Industry self-regulation standards or business practices may eventually be referenced in administrative rules regulating business activities, thus giving these standards or business practice legal compliance requirements. Self-regulation standards or business practices also may include specified forms of inspection and certification of compliance with the established standards or business practices. Self-regulation standards or business practices may be certified by the firm (first-party certification), industry trade association (second-party certification), an independent third-party auditor, such as a nongovernmental organization (third-party certification), or by an international quasi-governmental or nonprofit assessment organization (fourth-party certification), such as the United Nations, with its business practice–oriented Global Compact, or the ISO, the international technical standards–setting body, respectively.

Trends in Public Regulation

In democratic, market-based economies, the trend throughout most of the 20th century has been to increase public regulation of the private sector. Beginning in the late 1970s and continuing through the 1990s, an international regulatory reform movement emerged that predominantly emphasized economic deregulation of industry—but not exclusively. For example, regulatory reform efforts in the United States and Great Britain have generally reduced public regulation of industry, but recent changes in Germany and Japan have reinforced national regulatory agency control (largely because of the movement from public ownership to "privatization" of major industries). There have also been some deregulation efforts occurring in European countries, especially directed at social regulation. During the early 2000s, there was reregulation of the U.S. securities industry, a result of corporate scandals typified by the demise of energy giant Enron Corporation, focusing on developing administrative rules strengthening financial reporting practices.

In the mid-to-late 1970s, many economists argued that the administrative rules that had been adopted to regulate "price and entry" by business were sometimes ineffective and could actually block the effective attainment of the original policy objectives, that is, to compensate for market failure, by failing to provide economic incentives for industry innovation. In contrast to the criticisms of economic regulation, critics of social regulation attacked the regulatory procedures, objectives, and goals of administrative rule making. Citing legislation specifying rigid industry standards (and thus, only one approach) and precise deadlines to attain compliance, these "technology forcing" administrative rules were often impossible to meet, as the technology was not, or did not, become available. Other critics of social regulation believed that the health, safety, environmental, and equity legislative objectives embodied in administrative rules were simply not worth the increased role (and cost) of government in society, as society would be better off relying on the values and choices of individual citizens.

The increase in, and costs of, economic and social regulation in the United States can be illustrated through the longitudinal data analyses conducted by the Center for the Study of American Business at the University of Washington. For example, between 1960 and 1980, the staffing requirements of national regulatory agencies rose from fewer than 40,000 federal employees to approximately 100,000 federal employees—or a 150 percent increase in the number of federal employees. For the same range of years (1960 to 1980), the costs (unadjusted for inflation) of federal regulation rose from just under $20 billion (1960) to approximately $80 billion (1980)—an average annual increase in regulatory costs of $3 billion, or 15 percent on the base year 1960, borne by industry and consumers. While economic regulation costs modestly exceeded the costs of social regulation in 1960, the cost of social regulation was nearly two-and-a-half times that expended on economic regulation in 1980.

In spite of these rapidly rising public regulatory costs, defenders of increased public regulation, particularly of the social form, argued that the benefits still outweighed the costs (although benefits are more difficult to monetize). Since 1980, regulatory reform efforts in the United States have stanched the increase in national regulatory agency staffing, as the level of employment has increased modestly to approximately 110,000 employees by the middle of the first decade of the 21st century. However, the costs of federal regulation (unadjusted for inflation) has continued to rise to more than $170 billion (2005) over the ensuing 25 years, although reflecting a decreasing rate of growth in the cost of public regulation over the 1960–80 period.

As global commerce has expanded, so has the international regulation of business practices. In 1994, the World Trade Organization was established to define the rules under which international trade is conducted and to resolve disputes among member nations. The World Health Organization (WHO), an agency of the United Nations, has partnered with the global pharmaceutical industry to establish quality standards and resolve potentially harmful marketing and manufacturing practices. WHO had previously worked with infant formula manufacturers to develop an international marketing code, which would later be adopted as national policy by governments. The development of bilateral or multilateral regulatory agreements between or among nations is a process by which numerous stakeholders, representing business, government, and nongovernmental organizations (the latter representing labor, consumer, or environmental interests), engage in lengthy consultation. The list of multilateral agreements regulating business practices pertain to ocean fishing, chemical emissions affecting the earth's ozone layer, and the dumping of hazardous chemicals in oceans, to name a few.

Relationship Marketing

The term *relationship marketing* implicitly recognizes the importance of both the buyer (the customer) and the seller in the marketing process. Beginning in the 1960s, marketing practitioners and scholars (like Theodore Levitt and Philip Kotler) began to emphasize that marketing truly was an "exchange" in which both parties shaped the direction and outcome of the ultimate product offering. Marketing, according to this perspective, was not equivalent to merely selling a finished product to a passive audience who lacked input; rather, marketing, to be most effective, needed to encompass a much broader range of activities that extended far beyond the traditional marketing department and it needed to involve more players, including customers. As a new breed of marketers stressed, it was essential that customer feedback be more fully incorporated into the planning and execution of marketing initiatives.

This emphasis on the critical roles played by customers (not just sellers) in the marketing process led to the rise in the 1980s of the term *relationship marketing*. According to this dogma, organizations, if they expected to be successful, needed to build long-term relationships with their customers. The tasks of listening to customers and keeping them engaged and satisfied were heralded as not only good for corporate profits but also socially responsible business practices and hence also good for consumers and society writ large.

Concurrent with organizations' growing awareness of the necessity of building deep relationships with buyers was a rising focus on "customer lifetime value," which recognized the many benefits that a firm accrued from keeping customers fully satisfied and coming back for additional purchases for the remainder of their lives. The term *relationship marketing*, like *customer lifetime value*, conveys the importance of customer retention. Marketing is not solely about making a one-time sale to a customer. It is, as Levitt once said, "after the sale is over" that the challenge of long-term customer relationship-building begins in earnest.

The rising importance of relationship marketing is well exemplified by the trajectory of the automobile industry's approach to customers. In the 1920s, Henry Ford famously said that a customer could have a car in any color he wanted, as long as it was black. While this simplified approach was conducive to achieving economies of scale and hence temporarily quite effective, Ford ultimately fumbled by ignoring customers' wishes. Competitors like General Motors rushed to fill the void in model designs. Automobile manufacturers (as well as other organizations) learned the importance of listening to customers' wishes and incorporating their feedback into the products and services being offered.

The buyer-seller relationship, however, does not end at the point of purchase. Extended warranties, customer service telephone lines, satisfaction surveys, and installment plans are just several of the ways the relationship evolves and builds after the sale is consummated. A customer satisfied with the post-purchase experience presumably is much more likely to buy from the same manufacturer again when down the road, he finds himself in the market for a new product to replace the old one.

The term *relationship management* remains popular today, although the concept is broadening to include more parties than strictly the buyer and seller. Organizations are engaged in many relationships, such as with vendors, suppliers, and other stakeholders. Today, a growing number of organizations are beginning to appreciate more fully the importance of nurturing these relationships, too, and moving them from a short-term, often adversarial orientation to a long-term, mutually beneficial relationship basis.

The cultivation of long-term, solid relationships with multiple constituencies now is widely perceived as a critical element in an organization's overall strategy, facilitating an organization achieving not just long-term survival, but sustained success.

Renault

The French automobile manufacturer Renault takes its name from Louis Renault, the company's founder, and is currently the fourth-largest automaker in the world. It was founded by Louis, Marcel, and Fernand Renault, and also Thomas Evert and Julian Wyer, with Louis Renault being the main force behind the Société Renault Frères. The first car was made and sold by Louis Renault to his own father after it had gone on a test drive on Christmas Eve 1898, the company being formalized the following year. To gain attention for Renault cars, the first one having been driven by a 1¾-hp de Dion engine, the Renault brothers were involved in publicly racing their cars. However, Marcel Renault was killed in the Paris-Madrid race of 1903, and Louis gave up racing forever thereafter. There was a small battle for control between Louis Renault and Marcel's mistress. When Fernand Renault died in 1908, this left Louis in control of the entire company.

Renault's first sedan car was produced in 1899, and the company started manufacturing cars that were sold for 3,000 francs each, about 10 years' salary for the average worker. They also produced taxis and buses. Orders for the cars started coming from overseas, and even the young Winston Churchill was driven in a Renault taxi when he went to Buckingham Palace in 1911. During World War I, the company was involved in the construction of transport vehicles and also tanks such as the FT-17 tanks, which were effective on the battlefield and were involved in the victory parade in Paris on July 14, 1919. By this time, Louis Renault was wealthy, with a large house on Avenue Foch in Paris.

After World War I, the Renault company started producing agricultural and industrial machines. Their cars at this time were aimed at the very wealthy, and during the 1920s, they diversified to introduce smaller models, which were often shown for the first time at the Paris Motor Show in September/October each year. Renault by this time was selling many cars to Britain, and it was from there that these cars were sold to the United States. Renault cars were also sold around the French Empire.

The outbreak of World War II led to Renault helping in the French war effort. However, with the fall of France in June 1940, Renault continued production, mainly of trucks for Nazi Germany. The factories at Billancourt were heavily bombed during the war, and after the liberation of France in 1944, Louis Renault was arrested and charged with collaboration. He claimed he had to keep the factories going to protect his workers. However, he died in prison at Frèsnes, probably after having been attacked by a prison guard. The Renault car factories were seized by the new French government and were then run by them.

The rear-engine 4CV was produced in 1946 and soon became a rival of the British Morris Minor and the German Volkswagen Beetle. It was produced until 1961, with some 500,000 cars sold. Renault also started producing a number of other cars, introducing the Renault 4 in 1961, the Renault 8 in the following year, and the Renault 16 in 1966. The company gained a new corporate logo in 1972. In the oil crisis of 1973–74, Renault managed to flourish as their cars were remarkably cheap to operate and they were fuel efficient. This led to their entry into the U.S. market and they gradually started being sold in most countries around the world. In 1980 Renault was able to buy AMC and continue production of the Cherokee and other SUVs. By this time, they had a factory in Wisconsin and continued sales in the United States until 1989. Their cars remained popular in much of Europe and in former French colonies such as Algeria.

In 1996 the French government decided to privatize Renault and this coincided with the company aiming to expand in their markets in eastern Europe and in South America. They operated extensively from Turkey, Argentina, and Brazil, and gradually started taking over other companies or forming alliances with them. Renault took over Dacia, the Romanian car company, and also the Korean automaker Samsung. There have been press reports questioning whether Renault-Nissan will form an alliance with General Motors.

Repsol YPF

Repsol YPF is an integrated international oil and gas company with headquarters in Madrid, Spain. It operates in more than 30 countries and is the industry leader in Spain and Argentina. It is one of the 10 major private oil companies in the world and the largest private energy company in Latin America in terms of assets. The main oil and gas reserves are in Latin America and in North Africa.

The company is part of some of the most representative stock market indexes, such as FTSE Eurotop 100, Dow Jones Stoxx 50, and the Standard & Poor's Global 100. Since 2003, it is included in the FTSE4Good. In previous years, Repsol YPF has kept a leadership position in global sustainability indexes such as DJSI World (Dow Jones Sustainability Index World) and the European DJSI STOXX (Dow Jones Sustainability Index Stoxx), with maximum punctuation in transparency and social and human capital development.

Principal consolidated financial data for 2007 are as follows (in millions of euros): income from operations, 5,808; net income, 3,188; EBITDA, 8,573; operating revenues, 55,923; investments, 5,373; net debt, 3,493. Its number of employees was 37,565.

The main activities of the company are based in the following:

- Oil and gas exploration and production activities (in 2007, oil and gas production totaled 1,039 million barrels of oil equivalent per day)
- Oil refining activities in which it leads the sector in the Spanish and Argentinean markets, and is also present in Peru and Brazil
- Oil products marketing in 12 countries in Europe and Latin America through a network of over 6,500 points of sale
- Chemical activities, which are carried out principally in Spain, Argentina, and Portugal, and basic petrochemical production, which focuses on obtaining olefins and aromatics
- Gas and power activities, which comprise natural gas supply, storage, transport, distribution, and marketing in Spain and Latin America

Repsol YPF is the result of the acquisition in 1999 of YPF, the largest oil company in Argentina and the 12th largest in reserves, by Repsol, the dominant oil company in Spain and the 13th largest in the world in reserves. Repsol was founded in 1987 when the Spanish government consolidated various state-owned oil and gas assets. The government sold 24 percent of the firm to public investors in 1987, another 66 percent in 1996, and the remaining holdings in 1997. Its shares were quoted on the Madrid Stock Exchange and in the form of ADRs on the New York Stock Exchange. At that point, Repsol had operations in 26 countries and Latin America was the center of Repsol's expansion strategy. Prior to the YPF bid, Repsol had acquired refining assets in Peru and had a control majority in Astra, the fifth-largest energy company in Argentina since 1996. YPF, Argentina's largest company, was engaged mainly in exploration, development, and production of oil and natural gas, and electricity-generation activities, among others. The acquisition of YPF by Repsol facilitated the strengthening of upstream business, the international expansion of the company, and the diversification into gas and power generation.

Repsol YPF, one the world's 10 largest private oil companies, maintains 6,500 sales outlets in Europe and Latin America.

Currently, some of the main risk factors that Repsol YPF faces are the fluctuation in the exchange rates of the U.S. dollar against the euro, the changes of international reference crude oil prices, the concentration of operations in a few big markets, and the political instability and the negative regulatory environment and outlook for the oil and gas industry in some developing countries.

The main lines set up in the 2008–12 Strategic Plan of the company focus on the expansion of production and reserves, geographical diversification of activities, operational excellence as a low-cost operator, and profitability through an increase in average unit margins. In this sense, in the previous years there has been a strengthening of the company's position in some strategic geographical areas such as the Gulf of Mexico, North Africa (especially Libya and Algeria), Trinidad and Tobago, Peru, and Brazil. In April 2008, the company, jointly with Petrobras and British Gas, participated in the exploration of one of the biggest new oil fields in the world, located in the Santos Basin (Brazil) in the Atlantic Ocean. Biofuels and liquefied natural gas represent two key strategic areas for the company in upcoming years.

Research and Development

Research and development (R&D) is defined by the Organisation for Economic Co-operation and Development as "creative work undertaken on a systematic basis in order to increase the stock of knowledge ... and the use of this stock of knowledge to devise new applications." As this definition indicates, R&D is more than just scientific inquiry; it is also the application of new knowledge (scientific or otherwise) for the generation of economically useful products and processes. The "research" part of R&D is often associated with scientific inquiry in one form or another. The "development" part of R&D utilizes engineering skills to apply research results to create new or improved products and processes. Development is also closely linked to commercialization, although these two activities can be, and generally are, distinct.

It is a mistake to conceive of R&D as a linear process; backward linkages typically occur. Often, issues arise in the development and commercialization phases that require kicking the project back to the research team for further study of the fundamentals of the mechanisms involved in hopes of improving the product or process. This type of iterative process has, in fact, proven quite successful in the past, resulting in such landmark innovations as nylon, catalytic cracking, Viagra, compact discs, and a host of other breakthrough technologies. Because these new technologies rapidly destroy the markets for existing products and processes, R&D is the source for the "creative destruction" witnessed throughout the 20th century. The typewriter, slide rule, vinyl record, fax machine, and many other familiar products have become (or are becoming) obsolete in the face of the output of corporate R&D. R&D is not the sole activity of high-technology firms, but is a presence as well in the service industry. Financial corporations undertake R&D to design and develop new financial products and new ways to deliver these products to the market. Over the last few decades, R&D conducted by the U.S. financial industry introduced such innovations into the international economy as ATMs, online banking, and smart credit cards.

Corporate R&D can be traced back to the German chemical industry in late 19th century. The results of these R&D efforts were impressive with Germany achieving leadership in the so-called coal-tar products including dyes, medicines, synthetic resins, and fuels. The United States in the 20th century expanded corporate R&D to an unprecedented scale. Prior to World War II, General Electric and Jersey Standard (Exxon) were early leaders in developing extensive and effective centers of R&D. Jersey Standard's R&D department, for example, was critical in the research and development of advanced catalytic cracking technologies and, during World War II, played a vital role in the synthetic rubber program. By the 1950s, most of corporate America emulated these earlier models and the R&D department proliferated throughout industry. It is no coincidence that these years also ushered in historic expansion of the American economy.

With the spread of globalization, a process that in fact can be traced to the years immediately following World War II, companies in other countries emulated the U.S. model. Through the second half of the 20th century, a country's R&D activity has been viewed as a prime indicator of its ability to compete on the global stage. By the first decade of the 21st century, the developed nations competed for primacy in resources dedicated to R&D activity. By 2006, all industrialized (or developed) countries undertook significant R&D activity at both the public and private levels. The United States leads all other countries in total R&D expenditures (US$343 billion in 2006), followed in order by (2006 figures) the European Union (EU) (US$231 billion), Japan (US$130 billion), and China (US$115 billion). However, in terms of percentage of gross domestic product (GDP), China leads at 4.3 percent, followed by Japan (3.2 percent), the United States (2.6 percent), and the EU (1.8 percent). These figures indicate an Asia aggressively competing with Western countries in their commitment to an aggressive R&D initiative as a key strategy to advanced technologies and the economic growth that results.

Historically, R&D activity of large multinationals within the United States and Europe has been localized within the home country because of the existence and availability of an already large market and abundant technological resources. However, since the 1980s, a number of factors have converged to entice companies—including Hewlett-Packard and Microsoft—to disperse their R&D work globally. Improved information and communication technologies help to monitor and coordinate far-flung R&D operations, economic and technical development in a number of newly developed and developing countries provide critical infrastructural support, increased incentives of foreign governments for multinationals induce the establishment of R&D facilities in host countries, and growing global harmonization of international patent law helps multinationals to better protect the fruits of offshore R&D.

Multinationals have been able to either outsource or carry out—via a subsidiary—certain amounts of their R&D activity. Thus, they optimize their R&D function and gain competitive power by benefitting from the location-specific advantages found in different countries, such as tapping local (and often cheaper) scientific and engineering talent, facilitating a better understanding of how to design products and processes for local markets, and establishing important scientific, technical, and market contacts in host countries.

As a result, in an effort to gain competitive advantage through economies of specialization, multinationals differentiate and specialize their R&D activity across their different subunits. Fundamental research aimed at radically new products may be carried out at some locations, while other R&D sites focus more on development, including improvements to existing products, while still other R&D facilities customize products and processes for local markets. In 2008, the percentage of the R&D that U.S. multinationals undertook outside their home countries ranged widely, from as little as 5 percent to more than 25 percent, with the average being 15 percent. This average figure is expected to rise approximately three- to five-tenths of a percent annually over the next two decades.

As multinationals distribute their R&D activity across their geographically dispersed business units, an increasingly important issue in the area of global R&D is how most effectively and efficiently to coordinate and integrate far-flung R&D operations within the foreign subsidiaries. If a business unit conducts its R&D within a host country, it must transfer its knowledge and hardware to other parts of the organization so that the company as a whole can plan overall strategic expansion. In thus managing its decentralized R&D structure, a primary concern hinges on facilitating the movement of critical information and technology derived from R&D from one unit to the rest of the organization.

A relatively new way to structure R&D activity within the multinational context is through what is termed R&D co-practice, which refers to joint R&D programs carried out between two or more subunits of a company. Recent research suggests that the greater the R&D co-practice activity undertaken between subunits located geographically apart, the greater probability that knowledge and technology created in one subunit will be transferred and utilized by the second subunit. Through such novel organizational mechanisms, global companies are more likely to capture the full benefits of creative multinational R&D programs.

Research Methods: Mixed Methods

Mixed methods research is a field of inquiry that uses both qualitative and quantitative methods to answer research questions within a single study. The application of mixed methods research in social sciences can be traced at least to the beginning of the 20th century. The research is considered "mixed" because it uses quantitative and qualitative approaches in one or several of the following ways: it combines different types of research questions, data collection procedures, data, analytical approaches, or conclusions. One of the main advantages of mixed methods research is its ability to unite exploratory and confirmation research—in other words, it allows generating and testing a theory in the same study.

For over half a century, mixed methods research was considered legitimate in social sciences. However, during the 1970s to 1990s, the so-called paradigm wars broke out as a result of the ascendance of constructivism and the emergence of two distinct research subcultures associated with quantitative and qualitative paradigms. The wars were based on the incompatibility thesis, which posits that the assumptions of qualitative and quantitative paradigms are incompatible because they stem from different epistemological, ontological, and axiological views about the nature and purpose of research.

As a result of the paradigm wars, three major schools of thought emerged, namely purists, situationalists, and pragmatists. Purists and pragmatists lie on the opposite ends of the spectrum of views, with situationalists being somewhere in the middle. Purists fully support the incompatibility thesis and believe that quantitative and qualitative methods cannot and should not be mixed. They often picture qualitative and quantitative researchers as being in competition with each other. Situationalists also advocate mono-method studies, but they view qualitative and quantitative methods as complementary, arguing that both methods have value and some research questions lead to the use of qualitative methods while others are better suited to quantitative exploration. Pragmatists consider the attempts to contrast qualitative and quantitative methods as a false dichotomy. Neither do they agree that qualitative research always uses inductive reasoning and quantitative necessarily follows the hypothetic-deductive route.

Pragmatists are in favor of integrating mixed methods within a single study—they argue that both quantitative and qualitative methods have their strengths and weaknesses. The integration can take various forms such as contrasting, comparing, combining, or building one type of conclusion on the other. One of the main manifestations of pragmatism is the notion that research questions should be the central issue in any investigation and should drive the choice of methods. Methods are viewed as tools for the answering of research questions and not vice versa.

Pragmatists point out that researchers involved in the paradigm wars have tended to overemphasize the differences between the qualitative and quantitative approaches while failing to sufficiently take into account the similarities between them. For example, data reduction is important in both quantitative and qualitative studies; most researchers attempt to eliminate various biases and other sources of invalidity; theory plays an important part in both paradigms.

Some scholars argue that at the fundamental level, all research is ultimately qualitative because it depends on judgment, and meaning comes from the interpretation of the data, whether qualitative or quantitative, rather than depend on the type of data. Pragmatic researchers advocate deemphasizing the terms *quantitative* and *qualitative research* and suggest that research should instead be subdivided into exploratory and confirmatory methods. This would allow using different methods under the same framework.

Another justification for mixed methods research is the principle of triangulation, which implies that a single social phenomenon is studied from different points of view. If research findings converge, their validity is increased. They can also complement each other solving different parts of the same "puzzle" and providing deeper understanding of a phenomenon under investigation. Unexplainable divergence in findings is also useful because it can lead to the rejection of previously accepted theoretical assumptions that turned out to be false and suggest directions for future research. Many researchers now agree that by the end of the 1990s, the issues underlying the paradigm wars have largely been resolved in most social disciplines. However, in some fields such as finance, quantitative studies still dominate, whereas qualitative or mixed methods research is relatively uncommon.

There are different possibilities to combine quantitative and qualitative research, and various research designs are associated with them. Concurrent (triangulation) design with merged results is a study in which two types of data are gathered and analyzed independently (utilizing qualitative and quantitative methods). Subsequently, the results are merged in the discussion section to achieve deeper understanding.

Sequential explanatory design is used when the results obtained from the application of quantitative methods need further explanation or elaboration. A qualitative follow-up study is then conducted to explain the findings. Alternatively, the sequential explanatory design can take the form of an initial quantitative study followed by an in-depth qualitative investigation. For example, cluster analysis can be used to identify groups of people that are relevant for the study. Qualitative interviews are then conducted within each group to validate identified clusters and explain what it means to be part of each cluster.

Sequential design to generate and test a model is a study in which a qualitative stage is used to formulate a model. The conceptual relationships identified during this stage are used to formulate a hypothesis. Quantitative study is then conducted to test it formally using a survey of a representative sample.

Research Methods: Qualitative

Qualitative research is a field of inquiry that usually emphasizes words rather than numbers in data collection and analysis, is inductive in nature, and more concerned with rich description and meaning than causal connections and generalizations.

The origins of qualitative research date back to the beginning of the 20th century. Initially, it was mainly used in anthropology and sociology, but gradually was

This business researcher was conducting an informal interview with carpenters in East Timor to gauge attitudes about loans.

adopted by other social science disciplines. Qualitative research is often associated with interpretivism. Within this paradigm, the social world is examined through intersubjective interpretations of its participants and the reality is viewed as socially constructed rather than objective and existing "out there" independently from those who created it. However, many social scientists argue that it is wrong to assume that qualitative studies always fall within the interpretive paradigm—there also exists positivist qualitative research.

Research Designs

In qualitative studies, the emphasis is usually made on the depth and complexity of the phenomenon under investigation. Qualitative researchers generally favor "why" types of questions and concentrate more on theory generation than hypotheses testing. Several major research designs are associated with qualitative research: qualitative interviewing (which can be used on its own or as part of other designs), case studies, ethnography, focus groups, and designs that focus on the examination of language (such as conversation and content analyses). Main methods of qualitative data collection include interviewing, documentation, and observation.

Qualitative interviewing can be unstructured or semistructured. Unstructured interviews do not have any predetermined order or wording of questions and resemble friendly conversations. They are particularly useful when the research question is novel, relatively unexplored, and a set of useful directions for analysis is still to be identified. Semistructured interviews usually rely on some predetermined questions or topics. However, the researcher is still free to develop the conversation flexibly and invent new questions during the course of the interview.

Documents represent a major source of heterogeneous data that can include companies' annual reports, mission statements, logos and mottos, memos, e-mails, press releases, visual images, and so forth. Some of the methods concerned with the study of documents include qualitative content analysis and semiotics. Qualitative content analysis comprises the search of underlying themes in the source materials; further investigation then evolves around these themes and is usually illustrated by examples and quotations extracted from the documents. Semiotic analysis is referred to as the "science of signs."

Observation is another important method of qualitative data collection. This term is also used to refer to a research design. It is different from "just looking" in its analytical orientation—the researcher usually holds specific questions in mind, so data collection has direction and purpose. Nonparticipant observation is usually passive—the researcher observes the setting under investigation without getting involved, makes field notes, and may occasionally ask questions to clarify some of the issues.

In contrast, participant observation implies that the researcher actively participates in an investigated setting. In social sciences, the term *ethnography* is increasingly used in the same sense as participant observation (or sometimes in a broader meaning—when not only a research process is implied but also a particular written outcome of research that is characterized by rich description, personal perspective, and a detailed account). One of the varieties of participant observation is autoethnography—a study in which the investigator acts as a member of the group in question and the research outcome is produced in the form of writing about the self analytically. Interviews, observations, field notes, and research diaries constitute common methods of data collection within ethnographic studies.

Case studies represent in-depth inquiries into a single instance or setting and serve as another popular research design within qualitative research. They sometimes combine both qualitative and quantitative techniques and can be particularly useful when the phenomena under investigation are unusual or contain a temporal dimension.

Grounded Theory

One of the most popular approaches to qualitative data analysis is grounded theory. The term can also refer to the theory developed as a result of its application. Two main features of this approach are constant comparison between the data and emerging theory and theoretical sampling. Constant comparison implies that the processes of data collection and analysis are not separated but happen simultaneously and all the procedures are highly iterative. Theoretical sampling refers to the selection of cases for investigation: instead of selecting cases randomly on statistical grounds, theoretically useful cases that can extend existing conceptual categories are used. Grounded theory has been described by some as a compromise between extreme empiricism and complete relativism.

Research Methods: Quantitative

Quantitative research is a field of inquiry that emphasizes numbers, is often deductive in nature, concentrates on hypotheses testing, and aims to uncover causal connections between different phenomena as well as to make generalizations.

Quantitative research is often associated with a positivist paradigm. Positivists tend to see the social world as existing objectively and independently from the researcher. According to this paradigm, research should be conducted in a detached, impersonal way. Quantitative methods usually focus on testing theories as opposed to the qualitative approach, which is often more concerned with theory generation.

Main methods of data collection in quantitative research include experiments, surveys, structured interviews, structured observation, and various sources of secondary data. Experiments are characterized by an artificially created setting and an opportunity to control the experiment conditions. Two groups are normally used in experiments—a test group and a control group. Cases are assigned to the groups randomly. Although very useful and most similar to natural sciences in methodology, experiments have only limited applicability in business research and social sciences in general because of various ethical and practical issues. There also exist so-called quasi-experiments in which the groups emerge in a natural way rather than artificially, and the researcher has no power in assigning participants or cases to the groups.

Surveys are among the most popular methods of data collection in business research. They are conducted by mail or via the telephone; lately, Web-based and e-mail surveys are also becoming increasingly popular. A survey contains a predefined list of answers, so it is in effect a multiple-choice questionnaire. The questions embrace several interconnected topics, and the aim is usually to test multiple hypotheses. The answers are then coded, entered into statistical software, and subsequently treated as quantitative data.

Structured interviews are very similar to surveys. Just like surveys, they contain a predefined set of answers. What is different is that a researcher asks the questions rather than gives out questionnaires for respondents to fill in, and has an opportunity to clarify any issues if necessary.

Structured observation (also sometimes referred to as systematic observation) is a technique that emphasizes documenting observed behavior under explicitly formulated rules. This approach differs significantly from unstructured observation, which is common for qualitative research. Rules in structured observation help the researcher to pay attention to and record exactly those aspects of participants' behavior that are relevant for answering the research questions. The resulting data can then be coded in a way similar to that of the survey and analyzed statistically.

Content analysis is an approach to the document analysis that aims to quantify content in terms of predefined categories. Words or phrases can be chosen as the units of analysis. This approach is often used to determine the amount of attention paid to a particular topic in news or other media.

Secondary data are data that have been collected by someone other than a researcher conducting the study—often they come from government or statistical bodies, the media, or other researchers. Sometimes secondary data are used in combination with primary data within the same research project.

Data Analysis

Main methods of quantitative data analysis include univariate, bivariate, and multivariate statistics. In univariate methods, a single variable at a time is analyzed. Frequency tables display the number of observations and the percentage belonging to each category. Bar charts and pie charts are the most popular methods for visualizing frequency tables. Common methods in univariate data analysis include measures of the central tendency (arithmetic mean, median, and mode) that show a typical value for a given distribution; measures of dispersion (such as range, variance, and standard deviation) characterize variation in a distribution of values.

Bivariate analysis explores two variables at a time to establish if they are related. Contingency tables are similar to frequency tables, but they permit analysis of two variables simultaneously. Pearson's correlation coefficient is an important method of bivariate analysis. It indicates the strength and the direction of a relationship between two variables. The coefficient lies between 0 and 1, and the closer it is to 1, the stronger the relationship is. Correlation coefficient does not say anything about causality.

Multivariate analysis refers to statistical techniques that simultaneously analyze more than two variables. Some multivariate techniques are just extensions of univariate (such as distributions) and bivariate methods (such as correlation, analysis of variance, regression). Other techniques, such as factor analysis, are uniquely designed to deal with multivariate data.

Reserve Currency

A reserve currency is one in which institutions (mostly central banks, but also financial institutions or individuals) hold their nondomestic-currency reserves. A reserve currency must meet the requirements of an international currency and there must also be sufficient supply of the currency. Over the past decade, the U.S. dollar, euro, yen, and sterling have accounted for about 98 percent of all reserves held in foreign currencies.

An international currency is one that firms use to settle trade or financial transactions with their international clients. International currencies belong to strong, stable, and internationally involved economies that provide convincing assurances that they will not impose exchange controls on the use of their currencies. In addition, users of an international currency must believe that the exchange rates of the currency will not change at the whim of the government. When an international currency belongs to a large economy that can provide sufficient supply of the currency and large financial markets exist in that currency, the currency can be used as a reserve currency.

In addition to the four currencies listed above, the Swiss franc, French franc, Deutsche mark, and Dutch guilder (last three now replaced by the euro) have been used as reserve currencies during the past century. Note that small holdings of an international currency to facilitate transactions—much like a small bank balance in a checking account to facilitate normal operations of a firm or a family—do not constitute a reserve currency.

A reserve currency is different from a reserve asset. Most common of these reserve assets have been gold and Special Drawing Rights issued by the International Monetary Fund. Although historically gold had been a very important reserve asset, its use as a reserve asset declined sharply after the United States withdrew its promise to exchange gold at a fixed dollar price in response to its balance of payments problems in the 1960s. At the end of 2007, gold accounted for less than 10 percent of global foreign reserves.

Since the establishment of the Bretton Woods system in 1944, the U.S. dollar has become the prominent reserve currency. Before World War I and during the 18th and 19th centuries, sterling was the main reserve currency. At the end of 2007, total allocated foreign currency reserves (the portion for which currencies of holdings are known) in the world added up to the equivalent of US$4.065 trillion (currencies breakdown for another $2.3 trillion of foreign currency reserves are not known), of which 63.9 percent were in U.S. dollars, 26.5 percent in euros, 4.7 percent in sterling, 2.9 percent in yen, and the remainder 2 percent in other smaller currencies.

With the introduction of the euro as a currency for all transactions in 2001, however, the prominence of the U.S. dollar may be on a decline. Two factors have led to this decline. First, industrialized as well as developing countries have reduced the share of their foreign currency reserves they hold in the form of dollars. Industrialized countries reduced the share of dollars in their foreign currency reserves slightly from 72.3 percent at the end of 2000 to 69.4 percent at the end of 2007. Developing countries reduced their dependence on the dollar much more—from 69.9 percent to 60.7 percent over the same period. Second, foreign currency reserves of developing countries have grown much faster than those of the industrialized countries. In 1995 developing countries accounted for only 52.5 percent (59.4 percent in 2000) of global foreign currency reserves. By the end of 2007, this proportion had risen to 76.5 percent. The combined effect of these two changes has been to reduce the share of foreign currency reserves held in dollars from 71.1 percent at the end of 2000 to 63.9 percent in 2007.

Why would any country allow its currency to be used by foreigners as a reserve or an international currency? If foreigners hold nontrivial amounts of a country's currency, could they not influence the monetary policy of the country by changing the amounts they hold or destabilize the economy either by dumping the currency in the country or by influencing the currency's foreign exchange rate? In an extreme case, use of a currency in international markets could also become a conduit for introduction of counterfeit currency because unsuspecting foreigners are less likely to be able to distinguish between real and counterfeit bills.

Seigniorage Benefits

While these objections to allowing the use of a currency as a reserve currency are valid, such a use also confers important benefits on the issuing country. First, a reserve currency country is in the privileged position of being able to pay for foreign goods (and services) not by producing goods of equal value, but by merely producing its currency. The cost of producing currency is merely the cost of printing the bills. Governments derive "seigniorage" benefit (the difference between the face value of a bill and the cost of printing that bill) when they issue their currency in the domestic economy. Similarly, countries derive seigniorage benefit when their currency acquires the status of a reserve currency.

The U.S. economy has used this seigniorage benefit over the past few decades. For the period between World War II and about 1995, U.S. current account deficits, a measure of net import of goods and services by the U.S. economy, were financed largely by an increase in the supply of U.S. dollars to the rest-of-the-world dollars. During that period, players in the global economy were happy to acquire increasing volumes of dollars to carry out the increasing volume of international trade and financial transactions between themselves. During the past decade, financing of very large U.S. deficits has been made easier partly by an increase in the dollar reserves that the central banks have been willing to hold. In addition to these seigniorage benefits, use of one's currency as a reserve currency adds to the political prestige of the country.

Resource-Seeking Investment

Resource-seeking investment is one of the types of foreign direct investment; it mainly focuses on rich raw materials, low-cost unskilled and skilled labor, technological assets, and physical infrastructure. According to the United Nations Conference on Trade and Development (UNCTAD), resource-seeking investment was the most common foreign direct investment (FDI) type in the 19th and 20th centuries, representing the basis of colonial relationships between Europe and other countries. It still remains very significant, but it has been overtaken in importance by other types of FDI in today's more globalized world.

John Dunning defines three groups of resource-seeking multinational companies. The first group looks for physical resources such as oil, minerals, raw materials, or agricultural products. This kind of FDI mostly asks for significant capital expenditure and is relatively location bound. The second group of resource seeker looks for cheap, mostly unskilled labor. The third group wants to acquire technological capacity, management or marketing expertise, and organizational skills. An example of the latter group can be Chinese firms that set up collaborative alliances with U.S. firms in high-technology sectors. The foreign-based multinational companies invest abroad to gain access to resources, for example, minerals, agricultural products, unskilled labor, and so forth, that are either unobtainable or available only at a much higher cost in the home country.

Resource-seeking investment may provide training and enhance skills, create opportunities for employment, and reduce underemployment of labor and resources. On the other hand, resource-seeking investment done by foreign multinational companies can be exploitative if monopolization happens in factor markets, and can also be damaging if long-term contracts are combined with monopolization activities of these companies.

For Rajneesh Narula and Dunning, where a region or a country has an absolute advantage in a given scarce resource, the government of that location is in a strong bargaining position. If this scarce resource is a natural one, then the marginal cost of its extraction to both parties is almost zero. According to David Johnson and C. Turner, while availability and cost of access to natural resources would be the key criteria for foreign-based multinational companies to make investment profitable, countries that own these resources also benefit from these investments as these companies bring technical expertise that is essential in exploration and production; employ skilled and unskilled labor; and use resources that otherwise would not be used.

In the case of raw material, resource-seeking investment is the most important one for developing countries as it acquires absolute advantage in a particular scarce natural resource, such as oil, natural gas, and timber. In the Middle East and Africa, these products provide a strong bargaining-power position to those countries that own them. For example, countries like Nigeria or Iran attract resource-seeking investment in oil carried out by big multinational companies from all over the world, as the countries have rich oil fields and the marginal cost of extracting oil to both parties (to the country and to the company that extracts the oil) is considered very low as both parties benefit from generating economic rent based on locational advantages.

Resource-seeking investment in natural resources can be carried out by companies based in the primary sector (they either invest in resource-poor countries or resource-rich developing countries) or companies based in natural resource–related sectors, like metal manufacturing. Even though it has been generally accepted that multinational companies from developing countries should be able to access natural resources and secure the supply of raw materials for their rapidly growing economies, those companies from countries poor in natural resources have the motive to invest in locations determined by the availability of assets.

It is also commonly known that when international prices of raw materials have risen, the competition between American, Asian, and European companies for this kind of scarce resources, for example in Africa, has dramatically increased as well. However, multinational firms still prefer nonequity agreements with foreign firms or purchase their inputs at arms-length prices.

In the case of low-cost-labor–seeking investment, which Dunning defines as investment by companies from countries with higher labor cost setup, or by those who acquire subsidiaries in countries with lower labor cost, companies seek cheaper labor in the field of manufacturing and service sectors to lower their production costs. However, when the countries develop, the cost of utilizing cheap labor rises, and the labor-intensive production becomes gradually less attractive to foreign investors. For example, countries like China and India can attract foreign investments because of their unskilled labor as they are cheaper, but as the countries become more developed, foreign investors will find it very difficult to compensate for wage increases. Companies whose production extensively depends on raw materials for their products can either move their production to a foreign site where the raw material is located or extract and import the material to their home-country plants.

Other resource-seeking investment types in the context of Dunning's location factor include tourism and construction, which means that investment can take place only in a particular location because it utilizes resources or attributes that are immobile.

Retail Capital Markets

Retail capital markets are national and international exchanges, mostly formal though informal in some cases, where individuals can invest or obtain funds; because of the small size of most of these transactions, usually financial intermediaries such as banks or share brokers are involved. Retail capital markets can be broken into two broad segments: (1) debt, which refers to any agreement that obligates a borrower to repay a lender principal borrowed, along with a charge for borrowing the money, typically interest on the principal; and (2) equity, which refers to the issuance of shares in a business enterprise that promises no fixed principal or interest payments but entitles shareholders to the value of the portion of the enterprise that they own. In equity markets, the retail segment will consist largely of investors, each one owning a relatively small number of shares.

With respect to debt, most retail borrowers and investors will use intermediaries such as banks or other nonbank institutions to conduct transactions. Retail customers might be either "lenders" in the sense that they provide funds to intermediaries through deposits or investments in instruments such as certificates of deposit (CDs) or they might be borrowers, taking loans for various purposes such as mortgage loans for residential property purchases or business loans for small business enterprise. The retail segment of the debt market is very heterogeneous from the point of view of lenders, often quite profitable but also potentially very competitive and sometimes quite difficult to assess in terms of borrower creditworthiness.

A very large amount of personal retail borrowing is conducted by individuals through credit card purchases. Total credit card balances in the United States alone were estimated to amount to about US$900 billion in 2007, according to the U.S. Federal Reserve Board. Credit card borrowing offers tremendous convenience to retail customers but if balances are carried the interest charges are generally very high. Much regulation, especially in the United States, focuses on the cost of credit card interest, though not always effectively. There has also been concern about excessive issuance of credit cards to users with poor credit histories and recent turmoil in world financial markets has seen an increase in consumer credit card defaults.

On the equity markets, buying and selling of shares by individuals through brokers engaged in the larger organized stock exchanges in New York, London, and Tokyo is the primary retail activity. In 2005 the U.S. stock market was by far the biggest globally in terms of market capitalization (i.e., total value of shares traded), equalling almost $US17 trillion, or 39 percent of the total of the world's share market capitalization. The Japanese share markets accounted for 11 percent of the total, followed closely by the United Kingdom at 7 percent. Share markets in developing countries, especially in China, have seen rapid relative growth. Individuals may invest directly in shares by creating and managing their own portfolios or indirectly through managed funds (e.g., mutual funds) that take investment increments from individuals and collectively invest and manage those contributions in a portfolio on behalf of the individuals. To a certain degree these collective vehicles, such as pension funds, blur the distinction between retail and wholesale capital markets, indicating that these distinctions, while practical, are not always stable or easy to draw.

The retail activities described thus far are organized and formal and largely done through intermediaries. Retail capital can also be raised individual to individual and outside organized markets. Two simple examples would be a promissory note between one individual lending funds to another individual; or an equity investment by an investor in a small unincorporated business. Data for the scale of these activities is necessarily very sketchy but it could be a sizable amount and for many borrowers the only alternative in securing funds for business, investment, or consumption.

Microfinance and Remittances

In the developing world, two significant retail capital market institutions bear mention. One is microfinance, which refers to the making of very small loans, perhaps the equivalent of a few dollars, to especially impoverished borrowers who are engaging in or starting to engage in very small enterprise. The terms may be preferential but generally commercial, with the intention of making a profit for the lender. In countries such as Bangladesh, where the concept was originated, the default rates have been low and the investments generally successful if the process of lending and credit analysis is carefully managed.

Another important source of retail capital flow globally consists of remittances between individuals across national borders. One particular system, referred to by various terms in different countries but most widely known as *hawala* or *hundi* in south Asia, relies on exchanges of funds in which an expatriate borrower in one country will receive money from an expatriate lender in the same country by having a related party located in the home country draw down a balance in the home country in return for an increase in a balance to the expatriate lender. Done for commission but without formal paperwork and on "trust," the hawala system accounts for considerable but immeasurable transactions across national borders. Technically illegal in many countries, much of the exchange is done for legitimate retail capital raising but some portion of it is used for money laundering and other illicit activities.

Retail Sector

Retailing involves all the activities used to sell goods and services directly to final consumers for personal nonbusiness use; global retailing represents retailing activities that cross national boundaries.

Over the past several centuries, entrepreneurial merchants have ventured abroad to exchange merchandise and open retail operations. International trading and retail store operations were the two primary economic engines of the colonial firms. For example, over 150 years ago, Dutch-based apparel and accessories chain C&A began expanding throughout Europe; it now has a network of 1,200 outlets, with new expansions planned in Bulgaria in 2009. Deichmann, a German retail shoe chain, began operations in 1913, and now has over 2,200 stores and 32,000 staff in 16 European countries; they sold 122 million pairs of shoes in 2007. Woolworth, founded in 1878 in the United States as a five-and-dime store, began expanding to Europe, Mexico, and South Africa in the mid-20th century, and now no longer exists within the borders of the United States, yet survives in the United Kingdom (UK), Germany, Austria, Mexico, and South Africa.

The Largest Global Retailers

Three (Wal-Mart, The Home Depot, and Target) of the 25 largest businesses in the United States are retailers. Outside the United States, big retailers include Carrefour in France, Tesco in the UK, Metro in Germany, and Daiei in Japan.

Of the top 250 retailers, 104 (41.6 percent) have no international experience at all. The most international retailer is France's Carrefour, which has stores in just 29 countries, compared to multinationals in other industries that might operate in 100 or more countries. Overall, the 10 largest retailers in the world (with country of origin and corresponding sales in U.S. dollars) are Wal-Mart (United States: $348.7 billion), Carrefour (France: $97.86 billion), The Home Depot (United States: $90.84 billion), Tesco (UK: $78.98 billion), Metro (Germany: $75.25 billion), Kroger (United States: $66.11 billion), Target (United States: $59.49 billion), Costco (United States: $60.15 billion), Sears (United States: $53.01 billion), and Schwartz Unternehmens Truehand KG (Germany: $52.42 billion).The top four retailers in each market are as follows: Wal-Mart, The Home Depot, Kroger, and Target (North America); Carrefour, Tesco, Metro, and Schwartz (Europe); Seven and I Holdings, AEON, Woolworths, and Coles Group (Asia/Pacific); CBD Grupo Pao de Acucar, Cencosud, Soriana, and Casas Bahia (Latin America); and Pick 'n Pay, Shoprite Holdings, Massmart, and Metcash Africa (Africa/Middle East).

The predominant retail formats of the top 250 retailers are supermarkets (93), other specialty stores (88), hypermarket/supercenter/superstore (73), convenience store (73), department store (53), apparel/footwear specialty store (49), and discount store (46). Nearly 11 percent (10.6 percent) of these retailers operate in 10 or more countries.

Wal-Mart's approach has not worked in every market, and it now has stores in just 13 countries, including this store in Brazil.

Global Retailing Trends

According to the 2008 Global Powers of Retailing presented by Deloitte, Touche Tohmatsu in conjunction with *Stores* magazine, the total retail sales for the top 250 retailers rose to $3.25 trillion in 2006, up 8 percent from $3.01 trillion the previous year. Most of the growth was attributable to the rapid growth of consumer incomes in the emerging markets economies, where millions moved from poverty to the middle class.

Of the top 250 retailers, 36 experienced decline in sales in 2006, compared to 49 in 2005. The net profit margin for the group was up by 3.6 percent, slightly more than the 3.5 percent in 2005 and significantly better than the 2.7 percent in 2004. Only seven firms reported a net loss in 2006 compared to 15 the year before.

Based on the 2008 Retail Development Index developed by A. T. Kearney Analysis, Euro Money, and the World Bank, the top emerging markets based on four major factors—country risk, market attractiveness, market saturation and time pressure, and the most attractive markets for the next decade—are in Vietnam, India, Russia, China, Egypt, Morocco, Saudi Arabia, Chile, Brazil, Turkey, Mexico, Algeria, Malaysia, Peru, Indonesia, Bulgaria, Ukraine, Tunisia, Colombia, and the United Arab Emirates.

Some of the major trends among the top retailers are an increased emphasis on social responsibility. Because of the growth in mass media throughout the world, more consumers are focused on product safety issues. Moreover, with rapid globalization and reduced trade barriers, more food retailers are becoming more concerned about the safety of their supply chains.

Other trends include the shift away from the United States and toward Asia and other emerging markets. Retailers in the United States and in Europe are likely to face competition in the domestic market and hence seek opportunities abroad. As more countries grow and become affluent like the nations in the European Union, Japan, and the United States, consumer spending on services retailing continues to grow by leaps and bounds. Hence, more and more retailers are selling services related to their core merchandise. For example, Best Buy has Geek Squad, which offers after-market servicing for complicated home electronic products, while Tesco, the UK food retailer, offers many online and financial services.

There is also a trend toward multichannel integration as online retailing continues to take market share away from brick-and-mortar stores. The best retailers are integrating the two formats and enriching the customer experience for distinct customer segments across multiple channels to build brand identity, engaging consumers in dialogue, and obtaining feedback from them. As retailers become more powerful, they continue to develop long-term relationships with them, and develop as world-class marketing entities.

Failures in Global Retailing

Despite the successes of the major global retailers, some have encountered failures as well. After a decade-long effort to win German consumers, Wal-Mart decided to quit in late 2006. It sold its 85 stores to local retailer Metro AG, costing the retailer $1 billion. Earlier, it had to retreat from the South Korean market as well. It now operates in 13 countries around the world, compared to Carrefour, its largest competitor, which operates in 29 countries.

Analysts believed that the company was losing over $250 million a year on turnover sales of about $2.5 billion annually, despite several attempts to turn around the business. The German consumer could not get used to some of Wal-Mart's signature features like employees required to smile and heartily greet the customer, baggers at the checkout, or stores outside the town center. The firm was also frustrated with German shopping regulations, the feared *Ladenschulssgesetz*, which regulates store openings and restrictions on discounting. Other reasons included the fact that many of the stores were not in the best of areas.

Discount retailing as practiced by major firms such as Aldi and Lidl were firmly entrenched by the time Wal-Mart arrived and it had nothing new to add. In the United States, Wal-Mart is the undisputed price leader; Aldi owns that position in Germany. Wal-Mart's conservative management style, which worked in the United States, and involved hiring and firing at will and having everyone toe the company line, did not work in Germany.

Wal-Mart's annual turnover of $285 billion gives it a distinct scale advantage on globally sourced products such as Chinese-made toys and clothing. Yet, the purchasing clout did not extend to regional brands of bratwurst and beer. Wal-Mart's German selection was dominated by European brands from Fischer bicycles to Vernel fabric softener. The company also did not have superior distribution efficiencies because of a lack of strong enduring relationships with local suppliers.

Wal-Mart is now concentrating on expanding in China, India, and Central America. It has been acquiring stores in Brazil and entered a partnership with a retail chain in Central America. After a long struggle, it also boosted its investment in Japan when it gained a major share of Seiyu Ltd.

Reuters

Reuters, the world's largest international multimedia news organization, provides a variety of news-related services including newswires, pictures, video, online syndication, and news graphics. In 2008 the company employed 2,400 journalists reporting from 196 bureaus. In 2007, it filed over 3 million news items in 132 countries. According to company statistics, Reuters' news is viewed by over 1 billion people a day. Following the announcement of negotiations in 2007, Reuters Group plc and Thompson Corporation, the media conglomerate, combined in 2008.

The bulk of Reuters's profits derives from its portfolio of financial news services, which range from lower-tier off-trading floor products to advanced equities trading and analytics. These financial tools facilitate communication among brokers and other financial transaction intermediaries. Reuters conducts brokerage services in global equities to securities industry professionals and supplies trading research for institutional investors. It also provides research and advisory services. Despite competition from a number of other financial information service providers, such as Bloomberg and Dow Jones, Reuters has grown consistently since the 1990s.

Reuters's economic information services, although part of its offerings since the company was established in 1851, were consistently less profitable than its general news services until the 1960s. During the 19th century, Reuters transmitted commercial information via telegraph to and from England and the continental European bourses. These services principally comprised opening and closing prices and did not garner significant revenue. After the advent of shortwave broadcasting in 1923, which permitted the simultaneous distribution of larger news reports to multiple recipients, the company developed a variety of trade and market services. Relying on its existing international ramifications, which had developed in conjunction with its general news services, the company was able, unlike its competitors, to assemble a report of commercial information from markets around the globe. By the late 1960s, Reuters was poised to take advantage of emerging computer technology.

A key to the company's long-term success has been its ability to reinvent itself in the face of revolutions in communications technology. The rapid rise of the internet as a tool and platform for the collection and distribution of news was followed by the company's combination with Thompson Corporation. The advent of point-to-point computer portals enabled the company to reorient its business during the 1980s and to separate itself from ownership by the press. In 1984 the company was publicly floated after being held in trust by British newspaper interests since 1941. The development of a Reuters trust, controlled by British newspapers, was in part a solution to the growing threat that the company's news services faced from radio broadcasting.

Prior to the development of computer technology, the company struggled to meet the needs of its newspaper clientele and consistently make profits. At least until World War II, the company's revenues from the British press were not sufficient to meet the costs of international news gathering. Insufficient profits at home caused Reuters to pursue alternative sources of revenue abroad and to diversify its business. During the 1890s, the company developed a variety of auxiliary services including a remittance business that grew into a full-fledged bank, both of which collapsed with the onset of war in 1914. During the 1920s, the commercial news services replaced these alternative lines of business.

Reuters has always had a large international presence mainly because of its role as the news agency of the British Empire, but its reception abroad has been mixed. During its first 100 years, the company's foreign operations consistently lost money. Its exclusive access to international news, which derived from contracts with other national news agencies in Europe and the United States, sustained Reuters' dominant position abroad. These cartel arrangements, which formed in the 1850s and continued in varying forms until the 1960s, enabled Reuters to exercise significant control over the news circulating throughout the world. The company's position abroad has changed with developments in telecommunications, international trade, and the history of the British Empire. Following World War II, competition reduced Reuters's presence in its traditional imperial strongholds, causing it to focus its attention more on European and North American markets.

Revaluation

Revaluation occurs when a government or its central bank increases the official price at which its currency can be bought on the foreign exchange (Forex) market. For example, suppose that the current U.S. dollar (USD)/British pound (GBP) exchange rate was 2:1, meaning that $2 had to be given up for each £1 or, equivalently, that £1 was worth $2. If the GBP was revalued, this would mean that more USD had to be exchanged for each GBP, meaning that GBP had become more expensive in dollar terms.

Revaluation occurs under a fixed exchange rate regime. This was the traditional regime for most countries between 1945 (the Bretton Woods system) and the early 1970s, after which many countries moved to floating exchange rate regimes. Under such a regime, the government is committed to a particular exchange rate and manages its foreign exchange reserves (holdings of foreign currencies and gold) to ensure that this rate is maintained. Because a country's holdings of foreign exchange reserves are closely related to its balance of payments, the extent to which a government is able to maintain a fixed exchange rate is also affected by the balance of payments. For example, a country that had a surplus on its external account would face a positive net demand for its currency as foreigners seek to pay for their net imports. This, in turn, would place upward pressure on the exchange rate and the government would intervene to defend the exchange rate by selling its domestic currency on the Forex markets. This mechanism works in the opposite direction in the case of a devaluation.

The operation of this balance of payments mechanism is not costless: as the central bank increases the supply of domestic currency, inflationary pressures can develop. In more serious cases, and to avoid a conflict between external policy objectives (surplus on external account) and internal policy objectives (price stability), countries can revalue their currency. The advantage of revaluation in this case is that by making the currency more expensive, inflationary pressures are subdued because the central bank now only requires a more limited increase in the supply of its currency to the Forex markets.

Historically, countries that have revalued their currencies have benefitted from relatively higher rates of growth in productivity; this, in turn, has caused significant surpluses on the external account to emerge. This was the case with West Germany in 1961 and 1969. In 1985 Japan revalued in response to U.S. concerns that trade with Japan accounted for almost 50 percent of the U.S. trade deficit during the 1980s. In 2005 China revalued its currency at a time when it had accumulated approximately $700 billion of foreign reserves. It is often the case that heavy international speculation precedes a revaluation. This is because speculators hope to benefit from purchasing a currency at a lower price and selling it after revaluation.

In a global context, revaluation can help to improve relations between the country accumulating substantial foreign reserves and its main trading partners. In the cases of China and Japan referred to above, there were fears that they had adopted a deliberate policy of maintaining their exchange rate at an artificially low level—in direct conflict with Article Four of the Charter of the International Monetary Fund, which states that countries should avoid deliberate manipulation of their exchange rates to secure an unfair competitive advantage. It is also the case that revaluation can help to reduce the concentration of foreign direct investment in countries that have an undervalued currency. This is because it is relatively cheaper for multinational corporations to acquire assets in these countries by purchasing their currencies.

Countries that revalue their currency may incur a number of macroeconomic costs. For example, by making imports cheaper, revaluation will lead to deterioration in the trade balance; revaluation can cause expenditure-switching effects in favor of imports, which will exacerbate domestic unemployment. Finally, revaluation can reduce and/or reverse inward foreign direct investment. This is because acquisition of assets in another country becomes more expensive if that country revalues its currency.

Reverse Engineering

Reverse engineering refers to any activity that analyzes a product to determine either how it works or the principles underlying its functioning. Starting from the product itself, an attempt is made to derive an earlier stage in the design and development process; this could be a detailed design, a high-level design, or a functional specification. Conventional engineering starts from some sort of a specification (possibly a design or a set of desired functions) and works to create a product. Reverse engineering is the opposite. It is often used to contribute to a company's research and development activity, supporting the development of new products or the improvement of old products. Products that are analyzed in this way include motor cars, electronic goods, integrated circuits, software, and drugs.

The legality of reverse engineering someone else's product is a complex issue and will depend on many things including the jurisdiction where the activity takes place and the type of product being analyzed. However, when applied to a nonpatented product, it is usually acceptable as long as care is taken not to infringe copyright or trade secret laws. If a product is patented, then the invention, as defined in the patent, cannot be reproduced. However, a patent is unlikely to specify the functionality, but rather the mechanism, for implementing that functionality. So, if reverse engineering can legally reveal the functionality, which is then implemented in a different fashion, this may well be legal. Essentially, copying of any "document" (including program code) and obtaining information in any illegal way are not permitted.

A famous example of reverse engineering formed the basis of the early development of the personal computer (PC) industry. In the early 1980s, IBM introduced its PC. Its rapid success meant that many other companies wanted to market products with the same functionality, but to be successful, such machines needed to be capable of running the same software. The main barrier to entering this market was the PC BIOS—a program embedded in a chip that controls the computer's boot process. Copyright law did not allow copying of the PC BIOS: the only option was to reverse engineer it.

Specifically, copyright law does not allow the expression of an idea (i.e., the actual program) to be copied, but does not restrict the copying of functionality. The BIOS was studied carefully by a team of engineers to determine precisely what it did and to create a specification. Another team, which had no knowledge of the original program, then developed a new BIOS according to this specification. This is known as a "clean room" approach: the second team is not "contaminated" by knowledge of the original program, so they cannot copy it. Using a BIOS developed in this way, many companies were able to market an "IBM-compatible PC." These products have now evolved into the PCs we use today.

Interoperability

The legal issues are particularly complex in the case of software or other digital media, particularly with respect to interoperability. This is the property of different products or systems that allows them to work together—this often means that they must be able to process data stored with the same file structures. From a consumer viewpoint, interoperability is considered to be a good thing as it allows the development and marketing of a wide range of competing products, increasing both choice and value. If a company is unwilling, or unable, to provide details of file structures for interoperability, then it may be possible to obtain them through reverse engineering.

In the United States, the Digital Millennium Copyright Act generally forbids the circumvention of technological protection measures (Digital Rights Management), even when these measures give a product protection beyond the rights specified by law. However, it also specifies very limited circumstances under which a competitor may attempt this in pursuit of interoperability. In the European Union, the Copyright Directive has a similar effect. In this area of law, there is a clear conflict between the rights of consumers and those of intellectual property holders.

Another example of reverse engineering has been in the manufacture of replacement ink-jet printer cartridges. Typically, manufacturers of ink-jet printers include software in the printer which invokes a series of communications (known as "handshaking") with the printer cartridge to recognize the printer as one that they have manufactured. A chip is included in the cartridge that has this capability programmed into it. This makes it difficult for competitors to develop compatible cartridges—a problem of interoperability. This is of particular interest to consumers because in many cases, the cost of a cartridge is as much as a quarter of the cost of the printer itself. Many cartridges have now been reverse engineered and competing products offered at substantially lower prices. The original manufacturers have unsuccessfully taken their competitors to court to find that the reverse engineering of their products was legal under the Digital Millennium Copyright Act.

In addition to the above examples, reverse engineering has been used for generating documentation for products where this has been lost or is nonexistent; creation of illegal copies of products; the manufacture of obsolete parts; and the reduction of product development time.

While reverse engineering is seen by many businesses as a valuable, possibly essential, tool, its legal status is likely to change over time. This status is highly complex because it is determined by a combination of intellectual property, antitrust (or competition), and consumer protection laws. In most jurisdictions, all of these laws are being strengthened, but intellectual property laws tend to be in conflict with the other two. This makes the future status of reverse engineering highly uncertain. However, whatever its status, it is clear that many companies will continue to use it as a way of making themselves more efficient and more competitive in the marketplace.

Risk

Risk is a concept that refers to a possibility of occurrence of some undesirable event and is closely related to uncertainty. There is no universally accepted definition of risk. Risk has been considered in many academic disciplines and treated from various points of view. It has been studied as a decisional, behavioral, cognitive, cultural, societal, and emotional phenomenon. It is believed that the notion of risk (similar to the way we perceive it today) first appeared in the Middle Ages in the context of dangers that arise in marine voyages and was used in maritime insurance.

Sometimes risk is defined as a quantity that is characterized both by the probability of the occurrence of a particular event and the magnitude of loss or other undesirable effect resulting from this event. Risk is associated with uncertainty. Sometimes risk and uncertainty are used as synonyms, especially in everyday parlance where risk tends to be a very loose term.

The most famous definition of risk was formulated by Frank Knight, who wrote in the first part of the 20th century when active research and debates on the foundations of probability took place. To understand Knight's definition of risk, it is important to make a distinction between objective and subjective probabilities. According to the objectivists' view, the probabilities of events are real; they can be estimated by statistical analysis or discovered by logic. However, those who support the subjective interpretation of probabilities disagree that probabilities are intrinsic to nature. To them, probabilities do not exist objectively and represent nothing more than human beliefs. Objective probabilities can be obtained either a priori, from inherent symmetries (such as those that exist, for example, with the throw of a die) or statistically by examining homogenous data. Knight called "opinions" what others would describe as subjective probabilities. In Knight's view, probabilities reflect measurable uncertainty, or risk, while opinions describe unmeasurable uncertainty. Thus, Knight made a distinction between risk and uncertainty. The usefulness of such a distinction continues to be a topic of debates.

Some scholars argue that over time, two very important changes occurred in regard to our understanding of risk. At first, the notion of fate, which associated uncertainty with divine intentions and was dominant in the preindustrial epoch, was replaced with the confidence in the human ability to deal with uncertainty by using probability theory and scientific knowledge. Risk assessments based on probability led to the development of insurance, the emergence of a welfare state that provides protection against unemployment, ill health, and other hazards. However, starting roughly from World War II, a so-called risk society has originated—this is the term that sociologists use to describe an industrial society confronted with uninsurable risks such as global warming, the corruption of food chains, a global financial collapse, and so forth. Such risks are worldwide rather than national in nature.

Several academic disciplines have been concerned with decision making in the face of risk. Decision theory is a branch of knowledge developed by mathematicians, statisticians, and economists that studies the choices under uncertainty. Decision theory models people as rational agents who maximize their expected utility by making choices that are consistent with their preferences and objectives. However, problems arise when one attempts to apply these theoretical notions to a practical decision-making context. Psychological research has shown that individuals behave quite differently from the ways their behavior is described in decision theory and mainstream economic literature. There are suggestions that people tend to ignore risk situations that are very remote or highly unlikely, even if they have potentially important consequences. People make different risky choices about the same problem depending on the way it is framed. Another interesting finding is that humans treat absolute gains and losses differently. Low probability but very dramatic events tend to get excessive attention. This behavioral phenomenon has been observed in various contexts, including political decision making. When dealing with risky situations, many individuals prefer to use verbal rather than numerical characteristics of risk.

Types and Measures of Risk

A number of risks are particularly relevant in the business context. For example, the Basel II Framework, which sets capital adequacy standards, establishes that banks should hold sufficient capital to protect themselves against credit, market, and operational risks. Sometimes risk specialists also tend to analyze environmental risks that include natural disasters, political and regulatory changes, as well as changes in social norms and perceptions. Another risk that is becoming increasingly important is a reputational risk—the possibility of damage to a business that occurs as a result of loss of confidence by any group of stakeholders. It is particularly relevant to service businesses.

A special type of risk that has recently received much attention in the academic literature is a so-called systemic risk. This is the risk that an economic shock, such as a failure of a market, institution, or organization, triggers the collapse of a chain of markets or similar entities. The classic example of systemic risk is a bank run. Often, it begins with a failure of a single bank, which then leads to depositors' panic and results in defaults of healthy banks that fail because they are unable to satisfy too many simultaneous requests for cash.

Just as there is no single accepted definition of risk, there is no agreement regarding the way risk should be measured. One popular approach is to measure risk as the probability of the occurrence of a hazard. Another measure, especially popular in finance, is variance (or standard deviation) of the price or return of an asset. There were also some efforts to develop risk models based on semivariance where only negative deviations from a mean were taken into account. Semivariance estimates the average loss of a portfolio or a security. Value at risk (VaR) is another widely accepted measure, which is mostly used for the estimation of market risk. VaR shows the maximum amount of loss that can be incurred with a given confidence level over a given time interval.

In spite of the popularity of VaR, it has been subject to heavy criticism, particularly in the context of coherent measures of risk. This concept serves to formulate a set of axioms that imposes specific mathematical conditions that any risk measure should satisfy. Among the four axioms of coherency, a central role is played by the so-called subadditivity axiom, which, in essence, formulates the risk diversification principle: The risk of a portfolio should be less than risks of individual securities that constitute this portfolio. It has been shown that there are cases when VaR does not satisfy the subadditivity axiom, thus making it an incoherent measure of risk. To address this problem, alternative measures of risk have been proposed. One of them is expected shortfall, which incorporates both the probability and magnitude of the potential loss.

Risk Management

Human beings have been taking and managing risks for centuries. Peter Bernstein argues that the mastery of risk is what separates ancient from modern times. He attributes the calculation of probabilities, beginning in 16th-century Italy, with our ability to quantify risk and to make informed decisions on the basis of scientific forecasts.

Although risk management has been practiced for thousands of years, it was not until the 1950s that it was articulated and formally developed, by academics working in the field of insurance. Their initial focus was on "pure risk," or "hazard risk," where there is either a loss or no loss. For example, owning a house gives rise to the risk of loss from it burning down or being destroyed by a hurricane or other force of nature. These are risks that have traditionally been covered by insurers. Robert Mehr and Bob Hedges, widely credited as the fathers of risk management, argued that risks should be managed in a comprehensive manner and not simply insured.

Risk can also be classified as "speculative risk" if the source of risk gives rise to the possibility of gain as well as loss. For example, investing in the stock market generates the possibility of a gain if share prices rise or a loss if they fall. Such "financial risks" were of little consequence when interest rates were stable, foreign exchange rates were fixed, and inflation was low. This changed in the 1970s with the abolition of the Bretton Woods system of fixed exchange rates and the oil price increases that arose from cuts in production by the Organization of Petroleum Exporting Countries (OPEC). The oil price shocks led the U.S. Federal Reserve to focus on fighting inflation rather than stabilizing interest rates, with the result that U.S. interest rates became more volatile, leading to a spillover effect on other nations. Thus, financial risks became an important concern for companies and financial institutions, which required products to hedge them.

Most financial risks are hedged using derivative products—forwards, futures, options, and swaps. With the exception of swaps, which are a recent innovation (the first swap transaction, involving currencies, took place in 1981), derivative products based on nonfinancial assets had been in use long before they were adapted to deal with financial risks. However, it did not take long for a wide array of financial derivatives to be developed. An important catalyst was the publication of the Black-Scholes-Merton formula for pricing options. This coincided with the opening of the Chicago Board Options Exchange in 1973, the first exchange devoted solely to options trading, and laid the foundations for a rapid growth in the volume of contracts traded in this new market.

Financial risks can be classified broadly into three categories: market risk, credit risk, and operational risk. Market risk is the risk of a change in the value of a financial position arising from changes in the value of the underlying components on which that position depends, such as stock prices, bond prices, or exchange rates. All entities that own financial assets face market risk. For example, the value of currencies owned by banks depends on exchange rates. The most popular method to measure market risk is value at risk (VaR) which refers to the maximum possible loss from an unfavorable event, within a given level of confidence, for a defined holding period. It was popularized by the investment bank JP Morgan in 1994 when it published a technical document, *RiskMetrics*, to promote the use of VaR among the firm's institutional clients. Before this, VaR was largely unheard of among corporate treasuries and commodity trading firms, but after the publication of *RiskMetrics*, its adoption spread rapidly among both financial and nonfinancial firms.

Credit risk is the change in the value of debt due to changes in the perceived ability of counterparties (borrowers) to meet their contractual obligations (or sustain their credit rating). This failure to meet a contractual obligation could take the form of nonpayment ("default") by the borrower of the principal and/or interest on a loan; hence, credit risk is also known as "default risk" or "counterparty risk." It is faced by banks, by corporate bondholders, and by parties involved in contractual agreements such as forward contracts. Credit risk is assessed by independent credit rating agencies (usually Moody's, Fitch, or Standard & Poor's) in the form of credit ratings, which are opinions on an organization's ability to fulfill its contractual obligations on a timely basis (a probability of default).

Credit Derivatives and Securitization

Credit risk can be managed using credit derivatives or by the process of securitization. Credit derivatives are privately negotiated bilateral contracts between two parties in which the seller provides protection against the credit risk of the buyer in return for a fee. They have emerged as a major risk management tool in recent years as their use has spread beyond banks to insurance companies, mutual funds, hedge funds, pension funds, and corporate treasury departments.

Credit derivatives fall into two categories: funded and unfunded. The former refers to a bilateral contract between two counterparties, where each party is responsible for making its payments under the contract itself without recourse to other assets. Examples include "credit default swaps" and "total return swaps." The fundamental difference between them is that the former provides protection against specific credit events whereas the latter provides protection against loss of value irrespective of the cause, which could be a default or market sentiment causing credit spreads to widen. A funded credit derivative involves the protection seller making an initial payment that is used to settle any potential claims. Examples include "credit linked notes" and "collateralized debt obligations."

Securitization refers to the pooling and repackaging of cash flow producing financial assets (loans) into securities that are then sold to investors. The credit securitization market started in the United States in the early 1970s with the securitization of mortgage loans to create mortgage-backed securities (MBS). Since the mid-1980s, nonmortgage assets, such as consumer loans, car loans, and credit card receivables, have been increasingly securitized. The securitization of U.S. "subprime" (low-quality) mortgages—made to higher-risk borrowers with lower incomes or a worse credit history than "prime" borrowers—led to major liquidity problems ("credit crunch") in the global banking system in 2007–08 as defaults in these mortgages began to occur. As many lenders had transferred the rights to their mortgage payments—and related credit risk—to third-party investors by means of securitization, the purchasers of the resulting MBS incurred significant losses as the value of the underlying mortgage assets declined. As a consequence of this international transfer of risk, stock markets in many countries declined significantly.

Operational Risk

Operational risk is defined as the risk of loss resulting from inadequate or failed internal processes, people, and systems, or from external events. This type of risk applies mainly to banks and other financial institutions and is manifested in such events as mistakes made in carrying out or settling transactions, or the failure to set limits on, or adequately monitor, the activities of traders. Currently, although banks and financial institutions have made efforts to develop models to measure operational risk, none has gained widespread acceptance. To date, insurance is the only means by which operational risk may be managed, although not all insurance companies offer coverage.

The risk of bank failure is reduced by the requirement made of banks by the Basel Committee on Banking Supervision to put aside a minimum amount of capital, equal to at least 8 percent of their risk-weighted assets (Cooke ratio). Whereas the first Basel Accord of 1988 (Basel I) only took account of credit risk, the second Accord of 2004 (Basel II) incorporated market risk and operational risk, and it provides banks with an incentive to develop sound risk management systems so that they can lower the riskiness of their asset base and thereby reduce their regulatory capital charge.

Adopting an overall approach to risk management, by integrating the management of both hazard and financial risks, has led to a relatively new field of study called enterprise risk management. This has emerged as a result of hazard risk managers and financial risk managers reporting to the same individual, usually the treasurer or chief financial officer, leading to the realization that benefits can be achieved by taking a holistic approach to risk management.

Robotics

Robotics is the design, construction, and use of machines (robots) to perform tasks traditionally done by human beings. Although there is no consensus regarding the definition of the term *robot,* it is commonly defined as a mechanism that can sense its environment, process what it senses, and act upon its environment based on that processing. Robotics requires a working knowledge of electronics, mechanics, and software, and is usually accompanied by a large working knowledge of other subjects. The Robot Institute of America defines a robot as a programmable, multifunctional manipulator designed to move material, parts, tools, or specialized devices, through variable programmed motions, for the performance of a variety of tasks.

Karel Capek (1890–1938) made the first use of the word *robot* from the Czech word for forced labor or serf. He introduced the word *robot* into his play *R.U.R.* (*Rossum's Universal Robots*), which opened in Prague in January 1921. In *R.U.R.*, Capek poses a paradise, where the machines initially bring so many benefits, but in the end bring an equal amount of blight in the form of unemployment and social unrest. The word *robotics* was first used in "Runaround," a short story published in 1942 by Isaac Asimov (1920–92). *I, Robot*, a collection of several of these stories, was published in 1950. One of the first robots Asimov wrote about was a robotherapist.

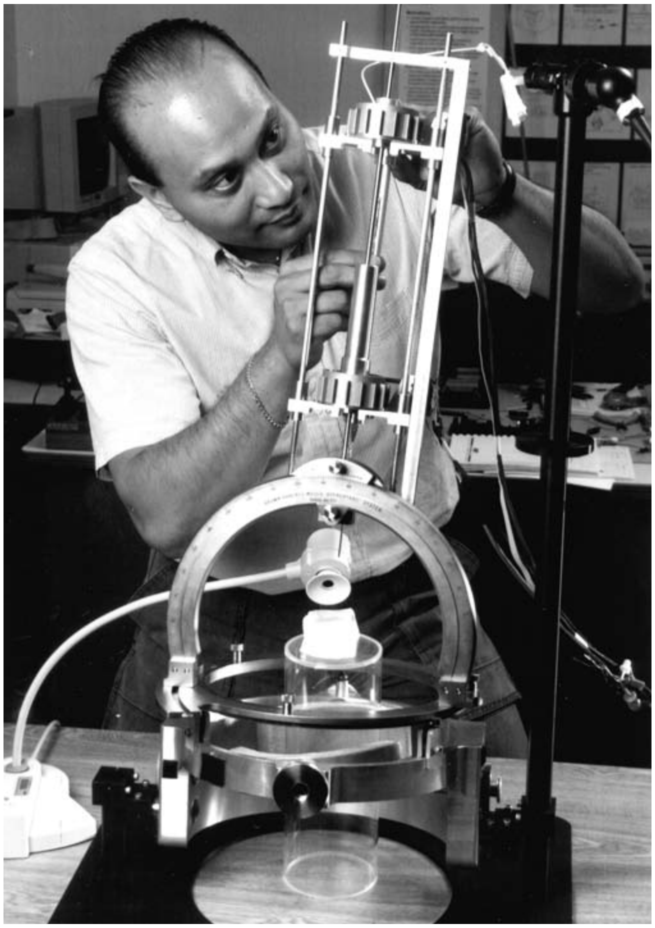
Today, robots are widely used in industries such as automobile manufacturing to perform simple repetitive tasks and in industries where work must be performed in environments hazardous to humans. Many aspects of robotics involve artificial intelligence; robots may be equipped with the equivalent of human senses such as vision, touch, and the ability to sense temperature. These functions vary depending on the purpose and application of the robots. Robots are also used for military purposes, in medicine, and in education, among other applications.

The architecture of robots requires the involvement of different fields of technology; currently those fields include theory of robots, sensors and transducer technology, motors technology (steppers or DC servomotors), motor drive and control, control theory, power semiconductor drive, microelectronics, digital systems, microprocessors, computer systems, and computer interfacing.

Robots are usually classified by the actions or series of actions they can execute for a predetermined purpose; a general classification includes robots as manual-handling devices, fixed-sequence robots, variable-sequence robots, playback robots, numerical control robots, and intelligent robots.

Advantages

Robots offer specific benefits to workers, industries, and countries. If introduced correctly, industrial robots can improve the quality of life by freeing



A NASA scientist at work on a medical robot used to improve the precision of brain surgery.

workers from dirty, monotonous, dangerous, and heavy labor. It is true that robots can cause unemployment by replacing human workers, but robots also create jobs such as robot technicians, salespeople, engineers, programmers, and supervisors.

The benefits of robots to industry include improved management control and productivity and consistently high-quality products. Industrial robots can work tirelessly night and day on an assembly line without a loss in performance. Consequently, they can greatly reduce the costs of manufactured goods. As a result of these industrial benefits, countries that effectively use robots in their industries will have an economic advantage on the world market.

Industrial robots have the following components: physical parts or anatomy, built-in instructions or instinct, and learned behavior or task programs. Their characteristics include lifting power (payload), reach (workspace), repeatability, reliability, manual/automatic control, memory, library of programs, safety interlocks, speed of operation, computer interface, and easy maintenance. Physical parts usually include a mechanical part or manipulator (such as body, arm, or wrist), an end effector (tool or gripper), actuators, controllers (sensors and processor), a power supply, and sometimes a vehicle.

The actuators are the muscles of a robot, the parts that convert stored energy into movement. The most popular actuators are motors, stepper motors (they do not spin freely like DC motors; they rotate in steps of a few degrees at a time, under the command of a controller), piezo motors (ultrasonic motors), air muscles (a device for providing a pulling force by inflating compressed air, it contracts by up to 40 percent of its original length), electroactive polymers (plastics that change shape in response to electrical stimulation), and elastic nanotubes (filaments to deform elastically by several percent).

Robots require some way to manipulate objects: pick up, modify, destroy, or otherwise have an effect. Thus, the "hands" of a robot are often referred to as end effectors, while the arm is referred to as a manipulator. Some effectors-manipulators are grippers (two fingers that can open and close to pick up and let go of a range of small objects), vacuum grippers (pick and place robots for electronic components and for large objects), and general purpose effectors (highly sophisticated devices with as many as 20 degrees of freedom and hundreds of tactile sensors).

The most common forms of locomotion for robots are varieties of wheels. There are different configurations and means for locomotion, for example, two-wheeled balancing or a ballbot (mobile robot that balances on a ball instead of legs or wheels). There are also track robots, flying robots, swimming robots, and more.

A manipulator is constructed of a series of joints and links. A joint provides relative motion between the input link and the output link. Each joint provides the robot with one degree of freedom. Many robots are designed based on human anatomy. Some parts of the robot seek to duplicate human movement, while others add features to extend transportation capabilities: ground, air, water, underwater, space. There are several types of robot joints, and in most cases, robots use a combination of joint types rather than a single designed joint. Joints are characterized by the movement or function they intend to recreate, for example, linear, rotational, twisting, and revolving joints. The arm joints are used to position the end effector, while wrist joints are used to orient the end effector.

Robotic languages range from machine-level to high-level languages. High-level languages are either interpreter-based or compiler-based. In complex applications, high-level languages provide better control and monitoring of actions.

Roche Group

Roche Group is a Swiss healthcare company operating in more than 150 countries and employing more than 78,000 people worldwide. Roche's operations are focused on two major healthcare areas: diagnostics and pharmaceuticals. In the field of diagnostics, Roche Group positions itself as a world leader in in vitro diagnostics, supplying a wide range of instruments and tests for disease detection and monitoring. In the area of pharmaceuticals, the company concentrates on illnesses for which their products are presumed to be needed the most: cancers, viral infections, metabolic diseases, disorders of the central nervous system, and inflammatory diseases.

The company was created in 1896 by Fritz Hoffmann-La Roche, a pioneering entrepreneur who believed in the future of branded, standardized, industrially manufactured pharmaceutical products. Shortly thereafter, the company opened its first affiliates in several countries of the world, including the United States, Germany, Italy, France, the United Kingdom, and Russia. Descendants of the founding family still own half of the company, while another Swiss pharmaceutical giant, Novartis, owns about a third. The most important and widely recognized Roche products are Xenical, Accutane, Valium, Bactrim, Tamiflu, and Valcyte.

Over the past 100 years, the company grew organically and through both mergers and acquisitions and strategic alliances with other major players in the market. Among the most significant deals in the beginning of the new millennium were the alliance with the Japanese research and development (R&D) company Chugai and the acquisition of Amira Medical of the United States, both completed in 2001. The alliance with Chugai facilitated creation of a leading research-driven pharmaceutical company, and at the same time, helped Roche strengthen its strategic positioning in Japan, the world's second-largest pharmaceutical market. The acquisition of Amira allowed the Roche Group (especially its diagnostics division) to complement its expertise in the all-important blood glucose monitoring sector. Other mergers, acquisitions, strategic partnerships, and alliances—for instance, with NimbleGen (performing genomic analysis and identification of potential drug targets), Transgene (developer of a vaccine against human papilloma virus–mediated diseases), Actelion (inventor of a new compound for multiple autoimmune disorders), and so forth—further enhanced and strengthened Roche's role as the world's leading player in the pharmaceutical market. Among the most recent developments was a merger with Ventana Medical Systems, which should enable Roche to move into a very promising market of tissue-based diagnostics.

With sales of approximately 46 billion Swiss francs (CHF) (US$44.3 billion) and net income of roughly CHF11.5 billion (US$11 billion) in 2007, Roche remains one of the most profitable pharmaceutical companies in the world. Since 2001, Roche has been led by a strong and charismatic leader, Franz Humer. Under Humer's leadership, Roche has been able to diversify its business portfolio of products and services that drove the company's success. This is closely linked to another determinant of the company's great achievements—its profitability. Even though R&D expenses have increased year after year, overall costs increased less than sales; this happened as a result of a variety of measures implemented under Humer. Continuous innovation, streamlined decision-making processes, and different productivity-enhancing methods all contributed to Roche's impressive accomplishments in the past eight years. In 2007 Humer announced that he would be stepping down as CEO to concentrate more on his responsibilities as chairman.

The company is also trying to project an image of a good corporate citizen. Roche's mission statement reflects the company's commitment to patients' needs. The company emphasizes the fact that its products and services bring significant benefits to patients—all from early detection and prevention of diseases to their diagnosis, treatment, and treatment monitoring. Roche prides itself on leading the way in highly customized healthcare solutions and in providing products that are adapted to the requirements of particular patient groups.

In spite of several controversies related to the manufacturing and distribution of anti–human immunodeficiency virus (HIV)/acquired immunodeficiency syndrome (AIDS) drugs in Third World countries, Roche's name is mostly associated with positive deeds. For instance, in 2005 and 2006, the company donated 50 million doses (5 million treatments) of its antiviral drug Tamiflu to the World Health Organization to help combat deadly influenza outbreaks. Also in 2006, Roche announced its partnership with the United Nations Children's Fund (UNICEF), aimed at improving the lives of children affected by AIDS in Africa.

Romania

Romania is a middle-income southeast European country with a population of 22 million. The population is 90 percent Romanian with a 7 percent Hungarian minority (mostly in Transylvania) and a 2.5 percent Roma minority. The economy remains on the internal periphery of the expanded European Union (EU). The share of the urban population is low for Europe, at under 60 percent.

Romania achieved its independence from the Ottoman Empire in the mid-19th century. The internal democratic tradition was weak. Romania spent most of the 20th century as an authoritarian state. Like other southeastern European countries, it remained caught between the interests of the great powers. It joined the winning side in World War I, gaining significant territory at the expense of its neighbors. It was less successful in World War II, joining Nazi Germany in 1941. In 1944, an internal coup enabled Romania to switch sides.

After World War II, the Communist regime pushed forward a nationalist industrialization program. It fell out with the Soviet Union in the 1960s as the government favored the local coal industry, iron and steel, and engineering, pushing, as they saw it, Romanian national interests. Romania was courted by the West in the Cold War. However, in the 1980s, under the leadership of the dictator Nicolae Ceausescu, economic difficulties grew. The regime responded with isolation and repression. This led to Romania's acquiring something of a pariah status.

Although the fall of communism involved more bloodshed than in other Soviet bloc states, the amount of political, social, and economic change was initially limited. Key figures and groups in the old regime established strategic positions in the new, pocketing former state assets. Poverty and inequality, already considerable in 1989, intensified and Romania came to be seen as a cause of European concern. Outmigration was considerable.

Romanian industry was inefficient, heavily reliant on "dirty" methods of production that had given rise to major environmental problems. A significant share of the labor force remains trapped in low-productivity agriculture. The economy slumped in 1992, began a weak recovery to 1996, and then slumped again in 1999. Over the decade as a whole, gross domestic product (GDP) growth per capita was negative. However, in the new century recovery and macroeconomic stabilization began, and strong growth has been sustained to date. Inflation was brought under control and reduced to around 6 percent and unemployment to around 5 percent. Romania is divided into 41 counties and the municipality of Bucharest, the capital. There is considerable regional inequality. The country's physical infrastructure needs improvement and the hope is that this can be done using EU structural adjustment and cohesion funds.

Romania's dissident position under communism led to engaging with the wider world economy at an earlier stage. But the difficulties of the 1980s and 1990s led to it falling behind. Romania joined NATO in 2004. It only joined the European Union, with Bulgaria, in 2007. As with a number of other transition countries, the Romanian political class also looked to Washington, strongly supporting the United States in Iraq. Brussels, worried about the levels of corruption and crime, insisted on reform as a condition of EU accession. However, membership of the EU appeared to lead to a degree of relaxation and there were also new sources of funds to contest. Infighting broke out, including a failed attempt to impeach the president. Transparency International still considers that Romania has one of the worst corruption scores in the expanded EU.

Today, Romanian trade is focused on western and central Europe. Seventy percent of exports go to the EU 27, with Italy and Germany taking around a third. Exports include machinery, equipment, metals, textiles, and footwear. However, Romania also has links to the east and southeast. Constantza is the largest Black Sea port and a significant transshipment point for legal and illegal goods.

Foreign investment was weak in the first decade of the transition. It took off from 2004 as the global and local investment climate turned positive. Western companies like Renault, Nokia, Vodaphone, and Carrefour have invested in Romania, as has LUKOIL from Russia and the Indian company Ranbaxy Laboratories. Ford is creating a major base for southeastern Europe in Romania, and Bucharest is the location of Microsoft's Global Support Center.

Ironically, Romania has been forced to present itself as a low-cost competitor within the EU, relying on its low wage costs and low, flat-rate corporate and income taxes to attract multinational investment. To some extent, this is a return to what was once seen as a failed pre-Communist past. Comparative surveys suggest that Romania is now mid-range in terms of the difficulties of new business start-ups. However, whether this is sufficient to sustain the strong and sustained growth necessary to close the gap with the West, even Europe, is doubtful.

Traditional agriculture continues to employ many Romanians, such as this family using a horse-drawn wagon in 2001.

Royal Africa Company

The Royal Africa Company was an English (British after 1707) slave-trading company. It bought slaves on the west coast of Africa and shipped them across the Atlantic. It then transported goods back to Europe. The company was formed from an earlier group of English traders called the Royal Adventurers Trading to Africa (founded in 1660). The Royal Africa Company was granted a monopoly right by the king of England to trade along the African coast in 1672. It lost this right in 1698. It later joined forces with the South Sea Company to sell slaves to the Spanish colonies in the Americas. It ceased trading in 1752 and was replaced with the African Company. Throughout its existence, it shipped thousands of people across the Middle Passage. It maintained a British presence in Africa and helped the state to raise funds. It was one of the major companies that featured in the early London stock market.

The Royal Africa Company was a joint-stock company. A joint-stock company allowed individuals to invest in a business enterprise with limited liability. The company would hold a royal charter permitting it to exist. This was often combined with a monopoly right. The Royal Africa Company was the only English/British company allowed to trade along the African coast. Joint-stock companies could take on existing government debt or lend money to the state in exchange for new rights. (The British East India Company and the Bank of England are famous examples.) Joint-stock company shares were easily tradable. Trading went on in different places such as the Royal Exchange and surrounding coffeehouses. It also occurred in an area of London known as Exchange Alley. This is at the heart of the City (London's financial district).

The Royal Africa Company rented land along the coast of Africa from local kings. It owned forts to hold slaves before they were put on ships. The slaves were brought to the forts by local African traders. The traders would barter for goods or accept different sorts of fiat money, for example, cowry shells or iron bars. The company's main fort was Cape Coast Castle in modern-day Ghana. Many other European nations also had forts and trading posts nearby. Armed conflicts would be fought between European groups to take over forts. The company had to have soldiers and cannon to defend its property. Slave ships were vulnerable to attack from pirates. So the company's ships were heavily armed with guns. The ships often got a Royal Navy escort vessel to protect them. Convoy protection was not easily available in wartime. The Royal Africa Company was struggling to keep trading during the Nine Years War (1688–97). (This war is known under a variety of names including King William's War [1689–97] in North America.)

Independent British traders had been able to break the monopoly. They lobbied the government and the Royal Africa Company lost its monopoly rights. The company was still expected to maintain its forts to protect other British traders. It was supposed to collect fees from other traders, but this was difficult in practice. The obligation to pay fees was revoked in 1712. The British government decided to pay subsidies to the company to maintain the forts from 1730 onward. The Royal Navy reported that the forts were often in disrepair.

The company entered into a contract with the South Sea Company (another joint-stock company formed in 1711). The South Sea Company was granted a monopoly contract by the Spanish crown to send slaves to Spanish colonies in the Americas. The South Sea Company gave its name to a financial market bubble, the South Sea Bubble (1720). Share prices increased to extremely high levels, especially for South Sea stock. Then prices suddenly dropped. Both companies survived the crash and continued to ship slaves. However, the Royal Africa Company had been in a gradual decline for many years. It survived until 1752 when it was replaced by the African Company.

Royal Dutch Shell

The Royal Dutch Shell Company is a multinational petroleum (oil) company that began in the 1800s from a merger of two companies (1907), one of which was English and the other Dutch. Currently Shell is a private company, the second largest oil company, and one of the six major oil companies in the world. It is, after Wal-Mart and Exxon, the third-largest company in the world. Its headquarters and tax residency is in The Hague, Netherlands; however, it is incorporated in London as well. Its stock is listed as RDS.A on the New York, London, and other stock exchanges.

Petroleum—from exploration to marketing of oil and gas—continues to be its main business. Besides exploration, production, transportation, and marketing of oil, it also has a significant stake in the petrochemical industry. The latter business operations are conducted through its subsidiary Shell Chemicals. With the possibility of most of the world's oil supplies being exhausted in the next century or more, it is also engaged in developing renewable sources of energy.

Shell Oil Company began in 1880 in the Dutch colony of Indonesia when Aeiko Jans Zijlker, a manager with the East Sumatra Tobacco Company, was shown a natural oil seepage. Over 50 natural oil seepages were known in the Indonesian archipelago. By 1885 the first well was producing and the Dutch king William III had granted the company formed to exploit the oil the Royal Dutch Company. When Zijlker died suddenly, he was replaced by Jean Baptiste August Kessler. The great early development of the Royal Dutch Petroleum Company was a result of his diligent efforts.

By 1900 Standard Oil and other oil companies were seeking to take over Royal Dutch. However, it was able to resist these efforts until it merged with M. Samuel & Company of London. The Samuel brothers, Marcus and Samuel, had developed a tanker fleet that had gained access to the British-controlled Suez Canal. Until the advent of the automobile, the oil business was the kerosene business. It was shipped in cans to consumers globally. However, with the development of tankers, the Samuels could ship kerosene in bulk to be dispensed locally in bulk and thereby master transportation costs.

In 1907 the Royal Dutch Shell Company was formed by a merger with the Shell Transport and Trading Company. The Dutch kept 60 percent of the company and the British arm got 40 percent. With the merger of operations, the new company was better positioned to compete with John D. Rockefeller's Standard Oil. The Shell brand was to become one of the world's most famous commercial symbols.

In 2007 Shell celebrated its 100th birthday. It has survived wars, depressions, competitors, and production and marketing challenges to become the second-largest oil company in the world. Today it is an energy company with five main businesses it aims to conduct with environmental care. These businesses are Exploration and Production, Gas and Power, Refining and Marketing, Chemicals, and Trading/Shipping, which operates in more than 100 countries. It is vertically integrated in order to gain the maximum in economies of scale and efficiency production and marketing. Its Shell Oil gasoline stations are seen throughout the United States and the world.

Exploration and production of petroleum is essential for Shell. Oil is its raw material for gasoline and petrochemicals. Because natural gas is often found in oil fields, it is captured and either piped to markets or shipped as liquid petroleum gas (LPG) to markets. The shipping of oil and LPG is a historic part of the company's operations. The use of natural gas as a clean fuel for the production of electricity for power and lighting is a natural outgrowth from its origins as a producer of kerosene lighting fuel.

With political instability in many oil-producing areas, which in the case of Nigeria have generated complaints of human rights violations, Shell has sought diversification into alternative energy production such as nuclear power (with Gulf Oil Company), coal, electrical generation, and with metals. These projects were not successful. Since 2000 it has sought to develop alternatives to fossil-fuel hydrocarbons through investments in solar power, wind-generated electricity, hydrogen fuel cells, and other sources of energy. However, in 2006 it quit the solar power business and in 2008 withdrew from a wind farm venture with London Array. It is currently invested in developing large-scale hydrogen projects.

Royalties

Royalties are compensation paid to a party in exchange for the use of its asset; the transaction is typically called licensing. The most common assets for which royalty payments are made are intellectual property and intangible assets. Examples of intellectual property include trademarks, patents, and copyrighted work such as books, poems, songs, plays, scripts, music, software, and movies. For example, if a movie production company wants to use a song in their movie, they may enter into a licensing agreement with the owner of that song. Royalties are also paid for the right to appropriate gas or mineral deposits. For instance, if a company wants to mine gold from a person's land, the company might negotiate to pay the landowner royalties for every ounce of gold found.

Royalties are usually agreed upon during contract negotiations between the owner (licensor) and the party using the asset (licensee). If the creator has previously sold the intellectual property, the new owner can enter into new contracts for use. Under U.S. law, royalties are personal property and can be transferred to another party contractually or upon death.

Royalties are usually calculated as a flat fee, fixed amount per unit sold, or a percentage of revenue or net profit. Flat-fee royalties can be either assessed at the time of purchase or as a fixed amount paid at regular intervals such as annually. For example, the owner of a baseball team may be compensated $4 million per year for the use of the team's logo on hats. Fixed-amount-per-unit royalties are assessed as a previously negotiated price for each unit of a good sold using the asset. For instance, the baseball team owner may negotiate a $3 royalty for each hat sold. Percentage royalties are assessed as a portion of either the revenue generated by the final products or the net profit. For example, the owner of a baseball team may negotiate a 35 percent royalty for all merchandise sold with the team's logo, based on revenue, or a 45 percent royalty based on net profit. The royalty payment to the owner of the baseball team varies greatly depending on the structure of the agreement and the method of assessing the royalty.

A party may license intellectual property from competitors, paying royalties to both. In this case, the licensee has economic incentive to maximize revenue by only promoting the intellectual property that provides the highest gain over cost (margin). To ensure that the licensee uses the intellectual property, a licensor may stipulate a minimum royalty in addition to a percentage of revenue or amount per unit sold, regardless of the level of sales. This provides incentives to the licensee to promote and use the intellectual property.

The use of royalty payments ensures that creators of intellectual property and intangible assets are compensated for their work. The use of royalties also allows people and firms with valuable intellectual property to expand into new markets despite such barriers to entry as a lack of capital or ownership regulations. Consequently, the ability to obtain royalties for intellectual property and intangible assets encourages international trade.

Intellectual property rights and regulation enforcement vary by country. In the United States and the European Union, if a party uses intellectual property without compensating the owner, the party can be sued for grievances and lost revenue by the creator or owner. This is not the case in countries with weak intellectual property rights such as India and China. The variation in intellectual property rights enforcement reduces the efficacy of royalty-based incentives for intangible asset creation. For example, firms are less likely to do business in countries where management perceives that their assets may be stolen because of lax regulations or poor enforcement. The prospect of lost economic value because of weak regulations has driven some countries to initiate legislation to grant additional intellectual property rights and improve enforcement.

In 1967, the World Intellectual Property Organization (WIPO) was created as a specialized agency of the United Nations to promote intellectual property protection worldwide. Currently, 184 nations are members that meet to establish intellectual property regulations and administer 24 treaties.

Russia

Russia is the largest country in the world and a major political player, being a member of the United Nations (UN) Security Council, the Group of Eight (G8) industrialized nations, and the Council of Europe. Main industries of the Russian economy include mining and extractive industries producing coal, oil, gas, chemicals, and metals; defense industries and information technology (IT), among others. From 1922 to 1991, Russia, among 14 other countries, was part of the Union of Soviet Socialist Republics (USSR). The USSR or the Soviet Union had the modern world's first centrally planned economy, which developed into the second-largest in the world. During and after the disintegration of the Soviet Union, when wide-ranging reforms including privatization and market and trade liberalization were being undertaken, the Russian economy went through a major crisis as it moved from a centrally planned economy to a free market system. Despite the country's strong economic performance since 1999 and the significant improvement of its international financial position, political, legislation, and management problems still remain. Nevertheless, Russia has a huge long-term potential and is on its way to being a developed country within the 2020–25 time frame.

Russia, officially known as the Russian Federation, is a federation with 89 provincial authorities including a number of semiautonomous republics. It has a land mass of 17,075 sq. km (6,592,800 sq. mi.), covering 11 time zones, and a population of 147 million. It has a rich cultural identity that has been shaped by its distinguished history and vast geography. The official currency in Russia is the ruble. However, it is very common for businesses to make their calculations in U.S. dollars or, more recently, in euros.

Industries

Main industries of the Russian economy include a complete range of mining and extractive industries producing coal, oil, gas, chemicals, and metals. It is the world's leading natural gas exporter and the second leading oil exporter. Thus, Russia remains highly dependent upon the price of energy. However, most such resources are located in remote and climatically unfavorable areas, thus making the exploitation of natural resources more difficult.

Other industries that play a key role in the Russian economy are defense industries including radar, missile production, and advanced electronic components. For instance, Russia has the largest stockpile of nuclear weapons in the world. Russia is the world's top supplier of weapons, a spot it has held since 2001, accounting for around 30 percent of worldwide weapons sales and exporting weapons to about 80 countries.

Moreover, the IT market is one of the most dynamic sectors of the Russian economy. Russian software exports have increased from just US$120 million in 2000 to US$1.5 billion in 2006. Meanwhile, the fastest growing segment of the IT market is offshore programming. Russia is the world's third-biggest destination for outsourcing software behind India and China. It is also worth mentioning Russia's attempt over the last few years to diversify its research and development in emerging technologies. For example, there has been a massive US$7 billion investment program in nanotechnology.

Other significant sectors of the Russian economy include all forms of machine building from rolling mills to high-performance aircraft and space vehicles; shipbuilding; road and rail transportation equipment; and communications equipment. Moreover, other industries comprise agricultural machinery such as tractors; construction equipment; electric power generating and transmitting equipment; as well as medical and scientific instruments.

Economic Reform

The Soviet Union's planned economy constituted the largest and most powerful economy in the world after that of the United States. The nation became among the world's three top manufacturers of a large number of basic and heavy industrial products such as steel, oil, and gas. During and after the disintegration of the Soviet Union, when wide-ranging reforms including privatization, market and trade liberalization were being undertaken, the Russian economy went through a major crisis. This period was characterized by deep contraction of output, with gross domestic product (GDP) declining by roughly 50 percent between 1990 and the end of 1995 and industrial output declining by over 50 percent.

Russia is one of the most industrialized of the former Soviet republics. However, years of very low investment have left much of Russian industry highly inefficient. Russia inherited most of the defense industrial base of the Soviet Union, so armaments are the single-largest manufactured goods export category. Efforts have been made with varying success over the past few years to convert defense industries to civilian use.

The economic reform in Russia comprised the abolition of all Communist planning ministries and bureaucracies, an end to price fixing, establishment of the stock exchange, and encouragement of foreign direct investment (FDI) and joint ventures. There has been a two-stage mass privatization program put in place: "voucher privatization" shares given away to workers, followed by public auctions of key state enterprises. The Soviet economy, moreover, was the most monopolized in the world. Up to a third of all industrial enterprises were absolute monopolies, producing goods that no other company in the Soviet Union produced. Not only in production, but also in the sphere of management, in trade and supply, in research and development, the system was characterized by the supermonopolism of state power. Denationalization would have to be accompanied by demonopolization to stop privatization simply transforming state monopolies into private ones.

The problem in Russia is a lack of a significant quantity of small firms—in capitalist countries the source of technical innovation, competition, and job creation. The main purpose of privatization was to break the dependence of enterprises on the state budget. The destruction of the old monopolies and their corporate dependence on the state not only began to create a capitalist market but also entailed the destruction of the associated bureaucracy in the Russian Federation.

Privatization has transferred over 70 percent of large enterprises into private hands, and most small businesses have been privatized as well. The state is still a large shareholder in tens of thousands of enterprises, but it plays virtually no role in their management. The great majority of new businesses and joint enterprises are to be found in Moscow, St. Petersburg, and Nizhniy Novgorod, whereas traditional industrial areas found it difficult to adjust to competitive market conditions. In Russia, a significant share of private ownership of industrial enterprises has emerged out of privatization efforts. Privatization proved to be one of the most successful policies. By September 1994, some 100,000 enterprises had been privatized and over 80 percent of the industrial workforce was in privatized enterprises. The privatization of large enterprises was subject to voucher privatization. The majority of privatized enterprises were not sold to the public but in elections by the workforce, who, encouraged by their managers, voted for the option that allowed staff to buy 51 percent of the stock at a fixed price. Rather than outside owners coming in and shaking out factories and sacking staff and managers, control remained within the factory gates. However, the privatization process was also heavily criticized for "insider" deals, because many strategic enterprises were practically given away for free to powerful individuals.

In contrast to developed market economies and leading transition economies in central Europe, private owners in the former state-owned enterprises (FSEs) are predominantly insiders. Private owners consist of "insiders" (workers and managers of the given enterprise) and "outsiders" (individuals and enterprises unrelated to the given firm, such as banks, investment funds, and foreign investors). Also, firms in the Russian Federation that have majority outside ownership stakes also have on average very significant insider ownership stakes. Enterprise insiders in Russia are a less promising source of radical new ideas and have less capability to provide investment funds.

Russia has significantly improved its international financial position since the August 1998 financial crisis. A principal factor in Russia's growth has been the combination of strong growth in productivity, real wages, and consumption. The devaluation of the ruble in 1998 made Russian exports far more competitive and at the same time made imports too expensive, thus influencing people to shift back to Russian alternatives. Because of the increased investment in the energy sector as well as sustained demand and high prices for oil and export raw materials (gas, steel), the entire economy was propped up and a large state budget surplus was created.

Despite the country's strong economic performance since 1999, the World Bank lists several challenges facing the Russian economy including diversifying the economy, encouraging the growth of small and medium enterprises, building human capital, and improving corporate governance. Much of the economy is still struggling without cash or reforms. Overall, however, Russia appears to have overcome the crisis relatively well. As of 2007, real GDP increased by the highest percentage since the fall of the Soviet Union at 8.1 percent, the ruble remains stable, inflation has been moderate (11.9 percent), and investment began to increase again.

Russia had an extremely poor record of attracting FDI until very recently. For example, Russia's cumulative FDI stock between 1991 and 2004 was US$4,478 million. In comparison, Poland, being a significantly smaller country than Russia, had a cumulative FDI stock of US$51,906 million over the same period of time. Integrating the Russian economy with the rest of the world through commerce and expanded foreign investment has been a high priority of Russian economic reform. However, a significant drawback for investment is the banking sector, which lacks the resources, capability, and trust of the population that it would need to attract substantial savings and direct it toward productive investments. Russia's banks contribute only about 3 percent of overall investment in Russia.

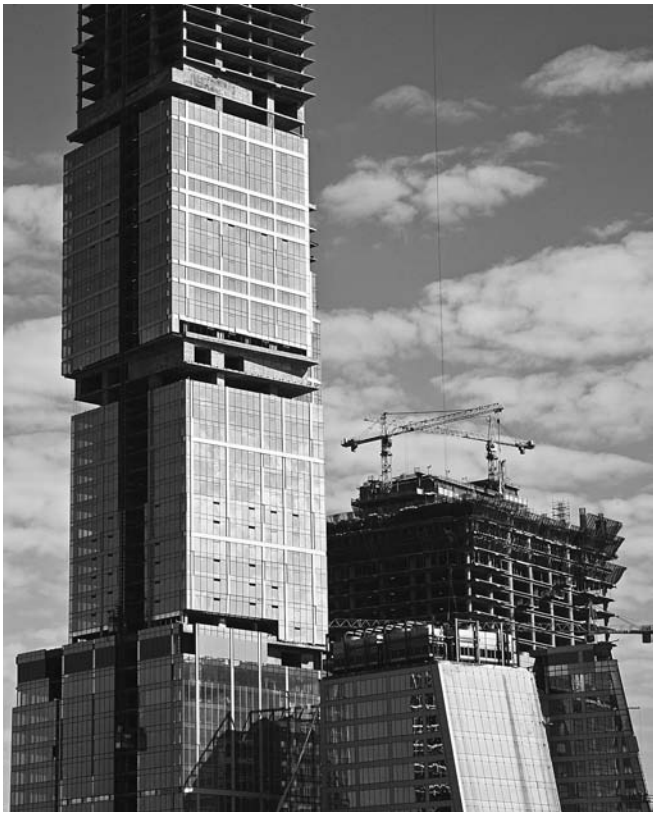
Labor Issues

Labor collective under communism issued the essential benefits to the labor force, but tied workers to the enterprise. The labor system under postsocialism needs a redevelopment of its role. Russian companies tend to mostly focus on core competencies and cannot afford to ensure workers' effective representation. Many of the social provisions are therefore passed on to the local councils who also cannot afford them. Hence, employees in Russian enterprises have few means of representation, and the development of new, independent trade unions is slow.

After the collapse of the Soviet Union, companies in Russia had severe debts to their staff, utilities providers, and materials suppliers. Thousands of companies could not pay their staff in the period 1993–2000. Many thousands of staff left these firms and the country suffered from a high unemployment rate. However, after the turn of the century, the situation was gradually improving and it is less of a problem now, employees generally being paid on time and the unemployment rate decreasing to 5.9 percent in 2007.

Other Developments

There has been an increasing importance of financial-industrial groups (FIGs), which are large holding companies acquiring hundreds of smaller enterprises and are based around a main bank. There has been a remarkable growth of huge business empires. Russia has three multinational corporations in the Fortune Global 500 and a larger number of billionaires than any other country in the world after the United States. While strategic FSEs in oil, gas, metals, and some parts of automobile and aircraft sectors are surviving and prospering, the vast majority of FSEs, on the other hand, are left in a state of slow decay and will eventually collapse.



Moscow skyscrapers under construction. Russia's economy experienced nine years of growth after its 1998 financial crisis.

On the downside, political, legislation, and management problems still remain in Russia today. On the one hand, the end to state planning liberated Russian enterprises: they can choose any sector, products, or strategies they want. On the other hand, they lost their previously guaranteed customers, clients, and most importantly, subsidies overnight. Russian companies were established with quite different environments in mind. Many are located far from their markets, with no customers and no market for their goods. Technologies and processes still remain extremely outdated. Skills development is also troublesome because some educational institutions are still turning out skilled staff whose skills are now redundant.

Even though there have been some successful investments in energy and services, there has been very little investment in technology. Despite software being a major domestic growth sector, there is no high-technology sector in manufacturing. Moreover, conversion of Soviet plants from military to civilian use has been a major disappointment. In addition, there have been very limited reforms of actual management and work systems in Russian companies.

Another major problem in Russia today is that public sector workers are often horrendously underpaid. Local government bureaucrats, police, army, and educational institution workers often do not receive a living wage, thus becoming vulnerable to bribery and corruption.

As for institutional reforms, they remain very slow. Although law and tax reforms are in place, they are not widely trusted and there is a lack of law enforcement in many areas of the economic activity. For example, the Russian state has a very poor tax collection record. In addition, crime has increased costs for both local and foreign businesses. On the positive side, however, Russian businesses are increasingly turning to the courts to resolve disputes.

Russia's leading cities like Moscow, the capital, and St. Petersburg, the second-largest city, are now modern consumer metropolises, but there are massive differences in wealth between the cities and the more traditional countryside. Nevertheless, the middle class has grown from just 8 million people in 2000 to 55 million people in 2006.

Russia is a vast and diverse nation with a rich cultural heritage that after almost seven decades of communism continues to evolve politically and economically. With the world's largest supplies of raw materials, oil and gas revenues heavily support Russia's economy. Recently, within the big cities, a consumer economy has been established. Russia also has a well-educated labor force with substantial technical expertise. Since the turn of the century, rising oil prices, increased foreign investment, higher domestic consumption, and greater political stability have boosted economic growth. The country ended 2007 with its ninth straight year of growth, averaging 7 percent annually since the financial crisis of 1998. In 2007 Russia's GDP was $2.076 trillion, the seventh-largest in the world, and GDP per capita was US$14,600. Although the immediate prospects of the Russian economy appear uncertain, and political, legislation, and management problems still remain, the longer-term potential of the country is enormous.

RWE

RWE is a power, natural gas, and water resources company based in Essen, Germany. RWE came into existence in 1898 when a contract was signed for a power plant to be built in Essen to provide power for that city. With over 63,000 employees, it is now the second-largest utility company in Germany, behind E.ON. In 2007 its revenue was €42.5 billion, of which €17.7 billion came from outside Germany. Its net profit that year was €2.7 billion. In 2008 it was rated A (Stable Outlook) by Standard and Poor and A1 (Negative Outlook) by Moody's.

RWE is the fifth-largest utility company in Europe and holds a large market share on the continent. The company provides electricity and what it describes as a full range of services. It serves 20 million customers that include private households, commercial operations, and municipal utilities and regional energy suppliers. It ranks number five in Europe and is the number two provider of electricity in Germany and Hungary, and number three in Britain and Slovakia.

RWE's customer base for its gas operations is 10 million customers, making it the number six provider of gas in Europe. It is the third-largest supplier of gas to Germany and Britain and the largest supplier to the Czech Republic. It supplies gas as well as related services, including transportation.

RWE provides water management and waste services. This business activity had RWE engaged in continental Europe, Britain, and the United States, but it has committed to withdraw from this aspect of its business outside Europe. In 2006 it sold its Thames Water division for £8 billion. In the following year RWE planned to sell its American Water Works division (which it had purchased in 2003) but delayed the sale due to uncertainty in American markets. It simply was not a good time to sell and RWE assumed that it could get only 80 percent of what American Water was worth. The sale did go through in April 2008 when it sold 36 percent of its stake in the company. Shares sold for $21.50 each instead of the planned $24. The issues that had caused RWE to delay its offering still existed and RWE received $1.2 billion from the sale, considerably less than it had hoped.

As has been the case with other power and gas companies in the European Union, RWE has had to face scrutiny by both the European Commission and the German Federal Cartel Office. One such case was the Cartel Office's investigation into the charge that RWE had been overcharging for electricity based on improperly factoring in CO_2 charges. The investigation and antitrust activity was dropped when RWE agreed to auction off some electricity from its coal-fired plants.

In 2008 RWE entered discussion with the European Commission to sell its gas transmission network in Germany. As part of its efforts to encourage competition within the EU, the European Commission has been trying to uncouple gas companies from the gas transportation networks. In return for the sale, the European Commission agreed that it would drop its antitrust investigations and would not file a complaint. In a related sale the year before, although this time prompted by action from the Dutch government, RWE sold its gas grid companies in the Netherlands.

Despite these activities that have reduced the reach of RWE in some ways, it has continued to expand, notably in eastern Europe. In 2008 RWE began operations in Turkey and in that same year signed an agreement to purchase a stake in a Turkish electricity-generation company. RWE will eventually assist in the construction of new power plants. In that same year RWE joined a consortium of five other companies from Bulgaria, Austria, Hungary, Romania, and Turkey to construct a gas pipeline from Turkey to Austria. RWE announced plans to expand its gas deliveries to Slovakia. RWE has also partnered with a Swedish corporation to purchase British Energy.

Finally, in a transaction that shows possible changes in RWE's business model, in 2007 it purchased a company, eprimo, that has successfully used a Web-based business model. RWE used eprimo to sell gas through the internet to supplement its current model of sales by direct contact between its regional companies and its customers.

Safeway

The third-largest supermarket chain in North America, Safeway, Inc., is also the 10th largest retailer in the United States. It had, as of January 3, 2009, some 1,739 stores in the United States and Canada. The company was formed by Sam Seelig in April 1912, and was initially a grocery store on the corner of Pico and Figueroa Streets in Los Angeles; within 10 years, it was operating 71 stores. In 1924 Seelig left the company to establish a real estate business. The company, in 1925, held a competition that resulted in its change of name to Safeway.

Charles Merrill, of Merrill Lynch, managed to organize a merger on July 1, 1926, of Safeway with 673 stores owned by Skaggs United Stores of Idaho and the Skaggs Cash Stores of California. Marion Barton Skaggs, originally from Missouri, had started the chain in 1915 after buying a grocery store in American Falls, Idaho, from his father, Samuel M. Skaggs, for $1,089. This resulted in the creation of the largest chain of grocery stores in the western states, with Marion Skaggs becoming the chief executive officer of the merged entity, remaining on the board of directors until his retirement in 1941. At that time, Safeway had its headquarters in Reno, Nevada, but three years later, it moved to Oakland, California, and it moved again to a nearby former creamery building, and later to Pleasanton.

Expansion

Financed by Merrill Lynch, Safeway expanded through buying up rival businesses or individual stores. This included many Piggly Wiggly stores, and by 1931, Safeway had 3,527 stores, gradually closing down smaller stores and replacing them with supermarkets.

The company had also begun to expand internationally, and in 1929, it bought nine stores in Canada, which became Canada Safeway. (Most of Safeway's expansion overseas was from the 1960s.) In 1934 it sold its business interests in Hawaii, and expanded those on the mainland United States until 1947, when it posted its first sales figure of more than $1 billion. Four years later, it had achieved sales of $1.5 billion, and in the following year, it adopted the "S" logo, which, with alterations, it has kept to the present day.

Buoyed by increasing sales figures, in 1959, Safeway opened a store in Alaska, its first in that state, and in 1962, Safeway bought 11 stores in Britain that had been run by John Gardner Limited, and these became Safeway (UK). In 1963 the company reentered the Hawaiian market, and in the same year when some of its representatives were in Australia searching for a source for apples, it decided to investigate supermarkets there. It soon purchased three Pratt Supermarkets in Australia; it expanded into Queensland, in the north of the country, when it bought the chain Jack the Slasher, which had 31 branches. It also bought two Big Bar Basat ("Big Bear") stores in Germany, and in 1981, it bought a 49 percent share in Casa Ley, the Mexican retailing business. It sold Safeway Australia in 1985 to Woolworths Limited, and in August 2008, Woolworths announced that it was ending its use of the name Safeway.

During the 1980s, there were a number of takeover bids with Herbert Haft and his son Robert Haft, well-known U.S. corporate raiders, attempting a hostile takeover in 1986. Safeway was helped by the private equity firm Kohlberg Kravis Roberts (KKR), and it went private, but had to assume large debts. To pay these off, the parent company sold the British and West German divisions of the company, as well as many branches in the United States, pulling out of Los Angeles. In 1990 the company went public again, and began to expand. It currently employs about 201,000 people and has revenue of $42.3 billion. As well as the main retail grocery business, it is also involved in manufacturing, processing, and packaging food for these stores and others.

Salaries and Wages

Wages and salaries are the main forms of payments made to an employee for her/his work or services performed. Salary is a fixed periodical payment paid to an employee for regular labor or services, generally into a bank account, while wages are habitually paid by the day or week for casual work or services that are of a more irregular nature, and are generally paid in cash. However, the terms *wage* and *salary* are generally used interchangeably.

Robert Torrens defines wages as "the articles of wealth which the labourer received in exchange for his labour." Torrens adds that "when the quantity of necessaries and comforts which the labourer receives is large, wages are said to be high; when it is small, they are said to be low."

Pay structures have changed considerably in recent years, with moves away from basic rates to more incentives payments, such as bonuses and fringe benefits such as pension and health contributions. In addition to the basic rate, employees often receive other payments—the most common examples are overtime pay, shift pay, merit, seniority, cost of living allowance, performance-related (such as bonuses), and special additions that are paid to workers during abnormal working circumstances (such as danger).

Minimum Wages

The minimum wage is a statutory and generally legally enforced minimum below which wages are illegal. It was established for the first time in Australia and New Zealand. Minimum wages vary country to country, and also may be restricted to certain industries or limited to workers above a particular age. Most countries have some sort of national minimum wage and it is upgraded periodically.

France introduced the statutory minimum wage with the *salaire minimun interprofessionel garanti* (SMIG) in 1950, and it was designed based on a special survey that identified an hourly rate to cover the basic needs of individual unskilled workers. The SMIG was replaced by the *salaire minimun interprofessionel de croissance* (SMIC), including provisions against inflation, adjustment to the national economic growth, and a national commission composed of equal proportion of government ministers, confederation of employers, and trade union representatives to revise the SMIC annually.

The United States has had a federal minimum wage since the Fair Labor Standards Act (FLSA) in 1938. The FLSA is enforced by the Wage and Hour Division of the U.S. Department of Labor. It establishes minimum wage, overtime pay, recordkeeping, and youth employment standards affecting workers in the private sector and in federal, state, and local governments. According to the latest FLSA signed on May 25, 2007, covered workers are entitled to a minimum wage of not less than \$6.55 per hour effective July 24, 2008, and \$7.25 per hour effective July 24, 2009, to be paid in cash or equivalent. Overtime pay at a rate not less than one and one-half times the regular rate of pay is required after 40 hours of work in a workweek. In the case of the United States, there are two types of coverage:

- Enterprise coverage, in which if a company of more than two employees and a turnover of more than US\$500,000 is covered by the FLSA, then all its employees are entitled to FLSA protections
- Individual coverage, in which even if a company is not covered by the FLSA, individual workers may be entitled to the FLSA protections

There are exceptions to the FLSA in the United States, such as employees working in small-scale construction companies, and small independently owned retail or services businesses.

In economics terms, the minimum wage is a price floor regulation applied to labor markets that makes it illegal to trade a price lower that the set minimum wage. It is widely presented in economics textbooks influenced by George Stigler that if a minimum wage is set above the equilibrium wage, the minimum wage is in conflict with market forces, and it does affect the labor market, and as a consequence, if the minimum wage is increased, employment will decrease.

However, more recent econometric evidence shows that there is no evidence linking an increase in minimum wage and unemployment.

Equal Pay

Equal pay is the principle that the pay for any job should be independent of gender, ethnic origin, religion, age, sexual orientation, or other characteristics; employees are to be free from discrimination in their compensation. Equal pay requires that employees will be given equal pay for work that requires equal skills, effort, and responsibility under similar working conditions in the same establishment. Equal pay for women and men is legally binding and protected with equal pay legislation in countries such as Australia, the United States, and the United Kingdom. Nevertheless, the enforcement of equal pay has been very difficult except when employees have identical employment contracts.

Pay Systems and Pay Practice

Pay has been a key conceptual and analytical human resource (HR) framework, aligned with other HR activities such as recruitment, communication, involvement, work design, and appraisal. In general terms, firms set wages using administered wage policies that emphasize job assignments, seniority, and education. Typically, jobs are rated using job evaluation and analytical schemes and assigned a corresponding wage range. Merit and other performance-related rewards complement the job evaluation. Wages are periodically calibrated to the competition using pay and other market surveys. Nearly universally, wages are nominally downward rigid.

Pay structures are designed to provide internal order and hierarchy of jobs within a specific organization, and provide a clear path for career development. According to Armstrong and Murlis, there are seven different types of pay structures:

1. Graded salary structure, which consists of a series of salary ranges; each of them has a defined maximum and minimum.
2. Individual job range is used where flexibility in response to market pressures or rapid organizational change is required. These are generally used for senior positions or for rapidly growing companies.
3. Progression or pay curves related to competency levels are used when job evaluation and analysis or market rates cannot discriminate between grades. This pay structure links pay to deliverable results with the market rate for specific individuals. It is used mainly in research and development departments.
4. Job family systems are oriented toward market rates for different categories of staff and individual competences.
5. Spot rate is when a specific rate is allocated to a job. Spot rate structures are generally referenced by market rates or by negotiations with trade unions.
6. Pay spine is a type of pay structure that is generally used in the public sector. It consists of a series of incremental point-based scales from the lowest- to the highest-paid jobs within the system.
7. Rate for age scale is an incremental scale in which the pay bracket is linked to the age of the employees in specific jobs. It is considered an out-of-date concept because it contradicts the equal pay principle.

Pay systems are the mechanisms founded on the principles of time and performance. Time-based pay is when employees are paid to work for stipulated periods of time (hourly rate, weekly wage, and annual salary). Performance-based pay is when the pay depends on collective or individual performance linked to a quantifiable and tangible measure such as piecework, commission, individual bonus, profit sharing, individual performance-related pay (IPRP), and employee share ownership schemes.

Rewards management is the process of designing, developing, implementing, and monitoring strategies, policies, and systems for financial and nonfinancial rewards to employees while increasing their motivation and commitment; at the same time being congruent with corporate strategy, values, beliefs, goals, and performance; and anchored in the realities of the labor market in which it operates. The areas in which rewards policies are formulated generally are market rates, flexibility, relationship of rewards to business performance, the level of rewards, equity, performance-related rewards, pay structures, delegation and control, and financial and nonfinancial motivators.

Sales

Businesses rely upon increasing market share, sales revenue, and profit, and the responsibility for maintaining and facilitating this growth and profitability is met by salespeople. A sale is the art of providing a product or service to a customer for a real or perceived monetary value, such that each party recognizes the benefit of the transaction. It is the salesperson's responsibility to maximize the perceived value both to secure the sale and to maximize the profit.

Organizations have evolved through successive stages of market development. Industry in the early 20th century was focused on mass production. At this time, any manufacturer that could provide good-quality goods at a reasonable price could be assured of a sale, predominantly because of the underlying shortage and high demand for the new products. However, businesses that were product oriented had to change to a sales-focused orientation once supply had been met and demand had decreased. A particular trigger point was during the economic Depression of the 1930s. It was during this time that "hard sell" techniques were developed, a practice that still occurs in some industries today.

After World War II, businesses were faced with increased national and international competition in addition to wealthier, more sophisticated, and more demanding consumers. Empowered more recently by digital technologies, the customer's increasingly complex requirements have taken precedence in strategic planning. The sales role has had to evolve to meet these expectations and has done so by combining knowledge from the fields of psychology, communications, and sociology.

Sales Channels

Most organizations sell though parallel channels, some of which involve little or no direct interaction with the customer. Examples include internet and catalog sales where the sales emphasis is either the brand reputation or a low price. Under these circumstances, low price can often be offset by bulk purchase and low fixed costs. Sales situations that may involve some proactive selling include exhibition and retail sales. These generally rely on interested customers selecting the product for purchase with some or no help from the sales assistant. The traditional door-to-door salesperson still exists, but has now largely been replaced by telephone call centers. This traditional "hard sell" approach involves an additional sales challenge in that buyer interest has to be gained within the first few seconds of the telephone call being answered.

Most major organizations will combine some of these sales channels with other direct channels such as sales agents, "missionary" or "new business" salespeople, geographic- (territory) or product-focused salespeople, and key account managers. This ensures that different market segments are targeted according to the frequency and value of orders and each is managed as cost effectively as possible. Other employees such as service engineers, technical support, and customer call center personnel may also be directly or indirectly involved in the sales process even though they may not be identified as part of a sales team. However, each role involves an element of customer interaction and is therefore likely to influence the overall impression of the organization.

Depending on the product or service for sale, sales teams may be focused toward either individual customers in a business-to-consumer (B2C) relationship, or to businesses in a business-to-business (B2B) relationship. The buyer expectations will be different for each scenario and the sales approach will need to reflect this.

B2B sales may be characterized as either transactional, such as the sale of office stationery materials, or consultative, where the salesperson provides added value over an extended timescale, for example, in the sale of manufacturing equipment. A transactional buyer will already be aware of the competitive products' features, benefits, and prices and will be looking for maximal value with minimal administrative effort. A consultative purchase is more likely to require additional information and possibly advice from the salesperson or account manager, particularly if the product or service is complex or expensive. The buyer might also rely on other specialists within his/her organization, and collectively, they would be classed as the decision-making unit (DMU). It is important that the account manager is aware of the composition of the DMU and maintains regular contact with each member. The account manager's role may also demand significant investment of time and resources in complaints handling, but if managed proactively, these will also add value to the relationship and help to secure future business.

The tightest relationship between B2Bs is a strategic alliance or partnership, which is often formed as a result of a previous long-standing consultative relationship. In a strategic alliance, value is added at multiple levels or "touch points" throughout both organizations, but the relationship is managed by a strategic or key account manager. A strategic alliance must provide equal benefit to both organizations and will include more than just sales. For example, confidential information and future budget projections are likely to be shared within the partnership, sometimes resulting in joint product development or service provision.

Salespeople

Salespeople are usually rewarded, in part at least, according to the revenue and/or profitability they generate. This form of financial motivation is known to be particularly effective with young salespeople looking to "make a name" for themselves. There are a number of alternative commission systems; however, most are calculated on three factors: the commission basis, for example, sales revenue or profit; the incremental rate of commission; and the point where commission commences. Thus, a sales agent might be employed with a low guaranteed or base salary and an uncapped steep incremental rate of commission linked to sales achieved over $10,000. A key account manager is more likely to maintain a high level of repeat business and might therefore be given a relatively high basic pay, with financial incentives to successfully conclude certain projects. Typically, sales forecasts are set by the sales manager on the basis of past performance, potential growth, and budget expectations. The achievement of on-target revenue, profit, or numbers of units may result in additional bonuses or awards being given as an added sales incentive. Support personnel such as in-house sales teams and service engineers might be rewarded through team-based commission or bonus systems.

The salesperson requires a wide range of abilities including time management, product knowledge, business knowledge, the ability to sell and communicate, and information technology (IT) skills. These may all be provided with the appropriate training. However, there are also many important personal attributes such as empathy, self-motivation, resilience, integrity, persuasiveness, initiative, and self-confidence that the salesperson must intrinsically have or develop for him-/herself. This combination of attributes is relatively rare and, despite the lure of high rewards, it is common to see a high number of dropouts in the first few months of a sales role.

Sales Processes

The sales process can, however, be taught, even if the experienced sales professional later adapts the process in the light of experience and intuition. The purpose of a sales process is to find a potential customer and negotiate a sale such that both parties are happy with the deal. This is known as a "win-win" situation.

Research has shown that successful selling is associated with asking questions and taking careful notes of the responses, providing relevant information, and where possible, supporting claims with evidence. It is also important to empathize with the customer and wherever possible release tension to make the process as natural as possible. While these tips may be useful, for the new recruit at least, a structured process is also required to maximize the chance of a sale. Fortunately, there are a great many published sales processes and often these form acronyms. A simple model (CAB) reduces the sales process to just three stages: Cognition (awareness), Affect (interest), and Behavior (action). The AIDAS acronym is more detailed and describes the sales process as stages that attract the Attention, Interest, Desire, Action, and Satisfaction. However, the majority of sales processes are based on six stages that guide the trainee salesperson from the first customer interaction through to closing the deal and after-sale follow-up. Throughout any sales process, the salesperson should be looking to differentiate his/her product or service offering by adding perceived or real value to his/her solution. The heaviest time investment should therefore be at the start of the sales process.

Prospecting

In many sales situations such as B2B and nonretail scenarios, the customer first has to be found. This process is called prospecting and will mainly include customers who have not previously bought from the company. New prospects are the lifeblood of any company because they replace those customers who no longer have a need or have taken their business elsewhere. It is also new prospects that guarantee long-term growth because a proportion of these customers may be important buyers in the future.

Prospects may be found by a number of different means. The simplest mechanism for finding prospects is to ask existing customers if they know of any other potential customers. Advertising, direct mail, coupons, and exhibitions will also generate leads or inquiries that can be followed up by the salesperson. The press is a useful source of information, especially when companies are recruiting, because this may identify expansion and potential business. Trade directories, telephone directories, and "bought in" databases also provide a framework for canvassing interest. Cold canvassing also can be performed in busy streets, from door to door, or by telephoning. However, these techniques are not applicable in professional or industrial sales situations where appointments have to be made with buyers.

Once an interest has been established, it requires evaluation or qualification to determine that it is genuine, a budget is available, the time scale is appropriate, and a solution can be provided. This process of qualifying may be performed by a more experienced salesperson rather than the prospector. Once qualified, the new prospect may be reclassified as a lead, and at this stage, the customer is likely to be entered into some form of record system or database.

Sales databases vary in sophistication and scalability, with the most sophisticated systems being integrated into a more comprehensive customer relationship management (CRM) system. CRM systems typically also combine data on campaign management, support services, training, project management, outbound and inbound customer communications, and so forth. These can provide a wealth of information that not only records all the customer interactions with the organization but also provides reporting tools that can help the organization to understand and anticipate customer needs. The sales database contains customer contact details and provides the facility with real-time tracking of leads. Typically, these systems are internet-based and therefore allow for remote working and collation of data across sales teams. Hence, the sales manager can produce up-to-date reports on data such as call rates, lead conversion ratios, likelihood of lead closure, order value, and forecast predictions.

On making the first customer contact, the salesperson should remember the importance of first impressions and aim to project a trustworthy and professional image. The meeting should fully evaluate the customer's needs, with considerations such as purpose, performance specification, size/number/volume, timescale, and price all being discussed. This information is gained through the use of open questions and should be considered carefully as it provides the opportunity for more detailed follow-up or clarification questions. Often, sales can be won or lost at this meeting because the salesperson incorrectly assumes that he/she fully understands the customer's requirements and moves on to the next stage. By doing this, he/she may miss some key features or requirements that other salespeople may identify.

Models such as the SPIN model (Huthwaite) focus on a specific stage in the sales process and subdivide it into a more detailed working framework. The SPIN acronym is a reminder of the sort of questions that salespeople need to ask at the "identifying and developing needs" stage in the sales process. These are Situation, Problem, Implication, and Need payoff questions. This tool is useful in all sales scenarios, but is particularly useful in account management situations where complex needs can be evaluated. Using questions based on this acronym, the buying organization can even be helped by the experienced salesperson in identifying and articulating its own needs.

Presentation, Negotiation, and Closing

Once the customer's needs have been fully established, a presentation of the most appropriate product or service may be made. This provides the salesperson with the opportunity to highlight the unique selling points (USP) of the proposition by explicitly focusing on the customer's stated requirements. These should be presented as benefits to the customer rather than just features. In this way, a potential solution is proposed rather than just a functional product.

The next stage may involve the demonstration of the product to the buyer or the DMU. This is the opportunity for the salesperson to show his/her knowledge, demonstrate the benefits, and generally reduce the "perceived risk" inherent in most purchases. Whenever possible, the DMU should be encouraged to interact with the product as this provides context and familiarity and can also serve as a memory trigger. Demonstrations, however, take time to organize, are time consuming, and can go wrong. Alternatives to demonstrations include "third-party testimony" using satisfied reference customers, or a trial offer possibly as a "sale or return."

Customer objections may come at any stage of the buying process and should be viewed as opportunities to highlight benefits, add value, and to close the deal. The skill of the salesperson is to empathize with the customer and then counter the objections in a positive and helpful way, at the same time overcoming or minimizing their concerns.

Preparation for the negotiation is essential because it will influence the balance of power between the buyer and seller. This power balance is determined by the number and feasibility of alternative options that are available to each party, the "confidential" information that is known about each other's position, the closeness of fit between the requirement and the proposal, and the external pressures on each party to conclude the deal. A salesperson will also be at a relative advantage if he/she is reliably informed about all of the competitor's products, services, and prices, as this provides boundaries for the negotiation. Hence, a noncompetitive technical sale that closely matches the buyer's requirements will put the salesperson in a relatively strong negotiating position.

Both sides in the negotiation will have minimal or "must-have" objectives and ideal or "nice-to-have" objectives. The opening of the negotiation is likely to start at the "nice-to-have" from either the buyer's or seller's perspective. In a negotiation when one side concedes something, it should be traded for something in return. For example, the seller might trade "low cost" but perceived "high value" items, such as training, for higher volumes or guarantees of future business. Experienced salespeople "reluctantly" start negotiating by trading low-value items followed by even-lower-value items, as a large discount or early giveaway immediately devalues the sales proposal. In most negotiating situations, there are many things that can be traded other than price, such as quantity discounts, guarantees of future business, credit terms, delivery times, trade-in values, and so forth. If the negotiation process reaches stalemate, the seller should restate the points of agreement, asking for clarification where necessary and, if required, request "time out" to rethink the strategy.

Closing the sale can occur at any stage with or without a buying signal. There are many closing methods including simply asking for the order, or more subtle approaches such as asking when the customer would like delivery or what color of product they would like. Once the order is placed and the product or service is delivered, it is considered good practice to follow up with the customer to ensure that everything is as expected, thus leaving the door open for future business.

Tendering Processes

Not all sales opportunities fit the typical sales process. Many large contracts are also awarded on the basis of a competitive open tender. These are commonly advertised in the national press or in trade magazines and are also available by subscription through organizations that compile and categorize tender publications. Typically, although not always, tenders originate from the public sector or from major corporations requiring large-value items. The tender process is an expensive one and does not lend itself to lower-value items.

A tender specification document is provided to those who wish to apply, with details regarding the expected format of the reply and the closing date for return. Commonly, the DMU is unknown or unapproachable, so if there was no previous opportunity to influence the tender specifications, the "selling" must be through the retuned document. The tender decision may therefore be based primarily on price rather than value through performance, reliability, reputation, and support. More sophisticated tendering processes require that prospective tender replies are filtered to a smaller number that enter a second round for further detailed questioning and bidding. This process attempts to reduce the number of bids from companies that exaggerate their claims and cannot realistically fulfill the tender requirements.

Laws and Contracts

Regulations are in place to prevent fraudulent and irregular practices through open tendering, the avoidance of corruption, and fairness in bid evaluation. Much of this regulation is to protect the misuse of public sector funds; however, there are also many laws and codes of practice that have come into effect in the last few decades that are designed to protect the consumer. These laws include restrictive trade practices (e.g., collusion), misrepresentation, faulty goods, debt collection, fair trading, unsolicited goods, consumer credit, and cooling-off periods that target not just the seller but also the advertiser. Much of this legislation revolves around the contract of sale.

A contract of sale is legally binding once a deal is agreed on and the terms are accepted. A contract can be verbal or in writing; both are enforceable but detailed written contracts are less likely to lead to a dispute. An important part of the contract are the terms and conditions (T&Cs), which state the circumstances under which the buyer is prepared to purchase and the seller is prepared to sell. T&Cs most commonly cover such things as alterations to orders, warranty conditions, delivery timescale, payment terms, and so forth. International terms of trade are more complex and include the responsibility of the goods in transit from exporter to importer and ownership while on ship (i.e., the bill of lading).

However, a salesperson does not just have to comply with the law, but he/she is also required to conduct business in an ethical manner. A good business relationship is based on trust and the building of value, which means delivering on promises, acting with discretion, not engaging in bribery or other inducements, avoiding the temptation to mislead, and not using undue pressure to conclude a sale. While this may not always be easy to achieve, especially when a salesperson's job or bonus is on the line or the sale is being conducted in an environment where these activities are commonplace, the reputation of both the salesperson and the organization he/she represents relies on it.

Samsung Electronics

Samsung Electronics is a "national" company in South Korea. The company contributes a great deal to the country's growth and is a major provider of semiconductor, television, mobile phone, and other electronic products in world markets. It has put special emphasis on export, local production, and research and development (R&D).

Founded in 1969, Samsung Electronics is the central company in Samsung, the largest Korean family-owned business conglomerate (*chaebol*) from 2001, which has 59 member companies with assets of 144.4 trillion Korean wons (some US$144.4 billion) as of April 2008. Kun-Hee Lee, the second-generation owner and group chairman, has controlled Samsung since 1987 and also led Samsung Electronics as a representative board member and the chief executive officer. In April 2008, however, Lee resigned from all the managerial positions after the prosecutions for succession and corruption scandals, although he remains the owner of Samsung.

In 2007 Samsung Electronics had sales of some $63.2 billion, 81 percent of which occurred in foreign markets. The sales were the largest among those by the 555 large public companies quoted on the Korean Stock Exchange and more than double the second-largest sales by Hyundai Motor. Also, the company made the largest net profit of some $7.4 billion, which was double the second-largest one by POSCO, the steel company. Samsung Electronics's 2007 sales accounted for 7 percent of the country's gross domestic product (GDP) and its foreign sales made up 14 percent of the country's exports. The company was given the $45-billion export award for the first time in the country. Meanwhile, sales generated in 2007 by Samsung Electronics and its 108 domestic and foreign affiliate companies amounted to more than US$100 billion (US$103.4 billion) for the third time in the industry, following Siemens and Hewlett-Packard, and 80 percent of the sales took place in overseas markets.

Samsung Electronics earned three-fourths of the 2007 sales from three products: mobile phones (29 percent), liquid crystal displays (LCD; 23 percent), and semiconductor or memory chips (21 percent), most of these sales (83 percent, 88 percent, and 95 percent, respectively) being foreign sales. The company also produces "digital media" items (such as televisions and computers) and home appliances (refrigerators and washing machines), and exports nearly half of them. To fully serve world markets, Samsung Electronics had organized a worldwide network of 76 subsidiaries and offices in 49 countries by 2007. There are 23 manufacturing subsidiaries in 12 countries (China, India, Malaysia, Mexico, Indonesia, the Philippines, Thailand, Vietnam, Hungary, Slovakia, Brazil, and the United States), 40 selling subsidiaries in 29 countries (seven in China; four in the United States; two each in Germany and the United Kingdom; 11 in Europe, six in Americas, seven in Asia, and one in Africa), and 13 selling offices in 13 countries. These are supervised by the main headquarters in Korea and eight local headquarters in China, India, Singapore, Dubai, Russia, the United Kingdom, Brazil, and the United States. In the world mobile phone market, Samsung Electronics (14 percent share in 2007) and Motorola (14 percent) are neck and neck, following Nokia (39 percent). In LCD, the company (23 percent share) narrowly competes with LG Philips LCD (21 percent) and AUO (19 percent). In memory chip, Samsung has remained the top brand and, in 2006, had 34 percent share for flash memory and 32 percent for dynamic random access memory (DRAM). And in television, the company had the largest shares in 2006–07 and, in the first quarter of 2008, secured more than 20 percent (21 percent) share for the first time in the industries, surpassing Sony (13 percent) and LG Electronics (11 percent).

Samsung Electronics has increasingly spent more money on R&D to improve quality through new technology: 7.3–7.5 percent of sales in 2001–02, 8.1–8.3 percent in 2003–04, and 9.4–9.5 percent in 2005–07 (some US$5.9 billion in 2007). The company registered 17,377 patents in the United States until 2006 and, in 2006, 2,665 patents, the second-largest number among those by the patentees. R&D is carried out by 35 domestic institutes and 10 organizations in seven countries (three in China; two in the United States; five in Japan, India, Israel, Russia, the United Kingdom). Also, the company has made strategic alliances with competitors (including Nokia and Sony) and other market leaders concerning technology, design, marketing, and raw materials.

Samurai Bond

A samurai bond is a yen-denominated debt security that is issued by a non-Japanese company on the Japanese bond market. These bonds enable the issuer to have access to Japanese capital, which can be used either for local investments or to finance existing operations outside Japan. The main advantages of samurai bonds include access to a diversified and deep pool of capital with comparatively lower interest rates. Also, American and European companies that enjoy a certain level of prominence usually have a relatively easy time in raising capital through samurai bonds. Unfortunately, there are continued concerns in the United States about the taxation of these securities, as well as grave concerns relating to the complexity of emitting these bonds that have progressively slowed use of this financial debt tool.

Samurai bonds were formally created in 1970; at the time, only governmental entities could issue them, but this privilege was later extended to large "blue chip" corporations in 1978. The bonds are subject to Japanese regulations and are akin to Yankee bonds in the United States (which are bonds traded in the U.S. foreign bond market). Recent trends have shown an increase in the issuance of samurai bonds; in 2007, issuances tripled to ¥2.2 trillion from ¥741 billion in 2006, but this is expected to be considerably lower from 2008 onward.

Historically, corporations from the United States have been the major issuers in the samurai market. This is mainly because of their high name recognition in Japan and elevated credit ratings. A credit rating of at least A is required to emit bonds on the Japanese market. In recent years, there have been pools of issuers that included companies from Europe, South Korea, Thailand, Australia, and New Zealand, but these are a minor fraction of the current market.

While samurai bonds were originally intended to create an opportunity for foreign companies so that they could raise money for their operations in Japan, many of the funds raised are now immediately converted into other currencies and exit the Japanese capital market to finance international operations.

Advantages and Disadvantages

Samurai bonds have the following advantages. Because they are issued in Japan, it is easy for Japanese institutional investors to invest in them. Also, samurai bonds do not have to be left in the custody of securities companies or other institutions. Japan possesses a large capital market and offers a deep pool of debt capital. Hence, it is an interesting market for larger companies seeking to diversify sources of funding. Also, companies usually find that interest rates are lower in Japan, so foreign companies find it advantageous to emit bonds in this market. As for Japanese institutional investors, foreign firms are very popular because of their high name recognition and good investment rating; as many of these funds are very conservative, they prefer to invest in larger companies with international presence.

The Japanese debt market is partially insulated from the world debt markets and is not always subject to the same variation and influences. It is resistant to outside phenomena, such as the U.S. subprime rout of 2007–08. Hence, it is not subject to the same variations and market swings as the U.S. and European markets, giving companies an alternative financing source during economic downturns. Nonetheless, high taxation and an uncertain fiscal environment related to samurai bonds is a strong deterrent to widespread usage. Continued changes in how the U.S. Internal Revenue Service (IRS) taxes these bonds has considerably shifted usage from U.S. companies. In the past, 60 to 80 percent of the samurai bond market was driven by U.S. firms. Although there are some arrangements to circumvent taxation, they were due to lapse at the end of 2008. Even if both countries continue to negotiate to further harmonize taxation, the lack of a constant policy remains a serious concern of U.S.-based companies.

Also, companies that have issued samurai bonds have found that there are high administrative burdens placed upon issuing companies, and there is a lack of flexibility in the choice of terms and conditions of issuance that create restrictive elements for usage of these bonds. Concurrently, easier issuing procedures and lighter taxation in the European markets (which offer a similar debt security environment) have made the Japanese bond market far less attractive to issuers, and it continues to grow slowly.

S&P 500 Index

The S&P 500 Index or the Standard & Poor's 500 Stocks Composite Index is a market value–weighted index of 500 leading U.S. large market capitalization or large cap stocks. The S&P 500 Index is widely regarded as the principal indicator of overall stock market activity in the United States and commonly serves as a proxy for the entire U.S. equity market. The S&P 500 evolved in various stages from 26 original industrial indices comprised of 233 stocks that were first developed by Standard & Poor's Corporation in 1923 to 416 stocks representing 72 industrial indices in 1941. The sample of stocks was increased from 416 to 500 in 1957 to create the S&P 500. Initially, three broad economic sectors were included in the index: 425 industrial companies, 60 utilities, and 15 railroads. In 1976 the index was revised to include some NASDAQ-listed companies, primarily insurance companies and commercial banks, resulting in an index composed of 400 industrial companies, 40 utilities, 40 financial companies, and 20 transportation companies. In 1988 the number of economic sectors represented in the index was expanded to become more representative of the U.S. economy. In May 2008 the economic sector breakdown of the index, based on the Global Industry Classification System (GICS), which includes 10 economic sectors, was as follows: Financials (92 companies); Consumer Discretionary (86); Information Technology (71); Industrials (56); Health Care (51); Consumer Staples (40); Energy (36); Utilities (31); Materials (28); and Telecommunication Services (9). In May 2008, 423 of the 500 stocks in the index were listed on the New York Stock Exchange, representing 84.1 percent of the index's market capitalization. The remaining 77 firms were listed on the NASDAQ.

An eight-member S&P Index Committee comprised of Standard & Poor's staff meets monthly to maintain the index and consider additions and removals of constituent companies according to published criteria. Eligibility criteria for a company's selection to the index include: (1) market capitalization of US$5 billion or more; (2) market liquidity for its shares as evidenced by a ratio of annual share turnover to market capitalization of 0.3 or more; (3) U.S. incorporation or otherwise considered a U.S. company; (4) public float, or shares available for trading, of at least one-half of shares outstanding; (5) contribution to the index's economic sector balance based on GICS, which includes not only 10 economic sectors, but also 24 industry groups, 67 industries, and 147 subindustries; (6) financial viability, commonly measured as four consecutive quarters of profitability; (7) publicly traded for 6 to 12 months; and (8) an operating company as opposed to, for example, a holding company or investment vehicle. Companies can be deleted from the index for failure to meet the above eligibility criteria, including violations that result from corporate restructuring.

As a value-weighted index, the S&P 500 Index is calculated by (1) multiplying each stock share's current price by the number of float-adjusted shares outstanding or shares outstanding that are available to investors; (2) summing each of these 500 products based on current share prices; (3) then multiplying each stock share's base price in the base period by the number of outstanding shares in the base period; (4)

summing each of these 500 products from the base period; (5) dividing the sum of the 500 products based on current share prices by the sum of the 500 products in the base period; and (6) multiplying this result by the beginning index value or base value, which in the calculation of the S&P 500 Index is 10. The S&P 500 uses a base period dated from 1941 to 1943. Should a company have multiple classes of stock, S&P uses only one of them, commonly the most liquid class, in its calculation of the index. Changes to the index are made when needed and are announced two to five days before their implementation.

Researchers have discovered that a company's inclusion in the S&P 500 results in positive abnormal returns on the stock. Among the explanations for this phenomenon are new demand pressures from large block orders for the stock, improved liquidity in the market for the stock as the result of increased institutional investor ownership, increased monitoring of the firm leading to improved operating performance, and increased investor awareness about the stock as a result of its inclusion in the index.

