In 1970 Oman initiated a comprehensive sustainable development program and it was among one of the first developing countries to place a real emphasis on the social sector. The program was called Oman 2020 and, since its inception, it has achieved some of the fastest-ever recorded growth in the history of human development. In 1970 there was no formal education system in place apart from 3 primary schools in Muscat that had a maximum capacity of 900 boys. By the end of 1994, 920 schools had opened all over the country and approximately 450,000 students were enrolled in formal education of whom about 50 percent were girls. In 1999, 70 percent of all Omani children attended primary school. In addition to the improvements in education, there have been far-reaching improvements in life expectancy and infant mortality. Life expectancy has increased by 24 years from 47 in 1970 to 71 in 1997, and infant mortality has been reduced 10 times over from more than 215 per 1,000 live births to less than 18 in 1997.

Before the development program began, there were many health problems that were prevalent in Oman due to the poverty and the lack of education. One of the most serious diseases that afflicted more than half of all Omani school children was trachoma, a disease that leads to blindness. This disease is spread through the bite of a blackfly, which breeds in fast-flowing rivers and streams. When the fly bites, it deposits the larvae of a parasitic worm which moves rapidly through the body, causing severe eyesight damage and possible blindness when it enters the eyes. This disease has now been totally wiped out. Additional gains in social and health conditions have led to improvements in the sanitation system; almost three-quarters of all houses have clean running water and toilets that flush. The vast majority of homes have electric light, electricity, and gas with which to cook. The government provides pensions for the elderly and the disabled as well as widows, orphans,

and divorced women. This massive investment in human capital was made possible by the revenues that the state collected from the oil industry. Without this income it is unlikely that Oman would have made such groundbreaking progress in achieving better standards of living for a large part of its population.

Although Oman serves as a good example for other less-developed countries, there is still much room for improvement due to the high income inequality. The female literacy rate is still less than half that of the male literacy rate, and the total fertility rate (the number of children the average woman will have in her lifetime) is 6.9, one of the highest in the world.

WORKING CONDITIONS

Oman is heavily dependent on expatriate labor with an expatriate community of 527,078 and a total labor force of 650,000. Expatriate workers send large amounts of their wages back home, and in 1997 these earnings amounted to US$1.5 billion or 9.5 percent of GDP. Foreign labor mostly comes from India, Bangladesh, Pakistan, and Sri Lanka, and in most cases these expatriates perform menial and physical jobs. In some cases they have managerial jobs. There are an estimated 30,000 young Omanis entering the workforce every year, and the government has realized that it can no longer provide jobs for the entire workforce. To this end, it has been pursuing a policy of "Omanization" whereby expatriate labor is slowly replaced by Omani labor. Foreigners are not allowed to work in agriculture or public relations, nor are they allowed to be Arabic typists, guards, or technical assistants unless the employer can show that no Omanis are capable of filling the position. Taxi drivers and fishermen must be Omani. In 1994 Oman joined the International Labor Organization (ILO). (This is a UN agency that seeks the promotion of social justice and human and labor rights.) As a consequence, Oman must follow international standards covering a wide range of issues in the world of work, including certain basic human rights, the abolition of forced labor, the elimination of discrimination in employment, the employment of women, and the employment of children.

Oman's labor code lays out basic workers' rights and in 1998 the minimum wage was raised by the government and set at US$260 (100 riyals) per month plus US$52 (20 riyals) for transport costs and housing costs. However, the minimum wage does not apply to all occupations such as small businesses that employ fewer than 5 people, domestic servants, dependent family members working in a family business, and some manual labor jobs. The government has been reluctant to enforce the minimum wage for foreign workers employed in menial jobs. In contrast, the foreign workers who are highly skilled and in managerial positions are often paid much more than their Omani counterparts. The working week is 5 days in the public sector and 5 and a half days in the private sector. Non-Omanis working in construction, **retail**, in the personal service outlets, or in the petroleum fields usually work a 7-day week.

Foreign men and women employed in manual labor or as domestic servants have made official complaints in the past about employers withholding salaries and inhumane treatment. In many cases the government has been unhelpful or undertaken investigative procedures that have been detrimental to the employee concerned, which clearly goes directly against the principles of the International Labor Organization. Employers who mistreat their foreign domestic servants are not always held accountable for their actions and several foreign women working in Oman have been forced to contact their governments' embassies to seek shelter and escape from abuse.

COUNTRY HISTORY AND ECONOMIC DEVELOPMENT

1921. Treaty of Sib is signed, which marks the British takeover of the government of Oman. A council of Ministers governs with British advisers and the British

take control of customs revenue. Also during this time, new Western strategic interests develop in Oman in the form of air routes and oil prospecting.

1951. British recognize Oman as an independent state.

1962. Oil is discovered.

1967. Oil production starts.

1970. Sultan Sa'id is overthrown by his own son, Qaboos Bin Sa'id, in a palace coup. Sultan Qaboos **liberalizes** the political system, and starts many development projects. Oman is plagued by civil war.

1980. Military agreement signed with the United States which reflects the Western strategic interest in Oman for the planning of rapid deployment force capabilities to secure Western access to gulf oil.

1981. Oman forms the Gulf Cooperation. This agreement is signed between the 6 conservative monarchies of the Gulf: Saudi Arabia, Bahrain, United Arab Emirates, Kuwait, Oman, and Qatar to coordinate their economic, political, cultural, and security policy.

1991. Sultan Qaboos expands and **restructures** Oman's consultative council.

1994. Oman joins the International Labor Organization (ILO).

1999. Oman is included in the International Finance Corporation's emerging market index. Electronic trading is introduced.

2000. Oman becomes a member of the World Trade Organization.

FUTURE TRENDS

Oman looks to the future with both pessimism and optimism. The pessimism comes from the certainty that the country's major source of revenue—oil—will run out before the year 2020. Oil accounted for the great majority of Oman's exports and GDP ever since it was discovered in the early 1960s. The oil boom had a widespread impact on the economy: it allowed Oman to provide jobs for many of its people in the public sector, it allowed the country to import labor to perform the least wanted jobs in the economy, and it allowed Oman to avoid developing other industries. With the coming decline of the oil economy, Oman must seek alternative means for economic development.

Fortunately, Oman's government has taken a number of steps to ease the country into new economic patterns. The government plans to develop the production of its natural gas and other non-oil energy-based industries. Its 4 previous 5-year plans have been successful and the current 5-year plan focuses on the private sector as the catalyst for non-petroleum economic growth. The government is moving ahead with **privatization** of its utilities, the development of a body of commercial law to facilitate foreign investment, and increased budgetary outlays. However, Oman will have to continue to liberalize its markets in conjunction with its accession to the World Trade Organization (WTO).

Managing the transition from an oil-based to a more diversified economy will not be easy. Even though Oman has a reputation for stability and cooperation, the country's future success is likely to depend on the wisdom and political will of the country's leaders.

DEPENDENCIES

Oman has no territories or colonies.

Islamic Republic of Pakistan
Islami Jamhooria Pakistan

CAPITAL: Islamabad.

MONETARY UNIT: Pakistani rupee (R). 1 Pakistani rupee equals 100 paisa. Currency notes of 1, 2, 5, 10, 50, 100, 500, and 1,000 rupees are in use.

CHIEF EXPORTS: Cotton, fabrics and yarn, rice, other agricultural products.

CHIEF IMPORTS: Machinery, petroleum, petroleum products, chemicals, transportation equipment, edible oils, grains, pulses, flour.

GROSS DOMESTIC PRODUCT: US$282 billion (purchasing power parity, 1999 est.).

BALANCE OF TRADE: **Exports:** US$8.4 billion (f.o.b., 1999). **Imports:** US$9.8 billion (f.o.b., 1999).

COUNTRY OVERVIEW

LOCATION AND SIZE. Pakistan is a country located in South Asia that covers an area of 796,095 square kilometers (310,410 square miles), almost twice the size of California. In the south, it borders the Arabian Sea, with a coastline of 1,046 kilometers (650 miles) and stretches north to the great Hindukush and Karakoram mountain ranges, with peaks as high as the Nanga Parbat (8,126 meters, 26,660 feet) and the K2 (8,611 meters, 28,251 feet). Pakistan is edged between India, with whom it shares a 2,192-kilometer (1,362-mile) borderline to the east, and Afghanistan and Iran, with whom it has 2,430 kilometers (1,510 miles) and 909 kilometers (565 miles), respectively, of common border. It also shares a 523-kilometer (325-mile) border with China in the north.

The country's temperatures are amongst the most extreme on earth, ranging from 50 degrees Celsius (122 degrees Fahrenheit) or more at the height of summer in the deserts of Sindh to -50 degrees Celsius (-58 degrees Fahrenheit) and below in the depths of winter on the northern mountain ranges. Until 1947, Pakistan was part of British India, which was then divided into the largely Hindu India and the Muslim state of Pakistan. Until 1971, this state consisted of a large territory to the west of the newly established Republic of India and a smaller territory in the northeastern part of historic British India, separated from each other by 1,600 kilometers (995 miles). East Pakistan succeeded in that year to become independent Bangladesh.

POPULATION. The government of Pakistan estimated that Pakistan's population was 137.5 million in June 2000, excluding about 1.5 million refugees from Afghanistan. Pakistan's Afghani refugee population increased significantly in the fall of 2001 after a U.S. bombing campaign against Afghanistan's ruling Taliban regime caused thousands to flee to Pakistan. A large majority of Pakistanis are very young, owing to the high rate of population growth in recent decades. About 41 percent of the population is under the age of 14 years, and 55 percent is between the ages of 15 and 64 years. Population growth is still quite high at around 2.2 percent in 2000. Pakistan has a very high infant mortality rate, with 88 deaths per 1,000 live births, but, on average, every woman in the country gives birth to more than 4 children. According to government figures, only about a third of the population lives in towns (33 percent in 2000), while two-thirds (67 percent) are rural. The population density was 175 people per square kilometer in 1999, according to World Bank figures, which makes Pakistan a heavily populated country despite its size. The largest towns are Karachi with 9.3 million inhabitants, Lahore (5.1 million), and Faisalabad (2 million).

Pakistan has 4 major provinces: the Punjab, Sindh, Baluchistan, and the North-West Frontier Province (NWFP), as well as some federally administered tribal areas. In 1998, 55.6 percent of the population lived in Punjab, 23.0 percent in Sindh, 13.4 percent in the NWFP, 5 percent in Baluchistan, 2.4 percent in the Federally Administered Tribal Areas (FATA), and 0.6 percent in the northern areas and the federal capital of Islamabad.

The provinces are, by and large, based on the 5 major ethnic groups prevalent in Pakistan. Punjabis live mainly in the fertile and most populous region, Punjab, in the center and east of the country. Sindhis live in the south; the Pashtuns share a common ethnic heritage with most Afghanis and live in the west. Baluchis live in the mountainous areas in the southwestern part of the country. Finally, the immigrants from India at the time of the partition and their descendants are called Muhajir (Muhajireen), after the Arabic term for immigrant.

Urdu is the national language of the state, and English is the official language, most widely used among the elite and in government ministries, since only 10 percent of the population speak Urdu as their native tongue. Punjabi is spoken by 48 percent of the population, while Sindhi is used by 12 percent; Siraiki, a Punjabi variant, is spoken by 10 percent, and Pashtu by 8 percent of the population. Only 40 percent of Pakistanis are able to read and write, compared to an average of 49 percent in South Asia and 53 percent in low-income countries worldwide. The literacy rate for women is even lower than for men, showing gender disparities in education.

Islam is the state religion of Pakistan, which was designed to be the homeland for Muslims living in British India. At the time of the census in 1998, 96.7 percent of Pakistanis were Muslims. The remaining 3.3 percent consist of non-Muslim minorities, such as Christians (1.6 percent of total population), Hindus (1.5 percent), and others. The majority of Muslims are adherents to the Sunni branch of Islam, but a minority, variously esti-

mated at 15 to 25 percent, are Shia Muslims. An offshoot Shia sect, the Ismailis, led by Prince Karim Aga Khan, are prominent in some northern areas. Shia-Sunni tensions have increased in recent years and there have been occasional clashes.

OVERVIEW OF ECONOMY

Pakistan is a poor, heavily populated country on which internal political instability, phases of military dictatorship, and inefficient, corrupt governmental rule have taken a toll as much as the costly confrontation with neighboring India ever since partition in 1947. The economy is dominated by services, but agriculture still plays an important role. Pakistan's most important industry is textiles, which alone represents about 60 percent of the country's exports. After growing at an average rate of over 6 percent per year from 1980 to 1991, **real gross domestic product** (GDP) growth slowed during the 1990s and dropped to 1.3 percent in 1996–97 due to a poor cotton crop and related setbacks in the textile industry. In 1997–98, growth hit 4.3 percent against a governmental target of 6 percent. Real GDP grew only by 3.1 percent in 1998–99 but went up to 4.5 percent during 1999–2000. Pakistan's **GDP per capita** was US$450 in 1999, which puts it slightly above the South-Asian average of US$440 per capita.

Since the late 1980s, Pakistan has pursued a program of market-oriented economic adjustment, reform, and development. With the support of international financial institutions—mainly the International Monetary Fund (IMF) and bilateral donors—this program has aimed at enhancing **macroeconomic** stability, promoting the **private sector** and export-led industrial development, and reversing past neglect of key social sectors such as health, education, and population planning. Specifically, the government has sought to reduce monetary and external imbalances, reduce trade barriers, modernize the financial sector, **privatize** state-owned industries, and offer specific incentives to attract foreign investment. Unfortunately, the implementation of this program has mostly lagged behind expectations.

Despite the availability of cheap labor, a large domestic market, and access to regional markets, foreign investors have shied away from investing their money in Pakistan because of its widespread corruption, lack of skilled labor, law and order problems (especially in Karachi, the industrial hub), and an outdated **infrastructure**. Domestic investment has also slowed in recent years. According to official figures, total investment has declined from an average of 17.1 percent of GDP a year between 1984 and 1994 to 7.9 percent between 1994 and 2000. One reason is that manufacturers, who are traditionally served by the domestic banking system (particularly yarn spinners and sugar refiners), have often failed to honor their debts, contributing to a banking crisis.

Underlying most of the economic problems faced by Pakistan is the "crisis of governance," as the World Bank calls it. This phrase refers to the poor performance of the public institutions in terms of accountability, efficient management, corruption, and tax collection. Among these, corruption is one of the most pressing problems. Transparency International, an international non-governmental organization monitoring governments, ranked Pakistan 2nd, 5th, and 11th, in its annual reports on the most corrupt countries in the world between 1996 and 1998. Corruption hurts the economy by raising transaction costs. Even if these payoffs are considered part of the cost of doing business, there is an economic loss as these payments are neither available for expansion and improvement in the quality of public services, nor for private sector investment. A 1994 survey conducted by the World Bank among 200 business firms in Pakistan revealed that a significant amount of time and money was wasted in numerous unpredictable interactions with petty and higher-level bureaucrats seeking bribes. Entrepreneurs reported spending about 12 percent of their time dealing with tax and regulatory requirements. Also, corruption depresses economic growth by lowering public investment. Only a part of the amount appearing in budget documents as expenditure on public projects may actually get spent on these projects; the rest is siphoned off by government functionaries and contractors. One study estimated that the value for money obtained in government construction of school buildings may be only 50 to 60 percent.

Another major problem is Pakistan's huge **external debt** and its continued dependence on financial aid. Foreign loans and grants provide approximately 25 percent of government revenue, and **debt service** obligations total nearly 50 percent of government expenditure, which means that as much as half of all government expenditures are used to repay loans. Defense and debt service together absorb more than two-thirds of total federal expenditure, or almost all revenues from federal taxes. Improving tax collection in the medium- to long-term is crucial if Pakistan is to maintain repayments on its combined foreign and domestic debt of about US$62 billion, almost equivalent to Pakistan's annual GDP. It is estimated that the country needs at least US$21 billion of aid up to 2004 just for debt repayment, a large figure for a nation with annual exports of less than US$9 billion and very little **foreign exchange reserves**. In the case of the provinces, the bulk of expenditure is taken up by establishment costs (civil servants' salaries, benefits, and pensions), interest payments, and **subsidies**. The government under General Pervez Musharraf, which overthrew the government under Nawaz Sharif in 1999, faced US$32 billion in external debt. General Musharraf's ambitious economic agenda includes measures to widen the

tax net, privatize **public sector** assets, and improve its **balance of trade** position. Commitment to these reforms, however, has to withstand strong opposition from interest groups such as employees of state-owned corporations, private traders, landlords, and government bureaucrats. It is unclear how the U.S. war against the Taliban regime in neighboring Afghanistan, begun in 2001, will impact Pakistan's economy.

POLITICS, GOVERNMENT, AND TAXATION

Democracy has not yet taken root in Pakistan. The military has intervened several times in Pakistan's history and has always remained an important political player even when not in power. A military intervention occurred as recently as 12 October 1999, when elected institutions were suspended. Under the suspended constitution, the parliament consists of 2 houses: a National Assembly elected directly through universal suffrage (voter eligibility begins at 21 years of age), and a Senate elected by the provincial legislatures. The prime minister is the head of government and is elected by and from the National Assembly. The president is the head of state and is chosen by an electoral college consisting of the National Assembly, the Senate, and the provincial assemblies. The constitution requires that the president be a Muslim and provides for a 5-year term. For all practical purposes, the prime minister has to be a Muslim as well.

Each of Pakistan's 4 provinces had its own directly elected provincial assembly, a government headed by a chief minister, and a governor appointed by the president upon recommendation by the prime minister. After 12 October 1999, however, provinces had only governors, with no assemblies or chief ministers. The 217-member National Assembly is elected for a 5-year term and the 87-member Senate for a 6-year term. The National Assembly seats are currently divided, with 8 going to the Federally-Administered Tribal Areas (FATA), 1 to the federal capital of Islamabad, and 10 additional seats reserved for religious minorities. Each of the 4 provinces has 19 senators; there are 8 senators from the FATA and 3 from the federal capital area. Indirect elections for half the members of the Senate are held at 3-year intervals.

The constitution guarantees an independent judiciary. The supreme court is the highest court in the country; high courts in the provincial capitals of Lahore, Karachi, Peshawar, and Quetta stand at the head of the provincial judicial systems. In principle, Pakistan's press publishes freely. However, self-censorship is widely practiced by journalists, and advertising and other tactics are used by the government to influence media content. About 90 percent of Pakistan's paper-reading public reads papers and magazines in the Urdu language which are not noted for their objectivity, fairness, or accuracy. The electronic media are strictly controlled by the state and are notorious for their propaganda against domestic political opposition and India.

Pakistan came into existence in August 1947 with the partition of British India and has had a turbulent political history ever since. The country was designed to be the homeland for Muslims living in British India. The creation of a separate Muslim nation was accomplished largely through the efforts of Mohammed Ali Jinnah, Pakistan's first governor general, who is also remembered as "Quaid-e-Azam" (The Great Leader). Between 1947 and 1948, Pakistan and India fought the first of 3 wars over the Muslim-majority territory of Kashmir, claimed by both states. The conflict ended in a stalemate. Kashmir continues to be a disputed territory and the principal subject of discussion within the Pakistani establishment and media.

Initially, Pakistan consisted of 2 parts: East Pakistan and West Pakistan, separated by 1,610 kilometers (nearly 1,000 miles) of Indian territory. In 1970 general elections resulted in the Awami League sweeping the East Pakistan seats to gain a majority in Pakistan as a whole. The Pakistan People's Party (PPP), founded by Zulfikar Ali Bhutto, won a majority of the seats in West Pakistan. The outcome was a country completely divided, with neither major party having support in the other area. Negotiations to form a coalition government broke down, and a civil war ensued. In 1971, the eastern section declared itself the independent nation of Bangladesh. Leadership of the western part of Pakistan was handed over to Bhutto, who became prime minister and the first civilian chief martial law administrator.

In July 1977, Bhutto was deposed by the chief of army staff, General Zia-ul-Haq, who became president in 1978. (Bhutto was executed in 1979.) Under Zia, the government of Pakistan became increasingly Islamized and benefited from supporting mujahideen (holy warriors) efforts to counter the Soviet invasion of Afghanistan. General elections were held in November 1988 after General Zia died in a plane crash, and the PPP, headed by Benazir Bhutto, daughter of the late prime minister, won a majority of seats in parliament and formed a coalition government. In August 1990, President Ghulam Ishaq Khan exercised his right under the constitution to dissolve the National Assembly, dismiss the prime minister, and call for new elections. In the general election held in October 1990, the Islamic Democratic Alliance won the largest number of seats, and Mian Nawaz Sharif, leader of its largest component party, the Pakistan Muslim League (PML), became prime minister. Nawaz Sharif, the first industrialist to lead Pakistan, continued a trend toward **liberalization** of the economy and pro-

motion of private sector growth, though largely unsuccessfully.

In 1997, Nawaz Sharif was re-elected prime minister with a substantial majority, but on 12 October 1999 his government was removed in a bloodless military coup. The chief of army staff, General Pervez Musharraf, took over as "chief executive," suspended the constitution, established a military-dominated National Security Council as the country's supreme decision-making body, and named a mostly civilian cabinet. Many western countries, led by the United States—Pakistan's Cold War ally and partner in the jihad (holy war) of the 1980s that expelled the Soviets from neighboring Afghanistan—tolerated the coup, even though it seemed a throwback to a pre-Cold War era. After the nuclear standoff with India over the Kashmir dispute, it seemed favorable to have the army in command rather than have Islamists take over the country from a run-down civilian government.

Upon assuming power, General Musharraf set an ambitious reform agenda, which included fighting corruption, devolving power to the local level, and fighting sectarianism. In May 2000, the supreme court validated the coup, but gave General Musharraf 3 years from 12 October to return to a civilian government. Musharraf agreed to this time frame. Tensions with India, religious sectarianism, corruption, and political uncertainty are among the many challenges his government faces.

Plans have been put forward to implement well-designed and comprehensive civil service reforms. These reforms, as favored by the World Bank, could foster economic growth and sustained poverty reduction by reducing the obstacles to private sector development that the poorly performing public sector now creates. They are also designed to expand access of the poor to good-quality basic social services, and address serious problems of governance, such as corruption. The country's civil service is largely unchanged since the days of British colonial rule and is characterized by rigid, often irrelevant, and unevenly enforced rules and mismanagement. The erosion of **real wages** even of high-level officials (which is the consequence of high rates of **inflation** without attendant pay raises in the civil service) add to the factors that have eroded accountability and transparency, and led to widespread corruption. At the same time, the government is burdened by wage costs and rising pension costs, which are making important non-wage expenditures impossible.

An economic team, headed by the finance minister, has identified tax reform as the single most urgent measure needed to hold Pakistan together. Without a rise in tax revenues the state will simply not have the money to tackle any of the major problems facing the country. Economists warn that Pakistan must eventually raise its annual tax collection to 20 percent of GDP, up from a range of 10.7 to 15.5 percent in the past decade, to begin balancing its budget. At the moment, annual tax revenues just about pay for debt servicing and national defense, leaving other crucial areas to be financed through more loans. Only about 1 percent of the country's population of nearly 140 million pay **income tax**.

INFRASTRUCTURE, POWER, AND COMMUNICATIONS

Pakistan's infrastructure is poor and suffers from decades of neglect. Roads and railways are insufficient and in poor condition. Both the telephone system and the provision of electricity are hampered by corrupt and inefficient governmental service providers, which increasingly face competition from private entrepreneurs.

TRANSPORTATION. Pakistan has a total of 247,811 kilometers (153,990 miles) of roads, of which 141,252

SOURCE: CIA *World Factbook 2001* [Online].

kilometers (87,774 miles) are paved. There are only 339 kilometers (211 miles) of expressway. Almost 90 percent of Pakistan's freight and passenger traffic travels by road. The major north-south and east-west link is Lahore and Rawalpindi to Peshawar and carries over half of Pakistan's goods and passenger traffic. The World Bank reports that Pakistan's road network is notable for its poor condition. Over two-thirds of paved arterial roads are not wide enough for 2 lanes. At both federal and provincial levels, Pakistan provides insufficient funding for road maintenance. According to the World Bank, these poorly maintained roads can result in 30 to 40 percent higher transportation costs.

Trains, the classic means of public transportation in British India, diminished in importance during the last decade of the 20th century. There are 8,163 kilometers (5,072 miles) of railway tracks. Pakistan Railways, an autonomous agency under the Ministry of Railways, operates the railroad system. Over the past 15 years, there has been a marked shift in freight traffic from rail to highways, a trend that the government hopes to stabilize and reverse. Railways carry about 15 percent of freight traffic and road vehicles 85 percent. The rail system comprises 781 stations. Rolling stock includes about 550 locomotives, 4,250 passenger coaches, and 32,000 freight cars. Pakistan Railways plans to improve railroad's share of long-haul freight traffic, upgrade track to permit trains to operate at higher speeds, and rehabilitate infrastructure to make better use of capacity.

Pakistan's major ports are Karachi and Port Muhammad bin Qasim, where Pakistan's merchant fleet of 20 ships is based; the country also has 2 proposed sites for future facilities at Gwadar and Pasni, both on Baluchistan's Makran Coast. Karachi is the main port, handling the majority of all dry and liquid cargo. During 1999 and 2000, Karachi Port handled 18 million tons of cargo, an increase of 2.4 percent from the preceding year. Port Qasim during the same period handled 9.5 million tons of cargo, showing an impressive increase of 19 percent over the corresponding period. To facilitate this expansion, the Pakistani government has allowed 2 shipping companies to construct and operate specialized integrated container terminals at Port Qasim and on Karachi's West and East Wharves.

The government-owned national air carrier, Pakistan International Airlines (PIA), has a fleet of 48 planes and serves 35 domestic and 37 international destinations. Karachi's Quaid-i-Azam International Airport, whose Jinnah Terminal opened in August 1992, is the principal international gateway to Pakistan, although Islamabad, Lahore, Peshawar, Faisalabad, and Quetta also have a number of international flights. In line with plans to continue modernizing and upgrading its civil aviation facilities, a new international airport is being constructed at Lahore. New airports and improvements in runways are also planned for Islamabad and other cities. The government recently opened the domestic aviation market to private sector competition. As of July 2000, 3 private airlines—Aero Asia, Shaheen Air, and Bhoja Air—are operating on local and international routes, while a fourth private sector airline, Safe Air, is operating on domestic routes only.

POWER. The combined generating capacity of the 2 public energy producers and distributors—the Water and Power Development Authority (WAPDA) and the Karachi Electricity Supply Corporation (KESC)—reached 11,701 megawatts (MW) in 1999–2000. Private producers contributed an extra 4,674 MW, bringing the total installed capacity to 16,375 MW. Pakistan's energy supply comes from a combination of oil (42.8 percent), natural gas (38.6 percent), water (12.8 percent), coal (5.2 percent), liquid petroleum gas (0.4 percent), and nuclear production (0.2 percent). Pakistan has faced chronic energy shortages, and domestic energy demand has outstripped supply. The development of the energy sector remains a high priority. From July 1998 to June 1999, the largest electricity consumption was by the industrial and transport sectors (34.4 percent each), followed by domestic (22.1 percent), commercial (3.2 percent), agriculture (3.0 percent), and other government sectors (2.9 percent). Pakistan's commercial energy demand is estimated to double over the next 10 years and, despite recent gas discoveries, the energy shortfall is expected to increase.

Even after recent rationalization of power **tariffs**, industrial and commercial tariffs are quite high in Pakistan. Nevertheless, the state-run WAPDA remains close to bankruptcy due to numerous unpaid bills. Unpaid bills (many in dispute) mounted from R15 billion at the end of June 1998 to R28 billion by the end of February 1999. KESC, which is supposed to be privatized, owes WAPDA R8 billion. The government reacted by using armed forces personnel to collect overdue electricity bills from private consumers and to check for theft of electricity. The successful drive against illegal connections led to a fall in sales demand as illegal connections were removed by WAPDA as well as by the consumers themselves. Although bill collection from private consumers is greatly improved, collection from government agencies is still a serious problem.

TELECOMMUNICATIONS. Pakistan has a mediocre but improving domestic telephone system. Service is adequate for government and business use, in part because major businesses have established their own private systems. Since 1988, the government has promoted investment in the national telecommunications system on a priority basis, significantly increasing network capacity. However, despite improvements in urban systems, telecommunication services are still not readily available to the majority

of the rural population. There were 2.861 million fixed lines in 1999 and another 400,000 applications are being processed, yet Pakistan's Telecommunication Corporation (PTC) is meeting less than half of this demand each year. One reason is that much of the demand is from customers in rural areas where two-thirds of the population lives and where the payback takes much longer and is less lucrative.

In December 1990, the Pakistan Telephone and Telegraph (PTT) Department, which was directly controlled by the Ministry of Communications, was converted into the Pakistan Telecommunications Corporation (PTC), which still is the only provider of basic telephone services. PTC today employs 60,000 civil servants and is the country's most lucrative state-owned franchise. PTC earned net profits of about R18 billion on sales of R60 billion in the first half of 2001. Nevertheless, the government is eager to privatize PTC by first selling 26 percent ownership to a "strategic investor," and then selling further parts after the firm is on a solid footing. This new urgency to sell parts of PTC stems from a desire to lay a telecom infrastructure that supports a wider ambition. Pakistan, with an eye on India's IT success, wants to develop a software sector, but IT companies will invest only if they have access to affordable bandwidth capacity. Since private-sector inflows are necessary to achieve this goal, the sector is being **deregulated** in rapid fashion.

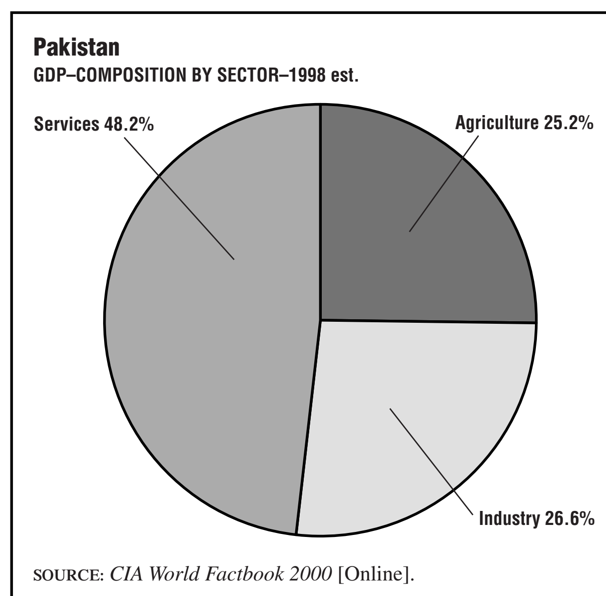
At present there are 3 cellular mobile phone operators. Cellular phones are a small market, with a penetration of only 0.24 percent, but it is growing quickly as deregulation lowers tariffs and as the cost of handsets falls. In 1998, there was only 1 operator, which had 158,000 subscribers. The current 350,000 cellular phone subscribers is forecast to swell to 1 million by 2003. There were 49 radio stations in 1998, broadcasting to about 13.5 million radios. In 1997, the country had 22 television broadcast stations, and Pakistanis owned 3.1 million televisions. In 1999, there were 26 different Internet service providers (ISPs); by 2000, this number had increased above 30 ISPs. Internet bandwidth usage grew heavily as access expanded from 29 cities in August 2000 to 350 population centers in a 4-month crash program. The number of Internet accounts is about 150,000, sharpening a market struggle between several Internet service providers.

Pakistan's IT policy focuses on education, and the budget reflects the emphasis: the allocation to science and technology went from R120 million in 2000 to R5 billion in 2001. The aim is to equip and upgrade universities; train teachers and public servants; improve economic rewards for PhDs; draw women into the IT net by training them for, say, medical transcription services; and teach the computer language Java on a mass scale, especially to the large number of jobless young people. At the same time, 15-year tax breaks are being offered to create the right business environment for foreign investment.

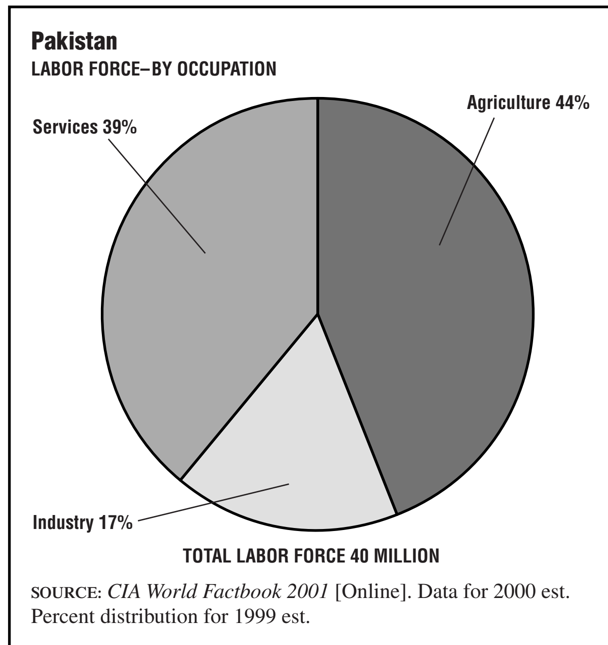
ECONOMIC SECTORS

Services dominate the Pakistani economy. In 1998, they contributed 48.2 percent to GDP, while agriculture and industry each accounted for about a quarter of **gross domestic production** (25.2 percent and 26.6 percent, respectively). After the crisis following the nuclear standoff with India and the subsequent international **sanctions** against Pakistan in May 1998, **value-added** large-scale manufacturing was projected to grow by only 2.4 percent in 1998–99, sharply down from 6.2 percent in 1997–98. Growth of the agricultural sector, too, was expected to be only about half the level of the previous year. The manufacturing sector has seen dramatic fluctuations, averaging 9 percent per year during the first 2 decades of independence, but dropping to less than 3 percent in the 1970s, when large-scale **nationalization** significantly reduced investment levels. The rate recovered in the 1980s, averaging 7.6 percent, but fell back to 3.9 percent in the 5 years prior to 1999–2000.

A common feature in developing countries is the **informal sector**, often making up a good deal of the services sector. The popular view of informal sector activities is that they are primarily those of petty traders, smugglers, drug traffickers, street **hawkers**, shoeshine boys, and other groups **underemployed** on the streets of the big towns. Evidence suggests that the bulk of employment in the informal sector, far from being only marginally productive, is economically efficient and profit-making, though mostly small in scale and limited by



SOURCE: *CIA World Factbook 2000* [Online].



SOURCE: *CIA World Factbook 2001* [Online]. Data for 2000 est. Percent distribution for 1999 est.

simple technologies and little capital. The informal sector employs a variety of tradesmen offering virtually the full range of basic skills needed to provide goods and services for a large though often poor section of the population. Persons employed in this sector are not documented, meaning they do not have access to public services and do not pay income tax. The informal sector also includes the heroin manufacturers flourishing in the North-West Frontier Province and Baluchistan, who compensate for the bareness of their soil and the neglect of successive central governments by resorting to the "**black market**" economy, notably the processing of opium, grown in neighboring Afghanistan, into heroin. Smuggling across the porous border with Afghanistan is also a large constituent of the economy. However, the opium smuggling trade with Afghanistan will no doubt be undercut by the U.S. bombing campaign in Afghanistan, which targeted Afghani poppy fields as well as Taliban military operations. Acting in cooperation with the United States, Pakistan officially closed its border with Afghanistan, which could also stem the flow of drugs into Pakistan.

AGRICULTURE

Agriculture is a vital sector of Pakistan's economy and accounted for 25.9 percent of GDP in 1999–2000, according to government estimates. The sector directly supports three-quarters of the country's population, employs half the **labor force**, and contributes a large share of foreign exchange earnings. The main agricultural products are cotton, wheat, rice, sugarcane, fruits, and vegetables, in addition to milk, beef, mutton, and eggs. Pakistan depends on one of the world's largest irrigation systems to support production. There are 2 principal seasons. Cotton, rice, and sugarcane are produced during the *kharif* season, which lasts from May to November. Wheat is the major *rabi* crop, which extends from November to April. The key to a much-needed improvement of productivity lies in a more efficient use of resources, principally land and water. However, change is dependent on the large landowners who own 40 percent of the arable land and control most of the irrigation system, which makes widespread reform difficult. Assessments by independent agencies, including the World Bank, show these large landholdings to be very unproductive. Pakistan is a net importer of agricultural commodities. Annual imports total about US$2 billion and include wheat, edible oils, pulses, and consumer foods.

Pakistan is one of the world's largest producers of raw cotton. The size of the annual cotton crop—the bulk of it grown in Punjab province—is a crucial barometer of the health of the overall economy, as it determines the availability and cost of the main raw material for the yarn-spinning industry, much of which is concentrated around the southern port city of Karachi. Official estimates put the 1999–2000 harvest at some 11.2 million 170-kilogram bales, compared with the 1998–99 outturn of 8.8 million bales and the record 12.8 million bales achieved in 1991–92. The government recently actively intervened in the market to boost prices and to encourage production. A major problem is that the cotton crop is highly susceptible to adverse weather and pest damage, which is reflected in crop figures. After peaking at 2.18 million tons in 1991–92, the lint harvest has since fluctuated considerably, ranging from a low of 1.37 million tons in 1993–94 to a high of 1.9 million tons in 1999–2000.

The 2000–01 wheat crop was forecast at a record 19.3 million tons, compared to 17.8 million tons produced during the previous year. This increase is due largely to favorable weather and a 25-percent increase in the **procurement** price to about US$135 per ton. About 85 percent of the crop is irrigated. Despite the record production, Pakistan will continue to be a major wheat importer. The government has imported an average of US$2.4 million annually over the past 5 years. The United States and Australia are the major suppliers. Demand for wheat is increasing from Pakistan's rapidly growing population as well as from cross-border trade with Afghanistan.

Pakistan is a major rice exporter and annually exports about 2 million tons, or about 10 percent of world trade. About 25 percent of exports is Pakistan's famous fragrant Basmati rice. Rice is Pakistan's second leading source of export earnings. Private traders handle all exports. Pakistan's main competitors in rice trade are Thailand, Vietnam, and India.

Tobacco is grown mainly in the North-West Frontier Province and Punjab and is an important **cash crop**. Yields in Pakistan are about twice those for neighboring countries largely due to the extension services provided by the industry. Quality, however, is improving only slowly due to problems related to climate and soil. Farmers have started inter-cropping tobacco with vegetables and sugarcane to increase returns. About half of the total production is used for cigarette manufacturing and the remainder used in traditional ways of smoking (in hand-rolled cigarettes called birris, in water pipes, and as snuff). The share of imported tobacco is increasing gradually in response to an increased demand for high-quality cigarettes.

Minor crops account for only 5 percent of total cultivated area; these include oilseeds (sunflower, soybean), chilies, potatoes, and onions. Domestic oilseed production accounts only for about 25 percent of Pakistan total edible oil needs. As a result, Pakistan spends more than US$1 billion annually in scarce foreign exchange to import edible oils, while its oilseed processing industry operates at less than 25 percent of capacity due to an inadequate supply of oilseeds. For 2000–01 total oilseed production was forecast to decrease 10 percent to 3.6 million tons. The government has highlighted development of the oilseed sector as a priority.

Pakistan's fishing industry is relatively modest, but has shown strong growth in recent years. The domestic market is quite small, with per capita annual consumption of approximately 2 kilograms. About 80 percent of production comes from marine fisheries from 2 main areas, the Sindh coast east from Karachi to the Indian border, and the Makran coast of Baluchistan. Ninety percent of the total marine catch is fish; the shrimp which constitute the remainder are prized because of their greater relative value and demand in foreign markets. During 1999–00, total fish production was 620,000 tons, of which 440,000 tons consisted of sea fish and the remainder were fresh-water species. About one-third of the catch is consumed fresh, 9 percent is frozen, 8 percent canned, and about 43 percent used as fish meal for animal food.

Livestock accounts for 40 percent of the agricultural sector and 9 percent of the total GDP. Principal products are milk, beef, mutton, poultry, and wool. During 1999, the livestock population increased to 120 million head. That same year Pakistan generated 970,000 tons of beef, 640,000 tons of mutton, and 190,000 tons of poultry. In an effort to enhance milk and meat production, the government recently launched a comprehensive livestock development project with Asian Development Bank assistance. Poultry production provides an increasingly popular low-cost source of protein. Modern poultry production is constrained by high mortality, high incidence of disease, poor quality chicks, and poor quality feed, combined with an inadequate marketing system. Frozen poultry have only recently been introduced.

Forests cover an area of 4.2 million hectares or about 5 percent of the total area of Pakistan. The principal forest products are timber, principally for house construction, furniture, and firewood. Many of the country's wooded areas are severely depleted as a result of over-exploitation. The government has restricted cutting to protect remaining resources—though corruption often jeopardizes environmental efforts—and has lowered **duties** to encourage imports. Forestry production has since declined from 1.07 million cubic meters in 1990–91 to 475,000 cubic meters in 1998–99. Pakistan imports an estimated US$150 million of wood products annually to meet the requirements of a growing population and rising demand by a wealthy elite.

INDUSTRY

Pakistan, which had almost no large industrial units at the time of partition in 1947, now has a fairly broad industrial base, and manufacturing accounts for about 17 percent of GDP. Cotton textile production is the single most important industry, accounting for about 19 percent of large-scale industrial employment. Cotton yarn, cotton cloth, made-up textiles, ready-made garments, and knitwear collectively accounted for nearly 60 percent of Pakistan's exports in 1999–2000. Other important industries are cement, vegetable oil, fertilizer, sugar, steel, machinery, tobacco, paper and paperboard, chemicals, and food processing. The government is attempting to diversify the country's industrial base and to increase the emphasis on export industries. Small-scale and cottage industries are numerically significant but account for a relatively small proportion of the GDP at about 6 percent. Small-scale industry includes facilities, which employ fewer than 50 workers, and cottage industries (industrial units in which the owner works and is aided by family members but employs no hired labor). In 1999, industrial production grew by 3.8 percent.

Privatization of many state-owned enterprises is a key element of Pakistan's reform program. In 1991, the government identified a group of 118 state-owned industrial units for privatization. Of these, 97 units have been sold off. Industrial units—including factories producing cement, chemicals, automobiles, food products, etc.—have mainly attracted domestic private investors. The government plans to spend 90 percent of privatization proceeds for debt repayment and 10 percent for poverty alleviation. The government has laid out a time frame for privatization of various organizations in the financial, oil and gas, power, industrial, and telecommunication sectors, and the privatization process is to be

completed by 30 June 2002. In most cases, the government aims to find "strategic investors" to buy up a certain stake of these firms and gain management control. The privatization process is a very complex undertaking, since new regulations of private sector entities in these sectors are still being established.

MINING/HYDROCARBONS. Unless there are major new discoveries, crude oil production—which satisfies under 18 percent of the country's requirements, compared with 35 percent in 1991–92—will ultimately run out. Recoverable reserves were estimated at 225 million barrels. Crude oil and related product imports cost R100.4 billion (US$1.7 billion) during the first 9 months of 1999–2000, accounting for 25.9 percent of all imports.

There have been promising gas discoveries in recent years. Natural gas production averaged 2.22 billion cubic feet per day in 1999–2000, about 10 percent above the previous year, while known recoverable reserves were estimated at over 19.5 trillion cubic feet at the end of March 2000. The government faced the prospect of buying this gas at international oil prices, since it had earlier promised to do so. However, it can hardly afford the price, which caused problems with the gas exploration companies.

There is an extensive range of non-fuel minerals. Deposits of limestone, marble, china clay, dolomite, gypsum, silica, ochre, sulfur, barytes, bauxite, iron ore, and emeralds are being exploited, but all on a very low scale. International exploration and development companies would, if they could, flock to Baluchistan, which is believed to possess massive reserves, particularly of natural gas. The problem is that the province's tribal chiefs, over whom the central government exerts little control, have been demanding too high a price for permission to drill. Most of the foreign companies initially awarded concessions were not able to make use of them when faced with obstruction from Baluchi tribesmen. An exception is the country's biggest development project in the remote Chagai district of Baluchistan, where the Metallurgical Construction Corporation of China is mining blister copper. It is also hoping to exploit some of the area's gold and silver reserves.

MANUFACTURING. Before 1947 there was little manufacturing in the area that makes up present-day Pakistan. Its primary role was as a supplier of raw materials, including cotton, to industrial hubs across British India, such as Bombay. In general, manufacturing still works with relatively basic technologies, generates few value-added products, and has a narrow production base, i.e., it does not diversify into many different product groups. Textiles are Pakistan's primary industry, and in 1999 accounted for 8.5 percent of the gross domestic product, 31 percent of total investment, 38 percent of industrial employment, and almost 60 percent of total exports. Pakistan is Asia's eighth-biggest textiles exporter, with export revenues of US$5.7 billion in the first half of 2000. Export growth has been declining since a recent peak of 6.1 percent in 1996. The trend is reversing, encouraged by large cotton crops in the past 2 years which have lifted output to about 11 million bales (each bale weighing 170 kilograms), the bulk of which is consumed at home, and large-scale capital investment to modernize plants. However, progress is still expected to fall short of targets, notably to be among Asia's top 5 exporters with sales of US$14 billion by 2005.

As a rule, large textile firms concentrate on spinning and weaving, leaving garment manufacturing to highly fragmented small to medium-scale producers. The industry, particularly its spinning and weaving sectors, has been under pressure since the mid-1990s, owing to increased competition in the international market, financial mismanagement within the industry, and rising global demand for value-added textiles, as well as the increase in production capacity in other developing countries. Pakistan's textile sector must move to higher value-added production to meet challenges and opportunities beyond 2005, when quotas are removed and tariff barriers lowered, as mandated by the World Trade Organization (WTO). This will expose Pakistan's mills to intense competition from China, Asia's largest textile exporter.

Food processing is a large industry, generating an estimated 27 percent of value-added production and making up 16 percent of the total employment in the manufacturing sector. Major sub-sectors of Pakistan's food industry are cooking oils and hydrogenated vegetable oils, sugar, flour, tea, dairy products, beverages, and canned foods. The fish, meat, and fruit and vegetable sectors remain underdeveloped, partly for lack of adequate infrastructure, including storage and transportation facilities. A small quantity of processed foods is imported to feed a few supermarkets catering to the country's elite. The vast agricultural resources and the country's geographic location make Pakistan an ideal country for investment in the food sector. Several foreign firms have entered the market and established their own presence as manufacturers, or established **joint ventures** with local partners. The fastest growing sectors are beverages—including carbonated soft drinks and juice and juice-flavored drinks—poultry, and edible oils.

Pakistan Steel, with an annual capacity of 1.1 million tons, is Pakistan's only integrated steel plant. It is located near Port Bin Qasim, 25 kilometers (15.5 miles) east of Karachi. The steel mill was constructed with technical assistance from the former Soviet Union, and currently employs about 20,000 workers. Iron ore, manganese, and cocking coal for the plant are all imported.

Leather is one of the major foreign exchange earners for Pakistan. The leather and leather products indus-

try is labor-intensive (directly employing more than 200,000 workers), and there are over 500 tanneries in Pakistan. The recent growth of the industry is due in large part to its successful progression from the export of raw hides and skins and semi-processed leather towards high value-added finished leathers and leather products (including leather jackets, gloves, footwear, and sporting goods). The tanning sector is concentrated in Punjab, where manufacturing units process primarily buffalo and cow hides; tanneries in Sindh process primarily goat and sheep skins. The local market for leather is limited, and about 80 percent of production is exported. More sophisticated machinery and productivity increases can be expected to further boost exports. Pollution, especially through tannic acid and dyes, is a serious problem for this industry.

SERVICES

In 2000, services contributed about 49 percent to GDP. Wholesale and **retail** trade alone accounted for 14.9 percent of GDP, while transport, storage, and communications contributed 10.1 percent, public administration and defense 6.3 percent, ownership of dwellings another 6 percent, and finance and insurance 2.5 percent. Other services contributed 9.3 percent to GDP.

FINANCIAL SERVICES. A ruling by the Pakistani supreme court in December 1999 obliged the government under General Pervez Musharraf to finalize arrangements for an Islamic banking system by the end of the 2001 financial year. The issue of converting to an Islamic banking system, under which fixed interest is abolished in favor of a regime where profits and losses are shared between depositors and borrowers, has never been as central in the country's history as it is now. Some of the existing instruments, such as leasing, are considered compatible with Islam and could be offered on a wider variety of products to respond to demand. Bankers assert that once the issue of Islamic banking is resolved Pakistan will launch the privatization of 1 or 2 of its 3 large public sector banks: Habib Bank, United Bank, and National Bank.

Financial reforms introduced in 1990 have liberalized Pakistan's banking sector, which had long been dominated by state-owned banks, and private banks are gradually playing a more significant role. In December 1990, the government announced plans to privatize state-owned banks and to allow the establishment of private domestic banks. As of 2001 the government had privatized 2 formerly nationalized banks: Allied Bank Limited (ABL) and Muslim Commercial Bank. There are 44 banks operating in the country, of which 25 are domestic, while 19 are foreign banks. The 25 Pakistani commercial banks have over 8,000 branches nationwide. Commercial banks are engaged predominantly in corporate lending. Consumer banking in Pakistan is largely undeveloped. There is no tradition of lending to small individual consumers, and purchases of automobiles, housing, and **consumer goods** are generally made on a cash basis. High interest rates combine with high start-up costs to discourage initiatives in the consumer sector.

In 1996, the banking system was on the verge of collapse due to the breakdown of governance and loss of financial discipline. Over the years there had been widespread political interference in both lending and loan recovery by banks, and borrowers had come to expect not to repay loans they took, especially from the state-owned banks. As a result, the stock of **non-performing loans** (NPLs) grew by almost 600 percent between the end of June 1989 and the end of June 1998, when the total amount of NPLs stood at R146 billion. Since December 1997 a reform program has been implemented, with support from the World Bank. Corporate governance has been improved through changes in management of the state-owned banks and protection given to the new management from political interference. The legal and judicial processes for recovery of loans have been strengthened. Operating losses have been reduced through staff separations and closures of non-viable bank branches. Much remains to be done to further strengthen banking regulation and supervision, and develop a well-functioning legal and judicial system. At the same time, privatization needs to be accelerated while ensuring that banks are sold to sponsors that bring in internationally recognized good corporate governance.

COMMERCE. Commercial activities such as wholesale and retail trade have the largest share of business in the service sector at around 30 percent.

In 2000, General Pervez Musharraf, the military ruler, ordered his troops to accompany teams of tax inspectors to visit neighborhoods to collect information on the expenditures of individual Pakistanis. The move sparked resistance from traders in parts of the country, eventually forcing the government to make some concessions. Many of the tax board's employees are poorly paid and have wide-ranging powers, a combination that breeds corruption. Businessmen complain of being harassed by tax officials and subjected to complicated bureaucratic procedures as penalties for not paying bribes. Concessions made to traders included the abolition of a newly introduced general sales tax at retail level. This measure did not meet International Monetary Fund (IMF) conditionality, and the organization subsequently stalled the payment of a sizeable adjustment loan.

TOURISM. The number of foreign tourist arrivals in the South Asia region was 5 million in 1998; Pakistan's share of tourist arrivals in this region was 7.6 percent. More than half of foreign tourists in 1999 traveled to Pakistan to visit friends and relatives, followed by business travelers (18.3

percent), holidays and recreational travelers (13.4 percent), and religious tourists (2.5 percent). Most of the total tourists from overseas visited main cities like Karachi, Rawalpindi/Islamabad, and Lahore. Of the 420,000 tourists visiting in 1999, the largest share of around 125,000 came from the United Kingdom, mostly native Pakistanis working and living in Great Britain.

INTERNATIONAL TRADE

The external sector was seriously affected by the economic sanctions imposed on Pakistan after it conducted nuclear tests in May 1998. The lack of foreign investor confidence following the freeze on foreign currency deposits led to a decline in foreign private capital inflows and a sharp decline in money sent home from citizens working abroad, or so called "workers' **remittances**." The level of **foreign direct investment** declined by 32.1 percent per year to a low of US$296 million in 1998–99, according to official data. Remittances from Pakistanis abroad, most of them in the Gulf, the United Kingdom, and North America, peaked at US$2.89 billion in 1982–83, but fell to under US$1.5 billion in 1998–99. These adverse developments, along with suspension of new economic assistance by major donors, pushed Pakistan's foreign exchange reserves down from US$1,533 million at the end of April 1998 to US$415 million (the lowest level reached during the crisis) by 12 November 1998, hardly sufficient to finance 2–3 weeks worth of imports.

Disappointing foreign sales performances have given Pakistan a trade deficit every year since 1972–73. This is partly due to the narrow range of export products. Five categories of goods—cotton yarn, garments, cotton cloth, raw cotton, and rice—still account for over 60 percent of export earnings. A second major reason is the vulnerability of key products, notably cotton, to droughts, floods, and pestilence. However, there are other reasons for the poor performance, including the small proportion of high value-added goods in the sales mix, low product quality, and poor marketing.

Trade (expressed in billions of US$): Pakistan

	Exports	Imports
1975	1.054	2.161
1980	2.623	5.359
1985	2.744	5.900
1990	5.598	7.388
1995	8.005	11.480
1998	8.501	9.315

SOURCE: International Monetary Fund. *International Financial Statistics Yearbook 1999.*

The United States has long been Pakistan's largest export market, absorbing over 21 percent of total sales in 1999–2000. The United Kingdom, Hong Kong, and Germany have also been major outlets. In recent years, Japan and the United States have alternated as Pakistan's top supplier, although Gulf countries took a bigger share in 1999–2000, reflecting the sharp increase in the cost of oil imports. In 1999, Pakistan exported goods worth US$8.4 billion; it imported goods in the value of US$9.8 billion, creating a trade deficit of US$1.4 billion. Pakistan's main exports are cotton, fabrics, yarn, rice, and other agricultural products, most of which go to the United States (21 percent), Hong Kong (7 percent), the United Kingdom (7 percent), Germany (7 percent), and the United Arab Emirates (5 percent). Imports are mainly machinery, oil and oil-related products, chemicals, transportation equipment, grains, pulses, and flour. They come mainly from the United States (8 percent), Japan (8 percent), Malaysia (7 percent), Saudi Arabia (7 percent), and the United Arab Emirates (7 percent). Exports of goods and services represent roughly 15 to 16 percent of GDP, and imports equal around 18 percent of GDP.

Pakistan is a member of the World Trade Organization (WTO). Though not a member of any regional free trade arrangement, the country is party to 2 arrangements which are progressing toward regional trade liberalization. The Economic Cooperation Organization (ECO), whose founding members are Pakistan, Turkey, and Iran, grants a 10 percent tariff preference on several goods. ECO membership was expanded to 10 in 1993, when Afghanistan, Azerbaijan, and the 5 former Soviet Muslim republics of central Asia were admitted. The second arrangement, the South Asian Association for Regional Cooperation (SAARC), is comprised of India, Pakistan, Bangladesh, Sri Lanka, Nepal, Bhutan, and the Maldives. Because of competition in key export sectors such as textiles among the larger member states, this association is not expected to stimulate regional trade flows. Pakistan's leading regional trading partners are Bangladesh (its former eastern part), India, and Sri Lanka. Pakistan is also a member (along with India and Nepal) of the Asian Clearing Union, which was founded in 1976 and aims to facilitate multilateral payments through the use of currencies of participating countries in regional transactions in order to expand intra-regional trade and save convertible foreign exchange.

MONEY

In June 2001, 1 U.S. dollar equaled 63 Pakistani rupees. The rupee's average value against the dollar had been R12.7 for US$1 in 1982–83. This shows that inflation has been running high since that time. For the decade from 1980 to 1990, the **inflation rate** averaged 7 percent per year, and from 1990 to 1995, it reached an average

of more than 11 percent annually. After the economic crisis that came as a consequence of the nuclear standoff with India and international sanctions against Pakistan in 1998, it went down to about 7 percent again. There are 3 stock exchanges in Pakistan: Karachi, Lahore, and Islamabad. In 2001 the Karachi stock exchange had about 780 listed companies with trading volume increasing from 1.1 million shares a day in 1990 to about 95 million in 2001. Lahore and Islamabad stock exchanges are substantially smaller than Karachi.

The State Bank of Pakistan (SBP), the central bank, controls the money supply and credit, supervises the operations of banks, administers the country's international reserves, and acts as banker to the federal and provincial governments. The government of Pakistan has followed a liberal **monetary policy** from 1999 to 2000 in order to provide cheap credit to the industrial sector. The demand for credit, however, has not come forth from the private sector. Although domestic credit expansion was higher this year due to large borrowing by the government sector, conversion of non-resident foreign currency accounts into rupees, and an increase in liquid reserves, actual growth in money supply has remained stagnant due to low credit demand from the private sector. The government and the SBP are attempting structural reforms in an effort to move toward more indirect, market-based methods of monetary control along with greater autonomy for the SBP. The central bank's autonomy was considerably strengthened with the passage of new banking laws in the State Bank Act in May 1997.

Pakistan's external debt increased significantly during the 1990s, mainly due to growth of private debt. Total external debt, including private sector debt, increased from US$27.5 billion in 1993–94 to US$32.6 billion in 1997–98, equivalent to 50.6 percent of GNP.

POVERTY AND WEALTH

A third of the population of Pakistan lives below the poverty line (34 percent in 1991). While the lowest 10 percent of the population has a share of only 4.1 percent in the overall household income and consumption, the richest 10 percent of the population has a share of 27.6 percent. The slowdown of economic growth in recent years has resulted in an increase in the incidence of poverty in the 1990s. Thus, there is a compelling need for a clear strategy focusing on reviving and sustaining high economic growth in a stable macroeconomic environment (i.e. low fiscal and external deficits with single digit inflation). It includes the provision of quality basic social services—particularly education, health, and drinking water—and an efficient and responsive social safety net program for the very poor. Low inflation in the prices of food and other mass consumption goods are also very important for the welfare of the poor.

Pakistan's human development indicators, especially those for women, fall significantly below those of countries with comparable levels of per-capita income. Only 40 percent of the population is literate (28 percent of women), compared with 49 percent in South Asia and 53 percent in low-income countries. About two-fifths of the population has no access to safe drinking water, and more than half has no access to sanitation. The infant mortality rate of 88 per 1,000 live births is higher than the average of 73 in South Asian countries and 83 for low-income countries. Pakistan's population growth rate of 2.6 percent remains among the highest in the world and frustrates efforts to increase the coverage of social services.

Distribution of Income or Consumption by Percentage Share: Pakistan

Lowest 10%	4.1
Lowest 20%	9.5
Second 20%	12.9
Third 20%	16.0

To address these problems, the government initiated a Social Action Plan (SAP) in 1993. Increasingly, the design and implementation of social service programs involve active participation from communities and nongovernmental organizations (NGOs). To make further progress in the social sectors, the second phase of the SAP was initiated in 1997–98. A key part of the poverty reduction strategy is the provision of adequate basic social services—particularly elementary education and basic health services—to a much higher proportion of the poor. Only through better education and improved health can the life-long earning capacity of the poor be enhanced.

Pakistan is a major transit and consumer country for opiates (opium, heroin, morphine) from neighboring Afghanistan, the world's largest producer of opium. In 2000, Afghanistan cultivated 82,000 hectares of opium poppies, yielding 3,275 metric tons of fresh opium. As a result of the high levels of opium production in the region over the past 2 decades, Pakistan now has one the highest addiction rates in the world. Drug addiction is a common reason for the incidence of poverty for individuals and families. A recent shift to injecting heroin instead of smoking or sniffing it has heightened fears of an HIV/AIDS epidemic.

WORKING CONDITIONS

The workforce comprises of 38.6 million people, growing at an annual average rate of 2.7 percent in 1992–99. There is an extensive export of labor, mostly to the rich Middle Eastern states in the Gulf region, where Pakistanis, alongside Sri Lankis, Indians, and Filipinos find work as cleaners and domestic servants, but also in industry, commerce, and governmental services. The convenience of affordable travel to the oil-rich Arabian Gulf states and the expectation of work opportunities makes those countries attractive destinations for Pakistanis seeking jobs.

Officially, about 7 percent of the workforce is currently unemployed, a crude measure in most countries, but even more so in a country with a massive undocumented labor force. Pakistan's employment statistics are incomplete, omitting a range of wage earners and self-employed persons, male as well as female, in what is termed "the informal sector." According to unofficial estimates, unemployment may reach about 15 percent, and represents a growing problem for the government. With a majority of the population poised to enter a job market with few employment prospects, the provision of jobs, especially in rural areas, is of increasing importance. Due to the low quality or absence of educational services, again particularly in rural areas, there is a lack of skilled labor.

Several attempts have been made to eradicate bonded labor over the past decade in Pakistan, but the system remains partially in place. The bonded labor system is a lending structure in which the debtor/worker is bound to the creditor/employer as long as all or part of the debt remains outstanding. In case of sickness or death, the family of the individual is responsible for the debt, which often passes down from generation to generation. The problem of child bonded labor is especially serious: bonded money is paid to a parent or guardian, who then provides the child to work off the debt. The most severe conditions have been detected among the *haris* (landless tenant farmers) in the Sindh region, as documented by the Human Rights Commission of Pakistan. Some 1,000 laborers surveyed revealed that three-quarters had been subject to physical restraint, such as private jails, and that some 90 percent of the children had been compelled to work. To alleviate this problem the Human Rights Commission of Pakistan has purchased land and set up temporary camps in order for families to take refuge, and the government has allowed haris to settle on government land.

A related but distinct problem is that of child labor. Although most Pakistani children work in the agricultural sector, a large number of children work in urban centers weaving carpets, manufacturing surgical instruments, and producing sporting goods for export. A 1992

UNICEF/Government of Pakistan study reported that 90 percent of the 1 million workers in the carpet industry are children, many of whom began working in the industry before 10 years of age. Just as the data on Pakistan's labor force is unreliable, figures on child labor remain somewhat unclear. Nevertheless, there is little doubt that child labor has assumed massive proportions in Pakistan. The actual total number of working children in Pakistan is probably somewhere between 8 and 10 million.

COUNTRY HISTORY AND ECONOMIC DEVELOPMENT

1930. The idea of establishing a separate state for all Muslims of South Asia is conceived by the poet-philosopher Allama Muhammad Iqbal.

1947. On 14 August, the British divide the crown colony of India into 2 territories: the Republic of India and the future Islamic Republic of Pakistan, essentially establishing separate Hindu and Muslim states. Several millions of Muslims and Hindus are killed in sporadic fighting between the 2 groups as people migrate across the border into the country aligned with their religious affiliation.

1948. On 30 July, Pakistan signs the General Agreement on Tariffs and Trade (GATT), an agreement aimed at regulating international trade.

1950s-60s. Pakistan uses military and economic aid from its Cold-War alliances to create an artificial prosperity.

1970–71. Zulfikar Bhutto's Pakistan People's Party (PPP) wins elections in West Pakistan, while the Awami League wins the overall majority due to its clear victory in East Pakistan. After the ensuing civil war, East Pakistan declares its independence as the People's Republic of Bangladesh. Bhutto becomes prime minister of the remaining Pakistan.

1970s. The 1970s oil boom in the nearby manpower-starved Persian Gulf enables Pakistan to export manpower in large numbers. Money from Gulf workers transferred home to Pakistan in large amounts helps to sustain the economy in the 1970s.

1977–79. The chief of army staff, General Zia-ul-Haq, overthrows Bhutto in a military coup on 5 July 1977 and becomes president in 1978. Bhutto is executed in April 1979.

1980s. Pakistan's opposition to the Soviet invasion of neighboring Afghanistan in late 1979 helps it procure heavy doses of financial aid from Western nations also opposed to the Soviet action. However, when the aid dries up with the end of the Cold War towards the close of the decade, Pakistan's economy becomes saddled with huge amounts of **foreign debt**.

1988. Pakistan returns to democratic rule after Zia-ul Haq dies in an airplane crash. The country once again comes under the rule of the Pakistan People's Party, now led by Bhutto's daughter, Benazir. The constitution is restored with some amendments on 30 December.

1996–97. The Bhutto government is dismissed by the president due to charges of corruption, mismanagement, and involvement in extra-judicial killings. Elections in February 1997 result in an overwhelming victory for the Pakistan Muslim League and Nawaz Sharif, who becomes prime minister.

1998. In May, India and Pakistan both conduct nuclear tests, demonstrating their strength and bringing the region to the verge of nuclear war over the disputed Kashmir province. The ensuing international economic sanctions and the related drying up of most capital inflows lead to severe financial difficulties.

1999. The government of Sharif is overthrown by the chief of army staff, General Pervez Musharraf, who jails Sharif and declares himself chief executive of the state. The supreme court validates the military coup against Sharif but restricts the rule of the chief executive to a period of 3 years.

FUTURE TRENDS

Pakistan's prospects for the immediate future are bleak. There is uncertainty as to the political future of the country; the supreme court legitimized General Musharraf's military coup of 12 October 1999 in the course of 2000, but also restricted the rule of the chief executive to 3 years. Nobody knows whether the country will return to democratic rule or whether this new phase of democracy will be equally dominated by the large landowners and characterized by widespread corruption as it was in the past. Observers warn that Pakistan's economic outlook and the extent to which its communities outside Punjab feel that they live in an unjust system could be the key determinant of the country's political future rather than the system of government it follows. The pending return of Benazir Bhutto, the former prime minister convicted of bribery and corruption, to Pakistan and possibly into politics further complicates the picture. The ongoing dispute with India over the province of Kashmir, where frequent ambushes have led to casualties and brought the 2 countries to the verge of nuclear confrontation, is unlikely to be resolved in the near future.

While Pakistan's military regime earns credit from Western economists for having a deeper commitment to reforms than previous rulers, many add that the pace of change is not fast enough. With a short-term mechanism

in place to service the debt, the long-term challenge is to seek a significant increase in annual export income and large inputs of foreign inward investment. Another challenge to face is the public sector's poor performance. Public sector companies alone run a combined annual deficit equivalent to about 2 percent of GDP. The government promised to begin privatizing some large companies in 2001 and eventually sell some loss-making ones in an attempt to improve the risky state of public finances. It is vital for the country that it keeps the support of the IMF and other donors as it struggles to maintain payments. Improving tax collection in the medium- to long-term is crucial if Pakistan is to maintain repayments on its combined foreign and domestic debt of about US$62 billion, almost equivalent to Pakistan's annual GDP. It is estimated that the country needs at least US$21 billion of aid up to 2004 just for debt repayment, a large figure for a nation with annual exports of less than US$9 billion and reserves of below US$1 billion—sufficient to pay for about 5 weeks of imports.

Pakistan, it seems, has plans for reforms, but the success of its program will ultimately depend on how quickly and comprehensively it can deal with low social indicators, attract investors, and convince lenders that the future management of the economy will be different from the past.

DEPENDENCIES

Pakistan has no territories or colonies.

PALAU

Republic of Palau
Belau

CAPITAL: Koror (a new capital is being constructed on the nearby island of Babeldoab).

MONETARY UNIT: United States dollar ($).

CHIEF EXPORTS: Fish, coconut products, shells, handicrafts.

CHIEF IMPORTS: Foodstuffs, beverages, tobacco, petroleum, cement, machinery, transport equipment, consumer manufactures.

GROSS DOMESTIC PRODUCT: US$160 million (1997 est.) [includes U.S. spending].

BALANCE OF TRADE: **Exports:** US$11 million (1998 est.). **Imports:** US$63 million (1998 est.).

COUNTRY OVERVIEW

LOCATION AND SIZE. Palau is located in the north Pacific Ocean some 2,000 kilometers (1,242.8 miles) north of Australia. It estimated that there are more than 200 islands in a chain running from northeast to southwest, although only 8 are inhabited. The islands are rocky and mountainous, with the highest point being Mount Ngerchelchauus at 242 meters. The largest island is Babeldoab (also spelled Babelthuap). The total land area is 458 square kilometers (176.8 square miles). There are gold deposits (although unmined) and the possibility of further minerals in the seabed within the 200 nautical mile economic zone claimed by the islands. The capital is Koror on Koror Island. However, the constitution calls for the capital to be sited at Melekeok on the nearby island of Babeldoab, and construction is under way to fulfill that requirement. The country is ranked as the fourteenth smallest nation in the world.

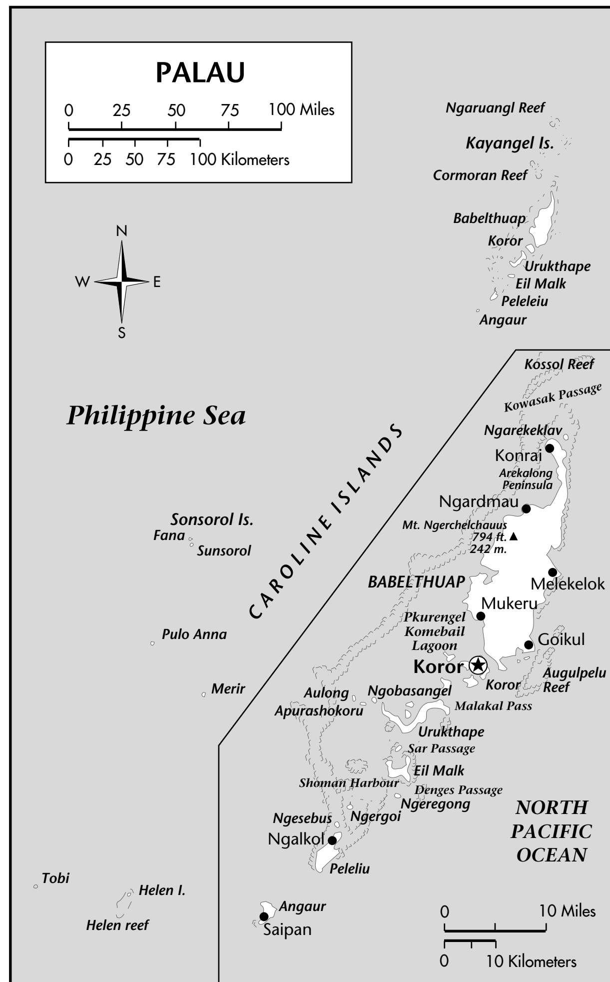
Palau is located in the tropics, and the weather is generally hot and very humid. Temperatures average around 27 degrees Celsius (80 degrees Farenheit), and vary little during the year. A rainy season lasts from May to November, with annual rainfall of around 3,600 milimeters (142 inches). The islands are hit by typhoons from time-to-time, and the main typhoon season is in the second half of the calendar year.

POPULATION. The population was estimated at 18,766 in mid-2000, giving a population density of 41 persons per square kilometer (106 per square mile), quite a bit lower than the neighboring Marshall Islands, which have a density of 375 persons per square kilometer (971 per square mile). The population was estimated to be growing at 1.8 percent a year in 2000. The birth rate is 20 per 1,000 people, and the death rate is 7 persons per 1,000. Migration is low, with about 90 citizens leaving each year. The average fertility rate is 2.5 children per woman. With this modest rate of population growth, the population can be expected to have most of its population in the working age groups. The 0 to 14 age group contains 27 percent of the population, and the 15 to 64 group contains 68 percent. Five percent are 65 and over. More than half the population live in the current capital, Koror, and urban residents account for 80 percent of the total population.

Almost all the people on the islands originate from Polynesian, Malayan, and Melanesian ethnic groups, and mostly follow the Christian religion, although a local traditional belief, Modekngei, is practiced by more than 30 percent of the population. English is the main official language. In 13 states Palauan is also an official language; in Sonsoral, Sonsoralese is also official; in Tobi, the Tobi language is also official; and in Angaur, Anguar and Japanese are also official. Overall life expectancy is 69 years, with male life expectancy being 65 years and female life expectancy 72 years. The adult literacy rate in 1980 was 92 percent, with 93 percent of adult males and 90 percent of females achieving literacy.

OVERVIEW OF ECONOMY

Given its small population, its inaccessible location, poor **infrastructure**, lack of skilled labor, and the absence



of any significant minerals, it is remarkable that the economy generates as much income for its citizens as it does. **Gross domestic product (GDP) per capita**, at $6,696 in 1998, places Palau in the upper-middle income group of countries in the world economy. This is increased by significant receipts from the United States, which add around 16 percent to the income generated domestically.

Most employment, 89 percent in 1995, was in the services sector. The agriculture sector is very small in terms of both its contribution to total output and employment, while the industry sector is also small and is mainly made up of construction. Fish is the main export, and tourism is the main foreign exchange earner. Almost all commodities, apart from some food, are imported.

Economic growth can vary yearly, affected by fashions in tourism and by the economic conditions in the countries of origin of tourists. Since 1992, the level of GDP has remained almost unchanged, with a zero growth rate over the period. However, the volatility is observed in a fall in GDP of 12.3 percent in 1993 and an expansion of 14.3 percent in 1995.

POLITICS, GOVERNMENT, AND TAXATION

The islands of Palau were originally settled by people from neighboring Pacific islands. In the 16th century, Spain claimed the islands, although Germany was allowed trading rights. With the decline of Spanish influence, the islands came under German control. The Germans established Palau as a protectorate. At the outbreak of World War I, the Japanese took over the islands and administered them under a United Nations (UN) mandate. This was a period of considerable development, with the creation of schools, hospitals, and a change in land tenure that allowed private land rights. By the end of their administration period, the Japanese in Palau numbered 26,000, outnumbering the local inhabitants. During World War II, the United States clashed with the occupying Japanese, and the United States established control of the islands in 1944. From 1947, the United States administered Palau as Trustees for the United Nations. Talk of self-determination for Palau began in 1965. In 1979, Palau approved a constitution, and in 1981 became the Republic of Palau, although not fully independent of the United States. Efforts to have approval for a Compact of Free Association with the United States (which would allow the United States to provide defense and contribute financial support) were continually thwarted by an inability to have the proposals approved by 75 percent of the vote in a referendum. After changing the constitution to allow approval by simple majority, the compact was approved in 1993, and Palau became fully independent in 1994.

The Palau government is a democracy modeled on the United States. Although the country has a long history of traditional tribal rule, democracy has been accepted and any citizen is eligible for high office. The 1979 constitution established a parliamentary government, with 2 houses. The Senate (Oibiil Era Kelulau) has 14 seats, and members are elected for 4-year terms by popular vote. The House of Delegates has 16 members, one for each state, and members are elected by popular vote, also for 4-year terms. Parliamentary candidates contest elections on the basis of their personalities and platforms; there are no party affiliations. There is a president and vice-president. There are 3 levels of court, headed by a Supreme Court, supported by a National Court, and Courts of Common Pleas.

Palau has been successful at blending its traditional heritage with its new democratic government, and that resulting government has helped to mix Palau's traditional economy with its new, more market-oriented one. Land ownership is one example of Palau's success at blending traditional practices with its new economy. As with many Pacific island nations, Palau has a long his-

tory of sharing income and land within a clan and community. Market economies are based on private ownership of land. The Palau government has taken legislative steps to accommodate the traditional sharing of lands with the free market economy by designing laws that provide guidelines for issuing land titles on land traditionally held by a family or clan.

In the year 1997–98, that government revenue (including grants) was anticipated in the budget as 57 percent of GDP. Of this, 59 percent was raised by government tax and other non-tax income, and 41 percent was grants from the United States. **Income tax** raised 11 percent of government revenues (excluding grants), import **duties** 10 percent, gross revenue tax on business 14 percent, other taxes 8 percent, and non-tax revenue (licenses, fees, trust fund income, investment income) 56 percent.

Total spending in 1997–98 was projected at 50 percent of GDP. General administration makes up 57 percent of total government spending, education 14 percent, health 14 percent, and capital expenditures 15 percent. A **budgetary surplus** of 6 percent of GDP was realized. The budget has been in overall surplus from 1992 to 1998, although the annual outcome has varied between a 119 percent surplus in 1994–95 (as a result of a substantial grant from the United States on the final acceptance of the Compact agreement), and a projected deficit of 18 percent in 1997–98.

The main tax rates are: 6 percent on incomes from employment, rising to 12 percent; 4 percent on the gross revenues of businesses; 4 percent on the net incomes of financial institutions; import duties varying between 3 percent (most goods) to 150 percent (tobacco); hotel room tax (10 percent); departure tax ($20); and road tax ($50 to $150).

INFRASTRUCTURE, POWER, AND COMMUNICATIONS

There are 61 kilometers (38 miles) of roads, of which 36 kilometers (22.4 miles) are paved. The road round Babeldaob, 100 kilometers (62 miles) in length, is a major improvement in the road system. The unpaved roads are coral-surfaced roads and provide practical, if bumpy, highways. There are no railways. The main port is on Koror, and this is the only port that is able to receive large ocean-going vessels. The mountainous terrain makes the construction of airports a problem, but there are 3 airports. The only one with a paved runway is the international airport located across from the capital Koror on Babeldoab island.

Palau's electricity is supplied mostly by diesel generators (85 percent in 1996), but the terrain does allow for the construction of dams, and 15 percent of electricity comes from hydroelectricity. In 1996 the Palau generated 200 million kWh. There is some domestic use of bottled gas for cooking. Water supply is adequate.

In 1988, there were an estimated 1,500 land line telephones in use and no mobile telephones. It is to be expected that provision of telephones, both land lines and mobiles, have increased substantially since then. International links are provided by an Intelsat satellite earth station.

The islands had 1 AM radio station and 1 shortwave station in 1998, and in 1997 there was 1 television station, and 11,000 television receivers. The *Palau Gazette* is published monthly by the government, and *Tia Belau* is published bi-weekly in both English and Palauan.

ECONOMIC SECTORS

The services sector dominates the economy, with a large number of **public sector** employees. In 1998, services generated 87 percent of GDP and employed 76 per-

Communications

SOURCE: CIA *World Factbook 2001* [Online].

cent of the **labor force** in 1995. The incomes in this sector are above average. The smallest sector in terms of output is agriculture (which includes fishing), which produced 5 percent of output in 1998 and engaged 9 percent of the labor force in 1995. The industry sector only employed 15 percent of the labor force in 1995, generating 8 percent of GDP in 1998.

AGRICULTURE

Palau does not produce enough food to support itself, mainly because the cost of doing so is higher than the cost of importing needed items. The main crops are coconuts, bananas, root crops such as taro (similar to the potato), vegetables, and tropical fruits. Poultry, pigs, and dairy cows are the main livestock. Crops and livestock generated only about 2 percent of GDP in 1998. Since Palau cannot incorporate any economies of scale in agricultural production, the likelihood of significant increases in the sector are slim. Fisheries generated about 3 percent of GDP in 1998, but output from the fisheries sector appears to be in a steady decline—in 1992, the value of fish landed was almost 4 times greater, and the fishing fleet has halved to 150 vessels in 1998.

Much of the catch from Palau's waters is taken by Chinese and Japanese vessels, and Palau receives income from licence fees of around $200,000 a year. It is felt that there is considerable illegal fishing. In addition, local boats meet with Chinese and Japanese vessels at sea and sell their catches to them, leading to under-recording of the Palau catch.

INDUSTRY

There is little mining and quarrying, being almost entirely the quarrying of coral for construction. The main manufacturing enterprise is a garment factory, employing some 300 workers. Other manufacturing includes bakeries, building material, furniture, and handicrafts, all of which serve the domestic market.

There are 2 power plants at Aimeliik and Malakai. The construction sector is the largest part of the industry sector, and it generates 8 percent of GDP and employs 14 percent of the workforce.

SERVICES

The services sector employs three-quarters of the workforce and generates more than four-fifths of GDP. Transport and communications generate 16 percent of GDP; distribution, restaurants and hotels, 27 percent; financial services 6 percent; and public administration, community and other services, 51 percent.

The banking sector is made up of 3 U.S. commercial banks, 5 domestically-owned commercial banks, and the National Development Bank of Palau (NDBP). Most lending by the commercial banks is made up of consumer loans for construction, travel, and education. The NDBP is responsible for most business loans. There was concern over the operation of the domestically-owned commercial banks in 1999, which were not subject to any banking regulation. A ban was imposed on certain international transactions, as it was thought that the banks were being used for **money laundering**. There have subsequently been U.S.-assisted initiatives to tighten control of the banks.

The publicly-owned Palau National Communication Corporation, by virtue of operating a **monopoly**, generally manages to cover its costs. However, the 1997–98 reduction in tourism, as a result of the Asian economic crisis, led to a fall in the number of lucrative international calls, and the corporation posted a loss.

Tourism is a major source of foreign exchange earnings. In 1997, there were 73,000 arrivals in the Islands, and the sector generated $70 million, equivalent to 53 percent of GDP. The sector is expanding rapidly—in 1993, tourism receipts were $18 million. At present there are 1,200 hotel beds, and a further 560 are planned to be in operation by the end of 2001.

INTERNATIONAL TRADE

Merchandise exports of $11 million in 1997–98 were made up almost entirely of fish products. There are some exports of copra (dried coconut), garments and handicrafts. Exports of seashells for buttons, ornaments, and making lacquers are not recorded, but there is probably a small amount of informal trade. The fishing sector appears to be in a steady decline. In 1992–93, fish exports were around $17.7 million. The decline is partly because of changes in the available fish stocks, as a result of oceanographic factors. In addition, fish prices fell after 1996 as a result of the Asian economic crisis, reducing demand for fish. Exports of fish have also been hindered by a shortage of refrigerated air freight services from Palau. Exports go mostly to the United States and Japan.

Merchandise imports were $52 million in 1997–99. Food products made up 14 percent of imports by value, beverages and tobacco 8 percent, petroleum 25 percent, chemicals 3 percent, machinery and transport equipment 23 percent, and manufactured **consumer goods** 26 percent. The main sources of imports were the United States (40 percent), Guam (18 percent), Japan (13 percent), Singapore (13 percent), and Taiwan (5 percent).

MONEY

Palau uses the U.S. dollar as its currency. This has the advantage of bypassing the expense of running a central bank. Also, the currency is completely convertible,

Exchange rates: Palau

US$	
Jan 2001	1.0000
2000	1.0000
1999	1.0000
1998	1.0000
1997	1.0000
1996	1.0000

Note: US currency is used in Palau.

SOURCE: CIA *World Factbook 2001* [ONLINE].

and price stability is reasonably well ensured, as Palau does not have the ability to print currency. The rate of **inflation** was less than 3 percent a year from 1996–98. The only drawback for "dollarised" economies is that they do not earn the seigniorage (the profit earned from the minting of coins) they would gain if they issued their own currency. The increasing number of countries that have been attracted to using the U.S. dollar in place of a domestic currency has caused the United States to consider sharing some of the seigniorage it earns as a currency issuer.

POVERTY AND WEALTH

There are no figures on the numbers below the poverty line, but given the income level and the structure of the economy, probably less than 10 percent of the population live in poverty. Most of those affected are among the 30 percent of the population living outside Koror, who rely on small-scale agriculture and fishing for their livelihoods. Infant mortality is 18 per 1,000 births in 2000 (in the United States, the rate is 6 per 1,000). The per capita GDP of Palau ($6,987 in 1998) was one-third that of Guam and about one-quarter that of Hawaii. Household and agricultural workers had the lowest wages, while bankers, insurance agents, and lawyers had the highest.

GDP per Capita (US$)

Country	1996	1997	1998	1999	2000
Palau	N/A	8,800	7,100	N/A	N/A
United States	28,600	30,200	31,500	33,900	36,200
Philippines	2,600	3,200	3,500	3,600	3,800
Solomon Islands	3,000	3,000	2,600	2,650	2,000

Note: Data are estimates.

SOURCE: *Handbook of the Nations*, 17th, 18th, 19th and 20th editions for 1996, 1997, 1998 and 1999 data; CIA *World Factbook 2001* [Online] for 2000 data.

Retail workers made up the largest category of wage earners and reported an average yearly wage ($6,044) that was slightly lower than the **GDP per capita**.

A life expectancy in 2000 of 69 years is high, and the level of adult literacy, last surveyed in 1980, was 92 percent. Taken together with its upper-middle income status, these factors, when evaluated by the criteria used by the UN, give Palau a position near the top of the countries with a medium level of human development.

WORKING CONDITIONS

The economically active labor force was estimated at 8,300 in 1988, and 7 percent of the labor force was recorded as being unemployed. However, the unemployment rate has little meaning in an economy like that of Palau—it relates to those registering as looking for jobs in the urban areas as a percentage of the formal labor force. A substantial part of the labor force is in the agriculture and fishing sectors, much of it in small-scale family enterprises outside the formal sector. There are no unemployment benefits, and those without work or support from families or charities cannot survive. It is likely that there is considerable disguised unemployment in the rural areas, with tasks being shared and the work capable of being carried out by a smaller workforce.

COUNTRY HISTORY AND ECONOMIC DEVELOPMENT

1000 B.C. Migration to Palau Islands from other Pacific Ocean islands begins.

1525. Spanish navigator Alonso de Salasar is first European to sight the archipelago of the Caroline Islands, of which present-day Palau is a part.

1529. Alvaaro de Saavedra lands on the Caroline Islands, and claims them for Spain.

1783. British vessel, under Captain Henry Wilson is shipwrecked near Koror, and the crew stays 3 months rebuilding the ship.

1885. Pope Leo XIII, acting as a European mediator, confirms Spanish dominion over the Caroline Islands, while also allocating Germany trading rights.

1899. Spain sells islands to Germany, who begin phosphate mining in Anguar, plant coconuts and begin to reduce the impact of influenza and dysentery which were causing widespread loss of life.

1914. With the outbreak of World War I, Japan assumes control of the islands.

1920. Japan receives a UN mandate to administer the islands, establish schools and land property rights, and develop Koror.

1922. Japan establishes administration of all of its Micronesian territories from Koror.

1944. After fierce fighting between Japanese and American forces, the United States occupies the islands.

1945. Japanese settlers are **repatriated**.

1947. UN assigns the Caroline Islands, as the Trust Territory of the Pacific Ocean, to the United States. The U.S. Navy undertakes day-to-day administration.

1965. Congress of Micronesia formed by delegates from Pacific islands to press for independence.

1967. Commission established to make recommendations on the future government of the islands of Micronesia.

1970. Commission confirms that the peoples of Micronesia have a right to sovereignty, self-rule, and to terminate association with the United States.

1979. Referendum in Palau District approves constitution, which forbids presence of nuclear weapons, including those on visiting vessels.

1981. Constitution comes into effect, and the islands become the Republic of Palau, although not independent of the United States. Haruo Remeliik becomes first president.

1982. The United States signs Compact of Free Association which will allow an independent Palau to rely on the United States for defense and to receive U.S. aid.

1983. Referendum in Palau fails to endorse Compact of Free Association (which allows transit and storage of nuclear materials) by requisite 75 percent of votes cast.

1984. Referendum again fails to endorse Compact.

1985. President Remeliik assassinated. Lazarus Salii elected to succeed Remeliik.

1986. Despite the United States agreeing to observe ban on nuclear material, Compact again fails to be endorsed in 2 successive referenda.

1987. Fifth referendum on Compact fails. President suspends 70 percent of public sector employees on the grounds of financial crisis. Further referendum approves change in constitution to require only simple majority for the endorsement of the Compact. In December, Compact is approved by referendum on a simple majority.

1988. Supreme Court rules against approval of Compact by a simple majority. President Salii, under investigation for corruption by U.S. General Accounting Office, commits suicide. Ngiratkel Etpison elected president.

1990. Seventh referendum again fails to approve Compact by required 75 percent.

1992. Kuniwo Nakamura wins presidential election. Second referendum to allow simple majority for endorsement of Compact is approved by 62 percent of voters. Challenge to decision in courts is unsuccessful.

1993. Eighth referendum on the Compact is endorsed by 68 percent of voters, but the decision is challenged in the courts.

1994. Court challenges fail. Palau finally becomes independent on October 1, under the terms of the Compact of Free Association.

1996. During presidential election, bridge between the islands of Koror and Babeldoab collapses, killing 2. Nakamura re-elected president.

1997. Legal settlement for collapse of bridge between Koror and Babeldoab with payment of $13.8 million to Palau. New bridge approved at cost of $3.8 million.

1999. Palau is subject to an international banking transactions ban as a result of practices thought to facilitate money laundering.

2000. Tommy Remengesau elected president. New $100 million road around the island of Babeldoab is announced which will allow capital to be moved to Melekeok.

FUTURE TRENDS

The economy is heavily dependent on the grants received from the United States as part of the Compact agreement. In the 1998–99 budget the Compact grants were $13 million (10 percent of GDP), and other grants from the United States were $11 million (8.5 percent of GDP). The Compact grants are scheduled to be phased out, and to end in 2008–09. Palau has invested some of the large early payments under the Compact agreement, and income from these investments will serve to cushion the position when the Compact agreement is due to end. It is expected that the Compact agreement will be renewed, as the defense provisions are an important consideration for Palau, and it is possible that Compact grants will be continued. Even if they are not, it is likely that the United States will increase grants under other headings to compensate, so that the situation after 2008–09 is not likely to be as severe as at one time anticipated.

Tourism is clearly the best long-term prospect for generating income in Palau, given the scenic attractions of the mountainous islands and the strong association with Japan (Japanese is an official language in one of the states). However, international investment will be necessary for the development of tourism, but a barrier at present is the regulation that prevents foreigners from owning land.

DEPENDENCIES

Palau has no territories or colonies.

PAPUA NEW GUINEA

Independent State of Papua New Guinea

CAPITAL: Port Moresby.

MONETARY UNIT: Kina (K). One kina equals 100 toea. There are coins of 1, 2, 5, 10, and 20 toea, and 1 kina. There are notes of 2, 5, 10, 20, and 50 kina.

CHIEF EXPORTS: Oil, gold, copper ore, timber, palm oil, coffee, cocoa, coconut products.

CHIEF IMPORTS: Machinery and transport equipment, manufactured goods, food, fuels, chemicals.

GROSS DOMESTIC PRODUCT: US$11.6 billion (purchasing power parity, 1999 est.).

BALANCE OF TRADE: **Exports:** US$1.9 billion (f.o.b., 1999 est.). **Imports:** US$1 billion (f.o.b., 1999 est.).

COUNTRY OVERVIEW

LOCATION AND SIZE. Papua New Guinea occupies the eastern half of the island of New Guinea (the western half, called Irian Jaya or West Papua, is part of Indonesia), as well as some nearby islands. New Guinea is part of the Pacific island region known as Melanesia. Papua New Guinea lies at the southeastern edge of Southeast Asia, to the east of Indonesia, and north of Australia. The total area of Papua New Guinea is 459,854 square kilometers (285,753 square miles). Papua New Guinea's only land border is with Indonesia, and it is 820 kilometers (509 miles) long. The country's coastline is 5,152 kilometers (3,201 miles) long. Papua New Guinea is about the same size as California. The capital, Port Moresby, is located on the southern side of the mainland, on the Coral Sea.

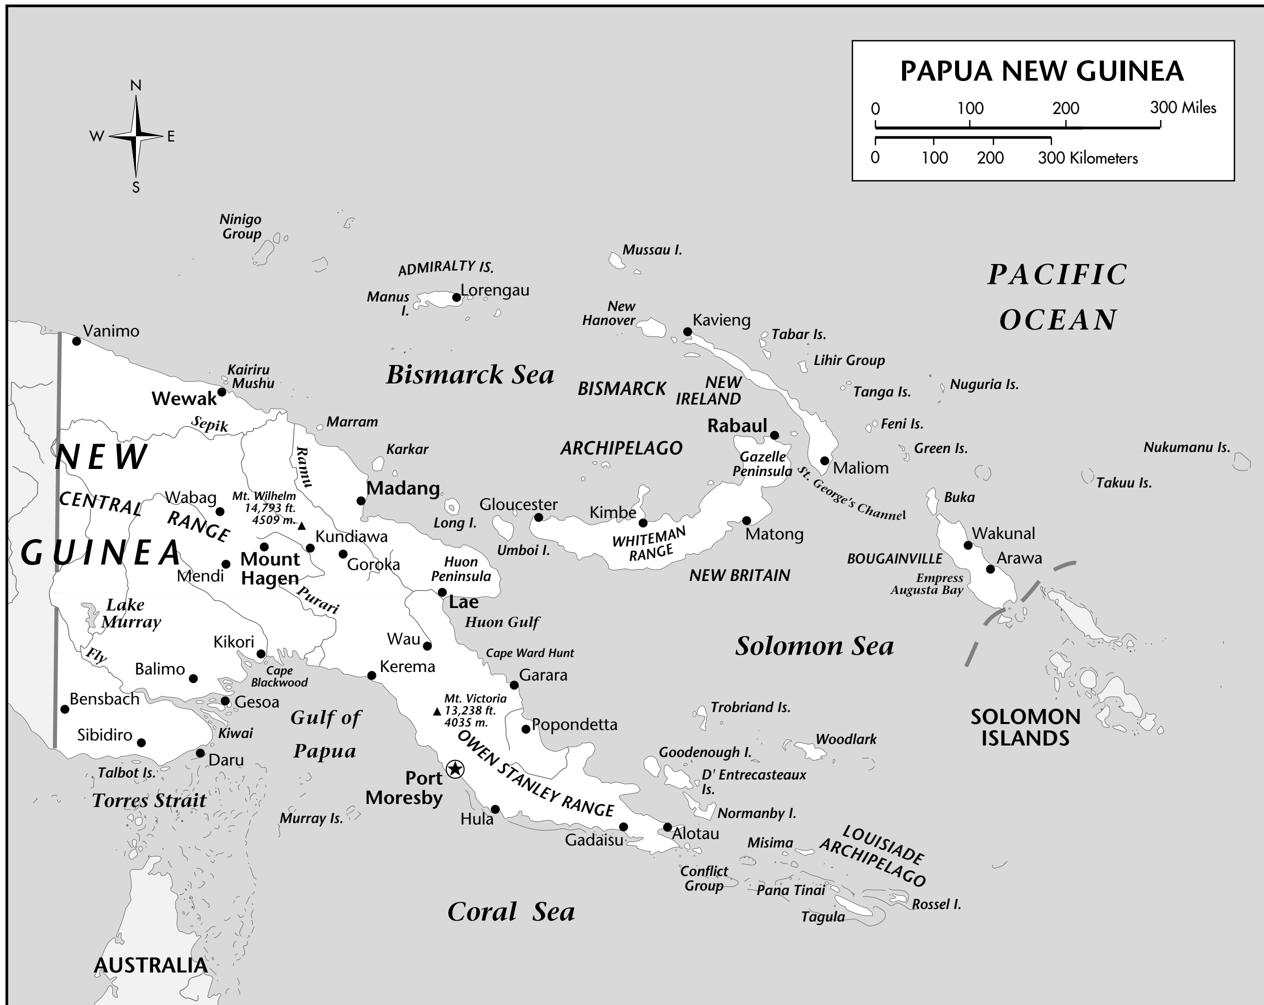
POPULATION. Papua New Guinea has perhaps the world's most diverse population, with at least 846 indigenous languages spoken. The population is almost entirely indigenous Melanesian, with small numbers of European and Asian immigrants. The population was estimated at 4.7 million in 2000. The growth rate of the population was estimated at 2.3 percent in the same year. Although the overall population density of Papua New Guinea remains low, there are great differences between regions. In general, the low-lying, coastal parts of the country have fairly low population densities, while the mountain valleys, or "highlands," have much greater population densities. For example, the Western Province averages only 1 person per square kilometer (2.6 per square mile), while parts of the highlands average up to 100 people per square kilometer (260 per square mile).

Papua New Guinea has few large cities. The largest is the capital, Port Moresby, with a population over 400,000. The most serious population issue facing the country is the migration of rural residents to the cities, especially to Port Moresby and to the second largest city, Lae. Many of these migrants are unable to find jobs, leading to crime and other social problems. The Papua New Guinea government has sought ways to control population growth but faces an uphill battle.

The population of Papua New Guinea is generally quite young, with 39 percent between the ages of 0–14, 58 percent between the ages of 15–64, and only 3 percent over the age of 64.

OVERVIEW OF ECONOMY

The extraction of Papua New Guinea's rich mineral and petroleum resource base dominates the national economy, accounting for 72 percent of export earnings. Gold, copper, and petroleum are the most important of these resources. Mining, however, is concentrated in only a few areas, employs only a small percentage of the country's population, and is dominated by international corporations. Most Papua New Guineans (85 percent) depend on **subsistence agriculture**, in which crops are grown for family and local use and not exported. Papua New Guinea's tropical climate and rich soil allow both subsistence and commercial agriculture to flourish. The commercial agricultural sector, which once dominated



the economy, has greatly decreased in size relative to the growing mining sector. Coffee, palm oil, cocoa, and coconut products (a dried form called copra and coconut oil) are the most important agricultural exports. Forestry is also a growing economic sector. Despite its rich mineral and agricultural resource base, Papua New Guinea has limited manufacturing and service sectors, and must import most manufactured products such as machinery, motor vehicles, and many foods.

The diversity of the population, political disputes, and the ruggedness of Papua New Guinea's landscape have been the key factors limiting economic development in the country. Changing political leadership and policies since independence in 1975 have hampered long-term planning. Additionally, the rugged terrain of much of the country, with extensive swamps, mountains, and scattered islands, requires expensive communications and extraction **infrastructure** with high maintenance costs. Conflicts between the national and provincial governments reflect the country's diversity and add to the difficulties of formulating economic policy. A revolutionary movement on the island of Bougainville, the location of one of Papua New Guinea's largest mines, led to sabotage and closure of the mine in 1989. The mine has not reopened but recent peace talks are putting an end to the conflict.

Papua New Guinea's total **external debt** is estimated at US$2.4 billion (1999). In 1998, the country's **debt service** stood at US$178 million. Australia is by far the largest donor of foreign aid, giving about US$150 million each year. Much of this aid is used for the development of health services, infrastructure, education, and the maintenance of law and order. Papua New Guinea also receives aid from other donors such as the Asian Development Bank. Donors have also provided additional aid in times of crisis, such as during the devastating 1997 drought.

POLITICS, GOVERNMENT, AND TAXATION

The territory comprising today's Papua New Guinea was colonized in the 19th century by both Germany and Great Britain. The British territory was transferred to Australia in 1906. During World War I, Great Britain ac-

quired the German territory and in 1920 transferred control of this territory to Australia as well. Australian policy and culture shaped much of modern Papua New Guinea, and the country remains a constitutional monarchy within the British Commonwealth, with Queen Elizabeth II as the ceremonial head of state. The parliament is **unicameral** (it has only 1 chamber) and the prime minister is a member of parliament. Mekere Morauta became prime minister in 1999 at the head of a coalition government. Papua New Guinea's parliamentary, political, and judicial institutions are similar to those in Australia and Great Britain.

The cultural and regional diversity of Papua New Guinea's population means that there are many political parties. The main ones are the Black Action Party, Bougainville Unity Alliance, Christian Democratic Party, Hausman Party, League for National Advancement, Liberal Party, Melanesian Alliance, Melanesian Labour Party, Milne Bay Party, Movement for Greater Autonomy, National Alliance, National Party, Papua New Guinea First Party, Christian Country Party, Papua New Guinea United Party, Peoples Action Party, and Peoples Democratic Movement. In the 1997 elections the People's Progress Party won the most votes, with just 15 percent, and led the coalition government. Because of the high number of parties, governments are composed of coalitions between several parties.

Papua New Guinea is divided into 19 provinces plus the national capital district. Legally, the national government retains most political power, and the provinces are therefore politically quite weak. In practice, however, the national government is often unable to exert its authority in provincial matters. The weakness of the national government in practice is demonstrated in the continuing difficulties on the island of Bougainville. In 1989, a rebel movement called the Bougainville Revolutionary Army (BRA) seized control of the Panguna mine on the island and demanded full independence for the province. The mine was closed and is not likely to reopen. Peace negotiations have been taking place over the past 3 years and are close to being resolved.

Papua New Guinea's government has in general encouraged foreign investment, especially in the mining industry. This is done by offering favorable tax rates for mining companies. The national government often takes a part interest in large mining projects by owning a portion of the stock in these projects, which provides revenue for the government. The national government also gathers revenue from personal taxes (on property and vehicles), a **value-added tax** (VAT), corporate **income taxes**, and mining taxes.

INFRASTRUCTURE, POWER, AND COMMUNICATIONS

Papua New Guinea currently has a limited infrastructure, largely due to the country's rugged terrain. Extreme weather, such as storms and floods, means that roads and other infrastructure deteriorate quickly. Political disputes and corruption, leading to unnecessary infrastructure and the diversion of money away from useful projects, also contributes to the problem. Papua New Guinea has 19,600 kilometers (12,179 miles) of roads, of which only 686 kilometers (426 miles) are paved (approximately 3.5 percent of the total). The main ports are at Port Moresby, Lae, Madang, and Rabaul. There are 492 airports, but only 19 have paved runways. The national air carrier is Air Niugini, which flies domestically as well as to Australia, several Asian countries, and the Solomon Islands. There is no rail system in the country.

About 70 percent of Papua New Guinea's electricity comes from fossil fuels, with hydroelectric power providing the remaining 30 percent. The total electricity consumption in 1998 was 1.618 billion kilowatt hours (kWh).

Telecommunication systems in the country are generally adequate. Papua New Guinea had 44,000 telephone mainlines in use in 1995, and has recently established a cellular telephone network in several areas. By 1997,

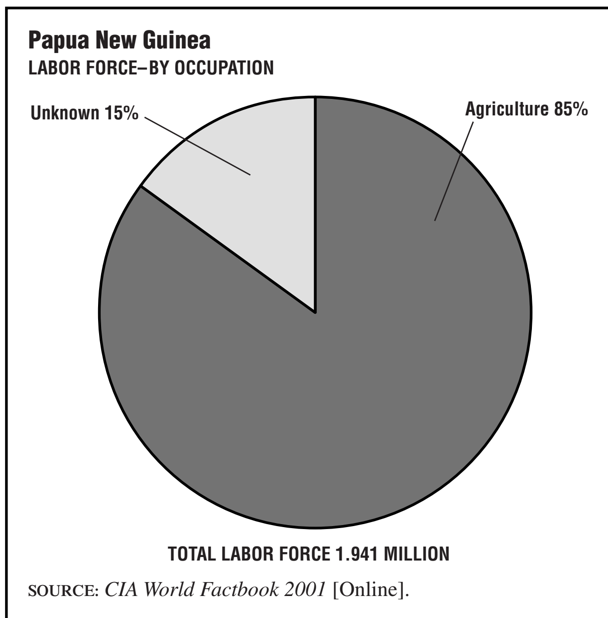
there were 3,053 mobile cellular subscribers. In 1999, the country had 2 Internet service providers.

ECONOMIC SECTORS

Papua New Guinea is heavily dependent on the development of its natural resources. Its rich mineral deposits make the country a leading world supplier of gold and copper. Mining began on a large scale in the 1970s and rapidly surpassed agriculture as the largest source of export earnings. However, the mining industry is concentrated in a few areas and does not employ many people. Most of the population still depends on subsistence agriculture for its livelihood. The manufacturing and service sectors remain extremely small in comparison. In 1999, agriculture represented 25 percent of GDP, industry represented 35 percent, and services 40 percent. Papua New Guinea's mineral-based economy is subject to world market fluctuations in commodity demand and prices.



SOURCE: *CIA World Factbook 2001* [Online].

AGRICULTURE

Agriculture is important to Papua New Guinea for both income and as a source of food. In total, the agricultural sector contributes 25 percent of **gross domestic product** (GDP), not including subsistence agriculture. This contribution comes primarily from the production of crops such as coffee, oil palms, cocoa, and coconuts, all of which grow well in the country's tropical climate. Coffee, palm oil, cocoa, and coconut products (copra and oil) are the main agricultural export revenue earners, with US$240.3 million total value in 1998, and their production employs an estimated 77 percent of labor in the country. The bulk of Papua New Guinea's export agricultural products are produced by villagers. Australia, Japan, and South Korea have consistently been the major buyers of the country's agricultural exports since 1970.

Most Papua New Guineans own the land on which they grow their own food crops, of which sweet potatoes, sago, bananas, coconuts, taro, and yams are the most important.

Forestry is an emerging part of the agricultural sector, and about one-third of forest lands have been opened to commercial exploitation. Much of the timber industry is dominated by Malaysian companies. Papua New Guinea is now the world's second-largest exporter of round tropical logs, most of these going to Japan and Korea.

INDUSTRY

MINING. Since the 1970s the mining of rich mineral deposits has dominated the Papua New Guinea economy. In contrast to the agricultural sector, mining in Papua New Guinea is characterized by large and highly mechanized operations. Copper, gold, and crude oil are the key income earners for the country.

In 1970 mineral exports were a mere 1 percent of total exports. Within 2 years, this figure had risen to 55 percent. By the start of the 1990s the contribution of the mining sector to total exports had continued to rise, reaching 70 percent. The large Panguna mine on the island of Bougainville opened in 1972, and until its closure in 1989 was one of the largest copper mines in the world. The shutdown of the mine was due to what many people have charged was environmental havoc created by the mine. It also became a flashpoint for resentment against the

Papua New Guinean government by the indigenous people on Bougainville.

Since the closure of the Panguna mine, gold has been the main mineral export earner for the country, with a peak contribution to export value of 50.9 percent in 1991. In 1994, gold was contributing 26.4 percent of the value of total exports, equal to crude oil as the dominant export earner. Gold is mined at Porgera in the highlands and at several other locations, and in 1997 a new gold mine on Lihir Island opened. The Lihir mine reserves are estimated to be 103.4 million tons of ore, with a mine life of approximately 37 years, making it one of the world's largest gold reserves.

The Ok Tedi copper mine near the border with Indonesia has in some respects replaced production from the closed Panguna mine. Ok Tedi is expected to operate for about 10 more years, though because of a lawsuit resulting from environmental damage caused by mining, the main operating company, Broken Hill Proprietary (BHP), would like to close the mine earlier, against the wishes of the Papua New Guinea government.

MANUFACTURING. The manufacturing sector in Papua New Guinea is small. In the 15 years between 1977 and 1992, the manufacturing sector's contribution to GDP varied between 15–18 percent. Food processing, beverage production, and tobacco processing are the main products manufactured in the country.

The Papua New Guinea government uses **tariffs** and **subsidies**, as well as direct industry support, to keep this sector afloat. While the industry has become dependent upon such measures, the government sees the manufacturing sector as providing employment for the increasing number of urban migrants. Most manufacturing is for domestic consumption only, and does not generate any export earnings.

SERVICES

The services sector in Papua New Guinea is small and almost entirely in the **public sector**. This sector employs an estimated 17.2 percent of the **labor force**, consisting mainly of government employees such as administrators, teachers, and health care workers. Approximately 66,000 tourist visas were issued in 1997, though under 10,000 of these are "real" tourists, with the others being people visiting relatives and other temporary visitors. Tourism generated US$72 million in 1997, but the high cost of travel to and within the country limits tourism development at present. Financial services are likewise a limited sector.

INTERNATIONAL TRADE

Papua New Guinea's traditional trading partners have been consistent for both exports and imports since the early 1970s. Prior to independence in 1975, Australia was the main buyer of Papua New Guinean exports, and while this relationship has continued, Japan, South Korea, Germany, and New Zealand have since played major roles as importers of Papua New Guinean goods. In 1998 20 percent of Papua New Guinea's goods went to Australia, 13 percent to Japan, 7 percent to Germany, 5 percent to South Korea, 4 percent to the Philippines, and 3 percent to the United Kingdom. Traditionally, the major exports to these countries have been **cash crops** such as copra, cocoa, and coffee. Australia has been a major buyer of Papua New Guinea's gold. Minerals are also exported to such countries as Japan and Germany. Papua New Guinea purchases most of its imports (machinery, foods, and technology) from these same countries, and especially from Australia. In 1998 Australia accounted for 51 percent of the country's imports, Singapore 10 percent, Japan 8 percent, the United States and New Zealand 5 percent, and Malaysia 3 percent. In 1999 the country enjoyed a positive trade balance of nearly a billion dollars on exports of US$1.9 billion and imports of US$1.0 billion.

Trade (expressed in billions of US$): Papua New Guinea

	Exports	Imports
1975	.441	.592
1980	1.031	1.176
1985	.912	1.008
1990	1.144	1.193

POVERTY AND WEALTH

Papua New Guinea has a complex distribution of wealth. The extremely varied and rugged terrain kept some indigenous people of the country isolated from any connection with the "modern world" until as late as 1970. This factor, combined with the belated and rapid economic development from the 1970s, has produced a highly variable distribution of income and wealth. While much of the wealth from economic development has been concentrated in urban centers, cultural factors also feature in the distribution of poverty and wealth. Much of Papua New Guinean society is still very traditional, and differs from European-based societies in several important ways. Papua New Guinean society is centered around agriculture and attachment to the land. Land is rarely sold, but instead is inherited by children. Papua New Guinean society has a complex structure, with many bonds among family members, distant relatives, and neighbors. These bonds include obligations to share wealth, and to give and receive gifts. Papua New Guinean society did not and does not have a tradition of chiefs or leaders who gain their status through inheritance. Instead, in traditional Papua New Guinea society men become leaders through their own efforts, especially through the gaining and sharing of wealth. All of these factors are important in the way that wealth is distributed in the country.

Despite these cultural factors, the Papua New Guinea government has made some efforts to decentralize services—especially health and education—and to provide equal access to them throughout the country. These efforts, begun in the 1970s, have made little difference, if any, in greatly varying levels of income and wealth between urban and remote areas. About 85 percent of the population still depends on subsistence agriculture, and 37 percent of these people are below the poverty line.

WORKING CONDITIONS

Papua New Guinea has a total workforce of 1.941 million, and the unemployment rate has fluctuated between 3 and 10 percent since the 1980s. The development of new sectors in the Papua New Guinea economy has shaped the characteristics of employment. Before 1950, plantations provided almost the sole source of employment for both women and men, with only a fraction of the workforce employed formally. Little changed until after World War II, when both a legal minimum wage was set and the transition to a formal cash wage system was under way. By the 1950s Papua New Guineans were extensively employed in all areas of the country's economy. Women's participation in the formal employment sector has remained very small, with an estimated 14 percent of wage employment in 1980. Women and unskilled men are still subject to difficulties in job advancement. Regional differences in employment are extreme. Most formal employment is in the urban centers, especially Port Moresby.

Working conditions vary accordingly. The plantations have traditionally required a young workforce, owing to the early retirement of plantation employees, whose work is hard and largely unregulated. In contrast, those sectors such as mining, which have been driven by the infrastructure created by international corporations, provide considerable salaries (and benefits to land owners). However, the value of mineral exports in relation to agricultural subsistence or commodity exports means that the proportion of those involved in the mining sector remains very small in comparison. Papua New Guinea also has a substantial **informal sector**, consisting of small businesses that do not typically pay taxes or keep accounting records. Such businesses receive little support from the

government, even though they may be in great need of loans to help start and expand their activities. Life for these small businesses is made even more difficult by laws that require them to, for example, obtain licenses or record their profits.

COUNTRY HISTORY AND ECONOMIC DEVELOPMENT

1526. First European exploration by Spaniard Don Jorge de Meneses, naming the principal island "Papua."

1545. Spaniard Ynigo Ortis de Retez names the island "New Guinea."

1828. The Dutch East India company, which controls the western part of the island, declares the island to be a colonial possession attached to the Dutch East Indies.

1884. Germany takes possession of the northeast part of the main island and the nearby smaller islands, while Great Britain establishes a protectorate on the southern coast of Papua.

1920. Britain, which took control of German possessions on the island during World War I (1914–1918), grants control of the entire territory to Australia.

1942. Japan takes possession of the Australian territories of New Guinea and Papua early in World War II. Following the Japanese surrender in 1945, the Territory of Papua is joined in administrative union with the Territory of New Guinea.

1964. The first House of Assembly opens, replacing the Legislative Council.

1972. The name of the territory is changed to Papua New Guinea; the Panguna copper mine on Bougainville island opens.

1973. Papua New Guinea receives self-government.

1975. Papua New Guinea achieves independence.

1984. The Ok Tedi copper and gold mine opens near the Indonesian border.

1990. The environmental consequences of mining come under scrutiny following natural disasters at Wau and Bulolo from disposal of tailings into Bulolo River.

1997. Lihir gold mine opens on Lihir Island.

1999. Port Moresby Stock Exchange opens; Sir Mekere Morauta becomes prime minister following the resignation of Bill Skate.

FUTURE TRENDS

Papua New Guinea will continue to depend heavily on mineral exports for the bulk of its foreign currency earnings, while simultaneously remaining a largely agricultural country in terms of employment and food production. Exploration for new mineral deposits continues on a large scale, and several projects, such as a nickel mine in Ramu, are likely to open within the next few years. The Lihir gold mine, one of the world's largest, has recently started operating and production is expected to increase. As always, the mining sector is subject to international market conditions, especially demand for minerals and changing prices.

The country's mining sector is coming under increased international scrutiny for its environmental practices. For example, villagers downstream from the Ok Tedi mine have accused the mining company of negligence in releasing toxic materials into local rivers and other water sources.

Papua New Guinea is also likely to see a continuation of political tension, especially with respect to tensions between the national and provincial governments. The independence movement on Bougainville island still simmers, although there is hope that peace talks will finally resolve the dispute. Other provincial governments are demanding greater powers and the national government will have to come to terms with these demands.

DEPENDENCIES

Papua New Guinea has no territories or colonies.

PHILIPPINES

Republic of the Philippines
Republika ng Pilipinas

CAPITAL: Manila.

MONETARY UNIT: Philippine peso (P). Paper money is printed in bills of 1,000, 500, 100, 50, 20, and 10 pesos. There are coins of 5 and 1 pesos and 25, 10, and 5 centavos. There are 100 centavos in 1 peso.

CHIEF EXPORTS: Electronic equipment, machinery and transport equipment, garments, and coconut products.

CHIEF IMPORTS: Raw materials and intermediate goods, capital goods, consumer goods, and fuels.

GROSS DOMESTIC PRODUCT: US$282 billion (1999 est.).

BALANCE OF TRADE: **Exports:** US$34.8 billion (1999 est.). **Imports:** US$30.7 billion (1998 est.).

COUNTRY OVERVIEW

LOCATION AND SIZE. Made up of about 7,100 islands, the Philippines is on the southeastern rim of Asia and is bordered by the Philippine Sea on the east, the South China Sea on the west, the Luzon Strait on the north, and the Celebes Sea on the south. Its land area, which is slightly larger than that of Arizona, measures 300,000 square kilometers (115,830 square miles), and its coastline is 36,289 kilometers (22,550 miles). The capital, Manila, is on the island of Luzon in the highly urbanized National Capital Region, which is made up of 12 other urban areas including the cities of Mandaluyong, Marikina, Pasig, Quezon, Kalookan, Valenzuela, Las Piñas, Makati, Muntinlupa, Parañaque, and Pasay. The main financial district is in Makati City.

POPULATION. The Philippine population has more than tripled since 1948, from 19 million to an official estimate of 81.16 million in 2000. From 1995 to 2000, and the annual population growth rate stood at 2.02 percent, slightly lower than in 1990 and one-third less than the growth rate of 3 percent during the 1960s.

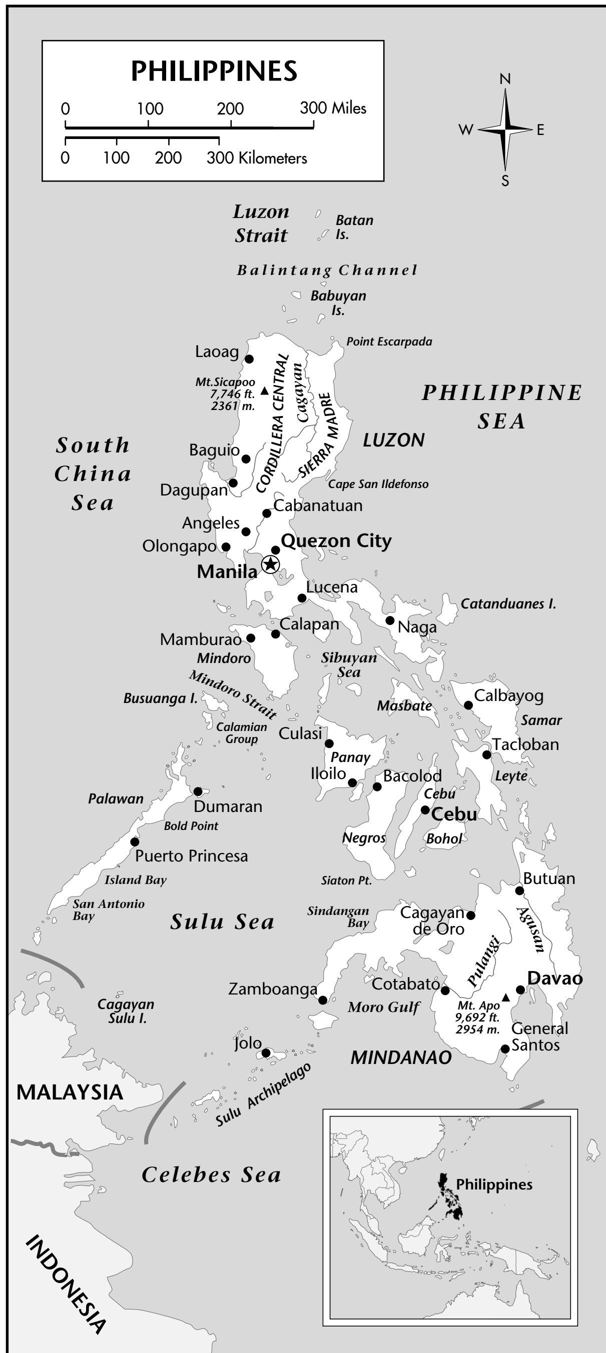
The population of the Philippines is young, with people aged between 15–64 years making up 59 percent of the population, while those under 15 make up 37 percent of the population. Those aged 65 years and above make up only 4 percent of the population.

In January 2000, the U.S. Agency for International Development (USAID) warned of the serious consequences of the booming Philippine population. It predicted the population will double by 2030 based on its 1999 growth rate of 2.3 percent, giving the Philippines "the equivalent of 58 percent of the current population of the United States [living] on 3 percent of its land area," a situation with "grave consequences" for the Philippine economy, society, and the environment.

The country is divided into 3 island groups: Luzon, Visayas, and Mindanao, known together as Luzviminda. These 3 groups are further subdivided into 16 regions. The 2000 National Census lists 61 chartered cities and 73 provinces in the Philippines, with the most populated regions in Luzon. Four out of ten persons in the Philippines lives in the National Capital Region and the adjoining regions of Central Luzon and Southern Tagalog.

OVERVIEW OF ECONOMY

The Philippine economy has experienced repeated boom-and-bust cycles in the 5 decades since the nation achieved independence from the United States in 1946. In the 1950s and early 1960s its economy ranked as the second most progressive in Asia, next to that of Japan. After 1965, when Ferdinand E. Marcos became president, the nation experienced economic problems and social unrest, especially from the 1970s, when corruption and cronyism (the practice of appointing friends to well-paid posts regardless of their qualifications) took hold. In 1972, Marcos declared a state of emergency and placed the country under martial law to stifle unrest and control economic development. By his third term in



1981, democratic institutions in the country had severely eroded, **foreign debt** ballooned, and the country's economy plummeted. In less than 20 years, the Philippines had gone from relative prosperity to becoming the "sick man of Asia." In 1983, the leader of the political opposition, former senator Benigno Aquino, was assassinated upon his returned from exile in the United States.

Marcos was removed from office in 1986 through a peaceful "People Power" revolution in which millions of people demonstrated in the streets. Aquino's widow, Corazon, became president, and a new constitution was approved in 1987. Meanwhile, the GDP growth rate increased steadily from 3.5 percent in 1986 to 4.3 percent in 1987, peaking in 1988 at 6.7 percent. The Aquino administration endured many troubles, including 6 coup d'etat attempts, many natural disasters (e.g. earthquakes, the Mt. Pinatubo eruption), and a power shortage problem that caused economic activities to stop. During this period, the Aquino administration passed various critical laws such as a liberal Foreign Investment Act, the Comprehensive Agrarian Reform Law, and the **privatization** of government corporations that brought the economy back to its feet.

Aquino's successor, Fidel Ramos, embarked on an ambitious development plan dubbed "Philippines 2000." Under the plan, several industries critical to economic development were privatized, such as electricity, telecommunications, banking, domestic shipping, and oil. The taxation system was reformed, and **external debt** was brought to more manageable levels by debt restructuring and sensible fiscal management. By 1996, GNP was growing at a rate of 7.2 percent and GDP at 5.2 percent. The annual **inflation rate** had dropped to 5.9 percent from its high of 9.1 percent in 1995. By the late 1990s, the Philippines' economic growth gained favorable comparisons with other Asian countries such as Taiwan, Thailand, South Korea, and Malaysia.

The Philippine economy took a sharp downturn during the Asian financial crisis of 1997. Its fiscal deficit in 1998 reached P49.981 billion from a surplus of P1.564 billion in 1997. The peso depreciated (fell in value) to P40.89 per U.S. dollar from its previous rate of P29.47 to a dollar. The annual growth rate of the GNP fell to 0.1 percent in 1998 from 5.3 percent in 1997. Despite these setbacks, the Philippine economy fared better than that of some of its Asian neighbors, and other nations praised the Ramos administration for its "good housekeeping."

In 1998, Joseph Estrada was elected president. Even with its strong economic team, the Estrada administration failed to capitalize on the gains of the previous administration. His administration was severely criticized for cronyism, incompetence, and corruption, causing it to lose the confidence of foreign investors. Foreign investors' confidence was further damaged when, in his second year, Estrada was accused of exerting influence in an investigation of a friend's involvement in stock market manipulation. Social unrest brought about by numerous bombing threats, actual bombings, kidnappings, and other criminal activities contributed to the economy's troubles. Economic performance was also hurt by climatic disturbance that caused extremes of dry and wet weather. Toward the end of Estrada's administration, the fiscal deficit had doubled to more than P100 billion from a low of P49 billion in 1998. Despite such setbacks, the

rate of GNP in 1999 increased to 3.6 percent from 0.1 percent in 1998, and the GDP posted a 3.2 percent growth rate, up from a low of -0.5 percent in 1998. Debt reached P2.1 trillion in 1999. Domestic debt amounted to P986.7 billion while foreign debt stood at US$52.2 billion. In January 2001 Estrada was removed from office by a second peaceful "People Power" revolution engineered primarily by youth, non-governmental organizations, and the business sector. President Estrada was the first Philippine president to be impeached by Congress, and his vice-president, Gloria Macapagal-Arroyo, became the fourteenth President of the Republic.

The economy of the Philippines is hampered by huge foreign debt, a low savings rate, inefficient tax collection, inadequate **infrastructure**, especially outside major cities, and poor agricultural performance. The Philippine economy is vulnerable to oil-price increases, interest-rate shifts by the U.S. Federal Reserve, and the performance of international stock exchanges. Social factors that have a negative impact on the economy include a high crime rate, especially kidnappings and rape, pockets of **Communist** rebels in rural areas, threats from Muslim separatist movements, high rates of poverty and unemployment, and the government's inability to begin its land-distribution program. Environmental factors also damage economic development, including frequent typhoons and drought. Worker productivity is adversely affected by illnesses brought on by air and water pollution. In metropolitan Manila alone, the effect of pollution on health and labor productivity has been estimated to be equal to a loss of about 1 percent of **gross national product** annually.

Foreign aid, or official development assistance (ODA) funds, have contributed immensely to the development of the nation's economy. Through grants and loans extended by development agencies and international creditors, the government is able to finance infrastructure development (bridges, roads, highways, railways, transportation systems) and social programs (livelihood projects, training seminars, immunization programs, and environmental projects). Since the late 1990s, ODA funds have helped improve living conditions in the most depressed rural areas, especially in Mindanao, Southern Philippines, mostly via agricultural programs. In 1999 most funds were allocated to agricultural programs. About 95 percent of ODA assistance is distributed in loans, with the remainder in grants.

POLITICS, GOVERNMENT, AND TAXATION

The government of the Republic of the Philippines is composed of 3 equal branches: the executive, legislative, and judicial, with checks and balances on each other. The popularly elected president is the nation's highest executive official. The legislature is divided into 2 chambers, a Senate (upper chamber) of 24 members and a House of Representatives (lower chamber) of a maximum of 260 members. The Supreme Court, led by the Chief Justice and 14 associate justices, is the highest judicial body, and acts as the final arbiter of the legal validity of any executive or legislative policy. In 1991 a Local Government Code was enacted that transferred some of national government powers to local government officials. Administratively, the country is divided into political subdivisions such as provinces, cities, municipalities, and barangays (villages). Each political subdivision has its own local government, which enjoys a certain level of autonomy (self-governance) and is legally entitled to an equitable share of the national wealth called the Internal Revenue Allotment.

The country practices a multi-party system. Political parties are required to register with the Commission on Elections (COMELEC) to which they must present a constitution, by-laws, and platform. In practice, parties in the Philippines are very weak and merely exist to host individual political ambitions. Hence, it is not unusual for new political parties to crop up just weeks before election time and dissolve after the elections, with winning candidates merely transferring to the dominant party.

Elections in the Philippines are often swayed by patronage (support given by a moneyed or influential individual) and the personality of the candidate. In fact, it is unusual for candidates to discuss their platforms during campaign rallies since many of those who attend such rallies are usually more interested in watching the entertainers that accompany these candidates than the candidates themselves. In 2001, after the ouster of former president Joseph Estrada, formerly a well-known movie star, reformers called for an end to personality-oriented elections and for campaigns built around a relevant discussion of national issues.

The military plays a significant role in the economy by ensuring peace and order in the country, particularly in Mindanao, southern Philippines, where a long-term war against rebels continues to be waged. In special instances, military personnel are partnered with police personnel to patrol the cities and minimize urban crime. The navy also guards the country's coastal borders against poachers and illegal fishing vessels, which deplete the country's coastal resources.

The policies and programs of government are funded by various taxes imposed at the national and local levels, and by borrowing. Taxes are collected by the Bureau of Internal Revenue and the Bureau of Customs. Domestic corporations, resident citizens, and resident aliens are taxed on their net income from all sources, worldwide, while resident foreign corporations are taxed on

their Philippine net income. Government also generates funds from other offices, such as the Land Transportation Office, which collect taxes for specific government services. Other sources of revenue are derived from the sale of government corporations to the **private sector**, fees and service incomes of various government agencies, foreign grants, and proceeds from the sale of transferred, surrendered, and privatized assets.

Revenue earned by government is usually inadequate to finance its programs and activities. Bernardo Villegas, an economist at the University of Asia and the Pacific, explains that for a developing country like the Philippines to remedy this situation, the government must resort to borrowing money either from external or domestic sources, such as via **treasury bills**, notes, and bonds issued as collateral (property pledged by a borrower to guarantee the investment of a lender) for domestic loans. Foreign sources are used because there is no adequate, long-term source of capital in the country, a situation that is made worse by the country's low savings rate. Funds borrowed abroad are readily available and come with lower interest rates. International lending institutions such as the Asian Development Bank, the International Monetary Fund, and the Japan Bank for International Cooperation are some of the country's foreign creditors. Borrowing has increased the **national debt** to P2.1 trillion. Domestic debt at the end of 1999 reached P986.7 billion, while foreign debt stood at US$52.2 billion.

In the past, the government has played an active role in influencing the country's economy, often to the displeasure of the business sector, which wants the economy left to market forces with minimal government intervention. Like many developing countries, the Philippines' economic policies include **import substitution** policies and the promotion of labor-intensive industries to support a burgeoning workforce. The government also exerts control over the economy through the regulation or prohibition of **monopolies**, the sourcing and formation of capital, the provision of private incentives, and through the regulation of strategic sectors that are vital to national interests.

Government in developing countries, such as the Philippines, must take charge of building strategic infrastructure, such as farm-to-market roads and bridges linking landlocked areas, to stimulate the exchange of goods and services between localities. It is also the government's function to protect natural resources from illegal exploitation.

INFRASTRUCTURE, POWER, AND COMMUNICATIONS

The transport infrastructure includes 492 kilometers (306 miles) of working railroads and 199,950 kilometers (124,249 miles) of roads, of which 39,590 kilometers (24,601 miles) are paved. In the first quarter of 2000, infrastructure projects got the biggest share of official development assistance (ODA) loans, taking 66 percent of the $11.4 billion ODA package extended to the Philippines. Among the projects are plans to decongest traffic by expanding roads and building bridges and highway interchanges.

The Philippine archipelago has more than 1,490 ports that serve to connect its major islands. As of 1996, there were 566 registered cargo and container ships, and total cargo handled was estimated at 140.1 million tons. The busiest national port is in Manila. Ninety percent of the country's imports and more than 20 percent of its exports pass through its South Harbor and the Manila International Container Terminal. In February 2001 the Philippine Ports Authority earmarked US$122 million to upgrade port services here and in even other locations.

As of 1999, there were 266 registered airports and 5 domestic airlines operating in the Philippines. Beginning in 2000, the government and its private-sector partners speeded up the schedule for the construction and upgrading of at least 20 airports to enable them to meet world standards by 2004.

In 1986 the country's economy was severely crippled by continuous power shortages that lasted more than 10 hours daily, paralyzing the manufacturing sector. In 1992 the Ramos administration took steps to resolve this problem by allowing private operators to build more power plants that substantially improved the country's power-generating capacity. By March 2000, 74 percent of the country's households had access to electric service, and dependence on oil-run power plants was reduced to 19 percent from a previous high of 80 percent. Power is now generated from several sources, including coal (38 percent), geothermal (27 percent), and hydroelectric (16 percent). The opening of the offshore Malampaya gas field in Palawan will further reduce dependence on foreign oil with its initial production rate of 145 billion cubic feet annually, which can be used to create 2,700 megawatts of power.

Under the Ramos administration, the monopolistic (one company in control) telecommunications industry was opened up to competition and by 2001 there were more than 50 firms offering service. Telephone density per 100 inhabitants nearly tripled during the 1990s, from 3 lines per 100 inhabitants in 1992 to 8 lines in 1998. In 1999 there were 1.9 million main lines in use and another 1.95 million cellular telephones, plus 93 Internet service providers. In September 2000, Globe Telecom and 7 other telecommunication carriers in the Asia-Pacific region agreed to create the C2C Cable Network, an undersea fiber-optic-cable system, worth US$2 billion. Upon completion, the C2C network will be able to accommodate 90 million conversations simultaneously.

The Philippines has been recognized as the global capital for text messaging, a feature of digital mobile phones virtually ignored in other countries. This allows the user to type brief messages and send it to another mobile phone. Each day, more than 18 million text messages are transmitted in the country, twice as many as in all of Europe. However, high fees make this service still out of reach for most people.

ECONOMIC SECTORS

In the Philippines, the 3 largest economic sectors are industry, service, and agriculture, in terms of contribution to GDP. In past years, the service sector has exhibited continuous growth. Agriculture, although still substantial, continues to decline. Estimates from 1997 reveal that agriculture contributed 20 percent to GDP, industry contributed 32 percent, and services dominated the economy with 48 percent of GDP.

In 1999 the rate of growth of the GDP stood at 3.2 percent. Economists blamed the sluggish growth on the lackluster performance of the industry sector, which grew by 0.5 percent. With the end of the dry spell brought about by El Niño weather conditions, the agriculture sector's performance rebounded and grew 6.6 percent, the highest rate in decades. Services grew by 3.9 percent that year because of the strong performance in **retail**.

Maximum economic growth for 1999 and 2000 was slowed by successive political crises in the Estrada administration that caused foreign and international lending agencies to lose confidence. In 2000 GDP posted a 3.9 percent positive growth rate, with industry growing 4 times faster than it did in 1999. Services continued its strong performance, with a 4.4 percent increase over its 1999 figures.

AGRICULTURE

The Philippines is still primarily an agricultural country despite the plan to make it an industrialized economy by 2000. Most citizens still live in rural areas and support themselves through agriculture. The country's agriculture sector is made up of 4 sub-sectors: farming, fisheries, livestock, and forestry (the latter 2 sectors are very small), which together employ 39.8 percent of the **labor force** and contribute 20 percent of GDP.

The country's main agricultural crops are rice, corn, coconut, sugarcane, bananas, pineapple, coffee, mangoes, tobacco, and abaca (a banana-like plant). Secondary crops include peanut, cassava, camote (a type of rootcrop), garlic, onion, cabbage, eggplant, calamansi (a variety of lemon), rubber, and cotton. The year 1998 was a bad year for agriculture because of adverse weather conditions. Sector output shrank by 8.3 percent, but it posted growth the following year. Yet, hog farming and commercial fishing posted declines in their gross revenues in 1999. The sector is burdened with low productivity for most of its crops.

The Philippines exports its agricultural products around the world, including the United States, Japan, Europe, and ASEAN countries (members of the Association of Southeast Asian Nations). Major export products are coconut oil and other coconut products, fruits and vegetables, bananas, and prawns (a type of shrimp). Other exports include the Cavendish banana, Cayenne pineapple, tuna, seaweed, and carrageenan. The value of coconut-product exports amounted to US$989 million in 1995 but declined to US$569 million by 2000. Imported agricultural products include unmilled wheat and meslin, oilcake and other soybean residues, malt and malt flour, urea, flour, meals and pellets of fish, soybeans and whey.

One of the most pressing concerns of the agricultural sector is the rampant conversion of agricultural land into golf courses, residential subdivisions, and industrial parks or resorts. In 1993 the nation was losing irrigated rice lands at a rate of 2,300 hectares per year. Small landholders find it more profitable to sell their land to developers in exchange for cash, especially since they lack capital for seeds, fertilizers, pesticides, and wages for hiring workers to plant and harvest the crops. Another concern is farmers' continued reliance on chemical-based fertilizers or pesticides that have destroyed soil productivity over time. In recent years however, farmers have been slowly turning to organic fertilizer, or at least to a combination of chemical and organic inputs.

Environmental damage is another major concern. Coral-reef destruction, pollution of coastal and marine resources, mangrove forest destruction, and siltation (the clogging of bodies of water with silt deposits) are significant problems.

The agriculture sector has not received adequate resources for the funding of critical programs or projects, such as the construction of efficient irrigation systems. According to the World Bank, the share of irrigated crop land in the Philippines averaged only about 19.5 percent in the mid-1990s, compared with 37.5 percent for China, 24.8 percent for Thailand, and 30.8 percent for Vietnam. In the late 1990s, the government attempted to modernize the agriculture sector with the Medium Term Agricultural Development Plan and the Agricultural Fisheries Modernization Act.

The fisheries sector is divided into 3 sub-sectors: commercial, municipal, and aquaculture (cultivation of the natural produce of bodies of water). In 1995, the Philippines contributed 2.2 million tons, or 2 percent of total world catch, ranking it twelfth among the top 80 fish-producing countries. In the same year, the country also earned the distinction of being the fourth biggest producer of seaweed and ninth biggest producer of world aquaculture products.

In 1999 the fisheries sector contributed P80.4 billion at current prices, or 16 percent of gross **value added** in agriculture. Total production in 1999 reached 2.7 million tons. Aquaculture contributed the most, with 949,000 tons, followed closely by commercial fishing with 948,000 tons, and municipal fisheries with 910,000 tons. Domestic demand for fish is substantial, with average yearly fish consumption at 36kg per person compared to a 12kg figure for consumption of meat and other food products.

INDUSTRY

In 2000 following the Asian economic slump of the late 1990s, industrial sectors (manufacturing, transportation, communication and storage, mining and quarrying) all posted positive growth rates, lifting the entire economy from the previous year's lackluster performance. Yet, the construction industry suffered because of the lack of long-term investments by the private sector. Although public construction grew by 15 percent from 1998 to 1999, private construction sank to 11 percent because of real estate oversupply. Mining and quarrying continued to suffer from low metal prices in the world market.

In the Philippines, small and medium enterprises make up 99 percent of all manufacturing companies. Revenue of the top 420 manufacturing firms increased by 9.9 percent in 1998. In 2000 manufacturing accounted for almost a quarter of the country's production. According to the Labor Department's January 2001 Labor Force Survey, 9.8 percent of all workers were employed in this sector.

The manufacturing sector produces the country's top export products such as semiconductors, electronics, ma-

chinery and transport equipment, and garments. Exports of electronics and semiconductors generated US$17.4 billion in 1998 and US$21.6 billion in 1999. Other chief imports of this sector include paper and paper products, textile yarn and fabrics, nonmetallic minerals, iron and steel, and metal products. Most of the large and medium manufacturing companies are in special export-processing zones or industrial parks. Some provinces have been specially designated to host these companies, such as the CALABARZON area which is made up of 4 provinces: Cavite, Laguna, Batangas, and Quezon.

SERVICES

According to the 2001 Labor Force Survey, employment in the service sector rose to 13.2 million in 2000, up from 12.7 million in 1999. The proportion of workers in the Philippines service sector increased accordingly, from 45.8 percent to 46.8 percent.

RETAIL. The Philippines has a variety of retail establishments scattered throughout the country, from small village-based general stores that supply all the needs of a small community to a web of specialized stores in the larger cities. The wholesale and retail sector was affected by the economic slowdown in 1998, so retailers and wholesalers tried to increase consumer spending with aggressive marketing campaigns, quarterly sales, and discount promotions. In 1999 revenue rose to P145.41 billion from a low of P138.64 in 1998. Around this time, the retail sector was opened to foreign competition by the Retail Trade **Liberalization** Act, which allows foreign retailers to conduct business and fully own enterprises as long as they meet certain capitalization (available funds) requirements.

TOURISM. According to the Department of Tourism (DOT), which works with other government agencies to improve infrastructure and guarantee peace and order in the country, the Philippines was the twelfth ranked tourist destination in Asia in 1997. In Southeast Asia, the Philippines ranked fifth, behind Thailand, Singapore, Malaysia and Indonesia. In 1999, 2.17 million tourists visited the country, mostly from East Asia, followed by North America and Europe. These tourists spent $2.55 billion in the country. The country offers nearly 12,000 rooms in numerous hotels. To attract more tourists, as well as to encourage locals to travel to other areas of the country, the government implemented 5 major programs in 1999. Among these programs were the promotion of community-based tourism, the rehabilitation of the world-renowned Ifugao rice terraces, and the promotion of Manila as a multi-faceted destination. Also introduced were programs geared toward overseas workers and attracting expatriate (living abroad), third- and fourth-generation Filipinos to visit their homeland, and programs highlighting cultural artifacts and national heritage. The Philippines boasts some of the best scuba diving in the world, and its World War II sites are also major tourist attractions.

COMMUNICATIONS. In the early 1990s, the monopoly of the Philippine Long Distance Telephone Company (PLDT) was abolished and the sector was opened to competition. Two telecommunications companies, Globe Communications and Smart Communications, are locked in battle over mobile-phone market share. By 1999, Globe was leading with 720,000 subscribers, but Smart followed closely behind. The call-center service business is thriving with the entry of foreign companies like America Online, Etelecare International, People Support, and Getronics. Although still in its infancy, the industry is expected to expand, aided by the availability of workers proficient in English, suitable facilities, and government incentives.

INTERNATIONAL TRADE

EXPORTS. The growth and stability of the Philippine economy is dependent on foreign trade, particularly on the dollar revenue generated from export. For this reason, the Department of Trade and Industry (DTI) has established an Export Development Council to oversee the growth of this sector as guided by the Philippine Export Development Plan. The plan uses a comprehensive approach in promoting Philippine exports to world markets. Another organization that assists the DTI in export promotion is the Center for International Trade Exposition Missions (CITEM), which assists Filipino exporters in marketing and promoting their products through regular trade fairs, trade missions, and other export-promotion programs and activities at home and abroad.

The primary trading partners of the Philippines have always been the United States and Japan, both former colonizers. Trade with these 2 countries has accounted for 50 to 60 percent of Philippine exports for the last 10 years. The Philippines also trades with Singapore, the

Trade (expressed in billions of US$): Philippines

	Exports	Imports
1975	2.294	3.756
1980	5.741	8.295
1985	4.607	5.459
1990	8.068	13.041
1995	17.502	28.337
1998	27.783	30.705

SOURCE: International Monetary Fund. *International Financial Statistics Yearbook 1999.*

Netherlands, Taiwan, Hong Kong, the United Kingdom, Malaysia, Germany, and Thailand.

Labor-intensive industrial manufacturers dominate the Philippine export scene. Electronics and semiconductors continue to lead the country's top-10 export products, generating US$1.74 billion in 1998 and US$2.16 billion in 1999. Officials of the Department of Science and Technology predict that earnings from electronic exports will reach US$4.7 billion by 2004. A 1997 government survey revealed that 75 percent of the 784 firms in the country's export-processing zones were electronics manufacturers, and that these firms account for 59 percent of the country's exports. Other important export products are machinery and transport equipment, garments and coconut products, furniture and fixtures, bananas, processed food and beverages, and textile yarns.

Trade officials have forecast that Philippine merchandise exports are likely to hit the US$50 billion mark by the end of 2001, up from $35 billion in 1999. Philippine foreign trade continues to increase every year. In 1998 and 1998, the Philippines posted positive export growth rates—16.9 percent and 18.8 percent—when those of other Asian countries were in decline.

IMPORTS. Imports for 1999 were $30.7 billion. The country's top 10 imports are electronic components, telecommunications equipment and electrical machinery, mineral fuels and lubricants, industrial machinery and equipment, textile yarn and fabric, transport equipment, iron and steel, and organic and inorganic chemicals. The Philippines has attempted several strategies to correct the trade imbalance where imports exceed exports. These strategies range from exchange and import controls to raising **tariffs** for imported products. Despite these efforts, imports have continued to surpass exports for the last 30 years, except in 1973. This forces the government to borrow from international lending agencies to pay for the products that it imports, which are paid for in foreign currencies, commonly in U.S. dollars. These loans are compounded by interest, which further increases the national debt. Over the last 2 decades, this imbalance has been eased somewhat by the money sent by Filipinos working abroad to their families, estimated at US$6.8 million in 1999, a substantial rise over the US$4.5 million figure for 1998.

The major countries importing goods to the Philippines are the United States (22 percent), Japan (20 percent), South Korea (8 percent), Singapore (6 percent), Taiwan (5 percent), and Hong Kong (4 percent), according to 1998 estimates.

MONEY

In the late 1950s, the **exchange rate** for the Philippine peso against the U.S. dollar was 2 to 1. Because the country's economy was undermined by flawed economic policies, innumerable political crises, and a ballooning foreign debt, the peso continued to weaken so that by 1972, the average exchange rate was P6.67 to $1 and, by 1982, at P8.54 to $1. By 1986, the peso had depreciated (lost its value) further and the average exchange rate was P20.39 to US$1, sinking to P40.8 during the 1997 Asian financial crisis. In 2000, at the height of the political crisis that hit the Estrada administration, the peso hit rock bottom at P55 to US$1. Immediately upon Estrada's ouster, the peso gained strength against the U.S. dollar and stabilized at the average exchange rate of P48.50 to a dollar.

In the late 1980s, the government began a series of financial reforms aimed at strengthening the banking sector. One of the most important was the restructuring and infusion of fresh capital to the nation's central bank, Bangko Sentral ng Pilipinas, which had become bankrupt following successive political and economic crises in the 1980s. Under the New Central Bank Act of 1993, the central bank was granted "increased fiscal and administrative autonomy (self-government) from other sectors of the government." The act also prohibits the Central Bank from engaging in development banking or financing.

The most important of the agencies overseeing the **monetary policy** of the Philippines are the Department of Finance, the Department of Budget and Management, and the Bangko Sentral ng Pilipinas (Central Bank of the Philippines).

The Department of Finance is the government's central finance office, which manages and mobilizes resources to insure that government policies inspire confidence in foreign investors. This Department manages the bureaus of Internal Revenue, Customs, Treasury and Local Government Finance, and supervises the Securities and Exchange Commission and the Philippine Deposit Insurance Corporation, charged with overseeing the stock market and guaranteeing bank deposits. The Department of Budget and Management is responsible for the formulation and implementation of the national budget and for the sound utilization of government funds to achieve

the country's development goals. The re-organized Bangko Sentral ng Pilipinas conducts monetary policy, issues currency, supervises lending to other banks and the government, manages foreign currency reserves, determines exchange rate policy, and provides other banking functions to the government.

BANKING SECTOR. There are 5 types of banks in the Philippines: universal banks (also called "expanded commercial banks"), commercial banks, thrift banks, rural banks, and government-owned banks. Thrift banks, which include savings and mortgage banks, private development banks, and stock and savings associations, service mainly the consumer retail market and small- and medium-size enterprises. The rural banking system services the needs of the agricultural sector, farmers, and rural cooperatives. There are 3 fully government-owned banks: the Land Bank of the Philippines, the Development Bank of the Philippines, and the Al Amanah Islamic Investment Bank of the Philippines. The banking sector encountered great difficulty during the Asian financial crisis in 1997, but owing to past reforms, the financial condition of the Philippine banking system has been more stable compared to several of its neighboring countries, and major bank failures have been avoided.

STOCK EXCHANGES. The Manila Stock Exchange was established by American businessmen in 1927 after a gold boom. In order to protect its investors, the Securities and Exchange Commission (SEC) was set up in 1936, making it the oldest securities regulatory body in Asia. The Makati Stock Exchange was founded in 1956 by some Filipino brokers who felt dominated by the Americans. For many years, the 2 stock exchanges competed against each other for clients, but they merged in 1992 after a Supreme Court ruling. The newly merged stock exchanges commenced commercial operations in March 1994. Standard and Poor's estimated the **market capitalization** of the merged exchanges at US$48.105 million and trading value was at US$19.673 million.

POVERTY AND WEALTH

Poverty remains a serious problem in the Philippines, which is the only populous country in East Asia in which the absolute number of people living on less than $1 a day remained constant over the 1981–1995 period, according to figures compiled by the World Bank. That body estimates that even if the Philippine economy posts a 6 to 8 percent growth through 2005, it will still not be possible to bring the poverty level below 15 percent. Economists believe that it may take some 20 years of continuous economic reforms and implementation of social programs before the country can match the single-digit poverty figures of its more wealthy neighbors. In general, widespread poverty in the country is a direct result of inappropriate and unresponsive economic policies, mismanagement of resources, corruption, and failure of the government to implement anti-poverty programs.

Economic policies from the 1960s to the 1980s focused on a capital-intensive, import-substituting strategy, which bred inefficient industries and contributed to the neglect of the agricultural sector. Policies promoting industrialization favored the development of urban areas to the detriment of rural areas, most of which remained underdeveloped. At the outset, urban areas, especially Metro Manila, cornered major infrastructure and social projects, thereby attracting most of the investments and jobs in the manufacturing and industrial sectors. In contrast, living standards in the rural areas continued to decline, leaving most of the peasant communities to subsist on a hand-to-mouth existence.

Starting in the mid-1980s, policies adopted by the government moved toward a more open, market-friendly economy. However, as government continued to pursue industrialization, the country's foreign debt ballooned and most of the government's resources went for debt and interest payments. This greatly hindered the government's ability to finance infrastructure and social programs for the neglected sectors of the population.

The mid-1990s witnessed a significant increase in income inequality. Only the top 10 percent of the population increased its share of total income, while the remaining 90

percent lost income share. A 1997 government survey revealed that more than a third of the population (36.7 percent) lived below acceptable standards. Still, the incidence of extreme poverty had declined since 1985, when the comparable figure was 49.2 percent. In 1999, the National Statistics Office estimated that, of the 14.7 million families in the Philippines, the top 20 percent earned 14 times more (P502.1 billion) than the lowest 20 percent (P35.8 billion).

A survey by the National Statistics Office of income distribution in the period from 1991 to 1997 shows the combined earnings of 80 percent of Filipino families amounted to only 44 percent of total income in the country, while the top 10 percent of families owned 39.3 percent. In 1999, almost half (46.6 percent) of the total income, or P417.9 billion, came from wages and salaries, and about a quarter (23.5 percent), or P210.3 billion, from entrepreneurial activities.

Among the poorest Filipinos, most family income is derived from entrepreneurial activities such as selling food on street corners or collecting recyclable materials to sell at the junkyards. Those belonging to the higher income strata obtain a bigger share of their incomes from wages and salaries. Most of the poor are lowland landless agricultural workers, lowland small farm owners and cultivators, industrial wage laborers, **hawkers**, microentrepreneurs, and scavengers. Most poor Filipinos live in rural areas, where they are subject to the low productivity of agricultural employment. Urban poverty is caused by low household incomes and the internal migration of poor rural families to urban areas.

Due to inadequate access to community health centers, members of poor households are not able to maximize health services benefits, such as family planning, the lack of which results in larger families with more malnourished and uneducated children. The condition of the poor is made worse by lack of housing, clean water and electricity, especially in the urban areas.

In 1987 Congress enacted the Cooperative Code of the Philippines in order to improve income opportunities, promote self-reliance, and encourage the entrepreneurial spirit in the countryside. As of December 2000, there were 57,470 cooperatives (a collective organization owned and operated by the people drawing benefits from it) registered with the Cooperative Development Authority. In 1991, Congress enacted the Local Government Code, which expanded basic social services on the grassroots level. The Social Reform Agenda (1993), formulated during the Ramos administration, is one of the government's most comprehensive development frameworks for combating poverty; its strategies aim at improving access to basic social services, increasing opportunities for employment, income generation, and self-reliance. The Estrada administration established the National Anti-Poverty Commission and allocated P2.5 billion for suitable programs.

WORKING CONDITIONS

Working conditions in the Philippines are closely related to one's social class. Those belonging to the upper class enjoy the best opportunities in terms of job satisfaction, facilities, advancement, and choice of career. Those from the middle class are usually able to land white-collar jobs with some room for advancement by capitalizing on education, company loyalty, and hard work. Those belonging to the lower class, due to their lack of education or capital, largely engage in poorly paid manual labor or blue-collar jobs, viewed as menial in Philippine society.

The unemployment rate in the Philippines rose to 10.1 percent in October 2000 during a political crisis provoked by President Estrada's impeachment trial on charges of graft (illegal or unfair gain) and corruption. The performance of the manufacturing industry sank to an historic low and investor confidence hit rock-bottom. Nearly 3 million Filipinos were unemployed and the unemployment rate in Metro Manila reached 17.8 percent.

The Department of Labor and Employment is the main agency making and implementing labor policies and

government programs. Guidelines set by the Labor Code of the Philippines guarantee equal work opportunities to all, equal compensation for work of equal value, secure work tenure, overtime and vacation benefits, safe working conditions, the right to collective bargaining, and social-security benefits.

OVERSEAS FILIPINO WORKERS (OFWS). Beginning in the 1980s, lack of employment opportunities and **inflation** at home caused many Filipinos to seek employment in Europe, the Middle East, and neighboring countries in Southeast Asia through legal and illegal means. According to labor statistics released in January 2001, a total of 789,000 documented OFWs left to work abroad from January to November 2000 as information technology workers, engineers, seafarers, housekeepers, and nurses, among others. As of December 2000 labor statistics released by the Inter-Agency Committee on Tourism and Overseas Employment Statistics reveal that there are 7,383,122 Filipino professionals working abroad. Money sent home by the OFWs in 1999 amounted to US$6.8 million, a big jump from US$4.5 million in 1998. The social costs of this phenomenon were also substantial, for it caused the breakdown of the family unit, carrying with it attendant problems such as extramarital affairs and increased delinquency among unsupervised children. An equally disturbing problem was the rampant sexual and physical abuse of OFWs, especially women, and those victimized by illegal recruiters.

WOMEN AND CHILDREN IN THE WORKFORCE. On one hand, economic growth has opened up more opportunities for women, particularly in export industries; on the other hand, women are first to be terminated when industries are forced to downsize. Since the Asian financial crisis in 1997, women have been forced to seek additional sources of income to supplement their meager take-home pay and are thus working longer hours than men. A 1998 study revealed that the number of women employed in the manufacturing sector had decreased by 12 percent, while those engaged in mining and quarrying increased by more than 16 percent.

A government agency, the National Commission on the Role of Filipino Women (NCRFW), is mandated to conduct gender consciousness-raising programs among government policymakers, planners, implementers, women in government, and non-government institutions. Through its initiative, the Philippine Development Plan for Women was formulated and adopted by the government. Another agency, the Bureau of Women and Young Workers, a subordinate agency of the Department of Labor and Employment, looks after the interests of working women and children. There are laws in place protecting women from gender discrimination and sexual harassment and establishing community day-care centers for children, but the implementation of these laws is not always strictly monitored.

Though the minimum age of employment is 18 years for hazardous jobs and 15 years for non-hazardous jobs, it is not unusual to see children engaged in some form of labor to contribute to their family's daily survival. A government survey in 1995 estimates that 3.6 million children, mostly boys aged 5 to 17 years, were engaged in some form of child labor. At least 1 in 10 of them is engaged in heavy physical work.

COUNTRY HISTORY AND ECONOMIC DEVELOPMENT

1521. In his search for the Moluccas, Ferdinand Magellan docks in the Philippines and is slain by native chieftain Lapu-Lapu in battle.

1543. Spanish conquistador Ruy Lopez de Villalobos names the islands Filipinas after Spain's Philip II.

1565. Miguel Lopes de Legazpe establishes his base in the province of Cebu and later moves it to Manila.

1575. Spain takes control of non-Islamic areas and monopolizes trade.

1896. Nationalist Jose Rizal is executed by the Spaniards. He is later honored as a national hero.

1898. Spain sells the Philippines to the United States for $20 million after a mock battle in Manila Bay.

1900. The United States establishes a commonwealth government and enacts a law that will grant the Philippines independence by 1944.

1935. Manuel L. Quezon is elected president and a new constitution is adopted.

1941. Japanese forces invade Luzon.

1942. Japanese forces conquer Manila as U.S. troops on the Bataan peninsula surrender to Gen. Yamashita.

1945. Japanese occupation ends. The Philippines joins the United Nations as a charter member.

1946. The Philippines gains independence from the United States on July 4, becoming an independent republic with Manuel Roxas as president.

1947. The Philippines and the United States sign a Military Bases Agreement.

1948. President Roxas dies and is succeeded in office by Elpidio Quirino.

1950S. The Communist Hukbalahap Movement collapses. The country rebuilds itself and earns the distinction of becoming the second most prosperous nation in Asia, next to Japan.

1953. Ramon Magsaysay is elected to the presidency as standard bearer of the Nacionalista Party.

1957. President Magsaysay dies in an air crash and is succeeded in office by Vice President Carlos P. Garcia.

1961. Vice President Diosdado Macapagal is elected president over incumbent Garcia.

1965. Ferdinand E. Marcos is elected president, defeating incumbent Macapagal.

1967. The Philippines joins the Association of Southeast Asian Nations (ASEAN).

1969. President Marcos is re-elected and becomes the first president ever to be sworn in for a second time. The New People's Army is founded.

1972. President Marcos declares martial law in the guise of controlling a Communist rebellion. He orders the arrest of all opposition leaders, suspends the constitution, and dissolves the National Assembly. A new constitution is approved in a national referendum that proposes a return to a parliamentary form of government. President Marcos serves as president while Cesar Virata serves as prime minister. Muslim insurgency in the South intensifies.

1981. President Marcos ends 8 years of martial law and wins elections for a second 6-year term.

1983. Senator Benigno S. Aquino Jr. returns from exile in the United States and is assassinated on his arrival at the Manila airport. Marcos calls for a quick election to quell domestic unrest and international pressure.

1986. Millions of Filipinos hold a peaceful "People Power" revolution protesting President Marcos's victory amidst charges of ballot tampering. Marcos and his family are exiled to Hawaii, and Corazon C. Aquino, wife of the slain Senator Aquino, assumes the presidency. A new constitution is soon ratified.

1989. Limited autonomy is granted to Muslim provinces. Dispute escalates with China over the Spratly Islands. Military stages a coup d'état.

1990. A destructive earthquake, measuring 7.7 on the Richter scale, kills more than 1,600 and destroys property amounting to hundreds of millions of pesos. Typhoons batter the Visayas region.

1991. Eruption of the volcano Mount Pinatubo, burying many towns under lava including the ones where 2 American bases, Clark Air Base and the Subic Naval Bay Station, were located.

1992. Fidel V. Ramos is elected president. He unveils his blueprint for development called Philippines 2000. The Philippine Senate votes against the continued presence of U.S. military bases in the country.

1990s. The Philippine economy registers positive growth. International agencies express optimism about the country's development and dubs the country as one of Asia's "tiger cub" economies.

1998. Joseph E. Estrada, running under a social-justice platform, wins the presidency by a wide margin. The Philippines' fiscal deficit balloons to P111.66 billion from a deficit of P11.14 billion in 1986.

2000. President Estrada becomes the first Philippine president to be impeached by Congress. After mass "People Power" demonstrations, vice president Gloria Macapagal-Arroyo becomes the fourteenth President of the Republic.

FUTURE TRENDS

The greatest task at hand for the government of President Gloria Macapagal-Arroyo is to stimulate the economy to sustained growth and reduce poverty by ensuring that the benefits of development are evenly distributed. In order to achieve this, government must manage its huge **budget deficit** and the national debt, and both the private and **public sectors** must reduce unemployment by attracting more foreign investors or generating employment locally through entrepreneurship. The new president is an economist by training, and it is believed she can inspire confidence in investment. By 2001, forecasters were revising upward their predictions of GDP growth from 2.7 percent to 4 percent.

In May 2001, voters will elect 13 senators, 209 representatives, 53 party-list representatives, and 79 governors and vice-governors. The outcome of the elections is crucial to the political and economic stability of the country. Any perception of election irregularities such as vote-buying or cheating will diminish investor confidence. In fact, most foreign investors are postponing business decisions until the outcome of the elections is known. In addition, it is crucial that the candidates of the current administration win a majority of the positions in order to affirm its mandate and ensure the smooth passage of its priority bills in both the Senate and the House of Representatives.

Some of the existing problems that can cause destabilization are the remaining pockets of Communist insurgency, the continuing struggle by Muslim separatists, and the feeble, but divisive, attempts of the former president to regain the presidency. The precarious state of the country's environment and natural resources can also hurt political stability and economic growth. In 2000, the government was severely criticized for not being able to effectively address the crisis in waste management. Dozens of slum dwellers living near the Payatas dumpsite were buried alive under mountains of trash that collapsed on their houses after continuing rains. A temporary shutdown of the dumpsite resulted in the accumulation of un-

collected garbage in Metro Manila and added to public perceptions of the government as incompetent and ineffective. The continuing degradation of the environment is negatively affecting health and livelihood. The heavily polluted air in Metro Manila is the primary cause of respiratory illnesses, which harms labor productivity. Water pollution disrupts marine-dependent livelihoods, as well as the country's source of food. Although initiatives for resource conservation and environmental protection have gone a long way, there is still much to be done in terms of strict implementation of the laws and instilling respect for the environment.

DEPENDENCIES

Philippines has no territories or colonies.

QATAR

State of Qatar
Dawlat Qatar

CAPITAL: Doha (Ad-Dawhah).

MONETARY UNIT: Qatari riyal (QR). One riyal equals 100 dirhams. Coins are in denominations of 50, 25, 10, 5, and 1 dirhams. Paper currency is in denominations of QR500, 100, 50, 10, 5, and 1.

CHIEF EXPORTS: Petroleum products, fertilizers, and steel.

CHIEF IMPORTS: Machinery and transport equipment, food, and chemicals.

GROSS DOMESTIC PRODUCT: US$15.1 billion (purchasing power parity, 2000 est.).

BALANCE OF TRADE: **Exports:** US$9.8 billion (f.o.b., 2000 est.). **Imports:** US$3.8 billion (f.o.b., 2000 est.).

COUNTRY OVERVIEW

LOCATION AND SIZE. Qatar is a tiny peninsula jutting into the Persian Gulf and bordering only Saudi Arabia. With an area of 11,437 square kilometers (4,416 square miles) and a short coastline of 563 kilometers (345 miles), Qatar is slightly smaller than the state of Connecticut. Qatar's capital city, Doha, is located in the east on the Persian Gulf and is home to 320,000 people. Other major cities include Umm Sa'id and al-Khawr.

POPULATION. The population of Qatar was estimated at 769,152 in July of 2001, a marked increase from the 1990 population of about 486,000. Arabs make up 40 percent of the population, but there are also Pakistanis (18 percent), Indians (18 percent), Iranians (10 percent). Non-Qataris make up the largest proportion of the country's **labor force**. Since 1998, the population growth has slowed down, as evidenced in the 5.3 percent drop in the population in 1998. The slowdown is believed to come as a result of the government's "Qatarizing" movement—to encourage the employment of local workers—following the sharp decline in oil prices in 1997 and 1998.

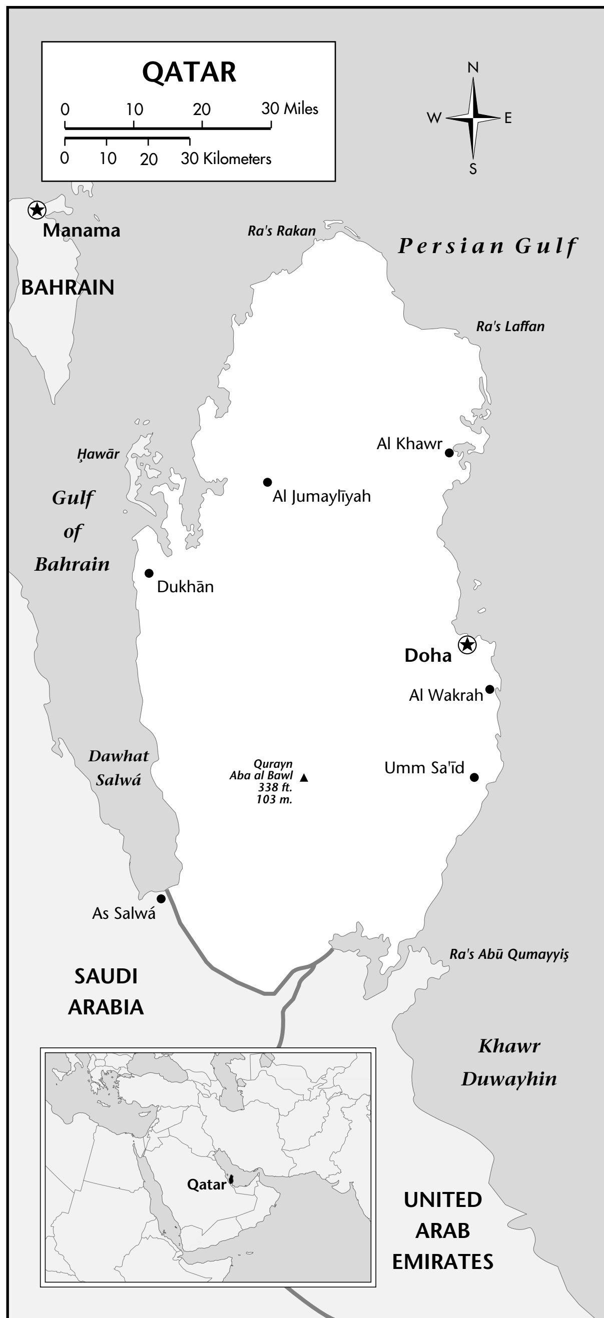
Qatar's population growth has accelerated since the 1960s, mainly as the result of the influx of large numbers of expatriate workers into the country. Between the late 1960s and 1997, the population grew from 70,000 to 522,000, of whom only 160,000 are Qatari nationals. According to the Economist Intelligence Unit (EIU) *Country Profile* for 2000, the population growth rate reached 1.5 percent in 1999, and is projected to reach 1.8 percent in the coming decade. The expatriate worker community, which accounts for 70 percent of the population, is largely made up of Indians and Pakistanis.

Like most Arab countries, Qatar's population is mostly young; 27 percent of the population is younger than 15. Also like many developing countries, a majority of Qataris (90 percent) are concentrated in urban areas. Major cities have been growing at the rate of 2 percent annually. Almost 80 percent of the population is concentrated in the capital, Doha. Other major cities include Messaieed, an industrial township 124 kilometers (77 miles) south of Doha.

OVERVIEW OF ECONOMY

Qatar's domestic economy is heavily dependent on the hydrocarbons sector. Oil accounts for about 40 percent of **gross domestic product** (GDP) and about 63 percent of government revenues. Qatar's oil reserves are small relative to its Persian Gulf neighbors, although its output has tripled in recent years with the exploration of new fields. Other non-oil industries exist, but they are heavily dependent on the oil sector, which means that Qatar's dependence on oil is likely to continue for a long time to come.

More importantly, Qatar has the third-largest reserves of natural gas in the world. Its reserves are expected to last for 250 years at the current rate of production. The government has increased emphasis on the natural gas sector since 1990 with the goal of replacing oil as the main



source of revenue. Several hydrocarbon-related industries, mainly petrochemicals, have also been set up since 1990. It is likely to take years before this diversification strategy begins to yield profit, however, largely because of the huge investments and heavy foreign borrowing that the government needed for the development of the natural gas sector. These loans would have to be paid before the government could show a profit.

Agriculture is not a major contributor to the economy. The state, which owns all agricultural land, has attempted to promote production by increasing the number of small farms. These efforts have been largely unsuccessful, mainly because of the lack of water for irrigation.

Qatar entered the 20th century as a tribal settlement on the peninsula nominally controlled by the al-Thani tribe, whose exact origins remain unknown. Real power, however, rested with the British, who effectively controlled the country's foreign relations. The al-Thani ruling family had signed a series of treaties with the British in the 19th century. In return the British promised protection against other powerful regional tribes, especially the Wahhabis from neighboring Saudi Arabia and against Bahrain, which claimed Qatar as its own. By the end of World War I, however, Qatar's importance had waned, largely due to the diversion of British trade routes to India after the opening of the Suez Canal. Unlike bigger oil producers in the Gulf region, oil was not discovered in Qatar until the 1950s. Until the 1970s, foreign companies, who owned and managed the oil industry in return for fees paid to the al-Thani family, dominated oil production. By the early 1990s, many of the foreign subsidiaries had become completely state-owned. After several Gulf sheikhdoms declared their independence from the British, Qatar followed suit on September 3, 1971, after securing continued support from the al-Saud tribe that ruled neighboring Saudi Arabia.

Since the early 1970s, increased oil revenue has allowed the government to embark on massive development projects that brought rapid material and social change. The state's role in the economy remains central, as the government controls the oil revenue. Income from oil fluctuates according to changes in world oil prices. The government's dependence on oil revenue and decades of government overspending have resulted in recurring **budget deficits**, especially during low oil prices, and a high **external debt**, which was estimated by the EIU to have reached US$12.2 billion in 1999.

Since 1997, at the recommendation of the International Monetary Fund (IMF), Qatar has embarked on a program to reduce **subsidies** on utilities, gasoline, wheat, and sugar and to introduce charges for health care and education for the purpose of stabilizing the **exchange rate**. As a result, the expatriate community in Qatar no longer enjoys free medical benefits. Services to Qataris, however, continue to be heavily subsidized by the state. In 1999, an official stock market was set up and the government issued 2 domestic bonds and 1 international bond as a means to develop alternative financing methods. In 2001, the government plans to **privatize** the generation, transmission, and distribution of utilities, and to continue its policy of encouraging locals to seek employment to reduce the country's dependence on foreign workers. The government is also expected to continue to encourage the **private sector** to play a bigger role in the economy.

POLITICS, GOVERNMENT, AND TAXATION

Qatar is an absolute monarchy that has been ruled by the al-Thani family since the mid-1800s. It is currently headed by Sheikh Hamad, who ousted his father, Sheikh Khalifa, in a bloodless *coup d'etat* (a takeover of a government) in June 1995. Although autocratic (ruling through absolute power), the ruling family has been committed to building the state and developing its resources. Since taking over, the widely popular Sheikh Hamad has embarked on an ambitious political and economic reform program to modernize the state and address the decline in economic performance that began in the early 1990s. In 1999, the first municipal elections in the country's history were held, followed by the establishment of a constituent assembly in mid-1999 entrusted with the task of drawing up a permanent constitution and providing for an elected parliament. Sheikh Hamad has also allowed greater political freedoms. Despite these efforts, however, ultimate authority continues to rest with him and his circle of advisors. The sheikh remains the source of absolute authority and enjoys the power to dissolve the Consultative Council (a 35-member advisory council appointed by the sheikh) and rule by decree, powers given to him by the 1970 provisional constitution.

Qatar is a **welfare state**, where health care and education are almost free. Since 1998, the government has moved to introduce small charges for these services, especially for health care, in an effort to boost the government's budget by reducing spending. However, most utilities in 2001 continue to be heavily subsidized by the government, and education remains entirely free. Qataris do not pay taxes and the government's budget continues to rely heavily on oil revenue.

INFRASTRUCTURE, POWER, AND COMMUNICATIONS

Qatar enjoys an extensive and highly-developed **infrastructure** that has been built and developed with oil wealth since the 1950s. The country is served by a network of over 1,230 kilometers (764 miles) of primary and secondary roads, linking Doha with major industrial and oil producing areas. Most of these roads, some 1,107 kilometers (688 miles), are paved. The country has no railway system. Qatar has 4 airports, 2 of which have unpaved runways. Doha International Airport is the country's major airport. Twenty-eight airlines service Doha and bring in most of the country's tourists. Qatar has 3 ports and harbors: Doha, Halul Island, and Umm Sa'id.

Electrical power is provided to Qataris from the Ras Aby Aboud and Ras Abu Fontas power stations. In addition, there are 6 gas turbines and an estimated 5,000 diesel units spread across the country. Altogether, Qatar's total power capacity is estimated at 2,019 megawatts (MW). In 2000, the government drew up plans to build an independent power station with a capacity of 1,902 MW to meet the increasing demands of industrial projects and satisfy rising power demand, which peaks in the summer due to soaring temperatures. Several foreign companies, which are expected to own 60 percent of the project, have submitted bids, but the project's completion date remained unknown in 2001.

Telecommunications services in Qatar are thoroughly modern. Telephone service is provided by the Qatar Public Telecommunications Corporation (Q-Tel), which is 55 percent government owned. There are 430,000 landlines in the country, and in 2001, Q-Tel will be installing additional exchanges for Doha and Ras Laffan. Q-Tel also provides Internet and cable television access.

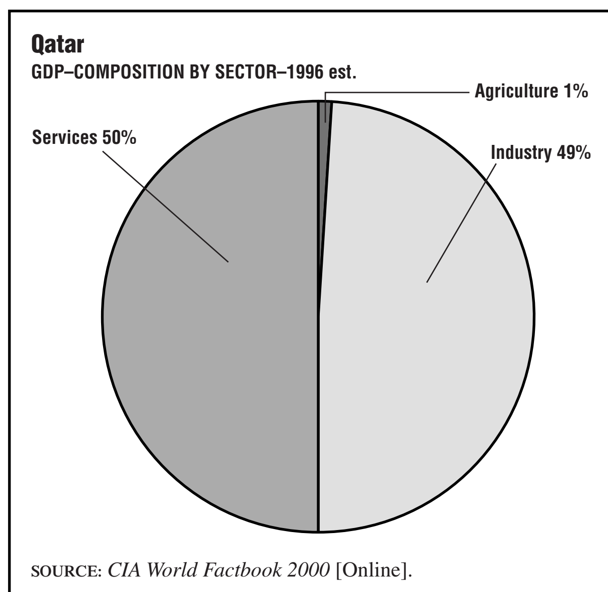
ECONOMIC SECTORS

Qatar's economic sectors reflect the small size of the country. Qatar relies heavily on the oil sector, exporting some 650,000 barrels a day, mostly to Europe and eastern Asia. The services sector is the country's second-largest economic sector and most important non-oil sector. According to the CIA *World Factbook* for 2001, the sector's contribution to GDP reached 50 percent in 1996. The industrial sector is also an important contributor to the economy, accounting for 49 percent of GDP in 1996. This sector is dominated by the oil industry, which accounts for a little over 40 percent of GDP. The non-oil manufacturing sector, on the other hand, accounts for only 8.8 percent, according to the EIU. Agriculture is an insignificant contributor to the economy, accounting for roughly 1 percent of GDP.

One of the greatest problems facing all of Qatar's economic sectors is the dependence on oil revenue and the adverse impact of the fluctuation of oil prices on the country's investment climate and fiscal deficit. Lower oil prices generally mean lower revenue for the government. Reduced government revenues in turn translate into lower government spending on economic projects, a situation that brings about an overall slowdown in the economy.

Recognizing these obstacles, Qatar has moved to diversify its sources of income by developing its liquefied natural gas (LNG) industry and expanding its industrial base. Qatar's efforts to diversify its economic base have not been very successful. Most economic activity continues to be centered on oil. Qatar has 2 natural gas plants that have been in existence since 1980. With the help of international oil companies, Qatar launched 2 LNG projects in 1992, the North Field development at Ras Laffan city. The first phase of the project was completed in 1992, and the second project is scheduled to start in 2001. According to the EIU *Country Profile* for 2000, once completed, the North Field will be "the largest single concentration of natural gas" in the world. The government invested some US$20 billion in the development of the North Field between 1995 and 2000. However, it is not expected to make a profit from these projects until its debts to the companies that financed the exploration projects are paid. Therefore, Qatar's dependence on oil is likely to continue.



SOURCE: *CIA World Factbook 2000* [Online].

AGRICULTURE

The government, which owns all agricultural land, has attempted to encourage agricultural production, accounting for only 1 percent of GDP. Given the scarcity of fresh surface water, however, most agricultural activity is dependent on wells. The government has also attempted to increase the number of small farms. As a result, the number of farms has increased from 338 in 1975 to 891 in 1995. Most farmers are absentee landlords, who are relatively uninterested in investing in agriculture, and the land is mostly cultivated by foreign workers.

Qatar's agricultural products are consumed locally, providing 70 percent and 40 percent of the consumption of summer and winter vegetables, respectively. In addition to vegetables, Qatar produces cereals, fruits and dates, eggs, poultry, and dairy products. Despite a noticeable increase in agricultural production in the course of the past 20 years, however, Qatar continues to rely on food imports, especially foodstuffs and live animals, which account for roughly 10 percent of total imports.

INDUSTRY

MINING. Qatar's economy is heavily dependent on oil. Oil accounts for 40 percent of GDP and 63 percent of the state's income. The Qatar General Petroleum Corporation estimates that Qatar's total oil reserves have reached 12.2 billion barrels, up from 3.7 billion in 1995, due to the exploration of new oil fields by western companies since 1990. Oil production has risen consistently since 1994. Average production reached 854,000 barrels a day in May 2000, up from 410,000 barrels a day in 1994. Despite the increased production levels, Qatar's output is relatively low by regional standards.

In addition to oil, Qatar has been a producer and exporter of natural gas since 1980, when the first liquefied natural gas (LNG) plant was opened. Altogether, there are 3 LNG plants in the country, and a fourth is being constructed. The first plant was opened in 1980, producing up to 1,284 tons a day of propane, 851 tons a day of

butane, 588 tons a day of condensate, and 1,350 tons a day of ethane-rich gas. A second LNG factory was opened in 1982, and it also produces large quantities of propane, butane, condensate, and other gases. The third LNG project was completed at Ras Laffan in 1992 as the first phase of the North Field Project. According to the EIU, the plant produces some 22.6 million cubic meters a day of gas and around 50,000 barrels a day of condensates. A fourth project, phase two of the Ras Laffan North Field project, is being constructed in 2001 to produce ethylene and polyethylene for use as feedstock (raw materials used for chemical and biological processes) by Qatar Chemical Complex. The project also aims to export 22 million cubic meters of gas a day to neighboring Persian Gulf states. LNG products are mostly exported to generate foreign exchange but are also used as feedstock for the emerging petrochemical industry.

MANUFACTURING. Qatar's non-oil industrial base is relatively small. However, the contribution of the non-oil manufacturing sector to the economy has increased steadily since the 1970s, in large part thanks to the huge investments and efforts by the country to build a non-oil industrial base. Since 1992, the government has moved to establish the Ministry of Energy and Industry to encourage industrialization and to set up the Qatar Industrial Development Bank to provide loans with easy terms to would-be investors. In 2001, Qatar enacted a law allowing foreign companies a 100-percent ownership of projects in some sectors, including education, tourism, and health care. Despite these efforts, however, industrial output remains low. The sector's contribution to GDP reached 8.8 percent in 1999.

Qatar's industrial base is dominated by the petrochemicals sector, which is controlled by the government. It is the biggest producer of low-density polyethylene and chemical fertilizers in the world. The sector has traditionally accounted for 40 percent of GDP. However, since 1998, the sector's contribution to GDP has been affected by the economic slowdown in Asia, the primary market for Qatar's oil products. Efforts are underway in 2001 to set up new petrochemical ventures that are expected to resume exports once the economic slump affecting Asia is over. In addition to petrochemicals, there is a small steel production operated by the 100-percent state-owned Qatar Steel Company. The sector produces 500,000 metric tons a year. Since 1998, the government has attempted to privatize the company by selling 49 percent of its shares on the Doha Securities Market to improve its profitability and as part of an overall scheme to reform the economy. The government, however, was forced to delay the partial privatization of the company as a result of the poor performance of the Doha Securities Market since 1998, which meant that the company's shares will be sold for much less than the government had hoped for.

SERVICES

TOURISM. Tourism is a very negligible contributor to Qatar's economy. Since 1996, the government has attempted to establish a tourism industry and to turn Qatar into a major destination for international sporting events. The government has, as a result, invested heavily in the construction sector. These efforts came to a halt in the wake of the 1998 spending cuts, which were prompted by the sharp fall in world oil prices, but were revived in the 2001 budget, as oil prices rose again in 2000.

