18,000) |
| Less: Issuance of note                        | 3,000      |
| Cash payment for purchase of land             | \$(15,000) |

The advantage of this approach is that the related items are shown in close proximity. The disadvantage is that a financing element (issuance of note) is disclosed in an investing section. Each of the alternative disclosures has its advantages and disadvantages. You must use good judgment to determine the most informative disclosure for the given circumstances.

## **Temporary and Long-Term Investments**

As we discussed in Chapter 15, a company reports its investments (whether temporary or long-term) in "available-for-sale" debt and equity securities as assets at their fair value (by using an allowance account) on its year-end balance sheet. It also includes any resulting unrealized increase or decrease in value as a component of its accumulated other comprehensive income<sup>18</sup> in its stockholders' equity. When the company sells this temporary or long-term investment, it eliminates the fair value (cost and allowance accounts) of the security, as well as any related cumulative unrealized increase or decrease in value, from its accounting records. It also records a realized gain or loss on the sale. It computes the realized gain or loss by comparing the proceeds to the *cost* of the security.

<sup>18.</sup> The company would first include the periodic change in the unrealized increase or decrease in value in its other comprehensive income for the period, as we discussed in Chapter 5.

Because the company used an allowance account and an unrealized increase or decrease account to value the investment in available-for-sale securities, it must carefully analyze any changes in these accounts to determine the impact (if any) on its statement of cash flows. The company reports an increase in the investment account due to the purchase of the securities on its statement of cash flows as a cash payment for an investing activity. The entry on the worksheet to prepare the statement is also made in the usual manner. The company does not report any changes in the allowance and the unrealized increase or decrease accounts resulting from a revaluation to fair value at year-end on its statement of cash flows. However, it must account for the changes on the worksheet. The company reports a decrease in the investment account because of the sale of the securities on its statement of cash flows as a cash receipt from an investing activity in the usual manner. However, the worksheet entry must reconcile the changes in the investment, allowance, unrealized increase/decrease, and realized gain (or loss) accounts.

Getty Images/Photodisc

### **Example: Purchase and Sale of Investment**

Assume that on November 28, 2010, the Dougherty Company purchased 1,000 shares of Bear Company common stock for \$40,000 as a temporary investment in available-for-sale securities. On December 31, 2010, the fair value of the stock has risen to \$42 per share, so that the company reported the temporary investment as a current asset of \$42,000  $(\$40,000 \cos t + \$2,000 \text{ allowance})$ . It also reported a \$2,000 unrealized increase in valueof available-for-sale securities as a component of its accumulated other comprehensive income in its stockholders' equity on the December 31, 2010 balance sheet. For its cash flow analysis, Dougherty Company would make the following worksheet entries at the end of 2010 to reconcile the \$42,000 change in the carrying value of the temporary investment:

| Temporary Investment in Available-for-Sale Securities | 40,000 |        |
|---|--------|--------|
| Cash Flows From Investing Activities:                 |        |        |
| Payment for Purchase of Temporary Investments         |        | 40,000 |
| Allowance for Change in Value of Investment           | 2,000  |        |
| Unrealized Increase in Value of Available-for-Sale    |        |        |
| Securities  |        | 2,000  |

The debit portion of the first entry is listed in the upper part of the worksheet. This helps to reconcile the change in the temporary investment account. The credit portion of the first entry is listed in the lower part of the worksheet and accounts for the cash payment for the purchase of the temporary investment. The company reports this \$40,000 cash payment in its 2010 statement of cash flows. Both the debit and credit portions of the second entry are listed in the upper portion of the worksheet and complete the reconciliation of the changes in the allowance and unrealized increase accounts. The company does not include this portion of the increase in the carrying value of the temporary investment on its 2010 statement of cash flows because there was no cash outflow.

Now suppose that the Dougherty Company sold its investment in Bear Company stock for \$45,000 on January 16, 2011. Dougherty Company would make the following worksheet entries at the end of 2011 to reconcile the changes in the various accounts:

| Cash Flows From Investing Activities: Receipt |        |        |
|---|--------|--------|
| from Sale of Temporary Investment             | 45,000 |        |
| Temporary Investment in Available-for-Sale    |        |        |
| Securities                                    |        | 40,000 |
| Net Cash Flow From Operating Activities:      |        |        |
| Gain on Sale of Temporary Investment          |        | 5,000  |
|   |        |        |

### Unrealized Increase in Value of Available-for-Sale Securities Allowance for Change in Value of Investment

2,000

2,000

These two journal entries (1) record the \$45,000 investing cash inflow from the sale of the securities, (2) treat the \$5,000 gain on the sale as a subtraction from net income to reconcile it to the net cash flow from operating activities, and (3) reconcile the changes in the temporary investment, allowance, and unrealized increase accounts. The company reports the first two items on its 2011 statement of cash flows in the usual manner.

A company may also make a long-term investment in debt securities (e.g., bonds) that it expects to hold to maturity. It amortizes any premium or discount each year as an adjustment to interest revenue, and reports the investment at its book value on the year-end balance sheet. For cash flow reporting purposes, it reports the purchase as a cash payment for investing activities. The company also adds any premium amortization on this type of investment to net income in the operating activities section of the statement of cash flows because the amortization reduced interest revenue to an amount lower than the cash received. The company subtracts any discount amortization from net income because the amortization increased interest revenue to an amount higher than the cash received. Each of these adjustments helps reconcile the net income to the net cash flow from operating activities. Although rare, if a company sells such an investment before maturity, it computes any gain or loss by comparing the proceeds to the unamortized cost. It reports the proceeds as a cash receipt from investing activities and deducts the gain from net income (or adds the loss to net income) in the usual manner on its statement of cash flows.

A company may also make short-term investments in trading securities. GAAP requires that a company report the cash flows from purchases, sales, and maturities of trading securities based on the nature and purpose for which the securities were acquired. Also, as we discussed in Chapter 15, GAAP requires a company to report investments in trading securities at their fair value and report any resulting unrealized holding gain or loss in net income. Consequently, for reporting its operating cash flows under the indirect method, a company adds (deducts) an unrealized holding loss (gain) on trading securities to (from) net income to help adjust net income from an accrual basis to a cash basis.

### **Financial Institutions**

One controversial issue regarding the classification of cash flows was the proper reporting of interest collected and interest paid, and collections and payments of notes receivable and notes payable. Most companies do not deal with notes receivable and notes payable as a primary part of their operations. On the other hand, notes are a major aspect of the business of banks (and other financial institutions). Banks also frequently buy and sell notes, mortgages, and similar securities. The question arose as to whether companies should be required to report the related cash inflows and outflows (i.e., interest and principal) as operating activities or as investing and financing activities. As we discussed earlier in the chapter, the FASB concluded that companies must report interest collected and interest paid as cash flows relating to operating activities. The Board concluded that this would provide consistency with the reporting of the related interest revenue and interest expense on the income statement. However, the Board decided that companies must report the collections and payments of the principal of notes receivable and notes payable as cash flows relating to their investing and financing activities, respectively.

However, GAAP is different for banks, brokers and dealers in securities, and other similar companies that hold loans for resale on a short-term basis or carry securities in a "trading account." (A trading account includes accounts that are acquired specifically for resale and are turned over very quickly.) The FASB requires that the cash flows from the purchases or sales of these trading accounts be reported in the operating activities section of the statement of cash flows. 19 In coming to this conclusion, the FASB reasoned that

<sup>19. &</sup>quot;Statement of Cash Flows-Exemption of Certain Enterprises and Classification of Cash Flows from Certain Securities Acquired for Resale," FASB Statement of Financial Accounting Standards No. 102 (Norwalk, Conn.: FASB, 1989), par. 8 and 9 (FASB Cod. # 230-10-45).

these types of assets for financial institutions are similar to inventory for other businesses and, as such, are part of the operating activities.

As we discussed earlier in the chapter, in most situations GAAP does not allow a company to "net" its cash outflows against cash inflows for reporting the results of related investing or financing activities. An exception is made for certain activities of banks and other financial institutions. These institutions are allowed to report the net cash flows for (1) deposits and withdrawals with other financial institutions, (2) time deposits accepted and repaid, and (3) loans made to customers and principal collections of these loans.<sup>20</sup> This exception is allowed because showing these items on a "gross" basis provides information that is costly for a company to accumulate and is of limited value to external users.

### **Cash Dividends Declared**

In the previous examples, whenever we discussed cash dividends, we assumed that the dividends were declared and paid in the current year. The declaration and payment of cash dividends causes a decrease in both retained earnings and cash. A company reports this as a cash payment for financing activities.

In some instances, a company will declare a cash dividend in the *current* year and pay the cash dividend in the next year. In this case, the cash dividend is handled differently in preparing the worksheet for the statement of cash flows. The declaration of the cash dividend is recorded on the worksheet as a decrease (debit) in Retained Earnings and an increase (credit) in Dividends Payable. Because no cash outflow occurs in the current year, the company does not report dividends paid on its statement of cash flows. In the next year, the company records the payment of the cash dividends on the worksheet as a decrease (debit) in Dividends Payable and a decrease (credit) in Cash. The company then reports the dividends paid as a cash payment in the cash flows from financing activities section of its statement of cash flows.

When a company follows a policy of declaring a dividend in one year and paying the dividend in the next year, its Dividends Payable account balance will change during each year. A comparison of the change in the account balance to the dividends reported on the retained earnings statement will determine the worksheet entry necessary to account for the cash dividends.

## Cash Flows for Compensatory Share Option Plans

In Chapter 16, we showed how a corporation records its estimated compensation expense for a compensatory share option plan. In Chapter 19, we explained how recording this compensation expense for financial reporting purposes but not recording any compensation expense for income tax purposes results in a deferred tax asset for the future deductible amount. Although both of these journal entries affect net income, neither results in a cash flow. Therefore, on the corporation's statement of cash flows, under the indirect method the increase in compensation expense must be added back to net income and the increase in the deferred tax asset must be subtracted from net income to help determine the net cash flow from operating activities.

When employees exercise the share options, the cash flow treatment is more complicated and we only provide a brief overview here. In Chapter 19, we explained that in the year an employee exercises the share options, the corporation is allowed to take a tax deduction (for compensation expense) equal to the difference between the market price of the shares on the exercise date and the exercise price. However, for financial reporting purposes, the corporation has already recorded all of the compensation expense during the service period. So, when the share options are exercised, the corporation has higher pretax financial income than taxable income because the previous future deductible difference has "reversed." Therefore, it eliminates the deferred tax asset (that it had previously recorded during the service period) and increases income

<sup>20. &</sup>quot;Statement of Cash Flows—Net Reporting of Certain Cash Receipts and Cash Payments and Classification of Cash Flows from Hedging Transactions," FASB Statement of Financial Accounting Standards No. 104 (Norwalk, Conn.: FASB, 1989), par. 7 (FASB Cod. # 230-10-45-8).

tax expense. For cash flow purposes, this decrease in the deferred tax asset is added back to net income under the indirect method to help determine the net cash flow from operating activities.

If the actual market price used to record the compensation expense for income tax purposes is the same as the estimated market price (based on the option pricing model) used to record the compensation expense for financial reporting purposes, then there are no more cash flow issues. However, this is not likely because of the use of estimates, and a "permanent" difference will exist that provides a tax benefit by reducing the corporation's income tax expense and income taxes payable. Therefore, GAAP requires that the corporation compute the excess realized tax benefit related to the difference between the compensation expense reported for income tax purposes and the compensation expense recorded for financial reporting purposes. The corporation is then required to report the excess realized tax benefit as a cash inflow from financing activities because it relates to the issuance of stock, which is a financing activity. The corporation is also required to *subtract* the excess realized tax benefit from net income to help determine its net cash flow from operating activities on its statement of cash flows.<sup>21</sup> The amount is subtracted because it reduced income tax expense but did not involve an operating cash savings.

For example, suppose that Petricka Corporation reported net income of \$500,000 and had a tax deduction of \$800,000 in the current year for compensation expense because employees exercised share options. In previous years, for financial reporting purposes, the corporation had recorded compensation expense of \$700,000 for this compensatory share option plan. If the corporation is subject to a 30% tax rate and uses the indirect method to report its cash flows from operating activities, then it would report the \$30,000 [(\$800,000 - \$700,000)  $\times$  0.30] excess realized tax benefit on its statement of cash flows for the current year as follows:

Cash flows from operating activities Net income \$500,000 Less: Excess tax benefits from compensatory stock option plan (30,000)Cash flows from financing activities \$ 30,000 Excess tax benefits from compensatory stock option plan

## Effects of Exchange Rates

Many companies have operations in foreign countries. When a company with foreign operations prepares its statement of cash flows, the statement must disclose the "reporting currency equivalent" of the "foreign currency" cash flows using the exchange rates in effect at the time of the cash flows. It may use a weighted average exchange rate for the period if this yields similar results. On the statement of cash flows, a company reports the effect of exchange rate changes on cash balances held in foreign currencies as a separate part of the reconciliation of the change in cash during the period.<sup>22</sup>

### Cash Flow Per Share

A company must report its earnings per share on the face of its income statement, as we discussed in Chapter 17. Although the cash flow information presented in a company's statement of cash flows is useful in evaluating the performance of the company, the FASB believes that cash flow (or any component) is not an alternative to income as an indicator of a company's performance. Consequently, a company is not allowed to report a cash flow per share amount in its financial statements.<sup>23</sup> Users often compute other cash flow ratios, however, as we discussed in Chapter 6.

<sup>21.</sup> FASB Statement No. 95, op.cit., par. 19 and 23 (FASB Cod. # 230-10-45), as amended by FASB Statement No. 123 (revised 2004) (Norwalk, Conn.: FASB, 2004), par. 68 and A96 (FASB Cod. # 718-20-55).

<sup>22.</sup> FASB Statement No. 95, op. cit., par. 25 (FASB Cod. # 830-230-45).

<sup>23.</sup> Ibid., par. 33 (FASB Cod. # 230-10-45).

### **Additional IFRS Adjustments**

The preparation of a company's statement of cash flows under IFRS requires several adjustments that are not required under U.S. GAAP. These adjustments can be broken down into two categories.

First, the application of IFRS involves several noncash transactions that affect only balance sheet accounts. For example, under IFRS, a company is allowed to write the value of its property, plant, and equipment and intangible assets up to fair value with a corresponding increase in stockholders' equity (a revaluation surplus account). In addition, IFRS allow a company to recognize any actuarial gain or loss related to its defined benefit pension plan directly in stockholders' equity. Even though no cash is involved in these transactions, the company must "reconstruct" the related journal entries on its worksheet for its statement of cash flows to properly account for the changes in these balance sheet accounts.

Second, the application of IFRS also produces several noncash transactions that affect both balance sheet and income statement accounts. For example, IFRS allow a company to reverse a previous inventory write-down taken under the lower of cost or market rule as well as to reverse any impairment losses related to a loan (note receivable). These reversals are recognized in income, but do not involve cash. In addition, IFRS require a company with an unvested prior service cost related to its defined benefit pension plan to amortize this cost on a straight-line basis until the costs vest, with no recognition of this amount in accumulated other comprehensive income. This amortization results in a noncash expense on the income statement. Finally, as we discussed in Chapter 12, under IFRS a company may capitalize development costs (that are part of its R&D) as an intangible asset. It then must amortize the cost as a noncash expense on its income statement. Similar to other noncash items (e.g., gains, losses, depreciation expense), the company would reconstruct the related journal entries on its worksheet to subtract from (or add to) its net income any of these amounts to reconcile its net income to the net cash flow from operating activities (assuming the indirect method is used).

### **Disclosure**

Real Report 22-1 shows the statement of cash flows for Kellogg Company. Note that Kellogg uses the indirect method to report net cash flow from operating activities and discloses the changes in current assets and current liabilities in the notes to its financial statements. Additionally, the effect of the exchange rate on cash is disclosed separately after net cash flow from financing activities.

### **Questions:**

- 1. How did Kellogg's net cash provided by operating activities differ from its net income for 2007? Explain this difference.
- 2. What type of activities did Kellogg invest in for 2007?
- 3. What kind of financing activities did Kellogg engage in for 2007?

# QUICK CHECK 22-3

The sale of a depreciable asset generally involves an increase in cash (classified as an investing activity), the elimination of the book value of the asset, and the recognition of a noncash gain or loss (the difference between the book value and the proceeds from the sale) which requires an adjustment to net income in the operating activities section of the statement of cash flows prepared under the indirect method.

(Continued)

- The retirement of bonds generally involves a decrease in cash (classified as a financing activity), the elimination of the book value of the bonds, and the recognition of a noncash gain or loss (the difference between the book value of the bonds and cash paid to retire the bonds) which requires an adjustment to net income in the operating activities section of the statement of cash flows prepared under the indirect method.
- A company using the indirect method must disclose the interest paid and the income taxes paid in a separate schedule, narrative description, or the notes to the financial statements.
- The reconciliation of net income to the net cash flow from operating activities may be provided in a separate schedule.
- For simultaneous investing and financing activities that involve some cash, a company may choose to report the cash portion on its statement of cash flows and the noncash portion in the accompanying schedule of noncash activities, or it may choose to report both the cash and noncash items on its statement of cash flows.
- Cash receipts or payments relating to the sale or purchase of investments in available-forsale securities are classified as a cash inflow or outflow from investing activities. However, the unrealized change in the market value of these securities is not included on the statement of cash flows.
- The sale or purchase of debt securities classified as held-to-maturity is recorded as a cash inflow or outflow from investing activities. The amortization of any premium or discount related to this long-term investment is a noncash item requiring an adjustment to net income in the operating activities section of the statement of cash flows prepared under the indirect method.
- Cash dividends declared in the current year and paid in the next year are recorded as a cash payment for financing activities in the year paid.
- The recognition of compensation expense (a noncash item) related to compensatory share option plans results in an increase in a deferred tax asset. On a statement of cash flows prepared under the indirect method, a corporation must add the increase in compensation expense and subtract the increase in the deferred tax asset in determining net cash flow from operating activities. When the share options are exercised, the decrease in the deferred tax asset is added back to net income in the operating activities section of the statement of cash flows.

# **APPENDIX: DIRECT METHOD FOR REPORTING OPERATING CASH FLOWS**

In the main part of this chapter, we used the indirect method to report the net cash flow from operating activities on the statement of cash flows. Most companies (99%) use this method. GAAP allows a company to use either the indirect method or the direct method to report the cash flows from operating activities on its statement of cash flows, but encourages the use of the direct method. As we briefly discussed earlier in the chapter, under the direct method a company deducts its operating cash outflows from its operating cash inflows to determine its net cash provided by (or used in) operating activities. This approach has the advantage of separating the company's operating cash receipts from operating cash payments, and of directly showing the cash it paid for interest and income taxes. Each of these disclosures may be useful in estimating its future cash flows. Because of the FASB's support for the direct method, use of this method is likely to increase. Therefore, we explain the direct method in this Appendix.

The direct method is an alternative to the indirect method for a company to report its net cash flow from *operating* activities. However, the company reports its cash flows from *investing* activities and cash flows from *financing* activities on the statement of cash flows in exactly the same manner as we discussed earlier. Therefore, in this Appendix we primarily

focus on determining and reporting the cash flows from operating activities. However, because there are some slight differences in preparing information concerning investing and financing activities, we discuss these differences as well.

## **OPERATING CASH FLOWS**

Under the direct method, a company reports its operating cash inflows separately from its operating cash outflows. We discuss each of these classifications in the following sections.

## **Operating Cash Inflows**

Under the direct method, a company reports its cash inflows from operating activities in three categories: (1) collections from customers, (2) interest and dividends collected, and (3) other operating receipts, if any. Generally, these cash inflows from operating activities are calculated by an analysis of income statement and balance sheet items as follows:

- 1. Collections from Customers. Sales revenue, plus decrease in accounts receivable or minus increase in accounts receivable, and plus increase in deferred revenues or minus decrease in deferred revenues.
- 2. Interest and Dividends Collected. Interest revenue and dividend revenue, plus decrease in interest/dividends receivable or minus increase in interest/dividends receivable, and plus amortization of premium on investment in bonds or minus amortization of discount on investment in bonds.
- 3. Other Operating Receipts. Other operating revenues, minus gains on disposals of assets and liabilities, and minus investment income recognized under the equity method.

## **Operating Cash Outflows**

A company reports its cash outflows from operating activities in five categories: (1) payments to suppliers, <sup>24</sup> (2) payments to employees, (3) other operating payments, (4) payments of interest, and (5) payments of income taxes. Generally, these cash outflows for operating activities are calculated by an analysis of income statement and balance sheet items as follows:

- 1. Payments to Suppliers. Cost of goods sold, plus increase in inventory or minus decrease in inventory, plus decrease in accounts payable or minus increase in accounts payable.
- 2. Payments to Employees. Salaries (wages) expense, plus decrease in salaries payable or minus increase in salaries payable.
- 3. Other Operating Payments. Other operating expenses, plus increase in prepaid items or minus decrease in prepaid items; minus depreciation, depletion, and amortization expense; minus losses on disposals of assets and liabilities; minus investment loss recognized under the equity method.
- 4. Payments of Interest. Interest expense, plus decrease in interest payable or minus increase in interest payable, plus amortization of premium on bonds payable or minus amortization of discount on bonds payable.
- 24. FASB Statement No. 95, par. 27 (FASB Cod. # 230-10-45) combines payments to suppliers and payments to employees into one category. However, it encourages companies to provide further breakdowns of operating cash receipts and operating cash payments, when useful. The authors believe that separating payments to suppliers from payments to employees may be useful to different external users, and do so throughout this Appendix. In a manufacturing company, a separation of payments to suppliers and payments to employees may not be practical. This is because the company may record various manufacturing costs, including direct and indirect materials as well as direct and indirect labor, directly in the work in process inventory and not show them as separate expenses. In this case it would be difficult to separate the related cash flows, so that reporting the combined payments to suppliers and employees may be the only practical disclosure.

**8** Identify the operating cash inflows and outflows under the direct method (Appendix).

5. Payments of Income Taxes. Income tax expense, plus decrease in income taxes payable or minus increase in income taxes payable, plus decrease in deferred tax liability or minus increase in deferred tax liability.<sup>25</sup>

Under the direct method, the company's net cash provided by (or used in) operating activities is the difference between the cash inflows from operating activities and the cash outflows for operating activities.

### **Diagram of Operating Cash Flows**

Under the *direct* method, a company computes the cash inflows from operating activities for its statement of cash flows by adjusting the various revenue accounts for changes in certain asset accounts (primarily current assets involved in the operating cycle) and deferred revenues, and to eliminate certain "noncash" revenues (gains). The company computes the cash outflows for operating activities by adjusting the various expense accounts for changes in certain liability (and asset) accounts (primarily current liabilities and current assets in the operating cycle) and deferred revenues, and to eliminate certain "noncash" expenses (losses).

Exhibit 22-5 shows these adjustments. The adjustments may have to be modified depending on the way that the company reports and classifies the related items in its financial statements. For instance, an increase in deferred revenue of an airline would be due to selling tickets in advance. In this case, the adjustment would be to sales revenue. On the other hand, an increase in deferred revenue of a retail company may be due to a collection of rent (for a sub-lease) in advance. In this case, the adjustment is to other revenue instead of sales revenues.

### **Example: Adjustments for Operating Cash Flows**

We now show the calculations for some of the adjustments in Exhibit 22-5. Assume for simplicity that the Smith Company made cash sales of \$30,000 and credit sales of \$42,000 during its *first* year of operations. So, its Sales Revenue account has a credit balance of \$72,000 at the end of the year. It also collected \$37,000 of the \$42,000 accounts receivable during the year, so that its Accounts Receivable account has a debit balance of \$5,000 at the end of the year. That is, the Accounts Receivable balance increased from \$0 to \$5,000 from the beginning to the end of the year. As we show in the top part of Example 22-7 on page 1185, by subtracting the \$5,000 increase in Accounts Receivable from the \$72,000 Sales Revenue, the company determines that it collected \$67,000 from customers during the year. (You can verify the \$67,000 cash collections by adding the \$30,000 cash sales to the \$37,000 cash collected from accounts receivable.) The company would include the \$67,000 cash collected from customers in its cash inflows from operating activities.

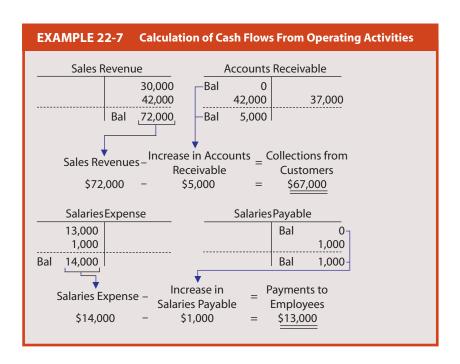

Now assume that the Smith Company paid salaries of \$13,000 during the year and that it accrued salaries of \$1,000 at the end of the year. So, its Salaries Expense account has a debit balance of \$14,000 at the end of the year. Its Salaries Payable account has a credit balance of \$1,000 at the end of the year. That is, the Salaries Payable account increased from \$0 to \$1,000 from the beginning to the end of the year. As we show in the bottom part of Example 22-7, by subtracting the \$1,000 increase in Salaries Payable from the \$14,000 Salaries Expense, the company determines that it paid \$13,000 to employees during the year. The company would add the \$13,000 cash paid to employees in its cash outflows for operating activities. •

If a company uses the direct method of reporting its operating cash flows, GAAP requires the company to reconcile its net income to the net cash provided by (or used) in operating activities in a separate schedule accompanying its statement of cash flows. This reconciliation is, in effect, prepared under the *indirect* method. Because we fully discussed the indirect method of reconciling net income to operating cash flows in the main part of the chapter, we do not repeat the discussion here.

<sup>25.</sup> For a company that has a deferred tax asset, it adds an increase in the deferred tax asset to income tax expense or subtracts a decrease. It handles a change in a related valuation allowance (contra account) in the opposite way.

| ncome Statement<br>Amounts                   | Adjustments   | Operating Cash Receipts<br>and Payments | Net Operating<br>Cash Flows               |

## **PROCEDURES FOR STATEMENT PREPARATION**

When a company uses the direct method to prepare the information for its statement of cash flows, it may use either the visual inspection method or the worksheet method. This depends on the complexity of its accounting information. The information is obtained, however, in a slightly different manner. Normally, under the direct method, a company obtains the information for its statement of cash flows from the following working papers:

- Post-closing trial balance (or balance sheet) from previous period. Recall from Chapter 3 that a post-closing trial balance contains the debit and credit balances of all the permanent accounts in a company's general ledger. In other words, a postclosing trial balance of the previous period contains the same information as the ending balance sheet of the previous period.
- Adjusted trial balance of *current* period. Recall from Chapter 3 that an adjusted trial balance contains the debit and credit balances (after adjustments but before closing) of all the temporary and permanent accounts in a company's general ledger. In other words, an adjusted trial balance of the current period contains the balance sheet, income statement, and retained earnings statement information for the current period.

In addition, the company needs other information to explain the changes in its balance sheet (permanent) accounts (other than cash). This information is obtained from its accounting records. In complex situations, use of the post-closing trial balance of the prior period and the adjusted trial balance of the current period is the most efficient way to prepare the statement of cash flows. In simpler situations, however, the statement may be developed based on the information contained in the beginning and ending balance sheets, the income statement, and the retained earnings statement of the current year.

## **Visual Inspection Method**

Under the visual inspection approach, the steps to complete the statement of cash flows using the direct method for operating activities are similar to those for the indirect method, except that the information for the cash flows from operating activities section is computed as follows:

Make adjustments to the applicable revenues for the period (e.g., to sales revenue for change in accounts receivable and deferred revenues) to determine the **9** Compute the operating cash flows under the direct method (Appendix).

- amounts of collections from customers, interest and dividends collected, and other operating receipts.
- Make adjustments to the applicable expenses for the period (e.g., to cost of goods sold for changes in inventory and accounts payable) to determine the amounts of payments to suppliers, payments to employees, other operating payments, payments of interest, and payments of income taxes.

Exhibit 22-5 is helpful for making these adjustments. Once the operating activities section is completed, the investing activities section and the financing activities section are completed by analyzing the changes in the other balance sheet accounts in the same way as we discussed for the indirect method.

#### **Example: Visual Inspection Method**

Assume that the following income statement items were taken from the adjusted trial balance of the Betha Company at the end of 2010:

| Credit   |
|----------|
| \$94,000 |
| 5,400    |
|          |
|          |
|          |
|          |
|          |
|          |
|          |

Also assume that a comparison of the post-closing trial balance for 2009 with the adjusted trial balance for 2010 shows the following *changes* in selected balance sheet accounts:

| Accounts receivable       | \$ 8,200 credit (decrease) |
|---------------------------|----------------------------|
| Interest receivable       | 1,200 debit (increase)     |
| Inventory                 | 6,300 debit (increase)     |
| Prepaid expenses          | 600 debit (increase)       |
| Accumulated depreciation  | 11,000 credit (increase)   |
| Accounts payable          | 4,800 credit (increase)    |
| Salaries payable          | 500 debit (decrease)       |
| Discount on bonds payable | 200 credit (decrease)      |
| Income taxes payable      | 300 credit (increase)      |
| Deferred tax liability    | 400 credit (increase)      |
|                           |                            |

Based on the preceding information, Betha Company prepares Example 22-8 to determine each of the operating cash inflows and outflows.

| EXAMPLE 22-8        | Schedule to   | Compute Cash Flows   |                                  |                  |   |  |  |
|---------------------|---------------|--|----------------------------------|------------------|---|--|--|
| Income Statement An | nounts        | Adjustments  | Adjustments Operating Cash Flows |                  |   |  |  |
| Sales revenue       | \$ 94,000     | + Decrease in accounts receivable of   | \$8,200 = \$102                  | 2,200            | Collections from customers  |  |  |
| Interest revenue    | 5,400         | <ul> <li>Increase in interest receivable of</li> </ul>   | 1,200 = 4                        | 4,200            | Interest collected  |  |  |
|                     |               |  | \$106                            | 6,400            | Operating cash inflows  |  |  |
| Cost of goods sold  | \$ (43,000) { | + Increase in inventory of  - Increase in accounts payable of  | ${6,300 \atop 4,800}$ = \$ (44   | 4,500)           | Payments to suppliers   |  |  |
| Salaries expense    |               | + Decrease in salaries payable of  | 500 = (19                        | 9,000)           | Payments to employees   |  |  |
| Other expenses      | (4,700)       | + Increase in prepaid expenses of  | 600 = (5                         | 5,300)           | Other operating payments  |  |  |
| Interest expense    | (9,200)       | <ul> <li>Decrease in discount on bonds</li> </ul>  |                                  |                  |   |  |  |
|                     |               | payable (amortization) of  | 200 = (9                         | 9,000)           | Payments of interest  |  |  |
| Income tax expense  | (3,900) {     | <ul> <li>Increase in income taxes payable of</li> <li>Increase in deferred tax liability of</li> </ul> | \$ (81                           | 31,000)<br>5,400 | Payments of income taxes<br>Operating cash outflows<br>Net cash provided by<br>operating activities |  |  |

Operating Cash Inflows The \$94,000 of sales revenue is increased by the \$8,200 decrease in accounts receivable to determine the \$102,200 collections from customers. This is because the company's cash collections exceeded its sales during the year. The \$5,400 interest revenue is decreased by the \$1,200 increase in interest receivable to determine the \$4,200 interest collected because the company received less cash than it recorded as interest revenue. The total operating cash inflows were \$106,400 in 2010.

Operating Cash Outflows The \$43,000 cost of goods sold is adjusted for two items. It is increased for the \$6,300 increase in inventory because the company's purchases exceeded its cost of goods sold. It is decreased by the \$4,800 increase in accounts payable because the company's cash payments were less than its purchases. Thus, payments to suppliers totaled \$44,500 in 2010. The \$18,500 of salaries expense is increased by the \$500 decrease in salaries payable to determine the \$19,000 paid to employees, because salaries paid exceeded salaries expense. The \$4,700 of other expenses are increased by the \$600 increase in prepaid expenses to determine the \$5,300 other operating payments, because the company's cash payments for prepaid items exceeded its expenses. Note that the \$11,000 depreciation expense is the same as the \$11,000 credit to accumulated depreciation. Because this is a "noncash" income statement item and is listed separately from other operating expenses, no adjustment is made for operating cash flows.

The decrease in the discount on bonds payable resulted from the amortization of the discount. Recall that the amortization of the discount on bonds payable increases interest expense to an amount greater than the cash the company paid for interest. Therefore, the \$200 decrease in the discount on bonds payable is subtracted from the \$9,200 interest expense to determine the \$9,000 interest paid. The \$3,900 income tax expense is decreased by the \$300 increase in income taxes payable and the \$400 increase in the deferred tax liability to determine the \$3,200 payments of income taxes, because the company paid less taxes currently than it recorded as an expense. The total operating cash outflows were \$81,000 in 2010, so that \$25,400 net cash was provided by operating activities during 2010 as we show at the bottom of Example 22-8.

Example 22-9 shows the cash flows from operating activities section of the Betha Company's statement of cash flows, under the direct method. The company includes cash flows from investing activities and the cash flows from financing activities in the usual manner to complete the statement of cash flows. •

#### **Worksheet Method**

Under the worksheet approach, the steps completed using the direct method are very similar to those of the indirect method. There are enough slight differences, however, that we list all of the steps using the direct method in Exhibit 22-6, after which we present an example.

#### EXHIBIT 22-6 **Steps in Worksheet Approach for Direct Method**

Step 1. Prepare the column headings on a worksheet (see Example 22-10). Then enter the account titles and the debit and credit amounts of the post-closing trial balance from the previous year and the adjusted trial balance for the current year in the respective columns. Total the amount columns to check the equality.

Step 2. Compare each account balance in the post-closing trial balance and adjusted trial balance, and record the debit or credit difference in the Change column. Note that each revenue and expense account listed on the adjusted trial balance will not have a beginning balance; in that case, the ending balance is the change amount. (To simplify the worksheet, sometimes the debit and credit amounts of the accounts in the trial balances are omitted, and only the changes in the accounts are listed.) Total the amount columns to check the equality.

**Step 3.** Directly below the account titles, add the following headings:

- A. Cash Flows From Operating Activities
- B. Cash Flows From Investing Activities
- C. Cash Flows From Financing Activities
- D. Investing and Financing Activities Not Affecting Cash

Under the heading Cash Flows From Operating Activities, list the eight possible inflow and outflow captions (e.g., collections from customers). Leave sufficient room below each of the subheadings so that each cash flow can be listed where appropriate.

**Step 4.** Account for all the changes in the noncash accounts that occurred during the current period. Reconstruct the journal entries that caused the changes in the noncash accounts directly on the worksheet, making the necessary modifications to show the cash receipts and payments related to operating, investing, and financing activities. Use the following general rules for the worksheet entries:

A. Start with the usual revenue and expense accounts. The changes in these accounts during the year represent potential operating cash receipts or payments. Therefore, the entry on the worksheet is to debit or credit the related operating cash inflow or outflow caption and to credit or debit the revenue or expense account. Observe that these changes represent potential cash flows. They may have to be adjusted later for changes in certain current assets (e.g., accounts receivable) and current liabilities (e.g., accounts payable), as well as other accounts, to show the actual cash flows.

Note that there are two exceptions to the previous procedures. First, the worksheet entries for any noncash revenues and expenses (e.g., depreciation expense) are made in the usual manner, without any modifications.

Second, worksheet entries are not prepared at this time to account for gains or losses (either ordinary or extraordinary). The changes in these accounts will be accounted for later when dealing with the investing or financing transactions to which they relate (e.g., retirement of bonds at a gain).

- B. Account for the changes in the current asset (except cash) and current liability accounts. Because most of the changes in the current assets and current liabilities relate to the operating activities, the impacts of these changes on cash are listed as adjustments to the related operating cash inflow or outflow. There are several exceptions to this procedure. These exceptions involve changes in short-term notes receivable and notes payable, changes in temporary investments (i.e., marketable securities), and changes in dividends payable. These changes are the results of investing or financing activities and are handled like the changes in the noncurrent accounts discussed in Step 4(C).
- C. Account for the changes in the remaining current assets (except cash) and current liabilities, as well as the changes in noncurrent accounts. Review each account and determine the journal entry responsible for its change. Identify whether the transaction involves an operating, a investing, or financing activity. If the transaction involves an investing or financing activity, make the entry on the worksheet with the following changes:
  - 1. If the entry affects cash, replace a debit to cash with either an investing or financing cash inflow caption, and list the item as a debit (receipt) under the proper heading of the worksheet. Replace a credit to cash with a proper cash outflow caption, and list the item as a credit (payment) under the proper heading of the worksheet. In the case of a transaction involving a gain or loss, record the gain or loss portion of the worksheet entry in the usual manner.

(continued)

#### **EXHIBIT 22-6** (Continued)

2. If the entry does not affect an operating activity or cash, it is a "simultaneous" financing and/or investing transaction. For this type of transaction, create "expanded" entries on the worksheet to record both the financing and/or investing activities. The first entry shows the financing aspect of the exchange, while the second entry shows the investing aspect. These types of transactions are disclosed on a schedule accompanying the statement of cash flows.

Step 5. Make a final worksheet entry to record the net change in cash. The worksheet entries must account for all the changes in the noncash accounts recorded in Step 2. The difference between the total cash inflows and outflows must be equal to the change in the Cash account. Total the debit and credit worksheet entries in the upper and lower portions of the worksheet to verify that the respective totals are equal.

Step 6. Prepare the statement of cash flows and accompanying schedules<sup>b</sup>. Use the information developed in the lower portion of the worksheet, along with the beginning and ending cash balances.

- The primary examples of changes in noncurrent accounts that affect operating activities are the amortization of premiums or discounts on bonds payable or investments in bonds, changes in deferred taxes, and changes in prepaid/accrued pension costs. In these cases, the related income statement item (interest expense or interest revenue, income tax expense, and pension expense) has already been treated as an adjustment to an operating cash flow (payment of interest or receipt of interest, payment of income taxes, and payment of pensions) in Step 4A. Therefore, the worksheet entry involves a direct adjustment to the operating cash flow. For instance, a change (credit) in the discount on bonds payable due to amortization is accounted for as a debit to Cash Flows From Operating Activities: Payments of Interest and as a credit to Discount on Bonds Payable to adjust for the lesser cash outflow.
- The separate schedules include a schedule of the investing and financing activities not affecting cash and a schedule reconciling the net income to the net cash provided by operating activities.

# **EXAMPLE: WORKSHEET (SPREADSHEET) AND DIRECT METHOD**

To learn how to use a worksheet under the direct method, look at Example 22-10. Assume that the post-closing trial balance and adjusted trial balance were obtained from the Copeland Company's accounting records. In addition, the following information was included in its accounting records for 2010:

- 1. Land costing \$2,000 was sold for \$2,800.
- 2. Equipment was purchased at a cost of \$24,700.
- 3. Common stock was issued for \$10,000.
- 4. Dividends of \$3,500 were declared and paid.

After entering the accounts and amounts of the trial balances, the changes in the accounts are entered in the appropriate change column of the worksheet (spreadsheet). Then, based on the preceding information, entries (a) through (r) are entered on the worksheet to complete it. We briefly explain each of the worksheet entries next.

# **Operating Cash Flows**

Entries (a) and (b) account for the sales revenue and interest revenue and record the "unadjusted" collections from customers and receipts of interest. (There are no other operating receipts.) Entries (c), (d), (e), (f), and (g) account for the cost of goods sold, salaries expense, other expenses, interest expense, and income tax expense, and record the "unadjusted" payments to suppliers, payments to employees, payments of interest, other operating payments, and payments of income taxes. Entry (h) accounts for the depreciation expense and increase in accumulated depreciation. Note that it is made in the normal manner in the upper part of the worksheet and, therefore, has no effect on the operating cash flows. The entry is necessary, however, to help account for the changes in all the income statement and balance sheet accounts.

Entries (i) through (m) account for the effect of the changes in the current assets and current liabilities on the "unadjusted" operating cash flows recorded earlier. Entry (i)

| 47       | Payment of dividends                                 |           |         |                  |         |                  |         |            |                  | (q)  | 3,500<br>4,500 |
| 48       | Net Increase in Cash                                 |           |         |                  |         |                  |         |            | 117,500          | (r)  | 117,500        |
|          | Totals   |           |         |                  |         |                  |         |            | 117,300          |      | 117,300        |
| 50       |  |           |         |                  |         |                  |         |            |                  |      |                |

reduces (adjusts) the collections from customers because of the increase in accounts receivable. Entries (j) and (k) reduce (adjust) the payments to suppliers because of the decrease in inventory and the increase in accounts payable. Entry (1) increases (adjusts) the payments to employees because of the decrease in salaries payable. Finally, entry (m)

reduces (adjusts) the interest payments because of the increase in interest payable. There are no adjustments to the other operating payments or to the payments of income taxes in this example.

## **Investing and Financing Cash Flows**

Entries (n) through (q) record the investing and financing cash flows. Entry (n) records the \$2,800 investing cash receipt (proceeds) from the sale of land costing \$2,000. Note that the \$800 gain is recorded in the usual way. Entry (o) records the investing cash payment for the purchase of equipment. Entry (p) records the financing cash receipt (proceeds) from the sale of common stock. Entry (q) records the financing cash payment of dividends.

## **Completion of Worksheet and Statement**

Entry (r) is the final entry and records the increase in cash. The debit and credit columns in the upper and lower parts are totaled to check for equality and the worksheet is complete. Example 22-11 shows the statement of cash flows of the Copeland Company, prepared from the worksheet in Example 22-10. Note that the only difference between this statement, prepared under the direct method, and a statement of cash flows prepared under the indirect method is in the presentation of the cash flows from operating activities.

| EXAMPLE 22-11 Statement of Cash Flows (Direct   | t Method)                         |                            |
|---|-----------------------------------|----------------------------|

# SUMMARY

At the beginning of the chapter, we identified several objectives you would accomplish after reading the chapter. The objectives are listed below, followed by a brief summary of the key points in the chapter discussion.

- Define operating, investing, and financing activities. A company's operating activities include all its transactions involving acquiring, selling, and delivering goods for sale, as well as providing services. Its investing activities include its transactions involving acquiring and selling property, plant, and equipment, acquiring and selling investments, and lending money and collecting on loans. Its financing activities include its transactions involving obtaining resources from owners and providing them with a return on, and of, their investment, as well as obtaining money and other resources from creditors and repaying the amounts borrowed.
- Know the categories of inflows and outflows of cash. A company's inflows of cash come from decreases in assets other than cash, increases in liabilities, and increases in stockholders' equity. Its outflows of cash come from increases in assets other than cash, decreases in liabilities, and decreases in stockholders' equity.
- Classify cash flows as operating, investing, or financing. Operating cash inflows (outflows) come from increases (decreases) in stockholders' equity because of revenues (expenses), adjusted for changes in certain current assets and current liabilities. Investing cash inflows (outflows) come from decreases (increases) in noncurrent assets and certain current assets. Financing cash inflows (outflows) come from increases (decreases) in noncurrent liabilities, stockholders' equity, and certain current liabilities.
- Explain the direct and indirect methods for reporting operating cash flows. Under the direct method, a company deducts its operating cash outflows from its operating cash inflows to determine its net cash flow from operating activities. Under the indirect method, a company adjusts (reconciles) its net income for differences between income flows and cash flows for operating activities to determine its net cash flow from operating activities.
- Prepare a simple statement of cash flows. To complete a simple statement of cash flows, use the visual inspection method. Prepare the heading and major sections, and list the net change in cash at the bottom. Next, list net income under the operating activities section. Then list the increase or decrease in each balance sheet account as a cash receipt or payment (or adjustment) in the appropriate operating, investing, or financing section. Subtotal each section, add them together to calculate the net change in cash, then add the net change in cash to the beginning cash balance to determine the ending cash balance. Verify that this amount is the same as the ending cash balance reported on the balance sheet.
- **Use a worksheet (spreadsheet) for a statement of cash flows.** Set up a worksheet that shows the change in the balance of each balance sheet account at the top and the sections of the statement of cash flows (and a section for noncash investing and financing activities) at the bottom. Make worksheet entries to account for the changes in all the noncash balance sheet accounts, making certain modifications to show the cash receipts and payments for operating, investing, and financing activities. Make a final worksheet entry to record the net change in cash. Total the debit and credit worksheet entries in the upper and lower portions to verify that the respective totals are equal.
- Compute and disclose interest paid and income taxes paid. To compute interest paid, start with interest expense and adjust this amount for any increase (decrease) in interest payable and any bond premium (discount) amortization. To compute income taxes paid, start with income tax expense and adjust this amount for any increase (decrease) in income taxes payable, deferred tax liability, and deferred tax asset. Disclose interest paid and income taxes paid in a separate schedule, narrative description, or notes to the company's financial statements.
- Identify the operating cash inflows and outflows under the direct method (Appendix). The operating cash inflows are: (1) collections from customers, (2) interest and dividends collected, and (3) other operating receipts. The outflows are: (1) payments to suppliers, (2) payments to employees, (3) other operating payments, (4) payments of interest, and (5) payments of income taxes.
- Compute the operating cash flows under the direct method (Appendix). To determine the operating cash inflows, make adjustments to the applicable revenues for changes in related balance sheet accounts to determine the collections from customers, interest and dividends collected, and other operating receipts. To determine the operating cash outflows, make adjustments to the applicable expenses for changes in related balance sheet accounts to determine the payments to suppliers, to employees, of interest, for other operating items, and for income taxes. Subtract the total operating cash outflows from the total operating cash inflows to determine the net cash flow from operating activities.

# Answers to Real Report Questions

#### **Real Report 22-1 Answers**

Net cash flow from operating activities is \$400 million higher than net income (\$1,503 million less \$1,103 million). This difference is mainly due to noncash charges for depreciation and amortization of \$372 million. Kellogg's income tax expense was less than its income tax payable,

resulting in a decrease in net income of \$69 million. Additionally, Kellogg made noncash accruals for employee compensation and benefit obligations, resulting in the net cash provided by operating activities being \$183 million higher than net income. Finally, Kellogg contributed cash to its pension and postretirement benefit plans in excess of its expenses by \$96 million.

- Kellogg's investments consisted primarily of additions to properties (\$472 million) and acquisitions of businesses (\$128 million).
- A review of Kellogg's cash flows from financing activities reveals that Kellogg repurchased a large amount of

common stock (\$650 million). Additionally, Kellogg experienced a net cash inflow related to debt of \$168 million (\$625 million + \$804 million - \$1,209 million + \$750 million - \$802 million). In addition, Kellogg was able to pay \$475 million (almost one-third of its operating cash flow) to shareholders in cash dividends. Overall, it appears that the major uses of Kellogg's net cash provided by operating activities were to make capital investments, repurchase common stock, and pay dividends to its shareholders.

# QUESTIONS

- **Q22-1** What is a statement of cash flows?
- **Q22-2** Briefly describe the three types of activities of a company reported in its statement of cash flows.
- **Q22-3** What does the information in a statement of cash flows help external users to assess?
- **Q22-4** Name the five items a company's statement of cash flows must clearly show. What items are reported in a separate schedule accompanying the statement?
- Q22-5 What are "cash equivalents"? How does a company's reporting on its cash and cash equivalents affect the statement of cash flows?
- Q22-6 What are the three categories of a company's inflows of cash? What are the three categories of a company's outflows of cash?
- **Q22-7** Starting with the basic accounting equation, derive a set of equations that show the relationship between increases (decreases) in cash and increases (decreases) in assets other than cash, liabilities, and stockholders' equity.
- **Q22-8** Briefly describe a retail company's operating cycle and the relationship of its various stages to cash inflows and outflows.
- Q22-9 What are the two ways to calculate and report a company's net cash flow from operating activities? Briefly describe each method.
- **Q22-10** Briefly describe the *indirect method* for reporting a company's net cash flow from operating activities. List several adjustments to net income and indicate whether they are additions or subtractions.
- Q22-11 Give two examples of a company's (a) cash inflows from investing activities, and (b) cash outflows for investing
- **Q22-12** Give two examples of a company's (a) cash inflows from financing activities, and (b) cash outflows for financing activities.

- Q22-13 Give two examples of a company's investing and financing activities not affecting cash.
- **Q22-14** What is the visual inspection method? List the steps in this method.
- **Q22-15** Briefly describe the worksheet method of analyzing the information for a company's statement of cash flows. (Do *not* list the steps in preparation.)
- **Q22-16** Indicate how a company computes the amount of interest and income taxes that it paid during the year.
- **Q22-17** What two alternatives are allowed for where a company may disclose the net cash flow from operating activities prepared under the indirect method in regard to its statement of cash flows?
- Q22-18 A company purchases equipment costing \$12,500 by paying \$5,000 down and signing a \$7,500 note payable. Show two ways of disclosing the effects of this transaction in regard to the statement of cash flows.
- **Q22-19** Two companies each incur interest expense of \$16,000 and pay dividends of \$30,000. In addition, the companies receive interest and dividends from investments of \$8,000 and \$12,000, respectively. How would the statements of cash flows differ if one company uses IFRS and the other uses U.S. GAAP?
- Q22-20 How is the reporting of income taxes paid different under IFRS compared to U.S. GAAP?
- **Q22-21 (Appendix)** Define the *direct* method of reporting the cash flows from operating activities of a company.
- **Q22-22 (Appendix)** List the three operating cash inflows that a company reports under the direct method.
- **Q22-23 (Appendix)** List the five operating cash outflows that a company reports under the direct method.
- **Q22-24 (Appendix)** Briefly describe how to determine each of the operating cash inflows and operating cash outflows under the direct method.

# MULTIPLE CHOICE

Select the best answer for each of the following.