The S&P 500 Index is widely used as benchmark for performance for fund and portfolio managers, individual investors, and financial analysts. "Beating the market" commonly is a reference to earning returns exceeding those reported by the S&P 500 in any given time period. Fund and portfolio managers' performance in the equity markets for any period is often measured in comparison to the return in the equivalent period on the S&P 500 Index. The return on the S&P 500 Index often serves as the proxy for the return on the overall U.S. equity market in the determination of individual firms' cost of equity capital in capital budgeting and firm valuation calculations. Equity and credit analysts rely upon financial ratios calculated for the S&P 500 Index or its constituent economic sectors as a basis on which to compare and assess individual companies' performance.

The S&P 500 Index also serves as one of 10 leading economic indicators released monthly by the Conference Board. The rationale for its inclusion is that as a broad measure of U.S. equity markets, it reflects both investor beliefs and interest rate movements, which are viewed as future economic activity indicators.

Sanofi Aventis

Sanofi Aventis is one of the world's leading pharmaceutical companies. It is headquartered in France and ranks as the number one pharmaceutical company in the European market. As a result of more than 100 years of accumulated experience in the pharmaceutical industry (through its two legacy companies, Sanofi-Synthelabo and Aventis), the firm is active in many medical disciplines and its business includes two main activities: pharmaceuticals and human vaccines through Sanofi Pasteur. In their pharmaceutical activity, major therapeutic areas include cardiovascular, thrombosis, metabolic disorders, oncology, central nervous system, and internal medicine. It is a major employer with approximately 100,000 employees worldwide and an impressive sales force of 35,000 medical visitors. It is also present in 100 countries throughout five continents, but its products can be found in more than 170 countries through local distributors.

Performance features include consolidated sales of approximately €25 billion, whereas more than €4 billion dedicated to research and development promises further growth. A manifestation of the firm's commitment to research and development is the establishment of 30 research centers that can be found in the French regions of Toulouse or Vitry/Alfortville, in other European countries such as Germany, the

United Kingdom, and Italy, and in countries such as the United States and Japan. Manufacturing of products is equally dispersed geographically, since 72 industrial sites of the firm can be found in such countries as France, Hungary, Italy, Germany, or the United States, whereas more can be found in Canada, China, Thailand, or Argentina (for the operations of Sanofi Pasteur). Last but not least, the firm enjoys a 5.3 percent market share in the global pharmaceutical industry with countries such as the United States (33.8 percent of net sales), France, Germany, Italy, and Japan generating most net sales.

Primary customers include wholesale drug distributors, independent and chain retail drug outlets, hospitals, clinics, managed care organizations, and government institutions. In order to reach these distribution channels, the company is dependent upon its medical sales representatives who assist health practitioners' work by providing updated information on drugs and their properties. Promotional channels include a variety of advertising, public relations, and promotional tools such as advertisements in medical journals and active presence at major medical congresses. In some countries, traditional, massive promotional channels such as television, newspapers, and radio are also used in order to promote brands directly to patients (primarily with regard to OTC healthcare products).

A major means Sanofi Aventis uses to market its top-selling brands is the use of strategic alliances with other firms such as Bristol-Myers Squibb, Procter & Gamble, and Teva Pharmaceutical Industries. The alliance agreements include marketing and financial arrangements that vary depending on the country in which products are marketed. Options include co-marketing the products independently under each one's own brand names, exclusive marketing, or co-promotion under a single brand name. Such a strategic marketing decision may offer commensurate benefits such as expanded distribution network and extended promotional coverage but is also subject to several risks. For example, the firm cannot ensure that collaborating partners will perform as expected with regard to operational management or promotion of own brands instead of promoting co-marketed brands. Additional risks the firm faces that potentially can be turned into dangers include the high levels of uncertainty of its investment in research and development (since the turnover may not counterbalance accumulated costs), its over reliance on the U.S. market, its dependence on third parties for the manufacture and supply of a substantial portion of raw materials and specialized components, and the problem of counterfeit products.

However, in the challenging market of pharmaceuticals, the major threat stems from the changing competitive environment, which is partly due to the multiplicity of laws regulating the healthcare environment and the number of sophisticated players active in the market. There is a constant need for product innovation, expansion of the product portfolio, and an extended presence in all geographical areas of the world for the company to sustain further profitable growth and stay ahead of competitors. Major competitive forces include the ever-increasing competition for research and development of new patented products and new therapeutic conditions and competition between generic products. In this respect, major competitors of Sanofi Aventis include Abbot, Astra Zeneca, Eli Lilly, GlaxoSmithKline, Merck & Co., and Novartis. The future will show which of these firms will optimally co-align its competencies and resources with these environmental contingencies and maintain a sustainable position in the global pharmaceutical industry.

Sarbanes-Oxley

On July 30, 2002, President George W. Bush signed the Sarbanes-Oxley Act (SOX) into law. SOX and the regulations passed by the Securities and Exchange Commission (SEC) pursuant to its mandate are the most dramatic and wide-ranging rules to apply to U.S. public companies since passage of New Deal–era financial legislation. SOX was passed in response to several corporate governance scandals involving improper financial reporting at U.S. companies such as Enron and Worldcom and remains a controversial piece of legislation.

All companies publicly raising funds in the United States must comply with SOX, whether the company is based in or does business in the United States. SOX seeks to increase the monitoring of U.S. public company managers by parties such as directors, auditors, and attorneys. SOX requires each director on the board's audit committee to be independent, which means that the director can provide no other services to the company and cannot receive fees other than for serving as a director. SOX also requires the audit committee to include a financial expert. In addition, the New York Stock Exchange (NYSE) and the NASDAQ stock market, in response to SOX and a request by the SEC to review their corporate governance requirements for listed companies, enacted rules requiring a majority of the directors on a board to be independent.

SOX also prohibits external auditors from providing any nonaudit services to issuers and prohibits lead auditor partners from providing services to the same company for more than five years. SOX established the Public Company Accounting Oversight Board (PCAOB), which is responsible for overseeing, investigating, and disciplining auditors. The PCAOB also took over the role of promulgating auditing standards for external audits of public companies from the American Institute of Certified Public Accountants.

SOX imposed new duties on company managers to improve the financial reporting process. Section 404 of SOX mandates that managers maintain, evaluate, and report on internal control over financial reporting. Internal control is a system to provide reasonable assurance to investors that a company's financial statements are reliable and comply with generally accepted accounting principles. Pursuant to Section 404, managers are responsible for completing an annual report about internal control that discloses any material weaknesses. An outside auditor must also provide an independent evaluation of management's assessment of internal control.

Under SOX, top managers have a particularly heightened responsibility regarding internal control and financial reporting. SOX requires the chief executive and chief financial officers to annually certify the truth of the company's financial and nonfinancial disclosures and publicly disclose any significant changes in internal controls. SOX also requires attorneys working for the company to report any violations of securities laws or breach of fiduciary duty up through the corporate hierarchy. In addition, SOX increased criminal liability for violations of the federal securities laws, enabled the SEC to prohibit persons from serving as directors and officers if they are found "unfit" to serve, and prohibited companies from making loans to directors or executive officers. The SEC also implemented regulations pursuant to SOX to reduce potential conflicts of interest between securities analysts, who provide third-party research about companies, and their employers, who may have investment banking or other relationships with the same companies.

Impact

The reaction to SOX was swift and is ongoing. What is indisputable is that the direct costs of complying with SOX have been substantial and that the burdens are the greatest for smaller public companies. According to Financial Executives International, in 2007 U.S. public companies spent an estimated average of $1.7 million and 11,000 man-hours complying with Section 404 alone. Supporters of SOX argue that despite its compliance costs, the law was necessary to improve financial reporting, restore investors' confidence in American capital markets, and prevent the types of abuses that occurred at companies such as Enron and Worldcom, which could be more costly in the long run.

Critics of SOX have raised several objections. They point out that SOX was rushed through Congress with little deliberation and that it improperly increases the role of federal corporate governance mandates at the expense of flexible rules from the states. Controversy over SOX has also centered on whether the law's "one-size-fits-all" prescriptions can universally improve governance given the diverse characteristics of U.S. public companies and whether SOX decreased the competitiveness of U.S. capital markets.

Evidence of public companies increasingly going private, staying private, or choosing to publicly list and raise capital in non-U.S. jurisdictions may indicate that

SOX imposes more costs than benefits. Evidence that the U.S. cross-listing premium (the additional amount investors are willing to pay for public companies governed by U.S. law) has decreased post-SOX, at least for some types of companies, suggests that SOX made U.S. financial regulation less valuable. However, U.S. capital markets were already losing their competitive edge as non-U.S. jurisdictions have continued to develop, making the exact impact of SOX difficult to isolate. Some also argue that even if SOX made U.S. markets less attractive, it did so only for poorly governed firms.

The events leading up to SOX and its fallout undoubtedly increased global attention to corporate governance issues. Several nations such as Japan and Germany modeled reforms after SOX, while the United Kingdom (UK) took steps to prevent SOX from applying to UK-listed firms.

Saudi Arabia

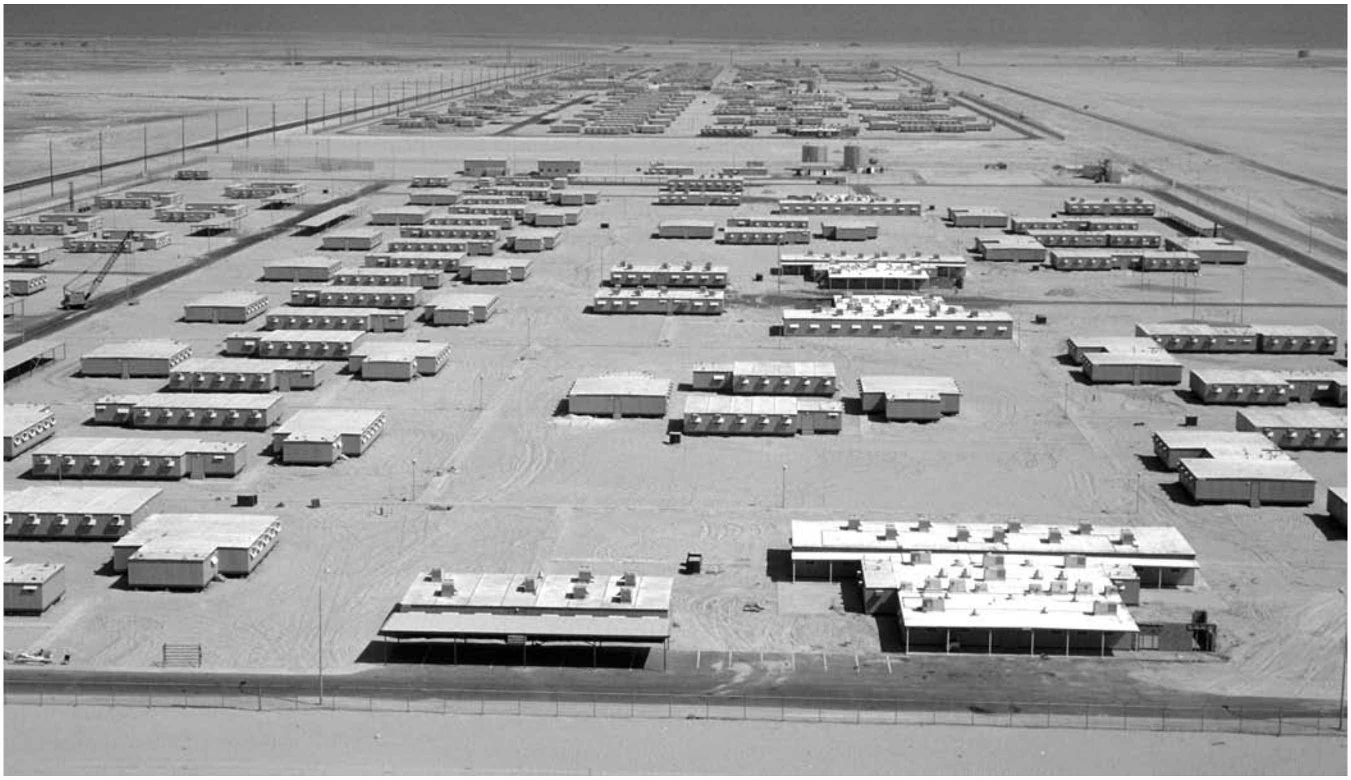
The Kingdom of Saudi Arabia is in southwestern Asia and occupies about four-fifths of the Arabian Peninsula, covering a land area of 2.24 million sq. km., and having a population of 24.7 million. The per capita income of US$11,770 is high compared to global standards.

As the world's largest oil producer, Saudi Arabia is riding a wave of prosperity buoyed by record-high crude prices. With the windfall that fills its national coffers, Saudi Arabia has paid off debts and driven economic growth to its fastest pace for nearly three decades. Saudi Arabia now has a free market economy with liberal trade policies. There are no exchange restrictions except items such as pork and alcohol that are banned because of religious restrictions. The reform process, initiated in 1998, aimed at privatization of some of the biggest companies, tackling unemployment, modernizing financial markets, and attracting more foreign investments.

The economic development is based on five-year development plans that started in 1970. The current economic policies are based on utilizing the oil profits for infrastructure and human resource development. Economic diversification is being attempted to move the country away from excessive dependence on oil and gas. There is emphasis on stronger private sector participation. Within, there are efforts to create a more balanced economy with all-round regional economic development in this geographically vast country.

The Saudi Arabian budget for fiscal year 2008 was the largest in its economic history. The salient feature of the budget was the government's continued commitment to increase spending to support development programs while adhering to fiscal prudence in an environment characterized by rising inflation, high monetary supply, and robust oil revenues. Long-term infrastructure was the cornerstone of the budget. With expenditures estimated at US$109.3 billion and revenues of US$120 billion, the resulting budget surplus is US$10.6 billion.

Saudi Arabia is a member of several international and regional organizations such as the United Nations (UN), World Trade Organization (WTO), International Monetary Fund (IMF), International Atomic Energy Agency (IAEA), Organization of Petroleum



Saudi Arabia brings in an estimated 6 million expatriate workers to staff its industrial facilities, such as this massive processing complex in the desert, and to fill low-level positions throughout the country.

Exporting Countries (OPEC), and Gulf Cooperation Council (GCC). It is also a signatory to many international agreements. In a milestone in its economic history, Saudi Arabia joined the WTO in 2005, initiating a process of aligning itself more closely with the global economy. In the process of preparing for membership to the WTO, Saudi Arabia enacted 42 new trade-related laws, created nine new regulatory bodies, and signed 38 bilateral trade agreements over a period of 12 years.

The currency of Saudi Arabia is Saudi riyals, 1 riyal being divided into 100 halalas. The exchange rate of the riyal has been pegged to the U.S. dollar since 1986 at the rate of 3.75 riyals to US$1. The official calendar of Saudi Arabia is the Islamic *Hijrah* calendar. The weekly holidays are observed on Thursdays and Fridays. The official language of Saudi Arabia is Arabic. English is widely understood in business circles. The legal system is based on the sharia and on royal decrees promulgated by the Council of Ministers known as the *Majlis Shoura*. There is free education and healthcare for citizens.

The central bank is called the Saudi Arabian Monetary Agency, which deals with monetary policy and currency. The stock exchanges use a trading system called *Tadawul* for real-time trading, clearing, and settlement of shares through electronic order routing. The International Finance Corporation includes the Saudi Share Market index in the emerging stock markets database. The Saudi Securities and Exchange Commission protects investors' interests and implements orderly securities dealing to regulate and develop capital markets.

Among the prominent industries existing in Saudi Arabia are the petroleum and gas reserves, petrochemicals, plastics, packaging, mining, food processing, power generation and transmission, construction and building products, healthcare, transportation, water treatment and desalination, agriculture, and travel and tourism. There is a growing information and communication technology, and telecommunications industry.

Saudi Arabia adopts a policy of *Saudization* that favors companies with local participation in investments, majority local holdings, and training and employment of locals. It should be noted that Saudi Arabia hosts a large number of expatriate workers estimated to be about 6 million. At the same time, unemployment among local youth is high, creating an anomalous situation. This happens because of various reasons, including the poor skill levels, reluctance to take lower-end jobs, and high expectations of locals. On the other hand, there is ample availability of a cheap, skilled expatriate workforce.

The economic challenges facing Saudi Arabia include unemployment and dependence on migrant labor, inequity in distribution of wealth, lack of investment in social and physical infrastructure, burgeoning population, aquifer depletion, and lack of long-term planning. As well as increasing liberalization, there is a need for broader labor reforms and continual investments in education, skill development, health, and social welfare.

Scenario Analysis

Scenario analysis attempts to capture the nonlinearity, complexity, and unpredictability of turbulent environments by incorporating techniques for eliciting and aggregating group judgments, specifically through Delphi techniques and cross-impact matrices. The Delphi technique involves asking an anonymous panel of experts to estimate individually the probability that certain events will occur in the future. The panel members have several opportunities to revise their initial estimates. They look at the anonymous responses from other experts on the panel to gauge how much their individual estimates deviate from other estimates. While Delphi forecasting can be described as constrained guesswork, its probability estimates are statistically sound because panelists selected are experts in their respective fields. Cross-impact analysis (CIA) is a complex technique sometimes performed by hand, as in the procedure pioneered by General Electric (GE), and increasingly by computer. Its output is a matrix showing the favorable or unfavorable interaction of likely developments generated earlier by the Delphi panel.

The origin of scenario analysis is claimed by theorists from many countries. Nicholas C. Georgantzas and William Acar attest that scenarios were introduced to planning literature by Herman Kahn who worked on military scenarios for the U.S. government in the 1950s. In the 1960s H. Ozbekhan of the Wharton School (of the University of Pennsylvania) used scenarios in an urban planning project for Paris, France. Pierre Wack asserts that it was a group of strategic planners at Royal Dutch Shell who came up with the idea of using scenario analysis for strategic planning in the 1970s.

Ansoff and other strategy theorists state that the 1970s witnessed the transformation of product markets into a global perspective. Changes in the external sociopolitical environment became pivotal in strategy making. Environmental challenges, many of them novel, also became progressively numerous. Combined with the geographical expansion of markets, they increased the complexity of managerial work. They rendered the managerial capability developed during the 1960s inadequate. Today, environmental challenges are developing progressively faster. Their novelty, complexity, and speed have increased the likelihood of strategic surprises.

Often regarded as the father of scenario analysis, Herman Kahn's method underlies the type of "systems analysis" represented in *On Thermonuclear War*, although it became more explicit as a methodology in Kahn's later futurological research, embodied in his book with Anthony Wiener published in 1967, *The Year 2000*.

For Kahn, scenarios were hypothetical sequences of events constructed for the purpose of focusing attention on causal processes and decision-points. They are designed to answer two kinds of questions: (1) How might some hypothetical situation come about, step by step? and (2) What alternatives exist, for each actor, at each step, for preventing, diverting, or facilitating the process? Kahn used scenarios to understand the alternative worlds represented by the year 2000. His method involved the sequence of steps described below.

The analyst first identifies what he/she takes to be the set of basic long-term trends. These trends are then extrapolated into the future, taking account of any theoretical or empirical knowledge that might impinge on such extrapolations. The result is called the surprise-free scenario. The surprise-free scenario becomes the base from which variations on the scenario or alternative futures are derived by varying key parameters in the surprise-free scenario. Kahn made no claim that scenarios were predictive. Instead, he was adamant that no one scenario is more probable than the other. The Kahnian approach was taken in 2002 by the Hudson Institute to investigate the possible impact on business of consumer fears post-9/11.

The value of scenarios for planners comes from a feeling of greater preparedness and flexibility in the face of high-velocity environments, as well as the "a ha!" moments created by combining key parameters from the surprise-free scenario that might be counterintuitive. Three examples provided below are drawn from the classic experience of Royal Dutch Shell and GE in writing scenarios for strategic planning purposes, and the scenarios generated by Peter Drucker to understand the impact of balance of payments deficits on national and world economies.

Examples

The team of Pierre Wack, Ted Newland, and Napier Collyns became critical to the success of scenario-driven planning at the Royal Dutch Shell group of companies. During the 1972 energy crisis, only Shell was ready for the change among oil firms. The firm's executives and managers responded together and responded fast, changing Shell's strategic posture as well as the company's market results. Formerly one of the weaker of the seven oil majors, Shell had become second only to Exxon in size and first in profits. Shell's senior planners were no longer concerned about forecasting, but now focused on liberating management insight and inspiring a long-term view through scenario-driven planning. Scenario-driven planning enables managers to reperceive a strategic issue and to discern their assumptions about the issue so that they can improve decision quality. Shell's scenario experience produced both promising results and methodological innovations. Betty Flowers, editor of global scenarios for Shell, describes a recent scenario development round for Shell called Geographies of Connection, a frame of reference through which managers explore a scenario from one of four positions: how people are connected globally; how nations are connected; how the globally connected edges of nations are connected to their own heartlands; and how we are connected to the earth through our environmental policies and practices.

Beginning in the 1960s, GE drew together into a single framework a variety of forecasting tools including Delphi expert panel to detect critical variables and indicators, as well as trend-impact and cross-impact analyses to assess the implications of the interactions among variables and indicators. The output of these techniques was used to develop probable future scenarios. GE's procedure entails an initial determination of the key trends by the planning analysts, followed by constrained expert guesswork by one or several panels of outside experts. Cross-impact analysis follows. Its output is a matrix showing the favorable or unfavorable interaction of likely developments generated earlier by the Delphi panel.

While the Kahnian, Shell, and GE scenarios were strategic in intent, the last example here, the Drucker scenarios, represents a macro-level environmental scenario exercise. Although Drucker introduced his scenarios in the 1980s, the environmental scenarios have increasingly become an input to the computation of strategic scenarios and represent one of the few ways strategic managers can account for the overriding, pervasive issues of business and the economy.

In addressing a world economy composed of the "real" economy of goods and services and the "symbolic" economy of money, Drucker considered a total of five environmental scenarios based on the outcome of continuing overall budget and trade deficits and the impact of deficits on investor (including foreign investor) confidence.

Scheduling

Scheduling is the allocation of resources over time to perform a collection of tasks, while taking all constraints into account, so that input demands are met in a timely and cost-effective manner. Most typically, this involves determining a set of activity start and end times, together with resource assignments, which satisfy all temporal constraints on activity execution, satisfy resource capacity constraints, and optimize some set of performance objectives to the extent possible. The result of scheduling is a schedule, which can be defined as a plan with reference to the sequence of and time allocated for each item or operation necessary to its completion. For example, time is the scarcest resource and scheduling could help us making the most of a limited amount of time. Effective scheduling can lead to due date performance that results in meeting the company's customer service goals, and reducing work in process inventories and production lead times.

Scheduling has been primarily studied from a mathematical point of view in a discipline called operations research. In the last 40 years, operations research has produced over 20,000 publications about scheduling problems. From this body of research, we now understand that it is often difficult to make a single schedule for the whole task system of an organization. Therefore, the task systems are often decomposed into a hierarchically organized planning and control structure to reduce the complexity of the scheduling problem. This approach is also known as hierarchical production planning (HPP), which is characterized by detailed, direct, restricted, and sustained control on the tasks, available materials, and capacity. Besides HPP, some other useful scheduling tools include the Gantt chart, Excel, heuristics, constraint programming, (integer) linear programming, and Advanced Planning System.

There are three general models in scheduling: time-line model, order-centric model, and resource-centric model. A time-line model slices time and duration for each task, using the greatest common divisor of the activities' duration as a base. It is generally used when a resource can be described in simple terms. An order-centric model studies a chain of activities per order by assigning resources to these activities. It considers three constraints: the supplier/consumer dependencies, the resource constraints, and the transition constraints. It is generally used for an order-driven production with a small number of alternatives and simple resource constraints. A resource-centric model deals with a sequence of activities per resource, with the focus on "what the resource can process" rather than "how to satisfy the order." It is generally used when the resource constraints are complex, with nonordered production.

The classic view on scheduling is to treat it as a problem-solving activity, that is, given problem constraints and objective criteria, scheduling is to figure out how to best cover the capacity over time surface with operations. The research goal of the classic view is to specify new problems and provide new optimum solutions. However, current researchers realized that practical problems can rarely be formulated as static optimization tasks. In reality, scheduling is an ongoing iterative process situated in a larger problem-solving context in a dynamic, unpredictable environment. Thus, scheduling is an ongoing process of responding to change. Based on this observation, the research goal of the modern view is to build schedules that retain flexibility and promote localized recovery with incremental rescheduling techniques and self-scheduling control systems.

In practice, scheduling is tightly coupled with an individual, that is, the scheduler. Although there is a large variety in responsibilities and roles that are fulfilled by schedulers, it is possible to mention some common characteristics. Often, a scheduler is someone who almost naturally assumes responsibility for the progress and timeliness of tasks, regardless of formal responsibilities. This feeling of being responsible is strengthened by the fact that the scheduler is an essential source of information for many colleagues, customers, and suppliers. Usually, only a small portion of the time of the scheduler is spent on constructing an initial schedule, whereas a large portion of the time is spent on monitoring the execution of the schedule. The aim of the monitoring activities is to identify problems, which are often solved by the scheduler, using a variety of skills such as communication, negotiation, and intuition. Schedulers also try to anticipate possible problems, with varying success. Thus, many practitioners in operations management are convinced of the fact that manual scheduling is to a great extent subject to improvement.

Schwartz Value Theory

Schwartz's value theory originated in the psychology literature and has now been used in business research as well. Based on data collected in the 1980s and 1990s from 60,000 respondents in 64 countries, Shalom H. Schwartz identified 57 items that represented 10 value types on an individual level and seven value orientations on the cultural level. The Schwartz Value Survey (SVS) avoided ethnocentric cultural bias by including questions from all world religions and all areas of the globe, including Africa and Asia.

The SVS questionnaire consists of three parts: two value lists and one list of demographic questions. The 57 value-list items are rated on how important they are for the respondent as a guiding principle in life on a scale between "0" (not at all important) and "6" (very important). Additionally, outstanding values, which are either opposed to the respondent's principles or which are regarded "of supreme importance," are scored as -1 and 7 respectively on the scale.

The basis for the value theory is that values direct people's individual choices and can be ranked in the order of importance. The 10 motivationally distinct values can be further organized around two bipolar dimensions: openness to change versus conservation and self-transcendence versus self-enhancement. This illustrates that the goals are in conflict with each other, e.g., individual versus collective goals. The 10 dimensions are defined as follows:

- Power: attainment of social status and prestige, and the control or dominance over people and resources
- Achievement: demonstrated competence in terms of what is valued by the system or organization in which the individual is located
- Hedonism: pleasure or sensuous gratification for oneself. It is derived from physical needs and the pleasure associated with satisfying them
- Stimulation: excitement, novelty, and challenge in life. Thrill seeking can be a result of strong stimulation needs
- Self-direction: independent thought and action in choosing, creating, and exploring. It comes from a need for autonomy and independence
- Universalism: understanding, appreciation, tolerance, and protection of the welfare for all people and for nature
- Benevolence: preserve and enhance the welfare of people with whom one is in frequent personal contact
- Tradition: respect, commitment, and acceptance of the customs and ideas that one's culture or religion imposes on the individual
- Conformity: restraint of action, inclinations, and impulses likely to upset or harm others and violate social expectations and norms
- Security: safety, harmony, and stability of society or relationships, and of self

Based on the above individual level values, Schwartz further identified three polar dimensions of culture:

- Conservatism (Embeddedness) versus Autonomy: The former emphasizes social relationships and tradition, while the later implies finding meaning in one's own uniqueness and being encouraged to express one's attributes. Autonomy can further be of two types: intellectual (self-direction, creativity) or affective (pursuit of stimulation and hedonism).
- Hierarchy versus Egalitarianism: legitimacy of hierarchical role and resource allocation versus transcendence of self interests and promoting others' welfare.
- Mastery versus Harmony: mastering the social environment via self-assertion (success, ambition) versus being "at peace" with nature and society. Organizations are viewed as a part of the broader social system.

There appears to be a slight overlap between Schwartz's typology and that of Hofstede. The "autonomy" in Schwartz's model appears to be synonymous with the individualism/collectivism dimension of Hofstede, whereas "hierarchy" is close to Hofstede's power distance. "Mastery" is similar to masculinity in that both emphasize goal achievement. "Harmony" and uncertainty avoidance are fairly close, and finally Schwartz demonstrated strong positive correlation between "egalitarianism" and femininity.

Sea Piracy

Crime in the form of sea piracy is on the rise in the 21st century. A steady flow of reports in commercial journals and newspapers has reflected the increasing incidents of piracy that are burdening merchant fleets and their corporations and threatening sea resources and ecologies. Estimates of losses to piracy and maritime fraud run as high as $16 billion a year. Pirates regularly attack or attempt to board oil tankers, along with a great variety of ships, in the Malacca Strait, in the South China Sea, off the east coast of Brazil, and along the east coast of Africa, especially Somalia. Reports of other attacks include locations on the coasts of India, Bangladesh, West Africa, Haiti, Jamaica, Peru, in the Gulf of Aden, and in the Caribbean. The pirate attacks on the cruise ship *Seabourn Spirit* off the coast of Somalia in November 2005 and a French luxury yacht in 2008, as well as the Maersk cargo ship in April 2009 are reminders that no type of seagoing vessel is immune to pirates.

There are four common strategies in pirate attacks. The first involves simple theft at sea, whereby pirates board and rob the vessel and its crew, then depart with their loot, much like a typical land robbery. A second approach is to kidnap crew or passengers and hold them for ransom. A third targets the cargo in the ship's

A U.S. Navy officer watches as a U.S. helicopter surveils a cargo ship filled with Ukrainian T-72 tanks that was being held by pirates off the coast of Somalia on September 30, 2008.

hold. This may involve holding the vessel for some time while the cargo is off-loaded or transferred to another ship. The fourth is to steal the ship itself. Vessels are given new names and flags, then either sold or used to hijack cargo from unsuspecting shippers.

Among critical pirate targets have been the oil and gas tankers that form the lifeline for Japan and other east Asian states, aid vessels carrying grain and supplies in relief missions, and increasingly, cruise and other passenger ships and sailing vessels.

There are a variety of costs to this resurgence of sea crime. First, there is the human toll. Crews are killed, passengers and resort patrons have been raped and robbed, and many people have been injured. In other cases, the crews simply disappear. Second, and at a more mundane level, employees are lost. Businesses have to replace, train, and give experience to new crew members. Third, sea piracy insurance, covering crew for injuries and with compensation for families, is an increasing burden as the number of incidents rises and the abilities of pirates to attack more and larger ships in more diverse settings grow. Insurance is now more often required and the premiums are rising. Fourth, there are losses of both carriers and their cargo. Cargo, including oil, is often taken and sold in black markets that are rampant in the South China Sea region. Everything from toys to television sets to cars to packaged homes can be bought on the black market and in coastal towns in Asia and Africa. Fifth, pirates also attack pleasure boats, killing or kidnapping crew and passengers and discouraging this form of tourism. This has become a particular problem as the pirates have begun to merge with terrorist groups in southeast Asia and the Middle East.

The most critical piracy problems today are the strategic ones. These include the interruption of oil and natural gas supply lines, the disruption of food supplies, and the possible destruction of a major port facility if a hijacked oil tanker were to be exploded by terrorists.

Sears Holdings

Sears Holdings (Sears Holdings Corporation) is a retailing chain operating in the United States and Canada through its subsidiaries. As the parent company, Sears Holdings operates Kmart and Sears Domestic specialty retail stores (in the United States) and Sears Canada specialty retail stores. Sears Holdings was incorporated in 1916 and now employs around 330,000 people (as of January 1, 2008). Sears Holdings is an Illinois-based company, formed by the merger of Kmart Holding Corporation and Sears, Roebuck and Company in 2005. Its headquarters is located in Hoffman Estates, Illinois. Sears Holdings is quoted in the New York Stock Exchange with the ticker symbol of SHLD. It has approximately 22,000 shareholders (as of January 1, 2008).

Sears Holdings generates its revenues through three business divisions: Sears Domestic (55 percent of its revenues in 2007), Kmart (35 percent of its revenues in 2007), and Sears Canada (10 percent of its revenues in 2007). The Kmart segment operates stores that offer general merchandise, including products sold under various labels, such as Jaclyn Smith, Joe Boxer, and Martha Stewart Everyday. It also offers home appliances, including Kenmore-brand products, and groceries, as well as operates in-store pharmacies. The Sears Domestic segment operates stores that offer a range of products, including, but not limited to, consumer products, home appliances, household products, consumer electronics, casual clothing and accessories, footwear, fashion products, and beauty products in the United States and Puerto Rico. In addition, this segment provides retail-related residential and commercial product repair services. The Sears Canada segment conducts retail operations in Canada, and offers apparel and other consumer products. Thus, the company's key products and services include the following: (1) products: appliances, auto, baby, clothing, electronics and computers, fitness and sports, home products, health and wellness, jewelry, lawn and garden-related products, shoes, tools, toys and games, and flowers; (2) services: car rental, hearing aid centers, home improvement, Sears photos, portrait studio, product repair services, carpet and air duct cleaning, and garage door installation.

Sears Holdings operates 2,317 full-line and 1,100 specialty retail stores in the United States through Kmart and Sears Domestic and about 380 full-line and specialty retail stores in Canada through Sears Canada Inc. (as of February 1, 2008), in which Sears Holdings owns a stake of 70 percent as a subsidiary. Sears Holdings has numerous subsidiary companies. Some of these companies include Big Kmart, Kmart Corporation, Kmart Little Caesar's Pizza, Land's End, Orchard Supply Hardware, Sears Canada, Kmart Holding, Kmart Management, Sears brands, Sears Financial Holdings, Sears Holdings Management, Sears Reinsurance, and Sears, Roebuck and Co.

Historically, Sears Holdings was developed through two separate entities as Kmart Holding and Sears, Roebuck and Co. Kmart Holding was originally formed in Delaware in 1912, as the successor to Five and Ten Cent Stores, a company founded by S. S. Kresge in 1897. The company name changed to Kmart Holding in 1977. In 2003 Kmart and its U.S. subsidiaries and affiliates filed for Chapter 11 reorganization process in the U.S. Bankruptcy Court. Sears Roebuck was established as a mail-order business in 1886. In 1953, it formed a joint venture with the Canadian merchandising company, Simpsons, to form Simpsons-Sears (now known as Sears Canada). In 2004 Sears Roebuck acquired ownership and leasehold interest of off-mall stores from Kmart and Wal-Mart. In 2005 Kmart Holding and Sears Roebuck were merged under the name of Sears Holdings.

A strength of Sears Holdings is its differentiated products. The company offers a broad range of products through its different divisions. These wide product offerings differentiate the customer base; therefore, they serve as a market entry barrier and help Sears Holdings compete with rivals. Sears also has a balanced brand mix. By blending self-owned private labels and outside brands, Sears Holdings decreases the chance of the occurrence of unsuccessful products and balances revenue growth and margins. Also, the company's market positioning is another strength. Its strong market presence in the United States and Canada boosts revenues, enhances its bargaining power, and increases the brand image of the company.

Seasonality

The term *seasonality*, by its semantic meaning, is rooted from *seasonal*, which means something that is happening or needed only at a particular time of year. That is, seasonality refers to the rise and fall in prices or in demand according to the various times of year. For example, the price of heating oil rising in winter is an effect of seasonality. Seasonality occurs in a wide range of industrial and agricultural sectors. It can be defined as a cyclical pattern that more or less repeats itself each year, and usually refers to a temporal imbalance in the demand. Seasonality also has a market characteristic in which a product or service becomes very popular for a period of a few months each year and then drops off significantly. Examples of seasonality would be Valentine's Day candy, swimming suits, winter ski chalets, or Halloween costumes.

Causes

Seasonality makes demand fluctuation occur not only yearly, but also daily, weekly, and monthly. The causes of seasonality incorporate two basic elements: natural and institutional. The first relates to regular temporal variations in natural phenomena, particularly those associated with climate (temperature, rainfall, snowfall, sunlight, and the like) and the period of the year. The second cause depends on social factors and policies concerning specific customs and legislated holidays. They include school schedules, industrial and public holidays, festivals (religious and cultural), and other events. Richard Butler added three more causes of seasonality: social pressure or fashion (e.g., taking waters at spas or hunting on country estates among the privileged elites), sporting season (e.g., snow skiing or surfing), and inertia or tradition (referring to the tendency of business operators to accept the status quo). For example, some family business owners might actually prefer to close for part of the year.

Put simply, climate or weather are generally held responsible for seasonal fluctuations in demand, but social customs, and especially holiday periods, exacerbate the tendency for summertime peaks in the Northern Hemisphere and wintertime peaks in tropical destinations. In addition to these two main factors, seasonality can also be influenced by business customs and calendar effects such as special events. The supply side is also a potential cause, such as where constraints in labor availability and the alternative uses of facilities lead to closures or altered target markets.

Much of the literature on seasonality focuses on the examination of destination-specific demand patterns and the consequent problems. Among various types of businesses, such as automotive, construction, food stores, hotels and motels, restaurants, department stores, retail stores, rental properties, and utilities, it is argued that hotels and motels, restaurants, food stores, department stores, and retail stores are most affected by seasonality. For instance, demand variability exists at a more micro level in terms of differences between midweek and weekend occupancy in business operations and between breakfast and lunch service in many hotels. Such variation has social as well as practical consequences and historically has been the justification of split shifts within the sector, itself an alleged contributory cause of alcoholism among hospitality employees. The sector also caters for extremes in demand in areas such as banqueting where demand may be occasional or erratic and where the management response is generally to employ an army of casual or agency staff as and when demand dictates.

Advantages and Disadvantages

Seasonality is often perceived negatively. Possible disadvantages include declining returns on investment and problems caused by recruiting and employing full- and part-time staff, the temporal effects related to the efficiency and the capacity of the facilities and to the management of public goods and services such as infrastructures, public safety, public health, and natural resources. Furthermore, a reduction in the quality of the services may occur because of congestion, overbooking, or saturation with subsequent reduced satisfaction level, when the demand exceeds the capacities of supply.

In addition to negative perception, seasonality can be viewed positively. For example, ecological impacts are occurring because of the concentration of visitors during the peak season at a destination. The negative effects include congested roads, disturbance of wildlife, physical erosion of footpaths, and litter problems. The off-season period provides such benefits as time for environmental reclamation and resident recovery. Moreover, some researchers argue that maintenance work on buildings or attractions is typically scheduled for the off-peak periods and supports construction jobs and specialist trades.

Seasonality of demand is typically caused by institutional and/or natural factors with the pattern usually remaining stable over many years. This predictability of seasonality makes it possible for businesses, lenders, and investors to anticipate many of its impacts as well as react to them. The literature suggests that employment, cost, and facilities are the three areas in which operations can adjust to counter seasonality. Facilities can be closed during off-peak seasons, staff can be laid off, and costs therefore can be reduced.

To lessen the impact of seasonality, some strategies are also suggested, such as (1) extending the season or introducing additional season(s) by holding some events and festivals; (2) identifying new market segments, which helps to increase demand outside the peak season; and (3) introducing a flexible pricing policy. In general, promotional pricing is effective in increasing demand over low or off-peak seasons.

Securities and Exchange Commission

The Securities and Exchange Commission (SEC) is an independent agency of the U.S. federal government, charged with the regulation of the securities industry and its markets, and with the enforcement of federal securities laws. The Commission consists of five commissioners, appointed by the U.S. president with the approval of the Senate, and about 3,800 employees. The commissioners serve terms of five years, staggered so that a term ends every year; commissioners cannot be fired, ensuring their independence. As they are often appointed from among the ranks of Congress, no more than three of them at any given time may belong to the same political party.

The SEC was established by the 1934 Securities Exchange Act, which came amid a flurry of New Deal banking and finance legislation, and was a direct response to the stock market crash precipitating the Great Depression in 1929. A considerable body of subsequent legislation has shaped the SEC, notably 1940's Investment Company Act and Investment Advisers Act, and the Sarbanes-Oxley Act of 2002. The most recent SEC-related legislation was the Credit Rating Agency Reform Act of 2006, which redefined the Nationally Recognized Statistical Rating Organization qualifications for credit rating agencies; the new rules were implemented in June 2007.

Seven of the SEC's 18 offices are in Washington, D.C.; the remainder are regional offices throughout the country. The Commission's operations and duties are divided among four divisions: Corporate Finance, Investment Management, Trading and Markets, and Enforcement. The Corporate Finance division operates EDGAR, the Electronic Data Gathering, Analysis, and Retrieval system, accessible online by investors in search of information about publicly traded companies—who can also file complaints and tips about potential violations of securities law. EDGAR has been in use since 1996. Corporate Finance is also responsible for overseeing company transactions and disclosures. The Investment Management division monitors investment advisers and mutual funds and administers the laws related to such.

The Trading and Markets division oversees investment houses, all brokerages and securities dealers, and the self-regulatory organizations like the Financial Industry Regulatory Authority (FINRA, to which much of T&M's duties are delegated) and the Municipal Securities Rulemaking Board (MSRB).

The Enforcement division coordinates with the other divisions and all offices in the investigation of reported or suspected violations. The SEC can compel the production of documents and testimony in the course of an investigation, but lacks criminal authority. Criminal matters are referred to state or federal prosecutors, while civil actions are brought by the SEC in U.S. District Courts or administrative proceedings.

Apart from the regional offices and the SEC's main headquarters in D.C., there is the Office of the General Counsel, representing the SEC in federal appellate courts and providing legal advice to the rest of the Commission; the Office of the Chief Accountant, responsible for the accounting and auditing policies set by the Commission; the Office of Compliance, Inspections, and Examinations, conducting the Commission's general inspections; the Office of Economic Analysis, which keeps track of the costs and benefits of SEC regulations; the Office of International Affairs, liaising between the SEC and foreign powers; and the Office of Investor Education and Advocacy.

In the wake of the 2007–08 economic crisis, the SEC has been criticized for, and acknowledges, deep and multiple failures in the Bernard Madoff case. For years, Madoff operated a Ponzi scheme (paying old investors with the incoming funds from new investors) that by his own account represents a loss of at least $50 billion. Investigation of Madoff began in 1992 when a feeder fund that only invested with Madoff promised unlikely returns, but the investigation was never followed up, despite numerous tips over the years; Madoff was only finally arrested when the economic calamities of the day led to too many investors attempting to cash out, prompting a confession to family, who turned him in. In the subsequent criticism of the SEC, critics have alleged that the Commission was "too close" to Madoff, pointing out that his niece—a compliance attorney in his firm—is married to a former SEC compliance officer.

Securities Financing

Securities financing is the provision of new funds to a firm whereby the firm either sells new debt instruments or equity or some combination of both. For governments, it entails the sale of short- and long-term bonds to raise additional revenue, usually through an auction.

Methods used to carry out sales of equity or new debt differ among countries and classes of securities. The general approach can nonetheless be described in terms of broad categories that span different countries and jurisdictions, private sales, or public offerings and auctions. Securities in this context are any intangible assets the value of which is a claim to future cash accruing to the holder, referred to as an investor. They date back to the 1600s when equity was traded in Antwerp and Amsterdam. Options and futures, called time bargains then, traded on the Amsterdam bourse in 1611. Firms have always needed external funding since then. The amounts have grown bigger and the list of instruments much longer.

Payments are typically fixed for debt instruments such as bank loans and bonds issued by governments and corporations. For equity instruments, on the other hand, the issuer of the financial asset has an obligation to pay the investor on the basis of residual earnings after all investors in debt instruments have been paid their fixed amounts. Both governments and companies can obtain external funding by offering securities to a small number of investors, a given class of investors such as current shareholders of a firm or the general public. For a company, the external source can be an individual investor, a venture capitalist, an institutional investor, a corporate investor, or the public at large.

The other source of funds can be venture capitalists. A venture capital firm is a limited partnership that raises funds specifically for investment in young firms. The limited partners in such firms are often institutional investors like pension funds, bonds, insurance companies, hedge funds, or mutual funds. The firm is run by the general partners, known as venture capitalists. By being limited partners in venture capital firms, the participants are able to diversify their investments. This is in addition to benefiting from the expertise of general partners that they work with in the venture capital firm. The institutional investors can invest indirectly through venture capital or directly into private firms.

There are a variety of forms for public issues. Securities can be offered for sale at a stated fixed price or auctioned off to the highest bidder.

Initial Public Offering (IPO)

An IPO occurs when common stock offerings are issued by companies that have not previously undertaken any sales of common shares to the public. Although not a necessary condition, such public offerings are almost always listed on an organized exchange, such as the New York Stock Exchange (NYSE). IPOs are mostly motivated by the desire of firms to access a higher and more diversified array of financing options. Specifically, public offerings enable firms to reduce expenses on bank lending and enhance their ability to utilize equity as an acquisition currency. Many private firms are heavily dependent on their banks for financing. Case studies confirm that there is value in public listing. Having public funds in the end improves the firm's relationship with banks, customers, and suppliers. This is partly attributed to the dramatic increase in the flow of information about the firm as a result of going through the process of an initial offering.

With respect to acquisition, when a firm wishes to purchase an existing firm thereby exchanging shares, the purchasing firm faces a binding constraint if it is not publicly traded. Its shares are then not registered and are sold only to exempt buyers rather than to the general public. The resulting lack of liquidity in the stock renders the firm's shares unattractive as a means of financing acquisitions. Firms that intend to make extensive takeovers find it advantageous to have their shares publicly traded.

Going public entails a procedure whereby an investment banker, a firm specializing in raising capital for companies, is consulted to initiate a formal IPO process in the first instance. Second, a document is produced for the public and for registration with stock market regulatory authorities—the prospectus—disclosing pertinent information regarding the security and its issuer. During this second phase, a choice is made of the broad type and terms of the public offering, out of four different types. In a best efforts offering, the shares are sold by the investment banker by way of an agency agreement undertaken to do its best without guarantee of success, being paid an amount for each share sold. In a firm commitment offering, the investment banker or underwriter purchases the new securities from the issuer at a set price and guarantees the sale of a certain number thereof. In the case of a bought deal, an underwriting arrangement is made whereby an investment bank or group of such banks (syndicate) offers to buy an entire issue of shares from the issuer. This is often even before the preliminary prospectus is drafted. The other option is a standby or rights offering whereby common shares to investors are offered at a discount to investors who already own shares.

Regardless of the type chosen, standard underwriting clauses are included, providing the issuer the authority to issue the securities, requiring it to prepare a prospectus, preventing it from issuing any other securities while the underwriting is still under way, and obligating it to pay the underwriter. The third phase is the waiting period during which the investment banker and issuer wait for final clearance from regulatory authorities to sell the securities.

Seasoned Equity Offering (SEO)

An SEO is the offer of new shares for sale by a public company. In the event of growth opportunities that cannot be fully financed from retained earnings after an IPO, the firm returns to equity markets to put up new shares for sale. The mechanics of an SEO are essentially the same as those of an IPO. The only distinction here is that there already exists a market price for the stock so that the process of price setting and discovery is not required. The SEO takes on two forms, namely, a cash offer and a rights offer. Whereas the firm offers the new shares to all investors in a cash offer, it offers new shares only to existing shareholders in the case of a rights offer.

Auction Procedure

In auction arrangements to raise external funds used by both private firms and governments, would-be buyers make submissions of both the price and quantities in their orders. The motivation for using auctions partly hinges on the relative advantages with respect to possession of information by investors at large compared to the information the firm and its advisers may have. For companies in some industries, the most relevant source of risk and uncertainty is the general environment under which they function. In such circumstances, it is preferred to pool the views of more investors by carrying out an auction of securities. This is in contrast with the case of industries where the success of the firm depends mainly on the specialized and strategic leadership such that management is better placed to assess and value its stock. A disadvantage of the auction approach is that there may be some sensitivity of the selling price to collusion by buyers. One way to deal with this problem is to adopt a fixed-price offer for sale, whereby the seller determines the price of the securities.

In the conduct of securities auctions, participants do not have an opportunity to revise their initial bids because they get to submit sealed bids. The auctioneer determines the pricing and allocation rules, leading to a choice of auction mechanism. The most common mechanisms are the discriminatory auction and the uniform price auction. In both mechanisms, bidders are able to submit multiple bids and the securities go to the highest bidder.

In uniform-price auctions, all the winning bidders pay one price, which is the lowest winning bid price and constitutes a market clearing price. In the discriminatory auction, the winning bidders each pay the price they put in their respective bids. In the end, this is a form of discriminating monopoly where the seller allocates securities so as to enable each bidder to pay the highest price affordable until all securities have been sold off.

Securitization

Securitization is the process of creating securities from other assets by pooling and repackaging them. Assets are combined into a pool that is split into shares, ideally structured in such a way as to reduce credit risk and improve profit, though securitized assets are indeed considerably more volatile than many other types because of the amortizing cash flows that back them and the possibility of debt-backed securities being at risk when that debt is defaulted upon.

Mortgage-based securities are a common securitized asset, their risks amply demonstrated by the subprime mortgage crisis. But the advantage is just as clear: the value of a mortgage is too large for a single investor to take on, just as a company is too large for a single investor. Pooling mortgages and dividing them into shares creates an investment opportunity as flexible as the stock market. Investment banks generally structure securitized assets, either of their own origination or more commonly on behalf of the originator.

Securitization is one of the main processes of structured finance, which has become an important part of the finance industry in the 21st century, using various financial and legal instruments to manage risk. Assets that are securitized are generally structured in other ways as well. After being pooled together, they are sold to a special trust called a special purpose vehicle (SPV), which exists for the purpose of funding and issuing the security. At that point they are generally tranched. Tranching is the diversion of cash flow from an underlying asset to the investors who own the structured notes backed by it. Tranching in turn is served through credit enhancement, in order to create a credit-rated security from unrated assets or a security with a higher rating than the average rating of the assets backing it.

Tranching is accomplished by dividing—*tranche* comes from the French for “slice”—the pool into related securities with different ratings, offered as part of the same transaction. Those with first lien on the underlying assets are the senior tranches, the least volatile and usually highest rated. Senior tranches often form part of the portfolio of pension funds and other risk-averse investment groups. Second-lien or no-lien tranches comprise the junior notes, much higher risk and appealing to high-risk/high-return investors like hedge funds and structured finance specialists.

A special type of SPV is the master trust, which is formed for the purpose of pooling credit card balances for securitization. These must be structured and handled somewhat differently from other debt-backed securities because of timing concerns; while credit card–backed securities may not mature for years, the underlying receivables pay off faster than that. Credit card–backed securities are usually structured with a revolving period (when cardholders’ payments are used to purchase receivables), an accumulation period (when payments are diverted to a separate account), and the amortization period (when payments are passed on to the investors of the notes).

Securitization began with mortgage-based securities in the 1970s, and in the 1980s was first applied to car loans, with other debt-based securities following shortly after and growing in popularity through the 1990s to become a significant part of investor activity in the 21st century. Forms of structured assets include collateralized debt obligations backed by corporate bonds or leveraged bank loans; collateralized fund obligations backed by private equity and hedge funds assets; collateralized mortgage obligations; and credit derivatives.

Selection

Employee selection is the process by which an organization identifies the candidate(s) in a pool of applicants who is likely to exhibit the highest performance in a specific job. Although selection practices differ widely among organizations, employee selection is one of the most important functions performed by a company because of the influence it has on the success of the organization. If organizations are incapable of attracting and selecting the most competent individuals, they will be unable to compete in an increasingly competitive global market. Because of its potential impact, an organization’s selection system should only be chosen after carefully considering the properties of each selection measure and the legal environment within which the system will operate.

Although the employment interview is the most common method of selecting employees, a number of alternative practices are also available. Among these alternatives are cognitive ability tests, personality tests, work samples (i.e., individuals perform tasks they would perform on the job), and integrity tests. An important concept to understand when choosing a selection measure is predictive validity. The predictive validity of a tool refers to the degree to which the inferences that are drawn from that test are justifiable. As an example, a valid selection test would be a good predictor of performance on the job it is used to select for.

Extensive research has been conducted on the validity of a wide range of selection tools and has generally shown that some predictors are more useful than others for hiring employees. For example, research consistently shows that cognitive ability is one of the best predictors of success for moderate to highly complex positions. The consensus among organizational researchers is that intelligent individuals are more adept at learning to perform work tasks and solving problems that arise in the work environment. However, because even the most capable individual will perform poorly if he or she is not motivated to do well, measures of personality are also commonly used.

A personality trait known as conscientiousness has been shown to be one of the strongest predictors of job performance for a variety of jobs. Conscientiousness refers to an individual's relatively enduring pattern of dependability, industriousness, and self-control. Despite the validity of conscientiousness for predicting performance in most jobs, other personality traits have been shown to predict performance in jobs where the behavioral manifestation of the trait closely aligns with the requirements of the position. As an example, extraversion (i.e., an individual's propensity to be outgoing, talkative, and to seek out social interaction) is a good predictor of performance in sales positions.

Another useful concept is the utility or practicality of a tool. Because of the cost and relative efficiency of their use, some tests may be more practical than others. For example, cognitive ability tests cost less and have higher validity than structured (i.e., standardized) interviews. In contrast, although work samples have higher validity than cognitive ability tests, they can be used with only applicants who have prior experience on the job. The testing medium can also influence the utility of an assessment. Because of the increasingly global economy, the use of unproctored internet tests is growing, providing organizations with a cheaper and more efficient method for selecting employees from multiple locations around the world. Despite these advantages, managers are concerned about the potential effects of cheating on these tests.

Choices between selection measures should also be influenced by the legal environment within which the company operates. Although there may be some similarities, each country will have a different set of laws governing hiring practices. In the United States, Title VII of the Civil Rights Act of 1964 prevents companies from discriminating against any person on the basis of race, religion, sex, color, or national origin. Subsequent court cases, and modifications to the Act in 1991, have clarified the meaning of discrimination and the responsibilities of the organization. As an example, *Griggs v. Duke Power Company* (1971) required an employer to demonstrate the validity of a selection tool if its use resulted in the disproportionate hiring of majority group members relative to a minority subgroup. With the passing of similar laws in other countries (e.g., South Africa), it is now a requirement for professionals implementing selection systems to be aware of the legal and political context in which they operate.

Self-Employed Women's Association, India

The Self-Employed Women's Association (SEWA) is an association founded in 1971, and based in Ahmedabad, Gujarat, India. It was officially registered as a trade union in 1972. SEWA's founder was Ela Ramesh Bhatt. SEWA was specifically created to protect self-employed poor women, who represent that sector of the labor force that does not enjoy the same welfare benefits of other workers. In India, poor women in the unorganized sector who earn their living handling small business are estimated to be a relevant portion of the actual labor force, but they have no voice, and their dignity as well as their rights are usually not recognized. SEWA was created with the specific purpose of helping and supporting these women through several initiatives. SEWA's main purpose is to organize women workers for full employment by allowing them to buy their own means of production. SEWA is not simply a trade union, as its history clearly shows. In fact, SEWA declared itself to be a *sangam*, or combination of three movements: the labor movement, the cooperative movement, and the women's movement.

SEWA originated from the women's wings of the Textile Labour Association (TLA), which was organized in 1920 by Anasuya Sarabhai, a Gujarati woman close to Mahatma Gandhi. SEWA is still very much ideologically linked to Gandhi's spirituality, and the principles followed by its members are clearly inspired by concepts like nonviolence and nondiscrimination. The guidelines of SEWA are truth, nonviolence, integration of all faiths and all people, propagation of local employment, and self-reliance.

Despite being part of the TLA, SEWA started, since the beginning, a number of independent initiatives to favor the emancipation of poor women workers. It promoted several activities in the field of money-lending specifically designed for poor women. One of the main problems that SEWA had to face was the urgent necessity of giving credit to poor women engaged in small businesses. In the 1970s, following an agreement with the Indira Gandhi government, the Bank of India provided poor workers with credit. In spite of the government's good intentions, the agreement did not work that well in practice, as SEWA soon realized, and poor women were often cut off from the credit because of their illiteracy and incapacity of dealing with the banking system. To overcome the difficulties related to the credit system, SEWA founded its own bank in 1974. The main goal was to give financial assistance to poor, illiterate women and establish a net of microcredit to sustain their activities. The new bank responded to the practical needs of dozens of women who were in need of money to continue their own independent work. The successful experience of SEWA in Gujarat prompted its promoters and leaders to expand the activities to other Indian states.

In 1981 SEWA and the TLA split, and the former became totally independent. The deterioration of relations between the two had begun some years before, when it had become clear that SEWA's interests and goals were often in conflict with those of the TLA, which represented workers in the organized sector. Since the 1980s, the number of SEWA initiatives grew remarkably; new cooperatives were created and new services were provided. In addition, SEWA started campaigns outside Gujarat and rooted itself in many other parts of India. Nowadays, SEWA is active not only on the Indian subcontinent but also internationally, having established a number of collaborative projects with nongovernmental organizations in Asia and Europe.

Seoul Composite Index

The Seoul Composite Index—the Korea Composite Stock Price Index (KOSPI)—is a weighted index that reflects the price of stock on the Seoul Stock Exchange in South Korea's capital. The Korea Stock Exchange (KSE) was established on March 3, 1956, to help raise capital for companies, three years after the end of the Korean War. At that time, it was a small operation. After six years, on April 1, 1962, it was reorganized into a joint-stock corporation, and on May 8, 1963, it became a government-run, nonprofit corporation. The current Korea Exchange was created in January 2005 through a merger of the KSE, the Korea Futures Exchange, and the Korean Securities Dealers Automated Quotations (KOSDAQ). In late 2005, the Korea Exchange ranked 15th in terms of market capitalization, but ninth in terms of trading value, among the exchanges that make up the World Exchange Federation.

Although local businesses had used the KSE to raise funds, and local investors had used the South Korean stocks, it was not until January 1, 1972, that the KSE started publishing its composite stock price index for the first time. In 1975 a continuous trading system replaced the call trading system, and on January 4, 1983, the KOSPI was launched with the initial value of 100. The launching of a computerized order-routing system on February 1, 1983, helped the value of KOSPI to be published more easily. The KSE Automated Trading System launched on March 3, 1988—two days after the KSE was privatized and incorporated into a membership organization—allowed KOSPI to be published in real time.

During the 1980s, there was widespread international interest in the stocks on the exchange, partly because of the performance of the South Korean economy at the time and partly because of the increased exposure to the country in the lead-up to the 1988 Seoul Olympics. While some pundits expected the South Korean economy to boom as had the Japanese economy in the 1960s and 1970s, some foreign investors wanted to balance their investments and a group of them established the Korea Fund in August 1984, whereby money was invested in a range of shares, with good results—the shares in the fund being listed on the New York Stock Exchange. However, industrial problems in South Korea regularly led to changes in the stock prices, and the situation was often made worse by tensions along the South Korea–North Korea border. There were also queries over corruption with the chief of the stock market watchdog being arrested in June 1996 for allowing companies he favored to obtain a quick listing on the KSE. In December 1997 there were also problems when Dongsuh Securities, the fourth-largest brokerage company in South Korea, collapsed, causing the stock exchange index to reflect the lowest prices in 11 years, the market having already been battered by the effects of the Asian economic crisis in July 1997. Indeed, on June 15, 1994, the KOSPI 200 started to be published by the KSE, reflecting the prices of the major 200 companies whose stock was listed by the KSE—again, starting from a base level of 100.

To try to increase investor confidence, in June 1998 the South Korean government designated 55 companies as unviable and sought to implement regulatory changes. In September 1999 the government sought to try to reduce the power of the major industrial conglomerates—in particular the 10 largest *chaebols*—which it felt had too much influence on the stock market and the composite index. During this period, the Financial Supervisory Commission spent much of its time chasing leads to prevent fraudulent trade in shares. In May 2000 the workers on the KSE went on strike when plans were introduced to end their lunch hour, which would force brokers to eat while trading shares—some 70 percent of all investors were individuals who dealt with specific brokers.

Soon afterward, a number of other KSE indices were published including the KOSDAQ Star Index on January 26, 2004 (with the values on January 2, 2003, equaling 1,000 points), and after the establishment of the Korea Exchange on January 27, 2005, the KRX 100 was published from October 28 of that year.

Service Expectations

Many definitions of service are argued with a common theme of intangibility and simultaneous consumption. James Fitzsimmons defines service as a time-perishable, intangible experience performed for a customer acting in the role of coproducer. This argument suggests the importance of customers' participation in the service process. Furthermore, the term *expectation,* by its semantic meaning, is defined as the "belief that something will happen or be the case" in the *Concise Oxford Dictionary*. Thus, service expectations can be understood as customers' beliefs regarding the level of service or their desire for service.

In services, unlike in manufacturing, a distinction can be made between inputs and resources. While inputs are the customers themselves, resources are the facilitating goods, employee labor, and capital at the command of the service manager. To make service function well, there must be interaction with the customers as participants in the service process. Customers normally arrive at their own discretion and with unique demands on the service system. For customers, service is an experience occurring in the front office of the service facility, and the quality of service is enhanced if the service facility is designed from the customers' perspective. Therefore, matching service capacity with demand is a challenge.

Service expectation is also related to service quality and customer satisfaction. A. Parasuraman and his colleagues have determined that customer expectations regarding the level of service offered are associated to their level of satisfaction with the shopping experience. Comparing the perceptions of service received with expectations of service desired, customer satisfaction can be identified. When expectations are exceeded, service is perceived to be of exceptional quality, even to be a pleasant surprise. When expectations are not met, however, service quality is deemed unacceptable. When expectations are confirmed by perceived service, quality is satisfactory.

For instance, people have different service expectations of different restaurants while dining out. When customers go to a fast-food restaurant, their expectations of the level of service are rapid ordering and accurate service delivery as well as a consistency in food quality compared with their past experience. The customers would not expect wait staff to come to dining tables to ask if any further assistance is requested. However, in a fine restaurant, guests expect to be well taken care of. Put simply, the higher the expectation, the higher the service level must be for customers to feel satisfied with the service. When expectations are low, customers tend to be satisfied with low levels of service.

Five principal dimensions that customers use to judge service quality are reliability, responsiveness, assurance, empathy, and tangibles. Reliability is the ability to perform the promised service dependably and accurately. Responsiveness is defined as the willingness to help customers and to provide prompt service. Assurance is known as the knowledge and courtesy of employees as well as their ability to convey trust and confidence. Empathy refers to the provision of caring, individualized attention to customers, which includes approachability, sensitivity, and efforts to understand the customer's needs. Tangibles are the appearance of physical facilities, equipment, personnel, and communication materials. The condition of the physical surroundings is tangible evidence of the care and attention to detail that are exhibited by the service provider. For example, a dust-free dining room gives the impression and implication of a high level of hygiene in the kitchen.

Understanding what consumers expect from a service organization is important because expectations provide a standard of comparison against which consumers judge an organization's performance. That is, service expectations serve as a salient reference point to customers when evaluating the current consumption experience or as equated to "predictions" of service quality.

Various studies have been conducted to incorporate the determinants of service expectations. It is suggested that customers formulate their expectations on the basis of a number of sources: advertising, firm image, implicit and explicit promises, past experience with the firm and its competitors; personal needs; personal background in terms of education, values, and so forth, and communications with friends as well as word of mouth. That is, expectations account for all the information present before, during, and/or after a service encounter.

Thus, these attributes can be categorized into four dimensions: (1) what customers have experienced in the past (i.e., past experience); (2) what customers have been told about the service provided by others (i.e., communications with friends and word of mouth); (3) what customers' personal needs are (i.e., personal needs in both mental and material forms); (4) what service providers have communicated to customers (i.e., advertising, firm image, and implicit and explicit promises).

Previous research studies suggest that customer service experience is influenced rationally and emotionally by functional clues (technical quality), mechanical clues (sensory and presentation), and human clues (behavior and appearance of service personnel). They advocate that designing and managing these clues is a critical management responsibility.

With expectations serving as a prediction of future events, they are also described in terms of desired (i.e., "should") or ideal (i.e., "will") standards, normative expectations of future events. Various possible levels of service expectations, from low to high, can be listed as minimum tolerable expectations, acceptable expectations, experience-based norms, normative should expectations, ideal expectations.

Compared to will expectations, which are associated with specific transactions and are therefore transient, the ideal/should standard exhibits much more stability over time, reflecting the way things "ought to be." In other words, will expectations stand for the minimum level of service a customer will accept, which normally are the lowest or adequate service expectations. On the contrary, should expectations represent the highest or desired service expectations, which customers believe service providers can and should be delivered.

Separating the desired service level (i.e., should service expectations) from the adequate service level (i.e., will service expectations) is a zone of tolerance. The zone of tolerance expands and contracts like an accordion. It can vary from customer to customer and, potentially, from one situation to the next for the same customer. The literature suggests that customers' adequate service expectations seem to be influenced more by specific circumstances, the number of service alternatives, for example, and are therefore more changeable than their desired service expectations. Thus, if customers perceive that they have alternative service providers, their zone of tolerance is likely to be smaller than if they do not feel they have this flexibility. When customers' options are limited, they take the best they can get. Their expectations are not necessarily lower, but their tolerance level is higher.

To understand customer service expectations, a careful study is needed. Surveys, focus groups, evaluation forms, and market research are all useful approaches to obtaining a better understanding of

Service expectations, such as quick, free shipping from online retailers, are influenced by a company's overall image.

expectations. Some practical techniques to collect and listen to customer service expectations include transactional surveys; mystery shopping; new-, declining-, and lost-customer surveys; focus group interviews; customer advisory panels; service reviews; customer complaint, comment, and inquiry capture; total market surveys; employee field reporting; employee surveys; and service operating data capture.

In addition to the awareness of service expectations, another big challenge is to actually meet these expectations. Five service imperatives, including define the service role, compete for talent (and use it), emphasize service teams, go for reliability, and be great at problem resolution, are suggested in relevant literature.

To conclude, service expectations play an important role in achieving high customer satisfaction. Service expectations are changeable from customer to customer or from time to time. Service providers need to constantly investigate and observe their customers' expectations for service by applying various survey methods. Useful information to improve service quality is collected not only from customers themselves but also from the competitors. Finding the gap between service expectations and perceived service determines the quality of services and enhances customer satisfaction.

Service Level

The concept of a service level balances the clients' expectation of immediate service fulfillment and the imperative of loading the capacity of service providers to meet the objectives by means of accounting figures. The basic problem is simply illustrated by a stochastic process of upcoming service orders, for example, customers arriving at a supermarket checkout or inbound telephone calls arriving at a call center. The process of service requests is usually a Poisson process, or if different qualities of services are considered, a multivariate Poisson process.

The number of operators who are active in a time unit determines the costs as well as the capacity of the system. If the operators are busy when a new service request arrives, the client has to wait for the service. The service level expresses the percentage of clients who do not have to wait longer than a given threshold: the acceptable waiting time. The arrival rate of service calls in the system is called λ (intensity of the Poisson process), and β is the intensity of handling and providing the service ($\beta = \mu^{-1}$).

The simplest system is modeled by an Erlang-C system. If there is an average of one call per time unit (i.e., on average, one customer enters the checkout zone of a hypermarket in a minute): $\lambda = 1$, the checkout takes about six minutes: $\beta = 1/4$, and if, in this example, there are six checkouts serving the customers, one would expect that none of the customers has to queue at the checkout, because the capacity is 90 customers per hour, but only 60 are arriving. However, the arrival process is a random process, and therefore the time intervals between the customers' arrivals are not fixed. Assume the waiting period of 30 seconds would be acceptable to the customers.

Solving this Erlang system mathematically now yields the interesting result that only a fraction, 78 percent of the clients, will get the service within the 30 seconds. Thus, the service level is 78 percent.

Defining an appropriate service level is relevant in various management tasks. The design of physical service systems is straightforward, for example, checkouts in retail outlets or check-ins at airports. A more prominent application domain is the configuration of information processing systems. For instance, database retrieval might be acceptable within 20 to 30 seconds, in the case of a hotel booking system or a flight reservation system. However, in the control of hospital intensive medical care, a response is needed within fractions of a second. Beyond these technical applications, human resource planning of many companies should be governed by the aim of reaching the appropriate service level. In outsourcing projects, mutual signing of a service level agreement (SLA) is common practice. During the negotiation of these projects, the partners discuss service level requirements (SLR), which address the same contents, but are not noncommittal contractually.

The service level has advanced to one of the most assessed aspects of service quality in technical disciplines, and has recently been receiving increasing attention in general management studies. This can be traced back to three modern management developments:

- The dominance of the service process perspective in the redesign of business process literature at the end of the 1990s: For instance, the balanced scorecard concept of Robert Kaplan and David Norton, which has been widely adopted in business practice, is grounded in the idea of separating business processes and assigning process responsibilities to individual employees.
- The ascendancy of supply chain management systems in business practice and research literature: The service level enables defining quality criteria for the replenishment of all kinds of physical goods at the point of sale. Criteria based on service level are superior to criteria concerning the periods of out of stock in a wide range of scenarios.
- The paradigm shift in marketing science: Starting with the seminal contribution of Stephen L. Vargo and Robert F. Lusch in 2004, marketing scientists, practitioners, and consultants are reconfiguring their marketing strategies and related performance metrics. The core contribution of Vargo and Lusch highlights the relevance of services rather than the products in conventional marketing mix management. Consequently, the service level advances to a key concept for deriving quantitative performance metrics for this innovative marketing gestalt.

The mathematical formalism to calculate the service level is implemented in standard business process software systems, such as SAP.

However, the concept of the service level has a serious drawback: No further information concerning the not-served clients is derived. Here, the critical question is their *actual* waiting time in addition to the *accepted* waiting time. More sophisticated performance metrics are derived from the stochastic Erlang model, but their adoption is restricted to technical applications.

Another problem is the determination of an appropriate service level. This task is comparatively easy in the replenishment application, if strategic goals are neglected. In this case, the costs of increasing the service level need to balance the profits from additional sales in an accounting calculus for determining the optimal service level. If additional strategic goals are considered, for example, differentiation from competitors by means of service offers, calculations are more complicated.

Settlement Date

Settlement date, also known as delivery date, is the final date by which the parties involved in a trade must complete the transaction. The designated date itself varies with the type of assets being traded. For illustration, we consider futures contracts and foreign exchange settlements, which are adequately representative.

A futures contract is an agreement between a buyer and a seller whereby the buyer undertakes to receive delivery of something at a specified price at the end of a designated period of time. The seller undertakes to make delivery of the "something" at a specified price at the end of the designated period. At entry into the contract, no one actually buys or sells anything. The parties' undertakings are all with reference to a future date. The price at which the parties agree to transact is called the futures price, while the designated date is the settlement date. The "something" the parties undertake to exchange is called the underlying asset. An investor agreeing to buy at a future date is said to have taken a long position, while one agreeing to sell will have taken the corresponding short position. Regardless of the positions taken, futures contracts typically have settlement dates in March, June, September, or December.

In practice, most futures contracts entered into do not culminate in the delivery of the underlying asset because many of them are closed out early. For those that do, however, the decision as to when to deliver is made by the party with the short position. After the decision, the investor's broker issues a notice of intention to deliver to the exchange clearing house. The notice specifies the number of contracts to be delivered, and when the underlying assets are commodities, it also specifies the location of the delivery and the grade of commodities. A party with a long position is then chosen by the exchange to accept delivery. The usual rule is to pass the notice of intention to deliver to the party with the oldest outstanding long position. There are three important days with respect to delivery. The first notice day is the first day on which notice of intention to deliver can be submitted to the exchange. The last notice day is the last day for the submission. The last trading day is typically several days before the last notice day.

In foreign exchange trades, the settlement date refers to the maturity date of a forward contract in currency. Foreign exchange transactions have both a trade date and a settlement date. The settlement date, also called the value date, is the forward banking (business) day common to both countries. On this day, parties to the transaction make currency payments with the expectation that they will receive the full amount that they are entitled to receive. Settlements in currencies can be made only on banking days. Bank holidays do not coincide in all countries, so some precision is required in fixing value dates.

Traders in foreign exchange settle according to standardized conventions. For a spot transaction in the interbank market, delivery and payment between banks usually take place on the second business day. Forward exchange rates, on the other hand, are normally quoted for value dates of one, two, three, six, and 12 months. Other arrangements for a different number of months can be made.

On the value date, most dollar transactions in the world get settled through the computerized Clearing House Interbank Payments System (CHIPS) in New York. There are four settlement dates for all foreign exchange futures traded on the International Monetary Market (IMM), a division of the Chicago Mercantile Exchange. They also apply to those traded on the Finance Instrument Exchange (FINEX), a division of the New York Board of Trade. The dates are the Wednesday following the third Monday of March, June, September, and December.

Shanghai Composite Index

The Shanghai Composite Index is an authoritative set of statistical indicators adopted by domestic and overseas investors in measuring the performance of the Chinese security market. The Shanghai Stock Exchange (SSE) Indices are price indices including the SSE 180 Index, SSE 50 Index, SSE Dividend Index, SSE New Composite Index, SSE Composite Index, Sector Index, SSE Fund Index, SSE Government Bond Index, and SSE Corporate Bond Index. The SSE Composite Index is the earliest one compiled.

The Shanghai Composite Index includes all listed stocks at the SSE. It includes A shares and B shares. The base day for the SSE Composite Index was December 19, 1990. The base period is the total market capitalization of all stocks on that day. The base value is 100. The index was launched on July 15, 1991. Companies are weighed according to their size in terms of market capitalization (calculated as the total number of outstanding shares multiplied by the market price per share). Market capitalization represents the total market value of all companies listed on the exchange.

The SSE New Composite Index comprises listed stocks that have completed split-share reform. The base day for the index was December 30, 2005. The index was launched on January 4, 2006.

The SSE 180 has made major improvements in methodology by taking China's current financial market situation into consideration and integrating international experience. Thus, the index represents the Shanghai market situation and forms a performance benchmark index. The SSE 50 is an index of good-quality and large-scale stocks. The SSE Government Bond Index and the Corporate Bond Index were launched in 2003. Thus, SSE Indices reflect overall price changes of stocks listed at the SSE from different perspectives. They provide investors with benchmark systems for different investment portfolios.

There are two major stock exchanges in mainland China: the SSE and the Shenzhen Stock Exchange. Both offer A shares and B shares of common stock issued by Chinese companies. B share listings all carry the same rights as A share listings and receive the same dividends. A shares are restricted to China's citizens residing on the mainland and are denominated in renminbi (RMB). B shares were initially restricted to non-Chinese nationals. In February 2001, the Chinese government allowed Chinese residents to purchase B shares. B shares are not convertible to A shares and are traded in U.S. dollars in the Shanghai stock market. The Chinese authorities allow dividends and capital gains from B shares to be sent abroad. Foreign securities houses can serve as dealers of B shares and if they are designated as qualified foreign institutional investors (QFIIs), they are allowed to trade and invest in A shares. QFIIs are foreign financial institutions that meet certain requirements and are permitted to invest in local currency and use the specific accounts investing in the local securities markets.

With the exception of the stock exchange in Hong Kong, the SSE is the largest stock exchange in China. It is based in the city of Shanghai, with a market capitalization of almost US$3 trillion in 2007. The number of listed companies is around 900 and the SSE is fifth largest in the world. Daily average turnover in 2006 was US$54 billion. Total turnover for stock was around US$8 trillion in 2006. In conclusion, the SSE Indices have become an indicator of China's economy. The current exchange is directly managed by the China Securities Regulatory Commission. Trading hours are 9:30 A.M.–11:30 A.M and 1 P.M.–3 P.M., Monday through Friday.

The Shanghai Securities Exchange began to operate in December 1990. From a base of 100, the Shanghai Composite Index reached 1,500 in February 1993, but fell to 340 in July 1994, possibly as a result of the implementation of company law in July 1994, whereby listed companies must provide financial and nonfinancial information to the public and false disclosure constitutes a criminal offense. The Composite Index reached 1,258 on December 12, 1996, and the

The Shanghai Stock Exchange, based in this building, is the second-largest stock exchange in China after Hong Kong's.

daily transaction value increased to US$2 billion on the Shanghai market, which was larger than the Hong Kong market at that time. The index rose again in February 1997 and reached a record high in April 1997. It seems that the Chinese stock market was not influenced by the financial crisis in East Asia that began in summer 1997. Government intervention in the stock market halted the rise in mid-1998. In mid-1999, state-owned enterprises were allowed to buy their own shares on the market, thus there was a sharp rise in the index for two months. In early summer 2001, the government started checking the source of the funds invested by firms on the stock market and the price collapsed.

Shareholder Activism

Shareholder activism is the proactive attempt by equity investors, usually large financial institutions, to change some aspect of firm behavior or governance. While the goals of activist shareholders vary, they primarily revolve around monitoring and attempting to bring about changes in firms believed to be pursuing goals that are not shareholder wealth maximizing. The move to shareholder activism, especially in the United States during the 1990s, is arguably an outcome of the weakening of an active market for corporate control in the 1970s and 1980s through anti-takeover stratagems and legislation, modifications in executive remuneration schemes and the requirement for shareholder approval, and changes in the attitudes and motivations of traditionally passive institutional investors. Shareholder activism can take any number of forms, but typically includes proxy battles, publicity campaigns, shareholder resolutions, litigation, and negotiations with management.

The fundamental basis for shareholder activism, and one reason for the apparently wide variation in activity around the world, is differences in corporate governance mechanisms. In the Anglo-American model (exemplified by the United States, United Kingdom, and Australia), corporate governance emphasizes a well-developed stock market, strong investor protection, substantial disclosure, and arms-length banking relationships. In contrast, the Germany-Japan model (prevalent in Germany and continental Europe, Japan, and parts of Asia) assigns a greater role to long-term manager-investor and firm-bank relationships, concentrated ownership, and cross-shareholdings among firms and between firms and financial institutions. The latter clearly favors entrenched management and leaves little room to maneuver for independent activist shareholders.

Motivation

The primary motivation for shareholder activism rests on the principal-agent relationship between shareholders and firm managers arising from the separation of ownership and control. Assuming that managers are rationally interested in furthering their own ends, the central problem for shareholders is how to motivate the managers to act in shareholders' interest, not their own; typically, in terms of shareholder wealth maximization. A variety of mechanisms provides incentives for managers in this regard. First, the market for corporate control disciplines managers to better shareholder interests or risk their position because of the hostile takeover of an underperforming firm. Second, the market for managerial talent entails incentive compensation in the form of stock options and performance-related pay. Last, the active monitoring of management decisions in compliance with shareholder wealth maximization. Primarily, this is through the firm's board of directors, but also institutional and block shareholders, and indirectly through banks and other debt holders. If any or all of these mechanisms break down or are compromised, shareholder activism may take place.

The question naturally arises that if a firm is underperforming in terms of shareholder wealth maximization, why do investors not simply sell their shares ("vote with their feet") and avoid the anticipated information gathering and legal costs associated with shareholder activism. While institutional investors especially engage in some monitoring of the firms they invest in by analyzing financial and strategic statements, and occasionally meeting with and questioning management, to go beyond and try to control management (by acting directly to influence the structure, processes, or decisions of the board) would appear to be prohibitively expensive in relation to the potential return. One answer lies in the notion of exit and voice and the influence of two types of information. The first type of information, speculative or value-neutral information, is backward looking and has no direct bearing on the firm's future decisions. Holders of this information will have little incentive to attempt to monitor and control the firm and may choose exit as a cost-effective means of coping with poor performance.

The second type, performance or value-enhancing information, is information that bears on the optimal wealth-maximizing course of action for the firm and is naturally forward looking. Investors with this information may engage in active monitoring and attempt to exert control, formally through the composition of boards or voting at general meetings, or informally through shareholder activism if denied avenues are more formal. For these investors, the anticipated benefits of activism outweigh the costs, especially in investor-focused governance systems that increasingly provide a variety of cost-effective means to discipline management. Concomitantly, in recent decades the proportion of firm ownership held by institutional investors (especially pension, mutual, and hedge funds) has steadily increased, reducing the free-rider effect of monitoring, and making it harder for block investors to deal with problems simply by selling because of investment illiquidity and the impact on market value.

While the primary motivation of shareholder activism is economic, nonfinancial concerns may also compel investors. These may include disinvestment from countries with a record of human rights abuses, the adoption of environment- and labor-friendly policies, and the avoidance of particular products or services, like tobacco, alcohol, gambling, uranium, and weapons. Thus, at least some episodes of shareholder activism link with the broader push toward socially responsible investment—investment strategies that attempt to maximize both financial return and social good, primarily practiced by socially responsible mutual funds. These efforts may include initiating conversations with management on issues of concern, submitting and voting on proxy resolutions, and engaging in publicity campaigns that bring together similarities of interest held by shareholders and other stakeholders.

Proposals

Shareholder activism in the United States currently employs two main approaches. These are presenting (or threatening to present) a shareholder proposal on a corporate governance issue, and petitioning the firm's managers or board of directors to achieve a change in management or strategy. For the former, the most common proposals concern the removal of poison-pill provisions and staggered board terms, the abolition of share classes (so that all ordinary shares have the same voting rights), separating the positions of chairperson and chief executive officer (CEO), making shareholder voting confidential, and other antitakeover measures, along with proposals to sell the company.

In the United States, shareholder proposals are typically under Securities and Exchange Commission (SEC) Rule 14a-8—Proposals of Security Holders. This entails a recommendation or requirement that the company and/or its board of directors take action after approval at an annual or special meeting of shareholders. If the proposal is on the company's proxy card, the company must provide proxy means for shareholders to choose between approval or disapproval (or abstention). To be eligible to submit, the shareholder must have continuously held at least $2,000 in market value or 1 percent of the company's securities for at least one year before the date of submission of the proposal. The company may exclude the proposal, however, for the following reasons. It would cause the company to violate law, it employs false or misleading statements, it entails a personal grievance or special interest not shared by other shareholders, is not significantly related to the company's business, or the proposal deals with a matter concerning ordinary business operations. The main advantage of this approach is that the shareholder can avoid the expense of making a proxy statement and soliciting its own proxies; the main disadvantages are the limits applying to the types of proposals made and that proposals must be submitted at least six months before the meeting.

CalPERS

Perhaps the earliest and most well-known example of institutional shareholder activism in the United States is the California Public Employees Retirement System (CalPERS). CalPERS—the largest public pension fund in the United States with assets totaling more than $235 billion and some 1.5 million members—set in place an organized program of institutional shareholder activism with the establishment in 1984 of the Council of Institutional Investors (CII), an umbrella organization for U.S. institutional investors. Membership of this body now includes more than 140 public, union, and corporate pension funds with combined assets in excess of US$3 trillion, with members using proxy votes, shareholder resolutions, and pressure on regulatory bodies, discussions with companies, and litigation to change firm governance.

CalPERS itself compiles a list of focus firms each year from the fund's internal portfolio where it has concerns with their stock and financial performance and corporate governance practices. It uses a variety of mechanisms to screen the nearly 2,000 U.S. corporations initially assessed, including long-term stock performance and economic value-added (EVA). For example, the five focus firms selected in 2008 (11 firms in 2007 and 6 in 2006) comprised Standard Pacific Corporation, La-Z-Boy, Invacare Corporation, Hilb Rogal & Hobbs Company, and Cheesecake Factory Incorporated. CalPERS highlights its particular concerns with the focus firms in fact sheets made publicly available on the fund's Web site. For instance, La-Z-Boy (with 7 percent of market capitalization held by CalPERS) was targeted for severe stock underperformance relative to the market and industry benchmarks, deteriorating trends in revenue growth and operating margins, and a lack of board accountability for permitting a classified or "staggered" board structure (arguing that annual elections for directors provided greater accountability for shareholders). However, under pressure from CalPERS, the firm had already agreed to remove supermajority voting requirements and adopt a majority vote standard for director elections.

Investment Funds

While early efforts at activism, like the CalPERS focus list, focus on governance issues more broadly by attempting to make the market for corporate control work better, recent efforts have aimed to intervene directly in strategic decision making and the selection of company managers. These include specialist engagement funds targeting a small number of relatively poorly performing firms where governance or strategic change could conceivably improve shareholder value. Indeed, CalPERS itself was an early investor in one of these funds, Relational Investors, in 1996. Other activist investment funds include Icahn Management, Santa Monica Partners, and Opportunity Fund.

Unlike the broader activism exemplified by CalPERS and the CII where the low exposure to individual firms brings with it a sizable free-rider problem, the engagement fund approach increases exposure (and hence the return from any improvement) to the targeted investment. Probably the most well known of these funds is the Hermes UK Focus Fund (HUKFF) established as a joint venture between Hermes (the British Telecom Pension Fund) and the U.S.-based LENS Fund. HUKFF takes significant positions (about 5 percent) in a small number of underperforming companies (four to eight each year) it believes it can successfully engage with, expecting to receive at least 20 percent more value than the current share price (after which it divests). For the most part, HUKFF's engagements include the sale of noncore divisions of diversified firms and the sale of noncore assets or the stopping of diversifying acquisitions. In nearly half of its engagements, HUKFF has been involved in replacing the CEO and/or chairperson.

Influence

Notwithstanding the variation in investor motivations, one empirical question is whether shareholder activism actually improves firm performance, for which an emerging body of evidence is now available. An important qualification is that in many instances, firms targeted for shareholder activism may also have high levels of institutional ownership, and as evidence already exists that these firms also have relatively higher performance, the impact of shareholder activism itself may be confused with an institutional investor effect. Putting this aside, several studies have attempted to find a link between contemporaneous and lagged firm performance (as measured by abnormal returns or the return on equity or assets) and instances of shareholder activism. One possibility is to consider those firms targeted by CalPERS or the CII in their focus lists. Nevertheless, current evidence is ambiguous with no clear indication of an improvement in future firm performance or in the current stock price.

Exactly why performance postshareholder activism does not improve is unclear, but more than one study has suggested that the different measures of firm performance in different studies may account for the wide variation in results. Another complication is that they invariably draw their sample firms from firms targeted through shareholder proposals and other readily visible forms of activism. This ignores the fact that shareholder activism can take subtler, less-public forms like in-person meetings with the CEO and board members. A final difficulty is the wide variation in the characteristics of the activism. For instance, even with shareholder proposals, we could compare and contrast confrontational versus nonconfrontational episodes, shareholder proposals augmented with attention by the media, and proposals by shareholders with the minimum legislated criteria of ownership to more substantial minority shareholders.

However, there is strong evidence that shareholder activism influences the actual behavior of firms with studies finding an increase in assets sales, spin-offs, company restructuring, and employee layoffs. This body of work has also found that successful shareholder proposals aimed at removing takeover defenses are associated with an increase in takeovers. This is consistent with the hypothesis that shareholder activists target firms already considered for takeover and that the episode of activism signals the market that existing shareholders are open to a takeover offer. More recently, hedge funds have been considered, with the finding that hedge fund activists target more profitable and financially healthy firms than other activists (with most prior studies on pension fund activism almost always finding that they are more likely to target poorly performing firms). The results of this body of work suggest that activists employ similar screening mechanisms, but that hedge fund activists target different types of companies.

Siemens

Siemens, a multinational German electrical engineering conglomerate, was founded by the German entrepreneur Werner von Siemens in 1847. The company from the outset demonstrated an orientation toward commercialization of inventions and internationalization of operations. From a traditional power engineering and communications engineering business, Siemens AG extended its portfolio to medical and infrastructure businesses. Siemens, by virtue of its transformation from a small workshop to a global player, has become a prominent representative of the "Made in Germany" brand.

In its more than 160-year history, internationalization has been an essential part of Siemens's corporate business strategy. With a business portfolio encompassing products, systems, and services for the energy, industry, and healthcare sectors, Siemens has positioned itself as a solution provider in more than 190 countries worldwide. The company's inventor and research concentration is evident in the enormous number of ground-breaking inventions, for example, the new technology of telegraph (1846), a gutta-percha press (1847), the discovery of the dynamo-electric principle (1866), the construction of a telegraph line between London and Calcutta (1870), the building of Europe's first underground rail line (1896), and the first metropolitan automatic telephone exchange (1909). By early 2008, Siemens had registered a total of 50,750 patents.

The Rise of a Global Player

Following his invention of a pointer telegraph, Werner von Siemens, together with Johann Georg Halske, formed the Telegraphen-Bauanstalt von Siemens & Halske in 1847. One year later, the newly founded company received a major contract from the Prussian government to build a telegraph line between Berlin and Frankfurt/Main. Despite the success of the early years, the company had a few poor years until new orders from Russia and Britain arrived. In Russia, Siemens & Halske began to install a telegraph network reaching from Finland to the Crimea. In Britain, the company commenced the production and laying of submarine cables. But the overseas activities did not stop here; in the 1860s, Siemens & Halske was contracted to construct a telegraph line between London and Calcutta. The significance of this project lies not only in the prestige of such a large-scale project, but also in the time-space compression of a world that had just begun to globalize. Telegrams between Great Britain and India now took only one hour. In the years that followed, Siemens & Halske opened foreign agencies in all of its focus markets.

World Wars I and II resulted in the expropriation of most of Siemens's foreign subsidiaries and patent rights, the collapse of its markets, and the loss of capital. The postwar years were dominated by the rebuilding of Siemens's manufacturing capabilities and its business abroad. As Siemens acknowledges today, the company's total workforce in late 1944 included approximately 50,000 forced laborers. By the end of the war, four-fifths of the company assets, according to Siemens, had been lost and destroyed.

In 1966 Siemens & Halske AG, Siemens-Schuckertwerke AG, and Siemens-Reiniger-Werke AG merged to form Siemens AG. The new company was divided into six independent operating groups, that is, Components, Data Systems, Power Engineering, Electrical Installations, Medical Engineering, and Telecommunications, plus five central departments. In the early 1990s, further restructuring measures took place. The organization was now split up into 15 smaller operating units. The following years saw expansion into the Asia-Pacific region, acquisitions in Germany and overseas, and on March 12, 2001, the listing of Siemens on the New York Stock Exchange. Further organizational restructuring into six major business groups was undertaken: Automation & Control, Power, Transportation, Medical, Information & Communication, and Lighting.

In more recent years, Siemens has been shaken by corruption scandals resulting in the reorganization of its business into three sectors (energy products, infrastructure, and healthcare) with a total of 15 divisions, business units, and the reduction of the advisory board. The new Siemens chief executive officer, Peter Löscher, the first president in Siemens's history to be appointed from outside the company, committed himself on the occasion of the company's 160th anniversary to the tradition of "the House of Siemens" and to the legacy of Werner von Siemens, which he described as "a tradition of strength."

Silent Language of Hall (Nonverbal Communication)

First published in 1959, *The Silent Language* is a book written by the American anthropologist Edward T. Hall. Drawing on research into variations in communication processes across different cultures, Hall argued that people communicate not only through words, but also through an array of behaviors—or "silent languages"—that are outside the range of most people's conscious awareness. He identified a number of such languages, including the languages of time, space, material goods, friendship, and agreements, and demonstrated how these differed from culture to culture.

Different cultures have different approaches to time. In the United States, for example, time is considered to be linear, sequential, and rational. People in such cultures tend to be very precise about timing: they schedule their day-to-day activities in detail, they attach importance to keeping appointments, they take deadlines seriously, and they are concerned about delays. In other cultures, such as France, people conceive of time in a more fluid and elastic manner. The members of such cultures take a less strict view of time. They attach less precision to scheduling and place less importance on postponement or delay.

Cultures also vary in the way they use space. For example, Hall argued that different cultures have different norms governing social distance, understood as the distance at which people naturally stand from each other. For example, standing at a close distance may seem normal and sociable to the Japanese, but intrusive and uncomfortable to Americans. Cultures also differ in the use of spatial positioning to denote rank or power. In Japan, for example, delegations of managers are commonly arranged with great precision so that their positioning indicates each manager's relevant rank. In delegations of American managers, by contrast, spatial positioning conveys little information about rank. Such spatial arrangements can be frustrating for the Japanese, who are unable to infer rank from physical position.

The importance attached to material goods also differs across cultures. Hall observed that Americans tend to place emphasis on material possessions and the accumulation of goods, using, for example, clothes, automobiles, and houses to ascertain each other's status. In the workplace, American firms commonly denote power and prestige through the use of material possessions: a corner office, a larger desk, a company car, and a salary that is very large compared to other members of the organization. Other cultures attach less importance to material goods. In Japan, for example, senior managers tend to share a large, open-plan office with little distinction in their physical surroundings, and their salaries tend not to vary greatly from those awarded to more junior staff members. In continental European companies, pay scales are more compressed than in the United States, again reflecting a lower importance attached to material goods as an indication of status.

Hall argued that cultures differ in the ways in which their members develop and maintain friendships. In some cultures, friendships are made relatively easily. For example, visitors to the United States commonly state that they make friends quickly and easily, but that their friendships are often transitory and without the depth or endurance of friendships in their home countries. By contrast, cultures that attach little importance to material possessions may be matched by greater emphasis on personal relationships. People are known not by what they own, but rather by their place within a social network of family and friends. As a result of this emphasis on relationships, friendships may take a long time to develop; once developed, however, they tend to be very durable, involving a strong sense of reciprocal obligation.

Hall also observed significant variations in how members of different cultures express agreement and disagreement. In countries such as France, agreements are based on trust and may be consummated with a handshake and only a brief statement. In the United States, by contrast, agreements tend to be explicit and spelled out in writing; this view is captured by the American saying "a verbal contract is not worth the paper it is written on." Likewise, the norms of expressing agreement and disagreement may vary widely during the process of negotiations that lead up to an agreement. The members of some cultures tend to voice their dissent quite readily: American managers, for example, do not hesitate to identify terms that are unacceptable or conditions that must be met for an agreement to be reached. The members of other cultures tend to avoid direct confrontation, and instead use subtle cues to express disagreement. Rather than openly saying that a proposal is unacceptable, a Japanese manager might suggest only that the proposal "may be difficult" or that "it raises some concerns."

As Hall continued his research, he observed common patterns in the ways that people socialized in different cultures using these five different languages: he noted that some people tended to communicate in a relatively explicit fashion, while others communicate effectively with much more implicit information. Drawing on these findings, Hall proposed a distinction between what he called "high context" and "low context" cultures.

Simulation Modeling

We are all familiar with scale models, which represent the salient features of the scheme being studied. Typical examples would be the day-to-day operations of a financial institution, an office or factory, or the performance of a share portfolio. Of necessity, the model will be a simplification. Typically the model is employed to predict the effect that changing inputs to the system can have on the outputs. While the model should mimic the real system, its complexity should not be a barrier to its interpretation. It is sensible to commence with a very simple basic model and to progressively increase its difficulty. At each stage, the model should be checked for its validity: are the outputs as expected? The simulation approach is adopted in contrast to a formal analytic approach that would give a purely theoretical solution. While the analytic approach may be more reliable and numerically more complex, it does lack flexibility, but with relative ease, additional factors may be "bolted on" to the model to be simulated.

Simulation is also referred to as the Monte Carlo simulation, stressing its obvious links to the gambling casinos in the Monegasque resort, and in particular the roulette wheel, a very accessible (hopefully) random number generator.

At the outset it must be appreciated that this approach has its foundations in probability and statistics. When building a model, you identify the key variables (both input and output) that are central to the problem being studied. Any variable that can be measured and that can take on different values, such as the value of an equity portfolio over a given number of years, is commonly referred to as a random variable. Having built what is essentially a mathematical model, the simulation stage may commence. This should clarify how the variables are interrelated. For example, the expected return on an equity portfolio in 12 months time is clearly not known with certainty, although we will know the historic returns that have been achieved. The simulation may be performed with specialist software or the facilities within popular brands of spreadsheets. Models can be developed for a variety of scenarios. A deterministic model has fixed values as both inputs and outputs (the outcome is predictable given specific initial conditions); while for a stochastic model, at least one of the input or output variables follows a probability distribution. A further level of complexity is introduced by considering the temporal relationship between the variables. Most simulation models encompass the stochastic and time-dependent properties of the system. The probability structure that is normally created is called the distribution function; it shows the frequency with which the random variable actually takes specific values within a certain range. It is this function, via its cumulative equivalent, that lies at the root of the simulation.

The simulation phase is the repeated operation of the constructed model. The model may be rapidly adjusted to address a series of scenarios, which would be prohibitively expensive in terms of time and/or resources in the real system being modeled. The results will indicate how the actual system is likely to perform. While in reality a system cannot be tested to destruction, extreme situations may be investigated via the model. In particular, results representative of long periods of time may be investigated.

In an ideal world, a model is built and simulation employed before commencing a new project or modifying an existing system. If we invest in increased marketing for our product, can we cope with the volume of new clients? Where might the existing systems fail to cope? Simulation is a very good technique when you need to bring together a lot of data and probabilities. Normally, software solutions are used to handle this. Indeed, with both the simulators themselves and computer capacity having grown, it is now possible to undertake very large simulations comparatively easily. However, even in large systems you will normally see that the simulation has converged by the time you have done a few thousand simulations, although more can readily be conducted if required.

Singapore

The Republic of Singapore was established in 1965, and it is one of the few remaining city-states in the world. After independence, Singapore soon became a highly developed market-based economy. Singapore is the 17th-wealthiest country in the world in terms of gross domestic product (GDP) per capita (US$39,952), and has foreign exchange reserves of US$176 billion (eighth in the world). Singapore is also the world's fourth-largest foreign exchange trading center (after London, New York City, and Tokyo) and is the financial center of southeast Asia. Because of its superior location, historically the economic activities of Singapore revolve entrepot trade. Singapore is one of the busiest ports in the world in terms of tonnage shipped (second after Shanghai). Among all the industrial goods, manufacturing goods are the most important, including biomedical sciences, chemicals, electronics, mechanical engineering, and petroleum refining. In recent years, the government has directed Singapore toward a service economy that emphasizes innovation, entrepreneurship, and cultural business. The transformation is ongoing.

Singapore is an island nation located at the southern part of the Malaysian peninsula, and is 707.1 sq. km. It is separated from Indonesia by the Singapore Strait in the south, and from Malaysia by the Johor Strait in the north. Singapore is in a tropical rainforest climate zone, so there is no clear difference in climate between the seasons. The Singaporean climate is characterized by high temperature, high humidity, and abundant rainfall.

Singapore has a population of 4,588,600, and its population density is 6,489 per sq. km, which is the fourth highest in the world. Today, 78 percent of the Singaporean population are Singaporean residents, which include Singaporean citizens and permanent residents. Among Singaporean residents, the Chinese form 75 percent, Malays form 14 percent, and Indians form 9 percent. At the time Singapore declared its independence, the government chose English as the administrative language in addition to the three official languages: Mandarin (Chinese), Malay, and Tamil. This choice proves helpful in terms of increasing the internationalization of Singapore and smoothing tension between the ethnic groups. Blended with the local dialects, the form of English most spoken by Singaporeans is a localized hybrid form known as Singlish ("Singapore English"). Most of the rest of the population is composed of foreign laborers, who are involved in both high-end and low-end economic activities, thus contributing to Singapore's status as the financial and business center of southeast Asia.

Singapore has long been an important port because it controls the Strait of Malacca, which connects shipping between Asia and Europe. In 1819 Sir Thomas Stamford Raffles landed on the main island and soon realized the military and commercial potential of Singapore. He managed to sign a treaty with Sultan Hussein Shah on behalf of the British East India Company to develop Singapore as a British trading post and settlement, and this entails the island's modern era. Singapore was the most important stronghold of the British Empire in southeast Asia until World War II. From 1942 to 1945, Singapore was occupied by the Japanese. Although it reverted to British rule after the war, the locals began to seek autonomy. After years of struggle, Singapore merged with Malaya, Sabah, and Sarawak to form Malaysia in 1963. Because of ethnic tension, Singapore split from the federation to become an independent republic in 1965 and subsequently joined the United Nations in the same year.

Singapore is a parliamentary democracy. The cabinet, whose head is the prime minister, has the bulk of executive powers. The office of the president of

A street market in Singapore. With its mixed population of Chinese (75 percent), Malays (14 percent), and Indians (9 percent), Singapore's authoritarian government has taken measures to ease ethnic tension.

Singapore has historically been a ceremonial one. Politics in Singapore have been controlled by the People's Action Party (PAP) since self-governance was attained. Singapore is thus criticized as a one-party state, illiberal, or procedural democracy. Nevertheless, the Singaporean government is often praised as the most efficient and incorruptible government in the world.

Lee Kwan Yew, one of the leaders in the pursuit of Singapore's independence, became the first prime minister in 1959. During his term from 1959 to 1990, his administration successfully transformed Singapore from an island with limited natural resources to a highly developed market-based economy, and became one of the Four Asian Tigers, along with Hong Kong, South Korea, and Taiwan. Goh Chok Tong succeeded Lee as prime minister in 1990. His administration tackled the impacts of the 1997 Asian financial crisis, the 2003 severe acute respiratory syndrome (SARS) outbreak, and terrorist threats after the 9/11 attacks. In 2004, Lee Hsien Loong, the eldest son of Lee Kwan Yew, became the third prime minister. His notable decisions are the plan to open casinos to attract more tourists, the plan to cultivate entrepreneurship and innovative industry in Singapore, and the plan to adjust Singapore's competitive position according to the rise of China and India.

Single Market

A single market is a common market between member states where barriers have been removed to enable free movement of goods, services, capital, and labor. These barriers may take various forms including physical borders, product standards, national laws and regulations, fiscal taxes, and foreign discrimination. There are elements of a single market in various custom unions or free trade areas in Asia (Association of Southeast Asian Nations [ASEAN]), South America (Mercosur/Mercosul), and the Caribbean (Caribbean Community and Common Market [CARICOM]). However, the closest example of a single market is the European Union (EU).

The European Single Market

The European single market has its origins in the 1951 Treaty of Paris, which created the European Coal and Steel Community, and the 1957 Treaty of Rome, which abolished all internal barriers to the free movement of goods, services, capital, and labor. In 1958, the European Economic Community was formed with the vision of creating a common market among six member states over a 12-year transition period (Belgium, France, Germany, Italy, Luxembourg, and the Netherlands). The common market required common external tariffs among member states and the elimination of internal tariffs within those member states. In 1968 this objective was achieved. The Treaty of Rome also called for the elimination of nontariff barriers including the harmonization of product standards and indirect taxes, ban of public purchasing discrimination, ban of cartel practices that restricted competition, ban of state aid that created unfair competitive advantages, and regulation of state trading monopolies that discriminated against imports. Finally, the treaty banned discrimination based on nationality, established the Common Agricultural Policy, the Common Transport Policy, and the Common Commercial Policy for trade with nonmember states. Although the original Treaty of Rome did not envisage a monetary union for the common market, in 1972, at a summit meeting in Paris, the Community endorsed the creation of the Economic and Monetary Union to be achieved by 1980.

In the 1970s and 1980s, both trade and nontrade barriers still remained, hindering the progression of the common market. Concerned about Europe's lack of international competitiveness during a period of increasingly globalized markets, the Community viewed further trade integration as the path to future economic prosperity and job creation. These concerns led to the discussion and culmination of the 1985 White Paper on the Single Market Programme (SMP). The SMP focused on completing the single market by removing the remaining physical, technical, and fiscal nontariff barriers by 1992. Also known as the Single European Act of 1986, this program was the most ambitious target the Community ever set for itself and one of its greatest achievements.

The provisions of the Single European Act increased the Community's powers to make laws based on the qualified majority of the Council of Ministers. However, fiscal matters still remained outside the Community's powers. This provided the Community with the power to harmonize national laws, thereby eliminating obstacles to the free movement of goods, services, capital, and labor. Vast legislation programs to expand the single market were adopted in the areas of the environment, research, and social policy. Specifically under the Treaty of Rome's Economic and Social Cohesion, the Community was committed to improving regional disparities. In 1992 the Maastricht Treaty, which officially created the EU, included a provision that member states that fail to comply with the Court of Justice are subject to financial penalties thereby making the EU's laws more binding.

In subsequent years, the EU focused on improving the integration of the single market, and in 2004 it embarked on enlargement. The single market welcomed 10 new member states from eastern Europe with an additional two eastern European states following in 2006, bringing the EU to a total of 27 member states (Austria, Belgium, Bulgaria, Cyprus, Czech Republic, Denmark, Estonia, Finland, France, Germany, Greece, Hungary, Ireland, Italy, Latvia, Lithuania, Luxembourg, Malta, the Netherlands, Poland, Portugal, Romania, Slovakia, Slovenia, Spain, Sweden, and the United Kingdom). The accession of these states provided the single market with a larger pool of consumers and a wider range of opportunities leveraging member states' comparative advantages. However, it also brought challenges with increased tensions among member states on migration flows, tax competition, and service markets.

The single market has made significant progress on the free movement of goods, services, capital, and labor since its inception in 1951. Border controls on goods and customs controls on people have been abolished within the EU. Many products benefit from the mutual recognition of national rules, which allows a product legally manufactured in one member state to be marketed in any other member state. Worker mobility has been improved based on mutually recognizing member states' educational diplomas and certain professions. A partial alignment in national value-added tax rates has enabled tax barriers to be reduced and public contracts are open to bidders from any member state.

Lawrence Technological University

Sinopec

Built upon the former China Petrochemical Company, Sinopec Corporation was founded in 1998. Sinopec Corporation is a publicly listed company in which 68 percent interest is held by Sinopec Group (Sinopec). With its headquarters in Beijing, China, Sinopec is a state-owned enterprise (SOE) of the Chinese government. After two decades' development, Sinopec has become one of the largest petroleum and petrochemical companies in Asia and ranks seventh in the world.

Sinopec is an integrated energy and chemical company with upstream (exploring for crude oil and natural gas), midstream (producing refined oil), and downstream (producing petrochemical products) operations. It comprises more than 80 subsidiaries and branches in six business sectors: oil and gas exploration, refining, chemicals, marketing, research and development (R&D), and foreign trade. The formats of these companies include wholly owned, equity holding, and equity sharing. As the largest Chinese petrochemical company, Sinopec's business assets and operations are mainly located in the east, south, and middle of China, the most well-developed areas and dynamic economic zones in China.

In the fast-developing petroleum market in China, Sinopec has firmly grasped the opportunities and grown rapidly. As the most recognizable brand in the Chinese petrochemical market, Sinopec's competitive advantages are reflected in its brand reputation, leading market position in China, and its emphasis on technological innovation. In addition to Sinopec's internal strengths, operating in the petroleum and petrochemical industry, the highest economic growth area in China, has facilitated Sinopec's development.

As the largest producer and distributor of petrochemical products in China and Asia, Sinopec's record of growth has been strong. In 2006 its output of crude oil of 40.17 million tons and natural gas of 7.27 billion cubic meters made it the second-largest producer of crude oil and natural gas in China. As the key provider of energy in China, Sinopec keeps refineries running at full capacity and guarantees a stable supply for the domestic oil product market. Since its foundation, Sinopec has ensured its leading market position in the Chinese petrochemical market. In 2005 Sinopec ranked first in the top 500 Enterprises of China and 17th in the Fortune Global 500 in 2007, up from its rank of 23rd in 2006.

Listing on the stock exchange markets was a milestone in the history of Sinopec's development. In October 2000 and August 2001, Sinopec Group issued H-shares and A-shares in both overseas and home stock markets in New York, London, Hong Kong, and Shanghai. By 2007 Sinopec had a total of 86.7 billion shares, 75.84 percent of which is held by Sinopec Group, 19.3 percent by foreign investors, and 4.81 percent by domestic investors in China.

In addition to its strong brand and leading market position, Sinopec has successfully promoted technological innovation throughout its business. To maintain its cost leadership market position, Sinopec has been insisting on innovation as one of its core values. Since its foundation, Sinopec has established six research institutions and invested a vast amount of resources to sustain its technological competitive edge. Sinopec's R&D team provides the requisite technology and knowledge and applies them to its production and operations. By the end of 2005, Sinopec held 5,466 valid patents. In 2007 the company applied for 905 domestic patents and 122 foreign patents, of which 677 were granted.

Additionally, China's continuing economic growth and huge domestic demand for oil and petrochemical products puts Sinopec in a more favorable market position than other industries in China. Compared with two decades ago, China's economic growth has witnessed remarkable changes. Consequently, the Chinese petroleum and chemical industry has rapidly developed. In 1993 domestic demand for gasoline, kerosene, and diesel was 7,600 million tons. This figure increased to 1.6 billion in 2007. Experts predict that by 2010, China's domestic demands will increase to 1.89 billion tons. Undoubtedly, the market demands in petroleum and chemical products in China created business opportunities for Sinopec in the past and will bring more opportunities for it in the future.

SIOP

The Society for Industrial and Organizational Psychology, Inc. (SIOP), a professional society, is the Division 14 of the American Psychological Association (APA) and an organizational affiliate of the Association for Psychological Science (APS). SIOP's Administrative Office is located in Bowling Green, Ohio, in the United States.

I-O psychology focuses on how people behave in organizations, particularly the workplace. A society of more than 7,300 members internationally and from across the globe with representation from academic, practitioner, and corporate sectors, SIOP's mission is to "enhance human well-being and performance in organizational and work settings by promoting the science, practice, and teaching of industrial-organizational (I-O) psychology." To accomplish this, SIOP supports its members in their efforts to study, apply, and teach I-O psychology; provides forums for I-O psychologists to exchange research, insights, and information; identifies opportunities for expanding and developing the science and practice of I-O psychology; monitors and addresses challenges to the understanding and practice of I-O psychology; promotes the education of current and future I-O psychologists; and promotes public awareness of the field of I-O psychology.

SIOP's roots date back to 1892 with the founding of the American Psychological Association (APA). In 1937 members of several applied groups, including APA's clinical section, formed the American Association of Applied Psychology (AAAP). Section D, Industrial and Business, was one of four sections within AAAP. In 1945 AAAP, APA, and the Society for the Psychological Study of Social Issues merged and reorganized as the APA. AAAP Section D became APA Division 14, Industrial and Business Psychology. In 1962 "Business" was dropped from the name, and in 1973, "Organizational" was added, and Division 14 became the Division of Industrial and Organizational Psychology. To establish some independence from APA, in 1982 Division 14 incorporated as the Society for Industrial and Organizational Psychology, Inc.

Organization and Membership

SIOP operates on a budget of $1.8 million annually. Its organizational structure consists of an executive committee composed of a president, president-elect, past president, five representatives to APA, financial officer/secretary, and eight portfolio positions. SIOP also has several standing committees (Fellowship, Membership, Election, Program, Program-APA, Program-APS, Scientific Affairs, Professional Practice, Education and Training, The Industrial-Organizational Psychologist (TIP), Workshops, Long-Range Planning, State Affairs, Awards, Organizational Frontiers Series, Professional Practice Series, Society Conference, Historian, Ethnic Minority Affairs, Placement and APA/APS Relations). The presidential seat is transferred at SIOP's annual conference. The SIOP Foundation provides financial support for the advancement of I-O psychology.

Membership in SIOP is open to Fellows, Members, and Associates of APA and Fellows and Members of the American Psychological Society, Canadian Psychological Association (CPA), and European Association of Work and Organizational Psychology (EAWOP). SIOP is affiliated with both APS and APA, and its members can join either. SIOP has experienced growth of membership over the years, growing from 5,841 members in May 2001 to more than 7,300 members in January 2009. The two largest sectors for membership employment in 2006 were colleges and universities (39 percent of members) and private sector consulting organizations (22.9 percent). Members with the highest annual income were employed in the pharmaceutical industry.

Publications and Events

SIOP also creates, publishes, and distributes numerous publications to its members and the I-O psychology community. Managed by the SIOP Administrative Office, *The Industrial-Organizational Psychologist* (TIP) is a quarterly publication that provides members news, reports, and noncommercial information related to I-O psychology. *Industrial and Organizational Psychology: Perspectives on Science and Practice* (IOP) is a quarterly journal organized with two focal articles on a specific I-O issue followed by peer-reviewed responses and then replies from the focal article authors. The first issue was distributed in March 2008. Also created in the SIOP Administrative Office, *SIOP Newsbriefs* is e-mailed to members monthly and presents deadlines, activities, and announcements. SIOP also publishes two book series: Organizational Frontiers and the Professional Practice Series.

In addition to its publications, SIOP organizes two large events each year. Since 1985, SIOP has hosted a conference in a different city every spring. The conference, which took on a 3-day format in 2008, includes hundreds of peer-reviewed sessions highlighting I-O psychology research, practice, and theory. In 2008, 4,069 registrants visited the conference from 45 countries. SIOP's Leading Edge Consortium also takes place in a different city every year. The consortium takes an in-depth look at a specific topic that is on the leading edge of I-O psychology. The event averages 200 attendees.

SIOP's Web site, www.siop.org, offers information on all of these publications and events as well as SIOP's online store PubHub, membership directory, media resources, consultant locator services, a job/resume board (JobNet), and other sources of information on I-O psychology.

Austin Peay State University

SK

SK is a leading family-owned business conglomerate, called a *chaebol*, in South Korea. It was transformed into a holding company system in 2007. Its member companies are involved in many businesses including petroleum, chemicals, and telecommunications; SK Energy and SK Telecom are the two main companies. They have increasingly paid attention to foreign markets and, in particular, SK Energy takes the initiative in securing sources of energy.

SK is the third-largest chaebol and has 64 member companies with assets of 72 trillion Korean won (some US$72 billion) as of April 2008. Originated from a textile company in 1953, SK has since been controlled by the Choi family, and recently governed by Tae-Won Choi, a member of the second generation, who became the owner in 1998 and the group chairman in 2004. The number of member companies has rapidly increased from 16 in 1987 to 32 in 1993 and then to 62 in 2002, standing at 64 in 2008, the second largest among the 30 largest chaebols.

SK adopted a holding company system in 2007. The central company in SK had been SK Corporation, which, founded in 1962, manufactured petroleum and chemical products and also acted as the holding company. This company was divided into SK Holdings and SK Energy in July 2007; the former, the holding company, took over the shareholding function with the life science business, while the latter took over all the other manufacturing businesses. In December 2007 SK Holdings had seven "son" companies, including SK Energy, SK Telecom, SK Networks (trading), and SK E&S (natural gas), which had 16 "grandson" companies. Meanwhile, SK E&S, formerly SK-Enron and a holding company from 2000, itself had 10 son and one grandson companies. In all, 35 of 57 member companies were organized into the holding company system, which is to be developed into a fully fledged one by mid-2009. SK Holdings supervises its subsidiaries and owns the "SK" brand, which replaced "Sunkyoung" in 1998. The company is under full control of Tae-Won Choi: he is a representative board member and the chief executive officer in both SK Holdings and SK Energy, and also the owner of SKC&C, a private company, which is the dominant shareholder in SK Holdings.

As with its predecessor SK Corporation, SK Energy remains a key company in SK. In 2007 it generated sales of some US$27.8 billion, 52 percent of which occurred in overseas markets. Two-thirds (66 percent) of sales was explained by petroleum, such as diesel oil (28 percent), bunker-C oil (12 percent), and gasoline (7 percent), and around a third (27 percent) by chemical products; and 42 percent and 70 percent of respective sales were by export. In the domestic petroleum markets, SK Energy had 32–33 percent shares in 2003–07, competing with GS-Caltex (27–29 percent). The company has recently made great efforts to gain access to sources of energy, and by 2007 secured interests in 27 sources of crude oil and liquefied natural gas (LNG), being involved in exploitation in eight of them; the sources are located in 15 countries including Vietnam, Yemen, Kazakhstan, Egypt, Libya, Côte D'Ivoire, Peru, and Brazil. Also, the company invested in a total of five coalfields in Australia (4) and China (1). For energy development, production, and marketing, SK Energy had founded some 15 subsidiaries in China, Australia, the United States, Brazil, and several other countries by 2007.

SK Telecom, another of SK's main companies, is Korea's top provider of mobile phone and internet service. The company has maintained 50–54 percent market shares since 2002 (51 percent in 2007), surpassing KTF (32 percent) and LG Telecom (18 percent); its sales for 2007 amounted to some US$11.3 billion, most of which was domestic sales. SK Telecom has attempted to achieve a competitive advantage in new technology, spending 2.6–2.9 percent of sales on R&D in 2002–07 (some US$297 million in 2007). In late 2000, the company provided, for the first time in the world, the third-generation mobile phone service, called 3G, which delivered less than 1 million bits per second. In mid-2006, it created 3.5G, the technology between the third and the potential fourth generation, whose capacity of 3 million bits per second enabled e-mail files to be exchanged efficiently. SK Telecom has increasingly served overseas markets and, by 2007, had established some 20 subsidiaries in China, Vietnam, and the United States, among other countries.

Slovakia

A landlocked country in central Europe, the Slovak Republic, or Slovakia (population 5,455,407 in 2008, gross domestic product $75 billion in 2007), is a developing country in the last stages of the transition from its communist past to its 21st-century capitalist present. The country was admitted to the European Union in 2004 and intends to adopt the euro as its currency in 2009, and is a member of NATO, the United Nations, and the World Trade Organization.

Settled by Slavic peoples during the second phase of the Migration Period—the 6th century, when Slavic tribes settled throughout central and eastern Europe at a time when Germanic tribes controlled much of western Europe—most of the Slavic states in present-day Slovakia became part of the Kingdom of Hungary by the 11th century, and thus part of the Austro-Hungarian Empire in later centuries. Slovakia seceded from the empire after World War I and formed the state of Czechoslovakia with Bohemia and Moravia. During World War II, Slovakia temporarily seceded from Czechoslovakia in order to acquiesce to Nazi control in exchange for self-governance (rather than being given to Hungary). Postwar Slovakia reintegrated with Czechoslovakia, expelling thousands upon thousands of Hungarians and Germans, some of whom had settled in the area recently and others of whom had lived there for generations. In the early years of the Cold War, Czechoslovakia was increasingly influenced by the Soviet Union, and in 1969 became a Socialist Republic. This lasted 20 years, until the Velvet Revolution ended communism in Czechoslovakia in 1989, and in 1993 Slovakia and the Czech Republic dissolved their union in the Velvet Divorce. They remain close allies.

Now a multiparty parliamentary democratic republic, Slovakia is governed by a president (directly elected for five-year terms) and a prime minister (with whom most executive power rests, appointed by the president and usually the leader of the majority party in parliament). The unicameral parliament, the National Council of the Slovak Republic, consists of 150 delegates elected to four-year terms.

Slovakia has enjoyed high economic growth and fares considerably better than many other postcommunist states. The country is often called the Tatra Tiger, in reference to the rapid growth in the 21st century (and the country's Tatra mountain range), paralleling the nicknames of the Asian Tigers of the 1960s and the various other "tigers" of recent decades. In 2004 and 2005, Slovakia's gross domestic product grew faster than nearly any in the European Union, bested only by some of the recovering Baltic States, and the 12-month growth in the third quarter of 2006 was at least 10 percent.

These economic improvements are largely the work of the right-wing coalition that came to power in 2002, which is criticized by the Slovakian public for the losses associated with these changes: unemployment rose (about 8.4 percent in 2007, but it jumped to nearly 20 percent in the first years of the reforms), government programs have been cut, a flat tax has replaced the progressive income tax, and so on. Currently some market regulations are being considered to deal with the global economic crisis, notably price ceilings on essential goods. In 2008, the government's budget deficit was about 10 percent of the budget. Inflation is about 2.5 percent.

The service sector accounts for more than half of Slovakia's economy, with construction at about 9 percent and agriculture about 6 percent, but industry is at 30 percent and rising. Automobile manufacturing and electrical engineering take the lead in the industrial sector, and Slovakia manufactures more automobiles per capita than any other country, primarily at Volkswagen, Peugeot Citroen, and Kia plants. Sony operates a large factory manufacturing LCD televisions. Metallurgy, chemicals, petroleum refining, construction materials, and nuclear fuel are other subsectors of Slovakian industry. About 40 percent of the country's land is cultivated, and agricultural activity includes the raising of livestock and the growing of wheat, rye, beets, and fruit.

Slovenia

Although one of the youngest nations in the world, Slovenia has quickly established itself as an equal partner and example to other nations. Today, Slovenia is an example of economic success and a guarantee to the stability in a traditionally volatile Balkan region. Several driving factors contributed to Slovenia's economic growth in recent years. First, it has an exceptional infrastructure. Second, it is situated in a strategically important area between western and eastern Europe. Finally, Slovenia is home to a well-educated workforce. These factors allowed Slovenia to be the first 2004 European Union (EU) entrant to adopt the euro as its currency and to be the first transition country to advance from borrower to donor as a World Bank member.

Slovenia (Republika Slovenija) is situated in central Europe. It lies northeast of the Adriatic Sea and shares borders with Croatia to the south, Italy to the west, Austria to the north, and Hungary to the east. The centrally located capital city of Slovenia is Ljubljana. Other major cities are Koper, Kranj, and Maribor.

Slovenia is one of the smallest European countries (20,273 sq. km) with a very diverse landscape. It has a short coastline (46 km) alongside the Adriatic Sea, a mountainous range (Alps) it shares with Italy and Austria, and fertile farmlands in the eastern part of the country. Such diverse landscape is directly related to various climates ranging from Mediterranean on the coast to continental in the eastern and alpine regions of Slovenia.

Approximately 2 million people live in Slovenia and their nationality is predominantly Slovenian (83 percent). Primary minority groups in Slovenia include Serbs, Croats, and Bosnians. Slovenian is the official language; however, a large portion of the population (6 percent) speaks Serbian, Croatian, or Bosnian (formerly Serbo-Croatian). The population in Slovenia is aging with a median age of 41 years and only 13 percent of the population younger than 15. As in the majority of other western European countries, the population growth has been in a slight decline (minus .08 percent).

Until recently, the people of Slovenia have been subjected to the control of foreign powers. Slovenia as we know it today was part of the Austro-Hungarian Empire until the end of World War I. After World War I, Slovenia joined its fellow Slavic states, Serbia and Croatia, in the Kingdom of Serbs, Croats, and Slovenians. In 1929, the Kingdom of Serbs, Croats, and Slovenians changed its name to the Kingdom of Yugoslavia (Yugoslavia = land of south Slavs). After World War II, Slovenia became one of the constitutive republics in the Socialist Federative Republic of Yugoslavia (SFRJ). Such constitutional status allowed

Slovenia to exercise its powers and declare independence from SFRJ on June 25, 1991.

While part of Yugoslavia, Slovenia was its most thriving region. It was the center for research and development and home to many successful firms. Once on its own, Slovenia continued to thrive. It became a member of the EU and the North Atlantic Treaty Organization (NATO) in 2004, and today it has the highest per capita gross domestic product (GDP) in central Europe. A strong economy and a stable democratic political system have assisted in Slovenia's transformation to a modern state. As such, Slovenia is a benchmark for other countries in transition.

While many positive outcomes symbolize Slovenia today, the transition process has not been without obstacles. Although reforms to provide incentives for foreign direct investment (FDI) are taking place, FDI in Slovenia has lagged behind regional averages. At the same time that taxes remain relatively high, the level of state control of the economy is one of the highest in the EU, and the labor market is somewhat inflexible. In addition, established Slovenian industries have been experiencing increased competition from firms originating in other transitional economies. Despite some of these setbacks, Slovenia's potential is great. It is home to a well-educated population, diverse industrial environment (top three Slovenian multinationals in 2007 were Mercator [retail], Gorenje [home appliance manufacturing], and Krka [pharmaceutical manufacturing]), and natural resources that could assure growth in years to come.

Smuggling

Smuggling is the importation or exportation of goods in a manner contradicting national or international laws. The last decade has seen a dramatic rise in the incidence of smuggling on a global scale. While illegal goods such as drugs and weapons are most commonly associated with smuggling, the worldwide trade in people, legal drugs, agriculture, and animals comprise a large percentage of the total value of smuggled goods. Typically, smuggled goods are imported or exported in one of two ways: either the entire method of transportation is concealed (for instance, underground tunnels are frequently used to transport munitions into Palestine from neighboring regions) or the illicit goods themselves are disguised to resemble or are hidden in permissible items. Goods have been smuggled in the past inside a variety of items, including luggage, clothing, and false panels in vehicles, and are sometimes ingested by humans or animals for disguised transportation. While the clandestine nature of smuggling makes the scope of its economic value difficult to determine, the approximate annual value of smuggled goods is believed to be in the tens of trillions of dollars.

History

Smuggling has undoubtedly existed since the first tariff, tax, or duty was imposed and has a storied past in all corners of world history. However, the first legislation explicitly addressing smuggling does not appear on record until Britain's 1351 Statute of Treason. This Act of Parliament explicitly forbade the importation of counterfeit money into England and those found guilty could be punished with death. Britain continued to struggle with the smuggling of goods into and out of the Commonwealth for the next several centuries due to high taxes levied on many goods in its expanding empire. To illustrate the magnitude of smuggling in the British Empire, Mathieu Deflem and Kelly Henry-Turner report that smuggling became so rampant during the 18th century that approximately one-third of all tea consumed in Britain was imported illegally. The tension between Britain and its colonies over taxes and smuggling eventually came to a head, resulting in protests such as the Boston Tea Party in 1773 that sparked many independence movements throughout the colonies. Throughout the 19th century, Britain and other nations gradually liberalized their restrictions and taxes on trade goods in a series of adjustments that brought about a decrease in the incidences of smuggling on record. While these growing economies saw the negative effects of smuggling decrease during this period, developing economies continued to struggle with smuggling. Developing countries and ungoverned territories remained greatly affected by smuggling and had little coordinated or enforceable recourse, as many of the economic benefits of their exports were smuggled to avoid exportation taxes.

Smuggling made a notable return to worldwide politics with the passage of various prohibition acts in the early 20th century including in Russia, Iceland, Norway, Finland, the United States, and select Canadian provinces. Smuggling continues to expand into the 21st century, unimpeded by stricter government controls after the September 11, 2001, attack on the United States, as agents opportunistically exploit price disparities and regulatory differences in countries of origin and destination. Presently, the most common goods smuggled worldwide include people (who are both smuggled and trafficked), weapons, illegal drugs, legal drugs, agriculture, and animals.

Human Smuggling

Although closely related, human smuggling should not be confused with human trafficking. Human smuggling is the assisted illegal migration of migrants from one destination to another. The smugglers are most often motivated by profit, and the demand for smuggling services is significant; for example, more than half of the illegal immigrants entering the United States from Mexico receive assistance from paid smugglers. Albeit a dangerous and often deadly expedition, smuggling humans illegally into economically advantageous nations can pay large rewards for both the smugglers and the smuggled. Kahlid Koser followed 50 migrants in their illegal journey from Afghanistan and Pakistan to the United Kingdom and found that in this case the smuggling ultimately benefited the smugglers, the smuggled, their families, and the third-party intermediaries who handled the transactions. While human smuggling is mainly driven by a motive to profit, there have also been numerous historic cases of assisted human smuggling for altruistic reasons. Notable examples include the participants of the Underground Railroad that helped blacks migrate from slave-owning Southern states, those who assisted Jews out of Nazi-occupied Germany, and many other recent cases of refugees being smuggled out of nations in conflicts.

In contrast, human trafficking rarely benefits the smuggled. Human trafficking is the purposeful acquisition of humans through deception, force, or coercion with the aim of exploiting the victim through sex acts and/or labor. The United Nations (UN) has recently devoted many resources to highlighting the gravity of this crisis and in March 2007 launched the UN's Global Initiative to Fight Human Trafficking through a grant made by the United Arab Emirates. This initiative has provided resources to over 110 countries and all levels of stakeholders within to combat the illegal forced trade of primarily women and children for sexual exploitation and forced labor. While the exact number of human trafficking is difficult to determine, the 2008 UN Report on the Overview of Human Trafficking identifies the number of human beings currently indentured against their will at a minimum of 2.5 million people.

Weapon Smuggling

Weapons and their components are another major object of smuggling and are primarily transported into regions undergoing periods of political turmoil. Because of the weakened enforcement mechanisms in these tumultuous regions, the responsibility to prevent smuggling of weapons and ammunition falls primarily to the UN Office and Drugs and Crime. The UN is currently working on two fronts to reduce the amount of gun and ammunition smuggling, estimated to be at least as big worldwide as legal arms sales. First and foremost, they are working to reduce the amount of guns entering conflict zones through increased monitoring and confiscation, and second, they have implemented a weapons destruction program through a partnership with foreign governments, which is designed to limit the amount of unused surplus weaponry that can potentially fall into the possession of smugglers.

Stable nations also struggle with the illegal importation of firearms, as organized networks of smugglers attempt to supersede laws designed to reduce firearm crimes and violence. In addition to deterring the bulk of weapons smuggling in the form of

Smugglers were trying to drop bales of cocaine like these from an airplane into a small boat when they were stopped by a U.S. Coast Guard cutter in 2007. That bust seized 450 of the 9,000 pounds of cocaine under guard at this Jacksonville, Florida, naval station.

small arms, national and international coalitions are actively combating the exchange of many other forms of mechanized weaponry and their components including both traditional and nuclear devices.

Drug Smuggling

Drugs of both the illegal and legal variety remain a lucrative product for smuggling in all parts of the world. Illegal drug smuggling occurs when chemical substances used to alter the body's normal biological functioning are imported into a jurisdiction that explicitly forbids their possession, consumption, and/or sale. Because most countries did not criminally penalize many drugs until the 20th century, illegal drug smuggling has been a relatively recent phenomenon. Smugglers of drugs around the world typically operate under a coalition known as a drug cartel. Cartels, responsible for the majority of drug smuggling worldwide, take various forms, but they all operate with the intent to profit by consolidating a drug supply chain, from growing to production and distribution. The 2008 UN World Drug Report provides a comprehensive evaluation of the world's current drug smuggling situation, with the top four drugs confiscated in 2006 (in unit equivalents) identified as (1) amphetamine-type stimulants (ATS)-related substances, (2) opiates, (3) coca/cocaine products, and (4) cannabis products.

The first of these categories is manufactured and smuggled in both legal (Dexedrine and Ritalin) and illegal forms (methamphetamine and ecstasy). The UN's 2006 report estimates the annual worldwide manufacturing of the drug to be approximately 494 metric tons, with 46 metric tons confiscated the same year. Because of the wide availability of many of the precursor chemicals, many illegal ATS are produced and distributed intraregionally. There is, however, evidence that a large amount of smuggling takes place as European and American demands are met from southeast Asian suppliers. The opium/heroin category, the second UN grouping, has seen a major resurgence in cultivation because of record yields in Afghanistan. In 2007 the worldwide illicit opium production was approximately 8,870 metric tons, with Afghanistan accounting for 92 percent of global production. Because of the regional specificity of growing conditions, the international smuggling market for opiates remains large. Imports to Europe, the Middle East, and Africa are primarily smuggled in from Afghanistan; imports to Asia primarily from Myanmar; and imports to North and South America are primarily smuggled in from Colombia and Mexico.

The third drug category, coca/cocaine products, is produced in the South American countries of Colombia, Peru, and Bolivia and is smuggled primarily into North America, Europe, and west Africa. The global production of cocaine has remained largely stable over the last decade and was estimated to be 994 metric tons in 2007, with Colombia accounting for 55 percent of the total. Cannabis products comprise the last of the UN's major drug categories and dominate all other categories in terms of cultivation volume and use. The UN estimates that 41,400 metric tons of marijuana was produced globally in 2006 with the majority grown in the Americas (55 percent) and Africa (22 percent). The majority of these cannabis products end up being produced and consumed intraregionally with a small percentage smuggled out of the African and Asian countries.

Legal drugs are also commonly smuggled items as price premiums in the destination over the place of origin allow smuggled goods to be sold profitably below local costs. These premiums can arise from tariffs, import quotas, or taxation present in the destination that are absent in the point of origin. Legal drug smuggling occurs both across state and national boundaries. Sari Horwitz recently highlighted the potential profit for the interstate smuggling of cigarettes and noted that a smuggler successful in procuring a truckload of cigarettes in Virginia (a state with low tobacco taxes) and smuggling them into New York (a state with high tobacco taxes) stands to make a potential profit of approximately $2 million. In addition to tobacco products, alcohol and prescription medicine are also commonly smuggled legal drugs.

Agricultural and Animal Smuggling

Agricultural goods and animals are also commonly smuggled at both the intra- and international level. Items are often smuggled for one of two reasons. The first is similar to the aforementioned motivation behind legal drugs: avoiding premiums arising from tariffs, import quotas, or taxation allows the smuggler of illegal agriculture to sell at below-market rates. For example, the U.S. Department of Agriculture's Smuggling Interdiction and Trade Compliance (SITC) Program was enacted after Asian fruit growers in Florida notified the federal authorities that goods illegally imported from Thailand were restricting their ability to profitably compete in eastern markets.

The second reason that agricultural goods and animals are smuggled is to provide exotic or rare materials to private collectors to be used as pets or collectibles. Particularly vulnerable are rare species whose limited availability increases the price premium and the motivation to smuggle, resulting in a reinforcing cycle of illegal smuggling. In addition to the threats posed by smuggling on endangered species, another major concern is the international spread of disease and invasive species. When agriculture and animals are smuggled into new ecosystems that have no natural predators or whose inhabitants have not been exposed to diseases or parasites that the imported animals may bring, disastrous loss of the native agriculture and animals can potentially ensue.

Future of Smuggling

Smuggling is a clandestine act motivated by profit and has taken many forms over its centuries on record. Disguising cargo or avoiding detection at an organized cartel level or by an individual working alone can constitute smuggling. The primary items currently smuggled internationally include both illegal and legal drugs, weapons, humans, agricultural products, and animals. Smuggling is currently combated at both the national level, primarily Customs or Border Patrol divisions, and the international level, through the aforementioned UN divisions and the International Criminal Police Organization (Interpol). Recent increases in trade and disparities in wealth highlighted by globalization have increased both the volume and breadth of international smuggling, resulting in renewed enforcement of antismuggling measures worldwide.

Social Contract

Social contract describes a broad set of philosophical theories that concern the legitimacy and preservation of extant governing institutions. While applicable to the entirety of the aforementioned theory, four books authored by Jean-Jacques Rousseau and collectively bearing the title of *Social Contract* are most commonly associated with the term. These books concern the balance between individual rights and social order imposed by a legitimate state authority. Rousseau asserts that humans are essentially self-interested and prone to short-term opportunistic behavior, which without limitations hinders the acquisition of stability and higher-order goals. To balance these immediate and long-term goals, Rousseau advocates governance by the "sovereign will" of the populace, with individual citizens free to engage actively in the process or freely emigrate. These views contributed significantly to 18th-century discourse, which typically held governance at two extremes: either the authoritative role of the monarchy or voluntary participation in small social collectives. Rousseau's positions have helped to shape the contracts citizens form with their governments and the contracts they form with businesses or other associations governed by the "partial will" of their select members.

Development

Theories of social contracts and the rights and obligations of a nation's citizens have been a topic of discussion since first appearing in 4th-century-B.C.E. Greek writings. However, the increasing amounts of subjugation by foreign governments during the Renaissance catalyzed modern writings on contract theories. The writings of Thomas Hobbes (*Leviathan,* 1651) were among the first to articulate the need for a governance contract to counter the individualistic and destructive tendencies of humans when residing in a state of nature. Hobbes contended that the populace left to its own devices would remain in a vicious and barbarous state unless people agreed to forfeit rights and liberties in exchange for absolute rule that allows order and social civility. Rousseau differed from Hobbes in a series of discourses written in the 17th century in which he suggested that humans had within them the potential for goodness and thus the "sovereign will" of the populace should dictate governance systems.

The *Social Contract* (1762) is the work of Rousseau most associated with outlining the role of political institutions and the rights of the citizens. As mentioned previously, the crux of his writings builds off Hobbes's earlier works and asserts that people must give up some rights to their government in exchange for social order and security. However, Rousseau's insistence that humans must have their "sovereign will" exercised to legitimate a governing body marked a notable departure from Hobbes's belief in rule by authoritarian monarchy. While differing greatly from Hobbes's position Rousseau stops short of advocating a fully participative democracy. In fact, Rousseau advocates that the will of the populace be carried out by a government ruled by aristocrats because of their advanced education and intelligence and in doing so does actively challenge the appointment of royalty by God to govern. In sum, Rousseau does not advocate any specific system of government, but primarily contributes the suggestion that a legitimate government must express the general will of the people.

Reception and Influence

The publication of the *Social Contract* was fundamental to the paradigm shift away from monarch rule in the 18th century. Its theories influenced social reform in Europe (most notably the French Revolution [1789]), the formation of socialist thought, and the founding of the United States of America. In light of its success, the *Social Contract* has also received much criticism. Many critics argue that the concept of maintaining of government that consistently expresses the general will is only feasible in the abstract. That once one attempts to elucidate the mechanisms and inner workings of such a government, the difficulties overwhelm its practicality. Others point to the lack of true ability for citizens to emigrate and thus decline participation in the social contract as a shortcoming. Mark Hulliung highlights this last critique in his assertion that the Southerners' inability to secede the Union and the resulting United States' Civil War marked a turning point in the influence of social contract on American and Western thought.

Challenges

In the last century, industrialization and the decline of available agrarian subsistence have brought the role of corporations into the social contract debate. As international boundaries and restrictions fall and the power, wealth, and social impact of corporations supersede many governments to which they were once dependent, citizens are now increasingly questioning the role of the "sovereign will" in directing corporate action. The businesses that Rousseau described as small and temporary collectives whose actions were easily directed by the "partial will" of their select and transient membership have been replaced by corporate forces now faced with managing the often-conflicted interests of investors, managers, employees, and direct and indirect stakeholders. The extant challenge for the social contract will be the balance of corporate profits, international competitiveness, and the continued expression of the "general will" in all things.

Socialism

Socialism is the idea that humans can live in justice, equality, and freedom in a world in which humanity collectively controls its own fate. Socialists see capitalism as a stage of the development of class society, which contains within it the potential and need to go farther and create a society where human lives are not determined by the whims of the powerful or the economic system. The terms *socialism* and *communism* were at one stage used interchangeably. They still are by some. However, the history of socialism in the broadest sense requires an understanding of the differences as well as the links between them.

The first use of the term *socialism* in English has been traced back to a cooperative magazine in 1827. Many accounts of the history of socialism, however, claim to identify roots that go back to the ancient world. It is true that throughout history men and women have imagined different and better worlds. But these visions (e.g., Plato's *Republic*, Thomas Moore's *Utopia*) were usually backward looking and elitist. Their authors had nothing but contempt for peasants or slaves who raised the flag of rebellion and who asked, in the words attributed to the radical priest John Ball in the English Peasant Revolt of 1381, "When Adam wove and Eve span, who was then the gentleman?"

Origins

Socialism as it is understood today was a product of the economic and political forces created by early capitalist development in Europe. Its political origins derive from the French Revolution. Although this was primarily a conflict for power between privileged groups, it unleashed massive political debate around the ideas of liberty, equality, and fraternity. The crowds of Paris and other towns, the artisans and sansculottes began to make an independent mark. This challenge from below was contained, but its legacy remained. The difficulty was to know how to build on it. Writers and activists like Babeuf, Buonarroti, and Blanqui recognized the suffering of the people, but at this time, could only see the way forward in terms of small groups taking power from society's existing rulers and handing it to the people.

It was the Industrial Revolution that opened up new possibilities. Urbanization and industrialization created a social force—the working class—that early on began to forge its own organizations (from trade unions to political movements like Chartism in England) to demand rights for itself and to challenge the injustices and inequalities that the mass of workers faced.

The great achievement of Karl Marx and Friedrich Engels, from the 1840s, was to see the potential of this new movement. At the level of theory, they took what was a moral critique of capitalism and turned it into a scientific one by trying to unravel the ways in which alienation and exploitation occurred. What compromised capitalism were not the irrationalities of individuals—these were themselves a product of systemic irrationalities. If capitalism was the most dynamic system yet known, it was also driven by a mass of contradictions. Capitalist class rule and organization perpetuated injustice, inequality, and suffering as the price paid by the mass of men and women for the privileges of those who ruled over them.

But a second aspect of their contribution was no less important. This was the argument that the solution to these problems lay in the hands of the mass of workers. Organized as a social force, workers had the power to change the world and they had to find a way to use this. In struggle, ordinary workers could find a common interest, solidarity, and understanding out of which a new society could be built. The emancipation of the working class had, therefore, to be an act of self-emancipation. When Marx and Engels called on workers of the world to unite, this was a call for men and women to take control of their own lives and not wait as a suffering class to be rescued from above or outside by the actions of philanthropists, statesmen, or conspirators.

When these ideas were first put forward, the working class, save in Britain, was still only weakly developed. As the 19th century progressed, industrialization spread and deepened and a working-class movement developed in the advanced countries with three arms. Trade unions were formed to cement the solidarity of workers in their workplaces. Cooperatives developed as an attempt to offer an alternative in distribution (and sometimes production) within capitalism. Political organization led to a proliferation of socialist organizations out of which the great socialist parties began to be formed in the late 19th century. These were then linked internationally with the creation of the Second International in 1889 (the First International of the 1860s, with Marx as its secretary, was a limited organization primarily focused on trade union links).

But as the socialist movement developed, major conflicts emerged, which led to a crisis that affected the meaning of socialism itself. The term came to be so widely appropriated and used and misused that in the late 19th century, a British liberal politician, Sir William Harcourt, could declare that "we are all socialists now." A half-century or more later perhaps, a majority of the world's population were told that they lived in socialist or semisocialist regimes even though none of them had advanced, and many had pushed back, the real cause of human emancipation.

Two related issues are central to an understanding of this. One is statification and nationalization, the other is the difference between socialism from above and socialism from below. For many commentators, capitalism is about the trinity of private property, markets, and profit. But over time, the state has come to play an important role in capitalist societies. If socialism is identified with statification then, with nationalization and control of the commanding heights in an economy, it can be argued that capitalism is giving or has given way to "socialism." The state seemed to many to offer a more rational way of running society. This idea proved especially popular with some intellectuals going back to the French writer Saint Simon and even before. Supporters of this view assumed a world of competing states, but argued that if private property were suppressed within them, then the irrationalities of internal competition could give way to rule by the expert, administration by the competent, and order and efficiency, and so on. This could then be used to rule in favor of the many and improve the general interest.

However, success here required that state power be obtained and used as a lever to uproot private property. "Statt, greif zu!" ("State, take hold of things"), Ferdinand Lasalle, an early German supporter of "state socialism," had argued. Subsequently, reformist socialists developed this idea, but gave it a more democratic tinge by arguing that if workers won the franchise, they could then use it to elect these leaders into power where they could use the state on their behalf. In these terms, although social democratic politicians were sharply separated from more dictatorial currents by their attitude to political democracy, they were much closer to them in their attitude to the state than they liked to imagine.

It needs to be stressed that this reduction of capitalism to a narrowly conceived argument about legal ownership of private property was not part of Marx's original vision. For Marx, property that was not under genuine social control was private property whether it was held by the individual or the state. The state was not an agent of human emancipation but a class institution and an instrument of repression over the many. It was not possible to use it to build a noncapitalist world; rather, it had to be cleared away.

The substitution of state property and planning seemed only to change the form rather than the continent of social relations—to replace a narrow private capitalism with forms of state capitalism. The issue was not whether the state controlled, but who controlled the state and what determined how it operated? The same point was no less forcibly made by Rosa Luxemburg, who argued that if socialism was about state control, then Napoleon and Bismarck should be counted among its pioneers.

Socialism from below looked forward by contrast to a world in which every cook might govern. For this to happen, workers had to take control of society and build democratic structures from the bottom up. This idea was at the heart of Lenin's arguments in his *State and Revolution,* written in the full flush of revolution in Russia in 1917. The existing state seemed to be disintegrating, to be replaced by factory committees, and workers' soviets and new organs of workers' power. It is often forgotten today that many of the democratic freedoms and social gains that are taken for granted were in fact a product of such struggles from below and social and revolutionary crises. Significant reforms have usually had to be battled for over long periods; intellectual argument was rarely enough. They have also had to be defended as the balance of power has changed and pressures have developed to reduce social protection and limit democratic gains.

Counterarguments

The challenge of socialism, especially from below, was often met with repression, but it also produced an intellectual counterattack by those who emphasized the limits to change and claimed that capitalism draws on "natural elements" in human society—a claim that socialists strongly reject. These counterarguments helped to form much of the development of the "classical" foundations of the modern social sciences. For these critics, the failure of socialism was inevitable (although some compromised their own intellectual integrity by the succor that they gave to fascism). Max Weber's arguments about the inevitability and rationality of bureaucracy were in part directed against socialist ideas of rule from below. Robert Michels argued that it was an "iron law" that oligarchies would always rule, basing his claims on his disillusioned analysis of pre-1914 socialist parties. For Vilfredo Pareto, revolution was simply a process by which an old elite was overthrown by a new one. Gaetano Mosca argued that there always had to be a ruling class. These arguments questioned the political impossibility of socialism. In economic terms, Eugen von Böhm-Bawerk argued that Marx's economics were flawed by internal inconsistencies. Ludwig Von Mises went further and argued that any attempt to suppress the price mechanism would produce chaos and irrationality so that socialism was economically impossible, too.

Whether these arguments against socialism are correct continues to be disputed and not least by socialists. But the subsequent development of self-proclaimed socialist states in the 20th century seemed to give credence to hostile arguments. But if in the past century it has always been possible to find someone to defend the indefensible in the name of "socialism," it is important to recognize the intellectual depth of the critique of so-called socialist regimes that developed within the socialist movement.

Socialist States

Following the outbreak of World War I, the socialist movement split into a majority tendency in which the different parties supported their own governments in the conflict and a minority tendency that opposed the war. This split was confirmed by the Russian Revolution. After the war, the former tendency developed into reformist social democracy embodied in the German Social Democratic Party, the French socialists, the British Labour Party, and the Swedish socialists. But in the 1930s, socialism was forced to retreat in the face of fascism, save in Sweden.

After World War II, social democracy made major political advances with social democratic governments often in power, albeit for differing lengths of time in different countries. Social democracy did achieve significant reforms although their critics on the left argued that these were still too few and came at a time when a growing capitalism could afford concessions. For many, the most extensive and to some extent model reforms were, and still are, to be found in a country like Sweden. The aspirations of socialist parties in power, however, soon reduced to that of creating a more humane capitalism, provided that this did not interfere with the essential functioning of the system.