FINANCIAL SERVICES. Qatar has a fledgling financial sector regulated by the Central Bank of Qatar. There are 14 banks operating in the country, including 5 locally-owned banks that hold 80 percent of the financial sector's assets. There are also 16 currency exchange companies. There are no investment banks. The Qatar National Bank, the country's largest bank, is the only bank involved in the government's hydrocarbon development program, and handles all the government's business. Other banks include the Qatar International Islamic Bank, Doha Bank, and the Commercial Bank of Qatar.

The government introduced new regulations in August 1995 to ease earlier restrictions placed on financial transactions. Despite these efforts, some restrictions continue to affect interest rates paid by banks on deposit accounts. Although the Central Bank requires banks to disclose accounts according to international standards, there is growing concern that some banks do not disclose their **non-performing loans**.

The Doha Securities Market (DSM) was established in 1997 with QR21 billion (US$5.8 billion) in assets. Nineteen companies are listed on the DSM, but trading has been generally weak, resulting in a 0.5 percent drop in the stock market index at the end of 1999.

RETAIL. Lacking many large commercial centers other than Doha and its suburbs, Qatar has a relatively undeveloped **retail** sector. While Doha is home to a variety of retail stores, including fast food franchises such as McDonald's, the majority of towns in the interior of the country have small family-owned shops, farmer's markets, and temporary roadside stands.

INTERNATIONAL TRADE

Over the past decade, Qatar has relied more and more on imports. The value of imports more than doubled since 1990, peaking to US$3.9 billion in 1999, up from US$1.2 billion in 1989. Imports have traditionally varied from basic foodstuffs to **consumer goods**. Since the early 1990s, however, capital purchases for gas development projects have accounted for approximately 40 percent of imports. The volume of imports is expected to rise by

Trade (expressed in billions of US$): Qatar

2002, largely because of revived government spending in the construction business.

Imports of foreign goods are dominated by Organization for Economic Development and Cooperation (OECD) suppliers, namely Japan, the United Kingdom, the United States, Italy, and Germany. (The OECD is a 30-member organization that provides governments with a forum to discuss and develop economic and social policy.) In 1998, Japan overtook the United Kingdom as Qatar's major supplier of machinery and manufactures, providing 15.4 percent of total imports. Imports from the United Kingdom accounted for 13.9 percent of total imports, followed by France, the United States, and Germany.

Qatar's exports are dominated by crude oil, although its importance has begun to decline in recent years due to the increase in the export of LNGs. As a result of its dependence on crude oil, which roughly accounts for 56 percent of exports, Qatar's export bill has fluctuated with world oil prices. Export revenue surged from US$4.36 billion in 1998 to US$6.6 billion in 1999. In 1998, Japan was also Qatar's largest export partner, accounting for 58.1 percent of the total export bill. South Korea came next at 11.0 percent, followed by Singapore, the United States, and Thailand.

The substantial oil revenue has allowed Qatar to maintain a **trade surplus**. However, the transfer of large amounts of money in **remittances** by the large expatriate workers community has consistently resulted in a deficit in the current account for most of the past decade. The deficit peaked to US$1.6 billion in 1993, and the government's efforts to reduce the number of expatriate workers is expected to reverse the trend in the coming years. Similarly, the service balance has registered a deficit for much of the past decade, due to the government's heavy spending on defense and capital imports related to the LNG development. In 1999, the deficit in the service balance reached US$1.5 billion. The income balance also has registered a deficit as a result of the interest on the country's mounting **foreign debt**.

MONEY

The value of the Qatari riyal has remained stable since it was first issued in 1969. The majority of Qatar's exports are denominated by the U.S. dollar. The Central Bank of Qatar has kept a **fixed exchange rate** of QR3.64: US$1, despite a fall in the value of the dollar in 1995, mainly to prevent **inflation**.

POVERTY AND WEALTH

Qataris enjoy one of the highest living standards in the world. Per capita income is high by both regional and international standards. In 1999, per capita income was estimated at US$21,841, US$1,803 higher than 1998. By contrast, per capita income in the United States is US$29,683.

The country's vast wealth from oil revenue and its relatively small population have allowed the government to invest heavily in education and in providing first-class health and educational services to its citizens since the 1970s. As a result, the literacy rate in the country is estimated by the United Nations to have reached 80 percent in 1995. Vast oil wealth has also allowed the government to offer heavily-subsidized or free services, such as public education.

GDP per Capita (US$)

Country	1996	1997	1998	1999	2000
Qatar	21,300	16,700	17,100	17,000	20,300
United States	28,600	30,200	31,500	33,900	36,200
Saudi Arabia	10,600	10,300	9,000	9,000	10,500
Bahrain	13,000	13,700	13,100	13,700	15,900

No information is available about the distribution of wealth in Qatar, but poverty among Qataris is believed to be virtually non-existent.

WORKING CONDITIONS

Qataris have traditionally been uninterested in working at menial jobs and have instead relied on foreign workers in the administration of their country. Locals generally tend to occupy high positions in government ministries and private businesses, but the bulk of the manual labor is performed by Indians and Pakistanis. Unemployment among nationals is believed to be quite low (figures are unavailable). Since 1998, the government has launched a program to encourage Qataris to replace foreign-born laborers. This program also expanded labor training programs for Qatari nationals. No official statistics are available to assess its success.

The Ministry of Interior controls all transactions relating to foreign workers in the country. There is no minimum wage requirement. Salaries are negotiable. Expatriate workers pay for health care and are required to pay annual residency fees in the amount of US$275. According to the U.S. State Department *Country Commercial Guide, 2001*, the wives and children of expatriate workers are required to pay US$137 and US$82 respectively in residency fees. Qatar has no tradition of labor unions, although trade associations and labor unions are not forbidden by law.

COUNTRY HISTORY AND ECONOMIC DEVELOPMENT

MID-1800s. Al Khalifa, Bahrain's ruling family, establish Qatar.

1915. Al Khalifa family expels the Turks from Qatar.

1916. Qatar signs treaty to receive protection from United Kingdom.

1949. Sheikh Abdullah abdicates in favor of his son Ali.

1950s. Oil is discovered in commercial quantities.

1971. Qatar declares independence from the British.

1973. World oil crisis. Qatar's oil revenue increases dramatically.

1981. Qatar, Kuwait, Bahrain, Saudi Arabia, Oman, and the United Arab Emirates form the Gulf Cooperation Council.

1995. Sheikh Hamad deposes his father, Sheikh Khalifa, in a bloodless coup.

1997. Economic reform program launched.

1999. The first municipal elections are held.

FUTURE TRENDS

Qatar entered the 21st century under a cloud of uncertainty. Despite the large sums of money that have entered the government's coffers from the sale of oil in the last 50 years, decades of government overspending and misuse have created serious financial constraints, mainly large foreign debt and recurring budget deficits. Despite the government's attempts to address these 2 problems by diversifying the country's economic base and introducing reform, Qatar's dependence on oil and the government's large role in the economy have meant that economic performance will continue to fluctuate according to oil prices. As a result, economic performance will be best when oil prices are high.

Given the structure of the economy, the government is expected to proceed with the "Qatarization" of its labor force. The government is also expected to forge ahead with the economic reform program started in 1997, which will seek to increase the role of the private sector, and to push for the privatization of more state-owned enterprises. Given that Qatar's budgetary problems are unlikely to be resolved until revenue from the sale of liquid natural gas exports begins to flow, the government will have no choice but to proceed with the promised democratization process and to engage the population

politically to deflect the potentially disruptive impact of declining conditions. Political participation will engage citizens in the decision-making process by allowing them to elect their representatives through a popular vote, hence reducing the perception among the largest proportion of Qataris that they are outside the political process.

DEPENDENCIES

Qatar has no territories or colonies.

SAMOA

Independent State of Samoa
Malo Sa'oloto Tuto'atasi o Samoa i Sisifo

CAPITAL: Apia.

MONETARY UNIT: Tala (WST). One tala equals 100 sene. Coins are 1, 2, 5, 10, 20, and 50 sene and 1 tala. Notes are 2, 5, 10, 20, 50 and 100 talas.

CHIEF EXPORTS: Copra, coconut oil, coconut cream, taro, fish, and kava.

CHIEF IMPORTS: Food, machines and transport equipment, manufactures, and fuels.

GROSS DOMESTIC PRODUCT: US$571 million (purchasing power parity, 2000 est.).

BALANCE OF TRADE: **Exports:** US$17 million (f.o.b., 2000). **Imports:** US$90 million (f.o.b., 2000).

COUNTRY OVERVIEW

LOCATION AND SIZE. Located in the South Pacific Ocean, about halfway between Hawaii and New Zealand and just east of the International Date Line. The country consists of 2 large islands—Savai'i to the west and Upolu to the east—and several smaller islands. It has a land area of 2,850 square kilometers (1,100 square miles) and a coastline of 403 kilometers (250 miles), making it slightly smaller than Rhode Island. The capital city, Apia is located on the north coast of Upolu.

POPULATION. The population of Samoa was estimated at 169,200 in mid-2000, an increase of 17 percent since the census of 1991. In 2000 the birth rate stood at 30.3 per 1,000 people, while the death rate was 6.4 per 1,000. With a projected annual population growth rate of only 0.6 percent between 2000 and 2010, Samoa would have 179,000 by 2010; the U.S. Central Intelligence Agency (CIA) *World Factbook 2001* estimated the population at 179,058 for 2001, though. The low growth rate resulted mainly from a high rate of outward-migration, which in 2000 was estimated at 17.6 per 1,000. This migration is mostly to the United States and New Zealand.

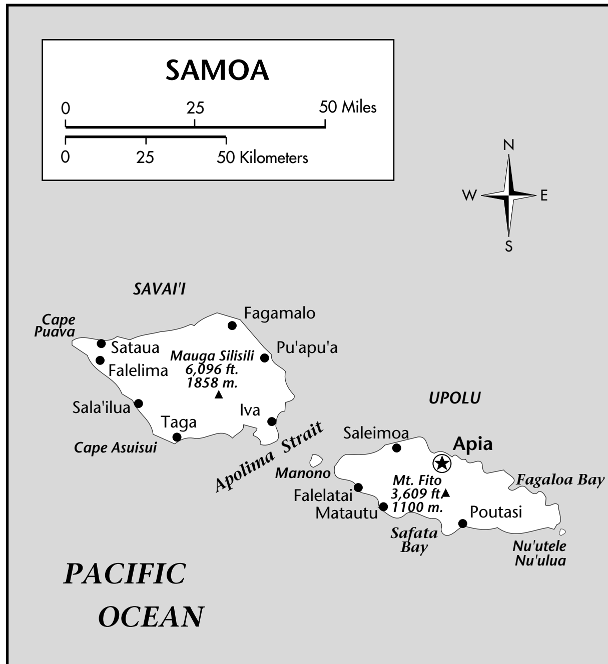
The population is predominantly of Samoan (Polynesian) ethnic origin, although about 7 percent also have European origins. Only 21 percent of the population live in an urban area, with Apia accounting for most of this. The urban growth rate is twice as high as the general growth rate, but at 1.2 percent per year still relatively low by Pacific standards.

OVERVIEW OF ECONOMY

As a small island country in the South Pacific, Samoa (formerly Western Samoa) has an economy largely based on agriculture, government and tourist services, and **remittances** from Samoans living abroad. The majority of households in Samoa are dependent on subsistence production for at least part of their food supply and other basic items. At the same time, most households rely on cash income to provide basics that are not available from subsistence. In other words, food products grown or caught for personal consumption—such as taro, coconut, banana, fish, and crayfish—are also sold to generate cash for village households.

The export economy mainly relies on agricultural products. The most important of these are coconut products such as copra (the dried flesh of the coconut), copra meal, coconut oil, and coconut cream. In the early 1990s taro (a tropical Asian plant) was an important export but was destroyed by disease in 1993 and is only starting to re-emerge as an export. In the late 1990s the development of a commercial fishing operation illustrated the competitive advantage Samoa has in this industry, with its proximity to fish canning facilities in American Samoa. Timber has been a modest source of export income in the past, but is not likely to be significant for 25 years when recently planted trees mature.

Manufacturing in Samoa is mainly to supply the domestic market, although there have been some initiatives to foster export manufacturing using tax breaks. Tourism grew steadily through the 1990s and has



considerable potential, especially if tourism **infrastructure** is developed.

Besides tourism, remittances and international aid offset Samoa's annual trade imbalance. Remittances from relatives overseas are an important source of income for many families in Samoa and a significant source of foreign exchange for the country. The largest source of remittance income, comes from the Samoan population living in New Zealand. Another substantial amount comes Samoan communities in Hawaii and California. International aid contributes about one-quarter of **gross domestic product** (GDP) and supports many of the government's development projects. The largest aid donors are Japan, Australia, and New Zealand followed by multilateral aid agencies such as the Asian Development Bank.

POLITICS, GOVERNMENT, AND TAXATION

Traditionally, political power in Samoa was held by matai (chiefs), whose positions were generally inherited, although individuals with charisma and power can earn positions. The matai system survives to the present day, but was changed during the colonial and post-colonial periods. Political turbulence characterized the 19th century in Samoa, during which matai-lead governments formed and reformed, often with support from traders, missionaries, and other foreigners. In 1899 the colonial powers of Germany, Great Britain, and the United States resolved this impasse for their own purposes by signing a treaty granting Germany control of Western Samoa and the United States control of Eastern (American) Samoa. Western Samoa, however, was occupied by New Zealand during World War I and was a colony of that country until it gained independence in 1962. In the 1920s the Mau movement, advocating non-payment of tax and whose ultimate goal was independence, was formed. The movement was suppressed by New Zealander troops in the late 1920s but it remains a symbol of nationalism to the present day.

Samoa has a parliamentary system with the Paramount Chief of Samoa as the ceremonial head of state. Until 1991, members of Parliament were elected by the matai, but in that year universal suffrage for all citizens 21 years and over was introduced. Tradition is still maintained, however, since only matai can be elected to 1 of the 49 parliamentary seats. There are 2 main parties, the Human Rights Protection Party and the Samoa National Development Party, but these parties tend to revolve around personalities more than political positions that allow them to be labeled left, center, or right.

Until recently the main domestic sources of government revenue were trade **tariffs** and, to a lesser extent, **income taxes**. In 1994, a **value added** goods and services tax (VAGST) was introduced despite popular opposition. The VAGST of 10 percent is imposed on most items of consumption including imports, with exceptions including unprocessed local primary production, financial services, and hospital and educational services. Since this tax's creation, most individuals do not have to pay income tax and trade tariffs have been reduced.

INFRASTRUCTURE, POWER, AND COMMUNICATIONS

The 2 main islands of Upolu and Savai'i are quite well serviced by 790 kilometers (491 miles) of roads, of which about 40 percent are paved. Nearly all villages can be accessed by road, and bus services reach most parts of the country. The 2 islands are linked by passenger and car ferries with frequent sailings. The size of the country and the existence of road and ferry services mean that internal air travel is relatively rare. The sole international airport, Faleolo Airport, on the northwest coast of Upolu, provides international air passage to New Zealand, Fiji, Tonga, American Samoa, Australia, and Honolulu, Hawaii. Polynesian Airlines, owned by the Samoan government, and Samoa Air are 2 of the main regional carriers. Samoa also has 2 unpaved airports on Savai'i for domestic travel.

While about 62 percent of Samoa's electricity is generated with the use of imported fuel, the remainder is generated by a local hydroelectric station. Telephone services extend to most parts of the country, although only about 1 in 4 households has a telephone and public telephones are rare. International telephone service is usually good. In 2000 there was at least 1 Internet service provider.

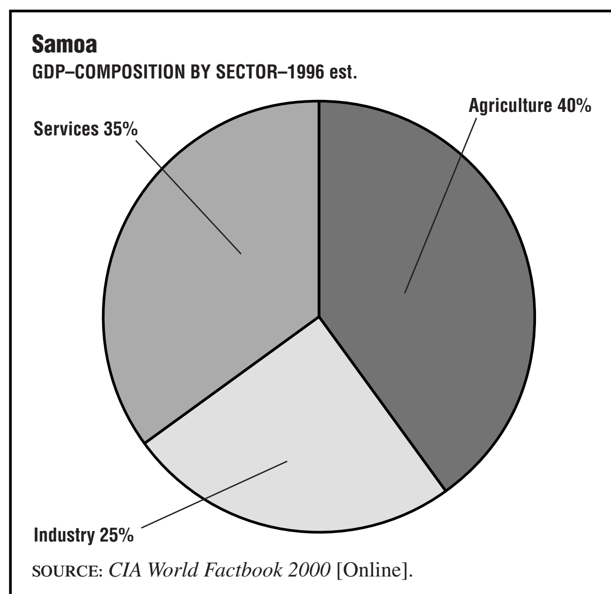
ECONOMIC SECTORS

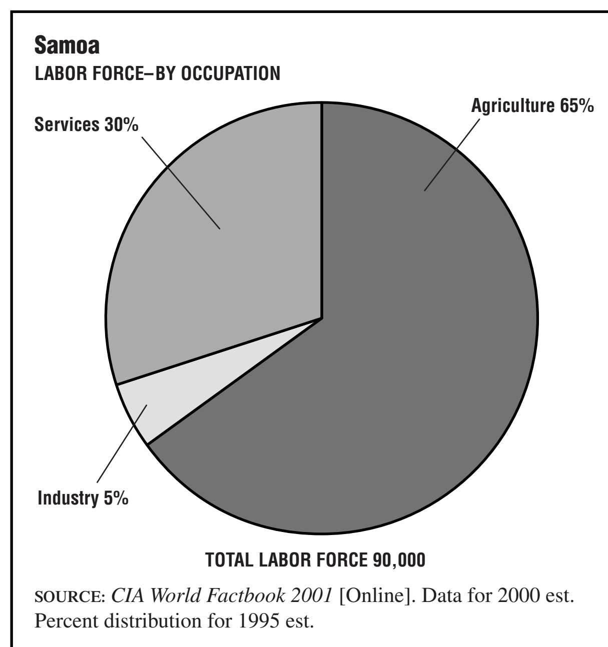
Calculating the size of different economic sectors is very difficult for Samoa's economy because a large proportion of the population works in the informal subsistence sector. In Samoa, there has been a relative decline in subsistence activities during the 1990s dropping as a percentage of GDP from 29.7 percent in 1992 to 17.7 percent in 1998, according to the Asian Development Bank. Over the same period, agriculture declined slightly from 21.2 percent to 19.3 percent of GDP. On the other hand, industry increased considerably from 15.8 to 23.7 percent as did services from 32 to 38.6 percent of GDP. In the **labor force** data, much of the agricultural employment is in unpaid village work—either informal or subsistence—so that it is difficult to compare these data with those from other countries. Official counts, however, show about 23,000 workers in the formal sector out of a total labor force of 42,494.

AGRICULTURE

About two-thirds of all households in Samoa depend on a mixture of **subsistence agriculture** and **cash cropping**. The non-monetary agricultural production of the country was estimated to comprise 17.7 percent of GDP in 1998, falling from 29.7 percent in 1992. This was partly a result of the growth of other parts of the economy, rather than a contraction of the subsistence economy. In 1998 non-subsistence agriculture and fishing



SOURCE: *CIA World Factbook 2000* [Online].



SOURCE: *CIA World Factbook 2001* [Online]. Data for 2000 est. Percent distribution for 1995 est.

made up 19.3 percent of GDP. Agriculture contributed about 30 percent of all export revenue in 1999. The main export products, in order of importance in the late 1990s were copra (dried coconut flesh), coconut oil, copra meal, coconut cream, and kava (a mildly narcotic drink traditional to the South Pacific). The importance of coconut products is obvious, but unlike many Pacific countries that only export copra, Samoa has added value to these products. For example, coconut cream canned in Samoa is worth several times its equivalent in copra. The vulnerability of dependence on a crop such as coconuts was illustrated when cyclones in 1990 and 1991 caused considerable damage to tree crops.

During the 1980s, Samoa identified an international niche market for taro, a traditional prestige root crop. The taro exported from Samoa was sold mostly to Samoan and other Pacific communities and, in 1992, made up more than one-half of all agricultural exports by value, surpassing the cyclone-depleted coconut products. In 1993, taro blight destroyed the whole crop, however, and by the late 1990s taro production was only beginning to recover.

In recent years, the government and international aid donors have been promoting agricultural diversification. Although there have been small amounts of other food crops exported (such as bananas), the only crop that has generated significant export income is kava, which has recently gained an international reputation as a soothing and therapeutic substance. In 1998, kava exports were valued at WST5.5 million (US$1.8 million), a sum similar to the copra exports in that year. Other agricultural products currently being promoted include cattle and tropical fruits.

FISHING. The Asian Development Bank estimated that 30 to 40 percent of all households in Samoa fish for their own consumption and that 12 percent of households rely on fishing as their primary source of income. Many subsistence fishers may also sell some of their catch. Larger commercial fishing endeavors have developed, though, mainly resulting from the introduction of long-line tuna boats. Thus, fishing's contribution to GDP rose from 4 percent in 1995 to 8 percent in 1999, with further expansion expected. Most of the catch is processed in the canneries of American Samoa, giving Samoa a competitive advantage because of the proximity of these facilities and because they allow access to the American market.

FORESTRY. In the past, there was relatively large-scale logging on the island of Savai'i, but logging has become small-scale and limited mostly to customary (village owned) land. Exports of timber are small as most production is for the local market. Large-scale establishment of forest plantations began in the 1970s, but most of these forests were destroyed by the cyclones of 1990 and 1991. Recent planting of high-value hardwood species such as mahogany will take about 25 years to mature, so there are few prospects of timber re-establishing itself as an important export before then.

INDUSTRY

Of the formal labor force, about 17 percent worked in industry, with about half of these working in construction and just over one-quarter in manufacturing in 1991. More recent data show that all industrial sectors together accounted for 23.7 percent of GDP in 1998. This percentage has grown through the 1990s.

MANUFACTURING. Much of the manufacturing sector, mostly located in Apia, serves the purpose of **import substitution**. Thus, the most important industries include food processing, beer production, furniture, and construction materials. There are, however, some export-oriented industries. Notable is the production of canned coconut cream, mainly for export. Beer and cigarette factories export some of their product. A small industries center has been established at Vaitele, near Apia. The most uncommon of the new endeavors, in a Pacific sense, is the Yazaki automobile electrical wiring assembly plant, which was transferred from Melbourne in 1991. This plant exports about US$50 million in automotive parts to Australia each year, however, the benefit to Samoa may be low since wages are low and the company pays no taxes or **duties**.

SERVICES

Services accounted for 51 percent of all formal sector employment in 1991, and this proportion has probably risen since then. In 1998 all services accounted for 38.6 percent of GDP, up from 32 percent in 1992. The largest subsector of employment was social and personal services, which accounted for just over half of all employment in the services sector, with many of these being government employees.

TOURISM. Through the 1990s there has been a steady increase in the number of visitors to Samoa, from just over 48,000 in 1990 to about 78,000 in 1998. Only about one-third of these can be considered as tourists, however, since another third are Samoan expatriates visiting friends and relatives while another third are traveling on business. Still, tourism contributed an estimated 15.4 percent of GDP in 1997.

Samoa has considerable potential as a tourist destination. It has a strong and visible culture and many Samoans consider their country *Hawai'iki* (the original home of all Polynesians). On this basis the Samoa Visitors Bureau presents Samoa as "The Cradle of Polynesia" in its international promotions. The visibility of Samoan culture—epitomized by traditional open-sided

houses—the many beautiful beaches, waterfalls, and other features of a "tropical paradise"; and the scale and architectural variety of Samoan churches exceed normal tourist expectations of a country its size. There are several international standard hotels, mostly in Apia and elsewhere on Upolu. Smaller hotels and guesthouses have seen growing competition from village-based tourist operations. Most local accommodations include fales (leaf houses), usually on a beach, with locally cooked food on offer. These are relatively low impact ventures, though, in which most of the profits stay in the village.

FINANCIAL SERVICES. Following the example of Vanuatu and Cook Islands, Samoa established an **offshore banking** center in 1988. About 500 banks and other companies have established themselves in Samoa, although information is not available to identify the costs and benefits of this operation to the Samoan economy. Domestic financial services are provided by Bank of Samoa (owned by ANZ Bank), Pacific Commercial Bank (a **joint venture** between Bank of Hawaii and Westpac) and National Bank.

RETAIL. The **retail** sector is similar to that in other Pacific countries of similar size. Apia has a number of medium-sized shops and small supermarkets that sell food imported from New Zealand and manufactures from Asia as well as local produce. Elsewhere in the country, shops stock mainly basic items necessary for everyday life. The largest market is in Apia, selling fruit, vegetables, fish, basic manufactured goods, and handicrafts. Smaller markets are found in other towns where the range of products is related to the size of the local population.

INTERNATIONAL TRADE

The difference between the level of Samoa's exports and imports is considerable. In the years shown in the table, the trade imbalance ranges from just over 3 to 1 in 1985 to more than 10 to 1 in 1995, and the general trend is an increasing imbalance. The value of exports has not kept pace with the expansion of the economy, which requires increased imports. Also, 2 cyclones in 1990 and 1991 and the taro blight in 1993 had a severe impact on the level of exports in the mid 1990s.

Australia has been the most important destination for exports in recent years, ranging between 50 and 85 percent of all exports between 1995 and 1999. New Zealand is the most important source of imports, but Australia, Japan, Fiji, and the United States are also significant.

The large negative balance of trade is possible because of other international transfers. Tourism contributes some international income. At the household level the most important source of income is remittances from relatives living overseas, particularly in New Zealand, the United States, and Australia. At the government level, international aid helps to counterbalance the **trade deficit**.

MONEY

The Samoan tala has depreciated against the U.S. dollar since 1982. This may be partly attributed to the vulnerable export base of the country, but a range of other factors in the international economy are less easy to identify. In the late 1990s a strong U.S. dollar devalued most currencies of the Pacific region that most influence the Samoan tala, including the New Zealand and Australian dollars.

POVERTY AND WEALTH

A total of 174 countries are ranked in the **United Nations Development Program**'s (UNDP) *Human Development Report 2000* according to the Human Development Indicator (HDI), which measures a country's state of well-being using income, education, and health measures. The HDI rank for Samoa was 95 which puts it in the middle range of countries, similar to other countries in Polynesia but higher than Melanesian countries. **GDP per capita** in 1998 was US$998, about one-thirtieth that of the United States.

There is no adequate information on income distribution in Samoa, but this may be inferred from other

information. Another indicator developed by the UNDP is the Human Poverty Index (HPI). It measures conditions for those worst off in a country, such as their educational level, health status, access to health services, access to safe water, and incidence of malnutrition in children. Of 15 Pacific countries measured by the HPI, Samoa falls in the middle, meaning that the people worst off in Samoa are comparatively better off than the worst off in most Melanesian countries. On indicators of education, Samoa boasts 96 percent literacy and a high participation rate in education. School attendance is mandatory up to age 14 and there are no central government fees, although local communities may levy them to cover maintenance of buildings.

In health, the indicators are generally high, with universal access to health services and with most households having access to safe water. Health service is free and available through clinics as well as at 5 public hospitals. There is not a system of universal pensions, but those who have worked in formal employment are likely to have provided for a pension through the National Provident Fund. Most other older people depend on their nuclear or extended families, in Samoa and overseas. Since 1999, migrants returning from working in New Zealand are able to bring their New Zealand pensions with them, and this is expected to be an increasing source of income in Samoa as the number of these migrants increases.

WORKING CONDITIONS

There is a minimum wage in the **private sector** of WST1.40 per hour, which has been readjusted to the cost of living over the last 20 years. This rate makes living in town problematic, although many households will have some people working for wages as well as others undertaking subsistence production. The minimum wage is about 10 percent of the salary that a new senior manager might get in the private sector.

Men make up an estimated 78 percent of the formal workforce. In almost all sectors they predominate. In public service men comprise only 47 percent of the full-time salaried workers but two-thirds of the temporary government workers. The unemployment rate of 13 percent is quite high, but it would be even higher if all those in the rural sector who wanted paid employment were counted. There is no unemployment benefit. Unionization is relatively strong with the Teacher's Association being formed in the 1950s and the Western Samoa Public Service Association starting in 1969. In the private sector, unions have been a recent development with the formation of the Western Samoa National Union of Workers in 1994.

COUNTRY HISTORY AND ECONOMIC DEVELOPMENT

1721. The first European "explorer" visits Samoa. Metal tools and weapons are introduced.

1830s-1890s. A series of governments under Samoan chieftainship and foreign support come and go. German coconut plantations are founded.

1899. Treaties are signed between Britain, Germany, and the United States giving Western Samoa to Germany and American (Eastern) Samoa to the United States.

1914. New Zealand takes control of Western Samoa during World War I.

1920s. The nonviolent Mau movement, formed to oppose taxes and support independence, is suppressed by force; 11 Samoans, including a matai, are killed.

1962. Western Samoa becomes the first independent nation in the Pacific Islands.

1982. Samoa experiences a constitutional crisis with 3 governments in 1 year. Tension continues between parliamentary and traditional matai systems.

1991. Universal voting franchise is introduced for all citizens over age 21; previously only matai could vote.

1997. The country's name changes from Western Samoa to Samoa.

FUTURE TRENDS

During the 1990s Samoa's economy experienced several blows related to natural disaster, but at the turn of the century, there is optimism about future development. The fishing industry has grown rapidly in recent years with further potential apparent. Tourism has grown slowly but steadily, and to some extent the degree to which this expands may depend not only on the government's promotion of it but also on the public's attitude to the desirable scale of the industry. The agricultural sector is likely to continue to be affected by weather, disease, and fluctuating world prices, but probably will continue as an important source of export income, even if the product mix changes. For many years there have been predictions that

migrant remittances will eventually slow down as expatriates become more settled in their countries of residence, but so far this does not seem be the case. Though international aid payments are being reduced in some cases, most small Pacific countries—such as Samoa—have managed to attract high per capita levels of aid, and this ought to continue into the foreseeable future.

DEPENDENCIES

Samoa has no territories or colonies.

SAUDI ARABIA

Kingdom of Sa'udi Arabia
Al-Mamlakah al-'Arabiyah as-Sa'udiyah

CAPITAL: Riyadh (Ar-Riyad).

MONETARY UNIT: Saudi Riyal (SR). One riyal equals 100 halalahs. There are coins of 5, 10, 25, 50, and 100 halalahs, and notes of 1, 5, 10, 50, 100, and 500 riyals. Since July 1986 the Saudi riyal has been pegged to the U.S. dollar at a rate of SR3.745:US$1.

CHIEF EXPORTS: Petroleum and petroleum products (90 percent).

CHIEF IMPORTS: Machinery and equipment, foodstuffs, chemicals, motor vehicles, textiles.

GROSS DOMESTIC PRODUCT: US$191 billion (purchasing power parity, 1999 est.).

BALANCE OF TRADE: **Exports:** US$48 billion (f.o.b., 1999). **Imports:** US$28 billion (f.o.b., 1999).

COUNTRY OVERVIEW

LOCATION AND SIZE. Saudi Arabia is located in the Middle East between the Persian Gulf and the Red Sea. It borders Jordan, Iraq, and Kuwait to the north, Yemen to the south, and Oman, the United Arab Emirates (UAE), and Qatar to the east. The country, which is divided into 13 provinces, is composed primarily of desert. Each region has a governor appointed by the king. With a land area of about 1.96 million square kilometers (756,981 square miles), Saudi Arabia is about one-fourth the size of the continental United States. Riyadh, the capital, is located in the central eastern part of the country.

POPULATION. The population of Saudi Arabia was estimated at 22,023,506 in July of 2000, a figure growing at about 3.3 percent a year. Saudi nationals account for close to 75 percent of the population. The remaining residents, nearly 6 million people, are expatriates comprised primarily of foreign workers. About 90 percent of Saudi nationals are Arabs. The rest of the indigenous population, according to CIA statistics, are Afro-Asian.

In 2000, the birth rate stood at 37.47 per 1,000 population, compared with a death rate of 6.02 per 1,000. According to a Saudi census taken in the early 1990s, a little over 50 percent of the population is male. While men make up a majority of the population, due primarily to the high concentration of males among expatriate workers, women are expected to live longer. Women on average live 69 years in Saudi Arabia, while the men live 66.

An overwhelming majority of the Saudi population is young. In 1999, according to the Saudi Ministry of Planning, 46 percent of the population was under 15. Another 38 percent was under 40. Those over 40 accounted for only 16 percent of the population. Efforts to accommodate the rising numbers of young adults entering the **workforce** each year have been only partly successful, and the consequent rise in unemployment has begun to aggravate the underlying tensions between the country's richest and poorest citizens.

Up until the 1960s a majority of the Saudi population were either nomadic or semi-nomadic desert dwellers with no fixed homes. However, after petroleum was discovered in Saudi Arabia in the 1930s, state revenues quickly began to rise. As the oil industry matured, the economy quickly modernized and nomadic herding faded as an economic base. By 2000, 95 percent of the Saudi population was settled.

The Saudi royal family and a majority of the population are Sunni Muslim. About 5 percent of the population, around 1 million people, are Shia Muslim. Tensions between the Sunni majority and the Shia minority have been especially high since the 1979 Iranian Revolution, when Saudi Shiites rioted in parts of the Eastern Province. Shia Muslims routinely suffer from religious discrimination.

OVERVIEW OF ECONOMY

The Saudi Arabian economy is fueled almost entirely by the production and distribution of petroleum and its derivative products. Over the past decade oil sales have generated, on average, 90 percent of the country's yearly export earnings, 35 percent of annual **gross domestic product** (GDP), and 75 percent of all budget revenues. High oil prices in the 1970s led to rapid economic expansion, with GDP growing over the course of the decade by 10 percent per year. As oil prices dropped in the 1980s, GDP growth slowed, averaging just 1.3 percent per year between 1980 and 1998. Rising oil prices beginning in 1999 again boded well for the economy.

Oil was discovered in Saudi Arabia by American geologists in the 1930s, but high level production did not begin until after World War II (1939–45). In the 1960s, the Saudi oil industry began to mature, resulting in a massive accumulation of wealth, fast paced economic growth, and rapid urban development. However, it was not until the 1970s that Saudi Arabia emerged as one of the Middle East's preeminent political and economic powers.

Two events in the 1970s were crucial to Saudi Arabia's economic development. One was the Arab oil **embargo** of 1973, during which time Arab countries withheld oil from the world market, raising world oil prices

dramatically. The other was the 1979 Iranian Revolution, when Shiites overthrew the western-backed monarchy in Iran and assumed control of the country. Both events disrupted oil supplies, causing the commodity's cost to rise. Throughout the 1970s, Saudi Arabia was able to export oil at substantially elevated prices, leading it to become one of the fastest growing economies in the world. The massive inflow of revenue allowed the kingdom to increase import levels and still maintain a favorable **balance of trade**. Spending on defense and **infrastructure** rose, and Saudi Arabia became a benefactor nation to the rest of the Arab world, supplying large amounts of financial aid. (Aid has averaged 4 percent of GDP per year over the past 25 years, making Saudi Arabia's average aid-to-GDP ratio the highest in the world.) In a matter of decades, Saudi Arabia transformed itself from a desert kingdom populated by nomadic tribes to a modern economic entity which controls over a quarter of the world's oil.

While petroleum exports are indeed lucrative, Saudi Arabia's dependence on oil as its primary source of revenue is potentially problematic. In the near term, the Saudi economy is left vulnerable to shifts in the price of oil, lowered demand, or disrupted production due to any number of factors, including regional conflicts and the Organization of Petroleum Exporting Countries (OPEC) shifting oil production quotas. In the long term there is the problem of dwindling supplies. While the Saudis maintain over a quarter of the world's known oil reserves (about 263 billion barrels at the end of 1999), these reserves, at the current rate of production, will last only 87.5 years. If, in that time, Saudi Arabia fails to sufficiently diversify its economy or discover new sources of oil, the country will be faced with a serious shortfall in revenues. And even if the kingdom does discover new reserves (as will likely be the case—some estimates put undiscovered reserves in Saudi Arabia at nearly a trillion barrels) the price of oil will probably steadily drop in the coming years as supplies and production efficiency increase.

The need to begin generating alternative sources of income was recognized as early as 1970, when the government issued the first in an ongoing series of 5 year plans aimed at expanding the non-oil sectors of the economy. While infrastructure expansion and urban development—both natural outgrowths of the oil industry—have proceeded at an impressive pace, attempts to diversify the economy have produced limited results. Similarly, efforts to decentralize the state run economy through broad **privatization** schemes have been largely unsuccessful.

THE FIVE YEAR PLANS. The first 5-year plans, covering the 1970s, focused on developing the national infrastructure (see Infrastructure, Power, and Communications). The third plan (1980–85) focused less on infrastructure and more on education, health, and social services. It also included efforts to expand the productive sectors of the economy, namely industry—a goal which was only partly achieved. While the building of 2 new industrial cities, Jubail and Yanbu, was completed, no broad industrial expansion occurred, leaving primary components of the plan unfulfilled.

The fourth plan, which covered the latter half of the 1980s, remained focused on education and training. It also sought to reduce government spending while generating growth in the **private sector**. **Joint ventures** were encouraged between foreign companies and Saudi state enterprises in the hope of increasing foreign investment. The role of the private sector grew during this time, rising to 70 percent of non-oil GDP by 1987.

Starting in 1990, the fifth 5-year plan concentrated on expanding the infrastructure and strengthening the Saudi national defense. The perceived need for a stronger military was reinforced by the Iraqi invasion of Kuwait, a move which destabilized the region and precipitated the 1991 Persian Gulf War. Between 1990–94 34 percent of Saudi expenditures went toward national defense. The fifth plan also sought to increase private sector employment opportunities for Saudi citizens by limiting the number of foreign workers on Saudi soil. Efforts to "Saudi-ize" the workforce—raise the percentage of Saudi workers—continued through the sixth plan (1995–2000), which also focused on the diversification of economic activity through private sector growth, especially in the areas of industry and agriculture.

The Saudi government will continue in its efforts to create jobs for Saudi citizens over the next 5 years and beyond. Indeed, with 100,000 nationals entering the workforce each year, job creation will remain a priority for the foreseeable future.

GOVERNMENT SPENDING. High petroleum prices in the 1970s boosted Saudi revenues and allowed increased spending. A series of ambitious, high cost initiatives were launched to develop the nation's infrastructure, expand industry and agriculture, overhaul health and education, and modernize the military (as outlined above). These efforts eventually put a strain on the government budget, as spending began to outpace the flow of revenues. In the 1970s, the problem was mitigated by the high price of oil, but in the 1980s, when oil prices declined, revenues fell and the government deficit grew, reaching 19.6 percent of GDP by 1986. Financial resources were further strained in 1990 when Iraq's invasion of Kuwait prompted the Saudis to appropriate US$30 billion in emergency defense spending. Though the value of Saudi exports exceeds that of its imports, the trade surplus has historically been unable to offset the deficit, which is generally financed through domestic borrowing. Eighty percent of the debt is held by autonomous government institutions, such as pension funds and social security. The other 20 percent is held by commercial banks.

Over the past decade, measures have been taken to lower government spending and reduce the fiscal imbalances created in the 1980s. In 1996 and 1997, spending cuts coupled with rising oil prices helped lower domestic debt and ease the pressure on government finances. However, this trend was interrupted in 1998 when oil prices fell, prompting calls for additional austerity measures and general economic reform. In 1999, government spending was reduced by an additional 13 percent. That year, with financial pressure building, the government also implemented new revenue-generating measures, a move it had resisted in the past. It raised domestic gasoline prices by 50 percent, introduced airport taxes, and doubled work permit fees. In 2000, surging oil prices produced the first government surplus in 17 years. However, the surplus may be shortlived, as the Saudi government plans to increase spending in 2001, a decision based primarily on expectations of rising oil prices.

While spending in 2001 is expected to be higher than in 2000, total spending between 2000–04 is actually slated to go down. The seventh 5-year plan (2000–04) calls for spending no more than US$200 billion, down from US$258 billion over the previous 5 years.

The Saudi government has expressed an interest in decentralizing the economy and increasing private sector participation. Although a number of privatization schemes have been considered, the government has yet to relinquish control over most major industries. Plans to privatize telecommunications and electric companies have stalled, as have plans to privatize the state-owned Saudi Arabian airlines.

Privatization efforts will likely be revitalized as Saudi Arabia attempts to gain entry into the World Trade Organization (WTO), an international regulatory body that sets standards for international trading practices and arbitrates disputes between member nations. (The WTO holds that free market, rules-based economies are more transparent than state-run economies and sees them as more fit for membership.) Joining the WTO will force Saudi Arabia to further **liberalize** its economy and would place its economic policies under international scrutiny, depriving Saudi policy makers of a certain degree of freedom. But once Saudi Arabia was admitted to the WTO it would have protection against the arbitrary exclusion of its imports by other members, a trade-off most Saudi officials find favorable. Among the measures the kingdom will have to take to gain entry into the organization are the removal of protectionist trade barriers, the lowering of import **tariffs**, and the opening of key service sectors to foreign participation—all policies which remove protection for local producers from competition. Saudi Arabia will also have to improve its protections for intellectual property rights. These measures will likely improve the investment climate in Saudi Arabia, paving the way for greater inflows of foreign exchange and smaller outflows of **remittances**.

Many workers in Saudi Arabia are from other countries, and send home much of their earnings. These worker remittances amount to approximately US$16 billion a year. Opening the private sector up to greater foreign participation—allowing, for instance, non-Saudis to buy homes and invest in local companies—could provide a means for keeping more capital in local markets.

POLITICS, GOVERNMENT, AND TAXATION

HISTORY OF THE RULING FAMILY. The foundations for a modern Saudi state were laid in 1744 when Muhammad bin Saud, the ruler of a local tribe, joined forces with a religious reformer, Muhammad Abd Al-Wahhab, in an attempt to unify the Arabian peninsula under strict Islamic law. Within 60 years, the Al Saud family, through a mixture of religious proselytizing and military conquest, had taken control of a majority of what is now Saudi Arabia, including the holy cities of Mecca and Medina. (Mecca is where the prophet Mohammed, the founder of Islam, was born in 570 A.D. and Medina is where, in 633, he died.)

The success of the Al Saud attracted the attention of the Ottoman Turks, who held the Arabian peninsula as part of their empire. In 1816, employing an Egyptian force, the Ottomans launched a campaign to recapture areas under Saudi control. The Al Saud, outnumbered and overpowered, were driven back by Egyptian forces and by 1818 had lost a majority of their empire.

Over the course of the 19th century, the Al Saud made numerous attempts to regain their lost territory, but superior Ottoman forces, as well as resistance from rival clans, proved difficult to overcome. By 1890 the Al Saud had been driven into exile in Kuwait.

In 1902, the Saudi prince Abdul Aziz Al Saud (who was to become known internationally as Ibn Saud) was able to recapture Riyadh, his family's ancestral home, from the rival Al Rashid clan. From there, Ibn Saud launched his campaign to reunify the peninsula. By the end of the First World War, in 1918, the Ottoman empire had collapsed, paving the way for Arabian independence. In 1924, having established a foothold in central Arabia, Ibn Saud moved west into the hejaz region where his army of fanatically religious desert dwellers known as the "Ikhwan" (brethren), defeated Sherif Hussein and took possession of the holy cities of Mecca and Medina. By 1932, Ibn Saud, with the support of the Ikhwan, had consolidated control over nearly the entire peninsula. That year he declared the Kingdom of Saudi Arabia with himself as its king.

Over the next 30 years the Al Saud and Al Rashid, vying for control over the peninsula of Arabia, remained at war. In the end, the Saudis emerged victorious, primarily due to Ibn Saud's ability to gain the loyalty of the Ikhwan. Ibn Saud, upon his death in 1953, had 34 surviving sons, who continue to sit at the center of the nation's political apparatus. Ibn Saud was succeeded after his death by his eldest son Saud, who, in his first year of rule, established the Council of Ministers, a body formed to advise the king on state policy and direct the development of the rapidly growing Saudi bureaucracy. Despite ruling for a full 11 years, King Saud was perceived as an ineffective leader. In 1964, under heavy pressure from religious elites and members of the royal family, Saud stepped down in favor of his half brother, Faisal, who had previously served as foreign minister.

As king, Faisal attempted to address issues to which Saud, and even Abdul Aziz, had given little thought, such as how to effectively modernize the country in the face of its emerging wealth. He also struggled with how to maximize the benefits of the kingdom's bountiful petroleum resources. Decisions on oil policy were not always easy to make, especially when matters of Arab solidarity conflicted with the country's drive toward economic prosperity.

When Arab oil producers decided to cut petroleum sales to the United States in 1973, this conflict came into full view. That year, the ever-present tensions between Israel and its neighbors erupted as Israeli and Egyptian forces clashed in the Sinai desert. U.S. aid to Israel during the war led to fierce protests in the Arab world, culminating in an Arab boycott of oil sales to the United States and other western countries. Saudi Arabia, which participated in the boycott, learned a hard lesson as a result: it could not maintain its economy without doing business in the West, for even though the price of oil went up during the boycott due to the cut in supply, the price spikes were insufficient to cover the loss in sales. In 1974, despite opposition from other Arab oil producers, the Saudis froze oil prices and resumed sales to the United States. That year, in a series of negotiations, the United States and Saudi Arabia came to an agreement by which America would provide the kingdom with military support in exchange for an uninterrupted flow of oil. Over the remainder of the decade, Saudi Arabia sold vast quantities of oil at inflated prices, leading it to become one of the fastest growing economies in the world.

King Faisal, who presided over the oil boycott and the subsequent agreement with the United States, was assassinated in 1975 by a member the royal family. The alleged assassin was executed for the crime. Faisal was replaced by his half brother, Crown Prince Khalid. Fahd, another half brother who would later become king, was appointed as the new Crown Prince and first deputy prime minister, where he was given the responsibility of overseeing a wide range of the country's international and domestic affairs.

Economic development was rapid under King Khalid. Saudi Arabia's acquisition of national wealth enhanced its political influence in the Middle East and heightened its role in world economic affairs. At the same time, however, the kingdom's growing relationship with the West began to concern religious hard-liners who feared that Western influence would corrupt the nation's Islamic ideals. In November 1979, about 250 armed followers of Sunni Muslim cleric Juhaiman Ibn Seif al-Oteif took over the Grand Mosque in Mecca. After a standoff, government troops ousted the militants by force. The incident was not without effect, as it alerted the royal family to the extent of the religious opposition it was fostering by failing to display a more overt commitment to the preservation of Islamic ideals. In response, a committee was established, chaired by interior minister Prince Nayef, to establish a set of societal rules based on Islamic principles. Still, opposition from Islamist religious forces continues to pose the greatest single threat to the royal family.

In June 1982, Khalid died and, in a smooth transition, Prince Fahd became king. Prince Abdullah, Fahd's half brother and commander of the Saudi National Guard, was appointed crown prince and deputy prime minister. The role of second deputy prime minister was filled by Fahd's brother, Prince Sultan, who also served as the minister of Defense and Aviation.

King Fahd, despite inheriting a weakening economy, quickly became a central figure in Middle East politics. In 1988, he played a key role in bringing about a cease fire in the Iran-Iraq war. He also helped reorganize and strengthen the Gulf Cooperation Council (GCC), a group of 6 gulf states (Saudi Arabia, Oman, Kuwait, Qatar, the United Arab Emirates, and Bahrain) formed to facilitate regional economic cooperation and peaceful development. Additionally, in the 1990–91 Gulf War, King Fahd used his influence as arbiter over Islam's holiest sites (Mecca and Medina) to help organize and hold together the U.S.-led war coalition that liberated Kuwait from Iraq. King Fahd suffered a stroke in November of 1995. By 1997, Crown Prince Abdullah had taken effective control of the state.

Over the decades, tensions between the royal family and radical religious forces have persisted as various Saudi kings have sought to balance the nation's dependence on the West with efforts to preserve the kingdom's cultural and religious heritage. Currently, opposition from Islamist religious forces poses the greatest single threat to the Saudi government. The royal family tries to maintain close ties with the religious leaders, who, it is hoped, can keep the extremist members of the clergy in

line. However, religious radicals have, especially over the past decade, attracted a growing number of followers. The reasons for this vary. The kingdom's uneven distribution of wealth is partly to blame, as it has led to rising discontent among the nation's poorest citizens. But more importantly, there is deep seeded resentment stemming from the presence of non-Muslim military forces on Saudi soil. U.S. troops and British soldiers have been stationed in Saudi Arabia since the Gulf War, a situation religious fundamentalists fiercely oppose. This opposition on more than one occasion has been expressed through violence. In November 1995, a car bomb exploded near a U.S. military installation, killing 7 people. In June 1996, there was another, more lethal attack in which a bomb blew up outside the Khobar Towers military barracks, killing 19 American servicemen. A Saudi dissident, Osama bin Laden, has been blamed for planning the attack. However, as of 2001, no arrests had been made.

GOVERNMENT STRUCTURE. Saudi Arabia is an absolute monarchy where the king essentially rules by decree. That does not mean, however, that judicial structures are entirely absent, or that the king's powers are limitless. The Basic Law, the closest thing the Saudis have to a written constitution, was introduced in 1992 to be used in conjunction with Islamic Sharia law, whose dictates up to that point had been the sole source of legal guidelines. Neither the Basic Law nor the king's decrees are meant to violate Sharia law.

The Mutawaa'in, or religious police, constitute the Committee to Prevent Vice and Promote Virtue. The semi-autonomous group enforces compliance with Islamic customs. Abuses by the Mutawaa'in are known to occur, especially in its treatment of Saudi Arabia's Shia minority.

The Council of Ministers, established in 1953, holds executive and legislative powers, but any of its decisions can be overruled by the king. The council is appointed by the king and is primarily made up of members of the royal family. There is also a Consultative Council, which was formed in 1993. Its members are also appointed by the king. Originally comprised of 60 members, the council was expanded to 90 members in 1997. Made up of tribal leaders, government officials, and educated elites, the council plays an advisory role to the king and has no governing power. Each of Saudi Arabia's 13 regions has its own council as well as a regional governor who is appointed by the king.

TAXATION. Saudi Arabia has a very limited tax regime, as it relies mostly on oil receipts, customs **duties**, and licensing fees to produce government revenue. Saudi nationals, rather than paying income or property taxes, pay what is called the zakat, an annual 2.5 percent assessment of a person's net personal wealth. Revenue from zakat collection helps pay for social services, such as health care and education. Foreign companies and self-employed foreigners in Saudi Arabia are not obliged to pay the zakat, but are, on the other hand, charged with **income taxes**, which range from 25 percent on income under US$26,667 to 45 percent on income over US$266,667.

Saudi Arabia also charges tariffs on imported goods which range from 12 percent to 20 percent. In order to gain entry into the WTO, the government will have to lower these tariffs to a maximum of 7.5 percent.

INFRASTRUCTURE, POWER, AND COMMUNICATIONS

In the 1970s, in order to accommodate its burgeoning oil industry, the Saudi government took extensive measures to expand the kingdom's infrastructure. Roads and railways were built, airports were expanded, and seaports were enhanced to handle heavy volumes of traffic.

By the end of 1999, the kingdom had around 150,000 kilometers (93,210 miles) of roads, about a third of them paved. Major arteries provide passage between urban and industrial centers. Jeddah, Mecca, and Medina in the west are linked to Riyadh and to the Eastern Province oil fields

by the trans-peninsular highway. The Tapline road provides a link between Damman, on the gulf coast, and the Jordanian border. The Red Sea road runs north-south, the length of the western shore.

Saudi Arabia's rail network is currently limited to a 571-kilometer (355-mile) single track line running between Damman and Riyadh, and a 322-kilometer (200-mile) line between Riyadh and Hufuf. As of 2000, new lines had been proposed to connect cities on the gulf coast in the east, such as Damman and Jubail, to mineral deposits in the northwest. A cross-peninsula line connecting the Red Sea port of Jeddah with the gulf port of Damman had also been proposed.

There are 6 major seaports in Saudi Arabia, along with 14 minor ones, sufficient to handle the country's importing and exporting needs. Four of the major ports—Duba, Yanbu, Jeddah, and Jizan—are on the Red Sea. The other 2, Damman and Jubail, are on the Persian Gulf. Yanbu and Jubail are industrial ports and together account for more than half of the country's import and export handling. As part of a larger effort to decentralize the economy, operation and maintenance of the seaports were turned over to the private sector in 1997.

Saudi Arabia has 3 international airports located at Jeddah, Damman, and Riyadh. These airports also act as the primary hubs for domestic flights. Other domestic airports include Medina, Jizan, Taif, Qassim, Tabuk, and Abha. Saudi Arabian Airlines, the national carrier, is owned and operated by the government. While privatizing the airline has been considered, as of 2000 no concrete moves had been made to that effect.

The expansion of the Saudi infrastructure was rapid in the 1970s, when oil revenues were at their peak. The completion of a number of major projects in the 1980s coincided with a downturn in the price of oil and a subsequent loss of revenues. As a result, spending on infrastructure declined. The growth in the transport sector, which between 1975 and 1979 reached 19.3 percent, had, by the early 1990s, dropped below 2 percent.

In 1998, despite a growth in investment, the telecommunications sector in Saudi Arabia was fairly limited. By 1999, the expansion of the industry had become a priority. The U.S. firm Lucent Technologies won a US$4 billion contract in 1994 to install fixed phone lines throughout the kingdom, but 4 years later the 2.9 million existing lines still represented under 15 lines per 100 inhabitants, according to the International Telecommunication Union. In an effort to bring the system in line with emerging East European economies, the government is seeking to increase the number of lines to at least 30 per 100 residents by 2002. Lucent, on top of its initial contract, was hired in 1998 to expand mobile phone service in a deal worth US$700 million. The government hopes the expansion will enable the kingdom to accommodate 5 million cell phone subscribers by the end of 2001.

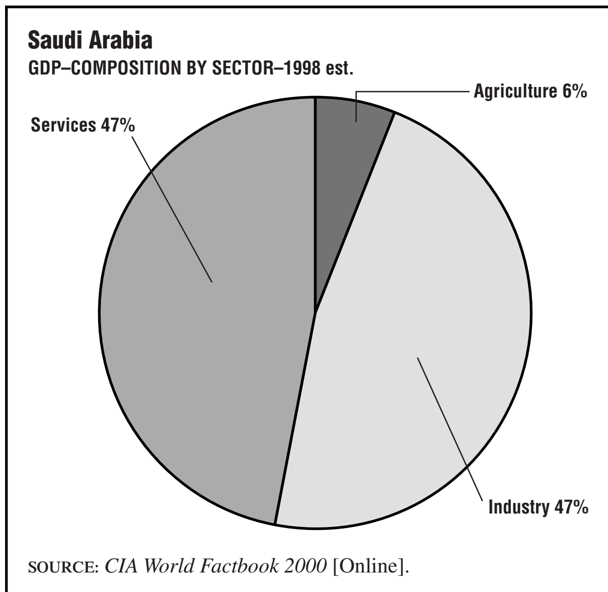
In a bid to privatize the telecommunications industry, the government in April 1998 approved the creation of the Saudi Telecommunications Company, an entity which originally comprised the telecommunications arm of the Post, Telegraphs, and Telephone ministry (PTT). According to the initial plan, shares in the company were to be sold starting at the beginning of 2000, with the government stake in the company being eventually reduced to zero. However, when talks broke down over the transfer of a large bulk of shares to the American firm SBC (Southern Bell Communications), government withdrawal of operations was delayed. By 2001, a deadline for complete privatization had still not been set.

By the end of the 1990s, the demand for energy in Saudi Arabia had reached an all-time high, outstripping supply and, in some cities, causing frequent power outages during periods of high use. Short-term solutions, such as raising prices to curb demand, proved ineffective. For instance, in 2000, price increases totaling almost 78 percent were introduced for electricity. However, after 6 months, vehement public protests were launched in response to high electricity bills. As a result, the price hikes were rescinded before they could have any substantial effect. To meet growing energy needs over the long term, the government has set out to **restructure** the industry and increase investment from both the public and private sectors.

In November of 1998, it was announced that the 10 separate electricity companies in Saudi Arabia would be consolidated into a single company, the Saudi Electric Company. The government has expressed its intention to eventually relinquish its 85 percent stake in the sector. By consolidating the sector, the government hopes to streamline operations and improve efficiency, making the industry more dependable and more profitable, and in turn more attractive to outside investors. By 2020, the government's aim is to increase power generation capacity by over 3 times from where it stood in 1990, from 22,000 megawatts (MW) to 69,000 MW. Saudi Arabia, which imports no energy, is entirely dependent upon oil for the generation of its power.

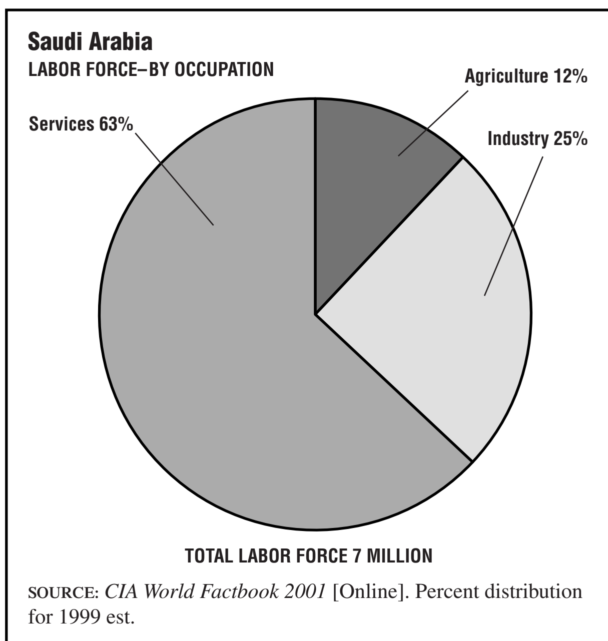
ECONOMIC SECTORS

Saudi Arabia, despite moves to diversify its economy, is still almost entirely dependent upon oil. Petroleum sales provide the kingdom with 90 percent of its export earnings and 75 percent of its annual budget revenues. Saudi Arabia is a founding member of the Organization of Petroleum Exporting Countries (OPEC) which was founded in Baghdad, Iraq, in September of 1960 to unify and coordinate members' petroleum prices.



SOURCE: *CIA World Factbook 2000* [Online].

Iraq, Iran, Venezuela, and Kuwait were OPEC's other founding members. Qatar, Indonesia, Libya, the United Arab Emirates, Algeria, and Nigeria are also current members. OPEC countries are responsible for 40 percent of the world's oil production and 77 percent of its known reserves. Saudi Arabian oil exports make up nearly 30 percent of OPEC's yearly total exports. The government hopes to increase non-oil GDP by 4 percent between 2000 and 2004, with agriculture projected to expand by 3.1 percent per year, industry by 5.1 percent, and utilities (electricity, gas, and water) by 4.6 percent. Construction activity is expected to increase annually by over 6 percent. And non-oil mining had been targeted for an expansion of 8.3 percent per year, which would make it the fastest growing sector of the economy. Despite all such efforts to increase non-petroleum related economic functions, it will be difficult to move the country away from dominance by the petroleum sector.



SOURCE: *CIA World Factbook 2001* [Online]. Percent distribution for 1999 est.

In 1998, industry, which included oil production, contributed 47 percent of GDP and employed 25 percent of the total workforce of 7 million. Agriculture contributed just 6 percent of GDP and employed 12 percent of the workforce, while the services sector contributed another 47 percent and employed 63 percent of the workforce.

AGRICULTURE

In the 1980s, in moves to diversify the economy, the Saudi government sought to expand the agricultural sector. It was hoped that eventually the nation would become self sufficient for food. This was an ambitious goal considering a majority of Saudi Arabia is desert where the potential for crop cultivation is limited. Still, the Saudis had some success with their plan. Food cultivation expanded in the 1980s, and as oil revenues fell, agriculture's share of GDP rose, stabilizing in the 1990s between 6 and 7 percent. By 1998, agricultural jobs provided work for 12 percent of the labor force.

Less than 2 percent of Saudi Arabian land is used for cultivation. Crops are grown mainly in the southwest of the kingdom, where there is rainfall sufficient for farming, or in areas where oases provide enough ground water for irrigation. Desalinated sea water, which is used for some purposes in Saudi Arabia, is too saline, even after treatment, to be used for farming.

The Saudi government, in its push to increase food production, had by the mid-1990s turned over 2.8 million hectares of public land to the private sector for agricultural use. About a fifth of the land was turned over to individual farmers, while the rest was designated for **agribusiness** projects or turned over to agricultural companies.

Government involvement in agriculture peaked in the 1980s. With production heavily subsidized, the **value added** in agriculture grew by 70 percent between 1985 and 1991. (Value added is the increase in the market value of a product at a particular stage of production. It is calculated by subtracting the value of all inputs bought from other firms from the value of the firm's output. For example, the value added by the cotton textile industry is the value of the textiles when they leave the factory minus the value of raw cotton and other materials used in their manufacture.) In the 1991–92 crop year, wheat production rose to an all-time high of 4 million tons, with Saudi Arabia becoming the world's sixth largest wheat

exporter. However, earnings from sales were nullified by the high costs of production. The government was spending 5 times the market price to produce a ton of grain.

With the outbreak of the Gulf War (1990–91), agricultural **subsidies** were reduced and, with funds needed for military expenditures, quotas were imposed on government purchases of grain from local farmers. By 1995–96, the land area devoted to grain production had fallen by over 65 percent. The harvest that year fell to 1.2 million tons. Meanwhile, domestic consumption stood at 1.8 million tons. Although the production of barley and grain had markedly declined by the late 1990s, fruit and vegetable production rose.

INDUSTRY

OIL. Due to vast petroleum reserves, low production costs, and high levels of distribution, the oil industry is the most vibrant sector in the Saudi economy, providing the country with the bulk of its capital. Oil revenues account for 35 percent to 40 percent of the Saudi GDP annually.

As of 2001, Saudi Arabia's proven oil reserves amounted to over 263 billion barrels, representing about a quarter of the world's known oil supply. Assuming production rates were to remain what they were in 2000, Saudi Arabia's reserves would last about 87.5 years. It is probable, however, that more reserves will be discovered in the future, extending the industry's viability. As of 2001, Saudi Arabia was the largest producer and exporter of oil in the world.

Sales of Saudi oil are highly profitable due to low production costs. The sheer abundance of oil in Saudi Arabia and its close proximity to the earth's surface makes it easy to find and cheap to extract. According to the kingdom's oil minister, Ali bin Ibrahim al-Nuaimi, the production of a barrel of oil in the kingdom costs about US$1.5 compared with an average cost of US$5/barrel elsewhere in the world. Discovery costs are also low—about 10 U.S. cents per barrel as opposed to the worldwide average of US$4/barrel. Of the 400 billion barrels of recoverable oil discovered in the last 20 years, about a quarter was discovered in Saudi Arabia. The low discovery costs and high yields in Saudi Arabia are very attractive to foreign oil companies, who work in conjunction with the Saudi government to extract and deliver oil to world markets.

A majority of Saudi oil is produced from fields near Riyadh, in the Eastern Province, the largest of which are Ghawar, Safaniyah, Abqaiq, and Berri. Ghawar, with 70 billion barrels, is thought to be the largest oil field in the world. These 4 fields alone account for nearly half of the kingdom's reserves and 85 percent of its production capacity. Oil fields in the "Neutral Zone"—lands shared between Saudi Arabia and Kuwait—contain about 5 billion barrels.

Saudi Arabia exports a majority of its oil by tanker. Tankers loaded daily on the Persian Gulf coast have a full capacity of 14 million barrels a day (b/d). The other primary distribution route is through the 1,200-kilometer (746-mile) Trans-Arabian pipeline linking the Abqaiq oil field, near Riyadh, with Yanbu on the Red Sea. The pipeline has a capacity of 5 million b/d. Most of the oil arriving in Yanbu is loaded onto tankers for transport out of the Red Sea. Some of the oil continues on through the Sumed pipeline to Sidi Krier on Egypt's Mediterranean coast.

As of 2000 the most recently developed field in Saudi Arabia was the Shaybah oil field in the Empty Quarter, which holds reserves of up to 7 billion barrels. The Empty Quarter is the harsh desert region covering the southeastern part of the peninsula. Sand dunes in the Empty Quarter average 600 feet in height. In the summer, daytime temperatures reach 122 degrees Fahrenheit, then plummet to 32 degrees at night. Because of the harsh climate and terrain, much of the Empty Quarter remains unexplored. The field came on line in 1999 after the completion of a 635-kilometer (395-mile) pipeline linking it to distribution points in Abqaiq.

Practically all oil production in Saudi Arabia is controlled by the state-run Saudi Arabian oil company, Saudi Aramco. While foreign companies are contracted to build infrastructure and install equipment, the Saudi government maintains ownership of the facilities.

Saudi Arabia played a lead role in orchestrating the 1973–74 oil embargo against the United States. The resultant rise in oil prices was not enough to offset losses in sales, prompting the Saudis to soften their position and resume business in the West. Over the course of the next 25 years a stable partnership formed between Saudi Arabia and the United States, with the United States guaranteeing Saudi security in return for an uninterrupted flow of oil. Saudi Arabia now generally favors only moderate price increases, realizing it is in the country's long-term interests to keep demand steady by ensuring that oil remains competitive with other forms of energy. Out of a total workforce of 7.12 million people, 127,000 are employed in the oil and mining industry.

The kingdom is also planning to expand the production of natural gas, a venture that will involve the participation of a number of foreign companies. In 1991, natural gas reserves in Saudi Arabia were estimated at 6.1 trillion cubic meters, about 3.9 percent of the world's total. While most of this gas is acquired as a derivative of crude oil production, non-oil associated reservoirs are thought to exist in abundance. It is the mining of gas from

these reservoirs that the government will focus on in the coming years, being that the use of oil-associated gas is constrained due to OPEC production quotas. It has been estimated that new foreign investment under the initiative could total tens of billions of dollars, more than the total level of foreign investment currently in the country.

NON-OIL MINING. Saudi Arabia is a country rich in minerals. Large deposits of gold, silver, iron ore, copper, bauxite, coal, tungsten, phosphates, lead, zinc, and uranium are known to exist, but have yet to be fully exploited. The reasons for this vary. For one, the kingdom's concentration on oil has led it to neglect other forms of mining. Furthermore, the mineral deposits are in remote areas where the lack of roads and water make extraction difficult. Still, the government views non-oil mining as a potentially lucrative industry, one that might help reorient the economy away from its dependence on oil. Thus, despite the difficulties, the government has decided to move forward in its efforts to exploit the country's mineral resources. Working in conjunction with the private sector, the government hopes to see the non-oil mining sector grow, on average, by 8.3 percent per year between 2000–04.

The newly formed Saudi Arabian Mining Company (Maadin) is at the center of the government's plans. The state-owned company, in partnership with privately run firms, has taken over key government mining operations with a goal to improve efficiency and increase production. Maadin is already active at the Mahd al-Dahab mine, from which over 100,000 ounces of gold are produced a year. In 2001, plans were approved to begin operations at Al Hajjar, in Asir province, with an anticipated annual yield of 55,000 ounces of gold. Renewed interest in phosphate mining is also expected to have an impact on the country's economy. If the deposits in the northern and center part of the kingdom can be feasibly removed, a major new processing plant may be constructed in Jubail to refine the high level yields.

Maadin is also involved in zinc mining near Riyadh, where results have been promising. In order to stimulate growth in the industry, the government may move to further **deregulate** mining in the second half of 2001.

MANUFACTURING. The Saudi government, in its bid to diversify the economy and increase employment opportunities, has encouraged growth in the non-oil industrial sector. However, results have been limited. The number of licenses issued and industries established did not grow by a significant margin in the last half of the 1990s. During this time, the sector's contribution to GDP remained steady at around 15 percent.

Although an informal manufacturing base (involving the production of such various items as textiles, soap, and furniture) has existed in Saudi Arabia for centuries, these small-scale private industries contribute relatively little to the GDP, and the government is doing little to promote their development. Primarily the government has focused on the growth of heavy industry—petrochemicals, fertilizer, and steel—in its efforts to stimulate the economy.

CONSTRUCTION. The rapid growth of the Saudi oil industry has led to fast-paced urban development and an ever-expanding infrastructure. As a result, construction is one of the more active sectors of the non-oil economy. It provided jobs for 16 percent of the workforce in 1998 and, in 1999, accounted for almost 9 percent of GDP.

Despite the construction sector's importance to the economy, growth in the industry during the 1990s was slow, averaging just 1.5 percent. This was partly due to the decline in infrastructure work following the completion of a number of major projects in the 1980s. However, industry prospects look good for 2001, with the pace of urban development once again on the rise. In 2000, the government issued over 27,000 work permits, with the number of contracts awarded rising 49 percent in the first 9 months of the year. The heightened activity pushed up the sales of cement by 6 percent.

SERVICES

TOURISM. Hoping to capitalize on its Red Sea coastline, unspoiled desert landscapes, and a slew of archeological sites, the Saudi Arabian government has expressed an interest in expanding the country's tourism sector. However, this task will likely be complicated by the country's rigid social structures and its fear of outside influence. Visitors have little freedom of movement in Saudi Arabia. All tourist activities are controlled by a sponsor, or guide, who is responsible for ferrying tourists to and from points of interest. Outsiders are expected to adhere to Saudi conventions. Western women, for instance, are required to abide by the country's conservative dress codes, covering their heads, arms, and legs whenever they are in public. Pants for women are not permitted, nor are women allowed to drive. Furthermore, unmarried couples may not stay in the same hotel rooms. There have been reports of Saudi citizens harassing or assaulting foreigners who fail to comply with Saudi norms of behavior. These restrictive social rules could be off-putting to some western tourists. Nonetheless, steps are being taken to increase the kingdom's annual number of visitors.

New guidelines were recently approved for issuing tourist visas to foreigners, making it easier for travel companies in Saudi Arabia to arrange group tours. The kingdom's efforts to accommodate non-Muslim, recreational travelers only began in 1998, when a tour group visited the kingdom for the first time. It was an archeological tour limited to married couples and women over the age of 45. Expanding the tourism industry amid the country's

restrictive social environment will not be easy. Still, the government hopes that between 2000 and 2004, it will grant some 3 million tourist visas to foreigners, generating revenues worth approximately US$2.67 billion.

A majority of the kingdom's tourism currently comes from Muslims performing the "haj," the pilgrimage to the country's holy sites. All Muslims are instructed to make the pilgrimage at least once in their lives. In 1999, the government moved to expand the travel rights of foreign Muslims, allowing them to venture beyond Mecca and Medina. In March 2000, it is estimated that over 1 million foreigners and 700,000 Saudis made their way to the western region of Hejaz to visit the holy cities.

FINANCIAL SERVICES. Ten commercial banks operate within Saudi Arabia. Seven of them are joint ventures with foreign banks which operate according to international norms. The other 3 banks—the National Commercial Bank (NCB), the Al Rajhi Banking and Investment Company, and the Riyadh Bank—are state-owned and are run in accordance with Islamic law. This forbids them from charging interest on their loans. Any expansion of the banking system appears unlikely, at least in the near future, as the government considers the current number of banks to be sufficient to serve the economy.

Saudi Arabia has a viable over-the-counter stock market where investors, primarily the domestic commercial banks, trade **equity** in 75 Saudi companies, up from 70 companies in 1996. The number of shares traded and the value of those shares rose dramatically in the last half of the 1990s, gaining 43.6 percent in 1999 alone. In 2000, the market rose another 11 percent, making Saudi Arabia the only Arab country outside of Tunisia whose stock market posted overall gains for the year.

The Saudi Arabian stock market has traditionally been closed to non-Saudi investors. However, laws barring foreign participation were amended in 1997, and foreign nationals are now allowed to trade in the market, although on a limited scale (generally through investment in mutual funds).

INTERNATIONAL TRADE

Saudi Arabia has maintained a trade surplus since 1967 (when its trade statistics were first compiled in their current form). As the kingdom generates a majority of its revenue from petroleum exports, this surplus tends to rise and fall with the price and production of oil. After the oil embargo of 1973, when oil prices were high, the kingdom's trade surplus rose, increasing steadily until 1978. This trend continued after the Iranian revolution of 1979 when oil prices rose to new levels. Between 1978 and 1981 Saudi Arabia's trade surplus doubled, reaching a peak of US$82.5 billion.

Trade (expressed in billions of US$): Saudi Arabia

	Exports	Imports
1975	29.682	4.213
1980	109.083	30.166
1985	27.481	23.622
1990	44.417	24.069
1995	50.040	28.091
1998	N/A	N/A

SOURCE: International Monetary Fund. *International Financial Statistics Yearbook 1999.*

The surplus declined steadily throughout the 1980s as export volume diminished and oil prices fell. By 1985, the balance of trade had fallen to just US$7 billion. In 1990, Iraq invaded Kuwait, prompting the United Nations to place an embargo on Iraqi oil. The cut in supply sent prices back up, and as Saudi Arabia heightened production to meet world demand (from 5.1 million b/d in 1989 to 8.2 million b/d in 1991), export revenues increased and the trade surplus rose once again. In 1996, export revenues exceeded import expenditures by US$35.3 billion.

In 1998, the world economy slowed. At the same time, oil production by both OPEC and non-OPEC members increased. The higher production levels coupled with lowered demand caused the price of oil to fall by almost US$7/barrel, from US$19.12/barrel in 1997 to US$12.76/barrel in 1998. In Saudi Arabia, oil receipts fell and the trade surplus dropped to US$11.2 billion. In 1999, oil producers worldwide lowered production, and the corresponding rise in prices helped boost Saudi Arabia's export revenues, pushing the trade surplus to US$25 billion. This upward trend continued throughout 2000 when the surplus rose to US$52.4 billion.

Saudi Arabia imported US$28 billion worth of goods in 1999. A majority of that expenditure went toward the purchase of machinery, electrical equipment, chemicals, foodstuffs, and transportation equipment (cars, trucks, buses). Agricultural imports accounted for 17 percent of the total in 1999, up 11 percent since 1992, reflecting cuts in farm subsidies and the consequent decline in domestic food production. Electrical equipment and machinery accounted for 24 percent of the kingdom's total imports in 1999.

Saudi Arabia's exports totaled US$48 billion in 1999. Over 90 percent of those earnings were derived from the export of oil.

A majority of Saudi Arabia's trade is conducted with the United States. U.S. goods in 1998 accounted for 21 percent of Saudi imports, over twice as much as the kingdom's next leading suppliers, the United Kingdom and

Japan, whose imports to Saudi Arabia amounted to 9 percent each. Germany, France, and Italy were other major suppliers of goods.

Japan emerged as the leading buyer of Saudi goods in 1998, purchasing 17 percent of the kingdom's exports. The United States was close behind with 15 percent of Saudi exports. Saudi Arabia provides the United States with approximately 20 percent of its imported crude oil. The kingdom also is a major exporter to South Korea, Singapore, India, and France.

Saudi Arabia and its fellow members of the Gulf Cooperation Council (GCC)—Kuwait, Qatar, the United Arab Emirates, Bahrain, and Oman—have, over the past decade, been trying to promote higher levels of trade between themselves by removing barriers to the free exchange of goods, services, and capital between member states. One of these barriers, the lack of a common external tariff, has continued to complicate moves toward greater economic integration.

Saudi Arabia generally applies a 12 percent tax on imported goods, unless those goods compete with locally produced items, wherein the tax is issued at 20 percent. (Taxing certain imported items at higher rates raises the price at which the items are then sold. This helps keep local manufacturers competitive.) This is the highest import tax in the Middle East and is a point of contention between Saudi Arabia and other GCC members. In order to gain entry into the WTO, Saudi Arabia will be forced to lower tariffs to a maximum of 7.5 percent, bringing import taxes in line with other WTO member states. Imported medical goods, basic foodstuffs, and other items considered essential are exempt from the tax.

Some items, either for religious reasons or purposes of state security, are banned in Saudi Arabia. The import of non-medical drugs and alcohol is forbidden, as is any religious material which might be deemed offensive to the principles of Islam. Furthermore, the import of weapons and electronic equipment is tightly controlled.

MONEY

The Saudi Arabian Monetary Agency (SAMA) regulates the kingdom's money supply. Since June 1986, the Saudi riyal had been informally pegged to the U.S. dollar at SR3.745:US$1. The fixed rate cuts down on revenue volatility, being that a majority of Saudi oil exports are sold to America and denominated in U.S. dollars. Keeping the riyal consistent in its relation to the dollar also helps keep the currency stable, and this, in turn, makes Saudi Arabia a more attractive market for international investment capital. At the same time, the pegged rate provides a stable **exchange rate** with other GCC countries whose currencies are also generally pegged to the dollar.

Exchange rates: Saudi Arabia

Saudi riyals (SR) per US$1	
2001	3.7450
2000	3.7450
1999	3.7450
1998	3.7450
1997	3.7450
1996	3.7450

Note: The rate of Saudi currency has been fixed since June 1986.

POVERTY AND WEALTH

Saudi Arabians generally enjoy a decent standard of living, due in large part to government programs designed to minimize poverty. Saudi citizens are given free education (although enrollment is not required and has historically been low, accounting for relatively high illiteracy rates) and health care, and all adult Saudis are entitled to a plot of land and a loan of US$80,000 with which to build a house.

The **GDP per capita** in Saudi Arabia reached its peak in the late 1970s and early 1980s, when elevated oil prices were generating high levels of revenue. In 1981, GDP per head reached US$16,650. Slumping oil prices and declining production in the ensuing years caused the per capita GDP to fall. By the end of the decade the figure dropped to US$5,500. Rising oil prices following the Gulf War coupled with increased Saudi production helped raise the per capita GDP once again. In 1999 the figure stood at US$9,000.

Despite the extensive social safety net in Saudi Arabia, the unequal distribution of wealth in the country is fostering resentment among the country's poorest citizens. In 1999, the National Commercial Bank estimated that out of a population of 20 million, there were 120,000 millionaires controlling a combined fortune of over US$400 billion. Meanwhile, according to the Saudi American Bank, 20 percent of Saudi men between the

GDP per Capita (US$)

Country	1975	1980	1985	1990	1998
Saudi Arabia	9,658	11,553	7,437	7,100	6,516
United States	19,364	21,529	23,200	25,363	29,683
Egypt	516	731	890	971	1,146
Iran	1,611	1,129	1,208	1,056	1,275

SOURCE: United Nations. *Human Development Report 2000; Trends in human development and per capita income.*

ages of 20 and 29 had no paid work. As a result, larger families were increasingly finding themselves under financial strain. The government, in recognition of the problem, began taking steps in 1995 to open more jobs to Saudi citizens. Two successive 5-year plans, from 1995 through 2004, have listed the Saudiization of the workforce as a primary objective. To this end, the government has passed laws requiring that at least 5 percent of the private sector be made up of Saudi citizens. Also, all firms have been ordered to increase the number of Saudi workers by 5 percent a year. At the same time, the government has attempted to limit the employment of foreign nationals by prohibiting the renewal of their work contracts and by raising the visa fees employers must pay to hire them.

Illiteracy rates are high in Saudi Arabia, hovering at around 20 percent in 1999. Consequently, the government in its development plans has placed heavy emphasis on improving education. Outside of defense expenditures, education spending accounts for the largest portion of the government budget (27 percent in 2000). Between 2000 and 2004 the government hopes to build over 1,000 primary schools, 819 middle schools, and over 900 high schools. During this time student enrollment is projected to rise from 3.9 million to 5.1 million. In efforts to create more highly skilled high school graduates, the government is also attempting to increase student enrollment in the kingdom's vocational schools and technical colleges. Efforts thus far have been successful, with vocational enrollment rising by over 20 percent between 1998 and 1999.

Health care also receives a great deal of government attention. Facilities are generally good. According to a 2001 report issued by the Ministry of Health, the 314 private hospitals provide 1 bed for every 461 people. The 2001 budget provided spending for the construction of 30 new hospitals.

WORKING CONDITIONS

The Saudi Arabian labor force is comprised of approximately 7.12 million workers. These workers enjoy few rights. The formation of unions is strictly prohibited, strikes are forbidden, and there is no collective bargaining. In the absence of a minimum wage, employers are free to pay their workers as they see fit.

While forced labor is against the law, abuses do occur, especially in remote areas and in the domestic service industry, where there have been reports of maids being forced to work up to 16 hours a day, 7 days a week. Employees have little freedom of movement, and cannot leave the country or even travel out of the region without their employer's permission.

According to labor regulations, the work week is 48 hours. Employers can require 12 additional hours of overtime at time-and-a-half pay. The law requires workers to be given a rest period of 24 hours, which is generally granted on Fridays, the Muslim sabbath. Labor laws, however, do not apply to domestic servants, who have little redress for any poor treatment they might receive. Those who run away are generally returned to their employers.

The International Labor Organization has cited Saudi Arabia for failing to adhere to conventions on equal pay, for continuing gender segregation in the work place, and for limiting vocational programs for women. Additionally, in 1995 Saudi Arabia was suspended from the U.S. Overseas Private Investment Corporation (OPIC) insurance programs for its failure to guarantee the rights of its workers as recognized by international norms.

According to human rights reports, foreign workers run the risk of being exploited. Workers recruited in foreign countries may be pressured after arriving in Saudi Arabia to sign new contracts with less favorable terms, or they may be pressured to accept lower pay than originally promised. Once in Saudi Arabia, workers may also find their freedom of movement restricted. Employers may refuse to grant them exit visas, making it impossible for them to return home.

Saudi nationals in general receive higher pay than non-nationals, especially in the agricultural sector, where Saudi citizens can make up to 3 times that of their foreign counterparts. The Saudi government has taken steps to introduce minimum wage requirements for foreign workers, making it more costly for employers to hire them. In this way the government hopes to spur more employment opportunities for Saudi citizens.

COUNTRY HISTORY AND ECONOMIC DEVELOPMENT

1745. Muhammad Abd Al-Wahhab, a religious reformer, allies with Muhammad bin Saud, a local ruler, and the 2 begin a religious/military campaign to unite the Arabian Peninsula under a new brand of strict Islamic law. They and their followers are known as Saudis.

1801. Saudi forces capture Mecca, an important religious site.

1805. Saudi forces capture Medina, another important religious site. The Ottoman Turkish government, which rules the region, launches a campaign to drive Saudi forces out of Arabia. By 1818 the Saudis have lost most of the territory previously captured and eventually take up exile in Kuwait.

1902. The Saudis renew their efforts to unify Arabia. King Abdul Aziz Al Saud (later known as Ibn Saud) recaptures Riyadh, the Al Saud ancestral home, from the Al Rashid, who are ruling in Arabia with Turkish support.

1932. Present-day Saudi Arabia is consolidated under Ibn Saud's rule. Ibn Saud declares himself king.

1953. Ibn Saud dies, leaving his kingdom to his surviving sons. His eldest son, Saud, becomes king and establishes the Council of Ministers, an advisory body made up of members of the royal family.

1962. Civil war breaks out in Yemen between Royalists and Republicans. Egypt backs the Republicans while Saudi Arabia backs the Royalists. Tensions between Egypt and Saudi Arabia are high over the next 5 years until 1967, when Egyptian forces withdraw from Yemen.

1964. King Saud steps down in favor of his half brother Faisal bin Abdul Aziz.

1967. War breaks out between Israel and 4 Arab nations, Egypt, Jordan, Syria, and Iraq. Saudi Arabia sits out the war, but later provides economic assistance to Egypt, Jordan, and Syria.

1973. War erupts once again between Israel and its Arab neighbors. Saudi Arabia and other Arab oil producers boycott the sale of oil to the United States to protest American financial aid to Israel. The price of oil rises steeply, but Saudi Arabian earnings still suffer due to loss of sales to the West.

1974. Despite Arab opposition, Saudi Arabia abandons the 1973 boycott, negotiating an economic and military cooperation agreement with the United States whereby the United States provides the kingdom with military protection in return for the guaranteed flow of oil. Saudi wealth begins to grow rapidly, heightening its political and economic influence throughout the world.

1975. King Faisal is assassinated. He is succeeded by his half brother, Crown Prince Khalid. Another half brother, Fahd, is appointed crown prince and first deputy prime minister.

1979. Armed religious militants take over the Grand Mosque in Mecca. The 250 men, followers of the Sunni Muslim cleric Juhaiman Ibn Seif al-Oteibi, are removed by force. The incident alerts the royal family to growing dissatisfaction in the kingdom among religious conservatives. In response, the government establishes a committee to lay out a system of societal laws based on Islamic principles.

1982. King Khalid dies and is succeeded by Crown Prince Fahd. Fahd becomes a key player in Middle East politics.

1988. A Saudi-brokered cease fire is declared in the 8-year-old Iran-Iraq war, bringing stability to the Middle East.

1990. Iraq invades Kuwait, drawing international condemnation and starting the Gulf War. The UN places an embargo on Iraqi oil. The cut in world supply causes oil prices to rise. Saudi Arabia begins to increase production to help meet world demand. King Fahd helps organize and hold together the coalition of Arab military forces which, in conjunction with a large contingent of U.S. forces, drives Iraq from Kuwait.

1995. King Fahd suffers a stroke. Over the next 2 years, Crown Prince Abdullah emerges as the de facto head of state.

1996. A car bomb explodes outside U.S. military housing at the Al Khobar military base in Eastern Province, killing 19 American servicemen. Responsibility is linked to Osama bin Laden, a Saudi dissident claiming to resent the Western presence on Saudi soil.

1999. Saudi Arabia cuts oil production by over 2 million barrels a day to boost prices.

2000. New laws are passed to facilitate foreign investment.

2001. Saudi Arabia and Iran sign a security pact pledging cooperation in combatting terrorism, drug trafficking, and **money laundering**.

FUTURE TRENDS

Barring the discovery of a new energy supply that renders oil obsolete, Saudi Arabia will be able to maintain its economy through the production and distribution of oil for nearly another century. The discovery of new reserves, which appears likely, will extend the viability of the oil-based economy even further. However, as oil supplies rise and efficiency increases, prices will likely go down. To compensate for lower oil revenues, the Saudi government will continue to take steps toward economic diversification, expanding its agricultural, non-oil mining, and tourism sectors. The government will also continue to push for private sector growth as it loosens its grip on the economy.

In the meantime, Saudi Arabia will continue to implement oil policies that are favorable to the West for 2 main reasons. One, Saudi Arabia is dependent on the West, primarily the United States, for trade and military protection. And two, it is in Saudi Arabia's own interests to maintain stable oil prices to keep the commodity competitive with other forms of energy.

Saudi Arabia will also further its efforts to attract foreign investment, especially in heavy industrial sectors where the government is encouraging the creation of public-private partnerships. Although the government has expressed interest in decentralizing the economy, full privatization in most industries has yet to occur.

Cooperation between the United States and Saudi Arabia should continue, at least into the near future. However, relations could become strained if the situation in Israel continues to deteriorate. Historically, U.S. support

for Israel has generated hostility in the Arab world. If the violence in Israel escalates and the Palestinians are perceived as being grossly victimized, the Saudi population, for reasons of Muslim solidarity, may begin pushing for intervention. Any move in that direction would complicate U.S.-Saudi relations.

Young Saudis will continue to enter the labor market in growing numbers. As such, the so-called Saudization of the workforce will remain a government priority for the foreseeable future. Hiring fees will be raised for foreign workers, and those workers with expired visas may be forbidden to renew them. The Saudi infrastructure will also expand in the coming decades as new oil fields are discovered and the non-oil mining sector grows. Saudi Arabia's push to gain entry into the World Trade Organization will accelerate the pace of economic reforms currently underway.

DEPENDENCIES

Saudi Arabia has no territories or colonies.

SINGAPORE

Republic of Singapore

CAPITAL: Singapore.

MONETARY UNIT: Singapore dollar (S$). One dollar equals 100 cents. There are coins of 1, 5, 10, 20, 50 cents, and 1 dollar. There are notes of 2, 5, 10, 20, 50, 100, 500, 1,000, and 10,000 dollars.

CHIEF EXPORTS: Machinery and equipment (including electronics), chemicals, and mineral fuels.

CHIEF IMPORTS: Machinery and equipment, mineral fuel, chemicals, and foodstuffs.

GROSS DOMESTIC PRODUCT: US$109.8 billion (2000 est.).

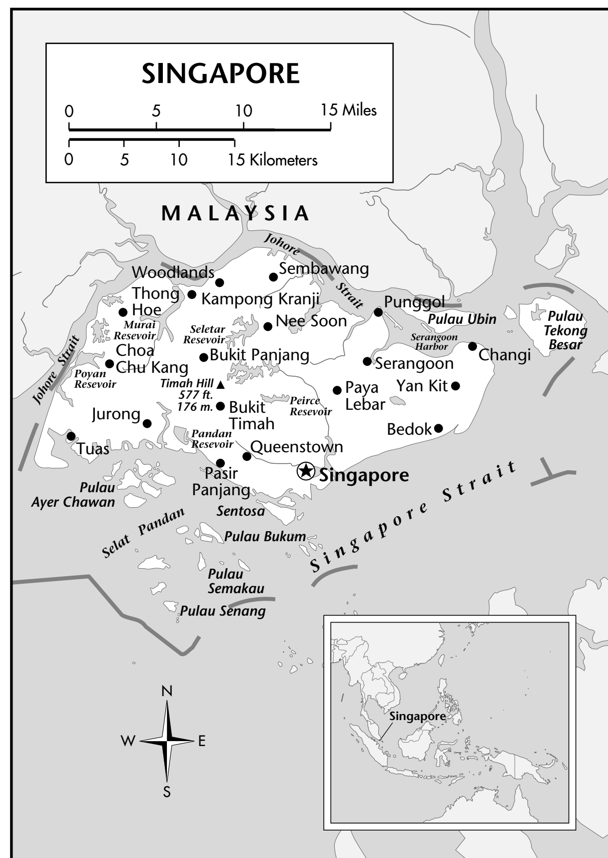
BALANCE OF TRADE: **Exports:** US$137 billion (2000 est.). **Imports:** US$127 billion (2000 est.).

COUNTRY OVERVIEW

LOCATION AND SIZE. Singapore is a city-state in Southeast Asia, located about 137 kilometers (85 miles) north of the Equator. It consists of 1 major island and 59 small islands. Singapore lies at the center of a major sea route connecting the Far East to Asia, Europe, and the Middle East, which gives the country its strategic importance. It is separated from Malaysia to the north by the narrow Johore Strait and from Indonesia to the south by the wider Singapore Strait. The country has a land area of 637.5 square kilometers (247 square miles), but no land boundaries, and its total coastline is 193 kilometers (120 miles). The territory of Singapore covers a slightly smaller area than that of New York City.

POPULATION. The population of Singapore, which is entirely urban, was estimated at 4,151,264 in July 2000. In 2000, the birth rate stood at 12.79 per 1000 people, a low level attributed to urbanization and birth control policies, and the death rate stood at 4.21 per 1000. The estimated population growth rate is 3.54 percent. Such a high rate is due to the high net **immigration** rate, which stood at 26.8 immigrants per 1000 people. These immigrants form a large community of foreign temporary workers estimated at about 10 percent of the total population. Singapore has one of the highest population densities in the world, with about 6,500 people per square kilometer (or 16,800 per square mile).

The Singaporean population is diverse and represents 3 major ethnic groups. Ethnic Chinese make up almost 77 percent of the population, Malays make up 14 percent, Indians 7.6 percent, and other ethnic groups 1.4 percent. Around 18 percent of the population is below



the age of 14, and just 7 percent is older than 65. The current ethnic distribution was formed in the 19th century when the British administration encouraged people to migrate to Singapore from neighboring Malacca, the Indonesian islands, India and especially China.

In 1957, Singapore's population was approximately 1.45 million, and there was a relatively high birth rate. Aware of the country's extremely limited natural resources and small territory, the government introduced birth control policies in the late 1960s. In the late 1990s, the population was aging, with fewer people entering the labor market and a shortage of skilled workers. In a dramatic reversal of policy, the Singapore government now plans to introduce a "baby bonus" scheme in 2001 that will encourage couples to have more children.

Singapore wants to limit the inflow of illegal immigrants. The effect of drugs and drug trafficking is another important issue, since Singapore lies near the "Golden Triangle," an area between Burma, Laos, and Thailand that is the world's largest producer of illicit drugs such as opium. Singapore is among the few countries in the world to have adopted the death penalty for possession and sale of drugs. New chronic diseases like AIDS are also of great concern to the Singaporean government, since the country is a busy tourist destination.

OVERVIEW OF ECONOMY

Manufacturing and services are the 2 main features of the modern Singaporean economy, but the economy's main economic engine is its seaport, one of the world's busiest. Singapore also has one of the largest commercial shipping registers in the world.

In 1819, when the British East India Company leased this territory from the Sultan of Johore to establish a trade and communication post, it was a small settlement in a swampy area. However, the British administration quickly cleared jungles, reclaimed marshes, and established a merchant seaport. This port expanded into a major regional trading post due to its strategic and convenient location along the main sea route connecting the Far East to British India and to Europe. The rise of Singapore as a communication hub would prove a foundation for its future prosperity.

As a free port and a major British naval base in East Asia, Singapore enjoyed a special status within the British protectorate for a long time. In 1959, Singapore achieved full self-governance, and in 1963, it joined the Federation of Malaysia. However, sharp political disagreements arose with the federal government, and in 1965, Singapore left the Federation and became an independent state. Having a small territory and no natural resources, the government staked everything on the transformation of the country's economic base from a trade mediator and regional transport hub to a manufacturing center, specializing in capital-intensive industries, high technologies, and financial services. Singapore's government promoted a free-market economy and export oriented industrialization (EOI), combined with a measure of state intervention, subsidized credits to selected industries, and high public investment in applied research and certain export targets. Export to the international market promoted efficient use of resources and generated **hard currency**, which was necessary for catching up with further development of technologies and industrial innovation. This policy brought unprecedented economic expansion, with an annual average growth rate of 6.4 percent from the 1960s through the 1980s. This development transformed Singapore into one of the "economic tigers" of Asia.

There are different interpretations about the causes of this high performance. A World Bank report argued that this success was because of a mix of private investors and available human resources. Others argue that state initiatives and government economic policies were important. In Singapore's transformation, the Economic Development Board, which is the government agency responsible for the formulation and implementation of economic and industrial development strategies established in 1961, played a crucial role.

The country's major export products are electronic goods, machinery, and equipment produced by major **multinational corporations**. Tourism is important. In 1996, Singapore hosted 4,795 international and regional conventions and received more than 7 million tourists, providing revenues of about 9 percent of **gross domestic product** (GDP). Finance and business services are other important sectors of the economy, accounting for almost 30 percent of GDP in 1996. Transport and communications contributed an estimated 10 percent of GDP in 1996.

The Singapore government is persistent in the promotion of initiatives to keep the country competitive in the international arena. One of these initiatives is IT2000, which depends on a vision of Singapore as an "Intellectual Island" where information technologies penetrate all aspects of life. Another initiative is Jurong Town Corporation, which offers ready-built factories and manages 33 industrial parks housing 7,000 companies. The government supported the selected sectors in manufacturing and other industries through different means. It owns the Government-Linked Companies (GLCs) that operate as commercial entities. Singapore has the second highest number of state-controlled firms (45 percent) in the world, higher than Korea or Japan.

One of the important features of the Singaporean economy is that the financial sector has been guided by conservative **fiscal policies**. In 1998, in response to the 1997 Asian financial crisis, the Singapore government

announced financial reforms to improve the country's international competitiveness, which included further **liberalization** of the financial sector and tax initiatives.

High economic performance and development kept unemployment at a low level during the last decades of the 20th century in all sectors of the economy including manufacturing, tourism, and finance. In 1999 unemployment was just 3.2 percent (by comparison, unemployment in the United States was 4.2 percent in the same year). Because of the speed of its economic expansion, Singapore began to experience shortages of skilled labor in the late 1990s and early 2000s.

POLITICS, GOVERNMENT, AND TAXATION

Singapore is a parliamentary democracy with a president as the constitutional head of state. The president plays a ceremonial role in the political life of the country and until 1991 was elected by the parliament. In 1991, the constitution was amended, allowing citizens to vote for their president in direct popular elections. Current president S. R. Nathan took office for a 6-year term in 1999. Singapore's **unicameral** (one house) parliament has 83 members elected by popular vote. Executive power rests with the cabinet, led by the prime minister who is responsible to the parliament.

Several political parties have been active since Singapore's independence in 1965. Five of these parties have a high profile and influence in the country. These are: People's Action Party (PAP); National Solidarity Party (NSP); Singapore Democratic Party (SDP); Singapore People's Party (SPP); and Worker's Party (WP). Unlike many neighboring countries, the Communist Party does not have mass support in Singapore, and there has been no violent confrontation with communists. The military has never been an influential force in the political arena of the country. Politically, Singapore has remained remarkably stable and nearly untouched by political violence since independence.

Since the end of World War II, the major issues shaping political competition in Singapore have been the promotion of political stability, economic growth, and maintaining a balance among the 3 main ethnic groups. The PAP came to power spreading an ideal of national consolidation, economic growth, and state paternalism. It has remained the country's dominant political force for the past 40 years, controlling parliament in every election since independence. The PAP's strong man, Lee Kuan Yew, became prime minister in 1959 when Singapore acquired self-governance, and retained this position until 1990. After his resignation, Goh Chok Tong, Lee's chosen successor, became the new prime minister. One of the unique features of Singaporean political development is the governing by a single party since gaining independence in 1965. This has led prominent human rights groups to criticize the Singaporean government over its failure to promote and protect the political and civil rights of its citizens.

Since the early 1960s, under the leadership of both Lee Kuan Yew and then Goh Chok Tong, the Singapore government has promoted a free-market and export-oriented economy. This policy has been successful and the country has experienced unprecedented economic growth and prosperity. Leading **technocrats** were able to capture major trends in technological change in the modern world and utilize the benefits of globalization. In 1992, as a member of the Association of South East Asian Nations (ASEAN), Singapore created a regional **free trade zone**, to be known as the ASEAN Free Trade Zone (AFTA). Singapore managed to minimize the negative effects of the oil crisis of 1979 and the Asian financial meltdown in 1997.

The country has continually attracted **foreign direct investment** and technological transfers from developed countries such as Japan and the United States. One of the important tools in the hands of the government has been its taxation policy and its initiatives. With few exceptions, capital gains are not taxed in Singapore. Both resident and non-resident companies are taxed at the same rate as the corporate tax rate, which stays at 25.5 percent. The typical withholding tax rate on interest payable to non-residents stays at 15 percent, but this could be reduced or even exempted by tax treaties in the future. A Goods and Services Tax (GST) was introduced in April 1994 at 3 percent, but was accompanied by compensatory reductions in **direct taxation**. Qualified employees may enjoy tax exemptions of 50 percent for up to S$10 million of stock option gains arising over a period of 10 years for stock options granted after June 2000.

INFRASTRUCTURE, POWER, AND COMMUNICATIONS

Singapore inherited from the colonial era a superior **infrastructure** and well-developed transport network. After independence, the Singaporean government made many efforts and sizable investments to improve these even further. This small city-state is served by a network of 3,122 kilometers (1,940 miles) of highways, 99 percent of which are paved. In the 1970s and 1980s, there was a steep increase in private car ownership, which led to traffic congestion and rising air pollution. The government reacted swiftly, investing significant sums in public transport, especially the mass transit system. It also restricted private car usage on Singaporean roads, using different measures, including taxes and Certificates of Entitlement. By the 1990s, 83 kilometers (51

miles) of mass rapid transit system, and 11 kilometers (6 miles) of light rapid transit system had been built, and the country could boast of an excellent public transport system, praised for its safety, quality of service, and punctuality. In 1998, the government launched a S$1.7 billion project to build a new transit line. There were at that time 681,924 registered motor vehicles, including 378,090 cars, 11,410 buses, 133,382 motorcycles and scooters, and other vehicles.

Throughout the colonial era, the port of Singapore was an important military base and commercial seaport. After gaining independence, Singapore maintained its status as an important regional transport hub. Its seaport is believed to be one of the world's busiest ports in tonnage terms, with 140,922 vessels making up a shipping weight of 858 gross tons calling at the port and total container traffic of 15.14 million 20-foot equivalent units. It also has one of the largest commercial shipping registers in the world. Its merchant marine included 891 ships (1,000 gross registered tonnage and over) in 1998. Singapore also houses the third-largest oil refinery in the world with a capacity of 1 million barrels a day (1998). Major petroleum companies, including Shell, ESSO, Caltex, British Petroleum, and Mobil, operate there.

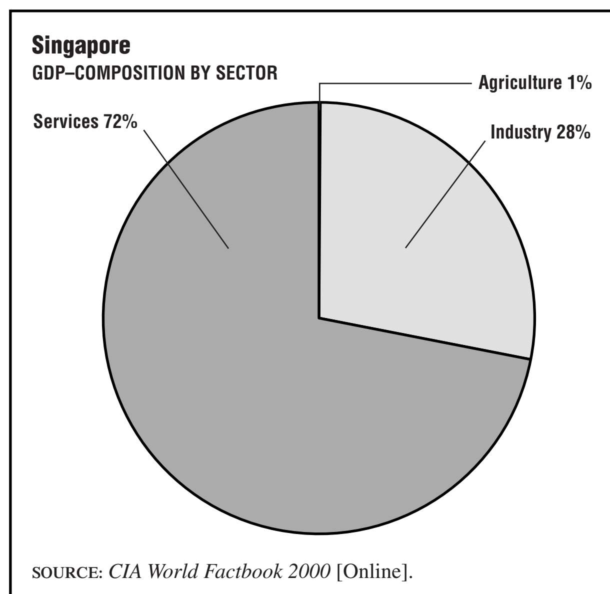
The government has invested heavily in the development of aviation, signing air service agreements with 90 countries, including "open skies" agreements with the United States, New Zealand, and Brunei Darussalam. The Civil Aviation Authority of Singapore (CAAS) oversees and regulates development in this sector. There were 9 airports in Singapore in 1999. The largest is Changi airport (a subsidiary of CAAS), which hosted 61 airlines and handled 23.8 million passengers in 1998 alone, making Singapore one of the major airports in the region. The 47-hectare (116-acre) Changi Airfreight Center handled 1.43 million tons of air freight movement in 1998. The government planned to invest a further S$1.5 billion in upgrading the airport facilities in the first decade of the 21st century. Singapore Airline (SIA) was created in 1972 after the split of Malaysia-Singapore Airline. SIA and its subsidiary, SilkAir, operated 87 aircraft, employed 18,800 people, and carried 12 million passengers a year in 1998. In 1998, SIA was ranked fourth in terms of international freight measured in ton-kilometers, and eighth in international passenger-kilometers.

Singapore is fully reliant on imports of mineral fuel for domestic consumption, and these imports accounted for 9.3 percent of merchandise imports in 1996. This makes the country vulnerable to unfavorable fluctuations in world oil prices. Electric power is produced from fossil fuel at 3 power stations. Electricity production was recorded at 28.586 billion kilowatt-hours (kWh) in 1998.

Telecommunication services in Singapore remain under state control. Telephone service is provided by the state-controlled Singapore Telecom (ST). The country had 54.6 million telephone lines and 1.02 million mobile cellular telephones in 1998. The government has attempted to end ST's **monopoly**. In 1993, it sold about 7 percent of its share to private companies and, in 1997, ST's monopoly on mobile and pager services came to an end. In 1998, there were 8 Internet service providers in the country and 458.4 computers per 1,000 people, which is more than in the United States. In 2000, the Singapore government announced a S$1.5 billion investment over 3 years into the e-Government Action Plan, which should enable Singaporeans to access a wide range of online services.

ECONOMIC SECTORS

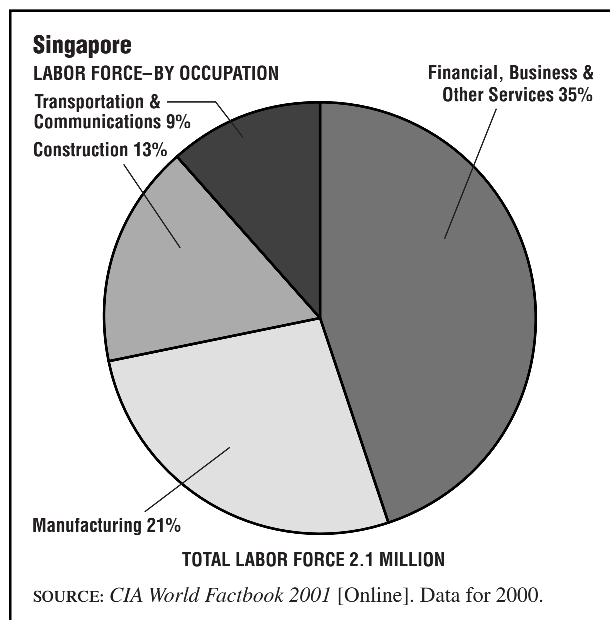
Singapore's separation from the Federation of Malaysia in 1965 had advantages and disadvantages. On the one hand, its economic development has been constrained by its small territory, small population, and extremely limited natural resources, and the country has always been fully reliant on the importation of foodstuffs. Yet Singapore has a huge advantage in its location in a major sea route connecting the Far East to South Asia, Europe and the Middle East. The country has a well-



SOURCE: *CIA World Factbook 2000* [Online].

trained, well-educated, disciplined **labor force** and has attracted major multinational corporations from Europe, Japan, and the United States. Many of them, such as Sony, NEC, Matsushita, Texas Instruments, and others, have established their manufacturing and assembly plants or distribution centers there.

Singapore has fully used the advantage of its superior location, reinventing itself as a major communication hub in Southeast Asia. The policy of encouraging private entrepreneurship, giving priority to the development of an export-oriented economy, and encouraging capital intensive industries combined with selective state intervention, brought Singapore unprecedented economic growth from the 1960s through the 1990s. By 2000, industry and services had become the 2 largest sectors of the modern Singaporean economy, contributing 30 percent and 70 percent of GDP, respectively, in 2000. (Agriculture's contribution was negligible.) Although there was a substantial slowing down in economic growth in all sectors of the economy after the 1997 Asian financial crisis, Singapore managed to avoid economic decline like neighboring Indonesia or Thailand.



SOURCE: *CIA World Factbook 2001* [Online]. Data for 2000.

AGRICULTURE

Agriculture, including fishery, is an insignificant part of Singapore's economy, accounting for just 0.2 percent of GDP and employing 0.2 percent of the workforce. Since the 19th century Singapore has been fully reliant on the import of foodstuffs, obtained from its neighbors. The country has a small fishing industry consisting of a small fleet and marine fish farms. There has been some interest in the greenhouse production of certain fruits and vegetables for domestic consumption, but it has not developed and remains small. Singapore does cultivate orchids for domestic and export markets.

In the late 1990s, Singapore businessmen expressed interest in biotechnology and genetically modified food production. The public outcry in Europe and the United States over genetically modified food has cooled this interest for the time being. Some private entrepreneurs invested in the agricultural sector in neighboring Malaysia and Thailand, aiming to export the products back to Singapore.

INDUSTRY

Singapore belongs to the "New Industrialized States" (NIS), the countries that underwent rapid industrialization from the 1960s to the 1980s. During these 2 decades, Singapore managed to attract technology transfers from the developed world as well as sizable foreign direct investment (FDI). The island has a small mining industry that is of no importance in the national economy.

MANUFACTURING. Singapore has a diverse, well-established, and economically important manufacturing sector, which contributed 28 percent to GDP and provided employment for 417,300 people, or 21.6 percent of the workforce, in 1999. Since the early 1990s, the manufacturing sector's share in GDP has been slowly declining due to the steady rise in competition from neighboring countries and the expansion of its own service sector. The United States remains the single largest investor in Singapore's economy. In 1999, about 57 percent of FDI commitments came from the United States.

Singapore began its industrial sector in the 1960s, using its superior location and well-trained and educated

labor force. The industrial sector initially consisted of electrical assembly, oil refining, and shipping facilities. The electronic sector became the country's most important manufacturing element. This sector underwent a rapid expansion in the late 1960s when Texas Instruments and other multinational corporations established assembly plants in Singapore.

In the 1990s, there was further growth in the manufacturing of different electronic products and computer components. In the late 1990s, Singapore became the world's largest producer of computer disk drives. In 1999, electronics accounted for 43.4 percent of **value-added** manufacturing in the country, making Singapore vulnerable to downturns in the international market. Most of these goods are produced in foreign-owned plants for export to the United States, Europe, and East Asia. Electronics manufacture was affected by the 1997 Asian financial crisis, although the Singaporean government supported the sector by tax breaks and other initiatives. After 1997, several multinational corporations such as Seagate, Western Digital of the United States, and others laid off staff and began **restructuring** their production capacity. Some considered moving their manufacturing operations to neighboring countries such as Malaysia, Indonesia, and the Philippines, where wages are lower than in Singapore.

Chemical production, petroleum production, and printing are also important contributors to the country's economy. Singapore has a well-developed chemical and chemical production sector. This sector experienced steady growth in the 1980s and 1990s by attracting substantial FDI. Chemical production contributed 18.1 percent of valued-added manufacturing in 1999.

Petroleum production underwent rapid expansion in the 1960s and 1970s, benefiting from the country's large and efficient seaport and modern oil refining facilities. This sector produces 18.8 million metric tons (20.68 million tons) of distillate fuel oils and 15.7 million metric tons (17.27 million tons) of residual fuel oil, and other petroleum-based products. Singapore has the world's third largest oil-refining industry. Petroleum production contributes 4.4 percent of valued-added manufacturing.

Singapore has developed high-quality color printing processes, producing several publications for major clients from the United States and Europe. Printing and publishing contributes 4.0 percent of value-added manufacturing (1999). The other manufacturing sectors produce transport equipment, machinery, and fabricated metal products.

SERVICES

TOURISM. Tourism is an important sector of Singapore's economy, providing employment for 118,900 people. Although Singapore was long known as a tourist destination for sailors, business people, and adventurers, mass tourism began in earnest in the 1970s and 1980s with the increase in international air travel. The number of tourists visiting the country rose steadily throughout the 1980s and 1990s, reaching 7.29 million in 1996. There was a decline of about 1.3 percent in 1997 and 13.3 percent in 1998, due to economic turmoil in the region. In response to this decline, the Singapore Tourism Board started "Tourism Unlimited," a program promoting regional tourism and developing tourist projects near Singapore. In 1999, about 6.96 million tourists visited the country, contributing S$11.2 billion dollars to the national economy.

Singapore promotes itself as a "dream destination," offering excellent service, a multicultural environment, local hospitality, exotic festivals, and tax-free shopping. To boost its competitiveness it has also signed visa-free agreements with most countries in Asia, Europe, and the Americas. According to the national authorities, in 1998 Singapore had 108 hotels with total room capacity of 32,000. Most visitors come from the ASEAN countries, Japan, Taiwan, Australia, the United Kingdom, and the United States. In the 1990s, Singapore reinvented itself as Asia's convention city. In 1996, the capital hosted 4,795 international and regional conventions with 426,000 foreign participants. According to the Union des Associations Internationales, Singapore ranks seventh among the world's major convention cities.

FINANCIAL SERVICES. The financial and business services sector is one of the most important sectors to the Singapore economy and provides employment for 266,000 people. Finance rests on the traditional foundations of the banking system, investments, insurance, and foreign exchange. There were 154 commercial banks in 1997, although banking was dominated by the "Big Four": the DBS Bank, the United Overseas Bank (UOB), the Overseas Union Bank (OUB), and the Overseas-Chinese Banking Corporation (OCBS). According to the IMF, Singapore is the world's fourth-largest global exchange center. The financial sector, particularly its banking component, has been tightly regulated by the Monetary Authority of Singapore (MAS), prompting sharp criticism from the United States and the World Trade Organization (WTO).

Although the 1997 Asian financial crisis affected the financial sector, there were no major bank collapses or bankruptcies. In 1997, Singapore's benchmark Strait Times Industrial Index (STII) fell 30 percent, leading to the STII being replaced by the simplified Straits Times Index (STI) in August of 1997. In 1999, the STI experienced some recovery due to an upturn in the manufacturing sector. The MAS reinforced its strict policy against internationalizing the Singapore dollar by limiting overseas lending and borrowing by non-residents. This policy restricts use of the currency outside the country for

activities unrelated to the domestic economic development. However, economic recovery has improved the Singapore government's fiscal position, and it intends to **deregulate** and gradually liberalize the financial sector.

The business services sector (including property services, accountancy, and information technology), the fourth-most important economic sector in 1999, experienced difficult times in the late 1990s. During this period, economic **recession** and declining investments in neighboring countries led to less demand for financial and business services and brought a sharp decline in spending in the property market.

RETAIL. Singapore's well-developed **retail** sector provides excellent service to the local population and to foreign tourists. Large, state-of-the-art supermarkets are complemented by thousands of small retail shops where tourists and local consumers can buy different products. Singapore has long been recognized as a major tourist shopping destination offering, among other things, the latest electronic products free of tax. In 1998, there were 281,200 people employed in the wholesale and retail trades. After the decline of 1997 and 1998 this sector recovered, with the value of retail sales up by 12.1 percent and their volume up by 14.1 percent.

INTERNATIONAL TRADE

Since the 1960s, Singapore has adopted a policy of export-oriented industrialization, promoting the export of goods and services in the international markets. It has few barriers against the import of goods and services, although the government's well-known interventionist policy in the regulation and ownership of many Singapore companies has been widely criticized. Singapore more than doubled its exports, from US$52.752 billion in 1990 to US$118.268 billion, in 1995. Exports dipped after 1997, but recovered to reach US$137 billion in 2000. The United States is Singapore's single largest trading partner, accounting for 19 percent of all exports in 1999, primarily from the sale of manufactured electronics and computer peripherals. A large part of these exports originates from U.S.-owned companies, which are traditionally the largest investors in the Singapore economy. Neighboring Malaysia is the second largest export market, accounting for 17 percent of total exports. Hong Kong and Japan are also important export destinations, accounting for 8 percent and 7 percent of exports respectively. Other important partners include Taiwan, Thailand, the United Kingdom, the Netherlands, China, South Korea, and Germany.

The United States and Japan are the largest suppliers of imports to Singapore, with both countries supplying 17 percent of imports. Malaysia remained one of the traditional sources of imports, accounting for 16 percent of the total. Major imports from Malaysia include **consumer goods** like foodstuffs and raw materials. China (5 percent), Thailand (5 percent), Taiwan (4.0 percent), Saudi Arabia (3 percent), and Germany (3 percent) are other major sources of imports. In 2000, the value of imports totaled US$127 billion.

Trade (expressed in billions of US$): Singapore

	Exports	Imports
1975	5.375	8.133
1980	19.376	24.007
1985	22.812	26.285
1990	52.752	60.899
1995	118.268	124.507
1998	109.895	104.719

SOURCE: International Monetary Fund. *International Financial Statistics Yearbook 1999.*

Singapore's government considers the development of free trade as an important factor for the country's future economic growth. Singapore strongly supported free trade negotiations between the members of the Asia Pacific Economic Cooperation organization (APEC), which tried to remove trade barriers between member countries, including the United States, Canada, Japan, Australia, and others. Singapore also strongly supported the creation of a regional free trade zone for the Association of South East Asian Nations (ASEAN), to be known as the ASEAN Free Trade Zone (AFTA). In 2001, Singapore announced its intention to discuss bilateral free-trade arrangements with Australia, Canada, Japan, and the United States.

Singapore's international trade rose during the last 3 decades of the 20th century, when the country managed its trade balance to achieve a **trade surplus** of US$10 billion by 2000. Singapore demonstrated its immunity to the sharp oil price rises in 2000 and 2001; however, it faces increasing competition from neighboring countries and has become vulnerable to changes in global market demands for electronic products. Nevertheless, political and economic uncertainty in neighboring Indonesia, the Philippines, and Thailand have strengthened Singapore's position, confirming its image as one of the most stable and business-friendly countries in the region.

MONEY

Over the last 2 decades, the value of the Singapore dollar showed remarkable stability because of the country's steady economic growth. During this period of unprecedented growth, Singapore managed to avoid high **inflation** or economic recession. The Asian financial crisis

SOURCE: United Nations. *Human Development Report 2000; Trends in human development and per capita income.*

of 1997 did affect Singapore's economy, but the country was able to avoid the political and economic calamities that brought high inflation and sizable recession to neighboring Indonesia and Thailand. There was slowdown of the Singapore economy in 1997 and 1998, affecting all sectors and bringing a small rise in inflation. In 1999 and 2000, the country overcame the difficulties and produced significant growth. Inflation stabilized at about 0.4 percent and GDP growth at about 5.5 percent in 1999.

According to the IMF classification, the Singapore dollar is a freely floating currency determined by the foreign exchange market. The Monetary Authority of Singapore (MAS), which acts as the central bank, closely monitors the **exchange rate** and ensures the stability of the currency against international currency speculators. Due to the regional economic downturn, the value of the Singapore dollar declined slightly against the U.S. dollar, from 1.4174 in 1995 to 1.6733 in January 2000. This stability was supported by Singapore's huge stocks of foreign reserves, the world's largest in per capita terms (US$23,864 per head against US$14,070 per head in Hong Kong). These foreign reserves are even larger than those of the United States. Singapore is also the world's fourth-largest global exchange center after London, New York, and Tokyo, with Chase Manhattan Bank, Citibank, Deutsche Bank, Morgan Guaranty, and others, operating in this market.

Singapore has a single stock market, which until 1997 was known as the Strait Times Industrial Index (STII). In August 1997, it was replaced by the Straits Times Index (STI). In 1997 and 1998 the STI was affected by the regional recession, recovering in 1999 and 2000. According to the Singapore Exchange (SGX) statistics, 388 companies, representing total capitalization of S$389.5 billion (US$236 billion), were listed in the SGX main board in December 2000.

POVERTY AND WEALTH

Extraordinary economic growth during the past 3 decades brought wealth and prosperity to Singapore. This growth was impressive during the 1980s and 1990s. In 1959, when Singapore gained self-governance, its per capita GDP was just US$400. In 2000, Singapore was ranked fifth in the world in terms of per capita GDP, ahead of the United States, Canada, and the United Kingdom. In 2000, the per capita GDP, figured at **purchasing power parity**, was US$26,500. A Central Provident Fund, to which employers and employees pay compulsory contributions, provides benefits in case of work injury, old age, and disability. Most people live in small apartments in high-rise buildings.

Social polarization is visible in education. The social prestige of a good education is traditionally very high in Singapore society. Private schools are very expensive and those who can spend a considerable part of their income on providing the best education for their children. Although the government is trying to encourage the development of a "knowledge society," education is not compulsory, and the poorer members of Singaporean society are disadvantaged, while the wealthy send their children to leading British, Australian, and North American universities.

In Singapore's society, as elsewhere, some people acquire wealth while others need to work hard merely to maintain a decent life. There are no statistics on the distribution of income, and therefore it is difficult to assess socio-economic and social division in the country. Traditionally, recent immigrants, both legal and illegal, have been the most disadvantaged members of the society. There is evidence, too, that social polarization exists along ethnic lines, with the ethnic Chinese community considered better off than the Malay community. In formulating social policy, the government has to take the importance of ethnic issues into consideration. The Singapore government supports such traditional values as a strong work ethic and the importance of family, promoting them as "Asian values" in opposition to the perceived "individualism" of Western societies. The National Council of Social Services, with the help of 150 voluntary bodies, provides most of the welfare services to individuals and families in need. The government also provides services for families in distress, with mandatory

counseling in cases of family violence, monthly **subsidies** for working mothers with children in child-care centers, and financial assistance to low-income families. All residents, regardless of social status, are eligible for low-cost medical care.

WORKING CONDITIONS

In 1998, Singapore's labor force was 1.932 million people, with the unemployment rate about 3.2 percent, or 61,700 people. Over the last 3 decades of the 20th century, unemployment has never been high, thanks to the country's robust economic performance across almost all sectors of the economy. Singapore's economy experienced 2 difficult years in 1997 and 1998, when unemployment rose, but since the beginning of economic recovery in 1999 and 2000 there has been strong demand in the labor market. The Employment Act established a 44-hour working week, although there is no official minimum wage or unemployment compensation.

Singapore's economy demands a highly trained and flexible workforce. The government strongly promotes the acquisition of different skills, supporting several higher education centers, and vocational and technical institutes. Facing shortages in the workforce, the government encourages women to work by providing different initiatives and support for working mothers. Women made up about 40 percent of the workforce in 1999. Due to the nature of the labor market and the nation's growing prosperity, there is no child labor problem. The law prohibits employment of children under age 12. Due to labor shortages, there is a growing number of foreign workers in Singapore, unskilled and concentrated in the service and construction sectors.

The activities of trade unions are allowed in the country within the framework of the Societies Act, labor laws, and other regulations. According to the U.S. State Department, in the late 1990s there were 255,020 union members, organized into 83 unions. Most of them are affiliated with the National Trades Union Congress (NTUC), which is closely associated with the ruling People's Action Party. Strikes, slow-downs, and other workers' protests are rare in Singapore. Collective bargaining is common in management-labor relations, but most disagreements are solved through informal consultations and, in disputed cases, through the Industrial Arbitration Court.

The rise of the "new economy" caused a surge in demand for information technology (IT) workers. It is expected that, with annual growth of 10 percent in the IT sector, manpower in this area will need to more than double from 95,000 in 2000 to 220,000 in 2008. The government intends to develop the existing workforce rather than rely on immigration for the acquisition of skilled personnel in the sector. To facilitate retraining, in April 2000 the Ministry of Manpower and the Infocomm Development Authority jointly launched the Strategic Manpower Conversion Program, emphasizing information technologies and "technopreneurship."

COUNTRY HISTORY AND ECONOMIC DEVELOPMENT

1819. Sir Thomas Stamford Raffles of the British East India Company leases a small territory from the Sultan of Johore and founds Singapore.

1821. First large group of Chinese migrants arrive from Xiamen.

1826. Singapore is incorporated into the Straits Settlements, a British colony.

1860. First census indicates a population of 80,792 in Singapore.

1858. Straits Settlements become a British Crown colony under the jurisdiction of the Colonial Office in London.

1914. Indentured labor system abolished.

1921. Singapore becomes a principal naval base for the British Navy in East Asia.

1942. The country is occupied by Japan during World War II.

1945. Allied forces liberate Singapore from Japanese occupation.

1946. Singapore becomes a Crown colony separate from Malaysia.

1955. A new constitution is adopted, introducing a measure of self-government.

1959. Singapore gains full self-governance under Prime Minister Lee Kuan Yew.

1961. Establishment of the Economic Development Board, a government agency responsible for the formulation and implementation of economic and industrial development strategies.

1963. Singapore joins the Federation of Malaysia.

1965. Singapore withdraws from the Federation of Malaysia and becomes independent.

1965. Singapore joins the United Nations.

1967. Singapore becomes a founding member of the Association of South East Asian Nations (ASEAN).

1970. Independent Monetary Authority of Singapore is established.

1971. Final withdrawal of British troops from Singapore.

1973. Last major ties with Malaysia renounced.

1979. Government begins a program of economic restructuring in response to the shock of the oil crisis.

1987. English is made the language of instruction in schools.

1990. Lee Kuan Yew resigns.

1991. The constitution is amended to allow Singapore citizens to directly elect their president.

1995. Huge losses made by a Singapore-based derivatives trader causes the collapse of Barings, the oldest British banking group.

1997. The ruling People's Action Party wins parliamentary elections, capturing 81 of 83 parliamentary seats.

1998. In response to the 1997 Asian financial crisis, the government announces financial reforms to improve the country's international competitiveness.

1999. The "Industry 21" Program, a new economic blueprint for the development of Singapore in the 21st century, is launched.

FUTURE TRENDS

Singapore has benefited from the globalization of the world economy and experienced 3 decades of extraordinary economic growth, which has brought prosperity and confidence to the people of this small city-state. Able to withstand economic turmoil such as the 1997 Asian financial crisis and the surge in world oil prices at the beginning of the 21st century, Singapore has proved that its economy has grown on a sustainable and strong basis. Inflation remains under control and the Singaporean exchange rate is stable. The quality of life has improved steadily and society has benefited from rising prosperity. The government's policies aim to maintain political and social stability by promoting economic growth from capital- and skill-intensive technologies, although it has been criticized for restricting freedom of press and associations, and for its interventionist economic policies.

In the long term, Singapore needs to maintain its international edge against growing competition from neighboring countries. It is also exposed to economic, political, and environmental developments in the neighboring countries of Indonesia and Malaysia. Continuous political turmoil and social unrest in Indonesia might threaten Singapore by causing an influx of refugees and regional instability. Recent forest fires in the Indonesian part of Borneo brought air pollution to dangerous levels, affecting tourism and the health of the Singapore population.

DEPENDENCIES

Singapore has no territories or colonies.

SOLOMON ISLANDS

CAPITAL: Honiara.

MONETARY UNIT: Solomon Islands dollar (SI$). 100 cents equals 1 dollar. Coin denominations include 1, 2, 5, 10, 20, and 50 cents, and 1 dollar. Paper notes include 2, 5, 10, 20, and 50 dollars.

CHIEF EXPORTS: Timber, fish, coconut products, cocoa.

CHIEF IMPORTS: Machinery and transport equipment, manufactured goods, food, mineral fuels, chemicals.

GROSS DOMESTIC PRODUCT: US$1.21 billion (purchasing power parity, 1999 est.).

BALANCE OF TRADE: **Exports:** US$142 million (f.o.b., 1998 est.). **Imports:** US$160 million (c.i.f., 1998 est.).

COUNTRY OVERVIEW

LOCATION AND SIZE. The Solomon Islands is an archipelago (a group of islands) in the South Pacific Ocean, about 485 kilometers (300 miles) east of Papua New Guinea, and about 1,900 kilometers (1,200 miles) northeast of Australia. Solomon Islands has a land area of 27,540 square kilometers (10,633 square miles) and a total coastline of 5,313 kilometers (3,301 miles). The land area of Solomon Islands is slightly less than that of the state of Maryland. Guadalcanal is the largest island, about 5,300 square kilometers (2,047 square miles). Other islands include Makira, San Cristobal, Vella Lavella Rennell, and Santa Cruz. Honiara, the capital, is located on the north coast of the island of Guadalcanal.

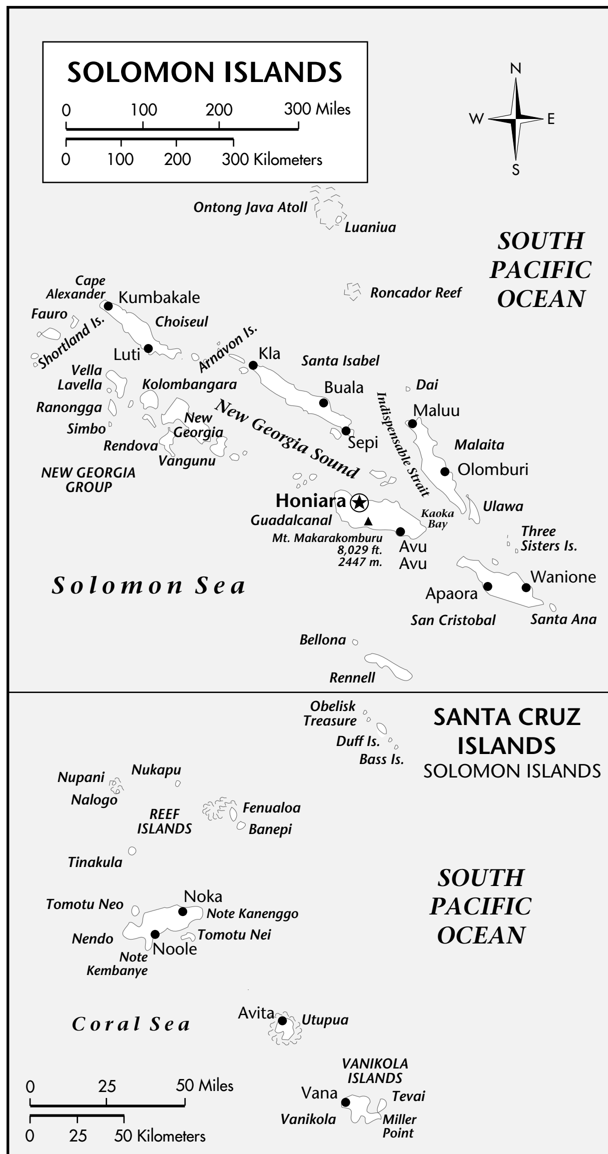
POPULATION. The population of Solomon Islands was estimated to be 466,194 in July 2000, based on a census taken in November 1999, the first since 1986. Over that period, the population increased by 43 percent, corresponding to an average annual increase of 2.8 percent. This was a substantial decline from the average rate of 3.5 percent per year between 1976 and 1986, but the current rate is still high by world standards. The birth rate was estimated at 40.9 per 1,000 population in 2000, one of the highest in the Pacific, and the death rate was 6.8 per 1,000 population. The projected population by the year 2010 is 620,500.

The great majority (93 percent) of the population is of Melanesian ethnicity, with about 70 different language groups, mostly located on the larger islands of the archipelago. A minority (4 percent) is of Polynesian descent comprising about 8 different languages; these people mainly originate on the small outlying islands, although many are now settled elsewhere. An even smaller minority (about 1.5 percent) is of Micronesian ethnicity, mainly descendants of those resettled from the Gilbert Islands (now Kiribati) during the colonial period. The rest of the population is mainly of European or Chinese ethnicity. Of the major countries of the Pacific, Solomon Islands is the least urbanized, with only 13 percent living in urban areas. The only significant urban center is the capital Honiara, with about 50,000 people; in recent years Honiara has been growing about 35 percent faster than the rest of the country.

Despite high birth rates, Solomon Islands governments have not aggressively promoted family planning. For several years, there has been a low-key population planning policy, which promotes smaller family sizes and infant and maternal well-being. According to the 2000 census, birth rates have declined considerably, perhaps due to improvements in infant health and greater availability of contraceptives.

OVERVIEW OF ECONOMY

The Solomon Islands' economy is largely dependent on agriculture, forestry, and fishing. For a high proportion of the population (mainly village-based), the Solomon economy involves the production of subsistence foods and other items for personal consumption. The main item of production for cash at the village level is copra (the dried flesh of coconut), but also significant in some areas is cocoa, market vegetables, and marine products including fish and shells.



The agricultural cash economy is a legacy from the British colonial period. After the establishment of the British Solomon Islands Protectorate in 1893, the colonial administration facilitated the establishment of plantations, usually run by British settlers, and the recruitment of local labor. While there were some attempts to introduce new crops into the subsistence economy, the colonial administration took few initiatives to diversify the economy before independence in 1978.

During the 1970s the logging, fishing, and rice industries increased production as a result of new private investments and international aid programs. Through the 1980s and 1990s the 2 most significant items of production for export were timber and fish. Ethnic tensions on Guadalcanal in 1999 and 2000 caused some disruptions, but a peace settlement was reached in October 2000, and these economic activities are projected to reach previous levels. Large-scale mining started in 1998, and this sector is expected to expand if political stability is maintained.

Various small-scale manufacturing enterprises in recent decades have resulted in some **import substitution** (replacing imports of some food, furniture, and similar items with locally made products) and limited exports of food, beverages, construction materials, and furniture. Local processing within the fishing industry is also important.

Services have been mainly confined to the **public sector**, particularly in civil administration and education. Tourism has remained a small-scale activity, partly because the government did not actively promote tourism as an economic alternative until the mid-1990s. An 18-month civil war disrupted economic activity in the country, but by 2001 the economy was rebounding even though tourists were warned to steer clear of Guadalcanal, where most of the fighting had occurred.

POLITICS, GOVERNMENT, AND TAXATION

Since independence in 1978, Solomon Islands has modeled the Westminster (British-style) system of government. The British monarch serves as head of state, and there is a **unicameral** parliament made up of 50 members (MPs) elected by voters over 21 years of age at least every 4 years. Each electoral constituency is represented by the MP who gains the most votes. The prime minister is elected by majority vote in parliament.

There is considerable fluidity in the party system, and parties have formed and reformed both during and between elections. Since independence in 1978, most governments have been coalitions, with the prime minister representing the party that gained the most votes in an election.

There are 9 provinces (Choiseul, Western, Isabel, Central, Rennell-Bellona, Guadalcanal, Malaita, Makira, and Temotu) and 1 Town Council (Honiara). Each has its own elected members and has authority over various aspects of development, including parts of the education, health, and transport systems. In response to ethnic tensions in 1999 and 2000, the central government has worked to increase the powers of the provincial governments.

Since the Solomon Islands has about 80 distinctive language groups, political parties have usually attempted to attract members and appoint cabinet ministers from various parts of the country in the interests of ethnic diversity. However, some degree of ethnic tension has persisted, and there have been calls for regional independence. In 1999 these tensions came to a head when the Guadalcanal Revolutionary Army attacked settlers from the neighboring island of Malaita who had settled on Guadalcanal, amid fears that Malaitans were beginning

to dominate the government and parts of the economy. In early 2000, the Malaitan Eagle Force took over the capital, forced out most Guadalcanalese and essentially overthrew the government. In October 2000 a peace settlement was signed, and international monitors arrived, mainly from Australia and New Zealand. By early 2001, there had been only minor breaches of the agreement.

Before the ethnic tension, the government had embarked on a modest **restructuring** program that involved some cutbacks in government expenditure, especially by reducing the number of civil servants. This was partly a response to high levels of government debt, and major fluctuations in revenue as a result of varying levels of exports and commodity prices. During the tension, the government approached insolvency (an inability to pay its debts), but was rescued by international aid, especially from the Republic of China (Taiwan). During this period, aid from Australia and New Zealand was channeled into peacekeeping activities.

The major sources of government tax revenue are customs revenue and inland (internal) revenue, which in 1997 accounted for about equal amounts of the total. Customs revenue is also equally divided between import taxes and export taxes, particularly on logs. Inland revenue originates from personal taxes, business taxes, and from other sources. A relatively small proportion of inland revenue is derived from individual **income tax** since only a small proportion of the population works in the paid **labor force**.

INFRASTRUCTURE, POWER, AND COMMUNICATIONS

The nation's numerous islands make its transportation **infrastructure** heavily dependent on maritime transport. Until the 1970s inter-island transport consisted mainly of canoes, mission ships, copra trading boats, and the occasional government boat. Regular passenger transport is now handled by government boats and increasingly by private companies.

The country is served by 1,360 kilometers (845 miles) of roads, but well over half of these are private plantation roads. Only about 34 kilometers (21 miles) of these roads are paved, mainly in Honiara. Most outlying islands have few or no roads, with a transportation infrastructure consisting of walking trails or outboard motor canoes.

Solomon Islands is served by 1 international airport, Henderson Field near Honiara, built by the U.S. military during World War II and since upgraded by aid from Japan and other sources. Another airport, at Munda in the Western Province, can also accommodate international (usually charter) flights. It was also built during World War II and has runways paved with coral. There are 31 other airports with unpaved runways throughout the islands, mostly for smaller aircraft operated by Solomon Airlines, but domestic airfares are high. During the ethnic conflicts in 2000, international and domestic flights were interrupted. By early 2001, Solomon Airlines was again flying to Brisbane and Nadi and operating most domestic flights, but other international airlines were still weighing the risks of resuming service.

Most households in Solomon Islands do not have access to electricity. In Honiara and in other provincial centers, power is generated by diesel generators operating on imported fuel. During the 1990s attempts were made to develop hydroelectric power for Honiara, but these plans were delayed due to problems related to land and compensation.

Telephone service is available only in Honiara and some towns. Domestic and international connections,

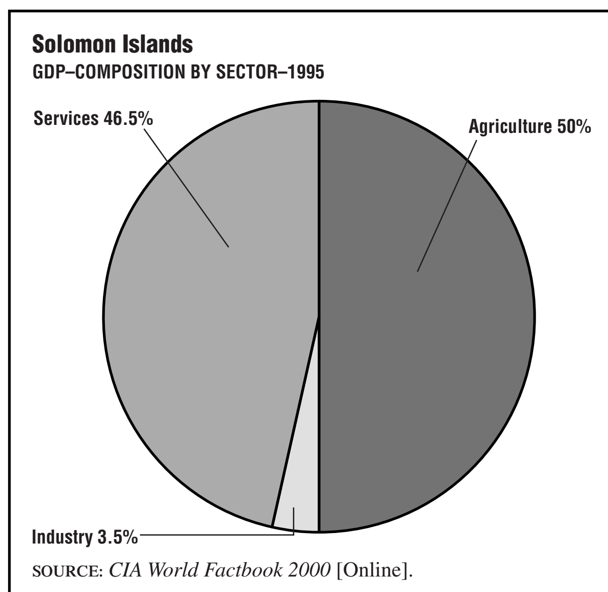
including Internet access, are usually good. These connections are provided via satellite by Solomons Telekom, a **joint venture** between the government and Cable and Wireless, Limited, and which holds a **monopoly** on telephone services. In 1997, Solomon Islands had 3 radio but no television stations, although there are about 3,000 television sets in the country. The civil war in 2000 destroyed many telecommunications buildings and equipment. All expansion was temporarily postponed during the conflict.

ECONOMIC SECTORS

While a very high proportion of the population lives in rural areas, agriculture, fishing, and hunting have contributed only about one-third of GDP in recent years, and this proportion has declined slightly since the early 1980s. In terms of formal employment, agriculture made up only 21.8 percent of the 34,000-strong labor force in 1998, although the subsistence and village **cash cropping** sector employs large numbers who are not enumerated in these surveys. Industry has shown slight growth in recent years, and made up 17.4 percent of the formal labor force in 1998. The service economy, which includes everything from domestic labor to work by skilled professionals, is the dominant sector, contributing about 40 percent of GDP, and supplying 60.8 percent of the formal labor force in 1998. The economy was devastated by the civil conflict that lasted between June and October of 2000. In the wake of the war, many major companies closed and farmers had difficulties moving their products to market. Foreign aid has helped the country weather the economic difficulties.



SOURCE: *CIA World Factbook 2000* [Online].

AGRICULTURE

AGRICULTURE. Through much of the 20th century, under British colonial rule, Solomon Islands represented a classic example of a plantation economy, with coconut production being the primary activity of both village **smallholders** (individual farmers) and large-scale expatriate (foreign) plantation owners. For village producers, the production of copra (dried flesh of coconuts) is still an important source of cash, and several large coconut plantations are still operating. As a source of export income, coconut products have steadily declined since the 1960s. During the 1990s, a number of coconut oil presses were installed in various parts of the country, and this has increased the value of this product.

For many years, government and international aid donors have sponsored initiatives to diversify the agricultural base of both smallholder and large-scale farmers by promoting the production of cocoa as a new crop. In 1998, cocoa comprised about 5 percent of export income. Also moderately successful has been the production of chilies, mostly at the village level.

In the late 1970s, large-scale rice production was established by an American company on the Guadalcanal Plains, leading to a small export trade. The industry collapsed in the next decade due to flagging domestic demand and the destruction of much of the crop in 1986 by Cyclone Namu. Production resumed in the mid-1990s on large plantations on Guadalcanal and on a smaller scale in many villages. The UN Food and Agricultural Organization estimated that 4,500 metric tons of rice were produced in 2000, up from 1,300 metric tons in 1998.

FORESTRY. Most timber exports have been of whole logs, with only about 10 percent of total production in the 1990s being milled within the country. Logging began during the British colonial period and escalated considerably after independence in 1978. It is estimated that accessible timber resources may be exhausted by about 2010 if present levels of logging continue. The rate of exploitation was a major political issue during the 1990s and into the 21st century.

FISHING. Fishing is an important activity at 3 different levels: subsistence production (production that only meets the immediate needs of the producer), small-scale cash fishing, and the large-scale offshore fishing industry. Small-scale cash fishing is most successful near urban markets, especially Honiara. Since the early 1980s, 31 fishery centers providing refrigeration and marketing services have been established throughout the country, although many of these have since failed. In the late 1990s, some centers were being renovated amidst attempts to facilitate the marketing of fish to Honiara and to Australia.

There were 2 major local fishing companies in 1999: Solomon Taiyo Ltd. (STL) and National Fisheries Development (NFD). STL has a large cannery at Noro in Western Province which produced nearly a million cases of canned tuna in 1999, about one-quarter of which was sold domestically. While domestic prices for fish remained high during the year, the world price of tuna plummeted, causing NFD to cease operations late in the year. STL closed during the period of ethnic tension, but is expected to open again.

INDUSTRY

MINING. Small-scale mining during the 20th century consisted mainly of gold-panning operations on Guadalcanal; the Gold Ridge mine in the central part of the island did not begin production until 1998. Developed by Ross Mining, this operation was expected to produce gold for about 10 years. The mine was closed down in June 2000 as ethnic tensions reached a peak. As of early 2001, the mine had not reopened, although negotiations were underway with landowners and the government about issues of compensation and security.

MANUFACTURING. Except for the production of traditional handicrafts, manufacturing has never been a major industry in Solomon Islands. In the late 1990s it contributed about 5 percent of the country's GDP. The most important manufacturing enterprises cater to the local market in such sectors as food processing, beer, furniture, construction materials, and construction of outboard canoes. Traditional handicrafts such as woodcarvings, weavings, and shell ornaments are sold to tourists or exported on a small scale.

SERVICES

TOURISM. Despite its beautiful beaches and calm lagoons, Solomon Islands has always had a relatively small tourist industry. About 12,000 people visited the islands each year, with relatively little increase until 1997–98. Although official figures are not available, the numbers of visitors dramatically fell in 1999 and 2000 as a result of ethnic tensions and the interruption of air services into the country.

Guadalcanal and the nearby islands were major battlegrounds during World War II, and in the decades after the war most tourists were returning veterans or their families, both American and Japanese. Following the end of the war, the landscape was strewn with downed airplanes, tanks, and other war material, and the beaches of Guadalcanal and some of the other islands were littered with landing craft. Much of this material has since been exported as scrap, but even in 2001 there are remnants. Both the Japanese and the Americans have constructed hilltop monuments for the many thousands of troops killed during the war. More recently the country has become a center for scuba diving and snorkeling; along with spectacular coral reefs, there are many sunken warships still intact for divers to explore. Many tourists are attracted by the great cultural diversity of the country and its traditional villages.

Tourist infrastructure is limited, with only a few international standard hotels, mostly in Honiara, although there are guesthouses in most areas. Since the mid-1990s, efforts have been made to develop **ecotourism** (nature holidays), mostly village-based but in many cases supported through international aid programs. Unlike neighboring countries such as Papua New Guinea, Vanuatu, and Fiji, the Solomon Islands has no flight and accommodation packages available to international travelers.

FINANCIAL SERVICES. The financial services sector is small and mainly serves the local market. International banks such as Westpac and ANZ are located in Honiara and 2 provincial centers. The National Bank of Solomon Islands (a joint venture between Bank of Hawaii and the local National Provident Fund) is the only commercial bank with branches in smaller towns. The Central Bank of Solomon Islands (CBSI) regulates money supply and is responsible for general economic monitoring, and the Development Bank of Solomon Islands (DBSI) offers small-scale lending for development projects.

RETAIL. The **retail** sector is not well developed. Most retail operations are in Honiara and other towns, but the range of goods is limited. Villages are served by small locally-run shops selling basics such as soap, kerosene, rice, tea, sugar, biscuits, and fishhooks, or by copra trading boats that also serve as retail outlets.

INTERNATIONAL TRADE

According to the International Monetary Fund and other sources, Solomon Islands' exports in 1999 were valued at US$116 million (a drop from US$168 million in 1995) and imports at US$110 million (a drop from US$154 million in 1995). The drop can be attributed in part to the economic crisis in Asia, which lowered demand for the logging exports of the Solomon Islands. Despite the drop in overall trade activity, Solomon Islands has had a positive **balance of trade** in recent years, a situation rare among Pacific countries. This may be attributed to high volumes of log exports during the 1990s and, to a lesser extent, the steady export of fish products.

Japan is by far the largest destination for exports, taking about one-third of all exports by value in 1999. It is also an important destination for timber products, even though companies operating in this industry are mainly Korean. The largest fishing enterprise in Solomon Islands

Trade (expressed in billions of US$): Solomon Islands

	Exports	Imports
1975	.015	.033
1980	.074	.089
1985	.070	.083
1990	.070	.091
1995	.168	.154
1998	N/A	N/A

is a subsidiary of the Japanese Taiyo Company, and many of the fish products are destined for the Japanese market. Other important export destinations for its timber and fish are Thailand and the Philippines.

Imports from Australia account for 37 percent of the total imports to Solomon Islands, making it the single largest source. The next largest import sources are Singapore, Japan, and New Zealand, which provide a variety of foodstuffs, fuels, and machinery.

MONEY

Since independence in 1978 the Solomon Islands dollar has floated freely. In 1982, its dollar was worth slightly more than the U.S. dollar (SI$.9711 to US$1), but fell to about one-fifth of the U.S. dollar by 2001 (SI$5.0745 to US$1). In the 1980s, this was partly a result of a negative trade balance, but this does not seem to have been a factor in recent years, when exports have tended to be of greater value than imports. During the 1990s, the rate of **inflation** has averaged 10.7 percent per year.

POVERTY AND WEALTH

The **United Nations Development Program**'s Human Development Indicator (HDI), which measures a country's welfare using income, education, and health statistics, ranks Solomon Islands 121st out of 174 countries. Although it ranks as the second poorest nation in the Pacific, it is better off than many African countries. Per capita GDP in 1998 was only US$753, about one-fortieth that of the United States. This is a decline from the peak figure of US$784 in 1990. Still, in most parts of Solomon Islands there is little evidence of the desperate poverty found in some parts of the Third World. Most households have sufficient food, although nutrition surveys have found some cases of malnutrition, particularly in urban areas where food is expensive.

Exchange rates: Solomon Islands

Nov 2000	5.0968
2000	5.0864
1999	4.8381
1998	4.8156
1997	3.7169
1996	3.5664

SOURCE: CIA *World Factbook 2001* [ONLINE].

Other indicators show that Solomon Islands is a poor country. Seventy percent of adults are illiterate, and only 41 percent of boys and 36 percent of girls aged 5 to 14 were enrolled in primary school in 1999. Health services have improved in recent years, but infant mortality is relatively high at 38 per 1,000, and there is only 1 doctor for every 7,292 persons.

WORKING CONDITIONS

Only about 16 percent of the working-age population participate in wage and salary employment, much of this centered in Honiara. There is far more demand for employment than there are jobs, especially for the unskilled. Wages for unskilled work are low, at SI$1.20 in agriculture and fishing and SI$1.50 in other sectors. Since many products consumed in urban areas are imported, these wages are inadequate for living well in town.

There are 2 major unions: The Solomon Islands National Union of Workers (SINUW), representing workers in the **private sector**, and Solomon Islands Public Employees Union (SIPEU), for government workers. Unions in the private sector have become weaker in recent years, possibly as a result of the surplus of potential labor; the public-sector union has been more successful in promoting the interests of its members.

COUNTRY HISTORY AND ECONOMIC DEVELOPMENT

1000 B.C. Evidence of human settlement on some islands.

140–670 A.D. Evidence of Lapita pottery culture on some islands.

1568. Spanish explorer Alvaro de Mendaña visits several islands in search of the fabled mines of King Solomon. Islands given Spanish names include Guadalcanal, Santa Isabel, San Cristobal.

1600–1700s. Explorers visit from Spain, the Netherlands, England, and France.

1800s. Regular contact between Solomon Islanders and whalers, missionaries, and traders. Labor recruitment ("blackbirding") for plantations in Fiji and Queensland. Lever's Pacific Plantations begins establishing large-scale plantations.

1893. British Solomon Islands Protectorate (BSIP) declared.

1942. Japanese invade Solomons; Allied forces counterattack.

1943. Allied forces occupy Guadalcanal in February; Japanese evacuate in December.

1940s. Rise of "Marching Rule," an indigenous movement on Malaita that advocates independence, non-payment of taxes, and return to tradition; leaders are jailed in 1948.

1978. On 7 July, Solomon Islands becomes independent; first prime minister is Peter Kenilorea.

1986. Cyclone Namu strikes; many people on Guadalcanal buried by landslides, plantations destroyed.

1990s. Escalation of ethnic tensions as vigilante groups (Guadalcanal Revolutionary Army, then Isatabu Freedom Movement) begin to drive Malaitan settlers off the land.

2000. Malaitan group (Malaita Eagle Force) takes control of Honiara in June; Townsville Peace agreement, with international monitoring, is signed in October, allowing full access to Honiara by all groups. It guarantees compensation to offended parties and mandates confiscation of weapons.

FUTURE TRENDS

There was much optimism about the economic future of Solomon Islands in the 1990s because of its wealth of timber, fish, minerals, and other resources. At the same time, there was a recognition that the timber resource was being exploited at an unsustainable rate, and that it would be only about a decade before the accessible forests were logged out. There was also some apprehension late in the 1990s about the oversupply of the global fishing infrastructure and the increasingly competitive nature of the industry in the Pacific. By 2000, ethnic tension between groups on Guadalcanal and Malaita raised fears about the survival of the nation-state. By early 2001 there was some optimism that the peace agreement of October 2000 would hold, and that the economy would eventually return to normal. However, many critical industries were still closed awaiting assurances of ongoing security. The future of the Islands' forests remains uncertain, but some efforts to improve the effects of over-fishing included sustainable harvesting of black pearls.

DEPENDENCIES

Solomon Islands has no territories or colonies.

SRI LANKA

Democratic Socialist Republic of Sri Lanka
Sri Lanka Prajathanthrika Samajavadi Janarajaya

CAPITAL: Colombo.

MONETARY UNIT: Sri Lanka rupee (R). One rupee equals 100 cents. There are coins of 1, 2, 5, 10, 25, and 50 cents, and 1, 2, 5, and 10 rupees. There are bills of 10, 20, 50, 100, 200, 500, and 1,000 rupees.

CHIEF EXPORTS: Textile and apparel, tea, gems and jewelry, coconut products, rubber and rubber-based products, and spices.

CHIEF IMPORTS: Machinery and equipment, textiles, petroleum, foodstuffs.

GROSS DOMESTIC PRODUCT: US$62.7 billion (purchasing power parity, 2000 est.).

BALANCE OF TRADE: **Exports:** US$5.2 billion (f.o.b., 2000). **Imports:** US$6.1 billion (f.o.b., 2000).

COUNTRY OVERVIEW

LOCATION AND SIZE. Sri Lanka is an island nation-state in the Indian Ocean. It is located 880 kilometers (547 miles) north of the equator, off the southern tip of India, and has a maximum length of 432 kilometers (268 miles) and a maximum width of 224 kilometers (139 miles). The island has an area of 65,610 square kilometers (25,332 square miles) and a total coastline of 1,700 kilometers (1,056 miles). Sri Lanka is slightly larger than West Virginia. Its capital, Colombo, lies on the country's western coast.

POPULATION. Sri Lanka's population was estimated at 19.24 million in 2000, indicating growth of 11.5 percent compared with the 1991 population of 17.25 million. Sri Lanka has the slowest-growing population in southern Asia—estimated at 0.9 percent yearly—and its population is projected to increase to 23.55 million by the year 2025. The density of Sri Lanka's population is fairly high, at 280 persons per square kilometer (725 per square mile). In 2000 the birth rate was estimated at 16.8 per 1,000 people and the death rate at 6.4 per 1,000 people. The majority of Sri Lanka's people live in the rural sector (67 percent), in urban areas (22 percent), and on plantation estates (11 percent). The infant mortality rate (16.5 per 1,000) and overall death rate are low for a developing country, and the average life expectancy (69 years for men and 73 years for women) is the highest in southern Asia. The low fertility rate and high life expectancy has led to a larger increase in the older population than the younger population. It took most western countries 45 to 135 years for their elderly population to double, while in Sri Lanka this process is expected to take only 2 decades. Sri Lanka is expected to have the third oldest population in Asia in 2025. The rising burden of maintaining an aged population could exert considerable restraints on the government's fiscal resources, and the need to provide retirement support income and health care will have serious consequences on the economy as a whole during the next 2 decades.

An important characteristic of the Sri Lankan population is its ethnic and cultural diversity. Approximately 74 percent of the population are Sinhalese, 12.6 percent are Sri Lankan Tamils, 5.5 percent Indian Tamils, 5 percent Muslims, and the remainder consists of Burghers, Malays, and others (2.9 percent). Among the ethnic groups, the Sinhalese were the earliest inhabitants of Sri Lanka and are descendants of the first colonists who occupied the island during the 5th century B.C. Most of them are Buddhist, and speak a language called Sinhala, derived from several Indo-Aryan languages. The Sri Lankan Tamils are the descendants of the early Dravidian invaders from southern India. They are predominantly Hindu and speak Tamil, one of the major Dravidian languages of southern India. Indian Tamils are the descendants of laborers brought by the British planters in the 19th century to work on plantations. The Muslims are the descendants of early Arab traders who settled in Sri

Lanka during the 10th century. The Burghers are the descendants of the Portuguese, Dutch, and British who occupied the island from the 16th to the mid-20th century. The Burghers are predominantly Christian and speak English as their first language.

OVERVIEW OF ECONOMY

Sri Lanka is a developing economy based largely on agriculture, services, and light industry. Agriculture accounts for approximately 21 percent of the **gross domestic product** (GDP) and employs 38 percent of the workforce. Agricultural output is divided between **cash crops** from plantation agriculture and food crops from subsistence agriculture. Cash crops—namely tea, rubber, and coconuts—are largely grown on plantations. Rice is the principal food crop and the main livelihood for over 70 percent of Sri Lanka's rural population. Manufacturing industries account for approximately 19 percent of the gross domestic product and employ about 17 percent of the workforce. Chief manufactures include textiles, ceramics, petroleum products, vegetable oils, fertilizers, and cement. The service sector is the largest of the Sri Lanka economy, employing 45 percent of the workforce and contributing roughly 60 percent of GDP. Tourism, banking, finance, and **retail** trade are the major components of the service sector.

The country is endowed with many natural resources. It has an equatorial climate with a high average rainfall. The land is fertile and suitable for growing a variety of crops, and one-third of the land is arable. Rivers cascading from the central hill country provide energy to generate hydropower, the major source of electricity in Sri Lanka. The country also has rich fishing resources. Sri Lanka's mineral resources include titanium ore, graphite, kaolin, and gemstones. It also has large deposits of unexploited iron ore.

Foreign trade is an important segment of the Sri Lankan economy. Major imports include petroleum, consumables, machinery and capital equipment, motor vehicles, and various manufactured goods. Major exports include garments, tea, rubber, coconut products, foodstuffs, gems, and jewelry. Sri Lanka is the largest exporter of black tea in the world and the third largest producer of natural rubber. A variety of gemstones, for which Sri Lanka is world famous, are also exported. Significant quantities of high-grade graphite, for which Sri Lanka is a world leader, are also exported. The industrialized countries taken together as a group accounted for 75 percent of Sri Lanka's total exports in 1999 and the United States is the largest single buyer of Sri Lanka's exports, with 39 percent in 1999. Other major export markets are the United Kingdom, Germany, Japan, Russia (tea), China (rubber), India, and the Middle East. In terms of imports, Japan is the single largest exporter to Sri Lanka. Motor vehicles, spare parts, and woven fabrics are the major items imported from Japan. India is the second largest exporter, followed by Singapore, South Korea, Taiwan, the United Kingdom, and the United States.

Sri Lanka is a mixed economy, in which both the **private sector** and the state sector engage in the production process. Foreign investments are encouraged and several **free zones** have been established. The country's banking system is well developed, so that both foreign and local banks function in the economy. Sri Lanka is committed to a free market ideology and has one of the most liberal foreign trade regimes in the world. This contrasts greatly to what the Sri Lankan economy looked like during the first 3 decades after the country gained independence from

Great Britain in 1948. The economy that evolved in Sri Lanka under British rule was predominantly oriented towards agriculture, with plantation agriculture being the major contributor to the nation's growth. The 3 plantation crops—tea, rubber, and coconuts—accounted for 30 percent of the gross domestic product in 1948 and the bulk of the output was exported. Manufacturing was an insignificant activity in the economy. Banking and commerce were, for the most part, only used to support plantation agriculture. Nearly all foreign exchange earnings were derived from the plantations. The country depended on imports for nearly three-fourths of its food requirements and almost all of its manufactured goods.

The Sri Lankan economy has since become highly diversified; it has rapidly growing manufacturing and service sectors, agricultural activities have been modernized, and the country is nearly self-sufficient in rice production. The significance of the 3 major export crops (tea, rubber, and coconuts) as the main source of export earnings has fallen (from 90 percent in the 1950s to 16 percent in 1999) and the significance of manufacturing has risen (from 1 percent of exports in 1950 to 60 percent in 1999). These changes in the structure of the Sri Lankan economy are a result of varying economic policy measures adopted by the government since independence. Development strategies that shaped the Sri Lankan economy over the last 5 decades may be distinguished under 2 eras: the first era covering the period between 1948–76, and the second era during the post-1977 period.

During the first era, development policy focused on achieving the objectives of **equity** and economic growth. The instruments adopted to achieve economic growth were aimed at **import substitution** industrialization, both in manufacturing and foodstuffs. The key measures used to achieve this growth strategy were the imposition of various restrictions on imports, and the encouragement of domestic production. Extensive social welfare programs such as price **subsidies** on food, statutory **price controls** on **consumer goods**, and the provision of free education and health services were the instruments used to achieve greater equity. The welfare programs achieved significant improvements in the area of human development, including lower mortality rates, increased life expectancy, and high literacy rates. However, high welfare expenditures restrained the nation's capital growth and ability to invest, slowing economic growth and causing high unemployment and low wages. During the 1951–1976 period, per capita gross domestic product grew only at an average of 0.2 percent per year. The achievements of the import substitution policies were even less noticeable, except in the production of rice and subsidiary food crops. With a worsening trade balance crisis, most newly established industries operated well below capacity due to a shortage of imported goods. This, coupled with increased government participation in industrial development, hindered industrial growth and the ability to remain commercially viable. The continued government intervention in all spheres of economic life reached its climax at the end of the first policy era.

The second era of Sri Lankan economic development (post-1977) marked a shift towards a free market economy. The strategy aimed at **liberalizing** the economy from excessive government controls and it chose the private sector as the engine of growth. Policies were designed to accelerate economic growth by stimulating private investment through various incentives and also to increase the country's foreign earnings by promoting export-oriented economic activities. The liberalization policies, pursued under the watchful eye and participation of the International Monetary Fund and the World Bank, met with success at the beginning. Stimulated by enhanced levels of foreign aid and investment, the economy was successful, recording real growth rates of about 6 percent per year until 1986. During the following 5 years, however, there was a marked deceleration of growth caused mainly by the disruptive effects of the ethnic conflict on economic activities. Gross domestic product grew at an annual average of 2.7 percent between 1986–1989, and at an annual average of 5 percent between 1990–2000. During the second era, the level of income in the economy grew significantly with per capita gross domestic product more than doubling (from US$382 in 1975 to US$802 by 2000).

The transition to a free market economy based on a liberalized trade and **exchange rate** regime has brought benefits to the Sri Lankan economy. Unemployment, a problem for decades, has reduced significantly, and remains at historically low levels (8 percent in 2000). Nonetheless, the high levels of **inflation**, fueled by the sharp deterioration of the Sri Lankan currency, combined with the mounting cost of civil war has raised the cost of living to very high levels. The soaring cost of living has made many Sri Lankans struggle to satisfy their basic needs. Over 45 percent of the population depends on benefits under the income supplement programs initiated by the government. The **balance of payments** problem remains unresolved. The persistent **trade deficit** has led to increased reliance on foreign aid to meet the country's import requirements, leading to an inevitably mounting **foreign debt**. Foreign debt as a percentage of the gross domestic product, which accounted for 21 percent in 1975, grew to 75 percent in 1994, and amounted to 59 percent in 1999.

POLITICS, GOVERNMENT, AND TAXATION

When Sri Lanka obtained its independence from Britain in 1948 it had an educated electorate conscious

of its voting rights and the concept of majority rule. The judiciary was respected and the rule of law was well established. The political party system was also established with the United National Party (UNP) as the foremost party of the time. Sri Lanka also had a written constitution incorporating some of the principles of the British Westminster system of government. There is a **unicameral** Parliament with 225 members elected to 6-year terms. The president is popularly elected to a 6-year term and is the chief executive.

The UNP was in power for 8 years until it lost the 1956 election to Sirimavo Bandaranaike. His Sri Lanka Freedom Party (SLFP)-led coalition swept into power on the promise to make Sinhala the national language. This created disquiet among minorities, especially among Tamils. Tamil leaders opposed the introduction of Sinhala as the official language because they wanted to speak Tamil; their opposition soon led to violence. The seeds of the separatist war in Sri Lanka can be traced to incidents that occurred in 1958. But the conflict grew into a large-scale military confrontation only after 1983, when a group of Liberation Tigers of Tamil Elam (LTTE) followers ambushed Sinhalese troops. The LTTE, who are the Tamil protagonists of the war, have used terrorist methods to finance and promote their cause. They have assassinated moderate Tamil leaders, including President Premadasa, and several Sri Lankan ministers and party leaders. They also killed Indian prime minister Rajiv Gandhi because he withdrew his support of the LTTE.

Another serious problem was the emergence of a Sinhalese youth revolutionary party called the JVP, which staged an armed insurrection in 1971, lasting for 2 years and followed by 3 years of sporadic outbursts. The JVP resurrected itself in the late 1980s with a subtle form of urban terrorism, but it was brought under control by a ruthless program of suppression by the government. Both the LTTE and the JVP have been serious impediments to steady economic growth in Sri Lanka. However, Sri Lanka has been endowed with a very strong democratic tradition which has managed to survive these major conflicts, even during periods of poor economic management.

The 2 dominant parties during 50 years of independence have been the UNP (conservative) and the SLFP (**socialist**-left, and more recently center-left). The 2 political parties have alternated in positions of power for half a century, with the UNP heading the government from 1948 to 1956, 1965 to 1970, and 1977 to 1994. An SLFP-led coalition government was in power from 1956 to 1965, 1970 to 1977, and since 1994 as a coalition called the Peoples Alliance (PA).

The Sri Lankan government epitomizes a classic democratic 2-party political system in operation. The UNP regimes during the period 1948 to 1970 placed emphasis on private sector participation with several ongoing subsidized programs such as free education, free health care, village land settlement, and colonization. The SLFP regimes continued the welfare programs and moved increasingly to public ownership and **nationalization** with limited private sector participation. In the early and the mid-1970s, they placed strict restrictions on imports and currency movement.

In 1977 the UNP government came into power and decided to run an open economy with few restrictions. The private sector became the main engine of growth. The rupee was devalued by 46 percent from its former artificial value. This immediately stimulated growth and received the backing and financial support of the World Bank. This UNP government lasted for 17 years. When the SLFP-led coalition known as the Peoples Alliance was elected to government in 1994, it accepted the importance of this open market economy as a positive growth strategy for the country.

A short time before the end of the first term of the Peoples Alliance in 2000, the LTTE attempted to assassinate the president of Sri Lanka, Chandrika Bandaranaike Kumarathunga. The bomb caused damage to one eye but she survived, and her party was elected for a second term. The PA has had a very difficult period in government because of the financial and political pressures generated by the escalation of the armed conflict with the LTTE. The election itself generated a degree of conflict never experienced before in Sri Lankan politics, but democracy survived as it had in every one of the elections held after 1948.

TAXATION AND REVENUE. The major source of government revenue in Sri Lanka is taxes (86 percent). However, unlike the United States, the contribution of **income taxes** to government revenue is negligible, at 13 percent, while **indirect taxes** dominate government revenue. There are 3 major sources of indirect taxes: the goods and services tax (GST), **excise tax**, and the national security **levy** (NSL). The GST is a recent addition to the tax system (introduced in April 1998), replacing the business **turnover** tax. The GST is levied on a **value-added** basis at a uniform rate of 12.5 percent with full credit given to all inputs. GST revenue accounted for 26 percent of the total tax revenues in 2000. An excise tax, which contributed 23 percent of the total tax revenue during the same period, is levied mainly on liquor, tobacco, petroleum, and motor vehicles. The third important source of government revenue, the NSL, was initially introduced as an interim measure to finance the rising cost of war in the north and the east. It has become an important contributor to national tax revenue, contributing 17.5 percent. The NSL is levied at a rate of 6.5 percent. Taxes on international trade account for 16 percent of the total tax revenue. With the liberalization of trade and **restructur-**

ing of the **tariff** regime, which began in the late 1980s, revenue from taxes on foreign trade has been declining.

The personal income tax (PIT) rate in Sri Lanka has 4 brackets, ranging from 10 percent to 35 percent. The PIT's contribution to the government tax revenue is small (about 1 percent of gross domestic product) and is lower than most other countries. The economy's high dependence on subsistence agriculture, low levels of income and tax compliance, and inefficient tax administration are the key contributors to low levels of PIT revenue. The corporate income tax (CIT) in Sri Lanka of 35 percent (flat rate) is relatively modest and is similar to the rates in other Asian economies. However, the CIT tax yield in Sri Lanka is quite low, as many firms are offered tax incentives to encourage investment.

INFRASTRUCTURE, POWER, AND COMMUNICATIONS

Sri Lanka has a well-developed transport system, including a road network of approximately 100,000 kilometers (62,140 miles). A rail network consisting of about 1,944 kilometers (1,208 miles) of tracks links Colombo with the rest of the country. Road networks are under severe strain due to the rapid increase in the number of vehicles since the 1980s. The number of registered vehicles nearly tripled from 478,000 in the mid-1980s to 1.38 million in 2000, generating severe traffic congestion. With a rising number of vehicles, and the need for a more efficient road network to facilitate the movements of goods and services, the government is actively engaged in improving, rehabilitating, and extending the existing network.

Sri Lanka has 14 airfields, the largest of which is the Katunayake International Airport, the principal gateway to Sri Lanka. The country is serviced by 32 airlines, both domestic and foreign, and the national carrier, SriLankan Airlines, handles about 56 percent of international passengers to and from Sri Lanka. It has scheduled operations to 35 destinations in 26 countries covering Australia, the Indian subcontinent, the Far East, Europe, and the Middle East. The Sri Lanka Ports Authority (SLPA) is responsible for operating the ports. The SLPA operates 4 major ports in Colombo, Galle (in the south), Trincomalee (in the east), and Kankasanturai (in the north). In addition, limited shipping facilities are provided by the Ceylon Shipping Corporation and by several private sector shipping companies. A major restructuring of the cargo handling facilities in Colombo port is now taking place in conjunction with the British PNO company.

Hydropower is the major source of electricity, accounting for 66 percent of the nation's electricity supply. One of the main sources of hydropower is the gigantic Mahaweli Scheme, which has harnessed the flow of Sri Lanka's longest river in several stages. The remainder is generated through thermal power (34 percent) and most recently, wind power. Electricity generation and distribution has traditionally been a government **monopoly**. However, the private sector has become much more involved in power generation during the past decades.

Telecommunications is the fastest growing sector in the country. During the first half of 2000, the telecommunications sector grew by 11 percent. Sri Lanka Telecom Ltd. (SLT) is the major supplier; its network provided 44,228 new telephone connections during the first half of 2000, with total network subscriptions of 621,394. The demand for telephones is growing much faster than supply: at the end of June 2000, there were 246,560 applicants on the waiting list. To meet rising demand the SLT is expanding its capacity with assistance from international donors. In addition to the SLT subscriber network, there are 4 cellular phone operators with a subscription of 307,027. Other service providers include wireless local loop telephones (2 operators with 101,093 subscribers), data communication services such as Internet and e-mail (15 operators with 32,633 subscribers), and public phones (6 operators with 7,491 public phone booths).

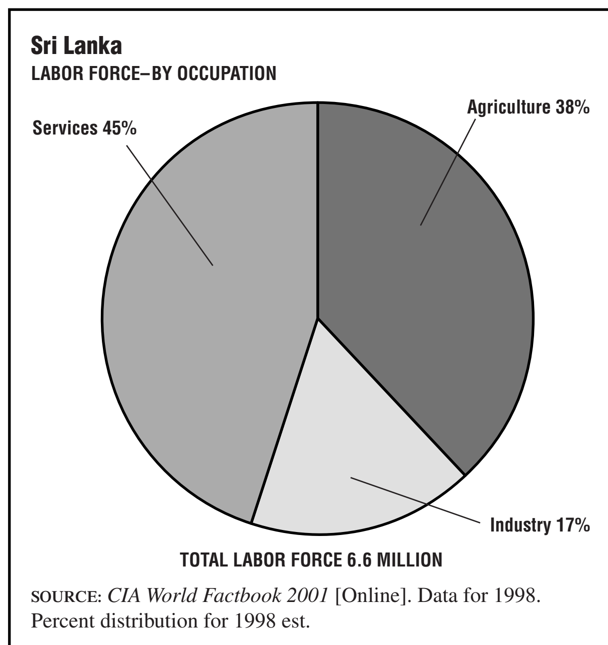
ECONOMIC SECTORS

The changing structure of the economy mirrored in the relative contribution of the key industrial sectors reflect the country's potential to realize substantial growth. It also reflects the transition of the agriculture-dominated economy to a more diversified one with growing industrial and modern service sectors. In 1950, agriculture accounted for half the gross domestic product and by the year 2000, its significance was reduced to one-fifth of the gross domestic product. The contribution of industry more than doubled from about 11 percent to 19 percent while the service sector expanded significantly from 39 percent to 60 percent during the same period. Sri Lanka is rich in resources, both natural and human. It has several unexploited mineral resources (such as iron ore) and underexploited mineral and fisheries resources with substantial potential for future growth. Another area with substantial growth potential is tourism, which is interrupted by the prolonged civil unrest in the economy.



SOURCE: *CIA World Factbook 2001* [Online]. Data for 1998. Percent distribution for 1998 est.

AGRICULTURE

Agriculture is the most important sector of the Sri Lankan economy. Even though its contribution to the gross domestic product declined substantially during the past 3 decades (from 30 percent in 1970 to 21 percent in 2000), it is the most important source of employment for the majority of the Sri Lankan workforce. Approximately 38 percent of the total **labor force** was engaged in agriculture in 1999. In the subsistence sector, rice is the main crop and farming rice is the most important economic activity for the majority of the people living in rural areas. During the last 5 decades the rice sector grew rapidly and output more than tripled, reaching the highest ever output of 2.9 million metric tons in 1999. Increases in the area under cultivation, and improved productivity due to the modernization of agriculture are the main reasons for an increase in production. The rehabilitation of Sri Lanka's extensive ancient irrigation network and massive new investment in construction and maintenance of irrigation **infrastructure** led to a large increase in the area under rice cultivation. Between 1960–2000, the area used to grow rice increased 6 times to 546,249 hectares. The modernization of farming methods, such as the use of high-yielding seeds, tractors, and chemical fertilizers also led to increased productivity in the rice sector. Between 1960–1999, rice yield per hectare doubled from 1,877 kilograms to 3,672 kilograms. In addition to rice, various other food crops are produced for local consumption. They include yams, pulses, grains, vegetables, and fruits. Most of these crops are cultivated in family gardens, except for potatoes and sugar. Sugar cane is cultivated in the dry zone, and Sri Lanka produces only 15 percent of what it consumes domestically.

The major plantation crops of tea, rubber, and coconuts continue to figure prominently in the economy of Sri Lanka; however, the contribution of these commercial crops to gross domestic product declined from 11.5 percent in 1970 to 5 percent in 2000. Tea, the prominent crop of the plantation sector, grows in many parts of the wet zone, and in particular in the central hill country. Sri Lanka is famous for its high quality black tea, and is the largest supplier in the world. In 1999, 269.3 million kilograms of tea (95 percent of total tea production) was exported, earning US$621 million in foreign exchange. The

United Kingdom, Russia, and the Middle East are the major export markets.

The second major commercial crop is rubber, growing in the ridge and valley country of the wet zone interior. Of 159,000 hectares under cultivation, about 80 percent was being tapped (harvested) and in 1999, 96.6 million kilograms of rubber were produced. A sizable proportion of rubber production is used in the domestic manufacturing sector (56 percent in 1999) and the remainder is exported. In 1999 export earnings amounted to US$33 million. China is traditionally the major buyer of Sri Lankan rubber. The performance of this sector has been subject to instability due to unfavorable movements in world prices. Competition from synthetic rubber producers has caused rubber prices to drop. However, with rising petroleum prices (the major ingredient for synthetic rubber) there is a chance for world rubber prices to improve.

The third commercial crop, coconuts, is grown mainly in the hinterland of the western seaboard. Production in 1999 accounted for 2,828 million nuts, the highest output since 1986. Coconut (mainly coconut milk) is a major ingredient used in food preparation in Sri Lanka, and nearly 65 percent of the output is consumed locally. The remainder is exported in the form of kernel products (desiccated coconut, coconut oil, copra), coconut cream, and coconut milk powder. In 1999, kernel products generated US$129 million in foreign exchange.

Forestry and fishing are less important components of the economy. Forests in the dry zone were cleared for settlement and agriculture early on. Unsustainable agricultural practices such as chena cultivation and logging resulted in land degradation and a reduction in the size of forest reserves. The country has abundant fishing resources, with an **exclusive economic zone** covering over 500,000 square kilometers (193,050 miles), a coastline of about 1,700 kilometers (1,056 miles), and a massive network of inland water reservoirs suitable for fish farming. However, this potential has not yet been exploited. Most marine fishing is concentrated in coastal areas, which account for about 12 percent of the exclusive economic zone. Total fish production in 1999 was estimated at 280 thousand metric tons, and the contribution of this activity to gross domestic product was about 3 percent in 1999. Fishing is a traditional livelihood for people living in coastal areas: in 1999 about 145,000 people were employed in fishing activities. A slow-growing sector, fish production increased at an annual average of only about 3 percent between 1992 and 1999. Poor production is mainly due to a lack of technical knowledge and equipment.

The livestock sector in Sri Lanka is small, consisting mainly of the dairy and the poultry subsections. Unlike in the United States, where dairy production takes place on large farms, in Sri Lanka dairy farming is a small-scale domestic activity. Total milk production in 1999 accounted for 342 million liters, sufficient only to meet about one-fourth of local needs. The remainder is imported in the form of powdered milk (in 1999, 54,000 metric tons of milk powder was imported). An important development in the livestock sector was the rapid increase in the poultry production. In 1999 approximately 57 million metric tons of poultry meat was produced, increasingly becoming a common source of animal protein in Sri Lanka.

INDUSTRY

INDUSTRY. Manufacturing accounts for 16 percent of the gross domestic product and employs nearly 400,000 people. The textile industry is the largest of Sri Lanka's industries, contributing 63 percent to industrial sector growth (1999). Other major manufacturing industries include processed diamonds, food and beverages, light engineering, chemicals, petroleum, rubber and plastics, and machinery and equipment. The manufacturing sector that evolved under the import substitution development strategy in the 1960s to cater mainly to the domestic market has transformed into a sector catering to the foreign market. Much of the industrial output is exported and it is the single major export earner in the economy (in 1999, industrial exports accounted for 54 percent of total export earnings). This remarkable achievement is attributable to the policy reforms introduced during the post-1977 period. Under the reforms, the private sector was encouraged to participate in export-oriented industries through various incentives, and several free zones were established. This resulted in a significant inflow of foreign investment; the private sector emerged as the major contributor to industrial output. Overall, market-oriented policy reforms introduced during the post-1977 period have led to far-reaching changes in the structure and performance of the manufacturing sector.

MINING. Mining is a minor economic activity contributing about 2 percent of the gross domestic product (1999). The country's mineral extraction industries include the mining of gemstones and graphite; excavation of beach sands containing ilmenite and monazite; and quarrying quartz sand, clay, and salt. Gem mining is traditionally the most important activity, producing high value gemstones such as sapphire, ruby, and topaz, and a variety of semiprecious stones, most of which are exported. Sri Lanka leads the world in high-grade graphite mining.

SERVICES

TRADE. Wholesale and retail trade, the largest subcategory in the service sector, accounts for about 21 percent of the gross domestic product (1999) and employs about 22 percent of the workforce (2000). With the lift-

ing of import controls and the government monopoly in the importation and distribution of essential consumer goods during the post-1977 period, the trade sector expanded rapidly. Domestic trade accounts for half the value of the trade sector. Increased participation by foreign firms in domestic trade in Sri Lanka is a relatively recent phenomenon, with international food franchises such as McDonald's and Pizza Hut in operation. Numerous small outlets including street stalls serve the retail trade, and in the major cities there are large shopping centers and supermarkets.

FINANCIAL SERVICES. Banking, insurance, and real estate accounted for 8 percent of gross domestic product in 2000. This sector expanded rapidly following the 1977 policy reforms that dismantled the virtual government monopoly in the insurance industry and lifted the restrictions in the banking industry. The increased incentives for the private sector led to the emergence of several new insurance companies and banks. A total of 6 new local banks were established and 11 foreign banks opened branches. The banking system consists of 11 local and 16 foreign banks. Two development finance institutions and several merchant and investment banks are also active participants in the financial markets in Sri Lanka. In addition, 22 financial institutions providing credit facilities are in operation. The Sri Lankan financial system comes under the regulation of the Central Bank of Sri Lanka, which is the monetary authority of the country.

