This is not to say that Canadian social concern for religion is more "European," since Canadians join with their American confreres in churches and religious organizations in roughly the same proportion. The Canadian Institute of Public Opinion reported in 1974 that 39 percent of Canadian adults attended church weekly, a figure that compares favorably with 42 percent of American adults. The 1972 Gallup Poll, which provided the American figure, also indicated that this percentage was higher than in Switzerland, Greece, and Germany, and significantly higher than in the Scandinavian countries. Statistics indicate that in 2001, 77.1 percent of Canadians identified themselves as Christian, while 76.5 percent of Americans were similarly self-identified.

However, joining may not indicate much about affiliation, and church attendance, once used by scholars to determine Canadians' religiosity, must now be replaced by more representative instruments: The most recent study of religion arising out of the 2001 census indicates continuing decline of church attendance and rise of nonaffiliation. According to Warren Clark and Grant Schellenberg, in their 2006 survey discussed in *Canadian Social Trends*, adults with no affiliation or who do not attend religious services increased from 31 percent to 43 percent between 1985 and 2004; no affiliation increased from 12 percent to 19 percent. This compares with Barry Kosmin, Egon Mayer, and Ariela Keysar's 2001 survey in the United States, "American Religious Identification Survey (ARIS), which found that 14.1 percent specified "no religion." Furthermore, recently there has been considerable divergence of opinion toward religion by Canadian-born and immigrant communities, with the percentage of those Canadian-born respondents reporting no affiliation rising from 33 percent in 1985 to 48 percent in 2004, while immigrant religious affiliation remained constant. This suggests that with the significant increase in immigration into Canada since 1985, religious values may likewise reflect greater diversity. Jack Jedwab, from the Canadian Studies Association, predicts that Canadian religion will change dramatically over the next five years; the Muslim population alone likely will increase by 160 percent according to his calculations (www.acs-aec.ca/oldsite/Polls/30-03-2005.pdf). To this feature of Canada must now be added the extraordinary rise of private religion. Of those who reported no regular attendance at religious services, 37 percent indicated that they practiced some form of religious activity on a weekly basis.

Still, numerical values may not indicate all dimensions of religiosity in a country; this is certainly the case in Canada. Diversity and pluralism have all along played a key role in the country's makeup, but the numbers tell of a more conservative organizational norm: Although Canadian institutional religion is pluralistic, it has an establishment character. Catholics in Canada make up over 50 percent of those who self-identify as Christian, and three churches—the United, Anglican, and Presbyterian—currently represent about 62 percent of Protestants. Canadian church polity reflects the centralizing tendencies: None of the major institutions is congregational, and the United Church of Canada, while it is the country's largest Protestant denomination and itself formed by corporate union, is far more centralized than, for example, either the Methodist or the Baptist church in the United States.

One way in which pluralism has developed in Canada has been through the key role that the church has always played in the immigration process—by being there as receiver of the homesteaders and by providing whole groups for homesteading. In the former, right from the founding of Canada the church was present to shape cultural developments; in the latter, the radiation from center to periphery has continued to exercise a restraining influence on divisions, with smaller groups following the model of centralized bureaucracy so evident in the larger institutions. Thus pluralistic religion became a feature in the very founding of the nation through the religious groups that were just transported en masse to Canada and encouraged to set up shop there. Both tended to eschew schisms.

In a peculiar way, the conflicts between the French and English have assured an establishment mentality in Canada. When the company of New France was granted the charter in 1627, all colonists were required to be Roman Catholic, even though France had a sizable religious minority in the Huguenots. It was partially this traditional homogeneity in New France that allowed the Roman Catholic hierarchy to support Confederation, as one way of preventing a feared annexation by the United States; and the creation of provinces (including the two most populous, Ontario and Quebec) was a tacit recognition of the counterbalance of Catholic Quebec and Protestant Ontario. The autonomy in cultural and educational matters in Quebec granted to the Roman Catholic hierarchy in exchange for its support for Confederation has guaranteed a self-confident church, which in turn has allowed it to influence public policy and initiate debate across denominational and provincial lines.

While this balance of religious forces might have provided Canada with positive elements for discourse across diversity in the early decades, this did not occur. Rather, a pluralism of viewpoints was reinforced. In fact, from the early days a tone of rancor and competition prevailed and played a role in the mission enterprises and immigration reactions of the churches in the developing West. Protestants looked to it as an arena to extend the Reformation heritage, and Catholics saw it as the logical extension of the church in Quebec. The French hierarchy supported the French language and culture as a means of maintaining the dominance of the Catholic vision in Canada, while Protestant groups labored vigorously so their dreams would not take second place. The one positive result not immediately evident was that settlement on the prairies was intimately tied to the “national” church, in direct contrast with the situation in the United States, where individuals and sects looked to western settlement for religious and personal freedom. Because of these characteristics, it must be recognized that organized religion asserted far more than a voluntary role in the shaping of the Canadian experience.

Another way that pluralism triumphed was through a cluster of ideological concerns with religious dimensions. Some of these concerns were connected with the mission of the church to the masses of immigrants. More than one church official saw the Christianizing of the nation as a necessary ingredient in civilizing it. The church, whether Catholic or Protestant, developed energetic mission programs, at the heart of which was the conviction that moral fiber and strong character were essential in building up the kingdom of God. Such a mission was to blossom mightily during the nineteenth century, when Catholic orders and Protestant mission groups set their sights on continuing the great values of Christian tradition in the new nation of Canada. These two religious orientations differed significantly in the definition of the mission—the ultramontanists of Quebec would look to a strong hierarchy, almost medieval in ideal, from the local parish through the archbishops to the Holy Father in Rome, while the most aggressive Protestants, the Methodists and the Baptists, would brandish millennial visions and actively fight against alcohol and other social vices in their effort to bring about the morally upright Canada of their hopes. Yet both Catholics and Protestants wanted legislation to reflect their concepts, and in many cases government was shaped by their concerns. Ultimately social activism embodied in legislation was to secularize the mission legacy of the churches, giving Canadian

governments the appearance of both liberalism and community sensitivity. Especially among Protestants, the moral responsibility built into missions would translate into the material and cultural development of the nation when the original message had withered and died.

This focus on community over the individual has made the Canadian experience far less schismatic and particularist than the American experience; Canada's wild West was very dull indeed when compared with that of its southern neighbor. The Northwest Mounted Police were already there before the settlers arrived, and the sense of extending tradition in a hostile environment applied not only to religion but also to law. Since some of the greatest conflicts were between groups within a religious tradition, the law mediated for them. Because law was held to embody the moral dimensions of society, it transmuted into a kind of supra-value-system for all. Respect for law remains one of the chief traits on which Canadians pride themselves, despite the rapid rise of crime in cities.

Loyalties to community and law have had their impact in turn on the religious life. No authentically Canadian religious group has sprung up. A number of movements and revivals have influenced the whole, but no new group has appeared as a genuinely Canadian religion. Canada's best-known evangelist, Aimee Semple McPherson, did not remain in her homeland but found her greatest success in Los Angeles. Individual initiative in a number of areas always seemed to run counter to the prevailing spirit of the country, with the result that Canada is lauded for its stability and conservatism while being chastised for its reluctance to risk and its resistance to difference. Conversion to a new or radical group is not effectively salable in Canada—only sixty-one groups are noted in the 2001 census of identifiable Christians—in contrast, the United States must have several hundred.

Then, too, religion has not sparked any equivalent of "Manifest Destiny." No religious group has linked its identity with Canada as a nation, and religionists have been far less concerned with the fact of Canada's existence than with its character. Since the inculcated values were the finest from the past, Canada was no "lively experiment." The spiritual patriotism that marks the church in the United States is absent in Canada, and the messianic mythology underlying the Union is exclusive to that domain. The church in Canada has been excited by national achievements, such as construction of the national railway system, but it has scarcely presented the country with a definite

answer as to whether Canada has any destiny, let alone one clear and manifest. The result is that participation in a local religious organization does not provide the average Canadian with an entrée into national identity and seldom links him or her with fellow Canadians in a common national symbol-system. The qualifier *seldom* is deliberate. The Roman Catholic Church may for some Canadians represent that system, while for others it is the United Church. By acknowledging its pluralism legally, however, and by firmly holding to ethnic and racial differences, Canada has effectively moved religion out of national identity. This does not mean that there is no religious dimension to Canadian identity, but that it may be of a diffuse and ambiguous nature. Nevertheless, some aspects of Canadian culture have religious dimensions, and these do foster a kind of civil religion.

Canadian "Civil Religion"

The most evident example of Canadian civil religion is in the province of Quebec. Quebec society has so embodied a vision of French culture in North America, and has given it form and substance through state festivals, legendary heroes, and popular epics, that elements of a grand destiny appear. This collective direction has continued to play an effective role, even when the province became far more ethnically divided and certainly more secular than in the ultramontane days of New France. It has continued to shape public opinion in the conflict between Quebec and the federal government and the other provinces, ultimately giving birth to the Parti Québécois and the Bloc Québécois, with their separatist agendas.

If, as some have contended, Protestant civic piety is one meaning of civil religion, then the other provinces have had their own form. Even when immigration has brought non-Christian traditions, the mores and customs take on a Protestant civic coloring. Some provinces, such as Alberta, mindful of the serious problems that prejudice and lack of communication between various social groups can have, have instituted major curriculum reforms with a view to incorporating more values in the educational diet. The very will to do this indicates a transorganizational ethic and a certain concept of what Canadians "should be" that harks back to the nation-building images of the missionaries of an earlier time. It also reflects a Canadian identity transcending sectarian consciousness.

If Canadians live in isolated communities strung out along the U.S. border, and if they relate primarily through

local group consciousness, one way they are held together is by a collective response to their natural environment (the following poem fragment by F.R. Scott, "Laurentian Shield," from *Events and Signals* [1954]):

Hidden in wonder and snow, or sudden with
summer,
This land stares at the sun in a huge silence
Endlessly articulating something we cannot hear.

The image of the land is not always depicted as so alien. Jacques Cartier went to great lengths to describe it as a "new earth," deliberately drawing on Christian allusions. The prolific writings of the Jesuits present a land of natural paradisaical dimensions. Even today, with all the scientific knowledge of the northern lights, people are overwhelmed by their dramatic and brilliant display on a cold winter's night, and poets and thinkers have etched the experience in the public's imagination. Thus it is certainly impossible on the basis of artistic and literary traditions to talk of "being Canadian" without noting the connectedness of identity with the land. By extension, the "land" has also been linked to weather: Canada was the land of constant engagement with cold—it tied the country together. A byproduct of the cold is hockey; the sport often overrides the fragmentation of a huge land by uniting disparate sections around the arena. In prairie towns the arena stands out as the largest building in the community, and it dominates the skyline, far beyond any church building. Secularists insist it reflects a much more tangible Canadian religion than Christianity.

If the land is so multivalent and perhaps awe inspiring, the human response posed by experiencing it is fairly simple and straightforward: one is lost. George Grant's *Lament for a Nation: The Defeat of Canadian Nationalism* is famous for the description of what happens to loyalty to Canada in the wake of a liberalism bent on fulfilling its individual entrepreneurial goals regardless of the cost. The result is a book moving for its sense of loss.

Other writers have attributed the loss not so much to the awe-inspiring nature of an unforgiving land or to the inability to relate to its first inhabitants but to slavish attention to U.S. values, culture, and influence. The ambiguity for identity is obvious. Some of Canada's best writers—Margaret Atwood, for example—use losing and victimization as unifying themes in their writing. It is too facile to regard this literature of deprivation as Canada's reaction to living next door to success. The United States throws a long shadow,

and existing at a time of doubt and alienation surely helps, but the trait goes back to the way people have looked upon their history. Some see it as a profound expression of the Canadian soul.

The Religions of the First People, Indian and Inuit

The people whose culture has been most associated with the land and who best have a reason for "being lost" are the people who were there when Europeans arrived. The diversity of religions and religious practices among Canada's Aboriginal population is legendary and quite beyond reduction to a few themes. The main conceptions are treated elsewhere in this collection, but something should be said about the Aboriginal response to the forced assimilation practices of the federal government and their impact on Canadian religion. It was Canada's major churches—Catholic, Anglican, Presbyterian, United—that participated in the discriminatory residential school policy of the federal government; it was they who agreed to set up schools that removed Aboriginal children from their parents, sent them away from their villages, forcefully attempted to undermine Aboriginal languages, and placed many vulnerable children in destructive situations. The result was devastating, leaving a history of alcoholism and abuse in its train. The long-festering sore between Christian traditions and Aboriginal peoples has finally been recognized officially and publicly: in 2005, the federal government set up a fund of \$1.7 billion to compensate those who endured the abuses of the policy, and on June 11, 2008, the Canadian government formally apologized to Canadian Aboriginals for the policy.

However, this was not the only religious reality that Europeans brought. They brought traditions that were embraced by Aboriginal peoples. Many Aboriginals married Christians in the early years of migration, forming another largely Catholic people known as Métis. Northwestern and Alaskan Aboriginals came in contact with Orthodox priests from the Russian Orthodox tradition and established firm Orthodox churches. Missionaries founded churches of various kinds funded by European or eastern Canadian churches. Even those who eventually rejected the establishment churches were attracted to aspects of the Christian message, especially the message clothed in evangelical and Pentecostal attire. Or they embraced minority traditions, such as the Bahai. The result is that the Aboriginal community today demonstrates the same pluralism found in the larger Canadian community.

It is important to consider the role of religious reaction among Aboriginal religions themselves. For example, messianic movements have influenced Canadian Indians since the seventeenth century. The Ghost Dance religion and the various nativistic movements are examples. More recently, the Native American Church, with its focus on peyote rituals, has had an impact, especially among the Plains people. This religion has succeeded in overthrowing many of the old ways still practiced by these tribes, notably in Saskatchewan as late as 1982.

Of a different order is the almost universal standing that elders have even when they are in a completely different cultural area. Young educated Indians are attracted to this sophisticated elder, who is able to represent to them the old ways but in a manner that stresses the broad unifying elements. Especially attractive is the herbalist and healer, who combines many of the characteristics sited by believers regardless of which religion they espouse.

Reservations, for all the segregation and loss of status that they imply to their inhabitants, have kept some areas relatively isolated from white prying, allowing some rituals to be carried on. Unfortunately, young Indians leaving the reservations have negative feelings toward them, and the elders are often included in those feelings. The result is that the young have rejected both Christianity and the old ways. Some have turned to atheism or agnosticism. With few skills in an urban society, they have become a disillusioned generation. In some areas of the prairies, the majority of the prison population is native, and alcohol and drug abuse is commonplace.

Canadian willingness to accept some form of collective representation of Aboriginal nations in Parliament might aid Indian identity in a way that would encourage a revival of traditional ways and, since Aboriginal rights are guaranteed in the new Canadian constitution, the Indians' special place in the makeup of the country is basically established. The role their religions will play is a question that has not been faced, but the Indians' fundamental religious connection with the land may have a long-term impact should Canadians define their identity in its terms.

Immigrant Religion

George Etienne Cartier, one of the fathers of Confederation, in 1865 expressed (as cited in Alistair Sweeny, 1976) the basis of religion for Canadian history as a unity of diversity:

If we unite we will form a political nationality independent of the national origin and religion of individuals. As to the objection that we cannot form a great nation because Lower Canada is chiefly French and Catholic, Upper Canada English and Protestant, and the Maritime provinces mixed it is completely futile. . . . In our confederation there will be Catholics and Protestants, English and French, Irish and Scotch, and each by its efforts and success will add to the prosperity, the might, and the glory of the new federation.

The fruit of this policy was to accept religion as a formative element in Canadian identity—the Charter of Rights and Freedoms notes that Canada exists under God—yet it ignored the potential conflicts in the prioritizing tendencies of religious commitment. For example, it said nothing about disagreements on what the foundations are of social and ethical norms.

The nature of Canadian immigration has been directly influenced by the national churches: in the early days a majority of the people came to Canada from or through their organizations. The result was that the number of immigrants with little church affiliation was small. Especially when the prairies opened up and the flood to the West began, arrangements for immigration that respected certain “values” allowed churches (for example, the Mennonites) to sanction the movements of whole communities of people onto the land. The result has been churches of national and ethnic consciousness.

The policy was carried out through the active participation of the governments of central Canada for their own reasons. It was, on the one hand, a colonization policy, designed to carry on Canadian national destiny by peopling the prairies. Part of this was motivated by a concern that if Canada did not populate the West, the United States would. Immigrants were part of national establishment policy. In addition, the prospect of a West that required the manufacturing capabilities of eastern Canada was attractive to Toronto and Montreal. But there was also Canadian ideology behind this move; a vast unpopulated land lay open to developing British conceptions of law, justice, and ultimately a distinctive sense of freedom.

Immigrant ethnic and religious diversity was the price the eastern governments were willing to pay, since it not only offset the dreams of the French Catholics but also guaranteed a grateful and submissive foreign contingent. All this took place in a remarkably short period of time, between

1870 and 1920, a factor that made continuity all the more important.

The manner in which traditional forms of religion came to dominate the West can be gauged by a look at the Orthodox Church. Orthodoxy derives from peoples of eastern Europe, Africa, the eastern Mediterranean, and Asia; the distinction from the Roman Catholic Church is usually identified with the schism of 1054, when the Eastern Church broke away from Rome. On occasion, Orthodoxy is known as the Eastern or Byzantine rite, to parallel it with the Western rite of Roman Catholicism.

The use of *rite* is significant, because for these Eastern churches it is the ritual commonality that unites, not the administrative and authoritative jurisdiction. This is demonstrated by the fact that there are believers in Canada who may owe allegiance to the ancient patriarchates of Constantinople, Alexandria, Antioch, or Jerusalem; they may also belong to one of the so-called national churches of Russia, Serbia, Romania, Bulgaria, Cyprus, Greece, Albania, Poland, or the Czech Republic; they could adhere to the autonomous churches of Sinai or Finland or Japan; or they could have recently joined a daughter church formed from one of the aforementioned national churches in Canada and the United States. There is also a small group of believers who do not adhere to this "Byzantine" Orthodoxy but rather follow the non-Chalcedonian doctrine of Christ's nature. (This doctrine places emphasis on the divine in the person of Christ, with the human element reduced to an impersonal humanity.) These Oriental Orthodox—the Armenian, Coptic, Syrian, Ethiopian, and South Indian Orthodox—churches are rejected as noncanonical by the Byzantines.

Probably the largest group practicing the Byzantine rite is the Ukrainian Orthodox Church in Canada, numbering in excess of 140,000 members. Their ancestors came to Canada at the turn of the century in the immigration flood, and most of them were from peasant stock; they have been joined recently by post-World War II immigrants who settled not on the prairies but in the eastern manufacturing centers. They came principally from Galicia in the Ukraine. The first church was established in Gardenton, Manitoba, which is still the scene of an annual pilgrimage. They are not regarded as canonically Orthodox by the other Byzantine rite churches, because Galicia was traditionally under the jurisdiction of the Roman Catholic Church and used the Ruthenian rite. The Galicians have a married clergy, however, and the Church of Rome wished to dispense with that right. They also had used the Ukrainian language in the

liturgy. By 1918 an organization called the Ukrainian Greek Brotherhood evolved, and many of its adherents joined the Orthodox Church in Nova Scotia. The church emerged from a growing awareness of solidarity at the turn of the century, and the resulting organization, founded in 1921, follows Orthodox liturgical practice and accepts the seven ecumenical councils. It is also significant that Orthodoxy first came to North America not through immigration but through Russian Orthodox missionary activity among the Aleut in Alaska. The diocese was established in 1799 and by 1905 had an archdiocese in New York. Most of the Orthodox organizations have a North American rather than a Canadian focus.

An entirely different genre of church is associated with the Doukhobors. A pietistic group, the Doukhobors originated in Russia in the eighteenth century. They rejected both the Russian Orthodox Church and the state. It was this conflict that led them to Canada in 1899. Indeed, they were opposed to all the trappings of church, dispensing with priests, liturgies, sections of the Bible, and church edifices, and they resisted any education that would lead them away from the immediacy of the oral tradition and spiritual enlightenment. Their life in the Crimea had centered on communal living and total nonviolence; the latter concept was close to that of the Quakers. When the czar moved to conscript the young men into his army, they resisted. News of the resulting bloodshed reached sympathetic ears in Canada, where Clifford Sifton was looking for strong farmworkers, like the Mennonites who had come earlier. By June 1899 over 7,500 Doukhobors had come to Canada, the largest group migration to the prairies. They immediately moved to communal farms in Saskatchewan, where they faced strong resistance from other immigrants, who envied the huge tracts of land they had been given. Ultimately they had to abandon their communal living and principles of universal peace and brotherhood. Required to give an oath of loyalty before they could get land, some simply "affirmed" and received land; many refused on grounds of religious conviction. This group, the largest, became known as the Orthodox Doukhobors and was led by the mystical Peter V. Verigin. They purchased private land in British Columbia and became quite successful. A third group, seeking a totally untrammelled existence, began a trek across the West to British Columbia and became notorious very quickly. The negative publicity applied to all Doukhobors indiscriminately, and the members in British Columbia were twice banned from voting in federal elections.

Despite the extraordinary nature of their religious convictions and the difficulties in transplanting them to Canada, the Doukhobors have persevered and today represent a Russian group that maintains an almost mystical belief in the homeland and in the principles of communal and non-violent living.

The Mennonites are another group who arrived on the prairies, but with an entirely different story. Originally an urban people, the Mennonites had been forced to live in rural areas because of their nonviolent and independent church conceptions. They became very productive farmers, achieving their most extensive holdings in Russia, where they enjoyed near self-government. The successors of Alexander I withdrew these privileges, however, and the Mennonites moved to the Canadian prairies, where the government gave them large tracts of land together and made concessions about military service and their own schools. Early in the 1920s thousands of Mennonites immigrated, displaced by the Russian Revolution. The large size of the group meant conflict with other Canadians and splits within the group over policy. Their goal of living an isolated life evaporated under the strain of realities in the Canadian West. Their Christian separation of church from state, the kingdom of God from that of human construction, and distinctive ways of life were all blurred under the pressure of living with others from all over the world.

Major Religious Diversity

No discussion of Canada's diversity would be complete without some mention of traditions of an entirely different nature—Judaism, Islam, Hinduism, and Buddhism. All have played a role in the development of Canada's religious environment.

Jewish immigrants came to Nova Scotia from New England in the mid-1750s, and Sephardim from England journeyed to Montreal at about the same time. By 1768 they had formed a group called Shearith Israel, similar to one in England. The census of 1901 reported only 16,400 Jews, but a dramatic change came in the next decade when the western Jewish population increased more than fourfold. This shift to the prairies came about through Jewish societies in the East, such as the Colonization Committee of the Young Men's Hebrew Benevolent Society of Montreal, which sponsored the oldest Jewish farm community, in Oxbow, Saskatchewan, in 1892. Farming communities were also established in Alberta and Manitoba. In 1905 many responded to Prime Minister Wilfrid Laurier's speech on the occasion of the

condemnation of the Russian pogrom against the Jews of Kishinev, when Laurier promised a "hearty welcome" to Jews who came to Canada. Following World War I, however, Jewish immigration slowed to a trickle, and in the face of the Nazi peril in Europe, Canada virtually shut the door on the problem. Meanwhile, believers moved from farming communities to towns and cities as they sought the social and religious advantages that numbers provided. Today there are synagogues in only two centers outside major cities—Prince Albert, Saskatchewan, and Lethbridge, Alberta.

Most of the first Muslims came to Canada from Lebanon, and they set to work not as farmers but as peddlers. A nucleus made Edmonton, Alberta, their departure point for selling routes to the North. These early families were finally able to construct a mosque, completed in 1938 with the help of a few Christian friends and much sacrifice. After World War II the much less restrictive immigration laws opened the way for additional Muslim immigrants, most of whom were from Pakistan and India. Today the South Asian population constitutes the largest contingent of Muslims in Canada; they are principally centered in urban areas, notably Toronto, Vancouver, and Montreal. A most unusual town in Alberta, Lac La Biche, has a sizable Muslim population, all of whom are Arab, and a mosque that is one of the main sights in town. Edmonton now boasts an Arabic-English bilingual program in its public school system, with classes through high school, and recently a joint Muslim community sponsored the first Chair in Islamic Studies at the University of Alberta.

The earliest Muslim immigrants were Sunnis, and the early preponderance of Muslims in Canada belong to that tradition, but in the twentieth century, largely through the policies of dictator Idi Amin, significant numbers of Ismailis came to Canada from Uganda. They settled in all major urban areas across the country and have had a major impact on Canada's religious diversity. At the same time, when Canada liberalized its immigration policies in the late 1950s, thousands of Muslims from most major Muslim populations came to Canada, bringing that diversity along—including Shias and Ahmadiyas from regions as disparate as Syria, Pakistan, Somalia, and India. The Druze, a sect with roots in Islam, also arrived at this time, contributing to the religious diversity of the country. The arrival of all these groups has not been without controversy, especially after 9/11. Their growing presence jarred some Canadians, and some communities in Quebec passed a policy on just how immigrants were to act and dress. This sparked an inquiry from the

provincial government on integrating divergent cultures into its society, with mixed results.

In 2001 in Toronto, a group proposed to establish Sharia law for legal issues, including divorce and custody. The Canadian Council of Muslim Women launched a nationwide debate over this and argued vigorously against such a plan. The Ontario government set up a committee to study the issue but finally rejected the initiative. After 9/11, the Canadian government supported the U.S. “war on terror,” including the attack on Afghanistan, to which it contributed forces. However, after 9/11, Muslims were often profiled in airport security and had to deal with widespread antagonism. While not as severe as the curtailing of Muslim freedoms that occurred in the United States, as noted in 2007 by Aisha Pena, Canadians generally supported the curbing of Muslim militants. Wearing the *hijab* was viewed as close to subversive in some areas of the country for a time and became a matter of wider conflict when the *hijab* was banned for girls playing soccer by the national soccer body. Subsequently, public opinion forced the ruling to be rescinded. The agreement to follow the lead of the U.S. president George W. Bush against Muslim jihadists, however, backfired when the Canadian government collaborated with the CIA in September 2002 in sending an innocent citizen, Maher Arar, to Syria to be tortured. The public outcry forced the federal government to admit its collusion in this miscarriage of justice and to negotiate a sizable compensation. As part of the fallout, the Canadian public refused to support the U.S. invasion of Iraq, and Prime Minister Jean Chrétien won widespread praise for his refusal to participate.

Canadians remain divided on how loyal Muslim groups are to Canada, and some have wondered why few moderate voices seem to be heard. No Muslim in Canada has argued publicly, as has Ameer Ali in Australia, about Muslim militancy and the need to embrace a tolerant Islam. In a marked break with this culture of gloom, however, has come the humorous television show entitled *Little Mosque on the Prairie*. A lighthearted take on the foibles and ironies of being Muslim in a small prairie town has captured the imagination of the Canadian public and given Islam a sympathetic audience. (It has since been sold to American television.) Still, the result of most of the recent events has definitely placed Muslims on the defensive, and a sense of unease rests on the Muslim community in Canada today.

The earliest Asian religious believers came to southern Alberta and the coastal regions of British Columbia from Japan at around the turn of the twentieth century. Some

worked on the railways; some came to work in the coal mines or to begin farming. A number of the latter settled in Raymond, Alberta. They banded together in 1929 and established the Raymond Buddhist Church, the first in the province. They purchased a former Mormon church and today have one of the finest temples in North America.

When World War II began, the Japanese were rounded up and sent to internment camps in Alberta and in the interior of British Columbia. Their forced evacuation from the coast spurred the building of churches, and new congregations sprang up in Taber, Picture Butte, Coaldale, and Rosemary, with Lethbridge, the largest town, as the center of Japanese activities. After the war, the Alberta churches organized into the Alberta *Kyoku*, or ministerial jurisdiction, as part of four *Kyokus* in Canada: British Columbia, Alberta, Manitoba, and the East. Despite a split and the formation of the Honpa Buddhist Church of Alberta, the Buddhists of the West have maintained an ongoing congregation. Regular and special services of the True Pure Land Buddhist tradition are conducted by resident ministers. Following the federal apology to the Japanese for their incarceration, relations between Buddhist communities and government institutions have been friendlier. Edmonton has had a continuing Dharmadhatu congregation, and that group has also decided to establish a permanent base in Halifax because of a stable community base; meditation rituals were successfully introduced to Canadians, and today followers of Buddhist traditions are found all across the country, with many converts among Caucasians.

The federal government’s multicultural policy has encouraged the various ethnic and religious groups to preserve their traditions, and Canada now has congregations of religions as disparate as the Rastafarians, Sikhs, and Hindus, as well as the traditional ancestor worship of the Chinese. The Sikhs suffer from a similar resistance from Canadians as Muslims: Sikhs were implicated in the bombing of a transatlantic flight that killed over three hundred, with the result that the tradition is linked in some minds to militancy and violence. However, some Sikhs continue to wear the turban and the *kirpan*, and the Royal Canadian Mounted Police (RCMP) has loosened rules so that Sikh Mounties may dress in the traditional headdress. This diversity of cultures is most noticeable in western Canada, where summer festivals of ethnic heritage are very popular. While the Canadians support the contributions these various people make to the country, some worry privately that they are challenging the essentially “Christian” character of Canada.

Material Religion

The coming of so many religious groups to Canada has spawned a dramatic change in the physical landscape of towns and cities. Architecture has shifted dramatically as these influences from abroad attempt to shape a building around the distinctive needs of an immigrant community. Consonant with this new trend, recently the federal government has matched a \$30 million initiative of the Aga Khan of the Ismaili tradition to transform the old Canadian War Museum in Ottawa into the Global Centre for Pluralism. Its concern will be research and education specific to the value of pluralist societies.

The concern with documenting this trend has encouraged scholars to move away from conventional evaluations of religion-as-doctrine to the impact of so much pluralism-in-landscape on Canadian identity. Spearheaded by Queen's University scholar William Closson James, and his groundbreaking study of religious pluralism in Kingston, a new way of looking at religion has evolved. Dubbed *material religion*, this trend changes the focus to the artifacts and constructions of religion, and tries to examine the impact of this kind of reality on the larger culture and identity. One has only to visit the many towns and cities and examine their architecture to realize how the landscape of Canada has changed—cities such as Mississauga are rich with temples, mosques, synagogues, and centers that reflect the vitality and variety of religious building. McGill University has developed the Montreal Religious Sites Project as a way to document this growing diversity.

The orientation was given a significant boost by the spectacular success of a turn-of-the-century display at the Provincial Museum of Alberta entitled *Anno Domini: Jesus through the Centuries*. Curated by University of Chicago graduate David Goa, the exhibit brought together a wide variety of material from around the Christian world: images, art, music, and architecture—2,000 years of Christian material engagement with Jesus. Thousands visited the displays that focused not so much on the doctrine of Jesus but on the variety of ways in which the figure of Christ had been portrayed, reflected upon, and embodied in architecture in the Christian West. Certainly another way material religion is expressed is in the spontaneous sanctifying of terrain: one of the most dramatic contemporary examples of how landscape becomes meaningful is ground zero in New York City, but across the Canadian landscape one sees this transformation not only in religious buildings

but also in roadside commemorative displays for accident victims.

Religious Movements

The face of religion in Canada has been decisively changed through a number of movements. A few lasting ones have modified Canadians' social outlook. In the main the impetus for these movements has come from the United States, and only two of significance, the Salvation Army and the Plymouth Brethren, have European origins. Canada has been impressed deeply by the religious ferment of its southern neighbor.

Some of this religious ferment was brought by Americans themselves. Before the War of 1812, eight out of ten residents of Ontario were Americans. Most of the Icelandic, Norwegian, Swedish, and Danish Lutherans who settled on the Canadian prairies came from the Dakotas. Early Congregationalists in Nova Scotia influenced the religious development of that province. The Mormons came directly to southern Alberta to establish a thriving community. Still, much of the religious ferment was a conscious adaptation of American forms to Canada.

Not all are as dramatic as the New Light movement among the Baptists of the Maritimes or the Camp Meeting movement among the Methodists. Anglicans molded their structures according to Episcopal innovations in the United States, and Canadian sectarian congregations used liturgical forms drawn from American evangelism. Strategies for winning converts, such as the huge religious forums of Billy Graham, were first tried in the United States and found an acceptance among Canada's evangelicals. Some groups, such as the Canadian Pentecostals, preferred the boisterous and dramatic evangelists of the United States, and Roman Catholic charismatics found adherents there before trying similar forms in Canada.

Despite this close connection, Canada has not always responded to these movements as has the United States. The revivalism that swept the eastern seaboard of the United States under Jonathan Edwards in the mid-eighteenth century had an impact in Canada, but not as broadly or as deeply. The United States' repeated revivalist history has not found similar expression in Canada.

The church in Canada responded, too, to its own agenda. Most notable was the Church Union movement, the most impressive achievement of which was the union of Presbyterian, Congregational, and Methodist churches in 1925, but which periodically took place between Baptists, Lutherans,

and others. Another impact deriving from religion has been the Social Gospel movement. The Anglican, Methodist, and Presbyterian churches were most inspired by the need to make the Gospel relevant to the everyday concerns of humans, although their motivations arose not from conditions that they saw as unique to Canada but as part of a movement that embraced the western world. The ways they responded may well not have come from the United States. In fact, the institutional structures, such as the brotherhoods, the settlements, and the labor churches, were of British derivation rather than American, but many of the themes had American counterparts. Even the antialcohol crusade, well-known in the United States, can be seen as an attempt to apply Gospel interpretations to social problems.

The center of the Canadian Social Gospel movement was not in the Maritimes or in Ontario but in Manitoba, at Wesleyan College in Winnipeg, where staff and students responded to the depression of the 1890s, which saw farmers inundated with unsold grain. Railway rates, tariffs, and a host of related issues became matters on which Christians had to take a stand. When Salem Bland arrived at Wesleyan in 1903, he found fertile ground for his social perspectives, and Methodists in particular dominated the progressive wing of the movement. The best-known Social Gospel clergyman, J. S. Woodsworth, was a Methodist, even though he later resigned from the church. The movement built rapidly. From 1890 to 1914 it dramatically increased its impact on church and labor organizations, but its very success spelled its doom: its impact fostered groups, institutions, and responses that outgrew its religious sources and spread its attitudes through church, labor, and social networks in such a way that by 1928 the movement had given over its formulation to labor and political forces. With the crash of 1929, it was no longer effective. Nevertheless, it has left an important legacy in Canadian society, and its ideas flow with regularity close to the surface of church discussion of issues.

Mention should be made of the Métis movement, led by Louis Riel. (The Métis were communities formed by the marriage of native people and early French trappers.) The Métis movement stood for independence from the federal government and the importance of local cultural difference, and its ideas were little different from those lauded by provincial premiers today. Riel was born in 1844 to a settled Métis family who represented well the combination of Indian and French blood. A devout Roman Catholic, he believed that Providence wanted the western lands to stay

under the domination of the people who lived on them, and he fought with messianic vision to resist federal encroachment on Métis land. He often did this in the name of French Canadian and Roman Catholic culture. His sense of destiny for the West ended with his execution for treason in 1885 by the federal government, but his dream of regional power and the rights of French Catholics is as alive as ever in western Canada.

“New” Religions

Of the welter of new religions that have sprung up in Canada since its inception, several seem to have been more successful than others. The Church of Jesus Christ of Latter-day Saints (Mormons) has made major headway in urban populations, especially in the West. The Bahais have built a national organization and have succeeded in attracting middle-class youth and educated Canadians alike. The Church of Scientology recruited aggressively in the 1970s and established groups across the country, as did the Reverend Moon’s Unification Church. Mantra meditation was taught earlier in Canada by transcendental meditation and still has adherents.

Various self-improvement groups operate in Canada, including Silva mind control and the New Light, which are based on certain religious views of the individual. And while Hare Krishna and Divine Light people are not as prevalent as they used to be, those groups attracted a wide range of converts at the end of the last century. Sri Chinmoy adherents are found across Canada, as are Tai Chi Chuan participants. While not new, spiritualist groups and the Unity Church appeal to some Canadians. Sometimes the charismatics are considered a new religion (for example, Toronto’s Airport Church), although their message is hardly different from that of the Pentecostals, and it is the closest to traditional Christian inspiration. Canadian animosity toward cults is largely inspired by media reports about non-Canadian groups, such as the Jonestown cult in Guyana, and about kidnapping and deprogramming of adherents. No government in Canada has enacted restraining laws, with the exception of some municipal jurisdictions for the control of street harassment. The groups have free rein in attracting secular or disillusioned persons to their organizations.

The most interesting recent new religious movement group has been that associated with Pastor John de Ruiter. Described now as a “worldwide phenomenon” by Judy Piercey, with converts to his movement in the United States,

Europe, Australia, and now India, Pastor John, as he is known, began as a shoemaker and a part-time Lutheran preacher in the small Alberta town of Stettler. He then moved to Edmonton, where he established a following that is hundreds strong. Seated on a raised dais, and responding to questions from a fixed “asking” seat among his New Age-type followers, he has moved away from Christian references and now concentrates on using silence as an operative religious medium. Believers follow him back to Edmonton from his many tours around the world. From his new building in the west end called the Edmonton College of Integrated Philosophy, he dispenses his tapes and videos to an enlarging circle of devotees—a tour to India garnered him a group from the Osho/Rajneesh ashram.

Some people regard the television evangelists as cultic, in that much of the impact of their message derives from personal appeal. David Mainse’s 100 Huntley Street, a Pentecostal TV program, is a good case in point. It has carved out a singular place in the television market and reminds us that technology is continuing to change the environment of religion. Canada has a long and vigorous evangelical tradition, however, and the strong support that evangelists receive from Canadians may only reflect that sympathy. They are a most important fact reflecting the continuous interaction between U.S. and Canadian culture and religion.

Canada: Protestants and the United Church of Canada

Canadian Protestant identity, like the identity of Canada itself, has been shaped by regionalism, cross-border politics, and the relatively peaceful transition from colonialism to sovereignty. Canadian Protestantism has been largely shaped by a spirit of ecumenism that cumulated in the formation in 1925 of the United Church of Canada (UCC)—a church that positioned itself to be Canada’s national church in a way that was distinctly Canadian.

In many respects, the Protestant experience in Canada has resembled that of Protestants in the United States. There are, however, a few notable differences, including the fact that the majority of the population has always been distributed among four or five major denominations. Mark Noll, for example, has suggested that religious allegiances in

Canada differ from those in the United States because of an absence of a significant war on Canadian territory. Noll argues that as a result Canadian religiosity is not as strong as that of its neighbors to the South (both the United States and Mexico underwent bloody civil wars that depended on religious affiliations, metaphors, and differences to foment their national consciousness). In contrast, it should be noted that Canadian historian John Webster Grant points to the War of 1812 as a significant moment in the historical articulation of Canadian national identity, one that is on par with that of the American Revolution. Likewise, the World War II battle of Vimy Ridge is often represented as a moment that had a profound effect on the construction of Canadian national identity. Other scholars have argued that the distinctiveness of Canadian religious identity stems from the historic “unofficial official” status of a few dominant denominations under the shadow of which other Protestant denominations were forced to develop. Some argue that this factor, combined with the scarcity of resources, especially in rural areas, led to a compulsory ecumenism among certain denominational families. Finally, it has been suggested that at the core of Canadian churches lie a laity who have maintained a highly suspicious and resistant attitude toward ecclesiastical control from outside Canada and who are ardently loyal to their chosen denominations.

Early History

The first sustained Protestant settlement in Canada corresponded with British control of the Maritimes and with primarily economic, rather than spiritual, interests and activities in the new colony. These early settlers included a mix of old-stock British Anglicans and Presbyterians, Lutheran and Reformed settlers from Germany and Switzerland, and some American Congregationalists. While the Church of England dominated the Nova Scotian capital, Halifax, well over half of the rural population were New England Congregationalists. Initially, there was limited missionary work undertaken and few clergy available or willing to serve the scattered Maritime congregations. The expulsion of Francophone Acadians in 1755 created space for the addition of several Free Church advocates who sought to distinguish the colonies from an established Anglican regime. Most notable was Henry Alline (1748–1784), a charismatic, uneducated, sectarian who preached a mystical “new light” revivalism, which reached its peak in around 1775 and emphasized sudden conversion, communion with God, and anti-Calvinism. Historian George Rawlyk has

suggested that Canadian evangelicalism as expressed in Alline’s “New Light” movement actually stood as even more radical, anarchistic, democratic, and populist than its American counterpart exemplified during the first Great Awakening. Rawlyk suggested that Alline’s radical anarchism stemmed from his movement’s freedom from the distinctively American characteristics of civic humanism, republicanism, the covenant ideal, and possessive individualism. After Alline’s premature death in 1784, the movement was largely absorbed, albeit without the anti-Calvinism of its founder, by Maritime Baptists and New Light Congregational churches. The legacy of Alline’s popular religious expression and revivalism in Atlantic Canada is traceable, though in a modified form, into the twentieth century.

Other early communities in the Maritimes included the American Quakers, who settled in Nova Scotia as early as 1762, and Moravian missionaries, who established missions in Labrador in 1771 working among the Inuit peoples in that region. Neither community was especially large but they did establish a presence and cleared the way for more sustained missionary efforts in the future.

The first Methodists in Atlantic Canada were organized under the leadership of Lawrence Coughlan in Newfoundland (1765) and William Black Jr. in Nova Scotia (1781), who set up the Methodist Church in opposition to the New Light movement. Black initially established his Methodist classes under the direction of the American Methodist Episcopal Church, by which he was ordained. Growing anti-American sentiment in the colonies following the American Revolution led him to redirect the affiliations of the Canadian colony to the Wesleyan Methodists of England.

Former Virginian slave David George organized the first black Baptist churches in Nova Scotia in 1783. George was part of the 1792 emigration of twelve hundred African Canadians who carried a modified version of Alline’s New Light theology to Africa. The current Baptist and Methodist churches in Sierra Leone are descended from the churches that were established there by these former residents of Nova Scotia.

In Quebec, following the British conquest of 1759, a plan to anglicize the Francophone population led to an introduction of government-supported, French-speaking Protestant clergy who were largely ignored by Francophones and Anglophones alike for religious and linguistic reasons, respectively. On the eve of the American Revolution, government policy legally recognized the Roman Catholic Church through the Quebec Act (1774), which was

implemented with the intent of keeping Quebec British. The legacy of this act resulted in a strong Roman Catholic presence and squashed any hope for anything but a Protestant minority in that province.

Following the establishment of Upper Canada (present-day Ontario) by the Constitutional Act of 1791, the Church of England maintained a semiofficial status as the only recipient of the “clergy reserves,” approximately 2,500,000 acres of land set aside for the support of Protestant clergy, despite the fact that it claimed at best only 20 percent of the population in Upper Canada. The clergy reserves system and resulting revenue acknowledged the Anglican Church as the de facto established church in Canada, but this was not without resistance. It should be noted, as historian John S. Moir states, that while many churches were resistant to the Anglican Church’s claim to official status, for the most part Protestant denominations (Presbyterians, Methodists, and Congregationalists) stressed British Christian values over and against Enlightenment free-thinking or American-style democracy.

The American Revolution dramatically changed the religious character of Canada, as British Loyalists flooded over the border, offering alternatives to the established Anglican Church in the form of ethnic and evangelical traditions. By 1812 over 80 percent of the population of Upper Canada were loyalists (or late-loyalists), having settled somewhat haphazardly: Quakers in Newmarket and Prince Edward County, Mennonites in the Waterloo and the Niagara peninsula, Scottish Presbyterians in the Glengarry region, and German American Lutherans in Dundas, Addington, and Lennox counties.

The most significant growth following the Revolution was in the Methodist Church. As noted by historian Phyllis Airhart, at the time of establishment in 1791 there were eight hundred Methodists in Canada with four circuits and only six preachers; in a little over half a century Methodism grew to become the second-largest denomination in Canada. Initially, Methodists in Lower and Upper Canada were deeply rooted in the New York network. Unlike their Maritime counterparts, who were closely tied to the English (Wesleyan) Church and were considerably more conventional in their piety and firm in their discouragement of overly emotional outbursts, the Methodists in Upper Canada espoused a revivalist theology that focused on the ecstatic conversion of the individual. The first Methodist Camp meeting in Upper Canada occurred in 1805 and was described by its organizer, itinerant preacher Nathan Bangs,

as quoted in Abel Stevens’s 1863 work *Life and Times of Nathan Bangs, D.D.* (p. 152), as if there were “a cloud of divine glory resting upon the congregation.” Central to this revivalism was an emphasis on a personal encounter between the individual (radically convicted by sin and isolated from the world) and God.

The conversion experience distinguished evangelicalism from the perceived established churches in Canada, enabling it to gain momentum following the War of 1812. In response to criticism from the Anglican bishop of Toronto, John Strachan (1778–1867), the Methodist Church was among the first of the evangelical churches to Canadianize and separate from their American and European mother churches. An autonomous Canadian Methodist church was established in 1828. Other denominations, such as the Baptists and German Lutherans, were constrained by their dependence on missionary revenue from American supporters.

Mid-Nineteenth and Early Twentieth Century

Increased religious diversity led to a challenge to the Church of England’s claims to the clergy reserves. During the War of 1812, the Presbyterian Church petitioned for a share of the revenue generated by the reserves following the destruction of Niagara on the Lake by the Americans. The Presbyterian claim was based on its status as the national Church of Scotland. Despite Anglican objections, the allocation of the clergy reserves was revised to include both Anglicans and Presbyterians. These two churches understood themselves as the rightful heirs of Canadian religiosity, in contrast to populist evangelicals, who argued from a voluntarist position that the clergy reserves should be secularized. By the 1830s evangelicals had moved from the fringes of society to the center, establishing powerful and successful churches and engaging in political and public debate. As such, their concerns were modified by such individuals as Egerton Ryerson in Upper Canada and Baptist preacher Edward Manning in the Maritimes, who turned their attention to the transformation of social order primarily through the establishment of voluntary societies, newspapers, public education, and denominational colleges.

Several important denominational schools and colleges were formed during this time as a means of providing a balance between evangelicalism and the Enlightenment. According to historian Michael Gauvreau, these two phenomena were not mutually exclusive in Canadian academe. Thomas McCulloch, a Scottish-born Presbyterian minister, founded Pictou Academy in 1816 as a response to what he

saw as religious destitution in the colony. Several important Protestant universities were founded during this time, including the Presbyterian Dalhousie University in Halifax (1818) and Queen's University in Kingston (1841), as well as Methodist Mount Allison in Sackville, New Brunswick (1839), and Victoria College in Cobourg, Ontario (1841, today part of the University of Toronto). Despite their smaller demographics, the Baptists established Acadia University in Wolfville, Nova Scotia (1838), and McMaster University in Toronto (1887, moved to its present location in Hamilton, Ontario, in 1930). Many universities in Canada maintained their church affiliations well into the mid-twentieth century, at which point they were forced to at least partly secularize in order to qualify for government funding.

In 1839 the clergy reserves were extended to the four mainline denominations: Anglican, Methodist, Presbyterian, and Roman Catholic. The Baptists refused government funding except in Nova Scotia, where they shocked their Upper Canadian contemporaries by accepting financial support for Acadia University. The question of what constituted Protestantism and who had the right to speak for it became a topic of much debate during this time period. The issue came to the forefront in the public voice of Egerton Ryerson, who ultimately emerged as the official adversary to the Reverend John Strachan. As an advocate for Anglican privilege in regard to the clergy reserves as well as higher education, Strachan was a fervent supporter of the Anglican establishment as the means of maintaining Canada's Christian identity. In contrast, Ryerson sought to redefine Upper Canadian Protestant society as populist. As the founder and editor of the weekly Methodist newspaper *Christian Guardian*, he served as the most prominent defender of "voluntarism," or dependence by the church on voluntary giving. Ryerson also served as the first principal of Victoria College. In 1844 he was named chief superintendent of education in Ontario, where he successfully reformed the provincial education system, making it accessible to all school-aged children while still providing Protestant instruction in public institutions. His influence on Canadian Protestantism specifically and Canadian public life in general can still be felt today. Ryerson is best remembered for having standardized education in Upper Canada; this standardization relied on a central textbook press that used Canadian authors, a library in every school, the formation of an educational journal, and professional development conventions for educators.

Ryerson's energies concerning the secularization of the clergy reserves paid off in 1854, when public debate surrounding their necessity led to the introduction of a bill to secularize them. The bill's intention was to "remove all semblance of connexion between Church and State" and represents the first and only such reference to the separation of church and state in Canadian law.

John S. Moir has suggested that the effects of the secularization of the clergy reserves led to an increased interdenominational cooperation on social and political matters. The Methodists, Baptists, Presbyterians, and evangelical Anglicans petitioned for government legislation of a Lord's Day law. Other ecumenical efforts included the formation of temperance societies, missionary organizations, Bible guilds, and YMCAs and YWCAs. Following Confederation in 1867, a national "vision" promoting a Christian Canada was taken up with increasing vigor by the evangelical movement, which imagined the new Dominion of Canada to be "His Dominion." This reference to Psalm 72:8, which serves as Canada's motto, was suggested by Samuel Tilley, one of the fathers of Confederation: "He shall have dominion from sea to sea, and from the rivers unto the ends of the earth."

Confederation and Protestant Presence in Western Canada

The decades following Confederation saw the purchase of Rupert's Land (present-day Manitoba) from the Hudson's Bay Company in 1870 and the addition of the province of British Columbia in 1871, which, following the completion of the Canadian Pacific Railroad in 1885, ushered in a new era of expansion and immigration. The Protestant churches undertook the task of evangelizing western Canada as their duty, though it eventually fell to the Presbyterians and the Methodists, with their newly established national offices, to set up missions and churches in the prairies.

The first Protestants in the pre-Confederation West were Scottish Presbyterians on the Red River near Winnipeg. This community was initially served by an Anglican minister until Presbyterian minister John Black arrived in 1851. The Presbyterian presence in the prairies expanded in the 1860s into Prince Albert, Saskatchewan. Likewise the first Methodists were of British stock (Wesleyan missionaries who had been invited by the Hudson's Bay Company to work among the First Nations populations there). The Canadian Methodist Church, however, took responsibility for missions in Edmonton in as early as 1853. As such, both Presbyterians and Methodists were firmly established and ready for

evangelism in the West at the time of Confederation (along with Baptists who concentrated their energy on missionary work among non-English-speaking immigrants).

With the completion of the railroad, an increasing number of immigrant churches were built in western Canada. Russian Mennonites arrived in Manitoba in 1874 and would be followed by a second, larger group fleeing the Bolshevik Revolution of the 1920s. Also from Russia, the controversial communal sect the Doukhobors immigrated to Canada in 1899 with the assistance of Canadian Quakers and Tolstoyans. The Doukhobors entered into the public spotlight when a segment of their community defaced public property and organized nude parades in protest against government intrusion into their communal lifestyle and educational practices. The end of the nineteenth century also witnessed the first entry of Mormons into Canada, in 1887 in Cardston, Alberta, where they constructed the first Mormon temple outside the United States.

In British Columbia the Protestant churches lagged behind the activities of the Roman Catholic and Anglican churches, which had established a strong presence in the years following the Fraser River gold rush. The Presbyterians established a church on Vancouver Island in 1861. The Baptist Convention of British Columbia was formed in 1897.

Following Confederation, several Protestant denominations amalgamated. Four groups of Presbyterians merged into the Presbyterian Church in Canada in 1875, followed by further consolidations in 1886. The many disparate Methodist groups came together in two successive waves, in 1874 and 1884, to become the largest single denomination in Canada. At about the same time, two Baptist conventions formed, first Ontario and Quebec, in 1888, and later in the Maritimes the Free Christian Baptists and the Regular Baptists amalgamated into the United Baptist Convention in 1905–1906. It was not until 1944, however, that a national organization, the Baptist Federation of Canada, was formed, representing only a fragment of Canadian Baptists.

Interdenominational ecumenism was also on the mind of Protestant leaders such as Presbyterian minister and principal of Queen's University, George Munro Grant, who in 1874 advocated for a transconfessional "organic union" among Canada's Protestant denominations. This notion of an organic union stemmed from a sense that Canada's national identity was a moral and spiritual concern; an independent Canadian church was deemed necessary in order to maintain social cohesion in the face of increased immigration. Church Union was aggressively pursued by the

Congregationalists, Methodists, and Presbyterians beginning in the 1890s. A national church was perceived as a possibility by overlooking theological differences concerning Methodist Arminianism and Presbyterian Calvinism and by limiting the emphasis of creedal statements. This proposal was met with strong opposition, especially from within the rank and file of the Presbyterian Church, who underscored the importance of the Westminster Confession and Scottish identity.

Ecumenism was also expressed in large-scale revivals. Mass evangelism gained popularity following Confederation, and the appearance of American and Canadian evangelists became more prominent after 1884. For example, the Canadian evangelist team of H. T. Crossley and John E. Hunter held revival meetings in major urban centers, converting more than 100,000 people—even Anglican prime minister John A. Macdonald was caught up in the momentum. Evangelists promoted key Protestant causes such as missionary societies, Sunday schools, and temperance, which in many ways became synonymous with Protestantism in nineteenth-century Canada. During the same time period the Woman's Christian Temperance Union established its Canadian branch under the leadership of its first president, Methodist Letitia Youmans. Initially concerned with moderation of alcohol, the temperance movement's objective became one of prohibition, which was temporarily achieved, except in Quebec, during the First World War by government legislation. The temperance movement became a key concern for promoters of the Social Gospel.

From the Social Gospel to Fundamentalism in Canada

Involvement in social reform movements was seen by many as a natural extension of evangelical commitments to the transformation of Canada into a Christian society. The Social Gospel in Canada was most prominent in the 1910s through to the 1920s. The most active participants in the Social Gospel movement were liberal Methodists and Presbyterians who replaced a theology of atonement and individual salvation with the project of constructing the Kingdom of God on Earth. As a movement, the Social Gospel found its initial home in Canada's theological colleges, especially the Presbyterian Queen's University in Kingston, Methodist Wesley College in Winnipeg, and Baptist McMaster University in Toronto. As in the United States, Christians sought a way to respond to the social problems that accompanied industrialization in urban

environments: poor working conditions, unemployment, health problems, and housing shortages.

It can be argued that in Canada, particularly in western Canada, the Social Gospel movement initially maintained a closer tie to evangelical and mainline Protestantism. Ultimately it diffused into the secular political sphere in such a way that it served as the foundation for one of Canada's major political parties, the Cooperative Commonwealth Federation (the socialist-democratic movement out of which Canada's current New Democratic Party evolved). Some of its less radical propositions also found their way into the Liberal Party of Canada through the political leanings of prime ministers William Lloyd Mackenzie King and Lester B. Pearson. Its most lasting effects were manifest in Tommy Douglas, the former Baptist pastor who moved from ministry into politics in the 1930s. Douglas went on to become the first socialist premier of Saskatchewan and leader of the federal New Democratic Party. Douglas is most specifically remembered as having established a universal health care plan in Saskatchewan that was later adopted across Canada.

For the Methodist Church, which continued to rely on its revivalist foundations in the form of teams of professional evangelists, the Social Gospel movement manifested itself in city missions that provided an important space for women, who were barred from ordained ministry, to participate in evangelism. The city revival was also seen both as a way to meet the challenges of the twentieth century—temperance, labor, health and educational reform—and as offering a means of attracting new members to the church.

Among the important proponents of the Social Gospel were Methodist Salem Bland and his student J. S. Woodsworth. Bland, a student of Queen's University's George Munro Grant, taught theology at Wesley College in Winnipeg from 1903 to 1917 until he was dismissed in part for his progressivism. Known as the Social Gospel's "spirit in the West," he was instrumental in moving Social Gospel concerns out of the classroom and the pulpit and into the public domain. Bland's role was crucial in the formation of the Cooperative Commonwealth Federation, whose first leader was former Methodist minister J. S. Woodsworth. Historian Ramsay Cook points out that Woodsworth's career mirrors the path taken by Canadian liberal Protestantism at the beginning of the twentieth century. In 1902 Woodsworth experienced a profound crisis of faith in which he expressed doubt concerning central tenets of church doctrine, including the divinity of Jesus and the authority of the Bible.

Despite his agnosticism, the Manitoba Conference refused Woodsworth's resignation in 1907, stating that there was nothing in his belief system that prevented him from ministering. With this in mind Woodsworth began a process of challenging established doctrines within the Methodist Church and expanding its missionary ministry toward immigrants. By 1914, in his role as leader of the Canadian Welfare League, he questioned whether the church was the ideal venue in which to enact social reform. Eventually, Woodsworth resigned from the Methodist ministry in 1918 as a result of his refusal to support conscription. Along with other Social Gospelers and labor advocates, Woodsworth joined the short-lived Labour Church in Winnipeg, which positioned itself as part church and part educational forum based on Salem Bland's "New Christianity." The Labour Church served as a venue in which the groundwork was laid for the Winnipeg General Strike of 1919. Woodsworth served one year in jail for his involvement in the strike and went on to political involvement with the Cooperative Commonwealth Federation at the federal level.

David Marshall has argued that the Canadian Protestant churches' acceptance of the Social Gospel was a significant contributing factor to its eventual diminution by the end of World War I. Marshall contends that Protestant clergy made a concerted effort to maintain relevancy in light of social, political, and intellectual challenges of modern life, which ultimately undermined the authority of the church in light of contemporary culture. In contrast, Nancy Christie and Michael Gauvreau maintain that while it eventually became subservient to secular interests and leadership, the Protestant churches and the Social Gospel remained influential well into the mid-1930s. The political activities of the Social Gospelers certainly contributed to the secularization of their initially theological mandate. When considered alongside the prevalent theological challenges of Darwinism and biblical higher criticism circulating at denominational colleges at the time, the story of secularizing trends within Canadian Protestantism becomes more prominent.

The denominational colleges were set up with the intention of educating the evangelical elite and training Canadian-born clergy, so as to limit the churches' dependence on European and American theologians. It was from within the theological colleges that the challenges of modern scholarship to the traditional Christian frame of reference were considered. Many of the church colleges offered a theologically liberal curriculum that focused on an attempt to reconcile the church with the concerns of secular society.

Many historians have concluded that this process served as a major contribution to the eventual secularization of Canadian society. Mark A. Noll concludes *A History of Christianity in the United States and Canada*, published by Eerdmans in 1992, his comparative work on Canadian and American Christianity, by suggesting that “the forces of modernity . . . have worked *through* the communal, top-down structures of traditional Canadian religion, while they have worked *alongside* the more fragmented, populist strictures of the American churches” (p. 549).

Nathanael Burwash (1839–1918), a leading Canadian Methodist, stands as the quintessential representative of liberal evangelicalism emerging from within denominational colleges. Burwash, professor of natural theology and chancellor of Victoria College, attempted to align moderate biblical criticism with a conservative understanding of evolution and the belief in the regenerative necessity of conversion. Because of his beliefs, Burwash makes for an interesting object of study, and his life is key to formulating an understanding of pre–World War I Canadian Protestantism. Burwash was also instrumental in the early negotiations on the part of the Methodists for church union.

It was under Burwash’s leadership at Victoria that the Methodist Church articulated disapproval regarding higher criticism. In 1890, Hebrew Bible professor George Coulson Workman was asked to resign from his teaching post because of his nontraditional views concerning the messianic prophecy. Following that, in 1909, English Bible professor-elect George Jackson was attacked by a number of prominent laity and ministers, including the general superintendent of the Methodist Church, Albert Carman, for applying higher criticism methods to the Book of Genesis. Burwash successfully defended Jackson at the Methodist General Conference in British Columbia in 1910. With this controversy, Burwash established Victoria College as a cornerstone institution in the teaching of higher criticism in Canada. That same year, the newly elected general superintendent of the Methodist Church, S. D. Chown, ensured that biblical criticism would be taught in all Canadian Methodist colleges. In his position as general superintendent, Chown went on to be active in the final negotiations that brought together the United Church of Canada.

At the opposite end of the spectrum, T. T. Shields, a controversial pastor at Toronto’s Jarvis Street Baptist Church, fought to keep higher criticism out of the classrooms at McMaster University, where he held a seat on the board of governors. In 1924 he attacked theology professor L. H.

Marshall for rejecting scriptural inerrancy (the idea that the Bible was literally accurate); atonement theology, which taught that Jesus’ sacrificial death was in atonement and satisfaction for the collective sins of humanity; and the innate depravity of humanity, which held that human nature was hopelessly crippled by original sin and irreparably flawed without divine intervention. Shields was censured two years later for his inflammatory accusations against Marshall at the General Council of the Baptist Convention. Jarvis Street Baptist Church was expelled from the Baptist Convention of Ontario and Quebec and formed its own denomination (the Union of Regular Baptists) as well as its own educational institution (Toronto Baptist Seminary), both of which remain active today. At the time of its founding, seventy-seven churches joined Shields’s new denomination, an act that attests not only to his popularity and charisma but also to the prevalence of fundamentalism in central Canada in the 1920s. Controversy followed Shields, however, when in 1933 the majority of those churches left to form the Fellowship of Independent Baptist Churches. In 1949 Shields was asked to leave the Union, at which point he established the Conservative Baptist Association of Canada.

Following the spirit of ecumenism, the Canadian Council of Churches was formed in 1944 as a representative body of twelve denominations in Canada (Protestant and Eastern Orthodox). The Council was established as a means of coordinating social service and missionary efforts in Canada and abroad. There are presently twenty-two member churches, which include representation from the major Protestant denominations as well as Anglican, Orthodox, and Roman Catholic traditions. A similar movement can be found among Canadian evangelicals in the Evangelical Fellowship of Canada (EFC), which was founded in 1964 and brought together twenty-four conservative denominations including the Pentecostal Assemblies of Canada and smaller groups such as the Salvation Army, the Mennonite Brethren Church, the Christian Reformed Church, and the Christian and Missionary Alliance Churches. Today, the EFC consists of forty affiliates, five observers (including the Canadian Council of Churches), and individual congregations across Canada.

United Church of Canada

Formally established on June 10th, 1925, the United Church of Canada was the amalgamation of the Methodist Church, Canada (which at the time was the largest Methodist denomination in Canada), the Congregational

Union of Canada, the Council of Local Union Churches (approximately 3,000 small congregations mostly in the West that had been established in anticipation of church union), and two-thirds of the Presbyterian Church in Canada. Upon founding, it was instantly the largest church in Canada, with over 20 percent of the Canadian population. Later additions were the Methodist Church of Bermuda in 1930 and the Canadian Conference of the Evangelical United Brethren in 1968.

The historian Marguerite Van Die links church union with a decreased emphasis on denominational identity and orthodoxy in light of the emergence of modern evangelism. George Pidgeon, the first moderator of the United Church of Canada and the former moderator of the Presbyterian Church, negotiated two competing narratives arguing that Jesus was not merely a social reformer but also an evangelist interested in individual transformation and union with God. For the most part, the founding members of the United Church were Social Gospellers advocating not just a shift from “salvation of the self” to “salvation of society” but more importantly for a transformation of what “salvation of the self” actually entails. The United Church set itself on an early path toward egalitarianism and began ordaining women in 1936. While it is often criticized by other Protestants as being theologically weak and too quick to accommodate secular society, the United Church continues to be widely recognized as the most tolerant and justice-oriented denomination in Canada.

The optimism of church union was renewed following the Second World War; between 1945 and 1965, the United Church constructed over fifteen hundred churches, saw its enrollment increase by over 25 percent, and had thousands of laypeople join adult Christian education groups. Charles Templeton (1915–2001) was appointed to conduct a national “Crusade for Christ,” which rivaled the evangelical campaigns of Billy Graham. Templeton’s tumultuous theological journey is representative of a larger dissolution of consensus among Protestants in Canada. Templeton’s career had two distinct stages, the first as an old-fashioned revivalist and the second as an advocate for a revised Christianity that drew upon contemporary insights with which to reinterpret doctrines. In a 1958 interview with the Toronto newspaper the *Globe and Mail*, Templeton declared himself an agnostic. This statement resulted in deep backlash from the evangelical community. Templeton went on to become a journalist and ran for leadership of the Liberal Party of Ontario in 1964.

In 1963 the United Church introduced its “New Curriculum,” which attempted to provide material for all age groups that engaged with biblical higher criticism and socially relevant material. It can be said that the New Curriculum intensified the polarization between liberal and conservative Christians in Canada and seemingly ends the ecumenist era of Canadian Protestantism. While the curriculum was subsequently taken up and adapted by several liberal denominations (it is comparable to the Anglican Church of Canada’s “Parish Education” of 1966), it was widely criticized by conservative churches and ended several decades of Sunday school collaboration between the United Church and Baptists.

The United Church continued to establish itself as an inclusive and liberal-leaning church throughout the second half of the twentieth century. In 1980 Lois Wilson was elected as the first female moderator of the United Church (Wilson went on to have a distinguished career as president of both the Canadian and World Council of Churches as well as serving as a Canadian senator from 1998 to 2002). Other notable moderators have included Robert McClure in 1968 and Anne Squires in 1986 (both nonordained laypeople) and Sang Chul Lee (the first Asian moderator) in 1988.

Recent Developments

The current configuration of Protestantism in Canada is characterized by a striking decline in membership in the years following the 1960s. From 1960 to 2000 the Canadian census reveals that membership in each of Canada’s four major Protestant denominations decreased dramatically: the United Church from 20.1 percent to 9.6 percent, the Anglican Church from 13.2 percent to 6.9 percent, the Presbyterian Church from 4.5 percent to 1.4 percent, and the Lutheran Church from 4 percent to 2 percent. Interestingly, Canadian sociologist Reginald Bibby’s statistics reveal that for the most part mainline Protestants continue to identify with their childhood religious affiliations, even in instances where they are not actively engaged with church institutions. In contrast, conservative Protestants are more likely to switch affiliations several times throughout their lifetimes. Conservative Protestants in Canada, as in the United States, are more likely to attend weekly services, to profess categorical beliefs regarding the existence of God, and to pray regularly.

In the mid-1980s and into the 1990s the United Church engaged in lengthy theological debate surrounding its stance on sexuality. After much debate, in 1988 the United Church

approved the ordination of openly gay and lesbian candidates for ministry. While this decision led to the departure of some congregations, for the most part the United Church became known as a safe place for people of all sexual orientations. The United Church was actively involved in presenting evidence in favor of same-sex marriage to the Canadian federal government, which went on to legislate same-sex marriage in 2005.