In the last decades of the 20th century, however, the commitment to reform wilted, especially in the face of new economic difficulties. A new accommodation was reached with capitalism by some parties—led perhaps by New Labour in the United Kingdom. Even socialism as a distant goal began to give way to talk of a "third" way between market capitalism and state planning (Russian style), although in reality, it was hard to distinguish what this consisted of as the retreat to promarket position grew more intense, especially in the United Kingdom.

Counterposed to the social democratic tenancy was the communist one. But this was soon marked by events in Russia. This marked not only the history of communism, but also, by association, that of socialism. While most historians accept that the Russian Revolution was a genuine mass revolution, it soon gave rise to a brutal dictatorship under Stalin as the regime tried to "catch up and overtake" the West. Dictatorship also characterized the regimes that followed in its footsteps after 1945.

One question that is the subject of wide debate is whether the revolution or its leadership was flawed from the start or whether a process of degeneration occurred because of contingent factors such as the civil war, hostile pressure, and so forth. Another is whether the resulting regime can legitimately be called socialist or whether its statism reflected the emergence of an extreme form of state capitalism or even some new third form that was neither capitalist nor socialist. The statism of the Soviet Union was in obvious contradiction to many of Marx's and even Lenin's arguments. But it did draw for legitimacy on that strand of socialism that identified change with the abolition of private property as a legal form and rule over the people, albeit in the name of the people. Western opponents of the Soviet Union were happy to take its self-proclaimed socialism at face value and to use it to condemn all forms of socialism. They were no less happy to claim that, as the Soviet Union expanded its influence after 1945, what was at stake was a systematic conflict between two worlds—"socialism" and "capitalism."

The equation "socialism = state = Soviet Union" (or China, Vietnam, Cuba, etc.) also narrowed the theoretical debate over socialism. In economics, for example, the question became not whether a socialist regime could begin to end exploitation and alienation, but whether state planners could emulate the alleged efficiency of market capitalism through either a directed central plan or some form of "socialist market." What became known at the level of theory as "the socialist calculation" debate seemed to be solved at the level of practice when growth rates in the so-called Socialist bloc faltered and many of these regimes disintegrated in 1989–91.

If the regimes that developed in what was once called the "third world" also had little relation to the ideas of socialism as set out by Marx, how then do we explain them? The answer seems to lie in the pattern of unequal development that capitalism creates within and between countries. This unequal structure, one associated with colonial rule, seems to have deeper roots in the global nature of capitalism as a system. Local bourgeoisies often accepted a subordinate role in this global order, compromising with big powers, merging with sections of the traditional local ruling class, becoming in the process an additional corrupt blockage in the way of development. Trotsky argued in the 1920s and 1930s that this created wider conditions for permanent revolution. Workers and peasants could overthrow their local ruling class and join with workers in advantaged countries to create the basis for a genuine global development. But he underestimated the extent to which modernizing elites—intellectuals, teachers, army officers, middle-ranking administrators, driven both by the hope of a different world and the shame of backwardness and frustration at their own marginal position in their own societies, and so forth—might organize to seize power in the name of the people.

Permanent revolution could then be deflected into anticolonial, nationalist development programs. This is what happened in Asia, in places like China and Vietnam and in many parts of Africa and Latin America after the end of World War II. Although these regimes variously described themselves as socialist, they were really nationalist development regimes. Moreover, because they had to rely on local resources for development, they were often forced to impose forms of superexploitation on the peasants and workers in whose name their leaders ruled. Growth did occur, but not to the extent that they hoped and not as often. Lacking democratic constraints, leaderships become more corrupt with coups and countercoups. This "third world developmental socialism" or perhaps better "developmental state capitalism" began to break down in the 1980s when it became obvious that the Soviet model was in difficulties and new spaces appeared to open up for development with the successes of the first Asian Tigers. Even in China, state control gave way to more market principles.

Socialism Today

Why has there not yet been a successful revolution in an advanced country? To explain this, socialists usually offer some combination of three arguments. The first is ideas. Capitalism generates ideas that can prevent workers seeing where their real interests lie. One aspect of this is what Marx called commodity fetishism—the tendency to imagine that it is not people but abstract "natural" forces like "capital," "supply and demand," competition, globalization, and so forth, that rule our lives. Ideologies then developed on this basis, which encourage people to believe that only a privileged elite has the knowledge, virtue, and merit to control capitalism. Workers are encouraged to identify with this class and to divide themselves through racism, sexism, nationalism, and so on.

When radical conflicts do occur, a second issue comes into play—this is the problem of organization and leadership. Organization is necessary to hold people together and allow their energies to be directed, but if political leaders are not prepared to seize opportunities when they arise in a revolutionary situation, then the impetus for change will be lost. To this must be added a third argument. No ruling class voluntarily relinquishes its power and whenever conflicts emerge, ruling classes have shown themselves able and willing to use state power and force to defend their interests.

When the Soviet bloc collapsed, its identification not only with communism but also with socialism seemed to suggest that history as a struggle between great ideological alternatives had ended. Liberal capitalism had triumphed and now had no serious competitors. But opportunistic declarations of the death of socialism seem premature and not least if what had actually collapsed was not socialism in any meaningful sense. Indeed, it could be argued that the destruction of these forms was necessary to allow a return to a more authentic tradition. Certainly, the case for a socialist alternative to capitalism retains an appeal.

Socialists point to the way in which capitalism in the new century remains polarized. The gap between rich and poor has been growing in many parts of the world and rates of social mobility declining. Corporate power remains concentrated and globalization has stretched it in a new direction without bringing an end to war. Worse, the pursuit of private profit seems to be risking environmental and ecological disaster. Equally, socialists would claim that a striving for justice, equality, and popular control continues and the idea of a world in which ordinary people control their own fates remains valid, no matter what critics of socialism and supporters of capitalism might say.

For socialists, the key issue perhaps remains wherever a movement can be organized and sustained to avoid the errors of the past and achieve this. Those who dismiss socialism argue that the answer is no. The failures of the old were inherent to the socialist project itself. Those who support it answer yes. However, we should note that for all the talk of the end of socialism, the paradox of history is that it might be argued that the objective conditions out of which it might be built continue to mature.

It was only in the late 1980s and 1990s that the working class, on a global scale, became the majority class for the first time in history. Hitherto, although the majority in individual countries, workers had been outnumbered on a global scale by other groups and not least peasants. Today, in many parts of the world, earlier struggles are being repeated and trade unions, for example, with over 160 million members worldwide remain the largest voluntary organizations in the world. No less, albeit in a contradictory way, the capacity of the world to eliminate want has increased, just as globalization is helping to integrate the lives and fates of the world populations. The emergence of the antiglobalization and antiwar movement began to breathe a new life into old arguments and challenge the complacency and complicity of the older socialist parties in some of the darker aspects of modern capitalism. Where this will lead remains an open question for the new century.

Social Pact

A social pact is a form of social protection, whereby governments, worker associations (such as trade unions), and/or management groups engage in policy-making initiatives for the purpose of maintaining appropriate living and working standards. This intersection of industrial relations and social policy has evolved to various levels in a variety of countries. In fact, the establishment of social pacts has been identified as one of the most noted events in western Europe's political economy during the 1980s. This bi- or tripartite relationship also is often referred to as social partnerships in many countries.

The purpose of such agreements is intended to reduce management and market attempts to commoditize labor—creating fair wage and living standard agreements that satisfy all parties. This responsibility is ideally shared among a tripartite: proponents and members of the industrial relations movements, government and government agencies, and the firms that employ such workers. Hence, it is also often associated with the welfare state, which is consistent with the fact that European countries tend to have social pacts, as opposed to the United States or other industrialized economies. These partnerships can generally provide multiple benefits to all parties involved in their development and advocacy. Shared benefits of social pacts include higher rates of employment for workers, the provision of benefits to the unemployed resulting in less likelihood of wages being forced downward, reduced worker-management conflict, and other measures. Social pacts are also seen as more fluid attempts to bridge gaps and address shortcomings of national policies, which are often less responsive in adapting to current economic and social conditions. In some cases, such as in Ireland, Italy, and South Korea, social pacts were initiated in response to an economic or political crisis.

Social pacts have been a prominent feature of industrial relations in Europe, particularly during the 1980s when these partnerships emerged. According to some, there has been considerable push by liberal movements, which have influenced many societies to engage in these partnerships with companies and unions. However, as globalization and technology have affected wages and the distribution of labor, capitalist influences have become more dominant, and firms are less willing to participate in these agreements. It is argued that the social pact at the governmental level may be less relevant because of the changes arising from globalization and technology—whereby workers' interests should be simultaneously represented and defended at the global level (e.g., the International Labour Organization) and at the firm level through corporate policies and procedures. However, trade unions still seek to maintain and strengthen the social pact, particularly in the European Union (EU).

While many social pacts in the EU member states (particularly those evolving in the mid-2000s) were developed at the national level, in some countries such as Austria and the Netherlands, social pacts were developed at the sectoral level (in some cases, these too involved the government as a participant, such as in Denmark). Other non-EU countries that have adopted social pacts include South Korea, Brazil, and Mexico. Overall, these social pacts can be very complex and are often developed with different configurations and levels of governance/participation among the parties involved. They have also been affected by collective bargaining practices. Many social pacts were developed when labor could bargain at a centralized level; now, in some instances, social pacts are used to assist bargaining at more decentralized levels.

One of the major issues that has affected social pacts is the demand for increased flexibility in labor utilization over the past 25 years. In response to the threats and opportunities associated with globalization and technology development, companies have sought a more flexible labor force; this was particularly accelerated during the 1980s. This allocation of work increased corporate reliance on the use of contingent work, part-time work, and other work that more conveniently suited rapid changes of supply and demand for goods and services. These economic shifts also cultivated a demand for wage reductions for workers—social pacts, in fact, typically center around a wage arrangement for workers.

Socioeconomic Status

Socioeconomic status (SES) is examined both at the internal, family level and as a group and national attribute. At the family level, SES is an indicator of a family's position in a hierarchy that defines societal standing and ultimately determines opportunity and future success of family members. SES considers family income, levels of education, occupational categories, family history or blood (e.g., royalty), gender, perceived intelligence of family members, community standing, and often race and religion. In some countries, the latter categories far outweigh more mutable traits such as income or education. As reflected in the term, both social attributes and economic standing are incorporated into the characterization. Status is sometimes divided into *ascribed* status (inborn, such as gender, intelligence, or royal blood) and *achieved* status (occupation, wealth, or education). Most commonly, SES is associated with wealth or poverty.

Families with higher SES almost always have greater opportunities for the success of their children in education and employment. Higher SES often is reflected in greater resources that are turned into higher-quality child care, greater access to reading materials and exposure to technology, more availability of communications such as cell phones and computers, and generally a better environment for learning. Simply being a part of a higher-level group alters, through regular exposure, vocabulary and language ability, which in turn opens opportunity for access to business, social, and educational groupings.

Likewise, the reciprocal is true. Lower SES is associated with deprivation of opportunity, greater likelihood of exposure to crime and gang violence, and even discouragement from academic success, thus developing a cycle of poverty and limited access to both skills and business capital.

The cyclic nature of SES often results in a rigidity of social stratification. Especially when SES is coincident with visible racial characteristics or religious identification, it can turn into a fractionalization of a society that leads to conflict. Examples include the relationship between whites and blacks in the United States, Malays and Chinese in Malaysia, Shia and Sunni in Iraq, and castes in India, among many.

The nature of government has an impact on SES within societies. In fact, the critical divisions between governments with capitalist and socialist objectives are only superficially about control of the means of production. The differences are as much about the leveling of SES and the government's role in that process. Political leaders from the 18th century forward have often seen their roles as being to lift the lower classes and to promote social mobility. In some cases, this effort is pursued as a moral imperative, while in others it is seen as a means of conflict avoidance and economic progression. Philosophical cleavages of great magnitude related to SES exist based on differences in thinking about human nature, intelligence, ethics and morality, and economic achievement. The gaps between rich and poor, which inevitably parallel SES, are the essence of issues of nationalism, revolution, war, and raw politics in virtually every country in the 21st century, as they have been throughout much of modern history.

Measuring SES remains a matter of debate as it has for the last half century. While simple wealth is often used as an indicator, matters of royalty (bloodlines), biological racial character, IQ, class, and other human characteristics are often entered into the equation and the measures remain imprecise, even though the term is commonplace. More progress has been made when talking about groups, rather than families, and especially about countries.

The International Country Risk Guide (ICRG), which rates Political Risk for 140 countries, classifies them on an equivalent spectrum termed *Socioeconomic Conditions*. These conditions, like status, cover a broad spectrum of factors ranging from country wealth to market conditions to health status. These are encompassed methodologically by breaking the variable down into three subcomponents, each given a weight of four. The Socioeconomic Conditions variable itself is therefore 12 points in ICRG's overall Political Risk rating of 100.

The measures are assessed by country experts, and each is asked to rate their view of the country on a unit scale. The specific measures are as follows:

1. Unemployment (assessed on a 4-point scale, zero being the worst, 4 being the best): While an unemployment level can mean different things to different populations (e.g., 5 percent in Japan versus 5 percent in Argentina), this subvariable tries to weigh the impact of an employment level on the particular society. Thus, while the same percentage might translate as a rating of 3.5 in one country, it might be 2.5 in another.
2. Consumer confidence (4 points): Now commonly measured around the world, this is a rating on the population's feelings about whether they can spend or instead need to set aside resources for an uncertain future.
3. Poverty (4 points): Like with unemployment, an official poverty level can mean different things in different countries, so a rating works better than a percentage. Poverty is the extent to which a section of the population cannot feed or sustain itself.

The poverty measure in particular parallels a critical element of SES. The use of multiple indicators to give a quantitative assessment is an important step. Similar measures need to be undertaken to measure SES for families or groups. However, SES remains a condition that we understand implicitly, but one that we have yet to put into a common cross-national measure.

Sony

Sony is a world-leading consumer electronics company that is also engaged in a range of industries, from video gaming to motion pictures to financial services. The firm offers a diverse product lineup, such as the Walkman brand of portable audio players, the VAIO brand of personal computers, and the PlayStation brand of video game consoles. Sony is often viewed as Matsushita Electric's rival, although the former is much stronger in entertainment and the latter more so in white goods. In fiscal year 2007, Sony had sales of over $70.3 billion. Based in Tokyo, Japan, Sony has a truly international presence—operating in more than 150 countries and employing more than 163,000 people.

Over the years, Sony has attracted much attention from scholars of business. Widely discussed topics include Sony's battle with Matsushita in the videotape formatting wars in the 1970s; the firm's successes in launching Walkman products; and Sony's recent struggles in developing its entertainment business. Many scholars have also used Sony as a case study by which to examine the management practices between Japanese and Western firms.

Established in 1946 as Tokyo Tsushin Kogyo, Sony was launched as a partnership between Akio Morita and Masaru Ibuka. Amid the chaos after World War II, the firm began its operations from a bombed department store and offered radio repair services and small electric gadgets, including Japan's first tape recorder. In the 1950s Sony began to study the advanced markets of the United States and Europe to learn from and import technologies. The company's turning point came when Sony obtained a license to produce transistors from Bell Laboratories in 1954, and launched a transistor radio in 1955. Sony's successes in these products enabled the firm to list on the Tokyo Stock Exchange in 1958.

In fact, Sony soon became a global company. Following the establishment of Sony Corporation of America in 1960, the company launched branches in Switzerland, Hong Kong, and the United Kingdom. During the 1960s, Sony developed a range of electronics, beginning with the transistor television and transistor videotape.

Sony is widely known for creating its own proprietary standards that are not compatible with rival manufacturers. This was epitomized in the 1970s and 1980s when Sony entered a videotape formatting war with Matsushita. Matsushita was the parent company of JVC, whose VHS format eventually won over Sony's Betamax format. While Sony had been the first to launch the videotape in 1975, it was unable to establish the Betamax format as the industry standard. Compared to its rivals, Sony had been less willing to collaborate with other firms and less responsive to consumers who valued longer running times and portability over technological sophistication.

From the late 1980s, Sony began to diversify out of consumer electronics into a multinational conglomerate. The company's initial steps were in the entertainment industry, first in music and motion pictures and later in video games. Sony launched its music venture through Sony Music Entertainment in 1988, after acquiring the American music company CBS Records. It expanded into the film business through Sony Pictures Entertainment in 1991, after acquiring the American motion picture company Columbia Pictures. Sony's initial foray into the video game business with Nintendo stumbled as the partnership faltered. However, the company continued to develop this business through its subsidiary Sony Computer Entertainment, and introduced its first PlayStation console in 1994.

Sony continued to diversify in the new millennium, most notably through a joint venture with the Swedish telecommunications firm Ericsson to develop a mobile phone business. The company also began to offer financial services, which included banking services through Sony Bank and life insurance services through Sony Life Insurance.

Sony faces several challenges amid the rising tide of globalization and increasing competition. One is a threat from foreign rivals such as Philips and Samsung, who also have large global market share, advanced research and development (R&D) facilities, and expansive distribution networks. In addition, the firm faces competition from companies in developing countries that can offer low-priced alternatives. Sony also faces increasing cost pressures from rising raw material prices. The company's future lies in its ability to capitalize on its brand image and diversified product range, form strategic alliances to pursue collaborative R&D, and invest in growing markets such as semiconductors.

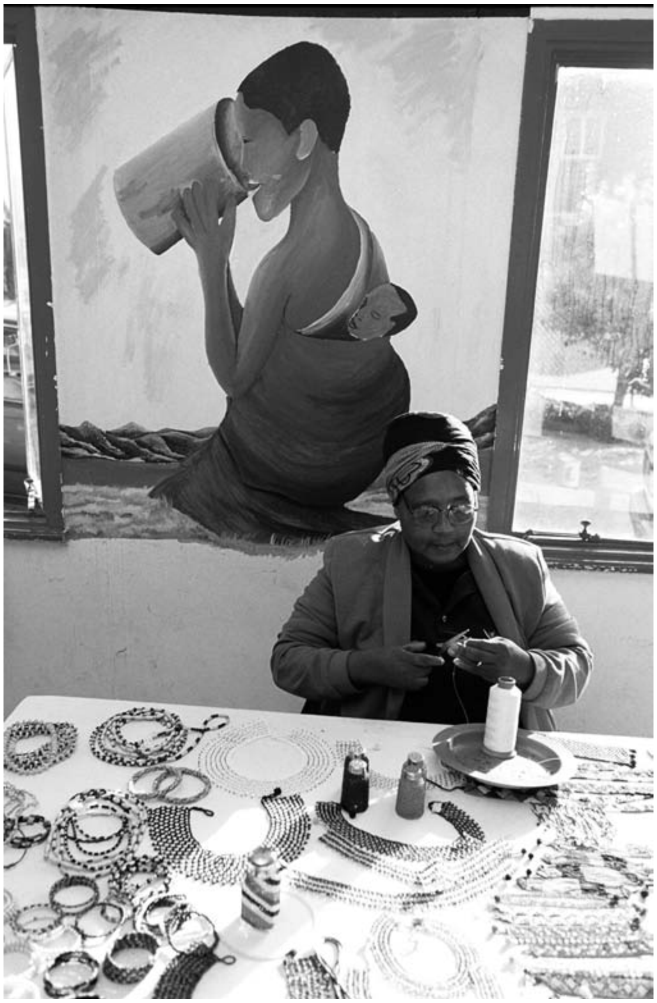
South Africa

South Africa has the largest economy in Africa and the 20th largest in the world. The nation of 43 million people of diverse origins, cultures, languages, and religions has a history of bitter racial strife, which has significantly hurt economic growth. Black Africans are the largest racial group (79.5 percent), from diverse ethnicities including the Zulu, Xhosa, and Basotho. Whites (9.2 percent) descend from many ethnic groups, including Dutch, Portuguese, German, French, and English. Mixed-race "Coloreds," and Indians/Asians comprise 8.9 percent and 2.5 percent of the population, respectively. While 11 official languages exist in South Africa, the three most



A woman sells handmade jewelry at a market in South Africa, where income inequality is worsening despite economic growth.

spoken first-home languages are Zulu (23.8 percent), Xhosa (17.6 percent), and Afrikaans (13.3 percent). Although English is the language of commerce, it is spoken by only 8.2 percent of South Africans at home. Christians dominate the religious, accounting for 79.7 percent of the population, while 15.1 percent have no religious affiliation.

The Dutch began European colonization by settling the Cape of Good Hope in the 17th century. Competition between Africans and Europeans for land through the 19th century was intensified by the discovery of diamonds and gold, further deepening native subjugation. Years of clashes between the descendants of the Dutch settlers, Afrikaners (Boers), and the British culminated in the South African (Boer) War of 1899–1902. The British won, but the two groups together drafted a constitution in 1908–09, and the British Parliament's 1910 South Africa Act gave the country its independence.

In 1948 the election victory of the right-wing National Party established the full legal system of apartheid, or "separateness," which cemented white minority rule. Blacks were forced into townships and the major black opposition movement, the African National Congress (ANC), was outlawed. By the 1980s, domestic and international repercussions of apartheid had crippled the economy. In 1990, National Party president F. W. de Klerk released Nelson Mandela, who, after 27 years in jail, became the head of the now-legal ANC and first president under fully democratic elections in 1994. Mandela then created a Truth and Reconciliation Commission to uncover apartheid crimes and unify the nation.

South Africa is a middle-income, emerging market of abundant natural resources; well-developed financial and legal sectors, including the world's 17th-largest stock exchange; and a modern infrastructure. South Africa's 2006 gross domestic product (GDP) growth of 5 percent was lower than that of Africa as a whole (5.5 percent), although fiscally conservative policies resulted in a favorable 2006 inflation rate of 4.6 percent. The major exports are corn, diamonds, fruits, gold, metals and minerals, sugar, and wool, primarily to other African countries, Germany, Japan, Switzerland, the United Kingdom, and the United States. Machinery and transportation equipment make up more than one-third of imports, followed by chemicals, manufactured goods, and petroleum.

Despite a decade of economic growth and a per capita income of about $12,000 (fourth highest in Africa), unemployment remains high at 26 percent partly because of the apartheid legacy of skill mismatch and inequalities. Development is significant around the four urban areas of Cape Town, Port Elizabeth, Durban, and Pretoria/Johannesburg, although elsewhere it is marginal, resulting in a poverty rate of approximately 50 percent. South Africa has one of the highest rates of income inequality in the world, which has been worsening over the last five years. A bright spot is the emergence of a growing black middle class, currently 10 percent of the adult black population, which has been aided by affirmative action, particularly in the public sector.

The agricultural industry accounts for 2.6 percent of GDP, and contributes around 10 percent of formal employment. Although commercial farming is relatively well developed, people in some rural areas still survive on subsistence agriculture. The largest locally produced crop is maize, with 9 million tons produced annually, while livestock farmers produce 85 percent of all meat consumed. Deregulation of the market, land reform (only 4 percent of the land is owned by the black population, far below a 2015 goal of 30 percent), foreign competition, farm attacks, and diminution of surface waters from climate change are current challenges for the sector.

Macroeconomic stability means South Africa can now focus on structural obstacles to growth and equity by strengthening trade, reducing crime, and engaging in an industrial policy that emphasizes business services and tourism while diversifying away from minerals and mineral processing. Combating the worsening human immunodeficiency virus (HIV)/acquired immunodeficiency syndrome (AIDS) epidemic remains the chief challenge. The adult prevalence rate is 16.2 percent, while life expectancy has fallen from 57 years in 2000 to 45 in 2006.

For the future, the government is aiming to increase public investment to prepare for the 2010 FIFA World Cup, improve public service delivery, generate employment, promote sustainable development in response to global warming, and reduce income disparities. Priority sectors are public works, housing, water, education, and health services. The state electricity supplier, Eskom, will supplement government efforts with investment spending designed to prevent the rolling blackouts that plagued the country in 2007. Significant spending by Transnet is also planned to improve the quality and efficiency of the country's rail network, major ports, and harbors.

Sovereign Borrowing

Sovereign borrowing is the process whereby a government raises debt finance, either on the capital markets or through borrowing from commercial banks. In general, the basic principles of borrowing are applied, but the specifics of the situation are given by the fact that the borrower is the government and/or a public entity that is considered to be owned or close to the government. The very traditional model would state that the borrower in the case of sovereign borrowing must be the government (the "state" in continental European parlance), and it cannot be derived for any other public entity, regardless of the fact that the (central) government would implicitly or explicitly guarantee for the entity. However, more recent internationally promoted documents widen the concept of "sovereign" (see, for instance, the text of the Basel II Agreement, where for bank risk purposes, the sovereign has been fairly widely defined). Here, we will primarily endorse the classical interpretation of sovereign borrowing, where only the central government may be regarded as (real) sovereign, while others may have derived sovereign status, primarily for risk management and risk assessment purposes.

Modern governments generally run deficits. In and before the 19th century, a good minister of finance was one who could provide a surplus in the government coffers; the beginning of the 20th century brought the fashion of a balanced budget; and finally, after World War II, and especially since the 1960s, deficits in public finances have become chronic, and the situation is unlikely to change anytime soon. At present, the U.S. federal government is the largest sovereign borrower, running its public debt to the amount of $9.5 trillion in early 2008. In fact, all major Organisation for Economic Co-operation and Development (OECD) countries are running public debts, which represent a significant part of gross domestic product (GDP). Sovereign borrowing (public borrowing) is not only the consequence of increased (or ever increasing) public spending per se, but also (as theory states) contributes to smoothing national consumption, or to undertaking projects that could not have been financed without externally raised finance.

Repayment

Sovereign borrowing raises the question of whether the holder of power is capable of servicing the debt or, in the case of being unable to serve it due to liquidity problems, is ready to address the problems and is willing to adhere to the internationally set arbitration committees. The issue of willingness to pay has attracted the attention of scholars. In a more traditional legal sense, the sovereign power may do whatever it pleases on territory that is under its control. However, from the very early 20th century, the absoluteness of the rights has been challenged, although more in private than in public law. Today, there are even legal theories that call for the support of more inherent rights and the intervention of sovereign powers (foreign governments) and international organizations, if the sovereign power in the case infringes the principles of international law (and/or principles of "natural law").

Economists are generally more prone to assume that even a government can be declared bankrupt, but usually they avoid considering the problem of enforcement. Creditors usually cannot seize the assets of the debtors, at least not on the territories where the debtor is a sovereign power. Assets may be seized if on the territories of other countries, but even then, enforcement costs may be higher than expected. Often, the local courts may refuse to look into the case, or the political factor may be as strong as the country where the claim is made and would not like to see the relationship with the debtor deteriorated. In practice, it may be only the U.S. courts that would consider the claim for repayment, if one is to base the judgment on the practice of "attracted jurisdiction" that the U.S. courts have exercised in the last decade or so.

Economic theory has offered two explanations as to why sovereign debtors (i.e., governments) repay their debt. One explanation revolves around the reputation theory, that is, that the government pays when the obligation is due to preserve a good reputation, and have the access to credit in the future. In other words, keeping a good credit rating is a crucial motivational factor, as it should provide easier access to finance internationally. The other explanation focuses more on possible sanctions. Although the sanction may not be a result of domestic court proceedings, the threat of sanctions, primarily by other governments, may serve as a motivational factor. Sanctions, usually trade related, can motivate, especially small open market economies. Most likely, the combination of both influences sovereign borrowers to follow the letter of contract and repay the debt. Even in cases where governments announced a moratorium on servicing foreign debt, they reversed their decisions fairly quickly, but not before there was damage to their reputation and credit rating internationally.

The theory of sovereign borrowing states that open economies, with significant inflows of foreign direct investments (FDIs), should have better access to international financial markets. However, more recent research has shown that, surprisingly, this may not be the case. It seems that reputation factors are the most important when granting funds to a particular sovereign borrower. The most important factors, not surprisingly, are those related to long-term stability, both economic and political, and prospects of the sovereign borrower. Often, international capital (debt) markets are very good at assessing the trends in economic performance of a particular country, and the loss of confidence in the borrower's abilities to meet the claims is an important signaling device in lending modeling.

The importance of sovereign borrowing is expected to increase, as public sector deficits are growing and need to be served in a way that will not destabilize national economies (i.e., through the monetization of the public deficit).

Space

According to the American anthropologist Edward T. Hall, people communicate not only through words but also through the ways in which they use and organize space. Since space speaks as loudly as words, a culture's underlying assumptions can be identified by examining how its members acquire, use, and protect space. Hall first articulated his thoughts on a possible relationship between culture and space in *The Silent Language*. Specifically, he developed the idea of *territoriality*, a term used to describe how animals take possession of, use, and defend the territories that they inhabit. Hall applied this concept to human beings and observed that how people lay claim to and defend their personal space varies across cultures.

Some cultures, he argued, are more territorial than others. The members of such cultures attach considerable importance to ownership: they mark out the areas that they inhabit, and may enter into boundary conflicts with their neighbors. Other cultures, he contended, are less territorial. In these cultures, boundaries and the ownership of space are less important: members are more open to sharing their living space, are less concerned about material ownership, and have a less-developed sense of "stealing" compared to members of cultures classified as highly territorial.

Hall developed further his concept of space in *The Hidden Dimension*. Here, he proposed the theory of proxemics, the study of how humans use space within the context of culture. According to Hall's theory, people are surrounded by so-called *proxemic zones*, a term used by Hall to describe invisible "bubbles" whose boundaries mark out personal space and zones of threat. Hall identified four zones that surround a person. Intimate space relates to the closest bubble of space surrounding a person. Entry into this space is restricted to only the closest of friends. Personal space defines the distance at which interactions among good friends are conducted. Social and consultative space is the space in which people feel comfortable conducting routine interactions with both acquaintances and strangers. Public space refers to the space beyond where people will perceive interactions as impersonal and relatively anonymous.

Hall argued that, of the four zones he identified, the area of personal space has the potential to differ the most significantly from culture to culture. To this end, he differentiated between what he referred to as noncontact cultures and contact cultures. He considered the United States and northern European countries to be noncontact cultures. The members of such cultures feel an aversion to casual touch and resent spatial intrusion. By contrast, Hall considered Arabic, Latin American, and southern European countries to be contact cultures. In these cultures, people tend to be more comfortable when interacting in close proximity to each other.

According to Hall, these different, culturally-grounded perceptions of space have the potential to generate misunderstandings in cross-cultural business encounters. Imagine, for example, that an American businesswoman and a potential Spanish customer are talking with each other at a trade fair. Given the preference of noncontact cultures for large personal space, the American may consider her Spanish interlocutor to be too intrusive: from the American's perspective, the Spanish customer may be standing too close, his voice may be too loud, the smell of his breath too disconcerting, and the feel of his hand on her arm too uncomfortable. Since contact cultures prefer close body space, the Spanish customer may find his American colleague aloof or stand-offish. He may feel that, despite his overtures of friendship, the American is coldly backing away and holding him at arm's length.

The value of Hall's theory of proxemics, argue its supporters, lies in the attention that it devotes to previously ignored channels of communication. In the absence of theories of nonverbal communication, they claim that his ideas have captured the imagination of a large number of academics who continue to use proxemics as the basis for their research. The anthropology of space, for example, has become an established area of research pursued by anthropologists interested in how architecture (understood as buildings, furniture, and design) expresses culturally-grounded ideas and sustains power relations between people.

However, Hall's theory of proxemics is not without its detractors. Although they accept the impact of his theory, critics argue, for example, that it is based on sweeping generalizations, not least since it divides the world into ideal types of contact and noncontact cultures. They have also criticized Hall for making bold assertions without providing concrete evidence to back them up. Hall's use of cultural and biological terminology, moreover, has been criticized for leading to conceptual confusion.

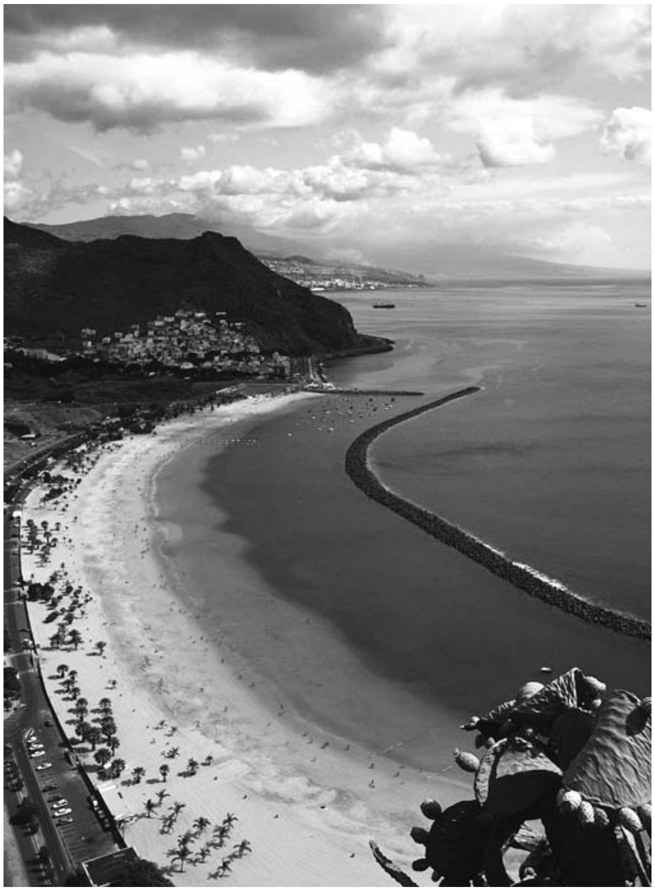
Spain

There was a time when geography teachers in northern Europe would often use an examination question that read: "Europe ends at the Pyrenees. Discuss." Travelers who visited Spain before the advent of mass tourism in the 1960s retain impressions of what appeared to be essentially a Third World country, not quite Africa, but certainly qualitatively different to anything else to be experienced in western Europe at that time. The so-called express trains took over 14 hours to run from Madrid to Barcelona, Spain's two most important cities, although, as the crow flies, the distance is only 300 miles. Today, modern electric trains run from Seville to Madrid, on to Barcelona, then through France to Paris. They are so fast and comfortable that Spanish airlines have reduced and cancelled many flight routes. In the 21st century, a British train operator chose the Spanish word *Adelante* to be the brand name of its new breed of fast diesel trains, which speaks volumes about changes in both Spain's external image and its real economy.

From 1939 until the death of the dictator General Francisco Franco in 1975, the economic environment of business in Spain tended toward isolationism and protectionism. Large government-backed monopolies dominated key industrial sectors. In Spanish discourse, the years 1975–86 are known as the "transition." In English-speaking circles, this word tends to be associated with the end of communism in Russia and the eastern bloc, and it could be argued that in many ways, Spain was the first European country to peacefully evolve from a near-totalitarian, planned economy to a pluralist, market-based democracy.

After Franco's death, instead of the chaos that many feared, there developed a carefully crafted and intelligently manipulated transition from autarky toward a modern pluralist society. This phenomenon, together with the collapse of communism in eastern Europe



A beach in Spain's Canary Islands. A tourism-related building boom brought 30 percent of all immigrants to the EU to Spain.

and Russia between 1989 and 1991, made Spain the target for many commentators, journalists, and academics interested in the possibility of a "role model" that offered lessons in peaceful change in the post–Cold War world. It can be argued that Spain's success contrasts with the dismal experience of, say, the Soviet Union, which, unlike Spain, lacked the institutions that were capable of adapting to a new democratic and market-orientated order.

Today, Spain is one of the most regionalized countries of the European Union (EU), with democratically structured autonomous communities such as Catalonia, Galicia, and Andalucia taking full responsibility for a wide range of government functions including education and economic development. Spain's postdictatorship embracing of regional autonomy without the dreadful balkanization experienced by Yugoslavia provides another contrast with the communist transition.

In common with the leaders of those members of the eastern bloc (Poland and Slovenia, for example) whose transitions are widely regarded as having been more successful, most Spanish modernizers (the *aperturistas*) realized from an early stage that close contact with and eventual membership in the EU's institutions would underpin and protect their new democracy and help foster economic development.

It can also be argued that well before the transition, Spain was (unlike the communist world) already participating in Western consumerism and popular culture, even if much of it was filtered through channels from Argentina, Mexico, or other of the more industrialized countries of Latin America. Unlike eastern Europeans under communism, Spaniards under Francoism wishing to emigrate found that there was no legal impediment to the mobility of labor, and on their return to Spain, the fortunate ones with money to invest could lock into a strong entrepreneurial culture that was already well established in the home country, together with a business environment which, although bureaucratic and sclerotic, was generally well regulated and, apart from some often-spectacular aberrations, part of a law-abiding civic culture, mostly free of corruption.

During the transition itself, Spanish policy makers were also far more circumspect than their eastern bloc counterparts in accepting the need for a headlong rush into wholesale privatization. It could also be argued that during the 1960s and 1970s, either by accident or by design, the Spanish educational system helped to better prepare the way for Spanish participation in the global economy by replacing French with English as the foreign language of first choice in the school curriculum. Last but not least, although to a large extent isolated from the European defense mainstream, Spain's strategic geographical position at the edge of the North Atlantic ensured that throughout the Cold War it was de facto part of the Western alliance's defense network through its acceptance of American military bases paid for, of course, in very useful U.S. dollars.

EU Membership

For Spain, the importance of EU membership was primarily political and psychological, providing Spain's post-Francoist governments additional leverage to push through far-reaching measures of political and economic liberalization that brought Spain into line with the business environments of northwestern Europe. EU membership was also hugely popular among Spanish voters, and has enjoyed more or less all-party support. Spanish business interests were also enthusiastic.

Since 1986, when it joined the EU, Spain has experienced an unprecedented period of economic growth, and although economic expansion has been patchy and unemployment has been stubbornly high, at times growth rates have been among the highest in the EU. The movement toward the single market during 1992 was viewed by most Spaniards as the start of real integration into the European business and political culture, but also as an opportunity to promote Spain on the world stage. During 1992, Madrid was chosen as the cultural capital of Europe, Expo ’92 took place in Seville, and Barcelona hosted the Olympic Games.

Western Europe has always been the most important market for Spanish exports and a major supplier of the Spanish economy. This pattern has been reinforced by EU membership. The concentration of Spanish trade in the EU is such that the largest four economies (France, Germany, Italy, and the United Kingdom) account for just over half of Spanish exports and supply just under half of imports. Spain participates fully in the Single European Currency, and has been a member of the euro since its launch in January 1999.

Despite all this, the Spanish economy can still be viewed as one of the least “open” in Europe, and its share of foreign investment is still not very high in comparison with some other countries, while Spanish investment abroad is small in relation to total output. On the other hand, the Spanish market is the fifth largest in Europe, with a population close to 40 million and a relatively high level of purchasing power.

One reason why the Spanish experience is important is that it provides an empirical counterargument to the “dependency” and “core periphery” theoreticians who predicted that free market forms of European integration would result in Europe’s already prosperous areas flourishing at the expense of the impoverished areas. Along with Ireland and (to a lesser extent) Portugal, Spain provides some practical evidence that cohesion can coexist and develop alongside supranational integration. Spain also provides encouragement to those who believe that political strength at the subnational level fosters economic strength. In spite of Spain’s labor market problems, it is not difficult to come across instances of articles in the international press of the “economic miracle” variety.

Industry

Spanish industry has traditionally been dominated by medium-sized firms, many of them family-run concerns that have been careful not to grow so big that there is a danger of the family losing overall control. From a globalist perspective, the lack of massive multinational firms could be seen as a handicap on Spain. However, in recent years, Spanish banks have been busy taking over other European banks; a Spanish company has become the owner of the three main London airports; and a Spanish toll-road company has won the contract to operate the Pennsylvania Turnpike in the United States.

From the late 1990s and into the 21st century, the building industry in Spain was a major motor of economic development in Spain, fueled by a buoyant housing market. Many of the houses being built were holiday and second-home apartments for buyers from other European countries such as Germany and the United Kingdom. Ironically, houses were being built in Spain at four times the rate in the United Kingdom, at a time when some British commentators were arguing that a shortage of housing supply in the United Kingdom was causing house price inflation. Many of the workforce in the Spanish building industry were immigrants and, generally, immigration into Spain was accounting for some 30 percent of all immigration into the EU. Much of the housing being built in Spain was purchased not for personal use, but by individuals and corporations for speculative purposes, with the intention of renting out.

The property market in Spain was already showing signs of slowdown when the U.S. subprime crisis of 2008 and the associated global credit crunch began to take effect. The Spanish building industry then became a major contributor to a problem of rising unemployment in Spain. The fact that many of the new unemployed were immigrants, a substantial proportion being illegal immigrants, and therefore not entitled to the safety net of the welfare state, added to social tensions in the outer suburbs of the large cities, and these tensions figured largely in the Spanish General Election of 2008, when the socialist prime minister José Luis Rodriguez Zapatero was grudgingly reelected, having had to defend immigration as being something vital to the economy, recruiting workers into the types of jobs that Spaniards either could not or did not wish to do. At the same time, he had to defend his record as a strict enforcer of measures against illegal immigration.

Modern Spaniards have living standards and expectations that occupy a different universe to those of their grandparents, and even their parents. However, in many ways, the growing middle class shares the worries, uncertainties, and insecurities of their counterparts in any other modern European country. Today, there is no doubt that Europe extends well beyond the Pyrenees, but there is much doubt about the type of economy and society that the Spaniards and their fellow Europeans wish to build.

Special Drawing Rights

The special drawing right (SDR) was created by the International Monetary Fund (IMF) in 1969 as an artificial international reserve asset. The SDR was created as a unit of account involving transactions of the IMF. At the time it was created, its gold value was the same as that of the U.S. dollar. SDR was introduced to compete with the U.S. dollar as an internationally accepted store of wealth. Its value is based on a simplified basket of several major currencies. However, since the introduction of the euro, the basket of currencies used to value SDRs consists of only the U.S. dollar, euro, Japanese yen, and British pound.

Under the Bretton Woods system of fixed exchange rates, a country with a deficit balance of payments account would settle its accounts by giving up assets or claims to foreign assets. This is referred to as an official reserve transaction. Such a transaction would lead to a transfer of ownership of gold and convertible foreign currencies like the U.S. dollar. The Bretton Woods system also allowed countries to utilize their official reserves to purchase their domestic currencies when such currencies depreciate in the foreign exchange market. The two key reserve assets at the time were gold and the U.S. dollar. The mechanism for boosting reserves depended on the United States' running a balance of payments deficit. By around 1969, the supply of gold and U.S. dollars was inadequate relative to the volume of international trade and commerce. This shortage of reserve assets was the motivation for the creation of the SDR.

When the Bretton Woods system collapsed, the SDR became a unit of account in transactions involving the IMF. Moreover, several international and regional institutions use the SDR as a unit of account. The SDR is not a currency in the true sense of the word because it is not a liability of the IMF that issues it. Many countries around the world peg their currencies to the SDR. There is a movement within the international private/commercial sector to issue SDR-denominated deposits in commercial banks. The focus on SDR is based on the fact that its value is not as volatile as that of many international vehicle currencies.

The Articles of Agreement of the IMF define the allocation of SDRs based on the quota of each member country with the IMF. The "net cumulative allocation" is the cumulative total holdings of SDRs allocated to a country. A country is expected to draw down its allocation of SDRs when it faces a balance of payments difficulty. SDRs can also be utilized to supplement the reserve holdings of a country. If a country draws upon its allocation of SDRs, it can exchange the SDR with foreign governments for their currencies to boost its reserves. Each member of the IMF is obligated to accept SDRs in exchange for its currency up to three times its net cumulative allocation. Sometimes the IMF can identify member countries with strong external positions to purchase SDRs from weak members in an attempt to help the latter.

The allocation of the SDR given to each member country translates to an acquisition of a costless asset because interest is neither paid nor earned. However, if a member holds SDR above its allocation, interest is earned on the excess. On the other hand, if a member holds SDR below its allocation, interest is paid on the shortfall.

When the SDR was introduced in 1969, its value was set equal to US$1 or 0.888671 grams of fine gold. In July 1976, its value was calculated based on a weighted basket of 16 currencies. In January 1981, the value of the SDR was redefined as a weighted average of five currencies. With the introduction of the euro in 2001, the value of the SDR was redefined again as a weighted average of four currencies. The criteria for selecting the currencies in the basket include the usability of currencies in accordance with Article XXX (f) of the IMF, and are also those issued by the member countries or unions whose exports of goods and services during a five-year period are adjudged to have the largest value. The weight assigned to each currency in the basket depends on the value of exports of goods and services and the amount of reserves denominated in the currency. The currency basket is reviewed every five years. The method used by the IMF to determine the weekly SDR interest rate is also based on a weighted average.

Specific/Diffuse

Specific and diffuse are concepts from the work of Dutch author Fons Trompenaars and British writer Charles Hampden-Turner, as explored in their management philosophy best sellers *Riding the Waves of Culture: Understanding Diversity in Global Business* (1997) and *Managing People Across Cultures* (2004). Trompenaars is a specialist in the field of cross-cultural communication, an interdisciplinary field that studies the communication differences among—and between—different cultures. Though incorporating academic disciplines, the field originated in international business, when corporate representatives abroad found that knowing the language was not enough to communicate effectively, and that the things at the heart of the cultural differences they

The difference between specific cultures, which put sharp dividing lines between work and personal life, and diffuse cultures, which do not, means that Americans doing business abroad need to be aware of the import of preliminary social activities.

encountered were more significant than simply chopsticks-versus-cutlery etiquette.

Trompenaars and Hampden-Turner developed a model of culture with seven dimensions; every culture can be described according to its position in those seven dimensions: universalism vs. particularism; individualism vs. collectivism; neutral vs. emotional; specific vs. diffuse; achievement vs. ascription; sequential vs. synchronic; and internal vs. external control. The first five govern the ways people interact with each other, the sixth governs time orientation, the last reflects the attitude toward the environment and general surroundings.

The differences described by these dimensions are often so deep that it can take a visitor a long time to even recognize that they are present; they may realize that something is off about their interaction in the foreign culture, but ascribe it to a language barrier, a lack of local intimate social group, or some other cause, because the expectations inculcated by these dimensions are so fundamental that it often does not consciously occur to us that they even are expectations. To expect someone to knock on a door before entering means being aware that knocking is a choice, that it is possible not to knock; that is merely etiquette, and deviation is empirical, concrete, easy to notice and articulate. What Trompenaars and Hampden-Turner attempt with their model is to articulate much of that which has remained unsaid about variations among and amid cultures.

The specific/diffuse dimension describes the extent to which people get involved with each others' lives—that is, the extent to which their life transpires in intersecting or nonintersecting layers or spheres. Trompenaars and Hampden-Turner provide the example of two bosses. One, when employees run into him at random in the mall or some other nonwork situation, may be greeted informally, spoken to informally, given less personal space. The other, when encountered in a nonwork situation, is still deferred to—is accorded some degree of respect in matters that have nothing to do with his job, treated as if his opinion has more weight, and this may even be true of people who don't work for him. Though the United

States is considered a culture of the former type—the specific type—there are nevertheless plenty of Americans who find themselves in the position of the latter, such as certain celebrities. Ian Fleming's James Bond novels, for instance, became American best sellers when Jack Kennedy revealed an affection for them, and Ronald Reagan's inclusion of Jelly Belly jelly beans in his inauguration celebration helped to propel that brand to national success.

When we describe the difference in terms of respect, it starts to sound like a class system, which is misleading. What is going on is whether one's reputation is specific (confined to context) or diffuse (permeating the rest of the areas of one's life). This affects, for instance, how much you expect to know about the personal lives of your coworkers, and how likely you are to interact with them socially outside work. Specific cultures put sharp dividing lines between work and personal life. Diffuse cultures do not. In Germany, for instance, the wife of a doctor will be called Frau Doktor just as he is called Herr Doktor—the title permeates just as the husband's surname does, and for the same reason: it is that much a part of him, as is she.

There is an online example of the difference between specific and diffuse approaches in the social networking sites Facebook and Myspace. Myspace groups all friends together without differentiation, except the ability to add "top friends," and some limited content filtering. It is essentially diffuse. Facebook, on the other hand, categorizes friends as workmates, roommates, significant others, schoolmates, family, and so on, and actively encourages the use of this differentiation, while optional applications allow for the mapping of acquaintanceship to show that Bob married Carol who went to school with Ted who lives with Alice who works with Bob.

Specific cultures are likely to keep business and personal life separate, while workmates and business acquaintances in diffuse cultures will want to know each other in nonbusiness contexts and consider that necessary in order to have a grasp of each other's character. This is one of the communications barriers overseas workers can run into; keeping to oneself or avoiding answering questions that seem intrusive in a diffuse culture can make one seem standoffish, cold, or awkward, regardless of personal charisma or social skills. Americans doing business with visiting foreigners often find that business negotiations only really begin once "the ice has been broken" somehow, which may take days of wining and dining, taking in a baseball game, and visiting nightlife hotspots.

On the other hand, while one's character permeates deeper in a diffuse culture, Trompenaars and Hampden-Turner describe the boundary of private space as being more severe. The French favor high windows and high fences, making a stronger boundary marker of private space. Trompenaars describes his own discomfort with an American friend helping himself to a beer in the refrigerator after it is offered; even though Trompenaars (from a diffuse Dutch culture) had invited him to have the beer, it was a breach of his expectations for an acquaintance to open the refrigerator instead of waiting to be served. In certain diffuse cultures, it may be strictly inappropriate to ask certain questions—such as about religious or political beliefs—of anyone who is not an intimate. Non-Americans often comment on the confessional nature of American culture, in which a virtual stranger may reveal sexual details, sometimes for no apparent reason except to make small talk—while those same Americans might be just as put off by moving to a culture where coworkers live in the same apartment building, and have fewer barriers between personal and work life.

Spot Market

A spot market is a real-time market for the trade of commodities or securities, where the transactions are conducted instantly, in contrast with the futures exchange or the forward market, where a price is agreed upon for a transaction that will occur at a specified point in the future. The spot market, then, is the one that operates most like ordinary retail markets, with cash exchanged for goods "on the spot." The spot price is the price for which something sells on the spot market, and is relevant in futures/forward trades as well as other considerations.

The internet and other technological advances have increased the importance of the spot market in commodities. Assets can be bought and sold repeatedly throughout the day, because of the lack of a need to take the time to physically transfer them back and forth. Even so, a delay is sometimes built into the way the market works: the spot market is especially huge in the foreign exchange market that has become the subject of such intense speculation in the last few decades, but on that market there is a two-day delivery date, a length of time originally chosen because of the time it took to physically deliver currency from one bank to another. Spot transactions are the second-most common on the global foreign exchange market, after swaps. Foreign exchange transactions are conducted with currency pairs: the transaction currency (the currency the buyer is paying in) and the counter currency (the currency that is being purchased), though this is somewhat a matter of perspective, since each party is both a buyer and seller.

The spot market has also become important to the energy market. Suppliers with surplus energy or natural gas can use the internet to instantly locate prospective buyers, negotiating prices—often almost instantaneously thanks to the algorithms in automated auction-style bidding systems (buyers can dictate ahead of time that they are willing to pay up to a certain amount for a certain quantity, without needing to be there to monitor the market, just as systems like eBay will increase the user's bid as necessary up to a specified maximum bid). The energy can then be transferred to the customer within minutes of the surplus being identified, an extraordinary acceleration compared to the pace at which transactions transpired when trading floors were the only venue for spot markets. Some energy markets mandate spot price pools, which are independent exchanges that pool the bids and prices of various buyers and sellers in order to set fair values, with the goal of "clearing the market," making transactions rapid and facilitating quick exchanges.

There is no single spot market for most commodities, and markets are less interlinked than stock exchanges. They can be privately operated, organized by industry agencies, or government operated, and may be available to the public, authorized brokers, or specific members, depending on the nature of the exchange and the commodity. Spot prices are generally publicly available, and affect other markets and exchanges by acting as a barometer by which the value of a thing can be estimated.

Though ownership transacts instantly, delivery and payment may be delayed some, depending on the market. As stated, foreign exchange has a two-day delivery; crude oil can have a delivery of up to a month; while energy delivers within an hour. In all cases, the spot price paid is the price set at the time of the transaction, regardless of whether anything impacts the value during that brief period before delivery.

Spread

Spread denotes the ability of an investor to trade in the market by being able to request to sell or buy financial assets/commodities at ask or bid prices, respectively. The difference between ask and bid prices is called spread and reflects liquidity available in the market. The larger the spread, the less willingness there is to trade in the respective asset. An alternative definition of the spread is related to the strategy that involves the simultaneous use of two or more options of the same type. These option positions are taken to profit from short-term movements. However, profits can be made even if the stock price does not diverge from a specific exercise price.

Market makers are in charge of supporting liquidity in the market. As a reward, they can purchase assets at the bid price and sell them at the offer prices. Before the reduction of the tick size, that is, the minimal price increase, from one-sixteenth of a dollar to one cent in 2001 at the New York Stock Exchange (NYSE), this strategy could have provided the market maker with significant profits. Specialists at NYSE also post bid and ask depth, which is determined by the volume of securities offered and requested at various ask and bid prices. The lower the difference between prices and the larger the volumes offered at each price, the greater the depth. The existence of the bid and ask price does not indicate that transactions are exclusively executed at these prices. Bid price is requested by the potential buyer, while the initial offer of the seller is summarized in the offer/ask price. The executed price may be bid, ask, or any other value within a spread. The swings from bid to ask prices and vice versa can lead to noticeable market movements, which was explained as part of a so-called January effect. Selling at a bid price in a seller-initiated trade in December will depress prices compared to an enthusiastic purchase spree at the ask price initiated by a buyer in January.

Albeit rather simple to define, the spread in itself has a challenging structure. Apart from the coverage of the already explained order processing cost for market makers, the spread contains the adverse selection component that reflects the attitude of an uninformed investor faced with informed counterparts. The spread will increase in the state of increased information asymmetry and vice versa. Finally, the third component is determined by the market maker's decision to change quotes in an attempt to hedge inventories as a response to the behavior of other market participants. To evaluate these elements, it is necessary to introduce the notion of a trade spread in which all trades higher than the spread midpoint are buyer initiated and all prices below the spread midpoint are seller initiated.

There are at least four spread trading strategies in the derivatives markets: bull, bear, butterfly, and calendar. In the bull spread, an investor intends to profit from an increase in the price of an underlying asset. The call option with the lower exercise price is purchased, while the second call option with a higher exercise price is sold. The initial loss due to the higher premium paid than received can be reversed if the price of the underlying asset reaches the higher exercise price.

In the bear spread, an investor expects a price decline and the call option with the higher exercise price is bought, while the one with the lower exercise price is sold. The positive difference between premiums is the major income source in this case. The same strategies can be achieved with put options. In butterfly spreads, the highest profit is realized if the stock price is close to the midway exercise price. Two call options with the highest and lowest exercise prices, respectively, are bought, while two call options are sold at the price that is close to the current market price and midway between the previous two exercise prices.

As in the previous two cases, put options can be used with identical purchase/sale steps involved. Unlike in bull, bear, and butterfly strategies, in the calendar spread there is no assumption about the use of options with identical expiration dates. The sale of a call option and the purchase of a longer-maturity call option with the same strike price lead to profits if the stock price is close to the exercise price when the short-term call option matures.

Sprint Nextel

Sprint Nextel, headquartered in Reston, Virginia, is the holding company of a telecommunications corporation that provides wireless and wireline communications services to consumers, businesses, and governments. Sprint Nextel's operational headquarters is located in Overland Park, Kansas. Sprint Nextel was formed through a merger of Sprint and Nextel announced in December 2004 and approved by regulators on August 3, 2005. Sprint Nextel employs approximately 60,000 people worldwide serving 54 million subscribers. Net operating revenues for fiscal year 2007 were approximately $40,146 million.

The logo from the merger of Sprint and Nextel, which was approved by regulators on August 3, 2005.

The Sprint Corporation was founded as the Brown Telephone Company by Cleyson Leroy Brown in Abilene, Kansas, in 1899. After emerging from bankruptcy in 1938, the company name was changed to United Utilities. The company grew throughout the midwestern and southern United States and changed its name in 1972, to become United Telecommunications.

In 1984 United Telecommunications announced its landline network would be converted to a 100-percent digital fiber optic network and would offer extraordinary clarity. By 1986, the long distance division, Sprint, was the first coast-to-coast fiber optic network. Sprint promoted its sound quality through a well-known series of "pin drop" advertisements and commercials. In 1992 United Telecommunications changed its name to Sprint Corporation. Also in 1992, Sprint became the first carrier to offer commercial internet access.

In 1987 entrepreneur Morgan O'Brien founded a company named Fleet Net. The company established itself as a nationwide provider of wireless communications, and by 1993 had changed its name to Nextel. Nextel subsequently merged with Dial Call and OneComm, and acquired all of Motorola's specialized mobile radio (SMR) licenses for the United States. With the infusion of a billion-dollar investment by wireless pioneer Craig McCaw, the company created the Nextel phone that used Motorola's iDEN technology, providing enhanced digital cellular, two-way radio, and text/numeric paging in one phone. The iDEN service was introduced as the

Nextel National Network in January 1997. By 2000 Nextel Worldwide offered all-digital wireless coverage in the United States and 70 other countries. In 2002 Nextel became the first carrier to offer live streaming video services.

Sprint Nextel uses a number of network technologies to provide its products and services. Sprint Nextel's networks include its nationwide Sprint personal communications service (PCS) network; its code division multiple access (CDMA) national Nextel network; its integrated digital enhanced network (iDEN); its fourth-generation mobility network using worldwide interoperability for microwave access (WiMAX) IEE standard 802.16e-1005; and its global internet network, a Tier 1 internet protocol (IP) backbone.

The Sprint PCS network has a voice calling area that covers more than 295 million people in the United States, Puerto Rico, the U.S. Virgin Islands, and Guam. The CDMA global system for mobile communications (GSM) provides international roaming for customers in over 160 countries worldwide. Sprint's mobile broadband network, evolution-data optimized (EV-DO), connects to more than 224 million people in 13,000 cities and more than 1,100 airports in the United States (its overlapping and faster EV-DO Rev A network provides services to over 212 million people in over 10,700 communities). Sprint Nextel's National Nextel Network is an all-digital wireless network in the United States that reaches 264 million people in 297 markets.

Sprint Nextel is regulated at the national level by the Federal Communications Commission (FCC) and in certain states by public utilities commissions. The FCC oversees the licensing, acquisition, construction, operation, and sale of wireless spectrum and operations. The FCC licenses Sprint Nextel for its 1.9 gigahertz (GHz) CDMA network, its 800 and 900 megahertz (MHz) iDEN network, its 2.1 and 2.5 GHz broadband radio services (BRS), as well as other licenses currently not utilized by its networks.

Sprint Nextel offers an array of technological advances to its customers in the rapidly changing telecommunications markets through its use of strategic alliances recognizing its own strength of expertise as being in wireless and wireline networks. Sprint Nextel partners with the following companies for various projects:

- Alcatel Lucent to provide mobile broadband services
- Cisco Systems to provide managed network telephony and security as well as third-generation wireless and wireline voice, video, and data integration
- Hewlett-Packard to develop embedded mobile technology solutions
- IBM to provide software assets and business process knowledge to its mobility framework
- Microsoft to provide business applications and network security
- Nortel to leverage telephony network management services
- Northrop Grumman to provide secure networks for the needs of local governments, state governments, and the federal government

As of December 31, 2007, Sprint Nextel had consolidated assets of approximately $64.1 billion and shareholder equity of $21.3 million. As of February 2008, Sprint Nextel had about 53,000 Series 1 common stock record holders and 11 Series 2 common stock record holders.

Sri Lanka

Sri Lanka was known as Ceylon until 1972. The modern name, Sri Lanka, is a reference to the Indian epic *Ramayana*, in which the island is named Lanka. The "Sri" prefix is a common term of respect in south Asia. Sri Lanka lies at the crossroads of the Indian Ocean and its early history consists of repeated migrations of peoples from the Indian mainland. Throughout some of India's history, kingdoms in south India were powerful enough to control parts of Sri Lanka. In 1505 a Portuguese fleet landed on Sri Lanka and controlled most of the island in just over 100 years. Portuguese control was replaced by the Dutch and later the British. From 1796 until 1948, Ceylon remained part of the British Empire. Ceylon achieved its independence from the British Empire on February 4 without the violence that had been prominent in India. However, tensions between the Sinhalese and the Tamil populations would increase and eventually lead to civil war between them.

Sri Lanka lies off the southern tip of India and is separated from the mainland by the Palk Strait. It is separated by only 35 km (22 mi.) from India. Sri Lanka is 65,610 sq. km (25,332 sq. mi.) or approximately half the size of New York State or slightly larger than West Virginia. Sri Lanka has a population of about 22 million, but since the 1980s, several hundred thousand Tamils have fled to Western countries. There are eight provinces that Sri Lanka is divided into: Central, North Central, North Eastern, North Western, Sabaragamuwa, Southern, Uva, and Western. In 2006 the Supreme Court ruled void a presidential directive merging the North and Eastern provinces. The merger is seen by some as a prerequisite to settling the conflict between the Tamils and the Sinhalese and a parliamentary decision on the issue is pending.

A new constitution for the Democratic Socialist Republic of Sri Lanka was promulgated on September 7, 1978. The executive president is directly elected for a seven-year term renewable once. The Parliament consists of one chamber, composed of 225 members who will next have elections by 2010. The prime minister and other ministers, who must be members of Parliament, are appointed by the president. Sri Lanka's legal system is highly complex because it is a mix of English common law, Roman-Dutch, Kandyan, and Jaffna Tamil law. As such, it has not accepted compulsory International Court of Justice (ICJ) jurisdiction. Judges for both the Supreme Court and the Court of Appeals are appointed by the president.

Sri Lanka is a member of the United Nations (UN), World Trade Organization (WTO), the Commonwealth, the International Organization for Migration, the Asian Development Bank, the Colombo Plan, and South Asian Association for Regional Cooperation (SAARC). Its defense consists of an army, navy, and air force. Twenty years of civil war have severely affected the socioeconomic status of Sri Lanka's peoples. Interregional commerce has been disrupted, poverty has increased, infrastructure has been damaged, and public finances have been weakened as a result of the continued conflict. However, a peace process was initiated in 2002 and since then, the government has embarked on reforms in order to rekindle the economy. Some of those reforms include privatization, amendment of bank laws, restructuring of financial markets, flotation of the exchange rate, and the introduction of a value-added tax system. Furthermore, in 2003, the international community promised aid worth $4.5 billion, which was to be disbursed from then until 2007 as long as the peace process continued. In 2006 fighting intensified and the government took control of the Eastern Province area in 2007. In January 2008, the government officially withdrew from the cease-fire and now actively engages the Tamils in the northern portion of the island.

Expanded port facilities are planned in Colombo, Sri Lanka, to take better advantage of the island's strategic trading location.

On December 26, 2004, a tsunami hit Sri Lanka and, along with a significant loss of human capital (31,000 lives), caused an estimated $1.5 billion in damages. Sri Lanka's gross domestic product (GDP) per capita is $4,100 (2007 estimate). Agriculture makes up 16.3 percent, industry 27 percent, and services 56.6 percent of its GDP, respectively (2007 estimates). The United States is its largest export partner, followed by the United Kingdom and India, followed by China. The ruling Sri Lanka Freedom Party is trying to reduce poverty by steering investment to disadvantaged areas, promoting agriculture, developing small and medium enterprises, and expanding the already enormous civil service. Currently, the government has halted privatizations. Around 800,000 Sri Lankans work abroad, most of whom are in the Middle East (90 percent). These expatriates send home more than $1 billion a year in remittances. The continued persistence of the Tamil Tigers of the north and east for an independent sovereignty continues to hinder the optimal progress of the economy. The major religion is Buddhism, with almost 70 percent of the population subscribing to it, followed by Islam.

Staffing Levels

There are different levels of international employees around the world. An expatriate is an employee who is sent by a company in one country to manage the same company's operations in another country. There are three types of expatriates: parent country nationals (PCNs), host country nationals (HCNs), and third country nationals (TCNs).

PCNs are employees who are born and live in the parent country. These employees tend to be responsible for starting up operations at locations in another country. A hiring manager is responsible for staffing the operations with employees who can adapt to the new environment and be self-motivated. Some of the desired characteristics of a candidate include work experience with other cultures, knowledge of multiple foreign languages, and extensive travel overseas. However, some multinationals are concerned about hiring too many PCNs, given the additional expenses that are incurred by the company. For example, the multinational corporation (MNC) will have to consider costs such as relocation expenses, cultural training, housing assistance, taxation allowances, incentives and rewards, and family issues. HCNs are employees who were born and raised in the host country. MNCs have found that hiring managers from the host country is an opportunity to build good public relations with the citizens of that country. This approach shows an economic commitment on the part of the MNC by providing local citizens with the opportunity to gain employment and fueling the local economy. Another incentive is that hiring an HCN is not as costly as hiring a PCN. TCNs are employees who were not born or raised in either the host or parent country but work in the host country. These candidates tend to be pursued when there are jobs that require a certain level of expertise and skills to perform certain jobs.

Different countries will utilize different combinations of these employees to staff their international operations. Four of the major approaches include the following:

1. Ethnocentric staffing approach: The staffing plan is dictated by the MNC's values, attitudes, practices, and priorities. The corporate office is responsible for establishing human resource policies and practices as well as selecting candidates who will be equipped to provide leadership to the subsidiaries in other countries.
2. Polycentric staffing approach: Although the corporate office may make all of the hiring decisions, there is consideration for the needs of the local subsidiaries. In addition, the policies and practices are developed at the local level to meet the needs of the local citizens filling the jobs. Although the locals are selected for managerial positions, it is rare for these individuals to be promoted to the corporate office. These employees tend to be promoted to positions at the local level only.
3. Regiocentric staffing approach: Human resource policies and practices are dictated by the needs of the region. The approach utilized is similar to what occurs in the polycentric staffing approach. However, there is a broader territory—it is regional versus local. Therefore, there are opportunities to hire and promote workers to regional levels.
4. Geocentric or global staffing approach: The multinational's focus is to look at the "big picture" and develop a plan that provides optimal utilization of all resources, not just human resources. Local and regional concerns are not given priority; rather, they are given equal weight as some other factors in the decision-making process. Staffing practices are developed at the corporate level and the selection process is based on a global pool without regard to a person's country of origin or cultural background.

When considering these approaches, the organization must consider issues such as the following:

- National concerns: MNCs are expected to work within the legal parameters of the host country. Therefore, it is essential to be aware of the local employment law policies and practices.
- Economic concerns: The MNC has to consider cost of living expenses (i.e., housing, food, incentives, and rewards).
- Technological concerns: Given the increased use of technology in business operations, MNCs will need to determine if the host country's workforce has a skilled pool of potential candidates.
- Organizational concerns: The MNC's level of internationalization as well as the product life cycle are two important factors evaluated when determining staffing needs.
- Cultural concerns: It is imperative that the corporate office considers the differences between the corporate and subsidiary cultures when making staffing decisions and policies.

Organizations will have to decide if it is best to establish the international business function internally or externally. It is important for organizations to assess their current workforce to determine if they will need to rely on expatriates to establish a presence in the host company or whether it is more feasible to hire employees from the host country to minimize cultural and language barriers.

If the organization elects to start internally, it may assign a team to set the budget, ship products, and develop the international marketing plan. However, this can become expensive, so the organization may evaluate two other options. One option is to hire employees from the host countries. Many organizations elect this option to minimize cultural and language barriers and secure labor that is cheaper than its current workforce. If the organization elects to hire employees from the host country, it is important that it assimilates these new hires into its corporate cultural so that they will have an understanding of what the organization values and how it operates.

Standard International Trade Classification

The Standard International Trade Classification is a classification system maintained by the United Nations Statistics Division. The system is used to provide a standardized classification of imported and exported goods, in order to make it feasible to compare sets of import/export data regardless of country, and to have accurate data about international trade. Although Revision 4 of the classification was written in 2006, Revision 3 remains the standard in international usage. Both versions follow the same essential hierarchy, with each digit adding further detail: the first digit indicates the Section; the second, the Division; the third, the Group; the fourth, the Subgroup; and the fifth, the Item. Zero and two Roman numerals are used in order to create 12 sections with single digits.

The first two levels of the hierarchy begin with the following items:

- 0: Food and live animals
  - 00: Live animals other than animals of division 03
  - 01: Meat and meat preparations
  - 02: Dairy products and birds' eggs
  - 03: Fish (not marine mammals), crustaceans, molluscs and aquatic invertebrates, and preparations thereof
  - 04: Cereals and cereal preparations
  - 05: Vegetables and fruit
  - 06: Sugars, sugar preparations and honey
  - 07: Coffee, tea, cocoa, spices, and manufactures thereof
  - 08: Feeding stuff for animals (not including unmilled cereals)
  - 09: Miscellaneous edible products and preparations
- 1: Beverages and tobacco
  - 11: Beverages
  - 12: Tobacco and tobacco manufactures
- 2: Crude materials, inedible, except fuels
  - 21: Hides, skins and furskins, raw
  - 22: Oil-seeds and oleaginous fruits
  - 23: Crude rubber (including synthetic and reclaimed)
  - 24: Cork and wood
  - 25: Pulp and waste paper
  - 26: Textile fibres (other than wool tops and other combed wool) and their wastes (not manufactured into yarn or fabric)
  - 27: Crude fertilizers, other than those of division 56, and crude minerals (excluding coal, petroleum and precious stones)
  - 28: Metalliferous ores and metal scrap
  - 29: Crude animal and vegetable materials, n.e.s.
- 3: Mineral fuels, lubricants and related materials
  - 32: Coal, coke and briquettes
  - 33: Petroleum, petroleum products and related materials
  - 34: Gas, natural and manufactured
  - 35: Electric current
- 4: Animal and vegetable oils, fats and waxes
  - 41: Animal oils and fats

42: Fixed vegetable fats and oils, crude, refined or fractionated
43: Animal or vegetable fats and oils, processed; waxes of animal or vegetable origin; inedible mixtures or preparations of animal or vegetable fats or oils, n.e.s.

5: Chemicals and related products, n.e.s.
51: Organic chemicals
52: Inorganic chemicals
53: Dyeing, tanning and coloring materials
54: Medicinal and pharmaceutical products
55: Essential oils and resinoids and perfume materials; toilet, polishing and cleansing preparations
56: Fertilizers (other than those of group 272)
57: Plastics in primary forms
58: Plastics in non-primary forms
59: Chemical materials and products, n.e.s.

The first two levels continue with the categories of (6) Manufactured goods classified chiefly by material, (7) Machinery and transport equipment, (8) Miscellaneous manufactured articles, (9) Commodities and transactions not classified elsewhere in the SITC, and the categories for gold, which are (I) Gold, monetary, and (II) Gold coin and current coin.

Standardization

Standardization refers to the efforts of companies to offer a common product, to use a common marketing approach, and to make their business activities the same or uniform throughout a particular market such as a country, a region such as Europe or western Europe, or the whole world. Companies pursuing the standardization approach tend to adopt the same or very similar strategies and marketing programs to offer similar goods and services in different markets throughout the world. The global marketing strategy refers to a plan that guides companies in how to position themselves and their products in international markets, what customers to serve, and the degree to which company activities should be standardized or adapted. Therefore, standardization is an element of the global marketing strategy. The importance of standardization for global business comes from the fact that standardization is one major strategy or approach used by companies in their international business operations; the others are adaptation and a mixture of standardization and adaptation. The term *standardization* is sometimes used to refer to global or global integration approach as well.

Strategies

When it comes to developing strategies streamlined for global markets, companies have three major strategy options. The first and perhaps the simplest one is standardization that comes from the geocentric view of the world that assumes that there are more similarities than differences across the markets throughout the world. Therefore, the global strategy, which is based on standardization, is the appropriate strategy to operate in international markets. Its argument is that markets throughout the world have become homogenized and thus companies can offer their goods and services through a high degree of standardization and a low degree of adaptation to meet some local market needs. The standardization approach may be appropriate for products having a high level of competitive advantage in terms of functionality and/or low price.

The second option is adaptation, which states that cultural differences exist among countries; therefore, companies should modify their strategies and offerings according to the local market's conditions and consumer preferences. Thus, multidomestic strategy, which is based on adapting different strategies for each country or region, is the appropriate strategy when operating in international markets. The last option is to use a strategy that is a mixture of standardization and adaptation to get benefits from both markets and products that require standardization and adaptation at the same time to a certain extent.

Which approach is better and used by companies? When we analyze the practices of companies with respect to whether they utilize the standardization or adaptation approach, we cannot determine precisely which one is mostly preferred because companies differ in their choices of the standardization and adaptation approaches.

A chronological analysis shows that during the 1950s, the adaptation approach was preferred because companies were not familiar with international markets and consumers. Lack of information as to the purchase behavior of consumers in different markets may have discouraged companies from adopting standardization because companies may have thought that consumers were not the same; therefore, companies preferred the adaptation approach. Companies got more and more knowledge about international markets and consumers as time went by and therefore they were able to see similarities among consumer preferences across markets throughout the world. This led to the replacement of the adaptation approach with the standardization approach during the 1960s. However, the adaptation approach became popular again during the 1970s because of increasing nationalistic tendencies.

Recent Developments

The 1980s were the years in which the world witnessed the birth and growth of many multinationals that favored standardization; multinationals tried to implement similar product strategies across countries. Because the international competition was not intensive at that time and many countries began to abandon their protective and closed trade regimes and adopt liberal capitalistic ones, many multinationals were able to operate in such countries where competition did not really exist and they enjoyed this smooth competition through their standardized products in these markets at that time. However, because global competition is very intense nowadays, many products are available in many markets, and there have been changes in consumer tastes and preferences, so the standardization strategy alone does not always result in the expected performance. Therefore, we see companies currently using a mixture of these two strategies in their international business activities.

One key feature of the global marketing strategy is the extent to which marketing programs are standardized or modified (adapted). Some key elements subjected to standardization and adaptation decisions in international markets are branding, product development, pricing, marketing communications, and distribution. When a company does not yet have international operations, it has its domestic marketing strategy, which refers to various marketing programs of the company in its domestic (own) market. However, as the company acquires more and more international operations in different international markets, the domestic marketing strategy becomes the international or global marketing strategy and such a strategy becomes very complicated because the company now needs to consider local and international rivals, cross-cultural differences in culture, language, religion, living standards, economic and politic conditions, regulations, laws, business practices, and economic and business infrastructure in many foreign markets. The challenge for the company is to determine the activities to be standardized across countries and the ones to be adapted for specific markets.

Standardization, whether full or partial, is a natural process to a certain extent because companies will try to get benefit from their proprietary processes (ownership and production expertise) and scale economies (more production and less unit cost) when it introduces a product to a new market. Therefore, the choice of standardization is inherent to a certain extent in new markets. Moreover, as some markets become similar as a result of globalization and as global competition intensifies, the standardization approach may be preferable. However, in addition to these factors, many other factors affect the standardization choice: Companies need to analyze the nature of products, their own capabilities, the extent to which adaptation is required because of the differences among markets, the structures of foreign markets, the rivals, and the regulations in foreign markets in which companies consider investing. It is normal that markets differ; therefore, some kind of adaptation may complement the standardization approach to get as much benefit as possible from international business operations. For example, the core technology of the product may be standardized while the size, shape, color, additional benefits, price, distribution, and sales terms may be adapted to the foreign market's needs. Computer chips, automotive electronics, color film, pharmaceuticals, chemicals, telecommunications, network equipment, steel, and petrochemicals are some examples of products to which the standardization approach is applicable. However, consumer electronics, automobiles, trucks, watches, toothpaste, shampoo, industrial machinery, toilets, chocolate bars, beverages, and clothing products are some examples of products to which the standardization approach is not much applicable, although exceptions are always possible, especially for prestigious products and brands.

Advantages and Disadvantages

There are many benefits of using the standardization approach. Other things being equal, companies generally prefer to utilize the standardization approach because it is appropriate in getting consistency in customer relationship and design; many companies operate in many countries throughout the world and when companies use the same product features, design, brand name, and packaging across markets, this can help create a universal representation of the products and the consistency among the offerings of the company. Such a consistency also helps create and sustain brand image, which refers to the perception of a company and its products by consumers. As such a perception affects buying behavior, a good and positive perception created through consistency is priceless.

Another benefit of the standardization approach is that when a product is successful in a market, when consumer preferences across markets converge, and when other markets have similar competitive conditions, then the standardization approach in new markets is expected to be successful and cost effective by capitalizing on similarities. The standardization approach is also beneficial in coordinating and controlling various company activities. As companies become international or global, it is hard to coordinate and control many and different company activities throughout the world. If company activities are standardized, then it becomes easier to coordinate and control these various and widespread activities.

However, when companies choose the standardization approach for one reason or another, they may miss some market opportunities. Although some markets are similar, a firm attachment to the standardization approach may not be effective as many markets are fragmented, and adaptation, albeit small, may be necessary to meet the expectations of local consumers. Therefore, it would be wise for companies to assess the advantages and disadvantages of standardization carefully and then determine what to standardize.

Standardization is not a good strategy when companies are required to adapt their offerings according to differences across markets. Culture, industry, legal environment, marketing infrastructure (distribution channels, quality and quantity of retailers, advertising agencies, and media), competition, consumer tastes and preferences, standards, and regulations as to product features may all differ. Such differences thus render the standardization approach not appropriate. In addition, the existence of "not invented here syndrome" in international companies makes the standardization approach not a good option. This syndrome refers to some internal resistance by subsidiaries and affiliates of international companies against the ideas, programs, and plans developed at the headquarters or somewhere else. Therefore, standardized plans and programs may not always be welcomed by subsidiaries and affiliates if such a syndrome exists and the managers of these affiliates are accustomed to autonomy in their decision making.

If full standardization is not viable all the time, then an appropriate question would be "what to standardize?" Strategic decisions that are related to the whole company are generally more standardized. Daily or tactical decisions may not be standardized and thus local managers can be flexible in their decisions. Marketing activities are generally less standardized than other business functions and within marketing activities, some marketing activities such as product design may be more appropriate for standardization than sales promotion. Standardizing corporate image, branding, and product positioning is beneficial as this can provide consistency and unification in company offerings across different markets. When deciding on what to standardize, managers need to consider the basis for customer purchasing behavior, the marketing's role within the company strategy, and the viability of mass customization. If purchasing behavior shows similarities among consumers across different markets, then companies can capitalize on these similarities through standardization.

In conclusion, the standardization approach corresponds to the efforts of companies toward global integration and is generally suitable in such global industries as commodities, industrial equipment, and high technology products. Aircraft manufacturing, pharmaceuticals, credit cards, and chemicals are some examples of such industries in which consumers across markets or segments do not differ much in their preferences. Therefore, companies can adopt the standardization approach by offering identical products and implementing similar programs across different markets. Three major benefits of pursuing the standardization approach are reduction in costs, enhancement in company image, and improvement in planning and control. However, companies generally do not implement standardization alone. Instead, they also use adaptation at varying levels because it is not always viable to pursue one product–one world strategy because of differences in consumer preferences, legal requirements, and competitive conditions.

State Farm Insurance Cos.

The State Farm Group, headquartered in Bloomington, Illinois, is an insurance and financial services company serving the United States and parts of Canada (Alberta, New Brunswick, and Ontario). State Farm's mission is "to help people manage the risks of everyday life, recover from the unexpected, and realize their dreams." The company has a strong reputation based on its values: quality service, quality relationships, mutual trust, integrity, and financial strength. As of 2007, State Farm had more than 17,000 agents, 68,000 employees, and 75 million policies in the United States and Canada. State Farm serves its customers through 13 regional zones. State Farm opened its first Canadian office in Toronto in 1938. For 2007, the combined net worth of the State Farm group of companies was estimated to be $63.7 billion.

State Farm was founded by a retired farmer, George Jacob Mecherle, on June 7, 1922, as the State Farm Mutual Automobile Insurance Company. It initially concentrated on providing automobile insurance for Illinois farmers. Mecherle thought that farmers drove less and had fewer accidents than city dwellers, and thus should pay less for automobile insurance. His founding philosophy for State Farm was based on insurance coverage at a fair price coupled with fair claim settlement. By 1942, State Farm was the largest automobile insurer in the United States and has retained its largest ranking every year since. In 2008 State Farm created its Code of Conduct reaffirming Mecherle's philosophy with its current chairman's statement, "At State Farm, not only do we do what is legal, but we also do what is right." State Farm's well-known theme song "Like a Good Neighbor" was written by composer and entertainer Barry Manilow and debuted in 1971.

State Farm Mutual Automobile Insurance Company is the parent company of a number of wholly owned subsidiaries that provide health insurance, property insurance, life insurance, banking products, and mutual funds. Its automobile business is underwritten by its State Farm Mutual, State Farm Indemnity, State Farm Guaranty, and State Farm Texas County Mutual units. State Farm Indemnity and State Farm Guaranty serve the unique automobile insurance needs in New Jersey, and State Farm Texas County Mutual serves motorists in Texas. Its fire insurance business is underwritten by its State Farm Fire and Casualty, State Farm Lloyds, State Farm General, and State Farm Florida units. These subsidiaries offer homeowners, business insurance, and other lines. Homeowners insurance was first offered by the company in 1955, and by 1966, State Farm was the largest writer of homeowners insurance in the United States. State Farm General provides homeowners and property liability insurance in the state of California, and State Farm Florida provides homeowners and property liability insurance in the state of Florida.

State Farm classifies its health insurance business into five categories: Medicare supplement, disability income, long-term care, hospital surgical, and hospital income. Its insurance and annuity business is underwritten by its State Farm Life insurance Company and State Farm Life and Accident Assurance Company. In 2007, the affiliate units held 7.7 million policies in force valued at $685 million. As of 2007, the combined net worth of the life affiliates was valued at $5.7 billion. State Farm Life and Accident Assurance Company operates to the special requirements for life insurance in New York, Connecticut, and Wisconsin. Its property/casualty reinsurance business is underwritten by its State Farm Mutual unit.

State Farm Bank and Mutual Funds

Chartered in 1998 and launched in 2000, the State Farm Bank offers lending in four areas: vehicles, home equity, mortgages, and credit cards. On the deposits side, State Farm Bank offers savings and checking accounts, certificates of deposit and money market accounts, individual retirement accounts, and health savings accounts. The State Farm Bank is a member of the Federal Deposit Insurance Corporation (FDIC) and is an Equal Housing Lender. As of 2007, State Farm Bank had 1.9 million accounts and assets of $15.9 billion. As a virtual organization, its services are available only through agents, online, by phone, and through the mail.

Its mutual fund business is composed of two entities: State Farm VP Management Corporation and State Farm Investment Management Corporation. These units have approximately $4.6 billion under management, representing over 406,000 accounts. State Farm offers a number of actively managed fund portfolios under the LifePath Funds brand managed by Barclays Global Fund Advisors. These funds offer a time-horizon-based mix of investments in domestic stocks, international stocks, domestic bonds, and money market funds with holdings in 10 asset classes. State Farm also offers a variety of individual stock and bond funds as well as money market funds.

State Grid

With headquarters in Beijing, the State Grid Corporation of China (SGCC) is the provider of electric power throughout China, reaching 88 percent of the country's area. It operates both the electric grid in the country as well as all power plants. In existence since 2002, it is a state-owned enterprise and has 49 subsidiaries as well as the responsibility for managing and operating the Tibet Electrical Power Company. Its 1.5 million employees serve a customer base of 128 million people. Its stated income for 2005 equaled $105.5 billion with profits equal to $21.7 billion. In the same year, it ranked 40th in the Fortune Global 500; the following year it ranked 32nd.

Among the responsibilities of SGCC has been that of bringing electricity for the first time to remote areas of China, a project analogous to that of the New Deal's Tennessee Valley electrification of the 1930s in the United States, only on a much larger scale. In 2006 SGCC brought free electricity to over 545,000 households. In addition to the newly created demand for consumer goods this electrification created, public works such as electrified irrigation pumps were now possible. SGCC has stated its intention to continue this effort to other areas of the country. SGCC has also been involved in international projects. In 2007, it was a partner with the Calaca High Power Corporation in a team that won a 25-year contract to run the Philippines power grid.

Challenges

An important part of SGCC's mission has been to ensure that China's industrial growth, which requires enormous amounts of power, can continue. SGCC's task has not been easy for a number of reasons. Shortages of fuel, inadequacies of infrastructure, and increased demand have combined to create an array of problems that must be solved.

In recent years, China has seen coal shortages that have affected the ability of the coal-fired plants that supply over 80 percent of China's power. Coal supplies (one-third of which came from illegal mines shut down by the government) fell seriously short in 2008. The result was some rationing of power. In addition, the inability of certain companies to produce up to capacity affected the nation's gross domestic product (GDP) as well as causing certain stock prices to fall. The coal-fired power plants connected to the nation's grid are supposed to maintain a 15-day supply of coal. In reality, 541 of these had less than a 12-day supply, while others had a seven-day supply, and others enough coal for only two or three days. The coal shortage combined with increasing demand and infrastructure problems prevent areas with a surplus from transmitting their electricity to areas that need it.

Solving the problem of transporting electricity from remote regions, and some of these have a great deal of available coal or are located where hydroelectric dams have been built, has been an important project for SGCC. In 2007 it proposed constructing and using an ultravoltage power grid that would make the transfer of energy possible from remote regions. The technology to enable these massive transfers exists (having been developed by the Soviet Union years before). It would completely bypass smaller grids between the interior and the coast, where the power is needed. In 2008 SGCC stated that it had awarded a $70 million contract for power equipment that would allow the construction of such a line to run from northeast China to urban areas. The line, which will run in parallel with already-existing lines, will allow the massive transfer of electricity. When completed and online in December 2009, the project will have cost $400 million.

Whatever specific course SGCC pursues, it must further develop and improve its existing infrastructure. The International Energy Agency has stated that China, probably through SGCC, must spend more than $1.5 trillion between 2008 and 2030 to ensure that its electric infrastructure can support growth. The demand for power is so great and will increase so dramatically that even a massive project such as the Three Gorges Dam, which will sell electric power to SGCC, will not be able to supply as high a percentage of the national requirement as had originally been planned.

In addition to developing new ways to increase power supplies domestically, SGCC has brokered agreements with other countries to supply power to China. In 2008 it was announced that SGCC would sign an agreement with Russia's Far East Power Grid to supply 10 million kilowatts to northeastern China. Three years earlier, another similar agreement had been signed with a Russian power grid to supply electricity. A 2008 agreement with Mongolia will result in that nation supplying 12 million kilowatts to northern China. Another agreement has been signed to bring electricity from Kazakhstan to China.

State-Owned Enterprises

A state-owned enterprise (SOE) is a business owned or controlled by a national government. SOEs are a common instrument of government economic policy in both developed and developing countries, although concerns about their costs and performance relative to private firms have led to a worldwide privatization trend since the 1980s. Typically, SOEs have been prominent in transportation, communication, and energy production and distribution, and common in capital-intensive industries including mining and the manufacturing of chemicals, metals, machinery, and transportation equipment. In some countries, SOEs are also found in virtually any other sector of the economy, including banking and finance, trade, consumer industries, construction, and agriculture.

As stated above, an SOE is a business owned or controlled by a national government. SOEs differ from private firms in a variety of ways. They tend to have a variety of objectives, sometimes of a conflicting or contradictory nature. Making a profit is usually one stated objective, but may or may not be the primary one. SOEs are supposed to offer social returns, meaning special benefits to the state's population, and be held accountable by the public through its elected or self-proclaimed representatives. At the same time, SOEs are generally expected to be financially viable and produce goods or services at prices related to their costs, and are thus different from ordinary government services and administration. Their business-like nature also differentiates them from state-owned producers in purely communist regimes without a legitimate private sector.

State ownership of an SOE may be complete or partial, and a company may be considered an SOE even when the government does not own a majority share of the company, as long as the state's minority position is enough to make political intervention possible. From a legal point of view, an SOE may be classified as a government agency subject to general public law, a public corporation (a separate legal entity subject to special statute), a state company subject to private law, or a listed firm with shares owned fully or in part by the government. The three latter organizational forms imply an increasing degree of autonomy from political and bureaucratic interference, but in practice autonomy also tends to depend on a variety of other factors, and especially on the company's financial status.

Historical Origins

The history of government-owned business operations goes back to antiquity, but SOEs as we know them today became widespread between the 1930s and the 1960s. Before that time, SOEs could be found in sectors with natural monopolies, meaning unlimited economies of scale (utilities, infrastructure), or in areas of strategic importance (heavy industry, weapons). With the collapse of international capitalism in the 1930s, however, state ownership and management of enterprises became increasingly popular as a political response to economic challenges. SOEs could eventually be found operating in a wide variety of economic activities, often because decision makers believed that state ownership would lead to more efficient and fair use of resources.

In industrialized countries, SOEs were seen as a solution to market failure and a way to promote long-term growth while limiting vulnerability to short-term business cycles. They were also intended as instruments of social engineering, with the hope of redistributing wealth and power, making business democratically accountable, securing employment, and improving industrial relations. In some cases, the creation of SOEs through nationalization also served to rescue mature industries, thus forestalling social unrest.

In the developing countries that became independent in the decolonization wave of the post–World War II era, SOEs were meant to serve several additional purposes. In general, SOEs were seen as instruments of nation building that were to promote economic growth, industrialization, national pride, and the exclusion of exploitative foreign interests. In many cases, SOEs were meant to engage in "state entrepreneurship" where a culture of private enterprise was missing. Nationalization could also represent a kind of "resource nationalism," with the nationalization of foreign oil operations as one prominent example.

By the 1970s, many had begun to question the performance of SOEs relative to private firms. SOEs incurred heavy losses and burdened states that increasingly found themselves in fiscal difficulties following the oil crisis and the stagnation of the world economy. In response, governments across the globe took steps to reform or privatize large numbers of SOEs. In the

1980s, the United Kingdom and western Europe were early leaders in this process, later followed by Latin America and Asia. In the 1990s, former communist countries in central and eastern Europe became transitional economies intent on privatizing state holdings. By the turn of the millennium, thousands of small, medium, and large SOEs had been sold in part or in full to dispersed private citizens, financial institutions, or multinational corporations. Nevertheless, vast numbers of SOEs remain, and their significance continues to be considerable. This is especially true for the least-developed countries, despite consistent efforts by the World Bank and others to impose privatization programs as part of broader strategies of structural adjustment.

Pros and Cons of SOEs

A variety of arguments have been put forward in defense of SOEs. Many politicians and scholars have held that the ability to introduce other objectives than merely the maximization of profits is an important justification for state ownership. SOEs may be required to provide certain goods and services to all citizens without regard to place of residence or wealth, and to provide continued employment in struggling industries. They may be used to encourage the development of impoverished regions and to resist the influence of capitalist elites and foreign multinationals. SOEs allow government to influence the economy through directing credit and investment, financing efforts in new industries, and encouraging or substituting for private capital accumulation. They may to some extent facilitate macroeconomic planning and enable the government to use SOE investment as an anticyclical measure. SOEs may also be important to foster social cohesion and enhance political legitimacy, especially in developing countries where the state is weak and unstable. In these various ways, SOEs are believed to promote social justice, economic growth, and national integration.

In recent years, arguments illuminating the downsides of SOEs have attracted more attention. Many economists describe SOEs as inefficient and unproductive by design. They believe that some of the market failures SOEs are intended to correct can be solved more efficiently through contracting out or government regulation of private firms. At the same time, they suggest that "government failure" is far more pervasive and harmful than market failure. SOEs are frequently subject to politicization, corruption, and rent-seeking behavior, and the assumption of a benevolent government allowing SOEs to operate at "arm's length" is rarely justified. Critics insist that SOE managers lack incentives to innovate and cut costs, while the multiplicity of objectives causes accountability and responsiveness to be less than optimal. These problems are accentuated by the fact that many SOEs are monopolies, meaning that efficiency is difficult to measure. In general, SOEs are difficult to monitor, and few sanctions are available even when performance is obviously suboptimal—continued losses do not result in bankruptcy, and even nonperforming SOEs continue to have access to credit through state-owned banks or government guarantees. This "soft budget constraint" is often seen as the most important factor explaining the inferior financial performance of SOEs.

The notion that SOEs are suitable instruments of distribution and social justice has also been countered by some critics. If SOEs are inefficient and contribute to long-term distortions in the allocation of labor and capital, they will impede economic growth, crowd out private alternatives, and in practice require large subsidies from taxpayers and consumers to SOE managers and workers. Thus, they also contribute to government deficits and inflation while artificially raising SOE wages. Such high wages may create economic dualities in developing countries, where poverty is most prevalent outside the modern sector. In this view, the distributional effects of SOEs may be primarily to reward special constituencies and (in low-income countries) to create a small "state bourgeoisie."

It is, of course, very difficult to determine how successful SOEs have been throughout history. The many different goals and purposes of these organizations make it inherently difficult to judge their performance or even decide how it should be judged. However, this has not discouraged observers from trying to assess SOEs from a variety of perspectives. The building consensus, based on hundreds of empirical studies, suggests that SOEs often have done poorly in terms of productivity and financial results, and that they have drained state budgets and national credit markets, with deleterious consequences for private businesses and the citizenry at large. Mainstream economists in particular tend to employ highly negative characterizations of SOEs, and politicians, too, seem to have reached a point of disillusionment. The next section provides a brief overview of the development paths of SOEs in some key countries to highlight the diversity of experiences with SOE as an instrument of economic policy.

SOE Trajectories

Western Europe has been remarkable both for its faith in SOEs in the 1930s to 1970s and for the high volume of privatization after 1980. Italy was an early leader in nationalization, prompted by the crisis of the 1930s to set up the massive, state-owned holding company IRI. Originally a temporary fix to rescue the banking system, IRI eventually became a permanent feature of Italy's political economy. The holding company branched out into a variety of manufacturing sectors and served as a major instrument for industrial development in Italy after World War II. IRI at the height of its powers owned hundreds of companies, with the total number of employees in IRI holdings surpassing 500,000. As late as the 1980s, fixed investment in IRI companies exceeded the fixed investment in all private industry in Italy. IRI subsidiaries were involved in shipbuilding, steel, engineering, biomedical industry, biotechnology, aerospace, food processing, cement, telecom, the operation of toll roads, shipping, banking, and financial services. In 1953, IRI was joined by ENI, a holding company in the oil and gas sector, and in 1964 by EFIM, a third holding company with interests in the production of trains, helicopters, aluminum, and glass. Many of the subsidiaries of IRI and other holding groups were in fact competitive and productive firms, but over time it proved difficult to achieve financial self-reliance. By the early 1980s, the Italian government was transferring amounts equivalent to billions of dollars a year to the holding groups. The steel subholding Finsider struggled even after cutting the workforce by 50,000, and the government had to write off almost $800 million of automaker Alfa-Romeo's debt. In the end, a program of privatization was implemented in the 1990s.

In the United Kingdom, the main drive toward SOE took place immediately after World War II, but it lasted in some respects until the election of Conservative prime minister Margaret Thatcher in 1979. Between 1946 and 1977, Labour governments pushed to nationalize coal mining, railroads, airlines, utilities, iron and steel manufacturing, and the building of automobiles, ships, and airplanes. The 1940s introduction of SOEs in coal, rail, and energy alone affected 2 million British workers. Unlike in Italy, however, government involvement in most manufacturing sectors and in banking remained limited. The relative productivity of British SOEs has been the subject of some debate, but the financial record was poor. In the 1980s, the Thatcher government spearheaded the worldwide drive toward privatization. The goals of the privatization program were to raise revenue, promote efficiency and competition, reduce government control of the economy, and develop the capital market by encouraging widespread ownership of stocks. This program was in general successful and popular, and offered evidence that the privatization process itself encouraged a positive change in organizational focus. By the time Labour returned to power in 1997, SOEs had ceased to be a factor in the British economy.

In France, some SOEs had been established in the 1930s, and more widespread nationalization followed World War II. Wartime collaboration with the German occupying forces and strong faith in collective solutions justified the takeover of airlines, large banks and insurance companies, the entire energy sector, as well as 20 percent of the manufacturing sector. A new wave followed in the early 1980s, following which SOEs existed in most sectors of the economy. As in other European countries, SOEs in banking, telecom, energy, and heavy industry were especially important, but the most impressive feature of state ownership was its near-ubiquity. The 1981–82 nationalization drive took 53 percent of corporate capital in France out of private hands. However, the election of a center-right government in 1986 led to an almost equally sudden reprivatization, with the sale of 22 major companies. At this point, key SOEs such as Renault, Air France, Credit Group Lyonnais, and the steel industry were experiencing severe problems and imposing great burdens on government budgets. By the late 1990s, even the Socialists had lost some of their faith in SOEs, and Prime Minister Lionel Jospin oversaw the privatization of France Télécom.

Since World War II, SOEs have played a comparatively modest role in the three remaining giants of industrial capitalism, that is, the United States, Germany, and Japan. In the liberal market economy of the

United States, many of the tasks performed by SOEs elsewhere have been handled by regulatory regimes or public enterprises at a subnational (state or municipal) level. In the Federal Republic of Germany, state ownership and interference was to a considerable extent discredited by the Nazi regime. The public offerings of Volkswagen and VEBA in the 1960s were early predecessors to the much later drift toward privatization in other Western countries.

Asia

Japan, too, avoided extensive nationalization following World War II, despite a generally statist orientation. SOEs were largely limited to the so-called system of three public corporations and five governmental departments. This did, however, include important activities in transportation (railroads, aviation) and communication (telephone and telegraph systems), as well as monopolies in tobacco and alcohol. These SOEs tended to be overstaffed, yet they were notorious for providing poor customer service. A public commission established in 1981 suggested major reforms of Japanese SOE, and partial privatization began in the mid-1980s. The $40.6 billion third tranche offering of Nippon Telegraph & Telephone (NTT) in 1987 was the largest single security offering to date, and the partially privatized NTT rapidly emerged as the world's second largest listed telecom company. Both NTT and the Japanese railroad system, unbundled into seven distinct corporations, showed improvements and used their newfound freedom to diversify into related business areas. NTT alone set up 85 new business entities in its two first years. However, the sell-off of NTT, the Japanese railroads, and other SOEs proceeded quite slowly, primarily because the stagnation of the Japanese economy had reduced the absorptive capacity of the stock market.

Elsewhere in Asia, many of the countries that became independent in the 1940s and 1950s had "legacy" SOEs that had been established by colonial powers. South Korea and Taiwan, for example, had SOEs in transportation, communication, energy, and other sectors created as colonial enterprises by the Japanese. However, these countries soon added to their existing holdings by creating new SOEs. In South Korea, there was an emphasis on heavy and chemical industry, which were seen as strategically important sectors where risk and capital needs were too great for private investors. The Taiwanese government offered strong support for SOEs in oil, electricity, and steel in order to support export industries with raw materials and intermediate goods. In both countries, SOEs were used to encourage rapid, state-directed industrialization.

Although South Korea and Taiwan achieved phenomenal growth, many other Asian countries relied heavily on SOEs with much less success. In South Asia, SOEs mushroomed after independence, with state ownership common across virtually every sector of the economy in India and Pakistan. Indian SOEs were dominated by noneconomic objectives, often devoid of cost control, and in many cases so vast as to create significant diseconomies of scale. SOE performance was consequently very weak. Considering that in the 1980s, 22 of India's 25 largest firms were SOEs, the negative effect on growth and development was substantial. Reform and privatization began in the 1990s. In Bangladesh, SOE sales began earlier, but as privatized firms continued to rely on the extremely lax banking practices of state banks, performance failed to improve. In fact, rent seekers were able to buy up SOEs with government money without any real commitment to pay debts or even taxes.

In Indonesia, state control of natural resources and strategic industries is required by the constitution. The oil revenue windfall in the 1970s turned many Indonesian SOEs into industrial giants, as oil revenues were deposited in state banks closely connected with state-owned industries. By the 1980s, Indonesia had more than 200 SOEs in sectors as diverse as banking, insurance, manufacturing, mining, agriculture, utilities, transportation, and trade, with a majority being monopolies. Since privatization of SOEs runs counter to Indonesian core values and national identity, a more modest approach of granting increased autonomy and exposing SOEs to competition has been the preferred and relatively successful approach of reformers since the mid-1980s. By contrast, the government of Malaysia has pursued a more aggressive privatization policy to divest itself of many of the more than 1,000 SOEs accumulated between 1957 and 1985. In Malaysia, the development of public enterprises has been linked with promoting the status of the Malay population (in the face of economic dominance by ethnic Chinese) since the 1969 race riots. Consequently, the privatization program also included strict restrictions on foreign and non-Malay ownership.

Since 1978, China has been through a process of liberalization leading from a system without private enterprise to a "socialist market economy." A process of separating governing and business, offering greater autonomy and more incentives to SOEs and their managers, began in the 1980s. However, the positive effects of these changes proved to be temporary. In 1992, SOE losses and subsidies ate up 62 percent of state revenues. A new policy of partial privatization was developed, leading to insider buyouts of many small SOEs and public listing of larger firms. In 2001, public offerings of major oil companies, banks, and telecoms ensued, and since 2005 the Chinese government has been determined to further decrease the state's holdings in large firms. However, the government still retains a controlling share in most companies listed on the stock exchanges, either directly or through state investment organizations known as "Legal Persons." Outsiders, therefore, continue to question the independence, transparency, and quality of corporate governance in leading Chinese companies.

Latin America and Africa

In Latin America, the development of SOEs has been based on an "organic-statist" approach to political economy, emphasizing moral obligations and economic interdependence within the political framework of "presidential patrimonialism." In Brazil, SOEs have been important in heavy industry, transportation, and utilities, and in such a large country, the economies of scale inherent in capital-intensive industries have allowed a modicum of success and many consistently profitable SOEs. However, the promotion of costly, import-substituting SOEs in Latin America in the 1970s also contributed to the grave debt crisis of the 1980s. Right-wing regimes in Chile and Argentina were pioneers of privatization already in the 1970s, and other Latin American countries have followed in their footsteps in the decades since (partly due to intense World Bank and International Monetary Fund [IMF] pressure). In many cases, these transactions took the form of debt-for-equity swaps, because SOEs carried most of the external debt. The immediate social cost of privatization (and liquidations) was often high, as in Mexico, where 400,000 SOE jobs were lost between 1983 and 1993. Latin America has arguably experienced the most radical privatization process of any market-economy region over the last 25 years. Mainstream economists tend to think of this process as successful and necessary, but the consequences of privatization have proved extremely unpopular in many Latin American countries.

African governments embraced SOE as a political and economic tool when independence came in the 1950s and 1960s. However, their poor performance and the accumulation of deficits and debts, combined with external pressure, resulted in 43 African countries having divestiture programs by 1992. Yet privatization in Africa is difficult because of a lack of capital markets, persistent economic troubles, and weak institutional frameworks. In Nigeria, the government embarked on a privatization program in the late 1980s, with the ambition of relieving the fiscal burden and encouraging private initiative in hydrocarbons, paper and pulp, sugar, and so forth. However, the sales have raised little revenue, and private entrepreneurship still leaves much to be desired. In general, SOEs remain pivotal and the private sector weak in most African countries.

Privatization: Progress and Pitfalls

Between the early 1980s and the early 21st century, governments around the world earned more than $1 trillion from the sales of SOE shares and assets. The global SOE share in GDP consequently dropped by an estimated one-half. In many cases, these sales were opportunistic, designed primarily to raise revenue or gather political support. In the worst cases, they were flagrant examples of corruption, allowing well-connected individuals access to significant assets at nominal costs. Outside pressure and a "bandwagon" effect also affected privatization programs. However, in most cases, privatization followed from an increasing concern with the performance of SOEs and a drastic devaluation of their merits since the mid-20th century. Governments found that the benefits of SOEs did not justify the costs.

Most scholars who study privatization agree that privatization "works," in other words, it tends to improve efficiency, productivity, and returns. The best results have been achieved when privatization has been combined with other reforms, such as deregulation and increased competition. In some cases, privatization without other reforms and appropriate institutional safeguards may have disastrous consequences, especially in developing countries where the operating conditions for private enterprise can be dismal. Privatization can also lead to unemployment, poverty, social problems, and political protest. Hence, it is reasonable to expect that SOEs will continue to play an important role in many countries for years to come.

Statoil

The former Norwegian petroleum company, Den Norske Stats Oljeselskap AS, was founded on July 14, 1972, and operated as a private limited company wholly owned by the government of Norway after a unanimous act of parliament passed by the Norwegian Stortinget. It came about after the discovery of large deposits of offshore oil and the Norwegian government was keen to take part in exploitation of oil on its continental shelf. Its initial managing director was Arve Johnsen.

The theory of oilfields in the North Sea led to problems about how these might be exploited, but these were largely academic until December 1969 when Phillips Petroleum, an American independent company, was able to map out the Ekofisk field in the Norwegian sector of the North Sea. Phillips negotiated a flat 10 percent royalty fee from the government, plus taxes. Initially, the Norwegian government was not sure how to exploit this, but it founded Den Norske Stats Oljeselskap AS—known as Statoil—to do this, using the expertise of other oil companies that would be hired on a contractual basis. This kept the control—and also the profits—with the Norwegian government, a move that became more important with the discovery of other oilfields such as the Statfjord one, which was then estimated to have 2 billion barrels, soon after the mapping of the Ekofisk oilfield.

The other economic imperative driving the decisions by the Norwegian government was that the oilmen should be Norwegian. To proceed, they moved far slower than their British counterparts who sought to exploit their oilfields in the North Sea as quickly as they could. The British were keen for the oil to save them from having to import increasingly costly oil—the price having quadrupled—and were in a precarious financial position. The Norwegians, by contrast, with a much smaller population, recognized that they would become self-sufficient in oil by 1975. They were helped by the fact that, at that time, 55 percent of all power in the country came from hydroelectricity. Initially, most of the oilmen operating in Norway were foreign, but the Norwegian government introduced a program of systematic training, and by 1974, four out of five of the oilmen working in Norway or in Norwegian waters were Norwegian.

In August 1975, to ensure greater Norwegian control over the oil, the Norwegian government took over Norsk Braendesloje, a subsidiary of British Petroleum (BP) that was 50 percent owned by BP. This was then handed to Statoil to improve its control of the sector. Thus, by late 1975, Statoil controlled 75 percent of production from Ekofisk, and to help with the exploitation of Statfjord, became equal partners with Mobil. Statoil was also invested with control of 37 blocks of seabed on Norway's continental shelf, each of which covered some 200 sq. mi. However, the strategic plan for the Norwegians was for Statoil to exploit an oilfield on its own. This became closer to reality when the Norwegian government, in October 1980, announced that an oilfield west of Bergen, with about 1 billion barrels of oil, was to be exploited by Statoil, which would have an 85 percent stake, Norsk Hydro a 9 percent stake, and Saga Petroleum a 6 percent stake.

There was further success for Statoil which, on July 15, 1981, reported that it had found large deposits of natural gas southwest of Stavanger, and that they hoped to start production there in 1986. In January 1988, Arve Johnsen stepped down as managing director, a post he had held for 15 years. He had been forced to resign two months after six government-appointed board members had also resigned after there had been massive cost overruns on the expansion of the Mongstad refinery. Indeed, in 1987 the company recorded a loss of $300 million, as against a profit in the previous year of $180 million. This led to the appointment of private sector economist Harald Norvik, who had headed the Astrup-Hoeyer construction company. Norvik introduced cost-cutting moves including reducing jobs as crude oil prices fell.

By 2004 the production of oil in Norway had leveled off at 3 million barrels a day, and fell progressively since then as no new oilfields were found. By this time much of the production by Statoil was concentrated near Stavanger. The problems that Statoil has faced with new exploration plans is that oil is believed to be at places such as the Lofoten Islands, off the northern part of Norway, in the Arctic Circle, close to the spawning ground of cod and where there are large seabird colonies.

There was also controversy for Statoil, which was seeking to expand operations in Iran, and some executives were involved in allegations of bribery, which saw a number of senior Statoil employees including the chief executive resign in September 2003. By this time, the Norwegian government no longer controlled Statoil. It had been privatized in 2001, and listed on the Oslo Stock Exchange and the New York Stock Exchange. In December 2006, plans were revealed by which Statoil was going to merge with the Norwegian conglomerate Norsk Hydro, and it did to form StatoilHydro on October 1, 2007, the world's largest offshore oil and gas company. Exports of petroleum and gas remain the most significant exports from Norway, the wealth having transformed the country markedly in the last 30 years.

Status

Status refers to a person's position within a social structure. Status typically involves a ranking (on the basis of relative power and prestige) and is determined by either ascribed or achievement-oriented factors. Ascribed status is automatically transmitted to a person—usually at birth (e.g., gender, ethnicity, and family heritage). Achieved status is attained as a result of individual abilities and performance (e.g., level of education, income, and type of occupation). The dominant form of status—thus how status is determined—differs from country to country and can have important strategic implications for marketers.

When ascribed status is the primary determinant of social standing, individuals can do very little to enhance their status. In countries where achieved status is dominant, individuals have at least the opportunity to improve their relative social standing. Attempts to improve status in achievement-oriented societies include engagement in conspicuous consumption—the acquisition and, most importantly, public consumption/display of products that are defined by members of society as symbolizing "the good life."

When searching for opportunities in the global marketplace, marketers often view achievement-oriented societies where conspicuous consumption transpires as prime markets for their products (which are essentially used as props to enhance status). Marketers can take advantage of the desire to enhance status via conspicuous consumption in a variety of ways. For example, products are sometimes advertised on the basis of providing the benefit of status enhancement by suggesting that public usage of the product serves as a means of communication—that one "can afford the fine things in life" or "has good taste." Marketers can also facilitate status enhancement via conspicuous consumption by pricing products high and distributing products in exclusive fashion (e.g., in upscale retail stores). Attempts at status enhancement via conspicuous consumption have changed in recent years due to the globalization of the economy.

Conspicuous Consumption and Status

Over 100 years ago, Thorstein Veblen coined the term *conspicuous consumption* to describe the highly visible, lavish, often wasteful consumption activities of newly rich elites in the United States—a nation where achievement-oriented factors weigh heavily in social status determination. The primary purpose of this behavior, practiced by members of what Veblen called "the leisure class," was to enhance social status and prestige. While this type of consumption activity was not confined to the United States and had existed for centuries, Veblen's conceptualization formally documented the realization that consumption was engaged in not only to meet one's basic needs. Consumption had become a means of identity creation.

Veblen's notion of conspicuous consumption remains viable today. This is particularly true in affluent nations where achievement-oriented factors are the primary determinants of social standing, and materialism and individualism are strongly held cultural values (e.g., the United States). In nations such as these, people often define who and what they—and others—are by what they possess and publicly consume. Products infused with symbolic meaning by members of society serve as vehicles for communication to others. Proper product use and display can signal wealth, power, and taste to others, thus improving one's social standing/status.

Although Veblen's original conceptualization of conspicuous consumption remains relevant today, refinement is called for due to changes in consumer behavior resulting from the recent and ongoing incorporation of nations—and their peoples—into the global economic system. Exemplary is the case of how conspicuous consumption has recently come to be increasingly used to enhance status in India.

Conspicuous Consumption and Status in Present-Day India

Traditionally, India is a nation characterized by the Gandhian philosophy of simple living and the socialist ideology of community/collectivistic living and self-reliance. India is also historically characterized as a nation where ascribed factors have dominated social status determination (e.g., via the caste system). As a result, consuming in conspicuous fashion has not been traditionally viewed as an appropriate—if even possible—means of enhancing status in India.

This began to change in the 1970s with the growth of a more individualistic middle class. The partial liberalization of the Indian economy in the 1980s and, most notably, more extensive liberalization via integration in the global economic system in the 1990s has paved the way for pursuit of a global culture characterized first and foremost by the ideals of Western consumerism—and for status enhancement via increasingly high levels of conspicuous consumption. This recent shift away from austerity—and from ascribed dominance of status determination—has been fueled by the glorification of consumption as a means of defining oneself in Indian media and cinema.

It is important to note, in closing, that seeking status enhancement through conspicuous consumption in present-day India differs somewhat from Veblen's original vision. It is not, for example, only very wealthy social elite—Veblen's "leisure class"—who signal status in this way. In India today, conspicuous consumption is used as a means of enhancing status by a fast-growing middle class (composed largely of knowledge workers and entrepreneurs).

In addition, status enhancement through conspicuous consumption in India does not involve only the public consumption of very expensive goods. Instead, social standing is often enhanced more subtly through consumption of less expensive products that symbolize "good taste" and "cultural refinement." These nonelite consumers do seek status through public consumption, but their status is based not so much on the display of extraordinary wealth as it is on the creation of exclusivity on the basis of intellectual and cultural distance from others. Marketers looking to take advantage of the escalating desires—and abilities—of consumers in India (and other transitional countries) to enhance status via conspicuous consumption are well advised to take factors such as these into account when formulating and implementing strategy.

Stereotyping

Stereotyping is the act of representing a group of people based on the assumption that they share certain attributes. The description, a stereotype, is typically an oversimplified, standardized conception or image due to the lack of direct knowledge and experiences those doing the stereotyping have of members of the other group. Stereotypes can be positive or negative and are often based on incomplete or false generalizations to describe individuals and the group to which they are assigned according to characteristics such as age, race, nationality, ethnicity, and religion. As a consequence of stereotyping, an individual is understood only in terms of the group to which they are perceived to belong.

Originally, the word *stereotype* is believed to have been used in the printing trade, similar to the word *cliché*, to refer to the duplicate impression of an original typographical element. In modern English, the noun *stereotype* first appeared in 1850 as meaning "image perpetuated without change." In his book *The Public Opinion*, published in 1922, American journalist Walter Lippmann described a stereotype in this way and cautioned that such partial images were an inadequate way of representing the world. Stereotypes continue in public and private life where those stereotyping have limited experience with individuals that they perceive to belong to a certain group. In particular, stereotypes are perpetuated in the media due to the frame of reference of writers, directors, reporters, producers, and editors. Similarly, stereotyping occurs in international business where individuals lack prior interaction with foreign business partners and may project their assumptions about the gender, nationality, or profession to which they categorize them. In this context, stereotypes are usually culturally embedded and may be difficult to change. For example, Americans may be stereotyped as unintelligent, self-important, obese, and loud by Europeans. In America, a typical stereotype of English people is as stiff, upper-class, prim, and having bad teeth.

In psychology, the causes of stereotyping have been explained as a type of ingroup-outgroup behavior whereby individuals favor those they identify as like themselves and magnify differences among those they perceive as different. On the other hand, sociologists emphasize the interrelationships between different groups and the relative standing of groups in a social structure. These two perspectives can be applied to understand stereotyping as a mechanism to explain, justify, and exaggerate differences between groups, related to the status or position of a group. The stereotype content of groups with fewer social and economic advantages will contain elements that assist to explain disparities, such as lower employment rates. For example, members of disadvantaged groups might be described negatively and undeservedly as unintelligent or unmotivated as a way of justifying the differences.

The role and content stereotyping in international business management and marketing has attracted much attention. Whereas stereotypes in their broadest sense represent individuals' cognitive associations and expectations about groups in society, national or country stereotypes describe qualities or associations that are perceived to be closely linked to a nation's population. Studies have demonstrated that national stereotypes can bias the perceptions of management, employees, and customers in decision making. Further, the popular view in international business literature warns managers of a tendency to reinterpret incoming information to make it more consistent with national stereotypes. This may result in negative consequences, such as the disregard for or discounting of ideas and input from managers from countries that have negative stereotypes.

National stereotypes have been demonstrated to affect decision making in a range of business situations. In the context of consumer decision making, research in international marketing into the effects of a product's country of origin on consumer evaluations has found that cognitive, affective, and normative factors of national stereotypes play an influential role, as well as political, economic, technological factors of country stereotypes. Examples of well-known product-country stereotypes include consumers' preference for French champagne, Italian fashion, German automobiles, and Belgian chocolate. Similarly, industrial buyers have been shown to categorize suppliers into two groups—those from technologically advanced nations, and those from less technologically advanced nations. Similarly, research in international management has shown that individuals have a tendency to evaluate colleagues in teams from the most advanced and economically strong countries more favorably. There is also evidence that suggests that managers stereotype their colleagues by country. For example, European managers hold stereotypes of each other. In particular, one study demonstrated that British managers were perceived by German managers to be more accepting and German managers perceived by British managers to be hardworking. Furthermore, it has been shown that stereotypes influence managers' assessments of their willingness to conduct business with others, that is, their eagerness to establish business relationships with outgroup members before direct contact occurs.

Stereotyping also influences investor, tourist, and migrant decision making since national images are influential in evaluations of a country as a potential location for foreign investment, as a tourist destination, or a place to live, work, and play. Consequently, nations must play an active role in positioning and differentiating their identity in the competitive global marketplace as these images can have considerable consequences for their products, services, industries, and residents.

Stock Exchanges

A stock exchange (sometimes called a securities exchange or, especially in Europe, a bourse) is both a physical facility and an organization or company that facilitates the trade of stock shares and other securities. Because so much trading is conducted outside the physical facility—electronically or through brokers—

there are fewer regional stock exchanges than there once were; more than half of the stock exchanges in the United States closed or merged with others during the 20th century, as the business of exchange reduced the need for a separate stock exchange in Arizona, Buffalo, Louisville, and so forth. Although the terms are sometimes conflated in casual speech, the *stock market* and the *stock exchange* are not synonymous; the *market* consists of all the trade conducted on all the exchanges, or all the exchanges of a large region. The American stock market, for instance, includes all the trading done at the various stock exchanges in the country, as well as over-the-counter trades.

Role in the Economy

Stock exchanges began as mutual societies owned and run jointly by the brokerages who participated in them, like a mall owned by its stores. The Dutch East India Company led the way in selling stock in its company, doing so for the first time in 1602 on the Amsterdam Stock Exchange. The London Stock Exchange opened in 1688, and more European and American exchanges followed. The first American exchange was the Philadelphia Stock Exchange, in 1790 (it was bought by NASDAQ in 2007); the New York Stock Exchange opened in 1817, succeeding a 1792 trading agreement (the buttonwood agreement, named for the tree under which it was signed) between two dozen New York brokers.

At the end of the 20th century, some stock exchanges began demutualizing—going public, turning the mutual society into a corporation. NASDAQ and the NYSE have both gone public in the 21st century, and as a result of the NYSE's merger with Euronext, the first "global exchange" is a publicly traded corporation. Between this shift in exchange ownership, the development of electronic trading and algorithmic trading discussed below, and the failure of investment banks in the wake of the 2007–08 financial crisis, the 21st century is seeing the shape of Wall Street, the stock market, and the world's stock exchanges transform more radically than they have done since the aftermath of the Great Depression.

The fundamental role of the stock exchange has been in the service of business—raising capital by selling shares to the public, enabling mergers and acquisitions to facilitate growth—but the nature of investment has taken on a life of its own. Investing in the partial business ownership represented by stock shares long ago ceased to be principally the activity of professionals. Stock ownership is a common part of many Americans' investment portfolios as they plan for retirement or midlife expenses like college tuition, and casual investing has become quite popular—especially with the advent of e-trading and online access to brokers and stock tips—among Americans of all walks of life.

The market itself is widely used as an indicator of economic health, putting the exchanges under scrutiny whenever major events occur; the market is watched for rises and falls after elections or announcements of key appointments, after policy changes, and so forth, presumably reflecting investor confidence in response to the events of the world and their perceived consequences.

World Stock Exchanges

The 20 largest exchanges in the world (roughly in order, though jostling may occur) are as follows:

- NYSE Euronext, formed in 2007 by a merger between the New York Stock Exchange and the European multinational exchange Euronext. The new company also operates the American Stock Exchange (acquired in 2008) and NYSE Arca (formerly the Pacific Exchange, and still located in San Francisco).
- The Tokyo Stock Exchange, which has lately been developing joint products with the London Stock Exchange (LSE), one of which will be a Tokyo market based on the LSE's less-regulated Alternative Investment Market.
- BM&F Bovespa, formed in 2008 by the merger of the Brazilian Mercantile and Futures Exchange with the São Paulo Stock Exchange. Though slower to adopt electronic systems than many North American exchanges, Bovespa adopted them more decisively: open outcry is long abandoned, and the exchange uses electronic trading exclusively.
- NASDAQ, the National Association of Securities Dealers Automated Quotations, an American exchange and the world's first electronic stock exchange.
- The London Stock Exchange, the center of "the City" that is the United Kingdom's equivalent of

Wall Street. After NASDAQ failed in an attempt to acquire the LSE, it sold most of its shares—28 percent of the company—to the Borse Dubai in the United Arab Emirates.

- The Hong Kong Stock Exchange, the largest exchange in China.
- The Shanghai Stock Exchange, the largest exchange in mainland China.
- The Toronto Stock Exchange, the largest Canadian exchange, with the most oil and mining stocks in the world. The TSX is Canada's only exchange for preferred stock; common stock is handled by the Canadian Venture Exchange, and derivatives by the Montreal Exchange.
- The Frankfurt Stock Exchange, owned and operated by the Deutsche Borse, which attempted to negotiate a merger with Euronext before the NYSE beat its offer.
- The Madrid Stock Exchange, Spain's largest exchange.
- The Bombay Stock Exchange, the largest exchange in south Asia, listing more companies than any other exchange in the world.
- The National Stock Exchange of India, one of the fastest-growing exchanges in the world.
- The Australian Stock Exchange, an all-electronic exchange that originated in the 19th century as an exchange to trade government-issued securities.
- OMX Exchanges, operating eight exchanges in Scandinavia.
- SWX, the Swiss exchange in Zurich.
- Korea Exchange, formed by the merger of the Korea Stock Exchange, KOSDAQ, and the Korea Futures Exchange.
- Borsa Italiana, in Milan, owned by the LSE.
- The Moscow Interback Currency Exchange (MICEX), responsible for 90 percent of the trading in Russia.
- The JSE Securities Exchange, in Johannesburg, the largest exchange in Africa.
- The Shenzhen Stock Exchange, mainland China's second-largest exchange.

Indices

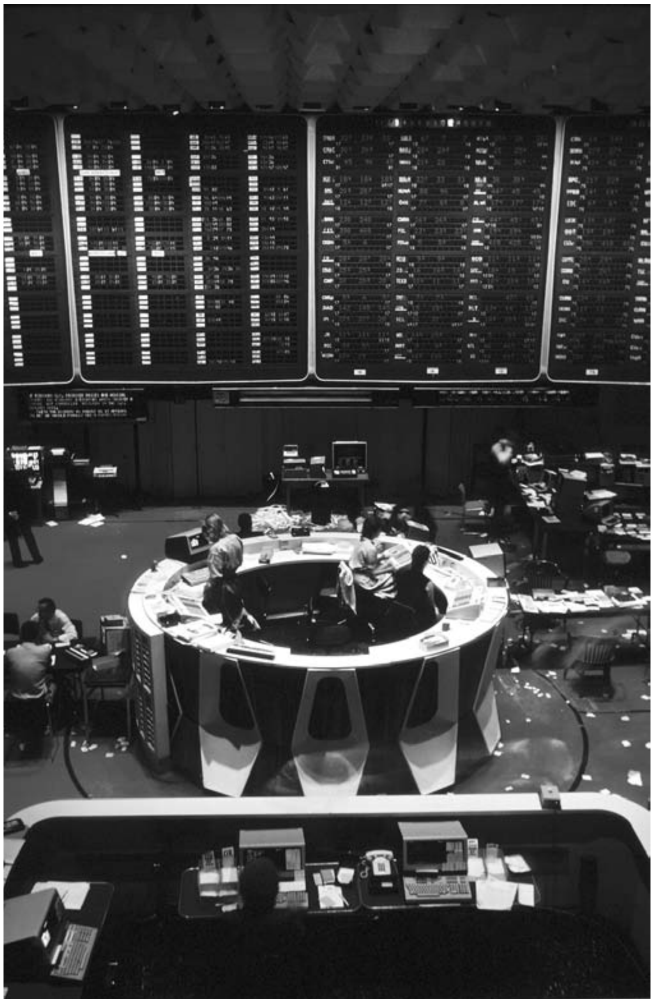
A stock market index tracks the performance of a section of the stock market, to various ends. There are various kinds of indices, but most indices are specific to a given exchange. Significant indices include the Dow Jones Industrial Average, or just "the Dow," an unweighted index tracking 30 stocks on the NYSE. The oldest such index in the world, the Dow is also the one most discussed as an economic indicator. The companies it lists are the giants of American industry, from Kraft Foods and McDonald's to ExxonMobil and Wal-Mart. The Dow is not maintained by the NYSE, but by the editors of the *Wall Street Journal*. The NYSE maintains the NYSE Composite Index, tracking over 2,000 stocks using free-float market cap weighting (in which the largest stocks impact the index the most).

The S&P 500 is another capitalization-weighted index, tracking 500 stocks (generally, those with the largest market capitalization) on the NYSE and NASDAQ. The FTSE Index, begun as a joint venture between the LSE and the *Financial Times*, is the leading indicator for the London market—tracking 80 percent of the market capitalization on the LSE, in a free-float market cap weighted index like the NYSE Composite. Most exchanges have an index tracking their top performers, prominent companies, or a large portion of the market; but there are indices designed along other lines as well. The Calvert Social Index, for instance, is a capitalization-weighted index tracking the most socially responsible companies on the market.

The Trading Floor

The trading floor of a stock exchange is where most trades occur. There is often, especially in older exchanges, a designated area for each stock on the exchange; on the floor of the NYSE, for instance, is a podium or desk for each of the 3,000 companies listed, and transactions are conducted face to face. A trading room, on the other hand—though traders at some exchanges use the phrase to mean the trading floor—is the office or set of offices set aside in a brokerage or investment bank for trading activity. In large firms, the trading room is often enormous; those of J. P. Morgan are so large that the six floors of trading rooms had to be cantilevered because they exceeded the footprint of the building itself. Trading rooms are filled with desks and phones for traders, and a good deal of expensive equipment for monitoring the markets both domestically and abroad.

Many trading floors use the open outcry system of communication between traders, an artifact of



Even in the age of e-trading, older stock exchanges reserve physical space on trading floors like this for each stock listed.

the pre-electronics age that persists on the major exchanges of North America and the United Kingdom. Open outcry uses a combination of shouting and hand signals to communicate orders from across the room or over a crowd. Hands away from the body, palms out, indicate a seller; hands up, palms in, indicate a prospective buyer. One hand is used to indicate the numbers one through 10 (six through 10 are indicated by holding the hand at a 90-degree angle), while the other hand indicates tens, hundreds, or thousands depending on its position. There are signals to indicate time frames of a trade, combination trades, options, and other information. Specifics vary some from exchange to exchange, but other near-universal signals include the thumbs-up to indicate that an order has been filled; an index finger, tilted, rotating forward to indicate that the order has not been filled yet but the trader is working on it (the open outcry equivalent of the hourglass icon in Windows); and the hand across the throat to cancel an order or show that an order has been cancelled. In most American exchanges, the part of the trading floor where open outcry takes place is called the pit, for its sloped sides, which make it easier for traders to see each other.

Electronic Trading

Electronic trading systems have replaced open outcry in many markets. One of the first was CATS, the Computer-Assisted Trading System, which was adopted at the Toronto Stock Exchange in 1977 and implemented at various exchanges throughout the 1980s, sometimes supplementing open outcry and sometimes replacing it. NASDAQ—the National Association of Securities Dealers Automated Quotations—originated as a computer bulletin board system in 1971, long before home internet access or even home computers were commonplace; originally it was not used to actually broker trades, but did lower the spread between the asking and bidding prices.

As NASDAQ developed into the first electronic stock exchange, it added the ability to make trades over the phone, and advertised itself directly to the public, the first exchange to do so. At the end of 1988, addressing complaints that stockholders had trouble reaching market makers on the phone in the wake of 1987's Black Monday market crash, NASDAQ adopted the Small Order Execution System (SOES), an electronic trading system for low-volume trades. Like NASDAQ itself, SOES was resented by many brokerage houses for—in general—reducing their profit margin on many transactions. NASDAQ would argue that this was offset by such systems attracting investors who might not otherwise enter the market.

Ten years later, in 1998, the SEC authorized the creation of electronic communication networks (ECNs) in response to the popularity of the internet and increasing ubiquity of home computers. ECNs facilitate trades outside stock exchanges, as a class of Alternative Trading Systems. Soon a number of electronic systems were being adopted to conduct trading at the exchange, rather than leaving the business of electronic trading to ECNs that bypass them. Retail brokers like Charles Schwab went online en masse in the late 1990s and turn of the century, offering e-trading options, often with significantly lower fees than more traditional services had charged. Automating more aspects of the trading process has brought transaction costs down, though many old-school traders resist the move away from open outcry because of the loss of the intangibles involved in the transaction; when you can see the other party, you can read body language and gauge the motivation of the trade.

Some exchanges have software for e-trading; others license software from a third-party provider. The development of e-trading software is quickly becoming a niche field in the computer software industry, and traders who deal with multiple exchanges find themselves required to stay on the technological cutting edge. One development, a case in which e-trading does much more than simply allow trades without face-to-face contact, is algorithmic trading. Sometimes called robo-trading or black-box trading, algorithmic trading relies on mathematical algorithms to determine one or more aspects of a trade—from the acceptable bid or ask price to the timing or size of the trade, and especially the relationship of those aspects to one another (buying more shares of a stock at a good price, for instance). On the one hand, it is the sort of decision making a human agent could do, using the same underlying logic; on the other hand, once such decisions are reduced mathematically, the process transpires much faster, allowing opportunities to be captured before the window closes.

By 2006 a third of stock trades made in Europe and North America were conducted algorithmically; the popularity of the software continues to steadily rise. Algorithmic trading is also popular, if slightly less so, on the futures, options, and foreign currency markets. Different common algorithms have developed, including the Guerrilla algorithm developed by Credit Suisse, which determines in real time which available offers or bids can be accepted without disrupting the stock's trading pattern. Another Credit Suisse algorithm, Sniper, is designed to detect "dark pools of liquidity," not shown on the trading platforms provided by stock exchanges as a result of algorithmic trading performed by other parties. Snipers are sophisticated algorithms, useful only in an environment where a significant amount of algorithmic trading is going on—and they are not the only one of their type. Sniffer algorithms are designed specifically to detect and identify trading algorithms in use, while Bespoke algorithms cloak algorithmic activity. The prevalence of electronic trading has led some to predict, plan, or hope for an online-only stock exchange.

Listing Requirements

Stock exchanges typically have certain requirements for companies that want to have their stock listed on the exchange. These requirements can include the minimum annual income, minimum shares outstanding, and minimum market capitalization. The NYSE requires that a company have at least one million shares of stock, that the total shares be worth at least $100 million, and that the company has earned at least $10 million over the last three years. NASDAQ requires 1.25 million shares, worth $70 million, and $11 million in three years of earnings. The London Stock Exchange has a different set of requirements entirely—12 months of working capital, three years of audited financial statements, 25 percent public float, and 700,000 pounds market capitalization.

Stockholm General Index

The Stockholm General Index—or the Affarsvarlden General Index—now usually known as the OMX Stockholm 30 (although this has a slightly different balance of companies), is a weighted listing of major companies traded on the Stockholm Stock Exchange in Sweden. Founded in the Swedish capital in 1863, the stock exchange is the primary securities exchange for the Nordic countries.

Since its creation, the Stockholm Stock Exchange has been important for raising capital in Sweden and also other parts of Scandinavia, particularly Norway, which was a part of the United Kingdoms of Sweden and Norway from 1814 until 1905. The Stockholm General Index was established to provide an easily accessible measure of the performance of the stock exchange by including the major companies, but weighting them against their importance and market capitalization.

Traditionally, the market has generally been buoyant, but it was badly affected by the start of the Great Depression, and indeed, in 1931, the index of shares on the Stockholm Stock Exchange registered the biggest fall of any major stock exchange in the world, more than Wall Street. This was accompanied by a major fall in the price on world markets of the Swedish kronor, which forced the temporary closure of the Stockholm Stock Exchange from September 29, 1931. Indeed, in March 1932, the Riksdag, the Swedish parliament, had to rush through legislation to stabilize the economy after the suicide of Ivar Krueger, which once again shook the nervous stock exchange. As a result, this period has attracted interest from historians, and by January 1934, the shares were trading at about 10 percent of their prices seven years earlier.

In the early period of World War II, the Stockholm General Index fell, and the market remained depressed, although it did pick up as Sweden benefited from its position of neutrality. In contrast to the economic performance of Sweden in the 1930s, after World War II the Swedish economy boomed, and this led to a dramatic rise in the values of many shares quoted in Stockholm, which was reflected in a steady increase throughout that period in the Stockholm General Index, regularly achieving "all-time highs," reaching 1,002.99 on January 9, 1989, buoyed in spite of the decision by the Swedish government in December 1988 to introduce a 15-percent tax on profits. It continued to rise and by January 1994 reached 1,603.9, but fell by July 1994 to 1,334.7, reaching 1,440.90 in September of the same year.

In the previous year, the Stockholm Stock Exchange had achieved much attention around the world because of a stock market competition that was played out in August–September 1993 when five Swedish stock analysts were given a nominal sum of $1,250, which they had to invest to see whether they could achieve better results than the Stockholm General Index. These competitions had been staged since the early 20th century, but this time, the newspaper *Expressen* managed to get Ola, a chimpanzee in the Stockholm Zoo, to stick pins into a board that had names of companies that were taken to represent the primate's "choice" for a share portfolio. Within four weeks, Ola was well ahead of the analysts, having made $190, about 15 percent.

All trading took place on the floor of the Stockholm Stock Exchange Building until June 1, 1990, when electronic trading changed that, and this helped encourage computer buying and selling which, in turn, not only increased the volume of shares bought and sold, but also led to more fluctuation in the Stockholm General Index. In 1998 the Stockholm Stock Exchange was bought by OMX, and five years later, its operations were merged with those of the Helsinki Stock Exchange. There are currently 79 members of the Stockholm Stock Exchange with 310 companies being listed and a market capitalization of 2,521 billion Swedish kronor (approximately $394 billion).

The 30 companies that make up the OMX Stockholm 30 are weighted heavily toward the largest companies. H&M is involved in the retail of apparel, with Nordea, representing diversified banks, TeliaSonera, for integrated telecommunication services, together making up a third of the shares traded. Probably one of the most well-known Swedish companies, Volvo, makes up 5.2 percent of the Index. The other companies that make up the OMX Stockholm 30 are ABB, Alfa Laval, Assa Abloy, AstraZeneca, Atlas Copco (class A), Atlas Copco (class B), Boliden, Electrolux, Eniro, Ericsson, Investor, Lundin Petroleum, Nokia, Sandvik, SCA, SCANIA, SEB, Securitas, Skanska, SKF, SSAB, Svenska Handelsbanken, Swedbank, Swedish Match, Tele2, and Vostok Gas.

Straits Times Index (Singapore)

The Straits Times Index (STI) is compiled by the Singapore *Straits Times* newspaper (which is owned by Singapore Press Holdings) and is considered Singapore’s premier equity index. STI is Singapore’s main market benchmark, which has evolved as part of a partnership between Singapore Press Holdings (SPH), FTSE Group, and Singapore Exchange (SGX). The STI is calculated by using data from SPH, FTSE, and SGX. The aim of the collaboration is to create a comprehensive suite of indices that will better reflect the performance of various sectors of the Singapore stock market and meet the needs of both retail and institutional investors.

STI was formed in August 1998 to replace the Straits Times Industrials Index (STII), which saw the removal of the “industrials” category from the index. Since 1998, the STI has comprised between 30 to 55 of the exchange’s most valuable firms. Together, these components represent more than 60 percent of the total market value of all issues traded on the Singapore Stock Exchange. STI is a modified weighted index that ensures that the largest firms have the greatest impact on the index’s value. Designed to provide both domestic and international investors with opportunities to access the Singapore market, the STI currently represents the performance of the top 30 Singaporean companies by market capitalization.

STI is the headline index of the FTSE. Stocks are free float weighted and liquidity screened to ensure that the index is tradable. This means that portfolio investments, nominee holdings, and holdings by investment companies represent more than 15 percent of any one company’s listing, and that stocks retain a median daily turnover value of at least .05 percent of the value of its free float–adjusted shares in issue for 10 out of the past 12 months.

To qualify for inclusion in any index, the market capitalization of a listed company must fall within the top 98 percent by full market capitalization of all SGX main board companies. As of December 31, 2007, the STI top 10 companies held 69 percent of the net market capitalization share and include Singapore Telecom, DBS Group Holdings, United Overseas Bank, Overseas Chinese Banking Corporation (OCBC), Keppel Corp., Singapore Exchange, Hong Kong Land, Singapore Airlines, City Developments, and Capitaland. With a net market capitalization of more than SG$232 million, banks retain the highest sector representation on the STI, accounting for over SG$65 million of the net market capitalization of the index, followed by general industries (SG$31 million), real estate (SG$29 million), and travel and leisure (SG$22 million).

A transparent and public set of rules is used to manage the indices to ensure that a continuous and accurate representation of the market is maintained. To achieve this, the STI is overseen by an independent advisory committee comprised of market practitioners and/or representatives from SPH, SGX, and FTSE, with reviews taking place semiannually in March and September. One such review in 2005 raised the number of stocks from 45 to 50. In doing so, the change increased its total market capitalization to 75 percent, while reducing the index representation of the average daily traded value to 60 percent. Other changes have included stock additions (e.g., Suntec REIT, Olam, Genting International, Labroy Marine, CapitalCommerical, and Thai Beverage in February 2007) and stock removals (e.g., Dairy Farm, Haw Par Corporation, BIL, and TPV Technology). The most significant change occurred in December 2007, in which the SPH, SGX, and FTSE announced a major overhaul of the STI. In 2008, the revamped STI dropped from 55 to 30 component stocks, with 18 new indices being created. A new family of FTSE ST indices consists of 5 benchmark and 13 industry indices, which includes an index to represent China stocks listed in Singapore. To facilitate cross-border analysis and comparisons, the new indices adopt FTSE's international methodology and are based on the International Classification Benchmark (ICB), the renowned classification system created by Dow Jones Indices and FTSE. The STI currently comprises 30 blue-chip companies ranked by market capitalization as of August 31, 2007.

Strategic Alliance

An informal or formal agreement between two or more companies with a common business objective is a strategic alliance. Strategic alliances can take forms ranging from informal cooperation to joint ownership of worldwide operations. Some contractual agreements are also treated as strategic alliances when those agreements involve a long-term, continual strategic partnership and thereby provide strategic gains for partners.

Strategic alliances are being used for many different purposes by the partners involved. A long-term and trust-based agreement between a manufacturer and supplier firm is considered a strategic alliance because it is beyond going to open market and choosing the best deal each time and affords mutually rewarding cost savings, consistency, and quality improvements for the manufacturer and stable sales and certainty for the suppliers. In banking, the "exporting" of services through alliance partners rather than direct investment or contracting (licensing) was common. That is, banks use correspondents with whom they maintain parallel (corresponding) balances of deposits and offer services to each other's clients in each country. Large banks tend to have many such relationships around the world, in addition to any overseas affiliates they may operate. Additionally, banks will use multiple-bank alliances to provide automatic teller machine (ATM) access to their clients in many locations, operate credit card alliances through Visa and MasterCard to offer such services globally to their clients, working closely with actual or potential competitors. Banks also often contract out parts of their activities to alliance partners in a vertical deintegration context, for example, contracting out their mortgage loan servicing activity to specialist firms or selling off their mortgages to intermediaries that create mortgage-backed bonds in a secondary market.

Penetrating foreign markets is a primary objective of many companies entering strategic alliances; others are aimed at defending home markets. Another focus is the spreading of the risk and cost inherent in production and development efforts. Technology companies have joined forces to win over markets to their operating standard. Each form of alliance is distinct in terms of the amount of commitment required, the extent of equity involved, and, therefore, the degree of control each partner has, as well as the number of partners.

In informal strategic alliances, partners work together without a binding agreement. This arrangement often takes the form of visits to exchange information about new products, processes, and technology or may take the more formal form of the exchange of personnel for limited periods of time. Such partners are unlikely to compete for markets and tend to be of modest size, making collaboration advantageous if not absolutely necessary. The relationships are based on mutual trust and friendship, and may lead to more formal arrangements, such as contractual agreements or joint projects.

Formal, contractual agreements between strategic alliance partners may be used for joint research and development (R&D), joint marketing, joint production, or outsourcing. Contract manufacturing allows the corporation to separate the physical production of goods from the research and development and marketing stages, especially if the latter are the core competencies of the firm. Such contracting improves company focus on higher value-added activities, provides access to world-class capabilities, and allows partners to reduce their operating costs. Contract manufacturing provides many companies, especially in developing countries, the opportunity to gain the necessary experience in product design and manufacturing technology to allow them to function in world markets.

In Japan, vertical alliances or *keiretsu* are very popular and have supported the rapid growth of many high-tech companies and enabled parallel enhancement of the technology used by component suppliers and assemblers. Pharmaceutical, automotive, and electrical goods industries are examples of this. Toyohiro Kono attributes the appeal of alliances to the group orientation of Japanese firms, as opposed to independence that characterizes Western firms.

Strategic alliances may also be used to aid development and produce economies of scale in production; for example NKK entered into an alliance with Tetint (of Argentina) to produce and market a seamless pipe, while Mitsui Ship Building is cooperating with Kawasaki Heavy Industries in the design and construction of ships. In Poland, production-oriented strategic alliances predominate in the food processing industry, whereas in Romania there are a greater number of consultancy relationships for managerial and organizational improvements, including foreign consultancies.

Government intervention continues on a major scale in some countries. Socialism puts serious restrictions on capitalism. The social contract in many nations of full employment and a good safety net requires boundaries on free capitalism. In some parts of the world and in certain industries, governments insist on complete or majority ownership of firms, which has caused multinational companies to turn to an alternative method of enlarging their overseas business; for example, a management contract in which the firm sells its expertise in running a company while avoiding the risk or benefit of ownership. Increasingly, governments are publicizing alliance opportunities, like the recent Chinese government promotion of foreign direct investment opportunities in the growing traditional Chinese medicines area or the Indian government's promotion of foreign direct investment opportunities in infrastructure projects.

In his analysis of strategic alliances, Kono identifies six major reasons for failure: financial loss, opportunity loss, goal differences, differences in corporate culture, lack of mutual trust, and lack of competitive power. Kono also identifies success factors, specifically mutual trust, first-class complementary capabilities to create competitive core competencies, and continuous mutual learning to enhance competencies.

There are other reasons for strategic alliance breakup. In the case of Eli Lilly and Ranbaxy in India, the breakup of the joint venture, another form of strategic alliance, came when both partners had developed sufficient strength to stand on their own in their chosen market. This has become a common occurrence in rapidly developing economies.

Structured Notes

Structured notes are a debt-based type of structured product, which the Securities and Exchange Commission (in rule 434) defines as

> securities whose cash flow characteristics depend upon one or more indices or that have embedded forwards or options or securities where an investor's investment return and the issuer's payment obligations are contingent on, or highly sensitive to, changes in the value of underlying assets, indices, interest rates or cash flows.

Those embedded components may be straightforward or may include exotic options; there is a wide variety of structured notes.

Structured notes originated with, and are still issued primarily by, investment banks. Investment banks wanted to increase the appeal of convertible bonds—bonds that could be converted into shares of the company issuing them, at a particular predetermined ratio, which encouraged investors to accept bonds of lower interest rates in exchange for the possibility of a higher profit after such a conversion. Because that higher return to the investor is tied to a greater success for the company, convertible bonds are an especially appealing way for investment banks to raise funds. Some such bonds were structured with additional features, such as risk protection or extra income; sometimes these extra features came with extra limits of their own, making structured notes potentially complicated, full of contingencies and multiple paths, always preserving a balance between investor appeal and a high profit margin for the investment bank. Such notes can be tailored very specifically to different types of investors.

Structured notes combine a debt security such as a bond with various derivatives, usually options. Most do not guarantee repayment, for instance if the company should go bankrupt; some offer guaranteed protection of the principal investment, in whole or in part, as a feature. The exotic options may include shout options (allowing the investor to lock in the price of the note at any time), capped-style options limiting the profit (to offset some investor benefit and preserve the issuer's profit margin), or involve one of the so-called mountain range options pioneered in the late 1990s, in which the value of the option depends on the performance of multiple underlying assets in the "basket."

Subprime Loans

Subprime loans are loans offered to people who otherwise would not be able to afford a loan. People who are credit worthy are those who have a demonstrated ability to pay back the loan. Subprime borrowers are those who would be turned away by conventional lenders because their credit rating pointed to a reasonable probability that the loan would not be repaid, but would end in default.

Those who need to borrow are those who lack the capital to achieve some goal. In the case of subprime loans, in recent decades in the United States, a very common goal was home ownership. However, other types of subprime credit were granted for a number of reasons by lenders. While lenders who give the largest loans are banks for home ownership, many credit companies lend for the purchase of automobiles. These are the two largest purchases made by most people. Also, many companies including well-known brands of clothing, jewelry, and other consumer goods have created credit companies or joined with them to make subprime loans to keep sales flowing.

The interest rate on subprime loans is usually higher than traditional loans, making them more expensive for those getting the loan. Such loans are usually to people with limited or small incomes. The higher interest charged meant that the cost of the loan increased by thousands of dollars over the life of the loan. In addition, to make the loan affordable in terms of monthly payments for paying the interest and principal, the life of the loan was usually longer, thus also adding to the cost of the loan.

Getting a subprime loan for those with limited means may have been their only realistic option for getting a credit card, consumer loan, or home mortgage. Even with a higher interest rate, it was possible to get credit at a subprime rate to repair a bad credit rating due to unforeseen circumstances such as illness, job loss, bad debt management, or other reasons such as the damage done to a family unit through divorce. Subprime lending is also called near-prime, nonprime, and second-chance lending. Those who get subprime loans are sometimes referred to as underbanked, meaning they lack bank accounts with substantial deposits.

All borrowers have a credit history that tells the story of their borrowing and repayment. Those borrowers with excellent or good credit ratings are those who have repaid loans promptly. Those borrowers with low or bad credit ratings have repaid slowly with delinquencies in prompt repayment or have defaulted on the loan. In contrast, lenders also have a lending record that tells the story of loans made, repaid, not repaid, and the money made and lost on the loans. All lenders, to stay in business, have to recover the principal on loans plus interest. They must incur only a few losses to make money for the creditor for the risks incurred and for increasing the capital available for lending.