**M22-1** If a company issues a balance sheet and an income statement with comparative figures from last year, a statement of cash flows

- a. Is no longer necessary, but may be issued at the company's option
- b. Should not be issued
- c. Should be issued for each period for which an income statement is presented
- d. Should be issued for the current year only

M22-2 Selected information from Brook Corporation's accounting records and financial statements for 2010 is as follows:

| Net cash provided by operating activities | \$1,500,000 |
|---|-------------|
| Mortgage payable issued to acquire        |             |
| land and building                         | 1,800,000   |
| Common stock issued to retire             |             |
| preferred stock                           | 500,000     |
| Proceeds from sale of equipment           | 400,000     |
| Cost of office equipment purchased        | 200,000     |

On the statement of cash flows for the year ended December 31, 2010, Brook should disclose a net increase in cash in the amount of

| a. | \$1,700,000 | c. | \$3,700,000 |
|----|-------------|----|-------------|
| b. | \$2,400,000 | d. | \$4,200,000 |

M22-3 In a statement of cash flows (indirect method), the amortization of patents of a company with substantial operating profits should be presented as a (an)

- a. Cash flow from investing activities
- b. Cash flow from financing activities
- c. Deduction from net income
- d. Addition to net income

M22-4 The net cash provided by operating activities in Seat's statement of cash flows for 2010 was \$8,000,000. For 2010, depreciation on fixed assets was \$3,800,000, amortization of patents was \$100,000, and dividends on common stock were \$2,000,000. Based on the preceding information, Seat's net income for 2010 was

| a. | \$2,100,000 | c. | \$8,000,000  |
|----|-------------|----|--------------|
| b. | \$4,100,000 | d. | \$11,900,000 |

**M22-5** The retirement of long-term debt by the issuance of common stock should be presented in a statement of cash flows as a

|    | Cash Flow From<br>Financing Activities | Cash Flow From<br>Investing Activities |
|----|--|--|
| a. | No                                     | No                                     |
| b. | No                                     | Yes                                    |
| C. | Yes                                    | No                                     |
| d. | Yes                                    | Yes                                    |

M22-6 The net income for Mountain Corporation was \$4,000,000 for the year ended December 31, 2010. Additional information is as follows:

| Depreciation on fixed assets | \$2,000,000 |
|------------------------------|-------------|
| Proceeds from sale of land   | 200,000     |
| Increase in accounts payable | 300,000     |
| Dividends on preferred stock | 400,000     |

The net cash provided by operating activities in the statement of cash flows for the year ended December 31, 2010 should be

| a. | \$6,000,000 | c. | \$6,300,000 |
|----|-------------|----|-------------|
| b. | \$6,100,000 | d. | \$6,500,000 |

M22-7 Which of the following need not be disclosed in a schedule accompanying the statement of cash flows as an investing and financing activity not affecting cash?

- a. Acquisition of fixed assets in exchange for capital stock
- b. Dividend paid in capital stock of the company (stock dividend)
- c. Retirement of a bond issue through the issuance of another bond issue
- d. Conversion of convertible debt to capital stock

**M22-8** The following information on selected transactions for 2010 has been provided by the Smith Company:

| Net income                          | \$20,000,000 |
|-------------------------------------|--------------|
| Proceeds from short-term borrowings | 1,200,000    |
| Proceeds from long-term borrowings  | 4,000,000    |
| Purchases of fixed assets           | 3,200,000    |
| Decrease in inventories             | 8,000,000    |
| Proceeds from sale of Smith's       |              |
| common stock                        | 2,000,000    |
| Depreciation expense                | 500,000      |

What is the net increase in cash for the year ended December 31, 2010 as a result of the preceding information?

| a. | \$32,500,000 | C. | \$16,500,000 |
|----|--------------|----|--------------|
| b. | \$25,700,000 | d. | \$12,500,000 |

M22-9 The following information was taken from the accounting records of Oregon Corporation for 2010:

| Proceeds from issuance of preferred stock | \$4,000,000 |
|---|-------------|
| Dividends paid on preferred stock         | 400,000     |
| Bonds payable converted to common stock   | 2,000,000   |
| Payment for purchase of machinery         | 500,000     |
| Proceeds from sale of plant building      | 1,200,000   |
| 2% stock dividend on common stock         | 300,000     |
| Gain on sale of plant building            | 200,000     |

Oregon's statement of cash flows for the year ended December 31, 2010 should show the following amounts for investing and financing activities, based on the preceding information:

|    | Net Cash Flow From<br>Investing Activities | Net Cash Flow From<br>Financing Activities |
|----|--|--|
| a. | \$700,000                                  | \$3,600,000                                |
| b. | \$700,000                                  | \$3,900,000                                |
| C. | \$900,000                                  | \$3,900,000                                |
| d. | \$900,000                                  | \$5,600,000                                |

**M22-10 (Appendix)** A company reports sales of \$200,000 and interest revenue of \$17,000 for the current year. During the year, accounts receivable increased by \$21,000 and interest receivable decreased by \$3,000. Under the direct method,

the company would report cash inflows from operating activities of

a. \$235,000 b. \$193,000 c. \$241,000

d. \$199,000

# Review Exercises

**RE22-1** Trenton Corporation has the following items. Specify what will be added (A) or subtracted (S) in the operating activities section of the statement of cash flows prepared under the indirect method.

Increase in inventory Decrease in accounts receivable

\_\_\_\_ Increase in interest receivable \_\_\_\_ Increase in salaries payable

\_\_\_ Increase in income taxes payable \_\_\_ Decrease in deferred tax asset

\_\_\_\_ Decrease in deferred tax liability

Gain on disposal of assets or liabilities

Depreciation expense

**RE22-2** Identify these cash flows as either investing activities (I) or financing activities (F).

- (a) Payment for purchase of a building
- (b) Payment of dividends
- (c) Proceeds from sale of land, at cost
- (d) Proceeds from issuance of note
- (e) Proceeds from issuance of bonds

RE22-3 In the current year, Harrisburg Corporation collected \$100,000 from its customers and paid out \$30,000 to suppliers, \$20,000 to employees, and \$8,000 for income taxes. Using the direct method, prepare the operating activities section of its statement of cash flows based on this information.

RE22-4 In the current year, Harrisburg Corporation had net income of \$35,000, a \$9,000 decrease in accounts receivable, a \$7,000 increase in inventory, an \$8,000 increase in salaries payable, a \$13,000 decrease in accounts payable, and \$10,000 in depreciation expense. Using the indirect method, prepare the operating activities section of its statement of cash flows based on this information.

**RE22-5** Tifton & Co. had the following cash transactions during the current year:

| Proceeds from issuance of common stock  | \$400,000 |
|---|-----------|
| Payment of dividends                    | 100,000   |
| Payment for purchase of land            | 75,000    |
| Proceeds from issuance of bonds payable | 300,000   |
| Payment for purchase of treasury stock  | 80,000    |
| Proceeds from sale of equipment         | 100,000   |
| Payment for purchase of building        | 500,000   |

Prepare the investing activities section of Tifton & Co.'s statement of cash flows.

RE22-6 Refer to RE22-5. Prepare the financing activities section of Tifton & Co.'s statement of cash flows.

RE22-7 Providence Company sold equipment for \$25,000 cash. The equipment had originally cost \$35,000 and had accumulated depreciation of \$15,000. Prepare the worksheet entry (in journal entry format) to record this transaction for Providence Company's statement of cash flows.

RE22-8 Annapolis Corporation paid \$270,000 to retire bonds with a face value of \$300,000 and a book value of \$290,000. Prepare the worksheet entry (in journal entry format) to record the retirement of these bonds for Annapolis Corporation's statement of cash flows.

**RE22-9** Lime Corporation participated in a simultaneous investing and financing transaction where it acquired a building costing \$50,000 by issuing common stock. Show how Lime Corporation would report this transaction in regard to its statement of cash flows.

**RE22-10** Given the following information, compute Lemon Company's interest paid.

| Decrease in interest payable                  | \$1,000 |
|---|---------|
| <ul> <li>Bond premium amortization</li> </ul> | 750     |
| Bond interest expense                         | 5,000   |

**RE22-11** Given the following information, compute Peach Company's income taxes paid.

| • | Decrease in income taxes payable | \$ | 600  |
|---|----------------------------------|----|------|
| • | Income tax expense               | 4  | ,400 |

**RE22-12** (Appendix) Given the following information, convert Lark Company's sales revenue from its income statement into collections from customers for its statement of cash flows.

| • Sales revenue                                     | \$80,000 |
|---|----------|
| <ul> <li>Increase in accounts receivable</li> </ul> | 20,000   |
| <ul> <li>Increase in deferred revenue</li> </ul>    | 10,000   |

**RE22-13** (Appendix) Given the following information, convert Cardinal Company's cost of goods sold from its income statement into payments to suppliers for its statement of cash flows.

| <ul> <li>Cost of goods sold</li> </ul> | \$50,000 |
|--|----------|
| Increase in inventory                  | 23,000   |
| Decrease in accounts payable           | 15,000   |

**RE22-14** (Appendix) Given the following information, convert Robin Company's salaries expense from its income statement into payments to employees for its statement of cash flows.

| • | Salaries expense             | \$40,000 |
|---|------------------------------|----------|
| • | Increase in salaries payable | 18,000   |

# EXERCISES

**E22-1** Classification of Cash Flows The following are several transactions and events that might be disclosed on a company's statement of cash flows:

- A. Issuance of common stock
- B. Purchase of building
- C. Net income
- D. Increase in accounts receivable
- E. Depreciation expense

- F. Sale of land at cost
- G. Conversion of bonds to common stock
- H. Increase in accounts payable
- I. Payment of cash dividends
- J. Issuance of a stock dividend

#### Required

- 1. Identify in which section (if any) of the statement of cash flows each of the preceding items would appear and indicate whether it would be an inflow (addition) or outflow (subtraction).
- 2. Under IFRS, how may the payment of cash dividends be classified?

**E22-2** *Net Cash Flow From Operating Activities* The following is accounting information taken from the Hyde Company's records for 2010:

- 1. Amortization of premium on bonds payable, \$600
- 2. Purchase of equipment, \$6,000
- 3. Depreciation expense, \$7,400
- 4. Decrease in accounts receivable, \$800
- 5. Decrease in accounts payable, \$2,800
- 6. Issuance of long-term note for cash, \$4,200
- 7. Increase in inventories, \$7,500

- 8. Gain on sale of land, \$8,000
- 9. Increase in prepaid assets, \$500
- 10. Declaration and payment of cash dividends, \$1,800
- 11. Increase in wages payable, \$300
- 12. Patent amortization expense, \$1,000
- 13. Net income, \$10,800

#### Required

Prepare the net cash flow from operating activities section of the 2010 statement of cash flows for the Hyde Company.

**E22-3** *Statement of Cash Flows* The following is a list of the items for the 2010 statement of cash flows of the Lombardo Company:

- 1. Depreciation expense, \$4,200
- 2. Proceeds from sale of land, \$5,600
- 3. Payment of dividends, \$5,000
- 4. Net income, \$7,900
- 5. Conversion of bonds to common stock, \$7,000
- 6. Increase in accounts payable, \$3,100

- Proceeds from issuance of note, \$6,200
- Gain on sale of land, \$1,800
- 9. Payment for purchase of building, \$13,000
- 10. Increase in accounts receivable, \$2,700
- 11. Ending cash balance, \$13,900

#### Required

Prepare the statement of cash flows.

Statement of Cash Flows The following is a list of items for the 2010 statement of cash flows of the Witts Company:

- 1. Receipt from sale of equipment, \$2,700
- 2. Increase in inventory, \$3,900
- 3. Net income, \$13,500
- 4. Payment for purchase of building, \$29,000
- 5. Depreciation expense, \$8,700
- 6. Receipt from issuance of bonds, \$8,000
- 7. Increase in prepaid expenses, \$800

- Loss on sale of equipment, \$2,200
- Payment of dividends, \$5,200
- 10. Decrease in accounts receivable, \$1,700
- 11. Issuance of common stock for land, \$6,900
- 12. Decrease in accounts payable, \$1,500
- 13. Beginning cash balance, \$10,200

#### Required

- 1. Prepare the statement of cash flows.
- Under IFRS, what alternative treatment of the payment of dividends is allowed? How would this affect the statement of cash flows?

**E22-5** *Direct and Indirect Methods* The Dauve Company reported the following condensed income statement for 2010:

| Sales                      |          | \$100,000 |
|----------------------------|----------|-----------|
| Cost of goods sold         |          | (58,000)  |
| Gross profit               |          | \$ 42,000 |
| Operating expenses         |          |           |
| Depreciation expense       | \$ 8,000 |           |
| Salaries expense           | 12,000   | (20,000)  |
| Income before income taxes |          | \$ 22,000 |
| Income tax expense         |          | (6,600)   |
| Net income                 |          | \$ 15,400 |

During 2010, the following changes occurred in the company's current assets and current liabilities:

|                              | Increase<br>(Decrease) |
|------------------------------|------------------------|
| Cash                         | \$3,700                |
| Accounts receivable          | (5,500)                |
| Inventories                  | 8,900                  |
| Accounts payable (purchases) | (4,600)                |
| Salaries payable             | 2,800                  |

#### Required

- 1. By visual inspection, prepare the net cash flow from operating activities section of the Dauve Company's 2010 statement of cash flows using the indirect method.
- 2. By visual inspection, prepare the net cash flow from operating activities section of the Dauve Company's 2010 statement of cash flows using the direct method.

**E22-6** Fixed Asset Transactions The following is an Equipment account and its associated Accumulated Depreciation account:

| Equipment |          |           | Accumulated Depreciation |            |       |              |          |
|-----------|----------|-----------|--------------------------|------------|-------|--------------|----------|
| Beginning |          | Machine A | 8,100                    | Related to |       | Beginning    |          |
| balance   | \$49,000 |           |                          | Machine A  | 6,300 | balance      | \$29,000 |
| Machine C | 25,000   | Machine B | 5,200                    | Related to |       | Depreciation |          |
| Ending    |          |           |                          | Machine B  | 4,600 | expense      | 12,000   |
| balance   | \$60,700 |           |                          |            |       | Ending       |          |
|           |          |           |                          |            |       | balance      | \$30,100 |

Additional data:

- 1. Machine A was sold at a gain of \$900.
- 2. Machine B was sold for its scrap value of \$200.
- 3. Machine C was acquired during the year.

Analyze the two accounts and show, in journal entry form, the entries that would be made in preparation of the statement of cash flows to reflect all of the changes listed in the accounts.

Visual Inspection The following changes in account balances and other information for 2010 were taken from the accounting records of the Gordon Company:

|                          | Net Chang | Net Changes for 2010 |  |  |
|--------------------------|-----------|----------------------|--|--|
|                          | Debit     | Credit               |  |  |
| Cash                     | \$ 1,000  |                      |  |  |
| Accounts receivable      |           | \$ 1,100             |  |  |
| Inventory                | 2,000     |                      |  |  |
| Buildings and equipment  | 8,800     |                      |  |  |
| Accumulated depreciation |           | 2,900                |  |  |
| Accounts payable         | 900       |                      |  |  |
| Common stock, no par     |           | 5,500                |  |  |
| Retained earnings        |           | 3,200                |  |  |
|                          | \$12,700  | \$12,700             |  |  |

Other information: Net income totaled \$5,800. Dividends were declared and paid. Equipment was purchased for \$8,800. No buildings and equipment were sold during the year. One hundred shares of common stock were sold for \$55 per share. The ending cash balance was \$4,200.

Using visual inspection, prepare a 2010 statement of cash flows for the Gordon Company.

**E22-8** Visual Inspection The following changes in account balances and other information for 2010 were taken from the accounting records of the Noble Company:

|                          | Net Changes for 2010 |          |
|--------------------------|----------------------|----------|
|                          | Debit                | Credit   |
| Cash                     |                      | \$ 2,000 |
| Accounts receivable      | \$ 1,900             |          |
| Inventory                |                      | 2,400    |
| Land                     |                      | 1,700    |
| Buildings and equipment  | 23,000               |          |
| Accumulated depreciation |                      | 4,500    |
| Accounts payable         |                      | 1,600    |
| Salaries payable         | 600                  |          |
| Bonds payable            |                      | 5,000    |
| Common stock, no par     |                      | 3,000    |
| Retained earnings        |                      | 5,300    |
|                          | \$25,500             | \$25,500 |

Other information: Net income was \$9,900. Dividends were declared and paid. Land was sold for \$1,700; a building was purchased for \$23,000. No land was purchased, and no buildings and equipment were sold. Bonds payable were issued at the end of the year. Two hundred shares of stock were issued for \$15 per share. The beginning cash balance was \$4,800.

# Required

Using visual inspection, prepare a 2010 statement of cash flows for the Noble Company.

**E22-9** Balance Sheet The following beginning balance sheet and statement of cash flows for 2010 are available for Fazzi Company:

| Balance | e S | heet |

You determine that the *amounts* of the items listed on the statement are correct, but in certain circumstances, incorrectly classified.

#### Required

Prepare a corrected 2010 statement of cash flows for the Andell Company.

**E22-11** *Partially Completed Worksheet (Spreadsheet)* The Hanks Company has prepared the following changes in account balances for the worksheet to support its 2010 statement of cash flows:

|    | A                        | В          | С       | D          |
|----|--------------------------|------------|---------|------------|
| 1  |                          |            |         |            |
| 2  |                          | Increase   | Workshe | et Entries |
| 3  | Account Title            | (Decrease) | Debit   | Credit     |
| 4  | Debits                   |            |         |            |
| 5  | Cash                     | \$ 830     |         |            |
| 6  | Noncash Accounts         |            |         |            |
| 7  | Accounts receivable      | (290)      |         |            |
| 8  | Inventory                | 1,280      |         |            |
| 9  | Investments              | 1,550      |         |            |
| 10 | Land                     | (700)      |         |            |
| 11 | Equipment                | 2,300      |         |            |
| 12 | Patents (net)            | (100)      |         |            |
| 13 | Total                    | \$4,870    |         |            |
| 14 |                          |            |         |            |
| 15 | Credits                  |            |         |            |
| 16 | Accumulated depreciation | \$ 350     |         |            |
| 17 | Accounts payable         | 120        |         |            |
| 18 | Bonds payable            | 2,000      |         |            |
| 19 | Premium on bonds payable | 300        |         |            |
| 20 | Common stock, \$2 par    | 480        |         |            |
| 21 | Premium on common stock  | 1,120      |         |            |
| 22 | Retained earnings        | 500        |         |            |
| 23 | Total                    | \$4,870    |         |            |
| 24 |                          |            |         |            |

Additional information: The net income was \$1,300. Depreciation expense was \$350 and patent amortization expense was \$100. At the end of 2010, long-term investments were purchased at a cost of \$1,550. Land that cost \$700 was sold for \$900. On December 31, 2010, bonds payable with a face value of \$2,000 were issued for equipment valued at \$2,300. Two hundred shares of common stock were issued at \$7 per share. Forty shares of common stock were issued as a "small" stock dividend, the relevant market price being \$5 per share. Cash dividends declared and paid totaled \$600.

#### Required

On the basis of the preceding information, complete the worksheet (spreadsheet).

**E22-12** Worksheet (Spreadsheet) The following 2010 information is available for the Payne Company:

|                                | Comparative Balance Sheets |                   |  |
|--------------------------------|----------------------------|-------------------|--|
|                                | January 1, 2010            | December 31, 2010 |  |
| Cash                           | \$ 400                     | \$ 600            |  |
| Accounts receivable            | 220                        | 200               |  |
| Inventory                      | 370                        | 610               |  |
| Land                           | 250                        | 410               |  |
| Equipment                      | 2,070                      | 2,200             |  |
| Less: Accumulated depreciation | (310)                      | (400)             |  |
| Total Assets                   | <u>\$3,000</u>             | <u>\$3,620</u>    |  |

(Continued)

| Accounts payable                           | \$  | 800   | \$ 500  |
|--|-----|-------|---------|
| Notes payable (long-term)                  |     | 900   | 720     |
| Common stock, no par                       |     | 600   | 1,000   |
| Retained earnings                          | _   | 700   | _1,400  |
| Total Liabilities and Stockholders' Equity | \$3 | 3,000 | \$3,620 |

Partial additional information: The net income for 2010 totaled \$1,600. During 2010, the company sold for \$390, equipment that cost \$390 and had a book value of \$300. The company sold land for \$200, resulting in a loss of \$40. The remaining change in the Land account resulted from the purchase of land through the issuance of common stock.

#### Required

Making whatever additional assumptions that are necessary, prepare a worksheet (spreadsheet) to support the 2010 statement of cash flows for the Payne Company.

**E22-13** Worksheet (Spreadsheet) and Statement The following 2010 information is available for the Stewart Company:

| Condensed Income Statement for 2010 |                |  |  |
|-------------------------------------|----------------|--|--|
| Sales                               | \$9,000        |  |  |
| Cost of goods sold                  | (6,000)        |  |  |
| Other expenses                      | (2,000)        |  |  |
| Loss on sale of equipment           | (260)          |  |  |
| Gain on sale of land                | 400            |  |  |
| Net income                          | <u>\$1,140</u> |  |  |

|  | <b>Comparative Balance Sheets</b> |                      |  |
|--|-----------------------------------|----------------------|--|

| Less: Accumulated depreciation             | (200)                             | (150)                |  |
| Total Assets                               | \$3,200                           | \$3,990              |  |
| Accounts payable                           | \$ 600                            | \$ 750               |  |
| Bonds payable (due 1/1/2015)               | 1,000                             | 1,000                |  |
| Common stock, \$10 par                     | 900                               | 1,400                |  |
| Retained earnings                          | 700                               | 840                  |  |
| Total Liabilities and Stockholders' Equity | <u>\$3,200</u>                    | \$3,990              |  |

#### Partial additional information:

- 1. The equipment that was sold for cash had cost \$400 and had a book value of \$300.
- 2. Land that was sold brought a cash price of \$530.
- 3. Fifty shares of stock were issued at par.

#### Required

Making whatever additional assumptions that are necessary,

- 1. Prepare a worksheet (spreadsheet) to support a statement of cash flows for the Stewart Company for 2010.
- 2. Prepare the statement of cash flows.

**E22-14** *Retirement of Debt* Moore Company is preparing its statement of cash flows for the current year. During the year, the company retired two issuances of debt and properly recorded the transactions. These transactions were as follows:

- 1. Paid cash of \$18,000 to retire bonds payable with a face value of \$20,000 and a book value of \$18,300.
- 2. Paid cash of \$38,000 to retire bonds payable with a face value of \$35,000 and a book value of \$37,000.

#### Required

Record, in journal entry form, the entries that Moore Company would make for the preceding transactions on its worksheet to prepare its statement of cash flows.

**E22-15** Interest and Income Taxes The Staggs Company has prepared its 2010 statement of cash flows. In conjunction with this statement, it plans to disclose the interest and income taxes it paid during 2010. The following information is available from its 2010 income statement and beginning and ending balance sheet:

| Income Statement   |          |
|--------------------|----------|
| Interest expense   | \$12,000 |
| Income tax expense | 35,000   |

|                          | <b>Balance Sheet</b> |          |  |
|--------------------------|----------------------|----------|--|
|                          | Cr. Bal.             | Cr. Bal. |  |
|                          | 01/01/10             | 12/31/10 |  |
| Interest payable         | \$ 600               | \$ 2,300 |  |
| Income taxes payable     | 5,000                | 3,000    |  |
| Bonds payable            | 80,000               | 80,000   |  |
| Premium on bonds payable | 9,000                | 8,100    |  |
| Deferred taxes payable   | 3,300                | 4,400    |  |

#### Required

1. Compute the amounts of interest paid and income taxes paid by the Staggs Company for 2010.

Under IFRS, how would interest paid and income taxes paid be reported?

E22-16 Investments On October 4, 2010, Collins Company purchased 100 shares of Steph Company common stock for \$64 per share as a temporary investment in securities available for sale. On December 31, 2010, the stock had a fair value of \$63 per share, and on February 8, 2011, Collins sold the stock for \$67 per share.

In journal entry form, prepare the worksheet entries to record these transactions for the Collins Company's 2010 and 2011 statement of cash flows.

**E22-17** Operating Cash Flows (Appendix) Use the information in E22-13.

## Required **S**

Based only on the information presented and using the direct method, prepare the cash flows from operating activities section of the 2010 statement of cash flows for the Stewart Company.

**E22-18** Operating Cash Flows (Appendix) The following is accounting information taken from the adjusted trial balance of the Woodrail Company for 2010:

|                    | Debit    | Credit   |
|--------------------|----------|----------|
| Sales              |          | \$75,000 |
| Interest revenue   |          | 4,300    |
| Cost of goods sold | \$43,600 |          |
| Salaries expense   | 13,600   |          |
| Interest expense   | 5,400    |          |
| Income tax expense | 3,000    |          |
|                    |          |          |

In addition, the following changes occurred in selected accounts during 2010:

| Accounts receivable | \$5,700 credit |
|---------------------|----------------|
| Inventory           | 9,800 debit    |
| Accounts payable    | 7,000 credit   |
| Salaries payable    | 900 debit      |
| Interest payable    | 300 credit     |

#### Required

Using the direct method, prepare the cash flows from operating activities section of the 2010 statement of cash flows for the Woodrail Company.

**E22-19** Statement of Cash Flows (Appendix) The following is a list of items to be included in the 2010 statement of cash flows of the Estes Company:

- 1. Payments to suppliers, \$31,500
- 2. Other operating receipts, \$1,200
- 3. Payments of dividends, \$4,000
- 4. Payments of income taxes, \$5,000
- 5. Collections from customers, \$68,400
- 6. Payment for purchase of equipment, \$18,500
- 7. Payments to employees, \$19,300

- 8. Interest and dividends collected, \$7,100
- 9. Other operating payments, \$900
- 10. Proceeds from issuance of bonds, \$11,300
- Payments of interest, \$8,400 11.
- Proceeds from sale of investments, \$6,000 12.
- 13. Beginning cash balance, \$28,400

- 1. Prepare the statement of cash flows using the direct method for operating cash flows.
- 2. Under IFRS, which items may be classified differently than under U.S. GAAP?

**E22-20** *Visual Inspection (Appendix)* The following changes in account balances were taken from the adjusted trial balance of the Walson Company at the end of 2010:

|                          | Net Changes for 2010 |          |  |
|--------------------------|----------------------|----------|--|
|                          | Debit                | Credit   |  |
| Cash                     | \$ 2,100             |          |  |
| Accounts receivable      | 8,700                |          |  |
| Inventory                |                      | \$ 2,500 |  |
| Land                     |                      | 1,900    |  |
| Buildings and equipment  | 10,400               |          |  |
| Accumulated depreciation |                      | 6,800    |  |
| Accounts payable         | 4,500                |          |  |
| Salaries payable         |                      | 800      |  |
| Income taxes payable     |                      | 1,000    |  |
| Common stock, no par     |                      | 9,000    |  |
| Retained earnings        | 4,000                |          |  |
| Sales                    |                      | 69,000   |  |
| Cost of goods sold       | 34,000               |          |  |
| Salaries expense         | 17,200               |          |  |
| Depreciation expense     | 6,800                |          |  |
| Income tax expense       | 3,300                |          |  |
| Totals                   | \$91,000             | \$91,000 |  |

In addition, the following information was obtained from the company's records:

- 1. Land was sold, at cost, for \$1,900
- 2. Dividends of \$4,000 were declared and paid
- 3. Equipment was purchased for \$10,400

- 4. Common stock was issued for \$9,000
- 5. Beginning cash balance was \$17,000

#### Required

Using visual inspection and the direct method, prepare a 2010 statement of cash flows for the Walson Company. (A separate schedule reconciling net income to cash provided by operating activities is not necessary.)

| <br>21. | Depletion expense                      | <br>25. | Lease of equipment under capital lease  |
| <br>22. | Increase in inventory                  | <br>26. | Proceeds from sale of patent            |
|         |  |         |   |

In the space provided and using the letters A through D, indicate in which section of the statement of cash flows (or the accompanying schedule) the preceding items would most likely be classified. After each letter indicate with a plus (+) or a minus (-) whether the items would be reported as an increase (inflow) or decrease (outflow). If an item would not be reported in the statement (or the accompanying schedule), put an X in the space provided.

**P22-2** *Net Cash Flow From Operating Activities* The following is accounting information taken from the Verna Company's records for 2010:

- 1. Decrease in accounts payable, \$4,600
- 2. Loss on sale of land, \$1,900
- 3. Increase in inventory, \$7,800
- 4. Increase in income taxes payable, \$2,700
- 5. Net income, \$68,400
- 6. Patent amortization expense, \$1,600
- 7. Extraordinary loss (net), \$6,200
- 8. Decrease in deferred taxes payable, \$2,500
- 9. Amortization of discount on bonds payable, \$1,300
- 10. Payment of cash dividends, \$24,000

- 11. Depletion expense, \$5,000
- 12. Decrease in salaries payable, \$1,400
- 13. Decrease in accounts receivable, \$3,500
- 14. Gain on sale of equipment, \$6,100
- 15. Proceeds from issuance of stock, \$57,000
- 16. Extraordinary gain (net), \$3,700
- 17. Depreciation expense, \$10,000
- 18. Amortization of discount on investment in bonds, \$1,500

#### Required

Prepare the net cash flow from operating activities section of the 2010 statement of cash flows for the Verna Company.

**P22-3** *Statement of Cash Flows* The following is a list of the items to be included in the preparation of the 2010 statement of cash flows for the Warrick Company:

- 1. Net income, \$59,200
- 2. Payment for purchase of building, \$98,000
- 3. Increase in accounts receivable, \$7,400
- 4. Proceeds from issuance of common stock, \$37,100
- 5. Increase in accounts payable, \$4,500
- 6. Proceeds from sale of land, \$7,000
- 7. Depreciation expense, \$12,600
- 8. Payment of dividends, \$36,000
- 9. Gain on sale of land, \$5,300

- 10. Decrease in inventory, \$3,700
- 11. Payment for purchase of long-term investments, \$9,600
- 2. Amortization of discount on bonds payable, \$1,900
- 13. Proceeds from issuance of note, \$18,000
- 14. Increase in deferred taxes payable, \$5,000
- 15. Equipment acquired by capital lease, \$19,500
- 16. Decrease in salaries payable, \$2,300
- 17. Beginning cash balance, \$20,300

#### Required

- 1. Prepare the statement of cash flows.
- 2. Assume the company's preferred stock has been selling for \$120 per share during 2010. How many shares would the company have had to issue to avoid having a decrease in cash during the year? Where would this issuance have been reported in the statement of cash flows?

**P22-4** *Statement of Cash Flows* The following is a list of the items to be included in the preparation of the 2010 statement of cash flows for the Trone Company:

- 1. Extraordinary gain (net), \$9,200
- 2. Proceeds from issuance of note, \$25,000
- 3. Decrease in accounts receivable, \$5,000
- 4. Payment for purchase of patent, \$19,800
- 5. Increase in inventory, \$6,700
- 6. Payment of dividends, \$30,000
- 7. Decrease in accounts payable, \$4,000
- 8. Proceeds from sale of investments, \$8,500
- 9. Amortization of premium on bonds payable, \$2,100

- 10. Net income, \$49,200
- 11. Common stock exchanged for land, \$14,000
- 12. Payment for purchase of equipment, \$39,400
- 13. Loss on sale of investments, \$4,800
- 14. Decrease in deferred taxes payable, \$3,600
- 15. Proceeds from issuance of preferred stock, \$52,800
- 16. Payment to retire bonds, \$37,800
- 17. Depreciation expense, \$10,700
- 18. Ending cash balance, \$22,100

- 1. Prepare the statement of cash flows.
- 2. What would have happened if the company had not issued the note during 2010? How did the issuance of the note affect the company's debt ratio (discussed in Chapter 6) at the end of 2010?

P22-5 Infrequent Transactions The following transactions were recorded on the books of the Baxter Company during the current year. The company:

- 1. Issued a "small" common stock dividend of 400 shares. The par value is \$10 per share and the relevant market price was \$20 per share.
- 2. Exchanged equipment with a cost of \$10,000 and a book value of \$3,800 for land valued at \$12,000, paying an additional \$8,500 in cash.
- 3. Converted preferred stock (\$100 par) with a total par value of \$20,000 and a book value of \$22,800 to 1,500 shares of its \$10 par common stock. The book value method was used to account for the conversion.
- 4. Recorded a loss of \$4,200 as a result of retiring bonds payable with a face value of \$30,000 and a related premium of \$5,000 by paying \$39,200.
- 5. Recorded an extraordinary gain (net of income taxes) of \$6,000 as a result of a tornado that destroyed a building costing \$100,000 and having an associated book value of \$70,000. The insurance proceeds (net of income taxes) totaled \$76,000.
- 6. Acquired equipment by entering into a capital lease. The lease required payments of \$5,000 in advance; the present value of the lease payments (before the initial payment) was \$34,000.

#### Required

For each of the preceding items, discuss if and illustrate how the transaction would be recorded on the worksheet to support the statement of cash flows. Use a journal entry format for your illustrations.

P22-6 Partially Completed Worksheet (Spreadsheet) The following partially completed worksheet has been prepared for the 2010 statement of cash flows of the Perrin Company:

|    | A                          | В        | С        | D                   | Е       | F          |
|----|----------------------------|----------|----------|---------------------|---------|------------|

Other relevant information:

| (a) | Beginning retained earnings |        | \$12,500 |
|-----|-----------------------------|--------|----------|
|     | Plus: Net income            |        | 8,000    |
|     |                             |        | \$20,500 |
|     | Less: Stock dividends       | \$ 840 |          |
|     | Cash dividends              | 3,660  | (4,500)  |
|     | Ending retained earnings    |        | \$16,000 |

- (b) Accumulated depreciation is a contra account for all the depreciable assets. Depreciation on these assets totaled \$2,200 for the year.
- (c) On January 1, 2010, the company issued 10% bonds with a face value of \$5,000 at 106. Interest was paid semiannually on June 30 and December 31. The bonds mature on January 1, 2012. Straight-line amortization is used for bond discount or premium. Bond interest expense was \$440.
- (d) Land was purchased for \$3,200 during the year.
- (e) Two hundred shares of common stock were issued for delivery equipment valued at \$2,900 and office equipment valued at \$3,100.
- (f) Twenty shares of stock were issued as a stock dividend. The market price per share was \$42.
- (g) Office equipment with a cost of \$1,000 and a book value of \$300 was sold for \$50.
- (h) Fifty shares of its own common stock were reacquired by the company as treasury stock. The company purchased the shares for \$40 per share.
- (i) One hundred shares of Doe Company stock were purchased for \$28 per share at year-end.

# Required 🔤

Complete the worksheet (spreadsheet).

**P22-7** *Worksheet (Spreadsheet) and Statement of Cash Flows* The following information was taken from the accounting records of the Lamberson Company:

|   | Account Balances |                   |  |

| Unrealized increase in value of marketable securities | 500              | 800               |  |
| Retained earnings                                     | _10,000          | _14,100           |  |
|   | <u>\$69,800</u>  | <u>\$85,400</u>   |  |

Additional information for the year:

| (a) | Sales                       | \$ 39,930 |
|-----|-----------------------------|-----------|
|     | Cost of goods sold          | (19,890)  |
|     | Depreciation expense        | (2,100)   |
|     | Wages expense               | (11,000)  |
|     | Other operating expenses    | (1,000)   |
|     | Bond interest expense       | (410)     |
|     | Dividend revenue            | 820       |
|     | Gain on sale of investments | 700       |
|     | Loss on sale of equipment   | (200)     |
|     | Income tax expense          | (2,050)   |
|     | Net income                  | \$ 4,800  |
|     |                             |           |

- (b) Dividends declared and paid totaled \$700.
- (c) On January 1, 2010, convertible preferred stock that had originally been issued at par value were converted into 500 shares of common stock. The book value method was used to account for the conversion.
- (d) Long-term nonmarketable investments that cost \$1,600 were sold for \$2,300.
- (e) The long-term note payable was paid by issuing 250 shares of common stock at the beginning of the year.
- (f) Equipment with a cost of \$2,000 and a book value of \$300 was sold for \$100. The company uses one Accumulated Depreciation account for all depreciable assets.
- (g) Equipment was purchased at a cost of \$16,200.
- (h) The 12% bonds payable were issued on August 31, 2010 at 97. They mature on August 31, 2020. The company uses the straight-line method to amortize the discount.
- (i) Taxable income was less than pretax accounting income, resulting in a \$396 increase in deferred taxes payable.
- (j) Short-term marketable securities were purchased at a cost of \$1,300. The portfolio was increased by \$300 to a \$3,800 fair value at year-end by adjusting the related allowance account.

#### Required

- 1. Prepare a worksheet (spreadsheet) to support the Lamberson Company's statement of cash flows for 2010.
- 2. Prepare the statement of cash flows.
- 3. Compute the cash flow from operations to sales ratio and the profit margin ratio for 2010. What is the primary reason for the difference in the results of the ratios?

**P22-8** *Worksheet (Spreadsheet) and Statement of Cash Flows* The following information is available for the Bott Company:

|  | Account Balances |                  |
|--|------------------|------------------|
|  | December 31,     | December 31,     |

|   |           |           |

- (b) Last year, depreciation expense was inadvertently understated in the amount of \$1,800. The correction was made this year to Accumulated Depreciation and to Retained Earnings as a prior period adjustment. The company also received a related income tax refund of \$500.
- (c) Sixty shares of treasury stock (common) were reissued at \$30 per share.
- (d) Bonds payable with a face amount of \$7,000 were issued for \$7,750 on April 30, 2010. The bonds mature on April 30, 2015, and pay interest semiannually. The straight-line method is used to amortize the bond premium. Interest expense totaled \$460 for 2010.
- (e) Fifty shares of preferred stock (originally issued at \$60 per share) were converted into 100 shares of common stock.
- (f) Land costing \$2,900 was sold for \$3,800.
- (g) Three hundred shares of common stock were sold for \$33 per share.
- (h) Equipment costing \$32,000 was purchased during the year.
- (i) Land was acquired at a cost of \$9,000 during the year.
- (j) Depreciation expense was \$6,000.
- (k) Patent amortization was \$400.
- (1) The company loaned money to one of its executives and received a \$1,000 short-term note receivable on December 31, 2010. The note matures 90 days from the date of issuance.

# Required 🔤

- 1. Prepare a worksheet (spreadsheet) to support a statement of cash flows for 2010.
- 2. Prepare the 2010 statement of cash flows for the Bott Company. Show the reconciliation of the net income to the net cash provided by operating activities in a separate schedule accompanying the statement.

Worksheet (Spreadsheet) from Trial Balance The post-closing trial balance as of December 31, 2009 and the adjusted trial balance as of December 31, 2010 are shown here for the Heinz Company:

| December 31, 2009<br>Post-Closing Trial Balance |           | December 31, 2010<br>Adjusted Trial Balance |

A review of the accounting records reveals the following additional information:

- (a) Bonds payable with a face value, book value, and market value of \$14,000 were retired on June 30, 2010.
- (b) Bonds payable with a face value of \$8,000 were issued at 90.25 on August 1, 2010. They mature on August 1, 2015. The company uses the straight-line method to amortize bond discount.
- (c) A tornado completely destroyed a small building that had an original cost of \$8,000 and a book value of \$4,800. Settlement with the insurance company resulted in after-tax proceeds of \$2,200 and an extraordinary loss (net of income taxes) of \$2,600.
- (d) Equipment with a cost of \$4,000 and a book value of \$1,400 was exchanged for an acre of land valued at \$2,700. No cash was exchanged.
- (e) Long-term investments in bonds being held to maturity with a cost of \$1,000 were sold for \$800.
- (f) Sixty-five shares of common stock were exchanged for a patent. The common stock was selling for \$20 per share at the time of the exchange.

#### Required

Prepare a worksheet (spreadsheet) to support a statement of cash flows for 2010.

**P22-10** *Prepare Ending Balance Sheet* On December 31, 2010, a fire destroyed a significant portion of the Richey Company accounting records. Only the January 1, 2010 balance sheet, the statement of cash flows for 2010, and several additional documents were saved as follows:

**Balance Sheet** 

#### January 1, 2010 Assets Current assets: \$ 1,900 Cash Accounts receivable 5,100 Inventories 13,900 Prepaid items 1,300 Total current assets \$22,200 Property, plant, and equipment: Land \$12,000 **Buildings** \$60,000 Equipment 20,000 \$ 80,000 Less: Accumulated depreciation (29,000)51,000 Total fixed assets \$63,000

| Payment of dividends   | (5,000)    |           |
| Net cash used for financing activities   |            | (2,000)   |
| Net Decrease in Cash (see Schedule 1)  |            | \$ (700)  |
| Cash, January 1, 2010  |            | 1,900     |
| Cash, December 31, 2010  |            | \$ 1,200  |

#### Schedule 1: Investing and Financing Activities Not Affecting Cash

**Investing Activities** 

Acquisition of land by issuance of preferred stock (40 shares) \$(4,800) Financing Activities

Issuance of preferred stock to acquire land 4,800

The remaining financial documents reveal the following additional data:

- 1. The new building was acquired on December 31, 2010. The related mortgage requires equal annual repayments of the principal over a five-year period beginning December 31, 2012.
- 2. The company issued a stock dividend of 200 shares of common stock on December 14, 2010. On the date of declaration, the stock was selling for \$18 per share.
- 3. The equipment that was sold had an original cost of \$1,900.

#### Required

Prepare a December 31, 2010 balance sheet for Richey Company. Include supporting calculations.

# **P22-11** Erroneous Statement of Cash Flows The bookkeeper of the Ryan Company prepared the following 2010 statement of cash flows:

| Flows of Cash Statement December 31, 2010     |            |           |  |
|---|------------|-----------|--|
|   |            |           |  |
| Net Source from Operations                    |            |           |  |
| Net income                                    | \$ 47,800  |           |  |
| Add: Cash receipt from sale of land           | 6,500      |           |  |

| Net income  | <u>\$ 64,018</u>   |  |

Your discussion with the company's controller and a review of the financial records have revealed the following information:

- (a) On January 7, 2011, the company sold marketable securities for cash. These securities had cost \$9,200, and had a fair value of \$8,600 at December 31, 2010. The remaining marketable securities were adjusted to their \$7,400 fair value on March 31, 2011 by adjustment of the related allowance account. The dividend and interest revenue on these marketable securities is not material.
- (b) The company's preferred stock was converted into common stock at a rate of one share of preferred for two shares of common. The preferred stock and common stock have par values of \$2 and \$1, respectively.
- (c) On January 16, 2011, three acres of land were condemned. An award of \$32,000 in cash was received on March 24, 2011. Purchase of additional land as a replacement is not contemplated by the company.
- (d) On March 25, 2011, the company purchased equipment for cash.
- (e) On March 26, 2011, bonds payable were issued by the company at par for cash.
- (f) The investment in 30% owned company included an amount of \$9,600 attributable to an increase in the recorded value of depreciable assets at December 31, 2010. This increase is being depreciated at a quarterly rate of \$480.

#### Required

- 1. Prepare a worksheet (spreadsheet) to support the statement of cash flows for Angel Company for the three months ended March 31, 2011.
- 2. Prepare the statement of cash flows.

**P22-13 AICPA** Adapted *Comprehensive* The following are the balance sheets of Farrell Corporation as of December 31, 2010 and 2009, and the statement of income and retained earnings for the year ended December 31, 2010:

| Cash dividends, paid August 13, 2010 | 43,000     |
| Retained earnings, December 31, 2010 | \$ 432,000 |

#### Additional information:

- 1. On January 2, 2010, Farrell sold equipment costing \$45,000, with a book value of \$24,000, for \$19,000 cash.
- 2. On April 2, 2010, Farrell issued 1,000 shares of common stock for \$23,000 cash.
- 3. On May 14, 2010, Farrell sold all of its treasury stock for \$25,000 cash.
- 4. On June 1, 2010, Farrell paid \$50,000 to retire bonds with a face value (and book value) of \$50,000.
- 5. On July 2, 2010, Farrell purchased equipment for \$63,000 cash.
- 6. On December 31, 2010, land with a fair market value of \$150,000 was purchased through the issuance of a long-term note in the amount of \$150,000. The note bears interest at the rate of 15% and is due on December 31, 2015.
- 7. Deferred taxes payable represent temporary differences relating to the use of accelerated depreciation methods for income tax reporting and the straight-line method for financial statement reporting.

#### Required

- 1. Prepare a worksheet (spreadsheet) to support a statement of cash flows for the Farrell Corporation for the year ended December 31, 2010, based on the preceding information.
- 2. Prepare the statement of cash flows.

**P22-14** *Operating Cash Flows (Appendix)* Use the information presented in P22-7.

#### Required

- 1. Using the direct method, prepare the cash flows from operating activities section of the 2010 statement of cash flows for the Lamberson Company.
- 2. *(Optional)*. If you completed P22-7 earlier, prepare the remaining portion of the statement of cash flows. (A separate schedule reconciling net income to cash provided by operating activities is not necessary.)

**P22-15** *Statement of Cash Flows (Appendix)* The following is a list of the items to be included in the preparation of the 2010 statement of cash flows for the Yellow Company:

- 1. Proceeds from sale of land, \$2,100
- 2. Payments of interest, \$5,000
- 3. Equipment acquired by capital lease, \$7,200
- 4. Proceeds from issuance of preferred stock, \$11,000
- 5. Other operating payments, \$1,300
- 6. Interest and dividends collected, \$4,700
- 7. Payments to employees, \$20,300

- 8. Payment for purchase of investments, \$12,100
- 9. Collections from customers, \$54,500
- 10. Payments of income taxes, \$2,900
- 11. Payment of dividends, \$5,200
- 12. Other operating receipts, \$1,600
- 13. Payments to suppliers, \$29,500
- 14. Beginning cash balance, \$29,700

#### Required

Prepare the statement of cash flows using the direct method for operating cash flows.

**P22-16** Worksheet and Statement (Appendix) Use the information presented in P22-13 for the Farrell Corporation.

#### Required

- 1. Using the direct method for operating cash flows, prepare a worksheet (spreadsheet) to support a 2010 statement of cash flows. (*Hint*: Combine the income statement and December 31, 2010 balance sheet items for the adjusted trial balance. Use a retained earnings balance of \$291,000 in this adjusted trial balance.)
- 2. Prepare the statement of cash flows. (A separate schedule reconciling net income to cash provided by operating activities is not necessary.)

**P22-17** *Comprehensive (Appendix)* The following are the December 31, 2009 post-closing trial balance and the December 31, 2010 adjusted trial balance of the Adair Company:

|                          | 12/31/09<br>Post-Closing<br>Trial Balance |         | 12/31/10<br>Adjusted<br>Trial Balance |         |
|--------------------------|---|---------|---------------------------------------|---------|
|                          |   |         |                                       |         |
|                          |   |         |                                       |         |
| Accounts                 | Debit                                     | Credit  | Debit                                 | Credit  |
| Cash                     | 2,700                                     |         | 3,300                                 |         |
| Accounts receivable      | 7,300                                     |         | 6,200                                 |         |
| Inventory                | 8,100                                     |         | 9,900                                 |         |
| Investments in bonds     | 10,000                                    |         | 18,600                                |         |
| Property and equipment   | 105,300                                   |         | 133,300                               |         |

| Sales                    |   |         |                                       | 89,000  |
| Cost of goods sold       |   |         | 48,800                                |         |
| Depreciation expense     |   |         | 6,800                                 |         |
| Salaries expense         |   |         | 12,000                                |         |
| Other operating expenses |   |         | 1,700                                 |         |
| Interest revenue         |   |         |                                       | 1,200   |
| Interest expense         |   |         | 900                                   |         |
| Income tax expense       |   |         | 6,000                                 |         |
| Totals                   | 133,400                                   | 133,400 | <u>247,500</u>                        | 247,500 |

A review of the accounting records reveals the following additional information for 2010:

- (a) Investments in bonds to be held to maturity were purchased at year-end for \$8,600.
- (b) A building was purchased for \$28,000.
- (c) A note payable was issued for \$9,000.
- (d) Common stock was issued for \$14,500.
- (e) Dividends of \$6,500 were declared and paid.

#### Required

- 1. Using the direct method for operating cash flows, prepare a worksheet (spreadsheet) to support the 2010 statement of cash flows for the Adair Company.
- 2. Prepare the statement of cash flows. (A separate schedule reconciling net income to cash provided by operating activities is not necessary.)

**P22-18** Complex Worksheet (Appendix) Use the information presented in P22-9 for the Heinz Company.

#### Required

Using the direct method for operating cash flows, prepare a worksheet (spreadsheet) to support a 2010 statement of cash flows.

# CASES

#### COMMUNICATION

#### **C22-1** Financial Statement Interrelationships

Prepare an outline of the general format of the statement of cash flows (indirect method). Include examples of cash inflows and outflows that would be reported under each major section. Finally, discuss the information that is disclosed on the income statement, balance sheet, and statement of cash flows, respectively, that is not disclosed on the other statements.

#### C22-2 Statement of Cash Flows

A friend of yours is taking an elementary accounting course. He says, "I understand the income statement and balance sheet, but I am confused by the statement of cash flows (and accompanying schedule). What is this statement, what is it useful for, what are its major sections, and what items are reported in each section and the accompanying schedule? I need to understand this statement better so I can do well in my class."

#### Required

Prepare a written response to your friend's questions.

#### **C22-3 Cash Flow Activities**

A company's statement of cash flows shows its cash inflows, cash outflows, and net change in cash from the operating, investing, and financing activities during an accounting period.

#### Required

Prepare a short memo that defines a company's operating, investing, and financing activities, and identifies the cash inflows and cash outflows related to each activity.

#### **C22-4 Worksheet Method**

The worksheet method is commonly used to analyze the information for preparing a company's statement of cash flows. This method involves the completion of several steps.

Explain the worksheet method and list and briefly discuss the steps in this method.

## **C22-5 Operating Cash Flows**

There are two methods to calculate and report a company's net cash provided by (or used in) operating activities.

Prepare a short memo that identifies the two methods and explains the calculations necessary for each method.

#### CREATIVE AND CRITICAL THINKING

## **C22-6** Financing and Investing Activities Not **Involving Cash**

AICPA Adapted The statement of cash flows is normally a required basic financial statement for each period for which an earnings statement is presented. The statement should include a separate schedule listing the financing and investing activities not involving cash.

