PREFACE

The *Worldmark Encyclopedia of National Economies* joins the Worldmark family of encyclopedias and attempts to provide comprehensive overviews of the economic structure and current climate of 198 countries and territories. Each signed entry provides key data and analysis on a country's economic conditions, their relationship to social and political trends, and their impact on the lives of the country's inhabitants. The goal of this set is to use plain language to offer intelligent, consistent analysis of every important economy in the world.

It is our sincere hope that this set will open the reader's mind to the fascinating world of international economics. Contained within this collection are a number of fascinating stories: of Eastern European nations struggling to adapt to capitalist economic systems in the wake of the collapse of communism; of Pacific Island nations threatened with annihilation by the slow and steady rise of ocean levels; of Asian nations channeling the vast productivity of their people into diversified economies; of the emerging power of the European Union, which dominates economic life across Europe; of Middle Eastern nations planning for the disappearance of their primary engine of economic growth, oil; and many others. To make all this information both accessible and comparable, each entry presents information in the same format, allowing readers to easily compare, for example, the balance of trade between Singapore and Hong Kong, or the political systems of North and South Korea. Economics has a language of its own, and we have **highlighted** those economic terms that may not be familiar to a general reader and provided definitions in a glossary. Other terms that are specific to a particular country but are not economic in nature are defined within parentheses in the text.

This set contains entries on every sovereign nation in the world, as well as separate entries on large territories of countries, including: French Guiana, Martinique, and Guadeloupe; Macau; Puerto Rico; and Taiwan. The larger dependencies of other countries are highlighted within the mother country's entry. For example, the entry on Denmark includes a discussion of Greenland, the United Kingdom includes information on many of its Crown territories, and the United States entry highlights the economic conditions in some of its larger territories.

ENTRY OBJECTIVES

Each entry has two objectives: one, to offer a clear picture of the economic conditions in a particular country, and two, to provide statistical information that allows for comparison between countries. To offer comparable information, we have used some common sources for the tables and graphs as well as for individual sections. Even the most exhaustive sources do not provide information for every country, however, and thus some entries either have no data available in certain areas or contain data that was obtained from an alternate source. In all entries, we tried to provide the most current data available at the time. Because collection and evaluation methods differ among international data gathering agencies such as the World Bank, United Nations, and International Monetary Fund, as well as between these agencies and the many government data collection agencies located in each country, entries sometimes provide two or more sources of information. Consequently, the text of an entry may contain more recent information from a different source than is provided in a table or graph, though the table or graph provides information that allows the easiest comparison to other entries.

No one source could provide all the information desired for this set, so some sources were substituted when the main source lacked information for specific countries. The main sources used included: the *World Factbook 2000* and *2001,* which provided the common information on the countries' gross domestic product (GDP) at purchasing power parity, the division of labor, balance of trade, chief imports, chief exports, and population, unless otherwise noted in the text; the World Bank's *World Development Indicators,* which was a valued source for information about the infrastructure and consumption patterns of many countries; the *Human Development Report,* from the United Nations, which provided GDP per capita information on many countries; and the International Monetary Fund's *International Financial Statistics Yearbook,* which provided historical records of trade balances for most countries. Each entry also contains a bibliography that lists additional sources that are specific to that entry.

ENTRY ORGANIZATION

All entries are organized under 16 specific headings to make it easy to find needed information quickly and to compare the conditions in several different countries easily. (The sole exception is the entry on the Vatican, whose unique features necessitated the removal of several sections.) The sections are as follows:

COUNTRY OVERVIEW. This section includes information about the size of all land surfaces, describing coastlines and international boundaries. It also highlights significant geographical features in the country and the location of the capital. The size of the country is compared to a U.S. state or, for smaller countries, to Washington, D.C. Also included is information on the total population, as well as other important demographic data concerning ethnicity, religion, age, and urbanization. Where relevant, this section also includes information about internal conflicts, major health problems, or significant population policies.

OVERVIEW OF ECONOMY. This overview is meant to provide an analysis of the country's overall economic conditions, mentioning those elements that are deemed most important to an understanding of the country. It provides context for the reader to understand the more specific information available in the other sections.

POLITICS, GOVERNMENT, AND TAXATION. This section identifies the structure of the government and discusses the role the government, political parties, and taxes play in the economy.

INFRASTRUCTURE, POWER, AND COMMUNICATIONS. This section offers a description of the roads, railways, harbors, and telecommunications available in the country, assesses the modernity of the systems, and provides information about the country's plans for improvements.

ECONOMIC SECTORS. This section serves as an overview for the three more specific sections that follow, providing a general description of the balance between the country's different economic sectors.

AGRICULTURE. This section discusses the agriculture, fishing, and forestry sectors of the country.

INDUSTRY. This section discusses the industrial sector of the country, including specific information on mining, manufacturing, and other major industries, where appropriate.

SERVICES. This section concentrates on major components of the diverse services sector, usually focusing on the tourism and banking or financial sectors and sometimes including descriptions of the retail sector.

INTERNATIONAL TRADE. This section focuses on the country's patterns of trade, including the commodities traded and the historical trading partners.

MONEY. This section offers a brief description of the changes in inflation and the exchange rates in the country, and the impact those may have had on the economy. It also mentions any recent changes in the currency and the nature and impact of the central banking function.

POVERTY AND WEALTH. This section paints a picture of the distribution of wealth within the country, often comparing life in the country with that in other countries in the region. It includes governmental efforts to redistribute wealth or to deal with pressing issues of poverty.

WORKING CONDITIONS. This section describes the workforce, its ability to unionize, and the effectiveness of unions within the country. It also often includes information on wages, significant changes in the workforce over time, and the existence of protections for workers.

COUNTRY HISTORY AND ECONOMIC DEVELOPMENT. This section provides a timeline of events that shaped the country and its economy. The selected events create a more cohesive picture of the nation than could be described in the entries because of their bias toward more current information.

FUTURE TRENDS. To provide readers with a view to the future, the entry ends with an analysis of how the economic conditions in the country are expected to change in the near future. It also highlights any significant challenges the country may face.

DEPENDENCIES. This section discusses any major territories or colonies and their economies.

BIBLIOGRAPHY. The bibliography at the end of the entry lists the sources used to compile the information in the entry and also includes other materials that may be of interest to readers wanting more information about the particular country. Although specific online sources are cited, many such sources are updated annually and should be expected to change.

In addition, a data box at the beginning of each entry offers helpful economic "quick facts" such as the country's capital, monetary unit, chief exports and imports, gross domestic product (GDP), and the balance of trade. The U.S. Central Intelligence Agency's *World Factbook* (2000 and 2001) was the main source of this information unless otherwise noted. Each entry also includes a map that illustrates the location of the country. Since economic conditions are often affected by geography, the map allows readers to see the location of major cities and landmarks. The map also names bordering countries to offer readers a visual aid to understand regional conflicts and trading routes.

ACKNOWLEDGMENTS

We wish to thank all those involved in this project for their efforts. This set could not have been produced

without the unfailing support of the publisher and our imaginative advisory board. At the Gale Group, managing editor Shelly Dickey and Peggy Glahn in New Product Development were especially helpful. We would also like to thank Gale editor William Harmer for his work in the early stages of the project, but special thanks must go to editors Rebecca Parks and Jeffrey Lehman who brought the set to publication. Copyeditors Edward Moran, Robyn Karney, Karl Rahder, Jennifer Wallace, and Mary Sugar must also be commended for their work to polish the entries into the form you see here.

COMMENTS

We encourage you to contact us with any comments or suggestions you may have that will benefit future editions of this set. We want this set to be a meaningful addition to your search for information about the world. Please send your comments and suggestions to: The Editors, *Worldmark Encyclopedia of National Economies,* The Gale Group, 27500 Drake Road, Farmington Hills, MI 48331. Or, call toll free at 1-800-877-4253.

—Sara Pendergast and Tom Pendergast

NOTES ON CONTRIBUTORS

Abazov, Rafis. Professor, Department of Politics, LaTrobe University, Victoria, Australia. Author, *Formation of the Post-Soviet Foreign Policies in Central Asian Republics* (1999), and annual security and economic reports, *Brassey's Security Yearbook*, and Transitions Online.

Abazova, Alfia. LaTrobe University, Victoria, Australia. Reviewed for *Pacifica Review* and *Europe-Asia Studies.*

Amineh, Parvizi Mehdi, Ph.D. Department of Political Science, University of Amsterdam, the Netherlands. Author, *Towards the Control of Oil Resources in the Caspian Region* (New York: St. Martin's Press, 1999); *Die Globale Kapitalistische Expansion und Iran: Eine Studie der Iranischen Politischen Ökonomie (1500–1980)* (Hamburg-London: Lit Verlag).

Arnade, Charles W. Adviser. Distinguished Professor of International Studies, University of South Florida. Author, *The Emergence of the Republic of Bolivia.*

Audain, Linz, M.D., J.D., Ph.D. Staff physician, Greater Southeast, INOVA Fairfax and Southern Maryland hospitals; former professor of law, economics, and statistics at various universities; editor, *Foreign Trade of the United States* (2nd ed.), *Business Statistics of the United States* (6th ed.).

Benoit, Kenneth, Ph.D. Lecturer, Department of Political Science, Trinity College, University of Dublin, Ireland.

Bouillon, Markus R. Doctoral student in international relations with a regional focus on the Middle East, St. Antony's College, University of Oxford.

Burron, Neil. Graduate student in International Development, The Norman Paterson School of International Affairs, Carleton University, Ottawa.

Campling, Liam. Lecturer in International Politics and History, Seychelles Polytechnic (University of Manchester Twinning Programme). Editor, *Historical Materialism—Special Issue: Focus on Sub-Saharan Africa* (2002). Contributor to *West Africa* and *African Business* magazines.

Carper, Mark Daniel Lynn. Instructor of Geography, Central Missouri State University.

Cavatorta, Francesco. Doctoral candidate in the Department of Political Science, Trinity College, Dublin, Ireland. Author, "The Italian Political System and the Northern League," in *Contemporary Politics,* March 2001.

Chari, Raj. Lecturer, Department of Political Science, Trinity College, Dublin, Ireland. Author, "Spanish Socialists, Privatising the Right Way?" in *West European Politics,* Vol. 21, No. 4, October 1998, and "The March 2000 Spanish Election: A 'Critical Election'?" in *West European Politics,* Vol. 23, No. 3, July 2000.

Chauvin, Lucien O. Freelance journalist, Lima, Peru. President of the Foreign Press Association of Peru.

Childree, David L. Graduate student in Latin American Studies at Tulane University, specializing in politics and development.

Conteh-Morgan, Earl. Professor, Department of Government and International Affairs, University of South Florida, Tampa, Florida. Co-author, *Sierra Leone at the End of the 20th Century* (1999).

Costa, Ecio F., Ph.D. Post-doctoral associate, Center for Agribusiness and Economic Development, Department of Agricultural and Applied Economics, University of Georgia, Athens, Georgia. Author, "Brazil's New Floating Exchange Rate Regime and Competitiveness in the World Poultry Market," in *Journal of Agricultural and Applied Economics.*

Cunha, Stephen, Ph.D. Professor of Geography, Humboldt State University, Arcata, California. Consultant, USAID, World Bank, National Geographic Society.

Davoudi, Salamander. Graduate student in Middle Eastern economics, Georgetown University, Washington, D.C. Former aid at the Royal Jordanian Hashemite Court.

Deletis, Katarina. M.I.A. (Master of International Affairs), Columbia University, New York. International communications officer, Deloitte Touche Tohmatsu, New York.

Divisekera, Sarath. Ph.D., School of Applied Economics, Victoria University, Melbourne, Australia. Author, *Income Distribution, Inequality and Poverty in Sri Lanka* (1988).

Eames, Rory. Honors student, School of Resources, Environment, and Society, The Australian National University, Canberra, Australia.

Easton, Matthew. Independent consultant, Cambridge, Massachusetts. Author, *In the Name of Development: Human Rights and the World Bank in Indonesia* (1995).

Feoli, Ludovico. Graduate student in Latin American Studies, Tulane University, New Orleans, Louisiana. Publications director and academic coordinator, CIAPA, San José, Costa Rica.

Ferguson, James. Writer and researcher specializing in the Caribbean. Author, *A Traveller's History of the Caribbean* (1999).

Florkowski, Wojciech J. Associate professor, Department of Agricultural and Applied Economics, University of Georgia.

Foley, Sean. Ph.D. candidate, History, Georgetown University, Washington, D.C. Author of various articles and a chapter in *Crises and Quandaries in the Contemporary Persian Gulf* (2001).

Foroughi, Payam. Ph.D. student in International Relations, University of Utah. International development consultant, NGOs, USAID, and the United Nations, Central Asia; freelance writer.

Friesen, Wardlow. Senior lecturer, Department of Geography, The University of Auckland, New Zealand. Author, "Tangata Pasifika Aotearoa: Pacific Populations and Identity in New Zealand," in *New Zealand Population Review,* Vol. 26, No. 2, 2000; "Circulation, Urbanisation, and the Youth Boom in Melanesia," in *Espace, Populations, Sociétés,* Vol. 2, 1994; "Melanesian Economy on the Periphery: Migration and Village Economy in Choiseul," in *Pacific Viewpoint*, Vol. 34, No. 2, 1993.

Fry, Gerald W. Adviser. Professor of International/Intercultural Education, and director of Graduate Studies, Department of Educational Policy and Administration, University of Minnesota—Twin Cities; former team leader on major Asian Development Bank funded projects in Southeast Asia.

Gazis, Alexander. Commercial specialist, U.S. Embassy, N'Djamena, Chad. Author, *Country Commercial Guides* for Chad (Fiscal Year 2001 and 2002).

Genc, Emine, M.A. Budget expert, Ministry of Finance, Ankara, Turkey.

Genc, Ismail H., Ph.D. Assistant professor of Economics, University of Idaho, Moscow, Idaho.

Gleason, Gregory. Professor, University of New Mexico. Former director, USAID Rule of Law Program in Central Asia.

Guillen, April J., J.D./M.A. International Relations candidate, University of Southern California, Los Angeles, with an emphasis on International Human Rights Law.

Hadjiyski, Valentin, Ph.D. New York-based freelance author, former United Nations expert.

Hodd, Jack. Queen's College, Cambridge, researching graphical presentations of general equilibrium models.

Hodd, Michael R. V. Adviser. Professor of Economics, University of Westminster, London, and has worked as a consultant for the ILO and UNIDO. Author, *African Economic Handbook,* London, Euromonitor, 1986; *The Economies of Africa,* Aldershot, Dartmouth, 1991; with others, *Fisheries and Development in Tanzania,* London, Macmillan, 1994.

Iltanen, Suvi. Graduate of the European Studies Programme, Trinity College, Dublin, Ireland.

Jensen, Nathan. Ph.D. candidate in political science, Yale University, and visiting scholar at UCLA's International Studies and Overseas Programs. He is currently completing his dissertation titled "The Political Economy of Foreign Direct Investment."

Jugenitz, Heidi. Graduate student in Latin American Studies, Tulane University, New Orleans, Louisiana. Research assistant, Payson Center for International Development and Technology Transfer.

Kiyak, Tunga. Ph.D. candidate in marketing and international business, Michigan State University. Research assistant, Center for International Business Education and Research (MSU-CIBER). Curator, International Business Resources on the WWW.

Kuznetsova, Olga. Senior research fellow, The Manchester Metropolitan University Business School, Manchester, UK. Author, *The CIS Handbook. Regional Handbooks of Economic Development: Prospects onto the 21st Century,* edited by P. Heenan and M. Lamontagne (1999).

Lang-Tigchelaar, Amy. Graduate student in joint MBA/MA in Latin American Studies Program, Tulane University, New Orleans, Louisiana.

Lansford, Tom. Assistant professor, University of Southern Mississippi, Gulf Coast. Author, *Evolution and Devolution: The Dynamics of Sovereignty and Security in Post-Cold War Europe* (2000).

Lynch, Catherine. Doctoral candidate in political science, Dublin City University, Ireland. Areas of interest include the political economy of implementing peace agreements, the politics of peace building, the implementation of policy, and other aspects of comparative political science.

Mahoney, Lynn. M.A., University of Michigan. Associate director of development, director of communications, American University of Beirut New York Office; freelance writer.

Mann, Larisa. Graduate student of economic history, cultural studies, and legal studies, London School of Economics. Presented "Shaky Ground, Thin Air: Intellectual Property Law and the Jamaican Music Industry" at the "Rethinking Caribbean Culture" conference at the University of West Indies, Cave Hill, Barbados.

Mazor, John. Writer and journalist specializing in economic and political issues in Latin America and the Levant. Graduated from Boston University with a degree in literature and studied intelligence and national security policy at the Institute of World Politics in Washington, D.C.

Mobekk, Eirin. MacArthur postdoctoral research associate, Department of War Studies, King's College, London, United Kingdom.

Mowatt, Rosalind. Graduate student in Economics, Wits University, Johannesburg, South Africa. Former economist for National Treasury, working with Southern African Development Community (SADC) countries.

Muhutdinova-Foroughi, Raissa. M.P.A., University of Colorado at Denver. Journalist, Radio Tajikistan; consultant, United Nations, World Bank, and Eurasia Foundation, Commonwealth of Independent Nations; freelance writer.

Mukungu, Allan C. K. Graduate student, University of Westminster, London, and has done consultancy work for the World Bank.

Musakhanova, Oygul. Graduate, University of Westminster; economist, Arthur Anderson, Tashkent, Uzbekistan.

Naidu, Sujatha. LL.M. in Environment Law, University of Utah. Ph.D. student in International Relations, Department of Political Science, University of Utah; freelance writer.

Nicholls, Ana. Journalist. Assistant editor, *Business Central Europe,* The Economist Group. Author of three surveys of Romania.

Nicoleau, Michael. J.D. Cornell Law School, Ithaca, New York. Co-author, "Constitutional Governance in the Democratic Republic of the Congo: An Analysis of the Constitution Proposed by the Government of Laurent Kabila," in *Texas International Law Journal,* Spring 2000.

Nuseibeh, Reem. Graduate student in Comparative Politics/Human Rights, University of Maryland, Maryland. Middle East risk analyst, Kroll Information Services, Vienna, Virginia.

Ó Beacháin, Donnacha. Ph.D. Political Science from National University of Ireland, Dublin. Civic Education Project visiting lecturer at the Departments of International Relations and Conflict Resolution at Tbilisi State University and the Georgian Technical University, respectively, 2000–2002.

Ohaegbulam, F. Ugboaja. Professor, Government and International Affairs, University of South Florida. Author, *A Concise Introduction to American Foreign Policy* (1999), and *Nigeria and the UN Mission to the Democratic Republic of the Congo* (1982).

O'Malley, Eoin. Doctoral candidate in Political Science at Trinity College, Dublin, and visiting researcher at UNED, Madrid, Spain. Author, "Ireland" in Annual Review section of the *European Journal of Political Research* (1999, 2000, 2001).

Ozsoz, Emre. Graduate student in International Political Economy and Development, Fordham University, New York. Editorial assistant for the Middle East, The Economist Intelligence Unit, New York.

Peimani, Hooman, Ph.D. Independent consultant with international organizations in Geneva, Switzerland. Author, *The Caspian Pipeline Dilemma: Political Games and Economic Losses* (2001).

Pretes, Michael. Research scholar, Department of Human Geography, Research School of Pacific and Asian Studies, The Australian National University, Canberra, Australia.

Sabol, Steven. Ph.D., the University of North Carolina at Charlotte. Author, *Awake Kazak! Russian Colonization of Central Asia and the Genesis of Kazak National Consciousness, 1868–1920.*

Samonis, Val, Ph.D., C.P.C. Managed and/or participated in international research and advisory projects/teams sponsored by the Hudson Institute, World Bank, CASE Warsaw, Soros Foundations, the Center for European Integration Studies (ZEI Bonn), the Swedish government, and a number of other clients. Also worked with top reformers such as the Polish Deputy Prime Minister Leszek Balcerowicz, U.S. Treasury Secretary Larry Summers, the World Bank, and OECD Private Sector Advisory Group on Corporate Governance, and with the Stanford Economic Transi-

tion Group; advisor to the Czech government (Deputy Prime Minister Pavel Mertlik), the Lithuanian parliament, and several Lithuanian governments, international organizations, and multinational corporations; founding editor, *Journal of East-West Business* (The Haworth Press Inc).

Sezgin, Yuksel. Ph.D. candidate in Political Science, University of Washington. Former assistant Middle East coordinator at the Foreign Economic Relations Board of Turkey.

Schubert, Alexander. Ph.D., Cornell University.

Scott, Cleve Mc D. Ph.D. candidate and graduate assistant, Department of History, University of the West Indies, Cave Hill Campus, Barbados.

Stobwasser, Ralph. Graduate student in Middle Eastern Studies, FU Berlin, Germany. Worked in the Office of the Chief Economist Middle East and North Africa, World Bank, Washington, D.C.

Strnad, Tomas. Ph.D. student, Department of the Middle East and Africa, Charles University, Czech Republic. Chief editor of the *Arab Markets Magazine*; author of "The Kuwaiti Dilemma," "OPEC—Main Sinner or Sheer Scapegoat?," and "Globalization in the Arab and Muslim World" in *International Policy* and other magazines.

Stroschein, Sherrill. Assistant professor of Political Science, Ohio University. Frequent contributor to scholarly journals on East European topics and a former contributor to *Nations in Transit* (1995 and 1997 editions).

Thadathil, George. Associate professor of History, Paul Quinn College, Dallas, Texas. Author, "Myanmar, Agony of a People" in *History Behind Headlines*, 2000. His research interests include South and Southeast Asia, and Asian collective security.

Thapa, Rabi. Editor and environmentalist, France. Environment/development assignments in Nepal, 1998.

Tian, Robert Guang, Ph.D. Associate professor of Business Administration, Erskine College. Author, *Canadian Chinese, Chinese Canadians: Coping and Adapting in North America* (1999).

Ubarra, Maria Cecilia T. Graduate student in Public Policy and Program Administration, University of the Philippines, Quezon City, Philippines. Research fellow, Institute for Strategic and Development Studies; case writer, Asian Institute of Management, Philippines.

Vivas, Leonardo. M.Phil., Development Studies, Sussex University (UK); Ph.D., International Economics and Finance, Nanterre University (France); fellow, Weatherhead Center for International Affairs, Harvard University.

Viviers, Wilma. Program director, International Trade in School of Economics, Potchefstroom University, South Africa.

Zhang, Xingli. Ph.D. student, University of Southern California, Los Angeles. Author, "Brunei" in *East Asian Encyclopedia* (in Chinese).

INTRODUCTION

THE POWER OF ECONOMIC UNDERSTANDING

The economies of the world are becoming increasingly interconnected and interdependent, a fact dramatically illustrated on 2 July 1997 when the Thai government decided to allow its currency to "float" according to market conditions. The result was a significant drop in the value of the currency and the start of the Asian economic crisis, a contagion that spread quickly to other Asian countries such as the Republic of Korea, Indonesia, Malaysia, and the Philippines. Before long the epidemic reached Brazil and Russia.

In this way, a small economic change in one less-developed country sent economic shock waves around the world. Surprisingly, no one predicted this crisis, though economist Paul Krugman in a prominent 1994 *Foreign Affairs* article argued that there was no Asian economic miracle and the kind of growth rates attained in recent years were not sustainable over the long term. In such an interconnected global economy, it is imperative to have an understanding of other economies and economic conditions around the world. Yet that understanding is sorely lacking in the American public.

Various studies have shown that both young people and the public at large have a low level of literacy about other nations. A survey of 655 high school students in southeast Ohio indicated that students were least informed in the area of international economic concerns, and the number of economics majors at the college level is declining. The economic and geographic illiteracy has become such a national concern that the U.S. Senate recently passed a resolution calling for a national education policy that addresses Americans' lack of knowledge of other parts of the world.

The information provided by the media also frequently reflects a distorted understanding of world economies. During the Asian economic crisis, we often heard about the collapse of various Asian countries such as Korea and Thailand. They were indeed suffering a severe crisis, but usually companies, not countries, collapse. The use of the "collapse" language was therefore misleading. In another example, a distinguished journalist writing in a prominent East coast newspaper claimed that Vietnamese women paid more in transportation and food costs than they were earning while working in a factory manufacturing Nike shoes. Such a statement, while well intended in terms of genuine concern for these women workers, makes no economic sense whatsoever, and is actually not accurate. The wages of these women are indeed extremely low by U.S. standards, but such wages must be viewed in the context of another society, where the cost of living may be dramatically lower and where low salaries may be pooled. At other times, a fact—such as the fact that a minority of the Japanese workforce enjoys employment for life—is exaggerated to suggest that the Japanese economy boomed as it did in the 1980s *because* of the Japanese policy of life-long employment. Such generalizing keeps people from understanding the complexities of the Japanese economy.

"THINGS ARE NOT WHAT THEY SEEM." In defense of this lack of economic understanding, it must be said that understanding economics is not easy. Paul A. Samuelson, author of the classic textbook *Economics* (1995), once stated about economics "that things are often not what at first they seem." In Japan, for example, many young women work as office ladies in private companies as an initial job after completing school. These young ladies often stay at home with their parents and have few basic expenses. Over several years they can accumulate considerable savings, which may be used for travel, overseas study, or investing. Thus, as Samuelson noted in his textbook, actual individual economic welfare is not based on wages as such, but on the *difference* between earnings and expenditures. Wages are not the only measure of the value of labor: one must also consider purchasing power and how costs of living vary dramatically from place to place. Without taking into account purchasing power, we overestimate economic well-being in high-cost countries such as Japan and Switzerland and underestimate it in low-cost countries such as India and Cambodia.

Consider the following examples: The cost of taking an air-conditioned luxury bus from the Cambodian capital of Phnom Penh to its major port, Sihanoukville, is less than $2. The same bus trip of equal distance in Japan or the United States would cost $50 or more. Similarly,

a (subsidized) lunch at a factory producing Nike shoes in Vietnam may cost the equivalent of 5 U.S. cents in 1998, while lunch at a student union on a U.S. college campus may cost $5. Thus a teaching assistant on a U.S. campus pays 100 times more for lunch than the Vietnamese factory worker. Who is more "poorly paid" in these situations? Add to this the reality that in many developing countries where extended families are common, members of the family often pool their earnings, which individually may be quite low. To look only at individual earnings can thus be rather misleading. Such cultural nuances are important to keep in mind in assessing economic conditions and welfare in other nations.

Various economic puzzles can also create confusion and misunderstanding. For example, currently the United States has the highest trade deficit in world history: it imports far more that it exports. Most countries with huge trade deficits have a weak currency, but the U.S. dollar has remained strong. Why is this the case? Actually, it is quite understandable when one knows that the balance of trade is just one of many factors that determine the value of a nation's currency. In truth, demand for the U.S. dollar has remained high. The United States is an attractive site for foreign investment because of its large and growing economic market and extremely stable politics. Second, the United States has a large tourism sector, drawing people to the country where they exchange their currency for U.S. dollars. Several years ago, for the first time ever, there were more Thais coming to the United States as tourists than those in the United States going to Thailand. Third, the United States is extremely popular among international students seeking overseas education. Economically, a German student who spends three years studying in the United States benefits the economy in the same way as a long-term tourist or conventional exports: that student invests in the U.S. economy. In the academic year 1999-2000, there were 514,723 international students in the United States spending approximately $12.3 billion. Thus, the services provided by U.S. higher education represent an important "invisible export." Fourth, 11 economies are now dollarized, which means that they use the U.S. currency as their national currency. Panama is the most well known of these economies and El Salvador became a dollarized economy on 1 January 2001. Other countries are semi-officially or partially dollarized (Cambodia and Vietnam, for example). As the result of dollarization, it is estimated by the Federal Reserve that 55 to 70 percent of all U.S. dollars are held by foreigners primarily in Latin America and former parts of the U.S.S.R. Future candidates for dollarization are Argentina, Brazil, Ecuador, Indonesia, Mexico, and even Canada. With so many countries using U.S. dollars, demand for the U.S. dollar is increased, adding to its strength. For all these reasons, the U.S. currency and economy remained strong despite the persisting large trade deficits, which in themselves, according to standard economic logic, suggest weakness.

SYSTEMS OF CLASSIFICATION. As in other fields, such as biology and botany, it is important to have a sound system of classification to understand various national economies. Unfortunately, the systems commonly used to describe various national economies are often flawed by cultural and Eurocentric biases and distortion. After the end of World War II and the start of the Cold War, it became common to speak of "developed" and "underdeveloped" countries. There were two problems with this overly simplistic distinction. First, it viewed countries only in terms of material development. Second, it implied that a nation was developed or underdeveloped across all categories. As an example, "underdeveloped" Thailand has consistently been one of the world's leading food exporters and among those countries that import the least amount of food. Similarly, in "developed" Japan there are both homeless people and institutions to house the elderly, while in "underdeveloped" Vietnam there are no homeless and the elderly are cared for by their families. Which country is more "developed"?

Later the term "Third World" became popular. This term was invented by the French demographer Alfred Sauvy and popularized by the scholar Irving Horowitz in his volume, *Three Worlds of Development.* "First World" referred to rich democracies such as the United States and the United Kingdom; "Second World" referred to communist countries such as the former U.S.S.R. and former East Germany. The term "Third World" was used to refer to the poorer nations of Africa, Latin America, and Asia (with the exception of Japan). But this distinction is also problematic, for it implies that the "First World" is superior to the "Third World." Another common term introduced was modern versus less modern nations. The Princeton sociologist Marion J. Levy made this distinction based on a technological definition: more modern nations were those that made greater use of tools and inanimate sources of power. Thus, non-Western Japan is quite modern because of its use of robots and bullet trains. Over time, however, many people criticized the modern/non-modern distinction as being culturally biased and implying that all nations had to follow the same path of progress.

More recently, economists from around the world have recognized the importance of using a variety of factors to understand the development of national economies. Each of these factors should be viewed in terms of a continuum. For example, no country is either completely industrial or completely agricultural. The entries in this volume provide the basic data to assess each national economy on several of these key criteria. One can determine, for example, the extent to which an economy is industrial by simply dividing the percentage of

the economy made up by industry by the percentage made up by agriculture. Or one can determine how much energy national economies use to achieve their level of economic output and welfare. This provides an important ecological definition of efficiency, which goes beyond limited material definitions. This measure allows an estimate of how "green" versus "gray" an economy is; greener economies are those using less energy to achieve a given level of economic development. One might like to understand how international an economy is, which can be done by adding a country's exports to its imports and then dividing by GDP. This indicator reveals that economies such as the Netherlands, Malaysia, Singapore, and Hong Kong are highly international while the isolationist Democratic People's Republic of Korea (North Korea) is far less international.

Another interesting measure of an economy, particularly relevant in this age of more information-oriented economies and "the death of distance" (Cairncross 1997), is the extent to which an economy is digitalized. One measure of this factor would be the extent to which the population of a given economy has access to the Internet. Costa Rica, for example, established a national policy that all its citizens should have free access to the Internet. In other economies, such as Bhutan, Laos, and North Korea, access to the Internet is extremely limited. These differences, of course, relate to what has been termed "the digital divide." Another important factor is whether an economy is people-oriented, that is, whether it aims to provide the greatest happiness to the greatest number; economist E.F. Schumacher called this "economics as if people mattered." The King of Bhutan, for example, has candidly stated that his goal for his Buddhist nation is not Gross National Product but instead Gross National Happiness. Such goals indicate that the level of a country's economic development does not necessarily reflect its level of social welfare and quality of life.

Another important category that helps us understand economies is the degree to which they can be considered "transitional." Transitional economies are those that were once communist, state-planned economies but that are becoming or have become free-market economies. This transitional process started in China in the late 1970s when its leader Deng Xiaoping introduced his "four modernizations." Later, Soviet leader Mikhael Gorbachev introduced such reforms, called *perestroika,* in the former Soviet Union. With the dissolving of the U.S.S.R. in 1991, many new transitional economies emerged, including Belarus, Uzbekistan, Kyrgyzstan, and the Ukraine. Other countries undergoing transition were Vietnam, Laos, Cambodia, and Mongolia. These economies can be grouped into two types: full transitional and partial transitional. The full transitional economies are shifting both to free markets and to liberal democracies with free expression, multiple parties, and open elections. The partial transitional economies are changing in the economic realm, but retaining their original one-party systems. Included in the latter category are the economies of China, Vietnam, Laos, and Cuba. This volume provides valuable current information on the many new transitional economies emerging from the former Soviet world.

KEY THEMES IN THE WORLD ECONOMY. In looking at the economies of countries around the globe, a number of major common themes can be identified. There is increasing economic interdependence and interconnectivity, as stressed by Thomas Friedman in his recent controversial book about globalization titled *The Lexus and the Olive Tree: Understanding Globalization.* For example, the People's Republic of China is now highly dependent on exports to the United States. In turn, U.S. companies are dependent on the Chinese market: Boeing is dependent on China for marketing its jet airliners; the second largest market for Mastercard is now in China; and Nike is highly dependent on China and other Asian economies for manufacturing its sports products. Such deep interdependence augurs well for a peaceful century, for countries are less likely to attack the countries with whom they do a vigorous business, even if their political and social systems are radically different. In fact, new threats to peace as reflected in the tragic terrorist attack of 11 September 2001, primarily relate to long-standing *historical* conflicts and grievances.

Conventional political boundaries and borders often do not well reflect new economic realities and cultural patterns. Economic regions and region states are becoming more important. The still-emerging power of the European Union can be gauged by reading the essays of any of the countries that are currently part of the Union or hoping to become a part of it in the coming years. This volume may help readers better understand which nations are becoming more interconnected and have similar economic conditions.

The tension between equity (fairness) and efficiency is common in nearly all national economies. In some economies there is more stress on efficiency, while in others there is more stress on equity and equality. Thus, as should be expected, countries differ in the nature of the equality of their income and wealth distributions. For each entry in this volume, important data are provided on this important factor. The geographer David M. Smith has documented well both national and international inequalities in his data-rich *Where the Grass is Greener* (1979).

Invisible and informal economies—the interactions of which are outside regulated economic channels—represent a growing segment of economic interactions in some countries. In his controversial but important volume, *The Other Path* (1989), the Peruvian economist Hernando de Soto alerted us to the growing significance of the informal economy. In countries such as Peru, research has

shown that in some cases individuals prefer work in the informal to the formal sector because it provides them with more control over their personal lives. The Thai economist Pasuk Phongpaichit and her colleagues have written a fascinating book on Thailand's substantial invisible economy titled *Guns, Girls, Gambling, and Ganja* (1998). Thus, official government and international statistical data reported in this volume often are unable to take into account such data from the hidden part of economies.

In an increasingly internationalized economy in which transnational corporations are highly mobile and able to move manufacturing overseas quite rapidly, it is important to distinguish between real foreign direct investment and portfolio investment. At one point during Thailand's impressive economic boom of the late 1980s and early 1990s, a new Japanese factory was coming on line every three days. This is foreign direct investment, involving actual bricks and mortar, and it creates jobs that extend beyond the actual facility being constructed. In contrast foreign portfolio investment consists of a foreign entity buying stocks, bonds, or other financial instruments in another nation. In our current wired global economy, such funds can be moved in and out of nations almost instantaneously and have little lasting effect on the economic growth of a country. Economies such as Chile and Malaysia have developed policies to try to combat uncertainty and related economic instability caused by the potential of quick withdrawal of portfolio investments.

Some argue that transnational corporations (owned by individuals all over the world), which have no national loyalties, represent the most powerful political force in the world today. Many key transnational corporations have larger revenues than the entire gross national products of many of the nations included in this volume. This means that many national economies, especially smaller ones, lack effective bargaining power in dealing with large international corporations.

Currently, it is estimated by the International Labor Office of the United Nations that one-third of the world's workforce is currently unemployed or underemployed. This means that 500 million new jobs need to be created over the next 10 years. Data on the employment situation in each economy are presented in this volume. The creation of these new jobs represents a major challenge to the world's economies.

The final and most important theme relates to the ultimate potential clash between economy and ecology. To the extent that various national economies and their peoples show a commitment to become greener and more environmentally friendly, ultimate ecological crises and catastrophes can be avoided or minimized. Paul Ray and Sherry Anderson's *The Cultural Creatives: How 50 Million People Are Changing the World* (2000) lends credence to the view that millions are changing to more environmentally conscious lifestyles.

In trying to understand the global economy, it is critically important to have good trend data. In each of the entries of this volume, there is an emphasis on providing important economic data over several decades to enable the reader to assess such patterns. Some trends will have tremendous importance for the global economy. One phenomenon with extremely important implications for population is the policy of limiting families to only one child in China's urban areas. This deliberate social engineering by the world's most populous country will have a powerful impact on the global economy of the 21st century. The global environmental implications are, of course, extremely positive. Though there is much debate about the economic, political, and socio-cultural implications of this one-child policy, overall it will probably give China a tremendous strategic advantage in terms of the key factors of human resource development and creativity.

THE POWER OF UNDERSTANDING. By enhancing our knowledge and understanding of other economies, we gain the potential for mutual learning and inspiration for continuous improvement. There is so much that we can learn from each other. Denmark, for example, is now getting seven percent of its electrical energy from wind energy. This has obvious relevance to the state of California as it faces a major energy crisis. The Netherlands and China for a long period have utilized bicycles for basic transportation. Some argue that the bicycle is the most efficient "tool" in the world in terms of output and energy inputs. Many new major highways in Vietnam are built with exclusive bike paths separated by concrete walls from the main highway. The Vietnamese have also developed electric bicycles. The efficient bullet trains of Japan and France have relevance to other areas such as coastal China and the coastal United States. Kathmandu in Nepal has experimented with non-polluting electric buses. In the tremendous biodiversity of the tropical forests of Southeast Africa, Latin America, and Africa, there may be cures for many modern diseases.

We hope to dispel the view that economics is the boring "dismal science" often written in complex, difficult language. This four-volume set presents concise, current information on all the economies of the world, including not only large well-known economies such as the United States, Germany, and Japan, but also new nations that have emerged only in recent years, and many microstates of which we tend to be extremely uninformed. With the publication of this volume, we hope to be responsive to the following call by Professor Mark C. Schug: "The goal of economic education is to foster in students the thinking skills and substantial economic knowledge necessary to become effective and participating citizens." It is our hope that this set will enhance both economic and

geographic literacy critically needed in an increasingly interconnected world.

AFGHANISTAN

Islamic State of Afghanistan
Dowlat-e Eslami-ye Afghanestan

CAPITAL: Kabul.

MONETARY UNIT: Afghani (Af). One afghani equals 100 puls. There are coins of 1, 2, and 5 afghanis and notes of 10, 20, 50, 100, 500, 1,000, 5,000, and 10,000 afghanis.

CHIEF EXPORTS: Opium, fruits and nuts, hand woven carpets, wool, cotton, hides and pelts, precious and semi-precious gems.

CHIEF IMPORTS: Capital goods, food and petroleum products, and most consumer goods.

GROSS DOMESTIC PRODUCT: US$21 billion (purchasing power parity, 1999).

BALANCE OF TRADE: **Exports:** US$80 million (1996 est.; does not include opium). **Imports:** US$150 million (1996 est.).

COUNTRY OVERVIEW

LOCATION AND SIZE. Afghanistan is located in southern Asia and shares a border with 6 countries: China, Iran, Pakistan, Tajikistan, Turkmenistan, and Uzbekistan. Landlocked, with an area of 652,000 square kilometers (251,737 square miles), Afghanistan is a mountainous country dominated by the Hindu Kush and the Himalayan mountain ranges to the north and arid desert to the south. Afghanistan endures the most extreme temperatures on earth. Comparatively, the area occupied by Afghanistan is slightly smaller than the state of Texas. The capital city, Kabul, is located in the northeastern part of the country.

POPULATION. The 1976 census estimated the Afghan population at 16.6 million, but 4 years later, similar research put the population at 15.5 million. In 1999, a United Nations (UN) sponsored census, carried out by the Taliban (originally, a group of Afghans trained in religious schools in Pakistan) put the population at 23 million, indicating an annual population growth of 2.8 percent. Finally, the CIA *World Factbook* estimates the population in July 2000 at 25,838,797. Doubts about the true figures stem from the war that began as a result of the invasion of the country by the Soviet Union in 1979. Not only did this war result in the loss of approximately 1 million lives but an estimated 5 million Afghans went into exile abroad, to countries such as Pakistan and Iran, thus creating the world's largest refugee population. Mass migration from the rural areas to the urban centers occurred and the population of the capital city of Kabul more than doubled after 1979. Over one-third of Afghan families have migrated to Kabul since 1995 and the share of the urban population increased from 10 percent in the 1970s to over 30 percent in 1995. The return of the Afghan refugees began in April 1992, following the victory of the mujahideen (anti-Soviet freedom fighters; from the Persian word for "warrior"), and by the middle of 1996 over half of the refugees had been **repatriated**. However, when the United States began military strikes against Afghanistan for harboring terrorist Osama bin Laden in 2001, another wave of refugees fled the country.

The principal linguistic and ethnic group in Afghanistan are the Pashtun. These people represent just over half of the population and live mostly in the south or in the east. Persian-speaking Tajiks, who live in the eastern valleys, make up 20 percent of the population; another 10 percent of the population is of Turkmen and Uzbek origin, and they live on the northern plains. There are an additional 20 other different ethnic groups of which the Baluch, the Hazaras, and the Nuristanis are the most well known, and these groups speak over 30 different languages. The vast majority—84 percent—of Aghanis follow the Sunni Muslim faith, while a significant minority—15 percent—are Shi'a Muslims.

Following the collapse of the **communist** regime in 1992, a civil war has been fought largely along ethnic lines between the Pashtuns, the Tajiks, the Uzbeks, and the Hazaras.

OVERVIEW OF ECONOMY

Following the end of 40 years of peaceful monarchical rule in July 1973, Afghanistan was plunged into a war that continued into the 21st century. The end of the monarchy was followed by the setting up of a communist-style regime that collapsed when 100,000 Soviet troops invaded the country in December 1979. For 10 years Soviet forces occupied the country and dictated its governance, but local rebel forces, known as the mujahideen, drove the Soviets out in 1989. The victory by the mujahideen brought no peace to the troubled country, however. For the next several years fighting continued between rival mujahideen factions. By 1996 the sitting government had collapsed, and effective control of the country was seized by the radical Islamic Taliban faction. The Taliban remained in power until 2001 when U.S. attacks toppled the faction from power.

In economic terms, Afghanistan is among the world's poorest countries due to the incessant fighting that has placed the economy on the verge of collapse and taken hundreds of thousands of lives. Two decades of war and political strife left the country's **infrastructure** in ruins and its people almost entirely dependent on foreign aid. The majority of administrative, economical, and social institutions were wiped out due to the Soviet invasion, mass migration, and continued fighting.

The principal source of revenue in Afghanistan traditionally came from the agricultural sector, and under normal circumstances the country is capable of producing not only enough food to feed its entire population but surplus food to export abroad. But as of 2001 the country was able to produce enough food no longer. Given that the country is heavily dependent on subsistence agriculture, the decline in income levels and the

increased lack of food security (a country's ability to feed its own people) increased poverty and caused other economic difficulties. Much of the land that was previously devoted to wheat farming began to be used to cultivate opium poppies, which are used in the production of heroin. The country's transport system was almost entirely broken down, as well as most industry and the agricultural infrastructure. These sectors were so seriously damaged that only sustained massive investment could salvage them.

Before the Soviet invasion in 1979, the economy was almost entirely controlled by the government of Afghanistan, with most investments taking place within the **public sector**. The **private sector** extended only to agriculture and trade. The past 2 decades have seen the dismantling of centralized governance and an increase in private sector participation. In 2000 the private sector played a major role in the country's traditional economic activities, and there was still much room for private sector investment in small-scale industries, provided that political stability was achieved. The Taliban emerged in the mid-1990s and swept through the country, taking control in a remarkably short period of time. Political stability was then entirely dependent on the future course the Taliban chose to follow and the economic policies they chose to pursue. The Taliban movement established nominal government in most parts of the country, but it was only recognized by Saudi Arabia, Pakistan, and the United Arab Emirates.

The Afghan economy is famously dependent upon the decisions made by its neighbors' governments. In the past, the country was heavily dependent on economic relations with the former Soviet Union, and in 2001 it was sensitive to economic decisions made by the Pakistani government. An example of this dependency can be seen within the markets. An increase in the prices of essential commodities (basic foodstuffs such as bread and rice) in Pakistan led to an increase in prices of the same commodities in Afghanistan. In addition, when Pakistan devalued its currency in 1998, the value of the Afghan currency was also reduced. Because of the lack of a governmental infrastructure, there were no reliable economic indicators available for such data as GDP, foreign trade, or national income.

POLITICS, GOVERNMENT, AND TAXATION

Due to its strategic geographical position, Afghanistan has been invaded throughout history and conquered by the Persians, the Macedonians, the Parthians, the Kushan Empire, the Huns, and the Arabs. The only peaceful period in the country's recent past was between 1933 and 1973 when it was ruled by King Zahir Shah. However, following the dissolution of the monarchy in 1973, a communist-style regime was established. The watershed event in the modern era was the 1979 invasion by the Soviet Union, which was launched in order to keep Afghanistan from becoming too independent. After a long, entrenched war which many have called "the Soviets' Vietnam," the USSR finally withdrew from the country in 1989. After that, the Taliban took control of most of the country, but a protracted war still continued with opponents of the Taliban, who practiced the same kind of guerilla warfare against the Taliban that they carried out against the Soviet Union.

Afghanistan has not had an effective central government capable of exerting its authority across the entire country because the population is structured by tribes. When the communist administration in Kabul crumbled in 1992, the religious, linguistic, and ethnic differences within the country deepened, leading to the fragmentation of Afghanistan into a series of fiefdoms controlled by warlords. The Taliban originated in the refugee camps on the Pakistani border towns and was initially comprised of religious students who blamed the failure of the previous government on its unwillingness to impose the tenets of fundamentalist Islam (the religion of the world's Muslims and the chief religion in the Middle East; Islam literally means "submission to the will of God"). The Taliban played cleverly on the deep divisions within the country, and in 2000 only 10 percent of the entire country was controlled by non-Taliban groups. This student militia ran the country in accordance with the strict Islamic principles laid out in Sharia Law (Sharia is the law of Islam, based upon the Qur-an, the Sunna, and the work of Muslim scholars in the first two centuries of Islam). Their rigid and often brutal interpretation of Islam caused the Afghan people tremendous suffering, especially among women who were entirely deprived of their rights. The Taliban's successful rise to power was attributed to the substantial help that it received from the Pakistani government combined with the inability of the opposing parties to organize themselves and join together to form an effective opposition. The main political figures within Afghanistan prior to the downfall of the Taliban were Mohammad Omar, the spiritual leader of the Taliban, and Colonel Ahmad Shah Massoud, the leader of the remaining opposition forces.

Afghanistan under the Taliban regime essentially had no central government—no executive branch, no legislature, and no independent and impartial judicial system. Many critics of the regime charged that there was no rule of law, no constitution, no civil society, and no system in place to monitor human rights abuses or address grievances. The Taliban's distaste for the standards of international human rights was made clear to the international community. The UN Security Council imposed **sanctions** on the Taliban in November 1999 under

Security Council Resolution 1267. (Sanctions are imposed unilaterally or multilaterally by states onto countries that violate international norms of behavior and can take many forms, from denying government aid or other benefits to banning any form of trade.) The UN demanded that the Taliban hand over the terrorist Osama bin Laden, who is suspected of being involved in the 1998 bombing of U.S. embassies in Tanzania and Kenya and the September 2001 attacks on the Pentagon in Washington, D.C., and the World Trade Center in New York City. When the Taliban refused to comply, the UN declared that UN member states may not operate commercial aircraft in Afghanistan, and all known funds and other financial resources controlled by the Taliban outside of the country were frozen. With the downfall of the Taliban regime in 2001, an interim government composed of tribal and Northern Alliance leaders was formed to restore stability to the country. However, fighting amongst the different leaders threatened the effectiveness of this new government. It is possible that lasting peace and stability will only come to Afghanistan under the watchful eye of an international peacekeeping force stationed in the country.

There has never really been a formal tax system in this essentially tribal country. Local tribal leaders often used to **levy** arbitrary taxes on commercial goods passing through their territory, but this revenue never reached Kabul. The Taliban tried to gain popularity by removing checkpoints erected for the collection of taxes, and local traders rewarded them with large donations.

INFRASTRUCTURE, POWER, AND COMMUNICATIONS

Before the Soviet invasion in 1979, considerable investment from the United States and development agencies had been channeled into the reconstruction of the Afghan road networks. Over 2,000 kilometers (1,243 miles) of roads were built linking the principal cities, giving the country a distinctly modern feel. The long war has undone much of the work carried out by development agencies in the 1970s. In 1993, the **United Nations Development Program** (UNDP) estimated that 60 percent of the 2,500 kilometers (1,553 miles) of paved roads needed to be totally rebuilt and that minor roads linking rural areas were in very poor condition. The country has just 21,000 kilometers (12,050 miles) of total roadways. Since 1993 the condition of the roads in Afghanistan has further deteriorated and hundreds of bridges have been destroyed, cutting off many remote mountain areas.

The telecommunications infrastructure has improved since 1999, and in 2001 it was possible to phone between 2 of Afghanistan's major urban centers, Kabul and Kandahar. Telephone calls were also possible to 13 foreign countries, including the United States, the United Kingdom, Canada, and Saudi Arabia. All calls made to Afghanistan have to go through an operator, and calls out of Afghanistan must be made on satellite telephones. In 2000, the Taliban signed a contact with a company based in the United Arab Emirates to increase the number of telephone lines in the country to 1 million by September 2001. This project also aims to put the country in touch with over 99 other countries instead of just 13 within the same time frame.

The aviation infrastructure was almost completely destroyed by the war. Most of the national fleet of aircraft is now unusable or too dangerous to fly commercially. When the first round of sanctions were imposed by the United Nations in 1999, Afghanistan's national airline, Ariana, was hit badly because its airplanes were no longer allowed to fly abroad. The country has only 14 airports with paved runways and another 32 dirt landing strips.

Before the Soviet invasion in 1979, energy consumption per capita was among the world's lowest. However, as a result of war and the Soviets' development of the country's gas reserves, consumption levels increased. In 1992 the authorities stated that Kabul's winter requirement was 300 megawatts even though the installed capacity was only 150 megawatts. Between 1992 and 1996, much of the capital had no power. In 1993 the UNDP estimated that over 60 percent of the gas transmission lines were not functioning. In July 2000, the Taliban initiated a project to build an electrical grid from Afghanistan to Turkmenistan; however, the project has not progressed due to a lack of funds. Reports coming out of the country in 2001 indicated that the severe winter had claimed hundreds of Afghan lives.

ECONOMIC SECTORS

The economy of Afghanistan, one of the world's least developed, has never been properly documented. Prior to the Soviet invasion in 1979 the very few economic data were often wholly unreliable. Official statistics almost entirely ground to a halt in 1979 and have not been produced since the communist government fell in 1992. Nevertheless, the CIA World Factbook estimated that in 1990 the agricultural sector produced 53 percent of GDP while industry contributed 28.5 percent and services 18.5 percent. In 1980 it was estimated the 68 percent of the workforce worked in agriculture, 16 percent in industry, and 16 percent in services.

Over 2 decades of war have either destroyed or seriously damaged the infrastructures of the agricultural, industrial, and service sectors. Nevertheless, the agricultural sector is still the largest employer. Its output is largely dependant on changing political conditions and, to a lesser extent, the weather.

AGRICULTURE

Agriculture has traditionally driven the Afghan economy, accounting for approximately 50 percent of GDP before the Soviet invasion in 1979. Nevertheless, the agricultural sector has never produced at full capacity. Before the invasion, only 30 percent of the total arable land of 15 million hectares was cultivated. At that time the main exports were sugarcane, sugar beets, fruit, nuts, vegetables, and wool. However, the continuing war reduced production significantly. Soviet troops planted land mines all over the country, rendering large areas of land useless and forcing large sections of the population to become refugees. The resulting cut in production caused massive food shortages. Kabul University produced a report in 1988 which found that agricultural output was 45 percent less than the 1978 level. The UNDP estimated that in 1992 only 3.2 million hectares of land were cultivated of which only 1.5 million hectares were irrigated. In 2001, the principal food crops were corn, rice, barley, wheat, vegetables, fruits, and nuts. In Afghanistan, industry is also based on agriculture, along with raw materials. The major industrial crops are cotton, tobacco, castor beans, and sugar beets. Sheep farming is also extremely valuable. The major sheep product exports are wool and sheep skins.

In 2000, Afghanistan experienced its worst food crisis ever recorded because of a very severe drought. Such low levels of recorded rainfall had not been seen in the

country since the 1950s. The water used to irrigate the lands comes from melting snow, and in 2000 the country experienced very little snowfall. The southern parts of the country were badly affected, and farmlands produced 40 percent of their expected yields. Half of the wells in the country dried up during the drought, and the lake feeding the Arghandab dam dried up for the first time since 1952. The barley crops were destroyed and the wheat crops were almost wiped out. In the middle of 2000, the drought's consequences were felt in Kabul, when more and more displaced people were migrating to the capital.

The prices of staple foods have also increased in different parts of the country because demand is much higher than supply. For instance, in Kabul, a family of 7 can earn US$1.14 a day if the head of the family is lucky enough to find employment, whereas a loaf of bread costs US$0.63, roughly half an individual's income per day. A large segment of the Afghan population depends on food imported from abroad or distributed by aid organizations. The civil strife and drought increased the country's food import requirements to a record 2.3 million metric tons in 2000/2001, according to the UN World Food Programme. Much of the needed imports come from the international community and the rest from Pakistan. The disruption to the flow of this international aid caused by the 2001 war between U.S.-led forces on the Taliban has threatened widespread famine and starvation to much of the Afghan population.

The number of livestock was greatly reduced during the years of war. In 1970, the total livestock population was estimated at 22 million sheep, 3.7 million cattle, 3.2 million goats, and 500,000 horses. According to a survey carried out in 1988, the number of cattle had declined by 55 percent, sheep and goats by 65 percent, and the number of oxen used to plow the fields was down by 30 percent. Much of the livestock is malnourished and diseased.

Afghanistan in 2000 was the world's largest producer of opium, used to produce the drug heroin. The total opium production for 1998 was estimated at 2,102 metric tons against a total of 2,804 metric tons in 1997. This reduction in the level of poppy production was due to heavy and continuous rains and hailstorms in some of the major poppy producing provinces. However, in 1999, the country produced a staggering 4,600 metric tons. The rotting economy forced farmers to grow the opium poppies as a **cash crop**, and this practice was supported by the Taliban until 2001, because it provided farmers with money that they would otherwise not be able to earn. However, in 2001, the Taliban ordered the country's farmers to stop growing poppies following an edict by Mullah Omar, the supreme religious leader, that opium cultivation is not permitted under Islam. While analysts contend that the reason had more to do with convincing the United Nations and the international community to lift sanctions, officials from various countries argued that this was done in order to boost the market price for heroin. Heroin still flowed from Afghanistan, only at a much higher price—after the Taliban's ban on opium growing, the price shot from $44 to $700 per kilo. This caused speculation that the Taliban had stockpiled a large supply of the drug, and the higher proceeds allowed them further funding for military and government operations. With the September 2001 attacks on the United States, opium production was believed to be resumed.

INDUSTRY

Afghanistan's significance from an energy standpoint stems from its geographical position as a potential transit route for oil and natural gas exports from Central Asia to the Arabian Sea. This potential includes the proposed multi-billion dollar oil and gas export pipelines to be built in Afghanistan by UNOCAL, an American oil company, and Bridas, an Argentinean firm. However, political instability has thrown these plans into serious question, and it is unlikely that construction will be approved until the fighting in the country stops.

GAS. Afghanistan's proven and probable natural gas reserves are estimated to be around 150 billion cubic feet. Afghan gas production reached 275 million cubic feet per day (mcf/d) in the mid-1970s. However, due to declining reserves from producing fields, output gradually fell to about 220 mcf/d by 1980. At that time, the largest field, Djarquduq, was tapped and was expected to boost Afghan gas output to 385 mcf/d by the early 1980s. However, sabotage of infrastructure by the anti-Soviet mujahideen fighters limited the country's total production to 290 mcf/d. During the 1980s, the sale of gas accounted for up to 50 percent of export revenues. After the Soviet pullout and subsequent Afghan civil war, roughly 31 producing wells were closed, pending the restart of gas sales to the former Soviet Union. In 1998, Afghan gas production was only around 22 mcf/d, all of which was used domestically. In February 1998, the Taliban announced plans to revive the Afghan National Oil Company, which was abolished by the Soviet Union after it invaded Afghanistan in 1979. The company is expected to play an important role in the resumption of both gas and oil exploration in Afghanistan.

OIL. Soviet estimates from the late 1970s placed Afghanistan's proven and probable oil reserves at 100 million barrels. Despite plans to start commercial oil production in Afghanistan, all oil exploration and development work, as well as plans to build a 10,000 barrel per day (bbl/d) refinery, were halted after the 1979 Soviet invasion. In September 1999, Afghanistan signed a deal with Consolidated Construction Company of Greece to

explore for oil and gas in the area of Herat in southwestern Afghanistan near the Iranian border. This area is believed to be potentially rich in hydrocarbons (any of a variety of organic compounds—including oil and coal—that can be harnessed to produce energy). In the meantime, Afghanistan reportedly receives some of its oil imports from Saudi Arabia as foreign aid. There have also been reports that Pakistan has offered to assist Afghanistan in constructing an oil refinery, as well as in repairing damaged roads in order to facilitate transport of oil products from Turkmenistan to Afghanistan and Pakistan.

COAL. Besides gas and oil, Afghanistan is also estimated to have significant coal reserves (probable reserves of 400 million tons), most of which are located in the northern part of the country. Although Afghanistan produced over 100,000 tons of coal annually as late as the early 1990s, the country was producing only around 4,000 tons as of 1998.

MANUFACTURING. Almost all manufacturing businesses have shut down or are producing at well below capacity because of the damage caused during the war and the lack of raw materials available in the country. Before this sector collapsed, it was mainly processing local agricultural raw materials. However, the country's cotton mills, woolen textiles, and cement plants were still not producing at full capacity. In 2000, the Taliban announced the startup of 26 production and servicing projects that would create 1,500 jobs, including the production of alcohol-free beverages, printing, syringe-making, and chemical products.

SERVICES

Like the other sectors of the economy, the services sector has been devastated by years of war. There are no reliable figures for **retail** trade in Afghanistan, and the current economy cannot support anything approaching a vigorous retail trade sector. There is no tourism sector in Afghanistan because the country remains unstable, extremely volatile, and dangerous for foreigners.

FINANCIAL SERVICES. In 1932, Afghanistan's banking system was founded by Abdul Majid Zabuli, who developed the economy and imported the necessary goods to start up plants and factories. His bank eventually developed into the Afghan National Bank, which has served roles as both the country's central and commercial bank. Until the beginning of the 1990s, the Afghan National bank had 7 branches in Kabul and 10 other branches in other major cities. It also had offices in Hamburg, Paris, London, and New York. However, like all institutions in 2001, the banking system has been severely affected by the war, and it virtually collapsed when the mujahideen seized power in 1992. The other important banks in Afghanistan are the Construction Bank, the Industrial Credit Fund, the Industrial Development Bank, the Agriculture Bank, and the Export Promotion Bank. The sanctions imposed on Afghanistan in 1999 forced the smaller banks to close, and by 2001, the resources of the remaining banks were very limited, allowing them to engage only in trade-related work.

Those who provide financial services to the average Afghan are not the banks, but money changers who operate in the streets. This situation has meant that opium has become vitally important for Afghanistan's poor, who otherwise would not be able to afford basic foodstuffs. These moneylenders give out informal loans in exchange for a fixed amount of crop. Clearly, opium production or its being banned affects income levels for the poor. These effects remain difficult to determine.

INTERNATIONAL TRADE

The Soviet invasion in 1979 damaged Afghanistan's industrial and agricultural sectors significantly, and as a result the country's exports, of which gas was very important, diminished. This shift naturally meant that the import bill had to rise to provide the Afghan people with basic commodities such as food and petroleum products and most **consumer goods**. Rising imports during the 1980s resulted in a serious **trade deficit**, although accurate figures are impossible to estimate, since official statistics exclude most illegal trade. From 1985 to 1986 and from 1989 to 1990 the value of exports fell almost 50 percent from US$566.8 million to US$235.9 million, with declining natural gas exports accounting for much of the difference. Other crucial earners of foreign exchange included the sale of nuts and vegetables to Pakistan and India and sheepskins to Europe. Imports declined somewhat during the 1980s as Afghanistan and the Soviet Union became more and more integrated. Between 1989 and 1991, the USSR was consuming 72 percent of Afghanistan's exports and supplying it with 57 percent of its imports. Despite the difficulties in determining trade figures, the CIA *World Factbook* estimated imports of

Trade (expressed in billions of US$): Afghanistan

	Exports	Imports
1975	.217	.350
1980	.670	.841
1985	.567	1.194
1990	.235	.936
1995	.026	.050
1998	N/A	N/A

SOURCE: International Monetary Fund. *International Financial Statistics Yearbook 1999.*

US$150 million in 1996 and exports of US$80 million, not including opium.

When the Soviet Union collapsed in 1991 and the communist government simultaneously fell in Kabul, most imports started to flood in from Pakistan. Under the Afghan Transit Trade (ATT) agreement, signed in 1965, Pakistan allows Afghanistan to have access to the sea and to engage in commerce with the international community to the extent required by Afghanistan's economy. Most of the goods imported under the ATT are reportedly electronics and other consumer items, which cross Pakistan's territory free of **duty**.

Since the Taliban's rise to power, trade has increased significantly with Pakistan, but most of it is not officially recorded. Trade between these 2 countries involves the importation of fuel, wheat, and cement and had included the export of opium. There has been an increase in the volume of trade between Afghanistan and Turkmenistan since 1998. In September 1998, the Taliban authorities signed an agreement with the government of Turkmenistan to begin importing gasoline, diesel, and jet fuel. This action has, to some extent, reduced Afghanistan's dependency on fuel imports from Iran. According to a World Bank report, the total trade between Afghanistan and Pakistan was estimated to be US$2.5 billion in 1996–97, of which US$1.96 billion was estimated to be the value of **re-exported** goods from Afghanistan into Pakistan.

MONEY

In 1993, the official **inflation rate** was more than 150 percent. While there has been no official figure since then, one estimate put the figure at a whopping 240 percent for Kabul in 1996. This kind of skyrocketing price increase in a society is often called "hyperinflation." Thus, a loaf of bread in the capital city may have cost US$1 in 1995 and risen to US$2.50 in 1996. The value of the afghani has also plummeted against the U.S. dollar, going from 36,000 afghanis to the dollar in October, 1998, to 45,000 afghanis to the dollar 6 months later. Weaker currency values can lead to higher prices and **inflation**. Until Afghanistan establishes normal relations with the rest of the world, there is little hope that its currency will have any stability or value.

Exchange rates: Afghanistan

afghanis (Af) per US$1	
Jan 2000	4,700
Feb 1999	4,750
Dec 1996	17,000
Jan 1995	7,000
Jan 1994	1,900
Mar 1993	1,019

Note: These rates reflect the free market exchange rates rather than the official exchange rate, which was fixed at 50.600 afghanis to the dollar until 1996, when it rose to 2,262.65 per dollar, and finally became fixed again at 3,000.00 per dollar in April 1996.

POVERTY AND WEALTH

At meeting of the World Health Organization in Copenhagen in March 1995, its director, Dr. Hiroshi Nakajima, stated that "There can be no social development or sustained economic growth without health. . . . Poverty remains the main obstacle to health development." These remarks clearly describe the situation concerning poverty in Afghanistan in 2001.

In 1996, a report published by the United Nations ranked Afghanistan as the third poorest country in the world. Very few Afghans have access to drinkable water, health care, or education. In Kabul, safe drinking water is enjoyed by only 1 out of every 8 families because the reservoirs have been polluted by the waste accumulated through war. Of all infant deaths, 42 percent are related to diarrhea and dehydration, which are caused by unsafe drinking water and unclean conditions. Unlike in the United States, children are not immunized against infant diseases such as polio or tuberculosis. There are very few polio-endemic countries left in the world today; Afghanistan is one of them.

Afghanistan has the third highest infant mortality rate in the world (185 per 1,000 live births), following Niger and Angola. It has a maternal mortality rate (number of mothers dying in child birth) of 1,700 per 100,000 live births, according to the UN. Life expectancy in 2001 was just 45 years for men and 46 years for women.

In 1997, UNICEF carried out a study in Kabul which concluded that the children of Afghanistan suffer from severe psychological trauma. Seventy-two percent of children interviewed had experienced the death of one or more family members between 1992 and 1996, and 40 percent of them had lost one parent. Almost all the chil-

GDP per Capita (US$)

Country	1996	1997	1998	1999	2000
Afghanistan	800	800	800	800	800
United States	28,600	30,200	31,500	33,900	36,200
India	1,600	1,600	1,720	1,800	2,200
Pakistan	2,300	2,600	2,000	2,000	2,000

Note: Data are estimates.

SOURCE: *Handbook of the Nations*, 17th, 18th, 19th and 20th editions for 1996, 1997, 1998 and 1999 data; CIA *World Factbook 2001* [Online] for 2000 data.

dren had witnessed acts of extreme violence, and all the children had seen dead bodies in the streets. Ninety percent of the children interviewed believed that they would die in the conflict. Unsurprisingly, all the children interviewed suffered from nightmares and anxiety attacks.

The Taliban forbade women to work or enter any workplace, decreeing that they should stay confined to their homes. But due to the country's critical shortage of doctors, the Taliban decided to allow some female doctors to work in public hospitals in 1997. These women doctors were allowed to treat only female patients. The U.S. Senate Foreign Relations Committee heard a report in 1998 about the mistreatment of female doctors. The report indicated that these doctors were often beaten by hospital guards in an attempt to uphold the policy of the Department of Commanding Good and Forbidding Evil. Male doctors were not allowed to treat female patients except members of their own family and female patients who actively sought medical advice were often attacked and beaten and ordered not to appear again in the street. According to Amnesty International, in 1994 a pregnant woman delivered her baby in a street in Kabul, while her husband was being beaten by the guards for trying to take her to the hospital.

WORKING CONDITIONS

Most of the Afghan **labor force** in 2001 was employed in agriculture, domestic trade, and, increasingly, cross-border trade. There are no exact figures, but it is estimated that many Afghans work as casual laborers in neighboring Pakistan and Iran. While income derived from **remittances** is not known, it is estimated to be increasing by the year. Unemployment has risen significantly in services, industries, and other formal institutions since the civil war began. Afghanistan's total workforce was estimated in 1997 as 8 million. The unemployment rate in 1995 was estimated at 8 percent, according to the CIA.

The Taliban's harshly discriminatory policies against women have affected the Afghan economy in a devastating way by cutting the labor force by almost three-quarters. The UN estimates that 60 to 75 percent of the Afghan population is composed of women, and there are hundreds of thousands of widows in Afghanistan, of whom 50,000 live in Kabul alone. Over 150,000 women in Kabul were not allowed to work under the Taliban.

COUNTRY HISTORY AND ECONOMIC DEVELOPMENT

1893. The Durand Line, created by the British and Russia, creates the border between India and the kingdom of Afghanistan.

1894. Tarzi Amanollah seizes power, becomes king, and launches a successful war against British domination.

1923. Amanollah initiates constitutional reforms, bringing Afghanistan closer to the USSR.

1933. Zahir Shah is crowned king and remains in power for 40 years.

1973. President Mohammed Daoud assumes the presidency of Afghanistan after a military coup and abolishes the monarchy. King Zahir Shah is sent into exile.

1977. A new constitution is drawn up establishing a one-party parliamentary system with additional powers given to the president.

1978. The president and his family are murdered in a military coup, and Nur Mohammed Taraki becomes president of a new communist-style regime.

1979. Soviet troops invade Afghanistan and install a government.

1980. Armed tribal groups begin a *jihad* (holy war) against the Soviet-installed government; the Afghan refugee population in Pakistan reaches 1.5 million.

1980s. Armed mujahideen groups fight Soviet and government forces; hundreds of thousands of Afghans die in the struggle, and millions more become refugees.

1986. President Mohammed Najibullah takes office.

1989. Soviet troops withdraw from Afghanistan.

1989–1992. Conflicts increase between government and opposition forces.

1992. In April, President Najibullah is replaced by a 4-member council under a United Nations plan; later, an interim government led by Professor Sebghatollah Mojadedi, takes over. Refugees begin to return to Afghanistan.

1992–1995. Intertribal fighting spreads to all major cities.

1994. The Taliban emerge as a major force in the ongoing internal conflict.

1996. The Taliban gain control of Kabul.

1998. Taliban forces capture key Northern Alliance stronghold of Mazar-e Sharif.

1998. U.S. cruise missiles strike alleged terrorist bases in Afghanistan in response to attacks on U.S. diplomatic facilities by groups led by Osama bin Laden.

1999. The Taliban rule out Osama bin Laden's extradition, leading the UN Security Council to impose sanctions restricting flights and the sales of arms.

2000. UN Security Council imposes further sanctions on the Taliban. The destruction of Buddha statues in the Bamian province by the Taliban sparks worldwide condemnation, further isolating Afghanistan.

2001. Following a devastating terrorist attack on the U.S. World Trade Center and the Pentagon by al-Qaeda terrorists in September, U.S.-led military action against the Taliban and the al-Qaeda terrorist group begins. The Taliban is forced to surrender all of its territory after attacks by U.S. and British forces, in conjunction with the Northern Alliance, a rebel group of tribal chieftains.

FUTURE TRENDS

After the September 2001 terrorist attacks on the United States, the U.S. military action initiated on Afghanistan resulted in the Taliban being stripped of their territory and power, but Afghanistan's future remains in serious disarray. Negotiations to set up an interim government began in Germany in November 2001, and while the participants claimed a desire for peace and a new beginning, Afghanistan's legacy of war and destruction certainly leaves the success of such platitudes open to doubt. Once the U.S.-led military action ends, an international peacekeeping presence will certainly be required to prevent further bloodshed. Given the volatile nature of the country and region, the international community will be called upon to help rebuild Afghanistan and protect the fledgling government that comes out of this latest conflict. Any sort of normalized economic relations are likely several years away.

The United Nations has recognized the need for massive humanitarian intervention in Afghanistan in order to prevent famine in the drought-stricken parts of the country in which 8 to 12 million people live. Of these people, 1.6 million faced starvation in January 2001. The UN made arrangements for weekly humanitarian flights to Kandahar with supplies and there was a project underway to fly extremely sick children to Germany for treatment. Many non-governmental organizations are calling for increased awareness and urgent action on the part of the international community.

DEPENDENCIES

Afghanistan has no territories or colonies.

AUSTRALIA

Commonwealth of Australia

CAPITAL: Canberra.

MONETARY UNIT: Australian Dollar (A$). One dollar equals 100 cents. There are coins of 5, 10, 20, and 50 cents, and 1 and 2 dollars. There are notes of 5, 10, 20, 50, and 100 dollars. An interesting feature of Australia's banknotes is that they are made out of thin plastic rather than paper.

CHIEF EXPORTS: Coal, wheat, gold, meat, wool, aluminum, iron ore, machinery, and transport equipment.

CHIEF IMPORTS: Machinery and transport equipment, computers and office machines, telecommunication equipment and parts, crude oil, and petroleum products.

GROSS DOMESTIC PRODUCT: US$445.8 billion (purchasing power parity, 2000 est.).

BALANCE OF TRADE: **Exports:** US$69 billion (f.o.b., 2000 est.). **Imports:** US$77 billion (f.o.b., 2000 est.).

COUNTRY OVERVIEW

LOCATION AND SIZE. Australia is a continent and a country in the Southern Hemisphere, lying to the south of Southeast Asia, and dividing the Indian and South Pacific Oceans. The total area of Australia is 7,686,850 square kilometers (2,967,892 square miles), with land constituting 7,617,930 square kilometers (2,942,282 square miles) and water 68,920 square kilometers (26,610 square miles). Australia is about the same size as the United States, not including Alaska. The only country that occupies an entire continent, the Commonwealth of Australia does not share any land boundaries with other nations. The length of the country's coastline is 25,760 kilometers (16,007 miles). The capital, Canberra, is located in the southeast corner of the nation and lies approximately halfway between the 2 largest cities, Sydney and Melbourne.

POPULATION. The population of Australia was 19,169,083 as of July 2000, with a population density of about 2.4 people per square kilometer (6.19 people per square mile). Most of the population is concentrated along the southeast coast of the country, in an arc running from the city of Brisbane to the city of Adelaide. This arc is sometimes called the "boomerang coast" because of its shape. All of Australia's large cities (those with more than 1 million people)—Sydney, Melbourne, Brisbane, Perth, and Adelaide—are on the coast. The population living inland (more than 200 kilometers, or 124 miles, from the coast) is rather small, and a large part of this region, called the Outback, is extremely sparsely populated. Australia's population is mostly urbanized, with about 88 percent of its people living in an urban area. Sydney alone has over 20 percent of the country's people.

Australia's population has become increasingly multicultural. In 2000, 21.8 percent of Australia's people were born overseas. Australia is still a land of immigrants and each year attracts new residents from all over the world. Fewer than 3 percent of the population is identified as Aboriginal or Torres Strait Islander (the latter being a Melanesian group native to northern Queensland). The country's population has doubled since World War II. With the exception of rapid growth shortly after the war, Australia's population growth has been steady at around 1 to 1.5 percent annually. The population in 1985 was 15.75 million, and in 1990 it was 17.06 million. The country's population is expected to reach 21 million by 2010. The Australian government has not found the need to create explicit population controls, given this slow rate of increase. Australia has a slowly aging population, with 21 percent between the ages of 0–14, 67 percent between 15–64, and 12 percent over the age of 65.

OVERVIEW OF ECONOMY

The Australian economy developed rapidly in the twentieth century to become relatively stable and

prosperous in world terms. Australia is characterized by an abundance of resources and a diverse yet predominantly primary sector-oriented economy. Grains, livestock, minerals, processed metals, and coal have been the mainstays of economic growth since European settlement in 1788 and continue to play the dominant role in export revenue. The **gross domestic product (GDP) per capita** continues to be high, with Australia ranked 17th out of 191 countries, with a GDP per capita of about US$17,575 in 1998. Australia's standard of living and lifestyle are similar to those of the United States and Europe.

Australia's economy depends on trade. Traditionally, Australia exported raw materials to its former colonial power, Great Britain, and to other European countries. When Great Britain joined what is now called the European Union (EU), trade between Great Britain and Australia declined. Australia has compensated by seeking new markets for its exports in Asia, especially in Japan and Southeast Asia. Japan, especially, has been a major purchaser of Australia's mineral and agricultural products. With the Asian financial crisis of the late 1990s, Australia sought to increase its exports to Europe and the United States while still maintaining a high level of trade with Asia.

Australia's geographic position and its topography have had an impact on its economy. The country is located relatively far from most world population centers and markets. Australia's immediate neighbors, with the exception of New Zealand, are developing countries. The Australian continent is generally dry and contains poor soils, limiting agricultural potential and requiring imports of water and fertilizers. Most of the continent's interior, the Outback, is unsuitable for agriculture except for limited cattle grazing. Australia is a generally flat continent with its few small mountain ranges being low in elevation; they primarily run north-south at the eastern edge of the country. Obstacles to road and railroad building are generally the great distances between population centers and between resources and population centers.

Australia's dependence on mineral and agricultural exports and the small size of the country's economy mean that it is exposed to fluctuations in world commodity prices. Fortunately, the diversity of minerals and agricultural products in Australia means that when some commodity prices are low, others are likely to be high, protecting the Australian economy from devastating shocks. Australia is self-sufficient in most resources including food and minerals; the major exception is oil, of which 20 percent of Australia's needs must be imported.

In the 1990s, the Australian government encouraged the **privatization** of government-owned companies. Large blocks of government-owned shares in the national telephone company, Telstra, and the national airline, Qantas, among other companies, were sold to the public. The Australian government has increasingly pursued a more free market approach to its economy, with fewer regulations and controls on business.

Australia's **external debt** is estimated at US$222 billion, and in 2000 the debt was estimated at approximately 3.3 percent of the GDP. The hosting of the Summer Olympic Games in 2000 contributed significantly to the rise in debt. However, Australia's debt has been declining as a percentage of both value of exports and GDP. **Debt servicing** continues but has little effect upon the performance of the economy as a whole, as it is large and strong enough to make interest payments without problems.

Australia is a contributor to global aid programs, but most aid is concentrated in the Asia-Pacific region. Australia contributes US$1.43 billion in overseas aid per year, and a significant proportion of this goes to Papua New Guinea, which is Australia's nearest neighbor and a former Australian colony. Australia is seen as a safe investment target for both domestic and overseas corporations. The mix of small, medium, and large companies is similar to that of the United States or Great Britain.

POLITICS, GOVERNMENT, AND TAXATION

The Commonwealth of Australia is a federal system with 6 states, 2 domestic territories, and a number of overseas territories, the latter consisting of small islands and a part of Antarctica. (However, the United States and many other countries do not recognize Australia's or any other country's territorial claims in Antarctica.) The 6 states are New South Wales, Victoria, Queensland, Tasmania, South Australia, and Western Australia. The 2 domestic territories are the Northern Territory and the Australian Capital Territory, the last of which, a small district containing the national capital, Canberra, is similar politically to the District of Columbia in the United States.

Australia is a constitutional monarchy with Queen Elizabeth II of England as the formal head of state. She is represented in Australia by a governor general. In practice, the political system is headed by the prime minister and the Australian parliament, which resembles that of Great Britain or Canada. Australia's parliament has 2 houses: the lower is the House of Representatives and the upper is the Senate. Australia is a member of the British Commonwealth. This organization of former British territories should not be confused with the formal name of the country, the Commonwealth of Australia. Australia's national government is usually called the Commonwealth government.

The major political parties in Australia are the Australian Labor Party, Australian Democratic Party, Liberal Party, National Party, and Green Party. The current Commonwealth government is a coalition of the conservative Liberal and National parties. The economic goals of these 2 parties are the promotion of free enterprise through reducing government regulation, privatization of government enterprises, and decentralization of government services, policies similar to those of the Republican Party in the United States. The leading opposition party, Labor, advocates policies similar to those of the Democratic Party in the United States.

Australia has a federal system, like that of the United States, which means that government income and expenditure is divided between the Commonwealth and state governments. Approximately half of the national government's revenues derive from a national **income tax**. Other leading sources of the national government's income include company taxes, sales taxes, excise **duties**, interest and dividends on investments, and various other taxes. The principal expenditures of the national government include social security programs, which account for about 37 percent of expenditures, followed by health care at about 15 percent, assistance to state governments at about 12 percent, defense at about 7.5 percent, general public services at about 7 percent, and education

at about 7 percent, with other expenditures making up the remainder.

For state governments, most revenue (about 52 percent) is derived from various state taxes, followed by transfers and payments from the national government (40 percent), and income from public utilities (8 percent). The major state government expenditures are on health, education, general services, transportation, law and order, community services, and other matters including cultural and environmental issues.

The Commonwealth government has played a very active role in the development of the economy towards reduced regulation, lowering of taxation rates, and the privatization of government corporations such as Telstra, the largest telephone company. Foreign investment is generally unrestricted and the United States is the largest source of **foreign direct investment**. The government does not usually interfere with the takeovers of domestic enterprises by foreign investors, nor does it offer any tax incentives for foreign investment. The Federal Treasury, however, regulates foreign investment through the Foreign Investment Review Board (FIRB). This regulation is a screening process to ensure conformity with Australian law and policy. As with many government controls, the greater part of regulating, promoting, and developing investment has been handed down to the control of the Australian states. Recent tax reform has introduced a 10 percent Goods and Services Tax (GST) nationwide, which replaced former taxes such as payroll and wholesale taxes. Most goods and services are now taxed through the GST at the flat rate of 10 percent. Corporate income, capital gains, and branch tax rates are all 36 percent. Personal income taxes are progressive, meaning that the rates increase with the taxpayer's income.

The Australian Defense Force, comprising army, navy, and air force branches, has 54,000 personnel currently serving, and in 1997 recorded an expenditure of US$8.4 billion. The Australian Defense Force is apolitical and does not play any role in economic development. The government has recently sought to increase funding for the Defense Force because of political instability in neighboring countries such as Fiji and Indonesia.

INFRASTRUCTURE, POWER, AND COMMUNICATIONS

Australia's transport and communications **infrastructure** has developed rapidly in close conjunction with the expansion of the country's main industries. The development of transport infrastructure in Australia has been almost entirely related to moving commodities for sale in cities or to gaining access to seaports.

ROADS. In 1996, Australia had 913,000 kilometers (567,338 miles) of roads, of which 353,331 kilometers (219,559 miles) were paved. Freeways constitute 13,630 kilometers (8,469 miles) of total roads in Australia. Road infrastructure in Australia is generally very good. Both urban and inter-city roads are well developed across the country. However, congestion, especially that caused by competition between freight and passenger road users, is becoming a problem in the large cities. The main cities affected are Adelaide, Melbourne, Sydney, and Brisbane; Sydney has the worst congestion problems, followed by Melbourne, then Brisbane. Intra-urban movement constitutes about half the total tonnage of road freight in Australia.

RAIL. In 1999 there was a total of 33,819 kilometers (21,015 miles) of rail lines in Australia. Rail infrastructure exists in both urban networks (mostly commuter rail) and regional networks (mostly freight rail). Rail infrastructure in Australia has never received much government support, despite the country's relatively flat topography and large distances. The consequence has been the development of a few high demand corridors being serviced by relatively poor infrastructure. While current rail infrastructure has sufficient capacity to deal with demand, major investments, totaling at least US$2 billion, have been identified as necessary to deal with the expected in-

crease in transport demand over the next 20 years. Additionally, conflicts between commuter and freight rail operators are becoming typical of the rail transport centers of Sydney, Melbourne, and Brisbane.

AIR. Australia currently has 408 airports, 15 of which serve as major intersections and destinations. The national air carrier is Qantas Airways. The country's second largest air carrier, Ansett Airlines, also has an extensive domestic network. The primary commercial airports are Sydney, Melbourne, Brisbane, Adelaide, and Perth. There are an additional 254 regional airports with paved runways across the country. Almost all of Australia's air movements constitute passenger travel. While Australia's air infrastructure is well developed, it has become increasingly overused and overworked and faces increasing maintenance and development costs. Between 2000 and 2020, an estimated US$1.4 billion in new investment will be required to adequately service air travel demand. Of this amount, roughly 67 percent will be directed at terminal expansion for the primary international airports. Currently, Australia's largest and most congested airport, the Kingsford Smith Airport in Sydney, remains efficient by world standards. Australia's main regional airports (Canberra, Coolangatta, Cairns, Darwin, and Hobart) are operating within capacity.

SEA. Australia has 14 major seaports, including Fremantle (Perth), Darwin, Brisbane, Newcastle, Sydney, Port Kembla, Adelaide, Melbourne, Davenport, and Hobart. In addition, export-dedicated seaports are located at Gladstone, Weipa, Hay Point, Dampier, and Port Hedland. Australian seaports are currently under-utilized, and most ports have the infrastructure to meet demand for the next 2 decades. The Bureau of Transport and Communication Economics found in 1996 that spending on infrastructure development will not likely exceed US$500 million over the next 20 years.

POWER. Australia does not import or export electricity. The country produces its own electricity supply, which is generated from coal (89.85 percent), hydro-electricity (8.35 percent), and other sources, mainly renewable energy (1.8 percent). Australia does not generate or consume electricity from atomic power. Total electricity production in Australia was 186.39 billion kilowatt hours (kWh) in 1998, with total consumption being 173.34 billion kWh for the same year.

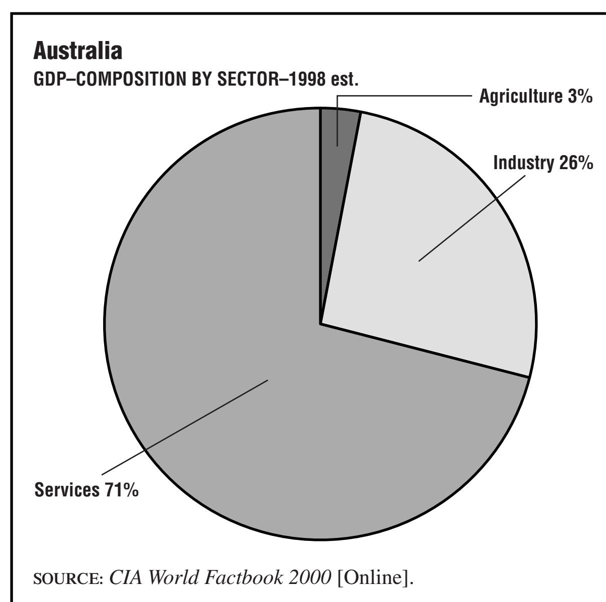
COMMUNICATIONS. In 1997, there were 9.5 million phone lines in use in Australia, representing a 15 percent increase since 1993. For the same period (1993–97), subscriptions to cellular phone networks increased 667.3 percent, with a total of 3.8 million users in 1997. Thus, Australia has one of the world's highest rates of cellular phone use. Recent upgrades to the digital phone system have achieved almost total coverage across the country. In 1999 Australia had 709 Internet service providers.

ECONOMIC SECTORS

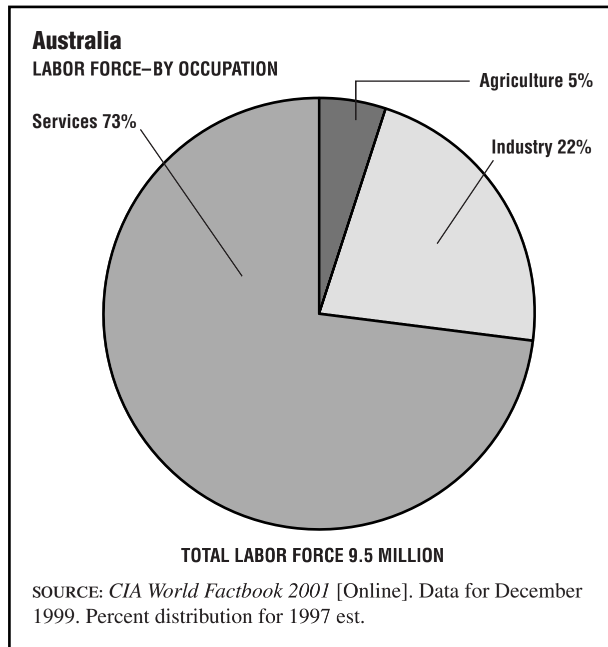
The export of agricultural and mineral resources has been the mainstay of Australia's economy for many years and continues to be a significant contributor to the GDP. Commodities produced in these sectors generate 57 percent of the value of total exports. The services sector (driven partly by the continuing development of the tourism industry) makes up an increasingly dominant proportion of GDP. The dependence on the export value of commodities puts Australia somewhat at the mercy of fluctuations in world commodity prices. Australia's attempts to increase manufactures have met with competition from the global market. Therefore, Australia has focused on developing its service sector.

During the 1990s, many Australian government-owned or partially government-owned companies were privatized or partially privatized. Notable examples of this process include the partial privatization of the Commonwealth Bank, the national airline Qantas, and the telephone company Telstra. Currently, public enterprises account for about 10 percent of total economic output in the country.

Australian companies are regulated by a number of government agencies. Chief among these is the Trade Practices Commission, which has the responsibility of encouraging competition and preventing **monopolization** in any industry. The Trade Practices Commission is concerned with price discrimination, resale price maintenance, misuse of market power, types of exclusive dealing, and anti-competitive agreements. Another government body, the Prices Surveillance Authority, identifies prices that are deemed excessive and establishes inquiries to determine if high prices result from anti-competitive or collusive com-



SOURCE: *CIA World Factbook 2000* [Online].



SOURCE: *CIA World Factbook 2001* [Online]. Data for December 1999. Percent distribution for 1997 est.

pany behavior. A third government body, the Industry Commission, is concerned with the allocation of resources in the economy as a whole. The Industry Commission advises the government on the setting of **tariffs** and other protective barriers needed to support Australian industry or to make it more competitive globally.

AGRICULTURE

Historically, agriculture has been as important in the development of Australia, as it was in the United States. Australia's traditional dominance in wheat and sheep continues into the 21st century. Recently Australian agriculture has become increasingly diversified. The considerable expanses of arable land have helped Australia to become a leading world exporter of grains, meats, and wool. Both grains (predominantly wheat and barley) and wool markets around the world are dominated by Australian exports. The market for cattle is more regional but is becoming increasingly important globally, given health concerns about European-produced beef. While only about 6 percent of Australia is suitable for crops and pasture, a considerable amount (60 percent) of the land area is suitable for cattle grazing.

Agriculture contributes roughly 3 percent of the GDP and employs about 4 percent of the total workforce directly. While the sector's contribution to the GDP is small, raw and unprocessed agricultural commodities contribute about a quarter of Australia's total export earnings each year. Australia exports a great deal more agricultural produce than it imports. In 1998 agricultural exports from Australia were estimated at US$15.14 billion, in comparison to the US$3.11 billion worth of agricultural imports for the same year. The main agricultural crops grown in Australia are wheat, coarse grains (barley, oats, sorghum, maize, and triticale), rice, oilseeds (canola, sunflowers, soybeans, and peanuts), grain legumes (lupins and chick peas), sugarcane, cotton, fruits, grapes, tobacco, and vegetables. The main livestock production is in sheep (wool and lamb), beef, pork, poultry, and dairy products. Exports account for over 90 percent of wool and cotton production, nearly 80 percent of wheat, over 50 percent of barley and rice, over 40 percent of beef and grain legumes, over 30 percent of dairy products, and nearly 20 percent of fruit production.

The distribution of agricultural production in Australia is largely determined by the physical environment and climate. The traditional large farm system of wheat and sheep production is spread fairly uniformly between parts of New South Wales, Victoria, South Australia, and Western Australia. Queensland, New South Wales, and Victoria produce the majority of beef, and New South Wales has the largest and most numerous poultry farms. Sugarcane and large-scale vegetable production occurs almost entirely in the tropical state of Queensland, while cotton is produced in both New South Wales and Queensland. Tropical fruits, such as mangoes and bananas, are grown in parts of New South Wales, Queensland, Western Australia, and the Northern Territory.

A notable characteristic of Australian farming and agricultural production is the extent to which net farm income varies from year to year. Australia's weather is subject to extreme fluctuations, which has an impact on annual production and ultimately on farm income.

Farm sizes range from relatively small part-time farms to operations of more than 5000 hectares. In general, Australian farming is characterized by large scale, highly mechanized and efficient operations, one of the key reasons why only a small percentage of the workforce is employed in this sector. Environmental factors have long been ignored in the production of agricultural commodities due to their importance to the economy. At the beginning of the 21st century, however, Australia is forced to pay more attention to the growing evidence of environmental stress and degradation caused by farming. In the past, the agricultural sector carried considerable political weight, being represented by the Labor and National political parties. Currently, there is increasing political pressure from urban residents to remove most **subsidies** and other forms of protection given to farmers. Australian farmers already do not receive many of the subsidies given to farmers in the United States and Europe.

INDUSTRY

MINING. Australia's mining sector is important to both Australia and the world. The mineral sector is the largest

primary sector in the economy, accounting for 6.5 percent of the GDP but for more than 60 percent of export earnings. World-wide, Australia is the third largest producer of minerals and metals (not including coal and petroleum). About 80 percent of total mineral production is exported.

Australia is the world's leading producer of alumina and bauxite (both used in the production of aluminum), diamonds (mainly industrial, not gems), opals, and sapphires. The country is the world's second largest producer of lead and zinc; the third largest producer of gold and iron ore; the fourth largest producer of cobalt and uranium; the fifth largest producer of aluminum, coal, copper, nickel, and silver; and the sixth largest producer of salt. Australia is virtually self-sufficient in most minerals and metals. The main exception is oil, but Australia does produce 80 percent of its own needs, mainly from offshore wells. However, Australia does have large deposits of coal, natural gas, liquified petroleum gas, and uranium, all of which are exported.

Many minerals are widespread throughout the country, but others are concentrated in particular areas. Most mining takes place in remote or rural Australia. Bauxite, diamond, and iron ore production is concentrated in the tropical north. Coal, lead, and zinc are mined primarily in New South Wales and Queensland. Uranium production is limited to a few mines in the Northern Territory and South Australia. Every Australian state and the Northern Territory have substantial mining activity. Most of Australia's oil is found offshore. The northwestern coast of the continent and Bass Strait, between Tasmania and the mainland, are the principal locations for petroleum extraction.

Of Australia's total mineral and energy production, 40 percent consists of metals, 30 percent of petroleum group products, 25 percent of coal, and 5 percent of industrial minerals (such as construction materials, clay, and salt).

Minerals of particular interest include coal, which is the largest foreign exchange earner in the sector, accounting for 25 percent of the minerals sector and 15 percent of the country's total export earnings. Australia is the sixth largest producer of coal in the world, but the world's largest exporter, most of which is sold to Japan and other Asian countries.

Australia's uranium mining has been controversial, as much of it has been conducted in environmentally sensitive World Heritage areas (sites recognized by the United Nations Educational, Scientific and Cultural Organization [UNESCO] as having global cultural significance). Some groups have protested against Australia's mining of uranium because of its role in energy production. Australia itself does not use atomic power and operates only one experimental reactor. Australia does not sell uranium for use in weapons and maintains strict controls on exports. Foreign investment in Australia's uranium industry was allowed in 1996. Australia has the world's largest reserves of uranium, about 25 percent of world total.

With respect to the ownership of minerals and mineral rights, each Australian state owns resources in its own area, while the Commonwealth government owns resources in the territories and offshore. However, the Commonwealth government has given control over non-uranium minerals within the boundaries of the Northern Territory to the territorial government.

Mining in Australia has frequently led to conflict with Aboriginal groups over ownership of land and resources. Much of Australia's mining takes place in remote areas, including the Outback, where Aboriginal people form a high percentage of the population. Aboriginal people have protested against mining activity which disturbs or destroys sacred sites, causes environmental damage, and negatively affects the customs of Aboriginal communities. The proposed expansion of the Ranger uranium mine, at Jabiru in the Northern Territory, has been criticized by Aboriginal people living in the area. Australian legislation in the 1990s belatedly recognized Aboriginal concerns. In 1996, the *Wik* ruling of the High Court of Australia determined that mineral leases in Australia are subject to Aboriginal claims. The effect that this ruling will have on mining is still uncertain, but it will probably have little financial impact on the mining sector as a whole.

Foreign companies control a majority of mining, smelting, and refining in Australia. Many mineral companies are vertically integrated, in that they mine, refine, and distribute their products globally. Australia's largest mining company, Broken Hill Proprietary (BHP), is one of the world's largest mining companies. It operates in Australia as well as overseas. BHP's recent merger with the South African mining company, Billiton, made it one of the three largest mining companies in the world. The new company is known as BHPBilliton. Two other large mining companies, Anglo American (South Africa) and Rio Tinto (Great Britain), also have substantial investments in Australia.

MANUFACTURING. The manufacturing sector has grown substantially since the 1950s, and while it remains a key sector in terms of its contribution to the GDP and employment, it also faces fierce competition from competing regional economies, especially those in Asia.

The relatively small population of Australia, and hence its small domestic market, has traditionally limited the development of certain types of manufacturing, such as sophisticated industrial equipment and electrical goods. Otherwise Australia is well equipped locally to

produce most manufactured goods competitively. Key manufacturing industries in Australia are industrial machinery, chemical production, transport equipment, food processing, and steel production. Australia has the ability to manufacture most of its needs and can obtain most raw materials domestically. About one-fifth of Australia's workforce is employed in manufacturing industries, and the growth of the sector since World War II has been fairly uniform. Australia has its own automobile industry, although foreign companies have overall control and ownership. Large investors include General Motors, Ford, Toyota, and Mitsubishi. General Motors owns the Australian automobile company, Holden, that produces its own line of Australian cars.

The manufacturing sector in Australia has been stable and sound, with a broad spectrum of industries that have had little need for tariff protection or government subsidies. However, the rapid development of similar industrial manufacturing industries in Asia has created many cheaper **import substitutes**. High levels of industry regulation (such as union-driven working conditions) and smaller margins of trade have also put the manufacturing sector under stress. Many **value-added** goods, refined fossil fuels, and metal products are now produced more cheaply in Asia, reducing the competitiveness of Australia.

The manufacturing sector in Australia is located almost completely in the urbanized regions of eastern Australia, with the exception of considerable steel and primary industry production in the state of Western Australia. Working conditions are generally very good, with "award wages" (nationally legislated working conditions and minimum wages) and Occupational Health and Safety measures addressing workers' interests. In 1998, 54 percent of employees did not take any time off work because of a work-related injury or illness. The manufacturing industry is one of the most unionized employment sectors in Australia and has taken a leading role in promoting an improvement in working conditions.

SERVICES

The service sector contributes approximately 69.2 percent of the GDP and employs an estimated 73 percent of the **labor force**. The recent growth in tourism, **retail**, and financial services contributes to a steady increase in these numbers.

TOURISM. By the end of the 20th century, tourism had become Australia's largest "resource," surpassing coal in value. In 2000 approximately 4.6 million international tourists arrived in Australia, bringing an estimated US$9.02 billion into the country, a 73 percent increase from tourist revenues in 1993. International tourist arrivals for 2001 are estimated to increase substantially to 5.2 million. International tourists come mostly from New Zealand, accounting for 17 percent, and Japan, accounting for 15 percent. Tourists come from other regions as well: the Americas, 12 percent; Asia (except Japan), 26 percent; Europe, 24 percent; and others, 6 percent. Some 99 percent of international tourists in Australia arrive by air.

The Australian Tourist Commission (ATC) is responsible for promoting Australian tourism internationally. According to their recent policy statements, the ATC "positions" Australia differently in tourism markets, meaning that they present different aspects of Australia in different countries. For example, in Japan, Australia is promoted as "close, affordable, safe," and with "inspirational experiences of nature and culture." In other overseas markets, Australia is typically positioned as "the most naturally free-spirited and liberating country in the world" and as a destination for a regular vacation rather than as the "trip of a lifetime."

Australia's scenery, variety of landscapes, distinctive animals, beach culture, modern cities, and relaxed lifestyle are all promoted as reasons to visit the country. The relatively weak Australian dollar, which has steadily declined in value against the U.S. dollar, makes Australia an affordable destination, as foreign travelers increasingly receive more Australian dollars per unit of their own currency. The 2000 Summer Olympics held in Sydney was a major factor driving an increase in international tourism to Australia. Televised events revealed many aspects of the country to potential visitors. The success of Australian films, particularly the *Crocodile Dundee* series, and television programs such as *Survivor II* and *The Crocodile Hunter* have also sparked an interest in visiting Australia. International tourists are forecast to increase by an average of 7.8 percent per year until 2010.

RETAIL. Australia has a diverse range of retail enterprises, similar in complexity to that of the United States or Great Britain. Australian-owned national retailers are numerous but are considerably outnumbered by smaller retailers. Small businesses (those employing fewer than 20 people) accounted for 95 percent of total retail businesses but only 38 percent of total retail income in the period 1998–99. For the same period, large businesses (those employing more than 200 people) made up less than 1 percent of total retail businesses but generated 41 percent of total retail income. The remaining 4 percent of retail businesses and 21 percent of income was attributable to medium-size businesses (21–200 employees).

The larger retail businesses in Australia are mainly comprised of department stores and supermarkets, which contribute 99.6 percent of total income. At the end of June 1999, there were 98,289 retail businesses in the country, generating about US$90 billion in revenue. Since 1991–92, the number of retail businesses has in-

creased by 18 percent, and employment in this sector has increased by 33 percent, with an annual sector-wide revenue growth rate of 5 percent. In the same period (since 1991–92) the operating profits of Australian retailers doubled.

Small businesses are most numerous and tend to dominate the total income for domestic repair and service industries, such as household equipment repair and motor vehicle services and maintenance. Small businesses also comprise the greater part of the total income for recreational goods, specialty foods, furniture, housewares, and appliances. Small enterprises and the large national retailers alike are subject to "award conditions" which specify minimum wages and employment conditions. The retail industry, while having a very high union membership rate, is not controlled by unions, and the Commonwealth government and business alike support moves towards direct employer-employee workplace agreements.

FINANCIAL SERVICES. Financial services is a growing sector in the Australian economy. With respect to commercial banking, the sector is dominated by 4 large private banks: the National Australia Bank, Commonwealth Bank (partially government owned), Westpac, and ANZ Bank. Together these 4 account for about 70 percent of market share and provide both retail and wholesale banking services (services to individuals and to companies). In an increasingly globalized economy, Australia's banks face international competition but have generally thrived. Australia's banking system has been consistently modernized by technological developments. For example, checks and checking accounts are no longer widely used, and Automated Teller Machines (ATMs) and electronic banking have replaced both the use of checks and in-person banking transactions.

Australia's financial services sector also includes many non-bank financial institutions. These include financial intermediaries such as building societies, credit unions, money market dealers, and finance companies. Building societies, similar to Savings and Loan companies in the United States, have generally been declining as they are no longer competitive and have been bought out by banks. Funds managers and trusts are other non-bank financial institutions. These institutions manage insurance funds, superannuation (retirement) funds, and real estate assets, among other matters.

Australia's central bank is the Reserve Bank of Australia, similar in concept to the Federal Reserve system in the United States. The Reserve Bank's functions include managing and issuing the currency, controlling the money supply, supervising the private banks, assisting the government in formulating economic policy, providing banking services to the government, managing the foreign **exchange rate**, and managing the Australian government's overseas financial holdings. The overall objectives of the Reserve Bank are to maintain the stability of Australia's currency, maintain **full employment** in the country, and ensure the economic prosperity of Australia.

INTERNATIONAL TRADE

Historically, Australia's largest trading partners were Great Britain and the rest of Europe. This historical trading relationship reflected Australia's colonization by Great Britain and the British need for new markets for manufactured goods as well as sources of raw materials. The cultural affiliation between Australia and its "mother country" also contributed to this historic trading pattern. Since the 1970s, however, Australia's international trade has shifted towards Asia and Pacific countries. When Great Britain joined what is now known as the European Union in the 1970s, Australia lost many trading advantages with that country and sought new markets closer to home. Japan, Singapore, other Southeast Asian countries, and the United States have all become important Australian trading partners. The composition of Australia's exports has largely remained the same, but new markets (including more recently South America and the Middle East) have been sought. The marked failure of some key Southeast Asian economies, particularly Indonesia, Thailand, and Hong Kong in the late 1990s, has had only a limited effect on the Australian economy. As of 2001, political events outside Australia, such as disturbances in the neighboring countries of Indonesia and Fiji, have had almost no impact on Australia's trade.

Australia's principal exports are meat, wheat, cotton, machinery and transport equipment, coal, iron ore, aluminum, gold, and other minerals. The largest destination for exports is Japan, which purchased almost US$9 billion worth of Australian products in 1999. The United States was the second-largest purchaser, at about US$4 billion, followed by South Korea, New Zealand, Taiwan, Hong Kong, China, Singapore, Great Britain, Indonesia, Malaysia, and Italy. Eight of the top twelve importers of Australian products are in Asia.

Trade (expressed in billions of US$): Australia

	Exports	Imports
1975	11.948	10.697
1980	21.944	22.399
1985	22.604	25.889
1990	39.752	41.985
1995	52.692	61.283
1998	55.895	64.668

SOURCE: International Monetary Fund. *International Financial Statistics Yearbook 1999.*

Australia's main imports are machinery and transportation equipment (mostly motor vehicles), computers and office machines, telecommunications equipment, oil and petroleum products, medical and pharmaceutical products, aircraft and related equipment, and clothing. Australia's largest source of imports is the United States. Australia imported nearly US$10 billion worth of goods from the United States in 1999. Other leading sources of imports to Australia are Japan, Great Britain, China, Germany, South Korea, New Zealand, Indonesia, Taiwan, Singapore, Italy, and Malaysia. With the exceptions of Hong Kong and Germany, Australia's top twelve trading partners are the same for both exports and imports.

The recent (2000) sharp drop in the value of the Australian dollar, especially against the U.S. dollar, could have an impact on Australia's current **trade deficit**. A devalued currency means that Australia's exports become relatively cheaper, while imports become more expensive. Thus, a weak Australian dollar may give the country a competitive edge over Canada, the United States, and other countries in selling raw materials to Japan, to take one example. However, the flip side is that imported products become more expensive, as Australians require more dollars to purchase the same product. For example, a product selling for US$100 would be the equivalent of A$153 in 1999, assuming all other factors to be equal. But with the drop in the value of the Australian dollar, the same US$100 product would be the equivalent of A$192 in 2001. Therefore, many Australian consumers might find imported products too expensive and stop buying them. If this situation continues, Australia's exports could increase and its imports decrease, leading to a decline in the amount of the trade deficit.

MONEY

Australia's economic performance depends on the world prices of mineral and agricultural commodities. The value of Australia's currency can considerably affect the value of export earnings. Australia has also managed to steer clear of **recession** and sharp fluctuations in the rate of **inflation** during the past 2 decades. Government policies of the 1990s, including allowing the value of the currency to fall, **deregulating** industry, and encouraging foreign investment, allowed Australia to weather the Asian economic crisis of that decade. In this period, inflation was low, averaging between 1 to 3 percent per year. Inflation is a controversial topic among economists and is still not clearly understood. However, within the past 2 years price increases in Australia have been attributed to the introduction of the Goods and Services Tax (GST) of 10 percent on most products and services; the fall in the value of the Australian dollar, which makes imports more expensive; and the increase in world oil prices, which are passed on to Australian consumers. Nevertheless, steady economic growth of around 4 percent per year has characterized the greater part of economic performance.

Australia has an established stock exchange. The Australian Stock Exchange (ASX) opened in 1987 through the merger of smaller, very well established (100 years or so of trading) exchanges. In 1998, there were 1,162 companies listed on the exchange.

POVERTY AND WEALTH

Australia has sometimes been called a "classless society," though this is not strictly true. Class in Australia is generally defined on the basis of income or self identification. The terms "working class," "middle class," and "upper class" are all in use, but are difficult to define statistically. Social mobility in Australia is high and there are no formal or cultural obstacles to movement between social or economic classes. Australia's high level of multiculturalism, with many recent immigrants, also contributes to class mobility. Immigrants are often concerned to get the best possible education for their children so that they will move upwards economically. There are some differences in standards of living between rural and urban residents, as the cost of providing basic services to rural areas is generally higher. Rural regions often have more limited services and higher prices for **consumer goods**.

In Australia the general living standards are very high, but differences remain between the country's richest and poorest. Moreover, the gap between rich and poor

is growing. The poorest 20 percent of households earned 1 percent of private income, while the richest 20 percent earned 50 percent. For a small minority of the population (nearly all Aboriginal), levels of education and health are very low, and these people are often at or below the poverty line. Australia has been internationally criticized for this situation. The richest minority in Australia are very wealthy and play key roles in international finance. On the whole, the majority of Australia's population would probably be defined as middle class.

Poorer families in Australia are generally characterized by financial struggle and limited opportunities. The national government has an obligation to provide basic services to such families. Australia, like many developed western economies, is partly a **welfare state**. The poorest citizens, and those on low wages or dependant upon care, receive social security and are granted access to free or reduced price health services, education, transportation, and housing. A poorer family in Australia will most likely live in a cheaply constructed, and often highly subsidized public housing area. Many of the basic family services provided by the Commonwealth government, such as rent assistance, childcare assistance, health care, and legal aid, are often busy and run on stretched resources. This situation is more extreme in the country's rural areas. General health levels among such families are low, primarily from inferior housing, poor diet, and increased susceptibility to the abuse of alcohol and drugs. While free education has been the hallmark of the Australian school system, budget cuts have increased the actual cost of sending children to school, with poor families having to pay for many extracurricular activities. The lifestyle of a poor family in Australia is characterized by the need to work to live and support a family in the short term. Rarely, even if members of a family are employed full time, is there the financial ability to take time off work for vacations. Access to higher education, the Internet and even basic computer knowledge, and inclusion in political decision-making are all limited.

The typical family in the higher income brackets of Australian society enjoys many more opportunities, choices, and luxuries than do poorer families. Many richer families have the choice of living outside busy urban centers in rural areas within commuting distance of the cities. Those who choose to live in the major metropolitan areas enjoy spacious, well built, modern or traditional heritage housing. Education has traditionally been a priority for the richer families, and children will often be sent to private schools where the educational standards are usually far better and more inclusive of physical and personal development programs. It is not uncommon for such children to attend boarding schools in another state or region. Almost universally, higher-income families take advantage of a well-developed private health care system, with education being a key factor in better levels of health among such families. While domestic violence, drug abuse, and support services are commonly associated with poorer families in Australia, such abuses transcend socio-economic boundaries and can also occur among the richer families. Richer families have ease of access to private vehicles, typically 1 per person in the family, and the ability to take time off work for domestic and international vacations. In contrast to poorer families, substantial and self-funded retirement plans are

universal among richer families. Such families easily access personal or home information and entertainment technology. Personal computers, reliable and private access to the Internet, cellular telephones, and entertainment technologies are common and form the basis of better connections to news, information, and public opinion. Richer families have a considerable political voice through their ability to make contributions to political parties, to be informed about current affairs, and to participate in debate.

WORKING CONDITIONS

In world terms, Australian working conditions are of a high standard. Australian industrial relations are characterized by fairly high union membership and a federally driven, but state determined, compulsory arbitration and conciliation system. Industrial relations practices are specified in the Conciliation and Arbitration Act (1904), which encouraged employer associations to recognize unions and empowered these unions to make working condition claims on behalf of employees. In Australia there are 7 distinct systems of industrial regulation and relations: the national system is supplemented by those of the 6 states, each having its own distinct industrial relations legislation and arbitration processes. As a result, there has long been a high degree of state intervention in the labor market. There is now only 1 main central union confederation, the Australian Council of Trade Unions (ACTU). "Awards" are the legal decisions made by independent industrial organizations, and they specify minimum standards of pay and working conditions that an employer must meet or otherwise face legal penalties. Working conditions are regulated by legislation and industrial awards.

While Australia carries no social restrictions on employment opportunities for women, the percentage of women in the formal workforce has traditionally been smaller than that of men. Female participation in the workforce has been increasing steadily since the early 1960s, when women comprised 25 percent of the workforce. In 1993, women's participation in the workforce was still increasing at 42 percent. The national Affirmative Action (Equal Employment Opportunity for Women) Act (1986) obliges employers to take steps specifically designed to remove discrimination towards women and promote equality in employment. Despite this act and award conditions for equal pay for equal work being well established, women's earnings on average remain slightly less their male counterparts. This inequity is partially due to the fact that women remain concentrated in industries where pay and working conditions remain relatively less favorable than other occupations and professions. More recent trends in equal opportunity employment address factors such as childcare, maternity and paternity leave, affirmative action, and sexual harassment, and sees them as significant industrial relations issues rather than exclusively women's issues.

Unemployment in Australia has been between 6 and 8 percent since the early 1980s and continues to remain in this range. Many Australian employers have readily employed immigrant workers, especially in times of labor shortages.

COUNTRY HISTORY AND ECONOMIC DEVELOPMENT

1770. Captain James Cook claims Australia for Great Britain.

1788. Australia is settled as a British penal colony.

1793. The first free settlers arrive.

1817. Australia's first bank, the Bank of New South Wales, is established.

1851. Gold is discovered in New South Wales and Victoria.

1883. Silver is discovered at Broken Hill, New South Wales.

1901. The Commonwealth of Australia, a federation of the colonies, is proclaimed. Australia adopts a federal system similar to the United States.

1914–18. Australia sends troops to fight for Great Britain in World War I.

1917. Transcontinental railroad opens.

1920. Qantas, the national airline, is founded.

1927. The national capital is moved from Melbourne to Canberra.

1940–45. Australian troops serve in World War II.

1942. Japanese planes bomb the Northern Territory capital of Darwin. Japanese midget submarines penetrate Sydney harbor.

1952. Uranium is discovered in the Northern Territory.

1960. Aboriginal people are granted Australian citizenship. The Reserve Bank of Australia is established.

1961. Iron ore deposits are discovered in Western Australia.

1966. Australia changes its currency from the British pound to the Australian dollar.

1992. The *Mabo* decision in the High Court allows Aboriginal people to claim title to their traditional lands.

1997. The Asian financial crisis weakens Australia's economy.

1999. A referendum to change Australia from a constitutional monarchy to an independent republic is defeated.

2000. The Summer Olympics in Sydney lead to a boom in tourism.

FUTURE TRENDS

Australia's well rounded economy is likely to see continued growth in both the near and distant future. The country's importance as a leading supplier of minerals and agricultural products, its increasing presence in financial services and specialized technology industries, and its growing appeal as a tourism destination all hold great promise. The diversity of the Australian economy, its many trading partners, and its peaceful democratic political system all help stabilize economic conditions and encourage new investment. The Asian financial crisis of the late 1990s slowed Australia's exports, particularly of minerals, but is unlikely to have any long-term effects on the overall economy. Australia's economy is a careful balance of free market policies with close regulation of key economic sectors, combined with extensive social services programs. Australia's standard of living is assured of remaining one of the world's highest.

The Australian economy will have to increasingly address environmental and Aboriginal issues. Environmental damage caused by mining and agriculture, especially, have come under frequent media attack. Current issues include soil erosion caused by overgrazing, urbanization, and poor farming practices; increases in soil salinity largely due to farming practices; depletion of fresh water supplies, again largely due to farming and urbanization; and coastal damage, especially around the Great Barrier Reef on the Queensland coast, caused by shipping and extensive tourism. Mining impacts on the environment, such as the release of toxic substances, tend to be more localized. Mining and agricultural enterprises are becoming more responsive to environmental issues, but there is still room for improvement. Australia only recognized the potential land claims of its Aboriginal population in the 1990s, placing it far behind the political history of indigenous-settler relations in other countries such as New Zealand, Canada, and the United States. The *Mabo* and *Wik* High Court decisions of the 1990s recognized that Aboriginal title to land may still exist and that it can overlap with pastoral and mining leases. The implications of these decisions have not yet been worked out. They will probably have no major impact on the Australian economy as a whole but will give Aboriginal people a greater voice in managing natural resources on their traditional lands.

DEPENDENCIES

Australia has no territories or colonies.

AZERBAIJAN

Azerbaijani Republic
Azarbaichan Respublikasy

CAPITAL: Baku.

MONETARY UNIT: Manat. One manat equals 100 gopiks; however, there are no gopiks in circulation due to inflation in the early 1990s. The currency comes in denominations of 50, 100, 250, 500, 1,000, 10,000, 50,000, and 100,000. Some coins may still be found of 10, 20 and 50 gopik.

CHIEF EXPORTS: Oil, gas, machinery, cotton and foodstuffs.

CHIEF IMPORTS: Machinery and equipment, foodstuffs, metals and chemicals.

GROSS DOMESTIC PRODUCT: US$14 billion (purchasing power parity, 1999 est.).

BALANCE OF TRADE: **Exports:** US$885 million (1999 est.). **Imports:** US$1.62 billion (1999 est.).

COUNTRY OVERVIEW

LOCATION AND SIZE. Azerbaijan, a country of eastern Transcaucasia, is located on the western border of the Caspian Sea, between Iran and Russia. It is bounded by Russia to the north, Georgia to the northwest, Armenia to the west, Turkey to the southwest by the border of Nakhichevan, and Iran to the south. Azerbaijan has an area of 86,600 square kilometers (33,436 square miles), of which 86,100 square kilometers (33,243 square miles) is land and 500 square kilometers (193 square miles) is water. The area is slightly smaller than Maine. The total area includes the exclave (portion of the country separated from the main part) of Nakhichevan Autonomous Republic and the enclave (a distinct territorial, cultural, or social unit enclosed within foreign territory) of Nagorno-Karabakh, a region whose autonomy was abolished by the Azerbaijani Supreme Soviet on 26 November 1991. The coastline on the Caspian Sea is about 800 kilometers (497 miles). The total borderline of the country is 2,013 kilometers (1251 miles) long. The capital, Baku, is located on the Caspian Sea border and the other major cities, Ganja and Sumgait, are located to the west and just to the north of Baku, respectively.

POPULATION. The population of Azerbaijan was estimated at 7.75 million as of 2000, an increase of 10.6 percent from the 1990 population of 7 million. The population growth rate declined from 3 percent between 1959–1970, to 1.3 percent in the late 1980s, and 0.27 percent in 2000. The population is expected to reach 8.6 million in 2010. Approximately 63 percent of the population is between the ages of 15 and 64, whereas people of ages 0–14 account for 30 percent of the population, while those of ages 65 and over account for 7 percent. The most populous city of Azerbaijan is the capital, Baku, with over 1.7 million inhabitants. As of 1999 the urban and rural population rates were 51.7 percent and 48.3 percent respectively.

The Azerbaijani population consists of different ethnic groups: Azeris are the majority with 90 percent share in the total population. The rest is made up of Dagestani (3.2 percent), Russian (2.5 percent), and Armenian (2 percent) groups.

OVERVIEW OF ECONOMY

Azerbaijan is a nation of Turkic Muslims. It became an independent republic following the collapse of the Soviet Union in 1991. The country has come into conflict with Armenia over the Azerbaijani Nagorno-Karabakh enclave, when almost 20 percent of total land in Azerbaijan was occupied by Armenia. In comparison to Armenia and Georgia, the industrial sector in Azerbaijan is less developed, with its main focus on the oil industry. There is high **structural unemployment**, and a low standard of living.

Following the break-up of the Soviet Union in 1991, Azerbaijan's economy suffered from serious problems. **Real gross domestic product** (GDP) declined by 60 percent between 1991 and 1995, by which time high **inflation**

had eroded real incomes, the **exchange rate** had weakened, and monetary reserves were nearly depleted. This sudden economic decline had a disastrous effect on the people's living standards. Per capita GDP declined from US$5,841 in 1988 to US$1,770 in 1999, the **inflation rate** rose as high as 1,664 percent in 1994, and from 1988–1998 food prices multiplied as much as 28,750 times. Economic recovery started only after 1996, mostly driven by investment from abroad in the oil, construction, and communications industries. Foreign companies, primarily from the United States, were eager to control Azerbaijan's oil-rich lands.

The main products of the economy are oil, natural gas, and cotton. In order to improve industrial development, Azerbaijan signed arrangements with foreign firms, which have already committed US$60 billion to oil field development. The conflict with Armenia over the Nagorno-Karabakh region, however, stands as an obstacle to economic progress, including stepped-up foreign investment. Due to the fact that old Soviet ties have been broken in the transformation to a market economy, trade with Russia and the former Soviet republics has decreased, while the country has involved itself with other regions like Turkey, Iran, the United Arab Emirates, and Europe. Oil is a very important product of the country, and economic success will depend on world oil prices and the agreements over a pipeline project in the region. In 2000 the construction of a prospective oil pipeline, originating in Baku, passing through the Republic of Georgia, and terminating at Ceyhan, a Turkish port on the Mediterranean coast, was still considered a high cost project. Increasing oil prices will likely make the project more affordable in the near future.

The **external debt** of the country increased steadily from 1991 onward due to economic **restructuring**, and was recorded at US$684 million in 1998. Though economic stabilization measures improved the economic climate considerably during the second half of the 1990s, and inflation improved (exceeding 1,000 percent in both 1993 and 1994, but thoroughly contained in 2000) Azerbaijan needed increasing amounts of International Monetary Fund (IMF) credits. As a result of successful restructuring with the aid of the IMF, Azerbaijan started to repay its debts after 1999.

POLITICS, GOVERNMENT, AND TAXATION

After the declaration of the independence of the republic in 1991, severe political and economic instability lasted until 1994. Heydar Aliyev seized power in June 1993 through a military coup, toppling the democratically elected Abulfaz Elchibey. In October 1993, however, Aliyev legitimized his rule by winning presidential elections. In 1998 the incumbent president was reelected to office for a second term which continues through October 2003.

In the executive branch of the government, there is a president, a prime minister, and a Council of Ministers appointed by the president and confirmed by the National Assembly. The president is elected by popular vote for a 5-year term. The prime minister and cabinet members are appointed by the president and confirmed by the National Assembly. The National Assembly is **unicameral** (one-chambered), has 125 seats, and the members are elected by popular vote for a 5-year term. Parties in the Assembly from 1998 were: the New Azerbaijan Party (center party) chaired by the president Aliyev, the Party of the Popular Front of Azerbaijan (nationalist) chaired by Abulfaz Elchibey, the Party for National Independence of Azerbaijan (nationalist) chaired by Etibar Mammadov, and the Musavat Party (liberal) chaired by Isa Gambar.

Azerbaijan's government consumes about 11 percent of the GDP. However, in 1998 Azerbaijan received only 1.28 percent of its revenue from state-owned enterprises and from government ownership of property. The **privatization** program following independence was poorly thought out and was derailed by poor administration and

corruption. It was thought necessary to privatize state-owned companies so that they could perform better in the market. However, the government mostly sold small firms rather than the large-scale companies that were poor performers. What made this process worse was that the opportunities for foreign participation were never properly defined. As a result of these major problems with the privatization program, the **public sector** remains large in the country's economic life. For example, 75 percent of outstanding loans in the banking system were from publicly owned enterprises in 2000, many of which chronically record operating losses. As high as that debt is, it represented some improvement from a 90 percent ratio of such loans in 1995.

The main revenue generators for the government are an **income tax** (levied on the employee's income at progressive rates ranging from 12 percent to 35 percent), a profit tax (0.5 percent), a **value-added tax**, and a **social security tax** (the employer is required to pay an amount equal to 33 percent of the gross salary of the employee). The contribution of these taxes reached 2.6 percent, 2.1 percent, 4.5 percent, and 3.7 percent of GDP in 1998, respectively.

INFRASTRUCTURE, POWER, AND COMMUNICATIONS

Azerbaijan's **infrastructure** of roads and railways is poorly maintained and needs investment. Important transport links with Russia were periodically cut off due to the war in Chechnya (an autonomous Muslim republic in southwestern Russia) that disrupted much of the road and rail links. The total length of the railways is 2,125 kilometers (1,320 miles) in common carrier service, excluding industrial lines. Much of these rails need an overhaul; however, Azerbaijan does not own repair facilities. The 24,981 kilometers (15,523 miles) of roads are also in poor condition. The European Union has sponsored a project to provide new transit routes. The number of passenger cars was 35.5 per 1000 people in 1998.

There are 69 airports in Azerbaijan, 29 of which have paved runways. There are flights to other former Soviet republics, Germany, the Netherlands, Switzerland, Israel, Iran, Turkey, the United Kingdom, and the United Arab Emirates. Baku, Ganja, and Nakhichevan have international airports that are in need of reconstruction and repair. Turkish Airlines, Lufthansa, and British Airways have offices in Baku.

Azerbaijan has maritime connection to the high seas only through the Volga-Don canal, a Russian waterway. Baku has the largest port on the Caspian Sea, but it needs repair. Azerbaijan has a 55-ship marine fleet (1000 GRT or over) and a total of 3000 kilometers of pipelines for crude oil, petroleum products, and natural gas, which are also main sources of export income.

Azerbaijan has an 18.9 billion kilowatt electricity generating capacity (1998), which is sufficient for domestic consumption. Hydroelectric power stations account for 18 percent of the total generation capacity. The generation technology is in need of replacement. The government subsidizes the household consumption of electricity, yet the collection of charges from the consumers is a persistent problem due to the fact that for many consumers the cost is still high considering the low income levels.

As a result of heavy investment during the Soviet era, Azerbaijan has an extensive natural gas distribution and use system. Its gas distribution network extends to over 80 percent of the population and comprises 4,500 kilometers (2,797 miles) of high-pressure transmission lines, 7 compressor stations, and over 31,000 kilometers (19,263 miles) of medium and slow pressure distribution lines. While the country was at one time self-sufficient in gas, declining oil and gas production in recent years has led to a need for substantial gas imports to meet increasing supply shortfalls. The gas sector recovered in 1998, after Azerbaijan managed to eliminate gas imports from suppliers such as Turkmenistan. Azerbaijan is likely to become a gas supplier to Turkey within 10 years.

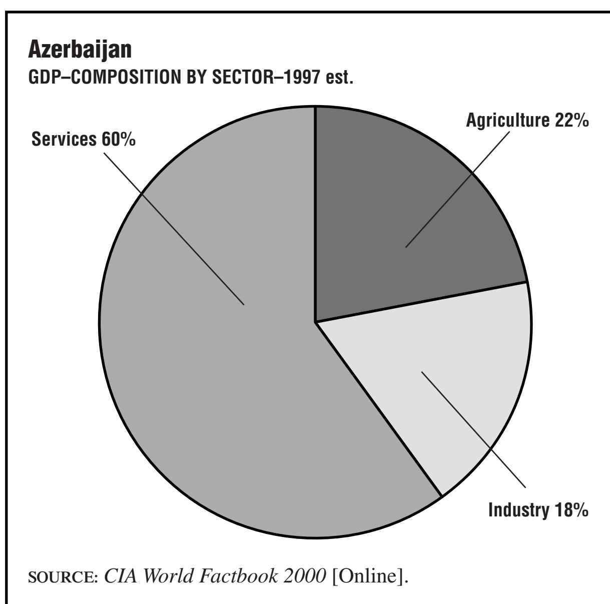
Azerbaijan's telecommunications system is poorly developed. Baku has the most telephones, whereas about 700 villages still do not have public telephone service. Although fixed telephone users are very small in number, mobile phone use is increasing, especially among a growing middle class, large commercial ventures, international companies, and most government officials. The Ministry of Communications (Azertel) handles international telephone requirements through the old Soviet system of cable and microwave which is still serviceable, and the satellite service between Baku and Turkey, which provides access to 200 countries. Azerbaijan is a signatory of the Trans-Asia-Europe Fiber-Optic Line (TAE) that is hoped to improve international communication; however, the lines are not yet laid.

Though Internet and e-mail services are available only in Baku, it is strictly controlled by the government. As of January 2001, Internet service cost was about US$0.62 per hour; however, given the relatively high cost of this service for many Azerbaijanis, the poor conditions of phone lines, and the high costs of imported personal computers and modems, the average number of Internet hosts was only 20 per 100,000 residents in January 2001. The number of television sets was estimated to be around 2 million in 1998.

ECONOMIC SECTORS

The main economic sectors are agriculture, industry, and construction, which have shown much improvement from foreign investment. Agriculture, about 90 percent privatized, represented 21.7 percent of GDP in 1999. Cotton was the leading crop; however, caviar production was world famous. Industry accounted for 23.6 percent of GDP in 1999, the main contributors to which were the metallurgy and fuel industries. It was widely estimated that about 10 percent of the world's oil reserves were located in Azerbaijan and the Caspian Basin. In 1999, construction accounted for 9.4 percent of GDP.



SOURCE: *CIA World Factbook 2000* [Online].

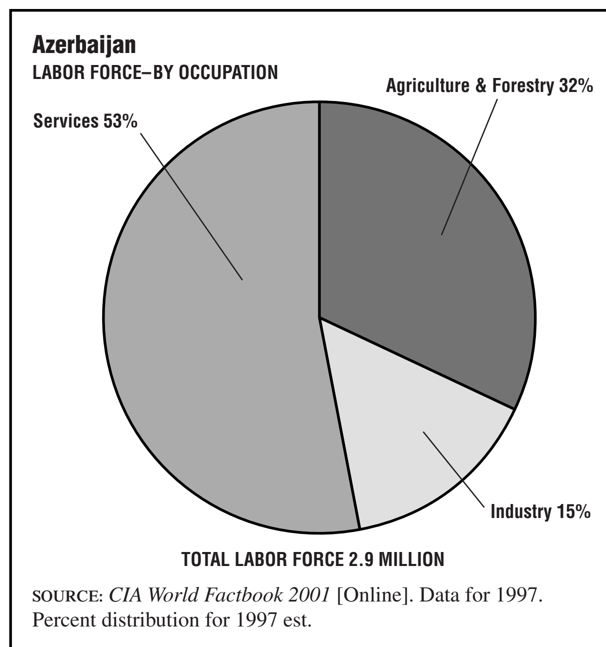
AGRICULTURE

Agriculture is the largest employer in Azerbaijan. In 1999, it had 32 percent of the total workforce and a 22 percent share of the total GDP. The primary products are grains, cotton, tobacco, potatoes, other vegetables, grapes, melons and gourds, fruits, and tea. The sector meets most of Azerbaijan's grain needs. Farming is concentrated in central Azerbaijan along the Kura and Araxes rivers, where the land is fertile. The collective and state farms that were common in the Soviet times have been dismantled, leaving room for smaller farms. Cotton, an important export crop, experienced sharp declines in production in 1999 due to shortages and price increases of fertilizers, defoliants, and spare parts of harvesting machinery.

The total value of agricultural exports decreased from US$168.2 million in 1994 to US$96 million in 1998, representing a decrease of 43 percent. Agricultural exports accounted for 26.2 percent of total exports in 1994, decreasing to 15.8 percent in 1998. Fishing also is an important sector, with 90 percent of the world's caviar production coming from the Caspian Sea.

INDUSTRY

MINING. The main mining product of Azerbaijan is oil. At the beginning of the 20th century, Azerbaijan ac-



SOURCE: *CIA World Factbook 2001* [Online]. Data for 1997. Percent distribution for 1997 est.

counted for nearly half of the world's total oil production. Although at the end of the century it lost this place to Middle Eastern countries, Azerbaijan is still the most geopolitically important country among the former Soviet republics, being relatively the closest to the high seas and possessing an open investment environment, which is crucial in terms of oil transportation. The State Oil Company of the Azerbaijan Republic (SOCAR) is the largest employer of the country, with 78,000 workers. The revenues from exports of oil products accounted for US$434 million in 1998, 64 percent of total exports. In addition, the expenses for imports of the oil sector accounted for US$355.7 million in 1998, or 20.6 percent of total imports.

Other mineral sources of Azerbaijan include iron, bauxite, zinc, copper, arsenic, molybdenum, marble, and fire clay. There are also small reserves of gold. Large reserves of iron and aluminum are located in the Dashkesen Mountains. Since the only buyer of the iron, Georgia, stopped purchases after the dissolution of the Soviet Union, iron production has been suspended. The mining industry is in need of modernization due to the aging technology and equipment employed in the sector.

MANUFACTURING. Oil equipment manufacturing and related sectors such as instrument-making, electrical engineering, and radio electronics sectors produce almost 20 percent of the total manufacturing sector. The government considers the oil engineering sector of strategic importance and the sector is not included in privatization plans. After independence, the manufacturing sector experienced a decrease in non-oil-related production. The majority of heavy industry is located in Sumgait, just north of Baku. However, much of this capacity is declining, due to a lack of government incentives, foreign capital, and infrastructure. Other important sectors include textile, food, and beverages. However, these sectors, too, have experienced a sharp decline and lost their competitiveness against imported goods for the same reasons.

CONSTRUCTION. The share of construction in total GDP increased from 8.1 percent in 1990 to 9.4 percent in 1999. Construction work related to the oil industry accelerated after 1995. Turkish companies are also active in the construction of homes and businesses.

SERVICES

BANKING. The Azerbaijan National Bank (ANB), responsible for **monetary policy** and the supervision of the financial sector, was established in 1992 and privatized in 1995. There are many commercial banks, but most of them are small and undercapitalized. After a consolidation in the number of the banks, as of July 2000, Azerbaijan had 66 commercial banks, the central bank, the state-managed International Bank of Azerbaijan, and the United State Industrial Bank. The ANB informally protects the state-owned banks from foreign competition by allowing only 30 percent of capital to be foreign-owned in the national banking system.

INTERNATIONAL TRADE

During the late 1980s, exports and imports accounted for 37 percent and 46 percent of GDP, respectively. In 1999, exports stood at US$885 million, and imports totaled US$1.62 billion. After a brief **trade surplus** was achieved in 1992, a deficit occurred again in 1993. Due to increases in the purchase of machinery and equipment for the oil industry and increased imports of **consumer goods**, there was a rapid increase in imports. Accordingly, there was a chronic current account deficit, which was expected to shrink with the increase of oil exports by 2001.

Azerbaijan relies heavily on crude oil exports. Oil export figures reached 68.9 percent of total exports in 1998. Turkey was the main trading partner of Azerbaijan for both exports and imports, accounting for 22.4 percent and 20.4 percent of total exports and imports in 1998, respectively. This high rate is mainly due to the special relationship between the countries (Azerbaijan citizens speak a dialect of modern Turkish and have the same religious and cultural background as Turkey). Other major trading partners include Russia, Georgia, Ukraine, Italy, the United Arab Emirates, and Iran.

MONEY

After independence Azerbaijan suffered from the mismanagement of the economy by the former Soviet Union. The country applied severe monetary and **fiscal policies** in order to stabilize the economy. Inflation was reduced from upwards of 1000 percent to single digit rates. The fiscal system, banking services, and exchange system were entirely overhauled. Azerbaijan remained in the Russian ruble zone (a monetary system used by the former Soviet countries) until 1993. Leaving the zone

SOURCE: United Nations. *Human Development Report 2000; Trends in human development and per capita income.*

marked the beginning of effective economic policy making. The manat became the only legal currency after January 1994.

The first 2 years of stabilization included tight monetary and fiscal policies, overseen by the central bank, the Azerbaijan National Bank. The gradual **liberalization** of prices caused interest rates and the exchange rates to become more realistic and led to a more stable financial situation. In order to prevent the currency from over appreciation due to high oil-related capital inflows, the exchange rate was also managed by the state. Oil-related foreign capital inflows increased the amount of foreign currency in the Azerbaijani money markets. These inflows, and the sharp decrease in inflation, caused the appreciation of the manat over foreign currencies. Therefore, to control the **balance of payments** and make the country's export-driven sectors more competitive, the government chose to depreciate the national currency by launching a managed float policy.

With the drop in oil prices during 1998 and 1999 and the tight monetary policies of the previous decade, the annual average inflation rate slowed to -8.5 percent in 1999, compared to 1,664 percent in 1994. Since then, basic foods such as bread, vegetables, meat, and dairy products have become more accessible to Azerbaijanis. There are no stock exchanging facilities in Azerbaijan.

POVERTY AND WEALTH

The level of poverty in Azerbaijan was officially estimated to be 34 percent of the population in 1989. However, with **subsidies** for employment, food, housing, and social services, poverty rarely meant severe deprivation. After independence, on the other hand, poverty increased dramatically. Average food prices multiplied as much as 28,750 times from 1988 to 1998. According to the Azerbaijan Survey of Living Conditions that was conducted in 1995, over 61 percent of the population was poor. Poverty was substantially higher among internally displaced people (due to Armenian occupation in the Nagorno-Karabakh region).

The gap between the rich and the poor widened after independence, especially when the oil-related sector began surging while the other industries (manufacturing, mining) deteriorated. The country consists of an upper class (2–4 percent) living in extraordinary luxury, while the majority of the population (80–85 percent) suffers from very low wages and poor living conditions.

Although poverty is high, human development indicators such as school enrollment, literacy levels, and infant mortality rates are positive. However, public spending on education declined by three-quarters from 1992 to 1996. The health system also suffers from mismanagement, deteriorating quality, excess capacities, and access problems. In 1998, the number of hospital beds was 9.6 per 1000 people. Bribes from patients were

a major form of financing adequate health care. During the 1990s, public health spending decreased. In 1999, the government's health spending was only about 20 percent of its 1990 level.

WORKING CONDITIONS

High incomes are mostly seen in the oil-related sectors and especially in foreign companies. The legal workweek is 40 hours. In order to ensure that citizens enjoy healthy and safe working conditions, a Labor Protection Law was passed in Azerbaijan on 19 September 1992. According to the law, labor protection is defined as a system of socioeconomic, organizational, technical, sanitary, and hygienic measures and means designed to ensure the safety, health, and working capacity of persons engaged in work activities. However, these regulations are not strictly applied.

Azerbaijan is a participant of the International Labor Organization. A minimum wage, which is about US$3 per month, exists. This wage is not sufficient to provide a decent standard of living for a worker and family. The recommended monthly wage level to meet basic subsistence needs was estimated to be US$50 per person as of 1999. Since practically all persons who work earn more than the minimum wage, enforcing its low level is not a major issue in labor or political debate. According to the European Commission, the average monthly wage rate was about US$44 in September 2000.

The largest labor organization is the Azerbaijan Confederation of Trade Unions (or the Azerbaijan Labor Federation), which depends on government support. Its main functions are to promote employment, develop the labor market, support social insurance, ensure employee health and safety, enforce the legal regulation of labor relations, and provide social partnership. The constitution provides the right to strike. Unions are free to form federations and to affiliate with international bodies; but none have done so.

COUNTRY HISTORY AND ECONOMIC DEVELOPMENT

1918. The first Republic of Azerbaijan is established.

1919. The Soviet Union conquers Azerbaijan, absorbing it back into the country.

1989. Azerbaijan calls for withdrawal from the Soviet Union. The conflict in Nagorno-Karabakh begins.

1990. Soviet military intervenes. Moscow appoints Ayaz Muttalibov as the leader of Azerbaijan.

1991. Azerbaijan declares independence in October.

1992. The war with Armenia dominates Azerbaijani politics.

1992. Abulfaz Elchibey wins the presidential election in June.

1993. Heydar Aliyev is elected president in October, with 98.9 percent of the votes.

1994. A ceasefire is signed with Armenia.

1995. A new constitution is adopted by referendum.

1998. Aliyev wins reelection as president.

2000. Aliyev's party wins parliamentary elections in November.

FUTURE TRENDS

Azerbaijan still has to go through a severe democratization process (including proper representation of the people, free elections, and the improvement of human rights), as observed in the parliamentary elections in November 2000, which proved to be a failure in the election mechanism.

Economically, Azerbaijan is improving, with some reservations in the non-oil sectors, which have deteriorated sharply due to the focus on oil. There has been a significant fall in the agricultural, mining (excluding oil), and manufacturing sectors' production levels, decreasing the export levels at the same time. Between 1994 and 1998, agricultural exports decreased by 43 percent, metals by 87.3 percent, chemicals and petrochemicals by 50.4 percent, and machinery and equipment by 62.6 percent.

Energy remains the keystone of Azerbaijan's economic future. In the oil sector, pipeline projects and the gains from production are estimated to reach substantial levels in 2010–2015, giving Azerbaijan political and economic leverage in the region. The production of oil and the supplementary sectors in the oil industry are of importance. In addition, recent discoveries of gas deposits will help supply both Azerbaijan's energy needs and provide exports to Turkey and Eastern Europe. Privatization is another important task. Renovation of the infrastructure, including roads, railways, communications, power generation and distribution, will gain importance as trade relations improve.

The resolution of the Armenian conflict over Nagorno-Karabakh will also affect economic and social conditions in the region and will help improve the international relations of Azerbaijan.

DEPENDENCIES

Azerbaijan has no territories or colonies.

BAHRAIN

State of Bahrain
Dawlat al-Bahrayn

CAPITAL: Manama (Al-Manamah).

MONETARY UNIT: Bahrain dinar (BD). One dinar equals 1000 fils. There are coins of 5, 10, 25, 50, and 100 fils. There are notes of 500 fils, and 1, 5, 10, and 20 dinars.

CHIEF EXPORTS: Petroleum and petroleum products (61 percent), aluminum (7 percent).

CHIEF IMPORTS: Non-oil imports (59 percent, including machinery and transport equipment, manufactured goods, chemicals, food, and live animals), crude oil (41 percent).

GROSS DOMESTIC PRODUCT: US$10.1 billion (purchasing power parity, 2000 est.).

BALANCE OF TRADE: **Exports:** US$5.8 billion (f.o.b., 2000). **Imports:** US$4.2 billion (f.o.b., 2000).

COUNTRY OVERVIEW

LOCATION AND SIZE. Bahrain is the smallest country and the only island-state in the Persian Gulf and the wider Middle East. It covers an area of 620 square kilometers (385 square miles), about 3.5 times the size of Washington, D.C. Bahrain consists of 33 islands, of which only 3 are inhabited. The capital, Manama, is on the main island of Bahrain, which contains most of the population and is linked to Saudi Arabia by a causeway. A southern portion of the main island is a restricted zone where the U.S. Middle East Operations Force is based.

POPULATION. With an estimated 645,361 inhabitants in 2001, Bahrain has the smallest population of all Gulf States, but its annual population growth of 3 percent (1990–98) was among the highest in the world, with an equally high fertility rate (3.2 percent). According to UN figures, it is estimated that the population will double by 2017. Approximately one-third of the population is under 14 years of age. Bahrain's population is highly urbanized: 91.06 percent of Bahrainis lived in cities in 1998.

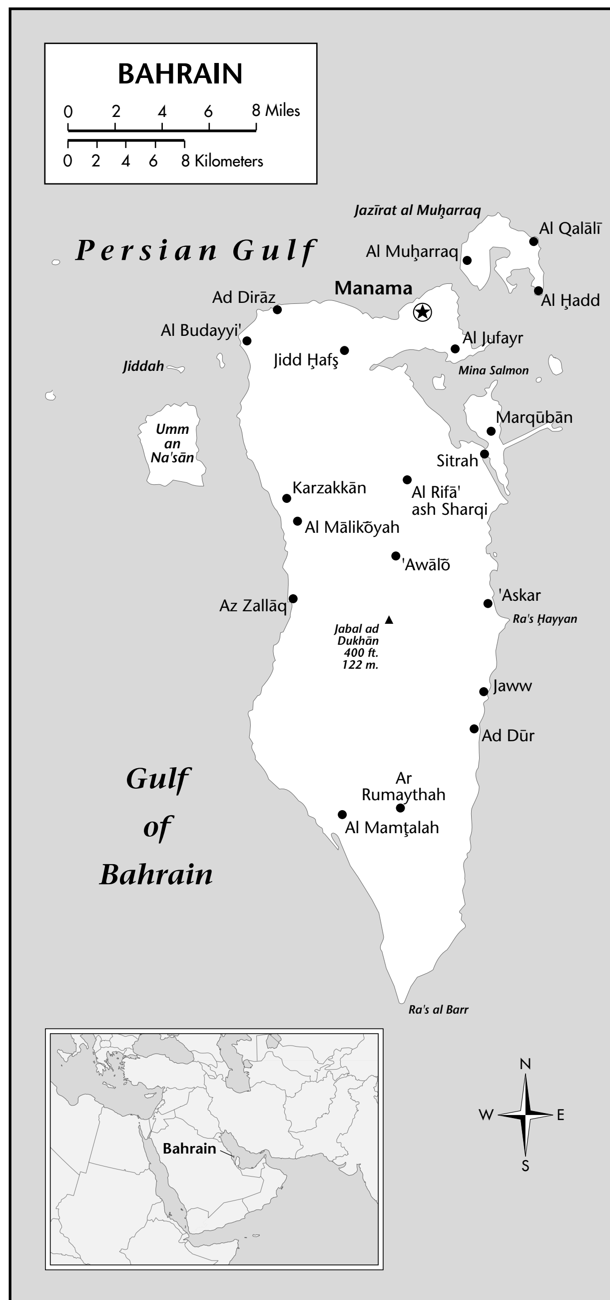
As much as one-third of the people are non-nationals, mainly foreign workers from Asia (19 percent) or other Arab countries (10 percent). Some 8 percent of the population is of Iranian descent, and the majority of the people (85 percent) are Muslims, 75 percent of whom are members of the Shi'a branch of Islam and 25 percent of the Sunni branch. Half of the Shi'a population is under 15 years old. The remaining 15 percent of the population is made up of Christian, Jewish, Hindu, and Parsee minorities.

OVERVIEW OF ECONOMY

Bahrain was the first country on the Arabian side of the Persian Gulf to discover oil in 1932. Oil wealth dramatically improved education and health care, but the country's oil reserves are relatively limited in comparison to most of its neighbors. Bahrain has therefore developed a more diversified economy than most of the Gulf States.

During the 1960s and 1970s, Bahrain emerged as the principal financial and communications center of the Gulf region. Oil and gas, however, still play a dominant role in the country's economy, providing about half of the government's income and accounting for two-thirds of exports. An undersea pipeline pumps oil from Saudi Arabia to Bahrain's large refinery, Sitrah. An estimated 70 percent of Bahrain's oil revenues come from the sale of products refined from crude oil extracted from an oilfield that is shared with Saudi Arabia, but from which Bahrain takes all the income. In effect, therefore, Saudi Arabia supplies Bahrain with financial aid. In addition, it enjoys grants from Abu Dhabi and Kuwait, which contribute considerably to the government budget. Most of the budget (60 percent) is used to pay salaries to Bahrainis and foreigners working in the **public sector**.

Until very recently, wholly or partially government-owned enterprises dominated much of the Bahraini



economy, but there has been an increase in **private sector** activity in recent years. This situation stems from the general decline in oil prices during the 1980s, which resulted in decreasing revenues. This financial downturn made an increase in free enterprise and foreign investment necessary in order to maintain the country's high standard of living and to guarantee its economic welfare. Bahrain became a member of the World Trade Organization (WTO) in 1992 and has since overhauled many laws and regulations. Nevertheless, the government has been slow to implement required measures. For example, it has only partially **privatized** 14 government-owned companies, and only one of these is an important industrial enterprise.

POLITICS, GOVERNMENT, AND TAXATION

Bahrain is characterized by autocratic tribal rule, with authority invested in a single family. The al-Khalifa family, minority Sunni Muslims in a majority Shi'a country, hold 11 of the 20 cabinet posts, while the rest are controlled by the prime minister, Sheikh Khalifa, who is the uncle of the ruler, Sheikh Hamad Bin Isa al-Khalifa. The present emir (prince) succeeded to the throne in March 1999, on the death of his father, and depends to a large degree on his much more experienced uncle, the prime minister, for the running of everyday government affairs. While Sheikh Hamad himself, and his son, Crown Prince Sheikh Salman bin Hamad, are in favor of implementing cautious political reforms, the prime minister is seen as the vanguard of the old order.

In 1899, the al-Khalifa family became the first of the ruling families in the Gulf to sign a so-called "exclusive agreement" by which local rulers granted control of foreign affairs to Britain in exchange for military protection. On August 14, 1971, during the reign of Sheikh Isa bin Salman, which lasted from 1961 until his death in 1999, Bahrain became independent, and a constitution was issued in May 1973. The elected National Assembly convened in December 1973 but was dissolved only 20 months later when the emir decided that radical assembly members were making it impossible for the executive to function properly. For 20 years, the country functioned without a representative body.

Since 1993, there has been a Consultative Shura Council, which is wholly appointive and does not possess any legislative power. There are no political parties and no elections for government positions. In many ways, Bahrain is a typical rentier state, i.e., a state whose political system benefits from large revenues from the sale of natural resources, in this case oil. The government distributes the state income to its citizens by providing them with jobs and a generous welfare system; in addition, the level of taxation is very low. In return, these citizens are tied to the state and remain loyal to undemocratic regimes. Such a relationship is often encapsulated in the phrase, "no taxation, no representation."

During the mid-1990s, the country experienced civil unrest directed against the regime, during which several people were killed. Protests, mainly orchestrated by the underprivileged Shi'a majority, have since continued, although on a lesser scale. The new emir, Sheikh Hamad, has promised municipal elections in the near future and has made new appointments to the Shura Council, including a woman and a Jewish representative. In addition,

a Supreme Council for Economic Development, chaired by the prime minister, was created in 2000 with the aim of identifying, developing, and promoting foreign investment opportunities. In February 2001 Bahrainis voted to approve a new constitution that would institute a partially elected parliament and grant political rights to women.

INFRASTRUCTURE, POWER, AND COMMUNICATIONS

Bahrain's **infrastructure** is modern, and the government is currently forging ahead with several major projects. These include constructing a new water distribution network, upgrading the Sitrah power and water station, and expanding other water, power, and waste-treatment facilities. Bahrain invested heavily in its infrastructure during the years of the oil boom, but the demand for water and electricity already taxes available capacity, and the expansion of the present facilities is a major priority.

The country's road network, with 2,433 kilometers (1,511 miles) of paved roads, is excellent. The low fees of Bahrain International Airport, located on Al-Muharraq Island, have turned it into a regional hub. The principal port, Mina' Salman, handles most of the country's general cargo, and petroleum products are loaded at the Sitrah jetty. A national bus company provides public transport throughout the populated areas of the country. There are no railways in Bahrain.

POWER. There are 3 main power stations. Rifaa, with a capacity of 700 Megawatts (mw), is the largest. Domestic demand for electricity was estimated to have reached 5.752 billion kilowatt-hours (kWh) in 1999, and this demand is more than exceeded by production of 6.185 billion kWh in 1999.

TELECOMMUNICATIONS. Bahrain is the communications center of the Gulf and has invested heavily in the sector since the late 1960s. There are excellent cable and satellite services using the latest digital exchange technology. The Bahrain Telecommunications Company (BATELCO) owns a 60 percent stake in the telecommunications network, which is operated by the United Kingdom's Cable & Wireless company. BATELCO is also the country's **monopoly** Internet service provider (ISP) and has recently begun to cut its relatively high access rates in an effort to boost subscriptions. Bahrain's cellular phone network has about 170,000 subscribers, according to the U.S. Department of State's *Country Commercial Guide* for 2001.

ECONOMIC SECTORS

Due to its small size and shortage of natural resources other than oil, Bahrain has developed a relatively diversified economy in comparison with the other Gulf states, which are almost exclusively dependent on oil. Oil, gas, and related products still dominate the economy, but finance, banking, industrial production (mainly in aluminum), and tourism are also important sectors in the country's economy and are becoming increasingly significant.

AGRICULTURE

The agricultural sector accounted for only 1 percent of **gross domestic product** (GDP) in 1998 and employed 2 percent of the workforce. The development of agriculture is limited by lack of water and the strong salinity (saltiness) of the soil. Over a period of 30 years since 1971, Bahrain's cultivated area has been reduced from around 6,000 hectares to less than 1,500 hectares. The major crop is alfalfa for animal fodder, although farmers also grow dates, figs, mangos, pomegranates, melons, papayas, water turnips, potatoes, and tomatoes, and produce poultry and dairy products for the local market.

Bahrain's fishing industry is small and only serves the domestic market. In the 1970s, the fishing industry declined, largely as a result of pollution and over-fishing in the Gulf. Since 1993, the government has been releasing young fish into local waters in order to boost stocks. Since 1997, trawlers have been banned from operating during the breeding season.

INDUSTRY

The industrial sector contributed 19 percent to GDP in 1996 and employed 34 percent of the **labor force**. Bahrain's aluminum industry was launched some 30 years ago as a measure to diversify the economy and take advantage of the country's low energy costs. The government-owned Aluminum Bahrain (ALBA) is one of the largest single-site aluminum smelters in the world and the biggest aluminum producer in the Middle East. Aluminum exports are one of Bahrain's biggest earners, particularly in light of increasing world prices. ALBA dominates the manufacturing sector with a production capacity of 500,000 metric tons per year.

Iron and steel production is increasing, and various free industrial zones have attracted export-oriented light and medium industries. These include plastics, paper, steel wool and wire-mesh producers; marine service industries; aluminum extrusion, assembly, and asphalt plants; cable manufacturing; prefabricated building; and furniture. In 1997, it was announced that the government was investing US$2.8 billion in the construction of a new seaport and a new industrial area in the eastern part of the country, and work was underway by 2000.

MINING/HYDROCARBONS. The mining and hydrocarbons (oil and related products) sector contributed 20.8 percent to GDP in 1998 but employed only 1 percent of the workforce. Bahrain is not a member of Organization of Petroleum-Exporting Countries (OPEC) and is thus not faced with production quotas but is a member of the Organization of Arab Petroleum Exporting Countries (OAPEC). Total oil reserves are estimated at between 150–200 million barrels, a minimal quantity in comparison with neighboring Arab monarchies.

SERVICES

Services contributed 53 percent of GDP in 1996. Tourism is Bahrain's fastest-growing industry and a heavily-promoted sector. It already accounts for over 10 percent of GDP and employs 16.7 percent of the workforce. Most visitors (3.3 million in 1999) come from the states of the Gulf Cooperation Council (GCC), especially Saudi Arabia, to enjoy the beaches and the comparatively liberal atmosphere in Bahrain, where alcohol is served and Muslim women are not forced to cover their heads. As of July 2000, the government has allowed citizens from member states of the GCC to visit the country using their local identity cards, and the number of tourists is expected to increase substantially over the next few years.

FINANCIAL SERVICES. Bahrain's banking sector has shown consistent growth, particularly since the outbreak of the Lebanese civil war in 1975, when many foreign banks began searching for an alternative regional base. There are now more than 200 financial institutions present in Bahrain. Assets of the country's **offshore banking** units have risen by more than 50 percent in the past decade. Bahrain also has the largest concentration of Islamic bank-

ing operations in the Middle East. Islam prohibits interest rates, and Islamic banking thus employs other methods of creating financial gains from investments.

INTERNATIONAL TRADE

Over the course of the last 30 years, Bahrain has maintained a relatively even **balance of trade**, with imports usually slightly exceeding exports. In 2000, however, the situation was reversed, with imports of US$4.2 billion trailing exports of US$5.8 billion. Bahrain's main export destinations are India (14 percent), Saudi Arabia (5 percent), the United States (5 percent), the United Arab Emirates (5 percent), Japan (4 percent), and South Korea (4 percent). All these countries import mainly processed and refined oil and oil-related products, which have the largest share in Bahrain's exports. Another important export for Bahrain is aluminum, accounting for about 7 percent. Bahrain's total exports rose by nearly 63 percent from 1998 to 2000, while oil-related exports increased from 52 percent of total exports in 1998, to 66 percent in 1999, and back down to 61 percent in 2000.

Bahrain's imports come from a similarly large range of countries. France supplies the majority of imports, with 20 percent, followed by the United States (14 percent), the United Kingdom (8 percent), Saudi Arabia (7 percent), and Japan (5 percent). The heavy trade volume between Bahrain and Saudi Arabia stems from the undersea pipeline between the 2 countries and the shared oilfield located in Saudi Arabia. Bahrain's imports, mainly machinery, manufactured goods, chemicals and food, come from developed industrial states.

MONEY

The **exchange rate** of the Bahraini dinar is fixed to the U.S. dollar, which means that developments in the American economy have repercussions for Bahrain. Bahrain's central bank is the Bahrain Monetary Agency (BMA), an independent organization praised for its adherence to international standards.

Trade (expressed in billions of US$): Bahrain

	Exports	Imports
1975	1.107	1.189
1980	3.606	3.483
1985	2.897	3.107

The Bahrain Stock Exchange (BSE) opened in 1989, and in 1995 Bahrain and Oman signed an agreement linking their stock exchanges. The link-up allows cross-listing of companies on both exchanges, which between them have 110 listed companies with a total **market capitalization** of US$8.1 billion. In 1996, the Bahraini and Jordanian stock exchanges linked up, and the BSE also has links with the Sri Lankan and Bangladeshi exchanges and plans to link up with the Bombay Stock Exchange.

POVERTY AND WEALTH

Although Bahrain is generally a wealthy country, there is a considerable gap between the rich and the poor. Wealthy families shop for the latest fashions in spacious new malls, young Saudi Arabians cruise the broad highways and enjoy the relaxed atmosphere of the island state, and foreign employees of the national oil company take advantage of huge leisure centers built for their exclusive use. The poor live only a short drive away from the cities, in many villages all over the island. Shiites, who make up 75 percent of the Muslim population, are often excluded from government jobs and form the poorest segment of Bahraini society. The ruling al-Khalifa family is Sunni Muslim and has "imported" many Sunnis from other Arab countries, and it is they who form the backbone of the widely resented security forces.

Most members of the ruling political elite are Sunni Muslims, and Bahrain's wealth is heavily concentrated

GDP per Capita (US$)

among them, while there are only a few wealthy Shiites in the country. Many Shiites have charged that there has been a systematic process of discrimination against them. Their dissatisfaction with the political and economic situation came to the fore in demonstrations and protests that turned violent in 1994 and 1995, triggering the first change of cabinet for more than 20 years in 1995.

For decades, the country has seen an influx of foreign workers who can earn good salaries in the oil industry or as domestic servants and in other jobs locals do not want to do, further exacerbating the plight of the Shi'a community. **Immigration** to Bahrain began in the early years of the oil boom and resulted in the employment of foreigners rather than Bahraini Shiites, who are often less educated and treated with suspicion by the ruling Sunni minority.

WORKING CONDITIONS

Due to the sharp rise in the growth of the local population since the 1980s and the increasing levels of education, the government, as in many other states in the Gulf region, needs to provide young Bahrainis entering the job market with employment. It plans to gradually reduce dependence on foreign labor by training the local workforce and by insisting that expatriates coming to Bahrain to work must have better expertise and skills and be willing to train their local counterparts. After decades of importing foreign labor, foreigners comprised about 44 percent of the workforce of 295,000 in 1998.

Population growth has been proportionately higher among foreigners and Shiites than among Sunni Muslims, who have enjoyed relative job security in government positions. Foreign workers and Shiites have increasingly had to compete for both skilled and unskilled jobs. Since Bahraini Shiites are not allowed to join the armed forces and are discriminated against for senior positions in the civil service, an increasing number of young Shiites try to enter the job market with few qualifications and few opportunities for work.

Officially, unemployment stands at only 2.4 percent, but the United States embassy in Bahrain estimates that the actual rate is closer to 18 percent. Among the Shi'a community in Bahrain, especially those under the age of 30, unemployment may be as high as about 30 percent. In rural areas, agricultural laborers represent about 25 percent of the population. Women are traditionally confined to the household and cannot participate freely in the labor market. Thus, only about 19 percent of the labor force is female, equaling figures in other Middle Eastern countries.

COUNTRY HISTORY AND ECONOMIC DEVELOPMENT

1820. Bahrain becomes a British protectorate with the signing of the General Treaty of Peace but is ruled by the al-Khalifa family. Treaties of protection with Britain are re-signed in 1861, 1892, and 1951.

1928. Iran claims ownership of Bahrain. The dispute is not resolved until 1970 when Iran accepts a United Nations report stating that the vast majority of Bahrainis want to retain complete independence.

1932. Oil is first discovered in Bahrain, to be followed shortly thereafter by discoveries in Saudi Arabia and Kuwait.

1968. Bahrain joins Qatar and the Trucial States (now the United Arab Emirates) in the Federation of Arab Emirates. These countries had all enjoyed the protection of Great Britain up until this point.

1971. Bahrain gains complete independence on August 15, leaving the Federation of Arab Emirates.

1973. A constitution is adopted and elections held for the National Assembly. The Assembly is disbanded in 1975 and indefinitely suspended in 1976.

1981. Bahrain is one of the six founding members of the Gulf Cooperation Council (GCC).

1990. Bahrain actively supports the allied forces against Iraq in the Gulf military conflict, and is the target of an Iraqi missile attack.

1994–97. Civil unrest breaks out following the decline of the economy and expectations of more political rights for the mainly Shiite population after the Gulf war.

1999. Sheikh Isa Bin-Sulman al-Khalifa dies and is succeeded by his son Sheikh Hamad Bin Isa al-Khalifa in March.

2001. In February Bahrainis vote to approve a new constitution that would institute a partially elected parliament and grant political rights to women.

FUTURE TRENDS

With high oil prices in 2000 and 2001, the pressure on the Bahraini government to reform the economy has recently eased a little. But given that the country cannot sustain its dependence on oil for much longer, economic reform remains necessary. The government is expected to push for limited privatization, starting with public transport, although the major state revenue-generating organizations such as the Bahraini Petroleum Company (BAPCO) and Aluminum Bahrain (ALBA) will remain off limits.

At the end of 2000, a new corporate law was introduced, aimed at streamlining regulations and enticing foreign investment. In addition, the establishment of a new international Islamic banking system in Bahrain in October 2001 suggests that there will be further progress in developing the offshore financial services sector. Unemployment among locals remains the government's main economic and social problem. The government will continue to emphasize training to enhance the skills of existing workers and the 6,500 new entrants into the job market each year. But where government policy clashes with the interests of foreign firms—for example, over efforts to encourage companies to replace foreign workers with locals (the so-called "Bahrainization" of the workforce)—the development of a welcoming business environment will take precedence.

Politically, there are several challenges ahead. The emir has signaled his will to broaden political participation but is still struggling with the prime minister over the pace of reform. In the long run, however, both political and economic **liberalization** will prove unavoidable, with one reinforcing the other to the benefit of the country.

DEPENDENCIES

Bahrain has no territories or colonies.

COUNTRY OVERVIEW

LOCATION AND SIZE. Bangladesh is situated in southern Asia, on the delta of the 2 largest rivers on the Indian subcontinent—the Ganges and Jamuna (Brahmaputra). It borders with India in the west, north, and east, with Burma (also known as Myanmar) in the southeast, and with the Bay of Bengal in the south. The country's area is 144,000 square kilometers (55,598 square miles), and it is divided into 6 administrative divisions (Dhaka, Chittagong, Khulna, Barisal, Rajshai and Sylhet) and 4 major municipal corporations (Dhaka, Chittagong, Khulna and Rajshahi). Comparatively, the territory of Bangladesh is slightly greater than the state of New York. Bangladesh's capital city, Dhaka, is located in the central part of the country. Bangladesh occupies the eastern part of the Bengal region (the western part of the region is occupied by the Indian state of West Bengal), which historically was part of the great civilizations in the northeast of the Indian subcontinent.

POPULATION. The population of Bangladesh was estimated at 129,194,224 in July of 2000, making Bangladesh the tenth-most populous state in the world. Having a total area the size of New York state, the country has a population equal to half that of the United States or 8 times the population of New York State. It has almost doubled since the 1960s, due to improved health, medical facilities, and longer life expectancy. In 2000 the birth rate stood at 25.44 per 1,000 (slightly higher than the world average), adding around 190,000 people every month. Meanwhile the death rate stood at 8.73 per 1,000. The estimated population growth rate is 1.59 percent, and if the current trend remains unchanged, the population could double within the next 45 years.

The Bangladesh population is relatively homogeneous, with Bengalis making up 98 percent of the population and other ethnic groups, including various tribal groups, making up the remaining 2 percent. Religion plays a very important role in this country, and the main division is between Islam and Hinduism. Almost 88.3 percent of the population are Muslims, 10.5 percent are Hindus, and 1.2 percent are Buddhists, Christians, or animists. The Bangladesh population is very young, with 36 percent below age 14 and just 4 percent of the population older than 65. In 1998 over 80 percent of Bangladeshis were living in rural areas, although during the last decade the growth of the population in the urban areas was twice as fast as in rural areas (due to both the migration of the rural population and the high birth rate). The rapid growth of the urban population is especially noticeable in the urban centers of Dhaka, Chittagong, Khulna, and Rajshahi.

In 1970, the population of Bangladesh was about 66 million, and the country at one time had one of the highest birth rates in Asia. The country's population doubled between 1950 and 1977 and almost doubled again between 1977 and 2001, putting severe pressure on the natural resources and leading to land shortages. In the 1970s the government introduced population control and family

planning initiatives, aided by various international organizations, including United Nations Children's Fund (UNICEF), United Nations Population Fund (UNFPA), and the World Bank. The fertility rate (the average number of children born to a woman) in Bangladesh declined from 6.8 babies per woman in 1965 to around 3 per woman in 1999. However, these population control initiatives were undermined by the fact that two-thirds of the population still lives in rural areas, where historically population growth was very high, and by the fact that almost two-thirds of the people in the country are illiterate. A number of issues still need to be addressed, including the supply of safe drinking water, malnutrition among children (which remains the highest in the world), early and forced marriages, and illiteracy among the population in general and women in particular.

The population growth in the country was offset by rapidly rising **emigration** of people, both permanent and temporary, in the 1980s and 1990s. The major destinations for Bangladeshi workers seeking temporary jobs are Kuwait, Malaysia, Qatar, Saudi Arabia, Oman, and the United Arab Emirates, where they are employed mainly in the low-skill and low-wage construction and service sectors and in agricultural plantations. Other popular destinations for emigration are Western Europe, the Americas and Australia, where large Bangladeshi communities formed during the last 3 decades. According to the *CIA World Factbook,* the emigration rate stood at the 0.77 migrant(s) per 1,000 population in 2000, or around 1 million a year.

OVERVIEW OF ECONOMY

Agriculture and labor-intensive manufacturing remain the 2 major pillars of the Bangladeshi national economy. Historically, a tropical climate and warm temperatures throughout the year made it possible to grow 2 or 3 crops of rice each year, although floods and cyclones regularly damaged crop yield. Flourishing trade, manufacturing—traditionally in light manufacturing and agricultural processing—along with the wealth of the region's nobility, attracted English, French, and Dutch traders. The British East India Company had slowly but steadily advanced into the region in the 17th and 18th centuries, acquiring trade privileges from the Mogul emperors and exploiting rivalries between local rulers, and gradually established control over the trade between India and Europe. The company and its often corrupt administration had greatly benefited from the trade between India and Europe. The British East India Company established control over administration of the Bengal province in 1765. However, in 1858 the company was abolished, and the British crown assumed direct control over British India, in response to the local uprising of 1857 to 1858 and to growing evidence of the company's inefficiency. Throughout the colonial era, East Bengal (the territory of modern Bangladesh) received very limited investments in its industrial sector or toward development of its transportation system, and largely relied on the production and export of its agricultural goods, including jute, rice, and tea. The British colonial rule in India was accompanied by uprisings, greater polarization of society, and a decline in the traditional values and institutions of the society; nevertheless, it included India in the global trade of the early capitalist era and introduced the British legal and political systems and the technological innovations of that era.

In August 1947, India was granted independence within the British Commonwealth and was divided into the dominions of India and Pakistan. Pakistan, which included the areas populated predominantly by the Mus-

lims, was itself divided with the West Pakistan comprising the area now known as Pakistan, and East Pakistan, occupying what had been Eastern Bengal. Powerful West Pakistan was politically and economically dominant over East Pakistan, giving rise to a secessionist movement in the eastern province. Despite attempts to ease the tensions, these factions gradually grew into open hostility and in 1971 a brief but bloody civil war flared up that lasted for 2 weeks and ended with the intervention of Indian troops. On 17 December 1971 a new government in Dhaka declared the independence of the new state, Bangladesh.

After achieving independence in 1971, Bangladesh confronted the challenging task of developing and diversifying its economy, as the country had very limited natural resources and arable land with which to support its rapidly growing population. The task was complicated by years of political turbulence and military coups (in 1975, 1981, and 1982) that did little to attract international investors and by devastating natural disasters that regularly visited Bangladesh in the 1970s and 1980s. By the beginning of the 21st century, according to the World Bank, Bangladesh had become one of the poorest and least-developed economies in Asia.

During the 1970s and 1980s the government of Bangladesh promoted economic development based on heavy state involvement both in economic management and economic planning. In fact, after achieving independence, the government led by the Awami League, **nationalized** large and medium-sized enterprises in jute, cotton textile, sugar processing, banking and insurances. Its economic policies were centered on 5-year plans (the first 5-year plan was launched in 1973), which aimed at development and public resource allocation modeled on the Soviet 5-year experience. However, the Bangladeshi experiment with **socialism** did not last long, and the government eschewed radical changes. The country's average **gross domestic product** (GDP) growth of around 3.3 percent in the 1970s and 4.4 percent in the 1980s (World Bank calculation) were very impressive, but this growth was offset by even more rapid growth of the population.

In 1991 the first free and fair election was held in Bangladesh and the Bangladesh National Party (BNP) won the election. The new civilian government considerably revised the economic policies of the previous government, introducing elements of free market economy, limiting state intervention, downsizing the government, launching **privatization** and attempting to attract **foreign direct investments** (FDIs) and technologies. The political stability of the 1990s and the new economic policies attracted international investors and greatly contributed to the economic growth of around 5 percent throughout the 1990s. However, Bangladesh still depends heavily on international assistance and loans, as well as **remittances** from Bangladeshis working abroad. According to the International Monetary Fund's (IMF) *Country Report,* in 1999 the country's **external debt** stood at US$15.145 billion, or 35 percent of GDP. This amount is relatively small according to international standards and mainly due to past capital account restrictions. According to the IMF, one of the peculiarities of the Bangladeshi **foreign debt** that makes it different from that of Indonesia or Malaysia is that it is almost entirely public, with private debt accounting for a low 5 percent of the total country's debt. Bangladeshi official reserves stood at a level of US$1.522 billion in 1999.

The structure of the Bangladeshi economy changed gradually over the last 3 decades. According to the World Bank, the contribution of agriculture to the country's GDP has been steadily declining from 55 percent in 1970 to 31.6 in 1999, although it still provides employment to large numbers of people. Bangladesh remains one of the world's leading producers of jute and rice, although most of the rice is for domestic consumption rather than export. The proportion of manufactured production grew from 9 percent of GDP in 1970 to 19.3 percent of GDP in 1999. Manufactured products accounted for around 60 percent of gross export earnings in 1999, with clothing goods becoming the single most important product. Tourism is a very small but rapidly growing sector of the economy that increased by around 42 percent between 1993 and 1998. Approximately 171,000 tourists visited the country in 1999, contributing Tk2.4 billion to the national economy. By comparison, tiny Singapore attracts a similar number of tourists every week.

For a long time Bangladesh struggled to diversify its economy. Large and medium state-owned enterprises dominate the manufacturing sector, although a number of private enterprises were established during the 1990s. Medium and small farms dominate the agricultural sector, and many farmers are still engaged in subsistence agriculture. Meanwhile, a number of medium and small, usually family-owned, enterprises dominate the service sector, especially **retail**. Bangladesh tried to catch up with the information technologies boom in the 1990s, but unlike neighboring India, it failed to promote this sector of its economy on a similar scale.

Economic growth and stability failed to bring economic prosperity to a large proportion of the population, especially in rural areas. Since the 1970s there has been an outflow of large numbers of the young and the most talented people from the country through various legal and illegal channels. Allegedly, organized criminal groups connected to drug trafficking control this outflow. Drugs are another important issue, as Bangladesh shares a border with Burma (Myanmar), which is a part of the world's largest opium producing region called the "Golden Triangle" (an area between Burma, Laos, and

Thailand). The **shadow economy** is believed to be very large due to incomplete economic activities data collection, tax evasion, and a strong tradition of cash economy, although this shadow economy is not necessarily related to organized criminal activities. In 1996 a national account task force was formed to upgrade the outdated and inefficient system of national accounting, having among other goals to deal with the problem of calculating and capturing shadow economy activities.

POLITICS, GOVERNMENT, AND TAXATION

Bangladesh is a parliamentary democracy largely influenced by the British parliamentary system. Executive power is in the hands of the prime minister, who is the head of the cabinet, and who must be a member of the 300-seat Jatiya Sangsad (**unicameral** parliament). She/he recommends the council of ministers to the president. The president is the constitutional head of state and is elected for a 5-year term by the parliament, but plays a largely ceremonial role. The president can act only on the advice of the prime minister, as the presidential power was significantly reduced in accordance with constitutional changes in 1991.

All adult citizens (18 years old and over) are eligible to vote, including women and ethnic minorities. One of the unique features of the political system in Bangladesh is that 30 seats (10 percent) in the parliament are reserved for female members, and they are elected by the members of the parliament.

Bangladesh experienced a number of military coups after achieving independence in 1971, and several military governments tried to restrict activities of political parties. However, after the return to civil rule in 1990, all political parties may openly function in the country. There are a number of political organizations in Bangladesh. Most prominent of them are: the Awami League (a coalition of 8 parties); the Bangladesh Nationalist Party; the Jatiya Party; and the Jamaat-e-Islami Party. The Awami League (AL), which led the country to independence in 1971, generally supports more government interventionist policies and has a very cautious attitude towards **liberalization** or opening of the national economy to international competition; in fact, in the early 1970s the party had strong pro-socialist elements in its economic policy. The Bangladesh Nationalist Party (BNP), which was the ruling party from 1991 until its defeat in the parliamentary election of 1996, is more free-market oriented. The BNP introduced the policy of economic liberalization and privatized some state-owned enterprises. It opened the national economy to international competition in an attempt to attract foreign investors.

Once Bangladesh had achieved independence, political stability, the creation of a viable national economy, and the elimination of poverty became the major political issues shaping political debate and conflict in the state. The political process in the country was complicated by the hostility and often violent confrontations between the 2 leading parties, AL and BNP. The Awami League won the first post-independence general elections while promulgating ideas of nationalism, socialism, democracy and secularism. In economic areas, this government took a strongly interventionist role in the development and industrialization of the national economy. The party, however, could not overcome the economic and political divisions within Bangladeshi society and lost its power in a military coup in August 1975. The coup pushed the country towards even greater political instability, which continued until 1990, when charismatic General Hossain Ershad was forced to resign. Military rule failed to bring stability to the country because it did not stop the rivalry between the 2 major parties, the AL and BNP. In fact, the army was drawn into the groups' political confrontations.

In 1991, the first free and fair election was held in Bangladesh. Begum Khaleda Zia (widow of General Ziaur Rahman, the president from 1978 until his assassination in 1981) and her party (BNP) won the election. The new government brought radical changes to the economic policy, promoting private entrepreneurship, especially among representatives of poor communities, and supporting small- and medium-size businesses and privatization. This program was successful, and Bangladesh experienced economic growth throughout the 1990s. According to the World Bank, between 1989 and 1999 the average annual GDP growth was around 4.8 percent, with industrial production growing at an annual average of 7.3 percent and exports of goods and services at an annual average of 14.2 percent, albeit from a very low base. For the first time in decades the Bangladeshi government had brought a sense of stability to the country.

The 1996 parliamentary election, however, was again accompanied by irregularities and almost pushed the country into chaos again. The BNP won the February 1996 parliamentary election, which was boycotted by the AL-led opposition. The confrontation escalated in violence, and the BNP handed power over to a caretaker government. After 2 decades in opposition, the Awami League won the June 1996 parliamentary election, with support from the Jatiya Party. This time the Awami Party significantly moderated its position, supporting a gradual liberalization of the national economy, encouraging private entrepreneurship, and advocating the secular state; it had largely abandoned socialist ideas. One of the most important achievements of the 1990s was the diminishing role of the army in the political life of the state, al-

though the army threatened to take matters into its own hands during the period of political conflict in 1996.

According to the IMF *Country Report,* the major source of government revenue comes from taxes, although the tax ratio of 7.6 percent of GDP remains one of the lowest in the world. Total government revenue was Tk210 billion in the 1997/1998 financial year. Tk51 billion came from **value-added tax** (VAT), Tk43.5 billion from customs **duties**, Tk20.0 billion from income and profit taxes, Tk21 billion from supplementary duties, and the rest from other sources. According to the U.S. Department of State, the maximum customs duty rate has been reduced from 350 percent in 1991 to around 37 percent in 2000.

INFRASTRUCTURE, POWER, AND COMMUNICATIONS

Bangladesh is a country of a thousand rivers, large and small, and most of its territory is regularly flooded during the monsoon season. This fact makes it extremely difficult and expensive to build modern transportation and communication networks. The river boats and ferries traditionally used for transportation are cheap, but slow and inefficient. The situation is further complicated by the fact that the Bangladeshi government has sharply limited resources not only for building new **infrastructure** but also for maintaining the existing one. From the colonial era Bangladesh inherited underdeveloped and unevenly distributed infrastructure and transportation networks. Poor and inefficient infrastructure undermined the economic development in the country, and only recently has the government been able to address the problem systematically and channel investments towards expanding its highways, railroads, seaports, and airports. More recently, with international assistance the government has also started to modernize its telecommunications infrastructure and introduce the Internet.

According to the *CIA World Factbook,* Bangladesh is served by a network of 201,182 kilometers (125,014 miles) of primary and secondary roads, but only around 10 percent of them, or 19,112 kilometers (11,876 miles) are paved. In June 1998 the huge US$1 billion Jamuna Multipurpose Bridge was completed, becoming the 12th-longest bridge in the world. The bridge connected for the first time the eastern and western parts of Bangladesh. The completion of this project made an important contribution to the development of the country's transportation network and significantly boosted the quality and speed of passenger and freight transportation. The number of privately-owned cars grew throughout the 1990s, albeit from a very low level (there were 40,000 private cars in 1994). Many cars are very old and in poor repair and produce high levels of pollution on the congested roads of the capital and other major cities. Despite all the problems with the roads and the often-outdated equipment, 66 percent of all freight and 73 percent of all passengers are carried by roads; however, animal-driven carts are still a part of the national landscape, as they provide the cheapest and most reliable transportation for people and goods in most of the country's rural areas.

Bangladesh has a railway system of about 2,745 kilometers (1,706 miles), of which only 923 kilometers (573.5 miles) is a broad gauge (1.676 meter gauge) and the remaining 1,822 kilometers (1,132 miles) is narrow gauge (1.000 meter gauge), according to CIA estimates for 1998. Major links run from the largest Bangladeshi port, Chittagong, to Dhaka and further to the north of the country; other links connect such centers as Khulna and Rajshahi. Historically, the railway was built by the British colonial administration in 1884, running between Calcutta (now India) and Khulna (now Bangladesh). Rail services were halted following the Indo-Pakistan war in 1965. In the 1970s cargo trains resumed their services between the 2 countries. According to a BBC report on 26 January 2001, the government of Bangladesh has expressed its interest in "seriously studying the potential of linking the national railways with the proposed Trans-Asian Railway Network." The Bangladeshi railway system remains a state-owned **monopoly** requiring large

subsidies, as it is notorious for its poor management and a long-established tradition of ticketless travel among the local population. In recent moves, the government began the privatization of some railway services, including ticket reservation and in-service catering. Despite all shortcomings, the railway remained an important mode of transportation, operating 3.7 billion passenger-kilometers and carrying 3.76 million metric tons of goods in the 1998–99 financial year.

The waterways are an important mode of transportation, especially to some remote areas of the country, as no other mode of transportation is available during monsoon season. Bangladesh has 3 major seaports, at Chittagong, Dhaka, and Mongla, and several smaller ports. The largest and most important port is Chittagong, situated around 200 kilometers (124 miles) southeast of Dhaka. According to the *EIU Country Report,* in 2000 the Chittagong seaport handled around 80 percent of country's imports and 75 percent of exports, or 14.6 million metric tons of cargo and 420,850 containers. There have been several plans backed by private investors to set up 2 modern container terminals (in Chittagong and in Dhaka), but these plans have met opposition from the labor unions. According to the U.S. Department of State, in 1998 the U.S.-based company Stevedoring Services of America (SSA) signed a US$440 million contract to develop a private container project, which includes the construction of 2 container terminals.

Currently, Bangladesh is putting considerable efforts into developing its aviation industry to serve growing tourism and business needs. According to the *CIA World Factbook,* the country has 16 airports with paved runways, including 2 international airports (Chittagong and Dhaka). The largest, Zia International Airport at Dhaka, is capable of handling 25 million passengers and 1.2 million tons of cargo annually. Bangladeshi Biman Airline, the national air carrier, operates a fleet of about 15 aircraft, including 3 Airbus 310–300s, flying to 25 international destinations and serving several domestic routes. In the 1998–99 financial year it carried 1.22 million passengers and 30,869 metric tons of cargo.

Bangladesh belongs to the group of countries with the lowest commercial energy consumption per head in the world. The CIA estimated that in 1999 the country produced 12.5 billion kWh, 85 percent of which was produced using gas, 7.0 percent was produced at hydroelectric power plants, and around 8 percent by using liquid fuel. According to the *EIU Country Profile,* 85 percent of households in Bangladesh have no electricity and in these places where it is delivered, 40 percent of the electricity generated is not paid for. The country experiences regular electricity blackouts and shortages, and its poor reliability is often cited among factors driving away foreign investors. The Bangladeshi government is willing to address the problem but in general has not had enough resources to build new electric power generating plants. In a recent trend, the Asian Bank of Development (ABD) approved a US$140 million loan to construct a 450-mw gas-fired power station near Dhaka, scheduled for completion in 2003.

Telecommunication services in Bangladesh are underdeveloped and provide one of the lowest rates of telephone ownership per 1,000 inhabitants in the world. The largest company is the Bangladesh Telegraph and Telephone Board (BTTB), which enjoyed a state monopoly until 1972, when private operators were allowed. As most of the telephone service uses outdated analogue technology, the quality of telecommunication services is often poor and in need of upgrades. In 2000 the country had a mere 490,000 telephone lines and 52,000 mobile phones serving 129 million people. The government is aiming to provide telephone coverage of remote towns and villages that until now have had no telephone connections. With international assistance and increasing private investments, Bangladesh is upgrading its telecommunication system, replacing analogue technology with digital, introducing the Internet and e-mail services, and expanding cellular mobile services.