C-paper is a subprime loan security that is expected to have a return that is above the prime rate of interest. Nonconforming loans in the United States are those that do not meet the standards of Freddie Mac and Fannie Mae. The reason for not meeting the standard can be any one of a long list of factors. In addition, bank loans to self-employed persons or on property that cannot be sold in the usual real estate markets may be subprime.

In 2007 the subprime mortgage industry collapsed amid the steepest plunge in U.S. home sales since the 1980s.

In the credit crisis of 2008, accusations against some subprime lenders claimed they engaged in predatory lending practices. The unscrupulous practices included playing on the ignorance of borrowers, lending to those who were unlikely to even make the interest payments, withholding information, and other fraudulent practices. In general, most predatory loans are subprime loans, but it is important to note that most subprime loans were not predatory.

Despite problems with predatory lending practices in the subprime market, most loans including those in the subprime category were bundled into securities issued by Real Estate Mortgage Investment Conduits (REMICs), which issued Residential Mortgage Backed Securities (RMBS) or other securities. These new types of securities were then sold to investors including pension funds, which historically invested in commercial mortgages or traditional real estate mortgages. The fees generated from these types of financial "products" were very profitable until the credit crisis bankrupted a number of large investment institutions involved in the business because the value of the RMBS seemed to vanish almost overnight.

Defenders of subprime lending claim that it gives credit to people who would not otherwise get loans.

In many cases these are people who will, unless harsh unforeseen circumstances arise, repay the loan even if occasionally delinquent. The higher interest rates and loan origination fees reflect the issues involved in making a subprime loan including the risk of default to the lender.

Subsidiary

The term *subsidiary* covers a range of organizational units and subunits, be they part- or wholly owned, foreign or domestic, acquisition or spin-off, formally or informally integrated. This term does imply significant legal ownership and a measure of control from the corporate headquarters (or upper) level of the organization, although, as already implied, contemporary parlance is to allow a broader range of relationships. *Affiliate* is a broader term used more and more to include legal subsidiaries as well as joint venture alliances and even outsourcing partners.

A corporation may have several national subsidiaries (in different countries). Each subsidiary may or may not be in a similar line of businesses, with identical or different brand names and market foci. For example, HSBC has several wholly owned national subsidiaries, each of which has a name that reflects their product-market focus—for example, HSBC Bank USA and HSBC France. Time Warner, Inc., has several subsidiaries—AOL, Warner Brothers, HBO, and Time, Inc., to name a few—each aiming at different product-market domains. Interestingly, the Time Warner Web site (www.timewarner.com) refers to them as "businesses" rather than subsidiaries. Similarly, GE refers to its six "businesses" (GE Healthcare, GE Commercial Finance, GE Money, GE Industrial, GE Infrastructure, and NBC Universal), each of which are multinationals in their own right, with subsidiaries of their own.

Traditionally, the international business literature was characterized by a top-down, headquarters-centric view of the multinational organization. According to Stuart Paterson and David Brock, there is more recognition these days that the subsidiary is the significant unit of analysis for competing and actually doing business. Thus, the management of multinational subsidiaries has quite recently emerged as a distinct field of research from within the fields of international and strategic management. Lars Otterbeck was one of the earliest authors to try to define the field with the publication *The Management of Headquarters-Subsidiary Relationships in Multinational Corporations.* A subsequent collection by Hamid Etemad and Louise Seguin Dulude contributed by bringing attention to Canada's policies encouraging world product mandates.

More recently, Julian Birkinshaw and various colleagues have made a relatively systematic effort to not only define the field, but also to delineate three substreams—namely HQ-subsidiary relationships, subsidiary roles, and subsidiary development—and, in subsequent work, build on this with a four-part classification of the field's base literature, as well as three other categories of more contemporary developments. More than just being pawns in the multinational corporation, this body of thinking describes proactive roles and strategies for subsidiaries such as various mandates and centers of excellence.

Contemporary thinking—both by researchers and in practice—is that multinationals now expect more from their subsidiaries than simply a return on their financial investment. Subsidiaries are expected to be sources of ideas and innovation. For example, an inventory control application developed by BMW's New Zealand subsidiary has been implemented in several other BMW subsidiaries; and innovations in furnishings and menu trialed in McDonald's Australia and France are now being adopted by some McDonald's restaurants in the United States.

Another view, expressed in the "global strategy" concept, is that subsidiaries' uniformity of branding and offerings enables clients to feel at home—be it at Avis, KPMG, Microsoft, or Starbucks—wherever they are in the world. Other advantages of the global strategy are cost savings via economies of scale and scope, and the ability to use global value chains. Thus, there is often pressure for subsidiaries to conform to corporate-wide policies, standards, and systems even if local managers feel they are not necessarily good for the subsidiary's home market. Chris Bartlett and the late Sumantra Ghoshal referred to these pressures as forces for global integration and see them as pervasive in the multinational arena. They explain how firms need to balance them with forces for local responsiveness—as illustrated in the BMW and McDonald's examples above—to maximize the benefits of their internal resources and external opportunities in global markets.

Subsidies

Subsidies (or subventions) are forms of financial assistance, economic concessions, or privileges granted by government to a company, businesses, segment of an industry, or industry for the purpose of encouraging their continued existence, growth, development, and profitability (subsidies may also be granted by government to individuals as a redistribution of income, and to local governments by central governments to promote public policy objectives). Subsidies are often "hidden" due to their various types, inherent objectives, and complex economic effects. It is, however, ultimately a political decision to grant a subsidy. When government grants a subsidy, it is ostensibly in the public interest that a company, business, or industry continues as a viable entity and provides needed business activities in the domestic economy.

In general, there are two forms of subsidies: direct subsidies involve a direct cash transfer to an economic entity, while indirect subsidies are forms of government subventions that usually do not involve direct money transfers. From a purely economic perspective, the use of subsidies may be inefficient as compared to not offering any subsidies or another policy instrument for achieving similar socioeconomic results or, contrarily, an efficient means of correcting a market failure and providing a public good. Furthermore, direct subsidies, that is, cash transfers, are considered more efficient than indirect subsidies, for example, trade barriers sought by domestic industries seeking protection from international competition.

The economic impact (total costs) of a subsidy is explained through the application of supply-and-demand curves and the concept of elasticity of supply and demand, that is, the subsidy per unit times the new equilibrium quantity. For example, a subsidy that encourages a business's production will tend to lower the product's price, that is, it shifts the supply curve downward along the demand curve; contrarily, a subsidy encouraging demand tends to increase a product's price, that is, it shifts the demand curve upward along the supply curve. Public goods tend to be less impacted by elasticity of demand, given that there is sufficient supply of such public goods and the total costs of subsidies remain constant (regardless of the volume of consumers). An exception to this public good tendency is when the number of suppliers of this good rises (reflecting a rise in demand for this subsidy "benefit") and increases cost.

Direct subsidies are considered preferable to indirect subsidies, as they allow for greater transparency in the political process. This political transparency can result in the opportunity for government representatives to eliminate economically inefficient "hidden" government subsidies benefiting rent-seeking business entities. In the United States, these so-called pork barrel federal subsidies, that is, unnecessary or wasteful subsidies, are popularly referred to as "corporate welfare" by government reform nonprofit organizations that publish lists of such pork barrel projects for public scrutiny.

Subsidies take many different forms and are best described by the means by which the subsidy is distributed to the business entity:

- Labor: A business receives a government payment to help cover employment costs and/or training expenses.
- Tax: A company receives a tax credit or deduction, accelerated depreciation (applied against business income) for equipment, or an outright exemption from a sales tax.
- Production: An industry will receive direct cash payments to encourage manufacture of a specific product or provision of a service.
- Procurement: As a consumer, a government may pay higher-than-market prices for goods or services it purchases.
- Consumption: A government may simply give away a good or service, offer the use of a government-owned asset or service at a price lower than production cost, or provide direct cash incentives to a business for the purchase of a good or service.
- Infrastructure: The public provision of infrastructure for a restricted number of business entities is a form of an indirect production subsidy provided by taxpayers.
- Regulatory Preferences: A public policy may directly or indirectly favor a class of products, company, segment of an industry, or industry over competitors, thus reducing a potential input into production costs.
- Trade Protection: Import limitations, such as a quantity limit, offer a hidden subsidy for a domestic industry.
- Export: To promote domestic industries in their bid to be competitive in a global market, certain tax measures are offered to encourage trade promotion.

International Trade

In the arena of international trade, the World Trade Organization (WTO) enforces the Agreement on Subsidies and Countervailing Measures. The agreement is designed to regulate two areas of international trade: first, it circumscribes the use of subsidies by a national government, and second, it regulates the actions that a national government can take to counteract the negative effects of subsidies. Under the agreement, a country may use the WTO's dispute settlement procedure to obtain the removal of the subsidy or its adverse effects on a nation's domestic industry, or the national government may initiate its own investigation into the prohibited use of a subsidy and, if the evidence supports the action, charge a countervailing duty on the subsidized import.

There are two categories of subsidies defined under the agreement: prohibited and actionable. Prohibited subsidies require companies or industries to meet government-prescribed export targets, or to use domestic inputs in the manufacturing process rather than imports, and are intended to negatively influence the free trade environment. With actionable subsidies, an aggrieved nation must provide evidence that the government-supplied subsidy has an adverse effect on its domestic industry or the subsidy is allowable. While so-called dumping is when a company exports a product and charges a price below what it charges in its domestic market, subsidies are offered only by government.

Sudan

The largest country in Africa and also one of the poorest, Sudan has traditionally been reliant on Egypt, which controls the mouth of the River Nile. In ancient times, the region that became Sudan, then known as Nubia, helped provide a workforce for Egypt and also supplies of grain. Europeans started exploring it in search of the source of the River Nile, but there was little economic interaction, although a small cotton industry was developed. When the Anglo-Egyptian Condominium was established in 1899, the government of what was called the Anglo-Egyptian Sudan helped introduce cotton gins to help the industry, and also built mills for oilseed pressing. They were also able to improve the irrigation system and communications by extending the railway line that covered a large part of central Sudan, linking that area to the capital Khartoum, to Egypt, and to the Red Sea.

Under the British, a number of agency houses operated, one of the major ones being Cotts, Drake & Co. Ltd., which was part of the British Mitchell Cotts Group of companies. They advertised themselves as "importers and exporters of general merchandise and Sudan produce," also being agents for General Motors, Michelin Tires and Tubes, and other companies. Other firms that operated in Sudan at the time included the Imperial Chemical Industries, Imperial Typewriter Service, and other British companies.

Sudan gained its independence from Egypt and Great Britain in 1956, but it was not until 1960 that the government of President Ibrahim Abboud started to revitalize the economy and introduced a national development plan. The first of these was the Ten-Year Plan, which started in late 1960, was formally adopted in September 1962, and lasted until 1970. However, the goals were ambitious and the private sector did not provide enough of the capital, with the result that some of the projects were abandoned. However, there were some successes with the Khashm al Qirbah and the Manaqil irrigation projects, and the Al Junayd Irrigation Project, as well as the building of a new sugar factory. The per capita income of the country also rose from US$86 in 1960 to US$104 by 1969.

The government soon faced problems implementing reforms; some of this came from the south of the country, which during the 1960s led to the outbreak of a civil war. In 1967 the implementation of the Ten-Year Plan was finally abandoned and few countries would consider investing in Sudan or lending money. A new plan was drawn up, but this was discarded after General Gaafar al-Nimeiri seized power in a coup d'état in May 1969. He drew up and started implementing the Five-Year Plan of Economic and Social Development, which was expected to run from 1970 to 1974. It benefited much from Soviet technical advisers with the aim of establishing a socialist economy and this led to a steady increase in prosperity. It faced many problems, including those over the failure to improve the transportation system in the country. This hurt the agricultural sector, and schemes were then drawn up to lengthen the implementation process in the Five-Year Plan. Furthermore, income from government companies fell far short of the projected figures, leaving the government seriously short of money.

Sudan has long been plagued by conflict, most recently in the Darfur region. Despite an influx of oil revenue and GDP growth of over 10 percent 2006–07, much of the population, like this fisherman washing clothes in the White Nile, lacks basic amenities.

A Six-Year Plan of Economic and Social Development from 1977 until 1982 was then drawn up, and in October 1983, the government decided to introduce a three-year public investment program. By this time, the government was extremely unpopular with many people in the country, a situation exacerbated by an austerity program that was introduced after the ousting of General Nimeiri in 1985. The new government sought help from the International Monetary Fund, but was unable to push through the most rigorous of reforms. As a result, many countries stopped providing financial aid, although nongovernmental organizations did continue to provide food relief during periods of hunger and famine.

With corruption rife in the country and widespread embezzlement of government monies and assets, few investors wanted to risk their money in Sudan. However, there were profits to be made, and with the discovery of oil in Sudan—450,000 barrels of oil being piped daily by 2004—there has been much renewed interest in the country. However, the apportioning of the oil wealth was one of the factors that have kept the civil war in the country going, bringing heavy criticism internationally of the Sudanese government's actions and inactions in Darfur. This has served to isolate Sudan further from the world economy. Some 64 percent of Sudan's exports (overwhelmingly oil) goes to China, with Japan and Saudi Arabia also taking some of the oil. Saudi Arabia and China each make up about 11 percent of the imports entering Sudan.

Suez

The Suez Canal, completed in 1869, was one of the major engineering feats of the mid-19th century, helping with the European access to India and east Asia. Since ancient times, many goods were carried by land along the route of where the Suez Canal was built, but offloading and then reloading all the goods was expensive and time consuming. This meant that some shipping companies preferred to go around the Cape of Good Hope, but this added much time to the journey.

It is believed that the pharaoh Senusret III (reigned 1878–1839 b.c.e.) started work on a canal that would join the River Nile to the Red Sea to allow direct trade with the fabled kingdom of Punt, and also to the Mediterranean, reducing the need for the Egyptians to have a navy in both places. However, over the next 1,200 years, the canal fell into disuse, although there were later attempts to rebuild it. In 1799, when Napoleon was in Egypt, he considered building the canal as it would not only help with trade, but it would also allow access to India. However, the survey work undertaken by the French showed that the Red Sea was 10 m higher than the Mediterranean, which was incorrect. Based on this, however, they felt that the locks needed would make the construction too complicated and far too expensive.

In 1854 the French diplomat Ferdinand de Lesseps managed to get a concession from the viceroy of Egypt, Said Pasha, to build a canal, and on December 15, 1858, he established the Compagnie Universelle du Canal Maritime de Suez (Suez Canal Company). Work started immediately and it took almost 11 years and work by as many as 30,000 people to build the canal, which stretched from Port Suez to Ismailia. It was opened for the first time on November 17, 1869. Because of the importance of trade to the British, they wanted to have a role in the construction of the canal, but when the company shares were sold, most were bought in France, with Ismail Pasha, the new viceroy of Egypt, being given a number of shares. However, he had severe debts and sold the shares in 1875 for £4 million, thus ensuring a major British interest in the company. The loan by which the British bought the shares was made possible by the good offices of the Rothschilds. By the Convention of Constantinople in 1888, the British undertook to protect the canal and it was to be a neutral zone in times of war. The Anglo-Egyptian Treaty of 1936 confirmed British control of the canal, and this was important in both World War I and World War II, as well as trade throughout the first half of the 20th century.

Egyptian nationalists resented the British control of the canal, the stationing of British soldiers in the Suez Canal Zone, and also the revenue from the canal which went to the Suez Canal Company. In 1951 the Egyptian government repudiated the Anglo-Egyptian Treaty, and in 1954, the British agreed to remove their soldiers, completing this in July 1956. Soon afterward, the Egyptian government of Gamal Abdel Nasser announced on July 26, 1956, that it was nationalizing the canal, buying all the company shares for the price they were quoted on the French stock market on the previous day. The British and the French objected to this and threatened to intervene, with Israel offering to launch a land attack. The British and French sent in their soldiers and they fought the Egyptians. However, the United States opposed the war, and the United Nations voted to create a peacekeeping force, the Canadian politician Lester Pearson being awarded the Nobel Peace Prize in 1957 for his work on this. The sinking of ships in the Suez Canal resulted in its being closed until 1957.

The Suez Canal was now under Egyptian management, but in 1967, the Israelis launched a strike against the Egyptian forces and attacked across the Sinai Peninsula to take the canal. It was then closed by an Egyptian blockade, with Egypt attacking Israel in the Yom Kippur War of 1973. The canal started operations again on June 5, 1975, and it has been open since then, under the control of the Suez Canal Authority. All ships going through it needed to take on pilots who were, until 1956, foreigners, and from then on Egyptians. The largest ships that are allowed through are supertankers known as "supermax." It costs about $150,000 for an average ship to pass through the canal, which between July 2005 and May 2006, raised $3.246 billion, helping finance many projects for the Egyptian government.

Sumitomo Mitsui Financial Group

The Sumitomo Mitsui Financial Group, Inc., (SMFG) is a financial services group established in December 2002 with ¥1.42 trillion in capital. In 2001 Sumitomo Mitsui Banking Corporation (SMBC) was created through the merger of Sumitomo Bank and Mitsui's Sakura Bank with ¥1.277 trillion in capital. It was Japan's second-largest bank. In Japanese, the corporate name is reversed to Mitsui Sumitomo Financial Group, a sign that Sumitomo was the stronger entity in the merged financial group.

SMFG is a holding company comprised of SMBC, Sumitomo Mitsui Card Company, Ltd., Sumitomo Mitsui Finance and Leasing Company, Ltd., the Japan Research Institute, Ltd., SMBC Friend Securities Co., Ltd., and is linked to Daiwa Securities SMBC Co., Ltd., Daiwa SB Investments Ltd., and Promise Co., Ltd. The Japan Research Institute was established in 2002 and the following year, two wholly owned subsidiaries were established: Sumitomo Mitsui Card (founded in 1967) and the SMBC Finance and Leasing Company (founded in 1963). From 2004, the SMFG formed an alliance with the Promise Co., Ltd. SMBC Friend Securities Co., Ltd., founded in 1948 as Meiko Securities Co., Ltd., became an SMFG subsidiary in 2006.

SMFG created a group corporate identity based on three strengths: the spirit of innovation, speed, and solutions and execution. The three strengths are said to be "the sources of our corporate value, on our way to becoming a team of professionals." The group slogan is "Lead the Value," which focuses on customers, shareholders and markets, and society in conjunction with the three strengths.

SMFG offers a wide variety of financial services including commercial and investment banking, credit card services, leasing, research, and securities. Specifically, SMBC offers services such as lending, deposit, securities retail sales and trading, investment trust sales, fund transfer, foreign exchange, corporate bond trustee and custody services, trust banking, and retail sales of insurance products. The Sumitomo Mitsui Finance & Leasing supports services such as corporate leasing and installment, rental business, international business, real estate leasing, finance, investment, and management support services. The Japan Research Institute offers services such as computer system development, information processing, consulting, and think tank services. Sumitomo Mitsui Card, which specializes in credit card services and credit financing, established in 2005 the Mitsui Sumitomo Card iD, a "wallet phone" service, in cooperation with NTT DoCoMo, Japan's largest mobile phone network service provider. It allows customers to pay for goods and services with their mobile phone functioning as a credit card.

Background and Global Presence

SMFG traces its establishment back to the Sumitomo company founded in 1630 by Masatomo Sumitomo, who began by selling medicine and books near Kyoto. His brother-in-law, Riemon Soga, and his eldest son, Tomomochi Sumitomo, expanded their business and became the leading copper mining, smelting, and trading company. The company expanded through warehousing and banking with their first Sumitomo Bank established in 1895 by Teigo Iba. Sokubei Mitsui began as a sake and soy sauce merchant near Kyoto, and his son, Hachirobei Takatoshi Mitsui, established the House of Mitsui in 1673 as a dry goods store in Tokyo, the precursor to the Mitsukoshi Department Store. Hachirobei Mitsui is said to have opened his first bank in 1683, next to his dry goods store in Nihonbashi, Tokyo. The Mitsui Bank, Japan's first private bank, was established in 1876 with ¥2 million in capital and headed by Takashi Masuda.

The Sumitomo Bank engaged in rapid expansion through the establishment of overseas offices. From 1916 to 1918, the Sumitomo Bank opened offices in Shanghai, Bombay, San Francisco, New York, London, and Hawaii. The company later expanded to South Korea, China, and Taiwan, and in 1952, it established the Sumitomo Bank of California. Today, the Sumitomo Mitsui Financial Group is active throughout the world, with 20,322 employees as of March 1, 2006.

Sunoco

Sunoco is the leading manufacturer and marketer of petroleum and petrochemical products. With headquarters in Philadelphia, Pennsylvania, Sunoco is one of the largest independent refiner-marketers in the United States. As of December 2007, Sunoco operated five domestic refineries with a total 910,000 barrels per day of crude oil processing capacity. Sunoco owns and operates approximately 5,500 miles of crude oil and refined gasoline products and has 4,700 retail sites selling its gasoline.

Sunoco is a major producer of petrochemicals. The company sells approximately 5 billion pounds of chemicals synthesized from petroleum, mostly intermediates that are used to make fibers, plastics, films, and resins. Through its subsidiary, Sunoco Chemicals, the company produces and sells such petrochemical intermediates as phenol, acetone, nonene, tetramer, alphamethylstyrene, toluene, xylene, and benzene. Sunoco also manufactures over 2.5 million tons of metallurgical-grade coke for consumption by the steel industry. The company is the "operator of, and has equity interest in, a 1.7 million tons-per-year coke making facility in Vitoria, Brazil."

Sunoco is a global company in terms of its markets: it has over 80 export markets in Europe, the Middle East, Africa, and Australia. Its subsidiaries in Belgium and Japan continue to produce and sell industrial oils and lubricants throughout Europe and Asia, respectively. Sunoco has seen impressive growth over the last few years. Between 2003 and 2007, sales more than doubled from nearly $18 billion to close to $45 billion; during this same period, net income for the company also increased about 2.5 times, from $312 million to $891 million.

Sunoco's first successes depended on developing and exploiting major technological change. By the end of World War II, technological leadership went to other, larger refiners and petrochemical producers. Unlike other oil and chemical companies, Sunoco did not rely ultimately on riding the growing wave of globalization. Foreign operations were, and still are today, of subsidiary importance to the company. Indeed, by the 1990s, Sunoco actually reduced its international presence. For example, Sunoco concentrated the vast bulk of its refining capacity to the United States. The strategy that set the company onto its growth trajectory after the 1970s was in general undertaken in its U.S. operations. However, at the same time, by maintaining a wide-ranging marketing and distribution system for its gasolines, oils, lubricants, and specialty products, Sunoco today has been able to transfer the benefits it receives at home to its commercial network worldwide.

History

Sunoco began its business as the Peoples Natural Gas Company of Pittsburgh, Pennsylvania, providing natural gas for business, commercial, and residential

While Sunoco has over 80 export markets on five continents, its foreign operations are secondary to those in the United States.

demand. The founders, Joseph. N. Pew and Edward O. Emerson, looking to expand and diversify, entered the oil business in 1886 by purchasing oil leases in the then-promising oil fields of Pennsylvania and Ohio. In 1890 the company officially became the Sun Oil Company of Ohio. By the 1890s, Sun Oil was "producing, transporting and storing oil as well as refining, shipping, and marketing petroleum products." By 1895 the company was operating a large refinery in Toledo, Ohio, a consequence of the purchase of the Diamond Oil Company. In 1899 Pew bought out Emerson's interest in the company and became sole head of Sun Oil. Two years later, Pew further extended the company's hold on the country's oil industry by obtaining leases and crude oil in the newly discovered Spindletop oil field of Texas. With a growing supply of oil now coming from the Southwest, additional refinery capacity had to be secured. Pew purchased 82 acres of land in Marcus Hook, Pennsylvania, as the site for the company's second refinery. The death of Joseph Pew in 1912 ushered in a new era for the company. His two sons took over the reins of power in the company: J. Howard Pew succeeded as president of the company and Joseph N. Pew, Jr., as vice president.

Over the next two decades, Sun Oil continued to expand and diversify. It entered the shipbuilding industry through the establishment of the subsidiary Sun Shipbuilding and Dry Dock Company. This was an important aspect of the business because it assured Sun in-house capability of available transportation of oil from field to refinery. In addition to shipbuilding, Sun produced oil field equipment through a joint venture with Sperry Gyroscope, and marketed its own gasoline through the owning and operating of its first retail service stations in Pennsylvania and Ohio. In 1925 the company went public under its new name, Sun Oil Company.

The most important developments during the decades between the world wars were technological in nature. Prior to 1937, the most advanced technology for cracking oil was thermal in nature: the refining process was conducted with the application of high heat and under increasingly elevated pressures. The major problems in these processes were poor efficiencies and quality of the gasoline. Developing the pilot project of the Frenchman Eugene Houdry, Sun Oil constructed the first workable catalytic process for cracking oil to produce gasoline at the Marcus Hook refinery. The entrance of catalytic cracking produced a revolution in the industry. It meant that the results were the highest-quality gasoline products then available. At this time as well, Sun Oil began to internationalize by opening a subsidiary in Belgium to produce and market branded motor oil, grease, and industrial petroleum products throughout Europe.

During World War II, Sun Oil participated in the production of high-quality gasoline and synthetic rubber for the U.S. government. However, problems with Sun's catalytic process (a.k.a. the Houdry fixed-bed process), limited its role in the government's fuel and synthetic rubber programs. Other companies had begun research and development activities on newer and improved catalytic technologies. In particular, Standard Oil of New Jersey successfully developed the famous fluid catalytic cracking technology, which became the gold standard for the cracking of oil during and following the war, both in the mass production of high-grade fuel and commercial synthetic rubber (which consumed the petrochemical intermediates produced by the process). Sun Oil, remaining dedicated to improving the older Houdry process that Sun patented, was deposed by Jersey Standard as the industry's technological leader.

Postwar Developments

The decades following the war became the era of change for the company that can be characterized as a growth through focusing strategy. The first non-family member to head the company came in 1947 when Robert G. Dunlop replaced J. Howard Pew as president (however, the first president to come from outside the company would not appear until the mid-1990s). During the 1940s and 1950s, Sun Oil expanded the reach of its oil and natural gas production operations internationally, notably in Venezuela's Lake Maracaibo and off the coast of England through offshore North Sea drilling.

In the late 1950s, the company heightened its marketing abilities. By 1956, Sun Oil became known for "custom blending," which allowed customers to choose from different octane-rated gasolines. The Sunoco stations would offer customers up to eight different grades of octane, all available through the same pump. In 1966 Sun Oil established a subsidiary in Japan to produce and sell industrial oils and lubricants throughout Asia. Besides this, Sunoco grew with the acquisition of other companies, including Sunray DX Oil Company (Tulsa, Oklahoma) in 1968. This acquisition gave Sunoco the advantage of refining and marketing gasoline under the DX name and expanded Sunoco's markets into the midwestern states.

By the 1970s and 1980s, the company saw that it had to compete in the future against larger oil producers and gasoline retailing chains. It made itself more competitive through a strategy that focused on cost consciousness, restructuring and streamlining of functions, and updated company image. Restructuring occurred on a regular basis, such as selling off its slower-growing operations. Thus, it disposed of its shipbuilding and "of all domestic oil and gas exploration and production," including its international exploration businesses. It also sharply curtailed its domestic retail business. By the early 1990s, Sun Oil closed down virtually all of its service stations in the southwestern United States and west of the Mississippi River.

At this time, the company's strategic direction was to focus on its two core competencies: refining and marketing. This meant increasing refining capacity and honing and expanding its gasoline marketing capabilities through strategic acquisition. With respect to its refining capabilities, between 1990 and 2005, Sun Oil, which had changed its name to Sunoco, acquired a number of refining companies in the Northeast that significantly increased its refining capacity. It also upgraded and modernized its facilities. Its most ambitious project involved the acquisition in 1994 (from Chevron Oil) of a 177,000-barrels-per-day refinery located in Philadelphia and located next to its Sun Refinery (purchased from Atlantic Petroleum in 1988). This acquisition meant that Sun could link the two refineries into one large and cost-efficient operation and then connect this refinery complex to its Marcus Hook plant by means of a 19-mile pipeline. Overall, by 2000, Sunoco's strategy allowed the company to significantly cut its costs in refining a barrel of crude oil.

Beyond optimizing refinery operations, Sunoco has also acquired new retail marketing outlets, including the Coastal and Speedway service stations located in Delaware, Maryland, Virginia, Florida, and Washington, D.C., and so reintroduced its Sunoco brand to areas in the United States that it had pulled out of only a few years before. As part of its marketing campaign to brand its new image to the public, Sunoco (in a manner similar to British Petroleum) has presented itself as environmentally responsible.

Supply Chain Management

Supply chain management oversees the businesses providing a product or service, through all stages from raw materials to purchase of a final product. The supply chain begins with natural resources and the cultivation, development, or discovery thereof. It proceeds from there to encompass the harvest, removal, or extraction of those resources, their processing into usable forms, the construction of components of the product, the assembly of those components, the use of storage and transportation resources, and the sales venue.

The supply chain of Coca-Cola, for instance, involves something like this: the agricultural concerns producing corn, vanilla, spices, and citrus; the processing and sale of clean water; the processing of the agricultural goods into corn syrup and flavor extractives; the production by the Coca-Cola Company of Coca-Cola syrup from those ingredients and water; the sale of that syrup to soda fountains and the Coca-Cola Bottling Company; the dilution and carbonation of that syrup by same, and subsequent packaging and distribution by the Coca-Cola Bottling Company; and the final sale to a customer of a fountain drink or canned or bottled Coca-Cola; as well as all transport of goods from one company or facility to another. Most consumer goods can be expected to involve at least four companies or subsidiaries: the provider of the raw material, the manufacturer of components, the manufacturer of the product, and the vendor of the product.

The group of businesses allied together in the production of a good or service is often called the *Extended Enterprise*, a term that emphasizes their mutual interests. These businesses can be subsidiaries of some larger company, or part of formal partnerships or alliances, or may only be linked by contracts. In the Coca-Cola example, the company has a long-standing association with the Coca-Cola Bottling Company, for instance, and long-term vending contracts with various chains of convenience stores, restaurants, sporting venues, and so forth. But many of the items it uses in the production of its product are purchased on the open market, its association with those providers thus maintained transaction to transaction, and likewise the majority of the locations where Coca-Cola products are purchased have no formal relationship with the company, having acquired the product from a distributor and nearly always stocking the company's competitors' products as well. The Extended Enterprise includes advertisers, marketing agencies, public relations firms, franchise attorneys, real estate lessors, consultants, IT firms, and other companies who are involved in the life of the product—the extended family thereof, so to speak—but not in the supply chain as such. As business processes like customer service, tech support, and accounting procedures become standardized in the international community, the Extended Enterprise increasingly includes outsourcing firms.

For that matter, businesses in general are less likely to perform every task themselves anymore, making most supply chains multicompany. The farmer driving his goods to market represents a smaller and smaller portion of the pie, and considering how many farmers' markets are patronized by restaurants' kitchen staffs, even that farmer often is not selling to the end consumer. The involvement of multiple businesses in a supply chain makes management of that chain a thing of mutual benefit to all, just as a single company doing multiple operations benefits from streamlining the operations. The term supply chain management dates from the 1980s, when business growth and the sophistication of business philosophy led to the recognition of the benefit of integrating and streamlining the processes involved in bringing a product to market.

Fundamentally, supply chain management involves sharing information among the companies participating in the supply chain. If there is a vanilla shortage on the horizon, Coca-Cola needs to know; if Coca-Cola is premiering a new flavor in the coming quarter, manufacturers of soda fountains need to know. Everyone's business runs more smoothly when they understand the supply chain they are part of. Ideally, optimizing the supply chain rather than optimizing each business's operations individually at the local level will benefit everyone. To an extent, supply chains form competitive units, competing against other supply chains—here the Coca-Cola example is less than ideal, because too many parties involved in its supply chain participate in Pepsi's as well.

One of the principal objectives of supply chain management's optimization efforts is to keep inventory at a minimum: supply should hew as close to demand as is feasible, never undersupplying but also avoiding warehouse and spoilage costs as a result of oversupply. The techniques used to optimize manufacturing flow toward this end are often called Just-in-Time techniques.

Supply chain management approaches are operational, strategic, and tactical. Operational activities include the optimization of production and distribution, down to minute-by-minute scheduling of manufacturing production at every facility in the chain; demand forecasting, in order to better serve inventory optimization; and the managing of process outsourcing. Strategic activities include the negotiation of partnerships among the companies of the supply chain, the engagement of third-party logistics providers, the use of information technology to integrate supply chain operations, and an informed design of new products such that they are easily integrated into the existing supply chain. Tactical activities focus on customer demand and inform inventory optimization.

Since the 1990s, it has become more common to outsource supply chain management to companies called third-party logistics providers (3PLs), though some definitions limit the scope of logistics to distribution issues, leaving out manufacturing and retail concerns. 3PLs do often specialize in scalable warehouse and transportation services. There are four broad types of 3PLs: the common 3PL that offers warehousing and distribution services; the service developer that adds security and advanced services; the customer adapter that optimizes a company's in-house logistics; and the customer developer that takes over the whole of the logistics operations for a company. 3PLs do not always own their own warehouses and distribution facilities, and may merely liaise between them, like a travel agent, arranging discounts or special treatment that the business would be unable to secure on its own. The small but growing sector of such 3PLs is sometimes referred to as the 4PLs, distinguished by their expertise and intellectual capital, and low operating expenses.

Supply Chain Risks

Supply chain risk may be defined as the risk created by any event that might interrupt the planned operation of a supply chain or network. To put this in context, Martin Christopher defines supply chain management as "the management of upstream and downstream relationships with suppliers and customers to deliver superior customer value at less cost to the supply chain as a whole." Therefore, in essence, supply chain risk is any interruption to either the inward or outward supply of raw materials, components, or finished products.

While an interruption of the inward supply may result in bringing processes to a halt, with the consequent loss of machine time or labor cost, the outward supply chain is equally critical to customer expectation or contractual obligations. It also has the very real physical manifestation of a build up of stocks (inventory), incurring further expense. The traditional insurance against inward supply chain risk is buffer or safety stock. This is a stock of materials or components held at key points of the supply chain to ensure continuity of supply for a specified period of time without replenishment. Thus, the larger the buffer stock, the longer the anticipated requirements for processing may be met.

Just-in-Time (JIT)

The greater the buffer stock, the more money must be tied up in these unproductive stocks. Thus, with the increased cost of money in the 1970s and 1980s, it was realized that better supply chain management, leading to a reduction in buffer stock, would reduce the overall logistics bill.

JIT manufacture was introduced into the motor manufacturing industry in Japan, and Toyota developed *kanban* and other sophisticated techniques to call forward components only when required to be incorporated into the vehicle under construction. This was extended to delaying components at all levels (place postponement) to spread the costs of stockholding. However, the reduced stockholding increases the risks that may be consequent upon any break or delay in the supply chain. Physical, political, and financial risks in the supply chain include the following:

- Accident or breakdown of transport
- Act of God, such as flood or earthquake
- Loss due to misrouting
- Theft in transit
- War or civil disturbance
- Act of terrorism
- Labor stoppage or strike
- Political embargo against supply
- Insolvency of any tier of supplier, or even in some circumstances, of the carrier

Product risk is not strictly supply chain risk, but such factors as perishability or a hazardous cargo classification require special care to avoid supply chain risk and may lead to products in the supply chain suffering from damage, degradation, contamination, or other third-party risk.

Scale of Risks and Risk Reduction

Just as supply chain costs tend to increase over distance, so supply chain risk tends to increase in proportion to distance between supplier and customer. The obvious reason is that it takes longer for goods to make the transit, but one also needs to take into account greater inflexibility of transport systems, such as irregularity of shipping services, and increased complexity of the supply process between domestic and international distribution. Unproductive time is the greatest cost in the supply chain.

Methods to achieve a reduction in supply chain risks include the following:

- Keep suppliers close to the next link in the supply chain. The motor manufacturing industry created supplier parks to have their first-tier suppliers adjacent to their factory, so they may call forward components while maintaining a negligible or zero stockholding. However, this may only move the risk upstream to the next tier of suppliers.
- Site factories near ultimate customers.
- Maintain alternative sources of supply, particularly from different points of origin to avoid all suppliers being isolated by a single event.
- Contract with several carriers to eliminate risks because of a problem with any single carrier.
- Ensure that information flow moves at the same rate as product movement within the supply chain.
- Transparent operation of the supply chain between all partners.

Sustainable Development

Sustainable development is the use of resources in such a way as to preserve the environment in order to continue to meet future needs as well as present needs. In the words of the Brundtland Commission that popularized the term, it "meets the needs of the present without compromising the ability of future generations to meet their own needs." The simplest example is harvesting the seeds from tomato plants in order to replant them every spring so as to continue to have tomatoes every summer; as each plant produces more seeds than necessary, even bad weather or other incidents make this a sustainable system without the need of external involvement or even a reduction of tomato usage.

Sustainability is the ability to maintain an activity or the availability of a resource like those tomatoes. Sustainable development calls for the "long view," asking not just what is best now, but what is best now that will remain the best choice in hindsight, and with respect to the impact on the future. Sustainability is not something that is achieved so much as something that is continually maintained, and perhaps adjusted. A relatively new concern, it encompasses a broad range of prescriptions and interpretations as to the best course of action.

The 1992 Earth Summit

The Brundtland Commission, named for its chair Gro Harlem Brundtland, the former Norwegian prime minister, was invited in 1983 by the United Nations (UN) to establish a World Commission on Environment and Development. The commission's findings were published in 1987, in a report entitled *Our Common Future*. The report was notable for its evenhandedness, placing environmental concerns square in the mainstream of political thought—indeed, doing everything possible to make "environmental concerns" as a notion not tied to any segment of any political spectrum, any more than is the notion of "economic concerns."

The publication of the report helped to stimulate the organization of the 1992 United Nations Conference on Environment and Development, or Earth Summit, where 172 governments sent representatives (most of them sending the head of state) to address environmental and sustainability issues. In particular, the summit discussed the production of toxic by-products in industrial nations; the possibility of alternatives to fossil fuels; the reduction of vehicle emissions; and water scarcity.

The Earth Summit produced the legally binding Convention on Biological Diversity and the Framework Convention on Climate Change, along with other nonbinding "principles" pertaining to the issues at hand. The Convention on Biological Diversity was the first document of international law concerned with biodiversity, naming it "a common concern of humankind." While emphasizing the preservation of biodiversity—then becoming a prominent issue due to the destruction of the highly biodiverse Brazilian rain forest, and it is no coincidence that the Earth Summit was held in Brazil—this is also a key legal document for sustainable development. The convention calls for the fair and equitable sharing of all benefits of genetic resources and biotechnology, and approaches conservation from a sustainability-minded point of view.

The Earth Summit also led to the creation of the Commission for Sustainable Development (CSD), which has remained the UN's forum for sustainability discussion since, and meets annually at the United Nations headquarters. CSD works to implement Agenda 21—the 21 stands for the 21st century—a series of principles composed at the Summit. Agenda 21 is a 900-page document divided into four sections: Social and Economic Dimensions (exploring consumption patterns, the impact of environmental and sustainability issues on health and poverty, and demographics); Conservation and Management of Resources for Development (protection of atmosphere, forest, and biodiversity); Strengthening the Role of Major Groups; and Means of Implementation (devoted to scientific and technological issues, as well as institutional and financial ones).

The Precautionary Principle

The Earth Summit built on *Our Common Future* by emphasizing the role of the precautionary principle in sustainable development. The precautionary principle is increasingly important in international business, having been adopted as a compulsory principle of law in the European Union, with all indications of inevitable adoption in some form in legal systems throughout the industrialized world. Under this principle, if a policy or act has the potential to cause severe environmental damage or bring harm to the public, the burden of proof falls to policy advocates. In other words, if it is unclear whether a company's planned actions are safe, it must be assumed that they

These children joined in a USAID project to plant sea grapes beside the Birán River in the Dominican Republic. The ecotourism cluster project aimed to promote sustainable development by drawing more low-impact ecotourism to the country.

are not until the company can prove otherwise. This is related to the "duty of care" concept in English common law, which states that if you can foresee that your conduct will cause harm, you are responsible for preventing that harm. What the precautionary principle introduces is a "better safe than sorry" carefulness, because of the history of vast environmental damage caused as science lagged behind industry, too often unable to say for certain whether an action would be safe or not. It is the sort of attitude one takes when recovering from a severe stomach upset, eating with the greatest of care, giving the benefit of the doubt to nothing but the blandest pieces of toast and lukewarm glasses of flat Coca-Cola.

One reason for the necessity of the precautionary principle is that market forces will not necessarily recreate it. The precautionary principle says that in the face of uncertainty, precautionary actions must be taken regardless of cost, and therefore regardless of cost-benefit analysis—requiring seatbelts even if they cost more than the medical bills incurred by not wearing them, in a sense, because of the unacceptability of accidental death, which cannot simply be paid for after the fact. The necessity of clinical trials for medication reflects the precautionary principle, though specific invocations of the principle are generally concerned with climate change issues, biodiversity, and threats to public health. The regulations concerning cloning, genetically modified organisms, and biosafety issues certainly fall under the purview of the principle, though some charge that GMOs are underregulated from a precautionary standpoint.

Interestingly, the recent slippery-slope arguments surrounding same-sex marriage and similar social change initiatives strongly resemble the precautionary principle, invoking as they do the uncertainty of the societal impact of social change rather than the uncertainty of scientific consensus vis-à-vis environmental change.

Sustainable development is not the same thing as environmentalism or "green" concerns. That is, it is not focused solely on ecological issues, climate change, and the physical environment; it is just as interested in social and economic issues, from the prescription of proper business practice from a sustainability-minded perspective to the interrelationship between poverty and environmental issues. Not only is environmental impact most likely to affect the poor, for instance, who will be forced by circumstance to live in the least healthy neighborhoods and who are least able to fight back if victimized by negligence that impacts public health, but in the broad scope of things they are the least able to minimize their environmental impact. Alternative energy is priced too high even for most of the middle class, let alone the poor; for various reasons, recycled products and environmentally safe products, while within the price range of the middle class, are not competitively priced with respect to the lowest-priced products in their category, and so are rarely if ever purchased by the lower class. A similar problem has long been recognized in the field of nutrition, due to the low cost and high calorie content of junk food compared to fresh produce, whole grains, and safe lean meat.

Goals

The global discussion of sustainable development has articulated a number of primary objectives:

- The prevention of irreversible ecological damage. The damage to the ozone layer and other atmospheric change is one obvious example, and climate change can be considered irreversible given the glacial pace at which it transpires.
- The prevention of long-term human health consequences, including but not limited to the impact of pollution, air and water quality, the handling of toxic products and by-products, the spread of disease, and the public health impact of genetically modified organisms and other biotechnology.
- Finessing the relationship between economic growth and environmental impact, which especially since the Industrial Revolution has essentially been negative. Ideally, the technology exists or can be developed such that economic growth can be environmentally positive or environmentally neutral, without the long-term necessity of government incentives to encourage "green" business. In other words, in the long run, businesses will ideally operate in environmentally friendly and sustainable ways, not merely because it is the right thing to do or because legal and tax codes have forced them to, but because it is the profitable thing to do.
- The integration of environmental, economic, and social concerns such that they are developed in tandem rather than independently or in inadvertent opposition.
- The achievement of intergenerational equity: avoiding present benefits at the expense of future generations.
- The achievement of distributional equity, avoiding the placement of the burden of negative impact on the poorest or most vulnerable populations, either regionally or globally.

Social, Natural, and Economic Capital

The three kinds of capital involved in sustainable development—social, natural, and economic—cannot be substituted one for another. We will undoubtedly find an adequate substitute for fossil fuels, but we will not find one for water, not least because natural resources are very often multifunctional. The Amazon rain forest contains trees that represent one sort of resource for the making of paper and wood products, but they also process CO_2 into oxygen, and the forest as a whole because of its size and unique characteristics contributes to the conditions of the global climate and the world's biodiversity. And diversity, unlike trees, is essentially nonrenewable. Even if eradicated species could be replaced with new species, it is debatable whether that constitutes replenishment of the resource.

In the social sphere, cultural diversity is sometimes discussed in the context of sustainable development, as a similarly nonrenewable human resource. The European Union has adopted this attitude faster than other bodies, perhaps made aware of the importance of cultural diversity in light of the cultural institutions that the Union has replaced, such as national currencies—and perhaps sensitive to the issue because of the history of groups like the Basques who have coexisted with the French and Spanish but had to fight for the survival of their culture. Because biodiversity is necessary for the survival of life on Earth, it is argued—not least by indigenous peoples and their advocates—that cultural diversity is similarly necessary for the survival of humankind, that there must be significant variation among human cultures. This opens up a difficult argument: It is problematic to argue against cultural diversity, and virtually untenable to argue for the eradication of any culture in particular. But that does not mean everyone agrees that cultural diversity itself is necessary in the same sense as biodiversity; a family with six members will, certainly, consider each member to be a necessary part of the family, but this does not support a position that the good of family, in the abstract, is furthered by the condition of having at least six members.

Cultural diversity is also harder to quantify. Biodiversity can be quantified to a certain extent by counting species, though this is much less clear-cut than the general public thinks: The difference between two species or one species with two mild variations is a thin one, and because there is professional and political cachet in identifying a new species, there is a certain amount of species inflation in the field. Even so, it is far simpler than quantifying cultural diversity, because there is no discrete unit of culture. Countries can be counted, ethnic groups can be counted, languages can be counted, but culture is not purely a product of any one or any particular combination of the three. Furthermore, the relationship between cultural change and cultural diversity is much more complicated than between extinction and biodiversity. The loss of a culture does not necessarily mean the death of its members, and though it can be tricky to argue that a member of one culture who becomes a member of another represents a loss to the first culture, on some level we must consider that to be what is happening if that process is repeated by enough members. Further, even when members do not switch cultures, the change within a culture still represents an abandonment of the culture being left behind, just as the evolution of a species leaves some traits behind in favor of others. Is that a loss of diversity? Clearly it is not always. Life on Earth is not less biodiverse as a result of evolution. But if globalism leads to cultures evolving closer and closer together, even if they never meet, they might be said to be less diverse.

Swap

In the financial derivatives markets, a swap is an agreement between two parties (counterparties) to swap cash flows for a specified period. A swap is a risk management technique. Swaps are used for hedging (insuring) against adverse movements in interest rates and foreign exchange rates. They provide certainty about future interest payments or foreign exchange liabilities, either through fixing payments or matching variable cash in-flows with variable cash out-flows.

The advantages of swaps are that they are flexible in size and duration and can be tailored to the requirements of the parties. The duration advantage is important because the parties can arrange swaps for as long a period as they wish. Swaps are over-the-counter (OTC) instruments with counterparty (default) risk. The international swap markets have grown enormously since the late 1970s and deal in interest rates, currencies, and commodities. The vast bulk of business is in interest rate swaps. Participants include the counterparties and swap dealers and brokers, who act as intermediaries. Central banks also use swaps to obtain foreign exchange for short-term market intervention. The principal swaps are in interest rates and currencies.

An interest rate swap is based on the interest rates differential between two parties with a common currency. If one party enjoys better borrowing terms than another party, then it is possible for the first party to sell part of its advantage to the other so that both can pay lower rates than they would by borrowing independently. The differing interest rates reflect the differing credit ratings of the parties (the quality spread).

For the swap to work, one party will want to pay a fixed rate and the other a variable rate on a common principal amount of borrowing. For example, Party A may be able to borrow fixed-rate funds at 12 percent and variable (floating)-rate funds at 9 percent, while Party B may be able to borrow fixed-rate funds at 10 percent and variable-rate funds at 8 percent. By negotiation, the parties could agree that B will raise money at 10 percent fixed rate and A will raise the variable funds at 9 percent. They will pay each other's interest commitments. If A also compensates B 1.5 percent, a situation will be produced where A is paying an effective fixed rate of 11.5 percent and B is paying an effective variable rate of 7.5 percent. Both parties are paying 0.5 percent less on their borrowing than they would by acting independently. The principal amount is not exchanged because each party raises the same amount in the same currency. Effectively, one party to an interest rate swap is selling some of its superior credit rating advantage to the other party to their mutual advantage.

The simplest currency swaps are where two parties agree to swap regular payments in each other's currency for a specified period at a mutually agreed exchange rate. For example, an American company might want to invest in France and a French company in America. The American company would provide the French company with dollars and the French company would provide euros to the American company at the agreed exchange rate. Each would make periodic payments to the other to cover the interest payments on the funds each had raised. At the termination of the agreement, each would exchange principal payments at the agreed exchange rate, enabling both to settle their borrowings. This would be an entirely private arrangement divorced from the currency market itself. A more complex swap would be the fixed-for-floating currency swap involving both a fixed-for-variable interest element and a currency element. One party will pay a fixed rate of interest on borrowings in one currency while the other pays a variable rate on borrowings in another currency. In this form of swap, the principal is also exchanged at the end of the agreement period to meet the repayment to the respective creditors.

Swaps can be arranged directly between parties who know each other. However, on such a basis, the scope for swaps would be very restricted. Consequently, most swaps will be arranged through dealers and brokers who will bring parties together. Brokers will introduce parties to each other, while dealers will arrange the swap and, for a fee, assume counterparty (default) risk. This is the risk that one party will fail to meet its obligations to the other. A further development of the swap instrument is the swaption. This is an option on a swap at a future date on terms agreed now. The holder can choose to exercise the option or not. This represents a derivative instrument in a derivative.

Sweden

Sweden, with approximately 9 million inhabitants, is characterized by its highly developed welfare state and an economic history and performance where exploitation of natural resources has been combined with refining such materials for export. Sweden is one of the world's leading producers of iron ore, and also extracts copper, lead, zinc, and pyrite. Manufacturing activities include iron- and steel-based products, machinery, precision equipment, and motor vehicles, and trade balance has in usual years been slightly positive in Sweden's favor. Sweden joined the European Union (EU) in 1995.

Sweden was like most European countries, a late but rapidly industrializing country that was predominantly agrarian until the latter half of the 19th century, with exports dominated by basic agriculture, mining, and forestry products. From the mid-19th century onward, new types of machinery (e.g., for producing pulp and paper) allowed for refinement of such products, and engineering as an industry by itself subsequently developed in terms of both employment and export shares (3 percent in 1880, 10.5 percent in 1910–11, and 20 percent in 1950) reaching an international status in the 1950s surpassed only by the United States. But until the 1980s and early 1990s, the more fast-growth high-technology sectors were not dominant within the Swedish economy. In fact, the proportion of production in industries that are intensive in research and development (R&D) efforts declined during 1975–91.

As pointed out by C. Edquist and L. Hommen, the entry into the EU in 1995 was in part motivated by the insight that the domestic market did not provide a sufficient basis for the growth and the development of new technologies and industries, and there was subsequently a need for increased exposure to international demand. This strategy did not immediately result in a more diverse structure of the economy, but rather in a consolidation of the preexisting structure dominated by engineering; however, the development during 1980–94 has been a modest increase in the share of employment in knowledge-intensive service industries in parallel with the general increase in service sector employment. Swedish production of high-technology products as a share of all manufacturing production also increased from 1993 (8.8 percent) to 1996 (12.5 percent). However, these exports were dominated by the two high-technology sectors in which Sweden was already specialized, that is, telecommunications equipment and pharmaceuticals.

The Swedish economy is experiencing a kind of paradox similar to the so-called European paradox, where there are high investments in knowledge-intensive activities such as research and innovation efforts, but seemingly limited payoffs in the form of innovative output and employment. Partly, this can be explained by the continued importance of industries that are not so knowledge-intensive. Also, according to Edquist and Hommen, the paradox is in part linked to globalization processes in the sense that Swedish multinational corporations and in particular those specialized in high technology simultaneous with domestic investments have also pursued a strategy of foreign direct investment.

Government

Sweden is also known as one of the prime examples of social policies for wealth distribution and intergender equality. State-administered minimum old-age pension was instituted in 1946 and followed by universal child benefits (1947), Occupational Safety and Health Act (1949), three-week statutory holiday (1951), compulsory health insurance (1955), compulsory nine-year education (1960), and a so-called million-homes housing program (1965–74).

Specific reforms focusing on families and female labor force participation include extension of maternity leave to six months (1963), separate taxation for married couples (1971), Parental Leave Act (1974), Working Environment Act (1977), Equal Opportunities Act (1979), and separate paternity leave (1995). From 2003 onward, the social policies have been organized as a comprehensive public health policy, meaning that there are 11 domains of objectives for both the prevention and amelioration of social problems (ranging from participation and influence in society to reduced consumption of tobacco and alcohol) where public health efforts are to be concentrated.

Swedish politics have been dominated by long and relatively stable government structures firmly held by the Social Democratic Party, who until 2006 were in power during all but nine years since 1932. While most of the other political parties to a large extent share the basic ideas behind the welfare state, there are profound differences regarding funding principles, extent of coverage, and so forth. In 2006 a conservative Alliance for Sweden won the general elections and ousted the Social Democrats. This led to a series of liberalization and privatization measures targeted at the public sector, although the Social Democrats had initiated a number of modest reform processes already prior to the power shift.

As for the current and future prospects of the Swedish economy and its welfare state provisions, the Organisation for Economic Co-operation and Development (OECD) has evaluated the macroeconomic performance as "excellent," with high rates of growth, low unemployment, and stable inflation expectations. They also point out challenges such as employment rates not having recovered to traditionally high levels, with unemployment rates particularly high among immigrants and young persons. In addition, disability and sickness rates are high in international comparison.

Swiss Market Index

The Swiss Market Index (SMI) is a weighted index for the Swiss Exchange (SWX), the stock exchange for Switzerland, which is based in Zurich. Because of its location in central Europe and also its neutrality in so many conflicts, as well as its well-known banking system, several stock trading operations had been established in Switzerland: in Geneva in 1850, Zurich in 1873, and Basel in 1876. Zurich took over from the other two, and has been one of the major stock exchanges in the world. Indeed, it was the first stock exchange anywhere in the world to introduce a fully automated trading, clearing, and settlement system in 1995. Controlled by 55 banks, each with equal voting rights, the Swiss Exchange is used to raise capital for Swiss companies and also companies operating in nearby countries.

To help with a measure of the "health" of the Swiss Exchange, as well as to allow investors to balance their portfolios, the SMI was established, made up of the 20 most important equity securities, the position being based on the market capitalization of the companies concerned. Essentially, it consists entirely of blue-chip stocks, and was introduced on June 30, 1988, with a baseline value of 1,500 points. It then rises or falls in line with the movement of the stocks that make up the index, as with other stock exchange indices. The level of the SMI is now calculated throughout the day of trading, with changes made every time there is a transaction involving shares that are a part of the index. The new figure for the SMI is then displayed in the trading room, a process made possible by the automated buying and selling on computers. Each year, the companies that make up the share index are examined and adjustments are made. The index is also weighted with the more important companies having far more influence on the SMI than smaller companies.

In August 2008 the major companies represented on the SMI were Nestlé (22.19 percent), Novartis, pharmaceuticals (18.76 percent), and Roche, also pharmaceuticals (15.3 percent). The other companies are UBS (banking) with 7.26 percent; ABB (electronic equipment) with 6.95 percent; Credit Suisse (banking) with 5.73 percent; Zurich Financial (insurance) with 4.63 percent; Richemont (clothing and accessories) with 3.75 percent; Syngenta (chemicals) with 3.26 percent; Swiss Re (reinsurance) with 2.83 percent; and another 10 companies with less than 2 percent each: Adecco (business training), Bâloise (insurance), Clariant (chemicals), Holcim (building materials), Julius Baer Group (investment), Nobel Biocare (medical equipment), Swatch Group (clothing and accessories), Swiss Life (insurance), Swisscom (telecommunications), and Synthes (medical equipment).

To ensure that the shares that make up the SMI are all "blue chip," there are stringent requirements regarding the liquidity and market capitalization of the companies. There are also analyses of trading volumes that help shape quarterly rankings, with the composition of the index reviewed each year on the third Friday in September. However, there has been a concern by some investors that the SMI does not represent the true value of stock because it does not take into account dividends. This makes the SMI not such a good guide of investment, but only of stock prices. For this reason, the Swiss Exchange has introduced the SMIC, the SMI Cum Dividend, which analyzes prices and takes into account dividends. However, this has not stopped the SMI from being used for many derivative financial instruments such as index funds, futures, and options.

Switzerland

The Swiss Confederation (15,940 sq. mi., population 7,676,500, gross domestic product $301 billion in 2007) is a quadrilingual, landlocked, alpine country in western Europe, long known for its neutrality in international conflicts, its banking, and as home to the Red Cross and the World Trade Organization. The four national languages of the country reflect its history, location, and ethnic makeup: German, French, Italian, and Romansh, a Romance language spoken by some 60,000 people and, like the Occitan of southern France, descended from the Latin used by the Roman settlers in the region. Romansh is spoken by so few speakers that spelling was not standardized until 1982; half of its speakers are bilingual.

Switzerland has been inhabited since the Paleolithic period, and had been settled by Celtic tribes long before the arrival of Germanic peoples in the aftermath of the fall of Rome. The Swiss Confederacy was formed in 1291 by cantons (regions) forming a union in opposition to the Habsburg dynasty. The conflicts with the Habsburgs and the Holy Roman Empire contributed to the reputation of Swiss soldiers, and thus to Pope Julius II hiring the Swiss Guard as the personal army of the papacy in 1506—a tradition that continues to the present day. The present Swiss government dates to the adoption of a federal constitution in 1848, in the aftermath of a civil war between the Catholics and Protestants of the country. Significantly, that war remains the most recent armed conflict on Swiss land. Even in World War II, Germany never acted on the invasion plans it had prepared for an attack on Switzerland, and the country had already become famous for its neutrality during the previous world war.

Most powers in the Swiss government are left to the cantons, while the federal government is responsible for trade, defense, and legal matters. The Federal Assembly is a bicameral parliament, consisting of the Council of States with 46 representatives elected from the 26 cantons (each canton decides how to elect its representatives) and the National Council with 200 members elected according to proportional representation. The Federal Court oversees judicial matters. The Federal Council is the executive branch of the federal government, made up of seven members who jointly act as the head of state; traditionally the seven members rotate through one-year terms as president of the Confederation, a practical role that carries no additional powers or authority.

The Swiss constitution calls for a system of "half-direct" democracy. Although the people turn over much of their power to their representatives, that power is borrowed and may be reclaimed: any group of citizens can challenge a federal law by presenting 50,000 signatures (less than one percent of the population) within 100 days, at which point a national vote on the law is held and a simple majority wins. Constitutional amendments can also be made through popular vote, an unusual feature in systems of constitutional law.

Because of its neutrality, Switzerland and its capital city of Berne are home to many international organizations, most notably the Red Cross and the International Olympic Committee. Interestingly, it is not a member of the European Union (EU), the Swiss citizenry having rejected a referendum on the matter by popular vote. Only in 2002, amid considerable debate among citizens, did Switzerland join the United Nations, concerned—as with the EU—that membership in such an organization would compromise the more than 150-year tradition of international neutrality. It is also a member of the Council of Europe, a UN-like organization of 47 European member-states that works toward economic growth and human rights.

One of the stablest economies in the world, with the longest history of policies protecting monetary and bank security, Switzerland is integral to the global economy and increasingly a target of foreign investment funds. Industrialized since the 19th century, the country's main industries are machinery, chemicals, timepieces, and precision instruments. Switzerland is more protective of its agricultural sector than some industrialized countries are, and works to promote domestic production of farm goods like dairy products, pork, beef, and produce. If the alpine pasturelands are included, about two-fifths of the country's land is used for agriculture, providing some two-thirds of the nation's food. The cost of living is high, but so is the average income.

Switzerland is, of course, famous for its banking. Zurich, the largest city, is the cultural and economic center of the country, its bankers sometimes derisively called the "gnomes of Zurich" by foreigners. The Swiss government treats the right to privacy as a fundamental human right necessary to protect all democracies, and the confidentiality between a banker and customer is like that between a lawyer and client or doctor and patient—sacrosanct, but occasionally broken by court order during a criminal investigation. Because federal law distinguishes between tax evasion and tax fraud, it can be difficult for foreign powers to get the cooperation of Swiss banks to provide financial data necessary to prove that a foreigner has been using a Swiss bank account to avoid paying taxes on assets. Swiss bank accounts remain popular among foreign customers for that reason, among others.

Syria

The contemporary Syrian economy has passed through two main eras: the first in which Syria was moving toward building a social economy (early 1960s through the 1980s), and the second in which Syria was moving toward liberalizing its economy. The latter era witnessed the adoption of the social market-based economy (1990s until present). In the former era, the Syrian government led by the Syrian leader party (Al-Baath) nationalized many of the main sectors and assets, such as the banking and insurance sector, the transportation sector, water, electricity, and refineries. It also took control of the importation of main products and restricted the importation of so-called luxury products. Moreover, it controlled the ability of the private sector to get foreign exchange to finance its needs.

Instead of achieving the goal of further developing the country and protecting its new industrial sectors, the strict control and overprotection, along with an acute principal-agent problem in public sector corporations, worked against developing Syrian industries.

In the 1990s Syria started changing its policy to create a less controlled environment. In 1991 Syria adopted the so-called Number 10 Act for Investment. This act aimed at encouraging foreign and domestic investments in Syria through some tax exemptions,

Syria's unemployment fell to 7.6 percent in 2007, improving the outlook for laborers like this construction worker.

and allowed exceptions regarding the restrictions imposed on the import of goods by these new investments. The adoption of this act caused a booming era for the transportation sector in particular, in which many private companies were established.

In 2001 Syria made serious steps toward the liberalization of its economy, starting with the banking sector. A new act was adopted to allow private banks to operate and finance foreign trade. In 2004 several private banks were created and commenced serving the Syrian market. Afterward, Syria liberalized its insurance sector, where the Law No. 43 of 2005 was enacted. This law allowed private insurance companies to operate in the Syrian market. Moreover, in 2005, Syria adopted a new law by which the Damascus Stock Exchange was created. This new development was considered a big step toward the liberalization of the Syrian economy.

In terms of liberalizing its trade, Syria finished working on the Greater Arab Free Trade Agreement January 2005. Moreover, it signed a free trade agreement with Turkey in January 2007. Syria is still to sign the Association Agreement with the European Union, although Syrian economists are still skeptical about the benefits that Syria could get out of this association. Syria continued the liberalization of its trade and in May 2008, it liberalized the importation of 20,000 products.

In 2007 the country experienced an increase in the gross domestic product (GDP) growth rate from 5.1 percent in 2006 to 6.5 percent in 2007, which is considered one of the highest levels that the Syrian economy has reached for a long time. However, the trade deficit reached 83 million Syrian liras, because both imports and exports increased.

The role of the private sector in developing the Syrian economy has recently grown. The private sector accounted for 65 percent of the GDP compared to 35 percent for the public sector. The deficit faced by public sector corporations (288 million lira) is mainly responsible for the declining role of the public sector in the growth of the GDP. The deficit is attributed to several factors such as bureaucracy, corruption, and, most importantly, the subsidies that the Syrian government is paying through the selling of some basic products (diesel) at nominal prices. In April 2008, the Syrian government made a decision to halt the subsidies for the consumption of diesel beyond a certain limit (1,000 liters for each family). This decision was thought to have a long-term impact on the Syrian economy. This impact would be in terms of an increase in the prices of both products and services.

Although the financial figures in 2007 reveal a significant decrease in the inflation rate (from 10.6 percent in 2006 to 4.4 percent in 2007) and in the unemployment rate (from 12 percent to 7.6 percent), and an increase in the GDP per capita, Syria is still facing serious problems in terms of the high population growth rate and the concentration of its exports on few products (mainly crude oil, where the production is decreasing, and raw cotton). Moreover, the persistent rejection of privatizing the public sector constitutes a serious obstacle toward further developing the Syrian economy.

Sysco

Sysco is a North American food distributing company. Through its subsidiaries, Sysco engages in the marketing and distribution of a range of food and related products primarily for foodservice or food-prepared-away-from-home industries in the United States and Canada. Its customers include restaurants, hospitals, nursing homes, schools, colleges, hotels, and motels. Sysco was incorporated in 1969 and employed around 51,000 people as of January 1, 2007. Sysco is a Texas-based company with headquarters located in Houston, Texas. Sysco is quoted in the New York Stock Exchange with the ticker symbol of SYY. It has approximately 13,500 shareholders (as of August 1, 2007).

Sysco's key products include fresh and frozen meats, canned and dry products, frozen fruits, vegetables, baked goods, poultry, dairy products, paper and disposables, seafood, beverages, and janitorial products. Sysco, while distributing nationally branded merchandise, also provides products packaged under Sysco's private brands. The company uses the following brands in marketing its own products: Sysco, Arrezzio, Jade Mountain, Casa Solana, Block and Barrel, and House Recipe.

The company operates through three business segments: Broadline, Sygma, and Others. The Broadline segment provides the distribution of a full line of food products and a wide variety of nonfood products to both Sysco's traditional customers (e.g., restaurants, hospitals, schools, dormitories, hotels, and industrial caterers) and chain restaurant customers (e.g., regional and national hamburger, sandwich, pizza, chicken, steak, and other chain operations). The Sygma segment is a network of foodservice distribution facilities, experienced in distributing to chain restaurants. The segment distributes a line of food products and a variety of nonfood products to chain restaurants. These services are supported by special physical facilities, vehicles, material handling equipment and techniques, and administrative and operating staffs. Diverse products are distributed by the Sygma segment. These include a line of frozen foods, fresh meats, fruits, and vegetables. The Sygma segment also provides a wide range of nonfood items, including tableware, such as silverware; cookware, such as pans and utensils; restaurant and kitchen equipment and supplies; paper products, such as disposable napkins, plates, and cups; and cleaning supplies.

The Others segment includes the company's specialty product services, which include custom-cut meat and lodging industry products subsegments. The specialty meat subsegment distributes custom-cut fresh steaks, other meat, seafood, and poultry. This subsegment also provides special foods for the Asian cuisine foodservice market. The lodging industry products subsegment, on the other hand, distributes personal care guest amenities, equipment, housekeeping supplies, room accessories, and textiles to the lodging industry.

Sysco was founded in 1969 by John Baugh in Houston, Texas, as a wholesale food distributor. The company went public in 1970. Sysco expanded its operations by choosing to grow by acquiring other companies. Today, the company operates in 177 distribution facilities throughout North America to provide its services to about 391,000 customers (as of July 1, 2007). Ninety-two percent of the company's 2006 revenues come from the United States, whereas its Canadian operations account for only 8 percent. Throughout its operations, Sysco uses its subsidiaries, which are more than 180 companies scattered in different parts of the American market, including Sysco Kingston, Buckhead Beef Northeast, Fowler and Hunting, FreshPoint Central Florida, Sysco Food Services of Jackson, and Sysco Food Services of Calgary.

There are many reasons why Sysco may be regarded as a successful company. One of the reasons may be its strong market positioning. Sysco is the largest marketer and distributor of foodservice products in North America with a large market share in the highly fragmented foodservices industry. Sysco's market dominance drives it to expand its business with less hindrance. The second reason may be its gigantic distribution infrastructure, which extends throughout the United States and Canada. Sysco has strong distribution infrastructure compared to its competitors, and this distribution network gives the company a competitive advantage against its rivals. Another reason may be the company's thriving financial management. Sysco's revenues have grown continuously in previous years. A consistent revenue increase paves the way for future growth for the company and strengthens its market position.

Taiwan Weighted Index

The full name of the Taiwan weighted index is the Taiwan Stock Exchange Capitalization Weighted Stock Index (TAIEX). TAIEX is maintained by the Taiwan Stock Exchange Corporation (TSEC), and therefore is also called the TSEC Index.

Among the indices maintained by TSEC, TAIEX is the most widely recognized one, and it represents the overall performance of Taiwanese stock market. TAIEX is a market capitalization–weighted index—similar to the Standard & Poor's Index—in contrast to price-weighted indices, such as the Dow Jones Industrial Average and the Nikkei Stock Average.

TAIEX is adjusted in the event of new listing, delisting, and new shares offerings, to offset the influence of nontrading activities on TAIEX. The base year value was set at 100 in 1966. Currently, there are more than 600 constituents in TAIEX.

Besides the major all-stocks index, the TAIEX series also derives subindices such as Electronics subindex, Finance subindex, and so on. Investors can gain exposure to the index through the futures and options traded on the Taiwan Futures Exchange. TAIEX is heavily weighted on technology-related firms, reflecting Taiwan's important position in the global computer industry.

TAIEX covers all of the common stocks listed on TSEC, excluding preferred stocks, full-delivery stocks, and stocks listed for less than one calendar month. It is calculated as

*Index = Current aggregate market value / Base value * 100.*

The current aggregate market value is the aggregate of the market values obtained by multiplying the price of each component stock by the number of issued shares; however, stock of newly listed companies included in the calculation of the index may be accounted for on the basis of the number of shares currently listed. The base value at the time of commencement of calculation of the index base period is the current aggregate market value at that time. The formula for adjustment of the base value is as follows:

*New base value = old base value * (aggregate market value after the change / aggregate market value before the change)*

Aggregate market value after the change = aggregate market value before the change + the sum total of all changes in market value.

Subindices and TSEC Price Indices

The subindices are calculated and adjusted based on similar rules of TAIEX except for different groupings of the constituents. The subindices include the Finance subindex, the Electronics subindex, the Nonfinance subindex, the Nonelectronics subindex, the Nonfinance Nonelectronics subindex, and several Industrial subindices. Among all the sub-indices, the Finance subindex and Electronics subindex futures and options are also traded on the Taiwan Futures Exchange.

The Industrial subindices are calculated for different industrial sectors. In December 1986, eight Industrial subindices were introduced: Cement/Glass/Ceramics, Textiles, Foods, Plastics/Chemicals/Rubber, Electric Machinery/Electric Appliance/Cable/Electronics, Paper/Pulp, Construction, and Finance. In August 1995, TSEC introduced 14 additional Industrial subindices: Cement, Plastics, Electric Machinery, Electric Appliance/Cable, Automobile, Chemicals, Glass/Ceramics, Iron/Steel, Rubbers, Electronics, Transportation, Tourism, Retail, and Others. This expansion gave a broader perspective of industrial performances and a more comprehensive comparison with the overall market trend.

TSEC publishes TAIEX Price Indices and Total Return Indices. All of the TSEC Price Indices are constantly updated every minute during trading hours through the TSEC MIS system and information vendors' networks. The Total Return Indices adjusted for dividends are only published at the end of each trading day, giving a better indicator to measure the performance of funds. The information can be easily accessed on the systems of local and international information vendors, such as Reuters, Bridge, Quick, Bloomberg, or Primark.

Currently, the total market capitalization of TAIEX is TWD 20.471 trillion ($623 million). The 10 largest companies of TAIEX, in terms of market capitalization in 2007, are (1) Taiwan Semiconductor Manufacturing, (2) Hon Hai Precision Industry, (3) Formosa Petrochemical, (4) Nan Ya Plastics, (5) Chunghwa Telecom, (6) Cathay Financial Holding, (7) Formosa Plastics Corp, (8) China Steel, (9) AU Optronics, and (10) Formosa Chemicals & Fiber.

Investors interested in Taiwan stock indices may also explore the TSEC Taiwan index series, which is introduced through cooperation between TSEC and FTSE Group. The most widely quoted one is the TSEC Taiwan 50 Index, which includes the 50 blue-chip stocks with the largest market capitalization and represents 70 percent of the Taiwanese stock market.

Tanzania

Tanzania, known for its natural wonders, from Mt. Kilimanjaro to the Serengeti, borders the Indian Ocean between Kenya and Mozambique. Its land mass, including the islands of Mafia, Pemba, and Zanzibar, totals 550,557 sq. mi., which makes it the largest east African nation. It also borders war-torn Burundi, Democratic Republic of Congo, and Rwanda, and still hosts over 500,000 of their refugees. It is a diverse country, with over 120 ethnic tribes, and nearly equal representation on the mainland of those practicing Christianity, Islam, and indigenous beliefs.

Tanzania achieved independence from Britain in the early 1960s. Dar es Salaam is the capital and the largest city, and a major seaport for the Tanzania mainland and its landlocked neighbors, although Dodoma, located in the center of Tanzania, has been designated the legislative capital. Kiswahili is the official national language, while English is the official language of commerce, administration, and higher education. The currency, the Tanzanian shilling, had an exchange rate of 1,255 TZS to one U.S. dollar in 2007.

Tanzania has tremendous potential for robust economic growth because of its stability in an unstable region, 885 miles of coastline, and a wealth of resources, including hydropower, tin, phosphates, iron ore, coal,

Tanzanian men hoe rice paddies on a Tanzania Social Action Fund (TASAF)-funded irrigation project in the Mtwango District. The economy of Tanzania relies heavily on agriculture, which makes up 45 percent of its GDP.

diamonds, gemstones, gold, natural gas, nickel, and wildlife. Its 2006 real Gross Domestic Product (GDP) of $11.98 billion grew at a rate of 6.2 percent, compared to 5.5 percent for Africa and 5.4 percent for the rest of the world. The inflation rate of 7.3 percent (2006) also compared favorably to Africa's 9.5 percent. Although only 4 percent of the land is suitable for farming, the economy depends heavily on agriculture, which accounts for 45 percent of GDP, provides 85 percent of exports, and employs 80 percent of the workforce. Agricultural products include coffee, sisal, tea, cotton, pyrethrum, cashew nuts, tobacco, cloves, corn, wheat, grains, cassava, fruits, vegetables, and livestock.

Accounting for less than 10 percent of GDP, Tanzania's industrial sector is one of the smallest in Africa and is hindered by poor infrastructure in water and electricity supply systems. The main industrial activities (90 percent) are dominated by small and medium-sized enterprises specializing in food processing, including dairy products, meat packing, preserving fruits and vegetables, textile and apparel production, leather tanning, and plastics. A few larger factories (10 percent) manufacture cement, rolled steel, corrugated iron, aluminum sheets, cigarettes, beer and bottling beverages, fruit juices, and mineral water. In general, Tanzania's manufacturing sector targets primarily the domestic market with limited exports of manufactured goods.

The largest service industry is tourism because of the country's concentration of wild animals and spectacular and diverse landscape, including the islands with their beaches, and the highlands, which include Mt. Kilimanjaro, Africa's highest mountain. Tanzania features famous national parks, game reserves, and the Olduvai Gorge, where the Leakeys discovered footprints estimated to be over 3 million years old.

Unfortunately, an unattractive investment climate has discouraged foreign investment. Inadequate infrastructure investment is mirrored in human capital investment. Although 85 percent of children are enrolled in primary education, 20 percent drop out before finishing and barely 5 percent complete secondary school. Life expectancy is 51.45 years, while the median age is only 17.8 years. The 2005 human immunodeficiency virus (HIV)/acquired immunodeficiency syndrome (AIDS) adult prevalence rate was 6.5 percent compared to 6.1 percent for the rest of Africa. Malaria accounts for 30 percent of the national burden of disease and loss of productivity in Tanzania, and is the number one killer among children in Tanzania. The result has made Tanzania among the poorest countries in the world, with approximately 36 percent of the 38 million people below the poverty line, and a per capita income of $319.

Significant measures were taken in 1986 to liberalize the Tanzanian economy along market lines and move away from its socialist past, rehabilitate the infrastructure, and encourage both foreign and domestic private investment, with assistance from the World Bank, the International Monetary Fund (IMF), and bilateral donors.

These measures included a comprehensive package of policies that reduced the budget deficit and improved monetary control, substantially depreciated the overvalued exchange rate, liberalized the trade regime, removed most price controls, eased restrictions on the marketing of food crops, freed interest rates, and initiated a restructuring of the financial sector. Continuing these initiatives while reducing external debt (Tanzania has an external debt of $7.9 billion, which amounts to 72 percent of GDP) and dependency on donors are goals designed to achieve the country's potential.

TA-100 Index (Tel Aviv)

The TA-100 Index is a weighted index reflecting the major shares traded on the Tel Aviv Stock Exchange (TASE), the only stock exchange in Israel. Although there are a number of indices reflecting the various different sectors of the economy, the TA-100 Index is the most broadly based and it provides the best reflection on the health of the Tel Aviv Stock Exchange.

The TASE has its origins in a securities market, the Exchange Bureau for Securities. It started in 1935 with support from the Anglo-Palestine Bank, and held brief meetings—sometimes lasting only three or four minutes—until the TASE was officially founded in 1953. In 1960, it started operating from premises at 113 Allenby Road in Tel Aviv. In its first eight years of operation, it gained a reputation for being one of the fastest-growing stock exchanges in the world. In 1960, the market capitalization of stocks quoted on it doubled in value, as compared to a rise of 33 percent in Tokyo, the stock exchange with the next-highest rise in capitalization at the time. This was from a small base, however, and in 1961, the exchange had only 28 members and 50 stocks and bonds traded, unlike the 1,366 members and 1,089 common stocks traded in New York. Unlike New York, whenever a stock was traded, it was offered to all members, who bid for them. Large profits were made, however, and this attracted more people to stocks and shares. As this increased, it became necessary for clients to be kept informed of the status of their investments, which also helped some people balance their portfolios. In 1964, it was reported that trading had risen 700 percent in six years, and there were about 40,000 stockholders in the entire country, which had a population of 2.5 million. The initial weighted index for share prices was the Tel Aviv Exchange General Share Index. It rose quickly as people started to balance their portfolio investments, using the share index as a way of reflecting the general trend of the market. The market had been through shaky periods, such as during the Suez crisis, but the major impetus for a rise in the early 1960s was the abolition of the market gains tax on July 13, 1965. This led to the Tel Aviv Exchange General Share Index rising from 138.36 at the end of June to 151.49 within two weeks—this was an unprecedented rise in such a short period of time.

By 1977, the investor base had increased and there were about 500,000 Israelis active in the market. By this time, there were some 200 stocks listed on the TASE, but only about 80 of these were traded regularly. Gradually the number increased, and there are currently about 660 stocks traded, with 60 of these listed on stock exchanges in other countries. Initially many people used the TA-25—the flagship index of the TASE—which included the 25 largest stocks by market capitalization. It was established in 1992 and is often known as the MAOF Index. However, some people did not feel that this provided sufficient balance for a portfolio that could be badly affected by as little as one stock trading badly. Therefore, the TA-100 was also established in 1992, consisting of the 100 largest stocks. Another index was created, the TA-75, which covers stocks that are included in the TA-100 but not in the TA-25. Of the stocks on the TA-100, the most significant four are Teva Pharmaceutical Industries, ICL, Bank Leumi, and Bank Hapoalim—these four companies each make up 9.5 percent of the exchange. It is interesting to note that Bank Leumi was originally the Anglo-Palestine Bank, the company that did so much to set up the stock market. Historically, the TA-100 has been a relatively stable indicator of the Israeli economy. It climbed from 412.20 in August 2003 to 1,005.33 in February 2007, fell back and then climbed again to 1,155.44 in December 2007, and then fluctuated from the 890s to the low 1,000s. There is a safeguard in the TASE whereby if the index falls by 10 percent, the market is immediately closed for the day to try to stop a crash. However, this was lifted on August 21, 1994, when the market closing time was extended by four hours, a move that will be introduced at other times should the market regulatory authorities deem it necessary.

Target

Target is an upscale discount department store that provides high-quality, on-trend merchandise at very competitive prices in the United States, and recently in Bangalore, India. Target Corporation ranks among the top 20 corporate contributors in the nation, giving back $2 million each week to the communities it serves. The company now has more than 1,600 stores in 47 states, and employs more than 300,000 team members.

The Target Corporation (NYSE: TGT) was originally known as the Dayton Dry Goods Co., and was founded in Minneapolis, Minnesota, in 1902. In 1962, the first Target store was opened in Roseville, Minnesota.

On March 10, 2004, Target Corporation hired Goldman Sachs Group to analyze options for selling its Marshall Field's and Mervyns chains of department stores. A few months later, on July 31, 2004, Target Corporation sold the Marshall Field's chain and several Mervyns stores to St. Louis, Missouri–based May Department Stores.

In 2005, Target reached 1,397 units and $52.6 billion in sales, and in 2006 it expanded to 1,488 units and sales reached $59.4 billion.

In May 2005, Target began operation in Bangalore, India, and these operations currently support all Target business units. In 2006, Target completed construction of the Robert J. Ulrich Center in Embassy Golf Links in Bangalore, and Target plans to continue its expansion into India with the construction of additional office space at the Mysore Corporate Campus.

On January 9, 2008, Bob Ulrich announced his plans to retire as CEO and named Gregg Steinhafel as his successor. This is because of Target Corporation's policy requiring its high-ranking officers to retire at the age of 65. Ulrich's retirement as CEO was effective May 1, 2008, but he remained the chairman of the board through the end of the 2008 fiscal year.

Target Stores in the United States

The breakdown of Target stores in the 47 states it operates in is Alabama (18), Arizona (47), Arkansas (6), California (225), Colorado (38), Connecticut (16), Delaware (2), District of Columbia (1), Florida (118), Georgia (52), Idaho (6), Iowa (21), Illinois (82), Indiana (32), Kansas (18), Kentucky (12), Louisiana (14), Maine (5), Maryland (33), Massachusetts (30), Michigan (58), Minnesota (72), Mississippi (4), Missouri (33), Montana (7), Nebraska (14), Nevada (15), New Hampshire (8), New Jersey (38), New Mexico (9), New York (59), North Carolina (45), North Dakota (4), Ohio (63), Oklahoma (11), Oregon (18), Pennsylvania (48), Rhode Island (3), South Carolina (18), South Dakota (4), Tennessee (31), Texas (138), Utah (11), Virginia (51), Washington (34), West Virginia (5), Wisconsin (34), Wyoming (2).

Target also has 218 SuperTarget Stores in 22 states: Alabama (6), Arizona (6), California (3), Colorado (17), Florida (34), Georgia (10), Iowa (8), Illinois (12), Indiana (7), Kansas (6), Louisiana (4), Minnesota (24), Missouri (3), Nebraska (6), North Carolina (8), North Dakota (1), Oklahoma (4), Tennessee (4), Texas (43), Utah (6), Virginia (4), Wisconsin (2).

Its distribution centers in 26 states are as follows: Fridley, Minnesota; Tifton, Georgia; Tyler, Texas; West Jefferson, Ohio; Little Rock, Arkansas; Oconomowoc, Wisconsin; Wilton, New York; Midlothian, Texas; Fontana, California; Albany, Oregon; Huntsville, Alabama; Topeka, Kansas; Pueblo, Colorado; Indianapolis, Indiana; Kalamazoo, Michigan; Lugoff, South Carolina; Bakersfield, California; Stuarts Draft, Virginia; Phoenix, Arizona; Amsterdam, New York; Cedar Falls, Iowa; Rialto, California; Woodland, California; Midway, Georgia; Chambersburg, Pennsylvania; DeKalb, Illinois. Target also maintains four import warehouses (Lacey, Virginia; Suffolk, Virginia; Rialto, California; Savannah, Georgia), and one fulfillment center servicing its online operations in Woodbury, Minnesota.

Target Subsidiaries

- Target Financial Services (TFS): Issues Target's credit cards, known as the Target REDcard, consisting of the Target VISA and the Target Card, issued through Target National Bank for consumers and through Target Bank for businesses.
- Target Sourcing Services/The Associated Merchandising Corporation (TSS/AMC): Locates merchandise from around the world for Target and helps import the merchandise to the United States. TSS/AMC has 27 full-service offices, 48 quality-control offices, and seven commissionaires located throughout the world. TSS/AMC employs 1,200 people.
- Target Commercial Interiors: Provides design services and furniture for office space and has six showrooms in Illinois, Minnesota, and Wisconsin, including a first-of-its-kind retail concept store and showroom in Bloomington, Minnesota, that opened on June 23, 2005.
- Target Brands: Owns and oversees the company's private label products, including the grocery brands Archer Farms and Market Pantry, Sutton & Dodge, their premium meat line, and the electronics brand Trutech.
- Target.com: Owns and oversees the company's e-commerce initiatives, such as the Target.com domain. Founded in early 2000 as target.direct, it was formed by separating the company's existing e-commerce operations from its retailing division, and combining it with its Rivertown Trading direct marketing unit into a stand-alone subsidiary.

Tariff

A tariff is a tax on imports. Tariffs are typically used for two reasons: to raise tax revenues and to protect domestic industries. Successive rounds of multilateral negotiations have reduced tariffs to historically low levels.

When taxing imports, governments may state tariffs as a specific tariff, an ad valorem tariff, or a combination of both tariff types. A specific tariff is a per unit import tax that is independent of the underlying value of the import, for example, a per unit tax of $10 or $20. An ad valorem tariff is a fixed percentage of the import price, for example, 5 percent or 10 percent. The final tariff, a combination tariff, has both per unit and value added components, for example $2 + 2.5 percent. The form the tariff takes has implications for how the tariff is implemented in practice, but does not affect the economic impact of the tariff. Specific tariffs, because of their simplicity, are easier to implement than ad valorem and combination tariffs. Ad valorem tariffs, because their application relies on the valuation of imports, are more difficult to implement.

Economic Impact of a Tariff

In evaluating the economic effect of a tariff, the economics convention of comparing the equilibrium outcomes with tariffs to the equilibrium outcomes with free trade is initially adopted. If an economy is initially enjoying free trade, the imposition of a tariff will cause the domestic price of the import good to increase. Although domestic prices have increased, the posttariff receipts of foreign producers that export goods to the home market have not increased, and as a result, total imports fall. Domestic producers, unlike foreign producers, receive the now-higher domestic price. As a result, domestic producers expand their production levels. In effect, tariffs have resulted in an international reallocation of production. The tariff has had the effect of protecting domestic producers as evidenced by the reduced competition that they face from foreign producers. The tariff has also created tariff revenues. The protection of the domestic industry has come at a cost, however, as higher domestic prices hurt domestic consumers. Overall, the welfare of the economy is reduced as the consumer loss exceeds the combination of producer gain and increased tariff revenue.

If initially an import tariff was in place and subsequently reduced and/or removed, then the effects of such tariff reductions would be the opposite of that described above. A reduction in the tariff levels would reduce the domestic price of the good, and as a result, consumers would benefit. However, it would also cause the domestic sector to contract, because the price they receive for products is now lower. Additionally, a reduction in tariffs would make the domestic market more attractive to foreign producers, and as a result, imports in the domestic market would increase. Overall, the welfare of the economy is increased as the consumer gain exceeds the combined reduction in tariff revenues and loss to domestic producers. This illustrates that reducing tariffs will improve aggregate welfare in the economy.

One exception to the welfare-improving effect of tariff reduction is in the case of a large country. When a country is "large" in international economics terms, modest tariffs may actually increase welfare. A country is defined as being "large" in an international economics context if it can change world prices for its import good due to its trade policy choices. This occurs because the large country is a major consumer of the good in question, and any shifts in its demand for the good will affect the equilibrium price.

Starting from a position of free trade, if a large country imposes a tariff, both the domestic price and the international price of the good will change. The effects in the domestic market are as previously described, with domestic prices to consumers increasing. This will cause consumer welfare to decrease. However, the effect on the world price is different than previously discussed. Given the importance of a large country, foreign producers are willing to share the tariff burden with consumers in the large country by absorbing part of the tariff. This means that the net per unit revenue to foreign producers after the tariff is lower than the free trade price. In essence, the tariff has caused the world price to fall, and the import good is now cheaper to purchase than before. This creates a benefit to consumers, as the posttariff price is lower than it would have been otherwise, and offsets some of the consumer welfare loss. If the benefit from a reduction in the world price is more than sufficient to compensate for the net consumer welfare loss, then the tariff may actually increase welfare. When this occurs, the optimum tariff for the large country (that is, the tariff that maximizes welfare) is positive. It is possible, therefore, for a large country to lose from the removal of tariffs. Most countries are small, and therefore removing tariffs for most countries improves their welfare.

Effective Tariff

The overall economic effect of a nominal tariff depends on the tariff structure in the economy. A nominal tariff is simply the stated tariff on a product. For example, the average nominal tariff on industrial goods after the Uruguay Round of the World Trade Organization (WTO) is 3.8 percent. While 3.8 percent is the stated level of protection, the effective level of protection that industrial products receive may be different than this nominal tariff rate, as additional tariffs may have been imposed on goods at various stages of production. The economic effect of tariffs imposed on goods that are used at the early stages of the production process will be magnified, and will affect the effective tariff on goods that use these early products as inputs.

Consider a simplified three-stage production process with raw materials, intermediate goods, and final goods. The tariff structure is a simplified one, with zero tariffs on raw materials and intermediate goods, and a 5 percent tariff on final goods. The effective rate of protection on the final goods will be 5 percent, as the domestic producers of the final good face input prices that have not been distorted by trade policies. In this instance, the nominal tariff and the effective tariff are the same.

The tariff structure may be more complex, such as zero tariffs on raw materials, 3 percent tariff on imported intermediate goods, and a 5 percent tariff on finished goods. The impact of this tariff structure is twofold: the first effect is an increase in the domestic price of the intermediate good by 3 percent; the second effect is an increase in the domestic price of the final good by 5 percent. Both price increases affect final good producers. They continue to benefit from a 5 percent increase in the final good price, but are hurt by the 3 percent increase in the price of the intermediate good, which is an input in the production of the final good. The 3 percent tariff on the intermediate good dilutes the gains from the 5 percent tariff on the final good. The effective rate of protection in this case is no longer equal to the nominal rate of protection because of the transfer of some of these gains to the intermediate goods producers. In fact, the effective tariff for the final good is now lower than the nominal tariff of 5 percent. Further complexity in the tariff structure to include tariffs on raw materials will have similar effects on the effective tariff, faced at both the intermediate and final good stages.

The extent to which tariffs on intermediate goods erode the tariff protection afforded to the final good sector depends on the importance of the intermediate good in final good production, as measured as a share of input costs. When intermediate goods account for a small share of final good input costs, then the impact on the effective tariff on final goods will be smaller than when intermediate goods account for a large share of final good input cost. In extreme cases, tariffs on intermediate goods may become so burdensome that the effective tariff on the final good is negative. A negative effective tariff on the final goods would occur, for example, if the tariff on the final goods is zero percent while the tariff on intermediate goods is 3 percent.

In recognition of the forward cascading effect of tariffs, tariff structures are sometimes based on the tariff escalation principle, with lower tariffs for raw materials and increasing tariffs as the degree of processing increases. Tariff structures that are based on deescalation (that is, higher tariffs on raw materials and lower tariffs on finished goods) may result in negative effective tariffs for processed products.

Tata Group

Although a household name in India, the name Tata did not enter global consciousness until the 21st century. By 2008, Tata had acquired a bewildering set of associations: acquirer of luxury auto brands Land Rover and Jaguar; developer of the world's cheapest car, Nano; buyer of Corus, the company formerly called British Steel; India's top software and technology service firm; luxury hotelier; and rebuffed suitor of Orient Express luxury travel properties. With nearly $60 billion in revenue, almost two-thirds from outside India, Tata Group has emerged as the top multinational business from India.

In the second half of 19th century, Tata Group's visionary founder, Jamsetji Nusserwanji Tata, decided that India—even as a British colony—should have world-class technological capabilities. Starting with the formation of a trading company in 1868, Tata Group steadily climbed a diverse ladder of enterprise founding steps. A textile mill (1874), the luxury Taj Hotel in Mumbai (2003), a steel company (1907), and an electric utility (1910) became part of the growing Tata Group. The diversified evolution of the group continued with the creation of other pioneering enterprises: airlines (1932), automotive firm (1945), software consultancy firm (1968), and telecom venture (1996).

Like other business group structures of Asia—for example, *keiretsu* of Japan and *chaebols* of South Korea—India's business groups such as Tata Group are characterized by cross-ownership of companies, overlapping directorates, and control through loyalty and moral persuasion. From its relatively simple headquarters at Bombay House in Mumbai, the controlling entities Tata Sons and Tata Industries direct the far-flung global Tata enterprises.

Tata Group and Indian nationalism have always gone hand in hand. For example, the founder Jamsetji Tata lived to see the completion of the iconic Taj Mahal Hotel in Mumbai, a hotel he launched because the British colonial rulers barred Indians from entering elite hotels and clubs.

Tata Group views itself as being entwined with the foundation of a technologically and scientifically capable India. The group helped establish key scientific institutions that laid the bedrock for, among other things, India's space and nuclear programs, the Indian Institute of Science (1911), Tata Institute of Social Sciences (1936), Tata Institute of Fundamental Research (1945), Tata Memorial Center—focusing on cancer research (1952), and JRD Tata Ecotechnology Center (1998).

Ratan Tata, a descendant of the Group's founder, has been credited with the aggressive global thrust of Tata Group since the mid-1990s, and with innovative ideas such as the launch of the Nano, the "people's car," priced at $2,500. Included in 2008 lists such as *Time* magazine's 100 most influential people and *Fortune* magazine's 25 most powerful businesspeople, Ratan Tata has a reputation of leading a simple life and providing exemplary leadership and inspiration to Tata Group. He announced his intention to retire after the successful market introduction of the Nano car.

The long history of Tata Group, while punctuated by many entrepreneurial triumphs, has also had its share of setbacks and middling performance. Tata entered the consumer products business as early as 1917, and launched Lakme, India's first cosmetics line, in the 1950s. The consumer businesses, however, have been overtaken by competition, and Tata has divested from many of these. Similarly, in chemicals, late entrants such as Reliance have overtaken Tata.

While some of the Tata Group companies have had international trade relationships and other connections for decades, the group began to attract global attention through high-profile acquisitions in the 21st century. Among the most prominent Tata Group global acquisitions are Tetley Tea (2000), Daewoo's truck division in Korea (2004), Corus—formerly British Steel—in 2007, and the Land Rover and Jaguar brands from Ford in 2008.

Taxes

Taxes are exactions on income, property, services, sales, value added, labor, luxuries, or on any form of wealth. There are two main reasons for levying a tax: to raise revenue or to regulate the uses of goods or services, or to suppress behavior authorities have deemed to be socially unacceptable.

Revenue taxes are raised to support the many functions and services of government. These include defense, policing, fire, flood, health, and other forms of protection, including maintaining prisons. In addition, revenue funds may be used to support the general cost of government, to supply education, mental health services, and general health services, or for other needs of the country's people. Regulatory taxes appear similar to revenue taxes, but the goal of these taxes is not to gain revenue, but to control. They are imposed to regulate products or behavior that government policy seeks to eliminate or control.

Regulatory Taxes

While the revenue from a regulatory tax may be a lucrative source of income for a government, regulatory taxes exist to penalize or even prevent the sale of a product, or to prevent socially undesirable behavior. Alcohol and tobacco, if not banned outright, have often been heavily taxed to reduce consumption. Part of the regulatory scheme could involve, for example, forcing companies producing alcohol to pay a regulatory tax in the form of a license fee.

Narcotics are tightly regulated drugs. In the 19th century, attempts by the Chinese to regulate the opium trade evoked the Opium Wars. In the 20th century, taxes have been used to regulate a range of narcotics and other drugs, such as marijuana. These regulatory taxes were later expanded to control organized crime. The taxing of the manufacturing and distribution of firearms and other weapons, such as machine guns, was enacted in part to control organized crime. Governments have sought to control drugs and gambling through taxes on a license to administer drugs or on those engaged in the gambling profession.

Regulatory taxes can also be used to protect producers. For example, tariffs were used extensively by the United States in the 19th century to protect American manufacturing from cheaper foreign goods. The protective tariffs made the cost of domestic goods seem cheaper because of the tariffs levied on imported goods.

Favored domestic corporations can be the beneficiary of regulatory taxes. Oleomargarine was taxed in the early decades of its use to protect the dairy industry. The tax was imposed because dairy farmers voted in greater numbers than did the oleomargarine manufacturers. Congress and the states have taxed futures in grain commodities and cotton at the behest of agricultural groups.

Regulatory taxes have been designed to protect public health. Congress sought to protect the health of children with a prohibitive tax on child labor. It also imposed a regulatory tax in the early 1900s to protect industrial workers making phosphorus-tipped matches from developing a degenerative disease ("phossy jaw") caused by prolonged exposure to phosphorus. Heavy taxes on smokestacks (effluent tax) seek to regulate air quality conditions.

In recent years numerous proposals have been floated that, if adopted, would tax the carbon dioxide emissions of business, manufacturing facilities, and other business activities. A tax on carbon dioxide emissions, if adopted, would be a regulatory tax. If allowed, even home fireplaces could be taxed. The justification for this form of taxation is the belief that global warming is occurring and that it is anthropogenic. Carbon dioxide is a natural gas that is breathed in by plants to make chlorophyll. After making chlorophyll, they breathe out oxygen. The issue over carbon dioxide and greenhouse gases is centered on the level of carbon dioxide in the atmosphere. Carbon dioxide is a natural greenhouse gas that aids the earth by retaining some of the energy radiated into space by the surface of the earth. The tax is being justified by hailing the need to reduce global warming caused by an excess of carbon dioxide. The excess is alleged to be due mainly to the burning of fossil fuels. If adopted, a global tax on carbon dioxide emissions would require a global enforcement mechanism.

Many observers have concluded that the ensuing tax burden would be enormous. It also has the potential for establishing a global rule of law that may be more rule than law. Some observers believe that a global carbon dioxide tax is less a way to care for the environment than it is a way to penalize productive corporations in a global scheme to transfer wealth from industrial countries to poorer, less well-developed countries.

Taxation and Government

Governments have imposed taxes since the recorded beginnings of civilizations. Modern governments have developed a catalog of taxes to gain revenues for their functions and for regulatory purposes. The variety of taxes developed historically and in modern times demonstrates the existence of very inventive minds. However, schemes for taxation often run afoul of the consequences of taxation.

The common approach of many governments has been to tax and spend with only occasional regard for the consequences. However, the development of economically sound tax policies requires the careful scripting of tax laws, otherwise taxation may do harm to businesses and to the people who work for them.

Taxes may be either direct or indirect. Direct taxes are levied directly on income or labor as a pecuniary burden. Indirect taxes such as sales taxes, gasoline taxes, value added tax (VAT), or goods and services tax (GST) are indirect taxes. They can be passed along to others from the producer, the supplier, or the seller to the one with the final economic responsibility. This usually ends up being paid by consumers. Many act as consumption taxes.

The globalization of industry, the urbanization of the world, along with the huge increases in agricultural production and the great expansion of global trading since 1945, have given government ever greater opportunities to tax businesses. Tax policies are the result of a variety of forces. These may be the demands of business for protection, infrastructure, and services. Other forces may demand that governments supply a variety of services, such as water, sanitation, utilities, policing, education, recreation, cultural supports, heathcare, retirement benefits, and national defense. All of these services require income that has to come from somewhere. Unless a government is to engage in a program of looting from conquests, which in the modern world would be very risky, it has to pay for these needs and demands with taxes.

Corporate Taxes

Taxes experienced in the developed world are usually corporate income taxes, payroll taxes, property taxes, and other types of taxes, some of which are hidden in the costs of goods and services. The most visible corporate taxes are those on corporate incomes. These taxes are usually levied on the profits of a corporation after its costs for labor, materials, losses, depreciation of capital, and even some types of taxes have been deducted. This type of tax is used globally by most countries; however, the tax basis often varies. For instance, in some countries, depreciation of capital is not an allowable business deduction.

Investors, whether corporate or individual, are often faced with taxes on rental income derived from rental properties in foreign countries. In some cases, there is little tax relief from the cost of maintaining or improving the property. These kinds of taxes have encouraged some people to move to a foreign country, with little intention of ever returning to their home country.

A long-standing complaint against corporate taxes is that they hurt investors, workers, and consumers. In the case of investors, they are often taxed on the dividends they receive from the profits made by the corporation. Many people in Europe and elsewhere, schooled in socialist ideologies, believe that profits should be taxed to be used for social purposes, or for the authoritative reallocation by the government. The tax in this case expresses a distrust of capitalism that may be found among workers; however, the consequences for workers in a high-tax state can be quite negative.

Global Examples

For example, Sweden is a high-tax state with many social welfare programs that use revenues from the state's redistribution system. However, observers have noted that the price of goods in stores is very high. Moreover, the incentive to engage in extra work to gain an increased income is suppressed by the tax burden rendering it an exercise in futility, when most of the extra income will be taxed away.

In Great Britain, high corporate taxes have also had a negative effect. Not only is there a high corporate tax, but corporations with earnings abroad are forced to pay taxes on overseas income that has been taxed at a lower rate, as well as having to pay taxes on domestic profits. The fact that such policies can make business prohibitive is usually lost on such ideologues. The consequence is that businesses in Europe, including England, are moving from high-tax countries to other countries where taxes are much lower.

In contrast to England and to India (another high-tax country), South Korea has had a booming economy that has slowed in recent years. To stimulate it, the government is moving to cut taxes in South Korea by billions of dollars per year. The move is one used to shift income from the government to private individuals, where the use of the money would likely stimulate new business, investments, and consumption.

In even greater contrast are some of the dynamic business centers developing in the Third World, where taxes are either low or nonexistent. The United Arab Emirates and other tax-free zones have boomed in recent decades. The revenues from investments yielded huge incomes and negated the need for taxes. Usually, such places have special circumstances that encourage this form of activity, but the key is that taxes have not prevented development, including the general welfare of the people.

For people working overseas for either a company that is the same as their nationality or that is a foreign company, from the perspective of their citizenship, the issue of income taxes is significant. Income earned in a foreign country is often not taxed by the home country until it reaches a level that is a good deal higher than it would be if the worker had remained in his or her homeland. The tax advantages can be significant, because it allows expatriate workers to earn higher salaries, accumulate savings, and to gain valuable foreign experiences. Unless the expatriate employee is in a tax-free zone, such as Dubai, it may well be that the taxes owed to the foreign government where he or she is a resident are high, and that taxes are also owed to their home country. Oddly, those who propose global tax schemes do not propose uniform global tax rates. Such a move would reduce national sovereignty, but would stimulate business globally.

Governments faced with budget deficits created by generous social entitlements have found that they can do little to lower taxes, even if their tax base withers as companies emigrate. Ultimately, on a nationalist basis, tax policies have to be competitive or businesses will relocate. Most of the high income and corporate tax rates are found in the developed world of Europe, North America, Japan, and Australia. In recent years, emigration of businesses seeking a tax haven has been a phenomenon observed in Great Britain and elsewhere.

American Corporate Taxation

American corporations face taxation from both the federal and state governments. The combined rates make corporate taxation in the United States the highest or nearly the highest in the world. The pressure from stockholders to produce higher profits can lead to businesses leaving for more tax-friendly countries or reorganizing to avoid treatment as a domestic business, because tax treatment for a foreign business can be more favorable.

A significant tax issue faced by American foreign subsidiaries is the double-taxation policy of the United States. It taxes domestic corporate earnings at a rate of 35 percent, and then also taxes the earnings of American subsidiaries in foreign countries at the same rate. However, to prevent the tax rate from being effectively a full combination of the tax rate of the foreign country and the U.S. rate, a tax credit is allowed, which reduces the taxes owed so that the American subsidiary pays a rate that is the difference between the U.S. 35 percent and the tax rate of the foreign country in which it is doing business. However, a U.S. corporation may invest in its operations in the foreign country in which it is doing business and be allowed to "defer" its tax obligations.

Capital gains taxes are also a burden for investors and often for corporations as well. The tax is levied on the profit made when a capital asset is sold. The treatment of capital gains is often as if it were ordinary income when it is not. Inflation can also make profits from the sale of assets at an inflated price seem as if there has been a significant gain, when in actuality there has not been, because of the change in money values and the increase in the taxes taken for the higher "profit" from the sale. For companies that have international operations, this can cause significant tax issues.

Global Taxes

A variety of plans have been proposed in recent times that seek to grant the United Nations (UN) the power to tax. Currently, the UN is a confederation in which the member states have retained sovereignty. As a consequence, the UN lacks the authority to levy taxes on either its member states or upon their businesses or people. However, a plan has been unveiled to allow the United Nations Development Programme (UNDP) to tax currency exchanges. The tax plan was proposed at the World Economic Forum in Davos, Switzerland. The plan is called the "Tobin Tax," after Professor James Tobin of Yale University. The tax would be levied on worldwide currency exchanges. It is estimated that the Tobin Tax would gain $3 trillion in funds that could be used by the UN to eliminate poverty in the Third World. Another source of global taxation would be fines on countries that are judged to be polluting.

Other global taxes have been proposed to support poverty programs, to educate children without schooling in poor countries, to prevent the spread of human immunodeficiency virus (HIV)/acquired immunodeficiency syndrome (AIDS), malaria, and for other noble causes. These proposals have met with fierce opposition in the United States. Assurances that there will be close exercise of democratic oversight by agencies of the UN have not been persuasive. This is especially the case when the tax schemes are tied to ideological perspectives that deny that prosperity in the Western world is not because of hard work, legal protection for property rights, and an excellent market system, and instead claim that global poverty is because of the exploitation of the industrialized world. A recent proposal calls for taxing airline tickets as a global tax to fund Third World poverty programs.

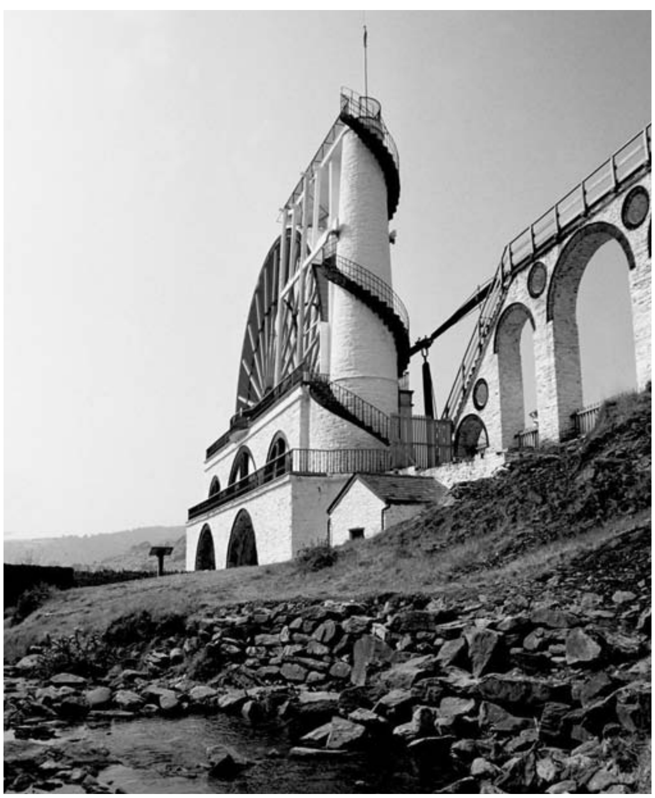
Tax Havens

Since World War II, a number of small jurisdictions have become "offshore financial centers" (OFCs), or "tax havens." Initially dubbed "tax havens" because they were associated primarily with opportunities for individuals and firms to lower their domestic tax bills by moving assets to jurisdictions that had low or zero tax rates, many of the offshore jurisdictions have branched out into providing highly specialized and sophisticated financial services. Although there are periodic disputes between relatively high tax jurisdictions, such as the United States, Canada, France, and Germany, and the offshore financial center jurisdictions, the offshore jurisdictions now play an indispensable role in the world economy and are unlikely to disappear.

Offshore financial centers are numerous. Anguilla, Aruba, the Bahamas, Barbados, Bermuda, Belize, the British Virgin Islands, the Cayman Islands, the Cook Islands, Cyprus, Dubai, Gibraltar, Guernsey, Ireland, the Isle of Man, Jersey, Liechtenstein, Luxembourg, Mauritius, Monaco, Montserrat, Nevis, Panama, Singapore, Switzerland, and Turks and Caicos all have significant offshore financial activity and other jurisdictions, from Mongolia to Native Americans in the United States, are investigating the feasibility of creating offshore sectors.

OFC jurisdictions share a number of characteristics. First, they are generally relatively small jurisdictions. Second, they are generally wealthy; several are among the top 20 gross domestic product (GDP) per capita jurisdictions each year. Third, successful OFCs are stable politically, giving investors confidence. The major difference between the activities in an OFC and the activities that take place in many onshore jurisdictions is that money invested in an OFC is generally later reinvested elsewhere, while onshore jurisdictions offer substantial domestic investment opportunities for foreign investors.



Taking advantage of a separate legal status, the Isle of Man offered wealthy Britons relief from high post–World War II taxes.

For example, money from outside the United States is regularly invested in American chartered companies and banks in New York. Just as OFCs do, the United States routinely reduces and even sometimes eliminates taxes on such investments as an incentive for foreign investors to put their money in the United States. Indeed, within the United States, Delaware plays a role with respect to corporate charters, and Vermont plays one with respect to insurance companies that are virtually identical to the roles of the Cayman Islands and Bermuda with respect to the United States as a whole.

The Growth of Offshore Financial Centers

The growth of OFCs began in North America, with the Bahamas, and in Europe, with the Channel Islands (Guernsey and Jersey) and the Isle of Man. Prohibition in the United States had brought great wealth to the Bahamas, which had become a center for smuggling alcohol into the United States. After the end of Prohibition, the Bahamian business sector looked for new opportunities. In 1934, Canadian mining magnate Harry Oakes moved to the Bahamas to escape a Canadian tax rate of 85 percent, and the colonial government soon began a campaign to lure other wealthy individuals to relocate to the islands. After the war, the Bahamas launched an ambitious tourism and business development program, which included establishing the Freeport complex with lucrative tax concessions and other steps that made the country a popular destination for tax exiles. The colony's access to both dollars from American tourists and pounds sterling through its ties to Britain also made it a favored business location for those attempting to avoid Britain's postwar capital and exchange controls. By 1960, the islands were the largest dollar earner in the entire British Empire.

British OFCs

As decolonization gathered steam, the ruling clique of "Bay Street Boys" lost control of the Bahamian government just as independence became inevitable. After a bribery scandal further eroded the former colonial elite's political clout, Prime Minister Lynden Pindling threatened to reduce the availability of work permits for expatriates in the financial sector. This prompted a rapid relocation of a large number of bank and trust companies to the Cayman Islands, one of Britain's few remaining Caribbean colonies.

Capitalizing on the Bahamas' mistake, Cayman quickly passed additional legislation to promote the offshore financial industry. Britain acquiesced in its Caribbean colonies' move into international finance because the British government recognized the lack of alternative development strategies for the small islands. The three islands that make up the Cayman Islands, for example, total only 100 square miles and have virtually no arable land and no natural resources. Cayman's maintenance of its ties with Britain (it remains a British Overseas Territory) is in part due to the value of retaining a final appeal from the courts to the British Privy Council as a means of reassuring investors.

In Europe, the Channel Islands occupied an important jurisdictional niche. Not part of Britain but separate possessions of the British Crown, the islands had originally been part of the English monarchy's continental possessions. Devastated by German occupation during World War II, the Channel Islands used tax incentives to lure investment for rebuilding.

Similarly, the Isle of Man had its own jurisdictional status, again through the Crown rather than through Parliament. While not devastated by the war, the Isle of Man faced an economic crisis of its own after the war and needed a development strategy. Taking advantage of their separate legal status, the islands offered wealthy Britons relief from the extremely high postwar income and estate tax regimes.

In particular, the Isle of Man proved adept at marketing its thousand years of experience with common law trusts to European clients from civil law jurisdictions that lacked such entities. As more and more trusts were established on the Isle of Man, the financial services industries of accountants, investment advisers, and lawyers emerged to service them. As in the Caribbean, the British government tolerated the islands' efforts because it recognized that without independent sources of income, the islands' populations would become dependent on British transfer payments for survival.

Cayman's development illustrates the transformation of the offshore financial sector from tax havens to OFCs. The earliest activities were company formations, to take advantage of the zero direct tax regime, and banking, to take advantage of confidentiality laws. Over time, however, Cayman developed a sophisticated business sector of its own, with virtually all of the world's 50 largest banks maintaining a presence, as well as international accounting firms and law firms that included partners with English, Canadian, and other Commonwealth qualifications.

Cayman passed additional laws, taking advantage of demand in America for alternative insurance company structures in the 1980s, and becoming one of the leading locations of hedge funds in the 1990s. In part because of its small size, Cayman was able to quickly respond when it identified an opportunity for a new financial product, and its reputation for responsive and stable government gave investors the confidence necessary for the jurisdiction to succeed. The focus on offshore financial services has paid handsome dividends for Cayman and Caymanians. The islands went from a barter economy in 1960 to among the highest GDP per capita jurisdictions in the world today.

Regulation of OFCs

OFCs have generally taken a quite different approach to financial sector regulation. Recognizing that customers for offshore transactions are generally sophisticated individual and institutional investors and corporate entities, OFCs' regulatory bodies tend to not pay as much attention to disclosure requirements as do regulators in countries with large retail investment sectors, like the United States. Thus, where American regulators shape regulations to protect unsophisticated individual investors from assuming too much risk, OFC regulators focus instead on ensuring that customers have legitimate business purposes for making use of offshore entities. As a result, it is harder to open an individual bank account in most OFCs than it is in the United States or the European Union (EU). The benefit of this regulatory approach is that it dramatically lowers compliance costs for the regulated entities, reducing the cost of doing business.

OFCs have had their share of difficulties as well as successes. One problem stems from their portrayal as shady places where criminals lurk with briefcases full of cash from illicit enterprises. Dubbed the "Grisham Effect," because novelist John Grisham used the Cayman Islands as a backdrop for such behavior in his crime novel *The Firm,* this reputation undercuts the leading OFCs' efforts to establish reputations as carefully regulated jurisdictions where fraud is less likely than in the onshore world. As part of this effort, many OFCs work closely with international institutions like the International Monetary Fund (IMF) to ensure that their adoption of best practices standards is recognized. (The IMF conducts regular assessments of OFCs' regulatory efforts.)

Despite these efforts, some OFCs have fallen victim to corruption. The chief minister and two other high government officials of the Turks and Caicos was arrested in the United States on drug charges in 2001, and Britain suspended the Montserrat government's authority over banking regulation. More generally, the EU and the group of large countries that are members of the Organisation for Economic Co-operation and Development (OECD) have launched periodic attempts to restrict what they term *harmful tax competition*. Using the threat of sanctions and blacklists, the EU, OECD, and the United States have all succeeded in persuading most OFCs to adopt tax information exchange agreements. In addition, several European countries, led by Germany, have purchased stolen financial information from former bank employees in Lichtenstein and have used the information to launch tax evasion investigations into their citizens' use of Lichtenstein business entities.

Tax Holiday

A tax holiday is a temporary reduction or elimination of a tax. Internationally, tax holidays frequently apply to corporate income taxes. Sales tax holidays have become popular in the United States, excluding sales taxes on a variety of items. Rationales for income tax holidays include promotion of industrial policies or economic diversification, increased access to foreign markets, increasing exports, attraction of labor-intensive industries, stimulation of economic development in less-developed regions, human capital development, innovation, transfer of technology, and attracting foreign investment.

Switzerland's Bonny Decree was implemented in 1978 to improve the unfavorable economic structure of particular Swiss regions. It has now been replaced by the New Regional Policy (NRP), which does not expire. Under the NRP, a company may be fully exempt from income taxation for up to 10 years. To qualify, a company must establish a new business activity in a qualifying area of economic development, perform an industrial enterprise, and create new jobs. The project must also demonstrate economic relevance for the area in question. These developmental areas represent weaker economic areas of Switzerland where approximately 10 percent of the population resides.

India has several tax incentives designed to channel investments to specific industries, to promote economic development, and to encourage exports. Among the incentives offered are a 10-year income tax holiday for enterprises that build, maintain, or operate certain infrastructure facilities. Also offered is a 10-year holiday for companies engaged in scientific research and development, and for companies involved in power generation and distribution. Five-year holidays are granted to companies that begin refrigeration operations for agricultural produce; handling, storage, or transport of food grains; or agroprocessing units. A five-year holiday is granted to activities in the telecommunications industry.

The Association of Southeast Asian Nations (ASEAN) has been one of the more successful regions in attracting foreign direct investment. Tax holidays are one of a number of incentives utilized by these nations. Indonesia grants a three- to eight-year holiday for new enterprises in 22 specific sectors. Malaysia offers a full 10-year holiday for "strategic projects" and five years for high-tech, research and development (R&D), and certain knowledge-based companies. The Philippines has a six-year holiday for pioneer projects, three to six years for expansion projects, and three years for modernization projects. Thailand allows priority activities, an eight-year tax exemption, and other privileges, but limits tax holidays to 100 percent of invested capital. Vietnam gives a full two-year holiday from the first profitable year and a 50 percent reduction for two additional years for certain industries and regions.

To attract skilled workers, New Zealand offers a four-year holiday on foreign-sourced income to new migrants. The theory behind this approach is that the skilled workers will accept lower wages in return for the tax benefit received. It also gives the migrant time to arrange a move of their investments to New Zealand during the holiday.

U.S. Tax Holidays

Tax holidays in the United States take a distinctively different approach because they are usually related to a period of time in which sales taxes are not collected for specified purchases. These holidays have included purchases of back-to-school items, hurricane supplies, clothing, and purchases of energy star and other energy-saving items. Gas taxes have also been the target of several tax holidays.

Sales tax holidays originated in 1997 in New York. It was a one-week holiday, suspending the state sales tax on most purchases of clothing and shoes. Two years later, Florida and Texas served up their own versions of sales tax holidays. Today, many of these holidays are timed to coincide with back-to-school or Christmas shopping periods.

Some sales tax holidays are rather simple to administer, such as Massachusetts's two-day holiday in 2005. It exempted the tax on all items priced below $2,500. Other states do not have such a simple approach. North Carolina's annual holiday has five categories of exempt items, with different exemption ceilings, while Florida had 10 categories in its hurricane holiday. Compounding the complexity of such an approach is the problem of defining items included in each category. Some states exclude only state sales taxes, while others exempt local taxes as well. Rather than attempt to deal with the complexity of when to collect tax on a sale, some merchants have chosen to close for business during the holiday period. Tax holidays have increased in popularity, but because they are legislated from year to year, they are subject to suspension during tight budgetary years.

Teams

A team can be defined as two or more individuals who work in an interdependent and collaborative manner to achieve specified goals. Teams can be differentiated from groups primarily through the psychological contract that is assumed to exist between each of the members. This psychological contract establishes a sense of responsibility and accountability on the part of each member to the final outcome achieved. Unlike groups, teams create a coordinated positive synergy that ensures that the overall performance level is greater than the sum of the individual inputs.

Teams can be differentiated on the basis of four key dimensions. The first is the degree of permanence, or the temporal life, of the team. The duration of time that teams remain together can vary from short-term assignments that last only a few hours, to long-term, ongoing relationships that span several years. Another point of differentiation is the level of skill and competency possessed by the team. While some teams may possess a high level of technical know-how and are composed of highly qualified technical experts who are required to keep up to date with the latest knowledge and technologies, others may require only knowledge and skills relating to a specific area.

The extent of autonomy and influence exercised by the team is another differentiating factor. Here, the concern is with the real power held by the collective, in terms of decision-making discretion and the extent to which the team is able to exercise authority to implement decisions and change. This is related to the last point of differentiation, which relates to the level at which tasks are completed. On one hand, teams may occupy lower levels of the organizational hierarchy and be involved in relatively routine tasks. On the other hand, however, teams can occupy the top managerial ranks of organizations and be involved in decisions relating to the overall strategy and direction of the company.

Types of Teams

The most prominent types of teams visible in contemporary organizations are problem-solving teams, self-managing teams, cross-functional teams, and virtual teams. Problem-solving teams typically comprise a group of up to 12 individuals from the same department who come together to share ideas and discuss methods for improving the efficiency of work processes and methods. While these teams have the capacity to produce new ideas, they lack the authority to implement their decisions.

Self-managing teams represent a relatively recent variation on the traditional command work group. Also known as an autonomous group—self-managed teams go beyond problem-solving teams in their capacity to implement decisions and to accept accountability for the outcomes of their decisions. These teams manage themselves on account of the organization's objectives, and rather than having a formally appointed supervisor, these teams often nominate their own informal leaders. Fully self-managed teams also select their own members and have their members evaluate each others' performance. Comprising members with diverse skills and competencies, self-managed teams can represent an effective means of organizing skilled workers. Nevertheless, these arrangements may not be suitable for all organizations, with research showing that the advantages are situationally dependent.

The cross-functional team is a team structure that has been used for many years. However, their number and popularity has increased significantly over recent years. Cross-functional teams comprise members from the same hierarchical level, but from different work areas and units in the organization. Creativity is increased as information is shared and dispersed among people with diverse areas of expertise in the organization. Although the outcomes associated with these teams can be highly beneficial for organizations, these teams do take longer to develop because of the diversity and complexity associated with working with people from different experiences and backgrounds. Levels of conflict tend to be high and if not managed appropriately, can prove counterproductive to the organization's goals.

While the aforementioned team structures are based on face-to-face communication, the virtual team represents a group composed of geographically dispersed individuals who are brought together through the use of information and computer technologies to achieve a common goal. Virtual teams are an effective way of bringing together the knowledge and expertise of those not located in close proximity, and can allow for increased speed of communication and decreased costs, as well as overcoming time and space constraints. On the other hand, the lack of face-to-face interaction restricts rapport development between members, making it difficult to establish trust and social connection. There is also far greater room for incomplete information and misinterpretation, due to the absence of paraverbal and nonverbal cues.

Technology

Technology plays a major role in international business today. It impacts in myriad ways the internal mechanisms of globalization, the operations of international trade and commerce, and the relative competitiveness of small- and medium-sized firms (SMEs), multinational enterprises, countries, and multinational regions. Indeed, understanding global business today requires an appreciation of the nature and workings of technology in the 21st century.

Technology is a broad concept that refers to the means by which humans can control and adapt to their environment. The two general categories of technology are products and processes; the former are meant for final consumer markets and the latter provide the means to make the products. Technology needs to be distinguished from science: whereas science looks to expand knowledge of how the universe operates, technology is concerned with practical applications useful in the real world to do work more rapidly and efficiently. Consequently, technology is closely related to engineering, and the productivity that technology via engineering creates.

Technological Change

Technological change refers to the advance in the state of the art of making products and the carrying out of processes. There are different types of technological change, depending on the degree of change involved; that is, incremental or radical. Incremental technology change is generally perceived as modifying, refining, and improving an existing technology platform. It consists of relatively minor changes to an existing technology. The results of incremental change, when cumulative, are often significant. Cumulative technological change may take place within the research and development (R&D) department or may occur on a daily basis on the plant floor by departmental employees in the course of everyday business.

Radical technology, in contrast, introduces completely new designs that depart fundamentally from existing practice and platforms. In the modern corporation, radical technology is often the product of the R&D department and requires creative experimentation and out-of-the-ordinary insights. Incremental and radical innovation generally take place within novel economic and organizational contexts; incremental change generally remains tied to established applications and markets and operates within familiar organizational structures and networks; radical change often opens up new markets and displaces existing products and companies from their market position.

Nylon ushered in the age of synthetics that toppled natural fibers from their preeminent position; jet propulsion replaced propeller aircraft; steel replaced iron; electrification replaced steam power; and so on. This process is famously described by the economist Joseph Schumpeter as the "winds of creative destruction." In recent decades, radical innovation often proves difficult to achieve for larger, established firms, with their complex and relatively rigid organizational structures. Since the 1980s, radical innovation has become centered in the small start-up firm, which often licenses intellectual knowledge from universities, and obtains support from a large and specialized venture capital community. Larger firms increasingly capture innovation through acquisitions of small, innovative enterprises.

In reality, the distinction between incremental and radical technology change is not always clear, especially in assessing their relative impact on an economy. The significance of individual, truly radical technology—such as the assembly line and the atomic bomb—cannot be denied. However, over time the cumulative effect—technical, economic, and even social—of incremental innovation can be equally, if not more, important. Recent studies suggest that the bulk of the aggregate economic benefits to society derived from the introduction of new technologies are realized only during the often lengthy product and process improvement stages, when incremental modifications are made to the initial dominant design.

Technology and the Industrial Revolution

While technological change occurred throughout human history, the Industrial Revolution marks a watershed in the history of technology. This revolution meant that productivity in the factories, on farms, and in homes increased at a pace unprecedented in human history. While elements of the Industrial Revolution can be observed as early as the mid-18th century, it emerged in full force in England in the first half of the 19th century. Mechanization of production particularly characterizes this period. England applied mechanization to a number of industries, most notably textiles and apparel. Indeed, America's southern states shipped significant amounts of their cotton to England in the antebellum period to feed the latter's textile plants. The fact that Europe's Industrial Revolution supported the plantation economy of the southeast United States in the decades prior to the Civil War testifies to the geopolitical and socioeconomic reach of technological change.

The Industrial Revolution was first and foremost a revolution in mechanical technologies. In the post–Civil War period, the United States wrested world leadership in mechanization from England. The so-called American System—with its production based on interchangeable parts and standardization of products—brought manufacturing to a new level of sophistication and efficiency that was the envy of late 19th-century Europe. In the decades leading up to World War I, labor-saving technology, innovation in organizing work and process flow, and the coming of the mass production revolution continually raised the upper limit of efficiency with which factors of production were utilized to create final products and services. Productivity grew, not simply because of the introduction of new types of production technology onto the factory floor, but in the ability of enterprises to effectively link this technology to all phases of business operations, including supply, distribution, and marketing.

By the 1970s, certain industries that regularly expanded their productivity, such as power generation, reached the technological limit to these increases. Similar barriers to productivity growth are anticipated in computers and information technology by 2020. At that point, semiconductor chips reach the point of diminishing returns to specialization and Moore's law begins to break down. Another technological revolution will then be required involving a new generation of advanced materials and hardware to break through these barriers and set semiconductors on a new technological path.

The Drivers of Technological Change

The question of the root drivers of technological change has intrigued scholars for decades. The fundamental issue is why technology emerges when and where it does and why it takes the path it does at a given time and place. One might ask, for example, why the United States took over leadership from England in the Industrial Revolution in the late 19th century and what sustained America's technological performance over time to the present day. In this age of globalization, why does technological activity appear in robust form in some places and not in others?

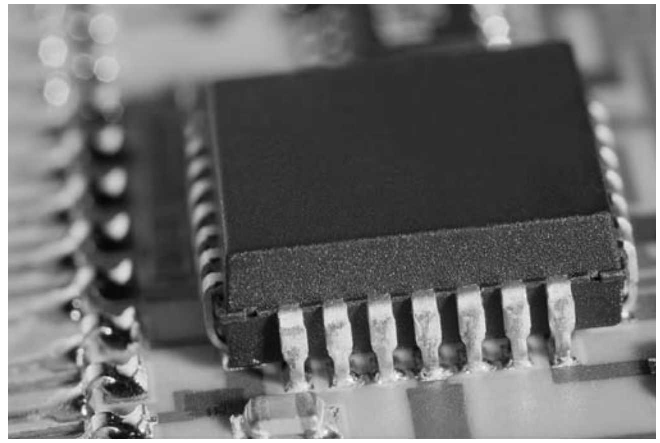
There are two main schools of thought on the root causes for technology change and observed differences globally in technological capability. On the demand side, economists and economic historians point to market pull as a potent driver of technology. In other words, technologies are created to satisfied society's needs and wants. Within the United States, for example, the existence of an expanding and relatively homogeneous market followed the Civil War, one that demanded standardized, inexpensive products, and spurred the growth of mass production technologies to make standardized products at low cost. The production of firearms in the 19th century and Ford's Model T automobile in the early 20th century is often cited to substantiate this point.

On the supply side, a number of theories for technological growth have been considered. As early as the 1930s, economists claimed that only large firms controlled sufficient financial, labor, and material resources to sustain large-scale technology creation. In this view, the lone inventor (i.e., Thomas Edison) no longer had a place in an increasingly corporate world. Evidence in support of this position was the rise of the research and development (R&D) function in large corporations, such as General Electric (GE) and Jersey Standard (later Exxon). Over the course of the 20th century, these departments housed increasing numbers of scientists, engineers, and technical personnel theoretically working in concert on increasingly costly technological innovation.

In some supply-side models of technological growth, scarcity of resources induces technological advance in an attempt to utilize limited amounts of resources more efficiently. Economic historians discuss relative, rather than absolute, resource supplies as the critical issue: a society creates technology that allows the substitution of more abundant (i.e., cheap) for scarcer (i.e., expensive) factors of production. In this view, for example, the United States outpaced England in industrial technology because of America's higher labor (wages) to capital ratios that compelled the creation of mechanization and mass production to effect the substitution of less expensive capital for higher-cost labor.

Another type of resource-based model concentrates on the interaction between intellectual capital and innovation. In particular, it focuses on the rise of modern science and its importance for technology creation. By this reckoning, scientific advance in a field leads directly to technological growth in a related industry. Advocates of this position point to the creation of the atomic bomb and its roots in modern physics as a case in point. The point, then, of corporate R&D is to push forward scientific inquiry, the results of which could then be used for the generation of new products and processes. On the other hand, recent research by historians of technology and management scholars points out that case histories and empirical analyses of innovation past and present show that technology is not simply "science grafted on," but operates according to a more complex scheme.

In fact, they claim that science and technology are actually two very separate communities with distinct cultures, each with its own specific language, goals, methods of approach, and reward systems. If the technological community dips into science, it does so occasionally and with great selectivity; it borrows only those elements from science that it can use, modifies them as technological necessity dictates, and then discards the rest. In this more sophisticated view of science-technology interactions, those individuals who can, through their backgrounds, interests, and experiences, span the worlds of science and technology and so serve as translator, so to speak, between the two communities, play an especially important role. Research continues on the functions and impact of such "gatekeepers" of technology creation.



Barriers to productivity growth are anticipated by 2020 when semiconductor chips reach the point of diminishing returns.

Recent research by management scholars uncovers other supply- or resource-based causes of technological change: organizational structure, social capital, and entrepreneurship. These models of technological growth, for example, downplay the role of the large firm in technology creation: the complex structures and professional barriers that have enveloped functional departments within the large corporation hinder critical communication between them and that is absolutely required for the essentially multidisciplinary process of innovation. Rather, it is the SMEs navigated by an entrepreneurial spirit and possessing a flexible, communication-friendly organization that now have taken the lead as centers of the most advanced technologies. Recent research by international business scholars points to the importance of entrepreneurship in SMEs as a future indicator of technology-based economic growth within the developing countries of eastern Europe, Asia, and Latin America.

Technology and Globalization

The relationship between technology and globalization is complex. Technological progress in information technology, telecommunications, the Internet, and transportation is often seen as a driver of the wave of globalization trends that we have experienced over the last few decades. However, one should be cautious in carrying this argument too far. It was, after all, soon after the end of World War II—that is, long before the rise of the microprocessor and World Wide Web—that average tariffs of the major industrialized economies began to dramatically fall and converge to the 4 percent level.

One can surmise that the desire of a war-torn world, in fear of the dire consequences of a World War III and the nuclear carnage that would be unleashed, pushed international agreements on trade and tariff policies in the 1950s, which, in turn, led to greater cooperation between, and convergence of, the major nations and their economies—the hallmark for advancing globalization. Moreover, the question of cause and effect is not clear-cut. It is possible, and some scholars do indeed argue, that it was this earlier move toward a global world in the years following World War II that established the appropriate market conditions that induced the need for new technology. In other words, the growing, coherent, unified global market that resulted from lowered tariffs and that emerged in the 1950s and 1960s, and the opening up of previously closed economies in eastern Europe and Asia, demanded—and therefore pointedly compelled—the creation of the electronic and telecommunications revolution of the 1970s, 1980s, and 1990s.

Effect of the Technological Revolution

Whatever the root causes of the globalization movement might be, there is little doubt that the technological revolution that took place during the last three decades of the 20th century has had a major impact on its pace and even direction, and continues to do so up to the present time. Innovative materials handling equipment and computer-aided operations—along with standardized "containerization"—has made the loading and unloading of global products at the docks highly time and labor efficient.

Telecommunications technology and systems and the World Wide Web have more closely linked production centers and product markets internationally, rapidly and effectively spreading Western tastes and products to all parts of the world and allowing companies to outsource both blue- and (increasingly) white-collar operations overseas to take maximum advantage of the benefits from the workings of comparative advantage. Information technologies have radically restructured the international monetary and financial systems to permit instantaneous recording and accounting of, and response to, transactions and events that occur virtually anywhere in the world. Technology is also a sine qua non of effective multinational strategies. Economies of scale are the handmaiden of "global" strategies; the linking of world markets through advances in transportation and telecommunications technologies facilitates the creation of global brands, the very foundation of "international" strategies; and flexible manufacturing systems lie at the very heart of "transnational" strategies.

The impact of these technologies on economies and societies has both encouraging, but also less sanguine, dimensions. On the one hand, technology-based globalization makes available a broader variety of products and services at lower costs to more people around the world than ever before; it provides the most precise and up-to-date economic, financial, and monetary information reflecting current conditions for accurate and strategic decision making by businesses than heretofore possible; it offers the prospects of economic growth to the less-developed parts of the world through integration with larger and more advanced market economies; and (according to some scholars) through the growing interdependence of international economies, it lessens the chances of another world war and provides negotiating leverage to mitigate and even defuse regional conflict.

On the other hand, some argue, the new technological world means lost jobs at home due to outsourcing; exploitation of labor and the environment by industrialized countries setting up operations in less developed areas, and a greater chance of international economic and financial crisis, because of the rapidity with which markets in one country or region feel the collapse of economies in other parts of the world. Additional factors may be an erosion in the economic, social, and cultural "uniqueness" of different countries and regions in the name of global homogenization of markets; and as the world has become smaller, increasing instances of "culture clash" between the so-called modern world and the less economically developed and fundamentalist "traditional" parts of society, with the September 11 tragedy and the ensuing war on terrorism serving as the prime example and harbinger of things to come.

Technology, Productivity, and National/ Regional Economic Competitiveness

Whatever the relative merits of arguments for the benefits and costs of technology in a global world, it is clear that international technology is a critical factor in a country's or region's ability to compete in world markets. As the World Economic Forum (WEF) emphasizes in its annual *Global Competitiveness Report*, technological prowess has become one of (if not the) most important indicator of a country's or region's current and future competitiveness, especially within the more developed parts of the world; and long-term productivity growth is commonly viewed as the speed limit for sustainable economic growth and prosperity.

More than any other type of technology, information and communications technology (ICT) ranks as the most vital of drivers of productivity. In the 1980s and 1990s in particular, these innovations entered into and transformed office and factory information and data processing systems. Memory and applications of computer technology expanded and new hardware and software products eased the adaptation of advanced systems to the workplace. These advances, in turn, had enormous advantages in workplace productivity, especially in such areas as data processing, inventory control, Just-in-Time (JIT) delivery, and the like. According to the WEF, the United States' robust productivity growth during these years, and continuing up to the present, is the result of the diffusion and adoption of the most advanced information technologies by manufacturing and the retail and wholesale service sectors. At the turn of the 21st century, about three-quarters of economic growth within the developed countries of the West rested on adoption of advanced technology, mostly residing in the electronics and IT sectors.

Over the course of the 21st century, biomedical and energy technologies will play increasingly important roles in the economic prosperity of developed (and developing) nations. Innovation in the energy sector results in greater efficiencies (and lower costs) in transportation (such as the automobile); oil refining, power generation, transmission, and distribution; and household and commercial appliances. It also means finding substitute energy sources for more expensive and environmentally problematic fuels. Innovation in biomedical devices and systems and in health care will significantly influence productivity growth, in part because such technologies increase the quality in the performance, and extend the useful working life, of a society's workforce.

Feeding into all these technologies are a new generation of advanced materials. Since the 1980s, these materials—in the form of advanced polymers, microcrystals, thin films, metals and metal compounds, advanced ceramics, and high-performance fuels—have been completely revolutionizing a broad spectrum of industries and their products and processes. These materials are particularly relevant to the advance of ICT, energy, and biotechnology, and indeed provide the very foundations for these sectors' continued technological advances.

By 2000, more than half of ICT's growth was attributable to advanced materials, and by 2030 this figure is likely to reach 85 percent. Advanced materials technologies will also continue to penetrate the energy and biotechnology sectors. Overall, by 2030, a significant portion of total productivity growth within the industrialized countries, and thus, their ability to remain globally competitive, will depend on their ability to develop a new generation of advanced materials and apply them to society's industrial base.

Technology Transfer

As with technology itself, technology transfer plays a critical role in 21st-century international business. Instances of technology transfer have increased manifold with the advance of globalization. It occurs between companies within different countries as well as within firms, such as between subsidiaries of a multinational firm located in different countries. The technology transfer process impacts the major developments in the world today, including outsourcing, cluster formation, the product life cycle, productivity, and competitiveness.

Technology transfer is the process of sharing skills, knowledge, and methods, and creating and applying new products and processes. Technology transfer can occur between industries, companies, organizations, governments, or countries. Technology transfer should be distinguished from the diffusion of technology. Diffusion generally refers to the penetration into an economy of a given product or process without the expectation that the diffusion process will significantly alter the dominant design. The goal for diffusion of technology is to find markets and a distribution system that can deliver the technology to the markets. In contrast, technology transfer generally results in modification or reformulation of a design as a result of the different context into which the technology finds itself.

For example, when the early electrical systems developed in the United States in the late 19th century were transferred over to Europe, adaptations were made to the U.S. design in order to account for the different technical, economic, and social context that applied to the European context. Technology transfer also can refer to the relocation of research and development (R&D) projects and personnel to other companies and geographical locations for the purpose of creating new technology from the knowledge previously created in the home firm.

Reasons To Transfer Technology

The fundamental questions that surface when considering the technology transfer process are (1) What compels technology transfer in the first place, and what organizational instruments exist for effecting the transfer? (2) Can a given technology that thrives in one economic, technical, and social climate take root in another? (3) And if so, what forces determine the modifications to be made in successfully negotiating the transfer?

There are a number of reasons behind a company's decision to transfer technology to other companies and locations. These include the desire to share the costs and risks of innovation with a partner firm; the need to be close to critical raw materials, technical personnel, and specialized or hard-to-access markets; the opportunity to take advantage of subsidies and incentives offered by governments looking to entice foreign firms to settle in their countries; and strategic need to avoid high tariff barriers. Government restrictions and regulations can also slow technology transfer, or even stop it in its tracks; such is the case involving the recent trade dispute between the United States and the European Union (EU) over genetically modified seeds, or when the United States restricts the transfer of certain technologies overseas in the name of national security. Periods of geopolitical or civil instability, such as war, need not put an end to technology transfer (although it often does). It was during the French Revolution that important French chemical innovations found their way to England via dislocated refugees. Similarly, during World War II, European research in atomic energy traveled to the United States through scientist émigrés escaping Nazi persecution, eventually leading to the development of the Manhattan Project and the atomic bomb.

Facilitating Technology Transfer

A variety of mechanisms exist for facilitating technology transfer, both domestically and internationally.

The above examples demonstrate the importance of the movement of pivotal personnel from one country to another, either because of troubled times or simply changing jobs. At the firm level, strategic managers generally consider such conduits as licensing, joint ventures, and partnerships as well as "greenfield" operations by which a firm builds a new plant from the ground up in the host country. Technology transfer can also occur through mergers with, or acquisitions of, other companies.

An increasing trend has been the merger or acquisition of a smaller, innovative start-up by a larger, established company for the latter to secure the central patents or licensing rights. The type of technology transfer mechanism to be employed generally depends on risk factors involved. For example, a U.S. company might think twice about licensing its new process to a company operating in a country that either has few piracy laws or is known not to uphold the piracy laws on the books. Or fear of culture clash with the management of a company in another country might steer a U.S. firm from a merger/acquisition strategy and toward a greenfield approach that allows it more control over the new facility in its daily management practices and decisions.

The issue of whether a technology, once transferred, can flourish on foreign soil depends on whether the new environment can supply the requisite resources for technological success, notably raw materials, scientific and technical personnel, complementary industries and companies within the region, transportation and power infrastructure, and appropriate and sufficiently large markets.

Government policy can play a major role in both intra- and international technology transfer. Within the United States, state and local governments typically provide tax breaks and other incentives to induce outside high-technology firms to relocate into their areas to create jobs and spur economic growth.

Cultural Factors

Whether the transplanted plant or product can thrive—even with government subsidies—is another question, and depends, in large measure, on economic, technical, and cultural factors. Knowledge-based clusters, such as Silicon Valley, play an important role in attracting technology transfers through firm relocation and, moreover, provide a favorable climate for such transplants. Such clusters offer important location-specific advantages for such firms in the form of agglomeration economies, especially in the creation and diffusion of specialized knowledge and skills within and between companies.

Turning to those forces that determine why and how a foreign technology requires modification is quite complex and still not well understood. Differences in scale and structure of markets can play an important role: what works for one type of demand curve may not be suitable for one rooted in different historical, cultural, and social forces. This was the case (at least in part) with the transfer of electrification technology to Europe in the early 20th century. It also applied to the transfer of mechanical design from England to the United States, where the larger, more homogeneous U.S. market was a key factor in the modification of less efficient European methods of manufacture to what came to be known as America's mass production system.

Differences in standards, such as technical or environmental, can also play a role as imported technology must be modified to those standards. This factor plays an important role in attempts to transfer information and communications technology from the United States to Europe and Asia. However, the supply side must also be addressed. A transferred technology may have to be adapted to the particular natural resource endowments of a region.

This was the case when, in the first part of the 20th century, the United States adapted German chemical processes, dependent on coal, to more efficient petroleum-based designs. Economic historians often discuss relative, rather than absolute, resource supplies as the critical issue: a society re-creates an imported technology that allows the substitution of more abundant (i.e., cheap) for scarcer (i.e., expensive) factors of production. In this view, for instance, U.S. leadership in mechanization in the 19th century derived from the greater need of U.S. manufacturing to replace more expensive labor with cheaper capital, which induced a need for labor-saving machines.

Studying Technology Transfer

Recent research by management and international business scholars interested in the movement and adaptation of new products and processes within and between multinational firms has examined technical, intellectual, and social factors that can catalyze or derail the technology transfer process. One line of research reveals the importance of "absorptive capacity" of the host (or recipient) party, or the degree of technical capability possessed by the recipient firm or subsidiary that sharpens the ability to recognize the value of new information, assimilate and adapt it, and apply it in commercial ways. The role of "stickiness" of information—the difficulty of transferring knowledge from its place of origin—is a closely related area of interest that impacts understanding of the technology transfer process.

A recent study of a pivotal 21st-century field—the advanced materials sector and its allied industries—shows the difficulty, even in the face of an increasingly globalized world, in successfully transferring the U.S. system of entrepreneurialism and multidimensional "innovativeness" into the European context. As a result, the United States maintains its position as the world leader in the development and application of cutting-edge technology and the economic benefits that accrue from there.

Another line of research sees knowledge and technology transfer as occurring within the social or community context, consisting of a network of relationships existing between and within multinational corporations. From these results, researchers conclude that the factors that aid technology transfer include not simply high absorption capability on the part of the recipient but also mobility of people (e.g., job changes) between firms, as well as strategic use of organizational and social incentive and control mechanisms. Factors, then, that can hinder or limit technology transfer internationally include geographical distance, culture clash, and low mobility of personnel between firms and countries.

Telecom Italia

The Telecom Italia Group is the largest telecom operator in Italy and one of the leading global providers of telecommunication services. Positioned among the top 10 international communication companies in terms of growth and profitability, its main global competitors are AT&T, BT, Deutsche Telekom, France Télécom, Telefónica, and Vodafone.

During fiscal year 2007, it recorded revenues of €31.290 million, an operating profit of €5.764 million, and employed 83,221 people. The core business is represented by fixed-line/mobile telecommunications and the Internet, where it operates through brand names Telecom Italia, TIM, Alice, and Virgilio. The office and systems solutions business operates under the Olivetti brand. Telecom Italia Lab is the brand name used for research and development (R&D). In the media industry, it operates through La7, MTV Italia, and APCOM. The television business unit manages satellite channels and pay-per-view services. The news business unit provides news and special reports.

Created in 1994 from the merger of Iritel, Telespazio, Italcable, and Sirm, after the merge with Stet and privatization in 1997, Telecom Italia has based its growth on new markets of expansion, and on the development of new business models, entrepreneurial ventures and technologies, monitoring its investment portfolio, and divesting noncore and low-return businesses. Its primary focus is organic growth, with selective mergers and acquisitions activity to support international development. National and international strategic partnership agreements have also been very important in accelerating its expansion.

While Italy is still its most important audience, with a market share of more than 94 percent of access line customers, 70 percent of broadband customers, and 40.3 percent in the mobile communications market, the group's internationalization has been very strong, particularly in Europe, the Mediterranean, and South America. The Telecom Italia Group offers fixed voice and mobile telecommunication in Italy and Brazil. Broadband is offered in Italy, Germany, France, the Netherlands, and Brazil. It also has stakes in Entel Bolivia, Telecom Argentina, and ETECSA in Cuba. Its international presence is the result of a selective strategy focused on high-growth markets where Telecom Italia has developed a strong competitive advantage mainly based on innovative business models.

In Europe, after a 2003 launch of its international broadband project, through its subsidiaries Telecom Italia France, HanseNet, and BBNed, the company has gradually rolled out Alice-branded broadband services to France, Germany, and the Netherlands, gaining a European portfolio of around 3.4 million customers.

In Germany, where Telecom Italia is one of the top four operators, with 2.3 million customers, the company has implemented an innovative business model based on the offer of a comprehensive and groundbreaking range of services: HanseNet is the only operator in the market proposing a full quadruple play offering, with ADSL, voice, mobile telephony, and IPTV, which will be integrated in the near future with mobile Internet, new channels, and new e-portals.

In the Mediterranean region, the Group has a leading role, handling over 50 percent of phone traffic between countries in this area through its extensive submarine cable ring.