At the other end of the theological spectrum, the 1990s witnessed an influx of visitors to the controversial Toronto Airport Christian Fellowship, originally a member of the Vineyard Church, to receive the “Toronto Blessing” in the form of speaking in tongues, divine healings, “holy laughter,” and the experience of being “slain in the spirit.”

Current theological concerns among Protestants, especially in the United Church, revolve around the representation of “theological truths” in the public sphere. Popular books and films such as *The Da Vinci Code* have prompted discussion about biblical accuracy and personal morality. As the most vocal institution of liberal Christianity in Canada, the United Church has become the centrifuge of debate. In 1997 Bill Phipps, United Church moderator from 1997 to 2000, entered the media spotlight when, during an interview with the *Ottawa Citizen*, he questioned the divinity of Jesus. More recently, in 2008, Gretta Vosper, United Church minister and founder of the Canadian Centre for Progressive Christianity, published *With or Without God*, in which she posits that language and references to God have outlived their usefulness in the church. Although there have been calls for her resignation, Vosper’s congregation understands itself to be a community that is intellectually rigorous, free of absolutist statements, and consistent with a worldview that conforms to accepted scientific and moral norms—a position that they insist the rest of Christianity needs to adopt in order to survive in the twenty-first century.

The core social issues facing Canadian Protestant churches today relate to an attempt to make sense of their pasts while accommodating the future. Partially as a response to decline in membership and also as a reflection of a mandate for multiculturalism in Canada, many of the mainline churches have established themselves as a resource for new immigrants to Canada. For example, in the Presbyterian Church in Canada services are conducted in at least seventeen languages with notable Korean and Ghanaian congregations. Likewise the United Church has continued to represent itself as Canada’s national church, not only by engaging in multiculturalism but also by promoting intercultural and

multifaith dialogue. In 1996 the United Church established its Ethnic Ministries Council as a means to support ethnic minority congregations and individuals within the church and to provide a venue for new immigrants, as well as for third- and fourth-generation Canadians to participate meaningfully in the denomination.

Caribbean Religious Culture and Influence

The Caribbean Sea, lying between the North and South American continents, is the setting for the archipelago of islands stretching from Cuba, off the shores of Florida, to Trinidad, which can be seen from the Venezuelan mainland. The geographical location of the Caribbean islands has shaped their historical importance as a crossroads of cultures, races, and religions. Because these many islands sit within the Gulf Stream and the African Equatorial Current, they have been the stage for power and politics stretching from October 12, 1492, down to the early twenty-first century.

The many religious traditions brought to the islands have been impacted by the islands' history and culture, influencing religious beliefs and practices in ways unique to the Caribbean. The impact of these transformations on religion has long been categorized with the term *syncretism*. This term has proven to be problematic, since it includes instances of both embracement and rejection of disparate elements without the intellectual tools to decipher variations in the process. The polemic use of *syncretism* has been especially prevalent in the theological literature of religious elites, for whom one or another set of beliefs is either acceptable or unacceptable. Considered less freighted with the polemics of previous literature, the word *hybridity* has been more recently incorporated. But under any category, transformations and mixing of cultures and religions exercise an undeniable presence in the Caribbean.

Formal religion, it has been claimed, has the capacity to absorb popular expressions in order to reproduce the devotions of the masses within the boundaries of orthodox belief. Jaime Vidal (in *An Enduring Flame*, 1994) not only insists that there is an acceptable form of faith mixture within religions such as Catholicism but also coins an expression, *synthetization*, to describe this acceptable mixture, arguing that this term rather than *syncretization* registers

the acceptability of certain kinds of faith mixtures, while differentiating it from the unpalatable jumble of religious beliefs that are not yet reconciled or are incapable of reconciliation with the formal theological system.

What is being ultimately argued is that Christianity's absorption of elements of faith from other religions is indispensable to an analysis of Caribbean religious culture. Consider, for example, the influences from African belief systems that are present in a Catholic devotion like that to the Cuban Our Lady of Charity. Her statues and prayers to her are also found in Santería. Certainly, the term *hybridity* fits both cases. But how does devotion to Our Lady of Charity also result in differing theological conclusions that make such devotions both orthodox to Catholicism and unorthodox at the same time? These differing judgments about the theological dimension in religion are crucial in assessing the influences on Caribbean religious culture and the historical path trod in the process of religious transformations.

A useful analogy to sum up the "breaking point" between an assimilating synthesization and an unacceptable syncretism is the split of the different Romance languages from the common original language, Latin. Following this logic, Gustavo Benavides suggests that when the symbolic languages of religion have become so differentiated that persons accepting the same symbols no longer understand each other, then a new religion has been created (*Enigmatic Powers*, 1995). Crucial to any analysis of Caribbean religions is an empirical test of whether religion is a coherent mixture of different elements or, in fact, a noncommunicating dyad. These are the different currents that run under the cover of Caribbean religious culture and its influences.

Historical Origins

Even before the arrival of European Christianity with Columbus, the Caribbean had already experienced the encounter of different peoples and religious cultures. Two distinct linguistic groups occupied contiguous regions of the Caribbean. The most numerous were the Arahuan-speaking Taínos and Taínas, who were also the first people encountered by the Iberians on the major islands of Cuba, Española, and Puerto Rico. In the Lesser Antilles of the Eastern Caribbean, Karina-speaking groups called "Carib" had successfully integrated themselves into the social fabric. One curious aspect of this contact is the linguistic phenomenon found among the peoples of the island of Dominica. A seventeenth-century French missionary assembling a catechism in the native language found that the men used Carib words for certain tools and activities,

while the women used the Arahuan terms for the same things. Anthropologists have concluded this is linguistic evidence that Carib men settled the island by replacing Arahuan men as husbands in the island population. These intrusions had already taken place in the smaller islands of the Eastern Caribbean and were being resisted in Puerto Rico when the Spaniards arrived. Thus, the cultural differentiations of the Greater and Lesser Antilles began before the European intrusions.

These pre-Columbian differences are not matters of idle trivia. The earliest Spanish documents expanded the cultural divide between these groups to view the Arahuan Taínos and Taínas as “docile natives” and the Caribs as “hostile cannibals who deserve enslavement.” In their famous Valladolid debates of 1550–1551, Bartolomé de Las Casas and Juan Ginés de Sepúlveda discussed whether or not the gravity of “sins against nature” by the American natives legitimized their enslavement. The arguments of Las Casas helped set the cornerstone of contemporary international laws that protect the religious and cultural rights of native peoples.

Speeches in Spain, however, did not erase the contradictions and conflicts among the different peoples and cultures in the colonies of the Caribbean. The distinction between preaching by word and preaching by example was made clear in Las Casas’s own commentaries on evangelization. In an encounter with a prospective native convert, Las Casas asked if he had become a Christian. The man answered that he was only a “little bit of a Christian,” explaining that he knew only a little bit about drunkenness, adultery, swearing, and lying, but by imitating the Spanish Christians, he would soon be a more complete Christian. The point is well-taken, even if Las Casas exaggerated here the contrast between the preaching of a religion and its actual practice.

African Presence in the Caribbean

Africans came to the Caribbean first as freemen working on Spanish boats and in the military and later as slaves after Queen Isabella decreed in 1503 that Taínos and Taínas could not be enslaved. The demand for a slave workforce quickly transformed the African presence in the Caribbean into one that was mostly of persons held in chattel slavery. It is also noteworthy that the first black slaves came from Spain and Portugal and not from Africa. Las Casas’s early defense of the American natives had led him to suggest that those already slaves could be substituted. Later, he more clearly repudiated the enslavement of Africans on their native soil, condemning such actions with the same

vehemence with which he had defended the American natives. He wrote of the exploitation in Africa in his *History of the Indies*, picturing oppression of peoples of color as a worldwide abuse of human rights everywhere, although these passages were omitted by nineteenth-century editors.

The distinctions between free- and slave-blacks, and between Iberian and African-origin slaves, greatly affected religious influences. For instance, the free-blacks and the Iberian slaves spoke Spanish and understood European culture, law, and religion. The slave-blacks and those taken directly from Africa had little previous exposure to Christianity until arriving in the Caribbean. This divide explains why the rituals of Africa and its linguistic heritage were preserved in the rural slave quarters and not among the domestic servants of colonial cities. The runaway slaves, called *cimarrones*, often lived in the hills and would reproduce a culture and religious expression most familiar to their memories of Africa. Eventually, arguments about fugitive African slaves as savages needing punishment would be extended by Spanish, French, and English authorities to include all black persons, slaves and freemen. Essential to this racist argument was citing rituals of African religion as enduring proof of savagery. On such a religious and cultural basis, the slaveholders conducted hunts to recapture and brutally suppress the *cimarrones*.

Also among these *cimarrones*, another kind of hybridity and racial mixture began in the sixteenth-century Caribbean. The runaway slaves often assimilated into the existing culture of the American natives. Thus, in addition to those who were a mixture of black African race and white European stock, there were peoples of mixed African and Native American ethnicities—the later the were more frequently found in the Caribbean than in Mexico or Peru. It has been suggested that the Taíno-African mixture is present in Haitian Vodun as well as in the cultural and religious practices of the so-called Black Caribs of Honduras and the Garifuna people of Belize. It is the mixed race and attendant religious and cultural heritage of the Garifuna that marks them as a Caribbean nationality. Racial mixtures do not automatically produce cultural transfers with theological results, but racial miscegenation is often the context for religious and cultural miscegenation.

Religion and Racial Politics

Cultural and religious bias is an ordinary occurrence in human history, and it affects the study of that history.

Accordingly, descriptions of the cultures and religions of the Caribbean need to be filtered through a critique that identifies underlying premises. Thus, some non-Catholic historians perceive the colonial effort of the Spanish in the Caribbean as unrelentingly exploitative. This so-called Black Legend emphasizes the negative aspects and results of Spanish colonization. Carried to the extreme, it interprets everything Spanish and Catholic as wrongful. On the other side, there is a rationalizing approach that emphasizes the positive aspects of Spanish intervention to the point of whitewashing any errors or mistakes. It is labeled as the “White Legend,” to contrast it as an opposite type of exaggeration.

Labels derived from sixteenth-century debates have persisted into the twentieth and twenty-first centuries. In 1987 in Hialeah, Florida, where many Cuban exiles live, the city council prohibited killing animals in Santería rituals. Defending the city ordinance, the chaplain of the police department compared the ritual to “the worship of demons” (do Campo 1995: 156). While a Supreme Court decision (*Lukumi v. Hialeah*, 1992) and subsequent federal law (Religious Freedom Restoration Act, 1993) included Santería rituals as the free exercise of religion, this case shows that the categories used by the White and Black Legends’ approaches to Caribbean religion persist in the contemporary United States.

The White Legend that supports the role of Christianity as a civilizing force is echoed in the approach of Anglicanism to slave-blacks in the English Caribbean in such places as Jamaica. Beginning in the eighteenth century, organizations such as the Society for the Propagation of the Gospel in Foreign Parts focused on evangelizing the slaves in the Americas. In his 1684 book *Sacred Theory of the Earth*, Thomas Burnet echoed the White Legend notion that supplanting native religion with Christianity was a benign process. The optimism for Anglicans about the potential for African slaves to become Christians stood in contrast with the Calvinist tendency to consider them unredeemable savages.

The failure of these earlier efforts helped spur the abolitionist movement of the early nineteenth century. Member of the British Parliament William Wilberforce (1759–1833) was one of many who cited the cruel mistreatment of African slaves in the Caribbean as a reason for Christians to end the slave trade. As with Las Casas two centuries earlier, Wilberforce found his most bitter opposition came from plantation owners, who considered slavery a necessary component of a profitable economy. Nonetheless, slave trade in the

Caribbean was restricted and finally abolished throughout the British Empire in a series of measures adopted by Parliament, beginning in 1807 and concluding in 1833. The religious sentiments that animated the British abolitionist movement spilled over into the U.S. abolitionist movement, which achieved success only after a bloody Civil War (1861–1865).

Without the dramatic examples drawn from the Caribbean, neither the history of the slave trade in Great Britain nor the emancipation of slaves in the United States would have been the same. Even critics who argue for economic rather than religious causes for abolition in the Caribbean recognize that religion exercised a crucial influence in the formation of Caribbean societies. In the case of abolition, as with the Spanish White Legend, the emphasis was on what Christianity did to uplift religion in the Caribbean, neglecting the power of other religious expressions among the slaves. Still, Wilberforce and his allies followed the trail blazed by Las Casas centuries before in urging reform, with a Caribbean scenario as the dramatic example presented on the world stage.

Often divorced from the processes of kings and parliaments, religion among the peoples of color in the Caribbean took on its own character. The most common form of religious hybridity arose from the need of the poor to apply medicines and cures to the sick. Before the invention of the urban pharmacy, ordinary people used plant leaves or seeds with medical properties for teas or for topical use.

Hybridity entered through two doors in the Caribbean. For one, the tropical forests and mountains did not always offer the same set of plants that were familiar to Europeans. Instead, there was an abundance of local and new sources for usage. Often these new Caribbean pharmacological resources had been used by the natives of the Caribbean long before the arrival of Spaniards or Africans. Moreover, at times the Caribbean variation of the plants more closely resembled African equivalents than European variations.

Patterns emerged for certain individuals skilled in recognizing and applying such home remedies to function in the stead of scientifically trained doctors. However, the material application of such herbal remedies was often accompanied by prayers for efficacy that could be traced to the non-Christian experience. As often as not, the practitioners invoked both Christian saints and nature spirits to provide the best path to recovery for the sick. Touching, rubbing, and anointing affected parts frequently accompanied such actions. This type of home medicine became known in the

Spanish-speaking Caribbean as *curanderismo*, and the skilled practitioners were *curanderos/as*. While in the early twenty-first century medical treatments are seldom associated with religion, history suggests that such holistic healing was applied with prayer and blessings. In this way, such home healing with religious overtones became associated with the poor, the rural, and the people of color.

With the twentieth-century efforts to build hospitals and bring scientific methods of care to the Caribbean countryside, the old arguments about savages and civilization, about the ignorant natives and the educated elites, resurfaced. On the one hand, it was argued that *curanderismo* was a vestige of ignorance and superstition. Prayers to spirits unrecognizable to Christian orthodoxy or use of plants with names unfamiliar to hospital doctors became proof that *curanderismo* should be rejected. Instead of proof of commonsense medical insight, the frequent efficacy of such home-style organic treatment was twisted to become evidence of devil worship and the like. This was exacerbated by the tendency among the *curanderos/as* to attribute illness to evil spirits who had taken up abode in the body of the sick.

Curanderismo has become part of the fabric of ordinary life in contemporary Caribbean societies. Such skills have become “spiritual capital” and have made such healing into “the business of magic” (Romberg 2003). More clinical approaches to *curanderismo* have emphasized its efficacy over its religious foundation and demonstrated the empowerment of women both as healers and as patients in what has been termed “traditional healing” in Puerto Rico and among the Latino community in the United States. Its persistence argues that *curanderismo* ought to be considered an important element of Caribbean religious culture.

Political Views of Caribbean religion

The American War of Independence and the French Revolution introduced politics into the Caribbean in ways that affected the perception of religion. While the rivalries between Catholic Spain and France on the one hand and Protestant England and Holland on the other had been present in the sporadic warfare and the piracy of the Caribbean, only in the nineteenth century did the religious cultures indigenous to the islands begin to assume political influence.

The first such manifestation was in the Haitian Revolution. The 1793 beheading of the French king in Paris and the subsequent turmoil that lasted until the final defeat of Napoleon in 1815 allowed a new nation composed mostly

of former slaves to emerge on the western part of Española. Ruled by blacks and supported by an army of former slaves, the Haitians repulsed European armies and eventually marched unimpeded into the Spanish eastern section of the island, annexing the colony of Santo Domingo in 1821. Viewing the Vatican, the central apostolic see of Roman Catholicism, with the same suspicion as existed for the European imperial powers, the new Haitian Republic witnessed the emergence of religious practices that were unregulated in the absence of clergy. Although by midcentury an accommodation was reached that allowed for restoration of institutionalized Catholicism, the hiatus had permitted a public role for rituals that exhibited elements of both Catholicism and African religions, known as Vodun, or “Voodoo.”

Haiti is not the only site for syncretism of Catholicism and African beliefs. The dichotomy between white free society and black slaves in Cuba permitted a similar syncretism that resulted in the religion of Lukumí, known outside of Cuba as Santería. Both of these forms as well as variations in the Dominican Republic (Gagá) share a common trait of hybridization, although in different measures and in various formulations.

Caribbean religions usually identified as “Afro-Caribbean” often also have been influenced by Spiritualism. Developed from European positivism, Spiritualism emerged in the nineteenth century as a philosophical system with the Enlightenment’s view that institutionalized religion was for the masses while rational science was the superior understanding of the elites. Propagated by Masonic organizations, positivism went beyond a passive deism and produced a religion to rival Christianity.

The Spiritualism that arrived in the Caribbean via Spain and France was derived from the writings of Allan Kardec, pseudonym for Hippolyte Leon Denizard Rivail (1804–1869), a French educator. Kardec insisted rational meaning was hidden within all religions. He offered the key to deciphering the progress of human history. Often cast into numerical formulae, the hidden meanings allowed Spiritualists to accept public religions such as Christianity to satisfy social expectations. Often, Spiritualists in the Caribbean were Masons or Free Thinkers who did not attack the church but tolerated it as an inconvenience whose inner esoteric symbolism was a prop for universal rationalism. While Kardec was still fashioning his synthesis of outward material religious symbols and inner spiritualist rational meaning, cases of spirit-tapping stirred public interest in

communication with the spirit world. The side result of Kardec's popularity on both sides of the Atlantic was the upper class gathering in a séance to speak with the dead.

In Puerto Rico, as in Cuba and Haiti, contact with spirits was a feature of the religion of the people of color, particularly of black slaves. In search of frequent contact with the dead, Spiritualists of an upper class were brought into symbiotic contact with Afro-Caribbean religions of blacks. Thus, there emerged cross-class religions that incorporated both the "white table," the nonsacrificial séance, with the "red table," or bloody animal sacrifice rituals.

Contact between these traditions was intensified with the migration of black persons to the cities of the Caribbean in the first third of the twentieth century and exploded with the immigration to the United States after World War II. Variations from the Caribbean islands survive among people from a particular culture who have migrated to the United States. There is, for instance, the persistence of Lukumí among Cubans in Miami of all social classes. In addition to these home-and-away linkages, the contact among the major Caribbean groups in cities such as New York has produced religious configurations found only in the United States. Moreover, the Afro-Caribbean variations in the United States attract not only new members from among African Americans with little or no Caribbean background but white people as well.

Jamaica had its own version of syncretism that combined religion with the utopian visions of Marcus Garvey (1887–1940). Garvey, who achieved his greatest successes in New York City, had lived much of his life in Jamaica before becoming an immigrant to the United States. During the Great Depression, he organized the Universal Negro Improvement Association (UNIA), a society in which blacks ran their own businesses and took pride in their African history. Although run from New York, the association popularized the notion of Pan-Africanism and the eventual prosperity of African peoples everywhere to a leading role in world affairs.

While Garvey's organization did not constitute a religion, it was a breeding ground for new religions, some of which appear unconnected to the Caribbean. It may be argued that Garvey's influence could be traced to the Black Muslims, since Elijah Muhammad had been a Garveyite before taking over the Nation of Islam. In Garvey's homeland of Jamaica, his economic and social utopian vision was hitched to a religious framework of salvation and millenarian fulfillment known as the Rastafarian faith. The first publication

promoting the religious dimensions that became the Rasta movement was Leonard P. Howell's *The Promise Key*, published shortly after the November 1930 coronation of the emperor Haile Selassie of Ethiopia in Addis Ababa. Ethiopia has a history dating back to biblical times and protects a Christian faith with unique beliefs and rituals partially explained by isolation from Roman Catholicism. Enlarging on the honorific titles such as "Lion of Judah" invoked in the ceremony, Howell (1898–1981) presented them as fulfillments of prophecies taken eclectically from Judaism and Christianity. His audacity rewarded him with jail time in Jamaica for sedition because he urged recognition of Selassie as a Black Messiah instead of continuing obedience to the English king.

The Rasta grew in numbers in Jamaica. Street preachers promoted a belief in a Black Messiah, using concepts taken from Christianity that were familiar to the new converts, and invoking Garvey's ideas on economic and social power for black people. By 1961, when Haile Selassie visited Jamaica, the Rasta had retreated from troublesome conflict with authorities into communes, where they promoted a return to Africa. Customs such as not cutting hair and letting it grow as dreadlocks and using marijuana, or ganja, in rituals mark members of the Rasta. The Rastafarians have also developed a musical style for songs that mirror their beliefs about the world and the role of blacks. The reggae music with words written and songs performed by Bob Marley are considered representative not only of the Rastafarians but of Jamaican culture.

In the Spanish Caribbean there is a current revival of the Taíno religion. While there was a historical break in continuity between the religion practiced by the natives of the Greater Antilles and groups of Puerto Ricans and Dominicans today, some have organized themselves as part of the Native American peoples. These new Taínos/as attend pow wows and other regional conferences for Native Americans in the contemporary United States. The Neo-Taínos/as intend to restore to contemporary practice the main elements of the religion that had been replaced by the sixteenth-century encounter with Spanish Catholicism. While there are questions as to whether or not these restorations actually reproduce the native religion of the sixteenth century, there is little doubt that such efforts have introduced Taíno/a spirituality into modern society. The revival of native religions is found not only on the Caribbean islands but also among groups of immigrants living in U.S. cities.

Not only traditional domestic customs and grassroots groups can be categorized as Caribbean religious culture. Religious institutions also generated much social influence, especially in politics. In prerevolutionary Cuba (1900–1959) as in the Dominican Republic under the Trujillo's dictatorship (1930–1961), Catholicism was used by tyrants in order to prop up their rule among the people. Their siren song was anticommunism, and at times this effort to frighten church leaders would distract religious attention from issues of social justice and government corruption. In Cuba and the Dominican Republic, however, church members from both Catholic and Protestant denominations eventually opposed the regime, participating in the dramatic overthrow of dictatorships.

In Cuba, the 1959 victory of rebel forces under the leadership of Fidel Castro over Fulgencio Batista's dictatorial regime was quickly followed by religious conflicts between the Catholic Church and the Revolution, when it was backed by the communist government of the Soviet Union. The rush of events produced the Cuban exile community of South Florida and elsewhere. Relations between the Cuban government and the Catholic Church underwent alternating periods of rapprochement and distancing for three decades, affected primarily by the Second Vatican Council, which opened up Catholicism to the theology of liberation. However, the so-called special time produced by the dissolution of the Soviet Union had the greatest impact on Cuban religion. At a party congress in 1993, the Cuban Constitution was changed from describing Cuba as "an atheistic state" to "a secular state." With the implicit censure of religious practice lifted, not only Catholicism and the historic Protestant denominations were invigorated, but also the religions of Lukumí and Spiritualism, which had often functioned secretly at the margins of state and religion. The historic visit of Pope John Paul II to Cuba in 1998 signaled a new epoch in religious influence in Cuba, and the full effects are yet to be experienced, as longtime Cuban leader Fidel Castro remains powerful even after resigning his office for health reasons in 2008.

In Puerto Rico, a U.S. colonial possession since the end of the Spanish-American War of 1898, the 1960 island elections produced a conflict between church and state when the Catholic bishops promoted the formation of a religious party, the Partido de Acción Cristiana (PAC), in opposition to the birth control policies of the established political leader, Luis Muñoz Marín. Although Muñoz Marín won reelection, and the North American bishops were replaced by native Puerto Rican hierarchs, the conflict produced a

division among Catholics and fragmented ecumenical participation for decades. Moreover, the political ineptness of the North American bishops in 1960 dimmed the glaring light cast on forced sterilization by a native bishop, Antulio Parrilla Bonilla (1919–1994). In 2000, Puerto Rico had the highest rate (33 percent) of sterilization of women of child-bearing age in the world, and endemic poverty made worse by its juxtaposition with the wealth of North American corporations. The ambiguous political status of Puerto Rico—ruled by the U.S. Congress but without voting rights—has stilled the prophetic voice of religious institutions such as the Catholic Church and many Protestant churches with headquarters in the United States.

Catholicism was identified in Puerto Rico from the 1940s through the 1960s with both conservatives and radicals. The revolutionary Nationalist Party leader, Pedro Albizu Campos (1893–1965), promoted a Catholic identity for Puerto Rico. Arguing that the United States was a Protestant country with culture and values inimical to Catholic Puerto Rico, Albizu Campos compared the situation of his homeland to what Ireland had suffered under Protestant British rule for some 400 years, and he urged armed rebellion. The legacy of religious resistance to colonialism acquired an ecumenical character after the Second Vatican Council and the arrival in Puerto Rico of liberation theology from Latin America. Beginning in 1999, successful protests led by religious groups forced the closing of the U.S. Navy base and its target bombing of the inhabited island of Vieques in 2003. Thus, unique among the religions found elsewhere in the Caribbean, many believers in Puerto Rico have come together to confront the moral implications of what they view as a situation of colonialism.

Diasporic Caribbean Religion

Each of the Caribbean islands has undergone a major out-migration of its people. Too complicated to reduce to any single formula, the twentieth century produced a scattering, or diaspora, of Caribbean peoples. The ties between the sending and receiving groups also allow for continual interchange or religious culture and influence between island homeland and migrant destination.

An example of the phenomenon of import-export of both people and religion is found in Puerto Rican Pentecostalism. Shortly after the U.S. annexation of the island in 1898, growers in faraway Hawaii began to bring displaced Puerto Ricans to the Pacific islands to work the agribusiness fields. Hawaii in 1900 was also a key player in the Holiness

movement, which spilled over into the Azusa Street Revival of 1913 in California, thus contributing to the birth of Pentecostalism. Juan L. Lugo, a Puerto Rican Pentecostal convert, returned to Puerto Rico after his acceptance into the Assemblies of God in 1916. The Pentecostal faith grew rapidly in Puerto Rico, and by 1932, Pentecostals outnumbered all other Protestants in Puerto Rico. Eventually, Puerto Rican Pentecostal missionaries would found churches in much of Latin America and most especially in New York City.

Caribbean Pentecostals have not been exempt from the syncretistic elements common in other expressions of the island cultures. Juanita Garcia Peraza (d. 1970) converted to Pentecostalism in the 1940s but became convinced that she was the incarnation of the Holy Spirit. With the name La Diosa Mita, her new religion integrated a strong network of support groups and enterprises to its worship and now has spread outside of Puerto Rico. Also fitting into this category of "Pentecostal heresies" are churches such as Fuentes de Agua Viva (Fountains of Living Water). In New York City, Pentecostals broke with the orthodox preaching that "retarded" children were possessed by the devil and condemned to hell. Instead, such groups as Angels Unaware nurture people of faith and care for children with special needs.

Ana Maria Diaz-Stevens has written convincingly, in "The Saving Grace," of a "matriarchal core" at the heart of diasporic Caribbean religion. Noting that males in migration seldom reach the social status afforded them in their homeland, she states that women have assumed the key role in sustaining faith and family. The same author, in *Oxcart Catholicism on Fifth Avenue*, demonstrated that the presence of large numbers of Caribbean peoples has forced substantial changes on the religious institutions of the diaspora. The changes include the use of typical folk music and the utilization of symbols both secular and religious to identify worship as specifically Caribbean. There is a growing literature that explores the diasporic experience of other groups and other religions.

Thomas Tweed undertakes an analysis of Cuban religious identity in his study of the Shrine of Our Lady of Charity in Miami, Florida. Because it is difficult when not also unlawful for Cubans in the United States to travel to the original shrine, in the Santiago region of Cuba, the Miami complex has developed a set of supports for cultural and religious identity with uniquely diasporic Caribbean characteristics. Likewise, Dominicans in the United States have transferred to American shores the devotion to their

national patron, Our Lady of Altagracia. Haitians have incorporated the Polish Our Lady of Czechostowa, the "Black Madonna," into their expression of cultural identity. Without claiming American exceptionalism for Caribbean religion, it appears that many in diaspora have become more religious in the United States than they were in their island homelands.

Caribbean Religious Forms

Caribbean religious culture has adapted to constantly changing circumstances in multicultural and multiracial societies. Some variations appear as syncretized or hybrid "new" religions that have no match elsewhere. The Rastafarians and the religion of La Diosa Mita fall into this category. Some view Afro-Caribbean religions as imperfect restorations of pristine African religions. The Neo-Táinos made a similar claim to have restored an old religion rather than having created a new one.

Most of Caribbean believers, however, are not members of these specialized religions. Rather, they belong to more familiar Christian churches. They have been affected, however, by the crosswinds and deep currents of religious encounters in multicultural and multiracial Caribbean societies. As suggested in the opening pages, the adaptation or lack thereof to syncretistic elements is the key to understanding Caribbean religious cultures and their influences. Caribbean peoples worship through familiar forms of Christianity but also with unique expressions such as Vodun, Santería, and the Rastafarian faith. Whether on the islands or in diaspora, the lived religion of the Caribbean peoples has proven to be creative and enduring.

Celebrity Culture

Celebrity culture influenced religious life long before such twentieth-century icons as Billy Graham, Elvis Presley, and the Dalai Lama. Most religions and spiritual movements

start around the lives of celebrated individuals. Two thousand years later, the Christian calendar is based on the major events in the life of Jesus of Nazareth. In the Roman Catholic Church, the person performing the central act of worship is referred to as the "celebrant." Long before modern mass media placed entertainers on the national pedestal, Christians looked to the lives of the saints for their celebrity needs. Muslims may not revere the image of their founder, but they certainly seek to emulate the life story of the prophet Muhammad. In the East, the life journey of Siddhartha Gautama, a man born in the sixth century BCE in modern-day Nepal, defines the foundation of the practice of Buddhism. In more recent times, however, the line between religious celebrity and pop stardom has become increasingly blurred. One noteworthy example of this occurred at an event in the San Francisco Bay Area during the 1990s when actress Sharon Stone took the stage to introduce the fourteenth Dalai Lama, His Holiness Tenzin Gyatso, as "the hardest-working man in spirituality."

History: Religious Figures as Celebrities

In the United States a long tradition of religious individualism and a consumerist approach to personal spirituality has only exaggerated the ancient tendency to personalize the mysterious power of the divine in celebrated individuals. During the colonial period the Boston Congregational Church minister Cotton Mather (1663–1728) was the first American preacher to gain international fame. He went down in history as the best-known American Puritan, in part because of his role in the Salem witchcraft prosecution of 1692, which stimulated widespread public excitement. While Mather was famous, he did little to foster the spirit of individualism and spiritual diversity that would come to characterize American religion and help create its celebrity culture. The colonial preacher best known for the cause of religious liberty was Roger Williams (1603–1683), the founder of the Rhode Island colony.

The Eighteenth and Nineteenth Centuries

The most renowned preacher of the First Great Awakening, the Calvinist clergyman George Whitefield, established the model for modern mass evangelism. Whitefield (1714–1770) drew thousands of people to hear him preach during his seven pilgrimages to the United States. His call for a "new birth" in Jesus, his ability to ignore denominational differences, and his strategy of taking his message outside church buildings and directly to the people were to become the

hallmarks of the American evangelical movement. Whitefield, an Englishman whose anti-Anglican stance made him popular in the American colonies, advertised his revivals in newspapers and advised his disciples that “the object of our measures is to gain attention.” Another celebrated preacher during this period of American religious fervor was Jonathan Edwards (1703–1758), who delivered the “sermon New England would never forget,” titled “Sinners in the Hand of an Angry God,” and wrote several famous treatises such as *The Nature of True Virtue*.

The next great wave of religious celebrities would come in the first few decades of the nineteenth century, as Protestant revivalists sought to counter the ideas of the Enlightenment and resist the deism of Thomas Jefferson and other leaders of the American Revolution. The best-known preacher of this Second Great Awakening was Charles Grandison Finney (1792–1875), who began his career as a lawyer but wound up testifying to a soul-shaking conversion that convinced him he had “a retainer from the Lord Jesus Christ to plead his cause.” He led revivals in the major cities of the East and in the fast-growing towns of the West. Finney developed such a personal popularity that he was forced to defend the whole idea of a religious revival led by man—rather than by God himself. “More than five thousand million have gone down to hell, while the church has been dreaming, and waiting for God to save them without the use of means,” Finney wrote.

This period of American religious history also saw the rise of religious reformers, who were reviled as much as celebrated. Chief among them was Joseph Smith, the founder of the Church of Jesus Christ of Latter-day Saints. The story of Smith (1805–1844) is a textbook example of how starting a modern-day religion around the life of a single person can be a mixed blessing. Smith wrote, and many Mormons believe, that God was once a man and that he and his wife, the Heavenly Mother, live near the star Kolob. Smith also preached that Jesus Christ was married. In the 1890s, the church was finally forced to renounce the most well-known of Smith’s doctrines—the practice of plural marriage, or polygamy. According to historians, Smith had taken thirty-three wives by the time he was murdered by an angry mob in Carthage, Illinois, in 1844. In recent decades, the Church of Jesus Christ of Latter-day Saints has sought to emphasize what it has in common with mainstream Christian thought, such as its belief that Jesus Christ was born of a virgin and resurrected from the dead, and that humanity can be eternally saved through Christ’s sacrificial death.

Mary Baker Eddy provides another example of how the life struggles of a spiritual celebrity can shape the doctrines of a religious movement. Eddy (1821–1910) was often ill as a young woman and found little help in the remedies of her time. She turned to Phineas P. Quimby, who used magnets and hypnotism in his healing treatments, but later developed her own ideas about faith healing, doctrines that were laid down in the Christian Science movement she founded. Another celebrated nineteenth-century woman who would influence the Spiritualist and New Age movements of the twentieth century was Elena Petrovna Gan, better known as Madame Blavatsky (1831–1891), who founded the Theosophical Society in New York City in 1875. During the final years of her life, Blavatsky told some of her students that the real purpose of the Theosophists was to pave the way for the return of the ultimate religious leader, a new world teacher. In 1909, her successors claimed to have found that teacher in India in the form of Jiddu Krishnamurti, a fourteen-year-old boy. Krishnamurti would be raised as the new “World Teacher,” only to denounce that messianic role at age thirty-four.

Christian revivalism didn’t stop at the end of the Second Great Awakening. The premier celebrity preacher of the second half of the nineteenth century was a shoe salesman from Chicago named Dwight L. Moody. In 1860, Moody (1837–1899) dedicated himself to Christian evangelism, working in army camps during the Civil War and offering words of hope to families displaced and otherwise devastated by the fighting. Moody had no theological training and only a seventh-grade education, but his simple gospel message found an eager audience in the decades following the Civil War. Newspapers devoted significant coverage to his revivals, which filled auditoriums in New York City, Chicago, and other American cities. Encouraged by wealthy contributors and powerful patrons, he founded the Moody Bible Institute and began to train a new generation of Christian revivalists who would continue the message into the twentieth century. Moody is the link between two of America’s greatest Protestant religious celebrities, George Whitefield and Billy Graham.

Another Protestant minister of this period, the Reverend Henry Ward Beecher of Brooklyn, New York, exemplified the growing national obsession with religious scandal and celebrity culture. Beecher (1813–1887) was a brother to writer Harriet Beecher Stowe and a preacher of enormous popularity in nineteenth-century America. In the 1840s thousands of people boarded ferries from Manhattan known

as “Beecher Boats” to hear his Sunday sermons. Newspaper stories of his alleged sexual affair with the wife of a close friend culminated in 1875 with an adultery trial that received unprecedented saturation coverage in American newspapers. The trial unleashed a media frenzy perhaps not surpassed until the 1995 murder trial of celebrity athlete and actor O.J. Simpson.

The Late Nineteenth and the Early Twentieth Century

Professional athletes were a major component of celebrity culture in the late nineteenth century and throughout the twentieth century. The first man to make the crossover from the major leagues to the mission field was William Ashley Sunday, better known as Billy Sunday. Sunday (1862–1935) was a popular outfielder in the National League in the 1880s and one of the league leaders in stolen bases. Following his evangelical conversion in the late 1880s, Sunday stopped drinking and partying with his teammates and started speaking before congregations and young people at local chapters of the YMCA. When his audience got too large for church halls, Sunday began erecting huge canvas tents in which to hold his revival meetings. He later erected an eighteen-thousand-seat church hall, known as Billy Sunday’s Tabernacle, on the corner of Broadway and 168th Street in New York City. Sunday was the nation’s leading Christian celebrity in the first two decades of the twentieth century, but his popularity began to decline after World War I. Movie theaters and movie stars were offering new competition for the revival tent and the celebrity preacher. They were the first in a series of technological revolutions that changed the nature of celebrity culture in America.

Movies, radio, television, and, finally, the Internet each brought about profound changes in twentieth-century America. And those changes began with a woman named Aimee Semple McPherson. Decades before such televangelists as Billy Graham, Pat Robertson, and Jim and Tammy Bakker started mixing show business and conservative Christianity, this pioneering Pentecostal preacher and radio evangelist presided over the lavish opening of her 5,300-seat Angelus Temple in southern California. Just as with other celebrities then and now, her reputation was built up and torn down by a news media hungry for scandal and sensation. Born to a farmer father and mother who worked for the Salvation Army, McPherson (1890–1944) was raised in the desolate countryside of Ontario, Canada. As a young girl, she found her salvation in an Irish immigrant and fiery preacher

named Robert Semple. The couple was swept up in a revival that was just gathering steam in towns and cities across North America. The revival sparked the modern Pentecostal movement, a lively style of Christian worship that stresses faith healing, prophecy, speaking in tongues, and a literalist approach to the Bible. They married in 1908 and two years later took off on a mission to China, but within months of their arrival Robert contracted malaria and died. Looking for security, Aimee married businessman Harold McPherson. She gave birth to a son, but it was not a happy marriage.

During World War I, McPherson crisscrossed America in a “Gospel Car” painted with the slogan, “Where will you spend eternity?” By the 1920s she was a famous faith healer filling auditoriums in Denver, San Diego, and other cities. Her giant Angelus Temple soon rose at Sunset and Glendale boulevards, just down the road from Hollywood. The huge church, described by one visitor as “half like a Roman Coliseum, half like a Parisian Opera House,” became one of the city’s premier tourist attractions. It was topped with a giant radio tower that sent McPherson’s sermons and speeches across southern California. The evangelist’s most notorious exploit came in the spring of 1926 when she suddenly vanished while swimming at Venice Beach. Her disappearance and feared death by drowning set off media speculation that only continued to build after she mysteriously reappeared five weeks later in Mexico, amid rumors that she had escaped to have an amorous affair. But by the end of the twentieth century, the religious denomination McPherson founded, the International Church of the Foursquare Gospel, had more than 1,850 U.S. congregations and more than 238,000 members.

McPherson was at her peak in the summer of 1925, when the nation was gripped by one of the watersheds of American cultural history. In Dayton, Tennessee, celebrity attorneys Clarence Darrow (1857–1938) and William Jennings Bryan (1860–1925) faced off in the landmark “monkey trial,” in which high school teacher John Scopes was prosecuted for violating a state law that prohibited teaching the theory of evolution. Reporters from across the country descended on Dayton for an event that would define a cultural split between the secular forces of modernism and the waves of religious revivalism that periodically sweep across the United States. This same religious and political divide would persist into the next century, separating the country into a nation of “red states” and “blue states.”

Radio and television were also the media that turned two Roman Catholic priests into national celebrities in the

1930s, 1940s, and 1950s. Father Charles Coughlin (1891–1979) was one of the first North American clergymen to use radio to preach a political message, including commentary that was widely viewed as anti-Semitic. Bishop Fulton Sheen (1895–1979) was a television pioneer with his *Life Is Worth Living* show in the early 1950s, which continued in various forms well into the 1960s. Coughlin and Sheen paved the way for an American-born nun Rita Antoinette Rizzo, later known as Mother Angelica (1923–), to viewers of her Eternal Word Television Network (EWTN).

“Living” Saints: Billy Graham, John Paul II, and Mother Teresa of Calcutta

Perhaps no religious celebrity in twentieth-century America has had as much fame and impact as William Franklin Graham. During that century, Billy Graham probably preached to more people than anyone in the history of the world. Graham’s television broadcasts have been viewed by hundreds of millions of people around the world, and millions more have personally witnessed his Christian crusades at massive revival meetings, from Aarhus, Denmark, to Azagorsk, Russia. Graham (1918–) was born on a dairy farm in North Carolina to Scottish Irish parents but was “born again” at a revival meeting sixteen years later. His evangelical career took off in 1944, when Graham, then a young suburban pastor and budding radio evangelist, was invited to speak at the 3,400-seat Orchestra Hall in Chicago before young servicemen from the adjacent USO.

Graham got his first big boost from newspaper czar William Randolph Hearst. Impressed by Graham’s anticommunism and strong moral values, Hearst reportedly told his editors to “puff Graham.” And they did, running glowing full-page stories about the young preacher in all twenty-two papers of the Hearst chain. During the 1950s Graham was an early supporter of the civil rights movement and Rev. Martin Luther King Jr. That cost him some southern support but improved his reputation among African Americans and the mainstream media. Graham was famous as the pastor to American presidents, and his closest and most controversial political tie was to Richard Nixon. While officially neutral, Graham was a behind-the-scenes force in Nixon’s 1960 campaign against John Kennedy, whose Catholicism worried many American evangelicals, and he also dropped clear hints in his support of Nixon’s successful 1968 presidential run. Graham stuck by Nixon during much of the Watergate scandal, only to be embarrassed later by the expletive-filled audiotapes secretly recorded in the Oval Office.

In the 1980s Graham remained untouched by the sex-and-money scandals that disgraced a series of major TV evangelists, and he was a strong voice for greater financial accountability in evangelical ministry. His unparalleled popularity landed him on the Gallup Poll’s list of “10 Most Admired Men in the World” more than forty times in the last half of the twentieth century. Graham often shared that list with another religious leader who was not born in the United States but whose American pilgrimages drew millions of Roman Catholic spectators and communicants.

Pope John Paul II (1920–2005) presided over a twenty-six-year papacy, in which he played a critical role in the downfall of communism and promoted traditional moral values as an alternative to the materialism of the West. Born as Karol Jozef Wojtyla in Wadowice, Poland, John Paul II had Eastern European roots that would define his pontificate, the second longest after Pope Pius IX, who served from 1846 to 1878. Wojtyla was elected pope in 1978, survived a would-be assassin’s bullet in the early years of his pontificate, and pushed onward to become the most-traveled pontiff ever, beginning with his first trip to Mexico in January 1979. Like former president Ronald Reagan, John Paul II was a former actor and charismatic speaker, someone who understood the power of television. His foreign tours, including five highly publicized visits to the United States, featured parades in his bulletproof “pope-mobile” and outdoor masses attended by millions of worshipers. The pope and his tour managers were masters of the photo opportunity, and images of the pope holding a koala bear in Australia, hugging a young AIDS patient in San Francisco, and kissing airport tarmacs around the world were deeply etched in the public mind.

One of the few religious celebrities who could compete with the pope for public renown and respect was another Catholic personality, Mother Teresa of Calcutta. During the last two decades of her life, the diminutive Catholic nun appeared nineteen times on the Gallup Poll of women most admired by the American public. Mother Teresa (1910–1997) was born Agnes Gonxha Bojaxhiu in the summer of 1910 in Skopje, Macedonia. At age eighteen, she joined the Loreto Sisters, a Catholic religious order, and traveled to Ireland and Darjeeling, India. The journey to India began a second conversion in the young nun, who started her own religious order there, the Missionaries of Charity, and devoted herself to compassionate aid for the “poorest of the poor.” Unlike many celebrities, religious or otherwise, Mother Teresa did not seek the spotlight. The tireless nun

first gained international attention in the 1960s, when she was discovered by the British author and filmmaker Malcolm Muggeridge.

In 1979 she achieved worldwide fame when she was awarded the Nobel Peace Prize for her decades of work with ill and dying people in India and around the world. Even after those accolades, Mother Teresa shunned publicity and downplayed her accomplishments. To avoid the media spotlight, she would often slip unnoticed into San Francisco to visit her main U.S. convent, where between eighty and one hundred sisters quietly prepared for religious life. Yet it was Mother Teresa's renown that made her Missionaries of Charity the most successful Roman Catholic religious order of the late twentieth century. At a time when many Catholic orders were in rapid decline, the Missionaries of Charity grew swiftly around the world, attracting thousands of idealistic young converts. In the process the wrinkled face and soulful eyes of Mother Teresa became synonymous with religious devotion and selfless charity.

Decades before her death, Catholics and non-Catholics alike began calling Mother Teresa "a living saint." The wheels of the official Roman Catholic process towards sainthood began to turn on September 5, 1997, the day of her death. Long before the days of television, *People* magazine, and celebrity Web sites, religious leaders were selected by a painstaking process undertaken in Rome at the offices of the Sacred Congregation for the Causes of Saints. But in the case of Mother Teresa, the process of sainthood had already begun. Over his long papacy, Pope John Paul II canonized more than 470 saints and beatified 1,280 candidates as "blessed," more than the combined totals of all his predecessors over the past four hundred years. Saints had almost gone out of style in the 1960s. Pope John XXIII, the pontiff who inaugurated the great liberal reforms of the Second Vatican Council (1962–1965), canonized only 10 of them and beatified 4 candidates during his five years in office. Many church leaders at the time saw Catholic saints—and the miracles performed in their name—as outdated or superstitious remnants from another era. John Paul II and Mother Teresa pushed sainthood back to the center of church life, but not all Catholics saw this as a sign of healthy faith. They complained that the number of canonizations by Rome lacked proper skepticism and represented a resurgent form of personal piety in the Catholic Church. Perhaps the same can be said for the larger rise of celebrity culture in American religion. There is a downside to focusing on individual personalities and choosing religious leaders because

they are photogenic or "great communicators." Both the mystical piety of the Polish pope and the good deeds of the late Calcutta nun were a move towards seeing the church as an agent of social transformation. Celebrity religion can rise at the expense of more complex questions of systematic poverty and social injustice.

Televangelism and Celebrity: Oral Roberts and the Bakkers

Most of Pope John Paul II's televised images were in the form of news coverage provided at no charge by the mainstream media. Television, in the form of paid programming and dedicated cable networks, was the key force in the rise of the major Protestant media celebrities in the last half of the twentieth century. One pioneer in that field was Oral Roberts (1918–2009), an Oklahoma faith healer who built his *Expect a Miracle* show into the top-rated religious television program of the 1970s. But another religious broadcaster would soon eclipse Roberts. Robert Schuller (1927–) came to southern California with his wife in 1955, right out of his seminary education in Chicago, and began preaching sermons atop the snack bar at the Orange drive-in theater in Garden Grove, as members of the congregation remained in their cars. Schuller was an ordained minister in the Dutch Reform Church, but his message was a hopeful "You can do it" proclamation, heavily influenced by the Positive Thinking ideas of Norman Vincent Peale.

It was a message that thousands of other displaced mid-westerners who had broken ties with churches back home were ready to hear. Two decades later, Schuller began building the Crystal Cathedral, a star-shaped, reflective glass church, television studio, and performance hall designed by architect Philip Johnson. Celebrity religion is all about glitz, and the Crystal Cathedral was certainly glitzy. But television, with its enormous power to provide an audience and financial base, creates a kind of church without walls. Schuller's cathedral is not unlike the modern stadium in a sports world dominated by television. Schuller's church provided the set for his *Hour of Power* television show, which began in 1970 and grew to become the most watched one-hour church service in the United States, with some twenty million viewers.

Schuller's show was seen in many parts of the country on the Trinity Broadcasting Network (TBN), which was founded in 1973 by two couples, Paul and Jan Crouch and Jim and Tammy Bakker, and grew to be the largest Christian television network in the world. Crouch and his wife,

famous for her towering bouffant hairdo, presided over an eclectic three-ring circus of Christian pop music, soap operas, aerobics classes, and other programming that unapologetically mixed celebrity glitz and gospel message. More traditional evangelicals have condemned the network for its promotion of the “prosperity gospel,” the idea that living a Christian life (and contributing financially) will inspire material success. Two of the network’s biggest stars, Jim and Tammy Bakker, split off to form their own operation, the Praise the Lord (PTN) network, which would collapse in 1987 in a scandal over embezzlement and sexual harassment. Their downfall—part of a series of televangelism scandals in the 1980s that also brought down the fiery TV preacher Jimmy Swaggart—revealed the shadowy side of celebrity Christianity and the fact that fame and fortune can be a double-edged sword. It also generated a firestorm of media attention in the 1980s, a journalistic free-for-all reminiscent of the newspaper coverage of the Scopes monkey trial back in the steamy summer of 1925.

Jim and Tammy were unapologetic in preaching a prosperity gospel, and they had their own rags-to-riches lives to offer up as testimony. They liked to say, “God wants his people to go first-class,” which is exactly what they did with their purchase of luxury cars and lavish homes. On a 2,300-acre pasture in the heart of the Bible Belt, in Fort Mill, South Carolina, the Bakkers built Heritage Village USA, a condo development and Christian theme park. It was also the site for the state-of-the-art television studio from which they broadcast their evangelical variety show, *The PTL Club*, which was seen by millions of viewers. Many of those viewers were “prayer partners” who sent in contributions, and during a two-year period in the 1980s, some \$200 million poured in.

It all collapsed after Jim Bakker’s March 1987 confession to a 1980 sexual encounter with church secretary Jessica Hahn, who went on to appear topless in the November 1987 edition of *Playboy* magazine. The Bakkers’ fall from grace was the perfect storm of consumerism, politics, Christianity, and celebrity culture. Before their downfall, President Ronald Reagan, himself a former show business celebrity, invited the couple to his first inaugural and praised their television network for “carrying out a master plan for people that love.”

Jim and Tammy Bakker also partnered with another powerful televangelist, Pat Robertson (1930–), and with his Christian Broadcasting Network (CBN). In fact, the couple began their Christian show business career in 1966 by

staging a children’s puppet show on Robertson’s fledgling network. Robertson’s Christian talk show, *The 700 Club*, was to Christian celebrities what the *Tonight Show* was to secular stars. Robertson was long active in Republican Party politics and made an unsuccessful run for that party’s presidential nomination in 1988. But it was another televangelist who first mobilized evangelical voters into a force powerful enough to sway presidential elections, the Reverend Jerry Falwell (1933–2007) and his Moral Majority. Founded in 1979 and credited with helping to bring Ronald Reagan into the White House, the Moral Majority mobilized a new political base with cable television, sophisticated direct-mail techniques, and emotional attacks on his *Old Time Gospel Hour* television show against legalized abortion, gay rights, and other causes. Robertson and Falwell illustrate another side of celebrity Christianity: their fame focused national media attention on them, which inspired the mainstream media to promulgate a series of controversial statements that eventually soured their reputations with many voters.

In the 1990s, Robertson and Falwell were overshadowed by James Dobson, another Christian celebrity and political power broker. Dobson (1936–), a conservative Christian psychologist and radio talk show host, had already been spreading his views on abortion, marriage, and child rearing for more than two decades. His views were broadcast from 2,500 radio stations across North America and 3,000 other outlets around the world. Most of those who contacted his Colorado City–based ministry were not seeking advice on how to vote in the presidential primary. The majority who called in to his *Focus on the Family* show were filing prayer requests or ordering merchandise from Dobson’s extensive catalog of books, magazines, videotapes, and audiocassettes on how to save marriages, stay off drugs, avoid fornication, and find Jesus. By the middle of the 1990s his sophisticated telephone marketing system handled nearly four thousand calls and eleven thousand letters a day.

Complementing the radio ministry of Dobson has been the rise of “Christian radio” and its own brand of celebrities: *Christian* music artists. Christian rock dates back to the 1960s, but it became more popular in the 1990s. That was the decade when Billy Graham—who once condemned rock and roll as Satan’s music—started asking Christian rock bands to warm up the crowds at his youth crusades. Graham drew tens of thousands of Christian rock fans to his crusades by booking Jars of Clay and DC-Talk, two of the most popular Christian rock bands at that time. These and other evangelical rock bands helped propel “Contemporary

Christian” music to sell more than forty-four million albums in 2000, making it the sixth-best-selling genre in the United States, ahead of jazz, classical, and new age combined.

Celebrities as Religious Promoters: The Beatles, Richard Gere, and Scientologists

Christians were not the only religionists to tap into the power of celebrity culture in the 1960s. Maharishi Mahesh Yogi (1917–2008) began teaching transcendental meditation in India in 1955 and brought the technique to the United States in 1959. But his big break came in 1967, when the Beatles rock band—at the height of their popularity—attended one of his lectures in Wales in 1967 and visited his ashram in India in 1968, along with Donovan, another rock star. The Beatles soon lost interest. There was a falling out between the Maharishi and the rock band amid rumors that the bearded guru had made inappropriate advances on actress Mia Farrow. John Lennon even wrote a song about the affair, “Sexy Sadie,” in which he promised that the Maharishi would “get yours yet.” But the image of the meditation teacher dressed in white and surrounded by four smiling young Beatles stuck in the public mind and helped

inspire hundreds of thousands of young American spiritual seekers to explore the mysteries of Eastern religion.

Another Beatle, George Harrison, was the real “spiritual” Beatle. Not coincidentally, he was also the first member of the band to take the psychedelic drug LSD in 1964, when he was just twenty-one years old. He later credited that experience with giving him a powerful glimpse into another realm of consciousness, an awareness he would cultivate for the rest of his life through chanting and meditation. Harrison went on to study with another Indian guru, the late Swami Srila Prabhupada, the founder of the International Society for Krishna Consciousness, better known as the Hare Krishna movement. Both the Maharishi and Prabhupada popularized specific types of Hindu religious practice. Maharishi stressed a simple form of silent meditation, while Krishna devotees were known for their shaved heads and chanting. Harrison remained devoted to Krishna, one of the central gods in the Hindu pantheon. Krishna is seen as the incarnation of divine love and beauty, and he is known for his quality of playfulness. “My life belongs to the Lord Krishna,” Harrison said in 1974. His 1970 No. 1 hit, “My Sweet Lord,” started out chanting the more familiar prayer of “Hallelujah,” then subtly switched to “Hare Krishna.”

English rock-guitarist, singer-songwriter, and member of the group the Beatles, George Harrison, wearing dark clothing, center, appears with a group of Hare Krishnas on August 29, 1969. References to eastern religion in the Beatles’ music played a large role in introducing these religions to Westerners on a wide scale.

The Beatles' endorsement of Maharishi was short-lived, but it had a huge effect on the West's new openness to the religious practices of India and the Far East. Of course, many other factors contributed to this East-meets-West religious syncretism, most notably a loosening of immigration restrictions that allowed a steady stream of Indian gurus, Tibetan monks, and Japanese Zen masters to come to the United States. But the massive popularity of the Beatles among the baby boom generation greatly amplified the impact of the Beatles' journey. The rock band's spiritual search was also reflected in the writings and drug-induced revelations of John Lennon. His reading of a seminal book of the sixties drug culture, *The Psychedelic Experience*, first inspired the band's mystical shift with the song "Tomorrow Never Knows." Like the book, coauthored in 1964 by Timothy Leary, Richard Alpert, and Ralph Metzner, the song was inspired by the *Tibetan Book of the Dead*, a classic Buddhist text. The song appeared on the 1966 album *Revolver*, prefiguring the release of the band's landmark tribute to the psychedelic sixties, *Sgt. Pepper's Lonely Hearts Club Band*, which included the group's tribute to LSD, the song "Lucy in the Sky with Diamonds." Leary, known as the "high priest of LSD," and Alpert, who took his own journey to India and returned as Baba Ram Dass, achieved celebrity status themselves in the 1960s and 1970s. Alpert's religious conversion to a devotional Hindu practice, chronicled in his seminal book *Be Here Now*, furthered the pop culture shift to the exotic mysticism of the East.

Later, in the 1980s and 1990s, celebrities played a large role in helping popularize another ancient Indian religion, Buddhism. The best-known "celebrity Buddhist" to emerge during this period was actor Richard Gere, who was best remembered for his role opposite Julia Roberts in *Pretty Woman*, and his 1999 selection by that bible of celebrity gossip, *People* magazine, as the sexiest man alive. Gere may have been a "celebrity Buddhist," but he is also a serious, longtime practitioner of Tibetan Buddhism. Gere first became interested in Buddhism during an existential crisis in his twenties. He studied under Zen teacher Sasaki Roshi before becoming a student in the 1980s of Tenzin Gyatso (1935–), the 14th Dalai Lama. Since then Gere has devoted much of his energies to the campaign to preserve the Buddhist culture of Tibet and oppose Chinese efforts to weaken the faith of that ancient seat of Buddhist learning. At the same time, the Dalai Lama hardly needed Hollywood stars to promote the Tibetan cause, especially since winning the Nobel Peace Prize in 1989. For the next twenty years, the

Dalai Lama's infectious giggles, self-deprecating humor, and spiritual addresses turned him into one of the world's premier religious celebrities, right beside Mother Teresa of Calcutta and Pope John Paul II. Tickets for the Dalai Lama's appearances were sold on the same Web sites used to promote rock concerts and sporting events.

Better-known new religious movements also have benefited from celebrity endorsement, most notably the Church of Scientology International. Founded in the 1950s by L. Ron Hubbard (1911–1986), a prolific science fiction writer and freelance philosopher, Scientology describes itself as "the only major new religion established in the 20th century" as a bridge to increased awareness and spiritual freedom. Scientology is based on the precepts of Hubbard's 1950 book, *Dianetics: The Modern Science of Mental Health*. Practitioners at Scientology centers around the world hook themselves up to a simple electric device, an "e-meter," for "auditing" sessions that purport to measure thoughts and emotional reactions, known in Scientology parlance as "engrams." Their goal is to attain a psychological and spiritual state called "clear," where they are said to overcome compulsions, repressions, and other self-generated diseases and psychoses. "Clears" are then sold advanced training sessions to become "operating thetans," spiritual beings said to possess such supernatural powers as the ability to leave their bodies. Scientologists purchasing 12.5 hours of advanced auditing, for example, were asked (in February 2001) to make a "donation" of between \$12,100 and \$15,125. Graduates purportedly achieve "a new viewpoint of sanity and rationality." From the beginning Hubbard encouraged his followers to actively recruit show business celebrities. In a directive issued in early 1955, Hubbard started "Project Celebrity" with a long list of movie stars to be courted, including Groucho Marx, Liberace, and Orson Wells. The church had little initial success in celebrity recruitment but decades later brought into its ranks two of Hollywood's most bankable actors, John Travolta and Tom Cruise. In 2004, Scientology leader David Miscavige expressed his appreciation of Cruise's work to promote the movement by awarding the actor the organization's 20th Anniversary Freedom Medal of Valor.

In the early 1970s the church purchased one of Hollywood's most distinctive buildings, a turreted castle on three acres of formal gardens originally built as the Château Élysée, a long-term residential hotel for movie stars. The church turned the building into its Celebrity Centre. It includes an exclusive hotel and restaurant described as "a safe

environment for Celebrities and Scientologists.” Travolta has personally endorsed the food and service and has appeared on the cover of a Scientology magazine titled *Celebrity*. In 2000, Travolta released the film *Battlefield Earth*, which was a screen homage, with a \$90 million budget, to one of L. Ron Hubbard’s science fiction stories. To promote the film, Travolta appeared in bookstores signing copies of Hubbard’s book, but the film failed at the box office.

Celebrities as Religious Figures

While some religious figures became celebrities and others endorsed a religion or spiritual movement, devotion to some celebrities, such as Elvis Presley, took on quasi-religious dimensions. Even in life, Presley (1935–1977) was known as “the King,” and he continued to defy death through countless “Elvis sightings” and celebrity impersonations. Numerous shrines have arisen, including the 24 Hour Church of Elvis, which began as an art project in Portland, Oregon, less than a decade after Presley’s death. Churches and new religious movements have arisen around the lives of other famous musicians, as well; included among them are the Saint John Coltrane Church in San Francisco and the short-lived Church of Unlimited Devotion, a hippie cult that saw Grateful Dead guitarist Jerry Garcia as an avatar of God.

Future Prospects

In the twenty-first century American religion and celebrity culture continues an exchange that began in the eighteenth century with George Whitefield taking out newspaper advertisements for his Christian revivals and continued into the new millennium with such Hollywood stars as Sharon Stone and Richard Gere promoting the Dalai Lama. Celebrity culture has no single effect on American religion. In some cases celebrity endorsements allow the promotion of minority faiths and exotic spiritualities—for example, the Beatles’ pilgrimage to India or the decision by pop icon Madonna to embrace Jewish mysticism. In others the rise of religious celebrities such as Mother Teresa can inspire a return to more traditional forms of Christian piety. Celebrity fame is, by its very nature, ephemeral, while religious belief appears to be long-lasting. Cable television can raise up religious celebrities—for instance, Jim and Tammy Bakker—and then destroy them with saturation coverage of the latest sex-and-money scandal. Over the past three centuries, technological innovations in mass communication (newspapers, radio, film, and television) have offered new ways to bring celebrity culture into religious life. That trend will no doubt

continue as computers and the Internet reshape the way Americans view themselves, society, and perhaps even their religious beliefs, practices, and communities.

Chabad-Lubavitch

The movement known today as “Chabad,” “Chabad-Lubavitch,” or “Lubavitch” grew out of the pietistic Hasidic revolution that swept through East European Jewry in the eighteenth century. The charismatic healer, preacher, and popular religious mystic Israel ben Eliezer Ba’al Shem Tov

("Master of the Good Name"), known by his acronym "the Besht" (c. 1700–1760) served as the central figure of this movement, which arose in response to such complex forces as the partition of Poland, anti-Semitic massacres, the stirrings of pseudo-messiahs such as Shabbetai Zevi and Jacob Frank, economic ruin, spiritual despair, and pietistic religious trends throughout the region. Hasidim defied traditional Jewish communal authorities and formed spiritual circles distinguished by their patterns of life and dress, their ecstatic religious practices, the mystical teachings that they communicated, their outreach to the poor and the illiterate, and their self-segregation. At a time when authority and prestige in Jewish life depended heavily upon Talmudic knowledge, early Hasidic masters insisted that God could also be approached through acts of love and devotional prayer.

Hasidism after "the Besht"

The leading figure in the Hasidic movement following the death of the Besht was his disciple, the charismatic preacher (*maggid*) Dov Baer of Mezhirech (d. 1772). He helped to popularize Hasidism by sending forth emissaries to recruit followers from the Jewish masses throughout Poland, while his personal conduct set the pattern for the institution of the *Zaddik*, the benevolent "spiritual father"-type leader of a Hasidic sect. He also gathered around him a group of significant disciples who studied his teachings and mystical practices. These disciples, following his death, decentralized and diversified Hasidism. They spread through Poland, the Ukraine, and into Russia, establishing Hasidic courts of their own.

Shneur Zalman (1745–1812/1813), one of Dov Baer's disciples, settled in Belarus, establishing a Hasidic court in the town of Lyady. With his broad learning, he developed a new school of Hasidism that placed greater emphasis on scholarship, study, and contemplation. He wrote a path-breaking volume of spiritual guidance, known as the *Tanya*, and sought to impart formerly restricted and esoteric Hasidic teachings throughout all levels of society. Shneur Zalman developed a three-part system of intellectual contemplation, connected to three rungs of the esoteric ten "spheres" (*sfirot*) described by Jewish mystics: "wisdom," "understanding," and (through a union of these two) "knowledge." The Hebrew acronym of these three words is *Chabad*, the name by which the movement came to be known.

Following the death of Shneur Zalman, his son, Dov Ber, settled in the town of Lubavitch, where he became the

movement's dynastic leader. As was Hasidic custom, followers of Dov Ber and his descendants became known by the town's name, the home of its central Hasidic court. Chabad also developed centers elsewhere in Russia, generally led by other members of the dynasty.

Emigration to America and Rabbi Joseph Schneersohn

Chabad Hasidim, like many other fervently Orthodox Jews, feared emigration to America. They considered it a "non-kosher land" where Judaism could not properly be observed. Nevertheless, in the face of persecution, some followers emigrated to America in any case. One of the first to arrive was Rabbi Chaim Yaakov Widerwitz (1835–1911), an ordained follower of the Rebbe ("grand rabbi") of Lubavitch, who was expelled from Moscow in 1891 and became a rabbi in the United States. Subsequently, as conditions for Jews in Russia worsened, others emigrated, some of whom continued to maintain contact with their Rebbe from afar. Synagogues named "Anshe Lubavitch" or named in memory of one of the Chabad Rebbes began to appear on the American scene.

Following World War I and the Bolshevik revolution, the Chabad movement in Russia, along with many other religious groups, was actively persecuted, and more followers emigrated, including Rabbi Israel Jacobson, who arrived in America on December 22, 1925. The fact that many Chabad followers were rabbis made it possible for them to enter the United States outside quota restrictions. Jacobson subsequently helped to bring other Chabad followers to the United States and played a major role in building the movement in North America and raising funds to send back to Chabad headquarters in Europe.

The Sixth Lubavitcher ("of Lubavitch") Rebbe, Rabbi Joseph I. Schneersohn (1880–1950), who became Rebbe upon his father's death in 1920, took a special interest in his growing band of American followers. He corresponded with them, and in 1923 he established an organization of Chabad Hasidim in the United States and Canada (Agudas Chasidim Anshei Chabad) to raise funds, promote Jewish learning, and spread the teachings of the Chabad movement. Following his imprisonment by the Communists, who allegedly sentenced him to death for promoting Judaism underground, and his subsequent expulsion from the Soviet Union in 1927, Rabbi Schneersohn personally visited the United States from September 17, 1929, to July 17, 1930. He toured Jewish communities, raised funds, lectured about Hasidism,

spoke out concerning the importance of Jewish education and the laws of family purity, and met with Justice Louis Brandeis and President Herbert Hoover. Unlike many other European rabbis, he expressed optimism concerning American Jewry and its future, believing that young American-born Jews would experience a religious revival. He even considered settling in America. Later, he continued from afar to encourage his American followers, dispatching personal emissaries to promote Chabad and raise funds for the movement.