ECONOMIC SECTORS

According to the *World Bank Development Indicators,* Bangladesh is the 50th-largest economy in the world, judged by its gross national income, although it is the 10th-largest state in the world if judged by its population. Although it has a good environment and climate for the production of various crops and huge potential for developing a tourist industry, the country suffers from

scarcity of natural resources, shortage of arable land, regular natural disasters (flooding and cyclones), and a lack of investment.

For decades after independence, political instability, low demand in the local market, and economic stagnation hindered the economic development of the country. Since establishing a civil government in 1991, Bangladesh has been struggling to diversify its economy, to reform its agricultural sector, and to expand its industrial sector, as it needs average annual economic growth of at least 7 percent in order to eliminate widespread poverty. In the 1990s while Bangladesh was unable to solve its economic difficulties and eliminate poverty, it achieved impressive growth in many areas, including manufacturing and agriculture. Recognizing the difficulties, the Bangladeshi government was willing to accept the IMF's recommendations and to conduct structural changes, which included relinquishing its socialist orientation and state control over the economy, decentralization of economic management, and privatization, although many of these changes were painful and implemented only slowly.

Agriculture is still the single most important sector of economy. Between 1989 and 1999, it experienced stagnation with an average annual growth of only 1.6 percent, which was not enough to support a rapidly growing population. Throughout the 1980s and 1990s, Bangladesh tried with some success to achieve politically and economically important self-sufficiency in food production, increasing productivity and diversifying the crop base. Nevertheless, the share of agriculture in the GDP declined from 55 percent in 1970 to 19.6 percent in 1999.

The role of the manufacturing sector is growing, but the growth is painfully slow due to a lack of foreign investment, small demand in the local market, and red tape and inefficiency in the local bureaucracy. According to the World Bank, the industrial sector in Bangladesh grew at an average annual rate of around 4.1 percent between 1979 and 1989 and around 7.3 percent between 1989 and 1999. Bangladesh has a relatively large reserve of gas, which has become increasingly important as a source of energy and has potential to become a source of export revenue.

Bangladesh tries to promote its service sector, especially tourism and the information technologies sector. However, in doing so it has to compete with neighboring India. Local trade, tourism, and other services currently make important contributions to the country's GDP, providing employment for 26 percent of the **labor force** in the country.

AGRICULTURE

Agriculture remains the most important sector of Bangladeshi economy, contributing 19.6 percent to the national GDP and providing employment for 63 percent of the population. Agriculture in Bangladesh is heavily dependent on the weather, and the entire harvest can be wiped out in a matter of hours when cyclones hit the country. According to the World Bank, the total arable land in Bangladesh is 61.2 percent of the total land area (down from 68.3 percent in 1980). Farms are usually very small due to heavily increasing population, unwieldy land ownership, and inheritance regulations. The 3 main crops—rice, jute, and tea—have dominated agricultural exports for decades, although the rice is grown almost entirely for domestic consumption, while jute and tea are the main export earners. In addition to these products, Bangladeshi farmers produce sugarcane, tobacco, cotton, and various fruits and vegetables (sweet potatoes, bananas, pineapples, etc.) for the domestic market.

Rice is the staple food in the everyday diet of Bangladeshis. The production of rice, which can be harvested 2 or even 3 times a year, reached 19.9 million metric tons in 1998–99. The production of wheat reached about 2 million metric tons in 1998–99. Both crops play an important role in achieving self-sufficiency in food production. However, due to weather conditions the production of rice and wheat fluctuate greatly, forcing Bangladesh to import food from the international market or turn to international aid. Bangladesh imported 1.6 million tons of wheat (mainly from the United States) in 2000 in order to meet the demand in the local market.

Jute, often called the "golden fibre" of Bengal, is the main export-earner for Bangladeshi agriculture, as Bangladesh remains the world's second-largest producer

of jute (after India) and the world's largest exporter of fiber. Jute is traditionally used for the fiber of carpet backing, burlap bags, cheap paper, and various other purposes. Its importance for the Bangladeshi economy comes from the fact that almost 3 million farms are involved in jute production. In 1999 Bangladeshi export earnings from jute amounted to US$55 million, with the country producing 720,000 metric tons of jute, although this is about one-third of the jute production of the middle of the 1980s. The decline in jute production is attributed to declining world prices for this crop and to farmers switching to other crops.

Bangladesh also produces tea leaves, mainly for export, although the export of this product contributes only 1 percent of the country's **hard currency** earnings. In 1998–99 the country produced 56,000 metric tons of tea leaves, but it could produce twice that amount. The main obstacle to increasing production is in falling prices for tea in the international market and in management and regulation problems in the industry in the country.

Tropical rainforest is important for maintaining the ecological balance in Bangladesh, and forestry contributes 1.9 percent to the GDP (1999–2000). The forest covers around 17 percent of the country's territory, or 2.5 million hectares (6.18 million acres). The timber is used by the construction industry as a source of building materials, by the printing industry as a source of materials to produce paper, and in the agricultural sector as a source of firewood. Commercial logging is limited to around 6.1 million cubic feet, and the government plans to plant more trees within the next 15 years.

Fishing is another important activity in the country, contributing 4.9 percent to the GDP (1999–2000) and providing 6 percent of the total export income. The overall fish production was around 1.6 million metric tons (1999–2000). Bangladesh mainly exports its shrimp to the international market.

INDUSTRY

MINING. The main commercially viable natural resource in Bangladesh is gas, although there are reports of the existence of moderate-sized reserves of coal. Total gas reserves are estimated at 21,000 billion cubic feet. In 2000 Bangladesh utilized 370 billion cubic feet, mainly for domestic consumption. The major gas fields are situated in Greater Sylhet district, the Bay of Bengal, and Greater Chittagong district. Transnational corporations are keen to be involved in gas exploration in Bangladesh and its exportation to the huge Indian market, however the Bangladeshi government is resistant to the idea of exporting the gas, as according to local experts' estimates the proven reserves could run out within the next 30 to 40 years.

MANUFACTURING. During the 20th century Bangladesh, like neighboring Burma (Myanmar) and Nepal, largely missed the industrialization wave that changed the economies of many countries in the Asian region, such as Malaysia, Singapore, and Taiwan. At the beginning of 2001, manufacturing contributed about 24.3 percent of the GDP, providing employment to 6.2 million people or 11 percent of the workforce. Between 1989 and 1999, the manufacturing sector in Bangladesh grew at an average annual rate of around 7.2 percent, albeit from a very low base. The cheap, reliable, and abundant labor available in Bangladesh is attractive to the world's leading transnational corporations, but they have been very slow to move into the country, as they face regular industrial unrest led by radical trade unions, poorly developed infrastructure, red tape, and a very small local market. As in neighboring India, the Bangladeshi government promoted the idea of state-led industrialization combined with heavy state involvement in and state control of enterprise activities.

The manufacturing sector in Bangladesh comprises mainly small, privately-owned, often unmechanized enterprises or large, state-owned, often loss-making enterprises. The main industrial centers are Dhaka, Chittagong, Khulna, and Rajshahi, which have (by local standards) well-developed transport infrastructure, including access to seaports and railways and the sizeable and very cheap unskilled and skilled labor force. The industrial enterprises concentrate mainly on the production of jute goods, ready-made garments, foodstuff processing, and chemical production.

Most of Bangladeshi jute goods are produced in large state-controlled enterprises for export to the United States, Europe, and other markets, contributing Tk13.3 billion in 1997–98 to the country's export earnings and Tk11.7 billion in 1998–99. According to the *EIU Country Profile,* Bangladesh accounts for 90 percent of world jute fiber exports. The jute processing enterprises are vulnerable to downturns in the regional and international market and experienced some **recession** in 1998–99. Additionally, during the last few years the demand for jute in the international market has been in decline due to increasing use of synthetic materials in the areas where jute was previously used. However, these jute processing businesses still have plenty of the cheap local supply of raw materials and, if they continue to improve the quality of their products, with efficient management and marketing they may expand their export potential.

During the last 2 decades Bangladesh has found a strong niche in ready-made garments (RMG), becoming one of the world's leading exporters of these products. There are around 2,600 small and medium-size garment-manufacturing enterprises, providing employment for about 1.4 million local workers, mainly women. Access to cheap and reliable local labor makes Bangladeshi

RMG manufacturers very competitive in the international market, although most of the fabrics and machinery must be imported (in 2000 Bangladesh imported 160,000 metric tons of cotton from the United States). According to the U.S. Department of State, total clothing exports reached about US$5 billion in 1999–2000, mainly to the United States, Europe, and Canada. Bangladesh especially benefited from the multi-fiber arrangement with the United States and the generalized system of preferences with the European Union, which set special quotas for the RMG imports from Bangladesh. The RMG sector experienced rapid growth during the last 5 years, but with the rise of free trade and elimination of the quota system at the end of 2004, Bangladesh will face very tough competition from other Asian countries such as China, India, Indonesia, Thailand, and Vietnam.

Bangladesh has a well-established food processing sector, which relies on domestic agricultural production and is oriented mainly to domestic needs. It includes sugar refining and milling, production of edible oils, processing and preserving of fruits and fruit juices as well as fish processing, especially shrimp and prawns. As a tropical country Bangladesh has a plentiful domestic supply of exotic fruits and sea species.

In the 1990s 2 major changes affected the development of the industrial sector in Bangladesh. First, the end of the numerous military coups and the establishment of civil government brought in political stabilization, which attracted direct international investments and encouraged the inflow of foreign aid. Secondly, the policy of economic liberalization, structural adjustment, and privatization helped to increase the competitiveness of the local industries and encouraged them to search for new overseas markets. In order to promote the attractiveness of the Bangladesh economy, the government established special export-processing zones (EPZ). They are situated in Chittagong, Dhaka, Chalna (near Mongla port in Khulna) and in Commila, where investors are given access to well-developed infrastructure and enjoy tax breaks and other privileges. By the year 2000, the EPZs had attracted around US$415 million worth of foreign investments and more than 150 firms had moved there. According to the U.S. State Department, the United States is the single largest foreign investor in Bangladesh with total fixed direct investment of about $750 million. The major investment projects were in the chemical, electronics, and electrical industries. The United States is followed by Malaysia, Japan, and the United Kingdom, and the next tier of investors are Singapore, India, Hong Kong, China, and South Korea. The U.S. State Department estimates U.S. investment in Bangladesh will be about $2.5 billion in 2 to 4 years.

SERVICES

TOURISM. Tourism is a small but rapidly growing sector of Bangladeshi economy. According to the International Labor Organization, together with the wholesale and retail sector it provides employment for almost 6.0 million people (1996), or around 10.8 percent of the labor force. Government statistics state that 171,000 tourists visited the country in 1998, contributing Tk2.4 billion to the national economy. Most visitors were from India, Australia, Germany, the United Kingdom, and the United States.

Tourism could only take off in the 1990s, after the stabilization of the political situation in the country and the end of the tribal insurgency in the Chittagong Hill Tracts area (southeast of the country). Bangladesh has huge potential for attracting foreign tourists as it has a deep cultural heritage, a number of ancient monuments and temples, and a rich natural heritage, including tropical forests, beautiful hills, rivers, and national parks. The country offers bargain-shopping and exotic souvenirs, as well as a wide variety of activities, from eco-friendly to adventure tourism. However, it needs to renovate and expand its hotels' infrastructure and other services, which are still underdeveloped.

FINANCIAL SERVICES. The financial service industry remains underdeveloped in spite of a decade of major reforms conducted under the Financial Sector Reforms Program. According to the International Labor Organization, this sector provides employment for 213,000 people (1996). Since independence it has been under state control, as the major commercial banks were nationalized soon after independence. The local banks are often accused of providing poor financial services and being beset by corruption, inefficient management and capital inadequacies. Bangladesh lags behind in the introduction of computerized banking payment systems, the development of electronic payment systems, and electronic banking. The Agrani Bank, Janata Bank, Rupali Bank and Sonali Bank are the main financial institutions still under state control. They account for almost half of all deposits.

In 1999 the government launched a Commercial Bank Reform Project intended to improve the functioning of the private commercial banks. One bank has provided a success story: the Grameen Bank, which was founded by university professor Mohammad Yunus, pioneered in providing small credits to local communities in need. At present the IMF and the World Bank, which are often notoriously ineffective in the poor countries of Asia and Africa, have carefully studied the Grameen Bank's **microcredit** model with a view to applying it in other developing countries.

RETAIL. In Bangladesh, as in many other Asian countries, many small- and medium-sized businesses have

been built around the retail sector and are often associated with small shops and restaurants. The retail sector provides employment for a large number of people, but it still remains relatively underdeveloped, due to a generally low level of income among the population. There are still a number of small family-run traditional shops and cafes, selling mainly locally-made products.

The United States has found that the enforcement of intellectual property rights is "weak" and that "intellectual property infringement is common." The Bangladeshi government has begun to address this problem seriously, introducing a new Copyright Act in 2000 in order to bring the country's copyright laws into compliance with the WTO. This act updated the Patents and Design Act of 1911, and some other outdated regulations.

INTERNATIONAL TRADE

Bangladeshi international trade is extremely small relative to the size of its population, although it experienced accelerated growth during the last decade. It is not very diversified and depends on the fluctuations of the international market. The Bangladeshi government struggles to attract export-oriented industries, removing red tape and introducing various financial and tax initiatives. Between 1990 and 1995 Bangladesh doubled its exports from US$1.671 billion in 1990 to US$3.173 billion in 1995 and then almost doubled them again from US$3.173 billion in 1995 to US$5.523 billion in 1999.

During the 1990s, the United States has been the largest trading partner for Bangladesh, with its exports to the United States reaching 35.7 percent in 1998–99. This percentage consisted mainly of Ready-Made Garments (RMG). Germany is the second-largest export market, with the proportion of goods reaching 10.4 percent; and the United Kingdom is in third place at 8.3 percent. Other export destinations are France, Italy, the Netherlands, Belgium, and Japan.

India, China, and Singapore are the 3 largest sources of imports. Most Bangladeshi imports originate from neighboring India, reaching 20.8 percent in 1998–99. The second most important source is China, totaling 9.3 percent, third is Singapore with 8.6 percent, with Hong Kong fourth at 7.6 percent.

During the last decade, Bangladeshi exports shifted from the sale of agricultural products and raw and processed natural resources to labor-intensive manufactured goods (including clothing, footwear, and textiles), but the country, unlike neighboring India, could not catch up with the exporters of skill-intensive products. While India is becoming an important international player in the field of software and applications development, Bangladesh lags far behind, despite the government's efforts to promote this area.

Bangladesh has a long history of maintaining a negative trade balance, importing more goods than it exports. In the 1970s and 1980s it imported goods and services twice and sometimes 3 times as much as it exported. Even during the relatively successful 1999 financial year, the country exported just US$5.523 billion worth of products while it imported US$8.381 billion worth of products, leaving a large trade shortfall of US$2.858 billion.

At present, Bangladesh faces growing economic competition from India, Pakistan, and Indonesia, countries which could offer better infrastructure and larger and growing domestic markets. A border conflict between Bangladesh and India, the worst in the last 30 years erupted in April 2001, bringing political and economic uncertainty to the region and undermining international investor confidence in the Bangladeshi market. If the investors move out, they could cause further social polarization and increased poverty in the country.

MONEY

The Bangladeshi government tightly controls the **exchange rate** of the taka against the U.S. dollar and major regional currencies. During the last decade the value of the currency showed a steady decline, mainly due to the **devaluation** of many of the neighboring currencies

Trade (expressed in billions of US$): Bangladesh

	Exports	Imports
1975	.327	1.321
1980	.793	2.599
1985	.999	2.772
1990	1.671	3.598
1995	3.173	6.497
1998	3.831	7.042

1997	43.892
1996	41.794

SOURCE: CIA *World Factbook 2001* [ONLINE].

(especially the Indian and Pakistani rupees). In 1995 the Bangladeshi taka was valued at 40.278 taka per US$1; in January 2000 the value of the taka declined to 51.000 taka per US$1. According to the IMF, the Bangladesh Central Bank has followed a policy of gradual depreciation of the taka against the U.S. dollar since the middle of the 1990s, devaluing the taka in gradual steps of 1 to 2 percent 2 or 3 times a year. The taka's market value has been protected by the large sums of foreign currencies Bangladesh receives every year through aid transfers and through remittances from overseas workers. The taka is still not fully convertible. The government periodically revises its exchange control regulations, introducing further liberalization of the controls. The government lifted restrictions on the **repatriation** of the profit and dividends from foreign direct investments (in the industrial sector); however, non-residents are not allowed to buy money market instruments or **treasury bills**.

During the period between 1970 and 1980 inflationary pressure was relatively small, as the country's economy was closed to outside influences and was tightly controlled by the government. In the 1990s consumer prices became more volatile, fluctuating between a low of 2.9 percent and a high of 8.9 percent a year, due to the liberalization and gradual opening up of the national economy to international competition.

The Bangladeshi banking system suffers from a lack of capital and poor management. Other problems include banks' exposure to corruption and to **bad loans** allegedly made to politically well-connected businessmen. There are 43 private banks in the country, including 29 domestic and 14 foreign banks, but most of them are active in major urban areas (Dhaka and Chittagong). The foreign banks are represented by such names as the Scotiabank of Canada and Societe Generale of France.

The 1997 Asian financial crisis did not bring damages in the scale of the economic and financial downturn in Indonesia, although it did negatively affect Bangladeshi exports. This escape was mainly due to the limited size of the Bangladeshi market, existing currency exchange controls and the relatively closed nature of its economy. Nevertheless, the Bangladeshi taka depreciated between 1997 and 1999 at a faster rate, declining from Tk43.892 in 1997 to Tk49.085 in 1999.

Bangladesh has 2 stock exchanges, the Dhaka Stock Exchange (DSE) and the Chittagong Stock Exchange (CSE; opened in 1995). Share prices shot up after the 1996 parliamentary election and **market capitalization** reached US$6.0 billion in November 1999; however, share prices fell dramatically the following year, with some shares losing up to 60 or 70 percent of their value. The all share indexes both in the DSE and the CSE still remain far below those of the 1996 levels.

POVERTY AND WEALTH

Bangladesh belongs to the poorest group of countries in the world; during the last 3 decades its **GDP per capita** income barely increased from US$203 in 1975 to US$348 per capita in 1998. The World Bank's *World Development Indicators* puts Bangladesh in 170th place (out of 207 countries) in the global ranking of gross national income per capita. Despite considerable international assistance, Bangladesh has been unable to eliminate extreme poverty and hunger. There is a huge disparity between standards of living in urban and rural areas of the country. The urban areas, especially the capital Dhaka, and major industrial cities such as Chittagong, Khulna, and Rajshahi, enjoy a better quality of living, with electricity, gas, and clean water supplies. Still, even in the major cities a significant proportion of Bangladeshis live in squalor in dwellings that fall apart during the monsoon season and have no regular electricity. These Bangladeshis have limited access to health care and to clean drinking water. The rural population, meanwhile, often lives in traditional houses in villages with no facilities associated with even the most modest standards of living.

Disparities encompass 3 dimensions that define considerable differences: geographic, educational, and gender. There is still considerable inequality in the distribution of income between rural and urban populations. In general, the urban population, in the areas around Dhaka, Chittagong, and other large cities, has long been involved in small- and medium-sized businesses or employed in various industries. They benefited from the recent growth and have higher incomes. Meanwhile, the rural population experience chronic shortages of land and regular floods and cyclones, which often a within matter of hours sweep away the results of months of hard work. The 1998 flood, for example, affected two-thirds of the country, wiping out the entire winter crop and displacing millions of people.

Education is another problem, as the adult literacy rate reached just 60 percent in 2000, despite the fact that primary education is universal, compulsory and free. The illiterate section of the population is generally much

poorer as they are missing employment opportunities in the industrial sector as well as government and international assistance in form of micro-credits, and awareness of better cultivation methods and other market skills. Also, women in Bangladesh, especially those with large families, have heavier workloads and often fewer skills than the male population; the illiteracy rate is much higher among women than men. These differences may be seen in the statistical data. The wealthiest 20 percent of Bangladeshis control 42.8 percent of the wealth. The poorest 20 percent of the population control only 3.9 percent of the wealth. In fact, the poorest 40 percent of the population controls just 20.7 percent of the wealth.

Since the 1970s, the Bangladeshi government has implemented a social policy aimed at the elimination of poverty and social inequality, and largely funded by international organizations and individual donors. This policy aims at increasing the literacy rate, providing access to safe drinking water, family planning, and micro-crediting the poorest and most disadvantaged groups of society.

Throughout the 1990s the Bangladeshi government achieved some positive results, although the 1998 floods put pressure on scarce government resources, brought hunger to some areas of the country, and made food prices higher. These difficulties particularly affected the most vulnerable social groups of society, both in rural areas and in major urban centers. The chronic poverty, **underemployment** and unemployment forced large numbers of people to migrate from the country, using all possible legal and illegal channels. Bangladesh's quality of life remains much lower than in neighboring India, Pakistan, or Sri Lanka. According to the *CIA World Factbook,* in 1996 around 35.6 percent of the population lived below the poverty line, most of them in rural areas of the country.

WORKING CONDITIONS

Due to rapid growth of the population in the last few decades the Bangladeshi labor force has grown rapidly, as there was a large proportion of young people born in the 1960s and 1970s. According to the *EIU Country Profile* the Bangladeshi labor force almost doubled in a matter of a decade, growing from 30.9 million people in 1985–86 to 56.0 million people in 1995–96. Although all sectors of the national economy experienced significant growth, they were far below the speed of the labor force growth. According to Bangladeshi national statistics, in 1995–96 only 12.4 percent of the labor force had formal employment, while 40 percent were considered "employed in family-based" businesses, 29.6 percent were considered "self-employed," and 17.9 percent had their jobs on a "daily basis." In general, the competition for working positions in the country is intense, and the working conditions are very harsh, especially in rural areas, where 63 percent of the labor force are employed.

The Bangladeshi government pays special attention to improving education at all levels, as it wants to attract labor-intensive manufacturing and services to the country. Primary education is compulsory. Various initiatives have been tried, including direct special stipends, designed to increase the proportion of female students at school. However, as the government admits, the country's education system suffers from poor quality education, chronic shortages of trained teachers, and a shortage of books. Secondary education is not accessible for

children from many poor families. The government channels considerable funds into tertiary education, and the quality of teaching in some areas, particularly in technical subjects, is relatively strong. Nevertheless, the overall quality of the Bangladeshi universities' graduates often does not match the demands of modern technological developments in many areas, including information technologies and engineering. A number of Bangladeshis, receive their education overseas, many with state or international organizations' support, although in the past many of the students have opted not to return home after graduating from overseas universities. Bangladesh suffers shortages of medical doctors, information technology specialists, qualified teachers, and professionals in various other areas.

The very low wages, starting from Tk1,500, and harsh working conditions drive large numbers of people to seek jobs as temporary workers in Kuwait, Malaysia, Qatar, Saudi Arabia, Oman, and the United Arab Emirates. According to some unofficial estimates there are as many as 20 million Bangladeshi illegal immigrants in neighboring India. Many are hired to work in the low-skill and low-wages construction and service sectors and on agricultural plantations. The workers' remittances, sent home regularly, are one of the most important sources of hard currency not only for the extended families of these workers, but also for the national economy as well, totaling, according to the IMF's figures, US$1.706 billion (1998–99) or equivalent to the Bangladeshi gross official currency reserves in 1998–99.

The trade unions are very strong in Bangladesh, although only 3.5 percent of the workforce is unionized, but most of the unions are limited to the **public sector** or state-controlled enterprises. According to the International Confederation of Free Trade Unions (ICFTU), there are a total of 23 national trade union centers in Bangladesh and approximately 5,450 trade unions. The largest of these are the Bangladesh Jatio Sramik League (BJSL); the Bangladesh Jatiyatabadi Sramik Dal (BJSD); the Jatiya Sramik Party (JSP); the Bangladesh Free Trade Union Congress (BFTUC); and the Jatio Sramik League (JSL). These bodies are organized together in the ICFTU Bangladesh Council. About 1.8 million of the country's workers belong to unions, out of a total workforce of approximately 58 million. The unions tend to have strong links to major political parties or are controlled by political figures, and they often lead political action and strikes in the country. The power of the trade unions is exemplified in the fact that their continuous general strikes (hartals) forced the BNP government to resign in 1996, and their support led to the victory of the Awami League in the 1996 parliamentary election. Strikes are extremely common in Bangladesh and can paralyze business activities for weeks. The **private sector** is less unionized and trade unions are practically banned from the Export Processing Zones (EPZ), as the EPZ is exempted from certain labor laws. In case of industrial dispute the problems are supposed to be solved through the Labor Tribunal.

Unlike many Middle Eastern countries, women in Bangladesh enjoy considerable freedom and are generally involved in education and labor, although the employment and literacy rates among them generally are lower than among men. Recent surges in the garment industry brought new employment opportunities for women, as around 95 percent of people employed in this sector are women. However, in the rural areas the women very often are disadvantaged and among the poorer members of the communities. Currently, more than 37 percent of the labor force is women. However, unionization among women, and hence the protection of their rights, is generally lower than among men.

Despite the presence of strong trade unions, the use of child labor was quite common until recently. Not until 1995 did the Bangladeshi garment exporters' association agree to eliminate children from the industry. However, according to the International Confederation of Free Trade Unions, included in export sectors such as garments and leather production, there are over 6 million child laborers between the ages of 5 and 14 years who work for pay and are not enrolled in school. About 1.9 million working children are below the age of 10. In addition to remunerated employment, children often have to work alongside other family members in small-scale and subsistence agriculture. Bangladesh has not ratified either of the ILO core conventions on child labor, although there are various laws and regulations protecting children.

COUNTRY HISTORY AND ECONOMIC DEVELOPMENT

1500 B.C. Hinduism, the system of beliefs, practices, and socio-religious institutions of the Hindus, is introduced in the Indian subcontinent.

327 B.C. Alexander the Great invades the province of Gandhara, in northwest Indian subcontinent.

800s A.D. The first Muslim Arabs appear in the north of the Indian subcontinent, and the first Muslim trading communities are established in various parts of the region.

1192. Muhammad of Ghur wins the battles of Taraori, which leads to the establishment of the Delhi sultanate, principal Muslim sultanate in North India from the 13th to the 16th century.

1341. Most of Bengal becomes independent of Delhi.

1498. Vasco da Gama, Portuguese traveler and adventurer, lands at Calcutta.

1576. Akbar, the great Mogul emperor, conquers the territory of modern Bangladesh.

1608. Dhaka becomes the Mogul's capital of Bengal province.

1757. The nawab (ruler) of Bengal is defeated by Robert Clive's British force at Plassey.

1765. The British East India Company establishes control over the administration of the territory of Bengal.

1857. Indian Sepoys (soldiers) in the Bengal army of the British East India Company rebel against British rule in India (known as the Sepoy Rebellion).

1858. The East India Company is abolished, and the British crown assumes direct control over British India.

1885. The Indian National Congress is founded.

1905. The British colonial administration introduces division into West Bengal and East Bengal, with East Bengal being more or less within the territory of modern Bangladesh, although the partition is withdrawn in 1911.

1947. Bangladesh becomes independent as a part of Pakistan under the name "East Pakistan."

1970. In November, a powerful cyclone hits Bangladesh, causing great damage and more than 500,000 deaths, one of the worst natural disasters of the 20th century.

1970. In December, Sheikh Mujibur Rahman (popularly known as Sheikh Mujib) and his political party, Awami League (AL), win both national and provincial elections and demand greater autonomy for East Pakistan.

1970. The AL declares its intention to achieve independence from West Pakistan.

1971. With the help of Indian forces, the Bangladeshi pro-independence movement wins independence.

1974. A state of emergency is declared in Bangladesh.

1975. Sheikh Mujibur Rahman becomes president and assumes absolute power.

1975. President Sheikh Mujib is assassinated in a military coup in August.

1975. Abusadat Muhammad Sayem becomes president but resigns 2 years later.

1978. General Ziaur Rahman wins the presidential election.

1981. President General Ziaur Rahman is assassinated in a military coup.

1981. Abdus Sattar wins the presidential election in November.

1982. General Hossain Ershad takes power in a military coup.

1985. General Hossain Ershad wins the presidential election and bans all active political opposition.

1988. Devastating floods hit three-quarters of the country, leaving 30 million people homeless and causing food shortages.

1990. General Hossain Ershad resigns.

1991. The first free and fair election is held in Bangladesh. Begum Khaleda Zia (widow of General Ziaur Rahman) and her party, Bangladesh Nationalist Party (BNP), win the election.

1991. A powerful cyclone hits Bangladesh, causing the deaths of more than 120,000 people and great damage to the economy.

1996. Begum Khaleda Zia wins the April parliamentary election, which is accompanied by violence and a low turnout, but is forced to resign shortly after.

1996. Hasina Wajed, daughter of Sheikh Mujib, and her Awami League (AL) win the June parliamentary election.

1996. An important 30-year agreement is reached with India on the sharing of the Ganges River's water.

1997. A peace treaty is signed between the government and Chakma rebels, ending a 20-year uprising.

1998. Another powerful cyclone hits the country, causing extensive damage to the national economy.

2001. Indian and Bangladeshi forces clash on the border between their 2 countries.

FUTURE TRENDS

For decades after 1971 the development of the Bangladeshi national economy has been hindered by political instability, poor economic performance, pressure on scarce natural resources by the rapidly growing population, and an ineffective bureaucracy. The major changes introduced during the 1990s included more flexible economic policies, export-oriented industrialization, and inflow of foreign direct investments. **Inflation** remains low and is under control. The Bangladeshi currency exchange managed to avoid any spectacular failures similar to Indonesia or South Korea during the Asian financial crisis of 1997, and it is still stable, tightly regulated and pegged to the basket of the regional currencies. In 1999 and 2000 Bangladesh achieved strong economic recovery after the devastating floods of 1998, and if the regional and global economic environment remains positive, the Bangladeshi economic annual growth rate of 5 to 6 percent might continue. This development may ease the poverty, low standards of living, underemployment, and unemployment problems.

Nevertheless, there are several issues to be addressed. There is strong potential for all the problems, including political instability and recession, to return if the government fails to improve the economic situation in the country or if global recession or global competition negatively affect the country's exports. Both the border clashes with Indian border guards in early 2001, which led to heavy casualties, and confrontations along the border with Burma (Myanmar) show how fragile regional stability is. Meanwhile, although the changes brought some positive results to the national economy and some level of prosperity to some groups of the population (often limited to the educated urban population of the large metropolitan areas), they also brought new social ills such as growing criminality and drug usage among youth. The government has often been criticized for its intervention in economic development and its inability to improve economic management or to conduct further reforms, including privatization. There is also a serious problem with widespread corruption, with some political groups accused of wasting public resources. The experience of Indonesia shows how dangerous corruption and political instability are. It remains to be seen whether economic liberalization combined with the force of globalization measures will strengthen the performance of the national economy.

In the longer term, Bangladesh will need to maintain its international competitiveness, since the current globalization trend eliminates borders for international trade and brings growing competition from **emerging markets** for FDIs and for the transfer of modern technologies. Political and social unrest in neighboring Burma might affect Bangladesh, threatening and undermining regional stability and thus scaring off potential investors. Environmental issues are also very important for Bangladesh in the longer term, as global climate change and the rise of the surface level in the world's seas may undermine the country's agriculture, which still plays a dominant role in the national economy. In fact, a warmer Earth could well witness sizeable areas of the country covered by water, or it might increase salinization of the currently arable land, making it impossible to continue agricultural activities.

DEPENDENCIES

Bangladesh has no territories or colonies.

BHUTAN

Kingdom of Bhutan
Druk-Yul

CAPITAL: Thimpu.

MONETARY UNIT: Ngultrum (Nu). One ngultrum equals 100 chetrum. Notes in circulation are Nu1, 2, 5, 10, 100, and 500. Indian currency (rupees) is also legal tender and at par value with Bhutanese currency.

CHIEF EXPORTS: Cardamom, gypsum, timber, handicrafts, cement, fruit, electricity, precious stones, and spices.

CHIEF IMPORTS: Fuel and lubricants, grain, machinery and parts, vehicles, fabrics, and rice.

GROSS DOMESTIC PRODUCT: US$0.44 billion (1999). [CIA reports GDP at purchasing power parity to be US$2.1 billion (1999 est.).]

BALANCE OF TRADE: **Exports:** US$146 million (1999). **Imports:** US$243 million (1999). [The *CIA World Factbook* reports exports to be US$111 million (f.o.b., 1998) and imports to be US$136 million (c.i.f., 1998).]

COUNTRY OVERVIEW

LOCATION AND SIZE. A landlocked country located in South Asia, north of India and south of China, Bhutan has an area of 47,000 square kilometers (18,1467 square miles). Comparatively, the area occupied by Bhutan is about half the size of Indiana. Bhutan's capital city, Thimpu, is centrally located towards the country's western border with India. Bhutan shares a 605-kilometer (376-mile) border with India and a 470-kilometer (292-mile) border with China.

POPULATION. In 2000 the population of Bhutan was estimated at 2,005,222 by the *CIA World Factbook.* The UN *Statistical Yearbook* gave the population as 1,034,774. Giving a third figure, the World Bank *World Development Report 2000/1* estimated the population at 782,000. The disparity between population estimates is caused by 2 different ways of counting people: the government of Bhutan's population estimate, the World Bank figure, is based upon those who have "official" citizenship, and the CIA estimate seems to account for those who claim such status or live in the country and may not be recognized by the government. Uncertainty in population figures is also connected to Bhutan's ongoing problem with the Lhotshampa people (Bhutanese of Nepalese origin), who have lost their citizenship or are simply not recognized due to a series of nationality-specific laws enacted in the 1980s. The government claims that a large number of the Lhotshampa are illegal immigrants who threaten the cohesion of traditional Bhutanese society, while the Lhotshampa argue that they are rightful citizens. Another problem with such estimates is the limited number of statistical gathering mechanisms in Bhutan, partly due to the country's limited financial resources and **infrastructure**. As a result, statistical indicators such as **gross domestic product** (GDP) or the quantity of telephones per capita are difficult to estimate. Clearly, the formulation of statistical averages depends upon which population estimate is used. To encourage comparative consistency, this entry indicates what population estimates are used to express particular statistical data.

In 2000 the birth rate stood at 36.22 per 1,000, while the death rate was 14.32 per 1,000. The overall population density is very low at 12.5 people per square kilometer, but this figure does not take account for the fact that, with 92.9 percent of the population living in rural areas, access to arable land is primary in any estimate of population density. Therefore, if the ratio of population to arable land is taken into account then density rises to 100 people per square kilometer. Bhutan has a very young population with almost 50 percent aged 17 years or younger. Given the continuation of Bhutan's current annual population growth of 2.19 percent, the United Nations Development Programme (UNDP) in Bhutan projects that there will be 3.64 million people living in Bhutan by 2025, from a 1998 level of 1.91 million. The

UNDP also estimates that 31,000 people live in Thimpu city (the capital and administrative center) and another 25,000 in Phuentsholing (the primary commercial center on the Indo-Bhutanese border).

OVERVIEW OF ECONOMY

In 2001 Bhutan's economy remained one of the smallest and least developed in the world, almost entirely dependent upon basic agricultural production, forestry, and hydroelectricity. In 2000 rural inhabitants constituted 92.9 percent of the total population, a slight decline from the 1990 level of 94.8 percent. A large majority of agricultural activity is subsistence-based and takes place outside of the **monetized economy**. In other words, **subsistence farmers** do not use the ngultrum (the national currency) in their day-to-day lives; they trade and **barter** goods for the few basic manufactured essentials that they might need. However, in 2000 the government cited indications that the monetized economy was experiencing substantial growth.

Bhutan is a very poor country with a **GDP per capita** of only US$197 (based upon a population of 1.03 million), although it is important to note that because the majority of subsistence farmers are outside of the monetized economy this figure is not an adequate representation of actual living standards.

After the serious attacks upon Buddhism in Tibet by the **communist** government in China during the late 1950s, Bhutan began to develop more links with India in order to counter the possibility of a similar fate. In 1960, Bhutan closed its borders with Tibet and, with considerable Indian financial and technical assistance, began to construct roads to link India with Bhutan. This action constituted a key turning point for Bhutan's economic development, and by 2001 the national economy was highly dependent upon Indian trade, aid, and investment.

It must be stressed that the government emphasizes the concept of "Gross National Happiness" (GNH) as an essential indicator and factor in Bhutan's development, a very specific approach to developmental ideology. The GNH idea stresses the importance of cultural heritage, the stability and protection of the natural environment, greater self-sufficiency, and human development. This approach, with its roots in the traditional Buddhist principles of compassion, compromise, and pragmatism, is in direct contrast to the globally dominant view of the primacy of economic and material development. As the government maintains in a policy document for the UNDP in 2000 that GNH "means that development is only valuable if it is an 'efficient means' to happiness and human development."

National debt in Bhutan is relatively stable and controllable in amount. The government has actually been able to reduce total **public sector** debt from US$139.5 million in 1993–94 to US$115.8 million by 1997–98. Consequently, over the same period **debt service** payments declined from US$17.6 million to US$9.6 million. Official development assistance from both individual governments and international financial institutions in 1997 consisted of US$59.9 million in grants and US$10.1 million in loans. The Asian Development Bank (ADB) made 2 loans to Bhutan in 2000. The first, of US$10 million, was to assist Bhutan in setting out a health reform program, The Bhutan Health Trust Fund, which has the aim of maintaining the free supply of medicines to the public. The second, of US$9.6 million, was for the regeneration of the country's primary road, the east-west highway. The ADB had made another loan of US$10 million in 1999 for a Sustainable Rural Electrification Project to provide electricity to the poorer and more remote areas of Bhutan.

POLITICS, GOVERNMENT, AND TAXATION

Bhutan is the world's only Buddhist kingdom. The Bhutanese name for their country is *Druk Yul* which means "Land of the Thunder Dragon." Ruled by a hereditary monarchy since 1907, Bhutan received full independence from India in 1949 after the British colonial ad-

ministration withdrew from India. Bhutan's political system is unlike historical precedents in the West and is most appropriately categorized as a "Buddhist monarchy."

The third hereditary monarch, Jigme Dorji Wangchuck, ruled Bhutan from 1952 to 1972. He is generally considered the "architect of modern Bhutan." In 1953 he established the National Assembly. Consisting of representatives of the people, the civil service, and the Buddhist monastic order, the National Assembly meets once a year to debate aspects of public policy and development. The Royal Advisory Council was formed by the king in 1965 to constantly monitor the progress of National Assembly resolutions and advise the king on day-to-day policy matters.

In a similar vein, his son King Jigme Singye Wangchuk (who acceded to the throne in 1972 and continued to reign in mid-2001) has also followed a reformist approach to rule. In 1999 an analyst of Bhutanese affairs, Thierry Mathou, maintained: "Many Bhutanese . . . were stunned by the suddenness and amplitude of the changes introduced by the king. . . . [c]ontrary to most countries with monarchies where royals have resisted democratic politics, Bhutan's has always been the leading force of change." For example, in 1998 the king pushed a political reform that reduced his authority through the devolution of executive powers to the cabinet. Nonetheless, the king continued to have final say on matters relating to security and sovereignty as well direct administration of the Royal Bhutan Army.

Even though Bhutan's governmental system of monarchy is justified on the grounds of maintaining traditional values and national identity by the country's ruling elite, it has received considerable criticism both domestically and internationally. For example, Freedom House (a U.S.-based political liberties and civil rights organization) classified Bhutan in 2000 as "Not Free." Freedom House measured this conclusion upon the lack of democratic representation of the people and the apparent mistreatment of critics of the regime. In its report for 2000, Amnesty International (a London-based human rights organization) maintained that individuals in Nepali-speaking communities faced police discrimination when they attempted to get permission to open a bank account, when attempting to travel abroad for training, for work, or to send their children to school.

In fact, discrimination against Lhotshampa is rife. A series of laws passed in the 1980s revealed tough remits for the acquisition of citizenship, even if an individual were married to a Bhutanese national, and the fact that naturalized citizenship can be terminated if a person criticizes the government. Still, there is some justification for this policy because militant Lhotshampa movements have called for a merging of Bhutan into a greater Nepal. Some of these militants, whom the government calls "anti-nationals," have been involved in campaigns of violence and have done damage to some infrastructure and development projects.

Nationalism and tradition are actively promoted in Bhutan. In part due to the economic and military-political weakness of the country in international relations and also due to the perceived threat from the Lhotshampa community's tendency to reduce Bhutanese identity, the government emphasizes rules of national dress, the code of etiquette (driglam namzha), and the national language (Dzongkha).

A serious ongoing security problem for the government is the presence of the communist guerrilla group, the United Liberation Front of Assam (ULFA) and the Assamese (Bodo) guerrilla insurgency in east and south Bhutan. These groups are fighting for independence for Assam. Although there has been vocal engagement between the ULFA and the Bhutanese government, a solution to their presence has yet to be reached. The existence of these anti-Indian government forces on Bhutanese territory could led to a deterioration in the special friendship between India and Bhutan.

Non-tax revenue constituted 61 percent of total revenue in 1998–99. The Chukha Hydro Power Corporation, the Department of Power, and the Department of Telecommunications are some of the key sources of this revenue. Government revenue from the power sector provided 42 percent of total national revenue in 1998–99. **Direct tax** collection improved in the late 1990s from Nu831 million in 1997–98 to Nu914 million in 1998–99. Of this direct tax 65 percent was from corporate **income tax**. Taxation on rural areas is very low, around 0.02 percent of total revenue in 1998–99, in order to encourage the population to remain on their farms and thus reduce the strain of uncontrolled urbanization. However, it should be noted that rural inhabitants contribute via the application of their labor to the construction and maintenance of local schools, water supplies, and health centers.

INFRASTRUCTURE, POWER, AND COMMUNICATIONS

Bhutan's infrastructure is limited although the government is actively attempting to open the more isolated areas of the country by improving the road network. Around 14,000 passenger vehicles were in use on Bhutan's 3,285 kilometers (2,041 miles) of roads in 1999. In 1997 the Road Surface Transport Authority was established to improve the efficiency and quality of the road infrastructure and to enforce the observation of transport regulations. There are no railways in Bhutan. In accordance with the government policy of allowing a restricted opening-up of Bhutan for both citizens and foreigners, total passengers on scheduled flights rose from 8,000 in

1990 to 36,000 in 1997. The national airline, Druk Air, owns 2 planes which fly to and from Paro International Airport which opened a new terminal building in the late 1990s. Bhutan is landlocked; the nearest seaport is 435 miles away in Calcutta.

Electricity, gas, and water provided 11.8 percent of **value-added** activity to the economy in 1997. In 2000, Bhutan's electricity-generating capacity was 3530 megawatts, 97 percent of which is hydro power and the rest thermal. The central role of electricity production to Bhutan's economy is likely to expand in the early 21st century. New large-scale hydro power stations were under construction by 2001 which are expected to provide considerable government revenue. However, over 95 percent of domestic energy consumption in Bhutan consists of biological mass, predominantly firewood.

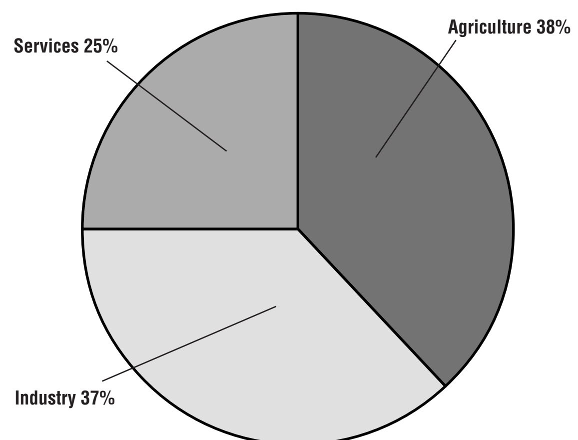
Bhutan was cut off from the outside world for centuries. Television only began to be provided by the state-run Bhutan Broadcasting Service (BBS) Corporation in 1999 and was limited to a small number of hours a day of programming (consisting solely of national news and documentaries about Bhutan). Nonetheless, (based upon a population of 1.03 million) there were already 5.5 televisions per 1,000 population in 1997, which by 2000 received 25 channels from 2 cable television companies. By 1997, there were 19 radios per 1,000 inhabitants. According to UN estimates there is only 1 telephone per 100 inhabitants. In 1999, a Japanese-funded project to provide domestic digital telecommunications was completed. The Internet became operational in Bhutan in 1999.

ECONOMIC SECTORS

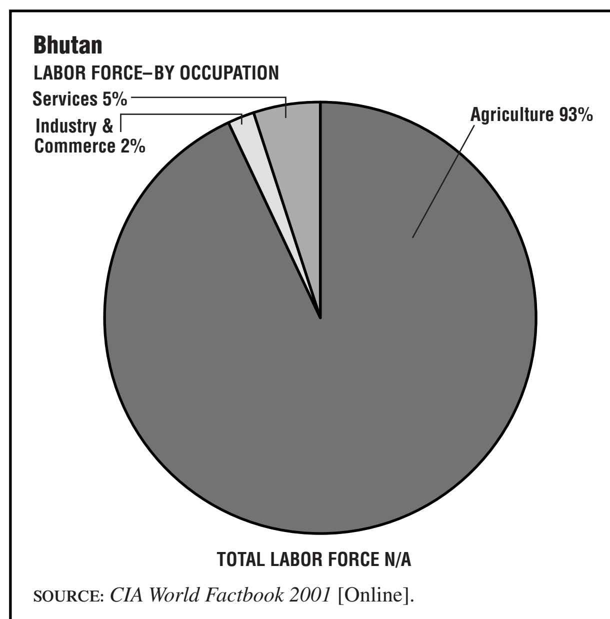
Bhutan's economic sectors are small like the country; the country has limited population, domestic markets, and natural resources. Geographical isolation caused by highly mountainous terrain and political isolation due to a formerly inward-looking society means that the economy's integration into the world economy is minimum. Isolation in combination with previously low levels of education means that a medium and large-scale **private sector** is almost non-existent. The majority of the monetized economy is dominated by **parastatals**.

Bhutan's economy is primarily agricultural, mostly subsistence farming, although some export-oriented commercial farming of fruit and spices does exist. Industry is limited to the production of hydro power and basic manufactures. Services to support these sectors are basic. Tourism, whilst small in size, provides a high proportion of the country's foreign exchange.

Bhutan
GDP–COMPOSITION BY SECTOR–1998



SOURCE: *CIA World Factbook 2000* [Online].



SOURCE: *CIA World Factbook 2001* [Online].

AGRICULTURE

The agricultural sector provided 38.5 percent of GDP in 1997, a significant decline from the 55 percent in 1985. The 1997 GDP consisted of a total production of 18.1 percent crops, 11.4 percent of economic activity in the forestry sector, and 9 percent livestock production. Of the 970,000 people who were employed in Bhutan in 1998 (using a population estimate of 2 million) 93.8 percent were engaged in agricultural activities. There were 160,000 hectares of arable land under permanent crops in 1998, compared to the 1980 level of 122,000. In 1998 only 40,000 hectares of this land was irrigated, an improvement upon the 1980 level of 26,000 hectares.

Cereal production increased from 95,000 metric tons in 1989 to a consistent level of 112,000 tons per annum in the period 1995 to 1998. While self-sufficient in maize, barley, millet, and buckwheat, Bhutan is only 50 percent self-sufficient in rice and 30 percent in wheat. In total the country is around 60 percent self-sufficient in cereals. Other key crops which are actually exported are potatoes, spices (mainly cardamom and nutmeg), and fruit which in 1997 consisted mainly of oranges (54,000 metric tons) and apples (13,600 metric tons). In total, agricultural goods provided 13.7 percent of Bhutan's total exports in 1997.

Bhutan continues to import substantial amounts of essential food items. The Food Corporation of Bhutan imports subsidized food items from India, among which are rice, wheat, edible oils, sugar, and salt. Between 1994–98 an annual average of 12,500 metric tons of rice, 12,500 tons of wheat, and 3,600 tons of sugar were imported. It is important to note that 58 percent of farming households own less than 2 hectares. This small level of landholding makes some households susceptible to seasonal shortages of food, to poor health, and even to malnutrition.

FORESTRY. The government is actively trying to maintain the economic exploitation of Bhutan's extensive forestry resources at sustainable levels. In keeping with the GNH concept, plans by the Forest Services Division of the Ministry of Agriculture for improved harvesting of forests are being undertaken to assure environmental balance. For example, 60 percent of Bhutan's total land area is required to have good tree cover; by 2000 72 percent was covered. In 1997–98, 27,770 cubic meters of trees were felled for commercial logging and an additional 22,884 cubic meters for housing construction and public works. The gross sales of Bhutan Board Products in 1998 were Nu383.8 million.

INDUSTRY

HYDRO POWER. The electricity sector showed an average growth of 48.2 percent in the period 1985–1995. In 1998–99 hydro power contributed 30 percent to total exports. This rate will increase considerably in the early 21st century when new hydro power stations being built in Tala, Kurichhu, and Basochhu are completed. Hydro power has also acted to stimulate the growth of the manufacturing and services sectors.

MANUFACTURING. Manufacturing provided 12.8 percent of value added activity to the economy in 1997. The production of cement is one of the principal enterprises in Bhutan's industrial sector. In 1998, Penden Cement Authority had gross estimated sales of Nu564.7 million, a substantial increase from the 1997 level of Nu265.5 million. Another cement plant was due to be completed by 2002, but due to disturbances related to Assam insurgents this project was suspended. The processing of Bhutan's agricultural produce is another significant dynamic factor in the manufacturing sector. For example, Bhutan Fruit Products enjoyed gross sales of Nu112.3 million in 1998; these sales were mainly of juices and canned fruit.

SERVICES

TOURISM. Bhutan is one of the safest countries in the world. Crime rates are minimal and foreign visitors are treated politely and with respect. The country's history, culture, and isolation offer a great deal to the more adventurous tourists who have been visiting Bhutan since 1974. The **privatization** of the tourism sector in 1991 led to fast-paced growth in hotels and travel agencies. This growth was so rapid that by 2001 there was excess capacity in tourism services. The failure to fully exploit this

capacity is primarily due to government restrictions on the number of tourists admitted into Bhutan, a policy devised to reduce outside influence upon national traditions. Consequently, only 6,203 tourists entered Bhutan in 1998, and these people provided US$7.8 million in much-needed foreign currency. Around 40 percent of these tourists came from EU countries, 24 percent from the United States, and 17 percent from Japan. Nonetheless, this is a significant rise from the 1993 level of 2,984 where only US$3 million in tourism receipts were recorded. The high level of foreign exchange earnings from tourism is partly due to a compulsory government charge on tourists of US$200 a day.

1998	41.259
1997	36.313
1996	35.433

Note: The Bhutanese ngultrum is at par with the Indian rupee which is also legal tender.

SOURCE: CIA *World Factbook 2001* [ONLINE].

INTERNATIONAL TRADE

Bhutan's engagement with international trade is highly dependent upon its neighbor and ally, India. In 1997, US$114.2 million of Bhutan's exports were purchased by India, which constituted 94.6 percent of the total. Bangladesh received US$5.1 million of Bhutanese goods. In the same year, the direction of the flow of Bhutan's imports consisted of US$97.6 million from India, 69.4 percent of the national total. In addition, Bhutan imported US$23.8 million of goods from Japan, US$4 million from Singapore, and US$1.8 million from Germany.

Bhutan is a founding member of the South Asian Association for Regional Co-operation (SAARC), whose other members are Bangladesh, India, Nepal, Pakistan, and Sri Lanka. Bhutan will host the 2002 SAARC summit meeting. As part of its policy of engagement with the world economy, Bhutan is preparing to join the World Trade Organization.

MONEY

The widespread use of money in Bhutan only began in the early 1960s with the growth of trade with India and the initiation of bilateral development aid from India to Bhutan. Even though Bhutan's economy is highly underdeveloped the price of **consumer goods** has remained fairly stable. The average percentage change of prices each year was only 10 percent between 1990 and 1998. Total international currency reserves by major Bhutanese holders (mainly the Royal Monetary Authority, Bank of Bhutan, and Bhutan National Bank) rose dramatically in value from US$106.9 million in 1993–94 to US$218.2 million in 1997–98.

Two banks operate in the country: the Bhutan National Bank has offices in Thimpu and a branch in Phuentsholing, and the Bank of Bhutan has branches in the country's main centers. No restrictions are placed on the quantity of currencies that can be taken into Bhutan although they are limited to the main international currencies. In the late 1990s Bhutan National Bank was partly privatized when the government sold 40 percent of its shares to Citibank and the Asian Development Bank; the government now owns only 27 percent of the bank. Bhutan has a stock exchange but it is not open to external investment.

POVERTY AND WEALTH

From the 1960s free basic health services began to be provided by the government across most of Bhutan where populations were concentrated. Nonetheless, by 2000 the UNDP estimated that 20 percent of the population still lacked sufficient access to health services.

Trade (expressed in billions of US$): Bhutan

Lack of health care is a serious drawback because the general diet lacks sufficient fruits and vegetables. Consequently, over half of the country's children 6 and younger suffer from stunting, and over 30 percent are underweight. Poor nutrition is not nation wide, however, but determined by regional, urban-rural, and socio-economic factors. For example, in Pemagatshel average calorie consumption per day is 1,647 whereas in Punakha it is 3,227.

The incidence of rural poverty is as high as 90 percent. Unhygienic conditions are prevalent in Bhutan with 42 percent of the population lacking access to safe water and 30 percent of the people living in conditions of poor sanitation. Nonetheless, poverty in Bhutan has declined as indicated by the rise of average life expectancy from 37 years in 1960 to 66 years in 1994. The increased longevity suggests that the consistent government policy of providing a socially oriented infrastructure, in accordance with the GNH concept, is effective even though much work remains to be done.

WORKING CONDITIONS

Bhutan is yet to ratify the key International Labour Organization Conventions Number 87 (Freedom of Association and Protection of the Right to Organize, 1948) or Number 98 (Right to Organize and Collective Bargaining). Trade unionism is not permitted in Bhutan, nor does it exist in practice. In fact, terms and conditions as well as salaries are generally fixed by the government, which requires employees and employers (at least in the formal economy) to engage in formal written contracts of agreement. The population employed in Bhutan is estimated at 970,000 (based upon a population of 2 million).

Education has received considerable emphasis by the government of Bhutan, and primary schooling is available in even the remotest areas. The Bhutanese government spent 7 percent of total expenditure on education in 1997. Mainly due to government initiatives in its drive to reduce illiteracy, levels fell from 71.9 percent in 1980 to 52.7 percent in 2000. The Bhutanese workforce is becoming more skilled, although this is problematic because there are serious limits upon the amount of educated workers required in what is essentially an agricultural economy. Consequently, while there are rising employment expectations amongst the literate population the labor market cannot provide sufficiently skilled work.

COUNTRY HISTORY AND ECONOMIC DEVELOPMENT

1616. Bhutan is unified by Zhabdrung Ngawang Namgyal who makes comprehensive laws and local administrations.

1907. The hereditary monarchy is created.

1949. The Indo-Bhutan Treaty of friendship is signed, and Bhutan receives full independence.

1952. Jigme Dorji Wangchuck (the "architect of modern Bhutan") becomes king.

1953. The National Assembly is established.

1960. Trading is entirely oriented toward India.

1965. The king forms the Royal Advisory Council.

1972. Jigme Singye Wangchuk becomes king.

1974. Bhutan begins to encourage tourism.

1983. The South Asian Association for Regional Cooperation is established.

1998. The king devolves some of his executive powers to the cabinet.

FUTURE TRENDS

Problems with the Lhotshampa population seem likely to continue into the 21st century. Unless the Bhutanese government finds an amicable solution to this problem, Lhotshampa militancy is likely to intensify. Similarly, the security issue of the presence of Assam independence insurgencies on Bhutanese territory needs to be addressed in order to avoid embittering relations with militarily powerful India. This point is all the more important due to the ongoing flow of free trade with India. Bhutan is highly dependent upon developments within India's economy. As a result, levels of integration with the world economy will closely follow those of India. Planned membership of the WTO will exacerbate Bhutan's economic openness.

In 2001, Bhutan's excellent environmental conservation and balance meant that the economy had greater ability to use its forestry and hydroelectricity resources. For example, while the government insists that 60 percent of the country remain forested, the 2000 coverage of 72 percent indicated room for increased use without compromising governmental policy. Similarly, the 3 hydroelectricity plants to be completed early in the 21st century are projected to contribute vast amounts of government revenue without significantly damaging the environment. This revenue is intended to support human-centered development. If the government remains true to these policies and continues to widen political freedoms, Bhutan has a bright political, social, and economic future.

DEPENDENCIES

Bhutan has no territories or colonies.

BRUNEI DARUSSALAM

Nation of Brunei, Abode of Peace
Negara Brunei Darussalam

CAPITAL: Bandar Seri Begawan.

MONETARY UNIT: Brunei dollar (B$). One Brunei dollar equals 100 cents. The Brunei dollar is at par with the Singapore dollar, and the currencies are interchangeable. There are coins of 1, 5, 10, 20, and 50 cents, and bills of 1, 5, 10, 50, 100, 500, 1,000, and 10,000 dollars.

CHIEF EXPORTS: Crude oil, liquefied natural gas, and petroleum products.

CHIEF IMPORTS: Machinery and transport equipment, manufactured goods, food, and chemicals.

GROSS DOMESTIC PRODUCT: US$5.9 billion (purchasing power parity, 2000 est.).

BALANCE OF TRADE: **Exports:** US$2.55 billion (f.o.b., 1999). **Imports:** US$1.3 billion (c.i.f., 1999).

COUNTRY OVERVIEW

LOCATION AND SIZE. Located in Southeast Asia, bordering the South China Sea and Malaysia, Brunei is geographically divided by Malaysia into 2 unconnected parts. Brunei has an area of 5,770 square kilometers (2,228 square miles) and a total coastline of 161 kilometers (100 miles). Comparatively, the area of Brunei is slightly smaller than the state of Delaware. Brunei's capital city, Bandar Seri Begawan, is located on the northeastern coast of the country.

POPULATION. The population of Brunei was estimated at 336,376 in July of 2000, with a growth rate estimated at 2.17 percent. In 2000 the birth rate stood at 20.81 per 1,000, and the death rate stood at 3.39 per 1,000.

The population is generally young, with 31 percent below the age of 14 and just 3 percent over the age of 65. In 2000, male life expectancy was estimated at 71.23 years and female at 76.06, and that of the population as a whole at 73.58 years. By 1995, the literacy rate of the total population was relatively high at 88.2 percent, with 92.6 percent of males and 83.4 percent of females over the age of 15 able to read and write.

The Malay people comprise 62 percent of Brunei's population, with Chinese accounting for 15 percent, indigenous people 6 percent, and other groups 17 percent. Islam is Brunei's official religion and Muslims account for 67 percent of the population. About 13 percent are Buddhist, Christians make up 10 percent, and those with indigenous beliefs make up the remaining 10 percent.

OVERVIEW OF ECONOMY

Brunei is a wealthy oil-rich country in Southeast Asia. Oil and natural gas have been the basis of the country's wealth. Dependency on this single valuable commodity has made it vulnerable to international market fluctuations, however, and the government has been making efforts to diversify the economy. The economy is dominated by the oil and gas sector, but large-scale government expenditure on **infrastructure** programs has made the construction sector the second largest economic sector in Brunei. The country's main exports are oil and gas products, but it must import most of its food.

Brunei has a limited **labor force**. Most ethnic Malays work in the **public sector** administration and government departments and enjoy substantial benefits, but the Malay labor force is limited in number. The country hosts a large number of foreign skilled and unskilled workers, especially in the construction sector. In order to maintain the leadership of Brunei Malays, government policies protect and promote Malays involved in industry and commerce.

The government of Brunei has very large foreign reserves from oil, no **foreign debt**, and is a significant international investor. The Brunei Investment Agency (BIA) manages foreign reserves for the government

(excluding the ruling sultan and other members of the royal family). The BIA tries to increase the value of Brunei's foreign reserves by spreading its investments across the United States, Japan, Western Europe, and the countries of the Association of South East Asian Nations (ASEAN).

POLITICS, GOVERNMENT, AND TAXATION

Brunei has long been ruled by sultans (kings), though for much of its modern history those sultans have ruled in cooperation with European colonial powers. Spanish and Dutch colonists began arriving in Brunei in the 16th century. English colonists came during the 17th century, and the country was made a British protectorate in 1888, which meant that Britain provided military and economic assistance. During World War II (1941), the Japanese occupied the country. The British returned after the war, and negotiations began for Brunei's eventual independence. In 1959 a written constitution was introduced granting Brunei internal self-rule under British protection. In 1984 Brunei achieved full independence and became an independent sovereign sultanate governed on the basis of a written constitution.

The 1959 constitution granted the sultan full executive authority, but called for an elected legislative council. A limited effort to meet this requirement with a partially elected legislative body was tried but quickly abandoned. In 1962 the Partai Rakyat Brunei (Brunei People's Party, PRB) won the election for the legislative council but was denied access to office. The party's ensuing uprising was rapidly crushed by the ruling sultan and the PRB was then banned. Since that time the legislative council has been an appointed body. Currently, the Brunei Solidarity National Party (PPKB), with closer allegiance to the government, is the only legal political party. In 1995, for the first time in 10 years, the PPKB was permitted to hold its national assembly, but its activities were circumscribed, and the party has had little influence.

Brunei is an Islamic sultanate. The hereditary sultan is the head of state and holds ultimate authority. He is also the country's prime minister, minister of finance, and minister of defense, and presides over a council of ministers, a religious council, a privy council, and a council of succession, all of whose members he appoints. There are no popular elections and the Legislative Council functions in a purely consultative capacity. The concept of Melayu Islam Beraja (Malay Muslim Monarchy, MIB) was introduced as a state ideology, invoking Brunei's history of monarchy, Brunei Malay culture, and Islamic values, in order to justify absolute monarchy.

The government plays a large role in the economy. In the 1990s the government has made concerted efforts to diversify the economy from oil and gas. Industries promoted by the government are agriculture, manufacturing, tourism, commerce, and banking. In the Seventh National Development Plan (1996–2000), the government allocated more than B$7.2 billion for the implementation of various projects and programs. Thanks to such commitments, the non-oil sector's contribution to the GDP rose from 24.3 percent in 1991 to 66 percent in 1998. The government actively encourages more foreign investment. It extends "pioneer status" to aircraft catering services as well as the cement, textile, furniture, glass, plastics, and synthetic rubber industries. Pioneer status companies can get exemption from the 30 percent corporate tax.

One of the government's most important priorities is to encourage Brunei Malays to move into the **private sector** from the public sector where most are employed. The government policy of "Bruneisation" of the workforce encourages Brunei Malays to work in the private sector. The Brunei Shell Petroleum (BSP) company and the 2 largest foreign banks, the Hong Kong and Shanghai Banking Corporation and Standard Chartered Bank, have

had to increase the number of Brunei Malays on their staffs under this policy. The Bruneian government also boosts private business to nurture Brunei Malay leaders in industry and commerce.

The sole tax levied by the government of Brunei is the corporate tax, generally 30 percent. Otherwise, everything that is normally taxed in other countries—capital, gains, import and export, sales, manufacturing—is free of tax, and there is no personal **income tax**. The huge government revenues from oil and gas are sufficient to finance government expenditures, and Brunei is the least taxed country in the region and perhaps in the world.

INFRASTRUCTURE, POWER, AND COMMUNICATIONS

Brunei's infrastructure is well developed. The road network serving the entire country is being expanded and modernized and totaled 2,525 kilometers (1,569 miles) in 1998. A 1,150-kilometer (715-mile) main highway, of which 399 kilometers (248 miles) are paved, runs the entire length of the country's coastline. It conveniently links Muara, the port at the eastern end, to Belait, the oil-production center at the western end of the state. Per capita car ownership in Brunei is one of the highest in the world. In 1995 there were 167,786 cars, of which 139,658 were private cars. Since 1996 the Brunei government has attempted to improve public transit by expanding taxi and bus services in Bandar Seri Begawan and its vicinity. Bus services to other districts are infrequent and irregular. Other than a 13-kilometer (8-mile) private railway line, there are no rail services in Brunei.

Brunei has 2 major ports: a large, deepwater harbor at Muara and a smaller port at Kuala Belait. They offer direct shipping to Hong Kong, Singapore, and several other Asian destinations. An expanded international airport is located at Bandar Seri Begawan. Royal Brunei Airlines (RBA) serves long-distance destinations in Asia, Australia, the Middle East, and Europe, as well as several short-haul destinations to East Malaysia and Indonesia, and Brunei Shell Petroleum (BSP) owns a small airport in the oil field at Seria.

Brunei has one of the best telecommunication systems in Southeast Asia. The rate of telephone availability is currently 1 telephone for every 3 persons. There are 2 earth satellite stations providing direct telephone, telex, and facsimile links to most parts of the world. There are 2 television broadcast stations and, by 1997, there were 196,009 TV sets. Brunei was connected to the Internet in September 1995 through Brunet. By the end of 1999 there were 15,000 registered Internet users in the country. Keen to develop **e-commerce**, the government is investing B$55 million in installing a countrywide multimedia highway called RAGAM 21 to serve both the private and public sectors.

According to the CIA *World Factbook 2000*, 2.56 billion kilowatt-hours (kWh) of electricity were generated and 2.381 billion kWh consumed in Brunei in 1998. There were no exports or imports of electricity. All the electricity is produced from fossil fuels (oil and gas). The country has no nuclear or hydro-power plants.

ECONOMIC SECTORS

Brunei's status as a major oil and natural gas producer and its political goal of promoting **full employment** for ethnic Bruneian Malays are the 2 forces most responsible for the shape of the Bruneian economy. Because it is the third largest oil producer in Southeast Asia, and the fourth largest producer of liquified natural gas in the world, the oil and gas sector dominates the private

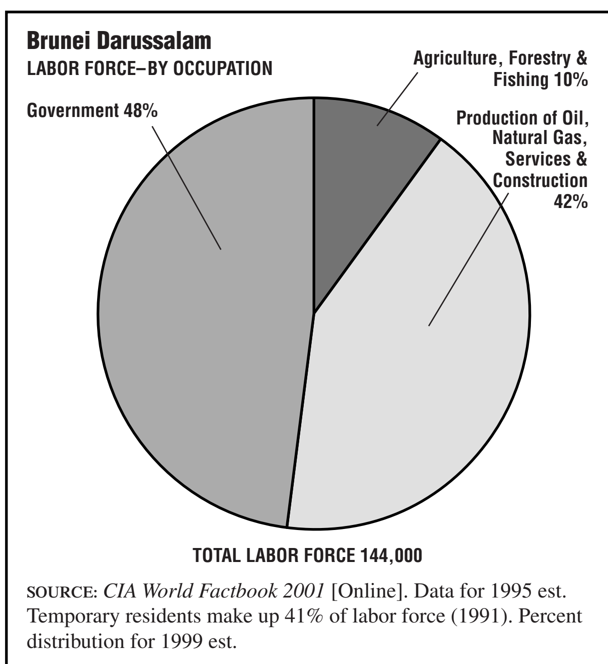
economy. Along with the construction which is heavily funded by the Bruneian government, oil and gas contributed some 46 percent of GDP in 1996. The construction industry was greatly affected by the Asian financial crisis in 1997–98, but the industrial sector as a whole was expected to thrive with rising world oil prices in 2000. Services, including finances, accounted for 49 percent of GDP in 1996. Within the service sector, community, social, and personal services contributed a large percentage of GDP. The government has made consistent efforts to diversify its economy to boost non-oil sectors.



SOURCE: *CIA World Factbook 2001* [Online]. Data for 1995 est. Temporary residents make up 41% of labor force (1991). Percent distribution for 1999 est.

Government estimates, which do not divide employment according to agriculture, industry, and services, indicate that 48 percent of the population is employed by the government and 42 percent in the oil, gas, services, and construction industries. Only an estimated 10 percent of the workforce are employed in Brunei's agricultural sector, which contributed about 5 percent of GDP in 1996.

AGRICULTURE

Agricultural activity in Brunei is not high. The government has attempted to increase agricultural production in order to achieve self-sufficiency in food, but results have been unsatisfactory. Agriculture made up only 5 percent of the GDP in 1996, and the country has had to import 80 percent of its food needs. While land, finance, and irrigation facilities are available, agricultural activities lack manpower resources. The gap between wages in farming and the public sector is large, and most Bruneians have little interest in agricultural production.

Brunei is nearly self-sufficient in vegetables, but only 1 percent of the nation's rice is produced locally. The production of tropical fruits is being encouraged. Cattle—both beef and dairy—buffalo, and goat rearing are also being promoted. Pig farming has been banned since 1993, but the country is self-sufficient in egg production and nearly self-sufficient in poultry.

FISHING. Fish is an important part of the local diet. The fishing sector, comprising catch, aquaculture, and seafood processing, contributed about 0.5 percent to the total GDP in 1998. In 1996 more than 60 percent of fish and prawns sold in Brunei were imported. The government hopes to develop the fishing industry, including fishing fleets and fish-processing factories, and sees foreign **joint ventures** as the way to obtain finance and expertise. The government believes the sector could become an important export revenue earner and employer. Brunei declared a 200-nautical mile fisheries limit in 1983.

FORESTRY. Because of Brunei's mostly urban population and the wealth deriving from oil and gas, forest use has been limited. Currently about 80 percent of Brunei's total land is covered by forests, nearly 60 percent of it virgin. Forestry accounted for only 0.3 percent of the total economic output in 1998. The government is committed to preserving the important environmental, biotechnological, and other economic and social functions of its forests and hopes to develop their potential as a tourist attraction. Consequently, logging, limited to 100,000 cubic meters annually, is confined to meeting local needs only, and timber extraction for export is strictly prohibited.

INDUSTRY

PETROLEUM PRODUCTS. Oil and natural gas mining is the backbone of Brunei's economy. In 1998 the oil and gas sector contributed an estimated 34 percent to GDP and dominated exports. In 1998 crude oil and partly refined petroleum accounted for an estimated 39 percent of total exports and natural gas for 49 percent. Brunei is the third largest oil producer in Southeast Asia and the fourteenth largest in the world; it ranks fourth in production of natural gas. Oil and gas mining is a capital-intensive industry and employs only a small percentage of the total labor force (5.2 percent in 1995). At the beginning of 1993 reserves were estimated at 1.4 billion barrels of oil and 320 billion cubic meters of gas. The government has pursued a national depletion policy since 1988 aimed at preserving resources and continuing exploration of new fields.

Brunei Shell Petroleum (BSP) is the biggest oil mining company. It has 7 offshore and 2 onshore oil fields in Brunei. The Brunei government is an equal shareholder with the Royal Dutch Shell Group in the company. Another important oil-exploration company is Jasra-Elf, a joint venture that has been actively exploring for hydrocarbons offshore and has made some discoveries.

Brunei's annual sales of liquefied natural gas (LNG) sales are currently nearly 6 million metric tons. LNG is as important a revenue earner as oil exports, and the bulk of it is purchased by 3 Japanese utility companies: Tokyo Electric, Tokyo Gas, and Osaka Gas. About 10 percent of LNG is used for domestic consumption.

Following the regional economic crisis in 1997, combined with concerns about falling oil prices throughout 1998, the Brunei government realized that the oil and gas industry can no longer limit itself just to exploration, drilling, and export. It is now aiming at developing a hydrocarbon products industry in Brunei.

CONSTRUCTION. The construction sector is the second most important industry in Brunei, contributing 6.6 percent of GDP in 1998. The sector's performance depends heavily on government spending. Indeed, the development of this sector is the direct result of increased government investment in developing infrastructure projects such as government offices, hospitals, schools, mosques, housing, fire stations, and sporting facilities.

Hit by the regional economic crisis in 1997–98, private sector construction projects almost collapsed. The government cut development spending on infrastructure projects by 50 percent from B$950 million in 1999 to B$550 million in 2000. Thus, growth in this sector is expected to be sluggish.

MANUFACTURING. Manufacturing contributes only a small portion of Brunei's economic output. Its contribution to GDP has increased from 0.8 percent in 1980 to an estimated 3 percent in 1998. The major large-scale industries include food and beverage processing, garment making, cement production, and the production of precast concrete structures. According to International Monetary Fund (IMF) data for the year 2000, 23 industrial sites are being established in Brunei. Food processing and furniture manufacture are designated for further development, while ceramic tiles, cement, chemicals, plywood, and glass are considered to have development potential by the government.

SERVICES

TOURISM. Before the mid-1990s the only tourists visiting Brunei were relatives and friends of expatriates who were working there. Several factors have held back the development of tourism: access to alcohol is limited; the cost of accommodation in the capital is high; accommodation and transport outside the capital is not available; and the general perception about the country is that there is little of interest to see. However, Brunei does offer both natural and cultural attractions, and the government is now actively promoting tourism as an important part of economic diversification.

The capital, Bandar Seri Begawan, is a neat, clean, and modern city. The cultural attractions there include the sultan's magnificent palace, the Brunei Museum, the Malay Technology Museum, and the Omar Ali Mosque. Kampung Ayer is a centuries-old collection of 28 water villages built on stilts in the Brunei River, and Jerudong Park is a recreational center located close to Tutong. The large tropical rain forest areas have been earmarked for **ecotourism** in sites such as Temburong National Park. However, the underdeveloped transport and accommodation facilities remain an obstacle to the expansion of the tourism sector.

In 1996 Brunei had 703,300 foreign visitors, most of them from the neighboring Sabah and Sarawak regions of Malaysia. Passengers on RBA flights to and from Australia are stopping over in the capital in increasing numbers. With 2000 designated as "Visit Brunei Year," the Asia-Pacific Economic Co-operation (APEC) meetings were held in Brunei and proved a boost for Brunei tourism.

FINANCIAL SERVICES. The contribution of financial services to the GDP was 6.4 percent in 1998. There are 9 banks operating in Brunei. The 2 largest foreign banks in the country are the Hong Kong and Shanghai Banking Corporation (HSBC) and Standard Chartered Bank. There are a number of Malaysian banks and 3 locally incorporated banks: the Islamic Bank of Brunei (IBB), Baiduri Bank, and the Development Bank of Brunei (DBB). The IBB offers savings and loan facilities in ac-

cordance with Islamic principles. The other Islamic financial institution is the Tabung Amanah Islam Brunei (Brunei Islamic Trust Fund, TAIB). The financial sector also includes a number of locally incorporated and international finance and insurance companies. The authorities have been preparing to implement a comprehensive financial regulatory system via the proposed new Banking Act.

RETAIL. Until the late 1980s the **retail** sector in Brunei was not particularly sophisticated. Aside from the local market, there were only coffee shops, general provision shops, Chinese supermarkets, and a few Chinese restaurants. In 1986 a Japanese store group, Yaohan, opened its first department store in Brunei. Since 1995 a more international range of shops has come to Brunei, including the Body Shop, and the fast food chains McDonald's, Pizza Hut, and Kentucky Fried Chicken. The new Sultan Foundation complex of shops now stands in the center of Bandar Seri Begawan.

INTERNATIONAL TRADE

In 1999 the value of Brunei's exports reached US$2.55 billion, while imports were valued at US$1.3 billion. The country's export trade is dominated by petroleum products. In 1998 crude oil and partly refined petroleum accounted for an estimated 39 percent of total exports and natural gas for 49 percent. By far the most important export market is Japan, which took 42 percent of Brunei's exports in 1999, followed by the United States (17 percent), South Korea (14 percent), and Thailand (3 percent).

Since only a few non-oil products are produced locally, Brunei has to rely exclusively on imports for nearly all of its manufactured goods and most of its food. Singapore is the largest supplier of imported goods, accounting for 34 percent in 1999. The United Kingdom and Malaysia both provided 15 percent of imports, while the United States provided 5 percent. As in many other countries, Japanese products such as motor vehicles, construction equipment, electronic goods, and household appliances dominate Brunei's local markets.

Although Brunei enjoyed a positive trade balance (a **trade surplus**) throughout the late 1990s, that surplus has been shrinking. This phenomenon was caused by reduced earnings from petroleum and an increase in imports due to a demand for higher living standards.

MONEY

Brunei's financial system is operated by a **currency board** which regulates the issue and management of the currency. There are laws that govern and regulate the activities of banks and financial institutions, designed to ensure a stable and fiscally sound business environment.

The Brunei dollar is at par with the Singapore dollar and both are freely traded in their respective countries. The trend of interest rates follows that of Singapore. The peg to the Singapore dollar has helped maintain a stable **macroeconomic** environment. There are currently no exchange controls in Brunei.

The Brunei dollar appreciated (grew in value) steadily for years until the beginning of the Asian economic crisis in 1997, when the depreciation of currencies in neighboring countries caused the Brunei dollar to weaken in 1997 and 1998. The Brunei dollar continued to appreciate against these neighboring currencies but was offset by its depreciation against the U.S. dollar, Japanese yen, and major European currencies. This combined effect helped moderate imported inflationary pressures since ASEAN members account for 45 percent of Brunei's total imports, while the United States, Japan, and Europe account for 39 percent.

POVERTY AND WEALTH

As the monarch of a rich state, Brunei's ruler, Sultan Hassanal Bolkiah, has been named as one of the richest men in the world. His wealth mainly comes from oil,

GDP per Capita (US$)

Country	1975	1980	1985	1990	1998

Malaysia	1,750	2,348	2,644	3,164	4,251

SOURCE: United Nations. *Human Development Report 2000; Trends in human development and per capita income.*

and he has attracted international attention by purchasing luxury hotels in Singapore, Britain, and the United States, while making generous donations in the United Kingdom. All members of the Bruneian royal family are engaged in business transactions such as property purchasing and rental.

Wage and benefit packages in Brunei tend to be generous and the labor shortage ensures that most citizens command good salaries. There are nonetheless unemployed and poor members of society, but most of these live under the protection of an extended family system, where idle youth can find shelter and the aged and infirm are cared for. The citizens enjoyed a per capita GDP of US$17,600 in 2000.

Oil-rich Brunei has a wealth that enables the sultanate to maintain a **welfare state**. All Brunei citizens receive free education (through university for those who qualify), free health care, and various other **subsidies** such as subsidized housing, food, fuel, and low-interest loans for government employees. Brunei's health care system is one of the best in Asia. Every citizen of Brunei pays only a nominal fee for medical and dental services. Medical treatment unavailable in Brunei will be conducted overseas (usually in Singapore) at government expense.

WORKING CONDITIONS

Brunei suffers a serious shortage of both skilled and unskilled labor and has to recruit large numbers of these from abroad. It was estimated in 1997 that 60,000 out of the total workforce of 130,000 were foreigners. Many unskilled and manual workers from neighboring Malaysia, Thailand, the Philippines, and Bangladesh work mainly in the construction industry. The government is concerned that too large a number of foreigners in the country might disrupt Brunei's society and thus only issues work permits for short periods. Despite the need for foreign workers, there are still unemployed Bruneians, since they are reluctant to accept manual work (e.g. in the construction sector) and are not qualified to fill other vacancies. The unemployment rate in 2000 was 5 percent.

Brunei's dependence upon foreign labor stems from a cultural predisposition for public sector employment. Most Brunei Malays prefer to work in well-paid government jobs or for large companies such as Brunei Shell Petroleum (BSP), Royal Brunei Airlines (RBA), and the banks. In the private sector, which is subject to chronic labor shortage in both professional and unskilled fields, Chinese and other foreign nationals make up the bulk of the workforce.

Women's participation in the labor force has increased significantly from 29.5 percent in 1986 to 52.3 percent in 1999, partly offsetting the labor shortage. Brunei law protects women and children. Women under age 18 are not allowed to work at night or on offshore oil platforms, and the employment of children below the age of 16 is prohibited. The government has continued to set up a number of technical and vocational training institutions to improve the abilities of job seekers. Occupational health and safety standards apply, but enforcement is lax in the unskilled labor sectors, especially where foreign laborers work.

Trade unions in Brunei are legal but must be registered. Conditions, however, are not conducive to the development of trade unions: the cultural tradition favors consensus over confrontation and workers have little interest in participating. There are only 3 trade unions, all in the oil sector, and they are not particularly active.

COUNTRY HISTORY AND ECONOMIC DEVELOPMENT

1847. Brunei signs a trade relations treaty with Britain.

1888. Brunei becomes a British-protected state.

1906. A treaty is established with Britain, introducing a representative of the British government, known as a British resident, to advise the sultan on all matters with the exception of local customs and religious matters.

1929. Oil is discovered and explored at Seria.

1941–45. Brunei is occupied by the Japanese during World War II.

1950–67. Sultan Omar Ali reigns.

1959. An agreement is signed with Britain replacing the 1906 treaty and giving Brunei self-governance under a new constitution. The British remain responsible for both internal and international security.

1962. The Brunei People's Party wins election to the recently established legislature but is denied access to office. Its ensuing armed uprising is crushed, and the sultan claims full executive authority.

1967. Brunei issues its own currency.

1967. The 28th sultan, Omar Ali, voluntarily abdicates in favor of his eldest son, Hassanal Bolkiah.

1970. The state capital, Brunei Town, is renamed Bandar Seri Begawan.

1971. The 1959 agreement with Britain is amended to give Brunei responsibility for its own internal security.

1972. A deep-water port is opened in Muara.

1973. The world's largest liquefied natural gas (LNG) plant opens.

1974. The Brunei International Airport is opened, followed a year later by the creation of the Royal Brunei Airlines.

1979. Brunei and Britain sign The Treaty of Friendship and Co-operation laying down a timetable for complete Bruneian independence some 5 years later.

1984. Brunei resumes full independent political sovereignty. Brunei joins the Association of Southeast Asian Nations (ASEAN), the Organization of the Islamic Conference (OIC), and the United Nations.

1997. The Asian financial crisis brings a **recession** to Brunei and hits the construction sector especially hard.

FUTURE TRENDS

In 1998, hit by the Asian financial crisis and falling world oil prices, the Brunei economy slipped into a mild recession with a 1 percent growth rate. Rising oil prices in late 1999 increased Brunei's economic growth, estimated at between 3 and 3.5 percent in 2000. Despite the beneficial rise in oil prices, Brunei has continued with plans to **restructure** its economy away from overreliance on oil and gas. The Brunei Darussalam Economic Council (BDEC) will oversee this development. The government will continue with its short-term economic stimulus plan, boosting manufacturing and tourism and attempting to create an offshore financial center. However, the diversification effort remains impeded by high public sector remuneration, restrictions on activities open to foreign participation, and cumbersome foreign investment approval procedures.

Whether Brunei can achieve sustained economic growth and maintain high living standards depends heavily on the world economy, especially on world oil prices, and on the government's ability to formulate and implement successful economic measures to bring economic diversity.

DEPENDENCIES

Brunei Darussalam has no territories or colonies.

BURMA (MYANMAR)

Union of Burma
Pyidaungzu Myanma Naingngandaw

CAPITAL: Rangoon (Yangon).

MONETARY UNIT: Kyat (Kt). One kyat is equal to 100 pyas. There are coins of 1, 5, 10, 25 and 50 pyas and 1 kyat, and notes of 1, 5, 10, 15, 20, 40, 90, 100, 200, 500, and 1,000 kyat.

CHIEF EXPORTS: Pulses and beans, prawns, fish, rice, teak, and opiates.

CHIEF IMPORTS: Machinery, transport equipment, construction materials, and food products.

GROSS DOMESTIC PRODUCT: US$59.4 billion (purchasing power parity, 1999 est.).

BALANCE OF TRADE: **Exports:** US$1.2 billion (1998). **Imports:** US$2.5 billion (1998).

COUNTRY OVERVIEW

LOCATION AND SIZE. Situated between Indian and Thailand, Burma is a southeast Asian nation. From the borders of India and China in the north, the country extends into the Andaman Sea and the Bay of Bengal in the south. The country also shares borders with Laos and Bangladesh. Slightly smaller than the state of Texas, Burma has an area of 678,500 square kilometers (261,969 square miles). Its land borders are 5,876 kilometers (3,651 miles) long and its coastline, home to many excellent natural harbors, is 1,930 kilometers (1,199 miles) long. Burma's capital, Rangoon (also known as Yangon), is in the south. Mandalay, Moulmein, Pegu, Bassein, Taunggyi, Sittwe, and Myanwa are the other most important cities in the country.

POPULATION. The population of Burma, according to July 2000 estimates, was 41,734,853. A high mortality rate caused by AIDS is factored into this estimate; it is estimated that at least 1 million people are infected with HIV, the virus that causes AIDS. This high mortality rate from AIDS has slowed population growth to a projected rate of growth of 0.64 percent. The country registered a birth rate of 20.61 per 1000 population and a death rate of 12.35 per 1000; consequently, the population of Burma in 2015 is expected to be 45,925,967.

In the past, the government of Burma sought to restrict **emigration** (people leaving the country) and **immigration** (people settling there from outside the country). Burmese authorities negotiated with India to reduce the number of people of Indian origin in the country. As a result, Burma **repatriated** about 100,000 people to India between 1963 and 1965. Thousands of Burmese also fled to neighboring countries to escape military repression and armed conflicts in the ethnic minority areas.

Ethnic diversity is an interesting feature of the Burmese population. Burmans, an ethnic group related to the Tibetans, constitute the majority at 68 percent of the population. Shan (9 percent), Karen (7 percent), Rakhine (4 percent), Chinese (3 percent), Mon (2 percent), Indian (2 percent), and other ethnic groups account for the rest of the population mix. Buddhism is the major religion, with 89 percent of the population; there are minorities of Christians and Muslims. A majority of the people, 65 percent, are between the ages of 15 and 64. Only 5 percent of the population is older than 65, while 30 percent of the population is under 14 years of age. This is in sharp contrast to Japan, west European countries, and the United States where the number of older people in the population is much higher. The density of population is about 65.2 per square kilometer (169 per square mile). With agriculture as the most important occupation, a majority of the people live in the rural areas and only an estimated 27.3 percent (1999) reside in cities.

OVERVIEW OF ECONOMY

Despite many attempts to industrialize and modernize, Burma remains an essentially agricultural economy. Attempts in the 1990s to encourage foreign investments,

revitalize the economy, and promote the tourism industry as a source of income and employment have been only moderately successful. Agriculture remains the most dominant sector of the economy, generating 59 percent of the **gross domestic product** (GDP) in 1997 and employing more than 65 percent of the workforce in 1999.

Only 10,680 square kilometers (4,123 square miles) of the country's arable land was irrigated in 1993. Agriculture, for the most part, depends on the monsoon rains. Periodic droughts are a major problem. Similarly, natural disasters such as cyclones, earthquakes, floods, and landslides, especially during the long monsoon season, can have an adverse impact on agricultural production.

Until it became independent in 1948, Burma was a British colony. The colonial authorities promoted agriculture by encouraging the settlement of people in the delta regions. Roads, bridges, and ports were built to facilitate the movement of agricultural products. This development led to an internal migration from the dry northern regions to south of the country. The delta produced large quantities of rice. The British were not interested in encouraging industries in Burma. Foreign domination of the economy was complete.

During the 1950s, the capital of Rangoon was one of the commercial centers of Southeast Asia. At the time, the World Bank estimated that Burma would become one of the most prosperous countries of the region. But independence, democracy, and a free market economy failed to produce political stability or economic prosperity. In 1962, a military takeover of the government led to **socialism** and central economic planning. Foreign businesspeople—especially those from India, China, and Pakistan—were expelled and foreign investment in Burma stopped. The new rulers adopted a "Burmese road to socialism"—a policy of state socialism and isolationism (a policy of keeping foreign influence and involvement to a minimum so that a country can develop on its own). Economic conditions did not improve under the harsh rule of the generals; rather, they worsened. In 1987, the United Nations declared the country a "Least Developed Nation."

Many people in Burma remained antagonistic toward the military rule and the state-controlled economy. This opposition finally led to mass protests and violence in March 1988, which the government sought to suppress. The army chief of staff took control of the government, abandoned the 3-decade-old period of state socialism, and freed the market from most of the state controls.

Burma now has a mixed economy with a private, state, and a joint private-state sector. Agriculture, light industries, and other businesses are in the **private sector**. Heavy industries that require huge capital investment are in the state sector. The economic reforms of the last decade sought to promote **joint ventures** between private Burmese and foreign firms. Therefore, foreign investments were once again encouraged with modest success. The state sector continues to be inefficient, and attempts to **privatize** at least a portion of it remain on the books. **External debt** amounts to 10 percent of the GDP, and imports exceed exports by 2 to 1, causing a serious trade imbalance.

Burma is a top producer of illicit drugs and contributes 80 percent of all Southeast Asian production of

opium. Most of the heroin available in the United States originates from Burma. The trafficking in drugs is illegal; thus, an accurate assessment of its contribution to the economy is impossible to gauge. A parallel **black market**, perhaps bigger than the state's economy, continues to pose problems for the authorities.

During the 1998–99 **fiscal year**, Burma received an estimated US$99 million in economic aid. In 1995, the figure was about US$157 million. Economic **sanctions** imposed by the United States, the European Community, and other nations have contributed to this decline. These sanctions are in response to continued political repression and human rights violations by the military regime. In 1990, the opposition National League for Democracy (NLD) had won a clear victory in the elections, but the generals refused to transfer power to the duly-elected representatives of the people. Moreover, the leaders of the NLD were harassed, detained, tortured, and even murdered by the regime.

Politically and economically, Burma remains a pariah (outcast) nation. Except for its membership in the Association of Southeast Asian Nations (ASEAN), the country is not befriended by most nations. In May 2000, U.S. president Bill Clinton imposed new sanctions on the military junta (a group of military personnel who overthrow a government) making it difficult for the Burmese authorities to get foreign loans, economic assistance, and foreign investments. Many American companies such as Apple Computer, Oshkosh B'Gosh, Eddie Bauer, Reebok, Levi Strauss, Pepsi Cola, and Liz Claiborne have withdrawn from the country. Therefore, the attempts of the military junta to revitalize the economy have been only partly successful.

Despite the introduction of banking and trade regulations in the late 1990s, Burma failed to achieve fiscal or monetary stability. **Inflation** continues to be high. Although poor and undeveloped, Burma is rich in natural resources. Nevertheless, the decline of the agricultural sector, regional economic crises, international sanctions, and shortages of electricity have all contributed to a slowdown in the economy since 1997.

POLITICS, GOVERNMENT, AND TAXATION

Burma fought for independence from Great Britain in the late 1940s under the Anti-Fascist People's Freedom League led by Aung San, U Nu, and Ne Win. The independence movement was a pro-Burman, anti-British, and anti-foreign movement that emphasized Burmese values, symbols, and experiences. This movement had very strong socialist leanings in response to Chinese and Indian domination of the Burmese economy during the British rule. In 1948, the country became independent under the leadership of U Nu because his political opponents had already killed Aung San, the father of Burmese nationalism. In 1962 the army, under the leadership of Ne Win, overthrew the democratic government and set up the Burmese Socialist Party, **nationalized** schools, banks, and factories, and followed a policy of socialist central planning and international isolationism. Later on, the party of the generals changed its name to the Burma Socialist Program Party. In 1974, all political parties were abolished.

In September of 1988, amid massive demonstrations against the government, a new regime seized power in a military coup. Calling themselves the State Law and Order Restoration Council (SLORC), the new regime also changed the name of the country from Burma to Myanmar, something that opposition groups still object to. Following the anti-government protests, riots, and bloodshed in 1988, the opposition parties coalesced into the National League for Democracy (NLD) under the leadership Aung San Suu Kyi, the daughter of the martyred national hero, Aung San.

Responding to nationwide protests, the SLORC allowed national elections in May of 1990. The NLD dominated the elections, winning 80 percent of the seats in the National Assembly, but the ruling SLORC refused to concede power and imprisoned NLD leader Aung San Suu Kyi. Since that time the SLORC has exercised complete control over all branches of government. The National Assembly elected in 1990 has in fact never convened, the judicial system is bankrupt, and all executive positions are held by military representatives of the SLORC.

In 1997 the ruling SLORC was reorganized as the State Peace and Development Council (SPDC) amid a shakeup that saw several high officials dismissed for corruption. Five top generals, including Secretary Khin Nyunt, consolidated their power but showed no signs of ceding control of the government to the opposition, most of which was banned from any official forms of organization. Like the SLORC, the SPDC is primarily concerned with cracking down on opposition and not on improving the economic fortunes of the country.

The government's mounting deficit financing, resulting mostly from declining tax revenue and escalating military expenditures, has had a negative impact on the economy. The regime's policies led to the growth in the money supply and accelerated inflation. Mounting **foreign debt** and depleting **foreign exchange reserves** also affected the health of the economy. Military expenditures increased while the funding for health and education declined. The government's oppressive attitude towards the opposition has caused international censure, prompting foreign firms to pull out or cut back on their activities. Because of foreign economic sanctions, Burma is unable

to get assistance from other countries or loans from international funding sources.

The country's tax base shrank in the last years of the 20th century, due to the government's inability to collect taxes because of a corrupt bureaucracy and a black market perhaps as large as the legitimate market. The sources of government revenue include general sales and **value-added taxes**, income from state enterprises, taxes on international trade, fees, and grants from donor nations and international agencies. The government also collects customs at its border posts, but most of the border trade is unrecorded.

The judicial system that Burma inherited from its British colonial masters was abolished in 1974. The new constitution calls for a council of People's Justices. In addition, there are lower courts at the state, town, village and ward level. The courts settle both civil and criminal cases. The armed forces—controlling most aspects of the country's politics and government—also exert influence over Burma's judicial system.

INFRASTRUCTURE, POWER, AND COMMUNICATIONS

In most developing countries of the world including Burma, inadequate **infrastructure**—roads, bridges, canals, railways, ports and communication facilities—impedes economic growth. Burma's long coastline is home to many excellent natural harbors such as Bassein, Bhamo, Mandalay, Rangoon, and Tavoy. The government has taken steps to develop new ports and maintain the existing ones, although all the ports are not used to their maximum capacity. A salient geographic feature of Burma is its many rivers, especially the Irrawaddy. The country's waterways remain the most important traditional mode of transportation to many remote areas of the country. Of more than 12,800 kilometers (7,954 miles) of waterways, 3200 kilometers (1,988 miles) are navigable by large commercial vessels.

Since the economic **liberalization** in 1989, the government started many public works programs. Early in the 1990s the government used forced rural labor to work on these projects. However, due to international criticism, the government began to engage the armed forces on these construction projects starting in mid-1990s. These projects did not bring about major improvement in the infrastructure needs of the country. The result has been that economic expansion was made difficult because in the absence of adequate transportation facilities, distribution of goods and services has been extremely difficult and costly.

In 1996, Burma had a total of 28,200 kilometers (17,523 miles) of roads, of which only 3,440 kilometers (2,138 miles) were paved. Although the government attempted to improve many major roadways during the final years of the 20th century, most remain in poor repair and are not passable during the monsoon season. A major effort in this regard was to reconstruct the Old Burma Road from Mandalay to the borders of China. As of late 2000, the work on the project was still incomplete.

Rail services remain poor despite attempts in the 1990s to renovate the existing lines, add new ones, and upgrade railway services on the main routes. Burma has a total of 3,991 kilometers (2,480 miles) of railways, over 320 locomotives, and more than 4,000 rail cars. The recent efforts include upgrading Rangoon-Mandalay rail line and beginning a new 162-kilometer Ye-Dawai Rail track project. In the 1995–96 fiscal year the railways carried 53,400,000 passengers and 3,280,000 tons of freight.

Burma has 80 airports and 1 heliport. Only 10 airports have paved runways. Both the private sector and the state sector are active in air transportation. The Department of Civil Aviation is responsible for the airports and the state-run airline. Air Mandalay, Myanma Airways, and Myanma Airways International are the chief airlines of the country. Burma's chief airports at Rangoon, Mandalay, and Bago were upgraded in the late

1990s. During the 1995–96 fiscal year state-run airlines carried a total of 719,000 domestic passengers and 138,000 international passengers.

Light transportation such as buses and cars are a private sector activity in Burma. As of March 31, 1996, Burma had 151,934 passenger cars, 42,828 trucks, 15,639 buses, 88,521 motorcycles, and another 6,611 registered vehicles.

Also during 1996, state-owned maritime vessels carried 24,491,000 passengers and 3,158,000 tons of freight. These numbers show an increase over the same period of the previous fiscal year.

Industrial production and expansion are limited due to inadequate production and intermittent supply of electric power. Electricity production of 4.38 billion kilowatt-hours (kWh) in 1998 was far below demand. Around 38 percent of the electricity is generated by hydroelectric projects while the remaining 62 percent comes from fossil fuels. Chronic shortages and frequent disruptions of supply exist. Therefore, state and private enterprises operate far below their capacity. Moreover, very often they have to depend on their own diesel-run power generators to meet their electrical needs.

As of 1995, there were 158,000 main telephone lines. In 1997, there were 500 exchanges with a capacity to reach 320 of the 324 townships in the nation. The number of mobile cellular phones was only 2,007 in 1995. Although the telephone system is capable of providing basic services, it is inefficient and outdated. Attempts in the 1990s to upgrade the system yielded only minimal results. Cellular and wireless phones function more efficiently than the traditional lines. The switching system is incapable of meeting current demands, and people have to wait for a long time for a telephone connection to their homes and factories. International service powered by a satellite earth station is relatively good.

The 2 television stations in Burma service 260,000 (1997) television sets. TV Burma is able to transmit 82 percent of its broadcasts to 267 of the 324 townships in the country with the help of 120 TV relay stations. These are in addition to Burma's 2 AM, 3 FM, and 3 shortwave radio stations. In 1997 the country had a total of 4.2 million radio sets. Radio and television stations are state-owned and operated. In 1996, there were 5 newspapers with an estimated circulation of 449,000, a significant decline from 1994 circulation figures.

There are about 50,000 computers in all of Burma. Public access to the Internet is prohibited for fear that it could encourage and widen political dissent and protest. Unauthorized ownership of modems is punishable by up to 15 years in jail. E-mail is restricted to foreigners and businesspeople with close ties to the administration. Private e-mail providers are prohibited, and only the Ministry of Post and Telegraph is allowed to provide e-mail service.

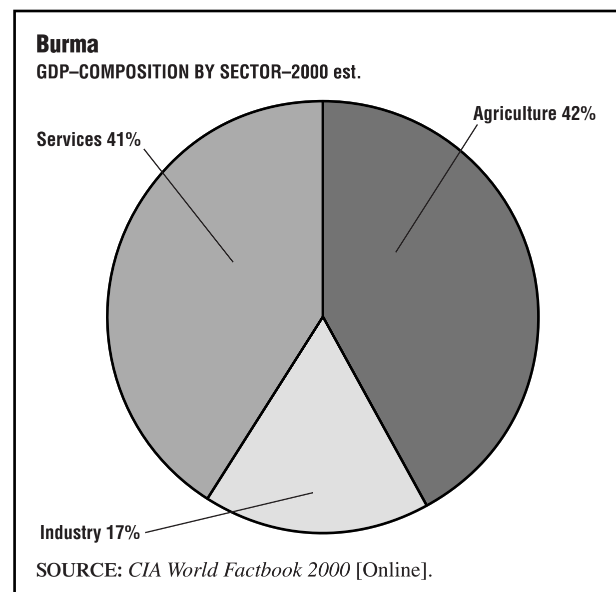
Improvements in the infrastructure were partly funded by deficit spending. In the absence of adequate funds, the government is unable to fully develop the country's transportation and communication systems and facilities. This situation had a negative impact on modernization and economic growth of the country for many decades.

ECONOMIC SECTORS

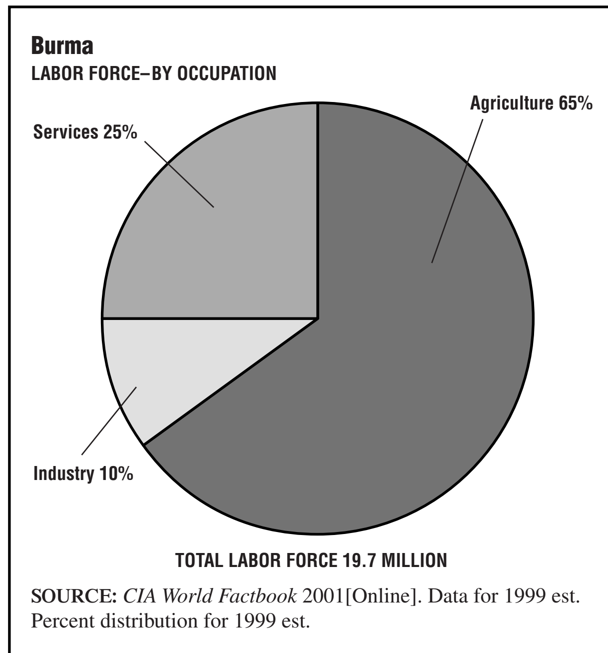
Agriculture, industries, energy and tourism are the main sectors of the Burma economy. Agriculture, however, is the dominant sector and accounts for almost 60 percent of the GDP. The heavy industries are owned and operated by the state. Agriculture is mostly a private activity, although rice exports are a state **monopoly**. Recent government initiatives to improve agricultural production failed because drought and flooding diminished in rice production. The cultivation of pulses and beans, however, has increased significantly.

Industrial manufacturing is still undeveloped. Government attempts to privatize some industries have stalled, even though government-owned concerns continue to lose large sums of money. Foreign investments, although encouraged, have failed to generate enough international interest due to sanctions and boycotts protesting the military regime's human rights violations. All told, industry contributed just 11 percent of GDP in 1997.

The energy sector grew considerably during the late 1990s. The exploration and discovery of petroleum and



SOURCE: *CIA World Factbook 2000* [Online].



SOURCE: *CIA World Factbook* 2001[Online]. Data for 1999 est. Percent distribution for 1999 est.

natural gas deposits continued during this period. The construction of the Yadna gas pipeline to Thailand was a major development and is expected to be a major source of revenue. The lack of sufficient electrical power contributes to the country's poor economic growth.

Following the military crackdown on the pro-democracy movement in 1988, there was a sharp decline in the number of foreign tourists visiting the country. Early in the 1990s the government placed great emphasis on tourism development. The government's attempt to turn tourism into a "cash cow" has not materialized, although the number of people visiting Burma has certainly increased in the last several years.

Realizing the difficulties on the road to rapid industrialization, the government of Burma, while not giving up on industrialization, is hoping to make the agricultural sector the centerpiece of its plans for economic revitalization of the country. This sector, however, has seen declining financial returns. Burma is caught in a vicious circle of inflation, deficit financing, unemployment, and poverty. In an age of increasing international interdependence, Burma cannot expect to develop without the cooperation of the international community.

AGRICULTURE

Agriculture, which includes crop production, hunting, fishing, and forestry, is the mainstay of the Burma economy. This sector is responsible for much of the income and employment in the country. About 60 percent of the GDP comes from agriculture, and as much as 65 percent of the **labor force** is employed in this sector alone. Burma produces enough food to feed its entire population. In the absence of purchasing power, however, many people go hungry. Further, about a third of the rural households do not have any land or livestock. Only half of the arable 45 million acres is under cultivation.

Rice is the most important agricultural commodity of Burma. Rice production increased from 5,200,000 metric tons in 1950 to 16,760,000 metric tons in 1993. The crop is cultivated along the river valleys, coastal areas, and in the Irrawaddy River delta. A wide variety of crops are cultivated in the northern dry zone. Rubber and other commercially useful products are cultivated in the Irrawaddy and Tenasserim regions. Agricultural products form the bulk of the export trade and include rice, teak, prawns, beans and pulses, and opiates.

Burma's agriculture is heavily dependent on the monsoon rains. While some areas suffer from too much rain, other regions receive too little. Government efforts in the 1990s increased the amount of irrigated land to 2.2 million acres. Many agricultural products like tobacco, sugar, groundnut, sunflower, maize, jute and wheat, however, have not reached their pre-1985 production levels. This reduction is offset by higher production in rice, pulses and beans. Rice production increased due to supportive government policies as well as favorable market forces. According to Asian Development Bank estimates, however, real annual growth in agriculture declined from 5.0 percent in 1996–97 to 3.7 percent in 1997–98 and to 2.8 in the 1998–99 fiscal years. Further, per-acre yield of the crops has not increased because of inadequate application of fertilizers and pesticides. One factor that helped to improve production was the removal of government controls over the agricultural sector.

Deforestation has been a major concern in Burma. The slash-and-burn method of agriculture is destroying the forests of the country, causing soil erosion and depletion of fertility. Periodic droughts, floods, landslides, and cyclones sometimes have devastating effect on agriculture. For example, flooding in Pegu and Irrawaddy during the 1997–98 growing season did considerable damage to rice production. Consequently, Burma exported only 28.4 thousand metric tons of rice in the 1997–98 season as opposed to 93.1 thousand metric tons in the previous year.

The heavy reliance on monsoons is a major handicap for Burmese agriculture. The authorities have recently renovated dams and reservoirs, built new ones, pumped water from rivers and streams and taken other measures to improve irrigation. More remains to be done in this regard. Another impediment to agricultural improvement is the inability of farmers to secure adequate loans to enhance cultivation. Private lenders charge exorbitant rates, and there are not enough banking institutions to serve people in the rural areas. As a result, farm-

ers are not able to buy fertilizers and pesticides for their crops. Financial services need to be improved to make funds available to the cultivators.

The economic liberalization policies of the military junta have transformed the agricultural sector. Under the new economic system, the government distributed land among the landless, improved irrigation facilities, and increased the **floor price** of paddy that the government procures from the farmers. Some private activity in the export sector has been allowed since economic liberalization began in 1989. Consequently, the share of the agricultural sector in the GDP has gone up.

LIVESTOCK. Burmese farmers raise a variety of animals including cattle, water buffalo, goats, sheep, chickens, and pigs. Oxen and water buffalo serve as draught animals in agriculture and for rural transportation. The GDP share of the livestock has increased slightly during the past decade. Most of the cattle are raised in the dry zone in the north.

FORESTRY. Burma is rich in forests and woodland. While its neighbors, India, China and Thailand, have already depleted their forests, Burma is still regarded as the "last frontier of biodiversity in Asia." (Biodiversity refers to ecosystems that are rich, varied, and largely unpolluted or tampered with by human development.) Most of the timbers, especially teakwood, consumed in these Asian countries come from Burma, although most of these exports are illegal. In their search for precious foreign exchange, the military junta is engaged in indiscriminate destruction of forests. Deforestation increases erosion and landslides and threatens the lives of many already endangered species in the rain forests.

Burma is the leading supplier of teak in the international market. In addition to hardwoods, Burma also produces large quantities of bamboo in the delta regions and in the areas of heavy rainfall. Elephants and water buffalo play a key role in hauling teak and other hardwoods.

FISHING. Burma is blessed with some of the world's most bountiful fishing grounds that extend from the Bay of Bengal to the Gulf of Martaban. Fish, often dried and salted, is part of Burmese cooking and is the most important source of protein in the diet. The government took many steps to encourage deep-sea fishing although the people prefer fresh-water fish. There has been a steady increase in the catch since the 1980s. Since 1989, Thai companies have been given permission to fish in the Burma waters. They use a modernized trawler fleet to harvest fish. The government also encourages fresh-water fish farms with a view to increasing fish production. Moreover, the Tenasserim area is home to some of world's finest pearls. As a result, the export value of fish and fish products alone has gone up from 159.4 million kyats in 1995–1996 to 227.8 million in 1996–97.

INDUSTRY

Primarily an agricultural country, Burma has always lagged behind in industrial production. The colonial authorities discouraged industrialization and encouraged only the production of raw materials, although there were some industrial developments towards the end of the colonial period.

World War II caused serious damage to the country's infant industries. It took a long time for production to catch up to pre-war levels, and in 1952, the government established the Industrial Development Corporation to stimulate industrial production. The country's effort to industrialize without foreign assistance was successful to a certain extent in areas such as petroleum and natural gas production. In the 1960s, under military rule, many industries were nationalized. Since the 1970s, there has been a steady growth in industrial production. In 1988, the government liberalized the economy, abandoned state socialism, and encouraged foreign investment.

Much of the industrial sector, especially heavy industries, is controlled by the government, although the share of private enterprise in this area is steadily growing. Industry accounts for only about 11 percent of the GDP and employs only 10 percent of the total labor force. Most of the industries center around agricultural processing, textiles, footwear, wood and wood products, copper, tin, tungsten, iron, construction materials, petroleum and natural gas, pharmaceuticals, and fertilizers. Cars and television sets are also assembled in the country. In 1999, the annual rate of growth of industries was estimated at 4 percent. The heavy losses of the **public sector** factories and industries are in part responsible for slow industrial growth.

Pegu is the seat of most industrial activity. In addition, the government has opened 17 special industrial zones all over the country, 5 of which are in the Rangoon area. Foreign investment is encouraged in 2 of the zones. While these zones are not fully developed, several factories and plants manufacturing clothing, **consumer goods**, and iron and steel materials are already operating there.

MINING. Although their GDP contribution is not very significant, mineral products are important in earning foreign exchange. Burma has large amounts of mineral deposits. They include tin, zinc, copper, tungsten, lead, silver, gold, iron and antimony. Coal, natural gas, and crude oil are also extracted. Jade, rubies, sapphires, and gold are also found in Burma. Should the country ever open to foreign investment there may be significant opportunities for development in this sector.

OIL AND NATURAL GAS. Burma's petroleum industry dates back to pre-independence days. During 1963–1964,

the government took complete control of petroleum exploration, extraction, and purification. Petroleum is found in the Irrawaddy basin, the delta region, and at offshore sites. Burma is self-sufficient in oil.

The discovery of natural gas reserves in the Gulf of Martaban added to Burma's energy reserve. In 1986 the country produced 32,600 million cubic feet of natural gas. Burma also has large deposits of natural gas in the Andaman off-shore fields. In its efforts to facilitate the growth of its energy sector, the government built the Yadana natural gas pipeline, connecting natural gas stores off the Andaman Islands and Thailand, with the help of Unocal and Total, 2 international petroleum companies. According to government estimates, the energy sector grew approximately 88 percent in 1998. Government projections showed a 77 percent growth for the year 1999.

SERVICES

With just 30 percent of GDP and 25 percent of the workforce, the services sector is not a dominant part of the economy as it often is in developed countries.

TOURISM. Like the cash-strapped countries of Jamaica and Cuba, Burma is also actively promoting itself as an island paradise to increase tourism. Both the government and private enterprises are heavily engaged in the tourism industry. In order to attract tourists, the country has improved roads, built international standard hotels, and other facilities. In 1988, roughly 40,000 foreigners visited the country, although following the suppression of the democracy movement that same year, tourism decreased. Between 1993 and 1996, tourism once again revived. The government proclaimed 1996 as "Visit Burma Year" and hoped to attract 500,000 tourists. However, only 180,000 people showed up. In the 1997–98 fiscal year 191,000 tourists visited the country. Both the government and the private sector, having invested heavily in new tourist facilities, were disappointed.

Nevertheless, Burma—the land of Buddhist pagodas—has great tourism potential. Rangoon, Mandalay, Pagan, Pegu, and Tawnggys, with their palaces and shrines and pagodas, are the centers of tourism. However, the tense political situation, human rights violations, and boycotts by the international community have deterred many people from visiting. Tourism, so far, makes up only a small percentage of the GDP.

FINANCE. During the post-independence days, most financial institutions were private. In 1964, the military junta nationalized all of the country's 24 banks. In their place, the government created 4 state banks. In 1990, the financial sector was revamped under the provisions of the Central Bank of Myanmar Law. Since then the financial institutions are the Central Bank of Myanmar, the Myanmar Agricultural and Rural Development Bank, the Myanma Economic Bank, the Myanma Foreign Trade Bank, the Myanma Industrial and Commercial Bank, the Myanma Small Loans Enterprise, and Myanmar Insurance. The 1990 law also allowed for both private and foreign banks. As a result, by February 1996, 16 private banks were formed, most of them in Rangoon. During the same period, more than 20 foreign banks opened branches or offices in Myanmar.

The banking sector is still underdeveloped. The people have yet to maintain regular banking habits. The **inflation rate** is so high that the real rate of interest does not encourage deposits. But without deposits, banks cannot provide credit. In contrast, during the 1970s, when the interest rate was raised, people deposited more money in the banks.

The Burma Securities Exchange was founded in 1996 as a joint venture between Japan's Daiwa Institute of Research and Myanma Economic Bank. The financial sector contributes only a small percentage of the GDP.

INTERNATIONAL TRADE

Historically, most of Burma's export-import trade was with Asian countries. In 1999, more than 80 percent of the country's export-import trade was with Asian nations, including about half with ASEAN countries. Japan, Singapore, Malaysia, and China are its major trading partners. Singapore is the single most important partner both in terms of imports and exports, providing 31 percent of imports and taking 10 percent of exports. There has been a decline in trade with Europe and the United States since the 1988 military crackdown on the democracy movement. Burma's export-import trade with the United States constitutes about 5 percent of the total foreign trade.

The country's exports are mostly agricultural products. They include pulses and beans, teak, prawns, rubber, rice and other agricultural products. There is a large black market that smuggles live animals, gems, minerals, teak, and rice into the neighboring countries. Burma

Trade (expressed in billions of US$): Burma

	Exports	Imports
1975	.173	.197
1980	.472	.353
1985	.303	.283
1990	.325	.270
1995	.846	1.335
1998	1.067	2.666

SOURCE: International Monetary Fund. *International Financial Statistics Yearbook 1999.*

also conducts brisk trade in narcotics. During the 1997–98 fiscal year, imports included raw materials, transport equipment, construction materials, and food items. While priority was given to the importation of materials needed for the Yadana natural gas pipeline, the government took measures to control importation of non-essential goods.

In 1998 the country exported $1.2 billion in goods and services while importing $2.5 billion, reflecting a steady increase of imports over exports during the 1993–98 period. In fact, the trade imbalance has been a chronic problem for the country for well over 2 decades. During the 1965–75 period, rice exports fell, and Burma cut back on imports. During the 1976–80 period, although exports increased, there was a corresponding increase in imports. By the mid-1980s, exports declined, but imports continued to soar. The adverse **balance of payment** situation continues to plague Burma.

This imbalance has a negative impact on the economy as a whole, forcing Burma to spend its precious foreign exchange reserves. To compensate for this situation, the government has printed currency to buy foreign exchange, thereby accelerating the inflationary tendencies of the economy. This inflation has wiped out many of the gains the country made as a result of economic liberalization in the 1990s. Making matters worse, the government had to buy foreign exchange from foreign sources at commercial rates. Consequently, Burma was unable to service its debt payment, prompting the World Bank to sever ties with the country. The net effect for Burma's people is that their purchasing power and standard of living declined.

The regime, while continuing to increase military spending, was forced to cut back on education, health, and other essential services. Growing international concern about human rights abuses and the regime's inability to tackle narcotics trafficking have led many countries, including the United States, and international financial institutions, to refuse aid or loans to the country. The government's use of forced labor has also led to boycotts of Burmese goods.

MONEY

Adverse balance of payments, decreasing tax revenues, high defense spending, and deficit financing all have led to the printing of more currency and price inflation. The official **exchange rate** of the kyat to dollar, however, remains unchanged. There are 4 different rates for currency exchange: the official exchange rate, the customs rate, the official market rate, and the black market rate. Officially, US$1 equals 6.73 kyats, whereas in the black market the dollar may fetch 375 or more kyats.

Exchange rates: Burma

kyats per US$1	
Jan 2001	6.5972
2000	6.5167
1999	6.2858
1998	6.3432
1997	6.2418
1996	5.9176

SOURCE: CIA *World Factbook 2001* [ONLINE].

The Asian currency crisis of 1997 added to Burma's currency woes. The sharp decline in the Thai bhat had a negative impact on the kyat. During the 1997–98 fiscal year, according to U.S. embassy estimates, the kyat lost 54 percent of its value. Between April and December 1997, the kyat declined from 167/dollar to 257/dollar. In 1997 and 1998, when the kyat fell, the government intervened to prop up the value of the kyat and took strong measures to keep foreign exchange from leaving the country. It put a monthly cap of $50,000 on **remittances**, cut the number of banks allowed to handle foreign exchange transactions, and placed stiff controls on trade.

The Asian economic crisis prompted foreign investors to either withhold investments or stay out of the Burmese market. Crises in the neighboring countries, Burma's principal trading partners, cost the country its export markets. The resultant ballooning of the **trade deficit** prompted the country to expand its money supply and draw down on foreign exchange reserves. According to the U.S. State Department *Commercial Guide* for 1999, the country was "virtually bankrupt."

POVERTY AND WEALTH

Like most countries of the world, Burma has extremes of wealth and poverty. Once prosperous, Burma was, in 2001, one of the poorest countries of the world.

GDP per Capita (US$)

Country	1996	1997	1998	1999	2000
Burma	1,120	1,190	1,200	1,200	1,500
United States	28,600	30,200	31,500	33,900	36,200
China	2,800	3,460	3,600	3,800	3,600
Thailand	7,700	8,800	6,100	6,400	6,700

Data are estimates.

SOURCE: *Handbook of the Nations*, 17th, 18th, 19th and 20th editions for 1996, 1997, 1998 and 1999 data; CIA *World Factbook 2001* [Online] for 2000 data.

Most people live in the 40,000-odd villages of the country, while the majority of the urban population resides in the capital city of Rangoon. Among the population engaged in agriculture, 37 percent of the people do not have any land or livestock. Poverty and misery have increased in the past 3 decades. In 1997 the CIA *World Factbook* estimated that 23 percent of the Burmese population had incomes that placed them below the poverty line.

The economic crisis of 1997 added to the problem. Inflation as of 1999 was at an all-time high of 50 percent on domestic goods and 104 percent on imported items. The government's policies have not helped to diminish inflation, which has eroded the purchasing power of Burma's citizens. The gap between rich and poor and rural and urban areas has increased. According to the International Monetary Fund (IMF), per capita income registered only a minimal increase in the 1990s. Many poor people are forced to send their children to work. Many women reportedly are sent to work in Thailand. The number of street children has also increased, and malnutrition among children is widespread. Sanitary conditions are far from satisfactory. Malaria, diarrhea, dysentery, tuberculosis, and more recently HIV/AIDS (due to drugs and prostitution) are the major health hazards of the country.

In the countryside, a bullock cart (a 2-wheeled cart drawn by 2 castrated bulls) is the most popular means of transportation. Most farmers own a pair of oxen or water buffalo, a hoe, and a bullock cart for agricultural purposes. The rural houses (actually huts without running water or toilets) are made of bamboo. One portion is used for cooking and the other for sleeping. In the major towns and cities, there are houses made of brick and concrete. They are usually small and overcrowded.

The government's socio-economic policies have not helped the people. Large outlays of money have been spent on the military, while only meager funds have gone to education and health issues. The numbers of children who do not attend school or who have dropped out reportedly increased in the 1990s. According to World Bank estimates, only 46.9 percent of the secondary school-age children were enrolled in schools during 1995. Education beyond the primary age is not compulsory. Burmese authorities boast a literacy rate of 83 percent, though independent observers have suggested that the rate may be as low as 30 percent. Most universities have been closed since December 1996.

Health care in the rural areas was marginal until the 1960s. The government has opened more rural health centers and directed more doctors to the rural areas. As a result, the doctor-patient ratio has decreased considerably, from 1 per 15,560 to 1 per 3,578 in 1986. Health care is provided free of charge.

WORKING CONDITIONS

The Burmese labor force is estimated to be 19.7 million strong and consists of people between the ages of 15 and 59. About 65 percent of the labor force is employed in the agriculture sector. Of the remaining 35 percent, 10 percent is employed in the industrial sector while the remaining 25 percent is employed in a variety of service sectors. The official government unemployment rate for the fiscal year 1997–98 was reported as 7.1 percent.

One serious concern about the Burma labor situation is the reported use of forced labor on public works projects. In November 2000, the International Labor Organization (ILO) concluded that Burmese authorities had not discontinued the practice and advised member nations to review their relations with Burma. In response, Burmese authorities said that they would stop cooperating with the ILO. The government has maintained that the ILO action represented an effort by its member states to exert improper influence on Burma's internal affairs.

According to U.S. sources in Rangoon, the government lessened its dependence on forced labor. Instead, it was using military personnel on some of these projects. Military authorities, however, continue to force civilians to work for them. Many women and children, for instance, have to work as porters for the army.

There are reports of the continued prevalence of child labor in the country. Legally, children must be 13 or above before they can be employed. This and the compulsory education law, however, are not fully enforced. Consequently, a large number of children never enroll in school and many do not complete the primary school course. Therefore, children are frequently employed in many areas, especially in the arts and crafts industries.

Since the military takeover in 1962, the authorities have consistently denied the people their freedom of speech, press, assembly, and association. Also in 1964, the government abolished all trade union organizations. Substituting for independent unions are government-sponsored Regional Workers Councils. In 1985, there were 1.8 million members. Coordinating the work of the regional councils is the central workers organization in Rangoon, formed in 1968. The Central Arbitration Board is given the responsibility to settle major labor disputes but is inactive. Minor labor concerns are addressed by the township level agencies. One labor organization, the Federation of Trade Unions-Burma (FTUB), is an anti-government group that was formed in 1991 by Burmese living in exile.

Working conditions were set forth in a 1964 law called The Law on Fundamental Workers' Rights and the Factories Act of 1951. An abundance of labor and the failure of the government to protect the workers have led

to substandard working conditions. The public sector employees follow a 5-day, 35-hour workweek. Employees in the private sector and state enterprises have a 6-day, 44-hour workweek. The law provides for overtime pay. However, these laws cover only a small percentage of the workers. Moreover, the workers are not allowed to organize in unions and bargain collectively. In the public sector industries, the government sets the wages and benefits. The **joint sector** companies are discouraged from paying their employees more than their counterparts in the public sector.

As of March 2000, all institutions of higher education, with the exception of a military academy and a medical school affiliated with the army, were closed. The middle class is frustrated that their children are not able to get an education. Many Burmese of all classes have fled the country for fear of oppression. Thousands of Burmese refugees remain in camps in Thailand and Bangladesh.

COUNTRY HISTORY AND ECONOMIC DEVELOPMENT

1044. Pagan empire is founded on the banks of Irrawaddy.

1824. First Anglo-Burmese war leads to Burmese defeat and loss of territory.

1886. Burma is defeated in the Second Anglo-Burmese war, and Britain annexes the remainder of the country's territory.

1941–45. Japanese forces invade Burma and occupy much of the country during World War II.

1948. Burma becomes an independent, democratic country with a free market economy.

1962. The military under General Ne Win overthrows democracy, establishing the "Burmese way to socialism" and nationalizing banks and other private industries.

1974. The government establishes a new constitution and announces the formation of the Socialist Republic of the Union of Burma.

1988. Amid widespread protests and riots, a military junta headed by Generals Ne Win and Saw Maung replaces the civilian president with a new government called the State Law and Order Restoration Council (SLORC). The SLORC renames the nation the Union of Myanmar, dropping the name "Burma," and liberalizes the economy.

1990. Elections are held, and the opposition National League for Democracy wins a clear majority. The SLORC refuses to cede power and opposition leaders are jailed.

1997. The Asian economic crisis damages Burma's economy.

2000. The International Labor Organization concludes that Burma is in violation of rules regarding forced labor and advises member nations to review their relations with Burma.

FUTURE TRENDS

Burma is a resource-rich, naturally beautiful, and culturally significant country. Its potential for growth and prosperity is tremendous. Yet Burma can never reach its potential until the military regime negotiates with the opposition and transfers power to the elected representatives of the people. The regime, however, has been trying to eradicate the opposition. Most international observers agree that the government must end human rights violations, release political prisoners, establish sound **monetary policies**, increase the tax base and revenue, enhance the infrastructure, and further liberalize the public sector if the country has any hopes of taking its place in international commerce. Despite announcing plans for such improvements, however, the ruling SPDC seems most concerned with retaining its grip on power through violence and intimidation of internal opposition and disengagement with the international community. In the absence of a change in this program, economic stagnation, poverty, disease, and illiteracy will remain Burma's most notable features.

DEPENDENCIES

Burma (Myanmar) has no territories or colonies.

—George Thadathil

CAMBODIA

Kingdom of Cambodia
Preahreacheanachakr Kampuchea

CAPITAL: Phnom Penh.

MONETARY UNIT: Cambodian riel (KHR). One riel equals 100 sen. There are no coins in use, but there are notes of 100, 200, 500, and 1,000 riel. The 1,000 riel note (worth about a quarter in U.S. currency) is the most commonly used. In recent years Cambodia has basically become a dollarized economy. People often pay for goods and services in dollars, but receive small change in riel banknotes.

CHIEF EXPORTS: Timber, garments, rubber, rice, and fish.

CHIEF IMPORTS: Cigarettes, gold, construction materials, petroleum products, machinery, and motor vehicles.

GROSS DOMESTIC PRODUCT: US$16.1 billion (purchasing power parity, 2000 est.).

BALANCE OF TRADE: **Exports:** US$942 million (f.o.b., 2000). **Imports:** US$1.3 billion (f.o.b., 2000).

COUNTRY OVERVIEW

LOCATION AND SIZE. Cambodia is one of the ten nations of Southeast Asia and part of mainland Southeast Asia. It is bordered on the north by Laos and Thailand, on the west by Thailand, and on the east by Vietnam. Its geographic area is 181,040 square kilometers (69,900 square miles), making it slightly smaller than the state of Oklahoma. Its total land boundaries are 2,572 kilometers (1,598 miles), and it has a coastline on the Gulf of Thailand of 443 kilometers (275 miles). The Mekong River flows directly through the country from north to south, eventually flowing into the Mekong Delta of Vietnam. Cambodia's largest city and capital, Phnom Penh, is on the Mekong River. The other major cities in Cambodia are Battambang, Siem Reap (the gateway to Angkor Wat), and Kampong Saom (Sihanoukville), Cambodia's major port.

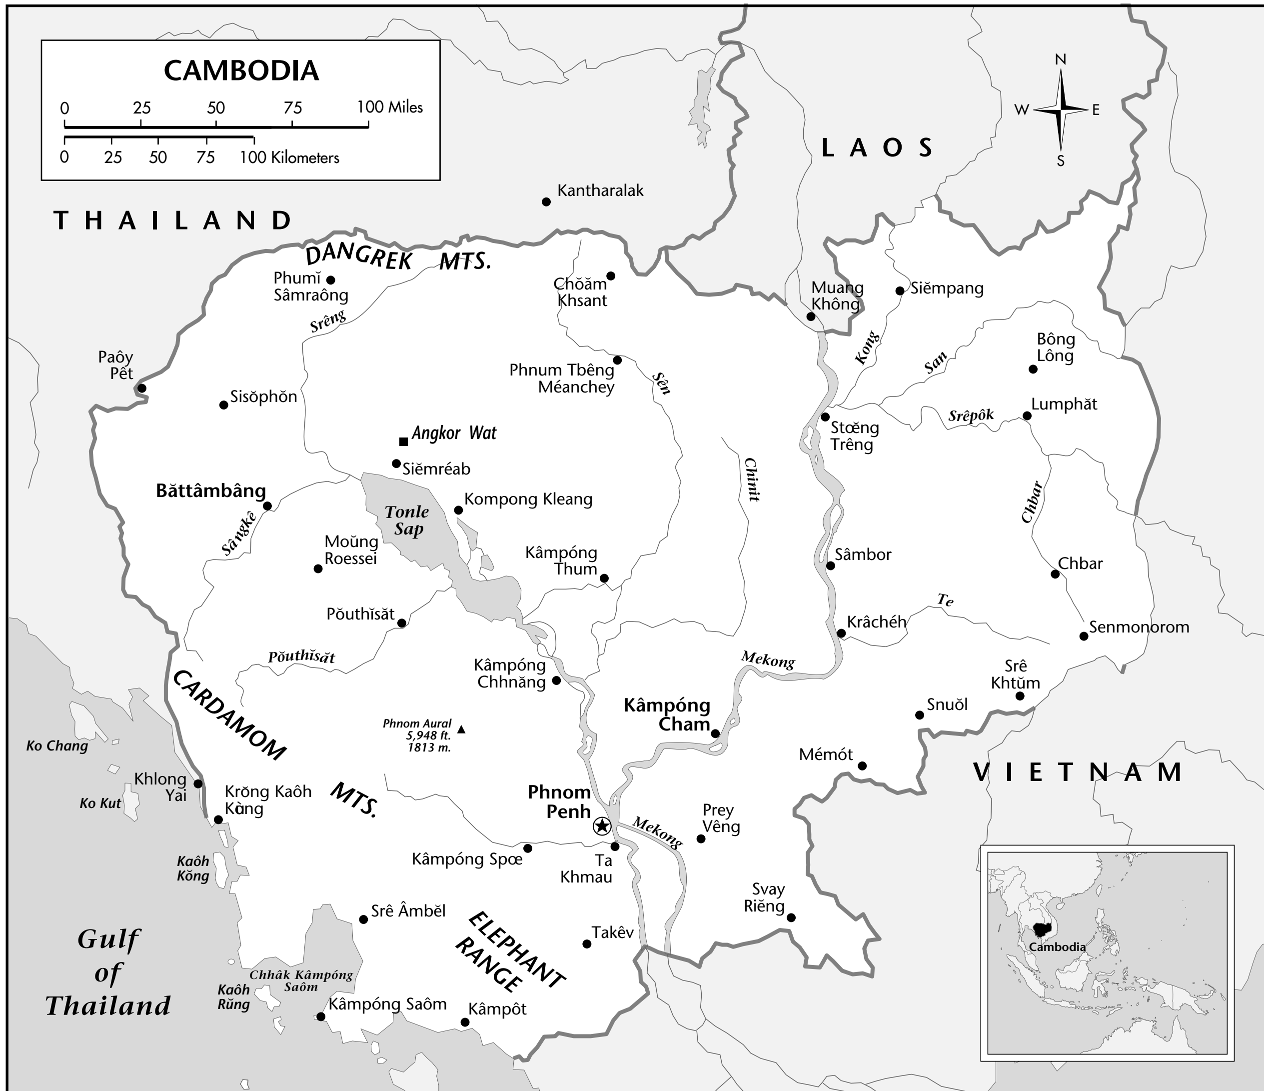
POPULATION. Cambodia's population was 12,491,501 in July of 2001, according to the CIA *World Factbook.* This compares with a population of 5,728,772 in 1962; 6,682,200 in 1981; and 11,426,223 in 1998. The current population growth rate is a relatively high 2.25 percent. If this population rate were to continue, the country's population would double to approximately 25 million by the year 2033. The major cause of this high population growth rate is the high fertility rate of Cambodian women. The average Cambodian woman has 4.74 children.

With such a high fertility rate and the loss of much of the adult population through the prolonged civil war (1970–75, 1979–98), the Cambodian population is extremely young. Around 41.25 percent of the population is less than 15 years of age, and only 3.47 percent of the population is over 65. Unfortunately, Cambodia has a serious AIDS problem, which will have a negative effect on its future population growth. In 1999, it was estimated that the HIV/AIDS incidence among adults was 4.04 percent.

Unlike many other Southeast Asian countries such as Laos, Burma, Indonesia, and the Philippines, the Cambodian population is relatively homogenous. Approximately 90 percent of the population is Khmer, with 5 percent Vietnamese, 1 percent Chinese, and 4 percent other (Cham, Lao, Tai, and various hill peoples in northeastern areas such as Ratanakiri and Mondulkiri). Khmer is also the official language. Theravada Buddhists are the dominant religious group, claiming 95 percent of the population.

OVERVIEW OF ECONOMY

Cambodia is one of the world's poorest economies, and, thus, economic development is its highest priority. Much of its population is involved in **subsistence**



farming (families producing what is needed for daily living). About 66 percent of the country is forested or woodlands, with only 13 percent of the land arable.

Another major disadvantage has been Cambodia's long period of turmoil and civil strife, which began in 1970 with the overthrow of the government of Prince Sihanouk. That strife and instability lasted 28 years and severely and adversely affected the Cambodian economy, its human resource base, and its physical **infrastructure**.

With respect to its economic history, Cambodia is an excellent example of pre-development (advanced development centuries before the European Renaissance). Its prehistory dates back to the fourth millennium B.C. By 500 B.C., the use of metal had become widespread. As early as the 3rd century there was an Indianized trading state named Funan with Mon-Khmer inhabitants. In the last half of the 6th century, a new state Chenla emerged.

The years from 802 to 1432 mark the period of the great Angkor Khmer civilization. This Khmer civilization produced the largest religious monument in the world, the Angkor Wat complex. The Chinese sailor, Chou Ta-kuan, visited Angkor and described vividly the Khmer Empire at that time. The dynamic leadership of King Jayavarman VII produced an impressive network of hospitals, royal roads, rest houses, and advanced hydraulic irrigation schemes which allowed for as many as 3 crops of rice each year. During the reign of Jayavarman VII the Khmer Empire encompassed what is currently Cambodia and much of what is Thailand, Laos, and the southern part of Vietnam. After Jayavarman VII's death, Khmer power declined at the hands of the Siamese and later the Vietnamese. After the Siamese sacked Angkor several times the capital moved to Phnom Penh, which became a center for maritime trade. During the 19th century, Cambodia fell under Siamese and Vietnamese domination.

In 1863 the French then established a protectorate over Cambodia, and in the early 1900s Cambodia became part of colonial French Indochina. Under its colonial rule, the French established plantations to exploit Cambodian natural resources such as rubber. In 1953 Cambodia achieved its independence from France. Under the leadership of Prince Sihanouk, Cambodia enjoyed peace and stability. In terms of its economy, the country was poor, but most of the population enjoyed affluent subsistence. Farmers, for the most part, had their own land and there was adequate fish, rice, fruit, and vegetables for much of the population.

In 1970, Cambodia became a war-plagued economy. With a coup against Prince Sihanouk in March of that year, Cambodia was drawn into the vortex of the Cold War and the U.S. war in Vietnam. For the next 5 years there was civil war between the Khmer Rouge (the Cambodian communists) and the U.S.-backed rightist government of General Lon Nol. The United States provided both military and economic assistance to the Lon Nol government. The secret bombing of the Cambodian countryside by the United States and the civil war drove hundreds of thousands of rural people into the capital of Phnom Penh and devastated the economy.

On 17 April 1975, the Khmer Rouge captured the capital and immediately evacuated the population to the countryside. There then ensued the most radical **socialist** experiment in the history of the world, in which basically the entire population became a huge work camp engaged in various agricultural activities. As a result, as many as possibly 2 million Cambodians may have died between 1975 and 1978, due to starvation, overwork, disease, and executions (of those who were part of the old elite, those perceived to be a threat to the state, or those who were uncooperative).

In December 1978, the Vietnamese intervened to drive the Khmer Rouge to the remote countryside in the west and northwest and installed a new Vietnamese-oriented Cambodian government, which was called the People's Republic of Kampuchea (PRK). Then Cambodia became a normal economy, though it still suffered from continued conflict with the Khmer Rouge. During this period, it also suffered from an economic boycott by the United States and other countries who would not recognize the legitimacy of the new government. In 1991, **communism** came to an end with the establishment of the State of Cambodia and the 2-year presence of the United Nations Transition Authority in Cambodia (UNTAC) to oversee the transition to a multi-party democracy and free market economy. UN-supervised national elections were held in 1993. However, real political stability came to Cambodia only in 1998 with new national elections and the death of Khmer Rouge leader Pol Pot in April 1998.

With this new stability, the Cambodian economy shows signs of recovering. Its being a dollarized economy (an economy which uses the U.S. dollar) gave it some immunity from the currency **devaluations** suffered by its close neighbors, such as Thailand and Laos. Cambodia achieved impressive economic growth of 4.5 percent in 1999 and 5 to 5.5 percent in 2000.

Two industries which have greatly helped the recovery of the Cambodian economy have been the garment industry and tourism. Output from the garment industry in 1993 was only US$4 million, but by 1999 it had increased dramatically to US$600 million. Cambodia is extremely fortunate to be home to the great Angkor Wat complex, recently publicized in the popular adventure feature film *Tomb Raider*. Cambodia wisely decided to allow direct international flights to Siem Reap, the gateway to Angkor Wat, and is one of the few countries in the world (if any) to allow international airlines to fly domestic flights within Cambodia. This flexibility has been a boon to Cambodian tourism, which was up 34 percent in 2000. A 3-day pass to visit Angkor Wat costs US$60. Thus, tourism is a major new source of significant foreign exchange earnings. Cambodia also benefits from considerable international aid, constituting 61 percent of its public funds.

POLITICS, GOVERNMENT, AND TAXATION

Prior to 1991, Cambodia had long been dominated by authoritarian regimes. Since 1993, however, Cambodia has had a multi-party democracy. During its first phase of democracy, Cambodia actually had 2 prime ministers, 1 from each of the 2 major political parties, as a kind of political compromise. In 1993, Cambodia became a constitutional democracy with the popular Norodom Sihanouk serving as the king. Sihanouk has been an important force in contributing to compromise among competing political factions. The system of having 2 prime ministers, however, became unworkable and was highly inefficient. It also created a particularly complex environment for international investors or others pursuing economic or development activities in Cambodia. New national elections in 26 July 1998, resulted in a new government with only 1 prime minister.

Cambodia has a **bicameral** legislature, consisting of a popularly elected National Assembly (122 seats) and a Senate (61 seats). The members of both bodies serve 5-year terms. The king chooses the prime minister after a vote of confidence by the National Assembly. Since 1998, the prime minister has been Hun Sen. There is also a judicial branch led by the Supreme Court.

Taxation and the ability to collect revenues by the government remain weak, though government revenues

increased 40 percent between 1998 and 1999. Such revenues represented only 11 percent of the GDP and **direct taxes** accounted for only 6 percent of total domestic revenue. Corruption and an inability to collect taxes plagued the government throughout the 1990s.

INFRASTRUCTURE, POWER, AND COMMUNICATIONS

As the result of decades of conflict and civil war, Cambodia's infrastructure is extremely weak. There is a limited train system which runs to the southern seaport of Kampong Saom and to the northwest (Poipet) on the Thai border. There are plans to rehabilitate the railway to Poipet and to build a new railway linking Phnom Penh and Ho Chi Minh City in Vietnam as part of the trans-Asia railway. These railways cover a total of 603 kilometers (375 miles). The country has 35,769 kilometers (22,227 miles) of highways, of which only 11.6 percent are paved. The best road is from the capital to the seaport of Kampong Saom. Past U.S. aid facilitated the renovation of that important road. Many factories are locating along that road because of its excellent access to a major Pacific seaport. Travel to many remote provinces is often done by plane. The country has 19 airports. The country also has 3,700 kilometers (2,299 miles) of navigable waterways, and it is possible to travel to the famous Angkor Wat complex by jetboat using the Tonle Sap River and the great Tonle Sap Lake.

In Cambodia's agricultural sector traditional forms of power such as waterwheels are still being used. Much of the population, especially in rural areas, does not have access to electricity. In 1999, Cambodia's electricity production was 147 million kilowatt-hours (kWh), of which 40.8 percent were derived from hydroelectric power; the rest was from fossil fuels.

Communications in urban areas has greatly improved in recent years. The number of mobile phones (which were estimated at 80,000 in 2000) are now 4 times greater than the number of conventional phone lines. Few rural areas have access to conventional phone lines. There are 10 radio and 5 television stations. In the capital of Phnom Penh, inexpensive cable television is available with a great number of diverse channels in many languages such as Thai, Japanese, Chinese, English, and French. The country had an estimated 97,000 televisions in 1997.

Cambodia has joined the Internet and has a .kh suffix. However, Internet access in Cambodia is extremely expensive relative to local income levels, which greatly restricts the use of the Internet by non-wealthy Cambodians.

With respect to print media, there has been a rapid expansion in recent years. There are currently 3 English language papers, a French language paper, 88 Khmer language newspapers, 19 Khmer language magazines, and 6 Khmer language bulletins.

ECONOMIC SECTORS

During the decade of the 1990s, Cambodia's agricultural sector grew at an average of 2.1 percent, its industrial sector grew at an annual rate of 9.6 percent, and its service sector grew at a rate of 6.9 percent, resulting in shifts in the economic structure of Cambodia. In 1998, agriculture contributed 43 percent of GDP, industry contributed 20 percent, and services contributed 37 percent.

Based on the 1998 census, the active **labor force** in Cambodia was 4,909,100. Around 76.8 percent of these individuals were engaged in agriculture; only 3.4 percent in industry; and 19.8 percent in services.

Though most Cambodians are still involved in agricultural work, the country's industrial and service sectors are both growing rapidly. With Cambodia's excellent tourism potential and its low cost labor in close proximity to a major seaport, the economy will continue to shift in the direction of greater industry and services. Nike, for example, is now sourcing apparel production in Cambodia.

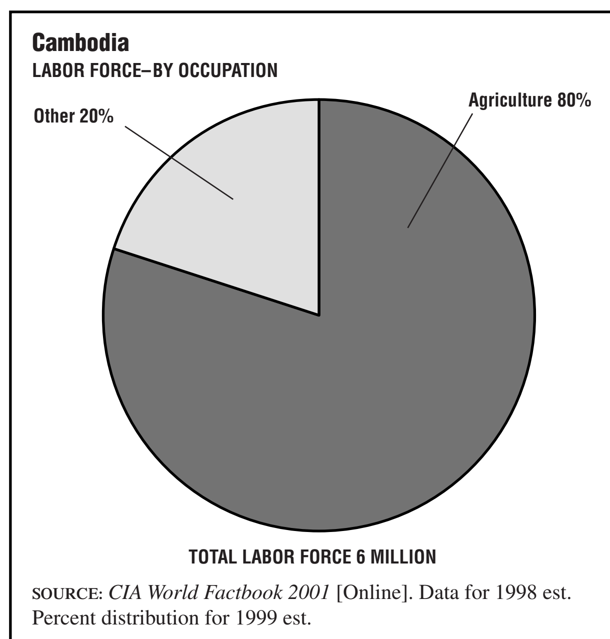
AGRICULTURE

With a population density of just 263 persons per square kilometer (681 per square mile) of arable land, Cambodia has special advantages compared to much more densely populated rural areas such as Bangladesh, Vietnam, or Indonesia, whose densities are 3 or 4 times as great. However, the sector is far below its potential. The 80 percent of the workforce engaged in agriculture account for only 43 percent of GDP in 1998. Average rice paddy yield in 1997 was 1.8 tons per hectare, compared to an average of 2.7 tons per hectare achieved by neighboring countries. Among numerous problems affecting agricultural productivity are a lack of irrigation, shortage of male manpower, and the continued presence of land mines in the northwest region of the country, a major rice-growing area. At present only 16 percent of rice land is irrigated, though the government has the goal to increase this figure to 20 percent by the year 2003. Important secondary food crops are maize, cassava, sweet potatoes, beans, vegetables, and fruit. Among industrial agricultural crops are cotton, soybeans, sesame, jute, sugar cane, and rubber. Principal crops in 1999 in order of magnitude of production were rice, cassava, vegetables, sugar cane, maize, soybeans, sweet potatoes, and mung beans.



SOURCE: *CIA World Factbook 2001* [Online]. Data for 1998 est. Percent distribution for 1999 est.

FORESTRY AND LOGGING. In 1969, 73 percent of Cambodia was forested. By 1997, only 58 percent of the country was forested. Much of this deforestation has resulted from illegal logging activities, with logs destined for Thailand, which has had a long-standing ban on logging. Illegal logging seriously threatens the long-term viability of Cambodia's timber resources. With sustainable forestry, the government could earn an estimated US$40 million to US$80 million in government revenue per year according to some estimates.

FISHING. Major sources of freshwater fish are the great Tonle Sap Lake in the center of Cambodia and the Mekong and Tonle Sap Rivers. However, deforestation represents a serious threat to freshwater fishing because of increased runoff into rivers and lakes. In 1999 Cambodia produced 124,000 metric tons of fish, of which 57.3 percent were freshwater fish.

INDUSTRY

Industry now employs approximately 250,000 people, 5 percent of the labor force. Until the mid-1990s, Cambodia's industry was dominated by rice mills (of which there were approximately 1,500) and 80 to 100 state-owned enterprises, a legacy from the communist period. The major new development in the latter half of the 1990s is the rapid development of Cambodia's garment industry, facilitated by the achievement of political stability, an abundant supply of cheap labor, good road access to Cambodia's major seaport, and having Most Favored Nation trading status since 1997 for exports to the large U.S. market. By the end of 1999, there were approximately 200 garment factories employing about 100,000 workers. In 1995, by comparison, there were only 13 such factories. Another major growth area associated with the need to build and rebuild Cambodia's infrastructure has been construction, which is expected to increase in importance as more investment is made in infrastructure.

MINING. Mining contributed only 0.3 percent of the GDP in 1999 and the country has few commercially viable mineral resources. However, in western Cambodia

in the Pailin area near Thailand, there is an abundance of high-quality gems, primarily sapphires and rubies. The trade in such gems was a major source of revenue for the Khmer Rouge in support of their guerilla warfare. Even currently the trade in gems is largely part of the **informal economy** and does not provide benefit to the central government.

SERVICES

BANKING AND FINANCE. Under the new capitalist system, the former socialist state bank became the National Bank of Cambodia (NBC) in 1992. The new system allows for private commercial banks, of which there are now approximately 30. Use of such banking services is limited, since much of the population has a preference for keeping their savings in either gold or U.S. dollars.

GOVERNMENT EMPLOYMENT. With the shift from a socialist to a capitalist system, the **public sector** has been downsized. Nearly all of the former state enterprises have been **privatized**. Many individuals lost jobs through this process. Major efforts have also been initiated to reduce the size of the military and police forces, including the elimination of "ghost soldiers" and "ghost police" who were listed only for budgetary purposes.

TOURISM. Cambodia has excellent potential to develop its tourism sector, which has grown significantly since the achievement of political stability in 1998. In 1999 tourism revenues increased 41 percent, and tourist arrivals have been growing 20 to 30 percent annually since 1998. In 1999, the number of visitors was 271,100. The largest number of tourists are from the United States, followed by China, France, and Taiwan.

Cambodia's major tourist attractions are the great Angkor Wat complex, attractive beaches with related tourist infrastructure at Kompong Saom (Sihanoukville), and **ecotourism** in pristine Ratanakiri Province in Cambodia's remote northeast. The capital Phnom Penh also is a charming city with numerous attractions. Its famous Royal Hotel has been totally remodeled. In the Angkor Wat area the Grand Hotel d'Angkor has been remodeled by the Raffles Group. At one point, 1 cabinet minister even proposed to have all of Cambodia become a national park as part of an effort to make Cambodia unique and attractive. This proposal was not approved, though Cambodia has developed an extensive system of national parks.

The operation of direct international flights to Siem Reap, gateway to the Angkor Wat area, has significantly improved Cambodian tourism, while adversely affecting tourism to the capital, Phnom Penh, which is no longer the sole gateway to Angkor Wat.

Primarily as the result of the presence of many UN military forces in the 1991–93 period and the shift to a free market capitalist system, a commercial sex industry has emerged which has contributed to international tourism, especially to Phnom Penh. Numerous Vietnamese prostitutes are guestworkers in this industry.

RETAIL AND THE INFORMAL ECONOMY. With a high level of unemployment and **underemployment**, an informal **retail** economy provides employment to large numbers, especially in urban areas. In Phnom Penh there are a number of local markets and 2 large markets popular with tourists (the Central and Russian Markets).

INTERNATIONAL TRADE

For years Cambodia has been running a negative trade balance, meaning that the value of its imports exceeds that of its exports. In 1997 the deficit was US$328 million; in 1998, US$391.4 million; and US$215.7 million in 1999. Contributing to an improved trade balance was the dramatic growth in the export of garments, now the country's major export. The export of garments more than doubled in value between 1997 and 1999. Cambodia's major exports in 1999 (in order of value) were garments, logs and sawn timber, and crude rubber. Its major imports (in order of value) were petroleum products, cigarettes, motorcycles, gold, and other vehicles. In 2000, Cambodia had exports of US$942 million and imports of US$1.3 billion.

Cambodia's leading export markets (in order of importance) in 1999 were Singapore, Hong Kong, Thailand, Vietnam, Taiwan, Japan, and Malaysia. Its imports were primarily from (in order of importance) Thailand, Hong Kong, Singapore, Vietnam, Japan, Indonesia, and France. Its greatest **trade deficit** is with Thailand followed by Vietnam and Hong Kong. It has a trade surplus with Singapore, Malaysia, and Taiwan. With the collapse of the Soviet Union and its shift to **capitalism**, Cambodia's trade with Russia has declined dramatically.

MONEY

Since Cambodia is basically a dollarized economy, the National Bank of Cambodia has only limited influ-

Exchange rates: Cambodia

ence with respect to **monetary policy**. Given the strength of the dollar and, thus, Cambodia's relative immunity to currency devaluation problems, the country has done well in avoiding **inflation**, which was virtually nil in 2000, 4 percent in 1999, and only 12 percent in 1998, despite the Asian economic crisis. In fact, inflation has been extremely low since 1994.

POVERTY AND WEALTH

Cambodia is currently one of the poorest countries in the world. Its per-capita income is only US$260. However, if adjusted for **purchasing power parity** (which takes into account the low prices for goods in Cambodia), its per-capita income jumps rather dramatically to US$1300. Approximately 36 percent of the population is living below the poverty line. Because of the years of civil war and strife, more than 25 percent of households in Phnom Penh are headed by a single mother. The existence of poverty and unemployment among less-educated women has contributed to the emergence of a commercial sex industry. This industry is part of a large informal economy in Cambodia that is not reflected in the official statistics reported in this entry.

Distribution of Income or Consumption by Percentage Share: Cambodia

WORKING CONDITIONS

Working conditions in Cambodia are best for those with good education who can find modern sector employment, particularly in the rapidly growing service sector such as in tourism or banking. There are also now in Cambodia a large number of both international and local non-governmental organizations (NGOs) which hire more educated Cambodians for work on diverse development projects.

Those working in the public sector, such as public school teachers, face the problem of receiving extremely low wages. Thus, they often are forced to take other part-time work to pay for their expenses.

Farmers possessing their own adequate land can enjoy a certain degree of affluent subsistence, if they can grow adequate rice, fruit, and vegetables and have access to fish resources. Recently, however, farmers, especially from western Cambodia, have complained about losing their land to business interests planning various kinds of development or **agribusiness**.

For those working in the rapidly expanding garment industry, there is concern about working conditions and low wages, though these jobs are desperately needed. Conditions are likely to vary considerably depending on the sub-contractors involved. Also, it is not appropriate to look simply at salaries of such workers in dollar terms. People with modern sector jobs tend to pool their "low" salaries in extended family situations. Also costs are much lower in Cambodia than in many other countries, particularly more advanced industrial countries.

COUNTRY HISTORY AND ECONOMIC DEVELOPMENT

2ND-6TH CENTURIES. The state of Funan, predecessor to Cambodia, is established in the Mekong Delta.

9TH-15TH CENTURIES. The glorious Angkor Empire reigns in present-day Cambodia.

1863. France establishes a protectorate over Cambodia.

1953. On 8 November, Cambodia claims its independence from France.

1955–70. The reign of Prince Sihanouk as ruler of the Kingdom of Cambodia; Cambodia remains neutral and peaceful in a sea of political turmoil.

1970. Neutral Prince Sihanouk is ousted by General Lon Nol and Prince Sirik Matak, who abolish the monarchy and rename the country the Khmer Republic (KR). Subsequently U.S. and South Vietnamese armies invade eastern Cambodia and the economy is totally disrupted by the civil war that ensues.

1973. The United States carries out an intensive campaign of bombing rural Cambodia, forcing a tremendous influx of people into Phnom Penh and other cities and disrupting Cambodian agriculture.

1975. In April, Phnom Penh is overtaken by the radical Khmer Rouge, who are led by Pol Pot. The urban population is forced into the countryside and over the next 3 years, the country—renamed Democratic Kampuchea (DK)—becomes a massive work camp, with up to 2 million dying from overwork, starvation, poor health, and executions.

1978. Vietnam invades Cambodia and overthrows the Pol Pot regime.

1979–89. The Vietnamese-backed government (People's Republic of Kampuchea, PRK) wages a long civil war against the Khmer Rouge. Though the economy returns to near normalcy, it is boycotted economically by the United States, the Association of Southeast Asian Nations (ASEAN), and many other nations because of its ties to Vietnam and the former USSR.

1993. United Nations-supervised elections are won by Prince Sihanouk's party, FUNCINPEC; as a compromise, a new 2-headed government is formed with 2 prime ministers, 1 representing FUNCINPEC and the other representing the Cambodia People's Party (CPP), the former communist party.

1997. The 2-headed government ends with military action by CPP Prime Minister Hun Sen.

1998. New national elections won by CPP and Hun Sen. Following the death of Khmer Rouge leader Pol Pot in April, peace and stability return to Cambodia for the first time in 3 decades, and tourism begins to grow rapidly.

2001. The consultative group of international donors pledge US$560 million of international aid to Cambodia, primarily for infrastructure development.

FUTURE TRENDS

With its debilitated infrastructure resulting from 3 decades of civil war and strife, Cambodia faces tremendous economic challenges in the years ahead. Major disparities between rural and urban areas remain a persistent problem. Reform implementation, particularly in the area of governance, also remains a major issue. There is considerable debate about the government and its commitment to reforms. In June, 2001, the International Monetary Fund representative in Cambodia stated "that the donors generally recognize that Cambodia, more than many other countries, has shown a high level of commitment to reform." The 2001 increase in aid pledges by the consultative group reflects such underlying confidence.

With its great Angkor Wat complex, Cambodia has tremendous tourism potential. The 11 September 2001 attacks on the United States will adversely affect Cambodian tourism in the short term, but in the long term, its tourist industry will provide substantial revenues to the government, which can be used for both physical and human infrastructure improvements. This special resource is not seen in many other developing countries. The country is also fortunate to have a deep seaport at Sihanoukville, which is being upgraded. With its great Tonle Sap Lake and with little of its agricultural land currently irrigated, it has considerable potential for improvements in agriculture as well. Finally, Cambodia has a special "wild card" that has been ignored. A good portion of its current population are survivors of the Khmer Rouge tragedy and, thus, represent a special genre of individuals with unusual capacities for survival, perseverance, and flexibility. Such a special human resource base augurs well for the economic future of Cambodia.

DEPENDENCIES

Cambodia has no territories or colonies.

CHINA

People's Republic of China
Zhonghua Renmin Gongheguo

CAPITAL: Beijing (Peking).

MONETARY UNIT: Chinese Renminbi (in Chinese "Renminbi" means "People's Currency") Yuan (RMB). One yuan equals ten jiao; one jiao equals ten fen. Paper bills include 1, 2, 5, 10, 20, 50, and 100 yuan; 1 jiao, 2 jiao, 5 jiao; 1 fen, 2 fen, 5 fen. There are coins of 1 yuan; 1 jiao, 2 jiao, 5 jiao; 1 fen, 2 fen, and 5 fen.

CHIEF EXPORTS: Crude oil, textile yarn, fabrics, chemicals, coal, soybeans, vegetable oil, rice, and small machinery.

CHIEF IMPORTS: Machinery, steel and other metals, wheat, chemicals, and fertilizers.

GROSS DOMESTIC PRODUCT: US$4.8 trillion (purchasing power parity, 1999 est).

BALANCE OF TRADE: **Exports:** US$194.9 billion (f.o.b., 1999). **Imports:** US$165.8 billion (c.i.f., 1999).

COUNTRY OVERVIEW

LOCATION AND SIZE. China is situated in the eastern part of Asia, on the west coast of the Pacific Ocean, in the southeastern part of the Eurasian continent, bordering the East China Sea, Korea Bay, Yellow Sea, and South China Sea, between North Korea and Vietnam. Its border countries include Afghanistan, Bhutan, Burma, (Hong Kong), India, Kazakhstan, North Korea, Kyrgyzstan, Laos, (Macau), Mongolia, Nepal, Pakistan, Russia, Tajikistan, and Vietnam. The land area consists of 9,596,960 square kilometers (3,696,000 square miles), the third largest in the world after Russia and Canada. The country's coastline is 14,500 kilometers (9,010 miles) long. China is divided into 22 provinces, 4 municipalities, 5 autonomous regions, and 2 special administration regions (Hong Kong and Macau). Beijing, the capital, is also the cultural and educational center of China. The city has an area of 65 square kilometers (25 square miles) and is partially surrounded by walls that were built in the 15th century.

POPULATION. The population of China was estimated at 1,262 million in July of 2000, an increase of 10.36 percent from the 1990 population of 1,143 million. In 2000 the population growth rate was estimated at 0.9 percent, the birth rate was 16.12 per 1,000, and the death rate was 6.73 per 1,000. With a projected annual population growth rate of 0.9 percent between 2000 and 2010, the population is expected to reach 1,392.5 million in 2010. A simulation study conducted by the China State Statistics Bureau indicates that country's total population will peak at 1,402 to 1,550 million in the 2030s or 2040s.

The population of China consists of 56 ethnic groups. Han Chinese make up 91.9 percent while Zhuang, Uygur, Hui, Yi, Tibetan, Miao, Manchu, Mongol, Buyi, Korean, and other ethnic minorities make up 8.1 percent. The great majority, 68 percent of the population, is between ages 15 and 64; while 25 percent is at the age of 14 or below, 7 percent is at 65 or older. The life expectancy at birth in 2000 is estimated at 71.4 years (total population), 69.6 years (male) and 73.3 years (female). The country's high life expectancy and low infant mortality rates are envied by much richer nations.

In 1949, when China became a **communist** nation, the population was about 541 million. Over the following 10 years, it increased by another 118 million. It continued to rise through the 1960s. The government encouraged this increase so China could develop water control and communication infrastructures. The government also thought increased production could help produce more food and strengthen the nation's defense. Twenty years later, the millions born during that period contributed to another baby boom. By 1970, there were roughly 830 million Chinese. The over-growing population had generated serious problems and negatively affected the national economy.

To slow the population growth the government introduced a one-child-per-family policy in the late 1970s.

The policy was created not only to deal with the huge population problem but as a prerequisite for the social and financial planning necessary in a **socialist** system. The policy is more strictly enforced in urban areas and is unpopular in the rural areas where male children are more important. However, it is enforced enough to make most couples obey it. With the introduction of the one-child policy, the population growth has slowed, with probably 250 million fewer births since 1979. Two types of obvious changes in population have taken place. First, the people are aging. The number of people 65 or older is estimated at 87.8 million in 2000 and is expected to be 167 million by 2020, compared with an elderly population of 66 million in 1990. Second, the population is becoming more urban. For instance, the urban population was at 297 million in 1990, up 90 million from 1982. During the same period, the populations of the 2 largest cities, Beijing and Shanghai, have increased 17 percent and 13 percent respectively.

Overpopulation is the number-one global problem. Many people question controlling population through legislation. Even after the 20 years that the Chinese civilization has trusted this solution to solve their problem, some still violate the policy. However, this does not imply that legislative control is wrong, especially when dealing with the extremes facing China. Backers of China's population policy say that such state-mandated birth control and family planning is necessary not only for the well-being of China but for that of the whole world.

OVERVIEW OF ECONOMY

China's economy has grown increasingly faster since the 1978 introduction of economic reforms. The Chinese

official statistics show that **real gross domestic product** (GDP) from 1979 to 1999 was growing at an average annual rate of 9.7 percent, making China one the world's fastest growing economies. According to the World Bank, China's rapid development has raised nearly 200 million people out of extreme poverty.

Since its establishment in 1949 and until the end of 1978, China maintained a centrally planned, or command, economy. The state directed and controlled a large share of the country's economic output; the state set production goals, controlled prices, and allocated resources throughout most of the economy. By 1978, nearly three-fourths of the country's industrial production was produced by centrally controlled state-owned enterprises (SOEs) according to centrally planned output targets. There were almost no private enterprises or foreign invested firms in China. It was estimated that China's real GDP grew at an average annual rate of about 5.3 percent from 1960 to 1978. Because the central planning economic systems and government economic policies put little emphasis on profitability or competition, the country's economy was relatively stagnant and inefficient. As a result the Chinese living standards were substantially lower than those of many other developing countries. The Chinese government took steps to improve economic growth and raise living standards in the late 1970s.

The first of China's economic reforms started in 1978 when Den Xiaoping came into power again. The reforms concentrated on the agricultural production system in rural areas. The central government initiated price and ownership incentives for farmers; for the first time, farmers were able to sell a portion of their crops on the free market. In addition, the reforms tried to attract foreign investment, boost exports, and begin the importation of high technology products into the country. To do this, the government established 4 special economic zones (SEZs). Additional reforms followed in stages that sought to decentralize economic policymaking in several economic sectors, especially trade. As a part of the decentralization of economic policymaking, provincial and local governments took economic control of various enterprises, allowing them to operate and compete on free market principles.

The economic reforms had produced such promising economic growth that by the middle of 1980s the government selected additional coastal regions and cities as open cities and development zones to test more free market reforms and to offer tax and trade incentives to attract investment from overseas. Moreover, the state gradually eliminated the **price controls** on a wide range of products. Agricultural output doubled in the 1980s, and industry also demonstrated major gains, especially in coastal areas close to Hong Kong and opposite Taiwan, where foreign investment helped stimulate output of both domestic and export goods. Even more reforms were initiated in late 1993 when China's leadership approved additional long-term reforms which would allow the state enterprises to continue to dominate many key industries in what was now termed "a socialist market economy."

The transition of the country's economic system from a command to a market-based economy helped fuel a strong average growth. Between the start of an economic reform program in 1978 and 1995, the GDP growth was 8.0 percent a year. The growth remained strong from 1996 to 2000. In 1999 China became the second largest economy in the world, after the United States. But China's **GDP per capita** of US$3,800 was much less than the United States.

China's trade and investment reforms as well as its incentives led to a surge in **foreign direct investment** (FDI), which has served as a major source of China's capital growth. Annual utilized FDI in China grew from US$636 million in 1983 to US$45.6 billion in 1998 (but dropped to an estimated level of US$40.5 billion in 1999), making China, in the late 1990s, the second largest destination of FDI (after the United States). About two-thirds of FDI in China comes from Hong Kong and Taiwan. The United States is the third largest investor in China, accounting for 8.0 percent (US$24.6 billion) of total FDI in China from 1979 to 1999.

Since the reforms, China has made great strides in improving its social welfare. Both consumption and saving have more than doubled, and the poverty rate has declined. According to the World Bank, about 200 million Chinese who used to live in absolute poverty have been raised above the minimum poverty line. And only 10 percent of the country's population of 1.25 billion were illiterate.

Although the reforms were encouraging, the Chinese government experienced various difficulties. It struggled to collect revenues due from provinces, businesses, and individuals; to reduce corruption and other economic crimes coinciding with the reforms; and to maintain daily operations of the large state-owned enterprises. Many of the state-owned enterprises had not participated in the vigorous expansion of the economy, and some of them had lost the ability to pay full wages and pensions.

POLITICS, GOVERNMENT, AND TAXATION

China's form of government is a communist state known as a People's Republic. The Chinese Communist Party (CCP) is the leading political party in China. Unlike parties in Western democracies, CCP is a tightly organized political force that controls and leads society at all levels. The party sets policy and controls its execution

through government officials who are required to be CCP members. It is organized as a hierarchy, with power concentrated at the top. Above the local units, or cells, is a pyramid-like structure of party congresses and committees at various levels, culminating in the National Party Congress.

Generally, CCP's national congress is supposed to meet every 5 years, though this has not always been the case. When it is not in session, direction of the party is in the hands of a Central Committee of about 200 members, which is symbolically elected by the congress according to the name list distributed by the congress board. The symbolically elected Central Committee, in turn, elects the Political Bureau. It is within the Political Bureau and its elite Standing Committee that power is concentrated, which make the state's highest-level decisions. There is also a secretariat, which carries on the day-to-day business of the party.

Theoretically, party membership is open to anyone over 18 years of age who accepts the party program and is willing to work actively in one of its organizations. In reality, only those who are deemed to be fellows of local CCP branch leaders will have the chance to be recruited into the party. Members are expected to abide by the party's discipline and to serve as model citizens. The backbone of the party consists of full-time paid workers known as **cadres** (Chinese, *ganbu*). The term *cadre* is also used for public officials holding responsible positions, who may or may not be members of the party.

The People's Republic was first governed according to the "Common Program" and organic laws adopted in 1949. Since 1954, 4 constitutions followed, each reflecting shifts in policy and the balance of power among factions of the top leadership. The government structure forms a pyramid, ranging from local units such as residents' (urban) and villagers' committees through counties, prefectures, and then to the 22 provinces, 5 autonomous regions, and 4 special status municipalities (Beijing, Shanghai, Tianjin, and Chongqing), each with its own people's congress and administrative organs, and 2 special administration regions (Hong Kong, Macau). At the top of the government structure is the national government in Beijing.

The chief of state is President Jiang Zemin, who has served as president since 1993. The president and vice-president are elected to 5-year terms by the National People's Congress. The head of government is Premier Zhu Rongji, who has served in his position since 1998. The president nominates the premier who is confirmed by the Congress.

The National People's Congress is the legislature of China and serves annual sessions with 5-year terms. The Standing Committee of the Congress exercises its functions between sessions. The highest administrative organ is the State Council (similar to the United States Cabinet), headed by the premier. The court system parallels the administrative system. However, the Chinese have traditionally tended to resolve conflicts through social rather than legal or judicial mediation, and the rule of law as it is known in Western countries is currently not well-known. The number of lawyers is very small compared with many Western countries, and legal methods are not familiar to most Chinese.

The judiciary is headed by the Supreme People's Court, which consists of 1 president and 1 vice president, who each serve 4-year terms. Other courts include Special People's Courts and Local People's Courts. Supreme People's Procuratorates and Local People's Procuratorates enforce laws.

Tax policies are administered by the Ministry of Finance (MOF) and the State Administration of Taxation (SAT). The SAT is the central tax authority at ministerial level. Tax policy is the exclusive domain of the central government although the local government may input some efforts in taxation. With the adoption of a new tax system in 1994, the country adopted a tax revenue-sharing system. This means that some taxes, mostly **direct taxes**, are assigned to local government, while other taxes, such as **value-added tax** (VAT), are shared between the central government (75 percent) and local government (25 percent). Shared taxes are levied on the same tax base and then allocated between different levels of governments at pre-determined ratios.

The ratio of the total tax revenue to GDP has declined over the 1990s, although the total tax revenue has increased substantially. The main reason for the decline is the rapid growth of the service sector, whose tax burden is lower than that of manufacturing, and an increase in foreign investment, mostly in special zones where very generous tax incentives have been granted. The 1994 tax reform emphasized taxation on consumption, and currently efforts are being made to fine tune these **indirect taxes**, particularly the administration and collection of VAT. The abuse of invoices is a serious, continuing tax fraud problem. The main tax types for business, citizens, foreign enterprises, and foreigners in China are value-added tax (VAT); consumption tax; business tax; foreign enterprises **income tax**; individual income tax; customs **duties**; urban **estate tax**; vehicle and vessel usage and license plate tax; land appreciation tax; stamp duties; resources tax; and deed tax.

INFRASTRUCTURE, POWER, AND COMMUNICATIONS

Infrastructure in China varies from fairly good to very poor. Resources for industry are currently heavily constrained by infrastructure shortages. The government

recognizes infrastructure as the key to achieving full-industrialized status and to offsetting a diminishing cheap labor advantage. Energy and transportation needs in particular have stalled growth and fueled **inflation**, while telecommunications is acknowledged as a requirement for further economic growth.

RAILWAYS. China has an estimated 69,412 kilometers (43,131 miles) of railroad. Every province-level administrative unit except Tibet was served by rail, and plans were being made to extend a line south from the Lanzhou-Urumqi line to Lhasa, in Xizang (Tibet). Railways have been the most important tools for transportation in China. For example, more than 50 percent of the country's traffic is moved by the railroad system. China's railway network consists of a series of north-south trunk lines, crossed by a few major east-west lines. Most of the large cities are served by these trunk lines, forming a nationwide network, with Beijing as its hub.

ROADS AND HIGHWAYS. China has 1,209,800 kilometers (751,894 miles) of highway in total, among which 271,300 kilometers (168,586 miles) are paved (with at least 24,474 kilometers or 15,200 miles of expressways). The network of all-weather roads and highways is not a unified national system with consistent standards; the conditions of many of the roads are poor. Despite its shortcomings, the road network is probably adequate to meet the country's current needs. China has a small number of cars, trucks, and buses as compared with the United States or Japan. In the early 1990s there were about 7 million motor vehicles, two-thirds of which were trucks and buses. It produces about 200,000 trucks annually and limited automobiles. An increasing number of cars are owned privately, which will lead fast demand for qualified highways. The highway network accounts for only about 2 percent of total freight traffic.

AIR TRANSPORTATION. China set up the General Administration of Civil Aviation of China (GACAC) after 1949, which has continued to serve as the nation's domestic and international air carrier. Most major cities are served by domestic flights, and a few large cities like Guangzhou, Shanghai, and Beijing have international service. GACAC planes fly to Europe, Japan, the United States, and South Asia. Some provincial and urban authorities operate intercity airlines that carry passengers and freight. There are 206 airports (1996 est.), among which 192 have paved runways.

SHIPPING. China has 110,000 kilometers (68,354 miles) of navigable waterways and 1,746 ships (merchant marine). It has 9,070 kilometers (5,636 miles) of crude oil pipelines, 560 kilometers (348 miles) of petroleum products pipelines and 9,383 kilometers (5,830 miles) of natural gas pipelines (1999 est.).

POWER. China's power sector has performed impressively in support of economic growth during the past twenty years. Faced with the need to expand its power capacity, the state is investing heavily in the construction of new power plants and self-financing capability. Equally significant in the development of the national power sector are the establishment of regional power grids and the implementation of an electricity **tariff** reform to tackle the problems of inefficient power distribution and usage. Electrical power is supplied mainly by the state-owned enterprises. China has effectively **restructured** its power industry by closing a large number of small thermal power plants with high coal consumption, heavy pollution, and poor economic efficiency. According to the official statistics, the country generated 1.16 trillion kilowatt hours (kWh) of electricity in 2000, a 6 percent increase from the previous year; the country has made headway in building and renovating 87 urban power grid projects and 1,590 rural ones. China has also developed its enormous hydroelectric potential so that a larger share of its domestic demand for electric power can be met with renewable hydropower. Renewable hydropower is tapped from moving water such as waterfalls and fast-moving streams.

The reform and opening up policies have brought great leaps and bounds to the development of the coun-

try's nuclear power industry. Meanwhile, China attracts foreign funds to supplement the domestic shortage of funds in power construction and to upgrade the technological equipment of the power industry. According to the statistic communiqué of the PRC on the 1998 national economic and social development issued in February of 1999, the newly-increased annual production capacity in 1998 through capital construction projects included 16.9 million kilowatts of power generation by large and medium-sized generators and 47.26 million kilovolt-amperes of power transformer equipment (including 7.79 million kilovolt-amperes of updated power grid in urban and rural areas). China is the country to deliberate the biggest nuclear power station construction plan in the world. According to the central government's plan, by year 2020, China will possess 40,000,000 KM of nuclear power installed capacity.

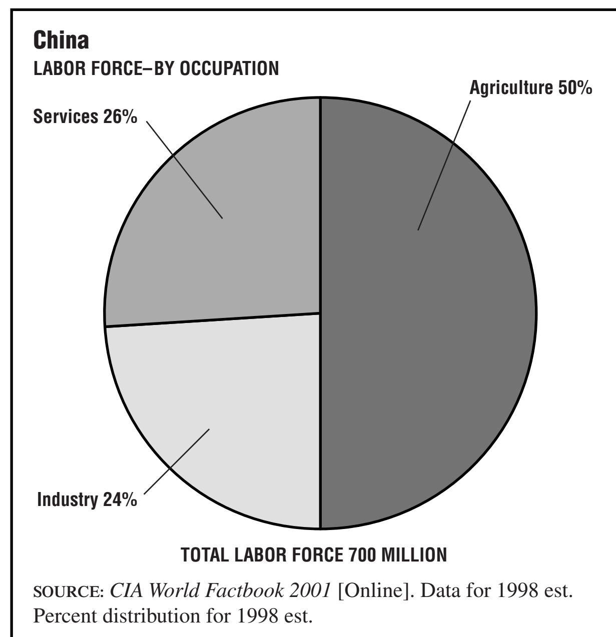
COMMUNICATION. Considerable effort has been expended on the postal and telecommunications systems in China since 1949, but they are still far from meeting Western standards of speed and efficiency. The mail is mainly carried by the nation's railroad. As is the case with transportation, the telecommunications system is sufficient enough to meet the needs of a growing economy. There were 110 million main lines in use (1999 est.) and 23.4 million mobile cellular phones in use (1998). Domestic and international services are increasingly available for private use; an unevenly distributed domestic system serves principal cities, industrial centers, and most small and middle-sized towns. Domestically, inter-provincial fiber-optic trunk lines and cellular telephone systems have been installed; a domestic satellite system with 55 earth stations is in place. Internationally, China has 5 Intelsat (4 Pacific Ocean and 1 Indian Ocean), 1 Intersputnik (Indian Ocean region), and 1 Inmarsat (Pacific and Indian Ocean regions), as well as several international fiber-optic links to Japan, South Korea, Hong Kong, Russia, and Germany. The country had 673 radio broadcast stations—369 AM, 259 FM, 45 shortwave—and 417 million radios. In 1997, the country had 3,240 television broadcast stations, (of which 209 are operated by China Central Television, 31 are provincial TV stations and nearly 3,000 are local city stations), and 400 million televisions. In 1999, the country had 3 Internet service providers (ISPs).

ECONOMIC SECTORS

Over the years, China has become gradually more industrialized. Like other modernizing countries, for instance, the contribution of China's agricultural sector to its GDP has kept decreasing, from 37.9 percent in 1965 to 28.4 percent in 1985 and then to 18.4 percent in 1998—a net decrease of 19.5 percent in the 3-decade period. At the same time, the contribution of the industrial sector to GDP has kept increasing, from 35.1 percent in 1965 to 43.1 percent in 1985 and then to 48.7 percent in 1998, a net increase of 14.6 percent in the 3-decade period. The contribution of tertiary industry (service) to the GDP has increased from 27.0 percent in 1965 to 28.5 percent in 1985 and then to 32.9 per cent in 1998, a total increase of only 5.9 percent in the same period.

The world's economic development history indicates that as a country heads toward modernization, the ratio of agriculture to its GDP is set to drop, the ratio of service to its GDP will go up, while the ratio of industry to its GDP will first go up and then drop. China's economic



SOURCE: *CIA World Factbook 2001* [Online]. Data for 1998 est. Percent distribution for 1998 est.

development followed the same patterns. For instance, the ratio of agriculture's **value added** to the world's GDP was 7 percent in 1980 and fell to 5 percent in 1998. The ratio of agriculture's value added to the GDP of developed countries is normally 2 to 3 percent. The popular development model also demonstrates that when the GDP annual per capita income stood between US$300 and US$500, the proportions of agricultural and industrial sectors were virtually similar in the GDP while the employment proportion was higher in agricultural sector; when the annual per capita income reached US$1,500, the proportions of the industrial sector and service sector were basically similar in the GDP while the employment proportion in agricultural sector fell to the lowest proportion. However, China's situation varies somewhat from the traditional development model. For instance, in 1999, the per capita income in China exceeded US$1,000 (using the **purchasing power parity** method), while the proportion of the employment in the agricultural sector was still as high as 50 percent.

As shown above, non-agricultural industries' value amounts to the main body of the national economy, but the proportion of employees in the agricultural sector dominates the workforce at present and will do so in the future. The conflict of a dual economic structure is still obvious. It is reflected in the enlarged income gap between industry and agriculture, rising from 2.12 in 1991 to 5.25 in 1995, and its estimated value will reach 5.62 in 2005. Obviously, the changes of the industrial structure and employment structures are not consistent with other developing countries. The Chinese government and scholars have noticed this phenomenon, and many efforts have been made to reshape the structure more properly.

AGRICULTURE

In the thousands of years that farming has been practiced in China, the Chinese have refined and perfected their agricultural techniques. Traditional Chinese agriculture is labor intensive; the emphasis is on using many workers to increase the crop yield per unit of land rather than on increasing the productivity of the individual worker. Chinese agricultural practices have been shaped by the a shortage of farmland in the country, at least relative to the population.

Agriculture and rural activities are important in China for many reasons. First, farming provides the food and fiber needed for the sustenance of China's people. At the same time, nearly 65 percent of the people depend on agriculture or other rural economic activities for their livelihood. Second, agriculture has always provided the means of employment for most new workers entering the **labor force**. With between 12 and 16 million new workers entering the labor force annually since the 1980s, agriculture must continue to absorb tremendous numbers of new workers while continuing to find ways to use these workers productively. Finally, the agricultural sector has been an important source of investment money. If, through hard work, good management, and the application of sound, scientific farming, Chinese agriculture can be more productive, capital surpluses can be created and invested in other sectors of the economy, which could accelerate the rate of economic growth and ultimately benefit all of China's people.

China's grain output hit over 500 million tons in recent years, while current annual consumption is 463.5 million tons. Grain reserves now stand at historically high levels. However, it is true that the weak and fragile foundations of the agricultural system remain basically unchanged. Grain supply is still threatened by a series of unfavorable factors in production, circulation, consumption and foreign trade. A recent detailed estimate forecasts that the country's grain consumption requirements in the year 2030 would be between 632.8 and 725.8 million tons, with projected production at that time of 662.5 million tons. So even faced with the maximum shortfall of 63.3 million tons, the country would still be able to satisfy 90 percent of its own needs. Over the past decades, China has imported about 12 million tons annually, or 3 to 4 percent of consumption. Considering the trend of grain shortages in the medium and long term, China might need to import about 5 percent of its grain demand, or 20 million tons, in regular years.

CROPS AND LIVESTOCK. China's principal food crops are rice, wheat, corn, *gaoliang* (Chinese sorghum), millet, barley, and sunflower seeds. China is the world's largest producer of rice, and rice accounts for almost half of the country's total food-crop output. Rice, wheat, and corn together make up more than 90 percent of China's total food grain production, and these crops occupy about 85 percent of the land under cultivation. Grain production has risen steadily since rural economic system reform started in 1978. There has also been a steady rise in the output of industrial crops, the most important of which are cotton, oil-bearing crops (such as peanuts and rapeseed), sugar (both cane sugar and beet sugar), tobacco, baste fiber (for cordage, matting, and similar uses), tea, and fruits. Poultry and livestock production, though rising, remains the weakest sector of Chinese agriculture. Livestock numbers are high, but the amount of meat produced per animal is low. Thus, China has 15 percent of the world's livestock and about 40 percent of its pigs, but it provides only 7 percent of the meat products and 15 percent of the pork.

FORESTRY. Despite China's large land area, its forest resources are modest. Much of the western interior is too high or too dry to support dense forest stands. In the humid east, the forests were harvested for centuries for

building material and firewood; limited effort was made to regenerate them. In 1949, it was estimated that about 8 percent of the total surface of the country was covered with forests. Since then, an active program of forestation has been undertaken, and it is estimated that the forested area has been increased to 12 to 13 percent. In recent years about 2.5 million acres (1 million hectares) of forestland have been added annually. The state is aiming to have 20 percent of the country's surface in forest. In contrast, more than 30 percent of the United States is forested.

FISHING. China has a long tradition of ocean and freshwater fishing and of aquaculture. Pond raising has always played an important role and has been increasingly emphasized to supplement coastal and inland fisheries threatened by over-fishing. China produces about 17.6 million tons yearly, first among the world's nations. More than 57 percent of the total catch is from the ocean. The remainder comes from rivers, canals, lakes, and ponds. China's coastal zone is rich in fish. All the coastal seas have extensive areas of shallow water over the continental shelf. In these seas, especially the Yellow River and East China River, cold and warm ocean currents mix, creating an environment that is particularly suitable for many species of ocean fish, including croakers, mackerels, tuna, herring, and sharks. Several varieties of shellfish and specialties such as squid and octopus are also produced.