TIM Brasil is one of South America's biggest suppliers of mobile lines. With a market share of about 26 percent and an offering of more than 31 million lines, mainly targeted to higher-value customers, it is the second operator in the country, continuously expanding into new markets and segments, such as the lower social segments and the broadband business.

Innovation is another distinctive factor of Telecom Italia: research and technology's investments create a relevant competitive advantage over other players in the market. The Telecom Italia Lab is not only an internal technology center, it also operates externally as a center of excellence for the telecommunications industry. Since 1995, the Group has had a significant involvement in defining the GSM and MP3 standards, and with optical transmission.

There are numerous projects currently supported by the company: fixed-line and mobile access network design and development, next-generation transmission networks, platform and service development, trials of next-generation handsets, and sensoristics. The relevance of innovation in Telecom Italia is consistent with its plan to expand its market share, not only in adjacent market sectors, such as IT, digital media, and advertising, but also in the advertising and digital content sector, where the company aims to grow in digital content distribution and Web 2.0 new media sectors.

Telefónica

Telefónica is a global telecommunications company founded and headquartered in Spain. Established initially as a fixed-line telephone company, Telefónica currently operates in the telecommunications, information, and entertainment businesses in 23 countries and has over 228 million customers. The company is listed in the Bolsa de Madrid (TEF), NYSE Euronext (TFA), London Stock Exchange (TDE), Frankfurt Stock Exchange (TNE5), and the Tokyo Stock Exchange (9481).

Telefónica was incorporated in 1924 as Compañía Telefónica Nacional de España (CTNE), a private firm owned by Spanish and international investors. From its inception, the company was granted a monopoly of the telephone service in Spain. In 1945, the government of General Francisco Franco gained control of almost 80 percent of CTNE as part of a larger process of the nationalization of utility companies. Starting in the mid-1980s, successive governments privatized the company through a series of public offerings, and the company changed its name to Telefónica de España, SA. In 1996, the Spanish government deregulated the telecommunications market, and in 1997, the country sold its last stake in Telefónica. However, despite the privatization process, the Spanish government helped Telefónica maintain control of the Spanish telecommunications market until 2005.

International Growth

The resources amassed during more than 60 years of monopoly fueled Telefónica's international growth from the beginning of the privatization process. Telefónica started expanding its territory through acquisitions of telecommunications companies, initially in Latin America. In 2005, the company began its European expansion through the acquisition of Cesky Telecom in the Czech Republic and O2, a mobile operator in Germany and the United Kingdom. Telefónica also entered the Chinese market through the purchase of a 5 percent stake of China Netcom, which has grown to over 7 percent as of 2008.

The postprivatization growth not only extended Telefónica's geographical reach, but it also pushed the company into new industries. Telefónica owns television and radio stations, production companies, directory publishing services, Internet portals, and satellite and broadband transmission companies. As a result of these acquisitions and its increasing participation in other industries, Telefónica's customers, sales, assets, number of employees, and market capitalization doubled between 2004 and 2006.

Currently, operations are organized into three geographical regions: Telefónica España, Telefónica Latinoamérica, and Telefónica O2 Europa, which serve the Spanish, Latin American and China, and European markets, respectively. The company also owns three firms that support the telecommunication business and leverage Telefónica's global network: Atento provides customer service and call center outsourcing in Spanish-speaking Latin America, Brazil, and Morocco; TGestiona offers consulting and outsourcing of business-support areas; and Telefónica I+D is in charge of Telefónica's research and development (R&D) activities. Telefónica also holds controlling interest in mobile companies 3Q Mobile AG (Switzerland) and Group 3G (Germany). In the United States, Telefónica USA, Inc., serves U.S.-based multinational companies with businesses in Latin America. Together, international operations accounted for more than 63 percent of Telefónica's income in 2007.

Telefónica's incumbent position after many years of monopoly of the telecommunications and data transmission markets in Spain has been both a source of competitive advantage and a target for criticism and judiciary action. Thanks to the monopoly, Telefónica accumulated the resources to grow through international acquisitions. It also allowed the firm to extend its network through areas of Spain where other operators find the costs of installation prohibitive. Customers and competitors have complained that Telefónica has abused its dominant position and engaged in unfair competition at the Spanish and European Union (EU) level.

Since 2000, the company has been fined over €80 million by the Spanish Tribunal de Defensa de la Competencia (Competition Defense Tribunal) for several violations of antitrust provisions. Additionally, the European Commission (EC) considered that Telefónica's practices affected the EU as a whole and constituted a "serious abuse of its dominant position," because of the duration and severity of the uncompetitive practices. The EC imposed a fine of €151,875 million, the largest fine in the EC's history.

Telefónica maintains a high level of investment in R&D through its I+D division, and also a network of strategic alliances with leading telecommunications companies. This has allowed the company to create specific components and services for the markets it enters. Although Telefónica's incumbent advantages cannot be denied, it is important to recognize that the company's success also comes from its technological prowess and productivity.

Tequila Effect

The Tequila Effect, also referred to as the 1994 Mexican Peso Crisis, is the informal name given to the effects of the 1994 currency crisis that originated in Mexico. It occurred as a result of political turmoil and social unrest in Mexico in 1994 and delays in making the necessary adjustments to Mexico's monetary policy during that time period. The crisis also affected other emerging economies that were similar to Mexico, in particular South American economies.

Since November 1991, Mexico operated a pegged exchange rate system in which the peso, the currency of Mexico, was initially linked to the U.S. dollar at a fixed exchange rate, and was allowed to trade within a set range. In 1994, the peso was devalued by 10 percent, but that devaluation was seen as insufficient, leaving the peso to remain overvalued. To keep the peso within its band, Mexico's central bank had to simultaneously manage the peso-dollar exchange rate and the money supply. Given the economic and political conditions at that time, the simultaneous management of the foreign exchange rate and the money supply proved to be a difficult balancing act.

Following the 1994 assassinations of Luis Donaldo Colosio and José Francisco Ruiz Massieu, two key political figures of the Party of Institutional Revolution (PRI), which dominated Mexican politics for decades, investors sensed choppy waters. The same year also saw a time of transition at the helm of Mexico, and the outgoing president was reluctant to devalue the peso during his term of office. It was feared that allowing the peso to devalue would cause generalized discontent among the population, as it did in the election years of 1976 and 1982. The issue of allowing interest rates to rise was controversial as well. First, it would further strengthen an already-overvalued peso. Second, it would raise the cost of capital to the private sector. Third, it could lead to a bank run, as nonperforming loans weaken banks' assets and rising costs of deposits heap more pressure on banks' liabilities. To ease the pressure on interest rates, the Central Bank of Mexico expanded credit by loaning more funds to commercial banks and by purchasing government securities held by corporations and the public.

The government's resistance to further increase interest rates and to devalue the peso meant that reserves had to be run down. With an overvalued peso, it was cheaper for Mexicans to import foreign-made

The Tequila Effect, or the Mexican peso crisis, refers to the sudden devaluation of the Mexican peso in 1994.

goods and more expensive for foreigners to buy goods made in Mexico. The overvalued peso led to increased imports and decreased exports, and a widening current account deficit.

A current account deficit can be financed by private capital in-flows and/or changes in foreign exchange reserves. The political turmoil and social unrest of 1994 caused private capital in-flows to dry out. Hence, foreign exchange reserves were used mainly to finance the deficit, causing Mexico to eventually run out of reserves. As a result, the Central Bank of Mexico soon ran out of reserves to guarantee deposits in the event of a bank run. The fact that a sizable chunk of total deposits were in dollar-denominations made matters even worse for foreign investors. In December 1994, an auction of government securities (to buy time for the Mexican government, hoping the shock would be transitory) failed, and that kick-started a wave of panic among investors.

Financial Panic

Given Mexico's political chaos, weak capital market, and low protection of investor rights, rumors of an imminent devaluation of the peso led to a capital flight out of Mexico, and the peso overflowed currency markets. The combination of political instability, an overvalued currency that may be subject to speculative attacks, huge current account deficits, and dwindling foreign exchange reserves (overtaking any benefit of Mexico joining the North American Free Trade Agreement [NAFTA] in 1994) contributed to its economic collapse. The Mexican government finally perceived the costs of defending the exchange rate to be too high and had to let the peso devalue. The devaluation led to extreme financial panic. Given that in 1982 the Mexican government froze dollar-denominated deposits and paid them back at an exchange rate well below market rate, investors feared that a repeat of that event could occur. Moreover, fearing a contagion effect, investors pulled out funds from other markets with characteristics similar to Mexico.

To contain the effects of the Mexican crisis and possibly to quell criticisms that Mexico's membership in NAFTA was hasty, the U.S. government and the International Monetary Fund (IMF) responded with a $52 billion aid package. The size of this international line of credit helped in appeasing investors' panic and bolstering confidence back in the Mexican economy.

Terms of Trade

A country's terms of trade is the ratio of its export price index to its import price index. Changes in terms of trade are sometimes used to indicate the direction of change in a country's gains from trade. Sudden changes in a country's terms of trade can affect its overall macroeconomic position. Significant improvements in a country's terms of trade may lead to Dutch disease, where the economy faces the possibility of a recession despite the boom in its export sector.

Terms of Trade and Comparative Advantage

David Ricardo's theory of comparative advantage is the standard for determining the pattern of trade between countries. It does not, however, pin down the terms of trade. Instead, it provides upper and lower bounds on the terms of trade that will allow mutually beneficial trade to occur. In the typical 2-good, 2-country model, the upper and the lower limits of the terms of trade are the opportunity cost for producing the good in each market. This is because if a good is more expensive in international trade than in autarky, countries would be better off producing the good themselves and not engaging in international trade. Mutually beneficial trade can therefore only occur at a price ratio that is bounded by the domestic opportunity cost in each market.

The extent to which each country gains from international trade is determined by the world price. The closer this world price is to a country's opportunity cost, the lower is its share of the gains from trade; the farther this world price is from a country's opportunity cost, the greater is its share of the gains from trade.

To illustrate this, consider a 2-country, 2-good model where the home country has a comparative advantage in production of commodities and the foreign country has comparative advantage in the production of the manufactured good. The home country opportunity cost is four commodities for one manufactured product. The opportunity cost for its potential trading partner, the foreign country, is one commodity for one manufactured product.

The terms of trade for home country is the price of commodities, its export good, divided by the price of manufactured products, its import good. This pattern of trade is consistent with that predicted from the pattern of comparative advantage. Assuming that the price of commodities is $1, then the price of manufacturing good is $4. These prices are consistent with the opportunity cost in the home country. This gives a ratio of export price to import price of 1/4. This ratio places a lower limit on the price at which the domestic economy is willing to engage in international trade. Further, at a terms of trade of 1/4, the home country does not gain from trade. This means that all the gains from international trade are captured by the second country.

The upper limit on the terms of trade is set by the foreign country's willingness to trade. As was the case with the domestic economy, this reflects the opportunity cost in the foreign country. In this instance, the upper limit on the terms of trade is 1, because the foreign country is not willing to trade at higher prices. At terms of trade of 1, where the terms of trade is measured relative to the home country's export good, the foreign country does not gain from trade. This means that all the gains from international trade are captured by the home country.

The terms of trade for the home country must lie between 1/4 and 1. The observed terms of trade is determined by demand for both goods in each country. If consumers have a strong preference for a country's export good, then this will tend to drive up the price of their exports.

Assume that the initial terms of trade for the home country is 1/2. There is an exogenous shock that causes an increase in the price of commodities, while the price of manufacturing goods remains unchanged. This is reflected in the home country's terms of trade, which increases from 1/2 to 3/4. With this improvement in the terms of trade, the home country captures more of the gains of trade. If instead, the exogenous shock caused a decrease in the price of commodities while the price of manufacturing goods remained constant, then the home country's terms of trade would have deteriorated. This is reflected in the movement in the home country's terms of trade from 1/2 to 1/3. With this deterioration in the home country's terms of trade, the international division of the gains from trade moves in favor of the foreign country and the domestic economy captures less of the gains from trade.

Generalizing the lessons from the 2 x 2 model, it can be concluded that countries experiencing an improvement in their terms of trade can purchase more imports with the same amount of exports. This occurs whenever the price of a country's exports rises by more than the price of its imports. Countries experiencing deterioration in their terms of trade can purchase less imports with the same amount of exports. This occurs whenever the price of a country's exports rises by less than the price of its imports.

Based on the foregoing, the direction of changes in a country's terms of trade over time is often used as a proxy for changes in its gain from trade. This is, however, only one source of potential gains from international trade, and caution should be exercised when trying to interpret the terms of trade in this manner.

Terms of Trade Adjustments

The degree of control that countries have over their terms of trade is dependent on the nature of their export goods. Countries that produce differentiated products have more control over the world price of their exports than do countries that produce commodity products. This is consistent with economic theory, where differentiated product firms have market power and firms with undifferentiated products do not. Developing countries, because their exports are often dominated by undifferentiated commodity products, have little control over their terms of trade.

This is particularly true for sub-Saharan countries where exports are dominated by primary products. As a consequence, changes in world demand or in supply conditions elsewhere, which cause fluctuations in world commodity prices, will impact their terms of trade.

Another factor that affects the ability of countries to control their terms of trade is the size of country. In particular, large countries can use tariffs, that is, import taxes, to affect their terms of trade. A country is considered large if it accounts for a significant share of world demand, as reflected in its ability to change world prices through its trade policy actions. To influence its terms of trade, a large country would impose a tariff on imports, and this would result in a fall in the world price of the large country's import goods. Because the price of the exports remains unchanged, the large country would have improved its terms of trade through the imposition of tariffs. However, very few countries are sufficiently large enough to use trade policy to influence their terms of trade. For those countries that are large enough to improve their terms of trade through trade policy, this choice is often not available because of the network of international agreements, principally the World Trade Organization (WTO) agreement, which limits these countries' ability to increase tariffs.

For most countries, terms of trade shocks, that is, unanticipated changes in relative price of a country's exports, are outside their control. If these terms of trade shocks are large, then it is possible for these effects to spill over into the broader economy and affect the country's income levels.

Consider what happens if the terms of trade shocks are negative, such that the price of exports falls while the price of imports remain unchanged. Such a shock would cause the country's export earnings to fall. Falling export earnings may reduce the income of agents in the export sector, which may be transmitted throughout the broader economy, resulting in a reduction in gross domestic product (GDP). If, instead, the price of exports increases, while the price of imports remain unchanged, then the terms of trade shock will be positive. Such a shock will cause the country's export earnings to rise. Higher export earnings may increase the income of agents in the export sector, which may be transmitted throughout the broader economy, resulting in an increase in GDP.

For commodity-intensive exporters, changes in world demand or in supply conditions that cause fluctuations in world commodity prices will impact their terms of trade. This raises the potential for significant variability in these countries' GDPs in response to the variability in world commodity prices.

Terms of Trade Adjustment and Exchange Rates

The ability of countries to adjust in the face of terms of trade shocks is influenced by various factors. One important factor is the country's exchange rate regime. There are two principal exchange rate regimes: flexible exchange rates and fixed exchange rates. With flexible exchange rates, demand and supply of foreign currency determines the price of foreign currency, that is, the exchange rate. With fixed exchange rates, the value of the country's currency is pegged to a foreign currency or basket of currencies. To maintain this fixed price, the monetary authorities stand ready to purchase or sell foreign currency as needed to remove excess supply or augment market supply as may be needed.

Countries with flexible exchange rates are better able to adjust to terms of trade shocks than are countries with fixed exchange rates. This occurs because the flexible exchange rate regime provides a secondary adjustment mechanism that dampens the impact of the change in export earnings. In contrast, when the exchange rate is fixed, there is no secondary adjustment mechanism available to absorb some of the impact on the economy. Consider a country that is an exporter of primary products and that imports a range of essential products. Suppose that this country experiences a terms of trade deterioration as a result of a reduction in its export price.

This will decrease export earnings and, as a result, the amount of foreign exchange that is available also decreases. If the exchange rate is fixed, then the monetary authorities will absorb the shortfall in foreign exchange earnings, and the price of tradables will remain unchanged. If the exchange rate is flexible, then the shortfall in foreign exchange earnings will be reflected in its price and the country's exchange rate will depreciate. This depreciation causes the price of tradables to increase. It is the adjustment in the price of tradables that leads to different adjustment patterns under fixed and flexible exchange rates.

With flexible exchange rates, tradable goods become more expensive. This makes exporting more attractive because the domestic currency equivalent that is received by exporters increases. This also makes importing less attractive because the domestic currency equivalent increases. This results in an increase in imports and potential substitution as formerly imported goods are replaced by domestic production. These changes serve to compensate for some of the income lost because of the fall in the country's export price.

With fixed exchange rates, there is no subsequent change in the price of tradables. This means that there is no further change in the incentives to export and no incentives to substitute domestic production for imports. In short, there are no compensating expansions to offset the contraction resulting from the fall in export earnings. In summary, the extent of the adjustment in GDP in response to deterioration in a country's terms of trade will differ under flexible and fixed exchange rates. With flexible exchange rates, the GDP response will be less significant than when exchange rates are fixed.

Suppose that instead the country experiences a terms of trade improvement. This will increase export earnings, and as a result, the amount of foreign exchange that is available increases. If the exchange rate is fixed, then the monetary authorities will accommodate the excess supply of foreign exchange earnings, and the price of tradables will remain unchanged. If the exchange rate is flexible, then the boom in foreign exchange earnings will be reflected in its price and the country's exchange rate will appreciate. This causes the domestic currency price of tradables to decrease because each unit of domestic currency buys more foreign currency than previously.

With flexible exchange rates, tradable goods become less expensive. This makes exporting less attractive because the domestic currency equivalent that is received by exporters decreases. This also makes importing more attractive because the domestic currency equivalent increases. This results in a decrease in imports and potential substitution as formerly domestically produced goods are replaced by imports. These changes serve to dampen the GDP expansion effect sparked by the increase in export earnings. With fixed exchange rates, there is no change in the price of tradables. This means that there is no further change in the incentives to export and no incentives to substitute imports for domestic production. In short, there are no built-in stabilizers to constrain the economic expansion resulting from the rise in export earnings. In summary, the extent of the adjustment in GDP in response to improvements in a country's terms of trade will differ under flexible and fixed exchange rates. With flexible exchange rates, the GDP response will be less significant than when exchange rates are fixed.

As explained above, the GDP response to terms of trade changes is larger under fixed exchange rates than under flexible exchange rates, independently of the direction of change in a country's terms of trade. This means that primary exporters who adopt fixed exchange rates will have significantly more variability in their GDP than primary exporters who adopt flexible exchange rates.

Improvements in the Terms of Trade and Dutch Disease

As previously noted, improvements in a country's terms of trade will often translate into economic growth, as the boost in export earnings is transmitted through the remainder of the economy. However, large increases in the price of a country's natural resource exports may have an adverse economic effect. This effect is known as Dutch disease, named after the observed negative economic effect experienced by the Netherlands following the discovery of natural gas in the 1960s. In the case of the Netherlands, the discovery of natural gas reduced the competitiveness of the Netherlands' traditional export sectors, causing them to contract.

A better understanding of Dutch disease can be gained through the use of a simplified version of the model originally developed by W. M. Corden and J. Peter Neary in the 1980s to explain this disease. In this model, the production side of the economy is comprised of three sectors: two of them produce exports, and one of them produces a nontraded good. The export goods produced are a traditional export good and a natural resource. Suppose that the world price of the natural resource good increases by a significant percentage, while the world price of the traditional export remains unchanged. Consistent with the earlier analysis, the higher world price for the country's export good will result in increased export earnings.

The higher world price for the natural resource good encourages expansion of this sector. This expansion is achieved by pulling resources away from the other sectors in the economy.

The increased earnings resulting from the export boom will be spent either on imports or on nontraded goods. If the demand for nontraded goods rises in response to the export boom, then the price of nontraded goods will increase. This increases the attractiveness of this sector, which expands to serve the now-higher demand. This expansion is achieved by pulling resources away from other sectors in the economy.

When two of three sectors, namely, the natural resource sector and the nontraded good sector, demand more resources, these resources must be released from the third sector, that is, the traditional export sector. As a result, the output of the traditional export sector contracts.

An exchange rate effect is also at play here. When exchange rates are flexible, the traditional export sector is further hurt by the appreciation of the domestic currency. Such appreciation further decreases the attractiveness of traditional exports and causes a further contraction of this sector. When exchange rates are fixed, there are no secondary price effects in the traditional export sector, and as a result, its contraction is less severe than with flexible exchange rates.

The Dutch disease phenomenon has been observed in various circumstances, including the discovery of North Sea oil for the United Kingdom, the first oil price shock of the 1970s, and the substantial increase in coffee prices in the 1970s, following the failure of the Brazilian coffee harvest. More recently, the increases in copper prices and in the prices of crude oil in the 2000s have raised concerns as to whether Dutch disease is at play in economies that are major exporters of copper and oil.

Terrorism

Since the attacks on the World Trade Center and the Pentagon on September 11, 2001, and the subsequent ongoing war on terror, people have become very aware of the problem of terrorism. Terrorism is not new; it is an age-old phenomenon. However, since the 1980s and the rise of new religious fundamentalist groups, there have been profound changes in the nature of terrorism. There have been fundamental changes in the structure of terrorist organizations, their mode of operation, motives, and the mind-set of terrorists themselves. The new terrorist groups operating in the 21st century pose a far greater threat than traditional groups did because they have a wider global span and operate with far greater lethality.

What Constitutes Terrorism?

An accepted definition of what constitutes terrorism is needed for the scope of law, international treaties, and cooperation, both nationally and internationally, in the fight against terrorism. However, there is no single universally accepted definition of terrorism. This, in part, arises because one person's terrorist is another person's freedom fighter, depending on if one sees the underlying cause as justified. Nelson Mandela was seen by many as a "freedom fighter," while to others he was a terrorist. Some viewed Osama bin Laden as a freedom fighter when he fought against the Soviet Union's invasion of Afghanistan, but he is now regarded as a terrorist by the West.

Another reason for the lack of a concrete definition is the wide array of the types of terrorism and the evolving nature of their organizations and activities. Since 2005, the National Counterterrorism Center in the United States has used the following definition when reporting incidents of terrorism: "premeditated, politically motivated violence perpetrated against noncombatant targets by subnational groups or clandestine agents."

Even this widely used definition is challenged. For example, it is debatable whether cyberterrorism and the use of weapons of mass destruction (nuclear, biological, and chemical) constitute violent acts. The inclusion in the definition of noncombatant excludes military personnel killed or injured in a war zone, such as members of the armed services in Iraq and Afghanistan. The criterion of being politically motivated excludes criminals, so a serial killer or rapist causing terror in a neighborhood does not constitute terrorism. Additionally, the state may terrorize its people when it imposes a reign of terror, such as the events that occurred in the Soviet Union under Joseph Stalin and in Chile under Augusto Pinochet. This type of state terrorism is excluded from the definition.

Terrorists can be classified into domestic and international groups. Domestic secular terrorism involves indigenous groups operating on home territory, such as animal rights activists in the United Kingdom, and antiabortionists in the United States. The Oklahoma

An aerial view of the scene where the World Trade Center collapsed taken by a U.S. Navy photographer following the Sept. 11 terrorist attack. The attacks on the World Trade Center and the Pentagon were the largest and most devastating in U.S. history.

City bombing in 1995 is an example of domestic terrorism, as are Irish Republican Army (IRA) operations in the United Kingdom. Although domestic groups are responsible for the majority of acts globally, attention is now being focused on international religious terrorist groups that operate within a different paradigm and across continents.

There are hundreds of terrorist organizations; for example, Hamas, Hezbollah, Real IRA, Shining Path, and the most famous of all, Al Qaeda. Most countries have domestic terrorist groups, for instance, the Soviet Union has problems with Chechen terrorists. Some terrorist leaders are well known, such as Osama bin Laden and Che Guevara.

Terrorist Acts

What constitutes a terrorist incident is somewhat open to interpretation, as the perpetrators do not always claim responsibility, unlike traditional groups such as the IRA in the United Kingdom. Counting the number of incidents is complex, especially now with the trend toward a number of related events occurring in swarms. According to the *Country Report on Terrorism,* published annually by the U.S. Department of State, in 2006 there were 14,338 incidents of terrorism worldwide, and 74,543 individuals were killed, injured, or kidnapped as a result of incidents of terrorism. The largest number of incidents occurred in the Near East and south Asia, with many taking place in Iraq.

Looking at the trend in terms of number of events is not very meaningful. An event now is not comparable to past events, as modern terrorists aim for a spectacular event with maximum lethality and damage. The worst terrorist act in history were the attacks on the World Trade Center and the Pentagon on September 11, 2001. There had been a previous attack on the World Trade Center in 1993 when a car bomb exploded. Other major terrorist incidents include train bombings in 2004, the Lockerbie plane bombing in 1988, the suicide attack on the USS *Cole* in Yemen in 2000, and the Bali bombings in 2002.

The purpose of acts of terrorism is not merely to cause physical damage and to kill or injure people, but also to terrorize the population at large and disrupt normal societal activities. The psychological impact of causing fear matters, as well as causing death and destruction. In addition, media coverage of an event draws attention to the group's particular cause and improves recruitment. The acts themselves are simply a means to achieve an end objective, such as a change in government policies or, with the religious fundamentalist groups, to bring about fundamental change in an economic system and the existing world order.

Why Terrorism?

Terrorism as a strategy is dictated by circumstances. Terrorist acts are not spontaneous, but well planned and premeditated, taken as part of an overall strategy of systematic and deliberate actions sustained over a long period of time. Violence is used because legal and political methods are thought to be ineffective. This violence takes the form of terrorist acts because asymmetrical military strength means the terrorists would stand no chance of winning an outright war. All terrorist groups, regardless of their wealth, possess relatively few resources compared to governments. Terrorist tactics put those few resources into effective use by targeting a few, yet impacting many. Therefore, terrorism is a rational strategy, as it is the easiest and most efficient form of insurgency, given the circumstances.

The increasing trend in suicide terrorism is because it is a very effective and cost-efficient method. It can be used for precision targeting and to inflict mass casualties and cause extensive damage. It is a very effective way of spreading terror because it is extremely difficult to prevent and, therefore, is usually successful. The Tamil Tigers in Sri Lanka killed two heads of state in the early 1990s using suicide terrorists.

The chance of any terrorist group achieving their ultimate objective is very low. Terrorist organizations may achieve interim goals, such as the withdrawal of military personnel from a specific area, the release of political prisoners, and so forth, but few achieve their end goals. The African National Congress (ANC) and, to an extent, the IRA were successful, but groups seeking fundamental change, such as the downfall of capitalism or the demise of Christianity, are thought to be unlikely to succeed.

Structure of Terrorist Organizations

The structure of terrorist organizations has changed. Domestic terrorist organizations formed an identifiable group, with a hierarchical structure and clear leadership. The new terrorist organizations now have a much bigger, more dispersed lateral network that spans the globe. Al Qaeda literally means "the base." It is an umbrella organization where different groups may come for help with funds, training, and logistical support. There can be thousands of terrorists in a group, operating in many cells, all pursuing the same cause. Groups are split into small cells of approximately six to seven members for flexibility, mobility, and security reasons. Larger organizations have specialist personnel, such as financiers dedicated to dealing with the management of funds.

The old terrorist groups were motivated by ideology or liberation with clearly defined objectives, usually taking credit for their actions, whereas the new religious groups are motivated by religion, and their objectives are more diffuse and seek fundamental changes. They do not usually claim credit for their actions, justifying their actions as pursuing God's will.

Combating Terrorism

There are two main approaches to combating terrorism. One is a defensive approach, when measures are introduced to preempt attacks and limit risk. The second is a proactive approach, when measures are taken to make it more difficult for terrorists to operate by reducing and hindering their capabilities to mount attacks. A further possible solution is to address the underlying causes, although this may be difficult or even impossible in practice, especially with the new groups.

Changes in the nature and type of terrorism are hampering the ability of authorities to act both defensively and proactively. The defensive approach now requires global surveillance and intelligence gathering, and, while developments in technology have helped, it has been hindered by the difficulty of infiltrating the international religious terrorist groups to conduct covert intelligence operations. Key targets are more heavily secured, the most obvious being screening at airports and the erection of concrete barriers around some buildings to prevent car bomb attacks. The new terrorist groups, however, are less discriminating about their targets and merely move to less-secure areas.

One policy, aiming to make it harder for terrorists to operate, is to confront state sponsorship. Economic and other sanctions are imposed on countries harboring and assisting terrorists to pressure them to stop giving terrorists protection and resources. Sudan has long been a haven for terrorist groups, but in 1996, under pressure from the United States, Osama bin Laden was ordered to leave the country. However, sanctions have a very limited impact, as terrorists are now less dependent on state sponsors. International terrorist groups have access to both private finance and income from criminal activities, particularly the trafficking of narcotic drugs. The remaining state sponsors of terrorism listed in the *Country Report on Terrorism* (2007) are Iran, Syria, North Korea, Sudan, and Cuba.

Counterterrorist policies appropriate for the new type of terrorism require a comprehensive approach, using a combination of economic, military, intelligence gathering, and diplomatic tools. They also require cooperation and coordination of these policies at a national and international level. In 2004, the United States created the National Counterterrorism Center as the primary organization for compiling and coordinating all intelligence pertaining to terrorism.

Democratically elected governments are constrained in their choice of counterterrorist policies, not only by the availability of financial and physical resources, but also by having to comply with civil liberty requirements, human rights laws, and their inability to restrict freedom of the press.

How Great Is the Threat of Terrorism?

To date, the favored weapons of terrorists have been bombs and guns, but authorities engaged in the abatement of terrorism are concerned that terrorists may turn to using weapons of mass destruction and cyberterrorism. With the growth in religious terrorist groups operating in a war paradigm and intent on mass destruction of their enemies, the possibility of terrorists using weapons of mass destruction in the future is thought to be much higher than before. Even if only one such act is not deterred, it could have catastrophic consequences. There have been only a few examples to date, such as the release of sarin gas in the Tokyo subway in 1995 and the anthrax postal attacks in the United States after 9/11.

The most well-known terrorist group, Al Qaeda, is proving to be highly adaptable and flexible, quickly evolving new methods in response to countermeasures. As counterterrorist policies become successful and restrict the movement of terrorists, they are changing their strategy in response. For example, groups used to train terrorists in one country and then insert cells into the target country to prepare for an attack. They have responded by recruiting nationals of the target country through propaganda (especially via the Internet) and expatriate immigrant populations. The 2005 attacks on London public transport and the thwarted 2006 attacks on planes from UK airports all involved British-born Muslim terrorists. The hotel and train terrorist attacks in Mumbai proved that developing nations are terrorist targets as well.

Thailand

One of the most vibrant economies of the world, Thailand ("Land of the Free") has witnessed rapid transformation from an agrarian-based economy to a globalized industrial one. The economic growth of Thailand since the mid-1980s has been remarkable. With a growth rate of 10 percent per year, Thailand became one of the Asian Tigers by 1991, along with Singapore, Taiwan, South Korea, and Hong Kong. A member of the "newly industrializing countries," Thailand has marched ahead with the new mantra of liberalization. The capital, Bangkok, has transformed a great deal. Social mobility became common, and the employment boom in the decade starting from 1985 resulted in much of the population flocking from rural to urban areas, bringing with them a growth of urbanization. Foreign direct investment (FDI) increased in Thailand. Thai currency, the baht, was attached to the America dollar, and it became cheaper for Japanese corporations to invest, as the value of the dollar went down against the yen.

The Rise and Fall of the Thai Economy

Thailand's trade with Japan grew phenomenally. In the beginning of 1994, the Stock Exchange of Thailand (SET) reached a high of 1,753.73. Foreign funds began to surge into Thai financial institutions and banks. Private capital inflows flooded the financial market of Thailand. There was an influx of offshore banks from Japan and the West. The Thai official policy had encouraged FDI. The government also gave all-out support for joint venture investment initiatives. The Thai financial environment for investment had become ripe, with a modernized capital city, excellent communication and transportation facilities, comparatively reasonable real estate rates, and availabile labor force.

Very soon, the bubble began to burst, and cracks appeared beginning in late 1996. Thailand, a model for economic development, was hit by the crisis leading to currency depreciation, unemployment, inflation, and foreign debts. The Asian economic crisis commenced on July 2, 1997, with Thailand becoming the epicenter of the crisis. The floating of the baht by the Bank of Thailand started a chain reaction. The repercussions were swift across the money market of southeast Asia. The situation in the financial sector became so critical that 56 finance companies had been shut down by the end of 1997.

With an index of 481.92, the SET reached its nadir in 1999. The economic growth rate of Thailand was 5.9, minus 1.7, minus 10.2, and 4.2 for 1996, 1997, 1998, and 1999, respectively. The exchange rate of the baht to the American dollar fluctuated from 24.3 (June 1977) to a low of 52.5 (January 1998). The credit rating of Thailand had gone down, and consequently investment plummeted, with a capital outflow from the private sector amounting to a staggering sum of 645,096 billion baht. The International Monetary Fund (IMF) secured $17.2 billion in loans for Thailand. There was a huge scaling down of expenditures in the government and private sectors. About 2 million people lost their jobs, leading to lowering of the standard of living.

The Thai economic crisis also witnessed a major change in the ownership of companies and financial institutions. Foreign firms and local businesses began joint ventures. There was a considerable increase of shares of foreign companies in Thai banks. Thailand endured the 1997 financial crisis, and recovery began after the government initiated a series of economic reforms pertaining to lending practices, incentives, and corporate governance. The economic recovery was gradual. The Thai government launched an ambitious program of reforms, by which domestic demand was stimulated. Support was accorded to domestic firms, but simultaneously, open markets and foreign investment were promoted. By 2001, Thailand had recovered from the crisis, and its gross domestic product (GDP) was 5.2 percent the following year.

Thailand's trade and investment abroad gradually improved. Japan, the North American Free Trade Agreement (NAFTA), and the Association of Southeast Asian Nations (ASEAN) countries are the three major zones for Thailand's import in commodities, such as capital goods, intermediate products, raw material, consumable items, fuels, and lubricants. Thailand began to expand its export with items such as garments, rice, and automobiles, along with auto accessories, canned shrimp, automatic data processing machines, electronic equipment, and so on. Apart from ASEAN, the European Union (EU) and NAFTA are also major exporting areas for Thailand.

Thai exports performed well in 2007, with continued emphasis on high-tech items. It explored new markets in Australia, Russia, and south and west Asia. The Thai outward FDI had reached a peak prior to the Asian economic crisis. The outward investment slowed down, but there was gradual recovery after 2002. The government, the Board of Investment (BOI), Thailand Board of Trade, EXIM Bank of Thailand, and the Federation of Thai Industries gave a helping hand to Thai companies investing abroad. Compared to countries such as Malaysia, China, India, and Brazil, it is not

This traffic jam attests to the fact that Thailand has rapidly transformed from an agrarian society to an industrial one.

a major outward investor, with a rank of 26 among emerging economy investors. Thai companies such as Amata, Baiyoke, Charoen Pokphand Group, Bangkok Bank, Thai President Foods, Banpu, Loxley, Jasmine, and Saha Union invest abroad mainly in manufacturing industry and services sectors. The major destinations for investment include ASEAN, south Asia, China, ex-Soviet bloc countries, and Africa.

In human development, Thailand has shown tremendous progress. The Human Development Index rate is 73. With a Human Poverty Index rate of 28, the population below the poverty line is only 10 percent, although poverty is still significant in poorer regions and villages. It is hoped that Thailand, a middle-income country, will achieve most of the goals projected by the United Nations' Millennium Development Goals. It has also made improvement in the business sector, and its rank, according to the *Doing Business* report, was 15 in 2007. The Thai economy seems strong enough to weather any storm, and its future looks bright.

Third Country National

A third country national (TCN) is an individual who is a citizen of neither the contracting government nor the host country or area of operations. A TCN is hired by the host government to perform a significant role in multinational corporations. This person is differentiated from the parent country national (PCN) and the host country national (HCN) or locals.

For example, a multinational company based in the United States may send a U.S. citizen (PCN) to Vietnam to establish operations there. Normally, if the PCN temporarily resides in the new country, the PCN will also be referred to as an expatriate. Once the multinational corporation establishes operations in the new country, the corporation must decide how the corporation will be managed and led. The multinational company can then use the PCN (the U.S. citizen) to run operations, the locals (HCN) to run operations, or someone who is neither a U.S. citizen (PCN) or Vietnamese citizen (HCN) to run the operations (hence the term *third country national*).

Usually, a TCN brings language skills that the PCN does not have. Additionally, TCNs can have a more adept understanding of the local culture than a PCN would have. TCNs can have a greater interest in the success of the operation, since they would have to seek other employment, while the PCN would simply return into the multinational corporation's fold should operations in the country fail. A TCN's value as a manager is highest when they come from a culture similar to the PCN, understand the language of the PCN, and understand the language and culture of the host nation as well. For instance, using a seasoned British or Irish TCN in Russia to manage local operations may be more advantageous for an U.S. multinational company seeking to expand operations in Russia over using a U.S. citizen (PCN) who must be trained in both language and customs. TCNs normally stay with the foreign national operations longer than a PCN, who may see this as a temporary assignment on his/her way up the corporate ladder. However, TCNs should not be seen as a cheaper alternative in providing management for foreign operations. If the multinational firm needs close coordination of efforts between the foreign operation and its headquarters, a PCN would serve the corporation better.

TCN Challenges

Particularly difficult issues in using TCNs in a multinational environment are compensation, promotion, and retirement. PCNs normally receive salary and benefits from the multinational corporation that allow them to live as well as or better than they would in the parent country. TCNs are normally equipped with similar skill sets and better language skills than a PCN (or an expatriate). However, multinational companies will often pay TCNs on the same scale as the host country nationals, or similar to the PCNs but without benefits, such as free housing, cost of living allowances, and medical and dental care.

Additionally, multinationals have to consider where the TCN will retire, in order to adequately help the TCN in his or her retirement. For a TCN living in a third world country (for example, Vietnam), the TCN will probably return to his or her home country for retirement. Therefore, the multinational may pay into the TCN's home country's retirement system, or may simply consider the TCN's salary as full payment for all services including retirement benefits.

As an example, the author of this entry worked in a U.S. embassy in the Middle East as an administrative officer. Only one HCN actually worked at the embassy. Other workers including people from east Africa (Somalia, Eritrea, Ethiopia), the Levant (Syria), Pakistan, and India, working in skilled (accounts, analysts, and translators), and unskilled (driver, laborer) positions. The embassy provided annual allowances for TCNs to return to their home country, and paid monies into a retirement fund for the TCN after they finished his or her service at the embassy. Establishing the retirement fund this way allowed the TCN to use the fund for retirement at a place of their choosing.

When hiring a TCN, the multinational corporation must specify all promotion opportunities to the TCN. Some TCNs may seek to find additional foreign postings with the multinational company, while the multinational company may see the TCN as little more than an HCN with additional skill sets. Clearly, discussing promotion opportunities upon hiring the TCN will provide a basis for future opportunities with the multinational corporation. Of particular concern in using TCNs in foreign operations is the TCN's ability to remain in the country and issues of morale. In many countries, the TCN must have a sponsor to remain in the country. The company may or may not be able to perform this sponsorship function. For both first and third world countries, the TCN may lose residency status if the country has sufficient HCNs with the same skills as the TCN. Recent research has shown that TCNs can suffer more issues with morale than either a PCN or an HCN. Morale problems will normally arise from lack of promotion opportunities and/or adequate compensation.

ThyssenKrupp

ThyssenKrupp AG, a German industrial conglomerate, was created by the merger of Thyssen AG and Friedrich Krupp AG Hoesch-Krupp in 1999. Today, the steel and engineering company remains a dominant steelmaker, with its service and engineering business recently earning almost a third of the company's sales. Employing a business concept mainly focused on technological innovation and expertise and diversification, ThyssenKrupp AG continues to follow its historical roots, making it Germany's 10th largest company (2006) and one of the key players in the European and world steel market.

More Than a Steelmaker

ThyssenKrupp ranks among the top 30 listed companies in Europe, and remains one of the top 12 (2006) largest steel-producing companies in the world (by steel volume), in the top five (2006) by sales, and number one in Germany. The expected sales figure for fiscal year 2008 is €53 billion. By splitting into five business segments, ThyssenKrupp gained for itself a much more precise market position in the world's highly competitive industrial markets. The company's major activities include its steel and stainless steel business (production of flat steel products and stainless steel flat-rolled products), and capital goods (divided into two units: elevators and technologies), and services (materials and industrial services).

The steel giant, with its 193,000 employees (2007) is increasingly expanding overseas. Already, more than two-thirds of its over 2,400 production sites, offices, and service centers are functioning outside Germany. Although approximately 70 percent of company sales (2007) are generated in Europe (inclusive of 36 percent in Germany), Thyssen's focus is firmly on North America, another key region and part of its long-term strategy of increasing market activities outside Europe.

Milestones in the Company's History

The origins of the company can be dated back to 1871, when August Thyssen first built up his steel and engineering business. In the early years, Thyssen focused on increasing his iron and steel production, and on the expansion of both the raw material base and his manufacturing operations in Germany and overseas. Thyssen's aim was to diversify and to integrate acquired companies, products, and businesses into one group, the Vereinigte Stahlwerke AG (1926).

In 1914, the internationalization of the group was disrupted by the outbreak of World War I. After the first abrupt downturn, production soon increased again in support of Germany's war effort. While the war resulted in the loss of foreign business opportunities, Thyssen remained nearly completely intact in Germany. Following a restructuring process and being renamed Thyssen-Hütte, the company played a significant role as a supplier of preliminary steel products for the World War II economy.

After the war, the company went into liquidation: Thyssen-Hütte was dismantled as part of Germany's war reparations. With the halt of the destruction of Thyssen-Hütte in 1949 and the split of Vereinigte Stahlwerke AG into separate companies, August Thyssen-Hütte AG returned to its original form and business. Once again, the focus of August Thyssen-Hütte AG's business strategy was on diversification through horizontal and vertical acquisitions, and restructuring. The company has become Europe's biggest steel producer and service provider, with technological expertise resulting in a diversified conglomerate.

Friedrich Krupp AG Hoesch-Krupp, another German steel giant, emerged in 1992, following a hostile takeover of Hoesch AG by Friedrich Krupp AG, marking the first hostile takeover in German business history. In 1997, the newly formed Friedrich Krupp AG Hoesch-Krupp attempted to take over the much larger Thyssen AG. However, massive resistance from Thyssen's employees culminated in both companies entering negotiations vis-à-vis a merger. April 1, 1997, saw the consolidation of the steel business of both companies, followed shortly afterward by the announcement of an intention to fully merge their entire companies. In March 1999, ThyssenKrupp AG came into existence.

The origins of Friedrich Krupp AG Hoesch-Krupp can be traced back to 1811, when Friedrich Krupp GmbH was established. Initially, the company produced high-quality cast steel and later focused on more finished products, such as high-precision rolls and forged and rolled seamless railway tires. Recognizing the importance of innovation, Krupp worked on the improvement of steelmaking processes simultaneously with the expansion of the company into a horizontally and vertically integrated concern. As in the case of Thyssen AG, Krupp's involvement in the war economy has been critically evaluated.

Time Orientation

Time orientation is principally the tendency to emphasize or prefer a certain time horizon in one's domain of attitudes, actions, and perspectives, that is, a dominance of the past, present, or future. Time orientations can influence individuals' behaviors and intertemporal decisions in diverse situations as a result of individuals' unique "time personalities," which ultimately guide perceptions, choices, and allocations of activities over time. Understanding the time orientation concept can therefore be beneficial in helping to classify people on a number of aspects related to perception and behavior; examples include motivation, risk taking, planning, and consumption of different products.

In general, individuals' backgrounds are rooted in societies dominated by one of the three time orientations, where each is portrayed by varying characteristics. For example, past-oriented cultures, such as Tibet, tend to believe that all the great decisions were made in the past, and present society is a deteriorated adaptation of a past golden age. They have a poor view of innovation, and prefer to conserve what already exists. Present-oriented individuals, such as the Navajo Indians of northern Arizona, consider only what is at hand, without valuing how their behavior relates back to tradition, or how it will affect their future state. They are likely to be impulsive and seek immediate gratification, as greater but future rewards are worthless for them. Future-oriented cultures, such as Western societies, believe in setting goals and planning how to reach them, and value innovation highly.

The Concept of Time Orientation

The concept of time orientation is multidisciplinary, given that it is intrinsic to human behavior. It has its roots in sociology, anthropology, educational studies, and experimental psychology and influences consumer behavior and global business management. It has been extensively associated with cultural phenomena, where it is pertinent to individual differences across cultures. Along these lines, cultural anthropology is a major contributor to the study of time orientation.

Anthropologists regard time orientations as cultural artifacts, because for them, it is not viable to assume that human beings are born with any type of innate "temporal sense"; in this viewpoint, people's concept of time is always culture-based. Experimental psychology approaches a study of time orientation through psychometric scales used for measuring individual adaptation to cultural time patterns. Time orientation is also one of the cultural value dimensions proposed by Geert Hofstede and Michael Bond, where it was first referred to as Confucian dynamism and then renamed time orientation. In addition, Edward T. Hall highlights temporality as one of the main elements of the communication process in a cultural system.

It is, however, recurrent to find the terms *time/temporal orientation*, *time attitude*, and *time perspective* often used interchangeably. Yet, each has slightly different meanings. Time or temporal orientation is the preferential direction in an individual's thought in being primarily oriented to actions and objects in the past, present, or future. Time perspective is exemplified by its degree of structure, extension, concentration, and level of practicality. Time attitude describes an individual's relatively positive or negative view of the past, present, and future.

Time Perceptions

Yet another important aspect of time orientation is the construction of time in the form of time perceptions. In consumer research, time orientation reflects how different people exhibit varying perceptions of time in various contexts, for example, for different purchases. Generally, research suggests there are three time perceptions: linear-separable, circular-traditional, and procedural-traditional. Based on cultural background and a number of factors including education, the socialization process, time attitude, and social class, people in societies living within each time perception have different characteristics, expectations, and attitudes. The linear-separable time perception characterizes Western cultures, such as the Anglo-Americans, whereas the other two time perceptions characterize Eastern cultures and Oriental societies.

With the linear-separable time perception, time is perceived as stretching along a straight line starting from the past through the present and progressing into the future; time is separated into discrete slices allocated to specific activities, and it has a heavy future orientation attached to it, where the past is gone and cannot be recovered. In societies endorsing a circular-traditional time perception, such as Native Americans, time operates in a circular system, where events repeat according to some cyclical pattern. In contrast, the procedural-traditional time perception, characterizing individuals in Latin America, is driven by rituals and procedures, where actions are undertaken when the "time is right." People who share traditional time perceptions rely heavily on the present, given that for them there is no new future, but only a recurrence of the past. Even within the same society, however, individuals are often not limited to one time perception, but rather may keep switching among them, depending on the performed task in terms of time and situation. Time orientation is thus one of the characterizations of different time perceptions.

Influences

Research also proposes that the role of parents in children's education may impinge on their ensuing time orientation along with their personal past, in addition to the influence of age, gender, education level, and social class. For example, some research holds that lower-class, less-educated, and older individuals are likely to be more past- and present-oriented than others with opposing characteristics. Furthermore, research suggests that future orientation is more often than not associated with Western societies, and connected with factors such as higher socioeconomic status and advanced academic achievement.

In sum, an individual's particular time orientation can exercise a dynamic influence on important judgments, decisions, and actions. In multinational business dealings, businesspeople must avoid the common mistake of assuming a single universal perception of time, most commonly the linear-separable—that which is associated with a future orientation—and hence jeopardize important business relationships with people from other cultures and backgrounds.

Time Warner

Time Warner is the world's second-largest media and entertainment conglomerate, whose business includes interactive services, cable systems, filmed entertainment, television networks, and publishing. The company is headquartered in New York City, and among its major subsidiaries are America Online (AOL), Time Inc., Time Warner Cable, Home Box Office (HBO), Turner Broadcasting System (TBS), Cable News Network (CNN), and Warner Bros. Entertainment. The company positions itself as a leader in media and entertainment, thanks to continuous innovations in technology, products, and services, as well as creativity, talent, and commitment by the company's employees.

Company Beginnings

The business was founded in 1972 under the name Warner Communications as a spin-off from Kinney National Company. Warner had been able to make significant profits in the early years of its existence, especially from the acquisition of Atari, which at its peak accounted for a third of Warner's annual profits. Although the purchase price Warner paid for Atari was rather high at the time (estimated at $28–$32 million), the investment paid off because of the incredibly fast growth of Atari's computer and game console sales in the United States. Also in the 1970s, Warner founded a joint venture with American Express—Warner-Amex Satellite Entertainment—which together owned popular cable channels, including MTV and Nickelodeon.

A situation of relative stability was changed somewhat toward the mid-1980s. First, there was an unsuccessful expansion into the world of professional sports—the company lost a significant amount of money acquiring and then selling a professional baseball team. Later, Warner was forced to sell Atari to a business rival. After that, Warner had to buy American Express out of their joint venture and sell the entire unit to its biggest competitor, Viacom. Finally, experiencing certain difficulties in coping with market pressures, Warner decided to merge with Time Inc., which actually turned out to be a sound business decision.

In the 1990s, the company continued to restructure and acquire various related businesses to ensure maximum synergy. Among its largest purchases was the acquisition of TBS from Ted Turner. During the same decade, the company combined all of its businesses under one name, Time Warner.

Mergers and Acquisitions

The new millennium brought about various changes to Time Warner, the biggest of which was undoubtedly the 2000 acquisition of the company by the much smaller America Online for $164 billion. The deal rather quickly passed the scrutiny of both U.S. and European regulators, effectively creating the largest media and entertainment company in the world, AOL Time Warner. The merger, however, has not resulted in any major improvements in either the company's balance sheet or income statement. Instead, by 2002, the profitability and the market value of the company's internet service provider division (AOL) tumbled drastically, which forced a significant write-off, which in turn forced AOL Time Warner to post the largest loss ever recorded in the world of business, an estimated $99 billion. The same year, the company dropped AOL from its official name, and the next year, the chairman of a unified company stepped down, causing considerable changes in Time Warner's leadership. At the end of 2007, the new chairman of the company, Jeff Bewkes, announced possible plans for the near future, which included, among other things, a sell-off of Time Inc.

The Future of Time Warner

Despite past financial troubles, Time Warner remains a profitable organization. Its 2007 gross revenues were in excess of $46 billion with a net income of nearly $4.5 billion. The company also owns a significant amount of assets worldwide, including major real estate properties in New York City—several buildings in Rockefeller Center, as well as some adjacent buildings, which house its headquarters and new CNN studios.

As with many of its direct competitors—Viacom, News Corporation, Walt Disney Company, and so forth—Time Warner has to deal with the recent trends brought about by rapid changes in the external business environment. For instance, the company needs to keep pace with the advancements in information technology, combat piracy that reduces its revenues around the world, and deal with the declining growth of the DVD market. Time Warner, in its own words, is ready to handle these challenges, mainly thanks to its unrivaled reputation for creativity and excellence, as well as its hunch for opportunities for constructive collaboration with various players in the worldwide market of media and entertainment.

Tokyo Electric Power

The Tokyo Electric Power Company (TEPCO) was established in 1951 with JPY 1.460 million in capital. With total assets of JPY 13.594 billion as of March 2006, TEPCO ranked first in Japan, and fourth among electricity companies worldwide. Japan is the third-largest energy consumer in the world.

Originally founded in 1886 as Tokyo Electric Lighting, the company began life as Japan's first electricity company, serving the general public since 1887. By 1920, more than 700 electricity firms were merged into five nationwide electricity suppliers. During World War II, the government took complete control of the industry via Nihon Hassoden K.K., distributing electricity through nine regional companies, namely Hokkaido, Tohoku, Tokyo, Chubu, Hokuriku, Kansai, Chugoku, Shikoku, and Kyushu. The Tokyo regional distributor formed the basis for TEPCO after the war. It serves the Kanto area (i.e., Tokyo, Kanagawa, Chiba, Saitama, Tochigi, Gunma, Ibaraki, Yamanashi, and parts of Shizuoka) of about 43.9 million people, or 34.4 percent of Japan's total electricity population.

The Niigata earthquake in July 2007 affected the operation of the Kashiwazaki-Kariwa nuclear power station, which is the world's largest nuclear power plant in terms of output capacity. The plant was forced to suspend operations, causing TEPCO's earnings to fall into the red for the first time in 28 years. TEPCO's president, Masataka Shimizu, is working to boost alternative sources of energy output and may, as a last resort, raise electricity charges for the first time since 1980.

Products and Services

TEPCO has an integrated power generation, transmission, and distribution system. Via its electricity utilization technology, it provides products such as heat-pump water heaters and air conditioners.

From its power quality-related technologies, it offers computer-related power system engineering services. It also offers products of various sensors and monitoring systems, visual machineries, software, as well as machinery products that support recycling and environmental technologies.

TEPCO takes the position that Japan should have a diversity of power generation sources to avoid excessive reliance on any one type of fuel. The main sources of TEPCO's energy supply are nuclear power, thermal power generation based on liquid natural gas (LNG), petroleum and coal, and hydroelectric power. Alternative or new energy sources to reduce carbon dioxide emissions include solar, wind, geothermal, fuel cell, biomass, and waste power generation. TEPCO pioneered the use of wind power in Japan with its 500 kW wind power plant on the island of Hachijojima. TEPCO established the Green Power Fund in 2000 with contributions from the company and its customers to support the use of natural energy by corporations and customers. In addition, TEPCO is active in research on new energy sources and promotes the spread of new energy through purchases of excessive power produced by facilities installed by its customers.

Corporate Structure and Global Presence

TEPCO supplies electricity through six affiliated companies. The company is diversified, offering information communication services through 14 affiliated companies in the areas of telecommunications, cable television broadcasting, information technology (IT) software and services, and construction and maintenance of information communication equipment. An additional 53 affiliates supply energy and environmental services, energy facility construction and maintenance, transportation of fuel, and materials and equipment. Twenty-six affiliated companies offer living environment and lifestyle-related services and real estate, and 14 affiliates are engaged in overseas business.

TEPCO has extensive electricity services overseas via investment projects in Indonesia, the Philippines, Taiwan, Australia, Timor-Leste, Vietnam, California, and London. TEPCO aims at international networking with the State Grid Corporation of China, the Korea Electric Power Corporation, Tenaga Nasional Berhad of Malaysia, Electricité de France, Réseau de Transport d'Electricité (RTE) of France, and PJM Interconnection (United States) via exchanges of top management and experts. The projects aim to improve technical exchanges and raise the standard of reliable and efficient power grid management.

Too Big to Fail

The term *too big to fail* refers to a corporation, an organization, or an industry sector that is considered by the United States government to be too important to the overall health of the economy to be allowed to fail. Beginning in the 1980s, the term was applied to the banking industry during the Continental Illinois Bank and Trust Company crisis. When Continental Illinois approached insolvency because of bad speculative investments, the Federal Reserve guaranteed Continental's liquidity needs. Eventually, the federal government spent $4.5 million to bail out Continental. When quizzed by the Senate Banking Committee why the Federal Reserve and the Federal Deposit Insurance Corporation did what they did, the regulators responded that they were concerned about the size of the bank (the seventh largest nationally), the number of smaller banks with significant portions of their capital invested in Continental Illinois, the specter of depositor panic and bank distress, and the potential disruption of national payment and settlement systems.

More recently, the government engaged in its biggest financial bailout in history. Bad mortgage investments essentially froze the credit market by September 2008. The first move by the government was to force Bear Stearns to be taken over by Morgan Stanley. Not wanting to engage in renewing the precedent of government bailouts, the government let Lehman Brothers enter bankruptcy. The demise of Lehman Brothers shook the investment markets, and the domestic and global stock markets plunged. The government then reversed itself and invested an initial $50 billion in AIG, eventually raising that investment to over $100 billion. Finally, the U.S. government approved over $700 billion to rescue the financial markets, taking equity positions in a number of banks in doing so. The rationale for the expenditure of nearly $850 billion was that the banking system was "too big to fail."

Ironically, while our largest banks may be deemed too big to fail, the smaller so-called community banks may be too small to fail. The FDIC reports the failure rate among banks with assets of $1 billion or more is seven times greater than among banks with less than $1 billion in assets. These community banks are outperforming large banks on most key measures, such as return on assets, charge-offs for bad loans, and net profit margin.

This is remarkable when one considers that just three institutions—Citigroup, Bank of America, and JPMorgan—hold more than 30 percent of the nation's deposits and 40 percent of bank loans to corporations. Unfortunately, while there were 14,000 such community banks in 1985, today there are less than 8,000. In addition, a number of large banks who received the government bailout have announced that they may be using the money to acquire these more successful community banks.

Other Industries

The intervention by the government to rescue the financial community has raised the question of whether other industries are "too big to fail." For example, until recently, the three companies that controlled the U.S. auto industry, despite competition from foreign automakers, still controlled significant global market share. In addition, the U.S. auto industry invested in manufacturing technologies that lowered the cost of production domestically, and steadily outsourced production to control labor costs. Relatively cheap fuel prices in the United States also helped the auto industry.

In recent years, however, the auto industry has run into an almost "perfect storm" of problems. First, foreign automakers made increasing inroads in market share, particularly in the smaller-car market. Second, the auto industry had to deal with increasing "legacy" costs—as more union workers retired, more industry resources were diverted to pension and medical costs. Third, a weakening economy and rising fuel prices changed consumer preferences from large sport utility vehicles to smaller cars. Finally, a severely tightened credit market helped crater vehicle sales. By the end of 2008, two of the three car makers—GM and Chrysler—were facing bankruptcy. Citing the notion that the auto industry was "too big to fail," the government approved some $18 billion in loan guarantees.

How many more industries will be deemed "too big to fail" is hard to determine as of this writing. What is clear is that this heretofore rather obscure term has taken on new meaning in the global economy.

Toshiba

Toshiba Corporation is a Japanese multinational enterprise and the seventh-largest manufacturer of electrical and electronic products in the world. Founded in 1875, Toshiba today consists of 10 in-house companies covering a wide range of products, including bullet trains and power stations as well as electronic consumer goods such as rice cookers, washing machines, and television sets. The company can draw on innovative ideas from more than 30 separate research and development (R&D) laboratories and 352 subsidiaries and affiliates globally. Unusual among large Japanese corporations, Toshiba has faced up to the challenge of globalization and has restructured and streamlined its organization, as well as having developed a shareholder value-oriented business philosophy.

Toshiba was founded in 1939 by the merger of Shibaura Seisaku-sho, which was a producer of electronic goods and which was founded in 1875, and Tokyo Denki, which was a consumer goods producer. Both companies were leaders in their respective fields. The new company was called Tokyo Shibaura Denki (Tokyo Shibaura Electric Co., Ltd.) and the name was not officially changed to Toshiba until 1978.

Since World War II, Toshiba has been part of the Mitsui *keiretsu*, which represents the typical Japanese conglomerate of affiliated companies. The company grew quickly during the postwar period. This growth was fueled by success in the domestic market as well as through the acquisition of heavy industries firms in Japan. The company's business fields are broad. Toshiba has developed in various directions, such as into the semiconductor industry, medical systems, power systems, and later into mobile communications and the digital media industry. The brand name Toshiba, however, is most strongly related to the company's electrical consumer products. The company's breakthrough as a manufacturer of consumer goods came in 1955, when it launched the first electronic rice cooker on the Japanese market. Within seven years, half of Japanese households owned one of them, a success which laid the foundation of Toshiba's ongoing role as an innovator and leader in consumer products.

Like many other Japanese multinational corporations, Toshiba's postwar success was guided and supported by the Japanese government, typical Japanese management practices, and a highly motivated workforce. In contrast to other Japanese manufacturers, Toshiba seemed reluctant to develop overseas

Toshiba has grown to be the seventh-largest manufacturer of electrical and electronic products in the world. Toshiba's corporate headquarters (building in center) are located in Hamamatsucho, Tokyo.

production. For many years, the company not only highly concentrated on the Japanese market but also strongly promoted a Japanese relationship-oriented management style inside the corporation.

This focus, however, did not prove to be very successful for the company, and in the 1990s Toshiba was not only confronted with the Japanese recession but also with increasing global competition. The strong appreciation of the Japanese yen put the company, with its many domestic manufacturing sites, under further stress.

In 1996, Taizo Nishimuro became president of Toshiba. He was an unusual choice. Nishimuro was not only the first president who did not have an engineering background, but he had also spent 10 years abroad and spoke fluent English. His appointment symbolized a new era and an increasing readiness to meet the new challenges the company faced. Nishimuro introduced numerous reforms, such as liquidating Toshiba's unprofitable businesses and cutting the main business groups from 15 to eight. He also introduced profit-oriented evaluation systems and set ambitious goals for the company's return-on-equity and shareholder value.

In the 21st century, Toshiba continues to restructure itself. Atsutoshi Nishida, who became president in 2005, introduced an even stricter concentration and selection policy focusing on businesses and industries that can sustain a long-term competitive advantage. The company concentrates on core competencies and on business in emerging markets. Toshiba has become an outstanding example for Japanese multinational corporations that are in the process of reorganizing in how to stay competitive in the global market. Thus, in contrast to other Japanese multinational corporations, Toshiba has followed a unique path over the past 15 years. It may be considered a role model for the development of Japanese corporations, many of which still need to overcome similar problems to the ones Toshiba faced in the early 1990s.

Total

The Total Oil Company, with its headquarters in France, is one of the six "supermajor" oil companies in the world, with its core business being oil and gas—including both exploration and production—and trading, shipping, refining, and marketing of gasoline, liquid petroleum gas (LPG), aviation fuels, lubricants, chemicals, petrochemicals, fertilizers, and other products. It has also diversified and is involved in coal mining and power generation. Some products are sold through retail outlets such as gasoline stations and through other companies.

As an entity, it was founded in 1924—six years after the end of World War I—to ensure that France did not have to rely on companies from other countries. It was formed at the behest of the then French prime minister, Raymond Poincaré. After World War I, Poincaré did not want France to have to be reliant on Royal Dutch Shell, as the Netherlands were neutral in the war. In some ways, the initial structure was modeled on British Petroleum (BP). As a result, the Compagnie Française des Pétroles (French Petrol Company; CFP) was established on March 28, 1924, with Ernest Mercier as its founder. Born in Algeria to a Protestant Republican family, he was a graduate of the prestigious École Polytechnique and had worked in the electricity sector. With government help, he managed to obtain the support of about 90 banks. It was not until 1929 that the company was listed on the Paris Bourse (stock exchange). During the 1930s, Mercier became heavily involved in politics.

Establishing the Company

The first major move made by CFP was to establish its source of oil. This came from the 23.75 percent share of the Turkish Petroleum Company, which had been held by Deutsche Bank and was awarded to France as World War I compensation after the San Remo Conference of April 1920. The French government assisted with building refineries for the oil from Iraq, but CFP never had the range of production that the Anglo-American companies did, leading to business rivalries and resentment. The Turkish Petroleum Company was renamed the Iraq Petroleum Company, and it discovered large oil fields in 1927, continuing production until the end of operations there in 1961.

The major flare-up between CFP and the Anglo-American oil companies was in 1946. The French held out for a larger share of the Saudi Arabian oil fields, recognizing that these were much more important than those in Iraq. CFP, however, did not get access to Saudi Arabia and started to turn its focus on Iran. In a deal negotiated with the Iranian prime minister, Mohammed Mossadeq, CFP agreed to take a 6 percent share in the new Iranian Consortium being established in Iran, and was soon also holding a third of the shares in Abu Dhabi Marine, as well as their share in Iraq, unchanged since World War I. Regular problems occurred, with CFP anxious to increase its permitted production level and angry at the restrictions placed on the company.

In 1956, CFP discovered a large oil field in Algeria and started working heavily with the Algerian government (northern Algeria was then a part of France, and the Sahara desert, where the oil was found, was a French colony). This discovery encouraged French governments to want to retain Algeria, in spite of their starting to lose the Algerian war for independence. During peace negotiations, the French had hoped to retain control of the oil fields, but the Algerian nationalist leader Ahmed Ben Bella recognized the wealth from oil and insisted on their becoming Algerian, and after independence, the Algerian government nationalized the oil fields in their country, and they were put under the control of the state oil and gas company, Sonatrach.

Global Expansion

During the 1960s, CFP, using the brand name Total, was spreading through Africa, establishing petrol stations in much of French Africa. In 1966, the French company Entreprise de Recherches et d'Activités Pétrolières (ERAP) was formed through the merger of two state-owned entities, and it started establishing gasoline stations under the name ELF, later Elf Aquitaine. CFP continued to grow, and in 1985 it was renamed Total CFP, and six years later, it became known simply as Total.

In 1999, following the takeover of Petrofina, it was renamed Total Fina, and in 2000, it merged with Elf Aquitaine to become TotalFinaElf. However, in 2003, the company reverted to its former name, and is again called Total. Altogether, it employs 96,400 people directly, and another 15,000 indirectly, in some 130 companies. This makes it, together with its subsidiary companies and affiliates, the fourth-largest publicly traded and integrated international oil and gas company in the world. It is now the second-largest petroleum company in France, with most of its oil sourced in, and most of its refining still taking place using oil from the Middle East.

Toyota Motor Corporation

Toyota Motor Corporation is one of the largest Asian multinational enterprises, in terms of sales, assets, and profitability. Its corporate headquarters is in Japan. It is the core corporation of the Toyota Group and a partner of the Mitsui Group. Toyota Motor Corporation's origins can be traced back in 1933, when Kiichiro Toyoda established an automobile department within Toyota Automatic Loom Works. The establishment of Toyota Motor Company as a distinct corporate entity took place on August 28, 1937.

During the first years of the post–World War II era, Japan's production capacity had largely diminished and the economy had slowed down to a large extent. Side effects of this were also manifested in Toyota's production capacity, which faced severe financial and operating problems. However, the Bank of Japan, which was virtually a consortium of several banks dominated by Mitsui Bank, provided necessary capital, which helped the firm rejuvenate its activities. The bank's decision for funding investments included the agreement that the sales department should form a distinct enterprise, production volumes should be rationalized to a lower level, and excessive labor force would be let go. This reengineering of activities reinforced the bonds of Toyota with leading banks in the country, which then became Toyota's largest shareholders. The original Toyoda family now possesses a small percentage of shares and has a small representation in the governing bodies of the firm, such as the board of directors.

Exporting Toyota Automobiles

The year 1957 was a milestone in the history of the firm because it commenced its exporting activity. Toyota Motor Sales USA Inc. was established, and the first export of the Japanese passenger car (the Crown) to the United States became a reality. International activity continued to flourish, and in the following years, the firm gradually established itself in other countries, such as Brazil (1958) and Thailand (1962). As a result of this internationalizing process, cumulative exports reached 1 million units in 1969. In the mid-1980s, Toyota possessed production facilities in a number of countries, such as Peru, Portugal, Indonesia, Australia, New Zealand, and Thailand. Moreover, in 1992, it established a production plant in the United Kingdom, to accelerate penetration in the important European passenger car market.

Currently, Toyota Motor Corporation is operating with more than 500 subsidiaries around the world. In the fiscal year between April 2007 and March 2008, the business performance figures, including consolidated subsidiaries, showcased the dominance of the firm as one of the world's largest corporations. The number of employees exceeded 316,000 and net revenues were JPY 26.289 billion, with a net income of JPY 1.717 billion.

An explanation for the generation of these impressive figures can be attributed to a main feature of Toyota's business activity: the establishment of strategic alliances with key players in a number of related fields. Such alliances help the firm to be at the edge of technological advances and create commensurate value for its customers. For example, in 1998, it formed an alliance with firms such as Fujitsu and Matsuhita to develop a database for an in-vehicle navigation system.

In 1996, it formed a strategic alliance with Panasonic to develop a system of rechargeable batteries that would be later used in its hybrid Prius model. Moreover, its pioneering position in the development and implementation of the Just-in-Time supplying scheme allows the firm to minimize costs stemming from procurement and obsolete materials. Another factor of success is its knowledge base, which has been achieved through continuous investments in research and development (R&D).

On the other hand, the firm faces severe competition from German automobile makers (especially in the premium segments of the market with its Lexus brand) and it has not managed to achieve similar results (as in Japan or the United States) in the major but highly competitive market of Europe. Moreover, the firm seems to have a "we can do it on our own" philosophy, which rejects extended acquisitions or mergers with other automobile groups. This avoidance goes against the flow of megamergers that have recently taken place in the automobile sector. The future will show to what extent this will be proven a strength or a weakness for the firm in the challenging landscape of automobile manufacturing.

Trade Balance

The balance on the goods trade in a nation's current account is known as the balance of trade, or trade balance. The current account includes all international economic transactions with income or payment within the year; the goods trade records all transactions involving merchandise or goods. The exports of goods by a country are merchandise credits; its import of foreign goods are merchandise debits. When exports (or credits) exceed imports (or debits), the goods trade shows a surplus. When imports exceed exports, the account shows a deficit.

The export and import of goods is known as merchandise trade. It is the oldest and most traditional form of international economic activity. Although many countries depend on imports of many goods (as they should, according to the theory of comparative advantage), they also normally work to preserve either a balance of goods trade or a surplus. Because the current account is typically dominated by the export and import of merchandise, the balance of trade, or trade balance, which is so widely quoted in the business press in most countries, refers specifically to the balance of exports and imports of goods trade only. For a larger industrialized country, the trade balance is somewhat misleading because service trade is not included. It may be opposite in sign on net (in surplus, for example, when goods are in deficit) and it may actually be fairly large as well. For example, the U.S. goods trade balance has consistently been negative, but has been partially offset by the continuing surplus in the services trade.

What does it mean if a country's trade balance runs a persistent deficit? It means that country is borrowing from the rest of the world so that it can spend in excess of its own consumption. Underdeveloped countries limited to a single export experience trade deficits, but developed countries that have lost their manufacturing base experience them as well.

Merchandise trade, the original core of international trade, has three components: manufactured goods, agriculture, and fuels. The manufacturing of goods was the basis of the Industrial Revolution. The decline in manufacturing by industrialized countries has caused massive economic and social disruptions. Weaker domestic currency, rapid economic growth in Asia and Latin America, and a substantial increase in agricultural exports raise the overall export of goods.

Merchandise Import and Export

Understanding merchandise import and export performance is much like understanding the market for any single product. The demand factors that drive both imports and exports are income, the economic growth rate of the buyer, and price (the price of the product in the eyes of the consumer after passing through an exchange rate). As income rises, so does the demand for imports. Exports follow the same principle but in reverse. When buyer economies are growing, demand for supplier economies' products will also rise.

While managers understand that expanding into international markets can have a positive impact on their firms' bottom line, and use foreign direct investment (FDI) to participate in the emerging global marketplace, they may not understand the impact of their FDI on the trade balance of the host country. Edward Graham and Paul Krugman have shown that affiliates of foreign firms in the United States show an apparent tendency to export somewhat less and to import significantly more—2.25 times as much as U.S. firms.

Raw material–seeking investment and low-cost production–seeking investment are two common types of factor-seeking FDI that have an impact on host and home country trade balance. Raw material–seeking investment increases exports from the host nation to the home country and other countries; low-cost production–seeking investment takes advantage of low-cost factors as part of a global sourcing strategy, leading to an ability to export products from emerging nations. Here, the host country is able to increase exports and improve its trade balance; the home country, on the other hand, raises the level of its service imports.

Negative and Positive Trade Balances

What does a negative trade balance mean for the foreign investor and its relationship with the host government? What does a negative trade balance mean for the host government and public policy? Lance Brouthers et al. found that higher levels of FDI inflows appear to confer positive trade balances to developing countries, at least in the short run, because investing firms tend to use FDI to gain factor-seeking advantages that can be exploited in export markets, leading to exports, and hence trade surpluses. However, for advanced nations, higher levels of FDI inflows appear, at least in the short term, to help generate trade deficits, because FDI here tends to be market seeking.

J. Orr and others have argued that FDI can contribute to positive trade balances in the long term if foreign-owned firms use only local suppliers of parts and components in producing their goods; replace imports with these goods; and/or export their products. In the absence of all three conditions being met, Orr suggests that trade deficits are the likely result. As K. Kojima suggested, by using FDI, the global firm can ignore or oppose the pattern of comparative advantages inherent in international trade and by doing so undermine what the economists call global welfare. Further theoretical development in this area may be of great value to countries in helping them determine their FDI policies, as well as to firms contemplating the use of FDI as part of a "socially responsible and economically rational" global business strategy.

Trade Balance and Economic Health

Government policies that directly target the trade deficit can easily develop into protectionism. "Export or die," a popular campaign poster in post–World War II Britain, became a sentiment embraced seriously by the Japanese. Island nations, both Britain and Japan perceived their ability to sell abroad as vital to maintaining their standard of living. While the British believed in free trade and the Japanese were strongly protectionist, each country considered exports vital, as did the Koreans and Taiwanese, taking Japan as a model. Continental European nations, in direct proximity to each other, often saw exports as a natural extension of domestic economic activity. Although China's history includes a long, disastrous period of isolation, the Chinese have learned from their mistakes and their neighbors' successes and have turned exporting into a national obsession.

The effect of the trade balance on national economic health depends on three factors: (1) the price of one country's products relative to the world price; (2) the value of exchange of the national currency relative to other foreign currencies; and (3) the relative incomes of the national and other foreign economies. The first two factors can be called the price effect or competitiveness; they, along with the relative income level, determine the trade balance of the nation. If the nation's (export) price level rises faster than that of foreign nations, the trade balance will deteriorate and competitiveness will worsen.

If the nation's (export) price level declines faster than that of foreign nations, the trade balance will improve as will competitiveness. The exchange rate reinforces the price effect: if the nation's currency revalues (upward), the trade balance will decline. If the nation's currency devalues, the trade balance will improve. If the income of our focus nation goes up, absorption does the same and the trade balance worsens. However, if the world expands more rapidly than the focus economy, the trade balance will improve and the foreign income level will relate positively to the trade balance.

While many economists predict dire consequences for a persistent trade imbalance, a contrarian viewpoint has emerged. According to Miranda Zafa who surveyed these viewpoints, some economists, including Ben Bernanke, chairman of the U.S. Federal Reserve, explain the increase in Asian savings as a consequence of the export-led growth strategy pursued by Asian governments. The result is persistent current account surpluses and reserve accumulation by Asian central banks, thus generating a global savings glut and keeping interest rates low. This strategy has permitted emerging markets that are net lenders to grow rapidly by ensuring efficient intermediation of their savings. Another contrarian view that Zafa calls the "portfolio balance view" attributes global imbalances to portfolio optimization. In effect, the United States, Asia, and much of the Middle East are part of the dollar zone, and therefore, the imbalances between them are as irrelevant as those between Germany and Greece or Spain.

Trade Barriers

Trade barriers can be described as government laws, regulations, policies, or practices that either protect domestic products from foreign competition or artificially stimulate exports of particular domestic products. The intention of these instruments is to raise the price of the traded products by imposing a kind of cost in trade. For Paul Krugman and Maurice Obstfeld, the most common foreign trade barriers are government-imposed measures and policies that restrict, control, and limit the international trade between countries by using restrictive instruments. These instruments can be in the form of tariffs, import quotas, export restraints, import licenses, subsidies, and nontariff barriers to trade.

In particular, if the government policy is to protect domestic infant industries from outside competition, then a protective tariff is considered as a tax levied when a good is imported. This tariff can be used as a tool for a trade policy to protect inefficient domestic industries. It is calculated as either a percentage of the value of the imported goods or as a fixed monetary amount per imported unit. The most popular method of calculating an average tariff rate is to divide total tariff revenues by the total value of imports. Import quotas are the limitations on the quantity of imports, and they can also be used as an effective tool for the trade policy. On the other hand, export restraints are the limitations on the quantity of exports imposed by the exporting country at the importing country's request. Subsidies make domestic goods and services artificially competitive against imports.

Nontariff barriers are particularly difficult to measure. For Dominick Salvatore, some of the nontariff barriers, such as antidumping measures and countervailing duties, might be used under certain conditions, but they can have the same effect as a tariff and they can be used like a tariff. Therefore, even though the World Trade Organization (WTO) imposed very significant reduction in tariff use, the use of nontariff barriers increased. Furthermore, manufacturing or production requirements of goods, health and safety rules, sanitation, and environmental standards can be under the category of nontariff barriers, but these are necessary barriers to keep standards higher. Other barriers to trade include overly rigorous health inspections and difficult licensing requirements, investment barriers, lack of intellectual property protection, and service barriers that regulate international data flow and foreign data processing.

Protectionists and Free Trade Supporters

In international economic history, in the 1930s, there was a wave of protectionism because of economic depression and because of the devastating impacts of the two World Wars. After World War II, governments looked for ways to diminish the trade protectionism and settled on Bretton Woods institutions in 1944. Then, the idea of removal of trade barriers gradually institutionalized itself with the establishment of the General Agreement on Tariffs and Trade (GATT) in 1948. Assisting trade in moving freely, removing obstacles through negotiations, providing stability, and resolving disputes were among the responsibilities of GATT. The WTO came into being in 1995 through the multilateral trading system and replaced GATT. A key target for the member states is tariff reduction.

In the context of trade barriers, there are different extreme groups who are in favor of trade barriers and those who are against trade barriers. Protectionists, who are in favor of trade barriers, argue that trade barriers protect domestic industries and create job opportunities. In history, the infant-industries argument was the key argument for some protectionists, who claimed that new industries should be protected from competition by using trade barriers, and particularly tariffs and quotas, to protect domestic jobs from cheap foreign labor. In addition, the argument for keeping money at home claims that limiting imports will increase a country's resources and sustain the balance of payments.

Economists generally support the idea that all these barriers decrease overall efficiency and reduce the welfare of consumers. Free trade supporters, who are against protectionism, defend the idea that free trade will increase the welfare of both customers and producers in the nation and region; therefore, all trade barriers should be gradually abolished, and free trade should be maintained between countries. For this group, trade barriers like tariffs and quotas raise domestic prices, reduce the welfare of domestic consumers, increase the welfare of domestic producers, and cause deadweight losses.

For free trade supporters, as one of the effective tools of trade barriers, a tariff can be perceived as a tax on goods produced abroad and sold domestically. Therefore, a tariff raises the price of imported goods above the world price by the amount of the tariff. In addition, a tariff reduces the quantity of imports and moves the domestic market closer to its equilibrium without trade. Kevin Lawler and Hamid Seddighi claim that, on the other hand, a quota on imports is a limit on the quantity of a good that can be produced abroad and sold domestically. Because the quota raises the domestic price above the world price, domestic buyers of the good are worse off, and domestic sellers of the good are better off. The quota can potentially cause a large deadweight loss, if such a mechanism, for example, lobbying activities, allocates import licenses. Because of the welfare effects, free trade supporters defend the idea of removal of all trade barriers, except perhaps those considered necessary for health or national security, Nevertheless, in real life, even those countries promoting free trade heavily subsidize certain industries.

Removing Trade Barriers

The key benefits of removing trade barriers are achieving general equilibrium approach to measuring economic benefits; removing agricultural subsidies globally; reducing trade barriers and agricultural subsidies, following the WTO's Doha Round; removing intra-American trade barriers, following the Free Trade Area of the Americas (FTAA) negotiations; and removing developed country barriers to exports from least-developed countries.

On the other hand, the economic costs of removing trade barriers are dealing with high expenditure on negotiating and on supporting the policy; developing and disseminating a convincing case for reform; paying the private costs of adjustment for firms and workers as reform forces some industries to downsize or close to allow others to expand; and bearing the social costs of social safety schemes (such as unemployment payments plus training grants to build new skills so displaced workers can earn the same wage as before). Social and environmental benefits and costs of removing trade barriers can be reducing poverty through free trade, environmental damage due to excessive production as a result of free trade, causing climate change, and reducing conflicts and financial instability.

Trade Bloc

Trade blocs refer to groups of countries that have established preferential trade arrangements aiming at increasing trade among each other. Trade blocs have been formed along geographical lines leading to the emergence of regional bloc trading. The terms *trade blocs* and *trade pacts* are often used as synonyms in literature. Here, trade blocs are understood as trading areas formed by one or several trade pacts.

In Europe, the European Union (EU) and the European Free Trade Association (EFTA) have established an even larger trade bloc, the European Economic Area (EEA). Via free trade areas (FTAs), preferential trading is planned to be extended to the Mediterranean area and southeastern Europe.

In the Americas, several regional trade blocs have emerged, mainly based on the Southern Common Market (Mercosur), the Andean Community (ANDEAN), the Caribbean Community (Caricom), the Central American Common Market (CACM), and the North American Free Trade Agreement (NAFTA). Mercosur and ANDEAN have concluded first steps toward the establishment of the Union of South American Nations. Intra-American trade integration is further fostered through bilateral trade agreements among individual American countries that are members of different trade blocs. Moreover, an all-American agreement, the Free Trade Area of the Americas (FTAA), is being negotiated, although negotiations have recently experienced setbacks.

In the Asia-Pacific, the Association of Southeast Asian Nations (ASEAN) Free Trade Agreement (AFTA), the ASEAN and China FTA, and the ongoing ASEAN plus three negotiations (with China, Korea, and Japan) have created or aim for plurilateral integration schemes fostering the emergence of an East Asian trade bloc. Furthermore, a network of bilateral trade pacts within the region has evolved. Also, the Pacific has seen several regional trade arrangements, while a multitude of trade pacts in central Asia aim to establish the economic links formerly existing within the Soviet Union.

In North Africa and the Middle East, integration attempts were launched with the Gulf Cooperation Council and the Greater Arab Free Trade Area. In Africa, high-level regional agreements have been concluded (e.g., the Southern African Customs Union and the West African Economic and Monetary Union). Nevertheless, Africa features a very low level of intraregional trade, trade pacts are overlapping, and the provisions of the agreements are rarely enforced.

Growth of Trade Blocs

Hence, although the number of intraregional trade blocs has grown, consolidation into continentwide trade blocs has recently stagnated. Furthermore, cross-regional trade pacts are increasingly concluded that link individual nations of different trade blocs with each other and trade blocs with individual nations of other trade blocs. Arrangements such as the Asia Pacific Economic Cooperation (APEC) that span several continents have evolved. This has led to the emergence of what Richard Baldwin calls "fuzzy leaky trade blocs."

With the proliferation of trade blocs, their welfare implications in the short run, and their role for further worldwide multilateral trade liberalization in the long run have been extensively debated in academia.

Jacob Viner was the first to highlight the effects of trade creation and trade diversion in 1950. Trade creation occurs when domestic products are replaced by cheaper products from trade bloc members. However, members of a grouping can also reorient their trade away from low-cost nonmember countries toward higher-cost member countries, leading to trade diversion. Which effect prevails depends on the trade patterns of a country or trade bloc and the levels of tariffs prevailing prior to liberalization. Moreover, when the terms of trade of trade bloc outsiders deteriorate as products from outside the bloc get more expensive, beggar-thy-neighbor effects occur. As the size of trade blocs increases, they obtain greater bargaining power and show more aggressive trading behavior, potentially leading to trade wars. Nevertheless, Paul Krugman and Laurence Summers have argued, although not without criticism, that trade blocs of countries that naturally trade with each other due to proximity or other economic motivations are welfare enhancing, as trade diversion is minor. A different set of welfare losses is anticipated as a result of the lack of transparency because of the "spaghetti bowl" nature of trade blocs. But also welfare gains are expected to occur in the long run, because of the increased market size and competition in trade blocs leading to economies of scale and higher productivity and innovation.

Opponents and Proponents

The question of whether trade blocs are building or stumbling blocks for further multilateral liberalization has been hotly debated since Jagdish Bhagwati coined these terms. Opponents of trade blocs argue that even a small increase in trade protectionism will lead to trade diversion. Once such measures are taken, interests are created that gain from the discriminating nature of the agreements and oppose further multilateral liberalization. Moreover, trade ministries have only limited resources and when concentrating on the formation of trade blocs, multilateral trade negotiations will suffer.

Proponents of the building-block nature of trade blocs claim that member countries of trade blocs might be inclined to agree to multilateral trade talks when they fear the emergence of another trade bloc stronger than their own one. Also, countries may go further in liberalization on a bilateral or plurilateral scale than on the multilateral one, demonstrating benefits to other countries and encouraging them to pursue further liberalization. Moreover, companies lobby governments to reduce tariffs to nontrade bloc members that produce intermediate goods for them to remain competitive. Academics also emphasize that developing countries can lock in overall trade reforms and multilateral trade liberalization by committing themselves to free trade within a trade bloc.

Hence, the impact of trade blocs on welfare and on further multilateral trade liberalization is ambiguous. Generating empirical evidence has proved to be difficult, as many of the agreements have existed for only a few years, have phased in liberalization schedules, and often coincide with a general period of economic growth. However, while computable equilibrium modeling frameworks in general have supported the trade creation argument, the recent ex post econometric studies are less clear cut.

Trade Liberalization

Trade liberalization refers to a significant reduction or removal of trade barriers that restrict a country's international trade. These trade barriers include tariffs, nontariff barriers (such as quotas and other government-imposed regulations), subsidies (such as those on production and exports), and other restrictive trade instruments.

In general, the liberalization of trade entails a greater integration with global markets. In the 1980s, many developing countries implemented trade liberalization as a part of a structural adjustment program offered by the International Monetary Fund (IMF) and the World Bank. Following the oil crisis of the 1970s, countries that had run high debt-to-gross domestic product (GDP) ratios and high current account deficits—such as Argentina, Brazil, Colombia, Mexico, and Turkey—were unable to continue their development strategies that relied heavily on foreign investments. Along with the fiscal restraints and currency devaluation, trade liberalization was an integral part of the structural adjustment programs. According to the IMF, developing countries now account for up to one-third of world trade, compared with a quarter in the early 1970s.

Trade liberalization is expected to increase a country's welfare through efficiency gains from specialization, exchange, higher competition, and access to a larger availability of intermediate and final goods. Moreover, Marc Melitz showed that once an industry is exposed to international trade, only the more productive firms will enter, while the least productive firms will be forced to exit. As a result, the overall productivity of the industry will increase. There is also a large literature on the impact of trade liberalization on GDP growth rates. In their seminal paper, Jeffrey Sachs and Andrew Warner examined the impact of postwar trade liberalization and showed that countries with open economies tend to grow faster than closed economies. On the other hand, Francisco Rodriguez and Dani Rodrik argued that liberal trade is no guarantee for faster growth rates, and emphasized the importance of other regulations, especially fiscal and monetary policies.

Protectionism

Almost every country has used protective trade barriers at some point in time. Following the Industrial Revolution of the late 1800s and early 1900s, today's developed nations, such as the United States, Canada, United Kingdom, and Germany, protected their manufacturing industries against global competition. Developing countries used protection as an industrialization strategy when their primary export markets slowed down because of the Great Depression in the 1930s. Argentina, Brazil, Mexico, and Chile have all used import restrictions to keep out competing imports for manufactured goods.

If trade liberalization is welfare improving, why do countries choose to implement protectionist policies? If a country has the potential advantages, such as lower labor costs and abundance of resources, to be competitive in the world market, but lacks experience or scale in production, then a temporary protection of that industry may improve the long-term welfare of the country. This oldest and most popular rationale of protectionism is also called the infant industry argument. The first-known reference to the argument was written by John Stuart Mill in 1848, who laid out two conditions under which it would be successful. First, the industry should have the potential to be able to eventually operate without protection. Second, the protection should be removed once the industry achieves competitiveness.

The first condition, as simple as it may sound, is quite difficult to accomplish. For example, the petrochemical industry of Colombia, the textile industry of Kenya, and the automobile industry of Malaysia were protected for a long time, without ever being competitive in the international arena. The difficulty in finding good candidates for protection rendered many economists skeptical about the infant industry argument. The second condition is also hard to implement. Once the protection is granted, a government may be unwilling to remove it. In many countries, the protected industries engage in heavy lobbying to ensure permanent protection from foreign competition. We see examples of this in the agricultural sectors of the developed nations, such as the United States and the European Union countries.

Trade Agreements

In the last two decades, instead of uniformly lowering trade barriers against all trading partners, countries increasingly applied differential treatment with certain trading partners. Preferential trade agreements (PTAs) are the most common way of economic integration, where members of the group lower the trade barriers on each other's products, but can maintain these barriers on nonmembers. These multilateral trade agreements fall under the complex multilateral rules and laws of the World Trade Organization (WTO), formerly known as the General Agreement on Tariffs and Trade (GATT). According to the WTO, there are 205 PTAs in force as of 2008, and about half of these PTAs came into existence after 1995. Some of the best-known PTAs are the European Free Trade Area (EFTA), the North American Free Trade Agreement (NAFTA), and the Southern Common Market (Mercosur).

In essence, the broad objective of the WTO is global trade liberalization. Will these regional agreements help or hinder further trade liberalization? In Jagdish Bhagwati's words, are these trade blocs "stumbling blocks" or "stepping blocks" for the global freeing of trade? Proponents of PTAs argue that integration allows member countries to specialize and trade according to their comparative advantage, increase their scale of production slowly, and give domestic industries a chance to adjust international competition. Others express doubt about the long-term benefits of PTAs. Countries that already benefit from trade blocs may be reluctant to lower trade barriers further if they do not expect significant returns. Also, these preference systems may distort production by diverting trade away from a potentially more efficient supplier outside the PTA and toward a less efficient supplier within the PTA.

Over the past two decades, the average growth of world trade was 6 percent a year, which is twice as much as the growth of world GDP. However, further liberalization of trade is needed in both industrialized and developing countries, especially in areas where developing countries have comparative advantage.

Trademark Infringement

The basic function of a trademark is that it is a sign of origin: it indicates the source or the trade origin of the goods and services to which it is applied. In addition to this essential function, trademarks can also fulfill other roles. For example, a trademark can act as a guarantor of quality; it can also fulfill an advertising role. For example, trademarks can convey particular messages or have a prestige associated with them that influence consumers' perceptions of the products bearing these marks. However, these additional functions are secondary to the trademark's principal role, which is to indicate origin.

Trademark Infringement Laws

In many countries, laws governing the definition, protection, and rights attributable to trademark owners date back to the 19th century. For example, Britain's first trademark legislation was provided by the Trademarks (Registration) Act of 1875. Many countries

A Chinese Airport Customs House captured ink cartridges suspected of infringing on the trademark rights of EPSON.

that subsequently introduced their own trademark legislation adopted similar guidelines, particularly the requirement that the trademark should be "distinctive" to fulfill its essential function.

The Trade-Related Aspects of Intellectual Property Rights (TRIPS) Agreement, which built upon the Paris Convention, defined a trademark as "Any sign, or combination of signs, capable of distinguishing the goods or services of one undertaking from those of other undertakings, shall be capable of constituting a trademark. Such signs, in particular words including personal names, letters, numerals, figurative elements and combinations of colors as well as any combination of such signs, shall be eligible for registration as trademarks. Where signs are not inherently capable of distinguishing the relevant goods or services, Members may make registrability depend on distinctiveness acquired through use. Members may require, as a condition of registration, that signs be visually perceptible."

Registration confers upon the owner exclusive rights to the trademark. Trademark infringement applies to registered trademarks and occurs when unauthorized use of another's mark is likely to cause confusion or to deceive as to the source or origin of the goods in question, although the precise emphasis differs between countries. For example, in the United States, the 1962 amendment to the Lanham Act of 1946 made more liberal the definition of infringement by removing the requirement that confusion, mistake, or deception of consumers as to the source or origin of the goods was required and stated that only the likelihood of confusion of an appreciable number of persons was necessary for infringement. It is often specified that for infringement to occur, the mark must be used in a commercial context, with a view to gaining economic advantage, and not as a private matter. The owner of a registered trademark is entitled to seek redress before the courts if there are grounds for believing that the mark has been infringed. The right to seek redress is provided for in the statutes governing the rights of registered trademark owners: for example, the Trademarks Act, 1994, in Britain.

Although the laws governing infringement stretch back to the 19th century, actions for infringement continue to be instigated by many of the world's most famous companies. For example, in the United States, Adidas versus Payless ShoeSource, which began in 2001 and ended in 2008; CISCO threatened to sue Apple for infringing its trademark iPhone in 2007. In Europe, actions for infringement have been launched involving Arsenal Football Club; Cadbury Schweppes; DaimlerChrysler AG; easyJet; Orange; and Waterford Wedgewood.

In many of these and similar cases, the action for infringement was brought by the plaintiff on the grounds that the goodwill associated with the trademark was being damaged. From a producers' perspective, trademarks can generate other advantages, all of which can be undermined by infringement. For example, reputation conveyed by a trademark can assist entry into new markets where high search costs would otherwise represent a significant barrier to entry; trademarks provide an endogenous mechanism for producers to maintain and uphold quality; trademarks help to reduce price and cross-price elasticity effects, thereby allowing their owners to achieve monopoly profits; finally, to the extent that they induce inertia in consumer preferences, trademarks facilitate the maintenance of monopoly power.

Global Trademark Agreements

It is common practice that marks are registered for a particular class, or classes, of goods. At the international level, the European Community, the United States, and over 50 other countries adhere to the Nice Agreement Concerning the International Classification of Goods and Services for the Purpose of the Registration of Marks. This agreement of 1957 has been through a number of revisions, most notably the eighth edition, which came into force in 2002. The Nice Agreement provides for the registration of marks in a number of classes of goods and services. In the former category, for example, there are classifications for bleaching preparations and other substances for laundry use; pharmaceutical and veterinary preparations; vehicles and apparatus for locomotion by land, air, or water. In the latter category, the eighth edition of the Nice Agreement has classifications for scientific and technological services, including design and development of computer hardware; services for providing food, drink, and temporary accommodation; and services for the protection of property and individuals.

The regulations governing trademark registration try to ensure that potential conflict between existing marks and marks put forward for registration are minimized. For example, the TRIPS Agreement stipulated that marks may be denied registration if they are simply reproductions or imitations of existing marks that are likely to cause confusion. Trademarks may also be refused registration if they are likely to deceive the public as to the quality or geographical origin of the goods. It is the normal practice that trademarks proposed for registration are published to allow owners of existing marks to raise objections. Trademark legislation in many countries permits the registration of the same or similar marks when there has been "honest concurrent use" of the two marks. Nonetheless, in deciding upon registration of concurrent marks, the courts will consider the following issues: the degree of likelihood of confusion from the use of the two marks; the duration of concurrent use; the evidence of confusion; and the honesty of the choice and subsequent use of the mark.

Classes of Infringement

Actions for infringement remain prevalent. Three broad classes of infringement exist. The first is the use of a mark that is identical to the registered trademark as applied to goods and services that are identical with those for which the mark is registered. A hypothetical example of this would be using an identical copy of the Coca-Cola trademark and applying it to a soft drink that was not manufactured by Coca-Cola. Second is the use of a mark that is similar to the registered trademark as applied to goods and services that are similar to those for which the mark is registered. A hypothetical example of this might occur when a mark that was identical in every respect to the Coca-Cola trademark—but colored blue instead of red—was applied to confectionary. Finally, use of a mark that is similar to the registered mark as applied to goods and services that may not be similar to those for which the mark is registered. A hypothetical example of this might occur when a mark that was similar to Coca-Cola's trademark was applied to jet engines.

Within these three broad classes of infringement, a number of issues arise that are specific to the precise nature of the infringement, for example, the extent to which use of a trademark by a third party is likely to cause confusion. For instance, suppose a trader uses another's trademark to sell merchandise. If the use of this mark by the trader is such that the impression is created that a material link exists in trade between the trader and the registered owner of the trademark, then the courts may decide that infringement has occurred. Much can depend on how the "average consumer" understands the way in which a particular trademark is used.

One illustration of this would be the case where a T-shirt had embossed on it a company's registered trademark. In such a case, the issue is whether the typical consumer believes there is a link between the trademark owner and the T-shirt, or whether use of the mark on the T-shirt is simply descriptive and therefore not designed to convey trade origin. Other examples of this type of infringement include use of a registered trademark by a third party on imported or exported goods, and/or use of such mark by a third party on advertising literature or trade material. Other infringement issues can arise from employment relationships. For example, unless prevented by contract, an employee may leave a reputable firm and set up a similar business of his/her own and advertise the former connection. However, this advertisement must not lead consumers to believe that the connection is still ongoing. Similar problems can arise when a business partnership folds and one of the partners claims the trademark of the partnership and its associated goodwill for an independent venture.

Seeking Redress for Infringement

Actions for infringement are not the only means by which the owner of a registered trademark can seek redress: an action for passing-off can also be instigated. Whereas an action for infringement has statutory provision by trademark legislation, actions for passing-off are based on common law to prevent unfair trading in its widest sense. The grounds for bringing a passing-off action are wider than trademark infringement itself, and give protection to all the means by which the goods of a particular trader are identified. However, passing-off actions are generally more complex and costly to enact than actions for infringement.

This is because registration provides prima facie evidence of the right to exclusive use of a mark, whereas in passing-off actions, there is a need to establish that false misrepresentation has occurred. Additional requirements for passing-off actions may also involve proof that goodwill has been damaged and that the characteristics of a particular product—for example, its labeling, wrapping, and the promotional activities associated with it—are understood by the public to be specifically distinctive of the plaintiff's goods or services; this last requirement may require witnesses to give evidence.

The key feature of trademarks that distinguishes them from other forms of intellectual property, such as copyright and patent, is that in theory, they have an eternal life. One consequence of this is that there will be an ongoing problem of trademark infringement for two reasons. First, as new products emerge, there will always be a risk that marks proposed for registration will "sail close to the wind," that is, they will be similar to registered marks. Second, as a matter of competition, traders have always been free to decide which marks they wish to use to distinguish their products from those of others. Nonetheless, it is for the courts, and the courts alone, to determine in each case whether infringement has occurred and the legal solutions to be adopted.

Trade Pact

A trade pact eliminates trade restrictions among its member countries while discriminating against third parties. Trade pacts can be constructed as preferential trade agreements (arrangements with a limited degree of tariff preferences) or as free trade areas (FTA) where tariffs on trade among member countries are removed, while tariffs for imports of nonmembers are not changed. Customs unions (CUs) additionally equalize the members' trade with nonmembers. Common markets (CMs), furthermore, allow for the free movement of factors. Countries in an economic union, moreover, harmonize their fiscal, monetary, and socioeconomic policies.

The World Trade Organization (WTO) permits trade pacts under General Agreement on Tariffs and Trade (GATT) article XXIV and General Agreement on Trade in Services (GATS) article V: Countries may conclude trade pacts if "substantially all the trade" in products between them is liberalized. Exceptions to article XXIV are possible for developing countries. The generalized system of preferences permits industrialized countries to grant developing countries one-way trade preferences, and the enabling clause allows developing countries to exchange any trade preference with each other to which they can agree.

History of Trade Pacts

Identifying the earliest trade pact is difficult: as long as nations have traded with each other, they have discriminated in favor of some neighbors. The Great Depression in 1929 led to a particularly strong disintegration of trade into regional clusters. Trade blocs were formed along the lines of colonial regimes and political affiliations. After the dismantling of existing trade regimes with World War II and the end of colonialism, states started to put effort into concluding trade agreements again at the end of the 1950s and in the 1960s. The most prominent example is the European Community established in 1957 under the Treaty of Rome. However, the number of trade pacts concluded during this period remained quite low and the scope of most of them was limited.

Often, they were aimed at extending import substitution regimes from the national to the regional level instead of focusing on market liberalization as, for instance, the Central American Common Market (CACM) or the Andean Group founded in 1960 and 1969, respectively. Since the 1980s and particularly in the 1990s, trade pacts have been rapidly proliferating. The WTO cites as many as 205 agreements (including enlargements of existing treaties) that were notified to it by May 2008. These trade pacts include both bilateral and plurilateral agreements as well as regional and cross-regional ones. Today, most countries and all WTO member countries belong to at least one trade pact.

The rise in number can be explained by several factors: The success of the European Union (EU) encouraged other country groupings to follow its example; the United States took a positive stance toward trade pacts when European countries started to show resistance toward U.S. proposals in multilateral forums. Moreover, developing countries changed their position toward trade, replacing their import substitution with market liberalization policies seeking agreements, not only with neighboring countries, but also their largest trading partners. The dissolution of the former Soviet Union led to new trade pacts among transition economies and between transition economies and other countries. Sluggish progress in multilateral trade negotiations during the Doha Round has accelerated growth of trade pacts.

Economic motivations for trade pacts differ: While some of them focus on intratrade flows as the EU or the North American Free Trade Agreement (NAFTA) do, other trade pacts aim at attracting third country trade and investment, for instance, the Southern Common Market (Mercosur/Mercosul). In Africa, obtaining external funds through development aid and private investment has played a major role for the conclusion of trade pacts. Further reasons lie in diplomatic reasoning and the desire of governments to obtain a stronger voice in multilateral negotiations. As the number of countries and hence interests involved in trade pacts is lower than in the case of trade negotiations on the global level, negotiations are less costly and more realistic targets can be achieved. Furthermore, it becomes easier to include other issues besides trade in the negotiations.

Thus, the late 1990s not only showed a shift in the number of the concluded agreements, but also in terms of contents. Formerly, measures governing trade played an important role in the design of trade pacts. Now, new issues such as investment, public procurement, competition, intellectual property, and so forth are increasingly covered.

Hence, trade pacts form part of the commercial policy of most countries, they become increasingly complex, they are increasingly concluded between developing and developed countries, and among developing countries, and they are also of cross-regional nature.

Trade Sanctions

The term *trade sanctions* refers to actions by which governments try to fulfill political or economic goals by using international trade as a policy instrument. Some other terms such as *trade embargoes, boycotts*, and *economic sanctions* are often used interchangeably and loosely to describe similar actions.

Sanctions are restrictions or policies directed very specifically at one country, or a group of countries, that attempt to restrict or even completely prevent trade or other economic interactions with that country. Restrictions may take the form of duties on imports from the sanctioned country that raise the cost of imports and may render that country uncompetitive, or they may take the form of complete ban on imports. Besides restrictions on imports, sanctions can be imposed on exports to the country and or on capital flows and investments between the two countries. In more extreme cases other forms of restrictions, for example, preventing a country from having economic interactions with third countries, can be used to achieve political goals. Sanctions may sometimes be imposed against a specific product such as arms or oil.

The purpose of imposing trade sanctions is to force the leaders of the sanctioned country to conform to the will of the sanction-imposing countries. Sanctions are seen as instruments that will impose economic costs on the targeted country and compel its ruling elite to bring about the desired changes. The most important sought-after change has been to bring about democratization of the regimes in the target countries. Trade sanctions are also imposed in response to a country's aggression against its neighbor(s). Other reasons for imposition of sanctions include nuclear proliferation, civil wars, violations of human rights, military coups, inability to control narcotics trade and distribution within the country, and support for international terrorism. It has also been argued that trade sanctions are sometimes imposed to serve the interests of particular interest groups within the sanctions-imposing countries that may wish to restrict imports into the country. International law permits use of sanctions to achieve certain goals because they do not involve the use of armed forces. Sanctions may be imposed by one country, or a number of countries may take the action together. Sanctions may be imposed under the aegis of an international body, such as the United Nations (UN), by an agreement between countries, or unilaterally by one country.

While economic warfare through sanctions is not a new idea, use of sanctions has increased during the past 50 years. According to one estimate, there were 62 acts of sanctions by the United States or the UN during the 1990s. Three examples of trade or economic sanctions during the past few decades help illustrate how trade sanctions work. The United States imposed trade and economic sanctions against Cuba starting in 1960 with the aim of bringing down the avidly anti-American regime led by Fidel Castro. Many countries joined together under the aegis of the UN to impose sanctions against the apartheid regime in South Africa in 1986. The UN was also used by some countries to impose trade sanctions against Iraq in 1990 in response to that country's invasion of Kuwait. These three examples highlight many aspects of trade sanctions as to their reasons, extent of the restrictions imposed, their effectiveness, and their consequences.

U.S. Sanctions Against Cuba

Treatment of Cuba by the U.S. government is a good example of the range of activities that encompass trade and economic sanctions. The U.S. government first imposed embargo on arms shipments to Cuba in 1958, due to political unrest in the country. These export restrictions were supplemented with restrictions on imports of Cuban sugar in 1960, after the 1959 revolution in which a U.S.-supported Cuban regime was overthrown by Marxist guerrillas. When Cuba aligned itself with the Soviet Union and confiscated U.S.-owned properties in Cuba, the scope of these sanctions was widened. Full economic sanctions were imposed after the Cuban Missile Crisis of October 1962. Under these sanctions, all goods made from or containing Cuban material (even if assembled in other countries) were embargoed, transportation of U.S. goods on ships owned by companies that did business with Cuba was banned, restrictions were imposed on U.S. citizens traveling to Cuba, and Cuban assets in the United States were frozen. At one point, the United States even suspended aid to countries that continued to trade with Cuba.

In 1996, the scope of the sanctions was expanded considerably when the Helms-Burton Act was passed. This Act placed restrictions on the U.S. operations of non-U.S. companies that were doing business with Cuba. Although the European Union (EU) initially challenged this law on the grounds of extraterritorial application of U.S. laws, it dropped its challenge as a result of a negotiated agreement with the U.S. government. Many of these sanctions have remained in place since their imposition, with some exceptions in years when the restrictions were not renewed by Congress. These sanctions have been imposed by the United States unilaterally, except for about a decade from 1964 when the Organization of American States (OAS) joined the United States in imposing sanctions on Cuba.

Cuban leader Fidel Castro (center) at the United Nations General Assembly in 1960, during the economic sanctions.

The declared objective of the trade and economic sanctions against Cuba had been to "bring democracy to Cuba" through the destabilization of the Castro regime. During the period just after the Missile Crisis, these sanctions were also justified on the grounds of national security. Any visitor to Cuba when Fidel Castro was still in power would have observed the effects of these sanctions. Cubans used American cars from the 1960s not out of their love for vintage cars, but because they were unable to acquire newer models.

While Cuba boasted the highest ratio of trained doctor to population of any developing country—even exporting its medical staff to other developing countries—the shortage of supplies was so severe that ordinary Cubans begged tourists to leave behind any medication they may have brought with them. The sanctions thus fulfilled their role as instruments for imposing economic costs on the target country. In its stated goal of replacing Castro, however, the sanctions were a complete failure. Castro remained in power until a ripe old age. Once the Soviets had withdrawn their missiles from Cuba, the national security argument for continuation of sanctions could not have been a serious one.

Sanctions Against South Africa

By 1980, most countries had begun to seriously oppose the minority-led South African government's policy of apartheid. In 1986, Canada on the behalf of Commonwealth countries, the European Economic Community, Japan, the United Kingdom, and the United States imposed trade sanctions against the South African regime. Each of these countries had its own list of sanctioned goods that could not be imported from or exported to South Africa. These lists included commodities, raw materials, textiles, weapons, oil, and computers. These trade sanctions were supplemented by restrictions on investments in and out of the country, as well as cultural, sports, and academic boycotts of the country.

The sanctions are credited with having contributed to changes that led to Nelson Mandela's election as the first black president of South Africa in 1994.

Sanctions Against Iraq

The UN imposed trade embargo against Iraq in 1990 after Iraq invaded the sovereign nation of Kuwait. This embargo was extended in 1991 to become what are now thought to be the most comprehensive sanctions in history. Trade in anything other than medicines and some food was prohibited by these sanctions. While some attempts were made to negotiate minor changes to the extent of sanctions, neither the Iraqi nor the U.S. (the driving force behind the sanctions, with some opposition from Russia and France) governments were willing to compromise. Saddam Hussein believed that the sanctions could not last, and the U.S. government was convinced that he would use any opportunity to rebuild his stock of weapons of mass destruction.

An "oil-for-food" (OFF) program was operationalized at the end of 1996, which allowed imports of food under stringent conditions. Before the implementation of this OFF program, Iraq's external trade had come almost to a complete halt. About $4.5 billion of Iraq's assets were frozen and the country had defaulted on all its foreign obligations. The country could not repair its damaged oil facilities and was unable to produce sufficient oil to reach its quotas permitted under the OFF program in some years.

The stated aim of the sanctions was to make life so uncomfortable for the Iraqi people that they would force the removal of Saddam Hussein from power, which would prevent him from developing weapons of mass destruction. Clearly, the sanctions failed in achieving the goal of change of leadership. They did succeed in achieving the second goal. The cost, however, has been the suffering of a civilian population that became pawns in the battle between Saddam Hussein and the Western powers.

Iraq had boasted one of highest human development index rankings in the Middle East before 1990. After the Gulf War of 1991, it ranked below most of the countries of the region. Sanctions were also blamed for higher death rates of infants in Iraq after the war. Although the number of deaths attributable to sanctions is widely disputed, both in terms of the number of deaths, and the attribution of those deaths to various reasons, high infant mortality rates became the cause célèbre for the battle between those in favor and those against the sanctions.

Do Sanctions Succeed?

The debate on whether trade sanctions are successful is unsettled. In most cases, sanctions manage to impose at least some economic costs on the sanctioned country. One study has found that the gross domestic product (GDP) in the sanctioned countries decreased by an average of about 3.3 percent in cases where the sanctions were successful. Sanctions, however, also impose costs on the sanctioning country. Cuban sanctions, by one estimate, have cost the United States lost exports of about $7 billion. These costs may alienate business interests within the sanctioning country or in the third country, and may weaken the force with which the sanctions are implemented. U.S. sanctions against the Soviet Union's construction of a gas pipeline were resisted by European governments who saw their own firms suffering from the embargoes.

Sanctions may lead other countries to come to the aid of a sanctioned country, when other parts of the world do not agree fully with the reasons for the sanctions. This has been especially true when sanctions are tied up in ideological battles. U.S. imposition of sanctions against Cuban sugar contributed to the strengthening of ties between Cuba and the Soviet Union.

Sometimes, sanctions do not work because they create their own antidote. Regimes in sanctioned countries often manipulate the impact of sanctions to their own interests. It has been argued that Fidel Castro remained in power for as long as he did precisely because he was able to unite the population behind his policies with a call to fight against the "oppressive measures of imperialists." When Britain and the UN had imposed sanctions against the white minority regime of Ian Smith in Rhodesia, the mostly white business community was manipulated by Smith to rally behind his government, even though that community had previously believed that a (black) majority rule was inevitable. Similarly, Saddam Hussein used the sanctions to his own ends by creating an external enemy. Through his control of the supply of whatever goods and food remained in the country, he managed to consolidate his power by limiting access to these supplies to faithful allies.

Autocratic regimes seem to be more resistant to compromises under sanctions than democratically elected government. In general, sanctions seem to work when forceful and quick actions are taken rather than when "screws are tightened slowly."

Trades Union Congress

The Trades Union Congress (TUC) is the coordinating organization of British trade unions. Founded in 1868, today the majority of independent British trade unions (59 in 2008) are affiliated with it and its authority largely stems from the fact that unlike in many other countries, it is the sole national interunion forum. Essentially, the TUC's main role is as a pressure group campaigning for a fair deal at work and exerting influence on the British government to pursue policies in line with the interests of workers generally, not just those of trade unions and their members.

The Role of the TUC

To this end, the TUC lobbies the government on draft employment legislation, meeting ministers privately, and responding publicly, orally and in writing, to government consultation documents. The TUC also seeks to exert pressure on the government indirectly through representation on government-funded bodies, such as the Health and Safety Commission, the Low Pay Commission, and the Advisory, Conciliation and Arbitration Service. In addition, it tries to influence members of Parliament—whatever their political persuasion—and members of the Welsh Assembly, and to build alliances with other voluntary pressure groups. The TUC also reaches out to the public through the Internet, telephone hotlines, and through the media. One example is its "Bad Bosses Hotline," which also generated media coverage.

At the same time as acting as a pressure group, the TUC has sought to act as a social partner with employers, in line with the European Union (EU) model. Accordingly, it has dealings with the Confederation of British Industry (CBI)—the employers' confederation—to try to agree on a common approach to employment matters—for instance, on age discrimination and consultation at the workplace.

The TUC's other roles include regulating and supporting trade unions and representing British trade unions abroad. In the case of the former, it carries out research on employment-related issues, helps unions avoid disputes with each other, and runs an extensive education and training program for union representatives. This program includes both general courses for union representatives and also specialist courses for union representatives with particular responsibilities, for instance, health and safety representatives, pension scheme trustees, and equality representatives. The TUC also runs what it calls an Organising Academy to provide training in union recruitment.

As to its role of representing British unions abroad, the TUC builds links with other trade union bodies worldwide and represents British workers on international bodies in the EU and at the United Nations (UN) employment body, the International Labour Organization (ILO).

The TUC has only modest authority over its member unions and thus develops and implements policy with their cooperation. Accordingly, it has a complex system of democratic control. The policy-making body of the TUC is the annual Congress or conference to which affiliated unions send delegates (the larger the union, the more delegates it can send), and at which motions (resolutions for debate) are discussed and form the basis for the work of the TUC during the following year. Between Congresses, however, responsibility lies with the 56-person General Council, which meets every two months, and on which the larger unions are automatically represented, with the smaller unions balloting for places. The General Council then elects a president for the year and a small (26-person) Executive Committee to implement policy, manage the TUC's financial affairs, and deal with any urgent business. The General Council also sets up industry forums and task groups to deal with special issues, such as learning and skills. In addition, there are permanent TUC committees, like the Women's Committee, the Young Members' Forum, and the Disability Committee.

The TUC has its own civil service— a cadre of officials employed by the TUC—at the apex of which is the general secretary, who often acts as the leader and spokesperson of TUC delegations. These officials include those in eight locations in England, Wales, and Scotland. In addition, Scotland has its own, completely separate, Scottish TUC, whose role is focused on purely Scottish employment matters. Furthermore, at a local level, there are Trade Union Councils. These are registered with the TUC and are comprised of representatives appointed by trade union branches that have members working or living in a locality.

In recent years, the TUC's actions have not been marked with success. Despite its Organising Academy, the TUC has not reversed the decline in trade union membership. Despite its campaigning, the TUC does not enjoy more political influence than employers. Moreover, there is tension in the TUC: tension between its affiliated unions, tension in its relationships with political parties, and tension between the TUC's various roles, such as its role as a social partner with employers and its campaigns against bad bosses. Nevertheless, its longevity suggests that it will continue to manage such tension, rather than being overwhelmed by them.

Trade War

Most economists and international policy makers argue that free trade and open international markets are the keys to global economic growth and wellbeing. The mutual reduction of protection expands the division of labor and the volume of trade, which increases national income. Economists and policy makers favor letting countries trade freely with few trade barriers. But although free trade seems to bring net gains for both nations and the world, sometimes a trade war begins.

A trade war refers to two or more nations creating trade barriers, such as tariffs, state subsidies, or import quotas, on each other to restrict international trade. A trade war can also be defined as an international conflict, which begins when one country (or group of countries) wants to hurt another country (or countries) with the help of trade policy measures. A country seeking to improve its terms of trade may provoke retaliatory behavior from other trading partners, making all parties concerned worse off. So, at the heart of any trade war is the belief that changes in trade arrangements can have huge impacts on domestic economies, on labor markets, and on social well-being.

World Trade

Since the mid-1980s, there has been a dramatic increase in regional trade agreements (RTAs), some involving several parties and others purely bilateral in nature. Regional integration structures vary from "free trade areas," in which members remove internal trade barriers among themselves but permit members to retain independent external tariff policies with the outside world, to "customs unions," in which members again remove all barriers to trade among themselves and also adopt a common set of external barriers. These two types of economic blocs are simply trade blocs and an important move toward free trade.

The formation of the European Union's (EU's) customs union is the first major modern trade bloc. The North America Free Trade Agreement (NAFTA), Mercosur/Mercosul, and the Asia Pacific Economic Cooperation (APEC) forum set up by countries in the Far East are other good examples of economic trade liberalization. This trade bloc revolution has raised the importance of trade discrimination and international trade wars.

At the same time, during the last few years, world trade has been facing higher growth rates. Emerging east Asian countries have followed an export-led development strategy that has negatively affected the U.S. and EU trade deficit. The more immediate threat to trade from trade deficit is the ammunition it has provided for increasing trade protectionism, which leads to trade wars. When a country is facing a trade deficit, it can either choose a free trade policy or impose a tariff on imports, which raises its own real income. When a country imposes a tariff on imports, foreign producers need to fully pass it on to domestic consumers, increasing product prices and becoming less competitive. This predatory behavior by one of the trading partners induces retaliation by the other, and it can end up in a trade war. Cooperation, in the form of trade agreements, offers a good solution to this problem, mainly if trade agreements are effectively enforceable. This is what the World Trade Organization (WTO) tries to do.

Changes in government, laws, or practices that protect or promote domestic or regional commercial interests at the expense of foreign interests are at the heart of most international trade conflicts. After World War II, the world's community of trading nations negotiated trade rules, which are now entrusted to the WTO. The WTO's procedure for resolving trade quarrels under the Dispute Settlement Understanding is vital for enforcing the rules, and therefore ensures that trade flows smoothly. Broadly, a country with a complaint requests a consultation, and, if the dispute is not resolved, the complaining country may request the establishment of a panel.

After the panel issues its decision, both disputing parties have the right to appeal. After the conclusion of all such proceedings, the Dispute Settlement Body (representatives of all the WTO members) adopts the report, unless it decides by consensus to reject it. Confidence in the system is borne out by the number of cases brought to the WTO—more than 300 cases since 1995 compared to the 300 disputes dealt with during the entire life (1947–94) of General Agreement on Tariffs and Trade (GATT). Nontariff barriers are the most frequent targets of complaint, followed closely by a large number of cases dealing with unfair trade practices or the measures taken to offset them (state subsidies, antidumping/countervailing duties).

The European Union and the United States

Two of the major players in world trade are the EU and the United States. Both support free trade, but they often accuse each other of pursuing protectionist policies or giving unfair advantages to its own exporters through state subsidies or safeguard actions, as in the case of imposition of tariffs on steel imports by the U.S. government. In the case of steel, the U.S. government alleged that many EU companies benefitted from earlier state subsidies and engaged in dumping steel products. Another famous trade dispute was the bananas case, where the EU was found guilty of discrimination against banana imports by U.S. companies in Latin America in 1997. The United States unilaterally applied a set of sanctions on a variety of EU goods because of the preferential banana trade agreement. The United States claimed that it was protecting its domestic interests, while the EU claimed that the United States was manipulating WTO rules to implement sanctions against countries trading with regimes it did not like. The bananas case presents two different long-standing questions about trading: whether nations can impose their will whenever they wish, and how free is the free market. Other trade conflicts between the United States and the EU stem from domestic regulatory policies. Conflicts over hormone-treated beef, bioengineered food products, and protection of the audiovisual sector, for example, are rooted in different U.S.-EU regulatory approaches, as well as social preferences.

From a political economy point of view, governments care about the political consequences of their trade policy, protecting the firms that provide the funds for their election and the individuals who vote for them. Within this context, trade wars can be seen as a direct outcome of domestic interests. So, most major economists would conclude that the story behind trade wars is one of protectionism—pure and simple.

Trading Volume

Trading volume is the number of shares transacted in a security over a given period of time, usually a day. It is essentially the quantity of the security traded in the market and can be calculated for stocks, futures, options, bonds, foreign exchange, and commodities. As there is a seller for every buyer, one way to think of trading volume, at least for stock, is as half the number of shares transacted: if person A sells 100 shares to person B, the volume is 100 shares. However, some markets measure volume differently. For example, the NASDAQ counts each side of the trade and so the volume would be 200 shares. We can also sum the volume of individual securities in a market and obtain a measure of overall market volume. The latter provides a useful measure of quantity analogous to a market price index.

An Important Indicator

Along with the price of a security, volume represents one of the most basic and important indicators of activity, for the security itself and the market as a whole. The trading volume gives investors a sense of the amount of activity in the security or the market during the day, and may provide signals to their future course. For example, increasing volume can be an indication that prices in the market will increase in the future. Simultaneous increases in prices and volume are an even more bullish (positive or buy) signal. On the other hand, decreasing volume is an indication that prices may fall in the future. A combination of falling prices and volume is then a bearish (negative or sell) signal for future prices.

Volume in financial markets tends to grow as the number of market participants (buyers and sellers) increases with the size of the market (for stocks, measured in terms of capitalization). For example, the New York Stock Exchange (NYSE) had a daily share volume of 1 million in 1886 and this had grown to 10 million in 1929, 500 million in 1987, and 5 billion in 2007: the highest volume day was 5,799,792,281 shares on August 16, 2007. Large trading volumes also tend to coincide with daily market record highs and lows. This need not be the case for an individual security: if the liquidity of a security is low, very large changes in price require only small volumes. Volume is also used to measure the share of trades conducted in different markets. For example, NYSE-listed securities are traded on the NYSE and in other markets (like NASDAQ), and their respective shares of trading volume can be used to identify which of these markets are relatively more important.

Technical Analysis of Volume

One area where volume is enthusiastically used is in the area of technical analysis. This is a financial markets technique that claims the ability to forecast the future direction of security prices through the study of past market data, including price and volume. Technical analysis considers only the actual price behavior of the market or security, on the assumption that the price reflects all relevant factors before an investor becomes aware of these through other channels. This contradicts the weak form of the efficient market hypothesis that states that current market prices incorporate all historical market information.

Technical analysts employ a variety of models and trading rules based on volume and these include on-balance volume, price and volume trend, and money flow. On-balance (or cumulative) volume relates the price and volume in the stock market. Volume on an up day (where the closing price is higher than the previous close) is added and volume on a down day is subtracted. This can be applied to individual stocks based upon their daily up or down close, or the market as a whole using breadth of market data. Generally, on-balance volume is used to confirm price moves. The idea is that volume is higher on days where the price move is in the dominant direction, for example, in a strong uptrend there is more volume on up days than down days. Accordingly, when prices increase, on-balance volume should also increase.

Price and Volume Trend

Price and volume trend is another indicator used to relate price and volume in the stock market. It is based on a running total volume, with volume added according to the percentage change in closing price over the previous close. Price and volume trend is interpreted such that volume is higher on days with a price move in the dominant direction, for example, in a strong uptrend there is more volume on up days than on down days. So when prices increase, price and volume trend should also increase, otherwise a weak market movement is indicated.

Money flow in technical analysis is the typical price (high price plus low price plus closing price divided by three) multiplied by volume: this provides an approximation of the dollar value of the day's trading. These are divided into positive (negative) money flows where the typical price is higher (lower) than the previous day's price and then totaled over a given period: unchanged prices are discarded. Dividing positive money flow (enthusiastic buyers) by negative money flow (enthusiastic sellers) forms a money ratio, while adding one to the money ratio, dividing it into 100 and subtracting it from 100 forms the money flow index. Generally, high (low) values of the money flow index indicate a stock is overbought (oversold).

More recently, volume has been used in statistical models that attempt to explain the level and volatility of price movements. Here, volume serves as a measure of information flow that affects the price of the security. The findings generally indicate that volume is a good proxy of information flow in the market.

Training

Training provides the skills, knowledge, and proficiency required to perform a task or excel in a position. Quite often, especially in positions expected to lead to a career, the business world requires training of its employees that goes beyond what was provided in school or college, or that updates the knowledge gained there. Sometimes this is required in order to keep up with developments in the field, or developments in the software applications, relevant legal codes, industry conditions, or other external changes that have transpired since the end of the employee's degree program.

On or Off the Job Training

Training can be on the job or off the job. On the job training is conducted in the workplace, usually in a "live" situation—this is the modern descendant of old systems of apprenticeship, in other words, and is used in modern systems of same. Someone moving to a new position may be designated a trainee for a certain period of time, shadowed by or shadowing an employee who has already been through the training, in order to perform the necessary tasks and have immediate feedback and the opportunity to ask questions. When possible and practical, this is often the most effective form of training. On a wide scale, it is also resource-intensive, consuming company time and extra labor, and it isn't appropriate for all skills. Learning a new computer programming language, for instance—or a new spoken language, for that matter—is difficult to accomplish this way, as are more abstract skills like management philosophy, supply chain management, information systems, or a legal professional learning a new branch of law.

Off the job training is conducted off-site, with the trainee's efforts not contributing to the business's production during his training period. This is necessary for some forms of training, practical for others; in some cases the business may simply lack the resources to provide the training, while in others there may be some reason in the larger hierarchy of reasoning why off-site training is preferable. McDonald's managers, for instance, all receive training off-site from the same training facility, not because it would be too difficult to conduct on the job training, but because it is a way of ensuring consistency of performance across all franchises' locations.

Physical training is less common in the business world, but could encompass the calisthenics performed by employees at some factory jobs in Asia and Europe, or the stress reduction courses prescribed by companies from time to time.

Taylorism and Human Resources

Training is essentially the purview of the Human Resources (HR) departments. HR departments developed in Western businesses at the end of the Industrial Revolution, when Frederick Winslow Taylor updated the managerial and psychological aspects of conducting a business to reflect the technological upgrades that had occurred over the previous century. His *Principles of Scientific Management* (1911) was so influential—providing a foundation for discussions of the division of labor that assembly lines had made attractive—that approaches to management that depended on the analysis of business processes with an eye toward improving labor's productivity became known as Taylorism, even if they referenced nothing specific from his books. There have been a number of stages and fads in the study of management and business philosophy, but Taylor's ideas continue to resurface, shined up to reflect modern conceptions. On top of that, similar ideas were adopted in Japan and the Soviet Union; even the Soviet Union's central planning owes a significant debt to Taylorism.

Out of Taylorism came the human relations movement from the 1920s on, which refined scientific management by incorporating into it the aspects of psychology (then a young discipline) that had become part of social scientific consensus, and the recognition that workers were not interchangeable parts, but rather had to be considered in terms of psychological compatibility and the possibility of having a natural knack for one role more than another. Out of this same school of thought came the development of public school guidance counselors who help students find the future career that is "right for them," an idea that in Taylor's view would have been novel, or perhaps entirely foreign, and which in the 100 years since Taylor's writings has become inseparable from discussions of long-term career planning and the lives of employees.

The primary purpose of HR departments is to put human capital—workers—to its best use, with the understanding that this means not exploiting them, but rather finessing a situation so that their needs and the company's needs are best met, without being put into opposition. To that end, HR is key in the development of corporate culture, and emphasizes training in part because it helps employees stay invested in the good of the company, while finding the ideal position to put their skills and potential to use. Larger HR departments often include trainers and training facilitators, instead of or in addition to an apprentice-like approach. HR trainers may also focus on specific kinds of training, like leadership, diversity management, IT, standards compliance, sensitivity, and change management.

Change management focuses on managing people and institutions in transition, which can be positive (as a result of mergers, expansions, new business ventures, promotions) or negative (in the aftermath of downsizing or other negative restructuring). Many change management techniques borrow from the work of psychologist Elizabeth Kubler-Ross, whose landmark book *On Death and Dying* provided a framework for the stages of grief, which are arguably applicable not just to the death of a loved one but to any negative change in one's life, personal or professional. Change management trainers can act as much as counselors as skills trainers.

Continuation of Training

Continued training is sometimes required by a particular profession. For instance, accountants, lawyers, doctors and nurses, and teachers are all required to take particular development and training courses periodically over the course of their careers, in order to stay current; no one wants a pediatrician who is not aware of the rubella vaccine, or an accountant who isn't current with tax code. While market forces alone should be sufficient to prevent either of those things from happening, these industries have been self-regulating long enough to put such requirements in place, for the sake of the reputation of the accreditation their governing bodies provide.

Such requirements are often a matter of state law, but were originally sponsored and supported by professional associations such as the National Education Association (NEA) and the American Medical Association (AMA). Specific training requirements vary from state to state, both in frequency and in content; some states have specific courses for teachers of various grade levels to attend during the summer or spring breaks, while others require a certain number of credits from a particular course list. Other industries may have mandatory periodic training required by licensing agencies or professional associations in order to retain membership—although such membership may not be necessary to legally operate in the field.

Professional development courses may include semester-long courses at accredited universities, or may take the form of a weekend workshop, with a good deal of variety in between. Some are purely technical in focus, covering new developments in software, procedure, and other objective, empirical material. Others may be discussion-oriented, focused on the underlying philosophies of the profession, such as managerial philosophies or medical ethics. Recent developments in the industry may be the subject of discussion, or the possible ramifications of events on the horizon.

Trans-European Networks

The Trans-European Networks (TENs) are large infrastructure networks for transport, energy, and telecommunications connecting the 27 member states within the European Union (EU). These networks contribute to the further development of the internal market by enabling the free movement of goods and persons, integrating the EU economically and socially, and supporting less favored areas within member states. Improving the interconnection and interoperability of the EU's infrastructure is a major element in enhancing the EU's competiveness, thereby creating economic growth, while simultaneously ensuring development within the Union is balanced and sustainable.

TENs' origins are found in the 1992 Maastricht Treaty, which brought forth the agreement that the Union's integration would require the development of trans-European networks. In 1994, the European Council identified 14 priority projects for network development, which were approved in 1996 by the European Parliament and Council of the European Union. In 2004, additional projects were added to the list based on the European Action for Growth initiative.

The funding of TENs projects is specific to each project and may be based on European Structural and Cohesion Funds, loans from the European Investment Bank, loan guarantees from the European Investment Fund, or other financing options.

Transport

The EU considers Trans-European Transport Networks (TEN-T) to be essential in ensuring the free movement of passengers and goods among member states. The network consists of the Union's motorways, railways, waterways, ports, and airports that need to be linked within the 27 member states and other European countries. The goal of European policy is to develop an integrated Europe-wide transportation infrastructure that is both efficient and sustainable. In the absence of TEN-T, the increase in the Union's transportation demands would be challenging to manage and would have a negative impact on economic growth. Through more effective use of rail and sea transport, the networks will also enable a reduction in vehicle emissions and congestion on roads, thereby enabling the Union to balance growth and the environment simultaneously.

Construction until 2020 on the network will involve not only complementing existing transportation networks by building the last missing motorways or railways to create a cross-border network, but will also significantly upgrade existing motorways, railways, and waterways. One of the TEN-T projects includes a high-speed railway for passenger travel between Paris, Brussels, Cologne, Amsterdam, and London, which connects five member states. Another TEN-T project entails creating a network of sea motorways that will enable a more effective use of sea routes, better connect peripheral and island regions to member states, and reduce road congestion. Various sea motorway projects have been identified to achieve this goal, such as the Baltic Sea motorway linking the member states in this region with member states in central and western Europe.

Energy

The EU's energy policy considers the Trans-European Energy Networks (TEN-E) to be an important priority in developing an internal energy market and creating a diversified and secure energy supply for member states. Furthermore, the Union's policy objectives include improving competitiveness in gas and electricity industries, and balancing the energy needs of the Union with protecting the environment. As a part of protecting the environment and securing supply, the Union's energy strategy is to pursue renewable energy sources and focus on issues with energy efficiency. Additionally, this strategy entails improving the energy network between member states and other European partner countries.

The EU has developed TEN-E priorities for both electricity and gas. The priorities for electricity are focused around improving connections with isolated networks, between member states, within member states, and with third countries. The priorities for natural gas are focused around introducing natural gas into member states, or regions within member states, that are not currently supplied, establishing connections with gas networks that are isolated, and increasing capacities for transport, receipt, and storage.

Telecom

The Trans-European Telecom Network (eTEN) is focused on implementing innovative e-services of social or economic interest to member states. Such services are a priority for the EU for various reasons. First, the Union wants to provide all citizens with the opportunity to participate in the information society so as to reduce the risk of leaving a portion of society behind. Next, the Union wants to promote economic growth, employment, and social cohesion. The eTEN program is based on developing public services that provide all member state citizens with the opportunity to benefit from the information society. There are seven initiatives in support of this program. In the area of government, the objective is to provide online services that are inclusive and allow citizens, businesses, and government sectors within member states to interact with each other.

In the area of healthcare, the objective is to focus on quality, cost, and access to healthcare, and the development of information networks to support these objectives. In the area of social participation, the objective is to develop services that overcome socioeconomic, geographical, or cultural barriers that may disadvantage citizens. In the area of education, the objective is to improve knowledge transfer and quality of learning for all member states. In the area of small and medium-sized enterprises, the objective is to increase their competitiveness by providing access to e-services. Finally, in the area of trust and security, the objective is to facilitate involvement of citizens, businesses, and other organizations in the information society by ensuring network infrastructures and services are secure.

Transfer Pricing

Transfer pricing is the price charged for goods or services that are exchanged among different organizational units of the same company. Transfer prices are used to allocate profit to company divisions. The price charged by the selling division becomes a cost to the buying division. Thus, a higher transfer price will result in more profit to the seller and less profit to the buyer. Transfer pricing might allow multinational corporations (MNCs) to reduce income tax worldwide, thereby increasing profit.

Companies set transfer prices so that divisions in low-tax countries report large profits, while those in high-tax countries report low profits. For example, assume a U.S.-based MNC has a division in France selling goods to a division in Ireland. Ireland then sells the goods to buyers outside the MNC. The tax rate in France is 35 percent, but the tax rate in Ireland is only 12 percent. The corporate goal is to set a low transfer price so that the France division reports close to zero taxable profit, thus paying little or no tax. As a result, Ireland division reports more profit and pays more tax. Nonetheless, the corporate entity generates savings on the difference in tax rates (35 percent minus 12 percent) for each dollar of profit shifted from the France division to the Ireland division.

Regulations and Standards

As world trade increases, more countries are implementing regulations to ensure they receive a fair share of taxable corporate profits. The universally acceptable approach for setting transfer prices is the "arms-length standard." This is a price that would have been reached by two independent parties trading in a free market. However, problems arise in applying this concept across country borders. Regulations and legal interpretations differ from country to country. A price acceptable to authorities on one side of a transaction may not be considered acceptable to those on the other side. Failure to comply with transfer pricing laws can result in significant penalties and fines. Even worse, a country may disallow a transfer price, thus forcing a change in a division's taxable profit. If the division on the other side of the transaction is not allowed to revise its price in unison, the same corporate profit can be taxed twice.

Transfer pricing regulations were established by the Internal Revenue Service (IRS) in the United States and the Organisation for Economic Co-operation and Development (OECD) for Europe. Most of the world has adopted some form of OECD regulations. The two sets of rules are essentially the same: both agree that transfer prices can be calculated by a number of acceptable alternative methods. All methods look at some element of comparability in the marketplace to determine an arm's-length transfer price. For example, one of these methods is called comparable uncontrollable price. It estimates transfer price by looking at prices charged by independent sellers of similar products. Another method, called cost plus, derives transfer price by using gross profit earned by independent sellers of similar products. It is up to the corporate entity to choose a method. The main criterion is that the method used should result in the most reliable means to estimate a price that would have been charged in a free-standing market.

After an MNC has selected a method and estimated an arms-length price, it must then determine whether its circumstances differ from those of the independent firm used for comparison. If differences do exist, then the transfer price will have to be adjusted accordingly. Factors to consider include product functionality, contract terms, risks, economic conditions, and differences in products. For example, an MNC division might be a new entrant to an existing market. An arm's-length price is estimated by looking at comparable prices from independent suppliers. However, outside suppliers normally require that purchase orders consist of larger quantities and longer contractual terms. Because the intracompany transaction provides more lenient terms, the arm's-length transfer price would be adjusted to allow for these differences.

The shared use of intellectual property between company divisions presents particularly difficult transfer pricing problems. Included are such intangible assets as patents, formulas, trademarks, and brand names, among others. It is difficult to determine a market value for intellectual property because such items tend to be unique in nature. It may also be difficult to separate the benefits of one type of intangible asset from others related to products being sold. For example, a division buys a brand name pharmaceutical drug from another division. It introduces the drug in a new geographic market and undertakes an intensive marketing effort. To determine a transfer price for the brand, the corporate entity would have to separate value of brand name from that of marketing. Despite difficulties in estimating value, this type of transaction is receiving increased attention worldwide by tax authorities.

An MNC has two primary ways to alleviate tax conflicts over its transfer prices. The first is to document all aspects of transfer pricing calculations to verify adherence to the arm's-length standard. The second is to enter into advance pricing agreements with tax authorities. Under this approach, an MNC creates a contract giving it assurance of compliance if it follows agreed-upon procedures for calculating transfer prices.

Transition Economies

Transition economies are countries with economies in transition that abandoned state socialism and central planning and have been attempting a move to capitalism. The central process of economic transformation typically involves three fundamental, revolutionary, systemic changes, including liberalization, macroeconomic stabilization, and structural adjustment through commodification, marketization, privatization, and the reduction of the role of the state. Broader mechanisms of economic transition involve the incorporation of transition countries into the world economy as well as the establishment of cultural attitudes, political, legal, and societal institutions supportive of and conducive to the continuous accumulation of capital through profit and investment. The successful creation of a thoroughly new, capitalist mode of social and economic organization should herald the formal end of transition economies as a meaningful descriptor.

In general, 34 countries and areas have been identified as economies in transition. They spread from Germany to China, Estonia to Uzbekistan, across central and eastern Europe, Russia, Transcaucasia, and central, east, and southeast Asia. Somewhat similar to the emergence of markets in the developing world, the declared rationale behind the transition economies' drive to capitalism lies in the ultimate goal to achieve developmental catch-up with the industrialized nations of the West.

Transition: From Plan to Market

Prior to the start of gradual market-oriented reforms in China in 1978 and before the radical anticommunist revolutions in Eastern Europe of 1989–91, state socialism was the primary doctrine of economic development and modernization across Eurasia. The main features of state socialism as a society included a state-owned, centrally planned economy, administered and controlled by a dominant communist party. On the basis of the ideology of Marxism-Leninism and through the capacity of the state, the Communist Party sought to mobilize the population to build an industrial and classless society. Despite considerable achievements of state socialism in terms of industrialization, economic development, low income differentials, full employment, good education, and healthcare, by the 1980s, it had become clear that capitalism was proving to be more successful as a system of production and consumption on a global scale. State socialist countries had failed to catch up with the core of the capitalist world economy. In response, most of these economies rejected central planning and embarked on a transition to capitalism.

To build capitalism, the transition economies were provided with policy advice, reform guidance, and some monetary assistance by the Western donors and international financial institutions such as the International Monetary Fund (IMF), the World Bank, and the European Bank of Reconstruction and Development (EBRD). The structural adjustment program, which had previously been implemented in Latin America, was consequently redesigned in 1989 in a more comprehensive fashion to fit the task of building capitalism from scratch. Dubbed the "Washington consensus" because of the location of the IMF and the World Bank in the U.S. capital city, the radical all-out transition approach called for rapid price and trade liberalization, accompanied by strict macroeconomic stabilization; the privatization of state-owned enterprises; the liberalization of labor and capital markets; tough monetarist fiscal consolidation through ending subsidies and cutting public services; rapid deregulation; and creation and the immediate opening of markets to entry by newly-created private businesses and foreign transnational corporations.

Simultaneously, a wide range of other structural and institutional changes, such as destatization, the market-oriented reform of the social protection sector, the tax system, the legal system, accounting standards, and so forth, had to be initiated as well. These "shock therapy" measures became a general prescriptive mechanism to ensure the transition of postcommunist countries toward the economic model of the so-called free enterprise economy epitomized in the Anglo-American system of competitive capitalism and limited government involvement. The widely held belief at the time was that a rapid expansion in total output and a progression from a lower to a higher level of development, understood broadly as raising the living standards of individuals in those countries, would follow almost immediately after the government restrictions on people's commercial activities were removed.

The 1990s

Contrary to such popular expectations, however, the 1990s turned out to be a lost decade for most transition economies. The ensuing transitional recession was to last for six years on average across central and eastern Europe and the former Soviet Union, ranging from two years in Poland to 10 years in Moldova and Ukraine. In terms of its scale, the deepest slump in output was suffered by Bosnia and Herzegovina (with a decline of 88 percent), Georgia (minus 75 percent), Armenia (minus 69 percent), and Moldova (minus 68 percent). Only four countries (the Czech Republic, Uzbekistan, Poland, and Slovenia) managed somewhat milder recessions, losing 15–20 percent of gross domestic product (GDP), whereas the scale of depression in the other remaining economies in the region ranged between 30 and 60 percent.

It has been argued that because of the often substandard quality of Soviet bloc production, the real welfare-reducing impact of the transitional depression was lower than the official GDP figures seemed to indicate. Yet the collapse of production also meant the end of employment, and the resultant job losses were massive. Large proportions of the redundant labor force had to withdraw from economic activity altogether, either migrating abroad or relying on informal survival strategies at home. Unemployment levels reached double digits in most transition economies, peaking around 20 percent in relatively successful Poland and Slovakia, and rising above 40 percent in the areas affected by civil strife and political instability. All the evidence based upon the broader human development indicators, including life expectancy, infant mortality, demographic growth, income distribution, headcount poverty, and educational attainment, suggest a very significant social cost to transition across the region.

Varieties of Emerging Capitalism

The spatial impact of economic transition was very uneven. The transition to capitalism produced a great divergence in outcomes between the different geographical blocs of transition states, between different individual countries, and between urban and rural areas within those countries. Most of the initial variation in the output performance of central and eastern Europe, compared with the former Soviet Union in the 1990s, is explained by the inherited structural liabilities and exogenous "transition shocks" caused by the collapse of centralized planning and the communist trade system, the disintegration of the Soviet Union, and the associated detrimental effects of disorganization and trade implosion on the respective transition economies. It is notable in this regard that the sharpest decline in output occurred amid chaos in war-ravaged countries like Bosnia and Herzegovina, Georgia, Armenia, Moldova, and Tajikistan. By contrast, the gradually reforming transition economies of east and southeast Asia, as well as the three former Soviet republics (Belarus, Turkmenistan, and Uzbekistan) that did not follow the "shock therapy" approach, generated a very different growth trajectory, either postponing the potentially severe economic dislocation or, perhaps, avoiding it altogether.

Despite substantial differences that exist among the transition economies, since 1999, all of these countries have been on a steady path of growth, with the majority enjoying a rapid economic recovery and further expansion. In terms of prospects for catch-up development, the average income disparity between the richest and the poorest transition economy grew during the transitional depression, peaking in 1999; yet it slowly decreased since, dropping from the ratio of 21:1 to 14:1 by the end of the 2000s. With respect to approaching Western standards of living, the transitional depression of the 1990s proved to be a major setback, as these economies' average per capita income on the purchasing power parity basis dropped to just 15 percent of the U.S. level. Within the following decade, the original income differential was restored and projected to reach up to 30 percent of the U.S. level by 2013.

Beyond Transition

On a more disaggregate level, four different post-transitional regime types can be identified as a succinct way to summarize the major outcome of transformation across postcommunist Europe and Eurasia. The first regime type includes politically unstable, war-damaged countries that have had to rely on substantial foreign assistance and workers' remittances to sustain a model of chaotic uncoordinated capitalism. In the second group of gradual or "lagging" reformers, state-led or statist capitalism has emerged in combination with firm authoritarian rule. These transition economies all appear in the low- and lower-middle-income groups within the World Bank's development classification scale. Most of them have remained on the medium level of human development as well. However, in sharp contrast to the uncoordinated capitalist economies, state-led capitalism has been characterized by high growth rates propelled mainly by strong manufacturing exports.

Another distinct type of the newly emerged market economies covers the whole of central Europe, the Baltic States, and the outlying parts of the Balkan region. These countries have already reached or have closely approached both the average Western standards of income and consumption, as well as of human development. In contrast to all the other post-transitional regimes, countries in this third group are usually described as consolidated democracies, with well-established pluralist and civil society tendencies. Capitalism in these states has acquired a certain affinity with the continental European model of coordinated market economy. The notable exceptions are the deregulated liberal market economies of the Baltic region. In general, the third group of transition countries has firmly allied itself with the European and Euro-Atlantic economic, political, and military structures.

Finally, there is a very diverse intermediate fourth group of the transition economies, covering primarily the former Soviet republics. These countries are broadly positioned in the middle of the global developmental ladder. Politically, they are not formally allied with the West, although these economies' dependence on the Westbound export-driven growth has been by far the most considerable among all other transition states. Despite some spectacular exceptions, these countries generally have not continued with the adoption of a Western-style polyarchy. Institution-wise, these economies are characterized by open trade and fluid product, labor, and capital markets. However, the level of political involvement in the economy is more evident in this post-Soviet group than in central Europe and the Baltics. An additional feature of their intermediate grouping is that its richest economies have benefited greatly from exporting primary commodities and raw materials, including oil, gas, ores, and minerals.

The future developmental prospects and potential of transition economies depend ultimately upon the progress achieved to date, favorable global market conditions, and the overall sustainability of their social formations, types of emergent capitalism coupled with particular modes of political regulation. Nonetheless, because economic development is a cumulative, combined, and unequal phenomenon, a lot of the economies in transition will hardly ever be able to catch up with the rest. Hence, for them transition is to become a permanent condition.

Transportation

Transportation is the movement of freight or passengers, by land (rail or road), air, or water. Though important to trade throughout history, since the Industrial Revolution, transportation concerns have become crucial to the operation of any business, whether the company ships its own goods or simply depends on transportation to receive its raw materials and inventory. Transport strikes and fluctuations in fuel prices have had a serious impact on local and national economies at various times in the last century and a half.

In the 21st century, human-powered and animal-powered transport have become essentially irrelevant from a business standpoint, though in some parts of the world they remain in use for special circumstances. The majority of the time, they both constitute recreational transport, such as the picturesque horse-drawn carriage tours offered in many touristed cities.

The modes of commercial transportation, then, are aviation, rail and road overland transport, and ship transport.

Air Transport

For purposes of transport, aviation relies primarily on fixed-wing aircraft, though because of their vertical takeoffs and landings, rotorcraft (helicopters) are sometimes used for private passenger transport to destinations that can't accommodate an airplane landing strip; the primary examples are military transport, and private helicopters used by businesses for rooftop landings.