Rabbi Schneersohn, confined to a wheelchair, was at the Yeshiva (Talmudical academy) that he had established in Otwock, Poland, when the Nazis invaded in 1939, and he soon made his way to Warsaw. There he was caught up in the German bombing and in the suffering experienced by the city's Jews once the Nazis came to power. Thanks to the efforts of his American followers, leading American political figures, and sympathetic Nazi officials (one of whom had a Jewish father), he and his household were saved. They arrived in the United States on March 19, 1940. His daughter, Chaya Mushka, and her husband, Rabbi Menachem Mendel Schneerson (1902–1994), followed a year later from France, which had likewise fallen under Nazi control.

As leader of the Chabad movement, Rabbi Joseph Schneersohn settled in the Crown Heights section of Brooklyn, reestablishing his movement's world headquarters at 770 Eastern Parkway. In the midst of war, and working from the premise that the United States was “no different” from European communities in its potential for Jewish life, he established a *yeshiva*, a network of Jewish all-day and supplementary schools, Jewish summer camps, a publishing house, and other institutions aimed at transforming America into the “new center for Torah and Judaism,” replacing Europe. Where other Hasidic leaders who settled in America during and after the war followed an enclave strategy, seeking to secure their followers against dangerous outside influences, Rabbi Joseph Schneersohn advocated an outreach strategy aimed at spreading his movement's mission to all Jews, affiliated and unaffiliated alike, in an effort to strengthen their religious consciousness and commitments in the face of the European catastrophe.

Movement's Growth under Rabbi Menachem Mendel Schneerson

Rabbi Joseph Schneersohn's death in 1950 set off something of a leadership crisis in the Chabad community. The Rebbe

left two learned, eloquent, dynamic, and competing sons-in-law—Rabbi Shmaryahou Gourary and Rabbi Menachem Mendel Schneerson—but no clear heir. Rabbi Gourary was older and had accompanied his father-in-law for some forty years. Rabbi Schneerson had attended university in Berlin and Paris, was more modern in outlook and dress, had assisted his father-in-law in Europe, and had, in the United States, achieved great success as head of the movement's publishing arm (Kehot Publication Society) and educational and social services arms (Merkos L'Inyonei Chinuch and Machne Israel). Rabbi Schneerson's lectures and scholarly writings won him renown among Chabad Hasidim in the United States. Thanks in part to their lobbying, he eventually emerged as victor and was formally installed as the seventh (and, as it turned out, the last) Lubavitcher Rebbe in 1951. Some members of the Gourary branch of the family, especially Barry S. Gourary, the son of Rabbi Shmaryahou, never fully acquiesced. In the 1980s, Barry Gourary fought and lost a widely publicized legal battle against his uncle over ownership of the Chabad library.

Under Rabbi Menachem Mendel Schneerson, the Chabad movement grew in numbers, wealth, and influence, and became a significant force in American Jewish religious life. Chabad emissaries—“the Rebbe's army”—spread through every Jewish community in the United States and also across the world. Chabad became the best-known Hasidic movement in America and among the fastest-growing postwar religious movements of any kind in the United States. While the movement maintains no membership figures, it bills itself as the largest Jewish organization in the world, with institutions in more than seventy countries and forty-eight states. It boasts several hundred thousand active devotees in New York (mostly Brooklyn) and other major Jewish communities, and a much larger number of friends who participate in some of its educational and religious programs and contribute to its work.

Modernizing Hasidism

Rabbi Menachem Mendel Schneerson made clear, soon after he assumed his position, that he appreciated modernity. Having himself studied mathematics and engineering, he encouraged his followers to utilize new technologies to strengthen their movement and Jewish life in general. Television, satellite communications, and the latest computer gadgetry all, in time, became part of the Chabad arsenal. Today Chabad.org and Lubavitch.com declare that their mission is to “utilize internet technology to unite Jews

worldwide, empower them with the knowledge of their 3300 year old tradition, and foster within them a deeper connection to Judaism's rituals and faith." But modernity still has its limits. The Rebbe insisted that the biblical view of creation was correct and opposed both the theory of evolution and scientific claims concerning the antiquity of the world.

Significantly, the Rebbe abandoned the distinctive fur hat and long Hasidic caftan that had been his father-in-law's uniform. He dressed in the somewhat more modern fashion to which he had grown accustomed in Europe, with a black Borsalino felt fedora. This became the uniform for Chabad Hasidic men, distinguishing them both from other Hasidim and from their American neighbors. Chabad women, though always modestly dressed, likewise made more concessions to modern fashion than most of their Hasidic counterparts, without compromising their understanding of what Jewish law demanded.

Rabbi Schneerson possessed deep Jewish learning, and was viewed as brilliant, charismatic, energetic, and a skillful administrator by many of his followers. His literary output fills dozens of volumes, comprising his regular weekly discourses on a range of subjects, occasional lectures, thousands of published letters, scholarly notes, and more. Followers considered his every word and action to be holy and maintained careful records of his activities and conversations.

Rabbi Schneerson devoted the bulk of his energies to strengthening the Chabad movement and Jewish life in general. He initiated a wide range of formal and informal educational and religious endeavors, including well-publicized and sometimes controversial campaigns, to promote the observance of individual commandments, such as the lighting of Sabbath candles by women, the donning of phylacteries (*tefillin*, small boxes containing verses from scripture) by men, and the public celebration of Chanukah by Jews. Chabad frequently borrowed military metaphors to promote these activities, perhaps appropriately given the movement's strict hierarchic organization. Emissaries drove around in "mitzvah tanks," reaching out to the unaffiliated, and children were registered at a young age as "soldiers" in Tzivos Hashem, the Rebbe's "army of the Lord."

Rabbi Schneerson and the Public Square

While many American Jews believed that the public square should be devoid of religious symbols based on the principle of church-state separation, the Rebbe insisted that public displays of religion were both constitutional and compatible

with U.S. tradition. He justified his efforts to promote non-sectarian prayer in the public schools on the basis that Congress opens with a prayer. He promoted Chanukah in the public square according to the same legal basis that justified Christmas trees. Of course, his larger goal was to gain access to secular Jews whose faith he hoped to strengthen. "Where Chanukah lamps were kindled publicly," he exulted in a letter, "the results have been most gratifying in terms of spreading the light of Torah and Mitzvoth [commandments], and reaching out to Jews who could not otherwise have been reached." The United States Supreme Court in *Allegheny County, City of Pittsburgh and Chabad v. ACLU* (1989) strengthened Chabad's hand, ruling that the public display of a menorah did not violate the First Amendment to the Constitution. Thereafter such displays became widespread across the country. By contrast, efforts on the part of Chabad to promote nondenominational prayers and "moments of silence" in the public schools, and to win state aid for parochial schools, failed to win court approval.

Late in his life, Rabbi Schneerson reached out beyond the Jewish community to "influence the nations of the world." While eschewing conversionism, he argued that non-Jews needed to observe a basic moral code set forth in seven laws that, according to Jewish tradition, God commanded Noah to observe following the flood. Chabad's hope for imminent messianic redemption of the world may have sparked this unusual universalistic campaign. An unknown number of non-Jews committed themselves to observing the Noahide laws, some calling themselves "children of Noah."

Rabbi Schneerson became a strong supporter of the state of Israel. His father-in-law, like many fervently Orthodox rabbis of the time, had once opposed Zionism, fearing that secular nationalism would replace religion as the central core of Jewish identity. About a year after the establishment of the state of Israel, however, Kfar Chabad ("Chabad Village") was established in Central Israel as the movement's Israeli headquarters. Over time, Chabad became a force in the country, particularly since the Rebbe's message of tolerance and love for every Jew contrasted with the more insular views of other fervently Orthodox groups. Rabbi Schneerson won thousands of followers in the Jewish state, and without ever traveling there, he exerted substantial influence—so much so that many Israeli leaders visited him in Brooklyn. Throughout the years, he advocated an amendment to Israel's Law of Return so that only Jews by birth and those converted according to strict Jewish law (and not

by non-Orthodox rabbis) might claim citizenship. Following the Six Day War, he opposed the Camp David accords and the return of any territory to Israel's Arab neighbors. He encouraged Israel's leaders to imbue the country with Jewish values and to ensure the security of the land. He also encouraged his Israeli followers to serve in the military, which most fervently Orthodox Jews did not. While he often disagreed with the direction of Israel's secular leaders, particularly its Labor governments, he remained a revered figure among his followers and was admired by many Jews from Arab lands who came to appreciate his spirituality, warmth, and leadership.

Messianism and the Death of Rabbi Schneerson

Rabbi Menachem Mendel Schneerson was a fervent messianist. Not only did he consider the messiah's coming to be imminent, he also believed that Jews, through their own active efforts, could induce the messianic coming. Many Lubavitch faithful had understood the catastrophe of World War II to be the "last labors prior to the arrival of our Messiah" and took solace from the movement's counsel to "be ready for redemption soon!" When that prophecy failed, they experienced grave disappointment. The Rebbe, through his lectures and outreach efforts to Jews around the world, his widely publicized pronouncements, and his interpretation of modern Israel's role in the divine plan, rekindled messianic hopes, spurring his followers to years of selfless commitment as foot soldiers in campaigns to "force" redemption, to bring "*Moshiach* [messiah] now." Many of these efforts focused on the observance by Jews of a single commandment and returning "lost" Jews to the fold. Personal emissaries (*shluchim*) dispatched by the Rebbe to set up institutions around the world wherever Jews lived or visited, served, in effect, as lifelong missionaries for his cause. In accordance with Hasidic teachings concerning self-abnegation, they established Chabad centers in communities large and small and modeled a fervently Orthodox lifestyle, often at personal sacrifice, so as to strengthen Jewish religious consciousness and hasten the messiah's coming.

Substantial numbers of Lubavitch followers concluded, as time passed, that the Rebbe himself was the not-yet-revealed messiah, a belief fostered by his childlessness, the rapid worldwide growth of the movement he headed, and, according to some, hints concealed in his public utterances. Rather than dampening these speculations, the Rebbe's death, in 1994, only heightened them, some believers insisting that "our Master, Teacher and Rebbe, King Messiah"

remained alive and would in time be revealed. Some Orthodox critics condemned these beliefs as alien to Judaism, and in time the mainstream leadership of the movement distanced itself from those who refused to declare the Rebbe dead. The messianist minority was also expelled from the movement's Brooklyn headquarters.

With the death of the Rebbe, his gravesite in Queen's, known as his *Ohel* (a "tent" built over the resting place of a righteous sage), became a site of pilgrimage. Daily, and especially on commemorative days, people come to recite psalms, light candles, and seek the deceased Rebbe's heavenly intercession. A visitor center, meditation area, and study hall have been erected close to the gravesite, and those in need are encouraged to write the Rebbe a letter. The Web site of the Ohel promises that faxes, e-mails, and ordinary letters "are brought to the Ohel shortly after their receipt."

Chabad after the Rebbe

Some predicted, following the Rebbe's death, that the Chabad movement would split asunder or decline. Few Hasidic groups have historically been able to thrive without a living Rebbe to guide and direct them. Chabad, however, has continued to grow, led by its army of more than four thousand full-time emissary families who oversee Chabad houses in far-flung communities around the world and on more than one hundred college campuses. These emissaries—"dedicated to the welfare of the Jewish people worldwide"—guide, teach, provide hospitality, lead religious services, engage in charitable work, serve addicts, minister to those in jail, and reach out to Jews of every sort.

In recent years, Chabad has created a synagogue movement in the United States that claims the involvement of hundreds of thousands of Jews, most of them not themselves fully observant. In the former Soviet Union, where Chabad's roots lie, it plays a major role in Jewish life on both the local and national levels. In Australia, South Africa, the Far East, and some European countries, its rabbis now lead a significant number of the community's major synagogues. Chabad has also established a popular program of adult Jewish education, known as the Jewish Learning Institute, and claims to be "the largest provider of adult Jewish education in the world."

The economics of Chabad, like those of many centrally driven, highly organized, and fiercely independent proselytizing movements, are somewhat mysterious. Much of the funding is thought to come from Jews outside the

movement who have come to respect Chabad's work and achievements. Chabad emissaries are responsible for maintaining their own operations and are encouraged to be entrepreneurial. While campus centers receive some start-up funding, every Chabad House is, in time, expected to fend for itself. What keeps the emissaries going is a strong sense of *esprit de corps* fostered by the movement, coupled with the deep-seated belief that they are carrying forward the Rebbe's work, serving and strengthening the Jewish people, and hastening the coming of the messiah.

Charismatics/Charismatic Movements

The word *charismatic* characterizes any Christian in any church tradition who exercises one of the postconversion gifts of the Holy Spirit. These gifts, listed in Romans 12:6–8 and 1 Corinthians 12–14, include, but are not limited to, the ecstatic religious experience of speaking in tongues, the

interpretation of tongues, prophecy, healing, and miracles. The term is derived from the Greek word *charisma*, meaning an unmerited gift of grace. The Holy Spirit manifests himself through these gifts for the common good of the body of Christ. Charismatics differ greatly in church background and doctrine but are united in a common experience—the baptism of the Holy Spirit.

The Charismatic movement is a global spiritual renewal over the past one hundred years that has been described by some as the “New Pentecost.” Pentecostals believe that the postconversion experience of baptism of the Holy Spirit is available for all believers and is evidenced by *glossolalia* (speaking in tongues). The “New Pentecost” has spread the Pentecostal beliefs and practices to mainline Protestant, Catholic, Orthodox, and nondenominational traditions.

Three Waves

Charismatic Christianity has no one founder, no one system of theology, no particular type of church government, and no defining liturgy. While scholars differ on which groups should be included in this category, they generally agree that the revival/renewal movement began at the turn of the twentieth century and consists of three phases or waves of the Spirit.

The First Wave: Classical Pentecostalism (1900–Present)

Numerous revivals marked the turn of the twentieth century around the world: the Welsh Revival of 1904, a revival in India in 1905, and several revivals in the United States between 1901 and 1906. Most scholars identify the 1906 Azusa Street Revival in Los Angeles, California, as the launching pad for the First Wave of the Spirit in the modern era and the catalyst for the extraordinary missionary activity that followed. Few events have influenced modern church history as much as the three and one half years of this revival. It became a magnet that drew people from many racial, ethnic, and denominational backgrounds to Los Angeles to receive the baptism of the Holy Spirit, as evidenced by speaking in tongues. When the participants returned to their home churches to share their experiences, they faced rejection by their denominations. Forced out on their own, the Classic Pentecostals eventually formed the first Pentecostal denominations such the Church of God in Christ, Church of God (Cleveland, Tennessee), the Assemblies of God, the International Church of the Foursquare Gospel, and others. Theologically, most Classic Pentecostals

believe that speaking in tongues is the initial physical evidence of Spirit baptism. Historically, they have been very missionary-minded people because they connect their experience with empowerment for evangelism and missionary effort.

The Second Wave: Charismatic Movement (1960–Present)

The Second Wave, also known as Neo-Pentecostalism, emerged in a dramatic and unexpected fashion in the 1960s when the Pentecostal beliefs and emphasis on the spiritual gifts spread to non-Pentecostal churches. Rather than leaving their own church traditions as the First Wavers did, most Second Wavers chose to stay and bring about a spiritual or charismatic renewal in those churches. The movement spread rapidly. In only ten years, it had penetrated all major Protestant, Roman Catholic, and Orthodox traditions and spawned numerous independent Neo-Pentecostal ministries. Theologically, the Charismatics accept the idea that the spiritual gifts are still valid today. They tend to believe that speaking in tongues usually accompanies Spirit baptism, but they do not give preeminence to this belief in the same way that Classic Pentecostals do.

The Third Wave: Neo-Charismatic (1981–Present)

The roots of the Neo-Charismatic movement extend back into the 1960s when numerous independent Charismatic churches were formed. The Signs and Wonders Movement, part of the larger Neo-Charismatic movement, developed in the early 1980s from the teachings of John Wimber, the founder of the Vineyard Church and professor at Fuller Theological Seminary in Southern California. C. Peter Wagner, one of Wimber's colleagues at Fuller, coined the phrase "the Third Wave of the Holy Spirit" in 1983. According to Wagner, the Charismatic movement has been replaced by a new stream that seeks the restoration of New Testament Christianity (Acts 3:21). People in this new stream do not like to be labeled as either Pentecostal or Charismatic but prefer terms such as New Apostolic and Restorationist. Theologically, Third Wavers identify Spirit baptism with conversion, emphasizing the continuing nature of the experience rather than one specific event. They stress the gift of prophecy, the miraculous working of the Spirit, power encounters, and the importance of modern day apostles and prophets. Speaking in tongues may be found among Neo-Charismatics, but not in the same way as it was in the first two waves.

A Global Movement

Each movement began in unique ways, but all share common elements that bind them together. Because of the interconnectiveness of the Pentecostal and Charismatic movements, it is becoming harder and harder to speak of them separately. The terms are often used interchangeably. Some scholars declare that the Charismatic movement is simply Pentecostalism within historic mainline churches and describe Charismatics as Pentecostals dressed in traditional church garb. The Third Wavers, on the other hand, may demonstrate Pentecostal or charismatic characteristics, but they reject Pentecostal terminology.

Because the Charismatic Renewal is so various and widespread, discussing it can be confusing. As the movement spread globally, it filtered through many church traditions and indigenous groups. In some cases, it changed so significantly that the original stream is hard to find. The Pentecostal/Charismatic movement with its multifaceted character constitutes the fastest-growing group of churches within Christianity. It has been estimated that more than six hundred million Pentecostal/Charismatic adherents exist worldwide today. Recognizing that statistics vary according to methods used to collect them, if these figures are in any way correct, they indicate that the Pentecostal, Charismatic, and associated movements have grown to represent one-fourth of all Christians in just over one hundred years.

Roots of the Charismatic Movement (1950–1960)

The beginning of the Charismatic movement is traced to the spiritual experience of Dennis Bennett (1917–1991), an Episcopal priest from Van Nuys, California, in 1960. However, the roots of the movement go back to the late 1940s and early 1950s, when speaking in tongues and exercising spiritual gifts began appearing periodically in non-Pentecostal churches. From the beginning of the Classical Pentecostal movement, individuals from historic churches sporadically received the baptism of the Holy Spirit. After their experience, they usually resigned or were coerced into leaving their churches. When Harald Bredesen (1918–2006), a Lutheran minister, received the baptism in the Holy Spirit in 1946, leaders in his church requested that he stay. His ministry was a precursor to the Charismatic movement and ignited a revival in 1960 at Yale University, where Episcopal, Lutheran, and Presbyterian students spoke in tongues. Under Bredesen's mentorship, several Charismatic leaders, including Pat Robertson, a Southern Baptist and host of the

Christian television show *The 700 Club*; John Sherrill, founder of the Chosen Books publishing company; and Pat Boone, conservative gospel singer and actor, experienced the baptism of the Holy Spirit.

Bredesen was not alone in this experience. In 1951, Richard Winkler, the rector of the Trinity Episcopal Church in Wheaton, Illinois, became the first Spirit-baptized Episcopal pastor in America. Agnes Sanford, the founder of the Inter Healing Movement; James Brown, a Presbyterian minister; and Tommy Tyson, a Methodist minister, were also part of the early beginnings of the movement. In 1959, *Christian Life* magazine featured several articles about the outpourings of the Spirit in mainline congregations. Although there was noticeable Pentecostal activity in non-Pentecostal arenas, it was sporadic and lacked a sense of cohesion.

The Immediate Forerunners

The ministries of Kathryn Kuhlman (1907–1976), Oral Roberts (1918–2009), and several other healing evangelists in the late 1940s and 1950s provided a platform for the coming Charismatic movement. In the large healing crusades and charismatic conferences, men and women from many religious, theological, and cultural backgrounds mixed together without difficulty. While most of these evangelists had Classical Pentecostal backgrounds, their ministries were independent of denominational control. Large numbers of mainline Protestants and Catholics were introduced to the Pentecostal experience in their meetings and joined a growing group of believers who fell outside the Classic Pentecostal boundaries.

Oral Roberts, a minister in the Pentecostal Holiness Church (International Pentecostal Holiness Church after 1975), began his healing ministry in 1947 with a citywide meeting in Enid, Oklahoma. From that small beginning, he went on to conduct more than three hundred healing crusades on six continents, ending each meeting by individually praying for the sick. By the mid-1950s, Roberts started filming his healing crusades for his national television program. Americans began to see Pentecostalism in a new light as they heard Roberts's positive messages and witnessed dramatic healings.

To appeal to a broader constituency of Charismatics and Christians, he opened Oral Roberts University, an accredited liberal arts college in Tulsa, Oklahoma, in 1965. Dedicated by Billy Graham two years later, Oral Roberts University was considered the foremost Charismatic university in the United States. To align himself more closely with

mainline Charismatics, he changed his religious affiliation to the United Methodist Church in 1968 and began televising prime-time religious variety shows featuring popular celebrities. In 1970, the religion editor of the *New York Times* claimed that Roberts commanded more personal loyalty than any other minister in America. In 1980, Roberts established the City of Faith Medical and Research Center, a huge health facility dedicated to merging prayer and medicine in the healing process. This institution struggled financially for eight years before it closed.

Theologically, Roberts is a classical Pentecostal, but his moderation made him a favorite with many people. Roberts's ability to discern change and adapt to new contexts has extended his influence into the twenty-first century. His trademark message, expect a miracle (from God), has brought hope to millions of people.

Kathryn Kuhlman was probably the most famous woman preacher between 1950 and 1979. She began traveling as an evangelist when she was only sixteen years old. In 1947, her healing ministry started after a woman announced that she had been healed during Kuhlman's sermon on the Holy Spirit. As her healing ministry developed, Kuhlman intentionally avoided some of the techniques used by other healing evangelists. She seldom prayed for people individually; however, she often used the Charismatic gift of the word of knowledge to point out people's medical conditions. She refused to be called a "faith healer" but tried to create an atmosphere of faith and worship where the sick could be healed through the power of the Holy Spirit.

Like Roberts, Kuhlman used the media well and gained nationwide publicity through more than four thousand radio broadcasts, five hundred telecasts, and a variety of printed materials. Dramatic and deliberate, she was a popular guest on talk shows such as the *Tonight Show* and was often featured in major Christian and secular magazines.

The Full Gospel Business Men's Fellowship International helped link the evangelists' message to the mainline churches. In 1951, Demos Shakarian (1913–1993), a Pentecostal layperson, started the first chapter of the nondenominational association of charismatic businessmen in the Los Angeles area, with Oral Roberts as the featured speaker. Using the format of prayer breakfasts and conventions, Shakarian created an atmosphere where Spirit-filled businessmen could evangelize non-Pentecostal professionals. In neutral venues such as hotel ballrooms or convention centers, businessmen from all denominations explored their common faith and enjoyed regular Charismatic fellowship.

In 1967, four women whose husbands were active in the Full Gospel Business Men's Fellowship International organized the Full Gospel Women's Fellowship in Seattle, Washington. The first speaker was Rita Bennett, wife of Dennis Bennett. The organization sponsored local Bible studies and prayer meetings as well as regional, national, and international conferences. Using a name taken from Romans 12:11 in the Amplified Bible, the group reincorporated as Women's Aglow Fellowship International in 1972 (later Aglow International). Organized around the themes of Charismatic spirituality and evangelism, Aglow provided Charismatic women with a place of fellowship and a showcase for their leadership skills.

David du Plessis (1905–1987), a South African Classical Pentecostal minister, was one of the first individuals to grasp what the Spirit could do across ecumenical lines. Dubbed "Mr. Pentecost," he worked to promote unity among Spirit-baptized believers, regardless of their church affiliation. Even when his Pentecostal colleagues frowned on what he was doing, du Plessis served as an unofficial ambassador of Pentecostalism to mainline denominations and the Roman Catholic Church. In 1951, he made a spontaneous visit to the headquarters of the World Council of Churches in New York City. Although he arrived uninvited and unannounced, his efforts to share his Pentecostal faith were warmly received and opened many doors for him to speak and lecture about his Pentecostal experiences.

In his work to promote unity, du Plessis initiated dialogue with the Roman Catholic Church and served as the invited Pentecostal representative at the Second Vatican Council in 1964. Between 1972 and 1982, he cochaired the Roman Catholic and Pentecostal Dialogues with Kilian McDonnell (1921–), an outstanding Charismatic Catholic scholar from St. John's University in Minnesota.

Many people regarded du Plessis as the unofficial father of the Charismatic movement. No other individual did so much to link the movements and bridge the differences as "Mr. Pentecost." Because of his efforts, *Time* magazine listed him as one of the eleven leading shapers and shakers of Christianity in 1974. In recognition of his outstanding service to Christianity, Pope John Paul II awarded him the Good Merit medal in 1983. Du Plessis was the first non-Catholic to receive this honor.

Birth of the Charismatic Movement (1960)

At 9:00 a.m. on a November day in 1959, Dennis Bennett, an American Episcopal vicar, knelt with some friends and

began to pray in an unknown, unlearned language. He had no idea at the time the far-reaching effect this personal experience would have on his life or on church history.

The origin of the Charismatic movement is commonly associated with Bennett's public announcement of his Spirit baptism to the St. Mark's Episcopal Church in Van Nuys, California, on April 3, 1960. Although he received some support, he faced a riot of rejection from a large percentage of his parishioners. They adamantly denounced his Pentecostal activity and called for his resignation from the church. He agreed to resign from St. Mark's but refused to give up the priesthood. Shortly afterward, *Time* and *Newsweek* magazines picked up the story, and Bennett became famous overnight.

After Van Nuys, Bennett accepted a pastoral assignment to the struggling St. Luke's Episcopal Church in Seattle, Washington. With the blessing of his new bishop, he openly shared his experience and an astounding thing happened. The church, which had been closed twice, flourished and grew in attendance under Bennett's leadership. The once nearly bankrupt parish quickly became an important Charismatic center. While the Sunday services remained traditionally Episcopal in worship, the Charismatic prayer meetings were packed with enthusiastic people from all denominations.

The Second Wave spread rapidly throughout the historic churches. By 1963, *Christianity Today* magazine estimated that two thousand Episcopalians in Southern California were speaking in tongues. Charismatic prayer groups popped up all over the United States in Methodist, Baptist, Mennonite, Presbyterian, and other historic churches. In these informal gatherings, participants had the freedom to sing, praise, pray, speak in tongues, and minister to one another with the various gifts of the Holy Spirit. Believing that this move of the Spirit was God's way of renewing existing denominations, the Neo-Pentecostal leaders and David du Plessis encouraged Charismatics to stay in their churches and work for renewal. For this reason, by the 1970s, most mainline churches dropped the term "Neo-Pentecostal" in preference to the more neutral "Charismatic renewal."

The Catholic Charismatic Renewal

The "Duquesne Weekend" marked the birth of the Charismatic movement in the Roman Catholic Church, but a number of events prepared the way for the leap from Protestant circles into the Catholic world. First, Vatican II, an

important Roman Catholic Church Council, adopted an open and receptive position on the work of the Holy Spirit and spiritual gifts in the church. The same council opened the way for interaction between Catholics and Christians of other churches. This was important because non-Catholic Christians would be instrumental in leading many Roman Catholics into the baptism of the Holy Spirit.

A second milestone came at Duquesne University in Pittsburgh, Pennsylvania. A group of teachers experienced an outpouring of the Holy Spirit and spoke in tongues after reading the first chapters of the Book of Acts and two other books, *They Speak with Other Tongues* by John Sherrill and *The Cross and the Switchblade* by David Wilkerson. Soon afterward on February 17, 1967, they sponsored a retreat that has come to be known as the “Duquesne Weekend.” During the retreat, a move of the Spirit fell on twenty-five students as they were going to the chapel for prayer. Some of the students praised God in new unlearned languages while others wept for joy. Their Holy Spirit-inspired worship lasted all night. This event not only affected the Roman Catholic Church, but it made the Charismatic movement a pan-Christian experience.

The renewal spread rapidly. Two graduates from Notre Dame University went to investigate the happenings at Duquesne and shared the same Spirit baptism. From there, the Charismatic experience extended to the students and faculties of Michigan State, Iowa State, and several other universities. From the university campuses, the renewal reached into the wider Catholic Church.

Large conferences and renewal gatherings provided unity and integrated the renewal movement into the life of the church. The celebration of a Charismatic Eucharist that blended traditional structure and the spontaneity of the Spirit was a popular feature at Catholic Charismatic Renewal Conferences. The ministry of inner healing gained popularity and produced several new ministries devoted to healing with a number of priests, nuns, and laypeople in charge.

The positive attitude by Catholic leaders toward the renewal promoted growth in the movement. Cardinal Leon-Josef Suenens (1904–1996) of Belgium, a leading voice of the reform movement in Vatican II, described the experience in his book *A New Pentecost* as a “high voltage current of grace which is coursing through the Church” (p. 111). He expressed his belief that the future of the Catholic Church depended on charismatic renewal within its ranks. Another Catholic scholar and prolific writer, Kilian McDonnell

(1921–) of the Order of St. Benedict, felt that the Spirit’s charismatic anointing was the key to Christian unity and living a fuller Christian life.

While the Catholic Charismatic Renewal was not without opposition, most Catholic bishops affirmed the movement because of Vatican II. By 1970, a Catholic Charismatic Conference at Notre Dame attracted thirty thousand Catholics who prayed in tongues, prophesied, and rejoiced in what God was doing among them. At a 1975 international conference in Rome, ten thousand pilgrims from more than fifty countries heard Pope Paul VI voice his gratitude for the move of the Holy Spirit in the Catholic Church. By the turn of the twenty-first century, statistics showed more than seventy million Charismatic Catholics in more than 120 nations of the world. To many of those involved, this move of the Holy Spirit was regarded as the answer to Pope John XXIII’s prayer at Vatican II for a “New Pentecost.”

The First General Conference on Charismatic Renewal

The first General Conference on Charismatic Renewal convened in Kansas City, Missouri, in the summer of 1977. It was the most inclusive gathering of Spirit-baptized believers to date and the first time that all segments of the modern renewal movement met together. Representatives from the Classic Pentecostal wing, the Protestant Charismatic wing, and the Catholic Charismatic wing attended the historic meeting in a demonstration of grassroots unity never before seen in the United States.

Kevin Ranaghan (a Catholic Charismatic), Larry Christenson (a Protestant Charismatic), and Vinson Synan (a Classic Pentecostal) served as the executive committee for the conference. The morning sessions were divided up according to denominational affiliations, but the afternoon workshops were opened to participants from all church persuasions. At night, the entire body worshipped together in the huge Arrowhead Stadium. The meetings were highlighted by periods of praise and solemn moments of prayer. With fifty thousand participants, the night sessions sometimes resembled an old-fashioned revivalist camp meeting as thousands of Spirit-filled Christians rallied around the theme, “Jesus Is Lord.”

The Kansas City conference demonstrated several trends. First, Dr. Pauline E. Parham, daughter-in-law of Charles and Sarah Parham, spoke at one of the main sessions. This hinted at a change in attitudes toward women in the ministry. This

change would evidence itself in other charismatic conferences where women like Joyce Meyer, a Word of Faith teacher and author; Marilyn Hickey, inspirational speaker and Bible teacher; and Ruth Carter Stapleton, sister of President Jimmy Carter, were frequent speakers.

The fact that Thomas Zimmerman, general superintendent of the Assemblies of God in America; Leon Joseph Cardinal Suenens, Roman Catholic primate of Belgium; Bishop J. O. Patterson, presiding bishop of the predominantly African American Church of God in Christ; and Anglican archbishop Bill Burrett of South Africa all graced the platform at the same time showed that shared relationships in Jesus Christ created both ecumenical and racial unity. A poignant moment in the conference came when Larry Christenson gave a remarkable prophecy. He declared that the racial struggle in South Africa would end without bloodshed as a white man and black man reached out to each other in Jesus Christ. These words came years before Nelson Mandela and F.W. de Klerk amazed the world with the 1994 bloodless transfer of power in South Africa.

The success of the historic Kansas City conference generated other conferences in the years following. The 1987 Congress on the Holy Spirit and World Evangelization in New Orleans called the Pentecostal and Charismatic movement to a “decade of world evangelization,” with the shared goal of winning half of the earth’s population to Christ by the year 2000. Other conferences that also fostered evangelism and personal witnessing were held in Indianapolis (1990), Orlando (1995), and St. Louis (2000).

Media and Literature

Charismatics learned to use the media to their best advantage, and it played an important part in spreading the renewal message. In 1959, Pat Robertson (1930–) founded the first Christian television station, the Christian Broadcasting Network. He contributed much to the development of religious broadcasting. He was the first to use the telethon to raise support for his station and the first to broadcast a Christian talk show on CBN. Both formats remained popular in the early twenty-first century.

In 1973, Paul Crouch (1934–) formed the Trinity Broadcasting network with Jim Bakker (1940–). A few months later, Bakker moved to North Carolina to start his own PTL (Praise the Lord) network. By the late 1970s, numerous Christian centers and evangelistic ministries televised their services and beamed conferences via satellite to cooperating churches across the USA. The increased demand for

teaching materials led to an “audio cassette tape explosion.” Audio and video tape libraries distributed millions of Charismatic teaching tapes around the world.

The rapid growth of the Charismatic movement generated the need for popular and scholarly charismatic literature. Dennis Bennett shared his charismatic journey in the book *Nine O’Clock in the Morning*. John Sherrill (1923–) authored and coauthored several Charismatic best sellers. He related his own personal experience in *They Speak with Other Tongues*. He and his wife, Rita, worked with David Wilkerson to write *The Cross and the Switchblade*, the book that influenced the Catholic Charismatic Renewal. The demand for popular Christian fiction in the 1980s was met by works like *This Present Darkness* by Frank Peretti and *The Left Behind* series by Tim LaHaye and Jerry B. Jenkins.

Problems Develop

The Charismatic experience conditioned believers to expect God to move in unusual ways that were sometimes outside the traditional milieu. The very thing that made the Charismatic movement strong also caused controversies when carried to extremes. New ideas based only on experience caused faulty interpretations of the Bible and led to dangerous excesses. Debates swirled around methods used by well-meaning Charismatic leaders who prayed for the sick or practiced exorcisms.

Although many Charismatics stayed in their original denominations, others eventually left their churches for various reasons and formed new independent Charismatic churches and fellowships. This growing number of independents did not associate with any one particular church or organization and functioned without a safety net of denominational supervision. They met in ad hoc prayer groups, randomly attended teaching conferences, and wandered from group to group in search of the newest teaching. Many leaders in the movement voiced concern over the increasing numbers of “floating” Charismatics.

Don Basham, Bob Mumford, Derek Prince, Charles Simpson, and Ern Baxter, all associated with the Florida-based Christian Growth Ministries, presented what they believed to be the answer to this problem. They began teaching that every Christian, including the leaders, needed to have a “covering” and be under the spiritual guidance of a personal pastor or shepherd. When large numbers of people accepted this teaching and submitted to the authority of the five men, the “Shepherding movement” was born in 1974. It was promoted and popularized in the pages of

Don Basham's *New Wine* magazine and thousands of newsletters, books, and teaching tapes.

Controversy started almost immediately. Charismatic leaders such as Pat Robertson, Demos Shakarian, David du Plessis, and Dennis Bennett all publicly opposed the new movement. Finally, the Shepherding leaders dissolved their association in 1989, thus ending the debate. The hard feelings generated during the ten years of the debate dampened some ecumenical relationships. In 1989, Bob Mumford issued a public apology for his part in the controversial movement, but the damage was done. Some Charismatic leaders never again attended the annual leadership conferences.

In the late 1970s, another controversy arose within the Pentecostal/Charismatic ranks—the “health and wealth” or “prosperity” gospel based on evangelist E. W. Kenyon's writings. Faith teachers Kenneth Hagin, Kenneth Copeland, and others proclaimed that it was God's will for every believer to be financially blessed. All a Christian needed to do was “speak” or “claim” the blessing and God would answer. Opponents felt these teachings overemphasized human faith and caused a lot of condemnation if a person did not receive what he or she had claimed—the tendency being to blame them for their lack of faith. In spite of the debate, the prosperity gospel became very popular. Kenneth Hagin's unaccredited Rhema (spoken word) Bible Training Center in Broken Arrow, Oklahoma, turned out hundreds of graduates who spread the Word of Faith teachings around the world and carried the teaching into the twenty-first century.

By the late 1980s, the Charismatic movement had changed into many different groups and lost much of its cohesion. The very public sex and money scandals associated with televangelists Jim Bakker and Jimmy Swaggart damaged the reputation of Pentecostals and Charismatics. Controversy and media attention swirled around Oral Roberts's dramatic ultimatum to his television audience in 1987 that God would “call him home” if he failed to raise \$8 million to support his struggling City of Faith hospital and medical school. Even though Roberts eventually raised more than \$9 million, both his fund-raising techniques and the idea that God would kill him created a huge uproar.

Charismatic Communities

Entire congregations or parishes often became Charismatic; however, in other cases Charismatics sometimes functioned as a subset within a parish. They met in weekly prayer meetings featuring Bible studies, testimonies, and fellowship. Central to these meetings were charismatic expressions of

prayer and ministry to each other with the spiritual gifts. In these small groups, Charismatic believers encouraged and strengthened each other in their faith and experience. While church leaders attended these meetings, the laity often took the leadership roles.

The renewal movement also spawned covenant communities, teaching seminars, and discipleship studies that provided special Charismatic ministry to the wider church. A Charismatic Benedictine monastery founded in 1969 in Pecos, New Mexico, and the Word of God Community near the University of Michigan in Ann Arbor are examples of these communities that sprang up across the United States and around the world. Members of these communities separated themselves from the world and lived a life of devotion. Some communities were both evangelistically inclined to attract new membership and socially orientated for the poor and underprivileged. Spirit-filled leaders guided and directed the members in prayer, teaching, and worship. The Word of God community, ecumenical in nature but with a large percentage of Catholic members and under Catholic leadership, was divided into “households” dedicated to university students, married couples, single men, and single women.

Loose-knit fellowships, associations, and networks linked the organizations. The Word of God community sponsored an ecumenical association called the “Sword of the Spirit.” The People of Praise Community created the Catholic Renewal Services to coordinate and administer large Charismatic conferences. These Charismatic communities contributed in a positive way to the greater renewal movement. First, they provided discipleship and training for volunteers who manned the large Charismatic conferences. Second, they fostered scholarships and provided an encouraging atmosphere for writing. The Mother of God Community in Gaithersburg, Maryland, was the home base for Peter Hocken and Francis Martin, two leading Catholic scholars.

The communitarian movement was not without controversy. The unity among the groups was shaken by the end of the 1980s when disagreements developed between Word of God and People of Praise communities. The Catholic Church itself found it necessary to examine the activities of some communities because they were too exclusive and interfered with members' private lives.

Neo-Charismatics or the Third Wave

The Neo-Charismatic movement, or Third Wave, is larger numerically than the first two renewal waves combined. By 2000, an estimated three hundred million members had

swelled the ranks of nondenominational or independent charismatic groups not aligned with either the Classic Pentecostal or Charismatic Renewal churches. C. Peter Wagner claimed that the Third Wave was taking place in the straight-line evangelical churches previously untouched by the first two waves.

The Third Wave has been typified by the ministries of John Wimber and C. Peter Wagner. Wimber's teaching led to the Signs and Wonders movement. His teaching declared signs and wonders were normal in the church and were necessary in evangelism and church growth. Wagner is more famous for his New Apostolic Reformation, which stresses the restoration of New Testament offices of apostles and prophets.

There is no one defining form of church government or style for this group. They accept the postconversion gifts of the Holy Spirit including speaking in tongues, prophecy, and healing, but they do not specify any one experience as a requirement for the reception of spiritual gifts. As in other Charismatic churches, worship styles vary, but holy laughter, dancing before the Lord, and Spirit-inspired singing are often found in the services. It can be said that Neo-Charismatics have Pentecostal-like experiences but no Classical Pentecostal or Charismatic affiliations. While they may share slight historical connections to the previous waves, sometimes there are none at all. Neo-Charismatics include organized denominations and fellowships such as the Association of Vineyard Churches, Every Nation, Sovereign Grace Ministries, and others.

Conclusion

The Charismatic renewal caught the whole church by surprise. At first, Classic Pentecostal denominations were suspect of a revival outside their boundaries; but as time went on, the majority of Pentecostals withdrew their criticisms and embraced the growing renewal movement. By 2000, the Charismatic renewal had encompassed more than 250 distinct ecclesiastical confessions, traditions, and groups of Christianity. The contributions to Christianity of a renewal movement of this size and magnitude are worthy of note.

Ecumenical Awareness. The Charismatic renewal produced ecumenical awareness and fellowship across denominational and traditional church lines. Two important events illustrate this impulse: the Kansas City Conference of 1977 and the Roman Catholic-Pentecostal Dialogues.

Vitality in Worship. Because of the infusion of charismatic innovations, the church worship has been

reinvented. New forms of doctrine, worship, organization, and outreach are reflected in praise and worship music, prayer marches, and innovative uses of mass media and technology.

New Awareness of Spiritual Gifts. Those involved in the Charismatic renewal discovered that the spiritual gifts that were available to build and strengthen the early Christian church are still available for the same purpose in churches today.

Scholarship and Education. Leaders of the Charismatic renewal such as Larry Christenson and J. Rodman Williams wrote books and educational materials that were influential in the development of Charismatic theology. Kilian McDonnell, the primary historian and adviser to the Catholic Charismatic Renewal, also produced several major works.

Slower Liberalization of the Church. The movement significantly reshaped the landscape of the church at large and slowed the liberalization of historic mainline denominations. The emphasis on Jesus as Lord and the work of the Holy Spirit drew churches back to the essentials of Christianity.

Unity. Roman Catholics and Protestants found each other in Jesus. Unity based on the shared experience motivated the establishment of closer relationships.

Concern for Fellow Human Beings. The charismatic movement muted the divisiveness between churches and church traditions. The work toward reconciliation was fueled by Christian love and desire for unity.

Evangelization. The belief that the Holy Spirit was given to empower evangelism inspired the large joint evangelistic efforts during the decade of the 1990s. The goal was to bring millions of people to the Lord before the end of the twentieth century.

New Vitality. New energy poured into the churches because of the Charismatic renewal. Charismatic worship services brought life into tired churches and produced significant growth.

Role of Women. The Charismatic renewal brought greater freedom for women leaders in the churches and strong ministries with women leaders.

Prayer. The renewal waves produced a new interest in prayer and the power of prayer for healing and deliverance.

Fellowship. Christian fellowship across church lines has been an important result of the Charismatic renewal. Small groups meeting together for prayer encouraged relationship building and spiritual growth.

Laity. The work of the Holy Spirit among all members of the body of Christ was a great equalizer. Spirit-filled laypersons found places of ministry in prayer meetings, small groups, and Charismatic communities.

This movement presents problems for those who wish to study it. First, it is hard to separate the parts from the whole because Charismatics did not form new denominations as did the Classical Pentecostals. Because the movement mixed with other traditions, it is difficult to separate the renewal stream from the larger matrix. Second, the movement, so full of diversity, is still in the process of development. Some churches that started out as Classical Pentecostal or main-line Protestant have blended Charismatic thought and practices with their traditional background to produce something different. In spite of who they are and where they originated, it can be said that this collection of Classic Pentecostals, Charismatics, and Third Wavers makes up a widespread spiritual movement. Together, they have come to constitute a major force in Christendom throughout the world.

Children and Adolescents

In his 1990 book *The Spiritual Lives of Children*, psychologist Robert Coles writes that children and adolescents use religion to find meaning in their lives, and in doing so they usually achieve greater maturity and growth. He found this was true for many religions: Christian children who deeply feared hell also found personal strength through the ministry of Jesus; Jewish children understood themselves to be Chosen, but also developed compassion for the suffering of others through their understanding of the persecution of Jews; and Muslim children grew in personal autonomy through surrender to Allah. In understanding religion in America, then, one must understand both how religions view children and how children experience religion. Many religious traditions form the religious landscape of the United States, ranging from the Protestantism that has long shaped the public discourse and much of the country's communal imagination to traditions that grew immensely after immigration laws

changed to allow greater diversity. Questions arise as to the nature of the experience of children and adolescents in some of those diverse traditions—Protestantism, Catholicism, Judaism, Hinduism, and Islam—before touching on an important moral and spiritual influence on many American children: children’s literature.

Protestant Traditions in Early America

In the early years of America, Protestant assumptions about children were hugely important to the experience of children in the United States. Not only were most children, statistically speaking, raised in Protestant homes of one stripe or another, but also Protestant understandings of children and childhood shaped much about American public education and underlie many of the assumptions of “secular” American society. For instance, the “spare the rod and spoil the child” style of parenting owes its origins to early American understandings of salvation and the best ways to ensure salvation for one’s children. Such a strict approach suggests harsh parenting, but seventeenth-century Puritan parents loved their children dearly, as numerous journal entries of parents espousing deep love for their children attest. Thomas Shepard, minister of the First Parish in Newtown (which would become Cambridge), Massachusetts, even feared that his oldest son’s life-threatening illness was caused by God because Shepard loved his child too dearly.

Although Puritan parents loved their children, they were simultaneously deeply dubious about their spiritual state. Calvinist theology argued that children were born either among the elect (saved) or not, that no actions on the part of parent or child could affect the child’s eternal state. The best that loving parents could hope for were signs indicating that their child was among the saved, and given the lack of self-control that is an inherent part of infancy, those signs were few and far between. Additionally, Puritans believed that children were born tainted with sin, as Anne Bradstreet’s description of her own childhood in *The Poems of Mrs. Anne Bradstreet* demonstrates: “Stained from birth with Adam’s sinful fact,/ Thence I began to sin as soon as act.” Early American Protestants believed that their beloved children were in fact “fallen,” deeply tainted by original sin and ruled, not by knowledge of God, but by their baser instincts.

This concern for the spiritual state and fate of Puritan children can be seen in the intense importance that Puritan parents placed on the rite of baptism for their children. For instance, before 1662, only babies whose parents had made

a confession of faith and become Communion-receiving members of congregations were eligible to receive baptism. Theoretically, having been baptized in no way affected whether one was saved, but many parents thought baptism encouraged the spiritual potential of their children. In particular, parents who had been baptized themselves but had never experienced saving conversion wished to see their own children receive the sacrament of baptism. In 1662, ministerial delegates from Massachusetts churches decided that while only the converted could take the Lord’s Supper, or Communion, anyone who had been baptized might have his or her own child baptized into the church community. This decision, called the Half-Way Covenant, reflected a dramatic shift in the understanding of the role of congregations in the spiritual lives of children. If previously the church had been understood as existing for the already saved, Puritans were moving in the direction of understanding churches as being able to encourage conversion among children by giving them some external markers of grace. In short, parents and communities might be able to help children on the road to grace.

Evangelical Child Rearing

Within a few generations, Puritan ambivalence about the nature of childhood had largely given way to an evangelical anxiety about childhood. In the increased evangelical fervor of the early eighteenth century, an understanding of childhood took hold that framed it as a time of innate depravity. Parents, then, were responsible for shepherding their children from a position of unrepentant and unknowing evil into Christ. One of the most important ways in which parents, particularly mothers, could do so was through their example of personal piety. If parents allowed themselves to be ruled by their tender feelings for their children, they ran the risk of damaging their children’s spiritual growth. A particular fear of evangelical leaders emerged in the paradox that, while parents would not want to frighten their “innocent” children with tales of hellfire and damnation, by failing to warn them about this potential, parents would damn children to just such a fate. Jonathan Edwards, one of the most prominent figures in New England Evangelicalism, responded to criticisms that one should not frighten children with eternal damnation:

As innocent as children seem to be to us, yet if they are out of Christ, they are not so in God’s sight, but are young vipers, and are infinitely more hateful

than vipers, and are in a most miserable condition, as well as grown persons; and they are naturally very selfish and stupid . . . and need much to awaken them. Why should we conceal the truth from them? (In C. C. Goen, *The Great Awakening*)

This trajectory demonstrates an important movement in how American Protestants understood salvation and the spiritual state. If Calvinist Puritans hoped that their children would be saved, but believed both that they could not affect their salvation and that the statistical odds were against salvation, they nonetheless moved quickly into looking for ways to assure themselves that their children would be among the saved. One can see such a trend in the Half-Way Covenant, which suggested strongly that it would benefit children to be within the church community. By the mid-eighteenth century, however, the operating assumption was that children, though they were born inherently depraved, could be and must be brought to Christ by making them very aware that if they did not become godly, they would burn. The message of damnation was harsh, but it was also hopeful, in that it offered parents a way to care spiritually for their children.

How, though, did it feel to be a child in the evangelical world that formed the dominant Protestant culture of the eighteenth and early nineteenth centuries? Certainly, there were children who found the evangelical narrative compelling. Some of the most articulate memories of life under evangelical parenting, however, came from the children of Lyman Beecher, a leading figure in the Second Great Awakening of the early nineteenth century. While his son, Henry Ward Beecher, a famous minister of the second half of the nineteenth century, remembered his profound love for his father and his father's gentle care for him in sickness, he also observed, as quoted by Debby Applegate in *The Most Famous Man in America*, "I don't remember a year of my life, after I was seven or eight Years old, that I did not go about with a feeling of sadness; a feeling that I was in danger of exile from Heaven—all because I was a sinner and I did not want to be." The reaction of people like Henry Ward Beecher to their evangelical upbringing brought about dramatic changes in the American religious landscape. Instead of evangelical fire, Henry Ward Beecher preached a "Gospel of Love" in which "God had a father's heart. . . . Christ loved me in my sin . . . while I was a sinner He did not frown upon me or case me off, but cared for me with unutterable tenderness, and would help me out of sin." Beecher's kinder, gentler Christianity had direct implications for child rearing.

In the words of his older sister, Harriet Beecher Stowe, "Tell a boy that God loves him, and religion has a chance to take hold. Tell a boy that he is under God's wrath and curse . . . because somebody ate an apple five thousand years ago, and his religious associations are not so agreeable—especially if he has the answers whipped into him."

Horace Bushnell and the Gospel of Love

While the evangelical model of parenting certainly continued in some streams of American Protestantism, this new form of Christianity suggested a more nurturing approach to religious training. A leader in this new approach, Horace Bushnell was a Connecticut minister and author who was one of the leaders of a cultural shift away from revival culture. His *Views of Christian Nurture and of Subjects Adjacent Thereof*, first published in 1847, specifically described children as spiritual beings counter to the evangelical model. The industrial revolution contributed to a shift in how Americans understood the family. As important as evangelical mothers were in the spiritual development of their children, their families were patriarchal in structure, with the home and children under the father's control. During the nineteenth century, the domestic sphere began to be cast both as female and as sacred space, while the public world became both male and worldly. For men, the home became a retreat from the cares of the world, but it was the mother who became primarily responsible for child rearing. Simultaneously, a Rousseauian understanding of childhood as a time of innocence began to take hold. This landscape provided fertile ground for Bushnell's ideas to become popular. For Bushnell, as for evangelicals, parents were responsible for their children's spiritual development, but rather than using fear of damnation, he espoused that they model a healthy relationship with God. Parents were to shape their child, understanding that every word uttered and every action performed had the potential to shape their offspring toward or away from Christ. That said, Bushnell also understood children as having an inherent Christian nature from birth—that the child's nature would develop as the child did, slowly, and with proper care, into adult faith. As a result of Bushnell's influence, the Christian home became the primary staging ground of childhood Protestant experience. Bushnell encouraged parents to create religious experiences out of most facets of childhood, including play, birthday celebrations, holidays, and careful attention to religious devotions including Bible study, catechism, and a family altar. These home practices were reinforced with church

attendance and community. Children attended worship and Sunday school, were aware of missionaries, and aided, as age appropriate, in the broader missions of the church.

Bushnell's views had a variety of critics and certainly represented a middle-class view of the family. That said, Bushnell's views were broadly culturally pervasive. For instance, Unitarian author Louisa May Alcott valorized the home and parental nurture in her wildly popular series for "young readers," *Little Women*, *Good Wives*, and *Little Men*. The March family, characterized by deeply loving and highly moral parents, is established from the opening scene as having raised Christian children when the daughters, despite some personal reluctance, sacrifice Christmas presents to the (Civil) war effort; sacrifice personal treats and vanities further to get gifts for their mother, Marmee; and, under her influence, give their Christmas breakfast to the poor. The model of Christian nurture ran counter to the Calvinist understanding of election. While not every person was automatically among the saved, salvation was possible for each person, especially if they were properly nurtured in loving homes and churches. That salvation, however, was not expected to be a life-altering conversion as in the Calvinist model. Instead, it was understood as a slow development of an innocent, childlike faith into a deep and mature one. Many of the liberal Protestants raised in the late nineteenth century felt little of the anxiety or alienation experienced by evangelicals, rather understanding themselves to be secure in both their Christianity and their family settings.

Protestant Children in the Twentieth Century

If Bushnell's views of childhood characterized the late nineteenth century, the early twentieth century was characterized by a fear that the family and the church were under siege from modern life. Neither, it was argued by ministers and Sunday school societies, could compete against the movies, the radio, jazz, and the marketplace. Christmas, it was feared, was moving from Christ to consumption. Additionally, parents were becoming more secular, so that family devotions and Bible study were on the decline. While many American Protestants became more secular or moved into the realm of "do-it-yourself" spirituality, which left children without formal, communal, religious training, throughout the second half of the twentieth century, evangelicals created a separate youth culture that ran parallel to secular American society. Evangelical youth culture includes literature, Christian heavy metal, and the positing of Christian culture as a

form of youth counterculture that proved deeply spiritually satisfying for many who participated.

Catholicism and the Spiritual Formation of Children

If Protestants debated the inherent nature of children, the Catholic position was more clear. Children were understood to be gifts from God. Though they inherited original sin, they were also of God. Parents, then, were responsible for raising their children in the church, so as to properly spiritually form them. While parents shaped children, children were also understood to have spiritual wisdom to impart to their parents and families, both through the innocence of their questions and through their childlike wonder at the world.

American Catholicism in the Nineteenth Century

Like their Protestant contemporaries, nineteenth-century Catholic mothers were invested in and responsible for the spiritual health of their children. Mothers were charged with leading the children in family recitations of the rosary, though other forms of home devotions were also encouraged. In addition to home devotions, by the mid-nineteenth century, American Catholics had an additional concern in terms of transmitting their faith to their children. Over the course of the first half of the nineteenth century, support grew for the idea of tax-supported public schools, such that by 1860, every state had some form of a public school system. While these schools guaranteed a basic education, they were also deeply dedicated to shaping moral citizens. Horace Mann, a Boston-based educational reformer, argued that publicly funded schools could offer an education that was nonsectarian, while nevertheless retaining key pieces of Christian moral teachings. The argument was that general precepts of Christianity, such as biblical readings and recitations of the Ten Commandments and the Lord's Prayer, were acceptable and left students to be guided in specifically theological concerns by their parents and ministers. From the Catholic standpoint, however, these practices were unacceptable because the Protestant King James Bible was the biblical text used, and Protestant versions of the Ten Commandments and the Lord's Prayer were the ones recited. To Catholics, even the not explicitly religious material, such as the readers and primers selected, demonstrated a distinct Protestant bias. As a result, Catholics tended not to support the creation of public schools. Starting in the 1840s, bishops began encouraging parents to send children to Catholic

schools. Additionally, all states with large Catholic populations had political battles over whether Catholic schools should receive public funds and whether the above-mentioned Protestant elements should be removed from the curriculums.

The conflict over public schools is perhaps best exemplified by a conflict in Boston, in which Catholic public school children publicly demonstrated their loyalty to the church. In March 1859, a ten-year-old Catholic student named Thomas Whall was asked by his teacher, Sophia Shepard, to recite the Ten Commandments. Whall refused, having been instructed by his father not to recite the Protestant version of the commandments. While Massachusetts law required the day to begin with the Protestant form of the commandments, most teachers had the class recite en masse, and Catholic students could simply say the Catholic version, with no one the wiser. Miss Shepard deviated in insisting on individual recitation, and the school board upheld her position. The following weekend, the Whalls' priest urged the Sunday school to avoid Protestant prayers. Additionally, the congregation passed a resolution recommending that the children should use Catholic versions whenever called upon to recite prayers. On Monday, Whall was once again required to recite the King James version of the Ten Commandments. He refused and was beaten until his hands were bloody. After the beating, the principal announced that all students who refused to recite the Ten Commandments would be sent home from school. Hundreds of Catholic students were discharged, and the following week, when they brought Catholic copies of the commandments, they were sent home yet again. The Whall family sued the assistant principal who had administered the beating, but the court ruled in favor of Assistant Principal Cooke.

This incident says quite a bit about Catholic-Protestant relations, but it also demonstrates the devotion of a ten-year-old boy to a sense of Catholic identity. While Catholics had been creating separate educational systems for more than a century, incidents like the Eliot School rebellion encouraged the creation of a separate American Catholic school system. While the purpose of such a system was, in part, to protect schoolchildren from Protestant influence, Catholic schools had internal religious goals as well. In the late nineteenth century, Catholic schools were huge forces in shaping Catholic culture, which was, at that time, deeply devotional. In addition to teaching the secular subjects, Catholic schools offered religious instruction that went well beyond the catechism. Historians have noted that schools were decorated

in styles similar to churches, with statues and paintings of saints. Religious devotional objects were used as rewards for academic achievement, and devotions to the saints and to the Virgin Mary became school holidays. As a result, school became sanctified space, designed to encourage the devotional lives of Catholic students and nurture in them a sense of divine figures within their daily lives.

Catholicism in the Twentieth Century

In the twentieth century, Catholic children continued to be taught that they, like Thomas Whall, might need to defend the faith. In the words of a midcentury teaching sister from Wisconsin, Catholic children were "the smallest of God's soldiers," who were directed by their teachers in "the part they were to play in winning the world for Christ. It will mean a tremendous battle."

The sacrality of the Catholic world did not, in the twentieth century, prevent it from also being fun. Scholar Julie Byrne describes women's basketball as a vital aspect of the Philadelphia Catholic high school and college experience. Catholic girls played basketball, and played it well, beginning in the 1930s and culminating in national women's college basketball championships in the 1970s. Basketball is significant because it models a way in which Catholic girls were encouraged to move out of traditional female roles, to be active athletes in whom their communities took pride. Given popular conceptions of the Catholic Church as repressive to women, this is hardly insignificant. The basketball court was also a place of spirituality, in that before the game, the team and coaches on the court and the parents, classmates, priests, and nuns in the stands would all pray, in the words of the Immaculata College Mighty Macs, "Oh God of Players, hear our prayers to play this game and play it fair." Perhaps most importantly, according to Byrne, the fun that Catholic girls took in basketball complicates the "culture of suffering" that characterizes Catholic women's history by demonstrating a place in which Catholic adolescent girls experienced pleasure in a church-sanctioned setting.

African American Children and Community Life

The pictures of Christianity traced out above, both Catholic and Protestant, were principally those of white Christianity. While African Americans were certainly affected by the theological trends discussed above, life in the black churches had distinct characteristics, particularly for children. For instance, according to sociologist Cheryl Townsend Gilkes,

until the late twentieth century, African American congregations were less likely to have programming explicitly for children and teens. Rather, children participated in adult activities as apprentices to adult positions. As a result, children were able to serve as junior leaders to adult congregations, and their voices were heard in church space. Since one of the primary social goals of black congregations was to provide children with a safe space from the harsh racism of the outside world, communities took special care to nurture and support the talents of youngsters. Children were raised to know that they were the valued future of the church. In fact, the nurturing influence of the church helped to mentor children into leadership roles in the secular world as well. Oprah Winfrey, Aretha Franklin, and Henry Lewis Gates Jr. all had their earliest public roles in their childhood churches. The positive role that the black churches have played in the lives of their children has not been static. There have been times when it has been more or less political and times when churches have failed to reach out to, or meet the needs of, the young people in the community. For many, however, African American churches have offered a deeply affirming recognition of talent.

The Role of Children in Judaism

Jews have lived in what is now the United States since colonial times; however, for much of that time communities were small, and many families lived as the only Jews in town. Waves of immigration at the beginning and the end of the nineteenth century and in the early decades of the twentieth century have created a sizable American Jewish community, though Jews remain a small percentage of the country's overall population. One of the major concerns of Judaism is *ledor vador*, the transmission of Judaism from generation to generation. Given the importance placed on passing on Judaism, children have been a major focus in American Judaism.

Life-cycle rites are an important aspect of Jewish childhood, particularly the *bris* (Yiddish) or *brit malah* (Hebrew), the ritual circumcision of a Jewish male on his eighth day of life. Through his *bris*, a boy was made part of the covenant between God and the Jewish people. At the age of thirteen, a Jewish boy became a *bar mitzvah* or a son of the commandments. A bar mitzvah took place after years of Jewish education and was marked by the teenager being called to read in Hebrew from the Torah, after which he offered thoughts on what he had read. Families often marked this occasion with some form of celebration, ranging from

offering refreshments to the congregation immediately following the service to a lavish party for the child's friends and the parents' social circles. The bar mitzvah marked the assumption of Jewish adulthood, with all the attendant ritual responsibilities. While thirteen-year-olds were still not considered to be adults in most ways, from that point on, the boy could be counted in a *minyan* (the ten Jews necessary for the recitation of certain prayers), fasted for Yom Kippur (the Day of Atonement), and abstained from certain foods during Passover. The extent to which any given boy observed these restrictions depended on the traditions of his individual Jewish movement and the conventions of his family, and many children observed these rituals before turning thirteen.

Study was a central piece of the Jewish childhood. While the Jewish movements had varied educational goals, traditionally, a boy would be able to read Hebrew, know the contents of the Hebrew Bible and its accompanying Jewish commentary, and be ritually literate. American Jews created a small separate educational system of day schools in areas where their numbers permitted, but communally supported Hebrew schools that provided supplemental religious education were far more common.

Until the twentieth century, the American Jewish community, like those elsewhere, was primarily concerned with the education and ritual lives of boys. Though the Reform movement instituted confirmation ceremonies for both boys and girls in the nineteenth century, generally girls were not formally educated in the Torah or in Hebrew. Instead, they learned how to maintain Jewish homes and became ritually significant mostly in their role as wives and mothers. That tendency began to change in the early years of the twentieth century. Jewish girls gained increasing access to forms of education previously reserved for boys, and in 1922, Rabbi Mordecai Kaplan performed the first *bat mitzvah*, or daughter of the commandment, ceremony for his daughter. While bat mitzvah celebrations were slow to catch on, by the 1970s, most girls in the Reform and Conservative movements received bat mitzvah celebrations and the Jewish education leading up to them. In these ceremonies, girls took a ritual role very similar, if not identical, to those taken by their brothers. Historian Jonathan Sarna suggests that such access to Jewish learning and synagogue ritual gave these girls both a deep connection to Judaism and empowered them, such that many grew up to expand the ritual and leadership roles available to Jewish women. By the late twentieth century, many Orthodox congregations were also

offering bat mitzvah celebrations, adapting the ceremony for the restrictions placed on women's ritual leadership.

Hinduism, Immigration, and Growing Up American

In India, Hinduism is primarily practiced in the home. There is no equivalent to Sunday school; rather, children learn what it is to be Hindu by immersion in a society largely ordered by a Hindu worldview. While changes in Indian society around the turn of the twenty-first century have affected the transmission of Hinduism within India, for Hindus who moved to the United States in the post-1965 waves of immigration, it became a central concern. Scholar Raymond Brady Williams describes the process as one of creating a sacred world that children could enter with their families and communities, apart from the daily world of secular American society. In an attempt to create such a sacred world, American Hindus have brought together many different strands of Hinduism from across the Indian subcontinent, each of which may have different languages, festivals, and traditions. In community settings often borrowed from Christianity and Judaism (Sunday school, summer camp, and community centers similar to the YMCA [originally, the Young Men's Christian Association] and JCC [Jewish Community Center]). Hindu parents inculcated children with Hindu values that they saw as transcending the various differences between forms of Hindu practice. The result was a new American Hinduism, different from what parental generations knew in India but nonetheless the Hinduism most familiar to their children.

In Hindu educational settings and at home, American Hindus taught their children about karma, or the moral consequences of one's actions; dharma, or one's duties and responsibilities according to one's familial status; and values such as moderate appetites, compassion, mediation, and charity. Children were also likely to learn Hindu epics, tales that they might read and discuss in classes, act out in plays, hear as bedtime stories, see in comic book form, or watch as TV miniseries. Classes and summer camps enforced values that were taught at home but that parents worried might not be reinforced by life in the United States.

For the earliest generations of Hindu children growing up in America, educational material was often created for an Indian market and rarely in English. The Hindu worldview, which is tightly interconnected with Indian social systems, often made more sense in an Indian context and was at odds with some American ideology. (The Hindu emphasis on the

extended family, for example, contradicts the American value of individualism.) Some American Hindu children found these contradictions inherently confusing, as they experienced both value sets as making inherent cultural sense. In this way, American Hindu children often end up bicultural. Simultaneously, Hindu parents and educators worked to create educational material that was in English and more socially accessible to American-raised children. In the early twenty-first century, however, the question of how to be Hindu in America remained one that each Hindu child found himself or herself working out in relation to families and communities.

Negotiating America as a Muslim Child

While Muslims have lived in the Americas since the slave trade, the Muslim American community has grown numerically and in visibility since 1965. There are many forms of and approaches to Islam, inflected by factors ranging from country of origin to individual piety. While many American Muslims in the United States became assimilated, the children in more traditional Muslim families often faced similar challenges, regardless of country of origin, principally related to the negotiation of American popular culture and public space.

Observant Muslim families in the United States took care to preserve Islamic customs in their homes, observing life-cycle rituals and dietary rules. They founded schools to ensure that children learned Arabic and studied the Qur'an, included events for children in celebrations for Ramadan and other holidays, and followed Qur'anic instructions to love their children and teach them self-respect. In an American context, however, Muslim parents also had to decide exactly how to allow their children to interact with American popular culture. Individual parents made decisions for their own families, but just as conservative Christians created an alternate popular culture for their youth, Muslims produced Muslim video games, Internet sites, and even a Muslim doll to compete with Barbie. Children in some families were encouraged to participate in prayer five times daily, but that practice as well as holiday observance and dietary rules proved problematic in the public schools. Children missed school for religious holidays; prayer times sometimes overlapped with class time; and in order to avoid unacceptable meat (that which is not halal meat), children avoided school meals, which limited their access to public aid and made them notably different from their classmates. Similarly, clothing caused problems, as physical education uniforms often did not meet Muslim standards for modesty, particularly for women.