INDUSTRY

Since 1949 when the People's Republic of China was established, and especially since 1978, China's transformation from a traditional agricultural society to a modern industrial society has been greatly accelerated by a rapid industrial restructuring. China's industrial structure developed according to the objective of industrialization, which aimed at the proportion of agriculture being declined ceaselessly, the proportion of the industrial sector being ascended continually, and the proportion of the services sector being ascended greatly. The industrial goods produced in China all range from **capital goods** to consumption goods currently, though certain consumer products remain in short supply.

China's factory outputs extend from textiles to railway locomotives, jet planes, and computers. China is the largest producer of inexpensive cotton textiles in the world and exports large quantities of textiles and garments. Food processing is very important, and many agricultural goods are exported. China is one of the leaders of cement production in the world. Iron- and steel-making has declined recently, the production having dropped somewhat to about 44 million tons annually. Other industrial products include television sets, bicycles, cars, trucks, and washing machines. The product quality and production technology lag behind those made in Japan, the United States, and the European countries. The processing and manufacture of chemicals, including fertilizers, petroleum products, and pharmaceuticals, is another large and expanding segment of Chinese industry.

China has become an industrialized country to some extent. The pillar industries, such as the auto industry and the housing industry, in the interim of industrialization have developed by leaps and bounds. Iron and steel manufacturing are also major industries in China. The most important export products are machinery and electric equipment; while the most important import products are raw materials. In recent years, due to economic extroversion, China's industry has competed internationally, and as a result, the country's industrial development is increasingly influenced by international economic environments. On one hand, exporting becomes more difficult and export prices keep declining; on the other hand, market share of foreign products and foreign-invested enterprises' products keeps growing. The above 2 factors increase the difficulties for the country's domestic industry in terms of producing and selling; the state-owned enterprises are impacted particularly. In fact, textile and other light industries have slowed their growth since 1985. Since 1989, the production capability of durable consumption goods has become idle; after the mid-1990s, bottleneck sectors including steel, oil, and raw material began to fall into market saturation. Large-scale IC chips account for only 40 percent of all IC chips made in China; 80 percent of the Chinese telecom equipment and instrument market is taken by foreign enterprises.

Generally, China's industrial system has a low level of technology; the high-tech industries are simply in their starting periods. The technologies of major industrial sectors are poor and lack self-equipment capability. Average life cycle for more than 2000 kinds of Chinese leading products is 10.5 years, 3.5 times that of the same products in America. And fewer Chinese work in the information sector than do U.S. citizens, for example. About 45 percent of the American workforce is involved in information technology, but only 10 percent of the Chinese workforce is. Chinese technological level of industries needs to be raised, particularly high-tech oriented industries, so that the country's industries can be advanced toward a knowledge economy in the 21st century.

MINING. With one of the largest and richest stocks of minerals of any country, China has enough minerals to support a modern industrial state. Mining of all types of minerals is expanding rapidly. The most significant minerals are coal, iron, tin, copper, lead, zinc, molybdenum, tungsten, mercury, antimony, and fluorspar. China has the world's largest coal reserves, which are estimated at more than 600 billion tons. These reserves would keep

the country supplied with coal for about 500 years, if usage were to continue at its present level.

PETROLEUM. The country also has substantial petroleum reserves, both on land and offshore. Offshore prospecting is under way in several locations, with a number of Western and Japanese petroleum companies assisting China. Such minerals as tungsten, aluminum, titanium, and copper have export possibilities. Extensive deposits and promising sites were located in 1960s. The main production centers are in the North China Plain and in the Northeast. For instance, Daqing petroleum production basis in Heilongjiang Province is one of the largest petroleum producers in the country. Since the mid-1970s, China has been ranked as one of the ten largest oil-producing countries in the world, with the capacity to produce more than 1 billion barrels yearly. A small quantity of this output has been exported for earning foreign currency.

MANUFACTURING. Chief manufactured products include cement, rolled steel, chemical fertilizer, paper and paperboard, sulfuric acid, sugar, cotton yarn, cotton fabrics, cigarettes, television sets, and washing machines. Generally, the Chinese industrial structure has a higher level of manufacturing although it is far from high manufacturing in terms of productivity. Since 1978, the proportion has decreased, largely of output of low-level manufacturing sectors in light industry with agricultural products as raw material and mining sectors in heavy industry, but low-level expansion and repetitious construction in these sectors are still very serious. Product quality upgrade is still behind the demand of structures' upgrade, which in turn leads to the dependence on import of high-level manufactured goods for economic growth. The proportion of the 2 preceding sectors dropped from 34.1 percent and 8.19 percent in 1985 to 27.16 percent and 5.97 percent in 1998, dropping in total by 7.03 percent and 2.22 percent respectively. Compared with the United States and other developed countries, the horizontal industrial expansion with low levels of manufacturing causes low-level malignant competition in the domestic manufacturing sector. The same effects can be found in high-level consumption of energy and raw materials. For this reason inflated demands bring about a large increase of sectors with low technology content and delay upgrade of industrial structures.

SERVICES

According to a State Development Planning Commission (SDPC) document entitled *Report on China's National Economic Growth and Social Development for the Year 2000,* China's fast growing service sector has become the country's key employer. Preliminary statistics indicate that the service sector created 5.71 million new jobs in 1999, making up 70 percent of China's total new employment in the year. The service sector employed the majority of the country's urban new labor force and at the same time rehired the redundant labor force from the other 2 sectors. The SDPC data show that employment in the service industry by the end of 1999 rose 0.6 percent from 1998 to 192.5 million people, accounting for 27.3 percent of the total national workforce.

The service industry has become a major factor in boosting national economic growth. The key growth areas for the service industry in recent years include community services, domestic tourism, higher and non-compulsory education, information, culture and other intermediary services. In the first 4 years of China's 9th 5-Year Plan (1996 to 2000), the average contribution of the service industry to the GDP was 40.8 percent, a 10.4 percentage point increase over the 8th 5-Year Plan (1990–95). The state aimed at encouraging more involvement by the **private sector** in the development of the service industry by channeling more private investment into the industry.

FOOD SERVICE. Dining out is one of the most important social activities for both personal and business reasons in China. The food service can be categorized as fine dining, family restaurants, neighborhood restaurants, quick-serve restaurants, street vendors, food courts, and cafeterias operated by the institutions or corporations. Since the 1980s, Western-style chain restaurants have been the driving force for the development of service, quality, value and distribution in the Chinese food service industry. A recent survey indicates that China has approximately 2.2 million restaurants and cafeterias. With the growth of China's economy, the changing life styles, and increased **disposable incomes** for the potentially largest group of middle-income families in the world, China is expected to be the new leader in the growth of the food service industry in the 21st century.

TOURISM. China is a world-class destination that offers several thousand years of history and brilliant cultural achievements. Tourism has been designated as an important growth area under the current national restructuring. Remarkable progress has been made in China's tourism since 1978, when it barely existed as an industry. In 1978, on the eve of the open-door policy, China received a mere 760,000 tourists and US$260 million in tourism-related foreign exchange earnings.

During the 1980s, the state council strengthened its management over tourism and adopted a policy of enlisting support from all quarters—the state, the collectives, related ministries or departments, individuals and foreign investors. China began the construction of a large number of tourist hotels by using foreign capital and also improved the ability of its travel agencies to solicit tourists. In 1988, the national tourism industry earned

US$2.24 billion in foreign exchange, or 10 times the figure in 1978. Meanwhile, efforts have continued to open up new scenic spots, tap new visitor sources and improve tourism-related rules and laws. Drawing experience from developed countries, China improved its management skills and the overall quality of employees to optimize the environment for tourism expansion.

In the 1990s, the country began to design special tourism projects. The Visit China '97 program was a big success, with overseas visitors hitting 57.6 million and foreign exchange earnings reaching US$12.074 billion, thus catapulting China's place in world tourism earnings from 41st to 11th. At the same time domestic tourism also reached a new record with the number of tourists jumping to 644 million and earnings reaching US$27 billion. As a result, tourism income in the year totaled over US$38 billion, or 4.1 percent of the GDP. Massive infrastructure investments and rising living standards helped to stabilize the basic tourism market and improve the overall environment for tourism expansion. China's tourism earnings in the year 2000 were estimated as US$43.9 billion, or 5 percent of the GDP, with US$14 billion in foreign exchange earnings from overseas.

RETAIL. **Retail** was one of the fastest growing sectors in China in the earlier 1990s. Since retail industry reforms began in 1992, the government has adopted some new policies highlighted by the proclamation of the Provisional Rules on Retailing and Wholesaling in June 1999. These policies have propelled the retail industry through a process of fundamental transformation. While shopping in the past meant visiting a run-down department store and choosing from a limited range of low-quality products, currently the Chinese consumer is exposed to a growing number of sophisticated retail formats and wooed by a wide range of foreign and domestic products. The existing retail formats in China are warehouse/discount stores, supermarkets, department stores, convenience stores, franchised service or chain-store outlets, specialty stores, shopping centers, catalogue sales, TV home shopping, and recently developed **e-commerce**.

One eye-catching development is that local governments, in spite of central regulations, approved a large number of joint commercial ventures. Some Chinese retail stores in large cities are even beginning to hire foreign managers or are being contracted to a foreign management team. Large **multinational corporations** have made considerable inroads into China's consumer markets. They do so by forming **joint ventures** with domestic manufacturers to produce and sell their own brand-name products. By doing so they effectively take over the well-developed distribution channels of the domestic firms, and consequently their market shares improve steadily. In this area, Asian businesses (especially overseas Chinese ones) again enjoy an edge because of their familiarity with the Chinese consumption culture. They are not deterred by the lack of policy transparency and inadequate legal infrastructure. They thrive on personal connections cultivated with state officials and often regard these as a better guarantee for security. In 2000, the activities of foreign-invested retailers remained subject to tight regulation although the government took its first steps towards opening the retail sector to real foreign participation in 1992. A pilot program restricted Sino-foreign retail joint ventures to 11 cities, with only 2 such ventures allowed in each pilot site.

INTERNATIONAL TRADE

International trade has been used to bring in new equipment and technologies and to meet scarcities in the domestic economy since China has sought to modernize its economy. Exports have been used as a means of producing foreign earnings to pay for the imports. The state has sought to maintain an even **balance of trade** so that the country can pay for imports rather than buying on credit. With 1.2 billion people and the world's fastest growing major economy, China is hailed as potentially the "market of all markets," which has helped to attract investments from around the world at such a magnitude that China is now the second largest recipient of foreign capital (next only to the United States). However, it has also given the government more reasons to carefully guard its market. The issue of market entry has been a contentious one, bogging down its negotiations to join the General Agreement on Tariffs and Trade and the World Trade Organization for over a decade.

The total volume of China's exports was US$232 billion (**f.o.b.**, 2000), according to the CIA *World Factbook.* The country's principal commodities are machinery and equipment, textiles and clothing, footwear, toys and sporting goods, and mineral fuels. The United States bought 21 percent of China's exports, Hong Kong 18 percent, and Japan 17 percent; Germany, South Korea, the Netherlands, the United Kingdom, Singapore, and Taiwan are other main export partners.

Trade (expressed in billions of US$): China

	Exports	Imports
1975	7.689	7.926
1980	18.099	19.941
1985	27.350	42.252
1990	62.091	53.345
1995	148.797	129.113
1998	183.589	140.305

SOURCE: International Monetary Fund. *International Financial Statistics Yearbook 1999.*

China exports agricultural commodities and goods (about one-third of total exports) and manufactured goods (about half), as well as mineral products such as oil and coal. Foodstuffs account for about 6 percent of total imports, and industrial supplies and materials such as crude steel and chemicals account for about 50 percent. The remainder consists chiefly of expensive capital goods such as machinery, precision instruments, and transportation equipment.

In 1998, machinery and transport equipment took the first place among the exports, amounting to 50.2 billion dollars. The proportion of it is 48.4 percent, much higher than the proportion of light and textile industrial products (26.5 percent). On the other hand, export structure of machinery and transport equipment is changing for the better. The proportion of more technologically-intensive products is growing up, and labor-intensive products are slowing down. Also, the interim structure of traditional export products, such as light and textile industrial products, changed tremendously. Resource and labor-intensive, low value-added, low-technological products declined, lower labor-extensive but higher technological and value-added products increased.

China imports a total volume of US$197 billion (2000). The principal commodities China imports are machinery and equipment, mineral fuels, plastics, iron and steel, and chemicals. Japan provides the main source (20 percent) of China's imports. The United States provides 12 percent, Taiwan 12 percent, and South Korea 10 percent. Other trading partners include Germany, Hong Kong, Russia, and Singapore.

The 5 top import products of China during the first semester in 1999 included mechanical and electrical products at US$35 billion (up 28 percent from 1998); plastics in primary form at US$4.1 billion (up 3.9 percent from 1998); steel products at US$3.4 billion (up 14.6 percent from 1998); computer parts at US$1.8 billion (up 18.7 percent from 1998); and crude petroleum oil at US$1.6 billion (down 23.6 percent from 1998). The commodities China imports are materials essential to modernizing China's economy and increasing export-oriented industries.

MONEY

China embarked on its open-door economic policy in 1979 by reforming the agricultural sector and establishing several special economic zones (SEZs). The high export-led growth rates in the SEZs contributed to an annual **inflation rate** of over 10 percent in the 1980s. As a result the economy was overheating. The monetary authorities were ineffective in dealing with inflation. Fiscal revenues declined during the reform period and pressed the Ministry of Finance (MOF) to sell bonds to the central bank in exchange for currency to cover its **budget deficit** and to release aggravating inflationary pressures. By 1994, laws were passed to create a more consistent and more transparent tax system, which would reverse the steady decline in fiscal revenues. The new laws also banned fiscal overdrafts on the financial system. In reflecting tighter **monetary policies** and stronger measures to control food prices, inflation dropped sharply between 1995 and 1999.

Financial reform first appeared in 1984, when the People's Bank (monobank) discarded its commercial banking functions to become a central bank. The 3 specialized banks were reformed as commercial banks, passing on their policy lending to newly established policy banks. The banking system was decentralized, and inter-bank competition was allowed. Urban and rural credit cooperatives were established as alternative banking institutions. Interest rates remained under government control; preferential lending rates have been removed in certain sectors but continue in many others. Although lending rates are a highly political issue for the impact on state-owned enterprise (SOE) **debt-servicing** obligations, **deregulating** lending rates and deposit will be on the official agenda. Various ministries, including the monobank and the State Planning Commission, are in charge of a credit plan that involves a multi-step, highly negotiated process in which lending quotas are allocated to the state banks (lenders) based on their balance of deposits against borrowings. A re-lending facility allows the central bank to reallocate deposits from surplus to deficit ones at bank levels or regional levels. The mechanism is funded by reserves set at 20 percent of deposits; thus, deposit-poor lenders are assured that their allocated funding requirements will be covered by monobank loans.

Under the re-lending facility the loans are generally rolled over, which make up 30 percent of state banks' liabilities and are estimated to equal 3 to 4 percent of the GDP. The continuing injection of funds to SOEs under

the credit plan allowed many profitless SOEs to remain in business, some SOEs even staying while making a net loss. Many of the loans to SOEs could not be called back and eventually became the bank's liabilities, which suggests that any financial sector reform and resolution of the SOE debt problem are intricately linked. Moreover, the continued reliance on state bank loans to support SOEs has also exacerbated the government's fiscal weakness, as it causes the lack of funds for much-needed enterprise and welfare reforms.

China used 2 systems of currency between 1979 and 1994: Renminbi and Foreign Exchange Certificates (FEC). Foreign exchange could be obtained through either FEC exchange centers (FECs) or foreign exchange adjustment centers (FEACs) until the 1994 currency unification. There were over 100 FEACs, or swap centers, where foreign currency was exchanged at a floating rate that varied widely among the centers in the 1980s. By 1993, 80 percent of all foreign exchange transactions were handled by FEACs. With the currency unification of 1994 came the gradual, complete withdrawal of FECs altogether from foreign exchange. The yuan's **exchange rate** is determined by the swap centers. It is noticeable that the movements toward convertibility of the current account have allowed foreign firms to make their transactions through designated foreign exchange banks and through FEACs. However, the domestic firms must sell all of their foreign exchange holdings to designated banks.

BANKING. The financial sector's main regulatory authority is the People's Bank of China (PBOC), the country's central bank. The PBOC controls the money supply, determines interest and deposit rates, and handles **foreign exchange reserves** through its division, the State Administration of Exchange Control. The PBOC also supervises banks' operations, uses the credit plan to administratively control overall lending, and oversees the People's Insurance Company of China as well as through its branches, trust and investment companies (TICs).

China has 4 state banks and eleven commercial banks. The state banks were created in 1984, when specialized banks and part of the monobank were transformed into commercial banks. The Agricultural Bank of China provides finance services in rural areas. The People's Construction Bank of China is responsible for medium- and long-term finance for capital construction. The Bank of China functions as the main international and foreign exchange bank, and the Industrial and Commercial Bank of China, the largest state bank, extends working capital loans to SOEs for fixed-asset investment. State banks with a network of branches, newly created affiliates, and special departments are responsible for implementing the credit plan.

More than 60,000 urban and rural credit cooperatives were established as an alternative to banks by 1999. Urban cooperative banks, small and manageable, are structured in a 2-tier system: the upper tier interfaces with capital markets and acts as a supervisor for the system, while the lower tier, a number of small-scale banks, handles deposits and loans. The rural or agricultural cooperative banks, acting under the guidance of the Agricultural Development Bank, have limited autonomy in management and lending decisions. Their clients are mainly rural townships and enterprises.

The state-owned People's Insurance Company of China (PICC) used to be a **monopoly** insurer. In 1993, it still handled over 95 percent of China's total insurance business. The new insurance law of 1995 limited the PICC to commercial insurance business and transferred its social insurance business to the Ministry of Labor. Currently, although the PICC and several government financial authorities own 17 regional life insurers, there are 3 other regional insurers and 2 independent national insurers. The market for life insurance and household casualty insurance is still small in China, and corporate customers purchase most casualty insurance. Most assets have to be deposited with domestic banks in interest-bearing accounts, while other investments need to be spread among safe investments and are limited to short-run commitments.

STOCK EXCHANGES. The Shanghai and Shenzhen Stock Exchanges, China's only 2 stock exchanges currently, were established in 1990 and 1991, respectively. No cross listing exists between these 2 exchanges. Since their founding, securities markets have grown rapidly, especially in the later 1990s. Securities exchange centers, limited to government and corporate bond trading only, exist in 18 larger cities. Securities exchange centers were established in the mid-1980s when SOEs were allowed to sell bonds to employees, other companies, and, to some extent, to the public. Securities exchange centers are linked to the stock exchanges through electronic trading networks.

Chinese companies offer 2 types of shares: A shares, which are exclusively sold to Chinese nationals, and B shares, denominated in Renminbi but traded and purchased in foreign currency exclusively by foreigners originally. By March 2001, B shares could also be purchased by Chinese citizens using foreign currency. B shares are restricted to limited liability shareholding companies. To be qualified, companies must have been profitable for at least 2 consecutive years; must possess sufficient foreign exchange revenues to pay dividends and cash bonuses; must be able to provide financial statements and earning forecasts for 3 consecutive years and at the time of listing; and must have a price-earning ratio of less than 15.

The state planning commission formulates quotas for stock and debt listings, which sets a figure for the aggregate offering price of issuances in a given year. The

formulated quotas are then allocated on a provincial level. This process generates some problems, such as politicized selection and approval process, lowered quality of issuer with a large number of small issuers, the lack of predictability in the schedule of announcements of annual quotas, and the fact that announced quotas change yearly according to market conditions. Furthermore, the quota system pushes non-quota activity into unofficial and semi-official channels such as the securities exchange centers. Because of these problems, it is widely agreed that the Chinese stock markets are far from formal and mature and, thus, are full of myth and risks.

FOREIGN PARTICIPATION. Foreign banks are generally restricted to **hard currency** operations, although the government has announced its intention to partially open a local currency business to foreign banks in its bid to join the WTO. Foreign banks are allowed to set up branches and local subsidiaries and to establish joint venture banks with Chinese partners in selected cities and SEZs. However, their activities must be limited to wholesale banking and only a limited number of foreign exchange transactions such as foreign exchange deposits and loans for joint ventures, foreign exchange investments and guarantees, and the settlement of import and export accounts. Foreign non-bank financial institutions consist of 6 finance companies and 6 fully-licensed insurance companies. Generally, it takes about 3 years for foreign insurance companies to obtain a PBOC-issued insurance license.

POVERTY AND WEALTH

In the early decades after the communist state was founded in 1949, incomes were low and roughly the same. However, according to a newly conducted investigation, economic reforms over the past 20 years have created a substantial class of very wealthy Chinese, with more than 5.3 million families boasting annual incomes of US$6,000 or more. The average annual urban income is about US$600, and the average earned by rural residents is about US$230. Private businessmen and managers make up the core of the newly affluent. Others include scientists who own patents, teachers who tutor privately, consultants, securities traders, entertainers or advertising executives. There are roughly 30 million Chinese considered to be well off, which makes only a small fraction of China's population of 1.2 billion. Heavily concentrated in major cities such as Beijing and Shanghai, the affluent Chinese represent a newly **emerging market** for all sorts of luxuries. China is counting on the desire of the well-to-do for better housing and **consumer goods** to help keep the economy growing.

URBAN-RURAL INCOME INEQUALITY. Economic reforms have made substantial improvements in the living standards of rural residents. Since 1978, the farmers boosted their incomes by engaging in specialized agricultural activities such as animal husbandry, agriculture, and orchard production, in addition to raising traditional crops. Furthermore, township and village enterprises (TVEs) accounted for the bulk of increased wage income earned by the rural residents. As the result, the disposable income among rural residents has increased dramatically since the early 1980s. However, in spite of these improvements, the rise in income of rural residents is markedly small when compared to that of urban areas. The total rural incomes are only 40 percent of urban incomes in China when in most countries rural incomes are 66 percent or more of urban income. The gap in income between rural and urban residents has grown at an increasing rate since the late 1980s. In fact, such disparity has been the most important contributor to the problem of social **equity** in China, followed by interregional disparity.

REGIONAL INCOME INEQUALITY. Decades of strict central planning created serious disparities in incomes among citizens in different regions. The average annual income is high, for example, in Jiangsu province located in the eastern region, but Guizhou, located in the western region, has a low income level. The difference is quite enormous. For instance, in 1996, per capita annual income of Jiangsu was 2613.54 yuan while in Guizhou it

was 609.80 yuan; the ratio between the two was 4.3:1. In the same year, per capita GDP and the total GDP of the eastern region were 1.9 times and 5.5 times larger, respectively, than those of the western region.

INTRA-URBAN INCOME INEQUALITY. In addition to the gap between urban and rural areas, city dwellers also feel the income inequality among themselves. According to the Urban Socio-Economic Survey Organization of the State Statistics Bureau, in the middle 1990s the per capita income of the top 20 percent income earners was 4.2 times greater than the bottom 20 percent, worsened from 2.9 times in the later 1980s. Although many enterprises in urban areas have either stopped working or closed down, many of the idle employees who have been laid off are waiting for future employment that would provide them the minimum incomes to maintain the basic standard of living in the urban areas. Currently, many idle workers are either receiving low incomes or no incomes at all. The wage level of retired employees is also quite low, and, considering the effects of inflation, their living standard is falling.

POVERTY REDUCTION. About 10 percent of the Chinese population lives below the poverty line. One of the largest challenges in China is poverty alleviation and elimination. According to the World Bank, due to aggressive measures, China has achieved great success in its anti-poverty struggle in the past 2 decades. The impoverished population dropped from about 250 million in 1978 to 125 million in 1985 because rural areas experienced economic growth. The Chinese government has been planning and organizing a number of large-scale anti-poverty programs all over the country since 1986. By the end of 1992, the poverty population of rural China was reduced to 80 million, reducing the poverty rate to 8.8 percent.

In 1994, in order to accelerate the poverty alleviation and ultimately eliminate poverty by the end of last century, the Chinese government launched the “8–7 Plan,” the main point of which was to eliminate absolute poverty in 7 years through the tax favorite policy, financial support, and social-economic development program. For the convenience of implementing the “8–7 Plan,” the central government selected the 592 poorest counties from the more than 2000 counties nationwide and designated them as “national poor counties.” It was estimated that more than 70 percent of the 80 million poor concentrated in these 592 counties had very bad natural environments and under-developed social-economic conditions.

After 4 years, the poor population of rural China was reduced to 42.1 million, and the poverty rate was 4.6 percent by the end of 1998. The Chinese government spent 24.8 billion yuan (US$3 billion) on poverty alleviation in 1999, 30 times more than in 1980. Rural per capita income among China’s 870 million rural residents in 1999 was 2,210 yuan. Only 3 percent of the rural population remained impoverished or living below the 635-yuan standard, making China’s rural poverty rate the lowest among developing nations. In 2000, China announced that it had eliminated “absolute poverty.”

WORKING CONDITIONS

China has the largest labor force in the world. According to Chinese official data, over 700 million people were employed by the end of 1990s. More than half of its labor force is engaged in agriculture, although that sector accounts for less than 20 percent of China’s GDP. In other words, China’s agricultural labor force is over 100 times as large as its U.S. counterpart. By the middle of the 1990s, most of China’s urban workers were employed in state-owned enterprises (SOEs). In the 1990s, China’s increasingly dynamic service sector employed more workers than industrial enterprises for each of the last 3 years. Latest sources from the State Statistics Bureau show that 6.4 percent of labor force in rural China shifted to the country’s secondary and tertiary industries in 1999. With 0.5 percent of its rural labor force having made a change in their life from agricultural to non-agricultural labor, the net shifting amount of rural labor force was placed at 5.9 percent of the rural total, up 0.4 percent over the same period in 1998. According to one official survey, as many as 50 million people leave rural areas in search of urban jobs every year. Of this number, approximately 30 million people leave their home provinces.

Shifting labor forces experienced a big rise in proportion on a provincial, regional, or municipal scale. About 79 percent of surplus labor force became locally employed in the industrial and service sectors in the country in 1999, up 11 percentage points over 1998. East China remains the hottest destination for drawing rural laborers, although more people began to focus on west China. Among the rural laborers leaving their native place to seek employment in other provinces, 79.8 percent headed for the East in 1999, down 2.5 percentage points compared with the same period of 1998. About 10 percent chose central China for employment, up 0.6 percentage points. More than 10.2 percent went to the country’s west, up 1.9 percentage points over 1998. Most of the laborers are young or people in their prime. People ages 18 to 40 accounted for 77.3 percent. Of these, 57.9 percent were between 18 and 30 years of age.

EMPLOYMENT PROBLEMS. Chinese labor has benefitted significantly from economic reforms. During the 8th 5-Year Plan (1991–95), real incomes increased by 7.7 percent annually in urban areas and 4.5 percent annually in the countryside. However some serious problems existed in the labor market, which threatened to impede economic reforms and to disrupt social stability. Increased lay-offs

(officially labeled as “temporarily losing a job”), placing workers “off post” (*xiagang*), as well as delayed wage and pension payments, resulted in a number of demonstrations by workers and retirees in several Chinese cities. Within a certain period, typically 1 year, these “laid off” workers are usually encouraged to take other types of jobs, generally with less pay and/or status than their original positions. Many workers also take second jobs. Some continue to draw a basic salary and benefits from their previous employer for whom they do little or no real work. By 2001, the problems caused by the increasing lay-offs from SOEs, along with several other issues, became the first worries of the nation’s leaders.

The official unemployment rate was officially reported to be 6 percent by the end of 1990s. Labor officials readily admitted that the official unemployment rate did not include 2 large and important groups that are effectively unemployed, redundant state sector workers and rural surplus laborers. By official estimate, the **underemployed** population in the countryside, defined as those with productive employment less than half of the year, exceeds 200 million people. Some probably more accurate estimates of urban unemployment vary anywhere between 10 and 23 percent. Even according to the official unemployment criteria, a report completed by China’s State Commission for economic restructuring in early 1997 projected that China could have 15 to 20 million unemployed urban workers by 2000. Meanwhile, it is estimated that between the years 2000 and 2010 over 40 million new entrants will be brought into the urban workforce.

LABOR LAW. A national labor law effective 1 January 1995 codified earlier regulations and provides a framework for labor reform. New provisions in the law require workers at all types of businesses to sign labor contracts with the employers; establish arbitration and inspection divisions at all levels of government; set out a preliminary framework for collective bargaining at all types of enterprises; and empower managers to dismiss workers for economic reasons. However, the local governments are less effective in enforcing strict worker safety and overtime provisions of the Labor Law. As the result, industrial accidents, particularly in the mining sector, claim a high number of lives every year.

The Labor Law also requires localities to establish local minimum wages. For instance, the monthly minimum wage in Beijing at the end of 1996 was RMB 270 (approximately US$33); RMB 300 (approximately US$36) in Shanghai; RMB 398 (approximately US$48) in Shenzhen; and RMB 140 (approximately US$17) in Guizhou province. Other parts of China, including Guangdong, Jiangsu, and Shandong provinces, have created a sliding scale of minimum rates for different trades and localities. The minimum wage level determinations are generally higher than the local poverty relief ceiling but lower than the current wage level of the average worker.

Labor disputes, including delayed wages and strikes, have been increasing over the last several years in China. The upward trend has made some labor and union officials become defensive. The official media continuously pay attention to worker abuse, invariably at small, export-oriented foreign ventures with Asian (Hong Kong, Taiwan, South Korea) investment. However, many unofficial observers indicate that working conditions are generally worse in private Chinese enterprises and in domestic small town and village enterprises, which are often owned by local government. Most labor disputes are solved through arbitration and recently some cases reached the courts. According to official statistics, based on National Mediation Center and Labor Bureau records, 48,121 labor disputes occurred nationwide in China during 1996.

ALL-CHINA FEDERATION OF TRADE UNIONS (ACFTU). For the most part, unions in China maintain their primary function of enhancing production and sustaining labor discipline, rather than supporting worker rights. Local unions also perform a variety of social and welfare functions, such as handling disability benefits and housing funds and operating clubs, eating facilities, nurseries, and schools. The All-China Federation of Trade Unions (ACFTU), the country’s only officially recognized workers’ organization, remains focused on the state sector. There is still little evidence to suggest that ACFTU is being positioned to assume the new role of worker advocate mandated by article seven of the labor law, although some union officials at the working level may be increasingly interested in representing the interests of workers, particularly on safety issues.

For the ACFTU, improving labor discipline and mobilizing workers to achieve party and government goals are their primary objectives. However, since the early 1980s, additional objectives have been to increase productivity and encourage participation in, and support for, economic reforms. Generally, the membership is limited to the workers in SOEs. Over half of the country’s non-agricultural workers are not members of the ACFTU, those who are outside the state industrial structure in collectives, private and individual enterprises, foreign-invested enterprises, and township and village enterprises.

WORKING CONDITIONS. The working conditions are generally poor in China, especially in the rural areas. The rate of industrial accidents had remained high until 1996 when, according to Ministry of Labor statistics, for the first time in many years the number of industrial accidents actually dropped. Total accidents stood at 18,181, 13.5 percent less than in 1995, with total fatalities at 17,231, a 13.9 percent drop from 1995. By 2001, there

was no evidence to confirm whether this decline represents a permanent trend. The official media continue to criticize the overall high number of work-related accidents and fatalities. The majority of industrial accidents in China occur in mines, particularly in poorly regulated small-scale private, township, and village mines. For instance, in 1996 there were 7,695 mining accidents and 9,974 workers were killed.

Work safety issues attracted the attention of senior government leaders; occupational safety and health became the subject of constant campaigns. All work units are required to designate a safety officer. Since 1991, the Ministry of Labor has conducted an annual "industrial safety week" during May, to promote safety consciousness among managers and workers. As of mid-1997, the Ministry of Labor fulfilled new National Occupational Safety and Health legislation. Labor Ministry officials have also indicated that they have the responsibility of drafting improved National Mine Safety legislation. However, much evidence demonstrates that enforcement of existing regulations, rather than the drafting of new legislation, is what is needed most. Moreover, pressures for increased output, lack of financial resources to maintain equipment, lack of concern by management, poor enforcement of existing regulations, and a traditionally poor understanding of safety issues by workers, all make it difficult, if not impossible, to lower the high rate of accidents.

On 1 May 1995 China reduced the national standard workweek from 44 to 40 hours, excluding overtime. The Labor Law mandates a 24-hour rest period weekly and does not allow overtime work in excess of 3 hours a day or 36 hours a month. The Labor Law also sets forth a required scale of remuneration for overtime work that is set at no less than 150 percent of normal wages. Enforcement of these regulations varies according to region and type of enterprise. The official media regularly report cases of workers required to work long overtime hours at small-scale foreign-invested enterprises, particularly in special economic zones and other areas of Southeast China. Similar abuses in non-state sector enterprises are also widely acknowledged to occur.

WOMEN IN THE WORKFORCE. Economic reforms have increased employment opportunities for both men and women in China. The growth of the less regulated non-state sector and the declining role of the government in job assignments has also increased the likelihood that women will face employment discrimination in China. In 1995 while hosting the U.N. Fourth World Conference on Women (FWCW), China pledged to pay more attention to the problems faced by women in the workforce. The state council promulgated the national program for Chinese Women's Development in August 1995 with the goal of increasing enforcement of the right to education and employment and asserting the status of women. Responding to the hesitancy demonstrated by government ministries to hire women at a Beijing job fair in early 1996, the All-China Women's Federation (ACWF) called for stricter safeguards of women's rights.

In SOEs, women are more likely to be forced into early retirement or placed "off-post." A joint study of sample enterprises in 5 cities performed by the Ministry of Labor and the ILO in early 1995 indicated that 70 percent of workers described as "surplus" were women. According to an official survey completed in Shanghai in August 1996, women were the first to be affected by unemployment in the city because of their overall lower level of skills. The 1988 Women's Protection Law provides a minimum of 3 months of maternity leave and additional childcare benefits for women. The law also provides exclusion for breastfeeding mothers from certain categories of physical labor and night shifts. However, the regulations are designed to provide additional incentives to women workers of childbearing age to abide by family planning policies, which do not affect rural workers.

AGE DISCRIMINATION. China perhaps is one of few countries that discriminates against middle aged and older workers in terms of re-entering employment after being laid off. Many employers will state openly in their job advertisements that they would not hire those who are over 45 years old. Older workers are also finding it increasingly difficult to compete. Some managers complain that older workers do not have the skills needed for the current marketplace; others note that older workers are in poor health. Older workers are likely to be the first to be affected by downsizing in the state sector. By all accounts, older women have an especially difficult time maintaining their employment. Many older women are poorly educated upon entry into the job force and receive little opportunity to upgrade their skills thereafter. While managers may want to keep on a certain number of experienced men, most view older women simply as a burden. Older women find the differences in China's statutory retirement age especially rankling. The retirement age for men is 60, while for women it is 50 in industry and 55 elsewhere. Although traditional views hold that women want to retire early to take care of grandchildren, women today, especially educated women, prefer to make this decision themselves and not be forced out of the workforce before they are ready.

CHILD LABOR. In theory, child labor is forbidden in China. For instance, the 1995 National Labor Law specifies, "No employing unit shall be allowed to recruit juveniles under the age of 16." Administrative review, fines, and revocation of business licenses of those businesses that hire minors are specified in article 94 of the Labor Law. Chinese children are entitled to receive 9

years of compulsory education and to receive their subsistence from parents or guardians. Laborers between the ages of 16 and 18 are referred to as “juvenile workers” and are prohibited from engaging in certain forms of physical work including labor in mines. The Labor Law mandates the establishment of labor inspection corps at all administrative levels above county government. The rapid growth of China’s non-state sector has outpaced the evolution of government inspection and enforcement regimes. However, in poorer, isolated areas, child labor in agriculture is widespread given the few options available to minors who have completed their primary school education at approximately 13 years of age. According to official statistics, 10 million children between the ages of 6 and 14, two-thirds of whom were girls, dropped out of Chinese primary schools during 1996. Presumably they ended up performing some type of labor to help the family’s financial well-being.

COUNTRY HISTORY AND ECONOMIC DEVELOPMENT

2205–1783 B.C. Early Bronze Age occurs, as does use of metal.

1783–1134 B.C. Economy is based on agriculture, with some hunting and animal husbandry. More advanced bronze metallurgy appears. Silk fabric appears.

1134–770 B.C. Feudalistic society appears. Routine taxation on agriculture begins. Systematic irrigation, fertilization, and animal-drawn plows are used in farming. Iron tools appear in farming and mining. Cowry shells, silk, jade, pearls, leather, and pieces of silver are used in trading.

770–246 B.C. Commerce improves through coinage and technology.

246–206 B.C. Standardization of legal codes, bureaucratic procedures, coinage, writing, philosophical thought, and scholarship take place. Walls from warring states are combined to make a Great Wall. Public works projects begin, including an imperial road.

206–1 B.C. Merchant class grows wealthy due to agricultural enterprises (cereals and rice), cattle, fish farming, cloth mills, private foundries, lacquer factories, shops, and money lending. State foundries appear in most areas. Technological advances occur, noticeably in paper and porcelain.

1–88. Government supports free, no-interest loans to curb usury. Regional commissions set prices on staple goods. Granaries hold surplus food in case of famine. State Wine Monopoly is formed. State monopolies in iron and salt are abolished.

89–166. Embassies from various nations are established.

220–265. Advances in medicine, astronomy and cartography occur. State supports silk weaving workshops, each with thousands of workers. Gunpowder is introduced in fireworks.

300–399. Oil wick lamps and umbrellas appear. Coal is used in lieu of wood in making cart iron.

400–499. Harness with paddle-horse collar is invented. Fusion process is used in making steel. First true porcelain is made in China.

552. Byzantine emperor, Justinian, sends missionaries to China to smuggle out silk worms and mulberry leaves.

600. Man-powered paddle-wheel boat appears. Merchants from 27 different lands meet at Zhang-ye on silk road to discuss trade.

618–907. Tang Dynasty adopts function of state affairs over public administration, finances, rites, army, justice, and public works. A censorate ensures compliance of governmental performance with plans. Use of receipts of deposit, for exchange of commercial transactions, begins. Earlier restrictions on business activities are ignored. Tang dynasty recognizes middle class over peasants.

894–1300. Japan severs all relations with China; however, it allows informal commercial visits by private traders with luxury goods.

960–1126. K’ai-feng becomes a major city, under the Northern Song Dynasty, with broad roads, wide canals, all-day markets, eateries, and restaurants, merchants, vendors, and entertainers. Invention of navigational compasses, astronomical instruments, celestial globes, water-driven mechanical clocks, blast furnace using coke, and spinning wheel occurs. Government prints promissory notes. Civil servants manage state monopolies. The government recognizes association of merchants and artisans and “chambers of commerce.” Silk working machinery aids production. Specialization in pottery occurs. Tea and cotton are major cultivated crops.

1000–99. Large-scale iron and steel complexes are built in the north using blast furnaces and employing some 3,000 workers. An industrial complex is built to mass-produce ceramic for imperial court.

1068–85. Under emperor Shen Tsung, provincial money taxes are substituted for labor obligation to reduce peasant’s dependence on moneylenders. A financial bureau reduces budget by 40 percent. Government loans cash or grain to poor to protect usury on crop loans.

1100–99. Intaglio printing is used in money printing to prevent counterfeiting.

1260–94. Kublai Khan rules over the Mongol empire, Central Asia, Persia, North China, and Mongolia. He

retains the salt and iron monopolies. Discrimination against the Huns begins. Three types of paper money are established: one based on silk and two based on silver. Fixed taxes are adopted and large **levies** of Song Dynasty are abolished. Government is reorganized to include a bureau of imperial manufactures (industrial matters), a secretariat (civilian matters), a privy council (military matters), a censorate (evaluating officials), and offices of personnel, revenue, rites, war, justice, and public works. Banners are used to advertise wine. Pawnshops are first seen.

1277. Marco Polo is appointed agent to the imperial council.

1287. Kublai Khan replaces paper money with new currency to fight against rapid inflation.

1295. Marco Polo returns to Italy, incites interest in trade with China.

1342. Weapons, fans, screens, laquerware, and books are traded during Japanese trading expeditions.

1368–1644. Ming Dynasty begins, and government is re-organized. Silk is reserved for imperial use. Nationwide tax system is implemented, and corrupt Mongols are replaced. Slavery is abolished. Large estates are confiscated and poor peasants rent land. The wealthy are taxed heavily. Contact with foreigners is restricted. Elementary school system is established.

1420. Ming navy produces combat vessels. More than 250 are capable of long-range voyages.

1421. Beijing becomes the capital. The imperial workshop employs more than 27,000 craftsmen in trade and foreign relations.

1557–97. Chinese allow Portuguese colonization and development on Macau.

1637. First English factory is established in Canton.

1644–1912. Manchu overthrow Ming Dynasty, and China enters Qing Dynasty.

1800. China produces 33.3 percent of the world manufacturing output. Foreign merchants exchange opium for goods.

1842. Treaty of Nanking is signed; Britain gets control of Hong Kong. Shanghai and other coastline cities are open to foreign settlements.

1873–90. Modern non-military enterprises begin to form, owned and operated by Chinese compradors and merchant middlemen.

1900–01. Boxer Rebellion tries to force foreigners out, suppressed by Britain, United States, France, and Japan. China pays US$330 million in restitution.

1916–31. Japanese receive commercial rights to Inner Mongolia and Southern Manchuria and create the puppet state of Manchuria.

1937. Japanese forces invade and eventually occupy Beijing.

1949. People's Republic of China is formed when Communists take over the government. A mass exodus of entrepreneurs to Hong Kong and nationalists to Taiwan occurs.

1958. Great Leap Forward begins by creating communes to increase production and increase collectivism. However, it fails to increase economic growth.

1966. Great Cultural Revolution is launched, attacking bourgeoisie ideology and capitalist thought, which leads to rioting and instability. These events have a devastating impact on the economy.

1976. The death of Mao Zedong and arrest of Gang of Four end Great Cultural Revolution.

1980. Special Economic Zones are extended for capitalist enterprises north of Hong Kong. The country's first management program is established and forms the Chinese National Center for Industrial Science and Technology at Dalian Institute of Technology.

1985. The development of consumer-based industry occurs. The first stockbroker in Shanghai trades with 10 corporations.

1989. The first Beijing International Fair opens, which is the first and the biggest international fair held independently by China. Growing student objections to official corruption lead to violence after a demonstration in Tiananmen Square.

1990. The 4th Asian Trade Promoting Meeting is held in Beijing. Official census counts 1 billion people. China is granted observer status in GATT.

1991. China Stock Association announces its establishment in Beijing.

1992. China announces that the goal of the economic reform is to set up a socialist market system.

1993. Electric power groups (North, East, Middle, Easter-North, and West-North) were permitted to be set up by the State Council.

1994. The launching ceremony of Yangtzi River Three Gorges is held and its construction started.

1995. The China Investment Association announces its establishment in Beijing.

1996. With sharp economic growth and controlled inflation under control, China achieves the goal of macro economic control.

1997. China decreases tariffs and promises to reduce the average tariff of the industrial products to 10 percent.

1998. In order to protect China's growing economy from the Asian economic crisis, Chinese government issues 1,000 billion **national debts** for the construction of domestic infrastructure and civil services.

1999. China resumes the collection of tax on the interest of personal savings.

2000. China successfully completes the 9th 5-Year Plan for economic growth; and the country's GDP reaches US$10,000 billion.

FUTURE TRENDS

Since 1978, China's economic system has undergone a market-oriented reform and begun its open-door policy. In more than 20 years, although system devolvement and structural transformation were mostly driven by domestic factors, China has been increasingly influenced by economic globalization and worldwide industrial upgrade. In the 21st century, it is estimated that Chinese economic development will be influenced by world economy, especially the economy of the Asian area. The Chinese economy will depend on the attitude and strategy China will take toward being involved in the globalization process.

OUTLOOK FOR CHINA'S ECONOMY. The long-term outlook for the Chinese economy remains unclear. China's commitment to join the WTO appears to represent a major commitment on the part of the Chinese government to significant economic reform and greater access to its domestic markets. Some observers believe that the Chinese government views accession to the WTO as an important, though painful, step towards making Chinese firms more efficient and competitive in the world market. In addition, the government hopes that **liberalized** trade rules will attract more foreign investment to China. It is expected that over the long run a more open market system would boost competition, improve productivity, and lower costs for consumers, as well as for firms using imported goods as inputs for production. Economic resources would be redirected towards more profitable ventures, especially those in China's growing private sector. As a result, China would likely experience more rapid economic growth than would occur under current economic policies. It is estimated that WTO membership would double China's trade and foreign investment levels by the year 2005 and raise real GDP growth by an additional 0.5 percent per year.

In the short run, due to increased foreign competition, widespread economic reforms (if implemented) could result in disruptions in certain industries, especially unprofitable SOEs. As a result, many firms would likely go bankrupt and many workers could lose their jobs. How the government handles these disruptions will greatly determine the extent and pace of future reforms. The central government appears to be counting on trade liberalization to boost foreign investment and spur overall economic growth; doing so would enable laid-off workers to be employed in higher growth sectors, especially in the growing private sector. However, the Chinese government is deeply concerned about maintaining social stability. If trade liberalization were followed by a severe economic slowdown, leading to widespread bankruptcies and layoffs, the central government might choose to halt certain economic reforms rather than risk possible political upheaval.

In February 1998 the officials announced their intentions to spend US$750 billion on infrastructure development over the next 3 years, although many analysts have questioned China's ability to obtain funding for such a massive financial undertaking in such a short period of time. It is likely that China intends to attract foreign investment for much of its infrastructure needs.

However, Chinese restrictions on ownership, profits, and operational control of major projects, China's demands for subsidized financing and sharing of technology, and uncertainties regarding obtaining approval from Chinese officials at the central and local levels have made foreign investors reluctant to invest in major Chinese infrastructure projects.

WEST REGION DEVELOPMENT. The central government has decided to accelerate the economic development in its west regions over the next few decades. China will build more highways in its western region, including 2 linking the heartland with the Tibet Autonomous Region, over the next 5 to 10 years. There are already 3 highways linking the inland areas with Tibet. China will also build another 14 main highways in the western region in the coming 10 years. China will have completed a modern highway network in the west by 2030. At the moment, roads in the western region are poor and insufficient. There are only 7.8 kilometers of highways per 100 square kilometers in the region, only half the national average. China has made the improvement of infrastructure the priority in its program to develop the vast western region. This development is expected to become one of the most dynamic forces in the country's economic growth.

ENVIRONMENTAL PROTECTION. The last 2 decades of rapid economic growth, urbanization, and industrialization have been accompanied by steady deterioration of the environment in China. The concentration of both air and water pollutants are among the highest in the world, causing damage to human health and lost agricultural productivity. Some major Chinese cities have particulate and sulfur levels from 2 to 5 times World Health Organization and Chinese standards. Soil erosion, deforestation,

and damage to wetlands and grasslands have resulted in deterioration of the national ecosystems and pose a threat to future agricultural sustainability.

China has already taken some steps to reduce pollution and deforestation and has staved off an abrupt worsening of environmental conditions in general. A system of pollution control programs and institutional networks for environmental protection is being constructed at the national and local levels. As part of the recent government reorganization, China's environmental agency, the State Environmental Protection Agency (SEPA), has been upgraded to full ministerial rank and its coverage expanded to include the "green" issues. For better urban and industrial pollution control, China has focused increasingly on river basin management, greater use of economic incentives, and increased use of public information campaigns. Issues of vehicle emissions in urban areas are being tackled through improved traffic management, public transport initiatives, changes in transport fees, and phasing out of leaded gas, which has already been implemented in the largest city centers. Coastal zone management has been introduced, and energy conservation efforts and the development of renewable sources of energy have been expanded.

DEPENDENCIES

China has no territories or colonies.

CYPRUS

Republic of Cyprus
Kypriaki Dimokratia

CAPITAL: **Republic of Cyprus:** Nicosia. **Turkish Republic of Northern Cyprus:** Lefkosia.

MONETARY UNIT: **Greek zone:** Cypriot pound (CP). One Cypriot pound equals 100 cents. There are coins of 1, 2, 5, 10, 20, and 50 cents and 1 pound. Paper notes include a 50 cent note, and 1, 5, 10, and 20 pound notes. **Turkish zone:** Turkish lira (TL). One Turkish lira equals 100 kurus. This zone uses the same currency as used in Turkey. The smallest unit in circulation in the TRNC is TL50,000. The kuru is no longer in circulation due to high rates of inflation and the devaluation of the currency. Paper money comes in bills of 50,000, 100,000, 250,000, 500,000, 1 million, 5 million, and 10 million lira. There are coins of 5,000, 10,000, 25,000, 50,000, and 100,000 lira.

CHIEF EXPORTS: **Both Greek and Turkish zones:** Citrus, potatoes, and textiles. **Additional exports from the Greek zone:** Grapes, wine, cement and shoes.

CHIEF IMPORTS: **Greek zone:** Consumer goods, petroleum and lubricants, food and feed grains, machinery. **Turkish zone:** Food, minerals, chemicals, machinery.

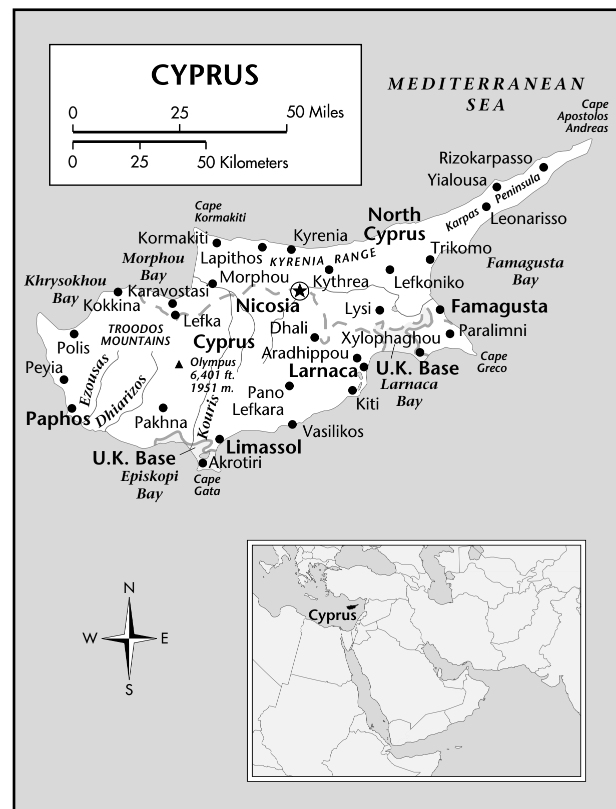
GROSS DOMESTIC PRODUCT: **Greek zone:** US$9 billion (1998 est.). **Turkish zone:** US$820 million (1998 est.).

BALANCE OF TRADE: **Exports:** *Greek zone,* US$1 billion (1999); *Turkish zone,* US$63.9 million (1998). **Imports:** *Greek zone,* US$3.309 billion (1999); *Turkish zone,* US$421 million (1998).

COUNTRY OVERVIEW

LOCATION AND SIZE. The Republic of Cyprus is the internationally recognized government on the island. In 1983, a separate Turkish administration declared the northern territory an independent state and calls itself the Turkish Republic of Northern Cyprus (TRNC). Unless otherwise indicated, the "Republic of Cyprus" or "the government of Cyprus" mentioned in this entry refers to the internationally recognized government administered by the Greek Cypriots. For practical purposes, the terms "Greek zone" and "Turkish zone" are used to describe the 2 parts of the island.

The third largest Mediterranean island after Sicily and Sardinia, Cyprus is located in the East Mediterranean Basin 75 kilometers (47 miles) south of Turkey. The island has an area of 9,251 square kilometers (3,571 square



miles) and a coastline of 648 kilometers (402 miles). Comparatively the island is only about half the size of the state of Connecticut. The capital, Nicosia, is located in the central part of the island. It is a militarily-divided capital, with the Greek Cypriots controlling the southern portion of the city (called Nicosia) and the Turkish Cypriots controlling the northern portion of the city (called Lefkosia).

POPULATION. The population of the entire Republic of Cyprus in 2000 was 758,363. The predicted growth rate for the population is 0.6 percent, according to 2000 estimates. The country is relatively young, with the age group between 0 and 14 making up about 23 percent of the total population. The life expectancy is 72 years for women and 70 for men in the Turkish zone, but 80 and 75, respectively, in the Greek zone.

The population of the Turkish Republic of Northern Cyprus, according to the revisions of the 1996 census, was 200,587. Of this number, 164,460 were Turkish Cypriot citizens, 30,702 Turkish citizens, and 5,425 people with citizenship in other countries. The natural rate of population growth in the Turkish zone is 0.9 percent.

The Greek Cypriots make up slightly more than three-fourths of the island's population, with 99.5 percent of them living in the Greek zone and the remaining 0.5 percent in the Turkish zone. Turkish Cypriots make up nearly all of the remaining population, with 98.7 percent of them living in the Turkish zone and 1.3 percent in the Greek zone. Other ethnic minorities make up less than 5 percent of the island's total population, and they live mainly in the Greek zone. Turkish nationals can enter the Turkish zone without passport formalities. However, entry is restricted from the Turkish to the Greek zones.

Three languages are spoken on the island: Greek, Turkish, and English. Greek is the dominant language in the south; Turkish predominates in the north. A majority of the population can also speak English. More than 90 percent of the population is literate.

The religious structure of the island is divided, like its people. Members of Greek Orthodox churches comprise 78 percent of the island's total population and live mainly in the Republic of Cyprus. The Turks in the TRNC are mainly Muslims. Other religious groups like Maronites and Armenian Apostolics together account for less than 5 percent of the total population.

OVERVIEW OF ECONOMY

The division of Cyprus into 2 areas, controlled by Greek and Turkish authorities respectively, shapes the economic affairs and structure of the island. The economy of the Republic of Cyprus experienced rapid growth in the 1970s after the island's division into 2 zones. The government financed investment to replace housing for the Greek Cypriots who moved to the Greek zone after the division. That explains why the **real gross domestic product** (GDP) growth rates were over 6 percent annually in the 1980s. However, the GDP growth rate fell back to an average of 4.3 percent between 1994 and 1999.

Both the Greek and Turkish zones face severe water shortages. The island has no natural reservoir and experiences seasonal inequalities in rainfall. Although there is an aquifer (underground water supply) on the island, it is subject to seawater intrusion, which increases salt content, especially in the Turkish zone. Both administrations have sought ways to overcome the issue; several desalination (salt removal) plants are planned for construction in the near future.

GREEK ZONE: The economy of the Greek zone is prosperous but can easily be affected by external shocks, since it is heavily dependent on the tourism industry. For instance, in the 1990s the region's economy attained inconsistent growth rates due to swings in tourist arrivals, caused by political instability on the island and changes in economic conditions in Western Europe. Being a candidate for membership in the European Union (EU), economic policies in the Greek zone are focused on meeting the criteria for admission. On the other hand, the attractiveness of the island has led to a concentration of investment and labor in the tourism sector, thus reducing the Greek zone's competitiveness in manufacturing and other sectors.

Inflation rates in the Greek zone have been moderate. The average was 4.8 percent between 1982 and 1990, and had dropped to 1.6 percent by 1999 as a result of economic slowdown. The government uses a wage determination system called COLA (cost-of-living-allowance), which automatically adjusts wages and salaries for **inflation**. The country's unemployment rate stood at 3.6 percent in 1999, below the levels of many EU countries. **Immigration** helps the Cypriot economy maintain its economic growth rate even in times of economic slowdown. Unskilled immigrant labor usually takes agricultural and domestic jobs.

TURKISH ZONE: The economy of the Turkish zone (US$820 million) is much smaller compared to that of the Greek zone (US$9 billion). The northern region has about one-fifth the population and only one-third of the per capita GDP of the south. The GDP growth rates in the north averaged around 4.7 percent in the 1980s, slowing down to an average of 2.8 percent in the 1990–98 period. In 1991 real GDP actually fell by 4.3 percent, and then by 4.1 percent in 1994 as a result of the economic crisis in Turkey. The "Turkish Republic of Northern Cyprus" is recognized only by Turkey, which means the rest of the world still considers the southern Greek administration as the sole administrator of the whole island.

This has created problems for the Turkish Republic of Northern Cyprus' government and its economy. Foreign firms and investors cannot do business in the Turkish zone, as they cannot transfer funds or goods from a country that is not recognized as an independent state. As a result, the economy of the Turkish zone remains heavily dependent on agriculture and government service, which together employ about half of the workforce. The economy also has a small tourism sector, with legalized gambling, serving especially tourists from Turkey, where all forms of gambling have recently been banned. The economy of the Turkish zone is more vulnerable to outside shocks not only because of its small size and its legitimacy (diplomatic recognition), but also because it uses Turkish lira as the legal tender, which has **devaluated** (decreased in value) greatly over the past decade. To compensate for the economy's weakness, Turkey provides direct and indirect aid to tourism, education, and industries located in the Turkish part of the island.

POLITICS, GOVERNMENT, AND TAXATION

Cyprus gained its independence from the United Kingdom in August 1960. Three years later, clashes between the Greek and Turkish communities on the island began, and the island started to disintegrate politically. A junta-based (a small military ruling group) coup attempt backed by Greece in July 1974 led to a Turkish intervention that divided the island in two, creating the de facto (existing if not officially recognized) Turkish Republic of Northern Cyprus. The Greek Cypriots took full control of the internationally recognized government of Cyprus while the Turkish Cypriot administration declared independence for its zone in November 1983. "The Turkish Republic of Northern Cyprus" (TRNC), however, has been recognized only by Turkey. The period from 1983 until 2001 has been characterized mainly by international efforts, under the leadership of the United Nations and the United States, to resolve the conflict between the 2 sides and to create a new type of government. The Greek Cypriot position on the issue has been towards a new federal system (with stronger power for the national government) while the Turkish Cypriots prefer a confederate system (with more power-sharing between Greeks and Turks).

The island has different constitutions and sets of governing bodies for each side. The Greek Cypriots are still using the constitution that took effect in 1960 following independence, while the Turkish Cypriots created their own constitution and governing bodies in 1975 following the 1974 break-up. The TNRC adopted a new constitution passed by a referendum (popular vote) in May 1985. Talks to find a peaceful resolution between the 2 Cypriot zones resumed in 1999.

Glafcos Clerides has served as the president of the Republic of Cyprus since February 1993. He serves as both the head of state and the head of government. According to the 1960 constitution, the post of the vice president is reserved for a Turkish Cypriot, but the office has not been filled since the 1974 separation.

The Turkish Republic of Northern Cyprus also elects a president by a popular vote, although he is only recognized as a head of state by Turkey. Rauf R. Denktash has served as president of the TRNC since February 1975. Dervis Eroglu has been the TRNC's de facto prime minister since August 1996, heading the Turkish zone's Council of Ministers (cabinet).

As there are 2 different heads of state and 2 separate sets of governing bodies on the island, political parties for the 2 zones are different. In the Greek Cypriot political system, the following parties have dominated: Democratic Party (DIKO), Democratic Rally (DISY), Ecologists, New Horizons, Restorative Party of the Working People (AKEL or Communist Party), United Democratic Union of Cyprus (EDEK), United Democrats Movement (EDI, formerly Free Democrats Movement or KED). In the Turkish Cypriot area the main parties have been: Communal Liberation Party (TKP), Democratic Party (DP), National Birth Party (UDP), National Unity Party (UBP), Our Party (BP), Patriotic Unity Movement (YBH), Republican Turkish Party (CTP).

Taxes and foreign economic aid provide the main sources of income for both the Greek Cypriot and Turkish Cypriot governments. In both zones, the government plays an important role in the island's economy. The Turkish zone relies heavily on financial aid from Turkey. Until recently, the Republic of Cyprus government has controlled key sectors of the economy by means of semi-governmental organizations such as those that oversee the telecommunications and power industries. The Republic of Cyprus government has been moving toward a more liberal role in the economy. The country's candidacy for EU membership supports efforts to loosen government control over the economy. For instance, the **liberalization** of air transportation in Europe has forced Cyprus Airways, the island's government-owned airline, to become more efficient. The traditional regulations that restricted retailers' hours of operations and limited special sales to certain times of the year have been recently liberalized so that the island's economy can be more competitive and productive.

INFRASTRUCTURE, POWER, AND COMMUNICATIONS

Cyprus has an efficient power and communications **infrastructure** according to European standards. The state-run enterprises handle most of the island's needs in

Communications

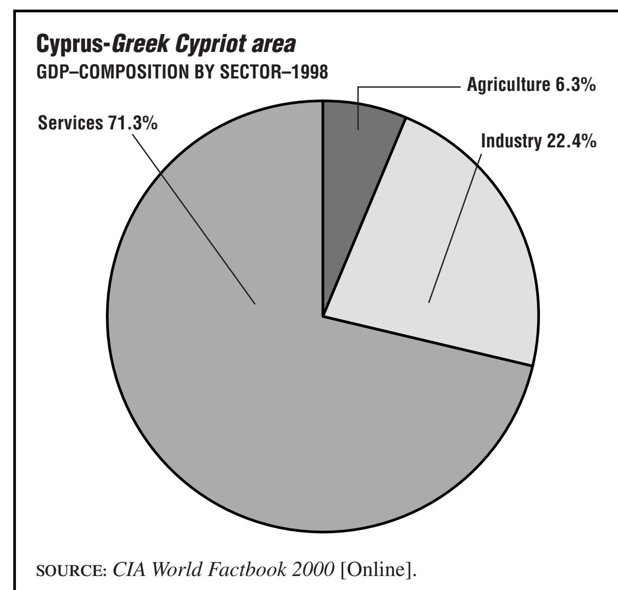
the way of power generation, harbors, airports, and telecommunications. The island does not have a railroad system; instead the country is covered by highways, of which 10,663 kilometers (approximately 6,626 miles) are within the Greek Cypriot zone and 2,350 kilometers (approximately 1,460 miles) within the Turkish zone. Most of these highways are double-lane highways. There is a limited bus system that connects the cities with the inland, and a convenient taxi service. The island also has 12 airports with paved runways (15 total), which benefits the growing tourist industry. Its main harbors are Famagusta, Kyrenia, Larnaca, Limassol, Paphos, and Vasilikos. Despite its small size, Cyprus maintains the sixth largest ship registry in the world with about 2,700 ships and 27 million gross registered tons. Power generation in the Greek Cypriot zone was 2.675 billion kilowatt hours in 1998, all derived from fossil fuels. Power details on the Turkish zone were unavailable.

The Cyprus Telecommunications Authority handles the communications services in the Greek Cypriot zone, while another state-run enterprise provides this service in the Turkish zone. The Greek zone has 405,000 main telephone lines and 68,000 mobile lines in use; the Turkish zone has 70,845 and 70,000, respectively. Direct international dialing is also available on the island, and postal and courier services are also efficient. There are 4 main TV broadcasting stations in both the Greek and Turkish zones. As of 1999, the island had 5 Internet service providers.

ECONOMIC SECTORS

GREEK ZONE: The Greek Cypriots are among the most prosperous people in the Mediterranean region, and the Greek zone has enjoyed a high level of economic development, especially from the tourism industry. The inflation rate was 2.3 percent in 1998 and declined to 1.6 percent in 1999. The unemployment rate remains around 3.6 percent. The Greek zone has an open, free-market, service-based economy with some light manufacturing. Agriculture and natural resources make up only about 6 percent of its economy, according to 1998 figures. The industrial and construction sectors, on the other hand, accounted for nearly 25 percent of economic activity in that year, with most of the production for domestic need. The remainder of the economy is based on tourism and other services. Included in this category are restaurants and hotels, with 21.6 percent of the GDP; and banking, insurance, real estate, and business sectors with 17.5 percent. Transport, communication, government services, and social and personal services make up the remainder.



SOURCE: *CIA World Factbook 2000* [Online].

SOURCE: *CIA World Factbook 2001* [Online]. Data for 2000. Percent distribution for Greek Cypriot area for 2000. Percent distribution for Turkish Cypriot area for 1998.

The island receives approximately US$3 billion from service-related exports led by tourism. Compared to only US$1.2 billion from merchandise exports, this is a fairly high proportion in the total economy. The service sector, including tourism, employs about 62 percent of the **labor force**. Consequently, the economy's growth rate is quite vulnerable to swings in tourist arrivals that are in turn affected by economic and political conditions in Cyprus, Western Europe, and the Middle East. According to the U.S. State Department's *Country Background Notes* on Cyprus, the real GDP growth was 9.7 percent in 1992, 1.7 percent in 1993, 6.0 percent in 1994, 6.0 percent in 1995, 1.9 percent in 1996, and 2.3 percent in 1997. Such a volatile pattern shows the effect of tourist arrivals on the overall economy.

Agriculture, on the other hand, employs only 12 percent of the population. Potatoes and citrus are the principal export crops. The island is not self-sufficient in agricultural products and must import other agricultural products for survival. More than 50 percent of Cyprus's trade is with the European Union. Cyprus signed an Association Agreement with the European Union in 1972, which established a Customs Union between the 2 zones. It applied for full EU membership in 1990 and since then the Cyprus pound has been pegged to the euro. The economic agenda in the Republic of Cyprus is geared towards joining the EU.

Trade is vital both to the Greek and Turkish Cypriot economies as the island is not self-sufficient. That explains why both zones have had structural **trade deficits**, which continue to grow. The Republic of Cyprus has a very important ship registry, and currently more than 2,700 ships are registered in Cyprus. As an open registry, it can include foreign ships and vessels. By 2001, more than 43 countries, including the United States, have registered ships with Cyprus. To encourage ship registrations, the Republic of Cyprus has enacted laws that provide incentives to Cypriot ships, including tax exemptions.

TURKISH ZONE: The Turkish Republic of Northern Cyprus does almost all of its trade with Turkey and uses Turkish lira, the currency used in the republic of Turkey, as its legal tender. Assistance from Turkey is the mainstay of this zone's economy, thus making it very vulnerable to shocks coming from Turkey. For instance, the TRNC experiences the same rate of inflation that exists in mainland Turkey. As the value of Turkish lira falls

against other currencies such as the dollar or the euro, so does the purchasing power of Turkish Cypriots against imported goods from the United States or Europe. In 1998, the Turkish zone experienced an inflation rate of 66 percent, which was the same as in Turkey. The unemployment rate in the Turkish zone reached 6.4 percent in 1997, almost double the rate in the Greek zone. According to an economic protocol signed in January 1997, Turkey has undertaken the provision of loans to the TRNC totaling $250 million for public finance, tourism, banking, and **privatization**.

AGRICULTURE

GREEK ZONE: Agriculture accounted for 6 percent of the GDP in 1997, and it employed about 12 percent of the labor force. Agricultural products accounted for 21 percent of total domestic imports in 1997. In 1998 revenue from agricultural products was US$531 million. Citrus fruits and potatoes are the main export commodities, followed by grapes, barley, and vegetables. In 1996 the area under field crops was 93,000 hectares. Vineyards covered 15 percent of this acreage, while permanent orchards accounted for 11 percent, and olive vineyards and nut trees an additional 6.2 percent. Agricultural production is dependent on the island's temperate Mediterranean climate with hot dry summers and cool winters. In terms of value, 56 percent of the 1996 gross harvest was consumed in Cyprus. Although domestic markets are important for agriculture, processing of agricultural products for other uses is becoming more important. Per capita consumption levels of fruits and citrus are exceptionally high in Cyprus, with 55 kg per person for citrus and 146 kg for other fruits.

In Cyprus, farm processing is important, with production of halloumi cheese, raisins, and wine being the most important. Such processed farm products have higher export values than unprocessed food products and are easier to sell abroad, especially since closer integration with the European Union has made more of Cyprus's farm products available to consumers in Europe.

Fishing is an expanding sub-sector of agriculture. Fish farms have been installed on the south coast, and local and tourist fish markets provide a continuous demand. In recent years, the catch from inshore and trawler fisheries has increased, while marine aquaculture (sea fishing) has stagnated. The Cyprus government reported that the Cyprus Fisheries produced more than 3 tons of fish in 1997.

Agriculture in the Greek zone has an uncertain future, because the sector is declining in importance against other sectors like tourism. It is also affected by rainfall fluctuations and by the water-shortage problem on the island as a whole.

TURKISH ZONE: The northern Turkish zone relies more heavily on agriculture than the southern Greek zone. Although only one-third of the island's area is under Turkish control, its agricultural sector accounts for 46 percent of Cyprus's total crop production and 47 percent of its livestock population. Agriculture employs more than 25 percent of the Turkish zone labor force. Its agriculture sector experienced a severe blow in 1995 when the region lost nearly 10 percent of its forests in a major fire. The sector has also been hurt by regulatory difficulties surrounding the export of agricultural products. The European Court of Justice has ruled that agricultural products must have phytosanitary (certifying that plants are disease-free) certificates from the legally recognized authorities of the Republic of Cyprus. As a result, many agricultural products from the Turkish zone must first be exported to Turkey before getting into European markets. Another disadvantage is that the Turkish Cypriots have to accept payments for their exports in Turkish liras instead of **hard currency** such as the dollar or the euro.

INDUSTRY

MINING. Information about mining in the separate zones is not available. Mining has long played an important role in Cyprus's economy. For several thousand years, the island has been an important source of copper ores. It also produces pyrites, asbestos, gypsum, salt, marble, clay, and earth pigment. In the 1950s, minerals accounted for almost 60 percent of all exports and employed more than 6,000 people. After independence in 1960, however, the share of mineral exports had fallen to 34 percent. The 1974 Turkish intervention further disrupted the mining sector. In 1981 its share in total exports fell below 5 percent and by the end of the 1980s to less than 1 percent. The contribution of the sector to the GDP also declined, to 0.5 percent in 1985 and 0.4 percent in 1987 and 1988. Most of the deposits on the southern part of the island are nearly gone today. The asbestos mines were closed in 1988, thus further reducing the share of the mining sector in the economy. By the 1990s, the main mining products were pyrites and copper. The mining of sand and other construction minerals fluctuates with demand. By the late 1990s, 250 quarries were operating in the Republic of Cyprus. Though the mining industry had declined since the Turkish invasion, the Hellenic Copper Mine's 1996 establishment of a mine at Skouriotissa was encouraging.

MANUFACTURING. According to the U.S. State Department's *Background Notes* on Cyprus, manufactured goods accounted for approximately 69 percent of the Greek zone's domestic exports in 1997. Before the partition of the island, most of the manufacturing goods were produced in what is now the Turkish zone by small, owner-operated plants. Most of the production was for

the domestic market. After 1974, the industries were reoriented for export, and large factories were built in the southern Greek-controlled zone. Output grew rapidly there through the 1980s. The manufacturing sector's contribution to the economy of the Greek zone declined from 17.3 percent in 1983 to 10.9 percent in 1999. During the same period, the total employment in the manufacturing sector has also declined, from 21 percent of the overall labor force to around 13 percent. The heavy industries include petroleum refining and cement while the light industries include clothing, footwear, and machinery and transport equipment. High **tariffs** put on imports to protect domestic manufacturing industries were lifted under the membership agreement with the European Union. This fact, plus the rise of tourism and the service economy, has hurt the competitiveness of the manufacturing sector in the Greek zone. In 2000, the Republic of Cyprus was actively trying to attract high-technology businesses to the country.

In the Turkish zone, industry in 1998 accounted for about 11.8 percent of the GDP and 55.4 percent of the total employment in its region, according to the *World Factbook 2000*. Manufacturing is almost entirely based on light industry, with textiles and clothing being the most important products. The only example of heavy industry is a cement factory at Boghaz. In the late 1980s, clothing accounted for over 30 percent of all exports in the Turkish region, exceeded only by citrus exports. In 1989, for the first time, manufacturing surpassed agriculture's contribution to the GDP and has grown since then. However, compared to the situation in the Greek zone, the Turkish-zone manufacturing sector is small.

SERVICES

TOURISM. Tourism is very important to the functioning of the Cypriot economy both in the south and the north. Revenue from tourism contributed approximately US$1.7 billion to the economy of the Greek zone in 1998. The reduced airfares resulting from the liberalization of the airline industry in Europe helped make Cyprus a major tourist destination during the 1970s. The tourist industry on the island was hurt during that decade because of the ongoing disputes between the Turkish and Greek populations, but since the 1980s, it has grown dramatically, especially in the Greek zone. By 2001, Cyprus, especially the southern side, had become a popular holiday spot for many Europeans. Offering natural beaches, warm climate, and unspoiled nature, the island attracts many vacationers from nearby countries. The Greek zone is also more easily accessible via its international airports and cruise-ship ports.

Tourism in the Turkish zone is hampered by legitimacy problems. Since the TRNC is not recognized as an independent and sovereign state by any other nation except Turkey, it does not have consular offices (official offices to represent a country's commercial interests abroad) in other countries where visitors or tourism agencies can easily arrange travel. There are few international flights to the Turkish zone. The TRNC's official airline, Cyprus Turkish Airlines (KHTY), circumvents such problems by making brief stops on the Turkish mainland prior to its final destination in Turkish Cyprus. Tourists from Turkey make up more than 80 percent of all tourists coming to the Turkish zone. Despite these limitations, tourism continues to be the driving force behind the TRNC's economy. In 1999, earnings from tourism were estimated at around US$405 million, equivalent to 43 percent of the region's GDP. Since gambling is permitted, the TRNC serves as an important holiday destination for tourists coming from Turkey, where casinos are banned. The Turkish zone is also a popular shopping destination for mainland Turks who take advantage of the region's lower taxes.

Both the Greek and Turkish zones have a good tourism infrastructure with sufficient, quality lodging and other facilities. As of 1998, the Greek zone had a capacity of 86,151 beds, according to the Cyprus Statistical Service. In 1999, 2.4 million foreign tourists arrived in the southern zone. U.S. State Department surveys forecast even higher revenues from tourism in coming years, though the political dispute between the 2 sides on the island remains a potential barrier.

FINANCIAL SERVICES. According to the U.S. State Department's *Country Commercial Guide* on Cyprus, finance, insurance, real estate, and business services recorded gains recently (from 16.6 percent of GDP in 1992 to 19.8 percent in 1998).

The banking system in Cyprus consists of the Central Bank of Cyprus and 9 local commercial banks, as well as several specialized financial institutions, leasing companies, and co-operatives. There is also an established foreign banking community, which includes 30 international banking units. Commercial banking arrangements and practices follow the British system. In 1996, the Central Bank of Cyprus achieved substantial progress in its campaign to liberalize and reform Cyprus's financial sector. **Monetary policy** is now conducted through the use of market-based instruments. Repurchase transactions between the Central Bank and financial institutions are the main tool of **liquidity** management, and the use of the minimum liquidity requirement has been abandoned. The new procedures are fully in line with EU practices.

In the Greek zone, a law that came into effect on 1 January 2001 abolished the 9 percent ceiling on interest rates that had existed since 1944, enabling depositors to receive higher returns on their savings. In addition, previous restrictions on Cypriots' ability to own foreign

currency and make overseas investments are being loosened as part of a 3-stage plan to harmonize the country's financial industry with EU standards. The Greek zone is now an open country for foreign investment, whereas prior to 1997 there were restrictions on the participation of foreigners in Cypriot firms. In preparation for EU membership, all foreign-investment restrictions for EU investors have been abolished since January 2000. Foreigners can own up to 100 percent of companies in the manufacturing and services sectors and up to 49 percent of businesses in the agriculture, media, press, and travel sectors. Cyprus also has a stock exchange, where foreigners are permitted to own up to 49 percent of publicly traded companies. Foreign investment makes the economy stronger by bringing new capital and technologies to existing industries, helping to modernize them, and creating jobs.

Businesses in the Turkish zone cannot attract foreign investment because of the legitimacy problem mentioned earlier.

INTERNATIONAL TRADE

GREEK ZONE: In 1998 the Greek zone recorded a **balance of payments** deficit of US$342.8 million compared to a deficit of US$229.9 million in 1997. The trade deficit reached a record of US$2.5 billion in 1998, due in part to a decline in tourism revenues in 1996 and 1997. Also, the volume of imports did not decrease as much as the decline in the country's export revenues, helping to make the deficit even higher.

Middle Eastern countries receive 20 percent of exports from Cyprus. Cyprus **re-exports** cigarettes from the United States to 2 major markets for tobacco products: Russia and Bulgaria. The economic crisis in these countries has hurt consumer purchasing power, thus lowering Cyprus's revenues from these exports.

The amount of total imports increased in 1998 to a total of US$3.5 billion. Most of these imports were **intermediate goods** and **capital goods**. While Cyprus faced difficulty in selling its products or re-selling U.S. products abroad, it bought more from abroad, making its trade deficit higher. Cyprus must import fuels, most raw materials, heavy machinery, and transportation equipment. More than 50 percent of the country's trade is with the European Union, especially with England.

Cyprus has recently attempted to liberalize its trade policies by eliminating import quotas and licenses. It has also lowered tariffs on most products as a result of its obligations to the EU for the Customs Union Agreement. The country's entry into the Customs Union with the EU has also made trade conditions more competitive (restrictive) for U.S. exporters doing business in Cyprus.

Trade (expressed in billions of US$): Cyprus

	Exports	Imports
1975	.150	.308
1980	.532	1.202
1985	.476	1.247
1990	.957	2.568
1995	1.229	3.694
1998	1.061	3.685

SOURCE: International Monetary Fund. *International Financial Statistics Yearbook 1999.*

However, according to the U.S. State Department's analysis, the United States has a competitive edge over its European allies in the sales of computer-assisted design systems, medical equipment, environmental products, and new capital equipment for production of textiles, clothing, and footwear. Compared to those of European origin, U.S. software products are in higher demand in Cyprus. U.S. pressure resulted in new copyright (1994) and patent (1998) laws that helped protect U.S. software products, thus increasing the sales of those products.

TURKISH ZONE: The TNRC does most of its trade with Turkey (around 47 percent in 1998), followed by England (slightly more than 25 percent) and other EU countries (15 percent). The Turkish zone's trading account continues to be in deficit, but is offset by earnings from tourism and development programs, which come largely from Turkey, and also from income by United Nations personnel stationed in the zone.

MONEY

GREEK ZONE: The Cyprus pound is printed and circulated through the Central Bank of Cyprus, which aims to keep it stable in relation to the euro. Cyprus does most of its trade with the European Union. As a result, the Cyprus pound has been linked to the European Monetary Union system of currencies (EMU). As of 1 January 1999, the Cyprus pound has been linked to the euro.

TURKISH ZONE: Following the 1974 separation, the Turkish Cypriot zone adopted the Turkish lira as the legal tender, but the Cyprus pound was used until 1983. The Cyprus pound is now considered a foreign currency in this region and is subject to foreign exchange regulations. Still, the Cyprus pound is used by businesses, along with the British pound and the U.S. dollar in the Turkish zone to assess export and import prices or in trading. There is also a central bank in the Turkish zone, but its functions and powers are limited. Since the Turkish lira is the legal tender and is printed in mainland Turkey, the central bank can neither print money nor decide on mon-

SOURCE: United Nations. *Human Development Report 2000; Trends in human development and per capita income.*

etary policy. It receives daily **exchange rates** from Turkey and passes them on to commercial banks operating in the northern zone, but it has no control over the interest rates. Since it has such strong links to Turkey, the economy in the TNRC is affected by the same high inflation as in mainland Turkey, where the consumer-price inflation rate was 99.1 percent in 1997 and 69.7 percent in 1998. The economy of the Turkish zone also suffered in 1994 when Turkey experienced a severe economic crisis and devalued its currency. To compensate for these problems, Turkey has long provided direct and indirect aid to nearly every sector. Today, financial support from mainland Turkey accounts for about one-third of the zone's total GDP.

POVERTY AND WEALTH

The people of the Greek zone are among the most affluent in the world. According to the World Bank's Development Report, Cyprus is ranked 16th in terms of per capita income adjusted for purchasing power. In 1988 per capita income was US$15,500, according to the CIA *World Factbook*.

The Republic of Cyprus reported that 97 percent of the houses in Cyprus are in good or average condition and that 69 percent of those houses have facilities like electricity and plumbing. No information is available regarding the percentage of the population below the poverty line. A May 2000 editorial in the *Sunday Mail*, a Greek Cypriot newspaper, estimated that 70,000 people in the Greek zone (about 10 percent of the population) live below the poverty line and receive welfare from the government. When the Turkish invasion of 1974 displaced about 25,000 people, the Republic of Cyprus responded with policies to provide housing to low and middle-income people. By 1995, the government reported that 14,000 housing units had been constructed, including schools, shopping centers, and playgrounds, and that 12,000 people had taken advantage of **subsidies** available to build their own homes.

In the Turkish zone, the per capita income decreased to around US$5,000. The Republic of Cyprus estimated that nearly one-third of the Turkish Cypriots have **emigrated** since 1974. Turkish nationals began moving to Cyprus in 1974 and by 1995 outnumbered Turkish Cypriots. In addition to the Turkish nationals, the TRNC maintains 35,000 Turkish military personnel who guard the area.

WORKING CONDITIONS

GREEK ZONE: The Republic of Cyprus had a 3.3 percent unemployment rate in 1999 and a workforce of about 314,000 people. Workers are protected by laws regulating their health and safety on the job. In addition to legislation, trade unions also play an important role in workers' lives. The initial attempt to form trade unions in Cyprus took place in 1915, when the country was under British rule, but the first of them, the Nicosia Footwear Union, was not recognized until 1932, a year after it was established. After labor unrest in 1944, Cyprus adopted a cost-of-living allowance (COLA) for its workers. The 8-hour workday was accepted only after independence.

TURKISH ZONE: The Turkish zone labor force was estimated at 80,200 people in 1998, and the unemployment rate was 6.4 percent. Almost one-third of the labor force in the Turkish zone is unionized. Minimum wages are untaxed and are fixed annually by law according to inflation indexing, the so-called "cost of living allowance" (COLA) standard.

COUNTRY HISTORY AND ECONOMIC DEVELOPMENT

1500–1450 B.C. First traces of settlement on Cyprus. Some evidence suggests that the settlers were related to the peoples of Asia Minor (present-day Turkey).

1450–1000 B.C. Beginning of the Egyptian domination of the island.

1200–1000 B.C. Establishment of the city-states of Salamis, Soli, Marion, Paphos, Kurium, and Kyrenna; arrival of Greek colonists.

850–750 B.C. Phoenicians settle in several areas and share political control with the Greeks.

750–612 B.C. Period of Assyrian rule. The Assyrian king Sargon II conquers the 7 independent kingdoms on the island.

568–525 B.C. Period of Egyptian rule.

525–333 B.C. Period of Persian rule.

333–58 B.C. Period of Hellenistic rule by the heirs of the Alexander the Great.

58 B.C.-395 A.D. Period of Roman Empire rule.

395–1191. Period of Byzantine Empire rule.

1191–1192. Briefly ruled by Richard the Lionheart of England.

1192–1489. Period of Lusignan rule. Tensions between the Greek Orthodox Church and the Roman Catholic Church increase. The Cypriots remain loyal to their Orthodox heritage and by the middle of the 14th century the Latin clergy become less determined to convert the islanders.

1489–1570. Island is dominated by the Italian city-state of Venice.

1571–1878. Period of Ottoman Empire rule. The Ottomans grant land to Turkish soldiers and peasants who then become the nucleus of the island's Turkish community.

1878–1914. Cyprus is administered by Great Britain according to an agreement with the Ottoman Empire.

1914. Cyprus is annexed by Great Britain at the start of World War I.

1925. Cyprus becomes a British Crown colony.

1960. Foundation of the Independent Republic of Cyprus.

1963. Inter-communal strife in Cyprus between Greek and Turkish sectors leads to establishment of United Nations peacekeeping mission.

1974. Greek army officers stage coup d'état and overthrow President Makarios with the aim of uniting the island with Greece. Turkey intervenes and lands its forces on the northern part of the island, where they have remained ever since. The island is divided into a Turkish Cypriot northern zone and a Greek Cypriot southern zone.

1983. Turkish Cypriots proclaim the Turkish Republic of Northern Cyprus (TRNC). Rauf Denktash is elected the president.

1987. The Republic of Cyprus signs a new association agreement with the European Union establishing a full customs union by 2002.

1996. Greece lifts its veto on Turkey's customs union with the European Union in exchange for a date for the commencement of negotiations to allow for Cyprus's membership.

1998. EU accession talks begin.

FUTURE TRENDS

Cyprus entered the 21st century as a separated island of 2 nations and 2 religions. The division between the two will be the main focus of debate and discussion in the international arena in the years to come. The division between the 2 economies also affects the level of development of the nation. The Greek zone (Republic of Cyprus) enjoys the benefits of international recognition and has attained high levels of development and per capita income, but the Turkish zone (TRNC) has suffered economically and politically from the international **embargo**.

Cyprus's application for full EU membership is also a critical step that will have further consequences for the island's political economy and development. It is unclear whether the Turkish Cypriots will abandon their claims for a confederation in favor of the Greek Cypriot proposal of a federated state. Although TRNC president Denktash has called for further integration with mainland Turkey, which would mean the annexation of the island's Turkish zone into the homeland, the likelihood of this scenario is still unclear. EU officials project that Cyprus will be a full member of the European Union by 2010.

As the Republic of Cyprus prepares for full EU membership, it will continue to harmonize its economy and institutional framework with EU standards. As indicated by the World Trade Organization (WTO) in its 1997 policy review, financial openness is one of the cornerstones of policy reform for Cyprus. The WTO also notes the growing importance of the nation's services sector. This sector accounts for roughly 70 percent of the country's foreign exchange receipts as well as its GDP. Although the economy of the Greek zone is a prosperous one, the fact that the country suffers from a structural deficit and that it must rely on imports is not likely to change, even after a possible EU membership.

DEPENDENCIES

Cyprus has no territories or colonies.

FIJI

Republic of Fiji

CAPITAL: Suva.

MONETARY UNIT: Fijian dollar (F$). One Fijian dollar equals 100 cents. Coins are in amounts of 1, 2, 5, 10, 20, and 50 cents. Notes come in denominations of F$1, 2, 5, 10, and 20.

CHIEF EXPORTS: Sugar, garments, gold, timber, silver, fish.

CHIEF IMPORTS: Machinery and transport equipment, petroleum products, food, chemicals.

GROSS DOMESTIC PRODUCT: US$5.9 billion (purchasing power parity, 1999 est.).

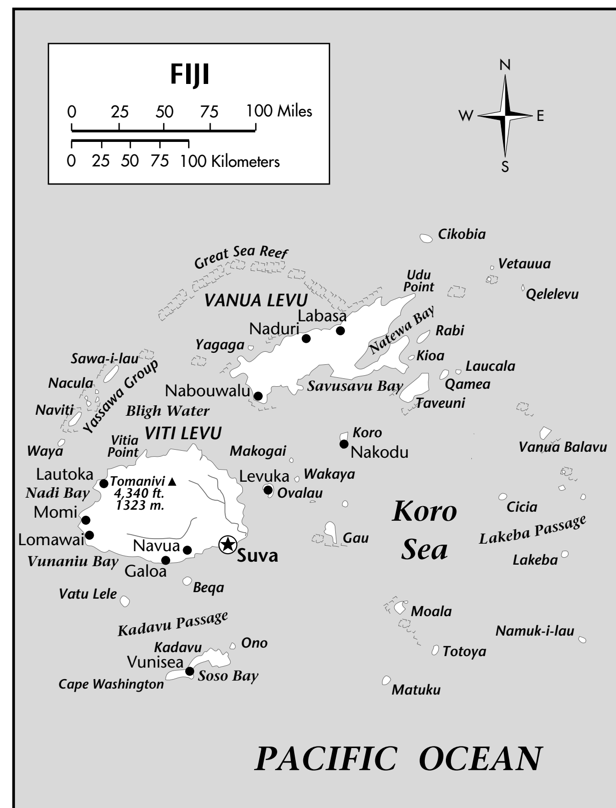
BALANCE OF TRADE: **Exports:** US$537.7 million (f.o.b., 1999). **Imports:** US$653 million (f.o.b., 1999).

COUNTRY OVERVIEW

LOCATION AND SIZE. Fiji is a Melanesian island group located in the South Pacific at 175 degrees east longitude and 18 degrees south latitude. The islands are about 1,770 kilometers (1,100 miles) north of New Zealand. The group comprises 332 volcanic islands scattered in a horseshoe across an area of ocean some 595 kilometers (370 miles) across. Fiji has a total land area of 18,270 square kilometers (7,054 square miles), of which 87 percent is made up by its 2 largest islands, Vanua Levu and Viti Levu. Comparable in size to New Jersey, with a coastline of 1,129 kilometers (702 miles), Fiji has more land mass and people than all the other Melanesian islands put together. The capital of Fiji is Suva (pop. 77,366), on the southeast shore of the island of Viti Levu. The country's highest point, also on Viti Levu, is Mt. Victoria (Tomanivi) at 1,324 meters (4,344 feet).

POPULATION. Fiji's population was estimated in 2000 at 832,494, up from 775,077 in 1996, and 715,375 in 1986. If its annual growth rate of 1.41 percent continues, Fiji's population will have passed the million mark by 2014. Relatively high standards of health care have given Fijians a life expectancy at birth of 67.94 years, with an infant mortality rate of 14.45 per 1,000. The population remains young, with a median age of 21; about 34 percent of the population is clustered between the ages of 5 and 20.

Only a third of Fiji's 332 islands are inhabited, and three-quarters of Fijians live on Viti Levu, the largest of them. In 1996 53.6 percent of the population lived in rural areas and 46.4 percent in cities. Of the latter group, 46.7 percent, or a little less than a quarter of the total population, live in the greater Suva district. The other



main urban center is Lautoka (pop. 36,083), on the northwest shore of the island of Viti Levu.

Fiji's ethnic composition is largely split between indigenous Melanesian Fijians, who constitute a narrow majority (51 percent), and those of Indian descent (44 percent); the remaining 5 percent is comprised of Europeans, Chinese, and other Melanesians. Fiji's religious situation reflects this division: 52 percent are Christian (including 37 percent Methodist and 9 percent Roman Catholic), 38 percent Hindu, and 8 percent Muslim. The proportion of Fijian Indians in the population has been decreasing since 1987, when army forces allied with indigenous Fijians staged a coup against the Fijian Indian-led government. (Fijian Indians are primarily the descendents of Indian indentured laborers brought to Fiji by British colonizers between 1879 and 1916.) As recently as the 1986 census, Fijian Indians made up a slight majority in population, with 48.7 percent as compared to 46 percent for the indigenous Fijians. But a slightly higher indigenous birthrate—27.3 per 1,000, compared to 17.2 for the Fijian Indian population—and heavy rates of Indian out-migration (the large-scale departure of persons from one region to another) have changed the population balance. The out-migration rate for 2000 is estimated at 3.6 per 1,000 per year, with most people moving to the United States, Australia, and New Zealand. Ongoing interethnic disputes threaten to further change population distribution.

OVERVIEW OF ECONOMY

As the largest and most resource-rich nation in the central South Pacific, Fiji also enjoys the region's largest and most developed economy. Still, its reliance on a single resource—sugar—makes it economically vulnerable, exposed both to an unpredictable tropical climate and an unstable world market. Attempts to expand and diversify the economy are being seriously undercut by Fiji's ethnic tensions and ongoing political uncertainty.

Since its introduction by Fiji's British colonizers in the 1870s, sugar production has been the mainstay of the Fijian economy. While the country has had some significant success in developing supplementary industries in mining, fishery, timber, clothing, and especially tourism, sugar continues to account for nearly a quarter of its export earnings. The industry's fragility was painfully demonstrated in late 1998 when an unusually severe drought, followed by widespread cyclonic flooding, saw sugar exports drop by almost 30 percent and earnings by more than US$100 million. Similarly, upsets in the world sugar cane price can be sudden and sharp. If pressure from the World Trade Organization (WTO) erodes the special, fixed prices (well above world market levels) that Fijian sugar enjoys in the European sugar market, the industry will face even further strain.

Recent ethnic strife between indigenous Fijians and the nation's East Indian population continues to threaten the stability of the nation's government. From 1879 to 1916, Britain imported tens of thousands of contract laborers from India to work on the sugar plantations, and their descendants remain an ethnically and culturally distinct community. In 1987 hostility erupted during the first of a series of coups designed to preserve and formalize indigenous Fijian political power. Subsequent efforts at reconciliation have failed to achieve a workable solution. In early 2000 there was a fresh outbreak of violence and rioting against Indian businesses, and Fiji's government buildings were seized by armed indigenous dissidents. Such unrest has had a devastating effect on Fiji's economy, paralyzing its tourist industry, and frightening away much of the foreign investment the country needs to develop its **infrastructure** and expand its economic base. The Reserve Bank of Fiji, its central bank, forecast an economic contraction of 8 percent in 2000 (down from its original estimates of 13–15 percent, however). Growth since 1987 has averaged less than 2 percent—well below half that of the average for developing nations.

Ethnic tensions also have a direct impact on the sugar industry. Indian planters control some 90 percent of Fiji's commercial sugar cane production, but 80 percent of plantations are on land leased from indigenous Fijian property owners. Given the country's volatile ethnic politics, it is expected that many of these 18,000 leases will be ceded to indigenous growers, thus threatening widespread displacement of Fijian Indian farmers. This is a problem for which the government has not yet found an adequate solution.

POLITICS, GOVERNMENT, AND TAXATION

Annexed as a colony of the British Empire on 10 October 1874, Fiji gained its independence exactly 96 years later, on 10 October 1970. For the next 17 years Fiji remained a British-style parliamentary democracy within the British Commonwealth.

In April 1987, the Alliance Party (AP), which had ruled Fiji since independence, was defeated at the polls by a coalition headed by the Fijian Labor Party (FLP) and the National Federation Party (NFP). The defeat represented a momentous shift in Fijian politics by introducing for the first time a substantial Fijian Indian presence in the government (although the coalition's leader and new prime minister was an indigenous Fijian, Dr. Timoci Bavadra). The new coalition moved power away from Fiji's traditional rural oligarchy and towards its long under-represented urban small-business and working

class. Seeing its position threatened, the old order turned to racial politics, and the eruption of ethnic tension that resulted provided the pretext for a coup a month later led by Lieutenant-Colonel Sitiveni Rabuka. Four months later, fearing foreign intervention, Fiji's parliamentary leaders brokered a power-sharing accord between the AP and FLP-NFP coalition. But the newly promoted Brigadier Rabuka, feeling the accord had sacrificed the coup's central aim of securing indigenous domination, staged a second coup that revoked Fiji's 1970 constitution and declared the country a republic.

Two months later civilian government was restored, though it excluded the FLP-NFP, and a new constitution was drafted. In the first election under the new constitution in May 1992, a coalition led by now-Major General Rabuka won office, and he became prime minister. A series of crises over budgetary matters forced an early election in February 1994. Although Rabuka survived, dissatisfaction mounted at his government's failure to address the country's political divisions and its economic crises. Heavy out-migration by Fijian Indians resulted in a crippling flight of capital and expertise.

In June 1997 a new and more equitable constitution was adopted. In the first election under it in May 1999, the Rabuka government was overwhelmingly defeated, and a new FLP-led coalition took office under Fijian Indian prime minister Mahendra Chaudhry. While Chaudhry won the election on a promise of better economic management, his victory also re-kindled fears of a Fijian Indian "takeover." Protests by indigenous groups led to widespread civil violence and rioting against Fijian Indian businesses, culminating on 19 May 2000 with the seizure of the government buildings by armed extremists. After holding the cabinet at gunpoint in a 2-month long hostage drama, the extremists managed to have the president and new government dismissed by the military on July 5. Although the military subsequently restored the civilian government on July 18, and discussed the drafting of a new constitution, Fiji's political stability and international credibility remain grievously damaged. Prime Minister Laisenia Qarase was given a second title—Minister for National Reconciliation—to highlight the job that lay ahead of him in the coming years.

Fiji's revenue base is taxation. In 1998, according to the Fiji Islands Statistics Bureau, 58.4 percent of its revenue (US$251.7 million) came from **income tax**, estate and gift **duties**, and 27.0 percent (US$116.1 million) from customs duties and port dues. Its revenue shortfall for that year was US$917.8 million. Quarterly indicators from 2000 suggest that the imbalance is likely to worsen. Economic reforms by the government in 1992 designed to stimulate business saw the top individual and corporate tax rate drop to 35 percent, and a new 10 percent **value-added tax** (VAT) was introduced on goods and services, replacing previous sales and **excise taxes**. Attempts by the government to re-ignite the economy after the 2000 coup have followed a similar tack: the 10 percent VAT (removed by the previous coalition) was reinstated, and the corporate tax rate was reduced to 34 percent, with similar cuts scheduled for 2002 and 2003. With these measures, government revenues will be reduced and lower-income families will have to shoulder a proportionally larger tax burden.

INFRASTRUCTURE, POWER, AND COMMUNICATIONS

Fiji has a fairly well-developed infrastructure, with a reasonably comprehensive system of bridges and highways. The islands have 2,137 miles (3,438 kilometers) of roadway, nearly half of which is paved, and 371 miles (597 kilometers) of rail lines. In 1998 Fijians registered 2,265

Communications

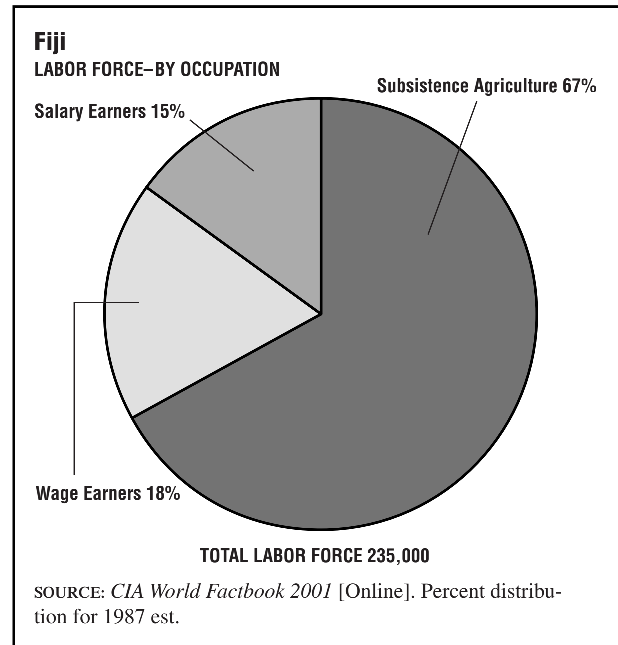
new motor vehicles, 1,424 being private cars. The country also has 5 commercial ports and 25 airports, 3 with paved runways. An international airport, the hub for most trans-Pacific air traffic, is located in Nandi, outside Suva.

Telecommunication systems are also expanding, with full inter-island and international telephone and teleprinter connections, cable links, and satellite access. In 1997 Fiji had 71,403 subscriber telephone lines, or about 1 for every 10 Fijians. A Fijian-British **joint venture** has attracted the investment of US$7.1 million in a cellular telephone network. As of 1998, there were 4,300 cellular phones in the country. The government intends to further its **deregulation** of telecommunications by **privatizing** all or part of Telecom Fiji and opening the market to new Internet service providers (ISP). As of 1999, there were 2 ISPs in Fiji.

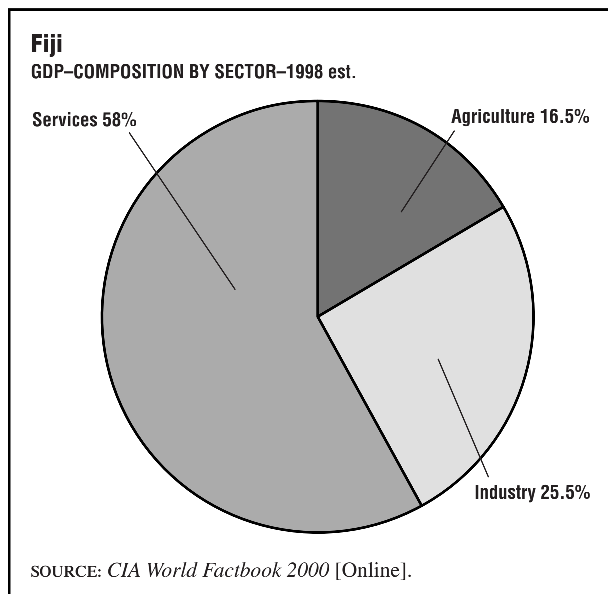
Fiji's mountainous terrain is favorable to the development of hydroelectric generation, which supplies 80 percent of its electricity; the remaining 20 percent is produced from imported fossil fuels.



SOURCE: *CIA World Factbook 2001* [Online]. Percent distribution for 1987 est.

ECONOMIC SECTORS

Despite government attempts to diversify the economy, the relative profile of Fiji's different economic sectors has changed little since 1992. Agriculture is still dominant and, along with forestry and fishing, accounted for 16.5 percent of **gross domestic product** (GDP) in 1999. But the manufacturing sector, especially the garment industry, and the **retail** and service sector, especially those businesses related to tourism, are also vitally important. Industry and services contribute 25.5 percent and 58 percent of GDP, respectively. The government has actively encouraged both the manufacturing and tourism sectors in an attempt to broaden the country's economic base, increase foreign exchange receipts, and expand the number of wage and salary earners. Fiji's political strife, however, has seriously undermined the effectiveness of these attempts.



SOURCE: *CIA World Factbook 2000* [Online].

AGRICULTURE

Agriculture continues to be the bedrock of the Fijian economy, accounting in 1999 for some 16 percent of its GDP and two-thirds of its 310,000-strong workforce. Sugar, the most important agricultural product, generated almost 30 percent of Fiji's agricultural GDP in 1998, and 15 percent (through sugar processing) of its manufacturing GDP. The 364,000 tons of sugar that Fiji produced that year earned the country some US$122.9 million. The commercial future of this industry depends on the resolution of the property system that has been in place since 1909, when the British colonial government froze landownership titles in an attempt to protect indigenous (Fijian) property owners. As a result, only 8 percent of a total of 607,982 acres (1,519,956 hectares) is freehold (privately-owned); the remainder is either tribal- (83 percent) or government-owned (8 percent) land. As of 1993, only 9.9 percent of that total acreage was arable, with most of it in tribal hands or leased to Fijian Indian farmers, who produce 90 percent of Fiji's sugar-cane. As these leases expire and the land is returned to indigenous growers, major disruptions in sugar-cane production can be expected.

With 64.9 percent of Fiji's land area being forest and woodland, timber is also economically important, especially pine and mahogany. Attempts since the mid-1980s

to bolster the industry, and offset Fiji's dependence on sugar, have encouraged significant strides in timber production. In 1999 timber provided US$27.6 million in export revenue, a 45 percent increase over 1994 levels.

The fishing industry, especially tuna harvesting, also shows significant promise. Fiji controls a 200-nautical mile (370.4-kilometer) economic exclusion zone around its shoreline. In 1998 fishing brought Fiji US$24.9 million in overseas earnings, and tuna is Fiji's fourth largest export earner.

Fiji also exports copra (dried coconut meat), ginger, and coconut oil, as well as bananas, rice (a product for which Fiji is aiming at self-sufficiency), cereals and vegetables, pineapples and other tropical fruit. Copra, in particular, has benefitted from the removal in 1998 of the ban on its export; since the licensing of a second copra-buying company, prices for producers have increased considerably. The discovery of kava's (a shrubby pepper) medicinal qualities and its potential as a pharmaceutical ingredient have also fueled the growth of a small but promising export industry.

INDUSTRY

MINING. Although Fiji lacks a heavy industrial base, it has made significant progress in mining and manufacturing. Mining and quarrying account for around 2.7 percent of Fiji's total GDP (1999). Most of this revenue is generated by gold, which in 1998 made up 6.9 percent (US$35 million) of Fiji's foreign exports. Although production capacity has increased, the low price of gold has depressed earnings. The dip in prices saw growth in production tumble from 30.9 percent in 1996 to 2.9 percent in 1997. In 1998 mining in 2 gold mines was suspended and further exploration discontinued. Fiji's uncertain political climate has also made it difficult to attract the foreign financing it needs to sustain the industry. In September 2000 the government was forced to issue tax concessions worth nearly US$2 million to rescue one its largest mining companies and preserve its 2,000 jobs. Fiji also produces silver and copper. When the copper mining venture launched at Namosi in 1997 hits full production, earnings of as much as US$178 million per annum are possible.

MANUFACTURING. Responsible for 14.5 percent of GDP in 1999, this sector is one of Fiji's diversification success stories. Whereas it once comprised largely the processing of agricultural products, especially sugar and timber, the introduction in 1987 of tax exemptions for factories exporting more than 70 percent of their annual production has seen the rapid emergence of a vibrant garment industry. Since 1986 the volume of garment production has grown twelve-fold, and in 1998 it provided 30 percent of Fijian exports, valued at US$152.4 million. However, the Australian government's refusal in September 2000 to renew its highly favorable **tariff** concessions for Fijian imports (a reaction to the coup) has clouded the future of this industry.

SERVICES

TOURISM. Fiji's beaches, climate, and relative proximity to Australia and New Zealand have helped tourism become one its most important revenue earners; in 1997 hotels, restaurants, and cafés made up 3 percent of GDP, accounting for 40,000 jobs. But tourism has been one of the biggest casualties of Fiji's political upheavals. In 1999, according to the Fiji Islands Statistics Bureau, 409,995 tourists visited Fiji, bringing with them US$274 million in foreign exchange. This represented an increase over the previous year of 38,000 visitors and US$30 million, a growth rate that showed every sign of continuing. But after the 2000 coup, visitor numbers dropped drastically, forcing some of Fiji's biggest resorts to close. Despite an energetic campaign by the industry to restore visitor confidence, and government tax incentives for investors, this sector has not recovered.

FINANCIAL SERVICES. Fiji's commercial banking sector is served by 6 banks, including the Bank of Hawaii and several other merchant banking providers and insurance companies, as well as the Fiji National Provident Fund (NPF, Fiji's national pension scheme), and Fiji Development Bank. The government-owned banking sector, on the other hand, is less stable. Mismanagement of the National Bank of Fiji led to its near-collapse in the mid-1990s and forced the government in 1997 into a US$105 million bailout. The relationship between government and commercial banking sectors has yet to be properly defined. As part of its economic stimulation program, the Fijian government is working to strengthen the financial system by expanding the Fijian Stock Exchange, decentralizing the NPF, and allowing greater investment flexibility for insurance companies.

RETAIL. With more than half of Fiji's population living in rural areas, and a large proportion of these outside the wage and salary economy, Fiji's retail sector is understandably small. Fiji's isolation makes imported goods expensive, further inhibiting its consumer culture, and leaving most retailing at the level of basic foods, clothing, and essential merchandise. The capital, Suva, has a variety of stores, including specialty stores that cater to tourists. The larger retail sector, taking into account wholesale suppliers, hotels, and restaurants, accounted for 15.2 percent of Fijian GDP in 1999.

INTERNATIONAL TRADE

With Fiji's own limited resources and industrial base, the country relies on imports for many of its basic

Trade (expressed in billions of US$): Fiji

	Exports	Imports
1975	.202	.268
1980	.470	.562
1985	.307	.442
1990	.615	.743
1995	.607	.864
1998	N/A	N/A

1996	1.4033

SOURCE: CIA *World Factbook 2001* [ONLINE].

goods, making international trade essential. As Fiji's political woes have worsened, however, its **balance of trade** has become less favorable. In 1999 Fiji ran a US$115.6 million trade deficit, or about 7.37 percent of GDP. In 1998 it had exports of $393 million and imports of $612 million. While the post-coup **devaluation** of the Fijian dollar will help Fijian exporters, it will also make Fiji's imports more expensive.

Fiji's main trading partners are its Commonwealth neighbors (Australia, New Zealand, other Pacific islands) and old and new regional powers (United Kingdom, United States). The chief importer of Fijian wares is Australia, which in 1999 bought 33.1 percent of all Fijian exports. Other important partners include the United States (14.8 percent of exports) and the United Kingdom (13.8 percent). Penetration into Asia has been limited and variable, and only significant with Japan and Singapore. Fiji's imports come primarily from Australia, whose dominance in the Fijian market (41.9 percent) continues to rise. Other suppliers include the United States (14.1 percent of imports) and New Zealand (13.3 percent). The main imports are manufactured goods (27.3 percent), machinery and transport equipment (26.3 percent), food (14.4 percent), and mineral fuels (11.1 percent).

MONEY

Since 1995 the Fijian dollar has been in steady decline. During the Asian financial crisis of the late 1990s, the government announced a 20 percent devaluation in 1997, when it was valued at around US$0.69. Further depreciation followed, accelerated by the 2000 coup. In 2001 the dollar stood at around US$0.44. **Fiscal policy** is now focused on controlling the deficit and reducing Fiji's large **national debt**, both of which are long-standing problems made worse by the costs of political crisis. A target deficit of 1.9 percent of GDP in the 1999 budget was found to be unattainable; 2000–01 targets stood at 4 percent, the equivalent of a debt level of around 45 percent of GDP.

POVERTY AND WEALTH

Fiji's traditional tribal structure creates wide status differentials, and there are wide gaps between the income levels of rich and poor. Although much of the land in Fiji is collectively owned, it is controlled by tribal chiefs who derive most of the economic benefit. Traditionally, Fiji's political leaders come from the eastern part of the country, from Vanua Levu and the Lau Group, where the feudal structure is best preserved. Fiji's cities and industry, on the other hand, are concentrated in the west, on Viti Levu in and around Suva, where most of the population lives. The result is a very unequal distribution of wealth and political power, which has survived because it has become connected with racial issues. Despite a very small Fijian Indian entrepreneurial class, many members of which have left the country, most Fijian Indians are no better off than indigenous Fijians since both groups suffer under a political system that concentrates power in the hands of the ruling class. The burden of Fiji's economic difficulties falls heaviest on its poorer citizens, who are obliged to commit a greater proportion of their incomes to basic essentials.

WORKING CONDITIONS

Fiji's workforce numbers around 310,000 people, and the official unemployment rate hovers at a low 6 percent. This figure is misleading since only a third of this workforce is in paid employment; the remaining two-thirds are

subsistence farmers and fishermen (subsistence workers produce just enough goods to support their own subsistence, with rarely any surplus to sell and generate additional income). There are 4 times as many young people in the workforce as there are available jobs. The unemployment rate also conceals large-scale under-employment such as seasonal workers in agriculture and casual laborers in the construction industry. While the numbers of wage and salary workers have been rising (8.5 percent over the period from 1993 to 1998), Fiji's economic crisis threatens to offset these gains. The loss of tens of thousands of professionals and skilled workers through out-migration has also produced a skills deficit, which poses a further obstacle to future growth. Labor disputes are another symptom of tension, and in 1999, an average of 19.7 worker-days were lost due to strikes, though this figure was atypically high. Part of the government's recovery program is to deregulate the workforce and shrink the **public sector**.

COUNTRY HISTORY AND ECONOMIC DEVELOPMENT

1643. Abel Tasman, the Dutch navigator, sites the Fiji island group.

1774. Captain Cook visits southern Lau.

1835. The first Methodist missionaries arrive.

1854. King Cakobau renounces his traditional gods and accepts Christianity.

1857. First British consul appointed at Levuka.

1862. King Cakobau invites the British to annex Fiji; Britain refuses.

1874. Britain, fearing Fiji will fall to another power, accepts Fiji as a colony.

1879–1916. Indentured laborers are imported from India.

1904. First elected Legislative Council.

1909. System of property leases instituted.

1966. Internal self-government achieved.

1970. Fiji becomes independent.

1973. Sugar industry **nationalized**.

1987. Defeat of Alliance Party by Fijian Indian-backed opposition coalition; the first Fijian coup by Sitiveni Rabuka removes Prime Minister Bavadra from power; Fiji declared a republic.

1994. New constitution enacted; Rabuka becomes prime minister.

1997. Fiji rejoins Commonwealth.

1999. Landslide victory by the Fijian Indian-led opposition coalition.

2000. Armed forces led by George Speight seize Parliament; dismissal of the Mahendra government by the military. Ratu Josepha Iloilovatu Uluivuda becomes president, and Laisenia Qarase prime minister.

FUTURE TRENDS

Before the return of the political problems that gripped Fiji in late 1999 and 2000, Fiji was believed by many observers to have, in the words of the *Wall Street Journal,* "the South Pacific's most promising economy." It was widely believed that Fiji was capable of increasing its production of every major exportable product, and capable of reducing its debt load accordingly. But the recent problems leave the growth of Fiji's economy in doubt. Striking problems remain: rising unemployment; declining investor confidence; a drastic fall in tourist visits, which reverberates throughout the economy; and the lack of any long-term solution to the political conflict between Fijian Indians, who control most of the sugar production companies, and indigenous Fijians, who own most of the land and provide most of the labor. Fiji's problems have left the country both politically and economically isolated, as former allies, potential investors, and tourists have all withdrawn their support from the country. The government's attempts to re-stimulate the

economy will continue to fail unless the root causes of Fiji's ethnic tension can be adequately addressed and substantive cooperation achieved, an unlikely prospect in the near future. However, if the potential mediation of outside entities returns Fiji to political stability, the island nation should be well-equipped for further growth.

DEPENDENCIES

Fiji has no territories or colonies.

FRENCH POLYNESIA

Territory of French Polynesia
Territoire de la Polynésie Française

CAPITAL: Papeete.

MONETARY UNIT: Comptoirs Français du Pacifique franc (CFPF), also known as the Pacific Financial Community franc or Pacific French franc. One CFPF has 100 centimes. There are notes of CFPF500, 1,000, 5,000, and 10,000, and coins of CFPF1, 2, 5, 10, 20, 50, and 100.

CHIEF EXPORTS: Cultured pearls, coconut products, mother-of-pearl, vanilla, shark meat.

CHIEF IMPORTS: Coconuts, fuels, foodstuffs, equipment.

GROSS DOMESTIC PRODUCT: US$2.6 billion (1997 est.).

BALANCE OF TRADE: **Exports:** US$212 million (1996 est.). **Imports:** US$860 million (1996 est.).

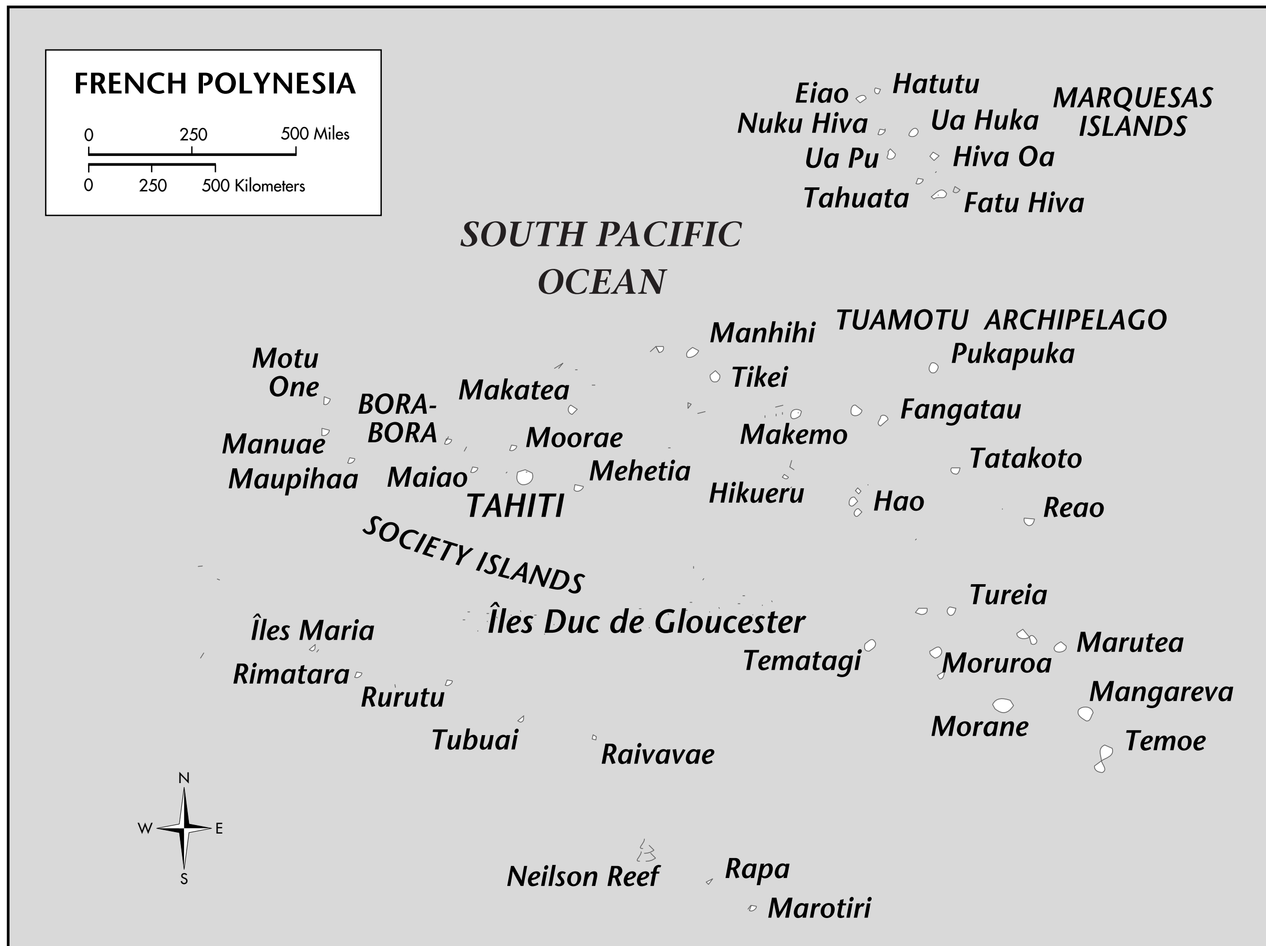
COUNTRY OVERVIEW

LOCATION AND SIZE. An overseas territory of France, French Polynesia's 118 islands and atolls are grouped into 5 archipelagos (group of islands) scattered across some 3,200 kilometers (2,000 miles) in the South Pacific Ocean midway between South America and Australia. The islands have a total land area of 4,167 square kilometers (1,609 square miles), slightly less than one-third the size of Connecticut. The 5 archipelagos include the Society Islands (which include Tahiti and Bora-Bora); the Tuamotu Archipelago; the Gambier Archipelago; the Marquesas Islands; and the Austral Islands. Together they have 2,525 kilometers (1,569 miles) of coastline. Only 65 of the islands are inhabited, and the overwhelming majority of French Polynesians live along the coastlines. The most inhabited island by far, with about 70 percent of the total population, is Tahiti, which also accounts for a quarter of the islands' total land area. Half of Tahiti's population lives in its major urban center, the capital city of Papeete (population, including surroundings, 69,000, 1996 est.). Tahiti is also the largest island, with a land mass equal to 1,041 square kilometers (402 square miles).

The islands represent a wide variety of topographies (land surfaces), from the plunging waterfalls and extinct volcanoes of Tahiti or Moorea to the low-lying, white-sand lagoon coral-reef atolls of the Tuamotu and Gambier groups. One of French Polynesia's most serious long-term problems is the threat presented by global warming and the rising of the world's water level, estimated by the United Nations Environment Program in 1993 to rise by more than 25 inches by 2100. If this proves correct, entire archipelagoes like the Tuamotus may eventually disappear. In the meantime, pressure from the ocean is eroding the available cultivatable land and contaminating the groundwater.

POPULATION. French Polynesia's population was estimated in 2000 at 249,110, with an annual growth rate of 1.78 percent. Comprehensive public health care has secured a long life expectancy—74.79 years at birth—and a low infant mortality rate—9.3 per 1,000 live births. The annual rate of **immigration**—3.14 per 1,000 of population—is accounted for mostly by French government officials and retirees. Those under 15 years of age make up 30 percent of the population, with 65 percent between 15 and 64 years of age. The remaining 5 percent are over 65 years of age.

The majority of the population (78 percent) is of Eastern Polynesian descent. They are closely related to the New Zealand Maoris, but quite distinct from the closer Western Polynesian Samoans and Tongans. Another 12 percent are of Chinese descent, and 10 percent French, of whom 6 percent are local French and 4 percent from France itself. These figures, however, conceal a considerable degree of racial mixture. Europeans, the majority of whom are French, are concentrated in Papeete. The Chinese, descendants of laborers imported in the 1860s to work Tahiti's short-lived cotton plantations, are scattered throughout the islands and run much of the



territory's **retail** trade. French Polynesians are 54 percent Protestant, 30 percent Roman Catholic, with 16 percent belonging to other religions. The official languages are French and Tahitian.

OVERVIEW OF ECONOMY

Until the 1960s, the French Polynesian economy was largely based on subsistence agriculture (raising enough to survive), but in 1962 France began nuclear testing in the islands. This attracted some 30,000 settlers to work in the Centre d'Expérimentations du Pacifique (CEP), a facility that changed the islands' economy forever. By 2000, only 1 in 8 French Polynesians was involved in agriculture. The rest were wage and salary earners in the territory's extensive service sector and various industries. The territory has the highest **GDP per capita** ($10,800, 1997 est.) in the South Pacific region.

Such progress can be credited to 2 factors: the strength of French Polynesia's tourist potential and continuing economic support from France. Both of these assets look secure for the immediate future. Tourism continues to climb, and new developments, such as the expansion of cruise ship facilities and the opening of isolated islands, have enhanced the industry's **infrastructure** and ensured its ongoing growth. French subsidization shows no signs of stopping; the French economy is one of the healthiest and fastest-growing in Europe, and both of its main political parties are committed to continued union.

Nevertheless, French Polynesia's overwhelming dependence on a single overseas patron leaves it highly vulnerable in the long term. France's long-range goal is for a more self-sustaining economy for the territory, and within the islands the independence movement is vocal. In the 1996 elections the Independent Front for the Liberation of Polynesia gained 10 of the Territorial Assembly's 41 seats. If this party should ever win a majority, it is highly likely to push for full independence. How the islands would adapt to such a change is unclear, but for it to achieve complete economic self-sufficiency, radical economic reorganization would be required.

A narrow economic base also makes the islands vulnerable. While tourism receipts continue to climb, and French Polynesia enjoys well-established "brand recog-

nition" as a vacation destination, tropical storms are a recurring threat, and competition from other international beach resorts is increasingly sharp. Other industries are being developed, such as cultured pearls (already an important export earner) and coconut products (especially palm oil), mother-of-pearl, vanilla, handicrafts, and fish. But these too are niche industries, susceptible to shifting world prices, and may not be strong enough to be the basis of real diversification.

POLITICS, GOVERNMENT, AND TAXATION

France began to take over the French Polynesian islands in the late 18th century, and formed them into the group as it exists today in 1903. In 1958, the islands were granted overseas territory status, acquiring further control over their internal government in 1975 and 1984. The territory enjoys considerable latitude over its domestic administration, with its 41-member Territorial Assembly responsible for public works, sports, health, social services, primary education, and the election of the president. However, the military, justice system, and **monetary policy** are directed by France, and the French constitution remains the supreme law. The high commissioner is France's chief representative in the islands and retains considerable control, with the power to dissolve the Territorial Assembly and take personal control of the budget (as was done in 1992). There is consequently a vibrant independence movement, provoked especially by France's resumption of nuclear testing in the territory in 1995. Protests against the testing led to extensive rioting in Papeete, which caused France to tighten its control.

French Polynesia is essential to France's perception of itself as a world power, even though such aspirations cost France around $300 million a year. The transfer of payments from France to the islands reached a high of 27.5 percent of French Polynesian GDP in 1997 and was estimated to be around 20.6 percent in 2000. These **subsidies** constitute the territory's primary source of income and are critical to its economic survival. The focus of the subsidies, beyond the maintenance of French facilities and personnel in the territory, is especially for projects designed to build a more self-sustaining economy. While full self-sufficiency is recognized as unfeasible except as a very long-term goal—and for which no specific timetable has so far been set—the immediate target is to slowly increase the islands' domestic contribution to national production. This has risen on average around 5 percent per year from 1989 to 1999, increasing the domestic share of production to 43.7 percent in 1999. The plan is to raise it to 60 percent by 2003.

In 1993, in return for the 5-year, US$118 million Pacte de Progrès subsidy program, France demanded the institution of an **income tax** in order to make the territory more self-supporting. A 3 percent tax on earnings over $1,600 was introduced. The government, however, continues to rely heavily on **indirect taxes**, which make up around half of the territory's tax revenues. **Levies** and excises on imported goods and licensing fees are thus among the highest in the Pacific islands.

INFRASTRUCTURE, POWER, AND COMMUNICATIONS

French Polynesia's infrastructure is in good condition. It undergoes ongoing improvement as a result of French development programs, including tax incentives for businesses who invest in infrastructure. The islands have 792 kilometers (492 miles) of roads, all of them paved. There are 30 paved-runway airports, with 15 more unpaved airstrips, and an international airport at Faa'a outside Papeete. The 4 seaports are Mataura, Papeete,

Rikitea, and Uturoa. Most of the islands' fuel needs (60 percent in 1998) are supplied by imported fossil fuels. The remaining 40 percent is provided by hydroelectric power stations. A comprehensive and reliable telephone network also exists, with 32,000 main lines and 4,000 cellular lines in use in 1995.

ECONOMIC SECTORS

With its large tourism industry and **public sector**, the economy of French Polynesia is heavily service-oriented, with services accounting for 78 percent of GDP (1997). Industry, especially pearl cultivation, is also important, making up 18 percent of GDP. Workforce figures reflect this division, with around 40 percent working for the government, 40 percent in services, and 10 percent each in industry and in agriculture.

AGRICULTURE

Farming was once the primary means of survival for most French Polynesians. The development of the French nuclear program in the 1960s lured thousands of workers away from farming, however, and the sector nearly collapsed. By 1965, exports of coffee and vanilla had ended, and coconut production had dropped by 40 percent. In 1997, agriculture made up only 4 percent of GDP and employed 11 percent of the population. In that year, 80 percent of the islands' food had to be imported. The islands have fairly good agricultural resources, however, with 6 percent of available land under crops, 1 percent arable, and a further 5 percent used for pasturage. Local production supplies about half of the islands' vegetables and three-quarters of its fruit. Other products include vanilla and coffee, especially on Tahiti; poultry, beef and dairy products, especially in the Marquesas; and coconuts in the outer islands. Aquaculture is also being developed, with cultivation of shrimp, prawns, live bait, and green mussels.

INDUSTRY

After tourism, French Polynesia's primary money-earning industry and export product is cultured pearls. Founded in 1963, the industry has shown buoyant growth. In 1990, pearl exports brought the islands $38 million, a figure that had risen to $184.9 million by 2000. Although production has steadily increased from 599 kilograms (1,318 pounds) in 1990 to 7,116 kilograms (15,655 pounds) in 2000, the price per kilogram has been dropping, from US$27.67 in 1997 to $20.84 in 1999. The fall can be blamed on the large quantities of pearls being harvested, which has depressed the price, and to the weakness of the Japanese market, the largest consumer of Tahitian pearls. Producers have tried to address these trends through brand differentiation, by promoting the uniqueness of Tahitian pearls, and by turning their attention to the U.S. market. But the failure of producers in the territory to form an effective marketing cartel, and pressure from other Pacific producers (such as the Cook Islands), have slowed the impact of these efforts.

Other manufactured goods include beer, sandalwood oil, sandals, and handicrafts. Food processing is also important, especially the refining of dried coconut flesh (or copra) into oil for use in vegetable oil, margarine, candles, soap, and cosmetics. French Polynesia's extensive waters also show signs of rich deposits of nickel, cobalt,

manganese, and copper. Though plans exist for their extraction, mining will prove expensive.

SERVICES

TOURISM. French Polynesia's tourist appeal is legendary. Even before the paintings of French artist Paul Gauguin gave form to the islands' paradise-like mystique, the islands held a special place in the Western imagination. Tourism proper, however, is relatively recent, largely a consequence of the opening of Tahiti's Faa'a Airport in 1961. Tourist numbers are still only a tiny fraction of those of Hawaii, which gets more visitors in 10 days than French Polynesia gets in an entire year. Still, tourist arrivals have continued to increase, bolstered by new hotel construction and renovation in the mid-1990s, which increased the number of hotel beds by 29 percent between 1990 and 2000. From 139,705 arrivals in 1989, numbers have climbed to 210,800 in 1999, an increase of more than 50 percent (with a 16.8 percent rise from 1997 to 1999 alone). Arrivals are estimated at 240,000 for 2000. Growth has been particularly brisk in terms of North American visitors, with an increase of 48.9 percent from 1997 to 1999. Some 85 percent of these are from the United States. There has also been an increase in cruise-ship traffic, whose generally older and more affluent tourists are especially valuable sources of revenue. Other important markets are Europe (40.1 percent of visitors in 2000, with two-thirds of these from France) and Asia (16.8 percent, with about two-fifths of these from Japan and two-fifths from Australia and New Zealand).

In 1997, tourism generated US$340.2 million in foreign exchange, and accounted for 4,000 jobs and 9.5 percent of GDP. In 2000, receipts of $396.2 million were expected, and a total GDP share of 10.1 percent. The tourism industry is dominated by **multinational corporations**, as most facilities are foreign-owned and managed—a situation that has tended to cause unease among the indigenous Polynesians. Some 80 percent of tourist spending, however, is for goods imported to the islands, and so brings little real gain to the territory's economy. In the long term, though, the hope is that tourist revenue will replace **transfer payments** from France.

FINANCIAL SERVICES. French Polynesia is served by 4 main banks: the Banque Socredo, Banque de Tahiti, Banque de Polynésie, and Australia's Westpac Bank. Offices are only on the main islands of Tahiti, Bora Bora, and Moorea.

RETAIL. Retail services vary widely. Papeete, with its long-established French presence, high standards of living, and extensive tourist trade, is a cosmopolitan city of expensive hotels, restaurants, cafés, cinemas, bars, and nightclubs. Papeete features a range of shops and markets selling jewelry, designer clothes, souvenir handicrafts, books, and art. This is also true to a lesser extent for the other major islands, Moorea and Bora-Bora. On remoter and more sparsely populated islands, where agriculture may still be the main form of livelihood, retailing becomes much simpler, with local food markets and general stores predominating.

Trade (expressed in billions of US$): French Polynesia

1975	.025	.286
1980	.030	.547
1985	.040	.549
1990	.111	.928
1995	.193	1.008
1998	N/A	N/A

SOURCE: International Monetary Fund. *International Financial Statistics Yearbook 1999.*

INTERNATIONAL TRADE

French Polynesia's narrow economic base leaves it dependent on imports for many of its basic goods, and its **trade deficit** has traditionally been a heavy one. In 1996, the country imported $860 million in goods while exporting only $212 million. The consumer culture that French subsidies have tended to encourage has given the islands one of the largest import-export imbalances in the world. In 2000 imports exceeded exports by a factor of around 5 and accounted for 19.3 percent of GDP, but the gap has been slowly closing. In 1991 the territory's imports had been worth nearly 40 times their exports. The largest supplier of goods to the islands is France, which provided 44.7 percent of the islands' imports (1994); a further 13.9 percent comes from the United States. Exports go to the United States (11 percent, 1994) and France (6 percent). Imports include food, fuel, building materials, **consumer goods** and automobiles; exports include copra, cultured pearls, vanilla, and perfume.

MONEY

The currency of French Polynesia is the Pacific Financial Community franc, known in French as the Comptoirs Français du Pacifique franc (CFPF). The CFPF is pegged at a fixed rate to the French franc (18.18 CFPFs = 1 French franc), and, through it, to the euro. Initiated in 1945, the CFPF is also used by France's 2 other Pacific possessions, New Caledonia and Wallis and Futuna. In 1967, responsibility for issuing and circulating this currency was transferred from the Banque d'Indochine to the French government. **Exchange rates** have affected the tourism sector most; prices have generally been high in the islands, and during periods in which currencies

Exchange rates: French Polynesia

such as the U.S. dollar have weakened, so has tourism. The reverse is true as well, with tourism increasing as foreign currencies grew stronger against the CFPF.

POVERTY AND WEALTH

In French Polynesia, where unemployment and **underemployment** are growing problems, the inequalities in wealth are sharp. At one end of the scale is the large ring of slums around Papeete, home to 20,000 dispossessed Polynesians; at the other end are the luxury holiday homes of French Polynesia's seasonal migrants, like actor Marlon Brando, owner of the island of Tetiaroa, just north of Tahiti. The 2,200 expatriate French administrators and advisors, who make up around 4 percent of the islands' population, earn 84 percent more than their metropolitan French counterparts, and are the country's economic elite. Such disparities are made worse by the division of haves and have-nots along racial lines, with French at the top, mixed races in business and minor government posts in the middle, and the indigenous Polynesians at the bottom. The result has been serious social tensions, which have also put a strain on the traditionally relaxed and egalitarian tenor of indigenous life. The public education system has not helped, although it has created a 98 percent literacy rate. With the curriculum entirely French, the indigenous failure rate is high, ranging from 40 to 60 percent. This, combined with unemployment, is threatening to produce a Polynesian underclass.

GDP per Capita (US$)

Country	1996	1997	1998	1999	2000

WORKING CONDITIONS

The massive influx of French personnel that accompanied the creation of the Centre d'Expérimentations du Pacifique (CEP) in the early 1960s radically altered the basis of the islands' economy. The nature of their labor conditions changed the economy as well, shifting the workforce away from fishing and farming and into services and industry. This set in motion a migratory drift toward Papeete that still continues. Whereas in 1962 46 percent of French Polynesians were employed in agriculture and fishing, in 1996 only 11 percent were so occupied. The trend has been supported by France's development subsidies, an aim of which has been job creation. From 1997 to 2000, the numbers of those in wage and salary employment increased by 4.2 percent per year, against a 1.6 percent annual increase in the general population over the same period. As a result, there were 20 percent more wage and salary earners in 2000 than there had been in 1995. The gains have been in industry and services, which employ 19 percent and 68 percent of the workforce, respectively. The single largest employer is the government, which accounts for around 40 percent of the workforce. The workforce was most recently estimated at 118,744 in 1988, and unemployment was estimated at 15 percent in 1992.

COUNTRY HISTORY AND ECONOMIC DEVELOPMENT

c. 300. Polynesians reach the Marquesas Islands.

1521. Portuguese explorer Ferdinand Magellan sights Pukapuka in the Tuamotus.

1595. Spanish explorer Mendaña lands on the Marquesas Islands.

1767. British navigator Captain Samuel Wallis discovers Tahiti for Europe.

1768. French navigator Louis-Antoine de Bougainville visits Tahiti and claims it for France.

1797. Protestant missionaries arrive on Tahiti.

1842. French protectorate declared over Tahiti and the Marquesas.

1880. Protectorate becomes a colony.

1903. Islands organized into a single colony.

1945. French Polynesians become French citizens.

1958. French Polynesia becomes a French overseas territory.

1962. The French establish the nuclear test program Centre d'Expérimentations du Pacifique (CEP).

1966. French begin nuclear testing on Mururoa.

1975. Worldwide opposition forces French to move nuclear testing underground on Fangataufa.

1984. Partial local autonomy granted.

1995. French president Jacques Chirac resumes nuclear tests after their suspension by President François Mitterand in 1992.

FUTURE TRENDS

After the end of French nuclear testing in 1996 and the subsequent winding down of the French military presence, the role of French subsidies in the economy has decreased. French Polynesia has been encouraged, with the help of considerable French assistance, to develop alternative sources of income. The territory has had some considerable success in doing so, and economic indicators suggest a positive forecast for French Polynesia. After sluggish growth in the mid-1990s, the economy has climbed from 0.3 percent annual growth in 1996 to 4.0 percent in 2000, while keeping **inflation** at around 1 percent. But French aid is a mixed blessing. If French support falters, or if not enough is done to address the condition of indigenous and economically excluded Polynesians, this progress could be quickly undermined. In the longer term, global warming and rising sea levels are expected to have an adverse effect.

DEPENDENCIES

French Polynesia has no territories or colonies.

HONG KONG

Hong Kong Special Administrative Region (SAR) of the People's Republic of China

CAPITAL: Hong Kong.

MONETARY UNIT: Hong Kong dollar (HK$). One Hong Kong dollar is equal to 100 cents. There are coins of 10, 20, and 50 cents, and HK$1, 2, 5, and 10. Paper currency comes in denominations of HK$20, 50, 100, 500, and 1,000.

CHIEF EXPORTS: Clothing, textiles, footwear, electrical appliances, watches and clocks, toys.

CHIEF IMPORTS: Foodstuffs, transport equipment, raw materials, semi-manufactures, petroleum.

GROSS DOMESTIC PRODUCT: US$158.2 billion (1999 est.).

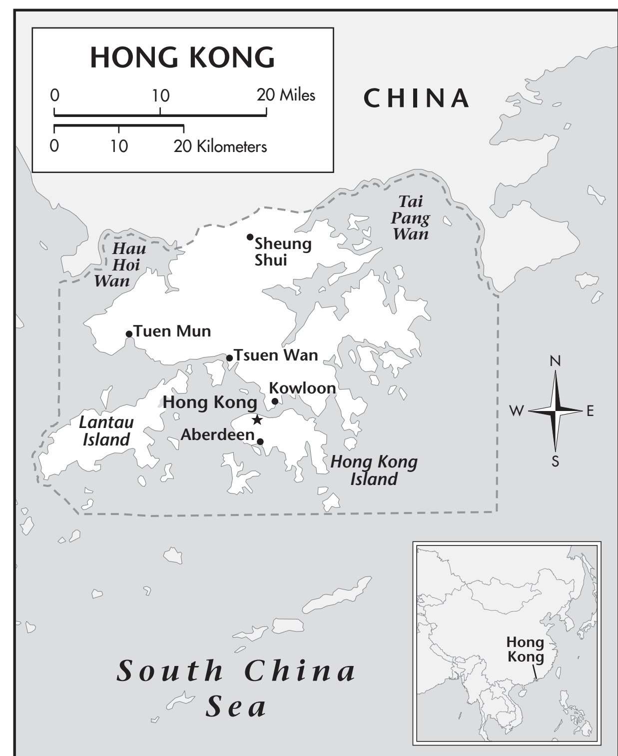
BALANCE OF TRADE: **Exports:** US$169.98 billion (including re-exports, 1999 est.). **Imports:** US$174.4 billion (1999 est.).

COUNTRY OVERVIEW

LOCATION AND SIZE. Hong Kong is located in eastern Asia. It borders the South China Sea to the south, west, and east, and shares a land border with mainland China to the north. It consists of 4 main areas: Hong Kong Island, Kowloon, the New Territories, and the Outlying Islands. Kowloon and the New Territories are on a peninsula, accounting for the bulk of Hong Kong's land. The New Territories link Hong Kong to mainland China. The Outlying Islands are made up of 234 islands in the proximity of Hong Kong, excluding Hong Kong Island where the capital city (Hong Kong) is located; the island is in the southern part of the territory. Lantau Island and Hong Kong Island are the largest islands. The entire territory, including its islands, has an area of 1,092 square kilometers (421 square miles), which makes it 6 times larger than Washington, D.C. The length of its land border and coastline are 30 kilometers (18 miles) and 733 kilometers (455 miles), respectively.

POPULATION. Hong Kong's population was estimated to be 7,116,302 in July 2000. Its population increased from 4.4 million in 1975 to 6.7 million in 1998, indicating a growth rate of 1.8 percent. With an estimated growth rate of 0.8 percent, the population will increase to 7.7 million by 2015. In the year 2000 the estimated birth rate was 11.29 births per 1,000 people while the estimated death rate was 5.93 deaths per 1,000 people.

The majority of Hong Kong's population is of Chinese ethnicity, but non-Chinese constitute more than 8 percent of the population. Out of 595,000 foreigners residing in Hong Kong in 1999, 274,100 were from Asian countries (Philippines, Indonesia, Thailand, India, Japan, and Nepal) and the rest from Western countries (United



States, Canada, United Kingdom, and Australia). The number of expatriates grew from 320,700 in December 1993 to 485,880 in December 1998.

The population of Hong Kong is old, with 18 percent of the population age 14 or younger and 71 percent between the ages of 15 and 64. This leaves 11 percent of Hong Kong's people 65 years old and up. Given the estimated low growth rate for the 1998–2015 period, the population will be even older by 2015 when 13.7 percent of the population will be over 65 years of age.

Hong Kong is a highly urbanized society. About 95.4 percent of its population lived in urban areas in 1998, an increase of 5.7 percent since 1975. The urban population is estimated to reach 96.7 percent by 2015. The capital city of Hong Kong and the Kowloon peninsula house the majority of the population.

OVERVIEW OF ECONOMY

During the first Opium War (1839–43), the British government colonized Hong Kong in 1841. Over time it established a free-enterprise economy in the colony and turned it into a trading center in Asia. Hong Kong has retained these characteristics since its hand-over to China in 1997, as stipulated in the 1984 Sino-British Joint Declaration on the transfer of Hong Kong's sovereignty to China. Accordingly, the Chinese government guaranteed that it would preserve Hong Kong's capitalist economy and its political and social systems for at least 50 years. This commitment was justified under the Chinese formula of "one country, two systems," which allowed for the co-existence of a capitalist Hong Kong with the **socialist** mainland China as 2 parts of 1 single country. The Chinese government also guaranteed that it would not intervene in the internal affairs of Hong Kong, and would let its government function independently in all its internal affairs, including economic policies. The Chinese central government in Beijing is in charge only of Hong Kong's foreign and defense issues. China's official acceptance of Hong Kong's mini constitution, the Basic Law of the Hong Kong Special Administrative Region, consolidated this arrangement when China's National People's Congress passed it in 1990. The latter guarantees free trade, free enterprise, and low taxes for at least 50 years.

Much of the anxiety of the pre-1997 period has proven to be baseless. China has kept its promise and Hong Kong continues to be a bastion of free enterprise. The territory has retained all its colonial financial and **monetary policies** and laws, including those regarding its currency, the free flow of capital into and out of its territory, and taxation. It uses its own currency, the Hong Kong dollar, and keeps its revenues for its own needs. Its government does not pay any tax to the Chinese central government. The hand-over has not changed Hong Kong's economy, but the post-1997 period has had at least 2 major impacts on it. First, this period has consolidated a change in the economy that began in the early 1980s. This was the transfer of large, sophisticated, and labor-intensive industries from Hong Kong to mainland China where there is no scarcity of land and raw material and where labor is significantly cheaper. As a result, existing manufacturing in Hong Kong mainly focuses on the necessary activities for the **re-export** of goods produced by Hong Kong enterprises in China. Being the largest economic sector even prior to 1997, Hong Kong's service sector has since grown significantly in the fields of trade and transportation. This was done to meet the increasing demand for re-exporting and to absorb the loss of jobs in the manufacturing sector. Second, there has been a growing interest in 2 new industries: high-tech and information technology (IT). This is a positive move towards the broadening of the service-dominated economy of Hong Kong. IT activities have also created new types of employment opportunities, most of which cannot be filled immediately due to a lack of skilled workers. Consequently, there were 18,400 vacant IT positions in 2000. The root cause of this problem is that those who have lost their jobs in other sectors (e.g. manufacturing) are either unskilled or have skills that are not in demand. The Hong Kong government has addressed this issue by increasing its spending on retraining programs by 5.4 percent in 1997–98, 11.8 percent in 1999–2000, and 42.8 percent in 2000–01.

Like many other Asian economies, the Hong Kong economy suffered from the financial crisis of the late 1990s. However, unlike most of them, it was able to cope with the crisis with tolerable losses and begin recovery in 1999. Its large service sector has been given credit for the economy's ability to recover. This sector has been the reason for a constant **balance-of-payment** surplus since 1997. In that year, Hong Kong had a balance-of-payment deficit of US$6.159 billion (equal to 3.6 percent of its GDP). However, it enjoyed 2 consecutive balance-of-payment surplus years of US$2.902 billion (equal to 1.8 percent of its GDP) and US$9.285 billion (equal to 5.8 percent of GDP) in 1998 and 1999, respectively. Figures for 2000 are not yet available, but there are indications of a surplus for that year as well. Unlike other Asian countries fallen victim to the 1997–98 financial crisis, Hong Kong's **external debt** has remained small in comparison to its available finances. For example, its total **foreign debt** was US$48.7 billion in 1998, US$53.5 billion in 1999, and US$56.5 billion in 2000 while its **foreign exchange reserves** were US$89.601 billion, US$92.236 billion, and US$97.218 billion, respectively. The crisis slowed down the economy temporarily, as reflected in a large drop in its GDP growth rate from 5 percent in 1997 to -5.1 percent in 1998. However, it did not lead to widespread closures of industries and companies

or massive unemployment as experienced in Indonesia and Malaysia, for instance. The economy began to recover in 1999 and 2000 when the GDP growth rates jumped to 3 percent and 9.7 percent, respectively. Additionally, its unemployment rate reached the record high of 6.2 percent in 1999, only to drop to about 5 percent in 2000 despite the continued relocation of the manufacturing jobs to mainland China.

Geography and size impose certain limits on the economic activities that Hong Kong can undertake, but they also open opportunities for its economic growth. Maintaining extensive ties with China has been an imperative for the survival of this small territory, which has no mineral and water resources and lacks an adequate agriculture sector to meet its essential private and commercial needs. Being connected to China via land, Hong Kong has depended on its only neighbor for raw materials, food, and water. Its small size and acute scarcity of land also lead Hong Kong to look to China for the establishment of large and labor-intensive manufacturing establishments. This has been a blessing in disguise as China's low wages significantly reduce the cost of production of its exports and make them more competitive in international markets. Reliance on China has also helped Hong Kong penetrate the huge and growing Chinese market, the largest in the world and to which many developed economies are trying so hard to gain access. Not only are Hong Kong businesses interested in China, but the Chinese government also encourages extensive ties with Hong Kong, its reunified territory. Expanding economic ties with China also helps Hong Kong tolerate losses in its economic transactions elsewhere.

The service sector dominates Hong Kong's economy. This is the result of the territory's limited opportunities for agricultural and industrial activities on the one hand, and the interest of the British colonizers to develop it as a trading center on the other. Being the engine of economic growth, the service sector is the largest employer and the largest contributor to Hong Kong's GDP (84.7 percent in 1998). The major services are trade, financial services (e.g., banking and insurance), tourism, **retail**, and real estate. Trade has been the heart of Hong Kong's economy. The service sector has been growing steadily over the last few decades under British and Chinese rule alike.

Agriculture is negligible as a source of employment or revenue and makes only a miniscule contribution to GDP (0.1 percent in 1998). The scarcity of arable land leaves very limited opportunity for agricultural activities. Hong Kong is heavily dependent on agricultural imports.

Industry is a significant sector, but is mainly geared to the re-export of goods produced in China. This sector is small, accounting for 15.2 percent of GDP in 1998. Thanks to a lack of minerals, there is no mining industry of any significance. There is a small utility (water, gas, and electricity) industry, a relatively significant construction industry, and a more important export-oriented manufacturing sector. As a small territory with limited land and a very large population, Hong Kong cannot support heavy industries, which are land-intensive by nature. Nor can it have large labor-intensive industries. Besides low wages and an abundance of resources in China, space has been the main reason for the relocation of Hong Kong's large and labor-intensive industries to that country. The remaining industries of Hong Kong are small-scale establishments, which employ small numbers of workers. Garment production has been the leading component of the manufacturing sector for decades, but Hong Kong has other marketable products—mainly light and **consumer goods** such as footwear, toys, and plastics. Manufacturing lacks a significant high-tech segment, but has a viable electronics branch in need of development.

POLITICS, GOVERNMENT, AND TAXATION

The political parties of Hong Kong are at the initial stage of their development and do not represent a long tradition of political activities. Political parties were illegal until 1990. Being a British colony directly ruled by a British-appointed governor, the territory did not need active political parties. They seemed to be irrelevant to a political system whose executive branch, the Executive Council (Exco), and the legislative branch, the Legislative Council (Legco), were simply advisory bodies. The latter was run by appointed or selected businesspeople and professionals and not by elected politicians.

As part of the preparation for the hand-over of Hong Kong to China, efforts to democratize the Hong Kong political system led to the introduction of an elected Legco and the gradual elimination of legislative seats occupied by the British governor's appointees. These developments justified the creation of political parties. Yet, the Basic Law of Hong Kong provides for an election process, which undermines the status of the Legco as a truly democratic and representative body. Out of its 60 members, only 20 members are directly elected by popular votes. Functional constituencies (created by professional, business, and labor groups) elect 30 members, and an electoral committee (formed mainly by functional constituencies' chosen delegates) elect the remaining 10 members. Consequently, big business dominates Legco, which reflects the pre-eminence of business-oriented groups and the irrelevance of political parties in the running of Hong Kong and overseeing its economy.

In such a situation, the emerging political parties, which suffer from internal weaknesses, are practically out of the decision-making process and are therefore unable

to have a major impact on the economy. Major politicians, including Chief Executive Tung Chee-hwa, do not have party affiliations and are prominent business figures.

The Hong Kong political parties are divided into 3 major groups: pro-democracy, pro-business, and pro-China. None of these groups advocate any economic policy to undermine the free-enterprise nature of the economy or the status of the territory as a center for free trade. The merger of 2 pro-democracy groups (the United Democrats of Hong Kong and the Meeting Point) formed the Democratic Party of Hong Kong in 1994, the largest pro-democracy party. It suffers from infighting on various issues, including economic issues. Pro-business parties include the Association for Democracy and People's Livelihood, the Hong Kong Democratic Foundation, the Frontier Party, the Citizens Party, and the Liberal Party. All these parties tend to advocate close ties with China and cooperate with pro-China groups. The major pro-China groups include the DAB (Democratic Alliance for the Betterment of Hong Kong). Not surprisingly, it also advocates close economic ties with China. The 3 largest parties in Legco are the Democratic Party of Hong Kong, the Liberal Party, and the DAB.

The Hong Kong government has a very limited role in economic affairs. This is in keeping with the proclaimed status of Hong Kong as a haven for unfettered free enterprise and free trade, in which the task of creating a viable economy is granted to the **private sector**. The intervention of the government in the economy is limited only to providing the essential services for its normal functioning and for creating an environment conducive to its growth. Therefore, government must ensure the existence of the required **infrastructure** for the daily life of the population and the economy—for instance, education, health care, communications, and telecommunications—with or without the involvement of the private sector. It must also ensure the absence of barriers to free economic activities. Such barriers include laws and regulations which complicate, impede, or prohibit economic activities such as difficult and lengthy processes for registration of economic establishments, various licenses for their activities, restrictions on the transfer of funds from and to Hong Kong, and the imposition of **tariffs** and restrictive export/import regulations.

To create a suitable environment for economic growth, the Hong Kong government imposes very few laws and regulations on economic activities. It continues the British policy of "positive non-intervention," meaning it **levies** low taxes to encourage economic activities and limits government expenditures as well as its role in providing essential services (e.g. education, health care, and housing). Apart from these functions, the government's role in the economy is limited to the extent justified for the well-being of the economy. In this regard, its first and foremost duty is to ensure the stability of the Hong Kong dollar, which demands the stability of the economy. To that end, in August 1998 it purchased US$15.3 billion worth of stocks to prevent the fall of the Hong Kong stock market and put it back in a healthy position. That move also prevented huge losses which could have seriously damaged the economy and weakened its currency.

Hong Kong's government gives a free hand to the private sector in practically all economic affairs pertaining to the 3 main economic sectors (agriculture, industry, and services), including investment, production, trade, and transfer of capital. For example, there is no need for a business to acquire a license in Hong Kong. Regardless of the nature of their activities, the only requirement for setting up businesses is to register them as companies; the registration process is not complicated. Nor is there any restriction on investments or on financial transactions regardless of size, including the transfer of funds from and to Hong Kong or the **repatriation** of profits and investments. Finally, tariffs do not exist in Hong Kong.

The private sector has been the main engine of growth before and after 1997. This sector also includes foreign businesses, which are treated practically like local ones. The only major restriction on foreign investors checks their involvement in television broadcasting concerns. These investors can buy up to 10 percent of the concerns' shares individually and cannot own more than 49 percent of the voting shares as a group. While there is no systematic restriction on the operation of foreign investors in Hong Kong, there is not any specific program to attract them either. The Hong Kong government believes that its territory's geographical location, its good infrastructure, its low taxes and absence of tariffs, and its very limited and simple business regulations make investment in Hong Kong attractive enough for local and foreign entrepreneurs.

TAXES. The Hong Kong government imposes tax on salaries, employment-generated incomes, pensions, property incomes, and on revenues of economic establishments. The simple tax system is characterized by low tax rates, varying between 15 and 16 percent. All individuals who receive salaries, wages, or pensions are liable for **income taxes**, which are not more than 15 percent of their income. As an **equity** measure provided by law, 61 percent of the workforce does not pay tax on salaries. All corporations or individuals involved in any type of trade, business, or profession are liable for taxes on their profits, excluding those generated from the sale of capital assets. There is a flat rate of 16 percent for the business profit tax.

The Chinese government cannot tax Hong Kong in any manner, as stipulated in the Basic Law and the Sino-British Joint Declaration. The Hong Kong government keeps all revenues, including taxes, for its own use. In February 1998, Hong Kong signed a treaty with China

to eliminate double taxation of their respective businesses operating in each other's territory.

Taxes account for more than 50 percent of government revenues. The amount of direct and **indirect taxes** (personal and corporate) collected in the **fiscal years** 1998 and 1999 was US$9.7 billion and US$4.9 billion, respectively. The total amount accounted for 52.5 percent of the total government revenue of US$27.8 billion. This showed a drop in both the absolute amount of collected taxes and in the percentage of their contribution to the government revenue in 1997–98. In that fiscal year, the government collected US$11.7 billion in **direct taxes** and US$8.39 billion in indirect taxes. The total collected taxes contributed to 55.4 percent of the government revenue of US$36.2 billion. The financial crisis of 1997–98 caused a slowdown in the economy and lowered the amount of collected taxes in the fiscal year of 1998–99. Transportation services, including those related to seaports and airport, and capital revenues (i.e. revenues generated from investments by the Hong Kong government) are 2 other major sources of government revenues. They accounted for 44.6 percent (US$16.11 billion) and 47.5 percent (US$13.2 billion) of such revenues in the fiscal years of 1997–98 and 1998–99, respectively. In the same years, the government's share of capital revenues fell from 29.4 percent (US$10.6 billion) to 22.8 percent (US$6.3 billion), while the share of transportation services rose from 15.2 percent (US$5.3 billion) to 24.7 percent (US$6.7 billion). A growth in the use of port facilities by China-based enterprises was the main factor for the rise.

The judicial system of Hong Kong plays a major role in the economy. It is an independent body in charge of ensuring the continuation of the rule of law in all fields, including in the economy as set prior to the hand-over of Hong Kong to China and as stipulated by the Basic Law. This is essential for the free enterprise economy of Hong Kong, as it guarantees the right of its people to private property and to engage in legitimate economic activities. It also guarantees the unrestricted economic environment of Hong Kong and prevents government intervention in Hong Kong's economic affairs, which would have a negative impact on the status of the territory as a bastion of free enterprise. This status has been the major factor for the phenomenal economic growth of Hong Kong and its continued attractiveness to local and international investors. Finally, the continuation of rule of law is a guarantee against any attempt on the part of the Chinese government to intervene in the internal affairs of Hong Kong and to impose its laws and regulation on that territory.

The Hong Kong courts are in charge of upholding laws, rights, and freedoms, including respect for private property and all rights and laws necessary for the continuation of economic activities. These courts are independent and exercise jurisdiction over all cases except those falling under the jurisdiction of China's central authority, namely defense and foreign affairs.

INFRASTRUCTURE, POWER, AND COMMUNICATIONS

Hong Kong has a superb infrastructure, which meets its population's needs and contributes to the efficiency and growth of the economy. Hong Kong has an advanced land, sea, and air transport and communications system, including 1,831 kilometers (1,138 miles) of paved roads (1997 est.) and 34 kilometers (21 miles) of electrified railways (1996 est.). The railway system is one of the most efficient systems of the world and is connected to Chinese railways via the Kowloon peninsula. The construction of 3 new lines was begun in 1998. In 2000, the Hong Kong government hinted at a huge project to construct 6 more lines to facilitate (make easier) rail traffic between Hong Kong Island and the rest of the territory and also to improve freight links with mainland China to meet the expected future needs.

Hong Kong's land transportation services are very efficient. To decrease the level of air pollution, its government encourages the use of public transportation

services and discourages the use of private cars in its small territory. It therefore keeps improving public transportation services while increasing the cost of maintaining private cars through various measures such as high car-registration fees, a compulsory inspection for cars over 6 years old, and a point system to disqualify offending drivers. Public transport facilities include the mainly underground Mass Transit Railway, which provided services to 2.2 million passengers every working day in 1999. It also includes very efficient bus services run by 4 private companies, supplemented by public and private light minibus services. A line of streetcars, about 18,000 taxis, 113,770 cargo vehicles, and 321,617 private cars further facilitated passenger movements in 1999.

Sea communications are vital for Hong Kong, both for trade and daily life. There are at least 5 major ferry companies providing daily service between the islands where its population lives and works. Hong Kong is a major port in Asia and one of the busiest container ports in the world. It handled 6.2 million twenty-foot containers in 1999. To meet future increases in cargo handling, an expansion of its container terminal facilities began in the same year.

Hong Kong's eminent status as a major international port could be undermined in 2 ways. First, Taiwan and Singapore rival Hong Kong by improving their port facilities regularly. Second, a major portion of Hong Kong's cargo handling is shipping of re-exports to and from China, which will decrease as China develops its mainland ports. Besides its good port facilities, Hong Kong has a very advanced commercial fleet, which operated 38,000 vessel departures in 1999. In the same year the capacity of its cargo fleet was 215,226 metric tons.

Hong Kong has high-quality private airlines and was home to 3 modern airports with paved runways and 2 heliports as of 1999. A new Hong Kong international airport, Chek Lap Kok Airport, replaced the old international airport (Kai Kak airport) in 1998. Kai Kak Airport handled 30 million passengers and 1.6 million tons of cargo in 1997. Located on Lantau Island, the new airport is one of the world's best airports, and is capable of handling up to 460 flights a day. Its annual passenger and cargo capability is 87 million passengers and 9 million metric tons of cargo, respectively.

Hong Kong's utility services are excellent even though they are highly dependent on imports for their daily operations. The territory has no source of fresh water, which makes it dependent on China for all its water needs to run its efficient water system.

Hong Kong has the highest rate of energy consumption per capita in Asia. For example, in 1998 its electricity consumption per capita was 5,569 kilowatt hours (kWh) compared to mainland China's 922 kWh. Hong Kong imports all its needs in fuel for private and commercial consumption, and power generation amounted to 18 million metric tons of oil in 1998. Hong Kong also imports gas from China and liquified gas through oil companies such as Shell, Mobil, Esso, Caltex, and China Resources, while producing gas from naphtha (a mixture of liquid hydrocarbons made from distilling petroleum, coal tar, and natural gas) at home. The value of its energy imports increased from about US$3 billion in 1998 to US$3.5 billion in 1999.

Two private companies supply electricity to Hong Kong and each has a **monopolized** area. In addition to the generated electricity in its 3 fossil-fuel power stations, Hong Kong imports electricity from China, including from the Daya Bay atomic power station, a Chinese government-Hong Kong **joint venture**. The power generation capacity of the 2 private companies (9,590 megawatts [mw] in 1998) is well above the demand (8,620 mw in 1998). This guarantees a continuous supply of uninterrupted power.

The telecommunications system of Hong Kong is excellent, consisting of fixed-line and cellular services. In 1998, there were 3.7 million fixed-line telephones and 2.4 million cellular phones in use. Hong Kong has one of the highest rates of usage of cellular phones in the world. In 2000, for instance, 55.6 percent of its population (3.9 million people) owned cellular telephones, an increase of 1.5 million from 1998. Personal computers are widely used and their availability is high (254 computers per 1,000 people in the same year). Internet services were provided by 49 Internet service providers in 1999.

Cable & Wireless HKT, a private company, dominates the telecommunications market. It had a 100 percent monopoly until 1997, when the Hong Kong government began to end its monopoly by encouraging competition. Through licensing of 3 new companies, the government reduced the market share of Cable & Wireless HKT to 97 percent in 2000. In that year it announced the licensing of 5 more companies.

Radio and television services are also advanced. In addition to foreign cable and satellite TV programs, 20 AM and FM radio stations and 4 television networks were operating in 1997. The number of televisions and radios in use in that year were estimated to be 1.84 million and 4.45 million, respectively.

ECONOMIC SECTORS

The economy of Hong Kong survived the financial crisis of 1997–98. This service-dominated economy began its recovery in 1999 and continued it in 2000 thanks to its viable service sector. To a varying extent, the 3 eco-

SOURCE: *CIA World Factbook 2001* [Online]. Data for 2000 est. Percent distribution for October 1999.

nomic sectors suffered from the crisis. The impact of the crisis on agriculture, the smallest sector with a very small contribution to the Hong Kong economy, was negligible. However, the industry and particularly the service sectors suffered considerably and experienced contraction during the crisis period. The CIA *World Factbook* reported the percentages of each sector's contribution to GDP in 1997 to be agriculture, 0.1 percent; industry, 14.7 percent; and services, 85.2 percent. As the largest and dominant economic sector, the service sector has always been the engine of growth and includes international trade, financial services, tourism, retail, and real estate. These service industries are the largest employers and taxpayers.

The industry and service sectors have undergone structural changes over the last decades. The catalyst has been the gradual relocation of large and labor-intensive manufacturing to mainland China, which began in the early 1980s. This trend has been reinforced since the 1997 hand-over of Hong Kong to China. As a result, the industry's manufacturing branch has been shrinking. The service sector has been expanding to re-orient itself towards functions pertaining to China's international trade.

The reunification with China has not changed the business-friendly environment of Hong Kong. As promised, China has respected the autonomy of the territory in its internal affairs, including its economic policies. China's approach has bolstered the confidence of the local and international business community in the stability and predictability of Hong Kong, which became somewhat shaky on the eve of the 1997 hand-over. Hong Kong is as friendly as ever to local and foreign investors, including Western (American, British, French, Swiss, and Dutch) and non-Western (Japanese and South Korean) **multinational corporations** (MNCs).

AGRICULTURE

Hong Kong has a small agricultural sector, including fisheries, with a very limited productivity and insignificant role in the economy. Its contribution to GDP and share of the workforce was about 0.1 percent in 1998. The available arable land is extremely limited in Hong Kong, where land is generally scarce. Less than 7 percent of Hong Kong's land is used for agricultural activities, i.e., farming and fish farming. As the available farming land cannot produce enough food for the Hong Kong population of more than 7 million, the population survives on large imports of agricultural products valued at US$8.32 billion in 1998, which fell to US$7.335 billion in 1999 as a result of the financial crisis. China is the main exporter of these products.

The scarcity of land has determined the nature of agricultural activities. Instead of land-intensive and low-priced rice and grain production, 2 lucrative activities (vegetable farming and flower growing) have become the dominant activities, accounting for 93 percent of the total value of crops grown in 1998. The scarcity of pastoral land sets limits on animal husbandry, and has led to the rearing of only poultry and pigs. Domestic production accounted for 10 percent of live poultry and 16 percent of live pigs in 2000.

Fishing is a very small source of employment, but its products meet a significant portion of demands for seafood. They amounted to 75 percent of the fresh marine consumption and 11 percent of the freshwater fish consumption in 2000. Fish ponds produced 4,900 metric tons of freshwater fish in 1998, and the fresh marine catch

was 188,000 metric tons. In 2000, the fishery fleet consisted of 4,460 vessels of various sizes, of which 3,820 were motorized.

INDUSTRY

Industry has experienced a slow decline over the last 2 decades. Its contribution to GDP was 15.2 percent (equal to US$23 billion) in 1998, a significant decrease from its 1990 contribution of 17.7 percent. Its share of the workforce, which was 28 percent in 1990, dropped to about 15 percent in 1998. The decline of industry has been the outcome of a steady contraction in manufacturing, the result of the continued relocation of manufacturing establishments to mainland China. Manufacturing's share of GDP sharply fell from 24.3 percent in 1984 to 6.2 percent in 1998. The constant expansion of the service sector has also contributed to the process of decline. Other activities, such as construction, energy, and mining, are not significant enough to stop the steady decline of the industrial sector.

The largest sector of industry is manufacturing. It is a major contributor to GDP (6.5 percent in 1998) and the workforce (7.3 percent in 1998, or 245,457 employees). Manufacturing's contribution to the workforce dropped to 7 percent (244,720 employees) in 1999, and the value of manufacturing exports also fell from US$10.31 billion in 1998 to US$9.42 billion in 1999, suggesting that the sector was beginning to contract.

There were 23,553 manufacturing establishments in Hong Kong in 1998. Known as "flatted factories," these establishments are mostly very small and located on 1 or 2 floors of a high-rise building. The average number of employees per establishment is 10. The migration of many large and labor-intensive industries to mainland China resulted in the loss of more than 500,000 industrial jobs in the 1990s.

Certain factors have created "natural" barriers to the growth of the manufacturing sector and have forced a peculiar pattern of development on it. Scarcity of land, the absence of mineral resources, the high cost of labor, and the close proximity to China have ruled out the establishment of heavy industry or other land- and labor-intensive industries in Hong Kong. Prior to the 1980s, Hong Kong produced mainly labor-intensive consumer products, including food, beverages, clothing, textiles, printed products, and fabricated metal products. Being a resource- and land-rich country with a very low-wage **labor force**, China became a "natural" place for Hong Kong's manufacturing in the 1980s. Improved relations between the 2 sides made the relocation of major industries to China feasible. China's growing interest in foreign investment facilitated the process.

The result was a re-structuring of Hong Kong's manufacturing sector. Labor-intensive and sophisticated industries were moved to China, mainly to the neighboring Guangdong Province, while light and capital-intensive industries were kept in Hong Kong. This trend is continuing. Given the removal of all political barriers and the willingness of the Chinese government, it is simply logical for Hong Kong industrialists to continue their establishment of the labor- and land-intensive industries in China where they have access to minerals, low-cost labor, and abundance of land. Their products are exported via the very modern and efficient port of Hong Kong.

The existing Hong Kong industries are small-scale operations. They are involved mainly in certain manufacturing processes pertaining to re-exporting goods produced in China by Hong Kong-owned establishments. These processes can involve the packaging of goods produced on the mainland, for instance. However, there are still export-oriented industries that produce textiles, electronics, plastics, and watches and clocks. The textile industry is the largest industrial employer and accounts for the bulk of annual domestic industrial exports, accounting for 45 percent (US$11.3 billion) and 49 percent (US$10.79 billion) of those exports in 1998 and 1999, respectively.

The electronics industry, including telecommunications, is the second largest export earner, but it is small and underdeveloped. The value of its exports was US$4.24 billion in 1998 and US$3.55 billion in 1999. Its products are generally of lower quality compared to other Asian products such as those of Singapore and Taiwan. Its rapid growth over the last 3 decades is owed to large foreign investments and transfer of technology. This situation makes it highly dependent on foreign sources for investments and parts; local industries can produce only 20 percent of the necessary parts. The electronics industry produces various sophisticated products, including semiconductors, computers, televisions and telecommunications equipment. The Hong Kong government has sought to help expand this industry, especially in the fields of computer products, in order to diversify the economy, now heavily dependent on services.

The plastics industry has been shrinking in Hong Kong, with most of its manufacturing establishments being moved to China. Nevertheless, Hong Kong is one of world's largest toy exporters. The exports of plastic goods generated about US$210 million in 1998 and US$163 million in 1999.

A major component of the industrial sector is the construction industry. It accounted for 6.1 percent of GDP and employed 2.2 percent of the workforce (72,253 employees) in 1998. In the aftermath of the Asian financial crisis, a decline in construction activities lowered its share of the workforce to 2.1 percent (71,789 workers)

in 1999, but government-financed infrastructure projects increased its share to 79,300 employees in June 2000. The constant government investment in infrastructure and private sector investments in related fields (such as housing and commercial establishments, which total more than 50 percent of investments in the sector) make construction a viable industry.

The industry has gone through periods of expansion and contraction for political and economic reasons since the 1980s. Politically, the smooth hand-over of Hong Kong to China encouraged investment in private and commercial construction projects in 1998 and 1999. Recent economic factors include a 1994 government policy on buying and selling unfinished apartments. That policy made those transactions more difficult and therefore lowered property prices, resulting in a reduction in investment in apartment building projects. Thanks to a wide range of road and railway expansion projects, the construction industry is expected to experience a period of growth in the first half of the decade (2000–10).

The utility industry is a vital sector in Hong Kong, which lacks freshwater and fossil energy resources. As discussed earlier, several companies ensure uninterrupted supplies of water and energy (electricity and fossil fuel) for private and commercial purposes through imports of water and both limited local production and large imports of energy. Despite its importance, the utility industry is small and employs an insignificant portion of the workforce, but its contribution to GDP is significant (2.4 percent in 1998).

There is no mining industry of any significance in Hong Kong, as the territory lacks mineral resources. The share of mining and quarrying activities of GDP was about 0.02 percent in 2000. Cement production is the most important activity of this sector.

SERVICES

The service sector dominates the Hong Kong economy. In the absence of a significant agriculture and a large and growing industrial base, it has become the largest economic sector in terms of income-generation, employment, and contribution to GDP. The contraction of the manufacturing sector has contributed to further enlargement of the service sector to absorb the growing number of those laid off from manufacturing jobs, a continuing trend since the 1980s. So far, this strategy has been successful, but there are concerns about the future ability of the service sector to absorb manufacturing job losses, especially because many of the affected workers are middle-aged and/or unskilled or poorly skilled. The contribution of services to GDP was 84.7 percent (equal to US$129 billion) in 1998, when they employed roughly the same proportion of the workforce.

The service sector consists of a wide range of companies of various sizes—local and foreign, including multinational corporations (MNCs)—interested in Hong Kong for its many opportunities for service activities. The major services are financial, trade, tourism, retail, real estate, and transportation.

Finance, insurance, real estate, and investment services are the most viable economic activities, which have made Hong Kong a major global financial center. These services accounted for 26.2 percent of GDP and employed 390,454 people (11.6 percent of the workforce) in 1998. The number of employees rose to 415,326 (11.9 percent of the workforce) in 1999, and to 429,300 (about 12 percent) in June 2000.

Banking is the heart of Hong Kong's financial services. In terms of the volume of external transactions, Hong Kong is the ninth-largest international banking center in the world. It is home to many local and foreign-owned banks. Banking makes a major contribution to the growth of the Hong Kong economy, and the huge revenues generated in this sector help the territory to tolerate fluctuations in its manufacturing exports and pay its foreign debt.

Hong Kong does not have a central bank, but the Hong Kong Monetary Authority (HKMA) assumes some of the functions of a central bank, namely monetary management, supervision of the banking sector, and regulating financial institutions. However, the issuance of banknotes is the task of 3 banks: the Hong Kong and Shanghai Banking Corporation (HSBC), the Standard Chartered Bank, and the Bank of China. In 2000, Hong Kong's banking system consisted of 285 authorized banks and 127 representative offices of other financial institutions. Of Hong Kong's 158 licensed (full-service) banks, 125 were registered outside Hong Kong.

Most major American, Japanese, and European banks operate in Hong Kong. There are also Thai and Taiwanese banks as well as 3 major state-owned banks from mainland China. In general, foreign banks concentrate mainly on large business clients (such as MNCs), unlike local banks, which tend to be more interested in small- and medium-size clients. Apart from its importance as an international trading center, Hong Kong's access to the growing market of China is the major reason for its attractiveness to foreign banks, through which they can enter the Chinese market. Foreign banks have a free hand for banking operations. The only restriction on their activities is a limit on their branch operations, meaning that in 2000 they could have only 3 branches.

The large and efficient insurance industry of Hong Kong is among the best such industries in Asia. This growing segment of the economy consists of 204 authorized insurers, of which 148 are general insurers, 43 long-term

insurers (mostly life insurers), and 19 combined life and non-life insurers. The insurance companies include foreign ones, e.g., American (22) and British (18). In general, the industry has experienced growth over the last decade, excluding the year 1999, when the economy was not performing well. Its average annual growth rate was 10.7 percent during the period 1993 to 1998.

Hong Kong's retail sector is well developed. The total value of retail sales was about US$25 billion in 1998, equal to 15 percent of GDP. The industry includes a wide range of establishments, including small privately-owned stores, foreign department store chains (e.g., British and Japanese), supermarkets, and domestic retail chains. There are also many large shopping malls housing a wide range of stores. The retail industry includes a large network of restaurants, including international franchises.

Hong Kong's transportation industry, including storage and communications, has developed over the last few decades to meet growing demand in international trade and internal movement of goods and people. As mentioned previously, the territory has an advanced land, sea, and air transportation infrastructure. This industry is a major contributor to GDP, accounting for 9.1 percent in 1998 (equal to US$14.88 billion), and a large employer with 175,000 employees in the same year. The number of employees jumped to 180,600 in June 2000, which indicated 3.2 percent growth from 1998.

The vivid night-life of Hong Kong, including its numerous night clubs and restaurants, and its low-priced imported goods (thanks to the absence of tariffs) attracts millions of tourists to this small territory every year. To host and entertain them, Hong Kong's tourist industry has become extensive and highly developed. The industry makes a significant contribution to GDP (4.15 percent in 1998 and 4.09 percent in 1999) and generates employment for a large portion of the workforce. Restaurants and hotels are major employers of this industry. Together with trade, they accounted for 27.2 percent (equal to 913,070 jobs) and 28.8 percent (equal to 1,002,263 jobs) of the workforce in 1998 and 1999, respectively. There are many hotels, including local and foreign five-star hotels, with 35,420 total rooms in 1999, which are fully capable of providing high-quality services to tourists. In the same year, 10,678,000 tourists visited Hong Kong and generated US$6.5 billion in revenues. In comparison to 1998, this showed an increase of 1,103,000 tourists, but a decrease of US$300 million in revenue. The major factors responsible for this phenomenon were an increase in the number of low-income Chinese visitors at the expense of high-income non-Chinese visitors that led to an overall fall in spending per head from US$715 in 1998 to US$615 in 1999.

A decline in the number of non-Chinese tourists and in the average amount of tourists' spending has created a concern about the declining interest in Hong Kong as a tourist destination. Apart from short-term reasons, 2 major factors endanger the industry in the long run. One factor is the existence of less expensive destinations in Asia offering the same quality of services (such as Singapore). Another is the expected easing of travel restrictions between China and Taiwan. This development may diminish the attractiveness of Hong Kong for the Chinese and especially for high-spending Taiwanese who have had to go through points such as Hong Kong to get to each other's countries, because of the current travel restrictions between China and Taiwan. To address this concern and to ensure a significant increase in tourism, the Hong Kong government has sought to attract more tourists through a joint venture with an American company, Walt Disney, to establish a theme park. It is expected to bring 5 million visitors in its first year of operation (2005) and 10 million by 2020.

INTERNATIONAL TRADE

International trade is Hong Kong's most important economic activity. Its government policy towards trade reflects Hong Kong's status as a center of free trade. This policy contains minimum restrictions and allows the market forces to regulate exports and imports. It therefore proscribes protective measures (e.g., tariffs and quotas) and **subsidies** as a means for avoiding **balance-of-trade** deficits.

Hong Kong is a major exporter and importer of goods and services in Asia. It exported US$175.8 billion in goods and US$34 billion in services in 1998. In the same year the value of its imports was US$183.7 billion for goods and US$11.7 billion for services. As a result of the financial crisis of 1997–98, the value of its international trade decreased in 1999 when it exported US$174.7 billion worth of goods and US$35.7 billion worth of services while importing US$177.9 billion in goods and US$13.2 billion in services.

Exports consist of goods produced in Hong Kong (domestic exports) and those produced in Hong Kong-owned industries in China (re-exports). Re-exporting has become the largest component of Hong Kong's trade since the early 1980s, when its large and labor-intensive industries began to move to mainland China. For example, between 1986 and 1996, the volume of re-exports and domestic exports rose by about 700 percent and 17.3 percent, respectively. The small contribution of domestic exports to total exports was evident in 1999, for instance, when the total value of exports of goods was US$174.7 billion, of which the share of domestic exports was only US$21.9 billion. Because of the growing value of re-exports, Hong Kong has experienced a constant balance-of-trade deficit since the 1980s. As recent examples, the deficit was

Trade (expressed in billions of US$): Hong Kong

US$17.298 billion in 1997, US$7.833 billion in 1998, and US$3.158 billion in 1999.

Consumer goods and light manufactures are the major exports of Hong Kong. In order of importance, they include apparel and clothing, electrical machinery and apparatus, textile yarn and fabric, office machinery and data processing equipment, watches and clocks, telecommunications equipment, jewelry, printed matter, plastics, toys, games, and sports goods. The major re-exports consist of consumer goods, raw materials, metals (iron and steel), semi-manufactures, **capital goods**, foodstuffs, and fuels. Hong Kong's major imports include consumer goods, raw materials, semi-manufactures, capital goods, foodstuffs, and fuels.

Hong Kong has lost most of its manufacturing capability since reunification with mainland China. Its most important domestic export industries are garments, textiles, and clothing, which accounted for 49 percent of its 1999 domestic exports. The Hong Kong government has tried to diversify this sector by encouraging the high-tech industry, which has expanded over the last decade, but its share of domestic exports is still small. For example, telecommunications equipment accounted for 2.2 percent of the domestic exports in 1999, valued at US$486 million.

The major trading partners of Hong Kong are China, the United States, Japan, the United Kingdom, and Taiwan. Its main export destinations in 1999 were China (33.4 percent), the United States (23.8 percent), Japan (5.4 percent), and the UK (4.1 percent). In the same year, its main sources of import were China (43.6 percent), Japan (11.7 percent), Taiwan (7.2 percent), and the United States (7.1 percent). Because of re-exports, China has become the largest trading partner of Hong Kong.

MONEY

The government of Hong Kong pegged the Hong Kong dollar to the U.S. dollar in October 1983 at a **fixed exchange rate** of HK$7.8 against US$1, and has continued this relationship as of 2001. Meant to ensure the stability of the Hong Kong dollar, this policy has been implemented under the Linked Exchange Rate System. This system subjects any change in the size and flow of the money in circulation to a corresponding change in the foreign exchange reserves of Hong Kong. This occurs whether as a result of Hong Kong's domestic resources or as a result of an inflow of foreign capital. Accordingly, the 3 banks in charge of issuing bank notes can do so only if they deposit an equivalent amount of U.S. dollars in an exchange fund kept by the Hong Kong Monetary Authority (HKMA) for any amount of HK dollars that they want to issue. The equivalent amount of these foreign currencies is determined at the fixed exchange rate of HK$7.8/US$1. Apart from this official **exchange rate**, there is also a free-**floating exchange rate**. This exchange rate has remained around 7.7 since 1995. While the official exchange rate of the HK dollar against the U.S. dollar is fixed and determined by the HKMA, the exchange rate of the HK dollar against any other major currency follows the U.S. dollar exchange rate against that currency, which makes it a free-floating rate.

The HKMA maintains the stability of the HK dollar-U.S. dollar exchange rate through an automatic interest-rate adjustment mechanism. This requires the control of local **liquidity** and interest rates. Through this mechanism, Hong Kong has managed to have monetary stability and avoid high **inflation rates** and sharp fluctuations in the value of the national currency. This has made a major contribution to the stability and growth of its economy, which has not experienced long and sudden periods of economic declines with their destructive impacts on employment and prices. The Hong Kong monetary policy has also helped its economy cope better with the financial crisis of the late 1990s, which devastated many Asian economies. However, this policy has a negative side since it links the HK dollar to the U.S. dollar and leaves little room for independent monetary

policy of Hong Kong since it has to follow that of the United States.

Consistent with its status as a strong base for free enterprise, there is no official control on foreign currency exchange transactions in Hong Kong. Regardless of their size, there is no restriction on transfers to and from Hong Kong of funds in any currency, including the HK dollar.

The Stock Exchange of Hong Kong (SEHK) was established in 1986 as a result of the merger of 4 stock exchanges. Having a **market capitalization** of US$616.3 billion (June 2000), the SEHK is one of the world's major stock markets, and the second largest stock market in Asia after Japan.

POVERTY AND WEALTH

Hong Kong is a prosperous territory with a high **GDP per capita** (US$18,813 in 1998). However, the distribution of income is uneven and there is a wide gap between social groups in terms of wealth and income. Large parts of the economy are dominated by a small group of tycoons who are among the richest people in the world and whose wealth is increasing. At the same time, there is a growing number of unemployed with practically no chance for rejoining the workforce. They are the victims of the migration of manufacturing establishments to mainland China who are middle-aged and unskilled or whose skills are not in demand. The service sector has absorbed a large portion of manufacturing unemployed since the 1980s, but the continuation of this trend is unlikely, since the skills of the unemployed often do not match those of the available positions.