#### Required

- 1. What are financing and investing activities not involving cash?
- 2. What are two types of financing and investing activities not involving cash?
- 3. Explain what effect, if any, each of the following seven items would have on the statement of cash flows.
  - a. Accounts receivable
  - b. Inventory
  - c. Depreciation
  - d. Deferred tax liability
  - e. Issuance of long-term debt in payment for a building
  - f. Payoff of current portion of debt
  - g. Sale of a fixed asset resulting in a loss

#### C22-7 Inflows and Outflows

AICPA Adapted Alfred Engineering Company is a young and growing producer of electronic measuring instruments and technical equipment. You have been retained by Alfred to advise it in the preparation of a statement of cash flows. For the fiscal year ended October 31, 2010, you have obtained the following information concerning certain events and transactions of Alfred:

1. The amount of reported earnings for the fiscal year was \$800,000.

- 2. Depreciation expense of \$240,000 was included in the earnings statement.
- 3. Uncollectible accounts receivable of \$30,000 were written off against the allowance for uncollectible accounts. Also, \$37,000 of bad debts expense was included in determining earnings for the fiscal year, and the same amount was added to the allowance for uncollectible accounts
- 4. A gain of \$4,700 was realized on the sale of a machine; it originally cost \$75,000, of which \$25,000 was undepreciated on the date of sale.
- 5. On July 2, 2010, a building and land were purchased for \$600,000; Alfred gave in payment \$100,000 cash, \$200,000 market value of its unissued common stock, and a \$300,000 mortgage.
- 6. On August 3, 2010, \$700,000 of Alfred's convertible preferred stock was converted into \$140,000 par value of its common stock. The preferred stock was originally issued at par.
- 7. The board of directors declared a \$320,000 cash dividend on October 19, 2010, payable on November 16, 2010 to stockholders of record on November 5, 2010.

#### Required

For each of the seven items, explain whether each is an inflow or outflow of cash and explain how it should be disclosed in Alfred's statement of cash flows (indirect method) for the fiscal year ended October 31, 2010. If any item is neither an inflow nor outflow of cash, explain why it is not and indicate the disclosure, if any, that should be made of the item in Alfred's statement of cash flows for the fiscal year ended October 31, 2010.

## C22-8 Analyzing Coca-Cola's Cash Flow **Disclosures**

Refer to the financial statements and related notes of the Coca-Cola Company in Appendix A of this book.

#### Required

- 1. What was the net cash provided by operating activities for 2007? What method was used to determine this amount? What was the largest positive adjustment to net income?
- 2. What was the net cash used in investing activities for 2007? What was the largest investing cash outflow? Investing cash inflow?
- 3. What was the net cash used in financing activities for 2007? What was the largest financing cash inflow? Financing cash outflow?
- 4. What was the interest paid in 2007? Income taxes paid?
- 5. Compute the "cash flow from operations to sales" ratio for 2007. How does this result compare to 2006? Why?
- 6. Compute the profit margin for 2007. How does this result compare to the cash flow from operations to sales ratio for 2007? Why?

#### C22-9 Ethics and Cash Flows

You are the accountant for Nello Company, which manufactures specialty equipment. Nello has been in financial difficulty, so its suppliers

require purchases to be paid in cash. Furthermore, Nello has long-term debt with a debt covenant that requires it to maintain a 1:1 acid-test (quick) ratio. Nello's employees work a five-day week, Monday through Friday.

On Wednesday morning during the last week of the current year, Sam (the production supervisor) comes to you and says, "I don't understand it. We have this large special order from a customer that must be delivered at the end of the first week in January. Once we get the raw materials, it is going to take five solid days of work without overtime to produce the order. If Bob (the president) would let me order the raw materials this morning, we could have them by late today. This would give us two days this week and the four days after New Years Day (Monday) of next week to complete the order without incurring overtime costs. But Bob says we must wait until next Tuesday to order the materials. This means we will have to work doubletime that Wednesday through Friday to finish the order. That overtime cost is going to really increase next year's factory salary expense, so our profit and operating cash flows from that order will be very low. Please talk to him."

When you approach Bob about buying the raw materials this morning, he says, "If we purchase those materials today, we will have to write a check. And that means our cash flow from operating activities for this year will be much lower, which our stockholders won't like. Furthermore, our quick ratio will go down from 1.01:1 to .90:1, so our creditors may be upset. I know our profit and operating cash flows for next year will be lower if we delay the purchase, but that seems to be the best decision. Don't you agree?"

#### Required

From financial reporting and ethical perspectives, how would you respond to Bob?

# RESEARCH SIMULATION

#### R22-1 Researching GAAP

#### Situation

You are the new accountant for 12th National Bank and are preparing its 2010 statement of cash flows. The bank reports net income of \$75,800 on its 2010 income statement. Included in this net income are the following items: \$6,700 gain on sale of trading securities, \$1,200 unrealized holding gain on trading securities, and \$5,100 loss on sale of securities available for sale. Among its 2010 transactions, the bank sold trading securities with a carrying value of \$22,900 for \$29,600, and purchased trading securities for \$65,200. The bank sold securities available for sale with a cost (and carrying value) of \$58,700 for \$53,600, and purchased securities available for sale for \$39,400. It also

made routine 90-day loans of \$47,500 to customers and collected \$20,000 principal on these customer loans. As a result of the preceding information, the bank's trading securities account increased by \$43,500, the securities available for sale account decreased by \$19,300, and the loans receivable account increased by \$27,500. The bank uses the indirect approach to report operating cash flows on its statement of cash flows.

#### Directions

Research the applicable generally accepted accounting principles and prepare a written memo to the 12th National Bank's auditors that explains how you plan to report the preceding items on the bank's 2010 statement of cash flows. Cite your reference and applicable paragraph numbers.

# Accounting for Changes and Errors

. .

ROGELIO SOLIS/AP Photos

After reading this chapter, you will be able to:

- 1 Identify the types of accounting changes.
- **2** Explain the methods of disclosing an accounting change.
- **3** Account for a change in accounting principle using the retrospective adjustment method.
- 4 Account for a change in estimate.
- 5 Explain the conceptual issues regarding a change in accounting principle and a change in estimate.
- 6 Identify a change in reporting entity.
- **7** Account for a correction of an error.
- 8 Summarize the methods for making accounting changes and correcting errors.

# **Eating Up the Profits**

According to a recent study released by Audit Analytics, the number of financial restatements fell by 31% in 2007, after reaching a record high in 2006. This drop reversed a nearly 10-year increase in the number of financial restatements. Not only did the number of restatements fall, but the severity of the restatements also declined. The average size of a restatement in 2007 was \$3.64 million, which was almost 17% lower than the previous year. Many observers attribute this decline in restatements to the implementation of the Sarbanes-Oxley Act of 2002. The argument is that this legislation has led companies to implement better controls that have improved the accuracy and reliability of financial reporting.

Although the number and size of the restatements have declined, the causes of restatements have largely remained the same. The top accounting issues that caused

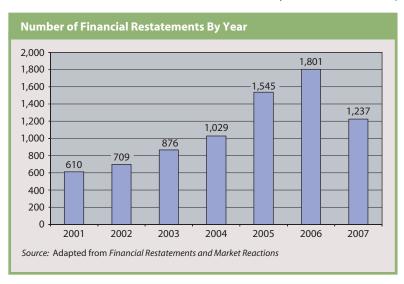

restatements involved the traditional culprits such as

- revenue recognition issues
- expense recognition issues
- deferred, stock-based, or executive compensation issues
- liabilities, payables, reserves and accrual estimate failures
- debt, quasi-debt, and other equity issues
- acquisition and investment accounting
- cash flow classification errors

While large misstatements, such as WorldCom's \$74.4 billion restatement in 2004

and American International Group's (AIG)

\$3.9 billion restatement in 2005, receive considerable attention from the financial press, many restatements are much smaller in size and result from the growing complexity of transactions and simple misapplication of accounting principles. Whether the restatements were caused by fraud, aggressive accounting, or simple mistakes, one thing is clear. The restatements certainly took a bite out of profits!

One of the qualitative characteristics of accounting is consistency (which we discussed in Chapter 2)—the conformity of accounting principles, policies, and procedures from period to period. However, in some instances a company may improve its reporting by changing its accounting to adopt a preferable or newly mandated GAAP, or to reflect changing economic conditions. When a company changes an accounting principle, the consistency of its financial statements is impaired. Therefore, it is important to report the effects of the change in its financial statements. Accounting for the effects of a change in an accounting principle is the primary topic of this chapter. We also discuss the related issue of accounting for a change in an estimate. Finally, we discuss accounting for errors.

# Types of Accounting Changes

GAAP defines three types of accounting changes<sup>1</sup> as follows:

- 1. Change in an Accounting Principle. This type of change occurs when a company adopts a GAAP different from the one used previously for reporting purposes. For instance, changing from the LIFO to the FIFO inventory cost flow assumption is a change in accounting principle.
- 2. Change in an Accounting Estimate. This type of change is inherent in the periodic presentation of financial statements. Preparing financial statements requires the use of estimates to determine many revenues and expenses. These estimates sometimes must be changed as new events occur, as more experience is acquired, or as additional information is obtained. For example, a company may change the estimated life of a depreciable asset to reflect newly available information.
- 3. Change in a Reporting Entity. This type of change is caused by a change in the entity being reported. For example, a change in the subsidiaries that are included in a company's consolidated financial statements is a change in a reporting entity.

In addition to the preceding changes, GAAP specifies how a company accounts for an error in its published financial statements. Errors are not considered to be accounting changes, but are the results of mathematical mistakes or mistakes in the application of GAAP.

# METHODS OF REPORTING AN ACCOUNTING CHANGE

There are two possible methods for a company to disclose an accounting change in its financial statements: (1) the retrospective application of a new accounting principle (restate its financial statements of prior periods, sometimes referred to as a retrospective adjustment or restatement), or (2) adjust for the change prospectively.

According to GAAP:

- A change in an accounting principle is accounted for by the retrospective application of the new accounting principle.<sup>2</sup>
- A change in an accounting estimate is accounted for prospectively.
- A change in a reporting entity is accounted for by a retrospective adjustment so that all the financial statements presented are for the same entity.

We discuss each of these methods and rules in greater detail in the following sections of the chapter. We provide a summary in Exhibit 23-1 at the end of the chapter. Note that a company reports an accounting change in its financial statements only if the amount is material.

1 Identify the types of accounting changes.

2 Explain the methods of disclosing an accounting change.

- "Accounting Changes and Error Corrections," FASB Statement of Financial Accounting Standards No. 154 (Norwalk, Conn.: FASB, 2005), par. 2 (FASB Cod. # 250-10).
- If it is not practical to determine the cumulative effect of applying a change in any accounting period, the new principle is applied as if the change was made prospectively at the earliest date practical, as we discuss later in the chapter.

# ACCOUNTING FOR A CHANGE IN ACCOUNTING PRINCIPLE

GAAP states that a change in accounting principle includes:

- A change from one GAAP to another GAAP when there are two or more alterna-
- A change in accounting principle because the principle formerly used is no longer generally accepted.
- A change in the method of applying an accounting principle.

Thus, a change in an accounting principle can be a voluntary change from one generally accepted principle to another, or a mandatory change because the FASB has adopted a new principle. However, a change in an accounting principle does not include the initial adoption of GAAP because of events or transactions occurring for the first time. It also does not include the adoption or modification of an accounting principle for transactions or events that are clearly different in substance from those previously occurring. Also, a change to GAAP from a principle that is not generally accepted is a correction of an error and not a change in accounting principle.

## **Retrospective Adjustment Method**

A company accounts for a change in accounting principle by the retrospective application of the new accounting principle to all prior periods as follows:

- 1. The company computes the cumulative effect of the change to the new accounting principle as of the beginning of the first period presented. That is, it computes the amounts that would have been in the financial statements if it had always used the new principle.
- 2. The company adjusts the book values of those assets and liabilities (including income taxes) that are affected by the change. The company makes an offsetting adjustment to the beginning balance of retained earnings to report the cumulative effect of the change (net of taxes) for each period presented.
- The company adjusts the financial statements of each prior period to reflect the specific effects of applying the new accounting principle. That is, each item in each financial statement that is affected by the change is restated to the appropriate amount under the new accounting principle. The company uses the new accounting principle in its current financial statements.
- 4. The company's disclosures include (a) the nature and reason for the change in accounting principle, including an explanation of why the new principle is preferable, (b) a description of the prior-period information that has been retrospectively adjusted, (c) the effect of the change on income, earnings per share, and any other financial statement line item for the current period and the prior periods retrospectively adjusted, and (d) the cumulative effect of the change on retained earnings (or other appropriate component of equity) at the beginning of the earliest period presented.

3 Account for a change in accounting principle using the retrospective adjustment method.

## **Example: Retrospective Adjustment**

A retrospective adjustment requires that a company change the prior financial statements to what they would have been had it used the new method in previous periods. Examples 23-1, 23-2, 23-3, 23-4, and 23-5 illustrate a retrospective adjustment. In this example, the Werner Company changes from the LIFO to the FIFO inventory method at the beginning of 2011. Example 23-1 shows the basic information for Werner Company. Example 23-2 shows the Werner Company's comparative income statements for 2010 and 2009. For those years, the company was using the LIFO method. Since the Werner Company changed from the LIFO method to the FIFO method on January 1, 2011 and presents the previous year's (2010) financial statements for comparative purposes, it must report its comparative income statements for 2011 and 2010 using the FIFO method. Example 23-3 shows these statements. The income statement

### **EXAMPLE 23-1** Retrospective Adjustment for a Change in Accounting for Inventory

- 1. Werner Company starts operations on January 1, 2009.
- 2. The Werner Company changes from the LIFO method to the FIFO method on January 1, 2011.
- 3. The company reports the previous year's financial statements for comparative purposes. Therefore, the beginning of the first period presented is January 1, 2010.
- 4. Retained earnings on December 31, 2009 is \$231,000. The company paid no dividends in 2009, 2010, and 2011.
- 5. The company's tax rate is 30% and there are no temporary or permanent differences.
- 6. The company pays its income taxes in a single payment in the following year.
- 7. The company must repay the taxes saved by using LIFO according to IRS rules but has *not* yet made any payments.
- 8. The company has 100,000 shares outstanding (for simplicity we only compute basic earnings per share).
- 9. The company calculated its inventory and cost of goods sold amounts under LIFO and FIFO as follows:

|            | Inventory Determined by |             | Cost of Goods Sol | d Determined by |
|------------|-------------------------|-------------|-------------------|-----------------|
|            | LIFO Method             | FIFO Method | LIFO Method       | FIFO Method     |
| 12/31/2009 | \$ 70,000               | \$120,000   | \$720,000         | \$670,000       |
| 12/31/2010 | 90,000                  | 160,000     | 780,000           | 760,000         |
| 12/31/2011 | 130,000                 | 210,000     | 860,000           | 850,000         |

|  | 2011                  | 2010<br>As adjusted |
| Sales  | \$2,000,000           | \$ 1,700,000        |
| Cost of goods sold   | (850,000)             | (760,000)           |
| Operating expenses   | (550,000)             | (500,000)           |
| Income before income taxes   | \$ 600,000            | \$ 440,000          |
| Income tax expense   | (180,000)             | (132,000)           |
| Net income   | \$ 420,000            | \$ 308,000          |
| Earnings per share   | \$ 4.20               | \$ 3.08             |

for 2010 shows the retrospective application of the change from the LIFO method to the FIFO method. Note that the 2010 income statement presented in 2011 is different from when it was originally presented in 2010. The cost of goods sold under FIFO is \$760,000, whereas it was \$780,000 under LIFO (see Example 23-2). This \$20,000 difference also increased the 2010 income before income taxes, increased income tax expense by \$6,000 (\$20,000  $\times$  0.30), and increased net income by \$14,000 [\$20,000  $\times$ (1 - 0.30)]. Although we don't show the balance sheet and statement of cash flows, Werner would also have reported these financial statements using the FIFO method for both 2011 and 2010. Werner Company must also adjust its beginning retained earnings for the cumulative effect of the change from LIFO to FIFO (net of taxes) for 2010 and 2011. Example 23-4 shows Werner Company's retained earnings statements for these years.

| EXAMPLE 23-4 Comparative Retained Earnings Statements  | s         |           |
|--|-----------|-----------|
| Werner Company<br>Retained Earnings Statement<br>For Years Ended 12/31/2011 and 12/31,                                   | /2010     |           |
|  | 2011      | 2010      |
| Beginning unadjusted retained earnings   | \$525,000 | \$231,000 |
| Plus: Adjustment for the cumulative effect on prior years' of retrospectively applying the FIFO inventory method (net of |           |           |
| income taxes of \$21,000 in 2011 and \$15,000 in 2010)   | 49,000    | 35,000    |
| Adjusted beginning retained earnings   | \$574,000 | \$266,000 |
| Net income   | 420,000   | 308,000   |
| Ending retained earnings   | \$994,000 | \$574,000 |

The \$231,000 unadjusted beginning retained earnings for 2010 is the net income for 2009 under LIFO because Werner Company paid no dividends in 2009 (remember that we also assumed that the company started operations on January 1, 2009). The \$35,000 retrospective adjustment to the beginning retained earnings for 2010 is the cumulative effect of the change from LIFO to FIFO for 2009. It is the difference between the \$231,000 net income reported under the LIFO inventory method for 2009 and the \$266,000 net income (\$1,500,000 sales - \$670,000 cost of goods sold - \$450,000 operating expenses =\$380,000 income before income taxes – \$114,000 income taxes) that would have been reported under the FIFO method for 2009. The \$266,000 adjusted beginning retained earnings is the retained earnings balance that Werner would have reported at the beginning of 2010 if it had been using FIFO during 2009. The \$308,000 net income that Werner would have reported for 2010 if it had been using FIFO is then added to the \$266,000 adjusted beginning retained earnings to determine the \$574,000 ending adjusted retained earnings for 2010.

The \$525,000 unadjusted beginning retained earnings for 2011 consists of the \$231,000 unadjusted retained earnings balance at the end of 2009, plus the \$294,000 net income for 2010 under LIFO because the company paid no dividends. The \$49,000 retrospective adjustment to the beginning retained earnings for 2011 is the cumulative effect of the change from LIFO to FIFO for all previous years, which in this example is 2009 and 2010. It is the difference between the \$525,000 cumulative net income (\$231,000 for 2009 and \$294,000 for 2010) under LIFO and the \$574,000 cumulative net income (\$266,000 for 2009 and \$308,000 for 2010) under FIFO. The \$574,000 adjusted beginning retained earnings is the balance that Werner would have reported at the beginning of 2011 if it had been using FIFO for 2009 and 2010. The \$420,000 net income for 2011 (under FIFO) is then added to the \$574,000 adjusted beginning retained earnings balance for 2011 to determine the \$994,000 ending adjusted retained earnings for 2011.

At the beginning of 2011, Werner Company records the retrospective adjustment as follows:

| Inventory            | 70,000 |
|----------------------|--------|
| Income Taxes Payable | 21,000 |
| Retained Earnings    | 49,000 |

Werner Company adds the \$70,000 increase (debit) in the Inventory account to the \$90,000 LIFO balance (see Example 23-1) to increase the balance to \$160,000 (the beginning balance for 2011; see Example 23-1). The \$21,000 increase (credit) in Income Taxes Payable is the amount that Werner is obligated under the Internal Revenue Code to repay for the income taxes it saved in 2009 and 2010 when the company was using LIFO. The \$49,000 increase (credit) in Retained Earnings is the cumulative effect of the change from LIFO to FIFO for 2009 and 2010, net of income taxes, that we explained earlier in Example 23-4.

Example 23-5, on page 1225, shows the Werner Company's disclosures for its retrospective adjustment, as required by GAAP. Section 1 of Example 23-5 shows Werner's discussion of the nature and reason for the change from LIFO to FIFO, an explanation of why the new principle is preferable, and a description of the prior-period information that has been retrospectively adjusted. In Section 2 of Example 23-5, Werner discloses the effects of the change from the LIFO method to the FIFO method by reporting the effects on the entire income statement, but only on the line items affected for the balance sheet and statement of cash flows. (Under GAAP, a company may disclose the entire statements or just the line items affected.)

The first part of Section 2 shows the effects of the change from LIFO to FIFO on the line items of Werner Company's income statement for 2010 under both the old (LIFO) and the new principle (FIFO). Note that this shows how the new principle changed the income statement line items that were reported (and analyzed by users) under the old principle. It allows the user to understand how the income in 2010 under the new accounting principle (FIFO) is different from that reported under the old principle (LIFO).

The second part of Section 2 shows the effects of the change on the line items of the income statement for 2011 under both the old and the new principle. Note that Werner never reported the LIFO amounts in its 2011 income statement (because it switched to FIFO at the beginning of 2011) but these amounts are a required disclosure that helps users understand the effects of the change in accounting principle. When users were analyzing the company in 2010 and predicting the amount of income it would report in 2011, they would have expected the company to report using LIFO. This disclosure allows them to see the effects of the new principle on those predictions.

The remaining parts of Section 2 in Example 23-5 show the effects of the change in principle on the line items of Werner Company's balance sheet and statement of cash flows. The inventory amount in each balance sheet is taken from Example 23-1. The income taxes payable in each balance sheet as originally reported under LIFO is the amount of the income tax expense in that period's income statement (because we assumed Werner has no temporary or permanent differences and pays its income taxes in the following year).

The income taxes payable in each balance sheet as adjusted under FIFO is more complex, because the company must repay the taxes it has saved under LIFO. The \$147,000 balance on December 31, 2010 is the \$132,000 income taxes from the 2010 income statement under FIFO plus the \$15,000 (\$50,000 change in income before income taxes for 2009  $\times$ 0.30) additional taxes that it owes for 2009 but has not yet paid. In 2011, the company pays the \$126,000 of income taxes that were due from 2010 under LIFO and adds the \$180,000 income taxes from the 2011 income statement under FIFO, which results in a balance of \$201,000. The retained earnings balance in each balance sheet is the beginning balance for each year plus the appropriate income amount for that year. Note that the \$574,000 adjusted retained earnings on December 31, 2010 includes the increase of \$35,000 from the cumulative increase in net income (after taxes) that was measured on January 1, 2010, as we explained in Example 23-4. The adjusted retained earnings balance on December 31, 2011 includes the net income computed under FIFO over the three-year period (2009–2011).

## **EXAMPLE 23-5** Disclosure of the Effects of a Change in Accounting Principle

#### **Section 1: Description of Accounting Change**

On January 1, 2011, the company changed its method of valuing its inventory and cost of goods sold to the FIFO method from the LIFO method used in all previous years. The new method of accounting for inventory and cost of goods sold was adopted to recognize...(state justification for the change in accounting principle)...and financial statements of prior years have been retrospectively adjusted to apply the new method. The effect on retained earnings at January 1, 2010 was an increase of \$35,000.

#### **Section 2: Effects on Financial Statements**

The following financial statement line items for 2011 and 2010 were affected by the change from the LIFO to the FIFO inventory method.

> Werner Company **Income Statement Effects** For Year Ended 12/31/2010

|                            | As Originally Reported under LIFO | As Adjusted to FIFO | Effect of Change |

| Retained earnings    | 525,000 <sup>b</sup>              | 574,000 <sup>c</sup>   | 49,000           |

 $a($50,000 \times 0.3) + $132,000$ 

(Continued)

The increase in inventory in each statement of cash flows is calculated as the difference in inventory amounts from year to year in Example 23-1. For instance, the \$20,000 increase in inventory as originally reported under LIFO for 2010 is the difference between the \$70,000 ending inventory for 2009 and the \$90,000 ending inventory for 2010. The increase in the income taxes payable in each statement of cash flows is the change from one balance sheet

b \$231,000 + \$294,000

 $<sup>^{\</sup>circ}$ \$231,000 + (\$50,000 × 0.7) + \$308,000

to the next. For instance, the \$27,000 increase in income taxes payable as originally reported under LIFO for 2010 is the difference between the \$99,000 ending income taxes payable for 2009 and the \$126,000 ending income taxes payable for 2010.

## Accounting for a Change in an Estimate

4 Account for a change in estimate.

GAAP frequently requires a company to use estimates for items such as uncollectible accounts receivable, inventory obsolescence, service lives, residual values, recoverable mineral reserves, warranty costs, pension costs, and the periods that it expects to be benefited by a deferred cost. Since estimating future events is an inherently uncertain process, changes in estimates are inevitable as new events occur, as more experience is acquired, or as additional information is obtained.

GAAP requires that a company accounts for a change in an accounting estimate in the period of the change if the change affects that period only, or the period of the change and future periods if the change affects both.<sup>3</sup> In other words, a change in an accounting estimate does not result in a retrospective adjustment, but is accounted for prospectively.

### **Example: Change in Estimated Service Life**

For example, if a company changes the estimated service life of an asset, it calculates a revised periodic depreciation expense based on the current book value, the estimated residual value, and the new estimated service life. Suppose that a company owns an asset with an original cost of \$100,000, an estimated life of 20 years, an estimated residual value of zero, and the company is using straight-line depreciation. The company has recorded depreciation of \$5,000 each year, so the asset's book value at the end of eight years is 60,000 [\$100,000 - (8 \times \$5,000)]. Now suppose that at the beginning of the ninth year of the asset's life, the company changes the estimate of its life to a total of 23 years, so that 15 years now remain in the asset's life. The company depreciates the remaining book value over the remaining service life so that the depreciation expense of current and later years is  $4,000 (60,000 \div 15)$  per year.

In addition to including this new amount of depreciation in its financial statements, the company discloses the effect of the change on its income from continuing operations, net income, and the related earnings per share amounts of the current period in the notes to its financial statements. (This disclosure is not required for estimates made each period in the ordinary course of accounting for items such as uncollectible accounts or inventory obsolescence, unless the change is material.) To continue the preceding example, assume that the income tax rate is 30% and the company has 10,000 shares outstanding. The after-tax effect of such a change is an increase in income from continuing operations and net income (because of lower depreciation expense) of \$700 [(\$5,000 - \$4,000)  $\times$  0.70], and the effect on earnings per share is an increase of 0.07 per share (0.07). The company discloses these amounts in the notes to its financial statements. We showed another example of a change in estimate in Chapter 11. •

## OUICK CHECK 23-1

- Consistent use of the same accounting principle enhances the usefulness of a company's financial statements. GAAP defines three types of accounting changes:
  - Change in an Accounting Principle—a change from one GAAP to another GAAP.
  - Change in an Accounting Estimate—a change in an estimate due to new events occurring, more experience being acquired, or additional information being obtained.
  - Change in a Reporting Entity—a change in the entity being reported, which results in financial statements that are those of a different reporting entity.
- A change in accounting principle is accounted for by retrospectively applying the new accounting principle to all prior periods. Retrospective application requires:
  - The computation of the cumulative effect of the change as of the beginning of the first period presented,
  - An adjustment to the book value of the assets and liabilities (including income taxes) affected by the change,
  - An adjustment to the opening balance of retained earnings for the aggregate effect of the change on income (net of applicable income taxes),
  - A restatement of the financial statements of each prior period affected by the change, and
  - Appropriate disclosures.
- A change in an accounting estimate is accounted for prospectively in the period of the change, or the period of the change and future periods if the change affects both.

## **ADDITIONAL ISSUES**

We discuss several additional issues related to accounting changes in the following sections.

## **Impracticability of Retrospective Adjustment**

Sometimes, it may not be practicable to determine the effect of applying a change in accounting principle to any prior period. In this case, GAAP requires a company to apply the new accounting principle as if the change was made prospectively as of the earliest date practicable. For example, a change to LIFO would require the company to compute any appropriate cost indexes (as we discussed in Chapter 8) and to be able to monitor any LIFO liquidations that occurred in the past. This would often be impracticable. In this situation, the company would apply the new accounting principle in the year of the change without adjusting the financial statements of prior years. It would disclose information similar to what we showed in Section 1 of Example 23-5.

In other situations, a company might have sufficient information to retrospectively adjust to the new accounting principle for some, but not all, of the prior periods presented. In such a situation, the company applies the retrospective adjustment as of the earliest date practicable. That is, the company computes the cumulative effect of the change to the new accounting principle on the book value of the assets and liabilities as of the beginning of the earliest period to which the new accounting principle can be applied. An offsetting adjustment (net of taxes) is made to the opening balance of retained earnings for that period. Effectively, we illustrated this situation with the Werner Company because we assumed the beginning of the first period presented was January 1, 2010. However, publicly held companies must present three years of income statements. Therefore, if Werner Company were a publicly held company, it would have used January 1, 2009 as the beginning of the first period presented. Note also that if a company provides a summary of its financial results for, say, 10 years, it must retrospectively adjust its disclosures for those periods, if practicable.

## A Change in Principle Distinguished from a Change in an Estimate

Sometimes it is difficult for a company to distinguish between a change in an accounting principle and a change in an estimate. For example, a company may change from capitalizing and amortizing a cost to recording it as an expense when incurred because future benefits associated with the cost have become doubtful. The company adopted the new accounting method because of the change in estimated benefits, and therefore, the change in method is *inseparable* from the change in estimate. The company is required to account for such a change as a *change in estimate*. That is, it accounts for the change prospectively.

An additional complexity arises with respect to the depreciation (including amortization and depletion) of the cost of an asset over its useful life. It can be argued that a change in the method of depreciation is in fact a change in estimate. That is, the criteria that a company uses to select a method of depreciation are that it is systematic and rational, and results in an appropriate matching of costs and benefits. Therefore, if the estimate of the pattern of future benefits is changed, for example, from declining benefits to constant benefits, a change in the depreciation method is appropriate. Thus, a change in an accounting method (depreciation) results from a change in an estimate. Therefore, a change in the depreciation method is treated as a change in an estimate under GAAP.4 It is referred to as a change in accounting estimate effected by a change in accounting principle.

### **Example: Change in Principle and Estimate**

Assume that at the beginning of year 1, the Dowson Company purchased an asset for \$20,000, which had an estimated life of four years and a zero residual value. The company was depreciating the asset using the sum-of-the-years'-digits method and decides to switch to the straight-line method at the beginning of year 3 because of a change in the estimated pattern of benefits the asset produces. Straight-line and sum-of-the-years'-digits methods produce the annual depreciation amounts we show in Example 23-6. In this example, we ignore the effects of income taxes.

| EXAMPI      | EXAMPLE 23-6 Alternative Depreciation Methods: Dowson Company |               |                                   |  |  |  |
|-------------|---|---------------|-----------------------------------|--|--|--|
|             | <u>M</u>  | ethod         | Reduced Depreciation Amount under |  |  |  |
| <u>Year</u> | Sum-of-the-Years'-Digits                                      | Straight-Line | Straight-Line Method              |  |  |  |
| 1           | \$ 8,000  | \$ 5,000      | \$ 3,000                          |  |  |  |
| 2           | 6,000   | 5,000         | 1,000                             |  |  |  |
| 3           | 4,000   | 5,000         | (1,000)                           |  |  |  |
| 4           | 2,000   | 5,000         | (3,000)                           |  |  |  |
|             | \$20,000  | \$20,000      | \$ 0                              |  |  |  |

The company writes off the unadjusted book value of the asset at the beginning of year 3 over the remaining life of the asset. In this case, under the sum-of-the-years'-digits method, the asset has a book value at the beginning of year 3 of \$6,000 (\$20,000 -\$8,000 - \$6,000). The company writes off this amount by the straight-line method through a depreciation expense of \$3,000 per year over the remaining life of two years. Since the company accounts for the change prospectively, the only effect in the year of the change (year 3) is a depreciation expense of \$3,000 instead of the \$4,000 that the company would have reported under the sum-of-the-years'-digits method. No change is made in the financial statements for years 1 and 2. The company is also required to make the disclosures we discussed in a previous section. •

## **Preferability of the New Accounting Principle**

After a company adopts an accounting principle, it should not change the principle unless a new principle is preferable. Therefore, when a company changes an accounting principle, management must justify the change on the grounds that the new principle is preferable to the old. For example, Nike justified its change to FIFO by stating that "this change was predicated on the fact that the LIFO method no longer matches the realities of how we do business." The SEC requires that when a company that files with it makes an accounting change, the auditor must submit a letter indicating whether the change is to an alternative principle that, in the auditor's judgment, is preferable under the circumstances. "Preferable" is defined to mean that the new method represents an improved method of measuring business operations in the particular circumstances. Some accountants object to the SEC's requirement because it relates only to a company making a change in an accounting principle. There is no requirement that the auditor make a statement about the preferability of the accounting principles the company is currently using.

The issuance of an FASB Statement of Standards is sufficient support for a change in accounting principle and does not require special justification. That is, the newly mandated principle is automatically considered to be preferable.

## **Direct and Indirect Effects**

In the Werner Company example, we assumed that the change in the accounting principle used for inventory was the only item affecting the previous year's income. In more complex situations, a change in accounting principle might have an "interactive" effect on other items that affect prior years' income. For instance, a company might have bonus arrangements with management, profit sharing plans for employees, or royalty payments, all of which are based on the company's income. In these cases, a change in an accounting principle has both a "direct" and an "indirect" effect on the company's income of prior years. The direct effect is the amount by which its prior years' income is increased or decreased specifically as a result of the change in accounting principle. The indirect effect is the amount by which the company's income of prior years is affected by how the change in principle affects other elements of income. For instance, suppose the Werner Company also has a bonus arrangement with management based on net income. If the company had

used FIFO instead of LIFO in prior years, the direct effect is an increase in income because of a lower cost of goods sold. However, this increase in income would have been partially offset by the indirect effect on the bonus arrangement. That is, because income was increased as a result of the lower cost of goods sold, the bonus expense also would have been higher, and this, in turn, would have offset some of the increase in income.

In situations in which a change in accounting principle has both a direct and indirect effect on prior years' income, GAAP states that a company recognizes only the direct effect (net of applicable income taxes) in determining the amount of the retrospective adjustment. Therefore, the indirect effects that would have been recognized if the newly adopted principle had been used in prior periods are *not* included in the retrospective application. For example, a bonus of a prior period that a company has paid to its employees would probably not be changed because of a change to an accounting principle that will be applied to the current and future periods. However, if indirect effects are actually incurred and recognized, they are reported in the year in which the accounting change is made.

### **Example: Indirect Effects**

The Werner Company's total pre-tax difference from the change to FIFO was \$70,000 (\$50,000 + \$20,000) at January 1, 2011. Suppose the company pays a bonus of 10% of its income before income taxes and bonus to employees. If the company did not change the amount of the bonuses it paid in the past, then the amounts and disclosures we illustrated earlier would not change (except for the direct effect of the bonus on reported income in 2011). If the company did pay an additional bonus based on the change in income, then it would recognize an expense of \$7,000 ( $$70,000 \times 10\%$ ) in 2011, the year it adopted the new principle. •

## **Adoption of a New Accounting Principle for Future Events**

If a company adopts a new accounting principle for use in the future but does not change the method currently used, it does not make a retrospective adjustment. For example, a company might use a new depreciation method for newly acquired assets, but continue to use the old method for currently owned assets. In this situation, the company should describe the nature of the change and its effect on net income of the period of the change, together with the earnings per share amounts, in the notes to its financial statements.

### Initial Public Sale of Common Stock

If a company makes accounting changes when it makes an initial public distribution (the first sale of common stock made available to the general public), it retrospectively adjusts the financial statements for all prior periods presented. This procedure is available only once for changes made at the time a company first uses its financial statements to (1) obtain additional equity capital from investors, (2) effect a business combination, or (3) register securities. This approach is logical because the company's financial statements have never before been available to the public and therefore there is no need to explain the changes made to the statements.

## Transition Methods Required by the FASB

As we discussed in a previous section, GAAP specifies the general rules to be applied for a change in an accounting principle. However, when issuing Statements of Standards, the FASB specifies transition rules, if appropriate. Transition rules define the accounting method a company uses when it changes an accounting principle to conform to a new principle required by the issuance of new GAAP. In these situations, the accounting principle being used is no longer acceptable and a new principle is required. The transition rule usually requires a retrospective application of the new accounting principle. However, the change is sometimes accounted for prospectively, when obtaining the information for a retrospective application is costly or not practicable. You should carefully examine each FASB Statement of Standards so that you follow the specific transition rules.

## **Accounting Changes in Interim Financial Statements**

The principles to be followed when accounting changes are reported in interim financial statements are also established by GAAP. If a company makes a change in accounting principle in an interim period, it also reports the change by retrospective application. However, the impracticability exception we discussed earlier does not apply to earlier interim periods in the year in which the change is made. Therefore, the new principle is applied retrospectively to, at least, the beginning of the year in which the change is made. In summary, the effect is that a company accounts for a change in principle at the beginning of the first interim period, regardless of the interim period in which the change occurs.

## **Litigation Settlement**

Another issue is whether a company should account for the results of a litigation settlement as a retrospective adjustment or a prospective adjustment. It could be argued that such a settlement is a retrospective adjustment because it relates either to the period in which the event causing the litigation occurred or to the period in which the litigation was filed. Alternatively, it could be argued that the litigation settlement is an event of the period of settlement and should be included in the company's current period's income. This issue was resolved by the FASB so that a litigation settlement is not a retrospective adjustment.<sup>5</sup>

## **CONCEPTUAL EVALUATION OF ACCOUNTING FOR A CHANGE** IN ACCOUNTING PRINCIPLE AND A CHANGE IN ESTIMATE

As we discussed in a previous section, there are two possible alternatives that a company uses to account for a change in an accounting principle or in an accounting estimate. These alternatives are retrospective application and prospective adjustment. We discuss the advantages and disadvantages of these alternatives, as well as selected additional issues, in the following sections.

## **Retrospective Application (Adjustment)**

The major argument in favor of retrospective application is that all the financial statements that a company presents at a given date are prepared on the basis of consistent accounting principles. Thus, when a user of the financial statements evaluates the company's current financial results, it is possible to make a comparison with the previous year's financial statements without adjusting for a change in accounting principle. Retrospective application is the usual method required for a change in accounting principle mandated by the FASB because it does not penalize (or increase) a company's current year's earnings for an event that is beyond the control of the company's management.

On the other hand, the retrospective application method has several disadvantages. First, a company's financial statements issued in previous years are changed under this method. This creates the possibility that users may be confused by the change in the reported results, and that confidence in the information may be reduced because "the numbers changed." Second, the method is not consistent with the all-inclusive income concept, which is the basis of GAAP as we discussed in Chapter 5. Third, there may be an impact on a company's contractual arrangements (such as bonus agreements, borrowing indentures, royalties, or profit sharing) when its previously reported income is changed. Fourth, the method lends itself to income manipulation by a company's management because items are excluded from its current year's income statement. When a company makes a retrospective application, it can decrease retained earnings without including the change as a reduction in its current year's income. Thus, the sum of the net incomes that it reports over the years would be more than the increase in its retained earnings (excluding consideration 5 Explain the conceptual issues regarding a change in accounting principle and a change in estimate.

<sup>&</sup>quot;Prior Period Adjustments," FASB Statement of Financial Accounting Standards No. 16 (Stamford, Conn.: FASB, 1977) (FASB Cod. # 250-10-45).

of dividends). Conversely, a retrospective application that increases the balance in a company's retained earnings does so without being added to its current year's net income.

## **Prospective Adjustment**

Accounting estimates used for periodic reporting inevitably change over time. A company also adopts new accounting principles from time to time. It may be argued that it is better for a company to account for such changes by considering their effects on the future and to make no attempt to change what has already been reported.

Since a company makes an estimate with the best information available at that time, and changes this estimate only to reflect new information, accounting for a change in an estimate with a prospective adjustment is especially appropriate. In addition, the alternative of reporting the effect of a change of estimate retrospectively might cause considerable confusion among users of financial statements because of the frequency of such changes.

In the case of a change in an accounting principle, the same arguments can be made about the desirability of a company not changing what it has already reported (that is, confusion and the all-inclusive income concept). Moreover, it may be argued that a change in an accounting principle, although it occurs in the current period, has little or no relation to the current period's economic events, or to the company's income generated from providing goods and services to its customers. Therefore, the change should be accounted for prospectively. Conversely, it can be argued that a change in an accounting principle is an event of the current period, and a company should not account for it prospectively but should report the cumulative effect in the income statement of the period of the change. Prior to 2006, this method was used for some changes in accounting principle.

## ACCOUNTING FOR A CHANGE IN A REPORTING ENTITY

The third type of change defined by GAAP is a change in a reporting entity. As we noted earlier, a company accounts for a change in reporting entity as a retrospective adjustment so that all the financial statements it presents are for the same entity. This procedure improves consistency.

A change in an accounting entity occurs mainly when (1) a company presents consolidated or combined statements in place of the statements of individual companies, (2) there is a change in the specific subsidiaries that make up the group of companies for which a company presents consolidated financial statements, or (3) the companies included in combined financial statements change.

When a change in an accounting entity occurs, the company includes in the notes to its financial statements of the period in which it makes the change a description of the change as well as the reason for it, and the effect of the change on income before extraordinary items, net income, other comprehensive income, and related earnings per share amounts for all periods presented. However, financial statements of later periods need not repeat the disclosures. We do not discuss the accounting for a change in an entity here,

**6** Identify a

change in

reporting

# OUICK CHECK 23-2

but it is included in advanced accounting books.

- In situations for which it is impracticable to retrospectively adjust the financial statements for a change in accounting principle, a company may apply the new accounting principle as if the change was made prospectively as of the earliest date practicable.
- If a change in accounting estimate cannot be distinguished from a change in accounting principle (e.g., a change in depreciation, depletion, or amortization method), it is considered a change in estimate effected by a change in accounting principle and is accounted for prospectively.

(Continued)

- Any change in accounting principle must be justified on the grounds that the new principle is preferable to the old.
- When a change in accounting principle has both direct and indirect effects on the company's income, only the direct effect of the change in accounting principle is included in the retrospective adjustment. Any indirect effects actually incurred are included in the year in which the accounting change is made.
- Any transition rule specified in a new accounting pronouncement is followed.
- A company accounts for a change in accounting principle at the beginning of the first interim period, regardless of the interim period in which the change occurs.
- A change in reporting entity is accounted for by retrospectively adjusting the financial statements of all prior periods presented.

## **ACCOUNTING FOR A CORRECTION OF AN ERROR**

A company may make a material error in the financial statements of a prior period that it does not discover until the current period. Examples of errors that a company might make include:

- 1. The use of an accounting principle that is not generally accepted;
- 2. The use of an estimate that was not made in good faith;
- 3. Mathematical miscalculations, such as the incorrect computation of its inventory; or logical errors, such as the omission of the residual value in the calculation of straight-line depreciation;
- 4. The omission of a deferral or accrual, such as the failure to accrue warranty costs.

The company must correct the error in the current period. The correction of an error made in a prior period is not an accounting change under GAAP. A company accounts for the correction of a material error of a past period that it discovers in the current period as a prior period restatement (adjustment).

A prior period restatement (adjustment) requires the following:

- 1. The company computes the cumulative effect of the error correction on prior financial statements. That is, it computes the amounts that would have been in the financial statements if it had not made the error.
- 2. The company adjusts the book values of those assets and liabilities (including income taxes) that are affected by the error. The company makes an offsetting adjustment to the beginning balance of retained earnings to report the cumulative effect of the error correction (net of taxes) for each period presented.
- 3. The company adjusts the financial statements of each prior period to reflect the specific effects of correcting the error. That is, each item in each financial statement that is affected by the error is restated to the appropriate amount.
- 4. The company's disclosures include (a) that its previously issued financial statements have been restated, along with a description of the nature of the error, (b) the effect of the correction on each financial statement line item, and any per-share amounts affected for each prior period presented, and (c) the cumulative effect of the change on retained earnings (or other appropriate component of equity) at the beginning of the earliest period presented.

Therefore, the effect of a prior period restatement is very similar to a retrospective application of a new accounting principle, except for the reason that the company made the adjustments.

We do not illustrate the disclosures, but they would be similar to those we showed in Example 23-5. Real Report 23-1 provides an illustration of the disclosure of a correction of an error made in a prior period by Dell, Inc. We discuss the journal entries required to correct errors in the next sections.

**7** Account for a correction of an error.

## Real Report 23-1 Disclosure of the Correction of an Error Made in a Prior Period

#### DELL INC

### NOTES TO CONSOLIDATED FINANCIAL STATEMENTS

#### NOTE 2—Audit Committee Independent Investigation and Restatement (in part)

The cumulative adjustments required to correct the errors and irregularities in the financial statements prior to Fiscal 2005 are reflected in the restated retained earnings as of the end of Fiscal 2004, as shown in the Statement of Stockholders' Equity. The cumulative effect of those adjustments reduced retained earnings by \$52 million at January 31, 2004.

The nature of the restatement adjustments and the impact of the adjustments to Fiscal 2006 are shown in the following table:

Fiscal 2006

|                        | Fiscal 2006 |             |        |                 |          |           |          |

Revenue Recognition Adjustments (in part)

Software Sales—The largest revenue recognition adjustment relates to correcting the timing and amount of revenue recognized on the sale of certain software products. The allocation of software sales revenue between the software license (recognized at point of sale) and post-contract support (deferred and recognized over time) for other high volume, lower dollar value software products has historically been assessed as a group and the post-contract support revenue was deferred based on an estimate of average "Vendor Specific Objective Evidence" ("VSOE"). During the course of its internal reviews, Dell determined that its application of Statement of Position No 97-2 Software Revenue Recognition ("SOP 97-2") for high volume software products was not correct. Dell has determined that the most appropriate application of SOP 97-2 is to defer all of the revenue from these "other software" offerings and amortize the revenue over the postcontract support period as VSOE has not been appropriately established. Additionally,

(Continued)

during the course of its reviews, Dell identified certain software offerings where it had previously recognized the gross amount of revenue from the sale but where it functions more as a selling agent as opposed to the principal in the sale to the customer. In those cases Dell should have recognized the revenue net of the related cost pursuant to EITF Issue No. 99-19, Reporting Revenue Gross as a Principal vs. Net as an Agent.

Other—The other revenue recognition adjustments include cases where Dell recognized revenue in the incorrect periods or recognized the incorrect amount of revenue on certain transactions, and cases where the allocation of revenue among the individual elements of the sale was not correct. The primary categories of other revenue recognition adjustments include the following:

- SAB 104 Deferrals—Instances were identified where Dell prematurely recognized revenue prior to finalization of the terms of sale with the customer, or prior to title and/or risk of loss having been passed to the customer. Sometimes these situations involved warehousing arrangements. Additionally, there were situations where revenue was incorrectly deferred to later periods despite title and/or risk of loss having passed to the end customer. Under SAB 104, there were also cases where the in-transit deferral calculation for the period end was not appropriately calculated or was based on incorrect assumptions.
- Deferred Warranty Revenue—Pursuant to FASB Technical Bulletin No. 90-1, Accounting for Separately Priced Extended Warranty and Product Maintenance Contracts, Dell defers and amortizes the revenue from the sale of extended warranties and enhanced service level agreements over the service period of the associated agreement. In some instances Dell's accounting estimates of the agreement durations were not correct, resulting in revenue being recognized over a shorter time period than the actual contract durations. Additionally, an error was identified in the amount of deferred revenue recognized and amortized during the restatement period.
- Sales Reflected in Cost of Sales—There were transactions identified involving the sale of certain computer component commodities and parts where the net proceeds were presented as a reduction of cost of sales rather than as revenue.

#### Warranty Liabilities

The issues related to Dell's warranty liabilities include situations where certain vendor reimbursement agreements were incorrectly accounted for as a reduction in the estimate of the outstanding warranty liabilities. There were also instances where warranty reserves in excess of the estimated warranty liability, as calculated by the warranty liability estimation process, were retained and not released to the income statement as appropriate. Additionally, certain adjustments in the warranty liability estimation process were identified where expected future costs or estimated failure rates were not accurate.

### Other Reserves and Accruals

Many of the restatement adjustments relate to the estimates and reconciliation of various reserves and accrued liabilities, including employee benefits, accounts payable, litigation, sales commissions, payroll, employee bonuses, and supplier rebates. Dell extensively reviewed its accruals and underlying estimates, giving consideration to subsequent developments after the date of the financial statements, to assess whether any of the previously recorded amounts required adjustment. Dell conducted expanded account reviews and expanded balance sheet reconciliations to ensure that all accounts were fully reconciled, supported, and appropriately documented. As a result of this review, Dell determined that a number of its accruals required adjustment across various accounting periods. The largest of these adjustments are described in more detail below:

(Continued)

The table (in part) below summarizes the effects of the restatement adjustments on the Consolidated Statement of Financial Position at February 3, 2006.

|   | February 3, 2006           |  |   |  |

## **Questions:**

- 1. What were the major errors that required Dell to restate its financial statements?
- 2. What was the cumulative effect of these errors on Dell's retained earnings balance at January 31, 2004?
- 3. What was the effect of the major errors on Dell's 2006 income statement and balance sheet?

## **Error Analysis**

Because errors, by their very nature, happen in unpredictable and often illogical ways, it is difficult to generalize about the kinds of errors that a company might make and the journal entries that may be required to correct them. Many errors are discovered automatically through proper use of the double-entry system. Others are found by the company's internal or external auditors before being included in its financial statements. In this section, we are concerned about errors that escape detection until after they are included in a company's published financial statements. We categorize them according to the effect they have on the financial statements.

## **Errors Affecting Only the Balance Sheet**

Some errors affect only balance sheet accounts. For example, a company may include a long-term note receivable as a current note receivable. Reclassification of the note only affects its balance sheet. Therefore, if the error occurred in a prior period, the company does not make a correcting journal entry. However, if it presents comparative financial statements in the current year, it corrects the financial statements of the prior period by reclassifying the item.

### **Errors Affecting Only the Income Statement**

Errors that affect only income statement accounts usually result from the misclassification of items. For example, a company may include interest revenue with sales revenue. Errors of this kind require reclassification but do not affect net income. Therefore, if the error occurred in a prior period, the company does not make a correcting journal entry. However, if it presents comparative financial statements in the current year, it corrects the financial statements of the prior period by reclassifying the item.