TOURISM. Tourism is an important activity with potential for growth. The country known as the paradise in the Indian Ocean offers a diversity of environments and tourist attractions, from tropical beaches and arid lands to lush forests, tea plantations, and a rich archaeological heritage. Promotion of tourism in Sri Lanka began in the late 1960s with the establishment of the Ceylon Tourist Board. Between 1976 and 1982, the number of tourist arrivals grew rapidly at an annual average rate of almost 24 percent, reaching a peak of 407,230 before declining to 337,342 in 1983 as a result of the civil unrest in the country. As the political violence in the country intensified, international tourist arrivals continued to fluctuate with a general trend of decline. Tourist arrivals increased to 436,440 in 1999. Tourism generates US$275 million in foreign exchange annually and employs approximately 87,600 workers. The majority of tourists to Sri Lanka come from Western Europe (65 percent), Asia (26 percent), and North America (5 percent).

INTERNATIONAL TRADE

One feature of the Sri Lankan economy, both in the past and present, is the high dependency on foreign trade. The country's dependency on trade, measured by the Trade Dependency Ratio (TDR), defined as the ratio of the sum of exports and imports to gross domestic product, stood at 66 in 1999 compared with a TDR of 33 for the period 1970–1977. In 2000 exports stood at US$5.2 billion while imports stood at US$6.1 billion. The changing degree of trade dependency evident in the post-liberalization era has been accompanied by significant changes in the structure of Sri Lankan foreign trade. The dominance of tea, rubber, and coconuts, which accounted for 74 percent of the total exports in 1977, had fallen to 21 percent in 1999. Industrial exports have become the major contributor to export earnings with their share rising from 14 percent to 76 percent during the same period. Of industrial exports, textiles and garments are the leading sub-category, contributing 68 percent to total industrial exports in 1999. The balance consisted of machinery and equipment (6 percent), rubber-based products (5 percent), travel goods and processed diamonds (4 percent each), petroleum products and footwear (2 percent each), crustaceans and mollusks and ceramic products (1 percent each), and other industrial products (7 percent). Despite the changes in the structure of exports, tea continues to be the leading export with a share of 65 percent of total agricultural exports while textiles dominate the industrial exports with a share of 67 percent of the total industrial exports.

Trade (expressed in billions of US$): Sri Lanka

	Exports	Imports
1975	.603	.816
1980	1.067	2.037
1985	1.293	1.843
1990	1.983	2.685
1995	3.798	5.185
1998	4.732	5.917

SOURCE: International Monetary Fund. *International Financial Statistics Yearbook 1999.*

Intermediate goods dominate Sri Lanka's imports (51 percent of total imports), followed by investment goods (27 percent), and consumer goods (21 percent). This is in contrast to the composition of imports in the pre-liberalization era, which was dominated by consumer goods (50 percent of total imports in 1977), followed by intermediate goods (36 percent), and investment goods (12 percent). Rice, flour, and sugar dominated consumer goods in the past, accounting for 80 percent of total consumer goods imported. Their significance, however, fell to 21 percent in 1999. This changing structure of imports reflects the new economic environment resulting from the economic reforms introduced in 1977. The improvement in the domestic supply of rice and other food items helped to limit food imports. The expansion in the in-

dustrial sector resulted in higher imports of intermediate goods. Developments in infrastructure facilities, construction and the transport sector, combined with increased use of advanced technology, increased the import of investment goods.

The destination of Sri Lankan foreign trade also has changed. The United States has become the single most important trading partner, and has continued to be the largest single buyer of Sri Lanka's exports (accounting for 39 percent of exports in 1999). Garment exports accounted for 74 percent of total exports in 1999. The United Kingdom accounted for 13 percent, while Germany accounted for 5 percent of Sri Lanka's exports. On average, one-third of the Sri Lankan imports come from the industrial countries. Japan is the largest source of imports to Sri Lanka, with 10 percent in 1999. Motor vehicles, spare parts, and woven fabrics are the major items imported from Japan. India is the second largest exporter (with 9 percent), followed by Hong Kong and Singapore (8 percent each), South Korea (6 percent), Taiwan, the United Kingdom, and the United States. Wheat, gold, agricultural equipment, and textiles are among the major items imported from the United Kingdom, while wheat accounted for 31 percent of imports from the United States. Textiles, tools and accessories for the garment industry, and fruits are the other major items imported from the United States.

Sri Lanka's trade with the rest of the world has changed in terms of composition, direction, and volume. However, the country has not been able to solve its fundamental problem, the unfavorable trade balance. As exports continued to grow, so did imports. Despite the persistent unfavorable trade balance, the country has managed to maintain its import levels with foreign assistance, capital flows, and an important and growing source of foreign exchange: **remittances** by Sri Lankan migrant workers in the Middle East. Prior to 1977 policy reforms, the fortunes of Sri Lankan exports depended primarily on the movements of world prices for the 3 major export commodities. While the export sector has diversified, the dependence on trade has also increased markedly. As the country's trade relations with industrialized countries rises, the Sri Lankan economy is vulnerable not only to changes in price levels of the major exports, but also to fluctuations in the levels of economic activity in industrialized countries.

MONEY

With the liberalization of the foreign **exchange rate regime** in 1977, which changed from a **fixed exchange rate** regime to a flexible one, the value of the Sri Lankan currency has continued to fall against major currencies. The Sri Lanka rupee (R) which was 16.5 per U.S. dollar in 1980 fell to R40 per dollar by 1990, and collapsed to R85 in 2001. With the high dependence on imports, the falling value of the currency means that the prices of imports continue to rise, pushing up domestic inflation.

Sri Lanka has an active stock market, the Colombo Stock Exchange (CSE), the origin of which dates back to the 19th century. Share trading in Sri Lanka began in 1886 when the Colombo Brokers Association commenced the trading of shares in limited liability companies. Share trading grew since then and Colombo had a very active share market throughout the 20th century except during the 1960s and 1970s where a spate of nationalization, including the insurance companies and plantations, effectively reduced the trading to insignificant proportions. This decline was short lived, and the stock market recovered quickly following the policy reforms introduced in the latter part of 1970s, which created free and open market ideals where the private sector was given the key role in economic activities. Today the exchange has 238 companies listed with a **market capitalization** of approximately 10 percent of gross domestic product.

POVERTY AND WEALTH

The wealthy, representing those engaged in commerce and industry, are largely concentrated in urban areas, while the poorest live on plantations and in rural areas. While the rich live in luxury, many urban poor live

in shanty houses with no sanitary facilities. The urban poor in Sri Lanka are found mainly in the capital, Colombo. The majority of the Sri Lankan population live in rural areas, and the major source of wealth among them is land. Landlessness and unequal distribution of land are key determinants of rural poverty. Those living on plantations are laborers with no access to land ownership or alternative employment opportunities. They live in substandard houses supplied by the owners of plantations. A fourth group of poor, those displaced by the continuing war in the north and east, live in various refugee camps with no access to any amenity or opportunities.

The overall degree of disparity in wealth is reflected in the distribution of incomes. The wealthiest 20 percent of the population account for over 52 percent of the nation's income while the poorest 10 percent account for only 2 percent. Disparities in wealth have risen steadily during the post-1977 period, a result of policy reforms that paved the way for more wealth generation through the increased participation of the private sector. An important byproduct of the policy reforms was the soaring inflation induced by the falling value of Sri Lankan currency, raising the cost of living of the poor disproportionately. Meeting basic needs is a struggle to the poor, because average Sri Lankans spend over 40 percent of their income on food alone. Rising poverty has led to considerable social unrest; strikes in work places and protest rallies are common occurrences. The government maintains several subsidy programs to improve the position of the poor. Over 45 percent of the population benefits from one such income supplementary program called Samurdhi. Another, the dry ration program, is aimed at helping displaced families of the north and east due to the continuing civil war. International agencies such as the World Bank and Asian Development Bank have sought to help Sri Lanka reduce poverty. Several funded projects have directly targeted the poorest segments of the population. Despite low per capita income levels, and high levels of the incidence of poverty, the quality of life in Sri Lanka is relatively high when compared with its neighbor, India.

WORKING CONDITIONS

According to the Department of Census and Statistics, the labor force in Sri Lanka is about 7 million and the total number of employed persons is 6.5 million. The unemployment rate is at around 8 percent (2000). While the overall unemployment rate is lower than in the past (which was about 15 percent in 1992), unemployment among youth is relatively high. Around 22.5 percent of the youth of age between 15 and 19 were unemployed and 15 percent in the age group 20 to 29. Of the total workforce, 66.5 percent are males and 33.5 percent are females. Women play an important role in the economic life of Sri Lanka. The largest concentration of women in professions is in the areas of teaching, nursing, and clerical work. In the plantation industry, women make up 68 percent of the workforce and, in the garment industry, about 90 percent of the workforce.

The basic minimum age for employment in Sri Lanka is 15 years, and the government has enforced laws to prevent child labor. The forced or bonded labor of children is prohibited. Despite the laws governing child labor, underage children work as street vendors and hold menial jobs in tile factories, coir-making operations,

fishing, and in domestic service. Poverty leads most of these children to work. According to a government study, about 60 percent of the employed children are secondary income earners, contributing as much as 30–40 percent of household income.

The constitution of Sri Lanka guarantees the right of workers to organize and establish labor or trade unions, except those employed by the security forces and members of the judiciary. All public and private sector employees possess the right to bargain collectively. The Department of Labor provides conciliation and arbitration services to resolve labor disputes. Although trade union freedom is substantial, it has been subject to periodic modification or curtailment during times of political strife. In Sri Lanka, there is no universal basic minimum wage, and the minimum wages differ from industry to industry. Sector-specific minimum wages are set by wage boards. There are about 39 wage boards, which set minimum wages for more than 100 occupations in industry, commerce, services, and agriculture. Remuneration tribunals also set minimum wages in some cases.

In Sri Lanka, working conditions and workers' rights are well protected by legislation. However, disruptions in the workplace are common. In recent years there were a number of labor actions such as strikes and protests. The rising cost of living has driven many workers to demand higher wages. There are instances where even those in the medical profession have gone on strike for higher wages. Because of the inability of most workers to make ends meet, many Sri Lankans seek employment abroad. The total number of Sri Lankan workers abroad was estimated to be around 788,000 in 1999, of whom nearly 90 percent are employed in the Middle East.

COUNTRY HISTORY AND ECONOMIC DEVELOPMENT

427 B.C. The legendary Sinhalese Prince Vijaya colonizes the north-central part of Sri Lanka.

250 B.C. The king of Anuradhapura, Devanpiya Tissa, embraces Buddhism.

210 B.C. Sinhala kingdom is invaded by Cholas from southern India and Elara becomes king.

161 B.C. King Dutthagamini defeats Elara and reestablishes Sinhala rule.

1055. Sinhala kingdom moves its capital to Polonnaruwa under King Vijayabahu I.

1232–1815. Sinhala kingdom moves south.

1371–1408. Dambadeniyan, Gampolan, and Kotten kingdoms.

1469–1815. Kandyan kingdom.

1521–1581. Sitawakan kingdom.

1505. The Portuguese capture the coastal belt and rule it until the Dutch oust them.

1658. The Dutch capture coastal areas.

1659. The British regain the coastal areas, displacing the Dutch.

1660. The British are invited by the Kandyan chiefs to usurp the king, gaining control. They maintain a colony in Sri Lanka until the 20th century.

1948. Sri Lanka gains political independence from the British on 4th February.

1948. The UNP is elected in Ceylon under the leadership of D. S. Senanayake.

1956. A coalition of parties (MEP) led by S. W. R. D. Bandaranaike is elected.

1959. The SLFP leader is assassinated and his widow becomes prime minister in 1960.

1965. The UNP regains power under the leadership of Dudley Senanayake.

1971. Sri Lanka becomes a republic, but retains membership in the British Commonwealth.

1977. The UNP, under the leadership of J. R. Jayawardane, comes to power.

1978. Jayawardane becomes the first president of Sri Lanka. Liberalization reforms begin.

1979. Riots in response to the ambush and killing of 13 Singhalese soldiers by Tamil Tigers.

1980. Military action launched against the Tamil Tigers, with help from India.

1981. R. Premadasa becomes the second president of Sri Lanka.

1993. Premadasa's authoritarian rule ends as he becomes a victim of the LTTE.

1994. Chandrika Bandaranaike Kumaratunga and the Peoples Alliance gain political power.

2000. Kumaratunga wins a second term as president.

FUTURE TRENDS

Since independence, despite low levels of per capita income, Sri Lanka has achieved an impressive human development record, with many of Sri Lanka's social indicators comparing favorably to those of more advanced economies. The country has broken away from a **public-sector**-dominated, highly regulated economic system and has laid the foundation for dynamic growth based on a

free market, liberalized trade and exchange rates, and **deregulated** foreign investment. This transition has led to rapid economic growth, a significant reduction in the level of unemployment, and a rise in the level of per capita income. However, the impressive growth of the economy evident during the 1977–1982 period has generated increasing economic inequality. The soaring inflation fueled by the deterioration of the value of the Sri Lankan currency has worsened the relative position of the poor. Despite the reduced levels of unemployment and the increased opportunities, nearly half of the population depends on government subsidies to meet their basic needs. The balance of payments, a fundamental problem of the economy that has persisted since the 1950s, has continued to worsen. Mounting foreign debt and the **debt servicing** obligations has added further burden to the already critical balance of payments.

The slowdown in the pace of economic growth over the last 2 decades, coupled with the rising costs of the civil war, seriously threatens the economy's ability to meet the challenges and changing socioeconomic needs of its population. With a rapidly aging population, the need for more resources to provide health care and income support will exert considerable pressure on the government's fiscal resources and the tax system during the coming decades. The solutions to most of the burning problems, and those bound to emerge in the near future, lie in the country's ability to achieve sustained levels of long-term economic growth. The continuing civil conflict poses the biggest obstacle to the country's growth prospects. The need for an immediate solution to the 18-year-old civil war is imperative. Given that the Sri Lankan economy managed to realize an average growth rate of about 5 percent during the last decade in spite of severe interruptions caused by the civil war, lasting peace would undoubtedly bring prosperity to the nation.

DEPENDENCIES

Sri Lanka has no territories or colonies.

SYRIA

Syrian Arab Republic
Al-Jumhuriyah al-'Arabiyah as-Suriyah

CAPITAL: Damascus.

MONETARY UNIT: Syrian Pound (S£). One Syrian pound equals 100 piasters. There are coins of 25 and 50 piasters and 1 Syrian pound. There are notes of 1, 5, 10, 25, 50, 100, and 500 Syrian pounds.

CHIEF EXPORTS: Petroleum, textiles, manufactured goods, fruits and vegetables, raw cotton, live sheep, phosphates.

CHIEF IMPORTS: Machinery and equipment, foodstuffs/animals, metal and metal products, textiles, chemicals.

GROSS DOMESTIC PRODUCT: US$50.9 billion (2000 est.).

BALANCE OF TRADE: **Exports:** US$4.8 billion (f.o.b., 2000). **Imports:** US$3.5 billion (f.o.b., 2000).

COUNTRY OVERVIEW

LOCATION AND SIZE. Syria, a Middle Eastern country, is located on the east coast of the Mediterranean Sea. It is bounded by Turkey to the north, by Iraq to the east and southeast, by Jordan to the south, and by Lebanon and Israel to the southwest. Syria has an area of 185,180 square kilometers (71,500 square miles), including 1,295 square kilometers (500 square miles) of territory in the Golan Heights captured by Israel in the Six Day War of 1967. There are 2,253 kilometers (1,400 miles) of boundary length, with a coastline of 193 kilometers (120 miles). The area occupied by Syria is slightly larger than the state of North Dakota. The capital city, Damascus, is located on the Barada River in southwest Syria. Other major cities, Latakia and Aleppo, are situated on the Mediterranean coast in the west and in northern Syria, respectively.

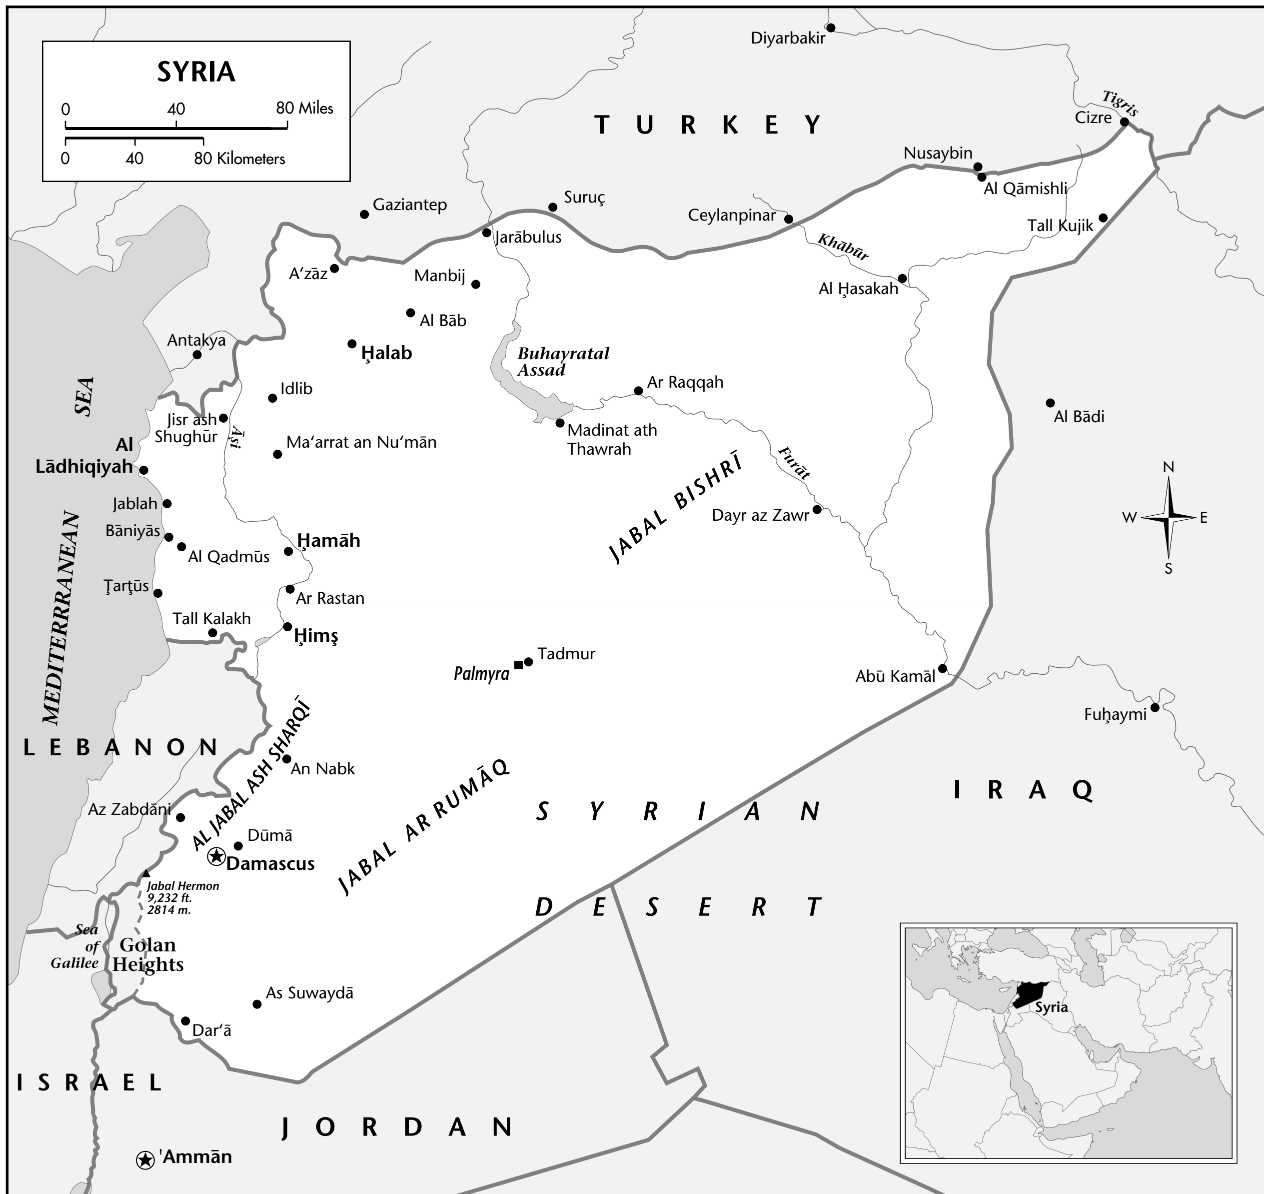
POPULATION. The population of Syria was estimated at 16,305,659 in July 2000, an increase of 3.4 percent from the 1990 population of 12,116,000. In addition, there are about 38,200 people living in the Israeli-controlled Golan Heights (excluding nearly 20,000 Israeli settlers). Syria has one of the highest population growth rates in the world. Over the last decade, however, Syria's population growth rate has gradually decreased from 3.30 percent in 1990 to approximately 2.58 percent in 2000. Despite the steady decline in its growth rate, the population is expected to reach 20.9 million by the year 2010.

Syrians are divided along profound ethnic and sectarian (groups divided by politics, language, and religion) cleavages. Arabs constitute the major ethnic group with 90.3 percent, while other minority groups such as Kurds, Armenians, Turcomans, and Assyrians make up the remaining 9.7 percent of the population. Sectarian divisions include Sunni Muslims (about 74 percent), Alawites (an extreme Shi'ite subsect), Druze (a secret Middle-Eastern sect and doctrine combining different Islamic, Jewish, and Christian elements), and other Muslim sects (about 16 percent). The Christian population in Syria is small (about 10 percent), and Jews number only a few thousand.

Syria's population is overwhelmingly young, with 41 percent below the age of 15 and only 3 percent older than 65. The urban-rural population ratio has been reversed over the last decade in favor of the urban population, which increased at a rate of 4.1 percent from 49.4 percent in 1988 to 53.5 in 1998. Because of this trend, major cities like Damascus, Latakia, and Aleppo have become the main venue of rural **emigration** within the country.

OVERVIEW OF ECONOMY

According to the World Bank, in 2000 the Syrian economy was classified as a low middle-income economy with a **gross national product** (GNP) per capita of about US$1,000. Although it does not possess the extensive natural resources of its richer neighbors, Syria was able to sustain one of the most integrated and productive economies in the region for several decades after gaining



its independence in 1946. Following unification with Gamal Abdel Nasser's Egypt under the United Arab Republic and the rise of the Ba'ath Party, however, **socialism** became the official economic policy in 1958. Although Syria left the United Arab Republic in 1961, government-sponsored land reforms and the **nationalization** of major industries and foreign investments had confirmed the new socialist direction of Syria's economic policy by the mid-1960s.

During the 1970s, Syria achieved high rates of economic growth. The dramatic rise of world oil prices from 1973 to 1974 led to increased production in domestic refineries. Moreover, higher prices for agricultural and oil exports, as well as the state's limited economic **liberalization** policy, encouraged growth. The October War in 1973 and later ostracism of Egypt from the Arab League due to its peace agreement with Israel put Syria, as a front-line state, in a position of leadership in the Arab-Israeli conflict. Because of this, Syria began to receive substantial quantities of foreign aid from the oil-rich Gulf states. Besides these higher levels of aid, Syria's economic boom was furthered by increased **remittances** from Syrians working in the oil-rich Arab states. By the end of the decade, the Syrian economy had shifted from its traditional agrarian base to an economy dominated by the service, industrial, and commercial sectors. Massive expenditures for development of irrigation, electricity, water, road building projects, and the expansion of health services and education to rural areas contributed to prosperity.

By the mid-1980s, the country's economic climate had shifted from prosperity to austerity. Syria's economic boom collapsed for a variety of reasons: a reduction in worker remittances, declining world oil prices, lower export revenues, agricultural devastation due to drought, and costly military involvement with Lebanon. A drastic decline in Arab aid, due to Syria's support for Iran against Iraq in the Iran-Iraq War (1980–88), also contributed to the country's economic woes.

The final collapse of Soviet Russia after 1989 left Syria without the generous Soviet economic and military aid on which it had depended. Syria did receive aid through substantial financial rewards—in the form of large injections of credits from Saudi Arabia, the Gulf states, the United States, the European Community, and Japan—for its decision to support the coalition forces in the Gulf War of 1991 against Iraq.

Agriculture remains the dominant sector in Syria, yet only 20 percent of arable land is irrigated. Although Syria has sufficient water supplies, the great distance between major water supplies and population centers poses serious distribution problems. The water problem is exacerbated by rapid population growth, industrial expansion, and increased water pollution. Oil production is leveling off, and the efforts of the non-oil sector to penetrate international markets have fallen short. A vibrant **black market**, smugglers, corruption, cumbersome bureaucracy, and inefficient state-owned enterprises are huge barriers to growth and development.

Besides these economic burdens, Syria suffers from a substantial **external debt**, which was estimated about US$22 billion in 1999, including US$10 to 12 billion owed to the former Soviet Union and US$900 million to the former East Germany which many observers doubt will ever be repaid. Much of the US$22 billion owed dates back to the Cold War (a period in history, lasting from approximately 1945–89, characterized by the arms race between the United States and former Soviet Union), stemming from arms transfers. Russia and Germany argue that the debt should be paid, but Syria claims that the debt is no longer valid because the predecessor states no longer exist.

POLITICS, GOVERNMENT, AND TAXATION

Syria is a socialist republic ruled by the Ba'ath Socialist Party dictatorship. According to the Syrian Constitution of 1973, the president governs with the assistance of an appointed Council of Ministers, headed by a prime minister. The president also functions as commander-in-chief of the armed forces and secretary-general of the Syrian Ba'ath Party. Since 1970, Syria has been under the patrimonial rule of the Assad family. During the reign of Hafez Assad, the Ba'ath Party became the major instrument in implementing economic and **fiscal policies**. Assad's takeover in 1970 gave new momentum to the Syrian economy. He relaxed many socialist restrictions and measures by previous Ba'ath leaders and adopted a moderate foreign policy toward the conservative oil-rich Arab states to accumulate their oil money in Syria.

A second phase of economic reform in 1986 and 1987 added to Assad's economic reform and relaxation policies of the early 1970s. In this second phase, the government largely surrendered its control over foreign exchange to the market. The state-owned banking sector, instead of being an instrument of control over private exports and imports, was gradually reduced to the role of an intermediary. It passed a new investment law in May 1991 (Investment Law #10), lengthening the list of goods that the **private sector** can either produce or import. Apart from foreign trade and currency regulations, this second phase involved a substantial liberalization of Syria's agricultural economy (pricing, production, and marketing of fruits and vegetables have been placed in private hands by the government). Although these limited liberalization schemes served their purposes well, they were not enough for a complete transformation from a socialist to a market economy. Throughout the 1990s, Syria's economy suffered from instability, **recession**, unemployment, rising external debts, and capital shortages.

Thanks to the liberalization schemes of the 1970s and the 1980s, by 2001 Syria developed a mixed economy based on agriculture, trade, mining, and manufacturing. The government controls the most vital sectors of the country's economy and regulates private businesses. The economy, where the public and private sectors have an almost equal share, is managed through a central planning system. The **public sector** (composed of enterprises wholly or partly owned by the state and controlled through a public authority which does focus entirely on commercial profit) is dominant in oil, banking, construction, electricity, chemicals, and much of the textile and food processing industries. The private sector (composed of enterprises owned by individuals in pursuit of profit) is dominant in agriculture, tourism, domestic trade, and certain light industries. State control in commerce is restricted to foreign exchange operations.

The Syrian government depends heavily on oil revenue, foreign aid, remittances from Syrian workers abroad, tourism, and tax revenues. In 1997, tax revenue constituted 16.4 percent of the GDP. For the same year, taxes levied on goods and services made up 20.72 percent of the current government revenue whereas **income taxes** and taxes levied on international trade accounted for 30.15 percent and 10.58 percent, respectively. Income taxes are levied on 3 main categories of income: 1) profits from an industrial, commercial, or noncommercial activity; 2)

wages; and 3) income derived from moveable capital assets. All businesses are charged a "profits tax" based on net profits derived from professional, industrial, commercial, and non-commercial activities. The business profit tax is applied in progressive rates (between 10 percent and 45 percent) depending on the amount of taxable income. Shareholding companies and industrial limited liability companies are taxed at a flat rate of 32 percent and 42 percent, respectively. An individual is liable for the same taxes as a company on his business income, income from movable capital, and real property. Individuals are also subject to a wage and salary tax; the rate varies from 5 percent to 12.5 percent. Tax on movable capital incomes, which is levied at a flat rate of 7.5 percent, applies to interest, royalties, and foreign source dividends.

INFRASTRUCTURE, POWER, AND COMMUNICATIONS

Syria has an inadequate and outdated **infrastructure** and transport system that is mainly controlled by state-run agencies. The highways, which provide the chief means of transporting goods and passengers, run about 36,377 kilometers (22,604 miles), nearly 10,000 kilometers (6,214 miles) of which are unpaved. The major Syrian cities are linked by the 2,750-kilometer (1,709-mile) long railway network all around the country, but the service is slow because of the obsolete trains.

Syria has 104 airports, including military airports, 24 of which have paved runways. The international airlines are in the capital of Damascus and Aleppo, where facilities can handle jet aircrafts. Syrian Airlines connects Syria with other Arab, Asian, and major European countries. Although Syria has a short coastline, which stretches for about 193 kilometers (120 miles) along the Mediterranean Sea between Turkey and Lebanon, it has a commercial fleet composed of 137 ships and 4 major ports and harbors in Baniyas, Jablah, Latakia, and Tartus.

Syria's electrical power is handled by the Public Establishment of Electricity for Generation and Transmission and the Public Establishment for Distribution and Exploitation of Electrical Energy. Syria's annual electricity production was 17.5 billion kilowatt hours (kWh) in 1998, 42.8 percent of which was generated from fossil fuel, whereas the remaining 57.2 percent was produced from hydroelectric resources. The main problems in the Syrian electricity sector are inefficiency and technical power losses that lead to periodic power outages.

The Syrian telecommunication system is undergoing a number of significant improvements and digital upgrades, including fiber-optic technology. The government-owned Syrian Telecommunication Establishment provides all services in this sector. The country had 1.4 million telephone lines in 1998. In addition, a pilot global system for mobile communications (GSM) cellular telephone network was launched in Syria in February 2000, with capacity for 60,000 subscribers in the Damascus and Aleppo areas. A permanent GSM telephone system to replace the pilot scheme was expected to launch in February 2001, according to an *EIU Country Report* of October 2000. Recently, the Syrian government approved the Syrian Computer Society (SCS) as the country's first Internet service provider. Only SCS members (Syrian scholars, university professors, engineers, computer specialists, public sector professionals, and some private entrepreneurs) are allowed access to the Internet. Their activities are subject to strict government control and monitoring. Most Internet services remain blocked, including most web mail and voice/telephony services.

ECONOMIC SECTORS

Since the 1970s, the Syrian economy underwent several sectoral changes not common in developing countries. Industry, especially service, has developed a great deal. Agriculture remains vital to the economy despite its diminishing contribution to GDP. In 1996 agriculture employed about 40 percent of the **labor force** and supplied

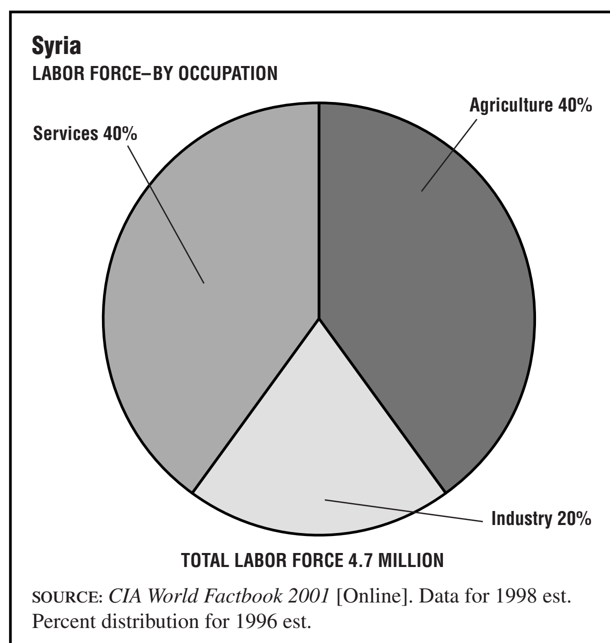
necessary products to the industrial sector. The oil sector is a driving force behind Syrian industry. Crude oil exports of US$1.342 billion accounted for nearly 43 percent of Syria's total exports in 1998. The Syrian services sector also made up 49 percent of its GDP in 1997 and employed about another 40 percent of the labor force.

Since the second half of the 1990s, the Syrian economy has been undergoing a recession. According to the 2000 *EIU Country Profile,* the Syrian agricultural sector has suffered in the last 3 years because of rapid climate changes and severe droughts in the region. The continuing rise of crude oil prices in international markets may promise an increase in Syria's export earnings, while service sectors such as construction, transport, and telecommunications have been steadily growing since the Gulf War in 1991.



SOURCE: *CIA World Factbook 2001* [Online]. Data for 1998 est. Percent distribution for 1996 est.

AGRICULTURE

The agricultural sector in Syria accounted for 29 percent of the GDP in 1997 and employed an estimated 40 percent of labor in 1996, including a significant proportion of townspeople. The primary agricultural products are cotton, olives, wheat, barley, lentils, chickpeas, sugar beets, beef, mutton, eggs, poultry, and milk. Cotton, grown on irrigated land, is Syria's premier **cash crop**. Besides providing employment and income for a significant amount of the population, it also has provided Syria with much needed **hard currency**. Until 1974, when it was superseded by oil as the largest Syrian export, cotton accounted for about one-third of Syria's total exports. By the late 1990s, cotton accounted for almost 50 percent of the agricultural sector's contribution to GDP. Nearly half of the cotton produced is used for local consumption by the largely export-oriented clothing and textile industry. Syria is also the second largest olive exporter in the Arab world after Tunisia and is sixth in the world after Spain, Greece, Tunisia, Italy, and Turkey. According to the *EIU Country Report,* the total value of agricultural exports in 1998 was about 24 percent of total exports, while the share of agricultural imports in 1998 was nearly 16 percent of total imports.

The average farmer's reliance on outdated and inefficient irrigation methods is a major obstacle to improving agricultural outputs. The introduction of drip, sprinkler, and subsurface irrigation methods is handicapped because of the limited amount of money available to the common farmer. Because of these shortcomings, Syria is susceptible to food shortages during long droughts.

Because of the government's revitalization efforts during the 1980s and 1990s, the agricultural sector recorded a 10 percent increase in its share of GDP in 1998. This kind of liberalization effort has been essential to increased agricultural production. The enactment of Decree #10 in 1986 allowed **joint sector** companies to be established with a minimum 25 percent stake to be held by the public sector. Pricing, production, and marketing of fruits and vegetables have also been placed in private hands. Liberalization measures since 1991 include the lifting of **subsidies** for seeds and pesticides, and the reduction of the fertilizer subsidy.

Because of geographic and topographic conditions, Syria has no forestry sector. Fishing is also quite limited, with a few small and medium-sized boats fishing off the Mediterranean coast.

INDUSTRY

The Syrian industrial sector contributed 22 percent of the GDP in 1997 and 20 percent of the labor force in 1996. State-owned organizations dominate heavy industry. Mining and quarrying (mostly oil) generates about 28 percent of gross industrial output, followed by the agro-food and chemical industries. The textiles and clothing industry comes next, and accounts for about 12 percent of industrial output.

MINING. Petroleum is Syria's chief mineral product. Most of the petroleum comes from fields in the northeastern part of the country. Phosphate rock is another important source of income. Phosphate, which is used to make fertilizer, is mined in the Palmyra area of central Syria. The principal limestone quarries are located north and west of Damascus, near the city of Aleppo. Marl is used in the cement industry with quarries near Damascus, Aleppo, and Rastan. Sandstone suitable for glass manufacture is mined in the Palmyra Mountains. The country's other mineral products include asphalt, gypsum, natural gas, and table salt.

OIL. Most of Syria's oil fields are located on the Euphrates Graben, which runs across the northeastern region of the country. The discovery of large crude fields in the mid-1980s boosted the role that oil plays in the Syrian economy. Since this time, output has expanded rapidly and reached a peak of 604,000 barrels per day in 1996. Production has been falling in recent years, because many fields discovered in the 1960s reached maturity. According to the International Energy Agency (IEA), as of 2000, Syria's production was about 520,000 barrels per day, of which some 325,000 barrels per day have been exported, accounting for some 65 percent of export revenue. Because of Syria's old, small, and dispersed oil fields, the *EIU Country Report* claims that the decline in Syrian oil production will continue in 2001, and most observers agree that the decline will continue for years to come.

Intense exploitation in the late 1980s and early 1990s saw oil production rise rapidly, fuelling economic growth, but at a cost. Fields were damaged as groundwater seeped into reservoirs and reservoir pressure fell, requiring injection projects to maintain pressure. Additionally, harsh government terms caused many foreign oil firms to leave the country. Investors have complained about the restrictive terms for exploration and development in the Syrian oil sector. In fact, international observers have forecasted that Syria will revert to being a net importer of oil within a few years as production declines and domestic consumption rises, unless new, substantial, and financially viable reserves are soon found. Syria exports Syrian Light, a blend of light and sweet crude oils produced from the Deir ez-Zour and Ash Sham fields. The country also exports fuel oil and other products. Syria is a member of OAPEC (Organization of Arab Petroleum Exporting Countries), but not OPEC (Organization of Petroleum Exporting Countries).

The oil exploitation of the 1980s attracted international interest to the Syrian oil sector, and several consortiums (companies formed to undertake an enterprise beyond the resources of any one member) were formed. Companies such as Agip, Bay Oil, Chevron, Conoco, Marc Rich, Shell, Elf, Total, and Veba are the most prominent involved in the sector. The largest of these is the Shell consortium made up of Pecten, Shell, and Deminex. In 1985 the Shell consortium entered a **joint venture** with the Syrian Petroleum Company (SPC) to create the Al-Furat Petroleum Company. This joint venture produces about two-thirds of Syria's oil output. All Syrian oil, including that produced by foreign companies, is sold on a monthly basis by the state-owned marketing company Sytrol. Since January 1994, Sytrol has had a clause in its term contracts prohibiting customers from re-selling Syrian crudes without written permission from Sytrol. This is intended to curb spot trading in Syrian crudes, especially sales to Israel. The unfavorable contract terms for exploration, development, and poor exploration results have only left 3 (Elf, Shell, and Deminex) out of the 14 companies that were operating in the country in 1991.

Syria's 2 oil refineries are located at Banias and Homs. Total production from these refineries was 242,140 barrels per day in 2001. Syria is planning to construct a third refinery, with an initial capacity of 60,000 barrels per day, at Deir ez-Zour to supply products to the eastern part of the country. The country's major oil export terminals are at Banias and Tartous on the Mediterranean, with a small tanker terminal at Latakia. Tartous is connected through a pipeline to the Banias terminal. The Syrian Company for Oil Transport (SCOT) operates all 3 terminals and is in charge of Syria's pipelines.

GAS. Syria's proven natural gas reserves are estimated at 8.5 trillion cubic feet (Tcf). Most (73 percent) of these reserves are owned by SPC, including about 3.6 Tcf in the Palmyra area, 1.6 Tcf at the al-Furat fields, 1.2 Tcf at Suwaidiyah, 0.8 Tcf at Jibsah, 0.7 Tcf at Deir ez-Zour, and the remainder at al-Hol, al-Ghona, and Marqada. In 1998, Syria produced about 208 billion cubic feet of natural gas, a 5-fold increase over the previous decade. As part of a strategy to substitute natural gas for oil in power generation to free up as much oil as possible for export, Syria plans to increase this production even further in the coming years. According to the *EIU Country Report* of 2000, Syria produced about 460 million cubic feet per day of gas, but this will nearly double by 2005 to 850 million cubic feet per day, as new gas sources are extracted.

SPC has been working to increase Syria's gas production through several projects. The Palmyra area in central Syria is the site of much of this activity, including the development of the Al Arak gas field, which came on stream at the end of 1995. In October 1997 the Syrian government announced the discovery of a large new gas field in the Abi Rabah area of the Palmyra region. One of the main problems for the gas sector is the location of gas in the northeast regions of the country, while the population centers are in the southwest. According to EIU reports, in July 2000 a step to ease the disparity was taken with the announcement that a Dutch company, A Halk Pijpleidingen, had been awarded a contract to construct a US$46 million pipeline from newly developed gas fields in the Palmyra area to the city of Aleppo. The 124-mile pipeline will be used to supply gas to a 1,000 megawatt power station in the city, constructed by Mitsubishi Heavy Industries of Japan. Bids are being measured to build a gas pipeline from Homs to the Mediterranean port of Banias.

Given the small size of Syria's gas fields, most of the large oil companies have shown little interest in the market, given the complex government bureaucracy that they must navigate. One of the exceptions is Conoco, the only U.S. oil company operating in Syria. Another is Elf of France, with whom Syria Petroleum Company signed a US$430 million service agreement in November 1998 to utilize associated gas in the Deir ez-Zour oil fields. Elf and Conoco each hold a 50 percent interest in the project, with Conoco as the lead operator. In March 2000 the 2 companies awarded Houston-based Kvaerner ENC a US$160-million contract to engineer, procure, and construct the infrastructure for the project. The Deir ez-Zour gas development work will include the construction of a gas gathering system and processing plant, and a 155-mile pipeline that will connect the system to the national grid near Palmyra that serves western Syria. When completed in late 2001, gas output from 22 fields should be about 280 million cubic feet per day. According to the *EIU Country Report,* Syria is planning to supply 3 million cubic meters per day of gas to Lebanon via a 107-mile pipeline that will run from the Syrian city of Homs to northern Lebanon. Elf announced that it is also considering joining the US$175-million pipeline project that would supply power stations in Lebanon with natural gas from Syria.

MANUFACTURING. Manufacturing accounts for about 6 percent of the value of Syria's production. The main industries are cement, glass, food processing, iron and steel, leather goods, brassware, fertilizers, and textiles. Cotton fabrics, wool, and nylon are Syria's most important manufactures. The textile industry is in Aleppo, Damascus, Homs, and Hamah. Natural silk is produced at Latakia. Technical engineering industries, most of which are in Damascus, are active in producing cement, glass panes, bottles, utensils, pharmaceuticals, plywood, and batteries. The food processing industry produces salt, vegetable oils, cotton cake, canned fruit and vegetables, tobacco, and a variety of dairy products. While manufactured goods made up 10 percent of total Syrian exports in 1998, the well-established textile industry contributed another 10 percent of export earnings and employed one-third of the industrial workforce.

Syrian manufacturing industries grew substantially in the 1960s. The government encouraged industrialization by raising **tariffs** on imported **consumer goods** and providing tax exemptions and credit for domestic industries. Therefore, most of the traditional handmade manufactures (damask steel, swords and blades, brass and copper work, wood engravings, gold and silver ornaments, mother-of-pearl inlays, silk brocades) have dramatically decreased since the introduction of industrial processing. Private sector participation in manufacturing has taken off in the 1990s, with the total capital investment in the industrial private sector growing from US$273 million in 1991 to US$735 million in 1995. Of the 1.1 million workers in manufacturing, more than 75 percent are now employed in the private or mixed sectors. While private sector involvement has been limited to the textile, food processing, leather, paper, and chemical industries, the government started to open heavy industry to private investment in areas where the public sector is unable to meet increasing demand.

SERVICES

TOURISM. Syria's rich history attracts large numbers of tourists. Artifacts from the ancient Mesopotamian civilization, castles from the crusaders, and many other diverse historical sites appeal to world travelers. The United Nations Educational, Scientific, and Cultural Organization has declared Damascus and Aleppo world heritage sites because these date to the early development of civilization, well before the Greek and Roman empires.

With such a rich cultural heritage and a Mediterranean coastline, Syria's tourism sector shows great potential, and the number of tourists who visit the country each year is on the rise. Since the Gulf War in 1990–91, an average of about 900,000 visitors have visited Syria each year. But regional instability after 1996 has hindered the tourist sector, evidenced by the drop in tourists to 400,000 in 1999 from 2.5 million in 1998. In the same time span, tourism revenue declined from US$1.3 billion in 1998 to US$712 million in 1999. Arab tourists continue to visit Syria in increasing numbers, enjoying the improved luxuries offered by the sector. According to the *EIU Country Report,* capacity at the luxury end of the market is about 8,000 beds in the five-star hotels, with occupancy estimated at 80 percent during the summer season of 2000.

There are a number of problems in the tourism sector, including a lack of marketing activities on an international level, the low number of airline carriers to Syria, and the lack of a nationally coordinated policy for the development of tourism. The hazy divisions between public and private sectors and the non-existence of large centers for tourist entertainment and cultural activities are other major weaknesses inhibiting growth. The most important challenge that the tourism industry faces is the lack of big investments in this vital economic sector. To encourage private sector and foreign investment in Syrian tourism projects, the government has made several aggressive decisions since 1986. Incentives include tax exemptions on all tourism-based projects. All imports needed to build tourism installations, if these imports do not exceed 50 percent of total investment, are tax exempt. There is also a 7-year corporate tax exemption, after which taxes are paid at 50 percent of the normal rate.

FINANCIAL SERVICES. The Syrian financial system has been run by the state since nationalization in the 1960s. The banking functions have been designed to cater to the financial requirements of the public sector. Because loans to the private sector are unknown, private businesses must finance projects with cash or through external loans. The Central Bank of Syria and the Commercial Bank of Syria are 2 of the 5 government-owned banks that deal in hard currency. Although previously only foreigners were allowed to open accounts with foreign currency in the Commercial Bank of Syria, beginning in September 1996 the government allowed Syrians to deposit foreign currency at government banks without disclosing the source of such currency, and plans to allow citizens to possess foreign currency. The new decision eliminates provisions in an old currency law that prevented Syrians from dealing in hard currency. The new decree allows hard currency to be transferred abroad provided it is used for education expenses, payments of books, medical treatment, newspaper subscriptions, and other non-commercial transactions. Changing money at rates other than official rates remains illegal and all transfers in and out of the country must be declared.

The EIU reports that the current banking system is in urgent need of reform. The system is criticized by business leaders for being inefficient and offering only basic services. There are, for example, no ATMs, checks, or credit cards in Syria. Commercial loans are hard to obtain without using political party or government connections or traditional patronage relations (a system of relations in which government or any other sectarian, tribal domineering authority distributes the sources at its expense to its supporters as rewards). The new Syrian government has acknowledged the need for reform of the financial system and these new moves show that progress is being made. Some modernization efforts have been initiated with the computerization of the Central Bank and other commercial banks.

The government has also announced that foreign banks will be allowed to open branches in Syria for the first time. Banks with at least US$11 million in capital will be permitted to operate in the country's **free zones** (an area where goods may be landed, handled, manufactured, reconfigured, and **re-exported** without the intervention of the customs authorities) to finance commercial and industrial activity. In August 2000 3 Lebanese banks were issued licenses while some non-Arab international banks expressed their wishes to enter the full international market rather than be restricted to the small free zones. The United Nations Industrial Development Organization (UNIDO) has estimated that Syria would gain US$8 billion in foreign investment if it allowed the establishment of private banks, opened a stock market, and unified **exchange rates**.

INTERNATIONAL TRADE

According to International Monetary Fund sources, because of the discovery of large oil fields, Syria's foreign trade volume has immensely increased over the last 3 decades. During this period, exports have grown from US$203 million in 1970 to US$4.8 billion in 2000, while imports have risen from US$360 million in 1970 to US$3.5 billion in 2000. Syria's foreign trade is highly dependent on its oil revenues and oil prices on the international markets. For the year 2000, the EIU reported that increasing oil prices have continued to boost export revenue and Syria recorded a surplus of more than US$1 billion for the first time since the Gulf War.

Syria's chief exports are petroleum, textiles, food, live animals, and manufactured goods which are exported to Germany (which received 21 percent of exports in 1999), Italy (12 percent), France (10 percent), Saudi Arabia (9 percent), and Turkey (8 percent). Syria's main import products are machinery, food and live animals, transport equipment, and chemicals. The country's main import partners include France (which purchased 11 percent of imports in 1999), Italy (8 percent), Germany (7 percent), Turkey (5 percent), and China (4 percent). Additionally, a large amount of trade (nearly US$200 million) with Lebanon, Turkey, and Iraq goes unrecorded. It is estimated that these invisible flows favor Syria, as evidenced by the use of its military and political influence on Lebanon to create a common market between the 2 countries, from which Syria will benefit.

As of 2001, there were about 200 state-owned trading companies that enjoyed prohibitive tariff protection, overvalued exchange rates, and restrictions on private-sector competition. These state-run companies regulated most of Syria's exports. According to the Syrian Min-

Trade (expressed in billions of US$): Syria

	Exports	Imports
1975	.930	1.685
1980	2.108	4.124

istry of Economic and Foreign Trade statistics, in 1998 72 percent of exports were made by the public sector.

MONEY

Syria maintains a multiple **fixed exchange rate** system that pegs the value of currency to the U.S. dollar. All the official rates overvalue the Syrian pound to varying degrees. Two principal exchange rates are used: the Official Rate that devalued the national currency in 1988 from S£3.925 to S£11.225 per U.S. dollar, and the Neighboring Countries Rate (NCR) that was introduced in 1990 and is periodically adjusted. The NCR was S£46.50 per U.S. dollar, according to EIU estimates in 2000. Tourist hotels use the Official Rate. Most local transactions are carried out at the NCR rate. A blended rate applies provisionally to certain public sector transactions, including sales of oil and gas. The black market rate has hovered between S£46 and S£54 per U.S. dollar since the early 1990s.

Over the last decade, the Syrian government has contracted the **inflation rate** from 34 percent in 1988 to minus 0.5 in 1999. The EIU forecasts that weak Syrian growth and the current low level of economic productivity in the local economy will further help the government keep **inflation** in check. The potential increase in government spending due to public sector wages and a steady growth in global non-oil commodity and raw material prices might threaten to reverse this trend over the forecast period.

POVERTY AND WEALTH

Besides existing ethnic and sectarian cleavages, Syrian society is also stratified along tense social and economic class divisions. The class structure is characterized by a high degree of maldistribution of wealth, meaning that much of the wealth is concentrated in the hands of the few, while large numbers of people live in poverty. Moreover, there is a high correlation between wealth and sectarian-ethnic background. The upper income group is composed of Alawite high-ranking officials, military officers, Sunni landowners, small industrial business owners, and important merchants. The middle-income group comprises most Alawite and Sunni government officials, shopkeepers, professionals, and farmers. The lower income group is made up of Alawite workers, peasants (farmers who do not own all the land they cultivate), and employees.

Although the Ba'athist Syrian government has directed its welfare policies—such as land reform—at easing social problems, an estimated 20 percent of the Syrian population lives under the poverty line. In the last 30 years, the pace of change from an agricultural to an industrial economy and the accompanying migration of people to the cities has worsened income distribution and caused the mushrooming of high-poverty shantytowns (poorly constructed temporary housing) on the edge of populous cities. To compensate for disparities in the distribution of wealth, the Ministry of Municipal and Rural Affairs has constructed blocks of low-income flats in these areas. Meanwhile, the Ministry of Social Welfare and Labor has been empowered to find work for and distribute cash allowances to the unemployed. The Ministry also encourages such youth activities as athletics, scouting, literacy campaigns, and the organization of cooperatives. The government gives substantial grants to private welfare societies in solving poverty problems. According to World Bank sources, however, the share of GDP allocated to the social security and

welfare policies was barely 0.7 percent a year between 1992 and 1997.

WORKING CONDITIONS

The Syrian labor force was estimated at about 4.8 million by the International Labor Organization in 1998. The service and agriculture sectors employ the majority of the labor force, each accounting for about a 40 percent stake. Although government figures put unemployment at below 10 percent, unofficial estimates more than double this figure, with under-employment accounting for another 25 percent. Syria has one of the highest population growth rates in the world, with an annual increase of 2.58 percent. Because of the high growth rate, an extra 200,000 new workers enter the labor market every year. According to the *EIU Country Report,* the unemployment rate among 15 to 29-year-olds is unofficially reported to be as high as 85 percent. As a part of an emergency plan in its 2000 budget, the government has allocated S£80 billion for the creation of 92,322 new jobs, but this falls far short of the number entering the labor market each year.

Due to these harsh conditions in the labor market, many Syrians go to Lebanon and the Gulf States to work. For that reason, in recent years, Syria has become economically dependent on Lebanon. Sources in Lebanon estimate that about 500,000 to 1 million Syrians work in the country. In Beirut, Syrian workers can earn twice what they make in their own country. Jobs in Lebanon reduce unemployment in Syria and the remittances of these workers to their families back home are estimated at US$1–3 billion dollars per year. The condition exacerbates economic deprivation in Lebanon, however. Lebanese Shiites and Palestinian refugees are hard hit by the influx of Syrian workers.

The 1973 Syrian constitution provides for the right of the "popular sectors" (workers, peasants, and state employees) of society to form trade unions. The government insists that there is in practice trade union pluralism (a condition in which a multiple number of unions with different particular interests can freely exist). Despite this, workers are not free to form labor unions independent of the government-prescribed structure. The General Federation of Trade Unions (GFTU) is the major independent popular organization. The government uses it as a framework for controlling nearly all aspects of union activity. The GFTU is charged with providing opinions on legislation, devising rules for workers, and organizing labor. In the private sector, unions are active in monitoring compliance with the laws and ensuring workers' health and safety. Strikes are not prohibited (except in the agricultural sector), but in practice they are discouraged.

COUNTRY HISTORY AND ECONOMIC DEVELOPMENT

1250. Mamluks take control of most of Syria.

1516. Syria is incorporated into the Ottoman Empire.

1869. The opening of the Suez Canal leads to a decline in Syria's economic importance.

1916. The Sykes-Picot agreement between Great Britain and France, made during World War I, places Syria and Lebanon under French "influence."

1922. The League of Nations approves the French Mandate for Syria and Lebanon.

1945. Syria becomes a member of the United Nations.

1946. Syria and Lebanon declare their independence from France.

1948. In the Arab-Israeli war, Syria joins the joint Arab forces fighting against Israel.

1958. Establishment of the United Arab Republic (UAR), a union of Syria and Egypt. Egyptian Gamal Abdel Nasser becomes president of the union and dissolves all political parties in Syria. He also introduces regulations on the size of land property.

1961. Opposition to the UAR grows in Syria, particularly against the socialist economic policies implemented by Nasser. The army takes control of Damascus, and declares a new independence for Syria.

1963. The Ba'athist party takes control of the country.

1967. In the Six Day War, Israel seizes the Golan Heights from Syria.

1970. Hafez Assad seizes power in a "corrective coup."

1971. Assad is elected president for a 7-year term in a plebiscite (a vote of the people).

1973. Syria and Egypt go to war with Israel to retake the Golan Heights.

1976. The Syrian army intervenes in the Lebanese civil war.

1981. Israel formally annexes the Golan Heights.

1982. An Islamic extremist uprising in Hama is crushed and thousands are killed. Israel invades Lebanon.

1987. Assad sends troops into Lebanon for a second time to enforce a cease-fire in Beirut.

1990. Following the Iraqi invasion of Kuwait, Syria joins the U.S.-led coalition against Iraq. This leads to improved relations with Egypt and the United States.

1991. Syria participates in the Middle East peace conference in Madrid, and holds bilateral talks with Israel. The Damascus Declaration aid and defense pact is signed with Egypt, Saudi Arabia, Kuwait, the United Arab Emirates, Qatar, Bahrain, and Oman.

2000. Assad dies and is succeeded by his son, Bashar, soon afterwards.

FUTURE TRENDS

In order to overcome its existing economic problems, Syria will need to attract major international investors. This does not seem likely in the near future due to domestic and international problems. In the domestic arena, the 34-year-old Bashar Assad, son of the late Hafez Assad, tried to cement his position while launching his liberal political and economic agenda. Bashar and his reformist elite tried to bring a new openness to the country, but efforts were thwarted by the "old guard" of military and political veterans who remained loyal to the legacy of Hafez Assad.

With regard to regional politics, it is clear that Bashar Assad must strengthen his domestic political standing before entering into peace talks with Israel. Syria's other main foreign policy concern, Lebanon, has become akin to a domestic policy issue. Syria has politically dominated Lebanon for a decade, making foreign and defense policy decisions for the country, and approving all senior politicians. Under the elder Assad, no opposition was allowed to Syria's dominant position in Lebanon. After Israel withdrew from Lebanon in May 2000, many Lebanese continue to resent the presence of Syria and call for the removal of its troops. Bashar Assad might be forced to make a vital decision regarding his policy towards Lebanon. Most likely, the Syrian government will ask Lebanon for some concessions because of the economic advantages they gain from about 500,000 to 1 million Syrian workers in Lebanon.

Syria has long sheltered revolutionaries and terrorists to get leverage in regional politics. If the government wants to attract foreign investors, it must reconsider its support for international terrorism. Depending on policy options embraced by the new president, the outcomes of these domestic and international policy decisions will shape Syria's economic performance in the next decade. Because of population and unemployment problems, Syria's reliance on oil revenue puts it in an unstable situation. Decreasing production in the sector might have a negative impact on the economy in the end, while increasing oil prices on the international markets seems to continue boosting export revenues in the short-run.

DEPENDENCIES

Syria has no territories or colonies.

TAIWAN

Republic of China
Chung Hwa Min Kuo

CAPITAL: Taipei.

MONETARY UNIT: New Taiwan dollar (NT$). One dollar equals 100 cents. There are notes of 50, 100, 500, and 1,000 dollars. There are coins of 50 cents, and 1, 5, and 10 dollars.

CHIEF EXPORTS: Machinery and electrical equipment (51 percent), metals, textiles, plastics, chemicals.

CHIEF IMPORTS: Machinery and electrical equipment (51 percent), minerals, precision equipment.

GROSS DOMESTIC PRODUCT: US$386 billion (purchasing power parity, 2000 est.).

BALANCE OF TRADE: **Exports:** US$148.38 billion (f.o.b., 2000). **Imports:** US$140.01 billion (c.i.f., 2000).

COUNTRY OVERVIEW

LOCATION AND SIZE. The island of Taiwan, in Eastern Asia, is about 161 kilometers (100 miles) away from the southeast part of mainland China, and about 483 kilometers (300 miles) north of the Philippine island of Luzon. The East China Sea forms the northern border of Taiwan, the Taiwan Straits are to the west, the Philippine Sea to the south, and the Pacific Ocean on the east coast. The territory is slightly smaller than the combined area of Maryland and Delaware in the United States. Taiwan occupies a total area of 35,980 square kilometers (13,892 square miles). Its capital city, Taipei, is in the northeast, and is the most densely populated area in the territory.

POPULATION. As of November 2000, the population of Taiwan was estimated at 22,257,000. People aged 14 years and under comprise 22 percent of the total population, while 70 percent belong in the 15 to 64 age bracket. The earliest government census records, dated 1905, set the island's population at 3.12 million, which doubled to 6.02 million by 1945. Subsequently, the Taiwanese population increased at an average of 3.84 percent, prompting the government to implement strict population control measures such as family planning. By 1997, the population growth rate had dropped to 1 percent.

Besides government family planning programs, the decline in population growth can be linked to the change of attitude in the younger generation who, due to better education and career opportunities, now tend to marry later. There has been a decrease in potential mothers between the ages of 20 and 34. Of the 326,002 births registered in Taiwan in 1997, the ratio was 109.04 boys for every 100 girls. The greater male-to-female ratio on the island is in keeping with Chinese culture, which traditionally values sons above daughters.

The population distribution curve measured by age groups indicates an aging population. In 1990 people aged 65 and over comprised about 6.1 percent of Taiwan's population. This figure increased to 8 percent in 2000 and, with average life expectancy at 76.35 years, the government estimates that the percentage of its elderly population will increase to 19.1 percent by 2030. In an attempt to encourage a moderate *increase* in population, the government modified its former population reduction slogan from, "One [child] is not too few; two are just right," to "Two are just right."

Because of the increasing industrialization of Taiwan, people are flocking to the urban-metropolitan areas of the island, which absorb 67.8 percent of the total population. In 1997 the population density of Taiwan was the second highest in the world next to Bangladesh, with 601 people per square kilometer (1,557 per square mile). The capital city, Taipei, which covers 272 square kilometers (105 square miles), is the most densely populated area with 9,560 persons per square kilometer (24,760 per square mile). Second to Taipei is Kaohsiung City with an area of 154 square kilometers (59 square miles), which is home to 9,350 persons per square kilometer (24,216

per square mile), while Taichung City, with an area of 163 square kilometers (63 square miles), has 5,519 inhabitants per square kilometer (14,294 per square mile).

OVERVIEW OF ECONOMY

The economic development of Taiwan can be broken down into 5 stages. In the 1950s, the main goal of the government was to stabilize the economy and ensure an adequate and regular food supply for the population. Hand in hand with agricultural production, the government encouraged the development of labor-intensive industries to provide much-needed employment to a growing **labor force**, and to ease the need for imported products by manufacturing substitute products locally.

In the 1960s, the government continued to promote the same labor-intensive industries, but this time the focus was on manufacturing products for export. By the end of the decade, the export industry was thriving and had stimulated local demand for the machinery needed to produce export goods. This export-led strategy had several positive results. Employment opportunities increased and a greater variety of manufactured products were developed. Expansion advanced local knowledge of management skills and the development of industrial technology. Moreover, receipts of foreign currency greatly enhanced the financial standing and stability of the government.

Supported by these developments, in the 1970s the government shifted its strategy to the encouragement of basic and heavy industries. These industries were designed to produce and promote domestic substitutes for imported products, and to develop those industries that would require heavy capital expenditures. By thus reducing Taiwan's reliance on foreign suppliers for components, government expenditure decreased.

By the 1980s, Taiwan's foreign trade was posting huge surpluses. The government directed these funds to building **infrastructure** such as roads, bridges, airports, and seaports, and to improve the quality of life on the island. The surplus was also able to finance the further development of capital-intensive and high-technology industries such as electronics, information, and machinery. At the turn of the decade, the government focused on building a world-class infrastructure and 1994 saw the approval of a plan known as the Twelve Major Construction Projects. The scope of the plan included transportation, culture, and education, improvement of living standards, development of water resources, and environmental protection.

In just 50 years, Taiwan had achieved rapid economic growth, characterized by stable prices and equitable distribution of income. Its rapid industrial advancement between 1980 and 2000 has earned the island recognition as one of the "tiger" economies of Asia.

One of the most important events that set the stage for Taiwan's economic development was its implementation of genuine land reform. Under this program, rents were reduced, public lands were distributed to the landless, and farmers were given the opportunity to own the land they had been tilling for many years. In 1953, 60 percent of the rural population became owner-farmers, and owner-cultivated land increased to more than 75 percent of the total land tilled. In the meantime, those land owners who were compelled to sell their property under the land reform program were compensated in government bonds. Dissatisfied with the government's action and highly suspicious of the value of the bonds, many of the landowners immediately sold them. At the same time, land prices went down in anticipation of the effects of

land reform. Taken together, these events contributed to eradicating the land-owning class and the landlord-tenant relationship, a transformation that saved Taiwan from the fate of other societies where huge income disparity between landowners and their workers set the stage for social and economic injustice.

Land reform also led to the reorganization of rural Chinese society. It brought the end of patriarchy, whereby authority was vested only in men, and saw the loosening of family ties. As agricultural processes were modernized, production became more efficient, allowing younger people to leave the farms and pursue other careers in the urban areas. This migration triggered urbanization which, in turn, fostered job specialization, lowered class barriers, promoted social equality, and increased cultural and social interaction.

As social interaction increased, people no longer confined close relationships to the family circle but made outside friends, thus further contributing to social stability and harmony. Under government guidance, the Taiwanese found themselves sharing a common vision and working toward a common goal. Besides economic policies, the government implemented policies that extended compulsory education to 9 years and established schools for vocational and technical training. By encouraging young people to acquire new ideas and skills, Taiwan created a well-trained and industrious labor force, which has served as the backbone of the nation's economic development.

The major economic sectors in Taiwan are composed of services, manufacturing, and agriculture. Since 1985, the service sector has contributed greatly to economic development by generating more than half the **gross domestic product** (GDP), increasing to 64 percent in 1999, while industry and agriculture accounted for 33 percent and 3 percent of GDP, respectively.

Small and medium enterprises (SMEs) in Taiwan are engaged in the manufacturing of products from toys and textiles to personal computers. SMEs can also be found in the construction industry, and in the service sector, particularly in financial, social, and personal services. According to the Ministry of Finance, 97.76 percent of the businesses in Taiwan can be classified as SMEs. In 1998, SMEs provided employment for 4 out of 5 workers in Taiwan, or 7.27 million out of 9.55 million workers.

The government of Taiwan is optimistic about the island's continued economic growth. Its optimism is based on past economic performance. Even at the height of the 1997 Asian financial crisis, which had a negative impact on the leading economies of Asia, Taiwan's gross domestic product still amounted to US$283.4 billion.

Taiwan's government is continually drawing up plans to create more businesses on the island to provide more employment and to strengthen its position against the re-occurrence of a regional or global economic crisis. For the 21st century, the government is working hard to secure the next step of that process. In his inaugural speech of May 2000, President Chen declared that Taiwan must respond to international developments by moving toward a knowledge-based economy in which high-tech industries constantly innovate, while traditional industries progressively transform and upgrade.

POLITICS, GOVERNMENT, AND TAXATION

In the early stages of its development, in the 1950s, Taiwan's economy was closely managed and controlled by the government. After the economy showed signs of rapid growth and continued development, government gradually exerted less control to give the economy free rein.

Government control during the early stages of Taiwan's economy was crucial to the provision of much-needed direction, guidance, and motivation of the population. The government's role included the maintenance of a stable and law-abiding society, strict implementation of their policies, and the formulation of programs to spur national development.

From the 1950s to the 1960s, the government assumed the role of an economic caretaker, exercising control and influence. The government gave support to emerging industries and acted to protect them against external competition. In the 1950s, foreign aid from the United States assisted the development of the textile and milling industries, while export industries tapped the country's limited foreign reserves. During this period, the government also encouraged the growth of Taiwan's domestic automobile industry by shielding it from foreign competition. Citizens wanting to buy foreign-made cars were penalized by a tax equivalent to the price of the imported car itself.

At this stage of Taiwan's economic development, the government demonstrated creativity in its plans to advance economic development. First, it maximized the contribution of state-run enterprises to the national coffers by taking a part of the profits in **indirect tax**. Second, the government provided incentives for private enterprise to thrive, lowering the price of electricity for industrial use, while increasing the price for commercial use. As intended, this ploy encouraged business into the manufacturing rather than the **retail** sector.

In the 1970s, the government took the initiative in building necessary infrastructure such as roads, bridges, airports, new cities, highways, and railways. It launched large-scale public investment projects, since dubbed the Ten, Twelve, and Fourteen Major Construction Projects;

the Six-Year National Development Plan; and the Twelve Economic Construction Projects.

Because of the government's protection and economic intervention, Taiwan's economy grew by leaps and bounds in just 4 decades. By the 1990s, private enterprise had grown strong and steady and needed little state assistance, although the expectation remains that government will continue to foster a healthy investment environment and move with the times in implementing new regulations. The role of the government, in short, has shifted from that of caretaker to that of teacher. As teacher, it has provided private enterprise with information on economic growth and technology, as well as assistance in training personnel.

Over the years, the government and people of Taiwan have attempted to uphold democratic principles and strengthen the island's political institutions. Political activities, especially elections which appear tainted by corrupt practices (buying votes, peddling influence, or provoking violence) are greeted with outrage. Beginning in the mid-1990s, certain reform-minded politicians campaigned for electoral reform. They tried to strengthen the role of political parties, improve their image, and highlight the importance of issues in elections. They aimed, too, to attract political candidates of a higher caliber, reduce the influence of personal connections and, finally, to combat factionalism (the breaking into smaller, differing factions or groups within a political party).

Taiwan's government is a multi-party democracy based on a constitution created in 1947 and amended in 1992, 1994, 1997, and 1999. The president and vice president are elected on the same ticket by popular vote and serve a 4-year term. The legislative branch consists of a **unicameral** (single-house) Legislative Yuan with a total of 225 members serving 3-year terms, 168 of whom are elected by popular vote, 41 of whom are elected by proportional vote by party, 8 elected from overseas constituencies based on proportional vote, and 8 elected by popular vote from among the country's aboriginal population, which constitutes 2 percent of the population. There is also a unicameral National Assembly of 300 members, all of whom are elected by **proportional representation** based on election of the Legislative Yuan and serve 4-year terms.

The year 2000 marked a significant political event in Taiwan when the candidates of the Kuomintang (KMT), Taiwan's ruling party for over 50 years, were defeated by the candidates of the leading opposition party, the 14-year-old Democratic Progressive Party (DPP). Taiwan's highest political office, the presidency, went to the DPP's Chen Shui-bian, the country's tenth president. His running mate, Hsiu-lien Annette Lu, became vice president, marking a victory not only for the DPP but also for the women's movement. Vice President Lu is known to have championed gender equality and women's rights since the beginning of her political career.

In the 2000 national elections, there were 3 major issues aside from the economy on which candidates had to make their attitudes clear to win votes. These were mainland policy, national defense, and foreign relations. Mainland policy dictates whether Taiwan should pursue its independence from mainland China or maintain the status quo. Currently, Taiwan upholds the principle of "one China, two political entities." Under the constitution, Taiwan is referred to as the Republic of China and regards itself as the national government of China, while the People's Republic of China is a political entity that controls mainland China. The issue is a cause of political tension not only for the 2 territories but also for other countries. Mainland China continues to use the threat of political and economic **sanctions** against those countries willing to recognize Taiwan as a separate country. Due to the scale of China's economic resources, its huge population, and its military capability, the threats are not taken lightly.

The KMT, or Nationalist Party, has the longest running political record in Taiwan. Founded by Dr. Sun Yatsen in 1894, the KMT celebrated its one hundredth anniversary on 24 November 1994. The party is of major significance in Taiwan's history, and was involved in the war against Japanese invaders, struggles against **communist** rebellion, implementation of the constitution, and the economic development of the island. The KMT enjoys wide support, with a membership of approximately 2.1 million. At the lowest level, members are organized into cells. Moving upwards, there are district, county, and provincial congresses and committees. The highest level includes the National Congress and the Central Committee. With its historic defeat in 2000, KMT's leadership began an evaluation of the party platform, direction, and standing, compared with the other political parties.

The Democratic Progressive Party (DPP) was long the leading opposition party to the KMT. It was established on 28 September 1986 and has approximately 200,000 members. Its main policy is in direct opposition to the KMT because it calls for Taiwan's complete independence from mainland China. In recent elections, the more senior officers of DPP have tended to attach less importance to the party's stance on independence in an attempt to attract more voter support. The lack of consensus on this issue has caused some dissent within the party and has resulted in the breaking away of members who are passionate advocates of Taiwanese independence. Several of these dissatisfied DPP members have left the party and, with new recruits, have formed the Taiwan Independence Party and the New Nation Association.

In the 2000 elections, the economic platform espoused by the DPP included the introduction of a **pro-**

gressive tax system, elimination of unemployment, the promotion of balanced development in every sector of the economy, the opening of state-run enterprise to private investment, and protection of the environment against further destruction.

Another opposition party that has emerged is the New Party (NP), formed in August 1993 by a KMT breakaway group composed of 6 Legislative Yuan (a branch of government) members and 1 former lawmaker. Their official statement of resignation from the KMT, as documented in Taiwan's 1999 Yearbook, gave as their reason the "undemocratic practices of the KMT" as well as ideological differences. The New Party has been led by such prominent political personalities as the former finance minister, Wang Chien-shien, and former head of the Environmental Protection Administration, Jaw Shau-kong. The party champions 2 major issues: anti-corruption and social justice. The goal of the NP is to attract those voters who were dissatisfied with the performance of the ruling KMT, but who are opposed to the DPP's support for independence. The NP now claims a registered membership of nearly 68,500.

One of the newest parties to emerge because of Taiwan's ongoing democratization is the People First Party (PFP), established on 31 March 2000 by former Taiwan governor James Soong. The PFP is distinct from the other parties in allowing eligibility for membership at age 16, 2 years younger than the minimum age required by the other parties. James Soong, who was elected as the party's first chairman, ran as an independent in the 2000 presidential elections, but was defeated. The PFP is still in the process of establishing its structure and political base.

GOVERNMENT EXPENDITURES AND TAXATION. Data generated by the Directorate General of Budget, Accounting and Statistics (DGBAS) shows that the government spent NT$1.164 trillion in 1999. A big percentage of the budget went to national defense (22.6 percent); followed by education, science, and culture (17.4 percent); economic programs (14.8 percent); social welfare (13.5 percent); general administration (11.6 percent); and pension and survivor's benefits (11.1 percent). In the same year, the government posted a **budget surplus** amounting to NT$64.6 billion, while **external debt** amounted to US$35 billion.

Taiwan's government collects 18 different categories of taxation, which provide the revenue for national expenditures. Nine of these categories are classified as **direct taxes**: corporate **income tax**, individual income tax, rural land tax, land value tax, land value increment tax, estate and gift tax, mining-lot tax, house tax, and deed tax. The other 9 taxes are indirect and include customs **duty**, business tax, commodity tax, stamp duty, vehicle license tax, securities transaction tax, amusement tax, slaughter tax, and harbor dues.

Taxes are collected by the National Tax Administration, which administers different tax collection offices in the different provinces and municipalities. In 1999 tax revenue alone accounted for 62.7 percent of the government's total revenues. In the same period, the government was able to collect a little over NT$770 billion in taxes according to DGBAS statistics.

INFRASTRUCTURE, POWER, AND COMMUNICATIONS

One of the key factors in Taiwan's rapid economic development is its well-planned and efficient transport network. As an export-oriented economy, its many businesses are heavily dependent on shipping, by air and sea, for the transport of their goods to overseas markets.

On 5 January 1995, Taiwan approved the Asia-Pacific Regional Operations Center (APROC) Plan, an

SOURCE: CIA *World Factbook 2001* [Online].

ambitious project that will transform the island into a center of business and investment in the Asia-Pacific region. With APROC, Taiwan plans to attract the establishment of new local, as well as foreign, companies on the island. Taiwan's world-class and well-organized facilities would see such companies conveniently placed to take advantage of opportunities in the flourishing Southeast Asian markets, and the much coveted market of mainland China.

There are a total of 34,901 kilometers (21,687 miles) of roads in Taiwan, 90 percent of which are paved. Taiwan has a modern railway system that provides frequent and convenient passenger service between major cities on the island. As of 1999, Taiwan's railway network totaled 2,481 kilometers (1,542 miles). Railways in Taiwan are operated by the Taiwan Railway Administration (TRA), the Taiwan Sugar Corporation, and the Taiwan Forestry Bureau. The TRA provides passenger and freight services to the general public, while the Taiwan Sugar Corporation and the Taiwan Forestry Bureau haul their own products and offer only limited passenger service.

The government has already begun the development of a high-speed railway (HSR) that is expected to begin operating in June 2003. The planned HSR route, 340 kilometers (212 miles) long, will pass through the west corridor of the island. Ten stations will be located from Taipei to Kaohsiung to serve about 22 million residents in the region. The estimated construction cost of the project is US$13.05 billion, and the HSR will cut the present travel time from north to south by train or highway vehicles from 4 hours to 90 minutes.

As of December 1997, Taiwan's shipping industry had a fleet of 255 vessels weighing over 100 gross tons. Taiwan claims to have one of the largest fleets of cargo container ships in the world. Taiwan has 6 international harbors: Chilung, Suao, Taichung, Hualien, Anping, and Kaohsiung. Waterborne imports and exports handled by these ports amounted to 166.1 million tons in 1997.

As of 1997 51 airlines have been providing flight services to destinations in Taiwan. There are 34 foreign carriers, and 5 domestic-based airlines: EVA Airways, Mandarin Airlines, China Airlines, Transasia Airways, and Far Eastern Air Transport Corporation. Three Taiwan-based carriers offer international charter services: UNI Airways Corporation, Great China Airlines, and U-Land Airlines.

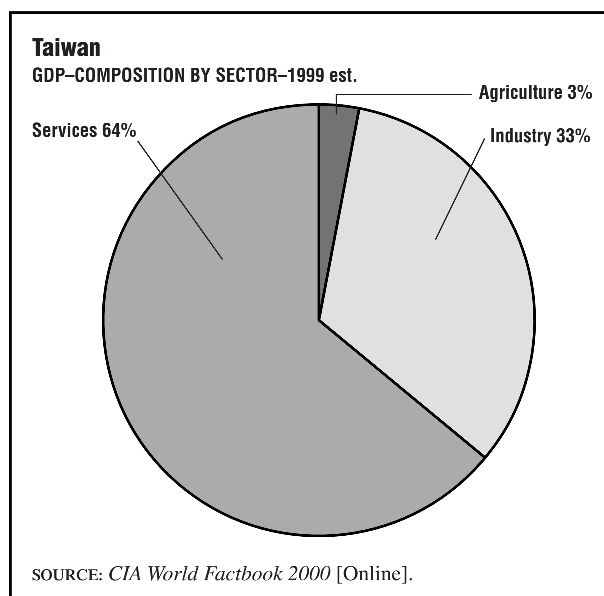
Taiwan has 2 international airports: Chiang Kai-shek International Airport at Taoyuan in northern Taiwan and Kaohsiung International Airport in the south. In addition, there are several domestic airports.

COMMUNICATIONS. The government is laying the foundation for a national information infrastructure through 30 different projects designed to make the country into a competitive and knowledge-based society. The different projects are focused on enhancing broadband access, improving the quality of Internet service, improving and diversifying the content of local web sites, and promoting electronic commerce and other Internet-based applications. As of 1 July 1999, Taiwan had 15 Internet service providers and 4.13 million Internet users. Based on official estimates, there are at least 52,000 locally authored web sites in Taiwan, 89.6 percent of which are dot-coms (Internet-based companies offering different types of conventional and innovative goods and services). Most of these web sites are written in Chinese, although many provide English versions.

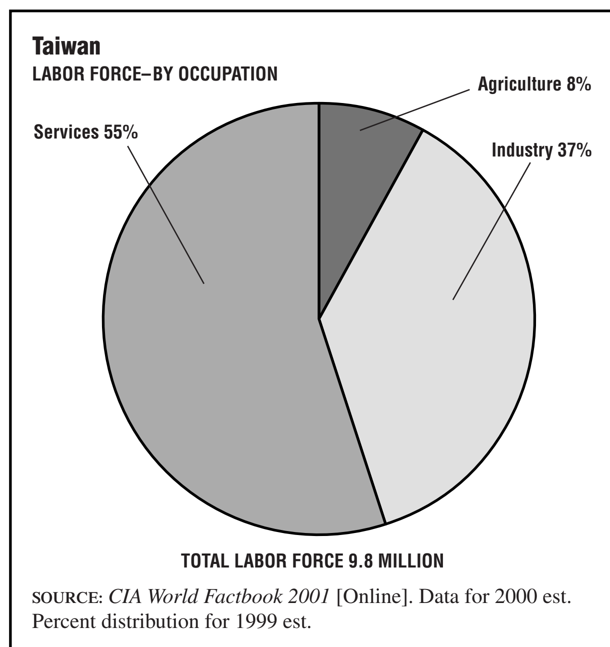
As of April 2000, the Directorate General of Telecommunications estimated the mobile phone subscribers at 13.78 million, a number that was higher than the estimated 12.49 million telephone main lines. In July 2000, Taiwan reduced its international direct dialing (IDD) fees by an average of 15 percent. Earlier, charges on local and mobile phones, leased lines and Internet service had seen reductions of between 2 percent and 5 percent. Further reductions are expected once a separate accounting system has been established and an evaluation of the state-run telecom company carried out.

ECONOMIC SECTORS

According to a study by the Nomura Research Center of Japan, the competitive advantage of Taiwan's manufacturing industry lies in information, telecommunications, and other high technology industries. Correspondingly, the government has identified and appropriated funding for the development of 10 high technology industries that will be the foundation of Taiwan's economic success in the first few decades of the 21st cen-



SOURCE: *CIA World Factbook 2000* [Online].



SOURCE: *CIA World Factbook 2001* [Online]. Data for 2000 est. Percent distribution for 1999 est.

tury. The 10 industries are: (1) communications, (2) information, (3) consumer electronics, (4) semiconductors, (5) precision machinery and automation, (6) aerospace, (7) advanced materials, (8) specialty chemicals and pharmaceuticals, (9) medical and health care equipment, and (10) pollution control and treatment.

Labor-intensive industries such as processed foods, leather products, and wood and bamboo products have gradually been replaced by capital- and technology-intensive industries. Examples of these industries are chemicals, petrochemicals, information technology, electrical equipment, and electronics. Electronics and information technology are the biggest players in the manufacturing sector, which employs 26 percent of the national workforce.

The service sector is thriving and shows promise of further growth as the spending power of the population increases. By the end of 1995, the growth of the service sector exceeded that of the agricultural and manufacturing sectors by more than 60 percent and has continued to do so. The different businesses that fall under the service sector in Taiwan are: finance, insurance, and real estate; commerce, including wholesale and retail business, food and beverages, and international trade; social and individual services; transport, storage, and telecommunications; commercial services, including legal, accounting, civil engineering, information, advertising, designing, and leasing; governmental services, and miscellaneous others. Among these businesses, finance, insurance, and real estate are the most dominant. The service sector creates the largest competitive employment opportunities and employs the bulk of Taiwan's labor force.

Meanwhile, the contribution of the agricultural sector to GDP has been steadily declining since the 1980s when Taiwan's government shifted the focus of its economic strategy to industrialization. Few of the younger generation are willing to work in the agricultural sector, preferring to pursue better opportunities in the other sectors. Farmers make up only 8 percent of the labor force and produce less than 3 percent of the island's total GDP according to 1999 statistics. Consequently, the sector diminished in importance while the manufacturing sector has risen to the forefront. The agricultural sector will face even more problems when the country is finally accepted as a member of the World Trade Organization (WTO). To comply with the WTO's requirements, the government has been systematically reducing the trade barriers on its traditionally well-protected agricultural goods, leaving local produce to face increased competition from the foreign agricultural products that will flood the domestic market when Taiwan becomes a full-fledged member in the WTO.

Manufacturing has long been overtaken by the service sector in terms of contribution to GDP. In 1999, the service sector contributed the biggest slice of GDP at 64 percent, with industry accounting for 33 percent, and agriculture 3 percent.

AGRICULTURE

In the 1950s, 90 percent of Taiwan's residents lived in farming communities growing rice, sugar, tea, camphor, and other crops. Two decades later, the government aggressively pursued industrialization, causing agricultural exports to fall behind agricultural imports. By 1999, agriculture constituted only 3 percent of Taiwan's GDP compared with 32.2 percent in 1952. Although the total area under cultivation decreased by one-third between the 1960s and the 1990s, the value of agricultural output to the national economy has increased by half because of improvements in overall productivity. Taiwan's biggest export markets are Japan, Hong Kong, and the United States.

In 1998, rice was Taiwan's most valuable crop, followed by betel nuts, corn, sugar cane, mangos, watermelons, tea, pineapples, pears, and grapes. In the 2 crop seasons of 1998, Taiwan harvested 1.49 million tons of brown rice. According to the Taiwan Provincial Department of Food (TPDF), this was more than was needed to meet local demand. The oversupply of rice is expected to peak as Taiwan braces itself for intensive competition from foreign rice imports as the country moves toward membership in the WTO.

Next to hogs, rice, and chickens, betel nuts rank as Taiwan's fourth most valuable farm product according to TPDF. Demand steadily increased in the 1990s, resulting in the expansion of areas cultivated for betel nuts. In 1997,

56,300 hectares of land were planted with betel nuts and produced almost 156,000 metric tons. Farmers were keen to plant betel nuts because, in a good year, the income can be 10 times higher than that from growing rice.

In 1998, 178,000 hectares of land were devoted to vegetable cultivation, which yielded 2,872,571 metric tons of produce. More than 100 kinds of vegetables are grown in Taiwan. The primary vegetables grown in planted areas are bamboo shoots, watermelon, leafy vegetables, vegetable soybeans, cabbage, cantaloupe, garlic, scallions, celery cabbage, Chinese cabbage, and radishes.

Taiwan produces 30 varieties of fruit, including apples, pears, peaches, citrus fruits, bananas, pineapples, lychees, longans, mangos, papayas, persimmons, loquats, and guavas. The main crops are citrus, mangos, lychees, bananas, pineapples, wax apples, and Asian pears. Pineapples and lychees are canned to satisfy domestic and international demand, while other fruits are processed into juice for local consumption.

FLORICULTURE. From 1986 to 1998, Taiwan's floriculture (flower-growing industry) underwent huge and profitable expansion, and its export value increased from US$3.7 million to US$41.5 million. As demand and sales increased, Taiwan's floral nurseries were expanded from 3,500 hectares to 10,000 hectares. The major export markets for flowers are Japan, Hong Kong, and the United States. Most flower farms allocate half of their planting area to producing cut flowers, that is, flowers sold as single stems for vases and floral arrangements, while the other half is used for nursery production. Annual production of cut flowers is 1.4 billion stems and 25 million potted plants.

FISHING. In 1998, the Taiwanese fishing industry harvested fish worth US$2.9 billion, of which 62 percent came from deep-sea fishing, 20 percent from aquaculture, 15 percent from offshore fishing, and 3 percent from coastal fishing. Skipjack and eel are Taiwan's biggest water-based export items. The export value of eel, most of which goes to Japan, exceeded US$400 million in 1998.

To protect natural resources and further develop the island's fishing industry, Taiwan's government invested in the construction of fishing harbors, wholesale markets, modern equipment, and other infrastructure during the 1980s. During the 1990s, the government complemented this initiative with renewed efforts to raise public awareness of environmental and conservation issues. Several environmental laws were passed, such as the Water Pollution Control Act in 1991 and the Environmental Impact Assessment Act in 1994.

Taiwan's mountainous terrain serves as a natural hazard to its thriving fishing industry, especially in the rainy season when mud and silt are deposited in the island's wide and shallow river beds. The government, therefore, set aside and developed areas especially suited to aquaculture (the production of scientifically farmed fish), and Taiwan has become a world leader in aquacultural development. The industry flourished in the 1980s, but received a setback when the grass shrimp industry was hit by an epidemic in 1987. During the 1990s, government further boosted production by promoting automation, encouraging the use of biotechnology, and improving its marketing strategy.

LIVESTOCK. In the 1950s, the farming of livestock in Taiwan was a backyard enterprise. In just 4 decades since, livestock grew into a multi-billion dollar industry and has become a major export product. In 1998, livestock production was valued at more than US$3.6 billion, accounting for 41.56 percent of the total value of agricultural production. Hog farming still ranks first in the livestock industry, followed by broiler chickens, eggs, and milk. However, an outbreak of foot and mouth disease in March 1997 caused a temporary decline in export sales. The official estimate of hog farms stricken by the disease is 6,147 across 20 cities. To control the spread of the disease, the government ordered the extermination of all affected animals and the immediate vaccination of those unaffected. Roughly 21 million doses of vaccines were used to bring the disease under control. Since then, the hog industry has recovered and export sales have returned to the normal level.

Taiwan attributes the growth of its agricultural industry to the dedication of its farmers, the development of a farmers' organization, continual improvements in techniques and infrastructure, and the implementation of a beneficial land reform program. The government continues to support its farmers with price guarantees, low-interest loans, economic incentives, and other helpful measures.

Through technological improvements such as new cultivars, growth regulators, and mechanization, crop yields per hectare of land jumped from 8,600 kilos in 1945 to 16,384 kilos in 1998. Taiwanese fruit growers have applied advanced horticultural technology to modernize their operations. Through the effective control of plant diseases, adjustments to fruit maturation periods, the cultivation of improved fruit strains, and the implementation of multiple annual harvests, the fruit sector has witnessed profitable growth.

Taiwan has used information technology to create the National Agricultural Information Service, an integrated agricultural information database that includes planning, production, and marketing information related to domestic farming, forestry, fishing, and animal husbandry. This database provides rapid access to information and communication, and allows players in the agricultural sector to exchange ideas at an international level.

Taiwan's agricultural sector faces several challenges. Efficient farming is hindered by the rapidly aging agrarian workforce and a severe shortage of new young workers, who have abandoned the rural life for more profitable careers in the cities. Farmers are having to confront falling incomes, rising costs, and increased foreign competition, and as Taiwan's entry into the WTO approaches, the farmers' predicament will worsen before it gets better.

Another factor that serves to hinder agricultural growth is the island's mountainous topography, which restricts farming to the arable western slopes and alluvial plains. To make matters worse, plots are small with most farmers having less than 1 hectare of cultivable land. This restricts the application of advanced agricultural methods such as mechanization, since these depend on economies of scale (large output) to be cost-effective. Promotion of efficiency in the farming industry has not kept pace with other sectors. About 10 percent of Taiwan's total farmland has been neglected because farming has ceased to be profitable.

The development of aquaculture is seriously threatened by environmental degradation. Freshwater aquaculture uses huge amounts of ground water, sometimes causing land to shift or cave in. Two of Taiwan's government agencies, the Ministry of Economic Affairs and the Council of Agriculture, have jointly promoted recycling systems that use fresh water more efficiently, and have encouraged aquaculturists to switch to marine ranching.

Taiwan's fishing and aquaculture industries are endangered by the pollution of its rivers and coastal waters caused primarily by the expansion of urban communities. There are 21 primary, 29 secondary, and 79 ordinary rivers in Taiwan. According to the Environmental Protection Administration (EPA), 33.8 percent of primary and secondary rivers are polluted to different degrees. Most industrial, agricultural, and residential wastewater drains directly into rivers, seriously polluting the water downstream. By April 1998 only 240,000 households (33.25 percent) were connected to the sewage system.

INDUSTRY

INFORMATION TECHNOLOGY. According to the Institute for Information Industry, Taiwan's software market will have reached up to NT$150 billion in production value by 2001 due to rising global demand for software. Continued investment and a steady supply of competent human resources are 2 major factors behind the sharp growth of Taiwan's software industry in recent years. The industry will have the opportunity to upgrade its production value further in the future, especially as **e-commerce** becomes increasingly popular among domestic enterprises in Taiwan.

In 1998 Taiwan's hardware information technology industry registered a total production value of US$33.8 billion, up by 11.9 percent from US$30 billion of the previous year, making it Taiwan's most important foreign exchange earner. Since 1995, Taiwan has been the world's third-largest computer hardware supplier after the United States and Japan. Taiwan has about 900 computer hardware manufacturers employing close to 100,000 workers. These companies manufacture laptop computers, monitors, desktop PCs, and motherboards which, in 1998, accounted for about 80 percent of the production value of the information technology industry. To secure a lion's share of the world market, Taiwan's manufacturers strive to maintain high quality and competitive prices. According to statistics released by the Institute for Information Industry, Taiwan has already replaced Singapore as Japan's second largest supplier of information products after the United States. In March 2000, Taiwan earned the distinction of becoming the world's leading manufacturer of CD-ROM drives, a feat made possible by Japan's withdrawal from the CD-ROM market in 1998. In 1999 Taiwan also claimed to be the world's largest supplier of notebook PCs, with an estimated world market share of 49 percent.

AUTOMOBILES. Thirteen automobile manufacturers have plants in Taiwan. Most of these are working in partnership with foreign carmakers, mostly Japanese. These companies produce and import automobiles. In 1998, roughly 402,000 automobiles were produced in Taiwan, and the value of the automotive industry reached US$9.93 billion.

However, limited parking space and the efficient mass transit systems in urban districts have resulted in the decline of the domestic car market. From a high of 542,000 units sold in 1995, only 476,000 were purchased in 1998, with 80 percent of the demand being for sedans. In recent years, competition between locally made and imported vehicles has gradually decreased. In 1998 the domestic automobile industry, although threatened by imports from Japan and the United States, still managed to capture about 84 percent of the market, with over 70 percent of the 292,000 domestically made sedans supplied by 3 companies: Ford Lio Ho Motor Co., Ltd. (20.3 percent), Yulon Motor Co., Ltd. (28.6 percent), and Kuozui Motors, Ltd. (22.4 percent). In the commercial vehicle market, China Motor Corporation maintained its traditional top position, producing over half of the 115,700 commercial vehicles sold.

To strengthen the industry, automobile manufacturers need to invest in research and design (R&D), and to improve their own technology in engines, computerized gearing systems, and several other components, to enhance their design capability. One of the industry's weaknesses is its dependence on foreign engines and its inability to produce other key parts such as airbags, which

has curtailed its plans to export vehicles. Since 1999, the Ministry of Economic Affairs has allocated funding to encourage R&D and thus alleviate the automobile industry's dependence on imports from Japan and elsewhere.

TEXTILES. The Taiwanese textile industry produces synthetic fibers, yarns, fabrics, clothing, and clothes accessories. In the last few years, local manufacturers have attempted to develop man-made fibers and fabrics to compensate for Taiwan's inability to produce cotton or wool, and its limited production of silk and linen. In 1998, Taiwan produced 3.25 million metric tons of man-made fiber, the third highest volume in the world. The country's output of polyester fiber, at 2.68 million tons, occupied second place globally. Nylon production was the world's highest at 301,000 tons. Taiwan has also started mass-producing carbon, spandex, and viscose fibers. The chief export markets for Taiwan's textile exports are the United States, Hong Kong, and other Southeast Asian countries.

SERVICES

FINANCIAL SERVICES. As in the past, Taiwan's banking system is dominated by state-run institutions. Despite pressure from foreign investors, the financial sector has not been **liberalized** and remains under government control. Consequently, the financial services sector is underdeveloped. In 1995, the combined factors of the Mexican peso crisis, the flight of foreign capital from Taiwan, and the collapse of several savings institutions brought even more restrictive government controls, the severity of which caused an increase in **black market** activities. In 1991, the Bureau of Investigation launched a campaign against unlicensed investment houses and underground futures brokers that resulted in prosecutions of certain companies charged with stock manipulation. Despite such moves, the sector continued to draw criticism for its perceived dubious and risky practices.

RETAIL. One of the biggest retailers in Taiwan is the 7–11 chain of convenience stores. In terms of store-to-population density, Taiwan has the highest ratio in the world with one 7–11 outlet for every 10,000 people. Owned by the President Chain Store Group, the company's revenues amounted to US$1.29 billion in 1998. The President Group is a household name in Taiwan, where almost everybody has used its products or services at one time or another. Moreover, it is the largest Taiwanese investor in mainland China. In October 1999, the Ministry of Economic Affairs approved a US$328 million mainland-bound investment project proposed by the President Group. The company is diversifying its operations by reinvesting in the Starbucks coffee shop chain and the Conforama home furniture and appliance chain.

Aside from food and beverages, an emerging retail market in Taiwan is the home improvement and furniture market. With the population's increased spending power, ever-increasing numbers of people are renovating their homes and surroundings. In 1992, internationally renowned companies like Ethan Allen, ID-design, Ikea, and B&Q entered the Taiwanese market. In an interview with the *Free China Journal* in 1999, an Ikea official estimated the annual value of the furniture sector in Taiwan at US$203 million. This estimate did not include the home improvement sector.

In 1998, Ikea's international chain of stores posted earnings worth US$7.02 billion. According to the Taiwan Furniture Manufacturers' Association, the huge potential of the sector evidenced by the earnings of the foreign companies has attracted Taiwan-based furniture exporters to offer their products to the domestic market as well.

INTERNATIONAL TRADE

The phenomenal growth of Taiwan's economy can be credited to its brisk foreign trade. From 1970 until 1990, the country amassed huge surpluses from its earnings in international trade, which peaked in 1987 when the **trade surplus** reached US$18.7 billion. However, several other countries became alarmed at Taiwan's huge surpluses and the corresponding economic power it might exert on other economies. The United States demanded that Taiwan remove trade restrictions and allow more foreign products into the country. Since then, Taiwan has reduced or removed a significant number of trade barriers, thus allowing foreign products to compete with local products in the domestic market. From 1992 to 1996, Taiwan's trade surplus declined by nearly 30 percent. However, from 1998, trade figures have once more shown a steady rise and, according to the Central Bank of China, Taiwan's **foreign exchange reserves** in 1999 amounted to US$106.2 billion, one of the highest in the world. In 2000, Taiwanese exports reached US$148.38 billion against imports of US$140.01 billion, producing a trade surplus of US$8.37 billion.

Taiwan is a major exporter of industrial products ranging from mechanical appliances and accessories, electronics, electrical appliances, personal computers and peripherals, metal products and transport equipment, to furniture and clothing. The United States has been Taiwan's most important trading partner over decades. However, as Taiwan pursued the expansion of its economy, it began seeking out other trading partners, which resulted in a decrease in trade with the United States. In the 1980s, 40 percent of Taiwan's total exports were U.S.-bound; by 2000 only 23.5 percent of the island's total exports were destined for the American market.

Trade (expressed in billions of US$): Taiwan

	Exports	Imports
1975	5.302	5.959
1980	19.785	19.764
1985	30.704	20.124
1990	67.142	54.830
1995	111.585	103.698
1998	110.454	104.946

Until 1999, Japan was Taiwan's biggest export destination after the United States. However, since 1999, Hong Kong has replaced Japan as the second leading export partner, since Taiwan uses it as an indirect link to send goods to mainland China. Major items exported to Hong Kong include electrical and electronic equipment and peripherals, machinery, accessories, raw plastic materials, and textiles. In 2000, exports to Hong Kong amounted to 21.1 percent of Taiwan's total exports, while those to Japan, due also to the slowdown of the Japanese economy, only accounted for 11.2 percent.

Southeast Asia has become an attractive trading partner for Taiwan. Many Taiwanese businesses have set up in Southeast Asian countries such as Thailand and the Philippines to take advantage of abundant skilled labor, availability of raw materials, and lower land prices. In 1986, only 5 percent of Taiwan's exports were bound for countries in the Association of South-East Asian Nations (ASEAN), but by 2000 the figure had climbed to 12.2 percent.

Taiwan has also set its sights on the large and economically strong European market. In 2000, Taiwan recorded exports to Europe at 16 percent of its total. The country's top 4 European trading partners are Germany, France, the United Kingdom, and the Netherlands, which, together, account for more than 60 percent of exports to the continent.

With huge exports fueling the economy, the spending capacity of the government and the population has multiplied. In the past, the government aggressively discouraged the entrance of imported products to the island by trade barriers and restrictive laws. However, with the new economy, the government has liberalized the situation and, in 2000, Taiwan's total imports amounted to roughly US$110 billion. More than a quarter, or 27.5 percent, of these imports came from Japan. Taiwan's industries, especially the information and automobile industries, rely heavily on the supply of parts and the transfer of technology from Japan. Most of the items imported from Japan are machinery, auto parts, electrical appliances, electronics, chemicals, and metal products. Other imports come from the United States (17.9 percent) and Europe (13.6 percent).

Despite the absence of direct transport links to mainland China, Taiwan's economic ties with the country are strengthening through the substantial Taiwanese investment being poured into China. Taiwanese businesses are eager to invest in mainland China, one of the most sought-after markets in the world. With a population approximately a billion strong, China is not only a huge market for any country's products, but also has one of the biggest manpower resources in the whole world. Trade relations between the 2 economies are so intertwined that breaking them off would bring major repercussions. Mainland China is a big contributor to Taiwan's overall trade surplus. In 1987, Taiwan had a trade surplus of just over US$1 billion with mainland China, and by 1998, this had grown to US$15.7 billion.

Based on data from Taiwan's Mainland Affairs Council, the value of 2-way trade between Taiwan and mainland China amounted to US$23.95 billion in 1998. More than 82 percent of the indirect trade consisted of exports from Taiwan, which totaled US$19.84 billion. Some major items exported to mainland China are industrial machinery and equipment, electronic parts, plastics, man-made fibers, and industrial textiles. Meanwhile, imports from China climbed to 4.1 percent in 1999 from 3.9 percent in 1998. Agricultural and industrial raw materials accounted for a huge percentage of these imported goods. However, in view of the uneasy political relations that prevail between the 2 territories, Taiwan does not concentrate too great a part of its investments in China. Taiwan is mindful that political upheaval in its dealings with China would jeopardize its own economic development.

Taiwan is gearing itself for membership in the WTO and is setting the proper economic policies in motion to ensure its acceptance. One of the long-standing trade issues for which Taiwan is criticized is its violation of agreements on the protection of intellectual property. Piracy in different forms—such as copying and reselling the contents of entertainment and software CDs—remains a serious matter. To its credit, Taiwan's government is addressing the problem through a combination of rules and regulations to control piracy, and efforts to raise awareness of the issues involved with it.

MONEY

The financial industry in Taiwan operates within 3 important legal frameworks: the Banking Law, the Securities and Exchange Law, and the Insurance Law. Three government agencies oversee financial operations: the Ministry of Finance (MOF), the Central Bank of China

(CBC), and the Departments of Finance of each municipal or provincial government.

The MOF is in charge of supervising the financial markets and allied financial institutions in Taiwan through its subordinate agencies: the Bureau of Monetary Affairs, the Securities and Exchange Commission, and the Department of Insurance. In addition, it formulates policies that contribute to the development and efficiency of Taiwan's financial service sector. The CBC controls the strict implementation of the **monetary policies** of Taiwan as outlined in the provisions of the Banking Law and the Law Governing the CBC.

Each of the provincial or municipal governments has its own Department of Finance. Collectively, these departments direct and control community financial institutions such as credit cooperatives and the credit of farming and fishing associations.

The several agencies and institutions that comprise the structure of Taiwan's financial sector offer a wide variety of financial services, designed to cater to clients from big business to individual account holders.

Banks fall into several categories such as commercial banks, specialized banks, local branches of foreign banks, and others, established under Taiwan's banking laws, which undertake savings and trust business and deal in securities. In the past, the sector was dominated by government-owned banks, but, as a result of increasing competition and government **privatization** policies, 15 new private commercial banks were established in 1991. These new arrivals now dominate the market.

Credit cooperatives provide banking services in regional communities where the customer base is small and it is not economically viable to establish commercial banks. Grassroots organizations such as farming and fishing associations usually have credit departments to take charge of promoting economic development in their particular areas. Investment and trust companies act as fund managers of trust funds and trust properties.

The Postal Savings System of Taiwan has more than 1,600 post offices throughout the island where people can remit or deposit money. Money may be withdrawn and re-deposited into banks, or reinvested in different financial instruments.

The insurance industry offers life and other insurance. Life insurance includes simple life insurance, health insurance, and accident insurance. Other policies offer fire insurance, marine insurance, land and air transportation insurance, liability insurance, and other non-life insurance.

In 1960 the Securities and Exchange Commission was founded in Taiwan, based on American and Japanese models. In 1961, the Taiwan Stock Exchange (TSE) was established and began operating in 1967, and the Securities and Exchange Law was passed in 1968.

The first securities traded in Taiwan were issued by the Taiwanese government in 1949, and were called "Patriot bonds." Trading in stocks began on an informal basis in 1953 when the government launched its "Land to the Tillers" program. The objective of the program was for government to buy land from large landowners and distribute it equitably among farmers with no land of their own. Rather than money, landlords were issued government shares in previously **nationalized** enterprises. Since the landowners were not interested in holding these stocks, an informal market developed to trade these shares.

POVERTY AND WEALTH

Poverty in Taiwan has almost been eradicated, with less than 1 percent of the population (129,968 people or 56,720 households) considered as poor or belonging to the low-income bracket. This means that more than 99 percent of the population enjoys the benefits of Taiwan's economic prosperity and greatly improved quality of life.

Families are classified as belonging to the low-income bracket if their average monthly income does not reach the estimated monthly minimum set by each city or province. To meet the family's basic needs (food, shelter, clothing, and education) in Taipei City, one would need to earn at least US$337 monthly. This amount changes depending on the city's standard of living; for example, one would only need to earn US$171 monthly to live in Kinmen County.

In 1999, the government spent US$5.08 billion on social welfare programs, and offers many kinds of assistance to individuals and families from low-income groups. In addition to cash, job-placement assistance is provided to the wage earners in families, along with educational aid for school-age children and health programs for mothers and children. There are also civic organizations, academic institutions, and private foundations that

GDP per Capita (US$)

coordinate with government agencies in assisting displaced or disadvantaged citizens.

Aside from low-income families, the government gives support to people, such as the elderly and the handicapped, who are unable to work. In July 1993, the government began providing a monthly **subsidy** to the low-income elderly. Citizens over the age of 65 whose average family income is less than, or equal to, 1.5 times the minimum monthly expenses are qualified to receive a monthly subsidy of US$174. Elderly people whose average family income is between 1.5 and 2.5 times the minimum expense are eligible for a monthly relief subsidy of US$87. In addition, the government pays the health insurance premium in full for low-income households and emergency aid where needed.

WORKING CONDITIONS

A well-trained labor force is the backbone of a developing economy, and Taiwan's economic growth over the past 50 years has been bolstered by a diversified and skilled workforce of about 9.7 million people. Approximately 6.6 million of these are employees, while the rest are either self-employed or have some other working status. The unemployment rate in 2000 was at a very low 3 percent.

Taiwan protects the rights of workers by law, while other important labor issues such as workers' welfare, gender equality, labor-management relations, safety and health, and appropriate quotas for foreign workers, are also clarified by legislation.

The Labor Insurance Act, which was passed into law in 1958, mandates the provision of insurance coverage to employees in the **private sector**, including industrial workers, journalists, fishermen, persons receiving vocational training in institutes registered with the government, union members, and those working in non-profit organizations. Teachers and employees working in government agencies who are not eligible for teachers' or civil servants' insurance are also covered under this law.

One of the most important labor laws in Taiwan is the 1984 Labor Standards Law. It supplies the basic legal definitions of worker, employer, wages, and contract, and outlines the rights and obligations of workers and employers. The law prescribes the minimum requirements for labor contracts, and makes provisions for working hours, work leave, and the employment of women and children. Furthermore, the law offers protections against unreasonable work hours and forced labor, and grants workers the right to receive compensation for occupational injuries and layoffs, as well as a retirement pension.

On the initiative of the Employment and Vocational Training Administration of the Council of Labor Affairs (EVTA), the Employment Promotion Measures law was formulated in 1985. This law aims to assist target groups such as women, people aged 45 and above, the disabled, aborigines (people from local indigenous groups), low-income households, and dispossessed workers to find decent employment. Under this program, the government assists women by promoting job equality between the sexes, providing women with vocational training, and surveying the demand for part-time and freelance opportunities to enlarge the employment market for women. The government also provides daycare centers for preschool children, after-school classes for elementary students, and day care for the elderly to relieve the pressure on women to stay at home.

In 1991 the Labor Safety and Health Law was amended to include many new requirements for the installation of safety and health equipment in work places such as dockyards and fireworks factories. The law covers almost all major industries in the industrial, agricultural, commercial, and service sectors, and specifically prohibits women and employees under the age of 16 from working in dangerous or harmful environments.

Passed into law on 8 May 1992, the Employment Services Act is a comprehensive law that seeks to ensure equal job opportunities and access to employment services for all. Specifically, the act calls for a balance of manpower supply and demand, efficient use of human resources, and the establishment of an employment information network. Further, the act requires the central government to encourage management, labor unions, and workers to negotiate reductions in working hours, wage adjustments, and in-service training to avoid layoffs, and for government to protect workers' rights during times of economic slowdown. The Employment Services Act also regulates public and private employment service agencies.

The Labor Inspection Law replaces the old Factory Law. It empowers the Council of Labor Affairs and local governments to inspect conditions in the workplace to ensure the safety and health of workers. The scope of

inspections carried out under the law covers health and safety, labor insurance, employee welfare funds, and the hiring of foreign workers. Employment at potentially dangerous sites requires approval from labor inspectors before employees can begin work on the project. Labor laws ensure the rights of workers to organize unions for the protection of their collective interests.

Under the revised Collective Agreement Law, labor unions are designated as the sole labor representative in the signing of collective agreements. Such agreements promote labor-management cooperation and cover working conditions such as wages, work hours, layoffs, pensions, compensation for occupational injuries, and the handling of labor complaints and disputes.

In Taiwan, women have been traditionally considered inferior to men and are expected to stay at home and submit to the decisions of fathers or husbands. However, new attitudes have slowly developed with the lobbying of women's groups for equal opportunities, and as Taiwan's society has become exposed to modern ideas. Over the last decade, society's expectations of women have changed as more women complete higher education, compete with men in the workplace, become financially independent, and postpone marriage to pursue a career. On average, first-time brides were 28.1 years old in 1998 compared to 25.8 in 1990. Almost half of Taiwan's women are regular wage earners and help support their families financially.

In 1998, the Ministry of Education reported that 56 percent of junior college graduates, 51 percent of university and college graduates, and 26 percent of graduate school graduates were women. This was a significantly large change from the figures of 20 years earlier, and marked the first time that female graduates outnumbered male graduates.

As in any country with a bustling economy, Taiwan cannot depend on its domestic labor force because the demand for workers exceeds available supply. In the high-tech industries, Taiwan produces 20,000 new workers annually, but 30,000 workers are needed. A sample survey of 302 Taiwan-based high-tech industries conducted by the Taipei Computer Association revealed that 80 percent of companies experience difficulty in finding suitable employees, particularly software specialists. Situations such as these call for the hiring of foreign workers to meet the labor shortage and, in August 2000, there were 316,078 foreigners working in Taiwan. Most of these workers come from Thailand, followed by the Philippines and Indonesia.

Aside from the large demand for labor, foreign workers are attracted to Taiwan by the range of job opportunities. The Taiwanese are now reluctant to take low-paying jobs or work in fields that demand heavy physical labor, and the agricultural sector is suffering shortages. An aging population and a low birth rate add to the problem. More workers are retiring than are entering the workforce, and the influx of foreigners is growing. The presence of a foreign workforce has created a degree of tension in Taiwan. Locals have expressed apprehension that their indigenous culture might be destroyed by foreign influences and, in practical terms, there is a possibility that wages will decrease because foreign workers are willing to accept less pay than the Taiwanese.

In July 2000, the unemployment rate of Taiwanese workers increased to 3.06 percent (300,000 workers) from 2.9 percent for the years 1999 and 1998. The main cause of unemployment is the layoffs in traditional manufacturing businesses, which are **re-structuring** or downsizing (cutting down the number of employees). The availability of sophisticated technology that can do the work of 2 or more people is one reason for downsizing, especially since the government is encouraging industries to shift from labor-intensive operations to high-tech manufacturing and services.

COUNTRY HISTORY AND ECONOMIC DEVELOPMENT

1206. The Island of Taiwan is declared a protectorate of the Chinese Empire.

1622. The Dutch establish a trading post and control much of the Republic of China (ROC) until 1662 when the Chinese expel them.

1887. Taiwan is granted provincial status by the Chinese mainland government.

1895–1945. Taiwan is declared a Japanese colony after the Sino-Japanese war in 1895, and remains a Japanese colony until the end of World War II in 1945.

1947. The Constitution of Taiwan is adopted.

1949. Chinese nationalist forces under Chiang Kai-Shek retreat from the Communist armies on the mainland to Taiwan and take power in Taiwan.

1949–91. Taiwan is officially in a state of war with the Peoples' Republic of China (PRC).

1951–64. The United States injects US$100 million annually into Taiwan's economy, supplying needed capital to Taiwan's industries, which grow rapidly during this period.

1953. The Taiwanese government begins a series of 4-year plans, setting goals and guidelines for economic development.

1961. The Securities and Exchange Commission (SEC) is established.

1969. For the first time, a popular national election is held and a handful of national politicians are elected with tenure for life.

1973–74. Taiwan's economic growth suffers a temporary setback due to the world oil crisis.

1975. President Chiang Kai-shek dies. For the next 3 years, the vast powers of the presidency rest in the hands of Premier Chiang Ching-kuo, chairman of the Kuomintang (KMT), the country's sole political party.

1978. Chiang Ching-kuo is elected president. The United States announces its decision to end recognition of the government of Taiwan and to transfer recognition and the United States embassy to the Peoples' Republic of China.

1983. The government opens the stock market to foreign investment.

1987. A vocal opposition, the Democratic Progressive Party (DPP), is established, thereby challenging the long-running dominance of the Kuomintang (KMT).

1988. The government lifts restrictions on the publication of new daily newspapers.

1989–93. Elections are described by foreign observers as progressively freer, leaving the KMT in power but facing a strong parliamentary opposition.

1993. The Ministry of Finance and the Central Bank of China allow the establishment of foreign exchange brokerage businesses and foreign insurance companies.

1994. The government assigns top priority to the implementation of the Twelve Major Construction Projects. A Comprehensive Physical Development Plan is initiated with a view to rationalizing land use, improving the investment climate, and upgrading the quality of life.

1994. President Lee and Premier Lien initiate the White Paper on China, which redefines Taiwan's one-China principle. The leaders of China bitterly oppose Taiwan's new one-China principle and accuse it of trying to establish an independent Taiwan.

1996. Conduct of the first presidential election results in victory for the KMT, with President Lee Teng Hui garnering 54 percent of the vote.

1996. Foreign mutual fund companies are allowed to invest in the stock market.

1997. The Plan for National Development into the Next Century is introduced. Aimed at accelerating Taiwan's transformation into a modern industrialized society, this plan is centered on the achievement of 3 goals: strengthening national competitiveness, improving the quality of life, and promoting sustainable development.

1999. President Lee provokes Beijing's fury in July when he declares that, in the future, Taiwan and China should conduct relations on a "special state-to-state basis," a move away from the official formula that they constituted one temporarily divided country.

2000. The opposition party, DPP, captures the top national positions as Chen Shui-bian and running mate Annette Lu are elected as president and vice-president respectively, breaking 55 years of uninterrupted rule by the KMT.

FUTURE TRENDS

Despite the current instability caused by the political realignment in the new administration of President Chen Shui-bian, Taiwan's future remains optimistic. Economic forecasts made by the Taipei-based World Economics Society point to continued growth, estimating that GDP growth over the next 10 years will not fall below 5.5 percent annually. The figure approximates the fluctuations of Taiwan's GDP annual growth performance in recent years: 8.2 percent in 1989, 6.68 percent in 1997, 4.57 percent in 1998, and 5.7 percent in 1999. This means that Taiwan's economy will continue to display stability and expansion, propelled by exemplary performance in the service and manufacturing sectors. Both sectors are expected to perform even better because of technological innovations and improved productivity. Moreover, employment levels and living costs are expected to remain manageable. Taiwan is also likely to benefit from its strategic position in the information technology industry. It aims to be known as the "Silicon Island of East Asia." This goal is not far-fetched since, in 2000, Taiwan ranked third in the world in the production of computer hardware and software, next to the United States and Japan. With its aggressive implementation of its growth plans, Taiwan is likely to attract more foreign businesses to the island and thus become a major international **procurement** and logistics base. The International Monetary Fund has recognized Taiwan's consistent economic performance by affiliating it with the rest of the world's advanced economies.

Politically, Taiwan's relationship with mainland China is still of major concern. To protect its economic achievement, Taiwan must tread slowly and wisely in setting the direction of its relations with mainland China. It must make sure that the relationship between the 2 territories is based on mutual respect and benefit. With regard to domestic politics, the government must continue to strengthen its democratic institutions.

The government is also taking steps to check the social and environmental impact of its economic programs

and policies. Environmental programs focusing on protection and conservation are being implemented across the island in line with President Chen Shui-bian's electoral promises, and research into green technologies is also promised.

Meanwhile, the newfound affluence of Taiwanese society has, inevitably, produced certain social problems that need to be nipped in the bud. The government has realized that the younger generation must be encouraged to retain the work ethic of their elders. This is crucial to the health of the country's economic future. The "nouveau riche" mentality that characterizes the poor who suddenly acquire wealth can result in people opening themselves to financial profligacy, profiteering, corrupt practices, and other social ills that accompany irresponsible wealth. Other emerging social concerns involve the rise in crime and criminal gangs, the breakdown of the family, and the neglect of children as parents become too involved with their careers.

DEPENDENCIES

Taiwan has no territories or colonies.

TAJIKISTAN

Republic of Tajikistan
Jumhurii Tojikiston

CAPITAL: Dushanbe.

MONETARY UNIT: Somoni (SM). Introduced in 2000 to replace the Tajik ruble. SM1 equals 1,000 Tajik rubles. Somoni are issued as notes of SM1, 5, 10, 20, 50, and 100. Also 1, 4, 20, and 50 diram notes (100 dirams in SM1).

CHIEF EXPORTS: Aluminum, electricity, cotton, gold, fruits, and textiles.

CHIEF IMPORTS: Electricity, petroleum products, natural gas, aluminum oxide, machinery and equipment, and foodstuffs.

GROSS DOMESTIC PRODUCT: US$7.3 billion (purchasing power parity, 2000 est.).

BALANCE OF TRADE: **Exports:** US$761 million (2000 est.). **Imports:** US$782 million (2000 est.).

COUNTRY OVERVIEW

LOCATION AND SIZE. Tajikistan is a landlocked country situated in Central Asia. Slightly smaller than the state of Wisconsin, Tajikistan's territory is measured at 143,100 square kilometers (55,251 square miles). It shares borders with Uzbekistan (1,161 kilometers) to the west, China (414 kilometers) to the east, Afghanistan (1,206 kilometers) to the south, and Kyrgyzstan (870 kilometers) to the north. The capital, Dushanbe, is in the west, near the Uzbekistan border.

POPULATION. The U.S. Central Intelligence Agency's estimated July 2001 population for Tajikistan was almost 6.6 million. The country's population density of 143 people per square kilometer is low except that 93 percent of the country is mountainous, resulting in a more real population density of 488 people per square kilometer; this figure is one of the highest in the world. Tajikistan's growth rate is about 2.12 percent. It also has a high infant mortality rate, estimated at 117.4 deaths per every 1,000 live births. Compared to many other countries, life expectancy at birth in Tajikistan is low, estimated at 64 years. Unlike many other countries, Tajikistan's rural population is rising due to a higher fertility rate in the countryside and reduced opportunities for employment in urban centers.

Tajiks comprise approximately 65 percent, Uzbeks about 25 percent, and Russians—due to economic and political reasons—less than 3.5 percent of the population. The autonomous (self-governing) Badakhshan province is primarily inhabited by Pamiri Tajiks whose various dialects can be considered separate languages from other Tajik dialects spoken in Tajikistan. Furthermore, whereas Tajiks and Uzbeks are mostly Sunni Muslims, the far majority of the people of Badakhshan are Shia Muslims. Other ethnic groups, such as Turkmen, Kyrgyz, and Tatars live in Tajikistan. While Tajik is the official language of the country, Russian and Uzbek are widely used, especially in business circles.

OVERVIEW OF ECONOMY

Civil conflict from 1992 to 1997 weakened Tajikistan's economy. It is estimated to have shrunk by 60 percent since 1991, when the Soviet Union broke up and its 14 former republics, including Tajikistan, declared their independence. Despite some economic gains in the past several years, Tajikistan still has one of the lowest **gross domestic products (GDP) per capita** among the former Soviet republics and Soviet bloc countries of eastern Europe. The country's primary source of foreign currency is the export of aluminum.

As in many other former **socialist** countries, Tajikistan has been implementing a **privatization** program. Since privatization began in 1991, the state has sold nearly 5,500 of its smaller properties. In 1999, nearly 300 auctions were held, resulting in more than 1,400 sales and generating the equivalent of US$14.4 million for the state treasury. One of the relatively larger privatized industries was most of the 26 factories for converting raw

cotton to cotton fiber. The government hopes that continued privatization in the agricultural and industrial sectors will lead to higher economic output.

POLITICS, GOVERNMENT, AND TAXATION

Soon after declaring its independence from the Soviet Union in 1991, the country was engulfed in a bloody civil war (1992–1997) fought along ideological and regional lines. That violent conflict took approximately 35,000 lives and led to massive amounts of **internally displaced persons** and refugees fleeing to other countries. The former communists, who had controlled the government, fought against a coalition of opposition parties dominated by the Islamic Renaissance Party and mostly composed of people with Gharm/Qarateguine regional origin. In June 1997, the opponents signed a peace accord, pledged to cease all hostilities, and promised to form a government of national unity.

The constitution, adopted in 1994 and amended in 2000, replaced the Soviet-era version. It established executive, legislative and judicial branches of government. The president of Tajikistan is considered the head of state, elected every 7 years for a maximum of 2 terms. The president appoints cabinet members, the prime minister, and the justices within the court systems, all subject to approval by the legislature. The ruling party in 2001 was the People’s Democratic Party of Tajikistan, associated with President Imomali Rahmonov. He has been in power since 1994 but his final term will expire in 2006. The prime minister acts as the head of government and directs the cabinet. In February 2000, elections were held to create a **bicameral** parliament.

The government generates most of its revenue from taxes. During 1996 and 1997, it maintained large **budget deficits**. There was a significant reduction of the deficit in 1999 to 3.2 percent of GDP and 3.8 percent in 1998. The government broadened the tax base and boosted revenue through the introduction of a new tax code in January 1999. The new code cut the number of tax categories from 45 to 17 and reduced the top rate of **income tax**. The government's budget deficit fell to a low of 2.2 percent of GDP in 2000. This was based mainly on the increased efficiency in tax collection and the revenue generated from privatization. The change was thought to increase tax revenue by as much as 1 percent of GDP.

INFRASTRUCTURE, POWER, AND COMMUNICATIONS

Tajikistan's **infrastructure** is relatively well developed. For example, a network of 13,000 kilometers (8,100 miles) of roads, mostly paved—though not in the best of conditions—covers large parts of the country. Despite the extensive road system, however, there is only 1 road linking Dushanbe with Khudzhand, the second biggest city in the country, which is located in the northern Leninabad region. Because climatic conditions often make this land route unusable, plans are underway to build the 13-kilometer (8.1-mile) Anzob Tunnel. The total cost for the project will likely surpass US$300 million.

The railway system is only 480 kilometers (298 miles) long and connects a few main towns to the Uzbekistan railway network. A major project nearing completion by end of 2001 is the construction of a railway from Qurghonteppa to Kulob, the 2 largest towns in the south. The country has 59 airports, 14 having paved concourses, though not all are operational due to lack of maintenance. The largest airports are in Dushanbe, Khudzhand, and Kulob. International destinations are limited and travelling on Tajikistan Airlines's dilapidated fleet is considered dangerous. Travel to Tajikistan from other parts of the world is time consuming, expensive, and cumbersome.

Access to information and communication tools are limited, with only an estimated 38 people out of every 1,000 having private access to a telephone. Moreover, the existing telecommunications system is prone to breakdowns and is in dire need of upgrading. Tajikistan was the last country among the former East European countries and the **Commonwealth of Independent States** (CIS) that was connected to the Internet. At least 2 Internet service providers and several cellular telephone companies of limited range operate in the country.

The 4 most important types of household fuel in Tajikistan are firewood, electricity, cow dung, and natural gas. Households and industry rely heavily on imported petroleum, natural gas, and—to a lesser extent—electricity, primarily from Uzbekistan. Tajikistan has an estimated 5.6 billion cubic meters of recoverable natural gas reserves, but due to financial barriers, it has been unable to increase its production. The government is attempting to encourage foreign companies to invest in **joint ventures** in the extraction of natural gas. The country's own oil production is about 3,000 barrels per day, while the consumption need of the country is more than 29,000 barrels per day. Tajikistan could be one of the world's leading per capita producers of energy if it were to expand its system of dams and hydroelectric plants. As it stands, due to the east-west configuration of its electricity grids, the country imports and exports electric energy without satisfying or affording its electricity needs. Large parts of the country, especially small towns and villages, face frequent and long periods of blackouts.

ECONOMIC SECTORS

In 2000, according to the Economist Intelligence Unit, Tajikistan registered a **real GDP** of US$1.1 billion. To find an estimate of its per capita income, GDP is divided by the estimated population of 6.6 million, arriving at a per capita GDP of a mere US$167 per year—

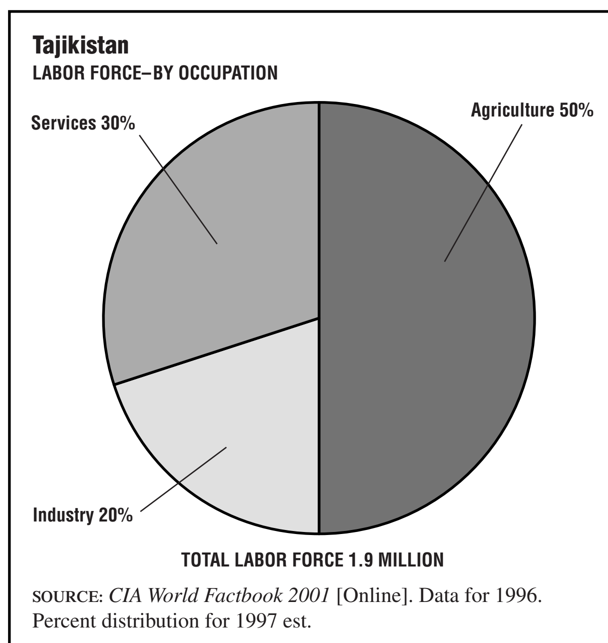
one of the lowest among East European and former Soviet republics. The economy of Tajikistan is heavily reliant on the export of 2 commodities—aluminum and cotton—and is highly susceptible to trade fluctuations. Trials of independence, a destructive civil war, and deteriorating terms of trade have combined to significantly reduce the capacity of the country to produce cotton and aluminum at levels comparable to pre-independence times. Furthermore, in 1998, due to stagnating world prices of both resources, a wide **trade deficit** of US$145 million and an equally large negative **current account balance** of US$107 million were incurred. Donor inflows, primarily from the United States and the European Union, and loans from the World Bank and International Monetary Fund (IMF), have helped moderate the current account deficit. However, **foreign direct investment** (FDI) in Tajikistan has been low, averaging only US$22 million per year between 1994 and 1998.



SOURCE: *CIA World Factbook 2001* [Online]. Data for 1996. Percent distribution for 1997 est.

AGRICULTURE

Tajikistan is primarily an agricultural country, with as much as 70 percent of its population living in rural areas and 65 percent of the workforce being employed in the agricultural sector, especially the cultivation and production of cotton. The Soviet Union had designated much of Central Asia's agriculture, including Tajkistan's, as a cotton monoculture (production of one type of crop). Before independence, production of raw cotton averaged more than 800,000 metric tons per year. In 1999, by contrast, raw cotton production was only 316,000 metric tons. Cotton still accounts for two-thirds of total agricultural output, however. Export of cotton fiber in 1999 accounted for a relatively low figure of US$92 million or 13 percent of GDP. The main reasons for a decline of cotton production are the substantial reduction in state **subsidies** to farms, the consequent inability of farms to purchase sufficient inputs such as fertilizers and other agronomic goods, and the deterioration of the irrigation system and agricultural machinery.

The primary food crops are wheat, barley, maize, potatoes, and rice. There are more than 800,000 hectares (2 million acres) of arable land in Tajikistan, which is equivalent to merely 6 percent of the country's land mass. The far majority of the arable land is located in the flood plains of the Kofarnihon, Vakhsh, Yakhsu, and Ghizilsu Rivers, all of which flow toward the Amudarya and Syrdarya rivers. In addition to the cropland, there are an estimated 3.5 million hectares (13,500 square miles) of permanent pastures. With its fast-growing population, Tajikistan has a comparatively and increasingly low per capita cropland. Wise use of agricultural lands, therefore, is an extremely important issue for Tajikistan. Since 1995, with the encouragement of semi-private farming and the distribution of more than 50,000 hectares (125,000 acres) of land to mostly rural households, there has been a significant increase in the production of grain, however, inclement weather since 1999 has severely affected overall agricultural production, including grain and cotton. The effects of floods have been exacerbated by the lack of proper land and water management by local governments, as in not maintaining riverbeds and allowing for the overgrazing of hills and valleys. The combined natural and human effects, have, among other things, led to a lowering of grain harvests, which had been an abundant 550,000 metric tons in 1997. This total fell by 57 percent to a low of 236,000 metric tons in 2000.

INDUSTRY

ALUMINUM. Following years of sharp decline, the end of the civil war in 1997 permitted relatively strong industrial sector growth, including real increases of 8 percent in 1998 and 5 percent in 1999. The mainstay of the industrial sector of Tajikistan is the production of aluminum, which requires alumina and large amounts of electrical energy. Even though Tajikistan does not have its own source of alumina, due to its potential for excess electrical energy, the Soviet Union built the Tursonzoda smelter, one of the world's largest aluminum smelters, near Dushanbe. The factory can produce as much as 500,000 metric tons of aluminum annually. Due to similar economic problems as the agricultural sector, however, since independence, aluminum production has declined. More than 90 percent of the aluminum produced is exported. Whereas the production of aluminum in 1990 was at a peak of 450,000 metric tons, by 1997, it had reached a low of 189,000 metric tons. Recently, however, the government has attempted to provide for the necessary inputs to increase aluminum production. Consequently, aluminum production in 2000 was estimated at about 300,000 metric tons.

MINING. Tajikistan has significant, largely unexplored, mineral deposits, such as gold, silver, antimony, and coal. Physical access to the sites—in remote areas with limited infrastructure—has been difficult and costly. A joint venture between British-owned Nelson Gold Company and the Tajik government, Zeravshan Gold Company, has been a success. In 1999, gold production in Tajikistan totalled 2.7 metric tons. In addition to gold, Tajikistan contains one of the world's largest silver deposits, Adrasmanskoye, which the country hopes to develop with the aid of foreign investors. Nine of the former Soviet Union's 34 antimony deposits are in Tajikistan. In 1997, 800 metric tons of lead was produced.

ENERGY. Tajikistan is a net importer of energy. In 1999, it consumed about 29,000 barrels of oil per day. The country has some petroleum deposits, and as much as 3,500 barrels of crude oil are extracted daily. There is no oil refinery, however, so all oil is imported—nearly 70 percent from Uzbekistan. Tajikistan has small natural gas reserves of about 200 billion cubic feet, and only minor domestic production. About 3 billion cubic feet of natural gas per year is produced domestically. In 1998, 37 billion cubic feet of gas was consumed, the majority imported from Uzbekistan and Turkmenistan. Gas pipelines run from Uzbekistan to Dushanbe, and from Uzbekistan to northern Tajikistan. Tajik authorities supply gas to Uzbekistan in exchange for Uzbekistan's free use of a rail transport corridor, a gas pipeline across northern Tajikistan (for **re-export** to Kyrgyzstan), and other incentives.

Due to the country's terrain and plentiful water, the major domestic energy resource is hydroelectric power: in 1998, Tajikistan produced 13.1 billion kilowatt hours (kWh). The southern and the northern power grids are linked to Uzbekistan. Over the past decade, depending on rainfall and domestic needs, Tajikistan has been both a net exporter and net importer of electricity. Due to a regional drought, begun in 2000, the country has experienced serious electricity shortages. It has imported more electricity and imposed increased power cuts on residential customers. Electricity prices were raised in April 2000 to limit demand. The Tursonzoda aluminum plant consumes 40 percent of the country's generated electric power. A new hydroelectric power dam, Sangtuda, is under construction with Russian and Iranian financing. It is expected to eliminate Tajikistan's need for power imports in the north and leave sufficient surpluses for export. A link between the northern and southern power grids is also planned. A study on improvements to the Tajik power grid, funded by the Kuwaiti government has been underway since 2001.

SERVICES

Services is the largest sector of the economy in Tajikistan. It constituted more than 60 percent of the country's GDP in 1998 and employs a significant part of the **labor force**. Much of the service economy is in the form of **retail** trade through micro- and small-enterprises scattered throughout mostly urban markets or bazaars. According to estimates from the state statistical agency of Tajikistan, the northern province of Leninabad sees more than one-third of retail trade, Dushanbe another third, and the southern province of Khatlon one-fifth. Despite the size of Badakhshan province—nearly half the territory of Tajikistan—its heavily mountainous geography limits its population to around 3 percent and its share of retail trade to even less. The primary products sold by small- and micro-businesses are domestically-produced agricultural goods and imported consumer items. Most of the consumer items sold by businesses are imported from Uzbekistan, Kyrgyzstan, and Kazakhstan. Increasingly, however, Tajik entrepreneurs—especially larger businesses—travel to Iran and Dubai to secure consumer items for import and sale. According to a 1998 survey of small- and micro-businesses throughout the country, the top 3 constraints facing them are racketeers demanding illegal fees, political instability, and taxation (the tax police).

FINANCIAL SERVICES. There were 17 registered banks in 1999. Four major commercial banks—Agroinvestbank, Orion Bank, Vnesheconombank, and Savings Bank—account for nearly three-quarters of all deposits and loans in the country. The banking sector, however, is marred by mismanagement and a history of extending **bad loans**. There are also few programs specializing in small loans to the agricultural and small business sectors, which are a crucial part of the economy. One study esti-

mated that owners of micro- and small businesses pay as much as 130 percent interest rates on loans.

INTERNATIONAL TRADE

International trade plays a significant role in the country's economy. Total trade in 2000 reached an estimated US$1.5 billion, equally split between imports and exports. In 2000, the country registered a small trade surplus of US$17 million. Main export items were aluminum (constituting roughly 40 percent of export earnings), electricity (19 percent), and cotton fiber (18 percent). From 1929 to 1991, Tajikistan was able to trade freely with the other Soviet republics. During that time, Tajikistan exported its minerals, cotton, and aluminum (starting in 1974) to the rest of the Soviet Union in return for **consumer goods**, grain, fuel, and technology. During the Soviet period, however, Tajikistan consistently registered a trade deficit and regularly received union budgetary transfers from the central government. Such budgetary assistance during the Soviet era constituted as much as 23 percent of Tajikistan's GDP.

Independence in 1991 broke much of the trade and government ties with the former USSR. Since then, most exports have gone to countries outside of the CIS. Exports to the CIS countries have been primarily electricity to Uzbekistan and vegetables and raw tobacco to Russia. The major destinations of exports with their corresponding percentage of the total value of exports are: Uzbekistan 37 percent, Liechtenstein 26 percent, Russia 16 percent, and Kazakhstan 6 percent (1997 data). The origin of most imports, however, is still the CIS. For example, the vast majority of imported electricity, natural gas, and oil are from Uzbekistan and Russia. Most grain imports are still from Kazakhstan, though as much as 100,000 tons/year of wheat and other foodstuffs are imported from western Europe and the United States as food aid. Tajikistan also has imported large amounts of alumina, the raw component needed for the production of aluminum, from Ukraine. The major sources of imports with their corresponding percentage of total value of imports are: Netherlands 32 percent, Uzbekistan 29 percent, Switzerland 20 percent, and Russia 9 percent (1997 data). Government **tariffs** stand at around 8 percent. Based on international standards, this is considered a liberal trade regime.

MONEY

Tajikistan's choice of currency has normally been according to the will of Moscow. Even after independence in 1991, for example, it began to use the new Russian ruble. In May 1995, however, it finally created its own legal tender, the Tajik ruble (TR). At that time, the National Bank of Tajikistan set the **exchange rate** as TR100 to US$1. Between 1995 to 1999, consumer price **inflation** increased by a rate of 1,680 percent, or an average annual compound rate of 420 percent. In 1999, however, the **inflation rate** was 28 percent. The depreciation of the Tajik ruble throughout the years is attributable to internal and external factors that diminished confidence in the local currency. Civil unrest and political instability, continued lack of economic opportunities for the average citizen, and the government's loose monetary and **fiscal policies** were among internal factors. External factors include Russia's 1998 economic woes, rise of petroleum prices, fluctuations of world cotton and aluminum prices, and a region-wide drought. By January 2001, the exchange rate reached TR2,200 to US$1.

Meanwhile, the government embarked on a new currency called the somoni in October 2000 to take into account several years of high inflation. Hence, cash transactions no longer require large wads of currency. The name change "ruble" to "somoni" was also a tactical move by the government to use the currency as a symbol for Tajik nationalism. As of April 2001, the somoni was to have been the sole legal tender of the republic. At its introduction SM1 was equivalent to TR1,000. The exchange rate of the somoni is expected to reach SM2.5 to US$1 by the end of 2001.

POVERTY AND WEALTH

Tajikistan is the poorest country among the East European and CIS nations. It had the lowest per capita income among the same groups during the Soviet era. In earlier years, though, the Tajikistan economy was much more robust, with industry and agriculture being doubly productive than today. Furthermore, the central government of the Soviet Union used to provide Tajikistan with a significant amount of its national budgetary requirements. Despite its relatively low ranking during the **communist** era, Tajikistan was not poor. The population was healthy, wages were paid, and public services were fully functional. In 2001, on the other hand, due to independence and civil war related issues, Tajikistan *is* poor. There are limited employment opportunities, wages are low—particularly in the agricultural sector—and a variety of financial and material input necessary for proper agricultural and industrial activities is sorely lacking. Poverty in Tajikistan is also evident in the decreasing access to basic public services such as education, health care, and clean water.

Income generated from employment remains the most important source of revenue for households. Other sources of income, however, such as revenue from micro- and small businesses and the sale of food and household goods, cover equally large shares of overall household incomes. The well-to-do and poor segments of the population—and between some urban folk and the mostly rural population—exhibit clear economic divergence. Expenditures at the richest households are 4 times those of the poorest. The poorest households spend 79 percent of their budget on food. They cover most of this need through **subsistence farming**, some **remittances** from abroad, and humanitarian aid. More female-headed households are considered poor than male-headed, partially due to the facts that Tajik women tend to be less educated, have fewer opportunities for business, and work in the public health and education spheres, where pay levels are significantly lower. Due to the continuing economic crisis, at best, the government can only provide minimal real provisions for social welfare to the needy. This is difficult for a population that still remembers the Soviet-era's generally good provision of health, education, and welfare services. A 1998 survey of households and small businesses throughout the country found that when asked what type of economy they hope Tajikistan to resemble in the future, 53 percent chose the USSR.

WORKING CONDITIONS

The fall of the Soviet Union, the civil war of 1992–1997 that resulted in several billions of dollars of damages, and the continued economic slump have led to a drop in the standard of living for the majority. **Public-sector** wages are among the lowest in the world. According to the World Bank, about two-thirds of the population of Tajikistan subsists on less than US$2 a day. Though the official unemployment rate was 3 percent at the end of 2000, it did not include more than 220,000 government employees not receiving their salaries. These figures would yield an unemployment rate higher than 16 percent. The average wages per month among the CIS countries is highest in Kazakhstan at US$101 and lowest in Tajikistan at US$8.8. The highest average monthly salaries in Tajikistan belong to people working in the sectors of finance and banking, where they earn about US$40; the lowest belong to those in education (US$6), health care (US$4), and agriculture (US$3).

Some sector-specific labor organizations exist, but they cannot be considered unions. They are remnants of the communist past, when labor rights were ingrained in the system. Due to the widespread economic slump and high unemployment rate, few workers dare to organize against their employers, who can replace protesting workers with any of the thousands of unemployed. Many people are not engaged in their learned professions, due to paltry government salaries. Some use a self-owned micro-business to supplement their government salaries. The **informal economy** consists of thousands of micro-businesses in the various bazaars around the country, where one can find doctors, accountants and engineers selling anything from potatoes to baby clothing.

COUNTRY HISTORY AND ECONOMIC DEVELOPMENT

875. Samanid dynasty, with its Persian speaking court, begins a 175-year reign over territory that includes much of today's Uzbekistan and Tajikistan.

1895. A treaty signed by Russia and Britain determines the southern borders and what becomes Eastern Turkestan, a Russian protectorate, which covers the territory of today's Central Asian republics and some parts of eastern China. The 1895 treaty considers Amudarya as the border between Russian and British influence.

1920. The Bolshevik army occupies Bukhara, forcing the emir to flee to Afghanistan.

1924. Tajikistan becomes an autonomous republic within the Soviet Socialist Republic of Uzbekistan.

1926. The first Tajik language newspaper in Soviet Tajikistan begins publication.

1929. Territory is annexed from Uzbekistan by orders of Stalin, and included as part of Tajikistan. Tajikistan is then declared an independent Soviet Socialist republic.

1930. Aggressive collectivization of agriculture is imposed on Tajikistan by Soviet planners, with an eye on expansion of cotton monoculture (the cultivation of a single crop).

1937. The Great Terror of Stalin purges much of the local communist elite, replacing them in favor of ethnic Russians and Europeans.

1991. Tajikistan declares independence from the Soviet Union. A coalition government is formed involving elements of the Islamic opposition as well as former communists. By June, civil war breaks out between supporters of the former communist incumbent president, Rahmon Nabiyev, and the Islamic and secular opposition groups. Shortly after, parliament appoints Imomali Rahmonov as head of state after Nabiyev's resignation in September. Civil war between government supporters and the Islamic and democratic forces begins.

1993. UTO, the Islamic opposition, which is based in Afghansitan and partly in Iran, forms an effective guerrilla force that carries out cross-border raids and eventually captures much of east-central Tajikistan.

1994. Rahmonov defeats a candidate from northern Tajikistan in a controversial election with 58 percent of the vote.

1995. Parliamentary elections are held; no opposition parties are allowed to take part.

1997. A peace accord brokered by the UN, Iran, and Russia is signed in Moscow between the government and the UTO. Refugees begin to return from Afghanistan.

1999. Voters re-elect Rahmonov as president. The UN's Organization for Security and Co-operation in Europe (OSCE) and Human Rights Watch accuse the government of vote rigging, manipulation of the media, intimidation of opponents and illegal disqualification of several political parties.

2000. The pro-government People's Democratic Party takes the majority of seats in elections to the new bicameral parliament.

2001. Despite relative calm in the country, assassinations occur sporadically and the drug trade is on the rise.

FUTURE TRENDS

Tajikistan is still in a nation-building stage. Because its territory is cut off from the centers of Tajik civilization—the cities of Bukhara and Samarqand, which are part of Uzbekistan—any central government in Tajikistan faces political and social maneuvering and challenges to unite an ethnically mixed and geographically dispersed population. In addition, recent government propaganda on the "Tajik" nature of the country, despite ethnic Tajiks comprising only 65 percent of the population, may not easily be accepted by an ethnically diverse population. Therefore, in addition to economic woes, which continue to cause barriers to the well-being of the country, the lack of democracy and security also wreak havoc. The presidential and parliamentary elections of 1999 and 2000, for example, were thought to be mired with improper intervention and influence by the ruling elite. Furthermore, although some level of banditry may have diminished due to the government's incorporation of many former opposition forces, other problems of insecurity are on the rise. Two of the most critical are the increase in the drug trafficking from Afghanistan and armed guerillas of the Islamic Movement of Uzbekistan (IMU) using Tajikistan as a base to invade neighboring Uzbekistan and Kyrgyzstan.

The future well-being of Tajikistan depends on a variety of factors, among which are whether the armed conflicts of Afghanistan and the sporadic guerrilla warfare of the IMU will eventually come to peaceful resolutions. Other factors are the will of the government to extend more democracy, human rights, and freedom of expression. The allowance of an independent media and encouragement of a strong civil society will be steps in the right direction. Provision of loans and logistics for small farmers and small businesses could truly alleviate the economic pains of the people. A plan to protect the natural environment in the form of establishing large parts of the country as national parks and creating accommodations for tourists via the creation of small locally-owned hotels throughout the country could encourage the establishment of a potentially lucrative **ecotourism** industry. This could simultaneously generate income for the local population, provide foreign capital for the central government, and preserve the natural environment. Finally, moves toward economic and cultural integration with other Central Asian republics and easing of travel throughout the region will be highly beneficial for the future of Tajikistan and the region as a whole.

DEPENDENCIES

Tajikistan has no territories or colonies.

BALANCE OF TRADE: **Exports:** US$58.5 billion (f.o.b., 1999). **Imports:** US$45 billion (f.o.b., 1999). [*International Financial Statistics 1999* reports 1998 exports of US$54.46 billion and imports of US$42.97 billion.]

COUNTRY OVERVIEW

LOCATION AND SIZE. Situated in Southeast Asia, Thailand is adjoined to Laos and Burma (Myanmar) to the north, Cambodia and the Gulf of Thailand to the east, Burma and the Andaman Sea to the west, and Malaysia to the south. Its total area, which is about twice the size of Wyoming, measures 514,000 square kilometers (198,455 square miles). The length of its coastline measures 3,219 kilometers (2,000 miles). Its capital city, Bangkok, is the most populated city in Thailand. Located in the central region, Bangkok is the center of Thailand's economic and political activities. Major cities in the north are Chiang Mai and Chiang Rai, Nakhon Ratchasima, Khon Kaen, Udon Thani, Phitsanulok, Nakhon Sawan, and Ubon Ratchathani. Meanwhile, major cities in the south are Nakhon Si Thammarat, Songkhla, Surat Thani, and Hat Yai.

POPULATION. The country's population in 2000 stood at 61.2 million, compared to 55.2 million in 1989, according to the *CIA World Factbook.* The country's population growth rate from 1988 to 1998 has been estimated at an average of 1.05 percent, according to the *Asian Economic Survey*. The population is expected to increase by 0.93 percent by 2010. The population is predominantly composed of young people, with 70 percent between the ages of 15 and 64, 24 percent below 15 years old, and only 6 percent older than 64 years.

The majority of the population still resides in rural areas. In 2000, the World Bank reported that approximately 40 percent of the country's population, or 25 million Thais, lived in urban areas and estimates that this will increase to 53 percent by 2010. Bangkok hosts about 12 million Thais.

The majority of the Thai population—75 percent—is of the Thai ethnic group, while 14 percent are Chinese and 11 percent are other ethnic groups. Fully 95 percent of the population is Buddhist, while 3.8 percent are Muslims and the remainder represent a variety of religions.

OVERVIEW OF ECONOMY

The Thai economy is one of the most robust in Asia. In the 1960s it was a predominantly agricultural economy largely dependent on its rich produce of crops such as rice, cassava, maize, rubber, and sugar cane, along with its seafood production, primarily of shrimp. Its strategic location and bountiful natural resources has enabled the country to maximize trade opportunities. The 1980s to mid-1990s marked its boom years and its emergence as a diverse, modern, and industrialized economy.

The economy's growth can be attributed to several factors. First, Thailand has pursued a rational approach to industrialization. Prior to its attempt at industrialization, Thailand already had a stable agricultural sector which became the springboard for industrialization. In the 1960s, its first attempt at industrialization was characterized by the strategy of **import substitution** which centered mainly on food processing. Hence, Thailand used the produce of its agricultural sector to initiate a

shift into industrialization. The availability of local laborers, combined with abundant natural produce, enabled the country to increase production and shift to manufacturing or processing products for export purposes. This led to the rapid expansion of the manufacturing sector and a marked increase in exports. This approach enabled Thailand to avoid the usual path taken by newly industrialized economies (NIEs) of pursuing industrialization at the expense of the agricultural sector. The strategy was to gradually build upon existing resources in order to facilitate the development of the economy.

A second important factor was Thailand's diversification of its economy. This is a pervasive trend in the development of the economy, which is rooted in the innate flexibility of the Thai people. This is exemplified by the stages of growth of the industrial sector which began with simple agri-based manufacturing, and steadily progressed to more sophisticated industries through the use of available resources such as rich natural resources and cheap labor. Diversification was also aided by huge inflows of **foreign direct investment** geared towards a wide range of products, namely electronics, chemicals, property, and processed food. In the 1980s, foreign direct investment totaled US$8 billion, with US$2.5 billion coming from Japan and the rest from Chinese, Korean, and American investors. In fact, 50 percent of the country's industrial output and 20 percent of its industrial workforce are attributable to foreign investors who are attracted by lower manufacturing costs, according to *Thailand's Turn.*

A third factor in Thailand's growth is government stability. The administration of Prime Minister Prem Tinsulanonda, which lasted from 1980 to 1988, developed a continuity in policies and programs that inspired the confidence of the **private sector** in both the government and the economy. This translated to a greater willingness to invest in the growing manufacturing industry and support further expansion of export activities.

Fourth, the dynamism of the private sector propelled export production. In 1981, a landmark policy was implemented which facilitated the formation of the Joint Public-Private Consultative Committee on Economic Problems that enabled businesspersons to influence public policy through their associations. This, in turn, led to an increased participation of the private sector in the development of state enterprises. Economic development in the country was largely propelled by the private sector, which invested heavily in industrial growth; the government had a limited role in determining the direction of the economy.

These factors have contributed greatly to the growth of the country's major economic sectors, namely agriculture and fishing, manufacturing and industry, and services, particularly tourism. In 1991, 98.6 percent of all Thai business enterprises were mainly small and medium enterprises, accounting for 90.7 percent and 7.6 percent, respectively. The Ministry of Industry defines small-scale enterprises as those with a maximum of 50 employees with an **equity** of 10 million baht, while medium-scale

enterprises employ 50–200 personnel and have an equity of 10–100 million baht.

The country's inability to produce oil has negatively impacted its growth, particularly during periods of oil crisis such as the world oil crisis between 1970 and 1979. The country's dependence on oil has been reduced with the discovery of its first natural gas field in the Gulf of Thailand in 1981. The country also taps alternative domestic sources of energy such as hydropower, liquefied natural gas, and coal. It is also in the process of studying the use of nuclear power.

At the end of 1990, the country's long-term **external debt** stood at about US$16 billion. However, annual **debt service** payments were only equivalent to 10 percent of the total earnings from exports, which means that the debt payments were manageable. The 1997 Asian financial crisis reversed this situation as the combination of US$90.5 billion in debt in 1996–97 and high levels of **non-performing loans** caused the near collapse of Thailand's financial sector. The troubles of the financial sector spilled over to the other sectors of the economy which were dependent on the financial sector for credit. Banks had to set aside finances to cover loans which creditors were not able to pay, so they no longer had any money to lend borrowers who were capable of paying. This forced the government to increase its allocation for **foreign debt** payments to take the pressure away from the financial sector. This resulted in a significant increase in **public sector** debt, which was only equivalent to 4 percent of GDP in 1996 but rose to 18 percent of GDP by mid-1999.

To alleviate the effects of the crisis, the International Monetary Fund (IMF) gave Thailand a US$17.2 billion assistance package in August 1997. With the help of these funds, reforms in the financial sector were implemented along with the **restructuring** of the industrial and agricultural sector to increase productivity. Policy reforms to increase accountability and transparency, as well as social reforms to improve education, social services, and human resource development are also being implemented by the government with assistance from the IMF, the Asian Development Bank (ADB), the Overseas Economic Co-Operation and Development (OECD) Fund, and the World Bank.

POLITICS, GOVERNMENT, AND TAXATION

On 24 June 1932, Thailand's political system changed from an absolute monarchy to a constitutional monarchy. The king is the head of state and is very much revered by the Thais. Presently, the monarch is King Bhumibol Adulyadej, who ascended the throne in 1946. King Bhumibol Adulyadej has been specially recognized for bringing the Thai monarchy closer to the people. In 1955, he visited the poorest regions of Thailand in order to see for himself the living conditions of the people. Since then, the king and his family have spent 7 months of every year visiting each of the 76 provinces of Thailand. As a result, the king is very well informed of the distinct needs of each region.

To date, the king has implemented over a thousand projects to improve the living conditions in the remotest rural areas, including the introduction of new crops, water conservation, irrigation, swamp drainage, preservation of national forests, and crop substitution. One of the king's most publicized projects is the Royal Rainmaking Project, wherein after years of careful experimentation, 14 different formulae were invented to address the problem of dry spells in Thailand.

The Thai Constitution mandates that the government should be placed under the administrative power of a prime minister, a cabinet, and a **bicameral** legislature composed of a 253-member appointed Senate and a 500-member, popularly-elected House of Representatives. The prime minister is selected from the majority party in the ruling coalition in the House of Representatives. Since 1932, Thailand has promulgated 16 constitutions, the latest of which was adopted in 1997.

The cabinet is composed of 13 ministries together with the Office of the Prime Minister and the Office of State Universities. Each ministry is led by a minister who is assisted by one or more deputy ministers. In addition, there are ministers holding the portfolio of "Minister Attached to the Prime Minister's Office." These ministers take charge of the sectors assigned to them and assist the government in the formulation and implementation of national programs. The National Economic and Social Development Board (NESDB) is the agency in charge of longer term development planning, which is implemented in 5-year periods. Aside from the NESDB, other important government agencies for economic planning are the Board of Investment (BOI), which provides incentives for investment, the Office of the Technical and Economic Cooperation Department, and the Office of the National Education Commission.

The Ministry of Industry is crucial in assisting the government in all industry and manufacturing-related activities such as formulating policies, licensing of factories, issuing mineral leases, formulating and supervising industrial standards, providing technical assistance to industries, and supervising the Small Industries Finance Office. Meanwhile, the Ministry of Commerce oversees external and internal trade. Specifically, it controls or supervises prices of certain strategic commodities such as rice and provides export promotion services to export companies.

The Thai government believes that the private sector should lead the country in its quest for progress and

development. In this endeavor, the government's major contribution to economic growth was to provide economic and social services; provide financial resources for the construction of physical **infrastructure** like highways, irrigation, and power facilities; and to formulate and offer various incentives and financial assistance to promote private investments, export businesses, and agricultural enterprises.

Since the 1950s, the government followed a clear direction towards private enterprise. International organizations like the World Bank and the United States Agency for International Development as well as the United States have strongly encouraged Thailand towards adopting that strategy.

Presently, the Thai government is at the forefront, alongside the business sector, in implementing a wide range of economic reforms to promote Thailand's economic recovery from the 1997 **recession**. Improvements have also been made in the implementation of economic and social welfare programs. This effort is guided by the new constitution, which promotes a stronger, more accountable, decentralized, and transparent government.

POLITICAL PARTIES. As of 1998, Thailand had at least 11 registered political parties, the biggest of which are the Democratic Party (Prachathipat Party) and Thai Nation Party (Chat Thai Party). The other political parties are the Liberal Democratic Party, Mass Party, National Development Party, New Aspiration Party, Phalang Dharma Party, Social Action Party, Solidarity Party, Thai Citizen's Party, and the Thai Rak Thai Party.

Political parties in Thailand serve as the breeding ground for future leaders and bureaucrats. They provide the venue by which those with political ambitions are able to familiarize themselves with the country's democratic structure and processes and obtain a certain measure of political leadership training. However, the political party system in Thailand is still in a state of evolution and can be best described as fragmented, structurally weak, and vulnerable to corruption. The cost of staging a national campaign is very high and the funds needed to finance such an endeavor are generally only available to those in the business world. Hence, businesspeople dominate most of the political parties in Thailand. Moreover, political parties in Thailand are not mass-based, have no distinct ideological differences, and lack full-time, dedicated, and qualified personnel to formulate and implement the party's programs. Since one Thai political party cannot really be differentiated from the other, switching party loyalties is not unusual in Thailand.

REVENUES. A huge percentage of government revenue comes from taxes which are collected at the national and local level. At the national level, the central government collects an **income tax** and a profit remittance tax, while the most important **indirect tax** is the **value-added tax** (VAT). In September 1997, the government announced an increase in the VAT from 7 percent to 10 percent in order to raise revenue and to meet the conditions of the US$17.2 billion loan extended by the IMF to Thailand. However, businesses making less than US$24,000 per annum were still exempted. The government levies taxes on all personal incomes including income from business, commerce, agriculture, industry, transport, construction, or contracting work. The corporate tax rate is currently 30 percent of net profits for all firms. Other taxes imposed by the central government are customs and **excise taxes**, and stamp **duty**. Local governments are authorized to collect different types of taxes such as property and land tax. Tourism and its allied services are the biggest source of revenue of the government, especially in terms of foreign currency earnings.

THE ROLE OF THE MILITARY. The military has played a large role in Thailand's political history and national development. In less than 3 decades, from 1932 to 1958, Thailand underwent 12 coups d'etat. Since 1958 there have been 6 more coups, half of which were successful in overthrowing the government. Since the transition from an absolute monarchy to a constitutional monarchy in 1932, the country has been led mostly by military leaders.

Against this scenario, it is important to analyze the contribution of military leaders to Thailand's current economic development since they had a hand in crafting most of Thailand's economic strategies. For instance, the rule of Field Marshal Sarit Thanarat after a coup in 1957 laid the foundation for Thailand's economic development. One of the most important contributions of his regime was the formulation of a national economic development policy, the first of its kind, which was implemented beginning in 1961. Numerous **technocrats** were tapped in the crafting of Thailand's economic strategy for development. His other achievements include the establishment of universities in the north, northeast, and southern regions, the enticement of foreign investors to invest in Thailand by offering incentives such as **tax holidays**, and hastening the completion of infrastructure projects such as dams, roads, and bridges. Succeeding regimes followed Sarit's example and crafted their respective development strategies after his, a key factor in Thailand's present economic progress.

INFRASTRUCTURE, POWER, AND COMMUNICATIONS

In the late 1980s, Thailand's infrastructure failed to cope with the rapid expansion of the economy. In fact, many experts believe that the country's economy could have grown more were it not for hindrances caused by inadequate infrastructure, a problem that is more pro-

nounced in the rural areas. Thailand's problem with inadequate transportation infrastructure is so severe that the Bangkok Metropolitan Region has become internationally notorious for its legendary traffic jams. Infrastructure for water, sewerage, and energy are also lagging behind the rate of urbanization and development. Secondary cities and rural areas are suffering because of their inability to attract investors due to poor infrastructure.

To address these problems, the Thai government has formulated a long-term infrastructure plan to meet the demands and requirements of a newly industrialized country. The government has prioritized the improvement of existing infrastructure and construction of new projects to alleviate the problem. Building on the goals of the previous economic plans, the Eighth National Economic Plan (1997–2001) allocated US$7.5 billion for infrastructure development, which is 47 percent more funds than the previous plan. The government also identified priority projects such as expressways, rapid mass transportation, port development, water supply, and telecommunications. At the same time, legal reforms are being instituted to enable the private sector to participate in infrastructure development.

However, the immediate implementation of the projects was stalled due to various reasons, the foremost of which was the onset of the Asian Financial Crisis in July 1997, which caused a serious economic recession. The immediate effect was a lack of adequate funds to continue on-going projects or to start construction of planned projects. Other obstacles were disputes with foreign builders and negotiations with potential operators of toll roads as well as last-minute changes in contract specifications and bureaucratic requirements like land-use permits.

Beginning in 1999 Thailand has slowly recovered from the debilitating effects of the recession. Combining funds from different sources like annual budgets, independent development loans, borrowings, and the private sector, a total of US$78 billion was allotted for infrastructure projects. The government is utilizing different strategies such as the Build-Operate-Transfer (BOT) scheme to fund construction of expressways and Mass Rapid Transfer (MRT) systems in Bangkok, to the installation of more telephone lines and the construction of privately-owned and operated power generating plants.

LAND TRANSPORTATION. Thailand's road networks cover over 170,000 kilometers (105,638 miles). To help alleviate the traffic in Bangkok, an elevated train system was opened in December 1999. An underground subway system is also under construction and is expected to be operational by 2003. A total of US$700 million was allotted for these mass transportation projects. Originating from Bangkok, Thailand's rail network spans 3,981 kilometers (2,474 miles) and transports people to the major regions, namely Chiang Mai, Nong Khai, Ubon Ratchathani, Padang Besar, and Sungai Kolok. The State Railway of Thailand expressed its plans to spend US$4.2 billion between 1997 and 2001 to improve and expand its rail network.

AIR TRANSPORTATION. Thailand is working on its goal to become the aviation hub of Southeast Asia. It is expanding its existing international airport to accommodate 36 million people by 2003. At the same time, a second international airport, 30 kilometers east of Bangkok, is currently under construction. Presently, Thailand has a total of 106 airports. Of these, 6 are international airports while 29 are domestic airports, with several more provincial airports in the offing.

WATER TRANSPORTATION. There are 8 international deep seaports in different parts of Thailand, with the major ports in Bangkok, Laem Chabang, Phuket, and Songkhla. In order to reduce the traffic in the over-utilized main port in Bangkok's Klong Toey district, the government is upgrading and constructing additional ports, particularly in the Eastern Seaboard and southern region, along the Gulf of Thailand and the Andaman Sea.

The importance of the Eastern Seaboard is increasing due to the establishment of industrial parks and export processing zones around the sea port in Laem Chabang. The

government foresees that the port areas in the south will grow in importance to equal existing main ports.

COMMUNICATIONS. As of 1998, there were 5.4 million land lines and 2.3 million mobile phone subscribers in the country. As incorporated in the Telecommunications Master Plan for 1997–2006, Thai authorities have set a goal of increasing the number of telephones per 100 people from 4 in 1993 to 18.2 by 2001. In 1999, the government completed the Rural Long Distance Telephone project and is currently operating a total of 20,732 lines or 47 percent of its target. A number of projects are currently underway, including the Fibre Optic Submarine Cable Network Development and the Telecommunication Satellite Network Development.

As of 1999, Thailand had 204 AM stations, 334 FM stations, and 6 short wave facilities servicing about 13.96 million radios. In addition, 5 television broadcast stations provide service to 15.19 million television sets in all of Thailand as of 1997.

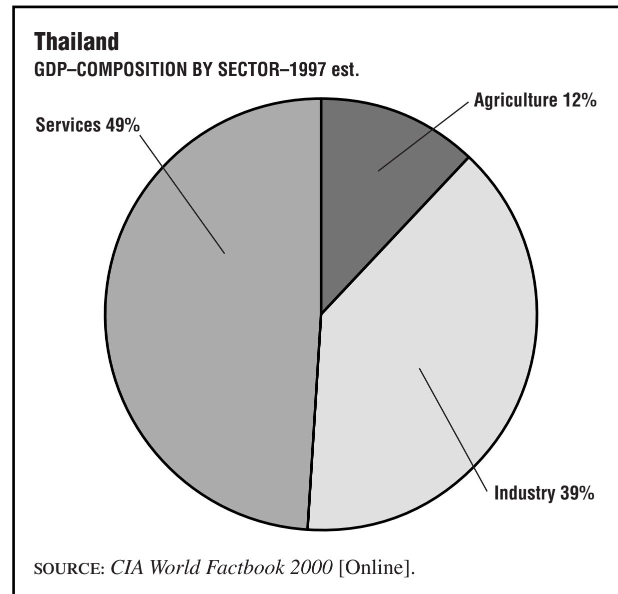
POWER. In the past, Thailand was heavily dependent on imported crude oil. After the world oil crisis in the 1970s, however, Thailand began to explore indigenous sources of energy and was rewarded with the discovery of a natural gas field in the Gulf of Thailand in 1981. As of 1996, 20 fields are in operation with daily oil production reaching 2,500 barrels per day, and of gas reaching 1,200 million cubic feet per day.

Due to the continued expansion of industries, the future demand for energy has been forecasted to increase by 7 percent in the period between 2002 and 2006. Demand for petroleum will still lead this increase at 49 percent, followed by imported coal at 12.4 percent. Demand for electricity has been forecasted to double from 10,203 megawatts in 1996 to 20,400 megawatts in 2006, according to the *Asia Pacific Economic Compendium* (1996).

Thailand continues to explore other sources of energy within its territory and from neighboring countries. In addition, it continues to construct different projects to meet its energy requirements. Among these are the Greater Bangkok Area Transmission System, the Yadana-Ratchaburi Gas Pipeline, the Ratchaburi Power Plant, and the Eighth Power Distribution System Improvement and Expansion Plan.

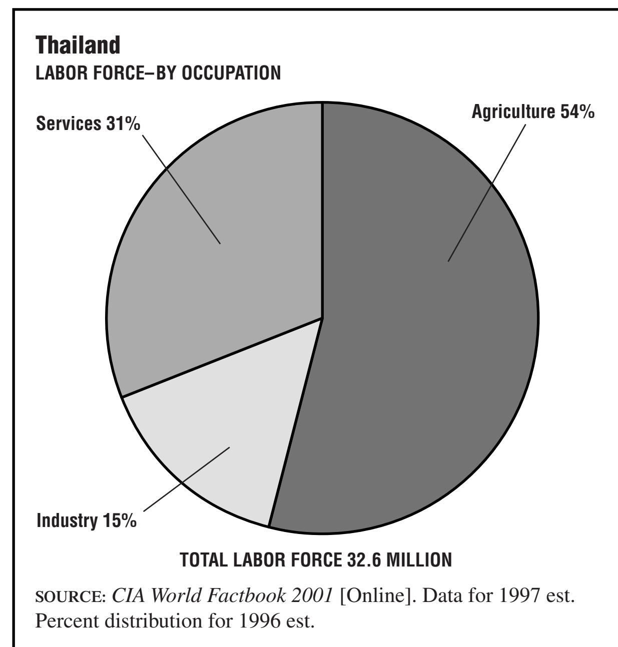
ECONOMIC SECTORS

Thailand's economy has grown steadily by an average of 8 percent for the past decade. There is a wide base for growth, with each sector contributing to the development of the economy. Starting out as an agrarian economy, Thailand's bid for industrialization strengthened its industry sector, while the boom in the tourism industry strengthened the service sector. In the 1990s, manufacturing and tourism are the 2 largest contributors to GDP.



SOURCE: *CIA World Factbook 2000* [Online].

Agriculture has been the traditional backbone of the economy, with Thailand being ranked among the top 5 producers of food in the world. In the 1970s, the country supplied 30 percent to 40 percent of rice in the world market. In the 1990s, it continued to be the leading exporter of rice, tapioca, and frozen shrimp. It is also the world's largest producer of rubber, the demand for which has increased due to the AIDS epidemic, which has increased the demand for condoms. Thailand is also one of



SOURCE: *CIA World Factbook 2001* [Online]. Data for 1997 est. Percent distribution for 1996 est.

the world's biggest suppliers of flowers, particularly orchids, which it exports mainly to Japan and Europe. Despite its output, the agricultural sector is on the decline, and is slowly being overtaken by the industry and service sectors in terms of contribution to GDP.

With the re-orientation of production from import substitution to producing for export, and the drive towards industrialization, the manufacturing industry grew steadily until it exceeded agriculture in terms of contribution to GDP. According to Bank of Thailand statistics reflected in the 2000 Business Monitor International Annual Report, the manufacturing industry accounted for 86.8 percent of the country's total exports in 1999. The country's first step into manufacturing was food processing, effectively building on its strong agricultural sector. Today, it is the world's largest exporter of canned pineapple, with one-third of all the canned pineapple sold in the United States coming from Thailand. It is also Asia's biggest exporter of tuna after Unicord, a local company, purchased Bumble Bee Seafoods, the third largest tuna canner in the United States. It now supplies 20 percent of the world market for canned tuna.

The country's service sector is experiencing steady growth, with the boom in the tourism industry. In 1992, tourism accounted for 10 percent of the GDP, with 600 tourists arriving every hour, or 5,256,000 tourists for the year, spending an average of US$1,000 each, equivalent to about US$5 billion a year. This amount is equal to 50 percent of the country's total exports. In 2000, revenues from tourism were expected to hit 343 billion baht or US$6.86 billion, with a total of 9,438,000 tourists expected to visit the country throughout the year.

Strong local corporations—such as Charoen Pokphand, which earns revenue of US$2.5 billion annually; Thai Union Frozen Products, the largest canned seafood exporter; and Boonrawd Brewery—work together with various **multinational corporations** to energize the manufacturing industry. Forecasts for the year 2000 predicted that multinational corporations which have set up shop in the country—such as Mitsubishi, Isuzu, and Honda for automobiles; Fujitsu, Seagate, IBM, Sony, and Matsushita Electronic for electronics; Heineken and Carlsberg breweries, and Nestle and Kellogg for food processing; and Exxon, Montell, and Bayer for petrochemicals—will expand their operations in the country and pump in more investment.

AGRICULTURE

Traditionally an agrarian economy with rice as its main product, the country's agricultural sector has since expanded to cope with the demands of its newly industrialized state. Thai agriculture has a clear advantage over other newly industrializing economies, namely the large portion of land allocated for cultivation, a climate suited to the growth of a wide variety of crops, and high quality strains of agricultural products.

In 1960, agriculture contributed over 40 percent of the national income. This contribution steadily declined due to the intense and rapid growth of the manufacturing sector. By the end of the 1980s, agriculture merely accounted for 17 percent of GDP, which declined even further to 12 percent until the late 1990s, to below 10 percent in 1999. The same pattern exists in terms of its contribution to exports, which stood at 46.9 percent in 1980 and plummeted to 9 percent by 1998.

However, these figures do not indicate a weakening of the sector's significance to the Thai economy, but more a strengthening of the industry and service sectors. Agriculture still accounts for 4 of the country's top exports—rice, canned fish, frozen or chilled shrimp, and rubber—and continues to serve as the foundation of booming manufacturing ventures such as food processing. Processed food such as canned fruits, vegetables, seafoods, and ready-to-eat meals, also enjoy a healthy domestic market, along with sugar and flour.

The agricultural sector has consistently employed about 50 percent of Thailand's 30 million-strong workforce. In 1993, farm population accounted for about 57 percent of the total workforce. If those indirectly engaged in **agribusiness** industries were included, the estimate would be even higher. Economists predicted that the 1 to 4 million people left unemployed by the 1997 financial crisis in the late 1990s would be absorbed by the agricultural sector.

FIELD CROPS. Agricultural production is focused on 7 major crops—namely rice, tapioca, rubber, maize, sugarcane, mung beans, and tobacco leaves—which are grown mostly for export purposes. Fifty percent of the country's cultivated land is devoted to planting rice; Thailand continues to be the world's top exporter of rice, exporting 6.8 million tons of its total production of 23.3 million tons in 1999, worth 7.1 billion baht. Based on Bank of Thailand statistics, exports of rubber amounted to 2 million tons worth 43.9 billion baht, while maize amounted to 80.7 thousand tons worth 528 million baht, according to *Business Monitor International.* Crop production is expected to increase as genetic research on plants improves yields and as cultivated areas are expanded. However, falling global prices and adverse weather conditions are likely to reduce farm incomes.

LIVESTOCK. The second largest component of agriculture is livestock production, which accounted for 1.3 percent of GDP in 1993. The decline in the prices of field crops and the reduced productivity of land have caused farmers to turn to contract farming of broiler chickens, cows, and pigs. A single broiler contract growing project

employs about 145 families who earn an equivalent of US$350 monthly, after paying for the bank loans needed to buy broiler houses and equipment. Research to improve egg production and feed conversion has also been successfully undertaken, making Thailand a leading producer and exporter of frozen chicken. The government also helps this sector by facilitating the improvement of beef and dairy production through cross-breeding and artificial insemination using high-grade breeds imported from the United States, Switzerland, Germany, Denmark, and Australia. Thai beef is exported to Singapore and Hong Kong, and the sector is angling to gain entrance to the Japanese market.

FORESTRY. The wood industry relies on the wide variety of hard and softwood available in the country's forests. Among these are tropical evergreens, hill evergreens, mangroves, and other trees which are processed to produce firewood, stick lac, gum benzoin, rattan, and bamboo. Rattan is then manufactured into furniture, while bamboo is used for furniture and paper. Dyes, tanning bark, and medicinal herbs are also harvested. The growth of the output from forestry fell from 2.6 percent in the period between 1967–71 to 0.25 percent in the 1982–86 period due to the massive depletion of the country's forest resources. The devastation is caused mainly by the destructive practice of slash-and-burn agriculture by villagers as well as illegal logging. Uncontrolled logging resulted in the felling of 1.5 percent of the country's total forest acreage every year. After heavy floods in 1988 washed away entire villages, the government banned logging and conducted reforestation efforts. Currently, 23 percent of the country is covered with forests following legislation in the early 1990s which called for the maintenance of a proper percentage of forestland.

FISHING. The country's 3,000-kilometer (1,864-mile) coastline produces an average of over 3 million metric tons of marine products annually, which amounts to about US$2 million. Its fishing industry, which is one of the largest in Asia, exports frozen shrimp, tuna, squid, and cuttlefish. There is also an abundance of freshwater fish in rivers, lakes, and streams as well as flooded paddy fields where farmers purposely raise them. The Fisheries Department also promotes freshwater aquaculture by farmers in large ponds. Forty-five freshwater fishery stations have been set up by the government to promote freshwater aquaculture. In 1999, fishery products accounted for 3.6 percent of total exports. However, its total contribution to GDP has diminished due to the exhaustion of resources in Thailand's coastal waters.

INDUSTRY

The country's industry and agriculture sectors were traditionally intertwined. Today, however, industry has eclipsed agriculture in terms of contribution to GDP, contributing 39 percent in 1997. The rapid growth of this sector can be attributed to free market forces, limited government assistance, and the private sector's quick response to shifting market demands. However, the Asian financial crisis from 1997 to 1998 heavily impacted industries and caused the closure of 8,000 businesses. The increasing cost of labor has also led to a departure from labor-intensive ventures. To date, only the manufacturing industry contributes substantially to national income, particularly the 4 sub-sectors of food processing, automobiles, electronics, and petrochemicals.

The initial move into industrialization in the 1960s was characterized by import substitution, which mainly involved the processing of its bountiful agricultural produce. In 1972, a new Industrial Promotion Act signaled the shift in government policy to an export-oriented economy. This new emphasis began the rapid diversification of the industry sector which saw the rise of several industries, including petrochemicals, textiles, transportation equipment, electronics, iron and steel, and minerals.

The manufacturing sector constitutes Thailand's main industry, producing a wide variety of goods such as textiles and garments, plastics, footwear, electronics, integrated circuits, computers and components, automobiles and parts, and cement. Manufacturing facilities are mostly located in Bangkok and on the Eastern Seaboard, which was launched in 1977 as the long-term site for large-scale small, medium, and heavy industries. In 1993, the manufacturing sector employed 10 percent of the entire **labor force**. By 1998, however, the sector already employed approximately 20 percent of the Thai workforce, who are among the highest paid workers in the country along with those working in the service industry, according to the *Ministry of Foreign Affairs Handbook.*

The manufacturing sector expanded its contribution to GDP from 16 percent in 1960 to 37 percent in 1993 to 39 percent in 1997. Given that manufactured goods are produced largely for export purposes, its share of export earnings grew steadily from 32 percent in 1980 to 74.7 percent in 1990 to 84.5 percent in 1999. Presently, its top export markets are the United States, Japan, the European Union, Singapore, Malaysia, Hong Kong, Taiwan, and China, with the United States and Japan jointly absorbing 36 percent of the country's exports.

FOOD PROCESSING. Canned foods constitute the main export earner of this sector, and Thailand is the world's leading exporter of canned pineapple and tuna. Its export growth rate increased by 6.8 percent between 1998 and 1999. This sector has shifted from basic refining to **value-adding** (increasing the value of a good in the process of production), hence, the biggest growth segments include ready-to-eat meals like canned traditional Thai dishes,

processed seafood, and snacks. Though still largely patronized by the domestic market, 2 rice dishes—namely *khaolam*, a rice dessert baked in bamboo trunks, and *krayasart*, a sticky rice dessert—are already being sold in China and Japan. Production of ready-to-eat halal food is another avenue to be explored, to tap the regional Islamic market.

The government has thrown its support behind agro-processing by promoting the establishment of industrial estates that are located near prime sources of raw material. Several multinational companies have also established their presence in the country, namely the Heineken and Carlsberg breweries; Nestle, whose 8 plants are producing a wide range of products from ice cream to mineral water; and Kellogg, which uses local rice as raw material for its ready-to-eat cereals.

MOTOR INDUSTRIES AND AUTOMOBILE ASSEMBLY. The country is currently the regional center for vehicle assembly and the manufacturing of motor parts, and is the second leading manufacturer of pick-up trucks in addition to the long-established motorcycle industry. Between 1991 and 1996, vehicle assembly peaked at 560,000 per year, in addition to 1.5 million units of motorcycles. The financial crisis debilitated this sector in 1997 and 1998, but it managed to rebound and produced 327,233 units of vehicles following a sharp increase in export orders in 1999, along with 725,425 units of motorcycles. Shipments in motor vehicles and parts in 1999 amounted to US$1.6 billion. Among the auto companies who have established factories in the Eastern Seaboard are Ford, GM, Mazda, Honda, and Toyota.

ELECTRONICS. This sub-sector produces a wide range of products from low-tech **consumer goods**, such as TV tubes and computer monitors, to advanced microchips. In 1999, total electronic exports amounted to US$21.4 billion. The government has encouraged its growth by offering official investment incentives to foreign investors. Among the multinational corporations that have been attracted by these incentives are Fujitsu, Seagate, IBM, Sony, and Matsushita Electronics, which produces the National Panasonic brand. However, the sector is undermined by lack of skilled scientific and professional workers and heavy reliance on foreign technology.

PETROCHEMICALS. Natural gas discovered in the Gulf of Thailand is being tapped for the raw materials upon which to develop a globally competitive petrochemical industry. This sub-sector was greatly affected by the financial crisis due to the massive debts that it accumulated during its development in the early 1990s. However, its performance is picking up with an increase of 2.1 percent in output in 1999, due to higher export demands. Foreign investment is expected to fuel its resurgence with Germany's Phenolchemie, Chevron, Bayer, and Montell pumping in fresh investments.

SERVICES

The services sector is Thailand's fastest growing sector, largely fueled by the boom in tourism. In 1997, services accounted for over 49 percent of GDP and employed over 4.1 million, or 31 percent of, Thai workers.