The benefit of air transport is the speed, which is unequaled by anything else available to the general public. On the other hand, aircraft and aircraft fuel are expensive, and they depart from fixed locations; transport is still required to and from the airstrip, and costs are high. Passenger transport costs are kept down by sharing vehicles—booking many passengers on the same flight between two airports, often with stops in between, a system that is in a sense inefficient for any flight that isn't to or from a "hub" (an airport where most of the airline's flights originate). This spreads the cost of the flight out among so many parties that the additional cost of such inefficiency and the inconvenience of lengthy layovers or odd departure and arrival times is outweighed by the overall savings. For passenger transport, commercial aviation is at its most efficient and cost-effective when the distance is at its greatest. A flight between neighboring cities will often save little time and less money relative to ground transport, because of delays and check-in time, especially with the security concerns of the 21st century.

In Europe, the 1990s deregulation of European Union airspace has had a significant impact on commercial airlines. More and more national airlines, like British Airways and Ireland's Aer Lingus, have privatized, while suffering in competition with deregulation-era budget airlines that focus on short flights at low prices. In the United States, deregulation came much earlier, in 1978; the United States has led the world in air travel in number of flights ever since, despite a series of challenges to the industry, including bankruptcy (of the pre-1978 airlines still in operation, only American Airlines has never declared bankruptcy), "air rage" and other passenger problems, the hijackings of the late 1970s and early 1980s, post-9/11 fear of flying, customer dissatisfaction over more stringent security precautions, and unstable fuel prices.

In addition to using measures such as overbooking and reducing the size of seats in order to fit more passengers on a flight, one solution to the financial travails of travel has been the rise of low-cost airlines. In that niche, Southwest Airlines has prospered, but Skybus and AirTran Airways have ceased operations, while the nonunion discount airline JetBlue—one of the few airlines to increase its profits after 9/11—has faced a series of scandals, lawsuits, and unfavorable headlines.

The air travel industry depends heavily on government assistance. In fact, once government subsidies are factored in, the entire industry has been operating at a loss over the whole of its history, despite steady growth. Business polymath Warren Buffett has called the airline industry one of the hardest to make money in—despite the vast amount of money accumulated, little of it is profit. Government funds are used to build airports to foster economic development, and to subsidize the development of aircraft for both military and commercial purposes. Government grant money is often used in the research and development of aircraft design. This level of government involvement is sometimes less obvious in the United States, where there is a long history of privately owned airlines, than in Europe, where until recently most airlines were nationalized.

Magnetic levitation (maglev) trains can travel at speeds of over 300 miles per hour and are inexpensive to operate.

Rail and Road Transportation

Rail transport relies on railroads, and, along with steam-powered water transport, was the hallmark of the Industrial Revolution. The use of rails (which minimize friction, compared to driving surfaces, and distribute weight more efficiently than other overland travel) and engine-driven trains allowed for much faster overland transport than before, and in particular allowed for a great deal more freight to be carried, rather than loading up covered wagons pulled by horses and other draft animals. Train travel is slower than air travel and suffers from the same indirectness with regard to target destinations; travel to and from the train station is required, and it is less popular than it once was for passenger transport. But freight trains continue to operate day and night around the world, and passenger transport remains popular in Asia, Europe, and to some degree in the northeastern United States, where distances between cities are relatively short. The diesel-electric locomotive succeeded the steam engine in the 1930s and 1940s and remains in use throughout most of the world.

Passenger rail travel is frequently brought up when the issue of public transportation reform is on the table. Often the discussion includes monorails and magnetic levitation (maglev) trains, the second of which can potentially move extremely fast because of the lack of friction, and which are cheap to operate once built, but which require expensive new infrastructure.

Road transportation is the most popular form of transportation, with hundreds of millions of automobiles worldwide and a well-established trucking industry in most industrialized nations. The building of roads has a long history, and along with aqueducts constituted the principal infrastructure built by civilizations like Rome. Because of the vast numbers of roads and the presumption that nearly every domicile and business is accessible by road, road travel offers the greatest flexibility—door-to-door travel. Nearly all freight transport involves transport by road on at least one leg of the journey.

Sea Transport

Sea transport is the slowest form, but because of the extraordinary tonnage that can be transported over the seas, it remains an efficient mode of freight transport for nonperishable goods, especially those which are delivered at regular intervals and for which thus the length of travel is essentially irrelevant. Water transport is generally cheaper than air transport over comparable distances, though air transport has the obvious advantage of being able to depart from landlocked locations.

Intermodal Transport

Intermodal transport is simply a transport route involving multiple modes. Most passenger travel is either exclusively road travel or intermodal, for the simple reason that road travel is necessary to reach the airport, train station, or harbor. This may be provided by shuttle buses, by taxis, by the passenger's own vehicle, or by public transportation.

Intermodal freight transport is extremely common. Containerization is a popular system of intermodal freight transport, using ISO (International Organization for Standardization) containers that can be transported by plane, ship, truck, or train without opening the container and handling the freight. The use of containerization has greatly increased the efficiency of ports and of freight handling at airports and train stations. Roughly similar boxes were in use from the early days of railroads in order to make it easier to shift freight from train cars to other forms of transport, and for reasons of practicality various railroads began using containers that were more and more alike.

When the first railroads standardized their containers in the 1920s, others soon followed, and American military transport needs further encouraged standardization throughout the 1940s and 1950s.

The first purpose-built container ships, designed expressly to transport freight in standardized containers, launched in the 1950s. Intermodal freight transport took advantage of standardized containers at the same time, using trains, ships, and trucks to ship freight in the Yukon and Alaska. The deregulation of American transportation industries in the 1970s and 1980s made containerization more practical; prior to deregulation, special permissions were needed if a single transport vehicle carried multiple types of freight, an impediment to many of the benefits of containerization.

In the 21st century, 90 percent of nonbulk cargo travels by standardized container, on ships carrying thousands of shipping containers in five standard sizes, most of them roughly the size of rental storage units or small apartments. Special trucks and train cars have been designed to accommodate standard containers with a minimum of wasted space. Containerization has revolutionized freight security: knowing what is in the containers requires a level of knowledge that the casual criminal simply doesn't have, usually requiring illicit cooperation with someone directly involved with the transport.

Transport Economics

A branch of civil engineering, transport economics analyzes the distribution of resources in transportation systems. It is crucial for transportation providers to understand the supply and demand in their field, the effects of competition, and potential externalities—in no small part because the costs of infrastructure are so high, and it can be time-consuming and expensive to adjust to circumstances that haven't been properly planned for. Transport economics examines not only the business applications of transportation, but urban planning issues such as traffic congestion, road space, and the impact and costs of public transportation.

Transport Delays

Global commerce depends on the smooth, reliable movement of materials, parts, and finished goods through their respective supply chains. However, as supply chains become more globalized with longer distances and lead times, there are greater possibilities for a shipment to be in transit longer than its expected delivery time. Sources of transport delays range from issues such as capacity constraints, missed transshipments, or lengthy customs processing, to natural disasters or terrorist attacks.

The impact of transport delays can be far reaching, with operational and financial costs on the immediate parties involved and ripple effects extending to unrelated parties. Successful businesses attempt not only to address the causes of transport delays, but also to build buffers in their systems and to develop contingency plans so that they can continue business operations with minimal effects.

Industry statistics reveal that transport delays are a common occurrence, although differences between transportation modes are considerable. Ocean freight is the most prone to delays. Analyzing the schedule reliability of ocean freight liner services, Drewry Shipping Consultants found that 21 percent of vessels arrived one day late, 8 percent arrived two days late, and 14 percent arrived three or more days late. Comparing individual shipping lines, performance ranged from an on-time arrival rate of only 4 percent to over 90 percent for the best-performing carriers. Road and air freight typically experience the least delay. Cargo 2000, an air freight industry association, reports that approximately 90 percent of air shipments are "flown as planned."

Causes of Transport Delays

Many causes of transport delays are chronic in nature. Examples include congestion, weather changes, missed connections, or security and customs processing. Limited port capacity can cause port congestion, forcing cargo ships to wait days to be unloaded. Likewise, roads and rail lines may be inadequate to meet demand, particularly during peak periods. For major U.S. road corridors, the Federal Highway Administration calculated buffer time indexes of 5–45 percent, indicating how much extra transit time should be allowed because of system variations caused by traffic congestion, weather, incidents, and work zones. Similarly, a transit time analysis for trucks in southern India found average delays of over 30 percent. Poor coordination presents additional problems.

For example, European industry data on combined transport trains showed that the major causes of delays were missing locomotives or staff at handover points along the route. These delays can be compounded by each connection or segment in a shipment's transport. One day's delay can result in a container missing its transshipment to another vessel, train, or truck. In the case of ocean liner services, it could be a week or longer until the next scheduled vessel.

Other transport delays are triggered by unusual events or circumstances. Examples include the September 11, 2001, terrorist attacks in the United States, which led to a disruption of air traffic for many days, as well as long delays for trucks at border crossings. Natural disasters such as the 2004 southeast Asian tsunami or Hurricane Katrina in 2005 also disrupted supply chains. Likewise, the 2003 West Coast port strike led to extensive delays that disrupted the holiday shopping season for U.S. retailers and customers, and impacted unrelated parties when cargo ships could not maintain their schedules. In other cases, a confluence of factors can create unexpected delays, as happened in 2008 at the Panama Canal when maintenance work, high demand, and labor slowdowns combined to delay cargo ships as long as 10 days.

Impact and Prevention

Transport delays can have a major impact on a firm's costs and its ability to maintain high customer service levels. In time-sensitive industries, serious delays may cause products in transit to spoil or depreciate in value by the time they are delivered. The industry trends of Just-in-Time and lean manufacturing aggravate a supply chain's vulnerability to transport delays, as a late shipment can leave a retailer's shelves empty or shut down a manufacturing plant if it runs out of a needed part. To guard against delays and other disruptions, firms typically hold extra safety stock inventory as a buffer. However, extra inventory comes with high holding costs. One case study showed potential differences in inventory holding costs of $0.4 million to $3.1 million annually because of unreliability in liner schedules for a company making regular shipments between Brazil and South Africa. Delays may also compel a firm to pay higher costs to expedite a shipment to keep needed items in stock.

At the macro level, transport delays can be reduced by identifying and addressing bottlenecks in transportation infrastructure. This requires a systems approach, as increasing a port's capacity to relieve congestion will have limited effect if inland carriers also lack sufficient capacity. Customs and security screening procedures can be streamlined to facilitate timely processing. By providing early notice of a shipment's contents to relevant government agencies, advance manifest initiatives allow clearance processes to begin even before arrival. Free trade agreements and common markets also minimize procedural delays. The European Union, for example, has eliminated almost all border clearance requirements within its 27 member countries.

At the firm level, shippers and carriers can analyze their processes to identify and address the causes of delays, as well as develop contingency plans for dealing with late shipments. When choosing carriers, firms should compare carriers' on-time reliability and recognize that the savings in transport costs for a less-reliable carrier may be negated by higher costs from stockouts, expediting, or increased inventory safety stock.

Treaty of Rome

The Treaty of Rome is the multinational economic agreement that created the European Economic Community (EEC), the forerunner of the European Union (EU), in 1958. Following two years of negotiations that began in Messina, Italy, in 1955, the Treaty of Rome was signed on March 25, 1957, and came into effect on January 1, 1958. An early example of European supranationalism, the objective of the Treaty of Rome was the creation of closer economic and political linkages between signatory nations including the founding of a common market and customs union.

The treaty was an example of the evolving 20th-century trend of European economic supranationalism. The effects of World War II motivated many European nations to adopt policies of closer economic and political cooperation. The Benelux Agreement (1944) established a common market between Belgium, Netherlands, and Luxembourg to facilitate more rapid economic recovery from the war. The success of the Benelux Agreement helped advance the idea of economic supranationalism in Europe, and the foreign minister of Belgium, Paul-Henri Spaak, was a key figure in the proposal and adoption of the Treaty of Rome.

Political considerations were also a factor in the Treaty of Rome. Many in war-torn Europe, including British prime minister Winston Churchill, began to advocate a federation among European nations as a catalyst for peace and stability and to more efficiently rebuild the economy and infrastructure of the continent. In 1951, the European Coal and Steel Community (ECSC) was created to remove both strategic industries, vital to warfare, out of the control of individual countries and place them under the regulation of a multinational authority. The ECSC established the foundation of the Treaty of Rome and the EEC by creating common markets among several European nations for coal and steel and by creating many of the institutional policies and structures that would later serve as the pattern for much of EEC bureaucracy. While the Treaty of Rome did contain elements addressing the goal of political cooperation, it stopped far short of creating a European political federation and was primarily focused on creating economic cooperation.

The Treaty of Rome created four distinct institutions, each of which would be managed by officials, judges, parliamentarians, and bureaucrats from member nations: the European Parliament, the Council of Ministers, the European Commission, and the European Court of Justice. The treaty reduced tariffs among the six original member states by 10 percent. However, the signatories of the treaty foresaw the development of more meaningful linkages including the elimination of all tariffs in the future. In the first decade of its existence, trade increased 400 percent among the members of the EEC.

The heads of state of six European nations signed the Treaty of Rome: Belgium, France, Italy, Luxembourg, the Netherlands, and West Germany. Known originally as the Treaty Establishing the European Economic Community, the document was later renamed the Treaty Establishing the European Community. The alteration of the formal name of the Treaty of Rome was facilitated by the Maastricht Treaty of 1992, which established the EU and in effect superseded the Treaty of Rome and the EEC.

The Treaty of Rome was controversial, and the concept of a politically or economically unified Europe was not supported by all segments of European society. Britain was invited to participate in the Treaty of Rome and join the EEC but declined, regarding the process as an affront to its national sovereignty and as unwanted interference in its national economy. Internal opposition to the treaty existed within the signatory nations as well, often stemming from nationalist sentiment, fear of erosion of national identity, and distrust of other nations and the multinational bureaucratic entity that the treaty would create.

In France, Charles de Gaulle opposed his nation's participation in the treaty and as he would eventually regain power as France's head of state, the signing of the treaty was undertaken in a hurried fashion in order that the French government at the time could sign the document and bind France to the Treaty of Rome before de Gaulle could return to power.

Trinidad and Tobago

Trinidad and Tobago is a twin-island republic located in the southern Caribbean approximately seven miles off the coast of Venezuela. Trinidad, the larger of the two islands, is situated at Latitude 10 1/2 degrees N, Longitude 61 1/2 degrees W and occupies a total area of 3,000 sq. mi. Tobago, the smaller of the two islands, is located at Latitude 11 degrees N, Longitude 60 degrees W and occupies a total area of 186 sq. mi.

The islands of Trinidad and Tobago were discovered by Christopher Columbus in 1498. Trinidad became a British colony in 1802 and was enjoined administratively to Tobago in 1889. Trinidad and Tobago achieved independence from Britain in 1962 and became a republic in 1976. Trinidad and Tobago follows the Westminster system of government and has two major political parties—the People's National Movement (PNM) and the United National Congress (UNC). With the exception of the 1986–91 and 1995–2001 periods, the country has been ruled by the PNM. English is the official language of Trinidad and Tobago and the country has a population of 1.3 million. The population is comprised of 40 percent people of African descent and 40 percent of Indian descent. The remaining 20 percent of the population is made up of people of European, Chinese, or Middle Eastern ancestry.

In 2006, the per capita gross domestic product (GDP) of Trinidad and Tobago stood at approximately $17,000. This was up from roughly $10,000 in 2001. The economy grew at a rate of 12 percent in 2006, up from just over 4 percent in 2001. Over the period 2002–06, the economy has averaged growth in the region of 9.7 percent. Growth of the Trinidad and Tobago economy is driven largely by the energy sector. In 2006, the petroleum industry accounted for some 47 percent of the country's total GDP with the exploration and production subsector being the major contributor. The energy sector is focused on the production of natural gas and related downstream activities.

The country is a major exporter of ammonia, methanol, and direct reduced iron, and is the number one exporter of liquidized natural gas (LNG) in the Western Hemisphere. This export composition represents a fundamental shift in the energy sector, which has traditionally focused on oil production. The government of Trinidad and Tobago (GOTT) collected revenues in excess of $69 billion from the energy sector over the six-year period ending fiscal 2007. It should be noted, however, that the Ryder Scott Hydrocarbon audit report indicates that Trinidad and Tobago's proven natural gas reserves are at 17.05 trillion cubic feet (tcf); probable reserves are at 6.23 tcf; and possible reserves are at 7.76 tcf. This report suggests that the country's natural gas reserves would be depleted in 12 years, assuming no further successful exploration and current levels of utilization.

GOTT's energy policy calls for continued diversification of the energy sector and the promotion of downstream industries that strengthen linkages with the rest of the economy. In this regard, GOTT's budget for fiscal 2007 prioritized a number of major gas-based projects which included the following:

The Alutrint Smelter. This aluminum smelter has a planned capacity of 125,000 tons per annum and is a joint venture of GOTT (60 percent) and Sural of Venezuela (40 percent). The plant will produce rods, wires, and cable, with plans to establish production facilities for the manufacture of wheel alloys, car wheels, and rims.

The Essar Steel Complex. This integrated steel complex is designed to produce flat hot rolled coil, as well as hot briquette iron and slabs. A unit of Indian conglomerate Essar Global will own and operate the facility in Trinidad, and has signed an agreement to purchase 140 million cubic feet of natural gas per day for the plant.

The Methanol Holdings AUM Complex. Methanol Holdings (Trinidad) Ltd. (MHTL) owns and operates five methanol plants in Trinidad with a combined capacity to produce over 4 million metric tons of methanol per year. MHTL is the second-largest producer of methanol in the world. MHTL is establishing a new petrochemical complex for the production of 1.5 million tons of urea ammonia nitrate and 60,000 tons of melamine per annum.

The Gas-to-Liquids Plant. This plant is a joint venture between World GTL, Inc., and the Petroleum Company of Trinidad and Tobago (Petrotrin), GOTT's wholly-owned integrated petroleum company. World GTL is a New York–based company established in 2000, while Petrotrin was established in 1993 and is involved in a range of activities from exploration and development to the manufacture and sale of products including gasoline, liquefied petroleum gas (LPG), and kerosene. Gas-to-liquid (GTL) technology involves the chemical conversion of natural gas to liquid fuels. The Trinidad plant will produce 2,250 b/p/d GTL and will require 21 million cubic feet per day of natural gas feedstock for its operations.

The Methanol/Propylene/Polypropylene Project (MPPP). This plant is expected to have a capacity of 160,000 tons per annum and will provide the necessary building blocks for the development of a plastics industry.

Tunisia

Located in north Africa, Tunisia has a population of 10 million, and was in ancient times the location of Carthage, the capital of the Carthaginian Empire. It then became a part of the Roman Empire, later being captured by the Arabs, and then was absorbed into the Ottoman Empire. Occupied by France in 1880, it gained its independence in 1956.

During the Carthaginian Empire, the area that is now Tunisia was the center of a rich and powerful civilization that had established itself as the center of a trading empire, with the Carthaginians exploiting the silver mines in Spain. However, the wealth of the city was sapped by the Punic Wars, and the city itself was sacked by the Romans in 146 B.C.E. Although the Romans built a new city on the site, it never regained its former glory. Cities and towns in Tunisia were stops on caravan routes across north Africa, but these declined with the increase in shipping. Under the Ottoman Turks, the city of Tunis became a center of learning and was also relatively wealthy, persuading the French to take it over in 1878, with their army taking control of the country two years later.

Under the French, the economy of Tunisia was linked to that of the French Empire, and many French and other European settlers moved to Tunisia, although more had moved to neighboring Algeria. After the fighting in World War II between the Germans and the Allies, the Axis was driven out in 1943, and nationalists started to agitate for independence from France, heavily influenced by events in French Algeria. This came about in 1956, with Habib Bourguiba becoming president of the country, a position he held until 1987. During that time, Bourguiba introduced many economic policies that resulted in the country becoming socialist, yet also taking a political stance of being largely nonaligned. During the 1970s, plans were broached to establish a gas pipeline through Tunisia, which would take natural gas from Algeria to Italy. With the rise in the price of oil, exploration in Tunisia located several new deposits to add to the Ashtart oil field, which started operations in 1973.

There were periods of economic stagnation, and there was labor unrest in 1968, 1978, and 1984. It also saw large numbers of import controls that helped with the development of industry in the country, although some of these were not as efficient as their competitors overseas, leading to problems when free trade policies were introduced in the 1990s. One of these was the textile industry established at Kairouan. President Bourguiba managed to get some concessions from the European Economic Community for Tunisia's exporting its textiles to their member states, but gradually these quotas were reduced. Carpets and rugs continue to be made in Tunisia for the export trade, and the craft industry has continued to operate in some parts of the country.

Following the overthrow of President Bourguiba, there were moves by the new government to free up the economy of the country and introduce free market reforms. However, the government started facing problems from Islamic fundamentalist groups, with events in Algeria once again impacting heavily on Tunisia. This coincided with a communist party, called the Mouvement de la Renovation, becoming a political force, as the government sought to implement reforms suggested by the World Bank. There were certainly allegations of human rights abuses, and when Bourguiba died in 2000 at age 96, tens of thousands of Tunisians turned up at his funeral to mourn someone who had presided over a long period of economic success.

The country's economy had slowly transformed after independence, but France accounts for 33 percent of Tunisia's exports and 25 percent of its imports. The agricultural sector continued to decline, and although it still employs over half the workforce of the country, it now makes up only 14 percent of the gross domestic product (GDP). Industry accounts for 23 percent of the workforce and contributes 31 percent of the GDP, while the service sector—which employs only 22 percent of the workforce—makes up 55 percent of the nation's GDP. Much of the income from the service sector comes from tourism, with Tunisia presenting itself as a safe, sunny destination, containing historic remains, for many European tourists. Indeed, 6.38 million tourists (2005) come to the country each year.

Turkey

Because of its geographical location, many businesses have operated from Turkey since early modern times, and the cities of Constantinople (now Istanbul) and Smyrna (now Izmir) were some of the busiest ports in

Workers sort through paper at a Turkish recycling plant. Turkey's economy has remained fairly strong with government involvement in the economy, particularly in the areas of banking, transportation, and communications.

the eastern Mediterranean. Many of the early western and central European trading companies operated through the Ottoman Empire, which then ruled the region from Constantinople, the most well-known being the British Levant Company and the Austrian Danube Steam Navigation Company.

Because of its pivotal position in terms of communications, the Ottoman Empire was one of the earliest countries to establish a telegraph line, the first being built in 1847. In 1881, the first telephone service was opened in Constantinople, but it was not until 1931 when telephone lines were run to Sofia, and then through to Berlin, that international calls were possible. And from the 1880s through to the early 20th century, the Austro-Hungarian, French, German, Italian, Romanian, and Russian governments all operated post offices in the country, mainly on the basis of ensuring regularity of business mail.

The loss of most of what was left of its European territories in the early 20th century, and its defeat in World War I, transformed the country and led to the creation of the Republic of Turkey in 1923, with its capital at Ankara. Constantinople was renamed Istanbul, but remained the center of much of the commerce in the country. By that time the Turks had won a war against the Greeks, and the victorious Turks had captured Smyrna and the other largely Greek port cities, expelling or killing the Greeks and causing most of the third country nationals to flee.

Modernizing Turkey

Under Ataturk, the new leader of Turkey, the country was modernized and transformed, dropping the script based on the Arabic script and using the European script. In 1930, the central Bank of the Republic of Turkey was established. Ataturk's aim was to build a new and vibrant country, and although he set the scene for what was to follow, most of the real economic transformation came after his death in 1938. Turkey remained neutral in World War II, and benefited from the U.S. investment in the country following Turkey's joining NATO and its use to station U.S. missiles. Turkey became a founding member of the Organisation for Economic Co-operation and Development (OECD) in

1961. The 1960s and the early 1970s were periods of economic growth, although Turkey had three military coups—in 1960, 1970, and 1980. The third one, on September 12, 1980, followed a long period of economic problems with inflation running at 130 percent a year, and political and criminal gangs acting with seeming impunity, frightening foreign investment, especially after Turkey's military intervention in Cyprus in 1974.

Following the restoration of democracy gradually during the 1980s and the reemergence of Suleyman Demirel, a former prime minister, as the president of the country in 1993, moves were made to bring the Turkish economy in line with those in Europe. Turkey began trying to get membership of the European Union, and became a member of the EU Customs Union on December 31, 1995. Although major unresolved political issues in the country remain, the economy has remained fairly strong with government involvement in the economy, with banking, transport, and communications being significant. There is wide disparity in wealth, with figures for *Forbes Magazine* in March 2008 showing that Istanbul had 35 billionaires, the fourth highest in any city after Moscow, New York City, and London.

In the agricultural sector, Turkey remains the largest producer of apricots, cherries, hazelnuts, quinces, and pomegranates, and is the second-largest producer of chickpeas, cucumbers, and watermelons. It is also a significant producer of apples, lentils, olives, tea, tobacco, and tomatoes. However, the vast majority of the agricultural sector still consists of small family-operated plots of land, and although it employs some 36 percent of the workforce (2005), it generated only 12 percent of the GDP of the country.

The industrial sector employs 23 percent of the workforce (2005), and makes up 30 percent of Turkey's GDP, with textiles and clothing (16.3 percent in 2005) being the largest sector, followed by oil refining (14.5 percent), food (10.6 percent), chemicals (10.3 percent), iron and steel (8.9 percent), and automotive production (6.3 percent). For the latter, the Devrim was the first car made in Turkey in 1961, and another Turkish car, the Anadol A1, became popular in the late 1960s and early 1970s. Turkey now produces nearly as many cars as Italy, and produces more television sets than any country in Europe. In terms of shipbuilding, Turkey is ranked number four in the world, after China, South Korea, and Japan.

In the service sector, tourism remains strong, with over 27 million foreign visitors to the country in 2007. Most people visit Istanbul, but many also visit the Mediterranean resorts in what has become known as the Turkish Riviera. The sites of World War I fighting at Gallipoli still garner much interest from Australian and New Zealand tourists.

Turnkey

Turnkey refers to something ready for immediate use, or to the creation of a turnkey project, or to some other business practice. A turnkey business is one that is delivered with everything that is needed for operating the business immediately. A turnkey operation is one that delivers a product or service that can be used immediately by the buyer just by "turning the key." When the term *turnkey* is used for something that is ready for immediate use, the reference is to something that is ready almost in a "plug-and-play" fashion.

Types of Turnkey Goods and Services

In the construction industry, a "turnkey" job is one in which materials may be bundled by a supplier for a job that is standardized. A supplier for a turnkey plumbing job in a new house would bundle the parts, such as the toilet, pipes, connections, faucets, tub, shower stall, shower door, and other parts. This practice would allow the plumber to work without reference to a general contractor.

In the motor sports industry, a turnkey car would be one in which a car can be custom-built for a customer, who avoids the costs of locating parts, performing the labor, and doing all other tasks that are needed to restore or to rebuild a custom automobile, especially in the case of rebuilding a classic. A racer in the motor sports industry may also want to drive a race car that has a particular drivetrain or to use parts from a previously raced car. The parts can be incorporation into the turnkey car.

Established businesses are often advertised for sale as a turnkey business. The benefit is that the buyer is given the keys to the business, and then only has to turn the key to the door to be in business. New start-up businesses can also be turnkey businesses that are standardized and ready for operations, from the implementation of a complete package of construction and management tools.

A turnkey property in real estate sales is one that is ready for immediate occupation. Luxury vacation homes or vacation rentals are offered as turnkey properties, offering all possible amenities. However, if the property has to go through a turnkey process, then it refers to an open location that must be selected, negotiated for sale or lease, planned, constructed, furnished, and then occupied. For example, a department store or a store of any size, even a big box store, must go through various processes, which include stocking the store before the doors open. However, the project becomes easier, eliminating some of the uniqueness inherent in projects, if it is a turnkey project that has standardized and repetitive features.

Current business practices sometimes refer to projects that are called *turnkey projects*. These types of projects involve separate organizations being responsible for setting up the parts of a project, and then putting it into operation.

Projects are unique activities that have a beginning, middle, and an end. They are usually very specific sets of jobs that can be small, medium, or enormous in size. Turnkey projects are projects that are viewed systemically as a set of jobs. The various phases of the project are handled by different companies or organizations as sets of jobs, which may be construction, finishing, deliveries, equipment installation, testing, training, or other sets of tasks. The jobs in a turnkey project may be contracted to different organizations. The bidders may offer the best price or performance or other qualities needed to complete that part of the project. Sometimes turnkey projects are extended to become turnkey plus projects.

In the developing world, the purchase of turnkey projects from suppliers or franchisers has the advantage that the whole business is built, supplied, installed complete, and ready to open with employees trained and inventory available for sale or use. This approach cuts the costs to enter into a global market. It also allows entrepreneurs to invest at known costs and profit expectations in places such as Africa or South America. African mining interests have installed turnkey smelters at favorable locations, for example.

The globalization of the music industry has been coupled with the spread of the Internet. The use of turnkey Internet products and multimedia products allows for recordings that can be delivered via the Internet from locations previously unlikely for production.

Many companies globally are offering turnkey solutions to business needs, such as a company Web page that is designed and installed as a single project by another company. Other computer solutions are offered as a package that enables the users to participate in a global business almost immediately, if not immediately. However, any entrepreneur who is purchasing a turnkey business must exercise due diligence to make sure that the turnkey package actually includes everything needed.

Tyco International

Tyco International, headquartered in Bermuda, is a manufacturer of industrial products and provider of services to businesses and consumers. Tyco was founded in 1960 as a research laboratory to do work for the government. Tyco was incorporated in 1962 as Tyco Laboratories, and went public in 1964. Beginning in 1965, the company began to acquire other companies and between 1986 and 2005, the company grew rapidly through major acquisitions. The company's name was changed to Tyco International Ltd. in 1993 to reflect its worldwide presence.

In July 2007, Tyco International divided itself into three independent public companies by spinning off its passive electronics components manufacturing (Tyco Electronics) and its healthcare unit (Covidien). Tyco International now focuses its business on providing fire and security services and engineered products. Tyco International has approximately 118,000 employees who work in more than 60 countries.

Tyco's Business Segments

Tyco International is organized by five business segments: ADT Worldwide, Fire Protection Services, Safety Products, Flow Control, and Electrical and Metal Products.

ADT Worldwide provides electronic security monitoring services and devices to residential customers, commercial customers, industrial customers, and governmental customers. ADT employs 57,000 people, has 40 monitoring centers, and operates 500 offices in more than 50 countries around the world. Among its clients are eight of the top 10 global logistics companies, eight of the top 10 U.S. banks, and 80 of the world's top 100 retailers. In addition to fire, health, and intrusion monitoring services, ADT services provide access control, video surveillance, radio frequency identification, and antitheft services.

Fire Protection Services provides fire detection, fire suppression, and special hazard services to commercial, industrial, and institutional clients. Its clients include hospitals, hotels, commercial ventures, petrochemical plants, schools and universities, government facilities, airports, and ships at sea.

Safety Products manufactures and sells products in three areas: electronic security, life safety, and fire suppression. It produces many of the devices used by Tyco's ADT and Fire Protection units. Its security and surveillance products are in use at more than 300 airports. Its Scott brand breathing apparatuses are used by more than 15,000 fire departments. Its Ansul brand fire suppression products protect more than 75 percent of the top 100 oil and gas refineries. The Safety Products unit has 38 manufacturing facilities worldwide and serves customers in more than 100 countries.

Flow Control provides pipes, valves, valve automation, fittings, and heat tracing solutions to a variety of industries. Flow Control serves the food and beverage industry, the oil and gas industry, the power industry, the chemical industry, the water and wastewater industry, as well as process industries. Flow Control has more than 100 manufacturing and service locations in 24 countries serving its worldwide client base.

Electrical and Metal Products provides steel tubing and pipes, armored and coated wire and cable, metal framing products, and other metal products used in construction, mechanical, electrical, fire and security, and automotive applications. Electrical and Metal Products has 45 manufacturing and distribution facilities worldwide.

Company Goals

Management has a number of strategic goals for Tyco International. The company will expand through organic growth as well as through targeted acquisitions to broaden its range of products and services within the focus of its portfolio. The company will increase its presence in emerging markets, especially in India and China. For example, in April 2008, the company opened a research and development (R&D) center in China, its 15th worldwide, to better understand the local needs of its customers in China. The company will enhance its efficiency through its Operational Excellence initiatives. Tyco International also emphasizes its core values of integrity, excellence, teamwork, and accountability in its daily activities.

For 2007, Tyco International had revenues of $18.8 billion. Of those revenues, $8.9 billion were from the United States; $5.5 billion were from Europe, the Middle East, and Africa; $3 billion were from the Asia-Pacific; and $1.4 billion were from the other Americas. Its diluted earnings per share from continuing operations before special items was $1.93. Strong first-quarter earnings in 2008 led to an upward revision of revenue growth from 8 to 12 percent. Revenue improved in all five business segments.

UBS

UBS AG is a global financial services company headquartered in Basel and Zurich, Switzerland. The company identifies itself as the leading global wealth management organization, a top-tier investment banking and securities firm, one of the largest global asset managers, as well as a market leader in Swiss private and commercial banking. The company also characterizes itself as a global, growth-oriented business that creates value by combining its expertise and finding synergies across the board.

UBS, as it is known now, was created in 1998. The company's roots, however, go deep into the 18th century when the first branch of UBS's predecessor, the Swiss Bank, was established. The company grew organically, and through various mergers and acquisitions, including such prominent acquisitions as the investment purchasing of banks Dillon Read (United States) and S. G. Warburg (United Kingdom). In 1998, the bank's direct predecessor, the Union Bank of Switzerland, merged with the Swiss Bank Corporation (SBC) creating a new company called UBS—which at that time ceased to be just an abbreviation for the Union Bank of Switzerland, but rather became a new brand name. In 2003, all UBS businesses and business groups—including UBS Warburg, UBS Paine Webber, UBS Asset Management, and so forth—relaunched under the common UBS brand name and under the same corporate logo—the three crossing keys that represent confidence, security, and discretion.

At present, UBS provides its clients with a variety of services, which are divided into three core business components. As a wealth manager, UBS provides its high-net-worth clients with customized solutions, ranging from asset management to estate planning to corporate finance. As a global asset manager, UBS advertises innovative investment management solutions to private, institutional, and corporate clients. These solutions involve offering its clients investment instruments associated with traditional assets, such as real estate, fixed income assets, and so forth, as well as some more advanced investment vehicles, like multimanager funds, hedge funds, and so on. As an investment banker and securities trader, UBS offers its corporate, institutional, and other clients research and securities products—anything from foreign exchange, energy and precious metals trading, fixed income instruments, and many others.

Although UBS has always positioned itself as a good corporate citizen, the company has not been able to avoid some major controversies throughout the years. For instance, in 2001, the company was accused of "sinking" Swissair by refusing to extend the line of credit to the national carrier in distress. In 2004, Indian government and business circles in India alleged that UBS played a significant role in the stock market crash, which resulted in the change of political power in that country. In 2005, the company was accused of racial discrimination in hiring and promotion, as well as of unfair employment practices in some of its U.S. branches. Although the lawsuit was later dismissed, it has left UBS with a somewhat damaged reputation. The most recent controversy played out in the last quarter of 2007, when Peter Wulffi had to step down as chief executive officer (CEO) of the company, bowing to pressure from the major stakeholders, amid enormous write-offs related to banking losses in the United States.

Recent Financial Performance

Up to the end of 2006, UBS has remained one of the world's most profitable financial services institutions, with posted net income of about CHF11.25 billion (or $9.4 billion at the time). Until 2007, the mixture of financial expertise, prudence, and risk aversion seemed to be working perfectly well for UBS and its major stakeholders. Starting in 2007, however, the financial performance of UBS has gone down tremendously, mainly because of massive losses the company had to endure due to the U.S. subprime mortgage crisis, as well as some expert-recognized blunders in the area of structured products and leveraged finance. In April 2008, the company reported that it expected to post net losses of about CHF12 billion (approximately $12 billion) in the first quarter of 2008, and that it would also take further losses and write-offs totaling approximately $19 billion on U.S. real estate and credit positions.

Despite financial underperformance and controversies, UBS remains a strong player in the financial services markets worldwide. The company's other business units are strong, and are expected to offset, to a certain extent, major financial losses in the banking sector. UBS has been thought to be among the best companies to work for—as an example, it has various active diversity programs, and it has been recognized as one of the 100 Best Companies for Working Mothers in the United States for several years in a row. UBS is also well known for its many sports sponsorship activities, including its close affiliation with Alinghi, an international sailing team participating in the prestigious America's Cup competition.

Ukraine

This European country was an independent nation until the 14th century, when parts of it were integrated into the Russian Empire, which gradually came to control nearly all of what had historically been the Ukraine. After the Russian Revolution, the Ukrainian Soviet Socialist Republic became a constituent part of the Soviet Union, but it gained its independence in 1991, becoming the Republic of Ukraine. Because of its long economic and political domination by the Soviet Union, until recently most of its major companies were successors to Soviet state enterprises.

History of the Ukraine

As far back as 1000 B.C.E., people in the Ukraine became known as cattle breeders—the Greek writer Homer makes mention of them—and later of horses. The Scythians and later the Sarmatians were involved in fighting the Romans. Trade in medieval times was along newly emerging trade routes, especially along the Dnieper River. In early modern times, the economy of the Ukraine was dominated by agriculture—with the Steppes producing much of the wheat for the region—and also heavy industry, with large underground coal fields and iron ore. There was also extensive trade around the port of Odessa in the Black Sea, which was increased with the development of Sevastopol as a major port, although its transformation into a Russian naval base sparked the Crimean War of 1853–56. During the latter part of the 19th century, much money—both Russian and foreign—was invested in building a large railway network, linking all parts of the Ukraine with European Russia. In Tsarist Russia, Kiev had a prominent role in publishing, containing a large number of printing firms, an industry that continues to the present day.

As a part of the Soviet Union, the Ukraine was a major source of hard coal, brown coal, iron ore, and industry. Kiev, the capital of the Ukraine, was one of the major industrial cities in the 1920s, and had extensive industrial capacity in regional centers, such as the city of Dnipropetrovsk. Much of the Ukraine was also involved in agricultural production, which led to the collectivization of the medium-sized farms run by the kulaks, or richer peasants, from 1929. The goal was to redistribute land to poorer peasants to increase production, but this failed disastrously with up to 400,000 kulaks being killed or dying. This wrecked the local economy, made considerably worse with the German invasion of the Ukraine in 1941, when much of the region was captured by the Germans and devastated by the war.

After the end of the Great Patriotic War, as World War II was known in the Soviet Union, there was a major rebuilding process. Dnipropetrovsk, a "closed city," became a major industrial and indeed political center. Many of the party elite under Leonid Brezhnev were from Dnipropetrovsk, giving it an important role within the region. The major industrial concerns in the Ukraine at this time included the Belotserkovshima Production Association, the Dnipropetrovsk Industrial Corporation, the Donetsk Excavator Plant, the Kharkhov Tractor Plant, the Mayak Kiev Plant, the Stankiev Machine-Tool Production Company, the Vinnetsa Plant for Tractors, and others located in and around specific cities.

USAID helped a Ukraine pickle cannery increase its production, leading to more income for farmers and cannery workers.

Postindependence

After independence in 1991, many of the government-owned industries that had operated in the planned economy were sold to the private sector, often at low prices, enabling people like Yulia Tymoshenko from Dnipropetrovsk to become massively wealthy. She gained the title "gas princess" due to her role as the president of the United Energy Systems of Ukraine, and her involvement in importing natural gas to the Ukraine from the Russian Federation. There was also considerable restructuring of the economy through programs of the World Bank and the International Monetary Fund.

About a third of the workforce in the country work in industry, and a quarter work in agriculture. The main industries in the Ukraine remain coal, electric power, iron, and other mining and extraction industries—manganese, nickel, and also uranium—and the manufacture of machinery and transport equipment. There is still heavy reliance on nuclear power, even after the Chernobyl disaster of 1986, and some 43.4 percent of electricity in the country is from nuclear power stations. In recent times, there has been an expansion of high-tech industries in Kiev. Ukraine is a member of the GUAM Organization for Democracy and Economic Development and the World Trade Organization (WTO).

Uncertainty Avoidance

Uncertainty is a fact of organizational life, and all organizations develop mechanisms for coping with it. However, not all organizations behave alike in their effort to avoid perceived uncertainty. According to Geert Hofstede, this is because uncertainty avoidance is a culture-dependent variable, and not all firms are embedded in similar cultures. Understanding this cultural dimension can, therefore, be helpful for making sense of particularities observed in the organizational context.

According to Hofstede, seeking recourse to the levels of uncertainty avoidance of the country in which an organization functions is a reliable guide for understanding its organizing processes and possibly predicting its reactions in the face of novel situations. Because cultures are considered to be highly country-specific, the patterns of behavior that individuals tend to exhibit are significantly affected by the cultural milieu in which they find themselves, for the reason that culture is seen as the collective mental programming of individuals.

Strong uncertainty-avoiding countries tend to feel more threatened by the unknown aspects of the world, versus weak uncertainty-avoiding ones that do not experience uncertainty with analogous degrees of threat. As far as organizations are concerned, the dissimilar levels of intolerance toward ambiguity affect firms' reactions in the precautions that they take to "combat" uncertainty. We should thus expect the procedures of Japanese firms to be quite different from those developed by Singaporean ones, because Japan is in the upper echelons of the uncertainty avoidance ranking, while Singapore is the least uncertainty-avoiding country in the relevant index.

Coping by Using Technology, Rules, and Rituals

More specifically, according to Hofstede, organizations cope with uncertainty through technology, rules, and rituals. Concerning the technological dimension, high uncertainty-avoiding firms are particularly prone to adopting technological solutions and are thus more likely to seek guidance from external agencies that they see as experts. By contrast, low uncertainty avoidance firms appear more skeptical regarding solutions of this kind.

With respect to rules, strong uncertainty avoidance cultures are more fertile for the structuring of activities. This is explicable by the fact that formalization, standardization, and specialization function as absorbers of the anxiety provoked by perceived uncertainty, by making the unknown seem more controllable. Although rules constrain the possible actions that may be undertaken, this "limitation of freedom" is in an important sense anxiety reducing in absolving agents from the burden of having to choose between alternative courses of action with uncertain outcomes. On the other hand, firms in weak uncertainty avoidance cultures are expected to function less uncomfortably in relatively unstructured environments. This means that employees are more likely to take initiatives and possibly bend formal and informal rules, if they believe that acting accordingly will be beneficial for their organization.

Last, pertaining to rituals, strong uncertainty avoidance cultures are more susceptible to adherence to established patterns of behavior that do not necessarily increase the efficiency of the organization, but instead function as a "comfort blanket." In contrast, weak uncertainty avoidance cultures are less prone to succumbing to ritualistic behaviors because they are less likely to be paralyzed by anxiety.

Uncertainty Avoidance Differences

It should be noted that high uncertainty avoidance cultures are not superiorly rational compared to low uncertainty avoidance ones, or vice versa. The uncertainty avoidance dimension is simply meant to document culturally conditioned tendencies in collective behaviors, without taking an evaluative stance. There are, of course, situations in which we may reasonably expect the levels of uncertainty avoidance to have a direct impact on the achievement of certain ends.

For instance, strong uncertainty avoidance cultures feel more threatened by deviant ideas and are thereby plausibly expected to be more resistant to change. From this perspective, the levels of uncertainty avoidance can explain the different levels of innovative activity across countries. While inventions may indeed develop more frequently in weak uncertainty avoidance cultures, strong uncertainty avoidance ones may, however, be more suitable for the commercialization of innovative ideas.

Finally, it should be highlighted that according to Hofstede, the workplace is only one of the social arenas influenced by culture. Concerning the dimension of uncertainty avoidance, he stresses that it can explain not only the persistent differences observed in the workplace, but its explanatory power also extends to the domains of legal, political, and educational organizing, not to mention a society's philosophical and religious predispositions. For example, Hofstede argues that people in strong avoidance cultures tend to believe in truth "with a capital T," and more often ascribe to the dogma "There is only one Truth and we have it." Cultures of this kind tend to rely to a greater extent on religious doctrines and show a preference for grand theories. This is in stark contrast with weak uncertainty avoidance cultures, which exhibit more relativistic attitudes toward truth and theories about the nature of reality.

University of Cambridge

Underdevelopment

Economists and sociologists have studied economic inequality between countries, trying to understand the causes of underdevelopment. Some see it as a type of historical setback that can be overcome by passing through certain stages as developed countries have already done. Others see it as a situation characterized by a dualism that paralyzes society; the dominion of a privileged minority and the submission of a poor majority that lives in traditional conditions, and the economy; an archaic agriculture that coexists with a modern economy geared toward the exterior. Third parties make underdevelopment a situation of misery and blockage, a product of the development of rich countries, leaving underdeveloped countries dominated, plundered, and corrupted by their colonizers.

Characteristics of Underdevelopment

Even though there are marked differences between countries, this diversity of ideas obliges one to describe underdevelopment. One fundamental characteristic is rapid demographic growth, a situation caused by immersion in the first (reduction of rate of mortality) and in the second (reduction of rate of natality) phases of demographic transition, bleak life expectancy, and a particularly young social makeup; correspondingly suffering from nutritional and medical deficiencies, illiteracy, underemployment, and low living standards.

Another trait of these countries is the dominance of the primary sector, with a mediocre industry yielding low outputs and a confined tertiary sector, which as a whole cannot absorb the surplus of farm labor. Depending on the North/South exportation of a few raw materials, they also have a trade debt. Their savings are insufficient with the added inconvenience that capital should be used on services for an increasing population. To develop, they must take on a large external debt that converts the rate of demographic growth into the contrary of that of the gross domestic product (GDP). In this framework, transportation is insufficient, regional differences are clearly pronounced, and industrial regions are lacking, which furthermore concentrate on the coast just as the sprawling and anarchic housing development.

The phenomenon of underdevelopment has been named many ways by international organizations according to changing theories or expectancy of reaching development. While in 1949, the U.S. president Harry Truman (1884–1972) assigned his country the mission to favor "the improvement of living conditions and economic growth in underdeveloped regions," the French economist and sociologist Alfred Sauvy (1898–1990) termed poor countries as *Third World* in 1952, in clear reference to the Third Estate of the French Revolution (1789). As development theory rhythms were changing, this term evolved: during the 1960s, the term *least developed countries* (LCD) emerged, as did the terms *developing countries* (contrasting the North/South and the center/periphery, especially in the 1970s, the *Fourth World* in the 1980s, and in the 1990s, prior to development, some countries are called emerging markets.

The question arises of how to measure if a country is underdeveloped. It is often considered that a low GDP per capita (GDP/pc) is a symptom of underdevelopment. In 2005, the World Bank distinguished three country groups by income: a first division gathered countries with an average income of less than $875; a second division separated into two groups with an mid-range income, and GDP/pc of $876 to $10,725; and a third division of countries with a GDP/pc of more than $10,725. Countries are considered underdeveloped when their income is less than $875 and some in the middle subgroup up to $3,466. However, this indicator has its defects, because it does not show how the average income is distributed, and the U.S. dollar does not have the same value in a rich country as it does in a poor one.

That is why, in the wake of the work by Amartya Sen (Nobel Prize winner in economics in 1998), the United Nations Development Programme (UNDP) created the Human Development Index (HDI) that synthesizes life expectancy at birth, adult literacy rate, the gross combined rate of registration in primary, secondary, and postsecondary education, and GDP/pc in purchasing power parity in U.S. dollars (PPP in US$). The maximum HDI rating a country can receive is 1.00. From 177 countries analyzed, three uniform groups can be formed producing the following indicators: the 70 countries of High Human Development had an average of 0.897 HDI in 2005 (average GDP/pc in PPP in US$ of $23,986), 85 countries of Medium Human Development had 0.698 HDI (average GDP/pc in PPP in US$ of $4,876), and 22 countries of Low Human Development had 0.436 HDI (average GDP/pc in PPP in US$ of $1,112). By way of comparing, the Organisation for Economic Co-operation and Development (OECD) gave an average for its countries with 0.916 HDI (GDP/pc in PPP in US$ of $29,197).

Theories of Underdevelopment

Underdevelopment is subject to theoretical dispute. For some, it is merely a setback in development. For others, it is a product of history, stressing the economic exploitation inherited from colonization, and solving it by means of adapting to modernity its economic and social structures. Since the 1980s, in the face of the inefficiency of approaches of the dependency theory or neo-Marxism and the development of some Asian countries (newly industrialized countries), liberal thinking, with some clarifications, has been reclaimed.

Former outdated approaches cited ethnic and geographical, and cultural and institutional theories. The first used Joseph Arthur Comte de Gobineau's (1816–82) thesis formulated in *An Essay on the Inequality of the Human Races* (1855), in which he affirmed that indigenous people's genetic inheritance was a determinant cause of underdevelopment. There are authors who explain underdevelopment in geographical terms—the idea being that natural conditions, poorness of soils, and aridity of climates determine the situation.

With respect to ethnic determinism, it seems to fail to convince when regarding civilizations that in other times were capable of initiating growth mechanisms (the Pyramids of Egypt, the Great Wall of China, and Machu Picchu). Neither geographical position nor resource endowments seem sufficient to explain areas that were developed in the past and now are not (Egypt and Morocco during the Roman Empire), while others currently with mediocre resource endowments are developed (Australia and New Zealand).

A cultural and institutional theory defends the idea that to promote development, sociocultural and institutional action (the state) are necessary. The best-known approach is that of Max Weber (1864–1920) in his work *The Protestant Ethic and the Spirit of Capitalism* (1904), where he alleges that puritan ethics, defined as a rational conduct to reach economic success, influenced the development of capitalism. Later clarifications claim that existing inefficient institutions are due to the incompatibility between traditional culture and one necessary to develop. For example, the absence of a true right to private property in sub-Saharan Africa or certain fatalism before natural hindrances and poverty impede innovation. Theodore Schultz (1902–98) demonstrated that the continuity of poverty in such countries is more a result of a rational method similar to that of the West, rather than a problem generated by institutions.

Rostow, Gerschenkron, Nurske, and Singer

Currently, the most prominent theories are the liberal (modernization theory), the dependency, and the Marxist, and the neo-Marxist theory. The liberal position was defended by Walt W. Rostow (1910–2003), adviser to President Lyndon B. Johnson from 1963 to 1968. In his work *The Stages of Economic Growth: A Non-Communist Manifesto* (1960), he made a lineal analysis of growth considering underdevelopment as backwardness with respect to developed countries. He indicated that if a country with a retarded development (preindustrial) wanted to develop, it could do so by undergoing the relevant phases, and copying Western methods of development. Considering the phases a country must pass through to industrialize itself, Rostow established a model of five stages, the last three being "take-off," "drive to maturity," and the "age of high mass consumption."

This analysis was soon criticized. For Alexander Gerschenkron (1904–88), development did not follow the stages described by Rostow because less-advanced countries could skip stages by employing high technology created by developed countries, an advantage of being backward, to shorten the process. On the other hand, it was argued that undeveloped countries also need institutional instruments to channel that industrialization. Likewise, Simon Kuznets (1901–85), Nobel Prize winner in economics in 1971, criticized the theorization of Rostow, considering problematic the selection of five stages and its limits, the measurement of leading sectors of the economy, and the parameters utilized to quantify political and institutional structures. He showed that no Western economy had experienced the take-off stage nor doubled its gross fixed capital formation (GFCF).

In the 1950s, Ragnar Nurske (1907–59) formulated the doctrine of "the vicious circles of poverty." It described a situation in which diverse factors that are interconnected produce a stagnation from which it is difficult to escape. Poverty would originate from insufficient incomes and too-low savings to finance a productive investment; the weakness of demand, the narrowness of the domestic market, and the impossibility to stimulate the demand of the state (by means of the Keynesian multiplier) are supplementary obstacles to the increase in productivity. "A country is poor because it is poor"; however, supporting himself on Keynesian analysis, Nurske recognized that an exterior intervention could break that "vicious circle." That intervention would make the initiation of development possible by means of international aid and a balanced growth strategy: investments in economic and social infrastructures (the government's role) and development of productive investments.

These ideas were defended by Hans W. Singer (1910–2006), who stated, "an undeveloped country is poor because it has no industry and it has no industry because it is poor."

Classical Models

During the 1950s and 1960s, classical models of structural change acquired relevance, one of which is the "dual economy." Arthur A. Lewis (1915–91), in his work *Economic Development With Unlimited Supplies of Labour* (1954), considered a characteristic of underdeveloped economies as the coexistence of two sectors, one archaic—rural and overpopulated with marginal productivity of insignificant exploits—and the other modern—urban and industrial with foreign capital and high productivity. Under these conditions, surplus labor from agriculture could transfer to the industrial sector without diminishing traditional production. Hence, profits from modern entrepreneurs would allow the accumulation of capital and investment, and the increase of labor demand, production, and employment. The structural change would proceed until solving development backwardness in which the total surplus of labor from the rural sector was absorbed by that of the industrial.

In the same sense, the U.S. author Albert O. Hirschman (1915–) saw an unbalanced form of growth in "dualism," where a series of disproportionate advancements in a sector was followed by other sectors trying to reach the same. This permits a bottleneck mechanism to extend the field of induced investment and foment decision making and new investments. In this manner, the key to growth is an original investment that brings posterior investments.

Theory of Dependency

A second group of theories that explain underdevelopment are joined under the denomination of dependency theory. They are a group of varied economic models that try to explain the difficulties that some countries find to develop.

A first stage of the review of this theory can be drawn from the "thinking" of the Economic Commission for Latin America and the Caribbean (ECLAC), which was formed in the 1940s and 1950s. Propelled by the Argentinean economist Raúl Prebisch, it assembled around itself a group of Latin American economists and sociologists: Celso Furtado, Juan Loyola, Aníbal Pinto, Osvaldo Sunkel, and the Spanish sociologist Juan Medina Echerarría. Its reflection took as a starting point the dissatisfaction that the neoclassical theory caused, and considered it as inadequate to promote development in the Third World.

ECLAC addressed economic and social problems from a historical and holistic (development and undevelopment are a single process) perspective, set on the basis of the center/periphery model. Structures of peripheral countries were different from central countries, those being heterogeneous (export agriculture and unsophisticated subsistence agriculture), and specialized (exportation of few primary products, absence of industry, enclaves of modern sectors, and demand for imported manufactures).

In this structure, "development and underdevelopment were connected processes in a single global economy" in which the center (production and export manufactures) and the periphery (production and exportation of primary products) complemented each other within the international division of work. This asymmetrical relation accentuated international inequalities. In the opinion of ECLAC, free trade increased inequality, besides producing a deterioration of the real relation of interchange for the periphery's specialization in primary products. It defended the interior market as a path to growth (industrialization as substitute for importation [ISI]), an act that had certain success until the 1970s with improvements in health services and education in many LCDs.

Marxist and Neo-Marxist Viewpoints

From this stance, development/underdevelopment thinking evolves toward Marxist and neo-Marxist positions that considered economic exploitation inevitable. Karl Marx (1818–83) first considered the importance of colonies for the development of capitalism, but around 1875, he changed focus, insisting that barriers were generated by the very fact of colonialism. Despite these antecedents, Marxist analysis of underdevelopment was further advanced by Vladimir I. Lenin and prolonged by Rudolphe Hilferding.

In the mid-20th century, Paul A. Baran published *The Political Economy of Growth* (1957). In this work, he defended that underdevelopment was a historical product of colonialism and imperialism, and dependence originated from harmful international economic relations. Capitalism was an obstacle for progress in the Third World in such a way that an anticapitalist revolution (the construction of socialism) was the only means to develop.

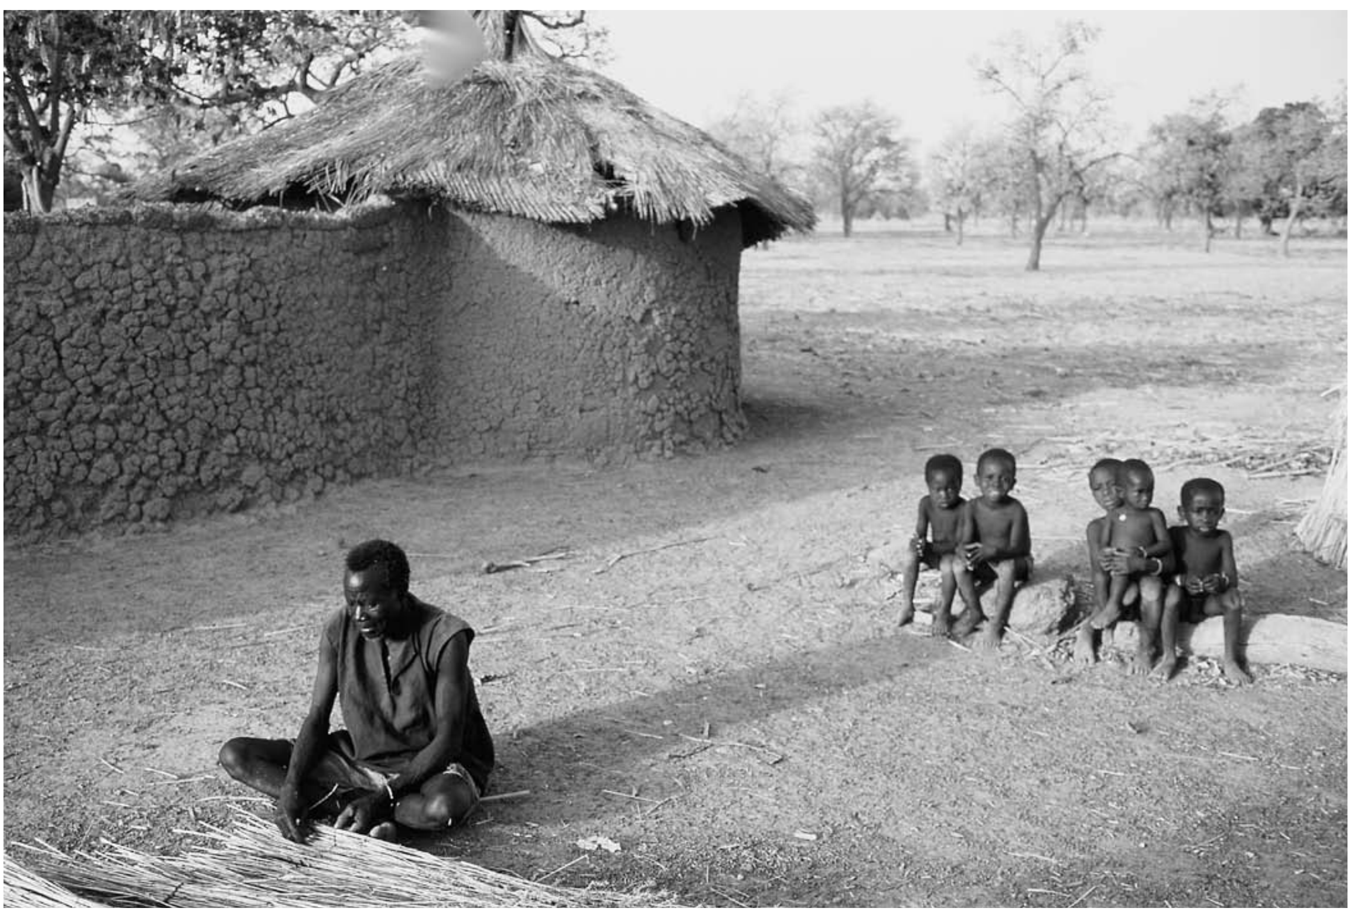
This focus was made popular in the 1960s and 1970s, although divided in tendencies. A first group of neo-Marxist authors were Andre G. Frank (*Capitalism and Underdevelopment in Latin America*, 1967) and Samir Amin (*Imperialism & Unequal Develop-*

ment, 1973) among others, which denied the possibility of sustained economic growth in the periphery and proposed the development of underdevelopment. They also described the negative evolution of the real relation of the interchange of manufactured goods/primary products for underdeveloped countries.

Another group was formed by C. Furtado (*Development and Underdevelopment*, 1961), O. Sunkel (*El Subdesarrollo Latinoamericano y La Teoría del Desarrollo*, 1970), and others as they reformulated the key dependentist approaches of ECLAC, admitting that economic growth was possible, although there would be contradictions between dependency and national development. And finally, the thesis from F. H. Cardoso and E. Faletto (*Dependencia y Desarrollo en América Latina*, 1969), for whom dependency permitted development of the periphery, although conditioned by contradictions and inequalities common to peripheral capitalism; the only possibility thereby was an "associated dependent development."

Since the crisis of 1973, developmental thinking evolved toward more liberal positions, putting in doubt interventionist state policies. At the same time, strategies of open development were successful in the newly industrializing countries (NICs) in Asia (Hong Kong, South Korea, Singapore, and Taiwan in 1970; and currently, China, India, Malaysia, the Philippines, Thailand, and Vietnam). Socialist countries saw themselves sinking as a confirmation of their development strategies' failure.

In the 1990s, national limits were seen as dissolving with the appearance of a global village, where private businesses became developmental agents in nations. The theory of globalization appears to describe how investment and employment are shifted (outsourced) from industrialized countries (center) to underdeveloped ones (periphery),



The landlocked west African nation of Burkina Faso is one of the poorest countries in the world. It suffers from a high population density, has few natural resources, and is seemingly caught in "the vicious circles of poverty."

permitting their own development (except in sub-Saharan Africa).

However, the problem of underdevelopment continues without a solution. The 1997 crisis of the NICs in Asia shows the limits of a liberal economy and compels the return of the state in economic life. With exception to South Korea and Taiwan, the NICs remain deposits of labor and poverty. Reasons other than dependency theory are being sought to justify the difficulties of development found in the lack of freedom and internal democracy, corruption, the squandering of resources, excessive military costs, the incompetency of authorities, the nationalization instead of privatization, or the emphasis on heavy industries instead of agriculture and light industry.

It is difficult to speculate over the future of underdevelopment theory, although there exists a certain consensus that underdeveloped countries will evolve in the framework of a globalized economy. In this setting, liberals have achieved the acceptance that economies need to be oriented toward the exterior; defenders of dependence theory have accepted state intervention in the economy and, a third position, that sees social questions and the fight against poverty priorities in the development process. This mix can be summed up by a well-known quote of the 1960s by Deng Xiaoping (1904–97) that summarizes the position of many countries: "I don't care if it's a white cat or a black cat. It's a good cat so long as it catches mice."

UniCredit Group

UniCredit Group is one of the leading European banking groups, with a core business of retail banking and other related services, but also offering asset management, insurance, and leasing services. During fiscal year 2007, the Group recorded an operating income of €29,655 million, an operating profit of €13,346 million, and employed 170,000 people. Today, UniCredit, whose origins date back to the establishment of Rolo Banca in 1473, operates through 9,714 branches in 23 European countries and has offices in 27 other markets.

The actual structure is the result of the merger of nine of Italy's largest banks and the recent acquisition of the German HVB Group and the Italian Capitalia Group. In central and eastern Europe, the network has been strengthened through the strategic acquisition of Ukrsotsbank in the Ukraine and ATF Bank in Kazakhstan. Their headquarters are in Milan, Italy, which represents the main market, accounting for roughly 51 percent of total revenues. In Italy, top competitors are Intesa Sanpaolo and Antonveneta. Outside national boundaries, its main European competitors are Deutsche Bank and Société Générale.

The Group has a leading position in Italy and Germany, where it is the second-largest player with a market share based on assets of 16 percent and 5 percent, respectively. In Austria, UniCredit is the first player with a market share of 19 percent. It is the undisputed leader in central and eastern Europe, where it offers a comprehensive product and service range to about 24 million retail, corporate, and institutional customers, provided with a strong network, which is twice the size of the second player. It has recently also started its expansion in central Asia. Its robust growth in international markets is carried out both organically and through strategic external activities.

The UniCredit Group is characterized by a division-based organizational model that represents a source of value creation and capitalization of growing opportunities. Some business lines—such as retail, corporate, and private banking—are common to all markets of operation. Retail banking is the most important source of revenue, generating about 38 percent of the total, followed by corporate banking, which accounts for 21 percent of total revenues. This strategic choice is based on the development of centralized divisions, allows pooling and leveraging their know-how to all group clients, regardless of their location, and transfers best practices to provide innovative products. The group's performance in core banking is one of the highest in Europe, allowing it to develop cross-selling activities for other financial products.

Other divisions, such as asset management, markets and investment banking, and global banking services, represent centers of excellence with the aim to increase product competitiveness and quality at a global level. Finally, to manage successfully the high economic growth characterized by a dynamic domestic demand and a high number of foreign direct investments, UniCredit has established a central eastern Europe division and a Poland market division. Support services, such as information and communication technology and back office activities are centralized, too, to fulfill the daily requests of all the divisions.

The centralization and coordination allowed by the divisional organizational structure does not contrast with the adoption of a multilocal approach. On the one hand, coordination ensures strategic support and generates added value for the growth of the Group's businesses: cost structures and internal processes are optimized, ensuring maximum synergies, savings, and operational excellence. On the other hand, the country-by-country approach is considered necessary to empower the local banks to oversee distribution networks and customer relationships.

This global approach is reflected in the UniCredit global brand strategy. In recent years, financial investments to build a strong brand both at the international level and at a local level have been high. It has been decided to align local brands closely with the UniCredit Group master brand, making it possible to significantly improve the efficacy and efficiency of marketing and communication investments. Positioning conveyed to the final consumer is focused on empowering optimism: the idea behind this concept is that people deserve encouragement in their private and professional lives. The objective is to create a single-minded, strong brand and presence throughout Europe, while maintaining the local brand value where awareness is high.

Unilever

Unilever is a modern multinational corporation employing over 180,000 people on six continents. It has research laboratories in England (Colworth and

Port Sunlight), Holland (Vlaardingen), Connecticut (Trumbull), New Jersey (Englewood Cliffs), India (Bangalore), Pakistan, and in Shanghai. With gross revenues from its worldwide operations in 2005 at €40 billion, Unilever is a major company, with its stock listed jointly on many stock exchanges as a Dutch firm (Unilever NV) based in Rotterdam, and as an English company (Unilever plc) based in London. However, the company has a unified board of directors and operates as a single firm.

Unilever Beginnings

The duality in Unilever's stock listing originated with its foundation in the 1930s when the Dutch margarine manufacturer, Margarine Unie, merged with Lever Brothers Company, a British soap maker. Their common motive for uniting was the ingredient palm oil, which was used in both the manufacturing of soap and margarine. The merger joined a soap maker with a food manufacturer, which have continued to be their major business focuses since the 1930s.

With the economies of scale achieved from the merger, the dual company was able to initiate new businesses in Latin America. During World War II, it was under some duress, as its Dutch center was in Nazi-occupied Holland. However, after the war, it recovered from its business losses on the Continent and began to expand again in the areas of soap making and foods.

Post–World War II Operations

In 1972, it bought the Canadian operations of A&W Restaurants, which are famous for selling root beer and fast food. It sold the chain in 1995. In the early days, soap was 90 percent of Unilever's revenues. However, by the 1980s, soap and edible fats sales were only 40 percent of revenues. In order to grow, it purchased the Brooke Bond Company in 1984, which manufactures PG Tips tea under the Brooke Bond label. Today Unilever claims that 35 million cups of PG Tips tea are consumed every day in Great Britain.

Unilever expanded its position in the skin-care market from soap to other products through the acquisition of Chesebrough-Ponds. The Unilever product list added food (Ragu spaghetti sauce), toothpaste (Pepsodent), skin-care products (Pond's cream and Vaseline), hairspray (Aqua-Net), and nail polish (Cutex). It continued its expansion into cosmetics in 1989 with the purchase of Faberge, the Calvin Klein cosmetic line, and the Elizabeth Arden line. The latter was sold in 2000 to FFI Fragrances.

When Unilever purchased Helene Curtis Industries in 1996, it established itself as a major company in the United States. The acquisition gave it control of the Suave and Finesse hair-care products, as well as Degree deodorant. It continued its American expansion in 2000 with the purchase of Best Foods. Then in April 2000, it purchased both Ben & Jerry's and Slim-Fast on the same day.

Today Unilever owns over 400 brands. Some are local brands, limited to only a few countries. Others, such as Lipton Tea, are widely recognized. It is also the largest ice cream manufacturer in the world. Most of its ice cream is marketed under the "Heartbrand," with Popsicle, Klondike, Breyers, and Ben & Jerry's being the exceptions. Almost all of Unilever's products are either in the food and beverage category, or in the home and personal care category. This is consistent with the origins of the company as a food producer and a soap maker.

Because of its presence in some of the more environmentally sensitive areas of the world, where tea and palm oil are produced, Unilever has taken a strong stand as an environmental champion. Since 1998, it has undertaken to engage in various forms of sustainable agriculture in producing its food products or ingredients used in personal care products. In 2007, it recruited the Rainforest Alliance as a certification agent. The Alliance certifies that Unilever teas produced in east Africa are grown through environmentally sound ways. By 2010, the company plans to market its Lipton and PG Tips teas in Europe as certified teas. By 2015 it will market globally as certified.

United Arab Emirates

The United Arab Emirates (UAE) is located on the Persian Gulf and is bordered by Saudi Arabia and Oman. There are seven states that make up this Middle Eastern federation. The seven states are referred to as “emirates,” and they include Abu Dhabi, Ajman, Dubai, Fujairah, Ras al-Khaimah, Sharjah, and Umm al-Quwain. Abu Dhabi is the capital of the UAE, and Dubai is the largest city. The official language is Arabic.

The country was established on December 2, 1971, as a federal constitutional monarchy, and the current president is Khalifa bin Zayeel Al Nahyan. He is the son of the first president of the UAE. When the first president died, his son succeeded him as the leader of this federation on November 3, 2004. Each emirate has its own ruler and has control over mineral rights and revenues. When established on December 2, 1971, the constitution provided for the positions of president and vice president. The ruler of Abu Dhabi is the president, and the ruler of Dubai is the vice president and prime minister. Each serves a five-year term.

Abu Dhabi is the UAE’s major oil producer and Dubai is the UAE’s commercial center. In addition to the above two positions, the government structure includes (1) a council of ministers led by the prime minister, (2) the Supreme Council of Rulers, and (3) a 40-member Federal National Council (FNC). The FNC functions as a consultative body. Twenty of the members are elected and the rulers appoint the remaining 20 members. The first election of members occurred in December 2006. There are no political parties in the UAE.

The UAE was called the Trucial States, which refers to the 19th-century truce (1892 treaty) between the United Kingdom (UK) and Arab sheikhs. In this agreement, the sheikhs agreed to (1) give territory only to the UK and (2) never to enter into any relationship with any other foreign government. In return, the UK offered to protect the Trucial Coast from hostile acts and assist with any land attacks.

Dubai is the commercial center of the United Arab Emirates and has been experiencing a construction boom in recent years.

The UAE is one of the most industrialized countries in the world. The gross domestic product (GDP) per capita is fifth in the world and third in the Middle East. The currency is the Emirati dirham. Petroleum and natural gas exports play an important role in the economy’s growth. The UAE became wealthy in the 1970s after they gained foreign direct investment funding.

Diversification and Growth

Mana Alotaba was appointed as the minister of petroleum in the late 1960s, and he has been credited with building the petroleum industry. Alotaba’s expertise and understanding of this market has earned him the legacy of being the president of the Organization of Petroleum Exporting Countries (OPEC) for a record six times. Although petroleum and national gas have contributed to the growth of the UAE’s economy, they had a desire to become less dependent on these two commodities as the primary resources for the territory’s revenue. As a result, they saw a need to diversify into other areas such as construction, manufacturing, and the service sector. Japan, South Korea, Thailand, and India are major markets, while western Europe, Japan, the United States, China, and India are major suppliers.

There are approximately 4.4 million people in the UAE, and the growth rate is 4 percent as of 2007. However, it should be noted that only 15 to 20 percent of the population are citizens of the UAE. Approximately 3 million people are in the workforce and 93 percent of this population are foreigners. During the mid-1970s, many believed that the foreign labor force was temporary and would decline when the construction industry started to bloom. However, that did not occur. Nationals were not interested in the new markets, and preferred the traditional managerial and administrative jobs in the public sector, oil, and financial services.

When traveling on business, it is important for foreigners to understand the customs and behaviors of the citizens. In this instance, the citizens of the country are predominantly Muslim and follow the laws of Islam. Some key points to remember when meeting include the following:

- Visitors are expected to abide by the local standards.
- Most of the body should be covered.
- Women should dress modestly.
- Alcohol and pork are inappropriate for practicing Muslims.
- Friday is considered the day of rest.
- Avoid bringing the topics of Israel and women into conversations.
- Shoes may be removed before entering a building.
- The decision maker in a meeting is usually the person who is silent.

United Kingdom

The United Kingdom of Great Britain and Northern Ireland (94,526 square miles, population 60,975,000, GDP $2.23 trillion in 2007) is an industrialized country of islands off the northwest coast of the European continent, consisting of four constituent countries: England, Northern Ireland, Scotland, and Wales. National administrative offices exist in all four countries, but are principally based in London, England. Its 14 overseas territories are the remnants of the British Empire, the largest empire in history, and the British head of state—presently Queen Elizabeth II (b. April 21, 1926)—presides over the Commonwealth of Nations as she does over the United Kingdom (UK) itself.

Terminology and Distinctions

There is a tendency to conflate nonsynonymous terms in relation to the United Kingdom and the British Isles. There are both geographical and political distinctions to make.

Great Britain refers to the largest island in the archipelago, on which are located the countries of England, Scotland, and Wales. Ireland is the second-largest island, off the west coast of Great Britain. Britain is a political-cultural term used for the United Kingdom, which includes Great Britain and Northern Ireland. The British Isles include all the islands in the archipelago, and thus encompasses southern Ireland, the sovereign nation sometimes called the Republic of Ireland or Eire.

Citizens of the UK are thus British, but more likely to refer to themselves as English, Welsh, Irish, or Scots. Non-English British citizens may sometimes be referred to by foreigners as English, and may find the conflation insulting or simply bewildering, as those in the American South feel when all Americans are grouped together as "Yankees."

Other islands within the United Kingdom include the Isle of Man and the Channel Islands (Guernsey and Jersey). These are Crown dependencies—nations over which the British monarch rules as head of state, but with their own heads of government handling the business of governance.

The Commonwealth of Nations consists of 53 sovereign states in a nonpolitical union, most of which were once part of the British Empire. Of those states, 16 are Commonwealth realms—those nations in which the British monarch is the head of state, often in a purely titular and honorary capacity: Antigua and Barbuda, Australia, the Bahamas, Barbados, Belize, Canada, Grenada, Jamaica, New Zealand, Papua New Guinea, Saint Kitts and Nevis, Saint Lucia, Saint Vincent and the Grenadines, the Solomon Islands, Tuvalu, and the United Kingdom. The remaining members are Bangladesh, Belize, Botswana, Brunei, Cameroon, Cyprus, Dominica, Gambia, Ghana, Guyana, India, Kenya, Kiribati, Lesotho, Malawi, Malaysia, Maldives, Malta, Mauritius, Mozambique, Namibia, Nauru, Nigeria, Pakistan, Samoa, Seychelles, Sierra Leone, Singapore, South Africa, Sri Lanka, Swaziland, Tanzania, Tonga, Trinidad and Tobago, Uganda, Vanuatu, and Zambia. The scope of the Commonwealth gives an indication as to the overwhelming size and ethnic and cultural heterogeneity of the British Empire at its peak.

Though the British Isles are considered part of the continent of Europe, the British will usually refer to "Europe" or "the Continent" to mean the mainland only, to distinguish it from Britain; "Europe" sometimes also designates the European Union, especially as an object of derision.

History

Inhabited since prehistoric times, the history of the British Isles was marked by a series of invasions and settlements by various groups from the Continent. The Roman Empire controlled the isles for four centuries, ending in 410, and the Latin name for the lands—Brittania—is still used to poetic ends. The Roman occupation brought Britain up to speed with the continent in the areas of agriculture, industry, and urbanization, and strengthened trade ties that remained when Rome did not. The Anglo-Saxon period followed, named for the invading Germanic tribes. The English language is descended from a mixture of their Germanic dialects with a strong Latin influence, and is one of the few major languages of western Europe that falls outside the Latin-derived Romance group; indeed, much of the Romance influence in English comes from dictionaries and grammar texts written in the 18th century with an eye toward "sophisticating" the language by making it more like French.

The first injection of French into the English language, though, came with the Norman Conquest of 1066, which removed the Anglo-Saxon rulers from power, replacing them with a French-born aristocracy. A long rivalry with France began, and a love-hate relationship with its culture and language (with some British patriots to this day pronouncing the "t" in "buffet" as a show of support for the Crown). They remained rivals during the age of exploration, as both nations carved out pieces of North America. The political unit of the United Kingdom originated in 1707, formalizing the union of Scotland and England that had begun 100 years earlier, when James VI of Scotland succeeded Elizabeth I of England to become James I, King of England. The 1707 treaty created the Kingdom of Great Britain, unified under a single parliament, a single monarch, a single constitution. The union was pivotal in strengthening the country for the massive expansions of its empire that followed over the next two centuries.

After the Seven Years War (1756–63), Britain became the world's dominant superpower, and arguably the most dominant such power since the fall of Rome. Winston Churchill later described the war as "the first world war," and the scope was indeed extraordinary. All the major powers of Europe were involved: Britain and its colonies, Prussia, Portugal, and the Electorate of Brunswick-Luneburg allied against Austria, Russia, France and its colonies, Sweden, Spain, and Saxony. The war began with Prussia's invasion of Saxony, and in a larger sense was precipitated by the rapid growth of the colonial powers and a thirst for dwindling resources.

Battles were fought in Europe, India, the Caribbean, the Philippines, Africa, and North America; the North American campaign is called the French and Indian War. After-effects of the war were far-reaching: France's colonial days were ended almost completely;

dissent against British rule and involvement in European conflicts flared in the American colonies, leading to the war for independence a dozen years later, and the British emerged as the largest colonial power with the greatest mastery of the sea. The war was one of the key conflicts studied by Napoleon Bonaparte, whose own ambitions led to the continent-spanning Napoleonic Wars a century and a half later.

Britain's empire expanded quickly without France to compete with, despite the loss of the United States; imperial efforts shifted to the already settled areas of Asia and Africa, rather than injecting settlements into new lands to grow British populations, as had been done with North America. Ireland joined the union in 1801. In 1921, the empire encompassed so much of the globe that the British monarch ruled over one-quarter of the world's population. But the following year, southern Ireland succeeded in its campaign for "home rule," seceding from the union while leaving Northern Ireland—Protestant, and in fear of a tyranny of a Catholic majority—to the rule of the UK.

The empire, like most of the empires of Europe, was dissolved after World War II, when the formation of the United Nations and attempts to prevent another world war led to a restructuring of the global distribution of power. At the end of the 20th century, legislative bodies were established for Wales and Scotland—the Welsh Assembly and the Scottish Parliament—and in the decade since, the nations of the United Kingdom have become more distinct from one another, as services such as healthcare vary according to the decisions of their various legislations. The Northern Ireland Assembly has comparable powers. A growing concern is the question of where this leaves England, which continues to be ruled by a body that is not exclusively English.

Though the strongest prime minister (PM) in recent British history was the Conservative Margaret Thatcher, the left-wing Labour Party has been in control since 1997, currently led by Prime Minister Gordon Brown. Like much of the world, in 2008 Britain entered an economic crisis, the full effects of and solution to which have not yet revealed themselves.

Politics

The United Kingdom is a constitutional monarchy, but lacks a written codified constitution—a situation so rare that many people forget that a "constitution" is a system of law establishing the procedures and foundational rules of a government, and that it need not necessarily take the form of a specific document. The Constitution of the United Kingdom thus includes Acts of Parliament, treaties, laws of the European Union, common law, informal constitutional conventions, and the royal prerogative: those powers that belong to the monarch (and are exercised, traditionally, by the prime minister in the monarch's name) that have no source in legal statutes. Because there are no statutes defining the royal prerogative, the specific limits and extent of the power of the monarch is undefined, but includes (based on previous royal actions) the power to issue passports and ratify treaties, the power to summon or dissolve Parliament, the power to declare war and peace, and the power to regulate the Civil Service.

Basic principles of the British constitution include the supremacy of Parliament (the exact limits of which have been under frequent debate for years) and the maxim that "the monarch reigns, but does not rule." The monarch traditionally abstains from active involvement in politics. Whether the monarch has any real authority or is just a figurehead is another matter of debate, though foreigners from non-monarchies outside the Commonwealth may have difficulty understanding that to be "just" a figurehead is still to be something sublime.

The bicameral Parliament system used in the United Kingdom is much like the system that has been adopted throughout the world. The 646 members of the House of Commons are elected via a first-past-the-post system from various electoral districts, while the 746 members of the House of Lords are appointed (and once consisted of hereditary peerages). The British Parliament is sovereign over the legislatures of Wales, Scotland, and Northern Ireland, and technically has the right to dissolve them at will.

The member of Parliament (from the House of Commons) who is selected by a majority in his house becomes the prime minister. This is traditionally, and nearly always, the leader of the majority party in that house. The monarch appoints the prime minister and his cabinet, but follows the PM-elect's recommendations in doing so.

The major political parties in the United Kingdom are the Labour Party, the Conservative Party, and the Liberal Democrats (formed in 1988 by the merger of the Liberal Party and the Social Democratic Party).

A member of the European Union, the UK is not part of the Eurozone, but continues to use its own currency, the British pound.

Economy

The United Kingdom is one of the largest economies in the world—the fifth-largest by market exchange rates, and the sixth-largest by purchasing power parity. The capital city of London is one of the financial centers of the world, and has been for centuries, rivaled if not matched only by New York, Hong Kong, and Singapore.

Once "the sick man of Europe" in the 1970s, Britain's economy was revitalized by the administration of Prime Minister Margaret Thatcher, who privatized many of the industries that had been nationalized in the 1940s. Despite the economic malaise of the world at large, the UK experienced steady economic growth from 1992 to 2008, its longest stretch of uninterrupted growth since the heyday of the British Empire 150 years ago. Inflation and unemployment are low, and have been low for some time.

The service industry accounts for 81 percent of the workforce, with industry at 18 percent, and agriculture a scant one percent; the British dependence on the Continent for much of its food supply is behind such disparate phenomena as the reputation of British food as rich but bland (a reputation dating to a time of more expensive and unwieldy transport, when fresh produce was unavailable in cold months) to the traditional giving of oranges as Christmas gifts, as their seasonality in southern Europe and the appropriateness of their expense coincided with the holiday.

British industry includes machine tools and industrial equipment, aircraft and motor vehicles, computers and electronics, metals, chemicals, coal and oil, paper, and textiles. The United States, Germany, France, and Ireland account for nearly half of their $442 billion (2007) in exports.

United Nations Centre on Transnational Corporations

Charged by the United Nations (UN) to provide research into foreign direct investment and the activities of multinational corporations, the United Nations Centre on Transnational Corporations (UNCTC) commenced operations in 1975. In 1992, it was disbanded and restructured as a component part of the United Nations Conference on Trade and Development (UNCTAD). The UNCTC became particularly noted for its investment policy assistance to developing countries, for its ultimately failed negotiations for a UN Code of Conduct on Transnational Corporations, and for initiating the annual *World Investment Report*, now published by UNCTAD.

The creation of the UNCTC may be seen as part of a wider movement initiated by developing countries called the New International Economic Order, in which they sought mechanisms to redress the economic power balance between themselves and richer developed economies. In 1972, against a background of rising concern by developing countries about the power wielded by multinational corporations, the UN Economic and Social Council enlisted a "group of eminent persons" to investigate the economic impact of such firms on developing nations. Out of their deliberations came the recommendation to establish a permanent commission of the Council on multinational corporations, with a supporting information and research center. Their recommendation was adopted, and a new Commission on Transnational Corporations with its supporting Centre on Transnational Corporations was created, the UN having preference for "transnational" over "multinational" in the title. In a program of restructuring, the UNCTC was closed in 1992, and after a year's hiatus, the UNCTC's activities became subsumed within an enlarged UNCTAD, eventually known as the Division on Investment and Enterprise.

Functions of the UNCTC

When it was established in 1974, a priority for the UNCTC was to write and gain agreement on a code of conduct for multinational corporations. Similar efforts, albeit more limited in scope, were also being made by the Organisation for Economic Co-operation and Development (OECD) and the World Health Organization (WHO), but the UNCTC's code was envisaged to provide explicit assurance to developing countries on the behavior of foreign (developed country) multinationals who were investing. The negotiations on the code were protracted, largely because of the differing perspectives among the developing countries, and reconciling these often divergent views became an insurmountable task.

A further problem was the breadth of the proposed code, which included corruption, human rights, the environment, transfer pricing, and international technology transfer. By the 1990s, the much-revised text looked dated, and some elements seemed irrelevant, as economic realities overtook the initial rationale. In particular, the proliferation of bilateral investment treaties (BIT) and the recognition of inward and outward foreign direct investment as an important part of economic development meant that negotiations over the code finally ceased. Elements of the draft code's intent resurfaced in the UN's Global Compact in 2000, a more all-embracing initiative on the fundamental ethics of corporate behavior.

A specific part of the UNCTC's remit was to provide support to developing countries in helping them better understand multinational firms, foreign investment, and the creation of appropriate investment policy and legal frameworks. To achieve this, the UNCTC ran cross-country seminars to share information on matters such as technology transfer, export processing zones, transfer pricing, and investment promotion and policy. The UNCTC advisory teams also helped individual developing countries in drafting regulations and laws. Supporting all of this advisory work were the UNCTC's original research and publications on multinationals and their investments. Its periodical *The CTC Reporter* (1976–90) summarized and disseminated some of this research, and in 1992, this evolved into a more conventional academic journal, *Transnational Corporations*.

A particular legacy of the UNCTC is its quinquennial publication *Transnational Corporations in World Development*, the last of which was published in 1988. This was superseded by the annual *World Investment Report*, which began in 1991, with the 1992 edition completed under the auspices of the UN Department of Economic and Social Development, before becoming a publication of UNCTAD from 1993 onward.

United Nations Conference on Trade and Development

The United Nations Conference on Trade and Development (UNCTAD), is both a conference held every four years and an organization within the United Nations (UN). The first Conference (UNCTAD I) was held in Geneva, Switzerland, in 1964, and subsequently it was institutionalized as a permanent body within the UN. UNCTAD was originally conceived by developing countries as a counterweight to the dominant position held in the world trading system by developed economies. Although accused of being ineffectual in its early years, UNCTAD has evolved into a more respected organization, still focused on assisting economic development but whose research into foreign direct investment (FDI) and provision of policy support is held in high regard.

A History of UNCTAD

During the 1950s, developing countries had little engagement with the emerging governance of international trade through the General Agreement on Tariffs and Trade (GATT). The principle of nondiscrimination in trade relations, as embodied in GATT, was seen as unhelpful to the future economic prosperity of developing countries. Marginalized from the GATT processes, these countries sought a way to press for preferential treatment in trade regulation. This was realized in the first UN-sponsored conference in 1964 (UNCTAD I), where developing countries gathered to argue for a system of positive discrimination in international trade regulation.

Those initial countries represented became known as the Group of 77 (G77). In what might be seen as a response to UNCTAD I, in 1965 Part IV of GATT was drafted, which gave leeway for developing countries to have special and differential treatment in trade policy. However, it was not until the 1970s that this potential became realized through what became known as the Generalized System of Preferences, first adopted by the European Community and Japan (1971), Canada (1974), and the United States (1976). Under this scheme, developing countries gained advantageous or zero tariffs on their manufactured goods when imported into participating developed nations, although there is uncertainty over how much developing countries as a whole gained.

By UNCTAD III in Santiago (1972), tariff policy was still the main focus, but discussion extended to the international monetary system and the power of multinational corporations. Through the 1970s, UNCTAD continued to support developing countries and in particular helped them to maintain their merchant marine fleets by establishing the Code of Conduct for Liner Conferences. By the 1980s, UNCTAD was providing increasing levels of technical support to developing economies, both in terms of policy and in more practical matters such as enhancing customs systems. Attitudes toward the success of UNCTAD vary, with the *Economist* arguing in 1992 that it was "still trying to live down its reputation as a sterile north-south talking shop and last bastion for those who champion an interfering state as the remedy for third-world poverty." But since then, UNCTAD has improved its research on the links between development and trade, extended its technical support for developing nations, and embarked upon closer cooperation with the World Trade Organization (WTO), specifically in providing support for firms through the jointly managed International Trade Centre, a cooperative venture between GATT and UNCTAD initiated in the 1960s.

With the demise in 1992 of the UN Centre on Transnational Corporations (UNCTC), UNCTAD became responsible within the UN for monitoring the activities of multinational corporations, and for providing research-based policy advice to developing countries on foreign investment. Much of this work has been reported in its flagship publication, *World Investment Report*. This annual publication, initially instigated by the UNCTC in 1990, has evolved into the primary source for information and analysis of multinationals.

Much of the underlying data used in this report are available online, including country FDI profiles and its famous listings of the world's largest multinational firms. Through these data, one can observe the growth of multinationals and the global spread of their activities. While these data are still beset with technical and methodological problems, they are well regarded and serve as a resource of lasting importance. UNCTAD also monitors changes to national and international regulation of FDI, and it is in these data that one has seen an overwhelming move to FDI liberalization since the early 1990s. Overall, it is this work on foreign investment and multinational corporations that has gained UNCTAD further prominence in the wider community of international business scholars and practitioners.

United Nations Industrial Development Organization

The United Nations Industrial Development Organization (UNIDO) was established in 1966, with headquarters in Vienna, Austria. UNIDO became a specialized agency of the United Nations (UN) in 1985. As a result, UNIDO has its own constitution and member states, and a regular budget. UNIDO works toward helping the developing countries in alleviating poverty and creating wealth through the development of the manufacturing sector.

The origin of UNIDO can be traced back to 1959, when the Industrial Section of the UN was separated out as a branch. Subsequently, the Industrial Section became a separate center as Industrial Development Center in 1962. The focus of the Industrial Development Center was on discussions and information dissemination. However, it was felt that this role needed to be broadened to include operational activities that could directly affect the industrial development of developing countries. As a result, UNIDO was created by Resolution 2152 (XXI) of the UN General Assembly in 1966. In the following years, several developing countries as well as intragovernmental committees suggested setting up a specialized agency. During the second general conference of UNIDO held in 1975 in Lima, Peru, the Lima Declaration on Industrial Development and Cooperation was adopted. The Lima Declaration expected developing countries to have a 25 percent share of global industrial output by 2000. To achieve this target, it was recommended to the UN General Assembly that UNIDO be converted into a specialized agency. However, industrialized countries had some concerns in making UNIDO a specialized agency, which led to considerable delay. It was only in 1985 that the formalities of converting UNIDO into a specialized agency were completed.

During the latter half of the 1990s, UNIDO faced challenges to its survival as many developed countries, which were also donors, quit the organization on the grounds that the organization was not run efficiently. It was also felt that with the end of the Cold War, there was no need for such an organization as industrial activities could be better carried out by the private sector. Between 1995 and 1997, several countries including the United States, Canada, Germany, the United Kingdom, and Australia withdrew from UNIDO. With a shrinking budget, UNIDO had to reform itself and find niche areas to create a place for itself. UNIDO streamlined its activities to make sure that there was no overlap with other multilateral agencies and started offering them as a package. The reforms did pay off, as UNIDO was ranked as the best specialized agency of the UN in a study by the UK Department of International Development in 2005. Some of the countries such as the United Kingdom and Germany have since rejoined UNIDO; however, the United States is still out of the organization.

UNIDO Activities

As of 2007, UNIDO had a membership of 172 states. Every two years, UNIDO holds a General Conference, which is its supreme governing body. The General Conference decides on policies and budget issues and appoints a director general every four years. UNIDO has two important organs—the Industrial Development Board with 53 members and the Program and Budget Committee with 27 members. These members are elected during the General Conference. UNIDO also has an Evaluation Group, which works as an independent evaluator of UNIDO projects. The Evaluation Group is under the Bureau for Organizational Strategy and Learning, which is the strategic think tank of UNIDO. Different UNIDO organs work based on the philosophy of result-based management and result-based budgeting.

UNIDO's activities are centered on three themes: poverty reduction through productive activities, trade capacity building, and energy and the environment. UNIDO focuses on small and medium-sized enterprise development, the rural sector, and women in its poverty-alleviation efforts. With respect to trade capacity development, UNIDO helps in developing the technical infrastructure for international trade activities, along with direct support to the export sectors. UNIDO's efforts on energy and environment conservation focus on helping countries fulfill their obligations on multilateral environmental agreements.

These efforts are in synchronization with several millennium development goals of the UN. UNIDO carries out these activities with the help of about 600 staff at the head office and about 500 staff in field offices around the world. UNIDO obtains its resources from donor countries, the United Nations Development Programme (UNDP), and several other agencies supporting the cause of poverty alleviation and environmental protection. UNIDO has been able to establish itself as an important UN agency. However, its future will depend on how efficiently it is able to pursue its goals.

United Parcel Service

United Parcel Service, Inc., a courier company using the trademark UPS, was established on August 28, 1907, in Seattle, Washington, by 19-year-old James E. "Jim" Casey (1888–1983) and his 18-year-old friend Claude Ryan. Casey's father, Henry, an immigrant from Ireland who worked as a quartz miner, had died when he was young, and as the oldest of four children in the family, he found work as a delivery boy in Seattle. However, his mother, Annie, who had been born in Massachusetts, the daughter of Irish immigrants, encouraged him to run his own company.

Humble Beginnings

It was originally known as the American Messenger Company, and the two teenagers borrowed $100 to start it up. The business was involved in delivering parcels and letters, which included baggage from train stations, notes, and even food from restaurants. Casey stated that the company offered the "best service and lowest rates." Casey paid his younger brothers, Henry and George, until Henry started to work as a chauffeur for a real estate company, and George later found work as a clerk in a steamship company. However, they did work with other teenagers to make their deliveries. Some went on foot, while others used bicycles or motorcycles.

In 1913, when they bought a Model-T Ford, Casey and Ryan decided to merge with a competitor, Evert McCabe, who ran Motorcycle Messengers. The combined operation was called Merchants Parcel Delivery. They also introduced a system of combining the delivery service of packages to particular neighborhoods. In 1918, the trio hired a new employee, Charles W. Soderstrom, who ran their deliveries and started introducing more cars to the business. The reputation was soon sufficient for three of the main department stores in Seattle to use the company for its deliveries. In the following year, the business was so successful that they decided to add service to cover Oakland, California. Because of the increasing delivery network, they renamed the company United Parcel Service.

A New Name—United Parcel Service

The introduction of the common carrier service in 1922 allowed for much cheaper and, for some people, more convenient collections and deliveries. This involved having automatic daily collections, several attempts to deliver parcels, and automatic return of undeliverable mail. In this, the company was able to vastly improve its service by use of the telephone.

In 1930, UPS started running a service in New York, and by this time, it had started using a variety of services—its own and those of others—to cover the mainland United States, with large operations throughout the East Coast states. It was not long before the company's headquarters moved to New York City. During the 1940s and 1950s, the delivery service was expanded to allow UPS to cover addresses anywhere in the mainland United States, with the service being improved by the introduction of Blue Label Air service, which offered speedy delivery. In 1961, the company started using the package and shield trademark that was designed by Paul Rand, and it remained in use until 2003.

In 1975, UPS expanded service to Canada with the creation of UPS Ltd., later UPS Canada Ltd., which operated from its headquarters in Mississauga, Ontario. This proved successful, and in the following year, UPS began a domestic service in West Germany. In 1982, UPS Blue Label Air became UPS 2nd-Day Air Service, and six years later, as the amount of business increased, UPS established its own UPS Airlines.

Moving toward retail business, UPS acquired Mail Boxes Etc., Inc., in 2001, and the company has made heavy use of the internet, allowing customers to check delivery rates and track their packages. It has also enlarged its two main air hubs in Louisville, Kentucky, and in Cologne, Germany, adding to them a new office in Guangzhou, China. UPS has now grown to become the largest express carrier and package delivery company in the world, and also helps provide specialized transportation and logistics advice. It operates throughout the world, having an office in nearly every country, exceptions being places such as Andorra, Monaco, San Marino, and Vatican City, which are well covered by services in nearby countries, and countries such as Afghanistan, in which parcel delivery is not practical.

United States

The economy of the United States is the largest of any country in the world, and was estimated to be worth $13.81 trillion in 2007. This has been generated with a relatively low rate of unemployment and high levels of research and development, funded both by government and by the private sector. The result has been that the U.S. economy has been able to maintain a very high level of output per person, a situation it still maintained in spite of the economic downturn in 2008–09. The main problem, however, is that the United States has managed to generate the largest external debt of any country in the world.

A Brief History

The first Europeans who arrived in North America recognized the economic potential of the continent, and the abundant resources. As a result, the British attempted to establish colonies, such as Roanoke and Jamestown, but they were unsuccessful. They did manage some trade with the Native Americans, but there were not sufficient migrants there to generate their own internal demand. This came about during the 17th century, and especially from the early 18th century when the pioneers opened up farmland—often after wars with the Native American inhabitants—and there was an emergence of towns across what is now called the United States.

Certainly the early settlements in North America imported most of their goods from Britain, but gradually a manufacturing industry began to emerge, especially after the American War of Independence (1775 – 83), after which the United States started cutting its ties with Britain—although there was still some trade through Canada and the Caribbean. The United States also began trading more with France and the Netherlands, both allies in the War of Independence.

This period of breaking trade links with Britain coincided with the Industrial Revolution, which saw the emergence of machinery and factories capable of producing cloth and later many other items at far cheaper rates than had henceforth been the case. The British had always been protective of their industrial designs, and when the capitalist Samuel Slater (1768–1835) left Britain for New York in 1789, before he departed, he memorized the information needed to set up a mill—knowing that any such plans concealed in his luggage would get him into trouble—and built his own mill in Rhode Island, earning him the title of the "Father of the American Industrial Revolution."

Economic Growth

The U.S. economy was transformed soon afterward with the invention of the cotton gin by Eli Whitney, which led to the creation of a large slave plantation society—there were many slaves up to that point, but slavery was rapidly becoming unprofitable in many parts of the United States. And during the War of 1812, Francis Cabot Lowell was able to take designs for a cotton mill to the United States, and was able to build a mill in northern Massachusetts, capable of turning raw cotton into cloth.

This in turn led to the growth of the cotton industry, which soon became one of the main sources of wealth in the southern states, leading to the emergence of very large plantations and exporting cotton to Europe and elsewhere in the world. The result of the building of U.S. factories was that many items were no longer imported to the United States, and indeed the United States became an exporter of some of them. It had transformed from being a source of furs, timber, and tobacco to being a viable economic unit with its own large and wealthy home market.

The growth of the U.S. economy led to a major enlargement of the U.S. merchant navy. Before the War of Independence, U.S. ships had the protection of the British Royal Navy. Without them, they were at the mercy of many pirates operating from North Africa, and problems over piracy led to the Tripolitan War of 1801–05 and the war with Algiers in 1815. These were the first projection of U.S. military power overseas, and with the newfound confidence, it was not long before U.S. traders started operating throughout the newly independent countries of Latin America, and also in east Asia, where they sourced pepper and other spices. In 1854, Commodore Perry forced an entry to Japan, and there U.S. traders found a ready market for their produce. And there were even U.S. businesses involved in shipping ice to India at the time, well before the availability of refrigeration. Much of the ice would melt during the journey, but enough would survive to make the voyage profitable.

The American Civil War changed the nature of the U.S. economy and showed that the industrial power of the northern states was far more powerful than the agriculturally based economies of the South. However, the Confederates managed to establish a small navy, and their merchant raiders attacked and sank U.S. ships around the world, causing many shipping companies to experience so much trouble insuring their ships that they sold a large part of their fleets, ensuring that the British retained their control of much of the world's trade until the 1910s.

After the American Civil War, the westward expansion of the United States saw the country having access to far more land and raw materials than the early settlers could have dreamed of. Railroad companies mapped routes throughout the country, opening up new areas, creating new towns, and conversely also causing the decline in others that were bypassed by the railroads. The boom in railroad shares led to an early stock market boom, with the railroads becoming essential not just for human transport but also used for postal services, transporting cattle, and for raw materials. With migrants flocking to the United States, it was emerging as the largest and most powerful single market in the world.

It was in this climate that many of today's major U.S. companies had their origins. Global business today is dominated by some of these companies, and also their offshoots—although some have completely changed the focus of their business (and indeed some have changed the entire nature of their business).

In terms of media, the largest media organization in the world, News Corporation (or News Corp), run by Australian expatriate (and now a U.S. citizen) Rupert Murdoch, operates from its headquarters in New York City. Some of the best-known newspapers in the world operate from the major cities of the United States: *Boston Globe* (founded 1872, circulation 720,000);

Despite the economic downturn in 2008, the New York Stock Exchange remains the largest stock market in the world. The Chicago Stock Exchange, the Chicago Board Options Exchange, and NASDAQ remain substantial exchanges as well.

Chicago Tribune (founded 1847, circulation 1 million); *Los Angeles Times* (founded 1881, circulation 1.2 million); *New York Times* (founded 1851, circulation 1.2 million); *San Francisco Chronicle* (founded 1887, circulation 600,000); *St. Louis Post-Dispatch* (founded 1878, circulation 350,000); *USA Today* (founded 1982, circulation 2.3 million); and *Washington Post* (founded 1877, circulation 1 million). As well as the papers, and the periodicals such as *Forbes* (founded 1917, circulation 900,000); *Fortune* (founded 1930, circulation 933,000); *Harper's Bazaar* (circulation 750,000); *Harper's Magazine* (circulation 200,000); *Newsweek* (founded 1933; circulation 3.1 million); *Time* magazine (founded 1923; circulation 4.5 million), and many magazines, there are also the headquarters of the news agencies Associated Press (founded 1848); Bloomberg Business News, the Dow-Jones News Service, and United Press International (founded 1907).

Television stations range from the Public Broadcasting Service (PBS), and Columbia Broadcasting System (CBS) to Ted Turner's Cable News Network (CNN, launched on June 1, 1980, now a subsidiary of Time Warner), based in Atlanta, Georgia; and Rupert Murdoch's Fox News (launched in 1996). Many television programs made in the United States are shown around the world, helping to fund their makers, but also spreading U.S. culture, and in recent instances providing opportunities for merchandising products connected with the films. Singers and other entertainers from the United States have also been popular overseas, as have recordings of foreign entertainers in the United States.

The success of U.S. sports players has done much to raise the profile of the United States, with sportswear (often designed in the United States, but made overseas) earning large profits for Nike Inc. (founded in 1972) and other sports manufacturers.

Advances in Communications

In the realm of telecommunications, U.S. companies have led the world in innovation and in their networks. The invention of the telegraph system came largely through the Morse code of Samuel Morse, and Western Union expanded the telegraph system around the United States, with news about developments all over the country communicated to other areas during the American Civil War and the American Indian Wars. Expatriate Scotsman Alexander Graham Bell introduced the telephone in 1876, and the instrument was exhibited at the International Centennial Exhibition at Philadelphia in May 1877; George Coy established the first private telephone exchange in 1878. Initially people were concerned that the telephone service was only duplicating the telegraph service, and elsewhere in the world, some countries tried to limit the money invested in the telephone network, having spent so heavily on the telegraph network. Bell Corporation fought with Western Union, and managed to establish the largest telephone service in the world, exporting its technology around the world.

To give some idea of the advances in the telephone service in the United States—in 1910 the 100 largest hotels in New York had 27,000 telephone lines between them, nearly the same number as in the whole of France only a few years earlier. Bell Atlantic Corporation and BellSouth emerged from Bell Corporation in 1983, with other important telecommunications companies, including AT&T (American Telegraph and Telephone Corporation) and Nynex. And as the service expanded, the production of business directories—the "Yellow Pages"—started in Chicago in 1886 with Reuben H. Donnelly featuring companies listed by the services that they provided. Verizon now controls the publication of numerous telephone directories throughout the United States and overseas.

And with telecommunications, from almost the start of the film industry, the name *Hollywood* has come to represent the industry with countless films devised and filmed in and around Hollywood, California, where many of the most famous actors and actresses in the world live. Some large film companies have remained independent, but many are now owned by other organizations or have merged. Rupert Murdoch's takeover of Twentieth-Century Fox saw the incorporation of it into News Corporation as a part of that firm's desire to have access to Twentieth-Century Fox's film archives and resources.

The Growth of U.S. Industry

From World War I, U.S. financial sectors had started to overshadow their counterparts in Britain, and during the economic boom of the 1920s, U.S. banks grew considerably in terms of deposits and capitalization. Bankers' Trust, Citibank, JPMorgan Chase (from a merger of J. P. Morgan and Chase Manhattan), and Wells Fargo are some of the more well-known names in the banking sector. Many of these operate throughout the United States, although New York remains very much the commercial center of the country. Most major U.S. banks also have operations overseas.

One of the reasons for the predominance of New York is the New York Stock Exchange on Wall Street, the largest stock market in the world in terms of the dollar value of its listed companies. The Chicago Stock Exchange also remains important, as does the Chicago Board Options Exchange, and NASDAQ, which have also proven important for raising capital and investing and speculating in stocks and commodities. And the U.S. financial sector is certainly not limited to banks and exchanges. American Express remains one of the most famous symbols of U.S. capitalism around the world; and VISA (founded in Fresno, California, in 1958) and Mastercard (founded in 1966 by the United California Bank) both have their head offices in the United States.

The food and beverage sectors of the U.S. economy are heavily diversified, and, at one end, rely heavily on agricultural produce. Wheat from the Midwest and rice grown in California are sold around the world. Fruit from the United States is available in Latin America and the Pacific, and U.S. meat products are both consumed locally and exported. However, the most potent symbols of U.S. capitalism in the food and beverage sectors are undoubtedly the soft drinks and fast food outlets. Coca-Cola and its related drinks and Pepsi-Cola and its other beverages can be found all over the world, with the head offices of both—located in Atlanta, Georgia, and Purchase, New York, respectively—jealously guarding the secret formulas used to make the drinks.

Recipes are similarly guarded by McDonalds and KFC (formerly Kentucky Fried Chicken), with Ronald McDonald and Colonel Sanders both becoming well-known icons in their own right. McDonalds and KFC are perhaps the best known of the worldwide franchises, and there are many others, including retail shops and hotels. The purchase of these franchises has been a great source of revenue for the parent company, as is a regular share in their profits. The debate over genetically manipulated (GM) products, many designed by Monsanto, also had its origins in the United States, where many GM products were designed, with many offered for sale overseas.

Manufacturing and Raw Materials

With its wealth of raw materials, the United States is also a major player both in the raw materials themselves and in the value-added produce and the final manufactured products. Coal is still mined in the Appalachian Mountains, and Pittsburgh, Pennsylvania, is still one of the centers of the regional steel industry. Iron and steel were used to help build the railroad system throughout the United States, and also for shipbuilding. The biggest boom was, however, the establishment of the automobile industry with Ford, General Motors, and a number of other automakers and related industries operating from Detroit, Michigan. Gradually, however, with the cost of labor in the United States rising and greater competition from overseas, the U.S. steel industry, its automakers, and its shipbuilding have had to be dramatically curtailed, something exacerbated in 2007 with a considerable decrease in demand. The retail sector, through companies like Wal-Mart, has been relatively strong, although facing problems since 2007.

Tobacco was one of the first exports to Europe from North America, and through the Altria Group (formerly Philip Morris) and British-American Tobacco, the manufacture and sale of cigarettes, cigars, and other tobacco products is still important. But so too is the healthcare sector, with the many of the new "high-tech" medical machines, ranging from modern x-ray machines and scanners to fiber-optic cables and remotely-operated capsules designed in U.S. medical research centers. U.S. doctors are at the forefront of research into treatments for cancer and other diseases and medical conditions, and major U.S. pharmaceutical companies are involved in researching and developing new treatments and drugs.

The focus of much of the U.S. manufacturing industry moved to the more technologically oriented construction of airplanes and defense-related items. Indeed, with the U.S. defense expenditure nearly equaling that of the rest of the world combined, and with much of U.S. weaponry made at home or under license overseas, the military-industrial complex (referred to in his final speech as president by Dwight D. Eisenhower) remains a major element in the U.S. economy. While Boeing makes civilian planes, it has an extensive range of military materiel. Companies like Raytheon have developed some of the most technologically advanced weaponry in the world. Others, like Halliburton—originally an oilfield company established in Texas in 1919—became heavily involved in defense contracts.

Technology

New technology has seen the United States at the forefront of the "computer revolution." With high levels of education, and a very large and affluent middle class to use computers—although they are now used throughout U.S. society—the United States was the center of "high-tech" development initially aimed at the business market and then at private owners. Companies such as Texas Instruments, 3M, and NCR (National Cash Register) started the move, which later saw companies such as IBM (International Business Machines Corporation, founded in 1889) and Apple, Inc. develop personal computers and networks for both large corporations and small businesses. Bill Gates and Microsoft furthered the development of software for everyday use, and helped spur interest in the internet. This, in turn, led to companies such as AltaVista and Yahoo establishing search engines, a market now dominated by Google.

The dominance of this new technology can be seen by the merger of AOL (America Online) with Time Warner (itself a merger of the Time-Life Corporation of Henry Luce with Warner Brothers), to form AOL Time Warner. And it was not long before many companies came to take advantage of the opportunities of the internet, with eBay coming to be the dominant online auction site, and Amazon dominating the sale of books and other items.

Labor

Although much of the research into business in the United States is devoted to firms, the movement of labor is also very important. This involves U.S. executives moving to other countries to take positions in U.S. subsidiaries or in non-U.S. companies, and foreign executives moving to the United States. It also relates to the large numbers of migrants who move to the United States each year, an example being the increasing migration from south Asia, with Indian migrants being some of the best-educated communities within the United States—some 64 percent have completed at least one university degree. There are also migrants from lower socioeconomic groups working in low-paid jobs, especially in California and in the Southwest. Many of these migrants (some of whom are also well qualified) arrive from Mexico and Central America.

Trade and the United States

One of the main problems that was faced by U.S. industry was the formation of trading blocs around the world, in particular the European Economic Community, which was renamed the European Union (EU) in 1992. Now consisting of 27 countries from a wide range of climatic and geographical conditions, and with major restrictions on trade with nonmember countries, the United States suddenly found that some of its industry, particularly its agricultural goods, were excluded from one of the largest single markets in the world. This was partly alleviated by the opening up of the economy of China, and also the countries of the former Soviet Union. U.S. predominance was under challenge from the EU, especially with the introduction of the euro in 1999/2002.

To counteract the enlarging EU through the 1990s, in December 1993, the United States helped launch the North American Free Trade Agreement (NAFTA), a move initially unpopular, as parts of the country feared a flood of goods made in Mexico, where manufacturing costs were much lower. In 1989, Asia Pacific Economic Cooperation (APEC) was established to promote trade and investment in the Pacific Basin. This allowed U.S. companies to continue to export to many of the countries in the Pacific, as they had done for a long time, especially to Australia and the more powerful economies of southeast Asia, the countries also being members of the regional grouping the Association of Southeast Asian Nations (ASEAN), which had been established in 1967.

In recent years, the United States has decided to embark on a series of free trade agreements with friendly countries working in a bilateral manner. These include the U.S.-Israel Free Trade Agreement (1985), followed by more bilateral free trade agreements with Jordan in 2001, with Australia, Chile, and Singapore in 2004, with Bahrain, Morocco, and Oman in 2006, and with Peru in 2007. These agreements have allowed the United States to continue to have access to these markets so crucial to developing and expanding its trade around the world.

United Technologies

United Technologies Corporation (UTC) is a global technology company with a history of pioneering innovation in aerospace, aviation, helicopter design, climate control, elevator design, and hydrogen fuel cells. Founded by engineers who created new industries, UTC continues to create products that consume fewer resources and produce less emissions during manufacture and in operation. The United Technologies Research Center scientists specialize in fields as diverse as fluid dynamics, advanced materials, controls, modeling, and simulation. In 2007, UTC invested $3.6 billion in company- and customer-funded research and development.

UTC maintains a balanced portfolio of businesses spanning a range of geographies and markets. In doing so, it is able to take advantage of both long and short business cycles, thereby reducing the impact of downturns in individual markets or economies. In 2007, UTC revenues exceeded $54 billion, which doubles revenues received since 2000. Earnings per share grew 15 percent in 2007 to $4.27 per share. Total shareholder revenue for 2007 was 24 percent, ranking UTC first among the Dow Jones Industrials and within the top quartile of the Standard & Poor's (S&P) 500. Regularly rewarded for performance with external recognition, UTC ranks among the 100 Most Sustainable Companies in the World at the Davos World Economic Forum and on the Dow Jones Sustainability Indexes. *Fortune* magazine ranked UTC first among aerospace and defense companies in its annual 2007 Most Admired survey.

Despite having headquarters in Hartford, Connecticut, 62 percent of UTC's revenues and 65 percent of UTC's employees remain outside the United States. UTC employs 225,600 employees worldwide.

UTC businesses include the following:

Carrier: Employees 42,800, Revenues $14.6 billion, Operating Profits $1.4 billion, www.carrier.com. Carrier is a heating, ventilation, air conditioning, and refrigeration (HVACR) company that provides systems, components, controls, and services for residential, commercial, industrial, and transportation companies. In 2007, Carrier won 69 percent of 2008 Beijing Olympics–related air conditioning contracts. Other customers include Princeton University, Mayo Clinic, and Asda/Wal-Mart.

Hamilton Sundstrand: Employees 18,300, Revenues $5.6 billion, Operating Profits $967 million, www.hamiltonsundstrand.com. Hamilton Sundstrand is an electrical power company that provides power generation and distribution systems, engine accessories, flight control systems, and pilot controls, light-emitting diode (LED) lighting, and fire protection products for aircraft and military ground vehicles. Hamilton Sundstrand is prime contractor for the National Aeronautics and Space Administration's (NASA's) space suit/life support system, electric power system, and various other systems for international space programs. Other customers include Airbus and Singapore Airlines.

Otis: Employees 62,900, Revenues $11.9 billion, Operating Profits $2.3 billion, www.otis.com. Otis is an elevator company that designs, manufactures, installs, services, and upgrades elevators, escalators, and moving walkways for buildings. Contract projects include the Beijing Olympics, Tres Molinos (Spain), New Songdo City (Seoul, Korea), and Bahrain City Centre. Otis currently maintains a service portfolio to 1.6 million elevators and escalators worldwide.

Pratt & Whitney: Employees 38,500, Revenues $12.1 billion, Operating Profits $2 billion, www.pw.utc.com. Pratt & Whitney provides turbofan engines for large commercial and military aircraft, and turboprop engines for regional, business, light jet, utility, and military aircraft. It also provides turboshaft engines for military and commercial helicopters, maintenance, repair, and overhaul services, and fleet management services. Customers include NASA's space shuttle and Vision for Space Exploration, and Lockheed Martin. Pratt & Whitney was also chosen by The Spaceship Company to power the White Knight Two launch aircraft for the world's first commercial passenger suborbital spaceship.

Sikorsky: Employees 14,600, Revenues $4.8 billion, Operating Profits $373 million, www.sikorsky.com. Sikorsky is a military and commercial helicopter company offering fixed-wing aircraft, spare parts and maintenance, and repair and overhaul services. Customers include the U.S. government and U.S. Navy fleet. The most well-known Sikorsky product is the Black Hawk helicopter.

UTC Fire & Security: Employees 47,200, Revenues $5.8 billion, Operating Profits $443 million, www.utcfireandsecurity.com. UTC Fire & Security is an electronic security and fire safety company that provides safety systems, software and services, design, integration, installation and servicing of access controls, intruder alarms, video surveillance, and fire detection and suppression systems. The company also provides monitoring, response, and security personnel services. UTC Fire & Security currently services more than one million global customers.

UTC Power: Employees 586, www.utcpower.com. UTC Power provides fuel cell systems for on-site, transportation, space, and defense applications. Customers include the U.S. space shuttle program, Navantia (Spanish shipbuilder specializing in submarines), and Van Hool (Belgian hybrid electric transit bus manufacturer). In 2007, *R&D* magazine rated UTC Power's PureCycle geothermal power system as one of the 100 most technologically significant products introduced during that year.

Universalism/Particularism

Universalism and particularism together comprise one of seven "cultural dimensions" identified by the Dutch cross-cultural researcher, Fons Trompenaars, in his book *Riding the Waves of Culture*. (Other dimensions include Individualism/Collectivism, Neutral/Affective, Specific/Diffuse, Achieved Status/Ascribed Status, Internal/External, and Sequential/Synchronic and some are discussed elsewhere in this encyclopedia.)

Universalists and particularists differ in the priority they give to laws, rules, circumstances, and interpersonal relationships when making decisions. Universalists tend to emphasize rules and laws over relationships and circumstances while particularists tend to emphasize relationships and circumstances over rules and laws. Given this cultural dimension's potentially strong influence on decision making, individuals, groups, and organizations engaging in business that spans cultures can benefit from understanding it.

In particularistic cultures, people view laws and rules as guidelines that help organize the way people relate to each other. They do not see laws and rules as ends in themselves or as artifacts of an "exemplary" culture, but rather the means to the end or ideal of human friendship and harmony. Emphasis is placed on friendship and looking at the particular situation to decide, based on that friendship, what is right or wrong, rather than looking to a general rule or code.

In universalistic cultures, people view laws and rules as the ideal or the end goal. They view these codes or values as immutable standards that uphold society, including all friendships and relationships. Great emphasis is placed on agreements, codes of law, formal contracts, and other forms of rules to decide what is right. The details of the situation or the nature of the relationship of the parties involved is less important to the universalist than following the rules and laws, at all times and in all places.

National and Individual Levels

It is useful to consider universalism/particularism at different levels, including national and individual levels. Although it is difficult to associate entire nations and cultures with either universalism or particularism (because of the significant variance on these dimensions within these nations and populations), it is possible to examine averages of nations and to sense general differences among cultures. (Fons Trompenaars [and Charles Hampden-Turner], for example, have suggested that Switzerland, Canada, the United States, Sweden, and the United Kingdom represent strong universalist cultures, while Venezuela, Korea, Russia, China, and Portugal represent strong particularist cultures.)

At the individual level, people who behave according to universalistic patterns are referred to as universalists and people who behave according to particularistic patterns are referred to as particularists. Although, obviously, not everyone can be classified as a particularist or a universalist, it is possible that many, if not most, people tend to subscribe more to one perspective than the other. To further illustrate the difference between a particularist and a universalist, we turn to a commonly used example:

Two close friends are driving down the street at a speed significantly over the legal limit. The driver of the car fails to see a pedestrian crossing the road and strikes him, resulting in a lawsuit.

Assuming no other form of evidence is available, the universalist would be more likely to testify in court that his or her friend was exceeding the speed limit than the particularist, because the universalist would place emphasis on the law (over the friendship) and the particularist would place emphasis on the friendship (over the law). Although this example is simple and perhaps an exaggeration of the expected behaviors of universalists and particularists, it succeeds in making the difference between the two clearer—the universalist's loyalty tends to lie with rules and laws, while the particularist's loyalty tends to lie with relationships and depend on situational specifics. So what does this mean for business?

Universalism/Particularism in Business

In the business context, universalists and particularists can behave quite differently because of the different emphasis they place on rules and relationships. For example, universalist managers and companies may tend to justify the allocation of rewards and resources (such as pay) based solely on the objective merits and work accomplishments of employees. However, particularists may be more likely to justify resource allocation based on the subjective consideration of functionally irrelevant characteristics, such as tenure, family size, and friendship. In the formation of agreements or contracts, universalists might expect or demand clarity, uniformity, and absolute dedication to the fulfillment of the contract, without option to back out. On the other hand, particularists may view an agreement or contract as fluid, changeable, and continually renegotiable, depending on changes that might occur in the relationship or environment.

Universalists and particularists are likely to differ in the way they make decisions involving moral issues. By way of the example provided above (with regard to the two friends who hit a pedestrian in a speeding car), it is clear that universalists and particularists may come to completely different decisions in identical circumstances, both believing their course of action to be correct and ethical. But referring again back to the speeding car example, are both courses of action always ethical? Part of the difference of opinion that can exist among universalists and particularists might stem from the reality that not all ethical decisions are obviously "black and white" and that not all rules apply equally well in all possible situations.

For example, we might consider a pure universalist claiming that some action is always wrong or unethical and a particularist simultaneously suggesting that the same action can indeed be wrong, but that it depends entirely on the surrounding circumstances and the people involved. (The "action" in question for this context might be anything that is questionably ethical—speeding, paying bribes, lying, abortion, doing special or secretive favors, impersonating, etc.) Considering the many topics or actions upon which a universalist and a pure particularist might therefore differ in their opinion about what is ethical, to the "neutral" observer, deciding who is actually morally right in a given situation is not always easy or clear, and strong feelings may even be associated with the differing positions.

Therefore, when people who are engaging in business across cultures are aware of the differences between universalist and particularist cultures, they can potentially be better prepared for differences when they arise. When preparation and education are absent, however, misunderstandings (or worse) can multiply, and business cooperation can subsequently suffer. Specifically, when particularists adhere to their perspectives too resolutely, blindly, and/or inconsiderately, they can find themselves isolated from any real global conversation or interaction—including profitable business opportunities. By the same token, overbearing universalists run the risk of ethnocentrism (being guilty of believing that their own culture, rules, laws, and systems are superior to all others), resulting in a similarly unfortunate and deprived situation. This reality underscores the importance of cross-cultural training, especially for repeat expatriate employees or employees who travel or plan to travel frequently to foreign countries as part of their jobs and careers.

Upstream

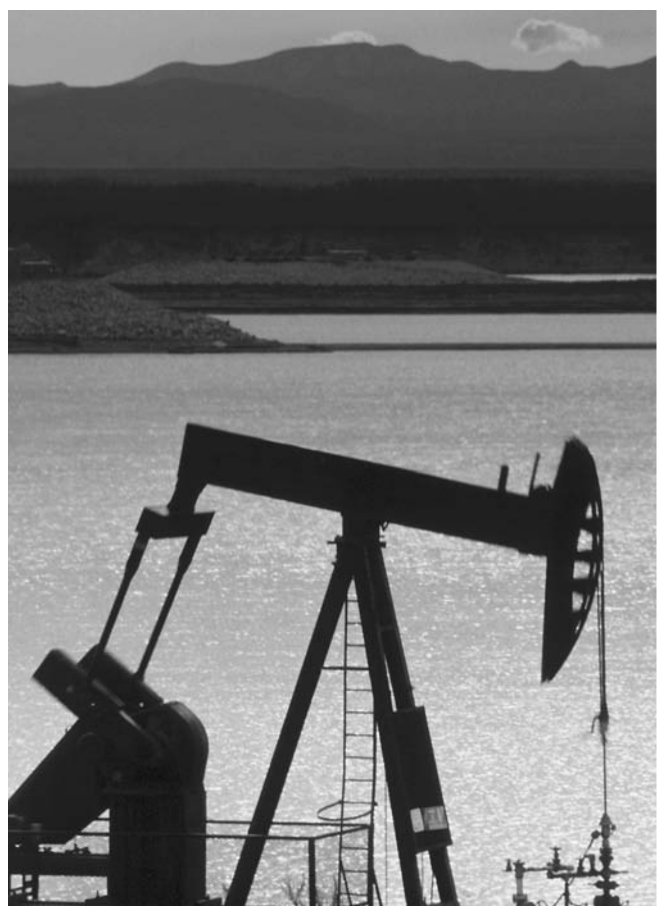
The term *upstream* has historically been used in the natural resource industry, and specifically in the oil and gas industry, to refer to activities that relate to the finding, associated development activity, and production of crude oil and natural gas or related petroleum products to the point where they are either landed, if produced from deep water, or enter a pipeline system if on land, or are transported into a processing plant as a feedstock for follow-on processes.

The origins of the term are in the sense of the location of the deposition of minerals in a streambed, for example, gold-panning activities (even older than petroleum exploration and production) where heavy minerals were deposited downstream from the water's source but originated "upstream." It is, however, also used today to refer to activities that are focused toward the code writers by generators of bugs and system fixes; in bioprocesses where it refers to the origination of new biological materials, and is even used to refer to data transfer speeds between clients and host servers analogously to uploading.

Crude or unrefined oil had been used for lamps and lubrication and sourced from ground seeps for many centuries. However, nowadays it is produced through pressurized wells, which force the oil out of the rocks in which it lies, after which it is pumped to the surface and separated. Oil wells are deep and costly, and the search continues for new sources and better recovery rates.

It was not until the latter part of the 19th century that the oil fields of Baku (now in modern-day Azerbaijan) attracted the interest of various European investors, followed by interest in Peru, Persia (modern-day Iran and the home of the precursor of today's BP plc), and Trinidad. Shell became involved in the oil business through the founding Samuels family's ability to supply maritime transportation to the Baku fields and thorough production in the Dutch East Indies (Sumatra)—modern-day Indonesia. In the United States, the discovery of oil in Pennsylvania in the mid-19th century spurred a commercially based oil boom, with further discoveries made in other areas, such as Oklahoma and Texas.

Typically, oil and gas are owned by the nation or state where the reserves are located, or through personal title-based mineral rights that may be bought and sold. The latter may be separable from land ownership. Oil and gas is discovered through a process of exploration and then produced or "won." Historically, the right to produce was granted or sold by the



The term upstream *has been used in the oil industry to refer to the activities of finding and processing crude oil.*

oil and gas owners (either state or individual) through concessions, although more recently and for larger developments, this partnership has taken the form of production-sharing or risk-sharing contracts.

Organizing the Industry

Prior to the 1970s, several large producing states believed that they were not being adequately compensated for their national resources that the governments perceived as exploited and removed by large nonnational companies to benefit economies. This led to the formation of the Organization of Petroleum Exporting Countries (OPEC) cartel, which has been successful in voicing the concerns and needs of member producing states, and also in setting the production rates of their members to attempt to impact the market price of crude oil. OPEC was instrumental in changing the legal basis for cooperation with externally based nonnational companies to one of coproduction and codevelopment of knowledge and expertise, using production-sharing contracts. Today's typical new development would include several partners who use contractual cooperative mechanisms to ensure that the development and production is managed appropriately for all parties and stakeholders, and whose cooperation is related to specialist knowledge and risk sharing as well as resource capture.

The upstream oil and gas businesses have been key drivers of innovation through the use of new technologies, such as four-dimensional (4D) seismic to assess oil in the reservoir and its ease of production. However, the industry has also been a key driver in the movement toward greater accountability and corporate social responsibility. Oil and gas exploration and production has always been a high-risk business: fire hazards and spills are not new events, but our increasing consciousness of environmental matters and greater accountability to local stakeholders have contributed to a higher awareness of the need to balance the quest for oil with the needs of the local environment and its stakeholders. As oil and gas fields reach the end of their producing lives, more attention is now paid to disposal and restitution, and a once-secretive industry is gradually becoming more openly accountable.

Uruguay

Uruguay, officially known as the Oriental Republic of Uruguay, is the second-smallest country in South America, with an area of 68,036 square miles. Brazil forms its eastern and northeastern border, while Argentina bounds it on the west and northwest. In the south, Uruguay possesses slightly over 400 miles of Atlantic coastline. Its population, as estimated in 2008, is 3,477,778 people. The majority, nearly 90 percent, are of European ancestry with the remainder claiming to be of African or Indian descent.

Uruguay was originally occupied by the Spanish early in the first half of the 16th century. Because there were no gold or silver deposits, major settlement would not occur until the beginning of the 18th century. At the beginning of the 17th century, however, the Spanish introduced cattle to the region, beginning what would become and remain an essential part of the Uruguayan economy.

In 1493, the year after Columbus's first landing, Pope Alexander VI divided the New World between Spain and Portugal. The region, although Spanish,

Gauchos herd cattle on an Uruguayan ranch. The Spanish first introduced cattle to the region in the beginning of the 17th century, and livestock ranching still plays a key role in the country's economy.

was claimed by the Portuguese in Brazil. That factor would influence Uruguay's history into the 19th century. Even now, there are many speakers of Brazilian Portuguese in Uruguay. In addition, Uruguay found itself dragged into the Napoleonic Wars. As the British were fighting against Spain—then one of Napoleon's allies—they occupied the capital city of Montevideo in 1807 with 10,000 troops before moving on to Rio de Janeiro.

In 1816, Uruguay declared independence from Spain, and was then promptly invaded by Brazil. That occupation would last until 1825, and full independence, as the result of a deal brokered by the British, would come three years later. Through most of the 19th century, after its revolution and liberation from Spain, Uruguay was engaged in both internal and external conflicts. There was a 12-year civil war, a war with Paraguay in the 1860s, and small-scale border conflicts with Brazil.

Despite the political and military unrest, immigration, mostly from Spain, Italy, France, Germany, and Russia, resulted in a large population growth, accompanied by economic growth, largely based on its agricultural exports. Through the second half of the 19th century, the country's standard of living was high, according to some sources, higher than in the United States. The government from the 19th century, well into the 20th century, focused on creating a welfare state. With a strong economy, Uruguay was able to do this with little difficulty until the middle of the 20th century. That level of support for social programs could not be sustained, however. As the century progressed, an increase in the country's debt and the failure of the economy to keep pace with the requirements of a welfare state caused a decrease in services.

In common with many Latin American nations, Uruguay was, for a time (1973–85), under the rule of a military dictatorship. This era saw severe political repression and many Uruguayans emigrated. An estimated 600,000 left the country for Europe, the United States, Canada, and Australia. With the voluntary departure of the military, a civilian government came to power in early 1985. From that time until 2005, the governments were mainly dominated by the Red (Colorado) Party, a centrist-rightist party. Since 2005, in common with several South American governments, Uruguay has been governed by a leftist party, who won by a very narrow majority.

Economic Challenges

Economically, Uruguay is currently a very mixed picture with improvements over the past few years. There have been severe economic problems dating back to 1999, although the nation itself has a history of dependable industries, a very well-educated population (98 percent literacy rate), and an improving infrastructure. The economic problems, beginning in the late 1990s that were exacerbated by problems in neighboring Argentina, have decreased. Up until that time, the economy in the 1990s had been growing at a rate of 5 percent yearly. The problems Uruguay faced have been an indicator of the way in which Latin American economies affect each other. Argentina's economic problems caused the withdrawal in 2002 of large amounts of Argentine funds that had been deposited in Uruguayan banks. The loss of this capital decreased the value of the Uruguayan peso. The decline of the Uruguayan economy at this was reflected in the nation's gross domestic product (GDP) decreasing by 20 percent.

In 2004, the situation began to improve. Uruguay received assistance from the International Monetary Fund (IMF) and has succeeded in making repayments as well as adjusting its economy to follow IMF guidelines. The peso is now stronger and prices for Uruguayan exports have risen. The estimated GDP for the country is $37.19 billion, with an inflation rate of 8.1 percent, and unemployment at 9.2 percent. Foreign investment, principally through the creation of a paper mill that began operations in 2007, has also occurred.

In the early 2000s, tourism was dramatically hurt, in large part as a result of the economic problems in neighboring Argentina. The tourist industry has begun to recover, however, with the government's Ministry of Tourism emphasizing resorts such as Punta del Este as tourist destinations. Most of the tourists are currently from Chile, Brazil, and Argentina.

Uruguay has, in large part because of its stability and low cost of living, become a destination for retiring Americans to live.

Uruguay Round

Begun in 1986, the Uruguay Round was the largest round of trade negotiations under the General Agreement on Tariffs and Trade (GATT), with 123 countries participating. The negotiations of the Uruguay Round had a very broad agenda and included agreements pertaining to trade in agriculture, manufactured goods, services, intellectual property, and other products. The negotiations concluded on April 15, 1994, and led to the creation of the World Trade Organization (WTO) in January 1995.

In the years immediately after the conclusion of World War II, there was a strong international consensus to develop supranational institutions and agreements that would foster peace, stability, and cooperation among nations. In the area of trade, efforts were made to create an International Trade Organization (ITO), which would serve to create and implement international trade policies with a goal of reducing trade barriers, resolving trade disputes, and enforcing multilateral trade agreements. The attempt to create an ITO failed in 1948, but the effort did lead to GATT, signed by 23 countries and including over 45,000 trade concessions affecting about $10 billion of trade (one-fifth of the world's total at the time).

Progress Through the Creation of GATT

GATT consisted of a series of eight rounds of negotiations with each round focusing on different sets of core issues, but with all rounds designed to reduce barriers to trade, in a broad multilateral process. The early GATT rounds focused on further reducing tariffs on an ever-wider array of products. The agenda shifted slightly in the 1960s with the Kennedy Round, which added an antidumping agreement and a section on development, and was signed by 62 countries. In the 1970s, the Tokyo Round included agreements on nontariff barriers for the first time and also introduced various reforms to the overall GATT system, and was agreed to by 102 countries. The multilateral approach to reducing trade barriers culminated in the Uruguay Round, begun in Punta del Este in 1986 and concluding in Marrakesh, Morocco, in 1994, with a final agreement signed by 123 participating countries.

The initial negotiating agenda for the Uruguay Round aimed to extend GATT to cover trade in services and intellectual property, and to introduce reforms to the sensitive areas of agricultural and textile trade. The trade ministers from member countries put all of the original GATT articles up for review and set forth an aggressive four-year time line for the process. This marked the first time that multilateral trade negotiations had included discussion of national agricultural policies with the intent of creating a more market-oriented agricultural trading environment through the reduction of government agricultural support programs. These programs frequently led to surplus production in developed countries, to the detriment of agricultural producers in less-developed countries.

Two years into the process, ministers met in Montreal, Canada, to assess progress, and set forth a more detailed agenda for the remaining two years. At that point, agreements had been reached on market access for tropical products, a streamlined dispute settlement system, and the creation of the Trade Policy Review Mechanism, which provided for regular reviews of GATT member nation trade policies.

In 1990, ministers met in Brussels, Belgium, with the intent of concluding the Uruguay Round. Instead, disagreements over agricultural trade reforms thwarted these plans and put the entire process in jeopardy. New deadlines were agreed upon and were then missed, as the political environment for free trade deteriorated and new issues were brought up that made reaching a consensus even more difficult. Significant ideological differences between the United States and the European Union (EU) were at the center of the conflict.

Finally in 1992, the United States and the EU settled their differences in an agreement that came to be known as the Blair House Accord. Progress continued over the next year, with agreement being reached among the United States, Canada, Japan, and the EU. More than eight years after the process had begun, the Uruguay Round came to an end with the signing of a final agreement. As in other GATT rounds, however, this agreement also included an agenda for additional negotiations in the future. This agenda formed the basis for what has come to be known as the Doha Round of trade negotiations.

The impact of the Uruguay Round has been somewhat mixed. In the area of agriculture, there have been relatively small reductions in national agricultural subsidies among developed nations and many of the objectives of the Uruguay Round provisions have yet to be realized. In other areas, however, such as intellectual property rights, significant progress toward the Uruguay Round objectives has been made.

U.S. Agency for International Development

The U.S. Agency for International Development (USAID) is a U.S. government agency that has been charged with the provision of technical and other assistance to developing and, more recently, transitional countries around the world. It is an independent government agency, headed by the administrator. The secretary of state (that is, the Department of State) provides foreign policy guidelines and the Agency works closely with the State Department, both in the United States and abroad. USAID missions are often attached to U.S. diplomatic missions and the officials are provided with full diplomatic cover.

USAID's work is focused on the promotion of democracy and furthering of free markets (market economy) and enabling citizens of the foreign countries to make a better living. In achieving the former task, USAID is supporting the U.S. foreign policy goals (promotion of democracy and free markets).

USAID Beginnings

The Agency was set up by an executive order of the then U.S. president John F. Kennedy, following the promulgation of the Foreign Assistance Act, in 1961. It is believed that the roots of USAID are in the post–World War II assistance to Europe, especially through the Marshall Plan, from which a number of countries in the Western Hemisphere that were severely affected by World War II benefited greatly. Similarly, President Harry S. Truman's Point Four program has contributed to the changing perception of the U.S. role in international affairs and rebuilding war-torn Europe.

Upon the completion of the activities under the auspices of the Marshall Plan, the U.S. Congress created the Mutual Security Agency in 1951, and in 1953, the Foreign Operations Administration to consolidate economic and technical assistance on a worldwide basis. In 1954, the International Cooperation Administration (ICA) was established. The newly formed ICA managed aid for economic, political, and social development purposes. ICA was not independent in delivering its tasks and it had been noticed. Also, at those times, major players in the foreign development assistance arena were multilateral donor organizations, primarily the United Nations (UN).

The Mutual Security Act promulgated in 1954 introduced the concepts of development assistance, security assistance, a discretionary contingency fund, and guarantees for private investments. And the 1957 revisions of the Mutual Security Act provided the legal framework for the development of the Development Loan Fund (DLF), which enabled ICA to become a lender as well. However, all the organizations that dealt with international assistance failed to provide for long-term sustained growth; it was necessary to reform the system of U.S. government foreign assistance, and in 1961, USAID was formed and major negative remarks on the position and powers of the previous aid agencies were addressed, making USAID prone to be more successful from the very outset.

Today's USAID

USAID as a government agency is bound by U.S. foreign policy and its work is based on three pillars: (1) economic growth, agriculture, and trade; (2) global health; and (3) democracy, conflict prevention, and humanitarian assistance. USAID supports long-term and equitable economic growth and advances democracy through its work. The Agency's budget is roughly 0.5 percent of the U.S. government budget, but it is seeking new forms of public-private partnership and now works in collaboration with more than 3,500 voluntary and nongovernmental organizations that are interested in the advancement of human conditions in foreign countries and uphold the values promoted by U.S. foreign policy.

Historically, USAID had an unchallenged position in providing foreign assistance beside some special programs executed by the Department of State. Now, the U.S. foreign assistance picture is more complicated, as former president George W. Bush had set up the Millennium Challenge Corporation (MCC) as a U.S. government-owned corporation, and the Office of the Global AIDS Coordinator. MCC was established in 2004 to work with the poorest countries in the world, upholding the position that (foreign) aid is the most effective when it reinforces good governance, economic freedom, and investments in people.

As it has proven to be rather complicated to coordinate efforts by a few government-sponsored agencies, as a part of the recent (2006) reform of the U.S. foreign assistance program, the post of the director of foreign assistance has been created. The post is charged with ensuring the efficiency and effectiveness of U.S. foreign assistance and provision of "value-for-money" models, where the taxpayers will be satisfied with the outputs and outcomes achieved through the spending of public money in assisting foreign jurisdictions. The post is also to ensure better alignment between the Department of State and USAID, and between all payers in the foreign assistance field in the United States that are funded from the public coffers.

The very environment in which international development assistance is provided has changed. While in the past, international and regional organizations were major donors and provided technical assistance, now the national development agencies play a major role in providing assistance. Most Western democracies will have a government agency with the remit similar to USAID, or if the independent body does not exist, there will be foreign assistance programs operating from within the foreign ministries.

USAID operates in five geographic theaters: Europe and Eurasia, sub-Saharan Africa, Latin America and the Caribbean, Asia, and the Middle East. Although there are regional initiatives that cover a few countries, most of the projects are single-country based. However, the fact that the project is single-country focused does not mean that USAID will not collaborate with other donors, but more that the project will be country specific and country monitored.

At the moment, a new U.S. model of foreign aid and assistance is emerging with a multitude of players covering the particular target countries. It seems that USAID will continue to play a pivotal role in that model.

U.S. Postal Service

The U.S. Postal Service (USPS) handles over 40 percent of the world's mail volume. In 2007, it delivered 212 billion pieces of mail to over 145 million addresses. With almost 37,000 retail postal outlets and a fleet of more than 210,000 vans and trucks, revenues in 2007 were close to $75 billion. The USPS's workforce of 786,000 employees makes it the second-largest civilian employer in the United States, after Wal-Mart. However, although this government agency enjoys a legal monopoly on the delivery of first-class mail and bars others from using its customers' mailboxes, it has experienced increasingly stiff competition. Its monopoly power has been undercut by new forms of technology that reduce the demand for its services. In the wake of declining mail volume, it had reported a net operating loss of $5.3 billion in 2007 and it faces calls for fundamental reorganization.

Establishing the Postal Service

In 1792, the United States Postal Service became a cabinet-level department of the federal government. It established a system of post offices and post roads, using high prices for the delivery of letters to subsidize newspaper delivery and the building of additional post offices and routes in rural areas. The post office soon became the largest enterprise in the country and employed about three-quarters of all federal government civilian workers by 1830. In the early 1800s, its speed and innovative hub-and-spoke delivery system impressed many Americans. Then the arrival of steamboats and railroads brought considerable competition in the 1830s, as entrepreneurs began carrying mail between cities.

By 1845, private enterprises carried about two-thirds of intercity mail. Other businesses sprang up to offer delivery of mail within cities, providing innovations, including home delivery, street corner letterboxes, and postage stamps. Some argued that the government-run post office was redundant. However, the political clout of postal employees and transportation contractors and the desire of politicians to reward supporters with patronage positions saved the post office. Congress responded in 1845 by drastically cutting postage rates and by granting the post office a monopoly on all carriage of intercity mail, forbidding private competition. In 1872, the post office further secured its monopoly position with legislation banning delivery of mail within cities by competitors.

Ending the Monopoly

The Postal Reorganization Act of 1970 replaced the cabinet-level Post Office Department with the USPS. In 1979, its monopoly on express mail was lifted and private businesses, such as United Parcel Service (UPS) and Federal Express, entered the market, easily outperforming the USPS. Simultaneously, faxes, e-mail, and other forms of electronic telecommunications developed as substitutes to traditional mail. In 2005, bulk advertising mail surpassed first-class mail (such as personal letters, postcards, and bills) in terms of total volume. From 2002 to 2006, first-class mail volume fell by about 5 percent—and volumes dropped by 7 percent for periodicals, 7.5 percent for priority mail, 8 percent for express mail, 10 percent for international mail, 22 percent for registered mail, and 35 percent for cash on deliveries (CODs).

Despite this increasingly fierce competition, rising costs have forced the USPS to substantially increase its prices. Between 1970 and 2008, the price of a first-class stamp soared from 6 cents to 42 cents—a 600 percent increase, considerably higher than the average economy-wide increase in prices of 450 percent.

The USPS purchased over 30,000 ethanol-capable vehicles, making it the biggest U.S. buyer of alternative-fuel vehicles.

Research shows that the USPS's costs are high for two major reasons: high wages and low productivity. Although the law requires the Postal Service to maintain wage and benefits levels comparable to similar work in the private sector, its average compensation is about 40 percent above market. (This excludes unfunded liabilities of approximately $75 billion for workers compensation, pensions, and postretirement health insurance.) Moreover, rather than economize on its expensive labor, the USPS feels pressure to preserve jobs by keeping open low-volume facilities and delaying the installation of efficient new mail-handling technologies. As a result, its annual total factor productivity growth was only 0.3 percent from 1972 to 1999, before climbing to 1.5 percent per year from 2000 to 2006. These rates are far below the pace of productivity growth in the rest of the U.S. economy.

Other nations have responded to similar problems by corporatizing their post offices, turning them into free-standing corporations, whose job is to maximize profits. These corporations are given the flexibility to improve productivity, shut down unprofitable operations and lines of business, redeploy workers, implement pay-for-performance plans, borrow capital from private markets, and enter into joint ventures. Some countries have completely privatized their post offices and removed barriers to entry from competitors. These reforms have generally brought major productivity improvements and cost reductions without delivery disruptions. The major roadblock to such reforms in the United States is the political power of the USPS's large workforce.

Uzbekistan

This central Asian republic, which shares borders with Kazakhstan, Turkmenistan, Tajikistan, Kyrgyzstan, and Afghanistan, has a population of 27.3 million, and covers a land area of 172,742 square miles. A landlocked country, it is one of only two countries in the world that is entirely surrounded by other landlocked countries. In medieval times, Uzbekistan was a wealthy entrepôt with the cities of Tashkent and Samarkand, being astride the famed Silk Road on which goods were traded between Europe and China. This continued through the Mongol occupation of the region, but declined in the 17th century because by this time, much of the trade went by ship. During the early 19th century, Uzbekistan became a part of the Russian Empire and later became a constituent part of the Soviet Union. In 1991 Uzbekistan gained independence as a nation from the Soviet Union.

During the time that Uzbekistan was a part of the Soviet Union, the centrally planned economy resulted in the establishment of a large cotton industry, drawing much water from the Aral Sea, heavily depleting the water supplies from it. With Uzbekistan being desperately poor throughout this period, the Soviet Union spent considerable funds on infrastructure, which saw the improvement of healthcare, education, and transportation. Many of these business structures were run centrally from Moscow, and this saw the emergence of a Russian managerial class, albeit at the time in state-owned corporations. As a result, most of the businesses in the country are still Russian, even though ethnic Russians make up only 5.5 percent of the country's population.

Postindependence

After independence, the Uzbekistan Economic Model was introduced from 1994, by which state control of many companies continues, with a reduction in imports and an attempt by the country to achieve self-sufficiency in energy. Many people were disappointed that there was no real attempt to introduce a large private sector, and Uzbekistan remains one of the least industrialized countries in central Asia. It was also no longer able to access as many of the raw materials from other parts of the former Soviet Union as had previously been the case.

The country is now the second-largest exporter of cotton and the sixth-largest producer. It is also relatively rich in natural resources with significant deposits of coal, oil, natural gas, and copper: roughly 2.5 million tons of coal and 65,000 tons of copper mined in 2005, and an average output of 126,000 barrels of crude oil each day in the year 2005. The country is also the seventh-largest producer of gold in the world, with some 99 tons being mined each year. Mining also results in some 80 tons of silver and 1,770 tons of uranium each year. However, in spite of this, much of the population in the country is desperately poor. Average monthly wages are as low as $50 and the average gross domestic product (GDP) of the country is $535 per year.

Agriculture continues to employ, officially, some 44 percent of the population, but it is believed that some 20 percent of the population are unemployed or underemployed (against the official rate of 0.7 percent). Some observers believe that only 28 percent of the population work in farming. As a result, the importance of the cotton crop means that at harvest time, teachers and students take part in the harvest. This, in turn, has led to some foreign companies, in opposition to the use of child labor, refusing to stock items made from Uzbek cotton. The per capita GDP is $2,283, the lowest of any of the former republics of the Soviet Union. Corruption in Uzbekistan is regarded as serious, with the country ranked 137 out of 159 countries in the Corruption Perception Index in 2005; it ranked 175 of 179 in 2007.