Negotiation of these problems continued into the twenty-first century, as Muslim communities and public schools sought solutions. Aside from policy problems, however, observant Muslim students can feel like outsiders: for instance, observant girls often chose not to wear *hijab* because, even when they were not openly mocked for the practice, looking so different put them on the outside of the social circle, making it difficult to maintain a spiritual practice and be socially accepted. Similarly, Muslim children reported feeling depressed and socially excluded during the anti-Islamic outbursts that followed September 11, 2001.

Religion, Moral Formation, and Children's Literature

While there are children growing up in many different American religious cultures, there are commonalities of experience among them. A central feature of childhood in twentieth-century America came in the form of literature written specifically for children. Sometimes the literature was explicitly religious, but often the most popular texts used religious themes that were embedded in stories that were not overtly religious. For instance, in 1950, the British Anglican author C. S. Lewis wrote *The Lion, the Witch, and the Wardrobe*, the first of *The Chronicles of Narnia* series. *The Lion, the Witch, and the Wardrobe* is a fantasy novel in which four children enter an enchanted land through the back of an old wardrobe, but it is also a Christological tale in which a magical land is saved by a Christ figure, who is both sacrificed and resurrected. According to *Time* magazine, *The Lion, the Witch, and the Wardrobe* was one of the best English-language children's novels of the twentieth century, and while it is hard to state precisely how it has shaped children's spiritual or moral thinking, it is also part of a genre of widely read books. Madeline L'Engle, an American and liberal Episcopalian author, won the Newberry Medal award in 1963 for her science fiction novel *A Wrinkle in Time*. While L'Engle's Christianity, as portrayed in the novel, is somewhat unconventional, the book tells the story of a battle against darkness, using biblical references, references to God and Jesus, and supernatural figures who are occasionally read as angels. Indeed, the strong Christian home and family of Bushnell's Christian nurture provides an ideal throughout all of L'Engle's work, particularly in her less supernatural and theological work.

Not all literature that presents children with tales featuring morality and the fight of good against evil is inherently

Christian. That does not mean, however, that such stories are not important in the shaping of American children. Susan Cooper's *The Dark Is Rising* series, written in the 1960s and 1970s, uses the myths of ancient England as the moral framework. Philip Pullman, the British atheist who authored *The Golden Compass*, was inspired by John Milton's *Paradise Lost*. His novels, which were written beginning in the 1990s for an adolescent market, deal with both the fall of man and with a corrupt church. The resulting books are concerned with both what Pullman refers to as the school of morals and with the dangers of conventional religion. Most famously, and deeply embedded in controversy both in their depiction of witchcraft and about the role of marketing in children's literature, are the Harry Potter books, a series of seven fantasy novels published between 1997 and 2007. While J. K. Rowling makes no explicit religious claims in the books, a pervasive theme throughout the series is the contrast between doing what is right and what is easy, acceptable, or politically expedient. In her 2008 commencement address at Harvard University, she spoke about the role of imagination in moral formation. All of these books have been popular examples of serial fiction, all in a similar literary genre, and they help to shape the moral and/or spiritual experience of children and adolescents. (Indeed, all of the authors deal with themes of adolescent sexuality at some point in their texts.) They are important cultural productions in the spiritual lives of children.

Christian Science

Christian Science is an indigenous American religious movement founded by Mary Baker Eddy (1821–1910), author of its textbook, *Science and Health with Key to the Scriptures* (1875), and founder, first pastor, and continuing leader of the Church of Christ, Scientist (1879). In the latter half of the nineteenth century, a battle for the hearts and

minds of American Protestants between explanations found in secular science and religion motivated new approaches to spiritual explanation, resulting in movements such as Christian Science. Christian Science emerged at a time also marked by a growing interest in spiritual and mental healing, at a juncture between stern Protestantism and religious liberalism. Christian Scientists view Jesus' teachings and his method of healing as scientific demonstrations of divine law, not as supernatural interventions. This law is spiritual, not material, and Christian Scientists believe that it sets aside the claims of material law, obliterating and destroying in human experience all that is unlike God.

Mary Baker Eddy: Formative Years

Born in 1821 in Bow, New Hampshire, Mary Morse Baker was the youngest of the six children of Mark Baker and Abigail Ambrose. Brought up in a strict religious household,

Mary Baker Eddy founded the indigenous American religious movement Christian Science and is the author of its textbook, *Science and Health with Key to the Scriptures*.

she joined the Congregational Trinitarian Church in 1838, though she rejected the Calvinist dogma of eternal damnation. Eddy later wrote that from her childhood she was impelled by a desire for a knowledge of God as the great relief from human woe, higher and better than matter. Her father was a strict Calvinist who emphasized judgment day and punishment, and her mother was a sympathetic heart who advised her to lean on God's love and seek his guidance through prayer. Her subsequent formulation of Christian Science would reiterate these gendered ideas in her conception of the Father-Mother God. Frail in her early life, she also suffered the loss of her mother and favorite brother in her early adulthood. Married in 1843 to George Glover, she returned home after he died within six months. Widowed with a child at the age of twenty-two, she spent the next two decades battling invalidism. In 1851 her ill health and family troubles caused her only son to move in with another family, who later moved away with him in 1856. She married again in 1853 to itinerant dentist Daniel Patterson but could not travel with him, and she was bedridden for most of the next eight years. In her search for relief, she adopted Graham's pure food cure; visited Dr. Vail's Hydropathic Institute in 1861; studied traditional medicine, homeopathy (using dilutions to heal with substances that would cause symptoms in a healthy person), and mesmerism (healing through the manipulation of magnetic vital forces); and visited Dr. Phineas P. Quimby several times between 1862 and 1865. It was Quimby who had an important effect on her health and well-being. During this time her literary aspirations began to emerge and mature as she contributed poems and incidental narratives to local newspapers and periodicals.

Phineas Quimby, a clockmaker and early student of mesmerism, believed that disease had a mental cause. To him, the impressionable "spiritual matter" of the human mind was the origin of both disease and its cure. He experimented with several methods, including animal magnetism, clairvoyance, and hypnotism, until he developed a suggestive talking cure where he simply sat by his patients, told them what he thought was their disease, and his explanations were the cure. Quimby believed that disease was a deception held in the mind and that the mind could chemically change the body. Through his method of correcting the patient's "errors," he supposed he could change the fluids of the system and establish health. He believed his experiments would be scientifically verified. Eddy was helped by him and continued to explore mental causation, lectured about Quimby's methods, opposing them to deism and spiritualism,

and attempted to recast his techniques into a Christian framework.

Several months after Quimby's death, Mrs. Patterson had a severe fall on the ice in February 1866 on her way to a temperance meeting. It was this event that she later claimed led to her discovery of the decisive curative power of a spiritual understanding of the scriptures. After reading an account of Jesus' healing, she experienced a powerful moment of recognition that life and reality were spiritual and glimpsed the sole reality of the spiritual nature of God: life. She believed this understanding of God's presence healed her. Soon after the experience Patterson deserted her (she was officially divorced in 1873). Socially dislocated, Mrs. Patterson relied on the kindness of friends and family and moved often into boarding houses across New England, all the while studying the scriptures in order to understand and clarify her new conviction that she had discovered the scientific laws of God, revealing Jesus' miracles as demonstrations of the healing power of divine mind.

Her understanding evolved slowly over the next few years. In 1867, students and patients began calling on her to teach them her method and heal them. By 1869 she completed writing her first manuscripts and began teaching organized classes based on them in Lynn, Massachusetts. In 1875 she published a more complete statement of her methodology in her book *Science and Health*.

Healing Theology

Eddy taught that creation was a dynamic unfolding of God's individual spiritual ideas; revelation was how this process appeared to humanity. Eddy considered the explanation of creation in Genesis chapter 1 to be the spiritual account of God's creation, while the second chapter contained the mortal or material view of creation. The platform of Christian Science rests on discovery of the facts of being as the revelation of absolute truth, making Christian Science closer to evangelical thinking than other mind cure or New Thought theologies. As humans discover their essential spiritual nature of being as the "image and likeness of God," the divine order or kingdom of heaven is revealed with the force of divine law, destroying sin and healing the sick.

Eddy defined God with seven synonyms in *Science and Health*: "infinite Mind, Spirit, Soul, Principle, Life, Truth, Love." Since God is infinite spirit, the only intelligence of the universe, including man, God's true creation cannot be seen by the material senses. In fact, matter itself is ultimately unreal. God is one mind, the only self-existence, and

spiritual man is his eternal image or expression. Much like the sunray partakes of the essence of the sun and yet is not the sun, God and man are inexplicably bound together as mind and idea. God, the divine ego, expresses himself in man. As the human yields to this divine mandate, it is saved from the bondage of mortality.

Eddy rejected pantheism—spirit does not enter matter, it supplants its claim to reality: the visible universe and material man are counterfeits of spiritual reality. The material senses, as faculties of “mortal mind,” lie to humanity and claim to have power as sin, disease, and death. These are rooted in false beliefs about the nature of creation and exist only in relationship to the lack of human understanding of God’s active spiritual law. Christian Science teaches that an understanding of humanity’s spiritual relationship to God dispels the claims of the senses and destroys any false claims of “error”—of evil, sin, and sickness. Eddy believed that this was Jesus’ method: the savior saw man as God’s image and likeness, and this correct view healed the sick and sinning.

Jesus was human, born of a virgin, and “appointed” to appear to humanity in a form they could both understand and perceive. Thus, he was the exemplar, the embodiment of the Christ, God’s divine manifestation that actively dispels the illusions of the senses. Moreover, Christian Scientists acknowledge Jesus’ atonement, demonstrated in healing the sick and sinning, and overcoming death in resurrection. To be born again means to realize one’s true spiritual identity, distinct in the mind that is God, and to constantly bring human thought into an awareness of this spiritual reality.

While the healing of sin remained the goal of Christian Science, healing of the body and the empirical evidence that ensued were powerful advertising. Christian Science practitioners, who practice the Christian Science method full-time, could be called upon to help patients in the healing process through scientific prayer, and paid for their help, making the public practice of Christian Science attractive to students, many of them women. By 1958 there were nearly eleven thousand officially recognized by the church, 90 percent of whom were women. Christian Science teachers, authorized by a board of education that inherited its responsibilities from the earlier Massachusetts Metaphysical College, teach yearly classes of not more than thirty pupils, thus creating and maintaining a cohesive community of student associations that convene annually.

Christian Science conquers “error” by denying its claims to truth. Healing is accomplished through an understanding that disease and any claims of evil are only beliefs or illusions

of mortal mind, a limited material view, and practitioners turn from the evidence of the senses in order to accept the consciousness of divine truth and love, so disease will “vanish into its native nothingness.” They might argue mentally until they are receptive to accepting the ever-present perfection of the divine mind and its expression: man, in Christian Science, is complete, intact, and flawless in every detail because he is perfectly created, intelligently governed, and tenderly cared for by infinite love. God is omnipotent; therefore there can be no cause and effect other than perfect God and perfect man. Nothing can exist and there is no substance that is contrary to God’s nature as divine principle, life, truth, and love. Christian Scientists believe that this type of mental argumentation leads to an understanding of the action of God’s law that restores spiritual sense to human consciousness.

The Church of Christ, Scientist

Though early attempts at proselytizing were problematic and even litigious, Eddy organized the Christian Scientist Association (CSA) of her students in 1876 and continued teaching. In 1877 she married her student and public practitioner of her method, Asa Eddy: he was an important soul mate but died five years later. In 1878 and 1879 Eddy preached in the vestry of the Tabernacle Baptist Church in Boston, but by April 1879 members of her association voted to organize their own church. Its function was to commemorate the word and works of Jesus, including reinstating primitive Christianity with its lost element of healing.

By 1881, the focus of the new movement shifted to Boston, then center of intellectual and religious life in the United States, where Eddy, at the age of sixty, became the church’s first official pastor. A year earlier, she had founded and chartered the Massachusetts Metaphysical College, where she and her students held classes into 1889, graduating nearly six hundred students. In Boston Eddy attracted attention among middle-class women, religious seekers from Protestant denominations, and businesspeople. Christian Science has always attracted a large female following—more than 75 percent of the overall membership. Founded by a woman, it offered women relief from suffering and a public profession as healers, readers, and teachers that reinforced the traditional role of women as caregivers, often with significant remuneration. The theology of the Father/Mother God was also undoubtedly attractive to women, and early Christian Science periodicals often focused on women’s issues. Eddy chose many of the more dynamic pupils of her

college, many of them women, to disseminate her teachings across the United States. In 1884 she taught a class in Chicago, where other mind cure organizations were proliferating, that helped demonstrate the Christian basis of her teachings. Often in her preaching Eddy emphasized the differences between Christian Science and other spiritual healing methods, since many of her students had defected to form their own New Thought groups (which taught the prosperity gospel and positive thinking “mind cure”), even if there were commonalities between their teachings. Emma Curtis Hopkins, who served as editor of the *Christian Science Journal* in 1884–1885, broke away to found the Christian Science Theological Institute in Chicago in the late 1880s and taught many of the subsequent founders of New Thought groups.

The Christian Science church, with its new institutes, academies, and branches spreading across the West, began attracting critical attention in the local and national newspapers and popular periodicals. Its own publishing society was operating by 1883 and issued the bimonthly *Journal of Christian Science*. Soon it was a monthly periodical called the *Christian Science Journal*, with a circulation of ten thousand. By 1886 the National Christian Scientist Association of students was formed. It met yearly through 1890 and established the first reading room in Boston in 1888. By 1890 Eddy dissolved much of the organization, and she removed herself to Concord, New Hampshire, in 1892.

Eddy was a careful organizer. In 1892 the Church of Christ (Scientist) was reorganized with a corporate structure based on a Deed of Trust for the purpose of building a church edifice. The Mother Church polity, once democratically based, was founded on new business models, governed by Eddy, a self-perpetuating board of directors, all male at the time, and twelve first members (whose power was given to the directors exclusively in 1901). New branch churches continued enjoying democratic self-rule. But for the Mother Church, a democratic organizational model would be particularly unwieldy for a growing far-flung international organization. Christian Science was enjoying the limelight at the 1893 World’s Parliament of Religions in Chicago, with students of Eddy invited to address a plenary session and hold their own congress. Eddy was in Concord working on her collaborative art project, the painting/poem book *Christ and Christmas*, with illustrative figurative paintings by James Gilman punctuating Eddy’s poem, published that year. She was also busy overseeing the planning of the first edifice of the Mother Church in Boston. Completed in late 1894,

the Romanesque revival edifice sparked a building boom across the United States that lasted into the 1920s. The original edifice was soon outgrown, and the members of the Mother Church built a grand extension: a domed classical revival auditorium church rising 224 feet above the street, seating more than four thousand, completed in 1906. Branch churches in their urban settings were often quite distinctive, inspired by the classical revival architecture of Chicago’s World’s Columbian Exposition of 1893, with imposing Greek classical porches and Roman domes of art glass that gathered the faithful in acoustically superior auditoriums.

The church continued to focus on creating a distinctive identity that became increasingly standardized in the 1890s, particularly with the publication of *The Manual of the Mother Church* in 1895. The *Manual*, which Eddy claimed was divinely inspired, established the rules and standards of the organization and was continually revised by her until her death in 1910. While some of its bylaws were clearly conceived to curb possible rival students, such as Augusta Stetson in New York, the *Manual* nonetheless became an important document in transitioning the church from Eddy’s charismatic leadership into an impersonal, legal, institutional form.

In 1895 Eddy ordained the Bible and *Science and Health* the impersonal pastor of the Mother Church and later its branches. This impersonal pastor would safeguard against the heresy that could creep into personal preaching. Thereafter, lay readers, a man and woman, would carry out the worship services in the Mother Church with hymns, scripture reading, suitable music, and a lesson-sermon: selections from the Bible and *Science and Health*. The services ended with a repetition of the scientific statement of being from *Science and Health*, which is still repeated today every Sunday in Christian Science churches:

There is no life, truth, intelligence, nor substance in matter. All is infinite Mind and its infinite manifestation, for God is All-in-all. Spirit is immortal Truth; matter is mortal error. Spirit is the real and eternal; matter is the unreal and temporal. Spirit is God, and man is His image and likeness. Therefore man is not material; he is spiritual. (P. 468)

Lessons from the Bible and *Science and Health* were established informally by 1888, followed in 1890 with the *Christian Science Quarterly Bible Lessons*, the first subjects adapted from the International Sunday-school Bible lessons, until

new topics were introduced in 1898. Also in 1895 a Board of Missionaries was established, replaced by the Board of Lectureship in 1898. The latter provided itinerant lecturers to serve the Christian Science field.

Taking over from the Massachusetts Metaphysical College was a Board of Education, established in 1898 to teach primary (foundational) and normal (teaching) classes. A Committee on Publication responsible for discussing and defending Christian Science in the press was also instituted. Other periodicals also began coming off the presses: the *Christian Science Weekly*, renamed the *Christian Science Sentinel*, in 1898; *Der Herold der Christian Science*, in 1903; and the *Christian Science Monitor*, in 1908. In 1904 Eddy provided for Christian Science organizations on college campuses. The first was at Harvard University.

The standardization of services, publications aimed at the educated middle class, the equal representation of men and women in the pulpits, as well as the new distinctive edifices being built by Christian Science congregations in cities and towns demonstrated to many that Christian Science was well organized and here to stay. Certainly the growing reputation of the *Christian Science Monitor* as a reform-minded international daily paper revealed that the church had a larger mission. Eddy had earlier authorized the opening of Christian Science Dispensaries in 1889, to help anyone without charge. There were thirty such dispensaries when they were closed in 1894. By 1900 Eddy instructed all branch churches to provide public reading rooms, popular with other publishers at the time, so that authorized literature published by the church could be made available in quiet meditative spaces in the bustling business districts of American towns and cities.

Broader Contexts of Appeal

Christian Science emerged in Gilded Age America at a time of a critical redefinition of religion, as well as a time of growing interest in science. Evangelical Protestantism was increasingly divided over doctrinal distinctions and social functions, unprepared for the rise of industrialism and threats to its cultural hegemony. Catholicism was growing, as was Judaism, and populations were migrating to cities. Christian Science offered an antidote to this fragmentation, decisively positioning itself as the new/old gospel of primitive Christianity and emphasizing Jesus' healing mission as practical in a time when conventional medical therapeutics were often ineffective or even harmful. It was also attractive to women, who were given equality within a church that

valued their self-sufficiency. The vast majority of public practitioners were women, who took their traditional healing role from the home into the public sphere.

Other currents paved the way for Christian Science's rapid growth. Transcendentalism injected an intuitive spirit and a recognition of the spark of the divine in humanity into the purely rational scientism that permeated the Enlightenment. Spiritualism indicated a broader social interest in the materialization of psychic phenomena and the next life. In the larger context of an interest in evolution and vitalism, as opposed to deistic and mechanistic explanations, Christian Science, made up chiefly of members from evangelical churches, espoused a method for humanity to progress and grow spiritward, beyond materialism. And Christian Science's idealism was nonetheless pragmatic: it claimed that to empirically witness a healing of sickness or sin indicated this spiritual growth. Periodicals were filled with testimonials—more than fifty thousand published since the beginning of the movement—and every week Christian Science congregations gathered at their testimony meetings that encouraged them to publicly testify to Christian Science's efficacy. One critique from 1912 suggested that Christian Science's gospel of healing, its religious message, its monistic idealism, its anti-materialistic spirit, its notable originator, as well as the responsive practical mind of the American people, were the reasons for its success.

Christian Science was widely criticized from the pulpit and from the medical establishment. Critics claimed that the new religious and healing movement was a fad, a mask for commerce, a haven for the affluent, an irrational female system, a modern doctrine of subjective idealism (only mind exists), a Gnosticism (spiritual knowledge that frees our divine souls from material bondage), a neo-Hegelianism (God is all substance), and a gloss of Swedenborg (emphasizing spiritual reality and the spiritual interpretation of scripture), among other criticisms. Many criticized the movement for its lack of social activism, which it began to significantly address during wartime.

Christian Science and the implication of its practice to medicine became increasingly an issue. Court cases establishing the difference between prayer and medical treatment were many. While some physicians recognized that Christian Science contributed to healing the nervousness of American women, they balked at its claims to heal organic disease. By 1911, under pressure from an increasingly powerful American Medical Association, Congress was on the verge of prohibiting the practice of Christian Science throughout the

United States, and many feared that Eddy's attitudes about hygiene and contagion were a threat to public sanitation and health. But Christian Scientists began winning court cases, particularly as they not only argued for the efficacy of their method of spiritual healing but defended their constitutional right to religious freedom.

What many clergymen feared was early Christian Science's rapid growth and the conversion of many of their own congregations' prominent members to the new church. The movement continued to develop into a mainstream denomination, through committed memberships whose influence was greater than their numbers might indicate. Due to her students' gratification over sizeable early growth, Eddy forbade the reporting of membership figures, so estimates varied widely. From a Mother Church with 26 members in 1879, by 1906 there were more than 85,000 members. In the late 1920s and into the 1930s, a church or society was being formed every week. The 1926 United States Census counted 1,913 groups, with a membership of more than 200,000, of whom 94 percent were urban and 75.5 percent were women. In 1936 there were more than 2,600 branch churches and societies worldwide, nearly 50 college organizations (which expanded to 200 by 1958), almost 11,000 practitioners, and more than 500 nurses. The 1936 United States census reported nearly 270,000 members in more than 2,100 churches in the United States, and the membership continued to grow. By 1958 there were more than 2,300 congregations in the United States and 700 in other countries, probably peaking with nearly 475,000 members. Since that time there has been a fairly precipitous decline. In 2008, the membership was possibly 200,000 worldwide, with 1,250 congregations in the United States and 500 in other countries, with some new growth in Africa and South America.

A Religion of the Word

Spiritual healing and new practices of worship created a distinctive religious community and a distinctive Christian Science subjectivity. This was partly a matter of the economic and cultural profile of church members, who were typically literate and middle-class women and men, at least in the great American cities. Indeed, it was largely through extensive publishing activity that the teachings of Christian Science reached the existing membership and new converts. Literature distribution was one of the most popular committees in many branch churches, providing young people social outlets that were church related. All members kept

abreast of the publications and bought numerous editions of *Science and Health*, which had more than 225 editions, as Eddy was ever refining and clarifying her writing. This emphasis on the divine and revelatory Word, whether on the printed page or read in the church, was not merely a matter of communication; it was an exercise of a power tantamount to spiritual healing. Even Mark Twain, Christian Science's most acerbic critic in the early twentieth century wrote in *Christian Science* that it was "the first time since the dawn-days of Creation that a Voice has gone crashing through space with such placid and complacent confidence and command" (p. 3).

Christian Science was most radically a religion of the Word, of reading and speaking, with crucial implications for the acoustics of their churches. These edifices were stages upon which the faithful reiterated the Word of God, revealed to reconnect the congregations with the sources of primitive Christianity, with signs following. While early edifices often featured symbolic elements such as the cross and crown motif that embellished the covers of *Science and Health* as well as stained glass windows, most congregations began to eschew overt Christian symbolism by the early 1920s. With the Bible and *Science and Health* the only preachers, quotations from the Bible and Eddy (she limited churches to one out of three specific quotations) became the primary decoration on the walls of branch churches. Eddy's ideas were visionary and dramatic. The reading of the Word became the liturgy, and church services in increasingly impressive edifices allowed the congregations to contemplate the grander verities of spirit, through Christian Science, clearly inscribed in the logic of their church buildings, often under soaring domes of art glass.

Eddy was often criticized for what some critics thought were her prosaic, illogical, and sometimes contradictory statements in *Science and Health*. But her style, expressed through literary, philosophical, and religious tropes and metaphors, was to her an ethical gesture at the service of spiritual truths that she felt could not be adequately expressed in material language. She often addressed the beliefs of mortal mind based in material existence; she addressed the human mind as the relative battleground of suffering and overcoming, where the action of the divine mind through Christ appeared. She also contemplated an absolute realm of spirit, where the divine mind, the true and only reality, knows nothing of sin, disease, and death, thus destroying the beliefs of mortal mind in the human realm. The mortal, the human, and the divine seem to exist, but

only the divine truly exists. These ideas led to apparent inconsistencies in her writings, because while mortal mind claims reality, through “animal magnetism,” sensuality, sin, and so forth, the human mind is redeemable, and the divine mind has no need of redemption.

These ideas and strongly worded statements became the fundamental basis for disciplined spiritual healing. The Word revealed spiritual ideas and supplanted a material sense of language with the enunciation or utterance of spiritual truth, transforming material appearances through the healing of sin and sickness. Christian Scientists studied the Bible and Eddy’s writings daily and in their church services in a sacramental way, for they led the student to understand eternal spiritual truths demonstrated in physical healing and well-being. In Christian Science, the language of the Bible and Eddy’s writings were utilized as an autonomous and divine discourse, which aided the student in the realization of the perfect spiritual subject that reflected the perfection of the divine principle, God, even though human language was at best feeble in its ability to describe the infinite beauty and intelligence of the spiritual. The language of Christian Science was found in the “new tongue,” which Eddy defined in her 1886 sermon “Christian Healing” as the spiritual language of soul instead of the senses, translating matter into its original language of mind, thus giving a spiritual instead of a material signification.

Eddy’s rhetorical strategies in her writings were highly metaphorical and, like Swedenborg, created corresponding spiritual meanings that became the language of Christian Science. Terminology was reinforced through relationships with other members, teachers, and practitioners and through the continuous reiterations from the official texts. Within this discourse, individual freedom and reason were emphasized within fairly strict moral codes, including chastity and temperance, though the renouncing of pleasure through the senses was to ensure pleasure in a different spiritual form. The disciplined argumentative method of Christian Science attempted to prove the scientific lawfulness of Christian spirituality as opposed to its supernaturalness, and claimed the beneficial redemptive healing effect of this spirituality. Living the active spiritual discipline of Christian Science created a process of regeneration through which the reality of God’s spiritual creation appeared.

The Church Matures

Into the twentieth century, the Christian Science church grew steadily in members, influence, and respectability,

even though challenges to its healing method continued. As media attention lessened after Eddy’s death, the church began to foster an image of quiet, disciplined spirituality, an emphasis on traditional family values, respect of authority and legal systems, and multigenerational reliance on spiritual healing in families that felt sustained by their religion even in a generally unsupportive social milieu. A new publishing society was built in 1934; subscriptions to and advertising revenues from the *Monitor* increased; and by the early 1960s a vision for a new sixteen-acre complex as headquarters began to take shape, centered on the Mother Church and its extension with a grand new entrance portal and flanked by the publishing house. Completed in 1973, the plan included an office building, a Sunday school building, a twenty-eight-story administration building, and a 670-by-100-foot reflecting pool covering a parking garage.

Also important was the creation of other institutions to care for members’ needs. In 1916 the directors established the Christian Science Benevolent Association, one of Eddy’s last requests, to maintain places to care for ailing and aged Christian Scientists and create a nurses training program to help minister to Christian Scientists in need. A sanatorium in Chestnut Hill, Massachusetts, was opened in 1919; Pleasant View Home in Concord, New Hampshire, was established in 1927; and the Christian Science Benevolence Association on the Pacific Coast, in San Francisco, was opened in 1930. Several such institutions were also established in the United Kingdom.

Not quite a decade after Eddy’s death, leadership challenges to the *Manual* model erupted in the “Great Litigation” or suit in equity. The lawsuits divided the church between the trustees of the Christian Science Publishing Society and the Christian Science Board of Directors between 1919 and 1921, but Eddy’s form of church government prevailed. Schisms did occur, such as Augusta Stetson’s short-lived “Church Triumphant” and British teacher Annie C. Bill’s “Church of the Universal Design,” the latter of which advocated a policy of cooperation with medical doctors, and had nearly eighty congregations by the 1930s, though none exist today.

Wartime challenged the church to become increasingly pragmatic. The church established a Relief Fund in Europe between 1914 and 1919, with committees throughout Britain and in France, Switzerland, Holland, and Italy that distributed food, clothing, and more than \$2 million to those Christian Scientists and other citizens negatively affected by

the war. When the United States entered the war, ten commissioned chaplains served the active armed forces, and Christian Science camp welfare centers were located in Army camps in thirty states.

Christian Scientists officially denounced fascism and defended the democratic system at their annual meeting in 1941, and soon after the gestapo in Germany closed all of the ninety Christian Science churches and reading rooms, arrested members for questioning, and banned public and private meetings. Profession of Christian Science was forbidden. Church services continued in private, and some could hear radio broadcasts of the Mother Church services: radio had been introduced in the early 1920s, with expanded testimonial programming on radio and then television beginning in 1953.

The Mother Church became a registered relief agency during World War II and worked through appointed and local wartime committees between 1939 and 1946. By the end of the war in 1945, more than 378 ministers and chaplains and other workers had served Christian Scientists in the armed forces in the United States and Britain. The camp welfare committees maintained 222 service rest centers on bases in the allied nations, as well as one in Hamburg, Germany, and several in France, Italy, and Belgium that helped reestablish Christian Science activities after the war.

Christian Science since the Later Twentieth Century

With the rise of improved medical care, and the growth of secularism and religious skepticism, by the 1979 centennial of the founding of the church the relevance of Christian Science's late-nineteenth-century religious language and formulations, approach to scientific terminology, and emphasis on spiritual healing began to be challenged as church membership declined. The 1980s witnessed a new media public relations push by the Boston leadership, who began amassing a media empire that some members felt was at odds with the church's religious mission. Between 1988 and 1993, unable to popularize the daily *Monitor*, they spent hundreds of millions of dollars to diversify into radio, television, cable, and Internet publishing. The church bought an international short-wave radio network, produced excellently reviewed radio and cable television news programs, owned a local Boston television channel, and started *World Monitor*, a glossy monthly news magazine that struggled to find an audience. The church lost more than \$325 million on these ventures.

Debates and scandal erupted when the Board of Directors, attracted by a possible \$97 million bequest that would expire in 1993 if they did not act, published the book of popular but esoteric teacher and lecturer Bliss Knapp in 1991. Entitled *The Destiny of the Mother Church* (written and privately printed in the 1940s but rejected by church leaders at that time), it proposed that Eddy had been prophesied in the Bible, an idea anathema to most Christian Scientists, who had been warned constantly during their lifetime against any deification of their person. However, these ideas appeared to be supported by a 1943 official pamphlet, and several influential Christian Science teachers had started their own independent groups based on these ideas. Though around five hundred reading rooms refused to carry the book, and members debated and publicly criticized the leadership, the church received \$50 million, which offset losses from the media projects.

Other controversies challenged the church. Both federal and state governments and insurance companies have long recognized Christian Science healing. The late 1980s and 1990s saw increased consideration of the issue of the care of children, due to the public outcry over illnesses and deaths of several children receiving Christian Science treatment, brought to the media's attention by one-time church members. With court cases mounting, press attention, and grassroots organizing, early laws protecting spiritual healing began to be questioned and overturned. Controversies concerning religious exemption laws, child neglect and endangerment laws, due process, manslaughter statutes, Medicare, and public policy are again affecting the practice of Christian Science healing.

The move into television prompted the church to use non-Christian Science workers, which also revealed certain underlying social prejudices and caused a debate about the presence of gays and lesbians in the church, who had always been part of the movement but had gone unrecognized and were sometimes openly castigated.

Members of the denomination maintain many institutions in common with other Protestant church bodies, and while not supported directly by the Mother Church, these continue the maintenance of a healing community. Today, Christian Scientists support more than forty-five retirement/nursing facilities worldwide. Members formed historical foundations such as Longyear (1938) and Daystar (1990); Christian Science schools and colleges such as Daycroft (1928–1991) and Principia (1898); and youth organizations such as *Monitor* Youth Forums (1946),

Adventure Unlimited (1962–present), and six summer camps (founded between 1915 and 1955). Emergence International (1985) was created to minister to gay and lesbian Christian Scientists, and several financial support networks and foundations are also available for members.

Some critics propose that the Christian Science approach is anachronistic, particularly in light of the increased success of medicine and the rise of popular secular holistic approaches to healing. Recently, even some church members have suggested that other emphases in Eddy's theological thought should be given a more thorough vetting by the church. Others believe that the church, in attempting to create new audiences for *Science and Health*, was modifying its radicalism and becoming more worldly and new age as the movement entered into the twenty-first century and began to participate in secular mind/body conferences. A renewed emphasis on Eddy's *Science and Health*, translated into seventeen languages, caused the textbook to continue to sell well: more than five hundred thousand copies were sold between 1993 and 1998. Its famous cross and crown emblem is now being offered as an official insignia to identify churches, societies, and reading rooms.

Mary Baker Eddy is one of the most controversial of American religious leaders. Biographers since her time have created idealized and hagiographic accounts of her life, negative psycho-biography, broader contextual narratives, feminist and psychoanalytic readings, and have even used biblical prophecy as a method to explain her relevance, often based on spurious secondary and tertiary sources. Reversing decades of secrecy and guardedness towards independent scholars, in 2000 the church announced the redesign of the publishing society building into the Mary Baker Eddy Library for the Betterment of Humanity, intended to emphasize Eddy's feminist credentials and innovative ideas concerning spirituality and health. The church released all of Eddy's papers to public study. The \$50 million research library contains more than 525,000 documents, photographs, and objects concerning Eddy's work and legacy, with state-of-the-art exhibition spaces.

The church today is trying to redefine its distinctive mission of positioning spiritual healing as an effective alternative to medical care, though there is some relaxation of earlier church social mores, including allowing members to use medical treatment. The fact that the church's policies and methods were fixed at the time of Eddy's death has remained somewhat problematic for innovation. Both public lectures and reading rooms were tremendously popular

modes of communication for a variety of groups and publishers at the turn of the last century, but today they are not particularly popular modes of publicity.

In an attempt to focus on its healing ministry, the church has recently put several of its Boston complex's buildings up for lease and has sold two of Eddy's former homes to the independent Longyear Foundation, which supports a museum about Eddy and early workers in the movement and already maintains six of her former homes throughout New England.

Today, with the rise of the Internet, the church has several Web sites, some marketed for youth searching for spiritual answers in today's world (spirituality.com). But many independent groups on the Web now promote Eddy and the study of Christian Science outside officialdom, including the Bookmark, the Aequus Institute, Healing Unlimited, the Mary Baker Eddy Institute, and the Christian Science End-time Center. All of these groups support historical Christian Science study materials as well as publication and distribution activities of teachers and writers outside and sometimes at odds with current church "authorized" literature.

Church and State: Revolutionary Period and Early Republic

Church-state issues have been the subject of heated debates throughout much of U.S. history, often focusing on whether the Constitution requires governmental secularism or whether the federal and state governments can support some religious activities or institutions in a land in which an overwhelming majority of citizens say that they believe in God. These debates often center on the manner in which the framers of the U.S. Constitution and the constitutions of the individual states addressed church-state issues during the American Revolution and in the early republic.

Church-State History and the Supreme Court

In a famous Supreme Court case in the 1940s, Justice Hugo Black recounted a common version of the history of church and state in America. It begins with people fleeing to America to escape religious persecution in Europe. On arrival, they found that traditional European church-state

patterns were difficult to cast off, and the colonists often failed to leave religious intolerance completely behind, at least in the early years. They even set up a number of state-supported “established” churches. Eventually, the colonials’ “freedom-loving nature” led towards recognizing the importance of the liberty of conscience, which paved the way for intolerance to be replaced by religious freedom.

During the Revolutionary Era, thanks to the efforts of Thomas Jefferson and James Madison (who later became the nation’s third and fourth presidents), Virginia set an example for the rest of the colonies, and for the new nation, by casting off its legally established Anglican Church. Moreover, Virginia refused to pass even a broader-based, more ecumenical tax to support religion and instead adopted a now-famous Statute for Religious Freedom drafted by Jefferson. A few years later, Madison, the “father of the Constitution” and the principal architect of the federal Bill of Rights, infused this same spirit into the First Amendment’s “establishment clause,” which says that “Congress shall make no law respecting an establishment of religion,” thus creating, in Jefferson’s famous phrase, “a wall of separation between church and state.”

In this case, *Everson v. Board of Education* (1947), the Court declared that the constitutional “wall of separation between church and state” meant that the federal and state governments could not provide aid to any one religion, nor could they favor religion over nonreligion. This “no aid” standard has come to be called the “strict separationist” approach to the establishment clause, and it has led the Supreme Court to ban many forms of state support for religious schools and to eliminate official prayers and Bible reading in the public schools on the grounds that these activities constitute a forbidden “establishment of religion.”

Because this interpretation of the Constitution has generated a great deal of controversy, and because it appears to have been derived by the Supreme Court justices from their understanding of the intentions of the framers of the establishment clause, the *Everson* case triggered an explosion of church-state historical studies. Opposition to the *Everson* Court’s “no aid” interpretation has come from those who believe that a better understanding of the framers’ intentions leads to the conclusion that federal and state governments can aid religion as long as that aid does not prefer any one religion over the others. This school of thought has generally been labeled “nonpreferentialism” or “accommodationism” (in the sense that it seeks to allow the government to accommodate the American people’s religiosity).

Meanwhile, a third school of thought has argued that both strict separationists and nonpreferentialists have missed the point. For this group, a significant element of the establishment clause's original meaning was to keep the federal government from interfering with the state-supported churches that existed in New England at the time of the Bill of Rights. Looking specifically at the text of the clause, which reads, "Congress shall make no law *respecting* [that is, on the subject of] an establishment of religion," these scholars assert that any law on the general subject of religious establishments—irrespective of whether that law is proestablishment or antiestablishment—would be forbidden. That is, Congress was rendered impotent to interfere with "establishments of religion" in places such as Massachusetts, where many towns collected taxes for the benefit of local (usually Congregational) churches. Accordingly, the clause should be read to insulate the way the states choose to organize their church-state affairs from anything Congress might do.

This "hands-off" approach to the establishment clause has been called "enhanced-federalism" because it bolsters the broader concept of federalism that many scholars have associated with the entire design of the Constitution itself. "Federalism" is a complicated subject, but it generally revolves around the notion that the federal government, having been created by the state governments, possesses only the specific powers that have been expressly delegated to it by the states, thus leaving the states with all governmental power to make laws except to the extent that the Constitution specifically provides otherwise. In this case, the power to decide whether to have an establishment of religion was not delegated to the federal government in the Constitution, and therefore the basic principle of federalism should mean that Congress has no power either to establish a religion or to interfere with religious establishments in the states. The enhanced-federalism approach takes this argument one step further by saying that the addition of the First Amendment's establishment clause was specifically designed to add another layer of protection for church-state practices in the states, in the event that the Congress might become disposed towards interfering with them.

All three of these interpretations—strict separationism, nonpreferentialism, and enhanced federalism—are built on historical foundations. Their proponents believe that a fair reading of the history surrounding the adoption of the First Amendment leads inescapably to their conclusions.

While the arguments among these schools of thought sometimes seem to split historical hairs, the language of scholarly debate has been unrestrained. "False," "frivolous," and "fiction" are just a few of the epithets hurled by prominent scholars at their distinguished adversaries. In light of the fact that these competing theories of the First Amendment have real economic and political consequences (many millions of dollars of funding for religious schools or other "faith-based" institutions, for example), it is important to recognize that many of the books and articles in this field have been written with the goal of presenting historical events in a light that is most favorable to a particular interpretation of the Constitution. While this kind of goal-oriented history writing is not unique to church-state studies, it is especially pronounced in this field, and so all sources (including this article) should be read with particular care.

In thinking about how the Supreme Court and various other commentators have discussed the original meaning of the Constitution's church-state provisions, it may be valuable to note that only some people agree with Justice Black that history is an important element of constitutional interpretation; many others believe that history is either irrelevant or is merely one of many tools to be applied to the understanding of a constantly evolving Constitution. Even those who think that the original meaning of a constitutional provision *is* important do not necessarily agree on how to employ those historical insights.

And so, while many people who debate church-state issues are "originalists" in that they believe that the Constitution should be interpreted in accordance with its original meaning, they differ in where they look for evidence of that meaning. Some scholars have concentrated on the specific intentions of important framers (as can be seen in the *Everson* case's focus on James Madison and Thomas Jefferson); others are more interested in the meaning of words such as *establishment* in legal or theological writings at the time; and yet another group looks for what the constitutional text would have meant to a fully informed member of the general public (and since it is often impossible to get conclusive evidence of what ordinary citizens thought, modern scholars try to create a hypothetical vision of what those people were likely to have been thinking). In evaluating the various arguments about constitutional meaning, readers should think not only about the historical evidence itself but also how that evidence should be applied to the task of constitutional interpretation.

Ever since the *Everson* case, Americans have become accustomed to having the Supreme Court decide church-state issues involving state and local governments as well as those arising at the national level. Even though the establishment clause only refers to laws made by “Congress,” and despite a decision by the Supreme Court early in the nineteenth century that the First Amendment did not apply to state or municipal laws, since the *Everson* era, the Supreme Court has consistently held that states, cities, and towns are now bound by the clause as well. Many of the Court’s most prominent church-state decisions over the past century have involved state laws, or even the administrative actions of local school boards, rather than acts of Congress.

The legal theory adopted by the Supreme Court to apply the establishment clause (and other elements of the Bill of Rights) to the states is usually called the “incorporation doctrine.” It is based on the Court’s argument that when the post-Civil War Congress passed the Fourteenth Amendment to the Constitution, that amendment’s “due process” clause (which reads, “nor shall any State deprive any person of life, liberty, or property, without due process of law . . .”) included the concept that many of the fundamental rights described in the Bill of Rights (that is, the first ten amendments to the Constitution) would henceforth apply to the state governments. Since most church-state issues in the past two hundred years have involved state and local governments rather than Congress, the incorporation doctrine has been extremely influential in shaping modern American views on how the phrase “the separation of church and state” relates to the Constitution. The incorporation doctrine is very well established in American constitutional jurisprudence at this time, although it has been challenged on historical grounds, especially by those who subscribe to the enhanced-federalism approach to the establishment clause. Their argument is that the original goal of the clause was to insulate the states from federal interference with their church-state decisions and, therefore, that the incorporation doctrine effectively reverses that outcome by subjecting state decision making to Supreme Court review.

Finally, it is important to note that the histories of church-state issues in America almost invariably focus on the generally Northern European Protestant immigrants who constituted almost all of the voting population in colonial America. As a result, these histories completely overlook the Native Americans, large numbers of slaves brought forcibly to North America, indentured servants, and any others who did not voluntarily choose to seek their

spiritual or financial fortunes in the New World. In fact, colonial and early national laws and constitutions upholding the principle of religious liberty were sometimes drafted by the same people who wrote the “slave codes” that placed severe restrictions on slaves’ religious freedom. There are also few, if any, women’s voices heard in the early American church-state debates, since those debates generally involved the men who were the leaders of the churches and the states—that is, those who served as members of the clergy and as legislators.

Church-State Colonial Background

People left Europe for America in the seventeenth and eighteenth centuries for many reasons, from the desire to “get rich quick” to the hope of establishing God’s kingdom on earth. The vast majority of these immigrants shared a common cultural background; perhaps 90 percent or more of the colonists at the time of the Revolution were English-speaking Protestants, at least by cultural background. How many of those colonists were actually active churchgoers when the Constitution was adopted has been the subject of lively scholarly debate, with some pointing to a fairly low percentage of colonists’ holding formal church memberships and others finding that many people affiliated themselves with churches even if they were not technically members.

The long and complicated relationship of church and state in the various colonies from the time they were founded until the Revolutionary Era is an interesting subject, but one that is well beyond the purview of this article. For present purposes, what may be most valuable to point out is that at the outset of the Revolution, several of the colonies had laws or provisions in their charters or constitutions (that is, their basic governing documents) to raise taxes for specific Protestant denominations; and most, if not all, restricted voting or public office-holding to Christians, limited secular activities on the Sabbath, punished blasphemy, and generally promoted specific forms of Christian beliefs or precepts over others.

Members of churches not receiving tax funding (often called “dissenters”) were sometimes but not always permitted to obtain exemptions from paying the official church taxes. The most vocal dissenters were usually the Baptists, but they were joined by some Presbyterians (especially in the South), Quakers, and others. The churches most commonly supported by taxes were the Congregational churches in New England and the Anglican Church in the South, but at various times even the Baptists and Presbyterians were the

beneficiaries of religious taxation in parts of New England, where each town voted on which local Protestant church would receive tax support.

During the Revolutionary Era, as the colonies moved towards becoming independent states, they drafted new constitutions, and thus they had the opportunity to consider whether to change their relationship with religion. How these issues were sorted out, especially in large colonies such as Virginia and Massachusetts, has provided considerable raw material for constitutional argumentation, and it is worth a more detailed look.

In Virginia, Anglicanism (that is, the official Church of England) was the “Church by law established,” from the colonial period until the Revolutionary Era, as it was in England. Its property was provided by the government, and its priests were essentially civil servants. Originally, all taxpayers were required to pay for the support of the church, but first dissenters were exempted, and then the church taxes were completely abolished in 1779. A remaining question was whether Virginia would adopt a church-funding plan under which there would be a “general assessment” levied on all taxpayers, who could then specify which churches would receive their portions of those religious taxes. Such a plan was discussed off and on for a number of years and was then seriously debated in 1784–1785.

Prominent Virginians were on both sides of the issue, with George Washington and Patrick Henry favoring the church-funding plan and Jefferson and Madison leading the charge against it. One of more than a hundred petitions circulating during this vocal campaign contained an especially powerfully worded and uncompromising argument against any religious taxation; it was written by James Madison but circulated anonymously. Although similar petitions received more signatures, Madison’s document, titled, “A Memorial and Remonstrance against Religious Assessments,” became very popular with the Baptists, first in Virginia and later in New England, and it has become very influential in modern Supreme Court decisions as well. Calling the general assessment proposal an establishment of religion, Madison wrote at length about the unhappy consequences of having established churches in Europe and America. Ultimately, intense lobbying by the Baptists and Presbyterians, combined with Madison’s clever maneuver to elect the formidable Patrick Henry as governor, thus removing his influence from the legislature, meant that the general assessment bill never became law. The legislature then approved the Virginia Statute for Religious Freedom that

had been drafted by Thomas Jefferson, another document to which the Supreme Court has turned for constitutional guidance.

Around the same time, the other southern states—Maryland, Georgia, North Carolina, and South Carolina—generally followed suit, diminishing or eliminating taxes supporting the Church of England. There are a variety of reasons why the Revolutionary state governments would stop supporting the Church of England, not the least of which was that they were at war with England. Additionally, Baptists, Presbyterians, and other dissenters had been protesting the special legal favors that had been granted to the Anglican Church, and there were undoubtedly others, including Jefferson and Madison, who opposed religious taxation as a violation of the basic principle of liberty of conscience. Once formal church taxes were eliminated, the idea of a general assessment was raised in Georgia and Maryland, as it had been in Virginia. While Virginia spurned the concept, the new constitutions in Maryland and Georgia provided for the possibility of general assessments for the support of the churches, although these provisions were never actually implemented.

The political situation was quite different in New England, where the tax-supported Congregational churches were usually stalwart supporters of the patriot cause. When Massachusetts adopted a new constitution in 1780, that document required each town to provide for the support of a Protestant church. Baptists and other dissenters fought against this provision, but proponents of what New Englanders called the Standing Order (which is a complicated term, but generally it refers to the tax-supported churches) ultimately prevailed. This kind of system of local taxation for a Protestant church designated by a majority of the town’s voters continued in Massachusetts, New Hampshire, Vermont, and Connecticut until the first part of the nineteenth century. Dissenting Protestants could usually obtain an exemption from the religious taxes, but the tiny Roman Catholic population was usually not given the same benefit.

In sum, then, as the colonies became states during the Revolutionary Era, church-state patterns were altered fairly dramatically in the South, where the politically unpopular Church of England had previously been favored; they were unchanged in Delaware, New Jersey, Pennsylvania, and Rhode Island, where no churches were being publicly supported at the dawn of the Revolutionary Era; and they remained largely unchanged in Massachusetts, Connecticut, Vermont, and New Hampshire, where each town would

continue to tax its citizens for the benefit of a Protestant church. In places where the issue was especially controversial, leading citizens stood on both sides of the debate.

It is therefore impossible to say that Revolutionary Americans, as a whole, held any particular view on the question of whether governments should tax citizens to support churches. Many people believed that good government required a religious citizenry because religion—especially the Protestant religion—was essential to morality, and most of the New England states chose to provide tax support for churches as a way of promoting that religiously inspired morality. These taxes were, therefore, understood by their supporters as being no different from taxes for maintaining the roads or the judicial system—all were public services for the benefit of all citizens. At the same time, many other Revolutionary Americans believed that such taxes violated the principle of “liberty of conscience,” that they unfairly benefited the demographically dominant churches to the detriment of others, or that they were an improper use of governmental power. Others simply looked for any opportunity to pay smaller amounts of taxes.

Even while the issue of religious taxation was being vigorously debated in various locales, other links between government and religion—such as punishments for Sabbath breaking and blasphemy; restrictions on governmental offices to members of certain religious groups, and legislative and military chaplains; and official days of prayer—continued to be widespread throughout the states and were rarely controversial. To be sure, it is possible to find a few prominent dissenters, such as Roger Williams (the New Englander whose century-old writings on religious liberty were rediscovered during this era) and Baptist leader John Leland, arguing against such practices, but their positions were well outside the mainstream and were often not shared even by other dissenters. That religion (usually Protestantism) was an essential component of society was a widely held view; even Jefferson and Madison helped draft laws in Virginia that would punish Sabbath breakers, and leading Baptists, Presbyterians, and other dissenters strongly favored religious tests for public office. There is, therefore, a complicated backdrop for the church-state issues that would surface at the new nation’s constitutional ratifying conventions, in the First Congress, and thereafter.

The Constitution

Today’s church-state debates generally revolve around the establishment clause, but that provision did not appear in the

original Constitution. There was, however, a controversial church-state provision approved at the Constitutional Convention: Article VI’s prohibition of any religious test for public office (that is, elected and appointed governmental positions, such as legislators or judges). At that time, at least eleven of the thirteen states restricted public office to Protestants or Christians. Some of the antifederalists—that is, those who opposed the adoption of the Constitution or who wanted the Constitution amended in a variety of ways—focused on this lack of a religious test as one of the weaknesses of the original Constitution. They feared the possibility of the government being run by unscrupulous and ungodly men. Since many Americans believed that Protestantism, or at least Christianity, was the essential foundation of morality, they worried that extending public office to nonbelievers was a threat to public safety.

Ultimately, the antifederalists were unsuccessful in removing the “no religious test” clause from the Constitution, but some of them had other church-state concerns in mind. These antifederalists, many of whom belonged to the dissenting churches (and some were even ordained clergy in those churches) saw nothing in the Constitution that would guarantee that they would be free of the kinds of legal disabilities that they had suffered in the colonies. Not only had colonial dissenters been forced on many occasions to pay taxes to support other churches but, in addition, some dissenting ministers were not entitled to perform marriage ceremonies and had even been jailed for preaching without governmentally issued licenses. Rumors also circulated that the Presbyterian Church, which was the legally established Church of Scotland, might seek to become the new nation’s official church, or that the Presbyterians and the Congregationalists, who had been holding joint annual meetings, might combine in an effort to create a Calvinist establishment. (These were two of the largest denominations in America at that time, and both churches traced their theological roots to Reformation Era theologian John Calvin.)

Madison and other federalists (that is, those who defended the Constitution and urged its adoption, not necessarily the same “Federalists” who favored John Adams over Thomas Jefferson’s “Republicans” ten years later in the presidential election of 1800) generally made two counterarguments: first, that the Constitution did not contain any grant of power by the states to the federal government that would permit it to establish a religion; and second, that there were so many Protestant denominations throughout the states that it would be practically impossible for any one church to

obtain enough political power to emerge as the nation's official church.

The federalists' arguments were successful in some states but not in others. By the end of the ratifying conventions, four states had formally proposed amendments relating to the establishment of religion. Three of them—from Virginia, North Carolina, and New York—were almost identical and were modeled on a Virginia proposal that had been adopted at Patrick Henry's urging despite the efforts of Madison and his fellow federalists. The Virginia version read, "No particular religious sect or society ought to be favoured or established by law in preference of others." A few months later, the New Hampshire convention, for which there is no official record of the debate, came up with a very different wording: "Congress shall make no laws touching religion." These proposals joined more than two hundred other amendments suggested by the state conventions. The subject of amendments was expected to be considered by the U.S. Congress soon thereafter at its inaugural session.

Newly elected Congressman James Madison took responsibility for collecting the various proposals and putting together a draft Bill of Rights for Congress to review in 1789. Since Madison had originally opposed amending the Constitution, he did so with some reluctance; and the rest of Congress, which was heavily populated with federalists, was even less enthusiastic about postponing the business of setting up a working federal government to deal with amending the Constitution. The records from the First Congress are sparse and often unreliable, so our knowledge of what transpired is limited, but those records, together with letters written by the members, provide some insight into the amendment process.

For the most part, congressmen from both North and South described Madison's list of amendments with comments such as "froth," "anodyne to the discontented," and "milk and water"—today we might say "Mom and apple pie": noncontroversial principles (free speech, free press, jury trials, due process, and the like) that might calm the antifederalists without actually changing anything. Moreover, the language of the amendments was so broad that the provisions did not even require that there be any agreement among the members of Congress on what it meant, for example, to have a free press or to provide due process of law.

Madison's initial proposal for amendments on the subject of religion included the following: "The civil rights of none shall be abridged on account of religious belief or worship,

nor shall any national religion be established, nor shall the full and equal rights of conscience be in any manner, or on any pretext, infringed." (All quotations in this section are from *The Complete Bill of Rights*, edited by Neil H. Cogan.) Somewhat surprisingly, this language did not resemble any of the four proposals for an establishment clause; the non-establishment language most closely tracked a provision that had been introduced but not approved at the Maryland ratifying convention. All of the amendment proposals were referred to a select committee, which modified Madison's nonestablishment language by dropping the word *national*, which was a term the antifederalists disliked.

Two months after Madison's initial proposals, the Congress finally got around to debating the following language: "no religion shall be established by law, nor shall the equal rights of conscience be infringed." The discussion was desultory at best. In response to the classic federalist argument from Connecticut's Roger Sherman that the Congress had no "authority whatever delegated to them by the constitution to make religious establishments" and that, therefore, the amendment was unnecessary, Madison gave a half-hearted defense of the language: "Whether the words are necessary or not, he did not mean to say, but they had been required by some of the State Conventions, who seemed to entertain an opinion that under the [necessary and proper clause of the Constitution, Congress might be able] to make laws of such a nature as might infringe the rights of conscience, and establish a national religion. . . ."

There followed a very brief debate in which only one other member of Congress appeared to push for the adoption of the clauses; this was Representative Daniel Carroll of Maryland, who said, "As the rights of conscience are, in their nature, of peculiar delicacy, and will little bear the gentlest touch of governmental hand; and as many sects have concurred in opinion that they are not well secured under the present constitution, he said he was much in favor of adopting the words. . . ."

Meanwhile, two congressmen expressed concerns about the nonestablishment clause: Sylvester of New York "feared it might be thought to have a tendency to abolish religion altogether," and Huntington of Connecticut worried that it might be misconstrued. He agreed with Madison, who had said that "the meaning of the words [was] that Congress should not establish a religion, and enforce the legal observation of it by law, and not compel men to worship God in any manner contrary to their conscience." But he was afraid that it "might be taken in such latitude as to be extremely

hurtful to the cause of religion,” especially in that the federal courts might not be willing to enforce Connecticut’s approach to funding churches. In response, Madison urged a return to his original proposal, which would make clear that church-state arrangements in the states would not be affected: “if the word national was inserted before religion, it would satisfy the minds of honorable gentlemen. He believed that the people feared one sect might obtain a pre-eminence, or two combine together, and establish a religion to which they would compel others to conform. He thought if the word national was introduced, it would point the amendment directly to the object it was intended to prevent.”

New Hampshire’s Livermore then said that his understanding of the amendment was the same as Madison’s but, to avoid confusion, it might better be worded, “Congress shall make no laws touching religion, or infringing the rights of conscience,” which was virtually identical to his state’s proposed amendment. Without further discussion, the members of the House, officially acting as a “committee of the whole” (which meant that the House would later need to vote again when not meeting as a committee), passed Livermore’s amendment by a vote of 31–20.

When the House returned to this topic, Representative Ames of Massachusetts proposed an entirely different wording: “Congress shall make no law establishing religion, or to prevent the free exercise thereof, or to infringe the rights of conscience.” This version was adopted by the House of Representatives on August 20, 1789. There was no further recorded debate.

The records of the Senate are even less illuminating than those of the House’s brief discussions. It appears that the first version adopted by the Senate was “Congress shall make no law establishing one religious sect or society in preference of others,” which resembled the proposals from Virginia, North Carolina, and New York. After further unrecorded discussions, the Senate then settled on alternative language, “Congress shall make no law establishing articles of faith or a mode of worship, or prohibiting the free exercise of religion. . . .”

At this point, both House and Senate versions began with the phrase, “Congress shall make no law establishing,” and they both ended with a ban on laws “prohibiting the free exercise” of religion. (The “rights of conscience” clause was dropped along the way, perhaps because a similar point was addressed by the “free exercise” clause.) A House-Senate joint conference committee would need to resolve the

differences between the prohibition of laws establishing “religion” in the House’s language and “articles of faith or a mode of worship” in the Senate’s version.

The conference committee, which had to deal with all amendment issues, not just ones relating to religion, included Ellsworth and Sherman of Connecticut, both devoted supporters of that state’s Standing Order, as well as Virginia’s Madison, who had fought against any tax support for churches in Virginia, and Charles Carroll of Maryland, a Roman Catholic who had grown up under an Anglican establishment that had leveled burdensome taxes on Catholics; so it is difficult to say that the committee members necessarily leaned one way or another on the subject of government support for religion. There is no record of the conference committee’s discussions, although it appears that the House agreed to virtually all of the Senate’s preferences as long as the Senate would consent to certain House proposals, one of which was a new version of the establishment clause: “Congress shall make no law respecting an establishment of religion.” This language then became a part of the “Third Amendment” sent to the states for ratification. It became the First Amendment not because it was first in importance or priority to the framers but because the states failed to ratify the first two proposed amendments.

Before leaving the House and Senate debates on religion, it may be valuable to consider the amendment that Madison called “the most valuable on the whole list.” This proposal read, “No state shall infringe the equal rights of conscience, or the freedom of speech or of the press, nor of the right of trial by jury in criminal cases.” Unlike the establishment clause, which expressly limited “Congress,” Madison’s view was that “if there was any reason to restrain the Government of the United States from infringing upon these essential rights, it was equally necessary that they should be secured against the State Governments.” One congressman thought it was better to “leave the State Governments to themselves,” but, after a minor amendment, the language was adopted by the House. The Senate rejected this proposal without any discussion. It is interesting to speculate about what it would have meant to require the states to respect the rights of conscience or why Madison’s proposal omitted a nonestablishment clause in this provision. Unfortunately, there is essentially no record to help address these questions.

This ends the First Congress’s brief debate about the establishment clause, which has been identified by many commentators as the foundation of America’s national

devotion to the principle of the separation of church and state. And since there are very few recorded comments from the discussions about ratification in the state legislatures, these debates represent virtually the entire legislative record for the establishment clause.

What Did It Mean?

Scholars have vigorously debated what “an establishment of religion” meant to the framers of the Bill of Rights. One of the reasons for the scholarly debate is that the term “establishment of religion” was used in a variety of ways around the time the Bill of Rights was adopted. The documentary record (newspapers, laws, letters, and similar types of writings) shows that some people believed that an establishment of religion only existed when laws specified an officially recognized creed and liturgy. These people denied that the New England Standing Orders constituted “establishments.” Others were quite sure that New England’s religious taxes did, in fact, create an established religion. Similarly, in the South, some agreed with Madison that general assessments were religious establishments, while others believed that disestablishment had occurred when taxes specifically for the Anglican Church were eliminated.

Justice Black and many strict separationists have generally based their arguments on the positions taken by Madison and Jefferson in Virginia, especially since Madison had said in his “Memorial and Remonstrance” petition that the proposed general assessment would constitute an establishment. To argue that the views of Madison and Jefferson provide an authoritative understanding of the establishment clause, they may point to Madison’s role in proposing the Bill of Rights in the First Congress or perhaps to Virginia’s church-state actions during the Revolutionary Era as being representative of American thinking at the time. Doing so allows them to see Madison’s “Memorial and Remonstrance” as something of an expanded gloss on the establishment clause, including the view that even an ecumenical, nondiscriminatory tax in favor of religion, like the proposed Virginia general assessment, would violate the Constitution. Advocates of strict separation will sometimes also point to Madison and especially to Jefferson to emphasize the role of the establishment clause in creating a secular government inspired by Enlightenment philosophy, a concept that they believe is properly captured in Jefferson’s “wall of separation” phrase, which appeared in a letter Jefferson wrote during his presidency to a Baptist group in Connecticut.

Some strict separationists have also examined the use of the word *establishment* and have concluded that Americans at the time of the Bill of Rights conceived of the New England Standing Orders as constituting an establishment of multiple Protestant churches; therefore, they argue, the framers were familiar with the concept of nonpreferential aid to religion and must have wanted to prevent anything of that sort when they adopted the establishment clause. The fact that the Senate explicitly rejected language that sounded nonpreferential (following the proposals from Virginia, North Carolina, and New York, it only banned laws favoring “one religious sect . . . in preference of others”) is cited as further support for the strict separationist view.

Those favoring the enhanced-federalism interpretation concur that the town-based religious taxes in New England were establishments of religion because, in their view, one of the central purposes of the establishment clause was to protect those establishments from federal interference. Meanwhile some nonpreferentialists and others have looked at early-nineteenth-century dictionaries and other sources (usually ministers of the Standing Order and other proponents of tax support for religion) and have found that the term *establishment* was most commonly used to describe a single church favored above all others, as in the case of the Church of England. Based on this evidence, they conclude that no “establishment” of religion existed in America at the time of the Constitution. Other nonpreferentialists take a different approach: they admit that the New England states “established” the demographically dominant Congregationalism but that there was no such thing as nonpreferential aid to churches at that time (and, therefore, the establishment clause could not have been meant to ban nonpreferential support for religion). Finally, some nonpreferentialists have latched onto the word *an*, arguing that the First Amendment could have forbidden a broad concept—“the” establishment of religion—but chose instead only to ban “an” establishment, that is, a single established church.

In summary, people at the time of the framing of the Constitution appeared to use the phrase “establishment of religion” in a variety of sometimes inconsistent ways. There seems to be no conclusive way to determine what definition the First Congress had in mind when it adopted the First Amendment, nor is it crystal clear how the American public might have understood the language when it was ratified by the states. This situation has allowed the advocates for various interpretations to pick and choose among

various pieces of the documentary record to support their preferred approaches to understanding the establishment clause.

Church-State Issues following Adoption of the First Amendment

The States

While the religion clauses of the Bill of Rights were largely noncontroversial, church-state issues arising in the various states would hardly be called “milk and water.” In the South, where the states had severed financial ties with the Church of England, there were lively disputes over the ownership of state lands previously owned by (or held for the benefit of) the Anglican Church and over the extent to which churches would be entitled to become “incorporated” entities. By becoming incorporated, the churches would receive a charter from the government that would grant them the ability to sue recalcitrant members to collect pledged contributions and to own property separately from the members or a member-elected board of trustees. Incorporation would therefore create an additional amount of institutional stability, as well as provide ministers with some degree of insulation from the members’ whims. These ongoing church-state disputes in the South sometimes involved the former dissenters’ trying to make sure that the Anglican Church would not work its way back into a favored position. But in other cases, even the dissenters were divided. As their numbers grew and as their members became more influential in their communities, some Baptists and Presbyterians sought to establish colleges, to promote an educated ministry, and to obtain the legal benefits of incorporation. Meanwhile, some of their fellow Baptists and Presbyterians campaigned against both an educated clergy and any governmental involvement in churches at all. Over the course of the nineteenth century, church incorporation became an increasingly well-accepted practice, but it was a heated issue in numerous locales, and it remained a controversial topic in Virginia as late as the 1850s.

In New England, the disputes were especially animated over the continuation of the tax-supported Standing Orders in Massachusetts, Connecticut, New Hampshire, and Vermont. The key elements of the debates between the supporters of the Standing Order and the Baptists and other dissenters who believed that churches should only be supported by voluntary contributions were summarized in an opinion by church-state traditionalist Theophilus Parsons in an 1810 Massachusetts case, *Barnes v. Falmouth*.

The dissenting position had been clearly and frequently articulated by Baptist spokesman Isaac Backus, and Judge Parsons made a point of responding to each of the three major objections to the Massachusetts Standing Order: “that when a man disapproves of any religion . . . to compel him by law to contribute [to it] is an infraction of his liberty of conscience, that to compel a man to pay for public religious instruction [from which he derives no benefit] is unreasonable and intolerant; and that it is antichristian for any state to avail itself of the precepts and maxims of Christianity . . . because the founder of it has declared that his kingdom is not of this world.”

Parsons commented on each argument in turn. The first, he said, “mistake[s] a man’s conscience for his money. . . . The great error lies in not distinguishing between liberty of conscience in religious opinion and worship, and the right of appropriating money by the state.” As to the second objection, he argued that “every man derives the most important benefits” from a religious instruction that is designed to “teach and to enforce . . . a system of correct morals among the people.” Finally, since “the Founder . . . did not intend to erect a temporal dominion,” Judge Parsons asserted that “it is one great excellence of this religion, that, not pretending to worldly pomp and power, it is calculated . . . to meliorate the conduct and condition of man, under any form of civil government.” Parsons’s efforts to defend the Massachusetts Standing Order proved to be persuasive; the state’s system of religious taxation was perhaps the most solidly entrenched in New England, and it would survive for a generation after Judge Parsons’s opinion.

To different degrees in each of the New England states, many factors—from immigration and rapidly changing religious demographics that favored the dissenters to theological disputes within Congregationalism and the beginnings of what would become party politics—made the Standing Order much less politically stable in the nineteenth century than it had been in the Revolutionary Era. Not only were the dissenting denominations growing faster than the Congregational churches, which were usually the tax-supported churches, but the Congregationalists themselves were increasingly divided by politics and, as the nineteenth century advanced, riven by a battle between the more traditional Trinitarians and the increasingly powerful but less orthodox Unitarians. Vermont became the first to abandon compulsory religious taxation (in 1807), followed by Connecticut and New Hampshire about a decade later, with Massachusetts waiting until 1833.