The role of the Hong Kong government in the economy is minimal, but it has an extensive role in providing essential services, including health care, education, and housing. The health-care system, which provides high-quality standard services, is accessible by the entire population. Government-run hospitals dominate the medical institutions and provided 85 percent of hospital beds in 1996, but there are also private medical clinics and hospitals. Government-provided health-care services are not free, but their fees are low, as these services are subsidized. Costs of medical services can be waived if patients cannot afford them. Government spending on the health-care system receives a large percentage of its total annual spending, increasing from 11.1 percent in 1989–90 to 14.3 percent in 1996–97. The government has considered reforming the health-care system since the cost has been increasing. If the current situation continues, this cost will absorb 21 to 23 percent of total government spending in 2016. Government spending on health-care services amounted to US$3.4 billion in 1998–99. Hong Kong's high life expectancy (78.6 years in 1998) ranks the territory fifth among the top developed economies after Japan (80 years), Canada (79.1), and Sweden and Switzerland (78.7 years). This rank puts it far ahead of China with its life expectancy of 70.1 years in 1998. In addition to the absence of widespread malnutrition and the availability of safe water and adequate sanitation, Hong Kong's impressive high life expectancy indicates the efficiency of its health-care system.

Hong Kong has a very good system for basic education, thanks to significant government spending. Total public funds spent on education were equal to 4.2 percent of GDP (US$4.6 billion) in 1998–99, an increase of about US$500 million from the previous year. About 92.9 percent of its population was literate in 1998. The government provides free and compulsory education for children between the ages of 6 and 15. Children over the age

of 14 who wish to continue their studies at the high-school level must pay for their education, but there are government subsidies for those who cannot afford it. In 1998, for example, the government subsidized the education of 84 percent of children of school age. Hong Kong's post-secondary educational system includes 7 universities, which offer degree programs to 18 percent of the 17–to–20 age group who wish to enter university programs. There were 65,800 university students in 1998, an increase of 11,800 from 1994.

Despite its merits, the education system has certain problems. Its inability to train people with the skills required for the economy is the main problem. This has resulted in a vacancy of thousands of jobs in the high-tech industry, for instance, while there is a large number of unemployed with skills irrelevant to the changing economy. Another significant problem is discrimination against the physically and mentally disabled in education, despite the existence of anti-discrimination laws. Finally, some primary schools operate 2 sessions a day at the expense of lowering educational standards.

WORKING CONDITIONS

Hong Kong has a large and growing labor force. Its numeric strength has increased steadily from 3,000,700 in 1995 to 3,476,600 in 1999, in spite of the 1997–98 financial crisis. Over the last 3 decades, Hong Kong's unemployment rate has usually been small. The average unemployment rate during from 1985 to 1997 was 3.5 percent, as the growing service sector could easily absorb many of those who had lost their manufacturing jobs. During the 2 years prior to the financial crisis, the unemployment rate declined from 3.2 percent in 1995 to 2.6 percent in 1996, and to 2.2 percent in 1997. The crisis and its aftermath pushed the rate up to 4.7 percent in 1998 and 6.2 percent in 1999 (equal to 217,100 people). The latter was a record high for Hong Kong. The rate fell to about 5 percent in 2000.

The overwhelming majority of Hong Kong's workforce is employed in urban economic establishments, due to the insignificance of agriculture. The workforce is a mixture of skilled and unskilled workers. The old and middle-aged manufacturing workers tend to be unskilled or low-skilled, whereas those employed with the growing service industries are more likely to be better educated and possess more advanced skills, including those related to high-tech and information technology. There was a shortage of skilled workers for the service sector as well as for the growing high-tech manufacturing sector in 2000.

In keeping with its emphasis on free enterprise, Hong Kong gives the market the authority to determine wages. Apart from a small number of professions with a uniform wage structure, wages are determined by supply and demand. Individual agreements between employees and employers set wages. Thus, there is no minimum wage except for foreign domestic workers, which was set at about US$500 per month in 1998. Employers of such workers are required by law to provide a decent standard of living for their employees, including housing and food, but the law is not widely observed. Two-income households are common in Hong Kong, although the average wage is usually adequate for most workers and their households. In addition to wages, some employers provide their employees with various kinds of allowances (e.g. free medical services and daycare centers), but employers are not obliged by law to do so. As part of the social safety net, employees are entitled to benefits such as pensions, disability insurance, and food assistance.

Hong Kong is a member of the International Labor Organization (ILO), and has laws and regulations on working conditions. These include laws on safety and health conditions at the workplace verified by government inspections. Workers' safety has improved over the last 2 decades, partly because of such inspections and partly because of the transfer of many high-risk manufacturing jobs to China. Nevertheless, there are still many serious safety problems.

Labor laws also include workers' rights, in accordance with international agreements. For example, the right of association is recognized, and trade unions are legal. There were 558 employee unions in 1998, but they represented only 22 percent of the 3.1 million salaried employees and wage earners. Unions are not strong and are unable to impose collective bargaining on management. Consequently, collective bargaining is not widely practiced as a means of settling labor disputes. Generally speaking, work stoppages and strikes are permitted, but there are some restrictions on civil servants' involvement in such activities. In practice, these activities could lead to loss of employment since most workers must include an article in their employment contracts that their refusal to work is a breach of their contracts. This gives the right to employers to dismiss workers involved in strikes or stoppages. There have not been major strikes or similar labor activities over the last 2 decades.

Hong Kong's labor laws also include provisions to ensure the rights of certain social groups and prevent their exploitation. In general, forced labor is prohibited. Employment of children under the age of 15 in industrial establishments is also prohibited. Nevertheless, children between 13 and 14 years of age with a minimum of 9 years of education can work in certain non-industrial establishments if their employers can ensure their safety, health, and welfare. These children are not allowed to work overtime and cannot work for more than 8 hours a day and 48 hours a week. With the exception of male

workers of 16 and 17 years of age, children are not allowed to work in dangerous trades. There is also an anti-discrimination law to protect women in the labor market. Women are well-represented in government and in the civil service (46 percent of senior civil servants are women), but they are not nearly as numerous in other prestigious areas. This includes the judiciary, where only 18 percent of senior employees (judicial officers and judges) are women. The physically and mentally disabled are discriminated against in employment and education in spite of the existence of anti-discriminatory laws.

COUNTRY HISTORY AND ECONOMIC DEVELOPMENT

1841. Hong Kong is seized by the British navy at the height of the first opium war (1839–42). The Chinese government is forced to accept Britain's sovereignty over the island by signing the Convention of Chuenpi.

1842. The British Royal Charter formally establishes Hong Kong as "a separate colony." The British government proclaims Hong Kong a free port, which encourages **immigration** from mainland China to Hong Kong. The United States government establishes the first foreign consulate in the colony.

1844. To control the Chinese population, the Hong Kong Legislative Council (Legco) passes a restrictive law which leads to a general strike, the return of many workers to China, and the paralysis of businesses. The Legco amends the law to restore normalcy.

1856. The Second Opium War (1856–58) begins. The Chinese workers of Hong Kong go on a strike and boycott British businesses.

1860. Britain expands its holdings in China by occupying Kowloon and Stonecutters Island. The Treaty of Beijing legalizes the occupation by leasing these lands to Britain in perpetuity.

1860s. Hong Kong's population grows significantly as a result of migration from mainland China. Its economy begins to flourish. Hong Kong's infrastructure emerges, including telegraph systems, street gas lighting, and secular schools.

1898. In the aftermath of the Sino-Japanese war (1894–95), the British government forces the weakened Chinese government to cede to Britain the New Territories and 235 islands in the proximity of Hong Kong on a 99-year lease to expire in June 1997.

1911. The Wuhan Uprising in Canton overthrows the Chinese Empire and makes its leader, Dr. Sun Yat-sen, the first president of China.

1920. Around 9,000 Hong Kong mechanics go on strike and leave for Canton. The subsequent paralysis of commerce leads to a wage increase and the settlement of the labor dispute.

1921. The Hong Kong government has to accept a wage increase for seamen similar to the one given to the mechanics in 1922 to end a general workers' strike.

1926. In October, the long general strike of Hong Kong's workers, in which 30 percent of the workforce participates, ends when the British Foreign Office agrees to change some of its unequal economic treaties with China.

1937. The Sino-Japanese War begins. The Japanese navy lands at Bias Bay in the New Territories.

1939. Japanese military forces occupy Hong Kong's Hainan Island.

1941. On 8 December, Japan invades Hong Kong. Governor Young accepts defeat and surrenders to the Japanese commander on 25 December.

1949. The Chinese Communist Party wins the civil war in China and declares the establishment of the People's Republic of China (PRC) on 1 October.

1950s. Hong Kong's population increases to 2.5 million as a result of the flight of hundreds of thousands of refugees from mainland China.

1961. Hong Kong's population increases to 3.1 million.

1970. Hong Kong's population grows to 4 million.

1979. As part of improving ties between China and Britain, China invites Hong Kong governor MacLehose for an official visit to discuss certain issues, especially the expiration of the New Territories lease in 1997.

1980. Hong Kong's population increases to 5.2 million. Hong Kong governor MacLehose announces the "Touch Base" policy to stop illegal immigration from China, which provides for the return of illegal immigrants to China.

1982. In September, British prime minister Margaret Thatcher visits Beijing to begin negotiations about the future status of Hong Kong.

1983. In July, the first official round of Sino-British talks over the future status of Hong Kong begins. In October, the Hong Kong dollar is pegged to the U.S. dollar at a rate of HK7.8 against US$1.

1984. The British and Chinese governments sign the Sino-British Joint Declaration regarding the peaceful hand-over of Hong Kong to China on 1 July 1997.

1985. In September, the Hong Kong government holds the first elections for Hong Kong's legislative body, the Legco.

1990. China's National People's Congress passes the Basic Law to serve as its mini-constitution based on the principle of "one country, two systems."

1991. In June, the Bill of Rights of Hong Kong is enacted with the power to override all other laws.

1994. Hong Kong holds its first fully democratic elections, and pro-democracy parties win a majority in the Legco. Selecting from among Hong Kong nationals, China appoints a 150-strong Preparatory Committee to lead Hong Kong's transfer to China. Over half of the committee are from Hong Kong's business elite.

1996. In December, China selects a Hong Kong tycoon, Tung Chee-hwa, to be Hong Kong's first chief executive after the 1997 hand-over.

1997. On 1 July, the British government returns Hong Kong to China, which is renamed as the Hong Kong Special Administrative Region (SAR) of the People's Republic of China. Its Basic Law guarantees legal, judicial, and legislative systems independent from those of China and full economic autonomy.

1998. Hong Kong signs a treaty with China to eliminate double taxation of their respective businesses operating in each other's territory. In May, a Legco is formed by elections, which replaces the Provisional Legislative Council (PLC).

2000. In September, a new Legco is formed by elections.

FUTURE TRENDS

Hong Kong has a very strong economic base, which has enabled it to tolerate periods of economic hardship. Its economic strength helped it survive the severe financial crisis of the late 1990s with minor damage, compared to the extensive devastation of many Asian economies. This strong economic base will help Hong Kong to regain its losses and expand its economy to play a more significant role in global markets. Hong Kong's access to China will make a large contribution to the expansion of its economy and will elevate its international status. The migration of the manufacturing industry to mainland China has weakened the local industrial base and created unemployment, but it has also opened a very promising economic opportunity for Hong Kong. China's abundance of land and raw materials and its low cost of labor have addressed the major limitations of the Hong Kong manufacturing sector. These limitations have prevented it from growing in light and consumer industries and from establishing labor- and land-intensive industries, including heavy industry. Mainland China has thus offered to Hong Kong an opportunity for industrial growth and expansion of exports of manufactures. It has also offered its huge 1.3-billion strong market, the world's largest, for investment and exports. This has put the Hong Kong economy well ahead of many other developed economies, which have been trying to gain extensive access to China. Hong Kong's manufacturing will surely expand, and its role in its economy will become more prominent, but the service sector will remain the largest and most dominant sector and the engine of growth. This is partly because of the strength and the phenomenal size of that sector, which have enabled it to grow and will ensure its continuity. It is also partly because of its crucial role in the re-export of goods produced in China, including their packaging, shipping, handling, and marketing, as well as financing their production.

Hong Kong's high-tech and IT industries have a great potential for growth. The territory's private sector has taken steps towards that end while its government has encouraged private initiatives. The high-tech and IT industries should have a stronger presence in international markets over the next few years, even though they face a challenge from the more developed industries of Taiwan, Singapore, and South Korea.

The service industry has absorbed most of the unemployed workers of the manufacturing sectors, but it has been unable to find jobs for a growing number of them. Given the continued migration of manufacturing industries to mainland China, the number of these unskilled or low-skilled middle-aged unemployed workers will continue to grow. Unless the Hong Kong government or the service sector retrains them to find jobs in emergent industries, most of them will become permanently unemployed. Their frustration will likely contribute to social and political disorder in Hong Kong, which has not experienced such phenomena in its contemporary history.

DEPENDENCIES

Hong Kong has no territories or colonies.

INDIA

Republic of India
Bharat Ganarajya

CAPITAL: New Delhi.

MONETARY UNIT: Rupee (Rs). Rs1 equals 100 paise. Coins are in denominations of Rs1, 2, and 5, and 10, 25, and 50 paise. Paper currency is in denominations of Rs5, 10, 20, and 50.

CHIEF EXPORTS: Clothing, engineering goods, chemicals, leather products, gems and jewelry, cotton fiber, yarn, fabrics.

CHIEF IMPORTS: Chief imports of India are crude oil and petroleum products, machinery, gems, fertilizer, chemicals.

GROSS DOMESTIC PRODUCT: US$497 billion (2001 est. of real GDP at market exchange rates). [The CIA *World Factbook* estimated the GDP at PPP to be US$2.2 trillion in 2000.]

BALANCE OF TRADE: **Exports:** US$46.0 billion (2001 est.). **Imports:** US$54.9 billion (2001 est.). [The CIA *World Factbook* estimated exports at US$43.1 billion in 2000 (f.o.b.) and imports at US$60.8 billion (f.o.b.).]

COUNTRY OVERVIEW

LOCATION AND SIZE. India is located in the south of the Asian continent, bordering the Arabian Sea and the Bay of Bengal. The country is slightly more than one-third the size of the United States. The country's territory is measured at nearly 3.3 million square kilometers (1.3 million square miles) extending from the snow-capped Himalayan Mountains in the north to tropical forests in the south. India shares more than 14,000 kilometers (8,800 miles) of borders with 7 neighboring countries. To the northwest are Afghanistan and Pakistan; to the north are China, Bhutan, and Nepal; and to the east are Burma (also known as Myanmar) and Bangladesh. A narrow channel of sea formed by the Palk Strait and the Gulf of Mannar separates another neighbor, Sri Lanka, an island nation with which southeast India shares strong cultural ties. The Indian mainland consists of 4 regions, namely the Himalayan Mountains, the plains of the Ganges and the Indus, and the southern desert. The Himalayas, which contains the highest peaks in the world, consists of 3 almost parallel ranges dotted with large plateaus and valleys, some of which, like Kashmir and Kullu valleys, are vast, fertile, and of great natural beauty. The plains of the Ganges and the Indus, about 2,400 kilometers (1500 miles) long and on average about 280 kilometers (175 miles) wide, are formed by the basins of 3 river systems of the Indus, the Ganges and the Brahmaputra Rivers. These fertile basins are among the most densely populated areas in the world. India is composed of 25 states and 7 union territories. The top 5 most populated states are Uttar Pradesh (140 million people), Bihar (86 million), Maharashtra (79 million), West Bengal (68 million), and Andhra Pradesh (67 million). The top 3 most populated union territories are New Delhi (10 million), Pondichery (800,000), and Chandigarh (650,000).

POPULATION. The population of India is estimated to have passed the 1 billion mark in May 2000 (1,014,000,000; July 2000 estimate). For centuries, India has been a land of startling contrasts. Maharajahs and millionaires, snake charmers and poor farmers, beauty queens and burnt brides, and a population explosion juxtaposed with high child and maternal mortality. The billionth citizen of this ancient land entered a country with 40 political parties and 24 official languages, each spoken by at least a million people. A cultural preference for male children (who are thought to bring prosperity to a household) has resulted in a significant gender disparity with 927 females to every 1,000 males. The 2 relatively prosperous northern states of Haryana and Punjab have the largest gender disparities. Only Kerala—the **socialist**-run state—has a gender balance of 1 to 1. Feticide (the killing of a fetus), infanticide (the killing of an infant) or, later in life, forced suicide are still the lot of some Indian girls and young women. Though India was

among the first countries to adopt population-control policies, those efforts have largely failed. The population continues to grow at the rate of 1.8 percent per year, and by 2025 India will likely overtake China as the world's most populated country, with a projected population of 1.42 billion. A newly established National Population Policy may lead to a reduction in the rate of population growth and to a stabilized population of slightly more than 1.5 billion by 2045. The immediate aims of the policy are to address the unmet needs of the health-care **infrastructure**, including the family-planning services, and to integrate delivery of basic reproductive and child health care. Special emphasis will be put in containing population growth in the states of Bihar, Madhya

Pradesh, Orissa, Rajasthan, and Uttar Pradesh, which currently constitute about 45 percent of the total population of India.

CASTE SYSTEM. The caste system (a centuries-old traditionally rigid social hierarchy which allows little social mobility), though not officially sanctioned today, continues to divide Indian society. The caste system has a historical basis in the economic organization of Indian society, with different peoples or castes allocated to various occupations. Many Hindus believe that people are born into a particular social status based on their experiences in past lives and that good deeds can help a person scale the rungs of caste, allowing movement up to a higher caste upon reincarnation in the next life. The caste system continues to be a strong force, especially in rural India. In many Indian villages, for example, one's caste influences what food one cooks or what sari one wears (the garment worn primarily by women in southern Asia made up of several yards of lightweight cloth). The *dalits* or "untouchables" are people of traditionally poor households who may be peasants, laborers, or servants (and their ancestors as well). Up to this day, many *dalits* are forced into menial and undesired occupations, such as cleaning restrooms, sweeping streets, and disposing of the dead—all considered "unclean" by orthodox Hindus. In the urban areas, the caste system is less obvious, though it is still defended by many as a way to uphold social order. In recent years, the government has taken serious measures to stamp out such age-old discriminatory practices. It has, for example, enacted affirmative action measures that recognize that some groups in society, such as the *dalits,* have been left far behind and have suffered on account of the practice and custom of caste differentiation.

OVERVIEW OF ECONOMY

India's economy encompasses a wide range of activities, anywhere from traditional village farming to the production of modern military hardware such as tanks. A full two-thirds (67 percent) of India's **labor force** of more than 450 million people is employed in agriculture, which accounts for about 23 percent of the country's **gross domestic product** (GDP). Another 26 percent of the GDP is accounted for by industry and 47 percent by services. The CIA *World Factbook* estimated the division of the GDP to be slightly different, indicating agriculture at 25 percent, industry at 24 percent, and services at 51 percent in 2000. Although India's human development indicators are among the worst in the world, the country has also a large number of highly qualified professionals, as well as several internationally established industrial groups. Reforms since 1991 in production, trade, and investment have provided new jobs and opportunities for Indian businesspersons. An estimated 300 million consumers are considered to be middle class. In past decades, India attempted to develop its industry as part of an effort to attain self-sufficiency, and as a result, the economy had remained closed to foreign investors. Recent liberal reforms, however, have opened some sectors to interested foreign investors. Currently, cars, motor scooters, electronic goods, and computers are manufactured by foreign firms and **joint ventures**.

During the 6-year period from 1996 to 2001, services have had the highest growth rate among the various sectors of the economy with an average of 8 percent growth rate per year, while the overall economy during the same period grew by an average rate of 6 percent per year. Despite the impressive economic performance of the past few years, however, several factors have hindered an even more impressive performance. The repercussion of the 1997 Asian financial crisis, the falling of world commodity prices, and the effects of **sanctions** after India conducted its first nuclear weapons tests in the late 1990s have all dampened further increases in the GDP. Other factors negatively affecting the GDP are the still slow process of market **liberalization**, limited access to investment capital, and reduced demand for manufactured goods. Infrastructure weaknesses such as poor transportation networks and erratic and insufficient power supplies have also limited increased growth and investment. Furthermore, for the past 2 decades, India's economy has been facing continuous problems of national **budget deficits**, much of it as a result of **subsidies** to inefficient state-owned industries. The majority of these state sector enterprises are debt-ridden and overstaffed.

There has, nevertheless, been a slow but steady trend in favor of market liberalization. As a result of the government's efforts and its membership obligations in the World Trade Organization (WTO), sectors of the economy such as power, steel, oil refining and exploration, road construction, air transport, telecommunications, ports, mining, pharmaceuticals, and banking have to a variety of degrees been liberalized. Since 1991, the **exchange-rate regime** has also been liberalized. This initially led to a 22 percent **devaluation** of the Indian rupee against the U.S. dollar. Furthermore, the leading political party, the Bharatiya Janata Party (BJP), has promoted the **restructuring** of state industry in favor of foreign and domestic competition. Despite these reforms, however, India's economy is still mostly closed. Foreign firms, due to historically disappointing experiences with India's bureaucracy and high taxes and **tariffs**, have been relatively reluctant to invest in the country. On the whole, there remains strong resistance to further market liberalization and globalization (increasing integration of the national economy and culture with the rest of the world, especially Western Europe and the United States) on the part of much of the population, such as the followers of the Hindu nationalist movement. Yet the fundamentals

of the economy, including the savings rate (household savings is estimated at 19 percent of income), national reserves (about US$24 billion in 1997), **inflation rate**, and **foreign debt** (about US$94 billion in 2001) are considered to be healthy and improving.

POLITICS, GOVERNMENT, AND TAXATION

India is considered by many to be the largest democracy in the world. Inspired by Mahatma Gandhi and his Satyagraha (a unique non-violent campaign), India declared independence from British rule on 15 August 1947. Free India's first prime minister, Pandit Jawaharlal Nehru who founded the Indian National Congress, described the moment as a "tryst with destiny." Since independence, India has developed as a multiparty democracy. The Indian National Congress that led India to independence in 1947 was the largest party, governing in coalition with minor centrist parties. It was later known as the Congress Party and ruled the nation until the 1990s—to some extent through the use of corruption and intimidation. Over the years, a number of parties were formed, and the major opposition to the Congress Party comes from the BJP, which among its followers has some strong Hindu nationalists, who believe that India should not be a multi-ethnic state.

India has a federal system with 25 states and various territories. The constitution separates the powers of the government into 3 branches: legislative, executive, and judicial. The relationship between the legislative and executive branches follows the parliamentary model of Great Britain. The initiative and responsibility for executive leadership rests with the office of the prime minister, not with the president. Neither of these offices is gained by direct popular vote, however. The president is the head of state for a 5-year term and is elected by an electoral college composed of members of parliament and state legislatures. The president's role is so limited by the constitution that he or she has rare opportunities to determine national policy. The president can, however, upon the advice of the prime minister, declare a state of emergency and suspend both national and state governments, an executive tool that has been used far more frequently than the framers of India's constitution envisioned. In general, the president serves as more of a symbolic head of state. The prime minister has the primary responsibility to lead the country and is officially invited by the president to form a government and lead it. In order to remain in power, the prime minister must enjoy the support of a majority of the 545-member Lok Sabha (People's House). The president normally looks first to the leadership of the majority party to nominate its candidate for prime minister. Legislative power is vested in the **bicameral** (2-chamber) parliament, which consists of a 245-member of Rajya Sabha (Council of States) and the Lok Sabha. The majority of the members of the Rajya Sabha are chosen by the state legislatures; the president selects the remainder. The members of the Lok Sabha are directly elected and serve for 5 years. According to the constitution, a new election must be held at least every 5 years. If none is called before that time, parliament is automatically dissolved. India has an independent judiciary, which is headed by a Supreme Court, the highest court in the land. The president appoints its chief justice and justices. The Supreme Court acts as the court of final appeal.

The Union (federal) government of India is responsible for developing and implementing various domestic and foreign policies and sets its economic policies in consultation with representatives of the states and various other representative bodies of businesses, farmers, and labor.

The government generates most of its revenues from taxes. For the **fiscal year** ending 31 March 2000, the total revenue generated through taxes for the central government came to about Rs3.28 trillion (US$73 billion). The main sources of Union tax revenues are customs **duties**, **excise taxes**, corporate taxes, and **income taxes**. Non-tax revenues largely comprise interest receipts, including interest paid by the railways and telecommunications, dividends and profits. The main sources of revenue for state governments are also taxes and duties, in addition to grants received from the central government. Property taxes are the mainstay of local finance. In recent years, tax rates imposed by the government have been cut. The current peak income tax rate of 30 percent and corporate tax rate of 35 percent, for example, are low compared to most industrial countries. Furthermore, the peak customs duty rate has been cut to 35 percent with a promise to move towards the East Asian average rate of 20 percent.

INFRASTRUCTURE, POWER, AND COMMUNICATIONS

INFRASTRUCTURE. Infrastructure covers a wide spectrum in India and includes transportation, power generation and distribution, telecommunications, postal facilities, and urban infrastructure. Historically, the responsibility for providing infrastructure services has been vested with the Indian government. This has been due to a number of reasons including high capital requirements, long gestation periods, high financial risks, and low rates of return. Fiscal shortages and technological innovations have challenged the old paradigm of a government **monopoly** in infrastructure development. Some amount of private involvement in the maintenance and formation of infrastructure, therefore, has been taking place.

Transportation in India includes roads, railways, aviation, and coastal shipping. The road network of India totals 2.7 million kilometers (1.3 million miles), making it one of the largest national networks in the world. Only 40 percent of the road system is paved, however. Nearly 63,000 kilometers (39,000 miles) of railroads are in operation in India, transporting millions of passengers and millions of tons of freight daily. Nearly 13,000 kilometers (8,000 miles) of Indian railroads function by electricity. Coastal shipping is an energy efficient and comparatively cheaper means of transportation, especially for bulk cargo. The country has the largest merchant shipping fleet among the developing countries. India has 14,500 kilometers (9,000 miles) of navigable waterways, which includes rivers, canals, backwaters, and creeks. Only about one-quarter of those waterways are navigable by large vessels, however. There are 11 major ports and 139 minor ports along the Indian coastline. The civil aviation sector is comprised of both private and public lines. Air India, Indian Airlines, Alliance Air (a subsidiary of Indian Airlines), and various private air taxis provide domestic and international air services. There are 343 airports, with two-thirds having paved runways.

POWER. With respect to energy, India is a net importer. Among other fuels, it imports nearly US$8 billion worth of petroleum annually. Though India constitutes nearly 17 percent of the world population, it consumes only about 3 percent of the world's total energy, or 12.2 quadrillion BTUs (British Thermal Units, a common means of expressing energy as the production of heat) per year. On a per capita basis (12 million BTUs), Indians consume more than 5 times less energy per year than the average world citizen (65 million BTUs) and 28 times less than the average American (352 million BTUs). With increasing economic development, however, these figures are likely to rise significantly in the near future. Some 75 percent of India's electricity comes from thermal power plants, which use coal or atomic energy to boil water and in turn produce electricity. India has large domestic coal reserves and is the third largest coal-producing country in the world, behind China and the United States. More than half (55 percent) of all energy consumption in India is produced by coal. Another third (31 percent) of energy needs is met by petroleum, and 7 percent by natural gas (the country consumes about 8 billion cubic feet per year). Some 4 percent of energy needs are met by renewable and traditional fuels (wood, for instance), 3 percent by hydropower, and a mere 1 percent by atomic power (India operates 14 atomic reactors with a combined annual generating capacity of about 2,700 megawatts). The consumption of natural gas is expected to more than triple by 2010, reaching 2.7 trillion cubic feet per year. Despite increased reliance on natural gas, coal will continue to be the dominant fuel for power generation in India. The country's consumption of nearly 350 million tons in 1999 will likely increase by more than 40 percent by 2010, reaching just short of half a billion tons. Proven coal reserves are estimated to be more than 80 billion tons. Much of India's coal reserves, however, are not anthracite (which is clean-burning coal), forcing the government to import some anthracite coal from Australia and New Zealand, much of it for use in the steel industry.

Various government agencies oversee energy policy in India, including the Ministry of Petroleum and Natural Gas, the Ministry of Coal, the Ministry of Non-conventional Energy Sources, and the Ministry of Power. The Directorate General of Hydrocarbons (DGH) was set up in 1993 to oversee petroleum exploration programs, develop plans for the state-owned oil enterprises and private companies, and oversee efficient utilization of gas fields. Continued economic development and population growth are driving energy demand faster than India's capacity for energy supply. Electricity in India reaches about 80 percent of the country. The country faces an electricity shortage conservatively estimated at 11 percent and as high as 18 percent during peak demand. As a result, electricity blackouts are common. Furthermore, industry cites power supply as 1 of the biggest limitations on progress. One estimate projects 8 to 10

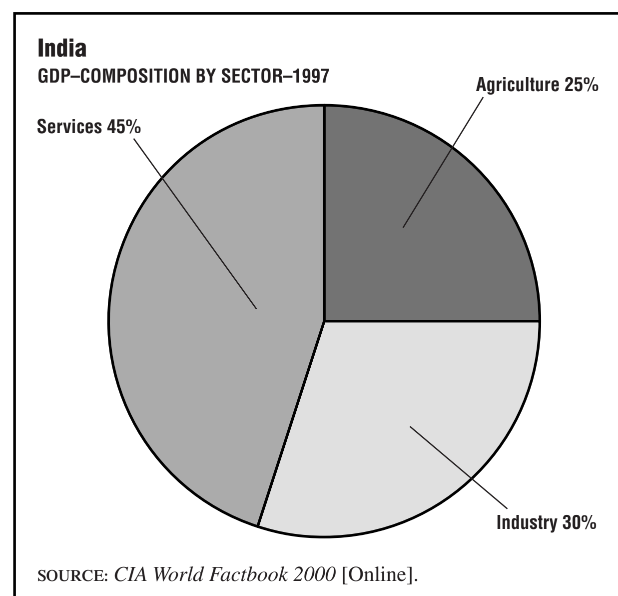
percent annual growth in energy demand over the next 15 years. Most of this energy will probably be imported via ship and pipeline. Oil consumption, for example, may increase by 60 percent by 2010, climbing to approximately 3.1 million barrels per day (b/d). Currently, as little as 750,000 b/d of oil is produced domestically, the majority of which is from the Bombay High, Upper Assam, Cambay, Krishna-Godavari, and Cauvery basins. The Bombay High Field is India's largest producing field, generating an average of about 230,000 b/d. The potential for discoveries of offshore oil reserves, particularly in deep water, is high. So far, exploration has taken place in only one-quarter of India's 26 sedimentary basins. India's offshore basins cover approximately 380,000 square kilometers (147,000 square miles). India's off- and onshore basins are estimated to contain as much as 30 billion tons of hydrocarbon reserves. To satisfy the growth in energy consumption, the country is also increasing its nuclear power capability via the construction of new reactors. Although India is trying to encourage greater foreign participation in its atomic power program, its failure to sign the Comprehensive Test Ban Treaty (CTBT, an international treaty that prohibits signatories from testing nuclear weapons) has inhibited investment and technical support from Western firms. Russia has taken advantage of this scenario and has been awarded permission to construct two 1,000 megawatt (MW) reactors at Kudankulam in southern India scheduled to begin service in 2006 and 2008. India would like to increase its atomic power capability by 2.7 times to 7,300 MW by 2007.

The country also has vast hydroelectric potential. Estimates place India's hydroelectric potential at 86,000 MW, a mere one-quarter of which is being utilized. India plans to build the world's largest hydroelectric plant on the Brahmaputra River. The dam is expected to have a capacity of 21,000 MW and cost US$23 billion and be operational by 2012. Furthermore, special attention is being paid to alternative energy sources such as wind, solar photo-voltaic (PV) technologies, and biomass. India has abundant wind resources, ranking fifth in the world in the number of wind power installations; wind power installed capacity as of June 2000 was 1,175 MW. The Ministry of Non-Conventional Energy Sources has identified 192 potential sites for wind stations with a total estimated potential of 20,000 MW. The ministry also estimates India's energy potential from biomass at nearly 20,000 MW, 3,500 MW being from co-generation plants using bagasse (a fibrous plant residue left over after the extraction of juice from sugarcane) from sugar mills. Plans are also in the works to create a national electricity grid, which would provide for easy power sharing among regions and even neighboring countries. An impediment to the construction of large power plants has been scrutiny by public interest groups, which have rightly cited the potential damage to the environment caused by large hydroelectric dams.

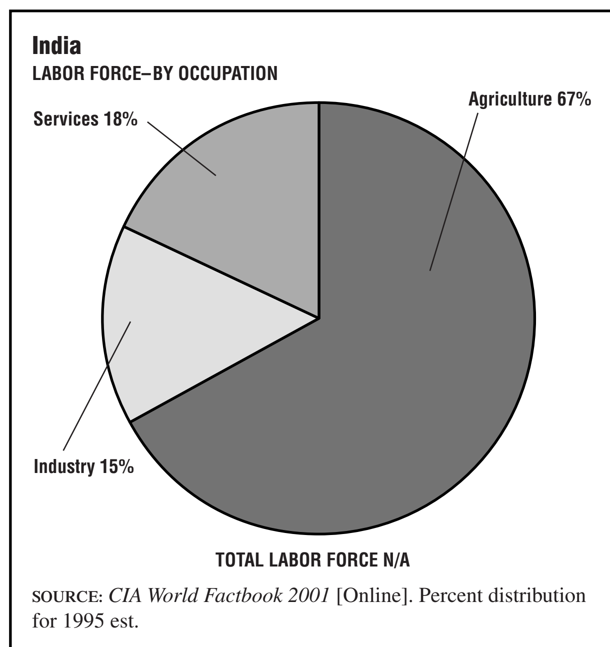
COMMUNICATIONS. India has probably the least adequate telephone system among industrializing countries. In 1996, for instance, it had only 12 million telephones. The equivalent of 3 out of every 4 villages have no telephone service and only 5 percent of Indian villages have long-distance service. Poor telephone service significantly impedes India's commercial and industrial growth and penalizes the country in global markets. Recently, several satellite earth stations (including 8 Intelsat and 1 Inmarsat) and submarine cables to Malaysia and the United Arab Emirates (UAE) were put into service for long-distance communications.

ECONOMIC SECTORS

The Indian economy presents a mixture of the traditional and modern. Prior to 1947, the major sectors were agriculture, forestry, fishing, and textile manufacturing. Currently, village farming, state agriculture, energy, manufacturing, mining, services, and a flourishing information technology are the chief economic sectors of India. Though agriculture employs the most people (186 million), the service sector, with a labor force of 57 million, contributes the most to the country's income, accounting for nearly half of India's GDP. Industry and manufacturing expanded rapidly during the 1990s, and information technology is a sector with very high expectations. The information technology sub-sector of software experienced 70 percent growth in 1999. The CIA *World Factbook* estimated that agriculture accounted for 25 per-



SOURCE: *CIA World Factbook 2000* [Online].



SOURCE: *CIA World Factbook 2001* [Online]. Percent distribution for 1995 est.

cent, industry for 24 percent, and services for 51 percent of GDP in 2000.

The Indian economy is currently at a difficult stage. Despite the initiatives taken by the government in deepening structural reforms and accelerating the **privatization** process, some problems of growth will likely be faced in the near future. Because of irregular rainfall for the second successive year, for example, agricultural growth was low or absent in 2000. Industrial growth also slowed, and despite some efforts to open the economy to private and foreign businesses, the sentiment for new investment has not improved. The persistence of high international oil prices and the slowdown of the global economy have compounded the problem. Although the major industries of Gujarat have fortunately escaped the worst effects of the recent massive earthquake, the impact of dislocations on the various sectors of the economy cannot be ignored.

AGRICULTURE

India's agriculture is composed of many crops, with the foremost food staples being rice and wheat. Indian farmers also grow pulses, potatoes, sugarcane, oilseeds, and such non-food items as cotton, tea, coffee, rubber, and jute (a glossy fiber used to make burlap and twine). India is a fisheries giant as well. A total catch of about 3 million metric tons annually ranks India among the world's top 10 fishing nations. Despite the overwhelming size of the agricultural sector, however, yields per hectare of crops in India are generally low compared to international standards. Improper water management is another problem affecting India's agriculture. At a time of increasing water shortages and environmental crises, for example, the rice crop in India is allocated disproportionately high amounts of water. One result of the inefficient use of water is that water tables in regions of rice cultivation, such as Punjab, are on the rise, while soil fertility is on the decline. Aggravating the agricultural situation is an ongoing Asian drought and inclement weather. Although during 2000–01 a monsoon with average rainfall had been expected, prospects of agricultural production during that period were not considered bright. This has partially been due to relatively unfavorable distribution of rainfall, leading to floods in certain parts of the country and droughts in some others.

Despite the fact that agriculture accounts for as much as a quarter of the Indian economy and employs an estimated 60 percent of the labor force, it is considered highly inefficient, wasteful, and incapable of solving the hunger and malnutrition problems. Despite progress in this area, these problems have continued to frustrate India for decades. It is estimated that as much as one-fifth of the total agricultural output is lost due to inefficiencies in harvesting, transport, and storage of government-subsidized crops.

INDUSTRY

India's policy of economic self-reliance after independence led to a surge in industrial activity, although much of it was inefficient. Indian industry currently, which includes the sectors of manufacturing, textiles, chemicals, food processing, construction, mining, energy, and IT, contributes about 30 percent of the country's GDP and employs 18 percent of the whole labor force. Among the Indian industry's successes are electronics and software manufacturing. Software engineering has been growing by around 50 percent per year, with as much as 80 percent of software production being exported, earning an estimated US$4 billion in 2000 out of a total export earnings of US$37.5 billion.

MANUFACTURING. According to the Central Statistical Organization of India, the manufacturing sector was expected to grow by 6.4 percent in 2001, slightly down from the 6.8 percent growth a year earlier. A combination of higher oil prices, a weak national currency, and an easing of import restrictions—in compliance with India's membership in the WTO—is thought to be having some initially negative effects on domestic manufacturing.

ENERGY. Indian consumption of natural gas grew from 17 billion cubic meters in 1995 to 34 billion cubic meters in 2000 and is projected to reach nearly 85 billion cubic meters in 2020. This is one of the fastest-ever increases in fuel demand by Indian customers. Most of the increase is due to a projected increase in the demand for

natural gas for power generation. Almost 70 percent of India's limited natural gas reserves are found in the Bombay High basin and the state of Gujarat. The Indian government has been avidly encouraging the construction of gas-fired electric power plants, especially in coastal regions where they can be easily supplied with liquefied natural gas (LNG) by sea. Given that domestic gas supply is not likely to keep pace with demand, India will have to import most of its gas requirements, either via pipeline or LNG tankers, making it potentially one of the world's largest gas importers. The dominant commercial fuel in India, however, continues to be coal. Coal accounts for more than half of India's energy demand, and 70 percent of coal consumption is used for power generation. Coal consumption is projected to increase to 465 million short tons in 2010, a 26 percent increase from 1998. India's coal industry is the world's third largest, and most of the country's coal demand is satisfied by domestic supplies.

MINING. The mining industry has grown substantially since independence, with the value of minerals mined exceeding US$10 billion today. Still, mining accounts for only about 2 percent of India's GDP. India has been extracting a range of minerals. Among others, it produces significant amounts of coal, iron ore, bauxite, copper, gold, diamonds, limestone, and chromite. India has among the world's largest reserves of iron ore (more than 19 billion tons) and is one of the world's lowest-cost sources. Most of India's iron ore—the largest being in the privately owned mines in the state of Goa—is exported to South Korea and Japan. India's bauxite reserve is approximately 2.7 billion tons or 8 percent of the world total. Given this, and bauxite's critical role in the production of aluminum, India has tentative plans to expand its aluminum production. Copper reserves are estimated at more than 410 million tons, yet India has been importing copper as well. Reserves of lead and zinc are estimated at 360 million tons. Foreign investors have shown interest in mining gold in partnership with the government at a mine in Kolar. The main mining industry remains, however, the production of steaming coal for power generation.

SERVICES

Services play a significant role in the economy of India, accounting for nearly 40 percent of the GDP or about US$200 billion per year. Services include the sectors of telecommunications, airlines, banking, construction, and small-scale enterprises. Some components of the services sector are also in the **public sector**.

FINANCIAL SERVICES. Although some form of banking, mainly of the money-lending type, has been in existence in India for thousands of years, it was only a little over a century ago that Western-style banking was introduced to the country. Indian households account for nearly 90 percent of the national savings. Whereas in 1980, as little as 10 percent of all savings of Indian households were held in financial form (as in bank deposits, shares, and insurance policies) rather than physical form (as in money under mattresses). As of 2001, that figure has surpassed 50 percent. In addition, although the percentage of people who own company shares or have invested in mutual funds is still low as compared to more affluent and Western countries, those numbers are also on the rise. Government banks still play an important role and own more than four-fifths of the banking business. However, private (especially foreign) banks are gradually taking up an increasing share of the financial market. There are an estimated US$400 billion worth of private savings in India, some 44 percent of which is in bank deposits, another 5 percent in mutual funds, and less than 25 percent in postal savings and pension funds. Despite considerable openness in the Indian economy, increasing liberalization of the financial sector is hindered by that fact that nearly 30 percent of assets are considered to be non-performing. This is due to an excessive number of loans having been extended to businesses and individuals through political pressure rather than economic merit. As a result, the rate of bankruptcy of financial institutions has been high, which in turn has forced interest rates to be high as well. As a result of these and other factors, Indian industry's access to proper credit has been limited.

Market liberalization in India has led to the sale of shares of private and some public companies to domestic and international bidders. Currently, there are more than 6,000 companies listed on India's largest stock market, the Bombay Stock Exchange, but only about 8 percent of them are actively traded. The stock market has attracted a good amount of international institutional **equity** investment, such as foreign pension schemes and mutual funds. However, the Indian stock market, not unlike others worldwide, has had periods of intense volatility. In 2000, for example, **market capitalization** fell by 62 percent in 6 months, from US$265 billion in February to US$100 billion in August.

TOURISM. Due to its wealth of cultural and recreational facilities, India has had a large tourism industry. Tourism is India's fourth largest foreign currency earner. The top states for tourist attractions are Kerala, Delhi, and Assam. The state of Kashmir used to have a thriving tourism industry; however, the number of tourists has sharply declined due to political unrest and extremist activities over the border dispute with Pakistan. Overall, India's tourism in the past decade has been growing at an average rate of about 7 percent yearly. With about 2.25 million people per year, India's international visitors constitute less than 0.5 percent of world's total number of international

tourists. (Top world tourism countries such as France and Spain receive as many as 50 million visitors and generate tens of billions of dollars from tourism annually.) The income generated from tourism in India is estimated to be a mere 1 percent of total world spending of international tourists or US$3 billion per year. Indeed, more Indians travel abroad (3 million per year) than tourists visit India. India's tourism industry is hampered by an international perception of India as being very poor, politically unstable, and requiring precautions against epidemic diseases, despite the attractions of its beautiful historic sites, rich and varied cultures, and appetizing cuisine. The Taj Mahal, for instance, is regarded as one of the architectural marvels of the world. The country also attracts backpackers and adventurers who come for the local festivals, to ride on India's famous railroads, or to see the holy Ganges River.

INTERNATIONAL TRADE

For decades after independence in 1947, India embarked on a program of autarky (national economic self-sufficiency) which included **import substitution** policies. By 1991, however, a sluggish economy combined with the forces of globalization led to a more open Indian economy. There was simultaneously a gradual rise in exports, imports, **foreign direct investment** (FDI), and overall economic growth. In the 1990s, exports of goods and services rose from 6.2 percent to 8.2 percent of total output. By the end of the decade, however, growth in exports began to level off due to reduced international demand, especially with India's main economic partners, the United States and the European Union (EU). Indian exports were further hit by serious competition from east Asian countries, which had recently experienced depreciated domestic currencies, which led to a decline in global prices for their manufactured goods. As a result, exports of Indian textiles, chemicals, machinery, electronic goods, and automotive parts all began to decline.

As compared to a couple of decades earlier, however, the size of India's foreign trade has noticeably expanded, both in absolute terms and relative to the country's GDP. Exports have again picked up since 1999, when they showed a 13 percent growth. Imports have also ballooned, showing an average of 20 percent growth per year during 1992–2000. Total exports in 2001 are expected to be near US$46 billion and total imports at US$51 billion. Petroleum constitutes the largest import item at more than US$6 billion and accounts for 14 percent of total imports in 1999. Petroleum imports may be as high as US$17 billion in 2001. Gems and jewelry constitute the single largest export item, accounting for 16 percent of exports and earning about US$4.5 billion in 1999. The top 3 export destinations of Indian goods were the United States, Britain, and Germany, which together constituted one-third of total Indian exports in 1999. In turn, the top 3 import sources were the United States, Britain, and Belgium, together constituting 21 percent of total imported items.

Trade (expressed in billions of US$): India

	Exports	Imports
1975	4.355	6.381
1980	8.586	14.864
1985	9.140	15.928
1990	17.975	23.642
1995	30.764	34.522
1998	32.881	42.201

SOURCE: International Monetary Fund. *International Financial Statistics Yearbook 1999.*

In 2001, FDI in India was expected to near US$4 billion. To further seek buyers for Indian products, Indian companies have also major plans for investing abroad. Several Indian information technology companies, for example, have plans to outsource some of their production to China, where labor is as much as 20 percent cheaper. Furthermore, India's largest car manufacturer, Mahindra and Mahindra, may soon be entering the European market via the production of tractors in the Czech Republic. One Indian investment that is already operating abroad is a US$180 million fertilizer plant in the Persian Gulf nation of Dubai.

MONEY

India has pursued a conservative policy in the expansion of its money supply during the past 2 decades. Money was thought to have grown by a relatively high rate of 15 percent during 2000–01, however. The reserve bank of India is the sole authority for issuing the national currency. It formulates and administers **monetary policy** with a view to ensuring stability in prices while promoting increased production of goods and services via the deployment of credit. The reserve bank's monetary policy

Exchange rates: India

Indian rupees (Rs) per US$1	
Jan 2001	46.540
2000	44.942
1999	43.055

1997	36.313
1996	35.433

SOURCE: CIA *World Factbook 2001* [ONLINE].

also plays an important role in maintaining the stability of the exchange value of the Indian rupee. Furthermore, the reserve bank is in charge of the borrowing program of the government from both domestic and international lenders. High levels of exports have led to a comfortable **balance of payments** situation in recent years, which in turn has put at the disposal of the reserve bank, aside from the nation's gold reserves, as much as US$38 billion of cash reserves in 2001. The total money supply in India (which includes the various deposits in commercial banks, the reserve bank, and the currency in the hands of the public) is estimated to have grown by 60 percent since 1995 and to have been a bit more than Rs3 trillion (US$66 billion) in 2000.

POVERTY AND WEALTH

At the time of India's independence famine and severe malnutrition were periodic occurrences, and life expectancy was only about 30 years. Due to improvements in health care and agriculture, by 1970 life expectancy had reached 50 years, and by 1993 it was 61 years. Infant mortality fell from 137 per 1,000 live births in 1970 to 71 in 1993. In agriculture and food production, India has also made great progress. While it was a nation dependent on food imports to feed its population after independence, it is now largely self-sufficient in food production. It has done so, to an extent, by enacting policies that have favored impoverished working-class citizens and farmers.

Despite improvements, by 1994 it was still estimated that 1 in every 3 Indians lived in what could be categorized as absolute poverty—a total of 310 million people. In essence, more Indians were estimated to be poor than the whole of sub-Saharan Africa. Currently, though starvation is something of a distant memory, a large part of the Indian population remains too poor to afford an adequate diet. According to the Indian Institute of Population Sciences, more than half of all children under the age of 4 suffer from different degrees of malnourishment. Diseases such as diarrhea, diphtheria (caused by bacteria leading to inflammation of the heart and nervous system), pertussis (whooping cough), tetanus (also known as lockjaw), and measles, long done away with in many countries, can still be found among some poor communities in India. Furthermore, due to iron deficiency, as much as 87 percent of all pregnant women are thought to be anemic.

GDP per Capita (US$)

Country	1975	1980	1985	1990	1998
India	222	231	270	331	444
United States	19,364	21,529	23,200	25,363	29,683
China	138	168	261	349	727
Pakistan	274	318	385	448	511

SOURCE: United Nations. *Human Development Report 2000; Trends in human development and per capita income.*

Inter- and intra-state discrepancies in terms of education and overall well-being also remains large. The poorest quintile (one-fifth or 20 percent) of the population is estimated to have 2.5 times more incidence of infant mortality, double the fertility rate, and a 75 percent higher rate of child malnutrition than the average figures for India. The south and west of India have traditionally been better off relative to the north and east. Furthermore, irrigated plains are richer than primarily rain-fed regions. For a variety of reasons, some states such as Maharashtra, Goa, Delhi, and Gujarat have been able both to provide better infrastructure, such as power supply and telecommunications, to their peoples and likewise attract a significantly higher FDI than other states. Kerala has a high literacy rate and access to health care even though its **GDP per capita** is less than the Indian average. Kerala's fertility rate dropped to 1.8 children per woman in 1991, which is below the replacement level; in the same year, literacy in Kerala was over 90 percent, compared to India's average of 51 percent. Kerala's infant mortality in 1996 was 13 deaths per 1,000 live births; in all of India the number was 72 per 1,000 births. Schools and health clinics are available throughout the state, and newspapers are also available in most villages. There is also a strong commitment to equal rights for women in Kerala, where women occupy significant government positions. Kerala's elected **communist** government, together with an emphasis on local control, participation in government, and investment projects are all thought to be important factors for Kerala's better quality of life. Those especially vulnerable throughout India continue to be rural women, the disabled, and people of lower castes.

Poverty in many developing countries is more predominant in rural areas. Though that has also been true

in India, the gap between rural and urban India was closing during the 1980s due to the continuing effects of state-sponsored expansion of irrigated agriculture and the green revolution. (This was the substantial increase in the production of food grains—such as rice and wheat—begun in the 1960s as a result of the introduction of improved plant varieties, better farming, and the application of newly-developed pesticides and herbicides.) By the early 1990s, however, India began to show signs of "Malthusian overload": Thomas R. Malthus (1766–1834) theorized that population tends to grow faster than its means of subsistence—food and other resources—and unless population growth is checked, it will inevitably lead to widespread poverty. The increases in food production brought about by the green revolution were not able to keep pace with the rate of population growth. This discrepancy was especially evident in the rural areas, where the majority of the people are farmers living off the land. The gap between rural and urban India since the early 1990s, therefore, began to widen again. Poverty, however, is not purely a phenomenon of rural areas. In recent years, for example, as a result of the population increase and the lack of sufficient waste disposal infrastructure, the city of Calcutta has seen an increase in the waterborne and communicable diseases such as tuberculosis, a problem exacerbated during the rainy season.

Illiteracy remains a major problem as well. The number of illiterate Indians actually rose in the 1980s. In the 1990s, successful government programs began once again to reduce illiteracy. Progress has been very slow, though. If India continues to reduce illiteracy by its current rate of approximately 2.8 percent per year, it is estimated that it would still take 16 years for it to reach the literacy rate of 90 percent, a rate which neighboring Sri Lanka currently holds. Even then, there would still remain 120 million illiterate Indians. Likewise, while fertility dropped from 6.0 children per child-bearing woman in the early 1980s to 3.8 in 1992, maternal mortality is a high of 430 per 100,000 live births, 23 percent more than the average of 350 for low and middle income countries.

Overall, though the per capita income in India is higher than in some of its neighbors, it remains very low compared to economically developed countries. India's per capita income of US$2,077 per year is 121 percent that of neighboring Pakistan. Yet, India's per capita income is still 67 percent that of China's, 9 percent that of Canada's, and only 7 percent that of the United States'.

WORKING CONDITIONS

The liberalization policies of the Indian government, begun in 1991, assisted in opening up the economy to domestic and international competition. Autarkic policies of the past decades had limited foreign investment and prioritized the growth of domestic industry through import substitution and public ownership of much of the means of production. Emphasis on self-reliance had eventually led to an economic crisis, which did not help to improve working conditions for the majority of the Indian labor force. During this period, many skilled and unskilled workers among the population had opted for better employment opportunities in other countries.

Despite the benefits of economic liberalization, it has not quickly solved the problem of unemployment and other social and economic ills. Short- and long-term job losses as a result of competition, for example, have been common, especially among the unprofitable firms. One of the main areas of employment for many of the poor has been the cotton textile industry with its traditional concentration of mills in the cities of Bombay, Ahmedabad, and Coimbatore. Along with mills that use the most advanced technology to process raw cotton and form cotton fiber, there also have existed a large number of small-scale workshops and households that use traditional handlooms (the type used by Mahatma Ghandi) and rely on manual labor for the processing of cotton. India's market liberalization led to the foreclosure of much of the traditional handloom cotton industry and resulted in nearly 2.3 million workers losing their jobs. Many of these workers have remained unemployed. Managers of the modern mills attribute this to the older age of handloom workers and their inflexibility or inability to adjust to the mechanized cotton mills.

As opposed to neighboring China, trade unions in India play a very prominent role in the business community. Every industry has a trade union that advocates the rights and employment opportunities of its members. Trade unions strive to obtain the best deal for their members in terms of wages, working conditions, acceptable remuneration, and welfare packages. As much as 92 percent of the labor force in India is unionized. Some of the laborers of the cotton industry have gained employment in the textile industry, which with its labor force of 39 million is among the largest unionized industries.

Women constitute an important segment of the Indian labor force whose working conditions have not made significant progress. Despite some noticeable advances for a small percentage of women, women as a whole have been relegated largely to agricultural and menial pursuits that pay the lowest wages. In some ways, as the overall economy has grown, the situation of working women in India has even deteriorated. In 1911, for example, three-quarters of the working women of India were agricultural workers; in 1991, the proportion was over 80 percent. Nearly 70 percent of the population as a whole derives its livelihood from land resources, and women contribute an estimated 55 to 66 percent of the total farm labor force.

COUNTRY HISTORY AND ECONOMIC DEVELOPMENT

2500 B.C. Inhabitants of the Indus River Valley develop an urban culture based on commerce and sustained by agricultural trade. This new activity leads to some ecological changes in the region.

1000–600 B.C. The caste system is established.

400–500. Northern India is unified under the Gupta dynasty which leads to new heights for the Hindu culture and politics.

1100s. Indian subcontinent is invaded by the Turks and Persians who establish their empires at Delhi. The descendants of Genghis Khan sweep across the Khyber pass and established the Moghul empire which lasts for 2 centuries.

1619. The first British outpost is established in Surat. Later, the East India Company opens trading stations at Madras, Bombay, and Calcutta.

1850. Great Britain expands its influence and controls most of the provinces of India (present-day India, Pakistan and Bangladesh) through direct rule and treaties established with local rulers.

1920. Indian leader Mohandas K. Gandhi transforms the Indian National Congress Party into a mass movement to campaign against British colonial rule. This change is achieved through parliamentary acts, non-violence, and non-cooperation.

1947. India achieves independence from the UK and is divided into 2 nations: India and Pakistan. The new Commonwealth nation of India is led by Jawaharlal Nehru as prime minister.

1961. India becomes a founding member of the Non-Aligned Movement, which among other tasks, seeks solutions for global economic problems.

1966. Indira Gandhi, daughter of Jawaharlal Nehru, becomes India's first female prime minister.

1975. Citing political and economic turmoil, Prime Minister Gandhi declares a state of emergency and the suspension of civil liberties in India. She loses power in the election of 1977 to Moraji Desai of the Janata Party.

1979. After the downfall of the Desai government, Charan Singh forms the interim government followed by a return of Indira Gandhi to power in 1980.

1984. Indira Gandhi is assassinated on 31 October. Rajiv Gandhi, her son, is chosen by the Indian congress as her successor.

1991. Rajiv Gandhi is assassinated by Tamil extremists which results in a sympathy vote for the Congress Party. P. V. Narashima Rao becomes prime minister. Under his leadership, the government serves a full 5-year term and initiates various economic liberalization reforms opening the Indian economy to global trade and investment.

1998. The president approves of a BJP-led coalition government. India conducts a series of underground nuclear tests in May, leading to United States-led economic sanctions in an attempt to force India to sign and abide by the Nuclear Non-Proliferation Treaty.

1999. The BJP-led coalition government falls apart, leading to fresh elections. The BJP forms a coalition with the National Democratic Alliance Party, with Atal Bihari Vajpayee as prime minister.

2001. On 13 December, Kashmiri separatists attack the Indian parliament building. Thirteen people are killed in the attack, including the five separatists. The separatists' ties to Pakistan lead India to accuse Pakistan of being behind the attack, which brings hostile relations between the two countries to a boiling point.

FUTURE TRENDS

There are many future challenges that India will need to address in order for it to be a more prosperous country. Government corruption, the population explosion, the issue of Kashmir and other potentially vigorous separatist movements, relations with Pakistan, nuclear arms, the growing gap between the rich and poor, and last but not least, ecological devastation are among the issues that the Indian government will need to address seriously.

The government sector in India is known to be among the most bloated and overstaffed in the world. Furthermore, nearly all transactions with government agencies, from acquiring one's passport to obtaining a birth certificate, often require some amount of bribe. Stealing and skimming services, such as electricity, is common. In New Delhi, for example, as much as 51 percent of electricity is "lost" in transmission, much of it stolen by relatively prosperous urban households. Increasing efforts by the government to minimize waste, corruption, and grand and petty theft would be beneficial.

Population growth will likely not subside for several more decades. The high rate of growth of the population has negative effects on the well-being of people. The number of Indians consuming diets with fewer than 1,900 kilocalories (kcal) per day, for example, has quadrupled since the early 1970s. (Many nutritionists assert that a diet of at least 2,600 kcal per day is necessary to maintain body weight.) During the same period, total food grain production in India has doubled. High rates of fer-

tility are thought to be indirectly proportional to economic well-being of households, as well as the level of education of parents—especially mothers. In essence, the more prosperous a household and the more educated the mothers, the fewer children couples have.

The success of government education and public health programs, however, depends not only on more spending but also on improving the quality of services. There is a need to phase out a number of anti-poverty programs and direct some of the savings to ensure quality education, which is more effective in reducing poverty over the long-term. For the poor to take advantage of the new educational opportunities, however, their health status needs to improve. Targeting government spending to primary education, reducing communicable diseases, improving water and sanitation, and reducing household insecurity through public works programs would do much to reduce poverty. The government should invest in health care and education, especially for children in grades 1 though 8. According to the United Nations, current spending on education takes up about 13.4 percent of the central and local government budget as compared to an average of 17.5 percent for all low-income countries. Without substantial increases in spending on education and health care, the gap between the rich and poor is likely to remain and intensify.

Improving relations with neighboring Pakistan is also a determinant of improvement of people's lives in India. Much of the dispute between the 2 countries is over Kashmir. Both India and Pakistan claim ownership to the entire Kashmir region. India is thought to have stationed nearly half a million troops in the state of Jammu-Kashmir along the Pakistani border. According to human rights reports, as many as 60,000 people have died in Jammu-Kashmir due to fighting between Indian troops and Kashmiri nationalists. Relations with Pakistan could also improve if a pipeline agreement that envisions pumping natural gas from Iran to India through Pakistan goes through. The proposed deal would allow India to increase its consumption of natural gas to as much as 85 billion cubic meters (3 trillion cubic feet) by 2020 and for Pakistan to collect up to US$600 million of transit fees. However, the 2001 attack on the Indian parliament by Kashmir separatists based in Pakistan placed the pipeline and future relations with Pakistan in serious jeopardy.

DEPENDENCIES

India has no territories or colonies.

GROSS DOMESTIC PRODUCT: US$610 billion (purchasing power parity, 1999 est.).

BALANCE OF TRADE: **Exports:** US$48 billion (f.o.b., 1999 est.). **Imports:** US$24 billion (c.i.f., 1999 est.).

COUNTRY OVERVIEW

LOCATION AND SIZE. Indonesia is an archipelago (a group of islands) stretching along the equator between the Southeast Asian mainland and Papua New Guinea, with which it shares an island. The country has a total land area of 1,919,440 square kilometers (741,096 square miles), or about 3 times the size of Texas. An additional 3.2 million square kilometers (1,235,520 square miles) of ocean is within Indonesia's borders.

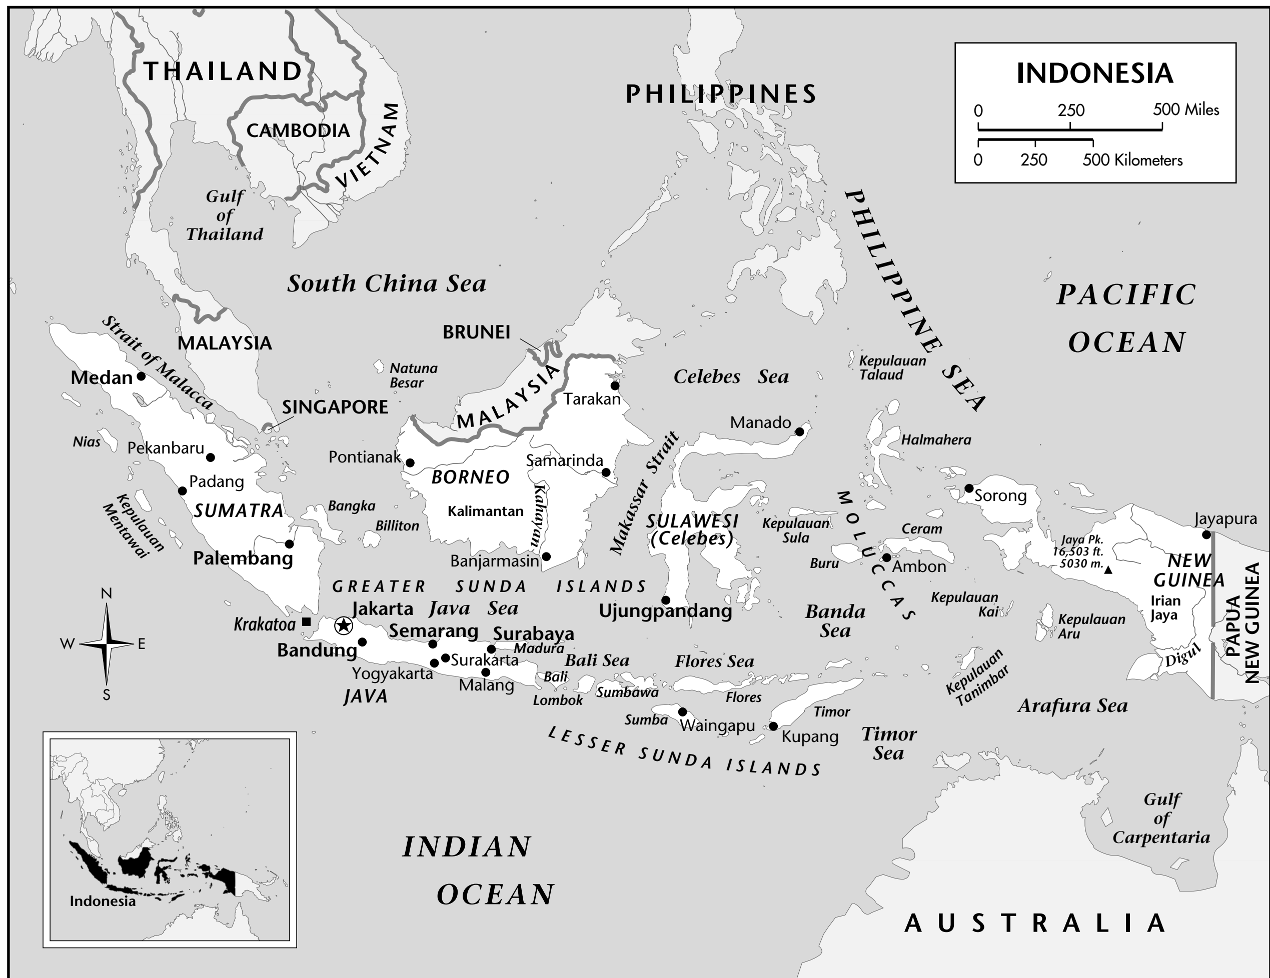
With 17,000 islands (11,000 of them inhabited), Indonesia's coastline stretches 54,716 kilometers (34,000 miles). The country controls important shipping lanes from the Indian Ocean to the Pacific Ocean, in particular the Strait of Malacca lying between the western Indonesian island of Sumatra and Malaysia. Indonesia has territory on some of the world's largest islands, such as New Guinea, Borneo, Sumatra, and Sulawesi.

POPULATION. The 2000 official census found 203,456,005 Indonesians (though most outside sources estimate 210 million), making Indonesia the world's fourth most populous country. An estimated birth rate of 22.6 per 1,000 people and death rate of 6.31 per 1,000 people means that the population is growing at an annual rate of 1.63 percent. The **United Nations Development Program** predicts that the population will reach 250.4 million by 2015. Like many developing countries, Indonesia has a young population, with 30.6 percent of its people under the age of 15. In 1998 almost two-fifths of the population lived in urban areas, double the 1975 level.

Indonesia has hundreds of ethnic groups, with the 2 largest—Javanese (45 percent) and Sundanese (14 percent)—living on the island of Java. One of the most densely populated places in the world, Java is about the size of New York State and is home to more than 110 million people. Other ethnic groups include Madurese and coastal Malays, who each make up 7.5 percent of the population, and numerous other ethnic groups accounting for 26 percent. Indonesian Chinese, whose ancestors mostly came to the Dutch East Indies as workers, are a small but economically important minority with 2 percent of the population but a majority of the wealth.

Java and Bali are often referred to as the Inner Islands, with the other less densely populated ones known as the Outer Islands. Starting in 1969, the government pursued a policy of transmigration (a program to shift inhabitants from more crowded to less crowded areas). Millions of people have joined this official migration program based on the promise of land and support. After years of criticism for damage to the environment, failure to live up to promises to the transmigrants, and conflicts with local inhabitants, the government announced an end to the program in 2000. Many Indonesians also migrate on their own from one part of the country to another in search of farmland or jobs.

Indonesia has 5 officially recognized religions: Muslim (88 percent), Protestant (5 percent), Roman Catholic (3 percent), Hindu (2 percent), and Buddhist (1 percent), as well as numerous traditional religions. More Muslims live in Indonesia than in any other country. The official



language is Bahasa Indonesia, a modified form of Malay adopted as a national language and taught in all schools. Most Indonesians, except some raised in Jakarta or by parents from different ethnic groups, speak Bahasa Indonesia as a second language after their native tongue, one of some 250 local languages and many more dialects.

Indonesia's family planning program was formally established in 1970 after years in which rapid population growth was not seen as a problem and even at times encouraged. The Indonesian family planning program has involved thousands of village-level volunteers, grassroots organizations, and religious leaders and a multifaceted approach that brings together agencies and organizations. The phrase "dua anak cukup" (2 children are enough) appears on T-shirts, statues, and television broadcasts, and family planning and reproductive health program services are made available in over 10,000 clinics, hospitals, and community health centers. The National Family Planning Coordinating Board (BKKBN) coordinates efforts but does not implement activities by itself.

Indonesia has a significant challenge in implementing a population policy, given the size of the population, the geographic distribution, and occasional cultural and religious objections. Despite this, Indonesia has achieved what the World Bank has called "one of the most impressive demographic transitions anywhere in the world." The growth rate has fallen from 2.5–2.7 percent in 1970 to 1.63 percent, and the total fertility rate fell from 5.5 births per women between 1967–70 to 2.6 births per woman in 1995–2000. Indonesia is often held up as a model for developing countries.

As a result of various conflicts, Indonesia has over 1 million internally displaced people (IDPs) who have fled their homes to avoid ethnic, religious, or political violence and military repression, most notably involving populations in Maluku, West Kalimantan, and East Timor.

OVERVIEW OF ECONOMY

Indonesia is made up of the islands of the former Dutch East Indies, a colony established by the Netherlands to control the important spice trade and take advantage of the fertile tropical soil. Indonesia's first 15 years after gaining independence in 1949 were marked

by high **inflation** and very little development beyond the economy inherited from the colonial system, which was heavily dependent on agriculture. The economy grew quickly after that, however, fueled first by oil and gas exports and then by the export of manufactured goods, such as shoes, clothing, and textiles. Agriculture remains important, including both small farmers producing crops for internal consumption and export, and large plantations producing products such as palm oil and rubber.

Indonesia has gone through 6 5-Year Development Plans, known by the Indonesian acronym Repelita. The first 5-Year Development Plan (Repelita I) started in 1969 and emphasized rebuilding the economy by improving agriculture, irrigation, and transportation. Repelita II, starting in **fiscal year** 1973–74, tried to increase the standard of living through better food, clothing, and housing, **infrastructure**, social-welfare benefits, and employment opportunities. Repelita III, beginning in fiscal year 1978–79, introduced the "trilogy of development" of high economic growth, national stability, and equitable distribution. Self-sufficiency in food and the promotion of industries processing basic materials into finished goods were also objectives. Starting in fiscal year 1984–85 Repelita IV continued to emphasize self-sufficiency in rice and industrial machinery. Repelita V, from fiscal year 1989–90, stressed rapid development with emphasis on the industrial and agricultural sectors. The sixth 5-Year Development Plan (Repelita VI) began to encourage foreign investment and abandoned policies of high **tariff** barriers, heavy regulation, and **import substitution** (manufacturing **consumer goods** domestically to reduce imports). The greatest success in attracting investment has been in textiles, tourism, shoes, food processing, and timber products.

Indonesia was hit hard by the Asian financial crisis that swept the region in 1997. Following problems with the currency in Thailand, the rupiah fell, causing investors to panic, debts to soar, and the banking sector to collapse. After growing throughout the 1990s, **real gross domestic product** (GDP) fell by 13 percent in 1998. The GDP was stagnant the next year, and increased slightly in 2000, but investment remained low, and many of the underlying problems still have not been dealt with: banks are weak, large companies are technically bankrupt, the government controls many assets acquired after bailouts, and reform of the corrupt judicial system has been delayed. While other countries in the region, such as Thailand and South Korea, began to rebound, Indonesia's failure to deal decisively with deep-seated problems and continued political uncertainty slowed recovery.

Before the crisis, Indonesia borrowed about US$5 billion annually from foreign countries and international financial institutions such as the World Bank and the International Monetary Fund (IMF) to finance its budget. The government debt slowly increased from US$55.5 billion in 1992 to US$59.9 billion in 1997, but the economy seemed strong and there was little domestic debt. However, in the same period, debt resulting from borrowing by private companies increased from US$28.2 billion to US$78.1 billion, making the economy vulnerable to a fall in the **exchange rate**. After the crisis, government debt soared as the government bailed out bankrupt companies and banks, and borrowed heavily from the IMF. The total cost of the bailout quickly reached US$69.6 billion. Due to the crisis, Indonesia borrowed US$43 billion from an IMF program and other outside financing from 1997 to 2000. Government debt is estimated by the World Bank to be equal to 80 percent of the GDP, and debt repayments eat up 27 percent of government allocations, more than the entire development budget.

Surveys of business travelers in Asia regularly rank Indonesia as one of the most corrupt places to do business. Corruption has interfered with recovery as well, as the IMF and the World Bank stopped payments in 1999 after a private bank was discovered to have funneled payments from the government to the former ruling political party. In September 2000, the Supreme Court convicted the son of former president Suharto for corruption in a real estate deal, but he vanished before he could be jailed. It is believed that Indonesia is becoming increasingly involved in the shipment of heroin from the Golden Triangle in mainland Southeast Asia.

POLITICS, GOVERNMENT, AND TAXATION

The Republic of Indonesia consists of 23 provinces, 2 special regions, and the capital-city district. In August of 1999, a referendum approved independence for East Timor, the area formerly known as Propinsi Timor Timur, but its status remains in transition. The president, who is both chief of state and head of government, is elected by the People's Consultative Assembly for a 5-year term, as is the vice president. Legislative power is vested in a **unicameral** House of Representatives of 500 seats, 462 of whom are elected by popular vote and 38 are appointed from the military. The People's Consultative Assembly, which meets every 5 years to elect the president and vice president and broadly approve national policy, is comprised of the House of Representatives plus 200 members chosen indirectly. Judicial power is vested in a Supreme Court, whose judges are appointed by the president. Major political parties include the Crescent Moon and Star Party (PDB), the Development Union Party (PPP), the Indonesia Democratic Party (PDI), the Indonesia Democracy Party-Struggle (PDI-P), the National Awakening Party (PKB), and the National Mandate Party (PAN).

The former Dutch East Indies proclaimed independence on 17 August 1945, and fought a lengthy war with the Dutch, who were not ready to give up their colony. After 4 years of fighting and negotiations, the territory was formally recognized as the independent nation of Indonesia. Under Indonesia's first president Sukarno (who like many Indonesians used only one name), Indonesia experimented with **socialism**, and the government controlled most markets, foreign trade, and banking. A violent change in government in 1965 brought General Suharto to power. He presided over the extermination of what had been the world's third largest **communist** party, a process that killed at least half a million suspected communists and arrested a million more. Most of those arrested were deprived of their civil rights for decades. Suharto's "New Order" government also appointed a group of U.S.-trained economists (sometimes known as the Berkeley Mafia) to guide economic policy in a more **technocratic** and non-political way. The government directed state investment and protected favored industries from competition, but the system was decidedly capitalist. At the same time, state corporations and private conglomerates, mostly owned by Suharto's family and supporters (many of them ethnic Chinese), were built through government-granted **monopolies** and preferential access to credit, licenses, and products.

The New Order adopted as its slogan a "trilogy of development" consisting of stability, growth, and equitable distribution. Stability was enforced by the harsh repression of dissent from students, journalists, workers, or politicians. Elections were scheduled every 5 years, but no meaningful opposition was allowed. Suharto maintained power through the support of the military and control of the bureaucracy but also in part through the perceived legitimacy that came with significant economic growth.

That legitimacy fell with the onset of the Asian financial crisis in 1997, which also revealed the deep-seated corruption, cronyism (favoritism shown by public officials to their political supporters) and nepotism (favoritism shown by public officials to their relatives) that had left the economy so vulnerable. The economic crisis led to massive student protests that forced Suharto to step down. His vice-president assumed power and announced the first democratic elections in 44 years, which took place in June 1999. After years of restrictions on parties and campaigning, 45 new parties participated in the elections. Despite fears of instability and corruption, the vote was considered a fair representation of the electorate, 93 percent of whom participated. The party winning the most votes (37.4 percent) was the Indonesian Democratic Party (PDI). Led by Megawati Sukarnoputri, the daughter of Indonesia's first president, this nationalist party was unable to form a coalition in the People's Consultative Assembly, where the president is selected. Abdurrahman Wahid, the moderate head of the National Awakening Party (PKB) party, was sworn in for a 5-year term in October 1999, with Megawati as vice-president. Wahid, usually known by the nickname "Gus Dur," is nearly blind and has suffered a stroke, but he is a shrewd politician who led the largest Muslim organization in Indonesia. Wahid's policies have generally supported foreign investment but have also been erratic, sparking fears of instability and economic uncertainty.

The Wahid administration reversed some of the Suharto-era restrictions on free expression: it released political prisoners, eliminated the feared security coordination body BAKORSTANAS, and increased freedom of the press. There is still very weak commitment to investigating and prosecuting human rights violations, which continue to be a problem, particularly in conflict areas such as Aceh, at the northern tip of the island of Sumatra and in East Timor. Moreover, Wahid failed to put a stop to the economic slide that began in 1998. By 2001 the legislature, responding to popular protests, proceeded with impeachment proceedings against Wahid. Ignoring Wahid's threats to dissolve the parliament, the legislature impeached Wahid and replaced him on 26 July 2001, with vice-president Megawati Sukarnoputri.

Although Indonesia has generally pursued a free-market approach to economic development, the government has kept state control over enterprises in sectors such as oil, plantations, and some areas of technology. The role of state-owned enterprises increased during the first decades of the New Order, contributing 30 percent of the GDP by 1990 and remaining dominant players in banking, plantations, transportation, and some areas of manufacturing. The bankruptcy of nearly all the major conglomerates and the subsequent bailout has left the government officially owning major segments of the economy at the dawn of the 21st century. There is pressure from the IMF to sell off assets and **privatize** the state-owned companies, but movement in this direction has been slow.

Wahid's policies aimed to encourage foreign investment and, in accord with IMF agreements, to take steps to strengthen the weak banking and corporate sectors. But President Wahid was distracted in pursuing these goals by such factors as the ongoing violence in certain regions, allegations of government corruption, the difficult problem of reforming the political role of the military, and battles with parliament. It is uncertain how Megawati, as the new president is known, will solve these problems, but it is clear that she will do so with the backing of the military, long the prop for political power in Indonesia. Indonesian voters will have a chance to voice their approval of Megawati's measures in elections in 2003.

Government revenues in fiscal year 1999–2000 were estimated at US$25.4 billion (including US$6 billion from

international financial institutions such as the IMF). Tax revenues have historically been small, with revenues from the personal **income tax** falling from 6.5 percent of total revenues in 1968 to 2.9 percent in 1984. To boost revenue, the government changed the personal and corporate tax system in 1983 and introduced a **value-added tax** (VAT) in 1985. The 2000 budget called for the government to broaden the tax base, end most VAT exemptions, and review **tax holidays**, which guarantee some businesses a period of several years of tax-free operations.

New decentralization laws scheduled to take effect in 2001 will shift most functions from the capital to the provincial and district levels and redistribute a much higher share of profits from oil, gas, forestry, mining, and fishing to local governments. This process has significantly slowed down, however, due to concerns from Indonesian authorities and foreign investors that the local governments were not ready to assume control.

The legal system is based on Roman-Dutch law, modified by indigenous concepts and recent reforms. The court system is extremely corrupt and vulnerable to political influence. Weak courts make it even harder to reform the economic system, as influence and corruption block attempts to resolve the crisis.

Under the New Order, the military was given "dwifungsi," or "dual function," in which it played a social and political role as well as a military one. Active-duty officers occupied important positions in the executive branch, including serving as governors and ministers. The military was also given appointed seats in the national assembly. In their self-described roles as "guardians of development," the military participated in such activities as reforestation and family planning, which led to some charges of coercion or other human-rights abuses. The military also played a pervasive but unofficial role in the economy by placing officers on the boards of private and state-owned enterprises. In exchange for political protection for the businesses, the military was given access to funds for personal and official uses. Military-owned companies also operated in the open market. For example, a **holding company** tied to the important Army Strategic Reserve Command owned a film company, an airline, and an automobile assembly plant. While its political function has been much reduced since the end of the New Order, the military still has 38 out of 500 seats in the National Assembly, although this may be reduced in the future. Military expenditures in fiscal year 1998–99 were estimated at $1 billion, or 1.3 percent of the GDP. The police force was only recently separated from the armed forces and are not yet seen as an effective or accountable agent of law enforcement.

INFRASTRUCTURE, POWER, AND COMMUNICATIONS

Indonesia has fairly effective telecommunications and infrastructure, especially roads. From 1969 to 1988, the first 3 Repelitas allocated 55 percent of expenditures on transportation infrastructure to road building and maintenance, with the rest for marine transportation, railroads, and air and river transportation. This trend has continued in the 1990s. As a result, Indonesia had 342,700 kilometers (212,954) miles of roads in 1997, although fewer than half of that number were paved. Railway lines totaled 6,458 kilometers (4,013 miles) in 1995. In 1998 there were more than 16 million vehicles on the road, but only 2.6 million were cars, with most of the rest (11.7 million) being motorcycles.

There are 446 airports throughout Indonesia, but only 127 of them have paved runways. As an archipelago, Indonesia relies on a huge fleet of ships for transporting both passengers and goods. Important ports include Cirebon, Jakarta, Kupang, Palembang, Semarang, Surabaya, and Ujungpandang. Once highly restricted and bureaucratic, inter-island shipping was **deregulated** as part of the economic reform packages of the 1980s. Traditional shipping still plays an important role, with an estimated 10,000 two-masted sailing ships shuttling around the islands, though many have been motorized.

Electricity production in 1998 was estimated at 73.13 billion kilowatt hours (kWh), mostly from fossil fuels (88 percent), with most of the rest from hydroelectric plants (8 percent). An August 1998 **restructuring** policy for the power sector included plans to restore profitability, improve efficiency, and attract private investment.

There were 4.8 million telephone lines in use in 1997, and an estimated 1.2 million cell phones, as well as 31.5 million radios and 13.75 million television sets. By 1999, Indonesia had 24 Internet service providers for an estimated 1 million users, a figure expected to grow by 50 percent by 2000, despite a shortage of phone lines and limited access to computers.

There are 2 state-owned telephone companies. Indosat provides international telecommunications while Telkom provides service domestically. Both are economically healthy, and Indosat is listed on the New York Stock Exchange. Indonesia is under pressure to privatize its telecommunications sector.

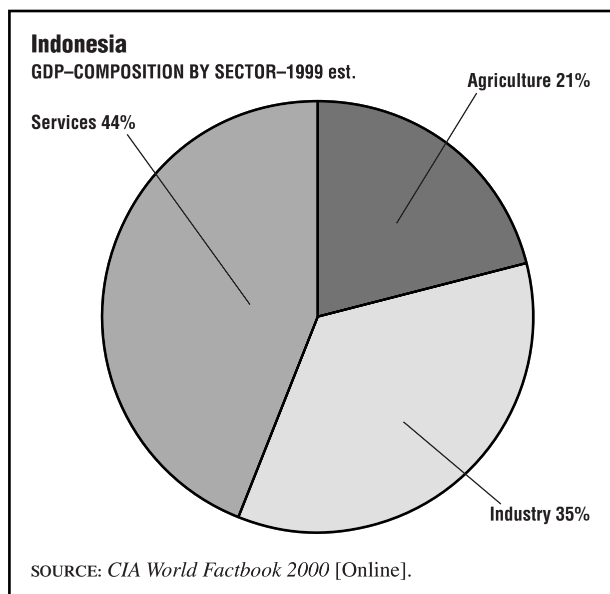
ECONOMIC SECTORS

In 1998, agriculture accounted for 19.5 percent of Indonesia's total GDP, industry for 45.3 percent, and services for 35.2 percent, a quite different scenario than in decades past. For the first 20 years after independence in 1945, the agricultural sector contributed more than 50 percent of the nation's GDP from independence. There was little development of industry, and production per capita was no more than it had been when Indonesia was a Dutch colony. From 1965–74 there were few major industrial projects due to the still weak economy and a strategy of import substitution, which created more jobs.



SOURCE: *CIA World Factbook 2000* [Online].

In the early 1970s the Organization of the Petroleum Exporting Countries (OPEC) raised oil prices, greatly increasing Indonesia's export income. Indonesia used this windfall, as well as profits from high prices for tropical agricultural products in the 1970s, to build heavy industries, such as steel, and advanced technologies, such as aeronautics. By the 1980s this industrialization process allowed growing industries such as steel, aluminum, and cement production to reduce the dependence of the economy on agriculture.

These industries, especially the high-tech ones, met with only mixed success, and none of them generated the significant employment required by such a populous country. Agriculture and natural resources were still important to the economy, and Indonesia's economy was vulnerable to frequent changes in the prices of these commodities, as well as of oil and gas. Oil earnings dropped in 1982–83 from US$18.825 billion to US$14.744 billion and kept falling over the next 2 years. Non-oil exports grew but not enough to make up for the fall in earnings. As Indonesia's **balance of payments** became negative, the World Bank pushed Indonesia to open its markets, and beginning in the mid-1980s the government initiated reforms to boost manufactured exports in order to strengthen the economy. These measures included a currency **devaluation** to help make exports competitive, export incentives, the relaxation of rules on foreign investment and trade, and an end to some monopolies, such as plastics.

AGRICULTURE

In 1998 agriculture accounted for 19.5 percent of Indonesia's GDP. The agricultural sector is crucial to the

economy not just for the portion of the GDP it produces, but also because it employs almost half the total workforce. Agriculture was hit hard by drought in 1997–98 but has recovered somewhat since then. Although the drop in the value of the rupiah resulted in much higher prices for fertilizer, pesticides, and other inputs, it did benefit some producers of export commodities, who could now get a higher price for their goods in the international markets. In January 2000, Indonesia told the IMF that the focus of its policy would be "to maintain food security and promote efficient production, processing, and marketing of agricultural products."

FARMING. In much of the nation, the primary crop is rice, sometimes grown in extensive rice terraces with complex irrigation systems. Secondary crops, known as palawija, grown outside of the rice-growing season, include soybeans, corn, peanuts, and mung beans. In mountainous areas highland vegetables are grown, including potatoes, cabbage, carrots, and asparagus. Major fruit crops include bananas, mangos, papaya, oranges, and pineapples. In drier areas root crops such as cassava are an important product.

In the 1970s the set of agricultural innovations known as the Green Revolution introduced new seed varieties that responded well to fertilizers and pesticides, dramatically boosting rice production. Indonesia went from being the world's largest importer of rice in the 1970s to being self-sufficient in 1985. However, the increased dependence on these costly chemicals also carried negative environmental and economic impacts, and the benefits did not reach farmers in dry, mountainous, and other marginal areas.

FORESTRY. Forests and woodlands cover 62 percent of the country, making Indonesia the most heavily forested region in the world after the Amazon. Tropical rainforests make up the vast majority of this acreage, particularly in Kalimantan, Sumatra, and Papua (Irian Jaya). The colonial authorities found the climate and rich volcanic soil perfect for commercial crops such as coffee, rubber, and palm oil. Large private European and American plantations were crucial to the colonial economy in the late 19th century. Many of these estates were **nationalized** and are now operated by state-owned enterprises. Large private plantations remained as well, such as the Goodyear rubber plantation in North Sumatra.

The 1967 Basic Forestry Law gives the government sweeping control over 143 million hectares (357.5 million acres) classified as public forest land. State interest takes precedence over customary ownership of forests, despite the frequent presence of communities who have used the forests for generations. The 1967 law sparked a boom in the timber industry, and in 1978 timber exports reached half the world's total. Exports dropped after the government issued new regulations on the export of unprocessed timber, forcing logging firms to build plywood plants to capture more of the value of the lumber. In 1999 there were some 442 concessions (rights to forest lands given to logging companies) covering 51 million hectares (127.5 million acres), nearly a third of the country. These concessions generally last for 20 years and average 98,000 hectares (245,000 acres) in size. The government promotion of timber processing, the transmigration program, and population pressures on traditional shifting cultivation systems led to annual deforestation of 1 percent in the 1990s, much higher than the world average.

In the last few years, the combination of drought and human activity has led to massive forest fires, on the island of Borneo in particular, covering parts of Southeast Asia in haze. Although the fires were at first blamed on small farmers, a major cause was determined to be illegal clearing of land for large plantations. In 2000 the attorney general's office carried out investigations into the misuse of Rp1.6 trillion (US$216 million) in funds intended for reforestation. The 5 suspects were all linked to Suharto, including 1 daughter and a half-brother. The Ministry of Forestry and Estate Crops recently suspended 46 forest concessions due to documentation errors and improper logging operations.

FISHERIES. Fish is a main source of animal protein in the typical Indonesian diet. The fishing industry continues to rely on traditional methods and equipment, although the government has been promoting the motorization of traditional fishing boats. Foreign fishing boats contribute to growing exports, mostly shrimp and tuna caught for sale in the Japanese market. However, the supply of fish is threatened by illegal fishing from foreign boats and severe environmental degradation.

Prawns are an important export and are increasingly raised on massive coastal farms capable of bringing in large amounts of export earnings. Indonesian prawn exports exceeded US$1 billion in 1998, a significant portion of total agriculture exports. These operations often destroy coastal mangrove forests and have been involved in the exploitation of workers in Sumatra who raise the shrimp on a contract basis and are unable to get out of debt to the shrimp farm companies.

INDUSTRY

MANUFACTURING. Manufactured goods such as textiles, clothing, footwear, cement, and chemical fertilizers are an important part of Indonesia's international trade, with textiles being the largest export, as well as other labor-intensive products such as garments, furniture, and shoes. Indonesia has been unable to move to high-technology exports like computer equipment but has had growing success with basic machinery and electronics. In 2000, electronics increased to 10 percent of total

exports (not including oil and gas), still much less than other developed Southeast Asian economies such as Malaysia, Philippines, and Thailand.

Government policies of the 1970s helped move industry toward heavy industries such as petroleum processing, steel, and cement. The sector shifted again in the mid-1980s towards manufacturing of goods for exports, this time mostly through private rather than government investment. Manufactured exports grew in value from under US$1 billion in 1982 to more than US$9 billion in 1990. As a share of exports, manufactures grew from only 4 percent in 1965 to 35 percent in 1990. After a long period of growth, industrial production fell during the financial crisis that hit the region in 1997.

Following the government bailout of bankrupt companies, the Indonesian Bank Restructuring Agency (IBRA) officially owned most of the manufacturing sector in 2000, although the original owners may retain control of their businesses in the end. Small and medium businesses were less affected by the crisis because they borrowed less. However, they also suffered from the sudden disappearance of credit and were not eligible for bailout programs as the big companies were. The government, recognizing the historical failure to reach Small and Medium Enterprises (SMEs) with government assistance, established a task force to develop an SME strategy with support from the World Bank and the Asian Development Bank. The strategy, under preparation in 2000, aims to make businesses development services more responsive to SMEs, expand access to credit, and simplify regulations.

MINING. Important minerals and metals include tin, nickel, bauxite, copper, coal, gold, and silver. As in the oil and gas industry, foreign companies carry out mining operations, assume all risks, and share revenues with the government. The world's largest copper and gold mine is in Papua (formerly Irian Jaya); it has brought in tremendous revenues, but there have been charges of environmental damage and human rights abuses of local inhabitants.

OIL AND GAS. The role of oil and gas in Indonesia's economy is extremely important, especially following the OPEC oil price hikes in 1974. As a result, the share of government revenues derived from this sector grew from 19.7 percent in 1969 to 48.4 percent in 1975. As a share of export earnings, oil and gas hovered around two-thirds of the total over the next decade and even reached 80 percent in 1981. During the 1970s, these revenues were a major source of the country's development budget. By 1999 the economy was more diverse and had a strong manufacturing sector, with oil and gas accounting for just 20 percent of total exports of US$48 billion.

Indonesia is the world's largest exporter of liquefied natural gas, much of it from the strife-torn area of Aceh, where resentment of the government's failure to share the benefits of the windfall is one factor in the separatist movement. Most oil exploration and drilling is done by foreign contractors under agreements with Pertamina, the state-owned oil and gas company. Pertamina grew in the 1970s to be a colossal conglomerate active in many sectors, but it was later discovered to be deeply indebted and in need of restructuring. During this time it was an important source of unofficial funds for military and political factions.

SERVICES

The service sector, including stores, food vendors, and banks, is an important part of Indonesia's economy, accounting for 35 percent of the GDP in recent years. While more people work in agriculture, the service sector is an important source of wage labor, accounting for 12.4 million jobs in 1996. However, there is low productivity in the service sector, much of which lies within the **informal economy** (small businesses such as street vendors that are outside the formal system of registration and taxes).

FINANCIAL SERVICES. The Indonesian financial sector was long burdened by heavy debt and by numerous **bad loans** made on the basis of corruption and cronyism. In the aftermath of the financial crisis of the 1990s, more than two-thirds of bank loans were thought to be impossible to recover, and the number of banks fell from 238 to 162. Many surviving banks are technically bankrupt or limited by very low amounts of capital. Following the collapse of the banking system, the government formed the Indonesian Bank Restructuring Agency to restructure banks, collect on bad loans taken over from banks, and, unlike similar agencies in other countries, even sell assets pledged to it in return for the bailouts. IBRA reported US$52 billion in assets in 2000. The agency has been slow to carry out its duties, and has also been accused of cronyism.

By 2000 banks had slowly begun lending again, but mostly to consumers rather than companies. Businesses were forced to try to raise money in other ways, such as through their business activities, by borrowing overseas, or by issuing bonds. Deregulation in 1998 opened the banking, securities, and insurance industries to more foreign investment. In 1999, the central bank, Bank Indonesia, was given full autonomy from government interference. Bank Indonesia still works to maintain the value of the rupiah and keep inflation under control.

TOURISM. Given Indonesia's beaches, temples, and rich spectrum of cultural events, tourism remains an important source of foreign exchange. Bali is one of the most visited spots in the world. Fears of political instability and conflict have hurt tourism, though, in recent years, but there is a good potential for recovery and growth, as

facilities and infrastructure are intact, and the exchange rate is favorable to visitors.

In 1983 Indonesia discovered that tourism had fallen by a third in just 1 year and took measures to increase visits, including issuing visas on arrival, creating better airline connections, and appointing a minister of Tourism, Post and Telecommunications. The strategy worked, and tourist arrivals peaked at more than 5 million just before the financial crisis. Tourism has slowed since then, but in 2000 the government recorded a small increase, to 4.15 million foreign tourists. The airport on the small island of Bali accounts for 1.47 million arrivals alone. Continued increases in tourist arrivals are likely, but some tourists may be scared off by violence, ethnic unrest, and labor stoppages.

RETAIL. The **retail** market was badly affected by the financial crisis, as increased unemployment and poverty reduced consumer demand for goods. Retailers selling imported goods were forced to charge much higher prices. There has been some recovery since 1998, partially due to wealthier Indonesians' bringing money back from overseas where they tried to shelter it from the effects of the financial crisis. The retail food sector is dominated by traditional outlets such as small restaurants and the omnipresent street stalls, known as warungs. Modern supermarkets and retail outlets make up only 20 percent of retail food outlets even in Jakarta, which has the most advanced economy in the country.

INTERNATIONAL TRADE

In 1999, Indonesia exported $48 billion worth of goods and services and imported $24 billion. Exports are mainly low-tech goods and natural resource-based products, including sport shoes, textiles, basic electronics, plywood, furniture, paper, palm oil, rubber, and spices. Imports are primarily machinery and equipment, chemicals, fuels, and foodstuffs.

Japan is the main destination for Indonesian goods, with 18 percent of total 1999 exports, followed by the European Union (15 percent), the United States (14 percent), Singapore (13 percent), South Korea (5 percent), Hong Kong (4 percent), China (4 percent), and Taiwan (3 percent). Japan also is the main source of imports (17 percent), followed by the United States (13 percent), Singapore (10 percent), Germany (9 percent), Australia (6 percent), South Korea (5 percent), Taiwan (3 percent), and China (3 percent).

The crisis of the late 1990s ended a period of rising levels of trade, with exports increasing an average of 11 percent annually from 1993 to 1996. After the onset of the crisis, fluctuating exchange rates and the sudden absence of credit made it difficult for Indonesian companies to trade. Inflation and unemployment also reduced consumer demand for the increasingly expensive imports. Initial reports estimated that imports of **capital goods** (goods used to produce other goods), such as manufacturing equipment, fell 70 percent from 1997 to 1999. High levels of debt continue to restrict the ability of firms to borrow to finance trade deals.

The beginning of 2000 saw export growth resume to pre-crisis levels, although some of that was due to the rise in oil prices. Imports also rose, but by early 2000 they were still at only 60 percent of what they had been before the crisis. Further growth in imports is likely, especially in educational and training services, computers, telecommunications equipment, life insurance, and food supplements, as well industrial and agricultural chemicals, pulp and, paperboard, and equipment for forestry, mining, oil and gas exploitation, and food processing. There is still a need for reforms to reduce corruption and cronyism and promote the rule of law. Fears of political instability have also compounded the economic problems, scaring off foreign investors and trading partners.

MONEY

The first decades after independence were marked by rampant inflation, as Sukarno's government printed money as needed. After Suharto's New Order government took power in 1965, the so-called Berkeley Mafia of U.S.-trained economists was able to bring inflation un-

Trade (expressed in billions of US$): Indonesia

	Exports	Imports
1975	7.102	4.770
1980	21.909	10.834

der control through tight control of fiscal and **monetary policy**. An exception was the sudden surge of oil wealth that sent inflation soaring to 40 percent. Inflation was brought back under 10 percent by 1978, but in the meantime exports fell due to the combination of inflation and a **fixed exchange rate**.

To facilitate the exporting of goods at competitive prices, the government lowered the value of the rupiah 50 percent in 1978, and again in 1983 and 1986. After that devaluations of about 5 percent a year were allowed. Until the crisis of 1997, the government tried to limit exchange rate fluctuations to within this range (a policy called a "managed float"). Between 1990 and 1996 the rupiah depreciated by an average of 3.9 percent. This stability encouraged investment, as investors knew that their profits would not be eaten up by inflation. It also encouraged domestic businesses to borrow money in foreign currencies such as the dollar (reaching almost US$80 billion), which would prove disastrous for them once the rupiah crashed. In August 1997, after seeing neighboring countries try and fail to keep their currencies stable, the government announced it could no longer pursue the managed float policy. Exchange rates fell from Rp2,500=US$1 in July 1997 to Rp17,000=US$1 in June 1998, before improving to Rp8,000=US$1 later that year. Indonesia does not maintain capital controls, and foreign exchange may be freely converted and can flow in and out of the country unrestricted. As part of the recovery strategy, the International Monetary Fund required Indonesia to raise interest rates to bring back foreign investment.

The first stock exchange was set up in Jakarta (then known as Batavia) in 1912, though it was closed during World War II. After independence an exchange was established in 1952, only to be shut down by a program of nationalization in which the government took over private companies. In 1977 the modern Jakarta Stock Exchange was opened, first under government control and later privatized. Growth was slow at first, with only 24 traded companies by 1987. By 2000, only 278 companies have been listed, most of them owned by the company founders with small amounts of public ownership.

POVERTY AND WEALTH

At independence, Indonesia was an extremely poor country, and it was not until after the change in governments in 1965 that any progress was made in lowering the rate of poverty. In the 2 decades prior to 1996, Indonesia saw consistent growth, with the official poverty rate falling from 60 percent to 15 percent. However, not all groups and regions have benefitted equally, and Indonesia has a highly uneven distribution of income. The poorest fifth account for just 8 percent of consumption, while the richest fifth account for 45 percent. Average income today is about US$650 a year.

Poverty rates have always been higher in the outer islands. The rise of manufacturing disproportionately benefitted Java, Bali, and Sumatra due to the better infrastructure of the inner islands. Economic disparity and the flow of natural resource profits to Jakarta has led to dissatisfaction and even contributed to separatist movements in areas such as Aceh and Papua (Irian Jaya). While the new laws on decentralization (moving more economic and political decision-making to the outer islands) may partially address the problem of unequal growth and satisfaction, there are many obstacles to putting this new policy into practice.

The financial crisis of 1997 had social ramifications by reversing many of the income-distribution gains made over the previous decades. Though the enormous informal economy and family-support networks helped soften the impact of higher unemployment rates, social effects were nonetheless profound. In a few parts of the outer islands, the devaluation meant higher prices abroad for export crops such as cloves, nutmeg, cocoa, and vanilla, but overall, Indonesians suffered from rising poverty, surging unemployment, reduced schooling and public services, worsening health and nutrition, more crime and violence, and increased social stress and fragmentation. While some 15 percent of the population was below the poverty line before the crisis, an additional 40 million

people (20 percent of the population) may have since fallen into poverty.

Inflation has been a particular burden to Indonesia's poorest citizens. During the late 1990s, the price of rice, the staple food for most people, leapt from Rp1,000 per kilogram to Rp5,000. In 1998 the Ministry for Food and Horticulture estimated that about 80 million individuals were facing food shortages. In Central and East Java alone over 30 million people were able to afford only 1 meal per day. Eastern Indonesia, hard hit by drought as well as economic problems, experienced widespread famine. Due to the rising costs of imports, medicine ran short and prices doubled or tripled. The International Labor Organization estimated that the number of Indonesians using public health services would double in 1998, to 68 percent of the population, even as the government was under pressure to spend less money on such health-related public services. It was reported in the press that the number of women dying in childbirth shot up from 22,000 per million to 35,000 per million in the space of 1 year, due to the lack of money to transport women to health facilities and to increased anemia levels in pregnant women.

In 1998 education accounted for 14 percent of household expenditures. Rising school costs and falling family incomes forced many poor students to drop out of school. Roughly 5 percent of students did so in 1999 alone, according to official estimates. Enrollments in junior high schools in Jakarta declined disproportionately in the case of girls (19 percent), as did enrollment in poorer rural areas. In July 1998 the government launched a scholarship program for the poorest students. However, to help pay for this program it had to cut funding for high schools and colleges.

WORKING CONDITIONS

The Indonesian **labor force** is estimated at about 95 million, two-thirds of which is between the ages of 15 and 34, and two-fifths of which is made up of women. Even during the period of significant GDP growth from 1985 to 1995, the rise in employment failed to keep up with the rise in population. More than 4 million people (nearly 5 percent of the labor force) were looking for jobs even before the crisis of 1997. The government's August 1999 Labor Force Survey found 6 million people over age 15 unemployed, and a much higher number **underemployed** (34 million workers, or 39 percent), working less than 35 hours a week in 1998. Some economists question the reliability of these figures, and suggest that more than half the population is underemployed.

In 1998, the labor force was distributed approximately as follows: agriculture (45 percent); trade, restaurant, and hotel (19 percent); manufacturing (11 percent); transport and communications (5 percent); and construction (4 percent). The manufacturing workforce is skilled in the basics but undereducated. While many light manufacturing companies, such as sneakers and clothing plants, opened factories in Indonesia to take advantage of a mostly young, female labor pool of migrants to the cities, high-tech manufacturers have been slow to move in. As competition increases from China, Vietnam, and India, these unskilled workers are starting to lose out. There have been well-documented charges of sweatshop conditions (forced overtime, unsafe workplaces, and inadequate pay) in many of these export-oriented factories.

The government sets minimum wages in each region; in Jakarta it was set at Rp286,000 (US$33) per month in April 2000. While workers were allowed to join a single union established by the government under the Suharto regime, new regulations put forth in 1998 have allowed the formation of more than 2 dozen new labor unions. Strikes have increased in recent years, with the return of economic activity. According to the International Labor Organization, "women are likely to be more adversely affected by the [economic] crisis than men. They are concentrated in the most precarious forms of wage employment and are thus more vulnerable to lay-offs."

Indonesia has also traditionally sent large numbers of workers overseas, both legally and illegally. As countries

such as Malaysia and Thailand suffered the effects of the crisis, nearly all of these Indonesian workers were sent home, worsening the problems of unemployment and poverty.

COUNTRY HISTORY AND ECONOMIC DEVELOPMENT

1300s. Islam begins to take hold in Indonesia.

1500. Fall of Majapahit marks the last Hindu-Buddhist empire.

1511. Portuguese explorers arrive in the islands seeking trade in spices.

1596. The first Dutch ships arrive.

1602. The Dutch East India Company is formed as a private stock company to trade, make treaties, and maintain troops in the Indies.

1799. The Dutch East India Company declares bankruptcy and is replaced by Dutch government bureaucracy.

1830. The Dutch institute the Culture System, a forced cultivation system to produce coffee, sugar, indigo, pepper, tea and cotton, resulting in rice shortages and famines.

1927. Sukarno, a university student who later becomes president, founds the Indonesian National Party.

1942. The Japanese invade Indonesia during World War II, driving out the Dutch.

1945. The Dutch return, only to find Indonesians declaring independence on 17 August.

1949. Indonesia's independence is recognized, and Sukarno is elected as the first president.

1965. Suharto takes power in a military coup.

1974. Oil revenues rise due to price hikes by OPEC.

1975. Indonesia invades East Timor.

1978. First major devaluation (50 percent) of the rupiah occurs following inflation.

1980s. Oil prices fall, leading to shocks in the economy.

1988. Economic reform packages begin to open up trade, investment, and banking and reduce monopolies.

1997. The Asian financial crisis hits Indonesia, leading to the crash of the rupiah, bank and business failures, and unemployment.

1998. Suharto steps down in the face of massive protests.

1999. President Abdurrahman Wahid is sworn in.

2001. Wahid is impeached in July, and vice president Megawati Sukarnoputri is installed as president.

FUTURE TRENDS

In 2001, Indonesia stood at a crossroads. Just 3 years after the removal of the autocratic Suharto, only the country's second leader since independence, the country had gone through 3 presidents, with the second, Abdurrahman Wahid, removed by impeachment. The biggest question on the political horizon is whether the newly-installed President Megawati Sukarnoputri can secure the stability of the presidency and lead the way to peaceful elections in 2003. Her critics worry that she will lead the country back to the days of military control. Foreign investment and economic stability in the coming years may well depend on her success.

If all goes well politically, Indonesia should be able to build on its strengths to restore the confidence of foreign investors. It has a large domestic market and labor force, a well-functioning telecommunications and infrastructure, extensive natural resources, a strategic location, and experience with market economics. Many obstacles remain to economic recovery, however: Indonesia's huge public and private debt, private assets under government control that must be restructured or sold, its ineffectual legal system, and cronyism. Despite the need for social programs, the much higher debt that followed the crisis will pressure the government to keep expenditures down. While more investment is needed, a forecast by the National Development Planning Agency in May 2000 found that even with optimistic assumptions about successful reforms, foreign investment would not return until 2002.

Reform is progressing slowly. At the end of 2000, the IMF was threatening to delay new loans unless Indonesia fulfilled previous promises to take action to reduce risks in its decentralization plan, use higher oil revenues to pay down debt, and set a timetable for selling assets obtained through the bailout.

The economy will also be affected by whether the decentralization process is able to increase the fair development of the regions while still reassuring investors of stability. It is hoped that better sharing of revenues with the provinces will reduce some tensions, but unrest is likely to continue in some of the most conflict-torn areas, such as Maluku, Aceh, and Papua (Irian Jaya).

DEPENDENCIES

Indonesia has no territories or colonies.

IRAN

Islamic Republic of Iran
Jomhuri-ye Eslami-ye Iran

CAPITAL: Tehran.

MONETARY UNIT: Iranian rial (IR). One Iranian rial equals 100 dinars. There are coins of 1, 5, 10, 20, and 50 rials and notes of 100, 200, 500, 1,000, 2,000, 5,000, and 10,000 rials.

CHIEF EXPORTS: Petroleum (80 percent), carpets, fruits, nuts, hides, steel.

CHIEF IMPORTS: Machinery, military supplies, metal works, foodstuffs, pharmaceuticals, technical services, refined oil products.

GROSS DOMESTIC PRODUCT: US$347.6 billion (purchasing power parity, 1999 est.).

BALANCE OF TRADE: **Exports:** US$12.2 billion (f.o.b., 1998). **Imports:** US$13.8 billion (f.o.b., 1998).

COUNTRY OVERVIEW

LOCATION AND SIZE. Iran, a country slightly larger than Alaska, is located in the Middle East, bordering the Gulf of Oman and the Persian Gulf in the south and the Caspian Sea in the north. It covers an area of 1.648 million square kilometers (636,296 square miles) and is edged between Iraq, with which it shares a border of 1,458 kilometers (906 miles), and Pakistan and Afghanistan in the east, with which Iran has 909 kilometers (565 miles) and 936 kilometers (582 miles), respectively, of common borderline. Iran also shares 499 kilometers (310 miles) of borderline with Turkey, 992 kilometers (616 miles) with Turkmenistan, 432 kilometers (268 miles) with Azerbaijan, and some 35 kilometers (22 miles) with Armenia, the latter 3 states formerly being part of the USSR.

Most of the 2,440 kilometers (1516 miles) of coastline are on the Persian Gulf and the Gulf of Oman. The 2 gulfs are connected by the strategic strait of Hormuz. Iran has dozens of islands in the Persian Gulf, many of which are uninhabited but used as bases for oil exploration. Those that are inhabited—notably Qeshm and Kish—are being developed, attracting investors and tourists. The Iranian coast of the Caspian Sea is some 740 kilometers (460 miles) long. Apart from being home to the sturgeon that provides for the world's best caviar, the Caspian Sea is the world's largest lake, with an area of some 370,000 square kilometers, and is co-owned by Azerbaijan, Russia, Kazakhstan, and Turkmenistan.

In general, Iran consists of an interior plateau, 1,000 meters to 1,500 meters (3,000 feet to 3,500 feet) above sea level, ringed on almost all sides by mountain zones. The Elburz range with the Iranian capital, Tehran, at its feet, features the country's highest peak, the snowcapped volcanic cone of Mt. Damavand, at 5,604 meters (18,386 feet). To the north of the range there is a sudden drop to a flat plain occupied by the Caspian Sea, which lies about 27 meters (89 feet) below sea-level and is shrinking alarmingly in size. The larger Zagros mountain range runs from north-west Iran down to the eastern shores of the Persian Gulf, and then eastward, fronting the Arabian Sea, and continuing into Pakistan.

The interior plateau of Iran is mostly desert, and the settled areas are generally confined to the foothills of mountains, though oasis towns, such as Kerman, are growing in size. Major towns and historical centers are spread all over the country, such as the country's largest cities of Tabriz (1.2 million) in the far northwestern corner; Mashhad (1.9 million) in the far northeastern corner; Esfahan (1.3 million) to the south; and Shiraz (1.1 million) to the distant south of the capital, Tehran (6.8 million).

POPULATION. Iran's population was estimated to total 65.6 million in July 2000 according to CIA figures. Almost two-thirds of Iran's people are of Aryan origin—their ancestors migrated from Central Asia. The major groups in this category include Persians, Kurds, Lurs, and Baluchi. The remainder are primarily Turkic but also include Arabs, Armenians, Jews, and Assyrians. Iran's

ethnic diversity is reflected in the variety of languages Iranians speak, with 58 percent speaking Persian and Persian dialects, 26 percent speaking Turkic dialects, 9 percent Kurdish, and 7 percent other languages. Persian—an Indo-European language almost unchanged since ancient times with a share of Arabic, Turkic, and European words—is now spoken by the majority of Iranians as their first language and operates as a lingua franca for minority groups. Although granted equal rights by the constitution, ethnic minorities are second-class citizens.

Iran's population is approximately 99 percent Muslim, of which 89 percent are followers of the state religion, Shi'a Islam. Some 10 percent are followers of the Sunni branch of Islam (mostly Turkomen, Arabs, Baluchs, and Kurds living in the southwest, southeast, and northwest). Sufi Brotherhoods (mystical religious orders) are popular, but there are no reliable figures available to judge their true size. Baha'is, Christians, Zoroastrians, and Jews constitute less than 1 percent of the population. The largest non-Muslim minority is the Baha'i faith, estimated at about 300,000 to 350,000 adherents throughout the country. Estimates on the size of the Jewish community vary from 25,000 to 30,000. These figures represent a substantial reduction from the estimated 75,000 to 80,000 Jews who resided in the country prior to the 1979 Revolution. The Christian community is estimated at approximately 117,000 persons. According to government figures the size of the Zoroastrian community was estimated at approximately 35,000 adherents. Zoroastrian groups cite a larger figure of approximately 60,000. Zoroastrianism was the official religion of the pre-Islamic Sassanid Empire and thus has played a central role in Iranian history. Zoroastrians are mainly ethnic Persians concentrated in the cities of Tehran, Kerman, and Yazd. In general, society is accustomed to the presence of Iran's pre-Islamic, non-Muslim communities. However, the government re-

stricts freedom of religion, creating a threatening atmosphere for some religious minorities, especially Baha'is, Jews, and evangelical Christians.

Iran has a relatively young population, with 34 percent of the population under the age of 14 and 61 percent between 15 and 64 years of age. Thanks to a family planning program, population growth decreased from 3.2 percent in 1984 to 1.7 percent in 1998 and further to 0.83 percent in 2000. Of the population, an estimated 38 million Iranians (or 60 percent) live in urban areas, while approximately 27 million live in rural areas. The population density was 37.6 inhabitants per square kilometer (97 per square mile) in 1998, though many people are concentrated in the Tehran region, and other parts of the country (especially deserts) are basically uninhabited. Basic literacy rates are above the regional average, although uncertain reporting standards give a wide margin for error. In 1997–98 the central bank estimated literacy at 80.5 percent in those over 6 years old, with 75.6 percent of women and 85.3 percent of men judged to be functionally literate, i.e. they were taught to read and write at some point.

Between 1920 and 1960 Iran's population doubled to 23 million, and by 1979 the equivalent to the entire population of the country in 1920 had been added. Most of the increase in population migrated to urban centers and found jobs in industry and services, as opposed to agriculture. In 1960, about one-third of the population lived in towns; by 1979 nearly half the population was urban. Tehran became the center of government, higher education, and industry; in 1976, it contained two-thirds of all university students, and nearly one-third of high school students; about half of all factories were in or around Tehran. After the Islamic revolution of 1979, this trend continued. Currently, around 60 percent of the Iranian population lives in towns. Tehran remains the principal political, economic, and industrial center, with a population of 6.8 million, according to a 1996 census, although it is very likely that the metropolitan area accommodates some 11–12 million people, or 20 percent, of the country's overall population.

The civil war in Afghanistan, the Iran-Iraq war of the 1980s, and Iraqi policies in the aftermath of the Gulf War in 1990–91 have caused a constant influx of refugees to Iran. The country hosts the largest refugee population in the world. According to the government, the total refugee population counts 2 million—1.4 million Afghans and 580,000 Iraqis—while a smaller number have been driven into Iran by the conflict in the Nagorny Karabakh region in Azerbaijan. The Iraqis include Kurds from the north and Arab Shiites from the south. Only 5 percent of refugees live in 30 designated camps, while others are scattered among cities and villages throughout the country. The increase in unemployment and deteriorating economic conditions have somewhat eroded the Iranians' so far rather tolerant and welcoming attitude toward refugees, and more pressure is being exerted for refugees to return to their countries of origin. The Iranian government feels it bears a heavy social and economic burden and believes the international community should share more of this burden.

OVERVIEW OF ECONOMY

Iran has a mixed economy that is heavily dependent on export earnings from the country's extensive petroleum reserves. Oil exports account for nearly 80 percent of foreign exchange earnings. The constitution mandates that all large-scale industries, including petroleum, minerals, banking, foreign exchange, insurance, power generation, communications, aviation, and road and rail transport, be owned publicly and administered by the state. Basic foodstuffs and energy costs are heavily subsidized by the government. Although economic performance improved somewhat during 1999 and 2000 due to the worldwide increase in oil prices, performance is affected adversely by government mismanagement and corruption. Unemployment was estimated to be as high as 25 percent, and **inflation** was an estimated 22 percent. Iran's **gross national product** (GNP) is the highest in the Middle East, although its GNP per capita is comparatively low because of Iran's large and growing population.

From medieval times until the 20th century, the socioeconomic structure of Iran remained almost unaltered. Only half of the population was settled; the remainder were tribal nomads, mainly engaged in the herding of grazing animals. A system of land assignment was in place, similar to the medieval European system of feudalism, under which the ruler, the shah, granted land to loyal subjects who became absentee landowners, collecting taxes from the peasants on their land. Economic activity further suffered from the handicaps of topography and climate, as well as prolonged political and social insecurity (with constant pressure by foreign powers). Things began to change when Reza Shah Pahlavi, a colonel in the Persian army and founder of the Pahlavi dynasty, seized the throne in 1925 and initiated a modernization of Iran's political and economic system, while also changing the country's name from Persia to Iran.

Following World War II the new shah, Mohammed Reza, guided the economy through public planning, urbanization, industrialization, and investment in the **infrastructure**, and achieved sustained growth, all supported by substantial oil revenues. Compared with other third world countries during the period from 1960–77, Iran's annual real growth rate of nearly 9.6 percent was about double the average. Therefore, one explanation for the Islamic revolution of 1979 is that the modernization

program imposed by the shah was too rapid for the Iranian people, who wished to hold on to their traditional values and ways. Another view suggests that in fact, the shah failed to modernize rapidly enough. The Iranian economic and social infrastructure was found increasingly inadequate to meet expectations, despite rising oil revenues that produced a superficial modernism. The standard of living did increase in Iran during the early 1970s, when per capita income rose from US$180 per year just before the massive oil price increase to US$810 in 1973–74, and up to an estimated US$1,521 just one year later. During the last years of the shah's reign, per capita income rose less rapidly and living costs soared. By 1978, the typical rent for a house in Esfahan had risen from about US$70 per month in 1973 to over US$500 a month, while a typical salary was still below US$2 per hour. In addition, corruption had become widespread.

In 1979 an Islamic revolution ousted Shah Mohammed Reza Pahlavi from power and placed the Shiite clergy in control of the government of the country. The revolution was followed by trade **sanctions** and the freezing of Iranian assets in the United States after radical Iranian students stormed the American embassy in Tehran and held embassy staff as hostages. These measures and the war which broke out between Iran and Iraq in September 1980 and lasted for 8 years harmed the development of the Iranian economy considerably. Since that conflict, efforts to resume broad economic development and diversification have been hindered by volatile world oil prices, by internal structural weaknesses and rampant inflation, and by persistent political tensions with the West, especially with the United States, which still considers Iran to be the most active state sponsor of terrorism, supporting extremist groups such as Lebanon-based Hezbullah and the Palestinian Hamas.

The most remarkable features of the post-revolutionary Iranian political and economic scene are the influence of the so-called *bazaar* and the *bonyad*. The bazaar refers to Iran's traditional import-export markets, the leaders of which wield considerable influence over economic policy. These leaders, known as bazaaris, showed their power in 1978 by calling a series of strikes, paralyzing Iran's economy and speeding up the departure of the shah. Since the revolution the bazaaris have enjoyed a close relationship with the Islamic regime, benefiting from lucrative business contracts in exchange for funding individual mosques and conservative parliamentary and presidential candidates. The bazaar also provides an informal banking service to the **private sector** and is responsible for much of the **black-market** trade in currency; as a result, bazaaris tend to oppose **exchange-rate** reunification. In broad terms, they also oppose wider economic reform, the reduction of **tariff** barriers, and the greater participation of foreign investors in the economy.

The bonyad (religious foundations) were created after the revolution to safeguard the Islamic Republic's revolutionary principles and to attend to the plight of the poor. While providing much-needed welfare support for the families of those killed or wounded in the Iran-Iraq war, the bonyad have exploited their position to become multi-billion dollar conglomerates controlling large portions of the Iranian economy, especially properties and businesses taken from the Pahlavi family and individuals associated with the monarchy. The larger bonyad, such as the Bonyad-e Mostazafan (Foundation of the Oppressed) and Bonyad-e Shahid (Foundation of the Martyrs), oppose better relations with the West and the **liberalization** of the economy, fearing that foreign investment in Iran could threaten their economic empires.

In the early 1990s, Iran faced a huge **foreign debt** and other serious economic dislocations stemming from the nearly decade-long Iran-Iraq war (1980–88), while its population continued to grow at a rapid pace. Most of the economic resources were allocated through the vast **public sector**, widespread **price controls**, extensive trade and exchange restrictions, heavily subsidized energy and petroleum products, and protective labor and business practices. With oil prices changing considerably during the 1980s, planning became difficult and resulted in inflation, since the government did not want to borrow on international markets, but financed war-related and other expenses through the central bank. Between 1981–82 and 1984–85, the **real GDP** had grown by about 8 percent annually, which reflected oil production and export recovery after the low-point during and in the immediate aftermath of the revolution. But when oil prices fell to a historic low in 1987–88, this drop was also reflected in the economy at large, and Iran witnessed a negative growth rate of 10 percent.

After the war, efforts were made to revive oil exports and to shift the economy onto a peacetime basis. Through the 1990s, attempts at **privatizing** public enterprises, liberalizing prices and the exchange system, removing tariff barriers, and lowering **income taxes** to encourage investment were made. During the First 5 Year Development Plan (1989–94), these measures worked well and the economy grew in real GDP terms at an average annual rate of 7 percent. While the First 5 Year Development Plan focused on infrastructure development and reconstruction programs, the Second 5 Year Development Plan (1994–99) concentrated on Iran's financial problems. The sharp drop of oil prices in 1998–99 forced the government to abandon structural reforms and brought about a **budget deficit** of US$2.1 billion, which was financed by monetary expansion, thus accelerating inflation from 17 percent in 1997–98 to 25 percent in 1998–99.

The reformist president Khatami, elected in 1997, has continued to follow the market reform plans of his

predecessor, President Rafsanjani, and has indicated that he will pursue diversification of Iran's oil-reliant economy, although he has made little progress toward that goal so far, mainly because of Iran's dependence on oil and the decline in oil prices in the first 2 years of his government. A broad program of economic adjustment and reform was issued in August 1998 to form the Third 5 Year Development Plan (2000–05). It involves restoring market-based prices, reducing the size of the public sector and encouraging private sector investment. As a result, domestic petroleum prices were raised by 70 percent in 1999, and a more market-based official exchange rate was introduced on the Tehran Stock Exchange (TSE).

The recovery of oil prices during 1999–2000 significantly strengthened Iran's external and financial position. Although annual GDP growth remained weak at 2.4 percent and the **inflation rate** remained almost unchanged at 20 percent, the government incurred a large **budget surplus** of about US$4.7 billion and hurried to pay **external debt**, reducing outstanding debt to about 10 percent of the GDP. The Third 5 Year Development Plan aims at accelerating growth to an average annual rate of 6 percent in order to create sufficient employment opportunities for the rapidly growing **labor force**, which currently increases by an estimated 5 percent every year.

POLITICS, GOVERNMENT, AND TAXATION

The Islamic revolution of 1979, during which the monarch, Shah Mohammed Reza Pahlavi, was driven out of the country, brought the Shiite clergy to power with Ayatollah Ruhollah Khomeini as its charismatic leader. Following the revolution, Iran adopted a constitution based on Ayatollah Khomeini's theory of Islamic government. The constitution ratified by popular referendum established a theocratic (from ancient Greek, literally meaning "the rule of God") republic and declared as its purpose the establishment of institutions and a society based on Islamic principles and norms, adopting the shari'a (Islamic law) as the basis for the country's legal system. The Constitution of the Islamic Republic provided for a *Vali-ye Faqih*, a Supreme Leader of the Islamic Revolution. Since the death of Ayatollah Khomeini, in 1989, this office has been held by Ayatollah Ali Khamenei. The Supreme Leader still enjoys primary control of many organs of the state and has the right to appoint key officials such as heads of the judiciary, the broadcast media, the armed forces, and various revolutionary bodies, as well as the power to supervise the overall policies of the regime.

The 1979 constitution created an Islamic Consultative Assembly called the Majlis, Iran's most democratic legislature in its history. Its 290 members are elected by universal adult suffrage—men and women from the age of 16 are eligible to vote—and serve for 4-year terms. The Majlis develops and passes legislation that is reviewed for adherence to Islamic and constitutional principles by a Council of Guardians, which consists of 6 clerical members. These are appointed by the Supreme Leader and 6 jurists, who in turn are appointed by the head of the judiciary and approved by the Majlis. The constitution provides the Council of Guardians with the power to disqualify candidates for elective offices based on a set of requirements, including the candidates' ideological beliefs.

The country's president is elected by popular vote to a 4-year term and has the power to appoint a cabinet known as the Council of Ministers, with the approval of the legislature. Mohammad Khatami was elected in elections held on 3 August 1997.

Political parties, legalized in 1998 after a 13-year ban, are still at an early stage of development. Nevertheless, factions within the ruling hierarchy, particularly in the Majlis, are increasingly visible. While these are most often defined broadly as "reformist" or "conservative," political allegiances do exist based on patronage, loyalties, specific interests, and the exchange of favors.

Several agencies share responsibility for internal security, including the Ministry of Intelligence and Security, the Ministry of Interior, and the Revolutionary Guards, a military force that was established after the revolution. Paramilitary volunteer forces known as Basijis, and groupings, known as the Ansar-e Hezbollah (Helpers of the Party of God), who often are aligned with specific members of the leadership, act as watchdogs, intimidating and physically threatening demonstrators, journalists, and individuals suspected of counterrevolutionary activities. According to Amnesty International and Human Rights Watch, both regular and paramilitary security forces committed numerous serious human rights abuses. Iranians also suffer from violations of freedom of expression. Iran's conservative-dominated judiciary waged an extensive campaign against the local reformist press, closing newspapers and prosecuting critical journalists throughout 2000.

HISTORICAL BACKGROUND. Although briefly occupied during World War II by Soviet and British troops, Iran is 1 of only 2 countries in the Middle East that were never colonized (the other being Saudi Arabia). However, the country's geopolitical significance—Iran has the longest Gulf shoreline and is a vital link between Asia, the Middle East and Europe—has made it of central concern to the world's most powerful empires and a target for frequent political manipulation. Following the occupation of Iran by allied forces during World War II, Iran's Pahlavi ruler, Reza Shah, was forced to abdicate in favor of his son, Mohammed Reza.

Mohammed Reza Pahlavi sought to ally Iran closely with Western powers and particularly with the United States. However, growing nationalist sentiment in Iran forced him to appoint the nationalist Mohammed Mossadeq as prime minister in 1951. Prime Minister Mossadeq **nationalized** the Anglo-Iranian Oil Company (AIOC) the same year, sidelining the shah politically. Alarmed at the threat the nationalist leader posed to their position in the Gulf and the broader Middle East, the Western powers imposed an oil **embargo** on Iranian exports, crippling the government. This was followed in 1953 by support from the U.S. Central Intelligence Agency (CIA) and the British counter-intelligence agency, MI6, for a successful coup, which overthrew Mossadeq and returned authority to the shah. Mohammed Reza subsequently initiated a massive modernization program, known as the "white revolution," accompanied by a greater centralization of power and increased use of repression to subdue political dissent. In 1964 the government exiled the cleric Ayatollah Khomeini after a series of his speeches led to widespread rioting.

The oil price explosion of 1973–74 fueled rapid economic growth, but at the cost of increased volatility in the Iranian economy and high levels of inflation. Economic hardship, the growing dominance of Western culture—which traditional Iranians found offensive—and the government's repressive security methods brought about an increasingly determined collection of opposition groups. Unifying into an anti-monarchist coalition with Ayatollah Khomeini as their figurehead, these activists organized nation-wide demonstrations and strikes, culminating in the overthrow of the Pahlavi dynasty in February 1979 and the return of Khomeini from exile. Following a popular vote, Iran became a self-styled "Islamic Republic" in March 1979.

International opinion turned strongly against the new government in November 1979, when militant students seized the U.S. embassy in Tehran and held 52 people hostage for more than a year. In September 1980, Iraqi forces invaded Iran, hoping for an easy victory that would allow the annexation of Iranian territory around the strategically important Shatt al-Arab waterway. While remaining neutral, the Western powers, together with many Arab states, assisted Iraq in order to suppress Khomeini's Islamic state. Until August 1988, when Iran finally accepted a U.N. cease-fire resolution, the 2 countries engaged in one of the bloodiest wars of the century, suffering widespread human and economic losses. Ayatollah Khomeini died in June 1989, and the Council of Experts, a clerical body empowered to choose the next Supreme Leader, selected Hojatoleslam Seyyed Ali Khamenei as Khomeini's successor, rapidly promoting him to the clerical rank of Ayatollah (literally: Sign of God). Hojatoleslam Ali Rafsanjani won the presidential election in August of the same year.

Since the amendment of the constitution in 1989 the president has appointed the government, though all ministers must be approved by the parliament before taking office. Iran's domestic politics have since evolved into an increasingly bitter power struggle between conservatives and reformers within the regime. From 1989 to 1997, President Rafsanjani sought to implement a program of gradual economic and political reform, but his more conservative rivals frequently blocked his policies. In 1997, the reform-orientated cleric, Mohammad Khatami, was elected to a 4-year term as president in a landslide victory and is set to stand a second term in June 2001 after winning the election with a great majority, almost 77 percent of the votes cast. Though with a turnout at the polls of only 65 percent of eligible voters, after 90 percent in the 1997 election, people seem to be disillusioned by politics and the pace of reform. Mohammed Khatami's reform-orientated supporters also defeated the conservatives in the parliamentary election held in February 2000, gaining majority control. Nevertheless, the power struggle with the conservatives continues. Through their control of various oversight institutions, the judiciary and state-run broadcasting, they manage to contain power.

INFRASTRUCTURE, POWER, AND COMMUNICATIONS

Iran's infrastructure is relatively poor and inadequate. Part of this stems from the fact that the vast country was never fully developed, but it also experienced considerable setbacks during the Iran-Iraq war of the 1980s, and restoration since then has been slow.

TRANSPORTATION. Iran has a network of 140,200 kilometers (87,120 miles) of roads, of which 49,440 kilometers (30,722 miles) are paved. The 2,500-kilometer (1,553-mile) A1 highway runs from Bazargan on the Turkish border across Iran to the Afghan border in the east. The A2 runs from the Iraqi border to Mirjaveh on the Pakistani frontier. Tehran is linked to major cities in the vicinity by 470 kilometers (292 miles) of expressways. A heavy expansion of car use has led to increased demand for fuel, severe overcrowding of roads in metropolitan areas, and mounting pollution problems. Government estimates put the average annual increase in domestic fuel consumption at 5.5 percent, well above the real economic growth rate. The government has sought to limit motor use by raising domestic fuel prices, but petroleum products in Iran remain heavily subsidized and among the cheapest in the world.

An important transportation link is the railway constructed with great effort before World War II between the Caspian Sea, Tehran, and the Persian Gulf. Other rail links with neighboring countries already exist or are un-

der construction. Recently the long-closed link to Van in Eastern Turkey reopened, enabling passengers and goods to travel from Tehran to Istanbul and on to Europe. Overall, the Iranian railway network covers 5,600 kilometers (3,480 miles).

The Shatt al-Arab, the main waterway shared by Iran and Iraq on the Persian Gulf, is navigable by maritime traffic for about 130 kilometers (81 miles). Ports include Abadan/Khorramshahr, which was largely destroyed in fighting during the Iran-Iraq war, and has been overtaken by Bandar Abbas as the country's major port. About 12 million tons of cargo pass through Iran's Gulf ports each year. Smaller ports at Bushehr, Bandar Lengeh, and Chah Bahar have also assumed new importance. The 1998 Lloyd's Register of Shipping lists 382 Iranian merchant vessels.

The 3 major international airports of Tehran, Bandar Abbas, and Abadan, have recently been joined by the international airports on the free-trade islands of Qeshm and Kish. Most domestic and international flights go through Mehrabad international airport in Tehran. The huge Imam Khomeini international airport to the south of Tehran, currently under construction, is going to take over operations in a few years with a projected capacity of 30 million passengers a year. The state-owned national carrier, Iran Air, serves 15 Iranian cities and runs scheduled routes in the Gulf, Asia, and Europe. In 1997 it carried 907,000 international and 6,240,000 domestic passengers.

POWER. Electricity generation was severely restricted by Iraqi attacks on power stations during the Iran-Iraq War, reducing available capacity from 8,000 MW to 5,000 MW, according to estimates. In December 1988, the Ministry of Energy stated that the general capacity of the national grid was deficient by at least 2,500 MW, owing to war damage, lack of fuel, and inadequate rainfall. At the beginning of the 1990s, residential consumption accounted for about 40 percent of total consumption, and industry for about one-quarter. However, industrial demand rose dramatically and accounted for almost half of total consumption in 1998. Overall consumption reached 90 billion kilowatt hours (kWh) in 1998, up from 73.4 billion kWh in 1994. Installed power production capacity had reached about 24,000 MW, with another 4,600 MW coming from private generators.

Iran plans to increase this capacity to 96,000 MW by 2022. Power plants currently under construction, and due for completion by 2002, will add about 13,000 MW to the national grid. Some 8,000 MW of this will come from hydroelectric (turbines powered by water that generate electricity) dams, although the proportion of hydroelectricity will fall in subsequent years. The balance of 5,000 MW under construction comes from gas-fuelled plants and other facilities. Currently, some 89.5 percent of electricity is produced by thermal power plants (using fossil fuels like coal, oil, or gas) and the rest by hydroelectric stations. Recent years have seen Iran advancing on a nuclear power program of 3,000–5,000 MW. The United States stated that nuclear cooperation and the transfer of technology to Iran was dangerous, as it would accelerate a secret program to develop nuclear weapons. Nevertheless, Chinese and Russian officials have expressed their determination to proceed with deals aimed at selling nuclear reactors to Iran.

TELECOMMUNICATIONS. As a result of heavy investment in the telephone services since 1994, the number of long-distance channels has grown substantially; many villages have been brought into the net. The number of main lines in the urban systems has approximately doubled since 1994, and the technical level of the system has been raised by the installation of thousands of digital switches. Countrywide, there were some 7 million lines in 1998. There is now also a mobile cellular system in place that was serving 265,000 subscribers in August 1998. This figure is up from under 60,000 in 1996 and has grown rapidly since.

Iran has radio relays to Turkey, Azerbaijan, Pakistan, Afghanistan, Turkmenistan, Syria, Kuwait, Tajikistan, and Uzbekistan. The fiber-optic Trans Asia Europe line

runs through northern Iran, and the country is also connected to the Fiber-optic Link Around the Globe (FLAG) through a submarine fiber-optic cable link to the United Arab Emirates.

Internet access is increasing. However, price rather than official censorship remains the greatest hindrance to wider use. The state remains in control of terrestrial radio and television broadcasts, but the illegal use of satellite television receivers in urban areas continues to be widespread. There were 82 radio stations in 1998, and Iranians had 17 million radios. Television receivers numbered 4.9 million.

ECONOMIC SECTORS

Iran's economy clearly relies on its natural resources, and most importantly, oil. Agriculture still contributed 21 percent to the GDP in 1999, while industry accounted for 34 percent, and services for 45 percent. About one-third of the labor force is engaged in agriculture (33 percent); industry employs 25 percent of the workforce and 42 percent are occupied in services. Except for petroleum and petrochemical industries, Iran also has industrial production in steel, textiles, cement and other construction materials, food processing (especially sugar refining and vegetable oil production), metal fabricating, and armaments.

After the Islamic revolution in 1979, Iran nationalized all major industries, banks, and insurance companies. It committed itself to heavy investment in both the agricultural sector and selected industries, with the ultimate goal of economic independence, but unstable internal conditions and the war with Iraq made economic growth almost unattainable until the mid-1990s. The revival of oil production helped stabilize national finances, and free-market initiatives and reforms sparked a rise in domestic agricultural and industrial production.

AGRICULTURE

Iran is a mostly arid or semi-arid country, with a subtropical climate along the Caspian coast. Deforestation, **desertification**, overgrazing, and pollution from vehicle emissions and industrial operations have harmed the land over the last few decades and hampered production. Other significant problems include poor cultivation methods, lack of water, and limited access to markets. Iran's agricultural sector is especially dependent on changes in rainfall, and although the government has attempted to reduce this dependence through the construction of dams, irrigation and drainage networks, agriculture remains highly sensitive to climate developments. Still, the agricultural sector accounts for about one-fifth of the GDP and employs one-third of the workforce. The country's most important crops are wheat, rice, other grains, sugar beets, fruits, nuts, cotton, and tobacco. Iran also produces dairy products, wool, and a large amount of timber. Irrigated areas are fed from modern water-storage systems or from the ancient system of qanat. Qanat are underground water channels stretching up to 40 kilometers (26 mi) and first used at least 2000 years ago. Unfortunately, many of them have fallen into disrepair in recent years.

The centerpiece of the "white revolution," during which the shah pressed the modernization of Iran during the 1960s, was land reform. Until the 1950s, only about 5 percent of peasants owned sufficient land to maintain themselves. The dominant figures in rural areas were the

landowners; it is estimated that about half of Iran's cultivated land was held by big landowners, those who controlled one or more villages, a typical holding being between 20 and 40 villages (there were some 70,000 villages altogether). These landowners were absentees and included members of the royal family, military officers, tribal shaykhs, religious dignitaries, and big merchants. The land reform, which began in 1961 and was not completed until 1971, had dramatic effects. The power and influence of large landowners was extinguished; smaller absentee landowners survived and in 1971 still owned half of all cultivated land. Seemingly, the benefits went to those 50 percent of peasants who had cultivation rights. By 1971, 90 percent of them were owners of land, though it turned out that for most of them acquired holdings were too small to support a family. Farm laborers remained without rights and holdings.

The traditional dominance of agriculture was eroded by oil and gas exploitation, which became the country's major source of export revenues as population growth made Iran a net importer of foodstuffs. The agricultural sector has nevertheless usually been the largest contributor to the GDP, its share falling only slightly in the 1990s, from 23.9 percent in 1992–93 to 19.7 percent in 1997–98, when it was overtaken by the industrial sector. In 1999–2000, real growth in the sector declined by 0.3 percent, production of cotton fell by 9 percent, and wheat and barley outputs declined by 27 percent and 39 percent, respectively. This came after the successful year of 1998–99, when a rise in rainfall led to sharp overall growth in the sector, achieving 9.5 percent growth. The government continues to gear efforts toward reducing its role in agriculture and encouraging private sector activities and the growth of cooperatives, while restricting itself to the provision of infrastructure. **Subsidies** have been reduced over the last few years, but agriculture remains favored with price guarantees and persisting subsidies, in particular for wheat.

The offshore fishing industry is important in Iran both for domestic consumption and for export, mainly of caviar. The total Iranian fish catch rose from 327,727 metric tons in the year 1991–92 to 385,200 tons in 1997–98, of which 244,000 tons came from the Persian Gulf and the Gulf of Oman, 76,200 tons from the Caspian Sea, and 65,000 tons from inland waters. The government remains committed to increasing the annual catch to at least 700,000 tons, principally by the development of fisheries in southern waters. The caviar industry, which enjoys a worldwide market, is by far the most developed field within Iran's fisheries sector. Iran, Russia, Azerbaijan, Kazakhstan, and Turkmenistan form a cartel to protect caviar prices and sturgeon stocks in the Caspian Sea, but over-fishing has begun to threaten the industry. Caviar exports averaged around US$30 million per year in the 1990s.

INDUSTRY

Petroleum and natural gas clearly dominate Iranian industry, which is mostly controlled by the state or run by one of the religious foundations, the bonyad. With the revolution came nationalization, and by the end of 1982, 130 nationalized industries were under the direct control of the 3 ministries that were authorized to conduct industrial policies, and 450 industrial units were placed under the control of the National Iranian Industrial Organization.

MINING/HYDROCARBONS. Iranians became involved with oil before most of the rest of the world, granting their first exploration concession to British prospectors in 1901. After the discovery of commercially viable deposits at Masjid-e Suleiman in 1908, the reserves were worked by the newly formed Anglo-Persian Oil Company, which changed its name to the Anglo-Iranian Oil Company (AIOC) in 1935 and is now known as BP Amoco. The oil industry's pivotal position in modern Iranian society was demonstrated during the 1979 revolution, when a series of strikes at oil installations culminated in the strikers' refusal to resume exports until the shah left the country. Iran's petroleum industry suffered extensive damage to wells, refineries, and export terminals with the outbreak of the Iran-Iraq war in 1980. Crude oil production recovered to 3.2 million barrels per day (bpd) in 1990 and since 1994 has averaged around 3.6–3.7 million bpd. Proven oil reserves at the end of 1998 totaled 90 billion barrels, representing 8.7 percent of world reserves, and were expected to last about 70 years at current production rates. As of January 2000, Iran possessed 9 operational refineries with an aggregate capacity of 1.5 million bpd, the government's aim being to boost refining capacity to 2 million bpd during its Third 5 Year Development Plan (until 2005).

The dramatic decrease in world oil prices from late 1997, to below early 1973 levels in real terms, prompted the Organization of Petroleum Exporting Countries (OPEC, a cartel grouping together most significant oil producing countries to fix production quotas and attempt to stabilize prices) to decree that its members should reduce production from April 1998 in an effort to boost prices. In March 1999 Iran agreed to cut its output from the benchmark of an average production of 3.6 million bpd by 7.3 percent, to 3.36 million bpd. In their September meeting OPEC countries decided to retain reduced quotas despite the sharp rise in world oil prices. When in March 2000 OPEC responded to what was seen as a dangerously high world oil price of US$30 per barrel by increasing aggregate production quotas by 1.7 million bpd, only Iran declined to accept the plan proposed by Saudi Arabia, on the grounds that OPEC was buckling to U.S. pressure for lower oil prices. However, resistance was short, and the new Iranian production quota

had increased to 3.84 million bpd by September 2000. As a result of the production cuts in 1999, exports fell by 10 percent from 1998–99 to 1999–2000, to 2.1 million bpd. Thanks to higher prices, however, oil export revenues increased by 63 percent to US$16.3 billion and are expected to hit the US$20 billion in 2000–01.

Iran's petroleum industry basically works as an extension of the government. The Minister of Petroleum serves as chairman of the 3 main companies, the National Iranian Oil Co. (NIOC), the National Iranian Gas Co. (NIGC), and the National Petrochemical Co. (NPC). The NIOC handles oil and gas exploration, production, refining, and oil transportation; NIGC manages gathering, processing, transmission, distribution, and exports of gas and gas liquids; and NPC handles petrochemical production, distribution, and exports. The majority of Iran's oilfields are concentrated in the southwest of the country, where 90 percent of Iran's total production of crude oil is produced. The state-owned gathering and distributing system for natural gas from Iran's enormous reserves—second in the world only to Russia's—is one of the largest in the Middle East. Other mineral resources are largely underdeveloped.

With proven natural gas reserves of 23 trillion cubic meters (at the end of 1999), Iran is the world's second richest country in gas resources after Russia, with some 15.7 percent of the global total and 46.4 percent of the Middle East regional total. Production increased from 12.2 billion cubic meters in 1989 to 29.5 billion cubic meters in 1993 and to 54 billion cubic meters in 1998, the bulk of which was consumed domestically in line with the government's policy of substituting gas for petroleum. Currently, natural gas accounts for about 40 percent of total domestic energy consumption. Iran plans to construct a 1000-kilometer (621-mile) onshore and 1200-kilometer (746-mile) offshore gas pipeline to India. In 1996, Iran signed an agreement worth US$20 billion to supply gas to Turkey over a 22-year period. With pipeline construction in its final stage, deliveries should begin in mid-2001. In April 2000, the discovery of the country's biggest onshore gas field to date, north of the city of Bushehr, was announced. It is estimated to contain 445,000 million cubic meters of gas not needing to be refined, as well as 240 million barrels of liquid gas. The field is to be brought to production by 2002 and is expected to yield revenue of US$16.5 billion over 20 years.

In addition to the enormous hydrocarbon reserves, Iran has considerable mineral resources. Around 80 million tons of minerals are quarried each year from some 1,500 non-metallic and 50 metallic mines in Iran, with the bulk coming from mines owned by the Bonyad-e Mostazafan (Foundation of the Oppressed). Minerals currently being worked include copper, lead-zinc, iron ore, bauxite, coal, strontium, gold, chromium, uranium, red oxide, turquoise, sulphur, and salt. Foreign investors have concentrated most on Iran's copper-extraction industry, which has taken the lead in moves towards privatization.

MANUFACTURING. Iran's industrial sector is dominated by relatively few but large public enterprises accounting for approximately 70 percent of **value added** in manufacturing. Steel, petrochemicals, and copper remain the country's 3 basic industries. Other important branches are automobile manufacturing (mainly assembled under license from Western or Japanese manufacturers), construction material, textiles (mainly woven carpets, for which Iran has traditionally been famous), food processing, and pharmaceuticals. Despite large investments in the 1970s, problems persist to this day, including a shortage of skilled labor, insufficient raw materials and spare parts, and an inadequate infrastructure.

After the revolution in 1979, no clear policy was formulated for the industrial sector. Subsequently, then-president Bani-Sadr estimated a drop of at least 34 percent in industrial output in the first post-revolutionary year alone. The manufacturing industries' poor performance continued throughout the 1980s with many factories still operating at only 30 percent of their capacity at the end of the decade. Much of this downturn had to do with the **emigration** of industrial owners and a resulting shortage of managerial skills. The high degree of Iran's dependency on imports for raw materials, along with the economic sanctions imposed against the Islamic Republic, further increased the vulnerability of the manufacturing sector. Taken together, these factors resulted in inefficiency and low productivity.

The steel industry is one of the few exceptions to Iran's disappointing manufacturing scene. Development began late—Iran's first steel mill was a **joint venture** with the Soviet Union in the 1960s—and proceeded slowly, with output standing at just 1 million tons per year in 1979. Since the end of the Iran-Iraq war, however, a huge expansion has taken place. New plants have been commissioned in Khuzestan, Khorasan, and Azerbaijan provinces, and Iran has become the world's third largest steel producer, with an output of 6.7 million tons in 1997–98.

In recent years the government has placed great emphasis on expanding the petrochemical industry to generate products of higher value added and higher export earnings. In the medium term the petrochemical industry represents Iran's only chance of diversifying away from crude oil exports. Iranian petrochemical production has more than doubled in the last 5 years, making it the second largest producer in the region, after Saudi Arabia. Total petrochemical output was estimated at about 12 million tons in 1998, compared to 2.4 million tons in 1989. The government plans to triple the annual output to 30 million tons within 20 years, which requires in-

vestments of US$20 billion. Government predictions were that Iran's share of the world's petrochemical production would reach 2 percent by 2005 and that the value of exports would rise from US$500 million in 1999 to US$2 billion in 2005. Main petrochemical products are fertilizers, methanol, aromatics, and olefins.

The automotive sector is underdeveloped. The most common vehicle on Iran's roads is the Paykan, the locally produced version of a 1960s British model. The car's old-fashioned engineering makes it inefficient and one of the worst polluters in the country. Since 1989, the industry has enjoyed a modest recovery, as local plants have contracted to assemble Nissan, Peugeot, and Kia models under license. Some manufacturers, such as Iran Khodro, which held the rights to assemble General Motors vehicles until 1985, have begun to modernize and **restructure**. Local production of cars reached 245,556 units in 2000–01, compared to some 80,000 units in 1995–96, and up 23 percent from the previous year. However, poor access to finance and a shallow inventory suggest that there is further need for improvement.

In 1995, the Chamber of Commerce and Industry reported that Iran's textile mills were operating at an average of 56 percent of their capacity, owing to shortage of foreign exchange and raw material. The textiles industry is partly based on domestic supply of cotton. During the 1970s, European manufacturers purchased Iranian cotton, but as profits fell in the 1980s, most cotton was absorbed domestically. The government hopes to promote textile exports, and some public investment has been devoted to improving production quality. However, the results have been visible only in niche areas, and export earnings in 1997–98 remained below US$100 million per year. Revenues from exporting carpets dropped severely in the 1990s from US$2 billion in 1990 to US$570 million in 1998, rendering it a shaky business.

SERVICES

The services sector is the largest in the Iranian economy and contributed approximately 40 percent to the GDP during 1999–2000. The sector has seen the greatest long-term growth in terms of its share of the GDP, but currency-exchange restrictions, excessive bureaucracy, and the uncertainty of long-term planning have hindered further development.

FINANCIAL SERVICES. The Iranian banking sector is dominated by 10 state-owned banks, including the 6 full-service commercial banks, and 4 sectorally specialized ones. In addition, 4 small private non-bank credit institutions have recently been licensed. The total number of state-owned bank branches was 14,518 in 1999, compared with 11,634 in 1995. Commercial banks engage mainly in short-term lending, primarily to the private sector and public non-bank financial enterprises, and act as agents of depositors in the investment of funds. The profits and losses from these investments are then distributed to depositors based on the duration and amount of their investment. Specialized banks lend mainly on a long-term basis (5 years or more) and have investments in various sectors of the economy.

After the revolution, 2 major changes were made in the banking system: one was nationalization and restructuring in the year immediately after the revolution, the other was the introduction of Islamic banking in 1983–84. Islamic banking is characterized by the prohibition of interest on loans, according to Islamic law. Interest on loans, or *riba*, was replaced by a commission of 4 percent a year compared with the traditional 14 percent, whereas interest on deposits was replaced with profits, estimated at a minimum of 7–8 percent a year. The banks would become temporary shareholders in major industrial enterprises to which they lent money. Unfortunately, the changes to the banking sector were made just when the public sector was relying heavily on the banking system to finance the large deficit, due to low oil revenues. Consequently, the inflation rate accelerated rapidly. While it amounted to only 4 percent in 1985–86, it surged to 21 percent the following year, and increased to 28 percent and 29 percent, respectively, during 1987–88 and 1988–89 and has since remained at a high level.

The Tehran Stock Exchange (TSE) benefitted from a wave of privatization during the early 1990s. Stock **market capitalization** of IR38 trillion at the end of 1999 corresponded to about 9 percent of the GDP, although relatively few of the shares are routinely available for purchase by the general public. The ownership of stocks is highly concentrated. The largest 5 shareholders account, together, for more than 82 percent of company shareholdings. A small handful of institutional investors dominate the market as a whole. These are all either government institutions or state-owned banks or their subsidiaries, but nevertheless operating on a market-oriented basis.

COMMERCE. Iran has traditionally been an agricultural nation populated by traders. With the exception of the carpet industry and a tiny jewelry industry, the Iranian economy was essentially agrarian until the time of Reza Shah Pahlavi. Despite the crash industrialization program launched by the Pahlavi regime in the 1960s and 1970s and the necessity for self-sufficiency during Iran's 8-year war with Iraq, the country retains its preference for trade over production.

The merchant, or bazaar, classes had profited from the economic boom Iran experienced under the shah in the 1970s. Many had amassed fortunes in these years. Yet, the bazaar provided valuable support to the revolutionary movement, contributing generously to the clerical cause

in the lead-up to the revolution. The bazaar merchants had several grievances against the shah, whose policies favored a new industrial and entrepreneurial elite, and import licenses made life difficult for the smaller merchants. The bazaar was relegated to secondary status, especially after some of the major industrial families started combining interests in industry with interests in banking, insurance, and trade by the mid-1970s; several of the largest trading companies developed alongside major industrial enterprises. These new trading companies threatened to drive the bazaar merchants out of wholesale trade, and then, by establishing new **retail** networks and outlets, out of retail trade as well.

After the revolution, the trading sector achieved positive growth, and this sector absorbed most of the new entrants into the job market. In the absence of a properly functioning banking system, demand for capital has been frequently met from moneylenders in the bazaar. Indeed, currency exchange and money lending has become a major source of business for the bazaar's traders in Iran's distorted economy. This further intensified a tendency among Iranians to invest in businesses with a cash-based return, such as constructing homes for the rental market or the import of **consumer goods**.

TOURISM. Before the revolution Iran had begun to build a reputation as an exotic holiday destination; its ski resorts at Shemshak and Dizin, north of Tehran, attracted international celebrities. After 1979, the Islamic government discouraged tourism, leaving many renowned archaeological and historical sites, including Persepolis, Pasargard, and Esfahan, barely visited by foreigners. Although hardly a booming sector, visitor rates are beginning to rise. The government has begun to issue visas more freely to non-Muslim individuals and groups, and the country is appearing with greater frequency in tourism brochures, but still only around 320,000 foreign tourists actually visit, bringing in revenue of US$170 million. The bulk of tourism remains to be founded on Shia pilgrimage centers such as Mashhad and Qom. The Bonyad-e Mostazafan (Foundation of the Oppressed), which owns most of Iran's large hotels, plans to increase the number of hotel beds from the current 34,500 to 59,500 by 2002.

INTERNATIONAL TRADE

Following a strong **balance of payments** performance in 1996–97, mainly due to high oil prices, the period 1997–99 witnessed the deterioration of Iran's external accounts, triggered by tumbling oil prices and stagnant non-oil exports. Imports went down due to the resulting scarcity of foreign exchange, and Iran negotiated re-phasing part of its external debt in 1998 in order to alleviate financial pressure. When oil prices recovered during 1999–2000, and non-oil exports also grew by 9 percent, the Islamic Republic's external position was enhanced considerably. Iran's trade balance had dropped from a surplus of US$2.8 billion in 1996–97 to a deficit of US$4 billion in 1997–98, although this was reversed again into a US$2 billion surplus in 1999–2000. The International Monetary Fund (IMF) in its 2000 country report on Iran estimated that exports during 1999–2000 totaled US$19.726 billion, while total imports that year amounted to US$13.511 billion. Changes in Iran's external balance are mainly dependent on oil prices. Thus, in 1999–2000, proceeds from crude oil exports rose by 60 percent, despite a decline in the export volume, reflecting the 77 percent increase in the average export price of Iranian crude oil.

Trade (expressed in billions of US$): Iran

	Exports	Imports
1975	7.963	10.343
1980	7.109	12.246
1985	13.328	11.635
1990	19.305	20.322
1995	18.360	13.882
1998	N/A	N/A

SOURCE: International Monetary Fund. *International Financial Statistics Yearbook 1999.*

Non-oil exports consist mainly of consumer goods (55 percent on average during 1997–2000), followed by raw materials and **intermediate goods** (about 38 percent). Carpets remain the single most exported Iranian non-oil product. Such exports have declined significantly over the second half of the 1990s, from US$2 billion in 1994 to US$570 million in 1998, which is attributed to competition from low-priced carpet-producing countries. Exports of fresh and dried fruits, at about US$600 million in 1998–99 (of which $416 million came from pistachios alone), have captured a larger share of the total. Chemicals are the most prominent export of raw materials and intermediate goods, hovering at about US$500 million during 1997–2000.

The direction of exports has also remained unchanged since the mid-1990s. While Japan and the United Kingdom are the largest importers of Iranian goods (absorbing about 16 percent and 17 percent of total exports, respectively), Germany and the United Arab Emirates (UAE) are the main destinations for non-oil exports, capturing 13 percent and 16 percent of these exports, respectively. Other important destinations for Iranian exports are Italy (6 percent of non-oil exports and 9 percent of total exports), Greece and South Korea (5 percent of total exports), and Turkey (5 percent of non-oil exports).

Iran imports mainly raw materials and intermediate and **capital goods**. Imports of consumer goods, at about US$2 billion per year, represent only 14 percent of total imports. Imports of machinery and tools average about US$4–5 billion, which cover the bulk of capital goods imports. Iran's imports of grains and derivatives fell drastically in 1998–99 from about US$1.8 billion the previous years to below US$900 million. Iran also imports a large quantity of chemical products, totaling about US$1.8–2 billion per annum. The most important sources of Iranian imports are Germany (12 percent), Japan (7 percent), and Italy (6 percent).

Since Iran's first application to join the World Trade Organization (WTO) in 1996, it has been constantly blocked by the United States. The application was blocked again in May of 2001, but the administration of U.S. President George W. Bush is thought to be considering dropping its objection now that Egypt has sponsored Iran's application. Iran is a founding member of the Asian Clearing Union (ACU), established in 1974 to provide a mechanism for the settlement of transactions among countries in the Asia-Pacific region. Members are Bangladesh, Burma, India, Nepal, Pakistan, Sri Lanka, and Bhutan. Iran undertakes only about 3 percent of its total trade within the ACU, with Bangladesh, India, Pakistan, and Sri Lanka importing oil and oil products, handicrafts, and machinery equipment. Iran's imports from these countries include machinery, spare parts, and spices from India, jute from Bangladesh, and rice and cotton from Pakistan.

MONEY

The Bank-e Merkazi-ye Jomhuri-ye Eslami-ye Iran, or Central Bank of the Islamic Republic of Iran, is the highest monetary authority in the country. Each year after the approval of the government's annual budget, the Central Bank presents a detailed monetary and credit policy. Short-term credit policies need to be approved by the government and long-term credit policies have to be incorporated into the 5 Year Development Plan with Parliament's consent.

After the introduction of the Tehran Stock Exchange (TSE) rate in July 1997 and until March 2000, 2 officially recognized exchange rates coexisted in Iran. The official rate of the Iranian rial—1,750 per U.S. dollar—applies to oil and gas export receipts, imports of essential goods and services, and repayment of external debt. The "export" rate, fixed at 3,000 rials per dollar since May 1995, applied to all other trade transactions, but mainly to capital goods imports of public enterprises. In order to ease pressure on exporters, the bank introduced a currency certificate system allowing exporters to trade certificates for **hard currency** on the Tehran Stock Exchange (TSE). This method finally replaced the fixed export rate in March 2000, and has since held steady at some IR8,500:US$1. There is an active black market in foreign exchange, but the development of the TSE rate and the ready availability of foreign exchange over 2000 narrowed the differential to as little as IR100 in mid-2000. The reunification of Iran's multi-tiered exchange-rate system, which has plagued Iran's non-oil exports and frustrated potential investors since the revolution, had been under discussion since a failed attempt in 1993 to operate a single, **floating exchange rate**. At the same time, as a step toward further liberalization and integration of foreign exchange markets, banks were allowed to deal relatively freely with foreign exchange. Despite this, foreign currency is still hard to get and even harder to keep for ordinary Iranians.

Given recent government decisions to allow banks to sell currency at free-market rates, together with the positive outlook for oil earnings, and the apparent willingness of new lenders, particularly European banks, to extend new credit lines to Iran, an attempt at reunification is likely to be made in 2001–02, at a rate of around IR9,000=US$1.

POVERTY AND WEALTH

Before the Islamic revolution, Iran had gradually been transformed from a largely farm-based economy to a modern society by ways of major changes in the traditional

Exchange rates: Iran

Iranian rials (IR) per US$1	
Jan 2001	1,754.71
2000	1,764.43
1999	1,725.93
1998	1,751.86
1997	1,752.92
1996	1,750.76

Note: Iran has three officially recognized exchange rates; the averages for 1999 are as follows: the official floating rate of 1,750 rials per US dollar, the "export" rate of 3,000 rials per US dollar, and the variable Tehran Stock Exchange rate, which averages 7,863 rials per US dollar; the market rate averages 8,615 rials per US dollar.

socioeconomic order between 1946 and 1979. Under the shah, thanks to considerable outlays allocated to education and health, great strides were made in improving social welfare. Infant mortality, malnutrition, endemic diseases, and illiteracy were greatly reduced. Caloric intake, life expectancy, and school enrollment were all markedly increased. While rural-income gaps and income inequalities within the respective areas did not narrow, indicators showed that absolute poverty was reduced. Although elementary school enrollment during the 1970s quadrupled to more than 9 million, this was achieved in many cases only by running students through in 3 shifts and having teachers in the classroom 60 to 80 hours a week. About 90 percent of high school graduates were denied admission to college because of inadequate facilities. About 20 percent of Iran's institutions of higher education had no library facilities, nor were they likely to obtain them because, while the state budget set aside 5 percent for sports, it did not have any reserves for books and libraries.

It was thought and hoped that the new regime would remedy these faults. The Islamic government declared a policy of improving the lot of the poor for whom, after all, the revolution itself had been launched, but there has been little evidence of success. Nominal wages and salaries lagged behind inflation throughout the 1980s, which according to one Majlis deputy left more than 90 percent of public servants below the poverty line. According to the official line, the poor were better off after, rather than before, the revolution. This was undoubtedly true for certain groups of people who have been especially well positioned within the regime, such as members of the Revolutionary Guards, many families of the war dead, some among the subsidized urban proletariat, and others from extremely low-income households. It does not hold true, however, for the majority of the population. In 1972, some 44 percent of the population were living below the subsistence poverty line. During the 1979–85 period, absolute poverty increased by 40 percent; some reports indicated that absolute poverty had spread among as many as 65–75 percent of the population in 1988. According to the IMF, 53 percent of Iranians still live below the poverty line.

Health conditions outside major cities are poor. Many small towns and rural areas suffer from unsanitary conditions and a shortage of medical personnel and facilities. The infant mortality rate remains a serious problem; it is very high by world and Middle Eastern standards, although it has been reduced significantly (26 deaths per 1,000 live births in 1998, down from 91.6 during 1980–85 and 50 during 1991–95). Although primary education is compulsory for 5 years, many rural children never attend school because of either parental objection or a lack of facilities. The secondary-school system in Iran is relatively underdeveloped, and it serves for the most part to prepare small numbers of students for university-level education. In order to improve the situation for the poorest segments of Iranian society, the government is considering an anti-poverty program comprising expanded provision of food, clothing, health care, education, social security, and bank credits to these people.

WORKING CONDITIONS

The highly fluid nature of Iran's labor market and the large size of the informal services sector make accurate estimates of employment levels difficult. A census, conducted in 1991, recorded 25.2 percent of the 57.8 million population as economically active, and 22.3 percent as in employment, suggesting that around 11 percent of the workforce was unemployed. However, the census ignored the fact that most Iranian adults must hold 2 or even 3 jobs in order to provide for the rest of their family. The government put unemployment at 2 million in 1997–98, equivalent to 12.1 percent of the workforce and up sharply from the previous year's estimate of 9.1 percent. Given the rapid population growth experienced over the past 20 years, together with a real reduction of government resources aimed at job creation, it is likely that even this estimate is too conservative. According to the Economist Intelligence Unit (EIU), an accurate estimate for unemployment figures lies between 14 percent and 18 percent, while the IMF suggests it may be as high as 25 percent.

High inflation has been another characteristic of the Iranian economy since the early 1970s and played a crucial role in the industrial action that presaged the 1979 revolution. In recent years changes in the exchange rate, the gradual removal of subsidies, and the suppression of imports have all contributed to rising prices and eroded **real wages**. Some evidence indicates that inflation has dropped steadily since 1995, settling in a range of 22–30 percent, according to sources from the International Monetary Fund (IMF).

The Labor Code empowers the Supreme Labor Council to establish annual minimum wage levels for each sector and region. The minimum wage has been inadequate for some years by the government's own admission. Officially the minimum wage should be sufficient to meet the living expenses of a family and should take inflation into account. The daily minimum wage was raised in March 1997 to US$2.80 (8,500 rials). This wage apparently is not sufficient to provide a decent standard of living for a worker and family. Information on the percentage of the working population covered by minimum wage legislation is not available. Private-sector personnel in contrast are better off.

Formally, workers are granted the right to establish unions; however, the government does not allow inde-

pendent unions to exist. A national organization known as the Worker's House, founded in 1982, is the sole authorized national labor organization. The leadership of the Worker's House coordinates activities with Islamic labor councils, which are made up of representatives of the workers and 1 representative of management in industrial, agricultural, and service organizations of more than 35 employees. These councils also function as instruments of government control, although they frequently have been able to block layoffs and dismissals. In 1993, the parliament passed a law that prohibits strikes by government workers. Nevertheless, strikes occur, apparently in increasing numbers. Reports over the last 2 years included strikes and protests by oil, textile, electrical manufacturing, and metal workers, and by the unemployed.

One unforeseen result of the revolutionary government's drive for gender segregation has been the improvement in women's education. As men and woman are expected to work separately, the demand for female professionals has risen markedly, boosting the number of female graduates. The war effort contributed to this process, as women took the places of men required for military service. In 2000, there were more women enrolled in universities than men. In tertiary education, vocational subjects such as computer studies and engineering are becoming increasingly popular, while the quality of language tuition is improving. These trends will undoubtedly improve the qualifications of the local population from the point of view of foreign investors, but they also present the government with higher demands for skilled job-creation and increase the pressure to cut bureaucratic and ideological obstacles to a free labor market.

COUNTRY HISTORY AND ECONOMIC DEVELOPMENT

4000 B.C. Ancient settlements develop in the Caspian region and on the Iranian plateau.

2000 B.C. Aryans arrive and split into the Medes and the Persians.

550 B.C. Cyrus the Great founds the Persian Empire.

200 A.D. After periods of Greek and Parthian rule, the Sassanids take power and rule until the Arab final victory in 641.

1502. The Safavid dynasty is established and continues to rule until 1736.

1904. The Qajar dynasty, founded by Fath Ali Shah, comes to an end.

1906–08. Iran's modern history begins when the Constitutional Movement achieves the declaration of a constitution and the establishment of a parliament in 1906 and when oil is discovered in 1908.

1919. The country is occupied by Russia and Great Britain during World War I; it signs a trade agreement with Great Britain in 1919, in which Britain formally re-affirms Iran's independence.

1921. After Iranian recognition of the USSR, the Soviet Union withdraws occupation forces from Iranian territory; Reza Khan, an army officer, establishes military rule and subsequently becomes shah in 1925 and founder of the new Pahlevi dynasty.

1941. Iran is occupied by British and Soviet forces at the start of World War II, prompting the shah to abdicate in favor of his son, Muhammad Reza Shah Pahlevi.

1943–46. Iran is formally guaranteed independence by the United States, Great Britain, and the Soviet Union in 1943; however, political instability delays the withdrawal of troops until 1946.

1951–53. The National Front Movement under Prime Minister Mossadeq nationalizes the oil business and forms the National Iranian Oil Company (NIOC); Mossadeq is subsequently ousted from power with the help of U.S. covert activity, and an international consortium operates Iran's oil facilities, with profits shared equally between Iran and the consortium.

1960–73. The shah's modernization program—named the "white revolution"—transforms the country and its economy, with a dramatic land reform, huge investments in infrastructure, and continued economic growth.

1973. The shah gives the NIOC full control over Iran's oil industry, placing the international consortium in an advisory capacity. Iran does not participate in the Arab oil embargo in September.

1979. After years of political repression and with a growing divide between rich and poor, popular protests oust the shah in the Islamic Revolution of 1979. Ayatollah Khomeini becomes the figurehead of the revolution and subsequently the Supreme Leader of the country until his death in 1989.

1980. On 22 September, Iraqi troops invade Iran, triggering a prolonged and devastating war that lasts until Khomeini accepts a UN-brokered cease-fire in July 1988.

1989. The Ayatollah Khomeini is succeeded by Iran's president, Ali Khamenei. Ali Akbar Rafsanjani becomes president and is re-elected in 1993. Iran begins to re-build its economy.

1997. Mohammed Khatami, a moderately liberal Muslim cleric, is elected president and becomes the figurehead for the country's reformist movement; economic reforms begun under Rafsanjani continue.

FUTURE TRENDS

The Iranian government has set itself the priority of achieving political reform, believing that its victory over conservative forces in the February 2000 parliamentary elections gives it the authority to deal with what President Khatami has described as Iran's "sick economy." Despite good intentions, President Mohammed Khatami has done little to change the overall pattern of Iran's **macroeconomic** policy. While many observers hoped that the new president would speed up the reform process, he has been bothered by entrenched political opposition in the Majlis (parliament) and pressure from the powerful bonyad (religious foundations) and by external debt repayments. Pending the outcome of the political battle, the government has to deal in the short term with a chronically weak currency, high unemployment, and the arrival of 800,000 young people on the job market every year. The lack of economic opportunities and social freedom has led to growing discontent, especially among young Iranians, and may result in extended civil unrest and an increase in emigration. Returns in the June 2001 presidential election gave President Khatami the thumping victory which is needed to revive the economic, political, and social reform process.

A key factor in Iran's economic prospects is whether the country will be able to break its international isolation which will have to be overcome in order to integrate the country into the world economy and to bring much-needed foreign investment into the Islamic Republic. This depends in particular on the lifting of U.S. sanctions. Signals show that Iran's rehabilitation is a desired U.S. objective if the reformists carry out their agenda. Iran's further international and domestic economic progress, therefore, depends in large part on the outcome of the political contest between reformers and conservatives in Tehran. Economic development will also depend on the success of privatizing enterprises in the inefficient state sector, to which about 60 percent of the current budget expenditure is allocated in subsidies and other support. Finally, to have the financial means to cope with needed reforms Iran will try to keep oil prices stable on a high level.

DEPENDENCIES

Iran has no territories or colonies.

IRAQ

Republic of Iraq
Al-Jumhuriyah al-'Iraqiyah

CAPITAL: Baghdad.

MONETARY UNIT: Iraqi dinar (ID). One Iraqi dinar equals 20 dirhams, or 1,000 fils. Coins of ID1, and 1, 5, 10, 25, 50, and 100 fils. Notes are in denominations of 5, 10, 50, and 100 dinars.

CHIEF EXPORTS: Crude oil.

CHIEF IMPORTS: Food, medicine, manufactures.

GROSS DOMESTIC PRODUCT: US$59.9 billion (purchasing power parity, 1999 est.).

BALANCE OF TRADE: **Exports:** US$12.7 billion (1999 est.). **Imports:** US$8.9 billion (1999 est.).

COUNTRY OVERVIEW

LOCATION AND SIZE. Iraq is located in the Middle East, between Iran and Saudi Arabia. Iraq is also bordered by Jordan and Syria to the west, Kuwait to the south, and Turkey to the north. A very small sliver of the Persian Gulf (58 kilometers, or 36.04 miles) abuts Iraq on its southeast border. With an area of 437,072 square kilometers (168,753 square miles), Iraq is slightly more than twice the size of Idaho. Iraq's capital city, Baghdad, is located in the center of the country. Other major cities include al-Basra in the south and Mosul in the north.

POPULATION. The population of Iraq is the fifth largest in the Middle East and North Africa. The population was estimated at 22,675,617 in July of 2000, an increase of 4.675 million from the 1980 population of 18 million. In 2000, Iraq's birth rate stood at 35.04 per 1,000, while the death rate was reported at 6.4 per 1,000. With a projected growth rate of 2 percent between 2000 and 2015, the population is expected to reach 38 million by the year 2030.

Some 97 percent of the population are Muslims. Shi'ite Muslims make up the majority (60–65 percent), while Sunnis comprise 32–37 percent of Muslims in the country. The remaining 3 percent is made up of Christians and other religious groups. The Kurds, descendants of Indo-European tribes who settled in Iraq in the 2nd century B.C., make up 15–20 percent of the population. Arabic is the official language, but Kurdish, Assyrian, and Armenian are also spoken.

Iraq's population growth has increased since 1993, despite the exodus of the middle class as a result of the Gulf War and the adverse effects of the United Nations (UN) economic **sanctions** imposed since 1991. Population growth before the 1991 Gulf War was as high as 3.6 percent annually. The government has strongly encouraged population growth. With a high fertility rate and a relatively young population, 45 percent of which is under 15 years of age, population growth is expected to remain high. Population growth dropped significantly to 1.9 percent in 1993 but resumed in recent years, with the growth rate reaching 2.98 percent in 1998. This rate suggests that the **emigration** of the middle class has slowed. The International Monetary Fund (IMF) also estimates that the effects of the UN sanctions have begun to fade. An estimated 1 to 2 million Iraqis live abroad, many as political exiles. The large majority of these are concentrated in Iran, after having been forced to leave in the wake of the 1990–91 Gulf War.

As in many developing countries, a majority of Iraqis live in urban areas. The population of urban areas has grown significantly since the 1960s at a rate of 5.2 percent annually. Baghdad and its suburbs are home to some 31 percent of the population. Rural-urban migration has eroded some of the ethno-religious and linguistic differences between regions, with the exception of the Kurdish minority, which is concentrated in the north. Iraqi society is dominated by tribal and familial affiliations.

OVERVIEW OF ECONOMY

Iraq's economy has suffered greatly as a result of the United Nations sanctions, imposed following Iraq's military defeat at the hands of a U.S.-led coalition that freed

Kuwait after it was invaded by Iraq in 1990. The sanctions were imposed to contain militarily the regime of Saddam Hussein by ensuring that all weapons of mass destruction (such as nuclear, chemical, and biological weapons capable of killing large numbers of people indiscriminately) at its disposal are destroyed by a UN-appointed inspections committee. However, Iraq's incomplete compliance with UN resolutions pertaining to the destruction of its weapons has precluded the removal of the trade sanctions more than a decade after the war.

Iraq entered the 20th century as part of an enfeebled Ottoman Empire (a 700-year empire that spanned much of the Middle East and centered in what is now Turkey). By 1915, Iraq became a British mandate area administered by a civil government headed by a British high commissioner. In 1921, the British replaced their direct rule with a monarchy headed by King Faisal. Iraq became a sovereign independent state in 1932 after the British finally acceded to local demands for full independence. Iraq was proclaimed a republic in 1958, after the monar-

chy was overthrown by a military coup executed by officers under the leadership of General Abdul Karim Qasim, who became Iraq's first president. In fact, Iraq has been controlled by a series of strongmen, the latest of which is Saddam Hussein, who took power in 1979.

Oil, discovered in Iraq in the early 1950s, has made Iraq one of the world's largest oil producers. Its economy is largely dependent on the oil sector, which has traditionally accounted for about 95 percent of foreign exchange. Iraq's economy has, however, been on a downward trend since the early 1980s. Gains achieved during the initial years of the Ba'ath party (Iraq's only political party and the center of power in the country) rule were reversed as the Hussein regime sought to finance the 10-year war with Iran that broke out in 1980. As a result of the war, Iraq's oil production capabilities were curtailed, and the government's debts to Western nations for the purchase of military materiél grew considerably throughout the 1980s. Iraq sustained heavy debts as a result of its war with Iran. Accurate figures regarding Iraq's total external liabilities are hard to establish because the Iraqi government did not publish official information on its debt. In 1986, Iraq's total debt was estimated to be between US$50 billion and US$80 billion. Of this total, Iraq owed about US$30 billion to Saudi Arabia, Kuwait, and the other Gulf states. Most of this debt resulted from the sale of crude oil on Iraq's behalf. Iraq's total **foreign debt** today is estimated to be in the range of US$130 billion. Iraq has not made any debt payments since the United Nations' sale of its overseas assets to compensate the Kuwaiti victims of the invasion and to pay creditors.

Since 1996, Iraq has been allowed to export only a limited quantity of oil, worth US$2.14 billion every 6 months, in return for food and medical supplies to address the country's deteriorating humanitarian conditions after the war, which include a lack of clean water supplies and basic services. Of revenues accruing from the sale of oil, some 53 percent is used to finance the import of food and medicine for the Iraqi people, while 13 percent is being diverted by UN agencies to the Kurdish provinces in the north. The effects of the sanctions have led to a sharp increase in poverty and infant mortality, especially in the south, and much of the country's **infrastructure** is not functioning.

POLITICS, GOVERNMENT, AND TAXATION

A complex web of social, economic, ethnic, religious, and ideological conflicts has hindered the process of state formation in Iraq since it gained independence from Britain in 1932. Festering socioeconomic problems—such as widespread poverty and deep divisions between the Sunnis and the Shi'ites in the post-World War II period—were compounded by an enduring leadership crisis that continued to afflict Iraqi politics and society for more than 5 decades after independence. The political process has been characterized by deep social and political divisions that have meant that no single political group was able to gain enough support to rule the country without resorting to violence. As a result, Iraq's deep-rooted fragmentation has allowed the armed forces to exercise great control over politics since the 1930s. A total of 11 coups took place between 1936 and 1968. The Ba'ath party, which came to power in 1968, also through a military coup, has greatly shaped the country's modern history and its economic system. The party espouses the goals of **socialism**, freedom, and unity, and has attempted to redress widespread social inequality through the redistribution of wealth.

According to the constitution, Iraq is a republic with an elected legislature and an independent judiciary. Executive power is concentrated in the hands of the president and Council of Ministers. In reality, and owing to the revolutionary nature of Iraqi politics, all executive and legislative powers rest with the Revolutionary Command Council president (RCC). The RCC elects the president, who, in addition to being the chairman of the RCC, also serves as prime minister and commander of the armed forces. The president and the Council of Ministers are accountable to the RCC.

Since the late 1960s, the ruling Ba'ath Party has used vast oil revenues to build a modern state, although it is also one of the most highly militarized countries in the world. The Ba'ath party adopted a centralized socialist welfare system, which regulated every aspect of the economy, with the exception of the agriculture and personal services sectors. Much of Ba'ath party's ambitious plans to develop Iraq and exploit its vast oil resources were done with Soviet technical assistance. Since taking office in 1979, President Saddam Hussein pursued a state-sponsored industrial modernization program that led to a more equitable distribution of wealth, greater social mobility, improved education and health-care standards, as well as the redistribution of land. The government experimented with economic **liberalization** in the 1980s, which sought to ease state control of the economy and to increase commercialization in the state sector. These efforts, however, were largely unsuccessful, mainly due to a long legacy of state control and a bloated state bureaucracy that was unable to meet the challenges of reform.

Iraq's spending on defense has traditionally accounted for 25–33 percent of the state budget, even when the country was not at war with any of its neighbors. Since the early 1970s, the government has dedicated huge resources to thwart efforts by the Kurdish people to estab-

lish their own state in the northern Kurdistan region. After efforts to reach an agreement to establish a politically and culturally autonomous area in the north failed in 1975, the government waged in 1976 a costly campaign to forcibly evacuate 800 Kurdish villages along the border with Iran. This campaign to replace the Kurdish population with Arabs resumed after an 8-year hiatus during the Iraq-Iran war. At least 300,000 Kurds were deported from their villages in the north, and chemical weapons were used against Kurdish civilians at Halabjah in 1988 in which more than 5,000 Kurds were killed. Following Iraq's military defeat in 1991, U.S.-led allied forces carved out an autonomous region for the Kurds in the north, effectively separating the region from the rest of the country. Since 1991, the Iraqi Kurds have enjoyed a large degree of autonomy from the central government in Baghdad under the protection of allied forces. Nevertheless, the Kurds live in primitive conditions, often in large "tent cities," with only the barest necessities (such as food, medicine and clean water) supplied by aid agencies.

In the wake of the Gulf War and its aftermath, the Iraqi government's role in the economy is bigger than ever, as it continues to control the vast majority of imports and foreign exchange flowing into the country from the limited sale of oil allowed under the sanctions. The government, however, lacks a clear economic objective, given its primary goal since the 1990 Gulf War has been to ensure the survival of the regime in the face of international political and economic isolation. Instead of using its limited resources from oil sales to benefit the economy and expand its base, the state has redirected its efforts toward guaranteeing the continued support of the regime's chief domestic allies, mainly the merchant class and the military. This class has been both paid off and allowed to accumulate wealth illegally to ensure its continued allegiance to the state.

Taxation is not and has never been a major source of government income. Iraq's relative prosperity in the years preceding the Iran-Iraq war enabled the government to adopt a welfare system that exempted the population from paying taxes. After the 1990 Gulf War, however, the government has attempted to impose taxes to increase its revenue, but collection enforcement has been rather poor. **Private sector** employees are required to pay **income tax**, although the tax is rarely collected. State employees continue to be exempt from taxation.

INFRASTRUCTURE, POWER, AND COMMUNICATIONS

Prior to the Gulf War, Iraq's infrastructure was one of the most highly developed and extensive in the region. The government has been largely successful in its efforts to repair the severe damage the infrastructure sustained as a result of the 1990 Gulf War. The lack of resources available to the government, however, has meant that most of the repair work is substandard. In 1996, the country was serviced by a network of over 45,550 kilometers (28,304 miles) of primary and secondary roads, 38,400 kilometers (23,862 miles) of which were paved. The nation's 2,032-kilometer (1,263-mile) railway system is in good condition and connects Iraq to its neighbors to the north, Syria and Turkey.

Iraq has 2 major airports, located in Baghdad and Basra. Both airports are in fairly good condition. There are 3 smaller civil airfields at Haditha, Kirkuk and Mosul. All commercial airlines stopped service to Iraq in 1991 under the United Nations sanctions. A number of countries, mainly France, Russia, and Jordan, began sending humanitarian flights carrying food and medicine to Baghdad in mid-2000, in violation of the sanctions. These flights were sent as an expression of opposition to the continuation of the UN sanctions against Iraq. The country has 3 ports at Umm Qasr, Khawr az-Zubayr, and al-Basra, which currently have limited functionality because of the damage sustained during the Gulf War and the subsequent trade sanctions. Since 1997, most of Iraq's needs are serviced at Umm Qasr, the main point of entry for most food imports.

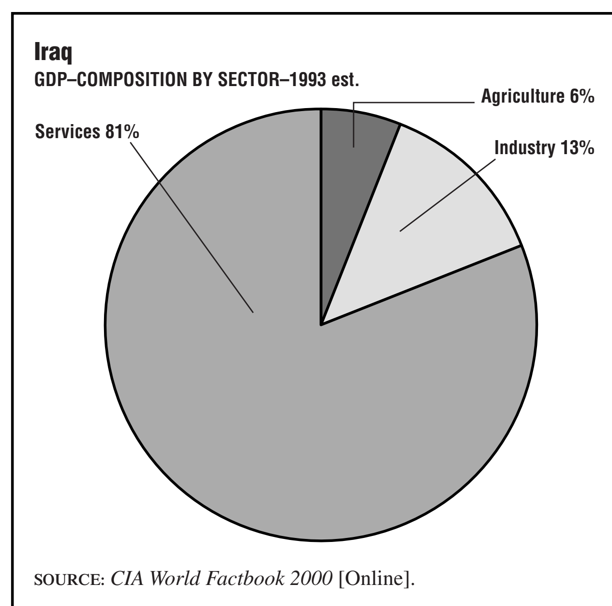
Electric power is supplied to Iraqis by state-owned power stations throughout the country, which have a total capacity of 17,000 megawatts of power. As a result of repeated bombings during the Iran-Iraq war and the Gulf War, power stations today can barely meet local demand, and it is estimated that in 2000, capacity in the central and southern regions supplied only 50 percent of demand. Despite the construction of 4 new power stations after the Gulf War, blackouts are common, and at least 14 central and southern provinces experience an average of 12 hours of power cuts daily. In Baghdad, 4-hour power outages are routine.