### **Errors Affecting Both the Income Statement and Balance Sheet**

An error may affect both an income statement account and a balance sheet account, such as the failure to accrue a liability at the end of the period. For example, if a company fails to accrue interest, it understates interest expense on its current income statement and omits interest payable from its ending balance sheet.

Errors that affect both the income statement and the balance sheet can be classified as counterbalancing or noncounterbalancing. Counterbalancing errors are those that are automatically corrected in the next accounting period, even if they are not discovered. Consider the effect of unrecorded interest in the previous paragraph, and assume that the amount of the interest is \$2,000 and the income tax rate 30%. The effects of the error on the company's financial statements of the period in which it made the error are as follows:

- 1. Interest expense is understated by \$2,000.
- 2. Income before income taxes is overstated by \$2,000.
- 3. Income tax expense is overstated by \$600.
- 4. Net income is overstated by \$1,400.
- 5. Retained earnings is overstated by \$1,400.
- 6. Interest payable is understated by \$2,000.
- 7. Income taxes payable is overstated by \$600.

In the next period, when the company pays the interest and records the entire payment as an expense, the following additional errors occur:

- 1. Interest expense is overstated by \$2,000.
- 2. Income before income taxes is understated by \$2,000.
- 3. Income tax expense is understated by \$600.
- 4. Net income is understated by \$1,400.

Since the amount of the interest expense overstatement in the second period is equal to the understatement of the previous period, the net income understatement in the second period offsets the overstatement in the first period. Therefore, no balance sheet accounts are in error at the end of the second period. That is, the total liabilities are no longer understated, and the retained earnings balance is now correct. The errors have automatically counterbalanced. Note also that even though the errors counterbalance, the need for a correcting journal entry and for correction of the financial statements depends on when the error is discovered. If the company discovers the error during the second year, it must make a journal entry so that the interest expense and net income for the second year are reported correctly. If the company discovers the error after the second year, no correcting journal entry is needed. However, the financial statements for the two years are in error, so the company must correct (restate) the financial statements unless sufficient time has passed so that they are *not* being presented for comparative purposes.

Noncounterbalancing errors are those that are not offset in the next accounting period. For example, suppose that a company erroneously records the purchase of an asset costing \$10,000 as supplies expense in the year of purchase. However, it should have capitalized and depreciated the asset by the straight-line method over 10 years with no residual value for both financial reporting and income tax purposes. Furthermore, the company records a full year's depreciation in the year of acquisition, the income tax rate is 30%, and the MACRS depreciation is assumed to be \$1,400. The effects of the error on the company's financial statements of the period in which it made the error are as follows:

- 1. Supplies expense is overstated by \$10,000.
- 2. The asset is understated by \$10,000.
- 3. Depreciation expense is understated by  $1,000 (10,000 \div 10)$ .
- 4. Accumulated depreciation is understated by \$1,000.
- 5. Income before income taxes is understated by 9,000 (10,000 1,000).
- 6. Income tax expense is understated by \$2,700 (\$9,000  $\times$  0.30).

## ETHICAL DILEMMA

As the controller for Coruscant Industries, you've just completed an extremely exhausting year with the issuance of Coruscant's annual report. After being surprised by the disappointing net income a year earlier, the Board of Directors charged you with improving the company's fortunes. Reviewing the previous year's financial results, you determined that the primary reason for Coruscant's disappointing results was higher than expected cost of goods sold. Seeking to improve the efficiency of operations and lower cost of goods sold, you had aggressively implemented several cost-containment measures to address this problem, which resulted in numerous complaints from the manufacturing supervisors. Despite these criticisms, the current annual report, which just met the analysts' projections of net income, should serve as validation that you successfully responded to the Board of Directors' challenges. As a reward for your efforts, you've decided to take a few days off to work on your golf game.

As you are preparing to leave the office, you receive an e-mail from a firstyear staff accountant whom you had asked to double-check the accuracy of the current year inventory count. In the e-mail, the accountant informs you that while the current year inventory records appear in order, she had discovered an error in the beginning inventory records. It appeared that you had inadvertently transposed two numbers in the previous year's inventory balance, resulting in a material understatement of the previous year's ending inventory. The e-mail continues that since the current year inventory records are accurate, the error had "self-corrected" and there is no need to adjust the current year financial statements. Do you agree with the accountant's assessment? What ethical considerations does this situation present?

- 7. Net income is understated by \$6,300 (\$9,000 \$2,700).
- 8. Retained earnings is understated by \$6,300.
- 9. Deferred tax liability is understated by \$120  $[(\$1,400 \$1,000) \times 30\%]$
- 10. Income taxes payable are understated by 2,580 (2,700 120).

The understatement of the asset and the depreciation expense continues until the end of the asset's life. At this point the balance sheet accounts (asset, accumulated depreciation, income taxes payable, and retained earnings) are correct for the first time since the error was made. Consequently, if the company discovers the error before the end of the life of the asset, it must make a correcting journal entry.

### **Error Correction**

The approach to correcting an error is difficult to generalize because of the variety of errors that may occur. Each error must be examined carefully to determine how the transaction was recorded and how it should have been recorded. The correction can then be made by (1) recording a single comprehensive journal entry (which is the preferred method in practice), or (2) reversing the original incorrect journal entry and then recording the original transaction or event as it should have been recorded initially.

## **Example: Error Correction Approaches**

Assume Larson Company recorded a building improvement costing \$20,000 as Repair Expense when it should have capitalized the item. A single comprehensive journal entry to correct the error when it is discovered in the next period is:

| Building          | 20,000 |
|-------------------|--------|
| Retained Earnings | 20,000 |

Note that in this entry, we are ignoring income taxes and depreciation, which we will discuss later. Note also that the correction is not made by a credit to Repair Expense because the company discovered the error in the period following the one in which it was made. At this point, the company's revenue and expense accounts for the previous period have been closed to retained earnings, so the correction of the previous year's income is made directly to the Retained Earnings account. The correction might also be made to an account, Correction of Prior Years' Income Due to Error in Recording Building Improvement, which is closed to Retained Earnings. If the company presents comparative financial statements, it corrects them as we discussed earlier.

If the second approach is used, two separate journal entries are required. First, the company reverses the original entry (but it again credits the Retained Earnings account because the Repair Expense account has been closed), and then the company makes the journal entry that it should have made, as follows:

| Cash              | 20,000 |        |
|-------------------|--------|--------|
| Retained Earnings |        | 20,000 |
| Building          | 20,000 |        |
| Cash              |        | 20,000 |

In this simple situation, the second approach may seem unnecessary, but it can prove useful in more complex circumstances.

In the previous example, Larson Company must also correct the recorded amount of depreciation. Since it discovered the error in the next period, it corrects Retained Earnings (for the previous period's depreciation expense understatement and income overstatement) and Accumulated Depreciation by the following journal entry (assuming a 10-year life, no residual value, straight-line depreciation, and that a full year's depreciation is recorded in the year of acquisition):

The company records depreciation expense for the second year in the normal way (because we assumed that it discovered the error during the second year). ◆

## **Steps in Error Correction**

A logical sequence of steps for the analysis and correction of an error is indicated by the preceding discussion:

- Analyze the original erroneous journal entry and determine all the debits and Step 1. credits that were recorded.
- Determine the correct journal entry and the appropriate debits and credits. Step 2.
- Step 3. Evaluate whether the error has caused additional errors in other accounts.
- Step 4. Prepare the correcting entry (or entries), remember to record any corrections of the revenues and expenses for prior years as adjustments to retained earnings.

We show additional examples of some types of errors that can be expected to occur more frequently in the following sections for the Huggins Company, which uses a periodic inventory method. For simplicity, these corrections ignore the potential impact on taxable income, income tax expense, and deferred income taxes, although, in reality, correcting entries for these items may be required. Assume all errors are material.

### **Example: Omission of Unearned Revenue**

In December 2010, the Huggins Company received \$10,000 as a prepayment for renting a building to another company for all of 2011. The company recorded this transaction by a debit to Cash and a credit to Rent Revenue. The revenue should be reported in 2011, but the company erroneously included the revenue in its 2010 income. If the company discovers this error in 2011, it has overstated income for 2010 by including \$10,000 rent revenue. Therefore, it has to decrease Retained Earnings by \$10,000. Also, it has to record the rent revenue in 2011. Therefore, the company makes the following correcting entry:

**Retained Earnings** 10,000 Rent Revenue 10,000

If the company does not discover the error until 2012, it does not make a correcting entry because the error has counterbalanced. However, if the company presents 2010 and 2011 financial statements for comparative purposes, the company corrects (restates) them as we discussed earlier.

## **Example: Failure to Accrue Revenue**

On December 31, 2010, the Huggins Company failed to accrue interest revenue of \$500 that it had earned but not received on an outstanding note receivable. If the company discovered the error in 2011, it has understated income for 2010 by omitting interest revenue of \$500. Therefore, it has to increase Retained Earnings by that amount. If we assume that the company credits any cash received in 2011 to Interest Revenue, it has overstated the revenue account by \$500 in 2011, and so it makes the following correcting entry:

**Interest Revenue** 500 500 **Retained Earnings** 

If the company discovered the error in 2012, it does not make a correcting entry because the error has counterbalanced. However, if the company presents 2010 and 2011 financial statements for comparative purposes, it corrects them. •

### **Example: Omission of Prepaid Expense**

In December 2010, the Huggins Company paid \$1,000 for insurance coverage for the year 2011. It recorded the original entry as a debit to Insurance Expense and a credit to Cash, and did not record a year-end adjustment. If the company discovers this error at the end of 2011, it has understated its income for 2010 by the \$1,000 overstatement of insurance

expense. Therefore, it has to increase Retained Earnings by this amount. Since the company did not record prepaid insurance in 2010, it has understated Insurance Expense by \$1,000 for 2011, and it makes the following correcting entry:

**Insurance Expense** 1.000

**Retained Earnings** 1,000

Alternatively, if the payment of \$1,000 in 2010 was for a two-year insurance policy, the correcting entry at the end of 2011 is:

**Insurance Expense** 500 **Prepaid Insurance** 500

**Retained Earnings** 1,000

If the company does not discover this error until 2012 and the payment in 2010 was for one year's insurance, it does not make a correcting entry because the error has counterbalanced. If the company discovered the error in 2012 and the payment was for two years' insurance, the correcting entry is:

500 **Insurance Expense Retained Earnings** 500

In this situation, \$500 of the error has counterbalanced, leaving only \$500 to be corrected. Once again, the company corrects the 2010 and 2011 financial statements if it presents them for comparative purposes. •

## **Example: Error in Ending Inventory**

At December 31, 2010, the Huggins Company recorded its ending inventory at \$50,000 based on a physical count. During 2011, it discovered that the correct inventory value should have been \$55,000 because it made an error in the inventory count. Since it understated the ending inventory for 2010 by \$5,000, it overstated cost of goods sold for 2010, and understated income. Therefore, it has to increase Retained Earnings by this amount. Since the company has understated its beginning inventory in 2011, it has to increase it by \$5,000, and so it makes the following correcting entry:

5.000 **Inventory Retained Earnings** 5,000

If the company does not discover this error until 2012, it does not make a correcting entry because the error has counterbalanced, but it corrects the 2010 and 2011 financial statements because the error in the inventory affects cost of goods sold in both years. Many companies use a perpetual inventory system. Under this system, they still take a physical inventory and may make similar errors. •

### **Example: Error in Purchases of Inventory**

During December 2010, the Huggins Company made a purchase of inventory on credit that it had not paid at year's end. It recorded this transaction incorrectly at \$17,000 although the invoice price of the inventory was \$27,000. Since the company understated the purchases and accounts payable by \$10,000, it understated cost of goods sold in 2010 (assuming it recorded the ending inventory correctly) and overstated income by \$10,000. Therefore, it has to decrease Retained Earnings by this amount. The company understated Accounts Payable in 2011 by \$10,000, and so it makes the following correcting entry:

**Retained Earnings** 10,000 **Accounts Payable** 10,000

Because of the creditor's demand for payment, it is difficult to conceive of such an error remaining undetected until 2012, but if that did happen, the correcting entry is as shown. Since the ending inventory was correct, the error was not counterbalanced, and the company has overstated its income for 2010 and retained earnings until it makes the correction. We illustrated more examples of the effects of errors in inventory and purchases in Chapter 9.

### **Example: Failure to Accrue Estimated Bad Debts**

The Huggins Company failed to accrue an allowance for doubtful accounts of \$7,000 in its 2010 financial statements. The result of this error was the understatement of bad debt expense by \$7,000. Therefore, the company has to decrease Retained Earnings by this amount. The discovery of the error in 2011 indicates that the company has overstated Accounts Receivable (net) by \$7,000, and so it makes the following correcting entry:

**Retained Earnings** Allowance for Doubtful Accounts 7,000

7.000

Alternatively, if the company discovers the error after it makes the estimate of doubtful accounts and records it by the aging method at the end of 2011, it has overstated the bad debt expense because part of the charge relates to the 2010 error. Therefore, it makes the following correcting entry:

**Retained Earnings Bad Debt Expense**  7,000

7,000

It is obviously not possible to give examples of every possible error. In each situation, the facts must be carefully examined, with particular consideration given to the time periods involved and the possibility of additional errors resulting from the initial error. For example, the effects of errors on the company's prior and current income tax expense and deferred income taxes must be assessed. Adjustments may have to be made to retained earnings if there were changes in income tax expense for prior periods. Also, if taxable income is incorrect for prior periods, amended tax returns may be necessary.

Example 23-7 shows a schedule that summarizes the effects of the multiple errors of the Huggins Company on its income before income taxes for the years affected. The schedule includes each of the errors. Note that the omission of the prepaid expense assumes a two-year insurance policy (not a one-year insurance policy). The net effect of the errors is to reduce its pretax income for 2010 by \$20,500, increase pretax income for 2011 by \$4,000, and reduce assets by \$6,500 and increase liabilities by \$10,000 on its 2011 balance sheet. If the income tax rate is 30% and the correction of each of these errors affects taxable income, the 2010 errors enable the company to obtain a tax refund of 6,150 (30%  $\times$  \$20,500), and it also makes the following journal entry:

**Income Tax Refund Receivable Retained Earnings** 

6,150

6,150

|                                       | Effect of Co<br>on Inc |          | Increases on<br>Balance Sheet           |
|---------------------------------------|------------------------|----------|---|
| Error                                 | 2010                   | 2011     | December 31, 2011                       |
| Omission of unearned revenue          | \$(10,000)             | \$10,000 |   |
| Failure to accrue interest revenue    | 500                    | (500)    |   |
| Omission of prepaid expense           |                        |          |   |
| (two-year insurance policy)           | 1,000                  | (500)    | Prepaid insurance \$500                 |
| Error in ending inventory             | 5,000                  | (5,000)  | ·                                       |
| Error in purchases                    | (10,000)               |          | Accounts payable \$10,000               |
| Failure to accrue estimated bad debts | (7,000)                |          | Allowance for doubtful accounts \$7,000 |
| Total pretax effect                   | \$(20,500)             | \$ 4,000 |   |
| Less: Income tax effect               | 6,150                  |          |   |
| After-tax effect                      | \$(14,350)             |          |   |

The 2011 corrections do not need a separate correction for income taxes in this example because we assume that the company has not closed its books for 2011.

- An error results from mathematical mistakes or mistakes in the application of GAAP.
- A material error of a past period that is discovered in the current period is accounted for as a prior period restatement (adjustment) which requires:
  - The computation of the cumulative effect of the error on prior period financial statements;
  - An adjustment of the book values of the assets and liabilities (including income taxes) affected by the error;
  - An adjustment to the opening balance of retained earnings for the aggregate effect of the error (net of applicable income taxes);
  - A restatement of the financial statements of each prior period affected by the error; and
  - Appropriate disclosures.
- Errors can be classified as:
  - Errors affecting only the balance sheet—reclassification of the balance sheet amounts affected is required.
  - Errors affecting only the income statement—reclassification of the income statement amounts affected is required.
  - Errors affecting both the income statement and the balance sheet—a correcting journal entry and correction of the financial statements may be required.
- If an error is a counterbalancing error (e.g., the error automatically corrects in the next accounting period), a correcting journal entry is needed if the error is discovered during the second year. If the error is discovered after the second year, no correcting journal entry is needed but the financial statements should be restated so that they are not misleading.
- If an error is a noncounterbalancing error (e.g., the error will not automatically correct in the next accounting period), a correcting journal entry is needed and any applicable financial statements must be restated.
- Every error should be carefully examined to determine how the transaction was recorded versus how it should have been recorded and then the appropriate journal entry to correct the error can be made.

## IFRS vs. U.S. GAAP

IFRS are similar to U.S. GAAP, but several differences exist. First, while both IFRS and U.S. GAAP require errors to be corrected by restating previously issued financial statements, IFRS allow an exception to this requirement. If restatement is impracticable for all prior periods, the error can be corrected by restating the financial statements for the earliest period practicable (which may be the current period). This exception could result in the correction of an error in a period other than that in which it initially occurred. Second, IFRS do not address when the indirect effects of a change in accounting principle should be reported nor the disclosures required. Finally, the disclosure requirements of IFRS for accounting changes and error corrections are considered less extensive than those required under U.S. GAAP.

## 8 Summarize the methods for making accounting changes and correcting errors.

## **SUMMARY OF EFFECTS ON FINANCIAL STATEMENTS**

Exhibit 23-1 shows a summary of the effects of the retrospective adjustment, prior period restatement, and prospective adjustment methods on a company's financial statements.

#### **Summary of Effects on Financial Statements of Methods EXHIBIT 23-1 Used for Accounting Changes and Errors**

#### **Retrospective Adjustment and Prior Period Restatement**

#### **Previous Years**

#### **Income Statement**

Change revenue and expense amounts to reflect new accounting principle, corrected information, or new accounting entity.

#### **Balance Sheet**

Change asset, liability, and stockholders' equity account balances to reflect amounts that would have been reported if the principle had always been used, the error had not been made, or the new entity had always existed.

#### **Current Year**

Compute revenue or expense amounts using new accounting principle, corrected information, or new accounting entity.

#### **Balance Sheet**

**Income Statement** 

No additional changes. Asset, liability, and stockholders' equity account balances are amounts that would have been computed if the new principle had always been used, the error had not been made, or the new entity had always existed.

#### **Prospective Adjustment**

#### **Previous Years**

#### **Income Statement**

No change

### **Balance Sheet**

No change

#### **Current Year**

#### **Income Statement**

Compute revenue and expense amounts using the new estimate or the newly adopted accounting principle for new events.

#### **Balance Sheet**

Asset, liability, and stockholders' equity account balances include amounts based on the use of the old estimate or principle in past years and the new estimate or newly adopted principle for new events in the current (and future) year(s).

## 

At the beginning of the chapter, we identified several objectives you would accomplish after reading the chapter. The objectives are listed below, each followed by a brief summary of the key points in the chapter discussion.

- Identify the types of accounting changes. The three types of accounting changes are a change in accounting principle, a change in accounting estimate, and a change in a reporting entity.
- **Explain the methods of disclosing an accounting change.** There are two possible methods for a company to disclose an accounting change: the retrospective application of the new accounting principle, or adjust for the change prospectively.
- Account for a change in accounting principle using the retrospective adjustment method. A company accounts for a change in accounting principle by the retrospective application of the new accounting principle to all prior periods as follows: (a) the company computes the cumulative effect of the change to the new accounting principle as of the beginning of the first period presented, (b) it adjusts the book values of those assets and liabilities (including income taxes) that are affected by the change and makes an offsetting adjustment to the beginning balance of retained earnings to report the cumulative effect of the change (net of taxes) for each period presented, (c) it adjusts the financial statements

- of each prior period to reflect the specific effects of applying the new accounting principle, and (d) it makes related relevant disclosures in the notes to its financial statements.
- 4. **Account for a change in estimate**. A company accounts for a change in estimate in the period of the change if the change affects that period only, or the period of the change and future periods if the change affects both.
- 5. Explain the conceptual issues regarding a change in accounting principle and a change in estimate. The conceptual issues include the consistency of the information presented, the changing of previously reported information, the all-inclusive income concept, income manipulation, and any impact on contractual arrangements.
- 6. **Identify a change in a reporting entity.** A change in a reporting entity occurs mainly when a company presents consolidated or combined statements in place of statements of individual companies, there is a change in the specific subsidiaries that make up the group of companies for which the company presents consolidated statements, or the companies included in combined financial statements change.
- 7. Account for a correction of an error. A company accounts for a material error of a past period that it discovers in the current period as a prior period restatement (adjustment) as follows: (a) the company computes the cumulative effect of the error on periods prior to those presented, (b) it adjusts the book values of those assets and liabilities (including income taxes) that are affected by the error and makes an offsetting adjustment to the beginning balance of retained earnings to report the cumulative effect of the error correction (net of taxes) for each period presented, (c) it adjusts the financial statements of each prior period to reflect the specific effects of correcting the error, and (d) it makes related relevant disclosures in the notes to its financial statements.
- 8. **Summarize the methods for making accounting changes and correcting errors.** A summary of the methods for making accounting changes and correcting errors is included in Exhibit 23-1.

## Answers to Real Report Questions

## **Real Report 23-1 Answers**

- Dell made numerous errors related to revenue recognition, the accounting for warranty liabilities, and the accounting for other reserves and accruals. Dell's revenue recognition errors resulted in a net adjustment to net revenue of \$118 million (\$248 million - \$130 million). These revenue recognition errors are summarized as follows. First, Dell provided a multiple deliverable (software license and post-contract support) and had recognized the portion of the revenue related to the software license at the point of sale. However, GAAP requires that this revenue be deferred. Second, Dell had recognized, in full, the revenue from sales where it acted as an agent. Under GAAP, this revenue should be recognized net of any related costs. Both of these errors led to overstatements of the amount of Dell's reported revenue. Third, Dell made other revenue recognition errors related to the recognition of revenue in the incorrect periods, the incorrect amount of revenue being recognized, and incorrect allocations of revenue being made. In addition to revenue recognition errors, Dell had incorrectly
- reduced warranty liabilities for vendor reimbursement agreements, failed to expense warranty costs, and used incorrect estimates in estimating its warranty costs. The net result of the errors related to warranties was to increase income before taxes by \$55 million. Finally, Dell had incorrectly estimated amounts for various accrued liabilities.
- The cumulative effect of the errors that occurred prior to January 31, 2004 reduced Dell's retained earnings by \$52 million.
- 3. The effect of the major errors on Dell's 2006 income statement was to increase net revenue by \$120 million (\$55,908 million \$55,788 million) and gross margin by \$59 million (\$9,950 million \$9,891 million). The result of these major errors on Dell's 2006 balance sheet was to decrease current assets and current liabilities by \$88 million and \$246 million, respectively. These errors had the effect of increasing Dell's apparent liquidity. In addition, Dell's total assets and total liabilities were decreased by \$143 million and \$225 million, respectively, while its stockholders' equity was increased by \$82 million.

## QUESTIONS

- **Q23-1** Describe the three types of accounting changes.
- **Q23-2** Describe the two possible methods that a company could use to report the effect of accounting changes. Give one reason in favor of, and one against, each alternative.
- **Q23-3** Describe two situations in which a company could justify a change in an accounting principle.
- **Q23-4** What distinguishes a change in an accounting principle from a change in an estimate? How should a company account for each?

- **Q23-5** Give three examples of a change in an estimate. How does a company account for such changes?
- **Q23-6** In which situations may it be impracticable for a company to apply the retrospective adjustment method? What is the correct accounting in such cases?
- **Q23-7** How is a change in depreciation method accounted for? Why?
- Q23-8 How does a company account for any indirect effects of a change in accounting principle?
- **Q23-9** How does a company account for the adoption of a new accounting principle for future events?
- Q23-10 How does a company report a change in an accounting principle in its interim financial statements?
- Q23-11 Describe a change in a reporting entity. How does a company account for such changes?
- Q23-12 How does a company report an error of a prior period that it discovers in the current period?

- Q23-13 Describe two errors that affect only a company's balance sheet.
- Q23-14 Describe two errors that affect only a company's income statement.
- **Q23-15** Describe two errors that are counterbalanced in the following period.
- **Q23-16** Describe two errors that are not counterbalanced in the following period.
- **Q23-17** Why does a company correct errors even after they have counterbalanced?
- **Q23-18** If a company that uses IFRS discovers an error but determines that it is impracticable to restate its financial statements for all prior periods, what alternatives does IFRS allow? How does this compare with U.S. GAAP?
- How does the accounting for an indirect effect of a change in accounting principle differ between IFRS and U.S. GAAP?

## MULTIPLE CHOICE (AICPA Adapted)

Select the best answer for each of the following.

M23-1 During 2010, White Company determined that machinery previously depreciated over a seven-year life had a total estimated useful life of only five years. An accounting change was made in 2010 to reflect the change in estimate. If the change had been made in 2009, accumulated depreciation at December 31, 2009 would have been \$1,600,000 instead of \$1,200,000. As a result of this change the 2010 depreciation expense was \$100,000 greater. The income tax rate was 30% in both years. What should be reported in White's retained earnings statement for the year ended December 31, 2010 as the cumulative effect on prior years of changing the estimated useful life of the machinery?

a. \$0 c. \$300,000 b. \$280,000 d. \$400,000

Items 2 and 3 are based on the following information:

The Shannon Corporation began operations on January 1, 2010. Financial statements for the years ended December 31, 2010 and 2011 contained the following errors:

|                      | December 31 |             |  |
|----------------------|-------------|-------------|--|
|                      | 2010        | 2011        |  |
| Ending inventory     | \$16,000    | \$15,000    |  |
|                      | understated | overstated  |  |
| Depreciation expense | \$6,000     | _           |  |
|                      | understated |             |  |
| Insurance expense    | \$10,000    | \$10,000    |  |
|                      | overstated  | understated |  |
| Prepaid insurance    | \$10,000    | _           |  |
|                      | understated |             |  |

In addition, on December 31, 2011 fully depreciated machinery was sold for \$10,800 cash, but the sale was not recorded until 2012. There were no other errors during 2010 or 2011 and no corrections have been made for any of the errors.

- M23-2 Ignoring income taxes, what is the total effect of the errors on 2011 net income?
- a. Net income understated by \$1,800
- b. Net income overstated by \$5,800
- c. Net income overstated by \$11,000
- d. Net income overstated by \$30,200
- M23-3 Ignoring income taxes, what is the total effect of the errors on the amount of working capital at December 31, 2011?
- a. Working capital overstated by \$4,200
- b. Working capital understated by \$5,800
- Working capital understated by \$6,000
- d. Working capital understated by \$9,800
- **M23-4** A change in the expected service life of an asset arising because additional information has been obtained is
- a. An accounting change that should be reported by restating the financial statements of all prior periods represented
- b. An accounting change that should be reported in the period of change and future periods if the change affects both
- c. A correction of an error
- d. Not an accounting change
- M23-5 The cumulative effect of an accounting change on the amount of retained earnings at the beginning of the period in which the change is made should generally be included in the retained earnings statement for the period of the change for a

|    | Change in<br>Accounting Principle | Change in Accounting Estimate |
|----|-----------------------------------|-------------------------------|
| a. | Yes                               | Yes                           |
| b. | No                                | Yes                           |
| c. | Yes                               | No                            |
| d. | No                                | No                            |

M23-6 On January 1, 2010, Belmont Company changed its inventory cost flow method to the FIFO cost method from the LIFO cost method. Belmont can justify the change, which was made for both financial statement and income tax reporting purposes. Belmont's inventories aggregated \$4,000,000 on the LIFO basis at December 31, 2009. Supplementary records maintained by Belmont showed that the inventories would have totaled \$4,800,000 at December 31, 2009 on the FIFO basis. Ignoring income taxes, the adjustment for the effect of changing to the FIFO method from the LIFO method should be reported by Belmont in the 2010

- a. Income statement as an \$800,000 debit
- b. Retained earnings statement as an \$800,000 debit adjustment to the beginning balance
- c. Income statement as an \$800,000 credit
- d. Retained earnings statement as an \$800,000 credit adjustment to the beginning balance

M23-7 When a cumulative effect-type change in accounting principle is made during the year, the cumulative effect on retained earnings is determined

- a. During the year using the weighted average method
- b. As of the date of the change
- As of the beginning of the year in which the change
- d. As of the end of the year in which the change is made

M23-8 Generally, how should a change in accounting principle that is affected by a change in accounting estimate be reported?

|    | Change in<br>Accounting Estimate | Change in Accounting Principle |
|----|----------------------------------|--------------------------------|
| a. | No                               | No                             |
| b. | Yes                              | Yes                            |
| C. | No                               | Yes                            |
| d. | Yes                              | No                             |

M23-9 On January 2, 2008, Garr Company acquired machinery at a cost of \$320,000. This machinery was being depreciated by the double-declining-balance method over an estimated useful life of eight years, with no residual value. At the beginning of 2010, it was decided to change to the straight-line method of depreciation. Ignoring income tax considerations, the retrospective effect of this accounting change is

a. \$0 c. \$65,000 d. \$140,000 b. \$60,000

M23-10 A company has included in its consolidated financial statements this year a subsidiary acquired several years ago that was appropriately excluded from consolidation last year. This results in

- a. An accounting change that should be reported prospectively
- b. An accounting change that should be reported by retrospectively restating the financial statements of all prior periods presented
- c. Neither an accounting change nor a correction of an error
- d. A correction of an error

# REVIEW EXERCISES

**RE23-1** There are two methods of reporting an accounting change: (a) retrospective adjustment and (b) prospectively. Indicate which method is used for the following changes by writing either (a) or (b) on the line after the change.

- Change in reporting entity\_
- Change in accounting principle\_\_\_\_\_
- Change in accounting estimate

RE23-2 Heller Company began operations in Year 1 and used the LIFO method to compute its \$300,000 cost of goods sold for that year. At the beginning of Year 2, Heller changed to the FIFO method. Heller determined that its cost of goods sold under FIFO would have been \$250,000 in Year 1. For Year 2, Heller's cost of goods sold under FIFO was \$360,000, while it would have been \$410,000 under LIFO. Heller is subject to a 30% income tax rate. Compute the cumulative effect of the retrospective adjustment on prior year's income (net of taxes) that Heller Company would report on its retained earnings statement for Year 2.

RE23-3 Refer to RE23-2. Assume the pretax cumulative effect adjustment is \$50,000. Prepare the journal entry that Heller Company would make at the beginning of Year 2 to record the cumulative effect of the retrospective adjustment for the change from LIFO to FIFO.

**RE23-4** Refer to RE23-2. Assume Heller Company had sales revenue of \$510,000 in Year 1 and \$650,000 in Year 2. Prepare the partial income statements (through gross profit) of Heller Company for Year 2 and Year 1.

RE23-5 Bloom Company had beginning unadjusted retained earnings of \$400,000 in the current year. At the beginning of the current year, Bloom changed its inventory method from LIFO to FIFO, and the cumulative effect (net of taxes) of this

change was \$28,000. In addition, Bloom earned net income of \$150,000 and paid dividends of \$30,000 in the current year. Prepare Bloom Company's retained earnings statement for the current year.

**RE23-6** Bliss Company owns an asset with an estimated life of 15 years and an estimated residual value of zero; it uses the straight-line method of depreciation. At the beginning of the sixth year, the asset's book value is \$200,000 and Bliss Company changes the estimate of the asset's life to 25 years, so that 20 years now remain in the asset's life. Explain how this change will be accounted for in Bliss Company's financial statements, and compute the current and future annual depreciation expense.

**RE23-7** Suppose that Blake Company's total pre-tax difference from a change to FIFO was \$100,000 and the company pays a bonus of 5% of its income before income taxes and bonus to employees. If Blake Company pays an additional bonus based on the change in income, would it recognize any expense? If so, when and how much?

**RE23-8** At the end of Year 1, Framber Company received \$8,000 as a prepayment for renting a building to a tenant during Year 2. The company erroneously recorded the transaction by debiting Cash and crediting Rent Revenue in Year 1, instead of Year 2. Upon discovery of this error in Year 2, what correcting journal entry will Framber Company make? Ignore income taxes.

**RE23-9** At the end of Year 1, Cortex Company failed to accrue interest revenue of \$3,200 that it had earned, but not received on an outstanding note receivable. Instead, it recorded the interest revenue in Year 2. Upon discovery of this error in Year 2, what correcting journal entry will Cortex Company make? Ignore income taxes.

**RE23-10** At the end of Year 1, Jayrad Company paid \$6,000 for insurance coverage for Year 2. It recorded this by debiting Insurance Expense and crediting Cash, but failed to record a year-end adjustment. Upon discovery of this error in Year 2, what correcting journal entry will Jayrad Company make? Ignore income taxes.

**RE23-11** At the end of Year 1, Manny Company recorded its ending inventory at \$350,000 based on a physical count. During Year 2, the company discovered the correct inventory value at the end of Year 1 should have been \$400,000 because it made a counting error. Upon discovery of this error in Year 2, what correcting journal entry will Manny Company make? Ignore income taxes.

**RE23-12** Abrat Company failed to accrue an allowance for doubtful accounts of \$13,500 in its Year 1 financial statements. Upon discovery of this error in Year 2, what correcting journal entry will Abrat Company make? Ignore income taxes.

## EXERCISES

**E23-1** *Identification and Effects of Changes and Errors* The following are several independent events:

- 1. Change from the LIFO to the FIFO inventory cost flow assumption.
- 2. Reduction in remaining service life of machinery from 10 to 8 years.
- 3. A change from an accelerated method to the straight-line method of depreciating assets.
- 4. Write-down of inventories because of obsolescence.
- 5. Receipt of damages won in a court suit instigated five years ago.
- 6. Recording as an asset costs that were erroneously expensed in a previous period.
- 7. Write-down of property, plant, and equipment because of closure of inefficient plants.
- 8. A change from successful efforts to full cost accounting for oil exploration costs.

### Required

Indicate how a company reports the preceding items (specify whether increases or decreases can generally be expected) in its financial statements of the current year.

**E23-2** *Identification and Effects of Changes and Errors* The following are several independent events:

- 1. Change from the FIFO to the LIFO inventory cost flow assumption.
- 2. Write-off of patent due to the introduction of a competing product.
- 3. Payment to the Internal Revenue Service in settlement of a dispute over previous year's taxes.
- 4. Increase in allowance for uncollectible accounts from 2% to 4% of credit sales.
- 5. Change from straight-line to double-declining-balance method.
- 6. Write-down of an asset to reflect probable future losses.
- 7. A change from full cost to successful efforts accounting for oil exploration costs.

Indicate how a company reports the preceding items (specify whether increases or decreases can generally be expected) in its financial statements of the current year.

**E23-3** *Identification and Accounting for Changes and Errors* The following are several independent events:

- 1. A partnership is preparing to become a corporation and sell stock to the public. At this time, it decides to switch from accelerated to straight-line depreciation.
- 2. A company has been debiting half its advertising costs to an intangible asset account and amortizing these costs over three years.
- 3. A company has been using accelerated depreciation. It now estimates that the pattern of benefits to be received in the future will be equal each period, so it decides to change to the straight-line depreciation method.
- 4. A company has been using straight-line depreciation in its property, plant, and equipment. It is now buying a new type of machine and elects to use accelerated depreciation on the new machines.
- 5. A company has been expensing all its manufacturing cost variances. It decides to allocate them between cost of goods sold and inventory in the future.

### Required

Identify the correct accounting treatment for the changes (if any) related to the preceding events.

**E23-4** Change in Inventory Cost Flow Assumption At the beginning of 2011, the Brett Company decided to change from the FIFO to the average cost inventory cost flow assumption for financial reporting purposes. The following data are available in regard to its pretax operating income and cost of goods sold:

| Year          | Reported Income<br>Before Income Taxes | Excess of Average Cost of Goods Sold<br>Over FIFO Cost of Goods Sold | Adjusted Income<br>Before Income Taxes |
|---------------|--|--|--|
| Prior to 2010 | \$1,600,000                            | \$130,000  | \$1,470,000                            |
| 2010          | 600,000                                | 50,000   | 550,000                                |
| 2011          | 700 000                                |  |  |

The income tax rate is 30%, and the company received permission from the IRS to also make the change for income tax purposes. The company has a simple capital structure, with 100,000 shares of common stock outstanding. The company computed its reported income before income taxes in 2011 using the newly adopted inventory cost flow method. Brett's 2010 and 2011 revenues were \$1,500,000 and \$1,750,000, respectively. Its retained earnings balances at the beginning of 2010 and 2011 (unadjusted) were \$1,120,000 and \$1,540,000, respectively. The company paid no dividends in any year.

#### Required

- 1. Prepare the journal entry at the beginning of 2011 to reflect the change.
- 2. At the end of 2011, prepare comparative income statements for 2011 and 2010. Notes to the financial statements are not necessary.
- 3. At the end of 2011, prepare comparative retained earnings statements for 2011 and 2010.

**E23-5** AlcPA Adapted *Change in Inventory Cost Flow Assumption* The Berg Company began operations on January 1, 2010 and uses the FIFO method in costing its raw material inventory. During 2011, management is contemplating a change to the LIFO method and is interested in determining what effect such a change will have on net income. Accordingly, the following information has been developed:

|   | 2010      | 2011      |
|---|-----------|-----------|
| FIFO—Ending inventory                                       | \$240,000 | \$270,000 |
| LIFO—Ending inventory                                       | 200,000   | 210,000   |
| Income before income taxes (computed under the FIFO method) | 120,000   | 170,000   |

#### Required

What is the effect on income before income taxes in 2011 of a change to the LIFO method?

**E23-6** Change in Inventory Method The Fava Company began operations in 2009 and used the LIFO inventory method for both financial reporting and income taxes. At the beginning of 2010, the anticipated cost trends in the industry had changed, so that it adopted the FIFO method for both financial reporting and income taxes. The company reported revenues of \$300,000 and \$270,000 in 2010 and 2009, respectively. The company reported expenses (excluding income tax expense) of \$125,000 and \$120,000 in 2010 and 2009, which included cost of goods sold of \$55,000 and \$45,000, respectively. An analysis indicates that the FIFO cost of goods sold would have been lower by \$8,000 in 2009. The tax rate is 30%. The company has a simple capital structure, with 15,000 shares of common stock outstanding during 2009 and 2010. It paid no dividends in either year.

## Required 🔤

- 1. Prepare the journal entry to reflect the change.
- 2. At the end of 2010, prepare the comparative income statements for 2010 and 2009. Notes to the financial statements are
- 3. At the end of 2010, prepare the comparative retained earnings statements for 2010 and 2009.

Change in Accounting for Construction Contracts The Delta Company uses the completed-contract method of accounting for long-term construction contracts. The company started business in 2008 and prepared the following income statements:

|                            | 2008      | 2009       |
|----------------------------|-----------|------------|
| Construction revenue       | \$100,000 | \$300,000  |
| Construction expense       | (40,000)  | (130,000)  |
| Other expenses             | (50,000)  | _(70,000)  |
| Income before income taxes | \$ 10,000 | \$ 100,000 |
| Income tax expense (30%)   | (3,000)   | (30,000)   |
| Net income                 | \$ 7,000  | \$ 70,000  |
| Earnings per share         | \$ 0.07   | \$ 0.70    |

The company changes to the percentage-of-completion method at the beginning of 2010. It determines the construction revenue and expense amounts under the percentage-of-completion method to be as follows:

|                      | 2008      | 2009      | 2010      |
|----------------------|-----------|-----------|-----------|
| Construction revenue | \$200,000 | \$420,000 | \$900,000 |
| Construction expense | 80,000    | 182,000   | 420,000   |

The other expenses remain unchanged for 2008 and 2009, and are \$80,000 in 2010. The company has not paid dividends on its 100,000 common shares outstanding. With the 2010 financial statements, the company issues comparative statements for the previous two years. Under the completed-contract method, construction revenue and construction expense would be \$600,000 and \$280,000, respectively, in 2010. The company uses the percentage-of-completion method for income tax purposes.

#### Required

Prepare the income statements and the statements of retained earnings for 2010. Notes to the financial statements are not necessary.

**E23-8** Changes and Corrections of Depreciation On January 1, 2005, the Klinefelter Company purchased a building for \$520,000. The building had an estimated life of 20 years and an estimated residual value of \$20,000. The company has been depreciating the building using straight-line depreciation. At the beginning of 2011, the following independent situations occur:

- 1. The company estimates that the building has a remaining life of 10 years (for a total of 16 years).
- 2. The company changes to the sum-of-the-years'-digits method.
- 3. The company discovers that it had ignored the estimated residual value in the computation of the annual depreciation each year.

### Required

For each of the independent situations, prepare all of the journal entries related to the building for 2011. Ignore income taxes.

**E23-9** *Journal Entries to Correct Errors* The following are several independent errors made by a company that uses the periodic inventory system:

- 1. Goods in transit, purchased on credit and shipped FOB destination, \$10,000, were included in purchases but not in the ending inventory.
- 2. A purchase of a machine for \$2,000 was expensed. The machine has a four-year life, no residual value, and straight-line depreciation is used.
- 3. Wages payable of \$2,000 were not accrued.
- 4. Payment of next year's rent, \$4,000, was recorded as rent expense.
- 5. Allowance for doubtful accounts of \$5,000 was not recorded. The company normally uses the aging method.
- 6. Equipment with a book value of \$70,000 and a fair value of \$100,000 was sold at the beginning of the year. A two-year non-interest-bearing note for \$129,960 was received and recorded at its face value. No interest revenue was recorded and 14% is a fair rate of interest.

Prepare the correcting journal entry or entries for each of the preceding errors, assuming the company discovers the error in the year after it was made. (Ignore income taxes.)

#### **E23-10** *Journal Entries to Correct Errors* Use the information in E23-9.

#### Required

Prepare the correcting journal entries if the company discovers each error two years after it is made and it has closed the books for the second year. (Ignore income taxes.)

**E23-11** *Effects of Errors* The following are several independent errors made by a company:

- 1. Failure to record a purchase of inventory on credit.
- 2. Expensing the purchase of a machine.
- 3. Failure to accrue wages.
- 4. Failure to record an allowance for uncollectibles.
- 5. Including collections in advance as revenue.
- 6. Including payments in advance as expenses.
- 7. Failure to accrue warranty costs.
- 8. Discount on a note payable issued for purchase of a machine is ignored.
- 9. Failure to record depreciation expense on assets purchased during the year.

#### Required

Indicate the effect of each of the preceding errors on the company's (1) assets, (2) liabilities, (3) owners' equity, and (4) net income in the year in which the error occurs. State whether the error causes an overstatement (+), an understatement (-) (2), or no effect (NE).

**E23-12** *Correcting Journal Entries for Errors* The following are several independent errors:

- 1. In January 2010, repair costs of \$9,000 were debited to the Machinery account. At the beginning of 2010, the book value of the machinery was \$100,000. No residual value is expected, the remaining estimated life is 10 years, and straight-line depreciation is used.
- 2. All purchases of materials for construction contracts still in progress have been immediately expensed. It is discovered that the use of these materials was \$10,000 during 2009 and \$12,000 during 2010.
- 3. Depreciation on manufacturing equipment has been excluded from manufacturing costs and treated as a period expense. During 2010, \$40,000 of depreciation was accounted for in that manner. Production was 15,000 units during 2010, of which 3,000 remained in inventory at the end of the year. Assume there was no inventory at the beginning of 2010.

#### Required

Prepare journal entries for the preceding errors discovered during 2011. (Ignore income taxes.)

**E23-13** *Omission of Accruals and Prepayments* The Dudley Company failed to recognize the following accruals. It also recorded the prepaid expenses and unearned revenues as expenses and revenues, respectively, in the year of payment or collection.

|                                 | 2009  | 2010   | 2011    |
|---------------------------------|-------|--------|---------|
| Prepaid expenses                | \$500 | \$ 900 | \$1,100 |
| Accrued expenses                | 800   | 700    | 950     |
| Revenue received in advance     | 300   | 400    | 1,300   |
| Revenue earned but not received | 600   | 1,000  | 1,200   |

The reported pretax income was \$20,000 in 2009, \$25,000 in 2010, and \$23,000 in 2011.

## Required 🔤

- 1. Compute the correct pretax income for 2009, 2010, and 2011.
- 2. Prepare the journal entries necessary in 2011 if the errors are discovered at the end of that year. Ignore income taxes.
- 3. Prepare the journal entries necessary in 2012 if the errors are discovered at the end of that year. Ignore income taxes.

## **P**ROBLEMS

**P23-1** AlcPA Adapted *Identification and Effects of Changes and Errors* On January 2, 2010, Quo, Inc. hired Reed as its controller. During the year, Reed, working closely with Quo's president and outside accountants, made changes in accounting policies, corrected several errors dating from 2009 and before, and instituted new accounting policies. Quo's 2010 financial statements will be presented in comparative form with its 2009 financial statements. Items 1 through 10 represent Quo's transactions.

- 2. As a result of a production breakthrough, Quo determined that manufacturing equipment previously depreciated over 15 years should be depreciated over 20 years.
- 3. The equipment that Quo manufactures is sold with a five-year warranty. Because of a production breakthrough, Quo reduced its computation of warranty costs from 3% of sales to 1% of sales.
- 4. Quo changed from LIFO to FIFO to account for its finished goods inventory.
- 5. Quo sells extended service contracts on its products. Because related services are performed over several years, in 2010 Quo changed from the cash method to the accrual method of recognizing income from these service contracts.
- 6. During 2010, Quo determined that an insurance premium paid and entirely expensed in 2009 was for the period January 1, 2009 through January 1, 2011.
- 7. Quo changed its method of depreciating office equipment from an accelerated method to the straight-line method to more closely reflect the pattern of benefits.
- 8. Quo instituted a pension plan for all employees in 2010 and adopted GAAP. Quo had not previously had a pension plan.
- 9. During 2010, Quo increased its investment in Worth, Inc. from a 10% interest, purchased in 2009, to 60%. As a result of its increased investment, Quo changed its method of accounting for investment in subsidiary from the fair value method to the consolidation method.

- 1. Indicate whether Quo should classify each transaction as: (a) a change in accounting principle, (b) a change in accounting estimate, (c) a correction of an error in previously presented financial statements, or (d) neither an accounting change nor an accounting error.
- 2. Indicate the accounting treatment for each transaction as: (a) a retrospective adjusment approach, (b) a prior period restatement approach, or (c) a prospective approach.

**P23-2** *Changes in Inventory Cost Flow Assumption* At the beginning of 2011, the Flynne Company decided to change from the LIFO to the FIFO inventory cost flow assumption. The following data are available:

| Year          | Reported Income<br>Before Income Taxes | Excess of LIFO Cost of Goods Sold<br>Over FIFO Cost of Goods Sold | Adjusted Income<br>Before Income Taxes |
|---------------|--|---|--|
| Prior to 2010 | \$240,000                              | \$42,000  | \$282,000                              |
| 2010          | 80,000                                 | 18,000  | 98,000                                 |
| 2011          | 70,000                                 | 16,000  |  |

The tax rate is 30%. The company has a simple capital structure and 10,000 shares of common stock outstanding. Assume that the balance in retained earnings is the sum of the company's reported income amounts (net of tax) and that the reported income before income taxes in 2011 uses the newly adopted method. Flynne's revenues for 2010 and 2011 were \$225,000 and \$230,000, respectively. Flynne's operating expenses (other than cost of goods sold) for 2010 and 2011 were \$32,000 and \$40,000, respectively.

#### Required

- 1. Prepare the journal entry at the beginning of 2011 to reflect the change.
- 2. At the end of 2011, prepare comparative income statements for 2011 and 2010.
- 3. At the end of 2011, prepare comparative retained earnings statements for 2011 and 2010.
- 4. Prepare a note to the comparative financial statements that discusses the nature and reason for the change from LIFO to FIFO and discloses the effects of the change on the company's income statements for 2010 and 2011. (Ignore the effects on the balance sheet and statement of cash flows because there is insufficient information to calculate these changes.)
- 5. Explain how your answer to Requirement 2 would change if the employees received a bonus of 10% of income before deducting the bonus and income taxes, and the company paid additional bonuses for prior years in 2011.

**P23-3** Change from FIFO to Average Cost Koopman Company began operations on January 1, 2009 and uses the FIFO inventory method for financial reporting and the average-cost inventory method for income taxes. At the beginning of 2011, the company decided to switch to the average-cost inventory method for financial reporting. The company had previously reported the following financial statements for 2010:

| Income Statement           |           | Retained Earnings Statement |          |
|----------------------------|-----------|-----------------------------|----------|
|                            | 2010      | · ·                         | 2010     |
| Revenues                   | \$100,000 | Beginning retained earnings | \$15,000 |
| Cost of goods sold         | (60,000)  | Add: Net income             | 10,500   |
| Gross profit               | \$ 40,000 |                             | \$25,500 |
| Operating expenses         | (25,000)  | Less: Dividends             | (6,000)  |
| Income before income taxes | \$ 15,000 | Ending retained earnings    | \$19,500 |

(Continued)

| Income tax expense<br>Net income | (4,500)<br>\$ 10,500 |                        |           |
|----------------------------------|----------------------|------------------------|-----------|
| Earnings per share               | \$ 1.05              |                        |           |
| Balance Sheet (12/31/10)         |                      |                        |           |
| Cash                             | \$ 9,000             | Accounts payable       | \$ 3,000  |
| Inventory                        | 38,000               | Income taxes payable   | 1,800     |
| Other assets                     | 64,100               | Deferred tax liability | 4,800     |
|                                  |                      | Common stock, no par   | 82,000    |
|                                  |                      | Retained earnings      | _19,500   |
|                                  | \$ 111,100           | -                      | \$111,100 |

An analysis of the accounting records discloses the following cost of goods sold under the FIFO and average-cost inventory methods:

|      | FIFO Cost<br>of Goods Sold | Average Cost of Goods Sold |
|------|----------------------------|----------------------------|
| 2009 | \$50,000                   | \$57,000                   |
| 2010 | 60,000                     | 69,000                     |
| 2011 | 70,000                     | 80,000                     |

There are no indirect effects of the change in inventory method. Revenues for 2011 total \$130,000; operating expenses for 2011 total \$30,000. The company is subject to a 30% income tax rate in all years; it pays the income taxes payable of a current year in the first quarter of the next year. The company had 10,000 shares of common stock outstanding during all years; it paid dividends of \$1 per share in 2011. At the end of 2011, the company had cash of \$10,000, inventory of \$24,000, other assets of \$70,800, and accounts payable of ?. The company desires to show financial statements for the current year and previous year in its 2011 annual report.