The debates in Vermont and New Hampshire were less heated than in Connecticut and Massachusetts, where the Standing Order was more firmly ensconced. To some extent in Connecticut, and even more so two decades later in Massachusetts, the Trinitarian Congregationalists, who had previously dominated the Standing Order and who had been the most zealous in defending the tax benefits they were receiving, found that they were increasingly losing ground—and the control of their churches—to the Unitarians. As a result, they naturally became less enthusiastic about tax monies going to their former churches. Ultimately, religious taxation ended in New England in 1833, and as was the case every time the religious taxation issue was raised throughout the new nation, prominent and distinguished politicians and clergymen spoke up for each side. As was the case in Virginia during the Revolutionary Era, the rising political power of the Baptists and other dissenting denominations was a significant factor in the movement to abolish religious taxes (and once again the dissenters frequently cited Madison's "Memorial and Remonstrance" as a bold statement in their favor).

The end of compulsory church taxation did not sever all ties between religion and government in any of these states. Many retained religious tests for public office (New Hampshire's provision limiting office holding to Protestants continued until late in the nineteenth century despite numerous challenges in the legislature); laws against blasphemy stayed on the books (although prosecutions died out); legislatures typically had official chaplains; and governors continued to declare days of prayer, fasting, or thanksgiving. The abolition of religious taxes did not necessarily lead to the creation of secular states but was a reflection of increasingly complex political and theological dynamics (almost entirely within Protestantism), such that a majority of voters would no longer support the traditional religious taxation system. Those who may have favored a genuinely secular state (a fairly small number in New England in the first part of the nineteenth century) undoubtedly supported this outcome, but the vastly larger number of Baptists and other dissenters generally saw the end of such taxes instead as a positive step towards creating a Christian commonwealth on what they believed were genuinely biblical principles.

The Federal Government

In the new nation's first few decades, the federal government periodically addressed church-state issues, and many modern scholars have looked at these events for help in

determining what the establishment clause might have meant at that time.

The very first act of the Congress following its approval of the Bill of Rights was to recommend that President Washington declare a day of thanksgiving to thank God for the blessings of the Bill of Rights. Only one congressman is recorded as opposing the concept on establishment clause grounds, and the resolution was adopted. Ever since, almost every president has declared such days (with Jefferson and Jackson being the notable exceptions).

For a significant part of the early national period, church services were routinely held on Sundays in the halls of Congress and other governmental buildings. The First Congress also appointed official chaplains (a Presbyterian minister in the House and an Episcopal priest in the Senate), another practice that has endured throughout essentially all of American history. Nonpreferentialists point to James Madison's service on the House Chaplaincy Committee as evidence that he approved of some links between church and state, while strict separationists cite one of his unpublished writings that appears to have been written much later in his life (called by scholars the "Detached Memoranda"), in which he argued against both chaplains and national days of prayer.

One event that generated little, if any, notice in the early national period has become extremely influential ever since the *Everson* case: Jefferson's "wall of separation" letter to the Baptist association of Danbury, Connecticut, in 1802. The Baptists were fighting against that state's Standing Order, and they wrote to President Jefferson seeking his support. Upon receiving this letter, he told his advisers that his reply would give him the chance he had been seeking to say why he did not declare days of prayer, fasting, or thanksgiving, as Washington and Adams had done. But his advisers talked Jefferson out of doing so because such practices were so popular in New England, even among many of Jefferson's supporters. So he took that argument out of his draft letter, leaving in the more general statement, "I contemplate with sovereign reverence that act of the whole American people" in adopting the religion clauses of the First Amendment, "thus building a wall of separation between Church and State" (quoted in *Church and State in American History*, edited by John F. Wilson and Donald L. Drakeman). This statement has become the rallying cry of the strict separationists, and it has been cited in more than two dozen Supreme Court cases. At the time, however, the Danbury Baptists appear to have disregarded Jefferson's letter, perhaps because the concept of

the “separation of church and state” was perceived as a quite radical position at the dawn of the nineteenth century. It appears that Jefferson’s letter only came to light decades later when it was included in a published compilation of his papers.

The church incorporation issue arose in the federal government as it did in a variety of states. Churches set up in the federal District of Columbia turned to Congress to approve their charters as incorporated entities. Although Jefferson, as president, signed a law incorporating a Presbyterian church in Georgetown in 1806, five years later Madison vetoed a similar law passed by the Congress on behalf of an Episcopal church on the grounds that it did not respect the appropriate distinction between government and religion. The Episcopal Church had to wait until 1893 for Congress to act again on its incorporation request; in between, however, numerous religious organizations were incorporated in the District of Columbia.

Two more areas of church–state interaction at the federal level bear mentioning, even though they have been cited by modern scholars less frequently than the ones mentioned above: federal funding for Christian missions and the church–state controversy over Sunday mail delivery.

President Washington’s administration continued a practice adopted by the Continental Congress and the colonial governments of providing funds to Christian missionaries for their work with Native Americans. Presidents and Congresses throughout the eighteenth and nineteenth centuries appropriated considerable sums that were awarded to a range of religious groups to educate and Christianize Native Americans. These funds paid for the building of religious schools, the salaries of the missionaries, and many other related expenses. Not until late in the nineteenth century were the potential constitutional issues surrounding this practice (such as whether it might constitute an improper “establishment of religion”) raised to a significant level, and the practice did not end until the beginning of the twentieth century.

Despite the lack of church–state debate over the direct funding of religious missions, there was a very well-publicized ongoing battle over the issue of whether a proposal to stop mail delivery on Sunday would violate the Constitution. When Congress passed a law in 1810 requiring mail delivery seven days a week, a coalition of Protestant groups protested this failure to observe the Sabbath and lobbied Congress to reverse its decision. The controversy became especially heated in 1829 and 1830, when many thousands

of Americans signed petitions asking Congress to eliminate the Sunday mails. These petitions were part of an organized effort coordinated by some of the nation’s leading Protestant churches. Their principal argument was that America, as a Christian nation, was obliged to obey the Ten Commandments’ injunction to respect the Sabbath.

The Senate and House committees responsible for the mails were chaired in successive years by the same man, Richard Johnson of Kentucky, who used the opportunity to release very strongly worded reports in support of the Sunday mails and expressing deep concerns about the pernicious influence of religion (and especially clergymen) on the actions of government. These reports became very popular in Jacksonian America (and helped propel Johnson into the vice presidency), but over time, those who sought the elimination of the Sunday mails ultimately prevailed.

In summary, influential interpretations of the establishment clause in the early republic ranged widely from the sharply anticlerical Sunday mails congressional reports to frequent assertions, as in the federal Northwest Ordinance, that “religion, education and morality” are essential components of good government. Even within one presidential administration, two fundamentally different views are evident. For example, Madison put forth a very strict interpretation of the establishment clause when he vetoed the incorporation of a church; meanwhile, one of Madison’s appointees to the Supreme Court, Harvard law professor Joseph Story, issued the highly influential *Commentaries on the Constitution* in 1833, proclaiming that “the general, if not universal sentiment in America” at the time of the Constitution was “that Christianity ought to receive encouragement from the State so far as was not incompatible with the private rights of conscience and the freedom of religious worship” (quoted in Wilson and Drakeman, *Church and State in American History*). These differing views have endured ever since, with the strict separationists following in Madison’s footsteps and the nonpreferentialists opting instead for Story’s outlook.

Conclusion

Some scholars have located the foundation for modern America’s approach to church–state issues in the founding era and the early national period described in this article. To be sure, the establishment clause prohibited Congress from making laws “respecting an establishment of religion,” yet the meaning of those words has been the subject of vigorous debate. And some scholars have countered that the

now-familiar concept of the separation of church and state actually developed significantly later as waves of Roman Catholic immigrants in the nineteenth century brought an entirely new dynamic to the largely intra-Protestantism church-state debates of the founding era. Those heated and sometimes violent nineteenth-century disputes between Protestants and Catholics centered on the Protestant prayers and Bible reading mandated by many public schools and the related issue of whether there should be state funding for a parallel system of parochial schools established by Catholics. These debates continued through the nineteenth and twentieth centuries, and while the *Everson* case is best known for the Supreme Court's commitment to a strict separationist originalism as the best way to understand the establishment clause, the main issue in that case was whether a state could reimburse parents for bus transportation to the Roman Catholic parochial schools. The *Everson* Court narrowly upheld the reimbursement plan—largely on the grounds that it could be seen as being similar to providing fire and police protection for church buildings—but the opinion's strict separationist legacy has led the Court to strike down public school prayers, many forms of aid to religious schools, and a variety of other state and federal programs supporting religion. This interpretation of the establishment clause, based as it was on the history of the Constitution's framing, has made the study of the relationship of religion and government in the Revolutionary and early national eras highly controversial, frequently politicized, and, as a result, extremely interesting and worthy of further study.

Churches of Christ

Churches of Christ represent a distinct American heritage that originated, along with the Disciples of Christ, in the Stone-Campbell Movement (also known as the “Restoration Movement”) in the early nineteenth century. They exist in many parts of the country, but their numbers are

strongest in “Bible Belt” states such as Tennessee, Arkansas, and Texas; like many other Christian fellowships, the majority of their members can now be found in Africa, India, and Latin America. This tradition should not be confused with the United Church of Christ or with the Church of Jesus Christ of Latter-day Saints.

Historical Development

As suggested by its name, the Stone-Campbell Movement was marked by dual leadership. The first leader was Barton W. Stone (1772–1844), who played a pivotal role in the Cane Ridge Revival (near Lexington, Kentucky) in 1801. Stone began his ministerial career as a Presbyterian; disenchanted, however, with creedal and synodical obligations, he withdrew in 1804. His anticonfessional, anticlerical followers embraced the generic label of “Christians,” and they sought to be governed by scripture and united by holiness. While Stone’s movement was still quite new, a similar venture appeared in southwestern Pennsylvania, led by Thomas Campbell (1763–1854) and his son, Alexander (1788–1866). They both departed the Presbyterian fold in 1809, and Alexander ultimately played the leading role in his own anticonfessional, anticlerical enterprise. He took a rationalistic approach, treating the Bible (especially the New Testament) as a formula for Christian identity and unity. In an effort to identify with the earliest Christians, his partisans were frequently known as “Disciples.”

Alexander Campbell was no revivalist, and Barton Stone was not inclined toward rational formulas. However, despite their differences on these (and other) issues, they joined forces in the winter of 1831–1832, and on the strength of this tenuous unity, their influence spread throughout the Midwest and into the South. Their followers, frequently meeting as “Christians,” “Disciples,” or “Churches of Christ,” labored to strip away the dross of tradition and to “restore” the unity and simplicity of first-century Christianity. Opposed to clerical oversight and creedal definition, this remarkable movement became a diverse and decentralized body during the 1840s and 1850s.

Churches of Christ were ultimately recognized as a separate body in the 1906 Census, but their isolation from the Disciples was realized, de facto, during the final decades of the 1800s. These parties shared common convictions about congregational autonomy, the weekly observance of the Lord’s Supper, and the salvific role of adult baptism; nonetheless, they became estranged on predominantly sectional lines, and their earliest tensions were manifested during the

Civil War and Reconstruction eras. Poorer, rural, southern churches were typically opposed to the liturgical use of musical instruments, and this proved to be a leading source of contention. Moreover, in contrast to their wealthier, relatively urban, northern counterparts, the southern churches refused to support the formation of a centrally governed missionary society.

It was not a consistent rule, but the nomenclature of the “Church of Christ” was increasingly applied to the southern churches, and the northern churches were widely known as “Disciples.” When the Census was published in 1906, the Churches of Christ had 159,658 members, a figure that was only one-sixth of the Disciples’ total. The increasingly liberal Disciples, however, soon suffered another division. Over the course of the next thirty years, a confederation of conservative “Christian Churches” withdrew from their midst and formed a separate fellowship. Aside from their use of musical instruments, these churches strongly resembled the Churches of Christ, and many adopted the “Church of Christ” name; nonetheless, they remained estranged from their noninstrumental counterparts.

Lacking any official corporate structure, the Churches of Christ were loosely organized around the editors of periodical publications. Among them were two primary papers: one was the Texas-based *Firm Foundation*, established by Austin McGary (1846–1928) in 1884; another, from Nashville, was the postwar *Gospel Advocate*, established in 1866 and edited by David Lipscomb (1831–1917). Meanwhile, the Disciples were largely defined by the *Christian Standard*, which was edited by Isaac Errett (1820–1888) from 1866 till 1888. By the turn of the twentieth century, the Churches of Christ were also identified by a growing collection of colleges, and some have survived to the present day. The Nashville Bible School (now known as Lipscomb University) began in 1891, and Abilene (Texas) Christian College was founded in 1906. Two others, Harding College (in Searcy, Arkansas) and Freed-Hardeman College (in Henderson, Tennessee), were founded in 1919.

Until his death, Lipscomb proved to be the most significant representative of the southern movement, and the official dissolution of 1906 was published on the strength of his reluctant testimony. In the region around Nashville (where Lipscomb’s influence was strongest), the Churches of Christ tended to be an economically marginalized, countercultural sect, eschewing earthly political systems and eagerly anticipating the premillennial return of Christ. By the end of two world wars, however, the pressures of

patriotism had become too great, and the movement was driven toward the mainstream of American Protestant culture. They retained their distinctive opposition to instruments, and they held aloof from the broader Protestant spectrum; nonetheless, in sociological terms, the Churches of Christ had become, by the 1950s, a conservative denomination. Like their fundamentalist and evangelical neighbors, they were deeply concerned about a host of predictable issues, such as Darwinian evolution, the “social gospel,” and the menace of communism.

The 1950s and 1960s were particularly heady days for the Churches of Christ. They enjoyed an explosion in numbers, and by 1970 they crested near the two million mark. To answer the call for additional ministers, new preaching schools were established: one of these, the Sunset School of Preaching, began in Lubbock, Texas, in 1961; another, the White’s Ferry Road School of Preaching, was founded in West Monroe, Louisiana, in 1964. Graduate programs were added to the religious curriculum at George Pepperdine College (1944, in Los Angeles), Abilene (1953), and Harding (1954, in Memphis). Through the generous donations of numerous churches, the Herald of Truth radio ministries were launched in 1952, and television programs were added the following year. Moreover, missionaries flowed from these new institutions, and a newspaper called *The Christian Chronicle* (founded in 1943) kept the churches informed about the projects that were being completed.

The prosperity of the twentieth century, however, did not guarantee unity among the Churches of Christ. For instance, there was a small coterie who challenged the biblical authorization for Sunday schools: these “nonclass” churches, mostly in Texas, withdrew to form their own fellowship during the 1920s, and they have maintained a separate fellowship ever since. Greater impact, however, was delivered by the “noninstitutional” protest, which reacted against the growing influence of the colleges and the Herald of Truth. Recalling the nineteenth-century arguments against missionary societies, this movement rejected parachurch institutions where religious influence could be centralized. In this dispute, the noninstitutional perspective was forcefully argued by Foy E. Wallace Jr. (1896–1979), who edited various periodicals such as the *Bible Banner* (1938–1949). For their part, the mainstream churches defended their colleges and radio programs; nonetheless, noninstitutional churches still constitute nearly 10 percent of the membership in Churches of Christ.

As the Churches of Christ moved into the second half of the twentieth century, their growth began to stagnate. Many churches sought to distance themselves from a notoriously disputatious heritage, and they began to adopt new points of emphasis. For example, *Mission* magazine appeared from 1967 to 1987, dealing frankly with cultural topics such as racial prejudice, warfare, and feminism. During the 1980s, another movement radiated from the Boston Church of Christ, placing radical emphasis on evangelism and discipleship. Mainstream congregations rejected this impulse, and despite its numerical success it was judged to be manipulative and “cultish.” Eventually organized as the International Churches of Christ, this movement became a separate fellowship in 1993.

Predictably, strong, reactionary forces have tried to preserve the “sound doctrines” of the previous generation. In their quest to distinguish themselves from mainstream American Christianity, these churches have been represented by journals such as *The Spiritual Sword*, which began in 1969, and by their own lectureship programs. They rigorously maintain an exclusivist, noninstrumental platform, and they continue to wield considerable influence.

To a significant degree, however, the Churches of Christ have moved away from their prior exclusivism, and many have sought to reverse their historical division with the instrumental Christian Churches/Churches of Christ. This particular quest for unity was stimulated, in large part, by a series of annual “Restoration Forums” that began in Joplin, Missouri, in 1984. Other churches, meanwhile, have reached beyond the borders of the original Stone–Campbell Movement and have embraced a broad range of evangelical associations. Some congregations, inspired by nondenominational “community church” models, have labored to erase entirely the distinctive marks of their tradition. As they entered the twenty-first century, the Churches of Christ had become a rich but fractured heritage, their identity hanging heavily on their colleges and on the continued reportage of *The Christian Chronicle*.

Distinctive Beliefs and Practices

Despite their debt to Barton Stone, the Churches of Christ have been primarily marked by the early legacy of Alexander Campbell. In his later years, Campbell softened his tone and became relatively ecumenical; Churches of Christ, however, have favored his original mission to overturn denominational creeds and to restore the putative purity of primitive Christianity. In many Churches of Christ, the earliest

centuries of Catholic development have been rejected as a time of “apostasy,” and the reformations of Martin Luther and John Calvin have been faintly praised as a partial move in a first-century direction. Hence, in this view, the restorative work of Campbell and Stone must be viewed as a decisive moment on the timeline of church history. Mainstream Churches of Christ have historically (but not unanimously) viewed themselves as the complete restoration of the first-century church; according to the cornerstones on many of their buildings, they were “established in A.D. 33.” In keeping with these convictions, they have typically refused to classify themselves as a “denomination,” believing that they have transcended that sort of category.

In 1816, Campbell delivered a “Sermon on the Law,” where he contrasted the Mosaic and Christian “dispensations.” He affirmed the abiding value of the Old Testament, but he rejected its normative authority for the restoration he envisioned. It was, he argued, the manifestation of an earlier dispensation, and its jurisdiction had been “fulfilled.” This disposition toward the Old Testament, historically, has become a trademark for the Churches of Christ and has mitigated most of the narratives and teachings that transpired before the death of Jesus. Significantly, this attitude has led to a disproportionate focus on the book of Acts and the Pauline epistles, with very little emphasis on the gospels.

Churches of Christ have traditionally used this canon-within-a-canon to identify a coherent biblical “pattern.” This pattern can be discerned, first of all, with a tripartite hermeneutic of “direct commands,” “approved precedents,” and “necessary inferences.” In many Churches of Christ, this approach has become the target of ridicule; nonetheless, it has been a distinctive interpretive tool through the years, and it still has vigorous defenders. The “direct commands” are drawn from biblical passages where imperative language is used: Acts 2:38, for instance, is frequently cited as an obligatory commandment from Peter, who said “repent and be baptized, every one of you.” Meanwhile, the “approved precedents” are based on reconstructions of first-century practice: Acts 20:7, therefore, sets a normative example for every believer when Paul breaks bread “on the first day of the week.” Other precedents, such as head coverings for women (1 Corinthians 11:3–16), can be explained by cultural considerations and are usually overruled. Third, the “necessary inferences” can be devised with simple syllogisms: Acts 2:38, for example, links baptism with repentance, which logically implies mature reflection and logically disqualifies infant baptism.

This hermeneutical strategy undergirds a nexus of distinctive practices in the Churches of Christ, beginning with baptism. In keeping with a literal translation of the Greek word *baptizo* (and the presumed example of the first-century church), it has been important for Churches of Christ to define baptism as a full bodily immersion. More distinctively, however, the purpose of baptism has been carefully defined in sacramental terms, as the means for receiving grace and forgiveness. It is not understood to be a meritorious act; on the contrary, it represents an essential, visible, and salvific moment. Once again, Acts 2:38 has been determinative here, along with Acts 22:16, 1 Peter 3:21, and numerous other passages. Campbell publicly articulated this understanding in 1823, and it became an immediate, decisive, and ongoing point of departure for his movement. Though it is scarcely unique to “Campbellites,” this definition of baptism has been central to the historical rivalry between Baptists and Churches of Christ and accounts for its distinctive priority among Campbell’s heirs.

From the very beginning, the Churches of Christ have also been marked by fierce assertions of congregational autonomy. Insisting that first-century churches were individually governed by a plurality of elders (1 Timothy 3:1–7; Titus 1:5–9), Campbell and Stone rejected the concept of monarchical bishops and authoritative councils. In this respect, their position was consistent with their Puritan forebears, but, with appeals to first-century practice, their own opinions pressed even further: most famously, Stone rejected the validity of the Springfield Presbytery in 1804, arguing that it should “die, be dissolved, and sink into union with the Body of Christ at large.” For his part, Campbell was affiliated with Baptist “associations” during the 1820s, but he also judged them, eventually, to be coercive and unscriptural. As noted above, this persuasion has led the Churches of Christ to be suspicious of any manifestation of centralized authority, including missionary societies, colleges, and radio programs. On the other hand, it has also allowed for remarkable freedom of expression and is largely responsible for the bewildering diversity that presently characterizes the movement.

Most visibly (and perhaps most famously), the Churches of Christ are known for their refusal to use musical instruments during worship assemblies. This issue did not originate with Campbell or Stone and has been explained, above, as a sectional affair. Among Churches of Christ, however, it has been consistently treated as a litmus test for obedience; for many, instruments are unauthorized by the New Testament because they cannot be justified by a direct command,

an approved precedent, or a necessary inference. Ephesians 5:19 and Colossians 3:16 are decisive, here, because they command “psalms, hymns, and spiritual songs” without any mention of instruments. As will be noted below, this issue continues to provoke considerable discussion, and many churches have abandoned the traditional position. Nonetheless, it is rare, even in those “progressive” churches, to find instruments used on a regular basis.

Internal Issues

To some degree, the traditional threefold hermeneutic can be traced to Thomas Campbell’s *Declaration and Address* (1809), where he spoke of “express terms,” “approved precedent,” and “inferences.” This approach to the Bible revealed rationalistic assumptions that he and his son, Alexander, had inherited from the Enlightenment. Similarly, in their quest for a coherent, authoritative, first-century pattern, the Churches of Christ have imbibed a modern, rationalistic mindset. They have been optimistic about the clear-cut authority of scriptural data, and they have considered themselves to be exempt from the foibles of human interpretation. Moving far beyond the Campbells, this certitude has led the Churches of Christ to refuse “fellowship” with churches who do not accept the ostensibly “clear” teachings of scripture. They have been reluctant, consequently, to worship or fraternize with Christians from other denominational affiliations.

With the advent of a “postmodern” era, however, these hermeneutical assumptions are being called into question, along with their exclusivist consequences. Some have concluded that the traditional, pattern-seeking strategy has inadvertently neglected crucial biblical themes, leaving Churches of Christ in a theologically shallow position. This concern was expressed as early as 1965 by Thomas H. Olbricht (1929–), who dared to suggest that Campbell had led the movement in a mistaken hermeneutical direction. Moreover, subsequent critics have observed that the genre of biblical literature does not lend itself to systematic, “patternistic” manipulation; Pauline letters, for instance, must be treated according to their epistolary genre with special attention to their occasional character. These suggestions have received a predictably mixed reaction, as traditionalists rightly recognize the threat that a “new hermeneutic” would pose to numerous cherished doctrines. The most celebrated response, *Behold the Pattern*, was published by Goebel Music (1934–) in 1991 and

stoutly defended the traditional hermeneutic. In Music’s presentation, he upheld the categories of command, precedent, and inference, and he denounced the critics of the pattern-seeking approach.

Normally, the Churches of Christ have reserved public leadership roles for their male members only. This practice has been predictably called into question, as the broader culture presses in egalitarian directions; nonetheless, there are very few exceptions to this rule, and the traditional hermeneutic, despite its detractors, has proven to be a sturdy constraint. With its customary emphasis on Pauline epistles, it highlights biblical passages such as 1 Corinthians 14:34 and 1 Timothy 2:11–15, where feminine roles would seem to be clearly and sharply curtailed. Egalitarian advocates, with a different hermeneutical approach, have argued that gender equality is an essential feature of the Kingdom of God, and they have cited passages such as Galatians 3:28, where Paul asserts that there is “no male or female” in the fellowship of Christ. Many congregations are revising their views on this subject, but the hermeneutical stakes are significant and the issue has been remarkably contentious.

The Churches of Christ have also been challenged by questions of ecumenicity; as mentioned above, the movement holds diverse opinions about its associations with other fellowships. For those who believe that the Churches of Christ have restored a biblical, first-century pattern, it has been difficult to avoid an exclusivist stance, and this attitude was typical for most of the twentieth century. Once again, however, a traditional position has been modified by hermeneutical considerations, and the Churches of Christ have become increasingly tolerant toward other Christian traditions. This non-denominational impulse was significantly endorsed by Rubel Shelly (1945–), whose book, *I Just Want to Be a Christian*, was published in 1984. More recently, the devotional writings of Max Lucado (1955–) have been featured on the *New York Times* best seller list, and he has provided a public, visible example of nondenominational fraternization. Shelly and Lucado have been strongly rebuked by traditional elements in the Churches of Christ, but those reactionary voices are reaching a shrinking audience.

Though the Churches of Christ are diverse, that diversity has significant limits. These churches remain stridently conservative, and they continue, with near unanimity, to make common assumptions about biblical inerrancy, the substitutionary atonement of Christ, and homosexuality. On these

and other issues, there has been no substantial activism toward a liberal point of view.

Interpretive Theories

One of the earliest chroniclers of the Churches of Christ has been Earl I. West, who began, in 1949, to publish a four-volume series entitled *The Search for the Ancient Order*, which describes the history of the Stone–Campbell Movement from its beginnings until 1950. West interprets the movement as the successful restoration of the first-century church, and he regards the Churches of Christ to be the purest remnant of that original quest. For West, therefore, it is a story about truth and error, and his interpretation is clearly premised on traditional hermeneutical assumptions.

Douglas Foster takes an entirely different approach in his 1994 publication, *Will the Cycle Be Unbroken?* He measures the Churches of Christ against the theories of various sociologists, including the “sect-to-church” typology of Ernst Troeltsch. In Foster’s assessment, the Churches of Christ have reached a predictable and respectable stage in the life cycle of a religious movement, and he warns about the likelihood of future fragmentation. Foster insists, however, that the prospect is still theoretical and can yet be resisted; indeed, for him, the central genius of the Stone–Campbell Movement was not its quest for restoration, but its quest for unity. By recovering that priority, Foster says, the Churches of Christ can defy the sociological odds and still retain their identity.

By contrast, David Edwin Harrell Jr. interprets the story of the Churches of Christ as a series of divisions. In his 1973 publication, *The Social Sources of Division in the Disciples of Christ, 1865–1900*, he explains the schism of 1906 in terms of sectional loyalties. He observes that the Churches of Christ took root in poor, rural, southern locations and had little success in the eastern parts of the country. In addition, he has written *The Churches of Christ in the 20th Century* (2000), where he describes the tensions provoked by deeply embedded loyalties and rancorous power struggles. Unlike Foster, Harrell concludes that the mainstream is already splintered in reality, if not in writing, between two evenly matched camps of “progressives” and “conservatives.” He does speculate about the eventual “winners” and “losers,” but he does not envision a peaceful solution.

The most comprehensive interpretation of the Churches of Christ has come from Richard Hughes, who acknowledges the movement’s divisions but proposes a different set

of concerns. In his 1996 book, *Reviving the Ancient Faith*, Hughes contrasts the legalistic rationalism of Alexander Campbell with the countercultural, premillennial pietism of Barton Stone. He believes that Campbell overshadowed Stone from the start, and he traces the “unequal fusion” of their influence throughout the 1800s. As mentioned above, the Churches of Christ were driven toward the patriotic mainstream of American Protestantism during the two world wars; in the judgment of Hughes, this constituted a tragic renunciation of the “Stoneite side” of their heritage and was a cultural compromise that neutered their Christian testimony. Hughes revisits this theme in a 2002 publication, *Reclaiming a Heritage*, where he laments the movement’s evangelical assimilation and urges the Churches of Christ to reconsider the choice they have made.

Critical Assessment

The Churches of Christ have inherited a vibrant heritage and a unique historical narrative, but their distinctive doctrinal identity seems to hang on a time-bound hermeneutical scaffold. As the modernist era fades into memory, it will be increasingly difficult for these churches to appeal to the clear-cut authority of biblical patterns. Traditionalists will surely continue to protect the old paths, and they will not be dissuaded by the disapproval of the majority. Their mission, however, will be increasingly difficult, and their ranks seem destined to dwindle.

Progressives will continue to press for hermeneutical changes, but it will be difficult to do this without a change of affiliation. For instance, many congregations have already erased the “Church of Christ” label from their stationery, and some are frankly indifferent about the historic ties they might sever. If they care about the past, they might salvage an ecumenical vision from the earliest days of the movement (as Foster has hoped), or they might recover the countercultural remnants of Barton Stone’s legacy (as Hughes has advised). These kinds of options, however, will require a serious commitment to the heritage, and this does not seem likely to happen. The path of least resistance will surely lead the progressive churches into generic evangelicalism.

The most interesting variable, here, could come from other parts of the world. As noted above, the Churches of Christ have a global presence, and most of their churches are now located in Africa, India, and Latin America. In these contexts, many people are deeply impressed with a modern

approach to the Bible, and they are happy to search for patterns. Only time can tell what role they will play, as they continue to grow. The picture looks complicated, and it is impossible to make confident assertions about the future of the Churches of Christ.

City Missions

A city missions movement developed in the late nineteenth and early twentieth centuries that was an essentially Christian response to the widespread social problems that grew out of the industrial revolution.

Nineteenth-Century Roots

The industrial revolution of the late nineteenth and early twentieth centuries brought economic opportunity and prosperity to unprecedented numbers of immigrants and Americans, but it was accompanied by widespread social problems such as unemployment, homelessness, crime, substance abuse, and destruction of families. In an era when governments offered little relief, voluntary associations and religious institutions responded to the cries of the urban poor. City missions, or rescue missions as they were often labeled, became the spearhead of a reform movement that

offered immediate relief and short-term solutions to complex urban industrial problems.

There was no single city mission that appeared first, proved effective, and then became the prototype mission to be duplicated throughout urban America. On the contrary, small storefront missions appeared almost simultaneously in every industrial city across the nation as soon as space could be secured in areas frequented by the people who lived and struggled to survive on the lowest rungs of the social ladder.

Those outposts designed to attract the least fortunate of the poor offered words of comfort, meals, cups of hot coffee or tea, and a warm and dry place to rest away from inclement weather and people who preyed on the weak. Typically these missions cared for the immediate needs of hurting people. Some missions offered shelter overnight. But for the most part these were short-term care facilities that offered little in the way of long-term solutions to systemic social problems. In brief, these rescue missions were inaugurated and sustained by Christians who ministered in marked contrast to Christians in the Social Gospel movement, who were more keen on changing the social, political, and economic systems that they believed caused the problems.

Evangelical Beginnings

The inspiration behind the earliest city missions was decidedly evangelical. Indeed, the twin purposes that motivated evangelical Protestants—evangelistic outreach to the unchurched and charity to the poor—worked like two blades of a pair of scissors. The name “mission,” which was proudly painted on the front of most of these facilities, had its roots in a biblical mandate to send out evangelists to convert non-Christians, and the impetus to care for the physical needs of shelter, food, and clothing for the poor came from the same Christian Bible.

Consequently, when a city mission opened its doors, it was commonly outfitted with a piano, pulpit, and benches or chairs to seat a few dozen people. There was usually a table to set out food, and where the buildings were large enough there were cots in a separate room so people could sleep overnight in a safe environment.

Typical City Missions

One of the earliest city missions that became well known because of its New York City location and its longevity (it is still operating) was founded in Manhattan's Bowery

District. Opened in 1872 and originally called the Helping Hand Mission, it was eventually named the McAuley Water Street Mission after its founder, Jerry McAuley. Born in Ireland in 1839, deserted by his parents, and taken to the United States by an older sister, McAuley lived hand-to-mouth on New York's East Side. This abjectly poor immigrant lad turned to petty crime as a means of survival, and he ended up in New York's Sing Sing Prison at age seventeen. While behind bars he converted to Christianity through the preaching and follow-up ministry of a woman prison evangelist. Upon release in 1864, McAuley began evangelistic preaching while he attempted to meet the survival needs of the Lower East Side's poorest people. By 1870 he raised enough money to open a rescue mission with a permanent facility.

In Chicago after the Civil War, a shoe salesman named Dwight L. Moody conducted similar rescue and relief activities among destitute people in the Windy City's rapidly growing slums. In 1876, two women of Free Methodist persuasion, Rachael Bradley and Mary Everhart, began the dual work of evangelism and social welfare in a low-income section of Chicago. Their mission, called The Olive Branch, was rivaled only by the Pacific Garden Mission as the largest and most famous of missions in the upper Midwest. Pacific Garden Mission, founded in 1877, became one of the most famous missions in the United States. Among the men who converted to Christianity at the missions and then went on to distinguish themselves as leading evangelical preachers were Billy Sunday, the major league baseball player, as well as Mel Trotter, Edward Cord, Bill Hadley, and Walter McDonald.

Meeting Wider Needs

During the 1880s and 1890s these rescue missions spread throughout the United States. By World War I, it is doubtful if there was a city with a population of eighty thousand or more that did not have at least one mission operated and supported by Christians in the local community. As the mission movement spread geographically, it also gradually embraced a wider vision. At first designed to rescue souls through conversion to Jesus Christ and to offer immediate but temporary relief from hunger and homelessness, the missions acquired larger facilities. Toilets, showers, and lockers for clothes were added, and people were allowed to live in the mission for up to a month if they attended the nightly religious services, promised to refrain from consumption

of alcohol and tobacco, and were willing to help with chores. The Salvation Army pioneered this type of wider ministry when it made its appearance in the United States in 1880 from England, where it was founded by William and Catherine Booth.

The Salvation Army was a purposively evangelistic and social welfare organization, but it was a Christian organization with a difference. Besides rescuing the spiritually and physically perishing, as the Salvationists labeled destitute people who were not Christians, these urban missionaries invested in longer-term follow-up. People were given food, clothing, and shelter as well as evangelistic preaching, but they were also given wide varieties of rehabilitation opportunities to learn how to earn a living and become self-supporting.

The Roman Catholic Church had always been sensitive to the needs of the poor, and as increasing numbers of Catholic immigrants arrived in America in the late nineteenth century, the Catholic Church rushed to care for their own for two reasons. First, it was a calling of the church to care for the poor. And second, the Catholic Church did not want its own people proselytized to by evangelical Protestants. Consequently, the Catholic Church had missions in every city where Catholic immigrants settled, but these facilities functioned in conjunction with local Catholic churches and always had worship facilities, nuns and priests to serve the people, and quite soon orphanages and schools for the children. In short, although the Catholics reached out to their own poor, their work was more holistic from the outset, and it never looked or functioned like the evangelical city missions. One of the striking examples of this Catholic work was that of Mother Cabrini and her Missionary Sisters, who worked to meet the socio-religious needs of Italian immigrants in the United States beginning in the late nineteenth century.

Late-Twentieth-Century Changes

The rural depression of the 1920s and the nationwide Great Depression of the 1930s stretched city missions throughout America beyond their limits. Indeed, by the late 1930s, most of these religious organizations suffered from dwindling donations at the time needs were greatest. The New Deal's infant welfare programs helped ease urban poverty. But World War II stimulated the economy and pulled many young men and women into factories and the armed services, thereby easing the strain on the nation's city missions.

As a result, some of the smaller and younger missions permanently closed their doors during the 1940s.

After the war, some of the older city missions continued to serve the homeless and destitute. By the late twentieth century, the city mission movement that had begun as a Protestant evangelical ministry was being complemented by Roman Catholic charities; and by the end of the century, local, state, and federal governments increasingly assumed the task of rescue and rehabilitation at taxpayers' expense and without the Christian religious dimension. To be sure, Christians' efforts to aid the poor did not end in the late 1900s. By the middle of the twentieth century the "main-line" denominations had founded churches in the inner cities with the purpose of offering pastoral care and places of worship for the poor and the newly arrived immigrants. Nevertheless, the rise of the welfare state gradually rivaled but never replaced the charitable efforts of Christians in the inner cities of America.

Civil Religion in the United States

The term *civil religion* comes from the writings of the eighteenth-century French philosopher Jean Jacques Rousseau, although the ideas it denotes are much older and more universal. In writing about the essential ingredients for a successful nation-state, Rousseau suggested that among them would be a shared moral system grounded in some overarching belief in a god whose providence was revealed in the common life of the people. Rousseau recognized that particulars of belief could vary considerably but felt that social cohesion required some sort of religious base to sustain it and to keep a nation viable.

An American Civil Religion?

In the ancient world, glimmers of what Rousseau had in mind come in the biblical Israel where the people believed that God had entered into a special covenant relationship with them at Sinai, a relationship in which they alone were chosen to receive the way to holiness through the keeping of the commandments. Civil religion is also apparent in the Roman Empire, when the Senate designated emperors as gods. Doing so endowed their rule with a transcendent, extraordinary power. Similar forces were at work in traditional Japan, for example, where the ruling family was also granted status as divine as a way to lift political control to a higher plane. Virtually no nation or people has existed who did not in some way regard themselves as a folk set apart from others, as a people whose collective well-being carried a dimension of divine destiny—although at times perhaps the people could fail to live up to the status God had granted them.

Historians and others had long recognized the close ties between religion and national identity in the United States, but the idea that there was a distinctive American civil religion received classic statement in an essay entitled "Civil Religion in America," published by sociologist Robert Bellah in 1967. Bellah insisted that there was a clearly defined civil religion that existed alongside more traditional religion, complete with its own belief system, rituals, and other apparatus. Drawing on frequent references to God or Providence in presidential inaugural addresses and looking to documents such as the Declaration of Independence and the Constitution as sacred texts, Bellah argued that this civil religion looked to divine intervention in key events of

American history, especially wars. Indeed, many of the ritual celebrations he identified had ties to wars, such as Fourth of July events that recalled Americans to their founding ideals fixed in the War for Independence, or Memorial Day happenings that recalled first those who had lost their lives in the War between the States and later all who sacrificed their lives in the service of the nation. As well, Bellah looked to battlefields as pilgrimage sites where the faithful were revitalized in their commitment to the core ideals of the nation. There was even a hymnody associated with this civil religion, including not simply the national anthem but songs ranging from “America the Beautiful” to “God Bless America.” Many of those songs also had originally emerged in times of conflict when national identity was at stake.

Bellah’s claims seemed to many the key to understanding how religion and nationalism or at least religion and American identity were linked to one another. But others questioned whether there was actually a discrete civil religion on a par with other religions, or whether what Bellah observed was more varied dimensions of transcendent or religious meaning layered on to political events. In time, those who probed most deeply would come to question whether even those ties adequately explained the nebulous ways religious meaning became attached to political phenomena, and whether at base they worked to link all Americans to a single sense of national purpose and identity. Before exploring the many challenges to the civil religion hypothesis, however, it is helpful to understand exactly what it seeks to delineate—namely, the many ways in which events in the common life of the American people take on a religious or transcendent quality as interpreters attempt to explain their full meaning and significance—and what forces sustain that understanding from one generation to the next.

Roots of an American Civil Religion

At the time European nations entered an age of conquest and established colonial empires across the globe, ideas of destiny and providence flourished. The Spanish *conquistadores* believed they were executing the will of God in subjugating the indigenous peoples of the New World and forcing them to submit to the Spanish expression of Roman Catholicism. But in the territory within North America that became the United States, English influence was ultimately dominant, and in that age of discovery and colonization England saw itself as a beacon of righteousness, chosen of God and protected by God.

Those ideas penetrated the subconscious of the Puritan settlers who peopled New England in the seventeenth century. In a now well-known sermon preached to the dissenters from the Church of England who were about to establish a foothold in Massachusetts Bay, the early colonial governor and leader John Winthrop spoke of the enterprise as equivalent to building a city on a hill, a biblical image denoting a model civilization that would be a beacon to the world. Others described the Puritan venture as an errand into the wilderness and likened their attempt to create a holy commonwealth to that of ancient Israel. Leaving England in an exodus as the Hebrews had left Egypt, they were journeying through a colonial wilderness as they sought to craft the ideal society in their own promised land. The colonists, like the Hebrews of old, had joined in a covenant with the Almighty and with each other. In this rich mixture of religious language and images with political tasks, elements of a civil religion begin to take shape.

But colonial Puritans moved beyond what Rousseau meant by civil religion’s providing a base for social cohesion and common identity. To be sure, cohesion was central, for they were reluctant to allow those whose vision differed to settle in Massachusetts Bay, lest they contaminate the purity of the ideal society. Yet they also tended to see the hand of Providence in historical and natural events, some as signs of blessing and some as signs of chastisement. For example, earthquakes signaled divine displeasure and resulted in calls to repentance; rulers were to exhibit characteristics based on scriptural models; conflicts with the French and Native American peoples appeared as omens of the ultimate confrontation between the forces of good and evil. The English colonial enterprise was, in the familiar phrase, “God’s new Israel,” and no event was too insignificant to be a medium through which Providence was nudging the people to be faithful to their covenant.

Although popular perception associates the Puritans primarily with New England, much of this thinking permeated the collective subconscious in all areas of English control, particularly because it had roots in an earlier sense of English particularism. Hence, as events moved the colonists towards independence, they carried an overlay of interpretation that fused the political and the religious. From the Stamp Act crisis of 1765 to the Boston Tea Party of 1773, many in the English colonies saw the hand of God at work, steering a righteous people toward independence from a king and parliament given over to iniquity.

The era of the American Revolution or War for Independence became a foundational epoch in crafting a distinctive American civil religion—at least in the eyes of white male colonists who wielded power. The Declaration of Independence and then the Constitution took on the status of a civil scripture, sacred texts that articulated core beliefs in liberty, justice, and equality that would guide all the people, regardless of their European ancestry. It was Providence that crafted this *novus ordo saeculorum* (new order of the ages), making *e pluribus unum* (one out of many)—Latin phrases that still appear on U.S. currency. Few at the time took account of the many who were not part of the one, from white women denied equal rights, to Africans yet held in bondage as property, to indigenous peoples not recognized as citizens. Nonetheless, there was a widespread sense at least among the political and economic elite that the Republic, this experiment in democracy that left behind monarchy and aristocracy, had launched a political order that reflected divine will, with its structures ordered by God to guide the people towards fulfilling their destiny not just in world history but in sacred history. American independence, through the lens of Revolutionary-era civil religion, moved all humanity forward to that day when there would be a new heaven and a new earth.

Hence a lively millennial sensibility and pervasive apocalyptic spirit infused the style of civil religion that took root in the United States. Yale's Ezra Stiles trumpeted how God would bestow great honor and glory on the nation if it remained faithful to the divine will. If not, it would—like the nations of Europe—experience decay. Early on, civic rituals emerged to reinforce this conviction of American uniqueness and righteousness. From liberty poles during the Revolution to celebrations on the Fourth of July, ritual symbols and acts recalled the people to their sacred beginnings. In those celebrations, their commitment to the covenant of liberty became revitalized and the people became empowered anew to live as those chosen by God to be a light to all nations.

Many of these images carried biblical overtones, but none required a theological construction associated with a particular denominational expression of biblical religion, although most Euro-Americans of that age were inclined towards some brand of Protestant Christianity. Even the First Amendment to the Constitution that forbade a national religious establishment and in theory guaranteed to all the free exercise of religion indirectly buttressed the idea that this civil religion was anchored in religious perceptions

common to all and shared by all. It mattered not whether one's personal belief bore the marks of a particular denomination—Episcopal, Presbyterian, Congregational, Baptist, Roman Catholic, Methodist, whatever. Specific doctrinal difference need not divide a people nor keep them from fulfilling their destiny, so long as all affirmed belief in an overarching Providence that informed all doctrines and creeds, even as it determined American destiny. Creed was a matter of opinion that amplified on common belief, and opinion could have many expressions.

Also sustaining this melding of the religious and political in the emerging identity of the nation and its people was the assumption widely held in the later eighteenth century that all the particular expressions of religion, despite their differences, inculcated in followers a basic morality that was essential to the common good. George Washington, who was well on his way to quasi-supernatural status in the popular mind even in his own lifetime, captured this well in his famous “farewell address.” There he asserted that morality could not exist without religion, nor could government endure without morality. This “religion-in-general” was thus indispensable to the well-being of the new nation. Religions could abound; what mattered was how they worked in tandem to create a moral citizenry who trusted in Providence to guide their collective destiny.

That the new nation was headed in the direction Providence intended and desired received fresh witness when revolutionary impulses spread in Europe. For many, the events leading up to the French Revolution, which erupted in full force less than three months after George Washington took the oath of office as the first American president, heralded another chapter in the unfolding drama of God's plan for humanity. Guided by the American spirit, other peoples would follow, and democratic principles of liberty, justice, and equality would gradually begin to prevail throughout the world. Here, too, are glimpses of that larger millennial hope underpinning these dimensions of a civil religion, for history seemed as if it were everywhere beginning to move towards its final culmination, with the United States standing as the beacon lighting the way. For many, though, as the French experience bordered on anarchy and some of its revolutionary leaders embarked on an assault on all religion, and thus by implication on the foundations of the morality essential to the commonweal, excess seemed likely to trump the righteousness America exemplified and threatened to demolish its place as exemplar to the world. In terms of civil religion, the controversy in the United States over whether

to ally with revolutionary France or with a once-misguided Britain brought a significant challenge. After renewed conflict with Britain led to another military outbreak in the War of 1812, the nation began to turn inward. Perhaps the hand of Providence could be discerned moving more in the internal life of the nation than in its efforts to be a model for all peoples.

The Spirit of Civil Religion in Antebellum America

Other dynamics quickly propelled a more intense intertwining of broadly based religious notions with American nationalism that some later analysts would see as evidence of a stratum of civil religion. With the Louisiana Purchase of 1803, the United States embarked on a policy of expansion that most of the founding generation had not envisioned. After the War of 1812 had reaffirmed the righteousness of the American democratic venture, with Providence guiding the fledgling nation to victory, those with an eye to expansion soon looked to Florida and then to territory farther west as regions where American democracy could establish itself. By the 1840s, Jacksonian Democrats especially talked about Manifest Destiny, the idea that God had ordained the United States would one day span the North American continent from the Atlantic to the Pacific. It was the nation's destiny ordained by God, and nothing human could ultimately stand in its path. Indeed, the idea of national destiny echoed the Calvinist theology that undergirded the Puritans, who had embarked upon an earlier errand to subdue a different wilderness.

Manifest Destiny stirred interest, for example, in annexing Texas (then the Lone Star Republic) in 1845, although Mexico still had a historical claim to the territory. It fueled interest in the Oregon Territory, which at the time included much of what is now the Canadian province of British Columbia. An agreement with Britain added some of that land to the nation in 1846. Already California had declared its independence from Mexico, and expansionists enamored of Manifest Destiny simply presumed that this land would join the American empire. Perhaps the most strident calls to heed the desire of Providence that the nation take in more land came as the United States embarked on war with Mexico in 1848. Indeed, there was little military justification for the conflict. The Mexican Cession of 1850, however, served as confirmation for expansionists that God had destined the nation to grow and take control of more land. Providence had blessed the nation through expansion and

reinforced the conviction that a democracy rooted in ideals of liberty, justice, and equality carried divine endorsement.

Of course, it helped that Manifest Destiny and its ties to democratic ideology flourished as antimonarchical sentiment once again swept through Europe in the wake of Napoleon's defeat and then the democratic "revolutions" of the 1850s. A closer look at the American nation, though, would suggest that Manifest Destiny, as other facets of an American civil religion taking shape in the eras of Revolution and the Early Republic, resonated more with the lived experience of a developing white male economic elite whose personal religious perspectives were shaped primarily by a broadly evangelical Protestantism. By the 1830s, sectional division over both slavery and the evolution of an industrial economy suggested a lack of consensus about the foundational values behind American republican democracy and its destiny. Could a nation that allowed some to hold other humans as property, as slaves, exemplify liberty and equality? Was its destiny less to expand from coast to coast than to founder in the quagmire of hypocrisy? Other religious and ethnic conflict, symbolized in the often violent anti-Catholicism that accompanied a surge in Irish immigration between 1830 and 1860, highlighted additional problems in trying to see the hand of Providence at work in national growth. Was liberty reserved for white Protestant males? It seemed increasingly so, especially to those of the ilk of William Lloyd Garrison, a strong antislavery advocate, and rank-and-file Irish pouring into Boston and other northern port cities seeking employment and hoping to make a new life in a land where justice presumably prevailed.

Civil War and the Revitalization of a Civil Religion

For those who probe the idea of an American civil religion, the War between the States from 1861 to 1865 looms large. Even at the time, those who sought to find larger meaning in this national inferno sought to understand it in religious terms that would not undercut the American enterprise altogether. President Abraham Lincoln, whose words have received careful study by a host of scholars, recognized the futility of identifying either the Union or the Confederate cause as the only one endorsed by God. In his mind, neither was faultless; both were misguided in trying to claim God for their side. But Lincoln and others also saw in the sectional conflict opportunities to revitalize a national commitment to the founding ideals of liberty, justice, and equality,

extending them in theory at least to include those once held as slaves, if the American people were willing to commit themselves anew to those principles. New England pastor and theologian Horace Bushnell, speaking at Yale's commencement ceremonies in 1865, used some traditional Christian language in trying to capture this sentiment. Talking about the obligations both North and South had to the hundreds of thousands who had given their lives in the war as well as about the heritage of democratic ideals, Bushnell saw the Civil War as a kind of baptism, albeit a baptism in blood, that reconsecrated the nation and its people to the core beliefs shared by all. War had renewed the national covenant.

The end of military conflict did not necessarily mean the end of sectional division. In one sense, as historian Charles Reagan Wilson has argued, the Southern states developed a regional civil religion that sought to mythologize the antebellum past, elevate Confederate heroes to the level of demigods, and perpetuate white racial superiority in regional culture as racism and discrimination replaced slavery. The Southern agrarian past evoked something of an Eden for those who glorified the "lost cause" of the Confederacy. As aspects of a regional civil religion emerged, antebellum white culture became idealized, with its evangelical Protestantism seen as a pure expression of truth for both individuals and society.

In the industrializing North, racial discrimination also remained the order of the day. But other issues linked to religion and ethnicity prompted many northerners to question whether there was adequate affirmation of values and beliefs associated with a civil religion. More so than for folk in other regions, massive immigration from central, southern, and eastern Europe that swelled the ranks of the Catholic, Jewish, and Eastern Orthodox population seemed to many northerners a threat to the core values of the nation. Because the rapid industrialization that was transforming the nation's economy centered more in the North and its cities, immigrants flocked to urban areas in the hopes of finding jobs and a secure future.

Josiah Strong, one-time executive secretary of the Evangelical Alliance, captured some of the apprehension of northern Protestants about immigration, urbanization, and industrialization in his *Our Country* that first appeared in 1885. Strong argued that God chose Anglo-Saxon Protestants to fashion American democracy and culture in such a way that the nation itself had special status in the divine plan for all history. The moral values instilled by Anglo-Saxon

Protestants had become endangered with the influx of millions of non-Anglo-Saxon Protestant immigrants. To protect the purity of the nation—to buttress elements of a civil religion—it was necessary to convert new immigrants to evangelical Protestantism in order to Americanize them. Strong did not single out a particular Protestant denomination as best suited for this task; in retrospect, the denomination did not matter. What Strong was promoting was in essence the kind of tie between a broadly held but loosely defined set of religious beliefs and an understanding of the nation as a people set apart by God. In other words, Strong saw as vital to social cohesion a kind of civil religion, albeit in this case one with links to a specific religious heritage, namely, Protestant Christianity. As was the case with New England Puritans in the seventeenth century, for Strong in the later nineteenth century, diversity threatened to contaminate the whole culture because it would render any civil religious sensibility dysfunctional.

By the time Strong wrote, public schools had taken hold in American culture. With roots in Massachusetts in the 1830s, public schools became vehicles for the transmission not only of basic learning thought essential to all Americans, but also of the moral values and political ideals associated with American democracy. The now-renowned McGuffey readers, used for generations to instruct public school children, freely mixed theological notions associated with the broad evangelical Protestantism Strong advocated with patriotic and moral virtues associated with American republican democracy. These two features were so intertwined in the primers that Roman Catholic leaders called for a parish or parochial school system where Catholic children, especially immigrant children, might receive basic education and even learn the moral values and responsibilities of citizenship, but without an overtly Protestant stamp. Parochial schools would demonstrate that Catholics could be good citizens without having to abandon their distinctive religious faith and practice.

Confidence that American political institutions and all the apparatus that accompanied them reflected God's design and will for humanity gained fresh reinforcement at the close of the nineteenth century when the United States engaged in the Spanish-American War. William McKinley, president at the time, made the war a religious crusade as well as a military venture when he recalled that it was while he was praying that God revealed to him the necessity of America's entering the war to bring salvation and civilization to heathen peoples. It mattered not that Cubans and

Filipinos, both of whom were for a time incorporated into the expanding American empire, already were overwhelmingly Roman Catholic Christians. McKinley's Anglo-Saxon Protestant vision of the nation and his effort to impose transcendent meaning on the trumped-up conflict with Spain also lay behind a widely publicized speech given by Albert Beveridge, a Republican senator from Indiana at the turn of the century. Beveridge insisted that divine blessing followed the imposition of American control on other peoples, since a morality sanctioned by God had given birth to American institutions. This later quest for empire was Manifest Destiny with all its ties to aspects of civil religion revamped and repackaged for a new day.

Global Conflicts Spur Concerns for Cohesion

The new age of American empire crumbled when World War I erupted. But for the United States, the war became another sign that God had chosen American democracy to influence if not dominate the world. Once again connections between religion and national identity suggest the undercurrents of dimensions of a civil religion. American president Woodrow Wilson, who turned the war from a struggle between fading imperial states in Europe into a quest to impress an American-style democracy on yet more peoples, drew readily on religious language in political speeches that were more sermons than public addresses. The son of a Presbyterian seminary professor, Wilson saw the war through a lens that fused his own Calvinist heritage with a conviction that God ordained and guided American democracy to bring true moral values to all humanity. Once again military engagement was vital to linking religion with national identity. Wilson's style and his sermonic tone help support the claim of Bellah and others that a religious substratum in American life constitutes a civil religion.

So, too, the Second World War took on religious dimensions as Hitler and the Nazi-Fascist Axis became identified with virulent evil and the United States and its allies with righteous goodness. Once again apocalyptic currents informed the ties between a civil religion and national identity, for the defeat of Hitler signaled the triumph of liberty, equality, and justice and thus pointed to a new future for all humanity. Yet this time, the religious euphoria quickly became muted. No sooner had the war come to a close than conflict broke out in Korea; more to the point was the emerging Cold War that pitted God-fearing, capitalist, democratic America against the godless communism epitomized by the Soviet Union and its puppet states.

The Cold War provided much fodder for those who insist there is a distinctive American civil religion. In 1954, for example, Congress added the phrase "under God" to the Pledge of Allegiance to the flag. No doctrinal definitions were provided; getting specific would reveal diversity and dissension. But the symbolic import was obvious: the United States was a nation with God on its side while the Soviet empire lacked divine blessing. So, too, when Congress ordered the phrase "in God we trust" to appear on all coins and currency, not just some of it, another symbol of American righteousness appeared. This mid-1950s move cemented the notion of the United States as a moral and upright nation. The most prominent Christian evangelist of the era, Billy Graham, added to the aura of civil religiosity, proclaiming a nondenominational gospel in arenas and stadiums across the nation and even abroad, insisting that simple faith in God, faith that was never carefully explained or articulated, provided a panacea for all social and personal problems and assured those who believed that they carried God's blessing in this life and beyond. The threat of nuclear annihilation at the hands of an expanding Soviet empire required social cohesion in the United States. Centuries earlier, Rousseau had advanced his notion of civil religion as a key ingredient in sustaining that cohesion. The United States did the same in the 1950s by attempting to use religious language in the public square and to cast the American people as righteous and moral, while acknowledging that individuals could hold a range of personal beliefs.

That connection became a central thesis in several sociological studies that appeared in the 1950s. Will Herberg's study entitled *Protestant, Catholic, Jew* (1955) demonstrated that for most Americans, it made no difference whether one was identified with any of the scores of Protestant groups, Roman Catholicism, or one of the branches of Judaism. People regarded all as equally functional and legitimate ways to inculcate the moral values that undergirded good citizens. Differences in fine-tuning beliefs from a theological perspective remained; such was the character of American religious life. But there was a core consensus that crossed all such boundaries. Herberg did not speak about civil religion as such, although he did insist that there was a religion of the American way of life, one based on capitalist free enterprise economics and its concomitant conspicuous consumption. Herberg regretted the prevalence of this culture religion, thinking that it lacked the prophetic dimension and sense of commitment he thought central to the biblical faiths.

Also in the 1950s, W. Lloyd Warner appraised Memorial Day celebrations held across the nation that were replete with parades and patriotic oratory, noting that they represented an “American sacred ceremony” whose function was to integrate the people into a cohesive whole. In his understanding, Abraham Lincoln, whose Gettysburg Address was frequently quoted at Memorial Day assemblies, became a collective representation of the idealized American. Moving from poverty to the presidency, Lincoln illustrated the popular American dream of what anyone could accomplish if committed to the core values of liberty, justice, and equality.

Forces Undermining an American Civil Religion

Minority voices soon challenged the perception of the United States as a righteous nation knit together and guided by Providence. In the 1950s, the civil rights movement erupted with particular force, reminding Americans of the depth of inequality and injustice that prevailed in a nation where racism was rampant and discrimination legally sanctioned. Civil rights leaders such as Martin Luther King also drew heavily on religious rhetoric to make their case for an end to segregation and racism. In doing so, they demonstrated that whatever dimensions of a civil religion might exist, they did not speak to the lived experience of African Americans. By the 1960s other dissenting voices reminded the nation that women also experienced exclusion, as did gay and lesbian Americans. As concern over U.S. military engagement in Vietnam mounted, those opposed to government policy came to think that political leaders themselves had forgotten the meaning of justice and freedom. To many, the core values of the nation seemed linked only to the lived experience of white males who were part of the nation’s political and economic elite. For millions, the extent of dissent appeared to undercut any sense of cohesion and unity.

This social disarray prompted Robert Bellah to create his mythic understanding of the American past in his seminal essay insisting that there was indeed an American civil religion. But Bellah also recognized that the social unrest of the 1960s and 1970s challenged the social cohesion promoted by this civil religion and threatened to render the civil religion dysfunctional. Hence he wrote a more penetrating study, suggesting that the social movements of that age had led to a “broken covenant” in the nation. At the time, even Bellah did not take note of other cultural transformations under way that would make it increasingly difficult to claim

that there was a single civil religion at the heart of the national experience.

Those shifts resulted in part from changes in U.S. immigration law in 1965 that allowed millions from Asia, the Middle East, Africa, and Latin America to enter the country. Like those of earlier generations, these immigrants brought with them their native religious expressions. But many of these religions were new to the United States, at least in terms of visibility and increasing numbers of adherents, and they were far removed from the biblical traditions that had once dominated and had informed not only Bellah’s understanding of civil religion but also much of the casual connections that gave national experience a religious aura grounded in a broad evangelical Protestant perspective. The numbers of Muslims, Buddhists, Hindus, and Sikhs, for example, began to skyrocket. For them a providential God loosely tied to the biblical tradition, particularly to ancient Israel’s understanding of itself as a chosen people, and who worked in the events of history, was altogether alien. Now there were millions more who were part of the American people but for whom the traditional religious construction of the American past or of the American political order had no meaning whatsoever.

Some, such as evangelical leader Jerry Falwell, looked askance at how immigration and other social changes were transforming the texture of American society. Reviving the genre of the jeremiad, a sermon type developed by the Puritans to bemoan presumed declension in the moral fabric of society, Falwell and others identified with the religious right sought to reclaim an understanding of the nation even narrower than Bellah’s. Only by curtailing developments such as expanding rights for women and for homosexuals, by evangelizing among newer immigrants, and by restoring overt religious practices in the public schools eliminated by Supreme Court decisions in the 1960s could America once again become a moral nation blessed by God. The religious right associated with groups such as the Moral Majority attempted to infuse civil religious discourse with a decidedly conservative Protestant Christian nuance.

Religious language and symbolism also continued to infuse political rhetoric. In the 1980s, President Ronald Reagan, prior to the collapse of the Soviet bloc, repeatedly referred to the communist nations as an “evil empire” in a way that brought Cold War apocalyptic images to mind. Two decades later, President George W. Bush also drew heavily on apocalyptic imagery in describing Iraq before the American invasion and in reflecting on the terrorist attacks

on the World Trade Center in September 2001. Yet efforts to use such language and attempts to revitalize whatever components of a civil religion remained operative in American common life faced increasing challenges by the early twenty-first century, given the expanding religious pluralism and the growing political diversity that had become characteristics of the nation.

Contemporary Challenges to an American Civil Religion

Of course, some critics had long before raised questions not only about whether an American civil religion existed as the kind of religion that Bellah had posited, but also about whether it was a meaningful construct for looking at links between religion and politics. John Wilson, for example, drew on a wealth of historical and sociological materials and interpretations to suggest decades ago that certain features of American common life had religious dimensions and could from time to time function in religious ways. So presidential addresses could have something of a sermonic dimension, and invocation of God in pledges and on coins could represent an effort to endow the American experience with transcendent meaning. However, Wilson insisted that careful scrutiny did not reveal a full-fledged religion at all, but simply what people in many places across time had done in trying to claim divine sanction for policies and programs.

The many prongs of the civil rights movement suggested as well that the civil religion hypothesis had limitations. If it did not speak to the lived history and experience of Native Americans, African Americans, or even women, for whom did it speak? More and more, it seemed as if efforts to invoke a civil religion echoed the experience only of white men of economic and political privilege. The deep angst about the course of American society unleashed by protests against military engagement in Southeast Asia in the 1960s and 1970s was echoed in concerns about war in Iraq and Afghanistan as well as about how best to combat international terrorism. Then, too, the biblical traditions had always anchored the religious ideas encapsulated in the idea of an American civil religion. With religious groups that denied divine action in history or at least construed history very differently than did the biblical traditions, it was harder to assume that a civil religion resonated in any way with the lived religion of increasingly large numbers of Americans. Certainly Americans identified with one of the many strands of Buddhism, for example, would look at history very differently and tend not to see it as the stage on which

Providence was working out a great cosmic scheme for humanity.

Yet the idea of civil religion remains important, even if it is tentative at best. It suggests that Americans, as every people, seek to give larger meaning to their corporate national experience. It signals that Americans struggle to unite diverse peoples within a framework of common values such as liberty, justice, and equality, even while nurturing an extraordinarily wide range of particular religious beliefs and practices. Finally, the notion of civil religion serves to remind Americans that much yet remains to be done if all the diverse peoples who call the United States their homeland are to be united in a cohesive whole.

Civil War

The Civil War (1861–1865) pitted the Northern United States against the Southern Confederate States of America. The bloodiest war in U.S. history, the military conflict cost approximately 620,000 soldiers and 50,000 civilians their lives. The war's political outcomes included the preservation

of the national union and the emancipation of about four million African American slaves, but the Civil War also represented a signal moment in American religious life. Nineteenth-century American public life was infused with a high degree of religious rhetoric, particularly that of evangelical Protestantism. Religion played a prominent role in the rending of the national union, and both the Union and the Confederacy went to war with the sanction of leading ministers in each section, assured that the Christian God had ordained their cause.

Theological Crisis over Slavery

A devout nation went to war in 1861. A year prior, somewhere between one-third and two-fifths of the American population claimed church membership, with at least double that number regularly participating in church-related activities. While American religion contained a noticeable degree of diversity, the social and political discourse of evangelical Protestantism dominated the landscape. The nation's three most populous denominations, Methodists, Baptists, and Presbyterians, all evangelical in style, accounted for approximately 67 percent of all existing churches, about 63 percent of church seating capacity (which could accommodate roughly 38 percent of the American population at any one time), and nearly 45 percent of the value of all church property. By no means did these three denominations represent all—or the only—evangelicals in antebellum America. Congregationalists, Restorationists, and some Lutherans and Episcopalians exhibited evangelical traits. More than ten million Americans—roughly 40 percent of the 1850 population—identified in some way with evangelicalism.

While antebellum evangelicals enjoyed unprecedented cultural power and authority, their seemingly broad consensus masked deep divisions. No issue was more divisive than slavery. At the core of evangelical belief rested a commitment to the primacy of the Bible as the divinely inspired, authoritative guide for the shaping of Christian life and practice. Moreover, evangelicals shared a common method of biblical interpretation. Emphasizing a literalist hermeneutic—inherited from the Reformed theological tradition, influenced by the common sense moral reasoning of the Scottish Enlightenment, and steeped in the American principle of democratic individualism—American evangelicals believed the Bible to be an eminently readable book that contained easily understandable, God-given teachings that applied to all people at all times. When forced to deal with

the morality of American slavery, that literalist method of biblical interpretation led to a theological crisis.

Key passages in both the Old and New Testaments suggested the Holy Writ sanctioned slavery. Southern proslavery divines made much of the biblical warrant for slavery, but many ostensibly antislavery ministers in the North also conceded the biblical imprimatur for slavery. Still, such concessions did not mean that antislavery clergy accepted the pro-slavery biblical argument. While some antislavery activists argued from a radical perspective that a higher human law demanded the Bible be rejected for its endorsement of slavery, more moderate antislavery religious voices held to biblical authority yet attempted to show how the slavery in scripture differed greatly from American slavery. Not only did the American system refuse to recognize such biblical concepts as the Jubilee Year—in Mosaic law, all slaves were set free every seven years—or allow for marriage between slaves but, most significantly, biblical slavery also was not based on racial difference. American slavery clearly was, though few white evangelicals questioned the racist foundations of their society. Thus, antebellum American evangelicals grew deeply divided over the slavery question. Two factions emerged, more or less divided sectionally, both claiming to read the Bible the same way and denouncing the other as sinful.