TOURISM. The beauty of the country attracts millions of tourists annually. Thailand boasts beautiful beaches, cultural attractions such as Buddhist temples, bountiful food, affordable high-quality goods such as textiles, and hospitable people. Beckoned by these attractions, tourists have steadily generated income for the country since 1982, with tourism posting a growth rate of 16 percent per year. In 1994, 6.16 million tourists visited Thailand. In 1998, 7.76 million tourists spent nearly US$8 billion. This was exceeded by the 1999 figure, which posted the arrival of 8.5 million tourists. In 1992, tourism employed 1,693,005 workers (5.1 percent of the total labor force), with 923,822 employed directly and 769,183 employed indirectly. The boom in tourism spurred the growth of related service industries which generated employment. Of the total number of workers in the tourism industry, 37 percent were hired by hotels, 26 percent by restaurants and food shops, 11 percent by leisure and entertainment, and 26 percent by the souvenir industry, travel agencies, and other related enterprises. In recognition of the importance of this industry, the Tourism Authority of Thailand works closely with other agencies to develop tourism resources efficiently by promoting investment in tourist-related facilities.

BUSINESS SERVICES. The continuous expansion of the Thai economy led to the increase in the need for business services including legal, advertising, employment, and general management. In 1997, legal and accounting firms reported the highest revenue while advertising bore the brunt of the financial crisis. The demand for financial restructuring services including merger, acquisitions, and debt collection remained high in 1998, which led to an increase in the sector's employment. To illustrate, one accounting company expanded its debt restructuring division from 2 to 20 people in 1997. Top international consulting firms have offices in Thailand, including Baker & McKenzie and Tilleke & Gibbins for law; Andersen Consulting and Boston Consulting Group for management consulting; Arthur Andersen and Price Waterhouse for accounting; and J. Walter Thompson and AC Neilsen for advertising and media.

RETAIL. The **retail** sector is composed of department stores, hypermarkets, supermarkets, and convenience stores, most of which are local companies. Among the international retailer stores are Carrefour, 7-Eleven, Marks & Spencer, and Makro.

FOOD. As of 1999, Thailand had 639 international restaurants and 328 local restaurants, and about 15,000

fast food, mid-level family style restaurants, coffee shops, noodle shops, specialty food shops, and delivery shops to fuel the food services sector. It also had 2,350 hotels, 364 resorts, and 784 bungalows which account for higher food sales than restaurants. In 1998, total food sales amounted to US$5.385 million. In 1992, restaurants and food shops employed approximately 440,000 workers. Even though the dollar value of food service sales decreased due to the **devaluation** of the baht during the 1997 Asian financial crisis, the sector grew by 7 percent based on actual sales.

FINANCIAL SERVICES. Thailand has 34 commercial banks, of which 13 are domestic and 21 are foreign. Among the foreign banks are Bank of America, Chase Manhattan, and Citibank. Leading local banks include Krung Thai Bank, with 646 local branches and 10 overseas branches; Bangkok Bank PCL, with 526 local branches and 21 overseas branches; and Thai Farmers Bank, with 497 local branches and 12 overseas branches. As a result of the financial crisis, some local banks have been taken over by the government and are in the process of reorganization and eventual **privatization**. The public financial sector includes banks geared for specific purposes including 1) the Government Savings Bank for small savings deposits; 2) the Bank for Agriculture and Agricultural Cooperatives for farm credit; 3) the Government Housing Bank for middle- and low-income housing mortgages; 4) the Industrial Finance Corporation of Thailand for industrial development projects; and 5) the Export Import bank for importers and exporters. Other financial services include finance companies, mortgage lenders, life and non-life insurance companies, and financial cooperatives.

INTERNATIONAL TRADE

Thailand has a long history of international trade. Beginning in the 15th to 18th centuries, during the reign of the Ayutthaya monarchy, foreign merchants who lived near the kingdom's capital conducted trade with foreigners. The country's first significant trade treaty was the Bowring Treaty in 1855 with Britain. Shortly after that, it also signed treaties with 14 other countries including the United States, France, Russia, Sweden, Spain, and Japan.

Today, the United States, Japan, and the European Union continue to be its top trading partners, absorbing 52.6 percent of all exports in 1999 and supplying 48.8 percent of total imports in the same period. Its other partners are Hong Kong, China, and the Association of South-East Asian Nations (ASEAN) countries, the most significant of which are Singapore and Malaysia. Other countries apart from those mentioned accounted for 18.4 percent of exports and 21.6 percent of imports in the same period.

Thailand's major exports are rice, tapioca products, cane sugar and molasses, and rubber for agriculture; chemicals, polymers, and plastics for the manufacturing industry; and gypsum, natural gas, and feldspar for the mining industry. Bank of Thailand statistics as reflected in the Asian Economic Survey of 2000 identified the country's major export products as machine parts, circuits, frozen shrimp, prawns, sundry items, computer parts, garments, vehicle parts, and plastic products. On the other hand, its major imports are petroleum, integrated circuit parts, and chemicals.

The **balance of trade** was consistently negative until 1998, which means that the value of the country's imports was bigger than the value of its exports. The discrepancy was minimal in 1970, with import value exceeding export value by only US$541 million. In 1975, imports exceeded exports by US$1.072 billion, which doubled in 1980 to US$2.709 billion. In 1985, imports still exceeded exports by US$2.21 billion, which had quadrupled by 1990 to US$10.309 billion. In 1995, the balance still stood in favor of imports by US$14.337 billion. In a considerable reversal, imports in 1997 exceeded exports by US$5.319 billion but the following year, exports exceeded imports by US$11.485 billion.

Despite the uneven balance of trade, the Thai economy continued to grow by an average of 6.8 percent in the 1970s, 7.5 percent in the 1980s, and 8 percent in the early 1990s before the Asian financial crisis. This growth can be attributed to 2 factors, namely the boom of the tourism industry and the inflow of foreign direct investment. According to *International Historical Statistics,* in 1970, the services sector contributed 44.1 percent of GDP, which increased in 1980 to 49.7 percent. Though this contribution fell to 46.9 percent in 1999, it is safe to say that the dollar earnings from the tourism industry generated a substantial amount, enough to offset the trade imbalance.

Foreign direct investment (FDI) is another major factor in the growth of the economy since the mid-1980s. In 1988, FDI infused US$1.25 billion into the economy,

Trade (expressed in billions of US$): Thailand

	Exports	Imports
1975	2.208	3.280
1980	6.505	9.214
1985	7.121	9.242
1990	23.070	33.379
1995	56.439	70.776
1998	54.456	42.971

SOURCE: International Monetary Fund. *International Financial Statistics Yearbook 1999.*

partly explaining the 7.5 percent growth despite a US$4.332 billion discrepancy in balance of trade in favor of imports. Foreign direct investment doubled to US$2.5 billion in 1990.

Thailand is a member of several international trade organizations including the ASEAN Free Trade Area (AFTA), the Asia Pacific Economic Cooperation (APEC), and the World Trade Organization (WTO).

MONEY

The Thai economy grew with the formulation of the first 5-year National Economic Development Plan in 1958. During the 1960s, the country grew by an average of 8 percent annually. In the 1970s the fluctuation of commodity prices, a rise in interest rates, and the 150 percent increase in world oil prices slowed the economy, although it continued to grow at the rate of 6.8 percent annually. Political instabilit—including student uprisings in 1973, 2 military coups, and increased **communist** insurgency—hindered the government in its adjustment of economic plans and structures to meet the challenges of the next decade. Surprisingly however, the economy continued to perform well in the 1980s with a 7.5 percent GNP growth rate. The year 1986 is significant because of the fall of the excess value of imports over exports to a mere US$301 million compared to the previous year's deficit of US$2.121 billion, indicating a substantial growth of the value of Thailand's exports. This can be attributed to economic adjustments launched by the government.

The first half of the 1990s was marked by similar growth until the Asian financial crisis hit the region. In 1996, **real GDP** growth rate fell sharply from 8.8 percent in 1995 to 5.2 percent and during the period of the crisis between 1997 and 1998, real GDP growth dropped to –0.43 percent and –10.18 percent, respectively, according to the *International Financial Statistics Yearbook.* The government spent much of the country's foreign reserves to stabilize the value of the baht, causing the further devaluation of the currency. The crisis led to a temporary increase in poverty levels in the city and unemployment due to massive lay-offs specifically in the construction and service industries. These unemployed city-dwellers went back to rural areas hoping to find employment, which led to a rise in poverty levels in the south, central, and northeast regions. Thailand's recession also started a domino effect that led to the fall of the economies of its South East Asian neighbors.

There has been a remarkable resurgence in the economy since then, fueled by the US$17.2 billion assistance package given by the World Bank, reforms in the financial sector, and increased foreign investment. For the first time since 1969, the economy posted a positive balance of trade with the value of exports exceeding imports by US$11.485 billion in 1999, according to the *International Financial Statistics Yearbook.*

The average **exchange rate** of the Thai baht from 1984 to 1997 was B25 to US$1. However, the baht was devalued by the administration of Prime Minister Prem Tinsulanonda by 8.7 percent in 1981, and again in November 1984 by 14.9 percent, as part of its austerity measures. This devaluation led to the decline in the cost of production, which resulted in increased revenue from exports.

With the onset of the financial crisis, the baht fell from its B25 to US$1 average to B31.36 to US$1 in 1997, and to an all-time low of B41.36 in 1998. The infusion of direct foreign investment in 1998 led to the recovery of the economy and the increase in the value of the baht to B37.81 against the dollar in 1999, which went even higher to B37.349 in January 2000. By 12 October 2000, however, the baht had devalued once more to a 27-month low of B43.27, which threatened to increase **inflation**. The depreciation was caused by external factors, including weak regional currencies such as the Philippine peso and the Indonesian rupiah, the strong showing of the dollar compared to currencies such as the Euro, and increase in world oil prices which used up the country's surpluses. Internal factors that were identified include weak economic policies and practices and the country's unstable political situation.

The Stock Exchange of Thailand (SET) was established through the passage of the SET Act in May 1974, and began operation on 30 April 1975. The second revision of the SET Act in 1992 produced the Securities and Exchange Act (SEA) which established a Securities and Exchange Commission to serve as the only supervisor of the securities business.

POVERTY AND WEALTH

In Thailand, the incidence of poverty or wealth is dependent on a person's occupation, location of residence or work, and level of educational attainment. From the 1970s until the early 1990s the poor were mostly agricultural workers in the rural areas, particularly in the

north, northeast, or southern regions, whose highest level of education was 6 years of primary schooling. Meanwhile, those working in the manufacturing or service sectors in the major cities or in the central region—specifically in the Bangkok metropolitan region—who completed at least 12 years of formal education, were more likely to be economically well-off. Due to the concentration of economic activities in the capital, such as construction of physical infrastructure and job creation, the regional disparities in income and wealth slowly began to widen. As Thailand slowly shifted from an agrarian economy to an industrialized economy, economic resources were shifted to the industrial sector and huge demand for factory workers created huge differences in wage rates between farmers and factory workers. As the contribution of the agricultural sector to the economy decreased so did the demand for farm workers. In the latter years of the 1980s, 80 percent of the people living below the poverty line worked in the agricultural sector.

Poverty in Thailand is not so much a problem of an increasing number of families being unable to provide for their most basic needs, as it is a problem of the huge difference in income between the upper 30 percent and the rest of the population. Thailand's impressive economic growth in the 1980s and 1990s has improved overall living conditions, but the benefits of this national affluence have not been distributed equitably. Those belonging to the lower 30 percent of the population are merely surviving while the upper 30 percent are enjoying the fruits of the country's affluence with brand new houses and cars, overseas education for their children, and increased savings for emergencies. Despite the fact that more and more Thai families are climbing out of the poverty pit, their earning capacity remains low compared to that of the upper 30 percent.

The government has addressed the increasing incidence of poverty in the different national development plans that are formulated every 5 years. From the second to the seventh National Economic Development Plan, the government formulated different strategies in order to achieve a fairer distribution of income and social services, to create more employment opportunities in the rural areas, to assist parents in their children's education, and to provide credit facilities for small-time business ventures.

Before the Asian financial crisis hit Thailand in 1997, government efforts to alleviate poverty were slowly gaining ground with poverty levels falling from 33 percent in 1988 to 11.4 percent in 1996, according to the World Bank. However, the income distribution remained inequitable with the top 20 percent earning 12.2 times more than the bottom 20 percent in 1988. The disparity

Household Consumption in PPP Terms

Country	All food	Clothing and footwear	Fuel and power[a]	Health care[b]	Education[b]	Transport & Communications	Other

worsened further in 1993 with the top 20 percent earning 15.8 times more than the lowest 20 percent of the population. Average income in the most impoverished region in the northeast was 11.9 times lower compared to Bangkok in 1994. Consequently, rural workers tried to find work in the urban areas, especially in the Bangkok metropolitan area, causing the proliferation of slum areas in the urban cities.

In July 1997, as the Asian financial crisis ravaged the Thai economy, hundreds of workers in the construction and service industries in Bangkok were laid off. These newly unemployed workers moved back to the rural areas to find work in the agricultural sector which was performing strongly in those times. This migration caused the incidence of poverty to increase in the agricultural regions because not all of the unemployed could be absorbed in the agricultural sector. The northeast region experienced the largest increase in poverty during this period, rising from 19.4 percent in 1996 to 30.8 percent in 1999. Overall poverty incidence in Thailand rose from 11.4 percent in 1996 to 13 percent in 1998 as an additional 1.1 million people fell below the poverty line.

Poverty in Thailand can be attributed to several factors. First is the concentration of economic activities in Bangkok and a number of other urban areas. Investment, goods and services, government programs, and well-paying jobs are still largely concentrated in the capital and nearby urban areas despite government efforts to decentralize economic development. The concentration of resources and investment in Bangkok is evidenced by the fact that it contributes over 50 percent of the country's GDP despite hosting only about 10 percent of the population. In contrast, other regions, especially rural areas, suffer from inadequate investment and employment opportunities.

Another reason stems from the failure of the Thai government to provide social safety nets amid the country's rapid growth and industrialization. The government over-prioritized the implementation of financial and industrial reforms and neglected to formulate and implement a comprehensive social service program to protect the most unprepared sectors from the ill effects of rapid industrialization. Moreover, experts have expressed that, had Thai authorities given the same attention to the social sector, it might have even surpassed its current development and would have ensured its future development with a steady source of well-educated and multi-skilled labor as it shifts to technologically sophisticated industries.

A third problem is the weak educational system in the country. Inferior and inadequate education is the root of the growing income gap between city dwellers and villagers. As poverty in the rural areas worsened, many rural folk could not afford to send their children beyond the 6 years of compulsory schooling, making them unqualified for the higher paying jobs in the manufacturing and service sectors. As a consequence, these families were trapped in the vicious cycle of poverty where living conditions of the succeeding generations do not improve due to lack of education.

Another problem is the failure of the government to implement agricultural land reform policies. This failure has resulted in insecure land ownership and increasing tenancy, or production on rented land. As the population increased, people in the rural areas encroached into the forest areas to settle and plant. After several years of residence in these areas, they claim illegal ownership of the land which results in periodic conflicts with government authorities. Due to the government's refusal to issue land titles to legalize the ownership of the land to the farmers who are tilling it, rural workers lack the proper legal documents to secure agricultural support such as credit facilities and technical support and have no security of ownership over the land. This leads to low productivity from the land. Another problem is the increase in the number of farm tenants who till other peoples' land because they either have no land of their own or because they had to sell their own land to pay off accumulated debts.

In 2000, the World Bank reported that Thailand has not fully recovered from its economic recession in 1997. The most recent data revealed that the number of poor increased from 11.4 percent in 1996 to 15.9 percent in 1999. Just like in the past, Bangkok remains affluent while other regions suffer. According to the World Bank's country report for 2000, poverty incidence in 1999 increased from 5.8 percent to 8.8 percent at the outskirts of the urban areas and 14.9 percent to 21.5 percent in the rural areas. At the same time, Thailand continues to suffer from unequal income distribution with the richest 30 percent accounting for some 80 percent of the aggregate national income while the other 70 percent account for roughly 20 percent of the aggregate national income.

According to the World Bank, during the 1990s the Thai government became more aggressive in addressing the root problems of poverty and the ever-widening income disparity. In 1993, the Ministry of Interior launched the Poverty Alleviation project which provides interest-free loans to poor rural households who want to engage in micro-enterprise. Meanwhile, the Ministry of Education is implementing the Educational Loans Program, which provides loans to students from low-income households to encourage them to continue their studies beyond the 6 years of compulsory schooling. The Thai government has likewise launched programs to create jobs in the rural areas by hiring villagers for the construction of rural infrastructure, such as in the case of the Tambon Development Program.

WORKING CONDITIONS

In 1999, more than 50 percent of the 362,683 establishments in Thailand were located in Bangkok and nearby provinces. Based on 1999 labor statistics, Thailand's total labor force was 8,134,644, with males (4,253,327) edging out females (3,881,317). About 4.4 million are working in the **informal sector**—which involves domestic work, traditional handicraft production, and manufacturing of export goods—and small-scale enterprises with less than 10 workers.

During the 1997 recession, it was estimated that about 8,000 businesses closed down while those that continued to operate had to lay off staff, reduce wages, and cut bonuses in order to stay afloat. Women were the first to be laid off in most of the industries except in printing and advertising, retail and wholesale, and furniture and wood products.

The unemployment rate fluctuated from 2.2 percent in February 1997 to 4.6 percent in February 1998 and 5.2 percent in February 1999 before dropping to 4.3 percent in February 2000. In the first 2 quarters of 1999, the total number of unemployed persons peaked at about 1.7 million. The recession has caused **real wages** to fall, with agriculture being the hardest hit sector. Between August 1997 and August 1999, overall real wages fell by 6.1 percent, with real wages falling by 15 percent in agriculture, 8 percent in manufacturing, and 7 percent in construction.

LABOR UNIONS AND ISSUES. In 1999, Thailand had a total of 1,087 private enterprise labor unions, 44 state enterprise labor unions, 19 labor union federations, 8 labor union councils, 226 employer associations, 3 employer association federations, and 10 employer councils, according to the Department of Labor Protection and Welfare. Membership in these voluntary organizations may vary from 250 to 8,000 workers. In specific industries such as textile, doll, and artificial flower making, it can be expected that the majority of the union members will be female. Female union leaders, however, are a rarity in Thailand.

One of the effects of the recession in 1997 was a marked increase in labor disputes compared to figures in the past 17 years. Approximately 80 percent of these cases involved the collection of severance pay.

Different government agencies, led by the Ministry of Labor and Social Welfare, ensure that working conditions, especially in the factories, conform to legally-established standards. However, despite periodic inspections, working conditions in the factories still need improvement. One study reports that over 20,000 Thai workers suffer occupational afflictions every year. In 1993, the Committee for Workers' Health and Safety was established after a tragic blaze that killed 188 Kader workers.

In general, Thai workers complain about low pay, excessive working hours, and inadequate medical benefits. The textile industry has been specifically cited in many studies as having some of the most dismal working conditions characterized by deafening noise, poor lighting, inadequate medical facilities, and improper ventilation. Each year about 30 percent of the industry's female workers suffer from byssinosis or "cotton sickness" from cotton dust particles. Meanwhile, women in other industries likewise suffer from other occupational hazards.

Based on 1998 labor statistics, of the total 186,498 cases covered by the workers' compensation fund, 67.8 percent involved temporary disability requiring less than 3 days of leave, 29.7 percent involved temporary disability requiring more than 3 days of leave, 2 percent involved permanent partial disability, while 0.4 percent involved death.

Thailand's 1997 constitution mandates equal rights and protection for men and women. However, the results of various surveys reveal that there is still some discrimination against Thai women in terms of professional advancement and wages. Most employers in the private sector hire women only when there is a difference in wage rates. Commonly, firms would rather not hire women or promote them to more important jobs because of traditional attitudes against women working outside the home. Likewise, women are not prioritized for skills training and upgrading since it is unlikely that they will be promoted to higher positions anyway. Women are commonly employed in labor-intensive industries, service and entertainment jobs, and the informal sector.

One of the negative consequences of Thailand's tourism industry is the prostitution of its women and children, especially those who have no formal schooling or only finished the first 6 years of schooling. The law prohibits women under 18 from working in nightclubs, dance halls, schools for dancing, bath and massage houses, and hotels, however, there are not enough government personnel to conduct inspections.

Thailand has been severely criticized by the international community for the proliferation of child domestic workers in its factories and brothels, or houses of prostitution. Child labor involves not only Thai children but also children of migrant workers of neighboring countries. Determining the exact number of child laborers in Thailand is difficult since parents or companies do not want to cooperate with authorities for fear of prosecution or loss of income. Different agencies have conflicting estimates of number of prostituted children in Thailand. The estimates range from 40,000 (1997) by the Thai government, to 200,000 (1997) by the international organization End Child Prostitution, and 400,000 (1998) by the BBC News. Based on the provisions of the Labor Protection Act (1998), persons between the ages of 15 to 18

can only work in non-hazardous jobs and must secure permission from the Department of Labor. Moreover, they cannot work at night or during holidays.

In the mid-1990s, only 40 percent of the Thai labor force had completed secondary or post-secondary education. Enrollment in secondary education is slowly increasing, although it is still low compared to other countries in the region. The gross enrollment ratio of formal secondary education increased from 64.8 percent in 1997 to 70.6 percent in 1999. The New Education Act of 1999, as provided for in the 1997 constitution, has mandated the extension of compulsory schooling to 9 years from the current term of 6 years and the implementation of a 12-year free education program by 2004. Moreover, the act has reduced the power of the central ministry in favor of new school districts within the next 3 years.

In its early years of development, Thailand placed too much priority on developing the primary level of education to the detriment of the quality of secondary and tertiary education. As a consequence, Thailand lagged behind other countries in terms of research and development in science and technology, which meant that its workforce was ill-equipped to handle the emerging opportunities in high technology industries. As a result, the companies that were engaged in these industries chose to set up the center of their operations in other Asian countries. It was only after the 1997 financial crisis that Thailand started paying attention to the improvement of its educational system.

Over the years, the Thai government has formulated different strategies to improve the skill level of its workforce (World Bank, 2000). Among these programs are the Vocational Training Promotion Act (1994), the Training Tax Exemption Decree (1995), and the Skills Development Fund (1997), which grants low-interest short-term loans for approved training courses that would provide skills certification.

COUNTRY HISTORY AND ECONOMIC DEVELOPMENT

1300s TO 1500s. Thailand's very first kingdom, Sukhothai, is established. It is remembered for its contribution to Thailand's art, architecture, and politics.

1378. King Borommaracha I of Ayutthaya conquers Sukhothai's frontier city of Chakangrao. The Kingdom of Ayutthaya becomes the dominant power in the Chao Phraya Basin, site of the present capital, Bangkok. This period, which ends in 1767, marks Thailand's earliest achievements in the area of international trade.

1767–82. General Phraya Taksin, former governor of Tak, defeats the Burmese invaders that destroyed the Ayutthaya kingdom and establishes his kingdom at Thon Buri, across the river from what is presently Bangkok.

1782–1809. Rama I, ancestor of the present monarch, establishes Bangkok as the capital of Thailand and rebuilds the Thai state. Some of Thailand's greatest structures are built during King Rama I's reign, including the Grand Palace and the Temple of the Emerald Buddha.

1821–68. The Thai Kingdom faces the challenge of avoiding Western imperialism during the consecutive reigns of the monarchs Rama II and his 2 sons, Rama III and Rama IV. Under the reign of King Rama IV, Thailand signs a significant trade treaty with Britain in 1855 called the Bowring Treaty which paves the way for greater Thai presence in the world market.

1868–1910. Under King Chulalongkorn's reign, Thailand's communication system is modernized with the introduction of post and telegraph services. Mass transportation is also introduced with the construction of a railway network. Under his reign, a more centralized and bureaucratic political structure is established, the slave system is abolished, and Thailand becomes more outward looking.

1910–32. The reigns of Rama VI and VIII are marked by their contributions to Thailand's educational system. In 1917, Thailand's first university, Chulalongkorn University, is founded. In 1921, Rama VI issues a law on compulsory primary education. Upon his brother's death, Rama VIII accedes the throne. He works on establishing Thailand in the international community.

1932. Thailand becomes a constitutional monarchy after a bloodless coup d'etat on 24 June. A formal constitution is promulgated and a National Assembly is established with the monarch as Head of State. In the same year, the first formal comprehensive education plan is implemented.

1942. The Bank of Thailand Act establishes the country's central bank. The Bank of Thailand holds the main accounts of the Thai government including those of government enterprises.

1946. On 9 June, King Bhumibol Adulyadej ascends to the throne. In the same year, Thailand becomes a member of the United Nations.

1949. Thailand becomes a member of the World Bank.

1955. King Bhumibol Adulyadej becomes the first Thai ruler to travel to the poorest provinces of Thailand, in the northeast region, to check for himself the living conditions of the people. This begins the implementation of more than a thousand social projects.

1957. The premiership transfers from Field Marshal Pibul to Field Marshal Sarit Thanarat. The policies of

his administration are focused on economic development and national security. Under his administration, the first national economic development plan is formulated.

1959. Thailand's Board of Investment is established. Its main tasks are to promote investment of both foreign and local capital in the private sector.

1962. The automobile industry is established as part of the government's import substitution policy.

1967. Through the primary initiative of Thailand, the Association of South-East Asian Nations (ASEAN) is established in accordance with the Bangkok Declaration.

1972. In December, Field Marshall Thanom Kittikachorn announces a new interim constitution that provides for a totally appointed legislative assembly, two-thirds of the members of which would be drawn from the military and police.

1973. In May and June, students and workers rally in the streets to demand a more democratic constitution and genuine parliamentary elections. On 14 October the military government of Field Marshal Thanom Kittikachorn and Field Marshal Prapass Charusathien is overthrown by student-led mass demonstrations which culminate in shoot-outs with almost 100 people killed.

1974. The Stock Exchange of Thailand is established and placed under the supervision of the Ministry of Finance and the Bank of Thailand.

1975. The pullout of 27,000 United States military personnel based in Thailand as part of the Vietnam War effort begins in March and is completed in mid-1976.

1976. A bloody coup d'etat is staged at the Thammasat University on 6 October.

1977. Another violent coup d'etat brings to an end the 1-year civilian regime of Thanin Kraivichien. General Kriengsak Chamanand becomes the prime minister. Under his administration, Thailand achieves some kind of political stability, thereby attracting foreign investors who establish businesses in the country.

1978. A new constitution is promulgated in December.

1980. In February, the government's decision to increase the prices of oil, gas, and electricity provokes opposition from elected politicians and demonstrations by students and workers, reminiscent of the 1973 demonstrations. As opposition grows, Prime Minister Kriangsak resigns and is replaced in March by General Prem Tinsulanonda.

1984. The Thai baht is devalued after much pressure from the International Monetary Fund and as part of the government's austerity measures.

1987. The manufacturing sector surpasses the performance of the agricultural sector in exports by a wide margin, marking the beginning of Thailand's industry-led economic development.

1989. Thailand becomes a founding member of the Asia Pacific Economic Cooperation (APEC).

1991. In February, a coup d'etat establishes yet another military government led by General Suchinda Kraprayoon.

1992. The Office of the Securities and Exchange Commission is established to closely monitor and supervise the operations of Thailand's stock exchange.

1995. Thailand joins the World Trade Organization as one of its founding members.

1997. A financial crisis hits the East Asian region, causing the Thai economy to nosedive with GDP growth falling to –0.14 percent from the previous year's 5.52 percent.

1998. Thailand's economy makes an impressive recovery. For the first time, the country registers a positive trade balance caused by an influx of foreign direct investment.

2000. National elections are conducted and culminate in the election of Thaksin Shinawatra, a successful Thai businessman and leader of the Thai Rak Thai Party.

FUTURE TRENDS

The success of the country's economic programs rely on the effective implementation of reforms that the government is presently putting in place after the financial crisis revealed the weaknesses and gaps in Thailand's economy. The Thai economy is poised for greater involvement in heavy industries, including automobile assembly, petrochemicals, electronics, and a more diversified food processing sector focused on value-added products such as ready-to-eat meals and canned foods. The economy has rebounded from the Asian financial crisis of 1997–98, although the World Bank believes that it has yet to fully recover. Challenges facing the economy include weak infrastructure, labor skills that do not match the needs of an increasingly industrialized economy, and the need to re-organize the financial sector to ensure that loans are paid in order to avoid a crisis similar to that of 1997.

Thailand has greatly benefitted from the US$17.2 billion World Bank assistance package in terms of recovering from the crisis. However, due credit must also be given to the strong inflow of foreign direct investment and the robust performance of the tourism industry that enabled the economy to rebound and pose the first positive balance of trade since the 1960s.

Efforts at decentralizing political power to local governments and communities must be stepped up in order to ensure that the rest of the country progresses along with Bangkok. Another important factor is the development of physical infrastructure in the rest of the country to promote the growth of rural communities and increase their contribution to Thailand's economic development. To achieve this, the government's proposed strategy to actively partner with non-government organizations in assisting rural communities must be implemented effectively since using this approach would also ease the disparity in income among the regions and within the different economic classes. Furthermore, the government must actively pursue the stamping out of corruption in order to bring about an even higher rate of economic growth.

Among the other concerns that government must address in the years ahead is the pending maturation of HIV-infected citizens into full-blown AIDS carriers. As of 1999, 700,000 Thai people are infected with HIV. The World Bank predicted that in the year 2000, 55,000 Thais will have developed AIDS and 29,000 more will have become infected with HIV. This will negatively affect the productivity of the country's labor force since those who are afflicted with the disease are mostly women in their prime productive years.

Thailand's industrialization has taken a toll on its environment, as its resources were depleted of raw materials that were needed to support the growing industries. Having realized the impact of environmental degradation, the government is stepping up efforts to rehabilitate its denuded forests and heavily polluted and over-fished coastal resources. In agriculture, research and technology has produced strains of crops that are high yielding and suitable to rotation which enables the land to recover from the effects of monoculture (the cultivation of a single type of crop). However, the continuous use of pesticides and herbicides still inflict considerable environmental damage.

DEPENDENCIES

Thailand has no territories or colonies.

TONGA

Kingdom of Tonga
Pule'anga Tonga

CAPITAL: Nuku'alofa.

MONETARY UNIT: Pa'anga (T$ or TOP). There are coins of 1, 2, 5, 20, 50 seniti and 1 and 2 pa'anga, and notes of 1, 2, 5, 20, and 50 pa'anga. One pa'anga equals 100 seniti.

CHIEF EXPORTS: Squash, fish, vanilla beans.

CHIEF IMPORTS: Food, machinery and transport equipment, fuels, chemicals.

GROSS DOMESTIC PRODUCT: US$238 million.

BALANCE OF TRADE: **Exports:** US$8 million (1998 est.). **Imports:** US$69 million (1998 est.).

COUNTRY OVERVIEW

LOCATION AND SIZE. The Tonga archipelago (group of islands) is in the Pacific Ocean about 4,000 kilometers (2,500 miles) southwest of Hawaii and about 1,600 kilometers (1,000 miles) northeast of New Zealand. The country consists of a series of islands, clustered into 3 main groups: Tongatapu, Ha'apai, and Vava'u; these were formerly known as the Friendly Islands. The total land area is 748 square kilometers (289 square miles), about 4 times the size of Washington, D.C. The coastline is 419 kilometers (260 miles). The capital is located on Tongatapu island.

POPULATION. The population of Tonga was estimated at 102,321 in mid-2000, a slight increase over the 1996 census population of 97,784. In 2000 the birth rate stood at 27.2 per 1,000 while the death rate stood at 6.1 per 1,000. With a projected annual population growth rate of 0.6 percent in the decade beginning with 2001, the population is expected to reach 104,100 by 2010. This relatively slow rate of growth is a result of an annual net migration rate of 15.1 per 1,000 population. Much of this migration is to New Zealand, but Tongans have also settled in Australia, the United States, and Europe.

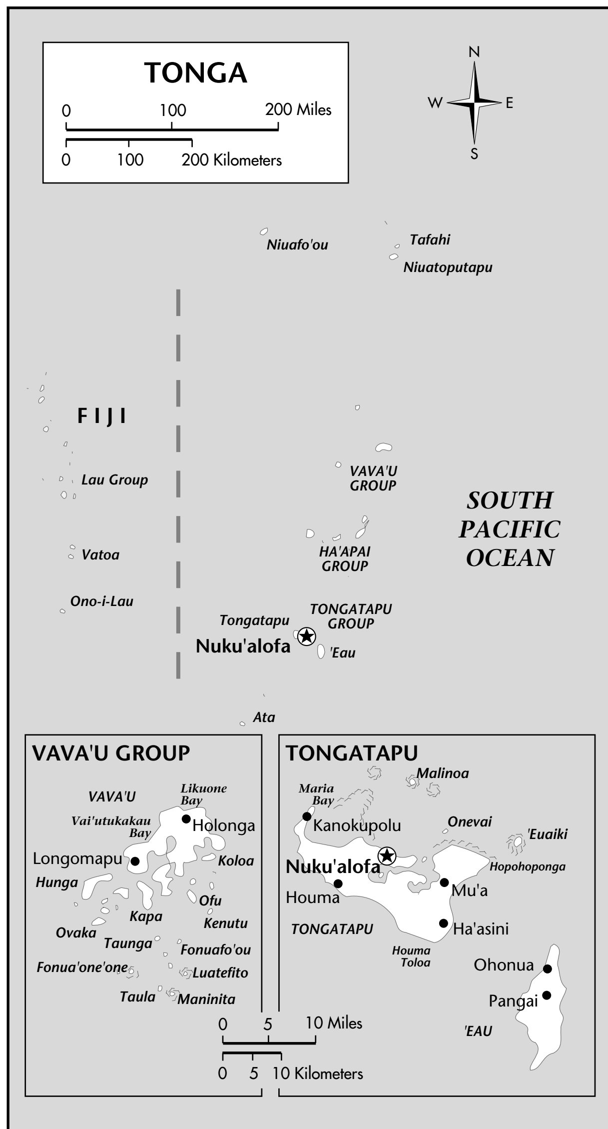
The population is predominantly of Tongan (Polynesian) ethnic origin, although there are small numbers of Europeans and Chinese. Only 32 percent of the population live in urban areas, mainly the capital, Nuku'alofa. The urban growth rate is only slightly higher than the total growth rate, which was estimated at 1.91 percent in 2000. The Tongan population is very young, with nearly 42 percent under 15 years of age. Those between the ages of 15 and 64 make up 54 percent of the population, with the remaining 4 percent 65 years old and over. Various branches of Christianity, including Roman Catholicism, the Tokaikolo Church of Christ, and Free Wesleyan, are among those practiced on Tonga.

OVERVIEW OF ECONOMY

On a chain of small islands in the South Pacific, Tonga's economy relies on several basic elements, including subsistence production (making enough to survive), agricultural exports, the **remittances** (money sent home by former citizens working abroad) of Tongan migrants, and international aid. In the villages of Tonga, there is a great reliance on subsistence production of food and other items. There is no reliable survey of the number of people working in subsistence activities, but if it is assumed that most of the adult population not formally employed are primarily subsistence producers, then about 28,000 are in this category. In 1996, about 29,400 persons were engaged in wage and salary employment, with a further 4,500 listed as unemployed.

Agricultural products and fish have always been the mainstays of the export economy. Tourism is relatively small-scale, employing only about 1,400 people in the mid-1990s, but it showed some growth in the decade up to 1997, with the number of visitors increasing by about 5 percent per year.

The Tongan economy also remains heavily dependent on 2 types of transfers from overseas, which together account for 27 percent of GDP. The private remittances



of Tongan migrants in other countries are an important source of income for many families in Tonga. Government expenditure is supported by international aid, mainly originating from Australia, Japan, New Zealand, the Asian Development Bank, and the European Union.

POLITICS, GOVERNMENT, AND TAXATION

Tonga is the only surviving kingdom in the Pacific. Its 1875 constitution is the oldest one in the Pacific islands, and although Tonga was a "protected state" of Great Britain from 1900 to 1970, most Tongans maintain that their country was never a colony. The current system of government is a hereditary constitutional monarchy, with King Taufa'ahau Tupou IV ruling since 1965. Beneath the monarch, there are 33 nobles, who control most of the land in the country. The nobility was established in the constitution of 1875 and is based on inheritance. The prime minister, deputy prime minister, and cabinet are appointed by the king from this group. The **unicameral** (single house) Legislative Assembly (Fale Alea) is made up of 30 seats, 12 of which are reserved for the cabinet appointed by the monarch, 9 are selected by the nobles, and another 9 are elected by popular vote of all citizens over the age of 21 years.

The most important political development in recent years has been the formation of a party called the Human Rights and Democracy Movement (HRDM). In 1994 the HRDM was formed under the leadership of 'Akilisi Pohiva; in the 1999 elections this party won 5 of the 9 "commoner" seats in the Assembly. The HRDM has advocated a broader democratic base and land reforms that would reduce the power of the nobles; for these activities, Pohiva and others have been jailed for short periods for "contempt of Parliament."

About 20 percent of GDP in 1994–95 was raised by taxation, and this accounts for nearly 70 percent of government revenue. Trade taxes are the most important, making up 68 percent of tax revenues, and this is almost equally split between customs **duties** and port and services taxes. Direct and **indirect taxes** each make up a further 14 percent of tax revenue. Personal **income tax** is set at 10 percent and corporate tax is typically around 30 percent. In each case there are many possible exemptions, so these taxes raise less revenue than they might.

INFRASTRUCTURE, POWER, AND COMMUNICATIONS

Transport needs within Tonga are served by roads, shipping services, and air. There are about 680 kilometers (423 miles) of roads, with 184 kilometers (114 miles) paved. These serve most areas within the main islands, with transport provided by private vehicles and bus services. Shipping among the 3 main island groups is provided by the government-owned Shipping Corporation of Polynesia and the private Uata Shipping Lines. These offer regular passenger, cargo, and car ferry services throughout the country.

Royal Tongan Airlines provides international air services from Fua'amotu Airport, the only of the country's 5 airports that has a paved runway. It also links the 3 island groups with regular domestic flights.

Parts of Tonga's telecommunications network are old. Domestic phone services link most of the country via the government-owned Tonga Telecommunications Commission, but there has been little upgrading since the 1950s. International communications via satellite are provided by Cable and Wireless Limited. Electricity is widespread and is generated completely by imported fuels. Tonga had 1 Internet service provider as of 1999.

Communications

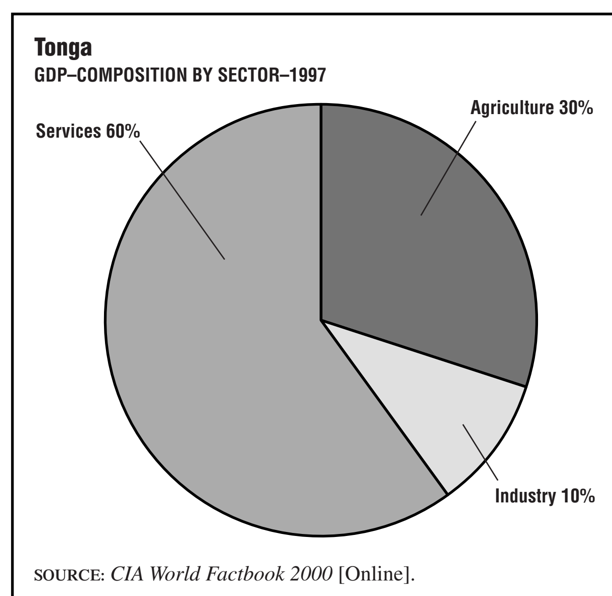
ECONOMIC SECTORS

According to the Asian Development Bank, Tonga's economic sectors contributed to total GDP in 1999 in the following proportion: agriculture, fishing, and hunting, 29.9 percent; industry, 10.7 percent; services, 43.8 percent; other, 15.7 percent. In 1996, the same source reported that the total **labor force** of 33,900 was distributed in these sectors as follows: agriculture, 34 percent; industry, 22.8 percent; services, 43.2 percent.

The agriculture sector's contribution to GDP has been fairly consistent, dropping slightly from 31.6 percent in 1984 to 29.9 percent in 1999. Between 1994 and 1996, Tonga experienced a downturn in agricultural performance, along with declining price competitiveness internationally, and a weakening level of remittances from overseas migrants. This caused high unemployment in 1996. Industry, which contributed 10.7 percent of GDP in 1999, is made up of relatively small-scale processing of food and timber products for the local market, as well as small factories making products for export, including woolen goods. The service sector is the largest, made up mostly of the government subsector, and a smaller tourism one.

AGRICULTURE

Agriculture contributed 29.9 percent of GDP in 1999, and in 1996 employed 34 percent of the labor force. In terms of GDP this proportion has been fairly consistent through the 1980s and 1990s, despite fluctuations



SOURCE: *CIA World Factbook 2000* [Online].

due to weather and unstable world market prices for agricultural products.

As in most Pacific countries, subsistence production for domestic use is an important part of the economy, although not well recorded. The export of agricultural products has been highly unpredictable over time. Through most of the 20th century, Tonga's main export was coconut products, mainly copra (dried coconut meat yielding coconut oil), but at various times other products have been exported in sizeable quantities, particularly bananas.

A specialized market for squash was established in the 1980s when Tonga secured a quota to supply the vegetable to Japan during several months of the year when other sources, especially New Zealand, were not producing. In the early 1990s, this source of export income grew, but in the second half of that decade, production fluctuated considerably as a result of disease, weather, and oversupply. Other squash producers from Vanuatu and Mexico have also offered competition by entering the same market.

Other agricultural products, such as bananas and market vegetables, are significant in the domestic market but have contributed very little to export income in recent years. Even vanilla beans, which were significant exports in the early 1990s, have declined in importance because of international competition. There has been a small but steady export of root crops, mostly to supply Tongan and other Pacific communities, especially in New Zealand. Kava (a mild legal narcotic) production has increased recently, and this has considerable export potential as illustrated by the success of this industry in Vanuatu.

Fish was the second most important export during the 1990s, mainly high-grade tuna and snapper. The potential sustainable harvest of tuna is about 30,000 tons a year, which is several times higher than the existing harvest. Most fish is exported unprocessed to the United States, Fiji, and American Samoa. A cannery in Tonga is under consideration, but a restraining factor is government legislation requiring that 90 percent of sales from such a venture would have to be to overseas buyers.

INDUSTRY

Industry contributed 10.7 percent of GDP in 1999, a slight decline from 1984, when it contributed 13.8 percent of GDP. The importance of industry to employment is somewhat greater than this, however, since 22.8 percent of the labor force is industrial. Construction was the biggest single sector, followed by manufacturing. The contribution of construction is variable, depending on the expansion of tourism **infrastructure** (especially hotels) and new businesses in any one year.

The most important manufacturing activities are related to food and timber processing, mainly for the local market. Under a trade agreement with Australia and New Zealand (SPARTECA), Tonga is allowed to export manufactured goods duty-free, and at times has been successful in establishing a market for woolen goods and other products produced in small factories or from home. The advantages of this trade agreement have declined with trade **liberalization**, which has opened up the Australian and New Zealand markets to cheaper Asian products.

SERVICES

The largest sector in terms of GDP and employment is services, making up 43.8 percent of GDP in 1999 and providing 43.2 percent of jobs in 1996. Within this sector, the largest employer is the government, in the areas of public administration and education. In terms of GDP the next largest subsector is trade (including hotels and restaurants), followed by transport, communications, and finance. It is not possible to separate tourism out from these data since it makes contributions to several of these subsectors.

TOURISM. Tourism's contribution to GDP is rather minimal (about 2 to 3 percent), and it employs about 1,400 people. The industry began expanding in the late 1980s, when it welcomed 20,000 visitors per year, to 1995, when it welcomed 29,000, though there have been some fluctuations since then. Improvements in domestic and international air services have contributed to this growth, especially after the **restructuring** of Royal Air Tonga, the national airline. This carrier has flights to and from Australia, New Zealand, Fiji, Samoa, and Niue. Other airlines serving Tonga include Air New Zealand, Air Pacific, Polynesian Airlines, and Samoa Air. Tourists visit Tonga for beaches, sun, and diving, but also to explore sites unique to the region, such as the 19th century royal palace and the Ha'amonga-a-Maui, a large trilithon (stone archway) built by a Tongan king sometime before the 13th century. Also on the island of Tongatapu are trees full of sacred bats, which only the monarch is allowed to kill, although presumably does not because of their tourist value.

FINANCIAL SERVICES. International financial services are limited in Tonga. The domestic market is mostly served by the Bank of Tonga, ANZ (Australia New Zealand) Bank, and MBF (Malaysian Borneo Finance).

RETAIL. **Retail** services are typical of those available in a small Pacific nation. In the capital, Nuku'alofa, shops provide a reasonable range of products, mainly food goods from New Zealand and manufactured goods from Asia. In other parts of the country, small village shops supply only the most basic goods. Many Tongans also rely on goods packages from relatives living overseas, which are consumed within the family or sold to others.

INTERNATIONAL TRADE

According to statistics from the International Monetary Fund (IMF), Tonga has had a negative trade balance since 1975. In 1975, Tonga's imports totaled $17 million and its exports $6 million. By 1998, according to the *CIA World Factbook 2000*, imports had risen to $69 million and exports to $8 million. This illustrates Tonga's very narrow export base, as it relies mainly on squash and fish, with small contributions from other agricultural and manufacturing products. Since squash is the most valuable export and the total production goes to Japan to be used in soups and various food products, that country accounts for more than 40 percent of Tonga's exports. The United States and New Zealand are the other significant export destinations, importing fish and small agricultural and manufacturing products respectively.

The most important imports into Tonga are foodstuffs, machines, and transport equipment. New Zealand is the most important source of foodstuffs and of some manufactures and is the source of about 35 percent of all imports. The next most important import sources are Australia, the United States, and Fiji.

The large negative trade balance is offset by other international transfers. Tourism contributes some international income, and there is potential for expansion in this sector. At the household level, the most important source of income is remittances from relatives living overseas, particularly in New Zealand, the United States and Australia. At the government level, international aid helps to counterbalance the large imbalance in trade.

Trade (expressed in billions of US$): Tonga

	Exports	Imports
1975	.006	.017
1980	.007	.038
1985	.005	.041

MONEY

The value of the pa'anga against the U.S. dollar has halved over the past 2 decades, from 0.9859 to the U.S. dollar in 1982 to 1.997 in February 2001. Much of this **devaluation** took place during the early 1980s, and then again in the late 1990s. During the 1980s, the export value of coconut products and vanilla declined, and remittance income fluctuated, causing an impact on the currency. In the late 1990s and early 2000s a further serious devaluation occurred, and this may be partly attributed to the strong American dollar against the currencies of the Pacific region, including the New Zealand and Australian dollars, which are part of a number of currencies to which the pa'anga is linked.

Exchange rates: Tonga

pa'anga (T$) per US$1	
Jan 2001	1.9885
2000	1.7585
1999	1.5991
1998	1.4920
1997	1.2635
1996	1.2323

SOURCE: CIA *World Factbook 2001* [ONLINE].

The National Reserve Bank of Tonga (NRBT) has several functions. One of these is to stabilize the Tongan currency. This is only possible, though, within the network of the other currencies to which the pa'anga is linked. The NRBT also monitors the economy by maintaining databases and providing advice on government spending and revenue, the supply of money, interest rates, and the trade balance.

POVERTY AND WEALTH

GDP per capita rose from $1,300 in 1975 to $1,868 in 1998, according to the Asian Development Bank. The *CIA World Factbook 2000* reports a slightly higher figure, which it estimated at US$2,200 for 1998. Although the Human Development Indicator (HDI) for Tonga does not appear among the 174 countries which are ranked in the UNDP's *Human Development Report 2000*, it does appear in the UNDP's *Pacific Human*

GDP per Capita (US$)

Country	1996	1997	1998	1999	2000
Tonga	2,250	2,100	2,200	N/A	2,200
United States	28,600	30,200	31,500	33,900	36,200
Philippines	2,600	3,200	3,500	3,600	3,800
Solomon Islands	3,000	3,000	2,600	2,650	2,000

Note: Data are estimates.

SOURCE: *Handbook of the Nations*, 17th, 18th, 19th and 20th editions for 1996, 1997, 1998 and 1999 data; CIA *World Factbook 2001* [Online] for 2000 data.

Development Report 1999. In that report, Tonga has the sixth highest HDI of the 15 Pacific countries considered. Its GDP per capita is only the eighth highest of these countries, but it makes up for this with high indicators of education and health. Adult literacy for both men and women is reported to be near 99 percent, the highest of any Pacific country. Infant mortality, at 19 per 1,000, is one of the lowest in the Pacific, and this is illustrative of a good system of health delivery and a safe water system. Primary education is free and compulsory, and participation at secondary school is also high, resulting in a combined enrollment rate of 83 percent.

Still, there is some evidence of inequalities within the country. No calculated measures of the distribution of income or consumption are available, but there is some inequality of income between urban and rural areas. Squatter (one who lives somewhere without paying rent) settlements around the capital, Nuku'alofa, have a poor standard of housing and inadequate water and sanitation systems. In some rural areas, land access is inequitably distributed, despite the fact that all adult males on reaching their sixteenth birthday are supposed to be granted a plot of land by the local noble.

WORKING CONDITIONS

According to official statistics, about one-third of the workforce is not "economically active." These people are mainly village-based subsistence workers, a disproportionate number of whom are women, who are producing goods and services that are not exchanged for cash. Many of these aspire to become part of the country's formal sector. The situation for those who want wage employment does not appear good. It is estimated that of the 2,000 school graduates each year, only about 500 will find work in the formal sector. The rest must either return to the subsistence economy, continue job searching and become officially unemployed, or migrate. It is the latter option that many choose, and this partly explains why there are an estimated 50,000 Tongans living in other countries.

In the formal sector, about 37 percent of the workforce is female. While it is difficult to calculate, about 12 percent of the labor force is said to be unemployed. There is no comprehensive system of unemployment compensation, nor is there a general pension scheme. The country does not have a minimum wage law; workers did have some amount of protection in that they could live without a monetary income with the support of extended families and **subsistence farming**, if needed. There is no legal provision for labor unions in Tonga, although 2 associations that represent working groups are the Tonga Nurses' Association and the Friendly Islands Teachers' Association.

COUNTRY HISTORY AND ECONOMIC DEVELOPMENT

1140 B.C. Evidence of human habitation and Lapita pottery.

950 A.D. Tuíi Tonga is the dominant leader.

1643. First European (Dutch) sighting of Tonga by Schouten and Le Maire.

1643–1800s. Many European contacts include visits by "explorers" from the Netherlands, Great Britain, France, and Spain, who introduce many new trade goods and diseases.

1777. British Captain James Cook explores what he calls the "Friendly Isles."

1822. First Christian conversions, by Wesleyan missionaries; Tonga becomes nominally Christian over the next 20 years.

1845. After civil wars, King Taufa'ahau Tupou I (George Tupou I) of the Ha'apai group becomes first ruler of a united Tonga.

1875. New constitution proclaims Tonga an independent constitutional monarchy.

1900. Great Britain declares Tonga a "protected state" but does not impose full colonial rule.

1918. Queen Salote Tupou III is crowned, and rules until 1965.

1960s. Large-scale migrations to New Zealand and elsewhere begin.

1965. King Taufa'ahau Tupou IV, the current monarch, is crowned.

1990s. Rise of republican movement proposing full democracy and end of monarchy; squash becomes primary export, to Japanese market.

FUTURE TRENDS

The late 1990s was a period of economic stagnation by some indicators. Primary exports in agriculture, forestry, and fishing had declined as a result of drought, hurricane damage and unstable world prices. However, the **balance of payments** was still positive as a result of some growth in services and a steady flow of remittances. Both the private and **public sectors** have been making an ongoing attempt to identify niche markets for Tongan enterprise, ranging from the export of new agricultural products such as the vaguely narcotic but reputedly therapeutic kava, to the acquisition of a number of satellite television bands, which Tonga has successfully leased. Despite a relative lack of resources, there is some optimism for the future based on the high educational levels of Tonga's pop-

ulation and the international networks established by Tongan migrants. At the same time, there will be ongoing pressure to further democratize Tonga's political system. In the long term, the monarchy may survive, accompanied by a more democratic Parliament, although such a change is not likely to have a significant economic impact, other than perhaps allowing a more equitable distribution of wealth.

DEPENDENCIES

Tonga has no territories or colonies.

TURKEY

Republic of Turkey
Türkiye Cumhuriyeti

CAPITAL: Ankara.

MONETARY UNIT: Turkish lira (TL). One Turkish lira equals 100 kurus (pronounced kouroush). However, because of the high inflation rates Turkey has faced in the past 20 years, kurus are no longer used due to the low purchasing power. As of the end of 2000, there are coins of 10,000, 25,000, 50,000, and 100,000 liras. The 10,000 and 25,000-lira coins were expected to be phased out by 2001, and probably replaced with new coins of 500,000 and 1 million liras.

CHIEF EXPORTS: Clothing, foodstuffs, textiles, metal manufactures.

CHIEF IMPORTS: Machinery, semi-finished goods, chemicals, transport equipment, fuels.

GROSS DOMESTIC PRODUCT: US$444 billion (purchasing power parity, 2000 est.).

BALANCE OF TRADE: **Exports:** US$26.9 billion (f.o.b., 2000 est.). **Imports:** US$55.7 billion (c.i.f., 2000 est.).

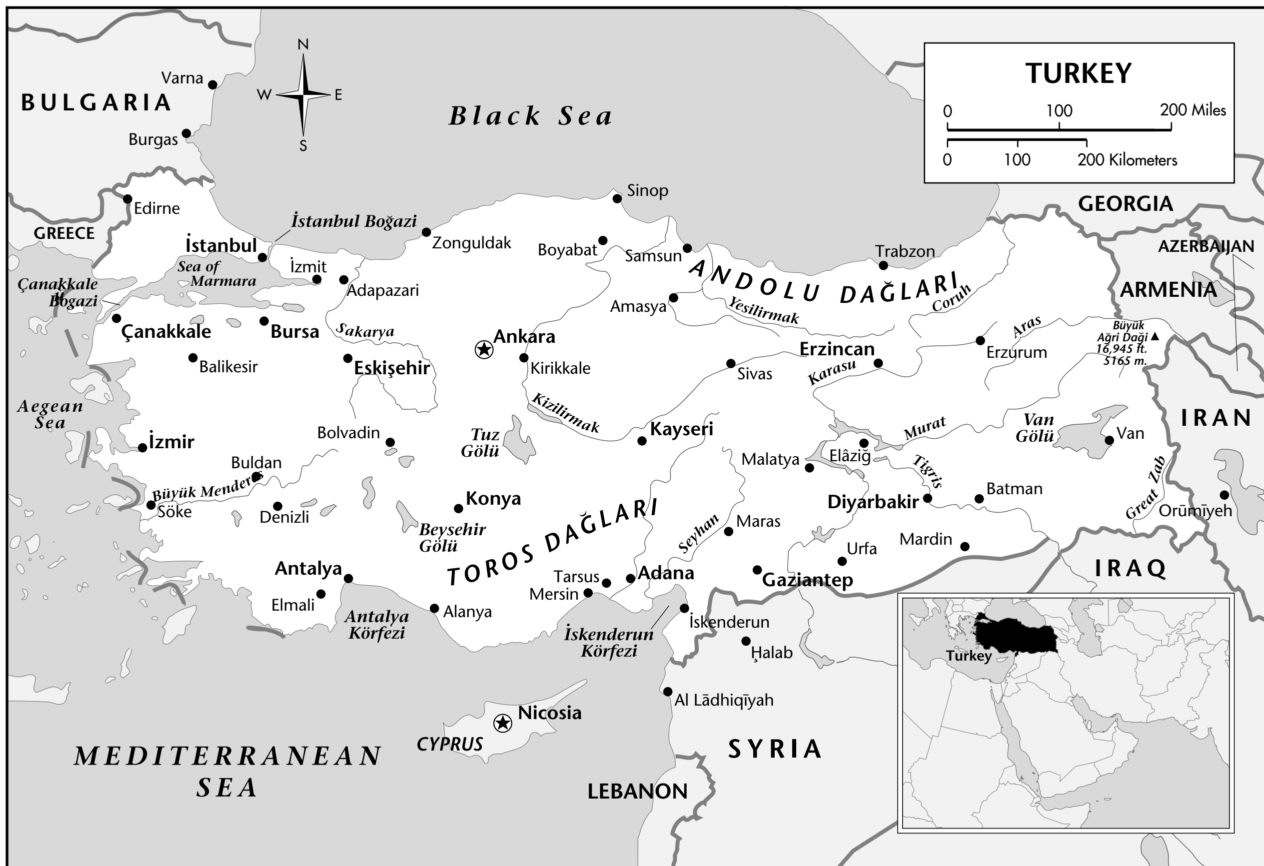
COUNTRY OVERVIEW

LOCATION AND SIZE. Turkey is a peninsula that, uniquely, straddles 2 continents. Located in southeastern Europe and southwestern Asia, 97 percent of its area occupies Anatolia, the peninsula of land that lies between the Black Sea on the northern coast of the country, and the Mediterranean to the south, where the continents of Asia and Europe meet. The remaining 3 percent of the country is in Thrace, a region in the southeastern Balkan peninsula, north of the Aegean Sea. Turkey has an area of 780,580 square kilometers (301,382 square miles) with a total coastline of 8,430 kilometers (5,238 miles), and shares its land borders with Armenia, Azerbaijan, Bulgaria, Georgia, Greece, Iran, Iraq, and Syria. The country is strategically situated since it controls the Turkish Straits, comprised of the Bosphorus, the Sea of Marmara, and the Dardanelles, which connect the Black Sea to the Aegean on the west coast. Comparatively, Turkey is slightly larger than the state of Texas. The capital city, Ankara, is located in the northwest center of Anatolia.

POPULATION. In July of 2000, Turkey's current population was estimated at 65,666,677. Between 1990 and 2000, the average annual growth rate of the population was 1.27 percent, with a total fertility rate of 2.16 children born per woman. The World Bank expects Turkey's population to reach 91 million by 2025. Since 1986, the state has actively promoted population control but, ironically, for about 40 years following the establishment of the republic in 1923 the government actually encouraged population growth.

The Turkish population is very young with only 6 percent aged 65 and over, and 65 percent between the ages of 15 and 65. In 1995, approximately 67 percent of the population lived in urban areas. As of 1999, urban dwellers increased to 75.3 percent of the total population. Approximately 20 percent of them live in Istanbul, making it the most heavily populated city in the country.

Turks constitute almost 80 percent of population and Kurds 20 percent. The rest of the population is made up of small minorities of Arabs, people from the Caucasus, Greeks, Armenians, and Jews. The ethnic Turks are a diverse people who differ from one another in dialect, customs, and outlook. The 3 major groups are the Anatolian Turks, who have lived in the Central Anatolian Plateau for centuries; the Rumelian Turks, who were originally mainly immigrants from the Ottoman territories in the Balkans; and the Central Asian Turks, descended from Turkic-speaking immigrants from the Caucasus region, southern Russia, and Central Asia. Turkey is the only country with a Muslim majority population (99.8 percent) that operates under a secular constitution and a democratic government.



OVERVIEW OF ECONOMY

Modern Turkey is a free market economy oriented to Western markets. While the **private sector** continues to be the country's powerful engine of rapid economic growth, the state has a significant involvement in essential sectors such as communication, transport, and banking. Modern industry and commerce play the majority role in the economy, although traditional village agriculture and crafts are still nurtured.

By the end of World War I, the long, drawn-out collapse of the Ottoman Empire was complete. Having lost the war, Turkey was not left with much in the way of an economy. The few factories that remained were in foreign hands, agricultural output had dropped significantly, and, with the loss of the Ottoman territories, many traditional markets disappeared. The country's technology was out-dated and there was a shortage of skilled labor. The several years of struggle for independence following World War I offered little opportunity for recovery.

With the establishment of the republic in 1923, the government was faced with the formidable task of rebuilding the country's economy. Initially, the focus was on returning agricultural production to pre-war levels while building a transport **infrastructure**, particularly railroads. Meanwhile, steady encouragement of private enterprise was evident in various government policies and measures. The economy exhibited impressive growth levels until 1930, when the Great Depression caused the collapse of external markets for Turkey's agricultural products. This prompted the state to take a more active role in the economy, adopting a policy of etatism (an economic doctrine where individual enterprise retains its fundamental role in the economy, but active government intervention is considered necessary. It applies particularly to basic industries and public services).

The economic role of the state continued until the early 1980s, when Turkey's policy makers embarked on a new course of **liberalization**, abandoning **protectionist policies** and initiating several reforms aimed at opening up the Turkish economy to foreign trade and investment. These new policies brought an annual growth rate averaging 5 percent over the last 2 decades of the twentieth century, giving Turkey the highest growth rate of any OECD (Organisation for Economic Co-operation and Development) country. By 2001, Turkey was one of the 20 largest economies in the world.

The path to economic growth in Turkey, however, has not been smooth. Since the 1950s, the country has

suffered serious disruption to its economy every 10 years. At times, this has been due to poor political leadership, at other times, the cause has been structural inadequacies and **balance of payment** problems. In 1994, the country faced one of its worst **recessions**, bringing an end to 13 straight years of growth, but the economy bounced back strongly over the next 3 years, growing by over 8 percent. In 1998, slowdown returned as a result of the Asian and Russian financial crises; in 1999, disaster struck in the form of 2 deadly earthquakes, measuring 7.4 and 7.2 on the Richter scale, which hit northwestern Turkey right in the middle of its industrial heartland. The World Bank estimated the economic loss at approximately US$10 billion, and Turkey suffered its worst contraction since World War II. That the country has survived this miserable period is seen as a positive sign for its economic future. A larger problem is that of persistent **inflation**, which has been over 60 percent annually for 5 years, and remained in the double digits in 2001. The expectation of inflation has become a way of life in Turkey, bringing an inertia that has made it extremely difficult to tackle the situation.

Despite these problems, several factors have allowed Turkey to remain attractive to foreign investors. A population of 64 million with significant purchasing power represents a big and fast-growing market, with strong potential for further development. Also, Turkey lies in the middle of the rich oil-producing area of the Caspian Sea and the consumer markets in Europe, while its strategic geopolitical position at the crossroads of Europe, Asia, and the Middle East makes it a prime gateway. In addition, Turkey has close relations with the Central Asian Republics, forged by ethnic and linguistic ties, and is the leading investor in many of these countries. Last, but certainly not least, Turkey entered a customs union agreement with the European Union (EU) in 1996, thus enabling the free flow of goods to and from other European markets. All these factors make Turkey an attractive destination for trade as well as for cost-effective export industries.

Turkey's economic profile is multi-dimensional in nature. Tourism is a significant economic sector, while textiles and clothing are the most important manufacturing industries, supplying the largest percentage of goods for export. Other important industries include iron, steel, cement, chemicals, and the automotive industry. The Turkish private sector is dominated by a number of large **holding companies**, whose senior management is controlled by prominent families. The best known and strongest of these are the Sabanci Holding and Koc Holding companies, both of which have a significant presence in most sectors of the economy. In order to limit outside interference in company management, most large businesses only float a small portion of company shares in the public market.

POLITICS, GOVERNMENT, AND TAXATION

The Turkish political system is a secular parliamentary democracy that recognizes the separation of executive, legislative, and judicial powers. The executive branch of government includes the president, the prime minister, and the cabinet (council of ministers responsible for a variety of governmental tasks). The president is elected by parliament for a period of 7 years. He serves as the head of state, has broad powers of appointment and supervision, and is non-partisan. The prime minister is the head of the government and is responsible for appointing the cabinet. The Turkish Grand National Assembly (TBMM), or parliament, is the legislative branch of government and consists of 550 elected representatives voted for by the citizens of Turkey. The judicial system consists of a constitutional court, a series of state courts, a council of state, and a high council of judges and prosecutors.

Modern Turkey has suffered several periods of instability and authoritarian rule. When the Turkish Republic was established in 1923, Turkey was governed under 1-party rule by the Republican People's Party (CHP) established by Kemal Ataturk, who founded the modern republic. This situation lasted until 1945, when the multi-party era commenced. The first change of power took place in 1950 when the Democrat Party won the national elections. They ruled until 1960, when power was seized in a military coup intended to end internal political tensions and growing economic problems. Democracy returned in 1961 as soon as a new constitution was written, but only lasted until 1971 when, after a 3-year period of political strife and resultant domestic violence, another coup was staged, replacing the civilian government with a succession of semi-military, non-partisan governments. In 1973, general elections were held once again in an effort to re-start the democratic process but, by 1980, a military coup was again necessary to restore order and stop political violence that was claiming more than 20 victims daily.

Another new constitution was drafted in 1982. It was approved in a national referendum, and elections were held 1983. The Motherland Party, formed by Turgut Ozal, won an absolute majority, formed a government, and won a second election in 1987, making for 6 years of stable rule until, in 1989, Turgut Ozal left the Motherland Party to become Turkey's new president. Many of the structural and economic reforms that have led to liberal trade policies and reduced the government's role in the economy were initiated during this period in the 1980s. Since then, however, no single party has been able to capture a majority in elections, and the Turkish political scene has witnessed one coalition after another failing in attempts to bring stability back to government.

In the 55 years since the beginning of the multi-party era, Turkey has had 43 governments (in addition to the 14 different governments in the single-party era). In 1999, the country witnessed the fall of yet another government, the establishment of an interim government, and the election of a third. With each government averaging just over 15 months in power, it is not surprising that the country has found it difficult to develop and execute a stable, long-term economic plan. The fundamental problem lies with the fact that there are too many political parties in operation (21 parties participated in the 1999 elections), many of them following similar pro-reform, centrist policies, offering little difference of choice other than between the distinctive personalities of their various leaders.

The last elections were held in April 1999. The Democratic Left Party (DSP), led by Bulent Ecevit, received 22 percent of the votes and won the most seats in parliament. This was not enough to secure a majority and, in June 1999, DSP formed a coalition with the National Action Party (MHP) and the Motherland Party (ANAP). If this coalition proves stable, the next elections will be held in 2004. There are grounds for optimism, since the 3-party coalition has a strong parliamentary majority, and has been aggressive in pushing an ambitious reform program, well supported both domestically and externally.

Of the 21 parties that participated in the 1999 elections, 6 are prominent. Two of these are center-left parties: the Democratic Left Party (DSP), who is the majority partner in the current coalition government, and the Republican People's Party (CHP). Bulent Ecevit, the current prime minister, leads the DSP, a social democratic party with a strong free-market economic agenda. Ecevit has had decades of experience in Turkish politics (he was prime minister 3 times during the 1970s). The CHP tries to carry on the tradition of the party's early days as the first political party in Turkey, but in the last elections it failed to get the 10 percent of the vote necessary to enter parliament. Thus excluded from parliament for the first time in its history, the CHP has embarked on a process of rebuilding itself.

On the opposite side of the political spectrum are 2 center-right parties: the Motherland Party (ANAP), a junior coalition partner in the current government, and the True Path Party (DYP), which holds 85 parliamentary seats. Both are parties of the conservative mass, have similar ideologies (social and political beliefs), and, in common with the center-left, support free trade and growth led by the private sector. However, such slight policy differences as there are have favored ANAP popularity in urban areas, while the DYP has more visibility in smaller towns and villages.

The Nationalist Movement Party (MHP) was the big surprise of the 1999 elections, capturing second place with 18 percent of the national vote and a partnership in the coalition government. It has a strong nationalist agenda, and has been historically connected to right-wing organizations partly responsible for the violence preceding the military coup in 1980. Despite retaining hard-line attitudes on certain issues, the MHP seems, overall, to have softened somewhat. It has strongly supported the economic reforms and has co-operated in maintaining the stability and continuity of the coalition government.

The Virtue Party (FP) is the successor to the Welfare Party, which was in government in 1996–97 but was shut down in 1998 for undermining the principles of Ataturk and secular Turkey. FP has a religious agenda, and rejects the secular principles on which the republic is based in favor of Islam. It won 15 percent of the vote in the 1999 elections, making it the main opposition party to the 3-party coalition government.

In Turkey, the military has traditionally exerted significant pressure on ruling parties, and military intervention in government has been frequent. Since the first coup in 1960, representatives of the army, air force, and navy join the president, the prime minister, several key ministers, and the Chief of the Turkish General Staff on the National Security Council (NSC), an advisory body that oversees the president and the cabinet. At times, the NSC has had a marked effect on the political agenda. The military played a major role in the resignation of the Welfare Party government by publicly supporting a popular opposition movement comprised of businesses, labor, and community groups. The influence of the military (which has closer ties with the center-right parties) seems to have diminished in the new government, although its stance on several sensitive issues is well known to the public.

The Ecevit government restarted structural reform, trying to make up for the time lost during the political uncertainties of the 1990s. In addition to social security reforms, one of the primary tasks of the new government was the reduction of the national deficit through accelerated **privatization**. A series of legislative measures have been designed to allow for the process to be as smooth as possible. These privatization projects will make Turkish industry more efficient and globally competitive, and will bring increased revenue to the government. The government is also trying to tighten its fiscal discipline by cutting expenditures and tightening up on tax collection. This latter measure is important, since Turkey has a large unregistered economy that could account for an increase in the official GNP by up to 50 percent. Indeed, although Turkey's population has grown by 30 percent over the last 15 years, its taxpayer base has remained static, indicating the seriousness of the problem. If the government can succeed in reducing this unregistered economy, the tax base will broaden and bring some much-needed relief to the country's finances.

INFRASTRUCTURE, POWER, AND COMMUNICATIONS

As an **emerging market** Turkey has a competitive commercial infrastructure. However, the government faces a continual challenge to meet the demands of a rapidly growing economy, and gives special priority to major infrastructure projects, particularly in the transport and energy sectors.

By the end of 1999, Turkey had 118 airports, 22 of which were open to international traffic. However, a large majority of international traffic targets 3 main airports: Ataturk International Airport in Istanbul, Adnan Menderes Airport in Izmir, and Esenboga Airport in the capital, Ankara. The new international passenger terminal in Istanbul, which opened in January 2000, is one of the largest in Europe. Several more new airports are under construction, including one on the Asian side of Istanbul. Over 300 foreign airlines serve Turkey, in addition to Turkish Airlines (THY). THY, with its fleet of 73 passenger planes, operates to both domestic and international destinations. There are 15 additional public and private domestic airlines operating on a smaller scale.

Shipping plays an important role in the Turkish economy. This is no surprise, since over 70 percent of Turkey's boundaries consist of 4 seas: the Black Sea in the north, the Marmara in the northwest, the Aegean in the west, and the Mediterranean in the south-southwest. The country's 8,430-kilometer coastline is covered with large and small ports, 21 of them international. Five ports, all state-owned, handle most of the country's sea freight: Istanbul and Kocaeli on the Sea of Marmara, Izmir on the Aegean, and Mersin and Iskenderun on the Mediterranean. Seaports on the Black Sea coast mainly handle export cargo of steel products, tea, and hazelnuts, and import cargo of coal, iron ore, raw minerals, fertilizers, and bulk construction materials. The area around the Marmara Sea is the country's industrial heartland and these ports serve a vital function in Turkey's economy, handling cargo carrying raw industrial materials, semi-finished materials, chemicals, steel, and petroleum. The Marmara Sea is also the only connection between the Black Sea and the Mediterranean through 2 straits, and is therefore one of the busiest maritime routes in the world. The Mediterranean ports also handle domestic and international cargo traffic. Iskenderun handles 75 percent of Turkey's steel exports, while a nearby port serves both the domestic and the Iraqi oil pipeline. Mersin, one of the main ports of the eastern Mediterranean, acts as an export hub for southeast Anatolia's products.

The railway system is one of the weakest modes of transportation in Turkey. Although the country has 10,933 kilometers (6,778 miles) of railways running between its western and eastern borders, only 2,133 kilometers (1,322 miles) are electrified. The railroads are state-owned and operated, but rail expansion has not been politically popular for the last several decades and has lacked funding. Most commercial and public transportation, therefore, must rely on other means while the aging rail system, badly in need of renovation, is primarily used to carry minerals and bulk commodities over long distances. The government has, however, begun engaging in plans for both the modernization of existing lines and the addition of up to 2,000 kilometers (1,240 miles) of railway.

The highway transport system carries over 95 percent of passenger transport and over 90 percent of the surface transport of goods in Turkey. The country's road network is extensive, with over 382,000 kilometers (nearly 237,000 miles) of roads. By the end of 1999, 1,726 kilometers (1,070 miles) of this network consisted of motorways, and a total of 96,000 kilometers (59,520 miles) was tarred. The government has made strenuous efforts to extend and improve its road network, especially in the building of additional motorways. The economic crisis of 1998 and the earthquakes of 1999 caused some of these projects to be postponed, but they, and others, are expected to go ahead.

Turkish telecommunications services are undergoing rapid modernization and expansion. As of 1999, Turkey

had more than 19 million telephone lines, exceeding a density of 25 percent. The target density for 2005 is 40 percent. Turk Telekom, a state-owned enterprise, provides basic telephone services in the country, utilizing a variety of communication systems including satellite, submarine cable, and fiber-optic cable. The government has announced plans to privatize up to 49 percent of the company in the near future. The country is also seeing a rapid expansion in cellular telephone services, with many licenses sold to private companies. The current cellular density is estimated at 15 percent and is expected to reach 30 percent by 2010. Cellular phones have received widespread acceptance in the large cities, where they have become a part of daily life among both business executives and teenagers. The Internet is also a well-accepted communication/information medium in Turkey, again primarily in the urban areas. At the end of 1999, Turkey had 1.7 million Internet users, 70 Internet service providers, and 8.06 Internet hosts per 10,000 people. Internet usage is seeing rapid growth, primarily due to cutting-edge Internet banking operations.

Turkey faces one of its biggest challenges in the energy sector. Rapid urbanization and strong economic growth have led to one of the fastest growing power markets in the world. It is no secret that Turkey is facing a major hurdle in trying to meet the demands of such growth. In 1999, imported energy supplied 60 percent of the country's primary energy consumption, and energy imports are expected to reach 75 percent by 2020. Turkey has an installed electric capacity of 26,500 megawatts, of which about 11,000 megawatts is hydroelectric and the balance is thermal power. This capacity not only cannot meet the 8–10 percent projected annual increase in demand, but is also insufficient for present needs. The Turkish government has been actively seeking investments and developing projects to triple energy production by 2010. The Southeastern Anatolia Project (GAP) is expected to be completed in 2005, and is the most crucial public project in Turkey. When complete, the 22 dams and 19 hydroelectric power plants that are a part of this project will produce 22 percent of Turkey's projected electricity requirements. Due to the current shortage of electric capacity, the 220-volt power system has suffered from occasional blackouts.

ECONOMIC SECTORS

Turkey's economy has been able to supply a broad range of goods and services since the early 1950s. Since then, the mix of domestic production has seen a shift from agriculture to manufacturing, and then to services. In the early 1950s, agriculture made up a little under 50 percent of **gross domestic product** (GDP), while the manufacturing sector's share was about 20 percent. In the 1970s, with the government's continued emphasis on industrialization, manufacturing caught up with agriculture for the first time and surpassed it. This trend continued until the 1980s. With the economic reforms of the 1980s, the economic shift accelerated as all sectors exhibited strong growth, though both manufacturing and services grew much more rapidly. By the late 1990s, the services sector began to dominate the domestic economy: in 1999, the services sector made up 56 percent of GDP, while manufacturing was at 29 percent and agriculture at 15 percent. However, all 3 remain vital to the Turkish economy.

AGRICULTURE

Historically, the agriculture sector has been Turkey's largest employer and a major contributor to the country's GDP, although its share of the economy has fallen consistently over several decades. In 1999, it accounted for 15 percent of GDP, while employing about half of the **labor force**. Although the sector has grown over time, the growth has been only about 1 percent faster than the country's population, and much slower than that of the industrial and services sectors. Farmers have been slow to adopt modern techniques, and much of the potential land and water resources are inefficiently managed.

Nevertheless, Turkey is one of the few countries in the world that is self-sufficient in terms of food. The country's fertile soil, access to sufficient water, a suitable climate, and hard-working farmers, all make for a successful agricultural sector. In addition, a broad range of crops can be raised because of the variety of different climates throughout the land. This has allowed Turkey to become the largest producer and exporter of agricultural products in the Near East and North African regions. In fact, according to *The Economist*'s world rankings, Turkey is one of the top 10 producers of fruit, wheat, and cotton in the world. More impressively, it ranks among the top 5 producers of vegetables, tea, and raw wool. As a result of this massive production base, Turkey enjoys a comparative advantage in many agricultural products, and a positive trade balance in agriculture that contributes significant relief to an overall **trade deficit**. The country's main export markets are the EU and the United States, to which Turkey exports dried fruit and nuts, cotton, and tobacco. Another major export market is the Middle East, which buys fresh fruit, vegetables, and meats from Turkey. By 1999, the value of agricultural exports had risen to US$2.4 billion and accounted for 9 percent of Turkey's export earnings (down from 60 percent in 1980). However, these figures could be misleading insofar as almost 50 percent of the manufactured exports also originate in the agricultural sector (primarily textiles and clothing). Therefore, the agricultural sector's direct and indirect total contribution would still account for 50 percent of total exports. Of Turkey's agricultural sector, crops account for 55 percent of the gross value, livestock represents 34 percent, and forestry and fishing make up the rest.

The vegetal (of, or relating to, plants and vegetables) production is primarily made up of cereals, pulses (edible seeds of various pod-bearing plants such as peas, beans, or lentils), industrial crops, and perishables. Of these, cereal crops occupy more than half of the cultivated land. The main species of cereal crops produced in Turkey are wheat, barley, oats, rye, maize, millet, and rice. These crops are produced in most parts of the country, with a heavier concentration in the central regions. Of all these, wheat has a special place in the Turkish economy. Turkey is both a top 10 producer and a top 10 consumer of wheat in the world. It is the essential food element in the Turkish diet, generally eaten in the form of bread. Production increases in the late 1970s enabled the country to become a wheat exporter and, although the output slowed down in the early 1980s, renewed efforts have seen wheat production continue to expand. In 1998, the total wheat production was 21 million tons.

Turkey is also the main pulse producer in the Middle East and one of the leading producers in the world. The pulse output increased from 617,000 tons in the early 1970s to 1.1 million tons in the 1980s and 1.6 million tons in 1998. Since the mid-1990s, over 60 countries import Turkish pulses, primarily chickpeas and lentils.

The major industrial crops produced in Turkey are cotton, tobacco, and sugar beets. Cotton is crucial to the wider economy since it provides the fiber for textiles, the leading category of Turkish exports. Cotton is primarily grown on the coastal plains of the Mediterranean and Aegean seas, in the south and southwest. Cotton production in 1999 was 855,000 tons. Only 10 percent of cotton is exported in raw form, while the rest feeds the domestic textile industry. The Southeastern Anatolian Project is Turkey's largest development project. It seeks improvements in energy production, tourism, mining, gasoline, education, health, communications, industry and transport, and in active farming by means of extensive irrigation systems. When the project is completed, it is estimated that Turkey's cotton production will expand to twice the level of production in the year 2000. Another industrial crop, sugar beets, saw a dramatic increase in production in the 1980s and 1990s. In the 1970s, annual production was around 650,000 tons, meeting only domestic needs. In the 1980s, this increased to 1.5 million tons, and in 1998 the total production of sugar beets was 22 million tons.

Tobacco has been grown in Turkey for many centuries, and the tobacco industry is a major player in the Turkish economy, contributing 18 percent of total agricultural exports. Turkey ranks as the fifth largest tobacco-producing country in the world, and its number-one producer of Oriental tobacco, of which it grows over half of the world's supply. The country is also the world's fourth largest tobacco exporter. The crops are primarily concentrated on the Aegean coast and Black Sea regions, but eastern Anatolia also contributes to the output. The crop yield varies considerably from year to year due to climatic changes, but averages around 200,000 to 300,000 tons annually. On average, 30 percent of this output is exported to the United States and another 20 percent to the EU.

Perishable fruit and vegetables are also important to the Turkish economy. Out of the 140 perishables grown in the world, the country produces 80 varieties of fresh

fruits and vegetables and exports 30 kinds of vegetable and 20 kinds of fruit. These include grapes, citrus fruit, melons, potatoes, onions, tomatoes, olives, and cucumbers. These exports are worth over US$1 billion annually to Turkey.

Turkey is prominent, too, in the world trade of edible nuts and dried fruits. In this category of agricultural products, hazelnuts, pistachios, sultanas, dried apricots, and dried figs are important exports. Records indicate that hazelnuts have been grown along the Black Sea coast since 300 B.C. and Turkey is a major producer, competing with Spain, Italy, and the United States in the international markets. In 1998, Turkish hazelnut production reached 580,000 tons. Turkey also leads the world in figs, producing 36 percent of the world's total production and accounting for 70–75 percent of total world exports.

Animal husbandry is also significant in the agricultural sector. Turkey has traditionally been an important supplier of live sheep, lamb, and mutton to the Middle East, especially Iran and Iraq, but the United Nations (UN) **embargo** on Iraq, following the Gulf War, adversely affected domestic meat exporters and led to a significant decline in exports in the 1990s. Sheep constitute 59 percent of the existing animal total in Turkey, followed by cattle (22 percent) and goats, both the common goat and the Angora breed (16 percent). Most livestock is grazed in the central and eastern Anatolian plains, as well as in the western Anatolian region. Turkey is self-sufficient in milk products, supplying around 10 million tons per year.

Turkey's basic agricultural resources are vast and offer considerable potential for expansion. However, to maximize this potential and increase efficiency, the agricultural sector needs government involvement in structural reforms and development projects. One of the several aims of the Southeastern Anatolian Project (GAP) is to strengthen and expand the agricultural resource base for one of the most underdeveloped parts of the country. Indeed, GAP is possibly one of the most crucial projects for Turkey, since the large economic disparity between urban and rural areas has created social tension, and contributed to damaging levels of migration from the countryside to the cities, primarily in the southeast. This situation poses a serious threat to future agricultural development and to the general economic health of Turkey.

INDUSTRY

The industrial sector in Turkey has been the primary focus of government policies since the early 1950s. Industrial policy until 1980 was based on an **import-substitution** strategy. This protectionist approach was very successful for several decades, and the sector grew at an average rate of 8.6 percent annually until the late 1970s. The first factories built in the country processed food and non-durable **consumer goods**, and remain among Turkey's most competitive manufactures. The next phase of development was in industries such as iron and steel, chemicals, and cement. By the end of the 1970s, **capital goods** and high-technology products had become the primary focus, but the rapid industrialization was taking its toll on the sector. Efficiency problems and energy shortages began to slow down growth, and prevented industry from becoming competitive in the international markets. The **liberal economic** policies introduced in 1980 were designed to address these issues by establishing a less protectionist, more outward-looking industrial policy. The idea was to use market signals to identify uncompetitive industries, transfer their resources to those industries where Turkey enjoys a comparative advantage, and thus compete in world markets. This strategy necessitated a greater emphasis on private sector-led growth. Accordingly, policies and reforms were designed to facilitate rapid expansion of the private sector.

While much progress has been made in the industrial sector since 1980, the process is still not complete. **Public sector** companies continue to dominate a number of critical industries, particularly those such as energy and steel whose products are crucial to private sector companies. Still, the industrial sector has achieved an average growth rate of 6 percent since 1990, and Turkey competes successfully in several areas of the international market. The country's abundance of natural resources, its geographical proximity to export markets, and the existence of a large domestic market give Turkey competitive strength in a diversity of industrial sectors. In 1999, the industrial sector in Turkey contributed to 29 percent of GDP and employed 27 percent of the labor force. More remarkably, industry accounts for 89.4 percent of Turkey's total export earnings. The key industries in Turkey are textiles, iron and steel, chemicals, cement, food processing, motor vehicles, construction, glass and ceramics, and mining.

TEXTILES AND CLOTHING. Industrial expansion in the 1960s and 1970s gave birth to the modern textile industry in Turkey. Currently, it is one of the most important sectors in the Turkish economy, accounting for 10 percent of GDP, 20 percent of the labor force, and 40 percent of total manufacturing output. This sector is the largest in the country and it is the largest supplier of exports as well. Today, Turkey is extremely competitive in international markets and was ranked sixth in world exports of clothing in 1998.

The fact that Turkey is a major grower of cotton is a great advantage for the textile and clothing sector. Thanks to the easy availability of the raw materials, Turkish spinning and weaving industries have developed significantly, creating integrated and diversified production

in all sub-sectors of the textile industry. In terms of cotton spinning, the installed capacity in Turkey is equivalent to around 33 percent of that of the EU as a whole. The export value of cotton and cotton textile products was US$777 million in 1999 and the main destinations were the EU countries and the United States.

In addition to the cotton-based textile industry, Turkey makes a strong showing in both woolen textiles and man-made fibers. It is the third largest mohair producer and has the sixth largest synthetics capacity in the world. In 1999, the export value of wool or woolen textile products was US$107 million, while the man-made fibers industry accounted for US$1.1 billion.

The Turkish home textile industry has also been a strong competitor in world markets. Turkish towels and bathrobes, produced primarily around the western cities of Denizli and Bursa, enjoy a worldwide reputation for quality, and the home textiles sector accounted for 3.2 percent of Turkey's total exports in 1999, bringing in US$859 million.

The clothing industry has shown stable growth over the years and is today one of the most important manufacturing sectors. In 1999, the production volume of clothing equaled 223,000 tons, and its export revenues reached US$6.2 billion, giving it a 23 percent share of Turkey's total exports. The major markets for clothing exports are again the EU and the United States. The EU accounts for 71 percent of all clothing exports, and Germany leads all European countries with 38 percent of total exports. The clothing manufacturers are spread through the west and south of the country, with the majority based in Istanbul.

IRON AND STEEL. The foundations of the iron and steel industry were laid in the late 1930s with the establishment of the first integrated steel mill (a steel mill that takes raw materials in the form of iron ore and coke to produce molten iron, which is further processed to produce finished steel products) in 1939. At present, there are 3 integrated steel mills: the recently privatized KDCI (Karabuk, Black Sea region) plant and the 2 public-sector plants, Erdemir (Eregli, Black Sea region) and Isdemir (Iskenderun, East Mediterranean region). With the 1980 reforms, private sector investments accelerated, and several private electric arc furnaces (lower capacity minimills that produce steel from iron-bearing scrap) were established. Today, there are 17 electric arc furnaces (EAFs), only one of which is state-owned. The total steel production capacity of these 20 plants is 19.9 million tons, of which over 70 percent comes from EAFs.

Since 1980, the Turkish iron and steel industry has been one of the fastest growing in the world. In 1999, Turkey's raw steel production rose to 14.3 million tons, with a 1.9 percent share of the total world production. Turkey currently ranks seventeenth among the 66 steel-making countries in the world and fifth in Europe. In 1999 steel products were exported to 149 countries, with the top 6 buyers being Italy, Israel, the United Kingdom (UK), the United States, the United Arab Emirates, and Greece. With a total export value of US$2.1 billion in 1999, the steel industry is the second most important export sector in the country, after textiles and clothing.

CHEMICALS. Turkey has been manufacturing chemicals since the very early years of the republic. Although it has not been a high-flying sector, it has shown slow but steady improvement over time. Currently, it is one of the country's largest industries in terms of value, and is the fourth major export sector, accounting for 6.6 percent of Turkey's total exports and worth US$1.7 billion. The major chemical exports are plastic raw materials and plastic products, followed by rubber and rubber products. There are 6,000 companies manufacturing chemicals in Turkey, the most prominent being Petkim, a state-owned petrochemical company established in 1965, which supplies around 40 percent of the domestic market. Petkim's 2 major complexes are located at Kocaeli (Marmara Region) and Izmir (Aegean Region). Aside from Izmir and Kocaeli, most of the private sector companies are located in Istanbul, Ankara, and Adana. Primary chemicals produced in Turkey include boron products, caustic soda, chlorine, industrial chemicals, and sodium phosphates.

CEMENT. In comparison with the rest of Europe, Turkey was a latecomer to the cement industry. However, with accelerated investments and a number of structural reforms such as the elimination of government price-setting practices in 1984 and privatization of the industry from 1989, Turkey has become self-sufficient in this sector. Today, there are 51 cement plants in Turkey, all of which are private companies. By 2001, the country was the eighth largest cement producer in the world with a 2.5 percent share of the world market, and the largest producer in Europe. In 1999, Turkey produced 38.1 million tons of cement. While 34.7 million tons of it went to the domestic market, the balance was exported. The chief markets for Turkish cement are the United States, Spain, Israel, Egypt, and France.

CONSTRUCTION. A domestic construction sector did not exist in the founding days of the Turkish Republic, with almost all building done by foreign companies. The sector developed steadily over 50 years following the establishment of the Republic. The 1970s and early 1980s saw a period of international expansion for Turkey's construction sector, and Turkish firms became quite successful in the oil-producing states of the Middle East. The industry contracted with the Iran-Iraq war, but large domestic infrastructure projects enabled it to survive the difficult period. The break-up of the Soviet Union marked the beginning of a new era in the Turkish construction

sector, and led to the diffusion of Turkish construction firms throughout Russia and Central Asia. Today, the construction sector makes up about 6 percent of the **gross national product** (GNP), and Turkey's share in international global contracting services is about 2–3 percent. (Since most construction is offered outside the country, the industry contributes only to GNP, and not to GDP.) During the 1990s, 34 percent of construction services performed were located in the Russian Federation, while Libya accounted for another 15 percent, followed by Kazakhstan, Pakistan, Turkmenistan, Uzbekistan, and Saudi Arabia.

MINING. Geologically complex, Turkey possesses some of the richest and most diverse mineral deposits in the world numbering 4,400, excluding petroleum and coal. Today, 53 minerals are produced in the Turkish mining sector, with 85 percent of production belonging to the state-owned enterprises that predominate in the production of mineral fuels and metallic ore. The 15 percent that belongs to the private sector is concentrated in industrial minerals. Turkey is a major producer of boron, chromite, marble, barites, magnesite, pumice, feldspar, celestite, and emery. Two-thirds of boron reserves and 40 percent of marble reserves in the world are located in Turkey, and the country provides 80 percent of the world demand of emery. In 1999, mining products accounted for 1.4 percent of total exports, worth US$353 million—down from 1998, when mining exports accounted for a 1.9 percent share of total exports, worth US$531.6 million.

SERVICES

The services sector accounted for 64 percent of GDP in 1999, while employing over one-third of the total labor force. Tourism and banking are the 2 primary service industries in Turkey.

TOURISM. With a share of nearly 26 percent of GDP, the tourism industry in Turkey is strategically important to the Turkish economy. The industry entered the 1980s with 1.5 million tourists annually and a global market share of 0.3 percent. However, the sector took off between 1983 and 1993, growing at an average annual rate of 18 percent, the highest tourism growth rate in the world for the period. In 1998, the number of foreign visitors reached 9.7 million, bringing revenues estimated at US$7.1 billion. As such, Turkey is currently in the world's top 20 tourist destinations, both in terms of visitor numbers and earnings.

Despite these statistics, Turkey remains a relatively undiscovered land for tourists. The country's long and gorgeous coastline, high mountains and lakes, and wealth of historical, religious, and archaeological sites offer opportunities for massive development of tourism. However, the growth of the sector has been plagued with problems, chief among them the fallout from the nuclear disaster at Chernobyl in the Soviet Union, Kurdish terrorist campaigns, and economic problems in neighboring regions. In addition, access to natural and historical wonders is difficult in most parts of the country, and much investment in transportation, waste management, and infrastructure is required to remedy this problem. Since the 1980s, the government has identified tourism as a high-priority industry and has been steadily developing the sector, encouraging both private and foreign investment through new laws and incentive programs.

Today tourism is considered to be one of the leading industries in the Turkish economy. It creates jobs for at least 10 million Turkish citizens and offers a capacity of 563,000 beds. Further capacity of nearly 8,500 beds is available on some 990 yachts that cruise the Aegean and Mediterranean coasts. These are operated by over 100 yacht agencies. The largest number of tourists are from Germany, the **Commonwealth of Independent States** (CIS, formerly the USSR), the United Kingdom, the United States, and France.

FINANCIAL SERVICES. The Turkish financial system is based upon a universal banking system that legally enables commercial banks to operate in all financial markets. As such, banks carry out nearly all of the activities in the money and capital markets in Turkey, and the banking sector has become almost synonymous with the Turkish financial system. The only 2 areas prohibited to commercial banks are leasing and the trading of goods for commercial purposes. On the other hand, development and investment banks may not accept deposits, but can engage in the 2 activities prohibited to the commercial banks. Excluding the Central Bank of Turkey, there were 80 banks operating in Turkey by the end of 1999. Of these, 61 are commercial banks and 19 are development and investment banks. Seven of the banks are state-owned. Much like their counterparts in Germany and Japan, the major private banks have ownership linkages with large non-financial conglomerates. Most state banks are located in Ankara, while many of the private banks are centered in Istanbul.

The banking system has undergone a rapid technological transformation in the last decade. According to the U.S. Department of Commerce, in terms of trade finance, treasury operations, electronic banking, and information management, the dozen leading Turkish banks are as sophisticated as their counterparts in developed countries. Certainly, Turkish banks are among the most profitable in Europe, but this statistic could prove misleading in the long term. Given the high **budget deficit** and high inflation, operations have a short-term focus and profits come primarily from banking investment in short-term government securities and short-term loans with high real interest rates. Therefore, profitability has not

been loan-based (contrary to their counterparts in developed countries) and banks lack a lending culture and risk-asset management systems. Therefore, as inflation responds to recent measures and begins to fall, banks will begin losing their highly profitable short-term operations, and will have to focus more on core banking operations with low margins.

The Central Bank of Turkey is responsible for the supervision of the banking sector in order to guarantee that banks meet **liquidity** requirements and operate responsibly. However, banking has suffered in the past from weak supervision and inconsistent accounting practices. The banking sector passed through a crisis in 1999 when 3 small banks failed. The same year, a new law was passed calling for the creation of an independent regulatory agency, toughening operating conditions, and giving weight to regulatory and sanctioning powers. It is expected that, under stricter supervision, the financial sector will grow considerably stronger.

INTERNATIONAL TRADE

Trade played a minor role in the Turkish economy before 1980, but grew rapidly after economic reforms promoted liberalization of foreign trade. These reforms were designed to remove **price controls**, decrease **subsidies**, reduce **tariffs**, and promote exports. In addition to rapid growth in both exports and imports, the reforms brought a change in the structure of foreign trade, and the predominant role of agricultural products came to an end with the emergence of a greater emphasis on industrial products.

In addition to being a World Trade Organization (WTO) member, Turkey has also entered a number of multilateral trade relationships to increase its presence in the world trade arena. It signed a free trade agreement with the European Free Trade Association (EFTA) in 1991. In 1992, Turkey and 10 other nations in the Black Sea region formed the Black Sea Economic Cooperation Organization. Turkey is also a member of the Organization for Economic Cooperation (covering Central Asian countries) and the Organization of the Islamic Conference. Separately, Turkey has entered into free trade agreements with Israel, and with several Central and Eastern European countries.

On 1 January 1996 the EU and Turkey entered into a customs union, covering industrial products and processed agricultural goods, but excluding traditional agricultural products from the agreement. Turkey's adoption of the EU's Common External Tariff has resulted in lower **duty** rates for third-party countries, including the United States.

In 1980, Turkey's total merchandise exports yielded US$2.9 billion. The share of agricultural products was 56.7 percent, while industrial products made up only 36.3 percent. Another 6.5 percent consisted of mineral products. In 1999, Turkish exports reached US$26.6 billion, a figure actually 1.4 percent lower than in 1998. The drop was primarily due to the difficult economic conditions that prevailed in Turkey as a result of the Asian financial crisis and the 2 earthquakes. The share of agricultural products in 1999 was only 9 percent, and mineral products 1.4 percent. By contrast, the share of manufactured products, on the other hand, made up 89.4 percent of total exports in 1999.

The 1991 Gulf war between the U.S.-led coalition and Iraq, and its resultant economic embargo against Iraq, have had adverse effects on Turkish exporters. While exports to Iraq were US$986 million in 1988, this figure had fallen to US$124.1 million by 1995. As a result, Iraq's share in Turkey's exports dropped from 8.4 percent (which would have been enough to rank Iraq as the third largest export market) to 0.56 percent in 1995. The 1992–95 war in Bosnia also took a toll on Turkish exports. Since most of Turkey's exports are to the European markets, the main method of transportation is surface freight. The Bosnian war brought a significant increase in freight costs, as well as causing numerous administrative difficulties. The 1997 Asian financial crisis also had a large impact on Turkey's exports, since the Asian countries are important competitors for Turkish products in overseas markets. The **devaluation** in Asian countries lowered their export prices and gave them a clear advantage over Turkey.

Edible fruits constitute a majority of Turkey's agricultural exports, and this trend continued in 1999. Among industrial products, textiles and ready-to-wear industries remained the major contributor. Other important industrial export sectors were iron and steel, electrical machinery, and motor vehicles and equipment. While Turkey's export markets are highly diversified, OECD countries make up a majority of the trade and took 67.8 percent of exports for 1999. Germany is the largest single export market for Turkey. In 2000, Germany took up 18.7 percent of Turkey's exports. The United States is the second largest

Trade (expressed in billions of US$): Turkey

	Exports	Imports
1975	1.401	4.739
1980	2.910	7.910
1985	7.958	11.343
1990	12.959	22.302
1995	21.637	35.709
1998	25.938	45.369

SOURCE: International Monetary Fund. *International Financial Statistics Yearbook 1999.*

export market, with a share of 11.4 percent, and the United Kingdom the third largest, with 7.4 percent. Italy and France take up the remaining 12.3 percent.

Turkish imports exhibit similar patterns of growth to their exports. In 1980, total imports amounted to US$7.9 billion. The figure grew to US$45.9 billion by 1998 and, by 1999, with economic difficulties affecting domestic demand, imports decreased by 11.4 percent to US$40.7 billion. In 2000, imports totaled US$55.7 billion. In 1999, 28.3 percent of Turkey's imports were made up of machinery, while chemicals made up 15.2 percent, semi-finished goods made up 14.5 percent, fuels made up 11 percent, and transport equipment made up another 9.5 percent.

Looking at the suppliers of the Turkish market, the patterns are very similar to the Turkish exports. OECD countries have taken the largest share of imports, a fact unchanged by 1999 when OECD countries constituted 69.6 percent of total supplies. Imports from the EU countries have the largest share within the OECD group, and 52.6 percent of total imports in 1999. Germany is the first import source for Turkey with a share of 14.5 percent. Italy ranks second with 7.8 percent, and France is third with 7.7 percent. The United States was the fourth most important source of Turkish imports, with a share of 7.6 percent.

MONEY

Inflation remains Turkey's principal economic problem. During the 1970s, inflation averaged about 20 percent, rising to 40 percent during 1981–87, 65 percent during 1989–93 and 85 percent during 1994–95. In late 1997, inflation reached 100 percent before the government launched another attempt at deflating the economy in mid-1998.

The extensive role of the government in the Turkish economy, coupled with weak political leadership, is the primary reason behind the country's chronic inflation. While the program of structural change and liberalization in the 1980s proved successful in promoting economic growth, the government remained hesitant in relinquishing the economic power it held through the strong public sector. However, inefficiencies in the public sector—primarily the expenditure on state economic enterprises—resulted in large, ever-increasing budget deficits. The situation was made worse by political uncertainty as the lack of a stable majority government led to frequent elections. Prior to each election, governments have tended to boost spending in an effort to gain short-term popularity, a ploy that results in even larger **national debt**. Such serious deficits naturally lead to very high rates of inflation.

In 1994, high inflation, coupled with government attempts to manipulate interest rates and an overvalued currency, brought financial crisis and economic recession. Things picked up in 1995, and financial expansion continued until 1998, when the economic difficulties of Russia impacted Turkey. This led to an 18-month program of **deflationary** measures, which was followed up by an IMF-backed 3-year program initiated in December 1999. This aggressive program rested on 3 pillars: an up-front fiscal adjustment to decrease the public deficit in the short-term, structural reforms to ensure long-term stability and a balanced fiscal budget, and a firm **exchange rate** commitment to control external factors. Based on the first 6 months' performance, it seems that the budget deficits have largely been brought under control. Several steps have been taken, and the rate of inflation has been visibly declining. However, more structural reforms need to be completed if this long-term problem is to find a permanent solution.

The Turkish lira (TL) has been a **fully convertible currency** since 1990. With the major economic reforms of the early 1980s, the financial policies were also revamped. For the first 5 years following these reforms, the Central Bank determined the foreign exchange rates on a daily basis, targeting a 5–10 percent per year real depreciation of the Turkish lira as an incentive to exports. After the first 5 years, the foreign exchange rates were completely freed. In 1994, the financial crisis led to a major depreciation of the lira against the U.S. dollar. From 1994 until the end of 1999, the Central Bank allowed the lira to depreciate against a trade-weighted dollar/Euro basket. In 1995, 1 U.S. dollar was worth 45,845 Turkish liras. In January 2000, the same U.S. dollar was worth 545,584 liras. Since the end of 1999, with the initiation of the 3-year deflationary program, the TL is allowed to depreciate based on a targeted **inflation rate**. By 2003, it is expected that the currency will be allowed to float freely, assuming that the deflationary goals are met. However, the uncertainty caused by the high inflation rate has led to the "dollarization" of the economy, where most business transactions and major consumer transactions are usually denominated in U.S. dollars or German marks.

Exchange rates: Turkey

Turkish liras (TL) per US$1	
Dec 2000	677,621
2000	625,219
1999	418,783
1998	260,724
1997	151,865
1996	81,405

SOURCE: CIA *World Factbook 2001* [ONLINE].

This limits the Central Bank's ability to maintain price stability and control inflation.

The Istanbul Stock Exchange (ISE) is the only securities exchange in Turkey. It allow the trading of a wide variety of instruments including stocks, depository receipts, government bonds, **treasury bills**, and real estate certificates. The exchange only began its operations in 1986, but it grew quickly to become one of the top emerging market exchanges of the world. In 1993, the ISE was the best performing stock market in the world, and foreign investment accounted for 25 percent of daily trading volume. By mid-1999 there were 268 companies listed on the exchange. In comparison, the New York Stock Exchange has 3,025 companies listed. The main indicator of the market is the ISE National-100 Index, comprising 100 companies with high **market capitalization** that are also representative of the major economic sectors.

POVERTY AND WEALTH

Using per capita income statistics, Turkey is ranked internationally in the low to medium income group. When compared to countries that were once at the same level but have gone on to make dramatic improvements in their income distribution, it is easy to see that Turkish efforts have been largely unsuccessful. In fact, the renewed and accelerated effort toward economic development and industrialization that began in the early 1980s has had the effect of sharpening the extreme income divide in Turkey. Between 1987 and 1994 the share of the national income earned by the bottom 20 percent of the population dropped by 7.25 percent, and in 1994 the richest 20 percent of the population controlled 47.7 percent of the wealth, while the poorest 20 percent controlled only 5.8 percent.

In addition to their primary residence, a wealthy family in Turkey typically owns several homes around the country. These usually include a second establishment for renting out, and one or more summer homes, mostly in the coastal regions of the Mediterranean or Aegean. Family ties are quite strong in Turkey; therefore most families invest in real estate and rent those homes out until their children grow up and move into them. The children of such families thus have the advantage of starting out in life as well-educated homeowners.

GDP per Capita (US$)

A poor family in Turkey might own a home. This could be a farming shelter in a rural area or a makeshift home on the outskirts of urban areas. Some poor families rent low-level apartments, or move into their parents' homes. Where numerous people share one dwelling, unsafe conditions can result from the overcrowding. The children of these families get some education through the public school system, and might occasionally even make it to college, but in rural areas where the nearest school is miles away, the family might choose not to send their children to school. As in the rest of the world, for those in poverty, life in general is hard.

The fostering of industrialization by Turkish governments has had a negative effect on the farming communities. Even though the agricultural sector has, historically, been Turkey's largest employer, it has declined in importance relative to the rapidly developing industrial sector. As a result, the disparity in income between the rural and urban parts of the country has also widened, and has been the cause of significant migration from rural to urban areas. Primarily due to economic instability, **emigration** to other countries has also been a factor since the 1970s.

High inflation and the constantly decreasing purchasing power of the Turkish lira create additional problems. Typically, wages and salaries have failed to keep pace with the increasing prices of consumer goods and services. The average consumer **price index** inflation in 1999 was 65 percent, reflecting a monthly increase in the prices of goods and services of approximately 5 percent. Even when earnings are adjusted for inflation, the adjustments are generally made at the end of the year, forcing consumers to absorb the mid-year price increases until the year-end.

Household Consumption in PPP Terms

The structure of social classes in Turkey is similar in all large cities where the population exceeds 100,000 and evolved with urbanization and industrialization. The urban upper class is mainly made up of government officials, wealthy business people, and professionals, and is primarily determined by political power and/or education. The urban upper class is smaller than the urban middle class and less diverse. Education, particularly a college degree, is the passport to joining the urban middle class. Even though the middle class was expanding steadily during the early 1980s, persistently high inflation rates impeded its stability and growth. The biggest social class to influence the growth of cities since the 1950s is the rural working class. Large numbers of rural poor migrated to the cities, and the movement continues. Prior to the 1950s, more than 80 percent of Turkish residents lived in rural areas, and most of the migrants who came to the cities were unable to find affordable housing. They built shelters on the outskirts of the cities without official permission or approval and, by 1980, up to 60 percent of the inhabitants of big cities were living in these primitive settlements, with no electricity, plumbing, or paved roads. Eventually, some of these neighborhoods were incorporated into the cities and provided with those amenities. About 65 percent of the poor classes depend on unskilled work for their livelihood.

The Turkish government subsidizes education at all levels, from pre-school to university, for all citizens. The law enforces attendance at primary and secondary schools, which accounts for 8 years of education and takes pupils to age 14 or 15. However, due to the insufficient number of higher education institutions, only a select few candidates for college actually get to attend. The selection process is conducted through a nationwide examination held every year, from which students with the highest scores are placed in accordance with their choices. There are also a limited number of private universities for those who can afford to pay.

The Ministry of Health is legally empowered to provide medical and preventive health care services. It establishes and operates hospitals and other health care centers, trains health personnel, and supervises private health facilities. The ministry also supervises the medical and health care personnel who work for the public sector. The pay for state-employed physicians is considerably lower than the earnings of private-practice doctors, and medical facilities are still concentrated in urban areas. Consequently, although steadily improving, access to medical and health care in most rural areas is inadequate.

WORKING CONDITIONS

Statistics for 1995 declared that the Turkish workforce is comprised of approximately 36 percent of the population, or 23.8 million people, 1.5 million of whom work abroad. The agricultural sector employs 46 percent of this workforce. Even though the number of female workers has increased considerably, the Turkish workforce is still male-dominated, with men making up 71 percent of the workforce.

The unemployment rate for 1999 was 7.3 percent, though the U.S. Department of State's *Country Commercial Guide* notes that it could be considerably higher, especially in urban areas, due to discouraged workers leaving the labor force. Even though Turkey has large numbers of unskilled and semi-skilled workers, there is a relative shortage of skilled labor, but the *Country Commercial Guide* also reports that the Turkish labor force is hardworking, productive, and dependable. In addition, labor-management relations have been generally good in recent years.

Labor laws in Turkey support a nominal 45-hour workweek, and the amount of overtime that employers may request is limited. Non-wage benefits that most workers receive include transportation and meals, and some jobs include housing and subsidized vacations. In recent years, fringe benefits have accounted for as much as two-thirds of total remuneration in the industrial sec-

tor. Even though the law mandates occupational safety and health regulations and procedures, limited resources and lack of safety awareness often result in inadequate enforcement.

With the exception of the police and the armed forces, Turkish workers have the right to unionize or join existing labor unions. The right to strike exists for most workers except those employed in the public utilities, education, and the petroleum, sanitation, and national defense industries, as well as those who are responsible for life and property protection. The law requires collective bargaining to have taken place before a strike. In order for a union to become a bargaining agent, the law requires that it must represent "50 percent plus one" of the employees at a particular work place and 10 percent of all workers in the particular branch of industry nationwide. However, since 1980 Turkey has been criticized by the International Labor Organization (ILO) for some of the above restrictions. The government has passed constitutional amendments to allow civil servants, who include central government employees such as teachers, to form unions, but it is still illegal for them to strike or bargain collectively.

Under the labor laws and constitution of Turkey, workers must be at least 15 years of age to qualify for full-time employment. Children of ages 13 and 14 can work in jobs that are not physically demanding or part-time if they are enrolled in school or in vocational training. Children are also prohibited from working at night or in physically demanding jobs such as mining. However, in practice, many under-age children continue to work in order to provide badly needed supplementary income for their families. In farming communities for example, the whole family can be seen at work during harvest times. The Turkish government has identified the child labor problem and is working with the ILO to find a solution.

COUNTRY HISTORY AND ECONOMIC DEVELOPMENT

2000 B.C. Hittites begin migrating to the Anatolian (Asia Minor) area of Turkey. Phrygians, Persians, Greeks, and Romans follow this migratory pattern.

1000–1100 A.D. Immigrants from Russia and Mongolia arrive in the area.

1100–1200. Islam becomes entrenched in Turkey and the residents are involved in the Crusade battles.

1300–1400. The Ottoman Empire is established and prevails as a vast trans-continental empire for several centuries. At the peak of its powers, the empire rules vast areas of northern Africa, southeastern Europe, and western Asia. However, it is unable to keep up socio-logically and technologically with developments in Europe. The influence of nationalism causes the diverse ethnic groups within the empire to seek independence, which leads to the fragmentation of the 600-year-old empire.

1923. After World War I and the collapse of the Ottoman Empire, Mustafa Kemal Ataturk founds the Republic of Turkey. Under Ataturk's leadership, the new republic focuses on reform—political, linguistic, economic, and social. Ataturk forms the Republican People's Party, which stays in control until 1950. A republic based on secular governance replaces the once religious and monarchist rule of the Ottoman Empire.

1938. Ataturk dies, having established the ideological base of Turkey as secular, nationalistic, and modern. Since then, the Turkish military has assumed the guardianship of Ataturk's vision.

1945. Turkey joins the United Nations (UN). The Democratic Party is founded and the multi-party era begins in Turkish politics.

1949. Turkey becomes a member of the North Atlantic Treaty Organization (NATO).

1950. The Republican People's Party loses the elections to the Democratic Party.

1960. Growing economic and internal political problems under the Democratic Party government result in a military takeover.

1961. The civilian government is reinstated and a new constitution written, which enshrines the formation of a National Security Council, composed of the president, the prime minister and other key ministers, and representatives of the army, air force, and navy.

1968. Political disturbance erupts between political extremists of the left and right, bringing domestic instability.

1971. The military interferes in order to deal with domestic disturbance, and calls for a replacement government.

1973. General elections result in a coalition government, which falters a year later.

1974. Turkey occupies Northern Cyprus in order to prevent a Greek takeover of the island.

1975. Until 1980, political and social instability increases under the coalition governments of Suleyman Demirel and Bulent Ecevit.

1980. Under the direction of General Kenan Evren, the National Security Council moves to restore public order and remains in control of the government for 2

years. During this time, a national referendum appoints General Evren as president for a 7-year term. A temporary law bans former political party leaders from political involvement for 10 years.

1983. New elections bring in the Motherland Party under Prime Minister Turgut Ozal. Under Ozal's leadership, the country sees the introduction of liberalizing economic reform.

1987. The 10-year ban on former politicians is lifted by a referendum and the government calls a national election. Turgut Ozal wins a second 5-year appointment as prime minister.

1989. Parliament elects Ozal as president of Turkey.

1991. Early elections are held and result in former prime minister Suleyman Demirel's new True Path Party forming a coalition government with the Social Democratic Populist Party.

1993. Demirel is elected president after Ozal's death and Tansu Ciller becomes the country's first female prime minister.

1994. Turkey suffers its worst recession since World War II after government attempts to influence interest rates. In local elections, the Welfare Party wins local elections.

1995. After much political turbulence during a very short period of time, the True Path Party, Welfare Party, and Motherland Party each emerge with a similar number of electoral seats. The coalition collapses in a year and the True Path Party forms a coalition with the Welfare Party, making Necmettin Erbakan the first Islamic prime minister of Turkey.

1996. Turkey enters into a customs union with the European Union.

1997. The coalition government is as unsuccessful as the previous one. The military's political role is challenged by Erbakan's anti-secular efforts, and the military supports business and community groups calling for the government's resignation. In order to ensure compliance with the secular state, the military takes measures that include banning Erbakan from government participation.

1999. The country experiences 2 devastating earthquakes and 3 changes of government. The economy holds up despite expectations of an economic downturn. The 57th government of Turkey, like its predecessors a coalition, is elected. The new government restarts structural reforms to bring stability back to the Turkish economy. In December, the European Union declares Turkey a candidate for full membership.

FUTURE TRENDS

Turkey entered the new millennium with renewed hopes of economic, political, and social development and reform. The 3-party coalition that came into power in April 1999 has shown signs of stability, and many international sources are hopeful that the government will achieve its aims in the next 3–5 years. Its aggressive reform program addresses most of the country's outstanding critical issues, including the often appalling human rights record, undisciplined **fiscal policy**, and state interference in the economy. These financial measures should help to reduce inflation, and speed up privatization of public sector enterprises. There is also a program for structural reform in the social security and taxation systems. With the completion of the Southeastern Anatolian Project (GAP) within the next few years, the Turkish economy should receive a boost. In addition, the project could accomplish much in terms of reducing the disparities in income in different regions of the country, and between rural and urban areas. The possibility of joining the EU in due course should act as a major incentive for the nation to continue on a path of democratization, industrialization, and modernization.

DEPENDENCIES

Turkey has no territories or colonies.

TURKMENISTAN

CAPITAL: Ashgabat.

MONETARY UNIT: Turkmen manat (TMM). One manat equals 100 tenge. There are notes of TMM1, 5, 10, 50, 100, 500, and 1,000. Coins come in denominations of 1, 5, 10, 20, and 50 tenge.

CHIEF EXPORTS: Natural gas, petroleum, cotton, chemicals, processed food, minerals.

CHIEF IMPORTS: Machinery and transportation equipment, chemicals, fuel, food and dairy products, sugar, textiles.

GROSS DOMESTIC PRODUCT: US$19.6 billion (purchasing power parity, 2000 est.).

BALANCE OF TRADE: **Exports:** US$2.4 billion (f.o.b., 2000 est.). **Imports:** US$1.65 billion (c.i.f., 2000 est.).

COUNTRY OVERVIEW

LOCATION AND SIZE. Turkmenistan is located in central Asia, bordered by Iran (992 kilometers/616 miles) to the south, Uzbekistan (1,621 kilometers/1,007 miles) to the northeast, Kazakhstan (379 kilometers/235 miles) to the north, Afghanistan (744 kilometers/462 miles) to the southeast, and the Caspian Sea (1,786 kilometers/1,110 miles) to the west. Turkmenistan has an area of 488,100 square kilometers (188,455 square miles), slightly larger than the state of California. The capital, Ashgabat, is located in the south-central part of the country, near the border with Iran.

POPULATION. The Turkmenistan population is smaller than in other central Asian states. According to the last Soviet census in 1989, 2.54 million Turkmens lived in the republic. In 1989 Turkmens comprised 68.4 percent of the population, Russians 9.5 percent, Uzbeks 9 percent, and Kazakhs 2 percent. Due to the **emigration** of Russians, in 1998 Turkmens made up 77 percent of the population, and Russians only 6.7 percent. Of all the former Soviet Republics, Turkmenistan had the highest infant mortality rate—73.25 per 1,000 in 1997—and the shortest life expectancy, 61 years in 2001 (both figures estimated). During the next decade, population growth is expected to slow considerably as infant mortality rates increase and health care deteriorates.

Only 3 percent of Turkmenistan's land is arable. The Kara Kum, or Black Sand Desert, occupies almost 75 percent of Turkmenistan's territory. The 16 urban areas along its borders and coastline account for 45 percent of the population. Almost 50 percent of the population lives around the capital, Ashgabat, and only 2 other cities have populations with more than 100,000 inhabitants.

OVERVIEW OF ECONOMY

Turkmenistan is one of the most politically conservative and impoverished of the former Soviet republics. It has made little progress toward **restructuring** its economic foundation. Between 1991 and 1998, Turkmenistan's economic activity plummeted 45 percent. Its economy is agricultural, accounting for almost half of the **gross domestic product** (GDP), primarily marked by livestock raising and cotton production. Prior to independence in 1991, Turkmenistan was the second-largest cotton producer in the Soviet Union (behind Uzbekistan) and tenth largest in the world. It produces more cotton per capita than any other country in the world. Turkmenistan has the world's fifth largest reserves of natural gas and considerable oil resources. Turkmenistan is also known for subtropical fruits, melons, and nuts, especially pomegranates, figs, olives, and almonds.

Since gaining independence in 1991, Turkmenistan's government has emphasized grain production to increase its self-sufficiency and to limit Russian influence. The government has taken a cautious approach to economic reform, though. In 1992 the government of President Saparmurat Niyazov introduced his Ten Years of Prosperity program, which provided for Soviet-style **subsidies** for natural gas, electricity, and drinking water to all households in the republic. The program was afterwards modified to Ten Years of Stability, yet continues to subsidize for social needs, accounting for almost 60 percent of the state budgetary expenditures.

In the 1970s the Soviets made major investments in oil and gas production in Turkmenistan. By 1992 gas

production accounted for almost 60 percent of GDP. Combined with the failure of trading partners to make payments, Russia's refusal to allow Turkmenistan gas transportation through its territory resulted in reduced output by more than 40 percent, mounting debts, and a sharp decline in overall industrial production. Turkmenistan continues to rely upon its abundant natural resources and cotton production to sustain its inefficient and declining economy.

Sources differ greatly on Turkmenistan's **macroeconomic** indicators since 1991. Government figures are often inflated to provide a more positive picture. Unemployment statistics for Turkmenistan are unreliable, but according to government sources in 1997 it was 5 percent. **Real wages** have declined by 25 percent since 1997 and **inflation**, which peaked in 1993 at more than 3,000 percent, dropped to 30 percent in 1999. The chief reason for the economic collapse was the failure of Russia, Ukraine, and other central Asian republics to pay for goods. In addition, the decline in energy prices hurt the economy.

POLITICS, GOVERNMENT, AND TAXATION

Turkmenistan was the first central Asian republic to create a new constitution, which proclaimed the country a presidential republic. It is dominated by Saparmurat Niyazov, who won election in June 1992. In January 1994 a referendum extended his rule from a 5-year term to a ten-year term; in December 1999 he was made president for life. He is the leader of the state and supreme commander of the armed forces. In accordance with the Turkmenistan constitution, he also appoints all cabinet ministers. Presidential powers extend to all facets of the country's economic and political life, even including the right to issue edicts that have the force of law.

The 1992 Turkmenistan constitution established a national assembly with 50 members elected to 5-year terms. Its primary duties are to enact and approve criminal legislation and ratify presidential decrees. In practice, however, international observers have criticized this body for its failure to limit the expansion of presidential powers

over domestic and foreign affairs. In addition, there are the national council and a council of elders, both of which wield little power or influence in political affairs.

In December 1991 the Communist Party of Turkmenistan was renamed the Democratic Party of Turkmenistan (DPT). It controls all political activity in Turkmenistan, though ostensibly allowing political opposition. In 1992, under an initiative proposed by Niyazov, a party called the Peasant Justice Party was formed, consisting of regional secretaries of the DPT. A small opposition party, independent of government sanction, was formed in 1989 but was banned in 1990. The Agzybirlik (Unity) Party operates mostly in exile from Moscow.

Since 1991 Turkmenistan has attempted to establish relations with neighboring countries and potential trading partners in order to exploit its natural resources. Internal reform, however, has hampered economic development. In 1992 and 1993 the government passed laws on foreign investment, banking, property ownership, and intellectual property rights designed to attract foreign investment. The laws allow 100 percent ownership by foreign investors, but in practice the government restricts this right and prefers **joint ventures** rather than the full purchase of plants, factories, and other facilities by foreigners.

In 1993 the government began an ambitious 10-year plan that was designed to double per capita income, which was less than US$3,000 per year in **purchasing power parity** terms. The government freed the population from certain fees, such as for heating and electricity, and initiated in December 1992 the Ten Years of Prosperity program, which envisioned a transition to a free market economy, the dismantling of Soviet-style planned management, and extensive social welfare services. Soon thereafter, however, the government changed the slogan to Ten Years of Stability when anticipated investments and profits failed to materialize. Nevertheless, the government took great strides to attract investment for the plan, as Turkmenistan struggled to upgrade its basic **infrastructure**. The government started a national airline and built a new airport, along with new roads, buildings, and hotels in Ashgabat. Emphasis later shifted to constructing new pipelines, or expanding capacity in old ones, to diversify its markets and avoid further dependency upon Russia to export its natural gas.

In 1994 Turkmenistan was in the midst of a severe economic crisis. The government was forced to ration food, GDP fell more than 20 percent, and inflation was growing at 1,100 percent. In 1995, the government fixed the minimum wage at TMM1,000, which, according to some sources, corresponded to roughly 4 kilograms (8.8 pounds) of meat or potatoes.

Roughly two-thirds of Turkmenistan's revenues come directly from gas exports. The decline in international energy prices forced the government to broaden the tax base to lessen the impact of revenue shortfalls. No information is available on tax compliance, but it has been estimated that it is quite limited. Corporate and **income tax** rates range from 25 percent to 35 percent, although collection procedures, liability, and individual rates are often complicated, contradictory, subject to abuse, and arbitrarily applied.

INFRASTRUCTURE, POWER, AND COMMUNICATIONS

Turkmenistan inherited an aging infrastructure from the Soviet Union, with 13,000 seriously depreciated railway cars, insufficient signaling and communication equipment, and inadequate staffing. The Turkmenistan government has ambitious plans for a highly extended transport infrastructure, with priorities devoted to railroad and pipelines development. Turkmenistan's transport system carries freight chiefly via rail, roads, internal waterways, and pipelines. Air transport accounted for less than 1 percent of transportation in the early 1990s. Turkmenistan still uses the Turkmenbashi-Ashgabat-Chardzhou Line as its primary railroad, which links Turkmenistan with Russia and Europe through Uzbekistan. Construction of this

railroad began in the 1880s to connect Turkestan with the Russian Empire. In recent years, construction has begun on a line expected to link Turkmenistan with Iran, although most observers do not expect it to develop as a primary trade route. Plans are being made to build 1,000 kilometers (621 miles) of new railroads, but this requires substantial foreign investment which is lacking. Another plan has called for a railroad that would connect Istanbul with Beijing, running through Turkmenistan, but this too has failed to materialize.

Turkmenistan has focused considerable attention on expanding its present pipeline capacity and building new pipelines. In April 1993, Niyazov announced that an agreement had been reached with Iran to construct a new pipeline to transport natural gas from Turkmenistan through Iran to the Persian Gulf. These plans were met with serious international opposition, particularly from the United States and Russia. The Russians profit from the Turkmenistan dependence upon old Soviet transport routes; however, aging pipelines and insufficient capacity subject Turkmenistan to the whims of Moscow and the inability of former Soviet consumers to make payment. The United States encouraged Ashgabat to construct a line under the Caspian Sea to Turkey, or increase merchant fleet trade, in order to export its most valuable commodity.

Roads in Turkmenistan vary considerably in quality, with 2 major highways that crisscross the country. In 1990, there were nearly 23,000 kilometers (14,292 miles) of roads, of which a little more than 15,000 kilometers (9,321 miles) were paved. Poor maintenance and increased freight and passenger traffic have severely strained the system.

Turkmenistan has 64 airports of varying sizes and capacities, with only 22 having permanently surfaced runways. The main airport, in Ashgabat, includes a new international complex connecting the country to China, Russia, Iran, Pakistan, Turkey, and European locations. There are plans to upgrade Turkmenistan Airlines with Boeing airplanes, replacing some of the aging Aeroflot aircraft.

Telecommunications is provided exclusively by the Turkmenistan Ministry of Communications, which also manages the country's postal services. There are 2 state-controlled broadcasting centers, the Orbita station in the capital and another in Nebitdag. The telephone network is inadequately maintained and insufficiently developed. Less than 30 percent of households have a telephone, and those are principally in the capital. The government has been upgrading the system, including signing agreements with Turkey to install electronic exchanges and international circuit capacity designed to improve local, long distance, and international communications.

Electrical power is one resource that Turkmenistan exports. Approximately 99.94 percent is supplied by fossil fuel, particularly natural gas, and 0.06 percent is hydraulically produced. In 1998, 8.745 billion kilowatt-hours (kwh) of electricity was produced, of which 2.7 billion kwh were exported. In May 1998, a new line was developed to export electricity to Iran. Plans to export electricity to Afghanistan and Turkey are also being negotiated.

ECONOMIC SECTORS

Turkmenistan's economy is dominated by state control of agriculture and industry, legacies of Soviet economic developments and regional links. The CIA *World Factbook* indicated that agriculture accounted for 25 percent of GDP and industry for 43 percent in 1999. Given that about 44 percent of the population is involved in agriculture, Turkmenistan has attempted **privatization** schemes, but with little success. Moreover, Turkmenistan, which has never opted for a market economy, continues Soviet-like systems with multiple **exchange rates**, state orders, and regulated prices, making expanded trade with neighboring states extremely difficult.

The best option for Turkmenistan to restructure its economy, and to develop some sort of sustainable growth, appears to be its ability to market and sell its natural resources, in particular natural gas. The absence of infrastructure, however, raises doubts about Turkmenistan's ability to do so at the pace necessary for economic expansion. Since transportation and export problems have caused problems throughout Turkmenistan's entire economy, especially for the international trade of its energy resources, establishing new markets and routes for trade

is of crucial importance. Foreign investment in Turkmenistan has been substantial, although due to the political environment it has decreased almost 70 percent since 1995. In 1992 investment was US$11 million, peaking in 1995 at US$233 million, but falling to only US$62 million in 1998.

AGRICULTURE

Since 1991, Turkmenistan has attempted to restructure the agricultural sector to reduce its dependency upon other former Soviet republics. Agricultural policy has focused upon grain production, which has resulted in significant increases in non-cotton production, but the new crops are unlikely to thrive unless changes are also made to the **procurement** and transportation sectors. Due to the distance between farms and processing plants, less than 10 percent of fruits, vegetables, and cereals are processed in the country. Livestock raising remains an important part of Turkmenistan's agricultural sector, primarily in meat products such as beef, mutton, and chicken. In 1997 agricultural exports, chiefly cotton, amounted to US$364.5 million, whereas the value of agricultural imports was US$271.7 million.

To understand Turkmenistan's agriculture, it is necessary to understand Soviet practices and collectivization schemes. Roughly 50 percent of arable land is planted in cotton. Due to Soviet planning and economic specialization, Turkmenistan has few textile factories and manufactures less than 1 percent of the cotton grown. It must continue to import cotton fabrics and clothing from Russia and other states in the region. Turkmenistan has made little progress in restructuring the agricultural economy, with only limited privatization and expanded diversification of crop production. Moreover, Turkmenistan is heavily dependent upon irrigation for agriculture. Dilapidated canals and inefficient water management, however, result in only half of the water being delivered to the fields.

The Soviets practiced surface level irrigation, in which water is provided along furrows rather than direct application. Consequently, watering sometimes took days instead of hours, even with around-the-clock irrigation. In addition, the Soviets abandoned nighttime irrigation in favor of daytime irrigation, increasing water usage substantially. Almost no mechanism was in place to determine optimal application, or if there was adequate monitoring equipment, it was in disrepair. The result was endemic over-watering and a casual disregard for resource management.

Management and maintenance of the country's irrigation network is expensive. The budget allocated for maintaining the existing irrigation canals has fallen from US$3.2 million to only US$20,000. In addition, the government has failed to reduce sediment in the canal, due to failing equipment and insufficient financial resources, cutting annual clearance requirements by more than 50 percent. Staffing for the irrigation network has also become a critical problem for Turkmenistan, falling from 1,700 personnel in 1987 to only 640 in 1999. Relatively few young people are employed in irrigation and water management, so Turkmenistan could be facing a severe crisis unless newly-skilled replacement personnel are found.

INDUSTRY

Soviet industrialization left a legacy of ecological devastation, uneven development, and an obsolete, rapidly deteriorating infrastructure. Furthermore, Soviet industrialization often ignored local conditions, conflicting with a traditional society hesitant to embrace new technology. Thus, the Soviets proceeded to emphasize heavy industry that was more and more based upon imported labor from the European regions of the Soviet Union. Local labor has not materialized to replace this technically skilled workforce. Turkmenistan has a strong resource base but inadequate training and financial resources to expand its domestic industry in the near future. Nevertheless, the government is taking steps to lessen its dependency upon industrial trade.

Turkmenistan has a critical shortage of industrial capacity to process its agricultural products and natural resources, a situation that has deteriorated considerably since 1991. Most industrial development in Turkmenistan under Soviet rule was oriented toward heavy industry, especially in chemicals and petrochemicals such as sulfuric acid, ammonia, detergents, and fertilizers. Small-scale steel production was used to manufacture water pumps

and construction. Since independence, Turkmenistan has invested in the development of cement production and farm machinery; however, these form a very limited part of Turkmenistan industry. Turkmenistan has also begun to develop local leather works and foodstuffs industries, which remain underdeveloped due to low mechanization and an insufficiently trained workforce. Turkmenistan has no textile factories, only spinning and clothing; however, the Turkmenistan carpet industry remains vibrant and has an international reputation for excellent quality. The Turkmenistan Carpet Production Association manages 10 factories, although household production accounts for a considerable share of overall production.

Turkmenistan has developed numerous joint ventures with international companies in order to update its industrial capacities, increase productivity, and lower pollution levels, which remain high. In addition, it has increased investment in light industry, particularly in consumer and durable goods, but Turkmenistan relies on trade for most products.

SERVICES

The service sector in Turkmenistan accounted for roughly 32 percent of GDP in 1999 and employed an estimated 37 percent of the workforce in 1996. Transportation, energy, and health care are particularly important. Tourism is relatively small, although in 1997 more than 250,000 tourists traveled to Turkmenistan, an increase of more than 400 percent from 1993.

Financial services are strictly controlled by the government, particularly currency exchanges and lending. Loans are provided to finance projects in the republic, with particular emphasize given to agriculture. The **retail** sector is rather primitive, with few major retail centers, as most citizens buy products at local bazaars and through state-run stores.

Health care in Turkmenistan continues to be free to all citizens, although the system lacks modern technology. Basic medicines are in critically short supply and treatment is crude at best. Medical training has also deteriorated since 1991. According to one study, in Dashhowez Province half of the patients treated died because physicians lacked proper training and surgical supplies. Moreover, most facilities do not have running water and central heating. In addition, pharmaceuticals must be purchased with **hard currency**, which is scarce and costly. In rural areas, many Turkmens must rely solely upon traditional healers, who use prayer and herbs.

INTERNATIONAL TRADE

Since independence, Turkmenistan has sought to advance its sovereignty by entering only bilateral trade agreements. The country's potential prosperity is dependent upon its ability to maintain peace and stability in a possibly volatile region. Thus, its international relations and trade are focused within former Soviet territories of central Asia, Russia, and the Caucasus, while seeking to cultivate new relations with Asia, Europe, and America. Since transportation and export problems have caused problems for Turkmenistan's economy, especially for the international trade of its energy resources, establishing new markets and routes is of crucial importance. Foreign investors are, however, hesitant to work in Turkmenistan, usually because the socioeconomic infrastructure has deteriorated or laws necessary to protect their investments can be violated by presidential decree.

Russia continues to be the most important partner for Turkmenistan's international trade. Russia dominates 50 percent of all trade within the **Commonwealth of Independent States** (CIS), particularly among natural resources, and appears unlikely to relinquish control in the near future because it commands the transportation grid built during the Soviet era. Thus, for example, with oil and gas, the pipelines run through Russia, which has often punitively regulated the amount of central Asian goods allowed to traverse its territory.

Russia was the only CIS country to export natural gas to the outside world until Turkmenistan signed an agreement with Iran in 1997. A pricing feud over supplies to Ukraine with Russia's state-run petroleum and natural gas company Gazprom severely disrupted Turkmenistan's ability to export any gas. Shipments were halted with the concomitant effect of handicapping all Turkmenistan trade, causing its exports to fall 61 percent in 1997 and GDP tumble 26 percent. Opening an export route through Iran eased some of Turkmenistan's economic woes. A resolution with Gazprom was reached, but the prices were so high that Turkmenistan will realize minimal profits.

Turkmenistan's trade with CIS states hovered around 50 percent in 1997. This was a slight decrease from previous years and represented Turkmenistan's somewhat successful efforts to reduce its dependency on Russia. Nevertheless, its export-import income has fallen significantly since independence. Export trade in 1992 was roughly US$1.5 billion and US$751 million in 1997. Exports have increased slightly since then, but the low volume reflects the country's continuing struggle to sell its natural gas. Imports, however, rose dramatically from the 1992 figure of US$446 million, jumping the next year to US$2.1 billion, but decreasing to US$1.2 billion by 1997. Because trade with the CIS consists mostly of energy resources, rather than manufactured goods, Turkmenistan has generally maintained a positive trade balance, but it has fluctuated widely since 1992. It is the only former Soviet republic to have a consistently positive trade balance since the collapse of the Soviet Union.

Efforts have been made by central Asian leaders to increase trade, but these have generally been rebuffed by Turkmenistan, which prefers bilateral trade agreements. Turkmenistan rejected Kazakhstan's attempt to create a Euroasiatic Union, but Niyazov agreed to join the Economic Cooperation Organization (ECO), which was founded by Turkey, Iran, and Pakistan in 1960. The ECO was designed to coordinate economic policies between these states and was given new life by the inclusion of the 5 central Asian republics. The move strengthened relations between Turkmenistan and Iran, a feature that disturbed Russia. Russia's demand that they choose between membership in the CIS or the ECO was hardly acknowledged.

Outside of the CIS, Turkey is Turkmenistan's most important trading partner and continues to be Turkmenistan's most vital supplier of technical and financial support. In 1993, for example, it provided the Turkmenistan government with credits worth US$92 million. Turkey further regards Turkmenistan as a country of transit to central Asian markets. Moreover, Turkmenistan is valued by Turkey essentially as a seller of natural gas. In a basic accord signed in October 1994, Turkey agreed to purchase natural gas from Turkmenistan for the next 30 years.

Turkmenistan has signed natural gas export agreements with Iran, believing its southern neighbor to be the most logical conveyor of Turkmenistan resources, even though the United States opposes the arrangement and central Asian leaders have strongly criticized Niyazov's attempts to enhance this relationship. In 1993 Turkmenistan and Iran signed a 25-year accord with the objective of delivering 28 billion cubic meters of natural gas. Delivery will be through a pipeline, jointly built but principally financed by Iran. In order to accelerate the process, in 1995 the countries agreed to transfer 8 billion cubic meters of natural gas annually.

MONEY

Turkmenistan maintains an official exchange rate (US$1=TMM5,200), but currency exchanges on the **black market** are often 3 times the official rate. The government has not significantly intervened to artificially support the national currency, although in January and again in April 1995 the Central Bank attempted unsuccessfully to unify the 2 exchange rates. Subsequently, the government decided to limit foreign exchange sites, which resulted in greater disparities between the official and black-market rates. Most banks in Turkmenistan are government owned and the principle lending task is to channel foreign loans into designated state-run enterprises. In 1998, prudent steps taken by the government required businesses to have minimum capital equal to US$1 million; however, audits to determine **solvency** and adherence to banking laws have been sporadic. In December 1998, the government suspended free convertibility of hard currency to limit **capital flight**.

Turkmenistan has a single stock market, with 300 joint-stock companies. In 1993, the Law on Securities and Stock exchanges was adopted, although companies have not been allowed to issue stock freely. The success of Turkmenistan's stock market will depend upon further privatization projects and a more transparent legal and accounting system, which remain the same from Soviet times and are not likely to be changed in the near future.

POVERTY AND WEALTH

By most accounts, living standards in Turkmenistan have not dropped as dramatically since 1991 as they have in other former Soviet republics, although conditions are worsening. During the Soviet era, Turkmenistan was considered one of the poorest republics, with roughly 45 percent of the population living below the official poverty line in 1989. The CIA *World Factbook* reported that, by 1999, 58 percent of the population lived below the poverty line. Since the collapse of the Soviet Union, uneven economic developments have served to create a tiny stratum of the population in Turkmenistan that holds most of the wealth. For the average Turkmenistan citizen, the availability of food and **consumer goods** has declined while prices have risen. Most people continue to receive their income from state employment. Wages are based upon the old Soviet method, with people working in in-

dustry, transportation, and science faring better than individuals employed in health, education, and services. By 1995, real wages had dropped nearly 48 percent since independence. Conditions in rural areas are often much worse than in urban, where unemployment is as high as 60 percent, although this is difficult to determine with any precision. It was estimated in 1997 that households in Turkmenistan spent 63 percent of income on food, which will likely increase as prices continue to rise and real wages decline.

Since independence, Turkmenistan has experienced significant increases in the rural population. This growth is expected to aggravate economic conditions in rural areas. Worsening economic conditions might force many to leave the rural areas to find work in the country's urban centers. Turkmenistan's cities are not able to accommodate rural migrants seeking employment in urban industries, however, thereby keeping wages below subsistence levels.

WORKING CONDITIONS

Working conditions in Turkmenistan have declined since independence, chiefly because the government has made almost no progress toward economic reform. Most Turkmens are employed in state enterprises and guaranteed a minimum wage. The CIA *World Factbook* reported that the **labor force** consisted of 2.34 million people (roughly 50 percent of the population) in 1996. Some sources indicate that the labor force is declining due to emigration and relative population stagnation. The majority of the population works in agriculture and decreased productivity and failing infrastructure means growing impoverishment for most Turkmens. Extremely limited privatization in rural areas also will lead to distressing economic and social conditions in the near future.

A Soviet-style trade union, the Federation of Trade Unions, is the only labor union in Turkmenistan. The government does not permit collective bargaining. The political environment acts as a sufficient obstacle to independent union formation and activity, however. Child labor laws are comprehensive, although children in rural areas often must work. Moreover, high school students are often deployed in the fields during intensive harvest periods, particularly in cotton fields. Women make up a significant percentage of the workforce, although they face discrimination. Labor disputes often go unresolved because the judiciary serves at the pleasure of the president, who appoints and can dismiss them at will.

COUNTRY HISTORY AND ECONOMIC DEVELOPMENT

1881. Russians defeat Turkmenistan tribes and annex Turkmenistan into the Governorship of Turkestan.

1888. Russians start construction of railway from Krasnovodsk (now Turkmenbashi) to Ashgabat.

1916. Widespread revolt in central Asia against the tsarist government's use of local troops during World War I.

1917. Russian Revolution and Civil War begin.

1920. Soviet General Frunze captures Ashgabat, ending the anti-Soviet government in Turkmenistan.

1921. New Economic Policy begins in Soviet Union.

1924. The Turkmenistan Soviet Socialist Republic is established.

1929. Collectivization begins in central Asia, widespread famine as Turkmens resist.

1930s. Pastoral nomadism ends in Turkmenistan; cotton production increases.

1959. Construction begins on the Karakum Main Canal.

1990. Turkmenistan declares its autonomy from the Soviet Union in August.

1990. Saparmurat Niyazov is elected president in October.

1991. Turkmenistan declares its independence from the Soviet Union.

1991. The Communist Party is renamed the Democratic Party of Turkmenistan in December.

1992. Niyazov introduces the Ten Years of Prosperity economic reforms.

1992. Turkmenistan joins the Economic Cooperation Organization (ECO), designed to coordinate economic policies among Iran, Turkey, and Pakistan and given new life by the inclusion of the 5 Central Asian Soviet republics.

1993. New Turkmenistan currency, the manat, is introduced.

1998. The financial collapse in Russia affects Turkmenistan's energy trade.

1999. Niyazov is named president for life.

FUTURE TRENDS

Turkmenistan is regarded by most observers as the most restrictive state in the region. Human rights organizations have consistently criticized the political and economic environment in Turkmenistan. President Niyazov has promoted a political system that rigorously opposes any **liberalization** or reform programs. Many specialists believe that Turkmenistan has the natural resources necessary to make an effective economic recovery; however, the political environment is considered by most to be a major impediment to future prosperity. For instance, the investments made by major transnational petroleum companies have thus far ended up in the bank accounts of political elite.

The best option for Turkmenistan to restructure its economy and develop some sort of sustainable growth appears to be its ability to market and sell its natural resources, in particular its natural gas. The absence of infrastructural preconditions, economic reforms, and political liberalization raises doubts about Turkmenistan's ability to do so quickly enough for expansion. The most serious non-political obstacle to Turkmenistan's economic future is its lack of access to markets with clients capable of paying for Turkmenistan's trade resources.

DEPENDENCIES

Turkmenistan has no territories or colonies.

TUVALU

CAPITAL: Funafuti.

MONETARY UNIT: Tuvaluan dollar (T$). There are coins of 1, 5, 10, 25, 50 cents, and 1 dollar. One Tuvaluan dollar equals 100 cents. The currency is tied to the Australian dollar at an exchange rate of 1 Tuvaluan dollar per 1 Australian dollar.

CHIEF EXPORTS: Copra, clothing, footwear.

CHIEF IMPORTS: Food, animals, mineral fuels, machinery, manufactured goods.

GROSS DOMESTIC PRODUCT: US$7.8 million (1995 est.).

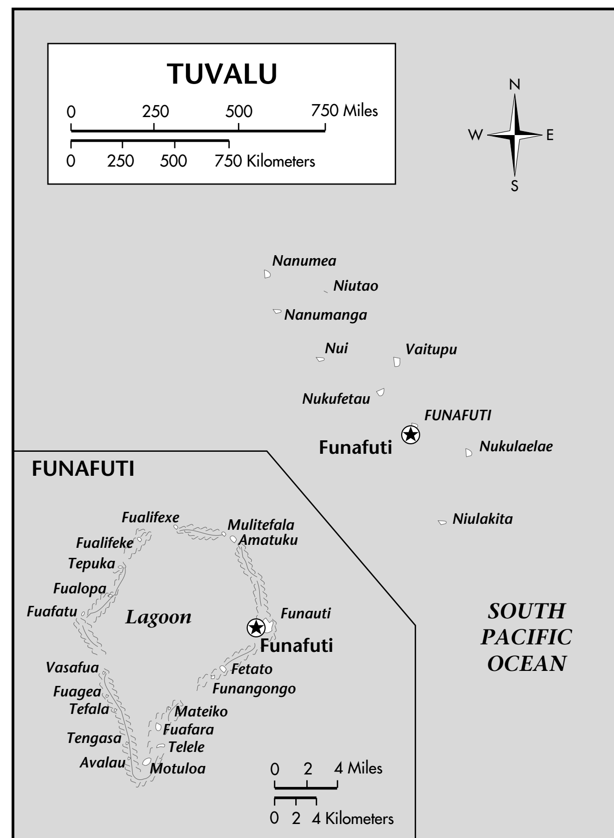
BALANCE OF TRADE: **Exports:** US$165,000 (f.o.b., 1989). **Imports:** US$4.4 million (c.i.f., 1989).

COUNTRY OVERVIEW

LOCATION AND SIZE. Tuvalu is an island group of 5 atolls (coral islands consisting of a reef surrounding a lagoon) and 4 islands in the South Pacific Ocean. It is located midway between Australia and Hawaii. The island chain stretches some 676 kilometers (420 miles) from the southern island of Niulakita to the northern-most island of Nanumea and covers 757,000 square kilometers (292,278 square miles) of ocean, but it has a total land area of only 26 square kilometers (10 square miles), including 24 kilometers (15 miles) of coastline. Tuvalu's land area is one-tenth the size of the city of Washington, D.C., making it one of the smallest nations in the world. Funafuti, the capital and largest city, is located on the islet of Fongafale in the Funafuti Atoll. The nation's largest island is Vaitupu at 4.9 square kilometers (1.89 square miles) and the smallest is Niulakita at 0.41 square kilometers (0.16 square miles). All of Tuvalu is less than 4.5 meters (15 feet) above sea-level. Due to environmental factors such as rising ocean levels and soil erosion, Tuvalu is slowly shrinking in land mass at a rate of 2 millimeters per year. It is expected that some time in the future Tuvalu will be entirely underwater.

POPULATION. The population of Tuvalu was estimated at 10,838 in July of 2000, up from 8,229 in 1985 and 9,043 in 1991. The current annual population growth rate is 1.41 percent, which would result in a population of 12,600 by 2010. However, the loss of island territory has spurred many Tuvaluans to abandon their homes to start over in New Zealand, a population shift that is certain to become more pronounced as the islands gradually disappear underwater. New Zealand has agreed to take in the entire Tuvaluan population as "environmental refugees" at a rate of 60 people per year. The birth rate is 21.78 births per 1,000 population or 3.11 children born per woman. The death rate is 7.66 deaths per 1,000 population.

Most Tuvaluans are young. Some 34 percent of the population is younger than age 15, while just 5 percent is over age 65. Most Tuvaluans are ethnically Polynesian



(96 percent), but the inhabitants of the island of Nui are Micronesian. The population is mainly urban and more than half live on the islet of Fongafale. This has led to a high population density in the area. Partially because of sanitation problems caused by the lack of fresh water, Tuvalu has a high infant mortality rate (23.3 deaths per 1,000 live births).

OVERVIEW OF ECONOMY

A tiny nation with a tiny economy, Tuvalu spent much of its history under the control of foreign powers. The islands were originally populated by immigrants from other South Pacific islands nearly 2,000 years ago. Later, Europeans seized many of the islands' inhabitants to serve as slaves; during the 19th century, slave traders from South America reduced Tuvalu's population by nearly 80 percent. Efforts to harvest copra (dried coconut meat which produces coconut oil) and mine guano (seafowl excrement used as fertilizer) led the United States to claim the 4 southern islands in 1856 and the British to claim the northern territory in 1892 as part of its Gilbert Islands Protectorate. Many Tuvaluans **emigrated** to the larger Gilbert Islands to find employment, especially after World War II. In 1974, Tuvaluans voted for independence from the other Gilbert Islands (now Kiribati). Tuvalu became independent from the British Commonwealth in 1978, but the new nation possessed few economic resources. In 1979, the United States relinquished its claim to the 4 southern islands.

Even among the developing nations of the South Pacific, Tuvalu's economy is relatively undeveloped. The bulk of the nation's economy is based on **subsistence farming** and fishing. However, the soil is poor and there are no natural sources of fresh water. This has created pressure for the limited arable land. The only significant cash export is copra, although the government derives funds from the overseas sale of stamps and coins to collectors and there is limited export of garments. There is little unemployment in the nation because of the prevalence of subsistence farming (unemployment hovers around 4 percent). The nation's main port is located in Funafuti and a major harbor dredging in 1980 made the port accessible to deep-draft ocean vessels.

During the latter part of the twentieth century, some 1,000 Tuvaluans worked in the phosphate mines in the island nation of Nauru and their **remittances** (money sent home to family or friends) contributed substantially to the nation's economy. However, by the turn of the century, the phosphate industry was in decline in Nauru and the government began **repatriating** (returning to their homeland) Tuvaluans. Many Tuvaluans are employed as sailors on foreign-based ships and also contribute remittances.

Until the year 2000, the principal source of foreign revenue for Tuvalu was international aid. In 1987, Australia, New Zealand, and the United Kingdom established a US$17 million trust fund for the territory. Later, Japan and South Korea also made contributions. Tuvaluan governments have only cautiously made withdrawals from the fund and generally adopted a conservative investment strategy which has substantially grown the fund. By 1999, the fund was valued at US$35 million. In addition, the United States makes payments to Tuvalu for fishing rights under the terms of a 1988 treaty between the 2 nations. In 1999, these payments totaled US$9 million.

The government has traditionally played a major role in the economy and controls many of the main economic sectors. In an effort to improve the economy, the government has undertaken a variety of reforms, including the **privatization** of many functions and personnel cuts of 7 percent. These reforms are especially significant in light of the fact that almost 20 percent of the Tuvaluan workforce is employed by the government. To raise revenue, the government began licensing Tuvalu's area code of 688 to international companies to use for "900" number calls in 1998. The arrangement has generated US$1.2 million per year. After it was discovered that a Hong Kong company was using the number for adult businesses, the overwhelmingly Protestant population of Tuvalu forced the government to revoke the licenses. In 1998, the government negotiated a contract to lease its Internet domain name ".tv" to companies in exchange for an estimated US$50 million over the next decade. Under the terms of the agreement, Tuvalu will receive a minimum of US$4 million annually for 10 years. These new sources of income could triple Tuvalu's GDP.

POLITICS, GOVERNMENT, AND TAXATION

The first parliamentary elections in the independent nation of Tuvalu were held in 1981, and the nation is now governed by a revised constitution which was adopted in 1986. Under the terms of the new constitution, the British monarch is the nation's head of state and is represented by a governor-general chosen from among the Tuvaluans by the prime minister. Tuvalu does not have formal political parties, but the 12 members of the **unicameral** (single-chamber) parliament often align themselves in factions. In 1999, Ionatana Ionatana was elected prime minister on a platform devoted to governmental reform to **liberalize** the economy and to bolster Tuvalu's international standing.

From independence onward, the government has been a major actor in the national economy. For instance, the only hotel in the nation is government-owned as is the islands' only radio station. In addition, the govern-

ment owns about one-fourth of the land on the islands (most of these lands are leased to clans to be farmed on a communal basis), and almost one-quarter of the nation's population works for the government. Until his death in December 2000, Ionatana sought to divest the government from these publicly-held ventures and encourage private enterprise. The main policy used to encourage new business and to attract foreign companies is the designation of "pioneer status" for certain new businesses (including tourism) which gives them tax-exempt status.

The government has also endeavored to lessen its reliance on foreign aid. The arrangement to lease its Internet domain name, ".tv," to the Canadian company dotTV is a major part of this effort. In order to assure input into the marketing of the domain name, the government is a significant minority shareholder in dotTV and has a seat on the company's board. The government merged the operations of the nation's 2 main banks in order to improve efficiency and reduce redundancy. In addition, the government has sought to improve the economies of the outer islands through a US$4 million program underwritten by the Asian Development Bank and through the construction of airfields on all of the nation's islands. A central goal of this effort is to direct power away from the central government and into the hands of localities. As the national government lessens its reliance on foreign aid to conduct day-to-day operations, it plans to shift the bulk of the funds it receives into programs to improve the health and living conditions on the outer islands where some two-thirds of the population live below the national poverty line with incomes of less than US$1,000 per year.

There is a fixed **income tax** of 30 percent on all income above US$1,900, and all corporate profits are also taxed at the flat rate of 30 percent. There are also sales taxes on certain goods and services. The government also taxes stamp sales, copra, and fishing licenses. The government maintains price limits on fuel and basic food items.

Under Ionatana, Tuvalu became the 189th member of the United Nations and a full member of the Commonwealth of Nations. The government also supports the establishment of a **free-trade zone** in the region. One of the major political issues is the status of the islands, as an increasing number of Tuvaluans support the removal of Queen Elizabeth II as their head of state and the establishment of a full republic. Tuvalu has likewise been a vocal supporter of international efforts to stop global warming, believed to be a factor in the rising ocean levels that are reducing the nation's land.

INFRASTRUCTURE, POWER, AND COMMUNICATIONS

The **infrastructure** of Tuvalu is rudimentary. Only the island of Funafuti has a network of paved roads (the government owns only 1 paving tractor to maintain the roadways). The other islands have either no or only limited paved roads. In fact, there are only 8 kilometers (5 miles) of paved roads in the entire nation. There are a few privately-owned vehicles and some government-owned ones. The most prevalent methods of transportation are bicycle and small motorcycle. The only airport is located on Funafuti. Government plans to build an airfield on each island have long been opposed for environmental and economic reasons. Estimates are that 3,000–4,000 palm trees would have to be cut down to make a serviceable landing strip. Since there is little arable land on any of the islands, such palm depletion would seriously undermine the local economies.

Inter-island shipping on small craft remains the main form of transport between the islands. The capital island and the island of Nui have navigable harbors in their la-

Communications

goons, but only Funafuti is capable of servicing deep-draft ships after a harbor dredging was completed in 1980.

There is a satellite dish in the capital and the government has put receivers on each of the islands so that transmissions are available to those with electricity and televisions. There is telephone service on Funafuti with about 700 subscribers in 1999 and radiophone communications exist between all of the inhabited islands. Electricity is available in the capital and in a limited fashion on some of the islands. While there are no broadcast stations, there is 1 Internet service provider and 1 local radio station. The government publishes the only newspaper, *Tuvalu Echoes*. Funafuti has a hospital, and each island has a dispensary (an office to dispense medical supplies). With the proceeds from the licensing of ".tv," the government expects to engage in several major infrastructure programs, although the main concern is the development of measures to protect the islands from flooding caused by storms.

ECONOMIC SECTORS

Tuvalu's economy is limited due to its small size and narrow range of natural resources. The nation's economic base is divided into 2 main sectors: agriculture and revenues from external licensing. Agriculture remains based on subsistence farming, with minor exports of copra. Concurrently, licensing of fishing, the nation's phone prefix, and the ".tv" domain name provide the majority of revenue for both the government and the national economy.

The government's main economic priority is to develop the economy to such an extent that foreign aid is no longer required. In addition, the government is endeavoring to support international efforts to stop global warming and pollution in general in order to protect both the islands themselves and the agricultural sector on the lands. For instance, in the spring of 2000, floods of 3.2 meters (11 feet) left most of the islands underwater. The government subsequently entered into agreements which would allow those Tuvaluans permanently displaced by global warming to **immigrate** to Australia or New Zealand. Finally, although substantial revenues are expected from the ".tv" licenses, the government is attempting to protect the local way of life from overt commercialism.

AGRICULTURE

As much as 75 percent of the population of Tuvalu is involved in agricultural production of some sort. Subsistence farming is the main source of both food and income for many Tuvaluans. Agriculture, in the form of the production of copra, also provides the nation's only true export. Total agricultural exports in 1998 amounted to US$400,000, and agriculture accounted for 25 percent of the nation's total GDP.

The main crops include copra, taro (a large tuber), bananas, and sugarcane. There is little or no livestock production, although many families keep small numbers of pigs and chickens for personal consumption. While copra is harvested from coconut trees, the other crops are planted according to traditional practices. The islands receive about 2,500 millimeters (100 inches) of rainfall per year, but the porous, volcanic nature of the soil means that islanders have to use cisterns to collect rainwater as the water rapidly soaks through the ground and there are no natural springs or wells on any of the islands. Because there is little fresh water, islanders often use coconut milk in place of drinking water. Water constraints have also led to the evolution of a distinctive form of planting. Crops are planted in trenches that are 3 to 6 meters (10 to 20 feet) wide and dug down to the water table (usually a depth of between 2 to 4 meters or 6 to 12 feet). In order to compensate for the nation's poor soil, these trenches are filled with leaves and natural fertilizers to produce a mulch capable of sustaining the crops. Indigenous foodstuffs such as breadfruit (a round seedless fruit from the mulberry family the texture of which resembles bread when cooked) are often cultivated on the banks and edges of the trenches for local consumption.

Most farms are small (less than an acre in size) and communally owned. The Agriculture Division has been implementing programs designed to join together communal lands into larger farms in order to increase efficiency with the ultimate goal of ensuring that no land capable of agriculture remains unproductive. As the communal farms are joined together, profits from production would be divided into 3 parts: one-third for the original land owners; one-third for the agricultural workers; and the final third would be deposited in a communal fund in a bank. This group fund would serve as a resource for future land improvements or to offset periods of underproduction or price declines.

Fishing is done extensively throughout the islands, but the majority of the catch is used for local consumption. Tuvalu allows other nations, including South Korea, Taiwan, and the United States, to fish for tuna in its territorial waters in exchange for license fees that totaled US$5.5 million in 1998. In addition, small quantities of sea cucumbers are harvested by Tuvaluans for export to China.

INDUSTRY

Industry in Tuvalu is quite limited. Copra production is the main industry and provides the nation with its main export. In addition, about 600 Tuvaluans are employed by foreign firms on merchant ships and 750 are employed in the phosphate mines of Nauru. Many fam-

ilies are supported by the remittances from these 2 groups. There is some local manufacture of handcrafts, clothing, and footwear for tourists and for export.

SERVICES

There is a small, but steady, tourist sector which generates some US$300,000 per year. The nation receives about 1,000 tourists per year. In addition to the 16-room hotel in Funafuti, there are about 12 guest houses on the islands. Because of the relative isolation of the islands, many indigenous Polynesian customs and traditions have survived. Tourists are exposed to dancing, singing, and variety of local crafts. There is also extensive diving, snorkeling, and fishing. Efforts to encourage tourism have resulted in government policies that give new tourist businesses tax-exempt status.

The subsistence nature of most of the population and strong cultural influences have combined to prevent the development of any significant **retail** trade. Instead local markets and home production of products is the norm. Each island has a cooperative store (Fusi) to sell local crops and products. All stores are closed on Sunday.

INTERNATIONAL TRADE

Tuvalu has an import-driven economy and relies upon products produced elsewhere. Though import and export statistics are outdated, they give a sense of the reliance upon imports: in 1989, the country imported US$4.4 million in goods and services while exporting just US$165,000 worth of goods and services. The main export of Tuvalu is copra, while the nation's main imports include food, animals, mineral fuels, machinery, and manufactured goods. Tuvalu's main trading partners are Australia, Fiji, New Zealand, and the United States.

MONEY

The Australian dollar is legal currency in Tuvalu, but the nation mints its own coins. Since Tuvalu's currency is tied to that of Australia, it is relatively stable and its value is determined by supply and demand in international exchange markets. The government-owned National Bank of Tuvalu is responsible for most financial services; however, the limited capital of the institution means that funds for development must come from abroad. In 1995, 1 U.S. dollar equaled 1.35 Australian dollars and in 2000, 1 U.S. dollar equaled 1.52 Australian dollars.

POVERTY AND WEALTH

Of the nation's inhabitants (not including persons employed outside of Tuvalu), only about 1,500 are formally employed. The average per capita income is only about US$1,000 per year, making Tuvalu one of the poorest nations on earth. However, education is free and compulsory for children between the ages of 6 and 13. Health care is also free, though limited by access (each of the main islands has a dispensary, but the only hospital is on Funafuti).

The society is egalitarian and democratic. Low income levels are mitigated by the strong social and village support networks. In 1998, Tuvalu was judged to be the only nation in the world above reproach for human rights violations.

WORKING CONDITIONS

Forced or compulsory labor is prohibited. Labor laws set a minimum wage and 8-hour work day, but the market determines most wage scales in Tuvalu. Average hourly wages in Tuvalu for unskilled workers are between 40 and 92 U.S. cents an hour with 47 cents per hour being the average. The current minimum wage is US$81.25 biweekly, regardless of age or gender. Managerial or technical wages range from US$3,000 to US$9,000 per year. Although workers may organize and have the right of collective bargaining, there has never been a strike in the nation's history. The only registered trade union is the Tuvalu Seamen's Union which is af-

filiated with the International Transportation Workers' Federation. However, government workers belong to associations that have some features of unions.

Children under the age of 14 are prohibited from working, and children under the age of 15 are prohibited from working on ships or in industry. Employers are required to provide adequate potable water, sanitary facilities, and medical care. The Ministry of Labor, Works, and Communications is responsible for overseeing labor practices and law.

COUNTRY HISTORY AND ECONOMIC DEVELOPMENT

0–100 A.D. Polynesians colonize Tuvalu; Samoans settle in the southern atolls, while Tongans settle in the north; Micronesians from Kiribati conquer Nui.

1861. Elekana, a Cook Islander castaway, brings Christianity to Tuvalu.

1863. Slave traders take 450 Tuvaluans as slaves to work in the guano mines of Peru.

1865. Elekana returns to islands with a Congregationalist missionary, A. W. Murray.

1877. Tuvalu comes under British control.

1880s. European traders establish a post on Tuvalu in order to acquire copra.

1892. In an effort to forestall American expansion in the area, Great Britain declares a protectorate over the northern islands.

1916. Tuvalu becomes a formal British colony.

1942–45. The United States lands military troops in the region during World War II and builds the nation's current airfield at Funafuti.

1974. The United Kingdom grants Tuvalu self-governing status; Tuvaluans vote for independence.

1976. Tuvalu is formally separated from the Gilbert Islands.

1978. Tuvalu becomes an independent nation and a special member of the Commonwealth of Nations (a voluntary association of nations giving symbolic or actual allegiance to the British crown).

1997. Three cyclones devastate the islands.

1998. Tuvalu signs a 10-year deal worth at least US$50 million to license the nation's Internet domain name, ".tv."

2000. Tuvalu becomes a member of the United Nations and a full member of the Commonwealth of Nations.

FUTURE TRENDS

With its Internet deal, Tuvalu entered the 21st century with prospects for dramatic economic growth. Royalties from the first year provided over US$20 million or US$2,272 for every Tuvaluan. These funds formed the core of a new government trust fund. If the royalties are as much as expected, the standard of living on Tuvalu will rise considerably. The government indicated that some of the revenues would be spent on communication links with the outer islands and the rest of the world. Some observers are concerned that the newfound wealth of the nation may destroy the traditional society and lifestyles of the islands. In addition, continued global warming, with the subsequent rise in ocean levels, and population increases have exerted considerable land pressure on the tiny nation.

DEPENDENCIES

Tuvalu has no territories or colonies.

UNITED ARAB EMIRATES

CAPITAL: Abu Dhabi.

MONETARY UNIT: Emirian dirham (Dh). One Emirian dirham equals 100 fils. There are coins of 1, 5, 10, 25, and 50 fils and 1 and 5 dirhams. Paper notes include 5, 10, 50, 100, 200, 500, and 1,000 dirhams.

CHIEF EXPORTS: Crude oil, natural gas, re-exports, dried fish, and dates.

CHIEF IMPORTS: Machinery, transport equipment, chemicals, and food.

GROSS DOMESTIC PRODUCT: US$54 billion (2000 est.).

BALANCE OF TRADE: **Exports:** US$46 billion (f.o.b., 2000 est.). **Imports:** US$34 billion (f.o.b., 2000 est.).

COUNTRY OVERVIEW

LOCATION AND SIZE. The United Arab Emirates (UAE) controls the southeastern portion of the Arabian peninsula south of the states of Bahrain and Qatar. The federation covers 82,820 square kilometers (31,976 square miles) and is bordered on the north by the Persian Gulf and Iran, on the east by Oman, and on the south and west by Saudi Arabia. The UAE separates Oman from the Musandam peninsula and extends 90 kilometers (145 miles) along the Gulf of Oman, an area known as the al-Batinah coast. The UAE is slightly smaller than the U.S. state of Maine.

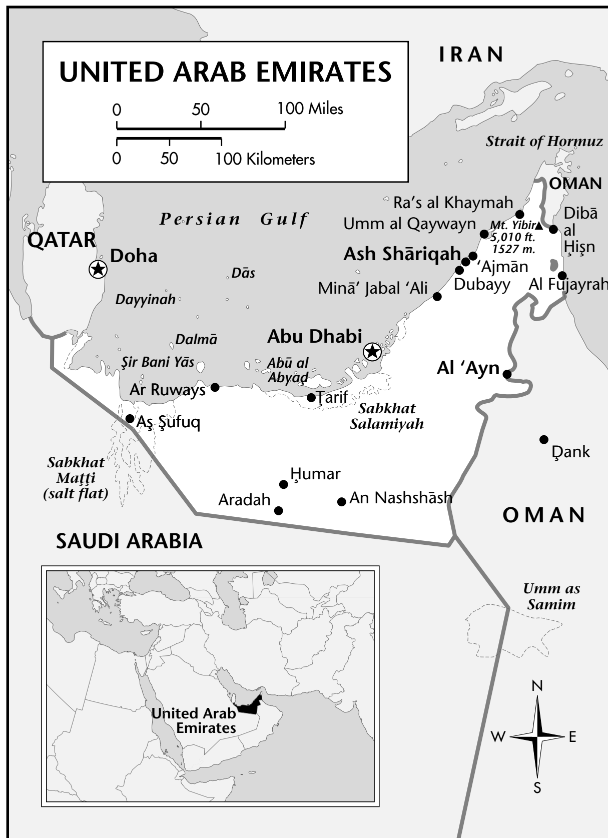
POPULATION. The population of the UAE is between 2.8 million and 3 million. About 85 percent of them live in cities that straddle the country's Arabian/Persian Gulf coastline. UAE cities tend to be ethnically heterogeneous and male, while there are more women and UAE nationals in rural areas. The 3 largest emirates—Abu Dhabi, Dubai, and Sharjah—collectively govern 84.3 percent of the population. Close to 80 percent of the population is comprised of expatriate nationals and nearly 63 percent of the population is male. Nearly 96 percent of Emiratis are Muslim. South Asians, mainly Indians and Pakistanis, make up 50 percent of the population. The next 3 largest expatriate ethnic groups are Iranians (2.5 percent), Arabs from other parts of the Middle East (13 percent), and Westerners (1 percent).

By all accounts the population is growing very rapidly. According to the UAE's Central Bank, the UAE's population grew by 5.5 percent between 1993 and 1997. The UAE government expects population to double by 2010, whereas Dubai projects the emirate's population to double by 2005. The World Bank projected a 37 percent increase in population, but with 30 percent of the current population under the age of 15, this still represents an important demographic shift. By contrast, the United Nations anticipates the UAE's population to double by 2029.

The principal causes of this rapid population growth are the federation's booming economy and the government's encouragement of UAE nationals to have large families. The UAE government provides substantial financial incentives for UAE nationals to marry each other and to raise large families. The UAE government hopes that this would help to balance the federation's population, which is overwhelmingly composed of expatriates.

OVERVIEW OF ECONOMY

The UAE is a tribal federation of 7 emirates occupying a portion of the southeastern Arabian peninsula. It is one of the most economically secure states in the world. The UAE controls 98 billion barrels of oil—10 percent of the world's proven oil reserves—as well as 212 trillion cubic feet of gas, the fourth largest amount in the world after Russia, Iran, and Qatar. The UAE has employed its natural resources and its strategic location to become one of the most modern and wealthiest states in the world. It boasts both large petroleum and non-petroleum sectors. Economic growth in large part has hinged on the price of oil and the ability of UAE governments, whose proceeds come almost entirely from oil sales, to invest in large **infrastructure** projects.



For much of the last 2 centuries, the inhabitants of the UAE depended on pearling, fishing, commerce, and, allegedly, piracy of commerce in the Indian Ocean. To protect its trade routes to India, Great Britain attacked many communities along the UAE's Arabian/Persian Gulf coast in 1819 and 1820 and for the next 50 years extended an informal protectorate (protection and partial control of one region or dependent country by another country) over the region, which became known as the "Trucial Coast" because of the non-aggression pacts (or truces) that Great Britain forced regional emirates to sign with each other and Britain.

The region "entered" the 20th century in the 1950s with the discovery of oil in Abu Dhabi and subsequent discoveries of oil in Dubai and Sharjah in the 1960s. Following Britain's withdrawal from the Trucial Coast in 1971, the UAE became an independent state composed of 7 of the original 9 emirates. The other 2 emirates, Bahrain and Qatar, became separate independent states. Abu Dhabi, Dubai, and to a lesser extent, Sharjah, used the proceeds from oil sales to build modern, urban societies. Dubai, with substantially smaller oil supplies than Abu Dhabi, sought to build commercial institutions, leisure industries, manufacturing, port and transportation facilities, and other service industries that were not dependent on oil proceeds. The crown jewel of this project is the Jebel Ali **Free Zone**, which opened in 1985 and now boasts 1,600 international companies from over 70 different nations. Sharjah too has sought to broaden its economy by investing in manufacturing. Since the early 1980s, Abu Dhabi has invested billions of dollars in non-oil industries, including manufacturing, services, and agriculture. After the Gulf War, the UAE used the **glut** in the world arms industry to mandate an "offsets" program requiring all firms selling weapons to the federation to invest in its non-oil related industries.

Because the UAE had a relatively poor and unskilled population when oil was discovered there, the federation has depended on expatriate laborers and managers to meet close to 90 percent of its labor demands. The vast majority of these expatriate workers are South Asian, though there are large numbers of Arab and Western expatriate workers. Expatriates earn half as much as UAE nationals but present 3 significant problems. First, expatriate workers may undermine the UAE by promoting their own governments' interests or that of organized crime within the federation. Second, expatriate workers often require high payments for social services and send virtually all of their salary home rather than spending it in the UAE. Third, expatriate workers intensify preexisting social divisions within the UAE since they tend to be the principal workers in non-oil UAE industries, while UAE nationals generally prefer to work for the government.

The federation cannot regularly feed itself or meet its water and electrical needs without significant imports or technological assistance. The UAE's hot and arid climate has few regions hospitable to large-scale farming. While the UAE has invested heavily in new technologies and irrigation systems, the federation's agricultural production cannot produce adequate amounts of the most basic commodities. Nor can the UAE meet the water needs of the federation for much longer due to the gradual poisoning through salinization (to become concentrated with salt) of the federation's extensive underground network of wells. Similarly, the demand for electricity is quickly outpacing supply and forcing the UAE to turn to desalinization plants as a way to provide adequate water and power resources for the federation since they generate energy as a byproduct of turning salt water into fresh water. These problems are particularly acute in the northern emirates, which lack the resources to meet the demand of their population for either water or electricity.

Still, the UAE has the financial and institutional resources to solve these problems. The UAE can depend on the proceeds from the sale of its petroleum and natural gas. Abu Dhabi has US$150 billion in overseas assets that can either cover budget shortfalls due to excessive spending or a sharp decline in oil prices. Equally importantly, the UAE's **free market system** and open economy has fostered the creation of numerous medium

and large corporations that produce highly competitive goods for the regional and world markets.

POLITICS, GOVERNMENT, AND TAXATION

The UAE is a federation of 7 tribally-based emirates (Arab royal houses): Abu Dhabi, Dubai, Sharjah, Ras al-Khaimah, Ajman, Fujairah, and Umm al-Qawain. Even though it has a central government based in Abu Dhabi, each emirate controls its own economy and retains broad autonomy. The federation's highest constitutional authority, the UAE Supreme Council of Ministers, is composed of the 7 emirate rulers; it establishes federal policies and sanctions legislation. Most council decisions are reached through a consensus of the emirates' rulers and leading families. Since the council meets 4 times a year, the UAE cabinet runs the day-to-day affairs of the federation. Through an informal agreement, the ruler of Abu Dhabi serves as president, and the ruler of Dubai serves as vice president and prime minister. The president chooses the cabinet and members of the federal judiciary. The Federal National Council, composed of representatives appointed by the ruler of each emirate, can comment on legislation proposed by the UAE cabinet. There is also a UAE Supreme Court composed of 5 judges that carries out 3 functions: it settles disputes between different emirates, settles disputes between individual emirates and the federal government, and decides on the constitutionality of federal laws.

Throughout the UAE's 3 decades of existence, the Ruler of Abu Dhabi, Shaykh Zayid al-Nahyan, has served as the federation's president and worked to unite the emirates, which had previously been virtual protectorates of Britain (the so-called Trucial States) from the 1820s until the 1970s. Zayid has used his political skills and Abu Dhabi's oil wealth to keep the federation together through times of crisis which strained the sometimes tenuous ties of the 7 emirates. Zayid has been most successful in mediating Abu Dhabi's rivalry with Dubai and convincing Dubai's ruling family to take on key positions in the UAE federal government. In recent years, however, Zayid's advanced age and poor health have forced him to delegate greater responsibility to his eldest son, Shaykh Khalifa. While it is certain that Khalifa will succeed Zayid as UAE president and ruler of Abu Dhabi, it is not clear how strong of a ruler he will be because of his fierce rivalry with his half brother, Shaykh Muhammad, the chief of staff of the UAE army.

Though the UAE's permanent constitution stipulates that each emirate provide half of its revenues to the federal government, Abu Dhabi annually uses the proceeds from its oil sales to provide between 60 percent to 90 percent of the UAE's federal budget. Dubai and revenues from the UAE ministries generally have covered the remainder. These revenues come from the 20 percent surcharge foreign banks pay on their profits, taxes and royalties from the proceeds on foreign oil companies, and a 4 percent customs **duty** on all imported products except tobacco and alcoholic beverages. Another key problem is the fact that there is little transparency in UAE budgets, and it is estimated that as much as a third of UAE's oil revenues do not appear on national accounts. Over the last 4 years, the UAE budget has been US$7 to US$8 billion in deficit, but this is not considered a great problem because the income from Abu Dhabi's US$150 billion in overseas investments more than covers **budget deficits** of that size. In addition, the UAE government maintains an extensive cradle-to-grave **social welfare system**. There are no income or consumption taxes within the UAE.

INFRASTRUCTURE, POWER, AND COMMUNICATIONS

The UAE has a modern infrastructure that has made it a regional transportation center. According to government statistics, the UAE has 1,088 kilometers of roads (676 miles) as of 1998, all of which are paved. The Abu Dhabi-Dubai highway has been upgraded several times, and the links from Dubai to the northern emirates are in

good repair as well. Rashid and Jebel Ali in Dubai are the largest of the UAE's 15 ports; together they handled 2.84 billion 20-foot container equivalent units of cargo in 1999, among the largest volumes in the world. Dubai has also won port and free zone management contracts in Djibouti, Sudan, Saudi Arabia, and Beirut since 1998. Dubai's airport is the largest of the UAE's 40 airports and, following the completion of the Shaykh Rashid terminal in March 2000, is now widely considered a first-class international airport. A significant expansion of the Abu Dhabi airport is expected to be completed in 2005. There are no railroads in the UAE, nor is there any domestic air transportation network.

Average annual rainfall in the UAE is very low (generally 42 millimeters) and there are few fertile areas except in the north (where annual rainfall is 150 mm per year) and among the oases. The U.S. State Department expects the UAE demand for water to increase by 50 percent by 2015 and warns that the demand will soon outstrip supply. The UAE has addressed this problem through the development of underground wells—which have rapidly depleted the water table—and desalinization. Many underground wells have gone dry or were rendered unusable because of increased salinity from salt leaching into ground reservoirs. Today, 82 desalinization plants, many of which are also power plants, meet 75 percent of the UAE's total non-agricultural water needs. Due to the depletion of renewable resources through farming and excessive urbanization, there is no alternative to desalinization. Other options, such as importing water from Turkey via pipeline, are not considered viable because of security considerations.

The UAE's desalinization plants are key components of an electrical network that witnessed phenomenal growth in recent decades from 5.5 billion kilowatt-hours (kWh) in 1980 to 19 billion kWh in 1998. Installed generating capability is 7,466 megawatts, with Abu Dhabi accounting for 45 percent of the total and Dubai 26 percent. Especially acute is the demand for gas; in Abu Dhabi and Dubai, demand doubled from 1996 to 2000. The UAE expects to spend $3.5 billion on new projects over the next 4 years to meet increased demand for electricity, which is expected to be 10 percent annually between 2000–2001. Among the most important of these projects is the $10 billion Dolphin Gas Project which aims to ship gas from Qatar's North Field to Abu Dhabi, Dubai, Oman, and Pakistan. A federation-wide electrical network is also being planned and will most likely be connected to the Omani electric grid. This would be the first step towards creating an electrical network throughout all Gulf Cooperation Council (GCC) countries: Bahrain, Kuwait, Oman, Qatar, Saudi Arabia, and the UAE. In addition, the UAE federal government and the largest emirates have **privatized** most of the power system along with the water system.

Telecommunications services in the UAE are among the most advanced in the world. They are managed by Etisalat, which is 60 percent owned by the UAE government. According to the *CIA World Factbook,* there are 915,223 main phone lines in use in the UAE and nearly 1 million mobile cellular phones. In 2000, the country had 1 Internet provider but there should be many more by 2005 as the UAE **deregulates** its telecommunications industry to comply with World Trade Organization guidelines. The management of Dubai Internet City has also confirmed that independent Internet service providers will be allowed to operate in Dubai.

ECONOMIC SECTORS

The UAE is a mixed free-market economy based on oil and natural gas production, and these industries combined take up more than a quarter of UAE **gross domestic product** (GDP). Over the past 2 decades, the UAE's economic diversification program has led to the rise of several non-oil sectors that now make up a significant percentage of the UAE's GDP: manufacturing (12.6 percent), commerce and hotels (11.4 percent), real estate (9.1 percent), construction (8.6 percent), transportation (7.3 percent), and finance and insurance (6.4 percent). The UAE also has a strong **re-export** sector. Government services account for nearly 11 percent of GDP. Industrial growth has been assisted by free trade zones, including Jebel Ali in Dubai, which have been magnets for international firms. In recent years Dubai has succeeded in attracting high-profile technology firms to the emirate's "Internet City," including Microsoft, Oracle, Hewlett Packard, and Cisco Systems.

Nonetheless, the health of the UAE's economy as a whole continues to fluctuate with the world price of hy-

SOURCE: *CIA World Factbook 2001* [Online]. Data for 1998 est. Percent distribution for 1996 est.

drocarbons and the economic vitality of its largest trading partners, particularly Japan, which accounts for close to a third of UAE petroleum exports. In part this is due to the large percentage of GDP taken up by petroleum and in part to the fact that government revenues—70 to 80 percent of which come from oil—and spending are closely linked to oil prices. These links have meant that different sectors of the economy have risen rapidly in recent years as oil prices increased sharply after oil prices hit historic lows in 1998. One exception to this trend is the demand for electricity and power: demand for power grew by nearly 400 percent between 1980 and 1998.