## Required 🔤

- 1. Prepare the journal entry to reflect the change in methods at the beginning of 2011. Show supporting calculations.
- 2. Prepare the 2011 annual report. Notes to the financial statements are not necessary. Show supporting calculations.

**P23-4** *Change from LIFO to Average Cost* Schmidt Company began operations on January 1, 2009 and used the LIFO inventory method for both financial reporting and income taxes. However, at the beginning of 2011, the company decided to switch to the average-cost inventory method for financial and income tax reporting. The company had previously reported the following financial statements for 2010:

| Income Statement           |                | Retained Earnings Statement |                  |
|----------------------------|----------------|-----------------------------|------------------|
|                            | 2010           | · ·                         | 2010             |
| Revenues                   | \$128,000      | Beginning retained earnings | \$27,000         |
| Cost of goods sold         | (78,000)       | Add: Net income             | _17,500          |
| Gross profit               | \$ 50,000      |                             | \$44,500         |
| Operating expenses         | (25,000)       | Less: Dividends             | (6,000)          |
| Income before income taxes | \$ 25,000      | Ending retained earnings    | \$38,500         |
| Income tax expense         | (7,500)        |                             |                  |
| Net income                 | \$ 17,500      |                             |                  |
| Earnings per share         | <u>\$ 1.75</u> |                             |                  |
| Balance Sheet (12/31/10)   |                |                             |                  |
| Cash                       | \$ 8,000       | Accounts payable            | \$ 4,000         |
| Inventory                  | 42,000         | Income taxes payable        | 7,500            |
| Other assets               | 60,000         | Common stock, no par        | 60,000           |
|                            |                | Retained earnings           | _38,500          |
|                            | \$110,000      |                             | <u>\$110,000</u> |

An analysis of the accounting records discloses the following cost of goods sold under the LIFO and average-cost inventory methods:

|      | LIFO Cost<br>of Goods Sold | Average Cost of Goods Sold |
|------|----------------------------|----------------------------|
| 2009 | \$62,000                   | \$56,000                   |
| 2010 | 78,000                     | 69,000                     |
| 2011 | 90,000                     | 80,000                     |

There are no indirect effects of the change in inventory method. Revenues for 2011 total \$130,000; operating expenses for 2011 total \$30,000. The company is subject to a 30% income tax rate in all years; it pays all income taxes payable in the next quarter. The company had 10,000 shares of common stock outstanding during all years; it paid dividends of \$1 per share in 2011. At the end of 2011, the company had cash of \$12,000, inventory of \$34,000, other assets of \$76,000, income taxes payable of \$6,000, and accounts payable of ?. The company desires to show financial statements for the current year and previous year in its 2011 annual report.

#### Required

- 1. Prepare the journal entry to reflect the change in method at the beginning of 2011. Show supporting calculations.
- 2. Prepare the 2011 annual report. Notes to the financial statements are not necessary. Show supporting calculations.

**P23-5** Change in Accounting for Construction Contracts Since the Goode Construction Company was formed in 2009, it has used the completed-contract method for financial reporting, but at the beginning of 2011, it changes to the percentageof-completion method. The company previously had reported the following pretax income:

|                                   | 2009      | 2010      |
|-----------------------------------|-----------|-----------|
| Sales of completed contracts      | \$300,000 | \$800,000 |
| Less: Cost of completed contracts | (200,000) | (550,000) |
| Gross profit                      | \$100,000 | \$250,000 |

Analysis of the accounting records discloses that the company earned the following gross profit on each of its projects based on the percentage-of-completion method:

|           | 2009      | 2010      | 2011      |
|-----------|-----------|-----------|-----------|
| Project A | \$100,000 | _         | _         |
| Project B | 120,000   | \$125,000 | _         |
| Project C | _         | 75,000    | \$400,000 |

In 2011, the company would have reported sales and cost of completed contracts of \$820,000 and \$350,000, respectively, under the completed-contract method. The tax rate is 30%. The company has a simple capital structure, with 100,000 shares of common stock outstanding. It paid no dividends. Ignore other expenses (i.e., gross profit is income before income taxes). The company uses the percentage-of-completion method for income taxes.

#### Required

- 1. Prepare the journal entry to reflect the change in method at the beginning of 2011.
- 2. If the company also presents the 2009 and 2010 financial statements for comparative purposes, prepare the income statement disclosures (starting with income before income taxes) and retained earnings disclosures that are required in 2011.
- What items (if any) would be restated on the financial statements?

P23-6 Changes and Corrections of Depreciation At the beginning of 2011, the controller of Holden Company asked you to prepare correcting entries for the following three situations:

- 1. Machine X was purchased for \$100,000 on January 1, 2006. Straight-line depreciation has been recorded for five years, and the Accumulated Depreciation account has a balance of \$45,000. The estimated residual value remains at \$10,000, but the service life is now estimated to be one year longer than originally estimated.
- 2. Machine Y was purchased for \$40,000 on January 1, 2009. It had an estimated residual value of \$4,000 and an estimated service life of eight years. It has been depreciated under the sum-of-the-years'-digits method for two years. Now, the company has decided to change to the straight-line method.
- 3. Machine Z was purchased for \$80,000 on January 1, 2010. Double-declining-balance depreciation has been recorded for one year. The estimated residual value is \$8,000 and the estimated service life is five years. The computation of the depreciation erroneously included the estimated residual value.

Prepare any necessary correcting journal entries for each situation. Also prepare the journal entry for each situation to record the depreciation for 2011. (Ignore income taxes.)

Change in Accounting for Inventory The Kraft Manufacturing Company manufactures two products: Mult and Tran. At December 31, 2010, Kraft used the FIFO inventory method. Effective January 1, 2011, Kraft changed to the LIFO inventory method. The cumulative effect of this change is not determinable and, as a result, the ending inventory of 2010, for which the FIFO method was used, is also the beginning inventory for 2011 for the LIFO method. Any layers added during 2011 should be costed by reference to the first acquisitions of 2011, and any layers liquidated during 2011 should be considered a permanent liquidation.

The following information was available from Kraft's inventory records for the two most recent years:

|                   | Mult   |           |        | Tran      |
|-------------------|--------|-----------|--------|-----------|
|                   | Units  | Unit Cost | Units  | Unit Cost |
| 2010 purchases:   |        |           |        |           |
| January 7         | 5,000  | \$4.00    | 22,000 | \$2.00    |
| April 17          | 12,000 | 4.50      |        |           |
| November 9        | 17,000 | 5.00      | 18,500 | 2.50      |
| December 14       | 10,000 | 6.00      |        |           |
| 2011 purchases:   |        |           |        |           |
| February 12       | 3,000  | 7.00      | 23,000 | 3.00      |
| May 21            | 8,000  | 7.50      |        |           |
| October 15        | 20,000 | 8.00      |        |           |
| December 24       |        |           | 15,500 | 3.50      |
| Units on hand:    |        |           |        |           |
| December 31, 2010 | 15,000 |           | 14,500 |           |
| December 31, 2011 | 16,000 |           | 13,000 |           |

Compute the effect on income before income taxes for the year ended December 31, 2011, resulting from the change from the FIFO to the LIFO inventory method.

P23-8 First Issuance of Financial Statements The Jackson Company has decided to issue common stock to the public in 2011. This will be the first public sale, and therefore, the company will issue its first publicly available financial statements since it was formed in 2008. The financial statements that it has prepared for its own use follow:

|                            | Income Statements |                   |            |
|----------------------------|-------------------|-------------------|------------|
|                            | For Y             | ears Ended Decemb | oer 31,    |
|                            | 2008              | 2009              | 2010       |
| Sales                      | \$100,000         | \$130,000         | \$180,000  |
| Cost of goods sold         | _(35,000)         | _(45,000)         | (65,000)   |
| Gross profit               | \$ 65,000         | \$ 85,000         | \$ 115,000 |
| Other expenses             | (62,500)          | (75,000)          | (83,200)   |
| Income before income taxes | \$ 2,500          | \$ 10,000         | \$ 31,800  |
| Income tax expense         | (750)             | (3,000)           | (9,540)    |
| Net income                 | \$ 1,750          | \$ 7,000          | \$ 22,260  |

|                                | <b>Balance Sheets</b> |             |           |
|--------------------------------|-----------------------|-------------|-----------|
|                                |                       | December 31 |           |
|                                | 2008                  | 2009        | 2010      |
| Cash                           | \$ 5,500              | \$ 12,500   | \$ 9,960  |
| Accounts receivable            | 30,000                | 50,000      | 63,000    |
| Inventory                      | 40,000                | 60,000      | 65,000    |
| Equipment                      | 100,000               | 100,000     | 140,000   |
| Less: Accumulated depreciation | (20,000)              | (52,000)    | (79,200)  |
|                                | \$155,500             | \$170,500   | \$198,760 |
| Current liabilities            | \$ 19,250             | \$ 27,250   | \$ 33,250 |
| Notes payable                  | 50,000                | 50,000      | 50,000    |
| Common stock                   | 84,500                | 84,500      | 84,500    |
| Retained earnings              | 1,750                 | 8,750       | 31,010    |
|                                | \$155,500             | \$170,500   | \$198,760 |

These financial statements are audited for the first time at the beginning of 2011, and the following facts are discovered:

- 1. The company has not made any allowance for noncollection of accounts receivable. An allowance of 1% of total sales is considered appropriate. Uncollectible accounts of \$630 should have been written off in 2010.
- 2. The notes payable are to officers of the company and have an interest rate of 12%. They were issued on January 1, 2008. No interest has been accrued or paid. (Assume simple interest and no compounding.)
- 3. The company has been using MACRS over a five-year life for both financial reporting and income tax purposes. It has been decided that the straight-line method should have been used for financial reporting, based on an economic life of 10 years and a zero residual value, with a full year's depreciation being recorded in the year of acquisition. No disposals of property, plant, and equipment have occurred.

- 4. After adjustments, with the exception of depreciation, expenses deducted for financial accounting purposes are the same as those deducted for income tax purposes.
- 5. The company is subject to a 30% income tax rate and pays its taxes at the end of each year.

- 1. Prepare the financial statements for 2008, 2009, and 2010 that the company would issue at the beginning of 2011.
- 2. Describe what method the company would use to account for each item if the financial statements for all three years had been publicly issued previously.

**P23-9** *Error Correction* At the end of 2011, while auditing the books of the Sandlin Company, *before* the books have been closed, you find the following items:

- a. A building with a 30-year life (no residual value, straight-line depreciation) was purchased on January 1, 2011 by issuing a \$90,000 non-interest-bearing, four-year note. The entry made to record the purchase was a debit to Building and a credit to Notes Payable for \$90,000; 12% is a fair rate of interest on the note.
- b. The inventory at the end of 2011 was found to be overstated by \$15,000. At the same time, it was discovered that the inventory at the end of 2010 had been overstated by \$35,000. The company uses the perpetual inventory system.
- c. For the last three years, the company has failed to accrue salaries and wages. The correct amounts at the end of each year were: 2009—\$12,000; 2010—\$18,000; 2011—\$10,000.

#### Required

- 1. Prepare journal entries to correct the errors (ignore income taxes).
- 2. Assume, instead, that the company discovered the errors *after* it had closed the books. Prepare journal entries to correct the errors (ignore income taxes).

**P23-10** *Error Correction* At the beginning of 2011, Tanham Company discovered the following errors made in the preceding two years:

|   | 2009    | 2010    |
|---|---------|---------|
| Overstatement of ending inventory           | \$5,000 | \$2,000 |
| Omission of wages payable                   | 700     | 800     |
| Omission of allowance for doubtful accounts | 1,300   | 1,700   |
| Prepayment of insurance recorded as expense | 500     | 200     |

Reported net income was \$27,000 in 2009 and \$35,000 in 2010. The allowance for doubtful accounts had a zero balance at the beginning of 2009. No accounts were written off during 2009 or 2010. Ignore income taxes.

#### Required

- 1. What is the correct net income for 2009 and 2010?
- 2. Prepare the adjusting journal entry in 2011 to correct the errors.

**P23-11** *Error Correction* A review of the books of the Anderson Corporation indicates that the errors and omissions pertaining to the balance sheet accounts shown as follows had not been corrected during the applicable years.

The net income per the books is: 2008—\$10,000; 2009—\$12,000; 2010—\$15,000; and 2011—\$20,000. No dividends were declared during these years and no adjustments were made to retained earnings. The Retained Earnings balance on December 31, 2011, is \$50,000.

|                | Ending                  | Ending                   | Omissions          |                      |                    |                     |
|----------------|-------------------------|--------------------------|--------------------|----------------------|--------------------|---------------------|
| December<br>31 | Inventory<br>Overvalued | Inventory<br>Undervalued | Prepaid<br>Expense | Unearned<br>Revenues | Accrued<br>Expense | Accrued<br>Revenues |
| 2008           | \$ —                    | \$4,000                  | \$600              | \$ —                 | \$300              | \$ —                |
| 2009           | 3,000                   | _                        | _                  | 500                  | _                  | 700                 |
| 2010           | 2,000                   | _                        | 400                | _                    | 100                | _                   |
| 2011           | _                       | 1,000                    | 900                | 200                  | 350                | 800                 |

## Required

Prepare a worksheet to determine the correct net income for the years 2008, 2009, 2010, and 2011, and the adjusted balance sheet accounts as of December 31, 2011. (Ignore possible income tax effects.)

**P23-12** *Error Correction* The bookkeeper of the Cask Company, who has maintained its accounting records since the company's formation in January 2008, has prepared the unaudited financial statements. In your examination of these statements at the end of 2010, you discover the following items:

- 1. Sales taxes collected from customers have been included in the sales account. The Sales Tax Expense account is debited when the sales taxes are remitted to the state in the month following the sale. All sales are subject to a 6% sales tax. Total sales (excluding sales tax) for the three years 2008 through 2010 were \$200,000, \$300,000, and \$500,000, respectively. The Sales Tax Expense account balance for the three years was \$10,000, \$15,000, and \$26,000, respectively.
- 2. An account payable of \$15,000 for merchandise purchased in December 2008 was recorded in January 2009. The merchandise was not included in inventory at December 31, 2008.

- 3. Merchandise with a cost of \$4,000 was included twice in the December 31, 2009 inventory.
- 4. The company has used the direct write-off method of accounting for bad debts. Accounts written off in the three years 2008 through 2010 were \$2,000, \$4,500, and \$6,500, respectively. The appropriate balances of Allowance for Doubtful Accounts at the end of 2008 through 2010 are \$5,000, \$6,000, and \$8,200, respectively.
- 5. On January 1, 2009, 12%, 10-year bonds with a face value of \$600,000 were issued at 102. The premium was credited to Additional Paid-in Capital. The bonds pay interest on June 30 and December 31, and use of the straight-line amortization method is appropriate.
- 6. Travel advances to the sales personnel of \$18,000 were included as selling expenses for 2009. The travel occurred in 2010.
- 7. Salaries payable at the end of each year have not been accrued. Appropriate amounts at the end of 2008 through 2010 are \$10,000, \$11,000, and \$7,000, respectively.
- 8. Installation, freight, and testing costs of \$25,000 on a machine purchased in January 2008 were expensed at that time. The machine has a life of five years and a residual value of \$10,000.

Analyze the effects of the errors on income for 2008, 2009, and 2010, and the 2010 ending balance sheet (ignore income taxes), according to the following format:

| Explanation | Income 2008 |        | Income 2009 |        | Income 2010 |        | Balance Sheet<br>December 31, 2010 |        |         |
|-------------|-------------|--------|-------------|--------|-------------|--------|------------------------------------|--------|---------|
|             |             |        |             |        |             |        | Amount                             |        |         |
|             | Debit       | Credit | Debit       | Credit | Debit       | Credit | Debit                              | Credit | Account |

**P23-13 AICPA Adapted Comprehensive** The financial statements of the Gray Company showed income before income taxes of \$4,030,000 for the year ended December 31, 2011, and \$3,330,000 for the year ended December 31, 2010. Additional information is as follows:

- 1. Capital expenditures were \$2,800,000 in 2011 and \$4,000,000 in 2010. Included in the 2011 capital expenditures is equipment purchased for \$1,000,000 on January 1, 2011, with no salvage value. Gray used straight-line depreciation based on a 10-year estimated life in its financial statements. As a result of additional information now available, it is estimated that this equipment should have only an eight-year life.
- 2. Gray made an error in its financial statements that should be regarded as material. A payment of \$180,000 was made in January 2011 and charged to expense in 2011 for insurance premiums applicable to policies commencing and expiring in 2010. No liability had been recorded for this item at December 31, 2010.
- 3. The allowance for doubtful accounts reflected in Gray's financial statements was \$7,000 at December 31, 2011, and \$97,000 at December 31, 2010. During 2011, \$90,000 of uncollectible receivables were written off against the allowance for doubtful accounts. In 2010, the provision for doubtful accounts was based on a percentage of net sales. The 2011 provision has not yet been recorded. Net sales were \$58,500,000 for the year ended December 31, 2011, and \$49,230,000 for the year ended December 31, 2010. Based on the latest available facts, the 2011 provision for doubtful accounts is estimated to be 0.2% of net sales.
- 4. A review of the estimated warranty liability at December 31, 2011, which is included in "other liabilities" in Gray's financial statements, has disclosed that this estimated liability should be increased \$170,000.
- 5. Gray has two large blast furnaces that it uses in its manufacturing process. These furnaces must be periodically relined. Furnace A was relined in January 2005 at a cost of \$230,000 and in January 2010 at a cost of \$280,000. Furnace B was relined for the first time in January 2011 at a cost of \$300,000. In Gray's financial statements, these costs were expensed as incurred.

Since a relining will last for five years, a more appropriate matching of revenues and costs would result if the cost of the relining were capitalized and depreciated over the productive life of the relining. Gray has decided to make a change in accounting principle from expensing relining costs as incurred to capitalizing them and depreciating them over their productive life on a straight-line basis with a full year's depreciation in the year of relining. This change meets the requirements for a change in accounting principle under GAAP.

### Required

1. For the years ended December 31, 2011 and 2010, prepare a worksheet reconciling income before income taxes as given previously with income before income taxes, as adjusted for the preceding additional information. Show supporting computations in good form. Ignore income taxes and deferred tax considerations in your answer. The worksheet should have the following format:

|  | Year Ended December 31 |             |  |
|--|------------------------|-------------|--|
|  | 2011                   | 2010        |  |
| Income before income taxes, before adjustments | \$4,030,000            | \$3,330,000 |  |
| Adjustments                                    |                        |             |  |
| Net adjustments                                |                        |             |  |
| Income before income taxes, after adjustments  | \$                     | \$          |  |
|  |                        |             |  |

2. As of January 1, 2011, compute the retrospective adjustment of retained earnings for the cumulative effect of the change in accounting principle from expensing to capitalizing relining costs. Ignore income taxes and deferred tax considerations in your answer.

**P23-14** AlCPA Adapted *Comprehensive* The Ingalls Corporation is in the process of negotiating a loan for expansion purposes. The books and records have never been audited, and the bank has requested that an audit be performed. Ingalls has prepared the following comparative financial statements for the years ended December 31, 2011 and 2010:

| Balance Sheet  |                       |                  |
|--|-----------------------|------------------|
|  | As of De              | cember 31,       |
|  | 2011                  | 2010             |
| Assets   |                       |                  |
| Current assets   |                       |                  |
| Cash   | \$163,000             | \$ 82,000        |
| Accounts receivable  | 392,000               | 296,000          |
| Allowance for uncollectible accounts   | (37,000)              | (18,000)         |
| Available-for-sale securities  | 78,000                | 78,000           |
| Merchandise inventory  | 207,000               | 202,000          |

| Fixed assets   |                       |                  |
| Property, plant, and equipment   | 167,000               | 169,500          |
| Accumulated depreciation   | (121,600)             | (106,400)        |
| Total fixed assets   | 45,400                | 63,100           |
| Total assets   | \$848,400             | \$703,100        |
| Liabilities and Stockholders' Equity Liabilities Accounts payable Stockholders' equity | \$121,400             | \$196,100        |
| Common stock, par value \$10, authorized 50,000 shares, issued                         |                       |                  |
| and outstanding 20,000 shares  | 260,000               | 260,000          |
| Retained earnings  | 467,000               | 247,000          |
| Total stockholders' equity   | 727,000               | 507,000          |
| Total liabilities and stockholders' equity   | \$848,400             | <u>\$703,100</u> |
| Statement of Income  |                       |                  |
|  | For the Yea<br>Decemb |                  |
|  | 2011                  | 2010             |
| Sales  | \$1,000,000           | \$900,000        |
| Cost of sales  | (430,000)             | (395,000)        |
| Gross profit   | 570,000               | 505,000          |
| Operating expenses   | 210,000               | 205,000          |
| Administrative expenses  | 140,000               | 105,000          |
|  | (350,000)             | (310,000)        |
| Net income   | \$ 220,000            | \$195,000        |

During the course of the audit, the following additional facts were determined:

- 1. An analysis of collections and losses on accounts receivable during the past two years indicates a drop in anticipated losses because of bad debts. After consultation with management, it was agreed that the loss experience rate on sales should be reduced from the recorded 2% to 1%, beginning with the year ended December 31, 2011.
- 2. An analysis of the available-for-sale securities revealed that this portfolio consisted entirely of short-term investments in marketable equity securities that were acquired in 2010. The total market valuation for these investments as of the end of each year was as follows: December 31, 2010—\$81,000; December 31, 2011—\$62,000.
- 3. The merchandise inventory at December 31, 2010 was overstated by \$4,000 and the merchandise inventory at December 31, 2011 was overstated by \$6,100.
- 4. On January 2, 2010, equipment costing \$12,000 (estimated useful life of 10 years and residual value of \$1,000) was incorrectly charged to Operating Expenses. Ingalls records depreciation via the straight-line method. In 2011, fully depreciated

- equipment (with no residual value) that originally cost \$17,500 was sold as scrap for \$2,500. Ingalls credited the proceeds of \$2,500 to Property and Equipment.
- 5. An analysis of 2010 operating expenses revealed that Ingalls charged to expense a three-year insurance premium of \$2,700 on January 15, 2010.

#### Required

- 1. Prepare the journal entries to correct the books at December 31, 2011. The books for 2011 have not been closed. Ignore income taxes.
- 2. Prepare a schedule showing the computation of corrected net income for the years ended December 31, 2011 and 2010, assuming that any adjustments are to be reported on comparative statements for the two years. The first items on your schedule should be the net income for each year. Ignore income taxes. (Do not prepare financial statements.)

#### 

#### COMMUNICATION

#### **C23-1 Accounting Changes**

There are three types of accounting changes: changes in accounting principles, changes in accounting estimates, and changes in reporting entities.

#### Required

Explain the differences and similarities between each of these types of changes, and explain the correct accounting for each. Include a discussion of the advantages and disadvantages of the required accounting method.

#### **C23-2 Accounting Changes**

**AICPA Adapted** The various types of accounting changes may significantly affect the presentation of a company's financial statements, and also affect the trends shown in its comparative financial statements and historical summaries.

#### Required

- 1. Explain a change in accounting principle and how a company reports it in the period of the change.
- 2. Explain a change in accounting estimate and how a company reports it in the period of the change.
- 3. Explain a change in reporting entity and how a company reports it. Give an appropriate example of a change in reporting entity.

#### **C23-3 Accounting Changes**

**AICPA Adapted** Berkeley Company, a manufacturer of many different products, changed its inventory method from FIFO to LIFO. The LIFO method was determined to be preferable.

In addition, Berkeley changed the residual values used in computing depreciation for its office equipment. It made this change on January 1, 2010 because it obtained additional information.

On December 31, 2010, Berkeley changed the specific subsidiaries comprising the group of companies for which consolidated financial statements are presented.

#### Required

- 1. What kind of accounting change is each of the preceding three situations? For each situation, indicate whether or not the company should show:
  - a. The retrospective application of a new accounting principle.
  - b. The effects on the financial statements of the current and future periods.
  - c. Restatement of the financial statements of all prior periods.
- 2. Why does the company have to disclose a change in accounting principle?

#### CREATIVE AND CRITICAL THINKING

### **C23-4** Transition Methods for a Change in Accounting Principle

When the FASB issues a new generally accepted accounting principle, it may require companies to apply the new principle prospectively, or to account for the change by the retrospective adjustment method.

#### Required

Why do you think that the FASB requires one of two different transition methods when a company adopts a newly required accounting principle? Do you agree with the use of two alternative methods?

#### **C23-5 Accounting Changes**

AICPA Adapted Sometimes a business entity may change its method of accounting for certain items. It may classify the change as a change in accounting principle, a change in accounting estimate, or a change in reporting entity.

The following are three independent, unrelated sets of facts relating to accounting changes.

Situation I A company determined that the depreciable lives of its fixed assets are presently too long to fairly match the cost of the fixed assets with the revenue produced. The company decided at the beginning of the current year to reduce the depreciable lives of all of its existing fixed assets by five years.

Situation II On December 31, 2009, Hyde Company owned 51% of Patten Company, at which time Hyde reported its investment using the cost method, owing to political uncertainties in the country in which Patten was located. On January 2, 2010, the management of Hyde Company was satisfied that the political uncertainties were resolved and the assets of the company were in no danger of nationalization. Accordingly, Hyde will prepare consolidated financial statements for Hyde and Patten for the year ended December 31, 2010.

Situation III A company decides in January 2010 to adopt the straight-line method of depreciation for plant equipment. The straight-line method will be used for new acquisitions, as well as for previously acquired plant equipment for which depreciation had been provided on an accelerated basis.

#### Required

For each of the preceding situations, provide the following information. Complete your discussion of each situation before going on to the next situation.

- 1. Type of accounting change.
- 2. Manner of reporting the change under current generally accepted accounting principles, including a discussion, where applicable, of how amounts are computed.
- 3. Effect of the change on the statement of financial position and earnings statement.
- 4. Note disclosures that would be necessary.

#### **C23-6 Accounting Changes**

AICPA Adapted It is important in accounting theory to be able to distinguish the types of accounting changes.

#### Required

- 1. If a public company desires to change from the sum-of-theyears'-digits depreciation method to the straight-line method for its fixed assets, what type of accounting change would this be? Discuss the permissibility of this change.
- 2. If a public company obtained additional information about the service lives of some of its fixed assets that showed that the service lives previously used should be shortened, what type of accounting change would this be? Include in your discussion how the change is reported in the year of the change, and what disclosures are made in the financial statements or notes.
- 3. If a company discovers halfway through a building's life that it ignored the residual value of the building in computing the straight-line depreciation, what type of accounting change would this be? Include in your discussion how the change is reported in the year of the

- change, and what disclosures are made in the financial statements or notes.
- 4. Changing specific subsidiaries comprising the group of companies for which consolidated financial statements are presented is an example of what type of accounting change? What effect does it have on the consolidated income statements?

### C23-7 Ethics, Enron, Arthur Andersen, and Accounting Changes

In 2001, Enron Corporation filed financial statements in which it did not consolidate various

Special Purpose Entities, thereby keeping large amounts of debt off its balance sheet. The company has since declared bankruptcy and admitted that it violated GAAP. Enron's auditor, Arthur Andersen LLP, issued an unqualified audit opinion stating that Enron had followed GAAP. Instead, Enron should have changed its accounting principles to conform to GAAP, and Andersen should not have issued an unqualified opinion.

The U.S. Department of Justice began an investigation of Enron and Arthur Andersen. Some employees of Arthur Andersen shredded certain documents related to the audit. As a result, the firm was found guilty of obstruction of justice and therefore was no longer able to perform audits. Only a few of the Arthur Andersen partners and employees were involved in the audit and even fewer in the shredding. However, thousands of Arthur Andersen employees lost their jobs.

#### Required

From an ethical perspective, discuss whether the actions of the Department of Justice were fair with regard to the employees of Arthur Andersen.

#### **C23-8 Ethics and Accounting Changes and Errors**

You are auditing the financial records of a company and reviewing the property, plant, and

equipment records. Included in the assets are two buildings and numerous machines in each building. One of the buildings is used to manufacture components of toys; the other is used for assembly and packing, using the manufactured components as well as others purchased from suppliers. You see that the company has changed from the straight-line to the double-declining-balance depreciation method at the beginning of the year. You also discover that a \$90,000 repair was added to the cost of the building in the previous year. You decide to ask the CFO about these calculations and she replies, "We decided to change the depreciation method because toys have such short lives and get obsolete so fast. You know how kids always want the latest fad. And that is partly why we are also going to recognize an asset impairment of \$150,000 this year. And, as for that \$90,000, those repairs should make the building last longer. But, anyway, the amount wasn't material to our depreciation calculations." As you walk back to your office, you recall from earlier in the audit that the company uses LIFO for its inventory and that income before income taxes has been around \$1 million for each of the last several years.

From financial reporting and ethical perspectives, discuss the issues raised by this situation.

<sup>&</sup>lt;sup>1</sup> Common stock purchased from employees exercising stock options numbered approximately zero shares, zero shares and 0.5 million shares for the years ended December 31, 2007, 2006 and 2005, respectively.

#### NOTE 1: BUSINESS AND SUMMARY OF SIGNIFICANT ACCOUNTING POLICIES

#### **Description of Business**

The Coca-Cola Company is predominantly a manufacturer, distributor and marketer of nonalcoholic beverage concentrates and syrups. We also manufacture, distribute and market finished beverages. In these notes, the terms "Company," "we," "us" or "our" mean The Coca-Cola Company and all subsidiaries included in the consolidated financial statements. We primarily sell concentrates and syrups, as well as finished beverages, to bottling and canning operations, distributors, fountain wholesalers and fountain retailers. Our Company owns or licenses more than 450 brands, including Coca-Cola, Diet Coke, Fanta and Sprite, and a variety of diet and light beverages, waters, enhanced waters, juices and juice drinks, teas, coffees, and energy and sports drinks. Additionally, we have ownership interests in numerous beverage joint ventures, bottling and canning operations. Significant markets for our products exist in all the world's geographic regions.

#### **Basis of Presentation and Consolidation**

Our consolidated financial statements are prepared in accordance with accounting principles generally accepted in the United States. Our Company consolidates all entities that we control by ownership of a majority voting interest as well as variable interest entities for which our Company is the primary beneficiary. Refer to the heading "Variable Interest Entities," below, for a discussion of variable interest entities.

We use the equity method to account for our investments for which we have the ability to exercise significant influence over operating and financial policies. Consolidated net income includes our Company's proportionate share of the net income or net loss of these companies.

We use the cost method to account for our investments in companies that we do not control and for which we do not have the ability to exercise significant influence over operating and financial policies. In accordance with the cost method, these investments are recorded at cost or fair value, as appropriate.

We eliminate from our financial results all significant intercompany transactions, including the intercompany transactions with variable interest entities and the intercompany portion of transactions with equity method investees.

Certain amounts in the prior years' consolidated financial statements and notes have been revised to conform to the current-year presentation.

#### Variable Interest Entities

Financial Accounting Standards Board ("FASB") Interpretation No. 46 (revised December 2003), "Consolidation of Variable Interest Entities" ("Interpretation No. 46(R)") addresses the consolidation of business enterprises to which the usual condition (ownership of a majority voting interest) of consolidation does not apply. Interpretation No. 46(R) focuses on controlling financial interests that may be achieved through arrangements that do not involve voting interests. It concludes that in the absence of clear control through voting interests, a company's exposure (variable interest) to the economic risks and potential rewards from the variable interest entity's assets and activities is the best evidence of control. If an enterprise holds a majority of the variable interests of an entity, it would be considered the primary beneficiary. Upon consolidation, the primary beneficiary is generally required to include assets, liabilities and noncontrolling interests at fair value and subsequently account for the variable interest as if it were consolidated based on majority voting interest.

Our consolidated balance sheets include the assets and liabilities of the following:

- all entities in which the Company has ownership of a majority of voting interests; and
- all variable interest entities for which we are the primary beneficiary.

#### NOTE 1: BUSINESS AND SUMMARY OF SIGNIFICANT ACCOUNTING POLICIES (Continued)

Our Company holds interests in certain entities, primarily bottlers, that are considered variable interest entities. These variable interests relate to profit guarantees or subordinated financial support for these entities. Our Company's investment, plus any loans and guarantees, related to these variable interest entities totaled approximately \$647 million and \$429 million at December 31, 2007 and 2006, respectively, representing our maximum exposures to loss. Any creditors of the variable interest entities do not have recourse against the general credit of the Company as a result of including these variable interest entities in our consolidated financial statements.

#### **Use of Estimates and Assumptions**

The preparation of our consolidated financial statements requires us to make estimates and assumptions that affect the reported amounts of assets, liabilities, revenues and expenses and the disclosure of contingent assets and liabilities in our consolidated financial statements and accompanying notes. Although these estimates are based on our knowledge of current events and actions we may undertake in the future, actual results may ultimately differ from estimates and assumptions.

#### Risks and Uncertainties

Factors that could adversely impact the Company's operations or financial results include, but are not limited to, the following: obesity concerns; water scarcity and quality; changes in the nonalcoholic beverages business environment; increased competition; inability to expand operations in developing and emerging markets; fluctuations in foreign currency exchange; interest rate increases; inability to maintain good relationships with our bottling partners; a deterioration in our bottling partners' financial condition; strikes or work stoppages (including at key manufacturing locations); increased cost of energy; increased cost, disruption of supply or shortage of raw and packaging materials; changes in laws and regulations relating to our business, including those regarding beverage containers and packaging; additional labeling or warning requirements; unfavorable economic and political conditions in the United States and international markets; changes in commercial and market practices within the European Economic Area; litigation or legal proceedings; adverse weather conditions; an inability to maintain brand image and product issues such as product recalls; changes in the legal and regulatory environment in various countries in which we operate; changes in accounting and taxation standards, including an increase in tax rates; an inability to achieve our overall long-term goals; an inability to protect our information systems; future impairment charges; an inability to successfully manage our Company-owned bottling operations; and global or regional catastrophic events.

Our Company monitors our operations with a view to minimizing the impact to our overall business that could arise as a result of the risks and uncertainties inherent in our business.

#### Revenue Recognition

Our Company recognizes revenue when persuasive evidence of an arrangement exists, delivery of products has occurred, the sales price charged is fixed or determinable, and collectibility is reasonably assured. For our Company, this generally means that we recognize revenue when title to our products is transferred to our bottling partners, resellers or other customers. In particular, title usually transfers upon shipment to or receipt at our customers' locations, as determined by the specific sales terms of the transactions. Our sales terms do not allow for a right of return except for matters related to any manufacturing defects on our part.

In addition, our customers can earn certain incentives, which are included in deductions from revenue, a component of net operating revenues in the consolidated statements of income. These incentives include, but are not

#### NOTE 1: BUSINESS AND SUMMARY OF SIGNIFICANT ACCOUNTING POLICIES (Continued)

limited to, cash discounts, funds for promotional and marketing activities, volume-based incentive programs and support for infrastructure programs (refer to the heading "Other Assets"). The aggregate deductions from revenue recorded by the Company in relation to these programs, including amortization expense on infrastructure initiatives, was approximately \$4.1 billion, \$3.8 billion and \$3.7 billion for the years ended December 31, 2007, 2006 and 2005, respectively.

#### **Advertising Costs**

Our Company expenses production costs of print, radio, television and other advertisements as of the first date the advertisements take place. Advertising costs included in selling, general and administrative expenses were approximately \$2.8 billion, \$2.6 billion and \$2.5 billion for the years ended December 31, 2007, 2006 and 2005, respectively. As of December 31, 2007 and 2006, advertising and production costs of approximately \$224 million and \$214 million, respectively, were recorded in prepaid expenses and other assets in our consolidated balance sheets.

#### **Stock-Based Compensation**

Our Company currently sponsors stock option plans and restricted stock award plans. Refer to Note 15. Prior to January 1, 2006, the Company accounted for these plans under the fair value recognition and measurement provisions of Statement of Financial Accounting Standards ("SFAS") No. 123, "Accounting for Stock-Based Compensation." Effective January 1, 2006, the Company adopted SFAS No. 123 (revised 2004), "Share Based Payment" ("SFAS No. 123(R)"). Our Company adopted SFAS No. 123(R) using the modified prospective method. Based on the terms of our plans, our Company did not have a cumulative effect related to our plans. The adoption of SFAS No. 123(R) did not have a material impact on our stock-based compensation expense for the year ended December 31, 2006. The fair values of the stock awards are determined using an estimated expected life. The Company recognizes compensation expense on a straight-line basis over the period the award is earned by the employee.

Our equity method investees also adopted SFAS No. 123(R) effective January 1, 2006. Our proportionate share of the stock-based compensation expense resulting from the adoption of SFAS No. 123(R) by our equity method investees is recognized as a reduction of equity income. The adoption of SFAS No. 123(R) by our equity method investees did not have a material impact on our consolidated financial statements.

#### **Issuances of Stock by Equity Method Investees**

When one of our equity method investees issues additional shares to third parties, our percentage ownership interest in the investee decreases. In the event the issuance price per share is higher or lower than our average carrying amount per share, we recognize a noncash gain or loss on the issuance. This noncash gain or loss, net of any deferred taxes, is generally recognized in our net income in the period the change in ownership interest occurs.

If gains or losses have been previously recognized on issuances of an equity method investee's stock and shares of the equity method investee are subsequently repurchased by the equity method investee, gain or loss recognition does not occur on issuances subsequent to the date of a repurchase until shares have been issued in an amount equivalent to the number of repurchased shares. This type of transaction is reflected as an equity transaction, and the net effect is reflected in our consolidated balance sheets. Refer to Note 4.

#### **Income Taxes**

Income tax expense includes United States, state, local and international income taxes, plus a provision for U.S. taxes on undistributed earnings of foreign subsidiaries not deemed to be indefinitely reinvested. Deferred tax assets and liabilities are recognized for the tax consequences of temporary differences between the financial reporting and the tax

#### NOTE 1: BUSINESS AND SUMMARY OF SIGNIFICANT ACCOUNTING POLICIES (Continued)

basis of existing assets and liabilities. The tax rate used to determine the deferred tax assets and liabilities is the enacted tax rate for the year in which the differences are expected to reverse. Valuation allowances are recorded to reduce deferred tax assets to the amount that will more likely than not be realized. On January 1, 2007, the Company adopted FASB Interpretation No. 48, "Accounting for Uncertainty in Income Taxes" ("Interpretation No. 48") to account for uncertainty in income taxes recognized in the Company's financial statements in accordance with SFAS No. 109, "Accounting for Income Taxes." Refer to Note 17.

#### **Net Income Per Share**

Basic net income per share is computed by dividing net income by the weighted average number of common shares outstanding during the reporting period. Diluted net income per share is computed similarly to basic net income per share, except that it includes the potential dilution that could occur if dilutive securities were exercised. Approximately 71 million, 175 million and 180 million stock option awards were excluded from the computations of diluted net income per share in 2007, 2006 and 2005, respectively, because the awards would have been antidilutive for the periods presented.

#### Cash Equivalents

We classify marketable securities that are highly liquid and have maturities of three months or less at the date of purchase as cash equivalents. We manage our exposure to counterparty credit risk through specific minimum credit standards, diversification of counterparties and procedures to monitor our credit risk concentrations.

#### **Trade Accounts Receivable**

We record trade accounts receivable at net realizable value. This value includes an appropriate allowance for estimated uncollectible accounts to reflect any loss anticipated on the trade accounts receivable balances and charged to the provision for doubtful accounts. We calculate this allowance based on our history of write-offs, level of past-due accounts based on the contractual terms of the receivables, and our relationships with and the economic status of our bottling partners and customers.

Activity in the allowance for doubtful accounts was as follows (in millions):

| Year Ended December 31,           | 20   | 07         | <br>2006 | <br>2005 |
|-----------------------------------|------|------------|----------|----------|
| Balance, beginning of year        | \$ 6 | <b>i</b> 3 | \$<br>72 | \$<br>69 |
| Net charges to costs and expenses | 1    | 7          | 2        | 17       |
| Write-offs                        | (3   | 32)        | (12)     | (12)     |
| Other <sup>1</sup>                |      | 8          | 1        | (2)      |
| Balance, end of year              | \$ 5 | 6          | \$<br>63 | \$<br>72 |

<sup>&</sup>lt;sup>1</sup> Other includes acquisitions, divestitures and currency translation.

A significant portion of our net operating revenues is derived from sales of our products in international markets. Refer to Note 21. We also generate a significant portion of our net operating revenues by selling concentrates and syrups to bottlers in which we have a noncontrolling interest, including Coca-Cola Enterprises Inc. ("CCE"), Coca-Cola Hellenic Bottling Company S.A. ("Coca-Cola Hellenic"), Coca-Cola FEMSA, S.A.B. de C.V. ("Coca-Cola FEMSA") and Coca-Cola Amatil Limited ("Coca-Cola Amatil"). Refer to Note 3.

#### NOTE 1: BUSINESS AND SUMMARY OF SIGNIFICANT ACCOUNTING POLICIES (Continued)

#### **Inventories**

Inventories consist primarily of raw materials and packaging (which includes ingredients and supplies) and finished goods (which include concentrates and syrups in our concentrate and foodservice operations, and finished beverages in our bottling and canning operations). Inventories are valued at the lower of cost or market. We determine cost on the basis of the average cost or first-in, first-out methods. Refer to Note 2.

#### **Recoverability of Equity Method and Cost Method Investments**

Management periodically assesses the recoverability of our Company's equity method and cost method investments. For publicly traded investments, readily available quoted market prices are an indication of the fair value of our Company's investments. For nonpublicly traded investments, if an identified event or change in circumstances requires an impairment evaluation, management assesses fair value based on valuation methodologies, including discounted cash flows, estimates of sales proceeds and external appraisals, as appropriate. We consider the assumptions that we believe hypothetical marketplace participants would use in evaluating estimated future cash flows when employing the discounted cash flows and estimates of sales proceeds valuation methodologies. If an investment is considered to be impaired and the decline in value is other than temporary, we record a write-down.

#### **Other Assets**

Our Company advances payments to certain customers for marketing to fund future activities intended to generate profitable volume, and we expense such payments over the applicable period. Advance payments are also made to certain customers for distribution rights. Additionally, our Company invests in infrastructure programs with our bottlers that are directed at strengthening our bottling system and increasing unit case volume. When facts and circumstances indicate that the carrying value of the assets may not be recoverable, management evaluates the recoverability of these assets by preparing estimates of sales volume, the resulting gross profit and cash flows. If we determine that the carrying value of the assets is not recoverable, we record an impairment loss equal to the excess of the carrying amount of the assets over fair value of the assets. Costs of these programs are recorded in prepaid expenses and other assets and noncurrent other assets and are amortized over the remaining periods directly benefited, which range from 1 to 11 years. Amortization expense for infrastructure programs was approximately \$151 million, \$136 million and \$134 million for the years ended December 31, 2007, 2006 and 2005, respectively. Refer to heading "Revenue Recognition," above, and Note 3.

#### Property, Plant and Equipment

Property, plant and equipment are stated at cost. Repair and maintenance costs that do not improve service potential or extend economic life are expensed as incurred. Depreciation is recorded principally by the straight-line method over the estimated useful lives of our assets, which generally have the following ranges: buildings and improvements: 40 years or less; machinery and equipment: 15 years or less; containers: 10 years or less. Land is not depreciated, and construction in progress is not depreciated until ready for service and capitalized. Leasehold improvements are amortized using the straight-line method over the shorter of the remaining lease term, including renewals that are deemed to be reasonably assured, or the estimated useful life of the improvement. Depreciation expense, including the depreciation expense of assets under capital lease, totaled approximately \$958 million, \$763 million and \$752 million for the years ended December 31, 2007, 2006 and 2005, respectively. Amortization expense for leasehold improvements totaled approximately \$21 million, \$21 million and \$17 million for the years ended December 31, 2007, 2006 and 2005, respectively. Refer to Note 5.

Management assesses the recoverability of the carrying amount of property, plant and equipment if certain events or changes in circumstances indicate that the carrying value of such assets may not be recoverable, such as a significant

#### NOTE 1: BUSINESS AND SUMMARY OF SIGNIFICANT ACCOUNTING POLICIES (Continued)

decrease in market value of the assets or a significant change in the business conditions in a particular market. If we determine that the carrying value of an asset is not recoverable based on expected undiscounted future cash flows, excluding interest charges, we record an impairment loss equal to the excess of the carrying amount of the asset over its fair value.

#### Goodwill, Trademarks and Other Intangible Assets

In accordance with SFAS No. 142, "Goodwill and Other Intangible Assets," we classify intangible assets into three categories: (1) intangible assets with definite lives subject to amortization, (2) intangible assets with indefinite lives not subject to amortization, and (3) goodwill. We test intangible assets with definite lives for impairment if conditions exist that indicate the carrying value may not be recoverable. Such conditions may include an economic downturn in a geographic market or a change in the assessment of future operations. We record an impairment charge when the carrying value of the definite-lived intangible asset is not recoverable by the cash flows generated from the use of the asset.

Intangible assets with indefinite lives and goodwill are not amortized. We test these intangible assets and goodwill for impairment at least annually or more frequently if events or circumstances indicate that such intangible assets or goodwill might be impaired. Such tests for impairment are also required for intangible assets with indefinite lives and/or goodwill recorded by our equity method investees. All goodwill is assigned to reporting units, which are one level below our operating segments. Goodwill is assigned to the reporting unit that benefits from the synergies arising from each business combination. We perform our impairment tests of goodwill at our reporting unit level. Such impairment tests for goodwill include comparing the fair value of the respective reporting unit with its carrying value, including goodwill. We use a variety of methodologies in conducting these impairment tests, including discounted cash flow analyses with a number of scenarios, where applicable, that are weighted based on the probability of different outcomes. When appropriate, we consider the assumptions that we believe hypothetical marketplace participants would use in estimating future cash flows. In addition, where applicable, an appropriate discount rate is used, based on the Company's cost of capital rate or location-specific economic factors. When the fair value is less than the carrying value of the intangible assets or the reporting unit, we record an impairment charge to reduce the carrying value of the assets to fair value. These impairment charges are generally recorded in the line item other operating charges or, to the extent they relate to equity method investees, as a reduction of equity income—net, in the consolidated statements of income.

Our Company determines the useful lives of our identifiable intangible assets after considering the specific facts and circumstances related to each intangible asset. Factors we consider when determining useful lives include the contractual term of any agreement, the history of the asset, the Company's long-term strategy for the use of the asset, any laws or other local regulations which could impact the useful life of the asset, and other economic factors, including competition and specific market conditions. Intangible assets that are deemed to have definite lives are amortized, primarily on a straight-line basis, over their useful lives, generally ranging from 1 to 20 years. Refer to Note 6.

#### **Derivative Financial Instruments**

Our Company accounts for derivative financial instruments in accordance with SFAS No. 133, "Accounting for Derivative Instruments and Hedging Activities," as amended by SFAS No. 137, "Accounting for Derivative Instruments and Hedging Activities—Deferral of the Effective Date of FASB Statement No. 133—an amendment of FASB Statement No. 133," SFAS No. 138, "Accounting for Certain Derivative Instruments and Certain Hedging Activities—an amendment of FASB Statement No. 133," and SFAS No. 149, "Amendment of Statement 133 on Derivative Instruments and Hedging Activities." We recognize all derivative instruments as either assets or liabilities at

#### NOTE 1: BUSINESS AND SUMMARY OF SIGNIFICANT ACCOUNTING POLICIES (Continued)

fair value in our consolidated balance sheets, with fair values of foreign currency derivatives estimated based on quoted market prices or pricing models using current market rates. Cash flows from derivative instruments designated as net investment hedges are classified as investing activities. Cash flows from other derivative instruments used to manage interest, commodity or currency exposures are classified as operating activities. Refer to Note 12.

#### **Retirement-Related Benefits**

Using appropriate actuarial methods and assumptions, our Company accounts for defined benefit pension plans in accordance with SFAS No. 87, "Employers' Accounting for Pensions," and we account for our nonpension postretirement benefits in accordance with SFAS No. 106, "Employers' Accounting for Postretirement Benefits Other Than Pensions," as amended by SFAS No. 158, "Employers' Accounting for Defined Benefit Pension and Other Postretirement Plans—an amendment of FASB Statements No. 87, 88, 106, and 132(R)." Effective December 31, 2006 for our Company, SFAS No. 158 required that previously unrecognized actuarial gains or losses, prior service costs or credits and transition obligations or assets be recognized generally through adjustments to accumulated other comprehensive income and credits to prepaid benefit cost or accrued benefit liability. As a result of these adjustments, the current funded status of defined benefit pension plans and other postretirement benefit plans is reflected in the Company's consolidated balance sheets as of December 31, 2007 and 2006. Refer to Note 16.

Our equity method investees also adopted SFAS No. 158 effective December 31, 2006. Refer to Note 3 for the impact on our consolidated balance sheet resulting from the adoption of SFAS No. 158 by our equity method investees.

#### **Contingencies**

Our Company is involved in various legal proceedings and tax matters. Due to their nature, such legal proceedings and tax matters involve inherent uncertainties including, but not limited to, court rulings, negotiations between affected parties and governmental actions. Management assesses the probability of loss for such contingencies and accrues a liability and/or discloses the relevant circumstances, as appropriate. Refer to Note 13.

#### **Business Combinations**

In accordance with SFAS No. 141, "Business Combinations," we account for all business combinations by the purchase method. Furthermore, we recognize intangible assets apart from goodwill if they arise from contractual or legal rights or if they are separable from goodwill.