Antebellum Church Schisms

The crisis over slavery fractured the nation's three most populous denominations. That religious fracture anticipated and fomented the national fracture that would come in the Civil War. The Presbyterians were the first to divide. In 1837 an "Old School" majority of the Presbyterian General Assembly voted to remove four "New School" synods located in New York and Ohio. The New School was accused of deviating from the denomination's stricter Calvinist roots, embracing more liberal revivalist doctrines, and advocating forms of interdenominational cooperation that modified traditional church polity. While the slavery question was not the primary issue at stake, it was a very closely related secondary matter. Much of the abolitionist agitation in Presbyterian circles came from New School ranks. There was little doubt that the South's presbyteries, overwhelmingly populated with conservatives, supported the Old School on theological grounds. However, following the Old School also gave southerners a chance to rid the denomination of abolitionist influence. The following year,

in 1838, a newly formed New School General Assembly claimed roughly 100,000 members, 85 presbyteries, and 1,200 churches, significantly less than the Old School's approximately 127,000 members, 96 presbyteries, and 1,763 churches.

The Presbyterian schism of 1837–1838 could not have happened without southern support for the Old School, but the divisions were not clearly sectional. A few southern presbyteries initially joined the New School, but in the next decade, agitation over slavery proved too much stress for the denomination. In 1857 the New School condemned slaveholding as sinful, prompting twenty-one southern and border state presbyteries—containing approximately fifteen thousand members—to leave the denomination, making the New School a wholly northern denomination. At the same time, an uneasy peace prevailed in the Old School until the start of the Civil War. Then, in 1861, when the General Assembly passed a staunchly Unionist and antislavery platform, southern Presbyterians—most of whom had not attended the General Assembly—responded by creating the Presbyterian Church in the Confederate States of America.

Among Methodists and Baptists, the divisions were more clearly sectional and more obviously about slavery. For Methodists, the issue had loomed large for several years, but it proved ultimately divisive in an 1844 debate about qualifications for bishops. James O. Andrew, bishop of Georgia, had acquired slaves through marriage and inheritance. The national General Conference instructed Andrew to free his slaves, arguing that bishops should not be slaveholders. After much southern protest and debate, the denomination agreed to divide along sectional lines. In 1845, the Methodist Episcopal Church, South, was created.

Baptist schism over slavery occurred almost concurrently. Abolitionism rose throughout the 1830s among northern Baptists, culminating with the 1840 American Baptist Anti-Slavery Convention in New York City. That meeting produced a treatise that denounced slavery as sin and called on southern slave-holding Baptists to repent and free their slaves or risk being cut off from fellowship. For the next few years, the issue came up repeatedly in Baptist meetings. It finally came to a head in the fall of 1844 when a group of Alabama Baptists pressed the General Convention for a ruling on whether slaveholders could serve as missionaries. The denomination's "acting board," located in Boston, answered that they could not appoint such a missionary. Baptists from

around the South responded in May 1845 by creating the Southern Baptist Convention.

Religion, Politics, and Society

Northern and Southern Protestants did not divide solely on how they read slavery in the Bible. They also divided on how they saw God's relationship to American society and the closely linked matter of the relationship between religion and politics. In the 1820s and 1830s the North experienced a wave of revivals. Led by famous evangelists such as Charles Finney (1792–1875), northern evangelicals came to believe that the society around them needed to be perfected through social reform, which would serve to bring about the kingdom of God on earth. At the same time, the North was steeped in the centuries-old Puritan notion of the United States as a covenanted nation like biblical Israel, a people chosen by God for a special purpose in the world. By the late antebellum years, northern Protestants came to believe key social reforms—such as the eradication of slavery—could be best achieved through political activism, particularly through the work of the antislavery Republican Party. As such, the political work of eradicating slavery gained a righteous stamp of approval. From a late antebellum northern religious viewpoint, the pro-slavery South, which stood in the way of the advancing kingdom of God, represented an enemy to be defeated. As armies prepared for war, Protestant ministers throughout the North overwhelmingly supported the Union effort and saw the war as a necessary "American Apocalypse" that would ultimately launch the Christian millennium.

Southern Protestants also came to believe that the Christian God sanctioned their section and, eventually, the Confederate nation. Unlike their counterparts in the North, however, such a view was a departure from historic patterns. For at least a century, dating to the colonial era, Southern evangelicals remained detached from direct political engagement, believing the church a purely spiritual institution that should not meddle with the purely secular affairs of state. This pervasive Southern Protestant doctrine, which achieved its fullest articulation among Southern Presbyterians as the "spirituality of the church," argued that the church's proper role was to aid in the saving of souls and the cultivating of individual piety, not to work for the perfection of society at large.

However, with the rise of more aggressive antislavery activism in the 1830s and the attacks on Southern society

that followed, Southern Protestants became increasingly political. Slavery, the bedrock of antebellum white Southern society, was ordained of God. It was not the South that had erred, but the North, which Southerners believed ignored the plain teaching of the Bible about slavery.

The election of Abraham Lincoln (1809–1865) to the U.S. presidency in November 1860 proved decisive in securing Southern religious support for the Confederacy. Southerners convinced of the righteousness of slavery came to believe that an abolitionist conspiracy had taken over the American government. When the Confederacy ratified its constitution in March 1861, in sharp contrast to the U.S. Constitution, the Southern document signaled to all readers that the new nation was “invoking the favor and guidance of Almighty God.” Like the North, the people of the South developed the belief that they were a chosen people who participated in a covenant relationship with God. From a Southern religious perspective, the Confederate cause—and war in its name—was a Christian one.

If the Confederate sense of Christian nationhood led Southerners to war convinced of their collective righteousness, God’s plan for the South also meant that the nation had to live up to Christian standards. On the eve of the sectional crisis, and then throughout the war, Confederates participated in regular “fast days,” ritual observances where ministers—like Old Testament prophets—called upon the nation to repent for its national sins and follow the Christian God. Fast days were also called regularly in the North during the conflict. In that section, they had been something of a regular occurrence dating to Puritan New England. For the South, however, like political preaching more generally, the tradition was much newer. Confederate President Jefferson Davis (1808–1889) called for no less than nine official fast days, and many others were called at the state and local levels. Since slavery was the core institution in the Christian South, fast day sermons often called on white Christian masters to realize the divine trust they had been given. They needed to bring the institution into conformity with biblical standards, making it more charitable, more benevolent, and more humane, or risk divine judgment at the hands of their oppressors—the heretical, abolitionist Union. War was God’s way of testing his people.

Chaplains

Many people in the North and South believed a chaplain system was necessary for good Christian armies and the sustaining of morale in the ranks. Prior to the war, the

chaplaincy was relatively small and weak in the American military. In the Civil War, the system expanded greatly, and it has remained a fixture in the U.S. military ever since.

Union and Confederate chaplains both fulfilled one primary duty: they held regular religious services for soldiers. To be sure, chaplains also assisted in hospitals, wrote letters for soldiers, taught classes, delivered mail, carried supplies, and more, but in the main they existed to provide spiritual care. Throughout the war, on both sides, chaplains were in short supply and often complained of unreasonable treatment. In the Union, they earned \$145 per month—equivalent to a cavalry captain—but they received private’s rations and no forage for their horses. They were not officially accorded officer status until 1864. In mid-1862, Union chaplains began to receive officer’s rations and forage but had their salary cut to \$100 a month. In the Confederacy, chaplains were paid \$80 a month, and they were not allotted uniforms, supplies, a horse, forage, or rations (though they were eventually allowed private’s rations).

Hundreds of clergy, both South and North, found their skills best put to use as regular soldiers or officers rather than chaplains. Such was the case for, among others, Leonidas Polk (1806–1864), the Episcopal bishop of Louisiana who became a Confederate lieutenant general; Robert Lewis Dabney (1820–1898), a noted Presbyterian divine who served as chaplain for Confederate general Thomas J. “Stonewall” Jackson (1824–1863)—also a devout Presbyterian—before becoming a staff officer; and John Eaton Jr. (1829–1906), an ordained Presbyterian minister who began the war as a Union chaplain, became a colonel over an African American regiment in 1863, and was then appointed by General Ulysses S. Grant (1822–1885) as superintendent of Negro affairs in Tennessee, foreshadowing the duties undertaken later by the Freedmen’s Bureau.

Over the course of the war, approximately 2,300 chaplains served in Union ranks, though no more than 600 ever served at once. Chaplains had long served in the U.S. military, but prior to the war, with a much smaller military, the peacetime number had been capped at 30 men. President Abraham Lincoln believed strongly in the importance and utility of the chaplaincy, seeing religion as cohesive and a morale-building agent. On May 4, 1861, the Union War Department issued orders that provided for the large-scale expansion of the chaplaincy so that each regiment might have spiritual guidance—though that goal was never fully realized.

Initially, federal orders only allowed for ordained Christian ministers to serve as chaplains, the expectation being

that chaplains would primarily come from Protestant denominations. Within a year, however, concerns arose about chaplains' lacking proper qualifications for service. In July 1862, Congress responded to the issue by revising the terms of the office to provide for more rigorous standards. These revisions also opened the chaplaincy to clergy from any religious background. Theoretically, it became possible for non-Christian chaplains to serve, but in fact only one Jewish rabbi filled the post (along with one nonordained Jew who had served illegally in 1861). Indeed, representation from non-Protestant traditions proved minimal. Approximately 200,000 soldiers, about 10 percent of the Union army, were Catholic, but only 3 percent of all chaplains were Catholic priests. Overwhelmingly, Methodists provided the largest number of Union chaplains (38 percent), followed by Presbyterians (17 percent), Baptists (12 percent), Episcopalians (10 percent), Congregationalists (9 percent), Unitarian/Universalists (4 percent), and Lutherans (2 percent). African Americans were not permitted to serve as chaplains until 1863. After that date, 14 served, the most prominent of whom was Henry McNeal Turner (1834–1915), a future bishop in the African Methodist Episcopal Church.

The Confederacy (or Confederate States of America, the C.S.A.) did not develop nearly as organized or expansive a chaplaincy as the Union. Over the course of the war, 938 chaplains—14 percent of all Southern clergy—served the Southern cause. Almost half were Methodists (47 percent), but Presbyterians (18 percent), Baptists (16 percent), Episcopalians (10 percent), and Catholics (3 percent) were also represented. In May 1861, the Confederate Congress authorized the creation of a chaplaincy but allowed chaplains few benefits and offered little guidance about formal duties. Confederate President Jefferson Davis and Secretary of War James Seddon (1815–1880), who saw chaplains as inconsequential to military efforts, offered little support for the office. The Confederacy had been created in rebellion against the centralized power of the U.S. government; the C.S.A. simply did not have an efficient bureaucracy for the organizing of chaplains, which Southern leaders saw as tangential to their primary military aims. Moreover, due to a long-standing Southern Protestant commitment to the separation of church and state, many Southerners opposed the creation of military offices for clergy. Because of the widely held “spirituality of the church” view, many Southerners maintained that religious bodies, not the secular government, should provide for soldiers' spiritual care. As a result, the

Confederacy's chaplains, while often visible and prominent members of the military, suffered from an ambiguous status.

Charitable Organizations

In addition to the formal military structure of the chaplaincy, numerous charitable civilian organizations emerged to support the war effort. In most cases, these supporting organizations drew from deep religious roots. An 1864 study estimated that in the Union alone, to that date, approximately \$212 million had been raised to support Civil War philanthropy. While charitable societies existed in virtually every town, one of the most visible organizations was the United States Christian Commission. Founded in November 1861 by members of the New York Young Men's Christian Association and led by Philadelphia Presbyterian layman George H. Stuart (1816–1890), the Christian Commission organized roughly five thousand volunteers from a wide variety of evangelical denominations. The Christian Commission offered general support to the armies by visiting sick and wounded soldiers, assisting surgeons, writing letters for soldiers, presiding at revival meetings, sponsoring chaplains, and running soup kitchens to supplement soldiers' diets. It is estimated that the Christian Commission received and distributed more than \$6 million along with roughly 1.5 million Bibles, 1 million hymnals, and 39 million tracts among Union ranks.

The United States Sanitary Commission was similarly visible in the Union war effort. Founded in July 1861 following a meeting of the New York City-based Women's Central Association of Relief and led by Unitarian Henry W. Bellows (1814–1882), the Sanitary Commission drew from a liberal Protestant emphasis on humanitarianism. It worked to regulate medical standards, distributed needed supplies to military surgeons, and provided donated food and clothing for soldiers. Over the course of the war, the Sanitary Commission raised an estimated \$25 million and helped to drastically lower the rate of disease in Union ranks.

Relief for freedpeople also constituted one of the primary outlets for civilian charity. Devoted primarily to providing educational opportunities for former slaves, by the end of the war, nearly one thousand teachers from variety of organizations were serving freedpeople. The most prominent freedpeople's relief organization was the evangelically minded American Missionary Association (AMA). Founded in 1846 and devoted to abolition of slavery, by 1865 the AMA had 320 workers operating schools for former slaves in every Southern state and almost every major Southern

city. Within the next decade their ranks would swell to the thousands, and they assisted in the opening of several hundred schools along with a number of Southern colleges—such as Fisk, Atlanta, Dillard, and Howard—for freedpeople.

In the Confederacy, civilian aid tended to be offered at a more local level, but soldiers and ladies aid societies existed in nearly every Southern town. Leading the way among broader religious relief efforts was the Evangelical Tract Society of the Confederacy, which became a primary dispenser of print among Southern soldiers. Organized in July 1861 in Petersburg, Virginia, it produced an estimated one hundred tracts and fifty million pages of print over the course of the Civil War. One of its primary outlets was the *Army and Navy Messenger*, a newspaper that circulated to soldiers. Several other significant newspapers were sponsored by denominations, including the Baptist *Soldier's Friend* (Atlanta), the Presbyterian *Soldier's Visitor* (Richmond), and the Methodist *Soldier's Paper* (Richmond). These organs collectively encouraged soldiers fighting for what they saw as a Christian cause.

Revivals

The course and progress of the war surprised both the Union and Confederacy. Neither side expected the war to take more than a few months, nor did they expect much bloodshed. By the end of 1862, it was clear that those expectations were misguided. On April 6 and 7 of that year, the Battle of Shiloh, in western Tennessee, claimed more than twenty-three thousand casualties. To date, it was the bloodiest battle in American history. Just a few months later, on September 17, Union and Confederate armies matched Shiloh's casualties in a single day. In what remains the bloodiest day in American military history, Confederate general Robert E. Lee's (1807–1870) Army of Northern Virginia battled Union general George B. McClellan's (1826–1885) Army of the Potomac at Antietam Creek near Sharpsburg, Maryland, resulting in roughly twenty-three thousand casualties.

Such catastrophic losses—and the knowledge that the war would not be ending in the near future—led many soldiers to look for religious meaning in the conflict. Drawing on a long nineteenth-century tradition of revivalism, including the recent “businessman's revival” of 1857–1858—which primarily spread through the urban centers of the North—Union soldiers stationed in Washington, Chicago, and St. Louis experienced waves of heightened

religiosity in 1862. It was not until the next year, 1863, that revivals had their most lasting impact among Union ranks. After significant victories in the siege of Vicksburg (May 18–July 4; nineteen thousand casualties) and the battle at Gettysburg (July 1–3; fifty-one thousand casualties), the Union army was dealt a serious defeat in September at Chickamauga Creek, near Chattanooga, Tennessee. The three-day battle was costly, with thirty-four thousand casualties, and the Union army was forced to retreat to Chattanooga while Confederates held highlands around the city and settled into a siege. As soldiers waited for General Ulysses S. Grant to come and take over command of the army, Union ranks became infused with heightened Christian fervor as soldiers implored God for their deliverance. Then, in late November, when Grant's army won the battle of Chattanooga by unexpectedly running Confederate forces off of their high position—a development that many contemporary observers saw as a miraculous show of divine favor for the Union—soldiers in the ranks became more sure of God's will for the Union. In the winter of 1863–1864, Grant's army camped nearby at Ringgold, Georgia. There, the revival continued among the soldiers, with hundreds baptized in the Chickamauga. The revivals of 1863–1864 strengthened Union resolve, improved morale, and prepared soldiers for the immense amount of bloodshed to come in the next year. For Union troops, revivals seemed linked to military fortunes as well as the promise of nearly certain death. As the army drew closer to victory but the battles grew more fierce—as in the case of 1864's Overland Campaign, which claimed one hundred thousand casualties—revivalism grew more prevalent among soldiers.

Among Confederate ranks, revivals followed a trajectory similar to those in the Union. Periodic revivals spread throughout the Confederate army in 1862 and 1863. Then, following Gettysburg and Vicksburg, revivalism seemed to become a constant fixture for the next several months. The Confederate religious press regularly made mention of revivals in the camp throughout the latter half of 1863 and into 1864. In that time in the Army of Northern Virginia, about seven thousand soldiers (roughly 10 percent of Lee's force) converted to Christianity, and thirty-two of thirty-eight brigades felt some effect of what participants called the “Great Revival.” In the Army of Tennessee, a reported eleven of twenty-eight brigades were touched by revival during the Chickamauga-Chattanooga campaign. Then, as they wintered in Dalton, Georgia—near the Union troops who were experiencing their own revival in Ringgold—the

revival continued into the spring of 1864. As was the case for Union soldiers, revival sustained Confederates and encouraged them to continue the fight, though for different reasons. Where Northern soldiers experienced victories, Confederates sensed imminent defeat. Yet convinced they served a just God who ordered the universe, Confederate soldiers still believed they had done right in the eyes of the Lord. If God's will required that the Confederacy be defeated, they could face death assured of the righteousness of their cause. In this way, both in North and South, the revivals that began in 1862 and reached their full flourishing in the winter of 1863–1864 contributed considerably to the prolonging of the war.

An estimated one hundred thousand Confederate soldiers converted to Christianity during the war. At least that number, but perhaps as many as two hundred thousand, converted in Union ranks. The experience of revival was relatively similar for soldiers on both sides. Following patterns established decades earlier in American religious history, revivals were a democratic affair. While chaplains and representatives of voluntary organizations aided revivals whenever and wherever possible, neither was ubiquitous enough in camps to provide consistent religious leadership. As such, it was the common soldiers themselves who drove revivals, with much emphasis placed on individual experience and little authority ceded to educated clergy.

Revivals in the camp were also a conspicuously masculine affair, differing greatly from the prior history of American evangelical experience. Throughout the nineteenth century and into the late antebellum period, the common assumption was that church and expressions of piety were particularly feminine in nature. Men were certainly active religious actors, but such expressions of devotion tended to be seen as reserved for women. Revivals in the camp fundamentally changed such views. As large groups of Civil War soldiers responded to gospel messages, their experiences recast evangelicalism and revivalism as masculine in nature. While there were certainly many, many soldiers who remained untouched by revivalist fervor, those who experienced revival often looked at their fellow men as Christian brothers, fit to serve one another in battle.

Women and the Home Front

As religious gender norms changed for men serving in Civil War armies, so they also changed for women on the home front. Military ranks were closed to women in the Union and Confederacy, but religious activism offered

opportunities for service and access to the world of politics. Not only were they the primary movers behind civilian relief efforts but, with an overwhelming number of men away from home, women also became heads of households. Moreover, as numerous churches had to close their doors due to lack of a minister or enough congregants or local military action, women stepped into new leadership roles in their religious communities.

These realities were particularly acute in the Confederacy. The Civil War brought massive destruction to the South, where all the battles other than Gettysburg took place. The toll on Southern religious life was particularly noticeable. Many overarching religious bodies, such as presbyteries, synods, conferences, and conventions had to suspend regularly scheduled meetings due to local military conflict. In other cases, when organizations opted to convene, representation was so thin that quorums could not be gathered. At the local level, many churches had to shut their doors to regular worshippers. In this religious environment, women on the home front worked to provide consistent religious support for those around them, holding prayer and reading groups at private homes. In the process, the site of religious community shifted from the public church to the domestic home.

That change in practice spoke to a larger change that occurred ideologically among religious Confederate women. At the outset of the war they believed that God was on their side and behind their cause. As the war progressed and the tide turned against the Confederacy, its devout women believed their new nation's suffering—like the biblical case of Job—was sent by God as a test designed to strengthen their faith. As the numbers of Confederate dead grew, devout Southern women found themselves suffering on an individual, psychological level. Over time, the loss of loved ones reminded religious women of their own mortality and enabled them to face death without fear. At the same time, however, it also led them to question the religious wisdom they had been taught about the nature of properly Christian social order. It was widely believed in the antebellum white South that God had ordained a system of paternalism and patriarchy that ensured proper relationships in human society. From God almighty, power was extended to white men, who were to exercise benevolent authority over women, children, and black slave dependents. The Civil War, however, caused Southern women to question that entire arrangement. Following God's will and embracing the Confederacy had only brought pain and loss to women at home.

Southern women did not abandon their faith en masse at the end of the war, but their understanding of gender roles, shaped by their experience over the previous four years, had changed to allow for a greater degree of religious autonomy.

African Americans and Emancipation

Slavery's end came with the Emancipation Proclamation (1863)—which declared slaves in conquered territories free—and the postwar Thirteenth Amendment (1865), which banned involuntary servitude in the United States (the border slave states of Missouri, Kentucky, Maryland, and Delaware, which had never joined the Confederacy, were not bound by the Emancipation Proclamation). These legal changes, which freed approximately four million slaves, launched a revolution in American religious life.

Like whites in the North and South who read Providence into their war effort, African Americans also saw the hand of God at work. However, blacks interpreted the war differently. Like the biblical Hebrews who had been liberated from Egyptian slavery in the Exodus narrative, American blacks had been liberated from the oppression of white masters. When former slaves were given the chance to seize their own religious destiny, apart from white influence, they took it. Autonomous black churches had existed in the North since the late eighteenth century, but in the South most slaves worshipped with whites in biracial churches and were relegated to second-class seating. While those antebellum biracial churches had often provided Southern blacks the only public space where they could speak with authority among whites, their postemancipation actions demonstrated clearly that they no longer wished to practice a religion dictated by their former masters. Almost immediately after the war, a significant percentage of former slaves moved to black denominations, either newly created or linked to those already existing in the North. The Methodist Episcopal Church, South, for example, counted 207,766 African American members in 1860. In 1866, that number dropped to 78,742 members.

The War's Religious Legacy

On April 9, 1865, Robert E. Lee surrendered to Ulysses S. Grant at Appomattox Courthouse in Virginia, confirming Confederate defeat and bringing an end to the war. Though the military conflict ended, the religious divisions between North and South persisted well beyond the war. In President Abraham Lincoln's Second Inaugural Address, delivered on

March 4, just a month prior to Confederate surrender, he perceptively surmised the religious stakes of the conflict, famously stating, "Both read the same Bible and pray to the same God, and each invokes His aid against the other." Lincoln was never baptized, nor did he ever join a church. Yet in his Second Inaugural, Lincoln suggested that neither Union nor Confederate Christians had clearly understood the work of Providence in the Civil War. In so doing, the president sought to repair the deep religious divide that had broken the nation years before.

Most religious Americans, however, stuck to the beliefs they maintained throughout the conflict. Union victory convinced Northerners that they had been right and uniquely blessed by God. The defeated South needed to repent for the division it had brought to the nation and its religious life. The Northern branches of denominations that split before the war refused to consider religious reunion afterward, without Southern confessions for the sins of slave-holding and disunion. That was not something white Southerners were prepared to do in the immediate aftermath of the war. (Methodists did not reunite until 1939, Presbyterians waited until 1983, and Baptists never repaired their schism.) Like Northerners, white Southerners retained their belief in the righteousness of their section and the divine sanction for slave-holding. Although slavery no longer existed legally, the inherent racism of the pro-slavery argument remained quite visible in the creation of a segregationist social order that relegated former slaves to secondary status. Former Confederates did their best to return the South to the antebellum status quo. As such, the theological crisis that had paved the way for the Civil War was never truly resolved.

At the same time, the inability to resolve that theological crisis led to a diminished role for clergy—and organized evangelical religion more broadly—in American society. The language of religion did not disappear from American public life as a result of the Civil War. Rather, it contributed to forging a civic faith, or "civil religion," devoted first to the causes of the nation. In the name of patriotism, American civil religion invented its own sacred days—such as Thanksgiving, celebrated annually in the North from 1863, when Abraham Lincoln called for a national day of Thanksgiving, and finally declared a federal holiday in 1939 by President Franklin D. Roosevelt (1882–1945). Civil religion also sacralized key texts in the national mythology, such as Lincoln's Gettysburg Address (1863) and Second Inaugural (1865). Moreover, civil religion also enshrined memories of

its national saints in monuments, as was the case of the Lincoln Memorial, erected in 1922 to mark the legacy of a president martyred in the name of preserving the nation and ending slavery.

The South developed its own form of a civil religion in the “religion of the Lost Cause,” which developed from 1865 into the early twentieth century. It had its own rituals, which reminded white Southerners of the righteousness of slavery and the supremacy of their race. In contrast to holidays that celebrated the Union—Thanksgiving and Independence Day, for example, were not regularly observed in the South until long after the Civil War—there were days set aside annually to remember Southern sacrifice, such as Confederate Memorial Day, begun in 1866 and held every June 3. Monuments to Confederate dead sprang up throughout the South, and famous Confederate leaders were enshrined in stained glass windows in Southern churches. Regiments of soldiers gathered annually for sermons on the sectional crisis, and when a Confederate veteran died, strict guidelines regulated the funeral service. Groups like the United Daughters of the Confederacy (founded 1894) and the Sons of Confederate Veterans (founded 1896) organized to preserve Confederate memory. The Ku Klux Klan, perhaps the most notorious racist terrorist organization in American history, was created in 1866 by former Confederate general Nathan Bedford Forrest (1821–1877) and claimed to be preserving a Southern Christian legacy. While none of these forms of memorialization came from a deeply theological foundation, they all drew from religious roots and spoke to the ways religious ideas about the Civil War persisted long after the fighting ceased.

Common Sense Realism

Common sense realism is a philosophical position that affirms the reality of the objects of our senses and the legitimacy of our knowledge of them. To nonphilosophers this might hardly seem to need affirmation, but in the history of philosophy it has been a controversial assertion, and indeed sometimes even treated with scorn. Nevertheless, common sense realism has been, and still remains, important in the history of American Christian intellectual life.

Origins: Thomas Reid and the Scottish Enlightenment

Common sense realism arose in reaction against the philosophy known as British empiricism, developed in the late seventeenth and eighteenth centuries by John Locke (1632–1704), George Berkeley (1685–1753), and David Hume (1711–1776). Locke taught that our minds only know “ideas,” that is, sensory perceptions, not the external world that provokes them. Berkeley drew the conclusion that nothing really exists except that which perceives or is perceived. What keeps objects in existence when no one is looking? Berkeley, a bishop, had an answer: God perceived them. But Hume took Berkeley’s metaphysical idealism to drastically skeptical conclusions. If all we know is a stream of

sense impressions, then the outside world is only a fiction. True, in everyday life we cannot help believing that there is an outside world, Hume admitted, but this belief is merely a psychological necessity, not *philosophically* justified. There were no arguments that justified faith in God, Hume claimed; indeed, even belief in causality was merely a custom, and not rigorously justifiable. A person could not be sure that memories represented events that had actually happened, and so did not truly know (in a rigorous sense) that she or he was the same person from one moment to the next. To these disturbing assertions, the metaphysical realism of common sense proposed a rebuttal.

Common sense realism first appeared in Scotland. Hume was a Scot, and his fellow countrymen felt most strongly the urge to find an answer to his skepticism. The original definitive formulation of common sense realism came from Thomas Reid (1710–1796), professor first at the University of Aberdeen and after 1764 at the University of Glasgow. In that year Reid published *An Inquiry into the Human Mind, on the Principles of Common Sense*. In 1785 he completed his *Essays on the Intellectual Powers of Man*.

Reid went back to the first epistemological principle of the British empiricists and challenged it. The objects of knowledge, he insisted, were not ideas in the mind, but sensible things in themselves. He found Locke's notion of representational ideas not only superfluous but a barrier to understanding. The human mind included certain built-in constituents of consciousness that Reid called "common sense." These were fundamental principles of knowledge. They included the axioms of mathematics and logic, belief in causality, trust in our own senses and memory, and belief that other people too exist and that their testimony is entitled to some credence. In sum, they provided the rebuttal to Humean skepticism. A Presbyterian clergyman, Reid accepted the principle that God is no deceiver, so the faculties he has given us are entitled to reliance. The proper task of philosophy, according to Reid, was to accept and deal with the data of experience—not to challenge their validity. Reid and his disciples saw themselves as Baconians, respecting evidence. The validity of inductive reasoning constituted part of their definition of common sense.

Reid termed his basic principles "common" not because they were merely ordinary but because everyone shared them. The word *common* was a powerful one, used for the common law, the common land of a village, the common weal, and the *Book of Common Prayer*. A commoner was a citizen, with a voice in the common affairs, represented in

the House of Commons. Reid declared his principles to be "sense" because he considered them rational, as one might speak of "a man of sense." Jane Austen used the word this way when she distinguished between "sense" and "sensibility." Thomas Paine called his great polemic against the British monarchy on behalf of American independence *Common Sense*.

Reid's philosophy of common sense realism figured prominently in the flowering of the Scottish Enlightenment. Reid belonged to the "Moderate" wing of the established Church of Scotland (the Presbyterian Church), a party eager to synthesize Christianity with the Enlightenment. Opposing the Moderates were the Popular, or Evangelical, party, who insisted on a stricter adherence to Calvinism and a more austere lifestyle. These ecclesiastical parties would remain significant in the history of the Presbyterian Church in the United States, recipient of many Scottish influences. Common sense realism demonstrated its strength by appealing to thinkers in both camps.

The impressive roster of famous intellectuals in the Scottish Enlightenment includes Adam Smith, Francis Hutcheson, Hugh Blair, Lord Kames, William Robertson, Adam Ferguson, and the philosopher who transmitted Reid's work to nineteenth-century Britain and America, Dugald Stewart (1753–1828). Out of the work of these thinkers developed much of the social science, history, and cultural studies of later generations. The Scottish Enlightenment had a large and multifaceted influence on the American Enlightenment, partly as a result of the institutional example of the Scottish universities on American higher education. The philosophy of common sense realism permeated these intellectual developments.

Reasons for Widespread Influence

To appreciate why Reid's ideas exerted such widespread influence, we need to understand the scope of moral philosophy in the eighteenth and nineteenth centuries. Reid succeeded to the chair of moral philosophy at the University of Glasgow upon the departure of Adam Smith. The discipline of moral philosophy as then defined included, along with what we call ethical theory, epistemology and metaphysics on the one hand and, on the other, all of what we consider the social sciences: psychology, sociology, anthropology, and political science. The problem of how we know what is right was thus considered in the context of how we have other kinds of knowledge. The social sciences gained inclusion as illustrations of applied morality. To us it seems an

anomaly that Adam Smith wrote both *The Theory of Moral Sentiments* and *The Wealth of Nations*. To his contemporaries, he simply addressed two facets of his assigned subject.

Because moral philosophy addressed not only ethics but also epistemology and the empirical sciences of human behavior, the word *moral* could be applied not only to ethical matters but also to inductive knowledge, as opposed to deductive conclusions. “Moral evidence” meant empirical evidence. From this usage, now obsolete, we retain the expression “moral certainty.”

Reid addressed the epistemology of morality in his *Essays on the Active Powers of Man* (1788). Reid believed in a rational moral sense, analogous to the common sense that structured our knowledge of sensory objects. The moral sense intuited principles of morality, such as that promises should be kept, in the same way that common sense intuited that the whole is equal to the sum of its parts and validated the existence of the outside world. Moral principles are objective and rational, declared Reid. Not all his contemporaries agreed with him; in Scotland itself, both Francis Hutcheson and Adam Smith described the moral sense as a feeling, a “sentiment,” rather than an intellectual function, although they did not deny the objective reality of moral principles. In the technical language of philosophy, Reid’s ethical theory represented a form of deontological intuitionism, one that he presented as compatible with common sense realism in epistemology.

Closely associated with moral philosophy was another academic discipline of former times, natural theology. Natural theology studied the phenomena of natural science in order to demonstrate from them the existence and attributes of the divine creator. The intelligent and benevolent design of the universe seemed obvious to practically everybody then. Even the harshest critics of organized religion, the deists, believed in intelligent design. Indeed, the deists critiqued biblical revelation as unnecessary, given the infinitely more impressive revelation God had provided in the testimony of his creation itself. Pre-Darwinian natural science did not refute natural theology, and although Hume’s *Dialogues Concerning Natural Religion* (published posthumously in 1779) presented telling criticisms of natural theology, they did not have much impact on received opinion. Treatises on moral philosophy in the eighteenth and nineteenth centuries often included a section on natural theology. Together, moral philosophy and natural theology served a desire for a science of human nature grounded in a God-given natural morality. The aspiration to value-free social science that

appeared in a later generation had zero appeal for thinkers of the Anglophone Enlightenment.

Scottish common sense realism exerted international influence for several generations—for example, on the French philosophers Victor Cousin and Theodore Jouffroy. But the distinctive synthesis of common sense moral philosophy with natural theology found a particularly receptive audience in the English-speaking countries. It represented a happy synthesis of Protestantism with the Enlightenment, and by no means excluded deists. The American founders shared in the assumptions and vocabulary of this consensus. Thomas Jefferson, Benjamin Franklin, and John Adams, discussing the wording of the American Declaration of Independence, chose to characterize their assertion that all men are created equal as “self-evident”—a favorite term of common sense realism and intuitionist moral philosophy. Later, when Jefferson went to Paris as ambassador to France, he made friends with Reid’s leading disciple, Dugald Stewart, and later hoped (vainly) to recruit him for the University of Virginia.

Common Sense Realism Comes to America

A figure of central importance in the transmission to America of common sense realism and the Scottish Enlightenment in general was John Witherspoon (1723–1794), an evangelical clergyman in the Church of Scotland who in 1768 accepted the presidency of the College of New Jersey, now Princeton University. Besides providing administrative leadership to the college, Witherspoon also taught moral philosophy. His lectures, delivered over a period of many years and eventually published, influenced hundreds of American statesmen, educators, and clergy trained at Princeton between 1768 and 1794. The lectures included a section on “civil polity,” or political philosophy, defending natural rights, including the right of resistance to tyranny, and the principle of checks and balances. Witherspoon exerted practical as well as theoretical influence in American politics, for he played a prominent role in the Sons of Liberty during the Revolution, signed the Declaration of Independence (the only clergyman to do so), served in the Continental Congress, and supported the Constitution at the New Jersey state ratification convention.

Witherspoon’s *Lectures on Moral Philosophy* (published posthumously in 1801) rejected the metaphysical idealism of Berkeley and Hume in favor of common sense realism. His account of human nature followed Francis Hutcheson’s in most respects but tipped it toward ethical intuitionism.

Under his leadership, Princeton moved away from the metaphysical idealism and ethical sentimentalism of its famous earlier president, Jonathan Edwards, and embraced the Scottish philosophical tradition of Thomas Reid.

Witherspoon's Princeton modeled higher education for other American colleges for decades to come. Moral philosophy, defined as Reid and Witherspoon did to include common sense realism in both epistemology and ethics, along with natural theology, constituted the capstone of the nineteenth-century American college curriculum. Because of its effort to synthesize a wide range of human knowledge into an intelligible, natural, moral, and Christian system, the moral philosophy of that time has been called a "Protestant scholasticism." Typically, moral philosophy constituted a required course for seniors, taught by the college president. As it had appealed to both moderates and evangelicals in Scotland, common sense realism bridged denominational and theological differences in the United States. Its prominent advocates included Francis Bowen and James Walker at Unitarian Harvard, Francis Wayland at Baptist Brown, Noah Porter at Congregationalist Yale, Mark Hopkins at Congregationalist Williams, and Archibald Alexander at Presbyterian Princeton Theological Seminary (a new institution, separate from Princeton University). Unless he attended a Catholic institution, practically everyone who went to college in the United States between, say, 1820 and 1870 learned the comprehensive moral philosophy of Scottish common sense.

Decline of Common Sense Realism

Scottish common sense realism in the United States reached a kind of culmination with James McCosh (1811–1894) of Princeton University. McCosh was a Scottish Presbyterian clergyman, who, like Witherspoon, was invited to take up the presidency of Princeton in 1868, exactly one hundred years after Witherspoon's arrival. McCosh defended what had become the conventional American academic philosophy in *Our Moral Nature* (1893) and *Philosophy of Reality* (1894). McCosh's neighbor at Princeton Theological Seminary, Charles Hodge, invoked common sense realism in his *What is Darwinism?* (1874), an attempt to refute Charles Darwin's theory of evolution. By this time, however, Scottish common sense realism had already fallen under serious criticism and had come to seem old-fashioned.

The dominance enjoyed by Scottish common sense realism declined in both Britain and the United States during the later decades of the nineteenth century. The

James McCosh, a Scottish Presbyterian clergyman, became president of Princeton University in 1868. He defended common sense realism when it came under assault during the late 1800s.

first important attack on it came not from a philosopher but from an historian. Henry Thomas Buckle (1821–1862), in *On Scotland and the Scotch Intellect* (1861), treated Scottish common sense philosophy as socially conservative and an instrument of clerical supremacy. Buckle's argument was based on the premise that deductive reasoning was elitist, while inductive reasoning was democratic. He then identified the Scottish philosophers with deduction, even though the thinkers considered themselves—often rightly—champions of Baconian induction. Buckle's caricature of common sense realism enjoyed a long life in intellectual historiography. Of more immediate effect was the assault that came from within the discipline of philosophy.

The great German philosopher Immanuel Kant (1724–1804) had despised common sense realism, which he dismissed as an appeal to the judgment of the crowd. (Just the opposite of Buckle's criticism, it appears.) Nevertheless William Hamilton (1805–1865), appointed professor of moral philosophy at Edinburgh in 1836,

undertook to reconcile Kant with Reid and subsume Kant's views within the framework of Scottish common sense. Hamilton's work provoked one of the most effective rebuttals in the history of philosophy: John Stuart Mill's *An Examination of Sir William Hamilton's Philosophy* (1865). Like Buckle, Mill (1806–1873) considered common sense realism a philosophy of political conservatism; he made its destruction in favor of the phenomenalism of the British empiricists (that is, their belief that we know our perceptions rather than things in themselves) a necessary part of his own liberal political agenda. Not a first-rate thinker, Hamilton proved a sitting duck for Mill. The Edinburgh professor had died, but James McCosh and others went to his defense. Still, the intellectual world of the time soon decided that Mill had demolished not only Hamilton but common sense realism in general. The pedagogical use of Scottish moral philosophy declined to the vanishing point throughout Anglophone higher education. Today, Mill has survived as a great thinker while Hamilton is forgotten. Mill's *Examination of Hamilton* is ignored, too, and not considered one of his major philosophical writings.

Meanwhile in the United States, the isolated genius Charles Sanders Peirce (1839–1914) was pioneering the philosophy of pragmatism along with other original intellectual endeavors. Peirce remained a metaphysical realist of sorts and developed his own argument for the existence of God. But his successors in the pragmatist tradition, William James (1842–1910) and John Dewey (1859–1952), departed further from the concerns of nineteenth-century academic philosophy. They saw the world as fluid and made by human beings, not as fixed and made by God. Like Mill they wanted a metaphysical foundation for democratic participation and did not see it in common sense realism. The rise of separate social sciences, which the pragmatists found hopeful, rendered the old-fashioned comprehensive academic course in moral philosophy obsolete. The version of common sense realism prevailing in American higher education had been Christian, and it is no accident that the secularizing universities of the early twentieth century hastened to leave it behind.

Twentieth Century: A Philosophical Revival

For most of the twentieth century, common sense realism remained in bad odor in the United States: out of fashion with philosophers, treated with condescension by historians, who followed in Buckle's footsteps. Joseph Blau

(1909–1986), in *Men and Movements in American Philosophy* (1952), expressed the prevailing view of the Scottish-American philosophy of common sense as naive, dogmatic, socially conservative, and the servant of an outmoded religion. Some of the advocates of common sense realism were indeed popularizers and polemicists (the Scotsmen James Beattie and James Oswald, for example) who deserved this treatment, but others were serious philosophers and educators who did not.

Significantly, philosophers and not historians led the revival of respect for Scottish common sense realism. Writing in *A History of American Philosophy* (1977), Elizabeth Flower (1915–1995) emphasized that the Scottish philosophy should be considered part of the Enlightenment, not a reaction against it, and even provided a sympathetic account of James McCosh's restatement of realist metaphysics. Not long afterwards, George Marsden (1939–) started to bring the intellectual historians around, describing the common sense realism of nineteenth-century American education as antielitist, democratic, and supportive toward natural science.

Crucial to the recovery of respect for the common sense realism of past times has been the fact of its being taken seriously in the present. Although common sense realism is now a minority metaphysical viewpoint, some noteworthy twentieth-century philosophers have embraced versions of it. The most famous of these was the Englishman George Edward Moore (1873–1958), usually called G. E. Moore. Moore defended metaphysical realism and, even more impressively, ethical intuitionism. He expounded the latter with extraordinary sophistication and persuasiveness, even in the face of the skepticism of the logical positivists (some of whom were his colleagues at Cambridge University). Moore did not believe in God, the major difference (apart from his greater analytic skill) between him and the earlier philosophers of common sense.

In the United States, common sense realism is still sometimes identified with evangelical Protestantism, including varieties of fundamentalism, but this is by no means invariably the case. Roderick Chisholm (1916–1999) and Amie Thomasson (1973–) have defended forms of common sense realism in recent years without reference to religion. Philosophers who formulate their own versions of common sense realism and synthesize them with Christianity include Alvin Plantinga (1932–) and Nicholas Rescher (1928–). It is a significant commentary on how the cultural climate has changed over the past century that the Protestant Plantinga

teaches in a Roman Catholic university and Rescher is a Catholic himself.

Congregationalists

A distinct stream within the sixteenth- and seventeenth-century English Reformation, Congregationalism is an old and influential American religious tradition. More specifically, Congregationalism was part of the Reformed wing of the Protestant Reformation, sharing broadly Calvinist beliefs but also emphasizing the freedom of the local church, formed by the signing of a members' covenant and unhindered by any higher forms of ecclesiastical authority.

At the same time, however, American Congregationalism has always insisted on the necessity of church connection. Since the earliest days of New England settlement, local

churches created various forms of mutual oversight, beginning with the Cambridge Platform of 1648 and continuing on through the evolution of a national denominational structure in the late nineteenth century.

But every move toward centralized structure has generated debate and controversy about Congregational identity, especially with the merger that created the United Church of Christ in 1957. Indeed, for a religious tradition with relatively few doctrinal requirements, the nature of "authentic Congregationalism" has remained a constant and often deeply vexing question.

The English Independents

Congregationalism originated in the dynastic woes of King Henry VIII (1491–1547), who wished an annulment of his first marriage in order to marry the young Anne Boleyn and produce a male heir. He had his way through the Act of Supremacy in 1534, which made him the "supreme head" of the Church of England. But though the act denied the authority of the Roman Catholic pope, it kept old beliefs and institutions intact; the Anglican Church, or Church of England, continued the hierarchical structure and ritual forms it had inherited from sixteenth-century Catholicism.

But Protestant dissenters saw in Henry's marital solution an opportunity to bring about more fundamental change. Those who wished to purify the English church of its Catholic elements—people often referred to in a generally pejorative sense as "Puritans"—began to envision a genuine fellowship of "visible saints," those who had undergone a spiritual change of heart. Under Henry VIII's daughter Elizabeth I (1533–1603), who attempted to chart a middle way between Protestant and Catholic parties within the Church of England, energy for reform swirled out of traditional government structures and into the streets and local churches. Dissenters began to join together in clandestine meetings or "conventicles," providing each other with biblical teaching and spiritual support and increasingly sharp critiques of the established religious order.

What emerged was not a linear debate between Anglicans and Protestants but a many-faceted discussion about the nature of a true church and the role of biblical authority. Most English Protestants accepted the foundational categories of Reformed theology, emphasizing the sovereignty of God, the dependent state of human beings, and the final authority of the Bible in all matters of faith and practice. But they differed on the means of application, especially in regard to worship and ecclesiology. Some, often known as Independents, took a minimalist approach to biblical

authority, insisting that only those practices specifically prescribed in scripture were permissible. Echoing in many ways an Anabaptist point of view, they refused to countenance any church order beyond that provided by the New Testament and pressed for simple lay-oriented structures with a minimum of hierarchy. A much larger group of more moderate Presbyterians argued that in matters pertaining to “adiaphora,” or “things indifferent,” broader Christian principles prevailed. Looking to Calvin’s Geneva and the state churches of Scotland as a model, they advocated a limited form of ecclesiastical oversight exercised through a graded system of presbyteries and synods.

By the late 1500s, increasing impatience with Elizabeth’s noncommittal policies began to fuel an urge toward entire separation from the Church of England. One of the earliest such was Robert Browne, whose *Treatise of Reformation without tarrying for anie* (1582) argued that godly piety was simply not possible under the Anglican Church and its lax exercise of spiritual discipline. Rejecting any forms of state control, Browne urged his followers not to “tarry for the magistrate” but to create their own churches by signing onto covenants together. Though the intemperate and apparently unstable Browne later recanted his position, his was an important early articulation of basic principles that later would become central to Congregational self-understanding.

During the later years of Elizabeth’s reign, pessimism spread. Leading Independents Henry Barrow and John Greenwood were executed in 1593; many others faced prison or banishment. Moreover, when James I took the throne in 1603, he inspired little confidence for positive change; thus, in 1608 a group of self-described Separatists, led by John Robinson and John Smyth, left England for the relative freedom of Holland. Smyth subsequently became a Baptist, but Robinson’s group of Pilgrims soldiered on. After a short stay in Leyden, they departed for New England, landing in Plymouth in the winter of 1620.

Non-Separatist Puritans, whose chief spokesmen were William Ames and Henry Jacob, held out for the importance of church connection. They sought to reform the Anglican Church from within, planting seeds of change through small congregational bodies within the existing structure. In their view, as long as the biblical word was preached and the sacraments regularly administered, the Church of England was still a legitimate home for Christian believers. In fact, non-Separatists argued that even the old parish system, which automatically assigned church membership to all those born in a certain geographic area, allowed its members to exercise free consent, and in some

form a covenantal arrangement, by the willing acceptance of their own clergy.

But prospects for reform grew dim under Archbishop William Laud (1573–1645). During the 1630s and 1640s, Laud’s High-Church policies and the monarchist agenda of King Charles I sparked a “great migration” of dissenting Protestants to New England. With upwards of twenty thousand new arrivals into Massachusetts Bay, churches grew rapidly—some twenty-nine in Massachusetts alone by 1640. Despite their large-scale departure, the settlers of Massachusetts Bay insisted that they had not abandoned their goal of reforming the English church. Especially as succeeding generations of Puritans settled into their new home across the Atlantic Ocean, they began to envision New England as a “city on a hill,” an explicitly godly community, and a righteous example for all the world to follow.

From Independent to Congregational

New England’s Puritans were not the dour, witch-hunting killjoys of American myth and legend. They were in many ways typical Elizabethan English men and women who enjoyed good ale and good company and who also held their religious beliefs with deep personal conviction. Early on they flourished in New England, buoyed by the conviction that they were God’s chosen people, with a central role in the unfolding of divine history. This confidence did not always make them easy to accommodate: when smallpox epidemics decimated the local Native American population, Puritan settlers accepted the tragedy as an affirmation of God’s providential care.

Very quickly the issues that once divided Independents from Separatists began to blur on New England soil. Without the Church of England as an ecclesiastical foil, questions about what constituted a “true church” needed to be addressed promptly and clearly. The very earliest Puritan settlements in Salem and Charlestown drew on Robert Browne’s notion of covenant as the means by which a legitimate church might be gathered, and this soon became a fundamental characteristic of the so-called Congregational Way. As Cotton Mather (1663–1728) described the practice in the late eighteenth century, a group of believers (with the minimum set at seven to follow the procedure laid down in Matthew 18:15–20) met together for a day of prayer and fasting before setting down their intention in a written agreement. These church covenants were sometimes lengthy, sometimes very short, but normally followed a dual pattern, laying out the new congregation’s obligations to God and to each other. Then each member signed his

or her name at the bottom of the document. Only at this point would the new congregation call a pastor, typically one already marked out as a spiritual leader but named to his new post as one church member among the rest. An ecclesiastical council of representatives from other nearby churches assisted in the ordination and installation of the new pastor, affirming—but not formally approving—the local congregation's choice.

Before long, however, the logic of the pure gathered church required new layers of ecclesiastical oversight. Often referred to as the constitution of American Congregationalism, the 1648 Cambridge Platform directly addressed worries, especially back in England, that New England churches were theologically rudderless. The Cambridge divines affirmed the Westminster Confession of 1643 as the standard of belief and outlined a “mixed polity” that affirmed the autonomy of local churches but within a larger structure of mutual oversight and care. Walking a fine line between Presbyterianism and out-and-out independency, the Platform allowed for the legitimacy of synods and local forms of cooperative supervision, while affirming the spiritual integrity of local congregations.

Churches in Connecticut tended to be less leery of cooperative forms than their coreligionists in Massachusetts. The first settlers in Connecticut, led by Cambridge pastor Thomas Hooker, left the original Puritan colony because they objected to what they saw as authoritarian trends. But the New Haven Colony, established in 1639, rested on a close alliance between church and state. In many ways, in fact, Connecticut leaned toward a more presbyterian polity: the Saybrook Platform of 1708 set up governing bodies with broad powers of ecclesiastical oversight. Under this system, associations composed of pastors and elders and “consociations” of representatives from local churches had the authority to decide disputes between churches and to approve and license new ministers. In Massachusetts, however, the basic form of association was between individual ministers themselves, a practice going back to the formation of the Massachusetts Convention of Congregational Ministers in 1692.

During the nineteenth century, many defenders of Congregational polity began to argue that the denomination's decentralized institutional structure was inherently democratic—and therefore a historical precursor of the United States Constitution. But in fact, the tie between Congregational ecclesiology and American political democracy is far from direct. Though, for example, all church members were

automatically voting members of their congregations and in the larger commonwealth, this privilege did not extend to women or to religious dissenters, who were still required to pay taxes for church support. Ecclesiological outliers, like Baptists and Quakers, or dissonant theological voices like Ann Hutchinson and Roger Williams, faced severe consequences, including banishment and persecution.

Still, contrary to the popular notion that Puritan settlements were theocratic—that is, ruled by the clergy—the government of the Massachusetts Bay colony included separate realms of activity for church and state. That partnership rested on an assumption that godly magistrates and the churches' spiritual leadership would always work cooperatively, maintaining covenant obligations that mirrored those governing local churches.

In the long run, of course, the arrangement was untenable, especially as the ranks of dissenters began to grow; but in the mid-seventeenth century, the obligations of church membership fell equally on all of the colony's inhabitants, whether or not they personally held to Puritan doctrines. Religious dissent was, in effect, illegal.

New England pastors also exercised considerable spiritual and intellectual authority, though within certain limits. In an age still bound by aristocratic assumptions, the minister's status in his community was taken for granted, simply by virtue of his superior training and erudition. Even so, however, evidence from church records shows that laypeople took their own covenant responsibilities very seriously. Though outright opposition to clerical authority was rare, many a disgruntled parishioner found ways to remind a pastor that he ruled only by his congregation's consent.

Spiritual unity was the highest goal, and in the end more important than the right of individual belief that Independents had guarded so carefully in England. Though the English Civil War ultimately brought about the Act of Toleration in 1689, allowing dissenting bodies to exist within a structure dominated by the state Church of England, New England churches resisted its imposition. Put simply, their primary purpose was not to provide a haven of religious liberty for all but to establish and maintain close-knit covenanted communities of visible saints.

Congregationalists in the Age of Revivals

In its ideal form, Congregational church government required high levels of individual piety and zeal. From early on, new members were required to “give a relation,” or publicly testify to a genuine conversion experience, in order

to join. Not just the minister and deacons but the entire congregation vetted the spiritual authenticity of each new applicant. Though the practice proved difficult to maintain in its pure form—relatively quickly exceptions were made for women deemed too modest to endure this kind of scrutiny—every effort was made to ensure that the unconverted would not compromise the congregation's spiritual purity.

But zeal did not translate easily across generations. Already in 1662 leaders of Massachusetts Bay had had to make allowances for the children of parents who had not passed the hurdle of church membership. The Half-Way Covenant created in effect a new type of church member, one who had not experienced conversion and who could not participate in the sacrament of Communion but, having publicly owned the church's covenant, could present children for baptism.

This pragmatic solution raised difficult questions of ecclesiology that would roil Congregational churches for the next century or more. Though nearly every New England church eventually accepted the Half-Way standard for membership, disputes divided leading churches and pitted eminent divines against each other in prolonged public debates. One of the most famous voices was that of Northampton pastor Solomon Stoddard (1643–1729), who defended the Half-Way Covenant as a converting ordinance, a way of keeping young families within the spiritual purview of their local church. He was vigorously opposed by Richard and Increase Mather, pastors of Boston's Second Congregational Church, who decried the decline in piety that made the new measure necessary.

The transatlantic religious revival known as the First Great Awakening tilted the scale in the other direction, back toward an insistence on heart piety as a requirement for church membership. During the 1730s and 1740s, under the fiery preaching of itinerating evangelists such as George Whitefield, Gilbert Tennent, and James Davenport, thousands of laypeople experienced dramatic adult conversions and became increasingly critical of the spiritual laxity they saw around them. All across New England Congregational dominance began to splinter, with self-described New Lights insisting on the necessity of a primal experience of grace and the Old Lights wary of the excessive emotionalism that often accompanied such religious "enthusiasm." At one end of the spectrum, Baptists and Separate Congregationalists lobbed insistent criticisms against the spiritually lukewarm clergy and unrevived church members in the established churches; in their view, the common

denominator of any religious fellowship was a personal encounter with Christ. At the other end of the spectrum, churchmen such as Charles Chauncy (1705–1787), who pastored Boston's First Church, argued that spiritual pyrotechnics of the revival were a counterfeit, distracting honest believers from embracing the means of grace already available through the ordinances of a duly gathered local congregation.

The enlarging debate generated a variety of intellectually sophisticated responses, none more influential than those of Northampton pastor Jonathan Edwards (1703–1758). An unapologetic defender of "religious affections" and a thorough scholar with a firm grasp of the Enlightenment critique of revealed religion, Edwards was an unparalleled philosopher and theologian. In his many published treatises and devotional works, Edwards constructed a subtle combination of classic Calvinism with a more modern affirmation of the authenticity of human moral choices.

Though the grandson and for much of his career a disciple of Solomon Stoddard, Edwards decisively parted ways with Stoddard's ecclesiology in the course of the revivals. In Edwards's view, parents who joined the church to have their children baptized were the worst possible influence on the tender faith of young children. He announced to his congregation that he would no longer acknowledge Half-Way members or baptize their offspring; nothing but a genuine change of heart would suffice. In many ways, Edwards's appeal won the day. The Half-Way model fell into disuse by the early nineteenth century, especially with a subsequent groundswell of religious fervor. But questions about what constituted membership in a Congregational church and about the nature of Congregational identity were far from over.

Nineteenth-Century Setbacks and Successes

The Revolutionary War was an important benchmark in Congregational history. Hundreds of New England clergy sided with the cause of independence, helping to organize militias, providing service as chaplains, and organizing boycotts of British goods. Some clergy, such as John Adams of Durham, New Hampshire, even led raids against British forts; Adams reportedly stored the gunpowder he acquired under his pulpit. But most of all, through fiery sermons and literary skill, the "black regiment" of New England's gowned clergy helped the Revolution to succeed.

In practical terms, however, American independence presented Congregationalists with some serious challenges. By the late 1700s, the New England clergy, sometimes referred

to as the Standing Order, were hardly enthusiastic at the prospect of a full Jeffersonian-style democracy, nor were they prepared for the effect of the First Amendment to the United States Constitution, cutting off all religious groups from any forms of government support. When Massachusetts became the last state to encode this principle into its own state constitution in 1833, the heart of the old Congregational order finally faced the unsettling prospect of relying on the voluntary donations of their members for survival.

The Dedham Decision of 1820 was another important defining point in Congregational history. The court case originated in a dispute in Dedham, Massachusetts, between the local parish and the gathered congregation, each claiming the right to name the next minister. By that time many Congregational churches were supported both by a society, defined geographically, and the church, which encompassed the worshipping body of visible saints. In the Dedham case, the church called a conservative pastor who the parish did not support, raising an immediate question about which group would have priority. The Massachusetts Supreme Judicial Court sided with the society, reasoning that the group paying the bills had the prior claim. The worshipping members of the Dedham church, and many others across eastern Massachusetts, were forced to leave their historic properties and build anew.

The Dedham Decision widened a growing divide between Trinitarian and Unitarian groups. By then, deep differences over the role of rationality in religious belief, forged within the fires of the First Great Awakening, had created two separate and increasingly disaffected parties. William Ellery Channing (1780–1842), pastor of Boston's Federal Street Church, laid out the basic differences in a sermon on "Unitarian Christianity" for the ordination of Jared Sparks in 1819. In short order, all of Boston's original Congregational churches—except for Boston's Third or Old South Church—identified with the Unitarian party.

Hampered by disestablishment and division, Congregationalists found it difficult to expand beyond their traditional New England base, though the problem was hardly new in the nineteenth century. When a Puritan congregation from Massachusetts attempted to form a church in Nansmond County, Virginia, in 1649, the colonial authorities forced them to leave—this despite the intercession of Massachusetts governor John Winthrop. Another group from Dorchester, Massachusetts, formed a church in Charles-town, South Carolina, sometime around 1680; in 1752 an

offshoot of this congregation settled in Midway, Georgia. But despite these scattered efforts, by the end of the colonial period, Congregationalism was thoroughly entrenched in New England. Indeed, by the 1830s, nine-tenths of all Congregational churches were located in that region; half a century later, the figure was still around two-thirds, with the vast majority of other Congregationalists in states due west—the so-called "Yankee Exodus" states of New York, Ohio, Illinois, Wisconsin, and Iowa.

Much of that expansion was the ambiguous by-product of an agreement that Congregationalists contracted with Presbyterians in 1801. Under the Plan of Union both groups agreed to pool their resources to allow for more efficient church planting on the frontier. Individual congregations could call a minister from either body and could participate in local presbyteries or ministers' associations regardless of their stated polity. By 1835, some 149 of these "presbygational" churches had been established just in the Western Reserve territory of Ohio; scores of others dotted the Great Lakes and upper Midwest, from New York to Iowa. The Plan of Union also included efforts to evangelize Native Americans and to establish institutions of higher learning. There the partnership was very successful, with an array of colleges stretching from Illinois, Knox, Beloit, Grinnell, and Rockford Colleges in the Midwest to a school that eventually became the University of California in 1868.

But both Presbyterians and Congregationalists found it difficult to compete with Methodists and Baptists. Only lightly invested in money and property, these "upstart" denominations expanded rapidly into the western frontier, soon overtaking Congregationalists in numbers, if not in cultural prestige. Thus, between 1776 and 1850, Methodism emerged as the leading denomination in the United States. Though some 20 percent of all religious adherents in 1776, Congregationalists numbered barely 4 percent by 1850.

Even so, the early nineteenth century was an important time of institution building. In 1810 Congregationalists sponsored the first national foreign missionary society, the American Board of Commissioners for Foreign Missions (ABCFM). Intended as a cooperative venture with Presbyterians, and the Dutch and German Reformed, by 1870 the American Board eventually became a solely Congregational entity, notable for a broad program of educational and humanitarian outreach from the Middle East to Hawaii to Japan. In its early days, the American Board also conducted a far-reaching home missionary program; in 1830 ABCFM missionaries took a public stand opposing the American

government's Indian Removal Act, specifically the forcible resettling of Cherokees from their homes in Tennessee and Alabama into the Oklahoma Territory.

In 1826 Congregationalists were lead sponsors of the American Home Missionary Society (AHMS), an organization dedicated to establishing churches in the western frontier. Originally involving Presbyterians and Dutch Reformed supporters, the AHMS also eventually lost its interdenominational character, changing its name to the Congregational Home Missionary Society in 1893. Congregationalists also helped found other organizations that in turn became non-denominational, including the American Tract Society (1825) and the American Education Society (1826).

The American Missionary Association (AMA), formed in 1846, joined the denomination's antislavery zeal with its commitments to education and evangelism. The AMA was an antislavery alternative to the ABCFM, originating in efforts of abolitionists to win the freedom of mutinying slaves on the ship *Amistad* in 1839. In the post-Civil War years, hundreds of AMA missionaries, including scores of young women and ex-slaves, established an educational network of primary and secondary schools across the South. Many of the colleges the AMA helped form became prestigious African American institutions, including Howard, Fisk, Atlanta, and Talladega.

Congregationalists were also pioneers in seminary education. Andover Theological Seminary, founded in 1807, was the first freestanding American theological seminary and in fact the first American graduate school of any kind. Its three-year curriculum also became a standard for ministerial education across all Protestant denominations. Other Congregational seminaries soon followed after Andover, including Bangor (1816), Yale (1822), and Hartford Seminary (1833), carrying forward an intellectual tradition of educated clergy established by the original Puritan settlers, who founded Harvard College in 1636.

Congregationalists also made important contributions to American theological thought. In the late eighteenth and early nineteenth centuries, the New England theology, articulated and taught by the heirs of Jonathan Edwards, defined mainstream Protestant theological discourse. The so-called New Divinity Party—men like Nathaniel Emmons, Samuel Hopkins, and Joseph Bellamy—led a complex debate about Calvinist doctrines of sin and predestination and about the social responsibilities of Christians. In the mid-nineteenth century New Haven pastor Horace Bushnell (1802–1876) laid the groundwork for the development of liberal thought.

In contrast to the more rationalist presuppositions of the New England theology, Bushnell emphasized the poetic, metaphoric nature of religious truth and the immanence of God in human experience. Bushnell's insistence that God lived within the most minute human interactions, described in his ground-breaking book on *Christian Nurture* (1847), laid the groundwork for liberal theories about child rearing and created an important rationale for the expansion of Sunday schools and other forms of religious education.

Other Congregational theologians, led by the faculty at Andover Seminary, developed Bushnell's ideas even further. In the late nineteenth century, the so-called new theology rejected the formal categories of Calvinist thought, emphasizing instead a more optimistic, ethical creed centering on Christ's role as a moral exemplar and affirming human efforts to bring about a just and peaceful social order. By the early twentieth century, these views were no longer those of the radical few, as liberal theology dominated the curriculum of most Congregational seminaries and spread rapidly into church pulpits across the country.

In the late nineteenth and early twentieth centuries, Congregationalists also became identified with a variety of progressive causes. In some cases, the denomination's loose polity allowed for innovative changes at the local level, including the ordination of the first woman to the Protestant ministry, Antoinette Brown Blackwell, in 1853. During the late nineteenth century, many Congregationalists, most notably pastor and writer Washington Gladden, were leading figures in the social gospel movement. This loose coalition of pastors, parish workers, and scholars worked to establish the "kingdom of God on earth" by campaigning for the rights of labor unions and aid to the urban poor.

Ecumenism

During the late nineteenth and early twentieth centuries, Congregationalists moved toward a more centralized structure. The process officially began at the Albany Convention of 1852, the first national gathering since the Cambridge Synod of 1646. The occasion for this meeting was simmering discontent with the Plan of Union, by then widely perceived as a win for Presbyterians, who had reaped the majority of newly planted churches. ("They have milked our Congregational cows," one critic exclaimed, "and made nothing but Presbyterian butter and cheese.") But in fact, the Plan of Union exposed the weakness of Congregationalism's decentralized polity, especially when isolated and struggling mission churches demanded support. Indeed, one major

outcome of the Albany Convention was the formation of the Congregational Church Building Society, an organization that provided funding for new churches in the West.

The Plan of Union also opened Congregationalists to criticism for their relatively open doctrinal stance. Indeed, the more conservative Old School faction of Presbyterians had repudiated the arrangement back in 1834, objecting to a lack of theological rigor among their New England partners. Not surprisingly, when Congregationalists convened again after the Civil War, talk turned to the necessity of some common creedal understanding.

The Boston Council of 1865 extended and further defined the work at Albany, involving some five hundred delegates from the various state organizations. One of the main results was the adoption of the Burial Hill Declaration of Faith at an historic site in Plymouth, the first such common statement since the Cambridge Synod. The Boston Council also adopted a “Statement of Congregational Principles,” codifying important points of polity for the first time.

Formal denominational organization came in 1871, with the creation of a permanent body, the National Council of Congregational Churches, in Oberlin, Ohio. The Council, which was composed of equal numbers of lay and clergy representatives chosen by their state organizations, had no formal legislative power over local churches. Its stated purpose was to oversee the work of Congregational missionary organizations, encouraging local churches to support the ABCFM and the AMA and dividing up their overlapping mission fields for maximum efficiency. To offset any lingering perception of sectarianism, the Oberlin meeting also produced a ringing “Declaration on the Unity of the Church,” affirming the unity and integrity of “all those who love and serve our common Lord.”

Other denominational statements followed. A Commission Creed, adopted in 1883, replaced the Burial Hill Declaration with a more nuanced liberal version. The Kansas City Declaration of Faith, adopted in 1913, put the denomination on record as a socially progressive body, working on behalf of justice, peace, and human “brotherhood.”

The push toward greater centralization tracked with a rising denominational consciousness during the early twentieth century. The National Council of 1907, for example, recommended a common legal structure for all of the various local organizations that had evolved to carry on the work of the churches since the seventeenth century, replacing all of the missionary societies, vicinage councils, associations, and consociations with a uniform arrangement of state conferences. A Commission of Nineteen, appointed

in 1910, tackled the financial and administrative complexities resulting from the decentralized structure of the denomination’s various missionary and educational organizations—in all some ten agencies, including three women’s boards and three different home missionary boards. Adoption of their recommendations in 1913 led to a closer relationship between these boards and the local churches represented in the National Council and, by 1929, to mergers that ended the independent existence of the various women’s boards.