Among the most important corporations based in the UAE is the Abu Dhabi National Oil Company (ADNOC). It manages the petroleum and gas extraction operations in Abu Dhabi along with the 2 major petroleum refineries in the UAE. Other key corporations are: Dubai state-owned Dubai Aluminum, a leading supplier of aluminum to the states of the Gulf Cooperation Council; Etisalat, the Abu Dhabi state-owned telecommunications firm; and Emirates Airlines, Dubai's state-owned airline. The airline has won a plethora of international "Best Airline" awards and maintains one of the most modern airline fleets in the world. It has outclassed "Gulf Air" (a consortium owned by Abu Dhabi, Qatar, Bahrain, and Oman), which remains one of the leading airlines in the Arabian/Persian Gulf region despite experiencing steep losses in the 1990s.

AGRICULTURE

Agriculture accounts for only 3 percent of the UAE's GDP due to the federation's severe climatic conditions, although it accounts for 20 percent of all water consumed, much from rapidly-depleting natural water supplies or desalinization projects. The UAE's agricultural sector annually produces about 600,000 tons of produce. The federation's chief crops are cereals. The UAE produces enough poultry and salad to meet its needs for most of the year. Some crops, such as tomatoes, are grown in quantities greater than what the UAE consumes in a whole year. The agriculture sector also produces watermelons, eggs, cucumbers, gherkins, aubergines (eggplants), green chilies, peppers, and dates.

For much of the 19th and 20th centuries, fishing and pearl diving were mainstays of UAE commerce. Today the government works to conserve fish stocks and protect the economic livelihood of the remaining fishing communities. The annual fish catch—96,000 tons—slightly exceeds domestic consumption.

Because a high proportion of UAE nationals are employed in fishing and agriculture, these 2 sectors receive a disproportionate amount of federal and local funding. For political reasons, the UAE government will continue to encourage agricultural self-sufficiency but it is aware that this goal is unattainable in either the short- or long-term.

INDUSTRY

MINING. Oil is the foundation of the UAE's economy and will be so for many years to come. Current estimates suggest that the federation has more than a century of oil supplies. Oil production represented more than a third of GDP in 1999 and virtually all of the government's revenues. These revenues are also important to government spending, on which most non-oil UAE industries are dependent. Abu Dhabi, Dubai, Sharjah, and Ras al-Khaimah all have some level of oil production, but Abu Dhabi dominates both the UAE's production and reserves. According to the U.S. Energy Information Agency (EIA), Abu Dhabi has crude reserves of 92.2 billion barrels, or slightly less than 10 percent of the world's total, and 92 percent of UAE reserves. The EIA also reported that total UAE oil production for 2000 reached 2.29 million barrels of oil a day but that Abu Dhabi's recent investments could push production closer to 2.7 to 2.9 million barrels. Generally Abu Dhabi has reduced its production to ensure that the UAE stays within OPEC (Organization of the Petroleum Exporting Countries) production guidelines.

The UAE is also blessed with the fourth largest gas reserves in the world: 212 trillion cubic feet, which is about 4 percent of the world's total. These reserves are expected to last for about 150 to 170 years. Abu Dhabi controls 92 percent of the UAE total, while Dubai, Sharjah, and Ras al-Khaimah control the rest. The UAE has soaring domestic demands for gas production. Abu Dhabi

has initiated a multi-billion-dollar program to address this need. The most ambitious part is the Dolphin gas project, which proposes to ship gas from Qatar's North Field to the UAE (principally Abu Dhabi and Dubai), Oman, and eventually to Pakistan. Significant funding is still needed for the project, but the *Economist* expected managers will be able to find the necessary funding because the project involves 4 national governments.

Finally, there is copper in Fujairah and Ras al-Khaimah, talc in Fujairah, and manganese in all of the northern emirates. It not clear whether there is enough of any of these minerals to justify commercial mining.

MANUFACTURING. The *Economist* estimated that the UAE has invested $6.8 billion in industrial development over the last 30 years, spurring the creation of 1,000 factories with more than US$20 billion in direct investment. The dominant industries have been chemicals and plastics (closely connected to UAE crude oil supplies) along with aluminum. Dubai Aluminum is a leading supplier of aluminum to the GCC states and accounts for 60 percent of Dubai's non-oil exports. The UAE government also has made significant investments in petrochemicals and other "downstream" hydrocarbon industries—"downstream" meaning those that involve refining petroleum. In addition, the government is encouraging local-foreign ventures to invest in manufacturing and offering low-interest loans through the Emirates Industrial Bank to private financiers willing to invest in manufacturing in the UAE. Fifty percent of all manufacturing centers are in Abu Dhabi, while Abu Dhabi, Dubai, and Sharjah collectively controlled 93 percent of the UAE's industrial production in 1998.

OFFSETS PROGRAM. A key source of local-foreign investment in manufacturing is the "offsets" program, launched in 1991. It requires arms manufacturing and military aerospace firms to invest 60 percent of the value of their sales to the UAE in non-oil UAE industries. It is designed to take advantage of the current glut on the world arms market and to escape the traditional dilemma of choosing between spending on guns or food. By law, a UAE citizen must retain 51 percent of the capital in the partnership. Virtually all offset projects must be completed within 7 years. If the obligations are not met by the target dates, the company is penalized 8.5 percent of the unfulfilled portion of the obligation.

FREE TRADE ZONES. Another key contributor to UAE industry has been free trade zones. The most important free trade zone is Jebel Ali Free Trade Zone in Dubai. Jebel Ali in 1999 boasted 1,600 corporations and nearly $2.5 billion in investments. The zone's principal advantage was that it allowed companies investing more than Dh1 million (US$272,479) to be 100 percent foreign owned. It also boasts some of the best transportation facilities in the world and has become a regional transportation center, servicing the U.S. Navy, among others. Since the founding of Jebel Ali in 1985, the other UAE emirates established their own free trade zones, which have sought to replicate Jebel Ali's success.

SERVICES

BANKING. According to the *CIA World Factbook,* nearly 60 percent of the UAE workforce is involved in the service sector of the economy. The most important of these industries is banking, which has grown far too large. The National U.S.-Arab Chamber of Commerce estimated that there were 20 UAE-owned banks with more than 200 branches and 28 foreign banks with 119 branches in the UAE. Much of the industry is controlled by the "big five" commercial banks—Abu Dhabi Commercial Bank, Emirates Bank International, National Bank of Dubai, MashreqBank, and National Bank of Abu Dhabi. The UAE Central Bank is responsible for regulating the UAE banking industry and preventing fraud, a continuing problem in the UAE banking system in the 1990s. The UAE was closely involved in the 1991 Bank of Commerce and Credit International scandal and eventually paid nearly US$2 billion in compensation. In 1998 it was revealed that the Dubai Islamic Bank lost US$200 million due to the actions of a corrupt employee. A year later, Madhav Bhagubhai Pater, an Indian businessman, fled from Sharjah, leaving behind debts of US$130.5 million to UAE and foreign creditors.

TOURISM AND RETAIL. The UAE has a thriving tourist industry centered in Dubai, which has 70 percent of the country's hotels. Dubai features horse races, desert safaris, golf courses, and a number of five- and four-star hotels. The emirate also has shopping festivals, such as the Dubai Shopping Festival, where goods are heavily discounted. The purpose of these festivals is to attract visitors. According to the festivals' organizers, nearly 2.5 million people vacationed in the emirates in 2000: they came mostly from Britain, from surrounding states, and from the states of the former Soviet Union. Fujairah, which faces the Indian Ocean, has witnessed a considerable upsurge in vacationers in recent years. **Retail** has generally benefited from this upsurge except when a strong yen increases the price of imported Japanese **consumer goods**.

CONSTRUCTION AND REAL ESTATE. For much of the 1980s and 1990s, the UAE underwent a building boom with new office buildings rising daily in the UAE's major cities, particularly Dubai and Abu Dhabi. In recent years, there have been reports that the boom is slowing, that UAE developers are taking a more reasoned/scientific approach to building, and that there is even a sign of a glut of office space in Dubai. Still, Dubai continues to build new hotels. The Saadiyat project in Abu Dhabi

promises 28,000 new homes, a bridge valued at US$220 million, and a new trade center valued at US$95 million.

RE-EXPORT. Finally, a rapidly emerging sector in the UAE economy is re-export, whose value, according to UAE government statistics, almost doubled between 1990 and 1998. At that time, foreign trade hit US$10.6 billion. The center of UAE re-export trade is Dubai, which accounted for 40 percent of the federation's re-export trade in the late 1990s. Among the most important markets for Dubai's re-export trade are Iran and the southern countries of the former Soviet Union. Reportedly Dubai also served as an entryway for smugglers attempting to circumvent U.S. **sanctions** against Iran imposed in the mid-1990s.

INTERNATIONAL TRADE

Since independence, the UAE has maintained an open, free market system with close links to the international economy. Historically the UAE's prime industries were pearling and fishing. Since the discovery of oil in the 1960s, the federation's closest trading partners have been industrialized nations in Europe and Asia, primarily France, Germany, Great Britain, Italy, Japan, India, and South Korea. The UAE exchanged crude oil for machinery, cars, transportation equipment, and food. Japan is critical since it usually accounts for a third of UAE petroleum exports: the EIA estimated that 80 percent of the UAE's crude oil exports in 1999 went to Japan and other east Asian countries. The UAE's modern infrastructure and port facilities also have allowed it to serve as an important re-export and transportation hub, particularly for Iran through Dubai.

Generally the health of the UAE's economy has depended on the price of oil and the economic vitality of its leading trading partners. At the same time, the federation's economy also has been impacted adversely by the politics of the Arabian/Persian Gulf region. Because of the UAE's perceived support for Iraq in the Iran-Iraq war, Iran attacked UAE oil tankers in the Arabian/Persian Gulf and compelled the UAE government to seek the protection of the U.S. Navy through a reflagging operation (UAE ships hoisted the U.S. flag and carried U.S. servicemen). The UAE and Iran also continue to dispute ownership over 3 islands in the Arabian/Persian Gulf: Abu Musa and the Greater and Lesser Tunbs. During the Gulf War, the UAE sought a close relationship with the United States as a way to protect the federation's economic assets from Iraqi threats. The UAE also benefited from the relocation of a number of businesses from Kuwait to the federation, especially to Dubai. Still, it is important to remember that the UAE's dependence on desalination plants for power and water ensures that the state's economy is especially vulnerable because economies of scale dictate that desalination plants should be large and located on the coast.

Since the Gulf War and the collapse of the Soviet Union, the UAE has faced new competitors and steadily increased its trade with China, the United States, and the former Soviet republics. Throughout the first two-thirds of the 1990s, large numbers of Russians traveled to the UAE and purchased products for sale at home, often using small transport planes or traveling through the emirate of Sharjah. U.S. firms also have made steady inroads into the UAE, helping the United States overtake Japan in 1996 as the leading exporter to the federation. U.S. exports to the UAE increased by 14.5 percent alone in 1999. Finally, erstwhile GCC-ally Saudi Arabia fought hard—but ultimately failed—to steal the UAE's share of the Japanese petroleum market throughout the late 1990s.

MONEY

Since 1981, the UAE's currency, the Emirian dirham, has been linked directly to the U.S. dollar at a rate of Dh3.67 to $1. The connection reflects the fact that crude oil—the UAE's chief export and the driving force in its economy—is denominated and sold in U.S. dollars. It also reflects the desire of the UAE government to ensure that domestic interest rates will move in sequence with those prevailing in the United States.

Trade (expressed in billions of US$): United Arab Emirates

SOURCE: CIA *World Factbook 2001* [ONLINE].

The UAE has achieved this stability through a tight **monetary policy** that regulates domestic **liquidity** under an open exchange and payments system: there are no prohibitions on the import or export of currencies into the UAE except for Israeli currency and countries subject to United Nations sanctions. The UAE Central Bank also adjusts the stock of domestic liquidity through the issuance of certificates of deposit (CDs) to the federation's commercial banks. The UAE is currently considering introducing an auction system for these CDs. The UAE government has no **external debt**, and its private debt-to-service ratio has been improving steadily since the 1980s.

Generally the dirham linkage has helped the UAE maintain **macroeconomic** stability and relatively low rates of **inflation**, generally between 4 percent and 5 percent annually. The principal problem for the system occurred in the late 1980s and again in the mid-1990s as the U.S. dollar dropped in value against the Japanese yen. This process created **balance of payments** concerns for the UAE since its principal trading partner at the time was Japan. There have been periodic discussions over the last decade of linking the dirham to a "basket" of currencies, including the U.S. dollar, the Japanese yen, and leading European currencies.

Dubai Financial Market (DFM), the UAE's first fully-regulated stock exchange, and its sister exchange, the Abu Dhabi Financial Market, both opened in 2000. Although initial interest in the stock exchanges was light, the UAE Central Bank expects that investors will flock to the 2 markets over the next decade. There have been discussions between representatives of DFM and the U.S. NASDAQ about a possible link up of the bourses (stock exchanges). The UAE Central Bank also has encouraged the development of a local bond market but has been hindered by several high-profile fraud cases involving large UAE investors.

POVERTY AND WEALTH

The United Arab Emirates is one of the wealthiest nations in the world and its citizens enjoy the highest standard of living in the Middle East: per capita income was estimated at US$17,700 in 1999. Although illiteracy was relatively high for wealthy nations at 25.4 percent in 1998, more than 90 percent of the UAE population has access to safe water, health services, and sanitation. In comparison, nearly 57 percent of the population was illiterate in 1975. The UAE government spends close to 16 percent of its annual budget on schools and has produced one of the lowest student-to-teacher ratios in the world, 12 pupils per teacher. Generous spending on health care has produced similar results in a number of key health indicators that are far better than the world average: life expectancy, infant mortality rates, births attended by trained physicians, and numbers of doctors per 100,000 people in the population. Overall, UAE citizens can depend on a cradle-to-grave **welfare state** that has few peers in the world.

GDP per Capita (US$)

Country	1975	1980	1985	1990	1998
United Arab Emirates	37,520	37,841	24,971	20,989	16,666
United States	19,364	21,529	23,200	25,363	29,683
Saudi Arabia	9,658	11,553	7,437	7,100	6,516
Iran	1,611	1,129	1,208	1,056	1,275

SOURCE: United Nations. *Human Development Report 2000; Trends in human development and per capita income.*

There are enormous socio-economic cleavages in the UAE, however, as wealth is not distributed evenly. Collectively, Abu Dhabi and Dubai control 83.2 percent of the UAE's GDP in large part because of Abu Dhabi's large oil production and Dubai's oil supply and commercial base. Sharjah has built its economy on trade and oil but has also depended on manufacturing. It is held back by large loans taken out in the 1970s and 1980s, reportedly receiving annual **subsidies** from Saudi Arabia. All 3 emirates feature modern cities that are as advanced as any in the major industrialized nations.

The other 4 emirates have little oil. In 1999 together they accounted for only 6.9 percent of GDP. They depend heavily on subsidies from the UAE central government. The economic future of these poorer emirates may revolve mostly around who emerges as the dominant figure in UAE affairs after Zayid's death. The *Economist* reported that Abu Dhabi Crown Prince Shaykh Khalifa wants to limit Abu Dhabi's assistance to the poorer emirates and accelerate privatization programs of large state industries. Army Chief of Staff Shaykh Muhammad favors a more federal system in which Abu Dhabi would help develop the economy of the entire federation.

Within individual emirates, there are also clear economic distinctions based on nationality and gender. While many basic social services are provided to expatriates at reduced rates, UAE citizens command salaries roughly double those of expatriates in similar jobs and have access to numerous subsidies, grants, loans, free services, and pensions unavailable to expatriate workers. UAE citizens also receive preferential treatment for many government jobs. Women are routinely discriminated against in hiring decisions. Very infrequently, they are sent abroad for post-secondary education in the United States or Europe. Increasingly, members of the UAE elite are educated in foreign universities rather than in the UAE.

WORKING CONDITIONS

One of the most striking features of the UAE is the demographic composition of its workforce and the striking differences between the working conditions. Nearly 70 percent of the UAE government's workforce is comprised of Emirati nationals, while expatriates overwhelmingly dominate the **private sector**. There is no minimum wage. All workers are prohibited from organizing unions, bargaining collectively, and going on strike. In 1995 the United States suspended the UAE from the U.S. Overseas Private Investment Corporation Insurance Program because of the government's failure to comply with internationally recognized worker rights and standards.

The UAE, however, does regulate workplace health and safety standards rigorously, and injured workers are entitled to fair compensation by law. Forced and compulsory labor is illegal and rare. Children under the age of 15 are not permitted to work, and there are special regulations for workers between the ages of 15 and 18. Most UAE workers work 8 hours a day, 6 days a week, and are not required to work outside when the temperature exceeds 44 degrees Celsius (112 degrees Fahrenheit)—a key consideration in a climate as hot as that of the UAE. The UAE Ministry of Labor and Social Affairs (MLSA) generally rejects contracts that provide excessively low wages and attempts to investigate all complaints made by workers. Workers also may seek redress in courts, including special labor courts established by the MLSA. Unemployment rates are believed to be very low.

Still, these labor regulations do not cover government employees, domestic servants, agricultural workers, and women. Such groups are at times obliged to work longer than mandatory hours, and domestic servants are often victims of abuse or work conditions approaching indentured servitude. Even expatriate workers, who are covered by labor laws, frequently are not protected because the costs of seeking redress in the courts can be prohibitively high and because the MLSA is understaffed. Expatriate workers also face the threat of immediate deportation because many are in the UAE on temporary work visas. Though not officially sanctioned, discrimination is often practiced against women. As a result, unemployment for female university graduates is far higher than that of their male counterparts.

Child laborers perhaps are in the greatest danger. There have been consistent reports for at least a decade of underage boys—sometimes as young as 5- or 8-years old—working as camel jockeys. Although the government in 1993 prohibited children younger than 15 serving as camel jockeys, the State Department's *1999 Human Rights Report for the UAE* speculated that the employers of underage camel jockeys are from powerful Emirati families considered to be above the law. Equally vulnerable are the large number of women from the former Soviet Union, Africa, and Asia who engage in prostitution and other acts associated with organized crime.

COUNTRY HISTORY AND ECONOMIC DEVELOPMENT

1820. Britain imposes a non-aggression pact on the rulers of the UAE for disrupting Indian-bound trade.

1892. Britain and the local rulers agree to transform the region into a British protectorate.

1958. Large quantities of oil are discovered in Abu Dhabi.

1971. Iran seizes 3 UAE administered islands: Abu Musa and the Tunb islands.

1971. Britain withdraws. The UAE is formed with all of the current emirates except Ras al-Khaimah.

1971. The UAE joins the United Nations and the Arab League.

1972. Ras al-Khaimah joins the UAE.

1973. OPEC raises the price, and cuts the supply, of oil. UAE GDP growth is 10 percent annually in the 1970s.

1981. Iran-Iraq war begins. The UAE financially supports Iraq. The UAE joins the Gulf Cooperation Council and pegs the dirham to the U.S. dollar.

1985. Dubai launches the Jebel Ali Free Zone.

1991. Gulf War begins. The UAE pays US$10 billion to support the anti-Iraq coalition.

1996. The UAE constitution becomes permanent. Abu Dhabi city is recognized as the UAE capital.

1996. The UAE agrees to a defense pact with the United States.

1999. Dubai Internet City and the Dolphin Gas Project are both unveiled.

2000. The first regulated UAE stock market, Dubai Financial Markets, opens for trading.

FUTURE TRENDS

There appears to be little doubt that the UAE has a bright economic future. The UAE controls nearly a century of oil reserves, maintains a modern infrastructure and a stable political system, lacks significant overseas debt, and has the financial resources necessary to address the economic, environmental, and social challenges of demographics, the dominance of oil in the state, and the paucity of water supplies before they become overwhelming. At the same time, the UAE's economic and

social problems are very real and will intensify if they are not addressed.

Most of the UAE's proposed solutions to these problems have exacerbated certain aspects of them. The gap in wealth between the poorer and richer emirates could exacerbate tensions in the future. Abu Dhabi has combined its privatization programs with deep cuts in subsidies to the northern emirates, a move that has only enlarged this gap. This issue will be paramount if Shaykh Khalifa emerges as the dominant figure in the UAE government after the death of Shaykh Zayid. Privatization also favors the UAE's service sector, which is dominated by expatriates. This, too, could cause very serious social tensions. In addition, the offset program is contingent upon the UAE's spending billions on arms for decades, an expenditure that is likely to become a great burden. Thus, the UAE's principal challenge in the next century will be to build a viable society whose economic success does not undermine its economic and political stability.

DEPENDENCIES

United Arab Emirates has no territories or colonies.

UZBEKISTAN

Republic of Uzbekistan
Uzbekiston Respublikasi

CAPITAL: Tashkent (Toshkent).

MONETARY UNIT: Uzbekistani sum (UZS). One sum equals 100 tyyn. Notes come in denominations of 100, 50, 25, 5, and 1 sum. Coins include 1, 5, 10, 20, and 50 tyyn.

CHIEF EXPORTS: Cotton, gold, natural gas, mineral fertilizers, ferrous metals, textiles, food products, and automobiles.

CHIEF IMPORTS: Machinery and equipment, chemicals, metals, and foodstuffs.

GROSS DOMESTIC PRODUCT: US$60 billion (purchasing power parity, 2000 est.).

BALANCE OF TRADE: **Exports:** US$2.9 billion (f.o.b., 2000 est.). **Imports:** US$2.6 billion (f.o.b., 2000 est.).

COUNTRY OVERVIEW

LOCATION AND SIZE. Uzbekistan is located in central Asia, bounded on the north and west by Kazakhstan (2,203 kilometers/1,369 miles), on the east by Kyrgyzstan (1,099 kilometers/683 miles) and Tajikistan (1,161 kilometers/721 miles), on the south by Afghanistan (137 kilometers/85 miles), and on the southwest by Turkmenistan (1,621 kilometers/1,007 miles). Uzbekistan has an area of 447,400 square kilometers (172,741 square miles), which is slightly smaller than California. Uzbekistan's area includes 22,000 square kilometers (8,494 square miles) of inland water, mainly the Aral Sea. It is one of only two countries in the world bounded only by other landlocked countries. The capital, Tashkent, is located in the eastern arm of the country, near the Kazakhstan border.

POPULATION. The population of Uzbekistan was estimated at 25.1 million in July 2001 and it was youthful, with 36.3 percent aged 14 years or younger, and only 4.6 percent 65 or older. The birth rate was 26.1 births per 1,000 and the death rate was 8 per 1,000 people. The population growth rate was 1.6 percent in 2001, and the fertility rate was approximately 3 children per woman. Life expectancy was lower than in industrialized countries, 63.81 years total; 60.24 for men, and 67.56 for women. The average population density was 51.2 people per square kilometer (132.6 per square mile), but 1995 figures show that most of the population was concentrated in the fertile Fergana Valley at 474.5 persons per square kilometer (1,229 per square mile). The central and western desert areas were sparsely populated, at only 6.6 persons per square kilometer in the region of Navoi, and 8.5 in the region of Karakalpakstan in 1995. In Tashkent, the largest city in central Asia with a population of 2.1 million in 2000, the population density reached higher than 7,000 persons per square kilometer (18,130 per square mile). About 35 percent of the population in 2000 was urban, down from 41 percent in 1995.

Uzbeks, a Turkic people, comprised 80 percent of the population in 1996, while Russians (5.5 percent), Tajiks (5 percent), Kazakhs (3 percent), Karakalpaks (2.5 percent), Tatars (1.5 percent), and Koreans (1 percent) made up the rest. Religious groups include mostly Muslims (88 percent, mostly Sunni), and Orthodox Christians (9 percent). The official language is Uzbek, spoken by 74.3 percent of the population. Russian is spoken by 14.2 percent and is still predominant in business and science, while Tajik is spoken by 4.4 percent of the population.

OVERVIEW OF ECONOMY

Although rich in natural resources, particularly natural gas and gold, Uzbekistan was among the poorest republics of the Soviet Union before its independence in 1991. The Soviet regime stressed the development of heavy industry, particularly mining, machines, and chemicals, while neglecting **consumer goods** production and the country's **infrastructure**. Although it developed as a major producer and exporter of natural gas

and gold and a sizable regional manufacturer of automobiles, aircraft, machinery, textiles, and chemicals, Uzbekistan remained predominantly rural. Nearly two-thirds of its population was concentrated in the heavily farmed river valleys where cotton production was the top priority of the central government. Uzbekistan was the principal cotton supplier to the Soviet Union and became the third largest cotton exporter worldwide in 2000. Monocultural (production of a single crop) agriculture and extensive irrigation in the arid Uzbek plains, however, caused severe environmental problems during the 1970s and 1980s. Poor land management resulted in the depletion of water supplies, the partial drying of the Amu Darya and Sir Darya rivers and the Aral Sea, heavy water and soil contamination, and newly formed patches of desert.

Following the collapse of the Soviet Union, Uzbek manufacturing experienced some decline in demand from its former Soviet markets, but the industrial sector protected the economy from the massive contraction seen in other former Soviet republics. The government of **communist** leader Islam Karimov, who stayed in office as president throughout the 1990s, subsidized state-owned, loss-making companies to keep them open. Karimov adopted **protectionist policies** in order to boost domestic industry, leading to expensive and inefficient industrial **import substitutions**. Industrialization was achieved but with the accumulation of a large **external debt** (US$3.3 billion in 1999) that was to be repaid with cotton and gold exports. In the late 1990s, however, the world prices of these key exports dropped, and the lack of competitiveness of the new Uzbeki industrial sector produced a **hard currency** shortage. The situation was aggravated by the government's reluctance to introduce current-account convertibility of the sum. The sum is not freely convertible to foreign currencies, and **exchange rates** for different purposes are set by the administration. The financial crises in Asia and Russia in the late 1990s and the lack of sufficient foreign investment caused economic stagnation and additionally-tightened import controls, fueling **inflation** and a deficit of goods in the domestic consumer market. Poor cotton harvests in the 1990s added to the growing **budget deficit**, and by 1995, Uzbekistan had received US$276.6 million in foreign aid to help meet its financial obligations.

To counter the negative trend towards debt, by the mid-1990s, the government introduced tighter monetary controls, launched a **privatization** program, and tried to lure foreign investors. However, its legal regimes still lacked transparency and many foreign partners complained about slow decision-making and persistent bureaucratic control complicated by red tape. Before 2000 there were several designated **strategic industries** that were not subject to privatization, such as mining of precious metals and gems, oil and gas drilling and processing, defense, aerospace, and communications. But by 2000, about 20 enterprises with foreign capital were expected to manufacture a wide variety of consumer and other goods, from tomato paste to electrodes to marble and granite. Unfortunately, a large South Korean investor, Daewoo Motors, went bankrupt in late 2000, threatening the future of its automotive plant in Uzbekistan.

By 1995 the country had returned to the level of industrial production that it had reached before the collapse of the Soviet Union. By the late 1990s, however, reforms had not been able to **restructure** the economy. The International Monetary Fund (IMF) suspended a US$185 million loan due to the failure of Uzbekistan to meet its **structural adjustment program** requirements. Without IMF aid and without hard currency, external debt default (suspension of all debt repayments) became likely. However, the IMF insisted that Uzbekistan adopt a stabilization program requiring a radical change in economic policy, including further privatization, an end to import substitutions, and a shift to the convertibility of the sum.

In early 2001 a 2-year government program was launched, envisaging the privatization of 1,244 enterprises. Thirty-eight of these, including several strategic enterprises and banks, were to be turned into joint-stock companies with the participation of foreign investors who would be offered between 39 percent and 70 percent of the shares. Approximately 49 enterprises were to be sold directly to foreign investors on the understanding that they would renovate their production processes, introducing modern technology and management. The number of firms with shares placed on the securities market and the off-exchange market to foreign investors in early 2001 reached 535, covering practically all sectors of the economy. Convertibility of the sum, however, was not yet on the government's agenda in 2001.

POLITICS, GOVERNMENT, AND TAXATION

Uzbekistan declared its independence from the Soviet Union in 1991 and a new constitution was adopted in 1992, declaring a multiparty democracy and a presidential republic. Since reelection in 2000, President Karimov has consolidated the government's power to run more like a dictatorship than a democracy. The 250-seat **unicameral** Ali Majlis (supreme council/parliament) has very little political clout. Although there has been universal suffrage since early Soviet times, members of parliament are nominated by local governors or selected from the People's Democratic Party (the former communist party) and other pro-government groups. The cabinet is headed by a prime minister who is nominated by the president, exerting total control on all other high-ranking national- and local-level officials. Other pro-government parties include the Homeland Progress, the National Revival, and the People's Unity Movement. Opposition groups, such as Birlik (Unity) and Erk (Will), were either silenced or banned in the early 1990s, and their leaders were banished. Only 2 human rights groups have survived under the strict government control. None of them has any large political role or represents any particular social group, and no opposition party at all existed legally in 2000. Adolat (Justice), an Islamic movement, was disbanded in 1992 and most of its members were incarcerated.

President Karimov considers Islamic fundamentalism and terrorism a major threat to the country, repeatedly citing it to justify his authoritarian rule to the public and the international community. Tajikistan is seen as a potential source of Islamic fundamentalist terrorism against Uzbekistan, as was Afghanistan prior to the toppling of that country's ruling fundamentalist Taliban regime in 2001. In many cases, the government's overreaction to real or imagined terrorist threats had the unintended effect of arousing sympathy from Uzbekistani citizens and pushing devout Muslims towards fundamentalism. Economic hardship also became a fertile ground for religious dissent during the 1990s. During the pre-1990 Soviet atheist regime, knowledge of Islam was minimal in central Asia. Even in early 2001, an attempt to overthrow the secular government and to establish Islamic rule was hardly thinkable. But in the late 1990s, tens of thousands of people were arrested by the government for their fundamentalism and put on trial to discourage the possibility of an Islamic fundamentalist revolution.

The key to understanding Uzbekistan politics lies in the domestic society's traditional clan structure, based on both kinship and territorial proximity. This society has survived the cultural impositions of both the czarist and the communist Russian regimes. Uzbekistan is ruled by representatives of the renowned Samarkand-Bukhoro clan. The clan's leader, President Karimov, took office in 1989 as a result of a compromise between the country's major clans, but he was resented by the powerful Fergana and Tashkent clans. In 1992 Vice President Shukrullo Mirsaidov, the chieftain of the Tashkent clan, along with the Birlik and Erk opposition groups tried to uproot Karimov but failed. The weakness of the opposition groups was mostly due to their inability to agree on one leader. In the early 1990s several independent organizations were

created by young **technocrats** and businessmen, forming an important talent pool that the president was able to draw on for technical and political support for his policies. The importance of traditional clans is expected to shrink with the modernization of the country.

After the breakup of the Soviet Union, Turkey was regarded as the bridge between Europe and the central Asian states, including the ethnically Turkic Uzbekistan. By 2000 Turkey's importance as a mediator declined considerably because Uzbekistan turned eastward to its former trading partners for political and economic support. Post-Soviet integration was more active than western European integration, and Uzbekistan was still dependent on Russia for its security and for more than half of its trade. Since the mid-1990s, the United States has also boosted its presence in Uzbekistan and considers it as an important ally against the spreading of Islamic fundamentalism and terrorism in central Asia.

Taxation in Uzbekistan is considered rather restrictive, although the actual collection rate is quite low. In 2001, the government proposed a reduction of the **income tax** rate from 31 percent to 26 percent to boost investment. **Foreign debt** service problems are very serious given the country's lack of foreign exchange revenues and shrinking exports. The government plans to pay off its official debt, which is owed to other governments, before paying back its debt to private creditors. In this manner, Uzbekistan hopes to stay in the good graces of multilateral lenders such as the IMF, from which it receives debt assistance.

INFRASTRUCTURE, POWER, AND COMMUNICATIONS

Uzbekistan's infrastructure is extensive, but badly needs modernization. In 1993 there were 3,380 kilometers (2,113 miles) of railroads, 300 kilometers (187.5 miles) of which were electrified, and 81,600 kilometers (51,000 miles) of highways, 71,237 kilometers (44,523 miles) of which were paved, including gravel. The construction of a 2,300 kilometer (1,437.5 miles) long high-speed highway is expected to start in 2002. An international tender will be announced for implementing the project, and credits from international organizations and local budget resources are to be mobilized. The system of inland waterways included 1,100 kilometers (687.5 miles) in 1990: crude oil pipelines 250 kilometers (156 miles), petroleum products pipelines 40 kilometers (25 miles), and natural gas pipelines 810 kilometers (506 miles) in 1992. There was 1 port at Termiz on the Amu Darya River and 3 airports with paved runways in 1997.

The policy of import substitution has made Uzbekistan self-sufficient in energy. Since independence, oil production increased by 189 percent to 8.1 million tons in 1998, thereby eliminating oil imports. This self-sufficiency was not achieved with foreign investment, but through the compulsory allocation of national credit and large amounts of government-guaranteed foreign debt. Natural gas production rose from 41.9 billion cubic meters in 1991 to 54.8 billion cubic meters in 1998, but most natural gas is exported to former Soviet markets that pay late, if at all. Relations with neighboring Kyrgyzstan deteriorated in 2000 when the Uzbekistan government demanded that Kyrgyzstan hand over part of its land as payment for natural gas.

The Uzbeki energy sector has lost efficiency since 1991 because of government-controlled energy prices favoring individuals over industries. According to the IMF, industrial gas users payed 812.5 percent more than private families in 1997, though this disparity fell to 203 percent in 1998. Smuggling oil out of Uzbekistan is a widespread occurrence since the domestic price is very low when converted at the free market exchange rate. Despite self-sufficiency in fuel production, fuel is in short supply, encouraging drivers to buy smuggled imported gasoline from private traders at a premium of more than 45 percent above the official price. Electricity production generally meets the needs of the country, standing at 43.47

billion kilowatt hours in 1998. Approximately 85.2 percent of Uzbekistan's electricity is generated in thermal plants, and 14.2 percent is generated at hydropower stations in the mountains. In 2000, the government launched a US$113 million import substitution program for power-sector machinery. It also planned to increase local coal production at the Angren mine from 3 million tons in 1999 to 5 million tons by 2007. Elimination of energy imports has come at the heavy price of high foreign debt, which Uzbekistan is finding difficult to service.

The Uzbekistan telephone system is outdated, with only 1.976 million main lines in 1999, and 26,000 cellular phones in 1998. In the late 1990s, the telephone system was expanded and improved under contracts with foreign companies, particularly in and around Tashkent and Samarkand. By 1998, 6 cellular networks were in operation, 4 of them of the European GSM type (Groupe Spéciale Mobile; or Global System for Mobile Communications). Uzbekistan communications are linked with other post-Soviet republics and other countries by a leased connection via the Moscow international switch. With the opening of a link to the Trans-Asia-Europe (TAE) fiber-optic cable, the country will become independent of Russia for its international communications. There was only 1 Internet service provider in 1999 and computer usage was low. In 2000 a shortage of hard currency made the state-owned telecommunications company Uzbektelekom repay its US$1.2 million debt to Kazakhstan's Kazakhtelekom in supplies of Uzbek telephone boxes and natural gas. Kazakhtelekom cut off calls coming from Uzbekistan in August 2000, claiming that the debt was in fact US$4.4 million.

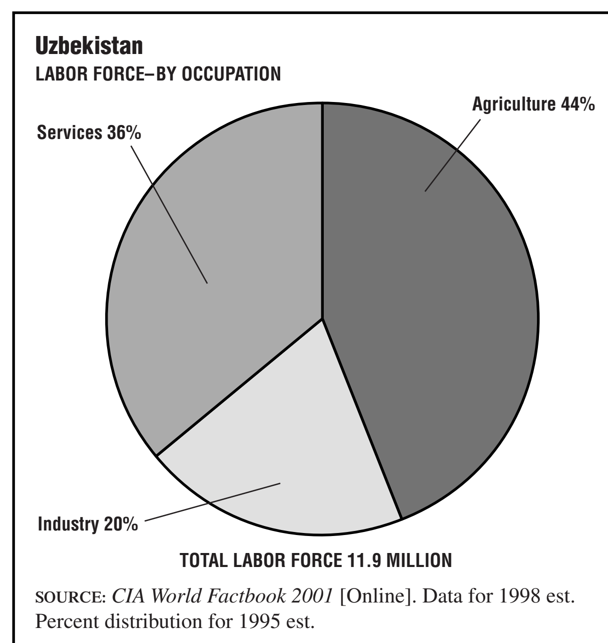
ECONOMIC SECTORS

Agriculture contributed 28 percent of **gross domestic product** (GDP) in 1999 and employed 44 percent of the workforce in 1995. Most agricultural and light industry output is related to cotton, accounting for 30.8 percent of total exports in 1999. Lack of environmental and management reform has plagued the agricultural sector. The cotton crop failed twice, in 1996 and 1998, and remained below the government's target of 4 million tons in 1999. The government's pursuit of self-sufficiency in food production led to some land reserved for cotton being reassigned for food growing.

Industry produced 21 percent of GDP in 1999, employing 20 percent of the workforce in 1995. Manufacturing made up the greatest part of the industrial sector and accounted for 13.9 percent of GDP and 12.8 percent of the workforce in 1999. A car factory in Andijan assembled Daewoo cars from imported components, while an aircraft factory assembled Russian aircraft. The rest of the industrial sector was comprised of truck and bus assembly, electrical engineering, textiles, agricultural machinery, and agricultural processing. Gold mining and refining is the country's next largest industrial endeavor, accounting for 10.4 percent of GDP in 1999. Most gold is mined at Muruntau in Navoi, where annual output is about 80 tons per year. Gold brings in less money than it did during Soviet times due to a drop in its price in the late 1990s.

Approximately 51 percent of GDP came from services in 1999; the sector employed 36 percent of the workforce in 1995. Economic volatility and isolation, the lack of consumer credit, and government controls have



SOURCE: *CIA World Factbook 2001* [Online]. Data for 1998 est. Percent distribution for 1995 est.

inhibited the development of a modern services sector. Outside of education and health, there were 398,000 employees in the services sector in 2000, or just 4.5 percent of the total workforce.

AGRICULTURE

Agriculture in arid central Asia is heavily dependent on irrigation. Arable land comprises only 9 percent of the territory because much of the land is desert. Only 1 percent is covered by permanent crops, about 3 percent is occupied by forests, and 46 percent is permanent pastures used by sheep and other livestock. Under the Soviet regime vast formerly-deserted terrain has been reclaimed for cotton growing, and agriculture was collectivized into large state-controlled farms. These lands remain under the control of the Uzbekistani government. The cotton sector is still the most important employer and export producer, characterized by the extensive use of machines and chemicals. The drying up of the Aral Sea due to excessive irrigation in the cotton fields has resulted in growing concentrations of pesticides and salts blown from the exposed bed of the lake. Mismanaged irrigation has contributed to soil contamination, **desertification**, water pollution, and many health disorders.

Apart from cotton, leading products include vegetables, fruits, grain, livestock, and animal products, including the world-famous karakul sheep. In 1998, President Karimov threatened to impose criminal penalties on local leaders who anticipated food shortages and restricted the sale of food at market in order to stockpile food locally. In 2000 the grain and cotton harvests were low due to persistent drought and mismanagement of water resources. The government would not raise water prices to encourage farmers to use it more efficiently, because allowing the sale of water at market prices defies the communist ideal of a state-run economy. To ensure that water shortages would not happen again in 2001, the government reached an agreement with Tajikistan (where its rivers originate) to cooperate on water use. Another pricing problem exists in the cotton industry: the domestic cotton fiber price was just 43 percent of the world price in 2000. In order to achieve self-sufficiency in grain production, the government is still shifting land from cotton to grain production, which deprives the economy of export revenue. A ton of cotton on the world market in 2000 was worth around US$1,100 in export revenue, while a ton of grain was worth approximately US$200.

INDUSTRY

Manufacturing in Uzbekistan is based on its wealth of natural resources including natural gas, petroleum, coal, gold, uranium, silver, copper, lead, zinc, tungsten, and molybdenum. Mining and metallurgy are the most important areas, but textiles, food processing, machine building, and electrical engineering are also well developed. Due to self-sufficiency policies, the industrial production growth rate was 6 percent in 1999, but the sector was performing poorly financially.

OIL AND GAS. Uzbekistan has failed so far to promote oil and gas exports due to its isolationist economic policy. The prices that Uzbekistan gets for its oil and gas exports in post-Soviet markets are low, and payments are insecure. Approximately 41.5 billion cubic meters of gas was produced in the first 9 months of 2000, up by 1 percent from 1999. Most gas is consumed locally by enterprises at prices above the cost of production, and by households at subsidized prices. Officially recorded crude oil production fell in the first 9 months of 2000 to 5.7 million tons, down by 6.2 percent from 1999. Refined oil production was rising though. It is likely that oil is illicitly exported to Kazakhstan. Fuel oil production, at 1.3 million tons, increased slightly during 2000, and the kerosene output of 300,000 tons rose by 17.1 percent in 2000. The government intended to increase investment in the state-owned oil and gas giant Uzbekneftegaz by taking on further external debts, expanding exploration and production in 2001. Free-market domestic prices were seen as a more efficient method to generate the capital for industrial investment domestically, without increasing the large external debt burden. The government also planned to sell 49 percent of Uzbekneftegaz to foreign investors in 2001. The subsidiaries of Uzbekneftegaz also were scheduled for partial sale to foreign investors, including 44 percent in Uzneftegazdobycha (exploration and development), and 39 percent in each of Uzneftepererabotka (oil refineries), Uzburneftegaz (drilling), and Uzneftegazstroi (oil and gas construction).

GOLD. Uzbekistan is the world's eighth largest producer of gold. The gold mine is owned by the Navoi Mining and Metallurgical Combine (NGMK), a Soviet-era, state-owned firm that the government refuses to privatize or reform. The estimated output in 1999 was 80 tons but there was no independent confirmation. Gold accounts for 10 to 20 percent of export earnings and the drop in its price since 1997 has discouraged foreign companies from investing. Yet, Newmont Mining of the United States has entered a **joint venture** with NGMK to extract gold from a 242 million-ton pile of tailings left beside the mine from the Soviet era. The project, with European Bank for Reconstruction and Development (EBRD) funding, should produce almost 143 million grams (5 million ounces) over 17 years.

MOTOR VEHICLES. As a result of the policy of import substitution, most industrial production supplies the domestic market and is not export-oriented. Even Uzdaemotors, a joint venture between Daewoo Motors and state-owned Uzavtosanaot that assembles motor vehicles,

produces cars primarily for the Russian and domestic market. Production started in 1996 when investment was expected to reach US$658 million. Supplies were ordered from Russia and South Korea. Uzbekistan was to provide the labor; however, Russia's economic problems in 1998 damaged export prospects, and few locals could afford to buy Daewoo cars. As a result, production in 2000 was even less than the 1997 target of 125,000 units and the 1998 target of 80,000 units. Although Daewoo's stake reached 70 percent in 1998, the Uzbekistan government kept the venture operational after the bankruptcy of Daewoo in 2000, switching it from a foreign investment into another government asset backed with foreign debt.

FOOD PROCESSING. In 1997 Jahn International of Denmark joined Intertrade from the United States and local Tashkent Sud to form Sun Juice, a fruit juice company. Nestle of Switzerland plans to invest US$30 million for the construction of a chocolate factory in Namangan, while British companies have invested in the Uzbek tobacco industry.

SERVICES

FINANCIAL SERVICES. Due to excessive government restrictions and controls, financial services are poorly developed. The central bank is not independent and acts as a money printing press for the finance ministry. Banks do not act as financial intermediaries for their clients, rather they pay negative interest rates on deposits, confiscate savings, and funnel government credit and foreign loans to enterprises and sectors selected by the government. The government refuses to push insolvent state-owned enterprises into bankruptcy, allowing them to stay in business. Banks fund their operations by refusing to pay back creditors, suppliers, and workers, eroding the banking sector. Of the 31 banks in Uzbekistan in 2000, just 4 small ones were private. Most banks were considered insolvent by international lenders, relying on further foreign debt inflows for survival. The largest bank was the state-owned National Bank of Uzbekistan (NBU), with 70 percent of the total loan portfolio and around 66 percent of the foreign exchange **turnover** in the country. The NBU is 1 of 4 banks allowed to deal in foreign exchange and makes a good profit by borrowing from the EBRD, nearly doubling the interest rate when lending to Uzbekistan firms. The government planned—but failed—to sell a 40 percent stake in the NBU in 1999. The main foreign-owned bank is ABN-AMRO (Netherlands), which operates in a joint venture with NBU.

RETAIL. Trading in domestically produced food and imported consumer goods in the vibrant traditional oriental bazaars is a major economic activity and important income source. Many government and other employees add to their income as small traders, and the vast majority of Uzbekistan people shop at the local bazaar. The largely unregulated bazaars have so far survived the government's restrictions, with illegal currency traders providing the dollars that fund the smuggling of consumer items into the country. Outside of the bazaars, Tashkent is the fourth most expensive city in the world, and its modern **retail** complexes are reserved for the rich and for foreigners. Levi Strauss (United States) and Benetton (Italy) have outlets in both, and Sony (Japan) and Daewoo have large consumer electronics stores. Several other international retailers entered the market in the late 1990s, including Jahn International, and Nestle. Uzbekistan may have a future in imported consumer goods trade since it shares a border with all central Asian states and has the largest domestic population, making it a natural distribution center. Yet in 2000, most consumer goods were flowing into Uzbekistan illegally from its neighbors.

TOURISM. Uzbekistan has many important historic and cultural monuments in the medieval capitals of Samarkand, Bukhoro, and elsewhere. The lack of adequate facilities and high prices for western goods have prevented the development of any significant international tourism. No particular government plans in the area have been revealed.

INTERNATIONAL TRADE

The Uzbeki policy of self-sufficiency prevents active international trade. The country exports cotton, gold, natural gas, mineral fertilizers, ferrous metals, textiles, foods, and automobiles; it imports machinery and equipment, chemicals, metals, and foods. Russia is Uzbekistan's principal trade partner, responsible for 53 percent of volume (1999). Russian imports include machinery and tools, metals, chemicals, pharmaceuticals, paper and lumber, and grains; exports to Russia include raw cotton (70 percent of all Russian imports in 1999), metals, chemicals, and farm products. There were about 250 Russo-Uzbekistani joint ventures in 2000. Other major export destinations included Switzerland (10 percent), the United Kingdom (10 percent), Belgium (4 percent),

Kazakhstan (4 percent), and Tajikistan (4 percent) in 1998. Imports to Uzbekistan originated from South Korea (11 percent), Germany (8 percent), the United States (7 percent), Turkey (6 percent), and Kazakhstan (5 percent) in 1998. Uzbekistan has a large current-account deficit and the ratio of external debt to exports in 1999 was 96 percent. With a more precise account of exchange rates, however, it might be as high as 137 percent.

MONEY

Despite government pledges that in 2000 the sum would be convertible (freely exchangeable for foreign currencies at market rates), Uzbekistan continued to operate a system of administratively-set multiple exchange rates in 2001. These were used to protect import substitution industrialization, including a set commercial bank rate and an administratively set commercial exchange rate, which kept the sum at around 50 percent of the commercial bank rate. The **black market** is widely used. In December 2000 President Karimov said that convertibility would take 3 to 5 years, but he was pushed to take action when a default on the country's external debt was imminent because of a threatened halt to IMF funding. Uzbekistan is plagued by a hard currency shortage and has serious problems with servicing its debt. It was scheduled to make US$900 million of repayments in 2000.

The Tashkent Stock Exchange is 26 percent government-owned, and most of the stocks in companies that are listed are owned by the employees of those companies. Trade at the Tashkent Stock Exchange is predominantly conducted through **treasury bills** because they are considered a liquid and safe asset, despite the fact that yields are negative and the market is extremely small.

POVERTY AND WEALTH

Under the Soviet regime, Uzbekistan was arguably a land of economic equality, although among the poorest republics of the Soviet Union. The vast majority of the population was state-employed, no private initiative was allowed, and central funds were allocated comparatively equitably as free health care, higher education, pensions, and other benefits. The only exceptions of the modest standard of living were the *nomenklatura* (the communist party elite) and the organized crime and black market economy players. The market reforms in the 1990s generated new wealth for a limited number of entrepreneurs who were well connected to the government yet understood the economic hardships of everyday Uzbeki life. In 1995 the country's **Gini index** was 33.3, lower than that of the United States and the United Kingdom but higher than in most former communist countries. Due to the government's policies of protectionism and import substitution, unemployment is still a minor problem, but the loss-making state industries and struggling agricultural sector are no longer able to sustain the living standards of the 1980s. Monthly salaries in the state manufacturing sector reached as low as US$34 in 1994, and had increased only slightly by 2001. Inflation, at 29 percent in 1999, is also a concern. Many Uzbekistanis suffer from problems other than financial insolvency such as a poor health system, the lack of safe water, epidemics, and excessive soil pollution and desertification. These problems are most apparent in the intensely farmed river valleys, where almost two-thirds of the population are concentrated. On many occasions throughout the 1990s, the government has appealed to international organizations for aid in dealing with severe droughts. In particu-

lar, Karakalpakstan has been an environmental disaster area plagued by the drying up of the Aral Sea and unprecedented scarcity of water.

WORKING CONDITIONS

Uzbekistan is party to all major universal legal instruments on economic and social rights, the rights of the child, the right to equal compensation and collective bargaining, and the elimination of employment discrimination. Its **labor force** numbered 12 million in 1999, and official unemployment was low at 2.2 percent in 1995, but no data have been released since. The hidden unemployment figure, made up of workers who receive no pay from cash-stripped companies or who are put on mandatory leave, affected about 1 million people in the agricultural sector in 2000. State employees' wages increased by 36 percent in 1996 (from a US$34 monthly average in 1994) but remained among the lowest of the former Soviet republics. The government has tried to hold wages in check to prevent inflation, setting the minimum wage to 75 percent of a typical consumer's spending. Pay raises in both the state and **private sector** are limited to a maximum of 70 percent of the sector's increase in output and are subject to government approval. Labor unions are government controlled. Many labor practices are inefficient due to obsolete technology, lack of management skills, and import substitutions.

COUNTRY HISTORY AND ECONOMIC DEVELOPMENT

100s B.C. The territory that is now Uzbekistan becomes a part of the Silk Road, linking China with the Middle East and Europe.

600s A.D. Arab invaders conquer Uzbekistan and introduce Islam.

1300s. The land is ruled by the empire of Tamerlane. Samarqand becomes the capital in 1369. Nomadic Turkic tribes form the Uzbek confederation and start moving south into Uzbekistan.

1700s. The Kokand principality emerges in the Fergana Valley. The Turkic-speaking Karakalpaks in the Amu Darya delta are subjugated by the new khanate of Khiva. Feudal agricultural economy develops.

1850. Russian forces march on Kokand, Tashkent, Bukhoro, and Khiva and take them over by 1876. A modern commodity economy starts developing but many locals resent the non-Muslim administration and colonists.

1916. Burdened with Russian demands to aid in its World War I effort, the locals revolt against a military draft but are suppressed.

1917. The Bolsheviks seize power in Russia and establish new political divisions in central Asia ruled by local soviets (councils), which are opposed by guerrillas of the Action for National Liberation party (called *Basmachi* by the Russians).

1918. Southern central Asia, including part of Uzbekistan, is organized into the Turkistan Autonomous Soviet Socialist Republic (ASSR) within the Russian Soviet Federated Socialist Republic.

1919. The Uzbek Soviet Socialist Republic is carved out from Turkestan (with the Bukharan and the Khorezmian republics), officially becoming a republic of the Soviet Union in 1922.

1928. Land is collectivized into state farms.

1931. The Uzbek S.S.R. is enlarged with the addition of the Karakalpak ASSR.

1941. In World War II, many industries are relocated to Uzbekistan from the western regions of the Soviet Union. Many non-Uzbek nationals **immigrate** to the republic.

1960s. Excessive irrigation brings an ecological disaster in the Aral Sea basin.

1991. Uzbekistan declares independence from the Soviet Union and joins the new **Commonwealth of Independent States** (CIS). Presidential elections, in which most opposition groups are not allowed to participate, leave Islam Karimov—the incumbent president and former communist leader—in office. Karimov establishes an authoritarian regime, banning opposition parties and claiming that more democracy would render the country vulnerable to Islamic fundamentalism.

FUTURE TRENDS

With President Karimov firmly in office, Uzbekistan will likely be characterized by political stability, but the policy of import substitution and the lack of sufficient structural reform may further aggravate economic problems. Poor cotton crops and recurrent droughts may add to the crisis. If accompanied by economic crisis, the president's exaggerated security threats—particularly about Islamic groups—could contribute to the authoritarian character of the regime and lead towards further political violence.

Particularly troublesome will be the persistent inconvertibility of the sum, the lack of hard currency, and the growing external debt. The country will not be able to serve its financial obligations in the 21st century without IMF help, but the IMF requires the closure of many loss-making industrial enterprises that would be particularly difficult for the government to effect. Significant reforms were promised in 2000, and there were hints that some harmful old policies would be abandoned.

Growth in the former Soviet area, Uzbekistan's main export market, is expected to be robust, but a weakening global economy in 2001 will restrain growth because of its impact on key commodity prices, especially of cotton and gold. Due to its natural wealth and strategic location, Uzbekistan has significant growth prospects once it implements market reforms and controls environmental hazards.

DEPENDENCIES

Uzbekistan has no territories or colonies.

VANUATU

Republic of Vanuatu
République de Vanuatu
Ripablik blong Vanuatu

CAPITAL: Port Vila.

MONETARY UNIT: Vatu (VT). There are coins of 1, 2, 5, 10, 20, 50 and 100 vatu and notes of 500, 1,000 and 5,000 vatu. One vatu equals 100 centimes, although there are no centime coins still in circulation.

CHIEF EXPORTS: Copra, beef, cocoa, coffee, timber, kava, squash.

CHIEF IMPORTS: Food, machinery and equipment, fuels.

GROSS DOMESTIC PRODUCT: US$245 million (1999 est.).

BALANCE OF TRADE: **Exports:** US$33.8 million (1998 est.). **Imports:** US$76.2 million (1998 est.).

COUNTRY OVERVIEW

LOCATION AND SIZE. Vanuatu is located in Oceania, about 2,000 kilometers (1,243 miles) to the northeast of Australia, to the south of Solomon Islands, and north of New Caledonia. It consists of a group of more than 80 islands with a land area of 14,760 square kilometers (5,699 square miles) (slightly larger than the state of Connecticut) and a coastline of 2,528 kilometers (1,570 miles).

POPULATION. The population of Vanuatu was estimated at 199,800 in mid-2000, an increase of 3.4 percent from the 1999 census population of 193,219. In 2000, the birth rate was 36.0 per 1,000 while the death rate stood at 6.2 per 1,000. With a projected annual population growth rate of 3.0 percent between 2000 and 2010, the population is expected to reach 267,600 by 2010 and to double in 23 years.

About 94 percent of the population are Melanesian by origin, made up of about 100 different cultural groups. A further 4 percent is French, and there are small but significant populations of Vietnamese and Chinese.

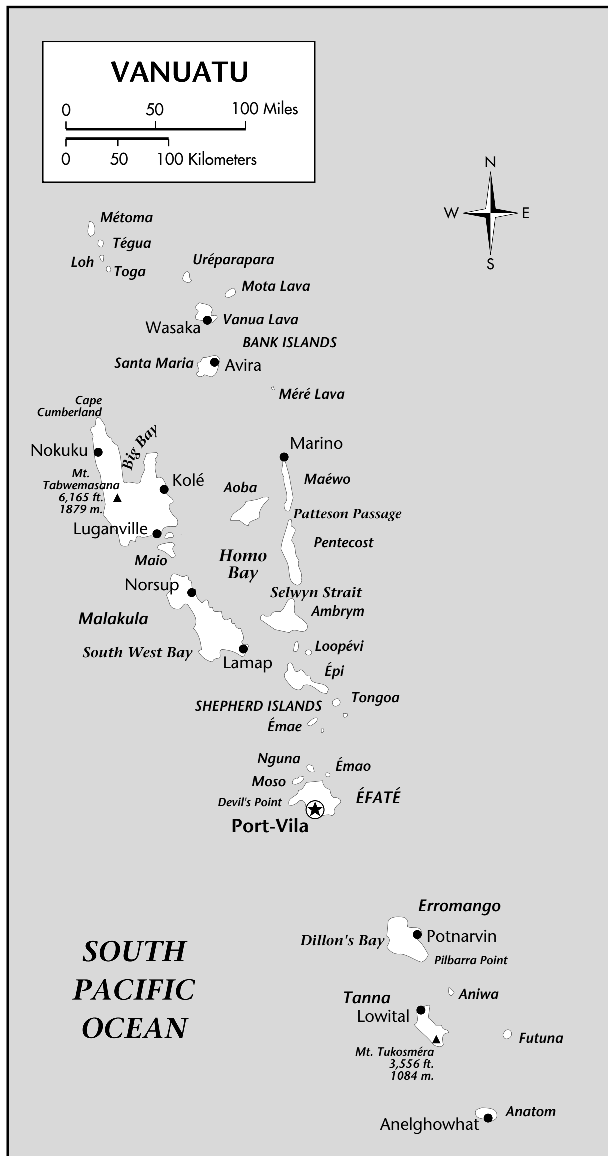
With a high total fertility rate of 5.3, the population is very young, with about 37 percent under the age of 15 and only about 3 percent over 65 years. This is a result of both the high birth rate and a relatively low life expectancy. The majority of the population is rural, with only 21 percent of the people living in urban areas. However, the urban growth rate is about 50 percent higher than the total growth rate, and this growth is mainly centered on the 2 largest urban centers, Port Vila and Luganville.

OVERVIEW OF ECONOMY

Lying in the Western Pacific Ocean, Vanuatu is made up of a chain of islands with diverse physical characteristics and economic potential. The islands range from small coral atolls to relatively large islands of volcanic origin. Nearly 80 percent of the population of Vanuatu live in villages, so subsistence production of food, housing, and other items is the mainstay of the household economy. Most households also participate in some cash production, mainly of agricultural products such as copra (dried coconut flesh), cocoa, and coffee. Recently, new items that have entered the village cash economy, and which are of relatively high value, are kava and squash.

The formal economy of Vanuatu is based mainly on agricultural products and services. Copra and coconut oil are produced on large-scale plantations as well as in the villages. Coconut plantations often have cattle as well. Other products common to the village economy are also produced in plantations, in particular cocoa and coffee. Fishing supplies the internal market and is also a source of export income.

Vanuatu regularly has a negative **balance of trade**, and this is balanced by the services sector. Tourism has been growing steadily in recent years, partly because of heavy promotion in nearby countries such as Australia



and New Zealand. Another significant source of employment and government revenues is the Offshore Financial Centre (OFC), which provides a **tax haven** for **offshore banks**, trust companies, insurance companies, and shipping companies.

International aid accounts for about 35 percent of GDP and development expenditure since independence in 1980 has been mainly financed by aid. Australia is the largest aid donor, followed by Asian Development Bank, France, Japan, and New Zealand.

POLITICS, GOVERNMENT, AND TAXATION

During the colonial period from 1906 to 1980, Vanuatu, then known as the New Hebrides, had the distinction of being ruled by 2 colonial powers, Great Britain and France. This "condominium" arrangement has sometimes been termed "pandemonium" since there were 2 systems of administration, education, and courts. Furthermore, in addition to the 2 colonial languages of English and French, inhabitants spoke one or more of about 100 indigenous languages. For most ni-Vanuatu (people of Vanuatu) the only effective language of communication was, and is, Bislama (a kind of Pidgin which has strong elements of English vocabulary and Melanesian grammar).

After obtaining independence from Great Britain and France in 1980, dual systems continued to operate in some contexts, especially education. Systems of administration, courts, etc. were combined, but still operated in at least 2 languages. The country adopted a republican system, with a president as head of state (elected by an electoral college of parliament and regional council presidents), and a prime minister selected by a parliament of 52 members elected by universal suffrage of all citizens aged 18 and over. A considerable number of political parties have formed and reformed since independence, but in most cases they are based on the colonial language split, either being Anglophone (English-speaking) or Francophone (French-speaking) parties.

The primarily Anglophone Vanua'aku Party, with Father Walter Lini as prime minister, held power from 1980 to 1991, when parliament voted him out in a no-confidence motion. Subsequently, Francophone parties, usually in coalition, have tended to form the governments. In the late 1990s, there was a great deal of political turmoil as governments changed and various political leaders were accused of corruption. In early 2001, Barak Sope, an English speaker, was selected as prime minister of a coalition government. Following much political turmoil in the late 1990s, the English-French divide appeared to be less important, as coalitions were sometimes forged across languages.

Local government is administered by 6 regional councils, and there are municipal councils in the 2 urban areas of Port Vila and Luganville. Authority over matters of tradition is held by *malvatumauri* (national council of chiefs) who are elected by district councils. These chiefs usually represent land-holding groups. As in many parts of Melanesia, they do not necessarily gain their position by inheritance but rather through skill in achieving economic and political power at the local level.

There is no corporate or personal **income tax** in Vanuatu. Import taxes accounted for 66 percent of all tax revenues in the country in 1997. There are also export **tariffs** that account for most of the other tax revenues. Application for membership in the World Trade Organization (WTO) means that in the future, these trade taxes will have to be progressively reduced. This means other types of tax may have to be imposed, according to David Ambrose and Savenaca Siwatibau in the *Pacific Economic Bulletin.*

INFRASTRUCTURE, POWER, AND COMMUNICATIONS

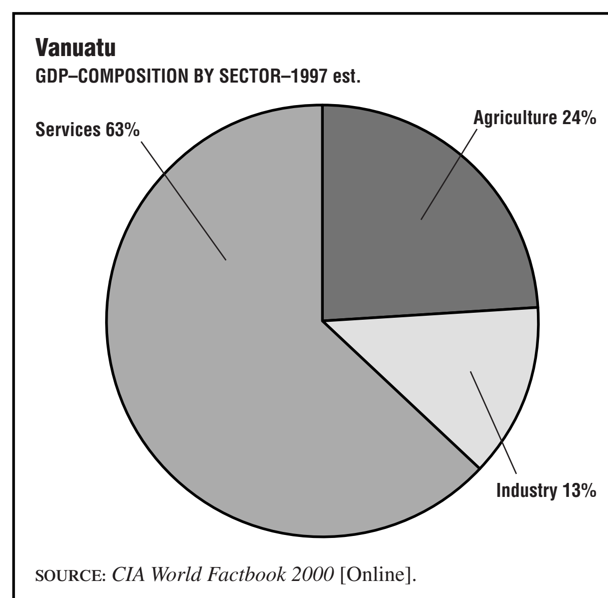
Because of the numerous islands in the country, the main internal transport linkages are by sea and air. The islands are served by a number of government and private passenger and cargo ships, although they do not usually run on a schedule and are not much cheaper than flying. International sea linkages are well served by shipping lines from Australia, New Zealand, and Asia. However, because Vanuatu is a flag of convenience registry, there were 78 vessels (some very large) from 15 different countries registered in Vanuatu in 1998. Most of these are not seen in Vanuatu waters.

Internal air services are provided by the government-owned Vanair, which flies to 29 destinations within the country. International air services link neighboring Pacific states including Fiji, New Caledonia, and Solomon Islands and most longer distance air linkages are routed through Brisbane, Australia, and Nadi, Fiji. The national airline Air Vanuatu flies to Sydney, Brisbane, Melbourne, Auckland, and Nadi. Within the country there are 32 airports, 2 of which have paved runways, but nearly all international traffic is channeled through Port Vila.

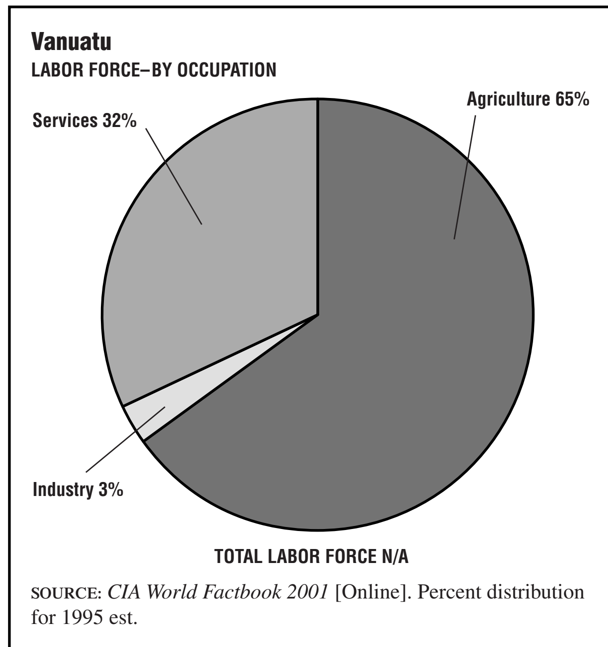
Electricity is mainly concentrated in the towns and is generated exclusively using imported fuels. Similarly, telephone services are mainly available in towns, and communication with rural areas is generally by 2-way radio or radio bulletins on the government-owned radio station.

ECONOMIC SECTORS

In 1999, agriculture contributed 25.7 percent of Vanuatu's **gross domestic product** (GDP), while industry made up 14.0 percent and services contributed 60.4 percent of GDP. Some value is attributed to subsistence agriculture in the statistics for agriculture, and other significant contributors are copra production and beef production. Industry is mostly made up of small-scale manufacturing and construction. The large proportion of GDP that derives from services can be attributed to government employment, especially in education, as well as the tourism industry and offshore banking facilities. The only data available about the **labor force** in Vanuatu are from the 1989 census, and these are quite different from the GDP data (and 10 years older). Since the subsistence sector is such an important element in the economy, it was decided by Vanuatu's statistics department that "labor force" should include all workers, whether they were working for cash or not. Thus, the statistics show that about 75 percent of the labor force in 1989 was in agriculture, and this percent-



SOURCE: *CIA World Factbook 2000* [Online].



SOURCE: *CIA World Factbook 2001* [Online]. Percent distribution for 1995 est.

age includes all of those growing their own food for consumption as well as those selling crops and those working for wages on a plantation. Industry accounted for only 1.3 percent of the labor force, and services 23.9 percent; however, nearly all of those in industry and services were in the formal sector. Also, it is likely that these proportions will have increased during the 1990s, even when the subsistence component is included.

AGRICULTURE

The most recent economic data available show that agriculture, forestry and fishing contributed 25.7 percent of Vanuatu's GDP in 1999. Although a further breakdown is not available from that year, data from 1995 shows that subsistence agriculture made up about a third of this sector, forestry and logging another third, and the rest made up of commercial agriculture, particularly copra production and beef production.

According to the Asian Development Bank, agriculture is more important to the Vanuatu economy than it is to any other Pacific economy, since it does not have the mineral and forestry resources of Papua New Guinea or Solomon Islands, the manufacturing base of Fiji, the marine resources of Micronesia, or the **remittances** of Polynesia. Throughout Vanuatu, subsistence agriculture is the mainstay of the village economy, since 80 percent of the population lives in villages. Food crops produced include taro, yams, kumara (sweet potato), bananas, coconut, and a great range of fruit and vegetables.

The most important agricultural product, in terms of cash production in the villages and in terms of export, is copra. This is the dried flesh of coconuts, produced by individual households and on large-scale plantations. Production of copra is highly variable year to year depending on weather conditions and world prices, although a general downward trend in production is noticeable since the early 1980s. One explanation is that the price in real terms paid to producers has declined over this period.

In recent decades there has been an attempt to diversify the rural economy away from coconuts to a variety of crops. Much effort went into the promotion of cocoa during the 1980s, but this was not very successful. By the late 1990s, cocoa exports were still only a small fraction of the value of exported coconut products. There has also been considerable promotion of coffee, but this too has not been very successful.

After copra, the second most important agricultural product by value is beef. Vanuatu is the only significant beef exporter in the Pacific, and this accounted for about 10 percent of all exports by value in the late 1990s. Cattle are often raised under coconut trees and serve both as a source of income and as a means of keeping plantations clear of weeds. The main export markets for beef have been Japan and the neighboring countries of Melanesia.

Two other crops that have increased in value recently are kava and squash. Kava, which is made into a drink that induces relaxation and mild euphoria, is a traditional crop that has recently been commercialized. The establishment of kava bars in the towns has accelerated since the 1980s, and in the 1990s kava was being exported around the world, where it can often be found in drugstores. The success of Tonga in securing a niche in the Japanese squash market caused other Pacific nations to look at this as a potential new crop. Vanuatu was one of the first to start squash production, but it is too early to determine whether this will be a successful case of agricultural diversification.

Logging in Vanuatu has never been on the scale seen in the neighboring countries of Solomon Islands or Papua New Guinea. Nevertheless, in 1997 and 1998, timber was the second most important export by value, after copra. The logging industry has maintained a relatively small but steady rate of production for many years, and involves both foreign companies and village-based sawmills. A ban on the exports of whole logs was implemented in 1989. Although temporarily lifted in 1993, the ban has been quite successful in adding value to the industry within the country by generating jobs in sawmilling and related activities.

Fish are an important food source in most parts of Vanuatu. However, commercial exploitation of fish is much less than in neighboring countries, considering the large area of ocean within Vanuatu's **Exclusive Eco-**

nomic Zone (EEZ). Fishing fleets based in the country in the 1960s and 1970s ceased operations in the 1980s after considerable losses. Thus, fish are not a significant source of export income. Vanuatu does, however, receive some income from royalties paid by offshore fleets fishing within its EEZ, especially Taiwanese and American. The catches of these offshore fleets are landed mainly in Fiji and American Samoa, so relatively little employment is generated within Vanuatu from these activities.

INDUSTRY

In 1999, industry made up 14 percent of GDP. Data from 4 years earlier showed that construction contributed about 48 percent of this sector. This contribution, however, varies considerably from year to year depending on new developments in the tourist sector and in private industry. Manufacturing made up 39 percent of the industry sector, and its contribution has been steady and slowly growing.

There was a manganese mine operating on the island of Efate in the 1960s and 1970s, but currently there is no significant mineral production. Nevertheless, there is much interest in the mineral possibilities of the country, since Vanuatu is similar geologically to Papua New Guinea and Solomon Islands, where gold and other minerals are currently being mined. In the mid-1990s, Australian aid allowed a countrywide survey of mineral potential, and following this, a number of exploration licenses were taken out by private companies.

Manufacturing is a relatively minor industry in Vanuatu, although in the late 1990s it contributed just over 5 percent of GDP. The most important manufacturing enterprises cater for the local market in areas such as food processing (especially meat), wood processing and construction materials. Most of the manufacturing is located in the capital, Port Vila, although small operations such as production of soap from coconut oil take place elsewhere. The growth of tourism has encouraged the production of traditional handicrafts.

SERVICES

The services sector is the largest broad economic sector in the Vanuatu economy, contributing 60.4 percent of GDP in 1999. The makeup of this sector is suggested by data from 1995, which showed that the most important service subsectors, in order, were wholesale and **retail** trade, government services, transport, storage and communication, finance and insurance, real estate, and hotels and restaurants. Although the last of these subsectors is mostly generated by tourism, a considerable amount of the income generated in other subsectors also relates to tourism. Specific amounts were not available.

The sector that is often thought to have the greater future potential in the Pacific is tourism, and it has been heavily promoted in Vanuatu in recent years. Visitor arrivals have doubled in the 2 decades since independence in 1980, rising from about 25,000 per year at that time to about 50,000 in the late 1990s. Tourism in Vanuatu is still a small industry compared to Fiji, but larger than neighboring Solomon Islands. The majority of tourists (about 60 percent) come from Australia, with smaller numbers from New Zealand and New Caledonia. So far, relatively few have come from the largest potential markets of Japan, North America, and Europe.

Tourism is largely focussed on the capital, Port Vila, on the island of Efate. There are several international standard hotels in Port Vila, but in the rest of the country tourist facilities are rare, despite the great potential of some islands. With over 100 indigenous cultural groups, one of the main attractions of Vanuatu is its cultural diversity, represented in different housing styles, dances, and artforms, especially carvings. There are also the typical Pacific attractions of beaches, diving and a tropical climate.

The national airline Air Vanuatu links Port Vila to Noumea, Brisbane, Sydney, Auckland, Nadi and Honiara, and other airlines serve the capital as well, including Air Pacific, Aircalin (New Caledonia) and Solomon Airlines.

Vanuatu is one of several tax havens in the South Pacific. The Offshore Financial Centre (OFC) was established in 1971 and has been maintained since independence. This provides a tax haven for offshore banks, trust companies, insurance companies, and shipping companies. It has been estimated that the OFC employs about 400 people. OFC pays registration fees to the government, which contribute about 2.5 percent of the overall gross domestic product, according to Ambrose and Siwatibau. Local banking services are provided by the National Bank of Vanuatu, ANZ (Australia New Zealand) Bank, Bank of Hawaii, and Westpac.

Like many Pacific countries, retail services are somewhat limited. In Port Vila there are medium-sized shops and supermarkets, but in most of the country there are only small shops with a very limited range of goods.

INTERNATIONAL TRADE

Vanuatu has a large imbalance in trade, with imports exceeding exports by 3 or 4 times. This imbalance is made up for by income from tourism, tax haven revenue, and international aid.

Copra has dominated Vanuatu's exports for many years; it made up 45 percent of all exports in the years 1995 to 1998. In those years, beef and timber were almost as equally important as each other, making up about

Trade (expressed in billions of US$): Vanuatu

	Exports	Imports
1975	.012	.040
1980	.036	.073
1985	.031	.070
1990	.019	.096
1995	.028	.095
1998	N/A	N/A

SOURCE: International Monetary Fund. *International Financial Statistics Yearbook 1999.*

12 percent each, while cocoa made up about 5 percent of all exports. For copra, timber, and cocoa, the processing countries of these products are significant; the 3 most important export destinations were Japan, Belgium, and Germany. Beef was mostly exported to the nearby countries of New Caledonia, Solomon Islands, and Fiji, and to more distant Japan.

The most important imports into Vanuatu are machines and transport equipment, foodstuffs, basic manufactures, and fuels. Japan is the most important source of imports, accounting for about half of these in value. Australia is the next major source of imports, especially for food and certain types of manufactures, followed by United States, Singapore, and New Zealand.

MONEY

In the period since 1982, the vatu has declined in value against the American dollar by about 40 percent. However, this is not as great a relative decline as experienced in many other Pacific countries. This may be because, despite a negative balance of trade, Vanuatu has a reasonably consistent source of foreign revenue coming from tourism and its tax haven activities. Also, the vatu is pegged against a group of currencies, and although these currencies are secret, it is believed that the most important are the Australian and U.S. dollars, with smaller weight given to the Japanese yen and French franc, according to the Asian Development Bank.

The Reserve Bank of Vanuatu has the usual functions of a central bank, including regulating the money supply, providing economic advice to the government, and general economic monitoring.

POVERTY AND WEALTH

A total of 174 countries are ranked in the United Nations Development Programme's (UNDP) *Human Development Report 2000* according to the Human Development Indicator (HDI), which measures a country's state of well-being using income, education, and health measures. The HDI rank for Vanuatu was 118, meaning that it was better off than many African countries, but was the third poorest country in the Pacific. **GDP per capita** in 1998 was US$1403, nearly twice as much as neighboring Solomon Islands but only about one-twentieth that of the United States.

While there is no adequate information on income distribution, partly because subsistence income is hard to measure, there is evidence that there are varying levels of well-being within the country. Another indicator developed by UNDP is the Human Poverty Index (HPI). It measures conditions for those worst off in a country, such as their health status, education level, access to health services, access to safe water, and malnutrition in children. While to a traveler in Vanuatu there appears to be a kind of "subsistence affluence" in most areas, the HPI suggests that Vanuatu is still a poor country, with the third lowest HPI in the Pacific, at a level similar to that of many of the poorest African countries. For example, illiteracy is estimated at 66 percent, about 23 percent of children under 5 are underweight, and about 20 percent of the population does not have access to adequate health services, according to the UNDP. However, since there is no poverty index in Vanuatu, it is not possible to determine how many people or households can be considered to be poor. The government has many different programs underway to try to overcome some of these problems, and often these are funded by international aid, especially in the areas of education and health.

WORKING CONDITIONS

The situation of the labor force is difficult to determine, due to a lack of recent data. Using Vanuatu's definition of labor force, the bulk of the adult population is said to be in the labor force, with most of these being involved in village agriculture. Most of those working in the wage and salary economy are located in Port Vila or Luganville, the 2 largest urban centers. At the time of the last census, the unemployment rate was calculated to be only 1 percent, although there appeared to be a great deal of **underemployment** involving people who were working only part time. As in most Pacific island nations, there is no unemployment benefit. The minimum wage was set at 16,000 vatu (US$140) per month in 1995, and this applied to both rural and urban employment. Earlier minimum wage levels had been lower in the rural sector, and it was felt by some that the rural minimum was above market rates and would inhibit job creation, according to the Asian Development Bank.

Workers in the formal sector are represented by at least 16 trade unions, generally organized according to industrial sector, but coordinated by the Vanuatu Council of Trade Unions.

COUNTRY HISTORY AND ECONOMIC DEVELOPMENT

1000 B.C. Evidence of human settlement on many islands.

1606 A.D. First European sighting of Vanuatu by Pedro Fernandez de Quiros, who founded an unsuccessful settlement on Espiritu Santo, the largest island in the Vanuatu group, and claimed the islands for Spain.

1768–89. Various European explorers—most commonly British and French—visit islands and introduce metal tools and weapons and new trade goods.

1825. Sandalwood trade starts, which accelerated trade even though the sandalwood resource was exhausted quickly.

1839. First Christian missionaries land; progress in conversion is slow, and some areas resist Christianity to the present day.

1864–1911. Labor recruitment for plantations in Fiji and Queensland, sometimes called "blackbirding."

1887. Condominium of New Hebrides established by French and British.

1940–41. New Hebrides joins Free French in WWII; Vila and Santo become American bases; Jon Frum movement starts proposing that Americans can deliver followers from missionaries and other Europeans.

1960s. Nagriamel, first political party, forms and demands independence and the return of some land.

1971. Tax haven established.

1980. Vanuatu granted independence; islands of Espiritu Santo and Tanna declare themselves independent under Nagriamel and Jon Frum movements; Britain and France refuse to take military action, so troops from Papua New Guinea defeat rebels and secure country for first prime minister, Walter Lini, leader of the Vanua'aku Party.

1982. Vanuatu declares itself nuclear free.

1991–2001. Series of coalition governments, often involving French-English party coalitions.

FUTURE TRENDS

In the late 1990s, much attention was being paid to the political struggles pitting one party against another. However, the party disputes tended to be based on regional and language interests rather than fundamental differences of opinion on economic policy. There was not much dynamism in the economy, with agricultural production and tourist numbers being relatively stable. In the future, the greatest hope appears to be held for tourism, since the country has many undeveloped possibilities. There is some potential for expansion in other sectors; for example, some localization in the fishing industry is possible, although these possibilities will depend to a great extent on a higher degree of political stability than has been seen recently. In terms of the development of human resources, especially in education and health, there will be an ongoing dependence on international aid.

DEPENDENCIES

Vanuatu has no territories or colonies.

VIETNAM

Socialist Republic of Vietnam
Cong Hoa Xa Hoi Chu Nghia Viet Nam

CAPITAL: Hanoi.

MONETARY UNIT: Vietnamese dong. One dong equals 10 hao and 100 xu. There are no coins in Vietnam. Only banknotes are used, and there are notes of 5,000, 10,000, 50,000, and 100,000 dong. While U.S. dollars are commonly accepted in Vietnam, the government policy is to foster the use of the local dong currency.

CHIEF EXPORTS: Crude oil, marine products, rice, coffee, rubber, tea, garments, and shoes.

CHIEF IMPORTS: Machinery and equipment, petroleum products, fertilizer, steel products, raw cotton, grain, cement, and motorcycles.

GROSS DOMESTIC PRODUCT: US$154.4 billion (2000 est.).

BALANCE OF TRADE: **Exports:** US$14.3 billion (2000 est.). **Imports:** US$15.2 billion (2000 est.).

COUNTRY OVERVIEW

LOCATION AND SIZE. Vietnam is bordered on the north by China and to the west by Laos and Cambodia. To the east is the South China Sea (called "Eastern Sea" by the Vietnamese). The country's shape and size is often compared to a bamboo pole with loads at the end (north and south). In the central part of the country Vietnam is only 40 kilometers (25 miles) across. The total land area of Vietnam is 329,569 square kilometers (127,247 square miles), making it slightly larger than New Mexico. It has a long coast of 3,444 kilometers (2,140 miles). Its 2 major cities are the capital Hanoi in the north and Ho Chi Minh City (formerly Saigon) in the south. Other major cities are the ancient capital of Hue in central Vietnam, the coastal cities of Danang and Haiphong, and Dalat in the central highlands.

POPULATION. Vietnam, in terms of population, is the second largest country in Southeast Asia after Indonesia. Its current population was estimated to be 79,939,014 in July 2001, making it the 13th largest country in the world. This compares with a population of 52,741,766 in 1979, 64,411,713 in 1989, and 75,355,200 in 1996. It has one of the higher population densities in the world, at 242.6 persons per square kilometer (628 per square mile). Vietnam has a little less than one-third of the population of the United States in an area that is only 3.5 percent as large.

The current population growth rate is estimated to be 1.45 percent (2001). If this growth rate were to persist into the future, the Vietnamese population would double to approximately 160 million by the year 2051. The Vietnamese woman on average currently has 2.49 children. In recent years, Vietnam has had considerable success in lowering both its population growth rate and fertility rate. Vietnam has a relatively young population with 32 percent of the population under 15.

The population of Vietnam has considerable diversity, with 54 ethnic nationalities. However, 85 to 90 percent of the population are Vietnamese. The second largest ethnic group is Sino-Vietnamese, concentrated in the Ho Chi Minh City area. Among the most numerous of other ethnic nationalities are the Tay-Thai Group (1,200,000), Khmer (1,000,000), Hmong (558,000), and the Cham (99,000).

OVERVIEW OF ECONOMY

Vietnam is one of the world's poorest countries, having suffered from years of war (1940–89) that damaged its economy and basic **infrastructure**. Thus, economic development is the nation's highest priority. It is still largely an agricultural economy, with 72 percent of its workforce engaged in that sector. Much of the country is made up of mountains and forests, with only 17 percent of its land arable.

Vietnam has a long history dating back to around 2879 B.C. when the first Viet state called Vān Lang was

founded. Later there was a state called Âu Lạc (257 B.C.-208 B.C.) and then a subsequent state called Nam Viêt (207 B.C.-39 A.D.). Almost 1,000 years of Chinese domination followed, until 939 A.D. when an independent Ngô Dynasty was established.

In terms of Vietnamese economic history, 5 themes are important. The first is the continual Vietnamese struggle to free itself from foreign domination, starting with roughly 1,000 years of Chinese rule, threats from the Mongols, and then external domination by the French, Japanese, and the United States. The second theme is the struggle against natural disasters such as floods and typhoons. Reflective of this struggle are the huge dikes protecting the capital, Hanoi, from possible flooding by the Red River. A third theme is *nam tiên* (expansion to the south), the need for additional land and territory, given the high population density of Vietnam. Through this process the Vietnamese moved south over time and took over lands which were once part of the Kingdom of Champa (1471) and the area of what is now southern Vietnam was once part of the Khmer Empire. Thus, the Vietnamese came to control both the rich Red River delta in the north and the Mekong River Delta in the south.

A fourth theme relates to Chinese cultural and intellectual influences, particularly in the cities. Close to 1,000 years of Chinese domination left an indelible influence on Vietnam, its culture, customs, and language. This influence has direct relevance to Vietnamese education and potential for human resource development. Unlike its Southeast Asian neighbors such as Thailand, Cambodia, and Laos, Vietnam is part of the Confucian world, as are Japan, Korea, and Singapore. Part of this cultural heritage is the great importance attached to learning and special respect for teachers, scholars, and mentors. A fifth theme is the importance of village life as the heart of Vietnamese culture and related wet rice cooperative culture. It is impossible to understand Vietnam without understanding its villages and their rich cultural traditions.

Vietnam historically had a royal system with imperial dynasties. The imperial capital of Vietnam was in central Vietnam in Hue. In 1858, France invaded Vietnam, capturing Saigon in 1861. By 1884 France controlled all of Vietnam, occupying 3 areas of the country known as Cochin-China (in the south), Annam (in the central region), and Tonkin (in the north). In 1887, France established the colony of Indochina, which included Vietnam, Cambodia, and Laos. Vietnam was the power center of the colony and the French trained the Vietnamese to help them administer the colony "backwaters" in Laos and Cambodia. The local populations in Laos and Cambodia both resented this practice. As in Cambodia, the French co-opted the imperial leaders and used them in their colonization process.

France's interest in Vietnam was economically motivated and the French thought that the Mekong River could be a gateway to the huge China market. Unfortunately, the Mekong turned out not to be a navigable river. To generate profits to run its Indochinese colony, the French introduced a plantation economy to facilitate rubber extraction and exports. Land alienation (transferring ownership to another) was the cornerstone of economic exploitation under the colonial government. The French also introduced **consumer goods** such as opium, alcohol, and cigarettes to generate revenues to support the running of their Vietnamese colony. The French film *Indochine* provides dramatic visual images of life (economic and social) during the French colonial period. Various rebellious movements against the French emerged and the

French were extremely harsh in punishing those Vietnamese for their disloyalty.

During the Second World War, Vietnamese nationalists and revolutionaries cooperated with the West in fighting against Japanese occupation. On December 2, 1945, nationalist leader Ho Chi Minh declared an independent Democratic Republic of Vietnam and was hoping for U.S. support of the new regime. Instead, the French decided to reassert their colonial authority in Vietnam, resulting in the first Indochina War from 1946 to 1954, which eventually led to the French defeat at Dien Bien Phu in May, 1954. The Geneva Accords of 1954 then resulted in Vietnam being temporarily divided into North and South Vietnam at the 17th parallel. The United States opposed 1956 national elections called for by the Geneva Accords, which could have led to the peaceful unification of Vietnam under the leadership of Ho Chi Minh. Instead the south-north division persisted and eventually the U.S. war in Vietnam ensued (1959–75) with tremendous destruction and loss of life in many areas of Vietnam. Vietnam was eventually unified with the "fall of Saigon" on April 30, 1975.

For its first eleven years after unification, Vietnam became a fully **socialist**, state-planned economy with agricultural collectivization. Its international economic relations were almost entirely with the Eastern bloc countries such as the USSR, which provided most of its economic assistance. In December 1979, the Vietnamese army invaded Cambodia to remove the hated Khmer Rouge regime, led by Pol Pot. For the next 10 years, the Vietnamese army became bogged down in Cambodia fighting the Khmer Rouge insurgents who retreated to the remote jungles of west and northwestern Cambodia. Vietnam's Cambodian adventure proved an adverse economic drag on the economy as well. Finally, Vietnam agreed to remove its troops from Cambodia in 1989 as part of a Cambodian peace process. Thus, the modern Vietnamese economy has really known only 12 years of peace, coming since the end of the Cambodian conflict in 1989.

In December 1986, at the Sixth National Party Congress, a new policy of *doi moi* (economic renovation) was introduced. This was a Vietnamese version of what the Soviets called *perestroika*. It basically used free-market mechanisms as a strategy to improve the economy and its productivity, and, in particular, to provide greater incentives for economic effort and performance. Prior to the introduction of this new economic policy, the economy was plagued by economic stagnation and excessive, triple-digit **inflation**. Vietnam's war-torn economy had multiple and extensive economic problems that required a fundamental rethinking of the economic system. Central to the economic renovation was also a commitment to reduce the large size of the state sector and state-owned-enterprises (SEOs). In 1988, the socialist cooperative method of agriculture was abandoned. While under the current economic system all land is still owned by the state, individuals can have long-term leases on land for their and their descendants' use.

With the new *doi moi* policy, the Vietnamese economy began to demonstrate impressive **macroeconomic** (economic system as a whole) performance in the 1990s. With the collapse of the USSR in 1991, Vietnam also opened its economy internationally, with dramatic increases in both international investments in Vietnam and international economic assistance. Still, a major stumbling block was the U.S. trade **embargo**, which was finally lifted in 1994. That was followed by Vietnam's joining the Association of Southeast Asian Nations (ASEAN) in 1995, and later the Asia-Pacific Economic Cooperation forum (APEC).

While the 1997 Asian economic crisis hurt the Vietnamese economy, the Vietnamese economy had much more immunity to this crisis than many neighboring economies, primarily because Vietnam did not have a stock market, nor an internationally traded currency. Also, rather than being part of the "Baht Zone" (areas with close economic interconnections with Thailand), Vietnam was partially a dollarized economy with strong economic links to greater China, an area showing greater currency stability during the Asian economic crisis.

Also, the 2001 global slump in the high technology sector has had minimal impact on Vietnam since it is producing more basic manufacturing/industrial products at the lower end of the technology scale, such as garments and footwear. Thus, Vietnam in 2001 had one of the highest economic growth rates (7.1 percent) in the world. In October 2001, the U.S. Congress finally approved the bilateral trade bill with Vietnam. This provides an important new opening for Vietnam to export to the large U.S. market and eventually to join the World Trade Organization (WTO). Vietnam has suggested the goal of becoming an industrialized country by the year 2020.

POLITICS, GOVERNMENT, AND TAXATION

Vietnam remains a one-party state with complete domination by the **Communist** Party of Vietnam (CPV). Vietnam has a **unicameral** National Assembly whose 450 members are elected every 5 years. As in neighboring Laos, non-party members may compete for seats in the National Assembly. In the last election for the National Assembly in 1997, 92 percent of those elected were CPV members. Economic policies are primarily determined by the Party Politburo, Central Committee of the Party, Party Congresses (every 5 years), and the National Assembly. Some argue that debates within these bodies represent a diverse spectrum of views and perspectives

that may even be broader than within the United States' own two-party Congress, where both parties are often fairly close in terms of basic ideology. With Vietnam trying to maintain a socialist political system and an increasingly capitalistic economic system, there is considerable space for divergence of policy perspectives, particularly with respect to how fast economic reforms should proceed.

As an example of an area in which government policy has changed in accord with the *doi moi* policy in the 1990s, the government opened the door for **privatization** in the higher education sector. The government realized that it did not have the economic resources to meet the growing social demand for higher education. The result was the emergence of a number of private universities. As of 2001, 82,902 students (approximately 8.9 percent of all Vietnamese college students) were studying in private universities or colleges.

Most of the government's tax revenues come from the following: sales tax (60 percent), taxes on profits (20 percent), license fees (10 percent), and property taxes (6.5 percent). Tax collection among non-state enterprises tends to be rather small. In Vietnam, local governments lack the capability to raise revenue through taxes. The customs department collects import-export taxes and the General Taxation Department (GTD) collects other taxes through its branches in the various provinces and districts of the country. Local governments are allowed to keep taxes collected in excess of specified targets. This provides an excellent incentive for local authorities to enforce tax collections.

INFRASTRUCTURE, POWER, AND COMMUNICATIONS

As the result of years of war, Vietnam's infrastructure is weak, but steadily improving. In the French colonial period, a 1,730-kilometer (1,075-mile) rail system was developed which connected Saigon to Hanoi, and the port city of Haiphong to Yunnan, China. Later in the 1950s, the Chinese assisted with the development of a rail link between Hanoi and Guangxi Province in China. All of these lines were badly damaged during the wars. Total railway length is 2,652 kilometers (1,650 miles), and many tracks need renovation. In 1999, it took 32 hours to travel by rail from Hanoi to Ho Chi Minh City. Vietnam has 93,300 kilometers (57,977 miles) of highways, 25 percent of which are paved. However, many of the paved roads are in poor condition. Notable improvements have occurred in recent years. For example, there is now an excellent highway from Hanoi to the International Airport and the road from Hanoi to Haiphong and Ha Long Bay is being steadily improved, as is Highway Number One, which links Hanoi and Ho Chi Minh City. A considerable amount of international economic assistance is being used to upgrade Vietnam's weak road infrastructure.

Vietnam's major ports are Haiphong (in the north), Da Nang (central region) and Ho Chi Minh City (in the south). To supplement these, additional ports have been developed at Cua Lo, Quy Nhon, and Nha Trang. Vietnam has 2 international airports (Hanoi and Ho Chi Minh City) and 32 local airports. Travel to distant remote provinces is often done by air.

With Vietnam's rapid economic development in the 1990s, energy demand has been increasing at about 20 percent per year, frequently outstripping supplies of electricity. In 1999, Vietnam generated 22.985 billion kilowatt-hours (kWh) of electricity, of which 47.1 percent was from fossil fuels and 52.3 percent from hydroelectric power. In the future, Vietnam could import electricity from Laos, which has great hydroelectric potential.

While Vietnam's telecommunications system has steadily improved, it remains inadequate. There were only 2.6 million conventional phone lines in 2000 and 730,155 cellular phones for a population of approximately 80 million. Vietnam has 101 radio stations, 7 television stations, and 5 Internet service providers. It is estimated that there

are 8.2 million radios, 3.57 million televisions, and 121,000 Internet users in Vietnam in 2000. Internet service in Vietnam tends to be slow and expensive.

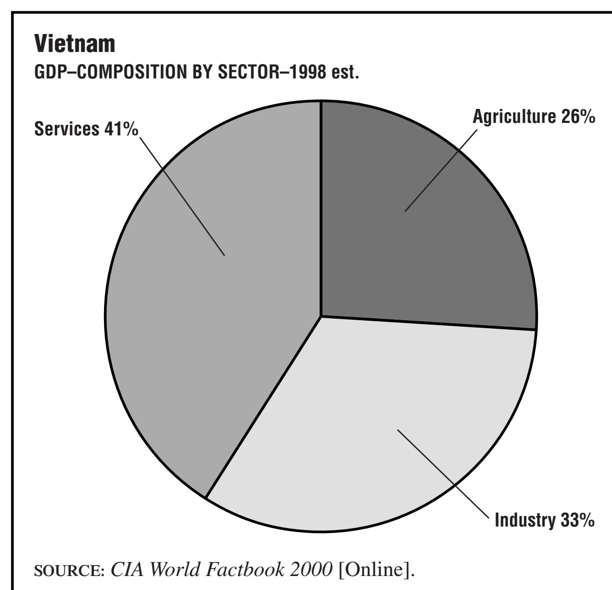
ECONOMIC SECTORS

The economic structure of Vietnam has changed a great deal since the end of warfare in the country in 1989, with agriculture declining in importance from 40.8 percent of GDP in 1989 to 27.1 percent in 1999. Industry has gained proportionally in importance, growing from a percentage contribution of GDP in 1989 of 22.9 percent to 36.7 percent in 1999. During this period, the contribution of the services sector remained virtually unchanged at 36 percent. The annual growth rates of these sectors show similar trends, with agricultural growth rates averaging 3.9 percent since 1995, while industrial sector growth rates averaged 11.4 percent over the same period. These changes reflect the impact of the *doi moi* economic renovation policy.

Despite these structural changes, Vietnam remains an agricultural economy in terms of employment. Around 72 percent of Vietnam's **labor force**, or approximately 28 million individuals, is engaged in agriculture.

With its *doi moi* reform policy and the goal of reducing the size of the **public sector**, as of the late 1990s the state sector employed only 9 percent of Vietnam's labor force of 39 million. In the industrial sector, about 25 percent of all employees were working in the state sector. In the commercial service sector, state employment consisted of only 13 percent of employment in 1997.

The Vietnamese service sector is comprised primarily of those in government work (including teachers), a growing modern **retail** trade sector, small-scale retail shops, a growing tourist industry, and an expanding finance/banking sector.



SOURCE: *CIA World Factbook 2000* [Online].

AGRICULTURE

Despite its limited amount of arable land, Vietnam's agricultural economy has demonstrated impressive success, particularly in the 15 years since the introduction of *doi moi.* The shift to the use of market mechanisms and price incentives contributed significantly to this success. Vietnam has not only achieved self-sufficiency in rice production, but is now a major global food exporter and is the world's third leading exporter of rice, competing actively with Thailand and the United States in this global market. Between 1988 and 1997, total food production in Vietnam increased 50 percent. This extraordinary agricultural success not only contributed positively to Vietnam's foreign exchange earnings, but also contributed to a reduction in the incidence of poverty.

In addition to rice, Vietnam has had success with other agricultural **cash crops**. In recent years Vietnam has become a major exporter of both groundnuts and cashew nuts. The export of cashew nuts in 1997 brought in US$125 million. Also, Vietnam has become Asia's second largest producer of robusta coffee, and coffee is now Vietnam's second leading agricultural export. Other important export crops are rubber and tea.

FISHING. With its long coastline, Vietnam has an active fishing sector. Most of its catch is marine fish (94 percent). Many of Vietnam's marine products are being exported to countries such as Japan, and marine products now represent 9.2 percent of Vietnam's total exports (in terms of value).

FORESTRY. Deforestation remains a major problem in Vietnam. In 1943, 44 percent of Vietnam was forests. By 1995, the forest area of Vietnam had declined to 23 percent. During the U.S. war in Vietnam, 5 percent of the forest was destroyed, and 50 percent was damaged. Deforestation has also been caused by uncontrolled logging, agricultural expansion caused by population growth, slash-and-burn agriculture, and the use of forest wood for firewood. To reverse this pattern of deforestation, the government has introduced 18 forest farming projects and a system of designated national parks.

INDUSTRY

During the colonial period, the French did not promote the development of Vietnamese industry in order to keep it from competing with their own industries. In the period following 1954, socialist northern Vietnam used a Soviet-type economic system emphasizing the development of Vietnamese heavy industry by the state sec-

tor. In the capitalist south, the emphasis was on the development of light industry such as the assembly of small-scale consumer goods. By the 1980s, a unified Vietnam was shifting to an emphasis on greater light industry to meet the basic needs of the population.

MANUFACTURING. The 1990s saw the emergence of Vietnam as a major player in 5 key manufacturing sectors: textiles, footwear and garments, agro-processing, electric and electronic industries, and automobile and motorcycle assembly. For example, Nike is now sourcing significant production of both footwear and apparel in Vietnam, and this has caused controversy related to alleged sweatshop conditions. On the improved road from Hanoi to Haiphong, there is a new Ford Motor Assembly plant; 45 different models of cars are now being assembled in Vietnam. Among the companies investing in car assembly production, in addition to Ford, are Mercedes-Benz, Toyota, Isuzu, Daihatsu, Suzuki, and several Korean auto companies. There are a total of 14 **joint ventures** in the emerging Vietnamese automobile industry. In Vietnam, there is a huge domestic market for motorcycles, the major mode of transportation for Vietnamese living in urban areas. Twenty percent of this huge demand is now being met by the local assembly. Vietnam's electronics assembly manufacturing sector also grew rapidly in the 1990s. Among the major international investors were Daewoo, Hitachi, and Phillips. The assembly of television sets almost tripled to a level of 364,000 in 1998.

Steel and cement production were also given high priority, primarily as a strategy for reducing or eliminating steel and cement imports. Another important new manufacturing area is plastics. Given its impressive oil and gas resources, this is a natural industry for Vietnam to develop.

ELECTRICITY. With Vietnam's rapid industrialization and urbanization, there has been a dramatic increase in energy needs. To respond to this need and to avoid frequent power shortages, Vietnam has completed a number of hydroelectric power projects to generate increased electricity. Among the new power stations and plants are Ba Ria-Vung Tau, Da Nhim, Tri An, Hoa Binh, YALY, and Thamco. Many of these are in the south, to serve the growing manufacturing sector in the Ho Chi Minh/Saigon area. The goal of the government is to achieve a generating capacity of 33 billion kWh by 2002. The government also has a goal of providing electricity to 80 percent of rural households by the year 2005.

MINING. Mineral resources were a major factor attracting the French to Vietnam. Vietnam has commercially viable reserves of coal, iron ore, bauxite, chromite, copper, titanium, zinc, gold, apatite, and gemstones. However, other than coal many are underexploited. In 1996, Vietnamese coal exports were worth US$115 million. Vietnam also mines unrefined salt and phosphate rock.

OIL AND NATURAL GAS. Vietnam has now become a player in the international petroleum industry. In 1998, its petroleum exports were worth US$2.1 billion. It has potentially huge offshore oil and natural gas deposits in the South China Sea (known in Vietnam as the Eastern Sea), many of which remain unexplored. Though the international Law of the Sea has articulated elaborate rules for determining claims to the natural resources of the oceans, numerous disputed island groups in the South China Sea (such as the Spratlys) have led to considerable controversy. Nations such as Vietnam, China, Brunei, the Philippines, and Taiwan claim rights to these vast reserves of oil and natural gas. Several international oil companies are active in Vietnam, trying to profit from the nation's oil wealth. The Russians are active in this arena as well, in a joint venture with Vietnam, Vietsovpetro. Vietnam also plans to build oil refineries.

CONSTRUCTION. The 1990s has seen a construction boom in Vietnam in areas such as infrastructure (highway and bridge construction and renovation), hotel construction for the emerging tourist industry, office and apartment buildings for Vietnam's growing modern service sector, factory construction for the emerging manufacturing sector, and improved residential dwellings for occupancy or rent. Ho Chi Minh City now has many impressive, modern new high-rises. Also visible are many renovated and/or new Buddhist pagodas and Catholic churches, especially in the south. Funding for such religious projects has often come from **remittances** from overseas Vietnamese.

SERVICES

BANKING. Subsequent to the introduction of the doi moi economic reform in 1986, in 1988 financial reforms began. Spun off from the State Bank of Vietnam (the country's central bank) were 2 new commercial banks: the Agricultural Bank of Vietnam (VBA) and the Industrial and Commercial Bank of Vietnam. Prior to the economic reforms, most bank lending in Vietnam was to state-owned enterprises (SOEs). However, by 1995 38 percent of credit went to the non-state sector. The newly created Agricultural Bank took an active role in expanding credit to farm households, reaching approximately 7 million households in 1995. The government subsidized lending rates. The central bank also continues to subsidize state commercial banks. Technically, the central bank is responsible for monitoring all financial sector organizations, though its implementation of this mandate has been weak.

GOVERNMENT AND STATE ENTERPRISE EMPLOYMENT. Integral to the *doi moi* economic reforms was a downsizing of the government sector of the economy.

There has been, for example, considerable demobilization of the Vietnamese army, especially after the end of the Cambodian conflict. By 1991, state enterprise employment represented only 6.2 percent of all employment. After initially reducing the size of the state sector in terms of employment, this sector has leveled off, and this part of the economy no longer is an engine to generate new employment.

TOURISM. Vietnam has considerable tourism potential and in 1998 it had 1,520,100 visitors. The country features multiple attractions, including the historical sites related to the war, majestic Ha Long Bay in the north, the ancient imperial capital of Hue, the former seaport of Hoi-an, attractive beach resorts, adventure tourism in the remote northwest, and the delightful central highlands. A Vietnam-U.S. joint venture in Dalat has produced a world-class golf course and club in the center of Dalat. Vietnam's tourism infrastructure has improved significantly in recent years, with the building of many new hotels and the remodeling of others, such as the famous Continental Hotel in Saigon. The new roads to the International Airport in Hanoi and to Ha Long Bay also reflect the commitment to improve the tourism infrastructure.

Vietnam's tourism, however, is constrained by cumbersome visa requirements and an emphasis on the building of expensive up-scale hotels in both Hanoi and Ho Chi Minh City. Tourist development in the Vung Tau beach area near Saigon will work well for domestic tourism, but will not attract international tourists, since it is competing with destinations such as Bali and Phuket. An area of considerable potential is Vietnam's possible collaboration with Cambodia, Thailand, Laos, and Burma in promoting joint tourism. Visitors to majestic Angkor Wat in Cambodia, for example, could also include Vietnam in their itinerary, or visitors to the world heritage site at Ha Long Bay, could include Luang Prabang, Laos, in their itinerary.

RETAIL AND INFORMAL ECONOMY. In Vietnamese urban areas there has been a rapidly growing small-scale retail sector and large **informal economy**. Much of this sector involves the retail sale of a wide variety of consumer products and services. They range, for example, from the large and formal Saigon Bowl to vendors selling fruits and vegetables on the streets. It is common to even find barbers setting up shop on a sidewalk using a wall to hang their mirrors. Unfortunately, exact data are not available on the exact size and scope of the informal sector, but it is substantial and largely unmeasured.

INTERNATIONAL TRADE

Prior to the collapse of the Soviet Union, most of Vietnam's trade was with the former Soviet Union and Eastern European countries. Since 1991, the country's trade has diversified significantly. It has also expanded dramatically, reflecting an internationalization of the Vietnamese economy. In 1999, exports plus imports divided by GDP reached the level of 84.5 percent, a useful indicator for the level of internationalization of an economy.

Trade (expressed in millions of US$): Vietnam

	Exports	Imports
1994	4054	5825
1995	5448	8155
1996	7255	11144
1997	9184	11592
1998	9360	11494
1999	N/A	N/A

SOURCE: United Nations. *Monthly Bulletin of Statistics* (September 2000).

Though Vietnam has consistently had **trade deficits**, the amount has narrowed with the boom in Vietnamese exports. For example, in 1989 exports were only 73.7 percent of imports. In 1999, exports had risen to be 98.9 percent of imports. With the passage of the bilateral trade law with the United States in October 2001, and the granting of most-favored nation status to Vietnam, there is potential for Vietnam soon to become a net exporter with a positive trade balance.

In terms of value (stated in US$), Vietnam's leading exports from January to September 2000 were: crude oil (2,471.8 million); textiles and garments (1,355.4 million); marine products (1,017.7 million); rice (531.5 million); computers and computer parts (460 million); coffee (384.1 million); handicrafts (185.4 million); fruits and vegetables (149.4 million); pepper (137 million); and diverse other products (2,603.5 million). Leading imports for the same period were: machinery, equipment, and other small parts (1,793.6 million); petroleum products (1,472.4 million); textiles and leather materials (941.3 million); iron and steel (577.1 million); electronic parts (520.3 million); motorcycles and parts (478.3 million); fertilizers of all kinds (373 million); plastic products (359.8 million); fabrics (234.4 million); chemical products (225.1 million); and miscellaneous other imports (4,004.8 million).

In terms of trading partners, based on data for the same period Vietnam's leading export markets were: Japan (18 percent), China (9.7 percent), Australia (8 percent), Singapore (6.5 percent), the United States (5.3 percent), Taiwan (5.2 percent), Germany (5.0 percent), the Philippines (4.0 percent), the United Kingdom (3.4 percent), and the Netherlands (2.8 percent). These data clearly indicate how successful Vietnam has been in di-

versifying its export markets, which tends to minimize risk. In terms of imports, Vietnam purchased the most from the following countries: Singapore (18.8 percent), Japan (14.5 percent), Taiwan (12.4 percent), South Korea (11.6 percent), China (8.2 percent), Thailand (4.9 percent), Hong Kong (4.8 percent), the United States (2.6 percent), Malaysia (2.5 percent), and Indonesia (2.3 percent). Thus, in terms of trade deficit, Vietnam has the most important trade imbalances with Singapore, South Korea, Taiwan, Thailand, and Hong Kong. In terms of favorable trade balances, Vietnam is doing well with the United States, Germany, and the Philippines. Trade with Japan and China appears fairly balanced.

Despite Vietnam's trade expansion and its membership in ASEAN, the ASEAN Free Trade Area (AFTFA), and APEC, its trade regime remains restrictive by international standards. This policy is obviously a legacy of the system of central planning. With the final conclusion of the bilateral trade law with the United States in October, 2001, Vietnam is obliged to relax various economic restrictions and obstacles which should pave the way for Vietnam's entry to the World Trade Organization.

Related to Vietnam's **balance of payments**, the country was extremely fortunate to have Russia agree to forgive 85 percent of its US$11 billion debt, accumulated during the Soviet period. It is only necessary for Vietnam to pay Russia US$1.7 billion over the next 23 years with only 10 percent in **hard currency**, and the rest being commodities or other products. In 1999, Vietnam's total **external debt** was US$11.142 billion, according to the World Bank. Its **debt service** payments as a percent of its export earnings was a manageable 13.7 percent.

MONEY

The central bank is responsible for **monetary policy**. During recent years, its performance in terms of keeping inflation low and the currency relatively stable has been impressively successful. For example, the inflation rate for the year 2001 is estimated to be 0.6 percent. Inflation in Vietnam since 1996 has normally been around 5 percent or less and has not exceeded 10 percent. While the Vietnamese dong has dropped in value in recent years, the decreases have been much less than in other Southeast Asian countries such as Thailand, Laos, the Philippines, and Indonesia. In the last 7 years, the dong has declined by only a total of 32 percent, from 11,000 dong to the dollar in 1994 to 14,530 dong to the dollar in January 2001.

POVERTY AND WEALTH

In 1999, average GNP per capita in Vietnam was only US$370, giving Vietnam the rank of 170th in the world on this indicator. This statistic, however, is quite misleading, since it does not reflect differential costs of living in different countries and societies. It is much more meaningful to think in terms of GNP per capita being 5,365,000 dong and then to assess what can be purchased locally with that amount of income. The World Bank has made such adjustments and the estimated **GDP per capita** (in terms of **purchasing power parity**) is a much higher $1,950. In 1998, it was estimated that 37 percent of the population was living below the poverty line, though this estimate seems too high and may not adequately reflect local purchasing power.

Rapid economic development in Vietnam has not been accompanied by worsening income distribution, as is common in many other countries at this stage of development. One reason for this outcome is the commitment of the government of Vietnam to target basic and key services to alleviate poverty, spread literacy, and improve health for individuals in all provinces in all areas of the country. A significant portion of revenues generated in the richer provinces are redistributed to poorer, more disadvantaged provinces. Such a policy reflects the government's commitment to prevent large regional disparities and social injustices. However, some researchers have found increasing gender inequality.

A major economic problem facing the Vietnamese economy is the large number of individuals who are unemployed or **underemployed**. This problem is exacerbated (made worse) by several factors: the improvement of agricultural productivity and limited land for expansion has driven farmers off the land; the reduction in the

size of the state sector; and Vietnam's historically rapid population growth rate and young population. Despite the excellent macroeconomic success of the economy in the 1990s, it is insufficient to generate adequate numbers of jobs for new entrants to the labor force. Also, over the next several years state-owned enterprises are expected to reduce employees as part of Vietnam's continuing economic reform process. In July 2001, a freeze on the establishment of new state companies was announced. The unemployment rate in 1995 was estimated to be an extremely high 25 percent. In 1996, an estimated 2 million rural residents migrated to the cities in search of employment (approximately 7 percent of the nation's workforce). The National Assembly has set a strategic target to create 1.4 million new jobs. The major source of new jobs will be from **private sector** development.

WORKING CONDITIONS

Vietnam has in place an extremely progressive national labor law which is designed to regulate working conditions. The major challenge is to ensure that the labor law is being properly and appropriately implemented. The high visibility of Nike, Inc., which decided to add Vietnam as an important site to source its production of footwear and apparel, generated considerable controversy in the United States, especially among activist labor rights groups such as the Workers' Rights Consortium. Accusations of sweatshop conditions and negligible pay were made by a number of journalists.

Actually, Nike's dynamic and creative marketing strategy has enabled the company to expand its production to a country that desperately needs expanded job opportunities. Unfortunately, the subcontractors (Korean and Taiwanese) producing for Nike in Vietnam were without question guilty in some instances of certain abuses and violated Vietnam's labor law. Managers found guilty of such abuses were deported. Though salaries in the Vietnamese garment, textile, and footwear factories are extremely low by U.S. standards, this additional income is often pooled in an extended family context and contributes importantly to families' economic welfare. With companies such as Nike active in Vietnam, in 1998 Vietnam was able to export US$1.4 billion worth of footwear overseas.

Those unable to find formal employment in the Vietnamese economy must seek income-generating activities in the informal economy. Conditions in the informal economy vary rather dramatically, depending on the activity involved. Some informal sector jobs provide individuals with far more freedom and independence than if they were working in a formal factory setting. In other instances, work in the informal economy can be rather humiliating, such as those involved in "begging" tourists to buy their souvenirs, for example. Unfortunately, an illegal commercial sex industry has emerged in Vietnam, especially in the Ho Chi Minh City area. Undereducated, unemployed women can be vulnerable to such an industry. Primarily as the result of the growth of this industry, it is estimated that approximately 100,000 Vietnamese have HIV/AIDS.

COUNTRY HISTORY AND ECONOMIC DEVELOPMENT

2879 B.C. Vān Lang becomes the first emperor of Vietnam, known as the Vān Lang Kingdom.

Household Consumption in PPP Terms

111 B.C. TO 939 A.D. Vietnam is under Chinese rule.

939. Vietnam becomes independent of China.

13TH CENTURY. Vietnam repels Mongol forces of Kublai Khan 3 times.

15TH CENTURY. Vietnam repels Ming China's attempt to control the country.

1801. The beginning of the unified reign of Emperor Gia Long, and the beginning of the Nguyen Dynasty.

1858. France begins its invasion of Vietnam, capturing Saigon in 1861. Eventually French control extends beyond Vietnam to all of Indochina.

1924. Vietnamese revolutionary Ho Chi Minh leaves for southern China where he establishes the first **Marxist** organization to promote revolution in Indochina.

1930. Formation of Indochinese Communist Party in Hong Kong.

1941. Ho, after extensive overseas travel, returns to Vietnam to establish the Viet Minh, a revolutionary organization.

1945. On 2 September, Ho announces the birth of Vietnam as an independent, unified nation.

1946–1954. Vietnam fights a war against the French, while the United States provides military and financial aid to the French. In 1954, the French are defeated at Dien Bien Phu by the Viet Minh. Vietnam is later divided at the 17th parallel into North and South Vietnam, with the United States providing aid to the pro-capitalist South Vietnam and opposing the communist North Vietnam.

1959–73. The American war in Vietnam begins, with the United States siding with South Vietnam against North Vietnam. The United States finally leaves the country in 1973.

1975. Following the fall/liberation of the South Vietnamese city of Saigon, the 2 Vietnams are united as the Socialist Republic of Viet Nam on 30 April.

1977. The Socialist Republic of Vietnam is admitted to the United Nations.

1978. Vietnam invades Cambodia and overthrows the Pol Pot regime, which leads to prolonged civil war in Cambodia between Pol Pot's Khmer Rouge forces and the Vietnamese-installed government in Phnom Penh, the capital of Cambodia.

1986. New *doi moi* economic policy calls for economic **liberalization** and the use of market forces and mechanisms.

1989. Vietnam withdraws its troops from Cambodia.

1994. The United States lifts its economic embargo against Vietnam.

1995. Vietnam is accepted as the 7th member of ASEAN.

1995. U.S. president Bill Clinton announces the normalization of relations with Vietnam. Clinton visits Vietnam in 2000.

2001. In October, a Bilateral Trade Agreement between the United States and Vietnam is approved by the U.S. Congress.

FUTURE TRENDS

There is considerable debate about the economic future of Vietnam. Pessimists focus on the country's inadequate physical infrastructure and its powerful state bureaucracy which makes doing business in Vietnam complex and difficult. They also point to persisting ambiguities in Vietnam's evolving legal structure and issues of corruption. These obstacles are normally more of an obstacle for those from the West than those from other Asian countries such as China, Taiwan, and Thailand.

In contrast, there are many reasons to be optimistic about Vietnam and its economic future. First, Vietnam has the good fortune of having access to Pacific ports and being strategically and centrally located near China, India, and Indonesia, all among the world's largest countries. These are potentially huge markets for possible Vietnamese exports.

Second, with its Confucian traditions, Vietnam has demonstrated a strong commitment to education and human resource development. The country's overall literacy rate is an impressively high 93.7 percent. Already, Vietnamese students are performing well in the Scientific Olympics in areas such as math and science. On several key educational indicators, Vietnam has equaled or surpassed Thailand, despite having a much weaker educational infrastructure. Vietnam may have the highest quality labor relative to cost of any country in the world.

Third, Vietnam shares a number of common characteristics with Japan and now seems in a number of ways similar to Japan during its post-war phase of development, though, of course, Vietnam does not have the industrial pre-war base that Japan had. Both countries had their infrastructures destroyed in war, and both were highly motivated to rebuild their societies and economies after suffering from war. The demographics of Japan and Vietnam are similar, with high population density and a relatively small portion of arable land, necessitating the ability to use limited space productively and creatively. Eventually Vietnam's population will be larger than that of Japan. Thus, like Japan it has important economies of scale and related people resources.

Fourth, Vietnam has excellent tourism potential which can be a valuable source of foreign exchange. It also benefits from substantial and increasing international remittances of overseas Vietnamese. Fifth, in fighting the Chinese, the French, and then the United States, the Vietnamese demonstrated impressive courage, determination, flexibility, and creativity. These traits bode well for the entrepreneurial potential of Vietnam.

Finally, the October 2001 approval by the U.S. Congress of a trade agreement between the 2 countries will provide Vietnam with greatly improved export access to the large U.S. market for a wide variety of products. Here there is also a parallel with the earlier economic history of Japan.

DEPENDENCIES

Vietnam has no territories or colonies.

YEMEN

Republic of Yemen
Al-Jumhuriyah al-Yamaniyah

CAPITAL: Sanaa.

MONETARY UNIT: Yemeni riyal (YR). One riyal equals 100 fils. There are coins of 1, 5, 10, 25, and 50 fils riyals, and notes of 1, 5, 10, 20, 50, and 100 riyals.

CHIEF EXPORTS: Crude oil, cotton, coffee, and dried and salted fish.

CHIEF IMPORTS: Food, live animals, machinery and equipment, and manufactured goods.

GROSS DOMESTIC PRODUCT: US$14.4 billion (purchasing power parity, 2000 est.).

BALANCE OF TRADE: **Exports:** US$4.2 billion (f.o.b., 2000). **Imports:** US$2.7 billion (f.o.b., 2000).

COUNTRY OVERVIEW

LOCATION AND SIZE. Yemen is located in the Middle East at the southern end of the Arabian Peninsula. The Arabian Sea, the Gulf of Aden, and the Red Sea bound its south and west. It is also bordered by Saudi Arabia to the north and Oman to the east. Yemen also includes the island of Socotra in the Indian Ocean, and the Kamaran group in the Red Sea. With an area of 527,970 square kilometers (203,849 square miles) and a coastline of 1,906 kilometers (1,184 miles), Yemen is slightly larger than twice the size of Wyoming. The capital city, Sanaa, is located in the west. Other major cities include Aden in the south and al-Hudaydah on the Red Sea coast.

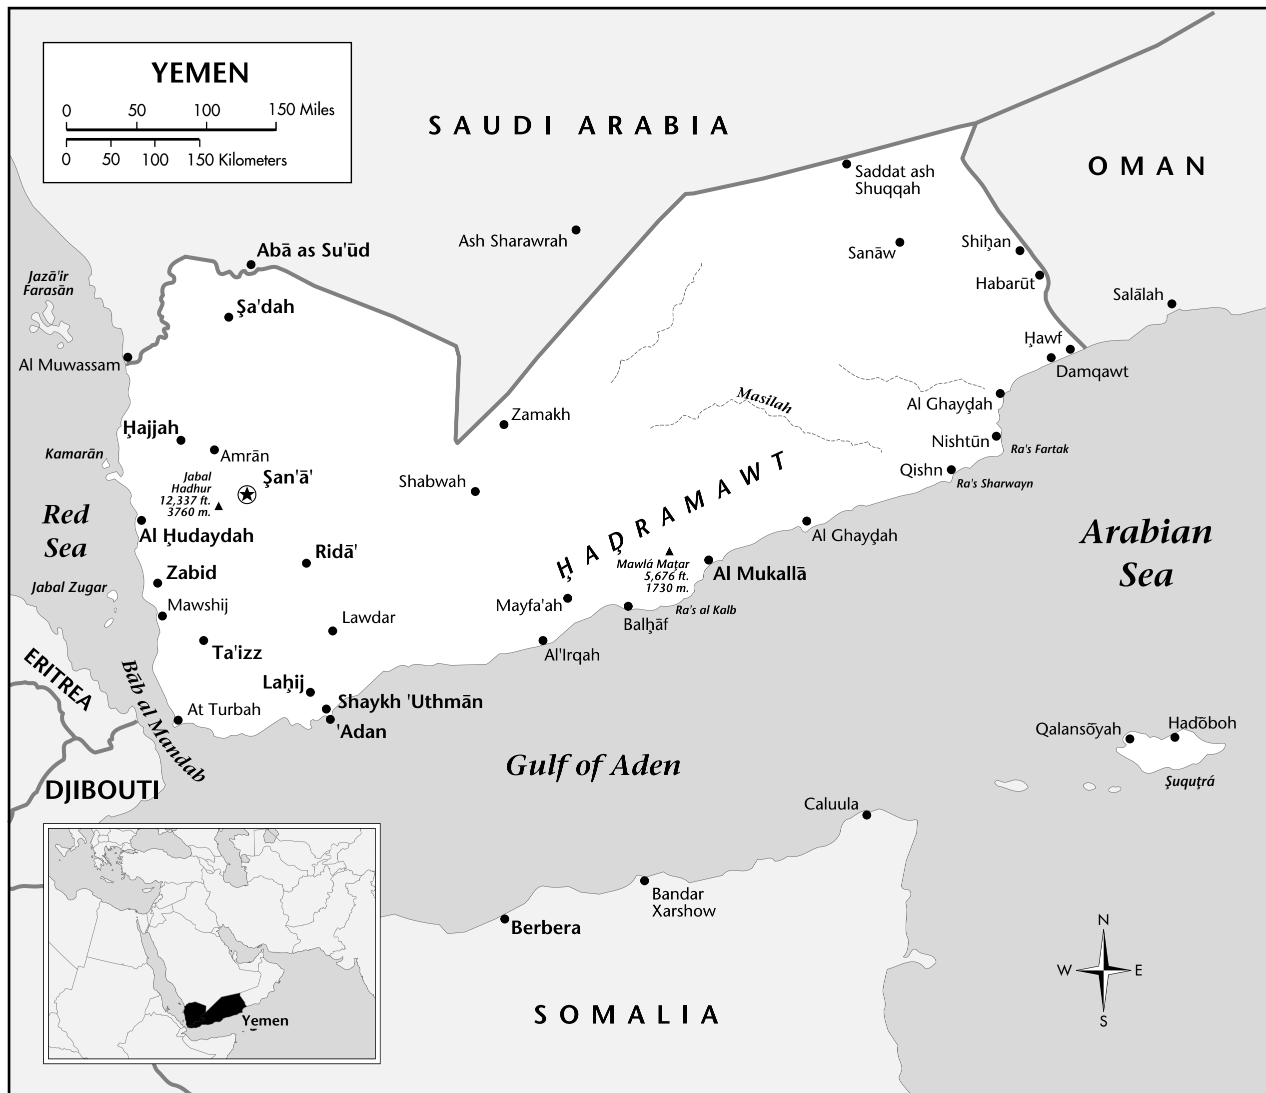
POPULATION. With a population of 18,078,035 (est. July 2001), Yemen is one of the most populous countries on the Arabian Peninsula. The 1990 population estimate was only 11.88 million. The population growth rate in 2000 was estimated at 3.36 percent, but is expected to drop significantly in the coming decade. With a projected growth rate of 2.8 percent between 2000 and 2015, the population is expected to reach 36 million by the year 2029. The majority of the population are Muslims of the Sunni Shaf'i and the Shi'ite Zaydi traditions. There is also a small minority of Jews and Christians.

Yemen's population growth is very high by world standards, and the highest in the Middle East. The population is generally young, with some 50 percent below the age of 15. About 25 percent of the population live below the poverty line, up from 19 percent in 1992, and the average annual income is less than US$400. Widespread malnutrition and diseases make the infant mortality rate in Yemen one of the highest in the region. An estimated 38 percent of Yemenis age 15 or older could read and write in 1990. Among women, the rate was only 26 percent.

OVERVIEW OF ECONOMY

Yemen's domestic economy is largely dependent on oil, which accounts for about 85 percent of export earnings and 75 percent of government revenue. Yemen's oil reserves, however, are small in comparison to its larger oil-producing neighbors, such as Saudi Arabia. Oil reserves are concentrated in the north and south, with the southern field of Masila being the largest, followed by the Ma'rib field, also in the south. Agriculture, the second largest sector, accounts for 20 percent of **real gross domestic product** (GDP) and employs over half of the **labor force**. Higher oil prices fueled GDP growth of 2.8 percent in 1999 and 6.0 percent in 2000, and that upward trend is expected to continue in the coming years, barring a drop in oil prices.

Yemen entered the 20th century as part of the Ottoman Empire, administered by officials appointed by the Ottoman sultan based in Istanbul. For most of the 20th century Yemen was divided into 2 separate states: South Yemen and North Yemen. South Yemen was carved out by the British, who had established a protectorate area



around the southern port of Aden in the 19th century. The British withdrew their forces from Aden in 1967. In 1970, when the government declared a **Marxist** state in the south, hundreds of thousands of Yemenis relocated to northern Yemen. North Yemen became an independent state in 1918, after the collapse of the Ottoman Empire.

In 1990, after years of hostilities and occasional conflict, north and south Yemen formally united to form the Republic of Yemen. Since unification, the country has struggled to overcome the legacy of the civil war that broke out between the north and the south in 1994, and to reform the economy. In 1995, Yemen launched an economic reform program in coordination with the International Monetary Fund (IMF). By the end of the 20th century, however, Yemen still had not created a vibrant economy or diversified its sources of income. As a result, Yemen remains dependent on oil revenue and on international lending agencies for financial assistance.

Yemen's economy is an underdeveloped free market economy with limited state control. Despite political violence, it has a fairly stable multiparty system and enjoys the support of the United States and the European Union. The economy's main exports are cotton, coffee, and dried and salted fish, but oil remains by far the largest single contributor to the national economy. Agricultural products account for one-fifth of GDP. Industry and mining, which are concentrated in Masila in the north and Ma'rib in the south, account for approximately one-fifth of GDP. Limited manufacturing, **retail** trade, and services are centered in the urban centers of Sanaa and Aden. Because of its limited productive capacity and industrial base, the country is heavily dependent on imported goods and on **foreign debt** relief and assistance to sustain its struggling economy.

Neither the agricultural sector nor the oil sector is capable of providing enough jobs to counteract long-stand-

ing problems with unemployment, which is exacerbated by rapid population growth. Unemployment reached 35 percent in Yemen during 1998, while the unemployment rate in the United States was just 4.2 percent in 1999. Despite the government's efforts to address the problem, unemployment will continue to present a serious challenge to the government for a long time to come.

Yemen's economic difficulties—sluggish GDP growth and high unemployment—have traditionally been offset by **remittances** from Yemeni workers abroad, and foreign aid from neighboring countries, especially Saudi Arabia. The Saudi government, however, both expelled Yemeni workers and cut off aid in 1990, due to Yemen's support for the Iraqi invasion of Kuwait that started the Gulf War. The country has also sustained a heavy foreign debt as a result of the 1990 unification, which, at its peak in 1990, was valued at almost twice the **gross national product**. Unable to make its debt payments, Yemen was forced to reschedule its debt to the Paris Club (a grouping of country creditors that extends loans to poor developing countries) in 1996. However, foreign assistance in the form of grants and loans, mainly from the United States and Europe, has alleviated the country's debt burden.

Corruption is a major problem in Yemen, and is especially so in the overstaffed and underpaid government bureaucracy. Chief illicit practices include soliciting bribes, evading taxes, and nepotism (favoring relatives, especially in hiring). The government has taken a tough stand against corruption, but with little success.

POLITICS, GOVERNMENT, AND TAXATION

Since independence, Yemen has been ruled by one party, the General People's Congress (GPC), which holds an absolute majority in parliament. The party is liberal and committed to reform. The emerging multiparty political system coexists with a feudal tribal system, and suffers from a legacy of deeply embedded rivalry between the north and the south. Until its unification with North Yemen, a Marxist-oriented government dominated South Yemen, and its economy was in ruins at the time of unification. For the first 3 years after unification in 1990, the country was governed by a transitional legal code under which the government was a hybrid of the pre-unification cabinets and parliaments of North and South Yemen. Before the 1994 civil war, the Marxist Yemeni Socialist Party ruled South Yemen. Its role diminished greatly after its leaders were sent into exile by the northern government as a pre-condition for peace.

Following the marginalization of the Socialist Party, the government was able to launch an economic reform program in 1995, which was formally endorsed by the IMF in 1997. The program stipulated deep spending cuts and the **privatization** of numerous state-owned facilities, including the National Bank of Yemen, the Yemen Cement Company, and Yemenia airlines, among other state-owned enterprises. It also aimed at keeping **inflation** levels low and encouraging foreign investment in the country. Although some progress has been achieved in the areas of cost-cutting and expanding the government's revenue base, the overall performance of the economy has been rather weak.

Taxes are an insignificant source of government revenue. As a result of the reform program, however, the government has attempted to improve its tax revenue collection system by computerizing its customs clearance at ports and airports. The government, however, has been largely reluctant to reform the **income tax** system in line with the IMF's recommendations. These efforts have been complicated by economic and political uncertainties, such as high unemployment rates, widespread poverty, and a high incidence of political violence. As a result, dependence on the oil sector for revenue is likely to persist.

INFRASTRUCTURE, POWER, AND COMMUNICATIONS

Yemen's **infrastructure** is relatively poor and underdeveloped. The country is serviced by a network of over 67,000 kilometers (41,634 miles) of primary and secondary roads, only 7,700 kilometers (4,785 miles) of which are paved. Southern Yemen's road system is in especially bad condition, as parts of many roads are washed away by flash floods and heavy rains. As a result, the country's road system constitutes a serious obstacle to economic development. There is no railway system.

Yemen has 5 major airports: the Sanaa, Aden, Rayyan, Taiz, and Hodeida airports. Renovation of the Sanaa and Aden airports began in 2000. Yemenia airline is the country's official airline and is largely protected against foreign competition. The carrier is slated for privatization, but the government has been reluctant to sell its 51 percent share in the airline. Yemen has 6 ports. With the exception of the Port of Aden, all ports experience delays in loading and unloading. Most domestic activity is concentrated at the Port of Hodeidah. Aden Container Terminal, which opened in March 1999 and is still being expanded, is gradually taking over as the country's main port.

Electrical power is supplied to Yemenis by the Public Electricity Corporation, which has a capacity of 400 Megawatts of power. The company can barely meet local demand; electricity reaches only 30 percent of the population. As a result of repeated blackouts and severe shortages—especially in Mukalla and Hadramawt, both

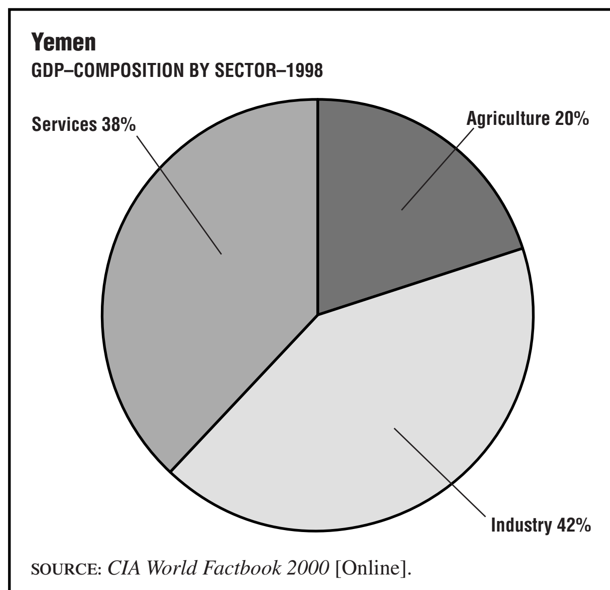
of which are not connected to the national grid—several factories and residences either have their own generators, or are forced to operate only one shift a day. The situation is worse in rural areas, where an estimated 60 percent of households have no electricity. The government has launched a program to upgrade and extend power supplies, largely with the help of the World Bank.

Telecommunications services in Yemen are unreliable. The country had 249,515 working lines in 1998, with a capacity of 296,129 lines. Telephone service, mobile included, is often interrupted for security reasons. Internet service is available, but is both costly and unreliable. In 2000, the country had just 1 Internet service provider for its 12,000 Internet users.

ECONOMIC SECTORS

Yemen's economic sectors reflect the small size of the economy. The 2 largest economic sectors are agriculture and oil. Agriculture accounted for 20 percent of GDP in 1998, industry (including oil) for 42 percent, and services for 38 percent. Oil accounts for 85 percent of export earnings and is the largest source of government revenue. Two of the greatest obstacles to growth in all of Yemen's economic sectors are overstaffing in all of the state institutions and the sensitivity of the oil sector to changes in world oil prices. Since 1995, the government has targeted certain areas of economic growth—especially the manufacturing and construction sectors—to fuel growth and to diversify the sources of revenue by investing in both the oil and non-oil sectors. Growth in these sectors, however, has been rather sluggish.



SOURCE: *CIA World Factbook 2000* [Online].

AGRICULTURE

Agricultural production is the single most important contributor to Yemen's economy, accounting for 20 percent of GDP. The agricultural sector provides approximately 58 percent of the country's employment. The labor-intensive sector is largely underdeveloped and inefficient, as a result of soil erosion, the high cost of credit and land, a lack of investment, and the scarcity of water. Most of the cultivated land is irrigated and dependent on groundwater, but high demand could exhaust water supplies by 2008. Although agricultural output has increased steadily in the past few years, crop yields remain low relative to those produced by comparable countries.

Major agricultural products include fruits, vegetables, and cereals, but production is rarely sufficient to meet domestic demand. As a result, Yemen continues to import most of its food. Yemen also cultivates qat, a mildly narcotic plant indigenous to Africa. Although legal, the government has recently moved to ban its consumption in public offices and on army duty due to economic and social costs associated with those under the influence. It continues to be widely consumed, and future efforts to ban it are unlikely.

FISHING. Though Yemen's location would suggest a booming fishing industry, actual fishing production re-

mains low, largely due to under-exploitation. Most fishing activity continues to center around small boats and family-owned businesses. The sector employs some 41,000 people and produced over 127,000 tons of fish catch in 1998. Yemeni fishing would likely benefit from regulation and effective enforcement to avoid the overfishing of some species.

INDUSTRY

MINING. Oil is a significant source of revenue for the government and of export earnings. Yemen's oil reserves, however, are small by regional standards. Oil reserves, proven and unproven, are estimated to be about 4 billion barrels, in comparison to Saudi Arabia, which has over 260 billion barrels of proven and unproven reserves. Most of the oil production is concentrated in the country's 2 largest fields at Ma'rib and Masila. There are also significant oil fields in Jannah, East Shabwa, and Iyad. Unlike neighboring Arab oil producing states, oil production is dominated by foreign companies. Several foreign companies, such as Hunt Oil Company (U.S.) and Canadian Occidental, enjoy production-sharing agreements, but Yemen's uncertain political atmosphere and dim oil prospects have limited the number of foreign companies interested in the oil sector. The sector's future lies in the successful exploration of new fields.

In addition to oil, Yemen's Ma'rib region is home to natural gas reserves estimated at 16.9 trillion cubic feet. Although small by regional standards, the gas is produced in commercial quantities, but competition and the lack of potential clients have thus far hindered the development of this endeavor. Other minerals include gypsum, salt, and gold.

MANUFACTURING. The manufacturing sector is an important and growing contributor to the Yemeni economy, accounting for about 12 percent of GDP in 1998. The sector has grown steadily in the last decade, but its growth is hindered by competition from imported goods and the lack of funding. Oil refining accounts for half of manufacturing activity. Refining activities are mostly concentrated in Aden and Ma'rib.

Yemen's small industrial base is built around small-sized, family-owned enterprises. Yemen has some 33,284 industrial establishments employing 1 to 4 workers. All large- and medium-sized establishments account for 5 percent of the total number of industrial enterprises. The bulk of Yemen's industrial base is centered on food processing and beverages, but production of cooking oil and flour has increased in recent years. The production of mixed metal products, such as water storage tanks, doors, and windows is the second largest industry, followed by the production of non-metallic products.

SERVICES

TOURISM. Tourism is not a significant contributor to Yemen's economy, despite the government's continuous effort to promote the country as a tourist destination. The sector suffers from a number of problems, foremost among which are political instability and the absence of modern facilities and infrastructure. Furthermore, at least 100 foreigners were reported kidnapped in 1999. Western countries have been advising their nationals against travel to Yemen since the 1998 abduction and killing of 18 foreigners. The number of tourists visiting the country dropped significantly after the 1998 incident, from 87,000 in 1987 to 45,000 in 1999.

FINANCIAL SERVICES. Yemen's banking system is poor and suffers from a number of problems, including a poor loan collection record, low bank monetary assets, and questionable policies regarding the extension of loans to clients. Despite government efforts to reform the financial sector by setting new standards for local banks in 1997, the sector continues to suffer from poor enforcement and compliance, a weak judicial system to ensure collection, and a general lack of public trust in the banking system as a whole. Furthermore, the government's efforts to sell its 2 major commercial banks have been rather slow, mainly due to the long preparation time required to bring these banks up to standard for sale.

Both public and private banks operate in Yemen. Both state-owned commercial banks and 3 of the 12 private banks follow Islamic banking practices, which includes not charging interest on loans. There are also 4 foreign-operated banks. Banking facilities are virtually absent in rural areas, and most loans are extended to well-known businessmen or on the basis of personal connections, making it hard for independent entrepreneurs to access funding.

RETAIL. Yemen lacks well-developed commercial centers—even in the larger coastal cities—and, therefore, has a poorly developed retail sector. The majority of shops in major cities are small and family-owned and run. Small family shops and temporary road stands characterize this sector in the majority of inland towns.

INTERNATIONAL TRADE

Over the past several decades, Yemen has relied more and more on imports, but, despite periodic peaks in the amount of imports, Yemen's oil exports have kept its trade balance positive. In 2000, exports stood at US$4.2 billion, while imports were worth US$2.7 billion. In addition to legitimate trade, the smuggling of firearms, alcohol, and **consumer goods** to and from Saudi Arabia is rampant on the Red Sea. Yemen im-

ports a wide variety of goods, except oil and oil products. Neighboring Gulf countries, mainly Saudi Arabia and the United Arab Emirates, supply the majority of Yemen's imports, followed by France, the United States, and Italy.

Oil accounts for over 85 percent of total sales abroad. Non-oil exports include semi-processed agricultural products, mostly foods. Given its weak industrial base, oil is expected to remain the country's major export. Sales of liquefied natural gas are expected to surge, but the prospects for that eventuality are far from certain. Yemen exports the majority of its oil to Asia, especially Thailand, China, South Korea, and Singapore.

MONEY

Since 1996, the government has allowed the value of the Yemeni riyal to float—meaning its value is determined by supply and demand, not by the government. Before 1996, the government officially set the price, which led to it being widely sold on the **black market**. The riyal was devalued in 1996 from YR12 per US$1 to YR50 per US$1. Since 1996, the value has fluctuated sharply. Between 1996 and 1997, the value of the riyal remained stable, selling for an average of YR125 per US$1 for most of that period. Since 1998, however, the value of the riyal has declined steadily, mainly due to rising fears about Yemen's increasing foreign debt and **budget deficit**. As a result, the riyal traded at YR170 per US$1 in mid-1999. The Central Bank's efforts to keep the value at a stable rate since then have been largely successful. Since late 1999, it has been trading at an average of YR160 per US$1.

POVERTY AND WEALTH

With a per capita income of US$254 annually, Yemen is by far the poorest country in the region. Living standards in the country have fallen sharply since 1990 as a result of high inflation, which in 1995 peaked at 56.3 percent. Although inflation dropped to 10 percent in 2000, the value of wages also decreased, forcing Yemenis to spend more than half their income on food and beverages and limiting their ability to purchase imported goods. An estimated 25 percent of the population lived below the poverty line in 1997, up from 19 percent in 1992.

WORKING CONDITIONS

Yemen's poor education system has meant that the majority of Yemen's labor force is unskilled. About 62 percent of Yemeni adults are unable to read and write. This problem is aggravated by the fact that the majority of Yemen's labor force is concentrated in the agricultural sector, in jobs that do not require advanced skills. The unemployment rate in the country is quite high by regional and international standards, reaching 35 percent in 1998. Local training programs are also poor by regional standards, and job opportunities for graduates of local universities are limited. As a result, thousands of skilled and semi-skilled laborers are forced to seek employment opportunities in neighboring Arab countries. Child labor has been prohibited since 1999, but it remains widespread, especially in the agricultural sector. Government work hours are from 8:00 AM to 2:00 PM. Private businesses maintain a different work schedule, which runs in 2 shifts: from 8:00 AM to 1:00 PM, and from 4:00 PM to 8:00 PM.

COUNTRY HISTORY AND ECONOMIC DEVELOPMENT

1538. Yemen falls under Ottoman rule.

1839. The British occupy Aden in southern Yemen.

1918. North Yemen gains independence from the Ottoman Empire at the end of World War I (1914–1918), calling itself the Yemen Arab Republic.

1935. The British create the Aden Protectorates.

1962. A group of nationalist officers revolt against the British and proclaim the Yemen Arab Republic (YAR) under the leadership of Abdullah al-Sallal.

1967. South Yemen gains independence from the United Kingdom.

1970. South Yemen, renamed the People's Democratic Republic of Yemen, **nationalizes** foreign-owned properties and establishes close ties with the Soviet Union.

1974–1978. A series of military coups in North Yemen leads to the ascendancy of President Ali Abdullah Saleh, who rules until the 1990 unification.

1986. A 12-day civil war erupts within the government of South Yemen. Former premier Haydar Bakr al-Attas is elected president in October.

1990. The Republic of Yemen is established peacefully on 22 May.

1993. Fair, multi-party, universal-suffrage elections are won by the General People's Congress.

1994. The south rebels against northern domination. The north wins, and the constitution is amended to establish a multiparty democracy.

1995. The government launches an economic reform program.

1999. In the first direct presidential election, Saleh returns to office.

2001. First municipal elections in country's history. The ruling General People's Congress wins the majority of seats. The constitution is amended to extend the term of the president from 5 to 7 years and parliamentary terms from 4 to 6.

FUTURE TRENDS

Yemen entered the 20th century under a cloud of economic decline. For much of the century, the rivalry between northern Yemen and the Marxist-led government of the south sapped the country's resources. The legacy of **socialism** left the southern economy in ruins. The reunification of the countries in 1990 and the subsequent civil war in 1994 further contributed to Yemen's economic decline. Government policies to stabilize the economy enacted in the mid-1990s have significantly improved the country's **macroeconomic** and structural conditions.

Yemen will likely address the unemployment problem, attempt to curb population growth, and implement the privatization policy in hopes of achieving long-term economic growth. The government has yet to lift **subsidies** on diesel fuel completely, cut military spending, downsize the public bureaucracy, or quash corruption in its public institutions and ministries. Much work will need to be done on the political front to achieve social and political stability, particularly to soothe the tensions between the current government and rural tribal groups and southern Marxists.

DEPENDENCIES

Yemen has no territories or colonies.

GLOSSARY

Advance Tax: A percentage of the previous year's tax bill which is paid at the beginning of the new fiscal year and later credited back at its end.

Agribusiness: Agricultural and livestock production on a large scale, often engaged in by large, multinational companies; also used to refer to the companies themselves.

Arrear: Usually plural, **arrears**. Unpaid, overdue debt.

Bad Loan: An unrecoverable loan; the amount cannot be reclaimed by the lender.

Balance of Payments: The measure of all the money coming into a country and all the money leaving the country in a given period, usually a year. The balance of payments includes merchandise exports and imports, the measure of which is called the **balance of trade**, as well as several other factors.

Balance of Trade: A measure of the value of exports and imports, not including services. When imports exceed exports, there is a trade deficit. When exports exceed imports, there is a trade surplus.

Bank of Issue: The bank that is given the right to issue and circulate currency in a country.

Barter System: An exchange of goods and/or services for other goods and/or services, rather than for money.

Bear Market: A sustained period of negative growth in the stock market.

Bicameral: A legislative body consisting of two houses or chambers.

Black Market: An informal market in which buyers and sellers can negotiate and exchange prohibited or illegal goods (such as exchanging local money for foreign currency). Black markets often exist to avoid government controls. *See also* **Informal Sector.**

Budget Deficit: A government budget deficit occurs when a government spends more money on government programs than it generates in revenues. Governments must borrow money or print currency to pay for this excess spending, thus creating potential financial difficulties. *See also* **Budget Surplus.**

Budget Surplus: A government budget surplus occurs when a government generates more revenues than it spends on government programs. Governments can adjust to surpluses by lowering tax rates, paying down the national debt, or stockpiling the money. *See also* **Budget Deficit.**

Cadre: A group of important and influential members of political parties who direct the actions of that party.

Capital Adequacy: The state of a bank having enough capital to maintain its loans and operating costs.

Capital Flight; also called **Capital Outflow:** Money sent abroad because investors fear that economic conditions within a country are too risky.

Capital Good: A manufactured good used in the production of other goods. For example, factories or machinery used to produce goods are considered capital goods.

Capitalism: An economic system based on the private ownership of the means of production and on an open system of competitive markets. It is assumed that producers in a capitalist system can use their skills and capital in the pursuit of profit.

Capital Outflow: *See* **Capital Flight.**

Cash Crop: An agricultural good produced for direct sale on the market.

Centrally-planned Economy: An economy in which the government exerts a great deal of control over economic planning, including the control of production, the allocation of goods, distribution, and prices. Common in **socialist** countries.

c.i.f.: Abbreviation of **cost, insurance, and freight**; a method of determining the value of imports or exports that includes cost, insurance, and freight in determining the total amount.

Commonwealth of Independent States (CIS): A loose union of 12 of the former republics of the Soviet Union, excluding Estonia, Latvia, and Lithuania.

Communism: An economic system in which the means of production and distribution are held in common by all

members of the society, and in which the rewards are distributed based on need. In actual communist countries, the state usually controls all the capital and land, and the economy is centrally planned. *See also* **Centrally-planned Economy.**

Consumer Good: A product sold directly to the end user, or consumer, such as food and clothing.

Crawling Peg: A fixed **exchange rate** between two currencies which is adjusted incrementally based on the movement of an economic indicator such as inflation.

Currency Board: An arrangement whereby a currency's value is fixed in some proportion to a strong foreign currency and such an exchange rate is guaranteed by the country's foreign exchange reserves.

Current Account Balance: The portion of the **balance of payments** that includes merchandise imports and exports (known as the **balance of trade**) plus imports and exports of services.

Debt Relief: Partial or full forgiveness of debts, offered to impoverished countries by lenders, usually after it becomes clear that continued payment on such debt is likely to ruin the country's economy.

Debt Service: Payment of interest on a loan or other debt. Debt servicing can be very expensive and debilitating for developing countries.

Deflation: Falling prices across an economy, expressed as a percentage per year. *See also* **Inflation.**

Dependency Ratio: The ratio of **pensioners** to the number of people employed.

Deregulation: A lessening of government restrictions on the economy.

Desertification: The progressive drying of the land.

Devaluation: An act by the government or central bank which decreases the official price of a nation's currency. When a currency is devalued, it can result in the country's exports becoming cheaper and more attractive.

Direct Tax: A tax levied directly on individuals or companies, such as income and property taxes. *See also* **Indirect Tax.**

Disposable Income: Those parts of a household income not needed for essentials such as food, healthcare, or housing costs. Disposable income may be saved, invested, or spent on non-essential goods.

Duty: A tax imposed on imported goods. *See also* **Indirect Tax.**

E-commerce: Economic activity conducted on the Internet.

Ecotourism: Tourism to natural and cultural areas which tries to minimize environmental impacts.

Embargo: A prohibition by a government against some or all trade with a foreign nation. *See also* **Sanctions.**

Emerging Market: A country with still evolving economic, social, and political structures that shows evidence of moving toward an open market system.

Emigration: To leave one's country to live elsewhere.

Enterprise Entry: The creation of new, predominantly small and medium size enterprises.

Enterprise Exit: The removal of businesses from an economy, either through bankruptcy or downsizing.

Equity: The value of all the shares in a company.

Estate Tax: A tax on inherited property and wealth.

Exchange Rate: The rate at which one country's currency is exchanged for that of another country.

Exchange Rate Mechanism (ERM): A mechanism set up in 1978 to handle fluctuations in the **exchange rates** of various European currencies. Each currency in the ERM may fluctuate only within agreed limits against any other currency.

Exchange Rate Regime: The mode of determining the **exchange rate** between the national currency and other major foreign currencies. In a fixed exchange rate regime, a currency is fixed or "pegged" to the currency of another, usually very stable currency, such as that of the United States. In a **floating** or flexible exchange rate regime, governments allow the value of their currency to be determined by supply and demand in the foreign exchange market.

Excise Tax: A tax on the sale or use of certain products or transactions, sometimes luxury or non-essential items.

Exclusive Economic Zone (EEZ): The area extending from a country's coastline over which that country has exclusive control of its resources.

External Debt: The total amount of money in a country's economy owed to enterprises and financial institutions outside the country.

Fiduciary: Related to a trust or trusteeship.

Fiscal Policy: The programs of a national government relating to spending on goods, services, **transfer payments**, and the tax system.

Fiscal Year: Any period of 12 consecutive months for which a company or a government calculates earnings, profits, and losses.

Fixed Exchange Rate: *See* **Exchange Rate Regime.**

Floating Exchange Rate: *See* **Exchange Rate Regime.**

Floor Price: The minimum price for a good or service which normally cannot be further reduced due to political, economic, or trade considerations.

f.o.b.: Abbreviation of **Free on board**; a method of determining the value of exports or imports that considers the value of goods excluding the cost of insurance and freight charges.

Foreign Debt: *See* **External Debt.**

Foreign Direct Investment (FDI): The total value of investment by foreign entities in a country, usually expressed on an annual or cumulative basis.

Foreign Exchange Reserves: The amount of money a country has in its treasury consisting of currency from foreign countries.

Free Market System: An economic system based on little government intervention and the freedom of private association and control of goods. *See also* **Capitalism.**

Free Trade Zone: Also called **Free Zone.** An industrial area where foreign companies may import, store, and sometimes export goods without paying taxes.

Full Employment: The level of employment at which a minimal amount of involuntary unemployment exists. It is considered the maximum level of employment in an economy.

Fully Convertible Currency: A currency that can be freely traded in international foreign exchanges for units of another currency.

GDP per Capita: Gross domestic product divided by the number of people in a country. GDP per capita is a convenient way to measure comparative international wealth.

Gini Index: An index used to measure the extent to which the distribution of income within an economy deviates from perfectly equal distribution. A score of 0 would mean perfect equality (with everyone having the same level of wealth) and 100 would signify perfect inequality (with a few extraordinarily wealthy people and the large majority living in dire poverty).

Glut: An excess of goods in a particular market, which typically causes the price of that good to fall.

Grey Economy: Economic activity that takes place in both the formal and **informal economy,** meaning that some but not all economic activity is reported to authorities such as tax collectors.

Gross Domestic Product (GDP): The total market value of all goods and services produced inside a country in a given year, which excludes money made by citizens or companies working abroad.

Gross National Product (GNP): The total market value of all goods and services produced in a year by a nation, including those goods produced by citizens or companies working abroad.

Guarantor: An institution or individual that guarantees to pay the debts of another institution or individual in the case of bankruptcy.

Guest Worker: Persons from a foreign country who are allowed to live in a host country so long as they are employed. Many guest workers send **remittances** to their native country.

Hard Currency: Money that can be exchanged on the foreign market and is stable enough to purchase goods from other countries.

Hawking: Selling wares, often pirated goods, in the **informal sector.**

Holding Company: A company that owns or controls several other companies.

Immigration: To move into a country that is not one's native country.

Import Substitution: A policy which calls for the local production of goods that have traditionally been imported. The goal of import substitution is to lessen a country's dependence on foreign suppliers.

Income Tax: A **direct tax** on an individual's earned income.

Indirect Tax: A tax which is not paid directly, but is passed on as part of the cost of an item or service. For instance, **tariffs** and **value-added taxes** are passed on to the consumer and included in the final price of the product. *See also* **Direct Tax.**

Inflation: A persistent increase in the average price of goods in an economy, usually accompanied by declining purchasing power of the national currency.

Inflation Rate: The rate at which prices rise from one period to the next.

Informal Sector: Also called **Informal Economy**. The part of an economy that lies outside government regulations and tax systems. It usually consists of small-scale and usually labor-intensive activities; it often includes illegal activities. *See also* **Black Market.**

Infrastructure: The system of public facilities, services, and resources in a country, including roads, railways, airports, power generation, and communication systems.

Intermediate Good: A good used as an ingredient or component in the production of other goods. For instance, wood pulp is used to produce paper.

Internally Displaced Person: A person fleeing danger (such as war or persecution) who has not crossed international boundaries. Those who relocate to another country are called "refugees."

Joint Sector: An economic sector in which private enterprise and the government invest jointly.

Joint Venture: A special economic initiative or company formed by a foreign firm and a domestic company, usually in a developing state. The domestic partner often holds a majority interest, thus allowing the host country to control the amount and kind of foreign economic activity. Can also be a simple joint operation by two or more companies.

Labor Force: Also called **Workforce**. The total number of people employed in a country plus the number of people unemployed and looking for a job.

Labor Mobility: The ability and readiness of workers to move to regions or sectors of higher growth within a country or economy.

Levy: A tax based on the assessed value of personal property and/or income.

Liberal Economy: An economy in which markets operate with minimal government interference and in which individual choice and private ownership are the guiding forces.

Liberalization: The opening of an economy to free competition and a self-regulating market, with minimal government-imposed regulations or limitations.

Liquidity: Generally, the amount of money on hand. When related to government, it refers to the amount of money in circulation.

Macroeconomics: Economic issues large enough to impact the nation as a whole.

Market Capitalization: The total market value of a company, expressed by multiplying the value of a company's outstanding shares by the current price of the stock.

Marxism: A set of economic and political theories based on the work of 19th century theorists Karl Marx and Friedrich Engels that holds that human history is a struggle between classes, especially those who own property and those who do not (the workers). Marxism provided the theoretical basis for the economic systems of modern **communism** and **socialism.**

Microcredit: The lending of small amounts of startup capital to the very poor as a way of helping them out of poverty. The World Bank and other aid agencies often make mircrocredit loans to small-scale entrepreneurs in the developing world.

Monetary Policy: A government policy designed to regulate the money supply and interest rates in an economy. These policies are usually determined by the central bank or treasury in order to react to or to anticipate inflationary trends and other factors that affect an economy. They are said to be "tight" when interest rates are raised and other measures are implemented in an effort to control inflation and stabilize currency values.

Monetized Economy: An economy based on money as opposed to barter.

Money Laundering: A method used by criminal organizations to hide income gained from illicit activities, such as drug smuggling, by manipulating banks to provide a legitimate explanation for the source of money.

Monopoly: A company or corporation that has exclusive control over the distribution and availability of a product or service.

Multinational Corporation (MNC): A corporation which has economic ties to or operations in two or more countries.

National Debt: The amount of money owed to lenders by a government. The debt occurs when a government spends more each year than it has raised through taxes. Thus, to spend more than it has, the government must borrow money from banks or through the issuance of bonds.

Nationalization: The movement of privately-owned (and usually foreign-owned) companies into government ownership. Companies have often been nationalized by the developing countries whose government argued that the foreign firms involved did not pay their fair share of the profits to the host country and unfairly exploited it in other ways.

Nomenklatura: The elite members of the Communist Party in communist nations, who were often given privileges not extended to ordinary citizens.

Nomenklatura Privatization: A system of **privatization** in communist nations that openly or covertly transferred ownership of state assets to the **nomenklatura.**

Non-performing Loan: A delinquent loan or one in danger of going into default.

Offshore Banking: Banking operations that offer financial services to people and companies from other countries, usually with associated tax benefits. Offshore banking operations are often suspected as a cover for **money laundering** or other illegal financial activities.

Overheated Economy: An economy that is growing at a very high annual rate, which leads to low interest rates, a high borrowing rate, and an abundance of money in the economy—all of which can lead to **inflation.**

Parastatal: A partly or wholly government-owned enterprise.

Participation Rate: The ratio between the labor force and the total population, which indicates how many people are either working or actively seeking work.

Pensioner: A retired person who lives off a government pension.

Price Control: Artificial limitation on the prices of goods set by the government, usually in a **centrally-planned economy.**

Price Index: An index that shows how the average price of a commodity or bundle of goods has changed over a period of time, usually by comparing their value in constant dollars.

Primary Commodity: A commodity, such as a particular crop or mineral, which is a natural rather than manufactured resource.

Private Sector: The part of an economy that is not directly controlled by the government, including businesses and households.

Privatization: The transition of a company or companies from state ownership or control to private ownership. Privatization often takes place in societies that are making a transition from a **socialist** or mixed-socialist economy to a **capitalist** economy.

Procurement: The purchase of goods or services by the government.

Progressive Taxation: An income taxation system in which tax rates rise in accordance with income levels. Thus, a person making a large salary will be taxed at a higher rate than someone who makes less money.

Proportional Representation: An electoral system whereby the number of legislative seats allocated to a particular political party is decided in proportion to the number of votes that party won in an election.

Protectionist Policy: A government policy used to protect local producers from competition from imported foreign goods. Countries may erect various trade barriers such as **tariffs** or quotas in an effort to protect domestic firms or products.

Public Sector: The part of the economy that is owned and operated by the government.

Purchasing Power Parity (PPP): The purchasing power parity method attempts to determine that relative purchasing power of different currencies over equivalent goods and services. For example, if it costs someone in the United States US$300 to buy a month's worth of groceries, but it costs someone in Ghana only US$100 to buy the same amount of groceries, then the person in Ghana can purchase three times as much for the same amount of money. This means that though the average citizen of Ghana may earn less money than the average citizen of the United States, that money buys more because goods and services cost less in Ghana. The PPP calculation attempts to account for these differences in prices and is used to calculate **GDP** and **GDP per capita** figures that are comparable across nations. Note: GDP figured at purchasing power parity may be three or more times as large as GDP figured at **exchange rate** parity.

Pyramid Scheme: Fraudulent investment strategy involving a series of buying and selling transactions that generate a paper profit, which, in turn, is used to buy more stocks. They were prevalent in Eastern Europe following the fall of the Soviet Union, and preyed on the average citizen's lack of understanding of **free-market** investment transactions.

Real GDP: The **gross domestic product** of a country expressed in constant prices which are determined by a baseline year. Real GDP thus ignores the effects of inflation and deflation and allows for comparisons over time.

Real Wage: Income measured in constant dollars, and thus corrected to account for the effects of inflation.

Recession: A period of negative growth in an economy, usually defined as two consecutive quarters of negative **GDP** growth. A recession is characterized by factors such as low consumer spending, low output, and high unemployment.

Re-export: An imported good that does not undergo any changes (e.g., not turned into a new product) before being exported.

Relative Income Poverty: This is a measure of the overall equality in income among employed workers. Relative income poverty is high when a high percentage of the sum of total income is concentrated in the hands of a small percentage of the working population, and it is low when income is more equally spread among all workers.

Remittance: Money that is sent back to people, usually relatives, living in the home country of a national working abroad.

Repatriation: Taking money out of a foreign country in which it had been invested and reinvesting it in the country where it originated.

Reserve Ratio: The percentage of a bank's assets in reserve against the possibility of customers withdrawing their deposited funds. Some governments impose a minimum percentage, usually enforced by a central bank in proportion to the total amount of currency in circulation.

Restructuring: A catch-all phrase for turning around a company, involving cutting costs, restoring finances, and improving products.

Retail: The sale of goods and services to individuals in small amounts.

Sanction: A penalty, often in the form of a trade restriction, placed on one country by one or several other countries as a penalty for an action by the country under sanctions. Sanctions are designed to force the country

experiencing them to change a policy, such as its human rights practices.

Shadow Economy: Economic interactions that are invisible to standard accounting and taxing procedures. See **Informal Economy.**

Sharecropper: A farmer who works someone else's land in exchange for a share of the crops they produce.

Smallholder: A farmer who has only a very small farm or plot of land.

Social Security Tax: A **direct tax** levied partly on the worker and partly on the employer in order to provide funds for a nation's **social welfare system.**

Social Welfare System: A set of government programs that provides for the needs of the unemployed, aged, disabled, or other groups deemed in need of government assistance.

Socialism: An economic system in which means of production and distribution are owned by the community, and profits are shared among the community. Countries with socialist economies put a premium on centralized control over an economy rather than allowing market forces to operate, and tend to have a relatively equal distribution of income.

Solvency: Financial stability.

Statist Economic Policy: A policy in **capitalist** or quasi-capitalist countries that favor state control or guidance of companies or sectors of the economy that are thought to be vital.

Strategic Industry: An industry considered extremely important to the well being of a country.

Structural Adjustment Program (SAP): A set of economic programs and policies aimed at stabilizing the overall structure of a troubled economy. Structural adjustment programs are often required by international lending agencies such as the World Bank and the International Monetary Fund. These programs often involve devaluing the currency, reducing government spending, and increasing exports.

Structural Unemployment: Unemployment caused by a mismatch between the needs of employers and the skills and training of the labor force.

Subsidy: A payment made by a government to an individual or company that produces a specific good or commodity. Some countries subsidize the production of certain agricultural crops, while others may subsidize mass transit or public art.

Subsistence Farming: Farming which generates only enough produce to feed the farmer's family, with little or nothing left over to sell.

Tariff: An **indirect tax** that is applied to an imported product or class of products.

Tax Haven: A place where investors shield their money from the national taxes of their own country. *See also* **Offshore Banking.**

Tax Holiday: A period of time in which businesses or investors enjoy exemptions from paying taxes. Tax holidays are offered as a lure to investment or business development.

Technocrat: Government official who is expert in specialized—usually technological—areas.

Trade Deficit: *See* **Balance of Trade.**

Trade Surplus: *See* **Balance of Trade.**

Transfer Payment: Cash paid directly to individuals by a government, usually as part of a **social welfare system.**

Transfer Pricing: A method used by foreign firms to overprice their overseas costs and thereby reduce their local tax liabilities.

Treasury Bill: Also called a **T-bill**. A guaranteed government investment bond sold to the public. They usually reach maturity after short periods, for example, three months or six months.

Trickle Down: An economic theory that contends that tax relief and other governmental incentives should be given primarily to the highest income earners in a society, on the assumption that their increased economic investment and other activity will provide benefits that "trickle down" to the lower- and middle-income wage-earners.

Turnover: The measure of trade activity in terms of the aggregated prices of all goods and services sold in the country during a year.

Two-tier Economy: An economy where skilled or educated workers enjoy a high standard of living, but unskilled workers are trapped in poverty.

Underemployment: A situation in which people are not reaching their economic potential because they are employed in low-paying or part-time jobs. For example, an engineer who is working in a fast food restaurant would be said to be experiencing underemployment.

Underground Economy: Economic transactions that are not reported to government, and therefore not taxable. **Informal sectors** and **black markets** are examples of underground economic activity.

Unicameral: A legislative body consisting of a single house or chamber.

United Nations Development Program (UNDP): The United Nations' principal provider of development advice, advocacy, and grant support.

Value Added: The increase in the value of a good at each stage in the production process. When a company adds value to its products it is able to gain a higher price for them, but it may be liable for a **value-added tax.**

Value-added Tax (VAT): A tax levied on the amount of **value added** to a total product at each stage of its manufacture.

Vertical Integration: Control over all stages of the production and distribution of a certain product. For example, if one company owns the mines, the steel plant, the transportation network, the factories, and the dealerships involved in making and selling automobiles, it is vertically integrated.

Voucher Privatization: A system for selling off state-owned companies in which citizens are given "vouchers" which they may invest in such companies. This system was devised to allow all citizens the opportunity to invest in formerly state-owned businesses; however, in practice many citizens invest their vouchers in voucher funds, which are professionally managed investment groups who amass vouchers in order to exert control over the direction of companies.

Welfare State: A government that assumes the responsibility for the well-being of its citizens by providing institutions and organizations that contribute to their care. *See also* **Social Welfare System.**

Workforce: *See* **Labor Force.**

INDEX

Page numbers appearing in boldface indicate major treatment of entries. A page number accompanied by an italicized "t" indicates that there is a table on that page, while a page number accompanied by an italicized "f" indicates there is a figure on that page.

PREFACE

The *Worldmark Encyclopedia of National Economies* joins the Worldmark family of encyclopedias and attempts to provide comprehensive overviews of the economic structure and current climate of 198 countries and territories. Each signed entry provides key data and analysis on a country's economic conditions, their relationship to social and political trends, and their impact on the lives of the country's inhabitants. The goal of this set is to use plain language to offer intelligent, consistent analysis of every important economy in the world.

It is our sincere hope that this set will open the reader's mind to the fascinating world of international economics. Contained within this collection are a number of fascinating stories: of Eastern European nations struggling to adapt to capitalist economic systems in the wake of the collapse of communism; of Pacific Island nations threatened with annihilation by the slow and steady rise of ocean levels; of Asian nations channeling the vast productivity of their people into diversified economies; of the emerging power of the European Union, which dominates economic life across Europe; of Middle Eastern nations planning for the disappearance of their primary engine of economic growth, oil; and many others. To make all this information both accessible and comparable, each entry presents information in the same format, allowing readers to easily compare, for example, the balance of trade between Singapore and Hong Kong, or the political systems of North and South Korea. Economics has a language of its own, and we have **highlighted** those economic terms that may not be familiar to a general reader and provided definitions in a glossary. Other terms that are specific to a particular country but are not economic in nature are defined within parentheses in the text.

This set contains entries on every sovereign nation in the world, as well as separate entries on large territories of countries, including: French Guiana, Martinique, and Guadeloupe; Macau; Puerto Rico; and Taiwan. The larger dependencies of other countries are highlighted within the mother country's entry. For example, the entry on Denmark includes a discussion of Greenland, the United Kingdom includes information on many of its Crown territories, and the United States entry highlights the economic conditions in some of its larger territories.

ENTRY OBJECTIVES

Each entry has two objectives: one, to offer a clear picture of the economic conditions in a particular country, and two, to provide statistical information that allows for comparison between countries. To offer comparable information, we have used some common sources for the tables and graphs as well as for individual sections. Even the most exhaustive sources do not provide information for every country, however, and thus some entries either have no data available in certain areas or contain data that was obtained from an alternate source. In all entries, we tried to provide the most current data available at the time. Because collection and evaluation methods differ among international data gathering agencies such as the World Bank, United Nations, and International Monetary Fund, as well as between these agencies and the many government data collection agencies located in each country, entries sometimes provide two or more sources of information. Consequently, the text of an entry may contain more recent information from a different source than is provided in a table or graph, though the table or graph provides information that allows the easiest comparison to other entries.

No one source could provide all the information desired for this set, so some sources were substituted when the main source lacked information for specific countries. The main sources used included: the *World Factbook 2000* and *2001,* which provided the common information on the countries' gross domestic product (GDP) at purchasing power parity, the division of labor, balance of trade, chief imports, chief exports, and population, unless otherwise noted in the text; the World Bank's *World Development Indicators,* which was a valued source for information about the infrastructure and consumption patterns of many countries; the *Human Development Report,* from the United Nations, which provided GDP per capita information on many countries; and the International Monetary Fund's *International Financial Statistics Yearbook,* which provided historical records of trade balances for most countries. Each entry also contains a bibliography that lists additional sources that are specific to that entry.

ENTRY ORGANIZATION

All entries are organized under 16 specific headings to make it easy to find needed information quickly and to compare the conditions in several different countries easily. (The sole exception is the entry on the Vatican, whose unique features necessitated the removal of several sections.) The sections are as follows:

COUNTRY OVERVIEW. This section includes information about the size of all land surfaces, describing coastlines and international boundaries. It also highlights significant geographical features in the country and the location of the capital. The size of the country is compared to a U.S. state or, for smaller countries, to Washington, D.C. Also included is information on the total population, as well as other important demographic data concerning ethnicity, religion, age, and urbanization. Where relevant, this section also includes information about internal conflicts, major health problems, or significant population policies.

OVERVIEW OF ECONOMY. This overview is meant to provide an analysis of the country's overall economic conditions, mentioning those elements that are deemed most important to an understanding of the country. It provides context for the reader to understand the more specific information available in the other sections.

POLITICS, GOVERNMENT, AND TAXATION. This section identifies the structure of the government and discusses the role the government, political parties, and taxes play in the economy.

INFRASTRUCTURE, POWER, AND COMMUNICATIONS. This section offers a description of the roads, railways, harbors, and telecommunications available in the country, assesses the modernity of the systems, and provides information about the country's plans for improvements.

ECONOMIC SECTORS. This section serves as an overview for the three more specific sections that follow, providing a general description of the balance between the country's different economic sectors.

AGRICULTURE. This section discusses the agriculture, fishing, and forestry sectors of the country.

INDUSTRY. This section discusses the industrial sector of the country, including specific information on mining, manufacturing, and other major industries, where appropriate.

SERVICES. This section concentrates on major components of the diverse services sector, usually focusing on the tourism and banking or financial sectors and sometimes including descriptions of the retail sector.

INTERNATIONAL TRADE. This section focuses on the country's patterns of trade, including the commodities traded and the historical trading partners.

MONEY. This section offers a brief description of the changes in inflation and the exchange rates in the country, and the impact those may have had on the economy. It also mentions any recent changes in the currency and the nature and impact of the central banking function.

POVERTY AND WEALTH. This section paints a picture of the distribution of wealth within the country, often comparing life in the country with that in other countries in the region. It includes governmental efforts to redistribute wealth or to deal with pressing issues of poverty.

WORKING CONDITIONS. This section describes the workforce, its ability to unionize, and the effectiveness of unions within the country. It also often includes information on wages, significant changes in the workforce over time, and the existence of protections for workers.

COUNTRY HISTORY AND ECONOMIC DEVELOPMENT. This section provides a timeline of events that shaped the country and its economy. The selected events create a more cohesive picture of the nation than could be described in the entries because of their bias toward more current information.

FUTURE TRENDS. To provide readers with a view to the future, the entry ends with an analysis of how the economic conditions in the country are expected to change in the near future. It also highlights any significant challenges the country may face.

DEPENDENCIES. This section discusses any major territories or colonies and their economies.

BIBLIOGRAPHY. The bibliography at the end of the entry lists the sources used to compile the information in the entry and also includes other materials that may be of interest to readers wanting more information about the particular country. Although specific online sources are cited, many such sources are updated annually and should be expected to change.

In addition, a data box at the beginning of each entry offers helpful economic "quick facts" such as the country's capital, monetary unit, chief exports and imports, gross domestic product (GDP), and the balance of trade. The U.S. Central Intelligence Agency's *World Factbook* (2000 and 2001) was the main source of this information unless otherwise noted. Each entry also includes a map that illustrates the location of the country. Since economic conditions are often affected by geography, the map allows readers to see the location of major cities and landmarks. The map also names bordering countries to offer readers a visual aid to understand regional conflicts and trading routes.

ACKNOWLEDGMENTS

We wish to thank all those involved in this project for their efforts. This set could not have been produced

without the unfailing support of the publisher and our imaginative advisory board. At the Gale Group, managing editor Shelly Dickey and Peggy Glahn in New Product Development were especially helpful. We would also like to thank Gale editor William Harmer for his work in the early stages of the project, but special thanks must go to editors Rebecca Parks and Jeffrey Lehman who brought the set to publication. Copyeditors Edward Moran, Robyn Karney, Karl Rahder, Jennifer Wallace, and Mary Sugar must also be commended for their work to polish the entries into the form you see here.

COMMENTS

We encourage you to contact us with any comments or suggestions you may have that will benefit future editions of this set. We want this set to be a meaningful addition to your search for information about the world. Please send your comments and suggestions to: The Editors, *Worldmark Encyclopedia of National Economies,* The Gale Group, 27500 Drake Road, Farmington Hills, MI 48331. Or, call toll free at 1-800-877-4253.

—Sara Pendergast and Tom Pendergast

NOTES ON CONTRIBUTORS

Abazov, Rafis. Professor, Department of Politics, LaTrobe University, Victoria, Australia. Author, *Formation of the Post-Soviet Foreign Policies in Central Asian Republics* (1999), and annual security and economic reports, *Brassey's Security Yearbook*, and Transitions Online.

Abazova, Alfia. LaTrobe University, Victoria, Australia. Reviewed for *Pacifica Review* and *Europe-Asia Studies.*

Amineh, Parvizi Mehdi, Ph.D. Department of Political Science, University of Amsterdam, the Netherlands. Author, *Towards the Control of Oil Resources in the Caspian Region* (New York: St. Martin's Press, 1999); *Die Globale Kapitalistische Expansion und Iran: Eine Studie der Iranischen Politischen Ökonomie (1500–1980)* (Hamburg-London: Lit Verlag).

Arnade, Charles W. Adviser. Distinguished Professor of International Studies, University of South Florida. Author, *The Emergence of the Republic of Bolivia.*

Audain, Linz, M.D., J.D., Ph.D. Staff physician, Greater Southeast, INOVA Fairfax and Southern Maryland hospitals; former professor of law, economics, and statistics at various universities; editor, *Foreign Trade of the United States* (2nd ed.), *Business Statistics of the United States* (6th ed.).

Benoit, Kenneth, Ph.D. Lecturer, Department of Political Science, Trinity College, University of Dublin, Ireland.

Bouillon, Markus R. Doctoral student in international relations with a regional focus on the Middle East, St. Antony's College, University of Oxford.

Burron, Neil. Graduate student in International Development, The Norman Paterson School of International Affairs, Carleton University, Ottawa.

Campling, Liam. Lecturer in International Politics and History, Seychelles Polytechnic (University of Manchester Twinning Programme). Editor, *Historical Materialism—Special Issue: Focus on Sub-Saharan Africa* (2002). Contributor to *West Africa* and *African Business* magazines.

Carper, Mark Daniel Lynn. Instructor of Geography, Central Missouri State University.

Cavatorta, Francesco. Doctoral candidate in the Department of Political Science, Trinity College, Dublin, Ireland. Author, "The Italian Political System and the Northern League," in *Contemporary Politics,* March 2001.

Chari, Raj. Lecturer, Department of Political Science, Trinity College, Dublin, Ireland. Author, "Spanish Socialists, Privatising the Right Way?" in *West European Politics,* Vol. 21, No. 4, October 1998, and "The March 2000 Spanish Election: A 'Critical Election'?" in *West European Politics,* Vol. 23, No. 3, July 2000.

Chauvin, Lucien O. Freelance journalist, Lima, Peru. President of the Foreign Press Association of Peru.

Childree, David L. Graduate student in Latin American Studies at Tulane University, specializing in politics and development.

Conteh-Morgan, Earl. Professor, Department of Government and International Affairs, University of South Florida, Tampa, Florida. Co-author, *Sierra Leone at the End of the 20th Century* (1999).

Costa, Ecio F., Ph.D. Post-doctoral associate, Center for Agribusiness and Economic Development, Department of Agricultural and Applied Economics, University of Georgia, Athens, Georgia. Author, "Brazil's New Floating Exchange Rate Regime and Competitiveness in the World Poultry Market," in *Journal of Agricultural and Applied Economics.*

Cunha, Stephen, Ph.D. Professor of Geography, Humboldt State University, Arcata, California. Consultant, USAID, World Bank, National Geographic Society.

Davoudi, Salamander. Graduate student in Middle Eastern economics, Georgetown University, Washington, D.C. Former aid at the Royal Jordanian Hashemite Court.

Deletis, Katarina. M.I.A. (Master of International Affairs), Columbia University, New York. International communications officer, Deloitte Touche Tohmatsu, New York.

Divisekera, Sarath. Ph.D., School of Applied Economics, Victoria University, Melbourne, Australia. Author, *Income Distribution, Inequality and Poverty in Sri Lanka* (1988).

Eames, Rory. Honors student, School of Resources, Environment, and Society, The Australian National University, Canberra, Australia.

Easton, Matthew. Independent consultant, Cambridge, Massachusetts. Author, *In the Name of Development: Human Rights and the World Bank in Indonesia* (1995).

Feoli, Ludovico. Graduate student in Latin American Studies, Tulane University, New Orleans, Louisiana. Publications director and academic coordinator, CIAPA, San José, Costa Rica.

Ferguson, James. Writer and researcher specializing in the Caribbean. Author, *A Traveller's History of the Caribbean* (1999).

Florkowski, Wojciech J. Associate professor, Department of Agricultural and Applied Economics, University of Georgia.

Foley, Sean. Ph.D. candidate, History, Georgetown University, Washington, D.C. Author of various articles and a chapter in *Crises and Quandaries in the Contemporary Persian Gulf* (2001).

Foroughi, Payam. Ph.D. student in International Relations, University of Utah. International development consultant, NGOs, USAID, and the United Nations, Central Asia; freelance writer.

Friesen, Wardlow. Senior lecturer, Department of Geography, The University of Auckland, New Zealand. Author, "Tangata Pasifika Aotearoa: Pacific Populations and Identity in New Zealand," in *New Zealand Population Review,* Vol. 26, No. 2, 2000; "Circulation, Urbanisation, and the Youth Boom in Melanesia," in *Espace, Populations, Sociétés,* Vol. 2, 1994; "Melanesian Economy on the Periphery: Migration and Village Economy in Choiseul," in *Pacific Viewpoint*, Vol. 34, No. 2, 1993.

Fry, Gerald W. Adviser. Professor of International/Intercultural Education, and director of Graduate Studies, Department of Educational Policy and Administration, University of Minnesota—Twin Cities; former team leader on major Asian Development Bank funded projects in Southeast Asia.