#### **Recent Accounting Standards and Pronouncements**

In December 2007, the FASB issued SFAS No. 141 (revised 2007), "Business Combinations." SFAS No. 141(R) amends the principles and requirements for how an acquirer recognizes and measures in its financial statements the identifiable assets acquired, the liabilities assumed, any noncontrolling interest in the acquiree and the goodwill acquired. SFAS No. 141(R) also establishes disclosure requirements to enable the evaluation of the nature and financial effects of the business combination. SFAS No. 141(R) is effective for our Company on January 1, 2009, and the Company will apply prospectively to all business combinations subsequent to the effective date.

In December 2007, the FASB issued SFAS No. 160, "Noncontrolling Interests in Consolidated Financial Statements—an amendment of Accounting Research Bulletin No. 51." SFAS No. 160 establishes accounting and reporting standards for the noncontrolling interest in a subsidiary and for the deconsolidation of a subsidiary. SFAS

#### NOTE 1: BUSINESS AND SUMMARY OF SIGNIFICANT ACCOUNTING POLICIES (Continued)

No. 160 also establishes disclosure requirements that clearly identify and distinguish between the controlling and noncontrolling interests and requires the separate disclosure of income attributable to controlling and noncontrolling interests. SFAS No. 160 is effective for fiscal years beginning after December 15, 2008. The Company is currently evaluating the impact that the adoption of SFAS No. 160 will have on our consolidated financial statements.

In February 2007, the FASB issued SFAS No. 159, "The Fair Value Option for Financial Assets and Financial Liabilities—Including an amendment of FASB Statement No. 115." SFAS No. 159 permits entities to choose to measure many financial instruments and certain other items at fair value. Unrealized gains and losses on items for which the fair value option has been elected will be recognized in earnings at each subsequent reporting date. SFAS No. 159 was effective for our Company on January 1, 2008. The adoption of SFAS No. 159 did not have a material impact on our consolidated financial statements.

In September 2006, the SEC staff published SAB No. 108, "Considering the Effects of Prior Year Misstatements when Quantifying Misstatements in Current Year Financial Statements." SAB No. 108 addresses quantifying the financial statement effects of misstatements, specifically, how the effects of prior year uncorrected errors must be considered in quantifying misstatements in the current year financial statements. SAB No. 108 was effective for fiscal years ending after November 15, 2006. The adoption of SAB No. 108 by our Company in the fourth quarter of 2006 did not have a material impact on our consolidated financial statements.

As previously discussed, our Company adopted SFAS No. 158 related to defined benefit pension and other postretirement plans. Refer to Note 16.

In September 2006, the FASB issued SFAS No. 157, "Fair Value Measurements." SFAS No. 157 defines fair value, establishes a framework for measuring fair value and expands disclosure requirements about fair value measurements. SFAS No. 157 was effective for our Company on January 1, 2008. However, in February 2008, the FASB released a FASB Staff Position (FSP FAS 157-2—Effective Date of FASB Statement No. 157) which delayed the effective date of SFAS No. 157 for all nonfinancial assets and nonfinancial liabilities, except those that are recognized or disclosed at fair value in the financial statements on a recurring basis (at least annually). The adoption of SFAS No. 157 for our financial assets and liabilities did not have a material impact upon adoption. We do not believe the adoption of SFAS No. 157 for our non-financial assets and liabilities, effective January 1, 2009, will have a material impact on our consolidated financial statements.

In July 2006, the FASB issued Interpretation No. 48 which clarifies the accounting for uncertainty in income taxes recognized in an enterprise's financial statements in accordance with SFAS No. 109, "Accounting for Income Taxes." Interpretation No. 48 prescribes a recognition threshold and measurement attribute for the financial statement recognition and measurement of a tax position taken or expected to be taken in a tax return. Interpretation No. 48 also provides guidance on derecognition, classification, interest and penalties, accounting in interim periods, disclosure and transition. For our Company, Interpretation No. 48 was effective January 1, 2007. As a result of the adoption of Interpretation No. 48, we recorded an approximate \$65 million increase in accrued income taxes in our consolidated balance sheet for unrecognized tax benefits, which was accounted for as a cumulative effect adjustment to the January 1, 2007 balance of reinvested earnings. Refer to Note 17.

In May 2005, the FASB issued SFAS No. 154, "Accounting Changes and Error Corrections, a replacement of Accounting Principles Board ("APB") Opinion No. 20 and FASB Statement No. 3." SFAS No. 154 requires retrospective application to prior periods' financial statements of a voluntary change in accounting principle unless it is impracticable. APB Opinion No. 20, "Accounting Changes," previously required that most voluntary changes in

#### NOTE 1: BUSINESS AND SUMMARY OF SIGNIFICANT ACCOUNTING POLICIES (Continued)

accounting principle be recognized by including in net income of the period of the change the cumulative effect of changing to the new accounting principle. SFAS No. 154 became effective for our Company on January 1, 2006. The adoption of SFAS No. 154 did not have a material impact on our consolidated financial statements.

In December 2004, the FASB issued SFAS No. 153, "Exchanges of Nonmonetary Assets, an amendment of APB Opinion No. 29." SFAS No. 153 is based on the principle that exchanges of nonmonetary assets should be measured based on the fair value of the assets exchanged. APB Opinion No. 29, "Accounting for Nonmonetary Transactions," provided an exception to its basic measurement principle (fair value) for exchanges of similar productive assets. Under APB Opinion No. 29, an exchange of a productive asset for a similar productive asset was based on the recorded amount of the asset relinquished. SFAS No. 153 eliminates this exception and replaces it with an exception for exchanges of nonmonetary assets that do not have commercial substance. SFAS No. 153 became effective for our Company as of July 2, 2005, and did not have a material impact on our consolidated financial statements.

As previously discussed, our Company adopted SFAS No. 123(R) related to share based payments effective January 1, 2006. Refer to Note 15.

In November 2004, the FASB issued SFAS No. 151, "Inventory Costs, an amendment of Accounting Research Bulletin No. 43, Chapter 4." SFAS No. 151 requires that abnormal amounts of idle facility expense, freight, handling costs and wasted materials (spoilage) be recorded as current period charges and that the allocation of fixed production overheads to inventory be based on the normal capacity of the production facilities. The Company adopted SFAS No. 151 on January 1, 2006. The adoption of SFAS No. 151 did not have a material impact on our consolidated financial statements.

In October 2004, the American Jobs Creation Act of 2004 (the "Jobs Creation Act") was signed into law. The Jobs Creation Act included a temporary incentive for U.S. multinationals to repatriate foreign earnings at an approximate 5.25 percent effective tax rate. Issued in December 2004, FASB Staff Position 109-2, "Accounting and Disclosure Guidance for the Foreign Earnings Repatriation Provision within the American Jobs Creation Act of 2004" indicated that the lack of clarification of certain provisions within the Jobs Creation Act and the timing of the enactment necessitated a practical exception to the SFAS No. 109, "Accounting for Income Taxes," requirement to reflect in the period of enactment the effect of a new tax law. Accordingly, enterprises were allowed time beyond 2004 to evaluate the effect of the Jobs Creation Act on their plans for reinvestment or repatriation of foreign earnings for purposes of applying SFAS No. 109. Accordingly, in 2005, the Company repatriated \$6.1 billion of its previously unremitted earnings and recorded an associated tax expense of approximately \$315 million. Refer to Note 17.

#### **NOTE 2: INVENTORIES**

Inventories consisted of the following (in millions):

| December 31,                | 2007               | 2006  |
|-----------------------------|--------------------|-------|
| Raw materials and packaging | <b>\$ 1,199 \$</b> | 923   |
| Finished goods              | 789                | 548   |
| Other                       | 232                | 170   |
| Inventories                 | <b>\$ 2,220</b>    | 1,641 |

#### **NOTE 3: BOTTLING INVESTMENTS**

#### Coca-Cola Enterprises Inc.

CCE is a marketer, producer and distributor of bottle and can nonalcoholic beverages, operating in eight countries. As of December 31, 2007, our Company owned approximately 35 percent of the outstanding common stock of CCE. We account for our investment by the equity method of accounting and, therefore, our net income includes our proportionate share of income resulting from our investment in CCE. As of December 31, 2007, our proportionate share of the net assets of CCE exceeded our investment by approximately \$337 million. This difference is not amortized.

A summary of financial information for CCE is as follows (in millions):

| Year Ended December 31,   | <br>2007     | <br>2006      | 2005         |
|---------------------------|--------------|---------------|--------------|
| Net operating revenues    | \$<br>20,936 | \$<br>19,804  | \$<br>18,743 |
| Cost of goods sold        | <br>12,955   | <br>12,067    | 11,258       |

#### A summary of our significant transactions with CCE is as follows (in millions):

| Year Ended December 31,                                       | 2007     | 2006     | 2005     |
|---|----------|----------|----------|
| Concentrate, syrup and finished product sales to CCE          | \$ 5,948 | \$ 5,378 | \$ 5,125 |
| Syrup and finished product purchases from CCE                 | 410      | 415      | 428      |
| CCE purchases of sweeteners through our Company               | 326      | 274      | 275      |
| Marketing payments made by us directly to CCE                 | 636      | 514      | 482      |
| Marketing payments made to third parties on behalf of CCE     | 123      | 113      | 136      |
| Local media and marketing program reimbursements from CCE     | 299      | 279      | 245      |
| Payments made to CCE for dispensing equipment repair services | 78       | 74       | 70       |
| Other payments—net  | 102      | 99       | 81       |

Syrup and finished product purchases from CCE represent purchases of fountain syrup in certain territories that have been resold by our Company to major customers and purchases of bottle and can products. Marketing payments made by us directly to CCE represent support of certain marketing activities and our participation with CCE in cooperative advertising and other marketing activities to promote the sale of Company trademark products within CCE

#### NOTE 3: BOTTLING INVESTMENTS (Continued)

territories. These programs are agreed to on an annual basis. Marketing payments made to third parties on behalf of CCE represent support of certain marketing activities and programs to promote the sale of Company trademark products within CCE's territories in conjunction with certain of CCE's customers. Pursuant to cooperative advertising and trade agreements with CCE, we received funds from CCE for local media and marketing program reimbursements. Payments made to CCE for dispensing equipment repair services represent reimbursement to CCE for its costs of parts and labor for repairs on cooler, dispensing, or post-mix equipment owned by us or our customers. The Other payments—net line in the table above represents payments made to and received from CCE that are individually not significant.

In 2007, our equity income related to CCE was increased by approximately \$11 million related to our proportionate share of certain items recorded by CCE. Our proportionate share of these items included an approximate \$35 million increase to equity income, primarily related to tax benefits recorded by CCE. This increase was partially offset by an approximate \$24 million decrease to equity income, primarily related to restructuring charges recorded by CCE. Refer to Note 19.

The Canadian Bottler's Agreements between our Company and CCE expired on January 28, 2008. We continue to operate under the terms of the expired agreements while we negotiate the terms of the new agreements.

In 2006, our Company's equity income related to CCE decreased by approximately \$587 million, related to our proportionate share of certain items recorded by CCE. Our proportionate share of these items included approximately \$602 million resulting from the impact of an impairment charge recorded by CCE. CCE recorded a \$2.9 billion pretax (\$1.8 billion after tax) impairment of its North American franchise rights. The decline in the estimated fair value of CCE's North American franchise rights was the result of several factors, including but not limited to (1) CCE's revised outlook on 2007 raw material costs driven by significant increases in aluminum and high fructose corn syrup ("HFCS"); (2) a challenging marketplace environment with increased pricing pressures in several high-growth beverage categories; and (3) increased interest rates contributing to a higher discount rate and corresponding capital charge. Our proportionate share of CCE's charges also included approximately \$18 million due to restructuring charges recorded by CCE. These charges were partially offset by approximately \$33 million related to our proportionate share of changes in certain of CCE's state and Canadian federal and provincial tax rates. All of these charges and changes impacted our Bottling Investments operating segment.

In 2005, our equity income related to CCE was reduced by approximately \$33 million related to our proportionate share of certain charges and gains recorded by CCE. Our proportionate share of CCE's charges included an approximate \$51 million decrease to equity income, primarily related to the tax liability recorded by CCE in the fourth quarter of 2005 resulting from the repatriation of previously unremitted foreign earnings under the Jobs Creation Act and approximately \$18 million due to restructuring charges recorded by CCE. These restructuring charges were primarily related to workforce reductions associated with the reorganization of CCE's North American operations, changes in executive management and elimination of certain positions in CCE's corporate headquarters. These charges were partially offset by an approximate \$37 million increase to equity income in the second quarter of 2005 resulting from CCE's HFCS lawsuit settlement proceeds and changes in certain of CCE's state and provincial tax rates. Refer to Note 19.

Our Company and CCE have established a Global Marketing Fund, under which we expect to pay CCE \$62 million annually through December 31, 2014, as support for certain marketing activities. The term of the agreement will automatically be extended for successive 10-year periods thereafter unless either party gives written notice of termination of this agreement. The marketing activities to be funded under this agreement will be agreed upon

#### **NOTE 3: BOTTLING INVESTMENTS (Continued)**

each year as part of the annual joint planning process and will be incorporated into the annual marketing plans of both companies. These amounts are included in the line item marketing payments made by us directly to CCE in the table above.

Our Company previously entered into programs with CCE designed to help develop cold-drink infrastructure. Under these programs, our Company paid CCE for a portion of the cost of developing the infrastructure necessary to support accelerated placements of cold-drink equipment. These payments support a common objective of increased sales of Company trademarked beverages from increased availability and consumption in the cold-drink channel. In connection with these programs, CCE agreed to:

- (1) purchase and place specified numbers of Company-approved cold-drink equipment each year through 2010;
- (2) maintain the equipment in service, with certain exceptions, for a period of at least 12 years after placement;
- (3) maintain and stock the equipment in accordance with specified standards; and
- (4) annual reporting to our Company of minimum average annual unit case volume throughout the economic life of the equipment and other specified information.

CCE must achieve minimum average unit case volume for a 12-year period following the placement of equipment. These minimum average unit case volume levels ensure adequate gross profit from sales of concentrate to fully recover the capitalized costs plus a return on the Company's investment. Should CCE fail to purchase the specified numbers of cold-drink equipment for any calendar year through 2010, the parties agreed to mutually develop a reasonable solution. Should no mutually agreeable solution be developed, or in the event that CCE otherwise breaches any material obligation under the contracts and such breach is not remedied within a stated period, then CCE would be required to repay a portion of the support funding as determined by our Company. In the third quarter of 2004, our Company and CCE agreed to amend the contract to defer the placement of some equipment from 2004 and 2005, as previously agreed under the original contract, to 2009 and 2010. In connection with this amendment, CCE agreed to pay the Company approximately \$2 million in 2004, \$3 million annually in 2005 through 2008, and \$1 million in 2009. In 2005, our Company and CCE agreed to amend the contract for North America to move to a system of purchase and placement credits, whereby CCE earns credit toward its annual purchase and placement requirements based upon the type of equipment it purchases and places. The amended contract also provides that no breach by CCE will occur even if they do not achieve the required number of purchase and placement credits in any given year, so long as (1) the shortfall does not exceed 20 percent of the required purchase and placement credits for that year; (2) a compensating payment is made to our Company by CCE; (3) the shortfall is corrected in the following year; and (4) CCE meets all specified purchase and placement credit requirements by the end of 2010. The payments we made to CCE under these programs are recorded in prepaid expenses and other assets and in noncurrent other assets and amortized as deductions from revenues over the 10-year period following the placement of the equipment. Our carrying values for these infrastructure programs with CCE were approximately \$494 million and \$576 million as of December 31, 2007 and 2006, respectively. The Company has no further commitments under these programs.

Effective December 31, 2006, CCE adopted SFAS No. 158. Our proportionate share of the impact of CCE's adoption of SFAS No. 158 was an approximate \$132 million pretax (\$84 million after tax) reduction in both the carrying value of our investment in CCE and our accumulated other comprehensive income (loss) ("AOCI"). Refer to Note 10 and Note 16.

If valued at the December 31, 2007 quoted closing price of CCE shares, the fair value of our investment in CCE would have exceeded our carrying value by approximately \$2.8 billion.

#### **NOTE 3: BOTTLING INVESTMENTS (Continued)**

#### **Other Equity Method Investments**

Our other equity method investments include our ownership interests in Coca-Cola Hellenic, Coca-Cola FEMSA and Coca-Cola Amatil. As of December 31, 2007, we owned approximately 23 percent, 32 percent and 30 percent, respectively, of these companies' common shares.

Operating results include our proportionate share of income (loss) from our equity method investments. As of December 31, 2007, our investment in our equity method investees in the aggregate, other than CCE, exceeded our proportionate share of the net assets of these equity method investees by approximately \$1,122 million. This difference is not amortized.

A summary of financial information for our equity method investees in the aggregate, other than CCE, is as follows (in millions):

| Year Ended December 31,                           |         | 2007            | 2006             | 2005                |
|---|---------|-----------------|------------------|---------------------|
| Net operating revenues Cost of goods sold         |         | ,112 \$<br>,003 | 24,990<br>14,717 | \$ 24,389<br>14,141 |
| Gross profit                                      | \$ 12,  | ,109 \$         | 10,273           | \$ 10,248           |
| Operating income                                  | \$ 3.   | ,369 \$         | 2,697            | \$ 2,669            |
| Net income (loss)                                 | \$ 1    | ,868 \$         | 1,475            | \$ 1,501            |

| Total liabilities                                 |         | \$              | 18,947           | \$ 17,616           |
| Shareowners' equity                               |         | \$              | 15,894           | \$ 12,874           |
| Company equity investment                         | 7 200 0 | \$              | 5,652            | \$ 4,998            |

Net sales to equity method investees other than CCE, the majority of which are located outside the United States, were approximately \$8.0 billion in 2007, \$7.6 billion in 2006 and \$7.4 billion in 2005. Total payments, primarily marketing, made to equity method investees other than CCE were approximately \$546 million, \$512 million and \$475 million in 2007, 2006 and 2005, respectively.

In 2007, the Company and Coca-Cola FEMSA jointly acquired Jugos del Valle, S.A.B. de C.V. ("Jugos del Valle"), the second largest producer of packaged juices, nectars and fruit-flavored beverages in Mexico and the largest producer of such beverages in Brazil. The total purchase price was approximately \$370 million plus the assumption of approximately \$85 million in debt and was split equally between the Company and Coca-Cola FEMSA. The Company's investment in Jugos del Valle is accounted for under the equity method. Equity income—net includes

#### **NOTE 3: BOTTLING INVESTMENTS (Continued)**

our proportionate share of the results of Jugos del Valle's operations beginning November 2007 and is included in the Latin America operating segment. Refer to Note 20.

During 2007, the Company acquired a 34 percent interest in Tokyo Coca-Cola Bottling Company ("Tokyo CCBC"). The Company's investment in Tokyo CCBC is accounted for under the equity method. Equity income—net includes our proportionate share of the results of Tokyo CCBC's operations beginning July 2007 and is included in the Bottling Investments operating segment. In the third quarter of 2007, the Company also acquired an additional interest in Nordeste Refrigerantes S.A. ("NORSA"). After this acquisition, the Company owned approximately 60 percent of NORSA. The Company began consolidating this entity from the date we acquired the additional 11 percent interest. The combined purchase price for these third quarter acquisitions was approximately \$203 million. NORSA is included in the Bottling Investments operating segment. Refer to Note 20.

In 2007, the Company sold a portion of its interest in Coca-Cola Amatil for proceeds of approximately \$143 million. As a result of this transaction, we recognized a gain of approximately \$73 million, which impacted the Corporate segment and was included in other income (loss)—net in our consolidated statement of income. Our ownership interest in the total outstanding shares of Coca-Cola Amatil was reduced from approximately 32 percent to 30 percent. Refer to Note 19.

During 2007, the Company sold substantially all of its interest in Vonpar Refrescos S.A. ("Vonpar"), a bottler headquartered in Brazil. Total proceeds from the sale were approximately \$238 million, and we recognized a gain on this sale of approximately \$70 million, which impacted the Corporate segment and is included in other income (loss)—net in our consolidated statements of income. Prior to this sale, our Company owned approximately 49 percent of Vonpar's outstanding common stock and accounted for the investment using the equity method. Refer to Note 19.

In 2007, our equity income was also reduced by approximately \$62 million in the Bottling Investments operating segment related to our proportionate share of an impairment recorded by Coca-Cola Amatil as a result of the sale of its bottling operations in South Korea. Refer to Note 19.

Equity income in 2007 was reduced by approximately \$99 million in the Bottling Investments operating segment related to our proportionate share of asset write-downs recorded by Coca-Cola Bottlers Philippines, Inc. ("CCBPI"). The asset write-downs primarily related to excess and obsolete bottles and cases at CCBPI. Refer to Note 19.

In 2003, one of our Company's equity method investees, Coca-Cola FEMSA, consummated a merger with another of the Company's equity method investees, Panamerican Beverages, Inc. At the time of the merger, the Company and Fomento Economico Mexicano, S.A.B. de C.V. ("FEMSA"), the major shareowner of Coca-Cola FEMSA, reached an understanding under which this shareowner could purchase from our Company an amount of Coca-Cola FEMSA shares sufficient for this shareowner to regain majority ownership interest in Coca-Cola FEMSA. That understanding expired in May 2006; however, in the third quarter of 2006, the Company and the shareowner reached an agreement under which the Company would sell a number of shares representing 8 percent of the capital stock of Coca-Cola FEMSA to FEMSA. As a result of this sale, which occurred in the fourth quarter of 2006, the Company received cash proceeds of approximately \$427 million and realized a gain of approximately \$175 million, which was recorded in the consolidated statement of income line item other income (loss)—net and impacted the Corporate operating segment. Also as a result of this sale, our ownership interest in Coca-Cola FEMSA was reduced from approximately 40 percent to approximately 32 percent. Refer to Note 19.

In 2006, our Company sold a portion of our investment in Coca-Cola Icecek A.S. ("Coca-Cola Icecek"), an equity method investee bottler incorporated in Turkey, in an initial public offering. Our Company received cash proceeds of

#### **NOTE 3: BOTTLING INVESTMENTS (Continued)**

approximately \$198 million and realized a gain of approximately \$123 million, which was recorded in the consolidated statement of income line item other income (loss)—net and impacted the Corporate operating segment. As a result of this public offering, our Company's interest in Coca-Cola Icecek decreased from approximately 36 percent to approximately 20 percent. Refer to Note 19.

Our Company owns a 50 percent interest in Multon, a Russian juice business ("Multon"), which we acquired in April 2005 jointly with Coca-Cola Hellenic, for a total purchase price of approximately \$501 million, split equally between the Company and Coca-Cola Hellenic. Multon produces and distributes juice products under the Dobriy, Rich, Nico and other trademarks in Russia, Ukraine and Belarus. Equity income—net includes our proportionate share of Multon's net income beginning April 20, 2005. Refer to Note 20.

Effective December 31, 2006, our equity method investees other than CCE, also adopted SFAS No. 158. Our proportionate share of the impact of the adoption of SFAS No. 158 by our equity method investees other than CCE was an approximate \$18 million pretax (\$12 million after tax) reduction in the carrying value of our investments in those equity method investees and our AOCI. Refer to Note 10 and Note 16.

If valued at the December 31, 2007, quoted closing prices of shares actively traded on stock markets, the value of our equity method investments in publicly traded bottlers other than CCE would have exceeded our carrying value by approximately \$5.8 billion.

#### Net Receivables and Dividends from Equity Method Investees

The total amount of net receivables due from equity method investees, including CCE, was approximately \$933 million and \$857 million as of December 31, 2007 and 2006, respectively. The total amount of dividends received from equity method investees, including CCE, was approximately \$216 million, \$226 million and \$234 million for the years ended December 31, 2007, 2006 and 2005, respectively.

#### NOTE 4: ISSUANCES OF STOCK BY EQUITY METHOD INVESTEES

In 2007 and 2006, our equity method investees did not issue any additional shares to third parties that resulted in our Company recording any noncash pretax gains.

In 2005, our Company recorded approximately \$23 million of noncash pretax gains on issuances of stock by equity method investees. We recorded deferred taxes of approximately \$8 million on these gains. These gains primarily related to an issuance of common stock by Coca-Cola Amatil, which was valued at an amount greater than the book value per share of our investment in Coca-Cola Amatil. Coca-Cola Amatil issued approximately 34 million shares of common stock with a fair value of \$5.78 each in connection with the acquisition of SPC Ardmona Pty. Ltd., an Australian packaged fruit company. This issuance of common stock reduced our ownership interest in the total outstanding shares of Coca-Cola Amatil from approximately 34 percent to approximately 32 percent.

#### NOTE 5: PROPERTY, PLANT AND EQUIPMENT

The following table summarizes our property, plant and equipment (in millions):

| December 31,                                   | 2007      | 2006      |
|--|-----------|-----------|
| Land   | \$ 731    | \$ 495    |
| Buildings and improvements                     | 3,539     | 3,020     |
| Machinery and equipment                        | 8,924     | 7,333     |
| Containers                                     | 828       | 556       |
| Construction in progress                       | 422       | 507       |
|  | \$ 14,444 | \$ 11,911 |
| Less accumulated depreciation                  | 5,951     | 5,008     |
| Property, plant and equipment—net <sup>1</sup> | \$ 8,493  | \$ 6,903  |

<sup>&</sup>lt;sup>1</sup> The increase in 2007 is primarily related to business combinations, purchases of property, plant and equipment and the effect of translation adjustments, which were partially offset by disposals. Refer to Note 20.

#### NOTE 6: GOODWILL, TRADEMARKS AND OTHER INTANGIBLE ASSETS

The following tables set forth information for intangible assets subject to amortization and for intangible assets not subject to amortization (in millions):

| December 31,   | 2007         | 2006        |
|--|--------------|-------------|
| Amortized intangible assets (various, principally customer relationships and |              |             |
| trademarks):   |              |             |
| Gross carrying amount <sup>1</sup>   | \$<br>685    | \$<br>372   |
| Less accumulated amortization  | <br>192      | 174         |
| Amortized intangible assets—net  | \$<br>493    | \$<br>198   |

- <sup>1</sup> The increase in 2007 is primarily related to business combinations and acquisitions of trademarks with definite lives totaling approximately \$333 million and the effect of translation adjustments, which were partially offset by disposals. Refer to Note 20.
- <sup>2</sup> The increase in 2007 is primarily related to business combinations and acquisitions of trademarks and brands totaling approximately \$3,075 million and the effect of translation adjustments, which were partially offset by impairment charges of approximately \$2 million and disposals. Refer to Note 20.
- <sup>3</sup> The increase in 2007 is primarily related to the acquisitions of Energy Brands, Inc., also known as glacéau, CCBPI and 18 German bottling and distribution operations, and the effect of translation adjustments. Refer to Note 20.
- <sup>4</sup> The increase in 2007 is primarily related to the acquisitions of CCBPI, NORSA and 18 German bottling and distribution operations, and the effect of translation adjustments. Refer to Note 20.

#### NOTE 6: GOODWILL, TRADEMARKS AND OTHER INTANGIBLE ASSETS (Continued)

Total amortization expense for intangible assets subject to amortization was approximately \$33 million, \$18 million and \$29 million for the years ended December 31, 2007, 2006 and 2005, respectively.

Information about estimated amortization expense for intangible assets subject to amortization for the five years succeeding December 31, 2007, is as follows (in millions):

|      | Amortization<br>Expense |
|------|-------------------------|
| 2008 | \$ 52                   |
| 2009 | 48                      |
| 2010 | 47                      |
| 2011 | 44                      |
| 2012 | 40                      |

Goodwill by operating segment was as follows (in millions):

| December 31,         | 2007        | 2006     |
|----------------------|-------------|----------|
| Africa               | \$ <b>—</b> | \$ —     |
| Eurasia              | 36          | 14       |
| European Union       | 780         | 696      |
| Latin America        | 207         | 119      |
| North America        | 2,412       | 141      |
| Pacific              | 30          | 29       |
| Bottling Investments | 791         | 404      |
|                      | \$ 4,256    | \$ 1,403 |

In 2006, our Company recorded impairment charges of approximately \$41 million primarily related to trademarks for beverages sold in the Philippines and Indonesia. The Philippines and Indonesia are components of our Pacific operating segment. The amount of these impairment charges was determined by comparing the fair values of the intangible assets to their respective carrying values. The fair values were determined using discounted cash flow analyses. Because the fair values were less than the carrying values of the assets, we recorded impairment charges to reduce the carrying values of the assets to their respective fair values. These impairment charges were recorded in the line item other operating charges in the consolidated statement of income. Refer to Note 19.

In 2005, our Company recorded an impairment charge related to trademarks for beverages sold in the Philippines of approximately \$84 million. The carrying value of our trademarks in the Philippines, prior to the recording of the impairment charges in 2005, was approximately \$268 million. The impairment was the result of our revised outlook for the Philippines, which had been unfavorably impacted by declines in volume and income before income taxes resulting from the continued lack of an affordable package offering and the continued limited availability of these trademark beverages in the marketplace. We determined the amount of this impairment charge by comparing the fair value of the intangible assets to the carrying value. Fair values were derived using discounted cash flow analyses with a number of scenarios that were weighted based on the probability of different outcomes. Because the fair value was less than the carrying value of the assets, we recorded an impairment charge to reduce the carrying value of the assets to fair value. This impairment charge was recorded in the line item other operating charges in the consolidated statement of income. Refer to Note 19.

#### NOTE 7: ACCOUNTS PAYABLE AND ACCRUED EXPENSES

Accounts payable and accrued expenses consisted of the following (in millions):

| December 31,                          | 2007     | 2006     |
|---------------------------------------|----------|----------|
| Other accrued expenses                | \$ 2,379 | \$ 1,700 |
| Accrued marketing                     | 1,749    | 1,348    |
| Trade accounts payable                | 1,380    | 929      |
| Accrued compensation                  | 696      | 550      |
| Sales, payroll and other taxes        | 352      | 264      |
| Container deposits                    | 359      | 264      |
| Accounts payable and accrued expenses | \$ 6,915 | \$ 5,055 |

#### NOTE 8: SHORT-TERM BORROWINGS AND CREDIT ARRANGEMENTS

Loans and notes payable consist primarily of commercial paper issued in the United States. As of December 31, 2007 and 2006, we had approximately \$5,420 million and \$1,942 million, respectively, outstanding in commercial paper borrowings. Our weighted-average interest rates for commercial paper outstanding were approximately 4.5 percent and 5.2 percent per year at December 31, 2007 and 2006, respectively. In addition, we had approximately \$4,963 million in lines of credit and other short-term credit facilities available as of December 31, 2007, of which approximately \$499 million was outstanding. The outstanding amount of approximately \$499 million was primarily related to our international operations. Included in the available credit facilities discussed above, the Company had \$3,750 million in lines of credit for general corporate purposes, including commercial paper backup. There were no borrowings under these lines of credit during 2007.

These credit facilities are subject to normal banking terms and conditions. Some of the financial arrangements require compensating balances, none of which is presently significant to our Company.

As of December 31, 2006, loans and notes payable included a liability to acquire the remaining approximate 59 percent of the outstanding stock of Coca-Cola Erfrischungsgetraenke AG ("CCEAG"). As of December 31, 2006, the Company owned approximately 41 percent of CCEAG's outstanding stock. In February 2002, the Company acquired control of CCEAG and agreed to put/call agreements with the other shareowners of CCEAG, which resulted in the recording of a liability to acquire the remaining shares in CCEAG. The present value of the total amount to be paid by our Company to all other CCEAG shareowners was approximately \$1,068 million at December 31, 2006, which was paid in January 2007. This amount increased from the initial liability of approximately \$600 million due to the accretion of the discounted value to the ultimate maturity of the liability and the translation adjustment related to this liability, partially offset by payments made to the other CCEAG shareowners during the term of the agreements. The accretion of the discounted value to its ultimate maturity value is recorded in the line item other income (loss)—net. The accretion was approximately \$58 million and \$60 million, respectively, for the years ended December 31, 2006 and 2005.

#### **NOTE 9: LONG-TERM DEBT**

On November 1, 2007, the Company issued approximately \$1,750 million of notes due on November 15, 2017. The proceeds from this \$1,750 million debt issuance were used to repay short-term debt, including commercial paper issued to finance our current year acquisitions. Refer to Note 20.

Long-term debt consisted of the following (in millions):

| December 31,                         | 2007     | 2006     |
|--------------------------------------|----------|----------|
| 5¾4% U.S. dollar notes due 2009      | \$ 399   | \$ 399   |
| 5¾4% U.S. dollar notes due 2011      | 499      | 499      |
| 57/20% U.S. dollar notes due 2017    | 1,747    |          |
| 73/8% U.S. dollar notes due 2093     | 116      | 116      |
| Other, due through 2014 <sup>1</sup> | 649      | 333      |
|                                      | \$ 3,410 | \$ 1,347 |
| Less current portion                 | 133      | 33       |
| Long-term debt                       | \$ 3,277 | \$ 1,314 |

<sup>&</sup>lt;sup>1</sup> The weighted-average interest rate on outstanding balances was 6.5% and 6.0%, respectively, for the years ended December 31, 2007 and 2006.

The above notes include various restrictions, none of which is presently significant to our Company.

The principal amount of our long-term debt that had fixed and variable interest rates, respectively, was approximately \$3,409 million and \$1 million at December 31, 2007. The principal amount of our long-term debt that had fixed and variable interest rates, respectively, was approximately \$1,346 million and \$1 million at December 31, 2006. The weighted-average interest rate on the outstanding balances of our Company's long-term debt was 5.8 percent and 6.0 percent, respectively, for the years ended December 31, 2007 and 2006.

Total interest paid was approximately \$405 million, \$212 million and \$233 million in 2007, 2006 and 2005, respectively. For a more detailed discussion of interest rate management, refer to Note 12.

Maturities of long-term debt for the five years succeeding December 31, 2007 are as follows (in millions):

| 2009<br>2010<br>2011 | Maturities of<br>Long-Term Debt |
|----------------------|---------------------------------|
| 2008                 | \$ 133                          |
| 2009                 | 591                             |
| 2010                 | 58                              |
| 2011                 | 553                             |
| 2012                 | 196                             |

#### NOTE 10: COMPREHENSIVE INCOME

AOCI, including our proportionate share of equity method investees' AOCI, consisted of the following (in millions):

| December 31,  | 2007   | 2006       |
|---|--------|------------|
| Foreign currency translation adjustment             | \$ 591 | \$ (984)   |
| Accumulated derivative net losses                   | (113)  | (49)       |
| Unrealized gain on available-for-sale securities    | 161    | 147        |
| Adjustment to pension and other benefit liabilities | (13)   | (405)1     |
| Accumulated other comprehensive income (loss)       | \$ 626 | \$ (1,291) |

<sup>&</sup>lt;sup>1</sup> Includes adjustment of \$(288) million, net of tax, relating to the initial adoption of SFAS No. 158. Refer to Note 16.

A summary of the components of other comprehensive income (loss), including our proportionate share of equity method investees' other comprehensive income (loss), for the years ended December 31, 2007, 2006 and 2005, is as follows (in millions):

|  |                      | Before-Tax<br>Amount |               | Income<br>Tax | A  | fter-Tax<br>Amount  |  |
|--|----------------------|----------------------|---------------|---------------|----|---------------------|--|
| 2007 Net foreign currency translation adjustment                   | \$                   | 1,729                | ¢             | (154)         | \$ | 1,575               |  |

#### **NOTE 11: FINANCIAL INSTRUMENTS**

#### Certain Debt and Marketable Equity Securities

Investments in debt and marketable equity securities, other than investments accounted for by the equity method, are categorized as trading, available-for-sale or held-to-maturity. Our marketable equity investments are categorized as trading or available-for-sale with their cost basis determined by the specific identification method. Trading securities are carried at fair value with realized and unrealized gains and losses included in net income. We record available-for-sale instruments at fair value, with unrealized gains and losses, net of deferred income taxes, reported as a component of AOCI. Debt securities categorized as held-to-maturity are stated at amortized cost.

As of December 31, 2007 and 2006, trading, available-for-sale and held-to-maturity securities consisted of the following (in millions):

|                                |      |      |                               |       | realized              | Esti | mated |
|--------------------------------|------|------|-------------------------------|-------|-----------------------|------|-------|
|                                |      | Cost |                               | Gains | Losses                | Fair | Value |
| 2007                           |      |      |                               |       |                       |      |       |
| Trading securities:            |      |      |                               |       |                       |      |       |

For the years ended December 31, 2007, 2006 and 2005, gross realized gains and losses on sales of trading and available-for-sale securities were not material. The cost of securities sold is based on the specific identification method.

#### Fair Value of Other Financial Instruments

The carrying amounts of cash and cash equivalents, receivables, accounts payable and accrued expenses, and loans and notes payable approximate their fair values because of the relatively short-term maturity of these instruments.

We estimate that the fair values of non-marketable cost method investments approximate their carrying amounts.

We carry our non-marketable cost method investments at cost or, if a decline in the value of the investment is deemed to be other than temporary, at fair value. Estimates of fair value are generally based upon discounted cash flow analyses.

#### **NOTE 11: FINANCIAL INSTRUMENTS (Continued)**

We recognize all derivative instruments as either assets or liabilities at fair value in our consolidated balance sheets, with fair values estimated based on quoted market prices or pricing models using current market rates. Virtually all of our derivatives are straightforward, over-the-counter instruments with liquid markets. For further discussion of our derivatives, including a disclosure of derivative values, refer to Note 12.

The fair value of our long-term debt is estimated based on quoted prices for those or similar instruments. As of December 31, 2007, the carrying amounts and fair values of our long-term debt, including the current portion, were approximately \$3,410 million and \$3,416 million, respectively. As of December 31, 2006, these carrying amounts and fair values were approximately \$1,347 million and \$1,386 million, respectively.

#### NOTE 12: HEDGING TRANSACTIONS AND DERIVATIVE FINANCIAL INSTRUMENTS

When deemed appropriate, our Company uses derivative financial instruments primarily to reduce our exposure to adverse fluctuations in interest rates and foreign currency exchange rates, commodity prices and other market risks. Derivative instruments used to manage fluctuations in certain commodity prices were not material to the consolidated financial statements for the years ended December 31, 2007, 2006 and 2005. The Company formally designates and documents the financial instrument as a hedge of a specific underlying exposure, as well as the risk management objectives and strategies for undertaking the hedge transactions. The Company formally assesses, both at the inception and at least quarterly thereafter, whether the financial instruments that are used in hedging transactions are effective at offsetting changes in either the fair value or cash flows of the related underlying exposure. Because of the high degree of effectiveness between the hedging instrument and the underlying exposure being hedged, fluctuations in the value of the derivative instruments are generally offset by changes in the fair values or cash flows of the underlying exposures being hedged. Any ineffective portion of a financial instrument's change in fair value is immediately recognized in earnings. Virtually all of our derivatives are straightforward over-the-counter instruments with liquid markets. Our Company does not enter into derivative financial instruments for trading purposes.

The fair values of derivatives used to hedge or modify our risks fluctuate over time. We do not view these fair value amounts in isolation, but rather in relation to the fair values or cash flows of the underlying hedged transactions or other exposures. The notional amounts of the derivative financial instruments do not necessarily represent amounts exchanged by the parties and, therefore, are not a direct measure of our exposure to the financial risks described above. The amounts exchanged are calculated by reference to the notional amounts and by other terms of the derivatives, such as interest rates, foreign currency exchange rates or other financial indices.

Our Company recognizes all derivative instruments as either assets or liabilities in our consolidated balance sheets at fair value. The accounting for changes in fair value of a derivative instrument depends on whether it has been designated and qualifies as part of a hedging relationship and, further, on the type of hedging relationship. At the inception of the hedging relationship, the Company must designate the instrument as a fair value hedge, a cash flow hedge, or a hedge of a net investment in a foreign operation. This designation is based upon the exposure being hedged.

We have established strict counterparty credit guidelines and enter into transactions only with financial institutions of investment grade or better. We monitor counterparty exposures daily and review any downgrade in credit rating immediately. If a downgrade in the credit rating of a counterparty were to occur, we have provisions requiring collateral in the form of U.S. government securities for substantially all of our transactions. To mitigate presettlement risk, minimum credit standards become more stringent as the duration of the derivative financial instrument increases. To minimize the concentration of credit risk, we enter into derivative transactions with a portfolio of financial institutions. The Company has master netting agreements with most of the financial institutions that are counterparties

#### NOTE 12: HEDGING TRANSACTIONS AND DERIVATIVE FINANCIAL INSTRUMENTS (Continued)

to the derivative instruments. These agreements allow for the net settlement of assets and liabilities arising from different transactions with the same counterparty. Based on these factors, we consider the risk of counterparty default to be minimal.

#### **Interest Rate Management**

Our Company monitors our mix of fixed-rate and variable-rate debt as well as our mix of short-term debt versus long-term debt. This monitoring includes a review of business and other financial risks. From time to time, in anticipation of future debt issuances, we may manage our risk to interest rate fluctuations through the use of derivative financial instruments. The Company had no outstanding interest rate swaps or other related derivative financial instruments as of December 31, 2007 and 2006. Any ineffective portion, which was not significant in 2007, 2006 or 2005, of these instruments was immediately recognized in net income.

#### Foreign Currency Management

The purpose of our foreign currency hedging activities is to reduce the risk that our eventual U.S. dollar net cash inflows resulting from sales outside the United States will be adversely affected by changes in foreign currency exchange rates.

We enter into forward exchange contracts and purchase foreign currency options (principally euro and Japanese yen) and collars to hedge certain portions of forecasted cash flows denominated in foreign currencies. The effective portion of the changes in fair value for these contracts, which have been designated as cash flow hedges, was reported in AOCI and reclassified into earnings in the same financial statement line item and in the same period or periods during which the hedged transaction affects earnings. Any ineffective portion, which was not significant in 2007, 2006 or 2005, of the change in the fair value of these instruments was immediately recognized in net income.

Additionally, the Company enters into forward exchange contracts that are effective economic hedges and are not designated as hedging instruments under SFAS No. 133. These instruments are used to offset the earnings impact relating to the variability in foreign currency exchange rates on certain monetary assets and liabilities denominated in nonfunctional currencies. Changes in the fair value of these instruments are immediately recognized in earnings in the line item other income (loss)—net in our consolidated statements of income to offset the effect of remeasurement of the monetary assets and liabilities.

The Company also enters into forward exchange contracts to hedge its net investment position in certain major currencies. Under SFAS No. 133, changes in the fair value of these instruments are recognized in foreign currency translation adjustment, a component of AOCI, to offset the change in the value of the net investment being hedged. For the years ended December 31, 2007, 2006 and 2005, we recorded net gain (loss) in foreign currency translation adjustment related to those instruments of approximately \$(7) million, \$3 million and \$(40) million, respectively.

#### NOTE 12: HEDGING TRANSACTIONS AND DERIVATIVE FINANCIAL INSTRUMENTS (Continued)

The following table presents the carrying values, fair values and maturities of the Company's foreign currency derivative instruments outstanding as of December 31, 2007 and 2006 (in millions):

| Carrying Values<br>Assets/(Liabilities) | Fair Values<br>Assets/(Liabilities)   | Maturity             |
|---|---|----------------------|
|   |   |                      |
| \$ (58)                                 | \$ (58)   | 2008-2009            |
| 46                                      | 46  | 2008                 |
| \$ (12)                                 | \$ (12)   |                      |
| Carrying Values<br>Assets/(Liabilities) | Fair Values<br>Assets/(Liabilities)   | Maturity             |
|   |   |                      |
| \$ (21)                                 | \$ (21)   | 2007-2008            |
| 18                                      | 18  | 2007                 |
| \$ (3)                                  | \$ (3)  |                      |
|   | Assets/(Liabilities)  \$ (58) 46  \$ (12)  Carrying Values Assets/(Liabilities)  \$ (21) 18 | Assets/(Liabilities) |

The Company estimates the fair value of its foreign currency derivatives based on quoted market prices or pricing models using current market rates. These amounts are primarily reflected in prepaid expenses and other assets and accounts payable and accrued expenses in our consolidated balance sheets. As of December 31, 2007, we had \$23 million reflected in prepaid expenses and other assets and \$35 million reflected in accounts payable and accrued expenses.

#### **Summary of AOCI**

For the years ended December 31, 2007, 2006 and 2005, we recorded a net gain (loss) to AOCI of approximately \$(59) million, \$(31) million and \$55 million, respectively, net of both income taxes and reclassifications to earnings, primarily related to gains and losses on foreign currency cash flow hedges. These items will generally offset cash flow gains and losses relating to the underlying exposures being hedged in future periods. The Company estimates that it will reclassify into earnings during the next 12 months losses of approximately \$46 million from the after-tax amount recorded in AOCI as of December 31, 2007, as the anticipated cash flows occur.

#### NOTE 12: HEDGING TRANSACTIONS AND DERIVATIVE FINANCIAL INSTRUMENTS (Continued)

The following table summarizes activity in AOCI related to derivatives designated as cash flow hedges held by the Company during the applicable periods (in millions):

|  |                      | Before-Tax<br>Amount |    | Income<br>Tax    |                     | After-Tax<br>Amount |  |
|--|----------------------|----------------------|----|------------------|---------------------|---------------------|--|
| 2007 Accumulated derivative net gains (losses) as of January 1, 2007 Net changes in fair value of derivatives Net reclassification from AOCI into earnings | \$                   | (16)<br>(158)<br>62  | \$ | 6<br>61<br>(24)  | \$                  | (10)<br>(97)<br>38  |  |

| 2005 Accumulated derivative net gains (losses) as of January 1, 2005 Net changes in fair value of derivatives Net reclassification from AOCI into earnings | \$                   | (56)<br>135<br>(44)  | \$ | 22<br>(53)<br>17 | \$                  | (34)<br>82<br>(27)  |  |
| Accumulated derivative net gains (losses) as of December 31, 2005  | \$                   | 35                   | \$ | (14)             | \$                  | 21                  |  |

The Company did not discontinue any cash flow hedge relationships during the years ended December 31, 2007, 2006 and 2005.

#### NOTE 13: COMMITMENTS AND CONTINGENCIES

As of December 31, 2007, we were contingently liable for guarantees of indebtedness owed by third parties in the amount of approximately \$267 million. These guarantees primarily are related to third-party customers, bottlers and vendors and have arisen through the normal course of business. These guarantees have various terms, and none of these guarantees was individually significant. The amount represents the maximum potential future payments that we could be required to make under the guarantees; however, we do not consider it probable that we will be required to satisfy these guarantees.

We believe our exposure to concentrations of credit risk is limited due to the diverse geographic areas covered by our operations.

The Company is involved in various legal proceedings. We establish reserves for specific legal proceedings when we determine that the likelihood of an unfavorable outcome is probable and the amount of loss can be reasonably estimated. Management has also identified certain other legal matters where we believe an unfavorable outcome is reasonably possible and/or for which no estimate of possible losses can be made. Management believes that any liability to the Company that may arise as a result of currently pending legal proceedings, including those discussed below, will not have a material adverse effect on the financial condition of the Company taken as a whole.

#### NOTE 13: COMMITMENTS AND CONTINGENCIES (Continued)

During the period from 1970 to 1981, our Company owned Aqua-Chem, Inc., now known as Cleaver-Brooks, Inc. ("Aqua-Chem"). A division of Aqua-Chem manufactured certain boilers that contained gaskets that Aqua-Chem purchased from outside suppliers. Several years after our Company sold this entity, Aqua-Chem received its first lawsuit relating to asbestos, a component of some of the gaskets. In September 2002, Aqua-Chem notified our Company that it believed we were obligated for certain costs and expenses associated with its asbestos litigations. Aqua-Chem demanded that our Company reimburse it for approximately \$10 million for out-of-pocket litigation-related expenses. Aqua-Chem also demanded that the Company acknowledge a continuing obligation to Aqua-Chem for any future liabilities and expenses that are excluded from coverage under the applicable insurance or for which there is no insurance. Our Company disputes Aqua-Chem's claims, and we believe we have no obligation to Aqua-Chem for any of its past, present or future liabilities, costs or expenses. Furthermore, we believe we have substantial legal and factual defenses to Aqua-Chem's claims. The parties entered into litigation in Georgia to resolve this dispute, which was stayed by agreement of the parties pending the outcome of litigation filed in Wisconsin by certain insurers of Aqua-Chem. In that case, five plaintiff insurance companies filed a declaratory judgment action against Aqua-Chem, the Company and 16 defendant insurance companies seeking a determination of the parties' rights and liabilities under policies issued by the insurers and reimbursement for amounts paid by plaintiffs in excess of their obligations. During the course of the Wisconsin coverage litigation, Aqua-Chem and the Company reached settlements with several of the insurers, including plaintiffs, who have or will pay funds into an escrow account for payment of costs arising from the asbestos claims against Aqua-Chem. On July 24, 2007, the Wisconsin trial court entered a final declaratory judgment regarding the rights and obligations of the parties under the insurance policies issued by the remaining defendant insurers, which judgment was not appealed. The judgment directs, among other things, that each insurer whose policy is triggered is jointly and severally liable for one-hundred percent of Aqua-Chem's losses up to policy limits. The Georgia litigation remains subject to the stay agreement.

The Company has had discussions with the Competition Directorate of the European Commission (the "European Commission") about issues relating to parallel trade within the European Union arising out of comments received by the European Commission from third parties. The Company has fully cooperated with the European Commission and has provided information on these issues and the measures taken and to be taken to address them. The Company is unable to predict at this time with any reasonable degree of certainty what action, if any, the European Commission will take with respect to these issues.

At the time we acquire or divest our interest in an entity, we sometimes agree to indemnify the seller or buyer for specific contingent liabilities. Management believes that any liability to the Company that may arise as a result of any such indemnification agreements will not have a material adverse effect on the financial condition of the Company taken as a whole.