Congregationalists also courted mergers with other denominations. In 1886, a Permanent Commission on Church Unity voted to unite with the Free Baptist churches, a move that was ultimately unsuccessful. But a few years later, in 1892, the Congregational Methodist Churches, a largely southern body affiliated with the Congregational Churches of Georgia, came under the wing of the National Council. Ensuing years saw a variety of ecumenical proposals—from Episcopalians, Disciples of Christ, Methodist Protestants, United Brethren, and Universalists—but little institutional change. Still, in 1925, the National Council accepted into fellowship the Conference of the Evangelical Protestant Churches of North America, a group of twenty-seven liberal German churches centered around Pittsburgh, Pennsylvania, and Cincinnati, Ohio.

The most important merger occurred in 1931 with the General Convention of the Christian Churches. The Christians, who numbered only around one hundred thousand (compared to slightly less than one million Congregationalists), were a loosely organized group, composed of several different geographic strands. One originated in New England in the early 1800s, under the leadership of Elias Smith and Abner Jones, both fiercely dedicated to liberty of conscience and an absolute minimum of church hierarchy. About that same time in Virginia, James O’Kelly gathered a group in opposition to the hierarchical structure of the Methodist Episcopal Church; Barton W. Stone led a similar protest against the Presbyterian Church in Kentucky. By the late nineteenth century, all three groups had found a common cause and adopted the simple name of “Christians,” reflecting their opposition to all forms of sectarian labeling. One large segment of African American churches in the upper South formed an affiliated Afro-Christian Convention in 1892.

Though Christians were on the whole more rural and less affluent than Congregationalists, both groups shared a commitment to organizational simplicity and freedom of thought; the new denomination they formed had a relatively minimal structure. The General Council of

Congregational Christian Churches consolidated all of the missionary boards into two, the American Board of Commissioners for Foreign Missions and the Home Mission Board, and created a Council for Social Action in 1934. Some social conventions, especially around race, remained untouched, however. The Afro-Christian Convention and African American Congregationalists in the South remained segregated, merging to form a single entity, the Convention of the South, in 1950.

The Council for Social Action soon became the focus of controversy. Its primary tasks were to gather and disseminate information about social problems, including labor relations, rural life, international relations, and race. But critics saw an anticapitalist bias in the Council's published materials, a suspicion amplified by an "anti-profit-motive" resolution passed by the General Council in 1934. Spiritual Mobilization, a group founded by Los Angeles pastor James Fifield in 1935, campaigned tirelessly against the denomination's perceived left-leaning agenda throughout the 1940s and 1950s, gathering strength with the rise of anticommunist fervor during the postwar decades.

UCC, NACC, CCCC

After World War II, the Congregational Christian Churches emerged as a leading voice for ecumenical cooperation. Already in 1891, with the formation of the International Congregational Council (ICC), American Congregationalists had become part of a wide network of sister churches from around the world. The ICC met roughly every decade during the early twentieth century; Americans such as Douglas Horton gave key leadership, but the gatherings themselves incorporated an array of denominational bodies from Great Britain, Canada, India, and the Philippines.

In 1937 leaders of the Congregational Christian churches—Truman Douglass, George M. Gibson, and Douglas Horton—began to discuss the possibility of union with leaders from the Evangelical and Reformed Church, a denomination formed by an earlier merger in 1934 of two German immigrant bodies. After years of negotiation, a Joint Committee on Union issued a Basis of Union in 1947. That July the General Synod of the Evangelical and Reformed Church approved the document, and prospects for merger looked relatively bright.

But on the Congregational Christian side, the Basis of Union proved deeply controversial and led to a series of departures. In 1948, evangelical churches opposed to the denomination's liberal theological stance formed the Conservative Congregational Christian Conference (CCCC).

The CCCC maintained a strong emphasis on liberty of conscience but within a conservative evangelical doctrinal framework. Some fifty years after its founding, the denomination numbered 242 churches and more than forty thousand members.

The National Association of Congregational Churches (NACC) provided a home for congregations and individuals who opposed the 1957 merger for polity reasons. Critics argued that a union with the Evangelical and Reformed Church would impose a Presbyterian structure that was fundamentally at odds with historical Congregationalism. They also argued that the General Council had no legal right to unite with another denomination, as this was the sole prerogative of local churches. The NACC, formed in Evanston, Illinois, in 1955, thus emphasized the authority of the gathered congregation and the right of churches to modify any act by a national body. Fifty years after its founding, the denomination reported more than four hundred churches and sixty-five thousand members.

The final merger leading to the creation of the United Church of Christ (UCC) came after a decade of tumult. In 1949 the General Council put the question of union with the Evangelical and Reformed to local churches, hoping for a 75 percent vote in favor; when the resulting return fell just short (72.8 percent), the Council declared it an acceptable mandate and voted to move ahead. Soon after, the Cadman Memorial Church in Brooklyn, New York, filed suit against Helen Kenyon, the moderator of the General Council, charging the denomination's leaders with a misuse of power. A complex progression of court rulings, appeals, and reversals delayed any other progress toward merger for several years, until the New York Court of Appeals dismissed the Cadman case in 1953. Shortly afterward, in 1956, the General Council of Congregational Churches voted (1,310 to 179) to go ahead with merger plans. After a parallel vote from the General Synod of the Evangelical and Reformed Church, a Uniting General Synod met in Cleveland, Ohio, on June 25, 1957, to form the UCC.

Like many mainline Protestant denominations, the UCC endured substantial membership loss, especially from the 1980s onward. Some of the decline was due to demographic factors—a declining birthrate for one—and some of it was related to a general mainline "malaise" in the face of the resurgent evangelical movement of the mid- to late twentieth century. In 2008 the UCC numbered just over 5,600 churches and 1.2 million members, a precipitous drop from the denomination's high point of 2.2 million members during the early 1960s.

Conclusion

Congregationalism is an important American tradition, though in some ways a vanishing one. Because of the tradition's historic aversion to creedal or doctrinal requirements, and because of its decentralized structure, Congregationalism was a relatively poor competitor in the American religious marketplace. Over the course of its long existence, the denomination has divided and merged several times, sometimes by choice and sometimes under duress. Consequently, in terms of sheer numbers, Congregationalism no longer enjoys the cultural and intellectual preeminence it once took for granted.

But in many other ways, Congregationalism is so deeply rooted in American religious life that its influence is almost impossible to measure. Its democratic and locally oriented polity is now broadly characteristic of many other denominations, from Baptists to Mennonites; even more hierarchically oriented denominations such as Catholics and Episcopalians have adopted more representative structures than their European counterparts. Congregationalism's historical insistence on toleration for other beliefs—a somewhat ironic legacy of its Puritan founders and their insistence on the freedom of the individual conscience—has also shaped modern acceptance of religious pluralism. The denomination's formidable intellectual contribution has long played a central role in the American historical narrative. Though the Puritans and their descendents are now no longer the first or only story historians tell about the nation's religious past, they are still an important and an intriguing one.

Congregations

In the last two decades of the twentieth century, *congregation* became the generic term for local religious institutions in the United States, a term intentionally inclusive of entities known to their own constituents by a great variety of names: church, parish, worship center, ward, synagogue, temple, mosque, Islamic center, *mandir*, *wat*, meditation center, and *gurdwara*, among other designations. Intending to

build on the ordinary sense of the term, scholars define the American congregation as an institution with regular and frequent face-to-face gatherings that are understood by their participants to be religious in nature but are predominantly composed of religious laity (nonprofessionals). The predominance of nonprofessionals, or what this article will call “religious amateurs,” is crucial. Congregations may be, but are not necessarily, led by religious professionals, who are disproportionately male. But the majority of those who attend congregations, and do their volunteer work, are women. In this sense, the work of congregations is disproportionately women’s work.

Congregations often own the building in which they meet, but many do not, instead renting their meeting spaces from other congregations or from such secular institutions as schools. Thus, there are more “congregations” in America than there are freestanding church buildings. Congregations so defined are widespread and prevalent across the United States, numbering approximately 330,000 in the year 2000.

The Study of Congregations

Systematic social scientific knowledge of congregations as units of analysis began with the work of H. Paul Douglass in the 1920s, with ironic results. Douglass’s studies led to efforts to curtail what was perceived as excessive proliferation of and differentiation among competing congregations, for which interdenominational cooperation was proposed. By the middle third of the twentieth century, congregations were generally regarded as unworthy of the attention of scholars or religious activists. Congregations were seen as especially conducive to bad faith, while seminaries and denominational and interchurch agencies were seen as conducive to religious integrity. Liberal clergy in the 1960s learned that their efforts to promote religiously inspired social change were more likely to be successful the further away they stayed from congregational entanglement.

The focus of scholars’ and activists’ attention changed in the 1970s as the fortunes of ecumenically inclined denominations and interchurch agencies declined from their 1960s peaks. Some scholars thought “new religious movements” were an exciting research frontier in the face of denominational decline, and conservative religious activists found meaningful engagement in such parachurch agencies as InterVarsity Christian Fellowship. But other scholars and church activists insisted that whatever future religion had in the United States, and whatever potential it promised for the betterment of the society, must ultimately rise

on the convictions nurtured and resources generated in congregations. From their point of view, the congregational bedrock of American religion had been rediscovered. Well-endowed foundations, notably the Lilly Endowment, encouraged their aspirations. Meanwhile, by the late 1970s, a small literature on congregations began to emerge, stimulated more by disciplinary agendas within sociology and anthropology (for example, participant observation, symbolic interaction, racial and ethnic studies) and religious studies (especially of non-Christian communities) than by religious agendas. A field of “congregational studies” coalesced by the mid-1980s.

The new field was made up of scholars and religious leaders of different backgrounds looking from different points of view. Historians produced new studies and collected extant ones of local religious communities from colonial times to the present. Some of these were the work of academic researchers, while others were labors of love on the part of dedicated amateurs. Researcher-activists based in divinity schools promoted and encouraged efforts on the part of congregations to understand their own cultures, social processes, and environmental challenges, the better to pursue their mission objectives. Large, well-funded, academically based projects employing the talents of multiple researchers took on the tasks of understanding how Vatican II changed American parishes; how congregations dealt with economic, social, and cultural changes in their communities; why and how most congregations were racially homogeneous (and a very few are heterogeneous); and in what kinds of congregations post-1965 immigrants were involved.

The resulting literature in congregational studies consisted disproportionately of single-case studies. Some projects compared multiple congregations within a single locale or sharing a particular situation (for example, economic downturn in the community). But it was difficult to generalize from these studies because what statisticians call the “sampling frame” from which they were drawn remained unknown. Eventually, Mark Chaves devised a “hypernetwork sampling” technique that in 1998 produced, for the first time, a representative sample of all American congregations in the “National Congregations Study” (NCS). By 2008, the NCS had undergone a second iteration. In the hypernetwork technique, randomly drawn respondents to the General Social Survey were asked if they attended religious services, and those who answered in the affirmative were then asked to name the institution in question. The result was a random sample of congregations, with the

chances of a given congregation's inclusion being proportional to its number of constituents. NCS researchers then contacted a key informant in each congregation with a lengthy battery of questions. The 1998 NCS has data on 1,234 congregations, and the 2008 survey has data on 1,506. These data can be used to weight the results of nonrandom but nonetheless large and representative samples of American congregations—for example, the survey conducted by the project on “Organizing Religious Work,” directed by Nancy Ammerman in 1997–1999.

Such survey data inform this article. Yet because small groups (either of individuals or institutions) are statistically unlikely to be chosen in random sample surveys such as the General Social Survey, the NCS can tell us little about, for example, congregations of Muslims, Buddhists, and Hindus, to name three important and growing religious communities, each of which accounted for little more than 1 percent of the American population in 2000. So the field of congregational studies will continue to rely on case studies and denominational rosters for much basic information.

Distributions

About 96 percent of America's 330,000 congregations in 2000 were Christian institutions, and, of them, about 94 percent were Protestant, the remaining Christian congregations being primarily Roman Catholic and Eastern Orthodox. The predominance of Protestant congregations is important, for, as we shall see, they have historically set the tone for other religious communities in the United States. Nonetheless, the number of non-Christian congregations has grown swiftly and significantly since the 1960s to about 12,000 in 2005. At the beginning of the twenty-first century, the largest group of non-Christian congregations comprised Jewish synagogues, temples, and *shuls*, numbering some 3,500. Mosques and Islamic centers numbered between 1,200 and 2,000, Unitarian churches and Buddhist centers each numbered slightly more than 1,000, and there were smaller but rapidly growing numbers of Hindu *mandirs* and Sikh *gurdwaras*.

Congregations vary enormously in the number of participants who compose them, and some of this variation is best explained by norms specific to one or another religious tradition. In general, Catholic parishes serve a thousand or more families, while the majority of Protestant congregations have fewer than a hundred regular attendees. Some Hindu temples serve dispersed populations that span several states, whereas Buddhist centers tend to have smaller constituencies. Synagogues tend to have more member families

than Protestant churches, although with a lower rate of regular attendance. Thus, the congregation gathered for a *shabbat* service in a large synagogue may number no more persons than are found every week in a small to midsize Protestant church. Methodist and Baptist congregations, disproportionately located in rural and small-town locations, tend to be very small, although there are many exceptions to such a generalization.

Most churches are small, but most worshippers attend large churches. In 1998, half of all American congregations had seventy-five or fewer regular attendees, but the average religiously active person attended a church with four hundred or more other worshippers. Thus, there are important differences between characteristics of “the average church” (which is very small) and the church of the “average churchgoer” (which is far larger). (“Average” here refers to the median, not to the arithmetic mean.) Both perspectives matter. Insofar as we are interested in what most churchgoers experience, we must pay attention to larger congregations. Insofar as churches themselves count, as units of representation in denominations or as icons of “religion” in America, we cannot neglect smaller ones.

Starting in the 1970s, such “skewness” became more pronounced. “Megachurches” (defined as congregations with weekly attendance of two thousand or more) attracted a larger proportion of the Protestant churchgoing population, at the expense of smaller congregations. What seemed to be happening was that it became increasingly hard to do what congregations are expected to do on the restricted resources that small congregations can command. In a highly mobile society where even faithful churchgoers find themselves looking for a church in a new hometown, people will be drawn to churches that can provide high-quality Sunday schools, youth programs, and worship music. Small churches will lose members who move away and will find it harder to replace them with people new to the community. But being conservative institutions that enshrine memories of ancestors, small churches do not easily die. They plod along with ever fewer members and programs. The end result is an increasingly skewed distribution with a few large churches attracting a rising percentage of the churchgoing population and a large and only slowly diminishing number of small churches serving a declining percentage.

Structural Types: Congregation, Parish, and Temple

The size distribution of American congregations not only tracks the increasing differentiation between megachurches

and the ordinary run of Protestant congregations. It also coincides with religiously defined differences in local religious institutions that may be obscured by the use of the generic term *congregation*. Strictly speaking, from an ecclesiastical point of view, a congregation is an assembly or gathering of voluntarily participating believers. In the congregational traditions, especially among Baptists and Jews, the congregation is, as the etymology of the word suggests, defined socially, by those who assemble to comprise it. (In the Roman Catholic tradition, a “congregation” is a religious order whose members take “simple” rather than “solemn” vows. Not only is that a different usage than the generic term that is the topic of this article, it is an opposed term, insofar as a Catholic “congregation” consists entirely of religious specialists whereas the congregation as we are discussing it consists primarily of religious amateurs.) The Baptist or Jewish congregation is autonomous, governed by its laity through a board of elders, deacons, or trustees. It hires (and fires) religious professionals. “Congregation” is a bottom-up concept for the local branch of the people of God.

Because the congregation is a voluntary association, most of its work is carried out by religious amateurs in groups dedicated to activities (rehearsing choral anthems, teaching Sunday school, counting the offering, assembling the monthly newsletter, maintaining the building, and cooking soup and sewing clothes for the needy) that draw on their talents and provide them with a meaningful connection to their faith. Congregations tend to be busy places where the religious content of many activities may not be immediately obvious to the outside observer.

Because they are defined socially, as voluntary gatherings, rather than administratively, by ecclesiastical mandate, and depend on the unpaid labor of their members, congregations are especially subject to what sociologists call the principle of “homophily,” the pattern by which like chooses like. Because friendship choices in American society are heavily determined by race, congregations tend to be racially and ethnically homogeneous or, to use a less benign word, segregated. According to sociologist Michael Emerson, only 5 percent of American Protestant congregations in 1998 could fairly claim to be multiracial.

The local unit of the Roman Catholic Church that is parallel to “congregation” in the sense of this article is the “parish.” In the Catholic tradition, parishes are defined spatially, in terms of the place, especially the neighborhood, in which they are located, rather than socially, in terms of the people who compose them. When the neighborhood is

segregated, so is the parish. Yet because of their somewhat less voluntary constitution, Catholic parishes are more likely to be multiracial than Protestant congregations. In the past, the rectory was home to a corps of priests who served the parish. Today, the priest-parishioner ratio has greatly declined with the reduction in priestly vocations and the growth of the Catholic population (especially due to immigration). Many parishes now have only one resident priest; some have none. The constituent population of Catholic parishes is much higher than that of most Protestant congregations, and the disparity is growing.

An important exception to the spatial definition of the Catholic parish occurred as a result of the great migration of a century ago (roughly 1880–1920), when American bishops authorized “national parishes,” defined by the immigrant group whom they served (and who often funded their construction). Thus, many American cities have a heritage of “German,” “Italian,” and “Polish” Catholic parishes that at one time enjoyed ecclesiastical sanction. But pressures toward Americanization, especially during and after World War I, brought about a renewed stress on the territorial definition of the parish. During the 1920s, the church became less willing to designate national parishes for Catholic immigrants. The typical pattern at the end of the twentieth century was for a territorially defined parish to offer masses in more than one language, Spanish being the most widespread.

The Protestant congregation and the Catholic parish are venues for ritual observances (a “service of worship” or a “mass”) on the part of an assembly of the religiously defined community in a space large enough to accommodate their numbers. A third type of local religious institution may be called the “temple,” using this term more in the manner of Mormons and Hindus than Reform Jews (for whom “temple” is a synonym for “synagogue”). Many rituals in Hindu and Buddhist temples consist of esoteric interactions between individuals or families and religious specialists; some important rituals are conducted by priests in the absence of any lay devotees. Some of the most sacred of Mormon rituals are conducted in the temple with only a small number of people present. Because of the relatively small numbers of Hindus in the United States and their dispersed pattern of residence, some of the largest and most prominent Hindu temples in the United States are devoted to the service of multiple deities. Thus, *pujas* in service to several gods, each involving a handful of participants, occur simultaneously on the temple grounds. If the main worship event in a Protestant church can give it the air of a movie

theater, the profusion of parallel worship activities in a Hindu temple can make it feel a bit like a trade fair.

De Facto Congregationalism

Notwithstanding these hallowed differences across religious traditions, Stephen Warner proposed in 1994 that a process of “de facto congregationalism” was at work in American religion at large. American Protestants’ beliefs (for example, about the Bible) and practices (for example, hymn singing) were decreasingly aligned with their denominational affiliation and increasingly with the congregation they attended. For their part, many Protestant congregations made decreasing public reference to their denominational affiliation, identification of which began to appear in ever smaller type on their signboards. Individual Catholics felt increasingly free to attend a parish other than the one territorially defined for them. Canon law was relaxed to make territoriality only a “determining” principle instead of being “constitutive” of the parish. “Magnet” or “niche” parishes were developed by entrepreneurial priests to serve diverse Catholic constituencies: Irish, African American, gay and lesbian, progressive and conservative, those who fought to extend Vatican II reforms and those who harked back to the Tridentine (or Latin) Mass. Naming one’s parish was no longer a shortcut way of referring to where one lived; it became a signal of one’s values.

Warner’s de facto congregationalism extended to new, often non-Christian, communities in the United States as well. Members of immigrant groups who initially came together to create suitable worship spaces in their new homeland often found that the space served them as well as a place to speak their home country language and eat their home country food in the company of their fellows. As often the immigrant group’s most prominent public space in their new American home, the religious institution recommended itself for the observance of ceremonies that are not, in their religion, strictly speaking religious, for example, weddings in some Buddhist traditions. As their children grew up speaking English and adopting ways of American youth, the parents’ religious space provided a critical mass of people of somewhat similar backgrounds or ethnicities to undergird the norms they wanted their children to respect. Finding themselves unable to explain what to their children seemed exotic religious beliefs and practices, immigrant parents recognized that new programs of religious education were called for. Pursuing these ends, they found that they needed to raise money, and for that purpose they learned

how to take advantage of tax deductions for religious contributions. Some found it necessary to honor donors and to specify the names of those who would be eligible for the services their emerging institutions intended to provide. The congregational pattern of the Protestant majority (and of Jews, the largest and most well-established non-Christian minority) recommended itself to them.

De facto congregationalism is an instance of a process sociologists call “institutional isomorphism.” (The paradigmatic case is the widespread adoption of the organizational form known as “bureaucracy.”) Pressures toward isomorphism can come from law (for instance, qualifying for Internal Revenue Service recognition as a 501(c)3 nonprofit organization) and from expectations on the part of interested parties. An imam of an Islamic center may learn from members of the interfaith clergy association ways to address the Muslim community’s needs. A doctor who invites a coworker’s family to her son’s wedding may be asked if the wedding is going to take place in her Buddhist temple. But not all processes toward congregationalism come from American pressure or models. Innovations in religious organization take place all over the modern world, wherever religion is decreasingly taken for granted. Several Hindu movements (for example, Chinmaya Mission, Swadhyay Parivar, and the Swaminarayan sect) organized themselves in India in ways that, intentionally or not, turned out to be well suited to American conditions, especially because of their focus on explicit instruction in rites that Hindu temples ordinarily take as culturally given.

The adoption of congregational organization in the United States can appear as an unwelcome devolution, compromising religious ideals. The practice of maintaining local membership rolls offends many Muslims’ concept of the *ummah*, the worldwide community of faith. The local Islamic center is supposed to be open to all Muslims, not just dues-paying “members.” The power of lay trustees over temple expenditures and personnel decisions comports badly with the deference owed to the *bhikku-sangha*, the community of monks, in the Theravada Buddhist tradition. The expectation that the family is supposed to show up at the mission every Sunday is not what many immigrant Hindus learned from their religiously observant parents. Congregationalism is the wrong way to organize religious life not only for some new immigrant communities but also for some old-stock American denominations. United Methodists pride themselves on their system of assigning clergy to congregations for brief terms and

under conditions that guarantee that poorer congregations are not left to rely on their own limited resources; congregational autonomy would undermine these commitments. In the face of the controversy over the ordination of non-celibate homosexual clergy, the Episcopal Church contested the claims of dissident congregations that they own the property they occupy. Although it is not simply a matter of Americanization, the concept of *de facto* congregationalism engendered controversy.

Functions: What Congregations Do

It should be obvious that the chief function of congregations is religious worship (although Buddhists may not use that term for their devotional ceremonies). Not only Chaves's and Ammerman's data showed as much, but also the case study literature that preceded these large-scale surveys. Yet it is also a well-established generalization about American congregations of whatever religious affiliation that they tend to be multifunctional. Their activities typically include not only worship but also religious education for children and adults, mutual care, social activities (or "fellowship"), cultural preservation or articulation, outreach and community service, and encouragement of members' civic and political participation. The activities in the middle of this list, especially mutual care and fellowship, have been underresearched. We know that those toward the top (worship and education) are nearly universal among American congregations, whereas those toward the bottom (community service and civic participation) are especially associated with the historical mainline Protestant tradition. Yet the prestige of that tradition and the early precedent it established for "religion" in America gives those activities normative weight as part of what Ammerman called the "template" for American congregations. Chaves gave special attention to the aesthetic component of worship as third in prominence (after worship and education) of congregational functions. Ammerman categorized congregational functions somewhat differently, but she agreed that congregations are places where the culture of the group (including its music, cuisine, and storytelling) is reproduced.

What occasioned more controversy is how political, civic, and service activities figured in the picture. In the post-1960s "restructuring" of American religion depicted by Robert Wuthnow, the "declining significance of denominationalism" was accompanied by the "growth of special purpose groups," and one implication was that Americans'

religious interests were increasingly expressed in terms of specific, especially political, agendas. The rise of the religious right in the 1980s suggested to many onlookers that these purposes were increasingly partisan. Chaves's 1998 data confirmed the findings of numerous case studies that congregations do not devote much of their effort to political and civic activism. Among Protestants, individuals who attend mainline churches were somewhat more likely to be encouraged to get involved in civic affairs, whereas those attending conservative churches were more likely to receive voter guides. Jews and black Protestants were more likely to hear speeches by political candidates in their congregations and to be encouraged to register to vote. Catholics were more likely to be recruited for a demonstration or protest march. But in all cases, such activities were the exception rather than the rule.

Another controversy arose from the "charitable choice" and "faith-based initiatives" policies of, respectively, the Clinton and George W. Bush administrations. Some advocates of these policies suggested that the governmentally provided "safety net" for economically distressed families could be supplanted by congregations' social service provisions—for example, soup kitchens, clothing banks, and warming shelters. The data are clear and consistent. Monetary and human resources devoted to social service activity are a small fraction of those expended by congregations. A small minority of the members of the typical congregation are involved in such efforts, and they are more likely to be found among mainline Protestant than conservative Protestant congregations and in larger ones rather than smaller ones. The programs that do exist are important for many congregations' sense of their mission, but they are most typically and effectively carried out in collaboration with organizational partners—religious, secular, and governmental.

Is the religiously provided social service glass half empty or half full? Chaves stressed that those who expect congregations to take up the slack of a shrunken welfare state suffer from a fundamental misunderstanding of the magnitude of the task. But Ammerman stressed how much social service work is in fact done through congregations, especially channeling volunteer efforts through organizational partners. Given the agreed-on finding that congregations spend their time on a welter of diverse activities—parenting classes, youth groups, Bible studies, new members classes, support groups, 12-step groups, prayer groups, missionary societies, building maintenance crews, choir rehearsals, hospital visits,

meal preparation, and a host of others, in addition to their primary activity of planning and conducting worship events—it was remarkable that three-fourths of religiously active Americans in 1998 attended congregations that featured some social service programs.

Constitution

The United States was the first modern nation to adopt a written constitution limiting governmental power and the first to enshrine religious liberty among its constitutional values. The U.S. Constitution contains no reference to a deity or any invocation of any divine power; the only reference to religion in the original Constitution is the provision that there be no religious test for holding public office. When the Bill of Rights was added, its first words expanded religious protection and symbolized the new nation’s commitment to religious liberty: “Congress shall make no law respecting an establishment of religion or prohibiting the free exercise thereof.” Of course, as James Madison recognized, words on parchment do not themselves make a constitution. Yet over the years the United States has managed, imperfectly but with reasonable success, to maintain both an extraordinary level of religious intensity and diversity by making the guarantees part of the way American society is constituted.

Adoption of the Constitution and the Bill of Rights

By the time of Independence, the American states had become quite religiously heterogeneous. Many of the new states retained some kinds of religious establishments, although by the late eighteenth century they tended to be far more relaxed than many of their more comprehensive European counterparts. The Church of England had been established in the five southern colonies, as was the Congregational Church in three New England ones. In the Middle Atlantic states there was no establishment, but there were religious qualifications for office. Pennsylvania, with no establishment, did not grant religious freedom to “papists.” Most states still required licensing of ministers and punished blasphemy, sacrilege, or criticizing the doctrine of the Trinity. Many required attending church and keeping the Sabbath. But by 1776, the trend was toward multiple Protestant establishments that provided public support for several churches, and establishment had come to mean support of religion generally through taxation, rather than support for a particular religion or penalties on nonbelievers or members of other faiths. But support was growing in many states, most notably Virginia, for the abolition of religious assessments. James Madison’s famous *Memorial and Remonstrance against Religious Assessments* both articulated and reflected this sentiment.

Under the Articles of Confederation, Congress ratified several treaties making reference to religious liberties. The Northwest Ordinance of 1787 guaranteed that “No person, demeaning himself in a peaceable and orderly manner, shall ever be molested on account of his mode of worship or religious sentiments.” The same ordinance funded religiously based education in the Northwest Territories. The Continental Congress made references to God and Christian practices.

The U.S. Constitution was adopted by the Convention on September 12, 1787, and ratified by the states on June 21, 1789. However, antifederalists had conditioned their support upon a promise that the first Congress would adopt a Bill of Rights, including a religious liberty guarantee. Among the advocates of such a guarantee, the growing Baptist minority played a particularly important role. Baptists, who had suffered both discrimination and oppression during the colonial era, took the leadership in advocating for a formal guarantee of religious freedom. Virginia’s Bill for Religious Liberty, first proposed by Thomas Jefferson in 1779 and finally adopted in 1786, became a model for the national conversation over a religious liberty guarantee in the new federal Constitution. Virginia’s bill provided

That no man shall be compelled to frequent or support any religious worship, place, or ministry whatsoever, nor shall be enforced, restrained, molested, or burdened in his body or goods, nor shall otherwise suffer on account of his religious opinions or belief; but that all men shall be free to profess, and by argument to maintain, their opinions in matters of religion, and that the same shall in nowise diminish, enlarge, or affect their civil capacities.

The creation of the Bill of Rights is embedded in conflict between federalists, who advocated a strong central government, and the antifederalists, who favored greater state autonomy. The debate over a Bill of Rights was dominated by concerns over its implications for the power of the new government. Many federalists considered a Bill of Rights not only superfluous but also seriously misleading because it might imply that the newly created national government had excessive power that needed to be restrained. In their view, the Constitution had already created a government of delegated powers, which lacked authority to take any actions that were not specifically authorized. Nevertheless, the commitment had been made

to win antifederalist support, and the new Congress set out to draft a Bill of Rights.

Originally twelve rights were proposed, including the religious freedom draft offered by James Madison on June 8, 1789: “the civil rights of none shall be abridged on account of religious belief or worship, nor shall any national religion be established, nor shall the full and equal rights of conscience be in any manner, or on any pretext infringed.” Ultimately two of the proposed amendments were rejected, and after several revisions, the religious rights guarantee was moved to the First Amendment and rephrased to read, “Congress shall make no law respecting an establishment of religion or prohibiting the free exercise thereof.” Members of Congress generally supported an amendment prohibiting a national religious establishment and guaranteeing religious liberty, but they devoted very little time or energy to analyzing its implications. The Bill of Rights was adopted on September 25, 1789, and ratified on December 15, 1791.

No Religious Tests

The problem of governing a religiously diverse nation had clearly been on the minds of the framers of the original Constitution. Article VI, section 3, provided that

The Senators and Representatives before mentioned, and the Members of the several State Legislatures, and all executive and judicial Officers, both of the United States and of the several States, shall be bound by Oath or Affirmation, to support this Constitution; but no religious Test shall ever be required as a Qualification to any Office or public Trust under the United States.

The provision for either an oath or affirmation reflects the recognition that some citizens have religious scruples against taking oaths, and others would object to invoking the name of a deity they did not recognize. Even more significantly, the prohibition against a religious test for public office was a departure from the common practice of requiring officeholders to swear to holding particular beliefs (usually the existence of God and/or faith in Jesus Christ, the Trinity, or divine reward and punishment). At the time this provision was adopted, eleven of the thirteen new States had religious requirements for public office.

There has been no significant litigation under this provision of the U.S. Constitution. However, religious tests and oaths continued to be common requirements for public

office in several states until ruled unconstitutional as a violation of the First Amendment's establishment clause in 1961. In *Torcaso v. Watkins* (367 U.S. 488), the Supreme Court struck down a Maryland law requiring a public officeholder to swear to a belief in the existence of God, because it privileged one kind of religious expression.

The First Amendment Religion Clauses

The opening sentence of the Bill of Rights provided that "Congress shall make no law respecting an establishment of religion or prohibiting the free exercise thereof." These words are typically divided into the establishment clause and the free exercise clause. (Grammarians note that they are not clauses at all.) The establishment clause offers protection against government-imposed religious obligations, and the free exercise clause offers protection against government-imposed burdens to religious practice. Constitutional scholars debate whether the two clauses should be considered as a single guarantee or treated separately and, if so, whether they might logically conflict with each other.

For almost a century, there was no significant litigation under these clauses. The one important nineteenth-century case to reach the Supreme Court was the case of *Reynolds v. United States*, 98 U.S. 145 (1887), in which the justices upheld a Utah law against polygamy and articulated a very constricted understanding of religious free exercise. Beginning in the 1930s, the religion clauses have been a major source of constitutional jurisprudence. Religious advocacy groups, beginning with the Jehovah's Witnesses Watchtower Bible and Tract Society and the American Jewish Congress, played a large role both in supporting litigation and in shaping constitutional doctrine, usually in support of separationist principles. Since the 1980s, conservative advocacy groups such as the Rutherford Institute and the American Center for Law and Justice have advocated successfully for a constitutional understanding that permits government to accommodate religious interests.

Contemporary Constitutional Disputes

Like all constitutional disputes, the religion clause conflicts reflect different interpretations of the Constitution's language. The following sections survey contemporary religion clause jurisprudence as it relates to the guarantee's specific words and phrases.

Congress

The First Amendment begins with the phrase, "Congress shall make no law. . ." As the word *Congress* indicates, these

guarantees originally bound only the lawmaking power of the federal government, leaving the states free to regulate religion as they saw fit. Some scholars have argued that the religion clauses had less to do with protecting religious freedom than with guaranteeing the autonomy of individual states to create whatever establishments they wished or regulate religious practice as they chose. However, the adoption of the Fourteenth Amendment after the Civil War extended the protections of life, liberty, and property against state infringement as well as national. And by the middle of the twentieth century, most of the guarantees of the Bill of Rights were "incorporated" into the Fourteenth Amendment. The Supreme Court incorporated the free exercise clause in the case of *Catewell v. Connecticut*, 310 U.S. 396 (1940), striking down a state law requiring a license for religious solicitation and the subsequent conviction of Jehovah's Witnesses proselytizers for breach of the peace. In the case of *Everson v. Board of Education*, 330 U.S. 1 (1947), a five to four majority of the Supreme Court incorporated the establishment clause while upholding New Jersey's policy of offering public transportation of schoolchildren to parochial as well as public schools. Since that time, it has been settled constitutional understanding that the religion clauses of the First Amendment apply equally to the states and to the federal government—or so it had seemed until 2002, when Justice Clarence Thomas suggested reversing that understanding. In a concurring opinion in *Zelman v. Simmons-Harris*, 538 U.S. 639 (2002), upholding an Ohio school voucher plan that provided students public funds for attending private (including religious) schools, Justice Thomas seemed to be making a variation of that argument, suggesting that while states could establish religions, they could not interfere with religious liberty. And when the Court voted five to four to uphold a display of the Ten Commandments among many monuments on display on the grounds of the Texas State capitol in *Van Orden v. Perry*, 545 U.S. 677 (2005), Justice Thomas wrote a concurring opinion reemphasizing his belief that the establishment clause should apply only to the national government. This suggestion would reverse more than seventy-five years of settled constitutional understanding and dramatically change the conditions of religious liberty within the United States.

"Respecting an Establishment"

Beyond the question of states rights, there remain major disagreements over the interpretation of the words "respecting an establishment of religion." Since colonial practice left

no single understanding of a religious establishment, we are left with no definitive understanding of what kinds of public policies constitute an illegal establishment, much less about the broader sweep of the language “respecting an establishment.” Traditionally, approaches to the establishment clause fall into two categories: accommodation of religion and separation of church and state. Those favoring separation of church and state take their imagery from Thomas Jefferson’s famous call for a “wall of separation” between church and state and envision religious and governmental functions as operating in separate spheres. Those favoring accommodation argue for a benevolent governmental stance toward religion, as symbolized by Justice William O. Douglas’s words, “we are a religious people whose institutions presume a Supreme Being” (*Zorach v. Clauson*, 343 U.S. 306 [1952]). In this view, both state and federal governments may voluntarily act to enhance opportunities for religious expression and may publicly recognize the religious culture of the American people, as long as they do not favor one religion over another.

In the process of deciding concrete establishment clause disputes, various justices have attempted to articulate what is at the heart of an illegal establishment. The following paragraphs describe some of these attempts, none of which are mutually exclusive.

Expenditure of public funds for religious purposes is the starting place, if only because Madison was so adamant about it in his *Memorial and Remonstrance against Religious Assessments*. Yet religious institutions have received public funds from the beginning of American history down to the present time, so this point has never been taken literally. As early as *Everson v. Board of Education*, 330 U.S. 1 (1947), the Supreme Court majority expressed concern about the expenditure of tax funds for transporting students to private religious schools but nevertheless upheld a New Jersey law providing bus fare for both public and parochial schoolchildren. The often contradictory series of Supreme Court cases about parochial school funding is inconclusive: *Zelman v. Simmons-Harris*, 536 U.S. 639 (2002), most recently, upheld state allocation of vouchers for children attending private religious schools. Since some expenditures of money are permissible and others are not, money alone does not seem to be the definitive factor indicating a religious establishment.

The longest-running “test” for establishment is the *Lemon* test, used, ignored, and criticized since it was announced in the case of *Lemon v. Kurtzman*, 403 U.S. 602 (1977). According to this “test,” a challenged activity is

acceptable under the establishment clause as long as it has a secular purpose and an effect that neither advances nor burdens religion and does not excessively entangle government and religion. The *Lemon* test reflects the separationist view that the establishment clause requires religious neutrality (secular purpose and religiously neutral effects), while accommodationists argue that the test is too stringent and that state and federal governments should be able to advance religion in nondiscriminatory ways. The *Lemon* test is the most comprehensive approach to establishment clause jurisprudence, but it seemed to have fallen out of use until it reappeared in the 2005 Ten Commandments cases. In *McCreary County v. American Civil Liberties Association*, 545 U.S. 844 (2005), the majority explicitly referred to the *Lemon* test in striking down Kentucky’s Ten Commandments display because it had an obviously religious purpose. In contrast, in the Texas Ten Commandments case *Van Orden v. Perry*, 545 U.S. 677 (2005), decided at the same time, the absence of an obviously religious purpose was one of the reasons the justices upheld the constitutionality of the monument.

As an alternative to the *Lemon* test, some judges suggest that religious coercion is the real danger to which the establishment clause is aimed; its goal is to protect freedom of conscience or freedom of religious choice. For example, in *McCullum v. Board of Education*, 333 U.S. 203 (1948), the justices struck down state programs offering religious education during the public school day because the programs relied on the coercive power of state compulsory education laws to foster religious education. In 1992, Justice Anthony Kennedy relied on this approach in his majority opinion in *Lee v. Weisman*, 505 U.S. 577 (1992). Kennedy argued that graduation invocations coerced students to participate in a religious event—and the coercion is all the more serious for young people, who are especially susceptible to group pressure and the pressure of school authorities.

Another explanation of the establishment clause is that it is an attempt to prevent religious conflict by avoiding institutional entanglement between church and state. Advocates of this view recall the dangers to civil peace when religious conflicts spill over into political ones, as they have often done throughout history. Particularly when tax money is involved, there is a danger of politicizing sectarian conflicts. Moreover, the institutional entanglement between church and state can easily compromise the integrity and autonomy of religious institutions. The concern is a practical one, as Justice Souter argued in his 2002 *Zelman* dissent. In his view, accepting government money puts a church in a

double bind: government requires some accountability to be sure the church is not using the money for illegal purposes. But that accountability involves the government in regulating and overseeing the activities of religious institutions. Thus, he explained, to accept vouchers, religious schools had to agree not to prefer their own church members, not to teach certain doctrines, and not to discriminate. All of those requirements potentially interfere with religious autonomy, so the entanglement endangers religious freedom.

One of the most thoughtful approaches to establishment is Justice Sandra Day O'Connor's "endorsement test," which she first introduced in her concurring opinion in *Lynch v. Donnelly*, 465 U.S. 668 (1984). Her opinion contends that the heart of an establishment clause violation is government endorsement of religion in a way that would make others feel excluded or give the impression that they were less than equal citizens. This test might inquire whether a Jew or a Muslim could feel less than equal seeing a Christmas nativity scene on public property, or whether a nonreligious person might feel excluded by the inclusion of invocations at public school graduation ceremonies, or whether a Hindu seeing an official posting of the Ten Commandments might experience a sense of "otherness" and exclusion.

Both separationists and accommodationists insist that the establishment clause requires religious neutrality, but they differ immensely on what that neutrality entails. Separationists insist that the establishment clause requires that government be not only absolutely neutral among religions but also between religion and nonreligion—hence, "religion blind." Seen in this light, one of the reasons the majority upheld private school vouchers in the *Zelman* case is because the voucher program provided money for public, community, and private religious and nonreligious schools on an absolutely neutral basis. Similarly, the majority opinion in *Rosenberger v. Rector of the University of Virginia*, 515 U.S. 819 (1995) emphasizes that the university's student activity money had to be distributed with absolute neutrality to student publications, irrespective of their religious content. Accommodationists understand neutrality only as demanding neutrality among various religious sects, while government is permitted to recognize, accommodate, and benefit religions in general, as long as it does so in a nonsectarian way. Thus, the heart of the clause is no religious discrimination. Laws granting military exemptions for religious conscientious objectors rest on this view, as does the funding of

military chaplains, as do laws protecting workers from religious discrimination.

Finally, Justice Antonin Scalia has advocated a historical approach to establishment clause jurisprudence, arguing that courts should be guided by the general understandings prevailing at the time the Bill of Rights was adopted. Moreover, contemporary understanding should give great weight to American traditions, including the enormous role that religion plays in the lives of the American people. Scalia makes this point in both *Lee v. Weisman* and *McCreary*, and Justice Rehnquist argued forcefully for a historical approach in his dissent in *Wallace v. Jaffre*, 472 U.S. 38 (1985) and again in *Van Orden v. Perry*, 545 U.S. 677 (2005). Dissenting in that case, Justice John Paul Stevens offers a powerful refutation of this view, noting how the framers' experiences of religious diversity were so much more restrictive than contemporary experience and how deeply their approaches would offend contemporary sensibilities.

While the establishment clause has been the source of a far greater number of constitutional conflicts than the free exercise clause, many observers claim that it is really the "dependent clause," intended to enhance the general theme of religious freedom as articulated in the free exercise clause.

"Of Religion"

Because the First Amendment singles out religion for special protection, the word *religion* serves as the threshold or gatekeeper to both constitutional guarantees, but the constitutional language gives no clue about what constitutes a religion. Most of the time, this threshold is passed without controversy, but occasionally courts are asked to decide whether the claim is a genuinely *religious* one. That question puts judges in the awkward role of deciding what counts as a religion for First Amendment purposes and what criteria to use for making the judgment.

Defining religion for purposes of the First Amendment constitutes a paradox, because no definitions are neutral. Every effort to define a religion privileges some particular kind of belief or practice and discounts others. History is singularly unhelpful. The authors of the Bill of Rights probably had a very limited understanding of what was a legitimate religion—often excluding the beliefs and practices of Native Americans—and they had little experience thinking (in Madison's phrase) of "Jews, Turks, and infidels. . . ."

The earliest judicial attempts to define religion emphasized belief—particularly belief in a supreme being. But by the mid-twentieth century, this definition already seemed

woefully outmoded. In *Torao v. Watkins*, 367 U.S. 488 (1961), the Supreme Court rejected such a definition and focused instead on the function of a religion and, especially, on the claims of conscience to which religions give rise. James Madison's earliest drafts of the First Amendment religion clauses had proposed the phrase "freedom of conscience." Furthermore, Madison's *Memorial and Remonstrance against Religious Assessments* defined religion as "the duty we owe to our Creator." The Court relied on this kind of reasoning in refusing to limit conscientious objector status to those whose objections to war were based on a belief in a supreme being during the Vietnam War era. In *United States v. Seeger*, 380 U.S. 163 (1964) and *Welch v. United States*, 398 U.S. 333 (1970), the Court relied on broader understanding that nontheistic beliefs function as religions and give rise to commands of conscience.

Important as this insight is, it does not encompass the full range of religious experience. Moreover, it provides little observable evidence of the kind the legal system prefers. Not surprisingly, then, judges have attempted to identify religion by observable behaviors, including the collective practices of religious communities—worship services and other rituals, institutionalized ways of propagating the faith to future generations, clergy or some other form of teaching or leadership, festivals and holidays or life-cycle events, for example. By the early twenty-first century, the trend seems to be to seek a family of characteristics, rather than a single essential element in identifying a religion. These may include some or all of the following: ultimate ideas; metaphysical beliefs; moral or ethical systems; comprehensiveness of beliefs; and accoutrements of religion, including such things as founders or teachers, writings, gathering places, ceremonies and rituals, organizational structure, festivals, and efforts at propagation. Of course, not every religion or individual religious person partakes of every one of these characteristics. Some conventionally religious persons are almost totally ignorant of the doctrine of their faith or unburdened by its moral commandments; others may partake in the spiritual life of their faith and ignore its communal manifestations. Still, taken in various combinations, these indicators help identify a wide range of religious phenomena.

“Exercise of Religion”

The very first free exercise case to reach the Supreme Court was *Reynolds v. United States*, 98 U.S. 145 (1878), upholding a federal law against religiously inspired polygamy. Chief

Justice Waite, writing for the Court, made a distinction between beliefs and actions, the former beyond government purview, the latter subject to regulation. Yet constitutional observers remind us that the First Amendment does not protect “religion” in the abstract, or even abstract beliefs, but the *exercise* of religion. However, identifying a religious exercise proves to be even more difficult than attempting to define religion. The scope of religiously motivated behaviors is virtually incalculable. Religious codes dictate a variety of means by which people worship: kneeling, standing, eating, fasting, ingesting alcoholic beverages or hallucinogenic drugs, making symbolic sacrifices or sacrificing live animals, covering or uncovering their heads or feet in houses of worship, singing, meditating, chanting, preaching, and speaking in tongues, to name only a few. Religions frequently mandate certain kinds of personal care, including bathing, hygiene, dressing, health care, diet, and hairstyle. Religious mandates cover comportment in the world at large in such areas as social responsibility, education, child rearing, relations between the sexes, medical practices, appropriate employment, financial decisions, and countless other aspects of life. Religious practices include ceremonial activities performed in religious institutions and secular practices motivated by religious faith—both obligatory and optional practices, practices sanctioned by recognized churches and those based upon individual conscience, as well as the folk practices of religious communities. And to add further complications, free exercise protection also covers the actions of religious institutions—including financial management, employment practices, social services, zoning, and architecture.

“Prohibiting”

The First Amendment provides that “Congress shall make no law . . . prohibiting the free exercise [of religion].” To “prohibit” a religious exercise—making it a crime or subject to a civil penalty—is indeed a very serious infringement on religious liberty, but it is only one of the ways in which liberty may be trammled. At least since *Sherbert v. Verner*, 374 U.S. 398 (1963), the Court has understood that clause to prevent unjustified burdens to religion. In effect, the word *prohibiting* has come to mean “burdening,” and thus the showing of a burden to religion is the threshold to free exercise protection. But what constitutes a burden, and how serious must it be to present a constitutionally cognizable problem? How can courts distinguish a major impediment to religion from a minor annoyance?

Harms to religious freedom are experienced in a variety of ways. Some laws literally prohibit a religious exercise. For example, in the case of *Church of the Lukumi Babalu Aye v. Hialeah*, 308 U.S. 520 (1993), the Supreme Court struck down a local ordinance that prohibited religious animal sacrifice while permitting most other nonreligious reasons for killing animals. Some condition government benefits on behavior inconsistent with religion, such as South Carolina's refusal to grant unemployment benefits to a Seventh-day Adventist who would not work on her Sabbath (*Sherbert v. Verner*, 374 U.S. 398 [1963]). Others make a religious practice impossible, such as the National Forest Service decision to build a logging road through land held sacred by local Native Americans (upheld in *Lyng v. Northwest Indian Cemetery Protective Association*, 5485 U.S. 439 [1988]). Some penalties or burdens on religious exercise or intentionally targeted at religious practices, but most are unintended burdens created when otherwise valid secular laws have the effect of burdening a religious practice. The difference may have great constitutional significance.

“No Law”

The wording of the First Amendment is stark: “Congress shall make *no* law. . . .” Not even constitutional literalists have taken “no law” to mean “no law.” This statement has never been taken literally; both state and federal government do prohibit various religious exercises deemed a threat to life or safety. To use a common example, nobody doubts that the state could prohibit human sacrifice, no matter how religiously sincere its motivation or how important it might be to its adherents. The real question is, under what conditions may government prohibit or otherwise burden a religious exercise? How are legislatures and courts to balance the protection of religious liberties against other important public interests?

Ordinarily, when a law is challenged, the state must only show that the law is reasonably related to legitimate interests, not necessarily that it is the best way to achieve them. In this kind of balancing, dominant interests generally prevail over minority interests. Furthermore, the person challenging the constitutionality of a law bears the burden of proof. Failing to overcome this burden leaves the law intact.

To put extra weight on the side of religious freedom, the courts developed the compelling state interest test. When a religious right is burdened, the burden of proof reverts to

the state to show that the public interest in burdening the religion is not only important, but *genuinely compelling*, and that no less burdensome strategies are available for achieving that interest. This method reflects the view that the whole point of having a Bill of Rights is to remove certain liberties from the ordinary balancing of the political process. Furthermore, in these cases the ordinary burden of proof is reversed, so that laws burdening religious freedom are to be unconstitutional, and its defenders bear the burden of establishing its constitutionality. Such laws are subjected to “strict scrutiny,” requiring their defenders to show (1) that the challenged law served not just an important public purpose, but a genuinely compelling one; (2) that the law was well tailored to achieve that purpose; and (3) that the purpose could not be achieved by some less burdensome legislative method.

Beginning in the 1963 case of *Sherbert v. Verner*, the Supreme Court ruled that only a compelling state interest was sufficient to justify burdening religious freedom, thus requiring the state to provide unemployment benefits for a Seventh-day Adventist who lost her job because she was not available to work on her Sabbath. In *Wisconsin v. Yoder*, 406 U.S. 205 (1972), upholding the free exercise right of Amish families to be exempt from state compulsory education laws, Chief Justice Warren Burger phrased the point by saying, “only those interests of the highest order and those not otherwise served can overbalance legitimate claims to the free exercise of religion.”

That approach remained constitutional doctrine until the ruling in *Employment Division, Department of Human Resources of Oregon v. Smith*, 494 U.S. 872 (1990), in which the Court majority ruled that the free exercise clause did not require exemptions from state drug laws for sacramental use of peyote in religious services. In this case, the majority held that the compelling state interest test was no longer necessary to justify unintentional burdens to religion stemming from valid secular neutral laws. Justice Scalia's majority opinion ruled that the free exercise clause is directly breached only by laws that specifically target religious practice for unfavorable treatment, not by generally applicable, religiously neutral laws. Consequently, laws inadvertently burdening religious exercise need not be justified by a compelling state interest.

The argument over balancing religious rights against other important interests is bound up with the distinction between intentional (or targeted) burdens on religion and

those that are the incidental results of other laws. Even apparently neutral laws can inadvertently burden someone's religious interests. For example, compulsory education laws were not adopted to impose burdens on the Amish (*Yoder*); narcotics laws were not intended to forbid the rituals of the Native American Church (*Smith*) or of Brazilian immigrant religious communities (*O Centro Spiritu Beneficente Uniao Do Vegetal v. Ashcroft*, 546 U.S. 418 (2006)). Military uniform regulations were not intended to burden Jewish men who are required to keep their heads covered (*Goldman v. Weinberger*, 475 U.S. 503 [1986]); nor were drivers' license photograph requirements imposed to burden Muslim women religiously required to cover their faces in public. Yet all of these laws imposed incidental burdens on religious practices.

Persons who claim to be burdened by secular laws usually do not ask that the law be withdrawn or overturned; they most often request exemptions. Religious exemptions to ordinary laws and policies are so common we often do not notice them at all. Legislation is full of religious exemptions, including laws that exempt churches from some provisions of the Civil Rights Act and from zoning ordinances, that exempt persons with religious objections from vaccination requirements, and even those that exempt Communion rituals from laws regarding serving alcohol to minors. These policies are sometimes criticized as violating the establishment clause by giving preferences to religion (*Estate of Thornton v. Caldor*, 472 U.S. 703 [1985]). Free exercise disputes center not on whether legislators and administrators *may* grant exemptions but on whether the constitution *requires* exemptions from otherwise valid, secular neutral laws in order to accommodate religious needs.

The question is thus whether the First Amendment requires that persons acting on sincere religious motives be granted exemptions from such laws. What kinds of justifications are sufficient to override religious burdens and refuse exemptions? The controversial *Smith* decision reversed the long-standing understanding that such exemptions were required unless there were a compelling state interest to the contrary. While Justice Antonin Scalia's majority opinion denied any free exercise *right* to religious exemptions, he insisted that legislatures are free to grant them as part of the normal political process. He recognized that this approach moves religious protection from the courts back to the political process. "Values that are protected against

government interferences through enshrinement in the Bill of Rights are not thereby banished from the political process." He readily admits that

leaving accommodation to the political process will place at a relative disadvantage those religious practices that are not widely engaged in; but that unavoidable consequences of democratic government must be preferred to a system in which each conscience is a law unto itself. . . . (*Unemployment Division, Department of Human Resources of Oregon v Smith*, 494 U.S. 872 [1990])

Hence, much of his argument turns on his preference for political solutions within the democratic process, rather than on judicial solutions. Critics of the *Smith* decision are appalled that this ruling removes this kind of religious protection from the status of a constitutional right and makes it simply a matter for negotiation within the political process.

Legislative Efforts to Restore Compelling State Interest

Almost immediately after the announcement of the *Smith* decision, a broad coalition of religious advocates, concerned about its potentially devastating implications for the rights of religious minorities, petitioned Congress to reverse the effects of the decision legislatively. In November 1993 Congress adopted and the president signed the Religious Freedom Restoration Act (RFRA), which legislatively restored the compelling state interest standard in cases where state or federally supported programs were involved. The key section of the bill states that government may restrict a person's free exercise of religion only if government can show that such a restriction "(1) is essential to further a compelling governmental interest; and (2) is the least restrictive means of furthering that compelling governmental interest" standard.

Congress relied on its authority under its Fourteenth Amendment power to "enforce by appropriate legislation" constitutional guarantees. The law was challenged in the case of *City of Boerne v. Flores*, 521 U.S. 507 (1997), a conflict between a church renovation plan and city's decision to preserve it unchanged as a historical landmark. Flores, the Catholic bishop overseeing the church, argued that the act required deference to the church's religious exercise unless the city could show a compelling state interest to the contrary. However, when the case reached the Supreme Court,

a majority struck down the act as violating the separation of powers by infringing on the judicial power. The majority ruled that while the Fourteenth Amendment grants Congress the power to enforce a constitutional right, the RFRA went beyond enforcement and, in fact, altered the meaning of the right, thus usurping both judicial power and the prerogatives of states. As Justice Kennedy wrote, “Legislation which alters the Free Exercise Clause’s meaning cannot be said to be enforcing the clause. Congress does not enforce a constitutional right by changing what the right is.”

After the demise of the RFRA, many states adopted their own versions of the statute, enhancing religious rights protection under state laws or constitutions. In 2000 Congress adopted the much more limited Religious Land Use and Institutionalized Persons Act of 2000 (RLUIPA), which forbids the federal government from implementing land use regulations that impose a substantial burden on the religious exercise of a person or on the religious exercise of a person confined to an institution, “unless that action is in furtherance of a compelling governmental interest and is the least restrictive means of furthering that compelling governmental interest.” Rather than resting on Fourteenth Amendment grounds as the RFRA had, this law was based on the commerce and spending clauses, since it extends to all programs that receive federal money. In *Cutter v. Wilkinson*, 544 U.S. 709 (2005), the Supreme Court upheld this law against an establishment clause challenge.

Proposed Constitutional Amendments Regarding Religion

From time to time various religious advocates have proposed constitutional amendments regarding religion, but none has come even near passage. The closest were reactions to the Supreme Court’s decisions in 1961 and 1963 that prohibited religious exercises in the public schools. In *Engle v. Vitale*, 370 U.S. 421 (1962), the Court struck down New York’s Board of Regent’s prayer, composed by state officials and promulgated for recital in the public schools. Two years later the Court struck down the common practice of public school Bible readings. (*Abington School District v. Schempp*, 374 U.S. 203 [1963]).

Almost immediately after those rulings, and continuing into the twenty-first century, there have been persistent efforts to reverse the impact of these decisions by constitutional amendments. Nearly every congressional session has seen the introduction of constitutional amendments to authorize prayers in public schools, religious symbols on

government property, and tax dollars for private religious schools. A typical version is the amendment President Reagan sent to Congress in 1982, which read, “Nothing in this Constitution shall be construed to prohibit individual or group prayer in public schools or other public institutions. No person shall be required by the United States or by any State to participate in prayer.” Similar proposals have occasionally received favorable hearings in congressional committees, but none has made it through the first stage of the amendment process.

Proposed constitutional amendments banning abortions and limiting marriage to one man and one woman reflect religious sentiments but are not overtly religious. Thus far none has succeeded. More extreme amendments have also been proposed—including one declaring the United States to be a Christian nation and one in 2008 declaring Islam not to be a religion. Such proposals are usually understood to be political statements and have not been taken seriously as genuine candidates for consideration.

Cult of Domesticity

In the early-nineteenth-century United States, a set of ideals regarding womanhood and the home emerged that was commonly called the cult of domesticity. Americans who subscribed to this widespread ideology, found in sermons, novels, and magazines, believed the ideal woman possessed the qualities of piety, purity, submissiveness, and domesticity. This “true woman,” as she was called, was suited to life in the home, a private domain removed from the public world of politics and economics. The true woman was an embodiment of virtue, whose moral goodness originated in her innately pious nature. Such perceptions of women’s spirituality led to an increasing association between women and Christianity in the nineteenth century that ultimately granted women a degree of religious authority in American culture. From the 1830s through 1880s, the cult of domesticity profoundly constrained women’s lives, governing how women evaluated themselves and were evaluated by others. At the same time, the cult of domesticity credited American women with a moral influence that enabled them to shape and at times challenge U.S. culture.

Separate Spheres

The cult of domesticity emerged in the context of changing political and economic structures. The nineteenth century saw the United States transform from a fledgling agricultural democracy into an industrialized global power. The new republic contended with ever-expanding national borders, large-scale immigration, and growing tensions between federal power and state sovereignty. In the same period, a process of industrialization was taking hold in the urban Northeast, beginning along the Erie Canal in upstate New York. In the midst of political uncertainty and economic upheaval, a new middle class arose. The members of this class—doctors, lawyers, managers, teachers, office workers, and their families—performed newly important functions in the changing society. The urban factory began to replace the rural subsistence farm as the center of economic production in the United States, dramatically altering women’s relationship to the economy. In the agricultural economy, women were vital producers who grew food, spun and sewed clothes, and made other goods that their families required for survival. In the emerging industrial economy, women of the upper and middle classes, who no longer needed to produce their own food or clothes, became consumers, purchasing necessities and accumulating material commodities

such as furniture, books, decorations, and clothes that showcased their taste and class status.

As these transformations took place, Americans began to conceive of men’s and women’s familial and national roles in new ways. Many Americans came to believe that society was divided into two separate spheres: the public sphere, associated with the political and professional worlds, and the private sphere, equated with the home and family. Men toiled at financial and political endeavors in the rough and ruthless public sphere. Women assumed responsibility for the family’s moral education, health, comfort, and happiness in the safe and serene private sphere. Ministers, doctors, and others claimed that women had physically and morally delicate natures that would be corrupted or damaged by voting, working, or otherwise participating in the fields of government and finance. Many Americans rationalized that women’s exclusion from the public sphere not only protected the “weaker” sex but also preserved the home as a moral refuge from the arduous and depraved world. In effect, the ideology of separate spheres allowed Americans to maintain certain cultural values, particularly the Christian values of modesty, obedience, and meekness, which conflicted with the self-interest necessary for attaining success in a developing capitalist society. In the private sphere, women ostensibly upheld the traditional religious ideals of American society, while men pursued wealth and political power in the public sphere.

True Womanhood

The ideal of the true woman emerged with this transformation in women’s roles. In the cult of true womanhood, femininity came to be equated with familial and religious devotion. Women’s identities as daughters, sisters, wives, mothers, and Christians formed the basis of their cultural value. True womanhood demanded that the completed woman be pious, pure, submissive, and domestic. Magazines, advice manuals, novels, and religious literature helped create and popularize the cult of domesticity and instructed women in the best ways to embody the essential qualities of true womanhood.

Religion, specifically Protestant Christianity, formed the basis of the true woman’s virtue. It was the source of her femininity as well as her power in society. In magazines such as *Godey’s Lady’s Book*, edited by Sarah Josepha Hale (1788–1879), perhaps the century’s most influential domestic arbiter, women read that religious reverence enhanced a woman’s personal attractiveness. Women were informed that

they would find fulfillment only when their lives were absorbed in Christianity. That process of fulfillment would begin sometime in adolescence, when girls were expected to undergo a personal Christian conversion. A lack of religious interest or conviction in women was considered an anomaly and an affront to femininity. Irreligion made a woman revolting, because her faith was the foundation of her chastity, obedience, and domesticity.

Purity was equally essential for the true woman. Women were expected to remain chaste until marriage, when they would bestow on their husbands the gift of their virginity. Without purity, a woman was deemed a “fallen woman” or “fallen angel.” Unworthy of respect, the fallen woman was no longer considered a woman at all. In popular books and magazines, women’s sexual activity brought about insanity, illness, and death. Death, in fact, was often considered preferable to seduction. The threat of impurity was serious enough that advice manuals suggested that young women should avoid sitting beside or reading from the same book as men.

The ideal of women’s submission, a distinctly feminine virtue, was frequently justified through Christian teachings, both Protestant and Catholic. Piety and purity were desired characteristics in men, but society expected and forgave their failings in these categories. Obedience, however, was demanded only of women. As men made decisions and took action, women were expected to passively conform. Many Americans claimed that this sexual hierarchy was established in the Bible. Others, such as George Burnap in *The Sphere and Duties of Woman* (1854), asserted that women needed and wanted protectors. Submission asked that the true woman serve her husband’s, father’s, and brother’s desires in a state of continual dependence.

Finally, the true woman exemplified domesticity. The home was the true woman’s domain; it belonged to her and she belonged in it. The cult of domesticity insisted that women make the home a warm, tasteful refuge from business and politics, a place to nurture children and ease a husband’s burdens. From housekeeping manuals such as *The American Woman’s Home* (1869), written by the popular authors and sisters Catharine Beecher (1800–1878) and Harriet Beecher Stowe (1811–1896), women received advice on everything from caring for the sick to polishing furniture. Home decoration, food preparation, cleaning, and children’s education became moral duties that reflected a woman’s virtue and her family’s Christian devotion.

Image and Reality

The image of the true woman was demanding and demeaning—it required women to live up to an exacting model of womanhood in which they remained explicitly subordinate to men. Moreover, the ideal was unrealistic. As much praise as they might receive for their feminine virtue, women were often plagued by feelings that they had failed to fulfill society’s expectations. Even Beecher, a popular writer and the daughter of the celebrated and influential minister Lyman Beecher (1775–1863), could not fully adhere to the ideals of domesticity. Catharine submitted neither to conversion nor to marriage as her father and society expected.

Furthermore, the prevailing image of the true woman was white, middle-class, and Protestant, reflecting the context of the industrializing U.S. Northeast in which the ideology of domesticity emerged. Women who differed from the true woman by religion, race, class, or region acutely felt their exclusion from this pervasive feminine norm. Catholic and Jewish women, for instance, were largely barred from acceptance as true women by widespread anti-Catholicism and anti-Semitism. Within the largely immigrant Catholic and Jewish communities, true womanhood represented not only an impossible ideal, given the need for many women to support their families by working outside the home, but also a departure from traditional religious values and practices. In Catholicism, the church, not the home, was the center of moral and religious education, and celibacy, rather than marriage, was celebrated as the paradigm of purity. Assimilation to Protestant ideals signified a rejection of the church’s authority and teachings, and as such Catholic Americans cultivated their own distinctly Catholic model of domesticity. In Orthodox Judaism, men were responsible for the spiritual needs of the family, while women, prohibited from studying the Talmud and excluded from full membership in the congregation, supported the family physically and economically. In contrast to American Catholicism, the American Jewish Reform movement largely adopted the tenets of true womanhood, revising women’s roles at home and in the temple.

Similarly, and perhaps more starkly, racial difference obstructed admission to true womanhood. Free and enslaved African American women were frequently sexualized in U.S. culture, perceived alternately as seductresses and victims of male lust. This supposed impurity barred black women

from the category of true womanhood. In her narrative *Incidents in the Life of a Slave Girl* (1861), escaped slave Harriet Jacobs shows how the standards of true womanhood are impossible to maintain within the system of slavery. Assailed by her owner's sexual advances, Jacobs's only method of preserving her purity is to choose another white man as her lover and hopeful protector.

Catholic, Jewish, and African American women were not alone in their anxieties. Women who lived in the U.S. South and West, women who sewed or laundered clothes for wages, women who toiled on farms, immigrant women, and Asian American and Latina women all felt their unquestionable deviation from the feminine standard. Still, the true woman remained a pervasive ideal and a symbol of national belonging with which U.S. women struggled throughout the century.

The Feminization of American Religion

Womanhood became nearly synonymous with Christian virtue in the nineteenth century. The true woman's piety was the source of her purity and her selfless obedience. Even the virtue of domesticity, women were reminded, was religious in origin; St. Paul himself had allocated the home and its cultivation to women. As femininity was increasingly viewed as an effect of women's natural religiosity, religion came to be seen as the province of women. Churches and religious organizations began to be viewed not only as appropriate outlets for female activity but also, along with the family, as part of the feminine sphere. The association of women with the church reflected a revolution occurring within Protestant Christianity, sometimes called the feminization of American religion. Scholars have used the term "feminization" to describe both a sentimentalizing trend in Christian theology and the transformation of women's roles within religious organizations that occurred during the nineteenth century. It should be noted that this feminization was largely rejected by Catholics through the 1860s, who endorsed the patriarchal parish and household over and against what they viewed as a nationalized culture of domesticity. In Protestant communities, however, women's power and presence increased during the nineteenth century, instilling in women a new consciousness about their moral responsibility. As religion became feminized, Protestant women were ascribed and assumed the role of spiritual guardians, taking upon themselves the task of developing and defending the Christian home and the Christian nation.