Telecommunications services in Iraq are in poor condition and are quite unreliable, mainly as a result of repeated air strikes by allied forces during and after the war. The country had 675,000 working lines in 1995. Mobile cellular service is unavailable. Internet service is available but is both costly and unreliable.

ECONOMIC SECTORS

Iraq's economic sectors reflect the state of devastation that the country has endured as a result of war. The economy has traditionally been heavily dependent on the oil sector, which accounted for more than 60 percent of the GDP before the Gulf War. The oil sector's contribution to the GDP, however, greatly diminished in the immediate years after the war, but its contribution to GDP has increased since the 1996 introduction of the United Nations oil-for-food program, which allows limited oil exports in return for food and medicine. Iraq in 1991 exported less than 10 percent of its pre-war oil export levels. By 2001, Iraq had regained three-quarters of the pre-war oil export levels. However, the UN's control of oil exports removed these revenues as a source of the GDP.



SOURCE: *CIA World Factbook 2000* [Online].

In the post-Gulf War era, services was the largest contributor to the GDP at 81 percent in 1993. Industry contributed 13 percent in the GDP, while agriculture accounted for 6 percent of the GDP. **Real GDP** was cut by around 63 percent in 1991, a direct result of the war and subsequent sanctions. The GDP was estimated in 1999 to be equivalent to US$59.9 billion. The country's major economic sectors witnessed a serious decline in 1990–91 because of the Gulf War, and continued allied bombardment of key Iraqi infrastructure facilities, including power generators and communications equipment. The manufacturing sector was hit by the shortage of imported raw materials and spare parts, while the collapse of the country's irrigation system in the aftermath of the war has left the agricultural sector in dire straits.

AGRICULTURE

Despite intermittent government efforts to develop the sector, agricultural production has always been a modest contributor to Iraq's economy, accounting for 7 percent of GDP prior to the 1980 Iran-Iraq war and 6 percent in 1993. Despite declining performance, however, the sector continues to employ almost one-third of the country's **labor force**. The agricultural sector employed 30 percent of the labor force in 1989, and although the number is believed to have declined as a result of the sector's declining performance, no hard figures are available to support this contention.

Iraq's arable land is estimated at 8 million hectares, comprising less than 15 percent of the country's total area. However, only 4 to 5 million hectares of this land is being cultivated. Arable land is mostly concentrated in the north and northeast, where winter crops—mainly wheat and barley—are grown, and in the valleys of the Tigris and Euphrates rivers.

The sector's contribution to the GDP has steadily declined since the early 1980s, despite repeated government efforts to boost agricultural production. Until the late 1980s, cultivable land was under the control of the state, the direct result of the land reforms begun in 1958. In 1988–89, in an effort to boost agricultural production, the state **privatized** agriculture, but the sector's weakness persisted. Further, the government continued to control the price of agricultural products, mainly to protect the urban consumer. Despite government efforts to encourage agricultural production after the Gulf War by raising the price of staple foods—especially of wheat, barley and rice—the labor-intensive sector remains in 2001 underdeveloped and inefficient, as a result of the high costs of energy, credit, and land and lack of investment. The problem is further aggravated by the lack of pesticides,

fertilizers, and machinery. Further, competition from produce and agriculture products imported under the UN food-for-oil program, which allows the sale of a given amount of oil in return for basic foodstuffs and medicine, has also hurt the sector. In 2000, Iraq's farmers were also hit hard by the worst drought in a century. This drought devastated output and forced many farmers to ask the government to loan them the money to pay local banks back for funds they had borrowed to plant their crops, which in the summer of 2000 were failing.

Major agricultural products are cereals, including wheat and barley. Iraq is also a producer of dates, sheep and goat meat, chicken meat, and milk. Most agricultural activity is concentrated in the fertile lowlands in the Mesopotamian plains irrigated from the Tigris and the Euphrates. The Kurdish areas in the north, which have received minimal attention due to the conflict between the central government and the Kurds, remain underdeveloped and mostly dependent on rainwater. Agricultural production in Kurdish areas has improved under the UN sanctions regime, due to the distribution of fertilizers and spare parts by international agencies in those areas.

INDUSTRY

MINING. Oil dominates the country's mining activity, and accounted for more than 60 percent of the GDP before the 1990 Gulf War. Iraq has 112,500 billion barrels in proven reserves—the second largest known reserves in the world. Prior to its war with Iran, which began in 1980, Iraq was also the second-largest exporter of oil in the world.

Oil production is concentrated in the north in Kirkuk, Jambur, Bai Hassam, Ain Zalah, Butman, and Baiji. Oil fields in the south include Rumaila and Zubeir, and until the Gulf War, oil was exported via the Gulf port at Khor al-Amaya. In addition, smaller fields can be found at Luhais, Nahr Umr, Buzurgan, Abu Ghuraib, and Jabal Fauqi. Iraqi oil exports consist of 2 types of crude. The "Kirkuk Crude," which forms the majority of exported oil, is extracted from the northern oil fields and exported via Turkey. The "Basra Light" comes from the fields in the south and is exported via the Mina al-Bakr terminal on the Persian Gulf.

Oil production and output has more than once been interrupted as a result of armed conflict, first with Iran and then with the allied forces during the Gulf War. Production before the Iran-Iraq war reached as high 3.5 million barrels a day (b/d) in 1979 but declined to 700,000–870,000 b/d with the start of the war in 1980. Although most damage to Iraq's facilities was repaired, and production was restored to 3.07 million b/d by the end of the 1980s, the Gulf War and subsequent UN sanctions imposed once more severely depressed both production and output capacity. Until 1996, Iraqi exports were forbidden under the terms of the UN sanctions, with the exception of 65,000 b/d exported to Jordan as part as a special deal worked out with the United Nations. As a result, oil production averaged only 500,000–600,000 b/d between 1990 and 1996, with the majority used for domestic consumption.

Iraq was allowed to resume partial exports in 1996, as part of the food-for-oil program designed to provide for the humanitarian needs of the Iraqi people. Oil production was estimated at 2.52 million b/d in 1999, 1.76 million of which are exported under the food-for-oil program. Local consumption accounts for 500,000 million b/d, while an estimated 166,000 million b/d are believed to be smuggled through Turkey and Iran. In June 1998, Iraq was permitted to import spare parts in the amount of $300 million every 6 months to repair its oil facilities. In December 1999, the value of imports was doubled to $600 million per 6 months, but Iraq was allowed to purchase parts only from a list of parts drawn up by the United Nations. Despite an increase in production, which reached 2.49 million b/d in July 2000, the oil sector continues to suffer from the lack of adequate investment and of the kind of Western expertise that was once available to Iraq before the war.

Before 1972, a consortium of British, U.S., French and Dutch companies virtually dominated the oil industry through the Iraqi Petroleum Company and its associates. This company was **nationalized** by the Iraqi government in 1972, and the U.S. and Dutch interests in the last remaining foreign oil firm—the Basra Petroleum Company—were confiscated because of their governments' pro-Israel stance during the 1973 Arab-Israeli war. The entire oil sector was nationalized in December 1975 and placed under the control of the state-owned Iraqi National Oil Company. In the late 1990s, however, and as a direct result of the sanctions, the Iraqi government has once again allowed production-sharing agreements with foreign companies, mainly Russian and Chinese, to develop the oil sector and increase production to 3.4 million b/d in the short-term and 6 million b/d in the medium-term. These agreements, however, are contingent upon the lifting of the UN sanctions, and it remains to be seen whether the United States will allow the Russian and Chinese firms to benefit from the development of the Iraqi oil sector.

In addition to oil, Iraq ranks tenth in the world in terms of proven reserves of natural gas, which are estimated at 3.1 trillion cubic meters. In 1998, Iraq's production of natural gas reached 2.9 billion cubic meters, most of which was used for domestic consumption. Natural gas is currently not being exported, although the government has recently signed agreements with Turkish

companies to export 10 billion cubic meters worth of gas annually from its northern field.

Iraq also has phosphate deposits located at Akashat near its border with Syria, which are used to produce fertilizers. Sulphur deposits can also be found in Mishraq. European companies were involved in the mining of sulphur before the Iran-Iraq war, but these efforts came to a standstill during the war and have not resumed. The mining of both phosphates and sulphur has largely remained limited in scope due to the dominance of the oil sector.

MANUFACTURING. The manufacturing sector is the second largest non-oil sector, accounting in 1993 for 13 percent of the GDP. The sector's contribution to the GDP in 2001 is hard to assess in the absence of government data about manufacturing activity in the country. Total employment in manufacturing in 1989 stood at 968,000 or 22 percent of the labor force.

Historically, the sector has been dominated by oil refining and natural gas processing industries. Refineries are situated in Baghdad, Basra, al-Hadithah, Khanaqin, Kirkuk, and Qayyarah, and by the late 1980s were producing a total of 743.3 million barrels of petroleum and 3.7 billion cubic meters (131 billion cubic feet) of natural gas per year. Since the 1970s, Iraqi companies have processed iron and steel at plants located at Khawr az-Zubayr. Other manufacturing activities include the production of advanced military hardware, tractors, electrical goods, car assembly, truck manufacture, aluminum smelting, detergents, and fertilizers.

Since the mid-1970s, Iraqi industries have been under the control of the state. The government experimented with privatization in late 1988, right after the end of its war with Iran, in an effort to boost manufacturing production. The state, however, continues to control all heavy industry, the oil sector, power production, and the infrastructure, while private investment is restricted to light industry. An important reason for the failure of the privatization program was the **price controls** that the government was forced to introduce following the outbreak of popular unrest over rising prices in 1989.

Overall, the sector has been characterized by mismanagement and constant policy shifts, which severely hindered its development. In the 1970s, the government encouraged the development of local food processing and building supplies industries to substitute for imports, but by the late 1970s, the government shifted its focus toward the development of heavy industries, such as iron and steel. The initiative, however, never took off. Efforts to expand the manufacturing sector came to a standstill during the Iran-Iraq war, as resources had to be reallocated to finance the war, and greater emphasis was placed on increasing the output of existing industries.

In the 1990s, the manufacturing sector has also been severely hurt by the UN sanctions and has shrunk considerably as a result. The UN closely monitors the import of industrial raw materials to ensure that implements necessary for the production of weapons of mass destruction do not enter the country. The sector has also been hurt by the lack of the foreign currency needed to purchase imported parts.

CONSTRUCTION. The construction sector has been a major contributor to the economy for most of the last 3 decades. The sector's growth can be attributed to the government's continuous involvement since the 1970s in reconstructing war-damaged facilities or in expanding the military infrastructure. Spending on construction dropped significantly in 1991, reaching ID578 million, down from ID1.7 billion in 1990. Spending on construction, however, has been on an upward trend since 1991, reaching some ID20 billion in 1994.

SERVICES

FINANCIAL SERVICES. Financial services in Iraq are fairly outdated. As a result of the nationalization of banks and insurance companies in 1964, all financial transactions are controlled by the government through the Central Bank of Iraq, which is responsible for issuing and monitoring all aspects of the Iraqi dinar. **Black market** currency dealings are prohibited but continue to take place. International banking transactions are undertaken by the Rafidain Bank, which represents the government in all transactions not undertaken by the Central Bank. The Rasheed Bank, established in 1989, deals with domestic transactions. The banking sector was liberalized in 1991, paving the way for the establishment of 6 new banks.

RETAIL. Iraq has a poor **retail** sector. Baghdad's once well-developed commercial centers have been severely hurt by the UN sanctions, and the lack of imported goods has forced many of them to close in the last 10 years. The majority of shops in major cities, including Baghdad, consist of small family-owned and -run businesses. Small shops and temporary road stands also characterize the majority of towns in the interior of the country.

INTERNATIONAL TRADE

Iraq's imports have declined dramatically in the last decade, as a direct result of the UN sanctions. In 2001, Iraq's total imports were estimated at US$8.9 billion, almost 40 percent lower than their 1989 levels of US$22 billion. Iraq was not allowed to import any goods until 1997. After the conclusion of the food-for-oil agreement, Iraq's imports have been regulated by the UN, which approves all goods entering the country.

SOURCE: *Handbook of the Nations*, 17th, 18th, 19th and 20th editions for 1996, 1997, 1998 and 1999 data; CIA *World Factbook 2001* [Online] for 2000 data.

Iraq imports a variety of goods, but food imports (wheat, rice, barley, sugar and meat) and medicine are by far the largest component of the import bill. However, the Iraqi government and its agencies control the purchase and marketing of imported goods. Before the Gulf War, Iraq imported the majority of its goods from the United States, Japan, the United Kingdom, Germany, France, Italy, Brazil and Turkey. By the late 1990s, France (19.2 percent of total imports), Australia (18 percent), China (12.5 percent), Russia (8.2 percent), and the United States (2.1 percent) are the largest exporters of goods to Iraq.

The majority of exports are dominated by oil, which accounted for about 95 percent of total sales abroad before the Gulf War. Iraq in 2000 had restored three-quarters of its pre-war oil export levels, which means that oil sales in 2001 account for around 70 percent of total exports. Other non-oil exports included fertilizers and dates. Sales of liquefied natural gas are expected to surge, but the prospects for that eventuality are far from certain. In 1999, Iraq exported the majority of its oil to the United States (US$3,879 million), the Netherlands (US$848 million), Japan (US$644 million), France (US$521 million), and Spain (US$402 million). Given its weak industrial base and the unlikely removal of the UN sanctions, oil is expected to continue to be the country's major export. Total exports in 1999 reached US$12.7 billion, with the vast majority of export earnings coming from the sale of oil.

MONEY

The value of the Iraqi dinar has declined steadily on the world market over a period of 20 years, making it increasingly harder for the average Iraqi to afford imported goods. The value of the dinar held steady until the beginning of the Iran-Iraq war, but that trend was reversed with the collapse of oil prices in mid-1980s. The dinar, which sold at ID0.3109=US$1 in 1982 (which is still the official rate set by the Iraqi government), was further weakened in the aftermath of the Gulf War, reaching a low of ID2,660:US$1 in December 1995. Despite occasional peaks, the value of the dinar against the U.S. dollar has held steady in the last 2 years at ID2,000:US$1 on the black market, the same rate sold by state banks since June 1999. However, the dinar's instability is likely to persist as a result of the uncertain political and the continuation of the UN sanctions.

Iraq has a single stock market, established in Baghdad in March 1992 in the wake of the privatization of state enterprises. Trading, however, remains thin due to the uncertain political conditions prevailing in the country.

POVERTY AND WEALTH

The UN sanctions imposed on Iraq since 1990 have severely affected the social fabric and living conditions in the country. As a result of the severe deterioration of services—including water and sanitation, health care, and education—the living standards of all Iraqis have declined. Rising unemployment and **inflation**, which was estimated at around 250 percent in 1995 and 135 percent in 1999, coupled with the falling purchasing power of salaries and rising prices, have deepened social divisions and inequalities, with all sectors of the society growing more impoverished. Wealth as of 2001 is concentrated in the hands of a small privileged group of regime supporters, mainly from among the military and the business community who have been allowed to benefit from the sanctions. This group is heavily involved in black market currency dealing and the smuggling of food and merchandise on a regional scale.

The economic **embargo** has also had an uneven impact on different Iraqi regions. Ethnic, religious, and tribal rivalries have always been the dominant feature of Iraqi society. The Sunni-dominated central government in Baghdad has historically discriminated against the Shi'ites in the south and the Kurds in the north. Systematic efforts to "Arabize" the predominantly Kurdish region in the north resulted in a rebellion in the 1970s that brought the Kurds further retribution. Under the

sanctions regime, living conditions in the northern provinces that are under Kurdish control have improved, partly because the UN, rather than the government of Iraq, is administering the oil-for-food program there, and partly as a result of the infusion of higher per capita international humanitarian assistance to this region between 1991–96. The future social and economic prospects of this region, however, remain uncertain, given that the status of the region is yet to be determined.

The predominantly Shi'ite south, which witnessed an uprising against the Sunni-controlled Baghdad government in the wake of the 1991 war, has been less fortunate. The military continued its water-diversion and other projects in the south designed to displace the Shi'ite community there, known as the "marsh Arabs." Since the 1980s, the government has drained most of the southern areas by either drying up or diverting the streams and rivers, effectively cutting off water supplies to the Shi'ite community inhabiting those areas for thousands of years.

The government also limited the delivery of food, medical supplies, drinking water, and transportation to the region. The regime has used food rations allowed under the oil-for-food program to reward regime supporters and silence opponents. As a result of this policy, the humanitarian conditions of Shi'ites in the south continued to deteriorate, despite a significant expansion of the oil-for-food program after 1997.

WORKING CONDITIONS

Iraq's labor force has increased steadily since the 1970s, reaching over 6 million workers in 1998. No official statistics are available for the unemployment rate in the country, but it is widely believed that the unemployment rate has increased dramatically as a result of the war and the subsequent sanctions. Iraq suffered labor shortages in the 1980s as result of the conscription of thousands of Iraqi men in the military. Declining economic conditions forced thousands of foreign workers who migrated to Iraq for work opportunities during the war to leave after the war ended. This problem was further aggravated by the exodus of thousands of Iraqi professionals at the outset of the Gulf War. The majority of the labor force (67 percent) is concentrated in the services sector, which is dominated by the military, in comparison to only 14 percent in the agricultural sector and 19 percent in the industrial sector.

Iraq's trade unions were legalized in 1936, and although more than a dozen are in existence today, the labor movement has been largely ineffective due to the domination of the government and Ba'ath Party. In 1987, the government established the Iraqi General Federation of Trade Unions (IGFTU) as the sole legal trade federation, which is used to promote the principles and policies of the Ba'ath party among union members. Iraqi employees work a 6-day, 48-hour week, but working hours in the **public sector** are set by the head of each ministry. Child labor is prohibited, although children under the age of 14 can work in the agricultural sector and are encouraged to help support their families.

Although labor laws protecting the right of workers have been in place since 1958 and subsequently amended in 1964, working conditions in Iraq are not ideal. Workers do not enjoy the right to strike, as mandated by the 1987 Labor Law; do not have the right to bargain collectively; and are often arbitrarily moved from their positions for political considerations. Salaries in the public sector are set by the government, but no information is available on minimum wages. Declining economic conditions in the 1990s have forced many government employees to take second and third jobs to support themselves.

Since the 1970s, the ruling Ba'ath party has encouraged the participation of women in the labor force and much effort was exerted to improve their level of education. The percentage of women in the labor force has, however, remained rather steady in the 2 decades between 1970 and 1990, hovering at around 16.8 percent. According to World Bank figures, Iraqi women's participation in the labor force has risen consistently since the 1990/91 Gulf War, jumping from 16.6 percent in 1991 to a high of 19 percent in 1998. This increase can be best explained in terms of the harsh economic conditions that Iraqis have had to endure as a result of the war, which have forced many women to seek employment opportunities outside their homes to earn a living.

COUNTRY HISTORY AND ECONOMIC DEVELOPMENT

1917. As the Ottoman Empire collapses, Iraq comes under the control of the British.

1921. The British declare Faisal king of Iraq.

1932. Modern Iraq gains independence. A new government headed by General Nouri al-Said is formed.

1933. Ghazi, the son of King Faisal, becomes king.

1941. The Ba'ath Party is founded by 2 Syrian students, espousing the goals of socialism, freedom, and unity.

1939. King Ghazi is killed in a car accident and is succeeded by his son Faisal II.

1958. Hashemite monarchy is overthrown by officers of the Nineteenth Brigade under the leadership of

Brigadier Abdul-Karim Qassem and Colonel Abdul Salam Arif. Iraq is declared a republic.

1963. President Abdul-Karim Qassem is overthrown by Abdul Salam Arif and a coterie of military officers in a bloodless coup.

1970. The government signs a 15-article peace plan with the Kurds after years of rebellion and conflict.

1972. Iraq and the Soviet Union sign a treaty of friendship for political and economic cooperation. Iraqi Petroleum Company is nationalized and Iraq National Oil Company is established to exploit new oil concessions.

1979. President Bakr resigns, and Saddam Hussein officially replaces him as president of the republic, secretary general of the Ba'ath Party Regional Command, chairman of the RCC, and commander in chief of the armed forces.

1979. Shah of Iran is overthrown.

1980. Iran-Iraq War begins.

1988. Iran-Iraq War ends.

1988. Government launches privatization program to spur economy.

1990. Iraq invades Kuwait.

1991. Iraq is defeated by allied forces. United Nations sanctions are imposed.

1997. Iraq is permitted to export limited amounts of oil in return for food and medicine.

FUTURE TRENDS

Iraq entered the 21st century under a cloud of great uncertainty. Despite the large sums of money that have entered the government's coffers from the sale of oil in the last 50 years, Saddam Hussein's legacy of war, first with Iran and then as a result of the invasion of Kuwait, has left the economy in ruins. The country's economic and social achievements during the 1970s and 1980s have been completely lost. Despite the food-for-oil program approved by the United Nations in 1997, the Iraqi economy will continue to suffer as a result of the sanctions.

Further, the prospects for the lifting of the United Nations sanctions remain uncertain, given that their termination has been made conditional upon the removal of President Saddam Hussein from power. Even after the sanctions are lifted, it is estimated that Iraq will have to pay US$12 billion in **debt-servicing** annually and to pay for food imports, medicine, and reconstruction. The problem will be further aggravated by the massive reparations payments that Iraq will be forced to pay. Unless forgiven, Iraq's debts will continue to greatly hinder its ability to undertake large-scale reconstruction and repair needed to restore the civilian infrastructure.

Internally, the social and ethnic divisions that have long characterized Iraq are stronger than ever. Despite being greatly weakened by the Gulf War and the sanctions, the repressive Saddam Hussein regime continues to rule the country unchallenged. The country itself has been divided into 3 zones, with the center and the south remaining under the control of the Iraqi government. Meanwhile, the north, where the Kurdish minority is concentrated, has been granted, at least temporarily, the right to administer its own affairs. For the last 10 years, the Kurds have enjoyed the protection of U.S. and British forces against potential military attacks by the Iraqi government. However, it remains uncertain whether such an arrangement can be sustained after the U.N. sanctions are lifted.

DEPENDENCIES

Iraq has no territories or colonies.

ISRAEL

State of Israel
Medinat Yisrael
Dawlat Israel

CAPITAL: Tel Aviv/Jerusalem. Israel proclaimed Jerusalem as its capital in 1950, but most countries, including the United States, have not recognized this internationally disputed move and maintain their embassies in Tel Aviv.

MONETARY UNIT: New Israeli Shekel (NIS, named after the currency in use in biblical Israel, was introduced in the late 1980s). Bills include 10, 20, 50, 100, and 200 shekels, and there are coins worth ½, 1, 5, and 10 shekels. The New Israeli shekel is divided into 100 agorots, of which there are 5, 10, and 20 agorot coins.

CHIEF EXPORTS: Machinery and equipment, software, cut and polished diamonds, chemicals, textiles and apparel, agricultural products.

CHIEF IMPORTS: Raw materials, military equipment, investment goods, rough diamonds, fuels, consumer goods.

GROSS DOMESTIC PRODUCT: US$110.2 billion (purchasing power parity, 2000 est.).

BALANCE OF TRADE: **Exports:** US$35.1 billion (f.o.b., 2000). **Imports:** US$31.5 billion (f.o.b., 2000).

COUNTRY OVERVIEW

LOCATION AND SIZE. Israel, a country slightly smaller than the U.S. state of New Jersey, is located in the Middle East, bordering the Mediterranean Sea for a length of 273 kilometers (168 miles). In the south and southwest, it borders the Gulf of Aqaba and the Sinai Peninsula, occupied in the war of June 1967 and returned to Egypt in April 1982. To the east, it shares a 238-kilometer (147-mile) borderline with the Hashemite Kingdom of Jordan and 307 kilometers (189 miles) with the Palestinian Autonomous Area on the western shore of the Jordan river. In the north, Israel shares 79 kilometers (49 miles) of borders with Lebanon, and with Syria for 76 kilometers (47 miles) on the disputed Golan Heights.

The “Gaza Strip,” a small piece of territory running some 40 kilometers (25 miles) along the Mediterranean coast, has been under limited jurisdiction of the Palestinian National Authority (PNA) since 1994 and may eventually form a part of a single Palestinian entity, together with the Palestinian Autonomous Area in the West Bank. The territories which were occupied after the war of June 1967 are not recognized as forming part of the State of Israel, although it seems unlikely that Israel will reverse its annexation of East Jerusalem. Control over the Old City, which is the Jews’ principle holy site, the Wailing Wall, and the Muslims’ holy mount, the Haram al-Sharif with the al-Aqsa mosque, is heavily disputed.

POPULATION. Israel’s population was estimated to total 5.85 million in July 2000. This number includes about 171,000 Jewish settlers in the West Bank; about 20,000 in the Israeli-occupied Golan Heights; about 6,500 in the Gaza Strip; and about 172,000 in East Jerusalem. The country’s population is heavily concentrated along the coastal strip, with about 75 percent of the Jewish inhabitants and around 60 percent of the non-Jewish population located between Ashkelon and Nahariya. In 1997, the Tel Aviv district had almost 1.2 million inhabitants, accounting for some 20 percent of total population. Jerusalem (Yerushalayim in Hebrew and al-Quds in Arabic) counted 633,700 inhabitants, in 1998. Haifa (Hefa) is the largest city in the north with some 265,000 inhabitants. Of the total population, 91 percent are defined as urban, that is resident in localities with more than 2,000 inhabitants. Around 80 percent of Israel’s population is Jewish of which 40 percent were born abroad, mostly European or American-born (1.2 million citizens), and 60 percent (2.8 million citizens) were Israeli-born Jews. The 20 percent of non-Jewish Israeli citizens are mostly of Arab origin.

There are 2 main Jewish communities, the Ashkenazim and the Sephardim. The former are the Jews from Eastern, Central, and Northern Europe, while the latter originate from the Balkan countries, North Africa, and the Middle East. There are around 15 percent Muslims and some 2 percent Christians and 2 percent Druze. Israel is also home to the Bahai community's principal sanctuary in Haifa.

Hebrew is the official language and Arabic is officially used for the Arab minority. English is the most commonly used foreign language. Ultra-orthodox Jews, who refuse to converse in the holy language of Hebrew, and elder Eastern European immigrants speak Yiddish. Due to the diversity of the immigrant population, most Israelis are multilingual.

After the Diaspora (the dispersion of Jews from their homeland) for nearly 2000 years, *aliyas* or waves of **immigration** started bringing Jews to what had once been Israel in the last decades of the 19th century, driven by the idea of establishing a Jewish national homestead in their biblical land. From the early 1920s, the Jewish population in Palestine increased more than sevenfold, from only 80,000 to 600,000 in 1948, when the State of Israel was declared. In the first 20 years of the state's existence, between 1948 and 1972, the country's population quadrupled.

OVERVIEW OF ECONOMY

Once a traditional economy based mainly on agriculture, light industry and labor intensive production, Israel was until the 1990s described as the "most **socialist** economy of any nation outside of the Eastern bloc". High growth, second only to Japan in the period 1922–73, was achieved through a highly centralized, state-driven economic policy, making Israel a world record-holder in high taxes, **foreign debt**, and finally **inflation**, which reached triple digit levels from 1977 to 1984.

Since a national unity government first began implementing measures of stabilization and reform in 1985, Israel's economy has been transformed from a highly state-centered one to a mixed economy focused on high-tech and exports. The influx of Jewish immigrants from the former Soviet Union topped 750,000 between 1989 and 1999, bringing the population of Israel from the former Soviet Union to 1 million, one-sixth of the total population, and adding scientific and professional expertise of substantial value for the economy's future. The influx, coupled with the opening of new markets at the end of the Cold War, and the onset of the Middle East peace process, energized Israel's economy, which grew rapidly in the 1990s, despite a slight setback during 1997 to 1999. Capitalizing on the country's human resource potential, the government instituted economic reforms and new policies that have created a global high technology powerhouse in such industries as semiconductors, computer software, telecommunications, and biomedical equipment. The dramatic growth of Israel's high tech sector in recent

years has led to a shortage of qualified workers and a significant rise in salaries for these positions.

In the 1990s, Israel enjoyed a remarkable economic expansion that brought new levels of prosperity and a significant increase in purchasing power. With economic growth averaging nearly 6 percent between 1990 and 1996, Israel's economy expanded by some 40 percent in real terms, and per capita income jumped from US$11,000 to almost US$17,000. The slowdown in economic growth between 1997 and 1999 was generally attributed to the waning of the stimulative effects of the immigration waves, such as for residential construction and new business investment, high interest rates, and much tighter **fiscal policy** in this period. A further reason was increased political and security uncertainty due to a lack of progress in the peace process. In 2000, Israel's **GDP per capita** was US$17,500—higher than in Spain or New Zealand.

Both major parties, the currently ruling Likud under Ariel Sharon and the Labor party, are committed to further **liberalizing** the economy, strengthening exports and attracting further foreign investments, mainly in the high-tech sectors, and to keeping the **macroeconomic** environment stable. Despite moving gradually toward a more open, competitive, and market-orientated economy over the past decade, the level of government involvement in the economy remains high, as do the public's expectations for government assistance. The country's **infrastructure** network remains publicly owned, as does much of the banking system. However, the pace of **privatization** has quickened in recent years.

POLITICS, GOVERNMENT, AND TAXATION

Israel is a parliamentary democracy. The president, who has ceremonial function, is elected by the Knesset, a **unicameral** parliament, for a 5-year term. Moshe Katzav, member of the Likud party and of Persian origin, was elected president in 2000. Since the May 1996 election, the prime minister is elected directly by a separate universal vote. The minimum voting age is 18. The prime minister since 2001 is Ariel Sharon, who took over from Ehud Barak. The latter had failed to achieve an agreement with the Palestinian National Authority at Camp David and could not meet the Israeli public security expectations in the early phase of the second intifada or uprising. Apart from Ehud Barak, the 1990s saw a number of prime ministers come and go. Benyamin Netanyahu, Shimon Peres, Yitzhak Shamir, and the much-loved Yitzhak Rabin, who was assassinated in 1995 by an ultra-orthodox Jew frustrated by rapprochements with the Palestinians, have held the office in the last decade.

The State of Israel was declared on 14 May 1948, its political leadership emerging from the Jewish Agency. Its chairman, David Ben Gurion, became the first prime minister and is considered the father figure of the state. For decades the country was dominated by the Labor Party (though under changing names) first under Ben Gurion, then under other leaders, and the Histadrut, Israel's General Federation of Labor. The 2 institutions formed a quasi-socialist system with large state welfare provisions. The first change of the ruling party came as a surprise in 1977, when the Likud Party, under Menachem Begin, won the largest share of seats.

With 5 wars fought since the inception of Israel with its Arab neighbors the Israeli Defence Forces (IDF) have at any stage played an important role. Virtually all leading statesmen in Israel had senior positions in the IDF before coming to office. A permanent peace settlement seemed possible for the first time when President Sadat of Egypt visited Jerusalem in 1977 and addressed the Israeli parliament. A year later at Camp David under the guidance of President Carter, Begin and Sadat agreed on a peace treaty that was finally signed in March 1979. Until today, though, a comprehensive peace agreement with all Arab neighbors has not been struck and the problem of a Palestinian entity has not been resolved.

The Israeli Parliament, known as the Knesset, consists of 120 members elected to 4-year terms, although the prime minister has the option to call for new elections before the end of the term, or the prime minister's government can fall on a vote of no-confidence in the Knesset. A total of 11 political parties are currently represented in the 16th Knesset. The political spectrum includes the Hadash Party, a left-wing umbrella group, including the Communist Party and other **Marxist** factions that is made up of both Arab and Jewish citizens; the left-wing Meretz Party; the center-left and chief opposition Labor Party; the new centrist Third Way Party; the ruling right-center Likud Party; the religious parties (National Religious Party, Shas, and United Torah Judaism); and the rightist Moledet. Yisrael B'Aliya is a centrist party focused on the rights of Russian immigrants. The United Arab List, a combination of the Democratic Arab Party and representatives of Israel's Islamic Movement, is a defender of the rights of Arab citizens.

After the failed talks between Palestinians and Israelis at Camp David the ongoing second intifada began in September 2000. The Israeli-Palestinian conflict over land and the status of Jerusalem remains a crucial issue. Israel had benefitted considerably from the onset of the Middle East peace process, and its economic success depends at least to some degree on political stability. Since the 1993 signing of the Declaration of Principles on Palestinian self-rule, the future status of Jerusalem and the continuing expansion of Jewish settlements in East Jerusalem and the West Bank have emerged as 2 of the most critical issues affecting the peace process. The

ongoing intifada was triggered when Ariel Sharon, as prime minister, paid a highly disputed visit to the Muslim holy site in the Old City of Jerusalem. The Old City, within the walls of which are found the ancient quarters of Jews, Christians, Muslims, and Armenians, has a population of some 25,500 Arabs and 2,600 Jews. In addition there are some 600 recent Jewish settlers in the Arab quarter. It is highly unlikely, though, that any Israeli government will give up control, gained in 1967, over East Jerusalem and the Old City, in particular.

INFRASTRUCTURE, POWER, AND COMMUNICATIONS

Israel's infrastructure is modern and well developed. To cope with its growing population and to improve the functioning of the economy, Israel is making large investments to upgrade its infrastructure. Major projects include the construction of a new terminal at Ben Gurion International Airport; a tunnel through Mt. Carmel to provide a bypass route around Haifa; the Cross-Israel Highway, a major north-south artery; and mass transit systems planned for Jerusalem, Beer Sheva, and the Tel Aviv region.

TRANSPORTATION. Israel has a total of almost 16,000 kilometers (9,942 miles) of paved roads, including 56 kilometers (35 miles) of expressways. The main highway runs along the Mediterranean coast, linking the north (Haifa) and the center (Tel Aviv). The second major link between Tel Aviv-Jerusalem causes major problems. Due to little space for the construction of new roads, the 45-minute-drive from Tel Aviv to Jerusalem takes about 3 hours during rush hours. Part of the old Beirut-Jerusalem railway connection runs from Nahariya via Haifa to Tel Aviv. The route from Tel Aviv to Jerusalem is not in use anymore. The importance of trains especially in passenger transportation is overshadowed by the government-owned Egged bus company, which operates the second largest bus system in the world after Greyhound. Freight traffic consists of grain, phosphates, potash, containers, petroleum, and building materials. Rail service serves Haifa and Ashdod ports and extends to Eilat port. Haifa and Ashdod on the Mediterranean Sea coast are the main ports in Israel. The port of Eilat is Israel's gateway to the Red Sea. In 1997, Israel's merchant fleet consisted of 55 vessels. There are 2 international airports in Israel, Tel Aviv's Ben-Gurion airport and Eilat airport. Plans to merge the airports of Eilat and of the neighboring Jordanian city of Aqaba did not materialize. An international airport in the Gaza strip in operation since 2000 but currently largely dysfunctional due to security problems.

POWER. The Israel Electric Corporation (IEC) has completed a US$10 billion investment program in 2000, which has boosted the country's generating capacity from 8,000 megawatts to about 12,000 megawatts. The country's plants almost entirely run on fossil fuels; no nuclear power plants are in operation. Israel is preparing for the availability of natural gas by planning a natural gas distribution network. Local authorities are searching for solutions to environmental problems related to municipal solid waste and wastewater treatment. The first international tender for a waste-to-energy plant was issued in January 1998. Development of regional sanitary landfills, a national air pollution monitoring system, and municipal wastewater treatment plants, even in outlying regions of the country, are indicative of a growing awareness of environmental issues.

TELECOMMUNICATIONS. Israel is one of the world leaders in mobile communications. There are currently 3 major Israeli cellular mobile network providers, as well as a Palestinian company and almost as many cell phones in use as main lines. In 1999, there were 2.8 million landlines and 2.5 million mobile users. The Israeli telephone

Communications

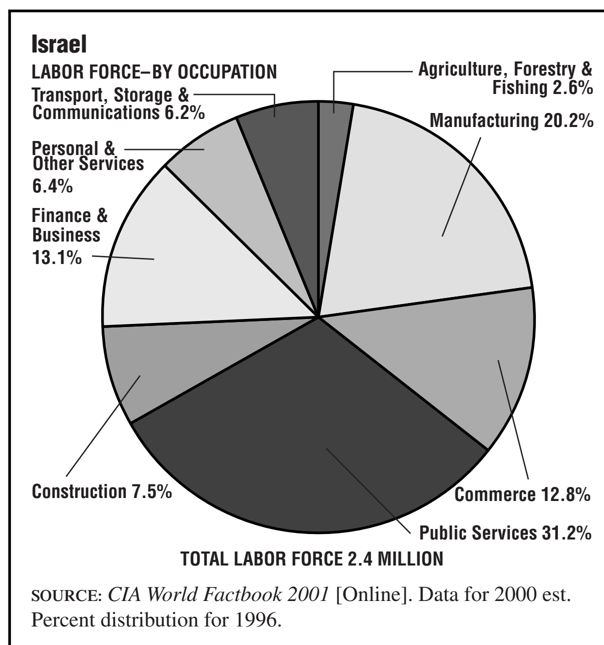
SOURCE: CIA *World Factbook 2001* [Online].

system, no longer **monopolized** by the government-owned Bezek company but open to competition, is the most highly developed system in the Middle East, with a good system of coaxial cable and microwave radio delay. All systems are digital. In addition to telephony providers, Israel has now at least 21 ISPs, a figure constantly increasing.

Israelis are radio listeners: There were 3.07 million radios in the country in 1997, compared to 1.69 million televisions. Given the importance of news and information, people commonly listen to the news at work; bus drivers usually turn up the volume to allow passengers to listen to the news. Since 1999, there has been a digital TV station in operation, which has also drawn a large number of subscribers.



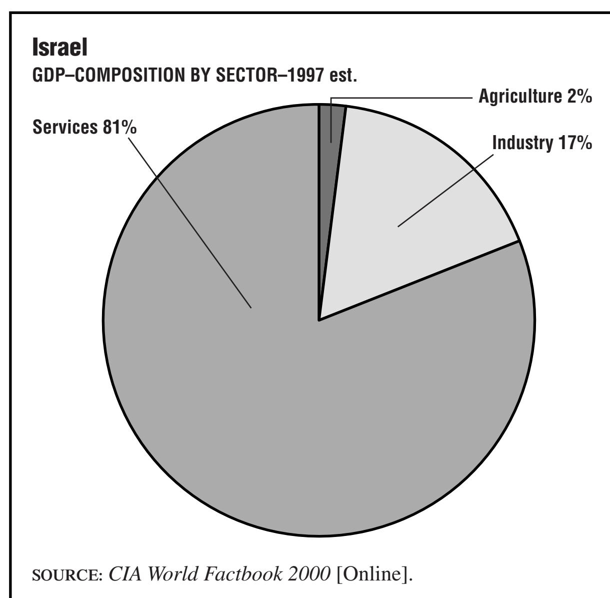
SOURCE: *CIA World Factbook 2001* [Online]. Data for 2000 est. Percent distribution for 1996.

ECONOMIC SECTORS

Once strongly based on agriculture and low-cost industrial production for the domestic market, the country has undergone major structural changes, shifting to a modern export-oriented economy. In recent years, it has been the high-tech sector that has grown most substantially. Agriculture contributed 4 percent to the GDP in 1999, while industry accounted for 37 percent, and services for 59 percent.

AGRICULTURE

The agricultural sector is fairly small, accounting for 3.5 percent of the GDP in 2000 and employing 2.6 percent of the **labor force**. Nonetheless, Israel is largely self-sufficient in foodstuffs lacking only in grains, oils, and fats. Since the establishment of the State of Israel, the area under cultivation has increased. Currently, the cultivated area totals 4.2 million dunams (4 dunams equal 1 acre) about 50 percent of which are irrigated crops. The main factor limiting agricultural development is not land but the availability of water. With several years of water shortages in summer the further development of Israel's agriculture will involve raising the yield of existing land and recycling wastewater. Revenues in the agricultural sector amounted to around US$4 billion in recent years. The main categories are livestock and poultry, vegetables, fruits, flowers and field products.



SOURCE: *CIA World Factbook 2000* [Online].

A special feature of Israel's agriculture that has gained a great deal of international attention is its cooperative settlements. For centuries, Jews in the Diaspora were barred from owning land; therefore, the Zionist movement saw land settlement as one of the chief objectives of Jewish colonization. There are 2 basic forms of settlements, the *moshav* and the *kibbutz,* both developed to meet the needs and challenges encountered by a farming community new to its professions and its sometimes hostile surroundings. The *moshav* works on the principal of a co-operative with individual farms of equal size with every farmer working his own land to the best of his ability. The farmer's economic and social security is ensured by the cooperative structure of the village which handles marketing his products, purchasing farm equipment, and providing credit and other services. In 1998, a total of 455 *moshavim* existed, inhabited by 180,000 people. The *kibbutz* is a collective settlement of a unique form, based on common ownership of resources and the pooling of labor, income, and expenditure. Every member is to work to the best of his ability. He is not paid any wage but is supplied with all the goods and

services he needs. The *kibbutz* is, therefore, based on voluntary action and mutual liability, equal rights for all members, and it assumes for them full material responsibility. In 1998, the 268 *kibbutzim* were inhabited by around 120,000 people.

INDUSTRY

Israel's industry was originally designed to cater to a domestic market. It was to supply such basic commodities as soap, vegetable oil and margarine, bread, ice, printing, and electricity. It used raw materials available locally to produce goods as canned vegetables and fruit, cement, glass, and bricks. In order to save foreign exchange, imports of processed goods were curtailed, giving the local industry the opportunity of adding local value to the manufacturing process of products imported from abroad. Although most of Israel's industrial production is still for domestic consumption, the country's economy is far more export-oriented. Higher valued processed goods (excluding diamonds), especially electronics and high-tech related, currently constitute 90 percent of total exports. There has been a heavy expansion in export-oriented industries as a result of government tax and investment incentive schemes.

MINING/HYDROCARBONS. The Dead Sea area, a land depression bordering Jordan, which contains potash, bromides, magnesium, and other salts in high concentration, is the country's chief source of mineral wealth. The large potash works on the southern shore of the Dead Sea are linked by road to Beer Sheva from which a railway runs northward.

Lacking large-scale resources of fuel and power, Israel is forced to import more than 90 percent of its energy requirements. Petroleum constitutes around 8 percent of all goods imports. The main sources of the annual crude oil requirements of around 50 million barrels are Egypt, Mexico, and Norway. Around 30 percent of requirements are purchased on the spot market. Most imported crude oil is refined at the Haifa oil refinery, which has a capacity of more than 6 million tons a year. Output of natural gas from the Dead Sea area is transported through a pipeline to the Dead Sea potash works and to towns in the Negev desert and a large phosphate plant. Production totaled 21.5 million cubic meters in 1994.

MANUFACTURING. The total value of Israeli exports has risen: US$18 million in 1950, US$780 million in 1971, and almost US$21 billion by 2000. The greatest expansion has taken place in the electronics industry with Israel specializing in defense-related and communication equipment, software, and network equipment. The value of exports of this sector and of metals and machinery has grown from US$12.8 million in 1970 to US$9.5 billion in 1999 and by an incredible 40 percent to US$13.3 billion in the strong export year of 2000.

Israel's single most important industrial export product is cut and polished diamonds. The diamond trading and processing industry has traditionally been a Jewish stronghold. Expertise and trading contacts were brought to Israel by immigrants from the Netherlands and Belgium, home to the world's largest diamond trading center, Antwerp. Israel's specialty is medium-sized diamonds which controls approximately 75 percent of the world market in this segment. Annual exports grew from US$4.6 billion in 1995 to US$5.7 billion in 1999 and jumped to US$6.8 billion in 2000.

SERVICES

TOURISM. Israel and the surrounding countries, also known as the Holy Land, are the sites of biblical history. David's mountaintop capital, Jerusalem, is holy to the world's 3 monotheistic religions. Nearby in the West Bank lies Bethlehem, birthplace of Jesus. But Israel is also an attractive destination for hiking, desert trips, diving, or relaxing in one of the Dead Sea spas.

Tourism is the industry most severely affected by the security downslide caused by the ongoing Palestinian uprising. Since October 2000 tourism has declined by 45 percent in comparison to the peak in the quarter immediately preceding the intifada. Experience has shown that tourists take many months to return after the end of unrest. With no improvement of the security situation in sight the sector is unlikely to recover in 2002. Since the end of the Gulf War visitor numbers had been on the rise. While in 1990 only 1.1 million tourist visas were issued, this number continuously increased to 2.3 million in 1999, according to Israel's Ministry of Tourism. Tourist receipts totaled US$2.77 billion in 1996 and reached US$3 billion in 1999.

FINANCIAL SERVICES. Israel possesses a highly developed banking system, consisting of a central bank, the Bank of Israel, 14 commercial banks, 5 mortgage banks, and other financial institutions. Bank groups, namely Bank Leumi group, Bank Hapoalim, and Israel Discount Bank, are at the core of the industrial complex and hold 92 percent of the total assets of the banking system. Once owned by the Histadrut, the all-powerful General Federation of Labor, they had to be bailed out by the government during an economic crisis in the early 1980s. Since then, they have been quasi-government owned, but there are plans for privatization. A law inhibiting banks to own more than 10 percent of industrial **holding companies**, introduced to prevent another structural crisis, has not been enforced strictly.

In 1997, the Tel-Aviv Stock Exchange (TASE) adopted an automated trading system leading to lower transaction costs. The then ongoing peace process and flourishing high-tech industries have since strongly at-

tracted foreign investors. The real value of stocks traded in TASE increased by 59 percent during 1999. In 2000, 681 companies were listed on the TASE. The **turnover** was US$58.7 billion in 2000. In October 2000, Israel's Securities Authority adopted a dual listing regulation, allowing for Israeli companies that are traded on the New York Stock Exchange (NYSE) and Nasdaq to trade on the TASE without additional regulatory requirements. This measure enables Israeli and foreign investors to trade in these shares at convenient hours, and at low costs. Nevertheless, the general slump, especially in the high-tech shares, has affected the TASE, too. The combined effects of the economic downturn and security uncertainties will have to be monitored. Investment in the Tel Aviv Stock Exchange, acquisitions of Israeli companies, and **equity** flotation by Israeli companies on foreign stock markets, principally New York, have brought billions of dollars in new capital to Israel in recent years, primarily though not exclusively to its high technology industries.

INTERNATIONAL TRADE

Until the 1990s, high **tariffs** and strong non-tariff barriers characterized Israel's trade policy, and several barriers are still in place in particular with regard to processed food and agricultural products. Israel has free trade agreements with the European Union (since 1975), the United States (signed in 1985, fully effective since 1995), the European Free Trade Association (EFTA, effective since 1993), Canada (1997), and Turkey and has concluded bilateral agreements with a number of other states. Israel is the sole country in the world to have both European Union and U.S. free trade agreements. In June 2000 an association agreement between the EU and Israel came into force. In line with WTO regulations, Israel gradually began exposing the domestic market to foreign imports since September 1991. This process allowed administrative limitations on imports from third countries to be canceled, imposed higher rates of customs tariffs that since have been reduced, according to their degree of influence on local production, and allowed Israeli industry time to adjust to competition. The final stage of this process came to an end in September 2000, when tariff rates reached a maximum range of 8 percent to 12 percent.

Trade (expressed in billions of US$): Israel

	Exports	Imports
1975	1.941	5.997
1980	5.540	9.784
1985	6.267	9.875
1990	11.576	16.791
1995	19.046	29.579
1998	23.286	29.342

SOURCE: International Monetary Fund. *International Financial Statistics Yearbook 1999.*

Israel's main exports are manufactured goods and software, which accounted for 97 percent of total exports (excluding diamonds, ships and aircraft) in 2000. Agricultural exports accounted for 3 percent in 2000, compared to 16.5 percent in 1970, illustrating the depth of Israel's structural changes. The share of Israel's information communication technology exports as a percentage of exports of services is substantially high. In 1997, this share (20.1 percent) was second only to Japan (24 percent), and much higher than the OECD average, which was 12.5 percent. The United States alone absorbs more than a third (41.2 percent) of Israel's exports. Other important destinations include the European Union (27.3 percent), of which Belgium (6 percent), Germany (4.8 percent), and United Kingdom (4.3 percent) dominate; and Asia (18.5 percent), of which Japan (2.7 percent) dominates, according to Central Bureau of Statistics 2000 figures. The change in Israel's exports between 1999 and 2000 indicate that the growth rate of traditional manufacturing exports increased slightly, whereas it increased dramatically in the high-tech industries.

The geopolitical situation that has prevailed in the Middle East, since the inception of Israel, has prevented trade between Israel and its neighbors. Furthermore, the difference in the level of development and production structure between Israel and its neighbors made Europe and the United States her main trading partner. In 2000, the United States and the EU accounted for 32 percent and 30 percent, respectively, of Israel's exports and for 22 percent and 41 percent of its imports. In 2000, exports for the United States (excluding diamonds) totaled US$21.7 billion, constituting an increase of 23.3 percent in Israel's exports. Within the EU, Israel's largest export markets were Germany (21 percent), the United Kingdom (18 percent), The Netherlands and Italy (both 11 percent), and France (10 percent). Exports to Asia (excluding diamonds) increased from 12 percent in 1998 to 16 percent in 1999.

Israel has traditionally run a large external **trade deficit**, meaning that imports exceeded exports. Israel's imports have always exceeded its exports because of the Jewish state's dependence on raw materials. In addition, Israel imports military equipment, investment goods, rough diamonds, fuels, and **consumer goods**, mainly from the United States (18.6 percent), Belgium (9.9 percent), Germany (7.5 percent), the United Kingdom (7.6 percent), Italy (4.8 percent), and Japan (3.3 percent), according to 2000 figures. The cost of Israel's imports has largely been offset by cash grants from the U.S. government and charitable organizations and individuals abroad. The EU accounted for 67 percent of Israel's 2000 trade

deficit, and Asia accounted for 15 percent. The trade balance with the United States was positive.

MONEY

Israel's fiscal policy has focused on reducing the state's intervention in the economy and improving Israel's fiscal stance, namely, reducing the budgetary deficit as a percentage of the GDP and the government's debt relative to the GDP. The reduction of the deficit law was drafted in 1991 for the **fiscal year** 1992 and for the years to come. The law sets a maximum level for the **budget deficit**. Indeed, the budget deficit as a percentage of the GDP decreased from 4.9 percent in 1990 to 0.6 percent in 2000. However, Israel's ratio of government debt to the GDP still remains high compared to European countries. The internal debt, as a percentage of the GDP was reduced from 104 percent in 1989 to 70 percent in 2000; the **external debt** decreased from 39 percent in 1990 to 24 percent in 2000. Both the political right and the political left are committed to a sound fiscal policy. Since 1985 the Israeli government has not been allowed to borrow from the Bank of Israel and has had to finance its debt by issuing bonds. The Israeli government issues bonds in Israel, as well as in the United States, Europe, and the Far East.

The end of the disinflation process in Israel, which began with the 1985 Economic Stabilization Program, is aimed for 2003. Israel's **inflation rate** was cut from a worrying 444.9 percent annual inflation in 1984 to 18 percent in the late 1980s. Currently, the country has virtually reached price stability with inflation down to 1 percent in 2000. The inflation rate in the past 2 years has been consistently under the inflation target and is one of the lowest in the developed world.

POVERTY AND WEALTH

Though Israel has a strong social record, as in most societies, inequality exists in different guises. In 1988, families in the upper 10 percent of household income received 8.4 times the share of the bottom 10 percent; in 1997, the share of the uppermost 10 percent increased to 10.6 times that of the lowest 10 percent. The 20 percent of households with the highest income increased their share of the national wealth while the share of the lower income households decreased. Nevertheless, the economic boom in the early 1990s has left the average Israeli better off. The GDP per capita has increased from US$5,600 in 1980 to US$17,500 in 2000, an increase only exceeded by Singapore and Hong Kong.

However, inequality between Israelis of different ethnic origins is deeply entrenched. The average incomes of Arab citizens of Israel are the lowest and have hardly changed over the last decade. The average income of Israel-born Mizrahi Jews (originating from Africa or Asia) are somewhat higher, increasing over the last decade, but the gaps between their incomes and those of Ashkenazi Jews (originating from Europe or America) did not change. The average incomes of Israel-born Ashkenazis are the highest and increase steadily. In 1997, Israel-born Ashkenazi salaried employees earned 1.6 times more than Israel-born Mizrahi employees and 1.9 times more than Arab employees, according the Central Bureau of Statistics. Israeli society also faces gender inequality, which are stronger among Oriental Jews and Arab Israelis. In 1997, women's monthly wages were, on average, 63 percent those of men. Women's hourly wages were, on average, 83 percent those of men. These figures show an

improvement over 1993 when women's earnings as a percent of men's was still 58 percent. The fact that many women only work part-time explains some of the gap in monthly earnings. Most salaried Israelis make less than the average wage; in 1996, 62 percent made less than 75 percent of average income. For about one-third of Israelis the labor market does not provide a decent living. Between 1979 and 1990, the proportion of Israeli families with poverty-level wages increased from 27.9 percent to 34.3 percent, according to the National Insurance Institute. This figure remained stable throughout the 1990s.

WORKING CONDITIONS

The Israeli civilian labor force were 2.435 million, or 54 percent of the 4.487 million population aged 15 years and over, in 2000. In Israel the rate of participation in the labor force is low compared to other developed economies. Women's rate of participation in the civilian labor force was 48.2 percent in 2000, as opposed to 60.8 percent for men. In 2 segments of the Israeli society, among Arab Israelis and ultra-orthodox Jews, the rate of participation in the labor force is rather low, especially for women. About 11.5 percent of the labor force in the business sector are foreign workers, of which 46 percent are Palestinians, and the rest are from other countries. Except for the Dead Sea minerals, Israel has almost no natural resources, making human capital the country's catalyst for economic growth and competitiveness. In 1999, about 13 percent of those employed were academic professionals, and 14.6 percent were professionals and technicians. In 1999 about 15 percent of the civilian labor force had 16 years of schooling or more, compared to 1 percent in 1979, indicating a sharp rise in qualified Israeli professionals.

The General Federation of Labor in Israel, usually known as the Histadrut, is the largest voluntary organization in Israel and an important economic body. It is open to all workers, including the self-employed, members of co-operatives and of the liberal professions, as well as housewives, students, **pensioners**, and the unemployed. The reach of the Histadrut extends to approximately 85 percent of all workers. Dues are between 3.6 and 5.8 percent of wages and cover all its trade union, health insurance, and social service activities. The federation engages in 4 main fields of activity: trade union organization, social services, educational and cultural activities, and economic development.

Israel's labor standards are in line with international regulations and norms. There is a minimum monthly wage, and employees are entitled to social benefits under the comprehensive national insurance, Bituah Le'umi. There is also a state-provided health-care system in place, the so called Kupat Holim. Every male conscript has to serve up to 30 days of army reserve duty every year; employers continue paying their employees' salaries during this time. Israel has a minimum wage law, which is 47.5 percent of the average wage. Sometimes questionable is the enforcement of labor standards with regard to foreign workers, mainly from Eastern Europe and South Asia, as well as Palestinian workers employed in Israel.

COUNTRY HISTORY AND ECONOMIC DEVELOPMENT

70 A.D. After a Jewish uprising against Roman occupation, the Diaspora begins, and Jews **emigrate** to Europe, the Balkans, the Middle East, and North Africa.

1882–1903. First Aliya (large-scale immigration) occurs, mainly from Russia.

1897. First Zionist Congress is convened by Theodor Herzl in Basel, Switzerland; Zionist Organization is founded.

1904–14. Second Aliya occurs, mainly from Russia and Poland.

1909. First kibbutz, Degania, and first modern all-Jewish city, Tel Aviv, are founded.

1917. The Ottoman rule, which has lasted for 400 years, is ended by British conquest; British Foreign Minister Balfour pledges support for establishment of a "Jewish national home in Palestine." (This statement is called the Balfour declaration).

1919–23. Third Aliya occurs, mainly from Russia.

1924–32. Fourth Aliya occurs, mainly from Poland.

1933–39. Fifth Aliya occurs, mainly from Germany.

1936–39. Arab revolt against Jewish immigration.

1947. After World War II and the Holocaust, the UN proposes the establishment of an Arab and a Jewish state in Palestine. The British pledge to end their mandate in 1948.

1948. On 14 May, David Ben Gurion, chairman of the Jewish Agency in the mandate of Palestine, declares the State of Israel. The following day, the armies of Lebanon, Syria, Iraq, Jordan, and Egypt attack the newborn Jewish State. The War of Independence (Israel) or the "Nakba" (catastrophe) begins and continues in 3 phases until 1949. Israel not only defends itself but increases its territory far beyond the original division plan. To Israelis, this is the miracle of David defeating Goliath; for the Arabs, it means escape and expulsion and the beginning of the refugee Odyssey of the Palestinians, the "Nakba." Peace talks in Cyprus fail.

1956. England, France, and Israel collaborate in a plot to remove Egyptian president Nasser, the hero of the Arab world and one of the leaders of the Non-Alignment movement, and attack Egypt. Under U.S. and Soviet pressure, Israeli troops withdraw, and Nasser claims victory

1967. On 6 June, following misinformation from Soviet observers, tensions suddenly build up and lead to an Israeli "pre-emptive" strike against its Arab neighbors. Within 6 days, Israel defeats all its enemies, among them the entire Egyptian air force before it can even take off, and occupies large amounts of land: in the South, Israel "frees" the Negev and occupies the Sinai peninsula; in the North, the Jewish state captures the strategic Golan Heights; and to the East, Israel occupies the Jordanian West Bank, including Jerusalem. The historic town is immediately declared the "eternal and undivided capital" of the Jewish state. At the same time, Israel becomes an occupation force controlling a large population of Palestinian Arabs in the West Bank and Gaza Strip.

1973. A surprise attack by Egypt and Syria gives the Arab states a face-saving "victory" that, in fact, is another defeat in the Yom-Kippur or October War.

1977. The Likud wins the general elections in 1977, introducing a new era in Israeli politics. Egyptian president Anwar Sadat visits Jerusalem and speaks to the Knesset, paving the way for ensuing peace negotiations at Camp David. A peace agreement between Egypt and Israel is signed in 1979.

1982. Israel invades Lebanon and manages to drive the PLO leadership from Beirut to Tunis. Ariel Sharon, the minister of defense and former war hero, single-handedly and somewhat illegally masterminds the invasion as far as Beirut. He has to resign after the invasion and later faces a court charge over a massacre of Palestinian refugees in the camps of Sabra and Shatilla by Israeli-allied Christian militias. In the midst of a deepening economic crisis, a national unity government and reform measures are implemented. Economic deprivation and general dissatisfaction with the Israeli military occupation trigger a Palestinian uprising, the Intifada.

1990. The downfall of the Soviet Union brings almost 1 million new immigrants to Israel. During the Gulf War and the liberation of Kuwait from Iraqi occupation, Iraq fires missiles on Tel Aviv and Haifa.

1992–93. The elections are won by war hero and ex-prime minister, Yitzak Rabin, in 1992. A secret channel leads to direct negotiations between PLO and Israel, resulting in mutual recognition and a Declaration of Principles for the assumption of peace talks, known as the Oslo Accord, presented to the public in Washington, D.C., on 23 September 1993.

1994–95. Israel concludes a peace treaty with Jordan and the Gaza-Jericho (Oslo II) agreement with the Palestinians. After a series of suicide bomb attacks within Israel, Rabin is assassinated on 4 November 1995. Shimon Peres becomes prime minister but loses the elections to Benyamin Netanyahu ("Bibi") who becomes prime minister in May 1996 and opens his reign with the tunnel under Al-Aqsa, leading to violent riots.

2000. Having won the elections against Bibi Netanyahu in June 1999 on a pro-peace platform, Israel's highest-decorated soldier, Ehud Barak, realizes his promise to pull Israeli troops out of South Lebanon within a year. Peace talks with the Palestinians at Camp David fail and the so-called Al-Aqsa Intifada breaks out in September, after a highly controversial visit of the new Likud leader, Ariel Sharon, to the holy sites in the Old City of Jerusalem.

2001. Ariel Sharon becomes prime minister.

FUTURE TRENDS

The real key to Israel's economic take-off will be its ability to come to some peaceful accommodation with its immediate Palestinian neighbors and the other countries of the region. As the Peace Process has stalled, so have the bright prospects for economic integration which were

supposed to boost the regional demand for Israeli products and services. With a genuine peace in this region, Israel is easily poised to be a significant "engine of growth" for the whole Middle East.

Israel remains well positioned to compete in the knowledge-intensive industries of the 21st century, and its economy has the potential to grow at some 4 to 5 percent per year. Israel's proportion of scientists, engineers, and other skilled personnel in the labor force is high by international standards, and Israeli companies are rapidly developing experience in the business aspects of transforming technology into marketable products and services. Further, the ongoing structural transformation of the economy, especially its shift from traditional to higher-value goods and services, should add to Israel's growth potential in the near future. Finally, structural reforms that will increase the level of competition and reduce the role of the state should add to overall efficiency and productivity.

DEPENDENCIES

THE WEST BANK AND GAZA STRIP. Since the Oslo Accords in 1993 between the Palestine Liberation Organization (PLO) and the State of Israel, a Palestinian National Authority has been established and autonomously rules over parts of the West Bank and Gaza Strip. Those territories are Israel's largest market and most important trade partner, with a total population of 2.9 million, of which 1.9 million lived in the West Bank and 1 million in the Gaza Strip in 1997.

With the occupation of the West Bank and Gaza Strip by Israel in the 1967 war, both territories became economically dependent on Israel. By 1987, almost 50 percent of the Gaza Strip's total labor force was employed in Israel. About 90 percent of imports came from Israel, in an involuntary and one-sided customs union. Local trade was concentrated in the hands of a few large-scale wholesalers. As a result, indigenous development did not occur. The Palestinians became increasingly dependent on Israeli wages, imports, and technologies. Industry remained weak, contributing only a small percentage of GDP, employing only a small fraction of the total labor force and remaining limited to small firms that were mainly engaged in subcontracting for Israeli firms of the textiles and clothing industry.

Until 1989, the combined level of the GNP in the Palestinian territories was only 6 percent of Israel's; the combined GDP of the territories was only 5 percent of Israel's, thus indicating the massive inequalities implied in the relationship. The outbreak of the first intifada, or uprising, in 1987, itself the result of the oppressive conditions of life under occupation, worsened the economic situation. The 1991 Gulf War effectively stopped vital **remittances**, direct aid, and income from wages in Israel, with frequent closures and curfews imposed on the territories. The repeated closures in the context of a deteriorating security situation in 1992 and 1993 led to mass unemployment and impoverishment.

The 1993 beginning of the peace process was hoped to bring remedy. But despite the peace process, employment of Palestinian workers in Israel steadily decreased, and as a result, unemployment soared to 20 percent to 30 percent on average and up to about 50 percent in Gaza. Closures have also contributed to a decline in the GDP, which fell by about 14 percent during 1992–96, while private investment declined by about 60 percent. Poverty has risen substantially. Trade relations have barely changed. Israel has remained Palestine's most important partner, still accounting for about 90 percent of trade. The current second intifada, an expression of the population's dissatisfaction with the peace process, has had devastating effects so far. Unemployment has soared to more than 50 percent, in the case of the Gaza Strip estimates reach figures as high as 80 percent. Billions of dollars of investments have been destroyed, and the little business infrastructure that has existed has been disrupted or destroyed.

COUNTRY OVERVIEW

LOCATION AND SIZE. Japan, an island nation in east Asia, is an archipelago (large group of islands) located east of the Korean peninsula. It has an area of 377,835 square kilometers (145,882 square miles), which makes it slightly smaller than the state of California. Japan is bordered by the Pacific Ocean on the north and east, by the Philippine Sea and the East China Sea to the south, and by the Sea of Japan on the west. It has a coastline of 29,751 kilometers (18,487 miles). Japan's major cities, including Tokyo, its capital, and Yokohama, its major port, are located in the southeastern part of the country, on the main island of Honshu. Kyoto, Nagoya, and Osaka are in the southern part of Honshu. Sapporo is located on the northern island of Hokkaido. The other 2 main islands in the Japanese archipelago are Kyushu and Shikoku, to the southwest.

POPULATION. Japan's population was estimated at 126,549,976 in July 2000. The population grew from 115,000,000 in 1975 to 126,300,000 in 1998, indicating a growth rate of 0.5 percent. With Japan in a state of near zero population growth, this total is expected to decline to 126,000,000 by 2015. In 2000, the estimated birth rate was 9.96 per 1,000 population, and the estimated death rate was 8.15 per 1,000. In the same year, the net migration rate was 0 percent.

The Japanese population is very old. According to the 2000 estimation, 17 percent of the population is 65 years old and over, a proportion that is expected to rise to 24.6 percent by 2015. In 2000, 15 percent of the population was under 14, and 68 percent was between 15 and 64.

Japan's population is very homogenous, with ethnic Japanese constituting 99.4 percent of the total. Ethnic minorities, which account for 0.6 percent of the total population, include about 24,000 indigenous Ainu people in Hokkaido and about 690,000 Koreans, mostly citizens of North or South Korea. There are much smaller groups of Chinese and Caucasians.

The population is highly urbanized, with about 78.5 percent of the population living in urban areas in 1998, a very small increase from 1975, when they accounted for 75.7 percent. The urban population is expected to increase to 82 percent by 2015. Based on 1999 statistics, Tokyo, the capital, is the largest urban center, with a population of 8,049,000. Other major urban areas are Yokohama (3,393,000), Osaka (2,594,000), Nagoya (2,167,000), Sapporo (1,811,000), and Kyoto (1,460,000).

OVERVIEW OF ECONOMY

Once a predominantly agrarian society, Japan began its industrialization in the second half of the 19th century by adopting Western technology, and developed itself into a major industrial power by the first decade of the 20th century. Its economic and military power continued to grow in the following decades, enabling it to emerge as an expanding global power in the 1930s. The Japanese entry into World War II (1939–45) led to a devastating defeat marked by the U.S. atomic bombing of the cities of Hiroshima and Nagasaki. Apart from the destruction caused by the atomic bombs, the war devastated

the Japanese economy and destroyed most of its industrial base and **infrastructure**.

Thanks in part to U.S. support during the postwar occupation, Japan began restoring its free-enterprise economy and industries in the 1940s. The Japanese economy began to expand in the 1950s and continued its impressive growth as a highly modern mature industrial economy until the early 1990s, when it slowed considerably. By the 1980s, it ranked as the world's second largest economic power after the United States. In 1999, Japan's GDP was 45 percent of that of the United States, but larger than the combined GDP of France and Germany. By the first decade of the 21st century, Japan had established itself as a major exporter of industrial products.

On average, Japan's annual GDP growth was about 10 percent from the 1950s until the 1970s. The growth rate began to fall in the 1970s for external and internal reasons. The first "oil shock" in the early 1970s pushed up oil prices and significantly increased imported fuel costs. Since Japan's economy depends heavily on imported fuel, this development slowed economic growth.

In 1974, the economy contracted by about 1.2 percent of total GDP. The second oil crisis of the late 1970s and the early 1980s slowed the economy to a smaller extent, causing a 0.4 percent annual shrinkage of GDP from 1980 to 1985. The situation worsened in the mid-1980s when an increase in the value of the yen increased the price of Japanese exports, leading to a decrease in global market demand. As a result, GDP growth dropped from 4.4 percent in 1985 to 2.9 percent in 1986. The damaged export industries sought to regain their competitiveness in international markets through massive relocation of their production to facilities abroad, notably in southeast Asian countries, where the cost of production was much lower than in Japan.

To offset the negative impact of the stronger yen on the economy and to stimulate growth in the domestic market, the Japanese government adopted a financial policy in the late 1980s to bolster the real estate and financial sectors. During this period, which came to be known as the "bubble economy," the Bank of Japan reduced its lending interest rate and the government increased its spending dramatically, which raised the value of stocks and inflated the price of land. This in turn stimulated spending and investment by both businesses and consumers. By 1991, stock speculation and large investments in real estate pushed prices up so much that the Bank of Japan was forced to intervene. This burst the bubble economy, and contributed to a decline in the Japanese economy during the 1990s. During that decade, Japanese products became less competitive in domestic and international markets because of higher prices.

The end of the bubble era initiated a period of sluggish growth and a loss of public confidence in the economy, both of which have continued into 2001. Although the government's **deflationary** measures (policies to reduce prices) triggered a decline in the Japanese economy in the 1990s, they did succeed in keeping **inflation** very low throughout the decade; annual rates were 1.8 percent in 1997, -0.3 percent in 1999, and -0.6 percent in 2000. The declines in the financial sector have resulted in higher unemployment through layoffs, once considered unthinkable in Japan. From its near-zero levels before 1991, the unemployment rate jumped to 2.2 percent in 1992, 3.2 percent in 1995, and 4.7 percent in 1999. The rate reached a record high of 4.9 percent in March 2000. Compared with many other developed economies such as Canada's, with an average unemployment rate of about 10 percent in the 1990s, Japan's unemployment rates since 1991 have not been very high. Yet they have been very high for a country which long prided itself on its traditions of "lifetime employment" for selected workers and strong employee loyalty. To avoid massive layoffs, many companies initiated a policy of reducing salaries, wages, and bonuses, thus lowering the living standards of many employees and decreasing spending, which, in turn, has prolonged the economic decline. Aimed at boosting the declining economy, Japan tried to **restructure** the financial sector in 1996 by introducing the so-called "Big Bang" reform measures. Its near zero-percent interest rate contributed to a short-lived increase in GDP (5.1 percent), but it failed to make growth sustainable.

The 1997 Asian financial crisis (which affected South Korea, Hong Kong, Thailand, Indonesia, Malaysia, and Singapore) was the major external factor responsible for Japan's economic downturn. It affected many markets of importance to Japan and worsened the Japanese economy by reducing export demand. The collapse of 3 major Japanese banks and a decrease in consumption further damaged the Japanese economy, which registered a 2.5 percent GDP decline in 1998, though it increased slightly, by 0.2 percent, in 1999 and about 1 percent in 2000.

Japan has benefited from continuous **trade surpluses** since the 1980s, amounting to $107 billion in 1999 and $95 billion in 2000. As a result, it has the world's largest foreign reserves, equal to $288 billion that same year. Four factors are responsible for these trade surpluses. First, Japan has a highly diversified advanced manufacturing sector capable of producing high-quality exportable products, and total exports were valued at $450 billion in 2000. Second, Japan's protected economy puts restrictions on foreign competition, including barriers to large-scale imports of foreign products. This situation has been gradually changing since the early 1990s, and the main barriers to foreign **consumer goods**, for instance, have been removed. Nevertheless, many restrictions have limited the flow of imports, which totaled $355 billion in 2000. Third, Japan's poor economic performance since the early 1990s has decreased demands for the import of various products, including fuel and raw material for commercial purposes, while also decreasing demand for many consumer products by a public concerned about unemployment and wage/salary cuts. Finally, Japan's aging population has, since the 1980s, gradually been spending less money on consumer products. If the population decreases as predicted, the shrinkage of the domestic market will have a severe economic impact on the Japanese economy.

Still, Japan is the world's second largest economic power and the second most technologically advanced economy after the United States. The most important sector of the Japanese economy is industry, which includes manufacturing, construction, and mining. Manufacturing is highly diversified and includes light industry, heavy industry, and high-tech. Manufacturing is the largest contributor to exports, but it is heavily dependent on imported raw materials and fuels. Industry is the second largest sector in terms of contribution to GDP (35 percent in 1999) and to the workforce (30 percent in 1999). Like other mature industrial economies, services form the

largest economic sector, accounting for the largest contribution to GDP (63 percent in 1999) and to the workforce (65 percent in 1999). The growing service sector consists of many services such as financial, **retail**, and tourism. At the beginning of the 21st century, agriculture, including fishing and forestry, is its smallest sector, accounting for the smallest share of GDP (2 percent in 1999) and of the workforce (5 percent in 1999). However, this sector is highly developed and produces all of Japan's rice, but it does not supply all its agricultural needs, which makes Japan dependent on large imports of agricultural products, including foodstuffs. Being a major industry, fishing has expanded into the world's most highly modernized and efficient fishing industry, accounting for 15 percent of the globe's annual catch. Nevertheless, its products meet only a portion of domestic needs, making large imports of fishery products a necessity. Japan is also dependent on large forestry product imports, because its forestry industry can only satisfy a fraction of needs.

The Japanese economy consists of a large **private sector** and a small **public sector**. The economy benefits from a very dedicated and disciplined workforce whose members are known for their strong work ethic and loyalty to their corporations. It also enjoys advanced technology, which makes it capable of producing state-of-the-art products. Close cooperation among suppliers, manufacturers, and distributors in close-knit groups called *keiretsu* also helps the economy grow fast. Such cooperation has received credit for the rapid rebuilding of the devastated Japanese economy in the post-World War II period. However, the economy lacks adequate domestic production of raw materials, fuel, and agricultural products; consequently, it is extremely sensitive to fluctuations in world prices for these items.

The Japanese economy is highly regulated. In the postwar period, this turned it into a well-protected economy practically closed to foreign competition by **tariffs**, restrictions, and quotas. Pressures by its trading partners and competitors (mainly the United States and the European Union) forced it to begin opening its market to foreign competition (goods and investments) in the 1980s. The economic decline of the 1990s inclined the Japanese government to encourage foreign investment by further **liberalizing** the economy. Since the early 1990s, the government has sought to reduce its role in the economy by initiating **deregulation** reforms that removed an enormous number of restrictive government regulations.

The Japanese government has not implemented the deregulation reforms evenly. The consumer-goods market is now open to foreign imports, while many restrictions on the financial sector have been removed. Deregulation in the air transport industry has increased foreign flights to Japan, especially from the United States, which now has an "open skies" pact with Japan. However, the reforms have been quite limited in the manufacturing sector due to a fear of massive unemployment caused by an extensive foreign presence in this sector. The increased competition will likely force domestic manufacturers to downsize their operations while bankrupting others, resulting in layoffs and unemployment. In short, the ongoing deregulation reforms have gradually contributed to a more open Japanese economy, although there are still many restrictions on economic activities.

History and geography have made an impact on the shaping of the Japanese economy. Japan's close proximity to the Asian Pacific countries (South Korea, Taiwan, Hong Kong, China, Singapore, Thailand, and Malaysia), all among the world's fastest-developing economies, has helped it expand its trade with them. These countries have been emerging as Japan's largest group of trading partners, accounting for 37.2 percent of its exports and 39.6 percent of its imports in 1999. These economies address some of Japan's major needs for fuel, minerals, and agricultural products, for example, while being large markets for its industrial products. Japan recognizes South Korea as the only legitimate Korean government, and its growing economic ties with South Korea have worsened Japan's relations with North Korea. North Korea's strong military force remains a security threat to Japan, a justification for spending $42.9 billion on defense (0.9 percent of its GDP) in the **fiscal year** of 1998–99. This is a small amount, with no major negative impact on Japan, but symbolically reflects concern about North Korea's military power. Russia's continued occupation of the Kurile Islands, captured by the Soviet Union in 1945, has prevented the conclusion of an official peace treaty between the 2 countries, and has limited their economic relations.

POLITICS, GOVERNMENT, AND TAXATION

Defeated in World War II, Japan began its postwar political life as an occupied country. The Allied military occupation, which aimed to democratize the nation, continued until 1952 when Japan regained its full sovereignty. Japan began political, economic, and social reforms in the second half of the 1940s, which paved the way for its future economic growth. In 1947, its new constitution provided for a democratic multi-party political system based on a free-enterprise economy. The emperor remains as a ceremonial head of state, but political power rests with the prime minister as head of government. The parliament consists of a 480-seat House of Representatives (Shugi-in) and a 252-seat House of Councilors (Sangi-in). Members of parliament are elected through regular free and fair parliamentary elections held every 4 years. In practice, the leader of a party, or coalition of parties, with the majority of seats in the House of Rep-

resentatives becomes the prime minister. The central government in Tokyo makes all major policies and decisions, which are implemented by the regional and municipal governments.

The Liberal Democratic Party (LDP) has dominated the Japanese political system for most of the postwar era, either as the ruling party or as the leading member of a coalition government. In the June 2000 parliamentary elections, the ruling coalition of the LDP, the New Komeito, and the Conservative Party maintained its parliamentary majority and remained in power. These 3 parties favor a free-enterprise economy with a strong private sector in which the state also plays a role.

The Japanese government has a great influence in the economy. It is extensively involved in the development and operation of the nation's infrastructure (roads, airports, power generation, and telecommunications services). The government's regulatory power enables it to exert control over economic sectors and activities. It uses its resources and power to develop domestic industries through direct financial assistance to emerging or ailing industries and by setting various regulations to protect industries from foreign competition. The worsening of the economic situation in 1991 resulted in a demand by business for the deregulation of the Japanese economy to enable it to cope with the economic downturn. Deregulation reforms have resulted in a smaller state role in the economy, although it still exercises great influence.

With the exception of the Japan Communist Party, the opposition political parties of Japan support a free-enterprise economy led by a strong private sector with a varying degree of state involvement. Among them, the most important ones are the Democratic Party of Japan, the Liberal Party, the Reform Club, and the Social Democratic Party.

TAXATION. Japan has a relatively complicated tax system. There are a variety of tax rates for corporations depending on their size, revenue, and location, and for individuals based on their income, location, and personal status. In 1999, tax rates ranged between 5 percent and 30 percent. Tax rates for Japanese and foreign corporations are the same. Foreign corporations operating in Japan are only liable for their income generated in that country. There are various tax breaks for businesses to stimulate economic activities. Corporate taxes accounted for 40.87 percent of total collected taxes in 1999, while other taxes, including personal **income taxes** and **indirect taxes**, accounted for the rest.

Taxes and stamp revenues form the bulk of government revenues (92.6 percent in 1999). Non-tax revenues (e.g., tariffs and various government fees) account for the remainder of government revenues (7.4 percent in 1999). **Budget deficits** are common, since government expenditures are always much larger than government revenues. There are 3 major reasons for this: tax rates are generally low; the aging Japanese population provides limited tax revenues, especially from the growing retired population, and consequently requires more government spending on health-care services; and the government spends large sums to stimulate economic growth. In the 1999–2000 fiscal year, total government revenues from tax and non-tax sources were about $446 billion while expenditures were $718 billion. The government finances budget deficits by issuing bonds, equal to $272 billion in 1999–2000. This reflects a substantial increase in budget deficit from the fiscal year of 1996–97. The Japanese government has tried to avoid raising taxes because of the reductions in consumer purchasing power caused by the economic decline of the 1990s.

The Japanese government's annual issuance of bonds to finance its deficits has created a huge debt. In 2000, the outstanding government bonds were estimated at about $3.5 trillion. The government also engages in off-budget spending (equal to 70 percent of its annual spending) under its Fiscal Investment and Loan Program (FILP), which funds large projects such as housing and road building. The source of this spending is the savings of individuals deposited in the state-run postal savings system. In 1999, the government paid $174 billion in service charges on its debt. This is a huge financial burden on the economy, though it has not yet created a crisis. Still, if the economy does not grow significantly in the next few years and the debt continues to increase, the debt burden will have a major negative impact on the Japanese economy between 2005 and 2010.

INFRASTRUCTURE, POWER, AND COMMUNICATIONS

Japan has a very advanced and well-maintained infrastructure, which undergoes regular upgrading and expansion. Both the private and public sectors undertake various infrastructural projects and operate their respective services.

Japan has a very extensive and modern road network. It consists of 1,152,207 kilometers (715,981 miles) of highways, of which 863,003 kilometers (536,270 miles) are paved. They include 6,114 kilometers (3,799 miles) of expressways. The number of motor vehicles increased from 70,106,536 in 1995 to 73,688,389 in 1999. Major development projects to expand the Japanese highway network include a $32-billion project for the construction of a second Tomei-Meishin Expressway, connecting Tokyo and Kobe via Nagoya. The length of Japan's railways is 23,670 kilometers (14,708 miles), more than half of which is electrified. Japan is famous for its high-speed trains.

As a country surrounded by water, Japan has developed a very extensive and modern sea transportation system. It includes many ports and harbors such as Akita, Amagasaki, Chiba, Hachinohe, Hakodate, Higashi-Harima, Himeji, Hiroshima, Kawasaki, Kinuura, Kobe, Kushiro, Mizushima, Moji, Nagoya, Osaka, Saki, Sakaide, Shimizu, Tokyo, Tomakomai, and Yokohama. Japan has a very large merchant-marine fleet, which is a necessity for its international trade and for ensuring an uninterrupted arrival of raw material, fuel, foodstuffs, and other necessary products. The fleet comprises 662 ships with a total capacity of 13,039,488 tons.

Japan benefits from a modern and extensive air transportation system. In 1999, there were 171 airports, of which 140 have paved runways, and 14 heliports. Airports in Tokyo, Kagoshima, Osaka, and Kansai provide international services. The major international airports are Narita, which serves Tokyo; Kansai, which serves Kobe, Kyoto, and Osaka; and Chitose (Sapporo) and Sendai in Northern Japan, which serve many northern cities. Major airport construction projects include a second runway for Kansai International Airport, a $7.2 billion-project for Central Japan International Airport in Ise Bay, and the New Kitakyushu Airport in the Kyushu region located in the western part of Japan. Japan has a large air passenger fleet consisting of private and public airlines.

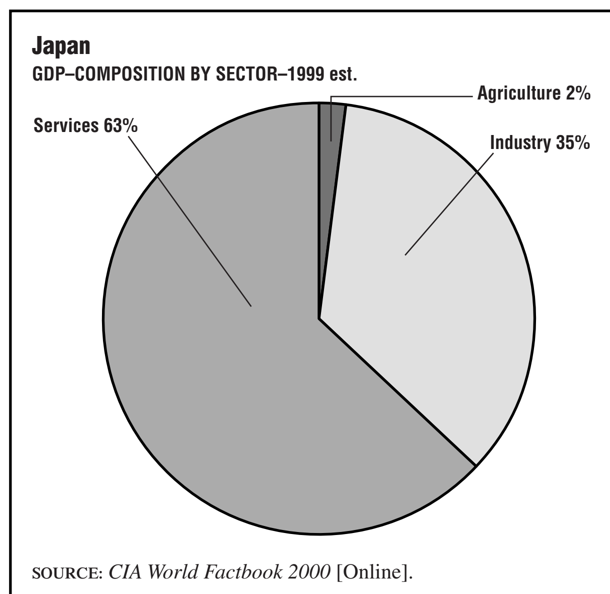
Japan's telecommunication system is very advanced. It consists of private and public service providers, but a public company, Nippon Telephone and Telegraph (NTT), is the largest provider, controlling about 95 percent of fixed telephone lines. In 1997 there were 60.3 million fixed telephone lines in use. By 1999, there were 30.6 million cellular phones in operation, a 260 percent increase in 2 years, and 6.3 million personal handphone systems (PHS), cheaper versions of cellular phones with limited signal coverage. Personal computer ownership is high: 237 PCs per 1,000 population, in 1998, compared to 459 per 1,000 population in the United States, which has the world's highest rate of PC use. In 1999, there were 357 Internet service providers in Japan. The rate of Internet use is low: 13.34 per 1,000 population in 1999, as compared with 112.77 in the United States. Japan has a very large television and radio industry operated by private and public sectors. In 1997, there were 86.5 million television sets and 120.5 million radios in use.

The Japanese power-generation industry includes both private and public companies, though in 1999, only 5 percent of the nation's power was created by the private sector, a proportion that is expected to increase with industry deregulation (a lessening of government controls). Japan's electricity is derived from 4 major methods: thermal (using oil, liquefied natural gas, and coal), nuclear, hydro (water power), and non-conventional (geothermal, solar, and wind). In 1998, the proportion of electricity generated from these sources was 57 percent, 32 percent, 9 percent, and 2 percent, respectively. In that year, total electricity produced amounted to 995.982 billion kWh, well above the consumption of 926.263 billion kWh. In anticipation of large increases in consumption in the 21st century, Japan is planning to increase its output to 1,280 billion kWh by 2020.

Since its thermal generators depend heavily on large imports of fuel, Japan is planning to decrease its dependency on this method and increase its dependence on nuclear power, although that method is more costly. Accordingly, 9 new nuclear reactors are planned to become operational by 2008, providing an additional 11.3 gigawatts (GW) of electricity. Japan is also encouraging the expansion of generators using renewable energy, such as hydropower and geothermal energy.

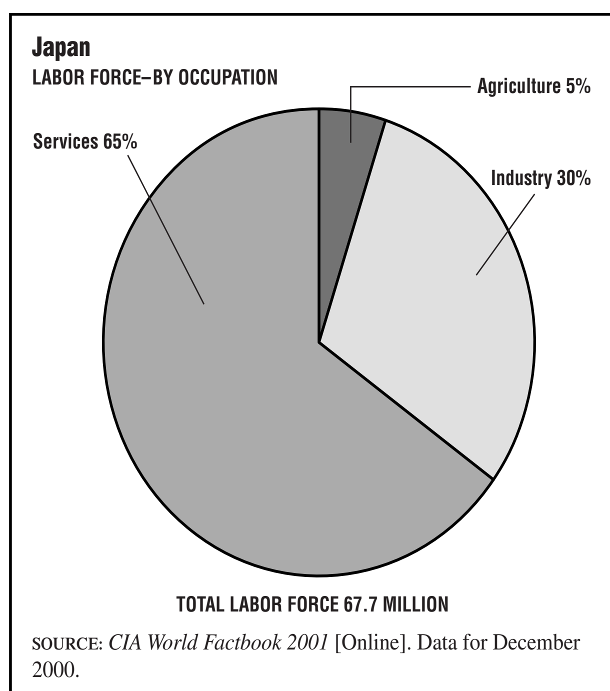
ECONOMIC SECTORS

Japan rebuilt its economy in the late 1940s and the 1950s to establish itself as the world's second largest economy in the 1980s, a position it still holds as it enters the 21st century. As a result, its 3 main economic



SOURCE: *CIA World Factbook 2000* [Online].

sectors are technologically advanced. Agriculture, the smallest sector, is capable of meeting some domestic needs, though most foodstuffs must be imported. Industry, the second largest sector, has a highly advanced and efficient manufacturing branch that has been the engine of growth for Japan since the 1960s. Its state-of-the art products have captured many markets to ensure healthy annual trade surpluses for Japan. As in all matured industrial economies, services constitute Japan's largest economic sector, and this sector has been growing since the 1980s.



SOURCE: *CIA World Factbook 2001* [Online]. Data for December 2000.

AGRICULTURE

Agriculture, including fishery and forestry, is Japan's smallest economic sector. Its contribution to GDP has decreased substantially since 1945. It represented 6.1 percent of GDP in the 1970s, but fell to about 2 percent in 1999. Its share of the workforce has remained stable since the 1980s; totaling 5 percent (about 3.38 million workers) in 1999.

FARMING. Production of agricultural products, including rice for domestic consumption, is declining due to the scarcity of farming land, which makes large-scale and efficient cultivation rather difficult. High input costs push up the prices of domestic products, as do restrictions on production, pricing, and marketing imposed by the government and agricultural cooperatives. As a result, expensive domestic products are less attractive to consumers than cheaper imported goods.

As an indicator of its declining economic importance, the growth rate of agriculture has been mainly negative over the last 2 decades, even with direct government support, such as heavy tariffs on imported rice (300 percent in 2000). In 1999, the growth rate was 1 percent, a slight improvement from 1996 and 1998 when the growth rates were -6.8 percent and -4.5 percent, respectively.

The agriculture sector is technologically advanced and completely mechanized, but it does not satisfy the essential agricultural needs of the country. Major agricultural products include foodstuffs (wheat, barley, maize, potatoes, rice, soybeans, sugar beets, and sugar cane), fruits, meat products (beef, veal, chicken, horse, lamb, pork, and turkey), fishery products, and forestry products (timber). Export items include fish, prepared foods, cigarettes, crude organic materials, and husked rice. Major imports are fish products, grains, and fruits. In 1998, for example, the values of agricultural exports and imports were about $2.2678 billion and $51.7805 billion, respectively, revealing Japan's dependency on agricultural imports.

In 1999, total agricultural production was 21,177,737 tons, down from 23,016,800 tons in 1995. Rice production met domestic needs, but total output fell from 13,435,000 tons in 1995 to 11,468,800 tons in 1999. Production of potatoes and wheat showed slight increases during this period.

FORESTRY. Forests cover about 70 percent of Japan, of which 40 percent are human-made. Reforestation is a necessity in a land that is endangered by systematic soil erosion caused by heavy rainfalls. Forestry products meet only a small portion of domestic needs (about 20 percent in 2000), while the rest has to be imported, mainly from such sources as the United States and Indonesia. The value of forestry imports was $5.7 billion in 1999, a sharp

decrease from 1995 when it was $10 billion. Japan's economic downturn was responsible for this decline.

FISHERIES. Japan has a large fishing industry. Despite the fact that its large annual catch accounted for 15 percent of the world's total for 1999, the industry is unable to meet Japan's domestic needs. Japan is therefore the world's largest importer of fishery products, consuming 30 percent of such imports in 1996. In 1999, 2,924,000 tons of fishery products were imported, a relatively large increase from the 1995 levels of 2,803,000 tons. The annual catch in the post-World War II era, which had always been above 10 million tons before 1990, dropped to 7.4 million in 1997. This decline is attributed to several factors, notably coastal-water pollution and disputes over fishing in international waters.

INDUSTRY

Industry, including manufacturing, construction, and mining, has been the engine of growth for Japan since the end of World War II. As happens in all mature industrial economies, the expansion of the service sector has surpassed that of industry, which has been reduced to the second largest sector. In 1999, industry's contribution to GDP was about 35 percent, a decrease from the 1970s when it was more than 40 percent. In 1999, industry employed about 30 percent of the **labor force** (20.34 million workers), a decrease from 1995 when it accounted for 31.7 percent (21.2 million).

MANUFACTURING. Japan has a highly advanced and diversified manufacturing branch that has been the heart of the Japanese economy in the postwar era. It helped the Japanese rebuild their shattered industrial sector after the end of World War II while enabling them to emerge as a global exporter of a variety of products. It is the reason for the high-value of exports from Japan ($450 billion in 2000). Manufacturing is the most important reason for its constant trade surpluses ($95 billion in 2000), despite the poor performance of the Japanese economy since the early 1990s. Its share of GDP increased from 24.5 percent in 1995 to 25 percent in 1999, registering a limited growth. Its share of workforce dropped from 14.6 percent to 13.4 percent in the same period.

The high cost of labor and the high value of the yen encouraged the relocation of manufacturing to other countries, especially in Southeast Asia and the Pacific region, since the 1980s. This trend has continued through 2001. Japan's direct investment abroad increased from $40.8 billion in 1998 to $66.7 billion in 1999.

Manufacturing consists of light industry (textiles and processed foods), heavy industry (chemicals, automobiles, shipbuilding, machine tools, steel, and non-ferrous metals) and high-tech industry (electronics, telecommunications, and computers). Japan is one of the world's largest and most technologically advanced producers of a wide range of light and consumer products such as semiconductors and electronic devices, as well as cars, ships, and steel. Manufacturing includes small, medium, and large enterprises, of which the first 2 groups account for the overwhelming majority, 99 percent in 1997.

The 3 largest contributors to exports are industries involved in high-tech transport equipment and non-electrical machinery. In 1999, the value of high-tech exports, including computer devices and semiconductors, was $101.5 billion, a decline from the 1995 figure of $113.5 billion but a significant increase from 1998, when it was $89.7 billion. The transport-equipment industry had 1999 exports valued at $94.8 billion, a substantial increase from the 1995 figure of $89.7 billion. Exports of motor vehicles were the largest segment of this industry, totaling $54.7 billion in 1999, an increase from 1995 and 1998 levels, when they totaled $53.1 billion and $50 billion, respectively. In 1999, the non-electrical machinery industry exported $89.1 billion in various products, such as office machinery, a decline from its 1995 exports of $106.5 billion.

A major weakness of the Japanese manufacturing sector is its heavy dependency on imported raw materials and fuel. For example, its iron and steel industry needs to import almost all of its iron ore requirements, which totaled 119.2 million tons in 1996.

CONSTRUCTION. The construction industry accounted for about 9 percent of Japan's GDP in 1999, against a 10.8 percent share in 1995. It employed 9.7 percent of the Japanese workforce (6.57 million workers) in 1999, a small decrease from 1995, when its share was 9.8 percent (6.6 million).

The deflationary policies of the Japanese government since the 1990s had a negative impact on the construction industry, as demonstrated in a 1.8 percent loss in GDP between 1995 and 1999. Construction projects declined along with the economy. These economic policies accelerated the process of relocation of many manufacturing units abroad, resulting in a decline in large construction projects at home. The Japanese government has tried to assist this industry by implementing large infrastructural projects. In 1999, the total value of construction projects was $136.3 billion, a sharp decline from its 1995 level of $206.8 billion.

Many new, major projects after 2000 will help the industry survive until the economy begins to grow again. There is a $400-billion project by the Kansai local government to build complexes for commercial, industrial, and research facilities. There are also 2 multibillion dollar airport projects: one to construct a second runway at

Kansai International Airport, and another to build a new airport in Ise Bay; as well as road projects such as the $32-billion Tomei-Meishin Expressway, connecting Tokyo and Kobe via Nagoya.

MINING. Japan's lack of adequate minerals and fossil energy (oil, gas, and coal) forces it to rely extensively on imports. For example, domestic production of copper ore, lead ore, zinc ore, and iron ore met only 0.1 percent, 4.8 percent, 2.2 percent, and almost 0 percent of annual needs in 1999, respectively. This greatly handicaps the Japanese economy, since this situation makes it highly sensitive to any interruption of imported supplies. The mining industry makes a very insignificant contribution to Japan's GDP, 0.2 percent in the period 1995 to 1999, with about the same contribution to the workforce.

Japan's small mining industry is in decline because of the depletion of the country's small mineral and fossil energy resources. The production of copper ore dropped from 6,043,000 tons in 1994 to 1,070,000 tons in 1998. Likewise, lead-ore production fell from 9,946,000 tons in 1994 to 6,198,000 tons in 1998, and coal production declined from 6,932,000 tons in 1994 to 3,663,000 tons in 1998. Iron-ore output dropped from 3,000 tons in 1994 to 2,000 tons in 1998, and zinc from 101,000 to 68,000 tons during the same period.

Japan has no significant energy reserves other than a small deposit of coal equal to 865 million tons. Most of its major deposits were consumed in the 1960s during the period of rapid economic growth, at which time the annual production was about 61 million tons. The existing deposits are not economically viable because of high labor costs and strict environmental regulations. In 2000, there were only 2 operating mines with a total annual production of 3 million tons. These mines operated with government **subsidies**, and the Japanese government will end these subsidies in 2003. This will make their continued operation unprofitable, since domestic coal is priced 3 times higher than imported coal. Domestic production accounted for only 2.8 percent of supplies in 1998 and 1999, a drastic decrease from 1960, when it accounted for 86 percent. In 1999, coal imports totaled 109,263,000 tons, while domestic production totaled 3,286,999 tons. This marked a decline from 1995 levels of 128,978,000 tons and 6,263,000 tons, respectively.

Consuming 5.5 million barrels of oil per day in 1999, Japan is the world's second largest oil consumer after the United States, but has practically no oil reserves, as its proven stock is equal to only 59 million barrels. This consumption will likely increase significantly when the Japanese economy begins to grow again. Japan's oil consumption has declined since 1996 because of poor economic performance. In 1999, Japan imported over 228,927,000 tons of crude oil, while producing only 604,000 tons, a decline from 1996 when their respective shares were 266,921,000 tons and 861,000 tons.

Japan's natural gas reserves are about 1.4 trillion cubic feet. Its domestic production is limited, which makes it rely on large imports of liquefied natural gas (LNG), mostly from Indonesia and Malaysia. In 1999, such imports equaled about 97 percent of its needs and reflected a 200-percent increase from 1991 levels, while domestic production remained almost the same.

SERVICES

The service sector (financial, retail, tourism, and transportation) has been growing since the 1970s and now forms Japan's largest economic sector. In 1999, services accounted for 63 percent of GDP and 65 percent of the workforce (44.07 million workers). Both figures indicate a significant growth from 1995, when they accounted for 54 percent and 63.2 percent, respectively.

FINANCIAL SERVICES: BANKS. Japan has one of the world's largest financial sectors, a necessity for its large economy. Among the most important are banks, securities companies, the postal savings system, and insurance companies. Financial services contributed 18.9 percent of GDP in 1999, an increase from its share of 17.9 percent in 1995. The entire financial system is highly regulated, making financial activities more difficult in Japan than in other mature industrial economies. The system is controlled and regulated by the Ministry of Treasury (formerly known as the Ministry of Finance), the Bank of Japan, which is the central bank, the Financial Supervisory Agency (FSA), and the Financial Reconstruction Commission (FRC). The Japanese financial system includes other institutions such as venture-capital firms, financial leasing, and asset-management firms.

Despite the deregulating reforms of the Japanese government since the 1990s, the financial system is still extensively regulated. Of these, the "Big Bang" reform has been the most comprehensive one. Launched in 1996, it was aimed at liberalizing the financial system to address the demand of domestic institutions for the removal of various government restrictions and also to open the financial sector to foreign competition. A new governmental entity, the Financial Supervisory Agency, was created to oversee the reforms. A major beneficiary has been foreign financial institutions, which are now faced with less restrictive regulations, and can extend their operations in areas previously closed to them, such as the mutual-fund business. They can also engage in alliances with Japanese firms or take them over. In 2000, for instance, Ripplewood Holdings, an American firm, took over the Long-Term Credit Bank of Japan.

Based on 1999 statistics, the Japanese banking system consists of 9 city banks, 1 long-term credit bank, 7 trust banks, 121 regional banks, 396 credit associations, and 322 credit cooperatives, with total assets valued at $6.74 trillion. City banks are large financial institutions that provide nationwide services while having extensive operations abroad. The largest of these have their headquarters in major cities such as Tokyo, Osaka, and Nagoya, where their principal activity is in serving large corporations, though they are gradually undertaking other types of activities including serving small corporations. Smaller regional banks, with total assets of $1.7 trillion in 2001, operate mainly in a particular region and provide services to small and medium-size companies. Credit banks, with 2000 assets valued at $570 billion, supply long-term industrial capital to large and small firms. Except for the Industrial Bank of Japan, all credit banks collapsed in the late 1990s. Credit associations, with estimated assets of $900 billion in 2000, function like credit unions in that they receive deposits from the general public and lend only to their members. Credit cooperatives, which provide financing to small- and medium-size businesses in urban areas, had assets of $172 billion in 2000. Like the credit associations, they receive deposits from, and lend to, their members only.

The Japanese banking system also includes public banks, such as the Development Bank of Japan (DBJ), the Japan Bank for International Cooperation (JBIC), and the National Life Finance Corporation (NLFC). Their mandate is to supplement the activities of commercial banks. The JBIC is mainly involved in international financial operations such as export/import and overseas investment loans. The DBJ provides Japanese and foreign companies operating in Japan with services such as long-term financing. The NLFC provides financial assistance to small businesses such as retailers, restaurants, and small construction companies.

There are also 89 foreign banks in Japan, of which 14 are American, 30 Asian, and 35 European. Owing to the financial reforms of the late 1990s, these banks can be involved in all types of banking operations, such as retail and investment banking and international business. They are also permitted to have branches and provide services to large corporations. As a matter of practice, they provide services mostly to foreign firms and **joint ventures**, while offering banking services to individuals.

OTHER FINANCIAL SERVICES. Securities companies, which are active in investment services, have the combined role of underwriters, dealers, and brokers. In 2000, there were 291 securities companies, of which the 3 largest—Nomura Securities, Daiwa Securities, and Nikko Securities—controlled most of the industry. Some 59 are foreign companies, such as 2 American giants, Merrill Lynch and Salomon Smith Barney.

With assets valued at $2.27 trillion in 1999, the Japanese postal savings system is the world's largest. It consists of about 24,000 post office branches that accept savings deposits and offer insurance activities and annuities. The system provides an inexpensive source of funds for government projects.

As part of Japan's financial system, the insurance industry has reformed many of its restricted activities since the late 1990s, such as non-life premiums. The industry consists of 46 life and 34 non-life insurance companies with total assets of $1.9 trillion, making it the world's largest insurance industry. Foreign insurance companies are small (44 life and non-life companies), but they are growing. Joint ventures between foreign and domestic firms are also increasing.

RETAIL. The Japanese retail industry is very large, consisting of a wide range of retailers capable of distributing goods and services throughout the country. In 1999, its share of GDP was 14.4 percent, an increase from its 12.7 percent share in 1995. The industry includes restaurants of various sizes, which also includes franchised restaurants of Japanese and foreign origin. Most retail stores are small (less than 500 square meters), although there are large supermarkets and department stores. High land prices and various regulations restrict the number of large stores, while regulatory laws seeking to protect small businesses from competition create a major barrier to the expansion of large stores. Regulations such as those limiting store space and business hours have contributed to high retail prices, though these have recently been relaxed to some extent. Laws also discourage the establishment of discount retailers and shopping malls.

The distribution system in Japan is complex, tightly controlled, and labor-intensive, making the sector difficult for foreign retailers to enter. As a rule, imported products are usually sold at large stores, department stores, and discount stores, while about half of all consumer purchases are made at small neighborhood stores with fewer than 5 employees.

TOURISM. Japan has a very large and well-developed tourist industry, which generated $4.3 billion in 1997. It provides an insignificant contribution to GDP, equal to 0.1 percent in 1997, no change from its share in 1993. The country's mild temperatures and long coastlines, together with its numerous historical sites, make the country an attractive destination. Foreign tourists mostly visit Tokyo and Kyoto on the main island of Honshu, while domestic tourists are also attracted to the northern island of Hokkaido and the southern islands of Okinawa, Miyako, and Ishigaki. Still, only 4.2 million tourists visited Japan in 1997, a significant increase of 24 percent from 1993, but still far below other Asia-Pacific tourist destinations, such as the 9 million who visited Hong

Kong in 1997, bringing $9 billion in revenues. This is mainly due to the high cost of living in Japan, one of the highest among the industrialized economies, and to its remote location. Events such as the 2002 soccer World Cup, which will be co-hosted by Japan and South Korea, will uplift the Japanese tourist industry. If successful, Japan's efforts to host the 2008 Olympics in Osaka will be a major boost for its tourist industry. In anticipation of an increase in tourism, many hotel projects are underway all over the country, including a 780-room Marriott hotel in Nagoya.

INTERNATIONAL TRADE

Japan has amassed large trade surpluses since the early 1980s because of 2 factors. Its diversified manufacturing sector has produced high-quality products such as electronics and cars, which are much in demand in many international markets. Also, the post-war Japanese economy was largely closed to foreign competition through restrictive regulations and high tariffs aimed at protecting domestic industries. Under heavy pressure of its trading partners and competitors such as the United States, Japan began to open its economy to foreign competition late in the 1980s. That resulted in a higher rate of imports, which lowered trade surpluses until early in the 1990s. The economic decline following the bubble economy era significantly reduced demands for imports, resulting in the return of large trade surpluses in the 1990s, which reached $144.2 billion in 1994 before falling to $131.8 billion in 1995 and $83.6 billion in 1996. By 1998, with the economic slowdown, the trade surplus had risen to $122.4 billion, but it declined again to $95 billion in 2000.

The return of large trade surpluses in the 1990s has restarted trade disputes between Japan and its main trading partners, including the United States and the European Union (EU). Two major trading partners of Japan—the United States and the EU—have negotiated with Japan since the 1980s to remove barriers preventing their extensive access to the Japanese market. These negotiations have resulted in relaxed regulations on the imports of foreign consumer goods, like foodstuffs, by Japan, but they have failed to remove barriers in many other areas. Nevertheless, the Japanese government's economic deregulation policy has made the Japanese market more open to foreign imports, especially in the field of consumer goods.

Trade (expressed in billions of US$): Japan

	Exports	Imports
1975	55.819	57.860
1980	130.441	141.296
1985	177.164	130.488
1990	287.581	235.368
1995	443.116	335.882
1998	387.927	280.484

SOURCE: International Monetary Fund. *International Financial Statistics Yearbook 1999.*

In 2000, the values of Japan's exports and imports were $450 billion and $355 billion, respectively. This registered a significant increase in both exports and imports from 1998, when their respective values were $374 billion and $251 billion.

Major exports of Japan include electrical equipment and machinery, electronics, telecommunication and computer devices and parts, transport equipment and motor vehicles, non-electrical machinery, chemicals, and metals. Its imports are mainly machinery and equipment, raw materials, including minerals and fuel (oil, liquefied natural gas, and coal), agricultural products, and fishery products.

Japan's major trading partners are the Asian Pacific countries, the United States, the EU, and the Persian Gulf countries. The United States is Japan's largest single trading partner. In 1999, it accounted for 30.7 percent of Japan's exports, an increase from its share of 27.3 percent in 1995, and 21.7 percent of its imports, a decrease from its 1995 share of 22.4 percent. As a group of countries, the Asian Pacific countries (South Korea, Taiwan, Hong Kong, China, Singapore, Thailand, and Malaysia) form the largest collective trading partner of Japan. In 1999, they accounted for 37.2 percent of its exports, a decrease from their 1995 share of 43.2 percent, and 39.6 percent of its imports, an increase from their 1995 share of 36 percent. The Asian financial crisis of the 1990s resulted in a decline in Japan's exports to these countries. The slowdown in the Japanese economy was the main factor in lowering the share of imports from the United States and the EU. The EU (especially Germany and the United Kingdom) is Japan's third largest trading partner, accounting for a 17.8 percent share of Japan's exports and 13.8 percent of its imports in 1999, compared to its 1995 shares of 15.9 percent and 14.5 percent, respectively. As the main oil suppliers to Japan, the United Arab Emirates and Saudi Arabia accounted for 5.5 percent of Japan's imports in 1999, a small decrease from their share of 5.9 percent in 1995. Japan's economic slowdown of the 1990s reduced its fuel requirements and therefore lowered its imports.

MONEY

Japan has a free-**floating exchange rate** system against foreign currencies (one in which the exchange market determines **exchange rates**). The rates fluctuate with the Japanese economy and those of its major trading partners, though the Bank of Japan intervenes in the

market to ensure that fluctuations do not damage the Japanese economy. Tokyo is the Japanese main foreign-exchange market where about 99 percent of all foreign-exchange transactions are conducted.

Japan has not experienced sharp and sudden fluctuations in its exchange rates since the late 1970s, even with the economic decline of the early 1990s. The rate of exchange of the yen against the U.S. dollar was ¥94.06:$1 in 1995; it rose to ¥130.91 in 1998, and then began to decrease, to ¥113.91 in 1999 and to ¥108 in 2000. As a result of the foreign-exchange liberalization program, which began in the 1980s, and the deregulatory reforms in the 1990s, various restrictions on foreign-exchange transactions have been removed. The 1998 Foreign Exchange and Foreign Trade Law eliminated almost all remaining government restrictions and controls over foreign-exchange transactions. Consequently, companies are now allowed to trade foreign currencies and individuals can open bank accounts in foreign countries without requiring government authorization.

Japan has a stock market of global significance. The **market capitalization** of the Tokyo Stock Exchange, the largest in Asia, was $4 trillion in 1999, an increase from the 1995 level of $3.2 trillion.

POVERTY AND WEALTH

Since the end of World War II, Japan has developed a highly efficient infrastructure capable of meeting the essential needs of its population in various services. This capability ensures the availability of safe water, sanitation, and health services to all citizens in urban and rural areas alike.

Japan spends a significant amount of its GDP on a modern and efficient health-care service. Spending equaled 7.3 percent of GDP in 1997, about half the level in the United States. The health insurance system introduced in 1961 ensures the availability of health-care services to everyone. Coverage is provided by 2 major insurers: the national health insurance scheme (NHIS) and the employee health insurance scheme (EHIS). Since all Japanese must take part in a public or a semi-public heath insurance plan, there are few private insurance plans. Depending on the case, the insurance programs cover 70 to 80 percent of the cost services, while the insured covers the rest. The health-care system has contributed to Japan's achievement of the world's highest life expectancy, which was 80 years in 1998.

Japan also has one of the world's highest literacy rates, 99 percent. The Japanese government provides free public schooling for 6 years of primary school and 3 years of junior-high school. In 2000, about 95.9 percent of eligible students attended 3-year senior-high schools, a huge increase from 1960 when only 57.7 percent of the students did so. In 1999, almost 90 percent of the Japanese population completed high school. The quality of the schooling up to grade 12 is very high. The schooling system has been given credit for training an educated and highly disciplined workforce. In 1998, about 45 percent of the population between the ages of 18 and 22 participated in post-secondary education.

Japan is an affluent society where extreme poverty does not exist, although extreme wealth does. High wages and salaries guarantee high living standards, reflected in the high percentage of ownership of electronic devices and home appliances, for instance. In 1999, a color TV, washing machine, vacuum cleaner, and re-

frigerator were found in 98 percent of Japan's households. The standard of living has fallen somewhat due to rising unemployment and reductions in wages, salaries, and bonuses in the 1990s. Heavy government spending on Japan's social safety net, including its unemployment and welfare benefits, prevents extreme poverty. Such spending accounted for $141 billion in 1999, equal to 8.4 percent of GDP.

WORKING CONDITIONS

The Japanese workforce is well-educated and mostly skilled, thanks to the Japanese educational system. It grew from 66.7 million workers in 1995 to 67.8 million in 1999, of whom about 95 percent worked in urban enterprises. The rural workforce involved in farming, fishing, and forestry forms only 5 percent of the total workforce, or about 3.39 million workers. In 1999, 4.7 percent of the workforce (3.18 million workers) was unemployed, a significant increase from its 1995 rate of 3.2 percent (2.13 million).

Japan is a signatory to the International Labor Organization's conventions on workers' rights and freedoms. The Japanese Constitution also guarantees the right to form and join trade unions. Its labor laws recognize the right to organize and bargain collectively. With the exception of the military, police officers, and firefighters, all employees have the right to join unions, to bargain collectively, and to strike. Public employees may join unions, but do not have the right to strike, and their collective bargaining rights are also limited. The government determines their pay according to the recommendations of an independent body called the National Personnel Authority.

There are many unions in Japan, which operate freely. The largest is the Japanese Trade Union Confederation (JTUC), formed when several trade unions merged in 1989. In 2000, it had a membership of about 7.6 million. In 2000, about 22 percent of the workforce (12 million workers) were union members.

Japanese labor law provides for a 40-hour workweek, but the law is not usually enforced in small enterprises. It also prohibits forced or compulsory labor as well as child labor. Children under the age of 15 may not work; children over the age of 15 may be employed for non-hazardous jobs only.

Based on the recommendation of tripartite advisory councils (formed by workers, employers, and public authorities), minimum wages are set that vary from region to region and from industry to industry. On average, minimum wages range between $46 and $53 per day, which are adequate for a decent living standard for a worker and family. Generally speaking, employers usually consult with their respective unions on wage-related issues.

The labor law forbids discrimination in the workforce, though it exists in practice. The Burakumin, who are ethnically Japanese but are the offspring of the so-called outcasts of the feudal era, experience both social and employment discrimination. The labor law provides for equal pay for equal work and the right of women to work. Still, women receive less compensation than men in the same age and work groups. They are also poorly represented in managerial positions, accounting for about 9.2 percent of such jobs in 2000. Also, they form a very small portion of local government positions. Unemployment is disproportionately higher among women and foreign workers, especially undocumented ones coming from the Asian Pacific countries like China, South Korea, and Thailand, who are usually denied their labor rights and are subject to abuses. Work-related safety and health regulations are enforced by government inspectors.

COUNTRY HISTORY AND ECONOMIC DEVELOPMENT

300 B.C. Jomon, an ancient hunting and fishing culture, begins to be displaced by Yayoi migration. Rice cultivation begins.

300 A.D. The Yamato state consolidates its power.

592. Prince Shotoku encourages the adoption of Chinese political and religious practices.

1543. First Europeans visit Japan in the form of Portuguese traders and Jesuit missionaries.

1573–1603. The Momoyama period begins as Oda Nobunaga assumes power.

1603–1867. The Edo period begins as Ieyasu establishes the Tokugawa shogunate, which closes Japan to foreign contact and expels European traders and missionaries. Rise of the merchant class in Osaka and Edo (Tokyo).

1853. Arrival of U.S. Commodore Matthew Perry in Japan leads to "opening" of Japan to the West after 2 centuries of relative isolation.

1868–1912. The Meiji period begins, initiating a period of Westernization. The power of the shoguns is curbed and the emperor is restored as a constitutional monarch.

1894–1895. Japan and China engage in Sino-Japanese War; Japan wins many decisive military victories.

1904–1905. Japan and Russia engage in Russo-Japanese War; Japan wins many decisive military victories.

1910. Japan annexes Korea and retains it as a colony until the end of World War II in 1945.

1912–1926. The Taisho period begins with accession of Emperor Yoshihito.

1923. The Great Kanto Earthquake levels much of Tokyo.

1926–1989. The Showa period begins with accession of Emperor Hirohito.

1931–1932. Japan invades Manchuria and annexes it to its empire as Manchukuo.

1937. Japan and China go to war.

1938. Military leaders in Japan call for "new order" in Asia, which leads to the Pacific War.

1941–1945. During World War II, Japan engages U.S., British, and other Allied troops in the Pacific, Philippines, and throughout Southeast Asia. The war ends with the American atomic bombings of Hiroshima and Nagasaki, forcing Japan's surrender. U.S. occupation continues through 1951.

1947. Japan adopts a postwar Constitution largely drafted by U.S. legal experts during the occupation period.

LATE 1940s. Japan begins the reconstruction of its industry and infrastructure, which were devastated during World War II.

1952. Japan regains full sovereignty upon signing a peace treaty with the United States and 45 other Allied nations.

1955. The Liberal Democratic Party (LDP) is formed by the merger of Japan's 2 main conservative parties, the Democratic Party and the Liberal Party.

1960s. Japan becomes a major global producer of electronics.

1973. The first oil crisis damages the Japanese economy and reduces GDP growth.

1979. The second oil crisis has a less drastic impact on Japan's economy than the first, in 1973.

1985. The yen appreciates against foreign currencies, increasing the cost of Japanese exports, and leading to the relocations of some manufacturing activities abroad.

1980s. Japan emerges as the world's second largest economy, and this era sees the beginning of the "bubble economy." Under foreign pressure, the Japanese government begins its economic liberalization program.

1989. Death of Showa Emperor (Hirohito). The Heisei period begins with the accession of Emperor Akihito.

1990s. The bubble economy ends with the intervention of the Japanese government, whose deflationary policy contributes to a period of economic decline and rising unemployment which lasts throughout the decade.

1995. In January, an earthquake kills more than 5,000 people in the Kobe area; in March, the Aum Shinrikyo cult attacks Tokyo's subway system with nerve gas.

1996. Prime Minister Murayama resigns and is succeeded by Ryutaro Hashimoto. Japan's economy experiences a significant growth rate (5.1 percent) after years of sluggish growth.

1998. Prime Minister Hashimoto resigns and is succeeded by Keizo Obuchi. The Financial Supervisory Agency is established.

2000. Prime Minister Obuchi suffers a fatal stroke and is succeeded by Yoshiro Mori.

2001. Prime Minister Mori resigns and is succeeded by Junichiro Koizumi.

FUTURE TRENDS

At the beginning of the 21st century, Japan has a very technologically advanced and mature industrialized economy. Even after a long period of sluggish and neg-

ative growth in the 1990s, its economy is still the world's second largest and most technologically advanced one. While the prospect for long-term growth is assured, certain internal and external factors will impede or slow down its growth in the short run.

The external factors include the poor economic performance of the major trading partners of Japan. After about a decade of healthy growth, the American economy is entering a period of low growth and quite possibly decline and **recession**. With the exception of Taiwan, all other Asian Pacific countries are still suffering from the devastating blow of the 1997 financial crisis. Some of them, such as South Korea, are showing recovery, but their heavy **foreign debt** could easily prevent their full recovery and growth. As the major trading partners of Japan, the poor economic performance of these countries will damage the Japanese recovery and prolong its economic stagnation. External barriers also include the toughening competition among and between Japan, the United States, and the Asian Pacific countries over world markets, especially for motor vehicles and high-tech products like personal computers and semiconductors. More intensive competition will reduce Japan's share of these markets and negatively affect its economic recovery.

Internally, Japan will be faced with continued pressure to liberalize its economy and make it open to foreign competition. Economic liberalization carried out under the deregulation reforms has encouraged foreign investment in Japan, which is a positive stimulus to the economy in the short run. However, in the long run, extensive foreign competition will likely lead to downsizing, bankruptcies, and takeovers. The Japanese government has restricted much deregulation in the manufacturing sector, but it is not clear how long it can resist foreign pressure to do so, mainly from the United States and the European Union. Japan faces a dilemma here: its refusal to comply with their demands could lead to restrictions on Japanese exports to other markets, while its full compliance could damage its manufacturing industry.

Japan's aging population is another major long-term factor. Any future economic recovery will encourage spending by the Japanese, which will further contribute to the recovery, but an aging population has a lower demand for goods and services than a young one and tends to spend less and more cautiously even when the economy is booming. The gradual shrinkage of the domestic market will hamper Japan's economic growth in the short run, and could create major problems in the long run as Japanese enterprises face tough competition in foreign markets while suffering a decline in domestic demand. With an aging population, Japan will face a reduction in tax revenues and an increase in spending for health care and other components of the social safety net.

If the post-war history of Japan is of any indication, the Liberal Democratic Party will remain a leading political party in the foreseeable future. Though a reduction in its popularity has denied it a majority of parliamentary seats necessary for its forming governments on its own, it has proven quite capable of forging coalition governments and will likely remain a determining factor in future elections.

DEPENDENCIES

Japan has no territories or colonies.

JORDAN

The Hashemite Kingdom of Jordan
Al-Mamlaka al-Urdunniyya al-Hashimiyya

CAPITAL: Amman.

MONETARY UNIT: Jordanian Dinar (JD). One dinar equals 1000 fils. There are coins of 1, 5, 10, 20, 25, 50, 100, and 250 fils. There are notes of 1, 5, 10, and 20 dinars.

CHIEF EXPORTS: Phosphates, fertilizers, potash, agricultural products, manufactures.

CHIEF IMPORTS: Crude oil, machinery, transport equipment, food, live animals, manufactured goods.

GROSS DOMESTIC PRODUCT: US$17.3 billion (purchasing power parity, 2000 est.).

BALANCE OF TRADE: **Exports:** US$2 billion (f.o.b., 2000 est.). **Imports:** US$4 billion (f.o.b., 2000 est.).

COUNTRY OVERVIEW

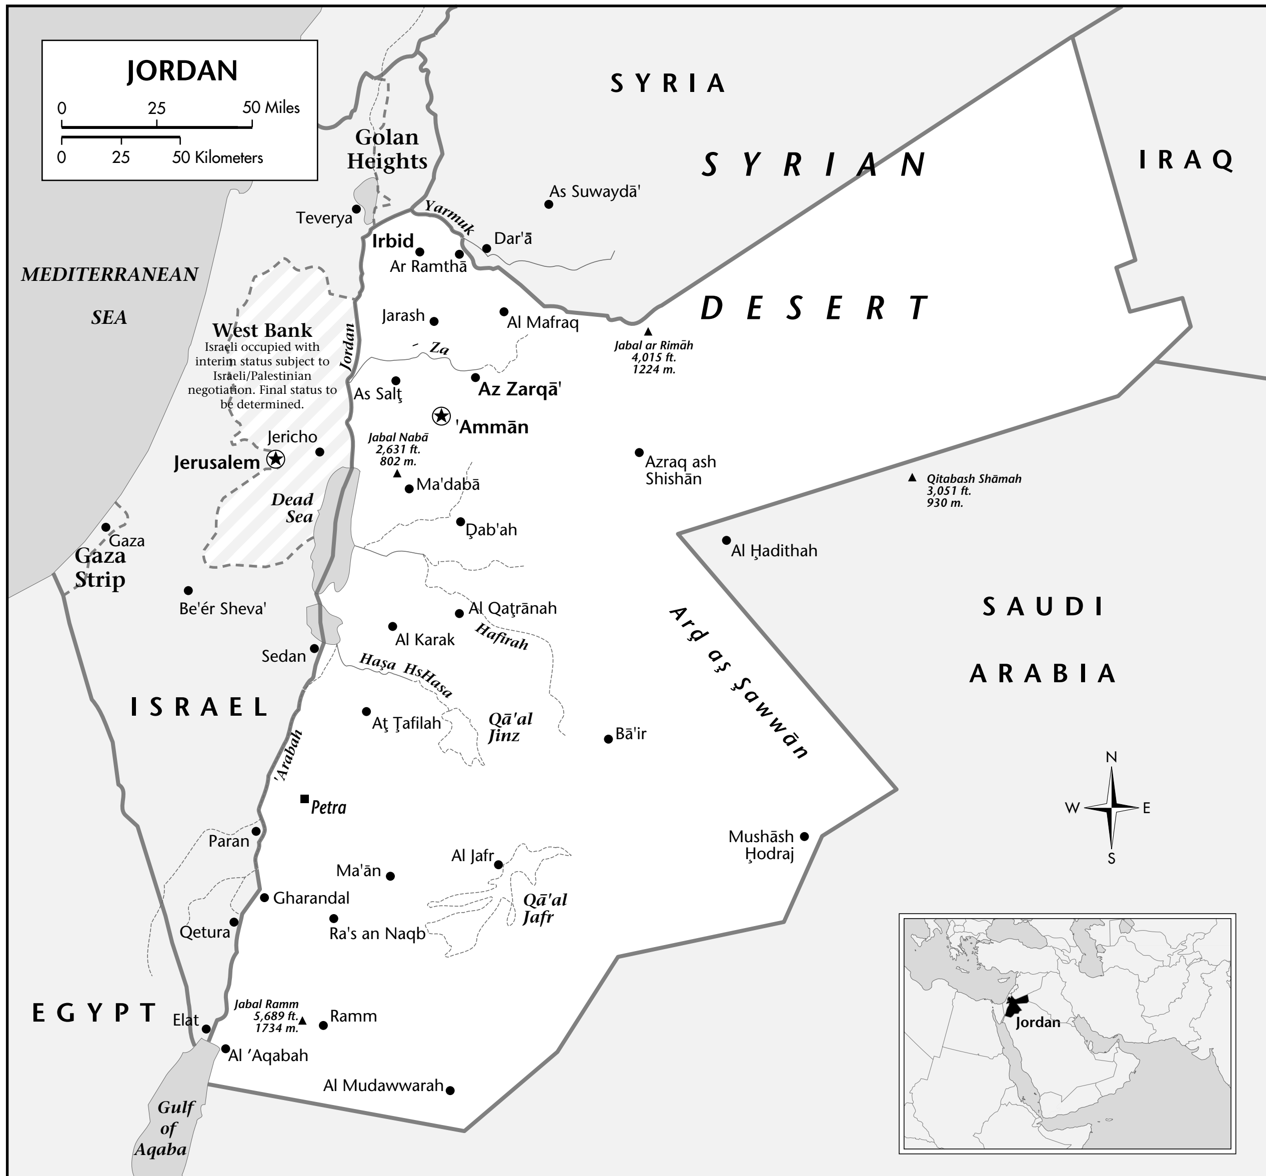
LOCATION AND SIZE. Jordan, a Middle Eastern kingdom, is sandwiched between Saudi Arabia in the south and east, Syria and Iraq in the north, and Israel (including the West Bank of the Jordan River) in the west. The country has an area of 89,213 square kilometers (34,445 square miles) and a coastline of only 26 kilometers (16 miles) along the Gulf of Aqaba in the south. Jordan shares its longest border with Saudi Arabia, some 728 kilometers (452 miles). Amman, Jordan's capital, is located in the northwest of the country. Jordan occupies an area slightly smaller than Indiana.

POPULATION. In July 2000 the population of Jordan was estimated to be 4,998,564, increasing on average by 3.1 percent a year. The country has a very young population, of which 41 percent are under the age of 20. Only 3 percent of Jordanians are over the age of 65. In 2000 the birth rate stood at 26.24 births per 1,000 while the death rate stood at 2.63 per 1,000. With a projected annual population growth rate of 3 percent, the population is expected to reach approximately 7.5 million by the year 2015.

The Jordanian population is almost entirely Arab except for pockets of people from Armenia, Chechnya, and a very small community of Circassians (the oldest indigenous people of North Caucasus). Although there are no accurate figures to date, it is estimated that up to 75 percent of the Jordanian population is Palestinian. The Palestinian people have been flooding into Jordan since the creation of the state of Israel in 1948, when they were either forced to leave their homes or subjected to such economic, cultural, and political hardship that they felt compelled to leave. There are existing tensions between the Jordanians who inhabited the country before 1948 and the refugees and immigrants who have since settled. The former group are known as the "East Bankers" and the latter group known as "West Bankers." Despite these tensions, the 2 communities are deeply inter-linked socially and economically. Many Palestinians living in Jordan refer to themselves as Jordanians, and it is hard to generalize about the loyalty and identity of the Palestinian population. In addition, there are 1 million foreign workers in the kingdom mainly from Egypt, Syria, and Iraq who perform menial, physical, and in some cases managerial jobs.

OVERVIEW OF ECONOMY

Jordan is a small Arab country with inadequate supplies of water and other natural resources such as oil and coal. Until the 1950s the economy was underwritten mostly by Britain, and in 1967 foreign aid still represented 60 percent of government revenues. The most important event for the Jordanian economy since the end of the World War II was the quadrupling of world oil prices in October 1973. Although Jordan possessed virtually no oil itself, it became inextricably linked to the other economies in the region. Between 1973 and 1981 the Arab budget (the sum of all Arab governments' budgets) rose more than 16-fold, from US$71.8 million to US$1.179 billion, and during the same period Jordanian exports rose almost 13-fold from US$57.6 million to US$734.9 million. In addition, Jordan



sent hoards of doctors, scientists, engineers, construction workers, and teachers to the Persian Gulf who sent home **remittances** of more than $US1 billion between 1973 and 1981. Even after deducting the dinars flowing out of the country from the 125,000 foreigners working in unskilled jobs, the net remittances rose from US$15 million in 1970 to US$900 million in 1981. During this oil boom, Jordan's annual **real GDP** growth averaged 10 percent.

This rapid economic growth combined with the increase in oil prices also caused prices and import bills to rise. Then when world oil prices crashed in the early 1980s, reductions in both Arab aid and worker remittances slowed real economic growth to an average of roughly 2 percent per year. Imports—mainly oil, **capital goods**, consumer durables, and food—outstripped exports with the difference mostly covered by aid and borrowing. The Jordanian government was immediately forced to downsize the **public sector**, stop construction projects, and cut **subsidies**.

In mid-1989 the Jordanian government embarked upon debt rescheduling negotiations and agreed to accept an International Monetary Fund (IMF) **structural adjustment program**, a lending program designed to correct an economies problems. Such programs usually involve devaluing the currency, reducing government spending, lowering the **budget deficit**, and implementing broad structural reforms. The Gulf War crisis, begun in August 1990, however, aggravated Jordan's already serious economic problems, forcing the government to shelve the IMF program, stop most debt payments, and suspend rescheduling negotiations. Aid from Gulf Arab states, worker remittances, and trade all contracted while refugees flooded into the country, producing serious **balance of payments** prob-

lems. (Jordan had to increase its imports, which pushed the trade imbalance further into deficit.) This action stunted GDP growth and strained government resources. The economy rebounded in 1992, largely due to the influx of capital **repatriated** by workers returning from the Gulf, but the recovery was uneven throughout 1994 and 1995. The government is currently implementing the reform program adopted in 1992 and continues to secure rescheduling and write-offs of its heavy **foreign debt**, which amounted to US$8.4 billion in 2000. A new IMF package was approved in April 1999 that entitles Jordan to funds worth US$174 million over 3 years. The U.S. Agency for International Development (USAID) agreed to an economic assistance program for Jordan in 1999 that amounted to $150 million. However, debt, poverty, and unemployment (which stood officially at 15.5 percent in 1999) remain Jordan's biggest on-going problems.

POLITICS, GOVERNMENT, AND TAXATION

Transjordan was created in 1921 by the British, who brought over Hashemite Prince Adbullah from Saudi Arabia to be head of state. The Hashemite clan claims to descend from the Muslim prophet Mohammed and have enjoyed very close ties to the West since the creation of the country. Transjordan achieved independence from Britain in 1946 and was renamed The Hashemite Kingdom of Jordan. Jordan is a constitutional monarchy based on the constitution promulgated in 1952. The king and his cabinet ministers hold the executive authority, and the king signs and executes all laws, however, his veto power may be overridden by a two-thirds vote of both houses of the National Assembly. He appoints and may dismiss all judges by royal decree, approves amendments to the constitution, can declare war, and holds the title of commander-in-chief of the armed forces. Cabinet decisions, court judgments, and the national currency are also all issued in his name. The cabinet is led by a prime minister who is appointed by the king. Legislative power rests in the **bicameral** (2-chamber) Majlis al-Umma (National Assembly). The 80-member Majlis al-Nuwaab (Assembly of Deputies or House of Representatives) is subject to dissolution by the king and of the 80 seats, 71 must go to Muslims and 9 to Christians. The 40 members of the Senate are appointed by the monarch for 4-year terms.

From 1953 until 1999 all this authority resided in Jordan's beloved King Hussein, who was one of the most famous and internationally respected Middle Eastern heads of state. King Hussein was instrumental in designing the framework for the "Peace Process" (the aim of which was to settle the historical conflict between the Palestinians and the Israeli government). His indefatigable commitment to a just and lasting peace accorded him the honor of being a guest speaker at the funeral of assassinated Israeli Prime Minister Yitzhak Rabin (prime minister of Israel [1974–77, 1992–95]). A strong proponent of democratization, King Hussein brought an end to martial law in 1991 and legalized political parties in 1992. He survived many assassination attempts, relying on the loyalty of his military. After King Hussein died of cancer, his son Abdullah II was crowned king on 9 June 1999. King Abdullah, along with Bashar Assad of Syria, belongs to a new generation of Arab leaders who have been educated in the West and whose priorities lie in the realm of economic **liberalization**, political accountability, societal justice, greater equality, and international status. Jordan's new politically accountable setting combined with its economic liberalization and its fast-growing population have led to the appearance of several political parties including the **Communist** Party and the Muslim Brotherhood. (The latter is a Sunni Islamic movement founded in Egypt in 1928 and active throughout the Arab world, although banned in most countries. It aims at the establishment of a Muslim state governed by Islamic law.) Several Arab nationalist parties are also active.

INFRASTRUCTURE, POWER, AND COMMUNICATIONS

Prior to 1950, Jordan had a very undeveloped **infrastructure** and the remarkable improvements that have

SOURCE: World Bank. *World Development Indicators 2000.*

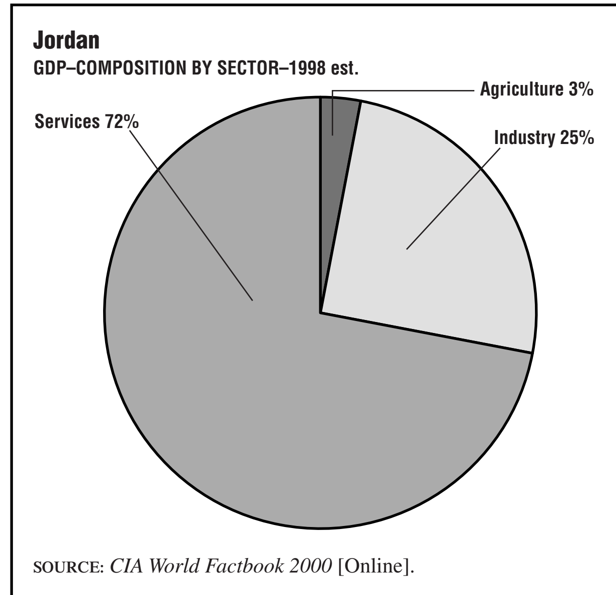
been made over the last 50 years have largely been shaped by the ever-changing politics and geography of the Middle East. Before 1948, Jordan's trade was almost entirely dependent on the port of Haifa, which was in Palestine at the time. However, Haifa was captured by the Israelis in 1948, and Jordan was forced to develop its own port at Aqaba. The peace treaty signed between Jordan and Israel in 1994 made Jordan a main route linking the Middle East to the Mediterranean and, therefore, a major trading hub. There are 2 major roads in Jordan, the north-south Desert Highway from Amman to Al Aqabah and the east-west highway from Al Mafraq to the Iraqi border. Jordan is a very small country that can be driven across in 5 hours, but in spite of its size, the country has a 6,200 kilometer (3,852 mile) road network. In addition, Jordan has a very small rail system that is used only for transporting raw materials to the southern port of Aqaba. There are 3 main airports, Queen Alia International Airport, 30 kilometers (18.6 miles) south of Amman; the old international airport at Marka; and King Abdullah Airport in Amman, used primarily by the Royal Jordanian Air Force.

The telecommunications sector was partially **privatized** in 1995 and currently Jordan enjoys a thoroughly modern communications system. Many people use cellular phones and pagers, and Internet access is widespread. In 1999, roughly 60,000 Jordanians owned mobile phones. In 2000 this number increased to 100,000. Forecasters have predicted that by the end of 2002 there will be 800,000 users. There were 403,000 main telephone lines in use in 1997.

Over 98 percent of the Jordanian population has access to electricity, and the demand for it has been growing at a rate of 10 percent in recent years. In 1999 total electrical energy production was 6.9 million kilowatt hours (kWh), and over 90 percent of this energy is supplied by the state-owned National Electric Power Company. Industry is the largest consumer at 34 percent of total production, and domestic consumption is the second largest consumer at 31 percent. Jordan has entered into a multilateral agreement with Egypt, Syria, Turkey, and Lebanon whereby electricity supplies will be taken from neighboring countries when domestic demand rises above domestic supply.

ECONOMIC SECTORS

The small size of Jordan is mirrored in the relatively small size of its economic sectors. Given that there are few natural resources in the country, the Jordanian economy is heavily dependent on imports from other countries, notably from the European Union. The largest economic sector is manufacturing and the smallest is agriculture. Unfortunately the agricultural sector is vulnerable to changes in climatic conditions, and droughts

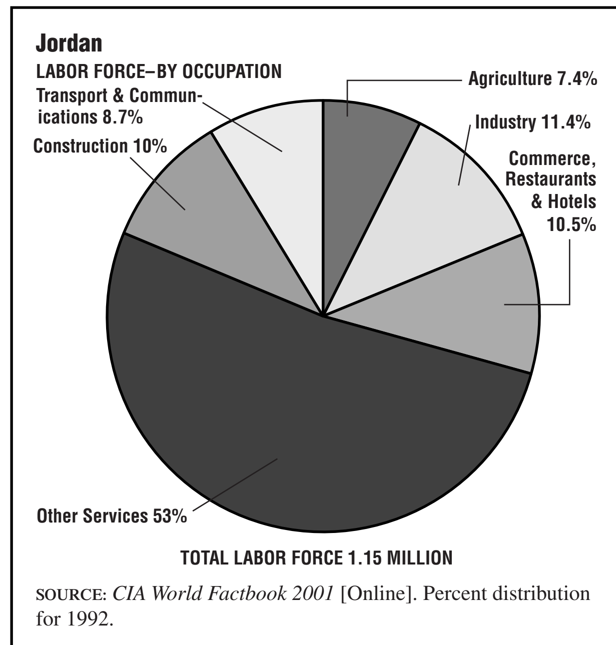


SOURCE: *CIA World Factbook 2000* [Online].

that plagued the country since 1998 seriously undermined the sector's productivity.

AGRICULTURE

In 2000, Jordanian farms accounted for just 500,000 of the country's 8.9 million hectares of land. The agricultural sector employed 7.4 percent of the Jordanian **labor force** in 1998 and contributed 3 percent to the GDP. Jordan experienced 2 serious consecutive droughts in 1998–99 and 1999–2000, which highlighted the agricultural sector's troublesome dependence on rainfall. Three-



SOURCE: *CIA World Factbook 2001* [Online]. Percent distribution for 1992.

quarters of the country's cultivable land is rain-fed territory to the north producing wheat, barley, lentils, and chickpeas. The remaining quarter of agricultural land in the Jordan Valley and the highlands is irrigated and produces eggplants, bananas, potatoes, cucumbers, citrus fruits, tomatoes, and onions. In 1999 tomatoes were the main crop with production reaching 293,000 tons, followed by 142,000 tons of melons. Agricultural products are mostly exported to the Gulf countries such as Bahrain, Kuwait, the United Arab Emirates, Saudi Arabia, and Lebanon. Some farmers, however, have tried to sell their produce to European markets. They have been largely unsuccessful because of their poor packaging, inadequate quality control, and the high transportation costs involved.

MEAT AND LIVESTOCK. There is very little land for grazing because 90 percent of the country is classified as desert, but Jordan is usually able to supply its people with 30 percent of domestic demand for red meat and milk, with the remaining 70 percent needing to be imported. However, regular outbreaks of foot and mouth disease (a destructive disease that infects cattle and sheep) associated with very dry climatic conditions have pushed the production of red meat and milk 40 percent below the normal levels. In 1999 only 21,000 tons of red meat was produced, along with 171 tons of milk. In addition to this problem, the structural adjustment program adopted by the government has cut subsidies on water and fodder, which has forced 30 percent of breeders to close.

The drought was so severe in 1998–99 that the cereal harvest met only 1.2 percent of domestic needs instead of the usual 10 percent. The reduction in cereal supply was coupled with soaring demand for wheat, which reached 650,000 tons in 1999–2000 when the country was producing only between 40,000–50,000 tons a year. The agricultural sector's problems have caused the food gap (the difference between the amount of food a country produces and the amount of food it has to import) to widen and the import bill to appreciate. In 1995 Jordan imported US$61 million worth of fruits and nuts, and in 1999 this figure amounted to US$82 million, an increase of US$19 million. This trend has shaken the Ministry of Agriculture into reviving talks with the Sudanese government over the use of their spare land and water. Jordan currently has use of 24,200 hectares of land to the north of Khartoum given by the Sudanese government in thanks for the medical aid provided by Jordan in the 1980s.

INDUSTRY

Jordan's industry can be divided into 2 sub-sectors: mining/quarrying and manufacturing. In 1998 the industrial sector employed approximately 14 percent of the country's labor force and contributed 25 percent to Jordan's GDP. This sector is the much-needed provider of foreign exchange because it accounts for 68 percent of domestic exports.

MINING AND QUARRYING. Phosphates and potash are Jordan's main natural resources, and both of these minerals are used in the production of fertilizers. In 2000 Jordan was the second largest supplier of phosphates in the world after Morocco, producing 7 million tons and announcing proven reserves of 1.5 billion tons. The bulk of the phosphate industry is located in the south of the country near the Saudi Arabian border and is dominated by the Jordan Phosphate Mines Company, which is mostly owned by the government. Mining is certainly one of the strongest **emerging markets** in Jordan, and the government has made significant investments in the sector. The sector's output has been growing steadily with profits increasing from US$27 million in 1997 to US$35 million in 1998. The Jordan Phosphate Mines Company has been very successful in attracting international capital especially through contracts with Indian and Japanese firms.

Jordan has impressive proven shale oil reserves that have been estimated to amount to the equivalent of 29.5 billion barrels of oil. This oil has not been exploited yet because shale oil is difficult and costly to extract. However, in 1999 a Canadian firm, Suncor, entered into talks with the Jordanian government and hopes to produce 17,000 barrels per day (b/d), 67,000 b/d after 2004, and 210,000 b/d after the year 2008. This project would be a great boost for the Jordanian economy because it would make Jordan self-sufficient in energy production. Currently, Jordan imports 100,000 b/d of oil from Iraq.

MANUFACTURING. Jordan has never had a large heavy industry base because it does not have the purchasing power to import the necessary and costly machinery. Second, the regional instability makes it an unattractive place for potential investors. The principal heavy industries, such as cement and fertilizer production, have developed only through heavy government intervention. Most private investment is concentrated in light industry such as **consumer goods**, textiles, food processing, and construction materials. In order to spur growth in the industrial sector, the Jordanian government has set up a series of **free trade zones**. Light industry has largely been driven by the growth of Jordan's pharmaceutical industry, which has been very rapid since 1998. In 2000, Jordan was exporting pharmaceutical products to over 30 countries. In 1995, US$125 million worth of pharmaceutical products were exported, and in 1999 this figure had increased to US$143 million.

CONSTRUCTION. The construction industry has been growing steadily since the oil boom in the 1970s, helped by the economy through the remittances flowing into the country from Jordanian workers in the Gulf. The fast-growing Jordanian population has led to growing urban communities, and the capital Amman has almost doubled

in size over the last 30 years. Major construction contracts are usually held by foreign companies because they hold the large amounts of required capital. However, these companies have been sensitive to the needs of Jordan and have often used Jordanian architects and engineers in major projects. Local companies have nevertheless been instrumental in building more schools, roads, and waterways.

SERVICES

Jordan tends to attract more tourists on average than other Arab countries because of its central geographic position in the region. Jerusalem is merely 1 hour away from the capital Amman, as are Jericho, Nazareth, and Bethlehem. Syria is a 2-hour drive to the north, as is Lebanon, and Egypt is only a ferry ride from the Gulf of Aqaba. Jordan itself has much to offer the adventurous traveler, including the magnificent "rose-red" city of Petra where the movie *Indiana Jones and the Temple of Doom* was filmed, the Roman city of Jerash, and the Dead Sea, where one can float on top of the water because of its heavy salt content. Jordan is also home to the Jordan river, beautiful deserts, and the Gulf of Aqaba, which boasts some of the best diving in the world.

The Jordanian tourism sector has certainly not been developed to its full potential because of the continuous problems with regional security. When the peace treaty was signed between Jordan and Israel in 1994, tourism grew as more and more Israelis visited the country. However, the sector did not achieve the growth targets that were hoped for. Following the Gulf War in 1991, there was a slowdown in the number of tourists from Saudi Arabia and the other Gulf countries, but recently the deepening of ties between all the countries in the region has led to an increase in the number of Arab visitors to Jordan. In 1999 over 50 percent of tourists were Arab. The number of tourists from Europe and the United States fluctuates in response to the regional political situation. In 1995 roughly 84,000 U.S. tourists visited Jordan, and in 1999 this number increased to 100,000. Since the beginning of 2001 many tourists have canceled their holidays to the country due to the violence that erupted in Israel and the West Bank and Gaza Strip in September 2000 between the Palestinians and the Israeli authorities.

Despite the daily uncertainties faced by the tourism sector, the government has continued to encourage hotel development in all parts of the country. Since 1995 many 5-star hotels have been built including the Holiday Inn, the Grand Hyatt, the Four Seasons, and the exclusive Movenpick Hotel on the Dead Sea coast, which boasts a luxurious health resort.

FINANCIAL SERVICES. Jordan has a modern and well-functioning financial services sector. The banking sector is regulated entirely by the Central Bank and includes 21 banks of which 5 are foreign, 5 are Islamic, and 9 are commercial. The Central Bank of Jordan has encouraged smaller banks to merge by offering incentives and raising minimum capital requirements to 20 million dinars (US$28.2 million). This is being done in part to offset the overwhelming national presence of the Arab Bank, which holds 60 percent of the country's financial assets. The Jordanian government has also historically encouraged the setting up of **microcredit** institutions and, unlike many other Arab countries, Jordan is well-served by 5 highly accessible organizations that provide substantial funds to people in the agricultural, industrial, and housing sectors. In 1996 the first mortgage company was set up allowing Jordanians to reorganize the loans they had taken from the Housing Bank and reschedule their payments in a manageable way.

Jordan has long been dependent on outside capital to sustain its development programs. In the 1980s, the kingdom sought to develop its internal financial base by establishing a stock exchange, the Amman Financial Market (AFM). The establishment of the stock market was an important step in enabling the country to use its financial resources in a more efficient way by allowing both Jordanians and foreigners to invest in the **private sector**, thus helping the economy to grow.

INTERNATIONAL TRADE

Given that Jordan does not posses a wealth of natural resources like the oil-rich countries in the Gulf and does not have a very wide industrial base, it has been plagued with **trade deficits** since its creation. The situation has worsened as the food gap in the country widens, and more and more food has to be imported. The past 4 governments have attempted to address this issue by promoting exports and tightening imports. The dinar was devalued in 1991, which made Jordanian products cheaper on the international markets and foreign imports more expensive. The Gulf War also helped to boost exports as regional demand exploded in the aftermath of the war,

Trade (expressed in billions of US$): Jordan

	Exports	Imports
1975	.153	.732
1980	.574	2.402
1985	.789	2.733
1990	1.064	2.600
1995	1.769	3.698
1998	N/A	N/A

SOURCE: International Monetary Fund. *International Financial Statistics Yearbook 1999.*

notably in the pharmaceutical industry. Jordan's principal export markets are Saudi Arabia and Iraq, the former an important market for pharmaceuticals and consumer goods and the latter an important market for out-of-season vegetables and fruit. Jordan's phosphates, potash, and fertilizers are bought by the Indians, the Chinese, and the Indonesians. As the Asian economies recover from their devastating 1997 financial crisis, demand is growing rapidly again. In spite of this positive growth, however, average annual imports cost twice as much as the revenues from exports. In 2000 Jordan exported US$2 billion worth of goods, but imported US$4 billion worth of goods, producing a trade deficit of US$2 billion.

In 1999, about 21.6 percent of Jordanian imports originated from Iraq (mostly oil), 9.9 percent from the United States, 9.7 percent from Germany, and 4.7 from the United Kingdom. The country imports most of its consumer goods from South Korea, Turkey, and China, and Saudi Arabia provides it with the bulk of its processed food.

FREE TRADE AGREEMENTS. An important free trade agreement was signed between Jordan and the European Union, which took effect in January 1999. It aims to eliminate **tariffs** on nearly 500 industrial goods over 5 years and to spur local industrial activity. Essentially, Jordan's products will be eased onto the European market as **duties** and taxes on European products are removed. Another significant part of the agreement will lift the ban on majority foreign ownership of Jordanian firms. Jordan also became a member of the World Trade Organization (WTO) in December 1999 and is currently in talks with the European Union regarding a free-trade agreement with the European Free Trade Association (EFTA). Jordan has been actively involved in promoting inter-regional free-trade zones, signing an agreement with Saudi Arabia that provides for a free-trade zone before 2005, and it is involved in similar talks with the Egyptians. In October 2000 Jordan also signed a free trade agreement with the United States, and as a result exports to the United States have risen rapidly. In 1999, Jordan provided US$13.1 million worth of exports to the United States, and in 2000 this figure had jumped to US$27 million.

MONEY

The aim of the Central Bank is to maintain a stable dinar so as to enable the economy to function competitively abroad. The Jordanian Central Bank controls foreign exchange transactions as well as the **exchange rate**. The dinar was devalued in 1991 against the French franc, the U.S. dollar, the British pound, and the German mark in order boost exports. In an effort to maintain exchange rate stability in 1995, the dinar was pegged to a **fixed exchange rate** to the dollar. In mid-2001, US$1 is equal to 0.7090 JD, which means that 1 JD is equal to US$1.41.

Exchange rates: Jordan

Jordanian dinars (JD) per US$1	
2001	0.7090
2000	0.7090
1999	0.7090
1998	0.7090
1997	0.7090
1996	0.7090

Note: Rate has been set since 1996; since May 1989, the Jordanian dinar has been pegged to a group of currencies.

POVERTY AND WEALTH

Amman is a capital in which the foreigner neither marvels at the numbers of homeless on the sidewalks nor remarks on the number of flashy Mercedes Benzes on the roads. Jordan is simply not a rich country like Saudi Arabia, and those families that do possess fortunes tend to be discreet about it. Of course, there are exclusive neighborhoods in Amman but, on the whole, wealth is not flashed around. Poverty, on the other hand, does exist in Jordan, especially in cities.

Approximately 15 percent of the Jordanian population of 4,998,564 live below the poverty line and up to two-thirds of these poor people are concentrated in urban areas. According to the World Bank, 17 percent of Jordanian children are malnourished, the infant mortality rate per 1,000 live births is high at 31, and 11 percent of the population does not have access to safe drinking water. In addressing these issues, the Jordanian government in 1997 set up a poverty reduction initiative called the Social Productivity Program. Not only did this ambitious scheme aim to reduce poverty and educate the poor but it also targets members of underprivileged groups who are typically more vulnerable to poverty such

as female-headed households, widows, divorced women, and mothers of disabled children. The fund has received money from the World Bank and the **United Nations Development Program** and has been very successful in reducing the percentage of those below the poverty line from 30 percent in 1998 to 15 percent in 2001.

WORKING CONDITIONS

Jordan has a mushrooming labor force. In 1997 the labor force stood at 1.2 million, a substantial increase from the 1991 figure of 525,000. The official unemployment rate stood at 15.5 percent in 1999. Half of the unemployed are under the age of 25, and many of these young people are unskilled. The country has a national literacy rate of 86.6 percent, and about 95 percent of the workforce under the age of 35 is literate. Many young graduates sadly find themselves without jobs, and those who do find employment are often very badly paid. It is likely that the real rate of unemployment is significantly higher than the official rate, and some estimates put it as high as 20 or 25 percent. According to the *EIU Country Profile 2000,* the largest percentage of the labor force, at 18 percent, work in crafts, only 14 percent of the labor force are professionals, and 14 percent of the labor force are plant and machine operators. In 1997, 158,097 people were employed by the public sector and their average monthly wage was US$310. There is also a substantial **underground economy** whose production is estimated at 3 percent of the GDP.

The Jordanian workforce is protected under labor laws enforced by Ministry of Labor inspectors. There is no minimum wage in Jordan, however, the government often assigns a minimum wage to certain trades based on recommendations made by unions. The maximum work week is 48 hours except in hotels, bars, and restaurants where employees can work up to 54 hours. Employment of foreign workers in Jordan is not permitted unless the employer is in need of the expertise and qualifications of a foreign employee. Arab technicians and experts are given priority over their foreign counterparts.

COUNTRY HISTORY AND ECONOMIC DEVELOPMENT

1920. The League of Nations places Palestine and Transjordan under a British mandate following the collapse of the Ottoman Empire at the end of World War I.

1946. Britain's mandate over Transjordan comes to an end, and Emir Abdullah is declared king.

1948. The state of Israel is created under the British mandate in Palestine. Thousands of Palestinians flee Arab-Israeli fighting to the West Bank and Jordan.

1950. Jordan annexes the West Bank of the Jordan River.

1951. King Abdullah is assassinated by a Palestinian gunman in Jerusalem.

1952. Hussein is proclaimed king after his father, Talal, is declared mentally unfit to rule.

1957. British troops complete their withdrawal from Jordan.

1963. Political parties are banned.

1967. Israel takes control of Jerusalem and the West Bank during the Six-Day War, and there is a large influx of refugees into Jordan.

1970. Major clashes break out between government forces and Palestinian guerrillas resulting in thousands of casualties in a civil war remembered as Black September.

1976. The Amman Financial Market opens for business. Non-Jordanian Arabs are permitted to buy shares in Jordanian firms without limit.

1989. First general election since 1967 is contested only by independent candidates because of the ban on political parties in 1963.

1991. The Gulf War begins. Jordan comes under severe economic and diplomatic strain as a result of the Gulf crisis following Iraq's invasion of Kuwait.

1992. Political parties are legalized.

1993. The World Bank agrees to restructure Jordan's debt.

1994. Jordan signs a peace treaty with Israel ending the 46-year official state of war.

1996. Food price riots occur after subsidies are removed under the economic plan supervised by the International Monetary Fund.

1997. Jordan signs an association agreement with the European Union that aims to establish a free trade zone over the next 12 years. Iraq agrees to supply Jordan with 4.8 million tons of crude oil at a considerable discount from market price.

1998. King Hussein is treated for lymphatic cancer in the United States.

1999. King Hussein returns home and is put on a life support machine. He is pronounced dead on 7 February. More than 50 heads of state attend his funeral. Hussein's son, Crown Prince Abdullah ibn al-Hussein, is sworn in as king.

1999. Jordan joins the World Trade Organization.

2000. The government bans public protests following clashes between demonstrators and police during anti-Israeli protests.

FUTURE TRENDS

The change in leadership following the death of King Hussein concerned the international community because many countries were unsure as to whether the young king would be capable of successfully taking a fragile economy into the 21st century. However, King Abdullah has shown the international community that he is committed to continuing the economic liberalization of Jordan. If **macroeconomic** policy continues to be well managed, the Jordanian people will enjoy increased foreign investment, increased privatization, and steady growth over the next few years. Forecasters put the future annual GDP growth as high as 4 or 5 percent.

Following the adoption of the IMF structural adjustment program, the government also hopes to expand the tourism industry, increase exports, and reduce interest rates in order to boost the economy. Nevertheless, the extent to which the Jordanian economy can grow is somewhat dependent on the events that will take place in neighboring Israel and the Occupied Territories during the course of 2001. If the violence continues in the West Bank and Gaza Strip and indeed if a war were to break out between the Palestinians and Israelis, Jordan's tourism industry would come to a halt. In addition, potential investors would be very unwilling to risk putting their money into a region that might possibly be on the brink of war.

DEPENDENCIES

Jordan has no territories or colonies.

KAZAKHSTAN

Republic of Kazakhstan
Kazakstan Respublikasy

CAPITAL: Astana.

MONETARY UNIT: Tenge (T). One tenge equals 100 tiyin. No coins exist. Paper currency comes in denominations of 1, 2, 5, 10, 20, 50, 100, 200, 500, and 1000 tenge as well as 1, 3, 5, 10 and 20 tiyin.

CHIEF EXPORTS: Oil, ferrous and nonferrous metals, machinery, chemicals, grain, wool, meat, coal.

CHIEF IMPORTS: Machinery and parts, industrial materials, oil and gas, vehicles.

GROSS DOMESTIC PRODUCT: US$54.5 billion (in purchasing power parity, 1999 est.).

BALANCE OF TRADE: **Exports:** US$5.2 billion (1999 est.). **Imports:** US$4.8 billion (1999 est.).

COUNTRY OVERVIEW

LOCATION AND SIZE. Kazakhstan is located in the center of the Eurasian landmass in what is known as Central Asia. Kazakhstan is bordered on the east by China, on the south by Kyrgyzstan and Uzbekistan, on the west by the Caspian Sea, and on the north by Russia. The capital city of Astana is located 1,300 kilometers (808 miles) north of Almaty (the former capital), roughly in the center of the country. With a total surface area of 2,717,300 square kilometers (1,049,150 square miles), Kazakhstan is the ninth-largest country in the world, slightly less than 4 times the size of the U.S. state of Texas. The northern border with Russia, which spans 6,846 kilometers (4,030 miles), is the longest continuous bi-national border in the world.

In physical respects, Kazakhstan is a country of superlatives. It sweeps from the high mountain border regions near China across the mineral rich regions of Eastern Kazakhstan, then further west across broad expanses of plains to the oil-rich regions of Western Kazakhstan near the shore of the Caspian Sea. To the north, Kazakhstan is bordered by the taigas of southern Siberia (taigas are subarctic forests that border on the harsher arctic tundra); to the south, Kazakhstan is bordered by the Aral Sea and the deserts of Central Asia. Kazakhstan is rich in oil, gas, and other mineral resources including gold, iron ore, coal, copper, chrome, and zinc. Large oil deposits are located in the western regions of Kazakhstan and in the Caspian coastal region. Massive Soviet Union-era mining and mineral processing complexes are located at various points around the country. Kazakhstan is home to the Baikonur Soviet Cosmodrome, still used as the launching pad for Russian space flights. Kazakhstan is also home to the main Soviet nuclear weapons testing range, not used since 1992, located near the city of Semipalatinsk in the northeastern part of the country.

POPULATION. The population of Kazakhstan was estimated at 16,733,227 in July 2000, a slight decrease from the 1990 population. In 2000 the birth rate stood at 16.78 births per 1,000 while the death rate was 10.56 deaths per 1,000 persons. Migration out of the country, estimated at 6.7 persons per 1,000, has been a major source of the country's population decline. The population was estimated to be shrinking at a rate of .05 percent a year in 2000.

Kazakhstan is the second largest state in terms of territory to emerge from the former Union of Soviet Socialist Republics (USSR). In December 1991, when Kazakhstan declared national independence from the USSR, the government and economy were still closely tied to the Soviet centralized economic and managerial systems. Kazakhstan's politically moderate, multi-national population was divided roughly in half between indigenous ethnic Kazakhs and other peoples—Russians, Germans, Ukrainians, Chinese, Uygurs, Koreans—as well as dozens of other smaller national and ethnic groups. In 2000 the population was roughly 46 percent Kazakh, 35 percent Russian, 5 percent Ukrainian, 3 percent German, 3 percent Uzbek, 2 percent Tatar. In terms of religious identification, roughly 47 percent of the

population professed Islam, while 46 percent was Russian Orthodox or Protestant.

The Kazakh language belongs to the family of Turkic languages. Turkic languages are far removed in structure and derivation from Indo-European languages. Russian shares many structural features and linguistic roots with other European languages. The Turkic languages, in contrast, have few links with major European languages. Soon after national independence, the Kazakh language was adopted as the official state language of Kazakhstan. Roughly 40 percent of the population of the country lists Kazakh at their principal language, about while 40 percent of the population lists Russian as their principal language. In practice, most government and commerce is conducted in Russian.

Kazakhstan's multicultural composition is a source of both tension and cooperation. Given the roughly equal balance of numbers among the largest ethnic groups, there is a widespread recognition of the need for equal treatment under the law.

OVERVIEW OF ECONOMY

Kazakhstan is a new state, established as an independent country in 1991 as a result of the breakup of the USSR. In the first decade of national independence, the Kazakh government demonstrated a commitment to establishing the foundation for an open, market-based economy. As a legacy of decades of Soviet-style centralized economic planning, Kazakhstan inherited a physical **infrastructure** designed to serve the Soviet economy by providing **primary commodities**, particularly energy and minerals, to industrial markets in the north, particularly in the Ural and central Siberian industrial regions of Russia. Kazakhstan's population of roughly 16.5 million makes it a relatively small country compared to international standards, but it is the world's ninth largest coun-

try. Kazakhstan is rightly considered to be the world's "largest small country."

The transition from a **communist** system of government and economy to a market-based system has been difficult for Kazakhstan. The transition began in 1991, but the economy contracted sharply in the first years, with 1994 a particularly difficult year. Kazakhstan was shaken by the economic instability that hit Asian financial markets in 1997 and swept across Russia in 1998. After recovering from the setbacks caused by the 1998 financial market crash, Kazakhstan began to make significant progress in 1999. Economic growth surged ahead in 2000, reaching a level of 8 percent. The government pursued prudent **fiscal policies**, avoiding overspending despite the fact that government revenues—taxes and other forms of income—exceeded original expectations. The economic recovery was led by strong growth in exports, particularly gas and oil, and was helped by high prices for fuel products in international markets.

Many areas of macro-economic reform have been highly successful, even providing a model for other post-communist countries to follow. The government established a legal foundation and regulatory system for a private economy. It moved quickly to establish sound and fiscal **monetary policies** and actively encouraged international trade and foreign investment. The government adopted sound taxation and spending policies. The government introduced a national currency, the tenge, which has been quite stable. The government established a regulatory structure for the private banking and financial sector and **privatized** major enterprises, including the majority of power generation facilities and coal mines. The government passed environmentally sound oil and gas legislation that meets international standards.

Yet Kazakhstan's reform has made less headway in other areas. Kazakhstan's agriculture remains without adequate investment in infrastructure such as roads, processing equipment, and farm inputs. Moreover, the banking system has virtually ignored agriculture, failing to provide much needed credit for farm expansion. Kazakhstan adopted a private pension system, moving ahead of other former communist countries, but the social safety net has worn thin in many areas. With a per capita income of US$1,300, most citizens of Kazakhstan have yet to see the benefits of macro-economic reform and the resurgence of world prices for the country's significant oil, gas, and gold deposits. The social safety net has been weakened with declines in health status, benefits for senior citizens, and education opportunities. Dramatic increases in infectious diseases, such as drug-resistant tuberculosis, pose serious social threats.

POLITICS, GOVERNMENT, AND TAXATION

The dominant feature of Kazakhstan's government is the transition from communism. As a part of the Soviet Union until 1991, Kazakhstan was a testing ground for many important communist policies of the USSR. The communist system was distinguished by a powerful central government, an official state ideology of **Marxism**, and a centralized, planned economy. The communist government took control of the means of production (farms, factories, and natural resources) in the early 1920s through a process of **nationalization**. The changes in the Soviet Union began in 1988 with the introduction of open and relatively free elections. Kazakhstan's first open election was held in February 1990. Nursultan Nazarbaev—then the first secretary of the Kazakhstan Communist Party—was elected chairman of the Kazakhstan parliament. A short time later the parliament passed the Kazakhstan Declaration of Sovereignty. The true meaning of the declaration was somewhat obscure. Kazakhstan became a sovereign government but remained within the larger government of the Union of Soviet Socialist Republics, the Soviet Union. As the Soviet Union began to unravel in the autumn 1991, President Nazarbaev scheduled popular elections. Running without opposition, he won the election and became Kazakhstan's first popularly-elected president. Just 2 weeks later the Kazakhstan parliament adopted the Kazakhstan Declaration of Independence, and Kazakhstan became truly independent.

In the first 2 years following the disintegration of the USSR, Kazakhstan began to define its strategy for the transition from communism to a market-based economy. One of the most important elements in this transition is the transfer of property rights from the government to the **private sector**. If property belongs to everyone—as is the case under communism—it is often treated as if it belongs to no one. Establishing private property rights is, therefore, a first step in the transition to the economically rational use of resources. In 1993 the Kazakhstan government adopted a privatization program to return control of economic assets to the people themselves.

The most important stage of privatization in Kazakhstan took place between 1994 and 1997. Sales and public auctions were held to distribute the country's 4 categories of properties: the country's major industries, mines, and oil fields; large factories; small shops, stores, and apartments; and agricultural enterprises. The "case-by-case privatization program" sold most of the country's major industries, mines, and oil fields. The "mass privatization program" held auctions for most of the country's large factories. Most small shops and stores were sold in the country's "small scale privatization program." Agricultural enterprises were privatized, although agricultural land itself was not. Residents were also

allowed to privatize the apartments and houses in which they were living at the time. Residents were required to pay a nominal sum for their property, but there were few cases of people who were left without hearth and home by the privatization program.

In December of 1991, Communist Party chiefs of 11 of the former 15 Communist Party organizations of the USSR gathered in the Kazakh capital (then called Alma-Ata) in a dramatic meeting to decide what to do about the collapsing Soviet Union. The outcome of this meeting was the Alma-Ata Declaration, announcing that the Union of Soviet Socialist Republics would "henceforth cease to exist." The Alma-Ata Declaration also established a loose coordinating structure called the **Commonwealth of Independent States** (CIS) and **sanctioned** the emergence of 15 new and independent states from the former Soviet Union. Kazakhstan was one of these states.

In its first decade of independence Kazakhstan made great progress in the transition to a modern, democratically governed state with a market-based economy. The steps the Kazakh government has taken over these years of independence follow a textbook description for the establishment of a civil society—a constitutionally organized, secular society based on the rule of law, the protection of human and civil rights, and the limited role of popularly elected, accountable government. The Kazakh government established the fundamental institutions of civil development, such as a constitutional form of limited government based on a separation of powers, open electoral process, a professional judiciary, a deliberative parliament, free press, and the rights of speech, assembly, and religion. The government also initiated and carried through the process of selling the state's assets to the public through privatization.

The Kazakh government carried out **macroeconomic** reforms including true price **liberalization**, freeing the markets from government controls. It also established the legal and regulatory structure of a private economy, including a modern civil code and tax, banking, and investment laws that accord with international standards. The Kazakhstan government relinquished control of the nuclear weapons on its territory in accordance with international treaty agreements. And, although it is not entirely unblemished, Kazakhstan's record of protection of human and civil rights compares favorably with that of its former Soviet neighbors.

Kazakhstan enacted its first post-communist tax code in April 1995. The Kazakhstan tax code is based on international standards and stresses **equity**, economic neutrality, and simplicity. Taxation takes place at the 3 levels of government: central, provincial (called an "oblast" in the Russian language), and local. The 3 most important taxes are the enterprise profits tax, the individual **income tax**, and the **value-added tax** (VAT). Profits for most private firms are taxed at a rate of 30 percent. Most business expenses are deductible, including wages. The individual income tax ranges from 5 to 30 percent. The VAT is applicable to all goods, work, and services, including imports into Kazakhstan. The VAT on imports is usually 20 percent of the **value added**, or the difference between the purchase and resale price. In addition to these basic taxes, there are a number of other, less common taxes such as the natural resource tax paid for the right to explore for oil and other mineral resources. Land is taxed annually. Business assets are taxed at .50 percent yearly. And individually owned land is taxed at .10 percent of the assessed value. Automobiles and trucks are taxed on their value.

INFRASTRUCTURE, POWER, AND COMMUNICATIONS

With a highway system that includes some 103,272 kilometers (64,123 miles) of paved highways, Kazakhstan ranks favorably in terms of miles of road per inhabitant. Many quite developed countries in the world have much less roadway per inhabitant. Kazakhstan's main form of transport infrastructure for haulage and

freight is rail. Kazakhstan's main railway system includes 14,400 kilometers (8,948 miles) of track. Kazakhstan's transport infrastructure also includes oil and gas pipelines. Kazakhstan has 2,850 kilometers (1,770 miles) of crude oil pipelines, 1,500 kilometers (932 miles) for refined oil products, and 3,480 kilometers (2,162 miles) of natural gas pipelines. In early 2001 a new pipeline was opened to carry crude oil from Kazakhstan's northwestern oil fields through Russia to western markets. Kazakhstan has major port facilities at the Caspian harbors of Aqtau and Atyrau, as well as ports on the navigable Irtysh River at Oskemen, Pavlodar, and Semey. There are 10 major airports in the country, with international airports at Astana and Almaty.

Kazakhstan's railway system was integrated into the Soviet system. Connections allowed for shipment of freight throughout the Eurasian landmass. However, the access to markets in Europe, the Middle East, and the Far East is through rail connections that now pass through the territory of Russia. Kazakhstan's highway system is in a poor state of maintenance but otherwise is adequately developed. The highway system allows for truck freight traffic through all bordering countries.

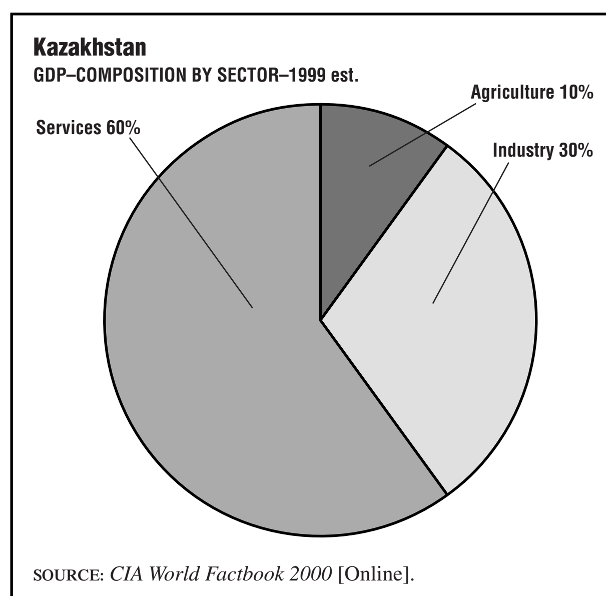
Kazakhstan is the largest of the 5 post-Soviet Central Asian countries (in addition to Kyrgyzstan, Tajikistan, Turkmenistan, and Uzbekistan). All the Central Asian countries are highly interdependent with respect to energy resources, transportation infrastructure, and markets. The greatest source of wealth in the region is natural resources, particularly gas and oil. The Caspian region's major oil and gas reserves are located in Azerbaijan, Kazakhstan, Turkmenistan, and Uzbekistan. Much of the oil wealth is located in the shallow coastal regions of the Caspian Sea or in the remote regions of western Kazakhstan. The potential for increasing oil and gas production in the region is great. Oil industry analysts expect that the region could be exporting as much as 2 million barrels a day by 2010. But because all the region's oil-producing countries are landlocked, routes to the market invariably involve shipment through third party countries. As a consequence, the complexities of the region's geography and the differing national interests of the countries make access to market a matter of mutual agreement.

Kazakhstan inherited from the Soviet period a telecommunications system that was exceptionally poor. In 1995 Kazakhstan had slightly fewer than 2 million phone lines in use. The number of mobile cellular lines in the country was quite small (4,600 according to U.S. government official estimates). Most cities and small towns rely on deteriorating fixed copper wire phone systems that are comparable to what was used in the United States in the 1940s. Inter-city communications take place through landline and microwave radio relay. However, the system is being modernized. The cities of Almaty and Astana have had recent telecommunications upgrades.

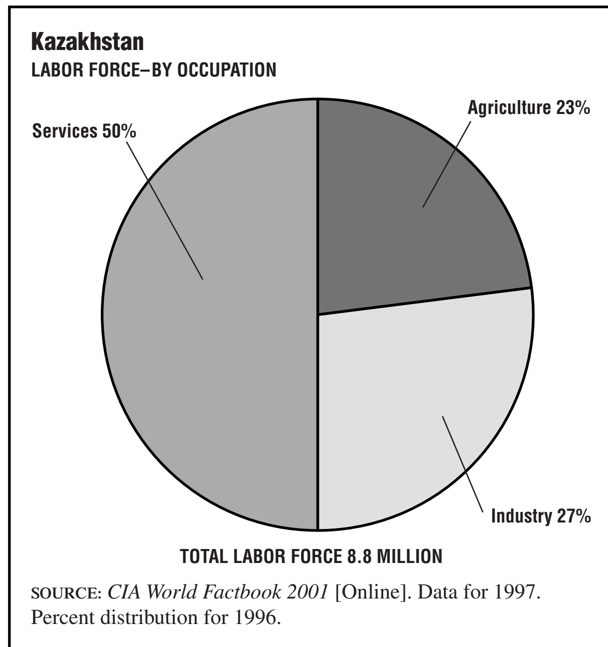
In 1999 the cellular and digital phone revolution arrived in Kazakhstan. Like many developing countries with aging fixed copper wire systems, a steep drop in the cost of cellular services made it possible to bypass over the existing copper service. Statistics are not available concerning the extent to which cellular phones are in common use, but observations on the street would suggest that soon the copper wire fixed system may be replaced by reliance upon new mobile phones. International phone connections are possible with other countries by satellite and by the Trans-Asia-Europe (TAE) fiber-optic cable, as well as by earth-to-satellite-to-earth stations.

ECONOMIC SECTORS

Kazakhstan's economy is export-oriented. Gas, oil, and metals make up 72 percent of Kazakhstan's exports. Since a rise in world market prices for oil in 1999, Kazakhstan's oil and gas sector has benefitted from strong foreign demand, comparatively strong domestic demand, a crossroads geographic location, a favorable foreign investment climate, and multiple **joint ventures** with Western and Eastern oil companies. Agriculture, while accounting for 23 percent of employment in Kazakhstan, accounted in 1999 for just slightly over 10 percent of the GDP. Industry, with 27 percent of the country's employment, accounted for 30 percent of Kazakhstan's GDP. Kazakhstan's industrial sector rests on the extraction and processing of natural resources and also on a relatively small machine building sector. This sector specializes in construction equipment, tractors, agricultural machinery, and transportation equipment such as small



SOURCE: *CIA World Factbook 2000* [Online].



SOURCE: *CIA World Factbook 2001* [Online]. Data for 1997. Percent distribution for 1996.

buses and railroad cars. The country has considerable agricultural potential with its vast lands accommodating both livestock and grain production.

The breakup of the USSR and the collapse of demand for Kazakhstan's traditional heavy industry products have resulted in a sharp contraction of the economy since 1991, with the steepest annual decline occurring in 1994. In the period 1995–97 the pace of the government program of economic reform and privatization quickened, resulting in a substantial shifting of assets into the private sector.

The December 1996 signing of the Caspian Pipeline Consortium agreement to build a new pipeline from western Kazakhstan's Tengiz oil field to the Black Sea increased prospects for substantially larger oil exports in the years ahead. Kazakhstan's economy turned downward, however, in 1998 with a 2.5 percent decline in the GDP growth due to slumping oil prices and the August financial crisis in Russia. A bright spot in 1999 was the recovery of international oil prices, which, combined with a well-timed tenge **devaluation** and a bumper grain harvest, pulled the economy out of **recession**. If initial reports of the production capacity of the new Kashagan field on Kazakhstan's Caspian shelf turn out to be accurate, Kazakhstan's ability to produce oil will far outstrip its ability to get it to market.

AGRICULTURE

Kazakhstan has substantial untapped agricultural potential, yet its agricultural sector is underdeveloped and under-financed. The country's capital, Astana (previously known as Tselinograd), was the epicenter of a major Soviet agricultural expansion program—the "Virgin Lands" program—of the 1950s and 1960s. During this period, tens of thousands of households moved to central Kazakhstan to assist in the expansion of agriculture. Currently agriculture is the country's major employer. Yet it comes in a distant second to the industrial sector in attracting government attention for investment and support.

Kazakhstan produced about 8 million tons of wheat in the 2000–01 growing season, down from 11.2 million tons produced the previous year. Total grain production was about 10.5 million tons, down from over 14 million the year before. Area under cultivation increased approximately 4 percent in 2000 from the previous year, to 9.0 million hectares of wheat and 11.4 million total hectares of grain. Conditions were generally favorable for wheat in Kazakhstan's key north-central oblasts since the beginning of the growing season, with adequate precipitation in the form of frequent light-to-moderate showers. Vegetation indices from late July indicate that crop conditions in Kazakhstan in 2000 were not as good as in 1999, when near-ideal conditions prevailed, but they were better than during the drought of 1998 when wheat output dropped to 4.7 million tons.

One constraint that some economists see on Kazakhstan's agricultural development is the failure of the country to develop firm private property rights for agriculture. Economists maintain that private property rights play a critical role in providing the incentives necessary for investment and careful use of resources. During the Soviet period, large-scale agriculture was carried out on state farms (Sovkhozes) and collective farms (kolkhozes). With the end of the Soviet period, these farms were reorganized into large agricultural cooperatives with the understanding that they would eventually become private farms. However, the Kazakhstan government has postponed the adoption of true private property in agricultural land for cultural and political reasons. The lower chamber of Kazakhstan's parliament decided in June 2000 to postpone debate on a proposed law on land ownership. The Kazakhstan government originally submitted the draft bill to the parliament for passage in 1999, but the law was withdrawn after widespread public protests against land privatization. An amended version was resubmitted for debate in 2000. The year 2000 version stipulated that only land adjacent to rural dwellings, but not all the country's agricultural land, could be privately-owned. The amended draft also triggered public protests, including a hunger strike by opposition members of the Alash party organization. Members of the Alash fear that if agricultural land is privatized there will be little public support for defending the interests of small farmers against the interests of large farm owners. Kazakhstan, they fear, will witness the develop-

ment of large plantation-style farms that derive profits for multinational companies while small farmers are increasingly pushed into subsistence-level farming.

INDUSTRY

The country is rich in mineral resources, including chrome, coal, copper, gold, iron ore, wolfram, and zinc. The economy is still closely linked with the other economies of the former Soviet Union and especially with the Russian Federation. However, since independence in 1991, foreign trade has been redirected toward markets outside the former Soviet Union.

Prior to the breakup of the USSR, Kazakhstan's electrical grid was a single component within the unified Soviet electrical system. When independence came, Kazakhstan underwent a wrenching withdrawal from the physical infrastructure of the Soviet system. Dozens of independent power grids appeared, fragmenting energy markets. The reliability of energy supplies fell sharply. Cases of forced restrictions of power supplies and disconnections rose. Many small towns in northern Kazakhstan were forced to suffer the severe Siberian winters without gas and electricity supplies in the early years of the transition. During this period the Kazakh government sought to develop independent electrical and natural gas supply systems for the purposes of self-sufficiency. Ultimately, the country came to see the wisdom of reintegrating regional Eurasian energy markets. In summer 2000 Kazakhstan began the steps to create a single power system stretching across the states of Russia, Kazakhstan, Kyrgyzstan, Uzbekistan, Tajikistan, and Turkmenistan.

In 1991 the Kazakh government began negotiating with international oil firms to develop Kazakhstan's Tengiz oil fields. The Kazakhstan government joined the large multinational oil firm Chevron to form a joint venture called Tengizchevroil. The agreement committed Chevron to spend about US$20 billion over 20 years to develop the Tengiz field's 6 billion barrels of proven reserves. The agreement anticipated that eventually Kazakhstan would be exporting as much as 700,000 barrels a day from the field. Other major international petroleum firms, including Birlesmis Muhendisler Burosu, British Gas, and Agip also committed investment in the country's oil fields.

Beginning in 1992, Kazakhstan's northern neighbor Russia **restructured** the management of its state-owned oil and gas companies. Large, powerful, and politically well-connected private oil companies emerged from the reorganization in Russia. These new firms and the Russian government cooperated to restrict the access of the Caspian states to the Russian pipeline system and its connections to western markets. Russia first imposed high taxes and surcharges on the movement of gas and oil and then, in order to block economic development that might run contrary to the interests of Russian energy firms, sought to blockade its southern neighbors by cutting off access to foreign markets entirely.

In response to the Russian measures, the Caspian oil and gas producing countries (principally Kazakhstan, Azerbaijan, and Turkmenistan) began seeking ways to bring energy supplies to market without having to pass through Russian territory. Russia lobbied for a continued reliance on the Soviet-era pipeline system, the so-called northern option. European and North American countries favored the idea of shipment across the Caucasus and on to world markets through the Bosporos, the narrow strait that leads from the Black Sea to the Mediterranean Sea. The Economic Cooperation Organization (ECO), based in the countries of the Middle East, urged pursuit of a southern option. Thus, 4 routes for the Caspian oil eventually gained attention. First was a pipeline from Baku (Azerbaijan) to Ceyhan (Turkey), the Baku-Ceyhan line. Another was a pipeline that originated in Kazakhstan, went through Turkmenistan and Afghanistan before going to Pakistan and the Indian Ocean. Yet another pipeline discussed would go from Turkmenistan through Iran, Turkey, and then onward toward Europe. Finally there was discussion of a pipeline that would supply Uzbek and Turkmen gas to Pakistan through Afghanistan.

In 1995 negotiations among the oil and gas producing countries resulted in the Caspian Littoral Agreement. The agreement, which included Azerbaijan, Iran, Kazakhstan, Russia, and Turkmenistan, was designed to coordinate trade routes, regulate the access to natural and mineral resources, and unite efforts at environmental protection. The agreement also established a Caspian Council, consisting of a secretariat and 4 specialists' committees. The council was to be politically controlled by an intergovernmental council representing the Caspian states. The Caspian Pipeline Consortium (CPC) was founded by Russia, Kazakhstan, and Oman in 1995. The goal of the consortium was originally to deliver oil from the Tengiz field in Kazakhstan to a Russian port on the Black Sea for shipment to western markets. In the summer of 1997, Kazakhstan and China concluded an over US$10 billion agreement for the extraction and transportation of Kazakh oil. In 1998 the 2 countries began to develop and operate the Uzen oil field and the Aktyubinsk oil and gas field in northwestern Kazakhstan. The Chinese National Petroleum Corporation (CNPC) bought a 60 percent stake in Kazakhstan's large Aktobemunaigaz oil field for US$325 million and pledged to invest another US$4 billion in it over the next 20 years. Kazakhstan and China began exploring the possibility of jointly laying an oil pipeline from Western Kazakhstan to China. The project would cost an estimated at US$3 to US$3.5 billion and be the largest pipeline construction project in history. The pipeline, if constructed, would be

about 3,000 kilometers long and its annual handling capacity would be at least 20 million tons.