The Company is involved in various tax matters, with respect to some of which the outcome is uncertain. We establish reserves to remove some or all of the tax benefit of any of our tax positions at the time we determine that it becomes uncertain based upon one of the following conditions: (1) the tax position is not "more likely than not" to be sustained, (2) the tax position is "more likely than not" to be sustained, but for a lesser amount, or (3) the tax position is "more likely than not" to be sustained, but not in the financial period in which the tax position was originally taken. For purposes of evaluating whether or not a tax position is uncertain, (1) we presume the tax position will be examined by the relevant taxing authority that has full knowledge of all relevant information, (2) the technical merits of a tax position are derived from authorities such as legislation and statutes, legislative intent, regulations, rulings and case law and their applicability to the facts and circumstances of the tax position, and (3) each tax position is evaluated without consideration of the possibility of offset or aggregation with other tax positions taken. A number of years may elapse before a particular uncertain tax position is audited and finally resolved or when a tax assessment is raised. The number

### NOTE 13: COMMITMENTS AND CONTINGENCIES (Continued)

of years subject to tax assessments varies depending on the tax jurisdiction. The tax benefit that has been previously reserved because of a failure to meet the "more likely than not" recognition threshold would be recognized in our income tax expense in the first interim period when the uncertainty disappears under any one of the following conditions: (1) the tax position is "more likely than not" to be sustained, (2) the tax position, amount, and/or timing is ultimately settled through negotiation or litigation, or (3) the statute of limitations for the tax position has expired. Refer to Note 17.

### NOTE 14: NET CHANGE IN OPERATING ASSETS AND LIABILITIES

Net cash provided by (used in) operating activities attributable to the net change in operating assets and liabilities is composed of the following (in millions):

| Year Ended December 31,                                  | 2007     | 2006     | 2005    |
|--|----------|----------|---------|
| (Increase) in trade accounts receivable                  | \$ (406) | \$ (214) | \$ (79) |
| (Increase) in inventories                                | (258)    | (150)    | (79)    |
| (Increase) decrease in prepaid expenses and other assets | (244)    | (152)    | 244     |
| Increase in accounts payable and accrued expenses        | 762      | 173      | 280     |
| Increase (decrease) in accrued taxes                     | 185      | (68)     | 145     |
| (Decrease) in other liabilities                          | (33)     | (204)    | (81)    |
|  | \$ 6     | \$ (615) | \$ 430  |

#### NOTE 15: STOCK COMPENSATION PLANS

Effective January 1, 2006, the Company adopted SFAS No. 123(R) using the modified prospective method. Based on the terms of our plans, our Company did not have a cumulative effect related to its plans. The adoption of SFAS No. 123(R) did not have a material impact on our stock-based compensation expense for the year ended December 31, 2006. Prior to 2006, our Company accounted for stock option plans and restricted stock plans under the preferable fair value recognition provisions of SFAS No. 123.

Our total stock-based compensation expense was approximately \$313 million, \$324 million and \$324 million in 2007, 2006 and 2005, respectively. These amounts were recorded in selling, general and administrative expenses in our consolidated statements of income. The total income tax benefit recognized in the income statement for share-based compensation arrangements was approximately \$91 million, \$93 million and \$90 million for 2007, 2006 and 2005, respectively. As of December 31, 2007, we had approximately \$441 million of total unrecognized compensation cost related to nonvested share-based compensation arrangements granted under our plans. This cost is expected to be recognized over a weighted-average period of 1.8 years as stock-based compensation expense. This expected cost does not include the impact of any future stock-based compensation awards. Additionally, our equity method investees also adopted SFAS No. 123(R) effective January 1, 2006. Our proportionate share of the stock-based compensation expense resulting from the adoption of SFAS No. 123(R) by our equity method investees is recognized as a reduction to equity income. The adoption of SFAS No. 123(R) by our equity method investees did not have a material impact on our consolidated financial statements.

During 2005, the Company changed its estimated service period for retirement-eligible participants in its plans when the terms of their stock-based compensation awards provide for accelerated vesting upon early retirement. The full-year impact of this change in our estimated service period was approximately \$50 million for 2005.

### NOTE 15: STOCK COMPENSATION PLANS (Continued)

### **Stock Option Plans**

Under our 1991 Stock Option Plan (the "1991 Option Plan"), a maximum of 120 million shares of our common stock was approved to be issued or transferred to certain officers and employees pursuant to stock options granted under the 1991 Option Plan. Options to purchase common stock under the 1991 Option Plan have been granted to Company employees at fair market value at the date of grant.

The 1999 Stock Option Plan (the "1999 Option Plan") was approved by shareowners in April 1999. Following the approval of the 1999 Option Plan, no grants were made from the 1991 Option Plan, and shares available under the 1991 Option Plan were no longer available to be granted. Under the 1999 Option Plan, a maximum of 120 million shares of our common stock was approved to be issued or transferred to certain officers and employees pursuant to stock options granted under the 1999 Option Plan. Options to purchase common stock under the 1999 Option Plan have been granted to Company employees at fair market value at the date of grant.

The 2002 Stock Option Plan (the "2002 Option Plan") was approved by shareowners in April 2002. An amendment to the 2002 Option Plan which permitted the issuance of stock appreciation rights was approved by shareowners in April 2003. Under the 2002 Option Plan, a maximum of 120 million shares of our common stock was approved to be issued or transferred to certain officers and employees pursuant to stock options and stock appreciation rights granted under the 2002 Option Plan. The stock appreciation rights permit the holder, upon surrendering all or part of the related stock option, to receive common stock in an amount up to 100 percent of the difference between the market price and the option price. No stock appreciation rights have been issued under the 2002 Option Plan as of December 31, 2007. Options to purchase common stock under the 2002 Option Plan have been granted to Company employees at fair market value at the date of grant.

Stock options granted in December 2003 and thereafter generally become exercisable over four years (with approximately 25 percent of the total grant vesting each year on the anniversary of the grant date) and expire 10 years from the date of grant. Stock options granted from 1999 through July 2003 generally became exercisable over four-years and expire 15 years from the date of grant. Prior to 1999, stock options generally became exercisable over a three-year vesting period and expire 10 years from the date of grant. The 1999 Stock Option Plan and the 2002 Stock Option Plan have been amended to provide a maximum option term of 10 years for all new grants.

The fair value of each option award is estimated on the grant date using a Black-Scholes-Merton option-pricing model that uses the assumptions noted in the following table. The expected term of the options represents the period of time that options granted are expected to be outstanding and is derived by analyzing historic exercise behavior. Expected volatilities are based on implied volatilities from traded options on the Company's stock, historical volatility of the Company's stock, and other factors. The risk-free interest rate for the period matching the expected term of the option is based on the U.S. Treasury yield curve in effect at the time of the grant. The dividend yield is the calculated yield on the Company's stock at the time of the grant.

The common stock to be issued, transferred and/or sold under the stock option plans shall be made available from authorized and unissued Company common stock or from the Company's treasury shares. In 2007, the Company began issuing common stock under these plans from the Company's treasury shares.

### NOTE 15: STOCK COMPENSATION PLANS (Continued)

The following table sets forth information about the weighted-average fair value of options granted during the past three years and the weighted-average assumptions used for such grants:

|                                     | 2007    | 2006    | 2005    |
|-------------------------------------|---------|---------|---------|
| Fair value of options at grant date | \$ 8.46 | \$ 8.16 | \$ 8.23 |
| Dividend yields                     | 2.6%    | 2.7%    | 2.6%    |
| Expected volatility                 | 15.4%   | 19.3%   | 19.9%   |
| Risk-free interest rates            | 4.6%    | 4.5%    | 4.3%    |
| Expected term of the option         | 6 years | 6 years | 6 years |

### NOTE 15: STOCK COMPENSATION PLANS (Continued)

A summary of stock option activity under all plans for the years ended December 31, 2007, 2006 and 2005 is as follows:

|  | Shares<br>(In millions)        | Weighted-Average<br>Exercise Price              | Weighted-Average<br>Remaining<br>Contractual Life |                | ggregate<br>Intrinsic<br>Value<br>millions) |

<sup>&</sup>lt;sup>1</sup> No grants were made from the 1991 Option Plan during 2007, 2006 or 2005.

The total intrinsic value of the options exercised during the years ended December 31, 2007, 2006 and 2005 was \$284 million, \$11 million and \$49 million, respectively.

<sup>&</sup>lt;sup>2</sup> Shares forfeited/expired relate to the 1991, 1999 and 2002 Option Plans.

### NOTE 15: STOCK COMPENSATION PLANS (Continued)

#### **Restricted Stock Award Plans**

Under the amended 1989 Restricted Stock Award Plan and the amended 1983 Restricted Stock Award Plan (the "Restricted Stock Award Plans"), 40 million and 24 million shares of restricted common stock, respectively, were originally available to be granted to certain officers and key employees of our Company.

At December 31, 2007, approximately 28 million shares remain available for grant under the Restricted Stock Award Plans, when all outstanding awards including promises to grant restricted stock and performance share unit ("PSU") awards at the target level are included. Participants are entitled to vote and receive dividends on the restricted shares and, for awards prior to January 1, 2008 under the 1983 Restricted Stock Award Plan, participants are reimbursed by our Company for income taxes imposed on the award, but not for taxes generated by the reimbursement payment. The 1983 Restricted Stock Plan has been amended to eliminate this tax reimbursement for future awards. The shares are subject to certain transfer restrictions and may be forfeited if a participant leaves our Company for reasons other than retirement, disability or death, absent a change in control of our Company.

The following awards were outstanding and nonvested as of December 31, 2007:

- 479,459 shares of time-based restricted stock and promises to grant restricted stock in which the restrictions lapse upon the achievement of continued employment over a specified period of time;
- 286,800 shares of performance-based restricted stock and promises to grant restricted stock in which
  restrictions lapse upon the achievement of specific performance goals over a specified performance period;
- 2,780,333 PSU awards which could result in a future grant of restricted stock after the achievement of specific performance goals over a specified performance period. Such awards are subject to adjustment based on the final performance relative to the goals, resulting in a minimum grant of no shares and a maximum grant of 4,545,750 shares; and
- 422,238 shares of restricted stock and promises to grant restricted stock were issued for PSU awards.

The Company recognizes compensation expense for awards that are subject to performance criteria, when it is probable that the performance criteria specified in the plan will be achieved. The compensation expense is recognized on a straight-line basis over the remaining vesting period and is recorded in selling, general and administrative expenses.

### NOTE 15: STOCK COMPENSATION PLANS (Continued)

#### Time-Based Restricted Stock Awards

The following table summarizes information about time-based restricted stock awards:

|                          | 2007     |  | 2006        |  | 2005      |  |
|--------------------------|----------|--|-------------|--|-----------|--|
|                          | Shares   | Weighted-<br>Average<br>Grant-Date<br>Fair Value | Shares      | Weighted-<br>Average<br>Grant-Date<br>Fair Value | Shares    | Weighted-<br>Average<br>Grant-Date<br>Fair Value |
| Nonvested on January 1   | 413,700  | \$ 35.84   | 432,700     | \$ 36.46   | 513,700   | \$ 39.97   |
| Granted                  | 55,180   | 56.34  |             |  | 9,000     | 41.80  |
| Promises to grant        | 20,579   | 53.35  | 21,000      | 48.84  | 10,000    | 42.84  |
| Vested and released1     | · —      | _  | (30,000)    | 58.48  | (100,000) | 55.62  |
| Cancelled/forfeited      | (10,000) | 42.84  | (10,000)    | 21.91  |           |  |
| Nonvested on December 31 | 479,4592 | \$ 38.81   | $413,700^2$ | \$ 35.84   | 432,7002  | \$ 36.46   |

- <sup>1</sup> The total fair value of time-based restricted shares vested and released during the years ended December 31, 2006 and 2005, was approximately \$1.3 million and \$4.3 million, respectively. The grant-date fair value is the quoted market value of the Company stock on the respective grant date.
- <sup>2</sup> The nonvested shares on December 31, 2007, 2006 and 2005 include promises to grant time-based restricted stock of 41,579; 31,000; and 10,000, respectively. These awards are similar to time-based restricted stock, including the payment of dividend equivalents, but were granted in this manner because the employees were based outside of the United States.

### Performance-Based Restricted Stock Awards

In 2001, shareowners approved an amendment to the 1989 Restricted Stock Award Plan to allow for the grant of performance-based awards. These awards are released only upon the achievement of specific measurable performance criteria. These awards pay dividends during the performance period. The majority of awards have specific earnings per share targets for achievement. If the earnings per share targets are not met, the awards will be cancelled.

#### NOTE 15: STOCK COMPENSATION PLANS (Continued)

The following table summarizes information about performance-based restricted stock awards:

|                          | 2007     |  | 200       | 16   | 2005      |  |  |
|--------------------------|----------|--|-----------|--|-----------|--|--|

| Nonvested on January 1   | 293,000  | \$ 43.40   | 788,000   | \$ 47.32   | 838,000   | \$ 47.62   |  |
| Granted                  | 28,100   | 53.43  | 224,000   | 43.66  | 50,000    | 42.40  |  |
| Promises to grant        | 15,700   | 63.77  |           |  |           | _  |  |
| Vested and released1     |          | _  | (50,000)  | 56.25  |           |  |  |
| Cancelled/forfeited      | (50,000) | 42.40  | (669,000) | 47.15  | (100,000) | 47.38  |  |
| Nonvested on December 31 | 286,8002 | \$ 45.67   | 293,000   | \$ 43.40   | 788,0002  | \$ 47.32   |  |

- <sup>1</sup> The total fair value of performance-based restricted shares vested and released during the year ended December 31, 2006, was approximately \$2.1 million. The grant-date fair value is the quoted market value of the Company stock on the respective grant date.
- <sup>2</sup> The nonvested shares on December 31, 2007 and 2005 include promises to grant performance-based restricted stock of 15,700 and 75,000, respectively. These awards are similar to performance-based restricted stock, including the payment of dividend equivalents, but were granted in this manner because the employees were based outside of the United States.

### Performance Share Unit Awards

In 2003, the Company modified its use of performance-based awards and established a program to grant performance share unit awards under the 1989 Restricted Stock Award Plan to executives. The number of performance share units earned shall be determined at the end of each performance period, generally three years, based on performance criteria determined by the Board of Directors and may result in an award of restricted stock for U.S. participants and certain international participants at that time. The restricted stock may be granted to other international participants shortly before the fifth anniversary of the original award. Restrictions on such stock generally lapse on the fifth anniversary of the original award date. Performance share units do not pay dividends during the performance period. Accordingly, the fair value of these units is the quoted market value of the Company stock on the date of the grant less the present value of the expected dividends not received during the performance period.

Performance share unit awards require achievement of certain financial measures primarily compound annual growth in earnings per share or economic profit. These financial measures are adjusted for certain items approved by the Compensation Committee of the Board of Directors. The purpose of these adjustments is to ensure a consistent year to year comparison of the specific performance criteria. Economic profit is our net operating profit after tax less the cost of the capital used in our business. In the event that the financial result equals the target projection, the Company will grant the number of restricted shares equal to the Target Award in the underlying PSU agreement. In the event the financial result exceeds the target projection, additional shares up to the Maximum Award may be granted. In the event the financial result falls below the target projection, a reduced number of shares may be granted. If the financial result falls below the Threshold Award performance level, no shares will be granted. Performance share unit awards provide for cash equivalent payments to former executives who become ineligible for restricted stock grants due to certain events such as death, disability or termination. Of the outstanding granted performance share unit awards as of December 31, 2007, 743,494; 754,700; and 1,045,639 awards are for the 2005-2007, 2006-2008 and 2007-2009 performance periods, respectively. Based on the Company's financial results for the 2005-2007 performance period,

### NOTE 15: STOCK COMPENSATION PLANS (Continued)

the Maximum Award of 150 percent of target was achieved. Also, outstanding as of December 31, 2007 are 164,500 performance share units granted in 2007 with certain financial measures of a business unit of the Company as the performance criteria. In addition, 72,000 performance share units, with predefined qualitative performance criteria and release criteria that differ from the program described above, were granted in 2004 and were outstanding as of December 31, 2007.

The following table summarizes information about performance share unit awards based on the Target Award amounts in the PSU agreements:

|                                      | 2007        | 7  | 2006        |  | 2005        | 5  |

| Paid in cash equivalent <sup>3</sup> | (23,790)    | 46.83  | (7,178)     | 41.87  |             | _  |
| Cancelled/forfeited                  | (305,794)   | 44.22  | (114,458)   | 43.45  | (62,159)    | 40.06  |
| Outstanding on<br>December 31        | 2,780,333   | \$ 41.50   | 2,271,240   | \$ 39.99   | 2.356,728   | \$ 40.42   |

- Represents performance share units converted to restricted stock based on the certification of financial results for the 2004-2006 performance period and for certain executives prior to retirement. The vesting of this restricted stock is subject to terms of the performance share unit agreements.
- Represents performance share units converted to promises to grant restricted stock for executives based on the certification of financial results for the 2004-2006 performance period. These awards are similar to restricted stock, including payment of dividend equivalents, but were granted in this manner because the executives were based outside of the United States. The vesting of promises to grant restricted stock is subject to terms of the performance share unit agreements.
- Represents share units that converted to cash equivalent payments of approximately \$1.2 million and \$0.3 million in 2007 and 2006, respectively, to former executives who were ineligible for restricted stock grants due to certain events such as death, disability or termination.

The following table summarizes the number of performance share units at various award levels:

| December 31,    | 2007      | 2006      | 2005      |
|-----------------|-----------|-----------|-----------|
| Threshold Award | 1,627,376 | 1,297,632 | 1,352,388 |
| Target Award    | 2,780,333 | 2,271,240 | 2,356,728 |
| Maximum Award   | 4,545,750 | 3,370,860 | 3,499,092 |

### NOTE 15: STOCK COMPENSATION PLANS (Continued)

The following table summarizes information about the conversions of performance share unit awards to restricted stock and promises to grant restricted stock:

|                                  | 200         | 2007  |             |   |
|----------------------------------|-------------|---|-------------|---|
|                                  | Share Units | Weighted-<br>Average<br>Grant-Date<br>Fair Value <sup>1</sup> | Share Units | Weighted-<br>Average<br>Grant-Date<br>Fair Value <sup>1</sup> |
| Nonvested on January 1           | 123,852     | \$ 42.07  | _           | \$ —  |
| Granted                          | 203,609     | 45.45   | 123,852     | 42.07   |
| Promises to grant                | 179,292     | 46.78   |             |   |
| Vested and released <sup>2</sup> | (59,515)    | 46.78   |             |   |
| Cancelled/forfeited              | (25,000)    | 46.78   |             |   |
| Nonvested on December 31         | 422,2383    | \$ 44.76  | 123,852     | \$ 42.07  |

- The weighted-average grant-date fair value is based on the fair values of the PSU awards-grant fair values.
- <sup>2</sup> The total fair value of restricted shares that were vested and released during the year ended December 31, 2007 was approximately \$2.9 million.
- The nonvested shares on December 31, 2007 include promises to grant restricted stock of 179,292. These awards are similar to restricted stock, including the payment of dividend equivalents, but were granted in this manner because the employees were based outside of the United States.

#### NOTE 16: PENSION AND OTHER POSTRETIREMENT BENEFIT PLANS

Our Company sponsors and/or contributes to pension and postretirement health care and life insurance benefit plans covering substantially all U.S. employees. We also sponsor nonqualified, unfunded defined benefit pension plans for certain associates. In addition, our Company and its subsidiaries have various pension plans and other forms of postretirement arrangements outside the United States.

Effective December 31, 2006, the Company adopted SFAS No. 158, which required the recognition in pension obligations and AOCI of actuarial gains or losses, prior service costs or credits and transition assets or obligations that had previously been deferred under the reporting requirements of SFAS No. 87, SFAS No. 106 and SFAS No. 132(R). As a result of the adoption, the Company recorded approximately \$288 million as a reduction of the December 31, 2006 retained earnings. The applicable December 31, 2007 and 2006 balances included in our consolidated financial statements and footnotes reflect the adoption of SFAS No. 158.

In February and October of 2007, the Company amended its U.S. retiree medical plan to limit the Company's exposure to increases in retiree medical costs associated with current and future retirees. Based on the materiality of the change in liability resulting from the amendments, we remeasured the assets and liabilities of the U.S. retiree medical plan effective February 28, 2007 and October 31, 2007. As a result of the remeasurements, the Company reduced its liabilities for the U.S. retiree medical plan by approximately \$435 million. In accordance with SFAS No. 158, the Company also recognized the appropriate effects of the change in AOCI and deferred taxes.

Certain amounts in the prior years' disclosure have been reclassified to conform to the current year presentation.

### NOTE 16: PENSION AND OTHER POSTRETIREMENT BENEFIT PLANS (Continued)

### Obligations and Funded Status

The following table sets forth the change in benefit obligations for our benefit plans (in millions):

|  | Pension  | Pension Benefits |        |  |
|--|----------|------------------|--------|--|
| December 31,   | 2007     | 2006             | 2007   | 2006   |
| Benefit obligation at beginning of year <sup>1</sup> | \$ 3,297 | \$ 3,041         | \$ 828 | \$ 787   |
| Service cost   | 123      | 108              | 40     | 31   |
| Interest cost  | 191      | 168              | 34     | 46   |
| Foreign currency exchange rate changes               | 117      | 79               | 1      | (1)  |
| Amendments   | 48       | 4                | (342)  |  |
| Actuarial (gain) loss                                | (189)    | (55)             | (95)   | (25)   |
| Benefits paid <sup>2</sup>                           | (159)    | (137)            | (31)   | (23)   |
| Business combinations                                | 103      | 96               |        | 10   |
| Settlements  | (23)     | (10)             | _      |  |
| Curtailments   | 1        |                  |        | Name of the last o |
| Special termination benefits                         | 7        |                  |        | -  |
| Other  | 1        | 3                | 3      | 3  |
| Benefit obligation at end of year <sup>1</sup>       | \$ 3,517 | \$ 3,297         | \$ 438 | \$ 828   |

- <sup>1</sup> For pension benefit plans, the benefit obligation is the projected benefit obligation. For other benefit plans, the benefit obligation is the accumulated postretirement benefit obligation.
- <sup>2</sup> Benefits paid from pension benefit plans during 2007 and 2006 included approximately \$41 million and \$31 million, respectively, in payments related to unfunded pension plans that were paid from Company assets. Benefits paid from other benefit plans during 2007 and 2006 included approximately \$13 million and \$23 million, respectively, that were paid from Company assets.

The accumulated benefit obligation for our pension plans was approximately \$3,080 million and approximately \$2,885 million as of December 31, 2007 and 2006, respectively.

For pension plans with projected benefit obligations in excess of plan assets, the total projected benefit obligation and fair value of plan assets were approximately \$1,372 million and \$691 million, respectively, as of December 31, 2007, and \$1,591 million and \$890 million, respectively, as of December 31, 2006. For pension plans with accumulated benefit obligations in excess of plan assets, the total accumulated benefit obligation and fair value of plan assets were approximately \$996 million and \$441 million, respectively, as of December 31, 2007, and approximately \$852 million and \$278 million, respectively, as of December 31, 2006.

### NOTE 16: PENSION AND OTHER POSTRETIREMENT BENEFIT PLANS (Continued)

The following table sets forth the change in the fair value of plan assets for our benefit plans (in millions):

|   | Pension  | Benefits | Other Benefits |        |  |
|---|----------|----------|----------------|--------|--|
| December 31,  | 2007     | 2006     | 2007           | 2006   |  |
| Fair value of plan assets at beginning of year <sup>1</sup> | \$ 3,091 | \$ 2,637 | \$ 248         | \$ 19  |  |
| Actual return on plan assets                                | 269      | 339      | 13             | 5      |  |
| Employer contributions                                      | 59       | 95       | _              | 224    |  |
| Foreign currency exchange rate changes                      | 98       | 62       |                |        |  |
| Benefits paid   | (118)    | (106)    | (18)           | _      |  |
| Business combinations                                       | 35       | 68       |                |        |  |
| Settlements   | (1)      | _        |                |        |  |
| Other   | (5)_     | (4)      | 3              |        |  |
| Fair value of plan assets at end of year <sup>1</sup>       | \$ 3,428 | \$ 3,091 | \$ 246         | \$ 248 |  |

Plan assets include 1.6 million shares of common stock of our Company with a fair value of approximately \$99 million and \$77 million as of December 31, 2007 and 2006, respectively. Dividends received on common stock of our Company during 2007 and 2006 were approximately \$2.2 million and \$2.0 million, respectively.

The pension and other benefit amounts recognized in our consolidated balance sheets are as follows (in millions):

|   |    | Pension ! | Benefits | Other B     | enefits  |  |
|---|----|-----------|----------|-------------|----------|--|
| December 31,  |    | 2007      | 2006     | 2007        | 2006     |  |
| Funded status—plan assets less than benefit obligations | \$ | (89)      | \$ (206) | \$ (192)    | \$ (580) |  |
| Fourth quarter contribution                             |    | 4         | 3        |             |          |  |
| Net prepaid asset (liability) recognized                | \$ | (85)      | \$ (203) | \$ (192)    | \$ (580) |  |
| Prepaid benefit cost                                    | \$ | 596       | \$ 494   | <b>\$</b> — | \$ —     |  |
| Current liability                                       |    | (42)      | (31)     | (1)         |          |  |
| Long-term liability                                     |    | (639)     | (666)    | (191)       | (580)    |  |
| Net prepaid asset (liability) recognized                | \$ | (85)      | \$ (203) | \$ (192)    | \$ (580) |  |

### NOTE 16: PENSION AND OTHER POSTRETIREMENT BENEFIT PLANS (Continued)

The following tables set forth the 2007 changes in AOCI for our benefit plans (in millions):

|  | Pension Benefits |             | Other Benefit |            |
|--|------------------|-------------|---------------|------------|
| Net actuarial loss (gain) at beginning of year       | \$               | 265         | \$            | 97         |
| Amortization of (loss) gain                          |                  | <b>(18)</b> |               | <b>(1)</b> |
| (Gain) loss arising during the year                  |                  | (227)       |               | (88)       |
| Translation loss (gain)                              |                  | 9           |               |            |
| Net actuarial loss (gain) at end of year             | \$               | 29          | \$            | 8          |
|  | Pension E        | enefits     | Other B       | enefits    |
| Net prior service cost (credit) at beginning of year |                  | \$ 37       | \$            | (5)        |
| Amortization of (cost) credit                        |                  | <b>(7)</b>  |               | 42         |
| Cost (credit) arising during the year                |                  | 48          |               | (342)      |
| Translation loss (gain)                              |                  | 1_          |               |            |
| Net prior service cost (credit) at end of year       |                  | \$ 79       | \$            | (305)      |

Amounts in AOCI expected to be recognized as components of net periodic pension cost in 2008 are as follows (in millions, pretax):

|   | Pension Benefits | Other Be | enefits |
|---|------------------|----------|---------|
| Amortization of actuarial loss (gain)       | \$ 9             | \$       | _       |
| Amortization of prior service cost (credit) | 10               |          | (61)    |
|   | \$ 19            | \$       | (61)    |

### Components of Net Periodic Benefit Cost

Net periodic benefit cost for our pension and other postretirement benefit plans consisted of the following (in millions):

|   |    | Pe    | ensio | n Benefits |        | Ot          | her Benefits | 3     |
|---|----|-------|-------|------------|--------|-------------|--------------|-------|
| December 31,                                |    | 2007  |       | 2006       | 2005   | <br>2007    | 2006         | 2005  |
| Service cost                                | \$ | 123   | \$    | 108        | \$ 91  | \$<br>40    | \$ 31        | \$ 28 |
| Interest cost                               |    | 191   |       | 168        | 156    | 34          | 46           | 43    |
| Expected return on plan assets              |    | (231) |       | (191)      | (167)  | <b>(20)</b> | (5)          | (1)   |

### NOTE 16: PENSION AND OTHER POSTRETIREMENT BENEFIT PLANS (Continued)

#### Assumptions

Certain weighted-average assumptions used in computing the benefit obligations are as follows:

|   | Pension Be |       | Other Be | enefits |
|---|------------|-------|----------|---------|
| December 31,                            | 2007       | 2006  | 2007     | 2006    |
| Discount rate                           | 6%         | 51/2% | 61/4%    | 6%      |
| Rate of increase in compensation levels | 41/4%      | 41/4% | N/A      | N/A     |

Certain weighted-average assumptions used in computing net periodic benefit cost are as follows:

|  | Pen   | sion Benefi | ts    | Ot    |       |       |
|--|-------|-------------|-------|-------|-------|-------|
| Year Ended December 31,                          | 2007  | 2006        | 2005  | 2007  | 2006  | 2005  |
| Discount rate                                    | 51/2% | 51/4%       | 51/2% | 6%    | 53/4% | 6%    |
| Rate of increase in compensation levels          | 41/4% | 4%          | 4%    | N/A   | N/A   | N/A   |
| Expected long-term rate of return on plan assets | 73/4% | 73/4%       | 73/4% | 81/2% | 81/2% | 81/2% |

The assumed health care cost trend rates are as follows:

| December 31,  | 2007 | 2006 |
|---|------|------|
| Health care cost trend rate assumed for next year                                 | 9%   | 9%   |
| Rate to which the cost trend rate is assumed to decline (the ultimate trend rate) | 5%   | 5%   |
| Year that the rate reaches the ultimate trend rate                                | 2012 | 2011 |

During 2007, the Company amended its U.S. retiree medical plan to limit the Company's exposure to increases in retiree medical costs for both current and future retirees. As a result, the effects of a one percentage point change in the assumed health care cost trend rate would not be significant to the Company.

The discount rate assumptions used to account for pension and other postretirement benefit plans reflect the rates at which the benefit obligations could be effectively settled. Rates for each of our primary U.S. plans at December 31, 2007 were determined using a cash flow matching technique whereby the rates of a yield curve, developed from high-quality debt securities, were applied to the benefit obligations to determine the appropriate discount rate. The rate of compensation increase assumption is determined by the Company based upon annual reviews. We review external data and our own historical trends for health care costs to determine the health care cost trend rate assumptions.

### NOTE 16: PENSION AND OTHER POSTRETIREMENT BENEFIT PLANS (Continued)

#### Plan Assets

Pension Benefit Plans

The following table sets forth the actual asset allocation and weighted-average target asset allocation for our U.S. and non-U.S. pension plan assets:

| December 31,                       | 2007 | 2006 | Target Asset<br>Allocation |
|------------------------------------|------|------|----------------------------|
| Equity securities <sup>1</sup>     | 58%  | 58%  | 56%                        |
| Debt securities                    | 29   | 31   | 34                         |
| Real estate and other <sup>2</sup> | 13   | 11   | 10                         |
| Total                              | 100% | 100% | 100%                       |

- <sup>1</sup> As of December 31, 2007 and 2006, 3 percent and 2 percent, respectively, of total pension plan assets were invested in common stock of our Company.
- <sup>2</sup> As of December 31, 2007 and 2006, 7 percent and 6 percent, respectively, of total pension plan assets were invested in real estate.

Investment objectives for the Company's U.S. pension plan assets, which comprise 66 percent of total pension plan assets as of December 31, 2007, are to:

- (1) optimize the long-term return on plan assets at an acceptable level of risk;
- (2) maintain a broad diversification across asset classes and among investment managers;
- (3) maintain careful control of the risk level within each asset class; and
- (4) focus on a long-term return objective.

Asset allocation targets promote optimal expected return and volatility characteristics given the long-term time horizon for fulfilling the obligations of the pension plans. Selection of the targeted asset allocation for U.S. plan assets was based upon a review of the expected return and risk characteristics of each asset class, as well as the correlation of returns among asset classes.

Investment guidelines are established with each investment manager. These guidelines provide the parameters within which the investment managers agree to operate, including criteria that determine eligible and ineligible securities, diversification requirements and credit quality standards, where applicable. Unless exceptions have been approved, investment managers are prohibited from buying or selling commodities, futures or option contracts, as well as from short selling of securities. Furthermore, investment managers agree to obtain written approval for deviations from stated investment style or guidelines.

As of December 31, 2007, no investment manager was responsible for more than 10 percent of total U.S. plan assets. In addition, diversification requirements for each investment manager prevent a single security or other investment from exceeding 10 percent, at historical cost, of the individual manager's portfolio.

The expected long-term rate of return assumption for U.S. plan assets is based upon the target asset allocation and is determined using forward-looking assumptions in the context of historical returns and volatilities for each asset class, as well as correlations among asset classes. We evaluate the rate of return assumption on an annual basis. The expected long-term rate of return assumption used in computing 2007 net periodic pension cost for the U.S. plans was 8.5 percent. As of December 31, 2007, the 10-year annualized return on U.S. plan assets was 8.3 percent, the 15-year annualized return was 11.2 percent, and the annualized return since inception was 12.7 percent.

Plan assets for our pension plans outside the United States are insignificant on an individual plan basis.

### NOTE 16: PENSION AND OTHER POSTRETIREMENT BENEFIT PLANS (Continued)

Other Benefit Plans

Plan assets associated with other benefits represent funding of the primary U.S. postretirement benefit plans. In late 2006, we established and contributed \$216 million to a U.S. Voluntary Employee Beneficiary Association ("VEBA"), a tax-qualified trust. While the VEBA assets will remain segregated from the primary U.S. pension master trust, the current investments were determined in a methodology similar to that applied to the U.S. pension plans described above.

#### Cash Flows

Information about the expected cash flows for our pension and other postretirement benefit plans is as follows (in millions):

|  | Pension<br>Benefits | Other<br>enefits |
|--|---------------------|------------------|
| Expected employer contributions:         |                     |                  |
| 2008                                     | \$ 52               | \$<br>1          |
| Expected benefit payments <sup>1</sup> : |                     |                  |
| 2008                                     | \$ 185              | \$<br>32         |
| 2009                                     | 168                 | 34               |
| 2010                                     | 179                 | 37               |
| 2011                                     | 177                 | 40               |
| 2012                                     | 185                 | 42               |
| 2013-2017                                | 1,083               | <br>208          |

<sup>&</sup>lt;sup>1</sup> The expected benefit payments for our other postretirement benefit plans are net of estimated federal subsidies expected to be received under the Medicare Prescription Drug, Improvement and Modernization Act of 2003. Federal subsidies are estimated to be approximately \$2 million in 2008 to 2012 and estimated to be approximately \$15 million for the period 2013-2017.

#### **Defined Contribution Plans**

Our Company sponsors qualified defined contribution plans covering substantially all U.S. employees. Under the primary plan, we match 100 percent of participants' contributions up to a maximum of 3 percent of compensation. Company contributions to the U.S. plan were approximately \$29 million, \$25 million and \$21 million in 2007, 2006 and 2005, respectively. We also sponsor defined contribution plans in certain locations outside the United States. Company contributions to those plans were approximately \$25 million, \$16 million and \$14 million in 2007, 2006 and 2005, respectively.

### **NOTE 17: INCOME TAXES**

Income before income taxes consisted of the following (in millions):

| Year Ended December 31, | <b>2007</b> 2006         | 2005     |
|-------------------------|--------------------------|----------|
| United States           | <b>\$ 2,545</b> \$ 2,126 | \$ 2,268 |
| International           | <b>5,328</b> 4,452       | 4,422    |
|                         | <b>\$ 7,873</b> \$ 6,578 | \$ 6,690 |

Income tax expense (benefit) consisted of the following for the years ended December 31, 2007, 2006 and 2005 (in millions):

|          | United<br>States | State a |     | nte | rnational | <br>Total   |
|----------|------------------|---------|-----|-----|-----------|-------------|
| 2007     |                  |         |     |     |           |             |
| Current  | \$ 664           | \$      | 75  | \$  | 1,044     | \$<br>1,783 |
| Deferred | 98               | (       | 13) |     | 24        | 109         |
| 2006     |                  |         |     |     |           |             |
| Current  | \$ 608           | \$      | 47  | \$  | 878       | \$<br>1,533 |
| Deferred | (20)             | (       | 22) |     | 7         | (35)        |
| 2005     |                  |         |     |     |           |             |
| Current  | \$ 873           | \$ 1    | 88  | \$  | 845       | \$<br>1,906 |
| Deferred | (72)             | (       | 25) |     | 9         | (88)        |

We made income tax payments of approximately \$1,596 million, \$1,601 million and \$1,676 million in 2007, 2006 and 2005, respectively.

#### **NOTE 17: INCOME TAXES (Continued)**

A reconciliation of the statutory U.S. federal tax rate and effective tax rates is as follows:

| Year Ended December 31,  | 2007           | 2006         | 2005          |
|--|----------------|--------------|---------------|
| Statutory U.S. federal tax rate  | 35.0%          | 35.0%        | 35.0%         |
| State and local income taxes—net of federal benefit                        | 0.6            | 0.7          | 1.2           |
| Earnings in jurisdictions taxed at rates different from the statutory U.S. |                |              |               |
| federal rate   | $(10.8)^{1,2}$ | $(11.4)^7$   | $(12.1)^{11}$ |
| Equity income or loss  | $(1.3)^{3,4}$  | $(0.6)^8$    | (2.3)         |
| Other operating charges  | 0.55           | $0.6^{9}$    | $0.4^{12}$    |
| Other—net  | $0.0^{6}$      | $(1.5)^{10}$ | $0.3^{13}$    |
| Repatriation under the Jobs Creation Act                                   |                |              | 4.714         |
| Effective tax rates  | 24.0%          | 22.8%        | 27.2%         |

- <sup>1</sup> Includes approximately \$19 million (or 0.2 percent) tax benefit related to tax rate change in Germany.
- Includes approximately \$85 million (or 1.1 percent) tax charge related to amounts required to be recorded for changes to our uncertain tax positions under Interpretation No. 48, including interest and penalties, in various international jurisdictions.
- Includes approximately 0.4 percent impact to our effective tax rate related to charges recorded by our equity method investments. Refer to Note 3 and Note 19.
- <sup>4</sup> Includes approximately 0.4 percent impact to our effective tax rate related to the sale of a portion of our investment in Coca-Cola Amatil and the sale of our investment in Vonpar. Refer to Note 3 and Note 19.
- <sup>5</sup> Includes approximately 0.5 percent impact to our effective tax rate related to the impairment of assets and investments in our bottling operations and other restructuring charges. Refer to Note 18.
- <sup>6</sup> Includes approximately \$11 million (or 0.1 percent) tax charge related to amounts required to be recorded for changes to our uncertain tax positions under Interpretation No. 48, including interest and penalties, in certain domestic jurisdictions.
- Includes approximately \$24 million (or 0.4 percent) tax charge related to the resolution of certain tax matters in various international jurisdictions.
- 8 Includes approximately 2.4 percent impact to our effective tax rate related to charges recorded by our equity method investees. Refer to Note 3 and Note 19.
- <sup>9</sup> Includes the tax rate impact related to the impairment of assets and investments in our bottling operations, contract termination costs related to production capacity efficiencies and other restructuring charges. Refer to Note 19.
- <sup>10</sup> Includes approximately 1.8 percent tax rate benefit related to the sale of a portion of our investment in Coca-Cola FEMSA and Coca-Cola Icecek. Refer to Note 3 and Note 19.
- <sup>11</sup> Includes approximately \$29 million (or 0.4 percent) tax benefit related to the favorable resolution of certain tax matters in various international jurisdictions.
- <sup>12</sup> Includes approximately \$4 million tax benefit related to the Philippines impairment charges. Refer to Note 19.
- <sup>13</sup> Includes approximately \$72 million (or 1.1 percent) tax benefit related to the favorable resolution of certain domestic tax matters.
- <sup>14</sup> Related to repatriation of approximately \$6.1 billion of previously unremitted foreign earnings under the Jobs Creation Act, resulting in a tax provision of approximately \$315 million.

#### **NOTE 17: INCOME TAXES (Continued)**

Our effective tax rate reflects the tax benefits from having significant operations outside the United States that are taxed at rates lower than the statutory U.S. rate of 35 percent. During 2007, the Company had several subsidiaries that benefited from various tax incentive grants. The terms of these grants range from 2010 to 2031. The Company expects each of the grants to be renewed indefinitely. The grants did not have a material effect on the results of operations for the years ended December 31, 2007, 2006 or 2005.

The Company or one of its subsidiaries files income tax returns in the U.S. federal jurisdiction and various states and foreign jurisdictions. U.S. tax authorities have completed their federal income tax examinations for all years prior to 2005.

With respect to state and local jurisdictions and countries outside the United States, with limited exceptions, the Company and its subsidiaries are no longer subject to income tax audits for years before 2001. Although the outcome of tax audits is always uncertain, the Company believes that adequate amounts of tax, including interest and penalties, have been provided for any adjustments that are expected to result from those years.

The Company adopted the provisions of Interpretation No. 48, effective January 1, 2007. As a result of the implementation of Interpretation No. 48, the Company recorded an approximate \$65 million increase in liabilities for unrecognized tax benefits, which was accounted for as a reduction to the January 1, 2007, balance of reinvested earnings. As of December 31, 2007, the gross amount of unrecognized tax benefits was approximately \$643 million. If the Company were to prevail on all uncertain tax positions, the net effect would be a benefit to the Company's effective tax rate of approximately \$147 million, exclusive of any benefits related to interest and penalties. The remaining approximately \$496 million, which was recorded as a deferred tax asset, primarily represents tax benefits that would be received in different tax jurisdictions in the event that the Company did not prevail on all uncertain tax positions. A reconciliation of the changes in the gross balance of unrecognized tax benefits amounts during 2007 follows:

| Year Ended December 31,  | 2007   |
|--|--------|
| Beginning balance of unrecognized tax benefit                              | \$ 511 |
| Increases related to prior period tax positions                            | 22     |
| Increases due to current period tax positions                              | 51     |
| Decreases related to settlements with taxing authorities                   | (4)    |
| Reductions as a result of a lapse of the applicable statute of limitations | (1)    |
| Increases/(decreases) from effects of exchange rates                       | 64     |
| Ending balance of unrecognized tax benefits                                | \$ 643 |

The Company recognizes accrued interest and penalties related to unrecognized tax benefits in income tax expense. As of December 31, 2007, the Company had approximately \$272 million in interest and penalties related to unrecognized tax benefits accrued, of which approximately \$82 million was recognized through tax expense in 2007. If the Company were to prevail on all uncertain tax positions, the reversal of this accrual would also be a benefit to the Company's effective tax rate.

It is reasonably possible that the amount of unrecognized benefit with respect to certain of our unrecognized tax positions will significantly change within the next twelve months. These changes may be the result of settlement of ongoing audits, competent authority proceedings related to transfer pricing, or final settlements in transfer pricing matters that are the subject of litigation. At this time, an estimate of the range of the reasonably possible outcomes cannot be made.

### **NOTE 17: INCOME TAXES (Continued)**

Undistributed earnings of the Company's foreign subsidiaries amounted to approximately \$11.9 billion at December 31, 2007. Those earnings are considered to be indefinitely reinvested and, accordingly, no U.S. federal and state income taxes have been provided thereon. Upon distribution of those earnings in the form of dividends or otherwise, the Company would be subject to both U.S. income taxes (subject to an adjustment for foreign tax credits) and withholding taxes payable to the various foreign countries. Determination of the amount of unrecognized deferred U.S. income tax liability is not practical because of the complexities associated with its hypothetical calculation; however, unrecognized foreign tax credits would be available to reduce a portion of the U.S. tax liability.

As discussed in Note 1, the Jobs Creation Act was enacted in October 2004. One of the provisions provides a one-time benefit related to foreign tax credits generated by equity investments in prior years. The Company recorded an income tax benefit of approximately \$50 million as a result of this law change in 2004. The Jobs Creation Act also included a temporary incentive for U.S. multinationals to repatriate foreign earnings at an approximate 5.25 percent effective tax rate. During the first quarter of 2005, the Company decided to repatriate approximately \$2.5 billion in previously unremitted foreign earnings. Therefore, the Company recorded a provision for taxes on such previously unremitted foreign earnings of approximately \$152 million in the first quarter of 2005. During 2005, the United States Internal Revenue Service and the United States Department of Treasury issued additional guidance related to the Jobs Creation Act. As a result of this guidance, the Company reduced the accrued taxes previously provided on such unremitted earnings by \$25 million in the second quarter of 2005. During the fourth quarter of 2005, the Company repatriated an additional \$3.6 billion, with an associated tax liability of approximately \$188 million. Therefore, the total previously unremitted earnings that were repatriated during the full year of 2005 was \$6.1 billion with an associated tax liability of approximately \$315 million. This liability was recorded in 2005 as federal and state and local tax expenses in the amount of \$301 million and \$14 million, respectively.

### **NOTE 17: INCOME TAXES (Continued)**

The tax effects of temporary differences and carryforwards that give rise to deferred tax assets and liabilities consist of the following (in millions):

| December 31,   | <br>2007      | <br>2006      |
|--|---------------|---------------|
| Deferred tax assets:   |               |               |
| Property, plant and equipment                                | \$<br>45      | \$<br>58      |
| Trademarks and other intangible assets                       | 76            | 75            |
| Equity method investments (including translation adjustment) | 238           | 354           |
| Other liabilities  | 845           | 190           |
| Benefit plans  | 881           | 1,056         |
| Net operating/capital loss carryforwards                     | 554           | 593           |
| Other  | <br>266       | 224           |
| Gross deferred tax assets                                    | 2,905         | 2,550         |
| Valuation allowances   | (611)         | (678)         |
| Total deferred tax assets <sup>1,2</sup>                     | \$<br>2,294   | \$<br>1,872   |
| Deferred tax liabilities:                                    | <br>          |               |
| Property, plant and equipment                                | \$<br>(670)   | \$<br>(630)   |
| Trademarks and other intangible assets                       | (1,925)       | (504)         |
| Equity method investments (including translation adjustment) | (841)         | (622)         |
| Other liabilities  | (90)          | (82)          |
| Benefit plans  | (226)         | (190)         |
| Other  | (157)         | (200)         |
| Total deferred tax liabilities <sup>3</sup>                  | \$<br>(3,909) | \$<br>(2,228) |
| Net deferred tax liabilities                                 | \$<br>(1,615) | \$<br>(356)   |

- Noncurrent deferred tax assets of \$66 million and \$168 million were included in the consolidated balance sheets line item other assets at December 31, 2007 and 2006, respectively.
- <sup>2</sup> Current deferred tax assets of \$238 million and \$117 million were included in the consolidated balance sheets line item prepaid expenses and other assets at December 31, 2007 and 2006, respectively.
- <sup>3</sup> Current deferred tax liabilities of \$29 million and \$33 million were included in the consolidated balance sheets line item accounts payable and accrued expenses at December 31, 2007 and 2006, respectively.

As of December 31, 2007 and 2006, we had approximately \$610 million and \$93 million, respectively, of net deferred tax liabilities located in countries outside the United States.

#### **NOTE 17: INCOME TAXES (Continued)**

As of December 31, 2007, we had approximately \$2,827 million of loss carryforwards available to reduce future taxable income. Loss carryforwards of approximately \$207 million must be utilized within the next five years, \$67 million must be utilized within the next 10 years, and the remainder can be utilized over a period greater than 10 years.

An analysis of our deferred tax asset valuation allowances is as follows (in millions):

| Year Ended December 31,    | 2007      | 2006      | 2005      |
|----------------------------|-----------|-----------|-----------|
| Balance, beginning of year | \$<br>678 | \$<br>786 | \$<br>854 |
| Additions                  | 201       | 50        | 43        |
| Deductions                 | (268)     | (158)     | (111)     |
| Balance, end of year       | \$<br>611 | \$<br>678 | \$<br>786 |

The Company's deferred tax asset valuation allowances are primarily the result of uncertainties regarding the future realization of recorded tax benefits on tax loss carryforwards from operations in various jurisdictions. In 2007, the Company recognized a net decrease in its valuation allowances of \$67 million. This decrease was primarily related to the reversal of valuation allowances on deferred tax assets recorded on the basis difference in equity investments. The Company also recognized a decrease in certain deferred tax assets and corresponding valuation allowances related to a change in German tax rates. In 2006, the Company recognized a net decrease in its valuation allowances of \$108 million. This decrease was primarily related to the reversal of valuation allowances that covered certain deferred tax assets recorded on capital loss carryforwards. A portion of the capital loss carryforwards was utilized to offset taxable gains on the sale of a portion of the investments in Coca-Cola Icecek and Coca-Cola FEMSA. In 2005, the Company recognized a decrease in its valuation allowances of \$68 million. This decrease was primarily related to a change in tax rates which resulted in a reduction of certain deferred tax assets and corresponding valuation allowances.

#### **NOTE 18: RESTRUCTURING COSTS**

During 2007, the Company took steps to streamline and simplify its operations globally. In North America, the Company reorganized its operations around three main business units: Sparkling Beverages, Still Beverages and Emerging Brands. In Ireland, the Company announced a plan to close its beverage concentrate manufacturing and distribution plant in Drogheda in September 2008. The plant closure is expected to improve operating productivity and enhance capacity utilization. The costs associated with this plant closure are included in the Corporate segment. Selected other operations also took steps to streamline their operations to improve overall efficiency and effectiveness.

Employees separated or to be separated from the Company as a result of these streamlining initiatives were offered severance or early retirement packages, as appropriate, that included both financial and nonfinancial components. The expenses recorded during the year ended December 31, 2007 included costs related to involuntary terminations and other direct costs associated with implementing these initiatives. Other direct costs included expenses to relocate employees; contract termination costs; costs associated with the development, communication and administration of these initiatives; accelerated depreciation; and asset write-offs. During 2007, the Company incurred total pretax expenses related to these streamlining initiatives of approximately \$237 million. These expenses were primarily recorded in the line item other operating charges in our consolidated statement of income. The Company currently expects the total cost of these initiatives to be approximately \$342 million. The Company expects to expense the remainder of the costs in 2008. The remaining costs primarily relate to severance pay and benefits and accelerated depreciation related to the closing of the Drogheda Plant.