Gazis, Alexander. Commercial specialist, U.S. Embassy, N'Djamena, Chad. Author, *Country Commercial Guides* for Chad (Fiscal Year 2001 and 2002).

Genc, Emine, M.A. Budget expert, Ministry of Finance, Ankara, Turkey.

Genc, Ismail H., Ph.D. Assistant professor of Economics, University of Idaho, Moscow, Idaho.

Gleason, Gregory. Professor, University of New Mexico. Former director, USAID Rule of Law Program in Central Asia.

Guillen, April J., J.D./M.A. International Relations candidate, University of Southern California, Los Angeles, with an emphasis on International Human Rights Law.

Hadjiyski, Valentin, Ph.D. New York-based freelance author, former United Nations expert.

Hodd, Jack. Queen's College, Cambridge, researching graphical presentations of general equilibrium models.

Hodd, Michael R. V. Adviser. Professor of Economics, University of Westminster, London, and has worked as a consultant for the ILO and UNIDO. Author, *African Economic Handbook,* London, Euromonitor, 1986; *The Economies of Africa,* Aldershot, Dartmouth, 1991; with others, *Fisheries and Development in Tanzania,* London, Macmillan, 1994.

Iltanen, Suvi. Graduate of the European Studies Programme, Trinity College, Dublin, Ireland.

Jensen, Nathan. Ph.D. candidate in political science, Yale University, and visiting scholar at UCLA's International Studies and Overseas Programs. He is currently completing his dissertation titled "The Political Economy of Foreign Direct Investment."

Jugenitz, Heidi. Graduate student in Latin American Studies, Tulane University, New Orleans, Louisiana. Research assistant, Payson Center for International Development and Technology Transfer.

Kiyak, Tunga. Ph.D. candidate in marketing and international business, Michigan State University. Research assistant, Center for International Business Education and Research (MSU-CIBER). Curator, International Business Resources on the WWW.

Kuznetsova, Olga. Senior research fellow, The Manchester Metropolitan University Business School, Manchester, UK. Author, *The CIS Handbook. Regional Handbooks of Economic Development: Prospects onto the 21st Century,* edited by P. Heenan and M. Lamontagne (1999).

Lang-Tigchelaar, Amy. Graduate student in joint MBA/MA in Latin American Studies Program, Tulane University, New Orleans, Louisiana.

Lansford, Tom. Assistant professor, University of Southern Mississippi, Gulf Coast. Author, *Evolution and Devolution: The Dynamics of Sovereignty and Security in Post-Cold War Europe* (2000).

Lynch, Catherine. Doctoral candidate in political science, Dublin City University, Ireland. Areas of interest include the political economy of implementing peace agreements, the politics of peace building, the implementation of policy, and other aspects of comparative political science.

Mahoney, Lynn. M.A., University of Michigan. Associate director of development, director of communications, American University of Beirut New York Office; freelance writer.

Mann, Larisa. Graduate student of economic history, cultural studies, and legal studies, London School of Economics. Presented "Shaky Ground, Thin Air: Intellectual Property Law and the Jamaican Music Industry" at the "Rethinking Caribbean Culture" conference at the University of West Indies, Cave Hill, Barbados.

Mazor, John. Writer and journalist specializing in economic and political issues in Latin America and the Levant. Graduated from Boston University with a degree in literature and studied intelligence and national security policy at the Institute of World Politics in Washington, D.C.

Mobekk, Eirin. MacArthur postdoctoral research associate, Department of War Studies, King's College, London, United Kingdom.

Mowatt, Rosalind. Graduate student in Economics, Wits University, Johannesburg, South Africa. Former economist for National Treasury, working with Southern African Development Community (SADC) countries.

Muhutdinova-Foroughi, Raissa. M.P.A., University of Colorado at Denver. Journalist, Radio Tajikistan; consultant, United Nations, World Bank, and Eurasia Foundation, Commonwealth of Independent Nations; freelance writer.

Mukungu, Allan C. K. Graduate student, University of Westminster, London, and has done consultancy work for the World Bank.

Musakhanova, Oygul. Graduate, University of Westminster; economist, Arthur Anderson, Tashkent, Uzbekistan.

Naidu, Sujatha. LL.M. in Environment Law, University of Utah. Ph.D. student in International Relations, Department of Political Science, University of Utah; freelance writer.

Nicholls, Ana. Journalist. Assistant editor, *Business Central Europe,* The Economist Group. Author of three surveys of Romania.

Nicoleau, Michael. J.D. Cornell Law School, Ithaca, New York. Co-author, "Constitutional Governance in the Democratic Republic of the Congo: An Analysis of the Constitution Proposed by the Government of Laurent Kabila," in *Texas International Law Journal,* Spring 2000.

Nuseibeh, Reem. Graduate student in Comparative Politics/Human Rights, University of Maryland, Maryland. Middle East risk analyst, Kroll Information Services, Vienna, Virginia.

Ó Beacháin, Donnacha. Ph.D. Political Science from National University of Ireland, Dublin. Civic Education Project visiting lecturer at the Departments of International Relations and Conflict Resolution at Tbilisi State University and the Georgian Technical University, respectively, 2000–2002.

Ohaegbulam, F. Ugboaja. Professor, Government and International Affairs, University of South Florida. Author, *A Concise Introduction to American Foreign Policy* (1999), and *Nigeria and the UN Mission to the Democratic Republic of the Congo* (1982).

O'Malley, Eoin. Doctoral candidate in Political Science at Trinity College, Dublin, and visiting researcher at UNED, Madrid, Spain. Author, "Ireland" in Annual Review section of the *European Journal of Political Research* (1999, 2000, 2001).

Ozsoz, Emre. Graduate student in International Political Economy and Development, Fordham University, New York. Editorial assistant for the Middle East, The Economist Intelligence Unit, New York.

Peimani, Hooman, Ph.D. Independent consultant with international organizations in Geneva, Switzerland. Author, *The Caspian Pipeline Dilemma: Political Games and Economic Losses* (2001).

Pretes, Michael. Research scholar, Department of Human Geography, Research School of Pacific and Asian Studies, The Australian National University, Canberra, Australia.

Sabol, Steven. Ph.D., the University of North Carolina at Charlotte. Author, *Awake Kazak! Russian Colonization of Central Asia and the Genesis of Kazak National Consciousness, 1868–1920.*

Samonis, Val, Ph.D., C.P.C. Managed and/or participated in international research and advisory projects/teams sponsored by the Hudson Institute, World Bank, CASE Warsaw, Soros Foundations, the Center for European Integration Studies (ZEI Bonn), the Swedish government, and a number of other clients. Also worked with top reformers such as the Polish Deputy Prime Minister Leszek Balcerowicz, U.S. Treasury Secretary Larry Summers, the World Bank, and OECD Private Sector Advisory Group on Corporate Governance, and with the Stanford Economic Transi-

tion Group; advisor to the Czech government (Deputy Prime Minister Pavel Mertlik), the Lithuanian parliament, and several Lithuanian governments, international organizations, and multinational corporations; founding editor, *Journal of East-West Business* (The Haworth Press Inc).

Sezgin, Yuksel. Ph.D. candidate in Political Science, University of Washington. Former assistant Middle East coordinator at the Foreign Economic Relations Board of Turkey.

Schubert, Alexander. Ph.D., Cornell University.

Scott, Cleve Mc D. Ph.D. candidate and graduate assistant, Department of History, University of the West Indies, Cave Hill Campus, Barbados.

Stobwasser, Ralph. Graduate student in Middle Eastern Studies, FU Berlin, Germany. Worked in the Office of the Chief Economist Middle East and North Africa, World Bank, Washington, D.C.

Strnad, Tomas. Ph.D. student, Department of the Middle East and Africa, Charles University, Czech Republic. Chief editor of the *Arab Markets Magazine*; author of "The Kuwaiti Dilemma," "OPEC—Main Sinner or Sheer Scapegoat?," and "Globalization in the Arab and Muslim World" in *International Policy* and other magazines.

Stroschein, Sherrill. Assistant professor of Political Science, Ohio University. Frequent contributor to scholarly journals on East European topics and a former contributor to *Nations in Transit* (1995 and 1997 editions).

Thadathil, George. Associate professor of History, Paul Quinn College, Dallas, Texas. Author, "Myanmar, Agony of a People" in *History Behind Headlines*, 2000. His research interests include South and Southeast Asia, and Asian collective security.

Thapa, Rabi. Editor and environmentalist, France. Environment/development assignments in Nepal, 1998.

Tian, Robert Guang, Ph.D. Associate professor of Business Administration, Erskine College. Author, *Canadian Chinese, Chinese Canadians: Coping and Adapting in North America* (1999).

Ubarra, Maria Cecilia T. Graduate student in Public Policy and Program Administration, University of the Philippines, Quezon City, Philippines. Research fellow, Institute for Strategic and Development Studies; case writer, Asian Institute of Management, Philippines.

Vivas, Leonardo. M.Phil., Development Studies, Sussex University (UK); Ph.D., International Economics and Finance, Nanterre University (France); fellow, Weatherhead Center for International Affairs, Harvard University.

Viviers, Wilma. Program director, International Trade in School of Economics, Potchefstroom University, South Africa.

Zhang, Xingli. Ph.D. student, University of Southern California, Los Angeles. Author, "Brunei" in *East Asian Encyclopedia* (in Chinese).

INTRODUCTION

THE POWER OF ECONOMIC UNDERSTANDING

The economies of the world are becoming increasingly interconnected and interdependent, a fact dramatically illustrated on 2 July 1997 when the Thai government decided to allow its currency to "float" according to market conditions. The result was a significant drop in the value of the currency and the start of the Asian economic crisis, a contagion that spread quickly to other Asian countries such as the Republic of Korea, Indonesia, Malaysia, and the Philippines. Before long the epidemic reached Brazil and Russia.

In this way, a small economic change in one less-developed country sent economic shock waves around the world. Surprisingly, no one predicted this crisis, though economist Paul Krugman in a prominent 1994 *Foreign Affairs* article argued that there was no Asian economic miracle and the kind of growth rates attained in recent years were not sustainable over the long term. In such an interconnected global economy, it is imperative to have an understanding of other economies and economic conditions around the world. Yet that understanding is sorely lacking in the American public.

Various studies have shown that both young people and the public at large have a low level of literacy about other nations. A survey of 655 high school students in southeast Ohio indicated that students were least informed in the area of international economic concerns, and the number of economics majors at the college level is declining. The economic and geographic illiteracy has become such a national concern that the U.S. Senate recently passed a resolution calling for a national education policy that addresses Americans' lack of knowledge of other parts of the world.

The information provided by the media also frequently reflects a distorted understanding of world economies. During the Asian economic crisis, we often heard about the collapse of various Asian countries such as Korea and Thailand. They were indeed suffering a severe crisis, but usually companies, not countries, collapse. The use of the "collapse" language was therefore misleading. In another example, a distinguished journalist writing in a prominent East coast newspaper claimed that Vietnamese women paid more in transportation and food costs than they were earning while working in a factory manufacturing Nike shoes. Such a statement, while well intended in terms of genuine concern for these women workers, makes no economic sense whatsoever, and is actually not accurate. The wages of these women are indeed extremely low by U.S. standards, but such wages must be viewed in the context of another society, where the cost of living may be dramatically lower and where low salaries may be pooled. At other times, a fact—such as the fact that a minority of the Japanese workforce enjoys employment for life—is exaggerated to suggest that the Japanese economy boomed as it did in the 1980s *because* of the Japanese policy of life-long employment. Such generalizing keeps people from understanding the complexities of the Japanese economy.

"THINGS ARE NOT WHAT THEY SEEM." In defense of this lack of economic understanding, it must be said that understanding economics is not easy. Paul A. Samuelson, author of the classic textbook *Economics* (1995), once stated about economics "that things are often not what at first they seem." In Japan, for example, many young women work as office ladies in private companies as an initial job after completing school. These young ladies often stay at home with their parents and have few basic expenses. Over several years they can accumulate considerable savings, which may be used for travel, overseas study, or investing. Thus, as Samuelson noted in his textbook, actual individual economic welfare is not based on wages as such, but on the *difference* between earnings and expenditures. Wages are not the only measure of the value of labor: one must also consider purchasing power and how costs of living vary dramatically from place to place. Without taking into account purchasing power, we overestimate economic well-being in high-cost countries such as Japan and Switzerland and underestimate it in low-cost countries such as India and Cambodia.

Consider the following examples: The cost of taking an air-conditioned luxury bus from the Cambodian capital of Phnom Penh to its major port, Sihanoukville, is less than $2. The same bus trip of equal distance in Japan or the United States would cost $50 or more. Similarly,

a (subsidized) lunch at a factory producing Nike shoes in Vietnam may cost the equivalent of 5 U.S. cents in 1998, while lunch at a student union on a U.S. college campus may cost $5. Thus a teaching assistant on a U.S. campus pays 100 times more for lunch than the Vietnamese factory worker. Who is more "poorly paid" in these situations? Add to this the reality that in many developing countries where extended families are common, members of the family often pool their earnings, which individually may be quite low. To look only at individual earnings can thus be rather misleading. Such cultural nuances are important to keep in mind in assessing economic conditions and welfare in other nations.

Various economic puzzles can also create confusion and misunderstanding. For example, currently the United States has the highest trade deficit in world history: it imports far more that it exports. Most countries with huge trade deficits have a weak currency, but the U.S. dollar has remained strong. Why is this the case? Actually, it is quite understandable when one knows that the balance of trade is just one of many factors that determine the value of a nation's currency. In truth, demand for the U.S. dollar has remained high. The United States is an attractive site for foreign investment because of its large and growing economic market and extremely stable politics. Second, the United States has a large tourism sector, drawing people to the country where they exchange their currency for U.S. dollars. Several years ago, for the first time ever, there were more Thais coming to the United States as tourists than those in the United States going to Thailand. Third, the United States is extremely popular among international students seeking overseas education. Economically, a German student who spends three years studying in the United States benefits the economy in the same way as a long-term tourist or conventional exports: that student invests in the U.S. economy. In the academic year 1999-2000, there were 514,723 international students in the United States spending approximately $12.3 billion. Thus, the services provided by U.S. higher education represent an important "invisible export." Fourth, 11 economies are now dollarized, which means that they use the U.S. currency as their national currency. Panama is the most well known of these economies and El Salvador became a dollarized economy on 1 January 2001. Other countries are semi-officially or partially dollarized (Cambodia and Vietnam, for example). As the result of dollarization, it is estimated by the Federal Reserve that 55 to 70 percent of all U.S. dollars are held by foreigners primarily in Latin America and former parts of the U.S.S.R. Future candidates for dollarization are Argentina, Brazil, Ecuador, Indonesia, Mexico, and even Canada. With so many countries using U.S. dollars, demand for the U.S. dollar is increased, adding to its strength. For all these reasons, the U.S. currency and economy remained strong despite the persisting large trade deficits, which in themselves, according to standard economic logic, suggest weakness.

SYSTEMS OF CLASSIFICATION. As in other fields, such as biology and botany, it is important to have a sound system of classification to understand various national economies. Unfortunately, the systems commonly used to describe various national economies are often flawed by cultural and Eurocentric biases and distortion. After the end of World War II and the start of the Cold War, it became common to speak of "developed" and "underdeveloped" countries. There were two problems with this overly simplistic distinction. First, it viewed countries only in terms of material development. Second, it implied that a nation was developed or underdeveloped across all categories. As an example, "underdeveloped" Thailand has consistently been one of the world's leading food exporters and among those countries that import the least amount of food. Similarly, in "developed" Japan there are both homeless people and institutions to house the elderly, while in "underdeveloped" Vietnam there are no homeless and the elderly are cared for by their families. Which country is more "developed"?

Later the term "Third World" became popular. This term was invented by the French demographer Alfred Sauvy and popularized by the scholar Irving Horowitz in his volume, *Three Worlds of Development.* "First World" referred to rich democracies such as the United States and the United Kingdom; "Second World" referred to communist countries such as the former U.S.S.R. and former East Germany. The term "Third World" was used to refer to the poorer nations of Africa, Latin America, and Asia (with the exception of Japan). But this distinction is also problematic, for it implies that the "First World" is superior to the "Third World." Another common term introduced was modern versus less modern nations. The Princeton sociologist Marion J. Levy made this distinction based on a technological definition: more modern nations were those that made greater use of tools and inanimate sources of power. Thus, non-Western Japan is quite modern because of its use of robots and bullet trains. Over time, however, many people criticized the modern/non-modern distinction as being culturally biased and implying that all nations had to follow the same path of progress.

More recently, economists from around the world have recognized the importance of using a variety of factors to understand the development of national economies. Each of these factors should be viewed in terms of a continuum. For example, no country is either completely industrial or completely agricultural. The entries in this volume provide the basic data to assess each national economy on several of these key criteria. One can determine, for example, the extent to which an economy is industrial by simply dividing the percentage of

the economy made up by industry by the percentage made up by agriculture. Or one can determine how much energy national economies use to achieve their level of economic output and welfare. This provides an important ecological definition of efficiency, which goes beyond limited material definitions. This measure allows an estimate of how "green" versus "gray" an economy is; greener economies are those using less energy to achieve a given level of economic development. One might like to understand how international an economy is, which can be done by adding a country's exports to its imports and then dividing by GDP. This indicator reveals that economies such as the Netherlands, Malaysia, Singapore, and Hong Kong are highly international while the isolationist Democratic People's Republic of Korea (North Korea) is far less international.

Another interesting measure of an economy, particularly relevant in this age of more information-oriented economies and "the death of distance" (Cairncross 1997), is the extent to which an economy is digitalized. One measure of this factor would be the extent to which the population of a given economy has access to the Internet. Costa Rica, for example, established a national policy that all its citizens should have free access to the Internet. In other economies, such as Bhutan, Laos, and North Korea, access to the Internet is extremely limited. These differences, of course, relate to what has been termed "the digital divide." Another important factor is whether an economy is people-oriented, that is, whether it aims to provide the greatest happiness to the greatest number; economist E.F. Schumacher called this "economics as if people mattered." The King of Bhutan, for example, has candidly stated that his goal for his Buddhist nation is not Gross National Product but instead Gross National Happiness. Such goals indicate that the level of a country's economic development does not necessarily reflect its level of social welfare and quality of life.

Another important category that helps us understand economies is the degree to which they can be considered "transitional." Transitional economies are those that were once communist, state-planned economies but that are becoming or have become free-market economies. This transitional process started in China in the late 1970s when its leader Deng Xiaoping introduced his "four modernizations." Later, Soviet leader Mikhael Gorbachev introduced such reforms, called *perestroika,* in the former Soviet Union. With the dissolving of the U.S.S.R. in 1991, many new transitional economies emerged, including Belarus, Uzbekistan, Kyrgyzstan, and the Ukraine. Other countries undergoing transition were Vietnam, Laos, Cambodia, and Mongolia. These economies can be grouped into two types: full transitional and partial transitional. The full transitional economies are shifting both to free markets and to liberal democracies with free expression, multiple parties, and open elections. The partial transitional economies are changing in the economic realm, but retaining their original one-party systems. Included in the latter category are the economies of China, Vietnam, Laos, and Cuba. This volume provides valuable current information on the many new transitional economies emerging from the former Soviet world.

KEY THEMES IN THE WORLD ECONOMY. In looking at the economies of countries around the globe, a number of major common themes can be identified. There is increasing economic interdependence and interconnectivity, as stressed by Thomas Friedman in his recent controversial book about globalization titled *The Lexus and the Olive Tree: Understanding Globalization.* For example, the People's Republic of China is now highly dependent on exports to the United States. In turn, U.S. companies are dependent on the Chinese market: Boeing is dependent on China for marketing its jet airliners; the second largest market for Mastercard is now in China; and Nike is highly dependent on China and other Asian economies for manufacturing its sports products. Such deep interdependence augurs well for a peaceful century, for countries are less likely to attack the countries with whom they do a vigorous business, even if their political and social systems are radically different. In fact, new threats to peace as reflected in the tragic terrorist attack of 11 September 2001, primarily relate to long-standing *historical* conflicts and grievances.

Conventional political boundaries and borders often do not well reflect new economic realities and cultural patterns. Economic regions and region states are becoming more important. The still-emerging power of the European Union can be gauged by reading the essays of any of the countries that are currently part of the Union or hoping to become a part of it in the coming years. This volume may help readers better understand which nations are becoming more interconnected and have similar economic conditions.

The tension between equity (fairness) and efficiency is common in nearly all national economies. In some economies there is more stress on efficiency, while in others there is more stress on equity and equality. Thus, as should be expected, countries differ in the nature of the equality of their income and wealth distributions. For each entry in this volume, important data are provided on this important factor. The geographer David M. Smith has documented well both national and international inequalities in his data-rich *Where the Grass is Greener* (1979).

Invisible and informal economies—the interactions of which are outside regulated economic channels—represent a growing segment of economic interactions in some countries. In his controversial but important volume, *The Other Path* (1989), the Peruvian economist Hernando de Soto alerted us to the growing significance of the informal economy. In countries such as Peru, research has

shown that in some cases individuals prefer work in the informal to the formal sector because it provides them with more control over their personal lives. The Thai economist Pasuk Phongpaichit and her colleagues have written a fascinating book on Thailand's substantial invisible economy titled *Guns, Girls, Gambling, and Ganja* (1998). Thus, official government and international statistical data reported in this volume often are unable to take into account such data from the hidden part of economies.

In an increasingly internationalized economy in which transnational corporations are highly mobile and able to move manufacturing overseas quite rapidly, it is important to distinguish between real foreign direct investment and portfolio investment. At one point during Thailand's impressive economic boom of the late 1980s and early 1990s, a new Japanese factory was coming on line every three days. This is foreign direct investment, involving actual bricks and mortar, and it creates jobs that extend beyond the actual facility being constructed. In contrast foreign portfolio investment consists of a foreign entity buying stocks, bonds, or other financial instruments in another nation. In our current wired global economy, such funds can be moved in and out of nations almost instantaneously and have little lasting effect on the economic growth of a country. Economies such as Chile and Malaysia have developed policies to try to combat uncertainty and related economic instability caused by the potential of quick withdrawal of portfolio investments.

Some argue that transnational corporations (owned by individuals all over the world), which have no national loyalties, represent the most powerful political force in the world today. Many key transnational corporations have larger revenues than the entire gross national products of many of the nations included in this volume. This means that many national economies, especially smaller ones, lack effective bargaining power in dealing with large international corporations.

Currently, it is estimated by the International Labor Office of the United Nations that one-third of the world's workforce is currently unemployed or underemployed. This means that 500 million new jobs need to be created over the next 10 years. Data on the employment situation in each economy are presented in this volume. The creation of these new jobs represents a major challenge to the world's economies.

The final and most important theme relates to the ultimate potential clash between economy and ecology. To the extent that various national economies and their peoples show a commitment to become greener and more environmentally friendly, ultimate ecological crises and catastrophes can be avoided or minimized. Paul Ray and Sherry Anderson's *The Cultural Creatives: How 50 Million People Are Changing the World* (2000) lends credence to the view that millions are changing to more environmentally conscious lifestyles.

In trying to understand the global economy, it is critically important to have good trend data. In each of the entries of this volume, there is an emphasis on providing important economic data over several decades to enable the reader to assess such patterns. Some trends will have tremendous importance for the global economy. One phenomenon with extremely important implications for population is the policy of limiting families to only one child in China's urban areas. This deliberate social engineering by the world's most populous country will have a powerful impact on the global economy of the 21st century. The global environmental implications are, of course, extremely positive. Though there is much debate about the economic, political, and socio-cultural implications of this one-child policy, overall it will probably give China a tremendous strategic advantage in terms of the key factors of human resource development and creativity.

THE POWER OF UNDERSTANDING. By enhancing our knowledge and understanding of other economies, we gain the potential for mutual learning and inspiration for continuous improvement. There is so much that we can learn from each other. Denmark, for example, is now getting seven percent of its electrical energy from wind energy. This has obvious relevance to the state of California as it faces a major energy crisis. The Netherlands and China for a long period have utilized bicycles for basic transportation. Some argue that the bicycle is the most efficient "tool" in the world in terms of output and energy inputs. Many new major highways in Vietnam are built with exclusive bike paths separated by concrete walls from the main highway. The Vietnamese have also developed electric bicycles. The efficient bullet trains of Japan and France have relevance to other areas such as coastal China and the coastal United States. Kathmandu in Nepal has experimented with non-polluting electric buses. In the tremendous biodiversity of the tropical forests of Southeast Africa, Latin America, and Africa, there may be cures for many modern diseases.

We hope to dispel the view that economics is the boring "dismal science" often written in complex, difficult language. This four-volume set presents concise, current information on all the economies of the world, including not only large well-known economies such as the United States, Germany, and Japan, but also new nations that have emerged only in recent years, and many micro-states of which we tend to be extremely uninformed. With the publication of this volume, we hope to be responsive to the following call by Professor Mark C. Schug: "The goal of economic education is to foster in students the thinking skills and substantial economic knowledge necessary to become effective and participating citizens." It is our hope that this set will enhance both economic and

geographic literacy critically needed in an increasingly interconnected world.

ALBANIA

Republic of Albania
Republika é Shqipërisë

CAPITAL: Tiranë.

MONETARY UNIT: Lek (Lk). One lek equals 100 qindarka. There are coins of 5, 10, 20, and 50 qindarka and 1 lek, and notes of 1, 3, 5, 10, 25, 50, 100, and 500 leke.

CHIEF EXPORTS: Textiles, footwear, asphalt, metals and ores, oil, fruits, tobacco, semiprocessed goods.

CHIEF IMPORTS: Machinery and equipment, foods, textiles, chemicals.

GROSS DOMESTIC PRODUCT: US$10.5 billion (2000 est.).

BALANCE OF TRADE: **Exports:** US$310 million (2000 est.). **Imports:** US$1 billion (2000 est.). [The CIA *World Factbook* estimates that exports in 1999 were US$242 million while imports were US$925 million.]

COUNTRY OVERVIEW

LOCATION AND SIZE. Albania is located in the southwestern part of the Balkan peninsula in southeastern Europe. It is bordered by the Yugoslav republics of Montenegro, Serbia, and Macedonia, and by Greece and the Adriatic and Ionian Seas. Albania has an area of 28,748 square kilometers (11,100 square miles), making it slightly smaller than Maryland. The capital, Tiranë, is situated in the west-central part of the country near the Adriatic Sea.

POPULATION. The population of Albania was 3,510,484 in July 2001, compared with 2,761,000 in 1981. Population density averaged 111 inhabitants per square kilometer (287 per square mile) but nearly two-thirds of the population were concentrated in the west, especially in the Tiranë-Durrës region. Density there reached 300 inhabitants per square kilometer (777 per square mile). In 2001, the birth rate was 19.01 per 1,000 population while the death rate equaled 6.5 per 1,000. Albania had one of the most youthful populations in Europe, with 30 percent below the age of 14 and just 7 percent older than 65. The population growth rate in 2000 was comparatively modest, at only 0.88 percent, and the **emigration** rate stood at 3.69 per 1,000. Since the collapse of **communism** in 1989, many Albanians, allowed to travel abroad for the first time, have left their impoverished country for western Europe, mostly for Italy, Greece, Switzerland, and the United States. The emigration rate has declined from a previous rate of 10.36 in 2000, however.

There are 2 major Albanian ethnic subgroups with distinct dialects: the Gegs in the north, and the Tosks in the south. The Gegs account for more than half of the population, but the Tosks have been traditionally in control. The Tosk dialect of Albanian is the official language. Albanians account for 95 percent of the population, Greeks for 3 percent, and Vlachs, Gypsies, and Bulgarians for the other 2 percent. Albania is predominantly rural, with about 59 percent of the population living in the countryside (1999). The population of the capital—Tiranë—is 312,220 (2000); other cities include Durrës, Elbasan, Shkodër, and Vlorë.

OVERVIEW OF ECONOMY

Albania is Europe's poorest country; its annual **gross domestic product (GDP) per capita** was about US$1,000 in 1997, more than 10 times lower than in neighboring Greece. Liberated from Turkish domination in 1912, the country endured periods of anarchy, autocratic rule, and foreign occupation before being taken over by communists in 1944. Until the collapse of communism in 1989, Albania was ruled in international isolation by a rigid Stalinist regime. All economic activity was **nationalized** and the production of **consumer goods** and the development of the **infrastructure** were neglected while heavy industry was stressed. Since the collapse of the Soviet Union in 1989, market reforms have taken a foothold and a **privatization** program has

been in place since 1992, when the pro-market Democratic Party formed a cabinet.

Reforms have been slow, however, and the economy shaky as a result. Particularly disastrous was the 1997 collapse of several financial **pyramid schemes**) that wiped out the life savings of half of the Albanian population, causing violent riots. The democratic government was toppled, and foreign investors fled in panic. The Kosovo refugee crisis of 1999 dealt another heavy blow. Albania has been plagued by corruption and inadequate reporting; the flow of goods crossing the frontiers has remained largely unknown, and tax collection rates have been unsatisfactory. Organized crime and the trafficking of drugs and stolen cars from western Europe are a major social problem.

The **socialist** government, in office since 1997, has curbed crime, strengthened customs inspections, improved tax collection, and carried on with privatization. Some 420 comparatively larger enterprises were put on the market after **restructuring**, including Albpetrol (oil and gas and pipelines), Albakri (copper mining), Albkromi (chrome), Telekom Shqiptar, and the Albanian Mobile Phone Company. Many state-held assets were liquidated. Stable and independent government institutions were still a dream in 2000, however, although younger **technocrats** had been involved in decision-making and a more informative economic database was created.

In 2000, the Albanian economy grew by 7 percent, although it started from a low base. The currency was stable, **inflation** was only 2 percent (in 1999), and money transfers from Albanians abroad fueled a house-building boom. The International Monetary Fund (IMF) cautiously praised the authorities for progress in structural reform and their commitment to reducing poverty. Foreign investments in 2000 reached US$143 million (up from US$43 million in 1999), a Greek-Norwegian consortium bought the first mobile-phone network, a Greek-British consortium bought the second mobile-phone license, and corruption diminished.

Poverty is still pervasive and the country is burdened by a large foreign **trade deficit** (US$690 million in 2000). Among the government's concerns are the improvement of agriculture and the obsolete road network, encouraging private enterprise, and **liberalizing** foreign trade. The opening up of **free trade zones** to attract investors is expected to be supplemented by an improved legal environment, a financial sector restructuring, and a strengthening of law and order (safety is still a big concern in Albania). Heavily dependent on foreign economic aid, in 1997 the country received US$630 million in financial support and a US$58 million poverty reduction and growth facility (loan) from the International Monetary Fund (IMF), the World Bank, and the European Union (EU). No considerable funding has yet been received from the Stability Pact for Southeastern Europe, a regional initiative backed by the EU and the United States. Albania has not yet started negotiations to become a part of the EU, which insists that more substantial reforms are needed before talks could start.

POLITICS, GOVERNMENT, AND TAXATION

Albania is a parliamentary democracy with a **unicameral** (1–house) 155-member parliament. The presi-

dent is the head of state, but the prime minister is the executive head of government. The 2 major parties are the left-of-center Socialists (reformed communists) and the right-of-center Democratic Party. In the 1997 elections, the socialists won 101 seats, blaming Sali Berisha, the first post-communist president, and his democrats for the financial pyramid scams, economic chaos, rampant corruption, authoritarianism, and fraud. The socialists, whose power base lies mostly in the south, formed a coalition with the center-left social-democrats (8 seats), the small, predominantly ethnic Greek Human Rights Party (4 seats), and the smaller centrist Democratic Alliance (2 seats). They have a chance of remaining in office at the election in mid-2001. The democrats, whose power base is mainly in the north, retained 27 seats in parliament.

In early 2001, the state's role in the economy was diminishing, but the government was still highly centralized and financial resources were concentrated at the national level. In an attempt to attract foreign investors, Albania planned to create free-trade zones and companies operating in them would be exempt from import **duties** and a **value-added tax** (VAT) but not from taxes on profits. In order to curb the **budget deficit**, the government nearly doubled the VAT to 20 percent and increased **excise taxes** in 1997. The tax share of GDP was set to 22 percent in the 2001 budget, close to the norm for other economies making the transition from a communist to a market system. Albania had a **foreign debt** of US$820 million in 1998, which was not considered disproportionate.

INFRASTRUCTURE, POWER, AND COMMUNICATIONS

Albania's infrastructure is far below the standards of other European countries. There are 18,000 kilometers (11,250 miles) of roads, of which 5,400 kilometers (3,355 miles) are paved, and rapid expansion in private car ownership (prohibited in communist times) has placed a great pressure on the network. Since the Kosovo war in neighboring former Yugoslavia, NATO has rebuilt the Albanian roads it used, and western governments have offered funding for several construction projects. One of them runs north-south from the border with Montenegro via Shkodër, Durrës and Vlorë to the Greek frontier (requiring US$94.8 million for its completion). Another runs east-west from Durrës via Elbasan to the Macedonian frontier (costing US$155.9 million). Albania has received US$108 million from the European Investment Bank (EIB) for completion of the Durrës-Kukës highway and other segments.

The railroad network has 447 kilometers (277.7 miles) of single track, not connected to the railroads of any neighboring country and in poor condition. Thirty-eight kilometers (23.6 miles) of the Durrës-Tiranë line were under renovation in 2000. Two seaports are located at Durrës and Vlorë. Albania's only international airport, Rinas, is located outside Tiranë and has 1 runway and a small passenger terminal.

Albania's power system has 1,670 megawatts (MW) of installed capacity, of which 1,446 MW is in hydropower plants (the country's mountainous terrain is favorable for that type of power) and 224 MW in thermal plants. A quarter of the energy is lost due to technical inadequacies, and blackouts are still frequent. Often, electricity reaching consumers is not paid for (70 percent of the clients refused to pay their bills in 1997). A particular concern is the theft of electricity by bypassing meters. The power utility, Korporata Elektroenergjitike, is still in state hands but is scheduled for privatization in 2001. A loan of US$30 million from the World Bank, US$12 million from Exportfinans of Norway, and US$1.2 million from the Chinese government helped Albania repair its electric grid in 2000.

The telephone system is obsolete, with 42,000 main lines in 1995 (11,000 telephones in Tiranë). In 1992, rioting peasants cut the wire to about 1,000 villages and used it to build fences. There were 3,100 mobile phones

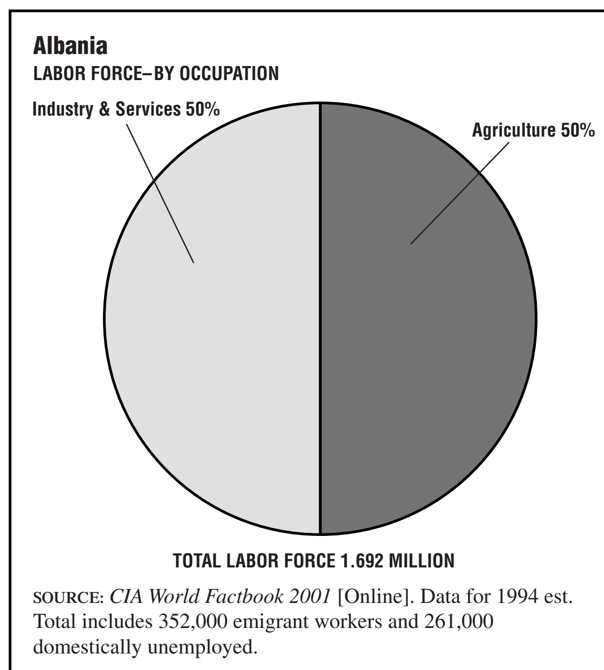
in 1999, with coverage limited to the main cities. In 2000, the privatization of the mobile phone company, Albanian Mobile Communications (AMC), was completed, and the sale of the fixed-line operator, Albtelekom, was set for 2001. A consortium of Vodafone (UK) and Panafon (Greece) won a mobile telephony license in early 2001 for US$38 million.

ECONOMIC SECTORS

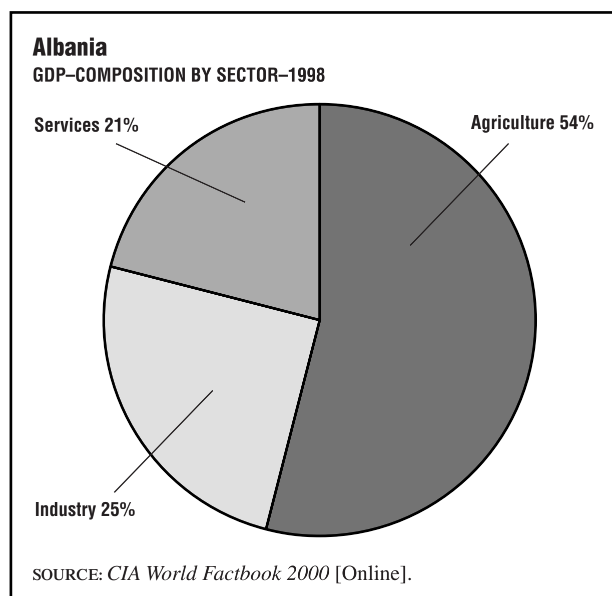
Albania's economy remains predominantly agricultural, and in 1999, the contribution of agriculture to GDP was 53 percent, up from 32.3 percent in 1989. Industry's share slipped from nearly 45 percent in 1989 to 26 percent in 1999, because of the collapse of loss-making state-run factories and the return of many workers to farming. The percentage of the population engaged in agriculture reached one-half by 1997. In 1998, 27 percent of the farms were engaged in **subsistence farming**—which means they did not sell their goods to the market—and only half used machinery. Prior to 1991, services were underdeveloped, with virturally no tourism and rudimentary banking and **retail** sectors. New service industries such as tourism and banking started to develop in the 1990s, mostly with foreign investment, but suffered in the 1997 financial collapse. The shrinking Albanian industry is based on local natural resources, notably oil, lignite, copper, chromium, limestone, bauxite, and natural gas.



SOURCE: *CIA World Factbook 2001* [Online]. Data for 1994 est. Total includes 352,000 emigrant workers and 261,000 domestically unemployed.

AGRICULTURE

In 1992, peasants took control of formerly collectivized land and livestock. Many collective farms (farms held by the state and worked by citizens) were looted, orchards were cut down for firewood, and agricultural output collapsed by almost half. Much of the irrigation works and greenhouses of the communist regime were looted. Under private ownership, agriculture picked up and by 1995, production was above the 1990 level. Serious problems facing farmers are the lack of technology and the tiny size of land holdings. In 1999, 42 percent of farms used animal and manpower alone. Self-sufficiency, forced on farmers by the communist prohibition of private trade, is high. In 1999, 48.5 percent of farm households bought no outside food. International lenders, such as the World Bank, the EU, and the U.S. Agency for International Development (USAID), have financed repairs and drainage projects, but the consolidation of small farm plots into larger and more efficient units has been slow. Albania imports basic foods (worth Lk3.8 billion in 1999, up from Lk3.7 billion in 1998), yet agriculture provides the livelihood for the majority of the population. Crops include wheat, corn, olives, sugar beets, cotton, sunflower seeds, tobacco, potatoes, and fruits. The livestock population was estimated in the early 1990s as including some 500,000 cattle, 1 million sheep, and 170,000 pigs.



SOURCE: *CIA World Factbook 2000* [Online].

INDUSTRY

Mining, metallurgy, food processing, textiles, lumber, and cement were among the leading industries in Albania under the communist regime, when heavy industry was a priority and some factories were capable of exporting. Until 1961, most equipment was supplied by the Soviet Union and then by China until 1978. After 1989, the sector declined due to the lack of new technology and financing and the dilapidated condition of the factories.

In the 1990s, plants and equipment were destroyed and sold for scrap, or fell into disuse, unable to compete with cheaper imports that came with trade liberalization. A revival of chromium, steel, and cement industries came with the increase of foreign investments in 2000. Some new equipment was purchased in the West for a cigarette-making plant in Durrës and for a manufacture of underwear in Korçë. Construction, especially in housing, was the main factor for investment growth.

Mining is a large (but shrinking) sector of the economy, given the rich deposits of bauxite, chromium, nickel, iron, copper ores, and petroleum. The export of raw materials is crucial for foreign exchange earnings. In the 1980s, Albania ranked third worldwide in chromium ore production. Output plunged 3 times to 157,000 tons in 1997, because of the weakening of domestic demand in addition to the closing down of loss-making industries, the lack of capital, high costs, problems with the electricity supply, and the economic chaos of 1997. Albania's output of copper was reduced from 1 million tons per year in the late 1980s to 25,000 tons in 1997. Iron-nickel mining collapsed in the early 1990s with the closing down of the steel works of Elbasan, its main client, but was revived in 2000 due to Turkish involvement at the plant. Coal and petroleum output and petroleum refineries production have also declined in the 1990s due to their inadequate technology.

SERVICES

Albania's banking system under communism was state-run and underdeveloped. By the early 1990s, the 3 major state banks were cash-strapped due to irrecoverable loans to loss-making industries. Since then, almost all banks (except the largest one, the Savings Bank) have been privatized, most in the form of **joint ventures** with foreign partners, including the Italian Albanian Bank (IAB), the Arab Albanian Islamic Bank (AAIB), and the Dardania Bank (DB). The sector has been plagued by a lack of capitalization and a lack of experience and technology. Little long-term investment credit is available, and debt collection is uncertain. The 1997 financial pyramids collapse annihilated US$1 billion in savings and only US$50 million seemed recoverable by 2000. To relieve the situation, the Bank of Albania (the central bank) imposed restrictions on banks (including credit limits and minimum interest rates) that additionally contracted the credit market. Albanians became extremely cautious in depositing money in the banks, and **private sector** investment started to rely on financing through family, friends, and partners. Larger companies transferred funds abroad and Albanian banks came to rely on short-term deposits and lending to selected customers for short-term trade financing. The privatization of the remaining state-owned bank, the Savings Bank (SB), was delayed in 2000 due to improperly audited accounts and was rescheduled for June 2001.

Albania's tourist industry is in an embryonic stage. There are few foreign visitors to its picturesque Mediterranean shore because of the lack of adequate infrastructure and fears for personal safety. A few modern hotels appeared in 2000, backed by foreign investment, but revenues were weak. With the privatization of retail businesses in the early 1990s, the sector was characterized by a large number of small family retailers. The quality of service was still rather poor because of the low household income and the subsistence farming of the majority of the rural population. In 1999 and 2000, the retail and hotel industry had a modest boom due to the presence of foreign troops involved in the Kosovo war.

INTERNATIONAL TRADE

Albania depends on imports for most of its consumption. It was not able to produce enough exports to offset its large trade deficit of US$814 million in 1999, a huge sum for the size of the economy. This trade deficit may create serious problems for Albania in the near future. A major contribution to offsetting the deficit are money transfers from Albanians abroad, which grew from US$324 million in 1999 to US$531 million in 2000. Raw material exports are also crucial but gradually shrinking. Exports are declining, particularly in minerals, contributing only 8 percent of domestic exports in the last quarter of 1999, down from 45 percent in 1998. **Re-exports** of goods processed in Albania for manufacturers abroad increased mostly in textiles and footwear but also in electrical appliances, foods, and metal products. In the last quarter of 1999, they contributed 70 percent of total exports, a 29 percent increase from the last quarter of 1998. Exports by the tobacco industry were down by almost a third in 1999 from 1998, and other agricultural exports were hit by drought. The EU countries are Albania's chief trading partners, notably neighboring Italy and Greece, partly due to subcontracting for Italian and Greek manufacturers drawn by cheap local labor. Other significant trading partners include Germany, Turkey, Bulgaria, Macedonia, and the United States. Albania joined the World Trade Organization (WTO) in 2000 and is committed to trade liberalization and reducing **tariffs** on imports. In 1999, the EU promised Albania preferred trade status and reduced some tariffs on Albanian exports.

MONEY

After the economic collapse of 1997, the **monetary policy** of the Bank of Albania was tightened and the regulation of the financial sector was improved. The currency was stabilized and kept under control. The **exchange rate** of the lek shifted from 179.06 per US$1 in

1997 to almost 140 per dollar in 2001. New legislation included a law on bank deposit insurance and the setting up of a credit information bureau, an investment advisory office, a mediation office for commercial disputes, and an agency for the execution of bankruptcy and other related court decisions. Nevertheless, banking is not efficient, and the economy is still cash-driven. There is no formal **equities** market in the country as the Tiranë Stock Exchange (scheduled for privatization) is trading in Albanian **treasury bills** only.

POVERTY AND WEALTH

Poverty in Albania is widespread due to limited job opportunities, low income, and limited access to basic services such as education, health, water, and sewerage. Under the communist regime, employment was almost total, and the government provided some livelihood for nearly everyone. In the 1990s, the collapse of the state-run farms and industrial enterprises, unemployment, organized crime, and corruption generated widespread new poverty along with numerous illicit fortunes. Many families came to rely on transfers from family members abroad as 25 percent of working-age Albanians emigrated, only a fifth of them legally. More than 17 percent of the population lived under the poverty line in 2000, and 90 percent of the poor live in rural areas. Sixty percent of those heading poor households are self-employed in subsistence farming. The situation is worse in the north, where many rural families own less than 0.5 hectares. In Tiranë, there were about 800 street children in 2000 and child laborers numbered between 35,000–50,000 as need forced them to leave school early. Drug abuse, prostitution, trafficking in women, and child abuse have all increased with the economic hardship of the 1990s.

WORKING CONDITIONS

The Albanian **labor force** numbered 1.692 million (including 352,000 emigrants and 261,000 unemployed) in 2000. The private sector had between 900,000 and 1,000,000 workers, mostly in agriculture and small shops and enterprises. The unemployment rate was 18.2 percent in 2000, but unemployment in the rural regions, particularly in subsistence farming, was not reflected in this figure. Minimum wages are US$50 per month, insufficient to provide a decent standard of living. Many Albanians work with outdated technology and without adequate safety regulations. Workplace conditions are generally poor and often dangerous. The workweek is 48 hours, but hours are set by individual or collective agreement. Under the communist regime, unions were government-controlled and independent unions only emerged in 1991. The Independent Confederation of Trade Unions, with an estimated 127,000 members, was formed as an umbrella group for most branch unions.

SOURCE: World Bank. *World Development Indicators 2000.*

The Confederation of Trade Unions represents school, petroleum, postal, and telecommunications workers and has 80,000 members. Union membership declined after 1997 because of the expansion of the private sector (few of its workers have unions). Labor disputes have been often confrontational and passionate.

COUNTRY HISTORY AND ECONOMIC DEVELOPMENT

168 B.C. Romans take over Illyria (comprising most of present-day Albania).

1000s A.D. Illyria becomes known as Albania; feudal agriculture develops and Adriatic cities become centers of commerce.

1388. Ottoman Turks invade Albania and subdue it by the early 16th century.

1500s. The Ottomans convert many formerly Christian Albanians to Islam. The feudal economy remains unchanged into the 20th century.

1878. Albanian nationalism grows and the Prizren League is organized in the present-day Kosovo province of Serbia to work for national independence.

1912. Albania is liberated from the Ottomans. The European powers recognize its independence but leave nearly half of the ethnic Albanians outside its borders.

1919. U.S. President Woodrow Wilson vetoes the partition of Albania among its neighbors following the end of World War I.

1925. Albania is taken over by a dictatorship and gradually turns into an Italian protectorate.

1939. Italian troops occupy Albania at the start of World War II.

1944. Albanian communists take over and impose Stalinist economic rules, which last until the collapse of the Soviet Union in 1989.

1990. A multi-party system is allowed as thousands of Albanians try to escape the country by fleeing to foreign embassies in Tiranë.

1991. The first multi-party elections are won by the reformed communists, while the opposition Democratic Party wins 75 seats in the Assembly. Massive labor unrest topples the government.

1992. Elections are won by the democrats, and economic reforms and liberalization gain momentum. Elections in 1996 leave the cabinet in office but the opposition voices fraud accusations.

1997. The collapse of pyramid schemes causes violent riots. The government is toppled and the socialists (reformed communists) return to power in early elections.

1999. More than 400,000 Albanian refugees from Kosovo flood into Albania.

2000. Albania joins the World Trade Organization.

FUTURE TRENDS

With its economy reviving from the collapse of 1997, Albania remains essentially a developing country requiring heavy investment for its modernization. Without significant progress in coping with crime and weak state institutions, its internal stability is not yet guaranteed. Reforms are needed to enforce democracy and develop favorable conditions for foreign investment. Albania has strong potential for growth due to its youthful population and the large number of **guest workers**, many of whom may return with capital and know-how once domestic conditions improve. Proximity to Italy and Greece, abundant natural resources, and potential tourist attractions are additional factors that may encourage development. EU membership is not yet an issue for Albania, but with the accession of Balkan neighbors, its chances will grow.

The Socialist Party is expected to stay in power after the election in 2001 and GDP is likely to keep its growth rate of 7 percent driven by the privatization of power, the Savings Bank, hotels, and other government assets. Inflation will be low and unemployment will gradually decline, but many Albanians will continue to support their families by working abroad. Import dependency will diminish as domestic industry slowly picks up and the development of tourism and increasing money transfers may alleviate the trade deficit situation. However, Albania will remain dependent on international aid for the foreseeable future.

DEPENDENCIES

Albania has no territories or colonies.

ANDORRA

Principality of Andorra
Principat d'Andorra

CAPITAL: Andorra la Vella.

MONETARY UNIT: No local currency; French and Spanish currencies are both used in the country. Both Spain and France, along with 9 other members of the European Union (EU), are in the process of changing over from their national currencies to the single currency of the EU, the euro, for all transactions. This transition will be completed with the introduction of euro coins and bills in January 2002.

CHIEF EXPORTS: Tobacco products, furniture.

CHIEF IMPORTS: Consumer goods, food, electricity.

GROSS DOMESTIC PRODUCT: US$1.2 billion (purchasing power parity, 1996 est.).

BALANCE OF TRADE: **Exports:** US$58 million (f.o.b., 1998 est.). **Imports:** US$1.077 billion (c.i.f., 1998 est.).

COUNTRY OVERVIEW

LOCATION AND SIZE. Andorra, a tiny landlocked principality in southwestern Europe, is situated in the eastern Pyrenees Mountains, bordered on the north and east by France and on the south and west by Spain. It comprises a region of 7 narrow valleys and the adjacent peaks reaching heights of more than 2,700 meters (about 8,860 feet) above sea level. Also named the Valleys of Andorra, the country has an area of only 468 square kilometers (181 square miles), about 2.5 times the size of Washington, D.C., or about half the size of New York City. The capital is Andorra la Vella (Andorra of the Valley), with a population of 21,985 in 1996.

POPULATION. The population of Andorra was estimated at 66,824 in July 2000, up from 64,716 in 1998. Although mountainous, the country is densely populated, with an overall density of 138 persons per square kilometer (358 per square mile). The population, however, is unevenly distributed, and is concentrated in the 7 urbanized valleys that form the country's parishes (political districts): Andorra la Vella, Canillo, Encamp, La Massana, Escaldes-Engordany, Ordino, and Sant Julia de Loria. Andorra has a slow population growth rate of 1.22 percent, fueled by a birth rate of 10.58 births per 1,000 population, a death rate of 5.27 deaths per 1,000 population, and a high net **immigration** rate of 6.9 migrants per 1,000 population

(all according to 2000 estimates). The Andorrans have a very high life expectancy at birth, standing at 83.46 years for the total population (80.56 for men and 86.56 for women). This is attributed partly to the pleasant mountainous climate, and partly to the prosperous economy and sufficient health care provisions in the country. The population is aging, as in much of the rest of Europe, with 15 percent of the Andorrans younger than 15 years, 72 percent between 15 and 64 years, and 13 percent 65 years or older.

Native Andorrans, curiously enough, represent a minority (only about 33 percent of the population) in their own country; they are Catalan in their culture and language. The official language of the principality is also Catalan, a romance language, spoken also by more than 6 million people in the regions of French and Spanish Catalonia (in southwestern France and northeastern and eastern Spain and the Balearic islands in the Mediterranean). More people of Andorran descent live outside the country (particularly in France) than in their home country, because historically, as in many similar societies with very limited land supply, land ownership has been strictly passed on to the oldest heirs while the rest often have had to seek their fortunes elsewhere. Spanish, French, and Portuguese immigrants (both working people and entrepreneurs) make up the majority of the population of the principality, and the Spanish, French, and Portuguese languages are widely spoken. Spaniards (Catalan-speaking or not) form the largest single ethnic group in the country with 43 percent; Portuguese constitute 11 percent and French 7 percent. Roman Catholicism is not only the predominant religion but also the religion of the state, unlike most European countries that strictly separate the church from the state. For example, only Roman Catholics are permitted to marry in the country, and all public records pertaining to issues such as birth, death, and family status are still kept by the church. Pilgrimages to the shrine of the Andorran patron saint, the Lady of Meritxell, are very popular among believers. The education law requires school attendance for children up to age 16 and a system of French, Spanish, and Andorran lay (secular) schools provides education up to the secondary level. Schools are built and maintained by the Andorran government but salaries for teachers are paid for the most part by France or Spain. About half of the Andorran children attend the French primary schools, and the rest attend Spanish or Andorran ones, which suggests that the role of the French language in the country's culture, communication, and business life will grow in the future.

OVERVIEW OF ECONOMY

Due to its small size and isolated mountainous location, Andorra has preserved its political independence over the years. But these factors also contributed to its economic and developmental impoverishment before World War II. The economy historically has been based on pastoral farming, the processing of tobacco and timber, and the smuggling of goods (mainly tobacco) into the neighboring regions of France and Spain. Over the last 4 or 5 decades of the 20th century, however, the principality has achieved considerable prosperity. This has been mostly due to its status as a tax-free port, the rapid development of tourism in Europe, the dramatic economic progress of its large neighbors France and Spain, and the European integration processes. Many investors and immigrants, both legal and illegal, are now attracted to its thriving economy and its lack of **income taxes**.

Tourism has been developing at a high rate since the mid-1950s and now dominates the principality's economic life. The extensive winter ski facilities, the cool summer climate, and the availability of inexpensive goods in the stores attract numerous tourists to Andorra's humming summer and winter resorts. With about 270 hotels and 400 restaurants, as well as many shops, the tourist industry provides a livelihood to a growing portion of the domestic and immigrant **labor force**.

Trade in consumer products is also very active, mostly in imported manufactured items, which, because of their **duty**-free prices, are considerably cheaper than in other European countries. Partly due to this, smuggling in the country, once a major livelihood, is still widespread. Duty-free status and the price differences between Andorra and its neighbor countries, however, are seen as a serious problem by the European Union (EU) and have had a very significant stake in the debate concerning the principality's relationship with the union. Andorra is a member of the EU customs union and is treated as an EU member for trade in manufactured goods (for which there are no **tariffs**), yet its duty-free shopping status gives it an edge over EU member states. However, the country's comparative advantage in duty-free shopping has been negatively affected as the economies of neighboring France and Spain have been **liberalized** and opened up over the 1990s, resulting in lower tariffs and a wider choice of consumer items.

Negotiations on maintaining Andorra's duty-free status and developing its trade links with the EU began in 1987, soon after neighboring Spain was admitted to the union. A difficult agreement, in effect since July 1991, has set some duty-free quotas and placed limits on certain goods such as tobacco, alcoholic beverages, and dairy products. But as of 2001, Andorra was still allowed to maintain its price differences from other EU countries, and visitors could still enjoy limited duty-free allowances. By creating a modern legal framework, however, the 1993 constitution has allowed Andorra to begin the needed shift from an economic model substantially

based on duty-free shopping to one relying largely on international banking and finance.

Andorra's **gross domestic product** (GDP) for 1998 was worth US$1.2 billion, with tourism providing by far the principal component (roughly 80 percent). **GDP per capita** was a healthy US$18,000 in 1996.

POLITICS, GOVERNMENT, AND TAXATION

Independent since 1278, for more than 7 centuries Andorra has been ruled jointly by the leader (the king, later the president) of France and by Spain's Roman Catholic bishop of the diocese of Urgel, who were acknowledged as "co-princes." Andorra's government, however, had no clear-cut division of powers into executive, legislative, and judiciary, as in most other (and virtually all democratic) states, until the late 20th century. Only in 1993 did Andorran voters approve their first written constitution, transferring all power to the parliamentary principality and proclaiming a sovereign parliamentary democracy. The constitution defined for the first time the rights and obligations of the citizens and the functions and specific terms of the separate legislative, executive, and judicial branches of the government.

The co-princes remained officially Andorra's heads of state, and they serve coequally, with limited powers and without the right to a veto over government acts. Presently, the co-princes are Jacques Chirac, the president of France, and Monseigneur Juan Marti, the bishop of Urgel. Naturally, they do not participate in person in the government's deliberations but are represented by delegates. As co-princes of Andorra, the president and the bishop maintain formally their supreme authority to approve international treaties with France and Spain, as well as all those state acts that deal with important internal security, defense, Andorran territory, diplomatic representation, and judicial or penal cooperation. Although the institution of the co-princes is viewed by many liberals as a medieval anachronism, the majority of the people of Andorra still regard them as an important symbolic element of their historical traditions and a practical way to mediate and balance the influence of both France and Spain. It is also worth mentioning that, until 1993, the principality of Andorra paid every other year, as the medieval treaties stipulated, a tribute worth US$2 to the French president and US$8 to the Spanish bishop. The bishop was additionally entitled to receive a contribution consisting of 6 hams, 6 cheeses, and a dozen live chickens.

The Andorran legislature is the General Council (founded in 1419), which has 28 members, elected to 4-year terms. There is universal suffrage in Andorra, with citizens over the age of 18 having the right to vote. At least one representative from each of the 7 parishes must be present for the General Council to meet. Historically, within the General Council, 4 deputies from each of the 7 parishes have been included in the representation. This arrangement lets the smaller parishes, who have fewer than 400 voters, be represented by the same number of delegates as the larger ones that have more than 2,500 voters. To correct this imbalance, the new constitution included a provision that introduced a modification of the process of electing the Council members; under this new arrangement, half of the delegates were to be selected by the traditional system by parishes and the other half elected from nationwide lists.

The executive power is vested in the Executive Council, headed by a president (in Catalan, the *cap de govern,* or head of government) who is chosen by the General Council and then formally appointed by the co-princes. The president appoints the other executive members of the council.

In the judiciary, civil cases are heard in the first instance by *batlles* (4-judge courts), with 2 judges each appointed by a co-prince. Appeals are heard by the one-judge Court of Appeals. The highest judicial body is the 5-member Superior Council of Justice. The Tribunal of Courts in Andorra la Vella hear all criminal cases. Andorra has no standing armed forces and only a small domestic professional police brigade. All able men possessing firearms serve without compensation in the reserve army, unique in treating all its men as officers. The army's principal responsibility is to carry the Andorran flag at official ceremonies; it has not fought a battle for more than 700 years.

Andorra's young democracy is in the process of redefining its political party system. In recent years, 3 out of the 5 parties that dominated the political scene have dissolved. The former Liberal Union (UL) is reshaping itself and changing its name to the Andorran Liberal Party (PLA), intending to offer a political umbrella to small parties and groups that have not yet consolidated. The currently ruling party is the PLA, led by the *cap de govern*, Marc Forne. The Social Democratic Party (PSD) attracts groups previously aligned with **socialist** ideals, and the third major party is the National Andorran Coalition (CAN). Given the number of parties and Andorra's size, no one party controls the General Council; therefore, legislative majorities arise through coalitions.

The fundamental impetus for the recent political transformation was a recommendation by the Council of Europe in 1990 that if Andorra wished to attain full integration in the European Union (EU), it should adopt a modern constitution which guarantees the rights of those living and working there. A Tripartite Commission made up of representatives of the co-princes, the General Council, and the Executive Council drafted the 1993 constitution. Since its adoption, the government has continued to

address many other long-awaited reforms. In addition to legalizing political parties and trade unions for the first time, freedom of religion and assembly also have been guaranteed.

Since its sovereignty was established with the 1993 constitution, Andorra has become an active member of the international community. In 1993, it established its first diplomatic mission to the United Nations in New York, and in 1995, it established diplomatic relations with the United States. Andorra also has expanded relations with other nations and is a full member of many international organizations, such as the United Nations (UN), the United Nations Educational, Scientific and Cultural Organization (UNESCO), the International Telecommunications Union (ITU), and the Organization for Security and Cooperation in Europe (OSCE). Since 1991, Andorra has a trade agreement with the EU.

The Andorran government collects revenue through the sale of postage stamps and a very small number of local taxes.

INFRASTRUCTURE, POWER, AND COMMUNICATIONS

Landlocked, mountainous Andorra has no railroads, harbors, or airports, but possesses a good road system and three-fourths of its nearly 270 kilometers (169 miles) of roads are paved. The country is rich in hydroelectric power and the power plant at Les Escaldes, with a capacity of 26.5 megawatts, provides 116 million kilowatt hours annually (1998), or about 40 percent of Andorra's electricity, while Spain and France provide the rest.

Andorra has a modern telecommunications system with microwave radio relay connections between the exchanges and land line circuits to France and Spain. There were 31,980 main telephone lines in use and 8,618 cellular phones in 1997. Andorra had 15 FM radio broadcast stations in 1998 but no local TV broadcasting stations, French and Spanish broadcasting and cable TV being widely available.

ECONOMIC SECTORS

Andorra's natural resources include iron and lead deposits, marble quarries, forests of pine and birch, hydropower resources, strips of fertile land in the valleys, and extensive pastures on the mountain slopes. But the economy is mostly influenced by the excellent skiing areas, the pleasant climate, and the crossroads location of the country. Nearly four-fifths of the GDP in 1998 was generated in the tourist and other related service sectors; about one-fifth was generated in industry, including construction and mining; and just about 1 percent in agriculture. The labor force was distributed by occupation as follows: agriculture, 1 percent; industry, 21 percent; services, 72 percent; and other sectors, 6 percent (1998 estimates). The most important industries included tourism (particularly skiing), cattle raising, timber, tobacco growing, banking, and **retail**. Before World War II, most families made their living off farming, tobacco and timber processing, and smuggling, but since the 1950s tourism has been the bulwark of economic progress. With the gradual dismantling of Andorra's duty-free shopping advantages in the course of EU liberalization, the economy will become gradually more dependent on banking and finance services.

AGRICULTURE

Andorra's territory is ill-suited for agriculture, comprising mostly rugged mountains traversed by narrow val-

leys with scarce arable land making up only 2–3 percent of the total area. Pasture lands suitable for sheep grazing cover about 45 percent of the territory, mostly the lower mountain slopes, and forests cover approximately 35 percent of the land. Agriculture, nevertheless, was the core of the Andorran economy until the boom in tourist activities in the 1950s. Sheep raising has usually been the principal agricultural activity, but tobacco growing, although limited, has been more lucrative, especially given the long-time Andorran tradition of smuggling tobacco products into the neighboring regions of France and Spain. Apart from the timber-related activities, agriculture products currently include small quantities of tobacco, rye, wheat, barley, oats, vegetables, and sheep products. Most food has to be imported from France and Spain.

INDUSTRY

In addition to traditional local handicrafts, manufacturing in the principality includes cigars, cigarettes, timber processing, and furniture for the domestic and export markets. Raw materials such as timber and iron and lead ore are also produced, and mining and construction are important sources of revenue and employment. However, construction is still unable to provide adequate housing at affordable prices for many of the families that migrated to Andorra over the last several decades. Given its relative size, Andorran industry is not able to play a significant role in European markets; however, it provides livelihoods for the local people, additional income for the economy, and also caters to the needs of the larger tourist and retail sectors.

SERVICES

Tourism, the powerhouse of Andorra's tiny but prosperous economy, accounts for roughly 80 percent of GDP. An estimated 9 million tourists (more than one-fifth of the number of visitors to Spain) visit the principality annually, attracted by its resorts, good ski facilities, pleasant summer climate, mineral waters, and duty-free shops. The small but vital banking sector—integrated with both the French and Spanish banking systems but maintaining its **tax haven** status—contributes substantially to the economy. In the mid- to late-1990s, the Andorran government passed a series of laws to strengthen the banking sector and deter activities such as **money laundering**. Retail trade is thriving, particularly in imported manufactured goods, notwithstanding the problems issuing from current EU liberalization and the substantial lowering of tariffs in competing neighboring countries that have diminished Andorra's advantages as a duty-free shopping area. The retail sector is comprised mostly of small privately-held stores.

INTERNATIONAL TRADE

International commerce is crucial to Andorra's otherwise isolated economy. In 1998 the country exported US$58 million worth of goods and services, while importing US$1.077 billion. This massive **trade deficit** is made up for largely by the booming tourist economy. As is to be expected given its tight integration with France and Spain, these countries are its dominant trading partners. The majority of the country's exports, 58 percent, went to Spain in 1998, while France received 34 percent. Imports in that year originated mostly from Spain (48 percent) and France (35 percent).

MONEY

Andorra has a traditional **budget surplus**, with revenues of US$385 million and expenditures of US$342 million, including capital expenditures, as estimated in

1997. The units of currency are both the Spanish peseta and the French franc. Both Spain and France, along with 9 other members of the EU, are in the process of changing over from their national currencies to the single currency of the EU, the euro, for all transactions. The euro started to be used in 1999, initially only for electronic bank transfers and accounting purposes. Euro coins and bills are planned to be issued in 2002, when the peseta and the franc will cease to be legal currency. The EU members have established the European Central Bank (ECB) in Frankfurt, Germany, responsible for all EU **monetary policies**. Since 1999, control over Spanish and French monetary issues, including interest rates and regulating the money supply, has been transferred to the ECB.

POVERTY AND WEALTH

Before World War II, Andorra was still living to a large extent in the ways it had known since the Middle Ages. Most of its people were rather poor and lived off small-scale farming, sheep breeding, and smuggling. Even now, many families still continue to live in the old farmhouses, and life still focuses on the family and the Roman Catholic Church. International tourism and European integration since the 1950s thoroughly modernized the country within several decades and most Andorrans have turned from agriculture to family hotels and restaurants, store-keeping, and various other tourism-related services. Currently, with an affluent service-based economy and a low **inflation rate** of 1.62 percent in 1998, Andorrans enjoy very good and comparatively equitable living standards and very high life expectancy. No extreme cases of poverty or very large private fortunes are currently known. Due to the high number of working immigrants, attracted over the past several decades mostly by jobs in the services industry, housing in Andorra is now probably the most acute social issue. Although many locals still live in their traditional family houses, housing is currently scarce; the construction sector is not yet in a position to address the challenge adequately, and the tiny real estate market in Andorra remains highly speculative.

GDP per Capita (US$)

Country	1996	1997	1998	1999	2000
Andorra	18,000	N/A	N/A	N/A	N/A

SOURCE: *Handbook of the Nations*, 17th, 18th, 19th and 20th editions for 1996, 1997, 1998 and 1999 data; CIA *World Factbook 2001* [Online] for 2000 data.

WORKING CONDITIONS

The labor force in Andorra included 30,787 salaried employees in 1998, and the unemployment rate was very close to zero. Trade unions were legalized for the first time only after 1993, and modern social institutions are still in the early phases of development. But the most significant labor-related issue recently has probably been the re-qualification for Andorran citizenship, a major challenge in a country where still only 13,000 people (20 percent of the population) are legal citizens. Citizenship issues are economically very important because the law allows non-citizens to own no more than a 33 percent share of a company, even if it is a small business. Citizenship problems generate major troubles for the enterprising immigrants forming by far the most dynamic economic group in the country. Only after residing in Andorra for 20 years are they entitled to possess full ownership of a business. A draft law aimed at reducing the required years from 20 to 10 is currently being debated. In 1995, a new, more liberal citizenship law was passed, but Andorran nationality nevertheless remains very hard to acquire. Only Andorrans can transmit it to their children, birth on Andorran soil does not confer it automatically, and dual citizenship is prohibited. Lawful permanent residents in Andorra may be naturalized only after 25 years of residency, and their children may opt for citizenship at 18 only if they have resided all of their lives in the country.

COUNTRY HISTORY AND ECONOMIC DEVELOPMENT

803. Andorra is given independence by the emperor Charlemagne, who names it a "March state," or buffer state created to keep the Muslim Moors of Spain from advancing into Christian France.

1278. Andorra comes under the joint suzerainty of France and Spain through the Catalan bishops of Urgel and of the counts of Foix of France. Throughout the Middle Ages and modern times up to World War II, Andorra remains outside the mainstream of European history, with limited ties to countries other than France and Spain. The economy is limited to small farm agriculture and forestry and is helped by smuggling.

1607. The head of the French state and the bishop of Urgel are established as the co-princes of Andorra.

1950s. International tourism starts to grow with the emergence of post-World War II western European welfare societies, the growing income and leisure time of the Europeans, and the increasing attractiveness of both neighboring France and Spain as two of the world's top tourist destinations. Tourism revenues, foreign investment, and the rapid development of tourist

infrastructure profoundly change the way of life in the course of a single generation and attract for the first time in the country's history many immigrants, lured by the opportunities for business and jobs offered by the economic boom.

1970. Women receive the right to vote.

1987. Andorra starts trade talks with the EU.

1993. Andorra adopts its first constitution and is admitted to the United Nations.

FUTURE TRENDS

The Andorran economy is now very closely related to those of France and Spain and is dependent on the overall trends in the EU. Despite positive recent changes in the economy, related to the increasing role of modern services, it is likely that Andorra will, at least over the next few years, continue to confront a number of problems arising from the large influx of foreigners and the need to develop modern social institutions.

In addition to questions of Andorran nationality and immigration, the country's priorities will include addressing housing scarcities and the tough real estate market, reinvigorating international tourism, and renegotiating its trade relationship with the EU.

The results of Andorra's polls so far have indicated that the people generally support reform initiatives and believe that the country has to integrate into the EU in order to preserve and develop its economic prosperity. It is likely that it will be successful in shifting from duty-free shopping to finance and other services as the second major economic sector and revenue source.

DEPENDENCIES

Andorra has no territories or colonies.

ARMENIA

Republic of Armenia
Hayastani Hanrapetut 'Yun

CAPITAL: Yerevan.

MONETARY UNIT: Armenian Dram (AMD). One dram equals 100 luma. Coins are in denominations of 1 dram and 50 and 20 luma. Paper currency is printed in denominations of AMD10, 25, 50, 100, 200, 1,000, and 5,000.

CHIEF EXPORTS: Diamonds, scrap metal, machinery and equipment, cognac, and copper ore.

CHIEF IMPORTS: Natural gas, petroleum, tobacco products, foodstuffs, and diamonds.

GROSS DOMESTIC PRODUCT: US$9.9 billion (purchasing power parity, 1999 est.).

BALANCE OF TRADE: **Exports:** US$240 million (1999 est.). **Imports:** US$782 million (1999 est.).

COUNTRY OVERVIEW

LOCATION AND SIZE. Armenia is located in the southwest Caucasus Region, neighboring on Georgia and Azerbaijan to the north, Iran and Turkey to the south, and a separate province of Azerbaijan in the southeast. The total area of the country is 29,800 square kilometers (11,505 square miles), making it about the size of Maryland. The nation's capital is Yerevan, with a population of 1.5 million.

POPULATION. The total population of Armenia was estimated at 3,344,336 people in July 2000. According to the United Nations' *Human Development Report*, the total population of Armenia in 1993 was estimated at 3.7 million people. Hence the population has dropped since 1993 by more than 350,000 people, or about 10 percent. This decline is the result of a low fertility rate and widescale **immigration** (there are 4.23 migrants per every 1,000 members of the population). Life expectancy at birth for the total population is 66.4 years (61.98 for males and 71.04 for females). The total fertility rate is 1.47 children born per woman, which is below the replacement level, with 10.97 births per 1,000 members of the population. (Replacement level is a term that refers to the number of children a couple must have to replace only themselves. Thus, a man and woman would have 2 children to achieve replacement level. If a society has an overall replacement level of 2, then it has a stable population, neither growing nor shrinking. When women in a society typically have fewer than 2 children on average, this can be a sign of a shrinking population over time.) The infant mortality rate is 41.48 deaths per 1,000 live births.

Ethnic Armenians comprise 93 percent of the population. Other ethnic groups include the Azeris at 3 percent, Russians at 2 percent, and Kurds at 2 percent. Almost 96 percent of the nation's population speak Armenian. Russian is the second most common language, although only 2 percent of the population uses it as their primary form of communication. Orthodox Christianity is the most popular religion. The population density is 137 people per square kilometer (355 per square mile). About 31 percent of the population lives in rural areas and 69 percent in urban areas.

OVERVIEW OF ECONOMY

In 1920, Armenia was incorporated into what was then the Soviet Union. While it was under Soviet control, an effort began in the 1960s to industrialize the nation. From its previous state of minimal industrial development, Armenia became a significant manufacturing center, supplying machine tools, textiles, and various manufactured goods to the other Soviet Republics. In return, Armenia received raw materials and energy from these republics. Since independence in 1991, however, many large agro-industrial complexes were divided into small-scale agricultural units. New investments and new technologies are necessary for the healthy development of the agricultural sector. The government has given a high priority to **privatization** of the industrial sector, although the speed of privatization in this sector is slower

than that in the agricultural sector. For food, Armenia relies partially on imports, and it possesses only small mineral deposits (mainly gold and bauxite).

The county experienced a severe economic decline in the beginning of the 1990s, due to a devastating 1988 earthquake, the conflict with Azerbaijan over the Nagorno-Karabakh region (see below), and the disintegration of the Soviet system. In 1994, with assistance from the International Monetary Fund (IMF), the Armenian government introduced an economic reform program which resulted in increased economic performance during the 1995–99 period. **Inflation** was reduced from a staggering 1,885 percent in 1994 to a mere 2.5 percent in 1999. In 1998, about 200 medium and large-scale enterprises and about 600 small enterprises were privatized. Thus far, 74 percent of the country's large and medium enterprises and 64 percent of the small enterprises have been privatized. As a result of economic **restructuring** and privatization, Armenia's economy has grown since 1994. In 1999, the nation's **gross domestic product** (GDP) grew by 5 percent. **GDP per capita** has also increased to US$2,900 in 1999 from only US$459 in 1994.

Armenia had no **foreign debt** when it gained independence from the Soviet Union in 1991. At that time, it signed an agreement with Russia that relieved Armenia of any obligations related to the former Soviet Union's **external debt**. In exchange, Armenia could not claim any of the Soviet Union's external assets. However, after independence the nation ran up a significant foreign debt. By 1998, Armenia's total outstanding external debt was US$827.8 million, or 53.9 percent of its GDP. The nation also has a significant **trade deficit**: in 1999, it imported US$542 million more in goods than it exported.

External factors have both harmed and helped the Armenian economy. The longstanding ethnic conflict with Azerbaijan over possession of the Nagorno-Karabakh region—an Armenian-dominated region that lies wholly within Azerbaijan—has hurt the economy in a variety of ways, creating internal instability and closing the Azerbaijani markets to Armenian goods (Azerbaijan used to be Armenia's largest trade partner). The conflict also led Turkey, which supports Azerbaijan, to impose a trade **embargo**. However, Armenia has been the recipient of substantial foreign aid. In 2000, the World Bank granted Armenia US$45 million to reduce the government's **budget deficit**. The Bank has also granted Armenia US$30 million for economic aid. The country on average has received over US$200 million per year since the mid-1990s.

POLITICS, GOVERNMENT, AND TAXATION

Armenia is a parliamentary republic. The government consists of the executive branch, a legislative branch, and a judicial branch headed by the Supreme Court. The 3 main institutions of the executive branch are the chief of state, the head of government, and the cabinet. Since March 30, 1998, the chief of state has been President Robert Kocharian, elected by popular vote for a 5-year term and winning with a vote of 59 percent. Since November 3, 1999, the head of government has been Prime Minister Aram Sarkisyan. The president appoints the prime minister (usually the leader of the largest political party in the parliament) who in turn appoints the cabinet members. The legislative branch is the **unicameral** (one-chamber) National Assembly (Azgayin Zhoghov). The Assembly consists of 131 members who are elected for 4-year terms.

In 1999, the Armenian government's revenues were US$360 million, but its expenditures were US$566 million. In an effort to reduce its deficit, the government has cut spending and received aid from the World Bank. In 1999, the government spent US$75 million on military expenditures, or about 4 percent of GDP. Payments on

SOURCE: World Bank. *World Development Indicators 2000.*

the debt are a major drain on the governmental resources. In 1999, the government spent US$108 million on payments on the debt.

Personal **income taxes** range from 0 to 30 percent depending on income, and corporate taxes also range up to 30 percent. Banks and insurance companies are charged a 45 percent tax rate.

In 1996, Armenia signed a trade agreement with the European Union (EU). The main benefit of this agreement has been increased foreign aid from the EU. The government has sought other trade agreements, but the ongoing conflict in Nagorno-Karabakh has created uncertainty about the Armenian economy and prevented significant foreign investment.

INFRASTRUCTURE, POWER, AND COMMUNICATIONS

Armenia's **infrastructure** needs substantial improvement. Much of the nation's roadways and railways were built during the Soviet period and are in need of repair and renovation. The length of the railway system in 1995, excluding industrial lines, was 825 kilometers (512 miles). Armenia had 15,998 kilometers (9,942 miles) of roads in 1998, of which 7,567 kilometers (4,702 miles) were expressways. All major roads were paved. Pipelines for natural gas in 1991 were 900 kilometers (560 miles) long. Armenia does not have any ports or harbors. There are 12 airports in Armenia (5 with paved runways), but only 10 are in service. Armenian Airlines, the national air carrier, operates service to a variety of international destinations including, Moscow, Paris, Athens, Amsterdam, Frankfurt, and Tehran.

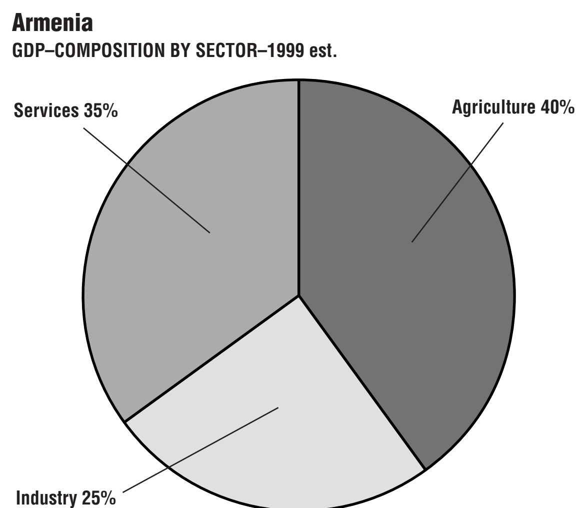
In 1995, of Armenia's total production of electric energy, 60 percent was from gas-fired plants, 34 percent was hydroelectric, and 5 percent was atomic. By 1998 these rates had changed to 25 percent thermal, 49 percent hydro, and 26 percent atomic. The total production of electrical energy in that same period was 5.6 million kilowatt hours (kWh), according to the IMF.

The nation has approximately 650,000 telephones, which gives it a telephone density of 17.7 phones per 100 people. This is relatively low when compared with Western European nations. For instance, Belgium has a telephone density of 50 per 100 people. However, the German company Siemens is engaged in a US$100 million project to upgrade the nation's telephone system with fiber optic and digital telephone systems. About 90 percent of the nation's telecommunications system is now privately-owned. Mobile phone use is increasing with 20,000 mobile units in use in 1998. Use of the Internet is also on the rise with the number of Internet service providers increasing from 1 in 1999 to 7 in 2000. The United States has provided US$1 million to Armenia to supply Internet service for schools.

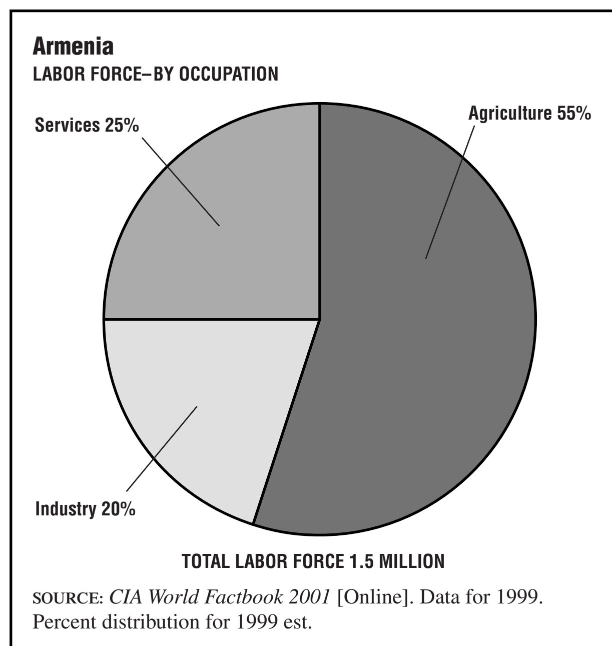
ECONOMIC SECTORS

Unlike most industrialized and economically developed nations where services and industry dominate the

Armenia
GDP–COMPOSITION BY SECTOR–1999 est.



SOURCE: *CIA World Factbook 2000* [Online].



SOURCE: *CIA World Factbook 2001* [Online]. Data for 1999. Percent distribution for 1999 est.

economy, in Armenia agriculture is the main employer and largest source of GDP. According to the World Development report 2000/2001, the total **labor force** in 1999 was 1.5 million people, of which 55 percent were employed in agriculture, 25 percent in services, and 20 percent in industry. In 1999, agriculture accounted for 40 percent of GDP, industry 25 percent of GDP, and services 35 percent of GDP.

AGRICULTURE

Among the nations that made up the former Soviet Union, Armenia was the first to privatize agricultural lands. It broke up the large Soviet-style farms and reallocated the land to small, independent farmers. However, only 17 percent of the country's land is suitable for farming, which severely limits agricultural production. The nation has numerous vineyards and is a major producer of wine and cognac. In 1998 the World Bank provided US$15 million to establish a fund to furnish loans for small farmers.

Despite the limitations of this sector, agriculture provides the largest source of income for Armenia. Agricultural exports totaled US$15.4 million in 1998, or about 34 percent of all of the country's exports. The most significant exports were alcoholic beverages, various fruit juices, calf skins, and processed tomatoes. In 1998, the nation had to import US$297.7 million in agricultural products. In all, 70 percent of all food consumed in Armenia was imported in 1999. The main imports were eggs, sugar, flour, and processed foods.

A variety of crops are cultivated including barley, corn, potatoes, and wheat. In 1999, the total volume of crops produced amounted to 715,400 metric tons. This tally included 425,000 metric tons of potatoes, 220,000 metric tons of wheat, 65,000 metric tons of barley, and 5,200 metric tons of corn. The main livestock products were chicken, beef, and pork. In 1999, total agricultural production declined by 4.2 percent.

INDUSTRY

Industry in Armenia has traditionally been based on mining and the manufacture of goods such as textiles, electric motors, tires, chemicals, trucks, machine tools, and some consumer appliances (mainly washing machines). The contribution of industry to the economy fell from 46.5 percent in 1991 to 25 percent in 1999. In 1999 alone, industrial production declined by 2 percent. This decline has been the result of a lack of new investment (because of political uncertainty) and because many of the industrial markets in the former Soviet Union closed due to lack of demand.

MINING. Armenia possesses the second-largest reserves of copper in the world. Other important reserves are molybdenum, zinc, gold, silver, construction stones (mainly granite and marble), and other materials such as betonite, bauxite, perlite, zeolite, and diatomite. In the 19th century, industrial metallurgical mining started in the Alaverdy and Zangezur regions, and during Soviet times these activities increased enormously. In the 1980s, 25 percent of the Soviet molybdenum was supplied by Armenia. In 1991 the mining industry collapsed due to deteriorating conditions in the mines and declines in demand. In 1996, the mining industry started to recover, with production rising 32 percent in the period from 1996–99. From January to June 2000, it rose an additional 16 percent.

After food processing and jewelry and diamond processing, Armenia's mining sector was the third-largest industrial sector and the third-largest exporter. According to the Armenian government, exports of minerals and non-precious metals totaled roughly 23 percent of exports in 1995. Although the mining sector does relatively well, its production and export are well below its potential. The government has prepared a program to increase mining and metal production and to export more semi-finished products because of their higher **value added**. The major copper-molybdenum companies and the gold company are not yet privatized.

MANUFACTURING. Armenia was the leading chemical producer in the Caucasus in the 1970s, producing synthetic rubber, latex, acids, various glues, and special films mainly for the military sector. In the 1980s the chemical industry employed 24,200 people and accounted for 6.6

percent of the industrial production. The collapse of the Soviet Union, the energy crisis of 1992–93, and the war with Azerbaijan decreased the volume of production by more than 50 percent. In 1999, Armenia imported 6 times as many chemical products and materials as it produced itself. The main chemical export product is rubber, comprising 82 percent of total chemical exports, of which 93 percent went to states of the former Soviet Union. According to expert Jocelyne Decaye, the main weaknesses of Armenia's chemical industry are "high dependence on imported raw materials, obsolete technologies and old production lines, logistical difficulties related to Armenia's location, overstaffing and high costs for transports and electricity."

Armenia's light industry sector was well developed in the 1980s, when it had 115,000 employees and accounted for 25 percent of total industrial production. In the 1990s, however, the share of light industry in the total industrial production declined to under 2 percent. Textile and clothing production make up the most significant activities in this sector.

In 1999, the food processing industry accounted for 39 percent of total industrial output and 61 percent of total manufacturing output. In the 1980s, food processing accounted for only 18 percent of Armenia's total industrial production. The first 5 years of the 1990s saw a rise of nearly 70 percent. The major food products are wine and brandy, with such products as vegetables, fruits, tobacco, potatoes, cotton, grains, and teas making up the rest. Less than 10 percent of the total production is exported (US$16 million in 1999).

SERVICES

The value of services to the Armenian economy increased as a percentage of GDP from 31 percent in 1990 to 35 percent in 1999. The main segments of the service sector include tourism and financial services. Many common Western services do not exist in Armenia. For instance, there are no fast food or **retail** chains.

TOURISM. During the first 5 years of independence, the tourist industry declined, but since 1996, this trend has reversed itself. Since 1996, the number of tourists has more than tripled but remains low compared to the 1980s (about 21,000 visitors in 1999, including business tourism). The share of tourism as a percentage of GDP was 1.7 percent in 1999. The tourism infrastructure needs substantial development and modernization to keep this industry growing.

FINANCIAL SERVICES. During the Soviet period, the State Insurance Company provided mandatory insurance for all citizens. The responsibility to regulate the insurance market now rests in the hands of the Ministry of Finance. The Ministry of Finance provides licenses for insurance companies, and in 2001 some 65 private and state companies were registered. As of 2001, a legal framework concerning the insurance market was still being developed. Domestic and international companies are treated equally under Armenian law.

The banking system accounts for about 10 percent of GDP. In 1999, there were 31 commercial banks. The main foreign banks are Mellat Bank of Iran and Midland Bank of the United Kingdom. Only Midland Bank has established Automated Teller Machines (ATMs), and only a limited number of businesses in the major cities can accept credit cards as a form of payment. The total capital of all commercial banks in Armenia is US$60 million. The largest private bank is HSBC Armenia Bank with assets of US$9 million.

INTERNATIONAL TRADE

Armenia has maintained a trade deficit since independence in 1991. According to the *CIA World Factbook*, Armenia exported US$240 million in 1999, an increase of almost 5 percent compared to 1998. The country has also diversified its trading partners and now trades with an increasing number of Western nations. Armenia imported US$782 million in 1999, a decrease of about 6.5 percent compared to 1998, but still 3 times the amount of 1993. Until the nation's economy recovers, this deficit will continue.

Belgium is Armenia's largest export partner, importing a total value of US$84 million, followed by Russia and Iran, both of which imported US$34 million in 1999. In fourth place was the United States, importing US$16 million, and in fifth came Georgia with US$11 million. Most of the Armenian exports, US$127 million, went to industrial countries, and US$97 million went to developing countries, according to the IMF.

Armenia's main import partner was Russia, accounting for US$181 million in 1999. Second came the United States, exporting US$86 million in 1999. The

United States was followed by Belgium, which exported US$85 million, then Iran with US$78 million, and in fifth was the United Kingdom, exporting US$67 million. Of Armenia's total imports, US$368 million came from industrial countries and US$451 million came from developing countries, according to the IMF's *Direction of Trade Statistical Yearbook 2000*.

MONEY

The value of the dram has declined significantly since the 1990s. In 1995, 405.91 drams equaled US$1. However, by 2000 it took 539.53 drams to equal US$1. This decline is the result of the continuing weaknesses in the Armenian economy.

In 1993, the Yerevan Stock Exchange (YSE) was established, which was followed by the establishment of 3 smaller exchanges. However, the total value of these 4 exchanges was only US$1.67 million in 1999.

POVERTY AND WEALTH

Officially, 45 percent of the population is considered to be poor, but unofficial estimates place the figure as high as 55 percent. Although poverty is mostly urban (59 percent), the incidence of extreme poverty is higher in rural than in urban areas. Rural poverty is expected to worsen as a result of people leaving rural areas for the cities. State expenditures on social infrastructure and product **subsidies** dropped drastically following independence from the Soviet Union in 1991, thus hurting the ability of the poor to meet basic needs. Since people make very low wages, food comprises about 67 percent of household expenditures. In 1996, the Ministry of Statistics and the World Bank found that the poor represented 55 percent of the total population, while the extremely poor constituted 28 percent. The only good news is that there has been a significant decrease in the proportion of the extremely poor, which is probably due to programs designed to help this sector.

Out of 580,000 **pensioners** (retired people receiving pensions) in Armenia, 223,000 are old age or retired pensioners, of which 186,402 are identified as needy and included in the system of family allowances. Pensions remain exceedingly low, with the average monthly pension worth US$7.5 and average family allowance at US$12. Without assistance from their families, many pensioners would face the most severe poverty.

WORKING CONDITIONS

In 1994, according to the IMF, 1,488,000 Armenians were employed and 106,000 were unemployed, resulting in an actual labor force of 1,594,000 people. The figures for 1998 give a different picture, with the number of total employed persons decreasing to 1,351,000,

and a total of 139,000 unemployed, resulting in an actual labor force of 1,492,000 people. Although official figures state that the unemployment rate was 9.3 percent in 1998, unofficial estimates place the rate as high as 20 percent. In the state sector, 794,000 people had jobs in 1994, and in the **private sector** 694,000 people were employed. By 1998, 441,000 people were employed in the state sector, and 912,000 in the private sector, reflecting a major decrease in government payrolls.

According to the constitution, employees have the right to join and form trade unions and to form associations, although members of the armed forces and law enforcement agencies are forbidden to do so.

The minimum monthly wage in 1994 was AMD1,851, although by the second quarter of 1999 it had risen to AMD5,000. Forced and bonded labor is forbidden in Armenia, and for children the minimum working age is 16 years, although with the permission of a medical commission and the relevant union board, children may work from the age of 14. The standard legal work week is 41 hours, and with such a low minimum wage, most people have to take multiple jobs to support themselves and their families.

COUNTRY HISTORY AND ECONOMIC DEVELOPMENT

c. 900 B.C. A number of small kingdoms are established in what becomes Armenia.

66 B.C. Armenia is conquered by the Romans.

1080–1269. During Armenia's "Silver Age," Armenia gains independence from Byzantium and there is a flowering of Armenian culture and the arts.

1375. Armenia is conquered by the Turks.

1639. Armenia is divided between Persia and Turkey.

1828. Eastern areas of Armenia are conquered by Russia.

1902. The Tiflis-Alexandropol-Yerevan railway is completed, dramatically increasing trade.

1915. During the Armenian Genocide, an estimated 1 million Armenians were killed by the Ottoman Turks.

1918. Armenia becomes an independent nation following the collapse of the Ottoman Empire at the end of World War I (1914–1918).

1918–1920. War occurs between Armenia and Turkey.

1922. Armenia is incorporated into the Soviet Union.

1923. The predominately Armenian region of Nagorno-Karabakh is transferred to Azerbaijan.

1950s. The Soviets undertake a broad effort to industrialize Armenia.

1988. An earthquake in Armenia results in the deaths of an estimated 25,000 people.

1991. Armenia gains independence from the Soviet Union after a nation-wide referendum.

1994. Azerbaijan and Armenia go to war over Nagorno-Karabakh. Economic conditions deteriorate and inflation exceeds 1,800 percent.

1995. A new constitution is adopted.

1996. Armenia signs a trade agreement with the EU.

1999. Prime Minister Vazgen Sarkissyan and other government leaders are assassinated.

2000. Armenia's request for admission to the Council of Europe is approved.

FUTURE TRENDS

A major impediment to Armenia's economic growth is its lack of infrastructure. Antiquated equipment has not been upgraded because of a lack of funds, and as a result many sectors of the economy are neither productive nor competitive. Most privatization efforts resulted in sales to people with connections who usually lacked either the commitment or the capacity to streamline operations. Industrial output is still low, and there is a lack of foreign investment. Armenia's imports exceed its exports by a 3-to-1 margin.

Although there are objective reasons for the failure of the Armenian economy, the widespread perception of corruption at every level of society seriously hampers the government's ability to attract foreign investment. The lack of confidence in the government has also created widespread political apathy among the population.

Furthermore, the high level of unemployment and seeming lack of hope in the country's future has created an **emigration** crisis. Although reliable statistics are hard to come by, the consensus among most observers is that hundreds of thousands of people have emigrated, with no indication that the exodus will abate anytime soon.

DEPENDENCIES

Armenia has no territories or colonies.

AUSTRIA

Republic of Austria
Republik Österreich

CAPITAL: Vienna.

MONETARY UNIT: Austrian schilling (ATS). One Austrian schilling equals 100 groschen. There are 20, 50, 100, 500, 1,000, and 5,000 schilling notes, and 1, 5, 10, 20, and 50 schilling coins. There are also 10 and 50 groschen coins. In January 1999 Austria introduced the new European currency, the euro, for all electronic transactions. One euro had a fixed rate of 13.7603 Austrian schillings. It is planned that by 2002, euro bills and coins will replace the currencies in all European Union (EU) countries, including Austria.

CHIEF EXPORTS: Machinery and equipment, paper and paperboard, metal goods, chemicals, iron and steel, textiles, and foodstuffs.

CHIEF IMPORTS: Machinery and equipment, chemicals, metal goods, oil and oil products, and foodstuffs.

GROSS DOMESTIC PRODUCT: US$190.6 billion (purchasing power parity, 1999 est.).

BALANCE OF TRADE: **Exports:** US$62.9 billion (1999 est.). **Imports:** US$69.9 billion (1999 est.).

COUNTRY OVERVIEW

LOCATION AND SIZE. Austria is a landlocked country situated in southern Central Europe. Slightly smaller than Maine, it occupies a territory of approximately 84,000 square kilometers (32,000 square miles), which includes much of the mountainous territory of the eastern Alps and the Danube region. From east to west, Austria stretches to 580 kilometers (360 miles) and 294 kilometers (183 miles) from south to north. In total, the country has 2,708 kilometers (1,682 miles) of borders. It shares borders with 8 European countries: Germany (820 kilometers), the Czech Republic (469 kilometers), Italy (430 kilometers), Slovenia (330 kilometers), Hungary (354 kilometers), Switzerland (167 kilometers), Slovakia (103 kilometers), and Liechtenstein (35 kilometers).

Austria is a federal state comprised of 9 provinces: Burgenland, Carinthia, Lower Austria, Salzburg, Styria, Tyrol, Upper Austria, Vorarlberg, and Vienna. The major cities of Austria and their populations are Vienna (1.64 million), Graz (237,810), Linz (203,044), Salzburg (143,978) and Innsbruck (118,112).

Austria has always been a junction for communication, trade, and cultural exchange in Europe. The capital, Vienna, located on both banks of the Danube River, in the northeast of the country near Slovakia and Hungary, was once the political and economic center of the Austro-Hungarian Empire (1867–1918). It is now the headquarters to some of world's most important organizations, such as the International Atomic Energy Agency (IAEA) and the United Nations Industrial Development Organization (UNIDO). Other international organizations based in Vienna include the Organization for Petroleum Exporting Countries (OPEC) and its Fund for International Development and the International Institute for Applied Systems Analysis (IIASA).

POPULATION. Austria has a population of 8,139,299 (July 2000 est.). The country is highly urbanized and densely populated, with 651 people per square kilometer (251 per square mile). Nearly two-thirds of the people live in urban areas. About 4.0 million are male and 4.2 million (51.5 percent) are female. Due to improved health conditions and a low birthrate, Austria has experienced the rapid growth of its elderly population. Average life expectancy for those born in 2000 was 73.9 year for males and 80.2 years for females. About 21 percent of the population was under 18 years old. If current trends continue, by 2030, the number of children under 18 will drop to only 17 percent. The fertility rate is an estimated 9.9 per 1,000 people, and infant mortality is 6.7 per 1,000 live births. An estimated 99 percent of Austrians age 15 and

older can read and write, and there is 1 teacher for every 11 pupils.

ETHNICITY. Approximately 98 percent of the population is German. The remainder of the population is divided among a number of ethnic groups, including the Neo-Latins, Slavs, Magyars, Croats, Hungarians, Romany, Sinti, Czechs, and Slovaks. Burgenland province is home to a number of Croats and Hungarians. The majority of Austrian Slovenes live in the Gail, Rosen, and Jaun valleys of southern Carinthia and in some villages in the southern part of Styria. Romany and Sinti live mostly in Burgenland and to some extent in Vienna. Many Czechs and Slovaks also reside in Vienna and in Lower Austria, particularly in the Marchfeld and Tullnerfeld regions. The country receives refugees from a variety of nationalities, many of whom are from the former Yugoslavia.

RELIGION. Roman Catholics constitute 78 percent of the Austrian population; a further 5 percent are Protestant, and most of them belong to the Augsburg confession. About 4.5 percent of the population belongs to various other religious groups, while another 9 percent are non-denominational, and the remaining 3.5 percent of the people do not belong to any religion. Every young person over the age of 14 can freely choose his or her religion according to Austrian law. Religious education in Austrian schools is not restricted to the Roman Catholic confession, but most schools are Roman Catholic.

OVERVIEW OF ECONOMY

Austria has a small, yet open, economy with exports of goods and services accounting for 47 percent of the **gross domestic product** (GDP). In the past 2 decades Austria has enjoyed higher economic growth and lower unemployment than many European countries. The **recession** in the early 1990s led to a downward trend in annual GDP growth, from 4.2 percent in 1990 to 0.4 percent in 1994. Since 1995, however, due to positive merchandise export and investment activities brought about by membership in the European Union, the economy has experienced fairly constant growth, with annual GDP growth rates for 1998, 1999, and 2000 of 3.3 percent, 2.8 percent, and 2.7 percent respectively.

The country has a strong economic infrastructure with well developed industry, banking, transportation, services, and commercial facilities. Most of Austria's in-

dustrial and commercial enterprises are small. However, there are a number of large industrial enterprises employing thousands of people, mainly in iron and steel works and chemical plants. Overall, industry accounted for an estimated 32 percent of gross domestic product in 1998, with an average growth rate of nearly 3 percent. Though forming a relatively small component of the GDP—1.3 percent in 1998—agriculture also plays a vital role in Austria. Austrian farmers provide about 80 percent of the domestic food requirements of the country and contribute to export earnings with processed food items. Farms in Austria, like those of other mountainous European countries, are small and fragmented, with production being relatively expensive. Since Austria became a member of the EU in 1995, its agricultural sector has been undergoing reforms to comply with the EU's common agricultural policy.

Export growth was very strong during 2000. Trade with other EU countries accounts for nearly two-thirds of Austria's total imports and exports. Approximately 35 percent of the total exports went to Germany and 10 percent went to Italy. Austria's location is of immense importance for its economic growth. Vienna is one of three capitals forming a strategic Central European triangle. Slovakia's capital, Bratislava, and Hungary's capital, Budapest, are within short distances to Vienna. Expanding trade and investment in the **emerging markets** of Central and Eastern Europe continues to be a major element of Austrian economic activity. Exports to that region increased significantly since 1989, reaching an estimated 17 percent of Austrian exports by 1998. Austrian firms have sizable investments in—and continue to move labor-intensive, low-tech production to—the region. Although the Austrian government and businesses support the European Union's plans to offer membership to several East European countries, they insist that the candidates meet EU economic standards before accession. They have also favored a transition period for the free movement of labor and services to prevent severe competition in the Austrian labor market during accession.

For many years, the government and its state-owned industries played a primary role in the Austrian economy. Many of the country's largest firms were **nationalized** after World War II to protect them from Soviet takeover as war reparations. These included all oil production and refining, the largest commercial banks, and the principal companies in river and air transportation, railroad equipment, electric machinery and appliances, mining, iron, steel, and chemical manufacturing, and natural gas and electric power production. Although the government retains substantial control over the economy, many of these enterprises were **privatized** in the 1980s and 1990s. Through privatization efforts including the 1996–1998 budget consolidation programs and austerity measures, Austria brought its total **public sector** deficit down to 2.1 percent of GDP in 1999 and public debt to 63.1 percent of GDP in 1998. After the formation of a new government in February 2000, Austria promoted further economic **liberalization**, privatization, reform of the welfare system, and abolition of the system of political patronage (where those in political power protect and support certain businesses). An opinion poll published at the end of May 2000 showed that 43 percent of Austrians were in favor of these reforms, and 23 percent were against.

Membership in the EU has brought economic benefits and challenges. An influx of foreign investors, for example, have been attracted by Austria's access to the single European market. Austria also has made progress in increasing its international competitiveness. Since Austria is a member of the European Monetary Union (EMU), its economy is closely integrated with other EU member countries, especially Germany. Although economists have generally agreed that the economic effects of the EMU on Austria, such as the use of a common currency, have been and will be positive, support for the EU in late-2000 fell to an all-time low. According to a poll by the national newspaper *Die Presse*, on 27 October 2000, only 34 percent of Austrians thought that their country has benefited from EU membership; the figure was 45 percent in autumn of 1999. Some Austrians have asked for their country's complete withdrawal from the EU. It is not likely that such initiatives will get very far, however, with the Austrian chancellor having attacked the idea of withdrawal as a "betrayal of the European idea."

POLITICS, GOVERNMENT, AND TAXATION

Austria has a well-developed market economy and a federal republic form of government; the state has historically played a large role in the economy, though that role decreased dramatically at the end of the 20th century. Governed by 2 major parties, the Social Democrats (SPO) and the conservative People's Party (OVP), Austria has enjoyed political stability and economic growth since 1945. The SPO, which garnered 33 percent of the votes in the 1999 national legislative elections, traditionally draws its constituency and much of its strength from the urban and industrial areas. In the past, the SPO has advocated heavy state involvement in strategic industries, the extension of social security benefits, and a **full-employment** policy. In the mid-1980s, the party shifted more toward the advocacy of free market economics and the balancing of the federal budget. The OVP's traditional constituency has been among farmers, large and small businesses, and lay Catholic groups. Its center of strength is rural Austria. The OVP has also advocated conservative financial policies and privatization

of previously nationalized industries. The OVP received 27 percent of the votes in the 1999 election.

The major opposition to both parties during the late 1990s and early 2000s elections was the populist right-of-center Freedom Movement Party, headed by the controversial Jörg Haider, characterized as an ultranationalist (one who supports the nation at any cost), and a xenophobe (one who fears foreigners). Haider made several strong remarks praising Nazi policies. The rise of the Freedom Movement Party—from 5 percent of the votes in the 1983 election to 27 percent in 1999—was credited to voters who were disappointed by the employment opportunities in Austria. A system known as Proporz, supported by the ruling parties, distributed most top jobs in state business and public service to members of those parties. After the fall of the Iron Curtain in November 1989, when the U.S.S.R. started to loosen its control on the borders of its Eastern satellites, cheap and skilled labor came into Austria from Poland, Czechoslovakia, Hungary, and Slovenia. Many Austrian workers lost their jobs to the immigrants who were willing to work for lower pay and fewer benefits. In addition, many farmers were dissatisfied over the EU agrarian policy put into place after 1995, which lowered prices for agricultural products. In addition, the lack of professional chances in the civil service and in many other state institutions due to the EU budget criteria aroused the dissatisfaction of many young people who were seeking traditionally secure government jobs. Haider's Freedom Movement Party, which was against **immigration** and interference from the European Union, won increasing support.

In February 2000 the conservative People's Party, which wanted to establish an effective and legitimate government that would enjoy the support of Parliament, formed a coalition with the Freedom Party. Nearly 54 percent of the electorate voted for the new federal government. The European Union condemned Austria's new coalition, froze diplomatic contacts, and imposed **sanctions**, accusing Haider of being a racist, xenophobe, and Nazi sympathizer. Austria criticized the European Union for interfering in a democratically elected government. Demonstrations in Austria and throughout Europe followed. Haider did not join the government, and in February 2000 he resigned from the Freedom Movement Party to concentrate on his role as governor of the Carinthia province. In September 2000, the European Union lifted sanctions against Austria. Haider was expected to wield influence from the sidelines, however.

Austria's federal structure of government involves a high degree of decentralization with the executive and legislative functions shared between the Federation (federal government) and the Länder (provinces). The Länder play a significant role in federal legislation, having independent regional legislations which cooperate with the Federation in the execution of the federal legislation. According to the constitution of 1920, the head of the country is the president, who is elected by popular vote every 6 years and who represents Austria in its international relations and serves as commander-in-chief of the armed forces. Thomas Klestil, who was elected on 8 July 1992, was elected to a second term on 19 April 1998, with 63 percent of votes. The president is limited to 2 consecutive terms or a total of 12 years in office. Presidential elections are scheduled for the spring of 2004. The president appoints the head of the government, a federal chancellor, who appoints others to the executive branch. With the chancellor's recommendation, the president appoints the ministers. The president also appoints judges. After 4 February 2000, chancellor Wolfgang Schuessel of the OVP headed Austria's government.

The constitution of Austria provides for a distinct division of power among the executive, the legislative, and the judicial branches of government. Executive authority is vested in the federal government composed of the federal chancellor, a vice-chancellor, and other ministers. Legislative authority is vested in the **bicameral** (2-chambered) Federal Assembly composed of the Nationalrat (National Council or lower chamber) and the Bundesrat (Federal Council or upper chamber). Legislative authority is concentrated in the 183 members of the Nationalrat who are elected by direct popular vote for 4-year terms according to **proportional representation**. The Bundesrat consists of 64 members elected by the legislatures of the 9 provinces for 4- or 6-year terms, also according to proportional representation, with each province guaranteed at least 3 representatives. The Bundesrat reviews legislation passed by the Nationalrat and can send legislation back for reconsideration, but the Nationalrat need only pass the legislation a second time to override a veto. Furthermore, the Bundesrat can only initiate legislation by way of the government. The 2 chambers meeting as the Federal Assembly can propose a national referendum, if needed. The highest courts of Austria's independent judiciary are the Constitutional Court, which has jurisdiction over constitutional matters; the Administrative Court, which handles bureaucratic disputes; and the Supreme Court, which deals with civil and criminal cases. All cases initiated in the Administrative and Supreme Courts can be appealed to the Constitutional Court. The president appoints justices of all 3 courts for specific terms.

The federal government is responsible for developing and implementing the domestic and foreign policies of Austria and sets economic policy in consultation with what is known as the social partnership, consisting of the representative bodies of businesses, farmers, and labor. Designed to minimize social unrest, this consensual approach has come under criticism for slowing the pace of economic reforms, particularly in inflexible labor and

product markets. With an increasing number of decisions being made at the EU level, the influence of the social partnership has declined significantly. The government no longer has majority ownership in companies such as OMV (oil and gas), Voest (steel and plant engineering) and Elin (electrical machinery and equipment). **Subsidy** programs have also been scaled back to conform to EU regulations.

In 1997, the government completed an ambitious 10-year privatization program, which included the privatization of steel, aluminum, petroleum, engineering, banking, and other entities. The sale of the Postal Savings Bank and the Austrian Tobacco Company were underway in 2001. Furthermore, the federal railroads were excluded from federal budget accounts, and the newly reorganized Post und Telekom Austria (PTA) (postal and communications company) was divested as a private corporation and was required by law to list its shares on the stock market. Another focus of economic policy was employment creation. Austria has been one of the foremost supporters of the EU's national employment plans, which place strong emphasis on training and education, removal of bureaucratic hurdles, more labor flexibility, and a favorable climate for business start-ups. While some of these plans have been implemented, the government has failed to completely do away with the governing parties' special relationships with business and labor representatives.

The major source of government revenue comes from taxes. The corporate income and capital gains tax rate is 34 percent. A withholding tax of 25 percent applies to dividends, except for those paid to Austrian companies, and interest. A 20 percent tax rate applies to royalties. Only the Austrian-source income of non-resident companies is subject to taxation. When Austria joined the European Union, the government was forced to accelerate structural reforms and to liberalize its economy. Most non-**tariff** barriers to merchandise trade were removed, and cross-border capital movements were fully liberalized.

The 1996–97 economic program enabled the government to cut the federal deficit to 3.7 percent of gross domestic product in 1996, and to 2.6 percent in 1997. Because of this program, which included tax increases, the share of total taxes in gross domestic product reached a high of 44.8 percent in 1997. In 2000 the government cut taxes. The tax reform was expected to reduce the burden on taxpayers by approximately US$2.2 billion by 2003. These reforms included greater tax privileges for old age, a decrease in marginal tax rates, and an increase in the standard tax credit from US$592 to US$817 per year. These measures will ease the burden on the taxpayer by between US$268 and US$469 a year. About two-thirds of the entire reduction of the tax burden will benefit people earning monthly incomes of less than ATS23,000 (US$1,540). Through these measures, the tax burden on the majority of incomes is expected to be lowered in real terms.

Regarding the taxation of enterprises, the 2000 tax reform package contained 2 new provisions: Interest payments on personal **equity** will be taken into consideration for taxation purposes, and a tax allowance of US$335,000 will be introduced for inheritance (gift) tax in the case of enterprise transfers. Moreover, the research contribution and apprenticeship allowance will be increased. Private provision for old age will be promoted. In addition, regarding the taxation of capital gains from the disposal of securities, the retention period will be prolonged from 1 year to 2 years.

Relative to the gross domestic product, this tax reform is more comprehensive than the previous ones implemented in 1989 and 1994. The main emphasis of the reform is on easing the tax burden on private consumption. Consumer demand is expected to continue to increase by a cumulative 1.8 percent per year in real terms by 2005. Since direct incentives for investors are extremely modest, investments are not expected to grow significantly. Higher domestic demand, which also results in higher imports, is expected to only modestly contribute to the growth of GDP by 2005. The labor market is thought to be able to absorb another 9,300 employees. Price increases are expected to be insignificant at 0.2 percent.

INFRASTRUCTURE, POWER, AND COMMUNICATIONS

A distinctive feature of the Austrian energy sector is its diversified sources of supply. In 2000, the total primary energy supply included liquid fuels (38 percent), natural gas (24 percent), hydropower (13 percent), other renewable resources (13 percent) and coal (12 percent). Nuclear power is legally banned, following a referendum on the subject in 1978. The renewable resources share in Austria's energy supply increased from 16 percent in 1973 to 26 percent in 2000. The government plans to completely liberalize the electricity market by 2003. Preparations are also under way to open up the natural gas market.

For decades, the telecommunications industry was a **monopoly** in Austria, with the state-owned Post and Telecom Austria (PTA) being the only national supplier of networks and telecommunication services. Because of EU liberalization directives, the government enforced legislation to open the telecom and energy sectors to competition. The Austrian telecommunications sector now exhibits much liberalization, though high interconnection fees are still a problem. Austria has a highly developed telecommunications system with 4 million telephones, 27 radio stations, 47 television stations, and 4 satellite

ground stations. Radio, television, telephone, and telegraph systems were all state monopolies until the broadcasting system was converted into a joint-stock company in 1957. The Austrian Broadcasting Company operates 3 radio and 2 television stations nationwide. Telephone and telegraph communications are directed by the Austrian postal and telecommunications service. More than 20 daily newspapers are published. Daily newspaper circulation averages more than 3.7 million. Influential dailies include *Die Presse* (published in Vienna) and *Salzburger Nachrichten* (published in Salzburg).

Austria has an excellent network of transportation and communication; due to its strategic location and relative political neutrality, Austria has established itself as a broker and an international place of encounter among nations. This role is exemplified by the countless summit meetings and conferences which the country hosts every year. Austria is also anticipating the increasing importance of its transport sector as an essential European communications hub. A factor of the growing importance of the transportation web is the growing European energy transit network (the transport of oil, natural gas and electricity), much of it passing through Austria.

A landlocked and mountainous country, Austria depends on roads and rail passage for a major share of its foreign trade. In the transportation segment, it has 200,000 kilometers (124,000 miles) of roads and 6,028 kilometers (3,744 miles) of railroads, of which about 5,388 kilometers (3,347 miles) are state owned and 640 kilometers (398 miles) privately owned. Furthermore, more than 350 kilometers (217 miles) of inland waterways carry approximately one-fifth of the country's total trade. The main river ports are Linz, Vienna, Salzburg, Graz, Klagenfurt, and Innsbruck. The Danube River, the only navigable waterway with barges carrying up to 1,800 tons, is an important connection between the North Sea, Germany, and the Black Sea. In terms of air connection, Austria has 55 civil airports, 20 with paved runways. The main international airport is Schwechat located in southeast Vienna. International flights are available from the airports in Graz, Innsbruck, Klagenfurt, Linz, and Salzburg.

ECONOMIC SECTORS

Austria is one of the wealthiest and most stable of the EU member countries. It has a free market economy with a strong emphasis on social factors favoring the economically less privileged and providing conditions for equitable wages and pricing. Service, industry, and agriculture are the 3 major sectors of the Austrian economy. The foremost products are foodstuffs, luxury commodities, mechanical engineering, steel, chemicals, and vehicles. Within the vehicle sector, the production of engines and transmissions is the most important, accounting for an export quota of more than 90 percent. Austria manufactures as many as 800,000 engines per year for major car manufacturers. In the electronic engineering field, Austria is known for its production of customized elec-

tronics products such as microprocessors and integrated circuits for airbags, ABS braking systems, and components for Airbus airliners and for high-speed trains.

Approximately 3 percent of all Austrians work in agriculture and forestry. In 1998 that sector accounted for 1.3 percent of Austria's gross domestic product. Although about 41 percent of Austria's total area is thought to be suitable for agriculture, currently about 18 percent of the surface area is actually covered by farmland. Another 27 percent of the country's area is considered as grassland and nearly half (47 percent) is woods and forests. With its 20,000 organic farmers, Austria occupies a leading position in Europe in the branch of organic agriculture.

In 1998, Austrian industry (commodities manufacturing, energy, and mining) accounted for 32.4 percent of the GDP and employed 29 percent of the workforce. In the field of raw materials and energy generation, Austria possesses ample resources. It has major deposits of iron ore and non-ferrous metals. It also has its own resources of oil and natural gas and is the EU's number-one generator of hydroelectric power. However, the constant growth of the industrial sector necessitates a significant amount of supplementary imports. This is also true of fuels and energy and of the electricity which generates industry.

There are an unusually high number of medium-size enterprises in Austria's commercial industrial sector. Austrian industry covers practically every branch of manufacturing starting from basic goods to the labor-intensive production of finished goods. Plant construction (encompassing the planning, delivery, and assembly of industrial facilities) is among the most important industries of the country. Plant construction and electronics sectors are strongly export-oriented. Another export-oriented sector is Austria's handicrafts, famous worldwide for, among other things, costume jewelry, ceramics, and glassware.

AGRICULTURE

The agriculturally productive land of Austria covers 28.1 million hectares (69.5 million acres), or 94 percent of the total area. The provinces having the largest proportion of arable land are in the southern parts of the country. The total value of agricultural exports in 2000 was US$2.85 billion and that of imports was US$4.56 billion. A large amount of agricultural exports go to neighboring Italy.

FARMING. Austrian farms, like those of other West European mountainous countries, are small and fragmented. Their products are relatively expensive, with an emphasis on **cash crops**. Although Austrian farmers provide about 80 percent of domestic food requirements of the country, the agricultural contribution to the gross domestic product has declined since 1950. The principal agricultural products are wheat, rye, oats, barley, corn, potatoes, sugar beets, and cattle turnips. Besides these principal crops, other crops of considerable magnitude are: buckwheat, flax, tobacco, fuller's thistle, and cabbage. The principal garden products are kitchen vegetables and fruit, of which large quantities are exported. The best fruit districts are in Upper Austria and Styria. The primary meat products are beef and veal, chicken, duck, game, goose, horse, lamb, pork, rabbit, and turkey. The most valuable agricultural exports in 2000 were non-alcoholic beverages, chocolate products, beef, pastry, and processed fruit. Large quantities of wheat and maize are imported, much of it from neighboring Hungary. Important exports are barley, oats, milk, beef, and pork.

FOREST PRODUCTS. Forests occupy just over one-third of the productive area of Austria or 98,000 square kilometers (38,000 square miles). As much as 85 percent of all Austrian forests are dominated by tall timber, such as oak, pine, beech, ash, elm, and spruce, which are important in the paper and pulp industry and in building construction. In 2000 about 17 million cubic meters (590 million cubic feet) of round wood was cut. A comprehensive reforestation and conservation program has been in progress since the early 1950s to compensate for damage inflicted during WWII and for postwar overcutting of forest trees. Economic development in 1998 and the opening towards the EU market have also affected forestry. Although the number of employees and production decreased slightly, investments in forestry increased.

FISHERIES. The fisheries of Austria are very extensive. The numerous rivers of Austria swarm with a great variety of fish. The lake fisheries are largely developed and employ about 4,000 vessels and over 16,000 fishermen. Fishing for sport in the mountain streams is popular and constitutes a large source of income. However, most table fish are imported.

INDUSTRY

The essential industries in Austria are construction, machinery, vehicles and parts, food processing, chemicals, lumber and wood processing, paper and paperboard, communications equipment, energy production, and mining. Austria has favorable conditions for industrial activity, including a very well developed **infrastructure**, a rich source of raw material, and a skilled, moderately expensive **labor force**. Industrial output in 2000 (including energy production) grew by an estimated 6.8 percent over the previous year. The biggest growth rate, 11.1 percent, was recorded for **capital goods**, while production of **consumer goods** expanded by 2.6 percent.

MANUFACTURING. The Austrian manufacturing industry consists of a few large organizations, most of which operate under government control, and a great number of small and medium-size production units. Manufacturing remains focused on medium-technology sectors producing intermediate and capital goods, much of it bound as exports to neighboring Germany. Due to its well-established export markets, the manufacturing sector has a relatively low level of research and development expenditure, at 1.6 percent of gross domestic product in 1999, as compared to the EU average of 1.9 percent. The principal manufacturing products are textiles, metals, alcoholic beverages, leather, paper, sugar, glass, porcelain, earthenware, chemicals, and scientific and musical instruments. Because of the traditional popularity of Austrian wood, glass, textile, and ceramic handicrafts, many establishments produce such goods. The principal industrial products are pig iron, crude steel, rolled steel, motor vehicles, cement, fertilizers, paper, and cotton, woolen, and synthetic yarns and fabrics. Annual production of crude steel totaled about 3.95 million metric tons in 2000. The textile industry in all its branches (cotton, woolen, linen, silk, flax, and hemp) is a historic industry and is mostly concentrated in the southern part of the country.

MINING AND ENERGY. The annual production of principal minerals in 2000 included lignite coal (1.8 million metric tons), iron ore (1.6 million metric tons), crude oil (1.2 million metric tons), magnetite (1.0 million metric tons), salt (702,000 metric tons), and zinc ore (16,450 metric tons). Other substances commercially mined included copper, lead, antimony, bauxite, tungsten, and natural gas. Austria has numerous hydroelectric installations, which together produce nearly two-thirds of the country's electrical output. More than 51 billion kWh of electricity are generated each year.

SERVICES

Austria has an advanced industrial economy with a significant service sector. The service sector contributes more than 66 percent of the gross domestic product and employs 68 percent of the population. There is a substantial amount of foreign investment in the service sector. Foreign interests control most of the large computer-servicing firms, whereas tourism is in the hands of local interests. Management consultancy has also come to play a larger role in the Austrian economy, especially given Austria's role as a link between Eastern and Western Europe.

TOURISM. Because of its wealth of cultural and recreational facilities—including historical sites and winter and summer resorts in the spectacular mountains—Austria has a large tourism industry, which acts as a major earner of foreign exchange. More than 8 percent of Austrians are employed in the tourism industry. Tourism is based on the services of traditional agriculture in the Alpine region of Austria, where tourists appreciate the cultural landscape safeguarded by farmers. As many as 17,000 farmers annually rent private rooms to holiday-makers. In 1998, this category accounted for about 15 million overnight stays out of the total 111 million overnight stays in Austria. Austria's major cities are also a major attraction, for they boast some of the most impressive architecture in Europe and are known for the quality of their theatre, music, and museum art. According to the World Tourism Organization, Austria had 16.7 million visitors in 1997 and these visitors spent US$12.4 billion in the country. Increasingly, however, Austria has experienced a decline in the numbers of overnight stays due to its high prices compared to Eastern European countries.

FINANCIAL SERVICES. The contribution of the financial services sector to gross domestic product amounted to 6.3 percent in 2000. It employed some 110,000 people, or 3.6 percent of the workforce. The sector grew by 4.1 percent per year over the 1996–2000 period. Austrians' propensity to save, at about 25 percent of gross domestic product, has contributed to the success of the financial services. Austria's domestic savings to GDP ratio in 1999, according to the World Bank, was more than Germany's 23 percent or the United States' 15 percent. With about 1,000 banks, Austria has more than twice as many banks as neighboring Switzerland. Central and Eastern Europe comprise one area where Austria's banks have a competitive lead over European rivals. Raiffeisen Zentralbank has 2,500 staff and 80 branches in Central Europe and Bank Austria has 100,000 personal customers

in the region. In addition to its presence in Western Europe, Austrian bank exposure abroad is also found in neighboring Hungary and the Czech Republic. Bank Austria has also been active in Russia.

RETAIL. At the turn of the 21st century Austria was undergoing a major shift in the nature of its **retail** establishments from a system based on small, locally-owned shops to one based on larger franchises and foreign-owned chains. EU membership has brought the entrance of large grocery, clothing, and household goods stores to the country, often driving family-owned businesses out of business. Small shops and boutiques once made up nearly 90 percent of the retail sector, but that number began shrinking in 1995. By 1999 large shopping centers and malls accounted for 12 percent of retail sales, and 33 new malls were in development in 2001. German retail chains represent the dominant foreign presence in the retail sector.

Franchising is a small but growing factor in the Austrian economy. Experts estimate that it accounts for about US$830 million in annual sales or just over 2 percent of total retail sales (compared to almost 50 percent in the United States). Current growth in the franchise market of Austria is around 10 percent annually. About 1 in 3 franchise systems operating in the country is of local origin. The top foreign participant in the Austrian franchising economy is Germany, with around 20 percent of the franchise systems, followed by the United States, with about 5 percent of all the systems.

INTERNATIONAL TRADE

Austria's economy is dependent on foreign trade and closely linked to the economies of other EU countries, particularly Germany. Austria trades with some 150 countries, with the European Union accounting for about two-thirds of the total. Beside a variety of goods, Austria exports money in the form of investments. It is a major investor in the former Eastern European countries, with some 40 percent of all direct foreign investments in that part of the world coming from Austria. Another important branch of Austria's foreign trade sector is transit trade for goods and services traveling east and west across Europe.

Austrian exporters sold merchandise worth US$65.6 billion in 2000, up from US$62.9 billion in 1999. In 2000, Austria's international trade continued to grow. The trade balance deficit dropped from 8.4 percent to 5.6 percent of the export volume, reaching its lowest level since 1945. The sound economic situation in Central and Eastern Europe, the booming economy in the United States, and the moderate economic development in the European Union, as well as the favorable **exchange rate** were the main contributing factors. What grew strongest was foreign trade with the Eastern European countries and the United States. Exports to Eastern Europe rose 23 percent in 2000 and imports 29 percent, while exports to North America increased by about one-third. Exports to the European Union rose 12 percent, while imports grew by 10 percent. Exports to Asia climbed by almost one-fifth in 2000, while those to Latin America showed a modest rise of 9 percent.

Trade (expressed in billions of US$): Austria

	Exports	Imports
1975	7.519	9.394
1980	17.489	24.444
1985	17.239	20.986
1990	41.265	49.146
1995	57.642	66.386
1998	62.767	68.277

SOURCE: International Monetary Fund. *International Financial Statistics Yearbook 1999.*

EU countries absorb the majority of Austrian exports and provide the majority of imports. In 1999, EU countries purchased 65 percent of Austria's exports, with Germany taking 36 percent, Italy 9 percent, and France 5 percent. Switzerland and Hungary each purchased 5 percent of Austria's exports. In 1999, 70 percent of all imports came from EU countries, with Germany providing 42 percent, Italy 8 percent, and France 5 percent. The United States is Austria's largest non-European trading partner, taking 4.5 percent of Austrian exports and providing 5 percent of its imports. Although the accession of Austria to the European Union has brought stiffer competition from European producers, U.S. exports to Austria increased considerably in the mid to late 1990s. Some U.S. exporters, particularly those in the data processing hardware and semiconductor sectors, are confronted with higher customs tariffs and regulations. Others have benefited from lower EU tariffs.

The EU ban on beef imports from cattle treated with hormones severely restricted U.S. exports of beef to Austria. Despite a World Trade Organization decision that the ban was inconsistent with the rules of international trade, the European Union did not lift the ban. Furthermore, the European Union ruled out the possibility of importing U.S. poultry or products containing poultry. The import of genetically modified food—what some Europeans call "Frankenstein food"—with the United States being the primary producer, was also banned. Austria went even further than its EU partners: Novartis corn and Monsanto BT corn, for example, which were major genetically modified foods approved by the European Commission, were banned imports in Austria.

MONEY

Austria has pursued moderate, stable, long-term **fiscal** and **monetary policies**. Throughout the decade, the money supply was constantly growing, as well as Austria's exports, imports, government revenue and spending, gross domestic product, and income. The Austrian currency, the schilling, is strong and convertible. Once called the alpine dollar, the Austrian schilling has become one of the most stable currencies in the world. The Austrian schilling depreciated against the dollar in 1996 and 1997 but was stable against most European currencies. With the decision on the European Monetary Union in place, fluctuations of the schilling against the currencies of the other 10 European Monetary Union participants were minimal during the remainder of 1998. The dollar continued to strengthen against the schilling during the first half of 1998 and 1999 parallel to its rise against the Euro.

In 1999, Austria adopted the euro, the common currency of the European Union, at a fixed conversion rate of ATS13.76 to Euro1. At the same time, Austria surrendered its sovereign power to formulate monetary policy to the European Central Bank (ECB), in line with other EU member states participating in the European Monetary Union. Austria's central bank, the Österreichische National Bank (ANB), is a full participant in the European System of Central Banks. The government successfully met all convergence criteria due to austerity measures implemented in 1996–97 and is pursuing a policy of further reducing the fiscal deficit and the public debt. The ECB's focus on maintaining price stability in formulating exchange rate and monetary policies is viewed by the ANB as a continuation of the hard schilling policy the ANB pursued since 1981. By fixing the Austrian schilling to the German mark, the government successfully kept **inflation** under control and promoted stable economic growth.

POVERTY AND WEALTH

The World Bank ranks Austria seventh in the world in terms of annual per capita income. The annual **gross domestic product per capita** is estimated to have surpassed US$30,000 by the late-1990s. Living standards are very high, and due to **socialist** policies of the federal government, the incidence of poverty is minimal. In 2000, the mean unemployment rate stood at 7.1 percent, and the mean gross monthly income was US$1,922.

There is no legally mandated minimum wage in Austria. Instead, minimum wage scales are set in annual collective bargaining agreements between employers and employee organizations. Workers whose incomes fall below the poverty line are eligible for social welfare benefits. Over half of the workforce works a maximum of about 38.5 hours per week, a result of collective bargaining agreements. The Labor Inspectorate ensures the effective protection of workers by requiring companies to meet Austria's extensive occupational health and safety standards. The Austrian system of social insurance is comprehensive, including sickness, disability, accident, old-age, and unemployment benefits; allowances for families with children; and rent aid. The program is financed by compulsory employer and employee contributions. Health insurance and some other types of insurance are voluntary for individuals who are self-employed. Health conditions and facilities in Austria are considered excellent.

WORKING CONDITIONS

Austria was ranked number-one in the World Competitiveness Report of 1999 for quality of life, providing high-performance infrastructure and rapidly falling telecommunications and energy costs. It also has one of the best records of price stability in the world. Corporate tax rates are one of the lowest among leading industrial nations.

There is a strong labor movement in Austria. The Austrian workforce is 3.7 million, 40 percent being females. About 45 percent of the total Austrian labor force belongs to the 14 unions that make up the Austrian Trade Union Federation. Membership in unions is voluntary, but all wage earners are required by law to join their respective chambers of labor. Guarantees in the Austrian constitution governing freedom of association cover the rights of workers to join unions and engage in union activities. The Austrian Trade Union Federation (OGB) comprises constituent unions with a total membership of about 1.5 million. Since 1945, the OGB has pursued a moderate, consensus-oriented wage policy, cooperating with industry, agriculture, and the government on a broad range of social and economic issues in what is known as Austria's social partnership.

Compared to other EU member states, Austria has the third lowest unemployment rate, with only the Netherlands and Luxembourg providing better job opportunities. (The European Union's average unemployment rate was 8.5 percent by the end of 2000.) In addition, Austria prides herself on having the lowest youth unemployment rate in Europe. In the past, both the federal government and the state governments spent billions of schillings to provide vocational training to those who left school at the end of compulsory education and to help others achieve secondary school qualifications. Now that more companies are willing to take on apprentices, the government has decided to **restructure** its vocational programs.

At a time of prosperity for the Austrian economy, however, the country received unexpectedly poor ratings from the Union of Industrial and Employers' Confederations of Europe (UNICE). It sharply criticized Austria for underfunding research and development. The organization also pointed out that Austria had far too few highly trained information technology personnel. UNICE expected a shortage of 13,000 qualified information technology workers.

COUNTRY HISTORY AND ECONOMIC DEVELOPMENT

1918. Austro-Hungarian empire collapses at the end of World War I, and the Republic of Austria is formed.

1922. Austria receives a loan from the League of Nations, pledging to remain independent for 20 years.

1930s. Dictatorship of Engelbert Dollfuss occurs.

1934. In February civil war breaks out, and the Socialist Party is outlawed.

1934. A coup d'etat by the National Socialists fails in July, and Dollfuss is assassinated by the Nazis.

1938. Austria is incorporated into Germany's Third Reich.

1945. In April Soviet troops liberate the eastern part of Austria, including Vienna. Austria is divided.

1945. Under the Potsdam agreements, the Soviets take control of German assets in their zone of occupation.

1955. All occupation forces are withdrawn, and Austria becomes free and independent.

1955. The Nationalrat enacts the Federal Constitutional Law, declaring the country's permanent neutrality. Austria becomes a member of the United Nations.

1979. Austria gains a permanent seat in the United Nations.

1972. Austria signs a free trade agreement with the European Community, abolishing all industrial tariffs.

1995. Austria becomes a full member of the European Union, together with Finland and Sweden.

1995. Austria joins NATO's Partnership for Peace program.

FUTURE TRENDS

Forecasts for economic growth in 2001 have been positive. A double-digit growth rate is expected in industrial output, retail trade has grown by 5 percent, and tourism is booming. Gross domestic product is likely to advance by 3.1 percent rather than the predicted 2.8 percent. Interest rates will rise slightly but remain low. Demand for Austrian goods is up, and this makes for full order books in the country's exporting industries. In addition to increased sales abroad, recent tax breaks are being used by private households for additional consumer spending rather than stocking up their savings accounts. Business confidence is buoyant given the competitive position of Austria's industry, strong foreign investment, and good export opportunities. Inflation is expected to remain lower than the EU average. The challenges that face the Austrian economy in the future will be securing the greatest possible congruence of its economic policy with common EU policies, most notably in the fields of trade, agriculture, regional development, taxation, and monetary policy.

On the agricultural side, Austria's organic farming and food industry may serve as an example to the world as an alternative to genetically modified food and hormone-treated cattle and poultry. With its ban on imports of genetically modified food, mostly produced in North America, and the outbreak of mad cow disease in Europe and foot-and-mouth disease worldwide, the already well-established organic farming of Austria is expected to continue to grow, generating record profits. Austria also faces social challenges of containing its right wing nationalists, as manifested by the ultranationalist Freedom Movement Party, and upholding the rights of thousands of non-ethnic Austrian and non-European immigrants who now compose an increasingly larger part of Austrian society.

DEPENDENCIES

Austria has no territories or colonies.

BELARUS

Republic of Belarus
Respublika Byelarus

CAPITAL: Minsk.

MONETARY UNIT: The Belarusian ruble (BR) became the official currency in May 1992. New bank notes introduced in 2000 include 1, 5, 10, 20, 50, 100, 500, 1,000 and 5,000 ruble notes. The currency contains no coins. As of February 2001, BR1,244 equaled US$1.

CHIEF EXPORTS: Machinery, transport equipment, chemicals, metals, textiles, foodstuffs.

CHIEF IMPORTS: Fuel, natural gas, industrial raw materials, cotton fiber, sugar, foodstuffs.

GROSS DOMESTIC PRODUCT: US$55.2 billion (1999 est.).

BALANCE OF TRADE: **Exports:** US$5.95 billion (2000). **Imports:** US$6.55 billion (2000).

COUNTRY OVERVIEW

LOCATION AND SIZE. Belarus is a landlocked state in Eastern Europe bordering Poland, Lithuania, and Latvia to the west; Ukraine to the south; and Russia to the east and north. It has a total border of 3,100 kilometers (1,900 miles), with almost one-third of its border (960 kilometers, or 600 miles) touching Russia. Slightly smaller than the state of Kansas, Belarus covers an area of 208,000 square kilometers (80,000 square miles). Belarus is divided into 6 oblastsi (provinces). The cities of Minsk, Gomel, Brest, Vitsyebsk, Grodno, and Mogilev are the capital cities of these oblastsi.

Belarus is the smallest of 3 Slavic republics (with Russia and Ukraine) that were once part of the Soviet Union. These Slavic republics, along with 12 other regions, gained their independence from the Soviet Union in 1991.

POPULATION. The population of Belarus was estimated at 10.4 million in July 2000, with almost 75 percent living in urban areas. The population of the city of Minsk alone was estimated at 1.67 million in July 2000. The number of people living in Belarus peaked in 1993 and has been declining at an average annual rate of 0.5 percent. It is estimated that by 2015 the population will fall to 9.8 million. The negative population growth rate is partly due to a falling life expectancy (68 years; 62 years for males and 74 for females), a low fertility rate, and **emigration**. Belarusians are marrying at an older age and

having fewer children. Low fertility combined with increased emigration has resulted in an older population. In 1960, for example, 32 percent of the population was considered "young" and 14 percent was considered "old." The corresponding figures for 1996 were 23 percent and 21 percent.

Ethnic Belarusians make up more than 77 percent of the country's population. Russians, many of whom were migrants to Belarus while it was still part of the Soviet Union (1917–91), form the second largest ethnic group (13 percent). The remainder of the population are Poles (4 percent), Ukrainians (3 percent), and Jews (1 percent), with a small number of Latvians, Lithuanians, and Tartars (0.1 percent). Before World War II, Jews constituted the second largest ethnic group in the country.

Belarusians emigrate from their country for economic, military, political, and religious reasons. Some estimates put the number of Belarusians living abroad at between 3 to 3.5 million. The United States is one of the principal countries of Belarusian emigration. Since 1946, more than 500,000 Belarusians have emigrated to the United States, many fleeing a country devastated by World War II (1939–45).

Both Belarusian and Russian are official languages. The Belarusian language is an East Slavic language, closely related to Russian and Ukrainian. Like many of the Slavic languages, Belarusian uses the Cyrillic alphabet. Most Belarusians who profess a religion adhere to the Eastern Orthodox Church. There is, however, a sizable minority of Roman Catholics, and the Eastern-rite (Uniate) church is experiencing a revival after centuries of persecution under Eastern Orthodox-dominated Tsarist Russia and atheistic (not subscribing to any religion) Soviet rule.

OVERVIEW OF ECONOMY

The breakup of the USSR (Union of Soviet Socialist Republics) in 1991 had a negative impact on Belarus. Although the majority of the former Soviet republics quickly shifted their economies toward the free market system, Belarus was among the slowest to open up its economy. International financial institutions, such as the World Bank, International Monetary Fund (IMF), and the European Bank for Reconstruction and Development (EBRD) assisted the country with credits and special economic development projects. Although their efforts resulted in some positive outcomes, they also increased Belarus's international debt. Whereas in 1991 the country was practically debt-free, in 2000 Belarus owed nearly US$800 million to foreign banks and government bodies.

Agriculture and industry are the largest sectors of Belarus's economy, making up 13 percent and 34 percent of GDP in 2000, respectively. Wheat, rye, oats, potatoes, flax, hemp, and sugar beets are the primary agricultural products. Dairy and beef cows, pigs, and chickens are also raised. The main industrial items produced in Belarus are tractors, trucks, earth movers, metal-cutting machine tools, agricultural equipment, motorcycles, chemicals, fertilizer, textiles, and some **consumer goods**. Peat, the country's most valuable mineral resource, is used for fuel and fertilizer and in the chemical industry. Belarus also has significant deposits of clay, sand, chalk, dolomite, phosphor, and rock and potassium salt. Forests cover one-third of the country's territory and the lumber industry is economically important as a result. Having only small reserves of petroleum and natural gas of its own, Belarus imports most of its oil and gas, mainly from neighboring Russia. It also imports large quantities of grain. The main export items are machinery and household items.

The Chernobyl nuclear power plant accident that took place on 26 April 1986 in Ukraine released massive amounts of radiation, contaminating large amounts of agricultural land in Belarus. An estimated 150,000 inhabitants had to move, and many people needed medical help. Chernobyl caused the government to take more than 23 percent of the country's agricultural land and 20 percent of forest land out of production. Economic output declined for several years after the accident, but revived somewhat in the late 1990s. The economic revival was due to several factors, including improved production techniques, better relations with foreign countries, and the introduction of **privatization**.

Under the **socialist** system of the Soviet Union, Belarus's economy was merely part of the national economy of the Soviet Union. After winning independence from the Soviet Union in 1991, Belarus moved very slowly on free market reforms, keeping its basic economic reliance on Russia. Some reforms were implemented between 1991 and 1994, but they did not last long enough to make an impression. When Alexander Grigorjevich Lukashenka became president in 1994, many of these free market economic reforms were reversed. The government reintroduced **price controls** (an enforced price on an item) on at least 26 basic goods and services. Currency exchange regulations were re-imposed, and privatization was halted. The government subsidized businesses and farms. About half of all enterprises remained in state hands in 2000. Structural reform has been slower than in most other **Commonwealth of Independent States** (the CIS is made up of 12 republics of the former Soviet Union, not including the 3 Baltic countries of Latvia, Lithuania, and Estonia).

Russia remains Belarus's main trading partner, accounting for more than 50 percent of Belarus's foreign trade. Belarus has made several attempts at economic and political re-integration with Russia. Belarus seeks to use

the Russian ruble as its currency by 2005, and hopes to see a common Russia-Belarus currency by 2008. Other major trading partners are Ukraine, Poland, and Germany.

POLITICS, GOVERNMENT, AND TAXATION

There are 3 governmental branches in Belarus: the executive, including the president, prime minister, and council of ministers; the legislative, consisting of parliament; and the judicial, or the Supreme Court. Belarus has a president as the head of the state, who serves a 5-year term. The president appoints the prime minister, who is the head of the government. A **bicameral** (2-house) parliament consists of the 64-seat Council of the Republic and the 110-seat Chamber of Representatives. Judicial power in Belarus is in the hands of courts. The Constitutional Court exercises control over constitutionality (determination of legal validity based on the constitution) of acts and decrees. Administratively, the country is divided into 6 oblasts (administrative divisions). Local administration and decision making are carried out primarily by the Soviets of Deputies. There are several registered political parties: the Belarusian Popular Front, Party of Popular Accord, Union of Belarusian Entrepreneurs, Belarusian Party of Communists, Belarus Peasant Party, Belarusian Socialist Party, Social Democrat Party, Agrarian Party of Belarus, and United Democratic Party of Belarus.

President Lukashenka consolidated his power through a highly controversial election held in 1994. Based on the results of this vote, the Constitutional Court lost its independence, and the democratically elected parliament was abolished and replaced by presidential appointees. President Lukashenka used his increased power to suppress the freedoms of speech, press, association, and assembly. He also eliminated the system of checks and balances over the executive branch. In 1996 Lukashenka extended his term, which should have ended in 1999, to 2001.

Taxes are the primary source of government revenue. The taxation system of Belarus includes national and local taxes as well as other types of taxes and **duties**. National taxes are collected throughout the country and transferred to the national budget and extra-budgetary state funds. Local taxes are levied only within respective administrative and territorial units and transferred to local budgets. Belarus signed international agreements on avoiding double taxation with a number of countries. The country took steps to **liberalize** taxation and customs regulations, granting some benefits to investors in the 1990s. Belarusian laws allow foreign entities to make direct private investments in the Belarusian economy through the creation of **joint ventures** with as much as 100 percent participation of foreign capital.

From 1993 to 1999, investments in Belarus totaled US$697 million, a low figure compared to other former Soviet countries. The bulk of foreign investment came from Gazprom (Russia's state-owned gas company). The Yamal pipeline project funded by Gazprom will export natural gas to Western Europe via Belarus. Western investors in Belarus include the Coca-Cola company, which has been building a US$50 million plant in the capital city of Minsk, and Ford Motor Company, which holds a 51 percent stake in a truck assembly plant outside of Minsk.

INFRASTRUCTURE, POWER, AND COMMUNICATIONS

Belarus has an extensive though aging **infrastructure**, which is badly in need of investment for repair and maintenance. A network of over 5,488 kilometers (3,409 miles) of railways and 52,131 kilometers (32,380 miles) of primary and secondary roads serve the country. About 11 percent of all roads are unpaved. The railways are used to transport both people and goods, and are in moderate use by international transit linking Western and Eastern Europe. Furthermore, the country has a large and widely used canal and river system, with 1 port at Mazyr. Nearly 5 percent of the former Soviet Union's fleet of ships are

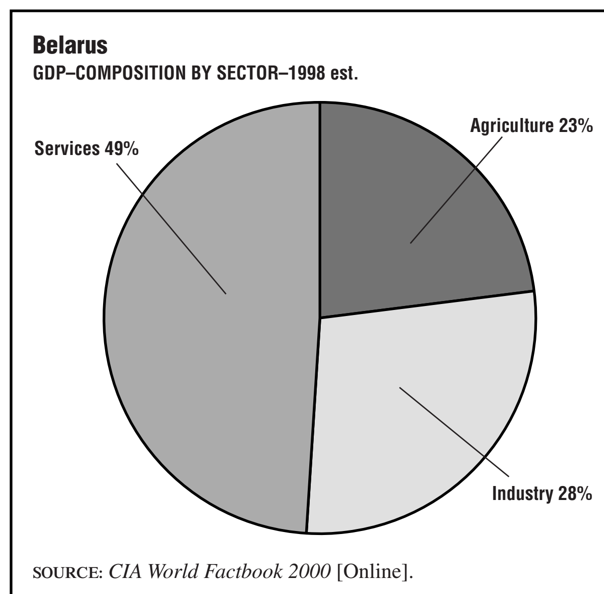
in Belarus. There are 118 large and small airports, few of which meet international standards. Only 36 airports have paved runways.

Belarus remains highly dependent on imported energy and has made little progress toward diversifying its exports and entering new markets. Many energy consumers, such as households, businesses, and even government offices, have not been able to pay their utility bills. Energy debt, mostly for natural gas, stood at more than US$250 million in May 2000. The government attempted to pay its debts by **bartering** and through agreements directly with Russia and Lithuania. Even though the large majority of electricity and fuel is imported, there is some domestic production of energy. In 2000 Belarus produced 25 billion kilowatts (kWh) of electric power, 1.8 million tons of gasoline, 3,500 tons of diesel fuel, and 5.6 million tons of industrial fuel oil.

Telecommunications services in Belarus are inadequate for both public and business use. Hundreds of thousands of applications from household telephones remain unsatisfied. Some investment on international connections and businesses has taken place, much of it in Minsk. There were 296 radios per 1,000 people in 1997, and 314 televisions per 1,000 people in 1998. A domestic cellular telephone system operated in Minsk, but only 1 person out of 1,000 owned a cellular phone in 1998. By 2000, the country had 9 Internet service providers. However, the number of personal computers in the country was very low.



SOURCE: *CIA World Factbook 2000* [Online].

ECONOMIC SECTORS

More than half of the economy of Belarus is owned and operated by the state. The government's insistence on maintaining a centrally planned socialist economy and encouraging private and foreign investment has not been successful. Belarus's economic progress has fallen behind neighboring countries, many of which have adopted free market economic practices. Yet Belarus has a high capacity for progress. It has a relatively educated and skilled **labor force** (4.44 million in 1999) and it is situated in a strategic location of Europe. Industrial production (34 percent of GDP) dominated the economy in 1999, employing 28.9 percent of the workforce, but services employed almost half of the total workforce.

The lack of a **free market system** and human rights violations, such as the arrest of peaceful political activists and the control of radio and television stations, has discouraged substantial amounts of foreign investment. The country is short of **foreign exchange reserves** and has a relatively high **inflation rate** (more than 150 percent per year for 1998 and 1999). By March 2000, Belarus had not reached many of the economic goals through which it could receive additional International Monetary Fund aid. The government has been looking toward Russia for increased economic cooperation, such as increased trade, foreign investment, and an eventual unified currency.

AGRICULTURE

Agriculture accounted for 23 percent of the country's 1998 GDP and employed nearly 650,000 people, or more than 17 percent of the labor force in 1999. The majority of agriculture is conducted on state-owned lands and farms. Private farms, however, are much more efficient than state farms. Private farms produce an estimated 40 percent of agricultural output, even though they constitute a mere 15 percent of all agricultural lands. The primary food crops produced by Belarusian agriculture are barley, corn, potatoes, sugar beets, and wheat. Meat products include beef, veal, chicken, lamb, and pork. The most profitable agricultural exports in 2000 were butter, alcoholic beverages, condensed milk, beef, and cheese. The total value of agricultural exports in 2000 was US$377 million, while the value of agricultural imports was US$911 million.

Independence for Belarus, as in many of the former Soviet republics, brought economic hardships and food shortages. Between 1990 and 1998, total agricultural production was reduced by 29 percent, and in collective and state farms, production was reduced by 44 percent. Production of grains and pulses in 1998 was 69 percent of that of 1990, potatoes 88 percent, meat 57 percent, and milk 70 percent. Animal husbandry also saw a reduction: the average yield of milk per cow in government farms fell by 23 percent from 1990 to 1998. The nutritional value of the average daily ration shrank by 14 percent during that period. Due to the poor economic situation,

the per capita annual consumption of meat decreased by 14 kg (19 percent), milk by 59 kg (19 percent), and eggs by 57 units (18 percent).

Production of grains in 1998 was 4,475,000 tons. This provided less than half of the minimal grain requirements for the country. Grain yields fell by 31 percent during the period of 1990–98. Land sown to grain also fell by 4 percent. As a result of the grain shortage, Belarus was forced to purchase and import grain from abroad. Russia was a major source of grain imports for Belarus, making up 44 percent of all grain imports in 1998. Imports of grain from Ukraine constituted another 30 percent of the whole. Ukraine was also a major provider of corn to Belarus. To encourage the domestic production of wheat, the government offered an artificially high price for wheat to farmers.

Belarus requires no less than 350,000 tons of sugar per year, but the capacity of internal sugar factories is only 150,000 tons per year. Since internal sugar beet production covers only about 44 percent of the country's needs, the rest is provided by imports. Belarus purchases the majority of its sugar from the Ukraine. During 1998 a total of 476,000 tons of sugar was both produced and imported, leading to an accumulation of sugar reserves and to the export of excess sugar to other CIS countries, mainly Russia. The sugar beet growing areas are located in the Brest, Grodno, and Minsk oblasts, where the 4 main sugar factories are located. The crop takes only 0.7 percent of total farmland in the country. In accordance with state sugar program, the development of the sugar industry aims to increase sugar beet production, increase the production capacity of the 4 sugar factories, and reduce energy and raw material expenses.

Vegetable oil is produced locally and sold to Russia, and it is imported from the Ukraine. Production capacities of the fat and oil industry meet the domestic market demand for vegetable oil, margarine, mayonnaise, and soap, as well as allow for the export of some finished products. The fields devoted to rape (a type of herb with oily seeds used to make canola oil) were increased from 88,000 hectares in 1998 to 150,000 hectares in 2000. The total sowing area under oilseeds was still 16 percent less than what it was in 1990. In order to solve the problem of domestic vegetable oil needs, to expand the growth of oilseeds and to increase the efficiency of oilseed production, the government supplied farms with quality seeds, mineral fertilizers, pesticides, and specialized harvesting machinery. Furthermore, it strengthened the material and technical base for seed processing and drying. An increase of the domestic production of vegetable oil was also induced by the rapid rise of the price for imported oils and oilseeds. In 1998 the price of vegetable oil was US$1,161 per ton as compared to US$823 per ton in 1995. The largest volume of vegetable oil export was recorded in 1998 at 11,300 tons.

INDUSTRY

Industry plays a leading role in the economy of Belarus, responsible for 34 percent of its GDP. It includes more than 100 sectors and 2,000 enterprises, many of which are fully self-supporting, and employs nearly 1 million people (26 percent of the Belarusian labor force). Before the breakup of the Soviet Union, much of Belarus's industry was geared toward making military machinery. After independence, the country faced the challenges of changing from military to peacetime production, modernizing factories, and cleaning up industrial pollution left by old factories.

MANUFACTURING. The main industrial products include metal cutting tools, trucks, earth movers, motorcycles, bicycles, television sets, radios, refrigerators, and chemical fibers. In addition, tires, timber, paper, board, textiles, and clothing are produced. Agricultural machinery is one of the specialties of Belarusian industry. Basic agricultural machinery produced in Belarus includes tractors, harvesters, fertilizers, and equipment for livestock-raising farms. Engineering and metalworking plants account for as much as 25 percent of the industrial output. The automotive industry specializes in the production of heavy-duty trucks. The Minsk tractor plant produces tractors, tractor engines, and spare parts. In 2000 alone, 26,500 tractors were produced. The electrical engineering industry produces alternating current motors, power transformers, electric bulbs, and cable products. In addition, computer-aided control systems, clocks, watches, cameras, and electrical measuring and process monitoring instruments are produced. Furthermore, road building machines, building and reclamation machines, roller bearings, passenger elevators, gas cookers, and equipment for the food industry are also produced. In 2000, exported manufactured goods included 7,800 trucks, 26,100 tractors, 3,200 metal-cutting machine tools, 505,100 refrigerators, 161,000 television sets, and 120,000 bicycles.

CHEMICAL AND PETROCHEMICALS. The chemical and petrochemical industries are well-developed. There are large complexes for the production of mineral fertilizers, tires, artificial fibers, and filament. In 2000 they produced 502,000 tons of nitrogen fertilizers, 2.8 million tons of potash fertilizers, 51.7 million tons of phosphate fertilizers, 209,000 tons of artificial fiber and filament, and 1.3 million tires for motor vehicles and farm machinery. The state dominates the chemical and petrochemical sector of industry, owning 73 percent of production. In 2000, 1 million tires, 2.6 million tons of potash fertilizers, and 161,400 tons of artificial fiber and filament were exported.

SERVICES

TOURISM. Belarus has fewer visits by tourists than its neighbors, but the numbers are increasing. In 1997, a reported 250,000 tourists visited Belarus, an increase of 36 percent from 1994. Tourists spent US$25 million in 1997. There are several reasons behind the low number of visitors to Belarus. There are few historic assets on which to build a tourist industry. Many of the country's historic buildings were destroyed during World War II. Minsk was completely flattened and is now characterized by grim Stalinist architecture (Stalin was the former dictator of the USSR) and high-rise buildings. In addition, as opposed to most Eastern European and Baltic countries that have dropped visa (government approval to enter a country) requirements for most visitors, Belarus requires visas for most tourists. The potential for increased tourism in Belarus is still favorable because it is considered a good candidate for **ecotourism**. Ecotourism could generate urgently needed revenue, create jobs, and help conserve the natural environment. The Ministry of Sports and Tourism and Ministry of Natural Resources and Environmental Protection have looked into establishing national parks and protected territories and monuments to stimulate an increase in tourism.

FINANCIAL SERVICES. After independence in 1991, the Gosbank (state bank) of the USSR was converted into the National Bank of Belarus (NBB). The specialized Soviet banks, including Sherbank, Agroprombank, Promstroibank, and Vnesheconombank, were turned into commercial banks offering corresponding specialized services. By mid-2000, Belagroprombank and Belarusbank together accounted for 51 percent of all Belarusian banking sector assets. There are 22 locally owned and joint venture banks. The largest joint venture bank was the Russian Mossbusinessbank. By mid-2000, the banking system of the republic, with a total of 28 banks, held an estimated BR1.5 trillion worth of assets (approximately US$1.6 billion). As a percentage of GDP, this made Belarus one of the lowest among the CIS countries. Assets in local currency accounted for 43 percent of total banking assets. Among the problems with the banking sector was a relatively high rate of lending to government enterprises (constituting 47 percent of all lending), considered to be economically unwise.

INTERNATIONAL TRADE

Foreign trade **turnover** totaled US$12.5 billion in 2000, nearly the same as the previous year, but down 20 percent from 1998. Exports accounted for an estimated US$5.95 billion and imports US$6.55 billion. Some 60 percent of Belarus's international trade and 85 percent of its trade with the CIS were with Russia, making that country its main trading partner. Half of the trade with Russia was in the form of barter deals. After the Russian financial crisis of August 1998, however, Belarusian exports to Russia shrank by about 17 percent and imports from Russia fell by 19 percent. Other CIS trading partners of Belarus were the Ukraine (11 percent of CIS trade), Kazakhstan (1.4 percent of CIS trade), and Moldova and Uzbekistan (1 percent each of CIS trade).

Trade (expressed in millions of US$): Belarus

	Exports	Imports
1994	2510	3066
1995	4706	5562
1996	5652	6938
1997	7300	8688
1998	7070	8548
1999	5922	6664

SOURCE: United Nations. *Monthly Bulletin of Statistics* (September 2000).

Main exports include vehicles (16 percent of total value of exports), machinery (13 percent), chemicals (13 percent), textiles (12 percent), and metal-ware (9 percent). In 1990, special priority was given to the development of bilateral links with various Russian regions. Exports to Russia in 1999 were 7 times higher than to any other country. Agricultural exports to Russia were primarily meat (12 percent of total), dairy products (21 percent), and eggs (7 percent). Nearly 90 percent of Belarusian meat and dairy exports went to Russia, in addition to 50 percent of potato, fruit, and vegetable exports. Exports to non-CIS countries decreased from 30 percent in early 1990 to less than 12 percent in 2000. Food and agricultural exports have increased, while machinery exports have decreased. Agricultural goods made up 8.2 percent of total trade in 2000 compared to 6.6 percent in 1996. Exports of meat products increased by 40 percent from 1996 to 2000, dairy products by 60 percent, eggs by more than 250 percent, and margarine by 440 percent.

Principal imports are energy (25 percent of total imports), machinery and equipment (16 percent), metals (13 percent), and food (11 percent). The main share (more than 50 percent) of food and agricultural imports comes from non-CIS countries. Another 25 to 30 percent of such products are imported from Russia. In 1997 the volume of agricultural imports was the highest it had been in years, at US$1.12 billion, and the average annual import of agricultural commodities during 1996–2000 was equivalent to US$929.3 million. The import structure changed after 1991 with some traditionally exported items such as meat, animal fats, and margarine being imported from abroad.

Belarus has had a **trade deficit** since 1995. The trade balance with Russia, however, has traditionally been positive. Exports to Russia exceeded imports by more than 200 percent in 2000. In the same year, the trade deficit with non-CIS countries amounted to US$433 million. During the 1996–2000 period, goods supplied by non-CIS countries were cheaper than items imported from Russia, except dairy products and grain. Vegetables, fruits, vegetable oil, margarine, and pasta imported from non-CIS countries were more than 200 percent cheaper; tea and candies were over 500 percent cheaper; meat products were 50 percent cheaper; fish was 30 percent cheaper; and sugar was 40 percent less expensive.

MONEY

Annual **inflation** in Belarus, as measured by changes in consumer price inflation, or CPI, has been very high during the 1990s. It stood at 294 percent by the end of 1999. There were several reasons behind the inflationary pressure on the economy. The 1998 Russian monetary crisis had a negative effect on the Belarusian ruble due to the dependence of the Belarusian economy on Russia. Government **subsidies** to several sectors of the economy (such as agriculture and housing) supported bad lending practices, poor weather conditions caused low agricultural production, and the government's periodic expansion of the money supply caused a **devaluation** of the Belarusian ruble.

In February 1993 Belarus set up the Inter-Bank Currency Exchange which is the main trading forum of the legal currency market. Trades are performed in 4 main currencies: the U.S. dollar, the German mark, the Russian ruble, and the Ukrainian grivna. The Russian financial crisis of 1998 forced the Belarusian ruble to depreciate against the Russian ruble and the U.S. dollar. In April 2000 the **exchange rate** stood at BR435 to US$1. The depreciation of the Belarusian currency continued to accelerate in the following months, reaching a whopping BR1,247 to US$1 by mid-February 2001.

POVERTY AND WEALTH

For most Belarusians, independence compromised their economic and physical welfare. Environmental problems, the loss of life savings, and the continued effects of the Chernobyl nuclear disaster undermined the health of the population. Compared to other East European and former Soviet republic nations, the income of Belarusians lagged behind. The **GDP per capita** of Belarus declined from US$2,761 in 1990 to US$2,198 in 1998, while per capita GDP in Russia and Poland increased by over US$1,000 during the decade (based on the 1995 exchange rate).

Though many of the former Soviet republics and East European countries worked to change from socialist, **centrally planned economies** to free market economies, Belarus was not anxious to follow that route; as a consequence, the economy was left behind the other former Soviet states.

The life expectancy of Belarusians, which in the mid-1970s stood at 71.5 years, was estimated at 68.0 years in 2000. The mortality rate increased from 10.7 in 1990 to 13.0 in 1998. Men had a life expectancy of only 61.8 years, while women were expected to live 74.5 years. Approximately 22 percent of the population lives below the poverty line.

WORKING CONDITIONS

The official unemployment rate in the country was reported at 2.1 percent in 2000. However, the reporting of the unemployment rate in former Soviet republics is generally considered inaccurate. Many people are officially employed at state-owned enterprises, and are reported as such, yet in reality are unemployed or working part-time in the **informal sector** of the economy, selling agricultural produce in the local market or working at other small businesses.

In 2000, the Belarusian economy had 4.5 million workers, 60 percent of whom were reportedly employed in state-owned enterprises. This number may be higher, since the so-called Joint Stock companies, which were formerly state-owned and employed more than 270,000 people in 2000, were still functioning with government assistance. Less than 400,000 people, or only about 9 percent of the workforce, worked in private businesses.

A rural-urban age gap has also emerged. Many of the young job-seekers migrate to larger urban areas. This has led to a high concentration of older people in the rural areas. Older people make up as much as 35 percent of the population of rural villages. The combination of negative rural population growth, an aging society, and the state-run economy, with the emigration of many of the professionals to western countries, has led to an unhappy environment for the Belarusian worker.

COUNTRY HISTORY AND ECONOMIC DEVELOPMENT

1919. A Soviet regime is established in Belarus.

1922. Belarus becomes a member of the USSR.

1923. The forced mass collectivization of agricultural lands begins.

1944. After 4 years of occupation by Nazi Germany, Minsk is recaptured by the Soviet Army.

1986. The Chernobyl nuclear power station accident in Ukraine leaks radiation into Belarus.

1990. Belarus declares state sovereignty from the USSR.

1991. Belarus declares independence. Belarus, along with Russia and Ukraine, forms the CIS.

1994. Russia and Belarus announce a monetary union, which is abandoned by Russia a year later. Alexander Lukashenka is elected as the first president of independent Belarus.

1995. Belarus joins NATO's Partnership for Peace Program.

1995. Russia and Belarus allow the free movement of certain goods across their border.

1996. The last nuclear weapon left over from the Soviet-era is removed from Belarusian territory.

1997. Russia and Belarus sign the Act of Union, which envisions the union of the 2 countries.

FUTURE TRENDS

The parliamentary election of October 2000 showed that President Lukashenka would keep his grip on the country by making sure that his opponents remained out of power. This continued to damage the legitimacy of his administration. President Lukashenka is expected to continue to dominate the political scene in the future, and he is almost assured of re-election. The opposition will remain weak, owing to consistent pressure from the administration and a lack of media access. However, the suppression of the opposition before the presidential election would damage relations with Western countries and international lending agencies.

The Belarusian leadership has had limited vision when attempting to tackle the country's economic problems. While its neighbors to the west (Poland, Lithuania, and Latvia) have long endorsed free market programs of

economic reform, with overwhelming success, Belarus has stubbornly stood by a plan of economic union with Russia at a time when Russia has been facing economic uncertainty and political instability. Some polls have indicated that a large segment of the Belarusian population believes in the supremacy of the state and continues to expect a **communist**-like state to look after their well-being. The hard grip of the former communists on power, and an aging society with an unsure attitude towards market reforms, are likely to contribute to the maintenance of the status quo in Belarus, with continuing economic hardship and political repression.

DEPENDENCIES

Belarus has no territories or colonies.

BELGIUM

Kingdom of Belgium
Royaume de Belgique
Koninkrijk België

CAPITAL: Brussels.

MONETARY UNIT: Belgian franc (BEF). One franc is equal to 100 centimes. However, the centimes denominations are no longer used. The Belgian franc is exchangeable on an equal basis with the Luxembourg franc. In 1999, Belgium began using the euro, the common currency of the European Union. The franc is set at a fixed exchange rate of 40.3399 per euro. The euro will replace all local currencies within the EU in 2002.

CHIEF EXPORTS: Machinery and equipment, chemicals, diamonds, metals and metal products.

CHIEF IMPORTS: Machinery and equipment, chemicals, metals and metal products.

GROSS DOMESTIC PRODUCT: US$259.2 billion (purchasing power parity, 2000 est.).

BALANCE OF TRADE: **Exports:** US$181.4 billion (f.o.b., 2000). **Imports:** US$166 billion (c.i.f., 2000).

COUNTRY OVERVIEW

LOCATION AND SIZE. Belgium is a nation located in Western Europe. It is between the Netherlands to the north, Germany and Luxembourg to the east, France to the south, and the North Sea to the west. Belgium is about the size of Maryland, has an area of 30,510 square kilometers (11,780 square miles) and includes 280 square kilometers (108 square miles) of inland waterways. It has 66 kilometers (41 miles) of coastline and its borders total 1,385 kilometers (861 miles). Belgium shares 620 kilometers (385 miles) with France, 167 kilometers (103 miles) with Germany, 148 kilometers (92 miles) with Luxembourg, and 450 kilometers (280 miles) with the Netherlands. The nation also claims an exclusive fishing zone that extends 68 kilometers (42 miles) into the North Sea. Belgium is the traditional crossroads of Europe and its capital, Brussels, also serves as the capital of the European Union (EU). Brussels also serves as the headquarters of the North Atlantic Treaty Organization (NATO) and the Western European Union (WEU). Brussels is located in the middle of the country and has a population of 954,460. It is one of the largest cities in Belgium. In contrast, Antwerp, Belgium's second largest city has a population of 447,632 and is located in the northern area of the nation. Lastly, Ghent, Belgium's third largest city has a population of 224,074 and is in the northwest.

POPULATION. In July 2000, it was estimated that Belgium had a population of 10,241,506. The population growth rate is estimated at a low 0.18 percent. The fertility rate is estimated at 1.61 children born per woman and the birth rate consists of 10.91 births per 1,000 people. The death rate is 10.13 deaths per 1,000.

Like many advanced industrialized countries, Belgium's population is aging and 16 percent of the inhabitants are over the age of 65, while only 18 percent are between the ages of 0 and 14. The life expectancy for men is 74.47 years and 81.3 years for women. A majority of Belgians now live in urban areas and, as people from both the rural areas and immigrants settle in the cities, this trend is growing rapidly. The population density of Belgium is second only to the Netherlands in Europe.

The nation has 3 major ethnic communities: the Flemish, the Walloons, and the German-speakers. The Flemish make up about 58 percent of the population and speak a form of Dutch known as Flemish. The Flemish are concentrated in the northern regions of the nation. The Walloons speak French and mainly live in the southern areas of Belgium. About 31 percent of Belgians are Walloons. German-speakers are the third major group and they mainly reside in the east around the city of Liege. German-speakers comprise about 1 percent of the population. There are also numerous other ethnic minority groups in the country. Brussels alone has 19 different

bilingual communities. Many of these other groups are from North Africa and the Middle East, particularly Turkey. There is also a significant Italian population. Since World War II, higher birth rates among the nation's foreign-born population have increased faster than that of native Belgians. The majority of new immigrants from the Mediterranean region tend to settle in the industrial areas of the Walloons—Brussels and Antwerp. There is a low migration rate of 0.98 per 1,000. Although a small number of recent Belgium immigrants return to their countries of origin each year, most emigrants go to nations within the EU or the United States.

Conflicts between the Flemish and the Walloons have traditionally divided Belgian society. Throughout most of the 19th and early 20th centuries, the French-speaking population dominated the region. However, the Flemish eventually gained reform, obtained regional autonomy, and then established Flanders as a unilingual region. The 1970 constitution created 3 autonomous political regions: Flanders, Wallonia, and Brussels. In 1984, the German community of Liege was also granted its own legislative assembly and began controlling its own educational and cultural matters. Disputes between the 2 groups continue and have led to numerous political compromises, including a new constitution in 1993, which changed Belgium from a unitary state (a country in which the central government has the most political power) to a federal system (a country in which the central government and regional governments collaboratively share power to a certain degree).

OVERVIEW OF ECONOMY

Belgium has a well-developed free market economy, based on both industrial and service sectors. It is heavily dependent on international trade and most of its economic sectors are geared toward exporting products. The nation's exports are equivalent to almost two-thirds of its GNP. On a per capita basis, Belgium exports twice as much as Germany and 5 times as much as Japan. In 1999, the nation ranked number 11 among the world's top exporters. In spite of its small size, Belgium's economy has consistently placed among the top 20 economies of the world and remains strong. The kingdom's exports have given it an account surplus that is the sixth largest among the highly developed economies of the world.

For most of its history, Belgium's economy was based on the nation's manufacturing capabilities. The country was the first in continental Europe to undergo the Industrial Revolution, and through the 19th century

it was a major steel producer. Large coal deposits helped fuel the industrialization. At the same time, agriculture began to decline. This decline was even more pronounced after World War II, and by 2000, agriculture only accounted for a small percentage of the economy. Currently, agriculture is concentrated in West Flanders, Liege, and Eastern Namur. In the post-World War II era, heavy manufacturing and mining declined. However, there was significant growth in the service sector, and the country switched from heavy production to light manufacturing and began producing finished products instead of steel, textiles, and raw materials. Belgium imports basic or intermediary goods, adds value to them through advanced manufacturing and then exports the finished products. With the exception of its remaining coal resources, Belgium has no significant natural resources.

Belgium's economic strength is based on its geographic position at the crossroads of Western Europe, its highly skilled and educated workforce, and its participation in the EU. During its industrial period, Belgium developed a highly efficient and capable transportation **infrastructure** that included roads, ports, canals, and rail links. The multilingual nature of the workforce and its industriousness has made the workforce one of the most productive in the world.

The oil crisis of the 1970s and economic **restructuring** led to a series of prolonged **recessions**. The 1980–82 recession was particularly severe and resulted in massive unemployment. Personal and consumer debt soared, as did the nation's deficit. Meanwhile, the kingdom's main economic activity shifted northward into Flanders. In 1990, the government linked the Belgian franc to the German mark through interest rates. This spurred a period of economic growth. In 1992–93, another recession plagued Belgian history. During this period, the kingdom's **real GDP** declined by 1.7 percent. Foreign investments have provided new capital and funds for businesses and have consistently helped maintain the economy. Consequently, the government has consistently implemented programs to encourage foreign investment. Since Brussels is the capital of the EU, many multinational firms have relocated to the city so they can be near the bureaucracy and regional body's government seat.

There are major regional differences in the kingdom's economy. In the former industrial and agricultural areas of the countryside, unemployment rates tend to be higher. However, in the newer urban centers (where the service economy is dominant), unemployment rates are lower. For instance, in Wallonia and Brussels, unemployment rates are 2 to 3 times higher than in Flanders. Nevertheless, overall national unemployment rates continue to be lower than the EU average. In addition, wage levels are among the highest in Europe. In 1993, in an effort to give the regions greater flexibility to deal with economic problems, each region was given broad economic powers to control trade, industrial development, and environmental regulation. Each region has also endeavored to attract foreign investment, often to the detriment of other regions.

The government has also engaged in initiatives to **privatize** many companies that were formally owned by the state. Ongoing efforts are underway to privatize 2 of the largest remaining companies: Sabena (the national airline) and Belgacom (the main communications company). Since 1993, successive governments have privatized some 280 billion Belgian francs worth of business.

The kingdom has few energy sources. Consequently, it must import a substantial amount of fossil fuel (which provides 42.48 percent of Belgium's total energy needs). The country has a well-developed nuclear industry that provides more than half of Belgium's energy needs (in 1998, some 55.72 percent of total energy usage). The remaining energy needs are met by a limited number of hydroelectric and coal plants.

As the profitability of many industries declined in the post-World War II era, the government attempted to support them in order to maintain employment. Among the strategies used were subsidizing certain industries, mainly steel and textile companies. In addition, the government reduced interest rates and offered tax incentives and bonuses to attract foreign businesses. All of these measures helped maintain the economy by preventing massive unemployment, but they also led to drastic government deficits in the 1970s and 1980s. The government was then forced to borrow funds from international sources in order to maintain their imports and to continue social welfare programs. By the 1990s, successive governments diligently worked to reduce the debt. In fact, they even shifted from foreign to domestic sources in underwriting their debts. In 1999, Belgium's **external debt** was $28.3 billion or about 10 percent of the nation's total debt. Belgium is a net contributor of foreign aid. In 1997, the kingdom provided $764 million in foreign assistance.

Belgium was one of the founding members of the European Community (later the EU), and has been one of the foremost proponents of regional economic integration. In 2000, 80 percent of Belgium's trade was with other members of the EU. Membership in the EU was the culmination of longstanding national support for economic cooperation. For instance, in 1921, Belgium joined with Luxembourg to form the Belgian-Luxembourg Economic Union (BLEU). This economic union provides for an interchangeable currency and it established a joint customs union. Belgium and Luxembourg have also joined with the Netherlands to form the BENELUX customs union. This organization oversaw cross-border trade between the 3 nations. Belgium is also a member of the Organization

for Economic Cooperation and Development (OECD), an organization of the world's most highly developed industrialized democracies.

Belgium has supported the main economic initiatives of the EU, including the elimination of trade barriers, such as **tariffs**, between the organization's 15 member states. The EU also coordinates the external trade of its member states. In 1999, Belgium was one of the founding members of the European Monetary Union (EMU). EMU will replace the national currencies of its members with a single currency, the euro. This is designed to further ease trade among the nations that adopt the euro by eliminating currency fluctuations.

POLITICS, GOVERNMENT, AND TAXATION

Belgium is a constitutional monarchy based on heredity. After political reforms in the 20th century, the monarch's role is now largely ceremonial and symbolic. The monarch's main political function is to appoint the prime minister following elections or the resignation of the government. In this often-divided country, the sovereign is a unifying symbol and plays an important role. The current king, Albert II, succeeded his brother Baudouin who died in 1993.

The executive branch of the Belgian government consists of the king, prime minister and cabinet. The number of cabinet ministers is limited to 15. By an unwritten rule, there is usually a rough balance between Flemish and French-speaking ministers in the cabinet. The kingdom's parliament is **bicameral** (it consists of 2 chambers). The upper house is the Senate and consists of 71 members—40 of whom are elected directly by the people; the 3 linguistic communities indirectly elect the other 31. The lower house is the Chamber of Deputies and has 150 directly elected members. Representatives in both houses serve 4-year terms. Citizens are required to vote in national elections. Elections are relatively short, usually with only a month of campaigning.

There are no national parties in Belgium. Instead the political parties are divided among the major linguistic groups. As a result, governments are usually by coalition (a government composed of members of several different political parties).

As a result of the 1993 constitutional revisions, Belgium changed from a unitary government into a federal system. There are now 3 levels of government: national, regional, and linguistic community. Including the national government in Brussels, there are now 6 different authoritative bodies. Flanders has a single 124-member assembly which represents the region and Flemish-language speakers. Wallonia has 2 assemblies, one 75-member chamber for the region and a 94-member chamber for all French-speakers. Finally, the Brussels region has a 75-member body and the German-speakers have a 25-member assembly.

The government's multi-layered structure means that each governmental body has considerable freedom over their region's economic activities. The regions and communities have jurisdiction over transportation, public works, education, housing, zoning, and industrial and economic policy. Regional governments also coordinate foreign trade with the national government. Of the total government spending, 40 percent is controlled by regional and community governments. These funds are provided through a system of revenue sharing with the national government. These governments also have the ability to levy additional taxes and borrow money.

Following the economic recessions of the 1980s and 1990s, the government attempted to stimulate the economy by implementing various programs. Initially, they tried to protect declining industries by subsidizing them. For those workers that lost their jobs because of cutbacks, generous social benefits were maintained. They also tried to attract foreign businesses and capital. However, in 1994, these efforts led to a massive **national debt** that exceeded the kingdom's GDP by over 137 percent. In 1992, the government attempted to reduce its debt by implementing various economic policies. Unfortunately, this task proved to be quite difficult because they did not meet EMU's official requirements (which called for a debt-to-GDP ratio of 60 percent). Nevertheless, Belgium was admitted in the first round of the monetary union. Its 2000 budget projected a deficit of 1.1 percent and a reduction of the national debt so that it equaled 112 percent of the kingdom's GDP.

In order to reduce this debt, the national government implemented various strategies. First, it privatized a number of industries. Since 1993, the government has privatized 280 billion Belgian francs worth of companies, and is expanding this process. For instance, in 1997, it privatized some 35 billion francs worth of assets, but in 1998, it increased its privatization campaign to 45 billion francs. Second, it has cut government spending. Some programs have been shifted to the regional governments, while others have been scaled-back. Third, the government has reformed the tax structure. The top rate on individuals is 55 percent, but companies, including foreign corporations, pay only 39 percent. However, small companies only pay between 29 and 37 percent. There are no taxes on capital gains and taxes on interest income are 15 percent. Foreign companies are attracted to special corporate tax breaks on corporate centers, such as call centers. Still, Belgium has the third highest taxes among the OECD nations.

The government utilizes various tactics to promote certain consumer behaviors and economic activities. For example, they utilize government-guaranteed mortgage loans to encourage home construction and building. They have projects that help immigrant workers build low-income housing. They have implemented special taxes, known as ecotaxes, designed to encourage consumers to purchase environmentally friendly products. In addition, they have implemented a number of programs to enhance foreign trade and also offer companies direct **subsidies**. Lastly, they provide funds for participation in trade fairs and the development of market research.

The government maintains **price controls** on products and services such as energy, rents, and pharmaceuticals. Pharmaceutical price restrictions have hurt competition and prevented foreign companies from entering the Belgian market. In addition, some U.S. firms such as Toys 'R' Us and McDonald's have had considerable problems in obtaining permits and licenses for new operations. Furthermore, the government-owned telecommunications company, Belgacom, requires new companies to pay relatively high fees in order to offer services to Belgian consumers. In spite of problems in the telecommunications sector, it is one of the fastest growing components of the Belgian economy. In order to promote the sector, the government continues to auction licenses for new mobile phone providers and to promote the use of the wireless Internet.

One of the more significant problems with the economy is that of **procurement**. Foreign companies have had difficulties competing with Belgian firms that are often given preferential treatment. Specific complaints include the failure of the government to issue public notification when it calls for bids on procurement and poor enforcement of rules.

Continuing government support for economic integration with the EU will further spur Belgian's economy. As trade barriers continue to be dismantled among members of the EU, Belgium should be able to expand its exports and enhance its role as a port of entry for goods coming into the region. Although the majority of Belgium's trade is with its EU partners, the kingdom conducts a significant amount of trade with the United States. In 1999, it was the ninth largest trading partner of the United States and imported some $11.9 billion in American services and goods.

Of special concern to the Belgian government are environmental problems. Centuries of industrialization have resulted in widespread pollution. Soil contamination and groundwater pollution exist at many former industrial sites. Steel production wastes have contaminated the Meuse River, a major source of drinking water. Other rivers are contaminated by pollution from agricultural practices, mainly fertilizers. Industrial air pollution has created significant amounts of acid rain, both within Belgium and in neighboring countries. There has been a steady increase in greenhouse gas emissions, including coal, natural gas, and petroleum emissions. From 1995 to 1999, there was a 12 percent increase in these pollutants.