In some categories of mining Kazakhstan is among world leaders. The country has about one-third of the world's chromium and manganese deposits. It has substantial tungsten, lead, zinc, copper, bauxite, silver, and phosphorus. Kazakhstan is also a major producer of beryllium, tantalum, barite, uranium, cadmium, and arsenic. Major iron mines are located in the north of the country. There are reserves of goethite and limonite, but these are generally considered to be low grade. The capacity of these mines has been listed as 25 million tons/year. Large reserves of coal are generally found in the central and northern parts of the country. Kazakhstan has large reserves of phosphorus ores in the Zhambyl region in the south. The government privatized state mining companies in 1994.

Kazakhstan has major aluminum, copper, steel, uranium, and zinc factories. The country's major steel producer, Karaganda Metals (or Karmet), was privatized in 1994 and sold to the international firm Ispat-Karmet. Production dropped for several years but in 2000 began to increase, reaching 300,000 tons. The major aluminum producer, Aluminum of Kazakhstan, is engaged in a major expansion of output. The country's chief zinc complex, Kazzinc, announced in 2000 that it would expand production to 250,000 tons. Kazakhstan also has a growing precious metals sector, with production increases in recent years in gold and silver in particular. The majority of gold and silver output comes as a by-product from base metal production, but there are also separate deposits. There are 23 gold-bearing regions in Kazakhstan. The Vasilkovskoye mine in north Kazakhstan is considered to be the fourth largest gold mine in the world.

SERVICES

Kazakhstan's consumer markets are small by comparison with the markets of Europe and Asia. Consequently, most manufacturing focuses on primary commodities for export rather than on the production of **consumer goods** to meet domestic demand. The service sector in Kazakhstan is large and growing in the major municipal areas. However, the service sector is limited by the relatively small size of the markets and the fact that Kazakhstan's urban population is concentrated in only 10 major towns that are located at great distances from one another.

Kazakhstan's **retail** sales and service markets have been underdeveloped for many years. As a result of the heavy emphasis on primary commodities, little attention was paid during the Soviet period to consumer goods and services. After Kazakhstan became independent, new laws and regulations made it possible to open private businesses offering consumer goods and services. The small service sector surged ahead as business people began offering services, such as car repair, housing construction and improvement, real estate services, legal services, beauty shop services, and other small businesses that did not require substantial investment.

Because few consumer goods, such as processed foods, small appliances, clothing, and beauty products were produced in Kazakhstan, people had to import them. For a brief period of 2 or 3 years after independence there was a remarkable amount of growth in the import of clothing and household consumer goods that was conducted by shopping tours. These were trips made by individuals either by car, plane, or train to foreign countries such as the United Arab Emirates, China, or Turkey in order to purchase and bring back to Kazakhstan for resale large quantities of goods which are imported as luggage. In 1997 government customs agents began to apply import taxes to these goods, thereby discouraging much of this activity. In addition, because the transaction costs of such economic activity is very high, the market for these goods was eventually taken over by shipping and hauling companies that could import large volumes of foreign-made consumer goods.

While Kazakhstan is a country possessing many areas of great natural beauty and potential, the tourist industry is still underdeveloped but growing rapidly. Kazakhstan's new capital, the city of Astana, has several recently constructed world-class hotels. Kazakhstan's other major city, Almaty, has numerous major hotels that cater to international travelers. But the majority of cities in Kazakhstan have few hotels that can offer tourists accommodations and travel services that are in accordance with international standards.

Kazakhstan's banking sector has undergone substantial restructuring during the decade of independence. During the period between 1997 and 2001 the number of banks in Kazakhstan went from 129 to 48 as many small and non-competitive banks went out of business, merged, or were acquired by larger banks. During this period of restructuring, Kazakhstan's banking sector won high marks from international institutions for its rapid adoption of international standards of policy and practice. But these standards have not yet succeeded in convincing international investors and Kazakhstan's citizens that the financial services that are offered by Kazakhstan's major banks are critical to business success and personal finance. The major banks have still not managed to attract major foreign investment. According to banking industry estimates, fewer than 3 percent of Kazakhstan citizens regularly use personal banking services such as checking and consumer credit cards. As a result, most small business transactions in Kazakhstan continue to be cash transactions.

Financial markets are those in which stocks, bonds, and other forms of investment and savings can be bought and sold. In the transition from a **centrally-planned economy** to a **liberal economy**, the growth of the financial markets is critical to success. Financial markets facilitate capital formation for businesses and governments and provide a means of profitable utilization of assets for investors. Efficient financial markets also encourage a lot of otherwise idle financial resources to circulate more freely in the economy, what economists refer to as high **liquidity**. A well functioning financial market is an engine of savings and investment for any free-market economy.

There was great expectation that Kazakhstan would be able to rapidly develop active and vital financial markets immediately after independence. A decade after independence, however, those expectations have not proved well-founded. Kazakhstan's capital markets and stock markets have not proved attractive to foreign investors. **Foreign direct investment** has been concentrated in a few sectors, particularly oil, gas, and minerals development. Kazakhstan's offering of government bonds has met with interest from investors primarily because investors have confidence that the Kazakhstan government, with its long-term expected revenues from the oil, gas, and mineral sectors, will continue to make good on its promise to pay off its state debt.

INTERNATIONAL TRADE

Kazakhstan has become a relatively open economy. In 1999 the shares of export and imports in terms of GDP stood at 38 percent and 35 percent, respectively, reflecting a favorable trade balance. In that same year exports stood at US$5.2 billion while imports were US$4.8 billion. The country has the trade structure of a primary commodity supplier. In 1999 oil, gas, and minerals accounted for 78 percent of exports. In contrast, in this same year consumer products dominated imports.

Kazakhstan's largest trading partner is Russia. In 1999 Kazakh exports to Russia accounted for 20 percent of all exports, followed by China accounting for 8 percent, Italy for 7 percent, Germany for 6 percent, and Switzerland for 6 percent. The United States accounted for less than 2 percent of Kazakhstan's exports. Russia was also the largest importer to Kazakhstan, accounting for 37 percent of total imports. Russia was followed by the United States, which accounted for 9 percent of imports, the United Kingdom for over 6 percent, and Italy for about 3 percent. Other trading partners accounted for less than 2 percent each.

Before independence 90 percent of Kazakhstan's trade was with Russia. After independence, the government committed itself to establishing the conditions for integration into the international market. These steps included price liberalization, through the reduction of **subsidies** and the **deregulation** of prices, as well as a balanced government budget through increases in taxes and cuts in government spending. The government also instituted a tight monetary policy through an increase in the Central Bank interest rate and encouraged foreign trade liberalization by lifting export and import licenses, granting permission to all firms to engage in foreign trade, and lifting **tariffs**. Kazakhstan also devalued the domestic currency to bring it down to the domestic market rate, and privatized and restructured state **monopolies**. The government sought to create a market environment through the legislative and regulatory reform of banking, capital markets, civil and contract law, and dispute adjudication. In order to cushion the social impact of these sweeping economic structural transformations, the government developed a social safety net. The Kazakh government has also pushed ahead with plans to join the World Trade Organization (WTO) in 2002.

MONEY

For a period after national independence, Kazakhstan chose to rely upon the Russian ruble as its currency. None of the successor states of the USSR was in a position at independence to rapidly introduce its own currency, yet none of the countries wanted to be dependent upon monetary decisions taken by Russian financial authorities. Each of the states considered the idea of introducing

separate currencies during the first months of independence. Estonia introduced the first post-Soviet currency, the Kroon, in June 1992. Throughout 1992 most of the states, however, stayed in the ruble zone—those countries that used Russia's currency. Russia announced that it would make the ruble a **fully convertible currency** in the summer of 1992. After the ruble floated on the international market as a tradable currency, it immediately plunged in value, falling from 130 to over 450 rubles to the U.S. dollar. The fall of the ruble motivated the movement of huge amounts of old rubles to post-Soviet countries, particularly Kazakhstan where the ruble was still the only legal currency. As a result, the Kazakh money supply quadrupled in just a few months. To insulate itself from such disruptions, Kazakhstan introduced a new national currency, the tenge, in November 1993.

The purpose of a national currency is to allow the central economic planners and bank managers a measure of control over the economic activity of the country and to provide a medium of exchange to promote domestic commerce and foreign trade. To be an effective medium for commerce, the currency must be tradable so that buyers and sellers can exchange their goods and services with knowledge that the currency is a reliable medium for exchanging things of value. The marketability of the currency depends upon a system that allows purchasers of the currency to buy it and sell it in accordance with their currency needs. This, in turn, requires that the banking system is arranged in such a way that banks may settle their accounts among themselves and foreign banks on a regular basis, moving the currency of the country and of other countries in response to the demands of the currency users. The Kazakhstan government has taken key steps to assure that the tenge is a tradable currency with adequate provisions for clearing and settlements among banking institutions.

The Kazakhstan National Bank, the government agency responsible for maintaining the stability of the currency, has sought over the past years to maintain a stable but flexible **exchange rate** for the tenge. The value of the tenge fluctuated in a narrow band at about T138–143 per U.S. dollar in late 1999 and early 2000, settling at about T142.5 per U.S. dollar in late 2000. Given the strong growth in deposits and the confidence of market participants in a stable exchange rate, interest rates declined. Rates on 3-month **treasury bills** declined by about one-half in late 2000, reaching about 8 percent per annum.

Kazakhstan's central bank has sought to avoid many of the problems associated with the "boom and bust" syndrome of economies that are dependent upon the sale of natural resources, minerals, and other primary commodities. During 2000 the government recorded a substantial surplus. Exports grew strongly, resulting in a current account surplus as a percentage of the GDP. During 2000 the Kazakh government borrowed money on the international market by issuing Eurobonds of US$350 million. These bonds are basically treasury bills that the government issues with a promise to pay at a later date. They are called "Eurobonds" simply because they can also be purchased by investors in European markets. In May 2000 the Central Bank (the National Bank of Kazakhstan, or NBK) repaid outstanding obligations of roughly US$385 million to the International Monetary Fund, substantially reducing the public **external debt** .

POVERTY AND WEALTH

Poverty is a major concern in Kazakhstan. More than a third of the population of the country was estimated by the World Bank to live below the subsistence minimum in 1996. Some 6 percent of the population was estimated to live on less than US$2.15 per day. Almost two-thirds of the poor live in the southern and eastern regions of the country, the areas that are largely agrarian and rural. Certain groups are most affected by poverty: the young, households with many children, households with one parent, and the retired.

Under the Soviet system, industrial facilities based in cities and regions were largely responsible for the welfare of the local citizens. The farms, factories, offices, and enterprises in which virtually every Soviet citizen worked were responsible for providing everything from road maintenance to health care to childcare. When Kazakhstan ended state ownership of industry and agriculture, these large enterprises ceased to provide social services. However, few programs came into being to rapidly assume the responsibility for providing these public services. Many Kazakh citizens who were unable to find employment in the new, rapidly changing circumstances of a market economy found their incomes lost or dramatically diminished and social services almost non-existent.

In the Soviet Union, most people lived at a roughly equal socio-economic level. The Soviet personnel system and the system of distribution of state resources such as

housing and access to education was highly standardized. Such systems are inherently wasteful because the scarcity of goods and services is not efficiently or accurately represented. The end of communism and the advent of market economics introduced new efficiencies. At the same time, the transition period introduced the possibility of using government positions or control over resources to amass great personal wealth. New extremes of rich and poor arose quickly. Some townspeople with access to wealth benefitted greatly from the first stages of the post-communist transition. Many rural dwellers, such as herdsmen and farmers, suffered terribly as government subsidies came to an end and health, education, and other social services ended abruptly. Many small towns that had been organized during the Soviet period were essentially "company towns," that is, towns in which virtually all the population worked in one large factory. After the Soviet era, many of these communities turned into ghost towns as unprofitable factories teetered on the edge of bankruptcy, released workers, and were unwilling to support the social services for the towns and villages.

Some analysts estimate that as much as 30 percent of the economic activity in the Kazakh service sector takes place in the **informal economy** and is thus not visible to tax collectors. In transition economies people often seek to conceal their earnings out of fear that conspicuous wealth may attract outlaws or the tax collectors. Payments for services are often made in cash; many kinds of government control over the economy allow bureaucrats to pad their modest incomes through bribes, that is secure payments for government licenses, approvals, or support. As a consequence, many business people find that they often have to make bribes or other payments to advance their business deals or assure that they will not be harassed by officials.

A step the Kazakhstan government has taken to address this situation is the strengthening of the funded pension system that was introduced 1 January 1998. This fully-funded pension system was designed to help the government improve the marketability of financial assets held by the pension funds. Pension funds are now compelled to use internationally-accepted accounting and valuation standards, and they have greater freedom to invest in high-quality foreign assets. In the long run, workers in Kazakhstan can be assured that their earnings over their productive years will grow and pay them dividends in retirement. However, the new system amasses money as new entrants into the **workforce** begin regularly paying a portion of their incomes into the pension funds. Those workers already on pension or close to pension will receive little benefit from the funds. A great social injustice of the transition period is the large number of **pensioners** who worked their entire productive lives and only to receive monthly pensions amounting to no more than US$15 per month.

The government has taken steps to focus public assistance programs on providing critical services to the truly needy. In 1998 the Kazakhstan government adopted a system of needs tests to ensure that social assistance is provided to those who need it and not provided to those who are not entitled to it. In addition, the government discontinued reliance on unemployment registration as a means of identifying eligibility for social assistance. Overall, public assistance in such areas as medical care,

assistance to children and the elderly, however, has fallen far below the level needed.

WORKING CONDITIONS

Kazakhstan has a workforce of roughly 8.8 million people. Some 27 percent of the labor force is occupied in industry, 23 percent in agriculture and forestry, 20 percent in education, and the remaining 30 percent in the service sector and other sectors such as government and military. The unemployment rate was estimated to be 14 percent in 1998. Unemployment is much higher in rural areas than in urban areas, where the service sector has enjoyed robust growth in recent years. Employment by women in urban areas lags behind that of men by a considerable margin, reaching 20 percent.

Kazakhstan has paid a high social price for its rapid progress in the transition from communism. Under communism, economic growth was restrained but there was a very low level of inequality. Most workers made roughly the same income. Extremes of high and low incomes were rare. Since independence, Kazakhstan's success in rapid macroeconomic and political reforms created anxiety among the country's southern neighbors, particularly Uzbekistan, where government-regulated prices and subsidized production were still the norm. Kazakhstan's abandonment of subsidies for Soviet-era industries permitted a steep industrial decline, throwing hundreds of thousands of Kazakh citizens out of work. Kazakhstan's success in privatization led to charges in the press and among many industrial workers that the Kazakhstan government had sold out to large **multinational corporations**, abandoning social principles in favor of rapid income gains for the few. Kazakhstan's efforts to court a few large multinational enterprises—particularly in the gas, oil, and minerals sectors—led to the widespread perception of growing corruption, bribery, and cronyism.

The socio-economic consequences of the transition are immediately visible in Kazakhstan. High unemployment, deteriorating or even non-existent social services, unpaid salaries, social security and pension payments, unheated apartments, and unavoidable confrontations with dishonest or corrupt local officials: these are everyday features of life in Kazakhstan.

Kazakhstan's industrial workers have sought to use collective bargaining to promote their common welfare. However, trade unionism has weak traditions in the country. The Confederation of Free Trade Unions claims a membership of about 250,000 workers. In fact, the number of independent trade union members is much lower. Other unions have had even less success. To obtain legal status, an independent union must apply for registration with local judicial authorities and with the Ministry of Justice. Registration is generally lengthy, difficult, and expensive. Independent unions gravitated towards opposition political candidates but turned more pro-government in 1999 when the government authorities introduced protectionist trade policies aimed at supporting domestic industries. Kazakhstan law does little to protect workers who join independent unions from threats and harassment by enterprise management or state-run unions. Members of independent unions have been dismissed, transferred to lower-paying jobs, threatened, and intimidated.

COUNTRY HISTORY AND ECONOMIC DEVELOPMENT

650–750. A tribal alliance of herders and nomads known as the Kaganate moves into the area that is now Kazakhstan.

750. Arabs invade the area, spreading the influence of the Islamic culture and religion.

1700. The people divide into 3 Kazakh tribes (called "Juz"), which become known as the senior, middle, and junior tribes.

1731. The junior tribe joins the Russian empire, while the senior and middle tribes remain independent.

1820. The khan of Kokand, ruling from the ancient city of Kokand located far to the south, extends its political influence northward, capturing and taking control of areas of southern Kazakhstan.

1850. Major Russian **emigration** occurs. Russians arrive in Kazakhstan in search of new agricultural lands.

1867. The Russian tsar decrees the establishment of the Turkestan general-governorship, extending official Russian rule into Kazakhstan and Central Asia, making Kazakhstan part of the Russian Empire.

1917. The Bolshevik Revolution in Russia toward the end of World War I leads to the establishment of a communist government and the creation, in 1918, of the Russian Socialist Republic (which includes the territory of present-day Kazakhstan).

1925. Ethnic Kazakhs in the southern region gain recognition as the separate Karakalpak Autonomous Province. The province is included in the new republic of Uzbekistan, not in Kazakhstan, thereby dividing the ethnic Kazakhs.

1929. The capital of Kazakhstan is moved from the city of Kzyl Orda to Alma-Ata (later known as Almaty).

1929–33. The Russian government embarks upon the collectivization of agriculture to reorganize agriculture along the lines of industrial management. The disastrous agricultural policies lead to widespread opposition, farmers' uprisings, and famine.

1936. The province of the territories of modern day Kazakhstan is proclaimed to be a Soviet Socialist Republic, called the Kazakh Soviet Socialist Republic. During the rule of Soviet leader Joseph Stalin, the communist government conducts campaigns against political opposition. Thousands of Kazakhs are imprisoned for crimes against the state, the political crime of disagreement with state policy.

1957–61. Under the leadership of Soviet leader Nikita Khrushchev a new agricultural initiative called the Virgin Lands Campaign relocates tens of thousands of people from the European parts of the USSR to Kazakhstan. Kazakhstan is identified as the new bread basket of the USSR.

1986. After a decision by Soviet leaders to appoint an ethnic Russian as the head of the Kazakhstan Communist Party, widespread nationalist opposition to the dominance of the Communist Party results in public protests and riots.

1990. Demands for greater political autonomy on the part of the Socialist Republics of the USSR lead to a movement for republican sovereignty. The Kazakhstan Soviet-era parliament passes the Declaration of Sovereignty, asserting that the natural resources of the country belong to Kazakhstan and not the Soviet Union.

1991. An unsuccessful attempt to take over the Russian government by Communist Party hard-liners precipitates a crisis in Moscow. Many rank and file communists join opponents of Moscow's long-standing domination of the rest of the country. Kazakhstan, like all of the 15 republics that made up the USSR, declares national independence.

1991. In December, 11 high Communist Party officials gather in Almaty (then known as "Alma-Ata") to sign a document announcing the end of the USSR and the establishment of the Commonwealth of Independent States (CIS).

1992. Kazakhstan joins major international organizations such as the United Nations, the World Bank, the Asian Development Bank, and the European Bank for Reconstruction and Development.

1993. The Kazakhstan Constitution is adopted.

1995. A new version of the Kazakhstan Constitution, assigning greater powers to the executive branch, is adopted.

1995. The first Kazakhstan tax code is introduced.

2000. Kazakhstan joins the Eurasian Economic Community, an international organization designed to create a common economic market throughout much of the former USSR.

FUTURE TRENDS

Kazakhstan's government has made substantial progress in the transition to a modern, globally integrated economy. Following independence, Kazakhstan quickly carried out macroeconomic reforms and established the legal and regulatory structure of a private economy. The country has adopted a tradable currency, liberalized prices, and privatized major sectors of the economy including industry, telecommunications, and energy. Kazakhstan lifted virtually all subsidies on consumer goods in 1994. State industrial subsidies were abandoned in 1994, and small-scale privatization has also taken place. Kazakhstan established the fundamental institutions of a civil society—a constitution recognizing a separation of powers, an electoral process, a professional judiciary, a deliberative parliament, a free press, and rights of speech, assembly, and religious freedom. Kazakhstan's record of protection of human and civil rights compares favorably with that of its former Soviet neighbors. Given these facts, it can be argued that Kazakhstan has gone further than many of the former Soviet states in the establishment of a modern state. Yet serious challenges remain.

Kazakhstan inherited a physical infrastructure designed to serve the Soviet economy by providing primary commodities such as energy and minerals to industrial markets in the north, particularly in the Ural and central Siberian industrial regions of Russia. Kazakhstan's industry was previously tightly connected to these regions of Russia because its industrial suppliers and consumers were primarily in these regions. The country's rail and road transportation systems were designed to connect its primary commodity industries with the northern manufacturing markets. These are the realities of Kazakhstan's contemporary situation: primarily commodity-based industries, a sparse population, previous economic specialization under Soviet-style **socialism**, and a legacy of centralized planning.

In terms of Kazakhstan's political future, the stakes are obviously big. Kazakhstan is potentially one of the richer countries of the region, and perhaps one of the richer countries of the world if it can succeed in negotiating access to world markets for its oil, gas, and mineral riches. But an oil-led economic development strategy has potential drawbacks for Kazakhstan. A strategy that relies exclusively on the export of primary commodities and raw materials is likely to make Kazakhstan susceptible to fluctuations in international markets. Like the other post-communist countries, Kazakhstan will very likely continue to be influenced by economic trends that it cannot control. Private international investors, with the exception of the major oil companies, have been reluctant to make major commitments to Kazakhstan. Those foreign companies that have moved into the Kazakhstan

market, such as Tractabel, the large European energy company, have found the Kazakh domestic market to be more challenging than they anticipated. There is a consensus that the Kazakh government needs to strengthen the institutional and legal underpinnings of a market economy, balance its public and private sectors, and make a more substantial commitment to strengthening the social safety net. The Kazakh government has made substantial progress in developing a market-based policy framework, at least in theory. Making this framework function in practice is one of the main challenges facing the country's economic managers.

DEPENDENCIES

Kazakhstan has no territories or colonies.

—Gregory Gleason

KIRIBATI

Republic of Kiribati

CAPITAL: Tarawa.

MONETARY UNIT: Australian dollar (A$). One Australian dollar equals 100 cents. There are notes of A$5, 10, 20, 50, and 100. There are coins of A$1 and 2, and 1, 2, 5, 10, 20, and 50 cents.

CHIEF EXPORTS: Copra, seaweed, fish.

CHIEF IMPORTS: Food, machinery and equipment, miscellaneous manufactured goods, fuels.

GROSS DOMESTIC PRODUCT: US$74 million (1999 est.).

BALANCE OF TRADE: **Exports:** US$6 million (1998 est.). **Imports:** US$37 million (1998 est.).

COUNTRY OVERVIEW

LOCATION AND SIZE. The Republic of Kiribati comprises 33 atolls in 3 principal island groups, scattered within an area of about 5 million square kilometers (2 million square miles) in the mid-Pacific Ocean. The 3 island groups are the Gilbert Islands, the Line Islands, and the Phoenix Islands. The country extends about 3,870 kilometers (2,400 miles) from east to west and about 2,050 kilometers (1,275 miles) from north to south and has a coastline of 1,143 kilometers (710 miles). The total land area is 717 square kilometers (277 square miles). The nearest neighbors are Nauru to the west, and Tuvalu and Tokelau to the south. The capital, Tarawa, is on the island of Bairiki. Bairiki is the most populous island with around 65,000 inhabitants. The nation's largest atoll is Kiritimati (Christmas Island)—in the Line Islands group at the eastern extremity—at 388 square kilometers (150 square miles). The smallest is Banaba Island in the west at 6 square kilometers (2.3 square miles).

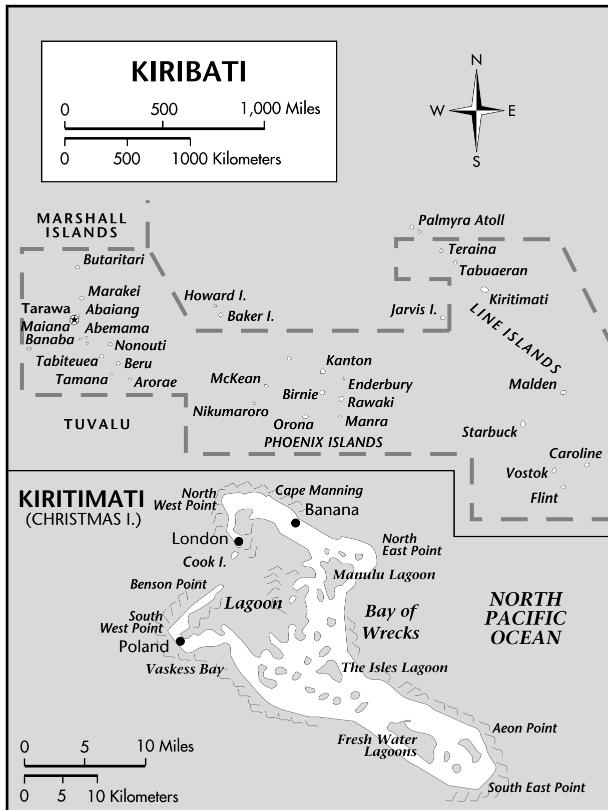
POPULATION. The population of Kiribati was estimated at 91,985 in July 2000. The current annual population growth rate is 2.34 percent, which will result in a population of 113,509 by 2010. The birth rate is 32.43 births per 1,000 population, and the fertility rate is 4.4 births per woman. The death rate is 9.01 deaths per 1,000 population. There is little or no migration to or from Kiribati. Partly because of sanitation problems caused by the lack of fresh water, as well as heavy pollution in the lagoon of South Tarawa, Kiribati has a high infant morality rate of 55.36 deaths per 1,000 live births (compared to the U.S. rate of 7 deaths per 1,000 live births).

The people are known locally as I-Kiribati. The population structure is biased toward the younger age groups, with some 41 percent of the population aged less than 15, while just 3 percent are over the age of 64. Most Kiribati are ethnically Micronesian (78 percent). The population is mainly urban and more than two-thirds (65,000) live on Tarawa atoll.

OVERVIEW OF ECONOMY

The Gilbert Islands were granted self-rule by the United Kingdom in 1971 and complete independence in 1979 under a new name, Kiribati. The United States relinquished all claims to the sparsely inhabited Phoenix and Line Island groups in a 1979 treaty of friendship with Kiribati, thus giving the island nation its present geographic composition.

The economy of Kiribati is small, and growth prospects are limited by the nation's remote location, poor **infrastructure**, poor soil, unskilled **labor force**, and lack of natural resources. Marine resources offer the greatest potential for the development of an independent, sustainable economy. Interest earned from the phosphate reserve fund is the nation's main source of foreign exchange. Prior to independence, it was realized that the phosphate resources of Kiribati were limited, and instead of using the royalty revenues from phosphate mining for immediate expenditures, they were placed in a trust fund, the Revenue Equalization Reserve Fund (RERF). The interest income from the investment of this trust fund has



been available for expenditure by the Kiribati government since independence in 1979. Commercially viable phosphate deposits were exhausted by the time of independence. Other sources of foreign exchange include some commodity exports (copra [coconut meat], seaweed, and fish), licensing income from fishing, and **remittances** from Kiribati citizens working for international shipping lines. The financial sector is at an early stage of development, as are private initiatives in other sectors. Economic development is constrained by a shortage of skilled workers, weak infrastructure, and remoteness from international markets.

Kiribati has a modest income level that places it among the poorer countries in the world's lower middle-income group. The agricultural base, including subsistence production, is narrow and generated 14 percent of GDP in 1996. Copra is the only important **cash crop**, and commercial fishing (mainly tuna) is undertaken by the small fleet of the national fishing company. The agriculture sector (including fishing) is the occupation of the majority of the working population and accounted for 71 percent of employment in 1990, though most of this employment was self-employment on small family farms. The industrial sector contributed 7 percent of GDP in 1996 (of which manufacturing was 1 percent) and the services sector contributed 79 percent. The main service activity is the government sector, with trade and hotels accounting for 14 percent of GDP. Tourism remains underdeveloped, although it has the potential to become the second largest sector after fisheries. Kiribati's extremely limited export base and dependence on imports for almost all essential commodities result in a permanent (and widening) **trade deficit**, which is in most years only partially offset by revenues from fishing license fees, interest earned on the RERF, and remittances from Kiribati working overseas.

The government has earmarked Christmas and Fanning islands in the Line group and Canton Island in the Phoenix group as prime areas for future development. There is little open unemployment in the sense of people being unable to find some gainful employment if they so wish, and unemployment is estimated at around 2 percent of the workforce. However, there is evidence of **underemployment**, with the workforce engaged for perhaps only 30 percent of the hours that might be considered normal in a working week.

Foreign financial aid is a critical supplement to GDP, equal to 25 to 50 percent of GDP since independence in 1979. Initially the United Kingdom was the largest aid donor, but has now been overtaken by some of Kiribati's Pacific Ocean neighbors. Grants from principal donors amounted to an estimated US$20.7 million in 1998, of which US$5.7 million was from Japan, US$4.5 million from Australia, and US$4.3 million from New Zealand. The country is particularly reliant on foreign assistance for its development budget. Remittances from workers abroad account for more than US$5 million each year.

The government is involved in all aspects of the economy—its spending accounts for 71.5 percent of GDP—and it is taking measures to expand the **private sector** and develop the fledgling industrial sector. The poor performance of most public enterprises burdens the budget and adversely effects economic efficiency. Unfortunately, little progress has been made in implementing the government's Medium Term Strategy, which focuses on reducing the role of the **public sector** by freezing civil service recruitment, reducing government spending, improving the accountability of public enterprises, and introducing **privatization**.

The sale of fishing licenses to foreign fleets provides an important source of income. Revenues from the sale of fishing licenses amounted to more than half of GDP in 1998. Mining of phosphate rock on the island of Banaba (which ceased in 1979) formerly provided some 80 percent of earnings. As well as providing foreign exchange, interest from the phosphate reserve fund, RERF, continues to be an important source of budgetary income. The value of the fund was put at US$380 million at the end of 1998, and generates around US$20 million a year in revenues from interest.

POLITICS, GOVERNMENT, AND TAXATION

Kiribati is an independent republic and a member of the British Commonwealth. The president is head of state and chief executive, and leads a cabinet made up of a vice-president, attorney-general, and 8 ministers. The president appoints the ministers, while the president is elected nationally from several candidates nominated by the House of Assembly (Maneaba-ni-Maungatabu). The House of Assembly consists of 41 members, elected every 4 years. Local councils have considerable autonomy in the management of local affairs.

Kiribati is governed by a constitution adopted in 1979. The first general election since independence took place in March-April 1982. The current president is Teburoro Tito, who was first elected in 1994 and re-elected in November 1998.

The Kiribati government aims to improve the growth performance of the country by encouraging new businesses and attracting new foreign companies through designation of "pioneer status." Any company that wishes to establish a business in Kiribati may apply to the Internal Revenue Board for "pioneer status". This allows for a reduced company tax rate of 10 percent for 5 years with the exceptions of business operations on South Tarawa and Christmas Islands. In addition, the government hopes to encourage diversification of the economy and is introducing reforms (such as privatization) to improve the efficiency of the economy.

There is personal **income tax**, which is set at 25 percent of gross income for the first US$36,000 and at 35 percent for amounts in excess of this. Normal company tax is based on a flat rate of 25 percent of net profit for the first US$36,000 and 35 percent for amounts above this. Tax on dividends paid to overseas investors is 30 percent, except for dividends paid to an Australian resident, where the rate is 15 percent.

Because of the high population density on South Tarawa was giving rise to social and economic problems, it was announced in 1988 that nearly 5,000 inhabitants were to be resettled on outlying atolls, mainly in the Line Islands. A further resettlement program from South Tarawa to 5 islands in the Phoenix group was initiated in 1995. Another important issue is a 1989 UN report on the "greenhouse effect" (the heating of the earth's atmosphere, and a resultant rise in the sea-level), which listed Kiribati as one of the countries that would completely disappear beneath the sea in the 21st century unless drastic measures are taken. None of the land on the islands is more than 2 meters above sea level, making the country extremely vulnerable to the effects of climate change.

The current president, Teburoro Tito, declared that reducing Kiribati's dependence on foreign aid would be a major objective for his government. He also announced his intention to pursue civil and criminal action against members of the previous administration for alleged misuse of public funds while in office.

INFRASTRUCTURE, POWER, AND COMMUNICATIONS

The infrastructure of Kiribati is quite rudimentary. Whenever practicable, roads are built on all atolls, and connecting causeways between islets are also being built as funds and labor permit. A program to construct causeways between North and South Tarawa was completed in the mid-1990s. Kiribati has about 640 kilometers (398

SOURCE: CIA *World Factbook 2001* [Online].

miles) of roads that are suitable for motor vehicles. All-weather roads exist in Tarawa and Kiritimati. In 1998, there were some 2,000 motor vehicles registered in the islands, of which some 75 percent were motorcycles.

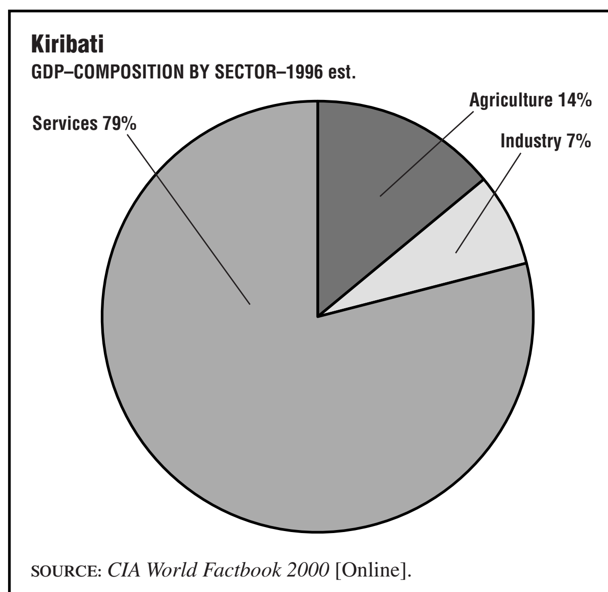
In early 1998, work began on a major project to rehabilitate the port terminal and facilities at Betio. Financing for the project, with expected completion by mid-2000, was funded by a grant from Japan of US$22 million. There is a small network of canals, totaling 5 kilometers (3.1 miles), in Line Islands as well as ports and harbors such as Banaba, Betio, English Harbor, and Kanton. There are 21 airports, 4 of them with paved runways. Only Tarawa and Christmas Island are served by international flights.

Electricity production and consumption was equal to 7 million kilowatt-hours (kWh) in 1998, 100 percent of which is produced from imported fossil fuels.

Kiribati has an earth satellite station, 1 Intelsat (Pacific Ocean). Kiribati is being linked to the Pacific Ocean Cooperative Telecommunications Network, which should improve the telephone service. In 1995, it was estimated that there were 2,600 main telephone lines in use. There is 1 short-wave radio station, 1 AM station, and 1 FM station broadcasting to 17,000 radios, according to 1997 estimates. There is 1 television broadcast station and 1,000 televisions.

ECONOMIC SECTORS

The majority of the population—an estimated 79 percent—depends on subsistence fishing and agriculture for its livelihood. Fishing and agriculture together contributed only 14 percent of GDP in 1996, however. The private sector of the economy is small, and there are few manufacturing activities. Industry contributed just 7 percent of GDP in 1996. Government services are the biggest portion of the services sector, which contributed a total of 79 percent of GDP in 1996. The country is heavily reliant on overseas aid for government administration, education, health, and the development of infrastructure. One of the government's main priorities is to reduce reliance on foreign aid through developing a more efficient economy.



SOURCE: *CIA World Factbook 2000* [Online].

AGRICULTURE

Agriculture (including fishing) employed 79 percent of the working population and contributed an estimated 14 percent of GDP in 1996. Much agricultural production goes to provide food for the families producing it. The major agricultural products are copra, taro, breadfruit, sweet potatoes, and vegetables; fishing is another major source of food for I-Kiribati. The principal cash crop is coconuts yielding copra, which accounted for an estimated 60 percent of merchandise export earnings in 1998. Bananas, screw-pine, breadfruit (a round seedless fruit from the mulberry family whose texture resembles bread when cooked), and papaya are also cultivated as food crops. Seaweed provided an estimated 8 percent of domestic export earnings in 1998. Pigs, chickens, and cattle are the most common agricultural livestock. Most of the land is farmed, and agriculture accounts for 51 percent of land-usage.

Average annual rainfall varies greatly, from 3,000 millimeters (118 inches) in the northern islands to 1,500 millimeters (59 inches) in Tarawa and 700 millimeters (28 inches) in the Line Islands, but the rains are reliable and sufficient to provide stable agricultural conditions.

The closure of the state fishing company was announced in 1991, as a result of a dramatic decline in the fish catch. Fish provided only 2 percent of export earnings in 1996 (compared with 32 percent in 1990). However, earnings from exports of fish had recovered to an estimated 12 percent of domestic export earnings by 1998. Agricultural GDP grew at an average annual rate of 4.1 percent in 1990–98, comfortably faster than the rate of increase of the population. Kiribati allows other nations such as South Korea, Japan, Taiwan, and the United States to fish in its territorial waters in exchange for license fees that amounted to US$28.3 million in 1998.

INDUSTRY

Industry (including manufacturing, construction, and power) contributed an estimated 7 percent of GDP in 1996. Industrial GDP increased by an average of 4.2 percent per year in the period 1990–98. Kiribati's industry is quite limited and mainly consists of fishing processing and handicrafts for tourists and for export.

SERVICES

Services provided 79 percent of GDP in 1996. The GDP of the services sector increased at an annual average rate of 4.2 percent between 1990 and 1998. Tourism makes a significant contribution to the economy, with the trade and hotels sector providing an estimated 15 percent of GDP in 1998. Between 3,000 and 4,000 visitors per year provide US$5 to US$10 million in revenues. Attractions include World War II battle sites, game fishing, **ecotourism**, and the Millennium Islands, situated just inside the International Date Line and the first place on earth to celebrate each New Year.

The financial sector is heavily reliant on 1 commercial bank, the Bank of Kiribati. Modern expertise is provided by the majority shareholder, the Westpac Banking Corporation of Australia, which owns 51 percent, while the government of Kiribati owns 49 percent. The bank has 3 branches and provides checking and savings accounts, makes loans to individuals and businesses, provides financial facilities for international trade (such as letters of credit), and undertakes foreign exchange dealings. However, the bank provides no credit card facilities. The only other bank is the Kiribati Development Bank, which lends to small-scale businesses.

The **retail** sector consists mainly of small outlets, with a few supermarkets and department stores, mostly owned by Australian companies, in the capital, Tarawa.

INTERNATIONAL TRADE

As a result of its small size and its negligible manufacturing sector, Kiribati relies heavily upon products produced in other countries. The main imports include foodstuffs, machinery and equipment, miscellaneous manufactured goods, and fuel. The main exports of Kiribati are copra (62 percent of the total), seaweed, and fish. Kiribati's main export destinations are the United States, Australia, and New Zealand, while the main origins of imports are Australia (46 percent), Fiji, Japan, New Zealand, and the United States. In 1998, the country had exports of US$6 million and imports of US$37 million.

MONEY

The Australian dollar (A$) is the legal currency of Kiribati. The value of the A$ fluctuates against the value of other world currencies. The Bank of Kiribati is responsible for the majority of the available financial services. In December 1997, its total assets amounted to US$26.1 million, of which deposits were US$23.3 million and reserves amounted to US$0.9 million. The Development Bank of Kiribati identifies, promotes, and finances small-scale projects, and its capital amounts to US$1.33 million. There is also a network of small-scale lending agencies known as "village banks" operating throughout the islands.

1996	1.2773

SOURCE: CIA *World Factbook 2001* [ONLINE].

POVERTY AND WEALTH

Only 2 percent of the working population is registered as unemployed, and poverty (as defined by the US$1 a day poverty line) is virtually unknown. Using the **purchasing power parity** conversion (which takes into account the low prices of many basic commodities in Kiribati, and which is the best indication of living standards) annual income per capita was US$860 in 1999 (in the United States, by way of comparison, it was US$33,900).

Education is free and compulsory for children between the ages of 6 and 15. Every atoll is provided with at least 1 primary school. The adult literacy rate was estimated at 90 percent in 1993–95. There are about 200 seamen trained each year by the Marine Training Center for employment by overseas shipping companies. In 1998, education was allocated US$7.8 million (22.5 percent of total budgetary expenditures).

The government maintains a free medical service. Each atoll has a dispensary, with a medical assistant in charge. In 1982, Kiribati had 34 government-controlled hospital establishments, with a total of 308 hospital beds. Life expectancy is 60 years (in the United States, by way

of comparison, it is 76). In 1999, a major public health project, involving the improvement of water supply and sanitation, was undertaken with a loan of some US$10 million from the Asian Development Bank.

WORKING CONDITIONS

The society of Kiribati is egalitarian, democratic, and respectful of human rights. There have been no reports of human rights abuses. However, in the traditional culture, women occupy a subordinate role and have limited job opportunities.

The Kiribati Trades Union Congress (KTUC) was formed in 1998 and includes 2,500 members affiliated with other unions, of which the most important are the Fishermen's Union, the Seamen's Union, and the Teachers' Union. Workers are free to organize unions and choose their own representatives. The government does not control or restrict unions. More than 80 percent of the workforce is occupied in fishing or **subsistence farming**, but the small wage sector has a relatively strong and effective trade union movement.

The Constitution prohibits forced or compulsory labor, and it is not practiced. The prohibition does not specifically mention children, but the practice of forced and bonded labor by children does not occur. The law prohibits the employment of children under the age of 14. Children through the age of 15 are prohibited from industrial employment and employment aboard ships. Women may not work at night except under specified circumstances. Labor officers from the Ministry of Commerce, Industry, and Employment normally enforce these laws effectively, given the rudimentary conditions of the economy and its industrial relations system.

The government has taken no concrete action to implement longstanding legislation authorizing the establishment of minimum wages. There is no legislatively prescribed length to the working week. The government is the major employer in the cash economy. Employment laws provide rudimentary health and safety standards for the workplace. Employers must, for example, provide an adequate supply of clean water for workers and ensure the existence of sanitary toilet facilities. Employers are liable for the expenses of workers injured on the job. The government's ability to enforce employment laws is hampered by a lack of qualified personnel.

COUNTRY HISTORY AND ECONOMIC DEVELOPMENT

0–100 A.D. Kiribati begins to be settled by Austronesian-speaking peoples.

1300. Fijians and Tongans arrive during the 14th century and subsequently merge with the already established groups to form the traditional I-Kiribati Micronesian society and culture.

1837. First British settlers arrive.

1892. British protectorate is established.

1915–16. Gilbert and Ellice Islands become a Crown Colony of Great Britain.

1919. Kiritimati (Christmas) Atoll becomes a part of the Crown Colony.

1937. Phoenix Islands becomes a part of the Crown Colony.

1941–45. Tarawa and other islands of the Gilbert group occupied by Japan during World War II. Tarawa is the site of one of the bloodiest battles in U.S. Marine Corps history when Marines land in November 1943 to dislodge Japanese defenders.

1975. The Gilbert Islands and Ellice Islands separate and the Ellice Islands are granted internal self-government (as Tuvalu) by Britain.

1979. Kiribati becomes independent on 12 July.

1995. Kiribati unilaterally moves the international date line to the east, so that all of Kiribati's islands are in the same date zone.

1999. Kiribati gains United Nations membership.

FUTURE TRENDS

Kiribati's economic prospects are limited by its small size in terms of both geographical area and population, its remote location, and the absence of any valuable mineral resources now that the phosphate deposits are exhausted. The population size not only means that there is not a domestic market of sufficient size to support any serious manufacturing, but that there is limited provision of services. There is only 1 bank, and as a **monopoly**, its services will tend to be expensive and the range of services limited.

On the positive side, Kiribati has a tropical location with good facilities for an expansion of tourism. Moreover, the marine fishing resources are excellent and can provide for expanded local production and employment and even be the basis of some manufacturing, such as fish processing and canning. Finally, the national revenue from the phosphate fund remains a vital, and secure, source of foreign exchange.

However, to make the most of its tourism and fishing grounds, it is important that Kiribati attract foreign investment into these sectors. The fishing is large-scale and requires expensive fishing fleets together with equipment and installations for storage. Tourism needs high-quality hotels and international marketing. The current

development plan recognizes these needs, but it remains to be seen how successful Kiribati will be in implementing the plan. A recent initiative is the agreement to lease land on Christmas Island to the Japanese National Space Agency, who will build a space shuttle launch facility there. Under the arrangement Kiribati will be paid just under $1 million a year in leasing fees. A research project is under way to use coconut oil to power internal combustion engines for electricity generation, and this may well contribute to energy self-sufficiency, as will the expansion of solar power on the outlying islands.

Overall, Kiribati can be expected to maintain its lower middle-income status in the immediate future, but its long-term growth prospects depend on its ability to expand tourism and undertake more of the exploitation of its fishing grounds rather than licensing foreign fleets.

DEPENDENCIES

Kiribati has no territories or colonies.

INTRODUCTION TO WORLD CURRENCY

The following insert contains color photographs of paper currency from around the world. Where possible, the most recent issue and lowest denomination was selected to show the bank notes of the countries represented in this encyclopedia. As of the year 2002, approximately 169 countries issued their own paper money.

Bank notes are more than a measuring system for value to be used as payment for goods and services. In many instances a banknote is a graphic reflection of a country's history, politics, economy, environment, and its people. For example, many bank notes depict plant life such as flowers and trees, as well as birds and other animals native to that geographic region. The 5-lats note of Latvia has a giant oak tree on the front, while the 25-rupee note of Seychelles and the 5-guilder note of Suriname both show flowers from the homeland. Birds adorn notes from São Tomé and Príncipe, Papua New Guinea, and Zambia. Large animals such as the mountain gorillas on the 500-franc note from Rwanda, the white rhinoceros on the 10-rand note from South Africa, and the bull elephant on the 500-shilling note of Uganda are commonplace.

Famous rulers and political figures from history are prevalent. Sir Henry Parkes, a famous 19th-century statesman, graces the front of the 5-dollar note from Australia; and Canada's Sir John Alexander MacDonald, a noted Canadian prime minister from the same time period, appears on the front of the 10-dollar Canadian note. Mieszko I, a medieval prince credited with being the founder of Poland in 966, is on the 10-zloty note from that country. Bank notes also reflect the power of more contemporary rulers, as exemplified by the image of Iraq's current president, Saddam Hussein, on that country's 50-dinar note, issued in 1994. Malaysia's paramount ruler and first chief of state, Tunku Abdul Rahman, is on the front of that country's 1-ringgit note and all notes of all denominations issued since 1967.

Architectural vignettes are common on world notes. Islamic mosques with minarets can be found on the 5000-afghani note from Afghanistan, as well as the 25-piaster note from Egypt, indicating the prevalent Islamic religious influence in those 2 countries. The 5-pound 1994 regular issue note from Ireland shows the famous Mater Misericordiae Hospital in Ireland, where Sister Catherine McAuley, founder of the Sisters of Mercy religious order, served in the area of health care. The depiction of religious figures is common on European notes. Examples include St. Agnes of Bohemia on the 50-koruna note of the Czech Republic, St. John of Rila on the 1-lev note of Bulgaria, and the Archangel Gabriel on the 50-denar note of Macedonia.

Artists, authors, scientists, and musicians are also honored on many bank notes. James Ensor (1860–1949), an innovative painter and etcher, is shown on the 100-franc note from Belgium, while Baroness Karen Blixen (pen name Isak Dinesen), the famed Danish author of *Out of Africa* is found on the 50-krone note of Denmark.

Several notes commemorate the new millenium, significant local events, or anniversaries. The front of the 2000-leu commemorative note from Romania has an imaginative reproduction of the solar system as a reference to the total solar eclipse of 11 August 1999. Another example of a commemorative note is the 200-rupee note from Sri Lanka. The note was issued 4 February 1998 to commemorate the 50th anniversary of independence as a self-governing Dominion of the British Commonwealth.

As of 2002, 15 countries did not issue or use their own paper currency, but allowed the bank notes of neighboring countries as well as U.S. currency to circulate freely in their local economies. Many of these countries are relatively small in size with economies to match. Countries such as San Marino, Monaco, Liechtenstein, and Vatican City are tourist-oriented and do not see a need to issue their own homeland currency. Five of these fifteen countries—namely Marshall Islands, Micronesia, Palau, Panama, and Puerto Rico—all use the U.S. dollar as their monetary unit of exchange. As of March 2001, Ecuador and El Salvador had joined the above-mentioned countries in adopting the U.S. dollar. Countries struggling with hyperinflation (uncontrolled inflation marked by the sharp devaluation of the homeland currency) may choose to use the U.S. dollar in place of their own currencies in an attempt to stabilize their economy by linking it directly to the strength and stability of the

U.S. economy. Countries that use U.S. dollars in conjunction with sound economic policies can usually expect to control and/or minimize inflation. The complete adoption of the U.S. currency has been more successful than the practice of pegging the value of local currency to the U.S. dollar according to a fixed ratio, an approach attempted recently by Argentina to disastrous effect. Even those countries that have not completely adopted the U.S. dollar as their currency often have economies operating freely with both their own national and the U.S. currencies. The strength of the U.S. dollar has also made it the currency of choice in the global black market.

Another trend that will probably continue into the future is the joining together of several neighboring countries to form a central bank issuing a common currency. The primary objective of these economic and monetary unions is to eliminate obstacles to free trade, creating a single unified marketplace. This grouping together tends to strengthen the economy and currency of the member countries as well as providing a cost savings in currency production. While such economic partnerships have occurred throughout history, more recent examples began in the early 1950s with the union of the East Caribbean States, followed by the Central African States, French Pacific Territories, and West African States. The most recent and highly publicized example is the European Monetary Union (EMU), composed of 12 European member countries—namely Austria, Belgium, Finland, France, Germany, Greece, Ireland, Italy, Luxembourg, the Netherlands, Portugal, and Spain. On 1 January 2002, the EMU, through its newly formed central bank, replaced the participating countries' homeland currencies with a new common currency called the *euro*. An example of the 10-euro note is shown on the following currency insert pages. Those countries that had pegged their currencies to an EU member's currency prior to the euro's adoption (as several Francophone countries in Africa did with the French franc) now peg their currency to the euro.

It should be mentioned that, in contrast to this recurring trend of country unification for economic and monetary purposes, there are several countries with isolationist governments that have done just the opposite in order to limit the influence of the international community on their economies and populations. For example, Iraq and Syria have made it illegal to use or export their currency outside of their homelands. Several other nations embraced this isolationist attitude through the use of trade voucher and tourist certificates in place of currency, thus keeping their national circulating bank notes from being used or exported by visitors to their country. China, Bulgaria, and Poland are examples of countries that issued what they termed "foreign exchange certificates" for this specific purpose. However, this practice has largely been discontinued, with the exception of Cuba, which still uses a similar certificate first issued in the mid-1980s.

So what does the future have in store for the economies of the world? Trends indicate most countries in the world want free, open, and balanced trade with a strong, stable, and growing economy, free of hyperinflation. More countries are achieving this goal by unifying in regional economic partnerships such as the European Union, or by clearing the barriers to free trade through agreements such as NAFTA (North American Free Trade Agreement). As the use of the U.S. dollar increases throughout the Americas, some economists predict that this region will follow in the footsteps of Europe in terms of establishing a common currency under a central bank. The Asian and Middle-Eastern regions are also likely candidates for similar regional economic partnerships given the prevalence of established trade agreements already in existence among those countries. As the globalization of trade necessitates closer economic ties between countries, it is not inconceivable that a single central bank and common currency will eventually unite the countries of the world. While that development is still only a remote possibility at this point, there is little doubt that nations' increased dependence on international trade for economic prosperity will promote a currency policy conducive to closer trade ties and cross-border partnerships.

KOREA, NORTH

Democratic People's Republic of Korea
Choson Minjujuui Inmin Konghwa-guk

CAPITAL: P'yongyang.

MONETARY UNIT: North Korean won (KPW). One won equals 100 ch'on (or jeon). There are coins of 1, 5, 10, and 50 ch'on. There are notes of 1, 5, 10, 50, and 100 won.

CHIEF EXPORTS: Minerals, metallurgical products, manufactures (including armaments), agricultural, fishery products.

CHIEF IMPORTS: Petroleum, coal, machinery and equipment, consumer goods, grain.

GROSS DOMESTIC PRODUCT: US$22 billion (purchasing power parity, 2000 est.).

BALANCE OF TRADE: **Exports:** US$520 million (f.o.b., 2000). **Imports:** US$960 million (c.i.f., 2000).

COUNTRY OVERVIEW

LOCATION AND SIZE. North Korea is in eastern Asia and occupies the northern half of the Korean Peninsula. It borders China to the north, Russia to the far northeast, the Sea of Japan to the east, South Korea to the south, and the Korean Bay and Yellow Sea to the west. The country covers an area of 120,549 square kilometers (46,543 square miles), making it slightly smaller than the state of Mississippi. It has 1,673 kilometers (1,039 miles) of land borders and 2,495 kilometers (1,550 miles) of coastline. The capital city, P'yongyang, is situated in the western part of the country, while the other major cities of Hungnam, Ch'ongjin, and Namp'o are in the east, northeast, and west, respectively.

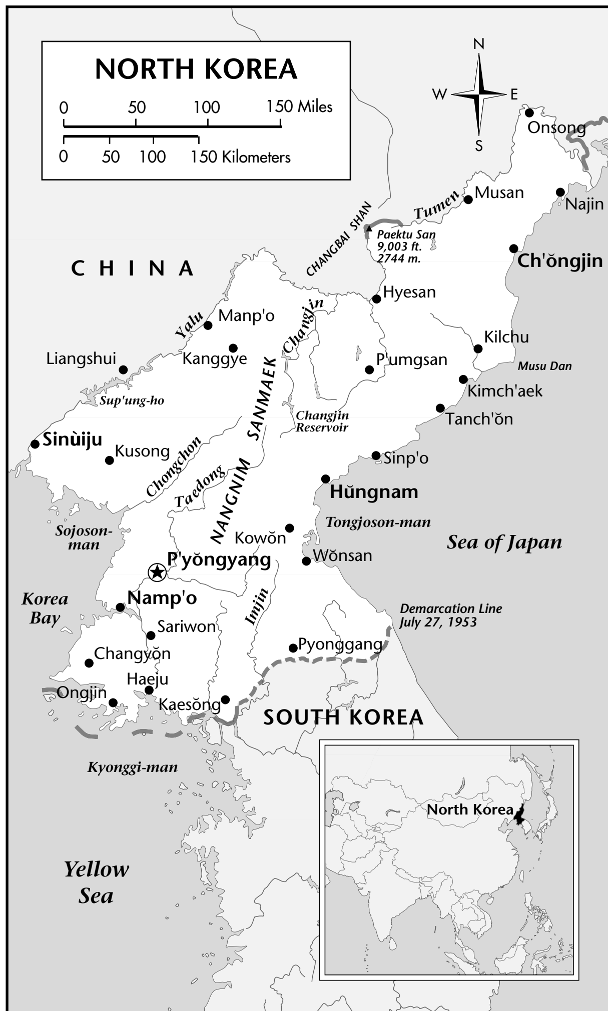
POPULATION. Data on North Korea's population is scarce and unreliable. Because of serious famine in the late 1990s, it is thought that between a half million and 3 million North Koreans may have died of hunger and about 100,000 might have fled to China in search of food. In July 2000 the population was estimated at 21,687,550, with a growth rate of about 1.35 percent. The birth rate in 2000 was 20.43 births per 1,000 population and the death rate 6.88 deaths per 1,000 population.

The population is ethnically homogenous, consisting primarily of ethnic Koreans plus small communities of Chinese and Japanese. About 68 percent of the people are aged between 15 and 64 years and 6 percent over 65 years. The literacy rate, estimated at 99 percent in 1990, is high. The majority of North Koreans (about 70 percent in 1993) live in urban areas. Based on 1987 statistics, P'yongyang is the largest city with a population of 2,355,000, followed by Hungnam (701,000), Ch'ongjin (520,000), and Namp'o (370,000).

Most of the population follows the Buddhist faith. There are a handful of Christians, but freedom of religion is illusory, religious practice—like all else in North Korea—being manipulated and controlled by the state.

OVERVIEW OF ECONOMY

The crippled economy of North Korea is the direct product of its political system, a **communist** dictatorship. Severe economic problems are the legacy of years of Soviet-style development and controls that have ceased to function efficiently in a free market oriented world. Korea was annexed by Japan in 1910. In 1945, at the end of World War II when the Japanese surrendered to the Western allies, Korea was divided into North and South under the control of the Soviet Union and United States, respectively. The division, marked at the 38th parallel, was made permanent in 1948. North Korea, under the dictatorship of President Kim Il Sung, emerged as an autocratic, state-controlled nation. Despite the establishment of an extensive **infrastructure** and the introduction of mechanized agriculture, the government's emphasis on heavy industry at the expense of light manufacturing, service, and agriculture, and the isolationist nature of the regime, have cost the country dearly. North Korea has accumulated many economic problems, experiencing years of negative growth in its **gross domestic product**



(GDP), which sank to -6.3 percent in 1997. The economy improved in 1999 and 2000 thanks to extensive foreign aid and better agricultural performance, but the reported growth rate of 6.2 percent for 1999 seems unrealistic. The estimated growth rate in 2000 was a more realistic -3.0 percent. Production in 1999 was 75 percent of the 1989 level.

The North Korean economy remains in decline, and the country is unable to meet its basic needs in food and **consumer goods**. It produces little for export, and its international isolation has limited its opportunities for trade or financial assistance, resulting in a **trade deficit** of US$440 million in 2000 and a growing dependency on foreign aid. High expenditures on defense (estimated at between 25 and 33 percent of GDP in 1998) has worsened the situation, while floods and drought between 1995 and 1997 devastated the country's agriculture and led to famine.

North Korea established its economy with assistance from the major communist powers, the Soviet Union and China. Until 1991, both regimes provided assistance in funds, equipment, training, and technology, enabling North Korea to advance more rapidly than South Korea during the 1970s. The government has also received loans from Japan, France, West Germany, Sweden, and Austria. By 1997, the country's **foreign debt** amounted to US$11.9 billion, of which US$7.4 billion was owed to China and Russia. Although hampered by financial problems in paying its debts, the government has refused to pay back loans even when it has been able to do so. It has acquired poor status in the international community, depriving the country of foreign loans. This is a serious situation for a country that requires substantial investment to modernize and expand its crumbling infrastructure, heavy industry, agriculture, light industry, and services.

The deteriorating economy has inclined the North Korean leadership to consider shifting to the Chinese model of **socialism**, which leaves room for a degree of free enterprise (though not a corresponding political and social openness). In 2000 President Kim Jong Il (who replaced his father upon his death in 1994) indicated a shift, reflecting constitutional revisions made in 1998. These revisions allow increased scope for private property ownership and the establishment of farmers' markets. By tolerating the expansion of these markets and increasing trade with China, North Korea's government has sanctioned the creation of a **private sector**. With its politically conciliatory hosting of official visits from South Korean President Kim Dae-jung and U.S. Secretary of State Madeline Albright to P'yongyang in 2000, North Korea hoped to create ties that would help in **restructuring** its economy. South Korea has offered to rebuild infrastructure in the North and to invest in its economy.

POLITICS, GOVERNMENT, AND TAXATION

The Korean Workers' Party (KWP) has dominated the North Korean political system since 1948. As a communist party opposed to free enterprise, it controls the economy with little room for private initiative. The state is the country's only economic actor, its only economic planner, and its sole employer. The suppression of any form of political dissent has not allowed opposition parties to advance an alternative economic model.

The constitution, created in 1948 and revised in 1972, 1992, and 1998, calls for a single legislative body called the Supreme People's Assembly, with 687 seats. Though Assembly members are "elected," in fact the KWP supplies a single list of candidates who are elected without opposition. The Assembly members similarly elect the premier, but true executive power lies with the president, Kim Jong Il. There is also a judicial branch whose members are selected by the Supreme People's Assembly.

The state's ideology and autocracy are responsible for North Korea's economic problems. The North Korean economy proved unstable because it relied on outside financing and socialist ideology, rather than private enterprise. In the absence of a viable private sector, the economy was forced to survive on foreign assistance and trade with the Soviet Union. The Soviet collapse in 1991 brought an end to its aid to North Korea. China's ideological "betrayal" of North Korea in establishing ties with South Korea in 1992 also deprived the North of much financial support. The North Korean government has since then found itself unable to solve its economic problems on its own. Despite the massive national deficit, the country spends vast sums of money (estimated at between US$3.7 and US$4.9 billion in 1998) on the armed services, maintaining one of the world's largest armies while requiring international food aid for the survival of its starving population.

Taxes and exports are the main sources of government revenues. In 1996 taxes accounted for 83 percent of revenue and exports for about 9 percent (US$9.4 billion). Additional funds come from the association of pro-P'yongyang Koreans residing in Japan, known as Chongryun, but the exact amount of their contribution is unknown. Income from rights leased to Japanese fishing boats operating in North Korean waters is another source of money. Allegations have been levied against the North Korean government about earning income from counterfeit money, heroin trafficking, and smuggling used cars.

INFRASTRUCTURE, POWER, AND COMMUNICATIONS

Although North Korea's infrastructure is extensive, it is crumbling and in need of expansion and modernization. The country's road system, estimated at 20,000 to 31,200 kilometers (between 12,400 and 19,344 miles), is limited and unpaved. Private cars are scarce and the number of trucks is limited. The 5,000-kilometer (3,100-mile) railway network, originally built by the Japanese, provides 70 percent of passenger transport and carries about 90 percent of the annual freight traffic.

Most of the country's ports and airports need modernization. Of North Korea's 12 ports, only a few can handle large ships, while only 22 of its 49 airports have paved runways. P'yongyang's Sunan airport operates 20 weekly flights, servicing only 6 destinations.

North Korea suffers from a shortage of oil and gas. The oil shortage came after the country was deprived of its access to low-priced Soviet oil and saw a significant decrease in oil shipments from China. The country produces electricity from fossil fuel (34.4 percent) and hydroelectric power generators (65.6 percent). Over the next several years, North Korea will approve funds to construct over 100 new power generating plants. The state-owned oil and gas facilities are being **privatized** and provide excellent opportunities for investment. In 1999 it was estimated that the country produced 28.6 billion kilowatt-hours (kWh) of electricity.

The telecommunication system is undeveloped. In 1995 there were 1.1 million telephone lines in use. Based on 1998 statistics, North Korea has 12 radio stations (AM, FM and short wave) and 38 television stations. There are 3.36 million radios and 1.2 million television sets in use. The country has 1 Internet service provider and no cellular telephone system.

ECONOMIC SECTORS

North Korea's economy is in ruins. The disintegration of the Soviet Union, government mismanagement, and natural disasters have been partly responsible for the poor performance of the country's economic sectors. Industry is the dominant sector but is unable to generate revenue, jobs, and consumer goods to meet the country's demands. While agriculture is mechanized, the equipment is outmoded and fertilizers are in short supply. The service sector is both limited and underdeveloped. The overhaul and development of these sectors is essential for

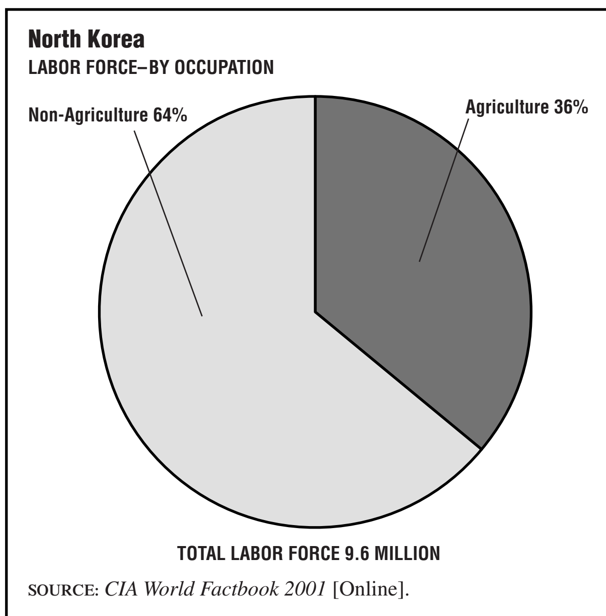
recovery and growth, as is the adoption of a new economic model.

AGRICULTURE

Despite the occurrence of drought in late spring, often followed by floods, the North Korean climate is temperate. Only 14 percent of the land is arable, however. North Korea has never been agriculturally self-sufficient. Agriculture is nevertheless a major contributor to the economy. In 1999, the sector accounted for 30 percent of GDP and employed 36 percent of the workforce (3.5 million workers). Rice, corn, potatoes, soybeans, pulses, eggs, and pork make up the bulk of agricultural production.



SOURCE: *CIA World Factbook 2001* [Online].

North Korea's agriculture was collectivized in the 1950s and was fairly successful until the early 1990s. Modern techniques more than doubled the total harvest from 3.85 million tons in 1966 to 8.47 million tons in 1984. However, the sector's annual growth rate fell from 2.8 percent in 1991 to 1.5 percent in 1995. A misguided emphasis on rice and maize production led to over-cultivation and exhausted the soil. Ill-conceived terracing, a shortage of fertilizers, floods, and a drought contributed to a steep decline in yield during the 1990s, leading to widespread famine and deaths. Massive foreign aid halted the death rate and helped increase the land under cultivation in 1998 and 1999. Crop production rose to 4.62 million tons in 1999, but remained 1.1 million tons short of the minimum needed. The country survived on foreign assistance, which included 550,000 tons of rice from Japan in 2000.

North Korea needs large investments for the revival of its agriculture. Recent initiatives include aid from the **United Nations Development Program** for Agricultural Recovery and Environmental Protection, and the expansion of farmers' markets, which might stimulate growth by creating financial incentives for farmers. However, these measures still fall short of what is required.

There is little data on 2 important contributors to the North Korean economy: forestry and fishing. Such data as there is suggests that these activities are sufficient to satisfy domestic demand for lumber and fish and to supply exports. Fish products are exported to Japan and lumber to Russia. However, North Korea's annual catch declined in 2000 when fuel shortages grounded much of its fishing fleet.

INDUSTRY

Accounting for 42 percent of GDP in 1999, industry is the largest sector of the North Korean economy. Along with services, it employs 64 percent of the North Korean workforce.

MINING. North Korea has significant mineral resources, including the world's largest deposits of magnesite. However, the rest of its resources (brown and lignite coal, iron ore, cement, copper, lead, zinc, gold, tungsten, graphite, salt, and silver) are not sizeable enough to make the country a major world producer, though it may be able to engage in some production should these sectors receive some investment. Precious and non-ferrous metals are the country's most important exports. Aging equipment and flood damage in the mid-1990s led to a fall in North Korea's mineral output. Mining recorded negative growth between 1991 (-6.8 percent) and 1995 (-2.3 percent), when its share of GDP was 8 percent. As with other in-

dustries, only significant investment will allow the mining industry to become a vital source of economic growth.

MANUFACTURING. Manufacturing is the largest contributor to North Korea's GDP, accounting for the bulk of industry's share of GDP. Manufacturing produces metallurgical products, armaments, and textiles for export to China, Japan, South Korea, Germany, and Russia. North Korea's heavy industrial base was developed originally by the Japanese and later expanded by the Soviets. However, while the country expanded heavy industry and the production of military hardware, little was invested in light industry or the manufacture of consumer goods. The heavy dependency on the Soviet Union for financing, technology, equipment, spare parts, and energy caused a major decline in manufacturing once the Soviet Union ceased to be a source of assistance. Many industrial units work at a fraction of their original output following the cut in Soviet aid in 1991.

The country's manufacturing facilities need modernization and the expansion of its light and consumer industries. An improved relationship between North and South Korea has brought the North limited investment by 2 South Korean companies, Samsung and LG, who manufacture electronics in North Korea. These companies take advantage of the country's low labor costs. The South Korea-based car company Hyundai has also been negotiating with the North Koreans about the possible creation of an export-oriented industrial complex.

CONSTRUCTION. The construction industry has also suffered from the country's economic decline. Since the 1990s, a decline in industrial construction, housing, and building of infrastructure has reduced activity in the sector. The construction industry's share of GDP fell from 9.1 percent in 1992 to 6.1 percent in 1999.

SERVICES

Services are the least developed sector in the North Korean economy, contributing just 28 percent of GDP in 1999. There is no precise record of employment figures for the services sector, but the little available evidence indicates that only a small percentage of the **labor force** is involved.

TOURISM. Since the 1990s, some tourists have begun to visit North Korea from Taiwan, Singapore, and the West. The country's scenic landscape and mountains offer much potential for the growth of tourism. The government built new hotels in the 1990s, and there is a casino for the use of foreigners, which accepts **hard currencies** only. Improved relations between the 2 Koreas have made short trips to the North possible for tourists from South Korea. The South Korean Hyundai company took a total of 80,000 South Koreans to Mount Kumgang between November 1998 and June 1999, but the South Korean government suspended such trips after a South Korean tourist was arrested on spy charges. North Korea claims that the number of tourists doubled in 2000 compared to 1999, but no actual figures are available for either year.

RETAIL. The **retail** sector is also state-dominated, although there is now a little room for limited private initiatives. The sector consists of state-run stores and direct factory outlets for average citizens, farmers' markets, and special shops for the elite where luxury products are sold. There is a chain of hard-currency stores in large cities that were established as a **joint venture** between the state and the Chongryun. As a general rule, the range of consumer goods is limited and their quality is low.

FINANCIAL SERVICES. North Korea's financial sector is state-dominated. Two state banks control the entire industry: the Central Bank of North Korea, which has 227 local branches, and Changgwang Credit Bank, with 172 branches. The Foreign Trade Bank handles most international trade affairs. Two state companies, the State Insurance Bureau and the Korea Foreign Insurance Company, **monopolize** the insurance industry.

INTERNATIONAL TRADE

North Korea's international trade is characterized by its ongoing deficit, which varied from US$570 million in 1995, US$320 million in 1998, and US$440 million in 1999. This chronic disparity between import expenditure and export income reflects the low level of the country's exportable products as well as its international isolation, which limits the number of its trade partners. The loss of large-scale trade with Russia in 1991 was a blow that worsened the trade deficit. Soviet-North Korean trade dropped from US$2.7 billion in 1990 to US$100 million in 1999. The loss increased North Korea's growing foreign debt.

North Korea exports minerals, metallurgical products, manufactures, armaments, timbers, and fish products, and imports energy products, grain, machinery, equipment, and consumer goods. Its 2 largest trading partners are China and Japan, with South Korea, Germany, and Russia making up its other markets. In 1995, Japan purchased 28 percent of North Korea's exports, followed by South Korea (21 percent), China (5 percent), Germany (4 percent), and Russia (1 percent.) The largest suppliers of imports to North Korea were China (33 percent), Japan (17 percent), Russia (5 percent), South Korea (4 percent), and Germany (3 percent).

Better relations between North and South Korea might well turn the South into the North's largest trading partner. Inter-Korean trade increased by 24 percent during the first 5 months of 2000, with more than a third of this sum contributed in aid from South Korea.

MONEY

North Korea used to have multiple **exchange rates**, but now has a single, fixed rate set by the Central Bank of North Korea. A free-**floating exchange rate**, determined by supply and demand, exists in the Rajin-Sonbong Free Economic and Trade Zone only (a zone in the north of Korea in which state control has been relaxed and free-market interactions flourish). This rate, and that of the **black market**, reveal the lack of worth of the North Korean currency. In 1999, floating and black market rates revealed an exchange rate of 200 won to US$1, while the official rate was 2.20 won to US$1. The economic upheavals of the 1990s had no impact on the official fixed rate, which has been kept just higher than 2 won against the U.S. dollar since 1989. The artificial rate and the low value of the North Korean won on the open market have made it very difficult for the country to trade with most modernized economies. North Koreans and foreigners are subject to exchange restrictions, with certain exceptions in the Rajin-Sonbong zone.

GDP per Capita (US$)

Country	1996	1997	1998	1999	2000
North Korea	900	900	1,000	1,000	1,000
United States	28,600	30,200	31,500	33,900	36,200
Japan	22,700	24,500	23,100	23,400	24,900
South Korea	14,200	13,700	12,600	13,300	16,100

Note: Data are estimates.

SOURCE: *Handbook of the Nations*, 17th, 18th, 19th and 20th editions for 1996, 1997, 1998 and 1999 data; CIA *World Factbook 2001* [Online] for 2000 data.

POVERTY AND WEALTH

Neither extreme poverty nor wealth exists in North Korea, though in general the inhabitants live under conditions that do not match those of people in more modern countries, including their prosperous neighbors in South Korea. The government is committed to providing necessities to every person, but the ruling elite enjoys a more prosperous life than the general population. They are entitled to privileges such as quality housing, access to select shops with quality imported goods, and foreign travel.

Until the famine of 1995, North Korea's education, health-care, and nutrition systems were thought to operate efficiently. Education is free and compulsory to age 15, which may explain the 99 percent literacy rate. A kindergarten system is available to all children. Higher education is serviced by over 200 institutions, which specialize in science and technology. In 1998 college graduates made up 13.7 percent of the adult population, compared to 9.2 percent in South Korea. Health care is free in North Korea. The health system provides a large number of hospitals and clinics staffed by skilled professionals.

The natural disasters of the late 1990s caused phenomenal human casualties, however. Although little information is available about survivors in the affected areas, the worsening economic situation and famine have lowered the living standard of the entire population. Attendance has fallen at all educational institutions, and there have been reports of severe shortages of medicines and equipment. Malnutrition among children has been increasing since 1995. A system of food rationing designed to provide an adequate diet collapsed in various parts of the country during the late 1990s. In 1998 about 16 percent of children were malnourished, and another 62 percent suffered from illnesses related to undernourishment.

WORKING CONDITIONS

Although North Korea has labor laws, it is not a member of the International Labor Organization. All working-age North Koreans are expected to work for the good of the nation. Women have equal rights, and are well represented in the workforce, except at senior party or government levels. Forced labor is not prohibited and is often used as punishment for political offenses; in addition, people are often mobilized for construction projects. Child labor for children under the age of 16 is prohibited, but school children are sent for short periods to factories or farms to help production. The law provides for an 8-hour working day, but some reports claim that the hours are longer.

The country's union, the General Federation of Trade Unions of Korea, is run by the state. It encourages workers to meet production goals and also provides health, education, cultural, and welfare services to its members. Workers do not have the right to organize, bargain collectively, or strike. The formation of independent unions is prohibited.

The government sets wages and assigns all jobs. Besides free medical care and education, it provides other benefits such as subsidized housing. No data exists on the minimum wage paid by the state-owned enterprises, but it fluctuates between US$80 and US$110 per month in North Korea's free economic zone, and in foreign-owned businesses and joint ventures.

COUNTRY HISTORY AND ECONOMIC DEVELOPMENT

1910. Japan annexes Korea following wars on the Asian continent with China and Russia, ruling Korea as a colony until the end of World War II in 1945.

1945. At the end of World War II, Japan surrenders to the Western allies and ends its colonial rule of Korea. The Korean Peninsula is "temporarily" divided between the Soviet Union and the United States.

1948. Led by Kim Il Sung, the Democratic People's Republic of Korea was established in the northern half of the Korean Peninsula.

1950–53. The Korean War pits the communist North, backed by Russia and China, against the capitalist South, backed by the United States. The war is fought to a standstill, and ends with the 2 countries divided by a demilitarized zone along the 38th parallel.

1950s. Agriculture is collectivized .

1980. Kim Il Sung's son, Kim Jong Il, is announced as his father's successor.

1991. The Soviet Union collapses and the Russian government stops economic assistance to North Korea.

1993. In December, North Korea's government admits the failure of its 7-year economic plan.

1994. Kim Il Sung dies and is replaced by his son, Kim Jong Il, as the country's supreme leader.

1995. A flood devastates North Korea's agriculture, sparking widespread famine.

1996. Another flood further damages agriculture and mining.

1997. A drought paralyzes the North Korean agricultural sector and worsens the famine.

1998. North Korea amends its constitution to make room for the growth of a small private sector.

2000. South Korean President Kim Dae-jung and U.S. Secretary of State Madeline Albright pay an official visit to P'yongyang, marking the end of North Korean isolation.

FUTURE TRENDS

Economic realities should soon force the North Korean government to loosen its constraints on free enterprise while keeping its socialist framework in place. The country needs foreign assistance in various forms to address its many economic problems, which should push it towards the cementing of improved relations and the forging of closer ties with South Korea. A better relationship with the United States would also help North Korea engage more actively in international trade. However, unless North Korea provides a suitable environment for economic growth, dissolves its isolationism, and improves relations with South Korea, the United States, and the major economies in its geographical region (e.g. Japan), the economic situation will continue to deteriorate and cause more social and political problems. The reclusive leader of the country, Kim Jong Il, has not yet given clear indications that he is capable of leading his country in the direction of improved economic conditions.

DEPENDENCIES

North Korea has no territories or colonies.

KOREA, SOUTH

Republic of Korea
Taehan Min-guk

CAPITAL: Seoul.

MONETARY UNIT: South Korean won (W). A won is equal to 100 chun. There are notes of W1,000, 5,000, and 10,000, as well as coins in denominations of W10, 50, 100, and 500.

CHIEF EXPORTS: Electronic products, machinery and equipment, motor vehicles, steel, ships, textiles, clothing, footwear, fish.

CHIEF IMPORTS: Machinery, electronics and electronic equipment, oil, steel, transport equipment, textiles, organic chemicals, grains.

GROSS DOMESTIC PRODUCT: US$764.6 billion (purchasing power parity, 2000 est.).

BALANCE OF TRADE: **Exports:** US$172.6 billion (f.o.b., 2000). **Imports:** US$160.5 billion (f.o.b., 2000).

COUNTRY OVERVIEW

LOCATION AND SIZE. South Korea occupies the southern half of the Korean Peninsula in eastern Asia. It is bordered by North Korea to the north, the Sea of Japan to the south and to the east, and the Yellow Sea to the west. South Korea has an area of 98,480 square kilometers (38,023 square miles), which makes it slightly larger than the state of Indiana. It has 238 kilometers (148 miles) of land borders with North Korea and 2,413 kilometers (1,499 miles) of coastline. Among its major cities, Seoul, the capital city, and Inchon are located in the northwestern part of the country, while Kwangju and Pusan are in the south, Taegu is in the southeast, and Taejon is in the center.

POPULATION. The population of South Korea was estimated at 47,470,969 in July 2000. It increased from 35.3 million in 1975 to 46.1 million in 1998, indicating a growth rate of 1.2 percent. At the current estimated growth rate of 0.6 percent, the population will increase to 51.1 million by 2015. In 2000 the estimated birth rate was 15.12 per 1,000 population while the estimated death rate was 5.85 per 1,000 population. The estimated migration rate was 0 percent.

South Korea's population is ethnically homogeneous. With the exception of a small Chinese community of about 20,000, the rest of the population are ethnic Koreans. Some 78 percent of the population falls within the age groups of 15–64 (71 percent) and 65 or older (7 percent). By 2015, 10.6 percent of the population will be older than 65.

South Korea is a highly urbanized society. In 1998, about 84.5 percent of its population lived in urban areas, a significant increase from 1975 when the urban population accounted for 48 percent of the total. The urban population is estimated to reach 92.2 percent by 2015. Seoul, the capital city, is the largest urban area, with a population of 10.4 million, followed by Pusan (3.9 million), Taegu (2.5 million), Inchon (2.5 million), Kwangju (1.3 million), and Taejon (1.3 million).

OVERVIEW OF ECONOMY

The 1945 surrender of Japan in World War II ended about half a century of the Japanese colonization of Korea. In its aftermath, the "temporary" division of Korea led to the creation, in 1948, of the Republic of Korea (South Korea) in the southern half of the Korean Peninsula and the Democratic People's Republic of Korea (North Korea) in its northern half.

South Korea opted for a free-enterprise economy at the time of independence and has since sought to consolidate it with a great deal of success. The mainly agrarian nation began to industrialize in the 1950s, after the Korean War (1950–1953). Its relatively insignificant industries mainly served its domestic market until the early 1960s, when the South Korean government encouraged

massive industrialization. Unlike many developing countries, South Korea chose an export-led industrialization strategy to produce labor-intensive products that could be produced more cheaply than in North America and Western Europe and therefore competitive and exportable to those markets. Initially, the emphasis was on light industry products such as fabric and clothing, later supplemented by assembly-line production of electronic products like radios or black-and-white television sets. By the late 1960s, South Korea became a major producer of telecommunication devices and computer parts.

The service sector, consisting of growing industries like **retail**, tourism, and finance is now South Korea's largest economic sector, accounting for 51.5 percent of **gross domestic product** (GDP) in 1999, while industry, including construction and mining, claimed a 43.5 percent share. Construction, though still a major industry, is in the process of decline. The industrial sector meets most of the needs of the country, but its manufacturing branch cannot produce without heavy imports of **capital goods**. Agriculture, which was the main economic activity in the 1960s, accounted for only about 5 percent of GDP in 1999. This sector, including forestry and fishery, was expanded and modernized in the 1950s and 1960s, a process that has continued to this date. The South Korean government has encouraged and generously supported its growth, while protecting it from foreign competition. The agricultural sector produces basic domestic needs in rice, vegetables, and fruits, though South Korea is still dependent on large imports of grains, fish, and forestry products (timber). The *World Factbook* reported similar, but not the same estimates of each sector's contributions for the same year, noting that services contributed 53 percent, industry 41.4 percent, and agriculture 5.6 percent of GDP.

Trade plays a major role in South Korea's export-oriented economy. In 1999, exports accounted for 45 percent of GDP, a phenomenal increase from the 1970s when it accounted for about 6 percent on average. Apart from a limited trade in fishery products, manufactured goods, including light- and heavy-industry products and high-tech devices and parts, are the major exports.

South Korea's economy grew rapidly from the 1960s through the 1980s, with an average annual GDP growth rate of 8.4 percent during that period. The growth rate fell to about 6.9 percent annually during the 1993–97 period. GDP contracted by 6.7 percent in 1998 alone as a result of the financial crisis, which pushed the unemployment rate to 6.8 percent (1,461,000 workers), a large increase from the 1997 rate of 2.6 percent (556,000). **Inflation** jumped from 4.5 percent in 1997 to 7.8 percent in 1998. Two factors helped economic recovery in 1999: the growth of the U.S. economy, which is South Korea's largest export market, and large direct foreign investments, made possible by economic **liberalization**. The latter rose to US$8.9 billion in 1998 and soon soared to US$15.5 billion, exceeding the total foreign investment over the previous 35 years. Data for the first 4 months of 2000 indicate such investment totaled US$3.7 billion, about 33 percent higher than the same period in 1999. South Korea's GDP grew by 10.7 percent in 1999, and continued its growth in the first quarter of 2000. The estimated growth rate for the entire year is about 8 percent. The recovery pushed the unemployment rate down to 4.8 percent (1,353,000 workers) in 1999, and it fell to 3.7 percent (about 800,000) in May 2000. It also brought the **inflation rate** down to 0.8 percent in 1999, a record low rate over the previous 3 decades. Inflation in 2000 was expected to be about 3 percent, far lower than during the 1980s, when the average inflation rate in the 1980s was 8.4 percent.

The South Korean government has helped the industrialization of its country via protectionist measures (the imposition of import quotas and **tariffs** aimed at limiting foreign competition in South Korea) as well as generous government financing for emerging industries and subsidization to make their products competitive in international markets. These government measures continued until the 1990s when they provoked criticism on the part of South Korea's competitors and trading partners, including the United States, Japan, and the European Union. Their growing pressure on the South Korean government to open its market to foreign competition and to stop subsidizing South Korean exports forced it to begin addressing these demands. Nevertheless, the South Korean market remained highly protected until 1997 when the financial crisis hit many Asian countries, including South Korea. Heavy borrowing by the public and **private sector**, especially from foreign banks, created the crisis, as most of the borrowers were unable to repay their large debts. Devastated by the crisis, the South Korean government, which desperately needed foreign financial assistance to stop the wave of bankruptcies and closures of large enterprises, had to accept the conditions outlined by the International Monetary Fund (IMF) in its rescue package: to liberalize its closed and highly protective economy through reforms and make it accessible to foreign competition.

Liberalization has sought to change South Korea's economy from one where the state directs and controls economic activities into one where the private sector, including foreign enterprises, operate with minimum government regulation. This required the nation to embark on a program of **privatization** designed to minimize the role of the **public sector** in the economy. This unfinished process has resulted in the sale of government assets in some large corporations to foreign investors, and the privatization of all state-owned banks, except for 2 development banks. By 2000, the government still owns about 108 non-financial enterprises, most of which are planned to be sold. Liberalization has also resulted in the removal of government regulations that restrict the economic activities of domestic and foreign enterprises in favor of a less-regulated economic system. Liberalization has also involved the **restructuring** of financial institutions and big corporations, most of which have long survived on heavy borrowing from public and private financial institutions, including foreign banks.

By and large, the reform of the financial system has been more successful than that of big corporations known as *chaebols* (conglomerates). The financial system's reform has justified the closure or merger of many non-viable private and public banks that formerly survived on government assistance, as well as the privatization of most public banks. The government's tight control on fiscal and monetary activities has been loosened in order to facilitate domestic and foreign private investments. In 1998, a Foreign Investment Protection Act was ratified to encourage and to ensure the safety of foreign investments. However, the 1998 corporate reform program called the "Big Deal" has been, so far, less successful. The program aims at turning the weak chaebols into strong corporations capable of offsetting the destructive impact of the financial crisis so that they might grow and compete with large foreign corporations inside and outside the South Korean market. To that end, the South Korean government has tried to reduce excessive competition between big corporations and to encourage their merger to create viable enterprises. It has also sought to encourage them to eliminate economic activities that are not of crucial significance to their main operations. For the most part, the chaebols' reform program is yet to be implemented.

South Korea has a very large **foreign debt**, which in 1999 was equal to more than 25 percent of its GDP. The debt burden emerged as a major economic problem in the 1990s. Encouraged and facilitated by the South Korean government, banks and large corporations borrowed heavily to finance industrialization, creating a debt that amounted to US$163.5 billion in 1996, a 5-fold increase from 1990. The heavy burden of this debt, most of which was borrowed on floating rates by major private enterprises, created the 1997 financial crisis, which resulted in a series of bankruptcies and closures of major enterprises. This situation also undermined the credit-worthiness of most surviving enterprises and forced the South Korean government to seek IMF assistance to prevent the total collapse of the economy. The IMF arranged a rescue package of about US$60 billion. It also facilitated an agreement between the South Korean government and the foreign banks for rescheduling debts held by South Korean private and public debtors. The IMF-led rescue package prevented the worsening of the situation and contributed to a gradual economic recovery. The recovery and the economic reform with its tough regulations on borrowing by large enterprises have reduced the debt from US$159.2 billion in 1997 to US$148.7 billion in 1998 and to US$136.4 billion in 1999. Statistics from the first 4 months of 2000 indicated a small increase in debt (US$4 billion), pushing its total to US$140.4 billion. Financing of a short-term **trade deficit** caused by an increase in the prices of imported oil products seems to be the reason for this increase. However, a predictably poor economic performance of South Korea's main trading partners (the United States and Japan) in 2001, which could reduce its exports and create a trade deficit, would likely increase its foreign debt substantially. South Korea's **foreign exchange reserves** are significant (US$86.8 billion in early 2000), but are still much smaller than its foreign debt.

History and geography have shaped the development of the South Korean economy to a great extent. The

division of the Korean Peninsula into 2 different political and economic systems has been a major factor. The Cold War rivalry between the United States and the Soviet Union made them the protectors of South Korea and North Korea, respectively. Each helped its protegé establish a peculiar economic system: free-enterprise in South Korea and a planned economy in North Korea. For South Korea, this situation led to a lack of ties with the 2 major supporters of North Korea: Russia and China, which lasted until the early 1990s when both sides began to normalize relations; South Korea established ties with Russia in 1990 and China in 1992. These ties have since expanded to the point where South Korea now produces some of its labor-intensive export products in China.

Threat of a North Korean military invasion forced the South Koreans to spend a significant amount on defense (US$9.9 billion in 1999, equal to 3.2 percent of GDP). However, South Korea's relations with North Korea have been improving since 1998 when President Kim Dae-jung initiated his "Sunshine Policy" to improve bilateral relations with the north. This policy led to a limited investment of South Korean corporations in North Korea, where local cheap labor is used to produce electronics for exports. South Korea's Hyundai group began tourist cruises to North Korea in 1998, but the trips were suspended after a South Korean tourist was arrested on spy charges. During that period, 80,000 South Koreans visited North Korea.

The South Koreans have backed the idea of peaceful unification of the 2 Koreas. Given the depth of North Korea's economic problems, they are not interested in an immediate unification, which would force them to spend an estimated US$1.2 trillion to rescue the North Korean economy. Instead, South Korea prefers a gradual process of unification in which it would help the economy of North Korea through modernization of **infrastructure** and by production of labor-intensive export goods in that country.

The bitter memory of the Japanese colonial era has also affected South Korean-Japanese economic relations. Japan has been a major source of equipment, machinery, and technology for South Korea, and has provided its largest source of tourism. Public resentment of the Japanese has limited their official and cultural ties. The situation has been improving since 1998 when President Kim Dae-jung took office. The heavy pressure of the 1997 financial crisis required Japanese economic aid and facilitated better official ties. The 1998 visit of President Kim to Japan broke the diplomatic ice between the 2 countries, and by mid-1999 a ban on Japanese cultural imports was lifted.

The South Korean economy has 2 major weaknesses. First is its heavy reliance on imported fossil fuels (oil and natural gas). South Korea is the second largest importer of liquefied natural gas (LNG), mostly from Malaysia and Indonesia. In 1999, it imported 874 million barrels of oil, 184.4 million barrels of petroleum products, and nearly 16.9 metric tons of LNG. These fuel imports accounted for 97.1 percent of its energy consumption in 1999, a significant increase from 1979 when fuel imports accounted for 73.4 percent of such consumption. Second, the South Korean economy depends heavily on imported capital goods and technology for its industries. Despite its emergence as a major exporter of light and heavy industrial products, its export industries require foreign machinery and equipment for production. While South Korea has surpassed Japan and the United States in selling memory chips, it still needs imported chip machinery to produce them. Another example is its automobile industry's reliance on imported parts and technology. Japan and the United States have been the major source of technology and capital goods for South Korea, constituting 40.5 percent of its annual imports in 1999.

POLITICS, GOVERNMENT, AND TAXATION

South Korea has a presidential system governed by a directly-elected president and a **unicameral** legislature, the National Assembly, in which various political parties are represented. Cabinet members are accountable only to the president. Parliamentary elections take place every 4 years, in which 227 candidates are elected, while an additional 46 parliamentary seats are distributed among political parties in proportion to their share of the popular vote.

Until 1995, the political system was a unitary one (the central government appointed all governors of provinces and mayors, who acted as its representatives). In 1995, the first elections for these provincial and local offices took place. A year later, there were local elections for councils at all levels: provincial, county, and ward. Still, the central government maintains enormous power at all levels by controlling appointments and by using its economic power, as in the allocation of construction projects.

Democratic regimes are very recent phenomena in South Korea's history, which has been ruled mainly by civilian and military authoritarian regimes. From 1948 to 1988, the country was governed by 1 civilian president (Syngman Rhee, 1948–60) and by 2 consecutive military rulers (Park Chung-hee from 1961–79 and Chun Doo-hwan from 1980–88). The first semi-democratic transfer of power happened in 1989 when Roh Tae-woo, a military nominee of President Chun Doo-hwan, was elected president in a relatively fair election. In 1993, he agreed to a peaceful transfer of power to a civilian, Kim Young-sam, who had been elected president in another relatively free election. The election of an opposition leader as pres-

ident, Kim Dae-jung in December 1997, was of great significance for the South Korean political system in that it marked the first transfer of power by an elected president to an opposition leader. Coming to power in the midst of the 1997 Asian financial crisis, President Kim Dae-jung has since presided over the restructuring of the economy.

The South Korean government has had a major role in the economy since the foundation of the nation in 1948. Through its direct involvement in the economy, it has sought the economic growth and industrialization by which it has turned South Korea from an agrarian society into a highly industrialized one. Various government measures and financial assistance have helped establish enterprises and protect them from foreign competition while helping them expand at home and abroad. The government has also been actively involved in industrial and financial activities through its industries and banks. Due to the IMF and other factors, its role in the economy has been limited since the mid-1990s, but it still plays a significant part in economic affairs as the mastermind of South Korea's economic reform, the director of its large infrastructure projects, and as the entity in charge of paying the country's foreign debt.

Despite the existence of political parties in South Korea, they had no major influence until recently. In practice, the military was the power base of the political system, and directly or indirectly ran the country—a situation that lasted until 1993. In that year, the election of a civilian, Kim Young-sam, as president laid the groundwork for meaningful participation by political parties, which led to the 1997 election of Kim Dae-jung, an opposition leader. Under his leadership, the Millennium Democratic Party (MDP) runs the country in coalition with the United Liberal Democrats (ULD). The opposition includes the Grand National Party (GNP) and the Democratic People's Party (DPP). However, the South Korean political parties have yet to establish themselves as the vehicles of representation of different political and economic interests. Generally speaking, they all lack internal cohesion, reflected in the constant defection of party members and their leaders from one party to another and the frequent formation, renaming, and merger of political parties.

All parties advocate a free-enterprise economy within which the state and the private sector both play a role. However, they also advocate a strong role for the government in economic growth through its policies and regulations. Under IMF pressure, the ruling coalition has significantly reduced the public sector by privatizing many state-owned financial and industrial enterprises and also by removing many economic regulations. Nevertheless, the government still has a major impact on the economy because its economic reforms and the payment of its foreign debt have incurred many new governmental regulations. Until the South Korean government privatizes all its enterprises, it will also remain a large economic player.

The South Korean constitution provides for an independent judiciary, though it is still trying to move toward that goal and away from manipulation by influential individuals. Absence of trial by jury gives judges the power of rendering verdicts in all cases, which makes the system more prone to abuse. Hence, in addition to political and economic liberalization, judicial reform is also necessary for creating a safe business environment. The judiciary provides for the defense of property and contractual rights through laws on economic activities. Commercial disputes can be adjudicated (settled) in a civil court, or may be presented to the Korean Commercial Arbitration Board. South Korea's membership in various international conventions obliges it to observe international commercial laws.

TAXATION. South Korea's tax system relies heavily on **indirect taxes**, which account for about 50 percent of tax revenue. Resident and non-resident individuals and corporations are liable for taxation. Real-estate rental income, business income, earned income, temporary property income, and miscellaneous income attributed to a resident are taxed progressively. Interests and dividends are subject to withholding tax. Non-residents are also taxed on income from sources in Korea. Tax rates on individual income range from 10 percent to 40 percent. Taxation applies to all corporations operating in South Korea, whether domestic or foreign. Companies that have been incorporated in Korea are considered to be domestic corporations and are liable for taxation on their worldwide income, whereas foreign corporations pay taxes on their Korean-generated income only. The corporate **income-tax** rates range between 16 percent and 28 percent.

Taxes, customs **duties**, and other government-generated revenues (assorted fees, social security contributions, and the income of public enterprises) are the main sources of government revenue. **Budget deficits** are financed through borrowing, either directly from domestic and foreign banks or through the issuance of bonds. In 1999, total government revenue was US$90.78 billion, of which all taxes and custom duties accounted for 70.1 percent of the revenue. Other government revenues accounted for 29.9 percent of the total revenue. The government spent a total of US$101.77 billion that year and incurred a deficit of US$10.99 billion. Better economic performance in 2000 resulted in a small surplus (about US$11 billion). Of the total revenue of US$118.18 billion, all taxes and customs duties accounted for 69.48 percent (US$82.12 billion) of the revenue, while other government revenues accounted for 30.52 percent (US$36.06 billion).

INFRASTRUCTURE, POWER, AND COMMUNICATIONS

South Korea has a very advanced and modern infrastructure, which has been expanding since the 1960s. Both the South Korean government and the private sector are involved in the financing, construction, and operation of various infrastructure projects and services. Over the first 20 years of the 21st century, the government will spend more than US$300 billion on airports, roads, railways, and mega-resorts. Additionally, it will spend US$60 billion on the construction of more than 100 new power-generation facilities.

South Korea has an extensive and well-kept system of roads. In 1998, it boasted 64,808 kilometers (40,272 miles) of paved roads, including 1,996 kilometers (1,240 miles) of expressways, and 22,182 kilometers (13,784 miles) of unpaved roads. There are several major north-south and east-west highways, but the growing number of vehicles in use puts heavy pressure on the land transport network. The number of private cars rose from fewer than 500,000 in the early 1980s to 7.581 million in 1999 when there were also 2.1 million trucks and 749,000 buses in use. To deal with the growing pressure on roads, the South Korean government has initiated a multibillion dollar project to expand the highways. Land transportation also includes regular train and bus services around the country. The railways consist of 6,240 kilometers (3,878 miles) of standard gauge tracks of which 525 kilometers (326 miles) are electrified.

In 1999, South Korea's air transportation system was served by 103 airports, of which 67 have paved runways. Major international airports are in Seoul (Kimpo), Pusan, and on Cheju Island. A new international airport, Inchon, is scheduled to open in 2001, after which Kimpo will function as a domestic airport for Seoul.

South Korea's sea transportation network includes various ports and harbors, the most important of which are in Chinhae, Inchon, Kunsan, Masan, Mokpo, Pohang, Pusan, Tonghaehang, Ulsan, and Yosu. To meet the needs of its growing economy, the South Korean government is planning billions of dollars' worth of port/harbor expansion projects. In 1999, South Korea's merchant fleet consisted of 461 ships of various size and functions (bulk, cargo, container, passenger, vehicle carrier, and fuel tanker) with a net cargo capacity of 5 million metric tons.

South Korea has a growing power-generation system that provides electricity for private and commercial needs. Originally a state-owned sector, the power system is being privatized. During the 1990s, total production increased from 184,660 gigawatt-hours (gWh) in 1995 to 239,325 gWh in 1999, outpacing demand by a comfortable level. Over time, South Korea's dependency on thermal and hydroelectric generators has been reduced in favor of nuclear-powered generators. The country lacks domestic fossil-energy resources, so the growing cost of imported oil and natural gas has encouraged this shift. Still, thermal generators account for the bulk of generated electricity. In 1998, the percentage of electricity generated by various methods was as follows: fossil fuel generators (59.56 percent), nuclear-powered generators (38.51 percent), hydroelectric generators (1.91 percent), and other (0.02 percent). The share contributed by nuclear-power generators rose to 42.8 percent in 1999.

The South Korean telecommunications system is among the best, the most modern, and the fastest growing in the world. The number of fixed telephone lines increased from 763,200 in 1973 to 20,963,000 in 1999, while the number of cellular telephone lines jumped from 1,641,000 in 1995 to 12,019,000 in 1999, an eightfold increase over a 5-year period. In 1999, there were at least 11 Internet providers. With 14 million Internet users in 2000, South Korea ranked third in the world after the United States and the United Kingdom. Also in 1999, there were at least 106 AM, 97 FM, and 6 shortwave radio stations, and 121 television stations apart from the 8 stations operated by the U.S. Armed Forces in South Korea. In 1997, there were at least 47.5 million radios and 15.9 million television sets in use.

ECONOMIC SECTORS

South Korea's economy has undergone a very impressive development experience. Through economic planning, its government modernized the agricultural sector, established a large industrial sector, and helped create a service sector. Its extensive regulations have largely protected domestic enterprises from foreign competition and helped them grow and consolidate over time. Government polices and practices, including generous loans, have stimulated economic growth. The 1997 financial crisis damaged the South Korean economy as a whole and forced it to contract in 1998, but the economy began its recovery in 1999 and continued it in 2000, an indicator of the strength of its sectors. At the beginning of the 21st century, South Korea's smallest economic sector, in terms of contribution to GDP, is agriculture, including forestry and fisheries. Second largest is the industrial sector, which consists of manufacturing, construction, and mining, a vital sector of which manufacturing accounts for the bulk of South Korea's expanding exports. As with agriculture, industry's share of GDP is declining while the service sector is growing, a phenomenon consistent with the maturity of the South Korean economy. The service sector is now the largest and the fastest growing economic sector, accounting for the largest share of GDP.

AGRICULTURE

FARMING. Arable land is limited in South Korea. It accounts for 21 percent of the total land (20.7 million hectares), a decrease from its share of 21.8 percent (21.6 million hectares) in the early 1950s. Growing urbanization and road building are the 2 major factors responsible for the decrease. Agriculture's share of GDP, including forestry and fishery, has declined from 6.2 percent in 1995 to 5 percent in 1999. The total output of the sector, including forestry and fishery, grew 4.7 percent in 1999, after a contraction of 6.6 percent in 1998 as a result of the 1997 financial crisis. In 1999, its share of the workforce was 10.09 percent (2,349,000 workers), a decrease from 1995 when its share was about 12.2 percent (2,534,000).

Since the 1950s, South Korea has a well-developed and highly productive agricultural sector, thanks to several factors: government financial assistance (US$8.3 billion in 2000), mechanization, and extensive use of fertilizers. To encourage growth and make the country self-sufficient in its major food item, rice, the government has prohibited rice imports under normal circumstances. It has also paid farmers higher than the world price for their rice while subsidizing consumers to make rice affordable for all. As a result, South Korea is now self-sufficient in rice production and the production of many kinds of fruit and vegetables. In 1999, rice production was 5,975,000 metric tons, a large increase from 1995 (5,060,000 metric tons). South Korea also produces significant amounts of other major items such as barley and wheat (189,000 metric tons in 1999), but it is not self-sufficient in grains. Therefore, it imports agricultural products, mainly cereals and preparations, equal to US$1.716 billion in 1998.

FORESTRY. Although forests account for 65.7 percent of its total land, the topography makes commercial forestry difficult, so South Korea imports most of its forestry products (timber), mainly from Indonesia and Malaysia. Beginning in the 1950s, the reforestation policy of the government, combined with the rural development program

of the 1970s known as the Saemaul Movement, has restored forests, which were massively destroyed during World War II. This resulted in a large increase in the production of timber from 30.8 million cubic meters in 1954 to 363.6 million cubic meters in 1998, mostly used by rural inhabitants as fuel. For its various needs, the country relies heavily on imported timber, which amounted to US$1.886 billion in 1998.

FISHERIES. The fishing industry has been declining over the last 2 decades, with only 315,000 people so employed in 1999, down from 750,000 in the 1970s. Its role in the economy has declined along with that of agriculture in general as a result of industrialization and the growth of the service sector. In 1999, fishery products accounted for about 1 percent of exports (about US$1.4 billion), a sharp decline from its share of 5 percent in the 1970s. South Korea relies on large imports of fishery products for domestic consumption, although catches increased from 2.4 million metric tons in the late 1970s to 3 million metric tons in the late 1990s. The value of imported fishery products was about US$1 billion in 1996–97, a huge jump from the mid-1970s when they were less than US$20 million annually.

INDUSTRY

The industrial sector, including mining, manufacturing, and construction, has been growing in South Korea since the 1960s. Its share of GDP has remained around 43 percent since 1995. The sector contracted by 6.1 percent in 1998 as a result of the 1997 financial crisis, but it expanded by 11 percent in 1999 when the South Korean economy began to recover. Despite its significant expansion, the overall economic growth pushed its share of GDP a little lower than 1998. In 1999, it accounted for about 25.61 percent (4,026,000 workers) of the workforce, a decrease from 1995 when it accounted for about 23 percent (4,824,000).

MINING. Mining and quarrying are very insignificant economic activities, accounting for only 0.4 percent of GDP (US$1.47 billion) in 1999. South Korea has few significant mineral resources, and no oil or natural gas. Its available minerals are lead, zinc, and copper, which supply only a fraction of its needs. As a result, it imports all its needs in fuel and almost all its needed minerals, accounting for 50.8 percent of its total imports in 1999. South Korea was once a major exporter of tungsten concentrate, but its output of tungsten ore stopped completely in 1993 when China flooded the world markets with tungsten, sharply decreasing its world prices. The mining industry, including quarrying, grew by 5.2 percent in 1999, a negligible growth for an industry that experienced a 24 percent contraction in 1998.

MANUFACTURING. Manufacturing has been the engine of growth and development for South Korea, which has emerged as a major supplier of various manufactured products. The sector's contribution to GDP was 31.8 percent in 1999, an increase from 30.9 percent in 1998 and an improvement over the levels during the economic slowdown of 1996 and 1997.

South Korea's manufacturing sector produces a wide range of labor- and capital-intensive products to satisfy domestic needs, but mainly for export. They include light and consumer products (fabrics and clothing); electronic, telecommunication, and computer devices; and heavy industrial products (metals, automobiles, and ships). Since the 1970s, South Korea has become one of the world's major steel producers. The automobile industry began growing in the 1980s for export purposes only, but it eventually expanded to meet domestic demands too. Annual production of automobiles grew from 935,271 in 1990 to 2.2 million in 1999.

The value of South Korea's manufactured goods was US$129.5 billion in 1999, as compared to US$97.9 billion in 1998 during the economic crisis. The best-performing sectors included telecommunications, electronics, industrial machinery, and transport equipment, which grew by more than 30 percent. Heavy industry and chemicals grew by 25.9 percent, and light industry (textile, footwear and food products) by 7.2 percent.

During the financial crisis of 1997, many manufacturers, including large conglomerates, went bankrupt. Corporate restructuring, as part of the conditions for receiving IMF aid, has changed the ownership structure of manufacturing to some extent. This previously closed sector is now open to unlimited investment and acquisition by foreign investors. In 1998 Hyundai Motor, the largest South Korean automaker, acquired the troubled Kia Motors, South Korea's third largest carmaker and its affiliate, Asia Motors. In 2000, Renault, a French automaker, purchased the bankrupt Samsung Motors while Ford, a U.S. company, bought the bankrupt Daewoo Motors.

The manufacturing sector employed 4,006,000 people in 1999, a substantial increase from 1998 (2,324,000 people). The 1999 figure indicates a large increase since the 1980s (15.3 percent), but a phenomenal increase since the early 1970s (169.9 percent). As has happened in most developed economies, the growing cost of labor has forced many South Korean manufacturers to relocate large industries and/or labor-intensive ones to countries with much cheaper wages, such as Thailand, Malaysia, Indonesia, the Philippines, Vietnam, and China. Thanks to better ties between the 2 Koreas since 1998, some South Korean manufacturers have established a few electronics factories in North Korea, but extensive relocation of South Korean industries to North Korea will not be a

real option until the 2 countries have further improved their relations.

CONSTRUCTION. Despite its decades of growth resulting from massive infrastructure projects, the construction industry has experienced a decline since 1995 when its share of GDP was 11.3 percent. With the financial crisis, its share fell to 10.1 percent in 1998 and 8.8 percent in 1999.

In the 1960s and the 1970s, construction prospered as South Korea was entering its industrialization phase. This continued until the housing boom of the late 1980s. The number of residences (houses and apartments) built averaged 196,000 annually from 1973 to 1982 and reached 750,000 in 1990. The boom continued until 1996 when the economic slowdown began. The 1997 financial crisis saw a sharp drop in construction-industry revenues from US$32.4 billion in 1997 to US$9.9 billion in 1998. The limited recovery of 1999 increased the revenues to US$16.7 billion.

Overseas projects have helped the construction industry over time, but their importance has declined since the early 1990s. Taking advantage of cheap labor, South Korean construction companies won contracts in the 1980s for road-building projects, mainly in the rich oil-producing nations of the Middle East.

SERVICES

The service sector has developed substantially over time, accounting for 51.5 percent of GDP in 1999, surpassing agriculture and industry. It is the largest employer, with 64.3 percent share of total workforce in 1999 (13,906,000 workers), a small increase from 1995.

FINANCIAL AND BUSINESS SERVICES. These services accounted for 19.7 percent of GDP in 1999, an increase of 5.7 percent since 1989. A major reason for its modest growth was the collapse of the Daewoo group with more than US$80 billion of unpaid loans. The collapse damaged the bond market and led to a loss of confidence in the investment trust industry.

Under the directive of the central bank (Bank of Korea), the government-owned banks have manipulated economic activities by providing credits to those enterprises who follow the government's development strategy, while punishing others by denying them credit. The 1997 crisis forced the government to reform the financial system to receive an IMF-led rescue package conditioned on economic restructuring. To minimize its intervention in the financial sector, the government has privatized all public banks with the exception of 2 development banks: the Korea Development Bank and the Export-Import Bank of Korea. They provide medium- and long-term credit for both export industries and the heavy-equipment and chemical industries funded by the South Korean government and foreign investors. In compliance with the IMF demand for the opening of South Korea's financial sector to foreign competition, it has sold one of its privatized banks to foreign bidders, while considering the sale of some others. Banks and insurance companies are still underdeveloped and suffer from various problems, a consequence of years of government mismanagement and especially the continued tight government control of financial services. Years of continued reform will therefore be required to address its underdevelopment.

The 1997 financial crisis forced many financial and business services to consolidate. Between 1997 and 2000, government regulators closed down about 498 financial institutions, including 11 banks, 21 merchant banking corporations, 13 insurers, 16 securities firms and investment trust companies, and 437 other non-banking institutions. In 2000, the financial system consisted of 22 banks and thousands of non-bank institutions, including 5 merchant banking corporations, 43 securities firms, 36 insurers, 28 investment-trust companies, 15 leasing companies, and 7 credit-card issuers. Non-bank institutions consist of several mutual savings and finance companies, credit unions, community credit cooperatives, postal savings plans, and insurance, installment-credit, and venture-capital companies. Assets held by all domestic banks totaled US$440.8 billion in 2000.

In January 2001, there were 44 foreign banks doing business in Korea, and some Korean banks have been taken over by foreign banks. Assets held by foreign banks are estimated at US$36 billion. Foreign banks work under regulatory conditions almost identical to those of domestic banks, but they are exempted from direct control by the South Korean government. However, they are not allowed to have a branch network, and therefore their retail operations are small.

Investment trust companies (ITCs) constitute another component of South Korea's financial and business services sector. The bankruptcy of the Daewoo group in late 1999 inflicted heavy damage on the ITCs, which had purchased a large share of its bonds. This drastic event caused panicked investors to transfer about US$84.2 billion of their investments from ITCs into banks. To restore confidence, the South Korean government has injected large sums (US$25.3 billion in 2000) into the worst-hit ITCs. It has also promised another rescue package of US$41.3 billion for 2001.

The South Korean life-insurance market is the world's sixth largest in terms of premium income. The insurance industry has also suffered from the weaknesses of the financial sector, and some companies have closed as a result. The government now supervises the insurance industry, which has been opened to foreign investors. In 2000, the insurance industry included 23 life-insurance

companies, including 7 foreign ones and 3 **joint ventures**, and 13 non-life insurance companies. In 1999, their assets were estimated at about US$47.2 billion.

TOURISM. With its ancient historical sites, many Buddhist temples, various opportunities for summer and winter sports, and natural beauty, South Korea has become an important tourist attraction. Government support and private investments have helped the tourist industry grow impressively in the 1990s, after it had been an insignificant industry in previous decades. The number of tourists grew on average by 7.2 percent per year between 1995 and 1999 to reach 3,921,000 in 1999, a large increase over the 2,294,000 visitors in 1995. In 1999, tourist-generated revenue was US$4.615 billion, a significant drop from 1998's figure of US$6.924 billion. The **devaluation** of the South Korean currency and a sharp decline in the price of many goods and services pushed down the tourist-generated revenues despite an increase in the number of tourists.

Tourists are mainly from the Pacific region. Japan has been the largest source of tourism, followed by the United States and Taiwan, with 1999 figures of 2,174,000, 473,000, and 146,000, respectively. South Koreans residing abroad form a large segment of tourists as well, sending 1,128,000 tourists that year. The tourist industry has a large and expanding infrastructure. In 1998, it included 446 hotels (nearly half of them 5-star) with 46,360 hotel rooms. The hotel industry received a boost in the 1980s with the 1986 Asian Games and the 1988 Summer Olympics. The 2002 World Cup soccer tournament, which will be co-hosted by Japan and South Korea, will give another major boost to the South Korean tourist industry.

TRANSPORTATION. South Korea's economic growth has contributed to the expansion of land, sea, and air transportation. The transportation industry grew significantly in the 1990s when South Korea began to emerge as a major trading nation. The industry accounted for 7 percent of GDP in 1999, a little more than its share in 1995 (6.6 percent). The South Korean marine commercial fleet has a large cargo capacity, (5,093,620 metric tons in 1999), and is expected to grow in the first decade of the 21st century. Its commercial air fleet grew rapidly in the 1990s, carrying 74,375,000 international passengers and 9,052,000 domestic ones in 1997. The slowdown in South Korea's economy in 1998 sharply reduced passengers to 55,736,000 and 6,877,000, respectively, but a likely recovery is suggested as the economy recovers.

RETAIL. South Korea has a very large and growing retail sector, whose share of GDP in 1999 was 10.9 percent. The retail industry, which had been dominated mainly by small-scale traditional shops and restaurants, began to diversify and include larger and modern establishments as well as various foreign retailing networks in the 1980s. Nevertheless, most retail units are still small family-run stores, stalls in markets, or street vendors, though this traditional retail network is giving way rapidly to large discount stores. Discount-store chains, including the domestic E-mart, the U.S. Wal-Mart and Price Costco, and the French Carrefour, are growing. The retail sector also includes a growing food service sector with estimated revenue of US$22.7 billion in 1999. Franchise restaurants, including American ones, accounted for about 5 percent of this sector's revenue in 1999. Like all other types of economic activities, the 1997 financial crisis damaged the retail sector in general and slowed growth of the franchised restaurants in particular, but the economic recovery has improved the situation. Retail and wholesale trade recovered 13 percent in 1999, offsetting a similar decline in 1998. Partial statistics for 2000 reflect about 6.9 percent growth of the retail industry and a sharp jump in retail sales of an estimated US$98 billion.

INTERNATIONAL TRADE

South Korea's international trade began in the 1960s when it started its export-led growth development strategy, exporting mainly light and **consumer goods** and labor-intensive products (toys, footwear, and clothing). Since the 1990s, it has reduced the exports of such items in favor of heavy-industry, capital-intensive, and high-tech products. This has come about for 2 reasons: light and labor-intensive products have lost their competitiveness in international markets where they now face cheaper products from the other Asian nations; and South Korea's industrial growth has enabled it to produce competitive heavy-industry products like automobiles and ships and high-tech products like memory chips and computer products. It is now a major exporter of telecommunications and computer equipment and devices. South Korea's shipbuilding industry now sells ships to Japan, a major global shipbuilder in its own right.

Since the early 1960s, South Korea has targeted developed markets (the United States, Japan, and Europe) for its exports. Since the 1990s, it has also added the growing Pacific market (China, including Hong Kong and Taiwan) to its target list.

South Korea's exports totaled US$143.7 billion in 1999, a growth of 8.6 percent from 1998 (US$132.3 billion) and of about 11 percent from 1995 (US$125.1 billion). An increasing demand for South Korea's semiconductors and telecommunication products pushed the share of semiconductors in total 1999 exports to 13.1 percent, slightly higher than its 1998 share of 12.8 percent. Vehicle exports also rose by 12.3 percent to US$11.1 billion, but textile exports increased only by 6.8 percent to US$5.8 billion. However, its labor-intensive steel exports declined by 13.4 percent to US$7 billion. In 1999, South Korea's major export destinations were the United States

(20.5 percent), the European Union (14.1 percent), Japan (11 percent), China (9.5 percent), and Hong Kong (6.3 percent).

South Korea's imports in 1999 totaled US$119.8 billion, a 28.4 percent rise over the 1998 levels of US$93.3 billion. South Korean export industries heavily depend on foreign capital goods (machinery and equipment) for their production. In 1999, South Korea's main sources of imports were the United States (20.8 percent), Japan (20.2 percent), the European Union (10.5 percent), China (7.4 percent), Saudi Arabia (4.7 percent), and Australia (3.9 percent). In the 1990s, its largest trade deficit was in 1996 (US$20.6 billion), while its largest trade surplus was in 1998 (US$39 billion).

MONEY

Four government entities are in charge of foreign exchange activities in South Korea: the Ministry of Finance and Economy (MOFE), the Bank of Korea (BOK), the Financial Supervisory Service (FSS), and the Korea Customs Service (KSS). The ministry sets the overall foreign exchange policy, and the Bank of Korea holds and manages the foreign reserves, while managing all transactions pertaining to foreign trade and capital movements. It also supervises money-changers and foreign-exchange brokers, and provides foreign-exchange banks with foreign currency loans. The FSS supervises financial institutions that are involved in foreign-exchange activities. The KSS has some foreign-exchange regulatory responsibilities towards international trade. Apart from these government regulatory and supervisory institutions, banks involved in foreign exchange have the authority to engage in such financial transactions, including international banking.

South Korea has a free-**floating exchange rate** (a rate determined by supply and demand). This type of fluctuating **exchange rate** limits the MOFE's ability to prevent or to minimize the negative impacts of sudden changes of exchange rates. In 1997, for instance, the MOFE temporarily prohibited South Koreans from purchasing foreign currencies for holding purposes.

The rate of exchange of the South Korean won against the U.S. dollar remained more or less stable in the early 1990s. As the economy began to experience problems in the second half of the 1990s, it began to depreciate gradually against the dollar from 771.27 in 1995, to 804.45 in 1996, and to 951.29 in 1997. This relatively small fluctuation did not have a major impact on the pace of economic activities and the purchasing power of the population until the financial crisis of 1997. In early 1998, the exchange rate jumped to 2,000 and gradually fell to average at about 1,401.44. As the economic recovery began, the rate fell to 1,188.82 in 1999 and to 1,130.96 in 2000. Reflecting the depreciation of the won against the U.S. dollar, the sharp and sudden increase in the exchange rate had a major negative impact on the South Korean economy, which is heavily dependent on large imports of capital goods and energy. The lowering of the exchange rate in 1999 and 2000, which was the result of a gradual economic recovery, contributed to the recovery itself by decreasing the cost of imported goods and fuel.

Exchange rates: South Korea

South Korean won (W) per US$1	
Jan 2001	1,271.89
2000	1,130.96
1999	1,188.82
1998	1,401.44
1997	951.29
1996	804.45

There have been various restrictions and regulations on foreign-exchange operations since the 1960s. These government-imposed measures were designed to ensure the availability of foreign currencies to South Korean enterprises and to prevent the flight of capital from South Korea. Under foreign pressure, the South Korean government began to liberalize the foreign exchange market in mid-1992. The 1997 IMF-led rescue package required the country to commit itself to liberalizing all aspects of the foreign-exchange system by the end of 2001. In reality, the system has yet to become fully liberalized as the South Korean government has introduced many new direct and indirect regulations in various forms, including restrictions on certain transactions, tax rules, and monitoring regulations, to ensure its control over the financial system.

The Korea Stock Exchange (KSE) in Seoul is the only stock market in South Korea for trading bonds and stocks. It was opened in 1992 to direct portfolio investment from abroad. The reform of the South Korean economy since 1997 has removed restrictions on foreign ownership of South Korean enterprises, and the KSE is now authorized to sell their stocks to foreign buyers without any limit.

POVERTY AND WEALTH

Since the 1960s, South Korea has greatly improved the living standards of its entire population, especially in infrastructures that ensure access to safe water, sanitation, medical services, and adequate diet. According to 1998 statistics, all South Koreans have access to health services and adequate sanitation, while only 7 percent has no access to safe water. The expansion and modernization of

the health-care system has been particularly effective: between 1963 and 1998, the number of doctors rose from 9,052 (1 for every 2,981 people) to 65,431 (1 per 710 people), and the number of hospital beds from 10,477 (38 beds per 100,000 population) to 236,187 (509 beds per 100,000). There has been universal health-care insurance since 1989. Infant mortality decreased from 43 per 1,000 live births in 1970 to 5 per 1,000 in 1998. Life expectancy increased from 62.6 years in the period 1970–75 to 72.4 years during 1995–2000. It is significantly higher than other Pacific nations such as Thailand (68.8 years), but much lower than Japan, which has the world's highest life expectancy (80 years), and the United States (76.7 years).

Education, which is compulsory until the age of 14, has been a priority for the South Korean government since 1948. During the period 1995–97, it accounted for 17.5 percent of government annual spending, which is higher than most countries including Japan and the United States. The literacy rate has risen from 22 percent in 1945 to 87.6 percent in 1970 and to 97.5 percent in 1998, but is a little lower than North Korea's rate of 100 percent. South Korea has surpassed certain major industrialized countries in college-level enrollments in science (34 percent in South Korea, 23 percent in Japan, 29 percent in the United Kingdom, and 31 percent in Germany). Nevertheless, it is still lags behind North Korea in the percentage of the population with post-secondary education; in 1998, post-secondary graduates equaled 9.2 percent of the adult population compared to 13.7 percent in North Korea.

Economic development has improved the standards of living of the South Koreans over time. As a result, only 4.2 percent of them lived below the poverty line in 1999. However, the rapid economic development has created extremes of wealth and poverty. The 1997 financial crisis worsened the situation as many people lost their employment while many others faced wage cuts and declining purchasing power. To address the situation, the government spends large amounts on the social safety net (welfare and unemployment insurance), which amounted to 7 percent of government expenditure in 2000.

WORKING CONDITIONS

South Korea joined the International Labor Organization (ILO) in 1991, but has not yet ratified the ILO conventions on Workers Rights (agreements on the freedom of association, on the right to organize and collective bargaining, and on the right of public-service employees to organize). South Korea's constitution provides for the right of workers to associate freely, excluding public-sector employees. According to 1998 legislation, white-collar public workers are allowed to form work-

place councils, but blue-collar workers in the postal services, railways, telecommunications, and the National Medical Center are allowed to have unions. In 1997, South Korea amended its labor laws to permit competing unions from 2002 onward, and also to permit more than 1 national labor federation. In 2000, there were 3 such federations: the Korean Confederation of Trade Unions, the Federation of Korean Trade Unions, and the Independent Korean Federation of Clerical and Financial Workers, in addition to 1,600 district labor unions.

The constitution and the Trade Union Law provide for the right of workers to collective bargaining and collective action. There are provisions for workers to seek retribution in case of unfair practices by employers. The 1997 revision of the labor law removed a ban on third-party intervention (union intervention) in labor disputes. In South Korea, labor disputes tend to escalate to work slowdowns and confrontational interruption of businesses through rallies, sit-ins, and occupation of company offices or factories.

Workers have the right to strike, but strikes in government agencies, state-run enterprises, and defense industries are prohibited. The government has the power to end labor disputes by compulsory arbitration in enterprises that are considered to be of “essential public interest” such as public transportation, public health, and utilities. Wage cuts and layoffs since the 1997 crisis have contributed to the rise of labor disputes, which had dropped to 80 cases in 1995 from the 1980s, when they numbered in the thousands.

The South Korean government implemented a minimum wage in 1998 for companies with more than 10 employees. The rate is subject to annual reviews. In 1999, the minimum wage was US$1.45 per hour. As a rule, it is not adequate for a typical blue-collar worker who must supplement his/her salary with overtime payments and bonuses that most companies usually offer to their employees.

The 1989 amendment to the labor law provides for a 44-hour workweek, but its 1997 revisions enable employers to require some 48-hour weeks without overtime. A reduction in the workweek to 40 hours has become a major goal of the labor movement.

Forced labor and child labor are prohibited, but children under the age of 18 may work under certain conditions. To do so, they require a special employment certificate from the Labor Ministry, which is rarely issued because education is compulsory until the age of 14. Children under the age of 18 who wish to work require written approval from their parents or guardians. There are several laws concerning child labor, which are usually enforced, but regular inspections are not done due to lack of human resources. The government sets safety and health standards at work, but accident rates are high because of the lack of regular inspections.

The 1987 Equal Employment Act provides for the equality of men and women in the workplace. Despite improvement in their hiring and promotion, women are still discriminated against, and many women have been sexually abused. The government has enacted laws to punish abusers and provide redress for the abused, but abuses still continue. Foreign workers, most of whom are undocumented, are subject to various physical and financial abuses. Although the government has legalized the status of some of them and sought to ensure their better treatment by employers, they are still vulnerable to various forms of abuse, including withholding wages and passports.

South Korea has a highly educated workforce of 22 million (1998 est.), a growing segment of which is skilled. Unemployment more than doubled during the 1997 financial crisis, from 2.6 percent (556,000) in 1997 to 6.8 percent (1,461,000) in 1998. Economic recovery reduced it to 4.8 percent (1,353,000) in 1999. In May 2000, the unemployment rate was 3.7 percent.

COUNTRY HISTORY AND ECONOMIC DEVELOPMENT

c. 100 A.D. Emergence of the Kingdom of Koguryo, the first truly Korean state.

668–892. Silla Unification Period marked by cultural borrowings from China.

914–1392. Koryo Dynasty marked by Mongol invasion and decline of Buddhism in favor of Confucianism.

1392. Yi Dynasty moves capital to Seoul.

1590s. Japan invades Korea under Hideyoshi and occupies Seoul.

1884. U.S. Presbyterian missionaries arrive in Korea.

1910–45. Japan colonizes the Korean Peninsula.

1919. Samil (1 March) Independence Movement suppressed by the Japanese.

1945. Japan surrenders in World War II and ends its colonization of Korea. The Korean Peninsula is “temporarily” divided between Soviet and U.S. spheres of influence.

1948. The Republic of Korea is established in the southern half of the Korean Peninsula. Syngman Rhee, a civilian, becomes the first president of South Korea.

1950–53. The Korean War is fought between United Nations (mostly U.S.) and **Communist** forces.

1950s. South Korea mechanizes and expands its agricultural sector.

1961. Park Chung-hee, a military person, becomes the second president of South Korea.

1960s. South Korea begins its export-driven strategy of industrial growth by producing and exporting light consumer and labor-intensive products as well as some electronics (radios and black-and-white televisions).

1970s. Production and export of more sophisticated electronics, such as color televisions and calculators.

1974. Assassination attempt on President Park; his wife is killed.

1976. Opposition leaders are purged by President Park's increasingly authoritarian regime.

1979. President Park is assassinated a year after his re-election; martial law follows for 15 months.

1979. Major General Chun Doo-hwan becomes South Korea's third president and tightens military rule.

1980s. South Korea begins its production and export of more advanced electronics, such as VCRs, microwave ovens, and cameras. Heavy industry (steel, automobiles, and shipbuilding) emerges as an important sector.

1988. South Korea hosts the Summer Olympics, which also help expand its tourism industry.

1989. Roh Tae-woo, a former military person, becomes South Korea's fourth president.

1990s. South Korea's high-tech industry emerges, which turns South Korea into a major supplier of telecommunication and computer devices and parts.

1990. South Korea normalizes relations with the Soviet Union.

1992. South Korea normalizes relations with China.

1993. Kim Young-sam, a civilian, becomes the fifth president of South Korea.

1996. South Korea joins the OECD, for which it begins liberalizing its economy.

1997. After labor unrest in the early part of the year, a financial crisis emerges, resulting in a series of bankruptcies and collapse of major enterprises. The government negotiates a bail-out package with the IMF for about US$60 billion. Kim Dae-jung, an opposition leader, is elected as the sixth president of South Korea.

1998. Kim Dae-jung takes office as president and announces his "sunshine policy" of seeking better ties with North Korea. Financial crisis eases with private and public initiatives to reduce long-term debt.

1999. The South Korean government establishes the Financial Supervisory Service, and announces a fiscal plan to balance the budget by 2006. Curbs on foreign investments are eased.

2000. Foreign automakers take control of some troubled South Korean firms. President Kim Dae-jung pays an official visit to P'yongyang, the first such visit since the creation of the 2 Koreas.

FUTURE TRENDS

South Korea went through a very difficult economic period in the late 1990s. Its gradual recovery has shown the resilience of its economy and its capability to grow further. The major factor for its success has been the strength of its export industries, the engine of growth since the 1960s. The diversification of this sector, which also includes high-tech industries, will ensure a position for South Korea as a major economic power and a major global exporter.

The high domestic labor costs have led to the relocation of some labor-intensive industries to other Asian countries like China and Vietnam. This process will likely be accelerated, especially because it can speed up recovery of the South Korean economy and help it grow faster by making its products more competitive in world markets.

If the current process of reconciliation between the 2 Koreas continues, better ties will likely lead to extensive production of South Korean goods-for-export in North Korea, where labor costs are much lower. Better ties will also provide a big opportunity for South Korean industries as their government has agreed to expand and modernize North Korea's crumbling infrastructure pending the settlement of major security concerns. The unification of the 2 Koreas could also turn a united Korea into a stronger economic and military power. Despite its current difficulties, South Korea has a large military force and is an economic power with a growing high-tech sector. North Korea suffers from major economic problems and requires heavy investments to repair its aging industries, devastated agriculture, and crumbling infrastructure. However, it has a very extensive industrial sector with an advanced military branch, a relatively significant mining sector, and a highly educated population. It is linked via land to China and Russia, which are South Korea's targeted markets. The combined economic and military capabilities of the 2 Koreas will likely help a united Korea to establish itself as a regional power in the Pacific.

The restructuring of South Korea's economy and the growing presence of foreign investors and enterprises in the previously protected South Korean market will impose bankruptcies and mergers on weak and small firms to make the larger firms strong enough to withstand foreign competition. Unless the economy grows fast enough

to generate employment for the jobless, this situation could contribute to a growing unemployment rate with negative economic, social, and political consequences on South Korea. The role of foreign firms in its economy will significantly increase as its closed and highly-protected markets are opened.

DEPENDENCIES

South Korea has no territories or colonies.

KUWAIT

State of Kuwait
Dawlat al-Kuwayt

CAPITAL: Kuwait City.

MONETARY UNIT: Kuwaiti dinar (KD). One Kuwaiti dinar is divided into 1000 fils. Bills come in denominations of ¼, ½, 1, 5, 10, and 20KD. There are coins of 5, 10, 20, 50, and 100 fils.

CHIEF EXPORTS: Oil and oil-related products and fertilizers.

CHIEF IMPORTS: Food and livestock, construction materials, vehicles and parts, clothing.

GROSS DOMESTIC PRODUCT: US$29.3 billion (purchasing power parity, 2000 est.).

BALANCE OF TRADE: **Exports:** US$23.2 billion (f.o.b., 2000). **Imports:** US$7.6 billion (f.o.b., 2000).

COUNTRY OVERVIEW

LOCATION AND SIZE. Kuwait lies at the northwestern corner of the Persian Gulf. With a total area of 17,820 square kilometers (11,073 square miles), it covers an area slightly smaller than the state of New Jersey. To the south and southwest, it shares a 222-kilometer (138-mile) border with Saudi Arabia. To the north and west, there is a 242-kilometer (150-mile) borderline with Iraq. Most major towns, including the capital, Kuwait City, are located along the Gulf, toward the south.

POPULATION. Kuwait's population totaled 2,041,961 in July 2001, of which almost 60 percent were foreign residents. The population increased 1.6 percent per year between 1980 and 1997. The population growth rate was estimated by the CIA to be 3.38 percent in 2001. Most of the growth stems from the arrival of foreign immigrants who come to Kuwait looking for jobs, rather than from a high birth rate. Nevertheless, an estimated 70 percent of the population is under the age of 24.

In 1998, the population density of Kuwait was 102 inhabitants per square kilometers (264 per square mile), with most people living in towns; the urbanization rate is 97 percent. The majority is Muslim (85 percent), with an almost equal split between Sunni Muslims (45 percent) and Shiites (40 percent). Christian, Hindu, Parsee, and other religious minorities make up the remaining 15 percent.

OVERVIEW OF ECONOMY

Kuwait is a small, open economy that depends to a large extent on oil. Worldwide, Kuwait's oil reserves are second only to those of Saudi Arabia, representing about 10 percent of total global reserves. Oil accounts for nearly half of the **gross domestic product** (GDP), more than 90 percent of exports, and 75 percent of government income. Over the last 20 years, the government has tried to broaden the country's importance as a player at all levels of the oil industry by purchasing petroleum distribution networks and gas stations in other parts of the world.

In 1990, Iraq invaded and annexed Kuwait and was then driven out by United Nations (UN) forces under the leadership of the United States. A decade later, Kuwait has fully recovered: the economy is on the upswing and the **infrastructure** has been restored. Kuwait operates the world's most generous state welfare system for its indigenous population. Nationals enjoy access to a free (local) telephone service, electricity at 10 percent of production cost, and water supplies at a third of cost. In addition, as the constitution stipulates, nationals are provided with lifetime guaranteed employment in the civil service, with subsidized housing for married employees.

Like many other Gulf states, Kuwait is heavily dependent on international oil prices. Therefore, it needs to develop a viable non-oil related industrial base and is pressed hard to create jobs for the growing number of young nationals entering the job market every year. The government is, in principle, committed to economic reform. It presented a package of structural reforms to the National Assembly in 1999, which are designed to

enhance overall efficiency and growth potential. However, implementation has been slow, and **privatization** programs have met stiff resistance because of fears over job losses between nationals and the possible elimination of consumer **subsidies**.

POLITICS, GOVERNMENT, AND TAXATION

The State of Kuwait is a hereditary constitutional monarchy, headed by an emir chosen from the Al-Sabah family. The current emir is Sheikh Jaber al-Ahmed al-Jaber al-Sabah, who acceded to the throne in 1977. Sheikh Jaber al-Sabah is head of state and head of the executive council of ministers, and he rules by decrees agreed to by the council of ministers and, in theory at least, approved by the 50-member National Assembly.

Kuwait can be considered a typical rentier state, that is, a state benefitting from large revenues from the sale of natural resources, in this case oil. As in another oil-dependent sheikhdom, Bahrain, the government distributes the income to its citizens by providing them with jobs and welfare and keeping taxation low. In return, Kuwait's citizens are tied to the state and remain loyal to an undemocratic regime. The concept may be captured in the phrase, "no taxation, no representation."

No political parties are allowed in Kuwait although informal groupings do exist. The largest are the religiously motivated Islamic Patriotic Coalition, the Islamic Constitutional Movement, and the Islamic Popular Grouping, also called the Salafi. The Kuwait Democratic Forum is the largest secular political group and is the voice of liberal and Arab nationalist opinions. The legislature, Majlis Al-Umma, is a **unicameral** National Assembly of 50 elected members, plus appointed cabinet ministers, serving for a 4-year period. The Assembly's legislative power is restricted, since the emir can simply dissolve it at will and rules by decree. In fact, the National Assembly was temporarily dissolved by decree of the emir in 1976, 1986, and 1999. Kuwaitis under the age of 21 and women cannot vote. Though the issue of women's suffrage (right to vote) is heavily debated, in January 2001, Kuwait's constitutional court followed a lower-court ruling refusing to grant women their voting rights.

The Kuwaiti emir also has ultimate authority over major decisions relating to oil. In December 1975, the country **nationalized** its domestic and foreign oil assets and created the Kuwait Petroleum Company (KPC), which is an umbrella company for subsidiaries handling oil production and marketing. The economy is heavily dominated by state-owned enterprises.

INFRASTRUCTURE, POWER, AND COMMUNICATIONS

Kuwait's infrastructure is modern and well developed. Within a few years after liberation from the Iraqi occupation, Kuwait managed to restore facilities and services to pre-war standards.

TRANSPORTATION. A network of 3,800 kilometers (2,361 miles) of good paved roads and modern multi-lane expressways link all areas of the country, extending south and west from Kuwait City to neighboring cities and to Iraq and Saudi Arabia. The ports—Shuwaykh, Shuaybah, and Mina Al-Ahmadi—handle commercial shipping and petroleum exports.

POWER. Kuwait has several major electric power-generating plants. These incorporate desalination operations, which remove salt from seawater to provide the country with drinking water. Currently, the country has enough electric capacity from plants fired by natural gas or oil, but with demand rapidly rising as the population increases, expansion projects are already underway to increase capacity. To meet demand, the *Middle East Eco-*

nomic Digest (MEED) estimates that Kuwait will need to spend US$3.6 billion over the next 10 years to install 5,000 megawatts (MW) of generating capacity to add to the 6,900 MW that was already available at end-1999.

TELECOMMUNICATIONS. Before 1990–91, the telephone system had more than 250,000 subscribers, with work under way to increase this number to more than 500,000. Since demand is running at only 400,000 lines, the emphasis is on upgrading rather than expanding the system. There is a mobile cellular system in operation, which had 150,000 subscribers in 1996. By 2000, Kuwait had 3 Internet service providers and 5,000 hosts registered under their own domain. The Ministry of Communications retains control over these services and access is expensive, but the Internet is hugely popular and, according to the U.S. State Department's *Country Commercial Guide for 2001*, the number of individual users is expected to jump to 300,000 by 2003.

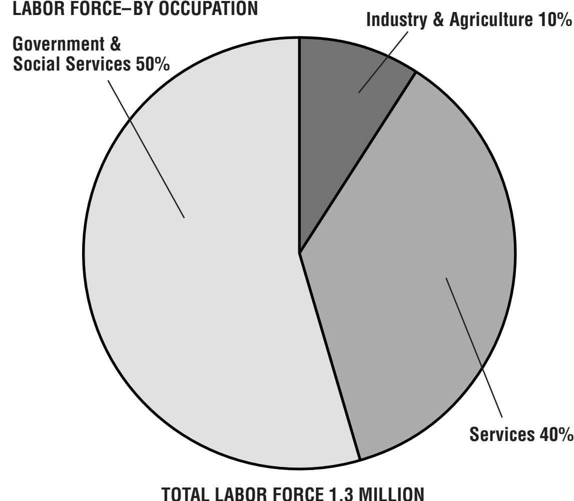
Kuwait
GDP–COMPOSITION BY SECTOR–1996

SOURCE: *CIA World Factbook 2000* [Online].

ECONOMIC SECTORS

The economy of Kuwait relies heavily on industry and services. In 1996, agriculture accounted for none of the country's GDP, while industry accounted for 55 percent and services accounted for 45 percent. Agriculture only contributed 0.4 percent to the GDP in 1999, while industry accounted for 51.4 percent, and services for 48.2 percent. These figures, however, can be misleading, since oil dominates the Kuwaiti economy. Except for petroleum industries, Kuwait's only other industrial enterprises are desalination, salt production, food processing, and construction.

Kuwait
LABOR FORCE–BY OCCUPATION



TOTAL LABOR FORCE 1.3 MILLION

SOURCE: *World Factbook 2001.* Percent distribution for 1996 est.

AGRICULTURE

Because Kuwait is desert and has almost no water, agriculture has seen minimal development. As a result, Kuwait imports over 96 percent of its food, while over 75 percent of its drinking water has to be distilled or imported.

Pollution, dating from the deliberate oil spillage and torching of wells under Iraqi occupation, has further hindered agricultural development in the aftermath of the war.

In the 1970s, over-fishing by many states in the Gulf considerably reduced catches of fish and shrimp. In the late 1980s, war and environmental damage, including oil spills, also harmed the fishing industry. Large-scale commercial fishing takes place as far afield as the Indian Ocean and the Red Sea but serves domestic demand.

INDUSTRY

Industrial development in Kuwait has faced formidable obstacles. The country, so rich in oil, is poor in most other resources. The small domestic market restricts production for local consumption to small-scale operations, while the small Kuwaiti **labor force**, possessing limited skills, and high labor costs are further constraints.

MINING/HYDROCARBONS. Kuwait's oil production of 2.095 million barrels per day (bpd) in 1998 accounted for 3 percent of total world output. Although Iraqi forces set fire to over 60 percent of Kuwaiti oil wells and thus destroyed about 2 percent of Kuwait's total reserves, the country holds about 10 percent of known world reserves. The U.S. Department of Energy estimates that Kuwait's importance as a world oil producer will steadily increase. Kuwait and Saudi Arabia hold about 80 percent of the world's excess production capacity, which means that the 2 countries can easily produce more or less oil at will, thus influencing the prices in the world markets. The emirate plans to invest US$15 billion over the period 1995–2005 to increase its output capacity to 3.5 million bpd. There are also plans to modernize 3 refineries to increase total domestic processing capacity from 800,000 barrels per day (bpd) to 1 million bpd and to allow for environmentally cleaner products. At present, Kuwait produces about 2 million barrels of crude oil per day. With oil prices remaining high throughout 2000, earnings amounted to an estimated KD5.4 billion (US$17.5 billion).

The emirate also ranks among the nations with the world's largest natural gas reserves. Most of its gas is used for domestic needs rather than export, but Kuwait estimates that it has 1.5 trillion cubic meters, or 1.1 percent of global reserves.

MANUFACTURING. Most industry is concentrated in petrochemicals and production of fertilizers. The Petrochemical Industries Company (PIC), a subsidiary of the Kuwait Petroleum Company (KPC) and the leading industrial enterprise, is involved in the production of petroleum-based fertilizers. Kuwait's capacity to produce fertilizer stands at approximately 1.65 million tons per year. In recent years, however, the market has been hit by technical problems, weak prices, and the imposition of European Union (EU) **tariffs**. Other light industries include chemicals, food processing, textiles, furniture, paper, mineral and metallic products, cement, sulphur processing, detergents, and construction materials.

SERVICES

Aside from oil, services dominate the Kuwaiti economy. Most people are employed by the government, whose over-staffed bureaucracy and generous welfare system provides most Kuwaitis with their income. Since there is hardly any tourism, banks and financial services are the only commercial services involving the **private sector**.

FINANCIAL SERVICES. By the 1980s, Kuwait's banks were among the Gulf region's largest financial institutions. Because of the high oil revenue in the 1970s, many private individuals with money to dispose began to speculate. This action prompted a small crash in the official stock market in 1977 and a much larger crash in the alternative stock market, the *Souq al-Manakh* in 1986. The debts from the crash (US$64 billion) left all but one bank in Kuwait technically insolvent and held up only by support from the Central Bank. A government imposed reform program for the banking sector was still incomplete in 1990 when the Iraqi invasion changed the entire financial picture.

After liberation, new plans were announced for reform, which involved the government purchase of the banks' outstanding debts, but the reform has not yet been completed. Only the National Bank of Kuwait (NBK), the largest commercial bank, which handled the exiled government's finances during the crisis, survived both crises intact. The NBK, with current assets of over US$12 billion, is one of the 5 biggest banks in the Arab world and ranks in the top 250 banks worldwide. the jointly owned Bank of Bahrain and Kuwait and 6 other Kuwaiti banks are also in the top 1,000.

INTERNATIONAL TRADE

Ever since the era of oil began after World War II, the priceless mineral has been Kuwait's main export product. Thanks to the huge revenue from oil sales, the government accumulated surplus money and invested abroad. Many of these reserve investments were cashed in during the Iraqi occupation and the liberation period to meet the expenses of Kuwait and the allied coalition. By the mid-1990s the value of exports exceeded the costs of imports by US$4 billion. **Trade surplus** hit a low in 1998, due to declining oil prices but began rising again in 1999. Figures show a US$2.7 billion increase to US$13.5 billion in the value of exports, and a US$1 billion drop in imports, which totaled US$8.1 billion, compared to 1998. By 2000, the *World Factbook* estimated

Trade (expressed in billions of US$): Kuwait

	Exports	Imports
1975	9.184	2.390
1980	19.663	6.529
1985	10.487	6.005
1990	7.042	3.972
1995	12.931	7.784
1998	9.529	6.130

SOURCE: International Monetary Fund. *International Financial Statistics Yearbook 1999.*

that exports totaled US$23.2 billion and imports totaled US$7.6 billion.

Because of Kuwait's small domestic manufacturing sector, the country's imports for its high-income economy are finished products, which come primarily from the United States and Japan. In 1999, according to the *Economist Intelligence Unit*, 15.4 percent of imports came from the United States, 10.2 percent from Japan, 7.3 percent from Germany, and 7.1 percent from the United Kingdom. Japan, however, led Kuwait's export markets, absorbing 22.8 percent, followed by the United States at 11.5 percent, Singapore 8.2 percent, and the Netherlands 7.3 percent.

MONEY

The Kuwaiti dinar's **exchange rate** is pegged to the U.S. dollar and has remained stable throughout the last few decades. The International Monetary Fund (IMF) has praised the Central Bank of Kuwait, established in 1959, for its successful policies in keeping the Kuwaiti currency stable. One dinar roughly equals 3 dollars.

Kuwait is one of the few major capital-exporting countries, that is, the state has more income at its disposal than it spends, and this surplus money is invested overseas or lent to the international banking sector. The Kuwait Investment Authority (KIA) controls 2 portfolios, the Reserve Fund for Future Generations and the State General Reserve Fund. The combined value of these funds is estimated at between US$60billion and US$90 billion; although impressive, these figures are well below the pre-1990 Gulf War peak of US$117 billion. KIA's investments include bonds and international stocks listed on the New York and London stock exchanges, as well as real estate property, in Europe and North America. The (official) Kuwait Stock Exchange is small and is characterized by intensive trading, of only a limited number of stocks, among local investors.

POVERTY AND WEALTH

In a state such as Kuwait, class based on private property and wealth becomes less important than the power of access to the state that distributes the large (oil) revenues. Although Kuwait is a wealthy country and poverty is almost non-existent, there are still important divisions within society. There are divisions between long-settled tribal families and those who only settled in the last 3 decades and do not benefit from long established ties to the powerful. Some of the latter have not even been granted Kuwaiti citizenship and are usually called *Bidoon*, meaning "without" (nationality) and thus face grave disadvantages. Another important determinant of proximity to the state apparatus is the sectarian division between Sunni Muslims and Shiites. The Shi'a community (immigrants from neighboring countries) has often been excluded from the government bureaucracy that provides Kuwaiti Sunnis with work and social security.

The provision of social services to Kuwaiti citizens, compared with most Western countries, is extensive. The state welfare system especially cares for the needy, providing direct transfers to widows and students, and aiding families in need because of divorce, old age, disability, parental death, illness, or financial difficulty. Educational and marital status are taken into account in granting aid.

WORKING CONDITIONS

Kuwait's vast wealth has attracted many immigrants from poorer countries who come looking for work. Thus,

GDP per Capita (US$)

Country	1975	1980	1985	1990	1998
Kuwait	21,838	16,922	10,736	N/A	N/A
United States	19,364	21,529	23,200	25,363	29,683
Saudi Arabia	9,658	11,553	7,437	7,100	6,516
Qatar	N/A	N/A	N/A	N/A	N/A

SOURCE: United Nations. *Human Development Report 2000; Trends in human development and per capita income.*

after decades of **immigration**, at least 55 percent of the total population of Kuwait are foreign, and the rate within the workforce is even higher (84 percent). In the private sector, 94 percent of employees are expatriates, working in shops, services and, frequently, as domestic servants. Only about 26 percent of Kuwaitis participate in the workforce, as opposed to 70 percent for expatriates. The Kuwaiti **participation rate**, although still low, has been gradually increasing (it was 22 percent in 1989) owing to a rise in female participation in the workforce. For cultural and social reasons this rate is still low, and, because of Kuwait's oil wealth, many women do not need to work.

Kuwaiti citizen workers—95 percent are government employees—are entitled to join unions. However, according to the U.S. State Department's *Country Commercial Guide for 2001*, in June 1998, there were only 50,000 union members. There is a legal minimum wage in the government sector, but none in the private sector. Public health care is free to citizens, but a health insurance charge is levied on employers to cover expatriates (most workers in the private sector). Foreigners thus do not benefit equally from the state social services, which favor Kuwaiti nationals.

About 40 percent of Kuwaitis are under the age of 14, and young Kuwaitis are seeking jobs in steadily increasing numbers. These factors are a cause for growing government concern, and the government will at some point have to abandon its guarantee of a **public sector** job for every university-educated citizen. One recent measure is the "Kuwaitization" of the economy, promoting the employment of Kuwaitis over foreign labor in the private sector and limiting immigration. It has been nearly impossible for foreign workers to obtain Kuwaiti citizenship; those who do achieve it are not entitled to vote for another 20 years.

COUNTRY HISTORY AND ECONOMIC DEVELOPMENT

1756. Part of the Ottoman Empire since the 16th century, Kuwait gains semi-autonomy under the Sheikh of the Sabah family.

1899. The ruling Sabah family accepts British protection to counter the spread of Turkish influence and grants control of external relations to Britain.

1918. The end of World War I ends what is already nominal Turkish control over Kuwait.

1938. Oil is discovered in Kuwait, but World War II interrupts further exploration. Drilling resumes after the war and Kuwait soon develops into a thriving commercial center. The government begins to use oil revenue to develop the country's infrastructure and a modern and comprehensive welfare system.

1960. Kuwait becomes a founding member of the Organization of Petroleum-Exporting Countries (OPEC) on 14 September.

1961. Kuwait's status as a British protectorate ends, and the country assumes independence on 19 June. The ruling sheikh becomes the emir and assumes full executive power.

1961–63. Iraq moves troops to the border, threatening to annex Kuwait but draws back due to international pressure and a coup within Iraq.

1974–75. The Supreme Petroleum Council is created, followed by the nationalization of domestic and foreign oil assets and the creation of the Kuwait Petroleum Company (KPC).

1977. Sheikh Jaber Al-Ahmad Al-Sabah becomes emir, succeeding Sheikh Sabah Al-Salem Al-Sabah.

1990–91. Iraq invades Kuwait. The international community condemns the invasion and, led by the United States, deploys armed forces to Saudi Arabia. The allied forces launch an aerial bombing campaign against Iraqi forces in Kuwait and Iraq on 17 January 1991. On 24 February 1991, American-led ground forces enter Kuwait, and on 28 February Iraq agrees to accept UN resolutions concerning Kuwait.

1999. A draft law granting women full political rights is narrowly rejected in December.

FUTURE TRENDS

At the beginning of the 21st century, Kuwait is facing major challenges. Political reform, including women's right to vote, is under debate and cannot be put off in the long run. Economic reform is even more pressing. Kuwait's oil reserves will last for another 100 years, but the country has to **restructure** its economy and reduce its dependence on oil. Many young Kuwaitis will demand their share in the country's wealth and need to be provided with work opportunities and prospects if they are not to challenge the country's political power structures. The government is currently debating various reform packages in both the economic and political arenas. And, however much resistance there may currently be to economic reform, privatization and **liberalization** might prove to be the only way to sustain the country's wealth in a post-oil era.

DEPENDENCIES

Kuwait has no territories or colonies.

Kyrgyz Republic
Kyrgyz Respublikasy

CAPITAL: Bishkek (formerly known as Frunze).

MONETARY UNIT: Som (KS). One som equals 100 tyiyn. Som are circulated in denominations of 1, 3, 5, 10, 50, 100, 500, 1,000, 2,000, and 5,000.

CHIEF EXPORTS: Cotton, wool, meat, tobacco, gold, mercury, uranium, hydropower machinery, shoes.

CHIEF IMPORTS: Consumer durables, oil and gas, machinery and equipment, foodstuffs.

GROSS DOMESTIC PRODUCT: US$10.3 billion (purchasing power parity, 1999 est.).

BALANCE OF TRADE: **Exports:** US$515 million (1999 est.). **Imports:** US$590 million (1999 est.).

COUNTRY OVERVIEW

LOCATION AND SIZE. Located in the central region of Asia, bordered by China on the east, Kazakhstan on the north, and Uzbekistan and Tajikistan on the west and south, Kyrgyzstan is a remote, landlocked, mountainous country with a total area of 198,500 square kilometers (76,641 square miles). It is a bit smaller than the U.S. state of South Dakota. Kyrgyzstan's capital, Bishkek, is located near the northern border of the country close to the border with Kazakhstan and Kazakhstan's largest city, Almaty.

POPULATION. The population of Kyrgyzstan was estimated at 4,685,230 in July 2000. In 2000 the birth rate stood at 26.29 births per 1,000 while the death rate was 9.15 deaths per 1,000 persons. The population growth rate was estimated at 1.43 percent in 2000. Migration out of the country was estimated at 2.8 per 1,000.

The vast majority of Kyrgyzstanis live in rural areas. The World Bank reported that only 33.6 percent of the population lived in urban areas in 1999. The population density for the entire country was 25 per square kilometer (65 per square mile) that same year, according to the World Bank.

At the beginning of the 21st century, roughly 50 percent of Kyrgyzstan's multinational population was ethnic Kyrgyz; 20 percent was ethnic Slavic (Russian, Ukrainian, and other Slavic groups); 13 percent was Uzbek; about 2 percent was German; and other groups comprised the remaining 12 percent. The Kyrgyz (also spelled Kirghiz) language is a Turkic language. Russian and Kyrgyz are the principal languages spoken in Kyrgyzstan, but Uzbek, Tajik, and Uigur are also widely spoken outside the major towns. In practice, most government and commerce is conducted in the Russian language in the large cities. Many Kyrgyz government officials and professional and technical workers use Russian as their principal language. Most rural areas use Kyrgyz or one of the other indigenous languages of the region as their principal language.

OVERVIEW OF ECONOMY

Kyrgyzstan is a remote, landlocked country with inadequate trade and transportation **infrastructure**. Kyrgyzstan's economy heavily emphasizes agriculture and animal husbandry, but there is a growing service sector in the urban areas. In 1999 agriculture accounted for 45 percent of the economy, while services comprised 35 percent. Industry made up the remaining 20 percent. Oil and gas, machinery and equipment, and foodstuffs are Kyrgyzstan's main imports. Kyrgyzstan's principal trading partners are Germany, Russia, Kazakhstan, and Uzbekistan. Cotton, wool, hides and meat are the main agricultural products and exports. Industrial exports include gold, mercury, uranium, and electricity. Kyrgyzstan is a mountainous country with significant hydroelectric power generating potential.

While it was part of the Union of Soviet Socialist Republics (USSR) from 1917 to 1991, Kyrgyzstan had a highly specialized economic niche in the **communist** economic system. Kyrgyzstan served primarily as a provider

of **primary commodities** such as gold, mercury, and uranium, and unprocessed agricultural goods such as foodstuffs, cotton, wool, and meat. After the USSR collapsed in 1991, Kyrgyzstan's mining and industrial enterprises underwent rapid contraction due to the loss of orders from buyers and the inability of the existing transportation infrastructure to make possible a rapid entrance into other markets. Kyrgyzstan's military industrial enterprises soon lost their financing. Production at Kyrgyzstan's gold, mercury, and uranium mines fell sharply.

After national independence on 31 August 1991, the newly established Kyrgyz government planned to create a market-based economy and to integrate into the world economy. Among the former communist countries, Kyrgyzstan became a leader in the movement of the post-Soviet states toward an open market economy. But the transition to an open economy has been difficult for this small country with few manufactured goods. The economy underwent severe contraction between 1990 and 1995. However, the Kyrgyzstan economy began to rebound in 1996 as new, post-communist practices began to take effect. The **budget deficit** as a proportion of the GDP was cut in half during the period 1995 through 1997.

With assistance from international organizations, such as the World Bank and the International Monetary Fund, the Kyrgyzstan government has made good headway in establishing the legal and regulatory foundation for a market economy. Kyrgyzstan carried out **privatization** of small enterprises and overhauled the country's banking and financial systems. In 1998 the Kyrgyzstan constitution was amended to allow for private ownership of land. Kyrgyzstan was the first country of the CIS to join the World Trade Organization (December 1998). At the urging of international financial institutions, the Kyrgyzstan government took steps to **liberalize** its foreign trade relations. These steps included eliminating some **tariff** restrictions (1991–92), eliminating certain highly bureaucratic export registration requirements (1998), and eliminating export **duties** (1999).

But Kyrgyzstan's enthusiastic pro-market posture has not met with the anticipated level of economic success. Basic economic indicators plunged between 1991 and 1995 when Soviet-era government **subsidies** for industry, farming, and public services were eliminated. Rapid **restructuring** of the economy led to sharp drops in farm and industrial output. From 1996 to 1997, the declines in output were reversed and the economic picture for Kyrgyzstan brightened considerably. A large increase in government revenue from the newly opened Kumotr gold mine, the largest single industrial enterprise in the country, combined with favorable weather that helped boost agricultural production. Economic growth in 1996 registered 7 percent and climbed to 10 percent in 1997. **Inflation** declined, and the government's current account

deficit, an indicator of the government's fiscal responsibility, dropped to its lowest level since independence.

This picture changed when Kyrgyzstan was hit hard by the 1998 financial collapse in its major trading partner, Russia. The financial collapse in Russia led to a sudden drop in orders for Kyrgyzstan goods from Russia. The contraction in output led also to a deterioration in Kyrgyzstan's **balance of payments** at the same time as the country's indebtedness to foreign lenders increased substantially.

POLITICS, GOVERNMENT, AND TAXATION

The Republic of Kyrgyzstan was an early leader in the post-communist transition. The country's pro-reform leader, Askar Akaev, a scientist and former president of the republic's Academy of Sciences, quickly established an impressive record of encouraging political and economic liberalization. The Kyrgyz government liberalized most prices, established a national currency, began privatization and financial sector reform, and introduced the legal and regulatory framework for open trade with its neighbors. Non-tariff barriers were removed, and export taxes were eliminated on all goods between 1994 and 1997. In December 1998, the Kyrgyz Republic became the first former communist country to qualify for entrance to the World Trade Organization.

Kyrgyzstan's legal system is based on the continental legal system. Kyrgyzstan's constitution was adopted in 1993. The constitution recognizes a separation of powers among 3 branches of government: an accountable executive, a deliberative legislative, and an independent judiciary. The constitution has provisions to ensure checks and balances, competitive elections, and judicial independence. The judiciary consists of Constitutional Court (to decide issues of constitutional import), the Supreme Court, an arbitration court to resolve commercial disputes. There is a system of lower courts. The constitution was amended in February 1996 by a popular referendum that substantially expanded the powers of the president.

The Kyrgyzstan political system is formally a competitive system. Officials are popularly elected in multicandidate elections. The country's president is elected by popular vote for a 5-year term. Kyrgyzstan president Askar Akaev was first elected in October 1990 and reelected in December 1995 and December 2000. High officials such as the prime minister and other top cabinet officials are appointed by the president and submitted for approval to the Kyrgyzstan legislature, the Zhogorku Kenesh. There are numerous parties and political movements. The officially registered political parties are the Agrarian Party, the Agrarian Party of Kyrgyzstan, the ASABA party, the Communist Party of Kyrgyzstan, the Democratic Movement of Kyrgyzstan, the Dignity Party, the Fatherland Party, the Justice Party, Kyrgyzstan Erkin Party, the Movement for the People's Salvation, the Ashar Party, the National Unity Democratic Movement, the Peasant Party, the Republican Popular Party of Kyrgyzstan, and the Social Democratic Party.

The Kyrgyzstan government has sought to limit the size of the **public sector** to enable greater opportunities for the growth of private industry and services. Accordingly the government has sought to reduce the total government revenue as a percentage of the GDP. However, after the 1998 economic crisis, tax collection fell behind anticipated levels. Tax revenue collection relies heavily on industry. Poor industrial performance contributed to the shortfall in tax revenue. Yet during the economic crisis total government expenditures were higher than anticipated in recent years due to the increased costs of social protection programs. International financial institutions urged the Kyrgyzstan government to maintain a tight **monetary policy**, reduce government spending, and increase revenue collection. Yet the Kyrgyzstan government was reluctant to adopt these politically unpopular measures.

INFRASTRUCTURE, POWER, AND COMMUNICATIONS

The main components of Kyrgyzstan's physical infrastructure include roads, rail, electric grids, gas pipelines, and a telecommunications system. The country's road system consists 16,854 kilometers (10,467 miles) of paved roads. The rail system consists of 1 major rail line of a length of 370 kilometers (299 miles) linking the Kyrgyz capital, Bishkek, with Kazakhstan. The fixed (copper wire) telephone system and microwave relay stations dating from the Soviet period (consisting of 357,000 lines) are rapidly being overtaken by new, decentralized mobile phone services. Of the country's 14 airports, only the capital airport is capable of accommodating international flights.

Mountainous Kyrgyzstan has abundant low-cost hydropower but only very limited amounts of oil, gas, and coal. Consequently, Kyrgyzstan is dependent upon the other Central Asian countries for much of its gas and petroleum. Kyrgyzstan trades hydroelectric energy for natural gas with both Uzbekistan and Kazakhstan. With the urging of international donors, Kyrgyzstan is seeking to adopt an energy policy that will reduce the role of the state, increase **private sector** involvement, and explore the potential for energy exports, particularly to China. China's recently adopted "Go West" policy has opened a potentially rich market for hydroelectric energy in the adjoining Xinjiang-Uigur Autonomous Province of China.

Since being corporatized (that is, separated from the previous unified Soviet system and turned into a Kyrgyzstan state-owned corporation) in 1994, the Kyrgyz state power company, Kyrgyzenergo, has operated 22 hydroelectric power stations with a combined capacity of over 30 billion kilowatt hours (kWh) annually. Electricity production averaged roughly 12 billion kWh per year. The expansion of electricity output was held back, though, by inadequate transmission equipment and inadequate pricing and cost recovery. Given these factors, Kyrgyzstan commenced the privatization of its energy utility in 1998. The process came to a conclusion in early 2001. The goal of the privatization was to separate regulatory functions from energy production and sales. As a result of the strategy to separate the various energy functions and shift to a cost-recovery basis for energy production, there have been significant increases in electricity and district heating costs. Loans and credits with the World Bank and other multilateral development banks are earmarked to reduce the social costs of the transition to a privatized energy sector.

ECONOMIC SECTORS

The 3 most important sectors of Kyrgyzstan's economy are: agriculture, accounting for about 45 percent of the GDP (US$52.8 million in 1999); industry, accounting for about 20 percent of the GDP; and services, accounting for the remaining 35 percent in 1999. The most significant economic sector, agriculture, is the largest employer in the country, employing over half of the country's **labor force**. In 1999 the International Monetary Fund estimated that 886,000 workers were employed in Kyrgyzstan's agriculture and forestry sectors. Agriculture accounted for about 22 percent of the country's exports in 1999. Other important sectors are hydroelectric energy production, mining, particularly gold mining, and service. Small industries and processing plants are located in Kyrgyzstan's larger cities, particularly Jalalabod, Osh, and Talas in addition to the capital, Bishkek.

AGRICULTURE

Kyrgyzstan produces cotton, sugar beets, vegetables, potatoes, grapes, melons, tobacco, fruits and berries, grain, wool, and meat. Total agricultural production dropped in 1992 from earlier levels and then began to rise. The disruption in farm inputs such as seeds, farm machinery, and agricultural extension services, along with transportation difficulties and weak consumer demand, led to the drop in output. After the effects of the market transition from communism began to be felt, overall agricultural production began to increase after 1996. However, livestock and wool production, 2 of the traditional mainstays of the Kyrgyzstan rural economy, continued to decline due to slack demand for products such as hides and wool and new competition from Turkish, Chinese, and other suppliers.

In connection with the Kyrgyzstan government's goal of maintaining an open market and **liberal economic** order, the government has avoided intervention in the agricultural economy through price supports and targeted subsidies. This policy contrasts sharply with that of neighboring Uzbekistan, where the government has continued to maintain a major presence in the agricultural economy. Kyrgyzstan instituted a land reform program to transfer use rights to land from the Soviet-era large state farm cooperatives to individual farmers. By 1999 over 90 percent of Kyrgyz farms were held in private hands with long term (99 years) use rights. Farm land may be bought and sold and transferred through inheritance. The CIA *World Factbook* reported that 55 percent of the Kyrgyzstan workforce was engaged in agriculture in 1999.

INDUSTRY

Since the collapse of the USSR, the industrial and manufacturing sector has undergone considerable contraction. Between 1990 and 1995 production declined in all sectors of the power industry, engineering and metalwork, and fuel, light, chemicals, and petrochemicals sectors. By 1999, the industry sector accounted for 20 percent of the country's GDP and employed 15 percent of the labor force, according to the CIA *World Factbook.*

Kyrgyzstan's manufacturing plants are concentrated in and around the capital, Bishkek. Many of these enterprises were not competitive on international markets and thus have been shuttered and closed since they lost subsidies from the government. The enterprises that remain tend to operate well below capacity.

Unlike other developing countries faced with transferring workers from low productivity subsistence agriculture to higher productivity industry, Kyrgyzstan faces the opposite problem. The government seeks to spur industrial restructuring to cut employment in formerly subsidized, inefficient industries, and to encourage the emergence of new lower tech enterprises in the agricultural and service sector.

The only industrial sector that experienced significant growth recently was gold mining. In May 1997 the Kumtor Operating Company, which is two-thirds owned by the Kyrgyzstan Republic and one-third by a Canadian company, began gold mining operations. The construction of the mine cost US$450 million. The initial estimate of recoverable gold was 16.5 million troy ounces of gold, and gold was expected to average around 485,000 ounces a year over the life of the project. In late 1999 the company revised its estimates of recoverable gold downward, taking into account the changes in the price of gold and a revision of the geological expectations of the mining work. Accordingly, the amount of recoverable gold was revised downward to 4.27 million troy ounces. Company officials announced that the mine would be closed in 2008. This represents a major setback for the Kyrgyz government's development plans, given that revenue from the gold mine constituted a major portion of the government's income (40 percent in 1999).

SERVICES

The service sector is the second largest sector after agriculture. An estimated 566,000 workers were employed in the Kyrgyzstan service sector in 1999, according to the International Monetary Fund. This sector was under developed during the Soviet period when the government put most emphasis on heavy industry and agriculture. After independence, the service sector expanded rapidly. New laws and regulations made it possible to open private businesses offering **consumer goods** and services. The small service sector surged ahead as business people began offering services, such as car repair, housing construction and improvement, real estate services, legal services, beauty shop services, and other small business that did not require substantial investment.

The banking and financial services industry expanded rapidly, although during the first decade of independence (1990–2000) this financial sector continued to be heavily oriented toward foreign economic activity rather than local financial services. The government adopted a program in 2000 to support micro-credit lending to put more emphasis on local financial services.

TOURISM. The year 2001 was declared the "year of the tourist." Since Kyrgyzstan is the "Switzerland of Asia," the government has sought to take advantage of the beauty of Kyrgyzstan's spectacular mountains and lakes to encourage greater tourism. The tourism sector is a priority area for economic development in Kyrgyzstan. The country, with major mountain ranges and some of the

highest peaks in the world, possesses breathtaking natural features. The towering mountains of Peak Pobeda (7,439 meters), Peak Lenin (7,134 meters), and Peak Khan-Tengri (6,995 meters) exist in what is called the "realm of eternal ice and snow." The country offers white water rafting, pony trekking, hiking, mountaineering, skiing, mountain biking, and many other possibilities.

INTERNATIONAL TRADE

Very nearly one-half of Kyrgyzstan's foreign trade is with former Soviet countries. Kyrgyzstan's largest trading partner is Russia, comprising almost 40 percent of foreign trade. Behind Russia is Ukraine, the United States, Uzbekistan, Turkey, the United Kingdom, Germany, South Korea, and other countries. Kyrgyzstan exported to Germany goods worth US$148 million in 1999. Russia imported goods worth US$70 million, Kazakhstan imported goods worth US$50 million, Uzbekistan imported US$46 million, and China imported goods worth US$25 million. In the same year, Kyrgyzstan imported from Russia goods worth US$110 million, from Kazakhstan US$73 million, from Uzbekistan US$50 million, from the United States US$56 million, from Germany US$47 million, from China US$36 million, and from Canada US$26 million.

Kyrgyzstan's main exports are processing industry products (67 percent) and agricultural goods (17 percent), while the main imports were machine-building products (21 percent), coal and petroleum products (11 percent), food and tobacco (7 percent) and textiles (6 percent).

Kyrgyzstan is heavily dependent on the outside world for fuel imports. In 1999 Kyrgyzstan imported 576 million metric meters of natural gas, 1,075,000 tons of coal and 368 tons of high grade petroleum fuels (diesel and gasoline). Kyrgyzstan sustains this level of fuel imports primarily through exporting electricity. The country exported, primarily to Kazakhstan and Uzbekistan, 2,001 million kilowatt hours in 1999.

Trade (expressed in millions of US$): Kyrgyzstan

	Exports	Imports

1995	408	837
1996	505	709
1997	603	841
1998	513	599
1999	453	201

SOURCE: United Nations. *Monthly Bulletin of Statistics* (September 2000).

The Kyrgyzstan government has taken measures to improve the trade environment. Customs procedures and non-tariff barriers have been reduced in recent years in anticipation of the country's joining the World Trade Organization (1998). However, Kyrgyzstan's trade potential is complicated by the fact that Kyrgyzstan is landlocked. Few goods and services move from Uzbekistan into Kyrgyzstan. The borders with Tajikistan and China have been subject to heavy security regulation. But Kyrgyzstan's border with Kazakhstan is a long and relatively open border. The Kazakh and Kyrgyz languages are closely related and mutually comprehensible. However, Kazakhstan produces few of the manufactured goods that Kyrgyzstan requires. Consequently, Kazakhstan serves mainly as a transshipment point for goods from outside Central Asia, particularly Russia and Europe.

The Kyrgyzstan government has taken steps to improve the foreign investment climate in the country. A new foreign investment law was adopted in September 1997. The law was adopted to bring the country into conformance with the standards of the World Trade Organization. The law provides protection against expropriation, that is, **nationalization** of property by the government. According to the law, foreign investors have the same legal status and conditions as Kyrgyz investors and can do business as wholly-owned foreign businesses in Kyrgyzstan or as **joint ventures** either with Kyrgyz partners or other foreign partners. Foreigners can buy stocks and securities in Kyrgyz companies and participate in privatization programs. Foreign investors can **repatriate** capital, that is bring earnings from foreign investments and foreign trade back into the country. They can also freely export profits as foreign currency or as goods produced or as commodities or services bought. Local currency is freely convertible into foreign currency, including for import purposes or payment against project expenses. Investors may retain earned foreign currency, without having to convert it into local currency.

MONEY

Kyrgyzstan was the first country in Central Asia to introduce its own currency (May 1993) following the collapse of the USSR. When first introduced, 4 som were equal to US$1. However, over the years since the som was introduced inflation reduced the value of the som relative to the dollar. Kyrgyzstan experienced hyperinflation in the early 1990s, with inflation reaching 1,400 percent, but economic measures have since brought inflation down.

Between 1995 and 1997, positive developments in the economy reinforced the government's intention to restrict the supply of money. A scarce currency will tend to be valuable, but as the currency becomes more available, its value declines. Accordingly, as the money sup-

SOURCE: United Nations. *Human Development Report 2000; Trends in human development and per capita income.*

ply increased, the value of the Kyrgyz som declined. Following the 1997 crisis in the Asian financial markets and, in particular, following the collapse of financial markets in Russia in August 1998, the Kyrgyz economy suffered dramatically. Kyrgyzstan's money supply rose in 1998 and 1999. During this period inflation, which had been brought under control, rebounded in 1998 and reached nearly 40 percent in 1999. During 1999, the som lost 35 percent of its value to the U.S. dollar. Public confidence in the currency was further shaken by a major financial fraud involving some of the country's largest commercial banks.

In 1998 the Kyrgyzstan banking system suffered a major financial crisis which led to closing half of Kyrgyzstan's 26 commercial banks in 1999. The Soviet-era banking system had been expanded and slightly modified during the period between 1992 and 1995 but had not adopted standards of bank operations in accordance with international practice. As a result, in 1995, according to a World Bank study, over half of the commercial banks had a negative net worth. The study also concluded that 60 percent of all the banking sector's loans were considered unrecoverable, that is, these loans would never be paid back by the borrowers, according to the IMF. The public lost confidence in the banking system, and many people withdrew their funds, leading many of the banks to go out of business.

Kyrgyzstan is a relatively heavily indebted country. Outstanding debt in the first quarter of 2000 amounted to US$1,409 billion, according to the IMF. Much of the Kyrgyzstan republic's debt is concessional; that is, it has been loaned by public entities as special assistance at better-than-market terms by international financial institutions such as multilateral development banks. But a considerable portion is non-concessional; that is, it is money that was loaned by private lenders such as commercial banks. Even if Kyrgyzstan is granted special repayment terms, delays, or postponements in the repayment schedule, the burden of future debt will remain high. The Kyrgyzstan government will need to bolster its fiscal position through reducing government expenditures and increasing revenue. More competent debt management and limits on contracting debt will help. More emphasis on government reforms may also improve the overall economic pictures by improving the investment climate and enhancing the productive and export potential of the country.

POVERTY AND WEALTH

Poverty in Kyrgyzstan increased between 1994 and 2000. IMF estimates of the consumer **price index** rose in 1995 to 143 percent, in 1996 to 189 percent, in 1997 to 233 percent, in 1998 to 252 percent, and in 1999 to 343 percent, and in 2000 to over 400 percent. At the same time, the index of **real wages** (adjusted for inflation and other factors) climbed only gradually from 100 percent in 1994, to 117 percent in 1995, to 112 percent in 1996, to 116 percent in 1997, to 139 percent in 1998, dropping to 128 percent in 1999 and further to 105 percent in 2000. Thus, while the cost of living increased fourfold between 1994 and 2000, wages remained approximately at the same level.

In 2000 Kyrgyzstan ranked 98 out of 174 countries listed on the UNDP Human Development Index. Income distribution and social indicators for Kyrgyzstan fell considerably behind other countries at comparable stages of

development. For instance, nearly a quarter of the population was not expected to reach age 60. The proportion of young people enrolled in schools dropped. The rates of infectious diseases, particularly tuberculosis, increased. By 1997 an estimated one-half of the population had fallen below the official poverty line, living on the equivalent of less than US$0.75 per day. The average monthly pension payment was among the lowest in the former Soviet states, amounting to less than US$10 in 1999.

Although on national average only 1 in 2 persons in Kyrgyzstan is categorized as poor, 80 percent of the poor live in rural areas. During the 1990s, despite substantial recovery in agricultural production, rural incomes per capita fell substantially. The degree of poverty in rural areas has also become more severe relative to urban areas. While extreme poverty decreased from 19.1 percent of the population in 1996 to 14.8 percent in 1997, most of this resulted from a targeted poverty reduction program in urban areas only. Poverty is also distributed unevenly in the population, affecting more women than men. The Kyrgyzstan government has initiated a national poverty reduction program, the Arakat program. Moreover, the government is waging major efforts to revamp its poverty-fighting strategy in coordination with major donors, including the Asian Development Bank and the World Bank.

WORKING CONDITIONS

Kyrgyzstan had a working population in 1999 of 1,854,000 people, but the total number of people within working age (16 to 60) was 2,542,000. An estimated 1,718,000 of these were employed, and 54,000 people were estimated as unemployed in 1999, only 5,400 of whom received unemployment benefits.

The decline in Kyrgyzstan industrial sector has pushed many people out of technical and professional positions. Most of this movement has been in the direction of the service sector. A large proportion has also moved to agricultural employment. While the legal system and social security systems traditionally provide for fewer protections for these sectors, in fact working conditions in Kyrgyzstan's declining industry deteriorated significantly in the post-Soviet years as workers' unions and collective bargaining was unsuccessful in promoting the health and safety of working conditions in such declining industries. The international donor organizations, such as the World Bank and the multilateral development banks, have identified social protection as one of the highest priorities of future assistance to Kyrgyzstan.

COUNTRY HISTORY AND ECONOMIC DEVELOPMENT

552. Formation of the first Turkic khanate, uniting Turkic-speaking regions under one political leadership.

750. Arabs conquer the area that is now Kazakhstan, spreading the influence of the Islamic culture and religion.

840. Formation of the Kyrgyz khanate.

1240–1440. The Mongol Horde—armies originating from what is now Mongolia—overwhelm the Kipchak nomads. The Mongol Horde sweeps westward and southward, extending Mongol influence over much of modern-day Central Asia.

1850. Major Russian **emigration** to Kyrgyzstan occurs as emigrants search for new agricultural lands.

1867. The Russian tsar decrees the establishment of the Turkestan general-governorship, extending official Russian rule into Kyrgyzstan, making the country part of the Russian Empire.

1917. The Russian provisional government, unable to rule a country exhausted by World War I, falls to the Bolshevik Revolution. Bolshevik revolutionaries (communists) in St. Petersburg proclaim the establishment of a communist government.

1918. The communists announce the establishment of the Russian Socialist Republic (which includes the territory of present-day Kyrgyzstan). Opponents of the communists rally to restore the monarchy. Civil war ensues and continues for 2 years.

1924. The Kyrgyz Autonomous District is formed within Russia.

1936. The Kyrgyz Autonomous District is transformed into the Kyrgyz Socialist Republic.

1957–61. Under Soviet leader, Nikita Khrushchev, a new agricultural initiative called the "Virgin Lands Campaign" relocates tens of thousands of people from the European parts of the USSR to Central Asia, including Kyrgyzstan.

1991. An unsuccessful attempt to take over the Soviet government by Communist Party hard-liners precipitates a crisis in Moscow. Kyrgyzstan declares independence from the USSR on 31 August. A group of 11 high Communist Party officials gather in Almaty (then known as Alma-Ata) to sign a document announcing the end of the USSR and the establishment of the **Commonwealth of Independent States** (CIS) on 21 December.

1992. Kyrgyzstan joins major international organizations: the UN, World Bank, the Asian Development Bank, and the European Bank for Reconstruction and Development.

1993. The Kyrgyzstan constitution is adopted.

1995. A new version of the Kazakhstan constitution, assigning greater powers to the executive branch, is adopted.

1998. Kyrgyzstan is the first post-Soviet state to be admitted as a member of the World Trade Organization.

2000. Kyrgyzstan joins the Eurasian Economic Community, an international organization designed to create a common economic market throughout much of the former USSR.

FUTURE TRENDS

Kyrgyzstan faces major challenges. The country has liberal trade orders in the former Soviet Union. However, as a small, landlocked country with only limited trade potential, the latitude for development through globalization is limited. The most urgent issue is reducing poverty. Changes in the way that the government treats foreign investors, tourists, and foreign companies may lead to an improvement in the country's ability to promote investment and create new jobs.

DEPENDENCIES

Kyrgyzstan has no territories or colonies.

LAOS

Lao People's Democratic Republic
Sathalanalat Paxathipatai Paxaxon Lao

CAPITAL: Vientiane (Viangchan).

MONETARY UNIT: Lao kip (K). There are no coins, and there are notes of 1, 5, 10, 20, 50, 100, 500, 1,000, 2,000, and 5,000 kip. With considerable inflation over the last several decades, kip notes under 500 are rarely seen or used now. The Thai baht and U.S. dollar are also commonly used, especially in larger transactions, though official policy calls for the exclusive use of the kip.

CHIEF EXPORTS: Wood products, garments and textiles, electricity, coffee, tin.

CHIEF IMPORTS: Machinery and equipment, vehicles, fuel.

GROSS DOMESTIC PRODUCT: US$7 billion (purchasing power parity, 1999 est.).

BALANCE OF TRADE: **Exports:** US$271 million (1999 est.). **Imports:** US$497 million (1999 est.).

COUNTRY OVERVIEW

LOCATION AND SIZE. The Lao People's Democratic Republic, or Lao PDR, is a land-locked nation bordered on the north by China, the east by Vietnam, the west by Burma (Myanmar), and the south by Thailand and Cambodia. The Mekong River forms much of the boundary between Laos and Thailand. The country's total land boundaries are 5,083 kilometers (3,159 miles). Its geographic area is 236,800 square kilometers (91,428 square miles), making it just slightly larger than the state of Minnesota. Its capital, Vientiane, the largest city in central Laos, is located on the Mekong River. The other 3 major cities are Luang Prabang, Savannakhet, and Pakxé.

POPULATION. The Lao PDR differs from many other Asian countries in that it has an extremely low population density of only 23.2 persons per square kilometer (60 per square mile). Its population density is almost the same as the state of Minnesota. In July of 2000 its population was estimated as 5,497,459. This compares with a population of 3,586,083 in 1985; 2,886,000 in 1976; and 1,789,000 in 1953. The current population growth rate is a relatively high 2.5 percent. If this rate were to continue, the country's population would double to over 10 million by the year 2028. The major cause of this high population growth is the high fertility rate of Lao women. The Lao women on average currently have 5.21 children.

Thus, it is not uncommon to find families of 4 to 10 children, even in urban areas.