Value Added Tax

Value added tax (VAT) is a type of tax on goods and services levied by the government in which they are sold. In some countries, such as Australia, Canada, Egypt, and New Zealand, the VAT is called a "goods and services tax" (GST). The VAT is not charged on exports. VAT is called a consumption tax because it is paid by the consumer using the value of the product. It is also called an indirect tax because it is collected from an entity (the seller) other than the end user who pays the tax. A VAT is an important source of revenue for governments, especially those that cannot generate substantial revenue from income or property taxes.

VAT differs from a sales tax in that a VAT is assessed at each stage of the production process as a percentage of the value added to the product. These stages might include raw materials, manufacturing, wholesale and retail. On the other hand, a sales tax is usually levied only on the end product. For example, if a sales tax of 10 percent is applied to a desk worth $1,000, then the end customer buying the desk from a desk retailer would pay $100 in sales tax and $1,000 to the desk retailer. All other entities involved in each stage of producing the desk would pay no tax. If a VAT of 10 percent is applied to the same desk, the end customer will pay $100 in VAT. If the desk builder has purchased wood and supplies for the desk totaling $400, he/she is thus assessing $600 of value that he/she has added in creating the desk. The desk builder would pay the 10 percent VAT of $40 on the supplies. When he/she remits payment of the VAT to the government, he/she will remit the total VAT assessed on the end value of the desk ($100) minus what he/she has already paid ($40), to total $60 based on the added value. In effect, each stage of the production process pays only the tax applicable on the value added by that entity.

One benefit of the VAT system over traditional sales tax is that it is applied to all commercial activities based on the margin of the transaction. The net income to the government is the same. A disadvantage of the VAT is that each entity involved in commercial activities must maintain accounting of the gross margin for each product.

The VAT is assessed in two ways. The first method is called the CIF + duty because the VAT is assessed as a percentage of the total value of the item cost, insurance, freight, and duty. The second method is called FOB + duty because it is calculated as a percentage of the total free on board value plus its duty. The free on board indicates that freight and insurance is paid by the seller (supplier).

The VAT on services is levied on the cost of the service rendered based on the VAT level of the place where the service took place. In the case when the supplier of the services is established in a different nation from where the service took place, he/she usually assesses the amount of the VAT based on the location of his/her establishment. For example, if a tax consultant is based in Germany but renders services in the Netherlands, he/she will assess the VAT on his/her services based on Germany's rates. For certain services, such as entertainment, the VAT is assessed by and paid to the government where the service takes place.

Currently, 135 countries use a form of VAT. The VAT on a product varies by country of origin, country of import, and product type. Throughout the world, the VAT rates range from 5 percent to 25 percent. For example, in the European Union, regulations require that member nations have a VAT rate of at least 15 percent and a tax rate for supplies for goods and services of at least 5 percent. Each member nation is free to specify its own rates.

Value at Risk

Value at Risk (VaR) provides an estimate of the greatest likely loss if a known risk were to occur. It may represent the loss in value of a portfolio of shares if a market slump occurred. In practice the analyst calculates the greatest loss that could arise in 99 percent of all cases. This means that in 1 percent of cases the loss would actually exceed the amount of the calculated VaR, which is effectively a boundary value. It is a probabilistic statement; if a VaR is estimated to be £1 million with a confidence of 99 percent (probability of 0.99) then a loss of more than £1 million might be expected on one day in every 100. A slightly more mathematical definition is given by P. Jorion: "VaR measures the worst expected loss over a given time interval under normal market conditions at a given confidence level".

There are several factors underlying the growth of VaR as a risk-management tool. Firms increasingly hedge their exposure to sources of market risk. Financial market volatility can dramatically impact the profitability of firms, particularly those firms that improperly hedge market risks. The experience of Enron, Orange County, Long-Term Capital Management, Metallgesellschaft, and Barings Bank illustrates the magnitude of large unanticipated events that are not going to be captured by standard VaR forecasts.

The VaR approach offers an appealing summary statistic of portfolio risk embodied within a single statistic. Specifically, VaR is a powerful operational tool to establish position limits for traders, but also enables managers and regulators to control to some extent the firm's overall margin between risk and return.

But while the concept of VaR is straightforward, its implementation is not. There are a variety of models and model implementations that produce very different estimates of the risk for the same portfolio. These difficulties were highlighted when regulators presented some of the largest banks in the world with the same test portfolio and asked them to compute the VaR. The answers varied widely, causing regulators to adjust their thinking on how the measure may be used to manage market risk. The difficulties in model-based evaluation were considered in a Bank of England study on valuation practices in banks. Another important point is the divergence in a model's implementation within software and how it, too, affects the establishment of a risk measurement standard. Discrepancies arise because of the VaR's extreme sensitivity to the modeler's choice of parameters.

Value Chain

The term *value chain* is used in two distinct contexts. The concept has developed into a well-known notion within global business and management theory since it was launched by Michael Porter in 1985. Meanwhile, Raphael Kaplinsky's reinterpretation of the concept is much used within developmental economics. The purpose of this entry is to explore the difference between the two potential meanings of the concept of a value chain and their different implications for understanding competition within global business.

The concept of a value chain was originally promoted by Michael Porter in the book *Competitive Advantage: Creating and Sustaining Superior Performance,* in which he explores the underpinnings of competitive advantage in the individual firm. A value chain describes the sequence of activities that firms perform to add value to a certain product or service. The difference between the total added value and the total costs to operate the chain results in a profit margin. The success of a company in managing a profitable value chain, maximizing value creation while minimizing costs, is an important aspect of competitive advantage.

Porter distinguishes between primary activities and support activities. Primary activities are directly concerned with the creation or supply of a product or service. They can be grouped into five main areas: inbound logistics, operations, outbound logistics, marketing and sales, and service. These primary activities are linked to support activities that help to improve efficiency such as procurement, technology development, human resource management, and strategic planning.

Porter showed that a company's competitive strategy should not be aimed at fine-tuning one activity of the chain, nor does it suffice to improve all the different activities. Although these value activities are the building blocks of competitive advantage, the value chain is more than a mere collection of independent activities. Value activities are linked within the value chain and these linkages determine competitive advantage or disadvantage. For Porter, streamlining the value chain is not enough; he puts the competitive logic of cost leadership and diversification up front.

Porter's insights on competition and the concept of the value chain have gained much attention in academia and management. Numerous empirical analyses have made use of the concept of a value chain and since 1985, the concept itself has even been reinterpreted. Raphael Kaplinksy broadened the scope of the analysis by stepping outside the individual firm. For Kaplinsky, a value chain describes the full range of activities that are required to bring a product or service from conception, through the different phases of production (involving both the primary and support activities), delivery to final consumers, and final disposal after use. Even when a primary or support activity has been outsourced by a particular firm, it still forms part of the total value chain that supports a product or service.

The big difference between Kaplinsky and Porter is that Kaplinksy reconstructs the value chain in relation to a certain product or service, not a particular firm. Only when there is full vertical integration would the two meanings of a value chain coincide. Porter saw the difference but called this network of interfirm linkages a value system, while James Womack and Daniel Jones refer to it as a value stream, adding further to the conceptual confusion.

Given his different definition of a value chain, Kaplinsky also has different insights to offer on the sources of a company's competitive advantage within global business. Whereas Porter wants to show how firms can successfully manage their internal value chain, Kaplinsky discusses how firms can successfully upgrade within a broader value chain, specializing in these nodes of the chain that are the most profitable ones because they offer the least competition. To Kaplinsky, diversification and cost leadership are but two ways through which a firm can arm itself against competition. Another strategy is to try to escape the pressures of competition by adopting a number of overlapping but related strategies: identifying pockets of activity that benefit from barriers to entry, learning how to leap over the barriers constructed by rivals, generating new barriers to entry (notably through innovation), and doing so on a dynamic basis.

Kaplinsky's reinterpretation of the concept has also triggered much empirical investigation, more so in the field of developmental economics than management studies. This leads to a situation in which the same term is used in two different contexts, meaning two different things. To highlight the difference with Porter's value chain analysis, researchers who use Kaplinsky's conceptualization have started speaking about global value chain analysis, underlining the interfirm and spatial nature of the linkages they are studying.

Value Network

The value network models value creation in the context of firms that create value by making it possible for customers to exchange goods, information, and capital. The value network model is most suitable for the representation of value creation for firms that compete in the network economy. Such firms manage clubs or sets of customers. The firms are not the network; they merely provide networking services to their customers. Typical examples include telecommunications firms, airlines, postal and financial services firms, and stock exchanges. Value is created by making exchange viable and efficient by reducing transaction costs. Firms that create value by making possible exchanges link clients or customers who are or wish to be interdependent for exchange purposes.

The value network model is one of three value configuration models. Value configuration analysis is based on the premise that competitive advantage stems from the performance of discrete activities by firms. All value configuration models share the underlying logic that by disaggregating a firm into its strategically relevant activities, managers can understand the behavior of costs and the sources of differentiation and hence understand competitive advantage. A value configuration analysis entails the identification of the primary activities of a firm and thereafter the study of the economic implications of those activities. The models assist managers in determining what activities a firm should perform, and how, and what is the configuration of the firm's activities that would enable it to add value.

Initially the value chain was advanced to assist managers in creating sustainable competitive advantage through the analysis of how companies create value. Proposed in 1985, the value chain, which has become popular worldwide, appropriately describes value creation in the manufacturing sector of the economy. However, the value chain fails to model value creation of telecommunications companies, consulting firms, doctors, lawyers and banks, and e-business. Its relative importance to managers has also been reduced as the contribution of manufacturing companies to gross national product has fallen since the 1980s, with current manufacturing share of gross domestic product at merely 15 percent in many developing countries. These factors have given rise to two complementary value configuration models, namely the value shop and the value network.

The value network model disaggregates the exchange-facilitating firm (value network) into its strategically relevant activities. The primary activities are "network promotion and contact management," including activities associated with the management of the adoption of a specific technology or the choice of a specific network provider, the selection of customers who are allowed to join the network, and the initiation, monitoring, and termination of customer contracts; "service provisioning," including activities associated with the initiation, maintenance, and termination of a range of exchange relations between customers; "network infrastructure operation," including activities associated with the development, rollout, and maintenance of the physical or informational infrastructure. The primary activities must be performed simultaneously to create value. For example, the technical features of the infrastructure affect the availability of services and the availability of services affects customers joining the network. To the extent to which one of the three primary activities is underdeveloped or not functioning, value creation is negatively affected.

Value network services are typically affected by network externalities. Network externalities exist when customer value is not only affected by the quality feature of the service but also by the number of other customers (global network externalities) and/or the composition (identity and number) of a specified group of customers (local network externalities) affiliated with the exchange-facilitating firm (value network). Scale is therefore a primary value driver in value networks. Accordingly, technology standard wars, standardization of platforms, and fierce competition at the initial stages of service introduction have been repeatedly observed in such industries as telecommunications, high technology, and banking.

The industry system where such firms operate is characterized by both interconnection and vertical coproduction of services. Unlike value chain and value shop firms, competing value network firms are typically interconnected to one another. For example, the existence of a telephone subscription with one mobile phone operator does not preclude a telephone call to a customer of a different mobile phone operator. Another unique strategic connection is the prevalence of various value network firms to cooperate in the delivery of a new service. For example, internet banking is only possible because of vertical coproduction by telecommunications and banking firms.

Managers of value networks face strategic challenges in terms of determining whether to expand to serve new communities of customers or serve the same customer set but enable more types of exchanges, as well as whether to expand by acquiring competitors or merely interconnecting with them.

Value Shop

Value shop models value creation at the firm level in the context of firms that create value by mobilizing resources and activities to resolve a particular customer problem. The value shop model is most suitable for the representation of value creation for firms that compete in the knowledge economy. Typical examples include consulting firms, law firms, accounting firms, and health service organizations. The principal value creation logic is the provision of a perceived beneficial solution to a customer's problem.

The value shop model is one of three value configuration models. Value configuration analysis is based on the premise that competitive advantage stems from the performance of discrete activities by firms. All value configuration models share the underlying logic that by disaggregating a firm into its strategically relevant activities, managers can understand the behavior of costs and the sources of differentiation and hence understand competitive advantage. A value configuration analysis entails the identification of the primary activities of a firm and thereafter the study of the economic implications of those activities. The models assist managers in determining what activities a firm should perform and what configuration of the firm's activities would enable it to add value.

Initially the value chain was advanced to assist managers in creating sustainable competitive advantage through the analysis of how companies create value. Proposed in 1985, the value chain, which has become popular worldwide, appropriately describes value creation in the manufacturing sector of the economy. However, not only does the value chain fail to model value creation of, for example, telecommunication companies, consulting firms, doctors, lawyers, and banks, but also its relative importance to managers has been reduced as the contribution of manufacturing companies to the gross national product (GNP) has fallen since the 1980s with current manufacturing share of the gross domestic product (GDP) at merely 15 percent in many developing countries. Those factors have given rise to two complementary value configuration models, namely the value shop and the value network.

The value shop model disaggregates the problem-solving firm into its strategically relevant activities. The primary activities of problem-solving firms are problem findings and acquisition including activities associated with recording; reviewing and formulating the problem to be solved and securing the rights to solve a problem; problem solving including generation and evaluation of alternative solutions; choice including choosing among alternatives; execution or implementation activities of the chosen solution; and monitoring and evaluation including activities associated with monitoring and measuring the extent to which the implemented solution has solved the original problem. The primary activities are recurring. To the extent to which a problem is yet to be solved, a new round from problem finding and acquisition to monitoring and evaluation begins.

A unique characteristic of value creation in the context of problem solving is the existence of two-sided information asymmetry. For manufacturing firms (value chain), the transformation process of inputs into outputs must be well understood prior to its execution. For problem-solving firms (value shop), the appropriate solution cannot be predefined. This dimension of information asymmetry makes the customer and the willingness to reveal problem-related information essential to the quality of the suggested solution. The other side of the two-sided information asymmetry relates to the inability of customers to ascertain the suitability of a specific firm to solve a particular problem. Price, which is a vital distinguishing purchasing factor for buyers of physical products, is only of secondary importance for the customers of problem-solving firms. Low prices for problem-solving services are usually associated with lesser proficiency in solving problems. Furthermore, in the presence of information asymmetry, value shop firms invest heavily in establishing their reputation. Firms develop a reputation relating to the type of problems that they can solve, the process by which they solve problems, as well as their expected remuneration.

Another distinguishing characteristic of value creation in the context of problem solving is the importance of project selection. Project/problem selection determines the path of competence development in firms as well as firm reputation. Taking into consideration the importance of project/problem selection, problem-solving firms routinely turn away potential projects. The industry is characterized by its extensive use of both referrals and subcontracting. Problems that do not fit with either the underlying competences of the problem-solving firm or its strategic competence development trajectory are referred to other more specialized problem-solving firms. For example, a general practitioner (doctor) commonly refers patients to more specialized professionals. Problems that require the collaboration of multiple problem-solving firms are disaggregated to manageable projects that are thereafter subcontracted to specialized firms. Typical strategic challenges that managers of value shop firms face include the tension between specializing in a narrow set of problems versus investing in knowledge breadth, which increases the range of problems that their firms can solve and the tension between taking upon, rejecting, referring, and subcontracting new problems.

Variable Costs

The total cost of a product can be segregated into two broad components: fixed costs and variable costs. Unlike fixed costs, which are constant for a given time period, variable costs change proportionally to the volume of the production units. Variable costs can be defined as those costs that vary in direct proportion to the quantity of output.

Such a classification of cost is done in a marginal costing system where costs are segregated into fixed and variable costs to compute the break-even point (level of operation where there is no profit and no loss) and margin of safety (the actual level of production less the break-even point). Variable costs can be labor costs, material costs, or overhead costs. Material costs and direct labor costs (those labor costs that are directly related to production) are variable costs as these costs vary directly with output. Examples of variable costs are packaging material costs, fuel cost for a transport company, and so forth. Variable cost is not the same for all firms in an industry. It depends on many factors such as size of the firm (large firms may have lower variable costs because of economies of scale), strategy of firm (self-production or subcontract), and so forth.

Certain costs that are currently fixed in nature can be turned into variable costs and vice versa. For example, by subcontracting the loading and unloading activity that was earlier done by permanent employees, a firm will have to pay a charge based on the actual volume instead of the fixed wages to the current employees. Similarly, costs that are variable in nature can be converted to fixed costs. For example, a firm that was earlier selling its products through retailers had to pay a fixed commission (margin) to the retailer. If the firm starts selling its products through its own retail outlets or through the internet, the costs become fixed, as they need to pay rental, salary, and other costs. One of the reasons for cheaper prices over the internet than at retail outlets is that while the company saves significantly in terms of commission and other selling expenses, the fixed costs are also very low.

Dell is able to auction its products online at a cheaper price because it saves in variable costs such as dealer's commission, store expenses, and so forth. Further, since Dell auctions huge quantities at a time, the fixed costs per unit decrease significantly. The e-tickets concept became so popular because airlines can save the variable costs that were earlier incurred in printing tickets, commission to airline agents, and so forth. Such benefits ultimately were transferred to the customers.

Furthermore, there are certain costs that are fixed up to a certain minimum level of production (fixed cost) and become variable after a particular level. For example, electricity charges are subject to a minimum fixed charge + a variable component for each unit consumed after a certain minimum level. Such costs are classified as semivariable costs.

In a continuing business, the cost incurred to produce an additional unit of output is the variable cost only because fixed cost is constant irrespective of the output. Unlike variable cost, an increase in output implies decrease in fixed cost per unit. The difference between sale price per unit and the variable cost per unit is termed *contribution* per unit. It is called so because it signifies how much the sale of an additional unit contributes to the fixed costs and profits of the business. So long as the contribution is positive, the profit of a firm can be increased by increasing the sales volume. It is always advisable to discontinue operations if the contribution per unit is negative because it implies increasing loss with each additional unit of output.

Break-even point is computed by dividing the total fixed costs by the contribution per unit. Sale quantity greater than break-even point implies net profit and sale quantity less than the break-even point implies net loss.

Estimating the variable cost per unit is very important while bidding for supply to any bulk buyers or for a one-time contract where a discounted sale price is not going to affect the sale price to other existing customers. In case we have unused installed capacity, any sale price above the total variable costs will result in increase in net profit of a firm. This is because the additional revenue (bulk order price x bulk order quantity) will be greater than the additional costs (variable costs x bulk order quantity). Therefore, the bid price should consider only the variable cost and not the total cost of the product.

Venezuela

The South American country of Venezuela, which shares borders with Colombia, Brazil, and Guyana, is one of the major oil producers in the Americas. It was taken over by the Spanish in the early 16th century, initially controlled from Santo Domingo (in the modern-day Dominican Republic), and from 1717 from Bogotá as a part of the Viceroyalty of New Granada. Part of the campaign for independence in Latin America started in Venezuela in 1806, with independence for Gran Colombia in 1819. In 1829, Gran Colombia fell apart and Venezuela became fully independent, with its capital established at Caracas.

Throughout much of the 19th century, Venezuela was plunged into a series of civil wars and this led various governments to borrow heavily from Great Britain, Germany, and Italy. This led to a later government reneging on payment of the loans, and the three countries sent ships to the Caribbean to blockade Venezuela's ports in 1902, forcing the new government to start repaying the loans. However, this did lead to the emergence of the dictatorship of General Juan Vicente Gómez, who took power in 1908 and ruled until his death in 1935. Although the nature of his rule was extremely unpopular, he did have access to vast wealth to sustain his long rule. This was because of the discovery of oil and its wide exploitation in Venezuela in the 1920s.

The Venezuelan oil industry owes much to Manuel Antonio Pulido, who recognized the hidden wealth in the country in the late 19th century. At that time, it was used for paraffin, but with the increasing popularity of the automobile, engineers from the United States, the United Kingdom, Germany, and the Netherlands started prospecting for oil, having to carve roads through the jungles to remote locations where oil drills were established. It was not long before drilling for oil started in Lake Maracaibo, later leading to the building of elaborate pumping stations.

Throughout the dictatorship of Juan Vicente Gómez, some 3,500 families continued to own about 80 percent of the richest farmland in the country, and they enjoyed much of the wealth from oil. The oil industry also tended to result in a neglect of agriculture, which led to the country having to import food, which, in turn, resulted in a rise in prices. The death of Gómez in 1935 paved the way for two more military governments. However, the people started protesting and in 1945, Rómulo Betancourt came to power leading the Acción Democrática Party, which planned to make the economy of the country more socialist. Reforms were introduced, but eight months later, this ended with a military coup. In 1958 Betancourt's supporters overthrew the military and he became president, becoming the first democratically elected president who stood down at the end of his term in office.

Oil continued to provide money for the Venezuelan government, and with the oil price increases in 1973–74, and again in 1979, the country started to become wealthy. However, in the 1980s, there was an economic downturn and unemployment rose, followed by an increase in inflation to such an extent that it looked as though Venezuela would not be able to pay back its international debts. Austerity measures were introduced in February 1989, and in demonstrations and rioting in Caracazo, some 300 people were killed. This instability led to Hugo Chávez Frías attempting to stage a coup d'état. Chávez was jailed but was released and in November 1998, his supporters won a majority in the congress and Chávez himself became president. He assumed office at a time of major economic problems in the country, with some 70 percent of the population living at or below the poverty line and about 35 percent of the population believed to be making a living by black market trading.

Since his time in power, Chávez has faced the hostility of the Venezuelan elite, but his control of the oil industry allowed the government to have more money to spend on the country's infrastructure and also to give extensive aid to other countries in Latin America. For some people, Chávez became a hero; for others, he was detested and there were a few attempts to overthrow him including a coup d'état, which was launched by oil executives in 2002. With Venezuela's gross domestic product (GDP) per capita being $6,100, one of the highest in Latin America, the country controls many gas stations throughout the United States, with about 55 percent of its petroleum exported to the United States, and substantial exports to the Netherlands Antilles where it is refined. About a third of the country's imports come from the United States, with considerable imports from Colombia and Brazil. Venezuela has also applied to join the Mercado Común del Sur (Mercosur), but that entry has only been ratified by Argentina and Uruguay.

Venture Capital

Venture capital is a type of financing used by small and medium-sized businesses. Because these companies are early in their development cycle, they are riskier investments, leaving them unable to get traditional financing from banks. Although venture capital is a relatively small fraction of global corporate investments, it has contributed to an amazing amount of economic growth, facilitating the emergence of companies such as Microsoft, Google, and Yahoo. Venture capital is usually invested in return for equity (shares) in the company rather than fixed debt, as to account for the greater risk these investments represent. Venture capital is usually invested with a three-to-seven-year perspective. Failure rates can vary anywhere from 20 to 90 percent of the portfolio, and expected returns are between 30 to 100 percent (to offset for failures within the portfolio).

Venture capital has the advantage of being available for risky and new businesses as well as providing access to venture capitalists, who are usually industry experts able to supply valuable insight to the companies they invest in. Nonetheless, obtaining venture capital implies a certain loss of control in management decisions, and can be quite costly in terms of administrative costs and time. Venture capital fills an important gap in the financing cycle, enabling the growth of high-risk companies.

There are five main types of venture capital adapted to different companies. A smaller venture capital investment is called seed capital, and is used by companies to create a prototype and fund basic market research. Start-up capital is used to fund recruitment of key management as well as finalizing the product for commercialization. Early stage capital is used to increase productivity and increase company efficiency, while expansion capital is used to enter new markets. The last stage of venture capital, late stage capital, is used to increase capacity and marketing, while preparing for the exit of the venture capital.

Venture capital can be obtained through two different processes. Some companies will negotiate milestone-type financing, where the next amount of financing will be made available once it reaches predetermined goals. For example, a company could link milestones to sales: once a sales target is reached, the venture capital would be released. The advantage is that the company can raise great amounts of capital upfront, leaving less pressure in the future to secure more funding. Other companies prefer seeking venture capital in the form of financing rounds, entering a new financing round after certain internal goals are met. In these cases, venture capital firms who have already invested in these companies usually require a right of first say, so they can be the first company to evaluate the potential investment and decide if they want to invest in the next round. The advantage is that financing terms are advantageous when negotiated as the company progresses. As the product is more successful, there is less risk for the investor, and the company can divest less equity, or give up less control than if it had negotiated the financing up front.

The venture capital investment usually takes the form of equity in ordinary shares, but can take many other forms. Financing is usually based on company effort, venture capitalist effort, venture capitalist preference, and feasibility of the underlying technology. The three main structures of venture capital investments are ordinary shares, preferred shares, and debt. Ordinary shares are cheaper for the company to finance in the short term, and profit expectations can be quite elevated for the investor, but usually imply a loss of control for the company (due to the emission of voting shares). Preferred shares have priority over ordinary shares in case of bankruptcy and usually have fixed dividends, but do not always carry a voting right. Finally, debt is usually secured against existing assets, and requires fixed repayment; this is also called venture debt.

Once a venture capitalist has made an investment, he or she can establish two types of relationships with the company. Some venture capitalists take a hands-off approach, leaving the management in charge of the raised funds; these are called silent partners, as the company is not allowed to disclose the name of the new investor. Others will prefer a more hands-on approach, supervising through a seat on the board of directors, sharing their expertise to increase the possibility of success.

Advantages and Disadvantages

The main advantage of venture capital is accessibility to liquidity, as traditional lenders (such as banks) usually do not provide funds to young, unproven companies. Without assets or sales, growing companies need access to investors to take them to the next stage of growth. Venture capital fulfills that role. The other advantage is that having venture capital translates into access to the expertise and networks belonging to venture capitalists. These investors have a vested interest in the success of the company, and can often supply expertise in recruiting the management team and the board of directors, as well as assisting in obtaining additional financing.

Venture capital imposes some constraints on the organization; as the company gives shares in exchange for liquidity, there is a loss of control in management decision making. For example, some investors will take a hands-on approach, requiring a seat on the board of directors so they can keep an eye on their investment. Some go as far as requiring a veto on major decisions as a condition for investing. This can effectively restrict the decision capacity of the current management. Getting venture capital also requires considerable investment in terms of time and money; from presentation to negotiation to signature, it is not uncommon for the process to take between three to six months. Finally, between 5 percent and 10 percent of the amount raised is often used to pay legal and investment fees.

Venture Capital Firms

Many venture capital firms are limited partnerships with a pool of investment capital; they invest the capital in selected companies under the guise of a portfolio. Venture capital firms can have portfolios ranging from the low millions up to billions of dollars. Most venture capital firms enter an investment with a perspective of three to seven years. After this period, venture capitalists usually try to exercise their exit strategy. Traditional exits include IPO (initial public offering, or being listed on the stock market), sale of equity to another company, or repurchase by management.

Venture capital firms fill an important gap in the financing chain. They are able to finance businesses that cannot rely on government subsidies, but which are still too risky for banks. As such, venture capital is an important actor to finance innovation, enabling the introduction of new products and processes to the market. Also, by their unique position in the financing chain, these firms are often essential to commercializing inventions generated by private and public research institutions.

Verizon Communications

Verizon Communications, Inc., provides broadband and telecommunications services to more than 100 million personal and business consumers. It was formed on June 30, 2000, with the merger of Bell Atlantic Corporation and General Telephone and Electronics Corporation (GTE). It was one of the largest mergers in United States business history, valued at more than $52 billion at the time of the announcement. The merger began on July 27, 1998, and took almost two years, until June 30, 2000, to become effective. Verizon began trading on the New York Stock Exchange on July 3, 2000, and in 2004, its shares became a part of the Dow Jones Industrial Average. Its line of businesses includes television, wireless telephone, local wireline telephone, and broadband internet services. According to the Fortune 500 list of 2007, Verizon is the 13th-largest company in the world. Verizon currently employs approximately 235,000 people and serves customers in more than 140 countries. It had operating revenues of $93.5 billion and operating income of $15.6 billion in 2007. Verizon has its corporate headquarters in Manhattan.

Verizon Business provides communications to large businesses in 150 countries, serving 97 percent of the Fortune 500.

Although Verizon is a relatively new company, its parent companies have a long history of operating in the telecommunications industry. Both Bell Atlantic and GTE had grown and evolved through a series of mergers, acquisitions, and divestitures. Prior to the merger, GTE and Bell Atlantic were among the largest telecommunications companies in the world. In 1999 GTE had revenues of more than US$25 billion, while Bell Atlantic had revenues of more than US$33 billion. GTE served approximately 35 million access lines in the United States, Canada, the Dominican Republic, Puerto Rico, and Venezuela. It was the leading wireless service provider in the United States, serving 7.1 million customers. It provided wireless services to more than 6.7 million customers outside the United States. Bell Atlantic's domestic telecom unit had 43 million access lines. Its wireless global unit managed 7.7 million customers in the United States and also served Latin America, Europe, and the Pacific Rim.

Business Segments

The different businesses of Verizon are clubbed in two segments—Wireline and Wireless. As of March 2008, Wireless has a 49 percent share in revenues, while Wireline has a 51 percent share. In terms of operating income, Wireless has a 75 percent share, while Wireline has a 25 percent share. Verizon's Wireline operations include Verizon Telecom and Verizon Business. Verizon Telecom provides local and long-distance telephone services, broadband video and data services, and other communication services to consumers and small and medium-sized businesses in 28 states in the United States. It has over 40 million access lines, 8.5 million broadband connections, and approximately 2.15 million video subscribers.

Verizon Business was formed in 2006 when Verizon acquired MCI, Inc. This acquisition made Verizon the largest telecommunications company in the United States, until BellSouth and AT&T merged, which relegated Verizon to second place. It is a leading provider of innovative communications and information technology solutions to large businesses and governments in 150 countries around the globe. Verizon Business has a customer base of over 70,000, which includes 97 percent of the Fortune 500.

Verizon's wireless business segment operates as Verizon Wireless, which is a joint venture between Verizon Communications and United Kingdom–based Vodafone Airtouch, with Verizon holding majority ownership (55 percent). Verizon Wireless began its operations on April 3, 2000. Soon after, GTE's wireless operations also joined Verizon Wireless. It provides wireless voice and data products and services as well as equipment sales to over 67.2 million customers across the United States. Based on revenue, Verizon Wireless is the largest American wireless company and largest wireless data provider, with annual revenue of $43.9 billion as of 2008. This wireless network is 100 percent digital.

Verizon's main competitors include AT&T, Cablevision, Comcast, Cox Communications, Time Warner Cable, and Alltel. In spite of a very competitive industry, Verizon has been able to maintain its competitiveness, both in terms of quality of services and customer satisfaction, because of the reliability of its networks. Its wireless network is the most reliable network in the nation and its wireline network has a reliability factor of 99.99 percent. Verizon has topped the American Customer Satisfaction Index for four years running.

Vertically Integrated Chain

A vertically integrated chain represents a series of make or buy decisions made by firms, beginning with raw materials and manufacturing (backward integration) and moving forward to distribution and marketing (forward integration). To this end, a firm may build or buy a wholly owned subsidiary, secure a minority shareholding, or join in a formal or informal strategic alliance to provide a specific segment of its value chain anywhere in the world where costs are lower and access to consumer markets are closer. The anticipated end result is a higher ratio of value to cost at each stage of the value chain. The assessment of value versus cost is complex because host country market characteristics, trade barriers, attitude toward foreign direct investment, and some 27 other location advantages, many industry specific, will influence ultimate cost.

The vertically integrated chain represents trade-creating as well as efficiency-seeking forms of foreign direct investment, reflecting both the rationalization of the operations of the multinational enterprise and the value chain specialization of affiliated companies in its internal and external network. While the vertically integrated chain increases intrafirm knowledge and goods flows, as well as the international exposure of the affiliates, in-depth, fine-grained analysis of location advantage factors is needed to understand exactly how location matters to the firm. It is important to understand the specific role given to or earned by affiliates in the company. They may act as "globally rationalized" subsidiaries performing a particular set of activities in the vertical chain or have a regional or world product mandate. John Cantwell argues that the vertically integrated chain increases intrafirm trade, building upon the location advantages benefiting each subsidiary, thereby leading to an increase of both intermediate goods trade and international production.

While traditional vertical integration has declined, vertically integrated chains have become more common as companies have begun to outsource critical elements of their business processes and sources of their supplies, whether through the minority investments and strategic alliances mentioned above or through contracts with outsource companies. The multitude of relationships needed to keep their businesses running and their customer needs satisfied compounds the firm's business risks. While companies benefit from lower labor costs, their risks increase substantially because of the political and economic instability in some of these regions. Contracts among companies are also difficult to monitor when the companies operate in a continually evolving network.

It is not enough to create a culture within individual organizations. The challenge is to create a cross-organizational culture in which the interests and the values of the partners coincide. In all forms of networks, the important managerial characteristics to be developed are trust and commitment as well as social norms of mutuality, solidarity, role integrity, harmonization of conflict, and restraint of power. As a result, constant monitoring of political and economic conditions in these regions must occur in addition to the regular risk metrics. Today, there is an increased focus on operations risks. In the United States, Sarbanes-Oxley has contributed to the focus by requiring senior managers and boards of directors to achieve a deep understanding of all significant financial/nonfinancial risks threatening their businesses.

Industries, as well as individual firms, may constitute vertically integrated chains. Technology, chemicals, and pharmaceuticals are three examples. In industries that constitute parts of a vertically integrated chain of system-compatible components, survival and success are not necessarily the result of superior performance, but may be determined by the possession and exercise of power to set the rules. A dominant integrated-system firm in the industry sets the rules under which potential competitors can enter and survive in the peripheral equipment and software markets. The critical rules are those that govern product design. The nature of these rules is determined by industry structure and, in particular, firm specialization or integration on the one hand and market concentration on the other hand. By introducing incompatibilities, large firms can impede rivals without having to suffer the losses of price cutting. Control of the rules of the game across the industry's markets includes the power to regulate the rate, direction, timing, and source of commercially viable innovations. Control of product design standards also enables large leading firms to block the pioneering effort of rivals. Here, the problem is the oligopoly control of innovation by others, which in the case of developing countries may affect total national host country output as well as national economic growth.

Vietnam

Vietnam is a long, narrow country located in southeast Asia, covering an area of 330,363 sq. km. Vietnam

Hmong ethnic minority farmers in Vietnam, where agricultural productivity growth has been surpassed by industry.

has shared borders with Cambodia, China, and Laos. The country had a population of 82.2 million in 2004 and the population growth has been around 1.2 percent annually. The average population density of the country is approximately 246 per sq. km. Life expectancy for the population as a whole was estimated to be 70.61 in 2005. The primary ethnic group in the country is the Vietnamese, with significant numbers of ethnic minorities, primarily consisting of Chinese, Hmong, Thai, Khmer, Cham, and Montagnards. Hanoi is the capital; it and Ho Chi Minh City (Saigon) are the two largest cities in the country. Vietnamese is the official language of the country and Mahayana Buddhism is the most popular religion. Vietnam has a very high literacy rate of well over 90 percent; however, much of the population has limited access to education. The Vietnamese Communist Party (VCP) has a monopoly on political power within the country. Vietnam is a member of the Association of Southeast Asian Nations (ASEAN) and the Greater Mekong Subregion.

Vietnam's history has been closely intertwined with that of China. It is commonly believed that Vietnamese culture originated in the Red River Valley and has slowly diffused in a southerly direction. The area of modern-day Vietnam was under Chinese rule for approximately 1,000 years beginning around 111 B.C.E., which was then followed by around 900 years of independence. Vietnam became a French colony in the 19th century, and in 1954 became divided into Communist North and U.S.–supported South Vietnam. Following a lengthy civil war, the country was reunited in 1975 under Communist rule.

Initially, following the reunification of the country, the economy fared poorly; however, starting with reforms in 1986, the economy has seen fairly rapid and steady growth. The economy grew by 8.5 percent in 2007, which followed an average growth rate of 7.8 percent in the previous five years. Per capita gross domestic product (GDP) grew by 5.6 percent in 2007 and it is estimated to be 5.6 percent and 6.7 percent in 2008 and 2009, respectively. Investment has been extremely high in Vietnam, contributing to over 40 percent of GDP in 2007. However, inflation has continued to be a problem and was 19 percent in March 2008. Vietnam has a substantial and growing negative trade balance. After a year of seeing the Vietnam (VN) Index prices rise by 144 percent in 2006, stock prices declined sharply in 2007.

The industrial sector of the economy has been the primary driving factor in recent GDP growth, with the private sector's growth exceeding that of the public sector. Agriculture productivity, however, has lagged behind, with only 3.4 percent growth in 2007. Unemployment was at 4.6 percent in 2007. A severe shortage of skilled labor has resulted in a rapid rise in professional salaries and high staff turnover rates. Other difficulties encountered by international businesses in Vietnam have been identified as the country's having insufficient infrastructure and excessive bureaucracy. The central government's expenditure measured as a percentage of GDP has risen from 30.6 in 2003 to 32.4 in 2007 and is by far the highest in southeast Asia.

Vietnam's economic performance has had a substantial impact on reducing poverty in the country. From the early 1990s to 2005, it has been estimated that the percentage of the population living in poverty has fallen from well over 50 percent to 29 percent. However, the declines in poverty have been unevenly divided, with urban areas, particularly Ho Chi Minh City, seeing both rapid rises in average income and declines in poverty, while the declines in poverty in many rural areas have been more modest. It has been reported that corruption and an inefficient public sector, including the state-owned banks, are obstacles that need to be overcome for the country to continue to experience rapid economic growth and further reductions of poverty.

Virginia Company

The Virginia Company was a joint-stock company that was chartered by King James I of England in 1606. Its purpose was to build up the British merchant fleet, find precious metals, and establish a permanent British presence in North America to counter the Spanish threat. Originally called the London Company, the Virginia Company held monopoly trading rights under its royal charter and was designed to generate a profit for its investors.

In 1607, 105 settlers arrived in current-day Virginia at the mouth of the Chesapeake Bay and founded the Jamestown Colony, which was America's first permanent settlement. These settlers agreed to undertake the risky voyage across the Atlantic because they were offered land for farms by the Virginia Company. However, 67 of the 105 first settlers died within one year of arriving.

The surviving settlers were joined two years later by 800 new arrivals, most of whom also died of disease and starvation. By 1623 the mortality had been high enough that the British launched a royal investigation, which found that 4,000 of the approximately 6,000 settlers who had migrated to Virginia since 1607 had died. The life expectancy in the first two decades of the Virginia settlements was a mere two years.

Scholars have argued that the high mortality rates among settlers were not entirely because of harsh conditions and disease. While these were important factors, mismanagement has also been blamed. Rather than devoting company resources to agricultural equipment, livestock, and food supplies for the settlers, management of the company devoted its resources to sending more and more emigrants across the Atlantic. The colony may have therefore simply been overrun with colonists who did not have adequate food and housing facilities.

Another aspect of potential mismanagement may have led to the Indian massacre of 1622. Wesley Frank Craven argues that the Indian attack was invited by having settlements too widely scattered and by the Virginia Company's failure to provide settlers with adequate arms and ammunition. Whatever the actual reasons for its failure, the Virginia Company charter was annulled in 1624.

The Virginia Company's objective was to generate a profit; however, profitability was never achieved and the company's venture into the New World was a financial disaster. The financial losses to the Virginia Company mirrored the hardships the settlers faced upon arrival. Neither principal nor interest on the Virginia Company's total investment of over £200,000 was ever repaid.

Despite its initial failure, settlers in the region eventually discovered that tobacco crops flourished there. Tobacco was ultimately a perfect crop for British economic interests. As J. J. McCusker and R. R.

Menard describe in their classic work on the colonial economy, tobacco

> permitted the English to acquire a commodity from a colony rather than on the international market; it created a processing industry in England and a valuable product for re-export; it attracted capital and labor to profitable employment across the Atlantic; and it provided Virginians the means to purchase manufactures and commercial services in the English market.

The long-term importance of the short-lived Virginia Company lies in its organizational form as a joint-stock company. This form of organization was, at the time, very new. The first joint-stock companies were formed only about 50 years before the Virginia Company's charter was issued. The risks of exploration of new territories an ocean away were very high and few investors, even those with partners, were willing to bear such risks. This was particularly true in explorations of this nature in which the investor had very little control over the project. Joint-stock companies circumvented these problems by limiting each investor's liability to his investment. This allowed a large number of small investments to be combined for the large sums needed for such a venture. Many scholars believe that joint-stock companies, such as the Virginia Company, were among the most important developments in the building of the modern world.

Virtual Vertical Integration

Vertical integration is the degree of control and ownership that a company has on the value chain it is a part of. Vertical integration allows a company to be self-sufficient in terms of intermediate goods and distribution of the final products or services. Apple, a premier computer and consumer electronics company, is a vertically integrated company. Apple has its own hardware-building facilities, software engineering department, exclusive distributorship, and service centers for its products.

Vertical integration reduces the cost and uncertainty of transactions with outside firms and facilitates quality control measures across the entire value chain. Under vertical integration, all the business entities in the value chain are under the same ownership, so they coordinate their activities much better than they would if they were competing firms.

While the advantages of vertical integration are tremendous, it also poses great challenges to a company. The company trying to take over its suppliers' or distributors' business may not have the industry knowledge to run those businesses properly. Vertical integration also increases the bureaucratic, accounting, and management costs. These drawbacks frequently offset the benefits of vertical integration.

Virtual vertical integration is a business integration model based on information sharing that captures the advantages of traditional vertical integration, but bypasses the disadvantages associated with it. Virtual vertical integration is an important strategy to consider for any firm with global presence. For firms that engage in business in vertically related activities across different countries, forming traditional ownership-based vertical integration is very difficult because of foreign country regulations, differences in business culture, and exchange rate volatility. Virtual integration offers these companies an attractive strategy to reap the benefits and avoid the pitfalls of vertical integration. Dell, a leading tech firm, and Toyota, the auto industry giant, successfully employ the virtual vertical integration model to gain competitive advantage in their respective industries.

The trick to successful virtual integration is to establish mutually beneficial business relationships that facilitate vertical transactions between companies. The main advantage of vertical integration stems from the direct link between the distributors, manufacturers, suppliers, and other players in the value chain. The direct link lets the different players of the value chain coordinate their activities efficiently. This direct link can be established because the different divisions of a vertically integrated firm can share their business information without restrictions such as different management styles, incompatible data systems, concern for competition, and corporate strategy secrecy.

In virtual vertical integration, a company builds strong and dependable partnerships with its suppliers and distributors and freely shares its information with them. Together, they form a direct link from one end of the value chain to the other end, which leads to reduced lead times, inventory costs, and returned goods. Virtual integration is based on cooperation rather than ownership. Hence virtual vertical integration allows a company to enjoy the benefits of vertical integration while avoiding the need to invest its assets in unfamiliar businesses. In a sense, virtual integration is similar to outsourcing, but it is unique in that companies share their business information, expertise, and profits across the value chain.

An example of the virtual integration model is Dell, Inc., a computer company that develops, manufactures, sells, and supports computers and related products. Dell has a direct business model, which means that it interacts with its customers directly. Customers place orders directly to Dell, and Dell manufactures and delivers the custom-made products directly to the customer. Because Dell does not make a product before it receives a customer order, it can keep its inventory costs very low.

Dell operates as if it is a vertically integrated structure that owns all the firms in the value chain (supplier, manufacturing firm, distribution firm, marketing firm, and support service). But in fact Dell depends on its business partners to deliver the final products. For example, to meet a personal computer order, Dell may assemble the central processing unit (CPU) while it gets the monitor from Sony and arranges support service through contracted service technicians. The different companies can work seamlessly because Dell, through its integrated information system, makes all the relevant information—hardware and software design, customer buying trends, inventory size, tracking information—available to them. By facilitating unrestricted information flow both ways through the value chain, Dell can link all the activities of the value chain to get the desired effect of vertical integration.

Visa

A visa is a document issued by a country giving an individual permission to formally request entrance to the country during a given period of time and for certain purposes. It is usually stamped or glued inside a passport, or is sometimes issued as a separate piece of paper. In recent years, some countries (i.e., the United States, Canada, and some European nations) have issued plastic cards that contain biometric information on a magnetic strip on the back of the card.

The U.S. work visa is a document issued by the U.S. Citizenship and Immigration Service (formerly known as the Immigration and Naturalization Service [INS]) to foreign individuals who wish to enter the country to work and reside for a period of time. The most popular work visas in the United States are the H-1B, H-2B, L-1, L-2, E-1, E-2, TN, EB-2, EB-3, J-1, O-1, O-2, P, EB-5, R-1, and green cards.

A U.S. I-94 Arrival-Departure Form is a form denoting the arrival-departure record of particular foreigners and is used by the U.S. Citizenship and Immigration Services. Form I-94 must be filled out at the time of entry to the United States by the foreign citizens who are being admitted to the United States.

Citizens of the countries on the U.S. Visa Waiver Program list who are entering the United States for a short stay and who are not U.S. citizens or permanent U.S. residents must fill out form I-94W instead.

Types

The types of visas issued by various countries worldwide include the following:

- Transit visa, usually valid for five days or less, for passing through the country to a third destination.
- Tourist visa, for a limited period of leisure travel, no business activities allowed.
- Business visa, for engaging in commerce in the country. These visas generally preclude permanent employment for which a work visa would be required.
- Temporary worker visa, for approved employment in the host country.
- On-arrival visa, granted immediately prior to entering the country, such as at an airport or border control post.
- Spousal visa, granted to the spouse of a resident or citizen of a given country to enable the couple to settle in that country.
- Student visa, which allows its holder to study at an institution of higher learning in the issuing country.
- Working holiday visa, for individuals traveling between nations offering a working holiday program, allowing young people to undertake temporary work while traveling.
- Diplomatic visa (sometimes official visa) is normally only available to bearers of diplomatic passports.
- Courtesy visa issued to representatives of foreign governments or international organizations who do not qualify for diplomatic status but do merit expedited, courteous treatment.
- Journalist visa, which some countries require of people in that occupation when traveling for their respective news organizations.
- Marriage visa, granted for a limited period prior to intended marriage, based on a proven relationship with a citizen of the destination country.
- Immigrant visa, granted for those intending to immigrate to the issuing country.
- Pensioner visa (also known as retiree visa or retirement visa), issued by a limited number of countries (Australia, Argentina, etc.), to those who can demonstrate a foreign source of income and who do not intend to work in the issuing country.

Visa Refusal

The border-crossing authorities make the final determination to allow entry and may even cancel a visa at the border if the alien cannot demonstrate to their satisfaction that they will abide by the status their visa granted to them.

A visa may be denied for a number of reasons, including (but not limited to) if the applicant

- has committed fraud or misrepresentation in his/her application
- cannot prove to have strong ties to their current country of residence
- intends to permanently reside or work in the country he/she will visit
- does not have a legitimate reason for the journey
- has no visible means of sustenance
- does not have lodging in the destination country
- has not arranged his/her transportation
- does not have health/travel insurance valid for the destination and the duration of stay
- has a criminal record or has criminal charges pending
- does not have a good moral character
- is applying on short notice
- is considered to be a security risk
- had their previous visa application(s) rejected
- is a citizen of a country with whom the host country has poor or nonexistent relations
- has a communicable disease such as tuberculosis
- has previous immigration violations
- has a passport that expires too soon

Conditions of Issue

Some visas can be granted on arrival or by prior application at the country's embassy or consulate, or sometimes through a specialized travel agency with permission from the issuing country in the country of departure. If there is no embassy or consulate in one's home country, then one would have to travel to a third country (or apply by mail) and try to get a visa issued there.

Some countries have reciprocal visa regimes: If Country A requires citizens of Country B to have a visa to travel there, then Country B may apply reciprocity and require a visa from citizens of Country A. Likewise, if A allows B's citizens to enter without a visa, B may allow A's citizens to enter without a visa. One example is the Schengen countries.

Once in the country, the validity period of a visa or authorized stay can often be extended for a fee at the discretion of immigration authorities. Overstaying a period of authorized stay given by an immigration officer is considered illegal immigration even if the visa validity period is not over, and is a form of being "out of status." The offender may be fined, prosecuted, deported, or even blacklisted from entering the country again.

Entering a country without a valid visa or visa exemption may result in detention and removal (deportation or exclusion) from the country. Undertaking activities that are not authorized by the status of entry (e.g., working while possessing a nonworker tourist status) can result in the individual being deemed removable.

Vision

One general and short definition of vision is the aspirations of an organization, namely, what the organization wants to become and intends to achieve in the future. In simple terms, the vision answers the question "Where does the organization want to go?" These aspirations are expressed in the vision statement, which was widely used in the late 1990s and early 2000s. The vision statement is often broad and states the aspirations only, without mentioning the ways that these aspirations will be achieved. Unlike the mission statement, the vision statement is mostly used for the employees of the company and not for external use (e.g., customers, suppliers, and other stakeholders).

The vision of the organization, in order to be successful, has to possess the following characteristics:

- It has to be short and succinct for everyone to remember it and be able to implement it in detail.
- It has to be precise and accurate so as not to create any misunderstandings among the members of the organization regarding its meaning and implementation.
- It has to be simple, clear, and straightforward so as to be understood and accepted by all members of the organization. Thus, employees will be able to participate in achieving the goals.
- At the same time, though, it should not be too detailed and specific, so as not to prevent individuals from expressing their own ideas and adopting innovative practices.
- It has to be inspiring so as to motivate employees toward a common goal.
- It has to create commitment and group cohesiveness and unite employees in such a way that they will be able to achieve that goal effectively, sharing common beliefs.
- It has to guide action so that employees can focus on implementing the strategic plans of the organization and maximizing performance.

Despite its importance, the emphasis on corporate vision has received many criticisms. These include the arguments that it neither motivates nor inspires employees, it does not provide guidance for future action, and it does not create consensus on the strategic goals of the organization. All these criticisms stem from a single argument against the use of visions: it is just a piece of paper on the wall. Opponents of the vision statement go on arguing that it is an internal marketing trick, a statement that is used to motivate employees, but it does not have any real value. To inspire, the opponents argue, the vision should be more than that.

The response to these criticisms is that the real value of it does not rest with the statement itself, but with its creation. During this process, the members involved should question every assumption and fact regarding the organization itself, the way of doing business, and their future plans. At that point, disagreements and conflicts are desirable because they reveal biases and problems in the strategic direction of the organization. In this way, the process of creating a vision statement constitutes a useful tool in identifying and solving organizational problems.

There are some steps that should be taken during the creation of the vision statement in order to possess the characteristics mentioned earlier:

- If possible, all employees, at all levels of the hierarchy, should participate, either directly or indirectly, offering ideas and reviewing the different versions of the vision statement.
- The employees involved should present and analyze the various forces operating in the external environment of the organization, namely, its competitors, customers, and suppliers.
- They should also analyze the internal environment of the organization, namely, its strengths, weaknesses, resources, and competences.
- They should correlate each of the external forces to each of the internal characteristics so as to identify how successful the organization is when dealing with its external environment.
- They should reflect on how the organization can become more efficient and effective in the future.
- When the employees involved prepare the initial version of the vision statement, they should send it to all the employees for comments, ideas, and suggestions.
- After receiving feedback, they can amend the initial version and repeat the procedure a few more times before preparing the final version.
- Once the final version is agreed upon, senior management should communicate the vision and the aspirations behind the vision to all the employees, at all organizational levels of the hierarchy, and actively support it in everyday activities and in the strategic orientation of the organization.

Finally, a successful vision statement does not have to be revised regularly. The means used to achieve the vision may change over time, but the vision itself may remain the same for several years. If, for any reason external or internal to the organization, the aspirations change and the vision statement is considered to be not applicable, unattainable, or obsolete, then the managers of the organization will start changing it and finding a new, more relevant one.

Vodafone

Initially conceived as a subsidiary of Racal Electronics, the first mobile phone call was made on the Vodafone network in the United Kingdom (UK) in 1985. Following a demerger in 1991, Vodafone Group plc (VOD) was formed, taking its name from the phrase "voice and data services over mobile phones." With its headquarters in Newbury, England, Vodafone has predominantly grown through acquisitions, joint ventures, and partnerships to become one of the largest mobile telecommunications companies in the world. During this period, its original core business of mobile communications has evolved into integrated mobile and personal computer (PC) communication services with more than 200 million (direct and proportionate) customers worldwide.

The rapid development from the first UK mobile network provider to that of global corporation was driven by Sir Christopher Gent, the chief executive of Vodafone from 1997 to 2003. Key mergers, acquisitions, and joint ventures during this time included BellSouth, New Zealand (1998); AirTouch, United States (1999); Bell Atlantic Corporation, United States (1999); Mannesmann, Germany (2000); and J-phone, Japan (2001). In 2003 Arun Sarin took over as chief executive and maintained this expansive growth strategy with the notable acquisitions of Singlepoint, UK (2004), and Telsim, Turkey (2005). Of these developments, two are particularly worth highlighting: the joint venture with Bell Atlantic, which saw the creation of Verizon Wireless in the United States, and the hostile acquisition of Mannesmann of Germany.

Verizon Wireless was created in 1999 from a $70 billion joint venture between Vodafone and Bell Atlantic to create a new wireless business with a single brand and common digital technology. Despite building a profitable ($44 billion in 2007) business, the agreement has not been entirely to Vodafone's satisfaction. Vodafone is a minority shareholder (45 percent) and subsequently has had minimal brand exposure in the United States. Additionally, the network protocol used by Verizon Wireless remains different from that of Vodafone. Verizon uses the Code Division Multiple Access (CDMA) while Vodafone uses the European network standard Global System for Mobile (GSM). These incompatibilities mean that Vodafone has found it difficult to achieve economies of scale with its wider global networks.

The £112 billion ($180 billion) acquisition of Mannesmann was at the time the largest corporate merger in history; the market value of the combined company ($314 billion) also made it the largest British company and the sixth-largest company in the world. The early bids were met with public protests in Germany and Vodafone's initial offers were subsequently rejected. In the meantime and possibly as a defensive action, Mannesmann acquired the UK mobile operator Orange, thus bringing the company into direct competition with Vodafone. In April 2000, Mannesmann accepted a higher offer and following merger approval by the European Union (EU), the Mannesmann Group was acquired and disbanded. With the manufacturing operations sold off, the real prize of Mannesmann's "land-line" internet market was absorbed into Vodafone's portfolio.

In addition to Vodafone's aggressive expansion strategies, the company has extensively utilized the concept of "partner networks" to gain relatively inexpensive market entry to more than 50 national markets. The partnership arrangement provides access and therefore revenue to Vodafone's international services while providing increased brand visibility.

Vodafone's ordinary shares are listed on the London Stock Exchange (LSE), with Vodafone posting a total market capitalization of approximately £82 billion in April 2008. Vodafone operations have been profitable since conception despite, in 2005, reporting the largest corporate loss in British history (£14.9 billion). However, the underlying operating profit of the company at this time was still a healthy £9 billion. The primary reason behind the loss was the payment of £23.5 billion in charges resulting from the acquisition of Mannesmann five years earlier. In common with its competitors and to support its growth strategy, other significant debts have been incurred, for example, as a result of the purchase of multinational 3G licenses. The price of these licenses has now been recognized by Vodafone as being highly inflated; £6 billion was paid for the licenses in the UK alone.

Vodafone's "partner networks" bring inexpensive entry to 50-plus national markets. Above, the Vodafone brand in Romania.

In the rapidly developing and converging communications market, Vodafone has had to anticipate market trends and preempt technological changes. In 2004 Vodafone launched its 3G service in Europe, followed by television and radio streaming to the new technology in 2006 and the continued expansion of 3.5G broadband (High Speed Download Packet Access [HSDPA]) networks.

The convergence of mobile communications and the internet has seen widespread developments from voice, SMS, and MMS to partnership agreements enabling applications such as YouTube, Google Maps, eBay, instant messaging (IM), and MySpace to be used on mobile devices. With other mobile tools such as mobile payment services and global positioning system (GPS) coming of age and with new companies such as Google, Microsoft, and Apple entering the wireless market, the future remains unpredictable.

Volkswagen

The Volkswagen Group, a German automobile manufacturer, offers a broad range of products, from middle-class to luxury cars and commercial vehicles. This company is one of the world's major producers of passenger cars and commercial vehicles, with sales revenue totalling €104.9 billion (2006). Best known from the 1960s onward for its popular Beetle model, the Volkswagen Group is today Europe's largest carmaker with vehicle sales in more than 150 countries.

The Volkswagen Group is divided into two divisions: Automotive and Financial Services. The Automotive Division deals with the development of vehicles and engines and the production of passenger cars, commercial vehicles, trucks, and buses. The Financial Services Division oversees the business fields of dealer and customer financing, leasing, insurance, and fleet business.

The business lines—Volkswagen brand group, Audi brand group, commercial vehicles, and remaining companies—are located under the umbrella of the Automotive Division. The Volkswagen brand group with its product line—VW passenger cars, Škoda, Bentley, and Bugatti—continues to be the business line with the highest sales revenue (€54.9 billion, 2006). However, the Audi brand group, with its Audi, SEAT, and Lamborghini vehicles, contributed more than 30 percent of the 2006 sales revenue. In 2006, taken together, the sales of the Volkswagen passenger cars brand increased by more than 10 percent.

In 2007, Porsche, having purchased $8 billion worth of stock, expanded its 20 percent investment (2005) in VW to a significant 31 percent. This was soon followed by an expression of intent by the Porsche supervisory board in early 2008 to increase its share in the lower Saxony carmaker to more than 50 percent. This brought the two companies together in an organizational amalgamation; the companies' common founder, who once dreamed of producing a "people's car" (*Volkswagen* in German), later gave his name to the production of the ultimate elite sports car, Porsche.

Competing in the Global Market

Volkswagen still achieves most of its sales from the European market. In South America and South Africa, sales figures were higher in 2006 than in the previous year, while negative operating results were reported in the North American and Asia-Pacific markets in 2006. Despite the conviction that higher sales revenue could be achieved in North America, the financial year ended with a significant loss because of higher sales promotion costs and unfavorable exchange rates. Volkswagen reports that because of exchange rates and increased local and international competition, the operating loss in this market showed an increase over the previous year.

A "People's Car"

Ferdinand Porsche's brainchild of a high-quality car for everyone began to be realized with the advent of Gesellschaft zur Vorbereitung des Deutschen Volkswagens mbH (founded in 1937) and its successor the Volkswagenwerk GmbH (renamed in 1938). Ferdinand Porsche became one of the latter's general managers. In 1939 the production of passenger cars was disrupted with the outbreak of World War II. After being integrated into the Nazi economy during the war years, the carmaker's focus switched to the production of munitions. With the increase in arms buildup, Volkswagen extensively used forced labor from abroad. Following the Allied occupation of Germany, the company was placed under the trusteeship of the British military government (1945–49).

By the end of 1945, Volkswagen had restarted the production of civilian vehicles. It was the start of the series production of the Volkswagen Type 1. In the following years, the organization restructured, reinvested, and reinvented; this period saw a significant increase in the production of passenger cars and the commencement of the production of commercial vehicles.

In the postwar period, Volkswagen quickly started to export cars abroad and to establish local subsidiaries and/or sales agencies. By October 1953, 44 percent of vehicle production constituted export business: Volkswagen epitomized the prosperity of the German economic miracle. Over time and with the production of the widely popular Beetle and its successful export to the United States, the Beetle soon vanquished earlier anti-German sentiment. It was to become a symbol of freedom and peace for a whole new generation.

Voluntary Export Restraints

A voluntary export restraint (VER) is a limit placed on exports by the exporting country, usually imposed because of political pressure from one or more importing trading partners. VERs are typically industry-specific, with prominent examples having been implemented by Japan in the automobile industry and by several Asian countries in the textile industry. VERs are rarely viewed as being truly voluntary because the alternative is usually the threat of tariffs or quotas that would accomplish the same objective that VERs are designed to achieve. An advantage to voluntary export restraints is that they can be removed at the discretion of the successful exporting country after the political aspects of the trading situation have moderated, whereas other tariff and nontariff barriers imposed by the importing country may not be so easy to remove once they are implemented.

In the early 1980s, the U.S. auto industry was facing stiff competition from more-fuel-efficient Japanese imports as the price of gas rose in the second Organization of Petroleum Exporting Countries (OPEC) oil price shock. A recession in the United States further depressed demand from auto buyers. Chrysler teetered on the verge of bankruptcy, and losses mounted at both General Motors (GM) and Ford. Intensive lobbying by the auto industry resulted in intervention by the U.S. trade representative's office and the eventual agreement of Japan to self-imposed voluntary export restraints on the import of automobiles to the United States. British automakers followed a similar strategy, and Japan also agreed to impose voluntary export restraints there as well. These VERs did not violate any agreements made under the General Agreement on Tariffs and Trade (GATT), and limited the total number of cars imported into the United States from Japan to 1.68 million in 1981. This cap was gradually raised to 1.85 million in 1984 and to 2.3 million in 1985.

The Japanese VER in automobiles did help U.S. automakers to increase their profits, but did so at the expense of American consumers. Japanese car prices increased by about 14 percent, and in many cases, U.S. consumers had to get on long waiting lists to buy imported Japanese cars—paying further premiums to dealers. Many buyers who might have otherwise purchased Japanese cars opted for less expensive U.S. models, boosting sales and profits at U.S. automakers. Profits also increased for Japanese manufacturers because of the premium pricing they were able to sustain in the face of curtailed supplies.

To get around the limitations imposed by the voluntary restraint agreement, Japanese manufacturers opened plants in the United States and invested heavily in U.S.-based production. Cars manufactured by Japanese firms in the United States were not subjected to the limits imposed by the VER. This activity, combined with a recession and softening demand for cars in the early 1990s, made the export restraints largely irrelevant. The program was terminated in 1994.

VERs have also been used in the textile industry as far back as the 1950s. Again, the original agreements originated because of competitive pressures felt in the United States by textile producers in Japan. After a restraint agreement was negotiated and agreed upon by Japan, textiles from other Asian nations such as South Korea and Taiwan began to flood the U.S. market. These nations also agreed to limit their exports to the United States rather than face more aggressive trade barriers. European textile companies also felt pressure from their Asian competitors, and the European Economic Community negotiated VERs with Asian exporters as well.

The trade situation in textiles became increasingly complex, resulting in significant attention being paid to the issue in GATT negotiations. In the early 1970s, this process resulted in the signing of the Multi-Fiber Agreement, which specified quotas from major exporters to major importers. Once the issue became part of multilateral trade negotiations, the export restraints were no longer "voluntary," resulting in an era of formally managed trade in textiles. Further agreements have subsequently phased out managed trade in textiles.

Voluntary export restraints, like many other trade barriers, protect less efficient producers in importing countries at the expense of consumers in those countries. Exporting firms sometimes get around the restrictions by shifting manufacturing to the countries that are the subject of the restraints, as occurred with Japanese automobile companies building plants in the United States in the 1980s and 1990s. GATT negotiations in the Uruguay Round resulted in an agreement to place limitations on the use of VERs. Based on that agreement, World Trade Organization (WTO) member countries must limit use of VERs to only one industry sector at a time.

Volvo

One of Sweden's leading global brands, Volvo is known worldwide for the quality and safety of its transportation vehicles and equipment, particularly its automobiles. The best-known aspect of the Volvo brand is Volvo Cars, which is owned by the Ford Motor Company of the United States. This company is distinct from the Volvo Group, also known as A. B. Volvo, which remains a Swedish company. The Volvo Group builds trucks, buses, construction equipment, and other vehicles, and also maintains a financial services component. Currently, the Volvo-branded companies employ over 100,000 workers, mainly in Sweden, but also in Europe, the United States, and around the world. The headquarters of the auto operations is in Gothenburg, Sweden, as is the Volvo Group's headquarters. The Volvo Group is a publicly traded company listed on the Stockholm Stock Exchange, while Volvo Cars is wholly owned by Ford Motor, which is also a publicly traded company, headquartered in Dearborn, Michigan.

Volvo was originally founded in 1915 by ball-bearings maker SKF. In 1924 two SKF employees, Assar Gabrielsson and Gustaf Larson, began building cars. Volvo, which means "I go" in Latin, became independent in 1935. First specializing in autos, the company

After being acquired by Ford, Volvo's auto operations, which include a worldwide network of about 2,500 dealers, have held a very small but steady share of the world auto market of less than 1 percent.

grew impressively from the first hand-built model in the 1920s. By the 1960s, Volvo production reached over 100,000 cars, buses, and trucks at 13 facilities in Sweden employing 18,000 workers. The company's ethos was very conservative and focused on quality: Volvo had only 15 different vehicle designs in its history and offered only seven different color choices, yet one-tenth of its employees were involved with product inspection.

With the success of models such as the 140 Series, the Amazon, and the 200 Series, Volvo established a reputation for safety innovation. Styling was a secondary consideration as Volvo cars were considered utilitarian. Many common safety features, such as laminated glass, the three-point safety belt, and padded dashboards, were first developed by Volvo. Although the cars were often criticized for their appearance, they were also heralded for their durability. Volvo cars also gained public exposure through the company's decision to enter into certain motor car races, as Volvo joined the European Touring Car Championship in the 1980s with some success.

Volvo began expanding its global operations beginning in the 1960s, especially its car production. It opened a plant in Halifax, Nova Scotia, Canada, in 1963, the first non–North American plant to operate on the continent. In 1974 the company broke ground on a US$100 million plant in Virginia that was intended to produce 100,000 vehicles and employ 3,500 workers within two years. Yet by 1976, the partially completed plant was still not producing vehicles, a victim of the recession in the auto industry and increased prices for Volvo products that slowed sales. Nonetheless, Volvo cars are still made in Belgium, the Netherlands, Malaysia, and Thailand with worldwide production around 450,000 vehicles.

In 1999 the Ford Motor Company purchased the auto assembly operations of Volvo Cars from the Volvo Group. Volvo became part of Ford's Premier Automotive Group (PAG) and remains the last brand in PAG since the sale of Land Rover and Jaguar to Tata Motors of India by Ford in 2008. Since being acquired by Ford, Volvo's auto operations have maintained a very small (less than 1 percent) but steady share of the world auto market, with approximately 2,500 dealers worldwide. While maintaining its reputation for safety and quality, the company has expanded the range of vehicles it produces, launching sport utility vehicles, sports cars, and other types of vehicles. There has been speculation that Ford Motor will sell Volvo, given the parent company's financial difficulties since 2005, but this has not yet happened.

The remaining Volvo Group has itself since expanded, establishing a link with Renault Trucks, acquiring Mack Trucks from Renault S. A., and Nissan Diesel from Nissan. With the Mack acquisition, Renault became the largest shareholder of the Volvo Group.

Wachovia Corp.

Wachovia (Wachovia Corporation) is a holding company providing commercial banking, retail banking, and trust services to its customers. It offers various banking and financial services through full-service banking offices. It is one of the largest banking groups in the United States with 13 million customers, and it has operations in 21 states through 4,100 financial centers and brokerage offices across the country. The company operates primarily in the United States, but also has operations in Latin America. Wachovia was incorporated in 1967 and employed around 108,000 people as of January 1, 2007. Wachovia is a North Carolina–based company headquartered in Charlotte. Wachovia is quoted in the New York Stock Exchange with the ticker symbol of WB. It had approximately 170,000 shareholders as of January 1, 2007. After suffering record losses largely from bad mortgages in the credit crisis of 2008, Wachovia merged with Wells Fargo on December 31, 2008.

Wachovia generates its revenues through five business divisions: general banking (52 percent of its revenues in 2006), corporate and investment banking (23 percent of its revenues in 2006), capital management (20 percent of its revenues in 2006), wealth management (4 percent of its revenues in 2006), and parent division (1 percent of its revenues in 2006). Wachovia's general bank division offers a broad range of banking products and services to individuals, small business, and commercial customers and government institutions. In addition, it serves mortgage customers and provides auto financing. Wachovia provides checking, savings, and money market accounts, home equity, residential mortgage, loans, debit and credit cards, mutual funds, and annuities to its retail customers; deposit, loan, and investment products and services to its small business customers; commercial deposit, lending, treasury management, dealer financial services, and commercial real estate products to its business banking and commercial customers.

Its corporate and investment bank division offers corporate lending, investment banking, advisory, capital raising, treasury services, and international trade finance services through its client relationship officers, product specialists, portfolio managers, and fixed-income and equity sales, trading and research professionals. The investment banking and the global markets businesses operate under the Wachovia Securities brand. The capital management division provides a range of proprietary and nonproprietary investment and retirement products and services to retail and institutional clients. The division includes Wachovia Securities, one of the three largest retail brokerage firms in United States. It also includes Evergreen Investments, a large and diversified company that provides asset management services.

The wealth management division offers private banking, personal trust, investment advisory services, financial planning, and insurance brokerage services to clients with $2 million or more in investable assets. The services are offered through relationship managers and specialty advisers, who provide sophisticated family wealth products to ultra-high-net-worth families. The parent division is responsible for all asset and liability management functions, such as managing the securities portfolio for liquidity and interest rate risk. This division also includes goodwill and other intangible assets, and related funding costs, certain revenues and expenses that are not allocated to the business segments.

Wachovia National Bank was founded in 1879 in Winston, North Carolina. Later, Wachovia Loan and Trust Company was established in 1893. The two companies merged in 1911 and formed Wachovia Bank and Trust Company, which later evolved into Wachovia Corporation. In 2001 Wachovia merged with First Union Bank, a large diversified financial services company chartered in 1908, which grew through mergers with more than 80 banks and other companies over many years. As a result of the merger, First Union changed its name to Wachovia Corporation. Following the merger, Wachovia continued to grow through various acquisitions.

The executive team of Wachovia, before the merger with Wells Fargo on December 31, 2008, included Lanty L. Smith (interim chief executive officer), Benjamin P. Jenkins (interim chief operating officer, vice-chairman), and Thomas J. Wurtz (chief financial officer). The board of directors included John D. Baker, Peter C. Browning, John T. Casteen, Jerry Gitt, William H. Goodwin, Maryellen C. Herringer, Robert A. Ingram, Donald M. James, Mackey J. McDonald, Joseph Neubauer, Timothy D. Proctor, Ernest S. Rady, Van L. Richey, Ruth G. Shaw, and Dona Davis Young.

There are many reasons for the success of Wachovia. First of all, it achieved strong market position in the competitive U.S. banking market. Wachovia's leading market position in various segments of the U.S. banking sector reflects its strong foothold and puts it at a competitive advantage against other players in the market. Another reason may be its broad service distribution network. By reaching masses of customers, Wachovia is able to cross-sell its products and services, which increases its revenues with less operational costs.

Walgreens

Walgreens is a leading pharmacy chain, mail service, and pharmacy benefit manager, with specialty pharmacy operations in 49 states in the United States, the District of Columbia, and Puerto Rico. Walgreens is situated in 6,614 locations (as of April 30, 2008) and is one of the two largest drugstore chains in the United States. According to Walgreens, headquartered in Deerfield, Illinois, it served 5 million customers per day and filled 583 million prescriptions in fiscal year 2007, and expects to have 7,000 stores by 2010.

The Walgreens chain began as a drugstore owned by Charles R. Walgreen, Sr., in Chicago, Illinois, in 1901. By 1915, there were five Walgreens drugstores and several improvements were added to the stores, such as soda fountains and luncheon service. Walgreens also began to make its own line of drug products and was then able to control the quality of the items and sell them at lower prices. By 1916, 19 stores were in operation, all in Chicago.

Walgreens also established its own ice-cream manufacturing plants to match the demand for ice cream at that time. By the mid-1920s, there were about 65 stores with annual sales of $1.2 million. By 1930 there were 397 stores in 87 cities with annual sales of $4 million. By 1934 Walgreens was operating in 33 states with over 600 stores. After Charles Walgreen, Sr., died, his son Charles R. Walgreen, Jr., took over and ran the chain until his retirement.

Charles "Cork" R. Walgreen III took over after Jr.'s retirement in the early 1970s and brought the company through many modern initiatives, including the switch to a computer-based inventory system (bar code scanning). In 1995, Kevin P. Walgreen was made a vice president and promoted to senior vice president–store operations in 2006.

On July 12, 2006, David Bernauer stepped down as chief executive officer (CEO) of Walgreens and was replaced by company president Jeff Rein. Holding degrees in accounting and pharmacy from the University of Arizona, Rein was a pharmacist, store manager, district manager, and treasurer prior to being named CEO and chairman of the board. Greg Wasson, former president of Walgreens Health Services, was named president and chief operations officer.

Other Ventures

Walgreens owned Sanborns, the largest pharmacy chain in Mexico, purchased from Frank Sanborn in 1946, and sold to Grupo Carso in 1985, after a series of economic downturns resulting from the Mexican currency crisis (devaluation of the Mexican peso).

In the 1980s, Walgreens owned and operated a chain of casual family restaurants named Wag's, a belated attempt to compete with Woolworth's lunch counters. The Wag's restaurants were very similar in concept to Denny's. Walgreens sold most of these to Marriott Corp. in 1988, and by 1991, the restaurant chain had completely gone out of business.

Wall Street

Among the most famous thoroughfares in the world, Wall Street is located in the southeast side of Manhattan in New York City. It is a narrow and relatively short street, running for 0.4 mile along nine blocks from a 19th-century church on Broadway down to South Street near the shore of the East River. Despite these geographic confines, Wall Street is lined with skyscrapers and historic buildings that signal the enormous influence and significance it has acquired over time in both American and international commerce. As a result of this historical evolution, Wall Street is not just a place, but it is also a symbol of everything connected to the operations of high finance in a global economic order.

What serves as the moniker of New York's financial district originated in 1653 as a path alongside which Peter Stuyvesant, the governor of what was then the Dutch colony of New Amsterdam, built a defensive wall made of sharpened logs. Designed to protect the budding colony from attacks by British settlers in New England, the wall proved useless, as the British attacked New Amsterdam by sea in 1664, bringing about its surrender and renaming it to New York. When the wall was subsequently torn down in 1698, the lane beside it was employed to carry traffic and christened as Wall Street.

Even though it developed into a dynamic commercial and trading precinct under British rule, Wall Street did not become a hub of financial activity—in which savers and investors supplying capital are brought together with the firms and governments demanding it—until the early days of the new American republic. The federal government was then the chief demander of capital, having decided to assume the debts incurred by the Revolutionary War. It initially issued $80 million in bonds and these, along with state bonds, constituted the most actively traded securities of the day. Banks and insurance companies

Wall Street and the Stock Exchange and Bankers Trust buildings in 1912, before the founding of the Federal Reserve.

soon joined the trading mart where transactions were negotiated in coffeehouses and outside along the curbs of the street.

One of the banks traded, the Bank of New York founded by Alexander Hamilton, became the object of Wall Street's first scandal. William Duer, a friend of Hamilton, sought to manipulate the price of Bank of New York stock, but ended up being ensnared by his own intricate machinations. In the wake of the scandal, a group of brokers met under a buttonwood tree, at what is now 68 Wall Street, to come up with an arrangement aimed at burnishing the image of the financial community. The result was the Buttonwood Agreement of 1792. In it, the brokers agreed to deal only with each other in the buying and selling of public securities at a fixed commission rate. This agreement constituted the foundation of the New York Stock Exchange (NYSE), the defining institution of Wall Street.

19th Century

The early 1800s witnessed the failure of two attempts to establish a central bank that could act as a "lender of last resort" to counteract a financial crisis on Wall Street. The first such attempt was the Bank of the United States, which operated for 20 years before its charter was revoked by Congress in 1811. Another effort was made five years later with the second Bank of the United States, but it also fell to political opposition fueled by a Jeffersonian suspicion of financial capitalism and federal concentration of power.

Much of the capital raising and trading during the 1800s was dominated by transportation issues, by which Wall Street enabled new markets to be opened and scale economies for ever-larger firms to exploit. Canal stocks, led by Erie Canal, excited investors and attracted capital from overseas, primarily Britain, whose London Stock Exchange would sway the financial tides on Wall Street for most of the 19th century. By the 1840s, railroad stocks came to the fore. To these were added mining shares, once the California gold rush gained momentum in the 1850s. After a fiat currency, the greenback, was instituted by the government to finance the Civil War, gold itself was traded, its price set in relation to greenbacks, the ratio varying with the fortunes of the Union cause on the battlefield.

Jay Gould, among a select coterie of audacious individuals who acquired notoriety on Wall Street for their speculative prowess, tried to corner this gold market. To forestall the U.S. Treasury from releasing its own gold reserves into the market, Gould actively schemed to ensure the conformity of government officials to his plans, even going so far as trying to coax the favor of President Ulysses Grant. The corner ultimately failed, but the stock manipulation and government corruption involved was symptomatic of the ethical morass that plagued Wall Street in the 19th century. Nor was it uncommon then for managers to use corporate treasuries as personal piggy banks, to engage in insider trading, and provide little in the way of proper accounting statements to investors.

As the 19th century drew to a close, industrial companies grew in prominence on Wall Street. In 1896, 12 of these companies were included in the Dow Jones Industrial Average (DJIA), published by the *Wall Street Journal,* now an internationally distributed daily that is Wall Street's newspaper of record. The stock index it originated, since increased to encompass 30 stocks, remains the best-known barometer of Wall Street's market movements, although investment professionals have come to prefer the Standard & Poor's 500 Index for its broader coverage of America's large capitalization firms.

20th Century and Beyond

Two events occurred in the opening third of the 20th century that would reverberate into the 21st. The first was the panic of 1907. Ignited by the failure of the Knickerbocker Trust Company, the public's loss of faith in the financial system led to a series of bank runs, generating a liquidity squeeze that spread to banks and brokerage firms. J. P. Morgan, the head of Wall Street's most influential bank, successfully piloted a rescue of the financial system through injections of liquidity. The lessons drawn from the panic overcame the century-old opposition to a central bank and in 1913 the Federal Reserve System was founded. Since then, particularly after World War II, the Federal Reserve's moves have been closely scrutinized worldwide as harbingers of market direction.

The second crucial event was the 1929 crash and the ensuing Depression of the 1930s. Driven by radio, auto, and airline stocks, along with rhetoric about a "new era" in economic conditions, a bull market swept Wall Street in the 1920s. The DJIA reached a high of 381.17 in September 1929, up almost 500 percent from its 1921 low. However, prices fell dramatically the next month, culminating in a spectacular two-day, 25-percent drop on October 28–29. While economists now generally agree that the crash did not cause the Depression—the Federal Reserve's tightening of monetary policy and the rise of trade protectionism are now commonly cited as the culprits—at the time, Wall Street was vilified for impoverishing the nation. Amid this hostility, the laissez-faire approach to Wall Street was ended with the establishment of the Securities and Exchange Commission (SEC). The fundamental rationale of this regulatory framework was, and remains, assuring that investors receive accurate and relevant information regarding public securities.

Not until the 1950s would Wall Street regain some of its luster, as the DJIA finally managed to overtake its 1929 high. By then, Wall Street had firmly displaced London as the center of international finance. Despite its role in deciding where and under what terms capital flows around the globe, Wall Street was not entirely impervious to international forces, as became evident in the 1970s, when higher oil prices triggered by the Organization of Petroleum Exporting Countries (OPEC) helped produce a stagflationary environment that saw the DJIA struggle to overcome the 1,000 milestone first breached in the mid-1960s.

Once the Federal Reserve successfully wrung inflation out of the U.S. economy with high interest rates in the early 1980s, Wall Street fully recaptured the exalted status it enjoyed in the 1920s, its practices and institutions emulated around the world, its capitalist ethos reinforced by the fall of Soviet communism. The DJIA finally broke through the 1,000 level in 1983 and continued to trend higher, ending the century above 10,000, making the October 1987 stock market crash appear as a mere blip on price charts. Indeed, toward the end of the 1980s–1990s bull market, the DJIA was overshadowed by the technology and internet stocks transacted on the NASDAQ exchange, an over-the-counter market that now seriously rivals the NYSE.

Although not facing the same degree of ill will as in the 1930s, Wall Street began the 21st century under a cloud of skepticism about its role in the economy. A severe bear market in 2001–02 uncovered a myriad of investment banking and corporate scandals that sent numerous executives to prison. The Federal Reserve's low-interest policy to combat the aftereffects of the late 1990s stock market bubble stoked a housing boom, which Wall Street helped finance with a slew of mortgage-backed securities. When the subprime segment of this market collapsed in 2007, Wall Street firms were forced to take huge write-downs, bringing about a credit crunch felt around the globe.

Wall Street currently faces a serious challenge from the City of London. The latter leads in foreign exchange trading, structured finance, new stock listings, and value of bonds traded. Wall Street, by contrast, continues to dominate in equities volume and the export of financial services.

Wal-Mart Stores

Wal-Mart is the world's largest corporation and private sector employer, with 1.9 million employees worldwide and 1.3 million employees in the United States. Its annual revenue in the fiscal year ending on January 31, 2008, was $375 billion, with weekly revenue topping $7 billion. In 2008 it operated more than 7,300 Wal-Mart stores and Sam's Clubs in 14 nations, reaching about 180 million customers each week. Its sales in the United States are larger than the next five largest retailers combined. More than 125 million U.S. consumers shop at Wal-Mart every week, and it is estimated that about 85 percent of Americans shop at Wal-Mart at least once in a given year. This vastness has raised concerns about Wal-Mart in some quarters, but most economists believe that its ability to reduce costs and to pass these savings along to consumers have been beneficial to the overall economy. Academic studies show that Wal-Mart has had a significant impact on the U.S. economy.

This gigantic corporation, headquartered in Bentonville, Arkansas, began in 1962 when Sam Walton opened the company's first discount store in Rogers, Arkansas. The company grew rapidly, reaching 24 stores in 1967, 125 stores in 1975, and 882 stores in 1985, becoming the nation's largest retailer in 1990, as it systematically spread its operations outward from its Arkansas base. It began international operations in 1991, moving into Mexico, and currently has operations in Argentina, Brazil, Central America, China, Japan, and the United Kingdom. It is the largest private employer in the United States, Canada, and Mexico.

Wal-Mart's growth and competitive advantages can be explained by its pioneering efforts to effectively use new technology. By the late 1970s, it had connected all its stores, distribution centers, and central headquarters to its computer network—well before competitors. It was an early adopter of bar codes in its distribution system. It completed a company-wide satellite communications network in 1989—linking all operating units with its Arkansas headquarters into what is now the world's largest private satellite communications network. In 1990 it introduced Retail Link software that connected its stores, distribution centers, and suppliers, providing detailed inventory data. It is currently in the forefront of utilizing radio frequency identification, which facilitates tracking shipments, inventory, and sales with tags on individual items that can be read by radio signal. Currently, its sheer size allows it to develop these systems more cheaply because it can spread their fixed costs over a greater sales volume—and to negotiate steep discounts from suppliers.

Wal-Mart has increased its productivity remarkably, increasing inflation-adjusted sales per worker by

With 7,300 stores, Wal-Mart has accounted for as much as 15 percent of U.S. imports from China in a single year.

about 55 percent from 1982 to 2002. The McKinsey Global Institute calculates that in the late 1990s, Wal-Mart's real value added per worker was more than 40 percent higher than for other general merchandise retailers. McKinsey estimates that one-eighth of the productivity growth for the entire nation in the last half of the 1990s was because of Wal-Mart.

Studies have concluded that Wal-Mart charges about 15 to 27 percent less than traditional grocery stores and supermarkets and about 23 percent less than drugstores. In addition, Wal-Mart forces its competitors to lower their prices, too—by about 10 percent. Adding together these direct savings and induced price drops elsewhere, research suggests that poorer families, female-headed households, and non-whites have gained the most. One study concludes that in 2003, the savings in the grocery sector alone equaled $782 per household per year—the equivalent of a 1.5 percent increase in income. Another estimate puts the overall savings to Wal-Mart's customers in 2007 at $109 billion, with savings of a similar magnitude for those who shop elsewhere.

On the other hand, economic studies suggest that Wal-Mart's impact on local employment has been fairly minor. Its compensation levels are similar to most other retailers, although its growth has forced unionized competitors to cut wages, resulting in a drop in general merchandise and grocery sector wages of a little under 1 percent. These major savings to consumers and minor impacts in the labor market may explain why 73 percent of professional economists in a recent survey agreed that a Wal-Mart store typically generates more benefits to society than costs, while only 15 percent disagreed.

Wal-Mart is the nation's biggest seller of groceries, toys, guns, diamonds, jewelry, CDs, apparel, dog food, detergent, sporting goods, video games, socks, bedding, and toothpaste—not to mention its biggest film developer and optician. It is also the largest customer of brand-name sellers such as Procter & Gamble, Kraft, Revlon, and Gillette. Wal-Mart began offering private-label brands in 1991, with the launch of Sam's Choice. Because price matters immensely to many of Wal-Mart's customers, its cut-rate house brands can substantially eat into sales by traditional suppliers. For example, Wal-Mart's Ol' Roy dog food, named for Sam Walton's English setter, has surpassed Purina as the world's top-selling brand. Approximately 40 percent of products sold in Wal-Mart are now private-label store brands. When Wal-Mart establishes a private label, it is often able to cut out the middlepeople and deal directly with overseas suppliers. In 2004 Wal-Mart bought 15 percent of American imports from China. If it were an individual economy, the company would rank as China's eighth-largest trading partner.

Walt Disney

The Walt Disney Company was founded in 1923 as an animation studio by two brothers—Walt Disney and Roy Oliver Disney. It was originally called Disney Brothers Cartoon Studio. However, in 1926, the name was changed to the Walt Disney Studio, which was later changed to Walt Disney Productions in 1929. The company name was again changed in 1986 to Walt Disney Company. As of 2007 Walt Disney had a total workforce of 137,000 employees and total revenue of US$35.51 billion. It is one the three largest entertainment companies in the world, the two others being Time Warner and News Corporation.

Although it started as an animation studio, today the Walt Disney Company is a diversified global corporation operating in four business segments—Studio

Entertainment, Parks and Resorts, Consumer Products, and Media Networks. Each of the segments has multiple divisions and subdivisions. The Studio Entertainment unit is called the Walt Disney Studios and comprises Walt Disney Pictures, Walt Disney Studios Motion Pictures International, Walt Disney Studios Home Entertainment, Disney Theatrical Productions, and Disney Music Group. The Studio Entertainment business is the foundation on which the Walt Disney empire has been created.

The Parks and Resorts business started in 1952, when work on Disneyland Park in Anaheim, California, started. As of 2008, Walt Disney has 11 theme parks in five resort locations, two of which are in the United States (Anaheim, California, and Lake Buena Vista, Florida), and the other three in Japan, France, and Hong Kong. The Parks and Resorts segment also operates a cruise line, guided travel around the world, and eight Disney vacation clubs, which have more than 100,000 members.

Disney Consumer Products is the merchandising arm of Walt Disney and comprises Disney Consumer Products and Affiliates (DCP), Disney Publishing Worldwide (DPW), Disney Interactive Studios, and dineyshopping.com, the official online portal of Walt Disney. The DCP division itself comprises Disney Toys, Disney Apparel, Accessories & Footwear, Disney Food, Health & Beauty, Disney Home, and Disney Stationery. The DPW division is the world's largest publisher of children's books and magazines. The Media Networks segment comprises some of the newer segments in which Walt Disney has made an entry. Three main divisions in the fold of Media Networks are Disney-ABC Television Group, ESPN, and the Walt Disney Internet Group. In addition, this segment also performs the marketing, research, and communication-related functions for the company.

Since its inception in 1923, Walt Disney has had only seven chief executive officers (CEOs), resulting in stability and continuity in decision making. For the first 50 years, the company was run by Walt Disney and his elder brother Roy O. Disney. After both Disney brothers died, the company has been run by a team of highly professional managers, even though Roy O. Disney's son Roy E. Disney has been a major shareholder and an important person for the company. He led two campaigns against the top management, first in 1984 and the second in 2004. Roy E. Disney was critical of the management style of the CEO, which led to the CEO resigning in both cases.

Walt Disney has several milestones to its credit including the only nomination that an animated movie—*Beauty and the Beast*—has received for the Academy Award for Best Picture. Part of the reason for the outstanding success of Walt Disney can be attributed to a very careful strategy of diversification into businesses that derive their competitive advantages from each other. Walt Disney started diversification as early as the 1930s, when it started the Mickey Mouse Club. Over the years, the Disney brand name has become synonymous with animation-related entertainment. Walt Disney not only uses its corporate image across all the affiliated businesses, but also makes sure that the success achieved in any segment is replicated across all other segments. It has also pursued a very careful acquisition strategy, focusing on firms that complement its existing line of businesses. Although there has been some criticism of Walt Disney's acquisition of ABC Television Network, having a control over the distribution channel for its product was a very logical step for Walt Disney. The synergy that Walt Disney has achieved through such integrated diversification efforts has been difficult for competitors to imitate.

Warranties

A warranty is a guarantee by a seller or manufacturer that a good will work as designed, advertised, and explicitly or implicitly promised, and that it will do so for a particular period of time. In conventional usage in North America, “warranty” usually refers specifically to a repair, replace, or refund guarantee, built into the cost of the product; when such a warranty is extended for an additional fee, it will often cover such circumstances as are beyond the fault of the manufacturer, including repairs necessitated by consumers’ errors. From an accounting perspective, a warranty is a contingent liability: an expense that might be paid; companies usually have a good sense of what each warranty costs them, when averaged out.

Express Warranties

Express warranties are those that are explicitly spelled out, whether extended or otherwise. They explain the terms under which they are honored: the conditions under which a return can be made, the period of time during which a return can be made, and the process and results of return. Depending on the warranty and the reason for the return, returned items may be exchanged for a working copy of the product, repaired, or refunded wholly or in part. Some items can be returned to the store, where they were purchased, others must be returned to the manufacturer. Generally a warranty can be expected to cover defects of manufacture and damage incurred in transit or in the store. Warranties generally do not cover consumer disappointment, which seems obvious, but the line between a defective product and a disappointing one can be narrow. An impressive knife advertised on television and shown cutting tin cans in half is defective if it arrives with the blade nicked or the handle broken; if it arrives, is put to use, and cuts a tin can in half but is useless thereafter, it’s only disappointing.

In American law, certain types of statements in advertising and promotional materials are protected from being read as express warranty—the legal term is *puffery*. Improvable superlatives or subjective truths are puffery—if a candy bar is not “the world’s best” candy bar or a consumer dislikes the soft drink that the advertisement said taste tests favored, the company is not bound to grant a refund. Statements made as testimonials fall under the umbrella of puffery as well, as do portrayals of a product having clearly impossible effects: such as deodorant spray causing women to chase its users down the street. The claims that must be substantiated, and which count as express warranty, are those that could be proven quantifiably. A disposable razor with “the most blades of any razor in the world” must indeed have more than its competitors, and “the most caffeinated soft drink” must have the federal maximum amount of caffeine per ounce. Legal departments in companies or their advertising agencies often examine the wording of any advertisements to keep their ducks in a row.

Implied Warranties

Implied warranties are those assurances that can be “taken as a given” even when they are not spelled out. In most countries this includes the warranty of fitness for a particular purpose and the warranty of merchantability, which are very similar: the principle of both is that, whether the seller says anything about the product or not, the buyer is reasonable to assume that a product by its nature is appropriate for some certain end.

A knife, whether or not it can cut a tin can, is meant to cut something. Tires are meant to bear the weight of automobiles and the friction of the road without falling apart. DVD players are meant to play DVDs. These items must fulfill those purposes whether or not any advertising or promotional material or packaging has said anything about them, because of their nature. In the United States, the warranty of merchantability holds products to a higher standard than the warranty of fitness does, but applies only to professional sellers, while fitness is applicable to all goods sold. For housing, there is an additional implied warranty, that of habitability—that is, no one putting an apartment up for lease can claim to be surprised that the lessee intends to live in it; the apartment must meet habitable standards.

An implied warranty can be disclaimed. The disclaimer must be specific—stores, especially secondhand stores, may specify that items are sold “as is,” which is more common than the older and less appealing “with all faults.” The federal Uniform Commercial Code in the United States requires that the implied warranty of merchantability can be disclaimed only explicitly—and must use the word “merchantability” in the disclaimer in order to leave no doubt as to its intent. Some states further restrict a seller’s ability to disclaim implied warranty. Doing so does not necessarily prevent a sale; a car that does not run can be sold as parts, changing the nature of what the warranty of merchantability implies, rather than trying to get around it.

Repair is a less common remedy than it used to be. Rare are the neighborhood shops that trafficked in little more than repair work, collecting their fee from the customer for repairs not covered by warranty and from the manufacturer for repairs that were. Rare, too, are the manufacturers that repair their own products, outside of the automobile and computer hardware industries; should a DVD player fail during its warrantied period, it will likely be replaced with a working model.

Extended Warranties

Extended warranties are sometimes called service agreements or service plans, which reflects their nature. They are usually offered for computers, home electronics, and expensive appliances. While an ordinary warranty promises a product of a certain quality, an extended warranty is essentially a form of insurance for the consumer, with the premium paid up front in a lump sum. Should anything go wrong with the product, the issuer of the extended warranty will fix or replace it. Extended warranties cover, in general, damage or defects that result in the course of normal use; misuse, such as using a microwave oven as an aquarium, may invalidate an extended warranty.

Extended warranties are often offered by third parties—sold at the store level, such as chain electronics and department stores, rather than at the manufacturer level. The cost can be as much as half the cost of the item but is usually closer to one quarter. Extended warranties may cover parts, labor, or both, and may or may not require the product to be mailed in to a service center.

Wells Fargo

Wells Fargo, as a diversified financial holding company, provides retail, commercial, and corporate banking services to its customers through its subsidiaries. It offers various banking and financial services through full-service banking offices. It is one of the largest banking groups in the United States with over 20 million customers and has operations in 24 states through 6,000 offices across the United States. The company primarily operates in the United States, but also has operations in Canada and Latin America. Wells Fargo was incorporated in 1929. Today, the company employs around 158,000 people (as of January 1, 2007). Wells Fargo is a California-based company. It is headquartered at 420 Montgomery Street, San Francisco, California. Wells Fargo is quoted in the New York Stock Exchange with the ticker symbol WFC. It has approximately 90,000 shareholders (as of January 1, 2007).

Wells Fargo primarily conducts its operations through three business segments: community banking, wholesale banking, and Wells Fargo Financial. The community banking segment provides various banking and diversified financial products and services to consumers and small businesses across the United States. It also offers investment management, wealth management insurance, and securities brokerage. This division provides mutual fund products, personal trusts, and agency assets as well as different types of loans. This division also provides receivables financing, inventory financing, equipment leases, real estate financing, small business administration financing, cash management, payroll services, and retirement plans. The division serves customers through a wide range of channels, including traditional banking stores, in-store banking centers, call centers, business centers, automated teller machines (ATMs), and internet branches.

The wholesale banking division mainly provides commercial, corporate, and real estate banking products and services, including traditional commercial loans and lines of credit, letters of credit, asset-based lending, equipment leasing, mezzanine financing, international trade facilities, foreign exchange services, treasury management, investment management, institutional fixed income, and equity sales. The wholesale banking division also offers construction loans for commercial and residential development, land acquisition and development loans, secured and unsecured lines of credit, interim financing arrangements for completed structures, rehabilitation loans, affordable housing loans and letters of credit, permanent loans for securitization, commercial real estate loan servicing, and real estate and mortgage brokerage services.

The Wells Fargo Financial segment provides consumer financing and auto financing. The consumer finance subsegment provides direct consumer loans and real estate loans to retail clients. Also, it purchases sales finance contracts from retail merchants scattered in the United States, Canada, and some other countries in Latin America. Auto financing subsegment operations specialize in purchasing sales finance contracts directly from automobile dealers. Wells Fargo Financial also offers credit cards, lease agreements, and other commercial financing.

Wells Fargo was founded in 1852 as Wells, Fargo & Company by Henry Wells and William G. Fargo, the two founders of American Express Company, to provide express (rapid delivery of gold and anything else valuable) and banking services (buying gold and selling paper bank drafts as good as gold) in the western United States during the California gold rush era. In 1905 Wells Fargo separated its banking and express operations. In 1929 the company registered as Northwest Bancorporation and the name later changed to Norwest Corporation in 1983. The company, in its current form, was formed in 1998, following a merger between Norwest Corporation and Wells Fargo & Company. As a result of the merger, the new enterprise was named Wells Fargo & Company. Following the merger, Wells Fargo continued to grow through various acquisitions.

Wells Fargo is regarded as a successful company in many aspects. One of the reasons may be its advantage of owning a well-established distribution network. The company enjoys a leading position in the highly competitive U.S. banking sector because of its wisely decided investments, such as having the largest telephone banking network in North America. On the contrary, one of the most critical disadvantages for Wells Fargo might be its high exposure to real estate investments. Given the American subprime mortgage crisis in recent years, Wells Fargo is facing decreasing revenues from its overfocused real estate business. On December 31, 2008, Wells Fargo merged with Wachovia Corporation, which had experienced even more crippling losses in the subprime mortgage crisis.

Western Europe

The United Nations defines western Europe as nine countries that include Austria, Belgium, France, Germany, Liechtenstein, Luxembourg, Monaco, the Netherlands, and Switzerland. The Western European Union adds the United Kingdom, Portugal, Spain, and Greece to this list, from which the organization excludes Switzerland, Monaco (considered holding special status within France), Austria, and Liechtenstein. For global business interests, western Europe consists of a quantity of markets that are consolidated into market groupings of different natures. These market groupings are characterized by partly harmonized market conditions. The most advanced group is the European Union, in Europe and in the world, in terms of degree of economic integration that spills over into such fields as social policies and politics. Western Europe is therefore a particularly interesting example for business in today's world.

The European Union

Western European markets and business interests benefit from a long-term process of integration that spans the past 60 years, from historical postwar understandings to harmonized policies. Because the European Union is both deeply integrated and counts numerous members, the legal business environment includes many national, regional, and European authorities, and it lays the basis of the role of the EU internationally. The fundamental treaties of Paris and Rome, signed in the 1950s and 1960s, defined the institutional structure and policy objectives of the European Communities in the areas of coal and steel (European Coal and Steel Community [ECSC]), atomic energy (European Atomic Energy Community [EAEC]), and economic integration (European Economic Community [EEC]).

Europe has elaborated its market conditions into a single market of now more that 500 million consumers. The Single European Act of 1986 made the customs union evolve into this single market, extended the scope of qualified majority vote in European decision making, and cleared the way to facilitate the Europeanization of business across Europe. The 1992 Maastricht Treaty changed the denomination of this unique organization to the "European Union," expanded former treaties allowing for the simplification of cross-border business further, introduced a codecision procedure, and flexible cooperation mechanisms for the member states that use the EU institutions to decide upon common goals and conditions. In 1999 the Amsterdam Treaty prepared the widening of the union through enlargement, that is, the integration of yet more members into its single market, and deepened the free circulation of people, goods, services, and capital. Each treaty has made the European business environment more efficient and more accessible as an entity. While constitutional efforts appear difficult at this stage, the 2008 Lisbon Treaty attempts to simplify a market grouping that has yet to adapt its institutional framework to the great breadth and depth of its own integration.

Treaties establishing the single market and its numerous common rules and policies have deepened the integration of members. At the same time, the market is geographically enlarging. The most extensive enlargement of the European Union took place in 2004: For the first time, former Soviet-ruled countries joined the community. This fifth EU enlargement had thus taken a strategic dimension that is prolonged through the accession of Romania, Bulgaria in 2007, and further members from this region applying for accession. Member states of the European Union since 2007 are Austria, Belgium, Bulgaria, Cyprus, Czech Republic, Denmark, Estonia, Finland, France, Germany, Greece, Hungary, Ireland, Italy, Latvia, Lithuania, Luxembourg, Malta, the Netherlands, Poland, Portugal, Romania, Slovakia, Slovenia, Spain, Sweden, and United Kingdom, of which Belgium, Italy, Luxembourg, the Netherlands, France, and Germany are the six founding members.

European Union Institutions

The institutions governing the European Union find their roots in the Treaty of Rome, establishing the European Communities (EC) in March 1957, enforced on January 1, 1958, among six western European countries. The European decision-making process is mainly dependent on the actions of three institutions: the European Commission, the European Parliament, and its Council. The European Commission (Commission of European Communities [CEC]) is the driving force and executive body of the structure; the European Parliament (EP) is the only directly elected body, elected by the people of the member states, and is gradually experiencing an increase in power. The Council of the European Union represents the governments of the member states. The Court of Justice guarantees compliance with the law, while the Economic and Social Committee has a main role in the representation of opinions of organized civil society on economic and social issues.

Other institutions, agencies, and bodies complete the structure that operates on three alternative decision-making modes, depending on the policy area and issue that is to be decided. The consultation, assent, or codecision procedures shape the legislative tools that the EU is in charge of and that regulate the business environment for both European and non-European firms in the single market, as well as international affairs of the EU. The EU budget is an essential tool in the management of the given EU objectives. It is sustained by value added tax (VAT), agricultural levies, customs duties, and its own resources, and benefits the business environment through, for instance, sector and regional spending and funds.

Business Environment

The European business environment has been subject to a rapid transformation ever since the mid-1990s. The introduction of a common currency in 1999, the extension of the single market rules to new areas such as e-commerce, and the ongoing trend toward supranational business taxation regulations are evolutions that have largely contributed to the construction of an increasingly harmonized business environment. On the business side, these evolutions have led to a diversification of firm structures: a Europeanization where more and more multinationals evolve into European transnational companies that compete worldwide, from a sound and vast home market. Small and medium-sized enterprises (SMEs) frequently operate on a European scale (as micro-multinationals) and are locally, nationally, and internationally exposed to large-scale competition and market harmonization rules formulated for all actors within the single market. Some of these structures are "born European," that is, they fully benefit from economic integration and Europeanization advantages from their start-up origins in terms of structure, markets, and operations, and can be created under European (rather than national) company law.

European integration has increased the pace of developments throughout Europe and its neighboring countries; in a similar fashion to that of globalization, it has created a rising compression of the time and space factors that rule the business environment. For a better understanding of this compression, consider the following example: During the Cold War era it was difficult, if not virtually impossible, to export goods, services, or capital from western Europe, already integrating, to some eastern and central European countries, still under oppression from the Soviet system—politically, logistically, and also culturally. Given the developments during the 1990s and the enlargements of the EU, politically and culturally the member states have become closer than ever, while logistically both virtual and real means of transport and infrastructures seem to have reduced distances dramatically and take less time. Mapping the business environment as "European" has the clear advantage of an EU-scale communication to the world level: along the lines of power that result from a "unity in diversity." A filtering or screening of its diversity (virtually or by means of maps) through specific search parameters allows any given corporation to target specific market opportunities.

Europeanization

The Europeanization of the business environment is based on the effects of globalization as well as geohistory and geoeconomic evolutions. International trade theory makes a strong case for the internationalization of firms that can obtain important advantages from going abroad. Also, the theories sustain the argument that integration is beneficial for the competitiveness of a nation or, in the case of Europe, a market grouping. The European business environment has been subject to major harmonization, liberalization, and deregulation efforts that are illustrated in the common policies that govern important policy areas and their outcome on an EU basis (in agricultural, industrial, competition policy, and numerous other fields). Nevertheless, income distribution is not equal, and the EU promises huge potential if harmonization efforts continue.

The dynamic though streamlined corporate sectors in the single market prove that Europeanization increases business efficiency and effectiveness. Most governments sustained their "national champion" expansion with nontariff trade and investment barriers directed against foreign competitors and strong borders protecting national markets. However, these policies failed and caused low growth, unemployment, and inflation after the first oil shock in 1973. The European Commission then decided to work on an integration program to eradicate the main trade and investment burdens.

The Single Market Program implemented in 1987 had a positive effect especially from the mid-1990s onward. The manufacturing industry was the main target of EU initiatives; this focus shifted toward the service industry around 2000. Consequently, "national champions" and championing governments had to adapt to a focus on becoming European leaders. Over the period of 1987–97, competition became EU-wide. Firms with a high dispersion of their activities at the outset benefited more than the others from the single market by rationalizing and concentrating their operations on the EU market. In all other cases, the EU's role is to monitor and stimulate competition and fair trade. This includes, for example, the fair access to third (i.e., non-EU) markets.

Globalization

Altogether, the globalization phenomenon has evolved in three consecutive steps: first, the internationalization of trade (particularly in the 1950s); second, the transnationalization of capital flows (in the 1980s); and third and more recently, the globalization of information flows. The development of the information society has become a reality with the installation of global digital networks, in particular throughout the 1990s. Technology developments especially in communication improve the productivity of all sectors of activity in the manufacturing and in the services industries.

The 2000s have brought major evolutions in innovation and competitiveness convergence through the European Lisbon/Gothenburg agenda that set the objectives (dimensions) for research and innovation to help the EU catch up in sectors in which it is not sufficiently competitive. For example, EU corporations outperform the United States in telecommunications, social protection, and sustainable development, but are outperformed by the United States in seven out of eight Lisbon dimensions, in particular research and development (R&D) and start-up conditions for SMEs. Compared to Asia-Pacific, western Europe excels in chemicals, pharmaceuticals, and services, but is outperformed in most manufacturing sectors (in particular office equipment and multimedia manufacture).

The development of multinationals under these market forces enhances competition. An international corporate structure and an externalization of productions are phenomena that are well founded in the evolution of both globalization and Europeanization. The very performance and nature of the business environment constructed in Europe is motivation to companies worldwide in their call for more regional integration. In the area of business management, this market holds many cultural differences but also some degree of similarities: a European strategy makes sense as long as it is not based entirely on standardization and in which diversity management holds an important place.

The Euro

European economics are characterized by the harmonization of rules that attempt to maximize the benefit gained from trade and financial integration through risk sharing (the main traditional argument for cross-border asset trade), spillover of macroeconomic fluctuations as well as product and consumption co-movements. A main step toward common measures was the introduction of the single currency in 1999 that provided the Eurozone members with a unique chance for economic cohesion. Also, it stimulated financial flows in an unprecedented manner. In regard to cross-border equity flows, geographical proximity is a strong stimulation factor, increasing flows even if informational asymmetries may increase transaction costs, and vice versa. Proximity affects asset holdings across borders because trade in goods has a significant impact on asset portfolios and stimulates their engagement. This confirms that institutional and cultural proximity affect cross-border bilateral asset holdings positively. It appears therefore that financial Europeanization and globalization is financially beneficial.

Unsurprisingly, western Europe shows some extent of convergence of the European finance sector, with some significant impact on the economy and corporate activity. Following the argument that investments and movements of financial assets are more frequent and intense when conditions of economic and political proximity grant stability, two main phenomena can be observed in the 2000s: On the one hand, national interests—of governmental income, of electorate considerations, and of social policy—have a significant impact on the willingness to negotiate the consolidation of financial markets and harmonized market conditions. On the other hand, public and private initiatives and interests across Europe drive a Europeanization for compatibilities that increase balance of payments (BOP) stability; it enhances the liquidity of financial markets in Europe. Also, a European approach in monetary, fiscal, and financial policy altogether can hamper economic and financial crises under the condition that it preserves the flexibility necessary in times of recession.

This has an impact in which the single currency, harmonization and convergence efforts, and diversity influence the purchase and sales of products and services in western Europe and on European marketing. The introduction of the single currency and the relative harmonization of financial management tools illustrate an increasingly competitive EU market. Transparencies, thanks to easier price comparisons, have increasing impact on pricing strategies and marketing investment. The need to excel through innovation and creativity, in the goal to differentiate one's product, is a determinant force of marketers in Europe. It is reflected in communication and brand-building strategies. Harmonization and diversity in Europe establish paradigms in marketing that are shaped on the basis of European-wide strategy and on the opportunities of standardization versus niche positions. These strategies depend on, in a similar fashion as in international marketing, the definition of the product, the market, and timing.

European Marketing

European marketing has been recognized as different from the typical "international marketing" theory. Marketers are positioning their product or service into a highly integrated market, facing Europe-wide levels of competition. All developments in the political economy and in the frame of business transactions and relationships in the market have a direct consequence on the work of marketers. This concerns marketing departments, advertising agencies, and market-research companies on a level that encompasses all European Economic Area (EEA) countries (in which we find three of the four European Free Trade Area [EFTA] member states: Iceland, Liechtenstein, and Norway, but also all EU member states) and Switzerland (linked to the other western European states through EFTA and Swiss-EU bilateral agreements), whether the concerned firms or products be of European origin or not—covering thus all of western Europe.

European marketing translates into far-ranging, long-term marketing strategies in which diversity management and strategic partner relationships are key. Also, the high rates of adoption of new communication technologies in Europe force the marketing manager to reinvent or readapt strategies in accordance to Europe-wide adoptions. For example, the internet and third-generation telephoning have significantly altered the panoply of marketers' tools in advertising and promotion, and also for the management of commercial transactions. A European market study is the collection of information on a market that is particularly diversified, but that also benefits from market group similarities for efficient marketing. These advantages are based on EU integration as well as on conditions that shape the perception of people in Europe, including politico-legal, economic, demographic, and sociocultural conditions. These conditions help the marketer identify opportunities and challenges according to a product's or service's needs, to demand, and to the environment.

The situational analysis of the European environment, customers, other actors such as distributors, suppliers, competition, opportunities, and threats can be based on a multitude of freely accessible data. The main challenges for market studies may be language barriers for in-depth studies in some of the newer member states. In accordance with the firm's internal objectives, strengths, and weaknesses, a segmentation of target markets may be undertaken or a standardized European-wide marketing strategy adopted. The latter option is certainly the most cost-efficient but applies to only a relatively few products and services. Among them, we have found those characterized by strong cross-border brand images and internet services that allow for high mobility and flexibility. Also, when logistics are unimportant and European harmonization is required, an EU-wide strategy makes sense.

In conclusion, the leakage effects of traditional marketing approaches in a European context make national approaches less effective, but still somewhat useful because of important diversities in perceptions by European peoples. Any corporation is well advised to market its goods or services on the European level, because the flows of trade, investment, and sourcing in the EU reduce the specific advantages that a firm would achieve from outsourcing or foreign supply. Marketing can, hence, be an underpinning of a sound European strategy wherever possible in terms of adapted product or service. Because all efficient marketers use the possibilities that the single market provides (on a regional or EU-wide basis), only those firms that still act only locally lose out on these opportunities.

Opportunity Networks

European business and international corporations from non-EU countries have recognized the importance of institutional opportunity networks at the EU level. These opportunity networks can be defined as more or less loosely organized relations among business and governmental authorities that are potentially beneficial to the involved parties. These networks play an important role in the search for sustainable competitiveness. In western Europe, the most efficient and recognized ways of how a business's voice may be "heard" focus on lobbying in Brussels, and to some extent in Strasbourg and Luxembourg, that is, in the locations of the three main decision-making institutions in European politics. This is a key to the essential competitive advantages for any firm that is doing business in Europe. Efficient multinetworked public affairs management is part of doing business in today's world and has grown in impact and size in Europe during the past two decades. It helps corporations reduce risk and uncertainty in the political economy that they are part of and recognize the strategic importance of Europeanization, vis-à-vis the traditional exclusively national focus on the political economy.

Any firm operating anywhere in western Europe is regulated by an increasing number of actors, on a state level as well as multilaterally, in the competition of the two for power through the expression of redistributive welfare, and hence, among others, the benefits from wealth creation through corporate activity. Each wave of European integration has given rise to ever-more EU-level lobbying activity, at the speed at which the EU public policy and the power of institutions have expanded. The landmarks of European integration incrementally fostered lobbying activity, in 1986 with the Single European Act, in 1992 with the Treaty of European Union at Maastricht, with the 1997 Amsterdam Act, and in particular through the waves of enlargement.

The Europeanized business environment and management have increased corporate awareness of the opportunities that lobbying can bring. Corporations need to build a message and transfer this message with the help of other actors in the arena. This happens through, at a minimum, replies to consultations, and at a maximum, EU lobbying that has to be committed to the EU process, procedures, and objectives. The EU policy network consists of national and EU institutions and nongovernmental actors. It is also heavily influenced by non-EU international organizations and foreign governments that exercise power. Hence, the lobbying activity involves interaction at different levels with directly or indirectly concerned state actors, policy professionals and experts, companies, and interest groups of different kinds.

In Europe, lobbying means simply that a person or a group of people tries to influence legislators so that an individual's or organization's point of view is represented in the government. A lobbyist is a person who is, most of the time, paid to influence legislation and public opinion. Most large corporations hire professional lobbyists to help promote their activities as agents, or open their own representation in Brussels, and their main objective is to maintain a positive regulatory environment for their organization, along codes of conduct established by the European Parliament. The many access points in the European opportunity structure offer the possibility for all actors to lobby the arena, whether directly or indirectly, whether individually or through partnerships and federations, whether in Brussels or at any other location in Europe, or where the European actors are represented, and finally, whether European or from a third country.

Altogether, western Europe is a fast business environment that is strongly integrated, deeply harmonized, and yet characterized by diversity and a "single" market only on the level of free flows of market conditions and common policies. The area is strongly integrated with the rest of Europe and a great variety of partners on bilateral, multilateral, and market group level in trade. In particular, the Euro-Mediterranean partnership ("Barcelona process") and relations with the Association of Southeast Asian Nations (ASEAN) and African, Caribbean, and Pacific Countries (ACP), and Gulf Cooperation Countries (GCC) underline European political, economic, and business directions for the future.

Wholesale Capital Markets

Wholesale capital markets are international exchanges, formal and informal, where banks, nonbank financial intermediaries, and other large institutions such as multinational corporations borrow from and lend funds to one another; also referred to as wholesale credit and wholesale funds markets and distinguished from retail capital markets where individuals and small entities transact a similar but much more fragmented trade, largely through financial intermediaries.

There are two major ways in which entities of any size raise capital: debt or equity. Debt refers to any agreement that obligates a borrower to repay a lender principal borrowed, along with a charge for borrowing the money, typically interest on the principal. Equity refers to the issuance of shares in a business enterprise that promises no fixed principal or interest payments but which entitles the shareholder to the value of the portion of the enterprise that it owns. Debt and equity might be issued either in primary markets (also referred to as original issue markets) in which case they are being issued and offered for exchange for the first time; or in secondary markets in which the original issues trade beyond the initial seller and buyer. Wholesale investors are the almost exclusive players in primary markets.

Debt may be short term (i.e., less than a year in duration for borrower and lender, with the short-term markets referred to as money markets) or long term (longer than a year where such markets are referred to as capital markets, the context of usage usually indicating whether this more precise meaning of the term applies). The most formal method of raising wholesale debt capital is issuance of large blocks of debt such as bonds. If floated openly on secondary markets available to both small and large buyers, the large denominations of individual debt issues will make the issuance de facto wholesale because only large investors can afford to buy the debt.

There are many different types of wholesale debt instruments. One example of a money market instrument is when large corporations issue short-term large denomination bonds called commercial paper, which are sold at a discount to par (i.e., a markdown from face value or principal amount) and typically have maturities of 90 days or less. For longer-term needs, corporations may issue corporate bonds with interest and principal repayment schedules. Banks may go to market short term or long term by issuing interest-bearing jumbo certificates of deposit (CDs), which are like retail CDs (essentially time deposits) offered to individuals but which have denominations of US$100,000 or more. Debt instruments may be privately placed, that is, issued by individual borrowers and then offered directly to selected individual buyers; have a limited placement, that is, offered to a subset of the potential buyers; or as mentioned above, placed on open markets.

Another popular debt instrument is the repurchase agreements (repos), which are agreements entered into by a borrower and lender (technically referred to as party and counterparty) in which one institution will give some sort of collateral such as a government bond for a set price to another and then buy back that collateral at a higher price at some agreed-upon later date. The difference between the sell and buy prices represents the implicit interest cost of the borrowing and if the borrower defaults, the lender gets to keep the collateral.

Institutions may borrow and lend directly to one another without issuing a tradable financial instrument. There are many examples of such markets; for example, there is a large short-term interbank funds market in which banks borrow from and lend unsecured funds to each other through formal and informal networks. In the United States, the U.S. Federal Reserve Bank maintains the Federal Funds Market in which banks can exchange overnight funds with each other (the benchmark borrowing rate being the Federal Funds Rate set by the Federal Reserve). In the United Kingdom and Europe, banks can transact through the London market, where the London Interbank Borrowing Rate (LIBOR), devised by the British Banking Association, is the benchmark rate.

As for equity, in the wholesale context this method of capital raising can take many forms, some of it off formal secondary share exchanges like the New York Stock Exchange. Private equity, in which large blocs of capital are raised from individuals and firms and then invested in business enterprises, either new or existing, is one example. Block share trading, in which institutional investors trade positions in their respective trade portfolios through secondary equity markets, is another example. Hedge funds, which raise capital and take speculative financial positions mostly in derivatives markets, are a third example.

Capital markets in general are global and very large in terms of annual financial flows. The International Monetary Fund estimates that in 2003 the value of the world's financial assets (including stocks, bonds, and other instruments) was more than $119 trillion, amounting to over three times the world's annual gross domestic product (GDP) (although it is not possible to break down this number by wholesale or retail markets as these are not formal but practical terms). The flow of funds moving into and out of markets is even larger than the value of assets at a point in time because it represents turnover of assets. For flows between banks alone considering only cross-border flows (i.e., across international borders), the Bank for International Settlements (BIS) estimated such flows at $28.5 trillion for the first quarter of 2007. This considerable number does not include domestic bank flows or nonbank flows.

In general, these large capital movements are salutary, providing necessary liquidity and financing for the world economy, but there are a number surrounding them. In particular, international regulation of wholesale financial markets to ensure stability and efficiency is an ongoing concern. Some institutions, such as banks, are heavily regulated by national central banks in their own country of domicile, with an international regulatory framework established through the BIS. There is also generally strong oversight of most share exchanges. But other entities such as hedge funds or private equity conduct largely unregulated large-scale transactions. There is some debate about whether financial regulation is productive or counterproductive, but the general issue of soundness of financial markets is perennial and most agree on the need for some sort of oversight.

Another issue is securitization, which refers to the process of issuing a financial instrument that is based on another, original underlying financial instrument. Securitization in general can allow institutions to generate more return on a given set of financial instruments by creating new tradable obligations to offer to the market. But this process by definition involves leveraging existing leverage (e.g., a mortgage loan, still outstanding, then put into a pool of mortgages with slices of that pool sold again offering principal and/or interest to the new security buyers), which increases risk as well as reward. In the "subprime crisis" in the United States, mortgage loans were packaged in various ways into other financial instruments, many of which turned out to be ultimately very volatile in terms of value and liquidity. The pricing and assessment of this risk has been a major problem in the subprime crisis and continues to be an issue studied by analysts in the field.

Wholesale Sector

Wholesaling bridges the gap between manufacturers and retailers or companies processing goods further, such as food producers. Wholesalers offer services similar to those of retailers but do not serve the end customer. For manufacturers, wholesalers offer access to the markets for selling goods and services, many by offering physical distribution facilities including sophisticated delivery logistics. Wholesalers operate in almost all industries, even distributing gas and electricity as well as package holidays. The main advantages for customers (in comparison to buying from manufacturers directly) are as follows:

- A high level of availability, enabling the reduction of own stock and quick responses to demand shifts
- A wide range of products
- Specialized pricing schemes frequently based on discounts according to monthly or annual buying volume
- Technical support and technical instruction of the customers' employees

Different wholesale formats have emerged in the course of time with varying degrees of importance all over the world:

- General merchandisers offer product assortments relevant to smaller retailers and convenience stores not affiliated with a powerful chain.
- Specialty merchandisers sell a narrow but deep assortment of goods, that is, they offer few categories but a wide range within those categories—for instance, screws and fasteners of all types and sizes, and pet food catering to all breeds and nutritional requirements, in addition to pet accessories, such as collars, leashes, and toys—and focus on certain types of clients. Mostly, wholesalers are well known within their industry and offer additional product-related services.
- Cash-and-carry wholesalers run their core business through selling foods to clients who need to pay immediately (e.g., pub owners or street traders) and handle the delivery on their own. In addition, the cash-and-carry outlets usually offer a wide range of nonfood assortments.
- Truck wholesalers are still common in some parts of the world. They visit their customers regularly in an assigned geographical territory. In contrast to sales representatives, they deliver their products immediately to the business customers.
- Rack jobber wholesalers are similar to truck wholesalers, but rack jobbers are responsible for managing a particular space in the outlets of their clients, for example, in-house magazines or the floor space of a supermarket.
- Drop shippers or brokers do not engage in the physical distribution process but take ownership of the products or services they provide. Drop shippers act as the interface between the customer and the supplier, receiving orders from the former and placing them with the latter, who deliver directly to the customer. Their services are used mostly for large orders to cut down on transportation and handling costs. Brokers, on the other hand, bring buyers and sellers together in a single transaction, do not take ownership of the goods, and are paid on a commission basis.

Drop shippers and brokers base their business on exploiting information not accessible to their clients. Thus, their business models are threatened by the digital information diffusion e-commerce offers . Customers could bypass the wholesale level of the supply chain, but of course, wholesalers aim to broaden their business scope by adding their own internet-based facilities. Interestingly, the concept of wholesaling was developed and the leading wholesale companies were founded in times of the brick-and-mortar business.

More formally speaking, the existence of the wholesale sector is justified by reducing the contact costs, known as the Baligh-Richartz effect. Theoretically, one might even justify several wholesale levels in the distribution chain, if there are enough vendors and customers and if contact costs are substantial. Digital information processing reduces the contact costs. It is worth noting that modern wholesaling is not restricted to exploiting information but adds a new quality of information available to other agents in the markets. The rationale behind the phenomenon is traced back to the assembling of products from different manufacturers. Because the perceived quality of the whole assortment might be tarnished by offering one low-quality item, wholesalers are motivated to strive for just one quality product. Consequently, the fact that the products of a manufacturer are listed or not listed in wholesalers' assortments provides the markets' own quality of information.

Assessment of the most important wholesalers is difficult because different criteria (turnover, number of employees, value of stock shares, etc.) lead to conflicting results. Moreover, some of the criteria are subject to substantial fluctuations (e.g., turnover in different currencies, value of stock shares) and the bigger companies are also engaged in retailing. However, according to the Fortune 500 ranking (in terms of turnover) and the *Financial Times* ranking (in terms of the values of stock shares), wholesalers like Metro AG (Germany), Costco Wholesale (United States), and Cardinal Health (United States) are among the world's leading companies. Moreover, some retail trusts operate wholesale outlets, which are not their core business, for example, Prodirect, Promocash of Carrefour (France), and Wal-Mart (United States). This is common practice in Western-type markets, and currently in eastern European transition economies as well, but the Japanese distribution system has a higher complexity and separates wholesalers rigorously from the final customer.

The warehouse clubs in the United States, for example, Costco, Sam's Club, and BJ's Wholesale Club, are not wholesalers according to the above definition but serve every client willing to be a member of the club—making no distinction between the final customer and the business customer. The clubs charge an annual membership fee. Therefore, they are not relevant for the majority of final customers. Particularly in Europe, general merchandisers and cash-and-carry wholesalers face competition from the discount retail chains, for example, Aldi and Lidl, offering similar or even better value-for-money ratios, but no delivery service related to grocery products.

One of the main strengths of modern wholesalers is their logistic infrastructure, advancing them to an essential element of the supply chain in many industries. By offering a logistics platform, smoothing the demand by accumulating orders from different regions, and providing a sophisticated information processing capacity, they are often the central partner in supply chain management. Information processing is important to avoid an out-of-stock situation and the "bullwhip effect" occurring in markets with volatility of demand because the variance of retailers' orders might be higher than the variance of their sales. Moreover, bar codes and radio frequency identification (RFID) tags increased both the data quality for wholesalers' control of the supply chain and the employees' productivity in the wholesale sector.

Women in Business

While we define women's work as paid and unpaid labor, whether at home, in the community, or in the formal or informal economy, not all work is captured by statisticians. The United Nations Statistics Division does capture both full-time and part-time paid employment. According to the United Nations Development Fund for Women (UNIFEM) 2000 study, by 1997 women comprised over 40 percent of the labor force in eastern and southeastern Asia, sub-Saharan Africa, the Caribbean, and the developed regions, approaching that of men. The largest increase

The country ranking highest in proportion of women in executive positions is France, with 34 percent, a rate that may be related to its strong public child care sector and long school days.

occurred in Latin America, where women constituted little more than a quarter of the labor force in 1980 but made up a third of the labor force in Central America and nearly two-fifths in South America by 1997.

From 1980 to 1997, the proportion of women in the labor force also grew in western Europe and the other developed regions, but remained the same in eastern Europe. While women's labor force participation rates have been increasing in most parts of the world, this is not true of the transitional economies of eastern and central Europe, where employment rates for both men and women have dropped since 1990, as well as in the Middle East and north Africa. As of 2008, the UN Statistical Division data show that women's share of the labor force overall and share of part-time employment have generally continued to increase.

Transitional Economies and the Middle East

While the growth of women's opportunities in the labor market is attributed to economic, social, and institutional forces, the decline of women's opportunities in transitional economies like the Russian Federation or China and in patriarchal societies like those of the oil-producing countries of the Middle East is explained by the same forces. For example, in the Russian Federation, many women have moved from active participation in the formal labor market to the unpaid work of the household. Galina Gvozdeva and Elena Gvozdeva found that young women between the ages of 20 and 29 left the labor force in larger numbers than young men, not to have children or because husbands are insisting they stay home, but because of a lack of suitable jobs. They also found a marked difference in employment levels between urban and rural areas. In rural areas, the number of women who do not work outside the home is 1.6 times higher than in urban areas, and the numbers have increased since 1994 from 22 to 30 percent. The tight job market in rural areas obliges people to be more active in household private farming.

Yuping Zhang et al. looked into the market reforms in China that have brought important changes to employment, most notably replacement of the socialist job placement system with a competitive labor market, the emergence of a private sector and privatization of state-owned enterprises, and the wholesale appearance of the profit motive as an organizing feature in personnel decision making. Their study links gender gaps in employment and earnings to family status. It is only married women and mothers who face significant disadvantages because wives and mothers spend much more time than husbands and fathers doing household chores.

Michael Ross argues that women in the Middle East (as well as women in Azerbaijan, Botswana, Chile, Nigeria, and Russia) are underrepresented in the workforce and in government not because of the strictures of Islam, but because of a culture built around oil and mineral production. He argues that oil production affects gender relations by reducing the presence of women in the labor force, leading to higher fertility rates, less education for girls, and less female influence within the family. Furthermore, he argues that women's absence from the workforce has far-reaching political consequences: when fewer women work outside the home, they are less likely to exchange information and overcome collective action problems; less likely to mobilize politically and to lobby for expanded rights; and less likely to gain representation in government. This leaves oil-producing states with atypically strong patriarchal cultures and political institutions.

Ross's argument challenges a common belief about economic development, namely that growth promotes gender equality, suggesting instead that different types of economic growth have different consequences for gender relations: when growth encourages women to join the formal labor market, it ultimately brings about greater gender equality; when growth is based on oil and mineral extraction, it discourages women from entering the labor force and tends to exaggerate gender inequalities. Furthermore, he suggests that oil extraction has even broader consequences than previously recognized: it not only affects a country's government and economy, but it also affects its core social structures. His argument has potentially important implications for Western energy policies.

Globalization and Democratization

Where women's employment opportunities have grown, this growth has been attributed to globalization and advancing democratization, both of which have encouraged governments to adopt a set of economic policies—from trade liberalization, deregulation, privatization of services to a reduction in state-paid services and employment—which have had an impact on job opportunities available to both men and women.

Dong-Sook Gills and Nicola Piper point to the central role of the state as a political actor facilitating social inclusion and exercising a powerful influence over domestic outcomes, such as unemployment and capital controls, as some governments in east Asia demonstrated during the Asian financial crisis. They argue that democratization is shifting the balance of forces in favor of the political inclusion of popular movements, expanding and enhancing the importance of a progressive program and bringing about the empowerment of new social forces, whether they participate in electoral politics or even the party system, by emphasizing autonomy, self-determination, and direct action. Such democratization demands the prioritizing of social equity over economic growth or private commercial interest. It also requires the will of the state to accept public accountability for the role of protection of societal interests from the depredations of private capital and economic interests. This viewpoint is supported by United Nations Development Fund for Women (UNIFEM) 2000 where the argument is made that women's ability to engage in paid employment is dependent on state policies that encourage or constrain their participation through the provision of affordable healthcare and child care and through the availability of service sector employment in health, education, and welfare.

Demographic Trends

Demographic trends also affect women's work, including fertility, aging, and migration. While the proportion of the working-age population increased slightly between 1950 and 2005 from 61 percent to 63 percent, UNIFEM 2000 estimates a decline to 52 percent is expected by 2050, and in less-developed regions, the proportion of the working-age population is expected to decline slightly, from 61 percent in 2005 to 59 percent in 2050. These trends have implications for employment, for the provision of paid and unpaid health and welfare services, and for unpaid care work.

Developing regions must somehow create jobs for the growing working-age population, while developed regions must find a way to support the care needs of growing numbers of older people. Even developing regions will also face the challenge of an aging population in the not-too-distant future. Even China, with 1 billion people (one-sixth of the world's population), is undergoing rapid demographic change marked by a rapidly aging population as well as exceptionally low fertility. The transition to a market economy has occasioned both rapid economic growth and widespread unemployment. The "one child" policy means that the unemployed older generations have a limited number of children to support them. There is also a marked gender imbalance in the children who are currently being born, based on a preference for sons, with boys significantly outnumbering girls. Among other problems, this will place great strain on the care-giving responsibilities of decreasing numbers of women—unless men become more active providers of care.

Some developing countries have experienced reversals in the demographic transition, mainly because of the human immunodeficiency virus (HIV)/acquired immunodeficiency syndrome (AIDS) pandemic. Over the last two decades, life expectancy has decreased dramatically in some sub-Saharan African countries; in South Africa, for example, life expectancy at birth fell from over 60 years in the mid-1990s to slightly over 40 years by 2010. In sub-Saharan Africa, the HIV/AIDS virus affects women in greater numbers and at a younger age than it affects men.

Worldwide, the growing number of young people also has implications for employment creation. The International Labour Organization estimates that unemployment among the young was twice as high or more as unemployment in the total labor force in all regions in 2003. It also estimates that there will be over 500 million new entrants into the global labor force between 2003 and 2015.

Education

International comparisons have demonstrated that female labor force participation is high in low-income countries and highly developed countries, and relatively low in middle-income countries, creating a U-shaped relationship between national income and female participation. J. Sinha first suggested a U-shaped female participation curve, observing that very poor countries have high female participation, which tends to fall during early stages of development. Middle-income countries have relatively low female participation. At the other extreme, highly developed countries also have high levels of female participation. Sinha attributed the downward portion of the U-shaped curve to a decrease in female agricultural work during shifts to urbanization and nonagricultural production. The upward portion of the U-shaped curve occurs when women return to the labor force at advanced stages of development to fill service sector jobs. Theorists have attributed this relationship to changes in labor market structure, social norms regarding the nature of women's work, and cultural factors such as religion, social mobility, and family structure.

A study by Jane Lincove focuses on the important intervening effect of female education in the relationship between economic growth and female labor force participation. In the past 30 years, developing countries have invested significant resources to expand female schooling. Since girls' education is a preferred policy strategy to promote development, Lincove argues that it is important to examine how investment in education influences labor markets. If female education results in greater productivity at home, investments may accelerate the decline in female participation. Alternatively, if female education increases labor market opportunities for women, investments may counteract the negative effects of initial economic growth.

Lincove's study adds to the understanding of the role of women in developing countries over time by integrating theories of education, labor, and growth in longitudinal analysis. Her results support previous conclusions about the U-shaped relationship between wealth and female labor force participation. However, controlling for country-specific fixed effects, the negative effect of initial economic growth is small, and female schooling is positively related to female labor force participation over time. If expansion of female education accompanies economic growth, developing countries will most likely see little or no decline in female labor force participation as growth progresses. Simulations suggest that low-income countries are likely to see increases in female participation when economic growth is accompanied by investments in girls' education.

The effects of female schooling are particularly important for policy makers because promoting girls' education is a central development strategy to increase household productivity by reducing fertility and improving child health, as well as a strategy to build the labor force. For many countries, female education has changed dramatically during periods of economic growth. Female primary school enrollment rates in developing countries have increased from 52 percent 30 years ago to 88 percent today. Growth in individual countries from all regions has been very impressive.

To cite a few examples provided by Lincove, Algeria increased girls' secondary enrollment from 6 percent in 1970 to 73 percent in 2000; Brazil increased from 26 percent in 1970 to full enrollment in 2000; South Korea increased from 32 percent in 1970 to 94 percent in 2000, the result of explicit policies to increase girls' education. Mexico's Programa de Educación, Salud y Alimentación (PROGRESA) program, which provides stipends for school attendance, is credited with increasing girls' primary completion by 15 percent; a scholarship program for girls in Bangladesh is credited with almost doubling female enrollment; and Indonesia has reached 90 percent enrollment for girls through a program with a focus on building new schools that meet the specific educational needs of girls. Countries that have not invested in girls' education have experienced limited growth. Girls' secondary enrollment remains below 20 percent in Pakistan, Cambodia, and many sub-Saharan African countries.

National Institutional Context

Becky Petit and Jennifer Hook examine whether and how the demographic and economic causes of women's employment vary with the national institutional context. Their argument suggests that national institutional arrangements affect the wage-labor exchange for specific subgroups of women, and thus influence the propensity to engage in paid labor. They investigate the utility of thinking about maternity leave, parental leave, and publicly supported child care as separate institutional arrangements that may influence the labor market decisions of women. Rather than focus on overall policy packages or welfare state typologies, they attempt to disentangle how different policy conditions and configurations influence the employment patterns of different groups of women.

While generous maternity leave policies may be associated with continuous attachment to the labor force after the birth of a child and the costs of leave taking are shared across social and demographic groups, in contrast, costs are highly individualized in countries without maternity leave provisions. In countries such as the United States and Australia, with no national paid maternity leave and very little publicly provided child care, the costs of having children are highly individualized as families negotiate private solutions for balancing work and family. In other countries, even though spending on family policy may be relatively generous, the configuration of benefits reinforces the traditional breadwinner-homemaker model. Extensive parental leaves, particularly in the absence of public or private supports for child care, may encourage women to stay out of the labor force and combine work and family sequentially rather than simultaneously. Extensive parental leave coupled with few other child care options may encourage women to stay at home to care for children while men work in the paid labor force.

Since 1990, almost 95 percent of eligible women in Austria take advantage of parental leave, and only a minority of mothers who take parental leave return to work immediately after taking leave. At the same time, there are few public child care facilities for very young children and sizable geographic variation in child care availability. Similarly, through the 1980s and 1990s, legislation had extended the length of parental leave available to West German parents and by 1989, parents were entitled to 12 months of parental leave with job protection. Parental leave has since been extended to more than two years, but despite generous parental leave policies, there is a substantial shortage of publicly and privately funded child care in the former West Germany so the birth of a child often necessitates one parent, usually the mother, to exit the labor force and provide at-home care. Hungary and the Czech Republic provide additional examples of countries that also combine relatively long parental leaves of three and four years, respectively, with low levels of public child care provision.

Structural accounts of women's labor force decisions suggest that the presence of children will be negatively associated with the probability of employment. The presence of children raises the costs associated with women's employment largely because of the need for child care during work hours. Public provision of child care not only reduces the financial burden of child care for mothers with preschool children, but it also reduces the costs of finding care, and indicates the social acceptability of nonmaternal or parental child care and shifts the financial burden of child care from individual mothers to all workers.

Several countries in Petit and Hook's data set provide generous child care in support of working women. Denmark has historically placed a premium on providing publicly funded child care. Publicly funded day care is regarded as a public responsibility and a necessity for maintaining high employment. France's universal approach to child care and early childhood education is long-standing and based on a pragmatic approach that supported women's labor force participation. From a theoretical standpoint, the Petit and Hook research suggests that there is clear evidence in support of the effects of parental leave and public child care provision on the employment decisions of women.

Egalitarian Wage Structures, Family Policies, and Earnings Disparities

In their study of 20 countries, Hadas Mandel and Moshe Semonyonov found that earnings disparities between male and female workers are less pronounced in countries with developed family policies, but it is not the family policies but their more egalitarian wage structures that lower earnings differentials between men and women in developed welfare states. In general, the earnings gap between men and women tends to be more pronounced in the liberal market economies of English-speaking countries than in the corporatist economies of continental Europe and Scandinavia.

As compared with liberal market economies, the corporatist economies tend to be characterized by more generous social policies (which protect workers' social rights), by more developed family policies (which support mothers' economic activities and employment rights), and by more comprehensive coverage of collective agreements (which protect workers' earnings and work conditions). Long parental leaves, reduced working hours, and tolerance toward absenteeism from work all are examples of family policies that, while increasing female participation and strengthening women's ties to the labor market, can also harm their economic attainments either directly by lowering their labor market experience and time devoted to paid work or indirectly by encouraging employer discrimination. Although the main objectives of family policies are to facilitate women's employment and to protect their rights, long absence from paid employment may reduce women's earning capacity by lowering their employment continuity and work experience. Mothers, not fathers, are most likely to use parental leaves and to reduce time devoted to paid work when children are young. Hence, long parental leaves are likely to lower women's work experience and undermine their earnings capacity.

Women and Advancement

In a study of work/life balance programs in Europe and their impact on women's career advancement, Caroline Staub finds that although women have made great strides in the job market, their increased employment has not reduced vertical gender segregation within the organizational hierarchy. On average, women, for all countries she studied, held 32 percent of manager positions and only 20 percent of executive positions.

Countries ranking above the average for women managers are France, Austria, Spain, Sweden, the United Kingdom, Ireland, and Finland, whereas countries ranking below the average are Germany, Italy, Greece, the Netherlands, Denmark, and Portugal. The proportion of executive positions filled by women is also above average in Finland, the United Kingdom, Ireland, France, Greece, and Italy, and below average for Portugal, Denmark, Spain, Austria, Belgium, the Netherlands, and Germany. Except for Austria, the United Kingdom, Ireland, and Germany, there was a big gap between the percentage of female managers and female executives.

In the case of Austria, women hold 39 percent of manager positions but only 15 percent of the executive positions. This might indicate a strong male-biased corporate culture hindering women's advancement. Another explanation might be that well-educated women do not stay long enough in the pipeline to be selected for executive positions in these countries. Although Italy and Greece are traditionally based on the model of men as breadwinners and women as caregivers, they show high percentages of women executives. This may be explained by the fact that these countries lack well-educated employees. Therefore, well-qualified women are in high demand. In addition, these countries are known for their strong family structure and cheap domestic services, both of which lighten the burden of child care and household tasks. This, in turn, may make it easier for women to spend more time on their jobs and strive harder for career success.

While Germany, Austria, and the Netherlands have high rates of women university graduates, they have the lowest share of women in executive positions. It seems that these countries still retain the traditional gender roles in which men are expected to be breadwinners and women to be housewives. This suggests that stereotyping based on gender may be higher in these countries, affecting selection, performance evaluation, training procedures, and overall corporate cultures. As a result, women are put in less strategic positions. Moreover, these countries are known for their lack of state support in child care, which can penalize women in their careers. The Nordic countries such as Finland, Sweden, and Denmark do not, contrary to expectations, possess significantly higher percentages of management and executive positions filled by women. Findings for France show a high percentage of women managers and a high percentage of women executives in companies. In fact, France ranks first for the proportion of women in executive positions (34 percent). Hence, one might conclude that France's strong public child care sector and its long school days seem to be extremely successful in promoting women's career advancement.

Staub's results suggest a number of avenues of further research. First, dramatic economic and social changes in eastern Europe and policy shifts in much of western Europe suggest the need to investigate how changes in the economy and public policy affect women's employment. Her paper has investigated the relationship between macroconditions and women's employment in the cross-section, but important variation over time could be exceptionally revealing. Additional research should further investigate the role of social and political organizations such as the presence of unions and bargaining centralization on the determinants of women's employment. Finally, future research should investigate the relative importance of structural and institutional conditions on women's involvement in part-time work, occupational sector, and earnings. Initial research suggests that a more thorough accounting of the relationship between structural and institutional determinants of women's labor force participation is necessary for understanding cross-national variation in women's economic progress.

Working Hours

Working hours refers to the time spent by individuals in paid market work. Differences in working hours across populations arise from difference in the share of individuals that are employed (the extensive margin) and the number of hours worked by each employed individual (the intensive margin). Over recent decades in industrialized nations, average hours of work per person have tended to rise. The increase in average working hours has been the result of growth in the share of the population employed, particularly the rise in women's rates of employment. The number of hours worked per employee has changed less, and in some nations, average hours of work per employee have declined.

Average annual working hours in the United States at present exceed those in European countries by about 50 percent. This is a relatively recent development. In the early 1970s, western Europeans worked more on average than Americans. Since then, the increase in employment rates in the United States has outpaced that in western Europe, and American working hours have significantly overtaken those in Europe. The productivity per hour of American workers remains similar to that of European workers. Much of the explanation for the greater per capita output of the United States compared to many European workers therefore lies in the greater number of hours worked per year by Americans.

Changes Over Time

In the United States, average weekly hours worked per person declined about five or six hours per week on average over the 20th century. Hours worked per worker declined more, about 16 hours per week, but this was offset by an increase in the rate of employment. Most of the decline in the hours worked per person has been concentrated among the young and the old, with the hours worked per person of prime-age individuals (those between 25 and 54 years of age) remaining roughly constant from 1900 to the present.

Despite the decline in the average hours worked by those employed in the United States, the notion of "overwork" arises frequently in popular and academic discourse, for example, in Juliet Shor's widely cited book *The Overworked American*. One possible explanation is the growing share of dual-earner and single-parent families. In the United States, the share of couples in which both husband and wife work rose from roughly one-third in 1970 to more than half by the year 2000. Single-parent and dual-earner families with children are more likely to experience challenges in balancing the demands of work against those of family.

In recent decades, the average hours worked by men has declined while the average hours worked by women has risen. A growing share of men is opting for earlier retirement. This, along with an increase in education levels, which delays men's entrance into the labor force, has reduced the hours that men work over the life span. Women, on the other hand, have increased their working hours over the life span. Women's labor force participation rates rose steadily over the course of the 20th century. The increase in the labor force participation rates of married women has been particularly marked since 1960.

Factors Affecting Working Hours

Several factors contribute to the difference in working hours across nations and individuals. Higher wages increase the incentive to work. Real wages in the United States, for example, increased roughly ninefold over the 20th century. While some economists, such as Keynes, predicted that increases in wages and productivity would enable individuals to increase their leisure time, it appears that despite higher hourly wages, Americans do not choose to significantly reduce their time spent in paid employment.

Higher marginal income tax rates are thought to decrease the incentive to participate in paid work and are cited as one explanation for lower hours of work in Europe relative to the United States. Retirement benefit policies have a significant effect on decisions regarding employment. National policies regarding vacation time and hours of work, such as the French 35-hour week, contribute to cross-country difference in working hours. Unionization and consequent regulations regarding pay and hours of work impact working hours. The presence of children as well as child care policies have a significant impact on employment rates, particularly among women. Education levels affect time in employment, with higher education levels associated with longer working hours.

Changing roles for men and women have complicated the management of work/personal life balance in recent decades.

Work/Personal Life Balance

Managing the demands of both work and personal life has become an important challenge facing most people today, and there has emerged a growing focus on workplace policies geared toward enhanced work/personal life balance. During the span of the past quarter to half century, rapid change in the composition of the family unit, the nature of work, and the function of the worker have together made the concept of work/personal life balance increasingly popular. Yet, settling on a universal or decided definition of work/personal life balance has proven to be an elusive goal of researchers, managers, and employees. This is because the term *balance* does not necessarily indicate that equal amounts of time and effort are dedicated to the demands of both areas of responsibility. Defining what effectively constitutes work/personal life balance has nevertheless become the source of much inquiry throughout the workplace and among the workforce.

One reason for this relatively recent phenomenon is that work life and personal life had been historically treated as independent areas of study. Plenty of social science, business, and related literature regarded work and personal life, or "home life," as two separate domains in which an individual could function productively in one domain without undue influence from or on the other domain. But by the mid-to-late 20th century, this concept was increasingly eroded by theories that argued for a link between thoughts, feelings, and behaviors in people's work and personal lives.

Although there exist various models of work/personal life balance, they generally accept that work has an impact on home life and vice versa. Among one strand of assumptions is that what occurs in one domain can positively or negatively influence—or "spill over" to—the experiences, behaviors, and attitudes in the other domain. A similar, though separate, set of research proposes that any needs, experiences, pleasures, and the like that lack in one domain could be compensated for in the other domain. An additional model advocates that one domain is a means by which to facilitate or obtain effects in the other domain. This model finds its philosophical underpinnings in the works of John Dewey, Émile Durkheim, and Robert Merton, who largely claimed that a certain environment or things within an environment can be used as tools to achieve an outcome or solve a problem in another environment. For instance, work could serve as a means to achieving a certain standard of living or quality of life. Examples aside, yet another model views work/personal life balance as a "conflict." This suggests that the norms of both highly demanding domains are incompatible to a point that the individual must make sacrifices in one domain to satisfy requirements in the other domain.

While such models of work/personal life balance differ to some extent, they each seek to provide an understanding of the relationships and causes and responses that result in whatever balance between the work and home-life domains. But where research to support these propositions exists, the efforts to confirm or refute such models have not yielded consistent results because application of each model is rather contingent on the range of individual and situational factors within the numberless workplaces. So it is that another branch of literature, which has examined the boundaries between work and personal life, could contribute to a better understanding of work/personal life balance. The frameworks from this body of knowledge convey the substance of the many roles that an individual is likely to juggle between work and personal life.