INFRASTRUCTURE, POWER, AND COMMUNICATIONS

Belgium has an excellent infrastructure of roads, waterways, ports, and airports. The kingdom has 145,850 kilometers (90,631 miles) of roads that includes 117,701 kilometers (10,999 miles) of paved highways and 1,682 kilometers (1,045 miles) of expressways. In 1997, some 395,505,000 tons of goods were transported across Belgium's roads. The kingdom is the only nation in Western Europe that has an average of 50 km (31 miles) of roadways for every 1,000 square kilometers (386 miles). Brussels is the heart of a dense highway network that extends beyond the borders of the kingdom to major destinations such as Paris, Amsterdam, and London (via the tunnel under the English Channel). There are 3,437 kilometers (2,136 miles) of rail lines, the majority of which are electrified. In 1997, the railways transported approximately 60,696,000 tons of products. There are 2,043

SOURCE: World Bank. *World Development Indicators 2000.*

kilometers (1,270 miles) of waterways, of which 1,528 kilometers (950 miles) are in regular commercial use for the transport of goods. In 1997, there were some 106,978,000 tons of goods shipped across the nation's inland waterways. Finally, there is an extensive network of pipelines. There are 161 kilometers (100 miles) of crude oil pipelines, 1,167 kilometers (725 miles) of lines for petroleum products, and over 3,300 kilometers (2,051 miles) of natural gas pipelines. These pipelines transported 96,540,000 tons of fossil fuels in 1993.

Belgium's extensive transportation network and geographic position have enhanced its role as the major point of destination for goods entering Western Europe. The kingdom has 42 airports and a heliport. In 1995, 535,000 tons of goods were shipped via air. The government and the private carrier, SwissAir, jointly own Sabena, the national airline. There is also a low-cost air carrier, Citybird, which provides no-frills inexpensive fares. The international airport at Brussels has become the hub for several major U.S. air carriers. Antwerp is Europe's second largest port facility and is the center of the international diamond trade. The seaports handled some 157,413,000 tons of products in 1995. Ghent and Zeebrugge are also major seaports. Meanwhile, Brussels and Liege are major river ports. In fact, Liege is the third busiest river port in Europe. The Albert Canal can handle river barges of up to 2,000 tons, while other canals easily accommodate barges of up to 1,350 tons. The kingdom has 22 medium to large merchant marine fleets that include 7 cargo ships, 7 petroleum tankers, and 8 chemical tankers. Combined, these fleets have a combined gross tonnage of 35,075 tons.

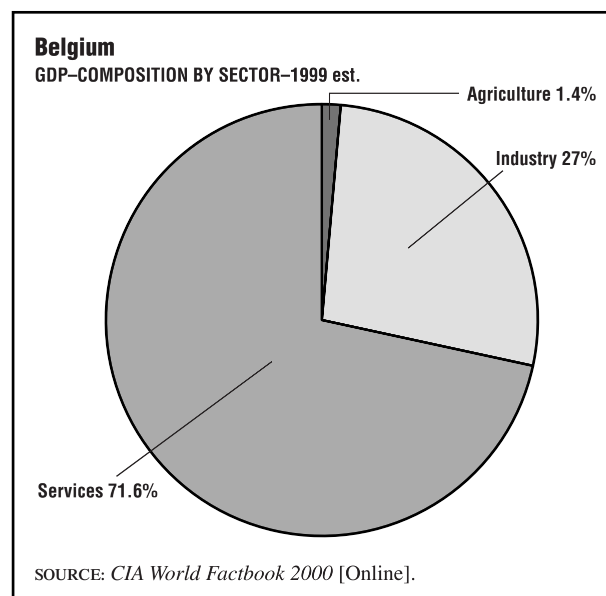
Belgians have an average of 427 automobiles per 1,000 inhabitants. The telephone system is highly developed and advanced. There is also an extensive nationwide system of cellular phones and 3.7 million mobile phones currently in use. Mobile phone usage is increasing at a rate of 20 percent per year. The kingdom also has 3 earth satellite stations. The Internet has gained in popularity and there are 51 Internet service providers in the nation. Approximately 1 million families use the Internet and 30 percent frequently purchase goods and services online. By 2004, **e-commerce** is expected to exceed $13.8 billion per year. In relation to the telecommunications industry, the government is in the third year of a privatization plan. Currently, there are 41 telecom operators besides the national carrier, Belgacom.

Electrical power production exceeds 78.7 billion kilowatts. Nuclear plants supply the majority of power (some 55 percent). Coal provides 12 percent of the kingdom's energy needs. Most of this coal is mined within the country. The nation meets 42 percent of its electrical needs through imported fossil fuels. Some 26.7 percent of these imports are natural gas. The majority of these natural gas supplies are imported from Algeria, the Netherlands, and Norway. The government has adopted a $9 billion program to provide for the modernization and maintenance of the nation's power system. **Deregulation** is also a priority of this program. Since Electrabel controls 84 percent of the energy market, new companies face significant obstacles while trying to enter this market. Although renewable energy sources, such as solar and wind power, currently only contribute about 0.17 percent of the nation's energy needs, the government continues to promote them.

ECONOMIC SECTORS

Belgium is located in one of the most industrialized areas of the world. Its unique geographic location and port structure make it ideally suited as a point for goods to enter Western Europe. The economy remains dependent on trade and any global market disruptions impact Belgium. Nonetheless, the nation's foreign trade bolsters its economy and helps it rank among the world's top economies. Unemployment remains a problem for the economy. The nation has made significant progress in unemployment. In 1984, it declined from a high of 14.3 percent. In the 1990s, the nationwide unemployment rate averaged between 8 and 9 percent, with the lowest rate, 4 percent, in Flanders, and the highest rate, 16 percent, in Wallonia.

Since the last century, Belgium's agriculture has been in decline and currently only accounts for around 2 percent of the kingdom's GDP. Agriculture is concentrated in the northern areas of Flanders. The nation is self-sufficient in a variety of farm products, including various dairy



SOURCE: *CIA World Factbook 2000* [Online].

goods, and exports some vegetables and meats. Fishing has also declined over the past decades and currently most of the catch is consumed within the kingdom.

In the post-World War II era, industry has become less important for the national economy. In contrast, the service sector continues to gain in prominence. Most of the kingdom's natural mineral resources have been exhausted. Steel and textile production have significantly declined. The remaining industry produces finished products from reprocessed materials. After the industrial transformation during the 1970s, a number of new industries emerged, including chemicals, refining, metals and machinery, food processing, and pharmaceuticals. Even newer industries such as automobile manufacturing have faced significant obstacles. Belgium has emerged as the center of the international diamond trade. Traditional manufacturing remains concentrated in Wallonia, while the newer industries tend to be located in Flanders.

As with most of the OECD nations, the service sector dominates the Belgian economy. In fact, service sector jobs now account for 73 percent of the nation's employment. In addition, the service sector is also the main area of growth for the kingdom. **Retail** businesses and tourism increasingly account for a larger percentage of the nation's GDP, while financial services continue to expand and attract foreign investment.

Belgium is the home to a number of international corporations and has outlets or subsidiaries of many multinational companies such as Ford, Volvo, and Renault. In fact, some sectors of the Belgian economy have come to be dominated by foreign firms. For instance, U.S. software manufacturers now control some 40 percent of the Belgian market while companies such as Compaq, Dell, and IBM dominate the personal computer market.

AGRICULTURE

The kingdom's agricultural sector has been declining for some time. Currently, only about 2 percent of the population is employed in agriculture and it accounts for just under the same percentage of the nation's GDP. The main areas of the country under cultivation are in the northern region of Flanders; however, small farms exist throughout Belgium. Some 39 percent of the nation's territory is used for some type of agriculture, including the production of forest products. Approximately 1 percent of the land is used for permanent crops.

There are 2 main trends in Belgian agriculture. The first is the disappearance of the small family farm. Farming is increasingly dominated by large **agribusinesses**. Over the past 3 decades, the number of small farms has decreased by 80 percent. The second major trend is the expanding output of the sector. New technologies and scientific crop research have combined to produce greater yields. Therefore, even if farmers' total acreage declines, they are still producing more. Between 1995 and 1999, crop production increased by 9 percent.

Agriculture in Belgium is mainly divided between crop production and raising livestock. The nation's main crops include barley, corn, potatoes, sugar beets, wheat, and assorted fruits and vegetables. Sugar beets, potatoes, and barley are the main staples. In 1999, the country produced 6.15 million metric tons of sugar beets, 2.7 million metric tons of potatoes, and 1.63 million tons of wheat. The country is self-sufficient in sugar, and exports certain vegetables and fruits. About 35 percent of Belgium's farms are engaged in crop production. Belgium also **re-exports** a number of fruits. For instance, bananas are imported into Belgium from the Caribbean and then exported throughout Europe. The nation also imports raw crops, processes them, and then exports them as prepared foods.

Stock farming or livestock production dominates Belgian agriculture. It accounts for 65 percent of the nation's farms. A variety of livestock is raised, including beef, veal, poultry, lamb, pork, and turkey. In 1997, there were 3.1 million head of cattle and 7.3 million pigs on Belgian farms. The beef industry is still recovering from a dioxin scare in 1999. Cattle were accidentally given feed that was contaminated with the cancer-causing chemical dioxin. This led to numerous recalls and various countries around the world banned the import of Belgian beef.

There is also a significant dairy industry and Belgium is self-sufficient in eggs, butter, and milk. In 1997, the nation produced 3.2 million tons of milk, 3.97 million eggs, and 175,000 tons of butter. Belgium also produces a variety of specialty cheeses. Currently, fishing is mainly done for domestic consumption. In 2000, the nation exported $193 million worth of fish, but it imported $833 million worth. The majority of imported fish came from the United States and included lobster, salmon, and prepared seafood meals.

While the nation is a net importer of wood products, it does have a significant timber industry. In 2000, the timber industry was worth $9.9 billion. Total exports were $991 million while imports were $3.5 billion. The United States supplied some 50 percent of Belgium's softwood and plywood needs.

INDUSTRY

Belgium's traditional industries face a number of challenges. Historically, the main industries were concentrated in the French-speaking areas of Wallonia. However, since the 1970s, the principal areas of industrial growth have been in Flanders. Newer light industries and more sophisticated technologies have replaced the older and labor-intensive manufacturing systems. Between Antwerp and Brussels, a new corridor of industries emerged. The majority of these were less labor-intensive and required more skilled workers. The principal industries that have fueled this growth have been the petrochemical and refining sectors. Nonetheless, the remaining industries tend to be highly advanced and technologically sophisticated. Light manufacturing and refining increasingly dominate the industrial sector. The entire industrial sector accounted for 26 percent of GDP in 2000.

STEEL AND PRECIOUS MINERALS. From the 1800s through the 1960s, steel making was the heart of the nation's industry. By the end of the 1960s, Belgian steel manufacturers became less competitive when foreign companies began producing steel for less by using cheap labor and less expensive resources. The twin oil crises of the 1970s further undermined the industry by reducing the worldwide demand for steel. In order to preserve jobs, the government tried to protect steel manufacturers by subsidizing the industry.

The high cost of labor continued to impair the competitiveness of these and other industries. Industry also suffers from excess capacity and continued high fuel prices. These factors have led car manufacturers such as Ford and Renault to cut production in Belgium and shift factories elsewhere. The government has also made considerable attempts to restructure its remaining industrial base. The main thrusts of these efforts have been tax incentives for both domestic and foreign companies in exchange for industry investments. It has also offered incentives for investments in new technologies and the creation of new manufacturing methods.

The steel and plastics industries continue to decline. Since 1990, steel, iron, and coke production has declined by 20 percent. Nonetheless, about 1,000 companies remain in this industry that employs 52,000 people. Belgium remains the eighteenth largest steel producer in the world. In 1999, the sector produced 11 million tons of crude steel and had revenues of 260 billion Belgian francs of which 45 percent came from exports. This was a 4 percent decline from the previous year. The primary plastic products include parts for automobile construction and for engineering projects.

Europe's largest electrolyte copper, zinc, and lead refineries are located in Belgium. The nonferrous metals industry includes: base metals such as aluminum, copper, zinc, lead, and tin; precious metals such as gold, silver, and platinum; and rare or special metals such as germanium, cobalt, and indium. The metals industry employs some 8,600 people. Its exports were worth 127 billion Belgian francs in 1999. New industrial investments totaled 2.6 billion Belgian francs in 1999 and attempted to reduce production costs. The kingdom is also a major producer of limestone, dolomite, various synthetic materials, and construction materials such as marble and concrete. There is also a significant mineral sector that is focused on the refining of imported minerals such as copper, zinc, and diamonds.

Antwerp is the center of the world's diamond trade. The diamond industry employs some 30,000 people and represents 6.4 percent of the nation's exports. In total, 9 out of 10 rough diamonds and 1 out of 2 cut diamonds pass through Antwerp. The diamond sector represents one area of industrial growth. The sector experienced an average growth rate of 6 percent in the 1990s. There are 400 companies engaged in trading rough-cut diamonds, and 700 companies engaged in trading cut diamonds. In 1998, the industry's exports were worth 369 billion Belgian francs.

Glassmaking remains a profitable and expanding industry. It employs some 12,000 people and in 1998, its output was 1.5 million tons of glass. This generated revenues of 100 billion Belgian francs. The industry's exports go mainly to other European countries (some 85 percent of glass exports). In Belgium, glass production was 3 times that of consumption and Belgian workers have among the highest levels of productivity. In 1980, Belgian glass workers produced 55 kg (lbs) of glass per hour; by 1999 that output had increased to 109 kg (lbs) per hour.

CHEMICALS. Belgium's chemical industry is highly diverse and efficient. From 1985 to 1999, the sector has

grown by an average of 3.5 percent per year. It is the second largest industrial sector in the nation. The industry is geared for foreign trade and some 80 percent of its products are exported (75 percent of these exports went to EU nations). In 1999, chemicals accounted for 23.5 percent of the kingdom's total exports and were worth 1.574 trillion Belgian francs. In an effort to remain competitive, the chemical industry invested approximately 50 percent of its profits in research and the development of new products and manufacturing techniques. In 1999, there were 97,167 people employed by chemical companies, which represents an 8.4 percent increase since 1985. Chemicals and pharmaceutical products are now Belgium's top exports.

TRANSPORT. Transport equipment is one of the strongest remaining industrial sectors in Belgium. This sector includes the automotive industry, shipbuilding, railway and tram construction, bicycles, and the aeronautical and aerospace industry. Although Belgium does not have its own national automotive manufacturers, it has a large number of international companies. Ford, General Motors, Opel, Renault, Volkswagen, and Volvo have plants in Belgium. In 1999, the nation produced 1.3 million cars. It also produces specialty vehicles including vans, trucks, buses, and minibuses. Of the vehicles manufactured in Belgium, 95 percent are exported. The main markets are France, Germany, and the United Kingdom. The automotive industry also produces a variety of specialty parts for cars. The industry specializes in "just in time" (JIT) manufacturing which involves producing products to be used immediately upon receipt. This process eliminates the need to stockpile items in warehouses.

Belgium no longer builds large sea-going vessels, but its shipyards still build smaller coastal and river craft. In addition, there are a number of firms that are capable of repairing and refitting larger ships. Companies also produce a variety of specialty products for marine use. Belgium invests considerable sums in aerospace. The government works with other European nations such as France and Germany on projects such as Airbus jet aircraft and the Ariane rocket.

TEXTILES. The textile sector employs over 42,500 people in 1,320 textile factories. Belgium is now the largest carpet exporter in the world. Textile revenues accounted for 250 billion Belgian francs. Unlike many of the other traditional industries, Belgium's textile manufacturers have been able to adjust to changes in the global market. Belgium is also noted for its quality leather products. There have been widespread consolidations and advancements in manufacturing techniques. As a result, the textile sector remains one of Belgium's largest industrial employers.

ELECTRONICS. Belgium produces a wide range of electronics equipment that includes both consumer and business products. This sector of the economy employs 49,000 people in 300 companies. These businesses produced products worth more than 300 billion Belgian francs. Two-thirds of the kingdom's electronic products are exported. The majority, 75 percent, goes to other members of the EU, while the remaining exports are divided among the United States, Eastern Europe, and Asia. Medical and hospital electronics are a major part of this sector. The electronics sector is the largest investor in the economy's infrastructure and research and development. The sector annually invests some 30 billion Belgian francs of which 60 percent is in research and development.

FURNITURE. Furniture manufacturing has a long and distinguished tradition in Belgium. Adaptability and quality reputation are its keys to continued success. Increased mechanization and automation have helped contain costs and kept the industry competitive. It has strong exports to Germany and the United Kingdom and has recently enjoyed dramatic growth in the Netherlands. The sector has also aggressively targeted the markets in Eastern Europe. Belgium furniture exports have increased by 57 percent and have grown by a phenomenal 79 percent to Russia itself. In 1998, the industry had revenues of 1.89 billion euros that included 1.13 billion euros in exports.

CONSTRUCTION. The construction industry in Belgium encompasses 2 different broad areas. The majority of activity is centered on the construction of new buildings and homes. There is also a considerable market in the restoration of older dwellings. Brick is the preferred building material and most homes are custom built. On average, only 10 percent of homes built are prefabricated. In 1998, residential construction accounted for 46 percent of new contracts, business construction accounted for 41 percent, and 13 percent of new contracts were in civil engineering. In 1997, Belgium's construction companies had revenues of 1 trillion Belgian francs. Belgian companies also carried out a number of projects abroad, mainly in developing nations. In 1998, total revenues from these projects were 88 billion Belgian francs. Government plans to eliminate slums and provide housing for low-income Belgians have significantly helped the construction industry grow.

SERVICES

The service sector is the largest area of the Belgian economy, accounting for 72.6 percent of GDP in 2000. It is well developed and diversified. Because of its geographic position as the gateway to Europe and the government's efforts to attract foreign banking and financial companies, Belgium is now the eighth-largest financial center in the world. In 1999, there were 130 different banking companies in Belgium. Of these, 81 were Belgian and 39 were foreign-owned. The majority of the

foreign-owned banks were from EU nations (23 of the 39). The implementation of EMU will make it even easier for foreign banks to establish a presence in Belgium as the members of the EU begin to use the common currency. The Belgian government encourages foreign banks to establish a presence in the kingdom. For instance, the government allows foreign banks to operate as either subsidiaries under Belgian law or to operate under the laws of the nation in which their parent bank is licensed.

FINANCIAL SERVICES. The financial sector has 3 main subdivisions: commercial banks, public credit institutions, and private savings banks. However, the divisions between these 3 types of institutions became less noticeable in the 1990s. There have been a substantial number of mergers across these fields. For instance, in 1999 the international banking corporation Dexia merged its Belgian and French subsidiaries to create a banking group worth $11 billion. Belgium's Banking Commission supervises private banks, finance companies, and the oversight of mutual funds. Investments in the country's financial sector ballooned from $55 billion in 1996 to $300 billion in 1999.

The 3 main trading banks in Belgium are the Fortis Bank, Brussels Bank Lambert, and KBC. Fortis has a workforce of some 40,000 and 3,000 branches. It services some 7 million customers in Belgium, Luxembourg, and the Netherlands, and is one of the leading banks in northwestern Europe. Brussels Bank Lambert has 900 traditional branches and 500 automated teller machines. It is the twelfth largest bank in Europe. KBC is the nation's third largest bank and is also one of the largest insurance companies. It has 1,500 bank employees, 500 insurance brokers, and 8,000 other brokers. This multinational bank has branches in 30 different nations. The fourth and fifth largest banks in Belgium are foreign-owned. Number-four is Dexier, a joint Belgian-French multinational, and number-five is Morgan Guaranty Trust of New York (a subsidiary of J. P. Morgan & Company). Other major international banks in Belgium are Citibank, Bank of America, and Chase Manhattan Bank.

In 2000, the EU enacted new rules that allow insurance brokers to operate in any other EU state as long as they are registered in their home nation. For instance, Belgian insurance companies will be able to set up offices in Germany or France without having to be licensed in that nation. This offers a variety of advantages to Belgian companies. For instance, 60 to 70 percent of the insurance bought by Belgian consumers was non-life (including car or home insurance). In contrast, in other EU states, non-life insurance typically accounts for some 20 percent of the market. Hence, Belgian insurance companies see these new markets as sources of great opportunities.

TOURISM. The main centers of the Belgian tourist industry are the country's coastal region and the Ardennes. The coastline has 65 resorts and numerous beaches. Most are designed for family-oriented vacations and draw tourists from France, the United Kingdom, and the Netherlands. Situated in the southeast of Belgium, the Ardennes forest is one of the few unspoiled natural areas in Western Europe. The area attracts campers and day-trippers. It is known for hiking, fishing, canoeing and kayaking, and mountaineering in the spring and summer months. In the winter, tourists engage in both downhill and cross-country skiing.

The total value of tourism in Belgium is $11.425 billion. Of this total, Belgians traveling within the country spent $4.9 billion. The United States is the number-one destination for Belgians traveling abroad. In 1999, some 257,000 Belgians visited the United States and spent $652 million.

RETAIL. Retailers in Belgium have rebounded from a period of stagnation in the early 1990s. Consumer spending has been increasing at a rate of 2.5 percent over the past few years and is expected to grow in the near future. Unlike many other markets in the EU or North America, independent companies still make up a large proportion of the retail market. For instance, although 78.5 percent of fashion merchandisers are independent, chain outlets control 16.7 percent of the market. The remaining 4.8 percent is in the hands of large department stores and supermarkets.

In 1999, there were 52,807 restaurants in Belgium. The largest chain is the Quick hamburger restaurant group that has 105 shops. The number-two chain is the U.S.-owned McDonald's. Other American chains such as Pizza Hut and Chi Chi's also hold significant market shares. Sales at foreign-owned restaurants were 10.45 billion Belgian francs while sales at locally owned stores were 7.53 billion Belgian francs.

INTERNATIONAL TRADE

Belgium's economy is dependent on international trade. From year-to-year, foreign trade accounts for approximately 70 percent of the nation's economy. This makes Belgium particularly sensitive to disruptions in global trade. Recessions or other economic problems around the world often cause reciprocal problems in Belgium's economy. Fortunately, the kingdom has a variety of trade partners so that problems in one export market are mitigated by export diversity. For instance, since companies were able to shift exports to other markets, Asia's economic problems in the late 1990s had little significant impact on Belgium.

The nation's main trade partners are in the EU. In fact, in 1998 some 76 percent of Belgium's exports went to nations in the EU. In that year, the main export mar-

ket for Belgian goods was Germany (19 percent), followed closely by France (18 percent), the Netherlands (12 percent), and the United Kingdom (10 percent). Most of Belgium's imports also came from the EU that provided 71 percent of the kingdom's imported products. Germany was the main exporter to Belgium and provided 18 percent of goods, while the Netherlands provided 17 percent, France 14 percent, and the United Kingdom 9 percent. Total foreign investment in Belgium is $68.1 billion. The Netherlands is the principal source of foreign investment (21.9 percent), followed by Germany (17.1 percent), France (16 percent), and the United States (11 percent).

The United States is a major trading partner of Belgium. The kingdom is the ninth largest trading partner of the United States. In 1999, the United States exported $11.3 billion to Belgium. About half of Belgium's imports from the United States are processed and re-exported to other markets. The kingdom is home to 1,300 U.S. companies. American investment in Belgium totals $18.9 billion. The majority of this investment is concentrated manufacturing ($8.969 billion), services ($5.262 billion), and wholesaling ($2.716 billion). Belgium also has significant investments in the United States that total $6.7 billion. The majority of these investments are in manufacturing ($2.6 billion), petroleum ($1.265 billion), and retail ($882 million).

Goods and products from EU nations enter Belgium without any tariffs or **duties**. However, goods from nations outside of the EU face import duties and a **value-added tax** (VAT). Depending on the product, these taxes amount to an average of 5–6 percent of the total value of the product. Consequently, many goods from outside of the EU face a price disadvantage.

Since Belgium is home to the headquarters of the EU and over 100 international organizations, it has a unique perspective on world trade and global markets. It also has significant influence on trade. Since it joined the European Community (now EU), Belgium has supported free trade and advocated measures that lower tariffs and reduce other barriers to the free movement of goods and services, labor, and capital within Europe. Belgium and Luxembourg also continue to be economically linked through BLEU. Despite its membership in the EU and BLEU, Belgium has bilateral trade agreements with 29 different nations. It has separate investment accords with Poland and Russia. It also has treaties with Bulgaria, Cuba, Liberia, Mauritania, and Thailand. Under the auspices of BLEU, it has jointly signed with Luxembourg. Many of these agreements have yet to be fully implemented.

Besides the national trade agreements, each of the 3 regions has the authority to grant financial incentives and other inducements to attract foreign goods and services. Among the tactics used are loan or interest rebates if the project is financed, financing by the regional government, and tax breaks for foreign companies.

MONEY

Through BLEU, Belgium and Luxembourg linked their currencies in 1921. Although the Belgian franc has declined in relation to the U.S. dollar, it has maintained its value against major European currencies. In 1995, 1 U.S. dollar was equal to 29.48 francs, but by 1999, 1 dollar equaled 34.77 francs. In 1999, Belgium joined the EMU that created a single currency, the euro, for all of the EU nations. The euro is fixed at a rate of 40.3399 francs per euro. Since its introduction, the euro has been weak against the dollar. In 2000, 1 U.S. dollar equaled 0.9867 euros (when the euro was introduced it was equal to $1.1789). The euro was only used in non-cash forms (such as electronic payments and transfers) until January of 2002, when euro coins and notes were issued and national currencies were phased out.

The Belgian National Bank acts as the state bank. It prints and issues the nation's currency and acts as the lender of last resort in certain credit operations. The bank also manages **monetary policy** by controlling interest rates. The Banking Commission oversees the operations of the nation's banks while the Finance Ministry regulates credit institutions.

In September of 2000, the Brussels stock exchange merged with the exchanges of Amsterdam and the Paris Bourse exchange to form Euronext. The new stock exchange is the first truly transnational exchange that combines stock, derivative, and commodity trading. The new exchange lists 1,861 different companies and has a value of 1.1 trillion euros. The merger will streamline trading and reduce transaction costs. It will also save approximately 50 million euros per year. The exchange also increases the transparency of stocks and gives investors greater cost comparisons. The stock-trading component of Euronext is divided into 3 broad areas: blue

chip traditional industrial companies, high tech stocks, and traditional securities. The new multinational exchange is actively seeking further integration and consolidation and may merge or absorb additional national exchanges.

In order to become a member of EMU, Belgium had to maintain low **inflation**. The government took steps that kept inflation low—as low as 1 percent in 1999. Low prices on imported goods are likely to aid efforts to keep inflation low for the foreseeable future.

POVERTY AND WEALTH

Belgium, like many Western European nations, enjoys a high standard of living and a high per capita income. Each year the United Nations ranks the world's countries in its *Human Development Report.* Belgium consistently ranks among the top nations in its human development index that measures the quality of life in countries. In the 2000 report, the UN ranked Belgium number-seven—just behind Switzerland and ahead of the Netherlands. Its per capita income was $28,790. Belgium ranked 8th out of 191 countries in terms of per capita income.

There are extremes of wealth and poverty in Belgium. However, the nation's generous social welfare programs prevent abject poverty. Only 3.7 percent of the population falls into the lowest 10 percent of income levels while 20.2 percent of the households are in the top 10 percentile.

The nation's social welfare programs are extensive. There are 5 main elements to the Belgian **social welfare system**: family allowance, unemployment insurance, retirement, medical benefits, and a program that provides salary in the event of illness. Employers contribute the equivalent of 35 percent of a worker's pay to the social welfare system and workers contribute 13 percent of their pay. Many companies also offer supplemental retirement and medical programs. Almost all Belgians are covered by medical insurance. Payments to medical providers were $12.97 billion in 1999. Belgium ranked thirteenth among the 24 OECD nations and fifth among the 15 EU nations. Each region has special councils that provide public assistance and aid to the poor. The National Housing Society provides low-income housing for the poor and immigrants. The Society is also in charge of eliminating slums and revitalizing urban neighborhoods.

Belgium's educational system is among the best in Europe. Freedom of education is a constitutional right in Belgium. Both public and private schools exist, but the government subsidizes private schools since the legal system abolished fees in 1958. Children must attend

school between the ages of 6 and 18. The nation has 7 universities (4 that teach in French and 3 that teach in Flemish). There are also a number of specialized and technical schools.

WORKING CONDITIONS

Belgium's workforce is highly skilled, educated, and productive. Belgian workers are the most productive in the EU. The workforce is well paid and has both generous employer and government benefits. However, there are wide regional differences in wages, unemployment, and quality of life. Generally, conditions are better in Flanders and the German-speaking areas than in the French-speaking areas.

The nation's educational system is designed to prepare workers for entry into the workforce. From the age of 15 onward, children may work part-time while they attend school. In addition, industrial apprenticeship programs are available for students between the ages of 16 and 18. There is also vocational training available for both students and adults. The national government and regional governments offer a variety of incentives for retraining workers. These initiatives are designed to reduce the national social security burden.

There are laws against forced labor. The minimum age for a person to begin working is 15. Since education is mandatory until age 18, students may only work part-time during the school year. Youths may work full-time during school vacation periods. Both the national and regional governments aggressively enforce child labor laws.

In 1999, the government revised its legislation on equal opportunity in the workplace. The new laws outlawed sexual harassment, and continued the ban on gender discrimination in hiring, working conditions, wages, and termination. Equal treatment of men and women is guaranteed by the constitution. In 1999, legislation was passed requiring that women make up one-third of all candidates running for office. Economic inequities between men and women continue. For instance, the female unemployment rate was 10.9 percent in 1998, while the male unemployment rate was 6.7 percent. In addition, women only earn 84 percent of the salary that men earn in the same professions.

The constitution guarantees the right of workers to organize and to collective bargaining. Union membership is high and 63 percent of workers belong to unions. In addition, 90 percent of workers are covered by collective bargaining agreements. National laws limit wage increases to 5.9 percent per year. Special labor courts oversee disputes between workers and businesses. Although Belgian unions often have links to political parties, they are independent of the government. While there have been several significant strikes in the past decade, including those by teachers, railway workers and air traffic controllers, these disputes were settled peacefully.

National law sets a 40-hour workweek and mandates overtime pay for work beyond 40 hours per week and for more than 8 hours a day. In addition, each workweek must include a 24-hour rest period. However, many agreements between unions and companies have separate agreements that lower the workweek to either 35 or 38 hours per week. The minimum wage for workers over the age of 21 is $1,228 per month. Workers under the age of 21 are paid on a graduated scale. Workers who are 18 years old must be paid 82 percent of the minimum wage, 19 year olds must be paid 88 percent, and 20 year olds must be paid 94 percent. There are strong safety laws and many of these regulations are supplemented by collective bargaining agreements. Although companies with more than 50 employees must have health and safety committees made up of both management and workers, the Ministry of Labor oversees workplace laws.

COUNTRY HISTORY AND ECONOMIC DEVELOPMENT

500–200 B.C. The area that is now Belgium is settled by a Celtic tribe, the Belgae (who gave their name to the region).

57 B.C. Julius Caesar begins conquering Belgium. The province comes to be known as Gallia Belgae. For the next 400 years, the area prospers under Roman control.

400 A.D. As Rome declines, the Franks gain control of the territory.

431. The Franks establish the Merovingian dynasty in Belgium.

466–511. Reign of Clovis I. During his reign, the last Roman territories in Gaul are captured and the kingdom is expanded to include areas of France and Germany. The Belgian people are converted to Christianity.

751. Pepin III deposes the Merovingians and starts the Carolingian dynasty.

768. Charlemagne succeeds his father, Pepin III. Charlemagne expands the empire to include all of Western Europe, and the king is crowned Emperor of the West by the Pope in 800. During his reign, organized trade begins along Belgium's rivers. After his death, the empire declines.

843. The Treaty of Verdun divides the empire among 3 of Charlemagne's sons. The western areas of Belgium come under France's control, while the eastern territories are controlled under the Middle Kingdom

of Lothair. Ultimately, Germans control the eastern territories.

867. In order to protect people from Norse raids, walled cities are created. The first of these is Ghent, followed by Bruges and Ypres.

977. Brussels is founded by Charles, the Duke of Lorraine.

1000. As the Norse raids subside, trade dramatically expands. This period is the golden age of Flanders. Merchants import wool from England that is woven into fine cloths and tapestries. Flemish cities become populous and wealthy.

1300. Because of their wealth, Ghent, Bruges, and Ypres gain virtual independence from the aristocracy. A civic culture flourishes. This independence is confirmed by the defeat of the French nobles in the Battle of the Golden Spurs.

1329. Aristocratic control is re-established and the independence of the Flemish cities is revoked.

1337–1453. There is a Hundred Years War between France and England. The English support their trade allies, the Flemish, in their continuing efforts to gain autonomy from France.

1384. Flanders comes under the control of Philip the Bold, Duke of Burgundy.

1419–1467. Philip the Good reigns. The Burgundian Empire in Belgium expands and includes the southeastern areas of Brussels, Liege, and Namur. Trade, arts, and culture expand. Prominent artists include Van Eyck, Rubens, and Van Dyck.

1490s. The canals around Bruges fill with silt and trade shifts further north to Antwerp.

1519–1713. Religious conflicts between the Protestant areas of Flanders and Catholics, led by Philip II of Spain, lead to the occupation of Belgium by Spain.

1648. The Protestant United Provinces of the North gain independence from Spain and become the Netherlands. The center of trade shifts from Antwerp and Ghent to Amsterdam. Meanwhile in order to avoid high labor costs and taxation, textile mills increasingly move from the urban areas to the countryside.

1719–1794. Austria occupies Belgium according to the terms of the Treaty of Utrecht. A revolt in 1790 leads to the establishment of the United States of Belgium, but Austrian control is soon re-established. During this period, landowners begin to mine various products, mainly coal and iron ore.

1795. France occupies Belgium and institutes a variety of civil reforms that serve as the foundation of the modern Belgian government. Encouraged by the French, industrialization begins during this period. By the turn of the century, factories with more than 100 employees become common. Ghent, home to numerous cotton mills, becomes the textile center of the country. Mining also continues to spread, especially in the French-speaking areas and in Liege.

1815. Belgium becomes part of the Netherlands by the Congress of Vienna. Dutch becomes the official language and William I of the Netherlands adopts a variety of programs to encourage industrialization in the south. However, the industrialization exacerbated the regional differences in the nation as the agrarian North sought free trade, while the industrialized South sought tariffs and other trade protections.

1831. Belgium gains independence from the Netherlands. Leopold of Saxe-Coburg becomes the Belgian king. Industrialization continues to sweep across the nation.

1835. The Banque du Belgique is founded. It provides financing for industry and serves as the model for similar banks in Germany, England, and France.

1844–46. Famine in Flanders leads to widespread economic problems and marks the final decline of the traditional linen industry. These combined problems slowed the economic development of the region well into the twentieth century.

1850. The National Bank of Belgium is formed.

1885. Congo becomes a personal possession of Leopold II.

1886. Worker unrest, which began in Liege, spreads throughout the nation. The government harshly suppresses this unrest, but it results in worker housing and wages reform.

1908. The Congo is annexed as a colony of Belgium.

1914. Germany invades Belgium at the start of World War I. During the war, some 20 percent of the nation's wealth is lost or destroyed.

1918. Universal suffrage is enacted.

1921. The Belgium-Luxembourg Economic Union (BLEU) is formed.

1930. Flanders and Wallonia become legally unilingual.

1940. During World War II, Germany invades Belgium and the Netherlands.

1944. Belgium joins the Benelux Economic Union, formed between Belgium, the Netherlands, and the Grand Duchy of Luxembourg.

1949. The nation joins NATO.

1952. Belgium joins the European Coal and Steel Community.

1957. Belgium is one of the founding members of the European Community.

1960. The Congo gains independence.

1961. Massive strikes lead to the creation of a permanent linguistic barrier between Flanders and Wallonia, while the Brussels region is officially bilingual.

1962. Rwanda and Burundi are granted independence.

1971. Flanders and Wallonia are granted cultural autonomy.

1973. The worldwide oil crisis initiates a period of deep industrial decline, which is exacerbated by the second oil crisis in 1979.

1989. A revised constitution grants greater autonomy to Flanders and Wallonia, and Brussels is granted the status of a region.

1993. King Baudouin dies and is succeeded by his brother, King Albert II.

1999. The kingdom joins EMU.

FUTURE TRENDS

Belgium is well positioned to continue its economic growth well into the 21st century. Its export-driven economy has created a **trade surplus** that will continue for the foreseeable future. In addition, Belgium's geographic position and its infrastructure indicate that the country will continuously serve as a point of entry for goods and services going into Europe. The introduction of the single European currency in 1999 will continue to make it easier for Belgian firms to trade within the EU.

While the 370 million people of the EU create one of the biggest commercial markets in the world, Belgium's dependence on intra-EU trade makes it vulnerable to economic slowdowns in the region. However, Belgium's trade with North America, namely the United States, continues to grow and may serve as a means to partially offset economic downturns in the EU.

Domestically, Belgium faces a variety of problems. Continuing tension between the Dutch- and French-speaking populations has led to the division of the nation into semi-autonomous regions that compete with one another for economic growth and investment. In addition, the unemployment rate remains stubbornly high, although it is lower than the EU average. Because of the high unemployment rate, the government is forced to maintain a high level of social welfare programs.

DEPENDENCIES

Belgium has no territories or colonies.

BOSNIA AND HERZEGOVINA

Republic of Bosnia and Herzegovina
Republika Bosnia i Herzegovina

CAPITAL: Sarajevo.

MONETARY UNIT: Marka (KM). One convertible marka equals 100 convertible pfenniga.

CHIEF EXPORTS: Manufactured goods, metals (aluminum, lead, zinc, steel), wood products, electricity, fruit and tobacco.

CHIEF IMPORTS: Fuel, machinery, transportation equipment, manufactured products, chemicals, and food.

GROSS DOMESTIC PRODUCT: US$6.5 billion (purchasing power parity, 2000 est.).

BALANCE OF TRADE: **Exports:** US$950 million (f.o.b., 2000 est.). **Imports:** US$2.45 billion (f.o.b., 2000 est.).

COUNTRY OVERVIEW

LOCATION AND SIZE. Bosnia and Herzegovina is in southeastern Europe. It is bound on the north and west by Croatia, the southwest by Croatia and the Adriatic Sea, and on the east by Yugoslavia (Serbia and Montenegro). The country has an area of 51,129 square kilometers (19,741 square miles), which is slightly smaller than West Virginia, and has a tiny coastline of 20 kilometers (13 miles). The capital, Sarajevo, is in the east-central part of the country, and other prominent cities include Zenica, Banja Luka, Mostar, and Tuzla.

POPULATION. The population of Bosnia and Herzegovina was estimated at 3,922,205 in July 2001; however, this estimation may include significant errors because of the dislocations and ethnic cleansing from the Bosnian civil war (1992–95). In contrast, the country had a population of 4,364,574, according to the 1991 census. The civil war caused hundreds of thousands of casualties and forced many others to flee. By 1998, the population had decreased by an estimated 1 million people.

With an estimated birth rate of 12.86 and death rate of 7.99 per 1,000 inhabitants, Bosnia (the shortened name for the whole country) has an estimated population growth rate of 1.38 percent. The population is young, with 20 percent below the age of 14 and just 9 percent over 65. Bosnia's population density in 1998 was estimated at 66 people per square kilometer (170 per square mile). In 1997, 42 percent of the population lived in urban areas.

Bosnia's major ethnic groups are Muslims (Bosniaks), Serbs, and Croats. The Serbs are traditionally Orthodox Christians, and the Croats are Roman Catholics. Muslims are descendants of former Christian Slavs who converted to Islam during the 15th and 16th centuries (under Ottoman rule). In 1991, the population consisted of 44 percent Muslims, 31 percent Serbs, and 17 percent Croats. In 1995, the population consisted of 40 percent Muslims, 38 percent Serbs, and 22 percent Croats. Events leading to this population change include the **immigration** of approximately 200,000 ethnic Serbs from Croatia and the deaths of about 7.4 percent of the pre-war Muslim population and 7.1 percent of the pre-war Serb population during the savage civil war. Bosnia and Herzegovina's populations of Serbs, Croats, and Muslims will likely embroil the country in struggles with its more powerful neighboring republics. Bosnian Serbs, for example, may continue to push for annexation to a "Greater Serbia."

OVERVIEW OF ECONOMY

Prior to becoming independent in 1992, Bosnia and Herzegovina was the second poorest republic in the former Socialist Federal Republic of Yugoslavia. Before the inter-ethnic war (1992–95), the economy was devoted to mining, forestry, agriculture, light and heavy manufacturing, and particularly armaments. Unlike many Eastern European countries, Bosnia and Herzegovina's farmland was never collectivized by the **communist** regime. Agriculture was insufficiently developed, and the country

heavily imported food, while its military industry was overstressed. The breakup of old Yugoslavia, the disruption of traditional markets and economic links, and the savage civil war caused industrial and agricultural output to plummet by four-fifths by 1995. Since 1996, production has recovered somewhat; however, the **gross domestic product** (GDP) remains far below its pre-war level.

By the time the civil war broke out in Bosnia and Herzegovina, the **inflation rate** was about 120 percent. During the war, **inflation** skyrocketed to over 1,000 percent. Unemployment was about 30 percent when the war began, but by 1995, it rose to 75 percent. All sectors of the economy were badly hurt, and 45 percent of industrial plants and 75 percent of the oil refineries were incapacitated.

When the war ended in 1995, the country was united under a federal government but split into 2 legal entities: the Federation of Bosnia and Herzegovina and the Republika Srpska (The Serb Republic). The end of fighting made some recovery possible, especially in construction, trade, services, and traditional light industries. The division between the Federation and the Serb Republic

proved to be a significant obstacle to reconstruction. The Serb Republic included most of the agricultural land and mineral deposits. In contrast, most heavy industry and power plants were within the Federation. This division made the most basic economic functions, such as the distribution of electricity, dependent on good cooperation between the once warring entities.

Economic data on each of Bosnia's 2 units are of little use because they do not reflect the **black market**, and national-level statistics are not published. The country's **external debt** was estimated at US$3.2 billion in 2000 and US$1.2 billion of international aid is now being pledged to help the country's finances. Bosnia also receives substantial reconstruction assistance and humanitarian aid from the international community.

POLITICS, GOVERNMENT, AND TAXATION

In 1990, Bosnia and Herzegovina seceded from Yugoslavia (which further dissolved into Slovenia, Croatia, Macedonia, and a new Federal Republic of Yugoslavia comprised of Serbia and Montenegro). The newly independent Bosnia and Herzegovina could not maintain cooperation between 3 of its ethnic groups: the Serbs wanted to unite with Serbia, the Croats wanted to unite with Croatia, and the Muslims wanted Bosnia and Herzegovina to unite as an independent state. The differing opinions sparked a bloody civil war.

Between 1992 and 1995, the 2 areas of Bosnia and Herzegovina were almost devastated by inter-ethnic carnage that stunned the world. International mediation efforts helped bring about the Dayton accord, which ended the civil war in 1995 by dividing the country into 2 ethnic entities: the Federation of Bosnia and Herzegovina and the Serb Republic. The government established has been labeled an "emerging democracy."

The country has a federal government and 2 administrative divisions: the Bosniak/Croat-led Federation of Bosnia and Herzegovina and the Bosnian Serb-led Serb Republic. (There is also a self-governing administrative unit called Brcko, which is under the authority of the sovereignty of Bosnia and Herzegovina but is not a part of the Federation or the Serb Republic.)

The presidency of Bosnia and Herzegovina is held by 3 officials (1 Bosnian Muslim, 1 Croat, and 1 Serb), who are elected to a 4-year term and rotate the chairmanship of the presidency every 8 months. Both the Federation and the Serb Republic elect presidents of their own administrative entities. The country is still establishing laws for voting and terms of the legislature, which has been created as a national **bicameral** Parliamentary Assembly. The Federation also has a bicameral legislature, and the Serb Republic is served by its own National Assembly. The judiciary system is similarly split between federal and administrative jurisdiction. There is a Constitutional Court heading the federal judiciary, and the entities have their own supreme courts and a number of lower courts. (In 2000, the Constitutional Court of Bosnia and Herzegovina ruled that the new governmental structure of Bosnia and Herzegovina had undermined the country's ethnic base and should be changed to reflect the multi-ethnic character of the country.)

Bosnia's political life is still highly fragmented and organized strictly along ethnic lines. These political parties include the Croatian Democratic Union; the New Croatian Initiative; the Party of Democratic Action; the Party for Bosnia and Herzegovina; the Social Democratic Party; the Democratic Socialist Party of Republika Srpska; the Party of Democratic Progress; the Party of Independent Social Democrats; the Serb Democratic Party; the Serbian People's Alliance; the Serbian Radical Party of Republika Srpska; and the Socialist Party of Republika Srpska. In 2000, the Muslim Party of Democratic Action, the Serb Democratic Party, and the Croatian Democratic Union again won the general election. These major parties were previously influential in leading major ethnic groups in the civil war.

The government plays a large role in the economy. Although 90 percent of businesses are private, the largest conglomerates remain state-owned. Corrupt leaders often arbitrarily apply taxes and regulations, and the black market is a significant economic factor. **Privatization** legislation exists, but disposing of state assets is slow and often receives much resistance. This situation is particularly prevalent in the utilities sector that is entirely controlled by party oligarchs. In mass privatization, free company vouchers or privatization funds shares are distributed to the public. Foreign investors are attracted to cash privatization because it generates fresh foreign currency inflows and brings western technology to important companies. However, due to lack of interest, results to this tender have been modest. Between May 1999 and September 2000, more than 1,000 small enterprises were listed for privatization; however, only 200 were sold during this time.

In 2002 a comprehensive tax administration reform is expected to create a more business-friendly environment and to attract foreign investment. But foreign investment relies on continued political stability. The implementation of democratic governments in neighboring nations is expected to improve privatization efforts within Bosnia and Herzegovina and to limit the risk of renewed political instability.

INFRASTRUCTURE, POWER, AND COMMUNICATIONS

The country's **infrastructure**, including highways, railroads, and communication networks were severely

SOURCE: World Bank. *World Development Indicators 2000.*

damaged by the war. In 1991, Bosnia had 21,168 kilometers (13,154 miles) of highways, half of which were paved. The war destroyed 35 percent of these highways and 40 percent of their bridges. The railroads had 1,000 kilometers (600 miles) of track, three-quarters electrified, and damage to the system was estimated at US$1 billion. Sarajevo's international airport was destroyed in the fighting. From 1995 to 1998, more than US$1 billion in foreign aid was provided to rebuild the infrastructure, and much is being done to reconnect the telecommunications networks. A US$20 million loan from the European Bank for Reconstruction and Development should aid in this process; however, ethnic divisions have hampered reconstruction. Guiding and implementing projects through conflicting local interests, jurisdictions, price structures, and corruption schemes is complex and often time consuming.

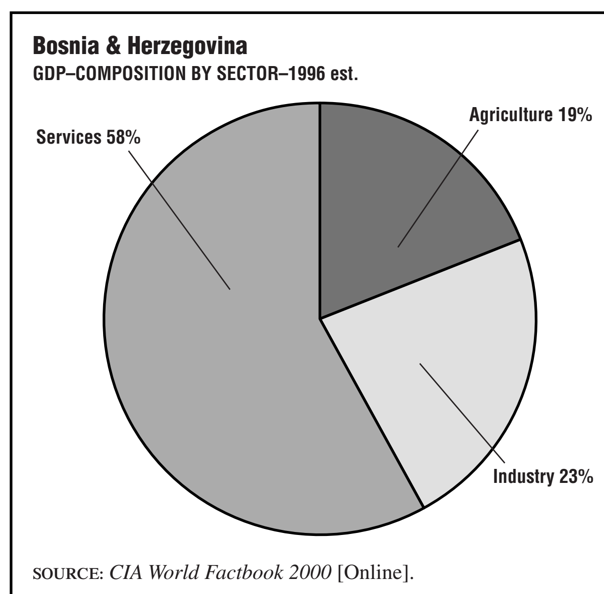
Electricity is produced in coal burning (32 percent) and hydroelectric (68 percent) plants. Because of the war, electricity-generating capacity declined by four-fifths. Most hydroelectric plants are in the Croat-controlled area. Therefore, close cooperation across Muslim- and Serb-held territory is essential for power distribution. Electricity prices vary substantially, with the Serb Republic subsidizing them heavily within its area. Hydropower Tyrol (Austria) is investing US$6 million in the Federation's 4 hydroelectric facilities.

ECONOMIC SECTORS

The distribution of the **labor force** and the contribution of the economy's different sectors have been difficult to estimate because of the internal conflicts in Bosnia and Herzegovina. Labor force information is limited to that estimated in 1990, when 48 percent of the labor force was employed in industry and 11 percent in agriculture. By 1996, the GDP contribution was divided as follows: 19 percent in agriculture, 23 percent in industry and utilities, and 58 percent in services. The war caused the leading industries—particularly armaments—to suffer greatly, and the disruption of economic links between the units, sanctioned by the Dayton accord, further decreased the economy's viability.

AGRICULTURE

As a part of the former Yugoslavia's **socialist** regime, agriculture was in private hands. Unlike other Eastern European countries, farms were small and inefficient. The republic has been, and still is, a net importer of food, relying on foreign supply for more than half of its food. The mountainous and rugged terrain is much less suitable for agriculture than Croatia and Serbia. Still the agriculture sector has traditionally produced wheat, corn, fruits, vegetables, tobacco, and livestock. The war and ethnic cleansing obliterated many Bosnian farms and severely affected the production of tobacco, the principal **cash crop**.



SOURCE: *CIA World Factbook 2000* [Online].

INDUSTRY

Under socialism, Bosnia specialized in mineral products; metals (steel, lead, zinc, aluminum); timber; manufactured goods (furniture, domestic appliances, and leather goods); and accounted for 40 percent of the former Yugoslavia's military production. Like Serbia and Montenegro, the industry wanted to counter unemployment and employed more workers than it really needed. Traditionally, the industrial bases were divided: heavy industry was in the Federation, and light industry was in the Serb Republic.

Most of the country's industry was damaged by the war, and in late 1995, manufacturing dropped to one-tenth of the pre-war level. Although destruction between regions varied, companies suffered because of disrupted supplier and buyer links. Given the low base, post-war industrial recovery was notable; however, it was limited to metal and wood processing, food, beverages, textiles, and clothing. Most factories are still operating at a fraction of their capacity.

In 1999, food processing accounted for 14 percent of the Federation's manufacturing production, metals for 13.4 percent, and wood processing for 5.4 percent. Recovery was much slower in engineering, chemicals, and pharmaceuticals. The Unis Vogosca company in the Federation and Germany's Volkswagen set up a **joint venture** to assemble Skoda cars, but had disappointing results. During this year, the Federation also established a consortium to manufacture tractors and other agricultural machinery. Construction grew, driven by housing reconstruction, and in 1999, Germany's Heidelberger Zement acquired a 51 percent stake in one of the cement plants, Kakanj. **Consumer goods** represent about 30 percent of total manufacturing output.

The government does not pursue a specific industrial policy. Trade is **liberalized**, there is no particular policy for protecting local companies, and domestic producers are exposed to foreign competition. Foreign investors are cautious in investing, donors favor the **private sector**, and large state-owned enterprises find it difficult to restart work because of lack of capital, technology, and extensive markets.

SERVICES

As in the former Yugoslavia, banks in the Federation and the Serb Republic are still too numerous, small, and undercapitalized. The political units have reached an agreement to allow Federation banks to operate in the Serb Republic as local ones. However, this arrangement may only add to the already over-banked sector. Although bank consolidation is needed for the gradual emergence of a sound banking system that will fuel investment and consumer spending and reinvigorate the economy, the government is more actively concerned with bank privatization.

Tourism has suffered from destruction and the general feeling of political instability. However, it has been recorded that domestic tourist visits have increased to the tiny Herzegovinian stretch of the Adriatic coast, and the number of lakeside resorts and foreign tourists has also increased. Before the war, Bosnia tourism was not as significant for the economy as in Croatia and Slovenia. However, it was given impetus as Sarajevo hosted the 1984 Winter Olympics and became internationally well known for its mountain resorts and colorful multicultural atmosphere. However, many tourist attractions were destroyed in the shelling of the city during the war.

Retail was well developed and to a large extent privatized before the war. It has since contracted because of the declining demand. The black market is still an important player in the economy. In contrast to Slovenia and Macedonia, foreign investment is limited.

INTERNATIONAL TRADE

In 1990, Bosnia imported US$1.9 billion worth of fuel, machinery, transportation equipment, manufactured products, chemicals, and food. It exported about US$2.1 billion worth of manufactured products, machinery, and raw materials. The war almost wiped out Bosnian foreign trade. As the economy was destroyed, Yugoslavia and Croatia imposed blockades and cut supply routes. In 1996, imports still totaled about US$1.9 billion, but exports were down to US$171 million. In 2000, exports grew to US$950 million, and imports remained much higher at US$2.45 billion.

From 1996 to 2000, the scope of the **trade deficit** amounted to well over US$1 billion yearly. This amount is huge for the size of the economy. Because of Bosnia's need to import vital commodities such as fuel, equipment, and food out of the limited international credit available, it is more heavily dependent on foreign aid from donor countries and international organizations than other former Yugoslav republics.

Metals and wood products were the most important components of Bosnia's exports in 2000, while electricity exports declined during and after the war. The EU accounted for 39 percent of the Federation exports in 2000 and leading trade partners included Croatia, Switzerland, Italy, and Germany (for the Federation), and Yugoslavia, Italy, Slovenia, and Hungary (for the Serb Republic).

MONEY

After the ethnic leaders failed to agree on a new currency, the UN introduced in 1998 a new currency, the

1996	0.015

SOURCE: CIA *World Factbook 2001* [ONLINE].

convertible mark. The convertible mark was fixed to the German mark. It gained acceptance, and the Central Bank of Bosnia and Herzegovina increased its reserves. Yugoslav dinars still circulate in the Serb Republic, and the Croatian kuna is used in the Croat areas of the Federation.

The government is still hoping to increase its capitalization by pressing for the privatization of the numerous small commercial banks. Raiffeisen Zentralbank Oesterreich, an Austrian bank, recently acquired many banks, including the Market Banka. The Austrian bank has also submitted privatization papers to the government bank privatization unit. It is not clear whether this will attract foreign attention, because the banking sector is weak and the economy is being reconstructed slowly.

POVERTY AND WEALTH

Before 1991, Bosnians, like most Yugoslavs, enjoyed a modestly prosperous life under the socialist governments, and Sarajevo citizens were proud hosts of the 1984 Winter Olympics. However, the war and the collapse of the economy ruined living standards. While average incomes sharply declined, prices of goods soared, particularly on the black market. Health, education, and welfare slipped into disaster. Physical survival was the only agenda for many Bosnians during the atrocities. While poverty grew, warlords, corrupt politicians, and officials made fortunes off looting and smuggling, and this caused an attitude of widespread resignation. After the war, the power of the party oligarchies remained almost unchallenged and was perpetuated by the country's highly complex ethnic-based political structure. Ethnic party elites still control much of the economy and oppose privatization in the most lucrative sectors such as energy.

GDP per Capita (US$)

Country	1996	1997	1998	1999	2000

Note: Data are estimates.

SOURCE: *Handbook of the Nations*, 17th, 18th, 19th and 20th editions for 1996, 1997, 1998 and 1999 data; CIA *World Factbook 2001* [Online] for 2000 data.

WORKING CONDITIONS

In 1999, unemployment was estimated at 40 percent. Employees were irregularly paid their wages which provoked waves of strikes in both the Federation and the Serb Republic. When paid, the average monthly wage in the more affluent Federation was US$194 in mid-2000, up by 8.4 percent from 1999, and inflation remained low. Wages and prices varied significantly by region. In the Federation, an average net wage in March 2000 bought 52kg of butter; in January 1998, 37 kg. In the Serb Republic, the March 2000 average net wage bought 26.6 kg of butter, in December 1998, 14.5 kg.

The limited scope of recovery has resulted in modest job generation, with most growth occurring in the public administration. The World Bank (WB) announced a US$15 million program to re-deploy unemployed ex-soldiers and insists that current labor laws and regulations, a legacy from the old socialist system, are now inappropriate. The WB provides generous severance payments for employees and keeps unpaid workers on waiting lists rather than laying them off. However some believe this will burden the companies, blur unemployment numbers, and impair **labor mobility**.

COUNTRY HISTORY AND ECONOMIC DEVELOPMENT

6TH-7TH CENTURY A.D. Slavic tribes, including Serbs and Croats, settle in the present territory of Bosnia and Herzegovina.

958. The name Bosnia is used to denote the land. Most Slavic inhabitants belong to the Roman Catholic Church.

1180. Ban (a feudal title of nobility) Kulin creates an independent Bosnian state, and feudal agrarian economy develops.

1326. Ban Stephen Kotromanic unites Bosnia and Hum, which later becomes Herzegovina.

1463–83. Bosnia and Herzegovina are conquered by the Ottoman Empire, and large numbers of Christians are converted to Islam. Predominant Muslim feudal lords rule over a poor and Christian peasantry.

1878. After the European Congress at Berlin, the country is taken over by Austria-Hungary, but Muslims

and Orthodox Christians resist occupation. The new regime promotes modern economic development.

1908. Austria-Hungary officially annexes Bosnia.

1914. Austria-Hungary starts World War I by declaring war on Serbia; most Bosnian Serbs, Croats, and Muslims remain loyal to Austria-Hungary.

1918. After World War I, Bosnia becomes part of the new Kingdom of Serbs, Croats, and Slovenes (renamed Yugoslavia in 1929); the economy suffers from the loss of Austro-Hungarian markets.

1941. Yugoslavia breaks up during World War II, and Nazi Germany makes Bosnia part of the Independent State of Croatia.

1945. Germany is defeated, and Bosnia joins socialist Yugoslavia as a constituent republic.

1945–80. Yugoslavia develops a socialist economy.

1980. Communist dictator Josip Broz Tito dies, and the socialist economy of Yugoslavia begins to decline. Serb nationalism begins to rise, and non-Serbs grow dissatisfied with the Federation.

1990. In a multiparty parliamentary election in Bosnia and Herzegovina, the Muslim Party of Democratic Action, led by Alija Izetbegovic, wins 34 percent of the seats; the Serbian Democratic Party, led by Radovan Karadzic, takes 30 percent; and the Croatian Democratic Union gets 18 percent. Izetbegovic becomes president of a 7-member tri-national presidency.

1991. Bosnia and Herzegovina declares independence from Yugoslavia, which is confirmed by a referendum in 1992. Bosnian Serbs, led by Karadzic and backed by neighboring Serbia and the pro-Serb Yugoslav army, start an armed offensive aimed at forming a greater Serbia and thus cause the bloody Bosnian civil war.

1994. Muslims and Croats create a Muslim-Croat Federation.

1995. In Dayton, Ohio, the warring parties sign a peace agreement, and Bosnia and Herzegovina is divided between the Federation of Bosnia and Herzegovina and a Serb Republic. A NATO-led peacekeeping force (IFOR) of 60,000 is deployed to implement the agreement, and an international high representative is appointed.

1996. A Stabilization Force (SFOR) of 19,000 (as of late 2000) troops—to prevent new inter-ethnic hostilities—succeeds IFOR.

FUTURE TRENDS

In Bosnia and Herzegovina, economic reform is at the core of the international community's strategy. Over the next few years, the government will accentuate tax reform, improve the tax administration system, aid financial sector reform and encourage privatization. Labor regulations and the pension system will also be thoroughly **restructured**. Foreign investment will be encouraged, but future support from international financial institutions will be dependent on the success of the reforms. In the long term, it is hoped that reconstruction, reform, and EU integration will bring more peace and prosperity to what is considered to be Europe's most troubled land after World War II.

DEPENDENCIES

Bosnia and Herzegovina has no territories or colonies.

—Valentin Hadjiyski

BULGARIA

Republic of Bulgaria
Republika Bulgaria

CAPITAL: Sofia.

MONETARY UNIT: Lev (plural Leva). One lev equals 100 stotinki. There are coins of 1, 2, 5, 10, 20 and 50 stotinki.

CHIEF EXPORTS: Machinery and equipment; metals, minerals, and fuels; chemicals and plastics; food, tobacco, and clothing.

CHIEF IMPORTS: Fuels, minerals, and raw materials; machinery and equipment; metals and ores; chemicals and plastics; food and textiles.

GROSS DOMESTIC PRODUCT: US$48 billion (purchasing power parity, 2000 est.).

BALANCE OF TRADE: **Exports:** US$4.8 billion (f.o.b., 2000 est.). **Imports:** US$5.9 billion (f.o.b., 2000 est.).

COUNTRY OVERVIEW

LOCATION AND SIZE. The Republic of Bulgaria shares its borders with 5 other countries in southeastern Europe and has a coastline on the Black Sea. Romania lies to the north, Turkey to the southeast, Greece to the south, the former Yugoslav Republic of Macedonia to the southwest, and Serbia (with Montenegro part of the Federal Republic of Yugoslavia) to the west. The eastern coastline on the Black Sea is 354 kilometers (220 miles) long, and the total area of the country is 110,910 square kilometers (42,823 square miles), making it slightly larger than the state of Tennessee. The capital, Sofia, is situated at the foot of the Balkan and Vitosha Mountains in western Bulgaria; other principal cities are Plovdiv in south-central Bulgaria, the coastal cities of Varna and Burgas, and Ruse on the Danube River.

POPULATION. The Bulgarian population recorded in the 1985 census was 8,948,649, but by July 2000, largely due to **emigration**, the population was estimated to have decreased to 7,796,694. In 2000, the birth rate stood at 8.06 and the death rate at 14.63 per 1,000 population, but this downward trend should be halted as the economy improves, emigrants return, and the country joins the European Union (EU) in 2007. By 2010, the population is projected to reach 7.26 million. Population density is about 70 persons per square kilometer (181 per square mile).

Ethnic Bulgarians account for 85 percent of the population, Turks 9 percent, and Roma (Gypsies) 3.7 percent. Other small, miscellaneous groups round out the total. Bulgarian, a Slavic language with a written tradition dating back to the 9th century, is the principal language, with other languages spoken corresponding to the ethnic breakdown. Religions include Orthodox Christian (83 percent), Muslim (13 percent), and Roman Catholic (1.5 percent), with Jewish, Protestant, and other groups making up the rest. The population of Bulgaria is aging, with 16 percent below the age of 14 and 16 percent older than 65. The median age is expected to increase from 37.5 years in 1995 to nearly 41 in 2005. A majority of the population, 69 percent, lives in urban areas, and Sofia and its suburbs are home to the largest number.

Prior to 1989, the government encouraged population growth by providing maternity benefits, free health care, affordable pre-school day care, and reasonably adequate pensions. Emigration was negligible due to government restrictions on travel. Since then, however, deteriorating living standards, the opening of the economy, and freedom to travel have generated emigration, mostly of young people, to Western Europe and North America, and of ethnic Turks to their neighboring homeland. Many of the latter, however, return or maintain households in both countries.

OVERVIEW OF ECONOMY

Until 1944, Bulgaria was a predominantly agricultural country. Under the **socialist** regime introduced after World War II, industry and **infrastructure** were **nationalized** and

operated in line with central government economic planning. Most farming was collectivized (organized into government-run units), and the development of heavy industry was made a priority. From the 1970s until 1989, Bulgaria enjoyed one of the most prosperous economies in Eastern Europe, with good health, education, and living standards. Considered by many to be the "Red Silicon Valley" (denoting its role as the **communist** equivalent of the U.S. technology breeding ground), it became the sixth nation to fly in space.

The socialist economy, however, was dependent on the imports of subsidized Soviet fuels (some **re-exported** to obtain **hard currency**) and the extensive but straightforward Soviet (and other socialist) markets for most exports of machinery, computers and peripherals, clothing, tobacco, beverages, and food. With the disintegration of the Soviet Union in 1989, the Yugoslav wars of the 1990s, economic **sanctions**, and the Persian Gulf crisis of 1990–91, Bulgaria lost many of its markets, its cheap energy sources, and hard currency revenues. As a result, living standards declined significantly in the 1990s. Bulgaria has become a poor European country and, like most its neighbors and near-neighbors, except Poland and Slovenia, it is a long way from improving on its 1989 real level of output. The Yugoslav wars interrupted both road and river (the Danube) trade routes to Western Europe and hurt the economy, but the Stability Pact, a regional initiative for economic development, democratization, and security devised in the late 1990s and backed by the United States and the EU, should facilitate future recovery.

Despite these many problems, Bulgaria earned a reputation for economic and political stability during the 1990s. The government followed a slow but sure path towards a market economy and expanded its commercial ties with Western Europe and the United States. The

European Union (EU) currently accounts for 52 percent of its exports and nearly half of its imports, and the United States is among the top foreign investors. Bulgaria aspires to join the North Atlantic Treaty Organization (NATO) in the first decade of the 21st century and is on course to join the EU.

In 1997, the government imposed tight **monetary policies** and strict financial discipline, stabilizing the banking system and cutting government spending. Triple-digit **inflation** gave way to moderate price increases, but growth and foreign investment have remained low. Ongoing market reforms include **privatization** or liquidation of state-owned enterprises and **liberalization** of agriculture and the creation of a land market. Privatization is seen as the only efficient way to **restructure** the economy, create jobs, and introduce new technology. It is also crucial for attracting foreign investment, stopping the slide in output, increasing exports, and generating cash for current needs. But the government has been criticized for relying heavily on controversial management-employee buyouts for smaller enterprises. New social policy measures include reforming social insurance and addressing the issues of crime and corruption.

The **external debt**—estimated at over $10.4 billion in 2000 and accumulated as a result of foreign **trade deficits** throughout the 1980s—is considered high but not unduly so. Although the **balance of payments** situation had stabilized by 2000, the debt has caused a negative long-term impact on economic growth and living standards. Another problem arises from the depreciation of the euro (the common currency of the EU), since most revenue is measured in euros while the debt is calculated mostly in dollars. There are attempts to encourage debt-for-**equity** swaps (transforming bank debt into **foreign direct investment**) which, along with the expected growth over the next few years, might alleviate the debt burden.

POLITICS, GOVERNMENT, AND TAXATION

In 1990, communist rule in Bulgaria gave way to a multiparty parliamentary democracy, with executive power vested in the Council of Ministers. Although political life has been active, Bulgaria has sound policies regarding minorities and is regarded as an oasis of stability in the tinderbox of the Balkans. In the 1997 parliamentary elections, the United Democratic Forces, an alliance of the reformist Union of Democratic Forces (SDS) and the People's Union, won 137 of 240 National Assembly seats. The Bulgarian Socialist Party (BSP), reformed communists, was reduced to 58 seats, which reflected the BSP responsibility for the 1996–97 financial meltdown, from which the SDS was perceived as a deliverer. The remaining seats were shared between the Movement for Rights and Freedoms (MRF); a centrist, predominantly ethnic Turkish party; the Euroleft; and the Business Block. The Bulgarian Agrarian People's Union and the Democratic Party form the People's Union coalition. The local elections in 1999 gave the BSP control over most local governments and signaled decreasing SDS popularity due to persistent economic hardship and corruption charges. All major parties currently support market reforms and membership in the EU and NATO. During the 1999 Kosovo crisis, the government cooperated fully with NATO.

The government aims to privatize all state-owned firms except for utilities, strategic railroads, natural gas, postal services, education and sciences, environmental protection, geology, and cartography. The law requires that the state retain at least a 51 percent interest in merchant shipping and passenger fleets, major ports and airports, transport, and highway construction companies. By June 1999, about 40 percent of state enterprises had been privatized, while the **public sector** accounted for 36 percent of the GDP. The **private sector** contributed 25–30 percent of the GDP in 1995; 35–40 percent in 1996; approximately 65 percent in 1997 and 1998, and 64 percent in 1999, and is expected to increase further.

Privatization processes were particularly dynamic in 1999 and 2000, with priority given to tourism, food processing, agriculture, heavy industry, engineering, textiles, and construction materials. The privatization program is being carried out through capital market offerings, mass privatization, and cash deals. The offerings on the capital market (through corporate stocks and bonds sales) are insignificant, and the local stock exchange is still in its infancy. In the mass privatization program, all citizens and company employees were made eligible to receive free vouchers for company (or privatization fund) shares. More significant for foreign investors is cash privatization, which allows investors to buy smaller enterprises from central government ministries, larger ones from the privatization agency, or municipal assets from local government. The privatization agency hires foreign consultancy firms to assess the value of important enterprises and to advise on marketing, but the process has often been described as slow and challenging. Potential investors have been frustrated by the difficulties of investing, and others are unhappy with inflexible procedures. Complex criteria for determining which buyers are eligible to invest has caused concern about corruption.

Taxes are a major source of government revenue. Personal **income tax** rates are progressive, from 20 percent to 40 percent. The profit tax rate is 20 percent for large firms and 15 percent for small firms. **Value-added tax** (VAT) is levied at a rate of 20 percent. All firms pay 10 percent on profits in municipal tax. Investors in high

unemployment areas get a 10 percent reduction on government profit tax. The tax system is still perceived by many as unfriendly to business, and tax cuts are being debated within the government.

INFRASTRUCTURE, POWER, AND COMMUNICATIONS

Bulgaria's transportation infrastructure includes railroads, with 3,979 kilometers (2,472 miles) of track in use, and about 36,724 kilometers (22,819 miles) of paved roads, although some of these are unsatisfactory. There are only about 250 kilometers (160 miles) of 4-lane highway. Back in the 1980s, Somat, the state trucking company, was among the largest in Europe. However, political troubles involving Serbia made the road route to Western Europe across Serbian territory problematic. The result was greater traffic via Romania across the only existing bridge with a ferry crossing on the Danube. Bulgaria recognized the need for a second bridge, but mixed signals from Romania have held up the project. However, the reopening of traffic through Yugoslavia following the ousting of Yugoslav leader Slobodan Milosevic in 2000 may rule out bridge construction.

Bulgaria has many highway projects under construction, notably portions of the Trans-European motorway connecting Budapest, Hungary, with Athens, Greece, via Sofia, and with Istanbul, Turkey, via eastern Bulgaria. International investors and the state budget are the main sources for financing road network improvements. Completion and modernization of portions of the Trakia, Cherno More, and Hemus expressways are being given out to contractors, and there are plans for a north-south tunnel under Mount Shipka.

The Danube River is an important artery, and much of the freight traffic uses the Black Sea. There is a sizeable merchant marine fleet operated by the Navibulgar shipping company. Two major seaports and east-west transport corridor gateways, in Varna and Burgas, are planned for rehabilitation. Balkan, the national airline, serves major cities and international destinations, although it has suffered after its recent sale to the Israeli Zeevi group in a questionable privatization deal. Smaller airlines also operate, and 3 major international airports, in Sofia, Varna, and Burgas, are currently undergoing modernization. There are 129 airports with paved runways.

Bulgaria's energy sector is state-owned and derives most of its output from thermal plants burning fossil fuels, mostly coal and natural gas (52 percent), nuclear plants (41 percent), and hydroelectric facilities (7 percent). Newer units of the Kozloduy nuclear plant will be upgraded under a contract between the National Electric Company and the U.S. company, Westinghouse. Bulgaria exports energy, primarily to Turkey and Yugoslavia. The country produced 38.423 billion kilowatt hours (kWh) of energy in 1998, a slight decrease from the previous year, and electricity consumption stood at 35.493 billion kWh. Studies to determine the feasibility of oil pipelines carrying oil from the Caspian Sea through Bulgaria to the Greek Aegean Sea coast or the Albanian Adriatic Sea coast could bring future opportunities for expansion. There are extensive networks of pipelines carrying natural gas throughout the country.

Bulgaria has the highest penetration of telephone service in Eastern Europe, at 38.47 percent. The network is operated by the state-owned Bulgarian Telecommunications Company (BTC). In 1998, it replaced antiquated facilities with up-to-date equipment and connected major cities with digital exchanges, satellite ground stations, fiber-optic lines, and digital microwave networks in a $300 million project funded by international investors. Residential telephone development will reach EU standards by 2008. There is analog cellular telephone network operated by the Mobifon company, created as a **joint venture** between Cable & Wireless (49 percent), BTC (39 percent), and the Bulgarian company Radio Electronic Systems (12 percent). The Bulgarian company, Mobiltel, operates a digital cellular telephone net-

work, and the country has many small, unregulated, Internet service providers. Privatization of 51 percent of the BTC, worth more than $500 million, will be the largest privatization deal in Bulgaria, and was being prepared in 2001, while the Greek telecommunications company, OTE, was granted a license for a second national digital cellular phone network.

ECONOMIC SECTORS

Since the late 1980s, manufacturing, mining, transport, construction, and agriculture have been declining in Bulgaria, while the service sector has been growing, particularly in **retail** business and finance. Energy, communications, and tourism have also become high-profile if turbulent industries. The *World Factbook* estimated that by 2000 agriculture accounted for 15 percent of **gross domestic product** (GDP), industry 29 percent, and services 56 percent. Estimates for the division of the **labor force** were from 1998, when 26 percent of the labor force was employed by the agriculture sector, 31 percent by the industry sector, and 43 percent by the services sector.

Much of Bulgaria's earlier economic strength lay in heavy industry powered, until the early 1990s, by subsidized energy from the Soviet Union. With the collapse of centrally planned Eastern European economies, manufacturing suffered a downturn. Major state-owned chemical, oil-refining, and metallurgical plants were targeted for privatization and examined to determine whether they could compete effectively in international markets. The largest privatization deal in heavy industry was the sale of the Sodi Devnia chemical plant to the Belgian company, Solvey, in 1999 for $160 million. Many other major assets, including oil refineries and chemical, metallurgical, and cement plants were privatized, while some were reduced to a shambles.

Food processing, textiles and apparel, and other **consumer goods** manufacturers have performed comparatively better, often attracting investment from renowned companies such as Kraft Jacobs Suchard or Danone. Future growth looks probable in light industry, led by electronics, textiles, and food processing. A small percentage of new private companies are involved in manufacturing. Private sector growth is greatest in the construction and food industries, maintenance and repair of electronic tools and equipment, household appliances, and automobiles.

AGRICULTURE

Bulgaria is renowned for sheep's milk cheese, oriental tobacco, wine, rose attar (used in perfumery), vegetables, fruit, medicinal herbs, and, particularly, natural yogurt. The temperate climate, abundant arable land, and soil conditions support the farming of both livestock and crops (grains, oil seeds, sugar beets, vegetables, grapes, fruit), but the country was affected by drought in the late 1990s and into 2000. Tobacco is among the most important of Bulgaria's crops, contributing nearly 20 percent to the value of agricultural goods. The principal timber areas are in the Rila, Rhodope, and Balkan Mountains. The fishing industry, which in the 1980s operated a large ocean fleet, is currently depressed. All told, the agricultural sector was estimated to account for 21 percent of the GDP in 1999 and to employ 26 percent of the workforce. Although estimations for the labor force were not available, the percentage of the GDP the sector contributed dropped slightly by 2000 to 15 percent.

Although historically a surplus food producer, Bulgarian agriculture was facing a downturn at the turn of the century. Cropland, livestock population, and yields were declining (limited use of fertilizers, however, has led to cleaner rivers and sea water). Animal feed is imported and its shortage has led to distress slaughtering, the killing of livestock in the face of a shortage of feed. The price of agricultural goods is not rising in line with inflation. Imported subsidized vegetables, fruit, dairy products, and meat from the EU adversely affect local producers. Restitution of collective farmland to private owners has been complicated and considerable collective farm assets were lost in the process. New private holdings are too small and can only be serviced with technical equipment or irrigated if their owners band together, but such efforts are proving slow to develop.

Price liberalization should encourage more output, especially as income gradually rises. Agriculture has the potential to make Bulgaria again basically self-sufficient in grains, and prospects are excellent for further increases

in hard currency earnings from wine and dairy products, particularly cheese.

INDUSTRY

Before 1989, heavy industry dominated the Bulgarian economy. Metallurgy was largely dependent on iron ore imports, while locally mined copper, zinc, and lead ores were smelted in Bulgaria. The chemical industry produced fuels, plastics, rubbers, soda ash, and fertilizers. Engineering was well developed, especially in the production of electrical equipment, electric and motor trucks, heavy machinery, machine tools, electronics, and shipbuilding. Since the transition to a market economy, with a few exceptions that have attracted major foreign investment or serve sizeable international demand, the remaining heavy industry companies have struggled under management-employee privatization schemes. By 1999 industry contributed 29 percent to the GDP and employed 31 percent of the workforce. More recent labor force estimations were not available, but the percentage of GDP the sector contributed by 2000 remained the same.

Computer and software industries grew spectacularly in the 1980s, but, since then, many hi-tech players have been severely hit. DZU, a modern data storage equipment manufacturer in 1989, later leased out its production facilities to dubious firms that made Bulgaria the world's second largest producer of pirated compact discs (CDs). A government crackdown then all but ruined DZU, whose chances of survival currently lie with Hungary's Videoton, which acquired it for a nominal price. At best, it will function as a cheap assembly plant, but other companies will not even be this lucky. Bulgaria lost more than 50,000 computer programmers and engineers to developed countries over the 1990s, and this drain on a skilled workforce showed no sign of slowing down.

Textiles, the oldest industry in Bulgaria, together with apparel, leather goods, and footwear manufacturers, use largely domestic raw materials. The manufacture of building materials—cement, bricks, and glass—is well established. Pharmaceuticals and beauty products, food processing, including wine and other beverages, and tobacco processing, were once major revenue sources and show prospects for future growth.

Industries whose market prospects show promise in the 21st century include the manufacture of electrical equipment; telecommunications equipment and services; computers, software, and information technology; medical equipment; automotive parts and service equipment; agricultural equipment; building materials; chemicals; and, to some extent, metallurgy. All these enterprises, however, require massive restructuring and investment for their revitalization.

SERVICES

The service sector, generating approximately half of Bulgaria's GDP in 1999 and employing 43 percent of the workforce, continues to experience the highest growth of any sector. Most private sector activity involves some form of trade or retail, and financial services such as insurance and lending, health-care services, and tourism are well regarded by private companies.

FINANCIAL SERVICES. With the breakup of the rigid socialist banking system, the 1990s witnessed expansion of the banking and financial services sector. In 1996, however, many state-owned and some private banks collapsed under the burden of bad debts accumulated by state factories that had become obsolete and by the now infamous "credit millionaires." In 1997, the government focused on achieving stabilization and financial discipline, forcing the banks to avoid new lending and to maintain very high **liquidity** rates (a measure of how much cash is kept on hand). Bulgaria's low inflation is accompanied by low interest rates, but the level of lending is a third of that in most central European countries and is a major barrier to investment. The economy is heavily reliant on cash payments, which is detrimental to efficiency and conducive to corruption and tax evasion. Savings have been declining since 1999 due to generally low income levels.

The government is privatizing remaining state banks, and there were plans to sell in 2001 the largest, Bulbank, to a consortium made up of UniCredito (Italy) and Allianz (Germany), and the Bulgarian State Savings Bank. The large Post Bank was sold in 1998 to a consortium of Greek banks and AIG (U.S.), which also bought a stake in the United Bulgarian Bank in 1999. Most hard-won loans are now going to private companies. Consumer credit is developing, although slowly, with banks actively encouraging car and home loans to the tune of $400 million. Credit card companies have also started operations in this formerly virgin market.

TOURISM. Tourism plays a significant but not crucial role in the economy. While its competitors, Spain, Greece, and Turkey, have the advantage of aggressive and expensive marketing campaigns and decades of exposure to the market, Bulgaria has been unable to capitalize on its popular image as a land with a rich folklore tradition. The country offers extensive beach resorts along the Black Sea coast, several alpine skiing resorts in the Vitosha, Rila, Pirin, and Rhodope Mountains, and natural mineral water health spas. Nevertheless, the number of Western tourists fell by a third between 1994 and 1996, and the total revenue from the tourist industry in 1996 was $669 million. Attracted by low prices, cultural similarities, the lack of visa formalities, and a Russian-friendly population, former Soviet nationals spent 130 percent more overnight stays in Bulgaria in 1996 than in

1985, and 63 percent more than in 1993. Former East Germans are also frequent visitors. In 1996, overnight stays by Russians and Germans were around 2 million each, but the number of British and Scandinavian visitors is low. Poles, Czechs, Slovaks and Hungarians, among the top tourists to Bulgaria in the 1980s, now prefer other destinations. Foreign-acquired tourist hotels on the coast are mainly Russian-owned, while others have been leased to tour operators such as Germany's Neckermann who carry out renovation. However, it is 5-star business hotels that most attract foreign investors.

RETAIL. Growing quickly during the 1990s, the retail sector was energized by the privatization of state and municipality-owned stores, the emergence of many small private firms, and the import of cheap foreign consumer goods. Major foreign retailers, such as the German Metro, the Turkish Koc Holding, and others from Austria and France, began developing a network of large hypermarkets. The choice of goods has widened impressively, but low-income Bulgarians are generally reluctant or unable to pay more for better-looking products, often leaving consumers reliant on traditional domestic suppliers. The lower price of subsidized agricultural goods from the EU make them popular with buyers but detrimental to local producers. Direct and network marketing, which became popular in Eastern Europe after Oriflame (Sweden) made a success of it, is taking root, but only gradually, due to low levels of **disposable income**.

INTERNATIONAL TRADE

As a consequence of the **foreign debt** incurred in the late 1980s, Bulgaria suffered from declining markets and negative trade balances during the early 1990s. Although dependent on imports as heavily as ever, Bulgaria showed improvement after 1994 as the lev weakened, making exports more affordable in foreign markets; trade with former Soviet republics was revived, and trade with the EU increased. However, after 1997, the Yugoslav **embargo**, together with the government's restrictive policies aimed at financial stabilization, brought a downturn in the balance of trade. In 1998, exports of goods stood at $4.293 billion and imports at $4.609 billion, generating a current account deficit of $316 million. This trade deficit mushroomed to $1.5 billion in 1999, when Bulgaria imported $5.3 billion in goods while exporting just $3.8 billion.

Trade (expressed in billions of US$): Bulgaria

	Exports	Imports
1975	N/A	5.949
1980	N/A	N/A
1985	13.339	13.657
1990	4.822	4.710
1995	5.354	5.657
1998	4.300	4.979

SOURCE: International Monetary Fund. *International Financial Statistics Yearbook 1999.*

An accumulating trade deficit would badly affect Bulgaria's ability to meet its financial obligations in the future, but June 2000 was the tenth month in succession to see an increase in exports. Exports for that month reached $393.6 million, an increase of 21.8 percent over 1999, attributed to the recovery of EU economies in general and the rise in the international price of Bulgarian exports. Exports to the United Kingdom (UK) rose by 40 percent, due to the strong pound against the weak euro, which is linked to the lev. Export to other Organization for Economic Cooperation and Development (OECD) countries rose by almost 45 percent, with most going to Turkey. Exports to Balkan countries, mainly Serbia and Macedonia, boomed after the Kosovo war in 1999, but those to other member countries of the Central European Free Trade Agreement (CEFTA) rose by less than 6 percent and those to the former Soviet Union fell by 17 percent, with exports to Russia falling by one-third.

Imports increased by 23 percent over the previous year, to $511.2 million in June 2000. Over 50 percent of the rise was due to higher oil prices. Imports of industrial raw materials rose by more than 8 percent and imports associated with the recovering metallurgical sector grew, while those required by the food sector fell. Investment also rose in 2000, but the greatest growth, 56 percent, was in energy, mainly imported from Russia. The EU is now the main supplier of consumer and investment goods to Bulgaria. Imports from Balkan countries expanded impressively a year after the Kosovo war.

A fairly active trade-show calendar attracts firms from many countries. Major export commodities included textiles, clothing and footwear; base metals and metal products; minerals and fuels; food, beverages, and tobacco; machinery and equipment; chemicals and plastics; furniture and household appliances. Italy accounted for 14 percent of exports in 1998. Germany (10 percent), Greece (9 percent), Turkey (8 percent), and Russia (5 percent) were other major partners. Together, EU countries accounted for 52 percent of exports.

Major import commodities included fuels, minerals, and raw materials; metals and ores; textiles and apparel; machinery and equipment; automobiles; chemicals and plastics; and food. Major import partners were Russia, accounting for more than 20 percent of all imports in 1998, Germany (15 percent), Italy (9 percent), Greece (6 percent), France (5 percent), and the United States (4 percent). Together, EU countries accounted for more than 48 percent of imports.

MONEY

The Bulgarian National Bank (BNB) is the **bank of issue**. It controls government funds and state-owned enterprises. All banks were nationalized in 1947, but since 1990, private banks have been established and international banks allowed to enter the market. The banking sector has been consolidated, and complete privatization of the remaining state-owned commercial banks was expected by 2001.

The Bulgarian currency plunged dramatically in late 1996 and early 1997, reaching a low of approximately 3,000 leva per US$1. Many banks that had extended loans to failing concerns, both state-owned and private, were forced into insolvency. By early 1997, most banking institutions were bankrupt or had closed doors to depositors. The new government that took office in May of 1997 committed itself to stringent financial and structural policies for dealing with this drastic situation and received the encouragement of backing from international financial institutions.

Since July 1997, as required by the International Monetary Fund (IMF), the Bulgarian government has been operating under the control of a **currency board**. This body rules that the BNB must hold hard currency reserves in leva to cover circulation and banking reserves. Further, the currency board dictates that the BNB cannot refinance commercial banks except in an emergency and restricts the government's freedom to take on new financial liabilities or provide sovereign guarantees. The lev was tied to the German mark and later to the euro at a fixed rate, and in 1999 the currency was redenominated (new bills and coins were issued and the **exchange rate** was fixed at 1 lev to 1 German mark).

Under IMF conditions for strict financial discipline, the government was pledged to close loss-making enterprises and speed privatization, bank reform, and restructuring. It issued an isolation list of loss-making state enterprises, that is, companies denied access to commercial credit unless they privatize. These accounted for half of the public sector, but by 1999 the government succeeded in privatizing, or beginning liquidation of, all such companies. In the early 1990s, there were 30–40 virtually unregulated stock markets in Bulgaria, most of whose listed firms turned out to be dealing in **pyramid schemes**. A national stock exchange opened in October 1997, but daily **turnover** has seldom been more than $200,000, and rarely exceeded $1 million, even in 1998.

Exchange rates: Bulgaria

leva (Lv) per US$1	
Jan 2001	2.0848
2000	2.1233
1999	1.8364
1998	1,760.36
1997	1,681.88
1996	177.89

Note: On July 5, 1999, the lev was redenominated; the post-July 5, 1999 lev is equal to 1,000 of the pre-July 5, 1999 lev.

SOURCE: CIA *World Factbook 2001* [ONLINE].

POVERTY AND WEALTH

Before 1989, Bulgaria was arguably a land of economic equality. Almost no private initiative was allowed, but the vast majority of the population was employed by the state, and large government funds were allocated to free health care, free higher education, maternity and disability benefits, and pensions. Most Bulgarians owned their houses, and many had small country "villas" and motor cars. Traditionally, even the poorest Bulgarians, the ethnic Roma, held jobs, received social security payments, and enjoyed a decent standard of living, particularly in rural areas. The only exceptions to this modest yet guaranteed standard of living were the **nomenklatura** and the **informal economy** players, whose privileges inflamed discontent among the population.

The market reforms of the 1990s created both new poverty and new wealth. Unemployment, hitherto almost unknown, skyrocketed, inflation all but wiped out most social benefits, and the cooperative farms that were the livelihood of many formerly landless villagers were disbanded. Many entrepreneurs, corrupt politicians and officials, and mobsters amassed spectacular fortunes, which most people resented. Restitution of urban real estate, and particularly of farmland and woodland, was controversial and failed to generate much wealth. Mass privatization also failed in this respect.

For all its problems, Bulgaria was in 1995 still more egalitarian than neighboring Greece or the wealthy United States. The poorest 20 percent were responsible for 8.5 percent of the nation's consumption (compared to 7.5 percent in Greece and 5.2 percent in the United

GDP per Capita (US$)

States), while the wealthiest 20 percent consumed 37 percent (40.3 percent in Greece, 46.4 percent in the United States). Bulgaria's **Gini index**—which rates a country's level of equality with 1 representing perfect equality and 100 representing perfect inequality—was 28.3 in 1995, while Greece's was 32.7, and the United States' was 40.8. Polarization increased between 1995 and 2000, but it is believed that economic growth over the next decade and the accession to the EU will gradually increase living standards for all Bulgarians.

By 2001 most of the population was enduring hardship. The growth of wages and pensions lagged behind the index of consumer prices and unemployment is officially estimated at 15 percent, although it is believed to be much higher. The prospects for many small businesses seem bleak, due to the unavailability of loans, weak demand, crime, and corruption. Agriculture is struggling to provide a sustainable livelihood for small farmers. While many professionals and business owners make a good living, thousands of Bulgarians can afford only the bare necessities. Numerous chronically ill people suffer from an inadequate supply of life-supporting medicines, and many children, particularly those of Roma families, are unable to attend school because of the growing cost of textbooks and clothing. Many people who live in small towns and villages with high unemployment rates, as well as single parents, **pensioners**, persons in state social homes, disabled people, and others face considerable personal distress.

According to the United Nations Development Programme (UNDP), Bulgaria is currently behind Hungary and Poland, but ahead of neighboring Turkey and Romania, in terms of its human development index. In 1998, Bulgaria still had a smaller population per physician and per hospital bed than the EU average, but health-care spending per head was much lower. Food constituted 33.1 percent of household spending (but was believed to be rising), while the EU average was 14.1 percent. Cars in use per 1,000 population were 219.9 for Bulgaria and 399.7 for the EU. Houses with piped water constituted 83.4 percent of households in Bulgaria and 99 percent in the EU, and houses with flush toilets were 57.7 percent in Bulgaria against 96.3 percent in the EU.

WORKING CONDITIONS

Bulgaria is a party to all relevant major universal as well as regional legal instruments, such as the International Covenant on Economic, Social and Cultural Rights, the Convention on the Elimination of Discrimination Against Women, and the Convention on the Rights of the Child. It is also a signatory to treaties on the right to equal compensation and collective bargaining and against employment discrimination. Market reforms, though, made Bulgarians aware of unemployment and job insecurity problems. Before 1989, the economy was plagued by the sustained labor deficit for blue-collar workers, but labor disputes were virtually non-existent since the Communist Party supervised trade unions. Nevertheless, over the decades after World War II, working conditions improved in both urban and rural areas with the introduction of new technology and progressive legislation and the development of health-care and social-security systems. At the same time, safety at work and environmental protection, particularly in the mining, energy, and chemical industries, were often inadequate.

Household Consumption in PPP Terms

Country	All food	Clothing and footwear	Fuel and power[a]	Health care[b]	Education[b]	Transport & Communications	Other
Bulgaria	30	6	17	8	11	5	23

SOURCE: World Bank. *World Development Indicators 2000.*

Bulgaria did not develop independent labor unions as such before democratic reforms took root. The only exception was the Podkrepa Labor Confederacy, now one of the major national unions. Along with the Confederacy of Independent Syndicates of Bulgaria and other groups, the Podkrepa participates in collective bargaining, and the unions' role is growing as many Bulgarians face unemployment and deteriorating working conditions. Conditions are notably bad in clothing sweatshops set up by foreign investors in rural areas severely afflicted by unemployment. Women have traditionally participated on an equal footing in the economy but are now suffering heavily from unemployment, job-related stress, and unsafe labor conditions. Over the 1990s, hundreds of thousands of educated young Bulgarians left the country, and it is expected that the forthcoming waiver of visa requirements for most EU countries will encourage others to seek short-term employment. EU membership is likely to intensify the mobility of workers between countries until a balance is reached.

COUNTRY HISTORY AND ECONOMIC DEVELOPMENT

550 A.D. Slavs settle into present-day Bulgarian (then Byzantine) lands, comprising the ancient Roman provinces of Moesia, Thrace, and Macedonia.

681. Khan Asparuh founds the first Bulgarian state as a union between Slavs and newcomer Bulgars, militant people from the steppes of the northern Caucasus. They are to be assimilated by the Slavs but leave their name and statehood tradition to the nation.

863. Bulgaria converts to Christianity under Prince Boris I and embraces Byzantine civilization as a feudal agrarian economy takes root.

893. The Cyrillic alphabet and Old Bulgarian (Slavonic) are adopted as the official language (instead of Greek).

893–927. The territory expands under Prince (later Tsar) Simeon. A rich medieval culture spreads its influence to other Slavs in Serbia, Walachia, Kievan Rus, and later Muscovy.

927. Bulgarian rulers recognize the title of tsar (emperor); Bulgarian Orthodox Church is elevated to patriarchy.

1018. The First Bulgarian Empire is violently subdued by Byzantium.

1185. The brothers, Asen and Peter, take over an uprising to liberate the Bulgarian lands and restore the state known as the Second Bulgarian Empire.

1230. There is territorial and commercial expansion under Tsar Ivan Asen II. Bulgaria becomes a major grain supplier to Byzantium, actively trading with Venice, Genoa, and Ragusa (Dubrovnik).

1371. Commercial and cultural development accompanies political crisis under Tsar Ivan Alexander. Bulgaria is divided into several lesser kingdoms and principalities.

1396. Bulgaria is violently conquered by the rising Ottoman Empire and remains under its rule for nearly 500 years.

1762–1876. A national revival develops new Bulgarian culture and pride. Agriculture and home industries thrive, benefitting from large Ottoman markets. Merchants and industrialists emerge and benefit the economy. The national liberation movement gains momentum.

1871. An independent Bulgarian church is restored.

1876. There are mass uprisings against Ottoman rule.

1878. Bulgaria is liberated from Ottoman rule as an outcome of the 1877–78 Russo-Turkish war.

1879. The first Bulgarian constitution establishes a democracy, modeled after the Belgian constitution.

1885. North and South Bulgaria unite after being separated since 1878 by the European powers. A sizable ethnic Bulgarian population remains under the Ottoman Empire.

1887–12. Democratic statehood develops as well as a market economy that remains largely agrarian and a national culture.

1903. There are mass uprisings of Bulgarians in the Ottoman lands (Macedonia and Adrianople area).

1912–18. Bulgaria participates in the Balkan Wars and World War I, which is aimed at liberating ethnic Bulgarians outside Bulgaria's borders. The war ends in defeat and brings an influx of refugees.

1923–41. Political life is troubled by violence as democracy gives way to bitter partisanship and is finally supplanted by a pro-Nazi Germany regime. The economy grows with the influence of German investors.

1944–56. Communist rule takes over. Central economic planning is introduced, focusing on heavy industries, and farms are collectivized. Economic cooperation with the Socialist bloc develops.

1946. Bulgaria is proclaimed a people's republic.

1955. Bulgaria joins the United Nations.

1956–80. Bulgaria exhausts the extensive socialist growth model and reaches stagnation.

1985–89. Economic and political crisis occurs as *perestroika* unfolds in the Soviet Union. The Bulgarian regime desperately seeks methods of market reform,

while cracking down on dissenters and the Turkish minority.

1989. Communist leader Todor Zhivkov resigns as the transition to multiparty democracy and a market economy begins. Bulgaria shifts its loyalties to the EU and NATO.

1991. A new democratic constitution of the Republic of Bulgaria is adopted, and elections bring the reformist Union of Democratic Forces (UDF) to power.

1995. Bulgaria is admitted as an associate member of the EU and applies for full membership.

1997. IMF-sponsored program for financial stabilization is implemented by the second UDF government.

1998. Effective IMF membership is established.

1999. Negotiations for full membership of the EU get underway.

FUTURE TRENDS

Bulgaria's economic policy after 2000 will be determined by the success of its preparations for EU membership. The EU opinion on its progress is favorable, but negotiations will become more difficult as they move from administrative to economic issues, such as the restructuring of the energy sector and agriculture. Bulgaria's market economy and its competitiveness within the single European market still require significant further improvement. Public expenditure will focus on investment in roads, natural gas, electricity, agriculture, and the environment. The government claims investment of some $9 billion is enough to fuel growth over the next years, but, all too optimistically, it relies on the private sector to provide most of the funds.

With Bulgarian privatization completed by the end of 2001, the IMF envisages strong annual growth of 4 percent to 5 percent over the next several years and single-digit inflation. However, slow and allegedly corrupt privatization processes are a potential obstacle to economic transformation, and corruption charges combined with insufficient growth, unemployment, poverty, and deteriorating health care and education, could bring about a change of government in 2001. This outcome would not mean any long-term changes in policy.

The end of Slobodan Milosevic's government in Serbia could prove beneficial by decreasing the risk of war on Bulgaria's borders. The reopening of land routes and river traffic on the Danube will facilitate trade with the EU, Bulgaria's largest export market, whose growth will have a positive impact on the economy.

DEPENDENCIES

Bulgaria has no territories or colonies.

CROATIA

Republic of Croatia
Republika Hrvatska

CAPITAL: Zagreb.

MONETARY UNIT: Croatian Kuna (HrK). One kuna equals 100 lipas. There are coins of 1, 5, 10, 20, and 50 lipas and 1, 2 and 5 kuna. There are notes of 5, 10, 20, 50, 100, 200, 500, 1000, and 2000 kunas.

CHIEF EXPORTS: Textiles, chemicals, foodstuffs, fuels.

CHIEF IMPORTS: Machinery, transport and electrical equipment, chemicals, fuels and lubricants, foodstuffs.

GROSS DOMESTIC PRODUCT: US$24.9 billion (purchasing power parity, 2000 est.).

BALANCE OF TRADE: **Exports:** US$4.3 billion (f.o.b., 1999). **Imports:** US$7.8 billion (c.i.f., 1999).

COUNTRY OVERVIEW

LOCATION AND SIZE. The Republic of Croatia is located in southeastern Europe, with a long coastline on the Adriatic Sea to the south, and borders with Slovenia and Hungary to the north, and Yugoslavia and Bosnia and Herzegovina to the east. It has an area of 56,538 square kilometers (21,829 square miles), approximately the size of West Virginia. The country's coastline stretches for 5,790 kilometers (3,598 miles), and consists of 1,778 kilometers (1,104 miles) of mainland coastline and 4,012 kilometers (2,493 miles) of island coastline. The capital, Zagreb, is located in the northwestern corner of the country. Other major cities include Osijek, Pula, Rijeka, Zadar, Split, and Dubrovnik.

POPULATION. Croatia's population has been gradually decreasing since its 1990 figure of 4,508,347 and, according to *CIA World Factbook* statistics, in July 2000 the figure stood at 4,282,216. However, the year 2000 saw a slight increase, with the birth rate, at 12.82 per 1,000, higher than the death rate (11.51 per 1,000). If this trend continues, a projected population growth rate of only 0.93 percent will not dramatically change the size of Croatia's population in the foreseeable future. By the year 2010 it is estimated to reach 4,697,548.

With 76.5 percent of its inhabitants Roman Catholics, Croatia is predominantly a Roman Catholic country. Although the majority of the population is Croatian, other ethnic groups include Serbs, Bosnian Muslims, Hungarians, Slovenians, and Czechs. Approximately 18 percent of the population is under 15, about 67 percent is aged between 15 and 64, and the remaining 18 percent is over the age of 65. According to 1997 figures, the majority of people (56.5 percent) reside in urban areas, showing a significant increase from the 1975 figure of 45.1 percent. By the year 2015, urban dwellers are expected to number 64.4 percent of the population. Although population density is only 83.5 people per square kilometer (216 per square mile), the population is not evenly dispersed. Almost a quarter of Croatians reside in the capital city of Zagreb and its suburbs, while many of the country's islands and rural areas are very sparsely populated by mostly elderly inhabitants.

Like several other European countries, Croatia is experiencing the problem of very slow population growth. The government recognizes the problem but has done very little to address it.

OVERVIEW OF ECONOMY

Prior to World War II, peasants comprised more than half of Croatia's population and the country's economy was based largely on agriculture and livestock. Croatia's northern region is rich in agricultural soil and has been exploited for those purposes since ancient times. The coastal regions are not as lush but have a perfect combination of climate and soil for growing grapes, olives, and citrus fruit. Industrialization took place after

World War II when Croatia became a part of the Socialist Federal Republic of Yugoslavia. During this time, the economy diversified, industry and trade grew rapidly, and tourism developed swiftly. Since Croatia and Slovenia were the most developed of the Yugoslavian republics, profits from their industries were used to develop poorer regions of the federation. This factor, together with hyper-**inflation** in the 1980s and austerity programs imposed by the federal government, led to both Croatia and Slovenia opting for independence from the Yugoslav federation at the beginning of the 1990s. Croatia's bid for independence was met with military force by the Yugoslavian government, unleashing a war that lasted from 1991 to 1995.

Prior to 1991, Croatia was part of a **socialist**-dominated country. Since then, it has been going through a transition from state-controlled economy to **free-market system**, but the conflict with Yugoslavia had a devastating effect on its economic **infrastructure**. During the war, parts of the country were destroyed or damaged. Many people became refugees, forced to rely on assistance from the state, while a large portion of the state budget was used for defense. The cost of material damage caused by the war was estimated at US$27 billion, more than the country's 2000 **gross domestic product** (GDP) of US$24.9 billion. The war also brought a substantial reduction in trade between Croatia and the former Yugoslav republics, and caused difficulties in com-

peting in European markets. Croatian tourism, a very important contributor to the country's GDP, suffered disastrously, as did trade and industry.

At the end of the war, Croatia began a slow process of economic rehabilitation. The structure of the Croatian economy is currently similar to that of a developed western economy, with services accounting for 71 percent of the GDP, industry for approximately 19 percent, and agriculture for 10 percent.

The country's major economic sectors are tourism and trade. Croatia has a beautiful coastline and many national parks, which attracted hundreds of thousands of annual visitors before the war. After the war ended in 1995, tourism revenues steadily increased, approaching the pre-war levels. In terms of trade, Croatia's major export industries include chemical products, textiles, shipbuilding, food processing, and pharmaceuticals. Agricultural production does not satisfy domestic needs, and food products comprise a significant part of the country's imports. Other imports include machinery and transport equipment, chemical products, and fuel.

The total **foreign debt** of Croatia stood at US$8.3 billion in 1998. Although the debt has been growing since 1991, the rate of increase has been much slower than the increase in government revenues. In 1991 the debt accounted for 12.3 percent of the government revenue, but by 1996 this figure had fallen to 8.4 percent. More than half the debt was to private creditors such as large banks and businesses, while the balance was in outstanding loans from the International Monetary Fund (IMF), the World Bank, and the European Bank for Reconstruction and Development.

European Union countries have contributed nearly US$1 billion to reconstruction efforts in Croatia since 1991. Some of the aid went to assist over 600,000 displaced people and 250,000 Bosnian refugees. The country received co-finance for most major projects from 3 sources: the World Bank, the European Bank for Reconstruction and Development, and Hermes Kreditversicherungs, known as Hermes. Hermes is a consortium of a private insurance company and a quasi-public company which provides credit insurance on behalf of the German government. Projects financed by these sources have included post-war reconstruction of infrastructure, support for the health sector, and improvements in the financial, enterprise, and agricultural sectors.

Foreign direct investment (FDI) has played a significant role in Croatia's banking sector and its pharmaceutical industry. According to CEEBICnet Market Research, current FDI in Croatia exceeds US$3.6 billion, most of it invested in mixed ownership enterprises, those owned jointly by foreign and local entities. Major investors have come from Germany, Austria, Italy, the United States, and the Netherlands.

Although the **private sector** has grown since Croatian independence, the country still has a fairly undeveloped enterprise sector consisting of small and medium-size operations. Between 1996 and 1999 employment in these businesses remained static due to a poor business environment, high taxation, and difficulties in obtaining appropriate financing for expansion.

POLITICS, GOVERNMENT, AND TAXATION

Croatia is a parliamentary democracy consisting of executive, legislative, and judicial branches. The executive branch consists of the president and the Council of Ministers. The president, who is the head of state and commander-in-chief of the armed forces, is elected by popular vote to a 5-year term of office and may serve a maximum of 2 terms. The president appoints the prime minister and the cabinet, as well as the Council of Ministers, whose members are proposed by the prime minister. The Croatian legislature is the parliament (Sabor), which consists of a Chamber of Deputies and a Chamber of Counties (Zupanije), all of whose members are elected to a 4-year terms. The first chamber has between 100 and 160 deputies and the second 68 members.

The judicial branch of the government consists of the Constitutional and Supreme courts. The Constitutional Court makes decisions on the constitutionality of laws and has the power to repeal a law and to impeach the president. It consists of 11 judges elected for 8-year terms by the Chamber of Deputies at the proposal of the Chamber of Counties. The Supreme Court holds open hearings and makes its judgements publicly. Its judges are appointed for life.

During its first 8 years of independence Croatia was ruled by the Croatian Democratic Party (HDZ) and its president, Dr. Franjo Tudjman, who remained head of state until his death in 1999. During this time the government was preoccupied with the war and was slow to **privatize** state-owned enterprises and attract foreign investment. The ruling HDZ party has occasionally, for political purposes, supported trade legislation that has benefited certain industries and economic sectors. After the elections in 2000, a coalition of 2 parties, the Social Democratic Party (SDP) and the Croatian Social Liberal Party (HSLS), came to power. The new government—led by President Stjepan Mesic and Prime Minister Ivica Racan—is dedicated to economic and social reform but, by the end of 2001, had not been in power long enough to show significant results.

As a former socialist country, Croatia is battling against the legacy of strong state control over the economy. This control had some positive results, such as a significant post-war reconstruction effort launched by the

government which, due to the lack of domestic capital, relied mainly on foreign borrowing. On the down side, however, it was very difficult for the private sector to expand or compete in a state-dominated economy; the government frequently exploited important positions in industry for political gain, which prohibited the private sector from entering the field.

Croatia generates government revenue through a wide range of taxation measures and is one of the most highly taxed countries in Central Europe. Heavy taxation has slowed the growth of the private sector and contributed to the rise of an **informal economy** whose interactions are not subject to taxation. Personal **income tax** paid on individual earnings ranges from 20 to 35 percent and **value-added tax** (VAT), paid on domestic sales and on most imports, is fixed at 22 percent. An import **duty**, levied on goods and services, is paid by the importer, while there are further taxes payable on property transactions, inheritance and gifts, tobacco and alcohol, and motor vehicles.

In 1993 the government launched a relatively successful economic program to stabilize prices and the **exchange rate**, which slowed inflation to approximately 3 percent by 1995. Since then, inflation has increased slowly by approximately 0.5 percent to 1 percent per year. At the same time, the government's continuing high rate of taxes and military expenditure to finance the war hindered the recovery process. During the first few years of the economic stabilization program, the currency remained stable, partly due to improvement in the economic climate, but largely because the central bank artificially maintained this stability.

The government established a Privatization Fund (CPF) to oversee transfer of state-owned enterprises to private hands. The privatization process used several methods, including the sale of company shares to employees at a discount, a system whereby vouchers are distributed for use in place of cash to bid for shares in companies undergoing privatization and to award compensation for property that had been taken away by the **communist** regime. These measures, however, were not very successful. They proved easy to abuse and led to many cases of corruption. Privatization of utilities and the country's main oil producer has been slow, as these are considered strategically valuable enterprises by many in the ruling party.

Croatia's ratio of **pensioners** (retired workers collecting government benefits) to workers is very high and puts a heavy burden on the economy. To ease this burden, the government, with help from the World Bank, introduced pension reforms. A 3-band pension system was approved but, by 2001, had not yet been implemented. This system will keep part of the monthly retirement contribution in government funds, while a portion will go into a privately managed fund.

The new government elected in 2000 managed to make a significant impact on speeding up privatization of the banking and telecommunications sectors, and in late November 2000, Croatia became the 139th member of the World Trade Organization.

INFRASTRUCTURE, POWER, AND COMMUNICATIONS

Judged by Eastern European standards Croatia has a comparatively developed infrastructure. In 1998, the country had 23,497 kilometers (14,601 miles) of paved highways, but only 330 kilometers (205 miles) of these were 4-lane expressways. Since the country suffered significant war damage between 1991 and 1995, it received loans from the World Bank and the European Bank for Reconstruction and Development to improve roads, railroads, the electricity and water supply network, and air-traffic control. The government is strongly committed to these efforts, and many of these projects, including the building of 1,600 kilometers (994 miles) of 4-lane highway, are under way.

There are 8 main airports in Croatia (Zagreb, Split, Zadar, Dubrovnik, Osijek, Pula, Rijeka, and Brac) ser-

SOURCE: World Bank. *World Development Indicators 2000.*

viced by major airline companies. Croatian seaports include Rijeka, Pula, Sibenik, Split, Ploce, and Dubrovnik, all of which are located on the Adriatic Sea. Transportation between these seaports and many islands is currently provided by only one company, Jadrolinija. The railway network extends for 2,699 kilometers (1,677 miles) but does not meet the country's needs. Plans to improve the railway system do exist, but carrying them out is not considered a priority.

Tourism is one of Croatia's main sources of revenue. Transportation facilities for tourists (a developed network of roads, railroads, and airports) plays an important role in making the tourist industry efficient. Since the majority of tourists arrive in Croatia by road, construction of highways has the highest priority. In addition, the country's odd "boomerang" shape requires excellent roads in order to link its northern, central and southern areas. If all these requirements are to be met, the country must provide a more modern and extensive highway and railroad system.

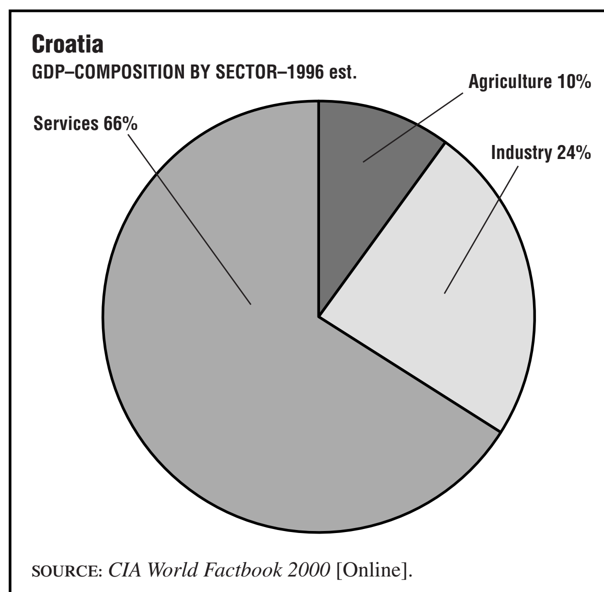
Croatia's demand for electricity is mostly satisfied by domestic production, while 10 to 20 percent is covered by imports. The country produces most of its electricity from fossil fuel and hydroelectric plants. A small portion comes from the nuclear plant Krsko, which Croatia shares with neighboring Slovenia.

Telecommunications services in Croatia are modern, although they lag behind those of Western Europe and the United States. Telephone service is provided by Croatian Telecom (HT), which has invested heavily in improving telecommunications. According to the *CIA World Factbook* there were 1.488 million telephone lines in use in 1997 and, although some domestic lines are still analog, they are being replaced by digital technology with a capacity of 2,200,000 telephone lines. The international telephone service is completely digital, and its main switch is located in Zagreb. A project is under way to install fiber-optic cables throughout the country and connect them with Slovenia. Currently there are 220,000 kilometers of fiber-optic cables connecting 4 main Croatian cities and 35 countries.

There are approximately 200,000 Internet users in the country, and, according to CEEBInet Market Research, Croatia had 5 Internet service providers in 2000. The 2000 World Development Indicators state that, in 1995, there were 272 television sets per 1000 people and 36 television broadcast stations.

ECONOMIC SECTORS

Being a small country, Croatia contributes relatively little to worldwide production in each of its 3 sectors. The country's economy is based on services, dominated by tourism and manufacturing, with international trade also an important contributor to the economy. The 5 years of war were mostly responsible for the country's poor economic performance, and post-war recovery has proceeded slowly. Other factors that limit economic growth are an inadequate legal structure and bureaucratic red tape, both of which restrict business activity; a slow privatization process; a poorly developed banking sector; and insufficient highway infrastructure. Some of these problems, such as privatization and highway construction, are being addressed, but it will take time for projects to be completed and for their effects to be felt.



SOURCE: *CIA World Factbook 2000* [Online].

Prior to the 1990s Croatia, and especially its beautiful Dalmatian coast, was a popular vacation spot for many Europeans, but with the eruption of war in 1991, tourism was decimated. Since the end of the conflict in 1995 the sector has seen a slow but steady recovery. Tourism was an important element in the services sector and contributed 71 percent to the GDP in 1999.

Agricultural production has been in decline since 1992, averaging about 60 percent of pre-war levels. Again, the war contributed heavily to the disruption of agriculture, but 1998 brought severe heat and drought, which caused disease and further hindered crop growth. By 1999 agriculture contributed just 10 percent to the GDP.

Industrial production declined sharply during the war years. Some of the worst fighting and destruction took place in areas where industry was located. During the war, this sector produced only a half of what it had in peacetime. Since 1996, industrial production has been experiencing growth, but certain industries tend to do better than others. The most successful are those, such as the food and beverage industry and manufacturing of

chemicals and chemical products, that underwent **restructuring** as a result of privatization. One of the most important companies headquartered in Croatia is the Croatian pharmaceutical giant, Pliva, whose shares are traded on the Zagreb and London stock exchanges. Major foreign companies who have a significant presence in the country are Swedish Ericsson (telecommunications), Austrian Hofmann & Pankl Bet (mineral processing), Swiss Soc. Suisse de Cim. Port. (cement production), Dutch Grassette Nederland (maritime services), Austrian Messer Griesheim (industrial gasses) and the U.S. Coca-Cola Export Corp. (beverages). All told, industry contributed 19 percent of the GDP in 1999.

AGRICULTURE

Agriculture, fishing, and forestry accounted for about 10 percent of the total GDP of Croatia in 1999, but they are nevertheless important to the overall economy. According to the Croatian Bureau of Statistics, these sectors combined to employ over 33,000 people and produce earnings of approximately US$1.4 billion per year. Croatia is fortunate not to have experienced the environmental damage from mass industrial development that characterizes its Eastern European counterparts. Environmental concerns do exist, but they do not have a heavy impact on agriculture, forestry, and fishing.

Croatia's geographical diversity led to different patterns of livelihood and culture. As a result, agriculture varies throughout the country's regions, influenced by regional climate. Agriculturally rich lowlands located in Croatia's northern part are dominated by the cultivation of wheat, corn and sunflower crops, while viticulture (the cultivation of grapes), fruit-growing, and olive-farming are popular in the coastal region, with pasture land common in the mountainous areas. Most agricultural land is privately owned, and the large cooperatives created during the communist era are being privatized and restructured. Croatian agricultural production is dominated by small farms. The *EIU Country Profile* for 2000 states that in 1991 almost 70 percent of farms were 3 hectares or less, with only 5.6 percent larger than 8 hectares.

The war had a devastating effect on Croatian agriculture, changing the country from an exporter of agricultural products to a net importer. After the war, government efforts to boost agricultural production created positive results, increasing production of wheat, improving agricultural machinery, and increasing the number of cattle. In 1999, combined earnings from agriculture, hunting, and forestry equaled US$1.39 billion. Aside from wheat, fruits, olives, and grapes, the agricultural sector also produces corn, sugar beets, seed, alfalfa, clover, livestock. and dairy products.

FORESTRY. The exploitation and management of forests in Croatia is carried out by a public company. Since one-third of the country is covered by forests, this industry is very important for the economy. In 1996 Croatia received a loan from the World Bank for replanting and protecting forests along the coast in order to stimulate tourism.

FISHING. Both war and over-fishing of the waters has had a negative impact on fishing, which is a traditional Croatian industry. The catch decreased from 40,000 metric tons in 1989 to just over 15,000 metric tons in 1995, and the sector's earnings decreased from US$32 million in 1996 to US$22 million in 1999. Current employment in the fishing industry stands at only 1,100.

INDUSTRY

MANUFACTURING. In the early 1990s total industrial output declined, partly due to the war but also because of the collapse in trade among Eastern European countries. During this time, Croatia lost a large share of its Yugoslav markets when the Yugoslav federation fell apart. After the war, industrial output began to recover, but major restructuring of industry and more investment is still necessary in order to increase efficiency. Due to a high unemployment rate of over 20 percent, the government is reluctant to worsen the situation by laying off industry workers.

Key industries in Croatia include textiles, chemicals, pharmaceuticals, and petrochemicals. The textile industry is especially well-developed and includes over 400 enterprises, the majority of which are engaged in co-operative activities with foreign manufacturers. In 1998, all of the key industries combined employed over 400,000 people and earned more than US$3 billion from exports. In the same year, the total export revenue across all sectors was approximately US$4.5 billion.

Two important heavy industries are ship building and metal products. Both were subsidized by the government during the war because of their strategic importance, but it remains unclear as to whether this **subsidy** continues. Growth of the construction sector has seen substantial expansion with the need for mass building and reconstruction caused by the war, and the government has been leading the building program and looking for international aid. The value of construction projects rose from almost US$1 billion in 1995 to over US$1.4 billion in 1997. During the same period, the number of employees in the sector rose from 23,600 to 29,500. This sector has drawn interest from international investors, such as the United Kingdom's RMC International Cement, which bought a majority stake in Croatia's largest cement producer, Dalmacijacement.

ELECTRICITY. Production in this sector has been increasing but is not able to keep up with the country's in-

creasing demand. Currently, between 10 and 20 percent of the demand is satisfied by imports, but plans by the Croatian Electricity Board (HEP) are under way to build additional plants and renovate existing ones. The electricity sector, together with oil, gas, and water supply, employs almost 26,000 people, accounting for 2 percent of the total **workforce**.

OIL AND GAS. This sector has experienced substantial difficulties, both because of the war and the slowness in privatizing Croatia's only energy company, INA. By 1995 the production of oil and natural gas fell to 73 percent of pre-war levels. In 1999, Croatia extracted over 1.2 million metric tons of oil and over 1.5 million cubic meters of natural gas, representing a decrease in production over previous years. The country's oil and gas reserves are located southeast of Zagreb, along the border with Hungary and along the Adriatic coast. As of December 1998, Croatia's oil and natural gas reserves were estimated at 15 million metric tons and 35 million cubic meters respectively. The country's demand for extra gas supply is satisfied by imports from Russia, but projects have begun with foreign investors to develop new gas fields. These are expected to produce enough to export gas to other countries in Eastern Europe.

SERVICES

TOURISM. Tourism is of major importance in a services sector that accounts for over 70 percent of the GDP. Croatia is not only rich in natural beauty and history but enjoys a very low crime rate and a reputation as a safe destination. These factors have made it a favorite vacation spot for many Europeans and Americans, but tourism was heavily affected by the war, and the revenue it currently generates has not yet regained pre-war levels. A year after the war started, this sector earned only half a billion U.S. dollars. As the stability returned to the region, earnings from tourism gradually increased, reaching US$3.5 billion in 2000. During the 1990s, the country not only suffered from war devastation, but little was done to develop and restructure the tourism sector. This work started in 2000 when privatization of hotels and businesses was speeded up and tourism expenditure increased.

The improvement in political stability towards the end of the 1990s brought an increase in the number of tourists visiting the country. In 1998, the Croatian Bureau of Statistics recorded over 31 million overnight stays, which was 3 times as much as the 1992 figure. This number, however, still does not compare to the pre-war years, such as 1989 when more than 61 million overnight stays were registered.

Currently, Croatia has a total capacity of 725,000 beds, almost 95 percent of which are located in the coastal region. It also has 43 marinas, 17 of which are open year-round, but many of these are in dire need of reconstruction and better management.

TRANSPORT. Croatia is situated along major routes linking South Central Europe with the world, and its transport services are of major importance to the country's well-being. During the war, one-third of the country was occupied by enemy forces, causing disruption to main traffic links between different areas and a substantial increase in transportation costs. Since the war, greater regional stability has improved the situation, and the construction of a highway that will connect the country's southern region with its northern areas and the rest of Europe will greatly contribute to expansion and further improvement of service. According to the Croatian Bureau of Statistics, transport, storage, and communication employed over 83,000 people in 1999 and earned more than US$1.6 billion in the same year.

INTERNATIONAL TRADE

International trade is a significant part of the country's economy, accounting for between 6 percent and 8 percent of the GDP in the last decade. In 1999, imports totaled US$7.8 billion, against exports of US$4.3 billion. The country experienced a sharp fall in trade during the war when commerce with the country's main trading partners, namely the republics of former Yugoslavia, substantially decreased. Since then, the country reoriented the trade sector towards Western and East Central Europe. As a result, in 1999 only a quarter of Croatia's exports went to the former Yugoslav republics and only 10 percent of imports came from these countries. Due to this new trend and extensive subcontracting in the textile and leather industries, Croatia's main trading partners currently are Germany, Italy, and Slovenia. Other trading partners include Bosnia and Herzegovina, Austria, France, and Russia. Even though trade has experienced growth, revenues from Croatian exports account for less than 2 percent of total European exports and import revenues for less than 3 percent of Europe's total. At the end of the war, the trade imbalance increased as the country's

Trade (expressed in millions of US$): Croatia

	Exports	Imports
1994	4260	5229
1995	4632	7509
1996	4511	7787
1997	4170	9104
1998	4541	8383
1999	4279	7777

SOURCE: United Nations. *Monthly Bulletin of Statistics* (September 2000).

imports substantially outstripped its exports. High labor and production costs, as well as high taxes, which make Croatian products more expensive than imports, have contributed to this trend.

The largest percentage of Croatia's exports went to the following countries in 1999: Italy (18 percent), Germany (15.7), Bosnia and Herzegovina (12.8 percent), Slovenia (10.6 percent), and Austria (6.2 percent). Some of these countries are also major sources of Croatia's imports, with Germany accounting for 18.5 percent, Italy 15.9 percent, Russia 8.6 percent, Slovenia 7.9 percent, and Austria 7.1 percent. Croatia's exports include chemical products, clothing, footwear, raw materials (wood, textiles, fertilizers), fuels (petroleum and gas), food products, beverages, and tobacco. Imports include machinery, transport, and electrical equipment, chemicals, fuels and lubricants, food products, clothing, and footwear.

MONEY

The Croatian currency, established in 1991, has experienced a slight depreciation (decline in value) since it was launched. The National Bank of Croatia uses the euro as a reference currency; therefore, the recent depreciation of the euro against the U.S. dollar had the same effect on the exchange rate between the kuna and the U.S. dollar. In 1995, US$1 equaled 5.230 kuna, while at the end of 2000, the exchange rate jumped to 8.320 kuna to US$1. According to the Quarterly Economic Report of Germany's Commerzbank, this situation is likely to change by 2002 when US$1 will equal 7.88 kuna.

There are many reasons for the depreciation of the kuna, among them deficits in the pension system, the slow rate of privatization, and compensations paid to depositors of bankrupted banks. The ratio of pensioners to the employed increased from 0.65 in 1998 to 0.95 in 2000. This statistic means that for almost every retired person there is only 1 person employed in Croatia. One external factor that influenced a drop in the kuna exchange rate was the recent increase in energy prices.

Croatian **monetary policy** and supervision of the commercial banking sector is managed by the National Bank of Croatia (the central bank). Although there are over 50 banks operating in Croatia, more than 70 percent of the overall assets of the banking system belong to the 6 largest. Most of these, and some of the medium-sized banking institutions, are indirectly owned by the government, which holds large proportions of shares in these operations through government-controlled companies. There are several representative offices of foreign banks operating in Croatia.

A large portion (approximately 75 percent) of the total assets of the Croatian banking system are immobilized, which is to say they are not generating returns. Such assets consist of state bonds, public debt, ownership in companies that yield no dividends, and investments that are unlikely to produce returns. This is the main reason for high real interest rates for long term loans, which are 25 to 30 percent per year. The government is committed to restructuring the most problematic banks and has received a pledge of US$100 million from the World Bank to assist in solving this problem.

The Zagreb Stock Exchange is the only stock exchange operating in Croatia. It originated in 1918 but was abolished by the communist regime in 1945. Almost half a century later, after Croatia became independent in 1991, the stock exchange was revived by 25 banks and insurance companies as a non-governmental, non-profit-making institution. The ZST is fairly small, and there are only a few privatized firms that trade on it.

POVERTY AND WEALTH

Until 1991 Croatia was part of a socialist-governed country whose system and ideology did not allow great disparity between rich and poor. Those who benefited most from the system and were better off than the majority, were the senior functionaries of the ruling Communist Party. They lived in pleasant, state-owned apartments, drove good cars, and earned relatively high salaries. The poor generally lived in underdeveloped rural areas of the country, were badly educated, and were not politically active.

Since Croatian independence in 1991 and a move to the free-market system, social conditions have changed, to the benefit of some and the disadvantage of others. Inadequate progress towards privatization and the appointment of political favorites to influential positions brought corresponding wealth to the few, although the free-market system has also rewarded a number of skilled or enterprising Croatians. Those groups dependent on the government for their survival suffered as a result of the changing economic system and suffered further from the social and economic impact of the war. These disadvantaged groups include pensioners and the privileged prewar middle class who later found themselves impoverished by changes in the country.

The poor of Croatia tend to be concentrated among the uneducated and the elderly. The **United Nations Development Program**'s 1999 Human Development Report states that in 1997 the average pension was less than half of the average salary. Pension payments are often months late, and the elderly have to rely on other means for survival, such as help from relatives. Retired people represent one-fifth of the total population, and as the ratio of pensioners to workers increases, the pension system is becoming overburdened.

The Croatian education system is almost entirely state-run and is very good. Close to 100 percent of children are enrolled in primary schools, and almost 70 percent attend secondary school. As a result, literacy rates are high (99 percent for men and 96 percent for women) and similar to those of other Eastern European countries and the industrial countries. The children of both the poor and the rich attend the same elementary schools, but although the vast majority of the poor are literate as a result of primary school education, they tend to drop out of the education system early. If they do pursue secondary education, they usually attend vocational high schools and few go to college. University education is not very expensive, but the number of scholarships and stipends that would help the poor are limited, and their numbers lag behind those of other East Central European countries. Insufficient education prevents the poor from competing for jobs that would earn them a better living, thus locking them into poverty.

The state maintains the country's health care system, although a small private sector does exist. A shortage of resources for the health sector has caused problems in recent years (only 6.7 percent of GDP goes towards health expenses), including a failure in targeting the needs of the poor, but most of the population does have basic health coverage. Since the price of food and clothes is high relative to average salaries, poor people spend most or all of their income on basic necessities. They tend to have weak and monotonous diets and although the majority have housing, they often find it difficult to pay for utilities or maintenance of their homes. Those households whose monetary income falls below 350 kunas per month (approximately US$55) qualify for the social assistance program. This monetary allowance equals 15 percent of average salary and, at this level, covers only a quarter of the expenses of poor households.

Even though Croatia has experienced significant social changes in recent years, differences between the rich and poor are not as vast as in Western economies. They are, however, greater than in other Eastern European countries.

WORKING CONDITIONS

Croatia's transition to the free-market economy began significantly to change the structure and level of employment in the country. During the socialist era, over three-quarters of the labor force of more than 2 million was employed in the **public sector** and by large, state-run enterprises. Unemployment was kept artificially low (approximately 9 percent in 1990) by over-employment and the creation of unnecessary jobs. During this period **emigration** was encouraged, and many people left the country to work abroad, contributing to low unemployment. A small private sector did exist under socialism, employing only 13 percent of the labor force in 1990.

With the arrival of the privatization process, new businesses opened and private sector employment increased to 45 percent. At the same time, employment in state-owned firms and the public sector fell to 36 percent of the labor force. Unemployment ceased to be regulated, and privatization and competition from more efficient businesses resulted in massive layoffs and early retirements. By 1998, 17 percent of 1.6 million people in the Croatian labor force were out of work. In order to ease the effects of high unemployment, the government pursued a policy of early retirement which, in turn, strained the pension system since there were far fewer people contributing to the fund than those seeking its benefits. Many pensioners received smaller pensions than they should have and were pushed into poverty.

The country's labor laws set regulations for a 42-hour work week, a 30-minute daily break, and a minimum 24-hour rest period during the week. Eighteen days of vacation are standard and time-and-a half is required to be paid for overtime. Most unions were able to negotiate a 40-hour workweek. The average salary after deductions such as taxes and contributions in 1998 was 3039 kuna, then equivalent to US$425. Over a half of gross salary (salary before deductions) goes to the government and various funds such as health care and pensions. The highest salaries are paid by the financial sector, which employs the smallest number of people. Those working in wholesale and **retail** trade, fishing, and mining average the lowest salaries. The average net salary is not enough to provide a decent standard of living for an average family. For this reason, most people supplement their income with self-employed activities, work in the informal sectors, or earn income from property such as rents and leases, in-kind income, or help from relatives living abroad. There is also a **barter system** for the exchange of goods and services, and those who can grow fruit and vegetables on small plots or in their gardens for personal consumption. In March 1999 the government signed an agreement which established a minimum wage of 1500 kuna (approximately US$211). Unemployment benefits also exist and currently assist almost 17 percent of the unemployed.

Croatia has a much higher level of job protection than other European countries. These regulations protect workers' job stability, but are costly to employers. For example, the law on termination of employment requires an advance notice of up to 6 months and, in certain instances, the approval of the workers' council. This makes labor costs much more expensive than in other countries whose economies are in transition and prevents the creation of new jobs. The regulations slow down the process of hiring new employees and make it difficult to offer part-time work. The government also regulates health and safety standards, which are implemented by the Ministry of Health.

Child labor has not been a problem in Croatia, while discrimination against women in the labor force is common if not prevalent. On average, women still earn less than men and share a higher percentage of unemployment than men (57.3 percent of women were unemployed in 1997 compared to 43.1 percent of men). Over half of the female workforce is employed in the service sector.

A large portion of Croatia's labor force is skilled and/or highly educated. In 1999, for example, out of 320,000 (33.7 percent) unemployed, over 30 percent consisted of skilled and highly skilled workers and about 7 percent were people with college or university degrees. Unemployment is highest among the young and is rising, and poor job prospects have driven many to seek work in other countries. Since 1990, the number of unemployed people under 30 years of age increased by 25,000. Since young people are generally most mobile, they tend to be the first to emigrate. Because of demand in other countries for a high profile labor force, many skilled and educated unemployed Croatians have been filling those positions. As a result, Croatia has been experiencing a serious brain drain since the 1990s.

COUNTRY HISTORY AND ECONOMIC DEVELOPMENT

600. Croatians begin settling in the area of present-day Croatia.

679. The first international treaty is signed between Croatian Duke Borko and Pope Agathur.

810–23. Duke Ljudevit Posavski establishes a powerful state in what is present-day northern Croatia.

925. Tomislav, the unifier of the territories of Pannonia, Croatia, Dalmatia, Bosnia, and Herzegovina, is crowned the first Croatian king.

1102. After the death of Petar Svacic, the last Croatian king, Croatia enters into a union with Hungary.

1527. By the decision of the Croatian Assembly, Ferdinand of the Hapsburg dynasty is elected to the Croatian

throne; massive migrations of Croatians (especially to Burhenland, Austria, and Molise, Italy) begin.

1815. After a short period under the rule of the French emperor Napoleon, almost the entire territory of present-day Croatia becomes a part of the Austrian Hapsburg monarchy.

1847. Parliament adopts Croatian as the country's official language, replacing Latin.

1848. Ban (Viceroy) Josip Jelacic defends Croatia against Hungarian attempts to occupy the country and unites all the Croatian provinces. Serfdom is abolished.

1903. Anti-Hungarian and anti-Austrian riots erupt, causing some 50,000 Croatians to leave for the United States.

1918. After the downfall of the Austro-Hungarian Empire in World War I, Croatia becomes part of the Kingdom of Serbs, Croats, and Slovenes, later proclaimed Yugoslavia.

1941. German and Italian forces occupy Yugoslavia during World War II and dismantle the country; a pro-Nazi government is installed in Croatia. The country becomes a German puppet state resisted by Croatian anti-fascists led by Josip Broz Tito.

1945. After World War II, the Federated Socialist Republic of Yugoslavia is proclaimed, consisting of 6 republics, including Croatia. Marshal Tito is made president and holds office until his death in 1980. Yugoslavia is aligned with the Soviet Union until 1990.

1990. The first multi-party elections since World War II take place in Croatia and are won by the Croatian Democratic Union. The Croatian Assembly elects Dr. Franjo Tudjman as the first president.

1991. Croatia proclaims independence from Yugoslavia. A Serbian rebellion starts in Krajina, supported by the Yugoslav National Army from Belgrade and resulting in the occupation of one-third of Croatian territory.

1992. Croatian independence is recognized by the world and the Republic of Croatia becomes a member of the United Nations.

1995. Croatia recaptures Krajina from the Serbs, and the war in Croatia officially ends.

1998. The last Serb-occupied region of Croatia, located in its eastern part which includes the city of Vukovar, is peacefully integrated into the country.

2000. Croatia becomes a member of the World Trade Organization.

FUTURE TRENDS

For Croatia the 1990s were difficult and traumatic. The country experienced war devastation, population displacement, and turbulent political change, all of which contributed to its ruined economy. As the 21st century gets under way, Croatia faces serious and urgent challenges in improving its economic situation. The country needs to make major policy reforms. Improved administration of business activity—including cutting red tape, offering tax incentives to stimulate business growth, and completing the privatization process—must be implemented. Reform is also necessary to increase the effectiveness of the health and pension systems. Improvement of the banking sector is another key factor in easing the path of such reforms. A firm commitment to these reforms would send a positive signal to foreign investors and act as an encouragement to international aid in financing reform. If these challenges are met and international investment acquired, Croatia could implement programs for sustained economic growth, thus achieving a higher standard of living for its people and full integration into the rest of Europe.

Successful restructuring is possible and realistic since the country possesses the necessary infrastructure and expertise. Its location and its promising economic opportunities are attractive to investors. What is desperately needed is decisive action by the government, which needs to grasp the necessity for economic reforms and to begin their implementation without delay; delay would serve only to burden the economy with more costly adjustments in the future. Without reform, growth will not be possible, unemployment will remain high, the banking system weak, and the economy will not recover.

DEPENDENCIES

Croatia has no territories or colonies.

CZECH REPUBLIC

CAPITAL: Prague (Praha).

MONETARY UNIT: The monetary unit is the Czech crown (Èeská koruna), abbreviated as Kè. Each crown is composed of 100 hellers. There are coins of 10, 20, and 50 hellers, and 1, 2, 5, 10, 20, and 50 crowns. Czech banknotes come in denominations of 20, 50, 100, 200, 500, 1,000, 2,000, and 5,000 crowns. This monetary unit came into being with the division of Czechoslovakia into the Czech and Slovak Republics in 1993, and is now valued at a different rate than the Slovak crown.

CHIEF EXPORTS: Machinery and transport equipment, other manufactured goods, chemicals, raw materials and fuel.

CHIEF IMPORTS: Machinery and transport equipment, other manufactured goods, chemicals, raw materials and fuels, food.

GROSS DOMESTIC PRODUCT: US$120.8 billion (1999 est.).

BALANCE OF TRADE: **Exports:** US$26.34 billion (1998 est.). **Imports:** US$30.24 billion (1998 est.).

COUNTRY OVERVIEW

LOCATION AND SIZE. The Czech Republic is located in Central Europe. It is surrounded by Germany to the northwest, Poland to the northeast, Slovakia to the southeast, and Austria to the south. The total area is 78,866 square kilometers (49,007 square miles). The terrain is generally composed of rolling hills and some mountainous areas. Its 4 borders total 1,881 kilometers (1,159 miles), and it has no coastline. Its size is comparable to Mississippi (48,434 square miles) and Louisiana (51,843 square miles).

The Czech Republic features 3 primary regions: the Czech Lands to the west, Moravia to the southeast, and Silesia to the northeast. The capital, Prague, is located slightly to the country's northwest. Other important cities include Ostrava to the northeast, Brno to the southeast (in the Moravian region), and Plzen to the west.

POPULATION. In 2000 the population was estimated at 10,272,179. Approximately 1.19 million inhabitants, or 11.56 percent of the population, resided in Prague. The birth rate stood at 9.1 births per 1,000 people in 2000, while the death rate was 10.87 deaths per 1,000, resulting in a projected growth rate of -0.08 percent. The first time the population growth rate was registered as negative was in 1994. According to the Statistical Office of the Czech Republic, the projected population for 2010 was 10.24 million.

While 81.2 percent of the population is Czech, 13.2 percent is Moravian. In addition, 3.1 percent of the population is made up of ethnic Slovaks. The remainder of the population includes Roma (Gypsies), Poles, Germans, Silesians, and Hungarians. However, the Roma population is often underrepresented politically because they are a nomadic (no fixed residency) people. Approximately 40 percent of the people declare themselves to be Roman Catholic, 40 percent declare themselves to be atheist, and the remainder are primarily Protestant, Orthodox, or other religions.

OVERVIEW OF ECONOMY

The territory that is now known as the Czech Republic was part of the Austrian, or Hapsburg, portion of the Austro-Hungarian Empire until the end of World War I in 1918. It then became a part of the Czechoslovak state. During the 1930s, Czechoslovakia was an industrial powerhouse. The Czechoslovak industries, including machine and automotive manufacturing, were among the world's most developed.

After World War II, Czechoslovakia fell under the political and economic influence of the Soviet Union. The **communist** economy included state ownership of enterprises, state-led central planning of economic activities, and artificial **price controls**. After some Czechoslovak leaders attempted to introduce some political, cultural, and economic **liberalization**, the country was invaded by the troops of neighboring communist countries under the direction of the Soviet Union (1968). This intervention put a stop to liberalization, when the government attempted to

increase production of **consumer goods** in exchange for compliance among the people. In spite of the government's efforts, the economy declined, causing a crisis by the late 1980s.

A series of anti-government protests took place in the late 1980s. By 1989, the more liberal policies of the Soviet Union toward Eastern Europe, as well as the weakening of communist governments in neighboring East Germany, Hungary, and Poland, made it impossible for the Czechoslovak communists to stay in power. In November and December of 1989, the communist government stepped down. Free elections for parliament were held in 1990, and Václav Havel was elected president. The government quickly made economic reforms based on free market principles. In addition, the government began the process of **privatization**.

From 1990 to 1992, these reforms were more popular in the Czech Republic (which had a larger industrial base) than in the Slovak Republic. Under Czechoslovakia's federal structure, which gave both republics independent power, the newly-elected prime ministers of the Czech and Slovak republics negotiated the divorce of Czechoslovakia. The Czech Republic and the Slovak Republic became separate sovereign states on 1 January 1993. After an initially strong performance, the Czech Republic experienced some setbacks, most notably in 1997 when the country experienced an economic crisis and a political scandal that forced out the prime minister.

The Czech Republic's strongest economic sectors are in the areas of industry and services. Its primary industrial products include iron and steel, machinery and equipment, motor vehicles, chemicals, armaments, textiles, and glass and ceramics. In the service sector, commercial, financial, and insurance companies are important.

The Czech Republic is famous for its beers, which are exported throughout the world. Other agricultural products include potatoes, wheat, and sugarbeets. Since freeing up its international trade in 1990, the Czech Republic has imported items such as machinery, consumer goods, raw materials and chemicals, and some foods.

Along with uranium, some of the country's natural resources include coal, timber, and fuels, which remain important energy sources, though some energy must still be imported from Norway and Russia. The Czech Republic experienced a sizable amount of Western investment during the 1990s.

As a NATO member since 1999 and a prospective member of the European Union (EU), the Czech Republic has been quite successful in reorienting its trade away from the East, and towards the West. It has received aid from international organizations such as the World Bank, the International Monetary Fund (IMF), the European Bank for Reconstruction and Development, and the European Investment Bank, in the form of loans and grants. In 1994, the Czech Republic polished its world image by paying some of its IMF debts ahead of schedule. The country's estimated **external debt** for 1999 was $24.3 billion. While organized crime has a notable presence in nearly all of the countries of east-central Europe, the Czech Republic is less affected by such activities than its neighbors.

POLITICS, GOVERNMENT, AND TAXATION

The Czech Republic is a democracy with a parliamentary political system, in which the parliament elects the president. The electoral system for the Chamber of Deputies is proportional, meaning that individuals tend to vote for specific parties rather than for specific candidates. After the elections, each party receives a number of seats in parliament according to the percentage it receives of the vote, provided it receives at least 5 percent. Each party organizes a list of individuals that they will send to the parliament to fill their allotted seats. The elections for the Senate are conducted according to single member districts, in which a single candidate wins a majority vote in each of the 81 Senate districts.

The Czech president is elected by the parliament and serves a 5-year term. Václav Havel was elected in 1993 and reelected in 1998, although he was not affiliated with a particular political party. The 200 members of the Chamber of Deputies are elected for 4-year terms. The 81 Senate members are elected for 6-year terms, with one-third of the Senate elected every 2 years.

The first parliamentary elections to be held in the independent Czech Republic took place in 1996. The party that favored immediate free market reforms, the Civic Democratic Party (ODS), and the party that favored a slower pace to free market reforms, the Social Democrats (ÈSSD), emerged as the most powerful parties in the Chamber of Deputies. A political and economic crisis led to early parliamentary elections in 1998. The third most significant party in the Chamber of Deputies elections was the Communist Party (KSÈM), followed by the reformist Christian Democrats (KDU). Other significant parties include the nationalist Republicans, the free-market oriented Civic Democratic Alliance (ODA), and the conservative Freedom Union (US).

The government has directed the complex process of transforming the economy from a centrally planned communist system to a market-based system. Each reform has required the passage of new laws and the implementation of new regulations. Among other general market reforms, a Commercial Code was adopted in 1991 under the Czechoslovak state and was revised in 1996. It outlined legal protections for private property and business activities for both Czechs and foreigners. Other reforms included a Foreign Exchange Act establishing the Czech currency as convertible abroad, and a Trading Act to set conditions for trade.

Part of the economic reforms involved the privatization of assets and companies that had been the property of the state. In 1990 and 1991, under the Czechoslovak state, some property, such as farms, shops, and homes, was given back to its pre-communist owners. The privatization of small enterprises was completed through auctions by the end of 1993. The privatization of large enterprises was a more complicated process involving vouchers that allowed citizens to buy shares of some companies. It also included direct sales, auctions, and free transfer. More than 80 percent of former state assets had been privatized in 2000.

The government obtains revenues through several different taxes. There is a progressive personal **income tax** that ranges from 15 to 32 percent. The corporate income tax is 31 percent, although investment companies and pension funds are taxed at a rate of 20 percent. Some **tax holidays** are offered as part of an effort to attract foreign investment. Other taxes include property tax, road taxes for business vehicles, inheritance tax, and fees for administrative services. In addition, a **value-added tax** is imposed on all goods except necessities such as food and health care. **Excise taxes**, customs **duties**, and real property transfer taxes also bring in government revenues.

INFRASTRUCTURE, POWER, AND COMMUNICATIONS

The Czech Republic inherited an extensive network of public transportation, in the form of bus and train routes, from Czechoslovakia. Even some of the most remote locations may be reached by bus. One of the most significant changes of the post-communist era has been an increase in independent auto transportation among the population. There are 127,693 kilometers (73,348 miles) of highways, including 497 kilometers (309 miles) of expressway, all of

SOURCE: World Bank. *World Development Indicators 2000.*

which are paved. The country now has 9,435 kilometers (5,363 miles) of railways. Continued improvements are planned for the railway and highway systems in order to bring them more in line with EU standards.

There are 10 public international airports and 114 total airfields, 71 of which have paved runways. The largest airport is Ruzyne, in Prague, which services approximately 95 percent of the total passenger traffic. There are 677 kilometers (421 miles) of waterways in the Czech Republic, the most important being the Vltava and Elbe rivers. Tourists tend to enter the Czech Republic via the airport in Prague or by train from Austria, Germany, Hungary, Poland, or Slovakia.

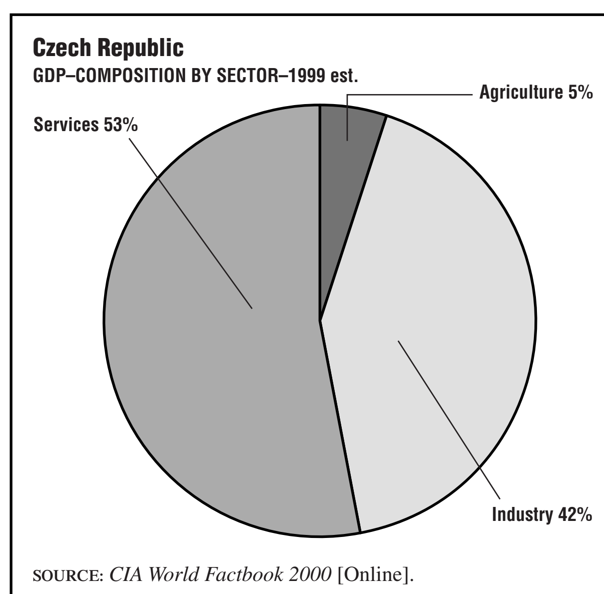
Electricity production stands at 61.5 billion kilowatt hours, and the country uses a 220-volt power system. The majority of electricity is generated by fossil fuels (76 percent). While a portion of this production comes from coal, oil provides a sizable portion as well and is imported from Russia. Nuclear power contributes 20 percent of electricity production.

The Czech Republic has a rapidly-modernizing communications **infrastructure**. In the first few years after the transition from communism, the installation of telephone lines by the state company was still difficult. However, the increased entry of private telecommunication companies and the growing popularity of mobile telephones has provided a way to sidestep these difficulties, and increased competition has forced the Czech telecommunications company, STP Telecom, to improve its service. There are 94 mobile phones per 1,000 people in the Czech Republic, compared to 50 per 1,000 in neighboring Poland, and there is 1 digital cellular system and 2 global system for mobile communication (GSM) providers for cell phone service. A number of Internet service providers sprung up in the late 1990s, creating between 20 and 30 options for service. Internet cafes are readily available, and the Czech government has taken steps to promote increased public computer and Internet technologies.

ECONOMIC SECTORS

During the 1990s, the Czech Republic experienced a drastic shift away from the industry sector and towards the services sector. This change resulted partly from the Czechoslovak split, and partly from the transformation to a market-based system. The communist system created several large **monopoly** industries, particularly in large machine manufacturing. Once privatized, only some of these industries were actually competitive in a free-market environment. Moreover, while the service sector was given a low priority under the communist system, the free-market environment demonstrated a strong demand for services.

Foreign direct investment (FDI) in Czech companies has been crucial to their successful transition, and the Czech Republic has benefited from high FDI levels. Some of the most famous Czech companies that have successfully survived the transition process are the Škoda



SOURCE: *CIA World Factbook 2000* [Online].

car company, the Tatra truck company, the glass production company Bohemia Glass, and several brewing companies such as Pilsner Urquell, Staropramen, and Budvar (Budweiser).

AGRICULTURE

Agriculture makes up the smallest sector in the Czech economy, contributing about 5 percent of the total GDP. In 1997 the agricultural sector employed 5.6 percent of the **labor force**, or roughly 200,000 people. This number was just 39 percent of the number of people employed in this sector under communist rule. The primary agricultural products were sugarbeets, fodder roots for animal feed, potatoes, wheat, hops, fruit, pigs, cattle, poultry, and forest products.

The Czech Republic has 3.1 million hectares of arable land, although roughly half of this land is not highly productive. Under the communist economic system, Czech agriculture was collectivized, meaning that small private farms were taken by the government in order to create state-owned cooperatives. After the end of communism in 1989, these cooperatives were transferred to private owners, often by the direct sale of the farm as a unit. However, some lands were also given back to their former owners. By 1999, 85 percent of agricultural lands were privately owned. Of this total, 40 percent are corporate farms, 34 percent are co-operatives, 24 percent are owned by individuals, and 2 percent are state owned.

Agricultural output decreased 28 percent between 1989 and 1998, with the greatest declines in livestock production. This reflects the overall decline of the agricultural sector in the Czech Republic, where more than half of all farms experience financial difficulties. Problems include the high costs of labor, machinery, fertilizer, and other agricultural inputs; the lack of modern technology; and low levels of state aid for agriculture.

INDUSTRY

Industry makes up a large but declining sector of the Czech economy, contributing 42 percent of the country's GDP in 1999, and employing 40.7 percent of the labor force in 1997. The majority of large and medium-sized enterprises have been privatized. Companies that are still run by the state are not very competitive and have sizable debts. Such companies lie primarily in the energy and mining sectors, although some of them are classified as strategic industries.

MANUFACTURING. Road vehicles are the country's most significant export, bringing in significantly more revenue than other important exports, such as electrical machinery and appliances, and industrial machinery and equipment. Other major export products include iron and steel, non-metallic mineral products, textiles, specialized machinery, transport equipment, furniture, power generation machinery, and rubber goods.

Because many of the manufacturing plants that were privatized after communism featured outdated equipment, foreign direct investment has been extremely important in determining which industries survive the transition to a market economy. The primary foreign investments have been in the area of consumer goods and tobacco, transport and communications (including equipment, commerce, and services), petrochemicals, financial and insurance affairs, mineral products, and electricity, gas, and water supply. By 1999 over 800 foreign companies had set up manufacturing subsidiaries, each employing more than 50 persons in the Czech Republic.

With increasing investments in the automotive sector, the Czech Republic is expected to become the third-largest auto manufacturer in Eastern Europe, after Russia and Poland. Other fast-growing sectors are electronics, precision engineering, environmental technologies, and software development. The government offers incentives for investment in high-tech products or machinery, and has begun a program to support the development of industrial zones throughout the republic.

The traditional Czech industries of glassmaking and beer brewing survived the economic transition in the form of the glassmaking company Bohemia Glass and the brewing companies Pilsner Urquell and Budvar/Budweiser. Companies producing transport equipment, such as Tatra Trucks, Zetor tractors, and Škoda cars, also remain visible in the current Czech economy. Other products that continued to be manufactured after communism include trams, planes, motorcycles, buses, and machines.

The most important products mined in the Czech Republic are coal and uranium. The coal is primarily used for heating purposes, while the uranium is used for the production of weapons, and a significant amount of uranium is exported. While uranium was exported almost exclusively to Soviet bloc countries before 1989, it is now exported more widely.

In the second half of the 1990s prices for commercial construction increased for small and medium enterprises, as well as for domestic non-financial corporations. The largest price increases for commercial construction were from firms employing more than 300 persons (especially for those employing more than 500), and for foreign non-financial corporations. Price increases for these types of structures indicated a higher level of demand relative to supply.

SERVICES

The service sector accounted for 53 percent of the GDP in 1999. As opposed to a negative trade balance in

industry, the Czech Republic registered a positive trade balance in services between 1993 and 2000. The service sector employed 53.7 percent of the labor force in 1997.

As insurance was not provided under the communist system, there was significant growth in this area during the first decade of **capitalism**. Financial services and consulting companies experienced similar growth. Although foreign companies initiated growth in this sector, they quickly gained competition from Czech companies. The majority of commercial banks are under private ownership. Foreign banks constitute a growing proportion of this sector.

There is an ever-increasing number of Internet service providers in the Czech Republic. In addition, there has been some growth in the area of Internet software development, which began attracting foreign investment in the late 1990s.

The **retail** portion of the service sector has undergone dramatic changes since 1989. Under the communist economic system, retail operated through state-owned shops. Not only were product shortages common and the displays unattractive, but these stores were often overstaffed and employed people unsuited to the job.

Retail stores were privatized early in the transition to a free market. The retail sector consists of **restructured** stores as well as completely new stores. These stores differ greatly from their communist-era predecessors, as they have adopted capitalist marketing methods and retail decorum. Among the most popular products among consumers are foreign appliances, such as televisions, VCRs, and stereos.

Tourism has increased exponentially since the demise of communism in 1989. Nearly all tourist facilities have been privatized. Tourism contributed $3 billion to the country's net foreign currency earnings in 1999, and approximately 100 million people visit Prague, the country's capital, each year. Most tourist revenues remain in Prague, which is renowned for its architecture and history. The majority of visitors come from the Czech Republic's neighboring countries. The dramatic increase in tourism has led to an increased need for tourist services, particularly for hotels. Foreign tourists visiting Prague account for three-quarters of all hotel capacity in the Czech Republic. In addition, the city of Prague is attempting to improve its image as a potential convention site. While in the Czech Republic, tourists engage not only in sightseeing, but also in concerts, sports, and gambling.

INTERNATIONAL TRADE

The Czech Republic has had a **trade deficit** since 1975. The primary industrial commodities exported by the Czech Republic are machinery and transport equipment, as well as other manufactured goods. In 1998, these categories comprised 41 percent and 40 percent of all commodity exports, respectively. Other significant exported commodities were chemicals, which made up 8 percent, and raw materials and fuel, which were 7 percent. Aside from commodities, the Czech Republic also exports some services, and has demonstrated a positive trade balance in this sector. The primary consumers of Czech exports are Germany and Slovakia.

Trade (expressed in billions of US$): Czech Republic

	Exports	Imports
1975	N/A	N/A
1980	N/A	N/A
1985	N/A	N/A
1990	N/A	N/A
1995	21.654	26.524
1998	26.337	30.239

SOURCE: International Monetary Fund. *International Financial Statistics Yearbook 1999.*

The Czech Republic imports primarily the same type of goods as it exports. Approximately 39 percent of all imports for 1998 were classified as machinery and transport equipment. Other imports included manufactured goods, which comprised 21 percent of imports; chemicals, 12 percent; and raw materials and fuel, 10 percent. Germany and Slovakia serve as the primary sources of Czech imports.

In the first few years following 1989, the Czechoslovak state made a concentrated effort to shift trade away from the former Soviet countries, and to the European Union (EU) and the United States. The Czech government actively encouraged this shift in an effort to improve chances for entry into the EU. Czech trading patterns continue to show increased volume in trade with the EU and the United States, and decreased volume with other East European countries and the former Soviet Union. As one result of this shift, trade with the Slovak Republic has declined, in spite of a favorable customs union between the 2 countries. The Slovak Republic made up 18 percent of the Czech Republic's foreign trade **turnover** in 1993, but by 1999 it was approximately 7 percent. The EU now makes up approximately 67 percent of the foreign trade turnover of the Czech Republic.

Among the EU countries, the Czech Republic's most significant trading partner is Germany, which made up 38 percent of the Czech trade turnover in 1999. Following Slovakia (7 percent), other important European trading partners are Austria (6 percent), France, Italy, Poland, and the United Kingdom, which each make up 4 to 5 percent of the trade volume. The United States and the Russian

Federation each make up approximately 3 percent of Czech trade turnover.

MONEY

The Czech crown has been convertible to other currencies on the world market since 1995. The Czech National Bank serves as the country's central bank, and sets **monetary policy**. It is designed to be autonomous from political structures. In spite of the bank's policies to curb **inflation**, the currency began to decline in value after a political and economic crisis in 1997. In addition to this bank, there is a government-owned agency to assist companies through the bankruptcy process.

The majority of banks have been privatized, with only 2 of the largest remaining in state hands. There has been some consolidation among the private banks, and the largest 5 banks conduct the majority of operations. In addition, the number of foreign banks operating in the country has grown. This process corresponds with the country's efforts to prepare for future integration into the financial structures of the EU.

The Prague Stock Exchange registers several hundred companies for security and derivative trading. It is engaged in a process of updating its trading rules and procedures to fit EU standards. In addition, there is an off-exchange market called the RM-system, for the trade of securities.

POVERTY AND WEALTH

Four decades of communist rule (1948–89) had a strong effect on the distribution of incomes, an effect that remains visible today in the Czech Republic. The communist system resulted in a social hierarchy very different from the class system in most capitalist countries. Under communism, wages were artificially kept at similar levels, so professionals such as doctors earned wages similar to those of factory or construction workers. Because property had belonged to the state and housing was distributed through state channels, those individuals who obtained large homes often did so through political means, such as good standing with the Communist Party.

Ten years later, this system is changing. As property has become privatized, individuals with successful businesses can now afford to buy the larger homes. Political affiliation matters much less for one's living standard than it did before. However, given the fact that the privatization process has been run by the government, political affiliation and social contacts have not been irrelevant, either. In spite of the fact that the Czech Republic's transition has been one of the most transparent, some instances of corruption have allowed a few individuals to improve their economic standing through dishonest means.

Although the social structure is rapidly moving away from relatively equal income distribution to a class system, as of the late 1990s income distribution and consumption in the Czech Republic remained more equalized than in the United States. In the United States, the richest 20 percent of individuals earn and consume 46 percent of available wealth. However, in the Czech Republic, the richest 20 percent of individuals earn and consume 36 percent of available wealth. In addition, the poorest 20 percent earn and consume only 5 percent of available wealth in the United States, but in the Czech Republic the poorest 20 percent earn and consume 10 percent of available wealth.

Under the communist system, higher education and health care were freely provided by the state. The Czech Republic has been implementing reforms that require individuals to pay for these services. These reforms have been difficult for average individuals, because institutions such as a comprehensive student loan system or health insurance have not been developed. The state does provide social security and social assistance, such as unemployment and disability benefits.

WORKING CONDITIONS

The Czech Republic's labor force is 5.2 million, and approximately 46 percent of the total Czech population was registered as employed in 1999. In 1999, the rate of unemployment, which registers those actively looking for work, was 9 percent. Unemployment has been on an upward swing since an economic crisis in 1997, but has shown recent signs of stabilizing. Unemployment benefits are available to individuals, and slightly less than half of those registered as unemployed receive these payments.

Prague consistently maintains the lowest level of unemployment in the country. The highest levels of unemployment are in northern Bohemia and in Moravia. Wage levels reflect these differences, with the highest wages in Prague. According to estimated figures for 1997, the majority of those employed—53.7 percent—worked in the service sector. Industry employed 40.7 percent of the workforce, and the remainder—5.6 percent—worked in agriculture. Given the importance of foreign investment in the economy, those individuals who speak English and German have an advantage in the labor market.

The Czech Republic features a system of laws which prohibits employment discrimination on the basis of race, sex, language, religion, faith, political views, and sexual orientation. However, discrimination against the hiring of Roma (Gypsies) persists in practice. There are 28 weeks of maternity leave available, with a possible extension to 3 years. A woman taking maternity leave is provided some income by the social security and health insurance systems, with some contributions by employers.

Workers' unions were a fixture of the communist system. After the end of communism in 1989, the communist-affiliated unions rapidly declined in popularity. Laborers now tend to belong to non-affiliated unions, and approximately two-thirds of all workers are union members.

COUNTRY HISTORY AND ECONOMIC DEVELOPMENT

1914–17. World War I. The Austro-Hungarian Empire, which includes Czechoslovakia, disintegrates.

1918. The Czechoslovak state is founded.

1938–45. Hitler takes over Czechoslovakia during World War II.

1945. Czechoslovakia is freed from the Nazis by the Soviets in the east, and by the Allies in the west.

1948. The Communist Party takes over the Czechoslovak parliament.

1968. Attempted reforms by the Czechoslovak state are met with an invasion of tanks from Czechoslovakia's Soviet bloc neighbors.

1970s. Some political dissidents begin to visibly resist the communist leadership.

1980s. Worsening economic conditions facilitate protests against communism.

1989. The communist government is forced to step down.

1990. The first post-communist parliamentary elections are held, and Václav Havel is confirmed as Czechoslovakia's new president. The government embarks on a series of reforms to replace the communist economic system with a capitalist system.

1992. The second post-communist elections result in a disagreement between the Czech and Slovak republics. The leaders plan the country's divorce.

1993. The Czech Republic is officially founded on 1 January 1993. It establishes a separate Czech currency in February.

1997. An economic crisis and political instability cause difficulties.

1998. The Czech Republic begins accession talks with the European Union.

1999. The Czech Republic joins NATO.

FUTURE TRENDS

The Czech Republic has come a long way since its founding in 1993, through nearly a decade of transition from a communist to a capitalist economic system. It is a member of the United Nations, Organization for Security and Co-operation in Europe (OSCE), Organization for Economic Co-operation and Development (OECD), International Monetary Fund, (IMF), World Bank, European Bank for Reconstruction and Development (EBRD), and the World Trade Organization (WTO), and became a NATO member in 1999. In addition, it is an associate member of the EU and the Western European Union (WEU). The government's primary focus in recent years has been the preparation of legislative and regulatory structures for future EU membership, for which it has made a formal application. Accession talks with the EU officially began in 1998, and the Czech Republic is slated to become a full member between 2003 and 2005.

In spite of the enormous changes that the Czech Republic successfully underwent in its first few years of independence, more remains to be done. The country is expected to continue to rebound from the economic **recession** of the late 1990s, especially as it improves its trade with Western European nations. But it is the interaction with Western European nations in the EU that is expected to pose the greatest challenge to the Czech Republic in the coming decade. Restructuring the large enterprises that remain in the hands of the state, and reforming legislation to conform to EU standards will cause some economic displacement. Yet once the country moves through this difficult period, its position at the heart of Central Europe, its well-developed infrastructure, its high-quality educational institutions, and its educated populace promise a vibrant economic future.

DEPENDENCIES

Czech Republic has no territories or colonies.

DENMARK

Kingdom of Denmark
Kongeriget Danmark

CAPITAL: Copenhagen.

MONETARY UNIT: Danish krone (DKr). 1 Danish krone is made up of 100 øre. There are coins for 20, 10, 5, 2, and 1 krone and 50 and 25 øre. Paper currency comes in denominations of DKr1,000, 500, 200, 100, and 50.

CHIEF EXPORTS: Machinery and instruments, meat and meat products, fuels, dairy products, ships, fish, and chemicals.

CHIEF IMPORTS: Machinery and equipment, petroleum, chemicals, grain and foodstuffs, textiles, and paper.

GROSS DOMESTIC PRODUCT: US$136.2 billion (purchasing power parity, 2000 est.).

BALANCE OF TRADE: **Exports:** US$50.8 billion (f.o.b., 2000). **Imports:** US$43.6 billion (f.o.b., 2000).

COUNTRY OVERVIEW

LOCATION AND SIZE. Denmark is in Northern Europe, bordered primarily by the Baltic Sea and North Sea. It consists of the peninsula of Jutland, north of Germany, and close to 406 islands, about 80 of which are inhabited. The most populated and largest of the islands is Zealand, where the country's capital can be found; Funen; and Jutland. Denmark occupies 43,094 square kilometers (16,621 square miles), a little less than twice the size of Massachusetts. Germany shares 68 kilometers (42 miles) of border with Denmark, and the other 7,314 kilometers (4,545 miles) is coastline. In 1 July 2000, the Øresund Bridge was completed, connecting Denmark and southern Sweden. The Kingdom of Denmark also includes the island of Bornholm in the Baltic Sea, and the territories of Greenland and the Faroe Islands.

POPULATION. Denmark's population in 2000 was 5,336,394, and was projected to fall to around 5,200,000 in 2025. From the late 1960s to the present, the fertility and mortality rates have been declining. Average life expectancy at birth has increased, but it is notable that life expectancy for men and for women in Denmark is still lower than all of its neighbors, especially for women (in 1999 life expectancy for women was 78.3, while in the United States it was 80.1). The overall population growth rate has been consistently low at 0.31 percent.

The Danish population is extremely homogenous. As of 2000, 97 percent are Danes (ethnic Scandinavians), and the rest are Inuit (Eskimo), Faroese, and Germans. The proportion of elderly people in the population has been increasing as well, with the result that in 2000 only 18 percent were under 14, and 15 percent were over 65.

The population is highly urbanized, with around 85 percent living in cities. However, population density is low compared to places such as the United States and European countries farther south. It is worth noting that to be classified as "urban" in Denmark, a settlement needs only 250 people (compared to Greece, where "urban" is defined as a settlement of 10,000 or more). Urbanization has slowed in the 1990s, with some Danes reversing the pattern and moving back to rural areas.

OVERVIEW OF ECONOMY

Denmark has a technologically advanced free-market economy, mainly involved in high **value-added** production such as processing and finishing products, rather than extracting and producing raw materials. Main exports are industrial products, followed by agricultural products—chiefly livestock-based products such as cheese, pork, and other meats. Denmark's reliance on export trade has meant that its economy has been sensitive to fluctuations in world demand, although its generous **welfare state** policies since the 1960s have cushioned the population from suffering much from this volatility. Because of its geographic location, Denmark is an important distribution

point for Eastern Europe, Scandinavia, England, and the rest of Europe.

Denmark's high-tech agricultural sector is the latest development in a long history of Danish farming. Before the late 1800s, Denmark's chief agricultural products were grains, but at the end of the 1800s an influx of cheap grains from the Americas and Russia caused prices to plummet. Danish farmers, supported by the government and the Folk High School Movement (a cultural and educational movement that encouraged knowledge-sharing, adult education, and agricultural research and reform, especially in rural areas), switched to livestock production, feeding their animals on the cheap grain. Danes developed an industry making processing machinery for its agricultural products. By the 1960s, industry had overtaken agriculture as the largest sector of the economy.

From the 1960s to the 1980s, the Danish economy followed a fairly regular cycle: increases in wages and benefits raised costs for firms, which led to price hikes and thus less ability to compete in foreign markets. This upset Denmark's **balance of trade**, as the high wages raised demands for imports, so the government would attempt to control rising consumption, usually by tightening credit and imposing a new tax. The 1970s and 1980s

saw labor, political, and economic troubles as the government attempted to impose austerity measures such as harsh savings programs. Strong public opposition (including labor strikes) to various plans led to the repeated dissolution of the ruling coalition governments. After 1973, rising oil prices and the international **recession** led to high unemployment and low domestic demand.

External debt stayed high during the 1980s, consisting mainly of bonds bought by outside investors that required interest payments by the government. However, the extent of debt was not enough to discourage foreign investors, thus Danish business did not have to worry about financing drying up. While Denmark's balance of trade was positive from 1990 to 1997, that surplus was used to pay off the debt, which gradually fell from over 40 percent of GDP in 1990 to 24 percent in 1997. The **budget deficit** was not eliminated until the mid-1990s, but since then government has generally run a small surplus.

Businesses in Denmark are mainly small- and medium-sized. Over 75 percent of Danish industrial companies employ fewer than 75 people. Most farms are family-owned, a tradition that was partly supported by a law prohibiting public companies from owning farms. This prohibition was lifted in 1989. The increasing accessibility to consumers in Europe has begun to encourage Danish businesses to look at ways to supply these consumers on a larger scale, including the possibility of merging small companies together into larger ones, as well as developing networks of coordination and communication between several companies.

Across most of the political spectrum, Danes are committed to ensuring a basic level of economic equality, which has been the impetus behind the creation and maintenance of a large and generous welfare, social security, national health care, and education system. The **public sector** in 1999 employed close to 800,000 people, over 25 percent of the **labor force**. Since the 1960s, the public sector has ensured that despite economic fluctuations, everyone in Denmark has completely free access to health care and education, as well as unemployment benefits, sick leave, parental leave, and housing and childcare **subsidies**. Although unemployment has been one of Denmark's most persistent problems, in the new century it has fallen remarkably, to a current low of just under 6 percent.

In 2000, Denmark opted out of the final stage of the European Monetary Union (EMU), choosing to keep their own currency rather than join the euro. However, as the krone is closely tied with the euro, the Danish economy is not autonomous. Arguments against the EMU in Denmark mainly accentuate the need to retain political autonomy. These opponents stress that integration into the EMU could result in a threat to Denmark's commitment to economic equality and the environment, especially if Danish businesses were required to compete with those based in countries which do not require them to comply with similar environmental or labor regulations.

POLITICS, GOVERNMENT, AND TAXATION

Queen Margarethe II is officially the head of state, but actual power resides in the prime minister and his or her cabinet (called "the government" in Denmark and virtually all other parliamentary systems, and similar to a U.S. "administration") and the Folketing (the parliament). The Queen formally appoints the prime minister and the cabinet, but this appointment is always the result of behind-the-scenes maneuvering and coalition-building after a general election. The prime minister is accountable to the Folketing for his or her actions. Most ministers have their own ministries, (such as the Ministry of Finance or the Ministry of the Environment), but some individual ministers may be selected without being assigned to a specific ministry. Legislation is created cooperatively by the Folketing and the government. Proposals for laws are considered twice in the Folketing, and if approved, must then be approved by the Queen and the government. The Queen is not independent from the government in approving legislation, but rather acts under its advice.

The Folketing has 179 seats; members are elected by **proportional representation** (voters elect parties rather than individuals, that receive a number of seats in the legislature proportional to the percentage of votes received). This system encourages the proliferation of political parties that may form coalitions not only to form governments, but to pass legislation in the Folketing. The prime minister can call an election at any time in the hopes of gaining more seats for the ruling coalition. And as in virtually all parliamentary systems, new elections may be called if there is a vote of no confidence in the Folketing, although this has not happened since 1909. The minimum level of popular support necessary for a party to be represented in the Folketing is 2 percent (corresponding to 3 or 4 seats), and 2 seats each are reserved for representatives from the Faroe Islands and Greenland.

Like much of Scandinavia, Denmark has a good record on women's representation in government and politics at both the local and national levels. In the government in the year 2000, 35 percent of cabinet ministers were women, as were 37 percent of the Folketing (compared with the United States in 2000, where women were 41.4 percent of the cabinet but only 12 percent of Congress).

Since 1973, there have been 10 major political parties. Underlying all but the most extreme right wing of

the parties is the Nordic emphasis on the importance of economic equality, ensured by strong social welfare programs. The issue of whether or how to join the European Community has been important to all the parties over the past 20 years, but does not divide them according to traditional "right-left" alignments.

The parties in the government in 2001 were elected in March 1998. The ruling coalition is comprised of the Social Democratic Party (65 seats), the Socialist People's Party (13 seats), the Radical Liberal Party (7 seats), and the Unity Party (5 seats); in the opposition are the Liberal Party (43 seats), the Conservative Party (17 seats), the Danish People's Party (13 seats), the Center Democratic Party (8 seats), the Christian People's Party (4 seats), and the Progress Party (4 seats).

The Social Democrats and Socialist People's Party do not wish Denmark to rely solely on market forces to organize the economy, and place a priority on equalizing income distribution and living standards. Trade unions are especially associated with the Social Democrats. The Radical Liberals (Det Radikale Venstre) are to the right of Social Democrats, and want to curb public spending, lower **income tax** rates for high earners, and reduce benefits for the unemployed. The Unity Party or Unity List is an alliance of far-leftist and environmental groups, to the left of the Social Democrats.

The Conservative Party (CP) has been generally gaining in popularity since the mid-1970s, although its peak was in the 1980s. Representing especially the interests of business and property owners, the Conservatives emphasize the rights of ownership while trying to reduce power of trade unions. While still supporting a welfare state, the CP wants to limit public spending on social programs, but increase spending on defense. The CP is fairly pro-European integration. The Liberal Party (Venstre) is close to but more extreme than the conservatives in wishing to reduce government spending and power, and are strongly pro-European integration. The Danish People's Party (DPP) is a nationalist party for ethnic Danes, against **immigration** and suspicious of refugees. They are strongly anti-European integration, although they support free trade and market-based agricultural policy. The DPP are for social welfare programs, but only for Danish citizens, and also support abolishing or greatly reducing property, inheritance, and other taxes. The Center Democratic Party wants fewer taxes, especially for individuals. They do support social welfare programs and are also pro-Europe. The Christian People's Party (CPP) was formed in response to the late-1960s legalization of abortion laws and lessening of restrictions on pornography, both of which they oppose. They want to decentralize political decisions, avoid special interests, and emphasize protecting the environment and quality of life. They have historically had a small share of popular vote, usually just above the 2 percent threshold required for representation in the Folketing. The Progress Party (PP) was founded in 1990, an extreme right-wing party with a reputation for unruliness. Their main platform is to abolish income taxes and greatly reduce government spending, and to restrict immigration. Against joining the European Union, their arguments often alienate more tolerant Danes, while some of their leaders and members have espoused more explicitly racist attitudes. Many of the other parties are reluctant to form a coalition with them.

In 1997, the public sector employed around a quarter of the workforce, and provided health care, welfare, social security, education, and administration of the government. Government-owned businesses are also still important to the economy, although there has been increasing **privatization** in recent years. Recently privatized businesses include a life insurance company (now totally private), the national telecommunications company TeleDanmark (totally private), Copenhagen Airport (now 49 percent private), and the computer services company Datacentralen, 75 percent of which was sold to the U.S.-based Computer Sciences Corp. The large Postal Service and Danish State Railroads companies have also been turned into private companies, although the government actually owns these firms. Some other public services such as sanitation, cleaning, and catering to public institutions are also being privatized.

The **value-added tax** (VAT) is the main source of government revenue, accounting for over one-quarter of total revenue in 1998. At 25 percent, it is one of the highest VAT rates in the world. Income tax is also high. In 1999, the marginal income tax rate was 40 percent for taxable incomes up to $21,500, while the highest bracket was about 60 percent for taxable incomes of more than $37,000. In 2001, 40 percent of all Danes in full-time employment were in the highest tax bracket. The Danish government, fearing an economic slowdown, is beginning to shift its tax burden somewhat away from individual incomes. "Green taxes" on pollution and to enforce environmental regulations are expected to make up some of the difference, and are already generating significant revenues; in 1995 over 8 percent of tax revenue came from environmentally-related taxes (over 2 percent of GDP). In the same year in the United States, only 4 percent of tax revenues came from environmentally-related taxes (less than 1 percent of GDP).

Even though most Danes must give almost half of their salaries to the government as income tax, they get most of it back in the form of free, high-quality health care, education, and **transfer payments**. For example, in 1996, 47 percent of the DKr386 billion collected by the national government was returned to the public in the form of transfer payments such as unemployment and sickness benefits, old-age pensions and housing subsi-

dies. Some 60 percent of all government revenues from taxes in 1996 were spent on the health service, while transfer payments accounted for 40 percent of total public revenues (22 percent of GDP).

At 32 percent, corporate taxes are high. Denmark plans to reduce them to 26 percent by 2002. However, contrary to many economists' predictions, Denmark's high corporate tax rate has not discouraged foreign investment. In a surprising situation that suggests that there must be multiple reasons why foreign companies choose to invest, Denmark in 1997 showed an increase in foreign investment that was an amazing 308 percent—almost 10 times that of the European Union as a whole.

The Danish currency is pegged in a **fixed exchange rate** with the euro, so interest rates nearly always follow the European Central Bank. This relationship changed slightly after the referendum in 2000 when the Danes narrowly voted to reject the last stage of the EMU and keep their own separate currency. After the referendum, the Danish national bank raised its interest rates, which encouraged people to borrow less (since interest on loans was higher), and thus reduced the amount of money in circulation. As money became scarcer, its value increased, and the bank prevented the krone from **devaluation**. However, the krone has never been allowed to fluctuate beyond the level allowed by the **exchange rate mechanism** (ERM).

Denmark was the first country to establish a Ministry for the Environment, in 1972. Danes spend more per capita on environmental protection than most nations in the world. This has also inspired the development of a local industry of pollution control equipment, which is now a significant international force. This environmental focus has also affected the Danes' relation to European integration. Many have feared that joining the European Union (EU) would require them to lower their standards of environmental protection in order to remain in line with the other EU nations. Other than environmental protection laws, there are few regulatory controls on the economy.

INFRASTRUCTURE, POWER, AND COMMUNICATIONS

Denmark has a thoroughly modern and extensive **infrastructure**. Its numerous islands have encouraged the development of a network of ferry services in domestic waters with 415 kilometers (258 miles) of waterways. A well-maintained road and rail network includes 71,437 kilometers (44,388 miles) of highways (including 843 kilometers, or 524 miles, of expressways), and 2,859 kilometers (1,773 miles) of railways which serve almost every town. Some 508 kilometers (316 miles) of the railways are privately owned, while the rest are owned by the state.

In cities, environmental concerns have encouraged bicycle riding for all. Urban traffic is minimized by legislation requiring nearly all new shops be built within the existing commercial centers of cities, towns, and villages. Additionally, most new workplaces are required to be a short walking distance from a transit stop. Shops, offices, and factories must make accommodations for bicyclists and pedestrians. As a result, in 1998 less than one-third of travel within cities was via cars and trucks, and motorized traffic in the city centers had increased very little over the past 25 years.

As of 1999, Denmark had one of the world's highest density air networks, with 28 paved-runway and 90 unpaved-runway airports. Air service for Denmark, Norway, and Sweden is provided by Scandinavian Airlines Systems (SAS). Copenhagen Airport was voted "World's Best Airport of 2000" by the International Air Transport Organization, the same year that also saw the completion of the 7.8-kilometer Øresund bridge linking Denmark with Sweden.

Danes consumed 33.03 billion kilowatt-hours (kWh) of electricity in 1998, importing 2.68 billion kWh, and exporting 7.1 billion kWh. Most of the imported fuel is coal, which in 1998 amounted to 6.3 million tons. Denmark is shifting further away from coal use, as the 1998

figure is 60 percent lower than it was just 2 years earlier. Since the discovery of oil and natural gas reserves in the 1960s, Denmark was self-sufficient in oil production by the 1980s. In 1998 oil production was 238.35 million barrels per day (bpd) with exports of 8.98 million bpd, while natural gas production was 267.68 billion cubic feet (bcf), and exports were 95.35 bcf. The state owns significant shares in both oil and natural gas extraction, although the giant Maersk/A.P. Møller Corporation is also a dominant figure. Overall, in 1998 Denmark generated 4.27 billion kWh of electricity. Fossil fuel from its own reserves accounted for 90.8 percent of this electricity, hydroelectric power for 0.07 percent, and the remaining 9.13 percent was generated by other means, including wind power. Denmark has, since 1980, banned nuclear power, and focuses much research and development on conservation and alternative energy sources.