The ethnically diverse Lao PDR population is comprised of 3 major ethnic groups: Lao Lum, lowland; Lao Theung, upland; and Lao Sung, highland. Among prominent highland groups are the Hmong and Yao. Ethnic minorities comprise 47.5 percent of the total population, according to the 1995 census, which distinguished 47 main ethnic groups and 149 sub-groups. Thus, the Lao PDR is one of the most ethnically diverse countries in Asia.

With the country's low population density and the need to import labor (often Vietnamese **guest workers**), the government has been reluctant to adopt a strict birth control or family planning policy. Instead the policy has been the more moderate one of birth spacing (delaying natural pregnancies so that women have fewer children than the biological maximum).

With such high fertility, the Lao PDR has a very young population. Roughly 54.2 percent of the population is under the age of 20. With poor health conditions, particularly in rural areas and related high mortality rates, only 2.2 percent of the population is over 70 years of age.

OVERVIEW OF ECONOMY

Laos is one of the world's poorest countries, and thus its primary policy goal is to strengthen its economy and develop its own means to earn foreign exchange. Much of its population is involved in a subsistence economy, in which families produce by themselves what is needed for daily basic living. Laos' major economic disadvantage has been that it is a landlocked nation with weak **infrastructure**. Nearly 80 percent of the country is mountainous and/or forested with only 21 percent of the land cultivable and less than 4 percent actually cultivated. Laos perhaps has the highest ratio of forest cover to land area in all of Asia: 47 percent of the country is forested.

Laos' long history dates back to the founding of its first kingdom in 1353. It was then known as Lan Xang (the land of a million elephants). It reached its period of greatest glory and influence during the years 1633–90. Later succession struggles led Lan Xang to break into 3 smaller kingdoms. These weakened kingdoms then came initially under the Siamese orbit and later French colonialism. Under French colonialism, Laos suffered neglect.

After achieving complete independence from the French in 1953, the royalist Lao regime was gradually drawn into the vortex of the U.S. war in Vietnam. The economy became war-torn, suffering from extreme dependence on foreign aid. Extensive U.S. bombing of northern, northeastern, and eastern Laos from 1965 to 1973 seriously disrupted the rural economy. The U.S. dropped 33 percent more bombs on Laos than on Nazi Germany.

On 2 December 1975, the Lao People's Democratic Republic was established, representing the culmination of a long extended revolutionary war. This event brought peace and independence to the country. The economy was transformed into a Soviet-style state planned economy and received economic and technical assistance from other **communist** nations. The attempt to collectivize agriculture was rather quickly abandoned, however. In 1986, a new policy termed the New Economic Mechanism (NEM) was introduced to transform the economic system from a state-planned one to that of free market forces and prices. The major goal of this reform was to provide greater incentives to increase economic performance and productivity. With the collapse of the USSR in 1991, the Lao PDR opened its doors to active economic involvement with the West, both in terms of international aid and investment. The Lao PDR became a favorite of diverse donors, and foreign aid currently represents some 20 percent of the GDP. From 1991 to 1997, the Lao PDR enjoyed considerable **macroeconomic** success under the NEM system, with annual economic growth averaging 6.5 percent

During the 1990s, the Lao economy became increasingly interconnected with the Thai economy. Laos imports many basic modern consumer products from Thailand. On weekends, it is common to find many Lao families from Vientiane visiting Thailand via the Friendship Bridge, shopping for basic household items such as various packaged foods.

Initially, it appeared that the Lao economy (with no stock market and a currency not traded internationally) would be immune to the Asian economic crisis of 1997 which shook so many Asian economies. In a somewhat delayed effect, the Lao currency went into a free fall far greater than that of any other Asian country. Given Lao's dependence on imports, this had a serious, adverse effect on nearly all Lao, except a small number of elite individuals connected to the dollarized economy. The Asian economic crisis also adversely affected the Lao economy by reducing **foreign direct investment** from other Asian countries and reducing the demand for Lao electricity exports, a major source of foreign exchange.

Since it received foreign aid earlier from the Eastern block countries and in the past decade from multilateral agencies (primarily the World Bank and Asian Development Bank) and other countries, the country does have a debt burden. Total **external debt** in 1997 was estimated to be US$2.32 billion, and debt payments represented 4 percent of government expenditures in 1995–98. Many Lao loans are granted at highly concessional terms, meaning that the interest rates are quite low over a long payment period and thus are almost like grants.

The major challenge facing the Lao PDR currently is to restore the sound macroeconomic performance of the early and mid-1990s and develop its own sources of foreign exchange earnings. Hydroelectric power development on the tributaries of the Mekong, the development of light industries such as garments and textiles, marketing of natural resources such as gypsum, tin, and wood products, and tourism development are the primary economic sectors being promoted.

The government plays an active role in evaluating and assessing potential international investments coming into the country. The government, with the strong support of the Lao Women's Union, has been active in preventing the development of a commercial sex industry. At this point, there is absolutely no standardized fast food industry in the country, such as KFC or McDonald's. Interestingly, in terms of the cola wars, Laos is a Pepsi country. Coke must be imported from Singapore or Thailand.

POLITICS, GOVERNMENT, AND TAXATION

The Lao PDR remains a 1-party state with complete dominance by the Lao People's Revolutionary Party (LPRP). The president since 1998 has been Khamtain Siphandon and the prime minister has been Sisavat Keobounphan. The National Assembly, last elected in 1997, has 99 members. Basic economic policies are determined in major Party Congresses which are held every 5 years. The LPRP is strongly supportive of the current mixed policy of having a **privatized** economy with a reduced role for state-owned enterprises but with a 1-party political system.

As part of the reform policies introduced in 1986, the government has attempted to reduce the size of the **public sector**, including the military. They have done this, however, in humanistic ways by avoiding the direct firing of people. International donors and agencies have been concerned that such reforms have slowed in the late 1990s.

The government's ability to tax is limited. Tax revenue is only 10 percent of the GDP, and major capital outlays are financed by external assistance, according to Bourdet. Major sources of revenues are business taxes, import/export taxes, and various fees (such as visa fees and fly-over fees). For smaller businesses, flat fixed taxes are used, which discourages tax evasion. In 1995–98, tax on foreign trade represented 27.1 percent of government tax revenues. The **income tax** represents only 6.3 percent of all revenues.

INFRASTRUCTURE, POWER, AND COMMUNICATIONS

Overall, the Lao PDR has a weak physical infrastructure. As yet, there is no train system. Travel to remote provinces requires a plane. During the rainy season, roads to remote areas may be impassable. At other times, inexpensive bus transportation is available for ordinary people to travel through the country.

The country is served by a network of 21,534 kilometers (13,381 miles) of roads, of which 16.5 percent are paved. As part of the 1996–2000 National Plan, major work has been undertaken to improve the country's limited road infrastructure. A key project is the reconstruction of Highway 13 which links China in the north and Pakxé in the south.

The Lao PDR is receiving considerable international assistance to develop its infrastructure. The Japanese, for example, provided assistance in building a new international airport in Vientiane, and the Thais assisted with a new airport in Luang Prabang. The country's weak road infrastructure adversely affects the development of its rich natural resources, such as minerals and wood products

In April 1994, the Friendship Bridge, the first ever across the lower parts of the Mekong River, was completed with a US$40 million grant from Australia. Upon completion of the bridge, the Lao government issued a regulation not allowing private cars to use the bridge. The government feared a wave of private cars from Thailand

which would cause accidents, congestion, and pollution. Thus, the bridge is used mainly commercially by trucks and buses and has helped landlocked Laos connect economically with its neighbors in the region. A second new bridge over the Mekong, the Lao-Nippon Bridge, was completed in the south near Pakxé in August 2000 and was financed primarily by the Japanese. A third bridge across the Mekong at Savannakhet is scheduled for completion in 2003. This bridge connected to Route 9 will connect both central Laos and northeast Thailand to the Vietnamese port of Da Nang. These bridges, as well as better road infrastructure, will improve Lao links with major ports in Thailand and Vietnam.

With its many mountains and tributaries of the Mekong River, the Lao PDR has excellent hydroelectric power potential. The country's total hydropower potential is estimated to be 25,000 megawatts (MW). Laos has even been referred to as the potential battery of Southeast Asia. Currently the country has 10 major electric power plants with a total capacity of 1329.5 MW. In 1998, the nation consumed just over one-third of the 1.34 billion kilowatt hours (kWh) of electricity generated. The Lao PDR plans to construct a total of 12 dams on the Mekong's tributaries over the next decade. The decision has caused considerable controversy in the international environmental community. Major concerns include effects on displaced rural populations in Laos itself, the fish populations of the Mekong and its tributaries, and unintended effects on downstream communities in Cambodia and Vietnam, which are highly dependent on the natural flows of the Mekong River.

Only those of higher socioeconomic status have telephones in their homes, though cell phones are increasingly popular among those of higher socioeconomic status. The country has only a total of 18,139 conventional phone lines, of which 71.8 percent are in the capital. Phone cards are also now available. It is the goal of Lao Télécommunications to have 49,000 telephone lines installed by 2001. Televisions are widely used wherever there is access to electricity. About 72 percent of urban households and 22 percent of rural households have televisions. Much of the Lao population lives in the lowlands in close proximity to Thailand. Thus, they have access to popular Thai TV programming with related advertisements for a variety of popular Thai **consumer goods**. Shinawatra (a Thai telecommunications conglomerate) has been active in assisting the Lao PDR develop its telecommunications infrastructure.

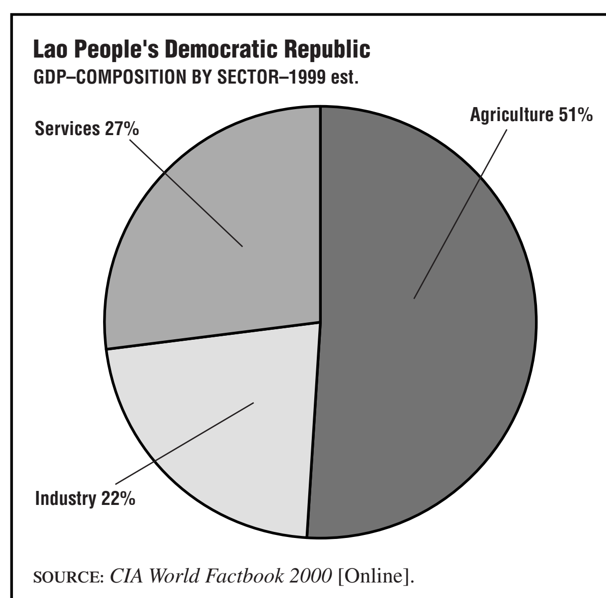
Though Laos has not officially joined the World Wide Web (there is not yet a .lao suffix), some Lao people, especially in urban areas, are using the Internet. There are now a number of private cyber shops in Vientiane offering public Internet service.

ECONOMIC SECTORS

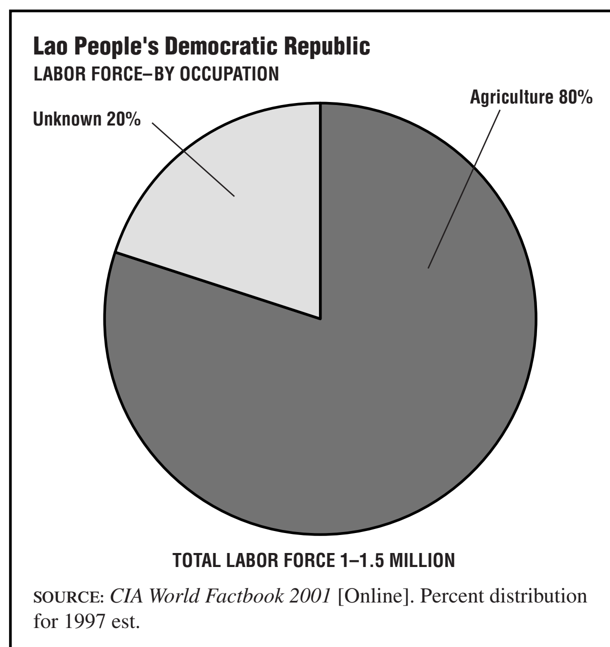
Like many undeveloped countries, Laos generates a majority of its GDP from the agricultural sector. Agriculture accounted for 51 percent of the GDP in 1999 and employs about 80 percent of the total **workforce** of 2,220,000. In most areas of the country, 90 percent of the people work in agriculture. Industry accounted for 22 percent of the GDP but employed only 3.3 percent of the people (though this figure was 20 percent in the capital). The services sector accounts for 27 percent of the GDP and roughly 10.3 percent of the workforce.

Traditionally, Laos has been a subsistence agricultural economy. That remains true today, though other economic sectors are growing in the Lao PDR. While the Lao PDR has no intention to develop heavy industry, it is developing its light industry, particularly the production of garments and textiles. The Lao PDR has excellent capability in producing attractive traditional textiles and handicrafts. Lao silk and cotton textiles are becoming known for their quality around the world.

The Lao PDR is also developing an important service sector, which has 2 new components: banking and tourism. There are now many newly established foreign banks located in the Vientiane area, most of which were established in the 1990s. Among 6 such Thai banks are the Bangkok Bank and Siam Commercial Bank. The 1999–2000 year was called the "Visit Laos Year" to promote tourism. In the late 1990s travel to Laos was dramatically **liberalized** with visas available on arrival. The tourist infrastructure was also improved substantially. Tourism has expanded dramatically in the 1990s from only 14,400 visitors in 1990 to 500,200 in 1998. In 1997 tourism contributed US$73.3 million to the economy,



SOURCE: *CIA World Factbook 2000* [Online].



SOURCE: *CIA World Factbook 2001* [Online]. Percent distribution for 1997 est.

representing 23 percent of export earnings. The designation of Luang Prabang, perhaps the best preserved traditional Southeast Asian city, as a world heritage site was definitely a positive development for Lao tourism. Other important tourist attractions in Laos are the Wat Phu ancient Khmer ruins in southern Laos, the Khon waterfalls in the same region, and the Plain of Jars in Xiengkuang Province. The latter area was heavily bombed during the U.S. War in Vietnam. In fact, as of 2001 Laos is the most heavily bombed country in the history of the world.

AGRICULTURE

The Lao PDR is primarily an agricultural economy, with this sector contributing 51 percent of the GDP. Approximately 1,880,000 individuals are involved in agricultural work. Recently the Lao PDR conducted a major agricultural census which provides an excellent overview of the basic nature of Laos' agricultural system. The results of this survey indicate that 79.7 percent of the total population is engaged in farming. The average land holding is 1.62 hectares with 27 percent of households having 2 hectares or more and 36 percent having less than 1 hectare. An impressive 97 percent of farmers own their own land. About 93 percent of the area devoted to rice production is for the production of sticky rice, a subsistence crop used primarily for home consumption. Tree farming is another important part of Lao agricultural life. About 23 percent of such farms have mango trees, 17 percent coconut trees, 17 percent banana trees, 11 percent jackfruit trees, and 11 percent tamarind trees. Also 8 percent of farmers are engaged in aquaculture, and 71 percent do other fishing. Roughly 31 percent of farmers have cattle, 48 percent water buffaloes, 49 percent pigs (73 percent in the case of Hmong people), and 73 percent chickens.

Only 6 percent of farmers sell their total output, while 35 percent sell some of their farm output. This means that the majority of farmers (59 percent) are engaged solely in subsistence agriculture. The basic staple of such farmers is the production of sticky rice for local consumption. Unlike its neighbors Thailand and Vietnam, the Lao PDR is not a rice exporting country. Their goal is simply to attain self-sufficiency in rice production, which is possible in good weather years. The production of sticky rice may be supplemented by vegetable gardens; animal raising (goats, chickens, ducks, turkeys, pigs); and mango, coconut, or banana trees. Some maize is also grown. In the tropical forests of Laos, there are also many edible wild plants and foods that are gathered, primarily by women. Hunting and fishing also supplement the subsistence diet and provide valuable protein. Lao greatly enjoy fishing.

In terms of tons of agricultural production, the top 5 crops in Laos in order of importance are rice, vegetables and beans, sugarcane, starchy roots, and tobacco. Since 1990, among these 5 leading crops, production of vegetables and beans has grown the fastest in percentage terms, followed by sugarcane. In the decade since 1990 rice production has increased 47.9 percent. Among agricultural products often produced as **cash crops** are mungbeans, soybeans, peanuts, tobacco, cotton, sugarcane, coffee, and tea.

Given its subsistence nature, Lao agriculture has not played a major role in the country's foreign trade. The major export products from Laos' agricultural sector are timber, lumber, plywood, and coffee. The major agricultural imports are sugar, condensed milk, and long-grain rice.

Numerous city dwellers have rural roots and the Lao love gardening. Thus, some urban dwellers supplement limited cash incomes by having gardens, small fish ponds, or raising animals. They also may engage in fishing in the Mekong River, hunting, and the gathering wild foods. Some urban dwellers in the capital of Vientiane cultivate gardens along the Mekong River during the dry season.

FORESTRY AND LOGGING. The Lao PDR has extensive tropical forests containing many valuable hardwoods such as teak. With a total ban on logging in Thailand, there is considerable demand for Lao wood products from other Asian countries such as Thailand, Malaysia, and Japan. Malaysia has projects for teak cultivation in southern Laos. The Lao military is involved in timber exploitation. In 1991, timber and furniture exports totaled 39.2 percent of all exports, while in 1996 such exports dropped to 28 percent. In 1998, export of all types of

wood products brought in US$115.4 million to the Lao economy.

Deforestation and the need for sustainable forestry are major environmental issues facing the Lao PDR and its agricultural/rural sector. The Lao are very conscious that much of Thailand's northeast was deforested as the result of expanded rice field acreage. Also, upland agricultural production can result in serious deforestation. The reduction of upland rice production and the expansion of irrigated rice lands to allow more crops on a given piece of land should help preserve Lao forests by reducing the need to expand acreage at the expense of forests.

IRRIGATION PROJECTS. A major recent policy is an ambitious irrigation project. Given the spread of the contagion of the Asian economic crisis to Laos, organizations such as the IMF strongly urged restrictive monetary and **fiscal policies**. The Lao PDR ignored the policy dictates of the IMF and instead they moved boldly ahead with a major rural irrigation infrastructure project. For doing this they were severely criticized by the international financial community, and no doubt this expansionary program contributed to both **inflation** and the **devaluation** of the Lao kip. In continuing their agricultural irrigation program, the Lao government was both demonstrating its economic sovereignty and also clearly putting the interests of the Lao agricultural sector ahead of those in urban communities which are most severely affected by inflation.

The French scholar Catherine Aubertin argues that Lao agricultural policy favors the lowland Lao over the upland Lao because of its resettlement schemes to decrease slash and burn agriculture in mountainous areas. The Lao government feels such policies are essential for forest conservation.

INDUSTRY

The Lao PDR has relatively little industry. This sector employed only 3.3 percent of the workforce in 1995. There is no heavy industry and much of the country's industry is comprised of smaller companies. In 1999, there were only 108 establishments in the whole country with more than 100 employees. However, there were 19,797 establishments with fewer than 9 employees. These small establishments are involved primarily in the production of textiles and handicrafts. Laos is well known for the high quality of its aesthetically attractive textiles. Even though industry plays a small role in the Lao economy, its importance has increased significantly. In 1987, industry represented only 11 percent of the GDP of the Lao PDR, while in 1999, it represented 22 percent, doubling since the introduction of the New Economic Mechanism policy.

MANUFACTURING. The following are the principal products manufactured in the Lao PDR: oxygen-acetylene, battery acid, industrial alcohol, detergent powder, soap, shoes made of animal skin, leather, medical drugs, fans, vaccines, plastic goods, timber, lumber, plywood, flood lumber, rattan furniture, books, fabrics, clothing, bricks, blocks, cement, tiles, chalk, lime, electric poles, agricultural tools, tin plates, nails, electric wire, and barbed wire. For the economy, the most significant of these are clothing/fabrics and rattan furniture. Manufacturing represented 16.5 percent of the GDP in 1999, up from 13.9 percent in 1995. Except for fabrics and clothing, most of these manufactured products are for local consumption. Laos' manufacturing export potential is currently limited by its status as a "non-market economy" restricting its access to U.S. and other developed country markets. Admission to the WTO and completion of a trade agreement with the United States are essential to enable Laos to have more secure access for its exports.

ELECTRICITY AND WATER. Electric power generation is one of Lao's most significant industries. In 1998, the country produced 1.34 billion kWh of electric power. About 43 million cubic meters of water were produced and distributed, primarily in the 4 major urban areas for household and industrial use. Electricity and water production represented 2.3 percent of the GDP in 1999. As of the mid-1990s, only 1 percent of the country's vast electric potential had been exploited.

MINING. The Lao PDR has an abundant supply of minerals. Gypsum, for example, is exported to Vietnam. Tin, coal, lignite, and limestone are also mined. In the Vanvieng area, there is a major cement works, established with the assistance of the Chinese. Mining and quarrying, however, represented only .051 percent of the GDP in 1999, and minerals are not yet a significant export. The major problem in exploiting Lao mineral resources is their inaccessibility.

CONSTRUCTION. In recent years there have been a number of new construction projects mainly in the capital of Vientiane. International funding has assisted many of these projects. Among notable recent projects have been the Lao-Nippon Bridge, the new International Airport, the Lao Plaza Hotel, and the National Cultural Hall (with funding provided by the PRC). Construction in 1999 represented 2.6 percent of the GDP.

SERVICES

Services represented 27 percent of the Lao economy in 1999 and employed roughly 10 percent of the workforce. The largest component (37.2 percent) of the service sector is wholesale and **retail** trade. Perhaps the largest entities in this arena are Honda and Shell. Honda retails a wide variety of products, particularly motorcy-

cles. With Laos' rapid economic development in the 1990s, many Lao in urban areas have up-graded from bicycles to motorcycles or scooters, or among elites from motorcycles to private cars or SUVs. Toyota, Pepsi Cola, and Bier Lao are also active retailers. In urban areas there are a large number of formal retail shops as well as a large **informal economy**. Those in the formal retail sector market a wide range of consumer goods. A large number of small family-owned stores sell a variety of low cost products for basic everyday needs. Those selling goods in the large informal economy are often selling agricultural products.

The next largest component of the service sector is represented by transportation, communications, and postal services (23 percent), followed by ownership and rental of dwellings (12.1 percent). The latter grew significantly in the 1990s with the presence of a growing expatriate community associated with diverse development aid activities who are in need of modern housing.

The public service still represents an important element of the service sector (11.6 percent), though the government, with assistance from organizations such as the World Bank has sought to reduce the size of the public sector. For the most part, the Lao government has used non-draconian methods to reduce the size of this sector. Considerable success has been achieved in reducing the size of the military, for example. The next most important component of the service sector is represented by hotels and restaurants (7.6 percent), reflective of the growing importance of tourism in the Lao economy.

TOURISM. In the Lao service economy, tourism has been a major growth area. Between 1991 and 1995, tourism grew approximately 60-fold, and from 1995 to 2000 it has more than doubled. On a per capita basis, Laos has even more tourists than Thailand. The major tourist attractions of the country are its rich culture and many Buddhist temples; Luang Prabang, the former royal capital in the north and a world cultural heritage site; the majestic Mekong River which flows through the country; and shopping for Lao textiles and handicrafts in Vientiane. Laos is also noted for its genuinely friendly people who warmly welcome tourists. By April 1999, tourism was the country's highest revenue earner, contributing US$79.9 million to the Lao economy. Despite such economic contributions, tourism employs at most only 3 percent of the non-farm workforce. Tourist facilities have improved significantly in recent years. There are now large numbers of hotels, guesthouses, and restaurants in major cities. Both Vientiane and Luang Prabang now offer some up-scale tourist facilities.

BANKING. In the early 1990s banking reforms were introduced which diversified Laos' banking system. These reforms led to the National Bank being separated from 7 state-owned commercial banks such as the Lao Foreign Trade Bank (BCEL) and 5 regional banks. The reforms also opened the sector to international banks from Thailand, Vietnam, and Malaysia. In 1999, 6 of the 8 state-run commercial banks were merged into just 2 entities. Thus, the Bank of the Lao People's Democratic Republic (the national bank) now monitors a total of 14 banks consisting of 4 government banks, 3 joint banks (for example, the Lao-Viet Bank), and 7 foreign banks (6 Thai and 1 Malaysian). This network of local and international banks provides standard banking and financial services for both the average citizen and the commercial community. This banking component represents 5 percent of Laos' service sector. A major current issue facing the industry relates to questions about the **solvency** of the banking system as a result of the Asian regional economic crisis.

INTERNATIONAL TRADE

In the 1990s there were considerable diversification of Lao exports. Laos' largest export earner is timber and furniture (28 percent of exports), followed by garments (19.9 percent), raw logs (10.6 percent), electricity (9.2 percent), manufactured products (8.6 percent), coffee (7.7 percent), agricultural products (5.5 percent), gold **re-export** (4.7 percent), and motorcycle assembly (3.9 percent). With respect to garment exports, Nike, for example, is now sourcing some apparel production in Laos. Imports are comprised primarily of consumer goods (44.6 percent), **capital goods** (40.2 percent), and industrial inputs (11.9 percent).

Approximately 52 percent of Laos' imports are from neighboring Thailand, while only 22 percent of its exports go to Thailand, reflecting a strong negative trade balance with that country. In contrast, 42.7 percent of Laos' exports go to Vietnam, while only 3.9 percent of its imports are from that country. Thus, Laos has an extremely favorable trade balance with Vietnam. Other leading export destinations for Laos are in order of importance (after Vietnam and Thailand): France (6.3 percent), Germany (5.1 percent), and the U.K. (4.7 percent). Since the Lao PDR does not have most favored nation

status with the United States, it is difficult to export to the U.S. market. Major sources of imports (after Thailand and Vietnam) are Japan (1.6 percent) and Hong Kong (1.5 percent).

Prior to the communist revolution, Laos had a severe trade imbalance with exports being only a tiny fraction of imports. While Laos still imports much more than it exports, the ratio of exports to imports has steadily improved. In 1975, the first year of the current communist regime, Lao exports were only adequate to cover 12 percent of imports. In 1999, exports of US$271 million were sufficient to cover 55 percent of imports, which stood at US$497 million. Also, the total of exports plus imports divided by the GDP has also steadily increased, reflecting the internationalization of the Lao economy. By 1998 this ratio had reached 72 percent. To decrease its dependence on international aid and to alleviate poverty, the Lao government seeks to expand its exports. That is the primary rationale for its long-term plan to build more dams to produce electricity exports, an area in which Laos has a clear comparative advantage. Laos also has a comparative advantage in the export of textiles such as clothing and garments.

Laos' current **trade deficit** is financed by 2 primary sources: international aid, primarily provided by Japan, Australia, and Sweden; and growing financial **remittances** from Lao living overseas. The State Planning Committee in a December 1999 report indicated that the latter was the single most important source of income in the Vientiane Valley. Given the recent economic crisis, the government has also turned to both China and Vietnam for important economic assistance.

MONEY

Since the establishment of the Lao PDR in 1975, the country has experienced periods of both currency stability and instability with related fluctuations in inflation. As part of the New Economic Mechanism introduced in 1986, the policy was to have a single **exchange rate** determined by market forces. During the early and mid-1990s the Lao PDR achieved impressive macroeconomic stability. However, contagion from the Asian economic crisis, especially in neighboring Thailand, eventually affected the Lao PDR dramatically in 1998 and 1999. The Lao currency at one point was worth only one-tenth of its previous value. It has since improved to be worth about one-seventh of its previous value. This led to 87.4 percent inflation in 1998 and 134 percent inflation in 1999.

In the year 2000 the currency stabilized and inflation fell to 33 percent. **Monetary policy** is implemented by the Bank of the Lao PDR, but it is certainly directly influenced by economic policies of the Party and Government.

POVERTY AND WEALTH

Though Laos is an extremely poor country with 46.1 percent living below the material poverty line in 1993, the country does not have the gross economic inequalities typical of many developing countries. Rural farmers generally have their own land and are engaged in subsistence agriculture which provides for certain basic needs. Major problems for the rural poor are access to quality health care and education.

There are also serious regional income disparities primarily between urban centers and remote rural areas, often mountainous areas with a large proportion of ethnic nationalities. An average person in the richest province, Vientiane, has approximately 2 and a half times more income than the average individual in the poorest province, Huaphanh. The incidence of poverty in rural areas (53 percent) is double that of urban areas (24 percent). The areas most economically disadvantaged tend to be those more remote areas inhabited by diverse ethnic communities.

WORKING CONDITIONS

Because of the country's low population density and its former **socialist** economic system, unemployment has not been a serious problem in the Lao PDR. The visible urban unemployment rate in Laos was 3.5 percent overall in 1994. The large informal sector also provides opportunities for those who cannot find meaningful em-

ployment in the formal sector. The Lao PDR has a progressive labor law, which is extremely specific related to working age, minimum wage, and overtime payments, for example. This labor law primarily covers those employees working in the modern formal sector. Women and children are active in the labor force, particularly in the agricultural sector and informal economy. Those able to attain higher levels of education can gain access to work in the public sector, the modern **private sector**, or with various international agencies and organizations present in the Lao PDR. Those with superior English language skills are particularly advantaged in the modern, urban labor market.

COUNTRY HISTORY AND ECONOMIC DEVELOPMENT

1353–73. Reign of Fa Ngum, king of Lan Xang (the land of a million elephants), marks the beginning of recorded Lao history.

1633–90. The height of the Lan Xang kingdom occurs.

18TH CENTURY. Lan Xang breaks into 3 independent kingdoms.

19TH CENTURY. Lao kingdoms fall under the Siamese orbit, and many Lao people are repopulated to Siam as slave labor.

1890. French colonial rule in Laos begins.

1953. On 22 October, Laos achieves its independence from France.

1975. Declaration of the Lao People's Democratic Republic occurs on 2 December.

1981. First 5 Year Plan begins.

1986. New Economic Mechanism approved at Fourth Lao People's Revolutionary Party (LPRP) Congress paves the way for major economic reforms.

1994. Completion of Friendship Bridge across the Mekong River connects Laos and Thailand.

1997. Lao PDR becomes the eighth member of the Association of Southeast Asian Nations (ASEAN).

1998–99. Asian economic crisis contagion spreads to the Lao PDR, leading to free fall of the Lao kip and triple digit inflation.

2000. The Lao-Nippon Bridge across the Mekong River is completed.

2000–01. Macroeconomic stability is restored.

FUTURE TRENDS

With its low population density and favorable natural resources/people ratio, the Lao PDR has a potentially bright economic future. Assuming recovery from the Asian economic crisis, there should be growing demand in the long term for Laos' valuable energy exports, which will enable the country to become more economically self-sufficient and less dependent on international aid. There are many in the West who would like Laos to adopt a multi-party system similar to that in liberal democracies. Given the problems of money politics and instability in such systems, however, the Lao PDR is more oriented toward a single party political system to ensure stability and avoid policy gridlock often associated with unstable multiple party systems. Given the past economic performance of areas such as Hong Kong, Singapore, South Korea, Taiwan, and Malaysia, the Lao are confident that their current political system is compatible with dynamic economic growth and reaching its goal to liberate the country from underdevelopment and mass poverty by the year 2020.

DEPENDENCIES

Laos has no territories or colonies.

LEBANON

Republic of Lebanon
Al-Jumhuriyah al-Lubnaniyah

CAPITAL: Beirut.

MONETARY UNIT: Lebanese pound. One Lebanese pound (known locally as the lira) equals 100 piasters. There are notes of 50, 100, 250, 500, 1,000, 10,000 and 50,000 liras. There are no coins.

CHIEF EXPORTS: Foodstuffs, tobacco, textiles, chemicals, metal and metal products, electrical equipment and products, jewelry, paper and paper products.

CHIEF IMPORTS: Machinery and transport equipment, foodstuffs, chemicals, consumer goods, textiles, metals, fuels, agricultural products.

GROSS DOMESTIC PRODUCT: US$16.2 billion (purchasing power parity, 1999 est.).

BALANCE OF TRADE: **Exports:** US$866 million (f.o.b., 1999 est.). **Imports:** US$5.7 billion (f.o.b., 1999 est.).

COUNTRY OVERVIEW

LOCATION AND SIZE. Situated in the Middle East, Lebanon is a small country on the eastern shore of the Mediterranean Sea. Lebanon has a narrow coastal plain along the Mediterranean Sea, which is 225 kilometers (139.8 miles) long and is bordered by Syria on the north and east and by Israel on the south. A small country, Lebanon's total area is only 10,400 square kilometers (4,014 square miles), roughly two-thirds the size of the state of Connecticut in the United States. Beirut, the capital, is located in the center and overlooks the Mediterranean Sea. Other major cities include Tripoli in the north and Sidon in the south.

POPULATION. The population of Lebanon is estimated at 3,578,037, according to July 2000 estimates, an increase of 578,037 from 1980. In 2000, Lebanon's birth rate stood at 20.26 per 1,000, while the death rate was reported at 6.42 per 1,000. With a projected growth rate of 1.2 percent between 2000 and 2015, the population is expected to reach 6 million by the year 2029.

Lebanon's population is highly divided along both religious and confessional lines (the presence of groups of different faiths within the same religion). Muslims in 2001 were believed to have accounted for 60 percent of the population. Christians form the second largest group in the country. Lebanon is also home to some 200,000 Palestinian refugees, mostly Sunni Muslims, many of whom have lived in refugee camps since arriving in the country in 1948. For political reasons, no official census has been conducted since 1932. Muslim and Christian factions in Lebanon were engaged in a devastating civil war that began in 1975 and ended in 1990, when stability was restored to the country.

As in many developing countries, a majority of Lebanese (around 90 percent) live in urban areas. The population is unevenly distributed, with the vast majority of the population concentrated in the coastal cities of Beirut, Sidon, and Tyre, while other parts of the country, namely the Bekáa Valley, remain sparsely populated. The uneven population distribution has given rise to regional disparities. The coastal cities continue to receive much government attention, while the rest of the country has remained largely neglected. The population of urban areas has grown significantly since the 1960s, mostly because the cities have received more government funding and attention. In 2000, the capital Beirut and its suburbs was home to 1.3 million people. The northern city of Tripoli is the second largest in the country, with an estimated population of 450,000.

Lebanon's population is generally young, with 50.7 percent below the age 24, and is one of the most highly educated in the region. The adult literacy rate in Lebanon is estimated at 90 percent. Primary education in Lebanon is mandatory, and private education is prevalent. Lebanon's university system is also highly developed. The health-care system is one of the most

developed in the region. As a result, Lebanon also has one of the highest average life expectancies in the region, at 68.5 years. Infant mortality in Lebanon is also low by regional standards.

OVERVIEW OF ECONOMY

Lebanon's relatively small economy is based mainly on services, which have traditionally accounted for approximately 68 percent of the GDP. The sector is mainly comprised of a thriving regional banking market, tourism, and trade. Most economic activity is concentrated in the coastal cities. Other economic activity includes quarrying for the cement industry and small-scale farming, largely concentrated in the coastal plain and the Bekáa Valley in the south. Agriculture has traditionally accounted for only 13 percent of the GDP, which explains why the country is heavily dependent on the import of foodstuffs. The industrial sector is also relatively small, mostly because of the small domestic market. Jewelry, cement, processed food, and beverages are among the country's chief exports.

Lebanon entered the 20th century as a French protectorate heavily dependent on trade, especially along the coastal cities of Tyre, Sidon, Beirut, and Tripoli. Most of Lebanon's present-day problems can be traced to 1920, when the French incorporated Beirut and other coastal towns, the Bekáa Valley, and certain other districts in Mount Lebanon to form Greater Lebanon. The establishment of Greater Lebanon meant that the Maronites, concentrated largely in the Mount Lebanon area, were no longer the majority, and the population became equally divided between Muslims and Christians. In 1926, the French drew up a constitution that provided a formula for power-sharing among the various religious groups, making it mandatory for the president of the republic to be a Maronite, the prime minister a Sunni Muslim, and the speaker of the chamber a Shi'ite Muslim. This formula ensured that the pro-France Maronites exercised more control than any other religious group, allowing France to continue to control Lebanon through its close relations with the Maronites long after its full withdrawal from Lebanon in 1946.

The 1926 constitution, coupled with an unwritten power-sharing agreement known as the National Pact drawn up between Christians and Muslims in 1943, allowed Lebanon to maintain parliamentary democracy until the mid-1970s. However, rising tensions between Christians and Muslims, who by the mid-1970s became a majority and began demanding more political power, led to the outbreak of the civil war in 1975. In the immediate years before the outbreak of the war, Maronite Christians, feeling threatened by Muslim demands, resorted to violence to crush Lebanese Muslim opposition. They also wanted to oust the Palestinian Liberation Organization (PLO), which had a strong presence in Lebanon in the 1970s and was seen as an ally of the Muslims. The civil war intensified and broadened during the 1980s, with Palestinian refugees and their allies launching attacks into Israel from Lebanon, and the taking of Western hostages in Beirut by various Arab guerilla groups (guerilla groups practice non-conventional warfare in an effort to wear down the resistance of their adversaries). Syria was also involved, stepping in to fill the vacuum left by the weak Lebanese government and army. In an effort to stop the attacks and destroy the PLO, Israel invaded southern Lebanon in 1982, and it required major efforts by the United States and other powers to stop the fighting—at least temporarily—and escort the PLO out of the country. But Lebanon's war dragged on and did not end until 1990, with the adoption of the U.S./Arab-brokered Ta'if accords, which essentially recognized Syria's continued involvement in Lebanon's affairs and slightly adjusted the power-sharing formula

among the various religious groups designed by the French in 1926.

Until 1975, Lebanon's economy was characterized by minimal state intervention in private enterprise. In those years, the country managed to transform itself into a major banking center by avoiding restrictions on foreign exchange or capital movement and enforcing strict bank secrecy regulations. Lebanon's economic **infrastructure**, however, was severely damaged by the 1975–90 civil war. International organizations estimated the cost of physical destruction to be between US$25 billion and US$30 billion. Since the end of the civil war, the country has been engaged in an economic reconstruction process and has made significant progress toward the restoration of democracy. As a result, **inflation** fell from more than 100 percent to 5 percent between 1992 and 1998, and **foreign exchange reserves** jumped to more than US$6 billion from US$1.4 billion in the same period. The Lebanese pound has been relatively stable. Much of the physical and financial infrastructure damaged during the war has been rebuilt.

Lebanon's economic policy after the war has been largely shaped by Rafik al-Hariri, who served as prime minister between 1991 and 1998 and returned to power in August 2000. Hariri's economic policies have focused on reconstructing the country's war-damaged economy through the infusion of huge capital into the construction sector. Much of this capital has come from Lebanese expatriates and Arab investors from the Persian Gulf region. As a result, the period between 1991 and mid-1996 witnessed high levels of growth. This growth, however, slowed in 1996, mainly as investor confidence began to weaken in the wake of Israel's 2-week bombardment of the country in April 1996. The resulting economic slowdown has affected the country since, and attempts by the government to curb inflation by raising interest rates has caused the economy to slow even further. The Lebanese economy has been in **recession** since 1999, and the country's **real GDP** has experienced a decline of 0.5 percent, mainly the result of the drop in private demand, consumption, and investment. The government's huge spending bill has fueled a large **budget deficit**, which was equivalent to 53.5 percent of expenditure in the first 7 months of the year 2000.

Lebanon in 2001 continues to be primarily a free-market economy and is by far the most liberal among Arab economies. Since the end of the civil war in 1991, the country has had a fairly stable multiparty system and is strongly supported by the United States and the European Union. The main challenge facing the economy is the large budget deficit, which is fueled by a substantial government debt, mostly spent on reconstruction and a large government bureaucracy. A hike in public spending has thus far failed to stimulate economic growth. Further, the government's **privatization** program, launched in the first half of 2000, has thus far not been successful; in May 2000, the Lebanese parliament adopted a new law that sets the general framework for privatization. However, privatizing state-owned companies is going very slowly and hinders true economic reform.

Corruption is widespread in Lebanon. Officially, several anti-corruption regulations are in place, but they are rarely enforced. According to the U.S. State Department, corruption is more pervasive in the **public sector** than in private businesses, and is especially evident in **procurement** and public works contracts. A 1998 study by the World Bank estimated that at least US$45 million is spent annually in bribes to brokers and government officials. Between 1998 and mid-2000, the cabinet of Prime Minister Salim al-Hoss made it a priority to fight corruption, which it mostly blamed on Prime Minister Rafiq al-Hariri's economic reconstruction drive while he was in office. The government's initial efforts to enforce anti-corruption measures led to the dismissal of hundreds of public servants, but the general verdict has been that corruption continues to be pervasive in the country.

POLITICS, GOVERNMENT, AND TAXATION

The country's political system in 2001 is derived from the 1989 Ta'if Accords, which put an end to the 16-year civil war. Lebanon is now a parliamentary republic with a president and a **unicameral** (single chamber) National Assembly. The president of the republic is elected by the parliament for a 6-year term. The speaker of parliament is elected by parliament every 4 years, which is also the length of time between parliamentary elections. The president appoints the prime minister, who forms the Cabinet of Ministers. Under the new constitution drafted after the conclusion of the Ta'if Accords, Muslims now have an overall numerical advantage in the National Assembly, since representation is based along sectarian lines. Further, the power of the president has been somewhat diminished, although by custom, the president of the republic must still be Maronite Christian, while the prime minister must be a Sunni Muslim and the speaker of the parliament a Shi'ite Muslim.

The major political parties are arranged, although not explicitly, along religious lines. The Hizballah and Nabih Berri's Amal movement represents the Shi'ite Muslim community, while the Sunni Muslims are divided between pro-government parties and marginal leftist parties. The Druze, a community concentrated around Mount Lebanon, are represented by Walid Jumblatt's Progressive Socialist Party. The Christian-Maronite community controlled the country before the war. The Ta'if Accords attempted to correct this bias but left the Christian community feeling

relatively powerless. This impression was especially intensified when the accords resulted in the expulsion of a generation of Maronite leaders, including former president Amin Gemayyel and former Christian warlords Michel Aoun and Samir Jaja.

Parliamentary elections were held in August 1992 for the first time in 20 years. Prime Minister Rafiq al-Hariri's coalition won the majority of seats in those elections and in subsequent parliamentary elections in 1996 and 1998. Turnout by Christians was very low, and there were charges of irregularities. Municipal elections were held for the first time in 35 years in May and June 1998.

As of 2001, at least 35,000 Syrian troops still remain in northern, central, and eastern Lebanon, where they have been stationed since October 1990. Syria's deployment into Lebanon was legitimized by the Arab League a few years after the civil war started and then reaffirmed in the Ta'if Accords. Only with Syrian military power could Maronite-Christian leader Gen. Michel Aoun, who rejected the Ta'if Accords and maintained that he was the legitimate head of the government, be expelled from the country in 1991 and Lebanon reunited under one government. While Syria remains the dominant player in Lebanon, it began to withdraw its troops from central Beirut in 2000 and abandoned many checkpoints. It is gradually ceding more control to Lebanese security forces, which now control most strategic points in Beirut as well as the main highway to the airport, but Syria still exercises de facto control over Lebanese politics. Syria continues to cast a shadow on Lebanese politics because of the Syrian-Israeli conflict in the area, which makes Lebanon strategically important to Syria.

Since the end of the civil war, Lebanon has been engaged in a massive reconstruction process to repair the damage inflicted during the war. In 1993, Hariri launched "Horizon 2000," an US$18 billion program to rebuild Lebanon and transform the country into a regional center of finance and services. Under this national reconstruction plan, a huge investment has been made in various sectors focused on rebuilding the country. Large infrastructure projects, including a coastal highway, a new airport, and a highway to the Syrian border are being built as part of "Horizon 2000." The program also seeks to rehabilitate Beirut's city center and the telecommunications network. The financing for the project has come from a growing budget deficit and foreign investors, particularly Saudi Arabia and Kuwait. The expansion was coupled with a **fiscal policy** that aimed to raise interest rates in order to curb inflation. Hariri's reconstruction program was hampered by increased government spending in the 1990s, mainly as a result of the government's hiring policies, which sought to expand the civil service by hiring employees of various religious backgrounds as a means to ease friction between the various religious groups. As a result, the Lebanese government's debt, considered one of the highest in the region, soared to 140 percent of the GDP by the end of 2000.

The budget deficit has also proven difficult to tackle for the administration of Salim al-Hoss, which came to power following Hariri's resignation in 1998. The Hoss government focused on **restructuring** the public-sector debt and other fiscal reforms. For instance, the government improved tax collection methods, increased income and corporate taxes, and increased customs **duties**. Customs duties and property transaction fees are the two most important sources of revenue for the government. Custom duties account for 40 percent of the government's revenue, mostly from Beirut port. The government's efforts were seen as half-hearted and ineffective, primarily due to its weakness in the face of opposition from the legislature and its inability to institute a **value-added tax** (VAT). Perceptions that the Hoss government had not followed through in its efforts to reform the economy led to the resignation of the prime minister in August 2000.

With the return of Prime Minister Hariri to office in August 2000, the government once more focused on resuming reconstruction efforts by securing foreign aid, mainly from European and Arab countries. In October 2000, the Kuwaiti government agreed to deposit US$100 million at the Lebanese Central Bank to help stabilize the Lebanese pound. Hariri is also expected to proceed with economic reforms, especially the privatization of state-owned enterprises. In mid-January 2001, the government announced plans to introduce a sales tax on consumer products rather than the VAT, previously planned by the government of Prime Minister Salim al-Hoss. The government, however, has no plans to slash the budget deficit and has argued that it can be maintained for years without affecting economic growth.

INFRASTRUCTURE, POWER, AND COMMUNICATIONS

Lebanon enjoys an extensive, though aging, infrastructure that was severely damaged during the civil war. The country is served by a network of over 7,000 kilometers (4,350 miles) of primary and secondary roads, 6,200 kilometers (3,853 miles) of which are paved. Since 1991, the government has given much attention to rebuilding the infrastructure. The road system, however, especially within Beirut and in remote areas, remains in poor condition. With growing numbers of licensed automobiles in the 1990s, the road system, especially in Beirut, has become congested. The country's railway system is mostly unusable, due largely to damage sustained during the civil war.

Lebanon has 9 airports, 2 of which have unpaved runways. Beirut International Airport, the country's ma-

jor airport, handles 2 million passengers a year. In fact, 35 airlines service Beirut and bring in most of the country's tourists. Lebanon has 12 ports, the most notable of which are Beirut, Tyre, Sidon, and Tripoli. The ports of Beirut and Tripoli are currently being rehabilitated and modernized.

Electrical power is supplied to Lebanon by the state-owned Electricite du Liban (EDL), which has the capacity to produce 1,500 megawatts (mw) of power. Plans are underway to expand power production to 2,700 mw by 2006. Total annual electricity production came to 9.7 billion kilowatt hours (kWh) in 1998, with the majority produced from fossil fuels. Power production falls short of actual demand, however, and the 220-volt power system is subject to repeated shortages and blackouts. Furthermore, several Israeli raids on Lebanon's power stations since 1996 have led to severe power cuts.

Telecommunications services, damaged during the civil war, have been largely restored. The government has been expanding the public telephone network to reach some 698,000 customers. Cellular telephone service is widely available with some 750,000 subscribers. In 1999, the country had 19 Internet service providers.

ECONOMIC SECTORS

Lebanon's economic sectors reflect the small size of the economy, which places limits on the availability of natural resources, population, and domestic markets. Before the civil war, the services sector was by far the largest contributor to the economy and employed the largest proportion of the **labor force**. The industrial sector was the second largest contributor to the economy, while agriculture accounted for a smaller proportion of national income.

As of 2001, Lebanon's economy continues to rely heavily on the services sector. Services—mainly banking, tourism and trade—account for 68 percent of the GDP. Lebanon's agricultural and manufacturing base continue to be small and has yet to regain its pre-war competitiveness. Economic slowdowns in Lebanon began in 1996, with a drop in construction activity, and the economy was in recession during the 2000–01 period. The greatest obstacles to growth in all of Lebanon's economic sectors are their vulnerability to regional instability and international trade opportunity.

Recognizing these obstacles, Lebanon has moved to form a series of trade alliances, including a customs union concluded with Syria in 2000, an Arab free trade agreement, and a Euro-Mediterranean Association Agreement with the European Union. Lebanon is also planning to join the World Trade Organization. Lebanon's domestic political environment has improved since the Israeli withdrawal from south Lebanon in May 2000. Although some elements of instability still remain (mainly the occasional exchanges of gunfire between guerrillas belonging to the Shi'ite Hizballah group and Israeli soldiers), the Israeli withdrawal is expected to enhance international confidence in Lebanon's investment potential. The tourism

sector stands to benefit most. Since 1997, the government has attempted to tackle seriously the budget deficit, raising custom duties by 2 percent in 1998 and introducing an entertainment tax on restaurant, bar, and hotel bills. However, spending continues to be high, and the budget deficit in 2000 was equivalent to 53.5 percent of expenditures.

AGRICULTURE

Lebanon's agricultural sector is underdeveloped and has yet to realize its potential. The sector's development is hindered by the large number of small un-irrigated land holdings and the lack of modern equipment and efficient production techniques. The sector also suffers from a lack of funding and inaccessibility to loans. In 1999, the government allocated only US$11 million, or 0.4 percent of the state budget, to agriculture.

There are 207,060 hectares of arable land in Lebanon, 60,047 hectares of which are irrigated. Most agricultural activity is concentrated in the High Bekáa Valley and the coastal plains, which combined account for more than two-thirds of the cultivated land. Bekáa Valley crops mostly consist of vegetables and some cereals. Fruits, such as bananas, melons, and apples, are cultivated in the coastal plains. The production of certain crops, such as tobacco, is subsidized by the government. During the civil war, Lebanon was a major producer and exporter of heroin and hashish. In 1992—pressured by the United States, Interpol, and the United Nations—the Lebanese government officially banned poppy and cannabis cultivation, a ban effectively enforced by the Syrian and Lebanese armies.

Agricultural production is a moderate contributor to Lebanon's economy, traditionally accounting for 13 percent of the GDP and employing approximately 13 percent of the labor force. Most of Lebanon's agricultural products are consumed locally and a small percentage is exported to the Gulf region, primarily to Saudi Arabia and the United Arab Emirates.

INDUSTRY

MANUFACTURING. The manufacturing sector is an important contributor to the economy, accounting for 17 percent of the GDP in 1998 and employing 15 percent of the labor force. In 1999, the sector accounted for 40 percent of exports. Total employment in the manufacturing sector in 1998 stood at 180,000 people.

Historically, and unlike neighboring Arab countries, Lebanon has never gone through a state-led industrial growth phase, and the governments have generally adopted an open policy that has encouraged free competition in the sector without government interference. Lebanon's industrial base is by all means modest, mostly comprised of family-based small firms. Most finished and semi-finished goods are imported. Much of Lebanon's local manufacturing consists of producing goods for local consumption—mainly food, furniture, and clothing manufacturing. The most important industrial activity is focused on food, beverages, and chemical products, which receive the highest level of investment. Manufacturing activity is concentrated in the population centers of Beirut and Mount Lebanon, where an estimated 60 percent of the firms are located. Some 19 percent of manufacturing firms are located in the north.

Since the end of the civil war in 1991, the manufacturing sector has had to struggle to regain its pre-war competitiveness and invest heavily in new equipment. During the war, several factories were forced to close as a result of the armed hostilities, declining consumer spending, and lack of funding. Major barriers facing the sector in 2001 are rising customs duties and political instability, 2 difficulties which have prevented many multinational companies from establishing subsidiaries in Lebanon. The U.S. State Department stated that "the sector's outlook remains bleak, as high operating costs, low productivity, obsolete equipment and limited access to medium and long term credit impede the performance of the sector."

MINING. With no commercially exploitable mineral deposits, Lebanon has no significant mining base. Quarrying for marble, sand, and limestone for cement production, however, has accelerated in recent years. The output is mostly consumed locally for construction, and only a tiny fraction is now being exported.

SERVICES

TOURISM. Tourism was once a very important contributor to Lebanon's economy, accounting for almost 20 percent of the GDP in the 2 decades before the start of the civil war. Since the end of the war, the sector has managed to revive somewhat, but tourism has yet to return to its pre-war levels. Tourism in 1999 accounted for 9 percent of the GDP. In 2001, the tourism sector was one of the fastest growing sectors of the economy, with the number of tourists visiting Lebanon between 1996 and 2000 growing at the rate of 14 percent annually. Lebanon's rich archeological and cultural heritage, coupled with a mild climate and diverse terrain, has been a major attraction to tourists.

Successive governments have invested heavily in the sector, and there has been substantial investment in building luxury hotels and upscale restaurants, in response to the return of tourists (mainly Gulf Arabs) to Lebanon, especially in summer. It is estimated that there are 12,000 hotel beds, with 90 percent located in Beirut and Mount Lebanon. Some 860 additional hotel rooms will be built in 2001 and another 1,200 will be added in 2002. Despite continued political instability, growth in the tourism sector is expected to pick up in the coming years, especially after the Israeli withdrawal from south Lebanon in May 2000.

FINANCIAL SERVICES. The most important sector of Lebanon's service industry is the financial services industry. The sector lost most of its importance during the civil war with the flight of the majority of foreign firms, but there has been a concerted effort to renew the sector since 1991. As a result, the sector grew rapidly in the 1990s, mostly the result of investment in government debt and reconstruction and reported double-digit growth throughout the 1990s.

Financial services continue to undergo expansion and consolidation, especially of small family-owned banks. Several international banks now have offices in Beirut. In an effort to present Lebanon as an international financial center, the government announced in 1995 a series of financial laws aimed at preventing **money laundering**. In particular, one of the passed laws gives international investigators access to the accounts of Lebanese banks.

Banking, by far the most profitable sector, employs some 15,000 people. Before the civil war, Lebanon was the banking center of the Middle East, owing to its liberal banking regime, one of the most liberal in the Arab world. Several Arab and foreign banks pulled out of Lebanon during the war, but by 2001 several of these banks had returned. However, most of them have only small branches in Beirut, and the pre-war interest in Lebanon's banking sector is yet to return.

There are some 67 active commercial banks in the country, in addition to small family-owned enterprises. Most of these banks are up to international standards, largely due to concerted government efforts to tighten regulations and increase **capital adequacy** requirements.

The Beirut Stock Exchange, closed in 1975 with the outbreak of the civil war, re-opened in 1995. Trading, which began in January 1996, has been thin, and the number of listed companies has been relatively small. There is a total of 12 listed companies, including 4 financial institutions, 1 car retailer, and a supermarket chain. Weekly trading in 2000 rarely exceeded US$2 million.

CONSTRUCTION. The construction sector grew at a very fast pace between 1991 and 1996, contributing to an average of 6.5 percent growth in the GDP. The sector's growth was in response to the influx of huge sums of private investments, mostly from Lebanese expatriates and Gulf Arabs who were devoted to the reconstruction of residential and commercial buildings destroyed during the war. These investments were coupled with large-scale government projects to rebuild the country's infrastructure, including the US$400 million project to rebuild Beirut International Airport and the complete renovation of downtown Beirut by the quasi-government company, Solidere.

Since 1996, the sector's contribution to GDP has dropped, as private investments and government spending began to dwindle. The slowdown was partly brought about by the oversupply in some areas of the construction market, especially in housing. International and domestic confidence in Lebanon's stability also dropped significantly in the aftermath of Israel's military operations in Lebanon in the summer of 1996.

RETAIL. Lacking many large commercial centers other than Beirut and its suburbs, Lebanon has a poorly-developed **retail** sector. While Beirut is home to a variety of retail stores, including fast food franchises such as McDonald's, Burger King, and Starbuck's, the majority of towns in the interior of the country have small family-owned shops, farmers' markets, and temporary roadside stands.

ADVERTISING. Lebanon has a booming advertising industry that ranks second in the region in terms of size and profitability after Dubai. Some 150 national and international advertising agencies are based in Lebanon, employing some 8,000 people. In the absence of reliable statistics, the sector's revenue is believed to be in the range of US$150 million annually. The largely unregulated sector is dominated by the country's 4 television stations and the print media, which account for 55 percent and 34 percent of the sector's revenue, respectively.

INTERNATIONAL TRADE

With few natural resources, over the past several decades, Lebanon has relied heavily on imports. The value of imports in 1999 was US$5.7 billion, while exports totaled just US$866 million. Lebanon imports the majority of its goods from Europe—mostly Italy (12 percent), France (10 percent), and Germany (9 percent)—followed by the United States (9 percent). On the other hand, the majority of Lebanon's exports are sent to neighboring Arab Gulf countries, especially Saudi Arabia (12 percent) and the United Arab Emirates (10 percent), which are Lebanon's largest trade partners. Major exports are food, vegetables and fruits, followed by chemical products and jewelry.

Imports of foreign goods have usually amounted to 40–65 percent of the GDP. Lebanon's imports consist of fuel, electrical goods, and vehicles. Expenditures on imports rose dramatically in the post-civil war period, largely due to the need to import **capital goods** and high consumer spending on food, cars, and luxury items. The trend has reversed since 1999 due to the economic slowdown but is expected to rise again as the economy recovers.

Although the value of exports increased from US$544 million in 1994 to US$866 million in 1999, the substantial trade imbalance that Lebanon has endured over the years has meant that the country will continue to run a **trade deficit** which forces it to borrow heavily to pay for its consumption.

MONEY

The value of the Lebanese pound has slowly improved on the world market since 1992, thanks to a wise monitory policy that has sought to restore its value. As a result, the value of the pound to the dollar has improved from 1,800 Lebanese pounds for every U.S. dollar at the end of 1992 to 1,508 pounds to 1 U.S. dollar at the end of 1999, and has remained at roughly this value in the years since. The U.S. dollar was widely used throughout the civil war, and although its use has decreased since 1991, more than 60 percent of transactions in 2001 are still conducted using the U.S. dollar, which is available at many Lebanese banks. The nation's central bank, the Central Bank of Lebanon, is highly respected by the international banking community and has done a good job of maintaining the value of the currency and keeping low inflation.

POVERTY AND WEALTH

Wealth and income are unevenly distributed in Lebanon. Despite the absence of reliable statistics, income disparity in Lebanon is believed to have increased in the last 10 years since the end of the civil war. According to a recent study, the income of the upper and middle classes has risen since 1991, but most Lebanese have not seen a significant appreciation in their income. A minority of Lebanese have in fact seen their incomes drop below the poverty line. Farmers in the Bekáa Valley, for example, have been affected by the ban on the cultivation of hashish, which during the civil war constituted a major source of income for the region.

Income disparity also is manifested along regional lines. According to the UN Economic and Social Council for Western Asia (ESCWA), the average **GDP per capita** in 1999 reached US$5,148 (the CIA World Factbook places the figure at US$4500). However, average GDP per capita in areas such as the Bekáa Valley is only US$620 per year. Almost one-third of the population live

SOURCE: World Bank. *World Development Indicators 2000.*

below the poverty line, with one-quarter of families subsisting on less than US$620 per year. Unemployment in 1997 was estimated to have reached 18 percent.

As a result of declining economic conditions, public-sector strikes have become commonplace. To prevent mass protest against its economic and social policies and to preclude opposition forces from exploiting discontent, the government uses the army to guard public security. As a result, the army has been privileged and strengthened, becoming assertive in its demands for salaries and promotions.

The government has generally adopted a hands off policy toward social inequality and has not attempted to redress differences between the poor and the rich. Lebanon's dependence on imports, especially food and fuel, has made it increasingly more difficult for the poor to spend a high amount of their relatively small incomes on the necessities of life. As a result, many Lebanese have opted to seek job opportunities in neighboring Arab countries, especially in the Gulf region.

WORKING CONDITIONS

Reliable official data about Lebanon's labor force are unavailable, but it is estimated that the country's labor force in 1999 was 1.3 million. A 1996 Ministry of Social Affairs survey estimated that there were some 944,282 foreign workers in the country as well. Foreign workers are mostly unskilled laborers from Syria, Asia, India, and Africa, and they are employed mostly in construction, agriculture, industry, and households. Unemployment in the country is high, with official estimates in 1999 set at 10 percent and unofficial estimates reaching as high as 25 percent; the CIA World Factbook reported 1999 unemployment of 18 percent.

Trade unions are allowed in Lebanon and are supported by the government with membership restricted to Lebanese workers. Trade unions operate under the umbrella of the Federation of Labor Unions, which negotiates cost of living adjustments and other social benefits on behalf of the workers. The 48-hour work week is the standard.

Although labor laws protecting the right of workers have been in place since 1964, regulations are rarely enforced, and working conditions in Lebanon are far from ideal. Labor actions, strikes, slow downs, and protests frequently disturb work life, and wages remain relatively low. The largest proportion of the labor force, some 15,000 people, is employed by the financial sector, working in banks and other financial institutions, followed by the manufacturing industry, which employs 15 percent of the labor force.

COUNTRY HISTORY AND ECONOMIC DEVELOPMENT

1516. Lebanon becomes part of the Ottoman Empire.

1920. French General Gouraud establishes Greater Lebanon with its present boundaries and with Beirut as its capital.

1926. First Lebanese constitution is promulgated.

1932. The first and only complete census is taken in Lebanon. Charles Dabbas, a Greek Orthodox, is elected the first president of Lebanon.

1936. Emile Iddi elected president.

1941. Lebanon gains independence from the French.

1943. General elections take place; Bishara al Khuri is elected president.

1945. Lebanon becomes a member of the Arab League and the United Nations (UN). French troops completely withdraw from the country, with the signing of the Franco-Lebanese Treaty.

1975. Civil war breaks out.

1978. The Riyadh Conference formally ends the Lebanese Civil War; Syria intervenes militarily in Lebanon.

1981. Fighting resumes.

1982. Israel invades Lebanon.

1989. Ta'if Accords officially ends civil war and sets power-sharing formula between Lebanon's religious groups.

1992. Prime Minister Hariri launches "Horizon 2000" reconstruction program.

1997. Entertainment tax is introduced. Custom duties are raised.

1998. Prime Minister Hariri resigns. Salim al-Hoss takes office.

2000. Israel withdraws its troops from South Lebanon. Prime Minister Hariri returns to office.

FUTURE TRENDS

After nearly 2 decades of civil conflict, Lebanon entered the 21tst century on a positive note. Most of the country's infrastructure has been restored, and despite occasional violence, Lebanon's political system has been fairly stable. The 1989 Ta'if Accords, which brought an end to the civil war and set the terms for power-sharing among the various religious groups, has thus far been successful in creating a functional government in Beirut that is increasingly spreading its control over the rest of the country. Parliamentary elections have been held periodically since 1992. After almost 2 decades of occupation, Israel withdrew its military forces from southern Lebanon in May 2000.

Despite these positive developments, the government is faced with serious challenges, mainly lowering the budget deficit by focusing on tax reform and modernization, expenditure rationalizing, and reducing of the burden of servicing its debt. The government is also under pressure from the IMF to proceed with plans to adopt a privatization program of state-owned enterprises. Having lost its status as a regional banking and trade center and lacking a solid agricultural and industrial base, Lebanon must develop alternative plans to define its new role in the Middle East region. So far, beyond rhetorical official statements, no steps have been taken in that direction.

DEPENDENCIES

Lebanon has no territories or colonies.

MACAU

Macau Special Administrative Region
Macao

CAPITAL: Macau.

MONETARY UNIT: Pataca (MOP). One Macau pataca equals 100 avos. Coins include denominations of 1, 5, 10, 20 and 50 avos, as well as MOP1 and MOP5. Paper currency comes in denominations of MOP5, 10, 50, 100, and 500.

CHIEF EXPORTS: Textiles, clothing, toys, electronics, cement, footwear, machinery.

CHIEF IMPORTS: Raw materials, foodstuffs, capital goods, mineral fuel, consumer goods.

GROSS DOMESTIC PRODUCT: US$7.65 billion (1999 est).

BALANCE OF TRADE: **Exports:** US$1.7 billion (1999 est.). **Imports:** US$1.5 billion (1999 est.).

COUNTRY OVERVIEW

LOCATION AND SIZE. Macau is located in Southeast Asia, approximately 60 kilometers (37 miles) southwest of Hong Kong, bordering China. Made up of Macau city and the islands of Taipa and Coloane, Macau has a land area of 21 square kilometers (8.3 square miles). Comparatively, the territory of Macau is 4 times smaller than the Manhattan area of New York City. Macau is joined to the Chinese province of Guangdong by a narrow land corridor. Because of land reclamation efforts, Macau has enlarged its territory by 50 percent since 1912.

POPULATION. The population of Macau, which is virtually all urban-based, was estimated at 445,594 in July 2000. In 2000, the birth rate stood at 12.54 per 1,000 and this low level is mainly attributed to the effect of urbanization. The death rate stood at 3.64 per 1,000. The estimated population growth rate is 1.83 percent, although unofficial estimates show higher figures due to a high net migration rate, which has been estimated at 9.41 migrants per 1,000. Macau has one of the highest population densities in the world, standing at a level of around 21,218 people per square kilometer (or 54,954 per square mile).

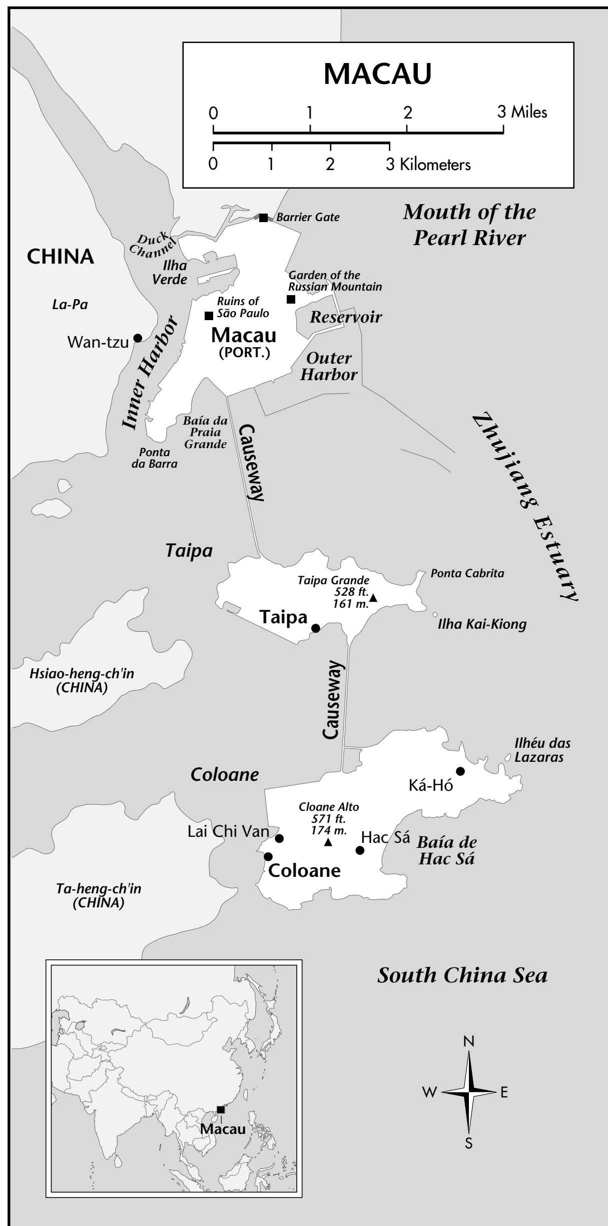
The Macau population represents 2 major ethnic groups, with ethnic Chinese making up almost 95 percent of the population, and Macanese (mixed Portuguese and Asian ancestry) and other ethnic groups making up the remaining 5 percent. Around 100,000 inhabitants of Macau hold Portuguese passports that give them the right to settle in Portugal. Approximately 23 percent of the population is below the age of 15, and just 8 percent of the population is older than 65. The current ethnic structure was formed in the 19th century and remains practically unchanged. Buddhism is the primary religion, with 50 percent of the population practicing; Roman Catholicism follows with 15 percent, and the remainder is made up of numerous other faiths.

The government is keen to limit the inflow of illegal immigrants from China. Between 20 and 25 illegal immigrants are deported daily, although foreigners may legally buy residential permits for US$250,000. New chronic diseases such as AIDS are also of great concern to the Macau government, since the country is a busy tourist destination.

OVERVIEW OF ECONOMY

Manufacturing and services are the 2 main pillars of the modern Macau economy. Macau, like Hong Kong and Singapore, has an export-oriented economy, which benefits from growing trade with Western Europe and the United States. Throughout the 20th century, Macau specialized in manufacturing for the export market and servicing international merchants and bankers.

Macau was established as a Portuguese colony in 1557, becoming one of the most important trade distribution centers in the region for the next 3 centuries. Its significance as a trading center rose as the Chinese government maintained a policy of voluntary isolation from



the world, allowing international trade only in few assigned ports. Portugal proclaimed Macau a free port (such ports were set up in Asia by the European colonial powers in the 19th century in an effort to promote international trade with a minimum of **tariffs** and other barriers) in 1849. However, in the 19th century Macau's importance declined with the rise of the British colony in Hong Kong.

The Macau administration has maintained a free-market economy, which in combination with the entrepreneurial skills of the local population and the region's political stability, has contributed to growth of wealth and prosperity. Macau's main exports are textiles, clothing, and services, though it lags behind Hong Kong and Singapore in the proportion of **value-added** production. Tourism also plays a significant role in Macau's economy. However, it has been the gambling industry that has contributed so much to the image of Macau as a tourist destination. The gambling industry also has attracted organized criminal syndicates, called "triads," which are involved in gambling, illegal people trafficking, prostitution, and pirated production of various goods, including music and computer CDs. During the 1990s, the government made considerable efforts to restrain and eliminate the power of these criminal groups.

The territory depends heavily on imports of foodstuffs and raw materials from neighboring China because it has no agriculture, due to its very small size. Nonetheless, it maintains a relatively high standard of living due to its sound **infrastructure**, promotion of economic balance, low **inflation**, stable currency, and foreign **trade surplus**.

POLITICS, GOVERNMENT, AND TAXATION

Throughout the 20th century, Macau remained a remote outpost of the Portuguese colonial empire. The situation changed, however, after the 1974 revolution in Portugal. The new democratic Portuguese government offered Macau back to China, although it took more than a decade before Portugal and China formally agreed on the future of Macau in 1987. This agreement was very similar to the one struck between the British government and China on the future of Hong Kong. On 20 December 1999, the administration of the territory was formally handed over to China. Macau became a Special Administrative Region (SAR) of the People's Republic of China with a "high degree of autonomy" (self-government) in domestic affairs for a period of 50 years under the principle of "one country, two systems." In 1999, Edmund Ho Hau-Wah became the first governor appointed by China's central government, replacing General de Rocha Vieira, the last Portuguese governor of the territory. According to the Macau's Basic Law (the territory's constitution), the governor has strong policy-making and executive powers, which are limited only by the central government in Beijing and by the Macau legislature. The Legislative Assembly is comprised of 8 directly elected members, 8 indirectly elected members, and 7 members appointed by the governor, totaling 23 members. After establishing its control over Macau, Beijing stationed its army on the territory. However, the military does not play any active role in Macau's economic development.

The Macau authorities traditionally did not attempt to establish control over the territory's economy and, unlike the **communist** Chinese, they always supported free-market institutions. Nevertheless, since the early 1980s, the Macau government has begun to adopt a more active role in the economic development, encouraging eco-

nomic variety, promoting large infrastructure projects, and introducing attractive fiscal initiatives for local and foreign investors.

In order to compete with neighboring Hong Kong, Macau established very low **direct taxes** and abolished currency exchange controls. The property tax ranges up to 15 percent and the wage tax up to 10 percent; this is a very low rate compared to countries in Europe or North America. There are also profit and business taxes on industrial enterprises. Nevertheless, the web of various fiscal initiatives reduces business and other taxes considerably. Imports are free of **duty**, but they are subject to a consumption tax. The main source of revenue in Macau is taxes on gambling, accounting for 44 percent of total revenue (1999). The pataca, the Macau currency, is pegged to the Hong Kong dollar at the rate of 1.03 patacas per Hong Kong dollar. Unlike South Korea, Thailand, or Indonesia, the pataca remained stable despite the Asian financial crisis in 1997 and the Russian **foreign debt** default in 1998.

INFRASTRUCTURE, POWER, AND COMMUNICATIONS

Macau's infrastructure and well-developed transportation network were established mainly during the colonial era. Visitors can reach Macau by ferry, hydrofoils, or helicopters from Hong Kong, or by cars or buses from China. The territory's international profile was boosted by opening the US$1 billion international airport built on reclaimed land on Taipa island. It is capable of carrying 6 million passengers and 180,000 metric tons of cargo per year. Macau was eclipsed long ago by Hong Kong as the area's leading port, because its surrounding waters were not deep enough for large ocean cargo vessels. Nevertheless, the Macau authorities made considerable efforts to develop its seaport as an alternative to Hong Kong, and Macau's port is currently able to handle container cargo vessels and oil tankers. In 1993, a new ferry terminal capable of carrying 30 million passengers a year was opened.

Macau is served by a network of 50 kilometers (31 miles) of highways, all of them paved. In the 1990s, there was a steep increase in private car ownership, leading to traffic congestion and rising air pollution. In 1999, there was a total of 55,144 registered motor vehicles or 123 cars per 1,000 inhabitants, an increase of almost 30 percent from the 40,600 cars in 1995.

Macau is totally reliant on imports of mineral fuel for domestic consumption, and these imports accounted for almost 6 percent of merchandise imports in 1999. This makes Macau particularly vulnerable to world oil prices. Electrical power plants, which use imported fossil fuel, have a total capacity of 351.6 megawatts (mw). In 1999 electricity net supply stood at 1.53 billion kilowatt hours (kWh) and imports stood at 194.4 million kWh.

Macau had 70,403 new telephone lines installed in 1999, bringing the number of telephones up to 300,000, or 686 telephones per 1,000 people. The number of mobile cellular telephones was growing rapidly, reaching 55,000 in 1998. Macau has only 2 radio stations—both FM—and no television stations, receiving their television signals from Hong Kong. Macau's Internet service was to be opened to applicants in October 2000, having formerly been a **monopoly** owned by Macau Telecom.

ECONOMIC SECTORS

Macau has the advantage of being an entry point to the huge China market, although its economic development has been held back by its small territory, small pop-

Communications

ulation, and extremely limited natural resources, as well as competition from neighboring Hong Kong. The policy of encouraging private entrepreneurship, giving priority to the development of export-oriented sectors and capital intensive industries—combined with a relatively cheap **labor force**—has contributed to the rise of Macau's prosperity. By 2000, manufacturing (textiles, clothing, toys, and electronics), gambling, and tourism became the largest sectors of Macau's economy.

The 1997 Asian financial crisis contributed to the slowing of economic growth in all sectors of the economy, although Macau managed to avoid an economic decline on the scale of Indonesia or Thailand. The crisis also indicated the need for a further broadening of the economy. Throughout the 1990s, the Macau government struggled to attract value-added manufacturing on the same scale as Hong Kong or Singapore, especially in such important sectors as computer hardware and information technologies (IT). Due to the small size of Macau's market, it lags behind neighboring Hong Kong in providing business and banking services. Macau tries to compete with Hong Kong by offering good infrastructure, cheaper business property rent and labor, and efficient administrative services.

AGRICULTURE

Agriculture and fishing play a negligible role in Macau's economy, accounting for just 1 percent of the GDP and employing less than 1 percent of the workforce. For a long time, Macau has been fully reliant on imports of foodstuffs, mainly from neighboring China. The territory has a very small fishing industry, consisting of a small fishing fleet, which supplies local restaurants and the fish market with fresh catch. There is a small land area under cultivation mainly for fresh vegetables. A very small livestock industry supplies chickens and ducks to the restaurants specializing in traditional Asian cuisine.

INDUSTRY

MANUFACTURING. Macau has a well-established manufacturing sector that plays an important economic role. Manufacturing contributes 40 percent of the GDP, providing employment to 87,141 people or 31 percent of the workforce (1998). In the 1960s and 1970s, Macau attracted investment and technologies to its manufacturing industry (mainly textiles, clothing, toys, and electronics) through low cost and efficiency, producing a range of exports to Europe and the United States. However, Macau fell behind Hong Kong and Singapore in attracting electronic assembling and computer technologies in the 1980s and 1990s. Since the early 1990s, however, the manufacturing sector's share in the GDP has been steadily declining because of strong competition from China's Special Economic zone of Zhuhai. The manufacturing sector is dominated by small- and medium-size enterprises, which specialize in small-volume and high-quality garments, toys, leather goods, and artificial flowers. It also produces optical goods, electronics, and machinery.

Manufacturing was negatively affected by the 1997 Asian financial crisis. However, Macau escaped a large-scale **recession** because the local business community switched quickly between markets and products, and because most of the goods were produced by small private enterprises for export to the United States, Europe, and East Asia. Macau benefited from the existence of U.S.-imposed quotas for goods made in China. Such restric-

tions can provide an initiative for **re-export** of goods manufactured in China and labeled as Macau-made products. During recent years, Macau reportedly became heavily involved in producing pirated computer software, CD-ROMs, and DVDs, which have been distributed in Southeast Asia, Eastern Europe, and even in the United States.

SERVICES

TOURISM. Tourism is the most important sector of Macau economy, providing direct employment (such as in hotels and restaurants) for 28 percent of the labor force or 78,708 people. Macau has long been a tourist destination for business people and other travelers due to its famous gambling facilities. Macau promotes itself as a "dream come true," offering 24-hour gambling services, a multicultural environment, exotic festivals, and tax-free shopping (most items are 50 percent cheaper than in Hong Kong). According to the national authorities, Macau had a total room capacity of 8,886 in 1999, although most of the hotels report an occupancy rate below 60 percent. Most visitors come for a short stay, arriving from Hong Kong, China, Taiwan, and Japan. The number of tourists visiting the territory rose steadily throughout the 1980s and 1990s, reaching a peak in 1996 with 8.1 million tourists. There was, however, a sharp decline of around 15 percent in 1997 and a further 3 percent in 1998, because of economic turmoil in the region and the outbreak of gangster-style killings and bombings on Macau's streets. In 1999 and 2000, tourism was helped by the economic recovery in Hong Kong and Taiwan.

GAMBLING. Gambling, together with tourism, is one of the most important sectors of Macau's economy. Macau's casinos and its facilities for horse and greyhound racing have attracted visitors to the region for decades. The government has benefited from the gambling industry by imposing direct taxes, which accounted for 44 percent of its revenue in 1999. However, the dark side of the industry is gambling addiction and criminal activities. In fact, the outbreak of violence in hotels, restaurants, and casinos in 1997 and 1998 was largely attributed to feuds between powerful organized crime syndicates.

FINANCIAL SERVICES. Macau has a small but vibrant financial services sector, which provided employment for 8 percent of the labor force, or 22,488 people, in 1999. It is built around banking, insurance, and business services. The banking sector was opened for international competition in 1992, and there were 9 local and 13 foreign incorporated banks in 1998. The largest banks are Banco Comercial Portugues and Bank of China. The 1997 Asian financial crisis hurt the financial services sector, although there were no major bank collapses or bankruptcies.

RETAIL. The **retail** sector is well-established in Macau, providing inexpensive products to the local population and foreign tourists. Large supermarkets are complemented by thousands of small retail shops where tourists and local consumers can buy a wide variety of duty-free products much cheaper than in Hong Kong. Thousands of small- and medium-size restaurants serve exotic Asian cuisine, attracting gourmands (sophisticated diners) from across the region.

INTERNATIONAL TRADE

Macau was declared a "free port" in 1849, establishing very few barriers against the import of goods and services and promoting export to the international market. Historically, the United States has remained one of Macau's major trading partners, with exports to the United States reaching US$1 billion dollars in 1999 or 46.9 percent of all exports, consisting mainly of textiles, garments, and manufactured electronics. The European Union is the second-largest trading export market, accounting for US$663 million or 30.2 percent of total exports. China and Hong Kong were also important destinations for Macau exports, accounting for 9.2 percent and 6.8 percent of exports, respectively.

Imports originating from China accounted for US$725 million, or 35.6 percent of its total imports in 1999, so Macau was running a considerable trade deficit with this country. Hong Kong was the second largest source of import accounting for US$368 million or 18.1 percent of total imports. The European Union, Japan, and the United States were other major sources of imports.

Macau's economic vulnerabilities were exposed during the sharp oil price increases in 2000 and 2001. It also faces increasing competition from low-cost, mass-production enterprises in neighboring China and is vulnerable to changes in the U.S. and EU markets.

MONEY

Macau's currency, the pataca, is pegged to the Hong Kong dollar and remains stable. The territory managed to avoid high inflation or economic recession during last

Trade (expressed in billions of US$): Macau

2 decades, although the Asian financial crisis of 1997 did hurt its economy. There was an economic slow-down in 1997 and 1998, affecting all sectors and bringing a small rise in inflation. However, in 1999 and 2000 the economy overcame these difficulties and began to grow again. One of the unique features of Macau's economy was that in 1998 it experienced **deflation** of 4 percent.

Due to the regional economic downturn, the value of the Macau patacas declined slightly against the U.S. dollar from 7.962 in 1996 to 8.1 in January 2000.

POVERTY AND WEALTH

Macau has no official poverty line, so the number of citizens living at that level is difficult to determine. Also, many foreign workers illegally enter Macau looking for jobs, and these individuals cannot be accounted for in official statistics. Their presence in Macau ebbs and flows, as the government fights a continuing battle to deport illegal entrants into the region.

Macau's gap between poor and rich is wide. Macau's per capita GDP was listed in 2000 at US$17,500, placing it 37th in the world. While impressive considering Macau's small size, such wealth does not get equally passed among all strata of society. Gambling, which provides more than 40 percent of Macau's income, benefits the poor very little.

GDP per Capita (US$)

Country	1996	1997	1998	1999	2000
Macau	13,600	15,600	16,000	17,500	17,500
United States	28,600	30,200	31,500	33,900	36,200
China	2,800	3,460	3,600	3,800	3,600
Hong Kong	26,000	26,800	25,100	23,100	25,400

WORKING CONDITIONS

In 1998, Macau's labor force stood at 281,117 people, with an unemployment rate of around 6.9 percent. Macau's economy experienced 2 difficult years in 1997 and 1998, when the unemployment rate was on the rise. However, since the beginning of the economic recovery in 1999 and 2000, there has been some improvement in the labor market. Wages are generally below those in neighboring Hong Kong, but much higher than in China, although there is no regulation of minimum wages or unemployment compensations.

The Macau government encourages women to work, and women made up around 40 percent of the workforce in 1999. In 1984 child labor was banned in Macau, but the law has never been strongly enforced.

Trade unions are allowed in Macau, within the framework of its labor law and other regulations. Labor actions, such as strikes, slow downs, and other protests, are very rare in Macau.

COUNTRY HISTORY AND ECONOMIC DEVELOPMENT

1513. First Portuguese ship anchors in the Pearl River estuary.

1557. Portuguese establish a trading post on the islands.

1849. Portugal proclaims Macau a free port.

1949. Communist party comes to power in China.

1951. Portugal officially makes Macau an overseas province.

1974. A military coup takes place in Portugal. The new democratic Portuguese government offers to return Macau to China.

1979. Portugal and China establish diplomatic relations.

1987. Portugal and China reach a formal agreement on future status of Macau.

1989. People demonstrate in Macau in support of the pro-democracy demonstrations in Beijing.

1989. Chinese language is made an official language along with Portuguese.

1992. A new banking ordinance is introduced, opening the banking sector for international competition.

1997. Outbreak of contract killings and bombings indicate the beginning of the war between organized criminal groups.

1999. Macau officially returns to Chinese jurisdiction.

FUTURE TRENDS

Macau has experienced 2 decades of economic growth, benefiting from the rise of international trade and the dismantling of barriers to free movement of goods and services in the global market. This has elevated standards of living and brought prosperity to Macau's people. However, globalization also made the territory's economy vulnerable to downturns in the international market and to increasing competition from other Asian economies. Still, Macau has been able to find its economic niche in services and manufacturing.

On the eve of the 21st century, the territory was finally returned to Chinese sovereignty, but was given a high degree of economic autonomy. In the longer term, Macau will depend on economic and political developments in China and Hong Kong. Future economic development depends fully on the capability of the government to maintain the country's economic position and to promote economic growth based on capital- and skill-intensive technologies.

DEPENDENCIES

Macau has no territories or colonies.

MALAYSIA

CAPITAL: Kuala Lumpur.

MONETARY UNIT: Malaysian ringgit (also known as the Malaysian dollar). One Malaysian ringgit (RM1) equals 100 sens. There are coins of 1, 5, 10, 20, and 50 sens. Paper currency is in denominations of RM2, 5, 20, 50, and 100.

CHIEF EXPORTS: Electronic equipment, petroleum and liquefied natural gas, chemicals, palm oil, wood and wood products, rubber, textiles.

CHIEF IMPORTS: Machinery and equipment, chemicals, food, fuel, lubricants.

GROSS DOMESTIC PRODUCT: US$229.1 billion (at purchasing power parity, 1999 est.).

BALANCE OF TRADE: **Exports:** US$83.5 billion (1999 est.). **Imports:** US$61.5 billion (1999 est.).

COUNTRY OVERVIEW

LOCATION AND SIZE. Malaysia is situated in Southeast Asia, bordered by Thailand in the north, Indonesia in the south, and the Philippines in the east. The country has an area of 329,758 square kilometers (127,320 square miles). Comparatively, the territory of Malaysia is slightly greater than that of the state of New Mexico, the fourth-largest state in the United States. The Federation of Malaysia consists of 13 states, and is divided into 2 parts: 11 states are located in Peninsular Malaysia (also called West Malaysia) and 2 comprise East Malaysia, which is situated on the island of Borneo (see map). Peninsular and East Malaysia are separated by 640 kilometers (400 miles) of the South China Sea. Malaysia's capital city, Kuala Lumpur, is located in southeast Peninsular Malaysia, just 300 kilometers (187 miles) from Singapore. However, a new capital, Putrajaya, is being developed outside the overcrowded metropolitan area as the new administrative center. The strategic importance of Malaysia is in its location along the Strait of Malacca, which is a major sea-route connecting the Far East to Asia, Europe, and the Middle East.

POPULATION. The population of Malaysia was estimated at 21,793,000 in July 2000. It has almost doubled since the 1960s due to improved health, medical facilities, and longer life expectancy. In 2000, the birth rate stood at 25.3 per 1,000, while the death rate stood at 5.25 per 1,000. The estimated population growth rate is 2.01 percent and if the current trend remains unchanged, the population could reach 31 million by 2020. The population is very unevenly distributed, with almost 81 percent, or 17.5 million, living in Peninsular Malaysia, and 19 percent, or 4.2 million, living in East Malaysia. The population density is about 129 people per square kilometer (334 people per square mile) in Peninsular Malaysia and about 20 people per square kilometer (52 people per square mile) in East Malaysia.

Malaysia is a multinational and multicultural country with a very diverse population. Malays and several indigenous groups make up 58 percent of the population. Ethnic Chinese, the second-largest ethnic group, make up 26 percent of the population; Indian descendants make up 7 percent, and various other groups together account for the remaining 9 percent. The current ethnic structure was formed during the colonial era in the 19th and 20th centuries, when the British administration encouraged migration from India and especially from China. The Malaysian population is very young, with 35 percent below age 14 and just 4 percent of the population older than 65. Urbanization came to Malaysia relatively late. In 1970, just over 28.8 percent of Malaysians lived in urban areas. In 1999 over half of Malaysians—57 percent—were living in urban areas. It is expected that within the next 10 to 15 years more than 70 percent of the population will live in urban areas, mainly in the Peninsular Malaysia.

Religion plays a very important role in the country. Islam is the official national religion and nearly all Malays are Muslims. Most ethnic Chinese are Buddhist. The majority of Indians (comprising the descendants of migrants from what became India, Pakistan, and Bangladesh) are Hindu, although there are many Muslims among members of this community. The largest proportion of the Chinese community has traditionally lived in the urban areas, while Malays have often lived in the country's rural regions.

In 1960, the Malaysian population was about 8 million, and the country at one time had one of the highest

birth rates in Asia. The population doubled between 1960 and 1990, although population growth began to decline in the 1990s. The decline in population rates could be linked to the socio-economic changes in the economy that tightened the labor market and increased the number of women in the workforce, and the better education of women. Malaysia experienced an inflow of foreign workers employed mainly in the low-skill and low-wage construction and services sectors and in agricultural plantations. The Malaysian government would like to regulate the inflow of illegal migrants, who arrive mainly from neighboring Indonesia, as well as from Bangladesh and Burma, attracted by the geographical proximity and higher wages.

OVERVIEW OF ECONOMY

At present, Malaysia's industrial and service sectors are the 2 major pillars of the national economy. However, agriculture and mining were the 2 dominant sectors during its early history. Britain had slowly but steadily advanced into the region in the 18th and 19th centuries, establishing control over the territory of what would become present-day Malaysia. The British were attracted by the rich natural resources of this region and its convenient location along the Strait of Malacca, which was the main sea route connecting the Far East with British India and Europe. The British established large-scale plantations and introduced new commercial crops (rubber in 1876, palm oil in 1917, and cocoa in the 1950s). They also developed a large mining sector and encouraged migration of Chinese and Indian workers to these plantations and mines.

In August 1957, the Federation of Malaya was granted independence within the Commonwealth of Nations. In 1963, the Malaysian Federation was founded, comprising the Federation of Malaya, Sabah, Sarawak, and the State of Singapore. Singapore, however, left in 1965.

Since achieving independence, the Federation of Malaysia faced a need to develop and to diversify its economy, having a rapidly growing population. The country abandoned reliance on the export of primary natural resources and agricultural products and established itself as a rapidly industrializing country with a diversified export base. By the beginning of the 21st century Malaysia had become one of the fastest growing economies in Southeast Asia and third-richest state (after Brunei and Singapore) in the regional grouping known as the Association of South East Asian Nations (ASEAN).

The Malaysian government promoted the free market with limited state intervention and export-oriented industrialization. Its exports to the international market were used to promote efficient use of the country's re-

sources and generate **hard currency**, which was necessary for catching up and further developing into areas of technological and industrial innovation. In the mid-1960s, Malaysia established 5-year planning, targeting certain areas of economic growth and social changes, and allocating public resources for priority sectors of the economy and for **infrastructure** development. Despite these efforts, the government was reluctant to institute centralized control over the state's economy. The 5-year plans became a basis for official development strategies. For example, the recently completed "Seventh Plan" (1996–2000) targeted productivity growth and moved the country towards capital-intensive, high-technology industries. The political and inter-communal violence that had undermined the country's stability and security in the 1960s and 1970s gave way to a period of remarkable stability. This has attracted international investors and greatly contributed to the rapid economic growth of the 1980s and 1990s, especially in the manufacturing and service sectors of the Malaysian economy. Unlike the government of neighboring Indonesia, the Malaysian government has managed to keep its **external debt** at a relatively moderate level. In 1998, external debt stood at US$42 billion, or 59 percent of GDP with **debt service** payments of about US$6.0 billion. Estimates for the year 2000 estimated that Malaysian official reserves stood at US$29.6 billion. However, the **repatriation** of the profits by foreign investors may cause a problem for the Malaysian economy in the future.

The structure of the Malaysian economy has changed during the last 2 decades. According to the World Bank, the proportion of manufactured production grew from roughly 20 percent of GDP in the early 1980s to 31.5 percent of GDP in the late 1990s. Manufactured products accounted for around 85 percent of gross export earnings in 1999, with electronic goods becoming one of the most important products. The role of mining has steadily declined during the last few decades (Malaysia was one of the world's largest exporters of tin in the 1970s), now contributing just 7 percent of GDP. Malaysia continues, however, to export tin, gold, bauxite, ilmenite (a titanium ore), oil, and gas. Meanwhile, the role of agriculture in the country's economy has also been declining, although it provides employment to large numbers of Malaysians. Nevertheless, Malaysia remains one of the world's leading exporters of rubber and timber and produces almost half the world's palm oil. Tourism is another important and rapidly growing sector of the economy, with about 7.5 million tourists visiting the country in 1999 and contributing RM10 billion to the national economy.

Malaysia has a very diverse economy. The manufacturing sector is dominated by large **multinational corporations**, with a heavy Japanese presence among the largest companies. Meanwhile, the agricultural sector is dominated by medium and small firms. In East Malaysia, Sabah, and Sarawak, and in some northern states, many farmers are still engaged in subsistence agriculture. In the service sector, especially in **retail** trade, large international superstores such as Marks and Spencer, SOGO, and Yaohan are complemented by a number of medium and small enterprises.

Rapid economic growth and stability brought economic prosperity to a large proportion of the population, especially in urban areas. It also helped to keep unemployment at a very low 3 percent (for comparison, unemployment in the United States was 4.2 percent in 1999). In some sectors, Malaysia has begun to experience a shortage of labor. In the late 1990s, there was an inflow of large numbers of foreign workers through legal and illegal channels from neighboring Indonesia, with whom Malaysia shares some linguistic and cultural similarities, and from Bangladesh, the Philippines, and Burma (Myanmar). This inflow is sometimes blamed for existing criminal activities and **black market** operations.

Drugs are another important issue; Malaysia is situated very close to the so-called "Golden Triangle" (an area between Burma, Laos, and Thailand) that is the world's largest producer of illicit drugs such as opium. Malaysia is among the few countries in the world to have adopted the death penalty for possession and sale of drugs. However, neither organized crime nor the black market have had a significant impact on the national economy.

Due to the tremendous economic growth and its ability to preserve stability and promote its multicultural environment, Malaysia has become an increasingly popular destination for tourists from Europe, Japan, and North America. Malaysian tropical forests and beaches, colorful festivals in major cities, and luxurious hotels provide a vibrant environment for the development of hospitality businesses.

POLITICS, GOVERNMENT, AND TAXATION

Malaysia is a federal constitutional monarchy with a parliamentary democracy largely influenced by the British parliamentary system. The country consists of 13 states and 2 federal territories. The heads of 9 of the states are hereditary rulers, and the heads of the remaining 4 states are governors appointed by the sovereign, on the advice of the federal parliament. One of the unique features of the political system in Malaysia is that the sovereign (Paramount Ruler or *Yang di-Pertuan Agang* in Malay) is elected every 5 years by and from the 9 hereditary rulers of 9 states of Peninsular Malaysia. The sovereign is the supreme head of Malaysia and supreme commander of the armed forces, but his power significantly diminished in the 1990s due to the constitutional changes

initiated by the parliament; at present he plays a visible but mostly ceremonial role in the political process in the country. The prime minister, who has considerable executive power, must be a member of the 192-seat House of Representatives, and he chooses the cabinet with approval from the sovereign.

There are a number of political organizations in Malaysia. Most prominent of them are the *Barisan Nasional* (National Front); the governing coalition of 14 parties that forms the United Malays National Organization (UMNO); the Malaysian Chinese Association (MCA); and the Malaysian Indian Congress (MIC). Of the opposition parties, the most influential is the *Barisan Alternatif* (Alternative Front), which brings together the *Parti Islam sa-Malaysia* (Islamic Party of Malaysia), the Democratic Action Party, and some others. The governing coalition of the UMNO, MCA, and MIC was formed on the eve of independence, on a platform of achieving independence by peaceful means. It was transformed into the National Front after bloody inter-communal riots between Malays and Chinese in 1969. The Malayan Communist Party (MCP), which had gained much of its influence through its leading role in the resistance to Japanese occupation during World War II, ran a militant campaign for independence that did not get mass support and led to the Malayan Emergency (1948–1960), a period of social and political unrest. The MCP was banned and has never played an active political role in independent Malaysia.

Since Malaysia achieved independence, preservation of the balance between the main ethnic groups, political stability, and equal access to the national wealth were the major issues that shaped political debate and fueled conflict in the state. The coalition between the 3 main political parties and later the National Front, which represent the biggest ethnic communities in Malaysia, came to power on a platform of national consolidation and state paternalism (where the state makes decisions in social and economic affairs that in other countries would have been left to individuals and the market). This coalition was able to overcome deep divisions in Malaysian society and implement a successful policy of economic reforms, and it has remained in power ever since. In economic areas, the government has taken a very active role in the development and industrialization of the national economy. This has included significant investment in the state sector, a close alliance between government and private businesses, and the gradual **privatization** of state enterprises under a major privatization program launched in 1986.

In response to growing discontent between ethnic communities and the resultant rising social polarization, in 1970 the Malaysian government introduced a 20-year program called the New Economic Policy (NEP). The program was intended to encourage rapid economic growth in all sectors of the national economy, promote private entrepreneurship—especially among representatives of poor communities—and support small and medium-sized businesses. It was also intended to attract foreign investments, especially in modern technologies, by offering cheap and well-trained labor. At the same time, however, the government made major efforts to redistribute wealth. The NEP recognized the need for radical social changes and aimed to improve living conditions, economic power, and access to education and social benefits for Malays and indigenous people. These groups, who were called *Bumiputera* (sons of the soil), received privileged access to public services, were granted land rights and preferences in education and training, and benefited from job quotas in the **public sector**. This program was successful, and Malaysia achieved impressive economic growth, especially during the late 1970s, and throughout the 1980s. Between 1979 and 1989, the average annual GDP growth rate was around 5.2 percent, with manufacturing growing at an annual average of 8.2 percent and exports of goods and services at an annual average of 9.3 percent. In 1990, the NEP was replaced by the National Development Policy (NDP), which continued to promote economic growth, but relaxed some of the social requirements and privileges institutionalized under the NEP. Between 1989 and 1999, the average annual growth of GDP was around 7.6 percent, with manufacturing growing at an even more impressive 10.2 percent.

However, in 1997 Malaysia was affected heavily by the Asian financial crisis that started with the currency collapse in neighboring Thailand. Unlike Indonesia and Thailand, Malaysia became the only country in Southeast Asia to reject the International Monetary Fund's package of conditions and financial assistance, blaming international speculators for creating the crisis. The government, led by Prime Minister Dr. Mahathir bin Muhammad, opted for direct state intervention, imposing temporary restrictions on the currency exchange market and introducing various other measures, while his deputy called for further **liberalization** and economic **restructuring**. Against the recommendations of the International Monetary Fund (IMF), the Malaysian government temporarily established tough capital-control measures to contain **capital outflow**. The Malaysian currency, the Malaysian ringgit, was pegged to the U.S. dollar at a fixed rate of RM3.8 per U.S. dollar (according to the IMF, out of 16 larger **emerging market** economies, only China and Malaysia have fixed pegs). Although the IMF initially criticized the Malaysian government's imposition of capital control and other restrictive measures, it later recognized their effectiveness.

Allegedly, disagreement over the handling of the crisis led to the dismissal of Anwar Ibrahim, finance minister and deputy prime minister, who was also expelled from the UMNO, effectively ending his career. In 1998, An-

war was arrested on charges of corruption and homosexual activity and allegedly beaten while in custody. The trial consolidated Anwar's supporters and sparked protests across Malaysia in 1998 and 1999. Nevertheless, he was convicted on controversial charges of obstruction of justice. This trial undermined Mahathir's popularity at home and his standing internationally. The irregularities during the trial and police actions against demonstrations were condemned by human rights activists around the world.

The major proportion of government revenue comes from taxes, totaling 76 percent of revenue in 1999 (46 percent from **direct taxes** and 30 percent from **indirect taxes**). In 1999, the **income tax** rate was 28 percent for both resident and non-resident companies; however, companies resident in Malaysia have tax exemption on income brought in from abroad. The Malaysian government has introduced a number of initiatives for manufacturing activities, tourism, the agricultural sector, transportation, and communication.

INFRASTRUCTURE, POWER, AND COMMUNICATIONS

From the colonial era, Malaysia inherited relatively well-developed but unevenly distributed infrastructure and transportation networks. After achieving independence, the Malaysian government made considerable efforts and large investments in expanding its highways, railroads, seaports, and airports. More recently, the government played an active role in encouraging development of modern modes of communications such as satellite telecommunications and the Internet. In the late 1990s, the government launched a privatization program in the transportation and communication sector, which brought private investments, allowed more flexibility, and provided initiatives for managers to increase profitability and production efficiency.

Malaysia is served by a network of 94,500 kilometers (58,721 miles) of primary and secondary roads, 70,970 kilometers (44,100 miles) of which are paved. This includes 580 kilometers (360 miles) of superior quality expressways, which connect Kuala Lumpur with Singapore and with major seaports and other destinations. However, the road transportation system is still underdeveloped in East Malaysia (Sabah and Sarawak), with most of the roads in Peninsular Malaysia. In the 1990s, with the rapidly growing number of privately-owned cars (840,000 new registrations in 1997 alone), the roads in the capital and other major cities became highly congested. This also brought air pollution in Kuala Lumpur to a very high level, which combined with pollution from forest fires in the Indonesian part of Borneo to create hazardous smog in 1997 and 1998. In 1996, there was a total of almost 7 million motor vehicles registered in Malaysia, including 2.8 million passenger cars, 3.4 million motorcycles and mopeds, 37,000 buses and coaches, and 400,000 trucks and vans. In response to the growing number of cars on the national roads, the government invested in development of the public transport system, including modernization of the country's railways and the construction of a light rapid-transit system in Kuala Lumpur.

Malaysia has a railway system of about 1,800 kilometers (1,120 miles), part of which was planned for privatization in 1998–99. In 2000, only 148 kilometers (92 miles) of railways were electrified. The major tracks run from Singapore to Kuala Lumpur, and further to Pinang and Bangkok (Thailand). However, the railways are unevenly distributed. There is only 1 railway track of about 134 kilometers (83 miles) in East Malaysia (in Sabah). Malaysia intends to invest heavily in development of a monorail system in Kuala Lumpur and into building new railways. The biggest project is the US$632 million (RM2.4 billion) Express Rail Link (ERL), which will connect Kuala Lumpur Central (the main railway station in the Kuala Lumpur City) with Kuala Lumpur International Airport (KLIA). In 1996–97, the 8.6-kilometer Kuala Lumpur People Rapid Transit (monorail) was built at a cost of US$300 million (RM1.14 billion). The U.S.-based Parsons Transportation Group provided design and engineering services to the local Malaysian firm build-

SOURCE: World Bank. *World Development Indicators 2000.*

ing Kuala Lumpur's light rail transit systems. Several other multi-multimillion dollar railway projects have been initiated, but some were put on hold due to the difficulties caused by the Asian financial crisis.

Malaysia's seaports were established during the colonial era and served as merchant ports as well as British naval bases. The major ports are Kelang, George Town, Pinang, and Kuantan on the Peninsula, and Kota Kinabalu and Kuching in East Malaysia. During the last few decades, these ports were expanded to serve rapidly-growing Malaysian exports and imports. The West Port of Port Kelang has seen RM2.2 billion worth of combined (private and government) investments, while there has been RM2.8 billion worth of investment in the Tanjung Pelepas Port. Competition has grown between Malaysia and Singapore for servicing international ships and handling containers, although 40 percent of Malaysia's international trade was handled through Singapore until recently. In 1998 Malaysia's seaports handled 83 million metric tons of cargo. In late 2000, there was an announcement that the world's largest container line, Maersk-Sealand, intends to move its regional transshipment operations from Singapore to the Malaysian port in Johor.

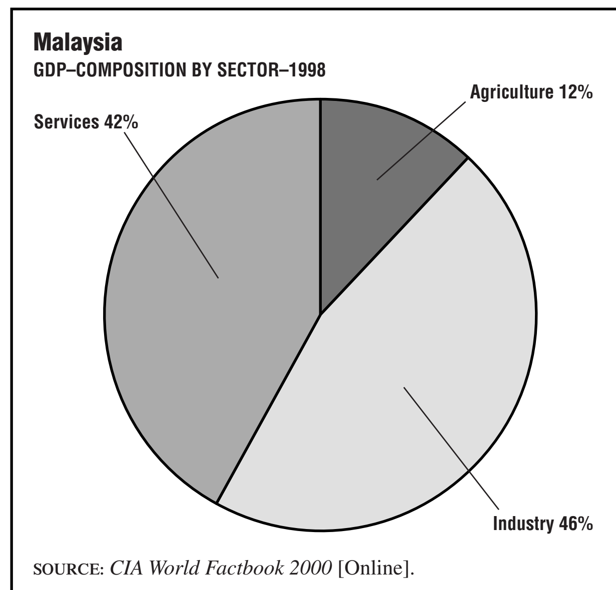
Malaysia has also promoted development of aviation in order to serve growing tourism and business needs. The country has 32 airports with paved runways, and 83 airports with unpaved runways. The largest of them, the US$3.2 billion state-of-the-art Kuala Lumpur International Airport, was opened in 1998. It is capable of handling 25 million passengers and 1.2 million tons of cargo annually. U.S. firms, including Harris, FMC, Adtranz, and Honeywell, have been awarded contracts to supply passenger trams, jetways, and information systems for this new airport. Malaysia transformed its national partly-privatized air carrier, Malaysian Airlines, into a world-class company, operating a fleet of about 100 aircraft.

In Peninsular Malaysia, electrical power is supplied by the predominantly state-controlled *Tenaga Nasional* company. Due to the rapid industrial development and growing demand for electricity, considerable efforts were made to privatize the national utility company and develop private initiatives to build and operate new power generating plants. To this end, a private consortium, the Independent Power Providers (IPPs), was established. Malaysia has sufficient reserves of oil, gas, and coal to meet its energy needs. Additionally, in East Malaysia there is huge potential for building hydroelectric power plants, but their development will require considerable investments. In the mid-1990s, the Malaysian government considered building the Bakun Hydro-electric Dam, which would have been one of the world's largest dams, in Sarawak; the controversial plan was abandoned, however, due to financial difficulties. In 1998, Malaysia produced 57.45 billion kilowatt hours (kWh), 94 percent of which was produced using fossil fuel and 5.22 percent by hydroelectric power plants.

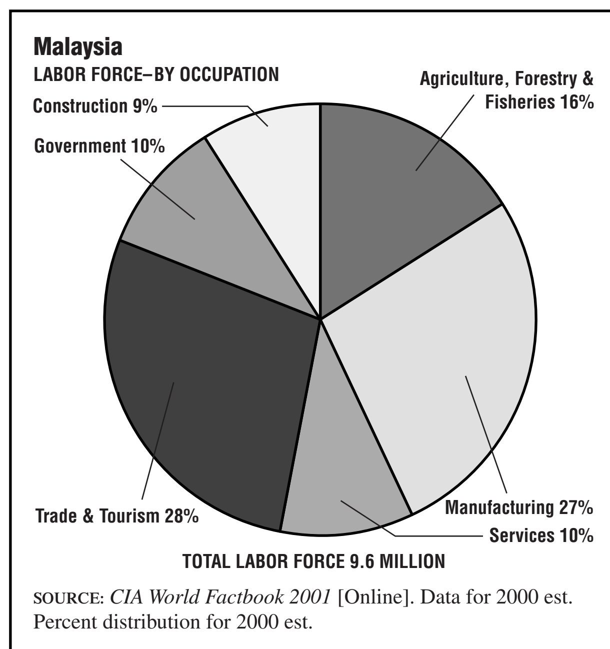
Telecommunications services in Malaysia are provided by several competing companies. The largest is Telecom Malaysia, which formerly had a state **monopoly** in the sector. The quality of telecommunication services is up to international standards, thanks to an inflow of private investments and the government's initiatives in developing this sector. In 1998, the country had 4.4 million telephone lines and 2.17 million mobile phones. In 1999 there were 8 major Internet service providers (including Telecom Malaysia, MIMOS Ltd., and Maxis Ltd.), with a number of new companies announcing their intention to enter the market. In 1998, the Malaysian government announced the development of the multi-billion-dollar Multimedia Super Corridor (MSC). This ambitious project, 15 kilometers wide and 50 kilometers long, and stretching from Kuala Lumpur to the new international airport, is planned to become a Malaysian "Silicon Valley." The MSC will include 2 "smart cities," employing a high-technology environment, high-capacity telecommunications, sophisticated infrastructure, and even "electronic government."

ECONOMIC SECTORS

By international standards, Malaysia has a medium-sized, but rapidly growing economy. It is self-sufficient in important natural resources, including gas and oil, and has a good environment and climate for the production of various crops. Its location, on a crossroads of major sea routes that connect the Far East to South Asia, the Middle East and Europe, provides some additional advantages for the development of its international trade.



SOURCE: *CIA World Factbook 2000* [Online].



SOURCE: *CIA World Factbook 2001* [Online]. Data for 2000 est. Percent distribution for 2000 est.

Malaysia has a diversified and rapidly expanding manufacturing sector, which between 1989 and 1999 grew at an annual average of 10 percent. Although in many areas of manufacturing, it relies on imported technologies and foreign investments, Malaysia was able to join the world's leaders in some fields. In the 1990s, it became the world's third-largest producer of integrated circuits and one of the leading producers of domestic appliances. Some of the world's largest corporations, such as Dell and Microsoft of the United States, NEC and Mitsubishi of Japan, and others, have opened branches in Malaysia.

Agriculture is still an important export earner, although it experienced stagnation with an average annual growth of only 0.2 percent between 1989 and 1999. Malaysia is the world's largest producer of palm oil, accounting for almost half of the world's production. In the past, the country also was the world's largest producer of rubber, but in the early 1990s it was overtaken by Thailand and Indonesia. Malaysia remains the world's fourth-largest producer of cocoa. Nevertheless, the share of agriculture in the GDP declined from 29 percent in 1970 to 12 percent in 1998.

The role of the mining sector, which once played a very important role in Malaysian exports, is also declining. For a long time, Malaysia was the world's largest producer of tin, but in the early 1990s was overtaken by Brazil and neighboring Indonesia. Malaysia has relatively large reserves of gas and oil. The country is ranked 13th in terms of the world's gas reserves and 22nd in oil reserves.

Malaysia also tries to promote its service sector, which has grown steadily over the last 2 decades, becoming the second-largest sector of the Malaysian economy. However, in doing so, Malaysia has to compete with neighboring Singapore. Local trade, tourism, and other services currently make important contributions to the country's GDP, providing employment for 32 percent of the Malaysian **labor force**.

AGRICULTURE

Agriculture remains an important sector of Malaysia's economy, contributing 12 percent to the national GDP and providing employment for 16 percent of the population. The British established large-scale plantations and introduced new commercial crops (rubber in 1876, palm oil in 1917, and cocoa in the 1950s). The 3 main crops—rubber, palm oil, and cocoa—have dominated agricultural exports ever since, although the Malaysian share of the world's production of these crops declined steadily during the last 2 decades. In addition to these products, Malaysian farmers produce a number of fruits and vegetables for the domestic market, including bananas, coconuts, durian, pineapples, rice, rambutan (a red, oval fruit grown on a tree of the same name in Southeast Asia), and others. The Malaysian tropical climate is very favorable for the production of various exotic fruits and vegetables, especially since Peninsular Malaysia seldom experiences hurricanes or droughts.

As rice is a staple foodstuff in the everyday diet of Malaysians and is a symbol of traditional Malay culture, the production of rice, which stood at 1.94 million metric tons in 1998, plays an important part in the country's agriculture. However, the overall production of rice does not satisfy the country's needs, and Malaysia imports rice from neighboring Thailand and Vietnam.

In 1999, Malaysia produced 10.55 million metric tons of palm oil, remaining one of the world's largest producers. Almost 85 percent or 8.8 million metric tons of this was exported to international market. Malaysia is one of the world's leading suppliers of rubber, producing 767,000 metric tons of rubber in 1999. However, in the 1990s, large plantation companies began to turn to the more profitable palm oil production. Malaysia also is the world's fourth-largest producer of cocoa, producing 84,000 metric tons in 1999.

Logging in the tropical rainforest is an important export revenue earner in East Malaysia and in the northern states of Peninsular Malaysia. In 2000, Malaysia produced 21.94 million cubic meters of sawed logs, earning RM1.7 billion (US$450 million) from exports. Malaysia sells more tropical logs and sawed tropical timber abroad than any other country, and is one of the biggest exporters of hardwood. Despite attempts at administrative control and strict requirements regarding reforestation in the early 1990s, logging companies often damage the frag-

ile tropical environment. Sharp criticism from local and international environmentalist groups gradually led to bans on the direct export of timber from almost all states, except Sarawak and Sabah. In December 2000, the government and representatives of indigenous and environmentalist groups agreed that there is a need to adopt standards set by the international Forest Stewardship Council (FSC), which certifies that timber comes from well-managed forests and logging companies have to be responsible for reforestation.

INDUSTRY

MINING. Tin, oil, and gas are the major natural resources of export significance produced by the mining sector in Malaysia. The mining of tin was introduced during the colonial era and until the 1980s the country was the world's largest producer of tin, being overtaken in the early 1990s by Brazil and neighboring Indonesia. The major mines are situated in Peninsular Malaysia, making it easy to transport their products to the nearest seaports. Malaysia's exports of tin declined from 36,812 metric tons in 1994 to 22,376 metric tons in 1998, affected by fluctuations in the world market.

During recent decades, Malaysia has increased production of crude petroleum and natural gas. In 1999, it produced 693,000 barrels of crude oil per day and 3.8 billion cubic feet of liquefied natural gas (LNG). The high-quality oil is extracted mainly from offshore platforms in the states of Terengganu, Sabah, and Sarawak, with a total of about 40 oilfields in operation (1999). There are 5 oil refineries situated in Malaysia. The production of gas increased steadily in the 1990s to meet the rising demand in the domestic and international markets, with exports mainly going to Taiwan, South Korea, and Singapore. Malaysia was ranked thirteenth in the world in terms of gas reserves and twenty-second in oil reserves in 1999. The state-controlled petroleum corporation, Petronas, has been seeking a greater role in the international market, investing in promising new projects in the Middle East and Southeast Asia.

Overall, mining plays a declining role in the national economy of the country, contributing just under 7.3 percent of GDP and providing employment for 39,000 people or under 1 percent of the labor force (1998). However, there is great potential for development of this sector, since Malaysia has various relatively under-exploited mineral resources in East Malaysia (Sabah and Sarawak), including bauxite, iron ore, copper, ilmenite, and gold. Additionally, there are large offshore reserves of high-quality oil and gas.

MANUFACTURING. Malaysia has established a diverse and quickly-growing manufacturing sector that plays an increasing role in the Malaysian economy. Manufacturing contributes about 29 percent of the GDP, providing employment to 2.3 million people or 27 percent of the workforce (1999). From the late 1970s, the proportion of GDP provided by the manufacturing sector in Malaysia grew from 20.2 percent in 1979 to around 29 percent in 1999. The United States continues to be the single largest foreign investor in Malaysia's manufacturing sector, with approved new manufacturing investments totaling US$1.37 billion (RM5.2 billion) in 1999. The major investment projects were in the chemical, electronics, and electrical industries.

Malaysia built up its manufacturing sector mainly in the 1970s and 1980s, utilizing its long-established industrial centers on the island of Pinang and the Kelang Valley, its well-developed transportation infrastructure (including seaports and railways), and the entrepreneurial skills of its small and medium-sized businesses. The industrial sector initially consisted of oil refining, machinery assembly, and light industries (including foodstuff processing and textile manufacturing). However, as in neighboring Singapore, the Malaysian manufacturing sector was boosted in the 1970s and 1980s by the extensive growth of the electric assembly and electronics sectors. Malaysia became an important producer of radios, television sets, stereo equipment, and other related products. In the 1980s, the Malaysian government launched its national automobile project, the locally produced Proton car (in cooperation with Mitsubishi of Japan), and in the late 1980s, it started exporting the Proton to the international market. In the 1990s, there was further growth in the manufacturing sector, especially in export-oriented electronics production, including semiconductors, silicon wafers, and other items. Malaysia has become the world's third-largest producer, and one of the world's largest exporters, of semiconductors.

As in neighboring Singapore, the Malaysian government has played an active role in industrialization and economic development. In this regard, the Malaysian Industrial Development Agency (MIDA) has been instrumental in promoting the rapid development of targeted sectors of industries (especially knowledge- and technology-intensive sectors), since all industrial projects that involve **foreign direct investments** (FDIs) must be approved by the MIDA. The government also used direct investments and encouraged the inflow of FDIs, establishing special export-processing zones where investors were given access to well-developed infrastructure and enjoyed tax breaks and other privileges. Since the 1980s, the government has actively promoted the electronics, information technology, and multimedia sectors, and has encouraged the relocation of labor-intensive industries to Indonesia and Thailand.

Most of Malaysia's electrical and electronic products are produced for export to the United States, Europe,

and other markets. This makes its manufacturing economy vulnerable to downturns in the regional and international market. Despite some restrictive measures and financial initiatives, Malaysia was negatively affected by the 1997 Asian financial crisis. In 1997 and 1998, its manufacturing sector experienced serious contraction; dozens of plants were closed and thousands of workers lost their jobs. In 1998 alone, the sector was reduced by about 10.9 percent across the board. However, in 1999 and 2000, Malaysia managed to reverse the **recession** in manufacturing, and this sector experienced an impressive growth of 12 percent per annum.

Malaysia is one of ASEAN's leading exporters of furniture, with total exports reaching about US$1.02 billion (RM3.9 billion) in 1999. Access to cheap local wood makes Malaysian furniture manufactures very competitive in the international market. In 1999, the United States was the largest single market for Malaysian wooden furniture (37 percent), followed by Japan (14 percent), Singapore (9 percent), and the United Kingdom (9 percent). If the rapid growth in this sector remains unchanged, by 2005 Malaysia could become one of the top ten furniture exporters in the world.

SERVICES

TOURISM. Tourism is becoming an increasingly important sector of Malaysia economy. Together with the retail sector, it provides employment for almost 1.57 million people, or around 17 percent of the labor force. Roughly 7.5 million tourists visited the country in 1999, contributing RM10 billion to the national economy. This makes tourism one of Malaysia's top foreign exchange earners. According to the national authorities, the country has 1,426 hotels, the total room capacity of which almost doubled during the 1990s to about 110,000 in 2000. Most visitors have been from Singapore, Thailand, Indonesia, Japan, China, the United Kingdom, and Australia.

In order to develop tourism, Malaysia has promoted its diverse cultural environment, hosting a number of cultural festivals and performances. It has also publicized its rich natural heritage, which includes tropical forests, coral reefs, unspoiled mountain ranges, rivers, and national parks. The country offers tax-free bargain shopping and excellent service, with top-class hotels such as Sheraton, Hilton, Intercontinental, and other well-established international chains opening branches. It offers a wide variety of activities, from eco-friendly and adventure tourism to scuba diving and relaxed family holidays on the numerous Malaysian islands and beaches. Additionally, Malaysia has signed visa-free regimes with most countries in Asia, the Americas, and Europe, enabling international tourists to travel to Malaysia without obtaining entry visas. In 1997, however, tourism suffered from the regional financial crisis and by the smog caused by several months of forest fires in Indonesia. The number of tourist arrivals declined significantly in 1997 and 1998; however, there was a strong recovery in arrivals in 1999 and 2000.

FINANCIAL SERVICES. The financial service industry is another rapidly growing sector of Malaysia's economy. In terms of employment, it almost doubled from 230,900 people in 1988 to 447,200 people in 1998. Traditionally, this sector was built around the banking system, investments, insurance, and some other activities. For more than a decade until 1997, the financial service sector experienced rapid expansion fuelled by the inflow of Foreign Direct Investments (FDIs), reasonably cheap credits, and overall rapid economic growth in all sectors of the economy. Malaysia developed a sophisticated computerized banking payment system, encouraging development of electronic payment systems and electronic banking. The U.S.-based Motorola and Unisys have taken part in these projects as members of consortia that included local companies. Malaysia's government considered developing Kuala Lumpur into a regional financial center, competing with Singapore for this role, although it was slow to allow foreign brokers to operate at the Kuala Lumpur Stock Exchange (KLSE).

The 1997 regional financial crisis started with the collapse of the Thai currency (the Baht), which severely affected the Malaysian financial sector. Share and property prices declined significantly, provoking panic among local and international investors. Within a short time, the Malaysian ringgit had depreciated against major international currencies, especially the U.S. dollar. This inflicted considerable damage on local businesses, as a significant number of credits were in U.S. dollars and local companies faced extreme difficulties repaying those credits. The Kuala Lumpur Stock Exchange (KLSE) lost more than half its value, plunging from RM807 billion in the middle of 1996 to RM376 billion in the middle of 1997. In response to this crisis, the Malaysian government imposed currency and capital controls, locked in foreign investors' share holdings for 1 year, and initiated a share-buying scheme with the government-controlled funds. In 1999 and 2000, financial services began their recovery, and the government slowly eased various restrictions and state control in this sector.

RETAIL. Traditionally, in Malaysia many small and medium-sized businesses were built around the retail sector and were often associated with small shops and cafés run by Chinese merchants. The retail sector grew, in terms of its size and quality of service, due to a general rise in income among the population and an increase in tourism arrivals. In the 1990s, major international retail chains such as Yaohan and SOGO of Japan, Marks and Spencer of the United Kingdom, MAKRO of France and

fast-food franchises such as McDonald's, Kentucky Fried Chicken (KFC), and others opened outlets in Malaysia. However, there are still a number of small family-run traditional shops and cafés, selling both imported and locally-made products.

Tourists can also buy pirated products, including footwear, optical disks (CDs), and computer software. According to one study, piracy may have accounted for losses of US$84.2 million (RM320 million) in market value in 1999. In April 2000, the United States Trade Representative (USTR) placed Malaysia on the special Priority Watch List for its failure to reduce pirated optical disc production and export. In response to this, the Malaysian police regularly launch crackdowns on unlicensed software businesses.

INTERNATIONAL TRADE

Malaysia's international trade experienced tremendous growth throughout the last 3 decades. The Malaysian government welcomed export-oriented industries, created a very positive investment environment in the country, and fostered close relations between government and private businesses. The government established a few barriers on the importation of goods and services, although it often opted for selective intervention and for protecting some sectors of the national economy. Over 5 years, Malaysia more than doubled its exports from US$29.416 billion in 1990 to US$74.037 billion in 1995. After the 1997 regional financial turmoil, Malaysia experienced economic recession, although this recession was much smaller and less destructive than that in South Korea or in Indonesia. Due to tough economic measures, Malaysia's exports recovered and reached US$83.5 billion in 1999.

Historically, the United States has long been one of Malaysia's largest trading partners, its exports to the United States reaching 21.9 percent in 1999, a year in which it was the United States' 12th largest trading partner. Trade between these 2 countries consisted mainly of assembled electrical goods and manufactured electronic products. Neighboring Singapore is traditionally the second-largest export market, with the proportion of goods to Singapore reaching 16.5 percent and dominated by electrical and electronic equipment, machinery, metals, and mineral fuels. Japan is in third place at 11.6 percent, and, once again, exports are dominated by electrical and electronic equipment, machinery and mineral fuels. Other export destinations are the Netherlands, Taiwan, and Hong Kong.

Japan, the United States, and Singapore are also the 3 largest sources of imports. Most Malaysian imports originate from Japan, with the Japanese share of imported products reaching 20.8 percent in 1999, and consisting mainly of electrical and electronic equipment and machinery. The second most important source of imports is the United States, totaling 17.4 percent and dominated by electrical and electronic equipment and transportation equipment. Malaysia was the United States' 17th largest export market in 1999. Malaysia's third most important source of imports is Singapore, totaling 14.0 percent.

During the last 3 decades, Malaysian exports shifted from the sale of agricultural products, raw and processed natural resources, and labor-intensive manufactured goods (including clothing, footwear, and textiles) to the sale of skill-intensive products, including electrical and electronic equipment and parts, and services. The proportion of exported electrical machinery, appliances, and parts—including semiconductors, electronic equipment, and electrical appliances—reached almost 56 percent in 1998. The other important export products were commodities, chemicals and chemical products, manufactured metal products, and textiles, clothing, and footwear.

Malaysia has managed to maintain a positive trade balance, exporting more goods than it imports. Even during the recession of 1997 and 1998, the country had a large **trade surplus** of US$4.0 billion in 1997 and US$17.7 billion in 1998.

In the mid-1990s Malaysia faced growing competition from neighboring Indonesia, the Philippines, and Thailand, which could offer cheaper labor and larger and growing domestic markets. However, recent political and economic uncertainty in the region, especially military conflicts and terrorist activities in Indonesia and the Philippines has undermined the attractiveness of those markets. This has given an advantage to politically and economically stable Malaysia, although its government has often been criticized for the undemocratic measures used to maintain stability and political balance within the country.

Although Malaysia's industrialization and economic growth is highly dependent on international trade, the Malaysian government was less supportive of full economic liberalization than neighboring Singapore.

Trade (expressed in billions of US$): Malaysia

	Exports	Imports
1975	3.843	3.566
1980	12.958	10.820
1985	15.442	12.301
1990	29.416	29.258
1995	74.037	77.751
1998	73.304	58.326

SOURCE: International Monetary Fund. *International Financial Statistics Yearbook 1999.*

Malaysia's leadership was quite reluctant to support free trade within the Asia Pacific Economic Co-operation (APEC) region, arguing that developing countries need more time to prepare for lifting all trade barriers. Additionally, the Malaysian prime minister, Dr. Mahathir, suggested setting up a new regional body, the East Asian Economic Caucus (EAEC), in order to strengthen the negotiating power of East-Asian countries with regard to the North American Free-Trade Agreement (NAFTA) and the European Union.

MONEY

During the last 2 decades the value of Malaysian currency has shown remarkable stability, mainly due to the country's steady economic growth and regular state intervention into the currency **exchange rate**. The Malaysian dollar was floated in 1973, and in that year its exchange rate stood at around RM2.45 per US$1. At the same time, the Malaysian dollar became the sole unit of legal tender, as Singapore and Brunei currencies were excluded from free circulation in the country. The government periodically revised its exchange control regulations, introducing further liberalization of the controls. In 1985, the Malaysian ringgit was valued at RM2.48 per US$1, and this exchange rate remained practically unchanged until the 1997 Asian financial crisis.

During the period between 1973 and 1997, inflationary pressure was relatively small, with a peak **inflation rate** of around 17 percent in 1974. Remarkable stability was supported by a very high rate of savings. Malaysia has one of the highest savings rates in the world, at a level of around 40 percent of GDP. However, Malaysians also borrow rampantly, with a large proportion of investments directed to the booming property market and stock market. Outstanding loans were equivalent to 170 percent of GDP by the end of 1997, one of the highest such ratios in the world.

The Malaysian banking system is well established, with 38 commercial banks operating in the country in 1996, including 14 foreign banks and 12 merchant banks.

Exchange rates: Malaysia

ringgits (RM) per US$1	
Jan 2001	3.8000
2000	3.8000
1999	3.8000

The foreign banks were represented by the biggest names, such as ABN AMRO Bank of the Netherlands, Mitsubishi and Tokyo banks of Japan, Citibank of the United States, Standard Chartered Bank of the United Kingdom, and others. However, the fundamental problem of the banking system in Malaysia, as in other emerging markets in Asia, was its exposure to **bad loans**, allegedly made to politically well-connected businessmen and to overheated property and share markets. This was an important factor that eventually led to a financial downturn.

The 1997 Asian financial crisis affected all regional currencies, dragging them downwards. The property and share markets also dwindled, putting additional pressure on the currencies. The Malaysian ringgit had plummeted from about RM2.55 per U.S. dollar in early 1997 to about RM3.75 in April 1998, and further to RM4.2 in August 1998 (speculations against the Malaysian ringgit on the currency exchange market largely contributed to this downturn). In response to this pressure, in September of 1998 the Malaysian government introduced a range of capital and currency-exchange control measures. A key component of this unprecedented move was pegging the Malaysian ringgit at RM3.80 per US$1. The Malaysian government also closed all legal channels for the transfer of Malaysian ringgit abroad and froze the repatriation of stock assets abroad held by non-residents in Malaysia for a period of 12 months. It even limited its own tourists headed abroad from taking more than RM500 in cash.

Such tough measures reduced the impact of the financial turmoil of 1997 and 1998, although they were sharply criticized by the IMF and other international organizations. In August 1998, Russia defaulted on its international obligations, while Malaysia was slowly achieving economic recovery. Malaysia rejected financial assistance from the IMF and kept its external debt at the relatively moderate level of US$42 billion, or 59 percent of GDP, with debt service payments of about US$6.0 billion (1998). In order to rehabilitate **non-performing loans** (NPLs), the Malaysian government established the *Danaharta,* an asset-managing company with the task of buying and rehabilitating NPLs, and the Corporate Debt Restructuring Committee, which facilitated voluntary debt restructuring between creditors and debtors. By May 2000, the *Danaharta* had acquired about 42 percent of NPLs, with a total value of US$9.63 billion. The government also injected US$1.9 billion into 10 banking institutions. In 1999 and 2000, Malaysia's economy was recovering, prompting the government to ease many of the restrictive measures, although it will take time for international investors to revive their confidence in the Malaysian market.

Malaysia has a single stock exchange, the Kuala Lumpur Stock Exchange (KLSE). During the period of expansion in the 1980s and 1990s, the KLSE was among the fastest growing stock exchanges in the region, with

ambitions to become one of the region's leading financial centers. However, the KLSE lost ground after the stock market collapse in 1997, with some shares losing up to 80 percent of their value. With the strong economic recovery, there was a return of investors and the KLSE strengthened in late 1999 and 2000.

POVERTY AND WEALTH

Malaysia experienced extraordinary economic growth during the last 3 decades, which brought prosperity and higher standards of living to the majority of the people. One of the most important achievements in Malaysia has been the elimination of extreme poverty and hunger. The urban areas—especially the capital Kuala Lumpur, and major tourist destinations and industrial cities such as George Town, Malacca, and Petaling Jaya—enjoy a quality of living very similar to that in developed countries. The major cities have first-class shopping centers, condominiums with air-conditioning and swimming pools, expensive private schools, and elite clubs. The rural population, meanwhile, often lives in traditional wooden houses in *kampungs* (villages) with limited facilities.

The monthly gross household income nearly doubled from MR1,167 in 1990 to MR2,007 in 1995. There has emerged a fairly strong middle class. However, incomes are still distributed unevenly. For instance, the wealthiest 20 percent of Malaysians control 53.8 percent of the wealth, while the poorest 60 percent of the population controls just 21.3 percent of wealth. At the very bottom of the income range, the poorest 20 percent of the population controls only 4.5 percent of wealth. Disparities exist along both geographic and ethnic lines. In general, the Chinese population, which has traditionally lived in urban areas and been involved in small and medium-sized businesses or employed in various industries, has had higher incomes than the Malays, who often live in small towns and villages and were traditionally engaged in agriculture. Secondly, there are considerable differences in standards of living, incomes, and access to medical and other social benefits in different parts of the country. Peninsular Malaysia, where the majority of the population lives, has much higher standards of living compared to East Malaysia.

Since 1970, the Malaysian government has actively implemented social policies aimed at the elimination of poverty and social inequality, and the development of a **social welfare system**. The communal unrest of 1969 prompted the Malaysian government to introduce the New Economic Policy (NEP). This 20-year program established state support of poor communities and access to education and social benefits for Malays and indigenous people (the *Bumiputera*). This latter aspect included the establishment of privileged access to public services, the granting of land rights, preference in education and training, and job quotas in the public sector. In the 1980s, Malaysia's leadership envisioned the formation of the *Malay Baru* (New Malays), a better-educated, politically and socially active people able to live in harmony with other communities. In the early 1990s the government relaxed some privileges and reduced some quotas for *Bumiputera,* making the social welfare system more inclusive and accessible to a wider range of people than it had been before.

The recent economic turbulence of 1997 and 1998 brought higher unemployment, higher prices, and lower incomes. This particularly affected the most vulnerable social groups of society, not only in rural areas, but also in major urban centers. Nevertheless, there were no large groups of people migrating from the country, and Malaysia's quality of life remained much better than in neighboring Indonesia, the Philippines, or Thailand. Around 6.8 percent of the population lived below the poverty line in 1997, most of them in East Malaysia (for comparison, in the neighboring Philippines 32 percent of the population lived below the poverty line in 1997). The economic recovery of 1999 and 2000 reversed the decline in incomes and standards of living.

WORKING CONDITIONS

During the last decade the Malaysian labor force has grown rapidly, due to robust economic growth and the large proportion of young people born in the 1970s. In

1999, the Malaysian labor force was 9.3 million people, with an unemployment rate of 3 percent, or around 270,000. Due to rapid expansion of all sectors of the national economy, there has been a high demand for all types of workers, especially skilled labor in the manufacturing sector and well-trained professionals in the services sector. This led in turn to better wages and rapidly improving working conditions.

The Malaysian government is trying to develop better education at all levels, as it wants to attract skill-intensive industries and services to the country. Primary education is compulsory, and young people may choose between a large number of both public and private schools and colleges. There is an established system of vocational and technical training. A number of Malaysians receive their education overseas, many of them with state support, although during 1997 and 1998, many students returned home. The most popular destinations for overseas education are the United States, England, Canada, and Australia. However, even the rapidly growing numbers of educated and trained Malaysians cannot meet market demand. In the late 1990s, Malaysia experienced shortages of medical doctors, information technology specialists, and professionals in various other areas. In order to meet growing demand of university-trained professionals, in 1994 Malaysia allowed foreign universities to establish campuses in the country.

The higher wages and better working conditions attract large numbers of temporary workers from neighboring Indonesia, Bangladesh, Thailand, and the Philippines. Many of them are hired to work in the low-skill and low-wage construction and service sectors and on agricultural plantations. However, Malaysia has also experienced an inflow of illegal foreign workers, prompting the government to implement harsh detention measures and mass deportation of unauthorized arrivals. Malaysian law does not allow foreign workers to join trade unions. The working conditions of illegal workers are generally inferior to those enjoyed by legally contracted workers. However, labor contractors may be prosecuted if workers complain about abuses or other problems.

The first trade unions appeared in Malaysia before World War II. There are currently 544 trade unions in Malaysia, engaging in the union activities of just over 11 percent of the workforce. Most of the **private-sector** trade unions are members of the Malaysian Trade Union Congress (MTUC), which was established in 1951. Around 90 unions of public- and civil-sector employees are members of the Congress of Unions of Employees in the Public and Civil Services (CUEPACS). Unions maintain their independence from the government and from political parties; by law, union officers may not hold principal positions in political organizations. However, some individual trade union leaders have been elected to the parliament, and the leader of MTUC joined the ruling party in 1997. The Malaysian Trade Union Act guarantees the right to form or participate in trade union activities, but it restricts the right to strike, calling for "socially responsible behavior." Strikes are extremely rare in Malaysia for several reasons, including strong demand in the labor market and the government's promotion of "industrial harmony." In case of labor disputes, the Ministry of Human Resources may intervene in conciliation procedures; in extreme cases, disputants may refer their case to the Industrial Court. The Industrial Relations Act prohibits employers from taking actions against workers for participating in lawful trade-union activities. There is no national minimum wage, although there have been calls recently from trade unions for its introduction. The Employment Act of 1955 established a maximum 48-hour working week.

The Malaysian Constitution prohibits forced and bonded labor by children, and the government claims that it rigorously enforces child-labor provisions. However, the International Confederation of Free Trade Unions estimates that 75,000 children are engaged as laborers. Faced with the shortages in the workforce, the Malaysian government encourages women to work, providing various initiatives. Currently, more than 35 percent of the labor force are women. However, unionization among women is generally lower than among men.

COUNTRY HISTORY AND ECONOMIC DEVELOPMENT

1400s. The Kingdom of Malacca is founded.

1511. Malacca is conquered by the Portuguese under Afonso de Albuquerque.

1641. The Dutch establish control in the region.

1786. The Sultan of Kedah leases the island of Pinang to the British East India Company.

1819. Singapore is founded by Sir Thomas Raffles.

1824. Malacca falls to Britain.

1888. British North Borneo and Sarawak become British protectorates.

1896. The British form a federation, comprised of Perak, Selangor, Negri Sembilan, and Pahang.

1909. British acquire control over Kedah, Kelantan, Perak, and Terengannu—the 4 northern states in Peninsular Malaysia—from Siam (now Thailand).

1921. Port Singapore becomes the principal base for British Navy in East Asia.

1942. Malay Peninsula is occupied by Japanese Army.

1945. Malaya is liberated from Japanese occupation.

1946. British impose a system known as the Malayan Union and grant political rights to immigrants.

1948. The Federation of Malaya is established.

1948. State of Emergency is declared in response to armed campaign by the Malayan Communist Party.

1957. Malaya is granted independence within the British Commonwealth.

1963. Malaysia is expanded to form the Federation of Malaysia; Singapore joins the federation.

1965. Singapore leaves the federation.

1967. Malaysia becomes a founding member of the Association of South East Asian Nations (ASEAN).

1969. Serious rioting breaks out in the capital city, Kuala Lumpur; more than 200 people killed.

1970. The Malaysian government introduces the New Economic Policy (NEP).

1981. Dr. Mahathir bin Muhammad becomes prime minister of Malaysia.

1983. Prime minister imposes restrictions on the power of the *Yang di-Pertuan Agang* and the Council of Rulers.

1995. The ruling political coalition *Barisan Nasional* wins parliamentary elections in landslide victory.

1997. In response to the Asian financial crisis, the government imposes restrictions on currency trading and announces public spending cuts.

1998. National Economic Action Council is established to advise the Malaysian Cabinet on the economic crisis.

1998. Prime Minister Mahathir bin Muhammad dismisses his apparent successor, Finance Minister and Deputy Prime Minister Anwar Ibrahim.

1999. The ruling political coalition *Barisan Nasional* wins parliamentary elections while losing 14 seats in the parliament.

FUTURE TRENDS

Malaysia's economy has benefited from several factors, including a stable political environment, an effective bureaucracy, flexible economic policies, export-oriented industrialization, and inflow of foreign direct investments (FDIs). This has brought prosperity and a high level of confidence to the majority of the population. The country has a healthy, rapidly growing economy, although its government has often been criticized for state intervention into economic development and the imposition of capital and currency exchange controls in 1998. However, subsequent events have shown that these were temporary measures, and the government is considering re-liberalization of its economy. **Inflation** remains low and is under control. Malaysian currency exchange is still tightly regulated and pegged to the U.S. dollar; with the economic recovery, the Malaysian ringgit might be floated again within the next few years. In 1999 and 2000, Malaysia achieved strong economic recovery and, if economic growth at an annual rate of 7.4 percent continues, within the next 20–30 years Malaysia may join the international club of developed nations. In 1998, as if to announce that it had arrived on the world stage, Kuala Lumpur saw the completion of the stunning Petronas Towers, the world's tallest skyscraper complex.

Nevertheless, there are several issues to be addressed. Malaysia's government has developed close relations with its private businesses. These "special relations" with some business groups have allegedly led to the emergence of political cronies with unlimited access to public resources. The experience of neighboring Indonesia shows that this is a dangerous trend that could negatively affect economic development in the future. In 1998–99, Malaysia was widely criticized for establishing increasingly tough political control of the country, and for some harsh measures against the opposition. It remains to be seen whether these measures have in the long term strengthened political stability or undermined it. The political succession of the current leadership will also be a problem. In neighboring Indonesia and Thailand, changes in the political leadership have led to destabilization of the political environment.

In the longer term, Malaysia will need to maintain its international competitiveness, since there is growing competition from other emerging markets for FDIs and for the transfer of modern technologies. Although political and social unrest in neighboring Indonesia and the Philippines has no direct effect on Malaysia, it threatens social stability by causing influxes of refugees and by undermining regional stability. Environmental issues are also important for Malaysia in the longer term as deforestation and global climate change may undermine the country's agriculture, which still plays an important role in the national economy. The recent forest fires in the Indonesian part of Borneo affected not only East Malaysia, but Peninsular Malaysia as well, by injecting hazardous air pollution. This sort of thing, if repeated, may undermine tourism, another important sector of the Malaysian economy. The forecast global economic slowdown may also negatively effect the export-oriented Malaysian economy.

DEPENDENCIES

Malaysia has no territories or colonies.

MALDIVES

Republic of Maldives
Dhivehi Raajjeyge Jumhooriyyaa

CAPITAL: Malé.

MONETARY UNIT: Rufiyaa (Rf). One rufiyaa equals 100 laari. There are coins of 1, 2, 5, 10, 25, and 50 laari, and 1 and 2 rufiyaa. There are notes of 2, 5, 10, 20, 50, 100, and 500 rufiyaa.

CHIEF EXPORTS: Fish products, clothing.

CHIEF IMPORTS: Consumer goods, intermediate and capital goods, petroleum products.

GROSS DOMESTIC PRODUCT: US$540 million (1999 est.).

BALANCE OF TRADE: **Exports:** US$92 million (1999 est.). **Imports:** US$402 million (1999 est.). [*CIA World Factbook* indicates exports at US$98 million (1998) and imports at US$312 million (1998).]

COUNTRY OVERVIEW

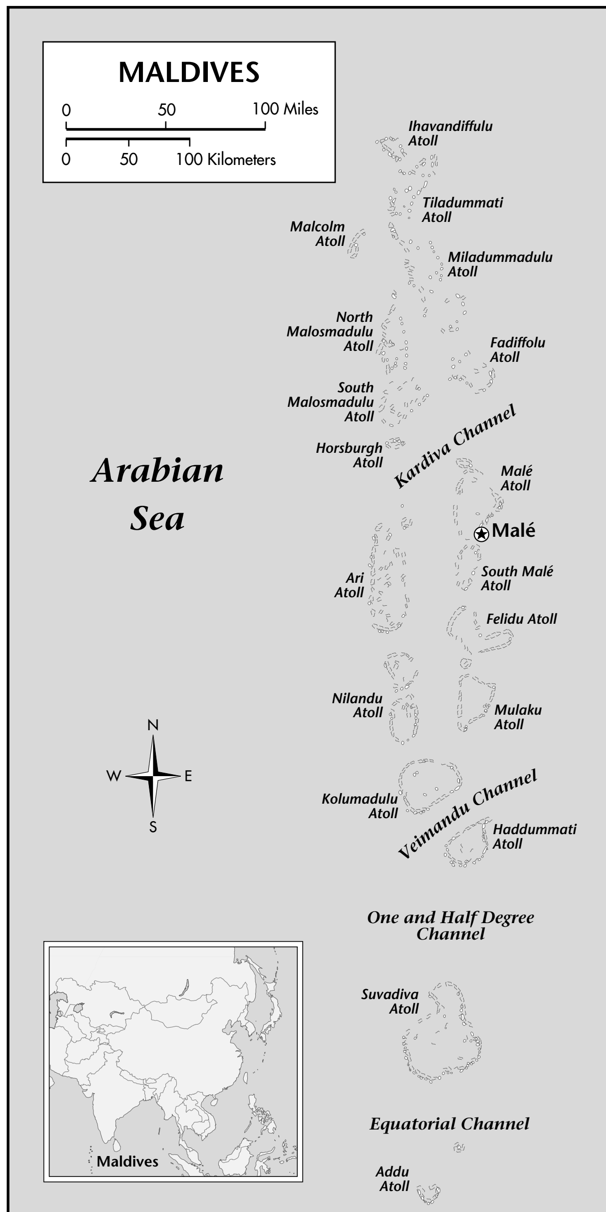
LOCATION AND SIZE. A series of 1,190 coral islands grouped into 26 atolls (a ring-shaped coral reef enclosing a lagoon) located in the Indian Ocean, the Maldives has an area of less than 300 square kilometers (115 square miles) and a total coastline of 644 kilometers (400 miles). The islands form a narrow chain 820 kilometers (510 miles) in length and 130 kilometers (81 miles) in width within an area of 90,000 square kilometers (34,749 square miles) of ocean. Of these islands, around 200 are inhabited and 85 are tourist resorts. Comparatively, the area occupied by the Maldives is about 1.7 times the size of Washington, D.C. The capital city island, Malé, is located within Malé atoll, which is in the center of the strip of islands that makes up the Maldives. The Maldives is the smallest country in Asia.

POPULATION. From a 1980 level of 155,300, the population of the Maldives was estimated at 301,475 in July 2000. With the 2000 population growth rate at 3.06 percent per annum (one of the highest population growth rates in the world), by 2010 the Maldives population is expected to have almost doubled. In 2000, the birth rate stood at 38.96 per 1,000, while the death rate was 8.32 deaths per 1,000. With the continuation of a similar population growth rate, the population of the Maldives will fail to stabilize for at least another 50 years.

More than 200 of the 1,190 islands in the Maldives are inhabited, of which only 5 islands have a population of more than 3,000. The majority have a population of 500 or less. Nonetheless, the country has a very high population density of 916 people per square kilometer. Twenty-six percent of Maldivians live on the overcrowded capital island of Malé, with an average of 10 persons per household compared with a national average of 6.5. The implications of the country's high population growth and density are severe. The traditional construction material, coral, is near its point of full depletion. More importantly, the fresh water held beneath the soil surface is in rapid decline. This means that the Maldives faces the prospect of importing a large percentage of its water needs to support the growing population, unless there are fast developments in desalination services on the islands.

OVERVIEW OF ECONOMY

The Maldives government has followed a policy of free market economy, making it one of the most liberal in the developing world. This has had considerable benefits. The promotion of a favorable economic climate has assisted the economy's inflow of **foreign direct investment**. This doubled from an annual average inflow of $5 million between 1988 and 1993 to $10 million in 1999. But with the economy's high level of dependence on just 2 economic sectors—fisheries and tourism—it is highly susceptible to constant fluctuations on world markets. Total dependence on imports to supply a number of its sectors, such as textile manufactures and tourist supplies, means that the rise and fall of the rufiyaa on international money markets can significantly affect the competitive-



ness of exports and cost of imports. The simultaneous decline of fisheries exports and influx of tourists in the early 1990s led to a serious deficit in the national **balance of payments** that required the government to introduce unpopular cuts in public spending.

Compared to the other Maldives, Malé is highly developed. Some of the other islands have benefited from the carry-over effects of the tourism sector, the availability of arable land, or from the collection service for fish catches provided by the government. However, the geographical isolation of a significant number of islands means that their access to the productive sectors of the economy and to social services is very limited. The government has initiated a set of policies to address these disparities and spent 28.7 percent of its 1999 budget on atoll development. This was done in part to take the strain off the high population density in Malé and also to allow more of the outlying population access to the strategic economic situation of the capital. One example is Villingili, a nearby former resort island, which was transformed into a residential island with a commercial harbor. It now supports around 15,000 Maldivians. A similar government policy is to provide **infrastructure** and facilities to regional centers throughout the atolls to encourage people to move from isolated islands to local commercial focal points and develop the economy in a more unified trajectory.

Although the Maldives has benefited considerably from growth over the past 20 years, there are a number of factors that act as considerable limitations on the continued sustainable development of the economy. For example, the exploitation of coral for construction purposes is at such a level that it is estimated that all of the reefs in the north Malé atoll will be depleted by 2014. **National debt** has risen considerably, from $13 million in 1979 to $203 million in 1999. Rising population growth and such factors as the rise of tourism and the mechanization of the fishing fleet has meant that imports have risen significantly, especially for such commodities as petroleum products. Consequently, whereas exports only rose from $8 million in 1980 to $64 million in 1999, imports expanded from $29 million to $402 million. Although the total national balance of payments remained at an annual average of $7 million in credit between 1994 and 1999, the serious drain of imported goods limits the potential of reinvestment and development on the islands.

The Maldives Ministry of Planning and National development emphasizes the government's "international reputation for its high-level commitment to environmental protection, demonstrating its readiness to subordinate short-term economic gain to environmental conservation." This progressive policy-orientation entails a number of factors of self-interest ranging from the desire to maintain the country's natural beauty to continue enticing tourists, to the more serious issue of 80 percent of the land elevation being less than 1 meter above sea level. This means that the islands will be even more susceptible to storms and rising sea levels if the projected consequences of the "greenhouse effect" are realized.

POLITICS, GOVERNMENT, AND TAXATION

The formation of the Maldives as a political entity is generally dated from the period of conversion to Islam in the 1100s. This makes the Maldives one of the oldest surviving small states in the world. Unlike most other countries in the region, the Maldives was not subject to the overt domination of foreign powers. This is most

likely due to the problems of navigating the sea around and within the islands as, without a high level of knowledge of the dangers of the reefs and shallow lagoons, ships would often be smashed or grounded. The Portuguese managed to rule the Maldives for a period of 17 years in the mid-1500s. They were soon thwarted in their dominance by a guerrilla war assisted by the Rajah of Cannanore in what is now India. Various sultans then ruled the Maldives unhindered, until Sultan Muhammad Muenuddin entered into an agreement with the British in 1887. The British, whose empire extended throughout South Asia, made the Maldives a British protectorate in return for the payment of tribute.

After a gradual rise in its level of sovereignty, the Maldives became fully independent of Britain on 26 July 1965. Three years after, a national referendum saw 80 percent of votes cast call for the abolition of the hereditary sultanate in favor of a republic, although the country's status as an Islamic state remained. This included civil law being subject to Sharia (Islamic law) which remained in place by mid-2001. Although the executive position of sultan was abolished, the office of the president wields similarly large powers. (The president is required to be a male Sunni Muslim.) The president is the head of state, the supreme authority defending the national faith of Islam, the chief executive, and commander-in-chief of the military. And not only does he have the power to appoint the prime minister and cabinet of ministers, but he can dismiss them too. Amir Ibrahim Nasir, formerly the prime minister under the sultan, was elected president in 1968. Nasir ruled until the 1978 elections, when he cited poor health and did not stand for office. He instead left for Singapore after the new president, Maumoon Abdul Gayoom, initiated investigations into Nasir's alleged misappropriation of government revenues.

President Gayoom was re-elected in 1998 for a fifth consecutive 5-year term with the support of 90.9 percent of votes cast. In each election, he ran unopposed—presidential candidates are selected by the Citizens' Majlis (parliament) and posed to the people in a simple "for" or "against" referendum. The Majlis itself consists of 48 members, 8 of whom are selected by the president, while voters in the Maldives' 20 administrative atoll districts elect the rest (2 members per district). In November 1988, Tamil mercenaries from Sri Lanka, in collusion with some Maldivian nationals, attempted to overthrow the government. However, President Gayoom appealed to India for military assistance, which swiftly foiled the rebels.

The Maldives electoral system has received criticism for being limited, unfair, and unrepresentative. For example, Freedom House (the U.S. political liberties and civil rights advocacy group) classified the Maldives in 2000 as "Not Free." Amnesty International (a London-based human rights organization) has reported the detention of a number of politically motivated prisoners. Gayoom himself is often cited as authoritarian. In a country profile on the Maldives, the British Broadcasting Corporation (BBC) suggested that Gayoom "has been accused of heading a small heredity elite which holds decisive power and which uses intimidation to discourage political activity." However, the government addresses these criticisms by maintaining that this limited style of democracy provides a stable and consistent form of rule that also acts to protect the basic tenets of the nation's Muslim faith. Maldives' brand of Islam is among the most emancipated of current Islamic states. This is exemplified by the Maldives' comparatively high rating in the Gender-related Development Index.

The Maldives government receives the majority of its revenues through **direct taxation** and the earnings of state-owned enterprise and property. There is no **income tax**. Import **duties** provided 63 percent of government tax revenues in 1997, while various taxes on the lucrative tourism sector accounted for 27 percent of tax revenues. Key non-tax revenue sources are government-owned property, such as resort islands which are leased to tour operators, and the profits from public enterprise, such as the regular collection of fisheries produce, which provided 46 percent of total government revenues in 1997.

INFRASTRUCTURE, POWER, AND COMMUNICATIONS

The Maldives transportation infrastructure is very limited. The capital city island, Malé, has 9.6 kilometers (6 miles) of coral highways. Due to their small size and the tiny amount of cars throughout the rest of the islands, the total quantity of roads is not known. There are no railways in the Maldives. Since the tourism boom of the 1970s, the availability and frequency of inter-island transportation has considerably improved. While the cheapest and most common mode of transport used by Maldivians are *dhonis* (wooden all-purpose water taxis/fishing boats), tourists and the wealthy have the option of using private seaplanes, helicopters, and speedboats. When travelling on an island, the majority of people use bicycles or motorbikes, although there are a limited number of cars and taxis in use on the more populated and larger islands.

When Malé International Airport on Hulhule Island (2.5 miles from Malé) was opened in 1981, it caused a considerable rise in tourist arrivals. While improved air transportation has benefited the tourism sector, international sea cargo remains very important. Malé's port can intake around 200,000 tons of cargo per year and offers shipping services to and from Europe and a large portion of Asia. With its fleet of 7 cargo boats and 1 container vessel, Maldives National Shipping Ltd. handles about 60 percent of the country's imports.

SOURCE: CIA *World Factbook 2001* [Online].

The **parastatals** the Maldives Electricity Bureau and the State Electricity Company (STELCO) provide power throughout over 95 percent of the Maldives inhabited islands. Tourist resort islands are required by the government to supply independent energy supplies, this is generally via oil-fuelled generators. However, wood accounts for 55 percent of total domestic energy consumption and is mainly used in households for cooking purposes.

Telecommunications facilities are of an excellent quality in Malé and throughout most of the tourist islands. By 2001, the government had successfully extended the availability of telephones throughout the vast majority of inhabited islands. Telecommunications are provided through a **joint venture** between the government and the British company, Cable and Wireless. By 1999, there were 8.1 Internet hosts per 100,000 people.

ECONOMIC SECTORS

The Republic of Maldives' economic sectors reflect the very small size of the population, a limited infrastructure principally caused by the country's division across hundreds of tiny islands, a low level of skilled labor, and the very limited level of agricultural potential and mineral resources. Consequently there are severe limits on domestic markets and the availability of land on those islands that are inhabited. Nonetheless, the country's situation as a series of small isolated islands works

more positively as a strategic trading point, a tourist destination, and as an excellent base for tapping the Indian Ocean's abundant fish stocks.

The Maldives economy consists of 3 main sectors—trade, tourism, and fisheries. Although the fisheries sector was historically the primary source of national employment and economic activity, the rise of tourism in the 1970s caused it to become the third most important economic sector by 2001.

AGRICULTURE

Traditional agricultural production in the Maldives is limited by poor soil, a low level of arable land, and a geographically split landmass which disallows large-scale commercial farming. In 1995, only 3,000 hectares of arable land was under permanent crops. There are, however, a number of crops grown for domestic consumption. These include coconuts, bananas, breadfruit, other exotic fruits, betel, chiles, sweet potatoes, and onions.

FISHERIES. Until the development of the tourist industry, the fisheries sector was the Maldives principle economic activity and source of export earnings. In 2000, the sector employed about 20 percent of the national workforce and acted as the main source of livelihood for a majority of Maldivians. In addition, it is the second largest source of foreign exchange and provides more than 10 percent of GDP. The government established the Maldives Fishing Corporation in 1979 to exploit the country's vast fisheries resource.

The use of fishing nets is illegal, and as a result, the more labor intensive traditional method of fishing by line and pole dominates. Nonetheless, the productivity of the fisheries sector has improved considerably during the 1990s. Although traditional small boats made of coconut wood remain in use, most are used in conjunction with outboard motors. The mechanization of the fishing fleet has been combined with the introduction of Fish Aggregating Devices (which allow the detection of shoals of fish). This meant that the nominal catch of fish in the Maldives expanded from 71,245 metric tons in 1989 to 118,183 tons in 1998. The opening of the Maldives **Exclusive Economic Zone** in the early 1990s meant that more Maldivian vessels were fishing in the sea around the islands. In fact, this zone allowed Maldivian fishermen to tap into a range of around 330 kilometers (200 miles). With the decline of fish stocks in the Atlantic Ocean, the price of fish on international markets seems likely to continue rising into the 21st century, although the subsequent increased pressure on Indian Ocean fish stocks threatens one of the foundations of the Maldives economy.

INDUSTRY

The Maldives industrial sector is small. Traditional industries are still in place. For example, women collect cowrie shells (the former national currency) for export. They weave the labor-intensive coir rope from coconut husks, which is a very strong, flexible and waterproof rope. Male carpenters build the traditional fishing boats (dhonis) from coconut trees, which can last up to 20 years. However, more modern developments have occurred in the Maldives industrial sector.

CANNING. The Maldives' primary industry is the canning and processing of fish. In 1998, $19.06 million of canned fish, predominantly tuna, was exported. The development of the Felivaru Tuna Fish Cannery in the early 1990s was a key factor in the modernization of this industry. The export of dried, smoked, and salted fish constituted an additional $9.07 million of exports in 1998. This constitutes a significant enterprise for levels of employment and national income, although it remains a more traditional industry. The canning industry is expected to continue to thrive and replace more traditional fish exports with the opening of the Kooddoo Fisheries Complex, which included large refrigeration facilities.

MANUFACTURING. The development of manufacturing is limited by the low level of domestic demand, limited skilled labor, and the lack of national resources. This means that many material and labor inputs into domestic goods rely heavily on imports. The economy has diversified into the production of clothing, both for domestic consumption and for export. In 1989, garment exports amounted to $10 million. Because of government initiatives, this had more than doubled to $25 million by 1999.

However, garment factories (some with U.S. investment) rely almost exclusively on the import of materials for the manufacture of their goods. The competitiveness of finished products is reduced due to the costs of passing through multiple **tariff** boundaries. In an attempt to address this problem, the government has granted duty-free status on the import of fabrics and similar materials essential in the production of clothing and apparel. The government is keen to follow this policy, as it wishes to improve the amount of foreign exchange earnings and, in a similar vein, to create jobs for an ever-expanding and very young population. Other low-level manufactures that have developed in the Maldives through the 1990s are the production of PVC piping, soap, and food products. Between 1989–2000, the average annual growth of the manufacturing sector was 9.4 percent.

SERVICES

TOURISM. The Maldives' principal assets are its beauty, geographical isolation, and rich marine resources. When

an Italian entrepreneur set up some uninhabited islands as resorts for foreign visitors in the early 1970s, the tourism sector began to develop very rapidly. Tourists come to spend time relaxing in one of the Maldives' 85 idyllic resort islands. A key pastime for tourists is diving in the cleanest ocean in the world amongst more than 1,000 species of fish, constituting one of world's most species-rich marine areas.

The influx of tourists to the Maldives has been increasing steadily since the 1970s. In 1993, 241,020 tourists travelled to experience the beauty of the Maldives, and by 1997, this number had risen nearly 50 percent to 365,563. Of these, the vast majority came from Western Europe, Japan, and from nearby countries in South Asia. The increase in tourist arrivals has significantly improved the country's receipts from tourism, which increased from $146 million in 1993 to $286 million in 1997. The recent purchase of resorts by the multinational hotel groups, Hilton and Four Seasons, is a clear indication of the projected growth of the Maldives' tourism sector. Yet the cultural effect of foreign influences has been controlled by the government policy of restricting tourist access to resort islands, unless they specifically apply for permission. Also, no Maldivians have their permanent residence on resort islands. The purpose of this is to maintain the population's apparent cultural unity as based upon the Islamic faith.

INTERNATIONAL TRADE

The Maldives is increasingly relying upon imports. This is due to a lack of agricultural production and fossil fuel resources, a growing population and household incomes, and the high influx of tourists since the 1970s who demand certain foodstuffs and luxuries. In 1977, imports totalled $11.1 million, whereas by 1998 they had boomed to $354 million. The Maldives receives its imports from a wide range of countries. The European Union countries supplied $65 million in 1998, of which the 2 largest partners, the UK and the Netherlands, provided $18.5 million and $12.5 million, respectively. In the same year, Singapore supplied $40.9 million in imports, India $39.3 million, Malaysia $34.9 million, Sri Lanka $30.9 million, the United Arab Emirates $23.8 million, Japan $22.3 million, and the United States $19.1 million.

Maldivian exports totalled $76.2 million in 1998—a considerable growth from a 1977 level of $4.8 million. The main destination was the EU countries, which consumed $20.1 million. The UK was the primary partner here and purchased $14.7 million in Maldivian exports, Germany imported $5.1 million. Exports to the United States totalled $15.7 million, nearby Sri Lanka $13.1 million, Japan $10.9 million, and Thailand $9.8 million.

The Republic of Maldives is an active member of the South Asian Association for Regional Co-operation (SAARC), whose other members are Bangladesh, Bhutan, India, Nepal, Pakistan, and Sri Lanka. Of these countries, the Maldives can boast the second highest GDP growth in the 1990s and the highest level of average individual incomes.

MONEY

There is no stock market in the Maldives, although at times some of the larger parastatals issue shares. According to the CIA *World Factbook 2001*, the national currency has had a fixed exchange rate since 1995 when it was pegged to the U.S. dollar at a rate of Rf11.77:US$1. This contributed to a low **inflation rate** of 3 percent in 1998. As a result, the price of **consumer goods** has remained fairly consistent, and the cost of living is steady. The Maldives Monetary Authority regulates the banking system and the money supply. It also functions as the central bank.

POVERTY AND WEALTH

Throughout the 1990s, nearly all of the available measures used to classify sustainable human development indicated that there had been considerable positive progression in the material and social conditions in the

lives of Maldivians. The **United Nations Development Program** has marked the Maldives out as being one of just two countries in the South Asian region to be a medium human development country. Between 1977 and 1995, the life expectancy of the average Maldivian increased by 20 years to 71 years, which is a remarkable level for a developing country.

Despite that, it is estimated by the Maldives Ministry of Planning and National Development that almost 50 percent of children suffer, to different degrees, from stunting and wasting in their physical development. This is due to malnutrition in the more remote and less easily accessible islands. This is mainly caused by limited agricultural potential and the high cost of imports. Consequently, the majority of Maldivians consume a relatively restricted range of foodstuffs, with rice, fish, and coconut being the staples. A 1993 survey found that less than 30 percent of children ate fruits and vegetables. On the other hand, the annual average intake of protein rose from 69 grams (1980–82) to 94.6 grams (1995–97), and over the same period caloric intake improved from 2,194.3 to 2,505.1.

WORKING CONDITIONS

The Maldives is not a member of the International Labor Organisation. Although the national constitution does not explicitly bar the formation of trade unions, they do not exist in the Maldives. This is partly due to the lack of the legal right to stage strikes or engage in collective bargaining processes. Also, most workers are employed outside of the formal sector. In fact, due to the low recognition of workers' rights by the Maldives government, in 1995 the United States temporarily suspended the Maldives' tariff preferences within the U.S. Generalized System of Preferences.

While enrollment at primary schools is very high (98 percent in 1999), secondary school enrollment is only about 50 percent of the relevant age group. This results from having only 2 secondary schools outside of Malé (even though the government spent 17.6 percent of its 1999 budget on education). This not only has the effect of limiting secondary education to the more wealthy tiers of Maldivian society but acts against equal educational opportunities for girls. Girls are considerably more socially restricted in their movement than boys and have fewer employment opportunities. In addition, a recent UNDP survey found that there were only around 250 Maldivians with university degrees. The end result is that professional, skilled, and even semi-skilled workers are lacking in the Maldives. For example, 70 percent of primary and secondary school teachers are foreign workers. The total amount of imported labor grew from 2,000 in 1986 to 18,500 in 1995, which places an additional drain on already sparse **foreign exchange reserves**.

COUNTRY HISTORY AND ECONOMIC DEVELOPMENT

12TH CENTURY. The population adopts the Islamic faith.

1558. The Portuguese colonize the islands (only to be driven out in 1573).

17TH CENTURY. Maldives becomes a protectorate under the Dutch rulers of Sri Lanka (then Ceylon).

1887. The British officially declared the Maldives a protectorate.

1965. The Maldives become fully independent on 26 July.

1968. A national referendum votes in favor of the abolition of the sultanate in favor of a republic. Amir Ibrahim Nasir is elected president.

1978. Maumoon Abdul Gayoom is elected president.

1981. Maldives Monetary Authority is established and Malé International Airport is opened.

1988. Coup attempt by Tamil mercenaries is successfully halted with the aid of Indian forces.

1998. Gayoom is re-elected as president for the fifth consecutive term.

FUTURE TRENDS

In mid-2001, the two most important issues in the continued development of the Maldives are the partly linked factors of population growth and anticipated global environment problems. If projected population growth proves correct (a doubling of late 1990s levels by 2010), there will simply not be enough jobs in the country to employ the country's young people. Slightly less than 50 percent of the population are under 15 years old and the Maldives future will be dominated by the effects of a large proportion of young people entering the labor market, with estimated annual levels of 5,000 new job

seekers looking for work. Similarly, population growth exerts considerable strain on already highly depleted reserves of potable water and building materials (particularly coral). Moreover, if pollution in the world's ecosystem continues to have the effect of raising the temperate of global climates thereby increasing sea-levels (a phenomenon know as the "greenhouse effect"), then the majority of the low-level land mass of the Maldives will simply disappear.

On a more positive note, the economy has consistently grown throughout the 1990s, and foreign investment is on the increase. With the decline of stocks of fish in most of the world's other oceans, the Maldives' access to the rich fish reserves of the Indian Ocean means that this industry will remain of significant importance, especially if the modernizing trend in the domestic canning and refrigeration of fish continues. In addition, except for some slight drops in tourism receipts during the financial crises of the late 1990s, the tourism sector is likely to continue to grow as is indicated by the recent investment of multinational hotel groups there.

DEPENDENCIES

Maldives has no territories or colonies.

MARSHALL ISLANDS

Republic of the Marshall Islands

CAPITAL: Majuro.

MONETARY UNIT: United States dollar ($). One U.S. dollar equals 100 cents. There are notes of 1, 2, 5, 10, 20, 50, and 100 dollars. Coins come in denominations of 1, 5, 10, 25, and 50 cents and 1 dollar.

CHIEF EXPORTS: Fish, coconut products, and shells.

CHIEF IMPORTS: Foodstuffs, machinery and equipment, fuels, beverages, and tobacco.

GROSS DOMESTIC PRODUCT: US$105 million (1998 est.).

BALANCE OF TRADE: **Exports:** US$28 million (1997 est.). **Imports:** US$58 million (1997 est.).

COUNTRY OVERVIEW

LOCATION AND SIZE. The Marshall Islands are located in the North Pacific Ocean some 4,000 kilometers (2,486 miles) northeast of Australia. They consist of 2 groups of small islands, atolls (coral islands), and reefs running from the northwest to the southeast. The more easterly of these is the Ratak Chain, the more westerly, the Ralik Chain. It is estimated that there are 1,152 islands and 30 atolls, but only 4 islands and 19 atolls are inhabited. With terrains of coral, limestone, and sand, none of the islands have any high ground, and the most elevated location of the islands is 10 meters (33 feet). The total land area is 181 square kilometers (70 square miles), and about 60 percent is taken up by crops. There are phosphate deposits and the possibility of minerals in the seabed within the 200 nautical mile economic zone claimed by the Marshall Islands. The capital is Majuro, which is located on an atoll of the same name.

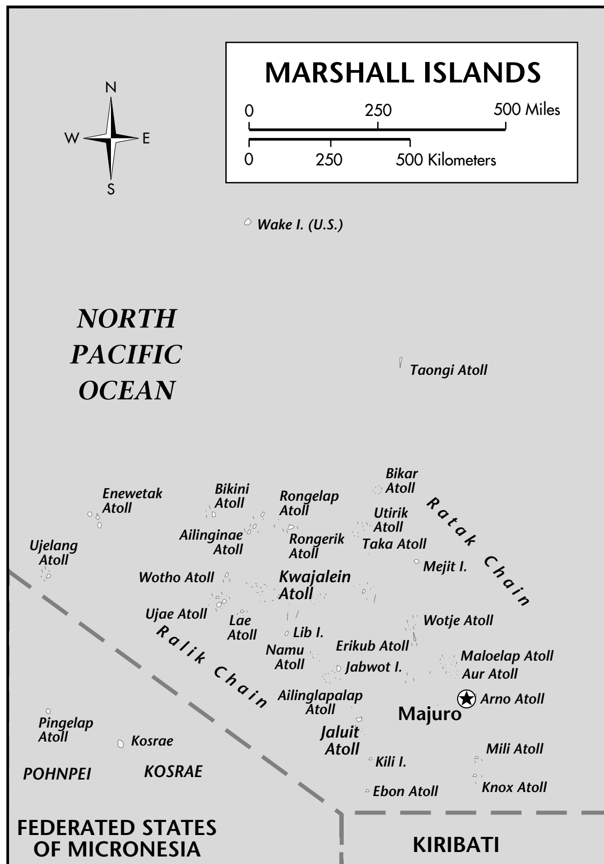
The Marshall Islands are located within the tropics, and the weather is generally hot and very humid. Temperatures average around 27°C (81°F), and vary little during the year. There is a rainy season from May to November, with annual rainfall of about 4,000 millimeters (157 inches), but the sandy terrain means that little water is collected, and the shortage of drinking water is a continual problem. The islands are occasionally hit by typhoons.

POPULATION. The population was estimated at 68,126 in 2000, giving a population density of 375 persons per square kilometer (971 per square mile), quite a bit higher than in neighboring island states in the Pacific. The population was estimated to be growing at 3.9 percent a year in 2000, which is considered a very rapid rate. The birth rate was 45 births per 1,000 population, and the death rate was 6 persons per 1,000. The figures indicate negligible migration, but the International Monetary Fund (IMF) has indicated that there is in fact significant out-migration to the United States. The average fertility rate is 6.6 children per woman. With such a rapid rate of growth, the population can be expected to have a young age structure. The 0–14 age group contains 50 percent of the population, the 15–64 group contains 48 percent, while only 2 percent are 65 and over. Slightly more than half of the population lives on Majuro Atoll, and a further 20 percent live on Kwajalein. The urban population is about 70 percent of the total.

Almost all of the people on the Marshall Islands belong to the Micronesian ethnic group and follow the Christian religion. Most are Protestant, although there are some Catholics and small communities of Seventh-Day Adventists, Mormons, Jehovah's Witnesses, and Bahai. English is the official language and is spoken by everyone. Two local Malayo-Polynesian dialects are in use as local languages, and they are used in parliament and for some radio broadcasts. Overall life expectancy is 66 years, with a 64-year expectancy for males and a 67-year expectancy for females. The adult literacy rate was 93 percent in 1980, with practically all adult males and 88 percent of females being literate.

OVERVIEW OF ECONOMY

Given its small size in terms of population, its inaccessible location, and the absence of any minerals apart



from phosphates (which are not currently exploited), it is surprising that the economy of the Marshall Islands generates as much income for its citizens as it does. The per capita **gross domestic product** (GDP) was estimated at $1,670 (**purchasing power parity**, 1998 est.), and this rate would just squeeze the Marshall Islands into the lower-middle income group. In addition, the Marshall Islands receive very substantial receipts from the United States—partly aid and partly rents for the use of military bases—which add more than 50 percent to the income that is generated domestically.

Most employment is in the services sector, which, because of the receipts from the United States, is able to support health workers, teachers, and government administrators. The agriculture sector is quite small in terms of both its contribution to total output and employment. The small industry sector, primarily engaged in crop and fish processing, is about what would be expected given the general level of development of the islands.

Coconut products and fish are the main exports, and these earnings are supplemented by tourism. Almost everything, aside from some food products, is imported and, without U.S. aid there would be a drastic fall in imports.

The growth of the economy varies from year to year and is affected by the impact of climatic conditions on agriculture. In recent years, output has declined by 2 percent to 5 percent per year, although El Niño weather conditions caused severe disruption in 1996, when output fell by 13 percent.

POLITICS, GOVERNMENT, AND TAXATION

The Marshall Islands were originally settled by people from neighboring Pacific islands. In the 16th century, Spain claimed the islands, although Germany was allowed trading rights. With decline of Spanish influence, the islands came under the control of Germany, who established a protectorate. At the outbreak of World War I (1914–18), the Japanese took over the islands and administered them under a United Nations (UN) mandate. World War II (1939–45) saw clashes between the United States and the occupying Japanese, with the United States finally establishing control of the islands in 1944. The United States administered the islands as a trustee for the United Nations and used them to begin a series of nuclear tests. The tests subjected the islanders to serious radiation and made Bikini Atoll uninhabitable. This was to have long-term implications for the Marshall Islands, leading to the United States providing considerable financial support while continuing to operate its military bases. In 1965, movements for self-determination of the islands began, culminating in full independence in 1990. The Marshall Islands has a Compact of Free Association with the United States, agreed to in 1986, by which the United States is responsible for defense of the Marshall Islands, rents military bases, and provides financial assistance. The initial agreement was valid for 15 years from 1986 and is being renegotiated.

The 1979 constitution established a parliamentary government, with a president as chief executive and head of state. The parliament is known as the Nitijela. Directly elected for 4-year terms, the parliament has 33 members, known as Senators. The president is elected by the parliament, and the president chooses his cabinet from among the members of parliament. The voting age is 18. Although elections were typically non-partisan on the Marshall Islands, opposition began to emerge in 1991, and subsequent elections have seen incumbents losing their seats. In 2000, the opposition gained 40 percent of the seats in the parliament and established a significant presence. Parliamentary candidates tend to contest elections on the basis of their personalities, rather than their party affiliations, and it is sometimes not clear which party an elected member supports. In 2001, during a no confidence vote (which decides if the ruling government has enough support to survive), 2 ostensible government members voted with the opposition and 1 opposition member voted with the government.

The legal system is based on the former Trust Territory laws, but has been modified by the legislature, mu-

nicipal bodies, customary law, and common law. There are 4 levels of judicial courts: the Supreme Court, High Court, district and community courts, and traditional courts. The traditional courts are limited mainly to jurisdiction over traditional titles and land issues.

In the **fiscal year** 1997–98, the budget anticipated that government revenues would be 25 percent of GDP. **Income tax** raised 32 percent of government revenue (excluding grants), import **duties** 28 percent, sales taxes 13 percent, and other income (interest, fees, licenses) 27 percent. There is a continuing program to try to improve tax performance by tightening administration, reducing tax **arrears**, simplifying import duties to a basic duty of 12 percent (with some exceptions), doubling the fuel tax, reducing tax exemptions, introducing a **value-added tax** (VAT) and taxes on commercial rentals, and the introduction of user charges.

Total spending in 1997–98 was projected at 53 percent of GDP. On the recurrent expenditure side, general administration takes up 12 percent of total government spending, education 23 percent, health 12 percent, and foreign affairs 10 percent. The gap between revenues and expenditures was more than met by receipts from the United States of 40 percent of GDP, and on this basis, a **budgetary surplus** of 11 percent of GDP was forecast. Budget surpluses have not always been the norm. Between 1992 and 1995, **budget deficits** averaged 14 percent of GDP.

INFRASTRUCTURE, POWER, AND COMMUNICATIONS

Perhaps because the country's limited roadways are scattered widely across the many islands, there are no measurements of roadway length on the Marshall Islands. The main settlements on Majuro Atoll and Kwajalein have paved roads, and the roads in Majuro have recently been upgraded. Elsewhere there are coral surfaced roads and sandy tracks. There are no railways. The main port is at Majuro, and this is the only port that is able to receive large ocean-going vessels. A dry-dock facility was recently completed on Majuro Atoll for the islands' fleet of 143 ships, mostly bulk and cargo carriers, petroleum tankers, and a vehicle carrier. Sixteen of the inhabited atolls and islands have airports and 4 have paved runways.

All of the Marshall Islands' electricity is supplied by diesel generators. In 1994, the Marshall Islands generated and consumed 57 million kilowatt hours (kWh). There is some domestic use of bottled gas, and many families use kerosene stoves or wood as cooking fuel. The water supply is erratic, and there are projects to increase water storage facilities and to construct desalinization plants.

In 1994, there were an estimated 3,000 land line telephones in use and 280 mobile telephones. The 3 major settlements of Majuro Atoll and the islands of Ebeye and Kwajalein are connected by a direct dial system; the other locations are linked by short-wave radiotelephone, mainly used by the government. International links are provided by 2 Intelsat satellite earth stations. There is a U.S. government satellite link on Kwajalein Island.

The islands had 3 AM radio stations and 4 FM stations in 1998, and in 1997, there were 3 television stations, although 2 of these were provided by the U.S. military on Kwajalein Island. The local newspaper is the weekly *Marshall Islands Journal.*

ECONOMIC SECTORS

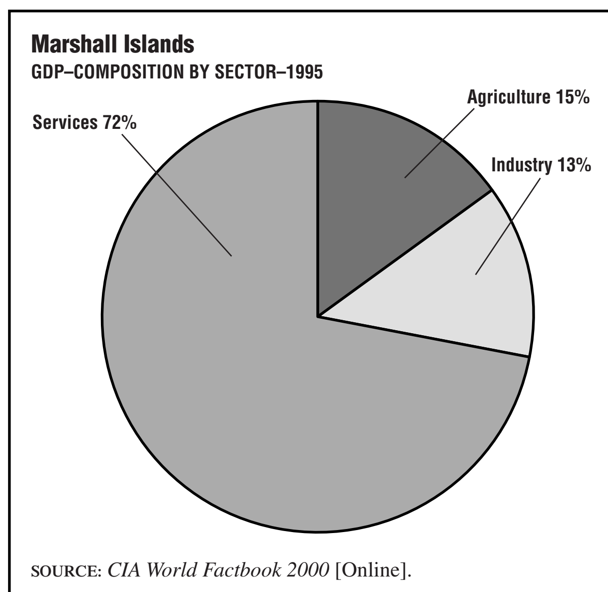
The services sector dominates the economy, and is primarily composed of the large number of government

employees, those providing services for the U.S. military installation on Kwajalein Island, and the tourism industry. In 1995, services generated 72 percent of GDP. The most recent employment figures, from 1988, indicate that the services sector employed 58 percent of the **labor force**. Incomes in this sector are above average. The smallest sector in terms of output is industry, which produced 13 percent of output in 1995 and engaged 23 percent of the labor force in 1988. The agriculture sector (which includes fishing) only employed 19 percent of the labor force in 1998, generating 15 percent of output in 1995.

AGRICULTURE

Copra (dried coconut) is the main **cash crop**, though its output has been falling. There was a 16 percent fall in 1996 as a result of El Niño rains, but this was followed by an 11 percent fall in 1997. The poor transport links between the islands, atolls, and Majuro is a problem, as the crop has to come to the capital for processing and packaging before exportation. The price earned by growers has fallen (the price halved between 1994 and 1997), reducing their incentive to produce, but it was still above the world price due to a government **subsidy**. The long-term problem is that the coconut trees are declining in productivity as they become older and, with lower prices, the growers have little incentive to replace the tree stock. The lack of private land titles and a land market is a further problem. Without land as collateral, farmers find it difficult to raise loans to finance replanting.

Fish exports appear substantial and fast-growing, but much of the catch is in fact caught by Chinese and Japanese vessels, taken to land, and then shipped from the islands in refrigerated cargo boats. The main benefits to the islands are fishing license fees, supplying the fishing fleet, and some processing and packaging of the catch. The Marshall Islands do have some government-owned boats, but their catches were very low. They ceased operation in 1996. Trochus shells are collected from the reefs. They are exported to be made into buttons and ornaments, and they can be ground to produce an ingredient for lacquers.



SOURCE: *CIA World Factbook 2000* [Online].

Food and livestock production has grown modestly in the period from 1993 to 1997 (by about 3.5 percent annually), basically reflecting the increase in the population. However, production is not encouraged due to the low prices of imported food as compared with domestic output. A total of 60 percent of caloric intake comes from imports. Local food producers are hampered by poor transportation, which raises the cost of their products. The main food crops are bananas, breadfruit (a large fruit with edible pulp and seeds), pandanus (a fruit with edible nuts), taro (a starchy root crop similar to the potato), vegetables, and tropical fruits. Livestock is mostly poultry and pigs, with some cattle.

INDUSTRY

There is no mining on the Marshall Islands, although there are some phosphate deposits. The main manufacturing enterprise is the Tobolar Copra Processing Authority, which is government-owned but run by a private management team. It is the only purchaser of copra, which it crushes to produce coconut oil. Currently, it is unable to purchase enough copra and operates at about one-third of its capacity. A garment factory was established in 1998 in a **joint venture** with China. Other manufacturers are involved in the production of drinking water and beer, and the processing of breadfruit and taro.

The Marshalls Electricity Company is government-owned, and manages to cover its costs, as does the publicly-owned Majuro Water and Sewage Services. The construction sector is made up of small private enterprises that mainly construct private dwellings. An international construction company undertakes any large project, such as the new port at Majuro, and the local workforce provides only some unskilled labor.

SERVICES

The services sector is the largest employer, and generates almost three-quarters of GDP. Transport and communications generate 7 percent of GDP; distribution, restaurants and hotels, 18 percent; financial services 14 percent; and public administration and community services, 30 percent.

Much of the high value of this sector comes from servicing the U.S. installation on Kwajalein Island, which is used for missile tracking and weapons testing. Another

source of service sector income has been the sale of Marshall Islands passports since 1996. These were initially offered at $350,000 each, and later at $100,000. The islands indicated that they were prepared to sell up to 3,000 passports, and to date the sales have realized about $10 million. The sales were suspended in 1997 but there are plans for resumption. The services sector also supplies the international fishing fleets operating in the waters that surround the islands, serves as an onshore leave destination, and generates further income from the sale of fishing licenses (about $1.5 million to $3 million, a year).