Today, many individuals conceive the border between work and personal life across a personally established continuum. Some people choose to allocate most of their time and effort to work whereas others focus more on personal life; a good many seek to invest highly in both roles. Different workplaces have their own sets of cultures, patterns, and processes, which means they each give varying degrees of purpose and respect to the employee. For example, one workplace may reward long hours and self-neglect, while the values of its competitor may be diametrically opposed; such dimensions could well be the case even among departments in the same organization. Yet, even in places where the demands of work-related tasks and responsibilities are clear, formal lines between work and personal life remain ambiguous. For instance, when does commuting time to and from work fall under the work domain versus the personal life domain? When does reading a newspaper constitute a work or personal life activity? When does volunteer work in the local community correspond to one's work rather than personal life pursuits?

The growing confusion over the work/personal life relationship has been attributed to a number of social transformations, including a marked increase in the number of dual-earning families and an increase in the number of single-parent households. Much of contemporary society has in numerous ways shied away from the traditional family life in which males gave precedence to work over home-life demands, leaving the female partner to tend to home-life demands and to adapt any career pursuits accordingly. Such relatively new social factors have had a permeable and significant impact on the global workforce, and have led to an upheaval in the establishment and management of work/personal life boundaries.

That there tends to be an effective incompatibility between the frequency, intensity, and time commitment across people's work and personal life roles means achieving a precise definition of work/personal life balance is a stable and complex challenge. Although research and insight into this and similar workforce issues is being consistently developed throughout the world, what is already known underscores the importance of considering individual differences in the context of balancing work and personal life.

World Bank, The

The World Bank has more than 60 years of experience in aiding developing countries and is a primary institution in governing the globalization process. In 2007 the World Bank provided US$23.6 billion for 279 projects in developing countries all over the world. The bank is currently involved in more than 1,800 projects in virtually every sector and developing country. The projects cover a very wide spectrum such as providing microcredit in Bosnia and Herzegovina, raising acquired immunodeficiency syndrome (AIDS)–prevention awareness in Guinea, supporting female education in Bangladesh, improving healthcare delivery in Mexico, and helping East Timor rebuild upon independence and India rebuild Gujarat after a devastating earthquake.

The World Bank's headquarters is in Washington, D.C., and its staff is composed of approximately 10,000 employees. The World Bank was established on July 1, 1944, during the Bretton Woods conference. Its resources come from all developed countries, considering their national wealth. The fact of being part of the globalization process does not reduce the role of the Bank. It has shown its ability to adapt to changes in the international financial system. The flexibility of the institution is its main advantage in maintaining a position of leadership among multilateral organizations.

The origins of the World Bank, its organization, and its interventions are the three main aspects to understanding this institution. The original core of the World Bank was composed of the International Bank for Reconstruction and Development (IBRD), which was created together with the International Monetary Fund (IMF) and became operative in 1946. The IBRD was created with the dual goal of aiding the reconstruction of countries that were damaged by World War II and promoting the progress of developing countries. Since the second half of the 1950s, the sound economic growth of western European countries and Japan and the end of colonialism had rapidly moved the center of the action of the Bank. In fact, the organization directed its attention from the financing of postwar reconstruction to aid toward developing countries. The first loans were at a market rate but with long terms of expiration. These loans mainly financed investment projects with the aim of increasing capital accumulation. Only in the 1960s and with the increasing number of recently independent countries that were poor both in capital and in technology did the World Bank start to give technical assistance alongside financing.

During the first years of activity, it became evident that the investments in high-cost infrastructures could not be done at market conditions. Therefore, in 1960, the need to finance at favorable conditions was realized by the International Development Agency (IDA), which together with the IBRD is part of the World Bank Group.

The goal of financing the private sector is forbidden to the World Bank by its statute. However, those limits were avoided by the creation of the International Finance Corporation (IFC) in 1956. Ten years later, the International Center for the Settlement of Investment Disputes (ICSID) was created with the aim of protecting direct investments to developing countries in disputes with multinational corporations and national governments. In its entirety, the World Bank is a financial conglomerate active in many fields from loans at market conditions to governments (IBRD), interest-free loans (IDA), to the private sector (IFC) and the settlement of investment disputes (ICSID).

For the last 60 years, the focus of the activity of the World Bank has been concentrated in two domains: technical consultancy and lending. Technical assistance and analysis of development policies are closely

The World Bank's more than 1,800 projects worldwide, such as the financing of this manioc-processing cooperative in rural northeast Brazil, aim to encourage economic development and reduce poverty through a variety of approaches.

related. The selection of priority areas toward which the limited resources of the Bank are allocated is the result of the study of development strategies at a global, regional, and national level. The simulation of long-term perspectives of the integration of the world economy (global economic prospect) shows a typical analytical contribution of the Bank in the selection and evaluation of development policies. For example, the effects of stopping aid to sub-Saharan Africa is considered to cause a reduction of more than 0.5 percent of economic growth and it justifies the concentration of aid in that region. The global nature of the members of the Bank and the long tradition of analysis of development are the main reasons why the Bank is considered a center of excellence whose studies are a point of reference in the debate on the reduction of poverty. The analysis is basically operative and its goal is to identify effective development policies to close the gap between rich and poor countries.

The activity for which the Bank was originally established is the financing of countries that do not have access to capital markets. Thanks to the commercial and financial liberalizations, capital markets have been growing in the last 40 years. During the financial crises at the beginning of the 1980s and at the end of the 1990s, financial and multilateral institutions had a stabilizing role compensating in part the interruption of financial flows to developing countries. On the contrary, in the last three years, the expansion of global liquidity has sustained the growth of direct investments. This fact has led many countries to an early closing of their position with the World Bank and the IMF. Furthermore, the Bank contributes to the stabilization of financial flows to developing countries protecting the poorest countries from the volatility of capital markets. Recently, the Bank has been gradually reducing its financial role of supporting developing countries. However, it is not possible to conclude whether it is a cyclical or structural phenomenon because of the current situation in the international financial markets.

Fighting poverty requires a relevant intervention both in terms of infrastructures and in terms of legal norms. The cost for the construction of roads, schools, and hospitals is as relevant as that of training teachers, physicians, and bureaucrats. The necessary means are often insufficient for poor countries and, therefore, the international community provides them through interest-free credits and grants. Of the entire amount of aid to developing countries, almost 70 percent comes directly from rich countries (bilateral assistance), while 30 percent is given by international institutions such as the United Nations or the World Bank (multilateral assistance). At the same time, the World Bank increases its capital with the emissions of bonds on financial markets.

The financial flows of development assistance have constantly grown in the last 10 years and in 2005 reached US$105 billion. However, only 64 percent of this amount is for investments, while the rest counts as debt cancellation. The World Bank tries to coordinate development aid due to the fragmentation and proliferation of funds, that is, there are more than 230 international organizations whose main activity concerns development.

World Customs Organization

The World Customs Organization (WCO) is an intergovernmental organization that helps members (governments usually represented by customs administrations from 173 countries) communicate and cooperate on customs issues. It was established in 1952 as the Customs Cooperation Council, and it adopted its current name in 1994. The WCO is now recognized as the voice of the global customs community.

The WCO is particularly noted for its work in areas covering the development of global standards, the simplification and harmonization of customs procedures, trade supply chain security, the facilitation of international trade, the enhancement of customs enforcement and compliance activities, anticounterfeiting and piracy initiatives, public-private partnerships, integrity promotion, and sustainable global customs capacity-building programs. The WCO also maintains the international harmonized system goods nomenclature, and administers the technical aspects of the World Trade Organization (WTO) agreements on customs valuation and rules of origin.

Headquartered in Brussels, Belgium, the WCO has established an international standard classification of commodities called the Harmonized Commodity Description and Coding System, which is used to classify goods for tariff (taxes) purposes and the application of tariffs. The WCO has 170 members and the current secretary general is Michel Danet (1999–present) from France.

The WCO's activities and mission can be summarized as follows:

- The WCO is an independent intergovernmental body whose mission is to enhance the effectiveness and efficiency of customs administrations.

- The WCO represents 173 customs administrations across the globe that collectively process approximately 98 percent of world trade.
- The WCO's governing body—the Council—relies on the competence and skills of a secretariat and a range of technical and advisory committees to accomplish its mission. The secretariat comprises over 100 international officials, technical experts, and support staff of some nationalities.
- As a forum for dialogue and exchange of experiences between national customs delegates, the WCO offers its members a range of conventions and other international instruments, as well as technical assistance and training services provided either directly by the secretariat or with its participation.
- The WCO combats fraudulent activities internationally.
- The WCO's mission is to enhance the protection of society and national territory, and to secure and facilitate international trade.

The following historical time line covers many of the major developments in the WCO's history:

1947 WCO activities began when the 13 European governments represented in the Committee for European Economic Cooperation agreed to set up a study group. This group examined the possibility of establishing one or more inter-European customs unions based on the principles of the General Agreement on Tariffs and Trade (GATT).

1948 The study group set up two committees—an Economic Committee and a Customs Committee. The Economic Committee was the predecessor of the Organisation for Economic Co-operation and Development (OECD); the Customs Committee became the Customs Co-operation Council (CCC).

1952 The convention formally establishing the CCC came into force. The Council is the governing body of the CCC and the inaugural session of the Council was held in Brussels on January 26, 1953.

1953 The inaugural session of the CCC Council was held in Brussels on January 26 in the presence of representatives of 17 European countries. This date is now celebrated annually as International Customs Day.

1974 The International Convention on the Simplification and Harmonization of Customs procedures (Kyoto Convention) entered into force on September 25.

1980 The Convention on Mutual Administrative Assistance in the Prevention, Repression, and Investigation of Customs Offences (Nairobi Convention) entered into force on May 21.

1988 The WCO's International Convention on the Harmonized Commodity Description and Coding System (HS Convention) entered into force on January 1.

1993 The WCO Council adopted the Arusha Declaration on Customs Integrity.

1994 The Council adopted the working name World Customs Organization.

1999 The WCO Council adopted the revised International Convention on the Simplification and Harmonization of Customs Procedures (Revised Kyoto Convention).

2002 The WCO celebrated its 50th anniversary and was honored with a visit by King Albert II of Belgium accompanied by Didier Reynders, the Belgian deputy prime minister and minister of finance.

2003 The WCO Council adopted the Convention on Mutual Administrative Assistance in Customs Matters (Johannesburg Convention) in July.

2005 The WCO Council adopted the Framework of Standards to Secure and Facilitate Global Trade.

2006 The WCO launched the Columbus Program, the largest-ever customs capacity-building initiative committed to support implementation of the Framework Standards to Secure and Facilitate Global Trade. The Revised Kyoto Convention on the Simplification and Harmonization of Customs Procedures entered into force.

2007 The 2007 version of Harmonized System entered into force on January 1.

World Health Organization

Established on April 7, 1948, the World Health Organization (WHO) is an agency of the United Nations (UN), with its headquarters in Geneva, Switzerland. It inherited the mandate and also the resources of its predecessor, the Health Organization, which had been an agency of the League of Nations. At the International Health Conference that took place in mid-1946, an interim commission had been established, and the UN General Assembly agreed on the transfer of these operations to the WHO. The WHO agenda involves six objectives: promoting development; fostering health security; strengthening health systems; harnessing research, information, and evidence; enhancing partnerships; and improving performance. Its symbol is the official United Nations emblem with the rod of Asclepius, the traditional symbol of medicine, and it uses Arabic, Chinese, English, French, Russian, and Spanish as its official languages.

The first director-general of the WHO was Brock Chisholm from Canada, who remained in office until 1953. The second director-general, Marcolino Gomes Candau from Brazil, held office from 1953 until 1973. During the tenure of these first two directors-general, the WHO was involved in operating throughout the world in the eradication of diseases such as malaria and polio. It was also heavily involved in the campaign against smallpox, with mass inoculations around the world that saw the WHO being able, in 1980, to finally declare that the disease had been totally eradicated, making it the first disease ever to be totally eliminated by human work. The WHO is now planning to concentrate on polio.

The next five directors-general were Halfdan T. Mahler from Denmark (1973–88), Hiroshi Nakajima from Japan (1988–98), Gro Harlem Brundtland from Norway (1998–03), Lee Jong-wook from South Korea (2003–06), and Anders Nordström from Sweden (2006). The current director-general is Margaret Chan from Hong Kong, who took up the position on January 4, 2007.

The role of the directors-general has been to continue the advances that led to the eradication of smallpox, and they have worked on helping to reduce the proliferation of human immunodeficiency virus (HIV)/acquired immunodeficiency syndrome (AIDS), severe acute respiratory syndrome (SARS), and other diseases and infections through the distribution of vaccines and greater health education. They are also involved in undertaking and sponsoring clinical trials on medical procedures and medication including problems that might arise from electromagnetism from the use of cell phones and the increasing prevalence of obesity in the world. Other ongoing projects of the WHO include the International Classification of Diseases with the provision of a database to assist doctors, other medical practitioners, and patients. In addition, the WHO has produced numerous reports on the influence of tobacco smoking on disease and other epidemiological studies.

Currently, there are 193 member states in the WHO, which includes all UN member states with the exception of Liechtenstein. It also has a few entities with observer status such as the Holy See (Vatican City) and the Palestine Liberation Organization. Niue and Cook Islands, even though they are not independent (both are self-governing in association with New Zealand), are members of the WHO. For administrative purposes, the WHO is divided into six regions: Africa, run from Brazzaville, Congo; the Americas, run from Washington, D.C.; the Eastern Mediterranean, run from Cairo, Egypt; Europe, run from Copenhagen, Denmark; Southeast Asia, run from New Delhi, India; and the Western Pacific, run from Manila, the Philippines.

Economic Role

The importance of the WHO in the global economy can be measured for a number of reasons. On the very basic level, the WHO purchases vast supplies of pharmaceuticals and clinical equipment, employing directly or indirectly tens of thousands of doctors, nurses, researchers, and other medical industry professionals who study, document, and tabulate problems, and also treat people in the form of inoculations or provide other treatment. This is particularly important in poorer countries, especially in Africa and parts of Asia and Latin America where much of the provision of preventive medical care comes from the WHO. The provision of WHO statistical information system (WHOSIS) provides access to 70 core indicators on mortality, risk factors, and health systems, among other things, which has helped planning for the problems facing particular places. Much of this information is now available on the WHO internet site along with the global health atlas and extensive regional statistics.

However, the role of the WHO is far more important, as it helps promote particular forms of healthcare, either through its actions or its reports. These have been influential in providing the basis for medical research around the world and also detailing guidelines that many countries have followed in the introduction of preventive campaigns. Although such activities should not be measured in economic terms, the better health of so many people around the world has vastly helped with the global economy and increased the world population and provided hope to so many previously impoverished people. Indeed, the WHO has seen itself as being in the forefront of promoting development around the world—health being an important measure of socioeconomic progress—and as part of the Millennium Development Goals, the treatment of chronic diseases and also many tropical diseases is important in helping many poor countries in the world.

World Systems Theory

World systems theory is a theory of economic development that views the world as one complex social system driven by economic activity. From this theoretical perspective, economic development is to be understood in terms of the positions of and roles played by nations in the highly interactive global economic system. Arguably the greatest contribution of world systems theory to the understanding of economic development is its consideration of what are called semiperipheral nations and the important roles they play in the global economic system. An understanding of world systems theory is instrumental in appreciating the complex systemic nature of both today's global economy and, within this context, regional and national economic development.

Origins and Foundational Contentions

World systems theory is influenced by early Marxist thought on imperialism and capitalist exploitation. However, it is based most directly on the work of Immanuel Wallerstein in the 1970s and 1980s. The central focus of world systems theory differs significantly from that of other major theories of economic development (e.g., dependency theory and modernization theory). It does not, for example, focus on regional or national stages of development—most typically toward the standard of the United States. It also does not concern itself primarily with the level of control wealthy, highly developed, and heavily industrialized core nations hold over poor, underdeveloped, and largely unindustrialized peripheral countries. Instead, world systems theory focuses on the developmental implications of the particular positions nations occupy—and the roles they play—within a closed, interactive global social system driven by economic activity.

World systems proponents hold that this focus on the global system and the positions nations occupy within it is necessitated by the fact that there is but one world economy within which exists but one (global) division of labor. World systems theorists do recognize that the regions and nations of the world have separate and unique histories and developmental trajectories and states. However, world systems theorists contend that these histories and developmental trajectories and states cannot be meaningfully understood without first situating analysis of them in the context of the complex, interactive global system of economic activity.

The Semiperiphery

One of the main criticisms of dependency theory (of economic development) is that it grossly oversimplifies the nature of global economic activity by focusing on only two types of nations. The first type consists of affluent, heavily industrialized, highly developed, core countries from which emanates the bulk of global economic activity (e.g., the United States, Japan, Germany, and the United Kingdom). The second group of countries includes poor, unindustrialized, underdeveloped, inwardly focused peripheral nations (e.g., Burundi, Rwanda, Tanzania, and Zambia). World systems theory overcomes this alleged deficiency via development of the notion of the semiperiphery and in-depth analysis of the roles played by semiperipheral nations (e.g., Brazil, Mexico, India, Canada, China, South Korea, Australia, and South Africa) in the global economic system.

From the world systems perspective, semiperipheral nations exist between the core and the periphery and are seen as important to global system functioning for both political and economic reasons. Politically, the semiperiphery serves as a form of "middle-class social buffer," lessening the possibility of mass rebellion by the oppressed peoples of the world. This reasoning is based on the assumption that members of civil society in the (heavily populated) semiperiphery are not likely to join in rebellion with their counterparts in the periphery because they tend to see themselves as better off than the poorest of the—peripheral—poor rather than worse off than persons living in core nations. Economically, semiperipheral nations are important to global system functioning mainly because they often serve as low-wage, (foreign direct) investment-friendly export platforms for (core-based) manufacturing organizations. Here, the semiperiphery produces products that are consumed by people worldwide.

Today, semiperipheral nations play key roles in the global economic system for another reason not emphasized in original conceptualizations of world systems theory. As semiperipheral nations develop economically—as a result, for example, of more and more people moving from self-sufficiency in rural areas to relatively well-paid urban manufacturing jobs—they increasingly become viable consumer markets for an expanding range of products (produced both in the semiperiphery and elsewhere). This is particularly important given the large populations of many semiperipheral nations.

World Trade Organization

The General Agreement on Tariffs and Trade (GATT), which was created on October 30, 1947, gave way to the World Trade Organization (WTO) on January 1, 1995. It came into existence after the 1986–94 Uruguay Round talks, which aimed at doing away with quotas, lowering of tariffs, reforming agricultural trade, and focusing on intellectual property rights. After the meeting at Marrakesh, Morocco, on April 15, 1994, the 123 participating nations decided to replace the GATT and set up the WTO. An international organization for resolving differences among member states on global trade, the WTO also caters to the needs of consumers.

The WTO has 151 members along with 31 nations having observer status. The nations enjoying the observer status should take steps to become full members within five years. The Vatican is the only exception. Afghanistan, Iran, Iraq, the Russian Federation, and so forth, still send representatives as observers. The WTO functions from Geneva, Switzerland, with a staff of 635 and a budget of about US$141 million.

Organization

The top decision-making body is the Ministerial Conference meeting biennially and its policy decisions are implemented by a General Council, which also looks after administration. The Dispute Settlement Body looks after trade disputes, whereas the Trade Policy Review Body reviews trade policies. The present director-general of the WTO is former European commissioner for trade Pascal Lamy. The regional economic integration of countries has resulted in groups and associations speaking with one voice in the WTO. The European Union (EU) is the most forceful voice having member status in the WTO. The Association of Southeast Asian Nations (ASEAN), the African, Caribbean, and Pacific Group (ACP), the Latin American Economic System (SELA), and so forth, are examples of associations by which the member countries increase bargaining power in WTO meetings.

There had been phenomenal trade growth in the last five decades. The WTO sets norms for trade between nations and endeavors to lower trade barriers. The multilateral trading system emerged with agreements signed by countries, which were ratified in respective parliaments. By these contracts, the signatories formulate trade policies with some trading rights.

Criticism

The talks between nations have been a constant feature of the workings of the WTO. Agreements are reached in areas such as lowering of import duties, antidumping measures, information technology, agriculture, and intellectual property rights. The WTO has not always had smooth sailing. There is mutual bickering and the developed nations are targets of much criticism from the developing and underdeveloped nations.

The developing countries feel that they have agreed on intellectual property protection and liberalization of trade, but the developed countries are not reciprocating in a major way. It becomes difficult for the developing countries to gain access in a substantial way in the agricultural markets of developed nations. The Doha Round of talks held in Potsdam (June 2007) broke down as India, Brazil, the European Union, and the United States did not reach an agreement on tariff and farm subsidies. The WTO also has become an object of criticism, protest, and anger from different environmental and labor groups. Trade liberalization as such has not increased inequality. Rather, various studies undertaken by the World Bank have proven that it helps in eradicating poverty.

Yemen

Yemen, a country on the southwestern corner of the Arabian Peninsula, has been the center of commerce in the region since ancient times when it was a source of myrrh, frankincense, and spices. As a result, the ancient Egyptians started expeditions to the region in the 25th century B.C.E., and interest in the region continued so much so that the Roman emperor Augustus tried to take the region, and the Ethiopian kingdom of Aksum held it from about 520 C.E. until 570 C.E., when the Sassanian Persians took it. After the emergence of Islam, the region came under the control of the Arab rulers and was run by the Ottoman Turks. The famous Chinese admiral Zheng He (Cheng Ho) made a point of visiting Yemen in 1421.

Because of its geographical position, in 1839 the British occupied Aden, a natural port at the southern end of the Red Sea. It grew in importance after the opening of the Suez Canal in 1869, and the British continued to hold Aden, making it a major port in the global economy. Heavily garrisoned by the British, most non-French passenger ships going through the Red Sea and Suez Canal stopped at Aden (the French used Djibouti). During the British period of running Aden, a number of important trading companies were based there including Beese, with British Petroleum having a refinery in Aden, and there were also many companies supplying British troops and providing supplies for passengers passing through the port. With a massive upsurge in nationalist attacks on the British, they were finally forced to withdraw in 1967. With the decline in the use of passenger ships by the early 1970s, the importance of Aden dramatically declined. Yemen was divided between North Yemen and South Yemen until they were formally reunited on May 22, 1990.

In 1970 South Yemen was renamed the People's Democratic Republic of Yemen. It was a communist, centrally planned economy and had close political ties to Nasser's Egypt, the Soviet Union, and the People's Republic of China. This led to its isolation from the world community. North Yemen—the Yemen Arab Republic—was largely Royalist until reunification. In addition to Aden, the unified country now has a number of important ports including Al Hudaydah, Al Mukha, Salif, and Ra's Kathib, all on the Red Sea, and Al Khalf and Nishrun on the Gulf of Aden.

Economically, Yemen remains poor. It relies heavily on remittances from Yemenis working abroad and also from foreign aid. The problems with the economy from 1990 were complications that arose from the integration of the communist and the noncommunist system exacerbated by some 850,000 Yemenis returning from the Gulf States after the Iraqi invasion of Kuwait. Yemen sought help from the International Monetary Fund (IMF), and from 1995 with the support of the IMF and the World Bank, it drew up its First Five-Year Plan, which lasted from 1996 until 2000. The Yemeni government has subsequently embarked on many economic and regulatory reforms and has gained praise from the World Bank. A growing number of foreign multinationals have started operating in the country.

In 2008 Yemen had a gross domestic product (GDP) of $2,400 per capita. As much as 63 percent of the workforce remains working in the agriculture sector, although in 2008 it accounted for under 10 percent of the country's GDP. Eleven percent of the workforce is in industry, generating 52 percent of the 2008 GDP, and 26 percent work in services, resulting in 38 percent of Yemen's 2008 GDP. The major exports of the country are crude oil from refineries that operate in the country, coffee, and dried and salted fish. The major export destinations are Thailand and China (29 percent each) and India. Imports include food, live animals, machinery, and equipment, with 17 percent coming from the United Arab Emirates, and the other two main sources being Saudi Arabia and Kuwait.

Zaibatsu

The term *zaibatsu* refers to the conglomerate business groups that became prominent in Japan during the Meiji Restoration (1868–1912), although some had roots going back to the Edo Period in the 1600s and earlier. The groups survived through the first half of the 20th century until they were forcibly disbanded after the end of World War II. They have transitioned in form since then to the *keiretsu*, which retain many, but not all, of their features. A notable difference between the two organizational forms is that zaibatsu had a vertical chain of command under one family, while linkages in keiretsu are generally horizontal in nature. Some important zaibatsu whose business names remain influential today include Mitsui, Mitsubishi, Yasuda, and Sumitomo (known collectively as the Big 4 zaibatsu), among others.

In the early 1850s, Japan was forced to open its borders by the United States under the leadership of Commodore Perry, ending a self-imposed isolation that had lasted since the 1630s with very limited exceptions, primarily for trading in select ports. During the early stages of the Meiji Restoration, the Japanese rulers sent scholars to study leading institutions around the world in an effort to incorporate Western ideas into Japanese society so that Japan could effectively participate in the world economic system. Along with resulting changes to societal institutions (e.g., a new constitution and education system), these leaders provided preferential treatment to prominent, well-connected families to develop industries deemed necessary for the advancement of the Japanese economy. Some of these initial advantages came during a mass privatization of government-owned companies that occurred in 1880, and allowed these family firms to expand into numerous new lines of business; these firms became known as the zaibatsu. While precise definitions of the term *zaibatsu* vary, they are generally defined in terms of a pyramidal group of firms under the leadership of a family-owned company.

The zaibatsu were generally organized as a combination of industrial firm(s) and a bank(s), which were controlled by a family-owned holding company that maintained ownership over each of the participant companies. The industrial (manufacturing) firms were responsible for producing products for consumption in Japan and export, while the bank handled financing for the conglomerate. In addition, the zaibatsu generally contained trading companies, which were responsible for selling merchandise overseas. Because Japan had been closed off from the rest of the world for centuries, the role of the trading company was particularly crucial in providing intelligence regarding the various markets where products would be sold, what types of products would be desired by those markets, and the existence of local competition. By maintaining trading offices in major cities around the world, the zaibatsu were able to gain a stronger grasp of the world market from which Japan had been isolated for so long.

From the late 1800s through World War II, the zaibatsu helped build the Japanese economy, such that it quickly became an economic power. While estimates vary, it is clear that the zaibatsu controlled a major portion of the economy. For example, one estimate states that by the mid-1930s, the Big 4 zaibatsu alone controlled one-third of all bank deposits in Japan as well as one-third of all foreign trade. The zaibatsu were also known for their strong association with political parties during the early 20th century and, as such, were closely tied to the military buildup of Japan during this period. In particular, both Mitsui and Mitsubishi were associated with major political parties, with Mitsui also maintaining strong ties with the Imperial Japanese Army, while Mitsubishi maintained ties with the Imperial Japanese Navy. At times, tensions existed between the zaibatsu and Japanese leaders over the level of zaibatsu influence on government, although efforts to limit zaibatsu power were often unsuccessful.

After World War II, during the occupation of Japan by the United States under the leadership of General Douglas MacArthur, the zaibatsu were initially targeted for dissolution to prevent a recurrence of their previous role in the buildup of the Japanese military. However, they were later allowed to reappear under the form of the modern-day keiretsu, largely for strategic reasons, so that Japan could help counter what was considered a growing communist threat in Asia.

Zimbabwe

Zimbabwe is a landlocked southern African country sharing borders with Botswana, Mozambique, South Africa, and Zambia, with a land mass of approximately 386,000 sq. km. The population is 98 percent African, 1 percent mixed and Asian ethnicities, and less than 1 percent white. Although English is the official language, Shona and Ndebele are the prominent African languages spoken by the majority of people. Approximately 50 percent of the population practice a blend of Christian and indigenous religions, 25 percent practice Christianity, 25 percent indigenous religions, and 1 percent Islam. It is home to the world's largest waterfall, Victoria Falls, a popular tourist destination, although because of the crises in Zimbabwe, visitors view the falls from neighboring Zambia.

The country is endowed with various mineral resources, which have replaced agriculture as the primary export, including gold, platinum, diamonds, nickel, asbestos, tin, iron, chromite, copper, and coal. Among Zimbabwe's industrial products are iron and steel, cement, foodstuffs, machinery, textiles, fertilizer, and consumer goods. It imports machinery and transport equipment, other manufactures, chemicals, and fuels primarily from South Africa, Zambia, and China. Its major export partners are South Africa, the Democratic Republic of the Congo, Japan, Botswana, the Netherlands, China, and Italy. Its agricultural products include corn, cotton, tobacco, wheat, coffee, sugarcane, sorghum, peanuts, soybeans, and valuable hardwoods, including teak and mahogany.

British colonization began in the 1850s, establishing the territory of Rhodesia, which remained a self-governing colony until 1965, when the white-minority government, led by Prime Minister Ian Smith, unilaterally declared its independence from Britain. Increasingly violent guerrilla warfare, international economic sanctions, and the withdrawal of South African military aid led to a 1978 power-sharing agreement between Smith's government and African leaders of the black majority. In 1980 the country witnessed the first multiracial elections, bringing Robert Mugabe of the Zimbabwe African National Union (ZANU) to power as prime minister, as well as formal independence under the name Zimbabwe. Mugabe has been in power ever since, becoming president in 1987, thanks to rigged elections enforced by the militia and Zimbabwe High Court, including the most recent in 2008, with a challenge from Morgan Tsvangirai, the leader of the Movement for Democratic Change. However, just before the runoff election, Tsvangirai withdrew, accusing Mugabe of supporting violence against him and his opposition party. International condemnation and economic sanctions by the United States followed. Mugabe and Tsvangirai then negotiated to end the political violence and engaged in talks to form a unified government. They reached an agreement in February 2009 that led to Mugabe remaining president and Tsvangirai becoming prime minister.

Mugabe's authoritarian rule and disastrous economic policies have severely crippled the country. A corrupt and chaotic land reform program beginning in 2000 drove white commercial farmers from their land without compensation, leading to a sharp decline in agricultural production—51 percent between 2000 and 2007—traditionally the source of Zimbabwe's exports, foreign currency, and jobs. Consequently, Zimbabwe faces shortages of food and other consumer goods, which were exacerbated by 2007 price controls, leading to a thriving black market. The currency shortage and fiscal deficit financed by prolific printing of money has led to hyperinflation, estimated by private analysts at over 100,000 percent in 2007. Meanwhile, the official exchange rate fell from approximately 1 (revalued) Zimbabwean dollar per U.S. dollar in 2003 to 30,000 per U.S. dollar in 2007.

Further contributing to the economic crisis was Operation Murambatsvina ("Operation Drive Out Trash") in 2005 with the aim of redistributing people from urban to rural areas to combat illegal housing, crime, and sexually transmitted diseases. However, the destruction of homes and businesses of mostly poor supporters of Mugabe's opposition, leaving thousands homeless, unemployed, and starving, led to allegations that the purge was politically driven.

By all measures, the country is devastated: a decrease in the population of 4 million people between 2002 and 2006 because of the economic crisis, political repression, and acquired immunodeficiency syndrome (AIDS); a 40 percent decline in gross domestic product (GDP) between 2000 and 2007; 2007 unemployment rate and percent living in poverty rate around 80 percent; a doubling of the infant mortality rate since 1990; an increase in human trafficking because of the increasing vulnerability of the population; and an average life expectancy of 40 years, among the lowest in the world, primarily because of the AIDS adult prevalence rate, which has declined from 25 percent in 2001 to 15 percent in 2007. As a consequence of the country's meltdown, between 1998 and 2007 direct foreign investment fell by 90 percent and little government money has been spent on improving the infrastructure, capital, and human investment, including education.

Zurich Financial Services

Zurich Financial Services is a well-established insurance-based financial institution founded in 1872. Its initial 19th-century activities rapidly extended to Austria, Germany, Denmark, Sweden, and Norway. Currently, the organization encapsulates a global web of subsidiaries, which deliver a wide range of general (property and causality cover for individual and business customers) and life insurance products, called assurance in recognizing that the protection is provided against an event that is certain to take place. Zurich Financial Services' business model also includes annuities and a range of sophisticated investment policies, risk management, and risk solutions to customers in over 170 countries.

Insurance is a contract to pay a premium in return for which the insurer will pay compensation arising from legitimate claims; these can be substantial. Following the events at the World Trade Center, damage caused by Hurricane Katrina, and successive European floods, Zurich Financial Services was inundated with claims, which caused substantial, but temporary, challenges to the company.

The headquarters of the group are located in Zurich, Switzerland, which is a well-known leading banking center. Zurich is a city fundamental to the international brand identification of the company, the "Z" logo being one of the world's most recognizable images in the financial and insurance sectors. The group instills a local/global organizational culture promoted through the "Zurich Way," which presents a "one Zurich" mindset, encouraging the promotion of a consistent experience based on superior service. This philosophy is embedded in the business activities of the group and is prominent in the organization's literature.

Zurich Financial Services is consistently featured in the Fortune Global 500; its position on the list should be maintained by the strategic objective of rapidly increasing its life insurance business. This acceleration will likely be achieved through Zurich's vast network of international financial advisers, insurance agents, and insurance broking channels, which support expansion programs and growth within the group.

Recent criticism of the company following several high-profile claims of poor business practice damaged the international reputation of the group (a "one Zurich" operational model being vulnerable to the emergence of specific problems that garner media attention). Nonetheless, the wide-ranging response to a challenging international business environment has seen compliance procedures tightened within the group to improve sensitive areas in the business model, primarily in hedge funds, which are ironically noted for high risk and the absence of transparency in marketing and operation. Elsewhere, the relative absence of openness in the pricing of some established products (a feature potentially disguising noncompetitive products) has been remodeled to rebuild customer and client confidence.

Zurich Financial Services expanded aggressively through a well-targeted merger and acquisition program that has seen the group expand into challenging markets such as Russia. This expansion builds on experience in China, where the group, following approval from the China Insurance Regulatory Commission, became the first foreign-registered insurer to establish a presence in the Chinese capital Beijing.

Zurich Financial Services' cross-border organizational network combines global operations with local expertise (a practicing set of local/global linkages with the ability to offer a range of solutions and products to meet diverse risks). This approach provides a degree of protection for the boom and circle notable in the insurance industry (a feature that also impacts negatively, however, on human resource management issues with the arrival and departure of certain functions such as customer contact services in various cities and countries).

Evolving risk environments stemming from the natural (earthquakes), the political (conflict), the economic (credit crunch), and the social (demographic) are generating new risks in international and local insurance environments. Zurich Financial Services has established an International Advisory Council to advise on emerging threats and the impact on sustainable growth. In anticipating and responding to the ever-changing nature of risk, Zurich Financial Services is well placed, using established industry experience and global operations to maintain and evolve its position in a challenging market, a scenario conditional on product integrity and coherent sustained performance.

Glossary

A

Absolute Advantage: An absolute advantage exists when a nation or economic region is able to produce a good or service more efficiently (using the same amount of resources) than a second nation or region.

Accelerated Tariff Elimination: An increased rate of reduction of import duties at a faster rate than what was originally planned or decided upon.

Accounting Exposure: Changes in a corporation's financial statements as a result of changes in currency values. Also known as translation exposure.

Acquisition of Assets: In an acquisition of assets, one firm acquires the assets of another company.

Acquisition of Stock: In an acquisition of stock, one firm buys the equity interest of another firm.

Acquisition Premium: In a merger or acquisition, the difference between the purchase price and the preacquisition value of the target firm.

Active Fund Management: An investment approach that actively shifts funds either between asset classes (asset allocation) or between individual securities (security selection).

Active Income: In the U.S. tax code, income from an active business as opposed to passive investment income.

Activity-Based Costing (ABC): An accounting method that allocates costs to specific products or services or activities.

Adjusted Present Value: A valuation method that separately identifies the value of an unlevered project from the value of financing side effects.

Ad Valorem Tariff: A tariff assessed as a percentage of the value of an import.

Advance Payment: Trading method in which the buyer pays for the goods before they are shipped to the buyer.

Adventure: It is also called "marine adventure." It is a term of art in the marine insurance business. All insured cargo owners and every shipper on that vessel are part of the adventure.

Advising Bank: Bank, usually in the country of the seller, whose primary function is to authenticate the letter of credit and advise it to the seller.

Advisory Capacity: Used to indicate that a shipper's agent or representative is not empowered to make definitive changes or adjustments without approval of the group or individual represented.

African, Caribbean, and Pacific Countries (ACP): The African, Caribbean, and Pacific Group of States (ACP) is an organization created by the Georgetown Agreement in 1975. It is composed of African, Caribbean, and Pacific states signatories to the Georgetown Agreement or the Partnership Agreement between the ACP and the European Union.

African Developmental Bank Group (ABD Group): The ABD Group is one of four major regional developmental banks currently operating in the global economy; it is headquartered in Abidjan, Côte d'Ivoire.

African Union (AU): The African Union is an organization for regional, social, and economic cooperation. It consists of 53 member nations in Africa and was derived from the OAU (Organization of African Unity). Its goal is to unify Africa and promote peace, security, and stability on the continent through social and economic cooperation.

Agency Costs: The costs incurred to ensure that agents and managers act in the best interest of the principal.

Agent: Someone who represents another. In corporate governance terminology, management is the agent of the principal stakeholders in a principal-agent relationship.

Aggregate Demand: The total demand of all potential buyers of a commodity or service. Includes all individuals and organizations that have the ability, willingness, and authority to purchase such products.

Agreement on Textiles and Clothing (ATC): The Agreement on Textiles and Clothing (ATC) and all restrictions thereunder terminated on January 1, 2005. The expiry of the 10-year transition period of ATC implementation means that trade in textile and clothing products is no longer subject to quotas under a special regime outside normal WTO/GATT rules but is now governed by the general rules and disciplines embodied in the multilateral trading system.

Air Waybill: A nonnegotiable instrument of domestic and international air transport that functions as a bill of lading.

All-in-Cost: The percentage cost of a financing alternative, including any bank fees or placement fees.

Allocational Efficiency: The efficiency with which a market channels capital toward its most productive uses.

Allocation-of-Income Rules: In the U.S. tax code, these rules define how income and deductions are to be allocated between domestic-source and foreign-source income.

Allowance: An amount paid or credited by sellers to the buyers on products due to one or more reasons that did not meet buyers' specifications such as late shipment and faulty packaging.

Alternative Tariff: A tariff that has two or more rates for the same product, trading to and from the same points, with the authority to use one that produces the lowest charge.

American Option: An option that can be exercised anytime until expiration (contrast with European option).

American Shares: Shares of a foreign corporation issued directly to U.S. investors through a transfer agent in accordance with SEC regulations.

American Terms: A foreign exchange quotation that states the U.S. dollar price per foreign currency unit (contrast with European terms).

Andean Community (CAN): The Andean Community or Comunidad Andina de Naciones in Spanish (CAN) is made up of Bolivia, Colombia, Ecuador, Peru, and Venezuela. It is a series of bodies and institutions that work to bring Andean subregional integration, promote external projection, and reinforce the actions connected with the process.

Andean Pact: A regional trade pact that includes Venezuela, Colombia, Ecuador, Peru, and Bolivia.

Annuity: A level stream of equal dollar payments that lasts for a fixed time. An example of an annuity is the coupon part of a bond with level annual payments.

Annuity Factor: The term used to calculate the present value of the stream of level payments for a fixed period.

Antidumping Laws: Laws that are enacted to prevent dumping—offering a price in the overseas market that is lower than that at which a product is sold in its home domestic market.

Appellate Body (AB): The Appellate Body is a World Trade Organization (WTO) entity, which was established in 1995 under Article 7 of the Understanding on Rules and Procedures Governing the Settlement of Disputes (DSU). Its purpose is to hear appeals and reports issued by panels in disputes between WTO members. It is composed of a standing body of seven people and has the power to uphold, modify, or reverse the legal findings and conclusions of a panel. These rulings must be accepted by the parties of the dispute. The Appellate Body has its seat in Geneva, Switzerland.

Appreciation: An increase in a currency value relative to another currency in a floating exchange rate system.

Arab Maghreb Union (AMU): A regional alliance seeking economic and political unity in northern Africa. Members are Algeria, Libya, Mauritania, Morocco, and Tunisia.

Arbitrage: The process of purchasing and selling the identical products, such as foreign exchange, stocks, bonds, and other commodities, in several markets intending to make profit from the difference in price. Arbitrage is generally seen as a "risk-less" transaction.

Arbitrage Pricing Theory (APT): APT is a theory used in finance to find the prices of assets and is typically used in stock pricing. Its asset pricing model assumes a linear relation between required return and systematic risk as measured by one or more factors according to Rj = mj + b1jF1 + ... + bKjFK + ej.

Asian Development Bank (ADB): The Asian Development Bank (ADB) is a multilateral development financial institution owned by 67 members (48 from the region and 19 from other parts of the globe). Its goal is to improve the welfare of the people in Asia and the Pacific. ADB is headquartered in Manila, Philippines. It is one of four major development banks around the world.

Asia-Pacific Economic Cooperation (APEC): A forum designed to promote economic growth, cooperation, and integration among member nations. APEC has also worked to reduce tariffs and other trade barriers across the Asia-Pacific region. Its vision is based on the "Bogor Goals" adopted in the 1994 meeting in Bogor, Indonesia.

There are 21 member economies including Australia; Brunei Darussalam; Canada; Chile; People's Republic of China; Hong Kong, China; Indonesia; Japan; Republic of Korea; Malaysia; Mexico; New Zealand; Papua New Guinea; Peru; Republic of the Philippines; Russian Federation; Singapore; Chinese Taipei; Thailand; United States of America; Vietnam.

Ask Rates: The rate at which a market maker is willing to sell the quoted asset. Also known as offer rates.

Asset Allocation Policy: The target weights given to various asset classes in an investment portfolio.

Assets in Place: Those assets in which the firm has already invested (compare to growth options).

Association of Southeast Asian Nations (ASEAN): An economic and geopolitical affiliation formed in 1967 that includes Singapore, Brunei Darussalam, Malaysia, Thailand, the Philippines, Indonesia, Myanmar (Burma), Laos, Cambodia, and Vietnam.

Attachment: The legal seizure of a property or a person before the judgment is made in order to secure compensation if awarded. The prosecutor can request the court to issue an order to seize a property.

At-the-Money Option: Option with an exercise price that is equal to the current value of the underlying asset.

Autarky: In models of international trade, a situation in which there is no cross-border trade.

Aval: A guarantee of the buyer's credit provided by the guarantor, unless the buyer is of unquestioned financial standing. The aval is an endorsement note as opposed to a guarantee agreement.

Avalization: Payment undertaking given by a bank in respect of a bill of exchange drawn.

Average Accounting Return (AAR): Average project earnings after taxes and depreciation divided by the average book value of the investment during its life.

B

Back Order: A customer order for materials, goods in process, or finished goods that is not currently in stock but is to be delivered when it becomes available.

Backward Innovation: Building a more basic version of an existing product for a lesser-developed market.

Balanced Economy: In national finances, it is when exports are equal to imports.

Balance of Payments: The International Monetary Fund's accounting system that tracks the flow of goods, services, and capital in and out of each country.

Balance of Trade: The difference between a country's total imports and exports over a set period.

Balance Sheet: A statement showing a firm's accounting value on a particular date. It reflects the equation, Assets = Liabilities + Stockholders' Equity.

Bank-Based Corporate Governance System: A system of corporate governance in which the supervisory board is dominated by bankers and other corporate insiders.

Banker's Acceptance: A time draft drawn on and accepted by a commercial bank.

Banker's Draft: A payment instrument used to make international payments.

Bank for International Settlements (BIS): An international organization that promotes international monetary and financial cooperation among nations by fostering the cooperation of world central banks.

Bank Release: A document issued by a bank authorizing the delivery of goods.

Bankruptcy: The status of an individual or a legal entity that does not have sufficient resources to pay its debts as they become due.

Bargain Purchase Option: A lease provision allowing the lessee to purchase the equipment for a price predetermined at lease inception, which is substantially lower than the expected fair market value at the date the option can be exercised.

Barter: Trade in which merchandise is exchanged directly for others without use of money or the involvement of a third party.

Basel Convention: An international treaty concerned with restricting the movement of hazardous wastes between countries, especially from developed to underdeveloped countries.

Basic IRR Rule: Accept the project if the (Internal Rate of Return) IRR is greater than the discount rate; reject the project if IRR is less than the discount rate.

Basis: The simple difference between two nominal interest rates.

Basis Point: Equal to 1/100 of 1 percent.

Basis Risk: The risk of unexpected change in the relationship between futures and spot prices.

Basis Swap: A floating-for-floating interest rate swap that pairs two floating rate instruments at different maturities (such as six-month LIBOR versus 30-day U.S. T-bills).

Bearer Bonds: Bonds that can be redeemed by the holder. The convention in most west European countries is to issue bonds in registered form (contrast with registered bonds).

Benchmarking: A systematic procedure of comparing a company's practices against the best practice and modifying actual knowledge to achieve superior performance.

Beneficiary: A party who receives a legal benefit.

Beta: A measure of an asset's sensitivity to changes in the market portfolio (in the Capital Asset Pricing Model) or to a factor (in the APT). The beta of an asset j is computed as bj = rj,k (sj/sk), where k represents a market factor (such as returns to the market portfolio in the CAPM).

Bid Bond: A type of bond that guarantees the fulfillment of an offer or bid if it is accepted.

Bid-Offer Spread: The difference between the interest rates at which the bank borrows money and lends money.

Bid Rate: The rate at which a market maker is willing to buy the quoted asset.

Bilateral Investment Treaty (BIT): A treaty between two countries to ensure that investments between the two countries receive the same treatment as domestic or other international investments.

Bilateral Trade Agreement: A commercial agreement between two countries, often detailing what specific quantities of what specific goods can be exchanged.

Bill of Lading (BOL): A document that establishes the terms and conditions of a contract between a shipper and a shipping company under which freight is to be moved between specified points for a specified charge.

Blank Endorsement: The method whereby a bill of lading is made into a freely negotiable document of title.

Blanket Bond: A bond that covers a group of people, articles, or properties.

Blanket Contract: A long-term contract in which the supplier promises to resupply the buyers as needed at agreed-upon prices over the contracting time.

Blanket Rate: A rate that is applied broadly over different articles or entities.

Blockade: The act of seizing commercial exchange with a particular country. Such act is common during wartime.

Blocked Funds: Cash flows generated by a foreign project that cannot be immediately repatriated to the parent firm because of capital flow restrictions imposed by the host government.

Bogor Goals: The Bogor Goals were created by the Asia-Pacific Economic Cooperation (APEC) in Bogor, Indonesia, in 1994, with the intention of increasing economic unity among Asian Pacific nations by increasing trade.

The goals are to have free trade and investment in developed nations by 2010 and in developing nations by 2020.

Bonded Exchange: Foreign exchange that cannot be freely converted into other currencies.

Bond Equivalent Yield: A bond quotation convention based on a 365-day year and semiannual coupons (contrast with effective annual yield).

Bond of Indemnity: An agreement relieving the party to whom the bond is issued of responsibility in a situation in which the party would normally be liable.

Break-Even Analysis: Analysis of the level of sales at which a project would make zero profit. The term can also be used for sales of financial instruments.

Bretton Woods Agreement: An agreement made at Bretton Woods, New Hampshire, near the end of World War II to promote exchange rate stability and facilitate the international flow of currencies.

Bretton Woods Conference: An international conference held in 1944 at Bretton Woods, New Hampshire with representatives from 43 countries. The conference established the International Monetary Fund and the World Bank.

Buffer Stock: Goods set aside and reserved for sale specifically to balance out the market in the case of a shortage of that good. In the case of a surplus, more of the good would be bought and set aside.

C

Call Option: The right to buy the underlying currency or security at a specified price and on a specified date from the option writer/seller.

Calvo Doctrine: A foreign policy doctrine that states that the country in which an investment is located has jurisdiction over that investment.

Cap: In banking and finance, when the interest on borrowed funds is tied to the market rate, an upper limit or a cap can be negotiated and agreed upon, so that even when the market rate is higher than the stated level, no premium will be paid.

Capital Account: A measure of change in cross-border ownership of long-term financial assets, including financial securities and real estate.

Capital Asset Pricing Model (CAPM): An asset pricing model that relates the required return on an asset to its systematic risk.

Capital Budgeting: Planning and managing expenditures for long-lived assets.

Capital Formation: The process of increasing the amount of capital goods—also called capital stock—in a country.

Capital Gain: The positive change in the value of an asset; a negative capital gain is a capital loss.

Capital Goods: Manufactured goods that are used for production, such as machine tools.

Capitalism: An economic system that is based on private ownership; economic development is proportionate to and dependent upon the accumulation and reinvestment of profits.

Capital Market Line: The line between the risk-free asset and the market portfolio that represents the mean-variance efficient set of investment opportunities in the CAPM.

Capital Markets: Markets for financial assets and liabilities with maturity greater than one year, i.e., long-term loanable funds, such as long-term government and corporate bonds, preferred stock, and common stock.

Capital Rationing: The case where funds are limited to a fixed dollar amount and must be allocated among the competing projects.

Capital Structure: The mix of the various debt and equity capital maintained by a firm. Also called financial structure. The composition of a corporation's securities used to finance its investment activities; the relative proportions of short-term debt, long-term debt, and owners' equity.

Caribbean Community and Common Market (CARICOM): CARICOM consists of Antigua & Barbuda, Bahamas, Barbados, Belize, Dominica, Grenada, Guyana, Haiti, Jamaica, Montserrat, St. Kitts & Nevis, St. Lucia, St. Vincent & The Grenadines, Suriname, and Trinidad & Tobago. Its purpose is to provide a continued economic linkage after the dissolution of the West Indies Federation for English-speaking countries in the Caribbean.

Carrier: An individual or entity that transports persons or goods for compensation under the contract of carriage.

Cartage: The delivery of goods with short distance.

Cartel: An agreement among, or an organization of, suppliers of a product to limit production in order to minimize competition and maximize market power.

Cash Against Documents (CAD): Payment for goods where a commission house or other intermediary transfers title documents to the buyer upon payment in cash.

Cash Cover: In a letter of credit transaction, money deposited by the applicant with the issuing bank.

Cash Flow: Cash generated by the firm and paid to creditors and shareholders. It can be classified as (1) cash flow from operations, (2) cash flow from changes in fixed assets, and (3) cash flow from changes in net working capital.

Cash in Advance (CIA): Payment for goods in which the price is paid in full before the shipment is made. This type of payment is usually only made for very small shipments or when goods are made to order.

Cash With Order (CWO): Payment for goods in which the price is paid at the time the order is placed.

Central America Free Trade Agreement (CAFTA-DR): CAFTA-DR is an extensive trade agreement between Costa Rica, the Dominican Republic, El Salvador, Guatemala, Honduras, Nicaragua, and the United States.

Central Bank: The sole institution of a nation that has the authority to issue bank notes and set monetary and credit policies. It manages the rate of exchange of the nation's currency and determines the internal and external monetary stability of the currency.

Centrally Planned Economy: An economy in which the government, rather than free-market activity, controls the allocation of resources.

Certificate of Acceptance: Term used in leasing. A document whereby the lessee acknowledges that the equipment to be leased has been delivered, is acceptable, and has been manufactured or constructed according to specifications.

Certificate of Analysis/Certificate of Inspection: Documents that may be asked for by the importer and/or the authorities of the importing country, as evidence of quality or conformity to specifications.

Certificate of Manufacture: A statement that is usually notarized in which the producer of goods certifies that the goods have been produced and are now available to the buyer.

Certificate of Origin: Documents that may be asked for by the authorities of the importing country, as evidence of the country of manufacture of the goods.

Certificate of Product Origin: A document required by certain foreign countries for tariff purposes, certifying the country of origin of specified goods.

Change in Net Working Capital: Difference between net working capital from one period to another.

Characteristic Line: The line relating the expected return on a security to different returns on the market.

Chattel: An item of movable personal property.

Chill a Sale: The collusion of buyers or bidders in a sale to check competition in order to obtain goods or properties below fair value.

Civil Law: A body of law created by the legislation of a state or nation, and based upon written statutes, for its own regulation.

Civil Society Organizations (CSOs): Nongovernmental and nonprofit groups that work to improve society and the human condition.

Clean Bill of Lading: A receipt for goods issued by a carrier that indicates that the goods were received in apparently good order and without damage.

Clean Collection: Collection in which only the financial document is sent through the banks.

Clearance: The completion of customs entry requirements that results in the release of goods to the importer.

Clearing: The settlement of a transaction, often involving exchange of payments and/or documentation.

Clearing House Interbank Payments System (CHIPS): Financial network through which banks in the United States conduct their financial transactions.

Closed-End Fund: A mutual fund in which the amount of funds under management is fixed and ownership in the funds is bought and sold in the market like a depository receipt.

Closed-End Transaction: A credit transaction in which the time for repayment and amount are fixed.

Codex: Codex Alimentarius Commission (a world food standards body).

Collar: An agreement that fixes the interest rate between a lower and an upper boundary, regardless of the market rate.

Collecting Bank: The bank that acts as the agent of the seller to collect payment(s) from the buyer and then transfer the payment(s) to the remitting bank (seller's bank).

Collection Order: In a collection, the document in which the seller instructs the banks as to how the collection is to be conducted.

Collective Mark: A trademark or service mark for a cooperative, association, or a collective group to indicate membership in this collective group.

Collectivist Society: A society in which people feel more comfortable thinking and acting in groups.

Collusion: An agreement (usually secret) among mostly oligopolistic competing firms in an industry to control the market, raise the market price, and otherwise act like a monopoly.

Command Economy: An economy based on government ownership and/or control of society's resources; during the 20th century, the dominant form of command economy was communism.

Commercial Bank: A bank whose primary function is to accept demand deposits (which can be withdrawn upon depositories' demand), and grant short-term and long-term loans.

Commercial Credit: A letter of credit that assures the seller that buyer will pay for the goods being sold. Such letter is usually issued by a bank upon client's request.

Commercial Document: General term for documents describing various aspects of a transaction, e.g., commercial invoice, transport document, insurance document, certificate of origin, certificate of inspection, etc.

Commingling: Method of packing a shipment in which various goods subject to differing duties are grouped together. Because of this, the value of each type of item is difficult to determine.

Commodity Price Risk: The risk of unexpected changes in a commodity price, such as with oil.

Commodity Swap: A swap in which the (often notional) principal amount on at least one side of the swap is a commodity such as oil or gold.

Common Carrier: An organization that transports persons or goods for a fee.

Common Law: The body of law based on customs, usages, and court decisions rather than statutory laws.

Common Market: A common market is a group of countries that have common external tariffs against nonmember nations. It may also allow labor mobility as well as common economic policies. For example, the European Union (EU).

Common Market for Eastern and Southern Africa (COMESA): An organization of states that intends to promote the development of the resources of its members, COMESA forms a major trading block of 20 nations: Angola, Burundi, Comoros, Democratic Republic of the Congo, Djibouti, Egypt, Eritrea, Ethiopia, Kenya, Madagascar, Malawi, Mauritius, Namibia, Rwanda, Seychelles, Sudan, Swaziland, Uganda, Zambia, and Zimbabwe.

Common Market of the South: See Mercosur.

Commonwealth: An association of independent states that promotes cooperation, consultation, and mutual assistance among members. However, such association has no treaty or constitution. For example, the British Commonwealth.

Comparative Advantage: A comparative advantage exists when a nation or economic region is able to produce a product at a lower opportunity cost compared to another nation or region. The rule of economics that states that each country should specialize in producing those goods that it is able to produce relatively most efficiently.

Compensatory Trade: The sale of goods or services that is paid for by bartering other goods or services.

Complementary Imports: The imports of goods or services that the importing country does not possess or produce.

Compliant Documents: Documents presented under a letter of credit that comply with all its terms and conditions. The banks are only obliged to pay the beneficiary if documents are totally compliant.

Compounding: Process of reinvesting each interest payment to earn more interest. Compounding is based on the idea that interest itself becomes principal and therefore also earns interest in subsequent periods.

Compound Interest: Interest that is earned both on the initial principal and on interest earned on the initial principal in previous periods. The interest earned in one period becomes in effect part of the principal in a following period.

Compound Rate: A rate that has both a specific rate as well as an ad valorem rate.

Compound Value: Value of a sum after investing it over more than one period. Also called future value.

Confirming Bank: Bank that adds its payment undertaking to a letter of credit.

Consignee: Party to whom goods are to be delivered.

Consignment: Delivery of merchandise from an exporter (the consignor) to an agent (the consignee) under agreement that the consignee sells the merchandise of the account of the consignor, while the consignor retains title to the goods until the consignee sells them. The consignee sells merchandise for commissions and remits the net proceeds to the consignor.

Consignor: A consignor is an individual entity, partnership, or company that ships its goods to another party to be taken care of. A consignor is usually an exporter.

Consolidated Income: The sum of income across all of the multinational corporation's domestic and foreign subsidiaries.

Consolidation: A form of corporate reorganization in which two firms pool their assets and liabilities to form a new company. The term can also be used for shipping, in which a freight consolidator combines shipments of cargo that are less than truckload (LTL) in order to reduce shipping rates.

Consular Statement: A document required by some foreign countries, describing a shipment of goods and showing information such as the consignor, consignee, and value of shipment. Certified by a consular official of the foreign country, it is used by the country's officials to verify the value, quantity, and nature of the shipment.

Consulate: The diplomatic station located in a foreign country that represents the commercial interests of the home country.

Consumer Goods: Goods produced for individuals rather than for manufacturing purposes.

Consumer Price Indexes (CPI): A program that produces monthly data on changes in the prices paid by urban consumers for a representative basket of goods and services. It is one indication of inflation.

Contango: The amount the buyer pays the seller to delay the transaction of a security, especially when the future price of the security is above the expected future spot price. The opposite is called backwardation.

Contingency Insurance: Contingency insurance protects the exporter in any situation in which exporter responsibility relied on the buyer to insure, but sustained a loss because of inadequate coverage from that source. It will cover situations in which the FOB endorsement would have otherwise served had that been in force.

Contingent Claim: Claim whose value is directly dependent on, or is contingent on, the value of its underlying assets. For example, the debt and equity securities issued by a firm derive their value from the total value of the firm.

Continuous Compounding: Interest compounded continuously, every instant, rather than at fixed intervals.

Continuous Quotation System: A trading system in which buy and sell orders are matched with market makers as the orders arrive, ensuring liquidity in individual shares.

Contract Manufacturing: A firm allowing another firm to manufacture a prespecified product.

Contribution Margin: Amount that each additional product, such as a jet engine, contributes to after-tax profit of the whole project: (Sales price – Variable cost) X (1 – T), where T is the corporate tax rate.

Controlled Foreign Corporation (CFC): In the U.S. tax code, a foreign corporation owned more than 50 percent either in terms of market value or voting power by U.S. shareholders.

Convention on the International Trade in Endangered Species (CITES): CITES (the Convention on International Trade in Endangered Species of Wild Fauna and Flora) is an international agreement between governments.

CITES aims to ensure that international trade in specimens of wild animals and plants does not threaten their survival.

Convertible Bonds: Bonds sold with a conversion feature that allows the holder to convert the bond into common stock on or prior to a conversion date and at a prespecified conversion price.

Convertible Currency: A currency that can be traded for other currencies at will.

Convex Tax Schedule: A tax schedule in which the effective tax rate is greater at high levels of taxable income than at low levels of taxable income. Such a schedule results in progressive taxation.

Cooperation Council for the Arab States of the Gulf (GCC): The Cooperation Council for the Arab States of the Gulf (GCC) was established on May 25, 1981. It joined the six states of the United Arab Emirates, State of Bahrain, Kingdom of Saudi Arabia, Sultanate of Oman, State of Qatar and State of Kuwait. The framework's focus is on achieving a state of unity in all fields among its member states. It also stresses a furthering of relations and cooperation among member states and provides a platform to address security and economic development challenges.

Copenhagen Criteria: The regulations that all applicant countries to the European Union must meet and that all EU member nations must maintain.

Corporate Culture: The set of values, beliefs, relationships between individuals, and functions that guide the decisions of a company to achieve its objectives.

Corporate Governance: The way in which major stakeholders exert control over the modern corporation.

Corporate Social Responsibility (CSR): The responsibilities that corporations (including MNCs) have to workers and their families, to consumers, to investors, and to the natural environment.

Corporation: Form of business organization that is created as a distinct "legal person" composed of one or more actual individuals or legal entities. Primary advantages of a corporation include limited liability, ease of ownership, transfer, and perpetual succession.

Correlation: A measure of the covariability of two assets that is scaled for the standard deviations of the assets (rAB = sAB / sAsB such that $-1 < rAB < +1$).

Correspondent Bank: A bank that, in its own country, handles the business of a foreign bank.

Corruption Perceptions Index (CPI): A ranking of countries by level of corruption that is researched and published by Transparency International (TI), the world's leading nongovernmental organization dedicated to fighting corruption.

Cost and Freight: A pricing term that indicates that the cost of the goods and freight charges are included in the quoted price.

Cost of Equity Capital: The required return on the company's common stock in capital markets. It is also called the equity holders' required rate of return because it is what equity holders can expect to obtain in the capital market. It is a cost from the firm's perspective.

Cottage Industry: An industry comprised of a labor force that produces goods for sale at home, often with their own equipment.

Counter Credit: Another name for back-to-back letter of credit.

Countertrade: The sale of goods or services that are paid for in whole or part by the transfer of goods or services from a foreign country.

Countervailing Duties: Duties levied on an imported good that has been unfairly subsidized by a foreign government. Imposing duties on the good is meant to raise the product's price to a "fair market value."

Country Risk: The political and financial risks of conducting business in a particular foreign country.

Coupon: The stated interest on a debt instrument.

Coupon Swap: A fixed-for-floating interest rate swap.

Courtage: A European term for brokerage fee.

Covariance: A measure of the covariability of two assets (sAB = sAsB rAB).

Cover Note: Insurance document evidencing that insurance cover for a consignment has been taken out, but not giving full details.

Credit Risk Insurance: Insurance that covers the risk of nonpayment for delivered goods.

Creeping Nationalization: The succession of small but important changes in a firm's condition or standing that bring it slowly under national control.

Cross-Hedge: A futures hedge using a currency that is different from, but closely related to, the currency of the underlying exposure.

Culture: Collective mental paradigms that a society imparts to individuals in the form of behavior patterns, shared values, norms, and institutions.

Cumulative Translation Adjustment (CTA): An equity account under Financial Accounting Standards Board Statement No. 52 that accumulates gains or losses caused by translation accounting adjustments.

Currency Coupon Swap: A fixed-for-floating rate nonamortizing currency swap traded primarily through international commercial banks.

Currency Cross-Hedge: A hedge of currency risk using a currency that is correlated with the currency in which the underlying exposure is denominated.

Currency of Reference: The currency that is being bought or sold. It is most convenient to place the currency of reference in the denominator of a foreign exchange quote.

Currency Option: A contract giving the option holder the right to buy or sell an underlying currency at a specified price and on a specified date. The option writer (seller) holds the obligation to fulfill the other side of the contract.

Currency Risk: The risk of unexpected changes in foreign currency exchange rates. Also known as foreign exchange risk.

Currency Swap: A contractual agreement to exchange a principal amount of two different currencies and, after a prearranged length of time, to give back the original principal. Interest payments in each currency are also typically swapped during the life of the agreement.

Current Account: A measure of a country's international trade in goods and services.

Current Account Balance: A broad measure of import-export activity that includes services, travel and tourism, transportation, investment income and interest, gifts, and grants along with the trade balance on goods.

Current Rate Method: A translation accounting method, such as Financial Accounting Standards Board Statement No. 52 (FAS #52) in the United States, that translates monetary and real assets and monetary liabilities at current exchange rates. FAS #52 places any imbalance into an equity account called the "cumulative translation adjustment."

Customhouse Broker: A person or firm obtains the license from the treasury department of its country when required, and helps clients (importers) to enter and declare goods through customs.

Customs: The authorities designated to collect duties levied by a country on imports and exports.

Customs Union: A form of a regional economic integration group that eliminates import and export tariffs among member nations and establishes common external tariffs.

D

Dealing Desk: The desk at an international bank that trades spot and forward foreign exchange. Also known as trading desk.

Debt Capacity: The amount of debt that a firm chooses to borrow to support a project.

Debt-for-Equity Swap: A swap agreement to exchange equity (debt) returns for debt (equity) returns over a prearranged length of time.

Debtor Nation: A nation that is owed less in foreign currency than it owes other nations.

Decision Trees: A graphical analysis of sequential decisions and the likely outcomes of those decisions.

Deferred Payment Credit: A type of letter of credit that provides for payment some time after presentation of the shipping documents by the exporter.

Del Credere Risk: Situation created when a sales agent sells on credit and there is a chance that the buyer either does not want to or does not have the money to pay.

Deliverable Instrument: The asset underlying a derivative security. For a currency option, the deliverable instrument is determined by the options exchange and is either spot currency or an equivalent value in futures contracts.

Delta-Cross-Hedge: A futures hedge that has both currency and maturity mismatches with the underlying exposure.

Delta-Hedge: A futures hedge using a currency that matches the underlying exposure and a maturity date that is different from, but preferably close to, the maturity of the underlying exposure.

Demand Management: A business process with the intention to coordinate and influence all sources of demand for a firm's products.

Depository Receipt: A derivative security issued by a foreign borrower through a domestic trustee representing ownership in the deposit of foreign shares held by the trustee.

Depreciation: (1) The expense against earnings to write-off purchase price of an asset over its useful life. (2) A decrease in a currency value relative to another currency in a floating exchange rate system.

Derivative Security: A financial security whose price is derived from the price of another asset. The value of a derivative is determined by the fluctuations in the asset.

Devaluation: A decrease in a currency value relative to another currency in a fixed exchange rate system. The purpose of devaluation typically is to increase export and decrease import in order to correct a balance of payment deficit.

Developed Countries: The richer, more industrialized countries in the world.

Developing Country: A country that is in the process of becoming industrialized. Average national income must be below $9,265 for a country to be classified as a developing country. A developing country typically lacks industrialization, infrastructure, high literacy rate, and advanced living standards.

Difference Check: The difference in interest payments that is exchanged between two swap counterparties.

Digital Divide: The digital divide refers to the widening technological gap between the richer and the poorer countries of the world.

Direct Costs of Financial Distress: Costs of financial distress that are directly incurred during bankruptcy or liquidation proceedings.

Direct Exporting: Marketer takes direct responsibility for its products abroad by selling them directly to foreign customers or through local representatives in foreign markets.

Direct Financing Lease: A nonleveraged lease by a lessor in which the lease meets any of the definitional criteria of a capital lease, plus additional criteria.

Direct Product Profitability: Measuring the direct costs associated with handling a product from the warehouse until a customer buys from the retail store.

Direct Terms: The price of a unit of foreign currency in domestic currency terms, such as $0.6548/DM for a U.S. resident (contrast with indirect quote).

Discount: If a bond is selling below its face value, it is said to sell at a discount.

Discounted Cash Flow: A valuation methodology that discounts expected future cash flows at a discount rate appropriate for the risk, currency, and maturity of the cash flows.

Discounted Payback: The length of time needed to recoup the present value of an investment; sometimes used when investing in locations with high country risk.

Discounted Payback Period Rule: An investment decision rule in which the cash flows are discounted at an interest rate and the payback rule is applied on these discounted cash flows.

Discounting: Calculating the present value of a future amount. The process is the opposite of compounding.

Discretionary Reserves: The accounting balance sheet accounts that are used in some countries to temporarily store earnings from the current year or the recent past.

Discriminatory Pricing: The practice of selling a product or service at different prices that do not reflect a proportional difference in costs.

Dispatch: An amount paid by a vessel's operator to a charter if loading or unloading is completed in less time than stipulated in the charter party.

Dispute Settlement Body (DSB): Dispute Settlement Body is a part of the World Trade Organization (WTO) that settles trade disputes between governments.

Dispute Settlement Panel (DSP): The WTO's Dispute Settlement Body forms different Dispute Settlement Panels to resolve conflicting issues among its members.

Dispute Settlement Understanding (DSU): The Dispute Settlement Understanding (DSU) of the World Trade Organization (WTO) was one of the key outcomes of the Uruguay Round of multilateral trade negotiations.

Distributor: A foreign agent who sells for a supplier directly and maintains an inventory of the supplier's product.

Diversifiable Risk: A risk that specifically affects a single asset or a small group of assets. Also called unique or unsystematic risk.

Diversionary Dumping: The sale of foreign products at less than fair value to a third country where the products are further processed and sold to another country.

Dock Receipt: A receipt issued by an ocean carrier to acknowledge receipt of a shipment at the carrier's dock or warehouse.

Dock Statement: A receipt issued by an ocean carrier to acknowledge the receipt of a shipment at the carrier's dock or warehouse facilities.

Domestic Bonds: Bonds issued and traded within the internal market of a single country and denominated in the currency of that country.

Domestic International Sales Corporation: In the U.S. tax code, a specialized sales corporation whose income is lumped into the same income basket as a foreign sales corporation.

Domestic Liquidity: The aggregate of money supply, quasi-money or savings and time deposits, and deposit substitutes.

Downstream Dumping: A type of dumping in which the primary producer first sells its product to another domestic producer at below fair value or cost. The second producer then further processes the product and exports it to another country at a lower than normal cost.

Draft: A means of payment whereby a drawer (the importer) instructs a drawee (either the importer or its commercial bank) to pay the payee (the exporter). Also known as trade bill or bill of exchange.

Dual Pricing: The practice of selling identical products in different markets for different prices.

Dumping: Selling merchandise in another country at a price below the price at which the same merchandise is sold in the home market or selling such merchandise below the costs incurred in production and shipment, that is, selling the product at less than fair value. Dumping is an illegal trade practice.

Dumping Margin: The difference between the fair value of a product and the amount for which it is available in the case of dumping.

Duty: A tax imposed on imports by the customs authority of a country.

E

Earnings Response Coefficient: The relation of stock returns to earnings surprises around the time of corporate earnings announcements.

Easement: A right held by one party to make use of the land of another.

East African Community (EAC): The East African Community (EAC) is a regional organization comprised of the Republics of Kenya, Uganda, and the United Republic of Tanzania.

The EAC provides a forum for cooperation on a broad range of topics including: trade, science and technology, wildlife management, investments and industrial development, and foreign affairs. The three East African countries encompass a population of 82 million and cover an area of 1.8 million square kilometers.

Eclectic Paradigm: A theory of the multinational firm that posits three types of advantages benefiting the multinational corporation: ownership-specific, location-specific, and market internalization advantages.

Economic Community of West African States (ECOWAS): A regional group consisting of fifteen West African nations. It is a free trade area for agricultural products and raw materials, and a preferential trade area for various industrial products.

Economic Exposure: Change in the value of a corporation's assets or liabilities as a result of changes in currency values.

Economic Freedom: Economic freedom occurs when individuals and businesses make most of the economic decisions in an economy.

Economic Integration: The integration of commercial and financial activities and commerce among countries through the abolishment of economic discrimination.

Economic Union: A group that combines the economic characteristics of a common market with some degree of harmonization of macroeconomic policies, such as monetary and fiscal policies.

Economic Value Added: A method of performance evaluation that adjusts accounting performance with a charge reflecting investors' required return on investment.

Economies of Scale: Achieving lower average cost per unit through a larger scale of production. This is achieved by spreading fixed costs over a greater amount of production.

Economies of Vertical Integration: Achieving lower operating costs by bringing the entire production chain within the firm rather than contracting through the marketplace.

Effective Annual Interest Rate: The interest rate as if it were compounded once per time period rather than several times per period.

Effective Annual Yield: Calculated as (1+i/n)n, where i is the stated annual interest rate and n is the number of compounding periods per year (contrast with bond equivalent yield and money market yield).

Effective Exchange Rate: Spot exchange rates that are actually paid or received by the general public, including taxes on any transactions as well as bank commissions.

Efficient Frontier: The mean-variance efficient portion of the investment opportunity set.

Efficient Market: A market in which prices reflect all relevant information.

Embargo: A type of economic sanction that totally disallows the imports of a specific product or all products from a specific country. Embargoes are typically placed in time of war.

Emerging Market: An emerging market has a very high growth rate, which yields enormous market potential. It is distinguished by the recent progress it has made in economic liberalization.

Emerging Stock Markets: The stock markets of emerging economies. These markets typically have higher expected returns than established markets but also higher risk.

Employment Rate: The ratio, in percent, of the number of employed persons to total labor force.

Endogenous Uncertainty: Price or input cost uncertainty that is within the control of the firm, such as when the act of investing reveals information about price or input cost.

Equity-Linked Eurobonds: A Eurobond with a convertibility option or warrant attached.

Erosion: Cash-flow amount transferred to a new project from customers and sales of other products of the firm.

Euro: The single currency of the European Economic and Monetary Union (EMU) introduced in January 1999; it became the official currency of EMU member countries on January 1, 2002.

Eurobond: A bond that is denominated in a currency other than that of the country of issue.

Eurocurrencies: Deposits and loans denominated in one currency and traded in a market outside the borders of the country issuing that currency (e.g., Eurodollars).

Eurocurrency Market: A money market for currencies held in the form of deposits in countries other than that where the currency is issued.

Eurodollars: Dollar-denominated deposits held in a country other than the United States.

European Article Number (EAN): A standard international numbering code system that is used primarily in retail applications. It is also compatible with the U.S. UPC (Universal Product Code).

European Bank for Reconstruction and Development (EBRD): One of four major regional development banks currently operating in the global economy.

European Central Bank (ECB): The central bank for the European Union (EU). It sets monetary policy for member countries.

European Committee for Standardization (CEN): An organization comprised of the national standards organizations of 30 European countries. The European Committee for Standardization, or CEN, seeks to promote the European economy in the global market by providing an efficient and standardized infrastructure for trade.

European Currency Unit (ECU): A trade-weighted basket of currencies in the European Exchange Rate Mechanism (ERM) of the European Union.

European Exchange Rate Mechanism (ERM): The exchange rate system used by countries in the European Union in which exchange rates are pegged within bands around an ERM central value.

European Free Trade Association (EFTA): The European Free Trade Association (EFTA) is an international organization established in 1960. It is comprised of Iceland, Liechtenstein, Norway, and Switzerland, promoting free trade and economic integration.

There are three main branches of the EFTA: the EFTA Secretariat, Surveillance Authority, and EFTA Court. Its function is to create a free trade area among its member states.

European Monetary System (EMS): An exchange rate system based on cooperation between European Union central banks.

European Option: An option that can be exercised only at expiration (contrast with American option).

European Terms: A foreign exchange quotation that states the foreign currency price of one U.S. dollar (contrast with American terms).

European Union (EU): An intergovernmental organization that coordinates foreign, economic, and judicial policy among its member nations.

Exaction: Demanding or imposing various fees from a position of authority.

Exchange Rate: The price of one currency in terms of another, i.e., the number of units of one currency that may be exchanged for one unit of another currency.

Exchange Risk: The risk that losses may result from the changes in the relative values of different currencies.

Excise Tax: A tax on the consumption of certain goods either made in or imported into a country.

Exercise Price: The price at which an option can be exercised (also called the striking price).

Ex-Im Bank: Export-Import Bank of the United States. Provides guarantees of working capital loans for U.S. exporters, guarantees the repayment of loans or makes loans to foreign purchasers of U.S. goods and services, and provides credit insurance against non-payment by foreign buyers for political or commercial risk. Currently, the bank is focusing on critical areas such as emphasizing exports to developing countries, aggressively countering trade subsidies of other governments, stimulating small business transactions, promoting the export of environmentally beneficial goods and services, and expanding project finance capabilities. Ex-Im Bank is not an aid or development agency, but a government held corporation, managed by a board of directors.

Exogenous Uncertainty: Price or input cost uncertainty that is outside the control of the firm.

Expiry Date: The date when a letter of credit is no longer valid, i.e., the date beyond which it cannot be used.

Explicit Tax: A tax that is explicitly collected by a government; includes income, withholding, property, sales, and value added taxes and tariffs.

Export: Any resource, intermediate good, or final good or service that producers in one country sell to buyers in another country.

Export Administration Regulations (EAR): EAR carry both civil and criminal penalties. The EAR are available by subscription from the Superintendent of Documents, U.S. Government Printing Office, Washington, D.C. 20401.

Export Broker: An individual or firm that helps to locate and introduce buyers and sellers in international business for a commission but does not take part in actual sales transactions.

Export Credit Insurance: Insurance provided to exporters in order to protect them against commercial and political risks.

Export Financing Interest: In the U.S. tax code, interest income derived from goods manufactured in the United States and sold outside the United States as long as not more than 50 percent of the value is imported into the United States.

Export License: A general export license covers the exportation of goods not restricted under the terms of a validated export license. No formal application or written authorization is needed to ship exports under a general export license.

Export Restraints: Quantitative restrictions imposed by exporting countries to limit exports to specified foreign markets, usually as a follow-up to formal or informal agreements reached with importing countries.

Export Subsidies: Any form of government payment that helps an exporter or manufacturing company to lower its export costs.

Export Trading Company (ETC): A company that facilitates the export of goods and services. An ETC can either act as the export department for producers or take title to the product and export for its own account.

Expropriation: A specific type of political risk in which a government seizes foreign assets.

External Market: A market for financial securities that are placed outside the borders of the country issuing that currency.

Extraterritoriality: A government practice that applies its laws outside its established territorial boundaries.

F

Face Value: The value of a bond that appears on its face. Also referred to as par value or principal.

Factoring: Sale of an accounts receivable balance to buyers (factors) that are willing and able to bear the costs and risks of credit and collections.

Factor Model: A model that assumes a linear relation between an asset's expected return and one or more systematic risk factors.

Fast Track Negotiating: Authority provided by the U.S. Congress to the Executive Branch to negotiate amendment-proof trade agreements.

Federal Trade Commission (FTC): The FTC is an independent U.S. government agency established in 1914. Its main goals are consumer protection and the prevention of trust formations by companies.

Financial Contagion: The spread of a financial crisis from a country or region to other countries or regions.

Financial Engineering: The process of innovation by which new financial products are created.

Financial Innovation: The process of designing new financial products, such as exotic currency options and swaps.

Financial Market: The market for the exchange of credit and capital in an economy. It consists of the money market and the capital market.

Financial Markets: Markets for financial assets and liabilities.

Financial Policy: The corporation's choices regarding the debt-equity mix, currencies of denomination, maturity structure, method of financing investment projects, and hedging decisions with a goal of maximizing the value of the firm to some set of stakeholders.

Financial Price Risk: The risk of unexpected changes in a financial price, including currency (foreign exchange) risk, interest rate risk, and commodity price risk.

Financial Risk: Financial risk refers to unexpected events in a country's financial, economic, or business life.

Financial Service Income: In the U.S. tax code, income derived from financial services such as banking, insurance, leasing, financial service management fees, and swap income.

Financial Strategy: The way in which the firm pursues its financial objectives.

Financial Structure: The proportion of debt and equity and the particular forms of debt and equity chosen to finance the assets of the firm. Also known as capital structure.

First-to-Market Advantage: Also known as "first-mover advantage." The idea of first-mover advantage is that the initial occupant of a strategic position or niche (market segment) gains access to resources and capabilities that a follower cannot match.

Fixed Cost: A cost that is fixed in total for a given period of time and for given volume levels. It is not dependent on the amount of goods or services produced during the period.

Fixed Exchange Rate System: An exchange rate system in which governments stand ready to buy and sell currency at official exchange rates. Fluctuations of this currency are not possible.

Fixed Forward Contract: Currency is bought or sold at a given future date.

Flight of Capital: The movement of capital from one place to another in order to avoid loss or increase gain.

Floating Currency System: An exchange rate system under which a government is not obligated to declare that its currency is convertible into a fixed amount of another currency.

Floating Exchange Rate: An exchange rate system in which currency values are allowed to fluctuate according to supply and demand forces in the market without direct interference by government authorities.

Floor: In banking and finance, a floor can be negotiated and agreed upon when the interest rate is dependent on the market interest rate.

FOB Endorsement: Used with FOB (Free on Board), FAS, C&F, or CFR (but not CIF) quotations, FOB sales endorsement to an open marine policy can cover transit risk from the point of origin until title transfers.

Food and Drug Administration (FDA): A U.S. agency that has power to set standards for food, drugs, cosmetics, and devices. Before new drugs can be approved by the FDA and be released to the market, they must undergo extensive laboratory testing within the pharmaceutical company. The company must then file a formal and thorough application for approval with the FDA.

Force Majeure: The title of a standard clause in marine and other contracts exempting the parties for nonfulfillment of their obligations as a result of conditions beyond their control, such as acts of God or war.

Foreign Aid: A grant of money, technical assistance, capital equipment, or other assistance typically extended by richer nations to poorer nations.

Foreign Base Company Income: In the U.S. tax code, a category of Subpart F income that includes foreign holding company income and foreign base company sales and service income.

Foreign Bonds: Bonds that are issued in a domestic market by a foreign borrower, denominated in domestic currency, marketed to domestic residents, and regulated by the domestic authorities.

Foreign Bottom: An ocean vessel built or registered in a foreign country.

Foreign Branch: A foreign affiliate that is legally a part of the parent firm. In the U.S. tax code, foreign branch income is taxed as it is earned in the foreign country.

Foreign Debt: The funds or money owed by one nation to foreign countries' investors, banks, or governments.

Foreign Direct Investment (FDI): The act of building productive capacity directly in a foreign country.

Foreign Equity Requirements: Investment rules that limit foreign ownership to a minority holding in a company.

Foreign Exchange: Currency of another country, or a financial instrument that facilitates payment from one currency to another.

Foreign Exchange Broker: Brokers serving as matchmakers in the foreign exchange market who do not put their own money at risk.

Foreign Exchange Dealer: A financial institution making a market in foreign exchange.

Foreign Exchange Markets: Networks of commercial banks, investment banks, and other financial institutions that convert, buy, and sell currencies in the global economy.

Foreign Exchange Rate: The price of one nation's currency in terms of another nation's currency. The foreign exchange rate is specified as the amount of one currency that can be traded per unit of another.

Foreign Exchange Risk: The risk of unexpected changes in foreign currency exchange rates. Also known as currency risk.

Foreign Remittances: The transfer across national boundaries of any kind of funds.

Foreign Sales Corporation (FSC): In the U.S. tax code, a specialized sales corporation whose income is lumped into the same income basket as that of a domestic international sales corporation.

Foreign-Source Income: Income earned from foreign operations.

Foreign Tax Credit (FTC): In the U.S. tax code, a credit against domestic U.S. income taxes up to the amount of foreign taxes paid on foreign-source income.

Foreign Trade Zone: A physical area in which the government allows firms to delay or avoid paying tariffs on imports.

Forfaiting: A form of factoring in which large, medium- to long-term receivables are sold to buyers (forfaiters) who are willing and able to bear the costs and risks of credit and collections.

Forward Contract: A binding commitment to exchange a specified amount of one currency for a specified amount of another currency on a specified future date.

Forward Discount: A currency whose nominal value in the forward market is lower than in the spot market (contrast with forward premium).

Forward Foreign Exchange: An agreement to purchase or sell a defined amount of forward currency in the future at a certain fixed rate.

Forward Market: A market for forward contracts in which trades are made for future delivery according to an agreed-upon delivery date, exchange rate, and amount.

Forward Parity: When the forward rate is an unbiased predictor of future spot exchange rates.

Forward Premium: A currency whose nominal value in the forward market is higher than in the spot market (contrast with forward discount).

Foul Bill of Lading: A receipt issued by a carrier to the exporter making use of its services that, to reduce the carrier's liability, notes that the goods were in some way damaged, short in quantity, or improperly packaged.

Franchise Agreement: An agreement in which a domestic company (the franchiser) licenses its trade name and/or business system to an independent company (the franchisee) in a foreign market.

Franchising: A parent company grants another independent entity the privilege to do business in a prespecified manner, including manufacturing, selling products, marketing technology, and other business approach.

Free Cash Flow: Cash flow after all positive-NPV (net present value) projects have been exhausted in the firm's main line of business.

Freely Floating Exchange Rate System: An exchange rate system in which currency values are allowed to fluctuate according to supply and demand forces in the market without direct interference by government authorities.

Free Market: The type of market in which goods and services cross national borders freely, unrestrained by tariffs or any other sort of government barrier to trade.

Free On Board (FOB): A trade term requiring the seller to deliver goods via a method of transportation designated by the buyer. The seller fulfills its obligations to deliver when the goods have passed through the seller's ownership and prepared for delivery to the buyer.

Free Port: An area such as a port city into which merchandise may legally be moved without payment of duties.

Free Trade Area of the Americas (FTAA): A proposed hemispheric trade zone that would cover all of the countries in North, South, and Latin America. The FTAA is highly controversial.

Free Trade Zone: An area designated by the government to which goods may be imported for processing and subsequent export on duty-free basis. Merchandise may be stored, used, or manufactured in the zone and reexported without duties being paid.

Freight Forwarder: An independent business that handles export shipment on behalf of the shipper without vested interest in the products. A freight forwarder is a good source of information and assistance on export regulations and documentation, shipping methods, and foreign import regulations.

Freight Shippers: Also known as freight forwarders. Freight shippers are agents used to coordinate the logistics of transportation.

Frequency Distribution: The organization of data to show how often certain values or ranges of values occur.

Full Payout Lease: A lease in which the lessor recovers, through the lease payments, all costs incurred in the lease plus an acceptable rate of return, without any reliance upon the leased equipment's future residual value.

Fundamental Analysis: A method of predicting exchange rates using the relationships of exchange rates to fundamental economic variables such as GNP growth, money supply, and trade balances.

Future Value: Value of a sum after investing it over multiple periods. Also called compound value.

Futures Commission Merchant: A brokerage house that is authorized by a futures exchange to trade with retail clients.

Futures Contract: A commitment to exchange a specified amount of one currency for a specified amount of another currency at a specified time in the future. Futures contracts are periodically marked-to-market, so that changes in value are settled throughout the life of the contract. Exchange-traded currency futures are marked-to-market on a daily basis.

G

G8: The G7 countries plus Russia.

General Agreement on Tariffs and Trade (GATT): A post–World War II agreement designed to promote freer international trade among the nations of the world. The General Agreement on Tariffs and Trade was replaced by the World Trade Organization (WTO) in 1994.

Generalized Autoregressive Conditional Heteroskedasticity: An economic time series model in which returns at each instant of time are normally distributed but volatility is a function of recent history of the series.

Generalized System of Preferences (GSP): A program of tariff preferences designed to encourage the economic growth of certain developing countries. In accordance with the Generalized System of Preferences (GSP), developed countries let the manufactured and semimanufactured goods of eligible developing countries enter with either no duty or a lower rate than is applied to other countries.

Generally Accepted Accounting Principles (GAAP): A common set of accounting concepts, standards, and procedures by which financial statements are prepared.

Geocentric Multinational: A multinational in which the subsidiaries are neither satellites nor independent city-states, but parts of a whole whose focus is on worldwide objectives as well as local objectives, each part making its unique contribution with its unique competence.

Global Bond: A bond that trades in the Eurobond market as well as in one or more national bond markets.

Global Economy: The international network of individuals, businesses, governments, and multilateral organizations that collectively make production and consumption decisions.

Globalization: A growing global movement to increase the flow of goods, services, people, real capital, and money across national borders in order to create a more integrated and interdependent world economy.

Global Quota: An import quota set by a nation that specifies the allowed quantity of a product from all countries.

Gold Exchange Standard: An exchange rate system used from 1925 to 1931 in which the United States and England were allowed to hold only gold reserves while other nations could hold gold, U.S. dollars, or pounds sterling as reserves.

Gold Standard: An exchange rate system used prior to 1914 in which gold was used to settle national trade balances. Also called the "classical gold standard."

Goodwill: The accounting treatment of an intangible asset such as the takeover premium in a merger or acquisition.

Gradualism: A steady and calculated approach to transforming an economy from communism to capitalism.

Graduation: The point at which a developing country's eligibility for Generalized System of Preferences (GSP) is terminated for the reason of sufficient economic progression.

Gray-Market Imports: Gray-market imports are parallel distribution of genuine goods by intermediaries other than authorized channel members.

Greenfield: A greenfield investment is the investment in a manufacturing plant, office, or other physical company-related structure or group of structures in an area where no previous facilities exist.

Greenmail: Buying shares on the open market in the hope that the target's business partners will buy back the shares at inflated prices.

Gross Domestic Product (GDP): A measure of the market value of goods and services produced by a nation. Unlike gross national product, GDP excludes profits made by domestic firms overseas, as well as the share of reinvested earnings in domestic firms' foreign-based operations.

Gross National Income (GNI): Previously known as gross national product, gross national income comprises the total value of goods and services produced within a country (i.e., its gross domestic product), together with its income received from other countries (notably interest and dividends), less similar payments made to other countries. For example, if a British-owned company operating in another country sends some of its income (profits) back to the UK, UK's GNI is enhanced. Similarly, a British production unit of a U.S. company sending profit to the United States will affect the British GNI but will not reduce it since it is not included in the first place.

Gross National Product (GNP): GNP is the total value of all final goods and services produced within a nation in a particular year, plus income earned by its citizens who are working abroad, minus income of nonresidents located in that country. It is essentially the measurement of the value of all goods and services produced by a country's citizens regardless of their location. It differs from gross domestic product (GDP) in that GDP measures the total production within a country regardless of the citizenship of the producer.

Growing Perpetuity: A constant stream of cash flows without end that is expected to rise indefinitely. For example, cash flows to the landlord of an apartment building might be expected to rise a certain percentage each year.

Growth Options: The positive net present value opportunities in which the firm has not yet invested. The value of growth options reflects the time value of the firm's current investment in real assets as well as the option value of the firm's potential future investments.

Growth Stocks: Stocks with high price/book or price/earnings ratios. Historically, growth stocks have had lower average returns than value stocks (stocks with low price/book or PE ratios) in a variety of countries.

G7: A formal organization of seven highly industrialized democracies: Canada, France, Germany, Italy, Japan, the United Kingdom, and the United States.

Guideline Lease: A lease written under criteria established by the IRS to determine the availability of tax benefits to the lessor.

Gulf Cooperation Council (GCC): A council created in 1981 and composed of Saudi Arabia, Bahrain, Oman, Qatar, Kuwait, and the United Arab Emirates. It is a forum to coordinate and integrate economic policies between these six countries, which account for about 40 percent of oil in the international market.

H

Harmonized Tariff Schedule (HTS): A method of classification used by many countries to determine tariffs on imports.

Heavily Indebted Poor Countries (HIPC) Initiative: The HIPC Initiative is a major international response to the burdensome external debt held by the world's poorest, most indebted countries. It originated in 1996 as a joint undertaking of the World Bank and the International Monetary Fund (IMF).

Hedge: A position or operation that offsets an underlying exposure. For example, a forward currency hedge uses a forward currency contract to offset the exposure of an underlying position in a foreign currency. Hedges reduce the total variability of the combined position.

Hedge Funds: Private investment partnerships with a general manager and a small number of limited partners.

Hedge Portfolio: The country-specific hedge portfolio in the International Asset Pricing Model serves as a store of value (like the risk-free asset in the CAPM) as well as a hedge against the currency risk of the market portfolio.

Hedge Quality: Measured by the r-square in a regression of spot rate changes on futures price changes.

Hedge Ratio: The ratio of derivatives contracts to the underlying risk exposure.

Hedging: Reducing the risk of a cash position by using the futures instruments to offset the price movement of the cash asset.

High-Withholding-Tax Interest Income: In the U.S. tax code, interest income that has been subject to a foreign gross withholding tax of five percent or more.

Historical Volatility: Volatility estimated from a historical time series.

Holding-Period Return: The rate of return over a given period.

Home Asset Bias: The tendency of investors to overinvest in assets based in their own country.

Homogeneous Expectations: Idea that all individuals have the same beliefs concerning future investments, profits, and dividends.

Hyperinflation: An extremely high rate of inflation, often exceeding several hundred or several thousand percent.

Hysteresis: The behavior of firms that fail to enter markets that appear attractive and, once invested, persist in operating at a loss. This behavior is characteristic of situations with high entry and exit costs along with high uncertainty.

I

Implicit Tax: Lower (higher) before-tax required returns on assets that are subject to lower (higher) tax rates.

Implied Volatility: The volatility that is implied by an option value given the other determinants of option value.

Import: Any resource, intermediate good, or final good or service that buyers in one country purchase from sellers in another country.

Import Licenses: Licenses required by some countries to bring in a foreign-made good. In many cases, import licenses are also used by the issuing country to control the quantity of imported items.

Income Baskets: In the U.S. tax code, income is allocated to one of a number of separate income categories. Losses in one basket may not be used to offset gains in another basket.

Income Statement: Financial report that summarizes a firm's performance over a specified time period.

Incremental IRR: Internal Rate of Return (IRR) on the incremental investment from choosing a large project instead of a smaller project.

Indemnity Clause: A clause in which one party indemnifies the other. In leasing, generally a clause whereby the lessee indemnifies the lessor from loss of tax benefits.

Independent Project: A project that is independent of the acceptance or rejection of other projects.

Index Futures: A futures contract that allows investors to buy or sell an index (such as a foreign stock index) in the futures market.

Index Options: A call or put option contract on an index (such as a foreign stock market index).

Index Swap: A swap of a market index for some other asset (such as a stock-for-stock or debt-for-stock swap).

Indication Pricing Schedule: A schedule of rates for an interest rate or currency swap.

Indirect Costs of Financial Distress: Costs of financial distress that are indirectly incurred prior to formal bankruptcy or liquidation.

Indirect Customers: The end users (e.g., consumers) of the products and services purchased from the wholesalers, retailers, and consignees—the direct customers of the seller.

Indirect Diversification Benefits: Diversification benefits provided by the multinational corporation that are not available to investors through their portfolio investment.

Indirect Exporting: Exporting of products to foreign markets by using an intermediary, usually an export trading company based in the exporter's country.

Indirect Terms: The price of a unit of domestic currency in foreign currency terms such as DM1.5272/$ for a U.S. resident (contrast with direct terms).

Infant Industry Argument: The infant industry argument is a rationale for the government's "temporary protection" of a new industry or corporation in order to help it become established domestically and later become competitive worldwide. These protections consist of tariff and nontariff barriers to imports, preventing global competition from entering the market.

Inflation Rate: The general increase in the price level herein measured by the growth rate in the GNP Implicit Price Index or the general price deflator.

Informational Efficiency: Whether or not market prices reflect information and thus the true (or intrinsic) value of the underlying asset.

Integrated Financial Market: A market in which there are no barriers to financial flows and purchasing power parity holds across equivalent assets.

Intellectual Property: Material or communicable result in forms of discoveries, inventions, designs, and literary and art works of scientific, humanistic, literary, and artistic endeavor. It includes, but is not limited to, works in the form of scientific discoveries and inventions, designs, patents, trademarks, books, monographs, papers, paintings, drawings and sculptures, performances, computer software, and lecture and conference presentations.

Intellectual Property Rights: Patents, copyrights, and proprietary technologies and processes that are the basis of the multinational corporation's competitive advantage over local firms.

Inter-American Development Bank: A regional development bank designed to promote sustainable economic development in the Western Hemisphere. Its headquarters are located in Washington, D.C.

Interbank Spread: The difference between a bank's offer and bid rates for deposits in the Eurocurrency market.

Interest Rate Risk: The risk of unexpected changes in an interest rate.

Interest Rate Swap: An agreement to exchange interest payments for a specific period of time on a given principal amount. The most common interest rate swap is a fixed-for-floating coupon swap. The notional principal is typically not exchanged.

Intermediated Market: A financial market in which a financial institution (usually a commercial bank) stands between borrowers and savers.

Intermodal: The use of two or more modes of transportation to complete a cargo move; truck/rail/ship, or truck/air, for example.

Internal Market: A market for financial securities denominated in the currency of a host country and placed within that country.

Internal Rate of Return (IRR): A discount rate at which the net present value of an investment is zero. The IRR is a method of evaluating capital expenditure proposals.

International Accounting Standards Board (IASB): The International Accounting Standards Board (IASB) is an independent, privately funded organization that sets international accounting standards. The IASB is committed to developing a single set of high-quality, understandable, and enforceable global accounting standards that require transparent and comparable information in general purpose financial statements.

International Asset Pricing Model (IAPM): The international version of the CAPM in which investors in each country share the same consumption basket and purchasing power parity holds.

International Bank for Reconstruction and Development: Also called the World Bank, an international organization created at Bretton Woods in 1944 to help in the reconstruction and development of its member nations.

International Bonds: Bonds that are traded outside the country of the issuer. International bonds are either foreign bonds trading in a foreign national market or Eurobonds trading in the international market.

International Chamber of Commerce (ICC): International nongovernmental body concerned with promotion of trade and harmonization of trading practice.

International Energy Agency (IEA): The IEA is an autonomous agency linked with the Organisation for Economic Co-operation and Development (OECD). It is the authoritative source for energy statistics worldwide and an energy policy adviser for 26 member countries. It was founded during the oil crisis of 1973–74 and was initially focused on coordinating efforts between member countries in times of oil supply emergencies. Since then it has expanded its role to encompass climate change policies, market reform, energy technology collaboration, and outreach to the rest of the world.

International Labour Organization (ILO): The International Labour Organization is the UN specialized agency that seeks the promotion of social justice and internationally recognized human and labor rights. The ILO formulates international labor standards in the form of conventions and recommendations setting minimum standards of labor rights.

International Monetary Fund (IMF): An international organization designed to promote global economic stability and development. It compiles statistics on cross-border transactions and publishes a monthly summary of each country's balance of payments.

International Monetary System: The global network of governmental and commercial institutions within which currency exchange rates are determined.

International Organization for Standardization (ISO): ISO is a worldwide federation of national standardization bodies of more than 140 countries. Established as a nongovernment organization in 1947, it develops international standards and publishes them. All branches other than electrical engineering standards are within the scope of the ISO.

Intervention: The efforts undertaken by a country or its central bank to affect the price of the country's currency on the exchange market. This can be done either through the government buying or selling large quantities of the currency to affect total supply, or by the central bank changing interest rates to affect the cash flow into the country.

In-the-Money Option: An option that has value if exercised immediately.

Intrinsic Value of an Option: The value of an option if exercised immediately.

Investment Agreement: Agreement specifying the rights and responsibilities of a host government and a corporation in the structure and operation of an investment project.

Investment Opportunity Set: The set of investments available to an individual or corporation.

Investment Philosophy: The investment approach (active or passive) pursued by an investment fund and its managers.

Invisible Barriers to Trade: Government regulations that do not directly restrict trade but have a hindering effect through the use of excessive and obscure requirements on goods before they can be sold, especially imported goods.

While known to local business people, foreign investors are not aware of these conditions, making them "invisible." Labeling requirements or other sorts of measurement or sanitary standards would be an example of this.

J

***Jeito*:** The way of somehow getting things done in Brazil; the jeito can help conquer seemingly insurmountable tasks (Portuguese).

Joint Venture: An agreement of two or more companies to pool their resources to execute a well-defined mission. Resource commitments, responsibilities, and earnings are shared according to a predetermined contractual formula.

Jurisdiction: The right of an authority to apply the law in a given territory.

Just-in-Time (JIT): An organization-wide practice that keeps the inventory to the minimum and provides customers the right goods or service at the right time.

K

***Kanban* System:** A Japanese Just-in-Time inventory system that makes use of cards to signal the need for more raw materials or supplies.

***Keiretsu*:** Collaborative groups of vertically and horizontally integrated firms with extensive share cross-holdings and with a major Japanese bank or corporation at the center.

Kyoto Protocol: A multilateral environmental agreement; its goal is to control global warming by reducing greenhouse gases emitted into the Earth's atmosphere.

L

Laissez-Faire: A term associated with the free enterprise economic system that calls for minimal government intervention or regulation, except in maintenance of this economic freedom.

Landed Cost: The quoted or invoiced cost of a commodity, plus any inbound transportation charges.

Law of One Price: The principle that equivalent assets sell for the same price. The law of one price is enforced in the currency markets by financial market arbitrage. Also known as purchasing price parity (PPP).

Lead Manager: The lead investment bank in a syndicate selling a public securities offering.

Leading and Lagging: Reduction of transaction exposure through timing of cash flows within the corporation.

Lease: A contract in which one party conveys the use of an asset to another party for a specific period of time at a predetermined rate.

Lease Rate: The periodic rental payment to a lessor for the use of assets. Others may define lease rate as the implicit interest rate in minimum lease payments.

Least Developed Countries: The poorest of the developing countries. They are characterized by a low gross national product per capita, a reliance on subsistence agriculture, rapid population growth, inadequate infrastructure, a weak safety net of social programs, and a low quality of life.

Note: Many sources prefer LLDC to denote Least Developed Countries and LDC for Less Developed Countries.

Less Developed Countries: This is a form of categorization in economic growth for the countries that are just beginning to industrialize.

Less Than Truckload (LTL): Refers to shipments of relatively small amounts of freight, typically between 100 and 10,000 pounds. It usually involves slower freight times than full truckload shipping.

Letter of Credit (L/C): A letter issued by an importer's bank guaranteeing payment upon presentation of specified trade documents (invoice, bill of lading, inspection and insurance certificates, etc.).

Letter of Intent: A document describing the preliminary understanding between parties intending to join together in some sort of action or engage in a contract.

Leveraged Lease: The lessor provides an equity portion (usually 20 to 40 percent) of the equipment cost and lenders provide the balance on a nonrecourse debt basis.

Liberalization: The process by which certain business activities become more market driven.

License Agreement: A sales agreement in which a domestic company (the licensor) allows a foreign company (the licensee) to market its products in a foreign country in return for royalties, fees, or other forms of compensation.

Licensing: One firm gives another firm a permission, which allows the latter to engage in an activity otherwise legally forbidden to it. Such activities usually involve the transfer of intellectual and proprietary knowledge in return for royalty as revenue.

Limited Flexibility Exchange Rate System: The International Monetary Fund's name for an exchange rate system with a managed float.

Liquidity: The ease with which an asset can be exchanged for another asset of equal value.

Liquid Market: A market in which traders can buy or sell large quantities of an asset when they want and with low transactions costs.

Loanable Funds: The pool of funds from which borrowers can attract capital; typically categorized by currency and maturity.

Location-Specific Advantages: Advantages (natural and created) that are available only or primarily in a single location.

Lombard Rate: The rate of interest changed by the Bundesbank, Germany's central bank, to loans backed by movable, easily sold assets.

London Interbank Bid Rate (LIBID): The bid rate that a Euromarket bank is willing to pay to attract a deposit from another Euromarket bank in London.

London Interbank Offer Rate (LIBOR): The offer rate that a Euromarket bank demands in order to place a deposit at or make a loan to another Euromarket bank in London.

Long Position: A position in which a particular asset (such as a spot or forward currency) has been purchased.

Lump of Labor Fallacy: The fallacious argument that, working on the assumption that there is only a fixed amount of work in the world, says that an increasing population will inevitably lead to increasing unemployment. This argument is often used by governments as reasoning behind reducing the workweek to reduce unemployment.

M

Maastricht Treaty: The treaty, formally known as the Treaty on European Union, signed in 1992, that led to the economic unification of many European countries. The treaty changed the name of the European Community (EC) to the European Union (EU) and led to the creation of a monetary union with a European Central bank, political and military integration, common foreign policy, and common citizenship among member countries.

Macro Country Risks: Country (or political) risks that affect all foreign firms in a host country.

Management Contract: An agreement by which one firm allows another to manage its foreign activities on behalf of it. The managing firm is forbidden to make capital investment or financing decisions.

Managerial Flexibility: Flexibility in the timing and scale of investment provided by a real investment option.

Manifest: Document that lists in detail all the bills of lading issued by a freight carrier of its agent or master (that is, a detailed summary of the total cargo of a vessel).

Maquiladoras: Duty-free assembly plants located mainly in the developing world. Maquiladoras are one type of foreign direct investment.

Margin Account: An account maintained by an investor with a brokerage firm in which securities may be purchased by borrowing a portion of the purchase price from the brokerage, or may be sold short by borrowing the securities from the brokerage firm.

Margin Requirement: A performance bond paid upon purchase of a futures contract that ensures the exchange clearinghouse against loss.

Market Access: The extent to which a domestic industry can penetrate a related market in a foreign country. Access can be limited by tariffs or other nontrade barriers.

Market-Based Corporate Governance System: A system of corporate governance in which the supervisory board represents a dispersed set of largely equity shareholders.

Market Economy: An economy in which resource allocations, prices, and other marketing decisions are primarily determined by the free market.

Market Failure: A failure of arms-length markets to efficiently complete the production of a good or service.

In the eclectic paradigm, the multinational corporation's market internalization advantages take advantage of market failure.

Marketing Mix: The set of marketing tools that the firm uses to pursue its marketing objectives in the target market.

Market Internalization Advantages: Advantages that allow the multinational corporation to internalize or exploit the failure of an arms-length market to efficiently accomplish a task.

Market Maker: A financial institution that quotes bid (buy) and offer (sell) prices.

Market Model: Also known as the one-factor market model. The empirical version of the security market line: Rj = aj + bjRM + ej.

Market Portfolio: A portfolio of all assets weighted according to their market values.

Market Risk Premium: The risk premium on an average stock; (E[RM]−RF).

Market Timing: An investment strategy of shifting among asset classes in an attempt to anticipate which asset class(es) will appreciate or depreciate during the coming period.

Marking to Market: The process by which changes in the value of futures contracts are settled on a daily basis.

Matchmaker Program: A service organized by the United States International Trade Administration. This program aids firms that are new to exporting or new to the market to meet prescreened business prospects in foreign markets who are interested in their products or services.

Maturity Date: The date on which the last payment on a bond is due.

Mean-Variance Efficient: An asset that has higher mean return at a given level of risk (or lower risk at a given level of return) than other assets.

Mercosur: The "common market of the South," a customs union that includes Argentina, Brazil, Paraguay, Uruguay, and Venezuela in a regional trade pact that reduces tariffs on intrapact trade by up to 90 percent. Bolivia, Chile, Colombia, Ecuador, and Peru are associate members.

Merger: A form of corporate acquisition in which one firm absorbs another and the assets and liabilities of the two firms are combined.

Method of Payment: The way in which a merger or acquisition is financed.

Micro Country Risks: Country risks that are specific to an industry, company, or project within a host country.

Microcredit: Small loans, perhaps $50 or $100, that are extended to small businesses to finance a business start-up or other business activity.

Middle Market: A market segment generally represented by financing under $2 million. In leasing, this sector is dominated by single investor leases.

Miller and Modigliani's Irrelevance Proposition: If financial markets are perfect, then corporate financial policy (including hedging policy) is irrelevant.

Mixed Tariff: A combination of specific and ad valorem tariffs.

Monetary Assets and Liabilities: Assets and liabilities with contractual payoffs.

Money Market Hedge: A hedge that replicates a currency forward contract through the spot currency and Eurocurrency markets.

Money Markets: Financial markets for debt securities that pay off in the short term (often less than one year).

Money Market Yield: A bond quotation convention based on a 360-day year and semiannual coupons (contrast with bond equivalent yield).

Money Supply: The total amount of currency in circulation and peso deposits subject to check of the monetary system.

Monopoly: Exclusive control or possession by one group of the means of producing or selling goods or services.

More Flexible Exchange Rate System: The International Monetary Fund's name for a floating exchange rate system.

Most Favored Nation (MFN): Most favored nation status is granted to one country by another; the granting country then accords the recipient's imports and exports the most favorable treatment that it accords any country.

Multilateral Environmental Agreements (MEAs): Environmental agreements negotiated by a number of countries.

Multilateral Investment Guarantee Agency (MIGA): One of the five institutions comprising the World Bank Group.

MIGA's purpose is to help encourage equity investment and other kinds of direct investment flow into developing countries.

Multinational Corporation (MNC): A corporation with operations in more than one country.

Multinational Netting: Elimination of offsetting cash flows within the multinational corporation.

Mutually Exclusive Investment Decisions: Investment decisions in which the acceptance of a project precludes the acceptance of one or more alternative projects.

N

Nationalization: A process whereby privately owned companies are brought under state ownership and control (contrast with privatization).

National Tax Policy: The way in which a nation chooses to allocate the burdens of tax collections across its residents.

National Trade Data Bank (NTDB): Is the U.S. government's most comprehensive source of international trade data and export promotion information. Types of information on the NTDB include international market research, export opportunities; indices of foreign and domestic companies; how-to market guides; reports on demographic, political, and socioeconomic conditions for hundreds of countries; and much more.

National Treatment: A country accords no less favorable treatment to imported goods than it does to domestic goods.

Natural Advantage: Theory in economics that certain countries have a competitive advantage in certain products due to their access to specific natural resources, their climatic conditions, or their transportation system.

Negative-NPV Tie-in Project: A negative net present value (NPV) infrastructure development project that a local government requires of a company pursuing a positive-NPV investment project elsewhere in the economy.

Net Asset Value (NAV): The sum of the individual asset values in a closed-end mutual fund. Closed-end funds can sell at substantial premiums or discounts to their net asset values.

Net Currency Exposure: Exposure to foreign exchange risk after netting all intracompany cash flows.

Net Exposed Assets: Exposed assets minus exposed liabilities. The term is used with market values or, in translation accounting, with book values.

Net Monetary Assets: Monetary assets minus monetary liabilities.

Net Position: A currency position after aggregating and canceling all offsetting transactions in each currency, maturity, and security.

Net Present Value (NPV): The present value of future cash returns, discounted at the appropriate market interest rate, minus the present value of the cost of the investment.

Net Working Capital: Current assets minus current liabilities.

Newly Industrializing Countries (NIC): A group of former LDC countries that, due to high levels of economic growth, have grown rapidly in recent years.

New Protectionism: Recent efforts to pressure national governments to exercise greater control over foreign trade and foreign direct investment.

New-to-Export (NTE): The name of the circumstances of a company that either engages in export activities for the first time, engages in exportation for first time in 24 months, or has only exported because of prior unsolicited orders.

New-to-Market (NTM): The name of the circumstances under which a company exports to a foreign market to which it has either never exported, has not exported to for the past 24 months, or has only exported to because of prior unsolicited orders.

Nominal Cash Flow: A cash flow expressed in nominal terms if the actual dollars to be received (or paid out) are given.

Nominal Interest Rate: Interest rate unadjusted for inflation.

Noncash Item: Expense against revenue that does not directly affect cash flow, such as depreciation and deferred taxes.

Nongovernmental Organizations (NGOs): A variety of special interest groups that operate in the global community.

Nonintermediated Debt Market: A financial market in which borrowers (governments and large corporations) appeal directly to savers for debt capital through the securities markets without using a financial institution as intermediary.

Nonmarket Economy: An economy in which the government, through the use of central planning, makes most economic decisions to control economic activity.

Nonmonetary Assets and Liabilities: Assets and liabilities with noncontractual payoffs.

Nontariff Barrier: An indirect measure used to discriminate against foreign manufacturers, for example, extensive inspection procedures for foreign imports that create barriers to entering the specific market.

Nordic Council: A regional alliance established in 1952 between Norway, Sweden, Finland, Denmark, and Iceland that is dedicated to cooperation among the Nordic countries. This has led to a common labor market, social security, and free movement of citizens across borders.

Normal Distribution: Symmetric bell-shaped frequency distribution that can be defined by its mean and standard deviation.

Normal Trade Relations (NTR): A new name for Most Favored Nation (MFN) trading status, in which the country that grants this status accords the recipient's imports and exports the most favorable treatment that it accords any country.

North American Free Trade Agreement (NAFTA): NAFTA is a regional trade pact among the United States, Canada, and Mexico.

North-South Trade: A name for trade between developed (northern) and less developed countries (southern).

Notional Principal: In a swap agreement, a principal amount that is only "notional" and is not exchanged.

O

Offering Statement: In the United States, a shortened registration statement required by the Securities and Exchange Commission on debt issues with less than a nine-month maturity.

Offer Rates: The rate at which a market maker is willing to sell the quoted asset. Also known as ask rates.

Official Settlements Balance: An overall measure of a country's private financial and economic transactions with the rest of the world. Also known as overall balance.

Offshore Financial Centers (OFCs): The many types of financial institutions that operate without financial supervision by governments or other agencies.

Oligopoly: A market dominated by so few sellers that action by any of them will impact both the price of the good and the competitors.

Open Account: The seller delivers the goods to the buyer and then bills the buyer according to the terms of trade.

Open and Reform Policy: An economic policy enacted by the Chinese government combining central planning with market-oriented reforms to increase productivity, living standards, and technological quality without exacerbating inflation, unemployment, and budget deficits, with the goal of moving from a centrally planned economy to a market-based one.

Open-End Fund: A mutual fund in which the amount of money under management grows/shrinks as investors buy/sell the fund.

Operating Cash Flow: Earnings before interest and depreciation minus taxes. It measures the cash flow generated from operations, not counting capital spending or working capital requirements.

Operating Exposure: Changes in the value of real (nonmonetary) assets or operating cash flows as a result of changes in currency values.

Operating Leverage: The trade-off between fixed and variable costs in the operation of the firm.

Operational Efficiency: Market efficiency with respect to how large an influence transaction costs and other market frictions have on the operation of a market.

Opportunity Cost: Most valuable alternative that is given up. The rate of return used in NPV computation is an opportunity interest rate.

Orderly Marketing Agreements: Agreements between two or more governments to hold back the growth of trade for certain products by limiting exports and imposing import quotas.

Organisation for Economic Co-operation and Development (OECD): A group of 30 countries that meets regularly to discuss global issues and make appropriate economic and social policies.

Organization of American States (OAS): A regional organization created in 1948 promoting the economic and social development of Latin America. OAS members include the United States, Mexico, most of South and Central America, and most of the Caribbean nations.

Organization of Petroleum Exporting Countries (OPEC): A producer cartel that produces and sells oil.

Out-of-the-Money Option: An option that has no value if exercised immediately.

Outright Quote: A quote in which all of the digits of the bid and offer prices are quoted (contrast with points quote).

Outsourcing: A situation in which a firm's functions are performed or provided by a person or group from outside the company.

Outward Swap: Purchasing foreign currency today and reselling it at a forward rate against the domestic currency.

Overall Balance: (See Official Settlements Balance).

Overall FTC Limitation: In the U.S. tax code, a limitation on the FTC equal to foreign-source income times U.S. tax on worldwide income divided by worldwide income.

Overseas Private Investment Corporation (OPIC): A U.S. agency that assists U.S. companies protect their investment against risk in a particular country besides providing other services.

Ownership-Specific Advantages: Property rights or intangible assets, including patents, trademarks, organizational and marketing expertise, production technology and management, and general organizational abilities, that form the basis for the multinational's advantage over local firms.

P

Packing List: Document listing the contents of a consignment of goods.

Parallel Loan: A loan arrangement in which a company borrows in its home currency and then trades this debt for the foreign currency debt of a foreign counterpart.

Partnership: Form of business organization in which two or more co-owners form a business. In a general partnership each partner is liable for the debts of the partnership.

Passive Income: In the U.S. tax code, income (such as investment income) that does not come from active participation in a business.

Patent: A government grant that gives inventors exclusive right of making, using, or selling the invention.

Payback Period Rule: An investment decision rule that states that all investment projects that have payback periods equal to or less than a particular cutoff period are accepted, and all those that pay off in more than the particular cutoff period are rejected. The payback period is the number of years required for a firm to recover its initial investment required by a project from the cash flow it generates.

Payoff Profile: A graph with the value of an underlying asset on the x-axis and the value of a position taken to hedge against risk exposure on the y-axis. Also used with changes in value (contrast with risk profile).

Payout Ratio: Proportion of net income paid out in cash dividends.

Pegged Exchange Rate System: The IMF's name for a fixed exchange rate system.

Pension Liabilities: A recognition of future liabilities resulting from pension commitments made by the corporation. Accounting for pension liabilities varies widely by country.

Perfect Market Assumptions: A set of assumptions under which the law of one price holds. These assumptions include frictionless markets, rational investors, and equal access to market prices and information.

Peril Point: The limit beyond which the reduction of tariff protection in a given industry would cause it serious injury.

Periodic Call Auction: A trading system in which stocks are auctioned at intervals throughout the day.

Perpetuity: A constant stream of cash flows without end. A British consol is an example.

Phytosanitary Measure: A piece of legislation, regulation, or procedure with the purpose of preventing the introduction or spread of pests. Phytosanitary procedures often include the performance of inspections, tests, surveillance, or other treatments.

Points Quote: An abbreviated form of the outright quote used by traders in the interbank market.

Political Risk: The risk that a sovereign host government will unexpectedly change the rules of the game under which businesses operate. Political risk includes both macro and micro risks.

Pooling: In logistics, pooling is when a group of carriers agree to share freight, customers, and revenues or profits. In the United States it is outlawed by the Interstate Commerce Act.

Portfolio: The combined holding of more than one stock, bond, real estate asset, or other asset by an investor.

Power Distance: The extent to which a society accepts hierarchical differences.

Predatory Pricing: It is a form of price discrimination that requires selling below cost with the intention of destroying competition. However, predatory pricing is against the law.

Premium: If a bond is selling above its face value, it is said to sell at a premium.

Present Value: The value of a future cash stream discounted at the appropriate market interest rate.

Present Value Factor (PVF): Factor used to calculate an estimate of the present value of an amount to be received in a future period.

Price Elasticity of Demand: The sensitivity of quantity sold to a percentage change in price.

Price Uncertainty: Uncertainty regarding the future price of an asset.

Private Placement: A securities issue privately placed with a small group of investors rather than through a public offering.

Privatization: A process whereby publicly owned enterprises are sold to private investors (contrast with nationalization).

Product Cycle Theory: Product cycle theory views the products of the firm as evolving through 4 stages: (1) infancy, (2) growth, (3) maturity, and (4) decline.

Production Possibilities Schedule: The maximum amount of goods (for example, food and clothing) that a country is able to produce given its labor supply.

Production Sharing: Production sharing occurs when a producer chooses to make a product in stages—and in different countries—so that the firm can employ the lowest-cost resources in production.

Product Life Cycle (PLC): The complete life of a product, from early planning through sales buildup, maximum sales, declining sales, and withdrawal of the product. Product life cycle lengths and types can vary depending on the type of product, the frequency of replacement, and other factors.

Profitability Index: A method used to evaluate projects. It is the ratio of the present value of expected future cash flows after initial investment divided by the amount of the initial investment.

Pro Forma Invoice: An invoice provided by a supplier prior to the shipment of merchandise describing the goods, their value, and other specifications.

Progressive Taxation: A convex tax schedule that results in a higher effective tax rate on high income levels than on low-income levels.

Project Financing: A way to raise nonrecourse financing for a specific project characterized by the following: (1) the project is a separate legal entity and relies heavily on debt financing, and (2) the debt is linked to the cash flow generated by the project.

Promissory Note: Financial document in which the buyer agrees to make payment to the seller at a specified time.

Proprietary Knowledge: Private or exclusive knowledge that cannot be legally used or duplicated by competitors.

Prospectus: A brochure that describes a mutual fund's investment objectives, strategies, and position limits.

Protectionism: Protection of local industries through tariffs, quotas, and regulations that discriminate against foreign businesses.

Psychic Distance: The similarities or lack thereof between country markets. This concept takes into account geographic distance, cultural similarities, linguistic aspects, legal systems, and methods of conducting business.

Public Relations (PR): A variety of programs designed to promote and/or protect a company's image or its individual products.

Public Securities Offering: A securities issue placed with the public through an investment or commercial bank.

Pull Strategy: In logistics, it is a strategy that uses actual customer demand to determine production and distribution schedules. In marketing, it is using intensive advertising to create customer demand for a product. In either case, the product is "pulled" through the system by the consumer.

Purchasing Agent: Someone who buys goods in his or her country on behalf of foreign buyers.

Purchasing Power Parity (PPP): The principle that equivalent assets sell for the same price. Purchasing power parity is a measurement of a currency's value based on the buying power within its own domestic economy.

Pure Discount Bond: Bonds that pay no coupons and only pay back the face value at maturity. Also referred to as zero-coupon bond or a single-payment bond.

Push Strategy: In logistics, it is a strategy that uses forecasts rather than customer demand to determine production and distribution schedules. In marketing, it is a wholesaler using promotion to create demand directly at the consumer level, bypassing retailers. In either case, the product is "pushed" through the system by the manufacturer to the customer.

Put-Call Parity: The relation of the value of a long call, a short put, the exercise price, and the forward price at expiration.

Put Option: The right to sell the underlying asset at a specified price and on a specified date.

Q

Quantitative Restrictions (QR): Restrictions on trade, generally in the form of quotas, that limit the quantity of a good or service that can be imported or exported. Another form of quantity restriction is a VER, or Voluntary Export Restraint.

Quid Pro Quo: The English translation is "a favor for a favor."

Quota: The quantity of goods of a specific kind that a country permits to be imported without restriction or imposition of additional duties.

R

Random Walk: A process in which instantaneous changes in exchange rates are normally distributed with a zero mean and constant variance.

Real Appreciation/Depreciation: A change in the purchasing power of a currency.

Real Cash Flow: A cash flow is expressed in real terms if the current, or date 0, purchasing power of the cash flow is given.

Real Exchange Rate: A measure of the nominal exchange rate that has been adjusted for inflation differentials since an arbitrarily defined base period.

Realignment: The coordinated revaluation and devaluation of the currencies of several countries.

Real Interest Rate: Interest rate expressed in terms of real goods; that is, the nominal interest rate minus the expected inflation rate.

Real Options: An option or option-like feature embedded in a real investment opportunity.

Reciprocal Marketing Agreement: A strategic alliance in which two companies agree to comarket each other's products in their home market. Production rights may or may not be transferred.

Reconsignment: In shipping, it is the change in either the name of the consignee, the place of delivery, or relinquishment of the shipment by the carrier at the point of origin.

Recourse: The right to demand return of money paid. In negotiation of a letter of credit, payment by the negotiating bank will normally be with recourse.

Red Clause: A banking term that refers to a special clause in a letter of credit allowing the seller of goods to obtain an unsecured advance from the issuing bank to finance the manufacture or purchase of the goods.

Regional Development Banks (RDBs): Banks that are owned and operated by member nations; they are designed to extend development loans and provide other assistance to member nations. The world's four regional development banks are the African Development Bank Group, the Asian Development Bank, the European Bank for Reconstruction and Development, and the Inter-American Development Bank.

Registered Bonds: Bonds for which each issuer maintains a record of the owners of its bonds. Countries requiring that bonds be issued in registered form include the United States and Japan (contrast with bearer bonds).

Registration Statement: In the United States, a statement filed with the Securities and Exchange Commission on securities issues that discloses relevant information to the public.

Re-invoicing Centers: An offshore financial affiliate that is used to channel funds to and from the multinational's foreign operations.

Remittance: The forwarding of funds from one party to another as payment for goods or services.

Repatriation: The act of remitting cash flows from a foreign affiliate to the parent firm.

Replevin: A legal action that entitles the rightful owner of property that has been wrongfully kept from him or her to recover it.

Rescind: To void or cancel a contract.

Reservation Price: The price below (above) which a seller (purchaser) is unwilling to go.

Residual Value: The value of an asset at the conclusion of a lease.

Restitution: In the case of a breach of contract, restitution is the restoration of the involved parties to their original positions prior to the contract.

Restrictive Endorsement: Endorsement transferring title or right to a named party.

Retention Ratio: Retained earnings divided by net income.

Return on Equity (ROE): Net income after interest and taxes divided by average common stockholder's equity.

Revaluation: An increase in a currency value relative to other currencies in a fixed exchange rate system.

Right of Priority: In patent, industrial design, and trademark laws, a priority right or right of priority is a time-limited right, triggered by the first filing of an application for a patent, an industrial design, or a trademark, respectively. The priority right belongs to the applicant or his successor in title and allows him to file a subsequent application for the same invention, design, or trademark and benefit, for this subsequent application, from the date of filing of the first application for the examination of certain requirements.

Rights of Set-Off: An agreement defining each party's rights should one party default on its obligation. Rights of set-off were common in parallel loan arrangements.

Risk Averse: Seeking stability rather than risk.

Risk Premium: The excess return on the risky asset that is the difference between expected return on risky assets and the return of risk-free assets.

Risk Profile: A graph with the value of an underlying asset on the x-axis and the value of a position exposed to risk in the underlying asset on the y-axis. Also used with changes in value (contrast with payoff profile).

Roll's Critique: The CAPM holds by construction when performance is measured against a mean-variance efficient index. Otherwise, it holds not at all.

Royalty: Payment made for the use of a person's or business's property based on an agreed percentage of the income arising from its use.

R-Square: The percent of the variation in a dependent variable (a y-variable) that is "explained by" variation in an independent variable (an x-variable). The concept is also known as the coefficient of determination.

Rules of Origin: Rules used to determine in what country a good will be considered as actually made for tariff and other trade purposes.

S

Safety Stock (SS): The materials in an inventory in anticipation of unforeseen shortages of materials or abnormal demand for the final product.

Scenario Analysis: A process of asking "What if?" using scenarios that capture key elements of possible future realities.

Section 201: Also known as the "escape clause" of the U.S. Trade Act of 1971, section 201 is a provision that permits imports to be restricted in a certain industry, for a limited time, if those imports have caused injury to U.S. firms.

Section 301: In U.S. trade law, section 301 is a provision that allows private parties to seek compensation through the U.S. government if they have experienced injury to their business because of the illegal or unfair actions of foreign governments.

Security Market Line (SML): In the CAPM, the relation between required return and systematic risk (or beta): Rj – RF + bj (E[RM] – RF).

Security Selection: An investment strategy that attempts to identify individual securities that are underpriced relative to other securities in a particular market or industry.

Seeking Stability Rather Than Risk: An element of the Paris Convention for the Protection of Industrial Property that gives an inventor 12 months from the date of the first application filed in a Paris Convention country in which to file in other Paris Convention countries.

This relieves companies of the burden of filing applications in many countries simultaneously. Approximately 100 countries, including the United States, signed the Paris Convention.

Segmented Market: A market that is partially or wholly isolated from other markets by one or more market imperfections.

Seller's Market: A seller's market exists when the demand for a good outweighs the supply, and so the economic forces of business cause the goods to be priced at or closer to the vendor's estimate of their value.

Semi-Strong Form Efficient Market: A market in which prices fully reflect all publicly available information.

Sensitivity Analysis: Analysis of the effect on the project when there is some change in critical variables such as sales and costs.

Separation Principle: The principle that portfolio choice can be separated into two independent tasks: (1) determination of the optimal risky portfolio, which is purely a technical problem, and (2) the personal choice of the best mix of the risky portfolio and the risk-free asset.

Set-of-Contracts Perspective: A view of the corporation as the nexus of a set of legal contracts linking the various stakeholders. Important contracts include those with customers, suppliers, labor, management, debt, and equity.

Settlement of Disputes: The Settlement of Disputes was a declaration made by the UN stating that any water-based international disagreement must be settled in a peaceful and diplomatic manner.

Sharpe Index: A measure of risk-adjusted investment performance in excess return per unit of total risk: SI = (RP – RF)/(sP).

Shipper: Usually the supplier or owner of commodities shipped.

Short Position: A position in which a particular asset (such as a spot or forward currency) has been sold.

Short Selling: Selling an asset that you do not own, or taking a short position.

Side Effect: Any aspect of an investment project that can be valued separately from the project itself.

Sight Draft: A draft that is payable on demand.

Signaling: The use of observable managerial actions in the marketplace as an indication of management's beliefs concerning the prospects of the company.

Simple Interest: Interest calculated by considering only the original principal amount.

Small Business Administration (SBA): An independent agency of the U.S. federal government that aids, counsels, assists, and protects the interests of small business concerns to preserve free competitive enterprise and to maintain and strengthen the overall economy of the United States.

Smoot-Hawley Act: Passed in 1930, this protectionist act increased import duties to the highest rate ever imposed by the United States, resulting in the downfall of the world trade system at the time, during the Great Depression.

Social Capital: Physical or real capital that is owned by the public sector rather than by private firms.

Society for Worldwide Interbank Financial Transactions (SWIFT): Network through which international banks conduct their financial transactions.

Soft Clause: In a letter of credit, a soft clause is a clause that renders it impossible for the beneficiary, or seller, to fulfill the conditions of the letter separately and independently of the purchaser.

Soft Currency: A currency that is not readily accepted in exchange for other currencies or convertible to gold.

Soft Loan: A loan with generous terms such as lower than usual or no interest, and/or a long payback period.

Sogo Sosha: A term referring to general trading companies that import and export merchandise.

Sole Proprietorship: A business owned by a single individual. The sole proprietorship pays no corporate income tax but has unlimited liability for business debts and obligations.

South Asian Association for Regional Cooperation (SAARC): The South Asian Association for Regional Cooperation (SAARC) was established on December 8, 1985.

Its member states consist of Bangladesh, Bhutan, India, Maldives, Nepal, Pakistan, and Sri Lanka. Its main areas of cooperation are Agriculture and Rural Development; Health and Population Activities; Women, Youth, and Children; Environment and Forestry; Science and Technology and Meteorology; Human Resources Development; and Transport.

Southern African Customs Union (SACU): Established in 1910, the SACU is the oldest customs union in the world and is composed of South Africa, Swaziland, Botswana, Namibia, and Lesotho.

The countries engage in the free exchange of goods across their borders, and share a common external tariff and excise duties, as well as the revenues generated by them.

Southern African Development Community (SADC): The Southern African Development Community (SADC) was first established in 1992. It is the successor to the Southern African Development Coordination Conference (SADCC). The member states are Angola, Botswana, the Democratic Republic of Congo, Lesotho, Madagascar, Malawi, Mauritius, Mozambique, Namibia, South Africa, Swaziland, United Republic of Tanzania, Zambia, and Zimbabwe.

Southern Cone: The geographic region including Argentina, Brazil, Chile, Paraguay, and Uruguay.

Sovereignty: The rights of a country to rule itself, to manage its own affairs, and to jurisdiction over land, airspace, and maritime matters.

Special Drawing Right (SDR): An international reserve created by the International Monetary Fund and allocated to member countries to supplement foreign exchange reserves.

Specific Tariff: A tariff assessed at a specific amount per unit of weight.

Spot Exchange Rate: Exchange rate today for settlement in two days.

Spot Market: A market in which trades are made for immediate delivery (within two business days for most spot currencies).

Stabilization Policies: Government policies designed to promote economic growth, steady employment, and stable prices.

Stakeholders: Those with an interest in the firm. A narrow definition includes the corporation's debt and equity holders. A broader definition includes labor, management, and other interested parties.

Stamp Tax: A tax on a financial transaction.

Standard Deviation: The positive square root of the variance. This is the standard statistical measure of the spread of a sample.

Standard Industrial Classification (SIC): A standard numerical code system used by the U.S. government to classify products and services.

Stated Annual Interest Rate: The interest rate expressed as a percentage per annum, by which interest payment is determined.

Stationary Time Series: A time series in which the process generating returns is identical at every instant of time.

Stock Index Futures: A futures contract on a stock index.

Stock Index Swap: A swap involving a stock index. The other asset involved in a stock index swap can be another stock index (a stock-for-stock swap), a debt index (a debt-for-stock swap), or any other financial asset or financial price index.

Stock Market: An institution that facilitates the buying and selling of stocks.

Strategic Alliance: A collaborative agreement between two companies designed to achieve some strategic goal. Strategic alliances include international licensing agreements, management contracts, and joint ventures as special cases.

Striking Price: The price at which an option can be exercised (also called the exercise price).

Subpart F Income: In the U.S. tax code, income from foreign subsidiaries owned more than 10 percent and controlled foreign corporations that is taxed on a pro rata basis as it is earned.

Subsidiary: Any organization controlled by another with more than 50 percent of its voting capital held by the latter.

Subsidized Financing: Financing that is provided by a host government and that is issued at a below-market interest rate.

Subsidy: Monetary assistance granted by the government to an individual or other entity in support of an activity that is regarded as being in the public interest.

Subsistence Agriculture: Small-scale agriculture designed to meet the consumption needs of individual households.

Sunk Cost: A cost that has already occurred and cannot be removed. Because sunk costs are in the past, such costs should be ignored when deciding whether to accept or reject a project.

Sunk Costs: Expenditures that are at least partially lost once an investment is made.

Supervisory Board: The board of directors that represents stakeholders in the governance of the corporation.

Swap: An agreement to exchange two liabilities (or assets) and, after a prearranged length of time, to reexchange the liabilities (or assets).

Swap Book: A swap bank's portfolio of swaps, usually arranged by currency and by maturity.

Swaption: A swap with option(s) attached.

Switching Options: A sequence of options in which exercise of one option creates one or more additional options. Investment-disinvestment, entry-exit, expansion-contraction, and suspension-reactivation decisions are examples of switching options.

Syndicate: The selling group of investment banks in a public securities offering.

Synergy: In an acquisition or merger, when the value of the combination is greater than the sum of the individual parts: Synergy = VAT – (VA + VT).

Synthetic Forward Position: A forward position constructed through borrowing in one currency, lending in another currency, and offsetting these transactions in the spot exchange market.

Systematic Risk: Risk that is common to all assets and cannot be diversified away (measured by beta).

T

Tangibility: Tangible assets are real assets that can be used as collateral to secure debt.

Tare Weight: The weight of a container and packing materials that excludes the weight of the goods it contains.

Targeted Registered Offerings: Securities issues sold to "targeted" foreign financial institutions according to U.S. SEC guidelines. These foreign institutions then maintain a secondary market in the foreign market.

Tariff Anomaly: The state of having a tariff on raw materials or semiprocessed products be higher than the tariff on the corresponding finished product.

Tariff Escalation: The situation in which duties are low or nonexistent for raw materials, moderate for semi-manufactured goods and relatively high for finished products.

Tariff-Quota: A tariff that is set at a lower rate until a specified quantity (the quota) of goods has been imported, at which point the tariff increases for additional imports.

Tariffs: Taxes on imported goods and services, levied by governments to raise revenues and create barriers to trade.

Tax Arbitrage: Arbitrage using a difference in tax rates or tax systems as the basis for profit.

Tax Clienteles: Clienteles of investors with specific preferences for debt or equity that are driven by differences in investors' personal tax rates.

Tax Haven: A country or region imposing low or no taxes on foreign source income.

Tax Haven Affiliate: A wholly owned affiliate that is in a low-tax jurisdiction and that is used to channel funds to and from the multinational's foreign operations. The tax benefits of tax-haven affiliates were largely removed in the United States by the Tax Reform Act of 1986.

Tax Holiday: A reduced tax rate provided by a government as an inducement to foreign direct investment.

Tax Neutrality: Taxes that do not interfere with the natural flow of capital toward its most productive use.

Tax Preference Items: Items such as tax-loss carryforwards and carrybacks and investment tax credits that shield corporate taxable income from taxes.

Technical Analysis: Method of forecasting future exchange rates based on the history of rates.

Temporal Method: A translation accounting method (such as FAS #8 in the United States) that translates monetary assets and liabilities at current exchange rates and all other balance sheet accounts at historical exchange rates.

Territorial Tax System: A tax system that taxes domestic income but not foreign income. This tax regime is found in Hong Kong, France, Belgium, and the Netherlands.

Tied Loan: A loan issued by a government requiring the borrower to spend the funds in the lending country.

Time Draft: A draft that is payable on a specified future date.

Time Value of an Option: The difference between the value of an option and the option's intrinsic value.

Timing Option: The ability of the firm to postpone investment (or disinvestment) and to reconsider the decision at a future date.

Total Cash Flow of the Firm: Total cash inflow minus total cash outflow.

Total Quality Management (TQM): An organization-wide approach to continuously improving the overall quality of its process, products, and service.

Total Risk: The sum of systematic and unsystematic risk (measured by the standard deviation or variance of return).

Trade Acceptance: A time draft that is drawn on and accepted by an importer.

Trade Balance: A country's net balance (exports minus imports) on merchandise trade.

Trade Barrier: A governmental policy, action, or practice that intentionally interrupts the free flow of goods or services between countries.

Trade Deficit: A trade deficit occurs when the value of a country's exports is less than the value of its imports.

Trade-in Allowance: Price discount granted for a new item by turning in an old item at the time of purchase.

Trademark: A registration process under which a name, logo, or characteristic can be identified as exclusive.

Trade-Offs: A kind of interaction involving the offsetting of high costs in one section with lower or diminished costs in another.

Trade Surplus: A trade surplus occurs when the value of a country's exports is greater than the value of its imports.

Trading Desk: The desk at an international bank that trades spot and forward foreign exchange. Also known as dealing desk.

Transaction Exposure: Changes in the value of contractual (monetary) cash flows as a result of changes in currency values.

Transaction Statement: A document that clearly outlines the terms and conditions agreed upon between an importer and an exporter.

Transfer Prices: Prices on intracompany sales.

Transfer Pricing: The price one unit of a company charges to another unit of the same company for goods or services exchanged between the two.

Translation Exposure: Changes in a corporation's financial statements as a result of changes in currency values. Also known as accounting exposure.

Transparency: The observed degree of clarity, openness, measurability, and verifiability in a law, regulation, agreement, or trade practice.

Treaty of Tordesillas: Treaty between Spain and Portugal that divided the South American continent (among other lands) between the two countries. Ratified in 1494, it originally gave Spain much more land than Portugal.

Trustee: A bank or trust company that holds title to or a security interest in leased property for the benefit of the lessee, lessor, and/or creditors of the lessor.

Turnkey Contract: An agreement in which a contractor is responsible for setting up a facility from start to finish for another firm.

Tying Arrangement: The condition imposed by a seller that obliges a buyer to agree to purchase an additional product (tied product) if they wish to purchase their desired product (tying product).

U

Umbrella Rate: In shipping, the umbrella rate is a rate system designed to protect less competitive carriers by setting artificially high minimum rates.

Unbiased Expectations Hypothesis: The hypothesis that forward exchange rates are unbiased predictors of future spot rates (see forward parity).

Uncertainty Avoidance: The extent to which a society tolerates uncertainty and ambiguity.

Unemployment Rate: The ratio of the total number of unemployed persons to the total number of persons in the labor force.

United Nations Conference on Trade and Development (UNCTAD): UNCTAD was established in 1964 with the goal of promoting sustainable development while integrating developing countries into the world economy. It acts as a forum for intergovernmental deliberations with an aim at building consensus; conducting research, policy analysis, and data collection; and providing technical assistance tailored to the specific needs of different developing countries.

United Nations Industrial Development Organization (UNIDO): UNIDO helps developing countries and countries with economies in transition in their fight against marginalization in today's globalized world. It mobilizes knowledge, skills, information, and technology to promote productive employment, a competitive economy, and a sound environment.

Unlevered Beta: The beta (or systematic risk) of a project as if it were financed with 100 percent equity.

Unlevered Cost of Equity: The discount rate appropriate for an investment assuming it is financed with 100 percent equity.

Unsustainable Debt: A financial condition in which a country is unable to service its foreign (external) debt without decimating its economy.

Unsystematic Risk: Risk that is specific to a particular security or country and that can be eliminated through diversification.

Usury: The practice of charging or paying exorbitant interest on a loan or other transaction. Note: in Islamic societies, charging or receiving any amount of interest is considered usury.

V

Value-Added Reseller: A company that purchases products from a variety of sources to produce a new finished product for sale.

Value Added Tax (VAT): A sales tax collected at each stage of production in proportion to the value added during that stage.

Value Chain: A value-added process in a firm to transform raw materials and other inputs to finished goods, which creates value to customers.

Value Date: Date on which a foreign exchange contract is executed, i.e., seller delivers.

Value Stocks: Stocks with low price/book ratios or price/earnings ratios. Historically, value stocks have enjoyed higher average returns than growth stocks (stocks with high price/book or PE ratios) in a variety of countries.

Variable Cost: A cost that varies directly with volume and is zero when production is zero.

Venture Capital: An investment in a start-up business that is perceived to have excellent growth prospects but that does not have access to capital markets.

Virtual Corporation: Partnerships so close that those partners become a single firm for all operational purposes.

Voluntary Export Restraint (VER): One country promises another country to limit its imports; this is often done when the promising country fears increased tariffs or quotas if it does not self-regulate.

W

Warehouse Receipt: A receipt issued by a warehouse listing the goods received.

Warehouse-to-Warehouse: An insurance policy that covers goods over the entire journey from the seller's to the buyer's premises.

Warrant: An option issued by a company that allows the holder to purchase equity from the company at a predetermined price prior to an expiration date. Warrants are frequently attached to Eurobonds.

Weak Form Efficient Market: It is a market in which prices fully reflect the information in past prices.

Weighted Average Cost of Capital (WACC): A discount rate that reflects the after-tax required returns on debt and equity capital.

Weight Note: A document issued by either the exporter or a third party declaring the weight of goods in a consignment.

West African Economic and Monetary Union (UEMOA): A regional alliance of francophone West African countries that promotes economic integration among the seven member countries. The country members are Benin, Burkina Faso, Côte d'Ivoire, Mali, Niger, Senegal, and Togo. They all share a common currency and have a central bank to oversee it.

Wharfage Charge: A charge assessed by a pier or dock owner for handling incoming or outgoing cargo.

Withholding Tax: A tax on dividend or interest income that is withheld for payment of taxes in a host country. Payment is typically withheld by the financial institution distributing the payment.

Without Reserve: In shipping this indicates that a shipper's agent has the power to make important decisions abroad without the consent of those the agent represents.

Working Capital: An accounting term that indicates the difference between current assets and current liabilities.

World Bank: An international organization created at Bretton Woods in 1944 to help in the reconstruction and development of its member nations. Its goal is to improve the quality of life for people in the poorer regions of the world by promoting sustainable economic development. *See also* International Bank for Reconstruction and Development.

World Customs Organization (WCO): The WCO is an international organization whose function is the facilitation of trade between member states through the simplification and standardization of customs practices. The WCO was established in 1952 as the Customs Cooperation Council. Today, WCO provides regulations and standards to 169 customs administrations worldwide.

World Intellectual Property Organization (WIPO): The World Intellectual Property Organization (WIPO) is an international organization focused on the protection of intellectual property. WIPO administers 23 international treaties and is one of 16 specialized agencies of the United Nations. WIPO members include 183 nations around the world.

World Trade Organization (WTO): The WTO is a multilateral organization that promotes free and fair trade among the nations of the world. The WTO was created in 1994 by 121 nations at the Uruguay Round of the General Agreement on Tariffs and Trade (GATT). The WTO is responsible for implementation and administration of the trade agreement.

Worldwide Tax System: A tax system that taxes worldwide income as it is repatriated to the parent company. It is utilized in Japan, the United Kingdom, and the United States.

Writ: A judicial order to an officer of the law, such as a judge or a sheriff, to perform or have performed a specified act.

WTO Committee on Trade and Development (CTD): The WTO Committee on Trade and Development is a forum for discussion on all multi-interest issues of special interest to developing countries.

Y

Yield to Maturity: The discount rate that equates the present value of interest payments and redemption value with the present price of the bond.

Y2K: The abbreviation used to refer to the year 2000 computer problems resulting from the use of two-digit year inputs. Left uncorrected, computers would have recognized the input 00 to mean 1900 and not 2000.

Z

***Zaibatsu*:** Large family-owned conglomerates that controlled much of the economy of Japan prior to World War II. The four most historically significant zaibatsu, the Big Four, are Mitsubishi, Mitsui, Yasuda, and Sumitomo, whose roots date back to the Japanese Edo period.

Zeitgeist: A German expression that can be interpreted to mean "the spirit of time." It indicates the general intellectual state and outlook of an era or generation.

WORLD TRADE IN MERCHANDISE BY PRODUCT
World Trade Organization

1. Overview

Table I.1

Growth in the volume of world merchandise exports and production, 2000-2007

(Annual percentage change)

	2000-07	2005	2006	2007
World merchandise exports	**5.5**	**6.5**	**8.5**	**6.0**
Agricultural products	4.0	6.0	6.0	4.5
Fuels and mining products	3.5	3.5	3.5	3.0
Manufactures	6.5	7.5	10.0	7.5
World merchandise production	**3.0**	**3.0**	**3.0**	**4.0**
Agriculture	2.5	2.0	1.5	2.5
Mining	1.5	1.5	1.0	0.0
Manufacturing	3.0	4.0	4.0	5.0
World GDP	**3.0**	**3.0**	**3.5**	**3.5**

Note : See the Metadata for the estimation of world aggregates of merchandise exports, production and GDP.

Table I.2

Growth in the volume of world merchandise trade by selected region and economy, 2000-2007

(Annual percentage change)

Exports				Imports		
2000-07	2006	2007		2000-07	2006	2007
5.5	**8.5**	**6.0**	**World**	**5.5**	**8.0**	**5.5**
3.0	8.5	5.0	North America	4.0	6.0	2.0
1.0	1.0	1.0	Canada	4.0	5.5	6.5
3.0	11.0	1.5	Mexico	3.5	10.5	4.5
3.5	10.5	7.0	United States	4.0	5.5	1.0

a Financial intermediation services are not allocated geographically. In 2006, they represented 2 per cent of exports, and 0.3 per cent of imports.
b The following transactions are not allocated geographically: travel exports and imports; financial services exports related to foreign exchange trading; imports of freight transportation services and, insurance on goods imports. Overall, they represent 12 per cent of commercial services exports, and 34 per cent of imports.
c ASEAN countries accounted for 12 per cent of total commercial services exports and 5 per cent of imports.
d In 2006 trade in commercial services not allocated geographically accounted for 10 per cent of exports and imports.
e In 2006 trade in commercial services not allocated geographically accounted for 6 per cent of exports and 11 per cent of imports.
Note: For more information on asymmetries, see the Metadata, Section II.2.

5. Regional Trade Agreements

a Financial intermediation services are not allocated geographically. In 2006, they accounted for 3 per cent of other commercial services exports and 1 per cent of imports.
b The following transactions are not allocated geographically: financial services exports related to foreign exchange trading and imports of insurance on goods imports.
c In 2006, ASEAN countries accounted for 16 per cent of other commercial services exports and for 5 per cent of imports.
d In 2006, trade in other commercial services not allocated geographically represented 10 per cent of exports and 8 per cent of imports.
e In 2006, trade in other commercial services not allocated geographically represented 5 per cent of exports and 3 per cent of imports.
Note: For more information on asymmetries, see the Metadata, Section II.2.