### NOTE 18: RESTRUCTURING COSTS (Continued)

The table below summarizes the balance of accrued streamlining expenses, which is included in the balance of accounts payable and accrued expenses in the consolidated balance sheets, and the changes in the accrued amounts as of and for the year ended December 31, 2007 (in millions):

|  | Costs<br>Incurred<br>in 2007 | Payments | Noncash<br>and<br>Exchange | Accrued<br>Balance<br>December 31,<br>2007 |  |  |
|--|------------------------------|----------|----------------------------|--|--|--|
| Severance pay and benefits                       | \$ 148                       | \$ (72)  | \$ 2                       | \$ 78                                      |  |  |
| Outside services—legal, outplacement, consulting | 4                            | (3)      |                            | 1  |  |  |
| Other direct costs                               | 85                           | (8)      | (61)                       | 16   |  |  |
| Total  | \$ 237                       | \$ (83)  | \$ (59)                    | \$ 95                                      |  |  |

The total streamlining initiative costs incurred by operating segment were as follows (in millions):

| Year Ended December 31, | 2007   |
|-------------------------|--------|
| Africa                  | \$ 33  |
| Eurasia                 | 3      |
| European Union          | 33     |
| Latin America           | 4      |
| North America           | 23     |
| Pacific                 | 3      |
| Bottling Investments    | 29     |
| Corporate               | 109    |
| Total                   | \$ 237 |

### NOTE 19: SIGNIFICANT OPERATING AND NONOPERATING ITEMS

During 2007, our Company recorded restructuring charges of approximately \$237 million (refer to Note 18) and asset write-downs totaling approximately \$31 million related to certain assets and investments in bottling operations, none of which was individually significant. Of this total, approximately \$14 million was recorded in cost of goods sold, and approximately \$254 million was recorded in other operating charges in our consolidated statement of income.

In 2007, the Company sold a portion of its interest in Coca-Cola Amatil for proceeds of approximately \$143 million. As a result of this transaction, we recognized a pretax gain of approximately \$73 million, which impacted the Corporate operating segment and was included in other income (loss)—net in our consolidated statement of income. Refer to Note 3.

During 2007, the Company sold substantially all of its interest in Vonpar. Total proceeds from the sale were approximately \$238 million, and we recognized a pretax gain on this sale of approximately \$70 million, which impacted the Corporate operating segment and was included in other income (loss)—net in our consolidated statement of income. Refer to Note 3.

In 2007, the Company recorded pretax gains of approximately \$66 million and \$18 million resulting from the sales of real estate in Spain and the United States, respectively. The gains were included in other income (loss)—net in the consolidated statement of income and impacted the Corporate operating segment. Total proceeds amounted to approximately \$106 million.

### NOTE 19: SIGNIFICANT OPERATING AND NONOPERATING ITEMS (Continued)

Equity income in 2007 was reduced by approximately \$99 million in the Bottling Investments operating segment related to our proportionate share of asset write-downs recorded by CCBPI. The asset write-downs primarily related to excess and obsolete bottles and cases at CCBPI. Refer to Note 3.

In 2007, our equity income was also reduced by approximately \$62 million in the Bottling Investments operating segment related to our proportionate share of an impairment recorded by Coca-Cola Amatil as a result of the sale of its bottling operations in South Korea. Refer to Note 3.

Equity income was increased in 2007 by approximately \$11 million in the Bottling Investments operating segment, primarily consisting of our proportionate share of tax benefits recorded by CCE, partially offset by our proportionate share of restructuring charges recorded by CCE. Refer to Note 3.

In 2006, our Company recorded charges of approximately \$606 million related to our proportionate share of charges recorded by our equity method investees. Of this amount, approximately \$602 million related to our proportionate share of an impairment charge recorded by CCE for its North American franchise rights. Our proportionate share of CCE's charges also included approximately \$18 million due to restructuring charges recorded by CCE. These charges were partially offset by approximately \$33 million related to our proportionate share of changes in certain of CCE's state and Canadian federal and provincial tax rates. The charges were recorded in the line item equity income—net in the consolidated statement of income. All of these charges and changes impacted our Bottling Investments operating segment. Refer to Note 3.

During 2006, our Company also recorded charges of approximately \$112 million, primarily related to the impairment of assets and investments in our bottling operations, approximately \$53 million for contract termination costs related to production capacity efficiencies and approximately \$24 million related to other restructuring costs. These charges impacted the Africa, the European Union, the Pacific, the Bottling Investments and the Corporate operating segments. None of these charges was individually significant. Approximately \$4 million of these charges was recorded in the line item cost of goods sold and approximately \$185 million of these charges was recorded in the line item other operating charges in the consolidated statement of income. Refer to Note 21.

The Company made a \$100 million donation to The Coca-Cola Foundation in 2006, which resulted in a charge to the consolidated statement of income line item selling, general and administrative expenses and impacted the Corporate operating segment.

In 2006, the Company sold a portion of its Coca-Cola FEMSA shares to FEMSA and recorded a pretax gain of approximately \$175 million in the consolidated statement of income line item other income (loss)—net, which impacted the Corporate operating segment. Refer to Note 3.

The Company sold a portion of our investment in Coca-Cola Icecek in an initial public offering in 2006. Our Company received net cash proceeds of approximately \$198 million and realized a pretax gain of approximately \$123 million, which was recorded as other income (loss)—net in the consolidated statement of income and impacted the Corporate operating segment. Refer to Note 3.

In 2005, our Company received approximately \$109 million related to the settlement of a class action lawsuit concerning price-fixing in the sale of HFCS purchased by the Company during the years 1991 to 1995. Subsequent to the receipt of this settlement amount, the Company distributed approximately \$62 million to certain bottlers in North America. From 1991 to 1995, the Company purchased HFCS on behalf of these bottlers. Therefore, these bottlers were

### NOTE 19: SIGNIFICANT OPERATING AND NONOPERATING ITEMS (Continued)

ultimately entitled to a portion of the proceeds of the settlement. Of the approximately \$62 million we distributed to certain bottlers in North America, approximately \$49 million was distributed to CCE. The Company's remaining share of the settlement was approximately \$47 million, which was recorded as a reduction of cost of goods sold and impacted the Corporate operating segment.

During 2005, we recorded approximately \$23 million of noncash pretax gains on the issuances of stock by equity method investees. Refer to Note 4.

The Company recorded approximately \$50 million of expense in 2005 as a result of a change in our estimated service period for the acceleration of certain stock-based compensation awards. Refer to Note 15.

Equity income in 2005 was reduced by approximately \$33 million for the Bottling Investments operating segment, primarily related to our proportionate share of the tax liability recorded by CCE resulting from its repatriation of previously unremitted foreign earnings under the Jobs Creation Act, as well as our proportionate share of restructuring charges. Those amounts were partially offset by our proportionate share of CCE's HFCS lawsuit settlement proceeds and changes in certain of CCE's state and provincial tax rates. Refer to Note 3.

Our Company recorded impairment charges during 2005 of approximately \$84 million related to certain trademarks for beverages sold in the Philippines and approximately \$1 million related to impairment of other assets. These impairment charges were recorded in the consolidated statement of income line item other operating charges.

### **NOTE 20: ACQUISITIONS AND INVESTMENTS**

During 2007, our Company's acquisition and investment activity, including the acquisition of trademarks, totaled approximately \$5,653 million.

In the fourth quarter of 2007, the Company and Coca-Cola FEMSA jointly acquired Jugos del Valle, the second largest producer of packaged juices, nectars and fruit-flavored beverages in Mexico and the largest producer of such beverages in Brazil. The purchase price was approximately \$370 million plus the assumption of approximately \$85 million in debt and was split equally between the Company and Coca-Cola FEMSA. As of December 31, 2007, the Company owned a 50 percent interest in Jugos del Valle. The Company's investment in Jugos del Valle is accounted for under the equity method. Equity income—net includes our proportionate share of the results of Jugos del Valle's operations beginning November 2007 and is included in the Latin America operating segment.

In order to increase the efficiency of our bottling and distribution operations in the German market, the Company, through its consolidated German bottling operation CCEAG, acquired 18 German bottling and distribution operations on September 1, 2007 for a total purchase price of approximately \$660 million. Following the acquisition, the Company owns the franchise rights for all of the German market. The purchase price consisted of approximately 17 percent of the outstanding shares of CCEAG valued at approximately \$385 million, approximately \$156 million in cash, guaranteed future cash payments valued at approximately \$85 million, and assumed debt of approximately \$34 million. The acquisition agreements also provide the former owners of the 18 German bottling and distribution operations a put option to sell their respective shares in CCEAG back to the Company on January 2, 2014, with notification to the Company required by September 30, 2013. In addition, the agreements provide the Company with a call option to repurchase the issued shares of CCEAG back from the former owners of the 18 German bottling and distribution operations on January 2, 2014, with notification to the former owners of the 18 German bottling and distribution operations on January 2, 2014, with notification to the former owners of the 18 German bottling and distributors by December 15, 2013. The strike price of the call option is approximately 20 percent higher than the strike

### NOTE 20: ACQUISITIONS AND INVESTMENTS (Continued)

price of the put option. Upon closing of the acquisition, we made preliminary estimates of the fair values of the assets and liabilities for consolidation. Due to the number of entities involved, our Company is still in the process of determining valuations for many of the assets and liabilities acquired; therefore, the preliminary estimates are subject to adjustment as additional information is obtained. This additional information includes, but is not limited to, valuations and physical counts of property, plant and equipment; valuation models for identifiable intangible assets; adjustments resulting from reviewing the closing balance sheets of the acquired entities; and income tax valuations. Accordingly, subsequent revisions to these preliminary estimates should be expected. As these issues are identified and resolved, adjustments will be made to the preliminary values assigned to the assets and liabilities acquired, including goodwill, which may be material. The preliminary amount of purchase price allocated to franchise rights was approximately \$343 million, property, plant and equipment was approximately \$251 million, deferred tax liabilities was approximately \$99 million, and goodwill was approximately \$111 million. Approximately \$33 million of the goodwill is deductible for tax purposes. The franchise rights have been assigned an indefinite life. This transaction was accounted for as a business combination, with the results of the 18 German bottling and distribution operations included in the Bottling Investments operating segment since September 1, 2007. Management has begun to formulate a plan to improve the efficiency of the German bottling and distribution operations. As of December 31, 2007, this plan had not yet been finalized.

In the third quarter of 2007, the Company acquired a 34 percent interest in Tokyo CCBC. The Company's investment in Tokyo CCBC is accounted for under the equity method. Equity income—net includes our proportionate share of the results of Tokyo CCBC's operations beginning July 2007 and is included in the Bottling Investments operating segment. In the third quarter of 2007, the Company also acquired an additional interest in NORSA. After this acquisition, the Company owned approximately 60 percent of NORSA. The Company began consolidating this entity from the date we acquired the additional 11 percent interest. The combined purchase price for these third quarter acquisitions was approximately \$203 million. NORSA is included in the Bottling Investments operating segment.

On June 7, 2007, in an effort to expand our still beverage offerings, our Company acquired Energy Brands Inc., also known as glacéau, the maker of enhanced water brands such as vitaminwater, fruitwater and smartwater, and vitaminenergy, for approximately \$4.1 billion. On the acquisition date, we made a cash payment of approximately \$2.9 billion for a 71.4 percent interest in glacéau and entered into a put and call option agreement with certain entities associated with the Tata Group ("Tata") to acquire the remaining 28.6 percent ownership interest in glacéau. As a result of the terms of these agreements with Tata, the amount to be paid under the put and call option agreement of \$1.2 billion was recorded at the acquisition date as an additional investment in glacéau, with the offset being recorded as a current liability within loans and notes payable on the consolidated balance sheet. On October 22, 2007, the Company exercised its right to call the remaining interest in glacéau and paid Tata \$1.2 billion such that the Company owned 100 percent of glacéau as of December 31, 2007. Under the purchase method of accounting, the total purchase price of glacéau is allocated to the tangible assets, liabilities and identifiable intangible assets acquired based on their estimated fair values. Any excess of purchase price over the aggregate fair value of acquired net assets is recorded as goodwill. Based upon a preliminary purchase price allocation, using information currently available, the Company allocated approximately \$2.8 billion to trademarks, approximately \$2.2 billion to goodwill, approximately \$0.2 billion to customer relationships and approximately \$0.9 billion to deferred tax liabilities. The trademarks have been assigned indefinite lives. The goodwill resulting from this acquisition is primarily related to our ability to optimize the route to market and increase the availability of the product, which will result in additional product sales. The goodwill also includes the recognition of deferred tax liabilities associated with the identifiable intangible assets recorded in purchase accounting. The goodwill is not deductible for tax purposes. These purchase price allocations are preliminary estimates and are subject to change as additional information is obtained. Some of these changes could be material. Some of the

### NOTE 20: ACQUISITIONS AND INVESTMENTS (Continued)

additional information the Company expects to obtain includes, among other things, valuations of property, plant and equipment and identifiable intangible assets. On August 30, 2007, the Company announced its plans to transition to a new distribution model for glacéau products. This new distribution model includes a mix of current glacéau distributors and existing Coca-Cola system bottlers. Also, the Company will retain the distribution rights for certain channels. The implementation of this plan resulted in approximately \$0.2 billion in liabilities for anticipated costs to terminate existing glacéau distribution agreements, which was reflected as an adjustment to the original allocation of acquisition costs. The Company completed the majority of the transition in the fourth quarter of 2007, and anticipates the remainder to be completed in the first half of 2008. The Company paid out approximately half of its originally accrued liability to former glacéau distributors as of December 31, 2007. The acquisition of glacéau was accounted for as a business combination, with the results of the acquired entity included in the North America operating segment as of the acquisition date.

In addition, certain executive officers and former shareholders of glacéau invested approximately \$179 million of their proceeds from the sale of glacéau in common stock of the Company at then current market prices. These shares of Company common stock were placed in escrow pursuant to the glacéau acquisition agreement.

As discussed below, in the second quarter of 2007, the Company divested a portion of its interest in Scarlet Ibis Investment 3 (Proprietary) Limited ("Scarlet"), a bottling company in South Africa.

During the first quarter of 2007, our Company acquired the remaining 65 percent interest in CCBPI from San Miguel Corporation ("SMC") for consideration of approximately \$591 million plus assumed net debt, of which \$100 million was placed in escrow until certain matters related to the closing balance sheet audit of CCBPI were resolved. During the third quarter of 2007, the entire escrow amount was released, and our Company recovered \$70 million. The adjusted purchase price after the recovery from escrow was approximately \$521 million plus assumed debt, net of acquired cash, of approximately \$79 million. Of the \$521 million of consideration, the Company has outstanding notes payable to SMC for approximately \$120 million. As a result of the acquisition, the Company owns 100 percent of the outstanding stock of CCBPI. Upon closing of the acquisition, we made preliminary estimates of the fair values of the assets and liabilities for consolidation. Our Company has prepared valuations for many of the assets and liabilities acquired, and the preliminary estimates have been adjusted accordingly. The preliminary amount of purchase price allocated to property, plant and equipment was approximately \$319 million, franchise rights was approximately \$354 million and goodwill was approximately \$152 million. The goodwill is not deductible for tax purposes. Future adjustments necessary to finalize the purchase accounting are not expected to be significant. The franchise rights have been assigned an indefinite life. CCBPI is included in the Bottling Investments operating segment. Management finalized a plan to improve the efficiency of CCBPI, which included the closing of eight production facilities during the third quarter of 2007. The acquisition of CCBPI was accounted for as a business combination, with the results of the acquired entity included in the Bottling Investments operating segment as of the acquisition date.

First quarter 2007 acquisition and investing activities also included approximately \$327 million related to the purchase of Fuze Beverage, LLC ("Fuze"), maker of Fuze enhanced juices and teas in the U.S., and Leao Junior S.A. ("Leao Junior"), a Brazilian herbal beverage company. The preliminary amount of purchase price related to these acquisitions allocated to property, plant and equipment was approximately \$13 million, identifiable intangible assets, primarily trademarks, was approximately \$150 million and goodwill was approximately \$163 million. The purchase price allocations will be adjusted once additional fair value information is obtained. The acquisitions of Fuze and Leao Junior were accounted for as business combinations, with the results of the acquired entities included in the North America and Latin America operating segments, respectively, as of the acquisition dates.

### NOTE 20: ACQUISITIONS AND INVESTMENTS (Continued)

The acquisitions of the 18 German bottling and distribution operations, glacéau, CCBPI, Fuze, Leao Junior, NORSA, our 34 percent investment in Tokyo CCBC and our 50 percent investment in Jugos del Valle in 2007 were primarily financed through the issuance of commercial paper and long-term debt.

Assuming the results of the businesses acquired in 2007 had been included in operations beginning on January 1, 2006, the estimated pro forma net operating revenues of the Company for the years ended December 31, 2007 and 2006 would have been approximately \$29.6 billion and \$25.9 billion, respectively. The estimated pro forma net income, excluding the effect of interest expense as a result of financing the acquisitions, for the years ended December 31, 2007 and 2006 would not have been significantly different than the reported amounts.

During 2006, our Company's acquisition and investment activity, including the acquisition of trademarks, totaled approximately \$901 million. In the third quarter of 2006, our Company acquired a controlling shareholding interest in Kerry Beverages Limited ("KBL"). KBL was formed by the Company and the Kerry Group in 1993 and has a majority ownership in 11 joint ventures that manufacture and distribute Company products across nine provinces in China. KBL also has a minority interest in the joint venture bottler in Beijing. Subsequent to the acquisition, the Company changed KBL's name to Coca-Cola China Industries Limited ("CCCIL"). As a result of the transaction, the Company owns 89.5 percent of the outstanding shares of CCCIL, and we have agreed to purchase the remaining 10.5 percent by the end of 2008 at the same price per share as the initial purchase price plus interest. We have all voting and economic rights over the remaining shares. This transaction was accounted for as a business combination, and the results of CCCIL's operations have been included in the Company's consolidated financial statements since August 29, 2006. CCCIL is included in the Bottling Investments operating segment.

In the third quarter of 2006, our Company signed agreements with J. Bruce Llewellyn and Brucephil, Inc. ("Brucephil"), the parent company of The Philadelphia Coca-Cola Bottling Company, for the potential purchase of the remaining shares of Brucephil not currently owned by the Company. The agreements provide for the Company's purchase of the shares upon the election of Mr. Llewellyn or the election of the Company. Based on the terms of these agreements, the Company concluded that it must consolidate Brucephil under Interpretation No. 46(R). Brucephil's financial statements were consolidated effective September 29, 2006. Brucephil is included in our Bottling Investments operating segment.

Also in the third quarter of 2006, our Company acquired Apollinaris GmbH ("Apollinaris"). Apollinaris has been selling sparkling and still mineral water in Germany since 1862. This transaction was accounted for as a business combination, and the results of Apollinaris' operations have been included in the Company's consolidated financial statements since July 1, 2006. A portion of Apollinaris' business is included in the European Union operating segment, and the balance is included in the Bottling Investments operating segment.

The combined amount paid or to be paid to complete these third quarter 2006 transactions totaled approximately \$707 million. As a result of these transactions, the Company recorded approximately \$707 million of franchise rights, approximately \$74 million of trademarks and approximately \$182 million of goodwill. The franchise rights and trademarks have been assigned an indefinite life.

In January 2006, our Company acquired a 100 percent interest in TJC Holdings (Pty) Ltd. ("TJC"), a bottling company in South Africa, from Chef Limited and Tom Cook Trust for cash consideration of approximately \$200 million. Subsequently, the Company renamed TJC as Scarlet. This transaction was accounted for as a business combination, with the results of Scarlet included in the Company's consolidated financial statements since the date of acquisition. In May 2007, Scarlet issued common shares to a Black Economic Empowerment Entity ("BEEE") at a price per share equal to the current carrying value of our investment in Scarlet, which was subsequently renamed as

### NOTE 20: ACQUISITIONS AND INVESTMENTS (Continued)

Shanduka Beverages (Proprietary) Limited ("Shanduka"). This issuance reduced the Company's ownership interest in Shanduka to 30 percent. As a result of subordinated financial support provided by the Company for the BEEE to complete this transaction, the Company concluded that we must continue to consolidate Shanduka's operations under Interpretation No. 46(R). Shanduka is included in our Bottling Investments operating segment.

Assuming the results of the businesses acquired in 2006 had been included in operations beginning on January 1, 2005, pro forma financial data would not be required for 2005 or 2006 due to immateriality.

During 2005, our Company's acquisition and investment activity totaled approximately \$637 million and included the acquisition of the German bottling company Bremer Erfrischungsgetraenke GmbH ("Bremer") for approximately \$160 million from InBev SA. This transaction was accounted for as a business combination, and the results of Bremer's operations have been included in the Company's consolidated financial statements beginning in September 2005. The Company recorded approximately \$54 million of property, plant and equipment, approximately \$85 million of franchise rights and approximately \$58 million of goodwill related to this acquisition. The franchise rights have been assigned an indefinite life, and the goodwill was allocated to the Germany reporting unit within the European Union operating segment.

In August 2005, we completed the acquisition of the remaining 49 percent interest in the business of CCDA Waters L.L.C. ("CCDA") not previously owned by our Company. Our Company and Danone Waters of North America, Inc. ("DWNA") had formed CCDA in July 2002 for the production, marketing and distribution of DWNA's bottled spring and source water business in the United States. This transaction was accounted for as a business combination, and the consolidated results of CCDA's operations have been included in the Company's consolidated financial statements since July 2002. CCDA is included in our North America operating segment. In July 2005, the Company acquired Sucos Mais, a Brazilian juice company. The results of Sucos Mais have been included in our consolidated financial statements since July 2005. Sucos Mais is included in our Latin America operating segment.

Assuming the results of our 2005 acquisitions had been included in operations beginning on January 1, 2004, pro forma financial data would not be required due to immateriality.

On April 20, 2005, our Company and Coca-Cola Hellenic jointly acquired Multon for a total purchase price of approximately \$501 million, split equally between the Company and Coca-Cola Hellenic. The Company's investment in Multon is accounted for under the equity method. Equity income—net includes our proportionate share of the results of Multon's operations beginning April 20, 2005. Multon is included in our Eurasia operating segment.

### **NOTE 21: OPERATING SEGMENTS**

Effective January 1, 2007, the Company combined the Eurasia and Middle East Division, and the Russia, Ukraine and Belarus Division, both of which were previously included in the North Asia, Eurasia and Middle East operating segment, with the India Division, previously included in the East, South Asia and Pacific Rim operating segment, to form the Eurasia operating segment. In addition, we combined the China Division and the Japan Division, previously included in the North Asia, Eurasia and Middle East operating segment, with the remaining East, South Asia and Pacific Rim operating segment to form the Pacific operating segment. As a result, effective January 1, 2007, our organizational structure consisted of the following operating segments: Africa, Eurasia, European Union, Latin America, North America, Pacific, Bottling Investments and Corporate. Prior-period amounts have been reclassified to conform to the new operating structure described above.

### **Segment Products and Services**

The business of our Company is nonalcoholic beverages. Our operating segments derive a majority of their revenues from the manufacture and sale of beverage concentrates and syrups and, in some cases, the sale of finished beverages.

### Method of Determining Segment Income or Loss

Management evaluates the performance of our operating segments separately to individually monitor the different factors affecting financial performance. Our Company manages income taxes and financial costs, such as interest income and expense, on a global basis within the Corporate operating segment. We evaluate segment performance based on income or loss before income taxes.

### **NOTE 21: OPERATING SEGMENTS (Continued)**

Information about our Company's operations by operating segment for the years ended December 31, 2007, 2006 and 2005, is as follows (in millions):

Certain prior year amounts have been revised to conform to the current year presentation.

Net operating revenues in Japan represented approximately 9 percent of total consolidated net operating revenues in 2007, 11 percent in 2006 and 13 percent in 2005.

Operating income (loss) and income (loss) before income taxes were reduced by approximately \$34 million for Africa, \$3 million for Eurasia, \$33 million for European Union, \$4 million for Latin America, \$23 million for North America, \$3 million for Pacific, \$47 million for Bottling Investments and \$121 million for Corporate primarily due to asset write-downs and restructuring costs. Refer to Note 18.

Income (loss) before income taxes was decreased by approximately \$150 million for Bottling Investments primarily due to our proportionate share of asset write-downs and restructuring costs, net of benefits from tax rate changes, recorded by equity method investees and was increased by \$227 million for Corporate primarily due to gains on the sale of real estate in Spain and in the United States, the sale of our ownership in Vonpar and the sale of Coca-Cola Amatil shares. Refer to Note 19.

<sup>4</sup> Principally cash and cash equivalents, marketable securities, finance subsidiary receivables, goodwill, trademarks and other intangible assets and property, plant and equipment—net.

### NOTE 21: OPERATING SEGMENTS (Continued)

<sup>5</sup> Property, plant and equipment—net in Germany represented approximately 21 percent of total consolidated property, plant and equipment—net in 2007, 19 percent in 2006 and 19 percent in 2005.

Principally equity and cost method investments in bottling companies.

Operating income (loss) and income (loss) before income taxes were reduced by approximately \$3 million for Africa, \$36 million for the European Union, \$62 million for the Pacific, \$87 million for Bottling Investments and \$1 million for Corporate primarily due to asset impairments, contract termination costs related to production capacity efficiencies and other restructuring costs. Refer to Note 19.

Operating income (loss) and income (loss) before income taxes were reduced by \$100 million for Corporate as a result of a donation made to

The Coca-Cola Foundation. Refer to Note 19.

Equity income—net and income (loss) before income taxes were reduced by approximately \$587 million for Bottling Investments primarily related to our proportionate share of impairment and restructuring charges recorded by CCE which were partially offset by our proportionate share of changes in certain of CCE's state and Canadian federal and provincial tax rates (refer to Note 3 and Note 19), and were reduced by

approximately \$19 million due to our proportionate share of restructuring charges recorded by other equity method investees.

10 Income (loss) before income taxes was increased by approximately \$298 million for Corporate as a result of net gains on the sale of Coca-Cola FEMSA shares and the sale of a portion of our investment in Coca-Cola Icecek in an initial public offering. Refer to Note 19.

11 Operating income (loss) and income (loss) before income taxes were reduced by approximately \$3 million for Africa, \$3 million for Eurasia, \$3 million for the European Union, \$4 million for Latin America, \$12 million for North America, \$3 million for the Pacific, and \$22 million for Corporate as a result of accelerated amortization of stock-based compensation expense due to a change in our estimated service period for retirement-eligible participants. Refer to Note 15.

12 Operating income (loss) and income (loss) before income taxes were reduced by approximately \$85 million for the Pacific related to the Philippines impairment charges. Refer to Note 19.

Operating income (loss) and income (loss) before income taxes benefited by approximately \$47 million for Corporate related to the settlement

of a class action lawsuit related to HFCS purchases. Refer to Note 19.

- 14 Equity income—net and income (loss) before income taxes were reduced by approximately \$33 million for Bottling Investments primarily related to our proportionate share of the tax liability recorded as a result of CCE's repatriation of unremitted foreign earnings under the Jobs Creation Act and restructuring charges, offset by CCE's HFCS lawsuit settlement proceeds and changes in certain of CCE's state and provincial tax rates, and by approximately \$4 million due to our proportionate share of impairments of certain intangible assets and investments recorded by an equity method investee in the Philippines. Refer to Note 3 and Note 19.
- 15 Income (loss) before income taxes benefited by approximately \$23 million for Corporate due to noncash pretax gains on issuances of stock by Coca-Cola Amatil in connection with the acquisition of SPC Ardmona Pty. Ltd., an Australian fruit company. Refer to Note 4.

### **NOTE 22: SUBSEQUENT EVENT**

On February 5, 2008, the Company and Honest Tea, Inc. completed an agreement resulting in the Company holding an approximate 40 percent interest in Honest Tea, Inc., the maker of organic beverages, including beverages sold under the Honest Tea trademark. The Company also may elect to buy, and the remaining Honest Tea, Inc. shareholders may elect to sell to the Company, the outstanding interest not currently owned by the Company.

### REPORT OF MANAGEMENT ON INTERNAL CONTROL OVER FINANCIAL REPORTING

### The Coca-Cola Company and Subsidiaries

Management of the Company is responsible for the preparation and integrity of the consolidated financial statements appearing in our annual report on Form 10-K. The financial statements were prepared in conformity with generally accepted accounting principles appropriate in the circumstances and, accordingly, include certain amounts based on our best judgments and estimates. Financial information in this annual report on Form 10-K is consistent with that in the financial statements.

Management of the Company is responsible for establishing and maintaining adequate internal control over financial reporting as such term is defined in Rules 13a-15(f) under the Securities Exchange Act of 1934 ("Exchange Act"). The Company's internal control over financial reporting is designed to provide reasonable assurance regarding the reliability of financial reporting and the preparation of the consolidated financial statements. Our internal control over financial reporting is supported by a program of internal audits and appropriate reviews by management, written policies and guidelines, careful selection and training of qualified personnel and a written Code of Business Conduct adopted by our Company's Board of Directors, applicable to all Company Directors and all officers and employees of our Company and subsidiaries.

Because of its inherent limitations, internal control over financial reporting may not prevent or detect misstatements and even when determined to be effective, can only provide reasonable assurance with respect to financial statement preparation and presentation. Also, projections of any evaluation of effectiveness to future periods are subject to the risk that controls may become inadequate because of changes in conditions, or that the degree of compliance with the policies or procedures may deteriorate.

The Audit Committee of our Company's Board of Directors, composed solely of Directors who are independent in accordance with the requirements of the New York Stock Exchange listing standards, the Exchange Act and the Company's Corporate Governance Guidelines, meets with the independent auditors, management and internal auditors periodically to discuss internal control over financial reporting and auditing and financial reporting matters. The Audit Committee reviews with the independent auditors the scope and results of the audit effort. The Audit Committee also meets periodically with the independent auditors and the chief internal auditor without management present to ensure that the independent auditors and the chief internal auditor have free access to the Audit Committee. Our Audit Committee's Report can be found in the Company's 2008 Proxy Statement.

Management assessed the effectiveness of the Company's internal control over financial reporting as of December 31, 2007. In making this assessment, management used the criteria set forth by the Committee of Sponsoring Organizations of the Treadway Commission (COSO) in *Internal Control—Integrated Framework*. During 2007, the Company acquired the 65 percent interest in Coca-Cola Bottlers Philippines, Inc. which it did not already own and 18 bottling and distribution operations in Germany. Refer to Note 20 of Notes to Consolidated Financial Statements for additional information regarding these events. In accordance with SEC Staff guidance, management has excluded these businesses from its evaluation of the effectiveness of the Company's internal control over financial reporting as of December 31, 2007. The net operating revenues attributable to these businesses represented approximately 3.5 percent of the Company's consolidated net operating revenues for the year ended December 31, 2007, and their aggregate total assets represented approximately 5.0 percent of the Company's consolidated total assets as of December 31, 2007. Based on our assessment, management believes that the Company maintained effective internal control over financial reporting as of December 31, 2007.

The Company's independent auditors, Ernst & Young LLP, a registered public accounting firm, are appointed by the Audit Committee of the Company's Board of Directors, subject to ratification by our Company's shareowners. Ernst & Young LLP has audited and reported on the consolidated financial statements of The Coca-Cola Company and subsidiaries and the Company's internal control over financial reporting. The reports of the independent auditors are contained in this annual report.

### Report of Independent Registered Public Accounting Firm

### Board of Directors and Shareowners

The Coca-Cola Company

We have audited the accompanying consolidated balance sheets of The Coca-Cola Company and subsidiaries as of December 31, 2007 and 2006, and the related consolidated statements of income, shareowners' equity, and cash flows for each of the three years in the period ended December 31, 2007. These financial statements are the responsibility of the Company's management. Our responsibility is to express an opinion on these financial statements based on our audits.

We conducted our audits in accordance with the standards of the Public Company Accounting Oversight Board (United States). Those standards require that we plan and perform the audit to obtain reasonable assurance about whether the financial statements are free of material misstatement. An audit includes examining, on a test basis, evidence supporting the amounts and disclosures in the financial statements. An audit also includes assessing the accounting principles used and significant estimates made by management, as well as evaluating the overall financial statement presentation. We believe that our audits provide a reasonable basis for our opinion.

In our opinion, the financial statements referred to above present fairly, in all material respects, the consolidated financial position of The Coca-Cola Company and subsidiaries at December 31, 2007 and 2006, and the consolidated results of their operations and their cash flows for each of the three years in the period ended December 31, 2007, in conformity with U.S. generally accepted accounting principles.

As discussed in Notes 1 and 17 to the consolidated financial statements, in 2007 the Company adopted FASB Interpretation No. 48 related to accounting for uncertainty in income taxes. Also as discussed in Note 1 to the consolidated financial statements, in 2006 the Company adopted SFAS No. 158 related to defined benefit pension and other postretirement plans.

We also have audited, in accordance with the standards of the Public Company Accounting Oversight Board (United States), The Coca-Cola Company's internal control over financial reporting as of December 31, 2007, based on criteria established in *Internal Control—Integrated Framework* issued by the Committee of Sponsoring Organizations of the Treadway Commission and our report dated February 27, 2008, expressed an unqualified opinion thereon.

### Report of Independent Registered Public Accounting Firm on Internal Control Over Financial Reporting

#### **Board of Directors and Shareowners**

#### The Coca-Cola Company

We have audited The Coca-Cola Company's internal control over financial reporting as of December 31. 2007, based on criteria established in *Internal Control—Integrated Framework* issued by the Committee of Sponsoring Organizations of the Treadway Commission (the COSO criteria). The Coca-Cola Company's management is responsible for maintaining effective internal control over financial reporting, and for its assessment of the effectiveness of internal control over financial reporting included in the accompanying Report of Management on Internal Control Over Financial Reporting. Our responsibility is to express an opinion on the Company's internal control over financial reporting based on our audit.

We conducted our audit in accordance with the standards of the Public Company Accounting Oversight Board (United States). Those standards require that we plan and perform the audit to obtain reasonable assurance about whether effective internal control over financial reporting was maintained in all material respects. Our audit included obtaining an understanding of internal control over financial reporting, assessing the risk that a material weakness exists, testing and evaluating the design and operating effectiveness of internal control based on the assessed risk, and performing such other procedures as we considered necessary in the circumstances. We believe that our audit provides a reasonable basis for our opinion.

A company's internal control over financial reporting is a process designed to provide reasonable assurance regarding the reliability of financial reporting and the preparation of financial statements for external purposes in accordance with generally accepted accounting principles. A company's internal control over financial reporting includes those policies and procedures that (1) pertain to the maintenance of records that, in reasonable detail, accurately and fairly reflect the transactions and dispositions of the assets of the company; (2) provide reasonable assurance that transactions are recorded as necessary to permit preparation of financial statements in accordance with generally accepted accounting principles, and that receipts and expenditures of the company are being made only in accordance with authorizations of management and directors of the company; and (3) provide reasonable assurance regarding prevention or timely detection of unauthorized acquisition, use, or disposition of the company's assets that could have a material effect on the financial statements.

Because of its inherent limitations, internal control over financial reporting may not prevent or detect misstatements. Also, projections of any evaluation of effectiveness to future periods are subject to the risk that controls may become inadequate because of changes in conditions, or that the degree of compliance with the policies or procedures may deteriorate.

As indicated in the accompanying Report of Management on Internal Control Over Financial Reporting, management's assessment of and conclusion on the effectiveness of internal control over financial reporting did not include the internal controls of Coca-Cola Bottlers Philippines, Inc. (CCBPI) and 18 bottling and distribution operations in Germany, which are included in the 2007 consolidated financial statements of The Coca-Cola Company and subsidiaries and constituted approximately 5.0 percent of the Company's consolidated total assets as of December 31, 2007 and approximately 3.5 percent of the Company's consolidated net operating revenues for the year then ended. Our audit of internal control over financial reporting of The Coca-Cola Company also did not include an evaluation of the internal control over financial reporting of CCBPI and the 18 bottling and distribution operations in Germany.

In our opinion, The Coca-Cola Company maintained, in all material respects, effective internal control over financial reporting as of December 31, 2007, based on the COSO criteria.

We also have audited, in accordance with the standards of the Public Company Accounting Oversight Board (United States), the consolidated balance sheets of The Coca-Cola Company and subsidiaries as of December 31, 2007 and 2006, and the related consolidated statements of income, shareowners' equity, and cash flows for each of the three years in the period ended December 31, 2007, and our report dated February 27, 2008, expressed an unqualified opinion thereon.

# List of the Official Pronouncements of the IASB

- C2 International Financial Reporting Standards (IFRS), IASB
- C2 International Accounting Standards (IAS), IASC
- C3 Interpretations Issued by International Financial Reporting Interpretations Committee (IFRIC) and the Standards Interpretation Committee (SIC)

Listed below are the major official pronouncements of the International Accounting Standards Board (IASB) and the International Accounting Standards Committee (IASC) that have established international generally accepted accounting principles, or had a significant impact upon the establishment of these principles. These pronouncements are typically referred to as International Financial Reporting Standards (IFRS). Also listed are the chapter numbers in which the related topics are discussed.

| Number           | Title  | Chapter Reference  |  |  |  |  |  |  |
|------------------|--|--------------------|--|--|--|--|--|--|
| Fra              | Framework for the Preparation and Presentation of Financial Statements Chapter 2 |                    |  |  |  |  |  |  |
|                  | International Financial Reporting Standards, IASB                                |                    |  |  |  |  |  |  |
| IFRS 1           | First-Time Adoption of International Financial Reporting Standards               |                    |  |  |  |  |  |  |
| IFRS 2           | Share-Based Payment  | Chapter 16         |  |  |  |  |  |  |

| IAS 21           | The Effects of Changes in Foreign Exchange Rates                                 |                    |  |  |  |  |  |  |
| IAS 23           | Borrowing Costs  | Chapter 10         |  |  |  |  |  |  |
| IAS 24           | Related Party Disclosures  |                    |  |  |  |  |  |  |
| IAS 26           | Accounting and Reporting by Retirement Benefit Plans                             |                    |  |  |  |  |  |  |
| IAS 27           | Consolidated and Separate Financial Statements                                   |                    |  |  |  |  |  |  |
| IAS 28           | Investments in Associates  | Chapter 15         |  |  |  |  |  |  |
| IAS 29           | Financial Reporting in Hyper-Inflationary Economies                              |                    |  |  |  |  |  |  |
| IAS 30           | Disclosures in the Financial Statements of Banks and Similar Financial In-       |                    |  |  |  |  |  |  |
| IAS 31           | Interests in Joint Ventures  |                    |  |  |  |  |  |  |
|                  | Financial Instruments: Presentation  |                    |  |  |  |  |  |  |
|                  | Earnings per Share   |                    |  |  |  |  |  |  |
| IAS 34           | Interim Financial Reporting  |                    |  |  |  |  |  |  |
| IAS 36<br>IAS 37 | Impairment of Assets   | Chapter 12         |  |  |  |  |  |  |
| IAS 37           | Intangible Assets  |                    |  |  |  |  |  |  |
| IAS 39           | Financial Instruments: Recognition and Measurement                               |                    |  |  |  |  |  |  |
| IAS 40           | Investment Property  | Graptero (, 11, 15 |  |  |  |  |  |  |
| IAS 41           | Agriculture  |                    |  |  |  |  |  |  |

Listed below are the interpretations of IAS and IFRS developed by the International Financial Reporting Interpretations Committee (IFRIC). IFRIC replaced the former Standing Interpretations Committee (SIC) in March 2002. Interpretations are part of the IASB's authoritative literature, and therefore, financial statements may

not be described as complying with International Financial Reporting Standards unless they comply with all the requirements of each applicable Standard and each applicable Interpretation.

#### Final Interpretations Issued by IFRIC

| Number                        | Title Re  | eference        |

# Brief Guide to Key IFRS vs U.S. GAAP Differences by Chapter

Below are brief summaries of the major differences between IFRS and U.S. GAAP for the topics discussed in each chapter of the book. For a more complete discussion, see the IFRS versus U.S. GAAP boxes in each chapter. Included in each box is also a discussion of the similarities between IFRS and U.S. GAAP for the relevant chapter topics (for reference purposes, the page number in each chapter is shown in parentheses beside each chapter title below). For a list of the major official pronouncements of the IASB and the chapters to which they relate, see Appendix C.

#### **Chapter 2 Financial Reporting: Its Conceptual Framework** (page 63)

- In joint tentative conceptual framework:
  - Fundamental qualitative characteristics are relevance and faithful representation.
  - Components of relevance are *predictive value* and *confirmatory value*.
  - Components of faithful representation are completeness, neutrality, and free from material error.
  - Enhancing qualitative characteristics are comparability (including consistency), verifiability, timeliness, and understandability.

#### Chapter 4 The Balance Sheet and Statement of Changes in Stockholders' Equity (page 157)

- On the balance sheet:
  - Typically, noncurrent assets are presented first, followed by current assets.
  - Typically, the ordering of liabilities and owners' equity is different.
    - ♦ Capital and reserves are listed first.
    - ♦ Noncurrent liabilities are listed next.
    - ♦ Current liabilities are listed last.
  - Reserves may result from upward revaluations of property and investments, as well as currency translation differences.
- In the notes to the financial statements:
  - Disclosure must be made of the measurement basis used for revaluations.

#### **Chapter 5 The Income Statement and Statement of Cash Flows** (page 214)

- On the income statement:
  - IFRS do not prescribe either a single-step or a multiple-step format.
  - The terminology may be different. For instance, some companies use the term "turnover" to refer to sales.
  - IFRS require expenses to be classified by their nature or function.
  - IFRS allow the adjustment of the related depreciation expense if property has been revalued upward.
  - IFRS allow alternative performance measures (other than net income).
  - IFRS prohibit the reporting of extraordinary items.
- On the statement of cash flows, see Chapter 22.

#### Chapter 6 Additional Aspects of Financial Reporting and Financial Analysis (page 274)

- For segment reporting, IFRS require the reporting of each segment's liabilities if regularly reported to the chief operating decision maker.
- IFRS do not specify which companies must publish interim reports or how frequently they must be published.
- For interim reports, IFRS do not allow the allocation of expenses between interim periods.
- For interim reports, IFRS do not allow the deferral of a temporary market decline in inventory that is expected to be recovered in a later interim period.

#### Chapter 7 Cash and Receivables (page 342)

- IFRS classify most receivables in a category called "loans and receivables," which is not defined by U.S. GAAP.
- IFRS allow receivables to be classified in the "available-for-sale" category.
- IFRS have more restrictions for reporting a receivable at fair value.

#### **Chapter 8 Inventories: Cost Measurement and Flow Assumptions** (page 398)

- IFRS do not allow the use of LIFO.
- IFRS require the same cost flow assumption to be used for all inventories that have a similar nature and use.

#### **Chapter 9 Inventories: Special Valuation Issues** (page 433)

- For LCM:
  - IFRS define market value as net realizable value, therefore eliminating the need for a ceiling and a floor.
  - IFRS expect that the market value will be applied to individual items.
  - IFRS do not specify where write-downs will be reported on the income statement.
  - IFRS allow the reversal of a previous write-down, which is then recognized in income.

#### Chapter 10 Property, Plant, and Equipment: Acquisition and Disposal (page 489)

- IFRS allow a company to write up its property, plant, and equipment to fair value, provided the fair value can be reliably measured.
- Any increase in fair value is credited to stockholders' equity as a revaluation surplus.
- When an operating asset of a company is made up of significant individual components, IFRS require the company to account for each component separately.
- IFRS require the cost of relocating or reorganizing property, plant, and equipment to be expensed.

#### **Chapter 11 Depreciation and Depletion** (pages 524 and 534)

- IFRS only require that depreciation be "systematic."
- IFRS require that the depreciation method, estimated useful lives, and residual values be reviewed at least once a year.
- IFRS require that the initial cost of an operating asset be allocated to the significant components of the asset and the components be separately depreciated.
- If a company has written up the value of its property, plant, and equipment, IFRS allow the company to adjust its related amount of depreciation each period.
- For impairments of property, plant, and equipment, IFRS use the higher of the asset's fair value (less costs to sell) or value in use to determine if an asset is impaired.
- IFRS allow an impairment loss related to property, plant, and equipment to be reversed if the value is recovered.

#### **Chapter 12 Intangibles** (page 576)

- In the research and development phase of internally generated intangibles, IFRS allow certain development costs to be capitalized.
- IFRS allow intangibles to be revalued upwards, with a corresponding increase in stockholders' equity.
- For impairments of intangible assets, IFRS use the higher of the asset's fair value (less costs to sell) or value in use to determine if an asset is impaired.
- IFRS allow an impairment loss related to an intangible asset to be reversed if the value is recovered.

#### **Chapter 13 Current Liabilities and Contingencies** (page 628)

- IFRS refer to contingencies as "provisions."
- IFRS use the term "probable" to mean the outcome is more likely than not to occur.

- IFRS require recognition of a liability if it is probable that the obligating event has
  occurred.
- For a "provision," if a range of estimates of the settlement price exists and no amount in the range is more likely than any other amount in the range, IFRS require that the mid-point of the range be used to measure the liability.

#### **Chapter 14 Long-Term Liabilities and Receivables** (page 673)

- IFRS require that a financial instrument be classified as a financial liability when it contains an obligation to transfer resources, regardless of the legal form.
- IFRS require a company that issues a compound financial instrument containing both liability and equity components to report each component separately.
- IFRS allow a company to record an impairment loss on a note receivable by reducing the receivable directly or through an allowance account.
- IFRS allow the reversal of an impairment loss in a later period, with the reversal amount included in income.

#### Chapter 15 Investments (pages 740 and 746)

- IFRS refer to the trading category of investments as "financial assets or liabilities measured at fair value through profit or loss."
- IFRS apply the three categories of investments to all financial instruments (including receivables).
- IFRS impose more restrictions on using fair value for financial assets or liabilities.
- IFRS allow for the reversal of an impairment loss on certain investment securities, with the reversal amount included in income.
- IFRS refer to an "equity method investee" as an "associate."
- IFRS define joint venture arrangements and allow proportionate consolidation.

#### Chapter 16 Contributed Capital (page 812)

- Under IFRS, stockholders' equity is referred to as "capital and reserves."
- Under IFRS, a company may have a revaluation surplus (or reserve) account if it has revalued its property, plant, and equipment and intangible assets upward to fair value.
- Under IFRS, if a company has share options that vest ratably or in installments, the company must treat each installment as an individual arrangement.

#### Chapter 17 Earnings per Share and Retained Earnings (page 853)

- For potentially dilutive share options for EPS, IFRS do not require a company to include any unrecognized compensation cost in the assumed proceeds from issuing stock under the treasury stock method.
- IFRS do not require any unvested contingently issuable shares to be excluded from basic EPS calculations.
- Because IFRS do not allow extraordinary items, there is no EPS disclosure for extraordinary items.
- IFRS allow the presentation of alternative EPS amounts in the notes to the financial statements.
- Under IFRS, corporations sometimes use the term "shareholders' interests" to refer to stockholders' equity.
- IFRS require the disclosure of any capital not yet paid in, restrictions on the repayment of capital, and shares reserved for future issuance under sales contracts.

#### **Chapter 18 Income Recognition and Measurement of Net Assets** (page 931)

- Under IFRS, revenue is recognized when:
  - It is probable that future economic benefits will flow to the company and these benefits can be measured reliably.

- The significant risks and rewards of ownership are transferred.
- The company retains neither continuing managerial involvement nor effective control over the goods sold.
- The costs of the transaction can be measured reliably.
- IFRS do not specify how revenue should be allocated to the different elements of a multiple deliverable contract.
- IFRS require the use of a cost recovery method when the outcome of a construction contract cannot be reliably estimated.

#### **Chapter 19 Accounting for Income Taxes** (page 991)

- IFRS allow a company to recognize a deferred tax asset when it is *probable* (more likely than not) that it will have sufficient future taxable income against which to use the deferred tax asset.
- Since IFRS allow the upward revaluation of certain assets to fair value, this results in the recognition of a deferred tax amount that is reported in shareholders' interests (stockholders' equity).
- Under IFRS, a company's measurement of deferred tax assets and liabilities is based on future tax rates (as well as the tax laws of the country in which it is located).
- IFRS provide no guidance about the measurement of deferred tax liabilities related to uncertain tax positions.
- IFRS require a company to classify its deferred tax assets and liabilities as noncurrent on its balance sheet.

#### Chapter 20 Accounting for Postemployment Benefits (page 1049)

- IFRS allow a company to report the components of its pension expense in different line items of its income statement.
- IFRS require a company to expense in full on its income statement any prior service cost that is vested immediately.
- IFRS allow a company to either recognize actuarial gains and losses by amortizing them into income or recognize them in full as other comprehensive income in the period in which they occur.
- IFRS allow defined benefit accounting for multi-employer plans.

#### **Chapter 21 Accounting for Leases** (page 1118)

- IFRS focus on the *substance* of the lease agreement rather than the *form* so that they do not have specific criteria.
- Under IFRS, a lease is classified as either a finance lease or an operating lease.
- IFRS require a lease to be capitalized as a finance lease when substantially all of the
  risks and rewards of ownership are transferred, as demonstrated by several examples or indicators not specified under U.S. GAAP. Two of these indicators are as
  follows:
  - The lease term is for the major part of the economic life of the asset.
  - The present value of the lease payments is substantially equal to the fair value of the asset.

#### Chapter 22 The Statement of Cash Flows (page 1171)

- IFRS differ in terminology, referring to a cash flow statement.
- IFRS require a company to report any cash paid for development costs (in R&D) that it has capitalized as an investing cash outflow.
- IFRS allow a company to report dividends and interest received as either an operating cash inflow or financing cash inflow.
- IFRS allow a company to report payments of income taxes related to financing or investing transactions as financing or investing cash outflows.
- IFRS allow a company to report its cash flow per share.

#### **Chapter 23 Accounting for Changes and Errors** (page 1243)

- For an error correction, IFRS allow an exception to restating previously issued financial statements. When restatement for all periods is impracticable, the restatement may be made for the earliest period practicable.
- IFRS do not address when the indirect effects of a change in accounting principle should be reported.
- IFRS require less extensive disclosures for accounting changes and error corrections.

*Note*: The letter n following a page number indicates a footnote; the letter f, an exhibit; the letter d, a definition.