The National Telecommunications Authority is still majority-owned by the government. By virtue of being a **monopoly** and making relatively high charges for international calls, it manages to cover its costs. Air Marshall Islands is government-owned. It sustained large losses in 1996 and 1997, and its routes have been restructured with plans of eventual **privatization**.

BANKING AND FINANCES. The banking sector includes 2 U.S. commercial banks, the domestic Bank of the Marshall Islands, and the Marshall Islands Development Bank. Most lending consists of consumer loans for construction, travel, and education. The lack of private titles to land or a land market makes lending to the agriculture sector difficult.

TOURISM. Tourism offers some prospects for expansion. In 1997, there were 6,000 arrivals in the islands, but less than 1,000 were tourists; the rest were on business or in transit. There are presently less than 200 hotel beds, although a new government-owned hotel of 150 beds is under construction. In 1997, tourism is estimated to have earned $3 million for the Marshall Islands. Visitors are presently deterred by the lack of facilities (particularly outside Majuro), the relatively high cost of transportation to the islands, the radiation contamination of some of the atolls by nuclear testing, and the current program of weapons testing on Kwajalein. It is thought, however, that the islands have some possibilities in establishing a specialty market in tourism, based on sport fishing, diving and snorkeling, gambling (approved in 1996), and the general tropical attractions of the islands.

INTERNATIONAL TRADE

Merchandise exports of $28 million were made up entirely of coconut products (11 percent) and fish products (89 percent) in 1997. Frozen fish exports have increased from $1.3 million in 1993 to $21.9 million in 1997 as a result of a Chinese fishing fleet that based itself at Majuro. Exports of trochus shells for buttons, ornaments, and making lacquers are not recorded, but there is probably some small informal trade. Diesel used to be **re-exported** to Micronesia, but this ended in 1996. Exports go mostly to China as a result of the frozen fish expansion, with the United States, Japan, and Australia being other export destinations.

Merchandise imports were $58 million in 1997, with food and beverages making up 31 percent and fuels 23 percent. The rest consisted of consumer manufactures, machinery and transport equipment, and chemicals. The United States supplied 52 percent of imports in 1997, much of which was goods for the U.S. workers at the Kwajalein installation. The next biggest supplier was Singapore with 4 percent.

MONEY

The Marshall Islands use the U.S. dollar as their currency. This has the advantages of not having the expense of running a central bank, the currency is completely convertible, and price stability is reasonably well ensured as the Marshallese do not have the ability to print currency. The rate of **inflation** has been in single digits in the period from 1993 to 1997, ranging from 4.8 percent to 9.6 percent. The only drawback for "dollarized" economies is that they do not earn the seigniorage (profit from the minting of coins) they would gain if they issued their own currency. The increasing number of countries that have been attracted to using the U.S. dollar in place of a domestic currency has caused the United States to consider sharing some of the seigniorage it earns as currency issuer.

POVERTY AND WEALTH

The are no figures on the numbers below the dollar-a-day poverty line, but given the income level and the structure of the economy, perhaps 20 percent of Marshallese might live poverty. Most of those affected will be among the 30 percent of the population living on the atolls other than Majuro and Kwajalein, relying on small-scale agriculture and fishing for their livelihoods.

Life expectancy (at 65 years in 2000) is considered high, and the level of adult literacy, last surveyed in 1980, was 93 percent. Together with its lower-middle

income status, the Marshall Islands has a medium level of human development when evaluated by the criteria used by the UN. Infant mortality is high, however, at 41 per 1,000 births in 2000 (in the United States the rate is 6 per 1,000).

WORKING CONDITIONS

The economically active labor force was estimated at 11,500 in 1988, of which 73 percent were males. Approximately 12 percent of the labor force was recorded as being unemployed. However, the unemployment rate has little meaning in an economy like that of the Marshall Islands, as it relates to those registering as looking for jobs in the urban areas as a percentage of the formal labor force. A substantial part of the labor force of the Marshall Islands is in the agriculture and fishing sectors, much of it in small-scale family enterprises outside the formal sector. With negligible social security provisions, those without work or support from families or charities cannot survive. It is likely that there is considerable disguised unemployment in the rural areas, meaning that the work could be carried by a smaller workforce than is used.

There is a Marshall Islands Social Security Administration, but it is under investigation for mismanagement, and it is not able to make much of a contribution to helping those who are out-of-work or in need.

COUNTRY HISTORY AND ECONOMIC DEVELOPMENT

1000 B.C. Migration to the Marshall Islands from other Pacific Ocean islands begins.

1525. Spanish navigator Alonso de Salasar is the first European to sight the islands.

1529. Alvaaro de Saavedra lands on the islands and claims them for Spain.

1788. The British sea captain, John Marshall, visits the islands.

1874. Pope Leo XIII, acting as a European mediator, confirms Spanish dominion over the islands, while also allocating trading rights to Germany.

1885. Germany establishes a protectorate over the islands.

1914. With the outbreak of World War I, Japan assumes administration of the islands.

1920. Japan receives a United Nations mandate to administer the islands.

1944. After fierce fighting between Japanese and American forces during World War II, the United States occupies the islands.

1945. Japanese settlers are **repatriated**.

1947. The UN assigns the islands (which are known as the Trust Territory of the Pacific Ocean) to the United States. The U.S. Navy undertakes their day-to-day administration.

1948. The United States begins a series of nuclear test explosions on the islands, which subject the islanders to high levels of radiation.

1965. The Congress of Micronesia is formed by delegates from Pacific islands to press for independence.

1970. A commission on self-government confirms that the peoples of Micronesia have a right to sovereignty, self-rule, and to terminate association with the United States.

1979. Marshall Islands District, named after the British explorer who visited the islands in 1788, drafts and approves a constitution, which is recognized by the United States. Amata Kabua, who holds the traditional position of High Chief, is elected as the first president.

1982. The United States signs a Compact of Free Association, which outlines proposals for the end of its trustee relationship with the Marshall Islands.

1983. Marshall Islanders vote to accept the Compact of Free Association. Kabua is reelected as president.

1986. The Compact of Free Association, after several mutually agreed amendments, comes into operation, and the islands become self-governing.

1987. Kabua reelected as president.

1990. The UN removes the trustee status of the islands, establishing the Republic of the Marshall Islands.

1991. The Marshall Islands joins the UN as an independent, sovereign nation. The Ralik-Ratak Democratic Party is formed to oppose the supporters of Kabua, and wins 2 seats in the parliament.

1995. Kabua is reelected as president. The Government Party (or Kabua Party, as it is often known) wins

23 seats, and the newly formed United Democratic Party (UDP) wins 10 seats.

1996. President Kabua dies and is succeeded by Imata Kabua, the paramount chief. The Kabua Party becomes Our Islands Party (OIP).

2000. Elections give the OIP 20 seats and the UDP 13 seats. Kessai Note, who had held no traditional post, is elected president.

2001. The United States Nuclear Claims Tribunal awards Marshall Islands $563 million, but the tribunal has no powers to enforce payment.

FUTURE TRENDS

It is clearly very important that the islands extend the agreement with the United States relating to the use of Kwajalein for missile testing. About 1,500 Islanders work at the complex, making up about 13 percent of the labor force, and the jobs are particularly well-paid. The major success in recent years has been the expansion of the frozen fish export sector, and the government would be wise to make sure that the agreements with the Chinese fishing fleets are continued. Tourism has some possibilities as a specialty market, but foreign investment will be vital if significant expansion is to be achieved.

The main sector of concern is the production of coconut products. In the long-term, many of these problems can be solved by registering land-titles and extending loans to farmers to replace exhausted trees. This is particularly important from a social standpoint, as the coconut farmers are among the poorest members of the community. In the short-term, some efforts to improve transport between the islands and atolls would help both the coconut farmers and the small fishermen.

DEPENDENCIES

Marshall Islands has no territories or colonies.

MICRONESIA

Federated States of Micronesia

CAPITAL: Palikir, Pohnpei Island.

MONETARY UNIT: The official currency of Micronesia is the United States dollar ($). One dollar equals 100 cents. There are coins of 1, 5, 10, 25, and 50 cents and 1 dollar. There are notes of 1, 2, 5, 10, 20, 50, and 100 dollars.

CHIEF EXPORTS: Fish, garments, bananas, and black pepper.

CHIEF IMPORTS: Food, manufactured goods, machinery and equipment, and beverages.

GROSS DOMESTIC PRODUCT: US$263 million (1999 est.).

BALANCE OF TRADE: **Exports:** US$73 million (1996 est.). **Imports:** US$168 million (1996 est.).

COUNTRY OVERVIEW

LOCATION AND SIZE. The Federated States of Micronesia forms (with Palau) the archipelago of the Caroline Islands, and lies about 800 kilometers (497 miles) east of the Philippines. The Federated States of Micronesia (FSM) consists of 607 islands and includes (from west to east) the states of Yap, Chuuk (formerly Truk), Pohnpei (formerly Ponape), and Kosrae. Micronesia covers about 702 square kilometers of land (271 square miles), has a coastline of 6,112 kilometers (3,798 miles) and is scattered over more than 2.7 million square kilometers (1 million square miles) of the ocean. Micronesia's largest island cluster is Pohnpei (163 islands), with an area of 344 square kilometers (133 square miles), while the smallest cluster is Kosrae (5 islands), spanning 110 square kilometers (42.5 square miles). The islands include a variety of terrains, ranging from mountainous islands to low, coral atolls and volcanic outcrops.

POPULATION. The population of Micronesia was estimated at 134,597 in July 2001, up 18 percent from 114,000 in 1998. The current annual population growth rate is 3.28 percent, which will result in a population of 176,815 by 2010. The birth rate is 27.09 per 1,000 population, with a fertility rate of 3.83 children per woman. The death rate is 5.95 per 1,000 population. The **immigration** rate is 11.65 migrants per 1,000 population. The infant mortality rate in July 2000 was 33.48 per 1,000 births (the U.S. rate was 7 per 1,000).

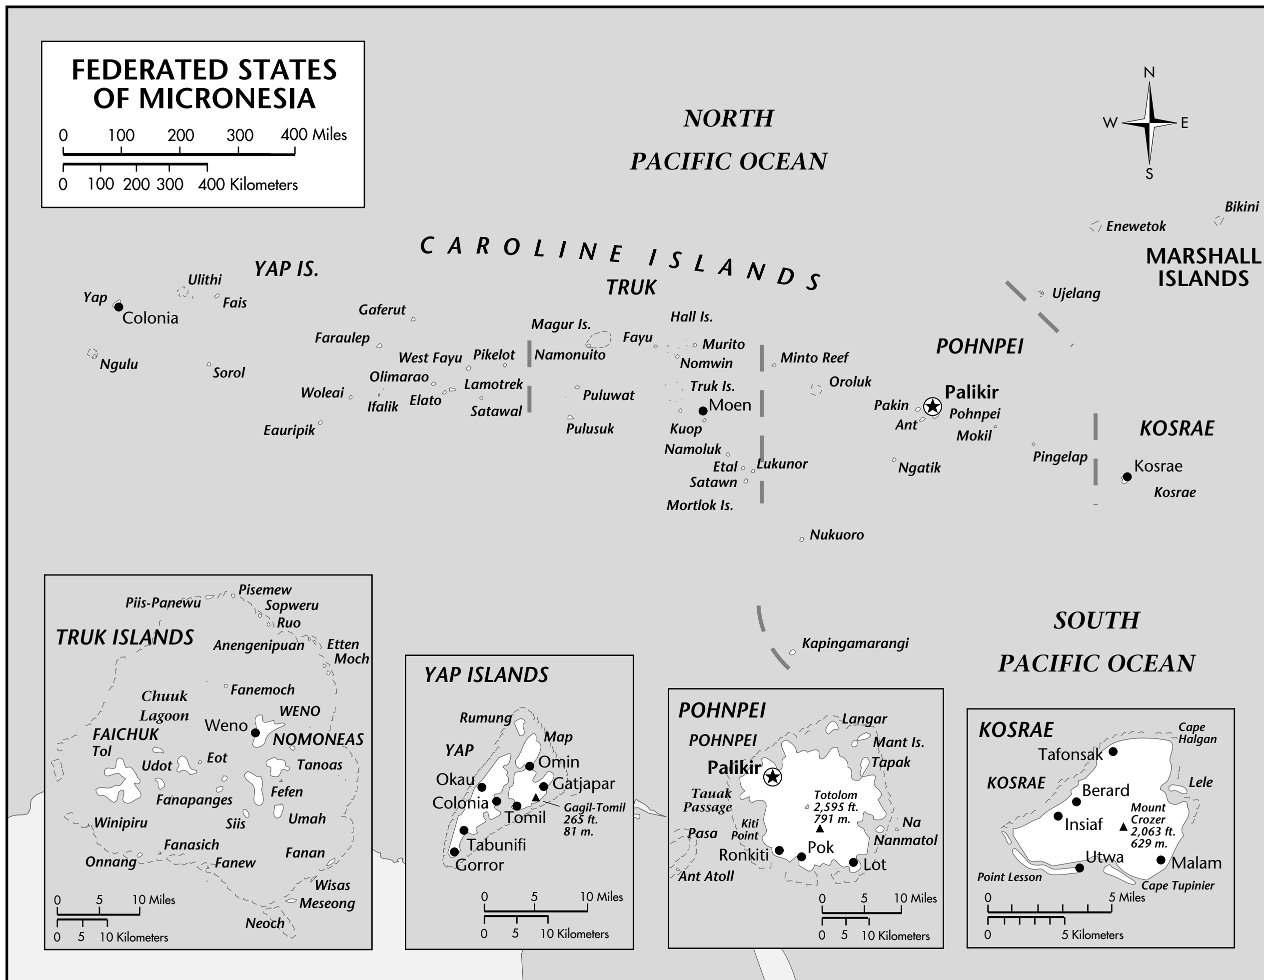
There are 9 ethnic Micronesian and Polynesian groups, spread across the islands. In 1994, around 53,319 people lived in Chuuk; 33,692 in Pohnpei; 11,178 in Yap; and 7,317 in Kosrae. The highest population density was estimated in Chuuk island with 419.8 people per square kilometer (1,087 per square mile) in 1994.

OVERVIEW OF ECONOMY

Previously administered by the United States as a Trust Territory of the United Nations, the Federated States of Micronesia became self-governing in domestic matters in 1986, and fully independent in 1991.

The small size of Micronesia, both in terms of geographical area and population size, its remote location, and its lack of commercially viable mineral resources all combine to set limits on the economy. The nation's main assets are its tropical location (which provides good potential for tourism), productive fishing grounds, and reasonably well-educated **workforce**.

Micronesia's estimated **GDP per capita** is $2,000, which places it near the top of 45 world economies the World Bank classifies as Lower Middle-Income (countries with GDP per capita in a range from $700-$2,800). Financial support from the United States has been a vital feature of the period since self-government was introduced in 1986, with $1.3 billion allocated over the period from 1986 to 2001, an enormous sum for a community of 134,000—almost $100,000 per person. The money has been allocated to improving educational and health provisions, providing **infrastructure**, training for political and community leaders, bolstering **public**



sector efficiency, and encouraging the **private sector**. Grants from external sources amounted to some $91.5 million in 1996–97 (equivalent to 43 percent of GDP).

The most significant cash export is fish, which accounted for 82 percent of total exports in 1996. Micronesia has established an **exclusive economic zone**, which covers an ocean area of more than 2.5 million square kilometers (965,250 square miles) of particularly productive fishing grounds yielding tuna, red snapper, and grouper. Local producers fish these waters, and licenses are granted to foreign fishing fleets to work these waters as well. Other marine resources include phosphate deposits, and there are currently trials under way to see if these deposits on the ocean floor can be exploited commercially.

In the past, copra (the sun-dried white flesh of the coconut, from which coconut oil is extracted) was Micronesia's main **cash crop**. However, low world prices have led to production plummeting from 8,500 tons in 1979 to 200 in 1992, and it has remained around that level since, although in some years no exports of copra are recorded at all, and this despite a government **subsidy** to try to maintain production. Copra now makes a small contribution to income in Micronesia, and the economy is no longer buffeted by fluctuations in world copra prices. Also, Micronesia no longer faces a dilemma of whether to continue production in the face of current low prices. Needless to say, the decline in copra production is a particular blow for farmers on the outer islands for whom coconuts have been an important source of income.

The islands all have some tree cover, and timber, including wood from the coconut tree, is used for house construction, furniture, and household utensils. The climate in the Micronesia is tropical, and there is a healthy amount of rainfall. The soil is rich, and fruits indigenous to the islands include bananas, mangos, pineapples, and papayas.

Economic growth in the Micronesia is heavily influenced by changes in global and regional commodity prices and the climate. The nation is mainly made up of small, flat islands, which makes it difficult to support large-scale cultivation. The main form of agriculture is therefore subsistence production. It is difficult for subsistence producers to create a large surplus due to the lack

of storage facilities and transportation. The strongest areas for economic growth are tourism, fishing, manufacturing and mining.

The government employed as much as two-thirds of the population before 1997. However, in 1997, the Asian Development Bank approved a loan of $17.68 million for the funding of a program of major economic structural adjustment. This was done in preparation for the ending of U.S. assistance under the Compact of Free Association at the beginning of the 21st century. The reform package included measures for attracting new sources of foreign aid and private investment, for fiscal reform, and for the strengthening of the private sector, as well as severe reductions in the number of public-sector employees. The year 1997 saw the balance of the workforce begin to tilt toward the private sector, and in 1998, government expenditures declined by 27 percent, spurred by continuing **privatization**. In terms of GDP components, the government's recent efforts to encourage privatization of certain industries seem to be working. Non-market production dropped 4.3 percent as more citizens chose to work in the money economy.

In exchange for allowing the United States exclusive access to its waters, Micronesia receives an annual fixed payment from the U.S. government.

POLITICS, GOVERNMENT, AND TAXATION

The Federated States of Micronesia emerged as a nation from the former United Nations Trust Territory of the Pacific Islands (TTPI) administered by the United States from the end of World War II. The Federated States of Micronesia became self-governing in 1986.

Political legitimacy rests on a majority vote through elections in accordance with the constitution. On May 10, 1979, the locally drafted Constitution of the Federated States of Micronesia incorporated the 4 states of Kosrae, Yap, Ponape (later Pohnpei), and Truk (later Chuuk). The Congress includes 14 members, called Senators. The 4 states each elect 1 "Senator-at-Large" for a 4-year term. The remaining 10 Senators are elected for 2-year terms: their seats are distributed in proportion to the population of each state. Each of the 4 states has its own constitution, governor, and legislature. The federal president and vice-president are elected by the Congress from among the 4 "Senators-at-Large." The president of the Federated States of Micronesia since May 1999 has been Leo A. Falcam.

The state governments are fairly autonomous and work like state governments in the United States, with individual executive, legislative, and judicial systems. In each state, traditional leaders work closely with the local governments to maintain cultural traditions.

There are 3 branches of government: an executive branch led by a president who also serves as head of state; a **unicameral** (single house) legislature elected from the 4 constituent states; and a judicial system that applies criminal and civil laws and procedures closely paralleling those of the United States. Under the Compact of Free Association, the United States is responsible for defence.

The Council of the Micronesian Government Executives aims to facilitate discussion of economic developments in the region and to examine possibilities for reducing the considerable cost of shipping essential goods between the islands.

The main tax that all businesses in Micronesia pay is the Gross Receipts Tax. The tax is assessed on the gross revenues of businesses, which includes all receipts without deductions. The rate is $80 on the first $10,000 of gross revenues and 3 percent of any excess for the calendar year. Businesses with less than $2,000 gross revenue in a year are eligible for a refund of the taxes paid for that year. A Wages and Salaries Tax is assessed on an employee's income. The **Social Security Tax** requires the employer to pay half of the tax and the employee to pay the other half. The current rate is 4 percent of wages paid by both the employee and the employer.

INFRASTRUCTURE, POWER, AND COMMUNICATIONS

Micronesia has a total of 240 kilometers (149 miles) of roadways, 42 kilometers (26 miles) of which are paved. Macadam (a mix of small broken stone and concrete or asphalt) and concrete roads are found in the more important islands. Other islands have stone and coral-surfaced roads and tracks. There are no rail lines in the islands.

The country has a total of 6 airports, of which 5 have paved runways. International airports which can accommodate medium-sized jets can be found in Pohnpei, Chuuk, Yap, and Kosrae, and there are airstrips in the outer islands of Onoun and Ta in Chuuk. The Federated States of Micronesia is considering expanding air terminals in order to meet the increasing demand for air traffic. The islands are served by Continental Micronesia, Air Nauru, and Continental Airlines (USA). Pacific Missionary Aviation, based in Pohnpei and Yap, provides domestic air services.

There are several ports and harbors, such as Colonia (Yap), Kolonia (Pohnpei), Lele, and Moen. All of the states in the Federated States of Micronesia have deep draft harbors capable of handling almost all commercial shipping needs. Each port is capable of providing containerized cargo handling, as well as some warehousing and transshipment capabilities. All ports offer cold storage

Communications

SOURCE: CIA *World Factbook 2001* [Online].

facilities. Shipping services are available to anywhere in the world on a monthly schedule by PM & O Line, Pacific Micronesia Line, Kyowa Lines, Palau Shipping Lines, Tiger Lines, and Saipan Shipping Company. Freight rates are relatively high, as volume shipping is rarely possible.

The 4 urban centers all have public water and sewer systems. Outside of the urban centers, the populations rely on water catchments (devices for trapping water), wells, and septic tank systems. Charges for water usage range from $1.50 to $5.40 per 6,000 gallons of water. Kosrae does not charge for water and sewerage.

With the exception of some small hydroelectric facilities in Kosrae and Pohnpei, electricity in the Federated States of Micronesia is produced by diesel generators. The principal energy source in Micronesia is imported petroleum. From 1993 to 1997, Micronesia spent $10 to $20 million per year for petroleum products. Power is generally available only in the 4 urban centers. The power system in Pohnpei is operated as a state enterprise fund and is the most reliable system. The other 3 states are moving in a similar direction. The existing power system can accommodate additional users, and the government is willing to provide such means when necessary. Electricity generating costs are $0.19 a kilowatt-hour, while charges range from $.05 a kilowatt-hour to $0.25 a kilowatt-hour.

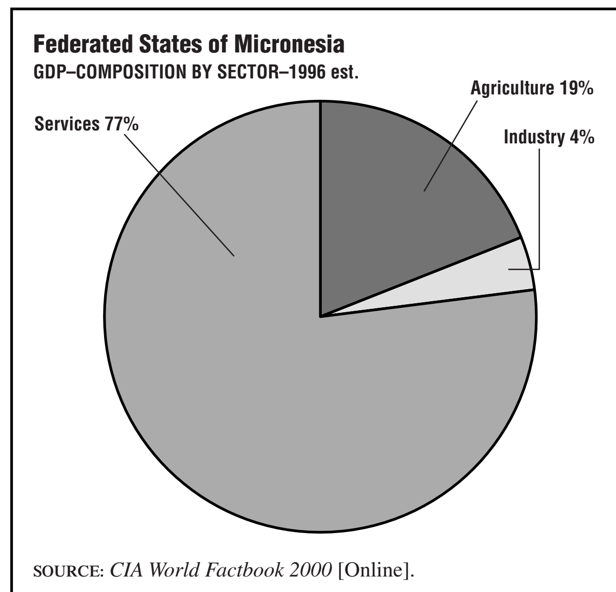
The telecommunications system in the Federated States of Micronesia is highly developed and offers satellite access for telephone, telex, and facsimile to any location worldwide. There were 8,000 main telephone lines in use in 1995. For domestic purposes, the islands are interconnected by short-wave radiotelephones (used mostly for government business). For international links there are 4 Intelsat (Pacific Ocean) satellite earth stations.

The Federated States of Micronesia Postal Service delivers and sends mail by air. The Federated States of Micronesia is part of the U.S. zip code system. Postage rates between the Federated States of Micronesia and the United States are the same as U.S. domestic rates.

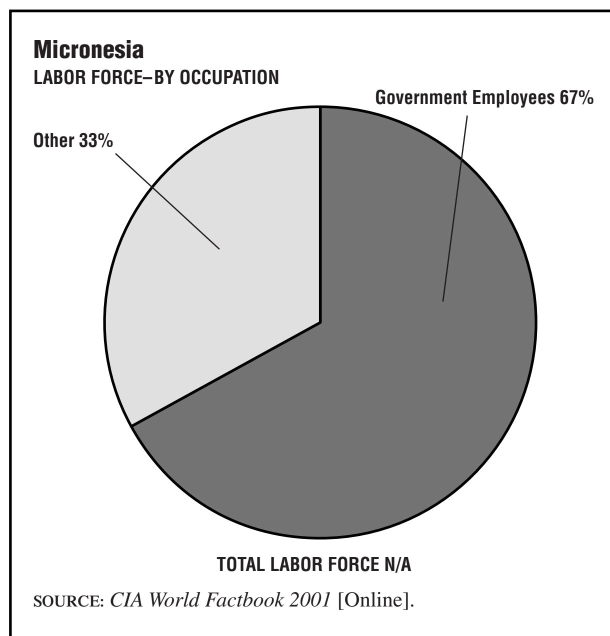
There are 5 AM radio stations and 1 FM radio station. The majority of stations broadcast in English. There are 2 broadcasting television stations.

ECONOMIC SECTORS

Economic activity in Micronesia consists primarily of **subsistence farming** and fishing as well as revenues from external licensing (the U.S. government, for example, makes a fixed payment to the Federated States of



SOURCE: *CIA World Factbook 2000* [Online].



SOURCE: *CIA World Factbook 2001* [Online].

Micronesia for exclusive access to its waters). In the financial year ending September 30, 1997, fees from fisheries licensing agreements, mainly with Japan, contributed some 30 percent of domestic budgetary revenues.

The islands have no mineral deposits worth exploiting, with the possible exception of off-shore phosphate, but it is uncertain whether these deposits can be extracted commercially. The potential for a tourist industry exists, but the remoteness of the location and a lack of adequate facilities hinder development. Currently, monetary aid from the United States provides the majority of revenue for both the government and the national economy.

The government's main economic priority is to develop a sustainable, independent economy by bolstering the private sector and reforming the public sector with the objective of reducing dependence on foreign aid and encouraging economic self-sufficiency. In addition, the government supports international efforts to stop global warming and pollution in general, in order to protect the islands and their agricultural sectors. In recent years, the climate has been very unstable with typhoons, flooding, and mudslides followed by a drought.

AGRICULTURE

Farming is mainly on a subsistence level, although its importance is diminishing. The principal agricultural crops are coconuts, bananas, betel nuts, cassava, and sweet potatoes. The agricultural sector contributed 19 percent of GDP in 1996 and engaged 27 percent of the total labor force in 1994. Exports of agricultural products (excluding fish) accounted for 6 percent of export earnings in 1996, while exports of marine products accounted for 84 percent of total export revenues in that year. The annual rainfall received each year varies from 2,500 millimeters (98 inches) in Yap to 4,500–7,500 millimeters (177–295 inches) in Pohnpei. The limited water reserves in both Chuuk and Yap are a source of concern for the long term.

INDUSTRY

Industry (including mining, manufacturing, utilities, and construction) provided 4 percent of GDP in 1996, and engaged 10 percent of the total labor force in 1994. The major industrial productions are construction, fish processing, and craft items from shells, wood, and pearls. There is little manufacturing, other than garment production (in Yap) and the manufacture of buttons using troche shells.

SERVICES

The service sector provided an estimated 77 percent of GDP in 1996, and government services alone contributed 42.1 percent. The national and state governments in 1996–97 employed a total of 6,015 people, and services as a whole employed 63 percent of the labor force. Tourism is an increasingly important industry, and it is hoped that several projects to improve communications will further stimulate the sector, which has been hindered by the territory's remote location. The tourism industry was identified in the Asian Development Bank in mid-1995 as having the greatest potential for development and thus contributing to Micronesia's economic growth. Presently, most of the Federated States of Micronesia's tourism industry is inadequate and not competitive with destinations such as Guam and, soon, Palau. As of 1991, the most recent year for which such data are available, the Federated States of Micronesia's entire tourism industry (hotel, motel, and other accommodations) amounted to only 290 rooms, 144 of which were in Pohnpei, 80 in Chuuk, 26 in Yap, and 30 in Kosrae. Among the visitors from overseas, 60 percent are from the United States and 25 percent from Japan.

INTERNATIONAL TRADE

Thanks to its lack of exportable goods, Micronesia has traditionally run a large trade imbalance. In 1996, the **trade deficit** was $95 million, on exports of $73 million and imports of $168 million. The main exports of the Federated States of Micronesia are marine products, while the main imports are food, manufactured goods, machinery and equipment, beverages, and fuels. Micronesia's main trading partners are the United States, Japan, Australia, and Guam. In 1996, the United States supplied 73.2 percent of Micronesia's imports and Japan 11.9 percent.

MONEY

The United States dollar is the official currency of Federated States of Micronesia. Its value fluctuates in terms of the other main currencies of the world, but remains relatively stable. Financial regulation is provided by the Federated States of Micronesia Banking Board. Commercial banks include the Bank of the Federated States of Micronesia, the Bank of Guam, and the Bank of Hawaii. There is also the Federated States of Micronesia Development Bank, which has branches in all of the states, and which makes low-interest, long-term loans primarily to local investors.

POVERTY AND WEALTH

The average per capita income was estimated at $2,000 in 1998 (in the United States, by way of comparison, per capita income in 1998 was $29,340). Although manufactured goods are expensive, as they are mostly imported, basic foodstuffs are cheap, and this does much to alleviate poverty. The government has a considerable amount of income at its disposal as a result of the financial support from the United States, and as a result, it is able to support sections of the community (such as farmers in the outlying islands, with the subsidy of copra production) that might otherwise be in poverty.

GDP per Capita (US$)

Country	1996	1997	1998	1999	2000

Philippines	2,600	3,200	3,500	3,600	3,800
Solomon Islands	3,000	3,000	2,600	2,650	2,000

Note: Data are estimates.

SOURCE: *Handbook of the Nations*, 17th, 18th, 19th and 20th editions for 1996, 1997, 1998 and 1999 data; CIA *World Factbook 2001* [Online] for 2000 data.

There is a compulsory education law that requires all children to begin school at the age of 6. Children may leave school when they reach the age of 14 or after completing the eighth grade. There are virtually 100 percent enrollment rates in primary and, until the age of 14, in secondary education. The adult literacy rate was estimated at 89 percent in 1980. The government maintains a free medical service.

WORKING CONDITIONS

The unemployment rate in Federated States of Micronesia was estimated at 27 percent in 1989, but had fallen to 16 percent by 1999. These figures are high, the degree of under-utilization of the labor force is somewhat greater than even these figures suggest. For much of the year in small-scale family farming there is relatively little work to do, and this is shared among the family members. During planting and harvesting, there is more work to be done, and everyone is more fully occupied. Everyone sharing the work appears to have an occupation in agriculture, but many workers are not engaged full time for all the year, and hence there is some "disguised unemployment."

The government respects the human rights of its citizens. There is no law dealing specifically with trade unions or with the right to collective bargaining. Individual employers, the largest of which are the national and state governments, set wages.

Neither the constitution nor the law specifically prohibits forced and bonded labor by children, but such practices are not known to occur. There is no law establishing a minimum age for employment of children. While in practice there is no employment of children for wages, they often assist their families in subsistence farming activities.

The 4 state governments have established minimum wage rates for government workers. Pohnpei has a minimum hourly wage rate of $2.00 an hour for government and $1.35 an hour for private workers. The other 3 states have established minimum hourly rates only for government workers of $1.25 for Chuuk, $1.49 for Kosrae, and $0.80 for Yap. The minimum hourly wage for employment with the national government is $1.68. These minimum wage structures and the wages customarily paid to skilled workers are sufficient to provide an adequate standard of living under local conditions.

There are no laws regulating hours of work (although a 40-hour workweek is standard practice) or prescribing standards of occupational safety and health. A federal regulation requires that employers provide a safe workplace. The Department of Health has no enforcement capability and working conditions vary in practice. Foreign

laborers are paid at a lower rate than citizens, work longer hours per day, and work a 6-day week in contrast to the 5-day week for citizens.

COUNTRY HISTORY AND ECONOMIC DEVELOPMENT

1525. Portuguese navigators in search of the Spice Islands (Indonesia) come upon Yap and Ulithi. Spanish expeditions later explored the rest of the Caroline Islands and make the first European contact with native peoples.

1526–1899. The Spanish Empire claims sovereignty over the Caroline Islands.

1899. Facing insurmountable management challenges in its Pacific empire as war with the United States looms, Spain sells the islands to Germany. The German administration encourages the development of trade and the production of copra (dried coconuts).

1914. German administration ends when Japanese naval squadrons take possession of the Caroline Islands, the Marshall Islands, and the islands of the Marianas at the start of World War I (1914–18).

1918. Japanese economic interest and settlement in the islands expands. The Japanese population in Micronesia exceeds 100,000, compared with an indigenous population of about 40,000. Sugar cane, other tropical crops, mining, and fishing are developed as major industries.

1939–1945. World War II abruptly ends the relative prosperity experienced during the period of Japanese civil administration.

1947. The United Nations establishes the Trust Territory of the Pacific Islands (TTPI), and the United States takes on the role of trustee as administering authority. The TTPI consists of the 4 island groups that will later become the states of the Federated States of Micronesia.

1965. The Congress of Micronesia formed.

1967. A commission is established to examine the future political status of the islands.

1970. Micronesians declare their rights to sovereignty over their own lands, to self-determination, to devise their own constitution, and to revoke their association with the United States.

1977. U.S. President Jimmy Carter announces that his administration intends to terminate the trusteeship agreement.

1978. Following a constitutional convention, the Federated States of Micronesia drafts a constitution that provides for federation of the 4 states: Chuuk (formerly Truk), Pohnpei (formerly Ponape), Kosrae (formerly Kusaie), and Yap.

1979. The 4 states ratify the constitution, and the Federated States of Micronesia comes into being.

1982. The United States signs a Compact of Free Association with the Federated States of Micronesia.

1986. The Federated States of Micronesia becomes self-governing.

1991. Micronesia achieves full independence and becomes a member of the United Nations.

1993. Micronesia joins the International Monetary Fund.

2001. Micronesia begins a renegotiation of Compact of Free Association with the United States to secure the continuation of financial support. The government announces a privatization plan.

FUTURE TRENDS

Although Micronesia will continue to be hampered economically by its isolated location, small geographical area, and population size, it has the enormous benefit of the generous financial support of the United States. The level of this support is undergoing renegotiation, with the United States offering $74 million a year and Micronesia requesting $84 million. Even at the lower level of support, this would secure Micronesia's living standards for the next 15 years of the agreement (the level of U.S. assistance in 2000 was $79 million).

Micronesia had a positive GDP growth rate in 2000 of 2.5 percent, and although this is encouraging in view of the negative growth rates recorded from 1996 to 1999, it is still below the population growth rate of 3.3 percent a year. There is pressure on the government from the IMF to reduce expenditures and increase revenue collection to maintain the **budget surplus** achieved since 1996, and to maintain the current low **inflation rate** (2.8 percent in 2000). The government has announced a privatization program to try to improve efficiency in the economy, and this is to be supported by loans from the Asian Development Bank

Fisheries is targeted as one the industries presenting the greatest potential for growth in the private sector. The fishing industry should see improvements in the near future as Japan is funding a $2.8 million project to train fishermen in Micronesia. However, both Taiwan and Japan are seeking to reduce the license payments they make for fishing in Micronesia's waters. They argue that the current low price for tuna on the world market makes

this necessary, and they also claim that tuna have begun to migrate away from Micronesia's waters to other parts of the Pacific.

Tourism is the second sector with expansion potential. In 2000, the islands received 17,152 visitors. The number of visitors has fallen slightly for each of the past 4 years. Initially, the fall was credited to the Asian financial crisis, particularly affecting the number of Japanese tourists. However, the fact that the fall has continued indicates that there is much to be done in regenerating the sector, and this will require foreign investment in hotels and an international marketing program. A British firm, Travel Research International, has been engaged to promote Micronesia's tourism, concentrating on diving, cultural tourism, deep-sea fishing, and **eco-tourism** as the main attractions.

In common with many other South Pacific countries, Micronesia is alarmed by the effect continuing global warming will have on its islands. The consequent rise in the level of the oceans threatens low-lying islands with flooding and, eventually, with submergence.

DEPENDENCIES

Micronesia has no territories or colonies.

MONGOLIA

Mongol Uls

CAPITAL: Ulaanbaatar (formerly spelled Ulan Bator).

MONETARY UNIT: Mongolian tughrik (togrog) (MT), equal to 100 mongos. There are coins of 1, 5, 10, and 50 mongos. Paper money comes in notes of 1, 5, 10, 20, 50, 100, 500, 1,000, 5,000, and 10,000 tughriks.

CHIEF EXPORTS: Copper, gold, non-ferrous metals and animal products, including cashmere, wool, livestock.

CHIEF IMPORTS: Machinery and equipment, chemicals, industrial consumer goods, fuel and food products, including sugar and tea.

GROSS DOMESTIC PRODUCT: US$6.1 billion (1999 est.).

BALANCE OF TRADE: **Exports:** US$454.3 million (1999 est.). **Imports:** US$510.7 million (1999 est.).

COUNTRY OVERVIEW

LOCATION AND SIZE. Formerly known as Outer Mongolia, the Republic of Mongolia is a landlocked country located between the Russian Federation and the People's Republic of China. The country has an area of 1,565,000 square kilometers (604,246 square miles), slightly smaller than the state of Alaska. Mongolia's capital city, Ulaanbaatar, is located in the northeast of the country, 200 kilometers (124 miles) from the Russian border.

POPULATION. The population of Mongolia was estimated at 2,650,952 in July 2000. It has almost doubled since the 1960s, due to improved health and medical facilities, and longer life expectancy. In 2000 the birth rate stood at 21.53 per 1,000 while the death rate stood at 6.14 per 1,000. The estimated annual population growth rate is 1.54 percent; if the current trend remains unchanged, the population is expected to double once more within the next 25–30 years.

With ethnic Mongols making up almost 90 percent of the population, Mongolia is ethnically homogenous (uniform). Kazakhs make up 4 percent, and other ethnic groups, including Chinese and Russians, round out the total. The Mongolian population is young, with 34 percent below the age of 15 and just 4 percent older than 65. Urbanization started only in the 1960s, but by the late 1990s almost 58 percent of Mongolians lived in urban areas. Ulaanbaatar and its suburbs are home to 773,700 people, or nearly one-third of the country's total.

At the beginning of the 20th century, the Mongolians were under threat of extinction due to the absence of medical services, high infant mortality, diseases and epidemics, and natural disasters. After independence in 1921, the government in this sparsely populated country began promoting population growth. This policy reversed the decline and stimulated a rapid increase in the population during the second half of the 20th century. However, population density remains one of the lowest in the world, with about 1.6 people per square kilometer (3.9 people per square mile). The country's low population can be explained in part by its geographic and climatic extremes: Mongolia is home to soaring mountains and burning deserts, including the Gobi Desert in the southern third of the country; because of the country's high average altitude, winters are long and temperatures extreme.

OVERVIEW OF ECONOMY

Mining, agriculture, and the processing of agricultural products are the 3 main sectors of the Mongolian economy. For centuries, the Mongolians have been engaged in animal husbandry, raising horses, sheep, goats, cattle, and camels. Since the vast prairie land could support millions of cattle and sheep, but not sustain crop cultivation, the Mongolians often bought wheat, barley, and oats from their neighbors, and crop production was of secondary importance for them. Animal husbandry and hunting provided other important sources of livelihood and products for trade, such as marmot and squirrels found in the rich forests of northern Mongolia.

The Mongolians long had close relations with neighboring China, which historically was one of its biggest trading partners. However, relations between Mongolians and Chinese were often interrupted by devastating wars and military conflicts and, gradually, the Chinese Empire established political control over Mongolia. These wars damaged Mongolian economic and social development. Consequently, Mongolia entered the 20th century as an underdeveloped, feudal country.

Most of the major economic and social changes in the 20th century came as a result of **communist** revolutions in neighboring countries. The Chinese Revolution of 1911 and the Russian Revolution of 1917, which were directed against imperial regimes and promised social justice, had profound effects on the Mongolian elite. In 1921, with Soviet assistance, Mongolia established an independent provisional government and declared independence from China. In 1924 the Mongolian People's Revolutionary Party came to power, remaining in control for the next 70 years. It introduced radical political and economic changes, state control, and central state planning, modeled on the Soviet political and economic systems. With Soviet assistance, the Mongolian government introduced large-scale farming centered around state-controlled collective farms. It also established light industry and mining operations. As in most **socialist** countries, almost all economic activities in Mongolia were state-controlled, and private entrepreneurial initiatives were limited. Until the 1990s, the Soviet Union and its eastern European territories remained Mongolia's main trading partners, the main market for its products, and the main source of foreign aid. According to the International Monetary Fund (IMF), the Mongolian economy grew at an average annual rate of 6.0 percent between 1979 and 1989, which was one of the highest growth rates in communist countries.

Major changes came in the late 1980s with the introduction of democratization and market-oriented reforms. These changes were largely peaceful since they were started by the ruling class under the influence of the neighboring Soviet Union and China. In early 1990s, the Mongolian government formulated its program of radical economic change (the so-called "shock therapy" approach) with the assistance of international organizations

such as the World Bank and the IMF. This program was based on 3 main strategies: rapid **privatization**, rapid price **liberalization**, and currency reform. According to the IMF, Mongolia's economy declined at an average annual rate of 0.1 percent between 1989 and 1999.

The modern Mongolian economy largely relies on the export of raw materials to international markets. The country's main exports are copper concentrate (which accounted for almost 47 percent of its total export earnings in 1998), cashmere (the country produces almost 30 percent of the world's cashmere), and textile and meat products. Mongolia depends heavily on imports of machinery, fuels, industrial and **consumer goods**, and food products. Because of the transitional **recession** and disappearance of aid from the former USSR, Mongolia's economy increasingly relies on foreign aid and credits. Total **external debt** has reached almost US$738.8 million (1998), quite a large figure for a nation of only 2.6 million people.

POLITICS, GOVERNMENT, AND TAXATION

Since achieving independence from China in 1921, Mongolia has made consistent attempts to expand political participation beyond tribal and religious identities and affiliations. An attempt was made to build a Soviet-type political regime based on political parties, a parliamentary system, and Communist ideology. The Mongolian People's Party was founded in 1921, and renamed the Mongolian People's Revolutionary Party (MPRP) in 1924. Until 1990, Mongolia preserved a one-party political system in which the MPRP remained the main political force.

Influenced by the late 1980s reforms of USSR leader Mikhail Gorbachev, the Mongolian Constitution was amended in 1990, and the first multiparty election for the Great Hural (Parliament) took place that same year. The MPRP was challenged by the newly formed Mongolian National Democratic Party (MNDP), the Mongolian Socialist Democratic Party (MSDP), and several others. The MPRP gained almost 80 percent of the seats in the new Parliament and formed a government led by President Punsalmaagiin Ochirbat. Despite their overwhelming victory, the former Communists showed a great sense of tolerance toward the opposition and promoted genuine reforms in liberalizing the political and economic system, introducing a new constitution (1992) and a new **unicameral** (one house) Parliament. However, the MPRP had a serious setback when President Ochirbat broke with his party; in 1993 he won the first direct presidential elections as an opposition candidate. In 1996, the Democratic Coalition, led by the MNDP and the MSDP, defeated the MPRP, taking 49 of the 76 seats in Parliament. The Democratic Coalition advocated a greater opening up of the economy and full privatization. In the 1997 presidential election, President Orchibat, the Democratic Coalition candidate, lost to MPRP candidate Natsagiin Bagabandi, who came to power calling for greater social assistance and more balanced reforms. The MPRP further strengthened its position in the July 2000 Parliamentary election, taking 72 seats. This latest Mongolian transition was largely peaceful, and its military does not play any active role in its politics.

Throughout the 1990s, the government promoted market-oriented reforms, abandoning the **centrally planned economy** and focusing on privatization, price liberalization, and a new monetary system. However, the state's sudden withdrawal of **subsidies** led to a steep transitional recession affecting almost all sectors of the economy, especially construction and industries. The weakness of the legal system and the inability of state institutions to implement property rights and contract law undermined confidence among local and foreign investors.

INFRASTRUCTURE, POWER, AND COMMUNICATIONS

During the Cold War (1945–89), Mongolia's transportation **infrastructure** enjoyed a relatively high level of investment to insure its military usefulness. After-

SOURCE: World Bank. *World Development Indicators 2000.*

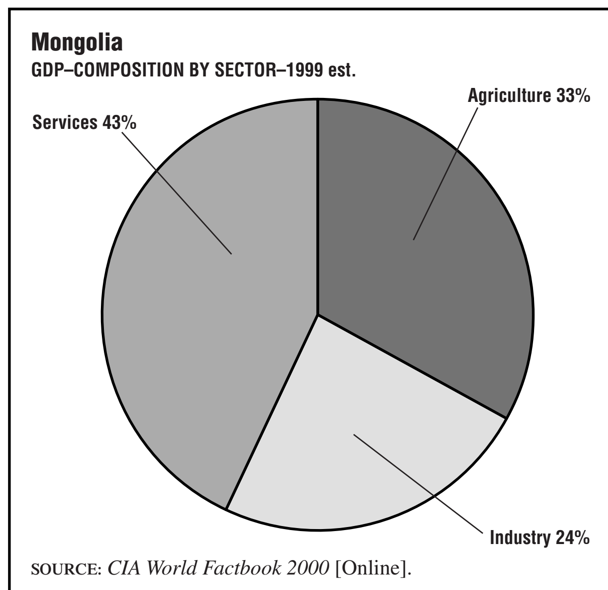
wards, investments in transportation infrastructure diminished considerably, and the quality of the roads is declining. The country is served by the 1,928 kilometer (1,198 mile) Trans-Mongolian railway, which connects it with both Beijing and Moscow. Mongolia also has 49,250 kilometers (30,603 miles) of unevenly distributed highways, of which only 1,674 kilometers (1,040 miles) are paved, mainly in the northern part of the country. In the south and southwest, horses and camels are still important modes of transportation. An international airport connects Ulaanbaatar with Beijing, Moscow, and other destinations, and there are 34 smaller airports, only 7 of which have paved runways.

Electrical power is supplied by the Central Electricity System (CES), which produces around 2.66 billion kilowatt hours (1998) of power. Five coal-fired power stations provide almost 85 percent of the total, with the balance imported from Russia. During the 1990s, attempts were made to renovate the CES with international aid and to build small hydroelectric and wind-powered stations. Power interruptions are common, and some remote areas remain without electricity, where diesel oil, wood, and dried horse and camel dung is used as fuel.

Telecommunication services in Mongolia have been under reconstruction since the early 1990s. In 1997, there were 93,800 telephone lines, 2,000 mobile-phone subscribers, and 13,000 personal computers. Internet access was established in 1996.

ECONOMIC SECTORS

In 1999, Mongolia derived its GDP from 3 principal sectors: agriculture, fishing, and hunting (33 percent), industry (24 percent), and services (43 percent). Historically, livestock breeding and agriculture have been the cornerstones of the national economy. With Soviet assistance, Mongolia established an industrial sector based mainly on mining and the processing of agricultural products. Mongolian economic development is limited by its landlocked isolation, harsh continental climate, and small population. Significant economic potential lies in its unexploited natural resources including copper, molybdenum, tin, tungsten, and gold. Domestic reserves of coal can satisfy growing energy consumption, and the discovery of oil reserves in 1994 raises the possibility that Mongolia might eventually become a petroleum-exporting country.



SOURCE: *CIA World Factbook 2000* [Online].

During the 1990s, Mongolia experienced a deep recession with the disappearance of Soviet economic assistance and the disintegration of the Soviet-backed Council for Mutual Economic Assistance (CMEA), which had been a major market for Mongolian exports. The country increasingly relies on the export of raw materials to the international market, and it is extremely vulnerable to fluctuations in world prices for its major export products, copper and cashmere. Mongolia needs large **foreign direct investments** and international assistance to modernize existing technologies and to begin major economic changes. In the 1990s, the Mongolian government undertook a series of free-market oriented economic reforms focusing on privatization, internal and external trade liberalization, and promotion of private entrepreneurs. In 1997, because of its rapid and extended economic liberalization, Mongolia became one of the first of the former socialist countries to be accepted into the World Trade Organization (WTO), opening up Western markets for Mongolian goods.

AGRICULTURE

The agricultural sector, which employs about half of Mongolia's population, underwent major **deregulation** during the 1990s. In September 1991, the *negdels* (state-controlled collective farms) were privatized and reformed into smaller units. A combination of mismanagement and harsh weather led to higher meat prices and a depression in the agricultural processing industries. Since 1991 many herders, having no experience outside their negdels, have struggled to adapt themselves to the new economic realities. Both animal herding and crop cultivation are extremely vulnerable to the region's harsh weather and climate changes, which include occasional drought. In 1996, forest and prairie fires caused damage estimated at $1.4 billion and seriously damaged the region's environment. In the winter of 1999–2000, approximately 2.4 million animals died as a result of extremely cold and icy weather, bringing poverty and hunger to many Mongolian farmers.

ANIMAL HERDING. Animal herding is the most important sector of Mongolian agriculture, providing almost two-thirds of agricultural production. It provides a source of income, food, and a mode of transportation for a significant part of the population as well as being an important part of Mongolia's exports. Mongols still migrate around vast prairies, raising horses, sheep, goats, cattle, and camels. By the second half of the 1990s, the livestock population had reached a record high of 31.2 million, almost 90 percent of which was privately owned. With the liberalization of international trade, many herders turned to raising goats to produce valuable cashmere, and the number of goats almost doubled to 11 million between 1992 and 1998. In 1998 Mongolia produced 502.1 tons of cashmere, but fluctuations in the world price of this commodity have hurt profits. Overgrazing of pasture land, especially by goats, could potentially cause environmental degradation in the fragile prairie ecosystem, and there are limited resources available to reverse the trend.

CROP CULTIVATION. In 1998 Mongolia produced 194,900 tons of cereals (down from 330,700 tons in 1994), 65.2 tons of potatoes, and 45.7 tons of vegetables. Crop cultivation is limited, due to the harsh continental climate (the growing season is just more than 100 days long) and a shortage of arable (cultivatable) land, though this sector plays an important role in sustaining self-sufficiency in foodstuffs. After the privatization of the large state-controlled farms in the 1990s, crop production fell sharply, a decline blamed on a lack of management skills, funds, and technologies, and on an ill-considered and ill-implemented privatization program. Other sectors of Mongolian agriculture include forestry, fishery, and fur production, all relatively minor.

INDUSTRY

Industrialization was introduced into Mongolia in the 1970s, with large investments from the Soviet Union, especially for mining and the processing of agricultural products. Through the 1970s and 1980s, the Mongolian government implemented an industrialization program that emphasized increasing investments and diversifying the country's exports. In the 1990s, because of prevailing conditions in the international market and the collapse of the traditional Soviet market, Mongolian industry underwent considerable restructuring. By 2001, Mongolia increasingly relied on export of its mineral resources, although there have been considerable efforts made to revive its manufacturing sector.

MINING. Copper, gold, molybdenum and fluorspar concentrates are the major natural resources of export significance in Mongolia. In 1998 Mongolia exported 485,000 tons of copper concentrate, valued at $124 million; around 12.5 tons of gold, valued at $117.2 million; and 4,131 tons of molybdenum concentrate, valued at $12.1 million. Export of these mineral resources provided around 60 percent of total export earnings in 1998. Mongolian coal reserves are estimated at approximately 100 billion tons, but the country extracts coal mainly for domestic consumption, at a level of around 5.1 million tons per year.

Mining is a relatively new sector in the Mongolian economy. Although the country is rich in various natural resources, until the 1970s they were under-exploited. Major mining plants were built in the 1970s with Soviet assistance. The biggest, Erdenet and Darhan, are situated in the north of the country, close to the Russian border. In the 1990s, the Mongolian government struggled to attract international investors into the mining sector. Mongolia still largely relies on Russian technology in this sector of the economy, although Russian involvement began to diminish during the 1990s as **multinational corporations** started to move into the mining sector.

In the mid-1990s, oil reserves were discovered, estimated at around 5 billion barrels, that could be used both for domestic consumption and for export to China. Extraction of oil from Tamsag basin began in 1997 and completion of an oil refinery is expected in Nalaikh, near Ulaanbaatar, in 2002. International investment is needed to develop its oil reserves at full scale.

MANUFACTURING. Mongolia's manufacturing sector accounted for 24 percent of GDP in 1998, employing 12.4 percent of the **labor force** in the production of agricultural products, garments, leather goods, and carpets. During the era of state-controlled industry (1924–91), these goods were produced mainly in small and medium-sized, state-owned enterprises for export to the Soviet Union and Eastern Europe. Russia was also the main market for Mongolia's food processing industry, which produced sausages and canned meat.

The manufacturing industry was one of the fastest growing sectors of the economy in the 1970s and 1980s, but because of excessive state control, it was relatively inefficient and made low quality products. In the 1990s, the government introduced a privatization program aimed at stimulating private initiative and increasing productivity, but the sector could not compete internationally because of a lack of management skills, lack of investments, and inefficient technologies. A steep recession, which threatened thousands of jobs and provoked social protests, followed. Between 1994 and 1998, production of leather footwear declined from 407,000 pairs to 33,000, leather coats from 35,000 to zero, sheepskin coats from 57,000 to 1,000, and woolen fabrics from 77,000 square meters to 5,000 square meters.

SERVICES

Between 1924 and 1991, Mongolia's services sector was heavily state-controlled and was significantly un-

derdeveloped. Since the early 1990s, the Mongolian government has made considerable efforts to deregulate this sector, with special attention focused on reforming the financial services industry. The **monopoly** of the state bank was broken and commercial banks were allowed to compete. This sector was restructured with assistance from the World Bank and the International Monetary Fund (IMF). In 2000 there were 12 banks, 6 state-owned and 6 privately owned.

Tourism is an underdeveloped sector of the economy, limited by lack of accommodation facilities and transportation infrastructure. Thanks to the combination of Mongolia's landscape and its position on the old Silk Road (the trade route connecting China with Western Europe in medieval times), adventure tourism offers a high growth potential. Mongolia welcomed about 160,000 tourists in 1999, and the government passed a law establishing the National Tourism Development Program: 2000–2015 in order to boost this sector.

The **retail** sector is quite underdeveloped by Western standards, consisting mainly of small shops and restaurants. With the growth in tourism since the 1990s, the quality of the retail sector and diversity of services have been improving.

INTERNATIONAL TRADE

Mongolian international trade has fluctuated considerably during last 3 decades. After the collapse of both the Council for Mutual Economic Assistance (CMEA) and trade with the former Soviet Union, Mongolian international trade experienced a dramatic decline that continued until the mid-1990s. Since then, Mongolian trade has started a slow recovery, boosted by growing exports of gold and other mineral resources. Mongolia joined the World Trade Organization (WTO) in 1997.

During the 1990s Mongolia managed to diversify its markets, and China became one of its fastest-growing trade partners. In 1998 exports to China amounted to 30.1 percent of total Mongolian exports, followed by Switzerland (21.5 percent), Russia (12.1 percent), South Korea (9.7 percent) and the United States (8.1 percent). In that year, Russia remained the primary source of imports (30.6 percent), followed by China (13.3 percent), Japan (11.7 percent), South Korea (7.5 percent), and the United States (6.9 percent.) In 1998 Mongolia exported a total of $316.8 million in goods and imported $472.4 million in goods.

MONEY

During the era of state control (1924–91), the Mongolian tughrik had a fixed rate (4 to the U.S. dollar in 1989), and was not freely convertible. With the introduction of convertibility in the early 1990s, there was a sudden surge in **hard currency** demand and the tughrik depreciated (dropped in value) sharply (MT448.61 to the U.S. dollar in 1995 and MT1,072.37 to the U.S. dollar in 1999). The Mongolian government has tried to stabilize its currency and its economy by relying heavily on international assistance from the World Bank and the IMF. The annual rate of **inflation**, which soared to around 300 percent in 1993, was reduced to 15 percent in 2000. The Bank of Mongolia, the nation's central bank, seeks to maintain a tight **monetary policy** in order to stabilize the value of the currency and reduce inflation.

POVERTY AND WEALTH

Reforms during the 1990s brought mixed results to the Mongolian people. While they removed state control over the economy, allowed private businesses, and di-

SOURCE: *2000 World Development Indicators* [CD-ROM].

versified international trade, they also brought widespread poverty, a diminishing **social-welfare system**, especially in health care and education, a rise in organized crime, and huge gaps in personal income.

In 1999, per capita GDP was estimated at US$2,320. According to the United Nations Development Program's Human Development Report, a statistical survey of the standard of living of the world's nations, Mongolia was ranked 110th, just behind China and Egypt, but just ahead of El Salvador and Bolivia. This is largely because of the strong education and health systems built during the single party (1924–1991) era, which remain strong despite declines in the 1990s. In 2000, the enrollment rate at primary and secondary schools stood at 84 percent, and most people had access to health care services. The government plans to increase spending in these areas, however, to return them to the levels the country enjoyed before 1991.

WORKING CONDITIONS

Since the abandonment of state guarantees of employment in 1993, the unemployment rate among Mongolia's workforce of 1.256 million has been rising, reaching an official rate of 4.5 percent in 1998. In 1998, there were 49,800 workers registered as unemployed, but some estimates put the figure as high as 200,000, especially in remote small towns and villages. Working conditions remain far from ideal because of low wages and harsh economic conditions. Until the 1990s, the trade-union movement was state-controlled; with the introduction of market-oriented reforms Mongolia's trade unions have struggled to gain membership, though they still maintain close affiliations with political parties.

COUNTRY HISTORY AND ECONOMIC DEVELOPMENT

1921. Mongolia declares independence from China.

1924. Mongolian People's Revolutionary Party (MPRP) comes to power, remaining the ruling party for the next 70 years.

1946. China formally recognizes Mongolia's independence.

1961. Mongolia joins the United Nations.

1987. Mongolia normalizes its relations with China and signs a treaty concerning the resolution of border disputes.

1990. Mongolian Constitution is amended, and the first multiparty election for Parliament takes place.

1992. New constitution is adopted by the Great Hural (Parliament).

1993. Punsalmaagiin Ochirbat is elected president in the first direct presidential election.

1993. Mongolian tughrik is made freely convertible.

1996. For the first time in modern Mongolian electoral history, the MPRP is defeated by a Democratic Coalition led by the MNDP and the MSDP.

1997. Mongolia joins the World Trade Organization.

2000. MPRP returns to power, taking 72 seats in parliamentary elections.

FUTURE TRENDS

By 2001, Mongolia was able to achieve **macroeconomic** (large-scale, overall) stability, although at the very high cost of growing poverty and inequality. It will likely take another decade before the country achieves full recovery from its transition from state control to private control of the economy. Mongolia's future is uncertain because of its geographical isolation, difficulties in attracting foreign investors, growing debt, and increasing dependence on international humanitarian assistance. Global climate changes may threaten the very existence of agriculture and animal husbandry in Mongolia. However, Mongolia should be able to depend on its strengths in exporting raw materials, and it has potential oil fields that could also contribute to export earnings—if oil field development receives the necessary investments. Moreover, private enterprise has proved surprisingly strong, outperforming state-controlled industries in head-to-head competition. As more private businesses gain experience and financial strength, the Mongolian economy should become more diversified and stable.

DEPENDENCIES

Mongolia has no territories or colonies.

NAURU

Republic of Nauru

CAPITAL: No official capital, but the Yaren District houses the government offices.

MONETARY UNIT: Nauru uses the Australian dollar (A$). One Australian dollar equals 100 cents. There are coins of 2 dollars, 1 dollar, 50 cents, 20 cents, 10 cents, and 5 cents. There is no 1 cent coin. Banknotes come in denominations of 100, 50, 20, 10, and 5 dollars.

CHIEF EXPORTS: Phosphate.

CHIEF IMPORTS: Food, fuel, manufactured goods, building materials, machinery.

GROSS DOMESTIC PRODUCT: US$201.3 million (1999 est.).

BALANCE OF TRADE: **Exports:** US$19 million (1997). **Imports:** US$17.2 million (1996).

COUNTRY OVERVIEW

LOCATION AND SIZE. Nauru is a tiny island in the Pacific Ocean, located just south of the equator, to the northeast of New Guinea and the Solomon Islands. Nauru is only 21 square kilometers (8.1 square miles) in size, making it one of the smallest nations in the world. As an island country, Nauru has no land borders with other countries. It is roughly circular in shape and has about 30 kilometers (18 miles) of coastline. Comparatively, Nauru is about one-tenth the size of Washington, D.C. Nauru has no cities and its population lives in small settlements along the coast.

POPULATION. Nauru's population was estimated at 11,845 in July 2000. About 58 percent of the total consists of indigenous Nauruans, a Pacific people of mixed Melanesian, Micronesian, and Polynesian ancestry. About 26 percent of the population consists of other Pacific peoples (mainly from the neighboring island countries of Kiribati and Tuvalu). Nauru's smaller minority populations are 8 percent Chinese and 8 percent European. The population growth rate was 2.4 percent in 1998. Nauru has no official population policy.

About 80 percent of Nauru's territory consists of land that has been mined for phosphate. This land is not inhabited and is not suitable for agriculture. Nauru's people live entirely in the fertile coastal areas, especially along the southwest coast.

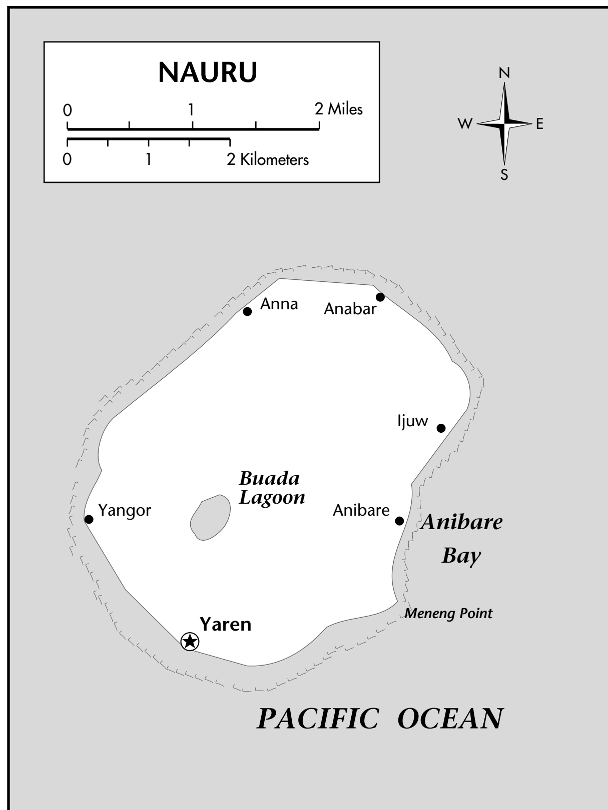
Nauru's population is very young. About 41 percent of the total population is under the age of 15, while about 57 percent are between the ages of 15 and 64. Only about 2 percent of the population is above the age of 65.

OVERVIEW OF ECONOMY

Nauru's economy is dominated by the export of phosphate, a mineral used as a fertilizer. Supplies of phosphate are running out and are expected to last no more than 5 years. The government is encouraging new industries, such as **offshore banking** and tourism, to replace the declining phosphate industry.

Phosphate has been the basis of Nauru's economy since 1906, when the island was a German colony. The decay of marine microorganisms on an atoll (a coral island made up of a reef surrounding a lagoon), supplemented by thousands of years of bird droppings, have made Nauru into an island made almost entirely of phosphate. Phosphate has been exported mainly to Australia and New Zealand, where it improved the poor soils in those countries. After Germany's defeat in World War I, Nauru was made a trust territory by the League of Nations (and later the United Nations) and governed jointly by Australia, New Zealand, and Great Britain, although Australia effectively handled all of the administration. Nauru became independent in 1968.

During the colonial administration, a trust fund was established in which part of the income from phosphate sales was deposited. This fund was set up to provide the country with income when phosphate supplies run out. This trust fund—the Nauru Phosphate Royalties



Trust—as well as the phosphate mining company, are controlled by the Nauruan government.

Phosphate mining has made Nauru very rich and provides citizens with some of the highest per capita incomes in the Pacific region. But phosphate mining has also seriously damaged Nauru's environment. About 80 percent of the land consists of mined-over territory that is now uninhabitable. Nauru's extreme dependence on phosphate means that it has to import nearly everything else, including food, fresh water, fuel, and all manufactured products.

As the country's reserves of phosphate have dwindled, the Nauruan government has encouraged other industries, especially tourism and off-shore banking, to locate in the country. Tourism is limited by Nauru's remote location and lack of major attractions. Off-shore banking has proved more successful, but has been marred by corruption and scandals involving **money laundering**. For example, the Russian mafia has been accused of using Nauruan banks to process its illegal revenues. Apart from Internet-based banking, there is almost no foreign investment in Nauru and no foreign investment policy.

POLITICS, GOVERNMENT, AND TAXATION

Nauru became an independent republic in 1968; it is the smallest republic in the world. Nauru is a member of the British Commonwealth and was admitted as a full member of the United Nations in 1999. Nauru generally follows the political system of Great Britain and has a **unicameral** (one chamber) Parliament with 18 members who hold office for 3 years. The Parliament elects the president, speaker, and deputy speaker. The cabinet, which consists of the president and 5 other members of Parliament, holds executive power. Members are elected as independents rather than from political parties. Nauru has had 8 changes of government since independence. Lately Nauru's government has become increasingly fractious, with a constant reshuffling of leaders and ministers.

The Nauruan government controls most aspects of the country's economy. The government owns most of the large businesses, including the Nauru Phosphate Corporation, the national airline, and the national bank. The government also controls the Nauru Phosphate Royalties Trust, which collects and invests phosphate royalties. The fund is currently estimated to have a value somewhere between $100 million and $800 million, but no details are publicly released. There are no taxes in Nauru, and government activity is financed entirely from phosphate revenues. The government is the largest employer and provides free health care and education to all citizens. As the Nauruan government is extremely secretive, it is difficult to obtain exact figures for many aspects of the country's economy.

Nauru has no military, but the Nauruan police are responsible for law and order and for national defense. Nauru generally has good relations with neighboring island countries. Nauru has had disputes with France because of French nuclear testing in the South Pacific in 1995, and the passage of French ships carrying plutonium and nuclear waste through Nauruan waters in 1992 and 1997.

The Asian Development Bank is the only provider of external financial assistance, in the form of loans, to Nauru. This aid is used to help reform the Nauruan government, to make it more open, to help diversify the economy away from phosphate mining, and to provide for health care, sanitation, and education.

In 1994, Nauru agreed to an out-of-court settlement in a lawsuit it had brought against Australia, New Zealand, and Great Britain. The basis of the lawsuit was to seek compensation for environmental damage to the country during the pre-independence period when phosphate mining was controlled by these countries. Australia agreed to pay Nauru US$73 million as part of the settlement. Great Britain and New Zealand reimbursed Australia for a small portion of this payment.

INFRASTRUCTURE, POWER, AND COMMUNICATIONS

Nauru has 30 kilometers (19 miles) of roads, of which about 80 percent are paved. The major road circles the island, while the others connect the phosphate mines with coastal settlements. The only rail facilities on Nauru are narrow-gauge and run 5.2 kilometers (3.2 miles) from the phosphate mines to a processing plant. Nauru has no port or harbor, but it does have a deep water anchorage and facilities for loading phosphate onto ships. Nauru operates its own airline, called Air Nauru, with 2 aircraft (Boeing 737s), based at Nauru's international airport. The airline connects Nauru with Australia and other Pacific and Asian countries. The government heavily subsidizes Air Nauru, and its future is questionable. Nauru has international telephone connections by satellite. The country is completely electrified and power is supplied by diesel generators, the fuel for which is imported.

ECONOMIC SECTORS

Nauru has only 2 important economic sectors: mining and financial services. Nauru's economy is dominated by phosphate mining, while Internet-based banking is an emerging sector. Nauru's agriculture is extremely small-scale and cannot provide enough food for the population. Despite being an island, Nauru has no real fishing industry. Apart from a few handicrafts, there is no manufacturing industry on Nauru.

AGRICULTURE

Agriculture accounts for only a tiny portion of Nauru's economic activity, making up only 5 percent of GDP in 1995. Apart from some market gardens, the only agricultural products of any significance are coconuts, in addition to chickens and pigs for domestic consumption. Because of environmental damage from phosphate mining, less than 20 percent of Nauru's land is suitable for agricultural production.

INDUSTRY

MINING. Phosphate mining dominates Nauru's economy and has done so throughout the 20th century. The large phosphate mines are located in the center of the island, an area called Topside. Between 1920 and the country's independence in 1968, Nauru was administered by Australia, and the phosphate mines were owned and operated by the British Phosphate Commission (BPC). After independence, the Nauruan government took control of the phosphate mines and created the Nauru Phosphate Corporation. The Nauru phosphate deposits are among the world's richest. Phosphate was and continues to be exported, primarily to Australia, New Zealand, Japan, South Korea, and Indonesia. Phosphate supplies are expected to run out within 5 years.

Mining has had a severe environmental impact on the country. About 80 percent of the land area has been devastated after phosphate has been removed, leaving a landscape unsuitable for any other kind of industry or as residential land.

SERVICES

TOURISM. The tourism sector in Nauru is very small, as the country does not offer many attractions and cannot compete with neighboring Pacific island countries. Nauru is remote and expensive to get to, and tourist facilities are extremely limited. There are only 2 hotels and no resorts.

Nevertheless, the Nauruan government is attempting to develop the tourist industry to replace dependence on phosphate mining, but little has been done so far.

FINANCIAL SERVICES. Nauru has developed a large Internet-based "offshore" banking industry, with more than 400 banks registered in the country (all of which are listed at the same address, that of the government-owned Nauru Agency Corporation). The advantages of banking in Nauru are the absence of taxes and banking secrecy. It costs only about US$5,680 to establish a bank in the country, and US$4,980 per year in registration fees after that. In 1998, Nauru was accused by the Russian government of accepting an estimated US$70 billion in deposits from the Russian mafia, and providing cover for organized crime (this money does not actually come to Nauru, but is electronically transferred through the Nauru banks). Other countries, including the United States, have also protested against Nauru's "laundering" of illegally-obtained funds. The United States even threatened to abolish Nauru's right to trade in U.S. dollars. In 1999, Nauru bowed to these international pressures and vowed to clean up its banking industry.

The government controls the Nauru Phosphate Royalties Trust, which receives a share of the profits from phosphate sales. The assets of the fund have been estimated as being anywhere between $100 million and $800 million. Most of the assets consist of overseas real estate as well as stocks and bonds. Major real estate developments owned by the Nauru Phosphate Royalties Trust include Nauru House, which is one of the largest office buildings in Melbourne, Australia, and hotel developments in Hawaii and Fiji. The secrecy of the Nauruan government prevents exact figures from being known, but most experts suggest that the lower end of the estimated asset range is more accurate. The trust fund has been the subject of numerous allegations of corruption and mismanagement.

SOURCE: CIA *World Factbook 2001* [ONLINE].

INTERNATIONAL TRADE

Nauru's major trading partner is Australia. Other important partners are New Zealand, Japan, South Korea, and Indonesia. These countries purchase Nauruan phosphate for use as a fertilizer. Phosphate is Nauru's only export. Apart from some locally-produced foods (fruit, coconuts, chickens, and pigs), virtually everything is imported into Nauru, including most foods, fresh water, fuels, motor vehicles, building materials, and machinery. Most of these goods are imported from Australia.

MONEY

Nauru does not have its own currency, but uses the Australian dollar. By doing so, it gains the advantages of allying its economy with a stronger, larger neighbor. As Australia is Nauru's largest trading partner, using the Australian dollar simplifies trade because currencies do not need to be converted. On the other hand, Nauru's **monetary policy** is linked to changes in the Australian dollar, which has dramatically depreciated (decreased in value) against the U.S. dollar over the past several years. **Inflation** in Nauru has generally been quite low.

POVERTY AND WEALTH

Nauru's phosphate wealth has made it one of the richest countries in the Pacific and, on a per capita basis, one of the richest countries in the world. Revenues from phosphate mining provide an extensive system of social support for Nauruan citizens. Nauru is a true **welfare state**, and everything is provided by the Nauru government, including free health care and education. Many Nauruans also receive various kinds of payments from the government, including a share of mining royalties, compensation for damage to land, and unemployment insurance. This has led to complete dependence on government. Nauruans have been described as living a life of "luxury and leisure."

Residents' luxurious lifestyles have come with a high price, however. The change in the local diet, which is now rich in high-fat imported foods, has given Nauru one of the highest rates of diabetes in the world. Nauru also has

GDP per Capita (US$)

Country	1996	1997	1998	1999	2000
Nauru	N/A	N/A	N/A	N/A	5,000
United States	28,600	30,200	31,500	33,900	36,200
Philippines	2,600	3,200	3,500	3,600	3,800
Solomon Islands	3,000	3,000	2,600	2,650	2,000

Note: Data are estimates.

SOURCE: *Handbook of the Nations*, 17th, 18th, 19th and 20th editions for 1996, 1997, 1998 and 1999 data; CIA *World Factbook 2001* [Online] for 2000 data.

high rates of unemployment and alcoholism, among other health and social problems. Unemployment has not become a major concern, however, as the government, as well as family members, provide support for non-workers. According to the Asian Development Bank, there is no evidence of absolute poverty in Nauru. The entire population has access to safe drinking water, and 97 percent have access to good sanitation.

WORKING CONDITIONS

The government is the main employer in Nauru, and the **private sector** employs only 1 percent of the workforce. Major branches of government employment include the government-owned Nauru Phosphate Corporation and the administrative and bureaucratic branches of government. Many Nauruans do not work but receive assistance from the government. Much of the mining work is done by foreigners, especially temporary workers from China, the Philippines, and the neighboring island countries of Kiribati and Tuvalu. About 3,000 foreign workers live in Nauru. Non-Nauruans face many restrictions, including limitations on travel in and out of the country and limitations on their political rights.

Nauruan workers have the right to form unions, but none have yet been established. Women's access to employment is restricted by social conventions, and there are few women employed by government companies and no women in Parliament. Because the government takes care of all its citizens' needs, there has been little incentive for education in Nauru, and few Nauruans travel overseas to study at universities.

COUNTRY HISTORY AND ECONOMIC DEVELOPMENT

1798. British whaler Captain John Fearn is the first European to visit Nauru and names it "Pleasant Island."

1888. Nauru annexed by Germany.

1899. Phosphate deposits discovered.

1906. Phosphate mining started by a British-Australian company.

1914. Nauru occupied by Australia after World War I begins.

1920. Australia begins administration of Nauru on behalf of the 3 trustees: Australia, New Zealand, and Great Britain.

1941. Nauru's industrial plant and housing facilities are completely destroyed by Japanese bombings.

1942. Nauru occupied by Japanese forces until 1945.

1951. A local government council set up to handle local affairs.

1968. Nauru achieves independence.

1994. Australia agrees to out-of-court settlement of US$73 million for environmental damage caused by phosphate mining during the Australian administration of the island.

1998. Russian mafia transfers an estimated US$70 billion to Nauru banks to evade taxes.

1999. Nauru bows to international pressures to control its banking industry; Nauru admitted as a member of the United Nations.

1999. Nauru government borrows US$100 million from General Electric Corporation; trust fund assets used as collateral.

2000. Fiji government seizes the Nauru-owned Grand Hotel in Fiji on the grounds that the Nauru government failed to develop the property as agreed.

2001. Nauru agrees to process more than 300 refugee "boat people" (mainly from Afghanistan, Iraq, and Pakistan) originally bound for Australia. Australian government agrees to give Nauru US$10 million and pay all costs of housing and feeding refugees. A refugee camp is built in the center of the island.

2001. Australia grounds Air Nauru's 2 Boeing 737 aircraft, claiming that the airline did not have sound management and that the Nauru airport was unsafe.

2001. Bank of Nauru closes because of lack of cash. Economists warn that the value of the Nauru Phosphate Royalties Trust Fund may be approaching zero.

FUTURE TRENDS

Nauru's phosphate industry has reached the end of its life, with the last supplies expected to run out within a few years. It is unclear how the country will support itself once the mines close. Diversification into other economic sectors, such as tourism and offshore banking, have not proven especially successful. Tourism has remained small due to the country's remoteness and lack of attractions. Offshore banking has been marred by scandals involving money laundering and corruption, and the country has been heavily criticized for this. With its tarnished reputation, many foreign companies will be hesitant about investing in Nauru.

The imminent closure of Nauru's phosphate mines mean that the country will be left with no major source of income and with severe environmental problems. About 80 percent of the country has been ecologically devastated by mining, and this land is not suitable for agriculture or for residential property. The cost of rehabilitating the mined-out land is expected to cost at least

US$200 million and it is unclear where this money will come from. Nauru's water supply is becoming more limited because of the depletion of natural underground reserves. The country already has to import drinking water.

Income from the country's Nauru Phosphate Royalties Trust will help tide over the country when the mines first close, but it will not be sufficient to replace the income from mining royalties themselves. The trust fund itself has been marred by allegations of corruption and mismanagement, and the ability of the trust fund to keep producing income is questionable.

With its mines closing and its environment in ruins, Nauru faces a grim future. The careful and wise investment of the country's remaining assets—in its trust fund—is the most likely source of salvation for Nauru.

DEPENDENCIES

Nauru has no territories or colonies.

NEPAL

Kingdom of Nepal

CAPITAL: Kathmandu.

MONETARY UNIT: Nepalese rupee (NR). One Nepali rupee is made up of 100 paisa. Rupee notes come in denominations of NR1, 2, 5, 10, 20, 25, 50, 100, 250, 500, and 1,000. Coins are denominated as 5, 10, 25, and 50 paisa and NR1, 2, and 5.

CHIEF EXPORTS: Carpets, clothing, leather goods, jute goods, grain.

CHIEF IMPORTS: Gold, machinery and equipment, petroleum products, fertilizer.

GROSS DOMESTIC PRODUCT: US$27.4 billion (purchasing power parity, 1999 est.).

BALANCE OF TRADE: **Exports:** US$485 million (f.o.b., 1998). **Imports:** US$1.2 billion (f.o.b., 1998).

COUNTRY OVERVIEW

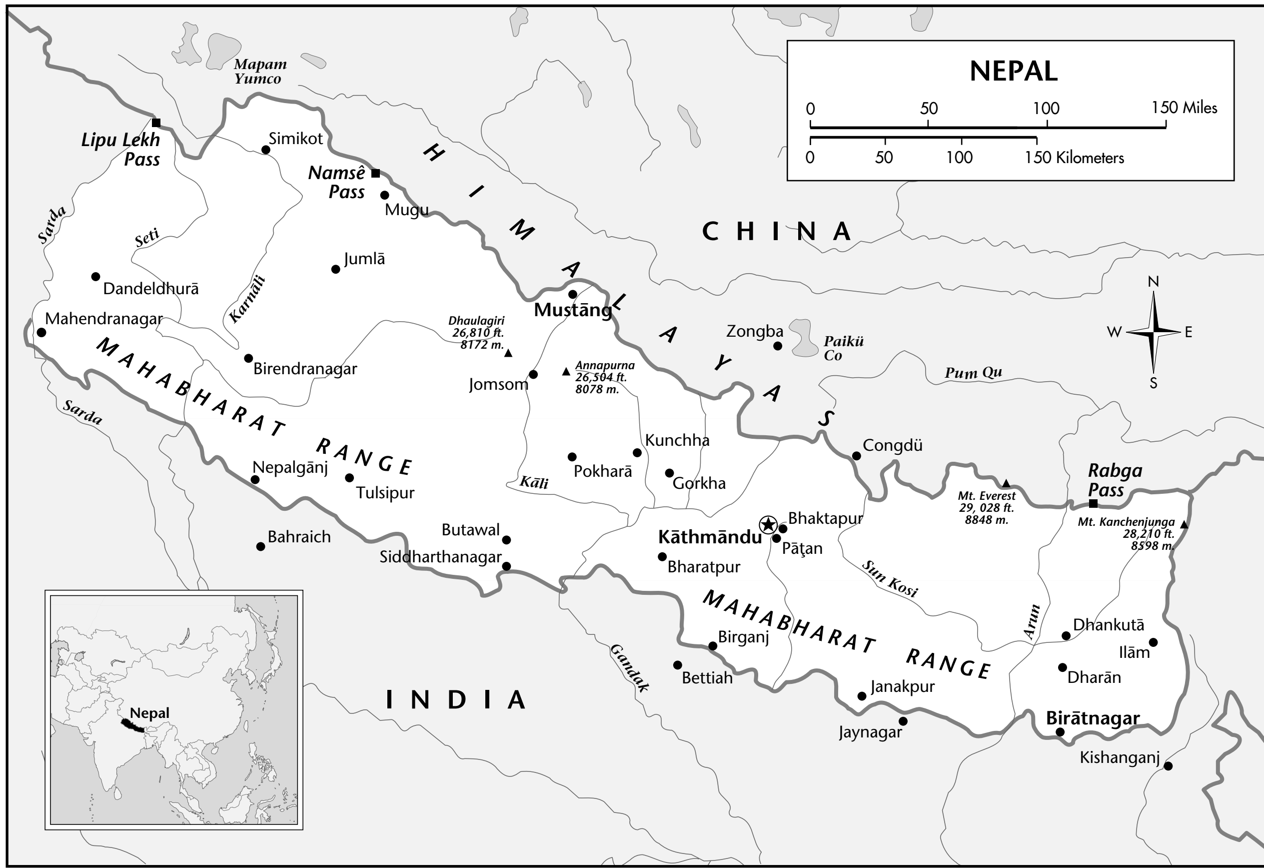
LOCATION AND SIZE. Nepal is a landlocked country in South Asia, bordered by India on 3 sides and by China to the north. It has an area of 140,800 square kilometers (54,363 square miles), a border of 2,926 kilometers (1,818 miles), and is slightly larger than Arkansas. Roughly rectangular in shape, Nepal can be divided lengthwise into 3 ecological zones from south to north: the fertile alluvial plains of the Tarai region, the mountains and valleys of the central Hilly region, and the inhospitable Mountain region, home to the Himalayas and the world's highest mountain, Everest. Nepal is drained by over 6,000 rivers which form the Karnali, Narayani, and Koshi river systems. Its capital, Kathmandu, is in the central part of the country.

POPULATION. Nepal had a population of 24,702,119 in 2000, up from 19,145,800 in 1990. Government sources estimate a population of 28,618,668 by 2010. While the death rate has declined significantly over the last few decades to 10.41 per 1,000 people, the birth rate has remained high at 33.83 per 1,000. The infant mortality rate declined from 147 deaths per 1,000 in 1985 to 64 deaths per 1,000 in 2000, but while health services have improved, high fertility rates have led to a population growth rate that increased from less than 2 percent in the 1950s to about 2.6 percent in the 1980s. According to the World Bank, the growth rate in 1999 was 2.3 percent.

Nepal is one of the few countries in the world where men live longer than women. Female life expectancy is 57.3 years, compared to 58.3 years for males. Forty-one percent of the population is aged 0–14 years, 56 percent are between 15 and 64, and only 3 percent are above 65 years of age in 2000. The population can be grouped by 3 major ethnicities: Indo-Nepalese, Tibeto-Nepalese, and indigenous Nepalese. In 1991 46.7 percent of the people resided in the southernmost plains of the Tarai region, 45.5 percent in the central Hilly region, and 7.8 percent in the northernmost Mountain region, but large-scale internal migration in recent years has led to overcrowding in the fertile Tarai region. The population of Nepal is overwhelmingly rural, with just over 9 percent living in urban areas such as the Kathmandu Valley. Population density stands at 175 people per square kilometer (453 per square mile).

Family planning in Nepal began in the late 1950s. An increase in government expenditure on family planning offices and door-to-door campaigns have contributed towards the adoption of family planning. In 1969, only 7,774 people used some form of contraception; this number rose to 419,950 by 1999. Difficulties in rural access to family planning services and cultural and socioeconomic considerations which favor large families continue to impede the implementation of a coherent population control policy.

In addition to the established Nepalese population, there are approximately 96,500 Bhutanese refugees in Nepal, 90 percent of whom are accommodated in 7 camps run by the United Nations Office of the High Commissioner for Refugees (UNHCR).



OVERVIEW OF ECONOMY

Nepal's place in the western imagination as a latter-day Shangri-La stems from its historical isolation, maintained until the overthrow of the Rana oligarchy (a small group of people who rule a nation) in 1951. Development planning commenced soon after, but half a century on, the country still struggles to free itself from its feudal legacy and temper the effects of an unpredictable global economy. Today, Nepal is one of the least developed countries in the world, with nearly half of its inhabitants living below the poverty line. Decentralization and **privatization** of government-run businesses have not worked for this agricultural nation; the 1989 trade-transit crisis with India, which caused severe commodity shortages, demonstrated how frail the economy was. Popular protests brought about multiparty democracy in 1990, and the reigning Hindu monarch was relegated to constitutional status. Ever since, recurring political instability culminating in a massacre within the royal family in June 2001 has hampered the implementation of economic reforms designed to relax trade regulations, attract foreign investment, and cut government expenditure.

Nepal's spectacular landscape, while attracting the tourism that both pays and pollutes the country, has been the major hindrance to its economic development. Rugged mountains cover over 80 percent of the land, isolating communities from each other and from the Kathmandu Valley. Trade, industrial growth, and foreign investment have been defeated by the terrain, despite significant efforts to improve the transport and communications **infrastructure**. As a landlocked nation, Nepal is heavily dependent on India economically. The industrial sector employs only 3 percent of the population, while the successful cottage industries that produce carpets and garments bring in up to 80 percent of foreign exchange earnings from countries other than India. Exports consist largely of primary produce sent to India, and trade with nations other than India is expanding. Imports include industrial and agricultural inputs such as machinery, fertilizers, petroleum products, and additional primary produce.

For now, agriculture constitutes most of Nepal's economy, with 81 percent of the population engaged in farming activities that account for over 40 percent of **gross domestic product** (GDP). The major food crops are rice, wheat, and maize, while sugar cane, oilseed, tobacco, and potatoes are other major **cash crops**. Despite government programs to introduce fertilizers and modern techniques, most farms still generate only enough produce to feed the farmer's family, with little or nothing left over to sell. **Underemployment** is high in the farm-

ing sector. The lack of irrigation facilities has left the average farmer dependent on the seasonal monsoon rains, and increased production has resulted mostly from the extension of arable land. The growth of a population heavily reliant on firewood has led to deforestation, which contributes to erosion and floods with serious consequences for communities in southern Nepal, India, and Bangladesh.

While efforts to develop the Nepalese economy systematically through the implementation of the government's 5-year plans have established a basic infrastructure, the benefits have been reaped by the urbanized, educated minority of Nepalese rather than by the rural poor. However, impoverished peasants and highly qualified urbanites alike **emigrate** and migrate within the country in search of better prospects, with serious implications for the economy. Foreign aid, which has supplied over 60 percent of development expenditure over the decades, has been underutilized and mismanaged. The increasing loan component of such aid has added to the country's **foreign debt**, which totaled US$1.5 billion in 1998.

POLITICS, GOVERNMENT, AND TAXATION

The unification of Nepal in 1769 under the Shah dynasty of Gorkha failed to prevent 2 centuries of intrigue among the aristocratic families of Kathmandu. From 1846 onwards, hereditary prime ministers from the Rana family governed in the name of the Shah kings. Their downfall in 1951 led to a succession of governments appointed by royalty. Nepal had its first democratic elections in 1959, and the Nepali Congress Party governed until a royal coup d'etat, or takeover, a year later. The partyless system known as *Panchayat* followed. This comprised public assemblies at village, district, and national levels, who were ultimately accountable to the king. Undercurrents of political dissent periodically rumbled beneath the Himalayan kingdom's facade of tranquility, but it took an economic crisis, a coalition of political parties, and widespread urban demonstrations before the ruling Hindu monarch, King Birendra Bir Bikram Shah Dev, was forced to dismantle the Panchayat system in favor of a multiparty democracy within a constitutional monarchy in 1990. More than a decade on from the introduction of democracy, Nepal has failed to achieve political stability. The turmoil of years past echoes among antagonistic factions and has led to much discontent, particularly in the neglected countryside, where a Maoist insurgency has claimed over 1,600 lives in the 5 years from 1996. In June 2001, a massacre within the royal family, instigated by the Crown Prince, led to rioting and curfews in the Kathmandu Valley. The political situation remains fragile.

With the transition to democracy in 1990, the Nepali Congress Party was voted into power. Established in 1947, this party is the largest political organization in the country and has governed for most of the last decade. The old guard of political leaders, represented by Prime Minister Girija Prasad Koirala and Krishna Prasad Bhattarai, has held sway over this reform-oriented centrist party. The Nepali Congress had its roots in democratic **socialism**, but in the 1980s it modified its program to espouse a mixed economy. During a relatively stable tenure from 1991 to 1994, the party implemented various economic reforms that facilitated privatization and foreign investment, and attempted to improve public enterprise management.

Left of the political spectrum, **communist** parties briefly worked with the Nepali Congress during the revolution of 1990. Parties within this United Left Front Coalition, however, differed widely in their socialist ideologies. The centrist United **Marxist**-Leninist Party (UML), which supports the creation of a **welfare state** (a political system in which the government assumes primary responsibility for the social welfare of its citizens), is the second largest party in Nepal, and remains a potent force despite a damaging split in 1998. The appointment of a minority UML government in 1994 slowed the process of **liberalization**, and **subsidies** to public enterprises increased. Other parties include 2 factions of the monarchist National Democratic Party and the Nepal Sadbhavana Party, which is based in the Tarai region and favors closer economic integration with India. Political bickering has consumed the national agenda, resulting in 9 changes of government between 1991 and 2001. The struggle for political power has filtered down to **public sectors**, which have witnessed widespread corruption and politicization. Though **inflation** has remained moderate and the urban population has benefited from exposure to the global economy, there has been little progress in reducing rural poverty. If the current state of affairs continues, problems with law and order may seriously jeopardize the internal security of Nepal.

The political system is based on the British parliamentary system. The king is head of state, and, along with the Council of Ministers retains executive powers. There are 2 legislative bodies: the National Council and the House of Representatives. Members of the National Council are appointed by the House, the king, and an electoral college. Members of the House of Representatives are elected by popular vote for 5-year terms. The political party with a majority in the House of Representatives appoints the prime minister. The judiciary is headed by the Supreme Court, and is composed of a network of appellate courts and district courts.

Management of the Nepalese economy has changed significantly over time. Prior to the 1950s, while feudal

overlords vied for economic gain at the expense of the rural population, little planned development took place. Under the Panchayat regime, a succession of 5-year plans attempted to impose government control over all aspects of the economy. However, against a background of poor infrastructure, the country's geographical difficulties, and the spread of corruption, the lot of the rural majority was little changed. Attempts to accelerate growth through increased government spending resulted in economic instability in the early 1980s. Under pressure from financial institutions such as the International Monetary Fund (IMF) and the World Bank (WB), certain structural reforms were implemented, which helped the growth of the **private sector**.

Before 1951, Nepalese administrations extracted revenue in the form of land tax and a **tariff** on foreign trade. Their reliance on middlemen reduced the revenue available and subjected traders and producers to exploitation that discouraged economic activity. Moreover, the income derived was rarely used for purposes of benefiting the economy. From the late 1950s, a combination of income, sales, and property taxes were introduced. Today, corporate tax stands at 25 percent, though certain industries are taxed at a maximum of 20 percent of their income. **Income tax** is progressive, with different exemption limits for individuals and families. Relative to average Nepalese incomes, income tax exemption is fairly high. Agreements are underway with other governments to avoid double taxation and encourage foreign investors. Government revenues have increased substantially in recent years, from just over 6 billion rupees in 1989 to a high of over 24 billion rupees in 1997, but falling to 17 billion the following year. Customs and consumption taxes (such as taxes of food and drink) have been the primary sources of revenue. A **value-added tax** was introduced from 1995. However, a weak tax administration, resulting in low tax compliance, limits this important source of development funds.

INFRASTRUCTURE, POWER, AND COMMUNICATIONS

In post-1950s Nepal, planners and foreign aid donors viewed the creation of infrastructure as vital to the success of the country's economic development. Five-year plans prioritized transportation and communications, but although the results were significant, they remain inadequate. Nepal has 13,849 kilometers (8,522 miles) of paved, graveled, and fair-weather roads, with the major highways linking east to west and north to south. However, monsoon rains work on the unstable mountain geology, causing widespread landslides and driving up road maintenance costs. There were 253,407 vehicles registered in 1999, of which 142,000 were in the Kathmandu Valley. Airports operate in 44 out of 75 districts, and include domestic airports in remote areas which link up with the international airport in Kathmandu. This network is crucial to the tourist industry. Recently, Nepal adopted an open-sky policy, allowing private airlines to operate domestic and international services.

Other forms of transportation are underdeveloped. There is a single narrow gauge railway line covering a distance of 52 kilometers (32 miles) from Janakpur to Jayanagar in the south, and an under-utilized 42-kilometer (26-mile) ropeway (suspended cable-car line) from Hetauda to Kathmandu, which transported 10,684 metric tons of goods in 1995. A limited trolley bus service operates in the Kathmandu Valley. Access to the sea is only possible through the Indian ports of Calcutta (1,150 kilometers, or 713 miles, from the Nepalese border) and Haldia.

Much has been said about the potential of Nepal's hydropower to fulfill local power needs, drive industrialization, and boost revenues through the sale of surplus power to India. Of a feasible potential of 27,000 megawatts (MW), Nepal currently uses a mere 332.7 MW. "Mega-projects," sponsored by institutions such as the World Bank, have been embraced and publicized by successive governments as a panacea to some of the country's eco-

Communications

nomic ills without sufficient consideration to the displacement of people and the environmental damage they may cause. Examples of power-generating mega-projects under consideration are those in Chisapani (10,800 MW), Pancheshwor (6,480 MW), and the Arun Valley (643 MW). Local opponents have cited the inherently unsustainable and wasteful nature of such projects, which stand to plunge the country into serious debt. Locally based small to medium hydropower schemes have met with success, but this approach needs government support.

Nepal has considerably improved its postal and telephone services, though they remain deficient in rural areas. The Nepalese telecommunications network is digitized, and the Nepal Telecommunications Corporation (NTC) provides basic services for the country. Television programming began in 1985 and many families receive (not always legally) transmissions from foreign networks such as Star TV. Radio Nepal has existed since the 1950s and has a significant rural audience.

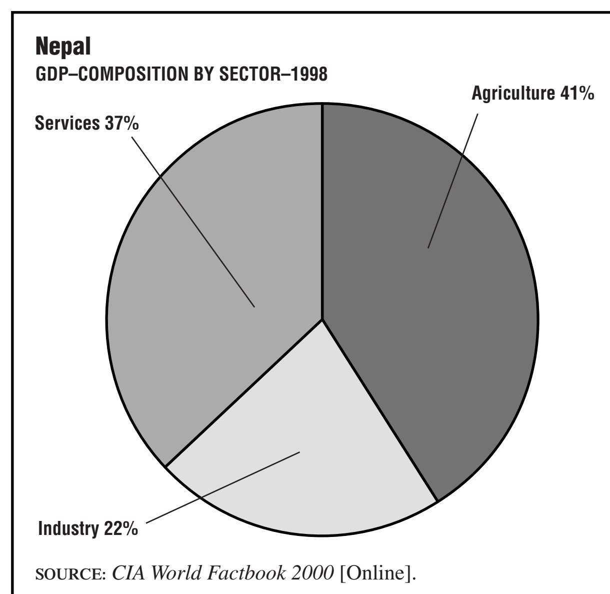
ECONOMIC SECTORS

The agricultural economy has failed to make the transition from **subsistence farming**, and is still largely dependent on weather conditions. Despite its undeveloped nature, agriculture supplied 41 percent of the country's GDP in 1998. The industrial sector only involves a minority of the population. In recent years, successive governments have passed legislation intended to encourage investment and privatization. Industry contributed some 22 percent to GDP in 1998. In contrast to the stagnation in both these sectors, the service industry derives major impetus from tourism, where the Himalayan kingdom enjoys a comparative advantage rivaled by few other nations. All told, the services sector contributed 37 percent to GDP in 1998. While the particular configuration of Nepal's topography and landlocked status have acted as limiting factors on the full development of its economy, this alone cannot explain the problems that continue to trouble a country with one of the highest per capita shares of foreign aid in the world today.



SOURCE: *CIA World Factbook 2000* [Online].

AGRICULTURE

Agriculture in Nepal has long been based on subsistence farming, particularly in the hilly regions where peasants derive their living from fragmented plots of land cultivated in difficult conditions. Government programs to introduce irrigation facilities and fertilizers have proved inadequate, their delivery hampered by the mountainous terrain. Population increases and environmental degradation have ensured that the minimal gains in agricultural production, owing more to the extension of arable land than to improvements in farming practices, have been cancelled out. Once an exporter of rice, Nepal now has a food deficit.

Over 80 percent of the population is involved in agriculture, which constitutes 41 percent of GDP. The seasonal nature of farming leads to widespread underemployment, but programs to grow cash crops and encourage cottage industries have had some success over the years. Two-sevenths of the total land is cultivated, of which 1.5 million hectares produced 3.7 million metric tons of the staple crop of rice in 1999. Wheat and maize together take up a similar portion of the available land, with harvests of 1 million metric tons and 1.5 million metric tons, respectively, in 1999. Production of cash crops increased

substantially in the 1970s, and sugarcane, oilseed, tobacco, and potatoes (a staple food in some areas) were the major crops. Agricultural production accounted for about three-fourths of total exports in the late 1980s. As noted earlier, most exports consist of primary agricultural produce which goes to India. In general the majority of Nepalese farmers are subsistence farmers and do not export surplus; this does not prevent a minority in the fertile southern Tarai region from being able to do so. Most of the country is mountainous, and there are pockets of food-deficit areas. The difficulties of transportation make it far easier to export across the border to India than to transport surplus to remote mountain regions within Nepal. A considerable livestock population of cattle, goats, and poultry exists, but the quality is poor and produces insufficient food for local needs.

Government efforts to boost the agricultural economy have focused on easing dependence on weather conditions, increasing productivity, and diversifying the range of crops for local consumption, export, and industrial inputs. Solutions have included the deployment of irrigation, chemical fertilizers, and improved seed varieties, together with credit provision, technical advice, and limited mechanization. This has had some effect. Land under irrigation increased from 6,200 hectares in 1956 to 583,000 hectares in 1990. The use of chemical fertilizers, introduced in the 1950s, climbed to about 47,000 metric tons by 1998. Still, the weather continues to determine good and bad years for the average farmer. On a national scale, while production of both food and cash crops grew annually by 2.4 percent from 1974 to 1989, population increased at a rate of 2.6 percent over the same period.

Increased agricultural activity has placed tremendous stress on the fragile ecosystems of the mountains, with severe deforestation leading to erosion and flooding that threatens the livelihoods of farmers throughout the country. In the rush to open up arable land in the early years of development, Nepal lost half its forest cover in the space of 3 decades. Government plans to maintain cover at 37 percent depend on the success of community forestry programs, which merge traditional and modern agro-forestry and conservation practices. Responsibility is placed in the hands of Forest User Groups, which included almost 800,000 households in 1999.

A potent issue is that of land reform. Before 1950, a feudal system held sway. Land ownership was concentrated in the hands of landlords who contracted out to tenant farmers. Increased productivity may have been suppressed by such a system. Even though the legal mechanisms for land reform (such as placing limits on the amount of land owned) do exist, in practice most farmers still have pitifully small holdings. Predictably, land reform has been the mandate of every political party in Nepal, particularly the communists.

INDUSTRY

The industrial sector in Nepal is very undeveloped. Early industrial ventures, spurred by domestic shortages in the 1930s and 1940s, fared badly due to inexperience. By 1960 there were 63 registered industries, unsupported by adequate institutional organization or infrastructure. With the influx of foreign aid targeted at both the industrial sector and the transport and communications infrastructure, a mix of modern industries and cottage industries slowly developed, numbering 3,557 institutions by 1997. They are small by international standards. Industrial activity, accounting for about 21 percent of GDP, employs only 3 percent of the population. Most of these industries are located around urban centers such as the Kathmandu Valley and in the Tarai region.

Nepal suffers from a lack of both internal and external investment. This stems from low domestic savings, a small domestic market, a severe shortage of skilled labor, chronically corrupt and inefficient public administrations, high transport and operating costs, the inadequacy of power resources and, increasingly, political instability. There have been recent attempts to encourage investment and privatization through the Industrial Policy 1992 and Foreign Investment and One Window Policy 1992, and the creation of industrial centers with governmental land and buildings on lease for private ventures.

MODERN INDUSTRIES. The largest manufacturing industries in Nepal produce jute, sugar, cigarettes, beer, chemicals, tea, vegetable ghee (clarified butter used in Indian and Nepali cooking) and oil, matches, soap, shoes, and processed leather. While industries such as jute, tea, and sugar use local raw materials, other industries have to import inputs from India. Mining is based on deposits of limestone (for cement), clay, garnet, magnetite, and talc. Surveys of other deposits have been sporadic and inadequate, and the difficulty of the terrain has limited development.

COTTAGE INDUSTRIES. As early as 1952, the Nepalese government recognized that industrialization would have to take into account the severe limitations imposed by the country's geography. Cottage industries—the local production of traditional handicrafts—were seen as a way to engage the underemployed rural population and contribute towards export earnings. In Nepal, these industries have included pottery, handmade paper and products, woodwork, metal work, weaving, embroidery, and basket making, and draw on artistic traditions dating back centuries. However, even with the creation of Cottage Industries Training Centers across the country, many of these crafts have been in decline. Still, they contribute about 60 percent of industrial production, with the garment and carpet industries showing rapid growth since

the 1980s and earning 84.3 percent of export earnings from countries other than India.

SERVICES

TOURISM. While the topography of Nepal has hampered economic development, it has also blessed the country with the matchless beauty of the mighty Himalayan mountain range in the north, rugged hills and valleys with cultural centers such as Kathmandu, and sub-tropical climes in the south that house rare species of wildlife such as tigers, rhinos, and gharial crocodiles. Ever since the successful ascent of Mount Everest in 1953, the tourist industry has been booming. For a country that was closed to the world until the mid-20th century, tourist arrivals of almost half a million in 1999 are impressive. A network of trekking agencies, hotels, and restaurants exists. There were a total of 708 hotels in 1999, with 31,355 beds. Tourism is an important contributor to the economy, constituting 3.6 percent of GDP and 26.3 percent of export earnings. Recognizing this, the state has supported the industry by building airports in otherwise inaccessible areas and opening up tourist routes.

Through the 1960s and 1970s, Nepal's allure as a tourist destination stemmed as much from the Himalayas as it did from its exotic appeal and the relatively easy availability of marijuana. Today, the industry is more broad-based, and mountaineering, trekking, white-water rafting, wildlife tours, cultural tours, and pilgrimages attract young and old, rich and poor alike. Almost a third of visitors are from neighboring India. The influx of tourists has been a strong influence on the Nepalese people. Ethnic groups such as the Sherpas, who escort mountaineering expeditions, have benefited considerably from their involvement with tourist activities. Culturally, Nepal has been exposed to western influence. Environmentally, the country has suffered adverse effects from tourism, though awareness of environmental issues is growing.

Tourism will continue to represent an important renewable resource, with government targets of a million visitors a year promoted through campaigns such as "Visit Nepal Year 1998" and "Destination Nepal 2002." Lately, pollution in the Kathmandu Valley, political violence, strikes in the hotel industry, and the royal massacre of 2001 have threatened to dent the number of tourist arrivals. Nevertheless, the potential for the expansion of tourism-related activities such as the provision of rural infrastructure and the local production of specialized food and equipment remains high.

FINANCIAL SERVICES. The use of institutional financial services has been slow to spread in rural areas. Until the mid-1990s, most Nepalese banks were state controlled or owned. The country's first commercial bank, Nepal Bank Ltd., opened in 1937. The central bank, Nepal Rastra Bank, opened in 1956, and Rastriya Banijya Bank opened in 1966. Specialized financial institutions such as the Nepal Industrial Development Corporation (NIDC) and the Agricultural Development Bank (ADB) were also established to provide assistance to private industry and small farmers, respectively. These have had mixed success since traditional moneylenders still play a central role in village financial affairs. By 1990 the ADB had only granted loans to 9 percent of all farming families. Since 1984, foreign banks have been allowed to operate in Nepal as part of a strategy to encourage foreign investment. By the beginning of the 21st century, there were 14 commercial banks and 45 finance companies in Nepal.

RETAIL. **Retail** services in Nepal are mostly small, independent, family businesses. Large franchises do not exist and, with the exception of Indian-owned businesses, foreign investment is limited. Ethnic groups such as the Marwaris and the Newars are noted for their entrepreneurial skills and have a large share of the retail sector.

INTERNATIONAL TRADE

Nepal is a landlocked nation, surrounded by India on 3 sides and by Tibet (now a province of China) in the north. Historically, international trade before the 1950s was with these countries. Exports have consisted of primary agricultural produce, while everything not produced locally has been imported. Throughout the years of development, these imports have included industrial inputs, fertilizers, and petroleum. Since the 1970s, the **balance of trade** has been increasingly negative. During the same period, however, exports of garments and carpets have grown, reaching sales close to US$300 million, and trade with other countries has increased to the detriment of the trade with India.

Until the 1950s, 90 percent of Nepal's trade was with its giant neighbor, India. The essentially open border facilitates trade, but also makes unquantifiable smuggling hard to control. Exports to India are generally supplied

Trade (expressed in billions of US$): Nepal

	Exports	Imports

by agricultural surplus from the fertile Tarai region—mostly rice, but also tobacco, jute, and vegetable oils. Raw materials such as hides, skins, herbs, textile fibers, metal ores, and some manufactured goods, such as bamboo products, wooden furniture, and textiles, are also exported. Imports consist of daily necessities such as salt, sugar, tea, medicines, petroleum products, and items such as chemicals, machines, cement, coal, and spare parts that are needed for development work. The trading relationship with India was first codified in 1950 with the Treaty of Trade and Transit, which lowered tariffs and tax **duties** on goods passing between Nepal and India. In successive modifications and renewals of the treaty (notably in 1960), transit facilities for trade between Nepal and other countries were established in India at the port of Calcutta. The decline in India's percentage of trade with Nepal to just above 30 percent in 1998 demonstrates the success of these arrangements. In March 1989, delayed negotiations led to the expiration of the treaty, and all but 2 trading points were closed for a year. This crippled the Nepalese economy, as internal trade (much of which had to pass through Indian territory) and external trade with India was subjected to virtual closure. Shortages of basic goods such as salt and petroleum caused considerable strife, leading to both anti-India and anti-government demonstrations in Nepal, and were partly responsible for the downfall of the Panchayat system. An interim government successfully reinstated the treaty in June 1990.

Trade with Tibet, mostly the **bartering** of agricultural produce, went into decline at the turn of the 20th century when the British in India opened alternative routes. The limited Tibetan market and its inaccessibility further hindered the development of this barter trade. Negotiations on maritime access via Bangladesh, traversing 26 kilometers (16 miles) of Indian territory, have been difficult. Nepal has been more successful in expanding its exports with countries such as the United States, Britain, Germany, and Japan, the value of which rose from 14.4 million rupees in 1965 to over 16 billion rupees in 1996.

Nepal's trade balance is skewed towards imports, partly because the demand for industrial inputs and **consumer goods** has grown while local production has not. In 1998, Nepal imported US$1.2 billion in goods while exporting just US$474 million. India, Hong Kong, and Singapore are the country's major import partners. Governments have attempted to increase export earnings by diversifying products, and also to reduce import costs by substituting imports with local production. Policies such as the Exporter's Exchange Entitlement Scheme and both a Dual Exchange Rate and a Single Exchange Rate were formulated to facilitate these objectives. To its credit, Nepal has obtained favorable agreements with its trade partners to offset its landlocked status. But the treaty crisis with India and the failure to agree on Bangladeshi access highlight the country's limited bargaining power. Still very much a developing nation, Nepal is unable to influence the global market to which it exports primary goods at prices that are generally both low and unpredictable; the geographical diversification of its trade needs to include a shift towards a wider array of manufactured products.

MONEY

With the establishment of the central Nepal Rastra Bank, Nepal began to gain control of its **foreign exchange reserves**, which until 1960 were channeled through the Central Bank of India. Indian currency, prevalent throughout the country and freely convertible, was separated from other foreign currencies. In 1983, in order to counter economic instability and increased inflation, the **exchange rate** of the Nepalese rupee was weighted against a basket of important currencies such as the U.S. dollar. In reality, the Nepalese currency is quite strongly influenced by fluctuations of the Indian rupee. The value of the Nepalese rupee has been in decline for years; as of June 2001, US$1 was equivalent to 74.66 Nepalese rupees. Inflation was moderate at 11.8 percent in 1999, but imported goods are still beyond the reach of many Nepalese. While economic growth was strong in the late 1980s, the temporary breakdown of the trade treaty with India significantly damaged the economy.

In 1993, the Nepal Stock Exchange was born out of the Securities Exchange Centre. Interest has exceeded expectations, though only a minority of the urban population is involved in the stock market. The minimal development of the industrial sector limits opportunities for investment.

POVERTY AND WEALTH

Nepal's largely rural population depends on subsistence agriculture for a living. As this is outside the realm of the quantifiable modern economy, the low **GDP per capita** of US$217 in 1998 may be misleading. Nonetheless, 42 percent of the population lives below the poverty

line (1996), and patterns of income and resource distribution reveal chronic inequalities within a population separated along the lines of the caste system (a hierarchical class system), gender, and place of residence.

Hindus fleeing Muslim invaders in India hundreds of years ago brought the caste system to Nepal. The educational and technological superiority of the Indo-Nepalese migrants allowed them to dominate both the indigenous and Tibeto-Nepalese ethnic groups. The caste system—with its notions of hereditary superiority and traditional rights to power, access, and livelihood—was imposed upon Hindus and non-Hindus. In order of status, the Brahmins (priests) were followed by Chhetris (administrators), Vaishyas (merchants), Sudras (farmers, artisans, and laborers), and untouchables (outcasts and the socially polluted). These divisions are not as sharply defined in the changing Nepal of today where caste has no legal justification, but a 1991 study revealed that 80 percent of civil service, army, and police posts were held by Brahmins and Chhetris of the hills (less than 50 percent of the population). The Newars of the Kathmandu Valley have also occupied an important niche in the political and economic culture of Nepal relative to their numbers.

Not surprisingly, land and income distribution is skewed. A 1983 study indicated that more than 50 percent of landholdings in the Hill region were smaller than half a hectare. In 1990, 75 percent of the families in Nepal earned less than 35 percent of the total national income. The harsh reality behind these figures has forced many in the Hill and Mountain regions to migrate to urban centers, the Tarai, and abroad to seek employment as soldiers, laborers, and domestic help. The burden of poverty is particularly hard on women, and a growing population of Nepalese sex workers in the brothels of India is sad testimonial to this problem.

Although government planning has channeled resources into the health and education sectors, doctors and health care centers are concentrated in urban areas, and rural services are still inadequate. Health services barely cope with widespread malnutrition, gastrointestinal diseases, tuberculosis, and polio. There is a rising incidence of cardiovascular disease in urban centers and a shortage of trained medical personnel and supplies. Those who can afford it prefer to be treated for serious illnesses abroad. Though many Nepalese are aware of the link between education and socio-economic betterment, regular attendance at school (conventional school is usually the only option; there are no distance/part-time/private tuition type educational courses in the villages) means time away from vital household and farming chores. Primary education is free, but standards in public schools are low, and literacy was still only 45 percent in 1999 among those over the age of 15. A college education abroad is much coveted, and is the prerogative of the rich or the fortunate few who secure scholarships.

So far, government policies have not significantly improved the lot of the poor Nepalese peasant. Programs targeting rural areas often end up enriching local officials and prosperous farmers. Ironically, the "development industry," fueled by foreign aid, has provided income for many in Kathmandu, while conditions remain bleak in the countryside. Governmental neglect of rural areas and ongoing political instability only add to the resentments that are manifest in the violence surrounding the Maoist "People's War" in the country.

THE LIVES OF THE POOR AND RICH. A rural family often lives under precarious conditions. In a typical village in the hills, a poor household relies on the produce from a small plot of land that has no irrigation facilities and is subject to erosion every year. A woman usually lives in her husband's house with his parents and siblings. The family house is made of stone and provides only 1 or 2 shared rooms. Cooking is done over an open stove in the main room. If they are fortunate, the family might own livestock such as cattle or chickens. Very little can be set aside from year to year, so they are unable to afford basic necessities. Such pleasures as a varied diet, clean water, fuel, medicines, decent clothing, and electricity may not be available. Education is considered a luxury that detracts from the time the children, especially the girls, can spend working. Water is drawn from the

local stream. Dependence on firewood has led to severe deforestation in the hills, and the women have to walk hours to forage. Health facilities are limited. If a member of the family falls sick, they may be carried along treacherous mountain paths for hours to reach a health post. Often, the men in the household leave the village in search of jobs to help support the family.

A prosperous family in Kathmandu may derive its wealth from an aristocratic legacy, or modern occupations such as business, law, or medicine. They may have houses in the urban center that can be rented out, and also own land worked by tenant farmers outside the Kathmandu Valley. Together, a wealthy married couple can earn upwards of US$6,000 a year. The easy availability of domestic workers from rural villages allows the wife to delegate household chores. The education of the children is perceived as fundamentally important in securing a future in modern Nepal. They study in private English-medium boarding schools and go on to complete college degrees abroad. Health services in Kathmandu are good in comparison to the rest of the country, but serious problems such as cardiovascular disease are entrusted to doctors in India or Thailand. Despite the irregular supply of electricity in the Valley, the family will have a range of electrical appliances and might have invested in a computer with Internet access. Their lives in Kathmandu are very comfortable, but they share with the poor the common problems of water and electricity shortages, frequent strikes, and the threat of political violence.

WORKING CONDITIONS

Working conditions in Nepal are largely unregulated. For the minority of the population working in the formal economy, labor laws allow for a 6-day, 48-hour week with 30 days of annual leave, 15 days of sick leave, basic health and safety standards, and some benefits. The amended Factories and Factory Workers' Act 1977, which set out these standards, was revised following the democratic transition in 1990. In the Kathmandu Valley, a 5-day, 40-hour week with 25 days of annual leave has been implemented. In 2000, unemployment was 14 percent, and underemployment 47.5 percent. The latter is a common feature of the agricultural sector, where work patterns are determined by the planting and harvest seasons, and alternate opportunities may be either unavailable or culturally unattractive. Skilled labor is severely limited in Nepal, and a quarter of the **labor force** is composed of Indians. This shortage has hampered the development of the industrial economy.

In practice, laws passed to protect workers have hardly been implemented. Working conditions in the family-run farms and businesses that drive the economy retain both positive and negative features of power structures within the family. So while arrangements may be more cooperative, women and girls bear the brunt of the drudgery, leaving the men to reap the benefits and have time for leisure. This is particularly true of rural Nepal. Larger farms which employ tenant farmers often maintain feudalistic structures of patronage. Safety and health standards in industry are also widely neglected.

The democratic change in 1990, especially in the light of communist success, has altered the dynamics of labor in Nepal. Labor unions, restricted prior to 1991 along with political parties, now operate nationally, overseen by the General Federation of Nepalese Trade Unions (GEFONT). In 1991, labor union membership included 30 percent of non-agricultural workers. Workers regularly carry out strikes, and deadlocks in negotiations with government and industry have caused great inconvenience in urban centers such as Kathmandu. Strikes in recent years by public transport drivers and trash collectors are examples of this disruption. In early 2001, a dispute between workers in the tourist industry and the hotel association concerning the inclusion of service charges led to a temporary breakdown in services. Nepal's export-oriented industries have also had to adjust to the demands of Western consumers. In 1994, the Nepalese government responded to negative publicity in Europe over the prevalence of child labor in the carpet industry, and continues

to work with non-governmental organizations to eliminate this problem.

COUNTRY HISTORY AND ECONOMIC DEVELOPMENT

c. 563 B.C. The Buddha (Prince Siddhartha) is born in Lumbini, in the Tarai region of Nepal.

c. 400–750 A.D. Licchhavi kingdom in power in Kathmandu.

1100–1484. Khasa Malla kings rule in western Nepal.

1484. Malla kingdom divided; the 3 kingdoms of Kathmandu, Bhadgaon, and Patan are established.

1769. Nepal emerges as a unified state under the leadership of Prithivi Narayan Shah, who has waged his campaign from Gorkha in midwest Nepal. For the next half century, the economy is geared towards military expansion pursued by successive Shah rulers and their administrators.

1791–92. War between Nepal and China.

1814–16. Nepal is at war with Britain; hostilities are ended with the Treaty of Sugauli, which reduces the territory of Nepal.

1846. Jang Bahadur establishes hereditary Rana rule.

1854. The country's first legal code is proclaimed.

1855. Nepal goes to war with Tibet, which results in duty-free privileges for Nepalese traders and payment of tribute from Tibet.

1923. Treaty of Friendship is signed with Britain, confirming the independence of Nepal and a special relationship with the British Empire.

1950–51. The first democratic revolution takes place in Nepal, leading to the end of the Rana regime and the rehabilitation of the Shah dynasty. The government signs the Treaty of Trade and Commerce with India.

1955. Nepal is admitted to the United Nations.

1956. The first 5-year plan of economic development is drawn up.

1959. The first general elections are held in Nepal. The Nepali Congress Party is elected to government with Bishweswor Prasad Koirala as prime minister.

1960. Important revisions are made to the Trade and Transit Treaty with India. King Mahendra dismisses the elected Nepalese government and imprisons political leaders.

1962. The Panchayat system is established. The Land Reorganization Act and a new legal code are established.

1972. King Mahendra dies and is succeeded by King Birendra.

1980. A national referendum votes to support the Panchayat system.

1985. Nepal becomes a founding member of the South Asian Association for Regional Cooperation (SAARC).

1989. Failure to renegotiate the trade and transit treaties with India results in economic disruption.

1990. Popular protests led by the Nepali Congress and the United Left Front Coalition lead to the establishment of multiparty democracy.

1991. General elections are won by the Nepali Congress. Girija Prasad Koirala becomes prime minister.

1994. The Communist Party of Nepal (UML) wins mid-term elections and forms a minority government under Man Mohan Adhikari.

1995. A coalition government is formed under Sher Bahadur Deuba of the Nepali Congress.

1997–98. Successive coalition governments take power following the collapse of the Deuba government.

1999. General elections bring a new government under Krishna Prasad Bhattarai of the Nepali Congress. He is replaced by Girija Prasad Koirala the following year.

2001. The Crown Prince Dipendra opens fire on a family gathering at the royal palace, killing 9 members of the royal family, including the king and the queen. Dipendra dies of a self-inflicted wound. Widespread mourning and rioting accompanies the ascension to the throne of Gyanendra, the surviving brother of the late king.

FUTURE TRENDS

Many observers have characterized Nepal as a country spanning the medieval and modern ages. The urban-rural divide illustrates this split. Nepal is in limbo, a condition that has managed to perpetuate itself through half a century of development planning and massive infusions of foreign aid. Undeniably, the country has made great progress since it opened up to the world, particularly in establishing a basic infrastructure in transport, communications, health, and education. However, its difficult topography, coupled with inefficiencies that are the legacy of an enduring system of feudalistic patronage in society and government, mean that the results of development plans rarely match expectations.

Economic gains in various sectors have been offset by population growth and environmental degradation, both poised to become even more problematic in the future. The disparity between rich and poor is growing, and discontent in the countryside bodes ill for the stability of a country that depends heavily on tourism. While Nepal has continued to prioritize liberalization and privatization of its economy in order to encourage growth and attract investment, the political problems of the last decade have hardly fostered a conducive environment. Until these policies are allowed to bear fruit, Nepal will not be able to break out of the shackles of its subsistence agriculture economy and develop industrially.

Cottage industries exporting goods such as carpets and garments will continue to grow. Tourism, as long as visitors remain safe from internal instability, will remain crucial to the economy. Foreign aid—so far mismanaged, underutilized, and responsible for a debt burden that demands servicing—is set to provide the bulk of development funds in the years to come. The development of large hydroelectricity projects could bring considerable benefits, but these carry inevitable social and environmental consequences. Ultimately, until Nepal achieves democratic stability and the institutional culture demonstrates that it is prepared to deal with corruption at every level, it will fail to achieve economic prosperity. The emigration of peasants and highly educated urbanites will also continue, draining Nepal of valuable population resources. The benefits of development have accrued to the rich, privileged, and educated; as in olden times, the country lives in the shadow of the Kathmandu Valley.

DEPENDENCIES

Nepal has no territories or colonies.

NEW ZEALAND

CAPITAL: Wellington.

MONETARY UNIT: New Zealand dollar (NZ$). One dollar equals 100 cents. There are coins of 5, 10, 20, and 50 cents, and of 1 and 2 dollars. Notes are of 5, 10, 20, 50, and 100 dollars.

CHIEF EXPORTS: Dairy products, meat, forestry products, fish, fruit and nuts, wool, manufactures.

CHIEF IMPORTS: Mechanical machinery, vehicles, electrical machinery, fuels, plastics, technical equipment, aircraft, paper products, pharmaceuticals.

GROSS DOMESTIC PRODUCT: US$63.8 billion (purchasing power parity, 1999 est.).

BALANCE OF TRADE: **Exports:** US$12.2 billion (f.o.b., 1998). **Imports:** US$11.2 billion (f.o.b., 1998).

COUNTRY OVERVIEW

LOCATION AND SIZE. New Zealand is an archipelago (group of islands) located in Oceania, southeast of Australia. The 2 main islands are North Island (Te Ika a Maui) and South Island (Pounamu), with some near onshore islands and smaller outlying islands including Chatham Islands, Kermadec Islands, and Auckland Islands. Its total land area is 268,670 square kilometers (103,733 square miles), making it about the size of the state of Colorado, with a coastline of 15,134 kilometers (9,404 miles). The capital, Wellington, is located at the south end of North Island.

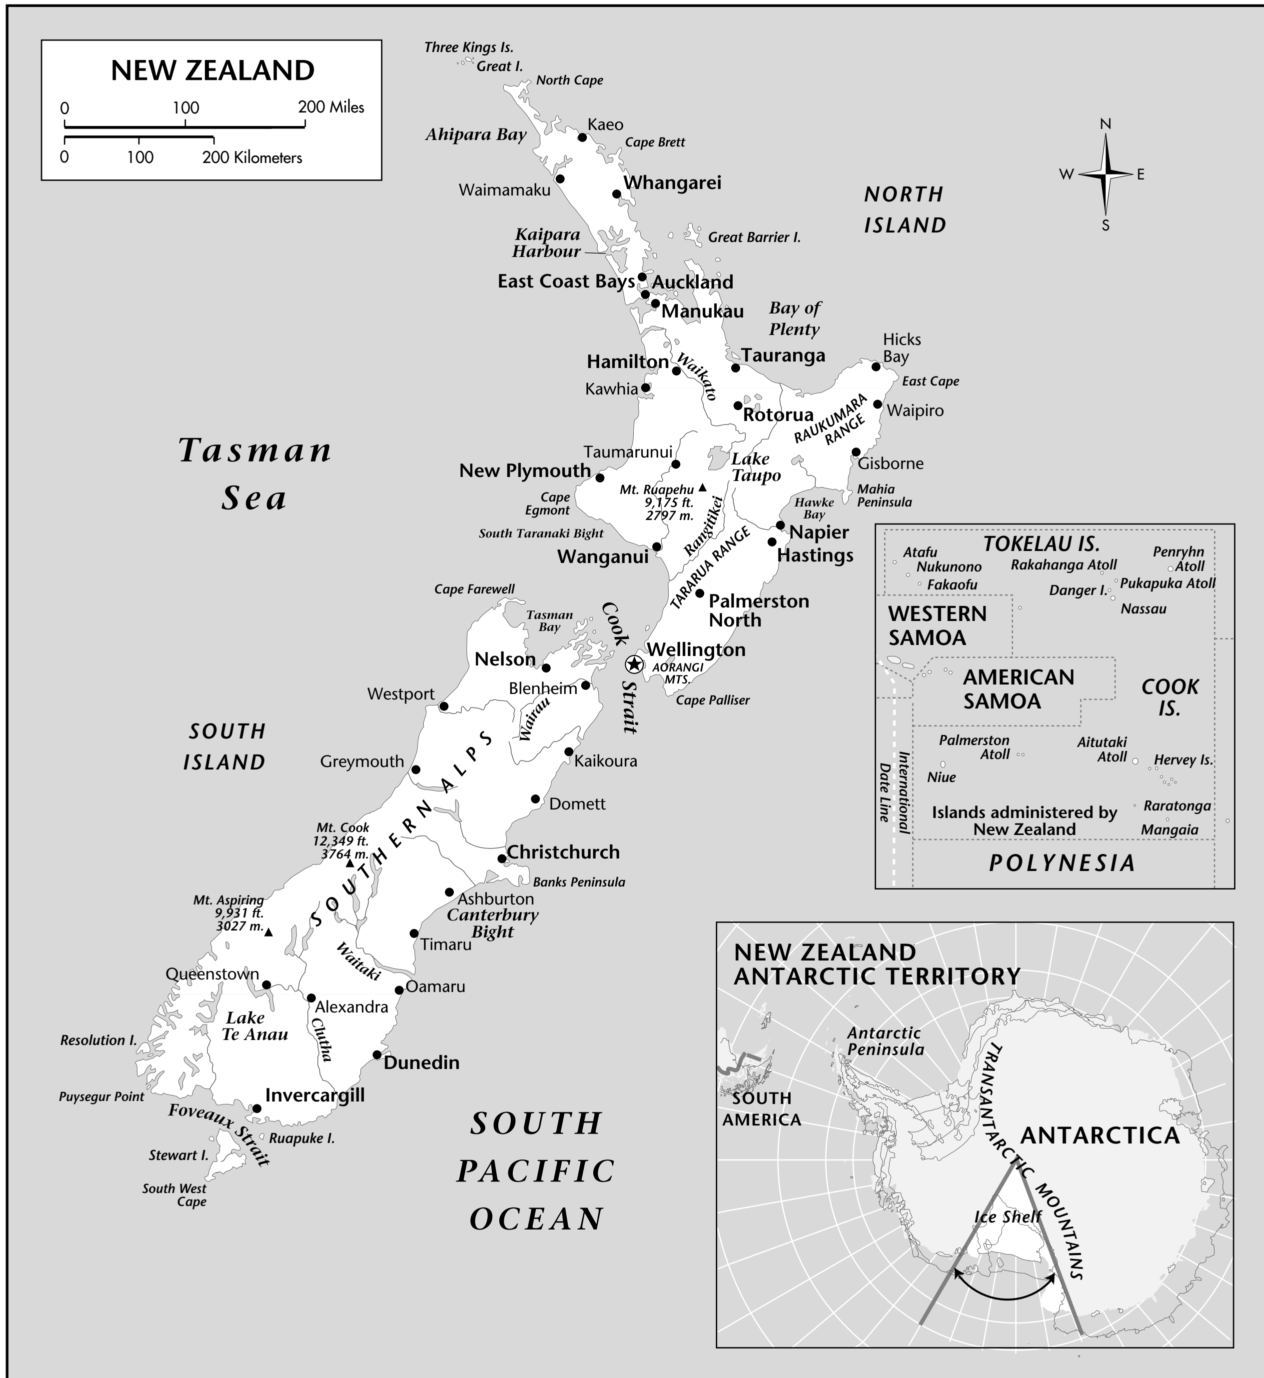
POPULATION. The population of New Zealand was estimated at 3,862,000 in mid-2000, an increase of 12.4 percent from the 1996 census population of 3,434,950. Between the censuses of 1991 and 1996, New Zealand had the highest rate of growth in the Organization for Economic Cooperation and Development (OECD), partly resulting from high levels of **immigration**, but also as a result of a relatively young population. In 2000 the birth rate stood at 15.3 per 1,000 population while the death rate was 7.8 per 1,000 population. With a projected annual population growth rate of about 1 percent between 1996 and 2010, the population is expected to reach 4,207,000 by 2010.

In most years, New Zealand has a net migration loss of New Zealand citizens who move to Australia, the United Kingdom, and elsewhere, so one of the objectives of its recent immigration policy (1987) is to offset this loss with new migrants, preferrably those with skills and investment capital. While migrants from the United Kingdom continued to arrive as they had throughout the 20th century, a significant new migration stream came from Asia especially from China, Taiwan, Hong Kong, and Korea. These new populations, together with Pacific peoples who arrived in earlier decades, have resulted in an increasingly multicultural society. In 1996 about 72 percent of the population considered themselves of European ethnicity, down from about 81 percent 10 years earlier. The indigenous Maori made up nearly 15 percent of the population, Pacific people 6 percent, and Asians about 5 percent. The Asian population had increased the most rapidly, from only 1.5 percent 10 years earlier.

By most standards, New Zealand is sparsely populated, with an average of only 13 persons per square kilometer. This population is unevenly distributed, with three-quarters on North Island, and one-third in the largest city, Auckland. Over the years, Auckland has grown faster than the rest of the country, being the center of much manufacturing and, more recently, service industries. More than half of all migrants have settled in Auckland, and of new migrants from the Pacific and Asia, about two-thirds have settled there.

OVERVIEW OF ECONOMY

Throughout the 20th century, New Zealand has been considered to be a nation of primary production, with exports being predominated by meat, wool, dairy products, timber, and fish. However, by 1999 agricultural exports had declined to about half of all exports, and less than 10 percent of the workforce were employed in agriculture. Nevertheless, agriculture remains an important



element in the economy and there have been ongoing moves to diversify the agricultural base. In recent years, horticulture has become more important; significant exports include apples, citrus fruit, kiwifruit, stone fruit, squash, and many other products. Wine production has increased rapidly in the last 2 decades, and New Zealand's reputation for its wines is growing.

Traditional sectors of agriculture still have great potential. With the **devaluation** of New Zealand's currency in recent years, producers of dairy products, meats, and wool have found their products very competitive on the world market and have increased their incomes substantially. Further, it is expected that as international trade **tariffs** decline, New Zealand will gain access to markets in which its products will be even more competitive.

Manufacturing has increased dramatically since World War II. With a comparative advantage in food processing, this sector led the post-war manufacturing boom.

With the protectionism of the 1950s and 1960s (i.e. high tariffs/taxes on imports), manufacturing diversified into many areas of **import substitution**, including textiles and footwear, home appliances, furniture, machine construction, automobile assembly, and many others. Following an economic restructuring program that began in 1984 with the election of a new government, some of these industries were exposed to increased international competition with the progressive reduction of tariffs. Some have done well, others have declined, and one has disappeared (the automobile assembly industry).

Most industrialized countries have had the greatest growth in services in the late 20th century. By 1998 in New Zealand, services accounted for 69 percent of **gross domestic product** (GDP) and fully 65 percent of wage and salary employment. Important sectors include government services such as general administration, education, and health. In the **private sector**, major growth areas have been tourism and specialized services in business advice, real estate, computing, and telecommunications. Tourism is often seen as the industry of the future, and New Zealand has experienced a steady increase in visitor numbers and an expansion of tourist **infrastructure**. Financial services have been especially affected by **deregulation** after 1984, and much of that sector has been acquired by foreign corporations.

POLITICS, GOVERNMENT, AND TAXATION

New Zealand is a parliamentary democracy with the British queen as the nominal head of state. It has a **unicameral** (1 house) parliament with 120 seats; half of these represent constituencies and the other half are "list" seats. In the mixed member proportional (MMP) system established in 1996, each voter has 2 votes: 1 for the constituency member of parliament and 1 for a party. After the constituencies are declared, the list seats are calculated so that a party's representation in parliament is similar to the party vote that they received in an election. In contrast to the "first past the post" system in which 2 parties predominate (as in the United States), MMP has allowed smaller parties to be represented, although they must either have a constituency member of parliament elected or get a minimum of 5 percent of the national party vote to qualify for list seats.

Throughout the 20th century, until 1996, the political system was dominated by 2 political parties: a conservative party called "National" since the 1930s and a liberal/left wing party called "Labour." The first Labour Party government was elected in 1935 and began constructing a **welfare state**, building state housing, and investing in health and education. New state enterprises were established. From the 1940s to the 1970s the Labour and National parties exchanged control several times, but the welfare state remained intact. Ironically, the election of a new Labour government in 1984 began a movement to weaken the welfare state and to reduce the role of government in the economy (a "monetarist" approach). The reforms instituted by the new government included progressive tariff reductions, **privatization** of many state enterprises, and cutbacks in some social services. These policies were pursued and, in some cases, strengthened by the National Party government elected in 1990; for example, there were cutbacks in social welfare payments and more privatizations. It was not until the election of 1999 that some of these policies were slowed or reversed with the election of a coalition government led by the "reformed" Labour Party in coalition with the "left-wing" Alliance Party.

The impact of MMP on the political system has been considerable. The 2 governments elected since 1996 have been coalitions, first of "the right" and then of "the left." In each parliament, several smaller parties have held 5 or more seats and, in some cases, have had an influence on coalition government policy. The smaller parties range from the ACT Party, which advocates more radical "monetarist" reforms than those already undertaken, to the Green Party, which has among its parliamentary members advocates for legalization of marijuana and environmentalists of various types.

Income tax is the largest source of revenue for the government, accounting for 46 percent of all taxes in 1998–99 (with an additional 5 percent withholding tax on interest and dividends). A Goods and Services Tax (GST) was instituted in 1996 and currently stands at 12.5 percent on virtually all goods and services; this tax contributed 26 percent of tax revenue. Company tax contributed only 12 percent to revenue in 1998–99 while the other 11 percent of tax came from various **duties**. There is a 3-layered income tax system, with income up to NZ$38,000 a year taxed at 19.5 percent, then income above this and up to NZ$60,000 taxed at 33 percent, and income above that is taxed at 39 percent. Companies are taxed at a flat rate of 33 percent.

INFRASTRUCTURE, POWER, AND COMMUNICATIONS

New Zealand's transport network is relatively modern. Of its 92,075 kilometers (57,086 miles) of roads, about 60 percent are paved, and over US$225 million was spent on road construction and maintenance in 1999. Most major cities and towns are linked by bus services and some by rail, but the private car is the predominant mode of transport. There are 3,973 kilometers (2,463 miles) of railways running the length of the country, although these now mostly carry freight rather than

SOURCE: World Bank. *World Development Indicators 2000.*

passengers. In North Island about 500 kilometers of the railway network is electrified. Large train/truck/car ferries link the North and South Islands with frequent services.

Throughout the country there are 111 airports, with 44 of these having paved runways. Domestic air services are predominantly provided by 2 airlines: Air New Zealand and Qantas New Zealand (which bought out Ansett New Zealand in 2001). Air New Zealand flies to at least 21 destinations in Australia, Asia, North America, Europe, and the Pacific Islands. In 2000, 24 international passenger airlines and at least 4 freight-only airlines flew into New Zealand. In addition to commercial flying, New Zealand is a global leader in the number of aviators per capita who pilot small, privately-owned aircraft: there is roughly 1 pilot for every 430 people, and 1 aircraft for every 1,170 people. At least 5 ports in the country can service large international shipping.

New Zealand's system of utilities is extensive and modern. Large hydroelectric dams, mainly in South Island, generate about 65 percent of electricity. Most of the rest is generated by fossil fuels, although 6 percent comes from geothermal plants, and small amounts from wind, wood, and biogas. Gas is piped from oilfields in the west of North Island, mostly to larger population centers.

The telephone system is modern and extensive with 96 percent of New Zealand households having a telephone in 1996. In 2000, about 30 percent of New Zealanders also had a cellular phone. As part of the privatization program of the 1980s, the telephone system was sold to a consortium of American companies. Currently, Telecom is the largest operator, but other companies have entered this very lucrative market.

In 1999 there were at least 80 Internet service providers in New Zealand and in the following year over 1 million Internet users; around 52 percent of the population had some sort of Internet access. In 2000 there were 46,000 .nz domain names, although some New Zealand websites also used generic names such as .com and .org.

ECONOMIC SECTORS

Despite its reputation as a country of primary production, the contribution of agriculture, fishing, and hunting to New Zealand's gross domestic product was only 8.4 percent in 1999. This proportion has been slowly declining since the early 1980s. The relative decline in industry has been even more dramatic, falling from 32.1 percent in 1975 to 23.2 percent of GDP in 1999. This has been partly a result of economic restructuring under which tariffs have been dramatically reduced on manufactured imports, but it also follows the trend in most industrialized countries away from manufacturing and other sectors in "industry" to services. However, the growth of the latter has not been great in relative terms in New Zealand. Services have increased only slightly from 45.3 percent in 1975 to 47.2 percent of GDP in 1999. Aspects of the economy which do not fit into the 3 service sector categories have increased the most over the last quarter century. These include gen-

eral government transactions and the increasing value of owner-occupied dwellings.

AGRICULTURE

New Zealand has been considered an agricultural country since the 19th century, when the introduction of refrigerated transport allowed its sheep and dairy industries to expand to provide the United Kingdom with meat, wool, butter, and other agricultural products. Throughout the 20th century agricultural imports have remained important to the New Zealand economy, contributing 50 percent of all export income in 1999. At the same time, with increasing mechanization and the rapid growth of other sectors, the proportion of the population working in agriculture (including fishing and forestry) declined steadily from about 37 percent in 1901 to 9.4 percent in 1999.

Pastoral farming involves the raising of sheep, cattle, and more recently other animals such as deer and goats. An often-heard statistic is that there are 20 sheep for every person in New Zealand, and this was true in 1981 when there were 80 million sheep on the land. As other types of farming have become popular, the number of sheep has declined to 45 million, so there are only about 12 sheep per person now. There are also about 5 million beef cattle, 4 million dairy cattle, and 1.2 million domestic deer. Sheep and beef meats comprised 12.5 percent of exports in 1999 and are processed at plants in various parts of the country for shipment to many parts of the world, notably Europe and North America, but also increasingly Asia. Wool is also an important export, and while Europe is the traditional destination for this export, increasing amounts are going to China for processing.

In terms of export income, dairy products have the highest value of agricultural products, making up 17 percent of exports in 1999. Dairy farms are found throughout the country, but certain areas are particularly well known as dairying areas, such as Waikato and Taranaki in North Island. The supply of fresh milk to New Zealanders explains the location of dairy farms near larger towns, but most dairy production is destined for international markets, and farms which produce for this market must locate wherever production conditions allow. There are a range of dairy products exported, but the most important are butter, cheese, and milk powders. The market for these products is wide; for example, in 1999 there were exports to all continents, with substantial quantities going to Latin America and Africa.

After pastoral farming, the next most important type of farming is horticulture, the growing of fruits and vegetables. New Zealand's climate is suitable for a large variety of fruit ranging from temperate fruit such as apples, pears, peaches, plums, and cherries, to subtropicals such as avocados, passionfruit, grapes, and kiwifruit, as well as many other citrus fruits. In terms of area planted and exports sales, the 2 most important of these in recent years have been apples and kiwifruit. The latter were rebranded from Chinese gooseberry when New Zealand producers started commercial production, and then controlled most of the world supply of this fruit in the early 1980s. Since that time, many other countries have started growing kiwifruit, and the New Zealand industry had a difficult time in the 1990s with problems of oversupply and low world prices (at least compared to the 1980s).

Another important and rapidly growing part of the horticultural industry is grape growing, especially for production of wine. Although wine has been produced in New Zealand for 150 years, the growth of the wine industry has been most dramatic in the last 20 years. The land area in grape production has steadily increased and the areas of production have diversified so that drinkable wine is now produced near the northern tip of the country as well as in the south-central area of South Island. Favored grape varieties include cabernet sauvignon, merlot, pinot noir, and chardonnay, but New Zealand has become best known for its sauvignon blanc. The most important destinations for New Zealand wine are the United Kingdom and Australia.

FORESTRY. Products based on the forestry industry, including logs, processed wood, wood pulp, and paper, make up just over 10 percent of exports by value. In the past, logging has taken place in the indigenous forests of New Zealand, but the depletion of these forests and the strong political support for their conservation have resulted in an end to this practice. The timber industry is

now centered on the exotic forests, mainly of pine, first planted during the depression of the 1930s, but much expanded from the 1970s onwards. The original planting was done by the state, but in recent years private companies have undertaken nearly all new planting. The largest forests are in the center of North Island, but smaller plantations are found in various parts of the country. The main destinations for forestry products are Australia, Japan, Korea, and the United States, and while a great deal of processing takes place in New Zealand, there is also a large trade in unprocessed logs.

FISHING. New Zealand has an **Exclusive Economic Zone** (EEZ) of 1.3 million square nautical miles, an area about 15 times its land mass (the EEZ extends 200 miles from the coast and is the area in which a country has rights to economic resources such as fish). However, in much of this area the waters are extremely deep and not suitable for many of the commercially significant fish species. Nevertheless, fishing is still an important industry accounting for about 5 percent of exports, as well as supplying the domestic market. Each year the government assesses the maximum sustainable yields of each major species and sets a quota which is divided up between those who hold quota rights. The fishing fleet is made up of foreign-based boats as well as those based in New Zealand, which process their catch within the country. The indigenous Maori have some traditional fishing rights which are separate from the quota system, but in recent years Maori corporations have also become important in the commercial industry, having bought a company which owns about one-third of the fishing quota. A growing part of the fishing industry more generally is aquaculture, especially the cultivation of salmon, greenshell mussels, and Pacific oysters.

INDUSTRY

MINING. There is a diverse range of minerals found in New Zealand, although minerals make up only about 3 percent of exports (not counting the export of aluminum; see below). Gold has been mined since the 19th century and there is a small but steady production, as well as of silver, which is usually associated with gold. The highest value mineral production is of iron and steel, processed from black ironsands on the west coast of North Island. A nearby smelter provides iron and steel for the domestic market as well as for export. At the southern tip of South Island is a large aluminum smelter which processes bauxite from Queensland using power from nearby hydroelectric stations. The output from this smelter accounted for 4.2 percent of exports in 1999.

MANUFACTURING. Manufacturing employed the full time equivalent of 234,220 people in 1999, but this number has fluctuated considerably through time. The processing of food products has been a significant part of manufacturing throughout the 20th century, but it was after World War II that many other types developed when the government placed high tariffs on most imports. As part of the economic restructuring from 1984 onwards, that process has been reversed with a rapid reduction in tariffs on most imported manufactured goods. Often these imported manufactures come from countries with low labor costs, and New Zealand manufacturing enterprises are not able to compete on the basis of price. In some cases New Zealand industries benefitted from lower input costs, although a considerable amount of the raw materials originated in the country, and there was little saving in the costs of production. This has resulted in the decline of some sectors such as clothing and footwear and the closure of the automotive assembly industry. The impacts on other sectors have varied. The processing of food has a comparative advantage related to the strength and diversity of agricultural production in New Zealand and the fact that most food processing takes place near a source of supply. Still there has been some restructuring of this sector related to technological changes and to changing company structures (e.g. the purchase of Watties Industries by the transnational company Heinz). New Zealand has established a reputation for the production of carpets, especially those made with high quality wool. Sectors supplying the construction industry have done well during the 1990s under conditions of rapid population growth, especially in the Auckland region. With its ongoing successes in international yachting, New Zealand is also establishing a reputation for the construction of both hi-tech sailing yachts and luxury leisure boats.

SERVICES

TOURISM. Consistent with a worldwide trend, tourism has been rapidly growing in New Zealand. In 1970, there were less than 200,000 visitors each year to New Zealand, but in 1999 this number surpassed 1.5 million. About half of these can be considered as tourists, the other half being involved with business, visiting friends and relatives and other activities (although even these are likely to be "partly tourists"). The economic impacts of tourism are great, although they are difficult to measure because tourism has an impact in many different economic sectors. In 1995 it was estimated that tourism provided about 58,000 full-time equivalent jobs directly and 60,000 indirectly. In the same year it brought in about NZ$4.3 billion (US$2.7 billion), more than all dairy exports (the largest agricultural export sector).

Tourism in New Zealand is based on a variety of attractions. Most generally the country is seen as having many natural assets, including mountains, subtropical forests, beautiful beaches, active volcanoes, geothermal pools, and geysers. Many also come to see the culture of

the indigenous Maori, which is expressed in many ways, including dance and art. As international tourism has become more competitive and diverse, tourists tend to demand a broad range of attractions, so dynamic urban spaces may also be seen to be part of the total tourist experience. Thus, for example, the waterfront village in Auckland built to host New Zealand's defense of the America's Cup has become an important part of the tourist infrastructure, as has the spectacular new national museum in Wellington, Te Papa. Other forms of tourism are also expanding. **Eco-tourists** come to watch whales and dolphins or simply to walk in the forests. New Zealand has also become well known for adventure tourism with such sports as bungee jumping, white water rafting, and hang-gliding.

FINANCIAL SERVICES. Since the economic restructuring which started in 1984, there has been considerable change in the financial sector. Most controls on the financial sector were removed and there has been a rapid growth in the money market since then, especially in relation to foreign exchange. New financial institutions entered the country, and foreign investment in the financial sector accelerated, as it did in other sectors. By 1999 there were 18 banks registered in New Zealand, only 1 of which was wholly New Zealand owned. About 70 percent of this foreign ownership was Australian. In 2001 the coalition government was set to introduce a state-owned enterprise "People's Bank" which would use the existing network of New Zealand Post outlets.

The Reserve Bank of New Zealand has several roles: 1) operating **monetary policy** to maintain price stability, 2) maintaining an efficient financial system, and 3) meeting currency needs. Thus, despite the distancing of the government from intervention in the financial system, the Reserve Bank may intervene to stabilize the currency or influence interest rates or the rate of **inflation**.

RETAIL. Wholesale and **retail** trade accounted for about 16 percent of GDP in 1999. During the 1990s the parts of the retail sector that grew most rapidly were food retailing, accommodation, hotels, liquor, cafes, restaurants, and takeaways. The 2 major factors in stimulating these sub-sectors were increases in tourist numbers and changing lifestyles among New Zealanders to favor more convenience foods, eating out, and diversity of food choice. These are trends common to other industrial countries. Other parts of the retail sector are also following international trends. The move to suburban shopping malls has taken place for several decades, but a relatively recent variation is the "mega-mall" with huge barn-like stores, each catering to a particular range of products (electronics, home furnishings, sports, etc.). At the same time, huge cut-price department stores have undercut traditional department stores. In New Zealand the most successful of these has been The Warehouse whose success is similar to that of Wal-Mart in the United States.

Another international trend experienced in New Zealand in the last 2 decades is international franchising. International brand names introduced during that period include McDonald's, Burger King, Pizza Hut, Starbucks, Planet Hollywood, Borders, and Body Shop. Of course, the same trend has occurred for specific product lines.

INTERNATIONAL TRADE

Over the years, New Zealand has tended to import more than it exports, but the trade imbalance is relatively small.

The major destinations of New Zealand's exports, in order of importance, are Australia, United States, Japan, United Kingdom, South Korea, Germany, and China. The products exported to each of these countries varies considerably. For example, there is a great contrast between Australia and United States. Since Australia produces many of the same agricultural products as New Zealand, the most important exports are manufactures such as machinery, textiles, and paper products, as well as wood and mineral fuels. Exports to the United States, however, are more agricultural: meat, dairy products, fish, fruit, and nuts, followed by specialized manufactures. There is a mixture of agricultural and manufactured products flowing to Japan, while to the United Kingdom the pattern is similar to the United States.

The sources of New Zealand's imports are similar to the export destinations: Australia, United States, Japan, China, Germany, and United Kingdom. From Australia, New Zealand imports products in many of the same categories as it exports, mainly fuels and manufactures. From the United States the most important imports are machinery, aircraft, plastics, and vehicles. More than half of the imports from Japan are of vehicles, with various types of machinery making most of the rest. Through the 1990s, as trade tariffs have been reduced, New Zealand's trade within Asian countries, especially China, has increased and is likely to increase further.

MONEY

A **floating exchange rate** was adopted in 1985 as part of the economic restructuring started the previous year. Before that time, the **exchange rate** was controlled in relation to a basket of currencies, and in 1984 it appeared that the New Zealand dollar was overvalued, since it was held at a value higher than was justified in terms of the country's trade and investment transactions. Through the 1990s the exchange rate has fluctuated, but from 1996 it has been steadily devalued against the American dollar, a process accelerated during 2000. The impact on the rate of inflation in the late 1990s was not as great as might be expected. One reason was that there was still a downward trend in the price of many manufactures, and many of these originated in countries whose currencies were also declining against the American dollar. Even for products originating in the United States, such as computer software, companies often kept prices down to remain competitive.

The New Zealand Stock Exchange is the only one in the country. At the beginning of 1999 there were 146 New Zealand companies and 83 overseas companies listed with the exchange. There are 3 types of stocks bought and sold on this exchange: company shares, bonds, and debentures and other loans, although the bulk of the trading is in the first of these.

POVERTY AND WEALTH

According to **United Nations Development Program**'s (UNDP) Human Development Indicator (HDI), New Zealand ranked 19th on the list of countries in terms of education, health, and the quality of life in 2001. This ranking is lower than it once was, but still definitely qualifies New Zealand as one of the world's "wealthy" countries. In terms of per capita GDP it is substantially below the American level, although between 1975 and 1998 **real GDP** per capita showed steady growth.

In the past, New Zealand has had a reputation as an equitable society because it was the first country in the world to give women the vote (1893), and it was one of the first to develop a welfare state, among other things. Yet a look at the income distribution in 1996 reveals that income is very unequally distributed, with the lowest 20 percent of income earners accounting for only 2.4 percent of all income, while the top 20 percent earned 51.8 percent, and the top 10 percent more than one-third of the total. A comparison of the data for 5 years earlier shows that in each of these last 2 categories the percentages have increased by nearly 5 percent (from 46.9 and 29.8 percent, respectively).

When gender differences are considered, it is shown that in the top 10 percent of income earners, only 22 percent are females. Although the equivalent comparison is not available by ethnicity, a comparison of median income is clear: men of European ethnic background earned 20 percent more than Maori men and 38 percent more than those of Pacific island origin.

Inequalities in income have existed for a very long time and result partly from large wage differences between professionals and managers on the one hand and unskilled laborers on the other. Minority ethnic groups and women tend to hold a disproportionate number of jobs in certain sectors, often those that are most vulnerable to economic change, such as seasonal work (e.g. fruit harvesting, food processing) and casual work (e.g. out-

work on clothing). In New Zealand the restructuring which took place after 1984 had a considerable impact on work patterns, with many becoming unemployed in the private sector as tariffs were lowered or **subsidies** withdrawn, and in the **public sector** as government services were reduced. In the late 1980s ethnic minorities in particular were affected, with unemployment rates 2 or 3 times the national average. Workers were also affected by changes in labor legislation which reduced the power of unions (see Working Conditions section). On the other hand, many investors made large profits in the recently deregulated finance sector.

WORKING CONDITIONS

Many of the reforms that resulted in a welfare state in New Zealand were brought into effect in the 1930s and again in the 1970s by the Labour Party, which was strongly supported by labor unions. This suggests that labor unions were quite powerful in some periods. However, as the economy became increasingly service-oriented the power of the traditional unions—associated with unskilled and semi-skilled workers—declined. In 1991, a new National Party (conservative) government brought in the Employment Contracts Act (ECA), which weakened the power of labor unions. In particular it abolished compulsory unionism in which, if a high proportion of workers in a workplace voted to have a union represent them, then all workers were obliged to join. It also made it more difficult to take strike action, restricted the rights of union representatives to enter a workplace, and instituted several other restrictions which ultimately weakened union power. Soon after the Labour Party was elected in 1999, new legislation, the Employment Relations Act, overturned some aspects of the ECA once again increasing the role of unions in the workplace.

Working conditions are regulated by several acts of parliament. The minimum wage in 2000 was NZ$7 an hour for adult workers and NZ$4.20 an hour for those aged 16 to 19. Minimum annual leave after 1 year of employment is 3 weeks, and there are 11 public holidays a year for which a worker must be paid if they fall on days which would otherwise be working days for them (Christmas and New Year's Day must be compensated regardless). The number of hours in the workweek are not legislated, but must be outlined as part of an employment contract; if nothing is explicitly stated in the contract, it defaults to a 40-hour workweek. Parental leave is available to either a mother or a father, and time periods vary according to particular conditions. Parental leave is currently unpaid, but under debate during 2001 is a more comprehensive system of paid parental leave.

COUNTRY HISTORY AND ECONOMIC DEVELOPMENT

1300 A.D. Evidence of human habitation on Aotearoa (New Zealand).

1642. Dutchman Tasman first European to sight "Staten Landt"; later renamed "Nieuw Zeeland."

1769. James Cook claims country for Great Britain.

1790s-1800s. Ongoing Maori-European (Pakeha) contacts: whaling, timber, spread of disease.

1840. Treaty of Waitangi between British Crown and many Maori chiefs cedes some political powers to British but maintains indigenous rights in perpetuity.

1860s. Land wars fought between Maori and British administration/settlers; Maori armed resistance ends in 1872 after loss of much land.

1882. First shipment of frozen meat to England.

1907. New Zealand becomes a dominion.

1914–18. World War I; New Zealand takes over Samoa from Germany.

1935. First Labour government elected; state housing program started.

1939–45. World War II; New Zealand troops in Africa, Europe, Pacific; bulk purchases of farm produce for war effort.

1950s. Manufacturing industry expands; Maori urbanization for employment; beginning of substantial Pacific immigration.

1960s. National government in power; open access to British market for farm products.

1972–75. Labour government in power.

1975–84. National government in power; New Zealand butter quotas set by European Commission; wage and price freeze.

1984–91. Labour government undertakes economic restructuring including reduction of tariffs, abolition of subsidies to agriculture, regions etc., privatization, reduction of government services.

1987. International and New Zealand stock market crash following period of much property speculation in New Zealand.

1991–99. National coalition government in power; Employment Contracts Act introduced; welfare benefits cut; further privatization.

1999. Labour-Alliance coalition government elected on reformed policies focusing on preservation of government services, more pro-labor stance.

FUTURE TRENDS

At the turn of the century there were mixed feelings about the economic future of New Zealand. The country has been quite successful in diversifying its agricultural base, and there is optimism that international trade **liberalization** will benefit producers who are efficient by world standards. There is an ongoing focus on identifying new niche markets whether they are in new varieties of wine, more exotic varieties of subtropical fruit, or in ostrich feathers. In the manufacturing sector there is ongoing concern about the degree to which New Zealand industries can compete with countries with low labor costs in Asia and elsewhere. Once again, there is some optimism that niche markets will boost manufacturing, with recent examples including carpet weaving and yacht construction. At the same time, there are regular reminders of the problems of global trade liberalization, with factories being closed or relocated to other countries which have lower rates of pay and government subsidies.

Further hope is found in the service sector. In particular, tourism is likely to continue to expand, although to some extent this may depend on the cost of international air travel. If airfares continue to decline in real terms as they have for some years, that will benefit New Zealand, distant as it is from major markets. However, if prices are increased substantially by fuel increases or the impact of global alliances, then New Zealand's tourism future may be more problematic. There have also been some successes in areas of high technology such as the software industry, and if New Zealand manages to fulfill its objective of achieving a "high knowledge" economy there are likely to be many other possibilities.

There are also areas of concern or even pessimism. For some, the socioeconomic inequalities which have increased during the period of economic restructuring are likely to increase under ongoing trade and investment liberalization. The restructuring has driven down wages for unskilled workers while at the same time provided large profits for investors in some sectors. The way in which these issues are resolved will depend on the economic and social policies of the new government.

DEPENDENCIES

New Zealand has no territories or colonies.

OMAN

Sultanate of Oman
Saltanat ‘Uman

CAPITAL: Muscat.

MONETARY UNIT: Omani riyal (OR). One OR equals 1,000 baiza. Coins are in denominations of 500, 250, 200, 100, 50, 25, 10, and 5 baiza. Paper currency comes in denominations of OR50, 20, 10, 5, and 1, as well as 500, 250, 200, and 100 baiza.

CHIEF EXPORTS: Petroleum, re-exports, fish, metals, and textiles.

CHIEF IMPORTS: Machinery and transport equipment, manufactured goods, food, livestock, and lubricants.

GROSS DOMESTIC PRODUCT: US$19.6 billion (purchasing power parity, 1999 est.).

BALANCE OF TRADE: **Exports:** US$7.63 billion (f.o.b., 1997 est.). **Imports:** US$5.682 billion (f.o.b., 1997 est.).

COUNTRY OVERVIEW

LOCATION AND SIZE. The Sultanate of Oman borders the Arabian Sea, the Gulf of Oman, and the Persian Gulf and shares borders with Yemen, the United Arab Emirates, and Saudi Arabia. Oman has an area of 212,460 square kilometers (82,030 square miles) and a coastline that totals 2,092 kilometers (1,299 miles). Comparatively, Oman occupies an area slightly smaller than Kansas. Muscat, Oman's capital, is located on the country's northeastern coastline.

POPULATION. In July 2000 the population of Oman was estimated at 2,533,389, of whom 2,006,311 were Omani and 527,078 were non-Omani. Large expatriate communities (communities of foreigners who have left their own country to live and work abroad) are very common in the Gulf countries on account of the oil and services industries. In Oman many unskilled expatriates from Asia are employed to carry out menial jobs, although this community has been declining slowly since 1996. The Omani population increases on average by 2.7 percent a year and, as a result, the country has a very young population. Some 47 percent of Omanis are under the age of 20 compared to only 4 percent who are over the age of 60. In 2000 the birth rate stood at 38.08 births per 1,000 population, while the death rate stood at 4.16 per 1,000. With a projected annual population growth rate of 3.46 percent, the population is expected to reach 3,848,217 by the year 2015.

The majority of the Omani population is Sunni Muslim, but a substantial number of people—including the ruling family—follow Ibahism, an offshoot of Shia Islam. Given Oman's long trading history, its population is a mixture of different races and even one of its most prominent mercantile families is of Hindu descent. Oman was a hub for the slave trade in the 18th and 19th century and although this practice was abolished in the 20th century, many continue to work for the families that previously owned their ancestors.

Employment in Oman is largely dependent on nationality. In the **public sector**, Omanis held 70 percent of the jobs in 1999, while in the **private sector**—which contains most of the lower-paying jobs—90 percent of the employees were from foreign countries. Rising unemployment in Oman has forced the government to realize that it can no longer pursue its policy of guaranteeing jobs to young Omanis entering the labor market and it is now focusing on increasing employment opportunities for Omanis in the private sector. Oman has seen a dramatic migration of people to the cities in search of better jobs; the largest proportion of the population is found in the capital city Muscat and in the larger northern towns of Suhar, Nizwa, and Sur.

OVERVIEW OF ECONOMY

Historically, Oman has been a gateway for trade between Asia and the Middle East. Its capital, Muscat, is

the country's most developed city as well as the center of economic activity, thanks to its coastal location. The strategic Musandam peninsula gives Oman control over the land adjacent to the vital Strait of Hormuz, through which a majority of the world's oil passes. Oil is the most important factor in the Omani economy and it is the oil industry that is the catalyst for growth in **gross domestic product** (GDP). GDP growth averaged 4.4 percent between 1993 and 1996, reached 6.2 percent in 1997, and fell to 2.9 percent in 1998 due to the crash in global oil prices. Crude oil has accounted for over 30 percent of Oman's GDP since 1980. Oman differs from other Gulf countries such as Saudi Arabia and the United Arab Emirates in that its reserves of oil are difficult to extract from the ground, limited in quantity, and predicted to run out in 17 years. Given that the oil industry is not labor intensive, the population in the Sultanate is growing rapidly, and the public sector is over-staffed, there is a serious unemployment problem in the country. However, the government has never released any unemployment statistics and no credible estimates have been made since 1995 due to international skepticism about the official population figures.

Oman is a free market economy, but the government is at present the most important factor in the economy, both as an employer and as a purchaser of goods and services. The Omani economy has been growing steadily over the last 25 years and considerable development has taken place. However, with the fluctuations in the global price of oil, an oil industry that will soon be negligible, massive investments made in **infrastructure**, and hence shrinking **foreign exchange reserves**, there is a pressing need to diversify the economy. It is especially important to expand the sources of export earnings as well as to provide jobs for a growing population. These 2 goals form the basis of Oman's policy initiatives. The government has encouraged private domestic and foreign investors to take the lead in promoting these initiatives, and a period of structural transformation from primary to manufactured exports has begun. In the late 1980s the government's commitment to economic diversification coincided with the discovery of abundant natural gas and since this time, drilling sites for both gas and oil are to be found all over the country. The Omani government has announced that it intends to implement a 5-year plan (2001–2006) in order to address these important challenges. In addition, policymakers will also have to focus on Oman's membership in the World Trade Organization (WTO). This will expose the country to even more foreign competition.

Political parties in Oman are not legal, but the major trading families who control the bulk of the country's trade and industry are very powerful groups and are represented in the government. In 1998 Oman received US$509,100,000 in official development assistance, the largest portion of which came from the United Kingdom, a country with which Oman enjoys strong ties. Oman also has a good relationship with the European Union and much improved relations with the United States; its main trading partners are Japan and China. The economy's main exports are oil, live animals, animal products, textiles, base metals, and mineral products. Before the discovery of oil in the 1960s, the Omani economy was dependent on agriculture, however, in 1999 this sector accounted for 2 percent of GDP due to the lack of water supply. Nevertheless, it still employs a large number of people along the northern coast and in the south.

POLITICS, GOVERNMENT, AND TAXATION

Oman has been ruled by the Royal Al Bu Sa'id family since the 18th century. Political parties are not allowed in the country and there are no directly elected representatives. The current sultan, Qaboos Bin Sa'id Al Sa'id, overthrew his father in a palace coup in 1970 and seized the throne. Although the family has traditionally ruled over all state affairs, the new sultan has been careful to balance tribal, ethnic, and regional interests and as a result he has placed several tribal leaders in the government. In 1991 the sultan established the 59-seat Consultative Council, or Majlis Ash-Shura, to act as a consultative body, thus allowing a limited form of political expression. The government selects council members from lists of nominees proposed by each of the 59 wilayats (regions). Nevertheless, the country is an absolute hereditary monarchy and the sultan still rules by royal decree. He can appoint and fire all council ministers as well as ministers in the defense department, the department of foreign affairs, and the department of finance.

Oman did not have a constitution until 1996, when the sultan promulgated (proclaimed) the "Basic Law" by decree. This basic law clarifies the royal succession, provides for a prime minister, bars ministers from holding interests in companies doing business with the government, establishes a **bicameral** legislature, and guarantees basic civil liberties for Omani citizens. The legislature has no power to overturn the sultan's wishes. Its role has been purposefully ill-defined so as to render it a fairly ineffective body. The state promises to provide health care and education for all citizens as well as maintain security through the use of the army. Basic freedoms such as freedom of the press are touched upon, however, they are not clearly defined and are still very restricted. The Omani legal system is based both on English common law and Islamic law. The ultimate authority in law remains the sultan and he has not yet accepted compulsory jurisdiction of the International Court of Justice (this institution has its seat in The Hague and is the principal judicial organ of the United Nations).

The major source of government revenue does not come from taxation but from oil revenues. The only **direct taxes** in Oman are **income tax** (which ranges from 15 to 45 percent) and some regional taxes; the only **indirect tax** is customs **duty**. There are 5 percent taxes on hotel and restaurant bills, a 2 percent tax on electricity bills exceeding OR50. Oman makes no distinction between resident and non-resident companies. If a company has income from Oman that requires occasional visits to the Sultanate, the income will be considered taxable. Tax rates on non-petroleum, foreign-owned firms were lowered in October 1996 for all except those firms with greater than 90 percent foreign ownership. The nature of the relationship between the petroleum companies and the government will often govern taxation and royalties on petroleum producers. Labor law and the Oman tax law also affects a foreigner's ability to do business in Oman. There is no complete body of regulations codifying these laws and many government decisions are made on an ad hoc basis.

INFRASTRUCTURE, POWER, AND COMMUNICATIONS

Due to the large-scale program of road construction carried out by the Ministry of Communications over the past 3 decades, there are now approximately 6,000 kilometers (3,720 miles) of paved roads and 24,000 kilometers (14,880 miles) of unpaved roads in Oman. In 1970 there were only 10 kilometers (6 miles) of paved roads and about 1,700 kilometers (1,054 miles) of unpaved road in the entire country. The number of licensed automobiles on the road increased from 261,627 in 1992 to 404,375 in 1998 and this increase in traffic also led to an increase in the number of road deaths from 218 in 1992 to 478 in 1998. Oman does not have a rail system.

The country's main airport, Muscat Seeb International, has a capacity of 1.3 million passengers. The

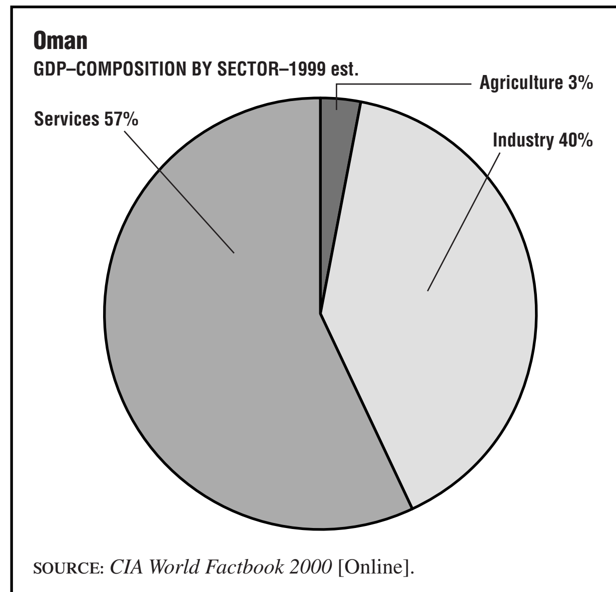
airport has been fully modernized and boasts duty-free shopping areas, impressive lounges, and large transit areas. The main runway has been extended to 3,585 meters (11,760 feet) and the passenger terminals have been expanded to handle 3,000 passengers an hour. In 1995 the total number of passengers passing through Seeb International airport amounted to 2,176,033. Salalah, the country's second airport, which was built initially as a military installation, began operating a passenger terminal in 1986 and the main runway was extended in 1992. Oman now has 6 civil airports in total at Seeb, Salalah, Sur, Masirah, Khasab, and Diba in Musandam. The country's main port is Mina Sultan Qaboos, which was completed in 1974 with a capacity to handle 2.2 million tons annually. Many improvements have since been made, including dredging the harbor entrance to a depth of 13 meters (42 feet). The second-largest port is called Mina Raysut and it is this port that serves Salalah and the Governorate of Dhofar. The construction of a third port in Suhar started in 1999 and the project is expected to cost US$250 million.

Electrical power in Oman is supplied both by the public sector and by the private sector. In 1999 the total national production amounted to 5.2 billion kilowatt hours (kWh) with consumption reaching 4.9 billion kWh. In 1999 there were 31 power stations with a total installed capacity of 1,662 megawatts. The government-owned General Telecommunications Organization (GTO) was established in 1980 and was responsible for setting up the modern telephone system throughout the country. Thirty years ago there were only 500 lines in and around the capital and international telephone calls could be made only through radio channels. As of 1998, all the telephone exchanges became digital and one can now telephone all over the world. Oman has an overall telephone capacity of 420,000 lines, both fixed and mobile, and given the widespread use of the telephone, it is estimated that Oman will need about 500,000 telephone lines by the year 2020, which will require massive investment.

ECONOMIC SECTORS

The Omani economy is a diverse one with services contributing 57 percent of GDP and industry contributing approximately 40 percent. However, over the past 40 years there has been a major shift in the structure of the economy. In the 1950s and 1960s, when the oil fields had not yet been discovered, the agricultural sector drove the economy. This sector has diminished in importance since the early 1970s, representing only 3 percent of GDP in 1999, whereas the export of oil and petroleum-related products and the manufacturing of goods such as textiles has increased. The sector's output is heavily dependent upon the weather, and accurate figures on employment in agriculture remain unknown.



SOURCE: *CIA World Factbook 2000* [Online].

AGRICULTURE

Prior to the discovery of oil in the 1960s, the agricultural sector was central in the Omani economy. However, in 1999 the sector contributed only 3 percent to GDP and was heavily subsidized by the government. Oman is not self-sufficient in food and in 1995 the country spent US$572 million on food and live animals. This figure rose to US$650 million in 1999. There are efforts underway to develop self-sufficiency in staple foods. The main crops grown in Oman are tomatoes, eggplant, dates, bananas, limes, and carrots. The principal agricultural area is found along the Batinah coast, in the northeast between Muscat and Diba al-Hisn, which accounts for about half the total crop area of approximately 101,000 acres. In the south, agriculture is centered on a small coastal plain that is fed by monsoon rain coming from the Indian Ocean. In spite of its small contribution to GDP, the agricultural sector is still a major employer. In 1994, the World Bank estimated that over half the Omani **labor force** was working in the agricultural sector. The Omani government reports that a total of 140,000 people are employed permanently in this sector and that 47,000 of these people are unpaid family workers. Agricultural employees are primarily of Omani descent.

Oman is famed for producing very high quality agricultural goods and the highest quality products are usually exported to the neighboring Gulf Cooperation Council (GCC) countries. (On 26 May 1981 an agreement was signed between the 6 conservative monarchies of the Gulf: Saudi Arabia, Bahrain, United Arab Emirates, Kuwait, Oman, and Qatar to coordinate their economic, political, cultural, and security policy.) However, the agricultural farm is threatened by many problems, in-

cluding outdated technology and an increase in the salinity of the water. The government has responded to these issues by investing more into the sector. Its goal is to obtain self-sufficiency in food production by improving agricultural conditions. In working to make the agricultural sector internationally competitive, the government has introduced incentives for foreign investors. These exemptions include tax reductions, utilities discounts, loans, and **tariff** protection. The government has also helped Omani firms in exporting their products.

FISHING. With 2,092 kilometers (1,297 miles) of coastline running from the mouth of the Gulf in the north to the border with Yemen in the south, Oman has very rich fishing potential which has yet to be fully developed. There is a 200-mile **exclusive economic zone** which extends from Oman out to sea and over 150 species of fish and crustaceans have been identified in Omani waters ranging from tuna and crayfish to lobster and shrimp. Large amounts of lobsters are caught off the Masirah islands and off the coast of Dhofar, and they are exported to Saudi Arabia and the United Arab Emirates where they are in great demand. In 1998, approximately 26,940 Omanis were employed in the fishing industry and a total of 116,780 tons of fish were caught. The number of fish caught per annum has been slowly declining over the past 20 years due to pollution and the depletion of fish stocks. In response to this, the Omani government has put restrictions on the amount of fish catches. Lobster may now be harvested only twice a year. The annual fish catch remains at over 100,000 tons per year, and efforts to produce **value-added**, manufactured fish products are underway. Processing and packaging for export are key concerns, as is the use of better technology at sea.

IRRIGATION. Oman's position in a semi-arid climatic zone results in the serious problem of water scarcity. The government has been pursuing programs of improved water efficiency and water resource development and some far-reaching legislation has been passed through the government. In 1999 there were 48 dams all over the country that collect rainwater as well as a major project underway to decrease water consumption through the use of water-saving devices on taps. The government has also initiated a plan for the supply of water to Muscat up until 2010 that involves extending the existing pipelines. Two additional reservoirs have been built around Muscat at a cost of US$3 million.

INDUSTRY

OIL. Similar to many of the Gulf countries, the Omani industrial sector makes up a large proportion of GDP, accounting for 40 percent of it in 1999. However, Oman is not a typical Persian Gulf oil producer due to its small, scattered oil fields and, as a result, production costs are much higher per barrel than those in other GCC countries. The average Omani oil field produces one-tenth the volume per well that Saudi Arabia or Iran produce. Oil was not discovered in commercial amounts until 1962, much later than most oil-producing Gulf states. Oman is not a member of the Organization of Petroleum Exporting Countries (OPEC). (OPEC is an international organization of 11 developing countries which are heavily reliant on oil revenues as their main source of income. The current members are Algeria, Indonesia, Iran, Iraq, Kuwait, Libya, Nigeria, Qatar, Saudi Arabia, the United Arab Emirates, and Venezuela.) However, in the past Oman has cut production in co-operation with OPEC in an attempt to raise prices. Oman's oil production has wavered between 910,000 barrels a day (b/d) and 890,000 b/d since April 1999. The Omani government has announced a new 5-year plan which is to run from 2001 to 2005 and which aims to increase production to 1 million b/d. The bulk of Oman's 5.28 billion barrels in proven reserves is situated in the north and in the center of the country. In the north the largest fields are Yibal, Natih, Fahud, al-Huwaisah, and Lekhwair. The largest field is Yibal, producing 180,000 b/d and, together, these fields produce half of the total Omani oil production. The crude oil produced in the north is mainly light or medium crude and is found alongside natural gas. The oil fields further south tend to produce heavier crude and are usually not associated with natural gas.

With oil reserves amounting to 5.28 billion barrels, Oman has a further 17-year supply of oil if it continues to produce at 910,000 b/d. Since the discovery of oil, the oil and gas industry has been the catalyst of growth for the Omani economy, contributing approximately 37 percent to GDP each year and as much as 55 percent of GDP up until the early 1980s. In addition, oil provides 75.3 percent of state revenues. The oil industry is largely run by Petroleum Development Oman (PDO) which has a government majority ownership. PDO controls 90 percent of the country's output. Shell owns 34 percent of the company and operates the majority of Oman's large fields. In 1999, Oman exported 95.8 million barrels of oil to Japan, 65.6 million barrels to Thailand, 55.9 million barrels to South Korea, and 39.4 million barrels to China.

GAS. The gas sector in Oman is considered to be the cornerstone of the government's economic growth strategy and great efforts have been made to turn natural gas into a thriving export industry. There are abundant gas reserves in Oman and 1999 estimates put the proven reserves at 29.28 trillion cubic feet (tcf). The government has projected that by the year 2002 natural gas will contribute 15 percent of GDP. Most of the gas reserves are located in areas that are controlled by PDO. Oman has entered into a number of projects with overseas companies such as Gulfstream resources of Canada and Neste Oy of

Finland to develop, explore, and produce natural gas in the northern part of the country.

MANUFACTURING. Following the discovery of large gas deposits, attention moved away from the manufacturing industry and in 1999, manufacturing contributed 5 percent to GDP. Most of the country's industrial enterprises are involved in light industry. Existing companies manufacture soft drinks, textiles, perfume, and cement. The sector grew by 3 percent between 1994 and 1998, but it relies heavily on skilled expatriate labor and therefore does not contribute much to the creation of local jobs.

SERVICES

TOURISM. Evidence of Oman's rich cultural and architectural heritage can be seen in its hundreds of historic sites and its many beautiful beaches. The country's varied geography and range of climatic conditions give it enormous potential in the tourism industry, a sector which is still very undeveloped. Given Oman's current unemployment problem, combined with the thousands of young Omanis entering the workforce every year, the expansion of the tourism sector could create much-needed jobs. The government initiated a 15-year tourism plan in 1990, easing visa restrictions in order to open up the country to more tourists, and very quickly the number of visitors rose from 290,000 in 1994 to 503,000 in 1999.

In 2000, tourism represented less than 1 percent of GDP even though there was an 11 percent increase in the number of visitors between 1988 and 1992. In 1994 there were only 37 hotels in Oman and in 2000 there were 89. The government has made an attempt to attract visitors from the Gulf region, signing an agreement with Dubai whereby nationals of both countries can easily obtain visas. However, the government's plan is to attract affluent European visitors to the country who are happy to take supervised coach tours instead of exploring the country on their own. Government concerns about local sensitivities as well as the continuing high tax on alcohol serve as major constraints to the growth of this potentially lucrative industry.

FINANCIAL SERVICES. The Omani government has made serious attempts to ensure the stability of the banking sector and in 2000 there were 16 commercial banks in the country, of which 9 were branches of foreign banks. In addition to the commercial banks, the government has set up 2 credit institutions that provide small loans for Omani citizens. The Omani Housing Bank provides loans to finance the construction of homes and the Oman Development Bank provides general **microcredit**. The Central Bank of Oman places restrictions on the amount of foreign exchange that banks are allowed to lend and invest and in addition sets the total amount of capital to be held by local banks at US$26 million and by foreign banks at US$9 million.

Oman's stock exchange was established in 1989 and is called the Muscat Securities Market (MSM). There are over 100 banks and companies listed on the exchange with a current capitalization of over US$2 billion. In 1999 Oman was included in the International Finance Corporation's **emerging market** index and the government has made concerted efforts to make the stock market more transparent and more regulated. Electronic trading was introduced in 1999 as well as a regulatory agency called the Capital Markets Authority (CMA).

INTERNATIONAL TRADE

In 1999, Oman's exports amounted to US$7.2 billion and its imports were valued at US$5.4 billion. The country's principal export is oil and in 1999 the commodity accounted for 76 percent of all exports. In the 1980s, however, oil accounted for over 90 percent but its share has declined due to the falling price of crude oil. The second major export in Oman is **re-exports** which totaled US$1.3 billion in 1999. Given that the Omani economy is not very diversified, the smallest proportion of exports is non-oil exports such as foodstuffs and animal products. These accounted for 35 percent of total non-oil Omani exports in 1999. In 1999 the principle importer of Omani crude oil was Japan. Japan imported a total of 95.8 million barrels followed by Thailand, which imported 65.6 million barrels.

Oman has slowly increased its production of crude oil and as a result the country has enjoyed **trade surpluses** throughout the last decade even though it has increased its imports. Nevertheless, the size of these surpluses varies considerably from year to year due to the world prices of crude oil. When Iraq invaded Kuwait in 1990 the price of oil increased substantially and that year Oman's trade surplus amounted to US$2.9 billion. However, when world oil prices fell drastically in 1998, Oman's surplus fell to just US$291 million. In 1993 the

Trade (expressed in billions of US$): Oman

	Exports	Imports
1975	1.044	.765
1980	2.386	1.732
1985	4.705	3.153
1990	5.508	2.681
1995	5.962	4.248
1998	N/A	5.682

SOURCE: International Monetary Fund. *International Financial Statistics Yearbook 1999.*

surplus stood at US$1.3 billion and in 1996 the rise in the price of crude oil pushed it up to US$3 billion.

Over the past 30 years, Oman has come to rely more and more on imports because it has a very small industrial sector and an agricultural sector that is unable to meet the demand for the variety and quantity of food that the middle- and upper-class Omanis desire. Imports of food amounted to 14 percent of the total value of imports in 1999. The bulk of imports come from the United Arab Emirates and Japan, representing 26.3 percent and 15.8 percent of all imports, respectively. Major Omani imports include food and live animals, beverages and tobacco, crude materials, and minerals. In 1999, Oman's imports totaled US$4.67 billion. Oman's main trading partners are Japan, China, Thailand, South Korea, the United Arab Emirates, and the United States.

In October 2000 the General Council of the World Trade Organization approved Omani membership and in November Oman became the 139th member. Prior to its accession, Oman had to make several changes in order to conform to WTO's membership rules. Not only did the authorities have to agree upon a custom duty ceiling, allow foreign firms with under 70 percent foreign ownership to be taxed the same rates as Omani firms, but also it had to establish intellectual property rights. The consequence of this new membership will open up the Omani markets further and expose local companies to increased competition. By 2003, Oman is required to allow fully foreign-owned computer companies, banks, and insurance companies to operate within the country.

MONEY

Due to the small size of the Omani economy, the country's **monetary policy** is quite straightforward. The goal of the Omani Central Bank is to maintain a stable riyal so that the economy can function competitively abroad. The riyal has been pegged to the dollar since 1973. In 1986 the riyal was devalued by 10.2 percent and since then it has been stable at about US$2.60 to 1 riyal. All the money flowing into the economy is regulated by the Central Bank of Oman. The central bank also regulates the commercial banks through a variety of measures.

POVERTY AND WEALTH