Denmark has an excellent telecommunications system based on 3.20 million telephone lines (1995). Cellular phone ownership increased by 304 percent from 1993 to 1997, and in 1999, such telephones were owned by 49 percent of the population, including nearly every person between ages 17–25. Cell phone ownership per capita in 1997 was 190 per 1,000, as compared to the U.S. figure of 128 per 1,000. Denmark's burgeoning IT services industry is supported by high Internet connectivity; 90 percent of all businesses use some aspect of the Internet. The Danish government has strongly supported the development of personal as well as business Internet use. In January of 2001, the prime minister announced that the government intends to provide all households in Denmark with access to the Internet, while at that time nearly 50 percent of all households with a computer were already connected.

ECONOMIC SECTORS

In modern Denmark, the economic sectors of agriculture and industry are so closely linked that it is difficult to separate their influences. Both food and wood-based industries such as paper depend heavily on agriculture for raw materials while using sophisticated technology to process them. In addition, agricultural production itself is quite technologically advanced. The agricultural sector's highly technical nature means that its great productivity is generated by a small fraction of the total workforce—4 percent in 2000. In contrast, well over two-thirds of the workforce was employed in the service sector in the same year.

Agriculture in Denmark also includes forestry and fishing. The agricultural industry was Denmark's first engine of growth, especially its livestock production and forestry industry. Agriculture's economic influence relative to other sectors has basically been declining; by the 1960s, industry had surpassed it in terms of employment and percentage of GDP, and by 2000 agriculture made up 3 percent of GDP. Despite the small size of Denmark's agricultural sector today, it is comparatively highly productive, accounting for around 15 percent of exports in 1999. In 1998, Denmark was the world's seventh-largest producer of pork, while the Danish fishing industry was the second-largest in Europe.

The lack of raw materials other than agriculture (until the discovery of oil and natural gas in the 1960s), meant Denmark's industries developed as secondary production and processing concerns, usually specializing in

narrowly-defined fields. This has led to the predominance of small- or medium-sized firms making niche products, often with a high-tech or design focus. For example, in a small design-oriented field such as furniture making, Denmark excels—in 1998 accounting for 20 percent of furniture exports by EU countries. The complexity and versatility of this organization of the industry has somewhat sheltered the Danish manufacturing industry from fluctuations in the world market. Alongside food processing and agro-industry, chemicals and engineering are important industries, and electronics are increasing in significance. Denmark's position in the North Sea has led to the development of a strong shipbuilding sector—it is currently the world's third-largest shipbuilder after Japan. The general trend in the manufacturing industry is that work- and material-intensive industries such as food processing, textiles, and metals decline or stagnate, while knowledge- and technology-based industries such as chemicals, electronics, and engineering have been expanding. Industry contributed about one-quarter of GDP in 2000. The sophisticated technology of much of Denmark's industrial sector has meant that high or increasing productivity does not always correspond with high or increasing employment. Over the past decade, the percentage of the workforce employed in manufacturing has remained fairly constant at around 25 percent.

In 2000, Denmark's services sector contributed more than two-thirds of GDP. Private services accounted for around two-thirds of productivity, and public services the remaining one-third. However, many private services are in fact subcontracted to public institutions. The majority of public services are in health, welfare, and administration. In the service sector as a whole, business services and wholesale/**retail** trade accounted for the most productivity growth. Wholesale and retail trade is the largest employer in private services, in 1997 accounting for a little over half of service sector employment. Between 1992 and 1998, the service sector saw a 12 percent increase in employment. Public services have consistently accounted for nearly one-third of employment in services (mostly in health and education) over the past decade, while telecommunications and business services have slowly increased their share of employment.

AGRICULTURE

Denmark is the only country in the Baltic region with a net export of agricultural products, producing 3 times the amount of food it needs for itself. A good percentage of arable land and moderate climate has been conducive to agriculture, but the sector's extremely advanced technology and infrastructure are what have made it so productive in recent years. Although agriculture's role in the Danish economy has steadily decreased as industrialization and economic development has progressed, it is still essential as a source of foreign currency, a direct and indirect source of jobs, and as a supply of everyday foodstuffs.

The increasing mechanization of agriculture, combined with changes in farm management and organization, plus the draw of industrial employment in the cities, has meant fewer people are required to farm ever-increasing quantities of land. Farm sizes have increased, and the number of individual farms has dropped dramatically since the 1950s. From the 1970s into the 1990s, 2,600 individual holdings disappeared every year, absorbed into larger farms. In the first half of the 20th century Denmark had around 200,000 individual farms, averaging 16 hectares in size; by 1997, there were about 60,900 farms averaging 43.6 hectares. Family-run farms are still dominant in Denmark, where even in 1997, some 91 percent of farms were family-owned and run, 7 percent company-owned, and the rest owned by the state, local authorities, and foundations. Along with increasing farm size, the typical farmer has to an increasing extent concentrated on one sole branch of farming, and specialization in animal production has led to fewer types, but larger numbers, of livestock.

In 1996, primary forestry occupied approximately 3,000 employees, while forestry formed the basis for most of the work for around 34,000 employees in the wood manufacturing industry. Denmark is Europe's primary supplier of Christmas trees. Profits from forestry have historically been invested both in modernization of the industry and in investment in other industries. The state is the largest owner of forests, with one-third of forested land under its control. The rest is owned by a multitude of private companies, individuals, and institutions.

In the early 1990s, Denmark was among the top 10 to 15 fishing nations in the world, catching 1.6 million tons in 1993. Industrial fishing (catching fish for industrial use, i.e. producing fish meal and fish oil) has been the most important branch of fishing with a total catch in 1993 of 1.2 million tons. In 1993, the export value of the fishing industry was around DKr10 billion, corresponding to some 4 to 5 percent of Denmark's total exports.

Environmental legislation has been on the increase in the past decade, some of which has directly affected productivity. For example, the greater emphasis on forests and parks has meant that some land had to be turned away from farming use. New restrictions on waste disposal and contamination have also forced some farmers to limit or end production.

INDUSTRY

MANUFACTURING. In 1996, 45 percent of the manufacturing industry's total production went to export,

corresponding to 75 percent of total exports. Mechanical engineering production, especially of electronic goods, was an increasing proportion of the sector's value, and also created some 12,400 new jobs between 1980 and 1996. Nearly all Danish electronics production is exported, including products such as measuring instruments, microphones, equipment for tele- and radio communication, computer networks, power units, engine controls, and hearing aids. Food, drink, and tobacco production/processing, by contrast, has declined between 1993 and 1997 from around 30 percent to around 25 percent of production in manufacturing. The Carlsberg beer company is the most significant producer of beverages, in 1998 having a **turnover** of DKr29.3 billion and employing 20,500 workers. The largest employers in manufacturing are the makers of metal products, machinery, and equipment; the food-processing industry (bacon factories, dairies, corn mills, and breweries); the paper and graphic industries; and manufacturers of transport equipment, especially shipbuilding. A significant percentage of workers are also employed making wood and wood products.

CHEMICALS. The chemical industry has also grown through the last decade, and in 1999 accounted for 24 percent of all chemical production in the EU. Denmark, in 1996, was the world's second-largest per capita exporter of pharmaceuticals, with exports valued at almost DKr15 billion. Novo Nordisk, despite its status as one of the largest chemical companies, is still in many ways typical of Danish industrial style: a high-tech, highly-specialized firm, investing heavily in research (in this case on insulin, hormones, and enzymes), exporting 98 percent of its products.

ELECTRICITY, COAL, GAS, AND OIL. Denmark is the third-largest oil producer in Western Europe, in 1998 producing 233.35 million barrels per day (bpd) of petroleum, while in the same year natural gas reserves produced 267.69 billion cubic feet (bcf) per year. Natural gas exports at that time were over 95 bcf per year, primarily to Sweden and Germany. Danish oil and gas production in 1998 was worth just over DKr30 million. In 1999, the energy and water industries together employed 17,000 people. Maersk/A.P. Møller, the largest company (of any kind) in Denmark, is heavily involved in oil production, although it began as a shipping concern. Statoil (owned by the state of Norway), and the American-based multinational Amerada Hess are the other significant operators in this industry. At the end of the century, Denmark was still opening up new areas of the North Sea for exploration, and it is possible that new reserves will be discovered. The government retains its shares in some oil industries, and licenses the right to explore and extract.

CONSTRUCTION. The construction industry illustrates the trend of a decline in work-intensive manufacturing. Devastated in the 1970s and 1980s by a severe fall in house building, production, and employment in this construction fell considerably and stayed low through the late 1990s. The value of construction products fell from 12 percent of GDP in 1972 to 6 percent in 1996. Over that time, employment fell by 43,000. The building and construction industry is mainly made up of small companies in which independent (paid) and assisting (unpaid) spouses constitute a relatively large proportion of those employed. The rapid decline in this sector in Denmark has in the first half of the 1990s led to the industry being more export-oriented, partly through Danish firms increasing activity in Germany. Construction has shifted somewhat from mainly making new buildings (which had accounted for 47 percent of its work in 1970) to a greater focus on repairs and maintenance, which grew from 23 percent in 1970 to 38 percent of construction work in 1999. New building construction in that time frame fell to 32 percent.

SERVICES

TOURISM. In 1997, 2.2 million tourist arrivals in Denmark were recorded (a 4 percent increase from 1993). In 1999, tourism generated around DKr44 billion in revenues, an increase of 1 million from the year before. This made it the third-largest sector after industry and agriculture. The attractions most visited by tourists are Tivoli Gardens (Copenhagen), Lego Land (Billund), Hans Christian Andersen's House and Museum (Odense), and the Viking Ship Museum (Roskilde). Old manor houses and castles are also popular destinations, while Copenhagen harbor was in 2000 one of the most popular stops on European cruises.

Tourism employed over 70,000 (1999) people full-time in the facilities described above, as well as 650 hotels, 30 inns, 525 registered campsites, and over 100 youth hostels. In 1998, the Danish Ministry of Business and Industry, SAS, the Danish Tourist Council, and other tourism interest groups joined forces with local authorities to promote Denmark as a tourist destination for businesspeople and wealthy weekend tourists from the United States, Germany, Southern Europe, Sweden, and Russia. The 3-year international marketing project was estimated to cost a total of US$7.7 million, of which SAS was to pay US$4 million, the Ministry of Business and Industry US$1.3 million, and the rest will come from various municipalities.

WHOLESALE AND RETAIL TRADE. Employment in the service sector is dominated by the wholesale and retail trades, with 441,000 people in 1998. However, employment has declined since the 1970s, as the sector has seen considerable **vertical integration** (an overall integration of retail, wholesale, and in certain cases production sectors). Moreover, 1980s-era mergers within the sector

(horizontal integration) have marked both areas, leaving wholesale and retail highly concentrated (with a few firms dominating the market). In 1995, 4 percent of firms accounted for about 75 percent of the total turnover. In 1998, there were 8 wholesalers operating domestically, the largest 2 of which were Maersk and the cooperative FDB, which together accounted for 61 percent of the market in 1998. Total transactions in 1998 amounted to US$10.7 billion. In retail, even though a few large players dominate the industry as a whole, there are still a large number of small shops; 3 out of 4 retail shops are one-person businesses, while the remainder are mainly small companies or cooperatives.

TELECOMMUNICATIONS. Growth in postal and telecommunications services was larger than any other business sector; from 1992 to 1998 productivity grew by 44 percent. **Deregulation** of the industry, beginning in 1986, paired with strong research and development supported by the government allowed firms to take advantage of new technologies. However, technological advances have meant that growth was not accompanied by much of a rise in employment, which in 1996 was 45,000 people, the same as in 1986. The major telecommunications companies are at least partly-owned by foreign companies. TeleDanmark, in which Ameritech (U.S.) owns a controlling interest, and Sonofon cellphones, almost half of which is owned by Bellsouth (U.S.), together account for over 75 percent of the market.

FINANCIAL SERVICES. Between 1989 and 1996 there was a one-third decline in the number of domestic bank and financial institution branches. This was mainly due to Denmark's banks being burdened by a number of bad debts in the early 1990s. Since 1994, the improvement in both Denmark's economy and the banks' lending policies has contributed to more stability in the industry, along with a number of consolidations among the country's banks. The reduction of branches of institutions coincided with a 14 percent decline in the number of employees over the same 7 years. In 1998, Denmark had 95 banks with assets of US$216 billion, while total assets of the 5 largest banks totaled US$179 billion, over 80 percent of total banking sector assets. The 2 largest banks, Den Danske Bank and Unidanmark-Gruppen, also operate as financial "supermarkets" offering a wide range of financial services, and account for 50 percent of the financial service market. Danish banks are technologically sophisticated, and have invested heavily in computers and the development of electronic transfer systems, in 1998 adopting one of the first nationwide electronic payment card systems (Dankort). Employment in business services has been increasing throughout the last decade; by 1999, 326,000 people worked in the financial services sector, with Den Danske bank employing 11,409 people, and Unidanmark-gruppen employing 9,960.

TRANSPORTATION. Road transport, both trucking/hauling and personal transport such as taxi services, dominates the domestic transportation sector. Road transport in 1996 generated just under half of the total revenues from the transport sector, while the remaining value was divided among other types of the transport: shipping (16 percent), railways (11 percent), and aviation (7 percent). The transport sector created around 9 percent of Denmark's GDP and 7 percent of total employment in 1996. Activity in the sector as a whole has risen steadily and at a faster rate than overall productivity since the 1980s. Production value in the sector rose by 74 percent between 1986–1996. In 2000, over half of Danish international trade was by road, and most of the remainder by sea. Denmark's increasing expertise in making high-tech liner and tanker ships has helped the shipping sector in recent years. Shipping accounts for most of Denmark's international freight traffic, and the country's almost 600-vessel merchant fleet is the fourth-largest in the European Union. Denmark's Maersk shipping line bought the U.S.-based Sea-Land Services in 1999 to become the largest container shipping line in the world.

INTERNATIONAL TRADE

Denmark is one of the most trade-oriented economies in the world. As a base for exporting, Denmark has many advantages. Its key location as the only Scandinavian country connected to mainland Europe, plus its position on the Baltic sea, gives it access to lucrative markets for both EU and non-EU countries. Its extensive infrastructure and well-educated, high-skilled workforce also help promote trade and foreign investment.

Germany is currently Denmark's most important export destination, followed by Sweden and the United Kingdom. Exports to these 3 countries totaled 41.7 percent of Danish exports in 1997. The United States is the largest trading partner outside the EU, and accounted for almost 5 percent of Denmark's total trade value in 1997. Over one-third of Danish industrial exports are machines and instruments, while pharmaceuticals, energy (especially oil), meat, and meat products make up the rest.

Trade (expressed in billions of US$): Denmark

	Exports	Imports
1975	8.712	10.368
1980	16.749	19.340
1985	17.090	18.245
1990	35.133	32.228
1995	49.036	43.223
1998	47.070	44.994

SOURCE: International Monetary Fund. *International Financial Statistics Yearbook 1999.*

Denmark's main imports are raw materials and unfinished products that are used in its own industrial sector. In 1997, imports for the industrial sector were about 70 percent of total imports, while the rest were consumer products, including cars. Of the services imported, computer software and management consulting are very important. Imports from Germany, Sweden, and the UK account for 42 percent of total imports.

The early 1990s were a difficult time for Danish international trade as its 3 most important markets—Germany, the UK, and Scandinavia—were all performing sluggishly. More recently trade has increased, especially due to a depreciation of the Danish krone. The krone is expected to remain stable through the next few years, which may reduce the growth in exports. However, Denmark is currently exporting more than it imports in all 3 sectors: industry, agriculture, and services.

MONEY

Since the 1980s, Denmark has pursued a fixed exchange rate linked to the German mark. On 1 January 1999, **monetary policy** was linked to the new European Central Bank. In September 2000, Denmark opted out of the European Monetary Union's (EMU) third phase (establishment of a joint EU currency and relinquishment of jurisdiction over monetary policy), although the country's economic performance exceeds the established criteria for membership. This was due to resistance on the right, especially from nationalist groups who wish to retain the Danish currency and not tie its economy so closely to that of Europe, and equal resistance on the left, where many fear that equalizing human rights and environmental regulations with the EU will chip away at the Danish welfare state and its environmentally-conscious business practices.

The National Bank of Denmark (Danmarks Nationalbanken) is the only **bank of issue** in the country and enjoys a special status as a self-governing institution under government supervision. Profits in the National Bank revert to the state treasury. Although Denmark has retained its own currency, separate from the EU, its currency is so closely tied to the euro that monetary policy often closely follows the European Central Bank. The National Bank lends to smaller banks and to the central government, and is responsible for administration of the foreign exchange policy.

The Copenhagen Stock Exchange (CSE) was established in the capital in 1861, and in 1999 had 233 listed companies. At the end of 1999 its **market capitalization** was US$105.29 billion. The CSE was a pioneer in computerized trading, being the first in the world to introduce electronic bonds and shares.

POVERTY AND WEALTH

The **Gini Index** measures the level of income inequality in a country, with 100 equal to total inequality (basically one person receiving all the income), and 1 indicating total equality (everyone having exactly the same income).

Raija Julkunen, a lecturer on social policy at the University of Jyväskylä, describes the differing U.S. and Nordic attitudes towards the role of the state: "American culture conceives citizenship and welfare as diametrically opposed, as if state-ensured welfare did not go along with a free society. In the Nordic countries, on the other hand, the notion of a welfare state has a positive ring to it. Only social rights—guaranteed minimum income, employment, education, health care—make citizens free and equal." The Nordic approach has succeeded in that there is virtually no poverty in Denmark.

Denmark's extensive **social welfare system** has existed in its current form since the 1960s, but has roots in Danish culture back to the 1930s. Because of Danes' long-standing preoccupation with economic equality, there is less of a difference between Denmark's high-income and lowest-income citizens than in the United States or many other countries. People who work in restaurants or cleaning buildings have free access to the same quality of healthcare as those who are lawyers, professors, or accountants. They have paid holidays, mater-

nity and paternity leave, sick leave, and unemployment benefits.

All families with children under 18 receive, irrespective of income, family allowances consisting of a regular, tax-free amount per child, with a higher rate for children under 7 years of age. Bread-winners who are single parents or **pensioners** can receive additional allowances per child. Families with children are entitled to free home help if the person who has the responsibility for the home and the children cannot manage it on account of, for instance, illness or confinement. Among other things, families living in rented accommodation can, depending on family income and the size of the rent, receive a housing benefit (in December 1998, there were 169,000 recipients).

According to sociologists Jens Hoff and Jorgen Goul Andersen in their article "The Danish Class Structure" in *Acta Sociologica* (1989), the concept of class is difficult to compare between countries with this kind of social system and countries such as the UK, the United States, or in less-developed countries. Class in Denmark is tied less to things like income and healthcare, and more to location, profession, and the kind of work engaged in, i.e. the amount of control over one's own responsibilities. Much of the Danish labor force works without much individual control over workplace decisions, without supervising others, and without much autonomy. This might make them working class by some definitions. However, these workers' quality of life is still very high by most standards, underscoring the impression that in Denmark, there is a lack of status distinctions between those who have high-skill or low-skill jobs.

One facet of the Danish welfare model has been the belief that benefits should not be tied to the kind of job one has, or whether someone is working or not. This approach has proven problematic as the country continually struggles with its unemployment rate—especially among the young. Critics argue that there is not enough incentive for people to choose to be employed rather than collect unemployment money. However, proposals of dramatic reductions in benefits are political suicide, as Danes are wary of what they might see as the sacrifice of a commitment to equality.

WORKING CONDITIONS

In 1999, the Danish workforce numbered 2.89 million, while the unemployment rate was 5.7 percent. The labor force is shrinking in Denmark. This is partly due to the aging of the population, as more workers retire than enter the workforce each year. High income taxes combined with generous unemployment assistance also may dissuade many, especially young workers, from entering the workforce. The government is currently attempting to **restructure** its taxation system to change this picture, shifting the burden of taxation away from individual income.

The standard working week is 37 hours, with a minimum of 5 weeks mandatory vacation. Three-quarters of those in employment have a 5-day work week, while those out sick may be paid up to 90 percent of their wage (with a maximum of DKr2,556 per week).

Danish laws guarantee the right of workers to organize and all (except civil servants and essential service

workers) have the right to strike, as well as the right to bargain collectively. The government stands behind these rights, does not interfere with unions, and prohibits anti-union discrimination by employers. More than 75 percent of all wage earners are organized in trade unions, as are about the same percentage of salaried employees, and collective bargaining is very common. Strikes are also rather common; in 1997, 101,700 workdays were lost due to labor conflict.

Mothers get extensive maternity leave—4 weeks prior to the birth of a child, and up to 24 weeks after—while fathers get paternity leave of 2 weeks after the birth. From the fifteenth week after the birth the mother can transfer all or a portion of her remaining maternity leave to the father. A tax-free benefit (known as the "children's check") is paid to the parents of all children 7 to 18 years old regardless of the household income. Denmark's child-care system enables either or both parents to work outside the home. In 1994, 80.3 percent of 3 to 6 year-olds were in childcare, (compared to 57.4 percent 10 years earlier). Women who used to be expected to care for their own children no longer face the same demand; in Denmark women's rate of participation in the workforce is very high—in 1995 89 percent that of men. In the same year women's salaries were 88.1 percent of men's.

COUNTRY HISTORY AND ECONOMIC DEVELOPMENT

1871. Denmark's **socialist** movement is officially founded, the start of a strong and diverse socialist tradition influencing Danish politics in the years to come.

1901. Change of political system to a constitutional monarchy, creating the Government (body of ministers selected by the queen) and the Folketing (representatives elected by the people).

1914–18. Denmark remains neutral during World War I.

1915. Constitutional reform; women and servants are enfranchised.

1933. Social reform movement begins, expanding the welfare and education system.

1940. Denmark occupied by Germany during World War II.

1941. United States establishes military bases in Greenland (with Danish ambassador's approval).

1945. Denmark liberated from Germany at the end of World War II.

1948. Faroe Islands, until this time part of Denmark, are granted home rule, which allows them control over domestic policy.

1949. Denmark joins North Atlantic Treaty Organization (NATO), a strategic military alliance of Western European and North American non-**communist** nations.

1960. Denmark joins European Free Trade Agreement (EFTA), which reduces or eliminates barriers to trade (such as **tariffs**) between participants.

1967. Pornographic text and photography (excluding photos of children) is legalized, a sign of Denmark's progressive/permissive social attitudes; however, response to this and the stance on abortion leads to the founding of the Danish Christian People's Party.

1973. Compulsory National Health Insurance set up (replacing sickness benefits fund).

1973. Denmark joins the European Economic Community (EEC—an organization of states that lowered barriers to trade between them).

1976. Social Assistance Act introduces a unified structure of public assistance and benefits, partly needs-based.

1979. Greenland, formerly part of Denmark, is granted home rule.

1985. Greenland leaves EEC over fears of EEC regulations' effects on its fishing industry.

1985. Denmark joins the European Union.

2000. Danes reject final stage of European Monetary Union (EMU) in a referendum.

FUTURE TRENDS

Danish manufacturing remains a strong base for growth, especially as research and development help support its further extension into high-tech industry. The Danish government's support for the growing use of Internet services for both businesses and individuals bodes well for Danish flexibility and responsiveness to global market trends. Public investment in education, particularly in relation to computers and computing, also supports prospects for growing computer-related services.

Unemployment has been reduced for the present, but the main mechanism was to shrink the size of the workforce through early-retirement plans and state-funded sabbaticals. A smaller workforce drives wages up, raising production costs for many Danish businesses, which makes them less competitive internationally. This has affected Denmark's **balance of payments**, which has even dipped into negative territory in recent years. It is not clear what effect this will have on the economy, but if the government can manage to strike a balance, keeping **inflation** and interest rates low without hurting industrial competitiveness, then a small deficit may be an acceptable price to pay.

Denmark's greatest challenge for the future is due to its aging population. Its welfare and social security system will be severely strained by the demands of the growing population of elderly people and the shrinking workforce and sources of tax revenues. If nothing is changed, Denmark will not be able to maintain the standard of benefits it currently grants to its citizens. As most Danes are fiercely supportive of state guarantees of a standard of living, any government attempting to reduce those guarantees faces hostility and resistance. The current government has made some changes in the labor market (reducing and altering some benefits and pensions), but it is unclear how much the public in the highly-unionized workforce will stand for reductions in benefits or wages. The governing coalition must tread carefully if it is to make changes without seeming to compromise its commitment to material equality.

In October of 2000, Danes voted not to join the last stage of the European Monetary Union, and to keep its own currency. Despite the urging of Prime Minister Poul Rasmussen, the Danish public did not support the euro. However, the krone is still closely tied to the euro, and Denmark's economic decisions, particularly monetary ones, will be heavily influenced by the EU. Resistance to the EMU has been made more on political grounds than economic ones. There is some fear that opting out of the EMU will hurt prospects for foreign investment, which in the previous 5 years had increased dramatically in Denmark. The current government has demonstrated its friendliness to business by lowering corporate taxes and other business taxes, which may help to counteract any possible flight of investment. It is too soon to tell if either effect has come to pass.

DEPENDENCIES

GREENLAND. Greenland (local name Kalaallit Nunaat) is the world's largest island, with an area of 2,175,590 square kilometers (840,000 square miles), slightly more than 3 times the size of Texas. Only 15 percent of the island is not covered in ice. There are no crops or trees, but there are many plants and flowers, as well as seals, fish, and reindeer. The population in 1998 was 54,100 with high birth and death rates. Greenlanders (Inuit and what the *CIA World Factbook* calls "Greenland-born whites") form the majority with 87 percent of the population, and the rest are Danish and others. Languages spoken are Greenlandic (East Inuit), Danish, and English. The 56 towns and villages on the island are mostly small; 40 have fewer than 500 people, and only 3 have more than 4,000. The administrative capital is Godthåb, called Nuuk in Greenlandic, with around 12,100 people.

Greenland was first a Danish colony in the 1300s, when Norway and Denmark were united kingdoms. In World War II, when Germany occupied Denmark, the U.S. and Danish ambassador in Washington D.C. agreed that U.S. troops could be stationed in Greenland. Some U.S. air bases remain there even now. A referendum (a nation-wide vote on a particular issue) in 1979 gave Greenland "home rule." Denmark has jurisdiction over foreign policy, defense, and justice, and there is joint authority over its oil and mineral resources. Greenland has its own legislature.

The population depends on fishing, and some also hunt seals. There is a small amount of mining, but the harsh climate and lack of transportation infrastructure have prevented much development. Greenland's economy has not been strong in the past 10 years. Since 1990, imports have outpaced exports. Following the closure of Greenland's last lead and zinc mine in 1989, the fishing industry and grants from the Danish government became the mainstay of the economy. In 1999, grants from mainland Denmark and EU payments for the right to fish in Greenland's waters made up about 50 percent of the home-rule government's revenues. As the cod is threatened with extinction, shrimp fisheries have taken over as the most important income earner.

Greenland is also looking to tourism as a sector for growth; however, the season is quite short due to the long and harsh winters. The public sector—both publicly owned businesses and municipalities—plays a dominant role in Greenland's economy. Greenland joined the European Community together with Denmark but withdrew in February of 1985 (after a referendum in 1982) due to disagreement with the EC over fishing policy.

FAROE ISLANDS. The Faroe Islands (local name Foroyar) are north of the Shetlands and northwest of Scotland, between the Norwegian Sea and the North Atlantic Ocean. There are about 30 islands, 18 of which are inhabited, with a total 2000 population of 45,296. The total land area is 1,399 square kilometers (540 square miles). The population is mostly descended from Viking settlers who landed there in the 8th century. The local language is Faroese, descended from Old Norse, although Danish is also required in schools, and adults on the island can speak it. The capital of the Faroes is Torshavn.

The Faroes have been part of the Danish Kingdom since the 14th century, but were granted home rule in 1948, although the Danish government is still responsible for defense and other aspects of administration. Denmark's Folketing (Parliament) reserves 2 seats for representatives from the Faroes.

Despite their small and remote location, the Faroes have a good domestic and international communications infrastructure, with 22,000 main telephone lines—about one for every 2 people on the island. There is also a satellite earth station and a fiber-optic submarine cable that

links the Islands to Iceland and Denmark. There are 14 radio stations and 7 television stations.

The mild winters, cool summers, and rocky terrain of the Faroes are unsuitable for agriculture, and in the past, sheep farming was very important to the economy. Nowadays fish and fish products are the center of the economy, with fish products comprising 90 percent of exports. Most other food is imported. This near-total dependence on fishing means the economy is very vulnerable, both to the changes in world demand and to environmental change. Even with the fishing industry, the Faroe Islands depend significantly on grants from Denmark. Without Danish government bailouts in 1992 and 1993, the Faroese economy would have gone bankrupt. The Faroes did not join the European Community (EC) when Denmark did, because of disagreement with EC fishing policies, which, the Faroese felt, put them at a disadvantage.

ESTONIA

Republic of Estonia
Eesti Vabariik

CAPITAL: Tallinn.

MONETARY UNIT: Estonian kroon (EEK). One kroon equals 100 sents. There are bills of 1, 2, 5, 10, 25, 50, 100, and 500 krooni, and coins of 1 and 5 krooni and 5, 10, 20, and 50 senti. The EEK is pegged to the German mark at a rate of 8:1.

CHIEF EXPORTS: Manufactured goods, machinery and transport equipment, timber, chemicals, food.

CHIEF IMPORTS: Machinery and transport equipment, manufactured goods, chemicals, fuels and lubricants, food.

GROSS DOMESTIC PRODUCT: US$7.9 billion (purchasing power parity, 1999 est.).

BALANCE OF TRADE: **Exports:** US$2.5 billion (f.o.b., 1999). **Imports:** US$3.4 billion (f.o.b., 1999).

COUNTRY OVERVIEW

LOCATION AND SIZE. Located in northeastern Europe, bordering the Baltic Sea on the west, the Gulf of Finland on the north, Latvia on the south, and Russia on the east, Estonia has an area of 45,226 square kilometers (17,500 square miles), smaller than New Hampshire and Vermont combined. The capital, Tallinn, is situated on the Gulf of Finland; other major cities include Tartu, Parnu, and Narva. Estonia is the smallest of the Baltic countries (the others being Latvia and Lithuania) that emerged as independent republics when the Soviet Union dissolved in 1991.

POPULATION. The population of Estonia was estimated at 1.43 million in July 2000, with a density of 32 persons per square kilometer (82 per square mile), one of the lowest population densities in Europe. In 2000 the birth rate was 8.45 per 1,000 population, while the death rate was 13.55 per 1,000, giving Estonia a negative population growth rate of negative .59 percent. The government may introduce tax breaks for families with 3 or more children in 2001 in an attempt to increase the population growth rate. Estonia is relatively prosperous and has not experienced any massive **emigration**, yet its net migration rate was estimated at -0.79 migrants per 1,000 population in 2000. The population is also aging, with just 18 percent below the age of 14, and approximately 14 percent older than 65 years of age. The urban population makes up about 73 percent of the total.

Ethnic Estonians, ethnically and linguistically close to the Finns, make up 64 percent of the population, and ethnic Russians (living mostly in and around Narva) form 29 percent of the population. Other minorities include Ukrainians, Belarusians, and Finns.

Ethnic Russians made up only 4 percent of the population before the Soviet Union annexed Estonia in 1940, but Russians **immigrated** in large numbers during the Soviet period of industrialization. After Estonia restored its independence in 1991, only Russians (and their descendants) who had lived in the country before 1940 were granted Estonian citizenship. All others were subject to a citizenship exam testing Estonian language proficiency. Many did not speak Estonian, and by 1998 about 22 percent of the Estonian population was considered foreign (9 percent had Russian or other foreign passports and 13 percent were stateless). In 1998, under pressure from Russia and the European Union, the government eased the citizenship provisions and amended the language law.

OVERVIEW OF ECONOMY

Until World War II, Estonia was poor and mostly agricultural. Its industrial economy was shaped during the Soviet period (1940–91) with the **nationalization** of industry and the collectivization of agricultural land into large state-run farms. Soviet central planning stressed the development of heavy industries. Prior to restoring its independence from the Soviet Union in 1991, Estonia was

the most prosperous Soviet republic. Its policy since independence has focused on building up relations with the Nordic countries, particularly Finland and Sweden, Western Europe, and its Baltic neighbors, while weakening ties with the rest of the former Soviet countries.

Estonia's economic record is among the strongest in Eastern Europe. Although its **gross domestic product per capita** was only US$3,951 in 1998, its total **gross domestic product** grew by over 4 percent in 2000, and expectations for 2001 were for a strong 5–6 percent growth. The Estonian monetary and banking system, which suffered after independence, stabilized with the introduction of a **currency board**. The central bank holds foreign currency reserves to cover all circulation and reserves in krooni. It cannot refinance commercial banks unless there is extreme need, and the government's freedom to take on debt is restricted, as recommended by the International Monetary Fund (IMF). The Estonian kroon was pegged to the German mark at a **fixed exchange rate** of 8:1. Despite the limitations of the currency board, stable finances and economic reforms have created a predominantly free market European-style economy.

Many state-owned assets were **privatized** after independence, and the sale of public companies was still underway in the energy, telecommunications, and transportation sectors in 2000. High levels of **foreign direct investment** have supported the privatization program. Foreign investors in Estonia have been most active in communications, financial services, manufacturing, transportation, and real estate. They have acquired control of local assets relatively cheaply, while increasing the value of domestic companies through capital expenditures. Approximately 60 percent of foreign investments in Estonia are from Finland and Sweden, followed by the United States, Denmark, Norway, Liechtenstein, and the United Kingdom.

In 1998 Estonia began negotiations with the European Union for accession by the end of 2002. It is among the front-runners for membership, with a functioning market economy and the ability to cope with competitive pressure in the single European market. Estonia's **foreign debt** is estimated at a manageable US$270 million. Estonia also receives economic aid from the European Union (US$137.3 million in 1995).

POLITICS, GOVERNMENT, AND TAXATION

Estonia is a democratic republic with the legislative power vested in a Riigikogu (a 101-member **unicameral**, or single-chambered parliament) elected by universal suffrage for 4-year terms. The Riigikogu appoints the cabinet, which is led by the prime minister, who is the head of government. The president, who is elected by the Riigikogu and who appoints the prime minister, has limited executive power. Political parties include the center-right Fatherland Union (Isamaaliit), the Reform Party (RE), the Moderates, the Center Party, the left-centrist Coalition Party, the agrarian Rural Union (KMU), the Country People's Party, and the mostly ethnic Russian United People's Party (UPPE). In 1999 the opposition Coalition Party received the highest percentage of votes (23.4 percent), but the Fatherland Union, led by Prime Minister Mart Laar (16.1 percent), was able to form a coalition with the RE (15.9 percent) and the Moderates (15.2 percent) to win the elections. Particular policies may spur political feuds but the major Estonian parties are committed to economic stability, openness, and EU integration.

Economic reforms have curbed the government's role in the economy due to the currency board regime and the legal requirement of a balanced budget. The **tariff** regime was **liberalized** dramatically by removing import tariffs (excluding agricultural products from certain countries) and by restricting **excise taxes** to several goods. Yet the state exerts considerable influence with the **public sector** accounting for roughly half of gross domestic product and the public consuming over one-fifth of the total gross domestic product.

The average **income tax** burden for citizens was 26 percent in 1999 but the government was trying to reduce it by 2001. Reductions were expected in the form of tax breaks for families with a third child and an increase in

the minimum taxable personal income base. Amendments sanctioning the taxation of dividends and other income earned by foreign companies in Estonia were passed in 2000.

INFRASTRUCTURE, POWER, AND COMMUNICATIONS

The transportation **infrastructure** includes 1,018 kilometers (634 miles) of railroads but only 132 kilometers (82 miles) of electrified rail lines. There are 10,935 kilometers (6,835 miles) of paved roads, including 75 kilometers (47 miles) of expressways. Estonia had 320 kilometers (200 miles) of navigable waterways and 420 kilometers (263 miles) of natural gas pipelines in 1992. All international flights use the Tallinn Airport, and there are several ports on the Baltic Sea, the port of Tallinn being the third largest in the Baltic Sea. A two-thirds stake in the state-run Eesti Raudtee railroad company was expected to be sold in a tender (possibly to RailAmerica) and the second-largest city, Tartu, was also expected to sell its public transportation company AS Liikor to a private investor in 2000.

Estonia's 2 oil-shale power plants produce twice what is consumed domestically. Under Soviet rule the country exported energy to Russia and Latvia but these markets dried up after independence. The government is forming a **joint venture** with the American NRG Energy company to renovate and operate the plants, bringing them into line with international environmental standards, and its priorities include creating an energy connection to western European electricity grids via an undersea cable.

The telecommunications market in Estonia is among the most liberalized in Eastern Europe. In 1998 a 49 percent stake in the state-held Eesti Telekom was sold to a consortium of state-controlled Telia (Sweden) and Sonera (Finland), and the government was considering selling the remainder of its stake in the company. Modern phone lines extend throughout Estonia. There are 3 mobile phone service providers: Eesti Mobiiltelefon (a subsidiary of Eesti Telekom), Radiolinja Eesti (a subsidiary of Finland's Radiolinja), and Ritabell (a joint venture between the British Millicom International and local Levicom). Estonia has the highest number of mobile phone users per capita in Central and Eastern Europe. Eesti Telefon, the fixed line division of Eesti Telekom, had a **monopoly** in domestic and international fixed line calls until 2001. In 2000, it had 521,901 subscribers (36.3 lines per 100 inhabitants), and the 3 cell phone operators had 514,000 users (35.7 per 100 inhabitants). The number of cell phones is expected to grow to 700,000 in 2003, when 1 out of every 2 Estonians is expected to own a cell phone. Estonia has one of the highest numbers of Internet subscribers in Eastern Europe, and the government intends to provide all schools with Internet access. In 2000 over 28 percent of the Estonians were online and 34 percent of them banked over the Internet.

ECONOMIC SECTORS

The economy of Estonia is service-based, with services contributing 65.7 percent of gross domestic product (GDP) in 1999, while industry is responsible for 30.7 percent, and agriculture and forestry comprise 3.6 percent of GDP. Estonia has natural deposits of shale oil, peat, phosphorite, amber, cambrian blue clay, limestone, dolomite, and timber and arable land. Services, especially transportation and tourism, are the principal growth sectors, although the manufacturing and the forest products sectors are also likely to see growth.

AGRICULTURE

Arable land covers 25 percent of the territory, permanent pastures 11 percent, and woodlands 44 percent. The foods produced include animal products, cereals, potatoes, fruits and vegetables, and fish. Agriculture was the traditional livelihood of most Estonians before

Soviet collectivization in the 1940s and there were over 100,000 family-held farms. After independence in 1991 land privatization carved thousands of new private farms out of the Soviet cooperatives. By the mid-1990s, these farms produced nearly 70 percent of the crops and 40 percent of the livestock, but most were unable to afford fertilizers, fuel, seeds, or capital investments. Competition from foreign producers put many farms out of business, and adjusting the sector to EU standards has been controversial. As a result, agricultural output decreased and almost one-fourth of the arable land was abandoned.

INDUSTRY

Traditional Estonian industries include oil shale mining, shipbuilding, phosphates, electric motors, excavators, cement, furniture, clothing, textiles, paper, shoes, and apparel. Many of these industries stagnated after independence, deprived of their Soviet markets and sources of cheap raw materials. Yet the sector has been growing at a rate of 3 percent (1996 estimates), mostly due to the rapid privatization and the entry of foreign (mostly Scandinavian) investors in electronics, cement, chemicals, and forest products. Estonia has developed adequate assembly capacities to supply electronic components to leading Scandinavian telecommunications companies and suppliers. In addition, with its low taxes, low labor costs, and trained workforce, the country is an ideal location for electronics manufacturing. In early 2001 telecommunications giant Ericsson (Sweden), the world's leading maker of telecommunications equipment, sold its loss-making mobile handset operation, dramatically cutting its orders with Elcoteq (Finland). Elcoteq terminated the manufacture of Ericsson handsets in its Estonian subsidiary, Elcoteq Tallinn/ET, which was responsible for one-quarter of Estonian exports in 2000. But Elcoteq quickly refocused on mobile systems components for Ericsson, reflecting its long-term demand. ET continues producing handsets for Nokia (Finland), and will launch systems components production in Estonia later in 2001.

SERVICES

FINANCE. The Bank of Estonia was established in 1990, and became the central bank following its merger with the Estonian branch of Gosbank (the Soviet central bank) in 1992. The early days of independence witnessed a rapid proliferation of banks—42 were started by the end of 1992—when they encountered serious **solvency** difficulties, caused by stagnation and **bad loans** (granted to insolvent private debtors or loss-making state firms). The sector has since been consolidated through mergers and the closure of loss-makers, and in 1998 there were 11 banks. The 4 largest in 1998 were Eesti Uhispank (Union Bank of Estonia), Hansapank, Eesti Hoiupank (Estonian Savings Bank), and Tallinna Pank, and there was only 1 foreign bank branch (Merita Bank of Finland) and 5 foreign bank offices. In 2000 Hansapank and Uhispank were owned, respectively, by Swedbank and SEB (both Swedish). The financial sector is considered modern and efficient. About 10 percent of Estonians banked online in 2000, and since only a few users had credit cards, banks developed other online payment systems.

TOURISM. Boosted by crowds of Finns visiting Tallinn for shopping and pleasure, tourism has grown by 15 percent yearly since 1993. The number of visitors in 1998 was 1.5 million and the revenues US$660 million. In

1998 the number of visitors increased by one-third from the previous year due to the abolition of visa requirements for Nordic countries and the lower costs of travel to Estonia. The government-funded Estonian Tourism Board, besides attracting visitors to Tallinn and Tartu, advertises Estonia's national parks and reserves and its Baltic seaside resorts.

RETAIL. Estonia's **consumer goods** boom is based on economic growth and high consumer confidence. Estonians have a passion for household electronics and, as the absence of customs tariffs keeps imported household appliances cheaper, toasters, coffee makers, and mixers are found in the majority of Estonian homes. Finnish retailers, attracted by liberal regulations, dominate **retail** in Tallinn. Finnish tourists form a quarter of the retailers' clientele, lured by Estonia's lower **value-added tax**. Estonia's clothing is 20 percent less expensive than in Finland; and Estonian food, especially cheese and alcohol, is cheaper. In 2000 Estonia had an upper-income class of about 10,000 and a growing middle-class numbering about 60,000, both fueling domestic retail demand.

INTERNATIONAL TRADE

Estonia benefits from its location between prosperous Finland and Sweden and the economic potential of Russia. Estonians, both Nordic in culture and experienced in working with Russia, can provide a bridge between these growing markets. Estonia's open economy, although constrained by the currency board, is export-oriented, but still unable to reduce its foreign **trade deficit** of about 12 to 13 percent of gross domestic product. Exports in 1999 amounted to US$2.5 billion, while imports stood at US$3.4 billion. In 1999 chief exports included electronic components, machinery, and appliances (19 percent), wood products (15 percent), textiles (13 percent), food products (12 percent), metals (10 percent), and chemical products (8 percent). Estonia's leading export markets were Sweden (19.3 percent), Finland (18.8 percent), Russia (8.8 percent), Latvia (8.8 percent), Germany (7.3 percent), and the United States (2.5 percent). Chief imports included machinery and appliances (26 percent), food (15 percent), chemical products (10 percent), metal products (9 percent), and textiles (8 percent). Leading suppliers of imports were Finland (23 percent), Russia (13.2 percent), Sweden (10 percent), Germany (9.1 percent), and the United States (4.7 percent).

MONEY

The currency board and the requirement for a balanced budget has prompted Estonia to establish an offshore stabilization fund where it deposits income above its expenditures. Such revenue comes from privatization, including the initial public offering of Eesti Telekom at the Tallinn Stock Exchange in 1998. The 2 largest banks, Hansapank and Uhispank, acquired by Swedish financial institutions, opened their own brokerage houses that fueled the boom of the Tallinn Stock Exchange after 1998. Swedish SEB and Swedbank have also made Estonia a center of financial consolidation in the Baltics as they target the largest Latvian and Lithuanian banks for acquisition. **Inflation**, which had been a serious problem in the years immediately following independence, has been tamed since the mid-1990s and was estimated at 3.3 percent a year in 1999.

POVERTY AND WEALTH

Under the Soviet regime, Estonia was arguably a land of economic equality and the most affluent republic of the Soviet Union. The vast majority of the population was state-employed, no private initiative was allowed, and government funds were allocated equitably (for free health care, higher education, pensions, and other benefits). The only exceptions to this modest standard of living were the **nomenklatura** (the **Communist** Party elite) and the **informal economy** players. Market reforms in the 1990s generated new poverty and wealth, however. Unemployment, hitherto unknown, increased, although not as dramatically as elsewhere in the region. Social benefits suffered from inflation in the early 1990s. The withdrawal of the Russian military from the territory

SOURCE: *2000 World Development Indicators* [CD-ROM].

and the breakup of collective farms deprived many Estonians of their livelihood.

At the same time, many entrepreneurs made fortunes and a new middle class started taking shape as privatization and free initiative changed economic rules. Estonia generally avoided the surge of corruption and crime that plagued other Eastern European countries. In 1995 its **Gini index** (measuring economic equality with 0 standing for perfect equality and 100 for perfect inequality) was 35.4—more equitable than the United States, but much less equitable than most Eastern European countries and Nordic countries. Although extreme poverty in Estonia was nowhere near the size in other Eastern European countries, 6.3 percent of its population lived below the poverty line in 1994. As a country with an aging population, Estonia is struggling to maintain its pension system, and the government is formulating a much-needed pension reform.

WORKING CONDITIONS

Estonia is party to all major universal and European legal instruments on economic and social rights, the rights of the child, the right to equal compensation and collective bargaining, and the elimination of discrimination in the workplace. The Estonian **labor force** numbered 785,500 in 1999. Unemployment is around 10 percent, yet working conditions are considerably better than in many other Eastern European countries. The labor force is skilled and educated and the average salary in 1997 was US$257 a month (US$322 in the manufacturing sector), a fraction of the rate elsewhere in Scandinavia but higher than most Eastern European countries. The percentage of people working in the services industry was 69 percent, industry 20 percent, and agriculture and forestry 11 percent. Labor unions have limited influence and have a non-confrontational approach to government and employers. With a decreasing and aging population, Estonia faces serious demographic challenges. Many labor practices are inefficient and improving productivity is key for Estonia's economy.

COUNTRY HISTORY AND ECONOMIC DEVELOPMENT

1561. Estonia is subjugated by Sweden; reforms improve the economic situation of the peasants.

1721. Estonia is ceded to Russia's Peter the Great.

1816. Russian reforms abolish serfdom, and peasants obtain the right to buy land. Nationalism grows.

1905. In the wake of the first Russian revolution, nationalism is boosted by modern press and literature.

1917. The Russian tsar is toppled by the second Russian Revolution.

1918. On February 24 an independent Estonian democratic republic is proclaimed.

1920. The Tartu peace treaty between Soviet Russia and Estonia recognizes Estonia's sovereignty.

1921. The Estonian Republic is recognized by Western powers, becoming a League of Nations member.

1934. A coup establishes an authoritarian regime.

Household Consumption in PPP Terms

[b]Includes government and private expenditures.

SOURCE: World Bank. *World Development Indicators 2000.*

1939. Estonia is left in the Soviet sphere by a non-aggression pact between Germany and the USSR.

1940. The Soviets invade Estonia and on August 6 the country is incorporated into the USSR.

1941. Nazi Germany invades the USSR and occupies Estonia until it is driven out in 1944.

1945. Soviet rule is restored and the economy is reformed along Soviet lines.

1985. With the reforms of Soviet president Mikhail Gorbachev, Estonia moves towards independence.

1991. Communist rule collapses and the USSR recognizes the independence of Estonia in September.

1991. Estonia becomes a member of the United Nations and adopts reforms for democratization and privatization.

1994. Russia withdraws troops from Estonia.

1995. Estonia becomes an associated member of the European Union.

1998. Estonia starts negotiations for full membership in the European Union.

1999. Estonia joins the World Trade Organization.

FUTURE TRENDS

Estonia is a leading candidate for EU membership and hopes that its accession could be finalized as early as 2002, although internal problems in the union may postpone it. Political consensus on EU accession will generate stability throughout the transition from a communist to a free-market economy. Gross domestic product growth may accelerate slightly in 2001 due to domestic demand. Exports will grow in line with international demand but the negative foreign trade balance is not likely to be offset in the first half of the decade. The Estonian economy will become more service-based and financial services will receive more weight. Domestic manufacturing will be dependent on the high-tech sector in Sweden and Finland and is likely to grow. Privatization may be almost completed with the railroad sale in 2001. New foreign direct investments will enter Estonia and the flow will increase when the country joins the European Union. Reform of the finance services sector may lead to a further rise in credit growth. Pension reform will be key in 2001 with the government making its new pension scheme obligatory for all new employees. The living standards of the Estonians will rise gradually after the country's EU accession. Access to the development funds and the expertise of the European Union, once full membership is achieved, will be greatly beneficial for the development of the country's infrastructure, rural regions, education, social services, and virtually all aspects of economic life.

DEPENDENCIES

Estonia has no territories or colonies.

FINLAND

Republic of Finland
Suomen Tasavalta

CAPITAL: Helsinki.

MONETARY UNIT: The markka (FMk or FIM) or finnmark. One markka equals 100 penni. Banknotes come in denominations of FMk20, 50, 100, 500, and 1000. There are 1, 5, and 10 markka coins, and 1, 10, and 50 penni coins. The markka will remain in circulation until 28 February 2002, when it will be completely replaced by the new European currency, the euro. The exchange rate for the euro is 1 euro=5.94573 markka.

CHIEF EXPORTS: Machinery and equipment, chemicals, metals, timber, paper, pulp.

CHIEF IMPORTS: Foodstuffs, petroleum and petroleum products, chemicals, transport equipment, iron and steel, machinery, textile yarn and fabrics, fodder grains.

GROSS DOMESTIC PRODUCT: US$108.6 billion (purchasing power parity, 1999 est.).

BALANCE OF TRADE: **Exports:** US$43 billion (1998 est.). **Imports:** US$30.7 billion (1998 est.).

COUNTRY OVERVIEW

LOCATION AND SIZE. Located between Sweden and Russia, Finland also borders the Baltic Sea, Gulf of Bothnia, and Gulf of Finland. Finland's area, at 337,030 square kilometers (130,127 square miles), is slightly smaller than the state of Montana. Finland shares a long border of 1,313 kilometers (816 miles) with Russia, 729 kilometers (453 miles) of border with Norway, and 586 kilometers (364 miles) of border with Sweden. The remaining 1,126 kilometers (700 miles) of its boundary is coastline, excluding islands and coastal indentations. The capital, Helsinki, is the northernmost national capital in Europe, but it is found in the south of Finland, as are the majority of its 94 towns. Finland also includes the island province of Åland, located between Sweden and Finland. The islands are locally autonomous, have their own government, and are entirely Swedish-speaking.

POPULATION. The population of Finland was estimated in July of 2000 as 5,167,486. The population growth rate is a very small 0.17 percent and generally has been small. Finland has a high proportion of elderly: only 18 percent of the population are under 14 years of age and 15 percent are over 65.

Finland is extremely homogenous. Ethnic Finns make up 93 percent of the population, ethnic Swedes 6 percent, and the rest is mainly made up of the Sami (also called Lapps), Roma, and Tatar. There are 2 official languages: Finnish (spoken by 93 percent of the population) and Swedish (by 6 percent). Due to the harsh climate in the north, population is concentrated in the lowlands in the south of Finland. Approximately 81.2 percent of Finns live in urban areas with around 1 million concentrated in the capital, Helsinki, and its metropolitan area.

Formerly a source of emigrants (people moving outwards from a country), Finland is currently becoming a destination for immigrants (people who move into a foreign country). In 1996, the number of foreigners living in Finland was 74,000, with Russians accounting for about 20 percent, followed by inhabitants with Estonian, Swedish, and Somali former citizenship.

OVERVIEW OF ECONOMY

Finland is a free market economy that is highly dependent on international trade. Around 1900, agriculture, especially forestry, was Finland's economic backbone, as trees were Finland's chief natural resource. The more arable southern provinces of Finland have always had higher population density and have dominated the agricultural economy. Finland now has a technologically advanced economy, in high-tech forest production, electronics, and other manufacturing. But the southern regions continue to dominate in population and productivity.

The late 19th century saw the heavily forested country first investing in sawmills and timber, followed by wood pulp and paper production. Wealth from the timber industry was used to invest in making the machinery for the pulp and paper industry. Technical know-how and growth in metalworking and engineering facilities enabled Finland to expand into metal shipbuilding after World War II. Combined with forest products, this industry led the economy until the mid-1990s. In the 1990s, high-tech electronics came to the foreground, with Finland currently the world leader in mobile-phone manufacture. Finland also produces high-tech instruments for environmental measurement and medical devices.

A strong focus on research and development (R&D) and cohesion between government, industry, and workers has helped economic development, especially in the past 50 years. The government's support and coordination of high-tech R&D began as early as 1983 when it founded the Technology Development Center (TEKES). TEKES is the principal organization in Finland for implementing technology policy. In 1984, one year after TEKES was founded, a small business called Nokia switched its focus to high-tech mobile phone production and became the largest mobile phone company in the world. Nokia's growth drove production in the manufacturing sector unlike many European economies, expanded its share of **gross domestic product** (GDP) throughout the 1990s. TEKES has also had an effect on agriculture through its support in 1997 of research into developing functional foods (foods with proven health benefits, often additives and substitutes that are less dependent on the quality of farming land than on the quality of the R&D **infrastructure**).

As in most other developed nations, the Finnish service sector has in recent years become the highest-producing sector in the economy and accounted for 63 percent of the GDP in 2000. Business services, data processing, and transportation are all key service industries, with expansion in business and financial services especially driven by new technological developments, expanding into Internet and Internet Technology (IT)-based services. Public services, primarily health care and education, are also important and employed 32 percent of the **labor force** in 2000.

A **welfare state** is made up of institutions reflecting the responsibility a government has assumed for the well-being of its citizens. In Finland, Europe, and most of the developed world, a welfare state includes health care, education, social security, and unemployment. In Finland, the extent of the welfare state is smaller than those of other Nordic countries, but it still accounts for over half of the GDP.

Finland's proximity to Russia, and formerly to the Soviet Union (USSR), has powerfully affected Finnish economic development. In the early years of the USSR, political differences prevented much trade. Yet Western European demand, especially for lumber, pulp, and paper, supported the forestry industry at that time. During World War II, Finland joined the Axis powers, partly in order to prevent partial annexation by the Soviet Union. After the war, Finland had to pay reparations to the Soviet Union, who required mainly industrial products. This requirement forced Finland to develop a substantial metal and engineering industry. After reparations were completed in 1952, trade with the USSR continued through a **barter system**, characterized by an exchange of goods for energy since Finland lacked natural fuel resources. Finland was the only free-market member of the Council of Mutual and Economic Assistance (COMECON),

an economic and development cooperative association formed in 1949, which was otherwise composed of **socialist** states. Finland was able to use its good relations with socialist states as a economic buffer against downturns in the Western market. Finland did not hesitate to link itself to Western markets as well, which helped its position as a trade gateway to the USSR. Finland joined the Organization for Economic Cooperation and Development (OECD) in 1969 and the European Free Trade Agreement (EFTA), a predecessor to the European Union (EU), in 1986. However, the USSR, as Finland's closest neighbor, remained a large and influential market, and its collapse in the early 1990s worsened Finland's already severe **recession**.

Deregulation of Finnish financial markets in the 1980s led to a domestic credit boom, which collapsed in the early 1990s, leading to stock and real estate market speculation and crashes. Finnish observers called this experience "casino economics": an economy becomes dependent on speculation (first seen as a sign of growth) and speculation runs out of control. The chief casualty was productivity and employment; the GDP fell by about 15 percent in 3 years while unemployment skyrocketed to 20 percent. The recession lasted until 1993, when Finland devalued its currency. This action allowed the nation to improve its export sector, especially through growth in manufacturing high-tech electronics and expansion of its export market for paper goods into the newly-booming Asian economies.

During the recession from 1990 to 1993, the Finnish government began accumulating **external debt**, which peaked at nearly 60 percent of the GDP in 1994. There has only been a partial recovery from the recession, with high unemployment lingering and debt continuing to increase. The currency **devaluation**, however, helped economic growth rebound, and by 1996 the GDP had recovered to pre-recession levels. The flourishing high-tech industry, led by the cellular phone manufacturer Nokia, was at the center of export-led growth. In 1998, Nokia alone accounted for 1 percent of Finland's approximately 5 percent growth of the GDP. Growth was fairly steady through the second half of the 1990s, except for a slight recession in 1998 that was mainly due to the slump in many Asian economies that were importers of Finnish goods and services.

In 1999, central government debt was 45.4 percent of the GDP. Since joining the European Monetary Union (EMU) in 1999, Finland has been required to reduce its debt. Even before its membership, partial **privatization** of many state-owned businesses, such as the telecommunications provider Sonera, helped to create revenue from the sale of shares. However, public debt is still high and has been increasing, posing a continued economic challenge into the 21st century.

POLITICS, GOVERNMENT, AND TAXATION

Finland is a parliamentary republic, with a president and a prime minister. The president is elected by popular vote for a 6-year term. The prime minister and a deputy prime minister are nominated by the president after the parliamentary elections, and the Eduskunta (parliament) must approve the president's nominations. The prime minister nominates ministers for the Council of State, or Valtioneuvosto (also simply called "the Government"), which is divided into 13 ministries overseeing various aspects of government. Nominations are approved by the president, and responsible to the Eduskunta.

The Eduskunta is responsible for legislation. Members are elected popularly under a system of **proportional representation** (voters elect parties, who have a number of seats in government related to the percentage of votes they receive). The election on 15 April 1999 put 10 parties in the 200-member Eduskunta. The Social Democrats (SDP) received 25.5 percent of the votes cast, the Center Party 23.5 percent, and the National Coalition (Conservative Party) 23 percent.

Women do not participate equally in government, but Finland's showing is better than most countries in this respect. In 2000, about 35 percent of the Eduskunta and 33 percent of the Cabinet were females. The Ministers of Foreign Affairs and Defense were female, as was the Speaker of Parliament. By comparison, in the United States women held 12 percent of the Congressional seats and 41.4 percent of the Cabinet seats in 2000.

The SDP has been the largest party in the legislature in almost every election since 1907. Its main base of support is skilled laborers, lower-class white-collar workers, small farmers, and professionals. It is also the closest party to the labor unions. SDP supported Finnish membership in the EU and voted in favor of Finland's entering the EMU in 1999. The National Coalition (also called Conservative Party, Kansallinen Kokoomus or "the Kok"), mainly represents private enterprise and the business community. The Kok strongly supported EU membership, favors limited spending, deregulation, and lower taxes but is still in favor of the welfare state. The Center Party has in recent years been split on the EU question, and it opposed Finland's joining of the EMU in 1999. Many of its voters live in rural areas, and the party especially represents agricultural interests.

In 1990, a conglomeration of socialists, ex-communists, and disenchanted Social Democrats, who believed that the SDP had compromised on social issues and international human rights, formed the Left Wing Alliance. There has been pressure on the government to cut costs and spending, and it has been difficult for the Alliance to remain in government alongside the Social Democrats and

Conservatives. The long-established minority of Swedish-speaking people is represented by the Swedish People's Party (RKP), which consistently receives 5 to 6 percent of the vote and has a strong base of support in the Åland islands. The RKP generally supports center-right causes and also was in favor of EU membership. Since the party is able to compromise with both socialist and non-socialist governments, its swing vote has been used to protect Swedish-speaking community interests. As of 2000, Finland had the first Green Party in government in all of Europe. The Greens strongly oppose nuclear energy but favor a moderate approach to key economic issues such as forestry, taxation, and the welfare state. They have strong appeal to young, urban voters and to women. Of the party's 9 Eduskunta members, 6 are women.

Many other small parties in Finland also influence debate, although few make it into the Eduskunta. As in other Nordic countries, public debate in the 1990s and beyond is more likely to include a few voices from some extreme right-wing parties, some of which argue for tightening borders against immigrants and refugees, others for abolishing taxes and regulations on business.

Indirect state management of the economy is aided by regular meetings with representatives from industry and trade unions, as well as incentive programs that the government uses to promote investment in areas deemed to be in need of development. The programs include cash grants, loans, tax benefits, and investments in **equity**, guarantees, and employee training. One institution that demonstrates the Finnish government's ability to influence the economy in this way is the Technology Development Center (TEKES), founded in 1983 to fund R&D in technology. TEKES set the stage for advances and innovation in Finnish technology in the early 1980s and business in the 1990s. The government continues to invest in this direction, contributing almost one-third of the total spending on R&D in 1999. Total R&D spending in Finland is higher than in most other highly advanced economies like the United States and Japan; it was estimated at FMk22,334 million (including private investment) in 1999, or around 3 percent of the GDP. R&D expenditure had risen in real terms by almost 15 percent from the year before.

In Finland, 3 of the 10 largest companies were majority state-owned in 1998; "majority state-owned" means that the state has a majority of share-determined votes, ranging from 53.4 percent control to total control. State ownership occurs mainly in metals and mining, chemicals, and utilities. These companies do not receive **subsidies** or special treatment, and private companies are not excluded from these sectors (with the exception of Alko, the state's **monopoly** on liquor sales). Sonera, a telecommunications company, was the largest state-owned company in 1999, but it competes like any other firm in the market. In addition, the state is authorized to sell off all of its remaining shares in Sonera and is likely to do so. The state still owns significant shares in metals and mining, chemical, and utility companies, as well as Finland Post and the Finnish State Railways. Total state ownership has become rare. In November 2000, among the 15 most significant state-owned companies only Patria, a defense company; Vapo, a peat manufacturer; and Alko were 100 percent state-owned.

Until the 1970s, Finland also had a much smaller **public sector** (as a percentage of the GDP) than its neighbors. In fact, the ratio of the public sector to the GDP did not approach the rest of Scandinavia until the recession of 1990 to 1993, when the overall GDP shrank dramatically. Rather than increase spending, Finland simply did not decrease it at the rate that the other sectors had declined, so its share of the GDP overall was increased. When recovery began, the public sector grew, although still at a slower rate than other Scandinavian countries. The public sector in 1998 employed almost one-third of the population and accounted for well over half of the GDP.

The state may help to provide a new direction for Finnish agriculture, which has been challenged by EU requirements, by funding R&D for agricultural products in the "functional foods" category. The EU agricultural regime has led to falling domestic prices (as they must be on par with EU levels) and fiercer competition from EU agricultural imports. Most Finnish producers still supply the same amount of goods to the Finnish market but have thus far seen significantly lower profits.

Taxes are the government's main source of revenue. Total central government tax revenue in 1999 was FMk188,499 million, about 32 percent of which came from income and property taxes, and 32 percent from **value-added tax** (VAT). In the 1990s, Finland lowered and adjusted its VAT, especially after EU membership, since VAT rates must eventually harmonize with the EU taxation system. The standard Finnish VAT in 2000 was 22 percent, the VAT on foodstuffs and animal feed was 17 percent, and there was an 8 percent rate for entertainment events tickets, passenger transport, pharmaceuticals, and books. Personal **income taxes** are quite high; the highest bracket was officially 34.9 percent in 1999. Both the OECD and the International Monetary Fund (IMF) have urged Finland to cut its income tax to encourage employment. Corporate taxation is 29 percent, giving Finland one of the lowest rates among OECD countries, along with Sweden and Norway. To replace revenue lost from income tax and VAT reductions, the government has been imposing "green taxes," or taxes supporting environmental regulations. In 1995, over 6 percent of tax revenue came from environment-related taxes (approximately 3 percent of the GDP).

INFRASTRUCTURE, POWER, AND COMMUNICATIONS

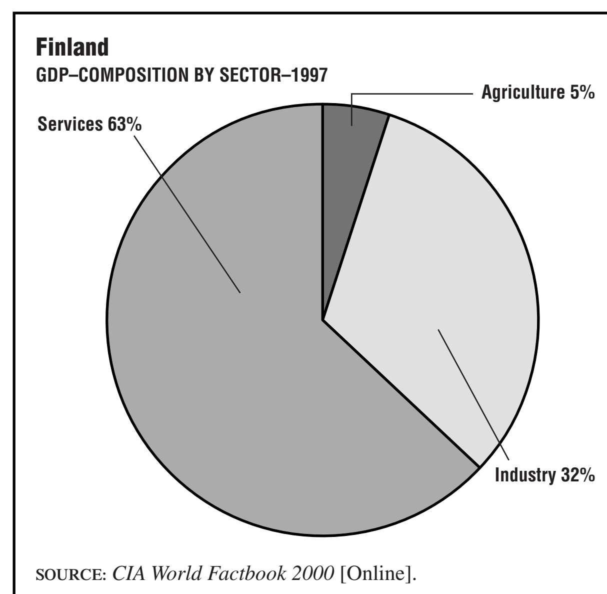
Finland has an efficient road and rail network, despite its only becoming fully developed in the mid-20th century. As late as the 1940s, difficult terrain and harsh weather had made internal communications and transport problematic. After World War II, steady improvements in infrastructure led to the current situation. By 1998, Finland had 77,895 kilometers (48,404 miles) of highways, including 473 kilometers (294 miles) of expressways. Bridges and car ferries assisted road travel in the lakeland areas and in the island archipelagoes. The gauge of Finnish railways is the same as Russia's, which enhances Finland's position as a trade gateway to the Russian region. However, Finland's 5,685-kilometer (3,533-mile) rail network is uneven, better serving the economically dominant southeast regions. Finland's sea communication and transport is extensive, with over 50 ports and loading places and 23 seaports open year round. Finland also has 157 airports and a state airline, Finnair. International air service is provided through Helsinki airport.

Finland produced 75.30 billion kilowatt hours (kWh) of electricity in 1998, of which fossil fuel comprised 41.62 percent, hydroelectric power 19.59 percent, nuclear power 27.59 percent, and other sources 11.2 percent. Total consumption was 79.28 billion kWh in the same year, or over 15,000 kWh per person, almost two-thirds higher than the average per capita consumption for the EU. This is due especially to the long Finnish winter and the high energy consumption of the paper and pulp industry. Finland relies on nuclear energy and imported hydrocarbons for almost 50 percent of its power, while imported fossil fuels make up the rest. Finland exported only 300 million kWh of electricity in 1998, while importing 9.55 billion kWh.

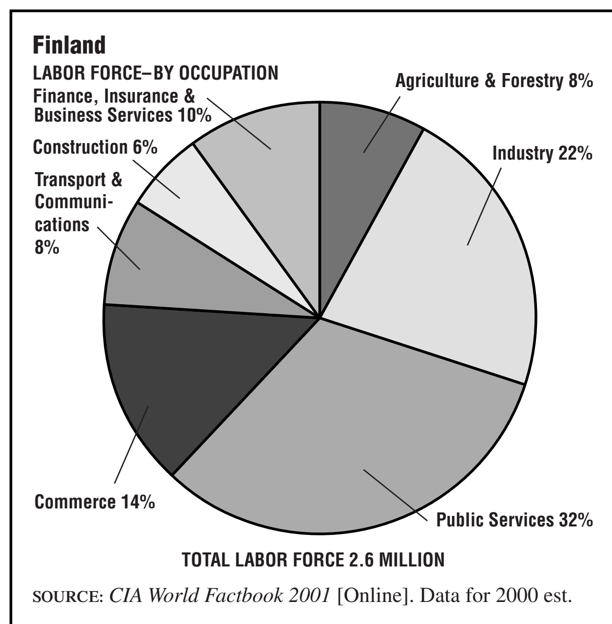
Finland's telecommunications system is cutting-edge and extensive, with 2.86 million main telephone lines in 1997 and 2,162,574 mobile cellular phones. The half-state-owned Sonera is the main telecommunications provider as of early 2000. Finland is famous for its quick adoption of cellular phone and wireless technology. About 60 percent of Finns had mobile phones in 1999, compared with 28 percent in the United States. Nokia, along with dominating domestic mobile phone sales, also supplies almost a quarter of the world's mobile-phone market. Internet connectivity is also very high, with more Internet service providers (ISPs) per person than any other country in the world. The telecommunications industry was fully deregulated by 1995, and subsequent laws have allowed telecom companies to share lines and have eased entry into the sector by eliminating the licensing requirement previously needed to construct a fixed telephone network. Phone **tariffs** are among the lowest in the EU.

ECONOMIC SECTORS

In 2000, the balance between Finland's economic sectors was consistent with those of most OECD nations,



SOURCE: *CIA World Factbook 2000* [Online].



SOURCE: *CIA World Factbook 2001* [Online]. Data for 2000 est.

with agriculture contributing 5 percent to the GDP, industry 32 percent, and services 63 percent. However, until the 1960s, Finland relied much more heavily on agriculture than its neighbors. It was partly the pressure of post-World-War-II reparations to the USSR that forced Finland to build and expand its industrial base. Finland's 1999 accession to the EMU has further shifted the emphasis from agriculture and has forced the end of many subsidies to farmers. In more recent times, growth in the various sectors also has set Finland apart from its neighbors and most of the OECD countries, as manufacturing (especially high-tech products) expanded more quickly than the service sector.

The U.S. Department of Commerce identifies milk production as "the backbone of the Finnish agriculture industry." In 2000, Finland produced 2.5 million units of milk, about 0.44 percent of world milk production. Dairies and egg farms produce more than Finland needs to feed itself, while Finnish meat production roughly equals consumption. Membership in the EU has deeply affected the agriculture industry; in 1996, producer prices fell more in Finland than in any other EU country. In 1997 food prices averaged 11.2 percent lower than in 1994 (prior to EU membership). Finnish producers had to reduce prices to EU levels, especially facing competition from agricultural imports of the union's members. A new focus for agriculture is research into specific enzymes and bacilli that have health and commercial use, with the raw products of the dairy and forestry industries (milk and trees) providing some of the raw material. Finland is also basically self-sufficient in meat production.

Finland's high-tech, highly productive forestry industry overlaps and links the agriculture and industry sectors. Finland has the world's highest per capita forestry production, twice that of Sweden and 3 times that of Canada. With about 70 percent of its area covered by forests at the end of the 20th century, Finland's use of its most abundant natural resource provides the materials for Finland's industrial wood-processing industries. Finland supplies 25 percent of the world's exports of printing and writing paper and 15 percent of the world's paper and paperboard exports.

From 1993 to 1998, industry's share of the GDP rose from 31.3 percent to 33.8 percent. Manufacturing dominates this sector, with output in 1999 worth FMk504.9 billion. Nokia, the cellular phone maker, has been the main engine of Finnish industrial growth in the late 1990s. In 1998, Nokia alone contributed 1 percent to Finland's 5 percent GDP growth. However, there is some concern that Nokia holds too much responsibility for the sector and the economy. It is far and away the largest firm in manufacturing, with no other company even approaching its level of production and employment. Other branches of manufacturing in general have not seen similar growth. Unlike many other developed nations, where the service industry is often the main sector for growth in employment, Finnish industry has been the biggest job creator, especially manufacturing.

In the service sector in 1997, government services make up nearly one-third of all service sector activity. Many private services, especially business and IT services, are growing at a faster rate than public services. The production of private services increased by almost 5 percent in 1997 and has been steadily growing since the mid-1990s, with telecommunications and service to businesses marking the fastest-growing sectors. However, unlike in other OECD countries, the service sector's share of the GDP and employment has not increased as quickly as manufacturing. New jobs in the service sector are mainly created by manufacturing, which outsources many of its production-related services.

AGRICULTURE

Finland's severe winters; short, frost-interrupted growing seasons; and relatively scarce and acidic arable land has made agriculture a continually tough endeavor. Before the end of the 19th century, Finland was so isolated from the rest of the world that its farmers focused on grains to feed the local population. In the 1880s and 1890s, cheap grain from Russia and the Americas began to flood the market, while simultaneously, dairy products began to be in more demand domestically and abroad. Finnish farmers began to use the imported grain to feed dairy cattle and other livestock, a pattern that has persisted to the present. Arable land is nearly always combined with forests, which cover approximately 70 percent

of Finland. Most farms have survived by a combination of farming and forestry. Farms in the more arable south and west focus less on forests than those in the more wooded north and east.

Productivity has increased and the number of farms has decreased since the 1960s. This is partly due to advances in agricultural technology, which required fewer people on the land, and partly to the expansion of the industry and services sectors, which have attracted people towards factories and the city. The traditional Nordic emphasis on family farming has meant that the image of the family farmer is a culturally heroic figure, which may have helped farmers resist the urge to set up huge impersonal **agribusinesses**. In 1999, average farm size in Finland was only 25 hectares (62 acres). The Finnish tradition of cooperative organization has meant that small farms coordinate marketing, transportation, and processing of agricultural and forestry products. Finland's desire for self-sufficiency in basic foodstuffs supported a system of subsidies for the remaining farmers, until the 1995 accession to the EU forced price equalization. Equalization meant a 50 percent or larger reduction in many producer prices. The price of a kilogram of eggs, for example, fell by over 75 percent in 1995. Finland's own budget had to try to cushion the blow, but during the first 3 years of EU membership over 10 percent of Finnish farmers gave up farming. Currently only 4 percent of the population engage in farming. Of the agricultural products exported, dairy products topped the list in 1998. Finland is a net importer of agricultural products, with a total value of agricultural exports of US$1.31 billion and imports worth US$2.3 billion in 1998.

Since the decline of other agricultural production in the past decades, forestry is now the most significant contributor to agricultural production, with a **turnover** in 2001 of around FMk10 billion. Due to improvements in management and harvest techniques, Finland's timber reserves have increased by over 25 percent since the 1970s. Much of its forest production goes to its industrial sector to make paper products, while a significant percentage goes to create wood products like furniture as well. Finland produces 5 percent of global forestry goods, and its printing and writing paper exports are 25 percent of world production.

Finland's fur industry dominates the world market for farm-raised foxes, accounting for over half of global fox pelt production in 1997 with revenues of US$2.55 million. Finnish mink furs also have a high reputation on international markets. Commercial fishing, once quite important to the economy, has gradually become less significant, currently accounting for only 0.1 percent of the GDP. The decline can be attributed to river pollution and dams built for hydroelectric works, which have adversely affected natural spawning habits.

INDUSTRY

METALS AND ENGINEERING. Metals and engineering now constitute the largest sector of Finnish industry, with motor vehicles and machinery driving much of the growth of the late 1990s. In 1999, mechanical engineering and metals manufacturing industries employed 187,175 people, and total revenues reached around FMk123 billion.

Finland holds a leading international position in the building of icebreakers, luxury liners, and other specialized ships. The are only 2 main ship building companies, Masa Yards and its rival, Finnyards, both dominated by Norwegian companies. Masa Yards was bought by the Norwegian firm Kvaerner in 1991 and Aker Maritime, another Norwegian firm, bought 60 percent of the shares in Finnyards in 1997. Both companies have specialized in niche markets in shipbuilding, which has helped them survive in an over-saturated global market. Finland's strong pollution control and other environmental laws, plus neighboring countries' environmental concerns and support from TEKES and other research organizations, has led Finnish industry to specialize in environmental technology. Finland made US$1.45 million of environmental equipment in 2000, much of it used by Finland's own pulp and paper industry.

INDUSTRIAL FORESTRY. Finland's abundance of forestry products is the historical heart of the Finnish export industry, accounting for almost 30 percent of total exports—although only 2.4 percent of the GDP—in 2001. There was record growth in nearly every aspect of forest industry in 2000. Total forest production increased by nearly 5 percent. Plywood production rose the fastest—over 8 percent compared with the previous years, with total production of about 1.2 million cubic meters. Sawnwood production rose by nearly 5 percent in 2000 to 13.3 million cubic meters. Paper and paperboard production reached 13.5 million tons, 4.3 percent higher than in 1999. Turnover in the forest industry in 2001 was worth FMk100 billion. In 1998, forest industries employed 95,886 people. Stora-Enso, the largest group in this sector, is the second largest producer of newsprint products in the world and had revenue of over FMk75 billion in 2000.

ELECTRONICS AND ELECTRO-TECHNICS. The electronics and electro-technical equipment industry employed 63,700 people and had revenues of FMk114.6 billion in 1997, while high-tech products accounted for almost 26 percent of total export value by 1999. The majority of growth in this industry can be attributed to the mobile-phone manufacturer Nokia. Nokia originated as a pulp and paper concern but began investing its profits in high-tech research in the early 1980s and is now one of the leading mobile phone manufacturers in the world. Nokia is an example of Finnish industry's emphasis on

R&D; it spent almost 9 percent of its turnover on R&D in 1999. Nokia, however, is the only high-tech company in Finland with a significant market share, unlike Sweden, which has a range of companies in competition. This means that growth in this industry is dependent on Nokia's fate, a risky situation.

CHEMICALS. The third largest industry in Finland, the chemicals industry, had a value of FMk56 billion in 1999, which was over one-tenth of the total value in Finnish manufacturing. The chemicals industry focuses on a number of core areas, including chemicals for the forest industry, agribusiness, and other industries, as well as paints, plastic products, environmental products, petrochemicals and oil products, and most recently biotechnical products. Finland's strong environmental consciousness has fuelled not only innovation in chemicals to help the environment—Finland was the world's top producer of water treatment chemicals in 2000—but also environmentally conscious business practices. In 1992 Finland joined a voluntary international program called Responsible Care, which is an environment, health, and safety initiative operating in 45 countries. Although only 12 percent of chemical firms have signed on, some of Finland's largest producers are members, meaning that over 80 percent of chemical production is covered by the initiative. Members commit themselves to continuous improvement in performance regarding environment protection, health, and safety and to open communication about activities and achievements on these issues. Some effects can be seen in the 60 percent drop in employee accident rates over the past 10 years, while emissions also fell significantly in 2000.

The recent growth of the electronics industry has spurred the production of plastic components and packaging for electronic equipment. In 1999, the chemical industry in total employed almost 39,000 people, or 9 percent of the total industrial workforce.

FOOD AND BEVERAGES. The Finnish food industry is a good example of how Finnish industry might grow throughout the 21st century. Finland has begun expansion into the niche market of "functional foods," researching and developing naturally-derived food additives which are deemed to have health benefits. One of the more well-known is xylitol, a sweetener derived from the birch wood chips of Finland's forests that has been shown to prevent tooth decay. Xylitol can be found in many chewing gums and as a sweetener in some medicines. The Finnish company Xyrofin is the market leader in producing xylitol; its predecessor Suomen Sokeri patented the industrial manufacturing method for xylitol in 1972. The more traditional sectors of the food and drink industry are also based on processing and refining raw materials and, in 1998, employed 40,700 people to produce a total output worth FMk49.3 billion. Meat processing accounts for over one-fifth of the total **value-added** sector, followed by beverages and dairy products. Russia, despite its economic troubles, is still a primary destination for food and drink exports. In 1997 Finnish food and drink industries sold Russia around 336 million euro worth of goods.

CONSTRUCTION. The construction industry faced a severe slump in the early 1990s. In 1994, commercial construction was less than 25 percent of what it had been in 1990. The decline in production reversed in 1997, partly due to government subsidies intended to rescue the industry. While a more recent economic boom has led to housing shortages in the Helsinki metropolitan area and a correspondingly high demand for house-building there, there is still little construction in other regions. In 1997, construction accounted for 5.1 percent of the GDP, employed 105,000 people, and produced FMk69 billion in revenues. Much of the construction work was exported to Russia, which in 1997 accounted for 25 percent of the construction industry's exports. The growth in construction is expected to continue, and there is some hope that it will spread outside of the city.

SERVICES

RETAIL AND WHOLESALE TRADE. Sales volumes in trade and commerce increased 5 percent in 1997, especially the purchase of vehicles, construction materials, and household appliances. **Retail**, wholesale, hotels, and restaurants accounted for a little over 12 percent of the GDP in 1998. The sales industry is very concentrated, with huge supermarkets accounting for over half of all retail outlets for everyday goods. Approximately 217,000 people were employed in retail and wholesale trade in 1998. The major Finnish wholesalers and importers are Kesko Oy, SOK-chain, and Stockmann Oy. Each company also has its own retail operation, each including several department stores and separate chain stores. Kesko, a wholesale and supermarket chain, had a turnover of FMk35.6 billion in 1998, which was 8 percent of total revenues (FMk440 billion).

TRANSPORTATION. Transportation and communications accounted for 10.2 percent of GDP in 1998. The increase of exports and industrial production in the second half of the 1990s raised demand in land, rail, and water transport and output grew by 8 percent in 1997. Road transport dominates domestically as 93 percent of passenger traffic and 67 percent of goods transport take place on the dense network of Finnish roads. The railway sector is currently state-owned, although discussions are underway to allow other companies to use the rails for moving freight. There are currently no plans to privatize the Finnish railway company, which provides long-distance passenger transport. Shipping is important

for Finland's international trade; in 1998 total shipping (imports and exports) between Finland and other countries totaled 76.59 million tons. Of that, two-thirds were shipped to other EU countries, 18 percent to Germany, and 16.4 percent to Sweden. Domestic shipping totaled 12.88 million tons, up from 11.85 million tons in 1997. Due to Finland's extremely cold winters, Finnish shipbuilding and shipping is dependent on the building and use of icebreakers. Total employment in the transport sector was 154,000 and total turnover in the same year was FMk440 billion.

TELECOMMUNICATIONS. Telecommunications contributed only a little over 2 percent to the GDP in 1997; however, it is the existence of a large, inexpensive, extremely sophisticated and efficient network that has enabled almost every other industry to grow. The telecommunications sector was fully opened to competition in 1995, and the government passed a series of laws to increase the flexibility of telecommunications operators sharing and trading access to infrastructure. The government also eliminated the need for operators constructing a fixed telephone network to purchase a license, although licenses are still required for mobile phone networks. High competition in this sector has kept tariffs among the lowest in Europe. Data processing services are in great demand owing not only to the Internet but also to the turn of the millennium and the adoption of the euro. The state-owned Sonera Corporation (previously Telecom Finland) and the 45 privately owned local telephone companies operating under the Finnet Group cover the majority of the telecommunications market.

FINANCIAL SERVICES. Although accounting for only 3.5 percent of the GDP in 1998, financial services have been the source of fastest growth in the private services sector. Banks and other services have been recovering steadily since the recession of 1990 to 1993, and by 1998 net operating profits in the financial sector were FMk7.6 billion. Approximately 42,000 people were employed in the banking sector in 1999. A recent development, spurred by the advances in connectivity and other computer technology, is the rapid increase in Internet banking, which rose to around 1.5 million users in 1998. Merita Nordbanken was formed from the merger of the local Merita and the Swedish Nordbanken banks Together with the cooperative Okobank group and the state-owned Leonia. These 3 largest banking groups account for 87 percent of all domestic lending and 85.8 percent of deposits.

INTERNATIONAL TRADE

In terms of trade-orientation, Finland was almost 4 times more dependent on external trade than the United States in 1998. This outward focus of the economy rendered it quite sensitive to disturbances in external markets. The scarcity of most natural resources (except for trees) and arable land has led to reliance on imports for raw materials. The continuing abundance of trees, plus well-developed livestock farms and a technologically advanced manufacturing base, enables the processing and exporting of imported raw materials, domestic timber and wood pulp, and machinery. The majority of its forest products go to the EU and the United States.

Trade (expressed in billions of US$): Finland

	Exports	Imports
1975	5.502	7.628
1980	14.150	15.635
1985	13.617	13.232
1990	26.571	27.001
1995	39.573	28.114
1998	42.104	31.364

SOURCE: International Monetary Fund. *International Financial Statistics Yearbook 1999.*

Finland's shared border with Russia (and previously the USSR) has had a tremendous effect on its trade practices. Finnish industry was able to supply the USSR with ships and some metalwork during World War I, but the Russian military collapse and the Bolshevik Revolution in 1917 ended that relationship. After World War II, war reparations demands from the Soviets required Finland to vastly expand its industrial capacity. This necessity led to the development of a specialized Finnish industry that made icebreakers and reinforced-hull ships. After reparations were completed in 1952, Finland and the USSR continued on a barter system, with Finland mainly trading machinery and ships in exchange for oil (a resource Finland lacks).

The collapse of the USSR in the early 1990s and the Soviet-Finnish barter system was catastrophic for Finland. Trade with Russia went from 26.7 percent of Finland's external trade in 1982 to only 2.8 percent in 1992, and the number of Finnish workers supported by economic ties with Russia plunged from 230,000 in 1981 to fewer than 50,000 in 2000. Trade with Russia in 2000 was about 5 percent of external trade.

The USSR's collapse forced Finland to focus much more on exporting to the West. Demand for timber has been a somewhat risky engine of growth, but the increasing demand for high-tech goods has helped Finland to rapidly expand its high-technology sector. Finnish and general Nordic concern with environmental issues has inspired Finland to specialize in environmental pollution-monitoring equipment for domestic and exported use. In the mid-1990s, Finland also began to increase exports to

Japan and other expanding Asian economies, mostly consisting of pulp and paper products. The economic troubles of the Asian economies in the later 1990s caused a mini-recession in Finnish industry, particularly in pulp and paper exports.

Finland has been able to improve its trade situation, and has consistently run a **trade surplus** in the past few years with an estimated trade surplus of US$10.74 billion in 1998. Electronics overtook paper as the second largest export earner in 1998, generating over 25 percent of all export revenue. Germany and Sweden are the primary suppliers of imports, followed by the United States, Finland's most important non-EU trading partner. Finland's primary export markets (in descending order) are Germany, Sweden, the United Kingdom, and the United States.

MONEY

Since 1 January 1999, the Frankfurt-based European Central Bank (ECB) has been in charge of Finnish **monetary policy**. The Bank of Finland still has some responsibilities, such as holding and managing Finland's official foreign-reserve assets and contributing to supervisory credit institutions. The ECB's main **macroeconomic** goal is to keep **inflation** in the euro zone below 2 percent.

In the 1980s, Finland's economy grew faster than the European average, with stable prices and relatively low unemployment. The Finnish financial market underwent rapid change. The state's role in the money market declined, and the economy became increasingly market-oriented. Foreign banks were first allowed to operate in Finland in the early 1980s and were permitted to open branch offices there in 1991.

However, the collapse of the USSR and its loss as Finland's chief trading partner was a severe blow to the Finnish economy. Following the banking and speculation crisis, the country fell into a severe recession. In the banking industry, nearly one-third of the employees were laid off.

Since its devastating recession in the first 3 years of the 1990s, Finland's economy has been steadily recovering and by early 1997, GDP had returned to pre-1990 levels. Recovery was led by Finland's export sector, which was greatly aided by the Finnish currency's devaluation in 1991 and subsequently changing the markka to a **floating exchange rate**. Both actions effectively lowered the price of Finnish exports in foreign markets, which led to increased demand for them.

In 1991–92 the markka was pegged (set by the Bank of Finland in a fixed relationship) to the euro, but these limits were abandoned 2 years later, allowing the markka to float. Finland then joined the **Exchange Rate Mechanism** (ERM) of the EMU in October 1996 at the central rate of 1 euro=FMk5.8066. As of 1 January 1999, the 11 EU member countries, including Finland, joined the EMU, locking together the **exchange rates** of the 11 currencies involved. The markka was pegged to the euro at 1 euro=FMk5.9457. In 2002 Finland will adopt the euro as its paper currency.

At the beginning of the 21st century, the economy was growing, especially in the high-technology industries. Although still saddled with debt, Finland has been attempting to reduce its deficit. However, membership in the EMU has removed the Bank of Finland's ability to set an independent currency policy, which is a major tool in debt reduction. The current government is attempting to curb public spending, but with some difficulty, partly because the left-wing parties in government resist this move and have significant popular support. High unemployment (around 10 percent in 2000) is also a major problem, which many blame on a taxes-and-benefits system that makes low-wage work less attractive than collecting unemployment benefits. Inflation has been high and increasing in recent years, especially because of rising world prices of crude oil, the depreciation of the euro in relation to the dollar, high interest rates, and housing price increases.

The Helsinki Stock Exchange (HSE) is small and remote, but EMU membership is changing this situation since the HSE is the only real euro-based stock exchange in the Nordic region. Since Sweden and Denmark do not participate in the EMU, the financial focus of the area could shift towards Helsinki. Trading almost doubled from 1997 to 1998, and the value of Finland's total stock market is 3 times the GDP, the highest ratio of stock market value to the GDP in the world.

POVERTY AND WEALTH

In states with a high level of income equality and widely used welfare programs, class is difficult to identify. In Finland to some extent, it is more meaningful to look at regional or urban-rural differences. During the

1960s Finland experienced one of the fastest rates of rural depopulation in the western industrialized nations. Over 10 years, 600,000 people were added to the urban population, and the urbanization rate (the rate of increase of the proportion of people living in urban areas) increased from 38.4 percent in 1960 to 50.9 percent in 1970. This uneven distribution of the population has interfered with the development of infrastructure and the provision of services, and it has made the costs of services in rural and small communities much higher.

The recession of the early 1990s led to some cutbacks in Finnish social programs. On the whole, health care and housing allowances were not diminished, but unemployment pensions, spouses' pensions, conscripts' allowances, disability benefits, refunds of medical examinations, and child-care allowances were reduced.

The poorest and most marginal members of the population tended to suffer more immediately as they had the least ability to influence those making the cutbacks. Yet in the longer term, cutbacks increasingly focused on larger programs that affected more of the population, which often made the government instituting the cutbacks less popular. Public services whose employees were numerous and well organized, such as the medical profession and trade union-dominated jobs, tended to be cut the least.

The urban-rural divide is simultaneously a regional divide, with urban areas heavily concentrated in the southern regions. In the south of Finland, overcrowding has sometimes hurt both the environment and access to social services (mostly creating waiting lists for non-emergency care), while the declining population in already sparsely inhabited areas makes it difficult to maintain even the existing economic and service facilities. However, the typical Scandinavian emphasis on social equality has ensured that nearly all inhabitants of Finland are not in a condition identifiable as poverty in terms of access to health, education, and sanitation.

WORKING CONDITIONS

For much of the post-war period, Finland had very low unemployment. The emergence of unemployment as a serious problem more or less coincides with the collapse of the USSR and the 1990s recession. Recent growth has not been able to solve the problem, especially as many of the fastest-growing businesses are in the high-technology sector and do not require as many employees as jobs of earlier eras.

The Finnish labor force was 2.53 million people in 1999, over 80 percent of whom were organized. Likewise, 80 percent of employers belong to an employers'

association. The Finnish constitution protects the rights to organization, peaceful assembly, and strike, and these rights are adequately enforced by the state. The government, major employers' associations, and representatives from the Central Organization of Finnish Trade Unions (Suomen ammattiliittojen keskusjarjesto or SAK, an umbrella organization consisting of 25 trade unions and totaling 1.1 million members) meet at the national level and communicate to discuss economic and employment policy. However, coordination of this kind has not prevented disagreement, which has often led to strikes. There were 18 strikes in the fourth quarter of 1997 alone, including a firefighters' strike.

There is no specific minimum wage law, but employers are required to bargain with workers' organizations at the industry level (usually with government participation) over contracts that include a minimum wage, which has historically been more than adequate. This wage is extended to non-union workers, and if other wages rise (either due to general rises in the cost of living or due to improvements in the industry), that benefit must be passed on to even the minimum-wage workers, so their situation will keep pace with the higher-paid ones.

There is still wage inequality among the genders in the Finnish labor force, despite the existence of an equal rights act and a law mandating equal pay for equal work. In 1998 women's average earnings were 81 percent of those of men, and women still tend to be segregated in lower paying occupations. While women have individually attained leadership positions in the private and public sectors, there are disproportionately fewer women in top management jobs. Industry and finance, the labor movement, and some government ministries remain male dominated.

Legally, the workweek is set at 5 days with a maximum of 40 hours of work. In practice, this limit is usually understood as a minimum provision, and many workers enjoy even stronger benefits through effectively enforced collective bargaining agreements.

COUNTRY HISTORY AND ECONOMIC DEVELOPMENT

1809. Finland, a province of Sweden, is taken over by Russia.

1836–86. Finland is supposedly granted autonomous rule under the Russian tsar Alexander II, but has little real independence. Finnish joins Swedish as an official language.

1905. The Eduskunta (national parliament) is created. Universal voting rights (including women and men who hold no property) are granted.

1917–19. The Russian Empire collapses. Finland declares independence, after which civil war briefly breaks out between political factions.

1919. The Eduskunta ratifies the Finnish constitution. Finland becomes a parliamentary republic with a president as the head of state.

1932. Finland and the USSR sign a non-aggression pact.

1939. The border region of Southern Karelia is ceded to the USSR after the 15-week "Winter War."

1940. A peace treaty with the USSR ends the Winter War.

1941–44. After Germany invades Russia in 1941, Finland enters the Continuation War alongside Germany against the USSR to win back Karelia.

1944. Peace is declared, and Finland stops fighting alongside the Germans.

1944–45. Finland fights against the Germans in the Lapland War as they retreat across Finland from the Soviet front.

1946. Finland signs the Treaty of Friendship, Cooperation, and Mutual Assistance with the USSR.

1951. Self-government is granted to the Swedish-speaking Åland Islands, formerly ruled from mainland Finland.

1970. Finland adopts a 40-hour working week.

1973. Finland signs a free-trade agreement with the European Economic Community (EEC), an international body that centralizes economic decisions and organization among its member states.

1991–93. The Soviet Union collapses, worsening an already severe recession and banking/financial crisis in Finland.

1995. Finland joins the EU, a replacement of the EEC. The new union has a more explicit political and human rights agenda in addition to the economic one. The first Green Party representatives in a European government are elected to the Eduskunta.

1999. Finland joins the EMU. All EMU member nations agree to adopt a single new currency, the euro.

FUTURE TRENDS

Finland's aging population poses the greatest challenge for the future. Its extensive welfare and social security system will be strained by the shrinking workforce and increasing population of the elderly. A major difficulty the government faces is the political unpopularity of suggesting reductions in the welfare system. The guarantee of a certain standard of living is considered to be of primary importance to most Finns, but the question of where the money will come from to support this policy has no easy answer. The suggestion made by Finland's

most right-wing political organizations—restricting those who are eligible for benefits based on ethnic criteria—is fortunately not popular. However, it is clear that significant re-structuring of the welfare system will be needed. The IMF, while praising Finland's strong recovery from its recession of 1991 to 1993, recommended several measures to anticipate and defuse the coming demographic crisis, including raising the effective retirement age of 59, altering individual pensions accounts, and reducing the length of time that unemployment benefit can be claimed. The Finnish government so far has focused on altering tax and wage structures and is more wary of reducing benefits.

Although steady economic growth reduced unemployment to some extent, Finland still faces an unemployment problem. National unemployment is still above 10 percent, and in areas of rural northern and eastern Finland it exceeds 30 percent. Since most export industries are highly automated and create relatively few jobs, it has been suggested that Finland is nearing its structural limit on unemployment. The state has been investing in education programs for adults and children to familiarize people with the Internet and computer programming and it is hoped to find a place for them in the new economy. However, public spending is expected to fall in 2001, and the government is trying to find a way to solve the unemployment problem without increasing government expenditure. Plans for lowering the income tax may be one way to encourage more participation in the labor force but cannot guarantee that the kind of workers required by the new economy will be available.

In 1995, the first Green Party representatives were elected to the Eduskunta, and their strong opposition to nuclear energy and fossil fuels poses a challenge to the government, which is looking for consensus on how to meet increasing energy demands. In the light of domestic and international environmental concerns about sustainability, pollution, and other risks associated with nuclear power, as well as dependence on exhaustible fossil fuels (which must be imported), Finland's energy system may need to be reexamined. It is unclear how the coalition government will deal with this challenge. Most attention has been given to research into sustainable energy sources, for which some funds have been allocated. Finnish businesses appear to be more sensitive to these issues than some of their European counterparts that may actually be better equipped to handle the task.

The importance of the timber industry to the economy may lead to future problems. Many current environmental reports describe commercial timber farming as destructive to Finland's ancient forests. The government and timber industry deny this claim, and they do not appear to distinguish between old-growth forests—which are ancient and full of a diverse range of plant, animal, and insect life—and homogenous, younger, and non-native trees that have been more recently planted. High levels of logging and clear-cutting of ancient trees and their replacement with commercially viable tree species threatens the bio-diversity of these ancient forests and poses extinction risks to local plant and animal species. Complaints by environmental groups on this issue have inspired the Finnish Ministry for the Environment to increase efforts to ease the ecological pressure on Finland's ancient forests. The timber industry, however, is highly dependent on world demand and is not as flexible in its responses as other industries. Finland's ongoing commitment to research and development in all its industries can be taken as a hopeful sign that further flexibility may come, as new industrial products are developed which can allow the industry to diversify.

Membership in the EMU has taken away Finland's ability to control the economy through interest rates and devaluation. **Fiscal policy** is now the main instrument of control. This situation could lead to problems, as the government has been running a **budget deficit**, and depends on high taxes for much of its revenue. If the EU starts to require harmonization of taxes among its members, Finland will be in great difficulty.

Although Finland has recovered well from its recessions of a decade ago, it is still in a slightly precarious position in its over-concentrated engine of growth. Specifically, Nokia alone accounts for around 65 percent of shares traded on the Helsinki Stock Exchange, and Finland is particularly sensitive to world demand of its main forest products for export. As the nation's population ages, the shift of people out of the workforce and into its pension system will strain the government's resources, which have only recently recovered from the recession. Membership in the EU gives some advantages, especially in terms of an export market but also removes some control over the economy. It is up to the Finnish state to attempt to strike a balance.

DEPENDENCIES

Finland has no territories or colonies.

FRANCE

French Republic
République Française

CAPITAL: Paris.

MONETARY UNIT: French Franc (FRF). A franc equals 100 centimes. Coins are in denominations of 1, 2, 5, 10 and 20 francs, and 5, 10, 20 and 50 centimes. Paper currency is in denominations of FRF 50, 100, 200, and 500. In 1999, the European Union (EU), of which France is a member, introduced a new currency, called the euro, to be the common currency among the participating member countries. The euro is scheduled to circulate amongst the members of the European Monetary Union (EMU) by 2002. When this happens, it will be the sole currency in member states, including France. The exchange rate between the euro and franc is fixed at 6.56 francs per euro. Both the franc and euro currently **float** against all other currencies. The exchange rate for 1 U.S. dollar was 0.98 euros at the euro's inception, but it has lost substantial value since then. There are 100 cents in a euro. Coins will come in denominations of 1, 2, 5, 10, 20, and 50 cents, as well as 1 and 2 euros. Paper currency will be issued in denominations of 5, 10, 20, 50, 100, 200, and 500 euros.

CHIEF EXPORTS: Machinery and transportation equipment, chemicals, iron and steel products, agricultural products, textiles and clothing.

CHIEF IMPORTS: Crude oil, machinery and equipment, chemicals, agricultural products.

GROSS DOMESTIC PRODUCT: US$1.373 trillion (in purchasing power parity, 1999 est.).

BALANCE OF TRADE: **Exports:** US$304.7 billion (f.o.b., 1999). **Imports:** US$280.8 billion (f.o.b., 1999).

COUNTRY OVERVIEW

LOCATION AND SIZE. France has the largest land area of any Western European nation and lies between the Mediterranean Sea on the southeast and the Bay of Biscay and English Channel to the north and west. France has a total land area of 547,030 square kilometers (211,208 square miles) and a coastline of 3,427 kilometers (2,130 miles). It shares borders with Andorra, Monaco, Belgium, Luxembourg, Germany, Switzerland, Italy, and Spain. Its area is about four-fifths of the size of Texas.

Paris, the capital city, is the largest city in France and Europe (excluding Russia), and accommodates about one-sixth of the country's population. Other cities with over a million people including surrounding areas are Lyon, Marseille, and Lille.

POPULATION. France's population was estimated to be 59,329,691 in 2000, with a slow growth rate of 0.38 percent. The French population is about one-fifth of Europe's total population and ranks third in Europe and sixteenth in the world. It has about 106 inhabitants per square kilometer (or about 275 people per square mile). Roughly one-sixth of the entire population lives in the Greater Paris area. France's ethnic groups include Celtic and Latin strains, with Teutonic, Slavic, North African, Indochinese, and Basque minorities. Foreigners comprise 6.3 percent of the population.

While the majority of the population (65 percent) falls between the ages of 15 and 64, about 16 percent are older than 65 years of age. The remaining 19 percent are 14 years old and younger. At the turn of the 19th century, France was the most populous country in Europe. But by the late 19th and early 20th century, France experienced the lowest birth rate in the continent. Due to government efforts and the post-World War II baby boom, however, France reached a birth rate of 21 per 1,000 people in the post-war era. This growth declined to 18 and 13.6 per 1,000 in 1963 and 1989, respectively. Currently, France's birth rate stands at 12.27 births per 1,000 population according to 2000 estimates. (France had 9.14 deaths per 1,000 population during the same

year.) The influx of immigrants into France at the last quarter of 20th century, though, has moderated the trend toward a shrinking population. It is estimated that France has received 0.66 net immigrants per 1,000 people in 2,000. The ratio between males and females is nearly one-to-one in almost all age strata of French population, with the exception of those over age 65, where there are 0.68 males per each female. This is mainly because the life expectancy for females at birth is about 83 years while it is only 75 for males. Life expectancy for the total population averages 79 years.

In 2000, France was the sixteenth most populous nation in the world. The French population is expected to decline by the year 2025 when France will rank twenty-fifth in the world. The **United Nations Development Program** (UNDP) estimates that the population will reach 61,662,000 in 2025 but drop to 59,883,000 in 2050, with 30 percent of the population over 80 years of age. (This number was 16 percent in 2000.) This means that the potential support ratio (the number of people aged 15 to 64 for each person aged 65 years or older) in 2050 will be half of its 1999 level. In other words, every 2 work-

ing people will be supporting a retired person in 2050, which doubles the burden on the society from 1999 to 2050 in providing care and benefits for the elderly.

Archaic **immigration** policies make France somewhat unattractive for foreigners who seek work or asylum, even though the need for more workers has been recognized by many. The government provides generous family and health support programs, though these have not necessarily encouraged population growth. Individuals with health problems, the unemployed, and the retired are protected from bankruptcy by the social security system. Some cities even tried to implement their own programs to encourage population growth, but they were aimed at French or European races, and thus quickly denounced as racist. Overall, the government's efforts to address the serious under-population problem of the near future have not been successful.

OVERVIEW OF ECONOMY

By the 18th century, France was one of the richest nations of the world. The potential for industrial development made France a rival to England, perhaps the most powerful country on Earth at the time. But it was its agricultural potential at the beginning of the Industrial Revolution (the period during the 18th and 19th centuries when Europe changed from agrarian, handicraft economies to the those dominated by industry and machine manufacture) which made France a world power. However, its sluggishness in moving from agrarian to industrial modes of production, together with several other factors such as a declining population, left France behind in an industrializing world in the 20th century. As this process continued, and due in part to nationalist sentiment, France largely closed its doors to foreign competition in order to protect its own industries. The **nationalization** of major industries in France took place in the late 1930s in railways, coal, natural gas, electricity, and the banking sector. Flagship companies in various transportation sectors, such as Renault and Air France, also came under the state control. Although a capitalist country, France made many **socialist** adjustments such as heavy government control over the economy, which included strict government regulation of many industries or powerful representation of the government in sectors considered essential to the national economy. As part of its statist economic policies, France implemented national economic development plans.

Despite its mixed economic system, France has also recognized since the early post-World War II era that economic integration with Europe is in its own best interests. To this end, France has been the major impetus in the formation of such bodies as the European Coal and Steel Community (in the early 1950s) and the European Economic Community. These organizations were the first steps toward both economic and political union in Europe.

Currently the government's role in the economic sphere is much less than before, especially because of the requirements of the European Union (EU). Since the early 1990s, French companies have faced competition from their European counterparts with less help from the government. In an effort to **privatize** the state-owned industries, the government is selling off its shares in France Telecom and Air France, along with companies from the insurance, banking, and defense industries.

Because of its fertile and vast land, France has become a major agricultural producer of Europe, making use of modern agricultural technology. The agricultural sector enjoys generous government support in the form of **subsidies**. This policy sometimes becomes a point of contention with France's EU counterparts. Three-fifths of the land is devoted to agricultural-related economic activities. Besides wine, France is famous for its beef, veal, poultry, and dairy products. Various types of grains also make France the leader among European nations in agricultural production. Overproduction of the world-renowned French wine and competition from foreign producers have conspired to bring about decreases in its price, although the government as of 2001 has tried to discourage overproduction in an attempt to reverse this alarming trend.

France has a long seashore, but fishing is not one of the major components of the economy, except in coastal areas such as Normandy and Brittany, the southern Atlantic coast, and the Mediterranean, where it employs a significant local **labor force**. France has few fishing ports used in shipment of fish products and ranks 20th in the world in total fish production.

Even though France has a highly-educated labor force, unemployment—which stood at 9.2 percent in December 2000, according to the International Labor Organization (ILO)—is still a major problem, mainly because of the slow growth of the economy. Employment opportunities for college graduates were especially lacking. A 35-hour work week was introduced in 1999 by the government in order to create more jobs. Small companies especially objected to the measure as burdensome, for it forced them to hire more workers. Larger firms are more comfortable with the shortened work week, arguing that participation in the European Monetary Union and a common currency have brought new flexibility into the market and hence has eliminated the costs brought by the shortened work week.

France still maintains its ties with many of its former colonies, especially those in Africa, such as Algeria, Benin, and Senegal. France provides support in the form of French francs in order to stabilize some African currencies. It also

provides other types of aid to some of its former colonies, totaling US$6.3 billion in 1997.

As of the end of the 20th century, the **capital goods** sector was one of the fastest-growing sectors of the economy, followed by automobiles and services. The French government predicts continuing stable growth in the first few years of the 21st century, largely due to investments in technology and the promise of structural reforms. France's **infrastructure** is modern in all respects.

POLITICS, GOVERNMENT, AND TAXATION

A democratic republic with a constitution approved by referendum in 1958, France is both economically and politically a hybrid of many systems. Economically, it is a capitalistic country with a socialist outlook, exemplified by property rights and a capitalistic concept of private ownership on one hand and an extremely generous social security system and a socialist approach to solving the society's problems on the other. France has a presidential system combined with a more typical European parliamentary arrangement.

The president of the republic, as the head of state, is elected by direct suffrage every 7 years, and appoints the prime minister as the head of government. However, the president must choose the prime minister from a party or a group of political parties determined by the National Assembly, which is the lower house of the French Parliament. It is quite possible that the president and the prime minister may come from different, and even rival, political parties. This is known as cohabitation. Following the 1995 presidential elections, President Jacques Chirac, who represents the center-right side of the political spectrum, cohabits with a center-left government headed by Prime Minister Lionel Jospin, who was his rival in 1995 presidential elections. Prime Minister Jospin is the head of the Socialist Party, and his coalition government includes representatives from the **Communist** and Green parties.

The French parliament is **bicameral** (a representative system with 2 houses in the parliament or legislature, as in Germany or the United States). Representatives are elected to the National Assembly (the lower house of parliament) by direct universal suffrage, and senators are elected indirectly by an electoral college which is comprised of approximately 145,000 representatives of city councilmen. Representatives serve for 5 years, whereas senators are elected for 9 years. The main power brokers in the French political spectrum can be classified from right to left as National Front (FN), Rally for the Republic (RPR), Rally for France (RPF), Union for French Democracy (UDF), the Socialist Party (PS), Green Party, and the Communist Party of France (PCF). The extreme left parties support continued state control over the economy with big spending programs, while the right-wing parties want to end most forms of state support. The right-wing parties also wish to see far less immigration and more people of European origin populating the country. The high level of unemployment and rising nationalism, expressed also in the form of xenophobia (enmity against foreigners and immigrants), have fueled the popularity of the extremist National Front. President Chirac is from RPR. Both that party and the RPF are neo-Gaullist parties (parties supporting the policies and principles laid down by former French statesman Charles de Gaulle, which call for greater European and French power, prestige, and independence, especially from the United States). The UDF is relatively moderate. There are other small parties which may play roles, sometimes influential ones, at the local but not the national levels. Left-leaning parties, especially the socialists, usually advocate implementing a domestic agenda aimed at fighting unemployment and promoting social programs.

Because of pressure from the EU, more budgetary discipline has been emphasized in governmental affairs. **Protectionist policies** have been abandoned against other members of EU countries. There is strong support for the EU amongst the French people as well as from the president and prime minister. In fact, France is among the most prominent supporters of a unified Europe. Some believe the basis of this support is France's effort to counter the power of the United States in the world's economic and political affairs.

French governments changed hands between left and right in the last quarter of the 20th century, and sometimes political movements changed course. After the influential General de Gaulle's right-leaning government in 1960s, President Francois Mitterand broke with tradition when he came to power in early the 1980s. De Gaulle held the office of the president between 1959 and 1969, and Mitterand served 2 terms as president (1981–95). Catering to the demands of the powerful Communist Party, which supported Mitterand, his socialist government increased government spending by engaging in several public projects and increased taxes in order to pay for the spending. While most of the capitalist world recognized the virtues of the free market economy, the Mitterand government embarked on nationalization efforts. This policy soon led the country into economic turmoil with higher levels of **inflation** coupled with lower values for the French franc. This tendency forced the government to reverse some of its previous policy decisions, even if it meant adopting policy suggestions of political rivals. Mitterand's prime minister (Chirac) lost the presidential election in 1988 only to win it in 1995. However, the solutions to the economic problems on which Chirac based his campaigns have not yet been completely achieved. With one of the highest levels of unemploy-

ment in the EU and its president battered by corruption charges, France saw a general strike in December 1995 that brought the country to a virtual economic standstill. The French government still has a strong presence in the economy, especially in such industries as aeronautics, defense, automobiles, and telecommunications. Even though a great deal has been achieved in privatization, the government can still exert its influence on privatized companies via its large minority stakes in such companies. Nevertheless, after a policy decision of the president in 1996 to streamline defense industries, a wave of mergers and **restructuring** took place among French defense companies.

France prefers to continue with a large government budget financed mainly by taxes rather than to curtail its spending. Currently, France ranks highest in broadly defined tax categories among G8 countries (a group of the most industrialized countries of the world consists of the United States, Japan, Germany, France, Italy, Canada, Russia, and the United Kingdom). The basic corporate tax rate is 33.33 percent. The largest tax burden in France, though, is **income tax**, which in the highest income bracket runs to 54 percent. (By comparison, U.S. federal taxes range from 15 to 33 percent.) The highest tax bracket starts at only about US$40,000, so the middle and upper classes in France pay a significant portion of their salaries in taxes. This rate is one cause, some economists believe, of unemployment, because high taxation together with generous government spending programs discourages working. Incomes of less than 26,100 French francs (approximately US$3,500) a year are not taxed at all, while all income levels above US$20,000 are taxed of a rate of at least 40 percent.

INFRASTRUCTURE, POWER, AND COMMUNICATIONS

France enjoys one of the most sophisticated infrastructures in the world, developed through the government's heavy investment in the field and made possible by advanced technology. A network of various modes of transportation blankets the whole country, including air, land, and rail transportation. Transportation is also possible via rivers. The technologically advanced rail system—utilizing some of the fastest trains in the world—is operated by the French National Railways (SNCF), a state-owned company. There are a total of 31,939 kilometers (19,846 miles) of rail lines in the country. There are approximately 828,000 kilometers (514,605 miles) of roads in France, all of which are paved. About 47 per cent of the waterways are heavily used. There are a total of 474 airports in France, many of which serve international traffic. The major airline is Air France, which provides service to all corners of the globe. Many of the ports and harbors are equipped to handle the needs of freight as well as passenger ships. The major port cities are Dunkirk, Bordeaux, Marseille, Nantes, Rouen, Le Havre, Boulogne, Cherbourg, Dijon, La Pallice, Lyon, Mullhouse, Paris, Saint Nazaire, Saint Malo, and Strasbourg.

The communications infrastructure of France also ranks high among advanced countries. There were about 35 million main telephone lines in use by the end of 1998, with mobile cellular phone usage at about 35 percent of that figure. About 218 newspapers were sold in France per 1,000 people in 1996. This number slightly exceeds EMU member countries' newspaper circulation rate for the same period but falls behind the high income countries' average of 286. The number of radios per 1,000 people in 1997 was 937, which shows the same pattern with respect to the EU and high income countries' averages. Radios broadcasting in AM, FM, and short wave cater to domestic and international clienteles. Television set ownership is somewhere in the middle of EU countries. Cable TV is not as widespread in France as it is in either high-income or EU countries as a whole. France's ratio of 27.5 cable subscribers per 1,000 is a far cry from Europe's 110.3 and that of the wealthiest nations' 184. In spite of its vast mobile phone usage, France also lags behind both EU as a whole and its wealthiest countries. There are fewer Internet service providers (ISPs) in France

Communications

Country	Newspapers	Radios	TV Sets[a]	Cable subscribers[a]	Mobile Phones[a]	Fax Machines[a]	Personal Computers[a]	Internet Hosts[b]	Internet Users[b]
	1996	1997	1998	1998	1998	1998	1998	1999	1999

SOURCE: World Bank. *World Development Indicators 2000.*

than in many other EU nations, but there is easy access to the Internet via both domestic and foreign ISPs. The dominant domestic telecommunications company, Minitel, is run by the government-owned France Telecom, which has a proprietary electronic commerce service. Even though it lags behind its counterparts in the developed world in some electronic communications industries such as the Internet, France is quickly catching up.

Nevertheless, France is a very conservative country, deeply committed to its own distinct national information infrastructure, which makes the country cautious in approaching innovations that do not originate within France. The government makes special efforts to prevent English, which is by far the most widely used language on the Internet, from taking over in communications. A law was even passed in the early 1990s in an attempt to bolster the use of French in the communications field, thanks to efforts of the Ministry of Culture. The French Internet industry and other communications sectors are more heavily regulated than those of Germany and Britain, and some economists maintain that this has significantly impeded developments in the Internet and related industries in the country. On the other hand, government is promoting the usage of information technology and began in 1999 to **deregulate** some aspects of the industry.

France is not rich when it comes to fuel resources, so it imports three-quarters of the fuel it needs, especially oil. The same does not hold true for electrical energy production, though. Electricity production reached over 480 billion kilowatt hours (kWh) in 1998. The biggest source of electrical power is nuclear energy, which supplies about 76 percent of the country's needs and making France the second largest supplier of nuclear energy after the United States. The next largest source of electrical power is hydroelectric, which supplies about 13 percent, which is produced by plants operating on the Isère, Durance, Rhine, Rhône, and Dordogne rivers. Additionally, a tidal power plant is located on the Rance River in Brittany. Fossil fuel represents about 11 percent of electrical power in France and supplies about 389 billion kWh of energy. France exports about 62 billion kWh of fossil fuel energy and imports 4 billion kWh more.

ECONOMIC SECTORS

The French economy is competitive on a global scale in many goods and service sectors. In 1998, about 3.3 percent of the GDP was contributed by the agricultural sector, and 26.1 percent by the industry. But the major portion of the GDP is accounted for by the service sector, which makes France a typical modern industrialized country. While most employment is provided by this sector (about 66 percent), agriculture employs only 7 percent and services 27 percent. Historically, France has been the capital of Europe with its vast expanses of farm land. French wine and cheese are famous throughout the world. For historical and cultural reasons, French farms have generally been small and family-owned, and worked with traditional tools and methods. Globalization, which involves the opening of France to the market forces of Europe, has led the country to think about modernization in agriculture, which has only partially adopted modern methods. Currently, the French economy is stronger and more competitive in world markets than before, even though many business enterprises are still smaller than their counterparts in Europe, Japan, and the United States.

SOURCE: *CIA World Factbook 2001* [Online]. Data for 2000. Percent distribution for 1997.

The leading industries are metallurgy, mechanical and electrical engineering, chemicals, textiles, and the manufacturing of airplanes and automobiles. The auto producers, Renault and Citroen, are household names in many European countries. The French are very proud of Airbus Industrie, which is the main competitor of the Boeing Company, the leading U.S. aircraft producer. Airbus has captured a sizable portion of the commercial airplane market, a domain which had belonged exclusively to Boeing and its smaller U.S. and British competitors before the rise of Airbus in the 1970s. The world famous Mirage and Concorde are also produced by French aviation companies. The tragic July 2000 crash of a Concorde in France marred the otherwise superb reliability of Concorde airplanes, but in 2001 the sleek jet was scheduled to go back into service with Air France. France is not very rich in natural resources other than bauxite, but the country processes imported material into commercial products and resells them domestically and to the rest of the world.

France has a diverse and important services sector. Paris has the fifth largest stock market in the world. France's 4 banks rank among the biggest 25 banks in the world. The insurance industry ranks fifth in the world. France has been, for much of the last century, the world capital in fashion, setting the trends in designer clothes. Although there is a threat from countries with lower labor costs, French textile products are among the best in the world. Perfumes produced in France are synonymous with high fashion. Paris is known all over the world for its cultural attractions, architecture, and cosmopolitan lifestyle. That is why France is 1 of the 3 most-visited countries in the world, along with Spain and the United States.

AGRICULTURE

France has been one of the most dominant agricultural centers of Europe for centuries. That gave France an important role in European and, to some extent world, affairs in the pre-industrial age. Currently, France still leads Europe in agriculture, excluding the Russian Federation. With about 730,000 farms, approximately 7 percent of the workforce is employed in agriculture or similar sectors such as fishing or forestry. When all people engaged in agriculture-related activities (including the processing of agricultural goods, for example) are considered, the percentage of the population engaged in agricultural production is much larger. As of 2001, many younger people tend to look for employment outside of family farms and help out only as part-timers. This trend, however, has generated an opportunity for others looking for jobs in agriculture. According to the French Ministry of Agriculture, the share of population actively involved in farming is decreasing. Nevertheless, new creative methods of marketing and agritourism have attracted some young talent to the sector. The sheer size of the land used for farming, about three-fifths of the total, indicates the place of agriculture in the lives of French people. In the post-World War II era, government has made a significant effort to modernize French agricultural production by switching to more scientific methods and modern equipment. In 1997, about 86 percent of farms owned at least 1 tractor, and farmers increasingly upgrade equipment. The size of irrigated land in 1997 is twice that in 1979.

The major agricultural products that place France among the top producers in the world market are sugar beets, wine, milk, beef and veal, cereals, and oilseeds. Producing 29 million metric tons of sugar beets, France leads the EU. It takes second place in both the EU and the world in the production of its highly popular wine varieties, with 5.3 million metric tons. Though fifth in the world, France ranks second in the EU in milk production, totaling 23.3 million metric tons. France is the major source of meat and veal in the EU with 1,815,000 metric tons. What is commonly known as "Mad Cow Disease" (an illness first discovered in British beef that causes death if it infects humans) created a rift among European countries, especially when France prohibited British beef from entering the country. In the cereals category, which includes soft wheat and grain maze, France leads the EU. With 4.1 million metric tons of production, France also holds the leading position in oilseeds in the EU.

The biggest export items among agricultural products are various types of beverages and alcoholic drinks. According to the Ministry's numbers, the value of alcoholic exports reached 56.6 billion francs in 1999. This amount registered a 6 percent increase over the previous period. Cereals and flour exports, which increased 12 percent, totaled 36 billion francs. Meat and other animal products experienced a shrinkage of 7 percent but were still valued at 28 billion francs. All categories of prepared food brought 27 billion francs into the country in the same year. However, this reflected a decline of 10 percent from the previous year. Dairy products also suffered a loss of 2 percent in the world market share, generating 24 billion francs. Demand for French sugar and sugar refineries declined sharply in the world market by about 8 per cent in 1999. The total export revenue obtained by this category was 11 billion francs. The economic crises in world markets played a role in the declines experienced by French exporters of agricultural products. The EU and the United States are France's principal customers for agricultural products.

France is also an importer of agricultural commodities. Prepared food tops the list of imported agricultural items. Figures from 1999 indicate that France imported 19 billion francs worth of meat and other animal products. Even though it has a sizable coastline, France imports a

large segment of its fish demand from abroad, which was valued at 16 billion francs in 1999. Fruits, dairy products, and various beverages cost France 14, 12 and 10 billion francs respectively in the same year. All import categories experienced moderate shrinkage between 3 and 6 per cent, except meat, animal products, and fisheries, all of which remained unchanged from 1997. France did most of its shopping from the same countries to which it sold its products.

Almost half of farm income in France is generated by livestock raising, and the other half is contributed by crops. Cattle are raised mainly in the north and west; sheep and goats primarily in the south and east, which is drier and more mountainous. Pigs and chickens are raised everywhere in France. The Paris Basin area is the source of wheat while some rice comes from irrigated fields of the Rhone delta. While Burgundy, Champagne, Bordeaux, and Alsace are well-known wine regions, wine is actually produced all over the country.

Fishing does not contribute to the French economy in comparison with the agriculture on the national scale. According to the data released by the Ministry of Agriculture, fish production in 1998 reached nearly 600,000 metric tons, a slight increase of 1.5 percent over the previous year. Because of favorable prices, though, the fish products sector exceeded 6.5 billion francs. The exports of the sector fall far behind imports, creating a **trade deficit** in fisheries which is more than double the exports. However, France still ranks twentieth in the world in total fish production. Locally, fishing plays an important role in such areas as Normandy and Brittany, the Southern Atlantic coast, and the Mediterranean. Concarneau, Boulogne-sur-Mer, Lorient, and La Rochelle are the main fishing ports of France.

France's forests are prized for both economic and ecological reasons. The National Forestry Service, founded in 1966, is responsible for managing the country's forests. From 1850 to 1900 a big reforestation campaign occurred, and as of 2001, about 27 percent of French land is covered by forests, making it the third-most forested country in the EU. Two-thirds of the forests are occupied by deciduous trees, and the rest are conifers. France's forests have grown 35 percent since 1945 and continue to grow by about 30,000 hectares each year. Close to 4 million people in France have private ownership of wooded areas. The marketed wood harvest was up in 1998 from its level in 1997 by about 1.6 percent. The rise in the wood industry is attributed to the renewal of activity in construction. As in many other countries, forests in France are utilized not only for wood production but as recreation as well. Hence, while supplying wood products and playing a role in a healthier environment, forests also contribute to the national economy by serving the tourism sector.

INDUSTRY

France is among the most industrialized countries of the world. It is a member of the G8, a group of countries which comprises the 7 largest industrial democracies, plus the Russian Federation. In 1999, the French GDP was almost identical to that of Great Britain and comfortably larger than that of Italy.

MANUFACTURING. About 19.3 per cent of the GDP was generated by manufacturing in France in 1999, compared to 17.8 percent in the United States and 18.5 percent in Britain. Manufacturing contributes roughly 20 percent of the GDP in Italy, Germany and Japan. Investment in the industrial manufacturing sector was 141 billion francs in 1999. (These figures excluded the energy and agricultural manufacturing sectors.)

Firms operating in the industrial manufacturing sector produced a variety of goods such as consumption goods , items related to the auto industry, and equipment such as electronics, machinery, and **intermediate goods**. The well-established name for French products in the fashion world helps France in the export of perfumes and even flowers. The consumption goods industry made nearly 200 billion francs from sales abroad in 1999. The contribution of the auto industry to the French exports figures in 1999 was almost 300 billion francs. France is one of the largest producers of passenger cars and commercial vehicles in the world, along with Japan, the United States, and Germany.

The principal manufacturing companies are located in Ile-de-France, Rhone-Alpes, Nord-Pas-de-Calais, and Pays de la Loire regions. New industrial areas emerged around the English Channel and Mediterranean Sea in order to save shipment costs of imported raw materials. Even though some French companies, such as Renault and Airbus, are world famous, most French firms are characterized as moderate to small-sized. But small firms tend to be ineffective in the world market because of heavy competition from companies based in countries with cheaper labor costs or higher and better production technologies. The pressure of competition was felt heavily with the unification of the European markets under the umbrella of EU, in which movement of capital and labor is not constrained. Unless smaller and relatively inefficient French firms can adapt, labor and capital may move elsewhere. With the advent of the euro, many French companies have had to restructure and form mergers.

The major European airplane producing company is Airbus, which is based in France but also supported by Germany and Britain. With more than 4,200 aircraft orders placed by international customers as of April 2001, Airbus is the world leader in aircraft production. Airbus and Boeing of the United States are in competition, and they have conflicting ideas about the future of the world

air travel. The perception of future demand and air travel habits shapes the design of aircraft to be produced. Airbus believes that huge aircraft with a short flight range will shape demand in the future. Boeing, on the other hand, believes that passengers will be flying long miles in smaller aircraft. Time will show which one is on the right track.

One other field where French companies are strong is construction and civil engineering. However, a recent declining trend in enrollment in science classes in the country is a major concern of education authorities. France is the second ranked producer and the leading exporter of agri-foodstuffs (processed food such as wine, cheese, and pasta) in Europe. It is the fourth-largest exporter in the world in chemicals, rubber, and plastics; and third ranked in pharmachemicals and pharmaceuticals.

MINING. Mining is not a field in which France competes, and only a very minor fraction of the labor force (less than 1 percent) is engaged in mining. Regarding coal, 2 major fields produce most of France's coal: the Lorraine coal field near Metz and the Nord-de-Calais coal field near Lille. Most of these fields do not have economically viable reserves compared to other big producers because they lack sufficient amounts in some cases or are difficult to extract. Many coal fields have shut down since the 1950s.

France is among the biggest producers of bauxite in Europe and also plays a big role in the continent's natural gas production. France's position may be threatened, however, if some Asian companies acquire access to the European market, although the **tariff**-free regulations that EU member states enjoy put France in a strong position. France is an importer of petroleum but processes petroleum at home to produce several oil products which are sold domestically and abroad.

SERVICES

As with any other developed country, the services sector is an important component of the French economy. Out of over 2 million companies in France, roughly one-third operate in the various subsectors of the services industry. More companies are currently in the services sector in France than in any other part of the economy. The services industry (other than government) provides jobs to about 27 percent of the workforce, or 4.5 million people, and contributes 39 percent of the GDP. Investment in the industry is also significant.

FINANCIAL SERVICES. France has a developed credit market which channels savings to investors very efficiently and in large volumes. The **market capitalization** of shares listed on the Paris Stock Exchange, the fifth largest in the world, accounts for about 32 percent of the French GDP. Market capitalization at the end of 1997 reached an extraordinary 4 trillion francs. The Paris Stock Exchange is an internationally used capital market, and foreign investors hold about 35 percent of French stocks. This puts Paris in an advantageous position to attract more international capital with the help of the euro, the common currency of the EU. In an effort to adjust to the introduction of the new currency, all asset management companies in France started to offer their services in euros as of January 1999, the date the euro was introduced as the common currency of Europe. Since not all EU, let alone the European countries, decided to adopt the euro as their currency, authorities in the Paris Stock Exchange believe it has a comparative advantage over the stock markets of these nations since it can offer more opportunities via its reach to wider international audience. The Paris Stock Exchange has gone through extensive technological and legal restructuring to become more investor friendly in the international market. According to the stock exchange's data, foreign investments in the Paris Stock Exchange have tripled in monthly trading since the beginning of 1998, due in large part to the restructuring of the exchange. The exchange has trade relationships with the Chicago Mercantile Exchange and the stock exchanges of Sao Paolo, Toronto, Brussels, Lisbon, Tunis, Casablanca, Warsaw, and Amman, among others. The French bond market is among the world's leaders and ranks second after its U.S. counterpart.

The French banking system is also quite competitive in the world market. Credit Agricole, Compagnie Financiere Paribas, Groupe Caisses d'Epargne, and Banque National de Paris rank among the top 25 banks in the world. In Europe, banks are allowed to engage in activities that would normally be reserved for either commercial banks or investment banks in the United States. In a unified Europe, there will be one central bank, while national central banks will be largely autonomous.

INSURANCE. Like banking and the stock market, the French insurance sector is also a world player, ranking among the top 5 in the global insurance market. Although French insurance firms have a global presence, 60 percent of their total international activity is carried out within the borders of EU. Like other insurance industries, French insurers are institutional investors. The largest chunk of investments in the insurance industry is in the form of bonds, at 69 percent. Stocks account for only 15 percent of investment, and the rest is real estate, commercial paper and other assets. French insurers saw their overall value rise 16 percent from 1996 to 1997. The introduction of the common currency is expected to boost profits in the insurance industry.

TOURISM. Over 60 million tourists visit France every year, making it one of the largest tourist centers of the world. Visitors are attracted to its high fashion (or *haute*

couture), beautiful scenery, historic heritage, and cultural activities. Paris, the center of France's tourist trade, offers attractions such as the Louvre (its famous art museum), fine restaurants, the Eiffel Tower, and the beautiful works of architecture along the Seine, its major river. With about 67 million annual tourists, France trailed behind only the United States and Spain in 1997. France has a surplus in tourism in its **balance of payments** accounts. The more than 100,000 businesses directly or indirectly involved in tourism in 1997 generated over 100 billion French francs. Investments in the sector came close to 15 billion francs in that same year. According to the Ministry of Tourism, there were about 634,640 people employed in the various categories of the tourism sector including travel agencies, restaurants, and hotels. About one-sixth of this figure is employed for less than full-time.

INTERNATIONAL TRADE

France, with its developed economy, is one of the most active participants in world trade. After World War II, the French government saw that closer ties to Germany would bring it political security and greater economic strength. Thus, the European Coal and Steel Community was formed, which brought the 2 countries and other European nations into a consultative body to discuss the production of steel and coal. The EU, which France was instrumental in creating, has helped it to diminish government intervention in economic affairs by privatizing several industries. In 1992, the Treaty of Maastricht was signed, which was the watershed event in bringing Europe into political and economic union. On a practical level, the lower trade barriers and fewer restrictions that integration has brought have opened doors to French products to be sold in many European countries and has allowed a wider freedom of movement of capital in Europe, all of which has benefitted France. The downside is that France, sharing common trade and tariff policies with the rest of the EU countries, has discussed the erection of trade barriers against non-EU companies and products. France will follow EU policy as a whole whenever the EU erects trade barriers to foreign goods and firms. The EU has made it clear that it will erect such barriers in cases involving health, safety, and environmental issues, for instance.

Trade (expressed in billions of US$): France

	Exports	Imports
1975	53.086	54.222
1980	116.030	134.866
1985	101.674	108.251
1990	216.588	234.436
1995	286.738	275.275
1998	305.384	287.687

SOURCE: International Monetary Fund. *International Financial Statistics Yearbook 1999.*

France's share of exports to the world's top ten economies was 9.3 percent in 1997, 9.8 percent in 1998, and 9.4 percent in 1999, putting it in fourth place behind the United States, Germany, and Japan. France is also the fourth largest exporter to the world, with over 5 percent of the world export market. France is the world's second largest exporter of agricultural products as well as services, including tourism and financial transactions. In the durable goods market, France ranks fourth in the world exports. The biggest trade partners of France are members of the EU, with which France enjoyed an overall trade surplus of 79 billion francs in 1999. The only EU countries with which France has a trade deficit are Germany and Italy. It also had a trade surplus with the Organization for Economic Co-operation and Development countries (OECD, a group of countries which promotes free markets and contributes to the development of members' economies through cooperation) of 66 billion francs in 1999. Its deficit with some Asian countries and Russia can be attributed to the economic crises experienced in these regions, which led to lower demand for French products.

Of over 2 million companies located in France, less than 5 percent take part in activities directly related to export, according to the Department of Foreign Trade of France. While mostly French-owned, some of these companies are **multinational corporations** . Companies such as IBM, Michelin, Hewlett Packard, and Daimler Benz are among France's top 20 exporters, with the top 3 exporters being PSA, Renault, and Airbus Industrie. The top 20 companies export mainly vehicles and such items as tires, aircraft, electricity, office products, plastic goods, industrial equipment, food items, computer products, pharmaceuticals, and chemical goods.

The 4 top exporters account for 10 percent of French exports, which is more than what the 100,000 next smaller companies bring into the country. The top 10 exporters contribute 15 percent of exports, while the first 100 make up 35 percent of it. Since some of these companies are active in more than 1 production area and usually operate under different names using subsidiaries, the real contribution of the largest 10 companies probably amounts to half of France's total exports. Hence, even though they may not appear in the list of large exporters, some conglomerates, such as Alcatel-Alsthom, are among the largest exporters.

The contribution of smaller-scale enterprises to the French export picture has been on the rise since 1990. Almost half of total exported goods and services were produced by companies having somewhere between 10

to 499 employees. These types of companies are called Small-to-Medium Enterprises (SMEs). Firms hiring fewer than 10 people are called Very Small Enterprises (VSEs). Foreigners control about 27 percent of SMEs in France and about 33 percent of VSEs. SMEs concentrate in agricultural products such as agro-foodstuffs and consumption goods such as wood and leather.

Oil tops the list of French imports. In 1997, petroleum products made up 4.64 percent of all imports. Natural gas is also a major import. Various auto parts, some from French companies located abroad, are also high in the shopping list of France.

Foreign investment in France has steadily increased since 1990. Direct foreign investment in France, in the form of expansion or start-ups, created over 31,000 new jobs in 1999, up 8 percent from its level in 1998. This trend was most likely due to France's skilled labor force combined with the government's efforts to make France attractive to foreign investors. Some 29 percent of all foreign investment-related jobs created in 1999 were due to hiring in U.S. and Canadian firms. This was followed by German investors. The information technologies and communications fields created 15 percent of new jobs. A similar pattern was observed in consultant and service sectors, including call centers and logistics, accounting for 13 percent of the jobs. France is the world's fourth largest receiver of international investments.

Realizing the importance of operating in the country where the market is, French companies have extended their presence abroad. French companies have established a sizable presence in other countries which amounted to 239.7 billion francs in 1998. France is a net exporter of direct capital investments to the rest of the world. The balance of export and import of direct capital investment almost doubled in 1997 from its 1996 value and did not change much in 1998, standing at 74.4 billion francs. This rate was due largely to the increased volume of foreign direct capital investment in France, overall, a remarkable change from the 1990 deficit of 112.3 billion francs. Emerging economies is another reason why French capital opted to take advantage of new markets abroad. But despite new investment in the developing world, two-thirds of French capital in 1998 was invested in the EU and the United States.

MONEY

The French franc is one of the reserve currencies of the world. However, its influence is nowhere close to that of the United States dollar. In 1999 France, together with certain other countries, agreed to phase out its domestic currency in favor of a common currency in Europe, which will work like the U.S. dollar among U.S. states. The euro was launched at a value slightly above the U.S. dollar, but by 2001 it had lost much of its value. The European Central Bank, with the help of the United States Federal Reserve and the Bank of Japan, undertook a salvage operation aimed at curbing further decline of the euro. The weaker euro made French products, along with other goods produced in the region that uses the euro (also known as the "Euro Zone"), cheaper with respect to the rest of the world. The sale of high-tech goods produced by U.S. firms, such as Intel and Boeing, has suffered during the process, which partly led to the U.S. central bank's participation in the joint effort to save the euro.

Not all EU member countries have opted to be part of the single monetary bloc. Great Britain's reluctance to join was a major blow to efforts to unite the monetary affairs of Europe. Though 10 countries initially joined, the Euro Zone now includes 12 countries (Austria, Belgium, Germany, Spain, Finland, France, Greece, Ireland, Italy, Luxembourg, Holland, and Portugal).

The euro is not yet a **hard currency**. However, it is used throughout the participating EU countries in non-currency financial transactions. Prices are quoted in both the domestic currency, such as franc, and the euro. Domestic currencies coexist with the euro in a **fixed exchange rate** regime. For example, 1 euro equals 6.56 French francs. However, the domestic currencies and the euro use market forces to determine their values on the world market in a flexible **exchange rate regime** (synonymous with a **floating exchange rate**). The transformation to the single currency will start in July 2001 when the banks begin issuing checks in the euros. A single currency is expected to ease the movement of labor and capital in Europe and generate a common market encompassing 20 percent of the world's trade.

The French monetary system is governed by the central bank of France, the Bank of France. The reserves of the Bank of France amounted to 72.19 billion euros as of January 2001. Of this amount, more than half (39 billion euros) was in foreign exchange, and 27.6 billion euros was in gold. The **Monetary Policy** Council is the decision-

making arm of the Bank, similar to Federal Open Market Committee (FOMC) of the United States. The governor of the Bank and Minister of Economic Affairs and Finance cooperate in making policy decisions. However, with the common currency, a new monetary governing body will be introduced, the European System of Central Banks (ESCB), which includes the European Central Bank and the national central banks of each country.

POVERTY AND WEALTH

World War I and II, which were separated by a widespread depression, had a dramatic impact on the whole of Europe, including France. In addition to the loss of manpower, productivity, and wealth, the infrastructure of the European countries was largely destroyed. In the 1950s, only half of French families had running water in their houses, and access to television and automobiles was highly limited. Half a century later, the picture has changed drastically, at least for the larger part of society. France is an advanced industrial country in every respect, although there are pockets in French society that are still comparatively under-developed. The per capita GDP in 1995 U.S. dollars has increased from under US$20,000 in 1975 to just under US$28,000 in 1998, making France among the highest-income nations in the world. However, men tend to earn US$10,000 (1998 dollars) more than women per year. The educational system, though, is more egalitarian: 94 percent of females and 91 percent of males have attended either a primary, secondary, or tertiary educational institutions. France spends about 6 percent of the GNP on public education, slightly higher than the average for OECD countries. However, only 5 percent of the students are in science in tertiary educational institutions, which is a concern to policy makers about the country's competitiveness in information age.

Standards of living are difficult to assess, and most economists group the Western European and North American countries close together at the top end of most "quality of life" scales. The United Nations Development Program ranked France as thirteenth on the "Human Development Index" in 2001, a testament to France's excellent health care, literacy, income, and life expectancy.

World Bank data show that the poorest 10 percent of the population receive only 2.8 percent of the national income in France. The poorest 20 percent receive only 7.2 per cent of the income. The highest 20 percent, on the other hand, possess 40.2 percent. Unemployment is a major problem, with a rate of 11.7 percent in 1998. Even though the unemployment rate decreased by 5 percent from 1994 to 1998, the rate is still high enough to cause concern among economists. Another related, but less apparent problem is the insecurity and low pay in

jobs which do not require special skills. Marginal increases in government aid programs have not alleviated the problem completely.

Worst hit by the economic inequalities in France are immigrants, who are often subjected to severe discrimination. Some authorities in certain parts of the country have tried to encourage the native population to have more children by offering child benefits while denying immigrants the same services. The EU, on the other hand, has special educational programs for minorities and immigrants.

The percentage of people living with AIDS (0.37 percent) is slightly above the OECD average (0.32 percent) according to UNDP statistics. Public expenditures on health increased from 6.6 percent of the GDP in 1990 to 7.1 percent in 1996–98.

WORKING CONDITIONS

Some 25.6 million workers were employed in France by the end of 1999. France's labor force resembles that of many advanced industrial nations and is one of the most highly-educated in Europe. The GDP per employee per hour was US$34, larger than Italy, the United States, Germany, and the United Kingdom. France ranks third in Europe in employee productivity, and fourth in labor costs.

Unionism in France has declined dramatically over time and currently stands at half the level of the United States and reached the lowest level in Europe in 1997. Traditionally, unionism is stronger in Europe than the United States, and unions fight for non-wage rights more than for issues such as job security and vacations. The major labor union in France is the Confederation Generale du Travail (CGT) with about 2.4 million members. It is controlled by communists. The independent labor union, Force Ouvriere, is estimated to have about 1 million members. Another independent union serving white-collar labor is Confederation Generale des **Cadres** with 340,000 members. Other labor unions are the Conseil National du Patronat Francais (Patronat National Council of French Employers, CNPF) and the socialist-leaning labor union Confederation Francaise Democratique du Travail (CFDT) with about 800,000 members.

The decline of unions in France has not left the labor force without protection. There are still strong laws and institutional arrangements that give workers a say in running the workplace. The labor code sets standards regarding issues ranging from the workweek to vacations. In companies with more than 10 employees, workers are represented at various decision-making levels and are free to file grievances, individually or collectively, with the courts against the employer. Worker-employer relations are peaceful overall. A total of 8.4 working days are lost per 1,000 working days in France, making it one of the lowest strike countries of Europe. The same number is well over 40 days in Spain.

Another challenge the French labor force faces is the eroding job security as a result of adjustment to the common market policies of the EU. Cheaper labor from such countries as Greece and Spain may drive unskilled French workers out of jobs. Adding to this problem is the possibility that France's skilled workers may find extended opportunities in other member countries. In 1999, the government introduced a 35-hour work week to ease the unemployment problem by creating more positions for the unemployed. (The 35-hour workweek is paid on a 39 hour basis.) Starting in the year 2000, companies gradually phased in the 35-hour workweek schedule. Businesses were vehemently opposed to the initiative, though some agreed to it after negotiations with the government. Firms that implement the rule earlier than they are required to are promised government aid based on the number of workers they employ, which is expected to be a significant burden on the national budget. The government has proposed dipping into the unemployment benefits fund to pay the costs of the new policy.

COUNTRY HISTORY AND ECONOMIC DEVELOPMENT

843. The treaty of Verdun roughly determines the borders of France. Charles the Bald becomes first monarch.

1338. The Hundred Years' War with England begins.

1643. Louis XIV's reign begins.

1789. The monarchy is overthrown by French Revolution. First Republic is founded.

1804. Napoleon Bonaparte declares himself the first emperor.

1870. France is defeated by Prussia in Franco-Prussian War.

1914. France is invaded by Germany during World War I and suffers enormous losses before winning the war, with the Allies, in 1918.

1940. France is invaded again by Germans during World War II. Allies liberate France in 1944. General Charles de Gaulle becomes head of the provisional government.

1946. France joins NATO.

1951. France plays a key role in the formation of the European Coal and Steel Community (ECSC), the first step towards the eventual formation of the European Union.

1954. France withdraws from Indochina (Vietnam) after its military defeat there.

1967. The ECSC, the European Economic Community (EEC), and Euratom all merge to form the European Community (EC).

1968. Students and workers strike in Paris in opposition to government policies regarding the poor; De Gaulle resigns after losing referendum on constitutional reform.

1974. Conservative Giscard d'Estaing becomes president.

1981. Socialist Francois Mitterand becomes president; massive nationalization campaign by the government begins.

1986. Jacques Chirac becomes the prime minister of the center-right coalition; the government embarks on privatization efforts.

1988. Francois Mitterand is elected for a second term and brings France much closer to integration with the EU.

1991. Socialist Edith Cresson becomes the first woman prime minister of France.

1992. The Treaty of Maastricht is signed, which calls for the political and economic union of European countries. A common monetary policy and legal structure is announced.

1993. France tightens immigration requirements and makes it easier to deport foreigners.

1995. Jacques Chirac wins presidency on his third try, cements relations with Germany and the European union.

1997. Socialist Lionel Jospin becomes prime minister.

1999. EU adopts the euro as the currency.

FUTURE TRENDS

France suffered twice from war in the 20th century at the hands of its neighbor Germany. The 21st century, however, looks much brighter than the preceding one. France is part of a European coalition which may create a United States of Europe in the future. Not only is France one of the leading players in this effort, it also has strong relations with Germany, once its invader, which brings it security. By joining the common currency efforts in Europe, France has secured an influential role for itself in European affairs, both economically and politically. It has already started to reap the benefits of one of the largest markets in the world by receiving a large volume of **foreign direct investment** and exporting its agricultural and other products within Europe in a tariff-free environment.

Recent **liberalization** and privatization efforts of the government, which reversed an earlier course of the 1980s, both brought confidence to markets and increased efficiency to the government, which is now much smaller than before. Its main problems lie in its relatively high unemployment rate and low population growth. The EU may provide a solution to the unemployment problem, but with a more integrated Europe comes the possibility that France may lose many of its more talented workers if they leave for better jobs. Coupled with rigid immigration policies and xenophobia, France may experience a shortage of technically capable individuals. Germany, which has many of the same racial difficulties, recently initiated a program which is similar to the U.S. green card and may encourage technologically savvy people to come to Germany. France may soon have to confront the same problem. Decreasing population growth may seem to be an answer to unemployment in the short run, but it is a fact that the burden of supporting the retired will have to be shared by fewer working people as France's demographics change. This situation may mean the need for higher spending on health care and related services, which will drain government aid funds. Perhaps this problem is the biggest challenge France has to deal with in the 21st century.

DEPENDENCIES

France has no territories or colonies.

GEORGIA

Republic of Georgia
Sakartveld Respublika

CAPITAL: T'bilisi.

MONETARY UNIT: Georgian lari (GEL). One GEL equals 100 tetri. Introduced in September 1995, the Georgian lari comes in denominations of 1, 2, 5, 10, 20, 50, 100, and 500. There are coins of 5, 10, 20, and 50 tetri.

CHIEF EXPORTS: Scrap metal, ferro-alloys, nuts, tea, and wine.

CHIEF IMPORTS: Oil, natural gas, cigarettes, electricity, and pharmaceuticals.

GROSS DOMESTIC PRODUCT: US$11.7 billion (purchasing power parity, 1999 est.).

BALANCE OF TRADE: **Exports:** US$329.9 million (2000 est.). **Imports:** US$700.2 million (2000 est.). The CIA *World Factbook* lists exports as US$372 million (2000 est.) and imports as US$898 million (2000 est.).

COUNTRY OVERVIEW

LOCATION AND SIZE. Georgia is located between Europe and Asia. East of the Black Sea, Georgia is separated from Russia by the Caucasus Mountains. It borders Turkey and Armenia to the south and Azerbaijan to the east. Georgia has a land area of 69,700 square kilometers (26,911 square miles) making it slightly smaller in size than the state of South Carolina. Approximately 75 percent of Georgia's territory is 500 or more meters above sea level. The country has a coastline of 315 kilometers (196 miles).

POPULATION. Georgia's most recent official census counted 5,400,481 in 1989. Recent state statistics, which underestimate the volume of **emigration**, keep the figure around 5.4 million. The U.S. Central Intelligence Agency (CIA) *World Factbook,* however, estimates the population in July of 2001 at 4,989,285. With estimated rates of 10.87 births and 14.52 deaths per 1,000 population and a net out-migration rate of 2.57 per 1,000 population, Georgia had an estimated growth rate of -0.62 percent in 2000.

Georgia is an ethnically diverse state. Georgians comprise only 70 percent of the population, while there are minorities of Armenians (8 percent), Azeris (6 percent), Russians (6 percent), Ossetians (3 percent), and Abkhazians (1.8 percent). These groups, while small in number, have posed problems for the T'bilisi government as they are concentrated in specific areas and some have aspirations towards independence. Georgia contains 3 autonomous republics: Abkhazia, Adjara, and South Ossetia.

OVERVIEW OF ECONOMY

It is difficult to understand the contemporary economic situation of Georgia without first understanding its tumultuous history since achieving independence from the Soviet Union (USSR) in 1991. Independence exposed the extreme reliance of the Georgian economy on the Soviet Union. At the time of independence, the vast majority of Georgia's trade was conducted within the USSR. Trade with the Newly Independent States (NIS), the name given to the states that emerged from the collapse of the USSR, was disrupted by the wars in Abkhazia and South Ossetia and by civil war. When Georgia was a part of the USSR, heavy-industrial enterprises were established throughout Georgia but fell into disuse when the country became independent. Net material product experienced an unprecedented decline in the immediate years after independence. It declined by 11.1 percent in 1990, by 20.6 percent in 1991, by 43.4 percent in 1992, and 40 percent in 1993.

Most of Georgia's recent economic problems can be attributed to the weakness of centralized authority and to an insufficiently developed civil society. The legacy

of the Soviet state is a primary cause of these problems. Georgian society was ill-prepared for independence—politically, economically, culturally, and psychologically. In particular, no social groups existed independent of the state and a democratic culture had not been established. Moreover, the de facto (existing whether lawful or not) federal administrative-political system imposed during the Soviet period weakened the power of Georgia's own government. Soviet control also fostered separatist tendencies in the region. Administratively, Georgia was a "little empire" that began to disintegrate in much the same way as the larger model of the USSR. The effective secession of Abkhazia, Adjara, and South Ossetia coincided with ineffective control over the Armenian and Azeri dominated regions. The war in Abkhazia was especially detrimental to national and civic integration as it occurred at a critical stage in the state-building process.

The economic path followed by the breakaway republics of Abkhazia, Adjara, and South Ossetia diverged considerably from that of the rest of the country. The Abkhazian victory in September 1993 led to an economic blockade by Georgia followed by a similar Russian blockade in 1996 as Moscow tried to improve relations with T'bilisi. The Russian ruble is the only currency in widespread use in Abkhazia and the region operates under Moscow time, 1 hour behind T'bilisi. Despite a flourishing unofficial trade with Russia, the Abkhazian people had to rely heavily on humanitarian handouts as a means of subsistence. The once dynamic tourism industry is in tatters. Despite maintaining the trappings of an independent state, lack of economic potential has forced South Ossetia to consider closer ties with the rest of Georgia. Adjara maintains the closest links with T'bilisi and has benefited accordingly.

Corruption has been a persistent feature of Georgian society for several decades and has been entrenched since the establishment of an independent state in 1991. The weakness of the central government is clear in its lack of control over its employees. Small and medium size businesses, which could provide a vital base for economic growth and employment are hindered by lack of resources to withstand persistent demands for bribes. Few citizens see the point in engaging in political protests as they perceive the members of the government as hopelessly corrupt and their situation as unavoidable.

For most of the 1990s, Georgia was torn between dependency on Russia and the West. Georgia relies heavily on Russia for fuel, and an estimated 800,000 Georgians who work in Russia **repatriate** a substantial sum to their families in Georgia every year. This economic lifeline was suddenly put at risk when the Russian government imposed a visa regime on Georgia. Before 5 December 2000, Georgians could travel freely to Russia but now are required to obtain permission from the Russian embassy in Georgia. An apparent punishment for alleged tolerance of Chechen guerrillas who take refuge in Georgia, the visa regime is symptomatic of a cooling of relations between Moscow and T'bilisi. Georgia has increasingly turned to the West for assistance. It has deepened relations with the European Union (EU) and declared its intention of joining the North Atlantic Treaty Organization (NATO) at some point in the future.

POLITICS, GOVERNMENT, AND TAXATION

Georgia's political system is modeled on that of the United States with a directly elected president, parliament, and judiciary. Politics in the Caucasian republic has been dominated by Eduard Shevardnadze since 1972, the year he became First Secretary of the Georgian Communist Party. Before becoming Soviet Foreign Minister under Mikhail Gorbachev in 1985, Shevardnadze gained a reputation for his anti-corruption policies and his economic initiatives. Shevardnadze entered into alliances with paramilitary forces when he felt it necessary and arrested them when he felt that he was strong enough to maintain power. He adopted an anti-Russian policy at the beginning of his administration, then sought and received Russian aid in putting down an internal rebellion. He even joined the **Commonwealth of Independent States** (CIS)—a heretical act for Georgian nationalists considering the dominant role Russia plays in that organization. When it became clear that Russian economic aid would not be forthcoming, he explained that he attained concessions for his country by such devotion. As Russia adopts a hostile position towards the small republic, some suspect that the Georgian president is now saying what the West wants to hear in order to get the loans and legitimacy necessary to retain control. Shevardnadze was elected for another—and, according to himself, final—5-year term of office in April 2000.

To consolidate his influence and further his policies, Shevardnadze founded the Citizens Union of Georgia (CUG) party in 1993. Officially dedicated to free market economics, the CUG advocates increasing the collection of taxes, fiscal rectitude, and improving social welfare provisions. The CUG emerged as the largest party after parliamentary elections in 1995 and 1999. As with society generally, politics is clannish in Georgia and many important administrative functions are handed out to family relatives and friends. Despite the more than 100 small parties in Georgia, there is little effective opposition to the Shevardnadze-led government. With the exception of the electorally insignificant **communist** faction, all political groups are committed to the free market, so alternative leaders provide a functional but not an ideological opposition to the status quo.

The "black hole" of tax collection is so great that tax revenues constituted only 10 percent of **gross domestic product** (GDP) in 1997, a year in which the Georgian economy enjoyed one of the world's fastest growth rates. Insubstantial tax revenues are partially due to the narrow tax base; most of those who do pay taxes are state employees for whom tax is automatically subtracted from salaries. While those living below the poverty line might have some ethical grounds for evading tax, many of those that have the means to pay have shown no willingness to contribute their share. The situation is aggravated by the actions of underpaid tax officials who ignore hidden income in return for pocketing a portion of the total amount due. The government has done little to develop more effective means of enforcing the law and appears resigned to the situation.

INFRASTRUCTURE, POWER, AND COMMUNICATIONS

There are 20,298 kilometers (12,613 miles) of roads in Georgia which consist of international motor roads (1,474 kilometers/916 miles), internal state motor roads (3,330 kilometers/2,069 miles), and local roads (15,494 kilometers/9,628 miles). The vast majority of roads are in poor condition. A Georgian railway network was established in 1872, which grew to 1,583 kilometers (984 miles) of track in 2000. T'bilisi is connected by rail to the capitals of Azerbaijan and Armenia, but due to unrest in Abkhazia, the route to Russia and Europe has not been in operation since the early 1990s. In 1988, during the last years of the Soviet regime, Georgian railways transported 36.2 million metric tons of cargo. The volume declined to 4.7 million metric tons in 1995, or only 13 percent of total railway production. Since that date, the volume of cargo has steadily increased, reaching 9.4 million metric tons in 1999.

The Georgian electricity power sector is in urgent need of modernization, refurbishment, and investment. The provision of electricity to Georgian citizens has declined every year since 1995 and the lack of power is an obstacle to economic growth. In 1998, a U.S.-based energy company (AES Corporation) bought Telasi, Georgia's bankrupt electricity distribution company. Government corruption, non-payment of bills, and a reliance on aging hydroelectric and thermal

power stations have all contributed to the electricity shortage. During the winter of 2000–01, electricity supply to households was an average of 4 hours per day. These shortages have inflicted misery on an already disenchanted population. Widespread protests and street demonstrations during November 2000 provided a safety valve for popular frustration but aroused fears of another civil war.

The communications sector is the most stable sector of the economy and has attracted the interest of foreign investors. The modernization of ground lines is a process that will continue for some years while the mobile phone operator networks have enjoyed rapid expansion. In 1998, there were 115 telephone lines, 11 cellular phones, and 0.1 public phones per 1,000 citizens. Most of the public phones, however, were in serious disrepair. Internet service providers have also recorded increased business but access to computers remains the luxury of a privileged few (0.15 per 1,000 citizens).

ECONOMIC SECTORS

In terms of volume of goods and numbers employed, agriculture plays a key role in the Georgian economy and is crucial in reducing poverty in rural areas. The **liberalization** of prices and the **privatization** of the land were important steps taken during the 1990s to improve the agricultural sector, though lack of capital has prevented the development of modern systems of management and the attraction of new markets.

The industrial sector has enjoyed modest advances in recent years. In 2000, industrial output grew by 10.8 percent, amounting to GEL1.051 million. Industry accounted for 21.5 percent of GDP in 2000. One positive trend was the increase in the number of small businesses, which totaled 2,296 in October 2000, though they only accounted for 14.5 percent of total industrial production. There is an unequal share of production among the in-

dustries—43.8 percent of industrial production is produced by 52 of the 2,713 industrial companies—indicating a low level of diversification. In addition, the shadow industry, a legacy from Soviet times, continues to hinder growth. The volume of informal or shadow industrial production was estimated to be 177 percent of officially produced goods in 2000. Industry employed 20 percent of the workforce in 1999.

The service industry constituted 51 percent of Georgia's GDP in 2000. Trade and transport both play a major role in the service industry and each accounted for more than 10 percent of the sector, respectively, by 2000. Tourism remains one of Georgia's great unfulfilled potentials, but the loss of Abkhazia and poor **infrastructure** continue to hamper development in this area. The banking sector has consolidated greatly since 1994 but there are still too many banking groups relative to both the population and the resources of the Georgian people. Approximately 40 percent of the workforce was employed in the service industry in 1999. The remaining 5.9 percent of the GDP was accounted for by net taxes.

AGRICULTURE

During the Soviet period, agriculture and food processing were major activities in Georgia and the country continues to be a significant producer of wine, tea, fruit, and vegetables. Land use in Georgia varies with local climatic and soil patterns. The cultivation of citrus is concentrated along the Black Sea, particularly in Abkhazia and Ajara. Georgian wine has a reputation for excellence, though the industry has suffered in recent years from the manufacture of fake Georgian wine. The cultivation of nuts and tea are also of fundamental importance. Overall, agriculture, forestry, and fisheries accounted for 21.5 percent of GDP in 2000 and employed 40 percent of the workforce in 1999.

Adverse weather conditions contributed to a substantial fall in agricultural production during the year 2000. The volume of agricultural produce fell by 18.5 percent compared with 1999 and the Ministry of Agriculture and Food estimated losses at US$225 million. A prolonged drought throughout the country was particularly devastating for the agricultural heartland of eastern Georgia; almost 400,000 hectares of agricultural lands were damaged. The damage included 155,000 hectares of grain fields causing the annual grain yields to average 900–1,000 kilos per hectare, half of normal production. The effect on sunflower plantations was even greater with 58,600 hectares of the crop suffering damage and the harvest being almost entirely destroyed in some regions.

Forty-three percent of the country's territory is forested. About 97 percent are located on the slopes of the main and small Caucasus Mountain systems, the remainder are to be found in the valleys of East Georgia and the Colkheti lowlands. As a result of the energy shortage, large forest areas have been cut down, leading to soil erosion, the reduction of underground and surface water, and the formation of land and snow slides. Collectively, these processes have caused soil salination and a decrease in soil fertility in many areas. Reliance on manual labor, out-dated techniques, and poorly maintained irrigation systems also lead to decreased productivity.

INDUSTRY

MINING. Georgia used to possess one of the world's richest manganese deposits in the Tchiatura and Sachkhere regions: present-day resources are estimated at about 200 million metric tons. Significant deposits of high quality mineral and drinking water exist in Georgia. Two-thirds of estimated resources (amounting to 17–18 cubic kilometers/4–4.3 cubic miles) are located in western Georgia at 10 to 15 meters depth while the remaining third in eastern Georgia is also accessible at a depth of 250 to 300 meters. A thriving industry during the Soviet period, bottled water production declined sharply after independence and by 1993 was down to 5 percent of pre-independence levels. In recent years, however, the mineral water industry has revived with the "Borjormi" label leading the way.

MANUFACTURING. Georgia's manufacturing base is so weak that many of its most important enterprises can only operate without paying for electricity. The government, afraid of the potential redundancies, has refused to take decisive action. The metallurgy and chemical sectors are commodities of most importance to the Georgian economy, specifically manganese ore, ferromanganese, mineral fertilizers, and synthetic ammonia.

Other industrial activities include domestic processing of agricultural products, which accounted for 4.7 percent of overall GDP in 2000, and construction, which accounted for 3.5 percent. While construction has been increasing relatively rapidly (4 percent in 2000), much of this activity is part of the **shadow economy**.

SERVICES

TOURISM. Georgia was once the tourism center of the Soviet Union with 3 million visitors annually, 250,000 of whom came from outside of the USSR. As Georgia descended into civil war in the early 1990s, its tourism industry ground to a halt. According to Georgia's State Department of Tourism and Resorts, about 383,000 people visited Georgia in 1999, of which 219,000 came from the CIS and 164,000 from other countries. Many of the hotels and health resorts that had catered to tourists were used to house the thousands of internally displaced

people who fled to the capital after the defeat of Georgian forces in Abkhazia. Tourism is also hindered by a cumbersome visa regime that requires letters of invitation and submission of passports to embassies prior to departure. Visas can be obtained upon arrival at the airport but only at very high prices.

The attractions for travelers in Georgia include the beautiful coastal regions along the Black Sea, though the 2 autonomous republics of Abkhazia and Adjara dominate most of the coastline. With its large mountain ranges (the highest peak is 5,150 meters/16,897 feet), Georgia is ideal for skiing, and the Bakuriani and Gudauri ski resorts were very popular among Russian tourists in the Soviet era. Revival of this tourist attraction will, however, require heavy investment and continued political stability. Though tourism could become one of the country's leading industries, hotels and restaurants contributed only 2.2 percent of GDP in 2000.

TEXTILES. The textile industry is also one that should witness significant development in the coming years. A legislative framework for investment and close proximity to EU markets complements the availability of raw materials and a cheap skilled workforce. Eighty-five percent of textile companies have been privatized, either as joint stock companies or companies with limited liability.

FINANCIAL SERVICES. The legacy of communism and the reality of corruption ensured that the creation of a strong banking system in Georgia would be troubled. The absence of an effective banking sector made it difficult for entrepreneurs to get the capital needed to invest in private enterprises, while government interference forced banks to give loans to dubious projects and individuals, further debilitating the development of financial services. Hundreds of banks were established in the early 1990s with capital of US$500 or less. Between 1998 and 2000 the number of banks fell from 294 to 33 and more closures are expected as a result of bankruptcy, closure, or merger.

INTERNATIONAL TRADE

As an integral part of the Soviet Union, Georgian trade was conducted almost exclusively within the USSR. On the eve of the country's independence, 95.7 percent of Georgia's exports and 72.3 percent of its imports were from trade with other Soviet Republics. In the decade following independence, Georgia had to seek out new trading partners because most of the former Soviet republics were poor and the new government did not wish to rely on Russia. In 1997, Russia accounted for 27.4 percent of exports and 15.2 percent of imports; 2 years later these figures had been further reduced to 12.4 percent and 7.1 percent, respectively.

Trade with the EU and Turkey has replaced much of the trade with Russia. In 2000, Georgia exported US$68.3 million to the EU and imported goods to the value of US$167.1 million. Though this meant that Georgia had a **trade deficit** of US$95.8 million, the figure represented a dramatic improvement on the 1998 figure when the trade imbalance was US$273.8 million. Germany has emerged as Georgia's largest trading partner among the EU member states. In 1999, Georgian exports to Germany amounted to US$24.5 million while it imported US$44.2 million of German produce. Despite improving the trade balance in 1999, Georgia still had a trade deficit with all EU member states except Spain.

At the beginning of 2000, Georgia had a trade deficit with 70 trading partners and enjoyed a trade surplus with 18 countries, the most significant of which were Turkey and Syria. Reducing the trade deficit is one of the key priorities of the Georgian government but its efforts are hampered by the conflict in Abkhazia and the de facto independence of South Ossetia and Adjara. The defeat of Georgian forces in Abkhazia resulted in the loss of the rail route to Russia and Europe. The independent regions are popular smuggling routes, depriving the government of revenues and hindering its regulation of trade.

MONEY

Like many former Soviet republics, Georgia used the Russian ruble as a unit of currency after achieving independence. In April 1993, however, the Georgian National Bank introduced a coupon currency to alleviate the shortage of Russian rubles, which was hampering payment of government salaries. Priced on a par with the Russian ruble, the currency was supposed to circulate with the ruble but by August 1993 it had become the sole legal tender. The value of the currency was expected to be maintained by the proceeds from privatization, but when these failed to materialize, a large quantity of unsecured credits were issued with the predictable consequence of rampant **inflation**. By 1994 US$1 was worth 2 million Georgian coupons and inflation was at 100 percent per month. Not surprisingly, most transactions were carried out in U.S. dollars or Russian rubles.

lari per US$1	
Dec 2000	1.9798
2000	1.9762
1999	2.0245
1998	1.3898
1997	1.2975
1996	1.2628

SOURCE: CIA *World Factbook 2001* [ONLINE].

The government introduced a new currency—the lari—on 25 September 1995, which became the only legal tender a week later. Coupons were exchanged at the rate of 1 million per Georgian lari (GEL). Due to the economic reforms that had already begun to take effect and the absence of war, the lari proved to be far more successful than its predecessor. Introduced at the rate of 1.23 Lari per U.S. dollar, the currency has remained relatively stable, declining to 1.35 lari by August 1998 and to 1.97 lari by September 2000. The rate of exchange dipped in the early months of 2001, reaching 2.11 by the middle of February, a decline that was attributed to economic crises in Turkey.

Only the Russian ruble is used in Abkhazia and South Ossetia. Though the lari is accepted as legal tender in the Armenian-populated region of Javaketi, the Armenian dram and the Russian ruble are the dominant currencies, the latter due to the presence of Russian troops. The relative stability of the lari since 1995 contributed to the reduction of inflation. With the ruble in circulation in 1992, inflation had stood at 913.1 percent for the year but war, the failure of economic reforms, and the introduction of the coupon saw this figure rocket to 7,380 percent in 1994. The rate of inflation dropped to 57.4 percent in 1995, 13.8 percent in 1996, 7.2 percent in 1997 and 4.6 percent in 2000.

POVERTY AND WEALTH

Before the collapse of the USSR, poverty was relatively unknown in Georgia. Since then, the standard of living has declined. In June 2000, 53 percent of the population was below the national poverty line, which meant that average spending was less than US$2 per day per person. Georgia's tradition of an extended-family support system has acted as a buffer against the worst privations of severe poverty, however.

Access to land has alleviated some of the hardships for the rural population. In 1997, the poverty gap and squared poverty gap index were 40 and 60 percent higher in urban areas, respectively, than those in rural areas. There are also significant differences in poverty rates and poverty gaps among the geographic regions, with poverty rates in the richest areas (Samegrelo/Poti, Adjara/Batumi) being half those of the poorest ones (Imereti, Guria). The people of the most impoverished region, Imereti, live in remote, mountainous areas that are almost inaccessible during winter partly due to lack of infrastructure maintenance. The former centers of Soviet heavy industry were most adversely affected while those that possessed diversified agricultural and agro-industrial sectors proved less vulnerable to the dramatic upheavals of the 1990s.

The minimum subsistence levels established by the U.S. State Department for Statistics (SDS) were GEL113.2 a month for a working man, GEL99.3 for an average consumer, and GEL197 (US$100) for a family of 4. In 2001, the country's 800,000 **pensioners** received payments of GEL14 (US$7) with GEL2 deducted for electricity. This represents only 12 percent of the SDS's suggested minimum *subsistence* income level. Pensioners, therefore, invariably rely on family, neighbors, street trading, or begging. The **dependency ratio** is 1:1.2, which is dangerously high compared to the suggested 1 dependent per 3 people. The large proportion of workers not paying taxes worsens the government's ability to introduce an adequate pension scheme. The pension system also suffers from a large number of "ghost" recipients: the 1999 registration revealed payments to 37,743

GDP per Capita (US$)

deceased pensioners. This unusual situation is partially explained by the high cost of funerals, which force many people to bury their relatives without registering their deaths. Postal workers, however, earn bonuses for withholding the delivery of pensions to unreported, deceased pensioners.

While the Soviet health-care system had imperfections, it was far superior to that of independent Georgia. In 1999, government spending on health care constituted 0.59 percent of GDP, a figure that compares unfavorably with Latin America (2.6 percent), eastern Europe (3.9 percent), and high-income nations of the western world (6 percent). Georgians are expected to pay for their own health care, but surveys indicate that almost 80 percent of Georgians spend less than US$5 a month on it. Because of the strong sense of family obligation that is a fundamental part of the Georgian culture, financial support for ailing and aging citizens often becomes the responsibility of family. This family contribution is one of the factors that allows Georgians to enjoy an average life expectancy of 73 years.

The Georgian educational system was one of the few institutions that did not collapse during the wars of the early 1990s, but the standard of education has diminished since the Soviet period. The university system is notoriously corrupt. Teachers are rarely paid. There is an acute lack of resources at all levels. Once renowned for their educational achievements, Georgians face an education crisis that may ultimately undermine one of the main attractions for potential investors—an educated workforce.

WORKING CONDITIONS

As the year 2000 came to an end, government statistics indicated that Georgia had a **labor force** of 2.06 million people, 8.4 percent of whom were unemployed. Official unemployment figures are deceptively low and do not accurately reflect economic realities. Most Georgians consider their chances of securing a job by registering themselves with the authorities as low, and they are not attracted by unemployment compensation. To qualify for standard monthly unemployment benefits, an applicant must have worked in the official sector and, even then, would only be entitled to receive benefits for the first 6 months of unemployment. The payments are fixed at GEL14 for the first 2 months, GEL12 for the third and fourth months, and GEL11 for the final period. On average, 2 percent of registered unemployed workers qualify for benefits.

Government labor force survey results for the last quarter of 2000 suggested that urban unemployment stood at 24.7 percent compared to a rural unemployment rate of 4.6 percent. The capital, T'bilisi, accounted for 41 percent of the country's unemployed. While the rural rate might seem encouraging, 65 percent of those in the countryside were self-employed. Indeed, agricultural self-employment comprised 86.5 percent of those described as self-employed and most lived below the poverty line.

The role of trade unions in Georgia is exceptionally weak, largely due to the poor state of key economic sectors. Strikes and other forms of industrial protest are meaningless against a backdrop of idle and bankrupt firms that are often *unable* to pay employees. Many employees continue to work in the hope that one day their salary **arrears** will be paid, a hope that evaporates if they cease working.

While there is no official discrimination against women, Georgia is a patriarchal society and in many menial jobs women are paid as little as half of what their male counterparts earn. Mass unemployment, however, has affected males disproportionately and upset traditional gender relations. Women have proved more successful at securing high-paid jobs with international organizations, which usually require proficiency in foreign languages.

COUNTRY HISTORY AND ECONOMIC DEVELOPMENT

1099–1125. David IV (the Builder) establishes the Georgian empire. Beginning of Georgian Golden Age.

1184–1213. Georgia's favorite monarch, Queen Tamara, defeats Turks and extends Georgian rule from the Black Sea to the Caspian Sea.

1220. Georgian Golden Age ends with the invasion of the Mongols under Genghis Khan.

1553. Ottoman Turks and Persians divide Georgia between themselves.

1801. Russian annexation of Georgia.

1811. Georgian Orthodox Church is stripped of its self-governing status as part of the Russification process.

1918. Georgia gains independence.

1921. Red Army invades Georgia and drives out the democratically elected government. Georgia is annexed and becomes part of the new USSR.

1972. Eduard Shevardnadze becomes First Secretary of the Georgian Communist Party and begins anti-corruption campaign.

1989. On 9 April, Soviet troops kill 20 civilians—mainly women—who were involved in a nationalist protest outside the parliament in T'bilisi. From this point on, Soviet rule is totally discredited in Georgia.

1990. In the country's first multi-party elections, a nationalist coalition is victorious and appoints Zviad Gamsakhurdia as president.

1991. On the anniversary of the T'bilisi massacre (9 April), Georgian parliament declares Georgia independent of the Soviet Union.

1991–1992. Gamsakhurdia is elected president by popular vote in May 1991 but is deposed in a coup in January 1992. Shevardnadze is invited by coup leaders to head the transitional government.

1992–1993. Georgian armed forces are defeated in Abkhazia. Abkhazia becomes a de facto independent republic, although it remains part of Georgia's national territory under international law.

1995. Shevardnadze is elected president. His Citizens Union of Georgia party emerges as the largest parliamentary grouping.

2000. Shevardnadze is re-elected president amid many voting irregularities. On 14 June, Georgia becomes the 137th member of the World Trade Organization.

FUTURE TRENDS

Georgia is a country of great economic potential but until it regularizes the supply of power to industry and to its citizenry, economic progress will be limited. The aging Shevardnadze, despite many imperfections, has played a pivotal role in securing stability. The question of who or what will follow his departure from the political scene remains unresolved. Political institutions and civic values are not yet rooted enough in Georgian society to permit total confidence in a smooth transition to a younger generation of politicians. The country will endure great difficulties in meeting external financial obligations. The shortfall in public spending—primarily on health, education, and welfare—will continue to bear hardest on the nation's poor. Georgia's greatest potential in the short- to medium-term lies in its geographical location. The government is committed to providing a trans-Georgian transportation infrastructure connecting Europe with central Asia to cater to an anticipated oil bonanza in the coming decades. The implementation of this so-called "Silk Route" project should enhance Georgia's international credentials, but this opportunity will be squandered if the endemic corruption that has plagued Georgia for decades is not seriously addressed.

DEPENDENCIES

Georgia has no territories or colonies.

GERMANY

Federal Republic of Germany
Bundesrepublik Deutschland

CAPITAL: Berlin.

MONETARY UNIT: Deutsche mark (DM). One deutsche mark equals 100 pfennigs. There are coins of 1, 2, 5, 10, and 50 pfennigs and 1, 2, and 5 deutsche marks, and notes of 5, 10, 20, 50, 100, 200, 500, and 1,000 deutsche marks. In January 1999 Germany switched to the new European currency unit, the euro, along with 10 other members of the European Union, as a part of the European Monetary Union (EMU) and the European System of Central Banks (ESCB). The euro was in use after 1 January 1999 for electronic transfers and accounting purposes, while euro coins and bills will be issued in 2002, and at that time the German currency will cease to be legal tender. On 1 January 1999, control over monetary policy, the setting of interest rates, and the regulation of the money supply was transferred from the German Central Bank (Bundesbank) to the European Central Bank (ECB) in Frankfurt am Main.

CHIEF EXPORTS: Machinery, vehicles, chemicals, metals and manufactures, foodstuffs, textiles.

CHIEF IMPORTS: Raw materials, machinery, vehicles, chemicals, foodstuffs, textiles, metals.

GROSS DOMESTIC PRODUCT: US$1.864 trillion (purchasing power parity, 1999 est.).

BALANCE OF TRADE: **Exports:** US$549.0 billion (1999). **Imports:** US$478.9 billion (1999). [The *CIA World Factbook* lists 1999 exports of US$610 billion and imports of US$586 billion.]

COUNTRY OVERVIEW

LOCATION AND SIZE. Located in western Central Europe, Germany has an area of 357,021 square kilometers (137,810 square miles), which makes it slightly smaller than the state of Montana. The country is bordered by the North Sea, Denmark, and the Baltic Sea to the north; Poland and the Czech Republic to the east; Austria and Switzerland to the south; and France, Luxembourg, Belgium and the Netherlands to the west. The capital city, Berlin, is located in the northeastern part of the country.

POPULATION. The population of Germany was estimated at 82.8 million in 2000, adding up to a 4.3 percent increase from 1990. The birth rate was only 9.35 births per 1,000 population and the death rate was 10.49 per 1,000, causing a decrease in the natural born population during 2000. The growth of the population during the 1990s was mainly due to **immigration**. The immigration rate was 4.01 immigrants per 1,000 population in 2000. The population of Germany has increased 21 percent over the second half of the 20th century, but it is expected to contract to 79.3 million by 2025 and 70.3 million by 2050. The birth rate is declining due to a fertility rate of 1.38 births per woman in 2000, far below the replacement threshold of 2.1 births per woman. The population, as in most of Europe, is also aging with a high life expectancy of 77.44 years for the total population (74.3 for men and 80.75 for women in 2000). In 2000, 16 percent of the population was 14 years old or younger, while an equal percentage was 65 years or older.

Germany's welfare system has supported population growth by offering social services, such as old-age pensions, health and unemployment insurance, disability benefits, subsidized housing, and **subsidies** to families raising children. However, these programs have so far failed to increase Germany's birth rate. Higher living standards and the modern economy restricted population growth during the 1990s. Germany's **labor force** is expected to shrink, particularly after 2020, and the number of **pensioners** will grow steadily. This decline in the ratio of active workers to retirees may force Germany by 2020 to bring in as many as 1.2 million immigrant workers annually (both skilled, such as computer programmers, and unskilled) to maintain its industrial output at 2000 levels. To offset these effects, the German government

has encouraged policies that sustain the life of native workers such as better health care, nutrition, and adult education. Public social security system reform is also important as the number of taxpayers decreases, causing intense financial pressures on those who still work. **Structural unemployment** has prompted the government to offer early retirement options to those who have skills and want to work yet cannot find work in their chosen fields. This has increased the pressure on the German retirement system and welfare system as a whole.

Higher living standards in Germany continuously attract many economic immigrants, mostly from eastern and southern Europe and the Middle East. The country received a considerable number of refugees from the Yugoslav wars in the early 1990s. In 2000 ethnic Germans formed 91.5 percent of the population and the most significant minority group was the ethnic Turks (2.4 percent), while Yugoslavs, Italians, Russians, Greeks, Poles, and Spaniards made up the rest. In 1998 there were about 7.3 million foreigners in the country. Some Germans blame immigrants

for taking jobs from native-born people, equating unemployment with foreigners. Some occurrences of racism and ethnic hatred have been reported throughout the country but mostly in the poorer eastern states.

The population density was 233.8 people per square kilometer (605.5 per square mile) in 1995. In 1997 about 57.4 percent lived in towns and cities of 20,000 or more inhabitants. Approximately 87.3 percent of Germans lived in urban areas in 1999, mainly in the industrial region of the Ruhr in the western portion of the country. The main cities are Berlin, the capital, with a population of 3.46 million; the free port city of Hamburg on the River Elbe in the north, with 1.71 million; the Bavarian capital Munich in the south, with 1.23 million; Cologne on the Rhine in the west, with 964,000; Frankfurt am Main, a major European financial center, in west central Germany, with 648,000; and Dresden and Leipzig, historic cities and cultural centers in Saxony in the east, each with approximately 450,000 (2000 est.).

OVERVIEW OF ECONOMY