Theological Transformations

In the first decades of the nineteenth century, the United States experienced the Second Great Awakening, a period of religious fervor and activity distinguished by the popularity of evangelical revivals and the proliferation of new Christian sects and denominations, including Mormonism and Shakerism. In the wake of this spiritual enthusiasm, the major Protestant Christian denominations began to adopt increasingly emotional models of religious practice. In 1800, Protestants were likely to explain their faith in terms of dogma, a system of beliefs the members of a particular church were required to accept. By the 1870s, Protestants were likely to describe their faith through the family values and civic responsibilities they advocated and practiced. This new emphasis on social values indicated a transformation from the repressive and patriarchal Calvinistic models that had dominated the American religious scene to a more sentimental and accommodating Protestantism. This change was reflected in Methodist, Baptist, Presbyterian, Congregationalist, Episcopal, and Unitarian churches with new policies and programs, such as infant baptism and children's Sunday school instruction. Interpretations of the figure of Jesus Christ similarly began to shift. In sermons and religious literature, ministers conceived of a new Christ defined by love, selfless sacrifice, and forgiveness. This modest and meek Christ was viewed as an affectionate companion, as the popular nineteenth-century hymn "Nearer My God, to Thee" illustrates. Nineteenth-century Americans likewise celebrated God's compassion. A mother's mercy as well as a father's authority comprised God's essence, according to Theodore Parker (1810–1860), a prominent reformer and Unitarian minister. As the church and its theology began to exemplify domestic virtues, Americans became increasingly conscious of a vital, distinctly feminine, religious responsibility.

Women and the Church

Although the ministers and theologians who constituted the church hierarchy remained overwhelmingly male, women's prominence within religious communities expanded throughout the nineteenth century. Church congregations frequently included more women than men, and their female members exerted powerful influence over the direction of the church. Realizing women were the chief consumers of religion in society, Protestant ministers routinely

addressed women's particular concerns, praising women's innocence, maternal inclinations, and quiet endurance of the various burdens that accompanied marriage and child rearing. Within the church community, women's presence was felt everywhere. Women taught and frequently supervised Sunday school and wrote popular hymns; and in the West, where congregations had fewer members, women occasionally participated in church services.

Beyond their individual churches, women became important members of religious organizations and reform movements. In temperance, antislavery, and religious tract societies, women raised funds, licked envelopes, and solicited support from their husbands and other family members. Women also channeled their sense of piety into missionary work, laboring most often within the United States to provide Christian instruction to indigenous communities. Some particularly daring women (who were able to find husbands who shared their religious enthusiasm and ambition) became missionaries in foreign lands such as China and the Holy Land. Cultural assumptions about female piety and virtue enabled women to assume an energetic role within the church and its endeavors. As she gained a sense of religious responsibility, the nineteenth-century woman began to see herself as a "new Eve," charged with improving and perhaps even perfecting American society.

The Christian Home

This new Eve sought to reform America starting at home. Her home was a space for reflecting Christian values and influencing others' moral actions. In *The American Woman's Home*, Beecher and Stowe included drawings for a home church, a house that may be converted at a moment's notice into a small chapel complete with steeple. Stowe and Beecher's image illustrates how many nineteenth-century Americans viewed the home and the true woman as extensions of the church's moral authority. In the Christian home, bed-making, cooking, and needlework were viewed as morally uplifting activities. Such tasks absorbed women in productive pursuits that left little time for sinful activities, and they created a pleasant environment that induced brothers, husbands, and sons to stay home and forgo the dangerous temptations (alcohol, gambling, sex) of the outside world. With her family comfortable and content at home, the true woman could bring her family closer to God. The tasks women performed at home—child care, nursing, gardening, mending clothes, financial management—aimed to make

the Christian family the foundation of society. Ideally, as women wielded their influence in the home, their families would embrace Christian values. Collectively, these families would constitute a Christian neighborhood and eventually a Christian nation. The new Eve could improve her society simply by setting the proper example for her family.

Sentiment and Social Reform

Women expanded their moral influence beyond the home through popular literature and social reform efforts. Although many ministers, teachers, and mothers expressed concerns about the dangers of women writing and reading, women's literary endeavors were accepted for the most part as an appropriate extension of women's moral facility. Women became enthusiastic writers and readers of domestic or sentimental fiction, which sought to instruct women and children in Christian virtue, general usefulness, and social responsibility. Sentimental novels, such as Susan Warner's (1819–1885) best seller *The Wide, Wide World* (1850), scripted the community and the nation as one large home in which sympathy and Christian duty formed the basis for social action. Conceived as an extended Sunday sermon or biblical parable, *The Wide, Wide World* asked readers to extend compassion toward the friendless child heroine Ellen Montgomery and to interpret her eventual happy marriage as a reward for her faith and humility. Although men were not considered a suitable audience for women writers, they evidently consumed women's fiction and helped solidify its incredible popularity. In fact, nineteenth-century women writers were more widely read than theologians, causing some scholars to suggest that domestic fiction had replaced theology as Americans' primary spiritual guide.

In conjunction with their literary endeavors, U.S. women increasingly channeled their piety and moral influence into social reform. This intrusion into the public sphere was justified, women argued, because society had violated Christian commandments and teachings through adultery, slavery, and excessive alcohol consumption. Feminine intervention was necessary to defend the family against the immoralities of male-dominated society. Seeking to eradicate prostitution and limit opportunities for adultery, the New York Female Moral Reform Society was founded in 1834. In addition to preaching to prostitutes and praying in brothels, the society published a popular national weekly, *The Advocate of Moral Reform*, which was staffed with women writers and editors.

Women also joined the antislavery movement, participating in the work of the American Anti-Slavery Society. Among the more famous female abolitionists were Lydia Maria Child (1802–1880), a notable author of fiction, housekeeping advice, and children’s literature, and Sarah Grimké (1792–1893) and Angelina Grimké Weld (1805–1879), sisters and public lecturers on the antislavery circuit. The temperance movement, which sought to curb or prohibit the consumption of alcohol in the United States, likewise attracted large numbers of women. Temperance appealed to women as a family issue, because drinking reputedly took money and men away from the home. By participating in these reform societies, women expanded their collective power while remaining within the bounds of conventional femininity.

The Little Lady and the Big War

Women’s writing and religious reform efforts often complemented each other and at times even merged. Stowe’s novel *Uncle Tom’s Cabin* (1852), the most popular book of the nineteenth century and the most famous example of literary activism in U.S. history, has often been credited with hastening the U.S. Civil War. Upon meeting Stowe, President Abraham Lincoln famously called her the “little lady who made this big war.” Stowe herself claimed the novel was written by God, excusing her interference in the intense public debate over slavery as an act of Christian piety. *Uncle Tom’s Cabin*, in fact, employs the values of domesticity and true womanhood to persuade its readers to join the antislavery cause. Written explicitly in response to the Fugitive Slave Law of 1850, which required northerners to return escaped slaves to the South, *Uncle Tom’s Cabin* depicts slavery above all as a destroyer of families and an affront to domestic life. As such, Stowe implies, slavery demands women’s attention and intervention. The novel calls upon true women to recognize slavery’s incompatibility with Christianity and exert their moral influence over husbands, fathers, and sons.

Moral Crusaders

As women endeavored to improve society through literature and social reforms, they changed the meaning of domesticity. Submissiveness, one of the central tenets of true womanhood from the 1830s to the 1860s, gradually diminished in importance as women embraced “moral authority” as a feminine prerogative. As a consequence, women’s attempts

to transform the nation through moral suasion gave way to increasing social and political activism, particularly following the U.S. Civil War.

Most notably, women converted their sense of moral righteousness into public action through the temperance crusades of the 1870s. Women temperance crusaders organized marches on the street and prayer meetings inside bars to protest the consumption of alcohol. In 1874, the crusaders formed the Woman’s Christian Temperance Union (WCTU), which eventually boasted more than 176,000 members, making it the largest association of women in the nation. The WCTU expanded its reform efforts under the direction of President Frances Willard (1839–1898) to include child care for working women and immigrant aid. Willard developed a protofeminist platform for the WCTU, even campaigning for limited woman’s suffrage. Under the banner of “Home Protection,” Willard argued that women needed the vote to make alcohol consumption illegal.

Despite its basis in women’s presumed moral superiority, women’s activism existed in tension with the ideals of domesticity. In uniting the temperance cause with the woman’s suffrage movement, Willard illuminated the inherent limitations of domesticity. Proponents of domesticity declared that women were supposed to influence men quietly in the home, not on the podium. Women’s rights activists might argue that suffrage would enable women to protect the family, but the political equality woman’s suffrage would establish between men and women conflicted with conventional morality. As early as 1837, Beecher had expressed her disapproval of the Grimké sisters’ lecturing before “promiscuous”—mixed male and female—audiences. The Grimkés, however, felt that women had an obligation to speak out not only against slavery’s wrongs but also against the subordination of women. The fundamental tension between these points of view persisted throughout the nineteenth century, causing many women’s rights activists to abandon the tenets of domesticity. This impasse would prove to be the cult of domesticity’s undoing. By the 1880s, the ideal of the true woman was becoming outmoded, the symbol of an old-fashioned moral framework that could no longer forward women’s interests.

Domesticity’s Interpreters

In the twentieth and twenty-first centuries, the cult of domesticity has served as a subject of heated debate. Critics have struggled to understand how deeply the ideology of

domesticity affected the lives of Americans and whether such ideas of womanhood ultimately served conservative or radical ends. Many of domesticity's original interpreters, including Barbara Welter, conceived of domesticity as a lived reality for nineteenth-century women, whose experiences deserved to be studied alongside political and economic histories. Subsequent critics, among them Nancy Cott, Ann Douglas, and Jane Tompkins, argued that domesticity and "separate spheres" were not realities but, rather, ideologies that deeply affected American political and religious culture. In Cott's view, domesticity and its consequent sex segregation created a sisterhood, at least among white, middle-class, northeastern women. Douglas, by contrast, perceived the cult of domesticity as a symptom of general cultural degeneration, in which feminized religion and sentimental fiction affirmed an unjust economic system and encouraged women to embrace confining roles. Countering Douglas's analysis, Tompkins suggested that domesticity, in its very conventionality, provided women with the means to mold, challenge, and transform mainstream cultural values. More recently, Amy Kaplan has proposed that the cult of domesticity was intertwined with the histories of national expansion, or Manifest Destiny, making domesticity a vital part of U.S. political history and foreign policy. Gradually, the cult of domesticity has come to be seen as an important element of nineteenth-century culture in the United States, neither separate from political, economic, and religious histories nor the cause of cultural deterioration. The cult of domesticity

was a complicated and integral component of nineteenth-century U.S. culture, a powerful and popular ideology that had the potential to serve both conservative and radical ends.

D

Death and Burial Practices

Death and burial practices in America have been as varied as the people who have populated the land. From the beginning of European settlement, attitudes toward death, beliefs about the afterlife, and practices surrounding death and burial were important markers of identity separating native from colonist, Protestant from Catholic, Calvinist from Anglican, and African from European.

Among European Americans, there has never been a single “American way of death.” Although American death practices and beliefs are far from homogeneous, it is possible to identify widespread patterns that reflect broadly shared religious and cultural values. As these values have changed, so have the practices and beliefs related to death and burial. In the early years of European settlement, the growing wealth in the colonies led to greater materialism and optimism, which were reflected in opulent funerals and an anticipation of salvation. In the nineteenth century the idealization of the domestic sphere found expression in images of death as a natural homecoming. The acceptance of embalming during the Civil War ushered in the professional role of undertaker and the removal of the body from family control. By the mid-twentieth century, death itself had been largely removed from the home and took place in the company of medical specialists and life-prolonging technologies. Critics of these “death-denying” practices gained enough popular support in the 1960s to demand substantial reform in the care of the dying and the disposal of the dead. As a result, Americans today can choose not only between burial and cremation, but also

from an array of traditional and novel religious and secular rituals and symbols to create a personally meaningful farewell.

Death in Early America

European settlers in the New World brought with them Catholic and Protestant religious traditions, which they aggressively introduced to the Native Americans. For the many Spanish and French Catholic colonists, a good death depended on the availability of a priest to administer the sacrament of last rites to the dying and perform the funeral mass. The last rites offered sinners a final chance to repent and receive forgiveness before their postmortem journey. Though necessary for the forgiveness of sins, the sacrament did not guarantee a direct entry into heaven. Apart from the saintly, most were destined to spend time in the state of purgatory expiating their sins, and the prayers of the faithful at funeral mass were believed to shorten this duration. Whereas these Catholic practices were eventually accepted by many Native Americans as they suffered devastating death tolls from epidemics under Spanish and French rule, Protestant missionaries had much less success. Protestant colonists rejected the existence of purgatory and the ability of the living to affect the destiny of the dead through prayers and other meritorious acts. Consequently, those of the Anglican and Reformed traditions simplified the sacramental and liturgical systems of the Roman Catholic Church to varying degrees. The most radical reforms were made by the Puritans in New England, who expressly forbade the superstitious ceremonialism.

Puritans' Approaches to Death

Seventeenth-century Puritans approached death with anxious fear of damnation, because the doctrines of depravity and predestination made any certainty of salvation impossible. John Calvin's insistence on the utter depravity of man derived from the assertion that because all had inherited Adam's guilt, none could merit salvation. Damnation was simply the logical outcome of divine justice. Through God's pure gift of grace some had been selected for salvation, but this knowledge was utterly beyond human capacity. Puritan ministers used death as a didactic tool, describing it in ghastly images of decomposition and hellfire to motivate their congregants toward conversion. Educated in the terrors of hell and unable to discern their predetermined fate, they were understandably terrified of the destiny awaiting them. In the context of belief in depravity, predestination, and the inscrutability of God, the sinner best approached death through stringent introspection and repentance. Appalled by their wretchedness, sinners had no choice but to rely entirely on God's mercy. As depicted in deathbed narratives, despair was the appropriate attitude of the dying. Ironically, doubt of salvation was the best assurance of salvation, because any suggestion that one deserved otherwise was a sure sign of self-delusion.

The first Puritans encountered death frequently and dealt with it efficiently. Families washed and dressed their own dead and laid them out at home or at the church for a few days prior to burial. The dead were buried at a central graveyard with no prayers or ceremony. Excessive displays of emotion, such as wearing black, were forbidden, and there is little evidence of grave markers. Mourners gathered at the family home afterward for a meal.

The stark simplicity of the Puritan funeral did not last long, however. By the 1650s signs of elaboration were apparent, and growing class distinctions were expressed through expensive funeral garments. Those who could afford to do so would send mourning gloves as an invitation to the funeral and give attendees mourning rings. Coffins were upgraded from simple to expensive woods and lined with cloth. The burial was accompanied by a funeral sermon often including a eulogy, and graves were marked with tombstones displaying winged skulls, bones, and hourglasses. The growing expense and formality of the Puritan funeral drew criticism, but it did not abate. The doctrines of depravity and predestination had not disappeared as the famous 1741 sermon by Jonathan Edwards, "Sinners in the Hands of an Angry God," makes clear. But because the

enthusiastic revivals of the eighteenth century (the Great Awakening) offered all sinners an opportunity to accept Jesus, salvation likewise could be attained through human agency.

Domestication of Death

In the nineteenth century fear of divine justice and damnation was eclipsed by peaceful images of death and a loving, merciful God. Letters, diaries, and sermons of this period indicate that death was a constant preoccupation, valued as a forewarning to the wayward sinner. Even though the unconverted were still destined for damnation, the faithful expressed confidence that a heavenly home awaited them. Heaven, pictured as an idealized earthly home where family and friends are reunited, seemed familiar and close by. Enslaved Africans had long thought of death as a return to their homeland in Africa, and their descendants who converted to Christianity routinely spoke of death as a homecoming and reunion in heaven. For example, the well-known slave spiritual "Swing Low, Sweet Chariot" declares,

Swing low, sweet chariot, Coming for to carry me home.
I looked over Jordan and what did I see, Coming for to carry me home?
A band of angels coming after me, Coming for to carry me home.
If you get there before I do, Coming for to carry me home.
Tell all my friends I'm coming too, Coming for to carry me home.

African Americans' belief that heaven was familiar can also be seen in the everyday objects they buried with their loved ones, who would need them on the other side.

In the nineteenth century European Americans also pictured death as a homecoming. The similarity and closeness between the spirit and earthly worlds became the basis for the spiritualist movement of the nineteenth century. Mediums traveled the country offering Americans a channel of communication with their beloved dead. Influenced by Romanticism, nineteenth-century Americans embraced death as a natural process that delivered the dying from earthly suffering rather than a punishment to be dreaded. Family and friends gathered around the bedside to witness the release of the soul as an edifying experience. Care of the dead continued to be the purview of the family: the family washed, dressed, wrapped, and laid out the body, keeping close vigil until the church service and burial. Keeping vigil showed great respect for the dead, but it also served the practical function of ensuring that no one was buried prematurely, a common fear at this time. The emphasis on familial bonds was expressed in elaborate displays

of sentimentality at the funeral and an extended public mourning period. As in the previous century, class distinctions were apparent in the degree of ornamentation surrounding the funeral, especially in the expense of the coffin and tombstone.

The disappearance of fearful images of decay and damnation can be clearly seen in the cemeteries of the nineteenth century. The tombstone engravings of New England had changed almost universally from skulls and hourglasses to cherubs and willow branches by the 1760s. The end of the eighteenth century also witnessed the first urban cemetery. Known first as “The New Burying Ground” and later as Grove Street Cemetery, it was built in 1796 in New Haven, Connecticut, but urban crowding and fear of disease pushed the dead farther from the living. A rural cemetery movement sought to integrate death with a cultivated natural setting that was both sanitary and peaceful. Mt. Auburn Cemetery, opened in 1831 outside of Boston, was a popular destination for locals and tourists. Designed as a beautiful garden where the living could commune with the dead in a natural setting, the rural cemetery expressed romanticized views of both nature and family. Families could purchase family plots to ensure they would remain together eternally. Following the model of Mt. Auburn, several dozen rural cemeteries, such as Laurel Hill Cemetery in Philadelphia and Spring Grove Cemetery in Cincinnati, were created across the country. By the latter decades of the nineteenth century, however, the rural cemetery was supplanted by the open expanse of the lawn-park cemetery with flush grave markers, which continues to dominate today. Unlike the often neglected graveyards of the early colonists, modern cemeteries required constant maintenance well beyond the care of family members. From the cemetery movement emerged the role of cemetery superintendent, one of many death professions to develop in the late nineteenth century.

The Modern Funeral

The Civil War was a turning point for burial practices in the United States. With so many soldiers dying far from home, Americans began to accept embalming in order to bring their dead home for burial. Embalming allowed families to view their dead one last time and be assured that they were buried in a fitting manner. Far from a modern practice, embalming had long been rejected by Christians on the grounds that it desecrated the body. When weighed against the practical problems created by the war, the religious opposition faded. The 1865 public

procession and viewing of President Abraham Lincoln’s embalmed body helped to popularize the practice. The scientific and technological allure of embalming also appealed to the modernizing impulse of the time. Although embalmers originally did their work at the family home, they soon insisted that the dead be brought to specialized facilities with the necessary equipment. Funeral parlors were designed to resemble the family home and minimize the disruption created by the physical removal of the dead from the control of the family. Undertakers organized themselves as legitimate professionals—funeral directors—in the 1880s and claimed authority over the care and handling of the dead. Many Americans resisted the transformation of funeral rituals, but wealthy Americans living in urban areas were the first to accept their expertise and pay for a refined funeral, as they sought to distinguish themselves from the commoner. It would be several decades before the majority of Americans would accept the modern funeral form.

By the early twentieth century, reliance on funeral professionals and acceptance of embalming had become the norm among urban Americans. Increasing urbanization and mobility, which disrupted local communities and their traditions, was one of many major social changes aiding this development. As families became more dispersed, embalming was essential for delaying the funeral long enough for everyone to gather. Because of rising life expectancy, Americans had less experience with death, and they turned to professionals for guidance. A similar shift was occurring in the care of the dying. Whereas doctors previously had made house calls, the modern hospital provided more efficacious treatment of disease. The dying were now in the hands of professionals with specialized knowledge and technology for staving off death. With their traditional caregiver role supplanted by doctors and nurses, Americans became unfamiliar with death and increasingly reliant on funeral directors to guide them.

Once the funeral industry began to disseminate ideas about proper preparation, display, and disposal of the body, as well as patterns of mourning, many Americans came to believe that they needed the expertise of a professional funeral director to guide them. The funeral director assured clients of a dignified farewell. In the United States, funeral directors successfully established not only the practice of embalming, but also the use of cosmetics and facial reconstruction to create a serene image of the restful dead. The elaborate preparation of the body and its placement in a costly, sturdy, but beautifully crafted casket were undertaken

for the benefit of the mourners, who took comfort in having a final picture of their loved one in repose. Cemeteries further added the practice of covering the casket with a grave liner or vault to ensure even greater protection of the peaceful dead. Together, the removal of the body from the home and the family's control, the practice of embalming and the use of makeup, and the body-preserving caskets served to mask the reality of death or at least push it to a more manageable distance. The funeral director arranged all the details of the funeral for the family, who could grieve free of disturbing images of decay. Public mourning practices greatly declined in the early decades of the twentieth century when extended or excessive grieving became viewed as a sign of psychological distress.

These modern practices of embalming and display combined with Christian beliefs in the afterlife with little difficulty. Efforts to sanitize death had no effect on the postmortem journey of the soul or the future resurrection of the body. The emergence of the American funeral industry did affect the clergy, however. The explicitly religious aspects of the funeral were retained: a church service with a theologically focused sermon and eulogy, followed by the burial in a local cemetery accompanied by prayers. But these rituals were increasingly overshadowed by the larger drama orchestrated by the funeral director. This loss of authority became even more obvious when Americans began holding the funeral service at the funeral home chapel to save themselves the expense and trouble of transporting the body elsewhere.

Although the funeral industry was able to wield considerable power in defining the ideal form of the modern funeral, its influence was by no means absolute. In rural parts of the country, families continued to care for the dead in the context of the local community and traditional Christianity. Even in urban areas, some religious and ethnic groups maintained control of their dead much longer than Anglo Protestants. For example, Orthodox and Conservative Jews refused to accept embalming and relied on their own burial societies, known as the *Chevra Kadisha*, to care for the dead. The *Chevra Kadisha* ritualistically washes and dresses the body and maintains a vigil until the burial, which takes place within three days. Jews have also resisted the elaborate casket in favor of a simple pine coffin. More recently, American Muslim communities have organized networks to care for their own dead in a similar manner. Today, many funeral homes will accommodate these traditional practices by inviting these groups to care for their dead within the rented

space of the funeral home, thus giving limited control back to the family.

Critique and Reform

Even though the funeral industry's practices had been criticized since its inception, by the 1950s piercing critiques were drawing much public attention. In her 1963 bestseller *The American Way of Death*, Jessica Mitford criticized the opulent materialism of the modern funeral, which sought to mask death through makeup and euphemisms. She condemned the industry's exploitation of grieving families and argued for a more authentic funeral experience. Mitford singled out embalming as an especially bizarre American anomaly. In response to public outrage, legislation was enacted in the 1980s to better regulate the funeral industry. Death professionals were required to provide detailed information about prices and forced to inform families that embalming was not legally necessary. These changes were insufficient for some consumers, who sought to bypass the industry entirely by creating local cremation and burial societies that offered inexpensive, no-frills options for disposal of the dead.

Concurrent with consumer demand for greater transparency in the funeral industry, the number of Americans requesting cremation rose dramatically. The practice was first introduced to the American public in 1876 as a more scientific and modern means of disposal, but it was widely rejected until the 1960s, when disgust with the funeral industry and the weakening of religious ties allowed cremation to become a viable alternative. Cremation took hold first on the West Coast, where religious affiliation is lowest, and has only slowly caught on in the southern Bible Belt. In 1950 the cremation rate was just 4 percent, but the number had risen to over 32 percent by 2005 and is projected to surpass 57 percent by 2025. The current cremation rate in the United States is substantially lower than in other Western countries: 72 percent in the United Kingdom and 56 percent in Canada. By comparison, Americans remain strongly tied to the practice of embalming, display, and burial, but the recent surge in the cremation rate indicates that American funeral practices are undergoing major changes.

The popularity of cremation has created significant challenges for both religious communities and the funeral industry. As noted earlier, the Abrahamic traditions have long required burial of the dead on theological grounds. Orthodox Jews, Muslims, and Orthodox Christians continue to reject cremation, as does the Church of Jesus Christ

of Latter-day Saints. Protestant Christians, especially African Americans, strongly prefer burial to cremation as do a slight majority of Catholics, but enough religiously affiliated Americans prefer cremation to push their religious communities to end restrictions on the practice. The Roman Catholic Church relaxed its absolute ban on cremation in 1963, but insisted that the body be present for the funeral mass. Because the presence of the body for the service required embalming and purchase or rental of a casket, cost-conscious Catholics often ignored the rule and proceeded directly with cremation. Rather than deny the funeral mass in these cases, in 1997 the church allowed cremated remains to be present at the funeral mass, but it has continued to insist that burial is the expected form of Christian disposal. Increasingly, Protestant and Catholic churches are adapting to the cremation trend by constructing scattering gardens and columbaria on their grounds, not unlike the ancient Christian practice of burying the faithful inside or close to the sanctuary.

From a financial perspective, immediate or direct cremation cuts sharply into industry profits. It requires no embalming, no facial reconstruction, no refrigeration, no casket (other than a cardboard box), no formal attire, no burial plot, and no memorial tombstone. To counter their losses, funeral professionals have creatively marketed new products and services to cremation customers as memorializing activities needed for grief facilitation. These activities include holding a viewing prior to cremation, which necessitates embalming and a casket; holding a memorial service, preferably at the nondenominational chapel of the funeral parlor; and purchasing a beautiful urn. In addition to holding a memorial service, families are encouraged to do some kind of memorializing activity around the disposition or scattering of the cremated remains. Here the options are large and expanding rapidly: burial in a cemetery plot is quite common, but many families will want to scatter the cremated remains at a site that was personally meaningful to the deceased. Whatever they choose, funeral directors encourage families to purchase some kind of stationary memorial marker where they can return as needed to spend time with the dead. Now that the industry has had to branch out beyond embalming and casket sales to survive, technologically savvy funeral directors are even offering video memorials and webcasting of services in real time. Just as embalming opened the door to the professionalized care of the dead, the practice of cremation is creating an opening for the development of new death rituals. The dizzying array

of choices now available appeals to the consumer seeking an alternative to the traditional funerary rites.

Personalizing Funerals

Today, American funeral practices are quickly diversifying as growing numbers of Americans seek a meaningful farewell to loved ones. The formal, professionally orchestrated, theologically focused funeral of the 1950s no longer achieves this goal for many Americans. Far from following a prescribed religious or professional script, contemporary death rituals are created out of the interactions among family, funeral professionals, and clergy. The demand for new death rituals is part of a much larger shift in American religiosity, which began in the counterculture of the 1960s. Spiritual seeking and denominational switching have loosened the commitment to the traditional religious forms in favor of a more flexible eclectic religiosity. Regardless of religious affiliation, the most recent trend in funeral practices has been toward greater personalization. Contemporary death rituals are designed to express the personality, values, and lifestyle of the deceased and to celebrate his or her life.

Thanks to the creativity and innovation of families and funeral entrepreneurs, the options for personalizing death rituals are expanding rapidly. For example, there are “theme” funerals complete with theatrical backdrops and props and “artistic” funerals in which everyone takes a turn at decorating the casket or urn. More common, families decorate the ritual space with photographs or create a slideshow that is featured during the service. The choice of readings and music is an obvious place to reflect the personality of the deceased. Although traditional scripture passages such as Psalm 23, “The Lord is my shepherd,” are very common, scripture is often juxtaposed with a contemporary song. A more subtle change in the funeral or memorial service is the central place now given to eulogizing. With the exception of the early Puritans, eulogies have long been part of the American funeral, but until now their significance has been secondary to the religious message delivered by the clergy. For the religiously unaffiliated, the entire service may consist of eulogies prepared by invited loved ones or a “shared eulogy” in which anyone is invited to speak at the service. Expression of feelings is further encouraged through a cyber memorial placed on the Internet where photos, videos, and shared reflections can be posted well after the actual funeral. Finally, the burial or scattering of the cremated remains is an obvious arena for a personalized farewell. Possibilities range from incorporating ashes into jewelry, artwork, and

fireworks to scattering cremated remains over a favorite beach or golf course.

Personal values, such as environmental concerns, are also expressed in the new death practices. Cremation has long been advocated as eco-friendlier than burial because it avoids the use of embalming fluids, the waste of precious materials in caskets and grave liners, and the use of land. For the environmentally conscious, cremated remains may be mixed with concrete and added to an artificial reef. However, concerns about pollution and energy conservation have caused some Americans to reject cremation in favor of “green burials,” or “woodland burials,” which are already common in Great Britain. In 2008 some thirteen green burial sites were operating in the United States, although the exact criteria for this designation have not yet been determined. At a minimum, these sites promote plant and animal life and prohibit embalming toxins, metals, concrete, and precious woods. Some do not even allow grave markers, but they do map the burial sites using global positioning devices. Loved ones are intimately involved in the green burial process by carrying the body to the actual burial. They are free to ritualize the burial in any manner they choose, including a traditional religious service held at the gravesite. Green burials bring together two contemporary American values: environmental conservation and nature-based spirituality.

As traditional religious forms are being renegotiated, there are seemingly endless possibilities for how Americans dispose of and memorialize their dead. Some new practices, such as space burial, cryogenics, or do-it-yourself burials, are too expensive or burdensome to gain many adherents. Others, such as the spontaneous shrines created in the wake of tragic deaths, have been quickly embraced by Americans and will become even more common. What most distinguishes American funeral practices in the twenty-first century is their celebration of the life of the deceased as the central narrative that brings meaning to death and life.

Death of God Theology

Death of God theology as a cultural and philosophical movement reached its pinnacle in the United States in the 1960s, but it has its roots in European intellectual history after the Enlightenment.

The theology emerged from the conviction that God had become culturally irrelevant in modern discourse and paradigms of selfhood. This movement stems from an increasingly secular worldview in discussions of morality, self-identity, and cultural issues. In spite of this theology’s provocative name, the notion of the death of God is not necessarily related to an atheist perspective, although it can be. More specifically, Death of God theology maintains that the view of God as a superior metaphysical being is no longer widely accepted, because the vision of God as a transcendent or providential being controlling the events of the world has essentially died. In a general sense, this view involves a move from transcendence to immanence: instead of religious paradigms, people now turn to scientific, pragmatic, or social explanations of the world. In the contemporary era the idea of God has meaning only in relation to what is known through human existence.

Death of God theology overlaps with some separate but closely related intellectual movements. The rejection of otherworldly sources of meaning places a strong emphasis on human experience and culture as the true sources of reality and is therefore very much compatible with existentialism. Furthermore, Death of God theology correlates with the

death of a certain type of Western metaphysical thinking. Rather than suggesting that philosophy can determine a category of absolutes, philosophical thinking is instead engaged in inquiry that relates to individual perspective and experience. The rejection of a traditional understanding of God—and thus a supreme grounding principle—suggests that things have value only to the extent to which they relate to other things in existence, an idea known as perspectivism. These ideas were considered in the views of existentialist thinkers such as Martin Heidegger and Paul Tillich in their expositions of how issues of ultimate Being must be considered in the context of the individual subject's being and experiences contained therein.

Nietzsche and the Death of God

At the forefront of the Death of God theological movement was the nineteenth-century German philosopher Friedrich Nietzsche (1844–1900). Nietzsche continued certain themes in his writings that also are prevalent in German Romanticism—human creativity, self-expression, and nature. In *The Gay Science* (1882) and *Thus Spoke Zarathustra* (1883–1885), Nietzsche describes characters who proclaim that “God is dead.” In both of these works, the characters in question are social outcasts who realize that the general community is not ready to recognize that God is dead. As sobering as this declaration may be initially, Nietzsche argues that human beings should ultimately view it as a moment of possibility. He views the Christian moral system as an outdated source of “slave-morality” that breeds resentment, pessimism, and self-doubt. Even though God has no real influence in modern-day culture, Nietzsche argues, people still cling to an antiquated view of the world that teaches them to doubt themselves and turn to an otherworldly God for solace—even though for all intents and purposes this God is dead. This realization is an important step in beginning the process of self-overcoming and the establishment of the *Übermensch* (the overman/superman), who for Nietzsche was the most enlightened and empowered version of the human being.

Nietzsche's influence on continental Europe and eventually the English-speaking world was significant. For one thing, many of the thinkers who followed Nietzsche interpreted his perspectivism and rejection of otherworldly sources of meaning as a basis for social critique and change. Without the perceived existence of a God who commands moral directives and metaphysical truth, the socially and

politically constructed value of the world is given much more emphasis.

Death of God Theology in the Twentieth Century

The Death of God movement took shape in the United States in the context of the social and political climate of the 1960s. It was represented by various voices.

Gabriel Vahanian

Operating from a Christian theological perspective, Gabriel Vahanian (1927–) in his *The Death of God* (1961) suggested that Americans were entering a “post-Christian” era. In his view, the death of God was only figurative, a cultural phenomenon marked by recent trends in secularism and pluralism that arose in the context of the twentieth century. For example, theologian Walter Rauschenbusch's idea of the “social gospel” at the beginning of the century provided an eschatological vision that pertained more to earthly matters of social justice, not otherworldly salvation. For authors like Rauschenbusch, Vahanian argued, the idea of God as a supreme or transcendent being was no longer essential. This idea led to an indeterminate era of “religiosity” in which doctrinal or theocentric religions were superseded by superficial forms. Some of Vahanian's examples included “do-it-yourself” religions that were most concerned about psychological and emotional well-being, or a watered-down view of God as the “Cosmic Pal,” a being who was little more than a calming influence amid the tumult of daily life. Vahanian suggested that in the contemporary age human beings would describe God in a manner that was most beneficial to their needs, and that ultimately these conceptualizations of religion would reflect anthropological need rather than religious awareness. He asserted that these movements shifted religion's influence away from the “transcendentalist” ideals of traditional Christianity and the Bible and toward “immanentist” ones, as defined by earthly goods and cultural institutions. Trends in Christian existentialism and humanism have only furthered the immanentist mindset, because their descriptions of the religious event downplay crucial theological moments, such as Jesus' death on the cross, in favor of anthropological observations.

Vahanian viewed this modern take on religion as superficial, if not idolatrous, and in need of an overhaul. In spite of his objections to the current culture, he observed that, ironically, the tradition of Christianity itself caused its

inception to a certain extent. In serving as the foundation of a civilization that eventually developed to the current secular state, it ultimately demonstrated its own majesty through the folly of the human condition. Echoing the nineteenth-century Danish philosopher Søren Kierkegaard, Vahanian suggested that the death of God demonstrated the true futility of the human condition, and ultimately human beings were even more dependent on God as the supreme living being than ever before.

Thomas J. J. Altizer

At the other end of the spectrum of Death of God theology was Thomas J. J. Altizer (1927–). Along with theologian William Hamilton, Altizer represented the more radical voice of the movement in the 1960s. Read widely in academic and popular culture circles alike, he was featured in two *Time* magazine articles in 1965 and 1966. The later article, “Is God Dead?” was published during the Easter season and fomented a national backlash. Many of Altizer’s public appearances throughout the country were met with protests, including an appearance on the *Merv Griffin Show* that abruptly ended when the studio audience began calling for Altizer’s death. Unlike Vahanian, Altizer viewed the death of God as a literal event. In spite of its seemingly sacrilegious nature, Altizer’s *Gospel of Christian Atheism* (1966) suggested that the death of God was actually a “Christian confession of faith” made possible by the very death of Jesus on the cross.

Following Nietzsche, Altizer viewed the death of God as the absolute moment of possibility for human beings. Altizer explained the death of God as a specific historical event that occurred when Jesus was crucified. He suggested that the radical Christian understands that God died along with Christ, and this death was in fact a final event. The true implications of this historical event have been overshadowed in traditional Christianity through the portrayal of the living transcendent God and the subsequent moral implications. To its detriment, the Christian tradition had understood itself as a tradition of sin and redemption, interlaced with supernatural elements. As an alternative Altizer offered a Hegelian interpretation of history, suggesting that the radical Christian vision involved a dialectical mode of understanding in which the profane event of God’s death was actually a mode of entrance to divinity. The world would be redeemed not as a supernatural act of God’s grace, but as part of the dialectical process of history itself. The Incarnation and Crucifixion were dual but necessary

moments in the singular process of God’s “self-annihilation” that negated the existence of God as only transcendent or wholly other. Only after God died on the cross, as a true human being, could absolute Spirit reach the world in a specific and determinate way.

When traditional Christianity viewed the sacrifice of God as a moral event that took place because of the shortcomings of humanity, it failed to appreciate that God’s own death was a deliberate act of self-annihilation and was the only event that makes true reconciliation possible. In Altizer’s view God’s death on the cross was part of a divine process, a gradual metamorphosis of Spirit into flesh. The death of God was also the moment of epiphany in which the world knew Christ and was thereby the possibility of transformation. Only an event as radical as God’s death could allow for true atonement: if God were a mere author of history, controlling its every event, the possibility for true reconciliation would not be possible. Insofar as God himself died and was also annihilated by this alien Spirit, then all forms of alien otherness would also be subject to this dialectical reversal. In this line of thought Altizer maintained that Satan himself was the “eschatological epiphany of Christ” and ultimately would be himself annihilated, and this would be made possible only by the death or annihilation of God.

Dietrich Bonhoeffer and Karl Barth

Like Nietzsche, Altizer and Hamilton saw the death of God as a ground for possibility, also describing the concept as a type of “radical theology” made necessary because of a perceived nihilism or complacency within contemporary culture. This emptiness was most dangerous because it created a false sense of security, even in times of great urgency. They cited the example of Dietrich Bonhoeffer (1906–1945), who wrote in his 1944 letters from prison that people must learn to live as if God were not there. The presence of Nazi Germany showed that “God is weak and powerless in the world,” and only once people make that realization and act on the basis of it could God continue to help them. Bonhoeffer described this realization of the death of God as a kind of “coming of age” process.

The Protestant theologian Karl Barth (1886–1968) represents an interesting foil to the Death of God theologians of the 1960s. On the one hand, as members of the Confessing Church in Germany, both Bonhoeffer and Barth criticized “liberal theology” because it placed too much emphasis on personal experience in the interpretation of religion. The

contemporary events of Nazi Germany should cause one to be highly critical of the human being's ability to do good. Barth emphasized the "humanity of God" as a central tenet of the Christian tradition, but believed that nineteenth-century thinkers such as Friedrich Schleiermacher and Ludwig von Feuerbach overemphasized the anthropocentric nature of this concept to the detriment of the tradition. Barth viewed the humanity of Jesus Christ as paramount, but it was solely because of his existence as the Redeemer of humankind. For Barth, subjectivism and cultural relativism as presences in religious thought needed to be corrected by a more precise interpretation of Reform theology. Although Bonhoeffer also believed in the value of Reform theology as the basis of the criticism of contemporary complacency, it was precisely the "coming of age" realization of the powerlessness—or "death"—of God in human culture that was central in his willingness to participate in the plot to assassinate Adolf Hitler.

Continuing Relevance of Death of God Theology

The problem of evil in the world introduces another important voice in Death of God theology, that of Rabbi Richard Rubenstein (1924–), who believed the death of God occurred within a specific historical event, the Holocaust. Rubenstein's *After Auschwitz* (1966; 2nd ed., 1992) was a revolutionary work that considered the problems of a post-Holocaust Jewish theology. Up to that point, Jewish thought was primarily conceived as following a covenantal model of election: God promises to act in history on behalf of the people of Israel as long as they keep the Commandments. Following from Deuteronomy 28, the people shall be "blessed" or "cursed" based on how well they maintain God's laws. God is viewed as a transcendent God who is an invisible author of history and the events that take place are an act of God's will. This logic poses a significant problem in the wake of the Holocaust, because it suggests that God willed the Holocaust to happen and that somehow Jews themselves are to blame for it.

Rubenstein argues that this notion of Jewish election or "chosenness" is no longer tenable after the Holocaust, and that the idea of God as a transcendent God who works through history is now dead. As a result, Jewish identity and the meaning of the covenant made at Mount Sinai must be radically reconceived. God should now be perceived as a God of nature who participates in its ebb and flow but does not control it. Although God's divinity exists everywhere, like the changing of the seasons, it is still subject to a basic

state of flux. This explains how God exists immanently, not transcendentally, and its paradigmatic example is found in Zionism, which Rubenstein explains as the Jewish people's yearning to return to their ancient homeland and union with the earth. Rubenstein is also heavily influenced by German philosopher Georg Hegel, but he ultimately suggests that Hegel's quest for continuity is inadequate. Drawing from the Kabbalah and other mystical traditions, Rubenstein suggests that God should be conceived as a Holy Nothingness without limit or end (En-Sof). God is not a tangible being or thing controlling the events of world; instead God is a "no-thing" that exists as the primordial ground of nature.

Death of God theology continues into the twenty-first century, although not with the same fervor of the 1960s. In addition to its contemporary applications by the thinkers noted here, it has been a significant influence within the circles of postmodernism, secular humanism, and existentialism. Over time, the idea of God as being real but dead—as illustrated by notions of "Christian atheism" or "Death of God theology"—was simply replaced by a more explicitly secular vernacular. In the latter part of the twentieth century, religious thought and religious ethics took more of a pragmatic turn. Because of both the moral and epistemological difficulties of proving the metaphysics of God's existence or death, such propositions are viewed as less important than the social and political impacts of such beliefs.

Deism

Deism, sometimes referred to as “rational religion” or the “religion of nature,” is the belief in a God disclosed in nature and by reason rather than in sacred scripture and by supernatural revelation. Deists typically reject scriptural inerrancy, miracles, providence, and ecclesial institutions, but accept the existence of a First Cause, the importance of virtuous behavior, and, less unanimously, an afterlife.

Originating in England, deism emerged from the context of the late seventeenth- and eighteenth-century Enlightenment. Deistic texts were appearing in the American colonies by the mid-eighteenth century, scandalizing orthodox Christians but attracting a lively following among young people and intellectuals. Although enthusiasm for deism waned in the first two decades of the nineteenth century, it gained surprising momentum, thanks especially to the tireless agitation of America’s most influential deist, Elihu Palmer (1764–1806), in the opening years of the Republic. Deism in the late colonial and early Republic periods became a rallying cry for freethinkers, religious-minded people disgruntled with Christianity, and radical republicans. In addition to Palmer, the leading American deists or deist sympathizers were Benjamin Franklin, Thomas Jefferson, Ethan Allen, Thomas Paine, and Philip Freneau. The young nation’s first five presidents seem more deistic than orthodox in their religious sensibilities.

Basic Principles

There was no universal agreement among the individual proponents of deism, any more than there is universal agreement among adherents of the major faith traditions. Moreover, the borders between eighteenth-century deism and liberal Christianity, on the one hand, and outright free thought, on the other, were sometimes difficult to establish. Some liberal Christians endorsed positions that sounded more deist than Christian, and charges of “infidelity” and “atheism” were frequently hurled at deists by their detractors. But there was a handful of core beliefs that nearly all deists of the period embraced. These principles can be grouped into two categories: critical and constructive.

Critical Deism

British and American deists consistently condemned revealed religion in general and Christianity in particular on two counts. (Early on, it was fashionable for deist authors to level their supernaturalist criticisms at Islam as a safe but transparent stand-in for Christianity.) First, deists argued that doctrines such as miracles, the divinity of Jesus, the Resurrection, and the Trinity were irrational. They ran counter to human experience—how can an enfleshed human being walk on water without sinking? How can a man dead three days be revived? And they violated the canons of reason—how can an entity be fully human and fully divine at one and the same time? Moreover, they argued, sacred scripture was full of unbelievable tales, self-contradictions, and sheer nonsense. As Elihu Palmer sarcastically asked in his deist masterpiece *Principles of Nature* (1801), if God condemned the serpent to crawl on his belly as punishment for tempting Eve, what was the serpent’s mode of locomotion prior to the divine curse? In short, the deists argued that no rational person could be expected to take the claims of revealed religion seriously. Indeed, any proposition based on a supposed revelation rather than experience or reason was immediately suspect.

But the irrationality of Christian doctrine was not the only point of deistic attack. Many but not all deists also criticized what they saw as the immorality of Christianity. All of them insisted that the church was an oppressive social institution that retained its power by intimidating, encouraging superstition, and collaborating with the state. Likewise, all of them rejected the doctrine of original sin as offensive to both reason and moral sensibilities. And nearly all of them also condemned the Old Testament as a morally dubious document that legitimizes wholesale slaughter and slavery and depicts God as fickle and vengeful. But some of them went even further by condemning the moral precepts taught by Jesus through word and example in the New Testament. Benjamin Franklin and Thomas Jefferson thought that the ethical precepts taught by Jesus were sublime. But Elihu Palmer believed that the scripture portrayed Jesus as petty (blighting the fig tree), unconcerned with private property (destroying a herd of swine into which demons were driven), and advocating unworthy behavior such as meekness or humility in the face of evil. Although Palmer’s fierce denunciation of Jesus as moral teacher was extreme, most other deists agreed with his claim that the New Testament neither offered a systematic ethic nor taught anything particularly new. As they saw it, the maxims attributed to Jesus

by the New Testament authors had been expressed earlier and more cogently by Greek and Roman philosophers.

Constructive Deism

Deists were first and foremost influenced by three fundamental Enlightenment principles: John Locke's empiricism, which held that all knowledge originates with experience; Isaac Newton's mechanism, which held that the universe is analogous to a cosmic machine and operates according to fixed natural law; and Francis Bacon's insistence that the true purpose of knowledge is to promote individual happiness, social progress, and development of the useful arts and industry. But the deists pushed these principles even further than their originators. Locke and Bacon, for example, were at least nominal Christians. Newton left open the possibility that God periodically intervened in miraculous ways in the operations of the cosmic machine, and he pored over sacred scripture scrutinizing prophetic texts.

Reason, experience, orderliness, a high regard for the concrete and practical over the abstract and speculative, and the reduction of religion to virtue were the primary ingredients of the deistic worldview. Experience disclosed patterns in nature that served as the basis for the natural sciences. The ability of the human mind to discern natural order attested to the fact that humans were rational creatures. Thus the orderliness of the human mind was a reflection of the larger orderliness throughout the universe. Just as the physical realm obeyed predictable laws of nature (as Newton demonstrated), so too did the psychological realm (as Locke demonstrated).

Deists were in unanimous agreement that the orderliness of both nature and mind pointed to the existence of an equally orderly and rational divine Architect. Few of them felt it necessary to offer rigorous arguments for their belief in God. At best they occasionally appealed to conventional arguments from design or causation. They concluded for the most part that the existence of a God as First Cause was evident from a consideration of nature and mind as opposed to sacred scripture or religious traditions. The Book of Nature was where God and God's ways were to be found. Moreover, they considered the study of nature to be one of the highest expressions of religious veneration.

Like many Enlightenment figures, the deists had little use for metaphysical speculation. Reason for them, as for Bacon, was primarily instrumental, a tool by which to expand human ability to manipulate matter and promote good works. An understanding of natural law was a necessary

condition for harnessing nature in the service of humankind. It was also essential to the liberation of humans from the religious superstition and political oppression that stood in the way of progress and felicity. So they were content to posit the existence of God as First Cause without speculating more closely about God's nature or whether there was an ultimate purpose or plan to God's creation of the world. This apparent indifference to God as anything but a convenient *deus ex machina* was just one of the signature characteristics that prompted the charges of atheism and infidelity so often leveled against the deists. (The primary cause of such charges, of course, was deism's repudiation of Christianity.) Although the accusation of atheism was unwarranted, it is true that the deist God was so minimalistic that the eloquent hymns to the Supreme Architect occasionally written by deists have a rather hollow ring to them.

Virtue was just as important to deists as reason and nature. All deists agreed that the best way to show reverence for the God of nature was by virtuous living, although they insisted that any assumption of a divine command foundation for virtue was incorrect. Practicing virtue may have been the most appropriate way to worship God, but virtue had no necessary connection to God except insofar as it reflected the rational order of nature.

For the most part what the deists meant by virtue was prudence and moderation—two practices they felt best accorded with reason. Benjamin Franklin, for example, famously worked out a moral calculus by which to habituate himself (and others who cared to try it) to moderate and prudent behavior. Ethan Allen and Thomas Paine, who in their private lives were anything but exemplars of either prudence or moderation, adamantly advocated both in their writings. Elihu Palmer, the closest thing to a systematic ethicist among the deists, defended the moral principle of "reciprocal justice," a prudential promise of mutual respect, as the foundation of morality.

After the 1789 French Revolution deists in both Great Britain and the United States, inspired by the ideals of radical republicanism, tended to espouse freedom of conscience, separation of church and state, elimination of slavery, emancipation of women, and universal suffrage. Their admiration for radical political principles earned them at least as much public censure as did their religious heterodoxy. In the United States opposition to what was seen as the social threat of deism was so great that Thomas Jefferson found it politically expedient to publicly distance himself from it. Thomas Paine, one of the French Revolution's most ardent

supporters and one of deism's most fiery champions, came to symbolize in the popular imagination the intertwining of political radicalism and religious free thought. Two generations after Paine's death, Theodore Roosevelt still referred to him as a "filthy little atheist."

British Origins

Edward Herbert, Lord Cherbury (1583–1648), is generally credited with the birth of deism. Herbert, a British diplomat, was horrified by the ferocious sectarian fighting in the Thirty Years' War (1618–1648). In his *De religione gentilium* (Of Pagan Religion), published posthumously, he seeks to distill sectarian differences into a system of belief about which Protestant and Roman Catholic adversaries in the war, despite their sectarian differences, could agree. He argues that the most widespread and therefore agreeable religious beliefs are the following: (1) God exists; (2) God deserves worship; (3) virtue is the chief part of religion; (4) it is appropriate for humans to repent of their sins; and (5) virtue and vice will be rewarded and punished in an afterlife. These five principles, while failing to satisfy the sectarians to whom they were directed, became the foundations of deism.

Herbert's *De religione gentilium* was influential primarily because it inspired more polemical and widely read successors. In 1696 John Toland (1670–1722) published *Christianity Not Mysteriorious* in which he explicitly denies Christian articles of faith such as miracles and revelation. For Toland, all human knowledge, including religious beliefs, has to be based on experience and display logical coherency. The creator of the universe is as orderly and rational as the creation itself, and religious inquirers have no need for appeals to the supernatural to understand either the world or God.

Anthony Collins (1676–1729) raised the polemical defense of deism to a new level when he attacked ecclesiastical authority in his 1724 *Discourse on the Grounds and Reasons of the Christian Religion*. Collins argues that sacred scripture is incomprehensible and irrational, and that it retains its privileged position only through the conniving of superstitious priestcraft. In *Discourses on the Miracles of Our Lord* (1729), Thomas Woolston (1668–1733) argues that the New Testament's account of Jesus' miracles is "broken, elliptical and absurd."

On both the British and American sides of the Atlantic, the most influential British deist was Matthew Tindal (1657–1733), whose *Christianity as Old as the Creation* (1730) soon became recognized as the "Deist Bible." Tindal repeats the denunciations of revealed religion indulged in by his predecessors. He denies the divinity of Jesus, questions the

ethical value of the Bible (he argues, for example, that sacred scripture paints a morally unworthy portrait of the Deity), and thunders against the influence of the church. He also provides a methodological rule of thumb that was embraced by subsequent deists: the only way in which supposedly "revealed" truths can be taken seriously is if they do not violate experience or reason. There is no other standard of truth other than empirical knowledge and the canons of logic. If any religionist claims as true a proposition that is "above" reason, much less "contrary" to reason, his claim is to be rejected immediately as confusion, superstition, or deliberate deception. This rule of thumb is most famously defended in David Hume's chapter "Of Miracles" in his 1748 *An Essay Concerning Human Understanding*.

British deism, while generating a relatively steady stream of polemical texts and broadsides from the late seventeenth century through the end of the eighteenth century, never fueled as acrimonious a public debate as its American counterpart. This relative calm stemmed in part from the prevalence of "liberal Christianity" in Great Britain during the period, defended by thinkers such as John Locke, Samuel Clarke, John Tillotson, and William Wollaston, who saw no necessary tension between reason and revelation, as well as the influence of Enlightenment empiricism on British churchmen and intellectuals. But what struck most British Christians as a minor annoyance (or, for some, an entertainment) tended to outrage the faithful, especially those in the Calvinist tradition, in America.

Deism in America

The writings of British deists trickled into the American colonies slowly. But by mid-eighteenth century their influence was being felt at Yale, Harvard, Princeton, and William and Mary. New England Congregationalist minister and future president of Yale Ezra Stiles wrote in 1759 that "Deism has got such Head in this Age of Licentious Liberty" that there was no choice for Christians but to "conquer and demolish it." Stiles, like most other American clergy, undoubtedly exaggerated the hold that deism had on the colonies. But it is true that by the end of the century worried college administrators throughout the young Republic considered their campuses to be hotbeds of impiety. Nor was deism an exclusively academic fad. Thanks to the polemical works of several apologists, deism was embraced by a sizable minority from Georgia to Massachusetts. Philadelphia and New York City appear to have been the two areas where deists were most active. Moreover, frequent denunciations in newspapers, pamphlets, and sermons, as

well as well-attended debates between deists and orthodox spokespersons, kept the religion of nature in the public eye. Most people in the colonies and early Republic were not deists. But most had heard of deism, and some, such as Benjamin Franklin, were undoubtedly converted to it after reading antideistic polemics.

Benjamin Franklin and Thomas Jefferson

Benjamin Franklin (1706–1790) and Thomas Jefferson (1743–1826) each endorsed private religious views that bore some resemblance to deism. Franklin confesses in his posthumous *Autobiography* that he abandoned his parents' Calvinism for deism while still a youth. Although occasionally attending Presbyterian or Anglican services as an adult, his religious convictions appear to have been more deistic than Christian. In his early "A Dissertation on Liberty and Necessity" (1725), he defends a mechanistic universe worldview that implicitly denounces Christian doctrines of free will and divine providence. Three years later, his "Articles of Belief and Acts of Religion" outlines a straightforwardly deist catechism that Franklin seems to have more or less adhered to for the rest of his life. But though he was widely rumored to be an "infidel," Franklin issued few public statements of personal belief during his lifetime and played no major role in the popularization of natural religion in America.

Thomas Jefferson was another deist sympathizer who was reticent about public expressions of his religious belief. Unlike Franklin, however, Jefferson was excoriated both during his lifetime and afterward as an infidel. As late as 1830 the Philadelphia Public Library refused to catalog his collected works on the grounds that he had died a free-thinker. Much of the rancor against Jefferson was politically motivated, associated as he was in the Federalist press after 1789 with French-style radical republicanism. But posthumously published correspondence by Jefferson, as well as his private redaction of the New Testament that expunged all supernatural references and retained Jesus' moral teachings, show that he endorsed natural religion.

Revolutionary Deists: Ethan Allen, Thomas Paine, Elihu Palmer, and Philip Freneau

America's first open defense of deism was written by the Revolutionary War hero Ethan Allen (1737–1789). His *Reason, the Only Oracle of Man* appeared in 1784. Although written in a tediously cumbersome style, the book was widely read and quickly earned Allen the anger and contempt of orthodox Christians. (Yale College president Timothy Dwight thundered that Allen was enlisted "in

Satan's cause.") Little is original in the book's criticism of Christianity and defense of deism. But especially noteworthy is the number of pages Allen devotes to denying the divinity of Jesus and arguing for the moral unworthiness of the God of the Old Testament. It is contrary to reason, he argues, to presume that "God should become a man and that man should become a God." Moreover, God should be held to the same moral standards as humans, "for the rules of justice are essentially the same whether applied to the one or to the other, having their uniformity in the eternal truth and reason of things."

The Age of Reason (1795) by Thomas Paine (1737–1809) is the best-known defense of deism penned by an American. As derivative as Allen's book but less difficult to read, *The Age of Reason* is important more for its public notoriety than its arguments. Predictably, Paine defends the "true theology" of natural philosophy: the "word of God is the creation we behold." He offers an argument for the existence of a divine First Cause, argues that miracles are "tricks to amuse and make the people stare and wonder," and condemns the church for its immorality. This condemnation does not extend, however, to Jesus, whom Paine believes to have advocated a morality of a "most benevolent kind." It is St. Paul, "that manufacturer of quibbles," who perverted Jesus' originally sublime message. Paine's book was greeted with outrage by the faithful, even though, ironically, Paine intended it as much as a response to the dogmatic atheism of the French revolutionaries as to orthodox Christianity. It is one of the few eighteenth-century defenses of rational religion still in print.

Undoubtedly the most original American deist was Elihu Palmer. A Presbyterian minister who renounced the pulpit for the law, Palmer devoted the last thirteen years of his life to spreading deism up and down the eastern seaboard. He lectured tirelessly; founded deistical societies in New York, Maryland, New Jersey and Pennsylvania; edited two widely read deistical newspapers; advocated founding "Temples of Reason," alternatives to Christian churches that would provide for the spiritual needs of deists; and agitated for republican political principles aimed against the "double despotism" of church and state. In 1801 he published *Principles of Nature*, a distillation and refinement of his thought. The book went through three editions before Palmer's death in 1806 and became known as the "American Bible of Deism." It is the most sophisticated defense of natural religion written on the American side of the Atlantic.

Much of Palmer's *Principles* is a recital of familiar themes: a denunciation of revealed religion and a defense of the God

of nature. What makes the book distinctive is Palmer's defense of an ethic based exclusively on naturalistic grounds. Earlier (and later) deists all insisted on the importance of virtue and the irrelevance for morality of a supernaturalistic God. But none of them offered a sustained argument on how to ground an ethic that claimed independence from religion. Palmer filled that gap by arguing that a naturalistic ethic rested on the twin principles of "reciprocal justice" and "universal benevolence." According to Palmer, humans are sentient creatures who naturally pursue pleasure and avoid pain. Pleasure promotes and pain destroys well-being. Reason dictates that the sensible person will act to maximize the chance for pleasure and minimize the possibility of pain, recognize that his actions toward others are reciprocated in kind, and conclude that his own best chance for well-being therefore lies in encouraging others to treat him well by treating them well. Elements of Christianity's "golden rule" are evident in all this. But the crucial point is that Palmer intended to defend morality on the basis of human nature and self-interest rather than scriptural injunction or religious tradition.

The final American deist worthy of mention is Philip Freneau (1752–1832), sometimes called the "poet of the American Revolution." Freneau, an anti-Federalist politician, journalist, and occasional civil servant, was an acquaintance of Palmer and corresponded with Paine. His defense of deism was expressed in verse and pithy parables that appeared first in newspapers and magazines and then in book-length collections. In "On Superstition," for example, he advises readers to "turn from her [superstition's] detested ways," and encourages cultivation of "the reasoning power, celestial guest/The stamp upon the soul impress'd." Like his fellow deists, he also insists that virtue is the highest form of veneration and that its practice maximizes happiness. Finally, Freneau predicts the coming of a "new age" in which reason will demolish political despotism and "dread superstition," the "worst plague of human race." Then he concludes that "the sun of happiness, and peace" will "shine on earth and never cease."

Decline of Deism

By the time Freneau died in 1832 deism in the United States had pretty much run its course. To a certain extent it died out as a clearly defined movement because it had succeeded in getting at least some of its message absorbed by the wider culture. Unitarianism, milder in rhetoric and more agreeable to popular sensibilities, gradually adopted

much of the antisupernaturalism endorsed by deism. Christian apologists, learning from deists the importance of reconciling notions of the divinity with the physical world, began to pay more attention to natural theology. And deism's criticisms of oppressive religious institutions and social practices began to seem a bit less radical when progressive movements such as abolitionism were endorsed by at least some Christian leaders.

But deism's decline in the second quarter of the nineteenth century was also attributable to the fact that the Enlightenment ethos from which it sprang gave ground in the United States to a new wave of Christian revivalism—the so-called Second Great Awakening—which tended toward anti-intellectualism and emphasized personal and emotionally turbulent piety. In addition, American transcendentalism, though not Christian, likewise called into question the Enlightenment conviction that reason was the best tool for understanding reality. The generation of infidels that immediately succeeded the deists—for example, Abner Kneeland, Robert Owen, and Frances Wright—were more influenced by the utopianism of Henri Saint-Simon and Charles Fourier than by Enlightenment ideals.

Finally, the rational religion advocated by deists was simply too impersonal to satisfy the popular religious imagination. Critical deism's savaging of supernaturalism in general and Christianity in particular appealed primarily to a generation of rebellious youth, many of whom returned to conventional religion with the passing of years, and to a small number of lifelong skeptics such as Thomas Paine. Constructive deism's God as a distant First Cause and virtue as the highest form of worship appealed only to a relatively small group of intellectuals. Such principles were too abstract for the general populace to find fulfilling. Deism always remained more a philosophical school than a religion, despite the efforts of deist popularizers such as Elihu Palmer.

Demographics

Demography is the statistical study and description of human populations. In its formal or narrow sense, it generates statistics that illustrate the conditions and processes of life in communities: births, deaths, migrations, education, income, race, family structure, spatial distribution, change, and the like. Like mathematics, however, demography is not ultimately about *numbers*; it is about *relations*. Thus economists, anthropologists, historians, and others borrow its tools. Religious demography analyzes the relationship between religion and the biological, economic, social, and cultural processes influencing a population across space and time.

Religion in America has long presented observers from abroad with a canvas of such kaleidoscopic dazzle as to provoke frustration and wonder in anyone who makes an effort to comprehend the whole. Little wonder that they wonder, for the United States is perhaps the most religiously complex nation in history. Most of the religions of the world are present, interacting internally with their own constituents and externally with one another, at least indirectly. These religions navigate the currents of a wider and partly secular culture. They deal with the inheritance of often obscure historical developments. And they respond to a dynamic, evolving present. Prudent analysts even within the United States cannot hope to comprehend all of this. But demography can help.

Challenges in Assembling and Interpreting Data

The work of demography is not without problems. All statistics harbor their own ambiguities, non sequiturs, and capacity to mislead. To convey even highly selective aspects

of America's religious history through statistics means at times indulging in risky calculations and generalizations.

For example, membership statistics for the seventeenth and eighteenth centuries are elusive, erratic, and difficult to compare. In most instances, therefore, one must gain a sense of a religion's size and proportion in this era by counting churches. What is referred to as a "church," however, may be an impressive building and its constituents, or instead a modest chapel-of-ease, an even more humble preaching station, or merely a loose collection of the like-minded. The term *church* thus varies in meaning in different periods and among different denominations.

Religious statistics after 1800 begin to inspire more confidence, but difficulties persist. *Membership* rather than *church* may seem at first glance a more accurate gauge for determining denominational strength. But *member*, like *church*, contains a span of meanings.

Religious bodies differ in their inclusiveness when they construe membership. Some churches tally everyone. Others count only those who remain in good standing, or who donate, or who are heads of families, or who are free persons, or who have been "born again." Some groups offer only estimates of their membership; others have no interest or few resources to keep records. Some bodies oppose the idea of enumeration on philosophical grounds. Maddeningly for the historical demographer, various churches periodically recalibrate their methods of tabulation.

One must, then, keep in mind qualitative variances in historical religious statistics, whether thinking of members or of churches (or synagogues, temples, centers, and mosques). The count of one hundred Pentecostal churches is not equivalent to that of one hundred Roman Catholic churches, but rather less, for a single Catholic church typically serves many more communicants than a Pentecostal one. Conversely, one hundred Baptist members will not be the equivalent of one hundred Roman Catholics, but a good deal more, because a Baptist group may count only adult baptized believers, whereas Catholics, who baptize their infants, claim the entire baptized family. By comparing denominations by both number of churches and size of membership and by complementing the demography with an informed historical awareness of the groups under discussion, one can achieve informed and balanced impressions.

A contrasting method of estimating religious affiliation offers an additional perspective. Here the measure is not how religious organizations enumerate their churches or

membership, but how people identify themselves religiously in response to surveys. This approach has the virtue of offering a direct glimpse into how contemporary Americans think of their religious attachments, beliefs, and practices. But like any method it has its limitations.

In light of the problems and necessity of religious demography what resources are available for guidance? And what demographic portrait of the nation emerges?

Sources

Selections from among the more important resources for helping to craft an understanding of the country's always-in-motion religious demography are listed in the bibliography. Three among them are examples of a strong starting point, especially if used jointly, because they employ demography in treating different but essential and complementary dimensions of religious life in America. The first work adopts the tools of geography, cartography, and narrative history; the second analyzes religion and contemporary public life; and the third reports private contemporary religious self-understanding.

Oxford University Press's *New Historical Atlas of Religion in America*, coauthored by Edwin Scott Gaustad and Philip L. Barlow, includes hundreds of color maps and graphs on dozens of religious groups. It is the most extensive effort to date to interpret the nation's institutional religious past to the end of the twentieth century through the combined means of statistical data, narrative history, and an array of maps. These maps place various "filters" over assembled data in order to depict a range of insights. Constructed maps, like assembled statistics and written history, are acts (or failures) of the imagination, using and arranging the building blocks of symbolized "facts." Maps thus bear their own dangers and distortions, all the while offering irreplaceable possibilities for visualizing enormous quantities of information and otherwise obscure spatial relationships. Maps are "white lies that tell the truth of the landscape."

The second recommended beginning point is AltaMira Press's "Religion by Region" series, under the general editorship of Mark Silk. The series is not a work of history, but a historically conscious exploration of religion and public life in the contemporary United States. More than fifty authors working with eight editors contributed to the series, which devotes an independently edited book to each of eight regions, supplemented by a summary volume reintegrating the sectional dynamics into a national story. Each volume begins with a chapter on its region's secular and

religious demography, and then integrates this demography with qualitative analysis of religion's encounters with politics, education, and other elements of the public sphere. The series demonstrates real regional differences and local religious-cultural accents that persist despite the homogenizing effects of modern mobility and mass communication.

The U.S. Religious Landscape Survey, conducted in 2007 under the auspices of the Pew Forum on Religion and Public Life, is a third resource for those beginning an exploration of America's religions. It is through this lens that this essay looks at the contemporary self-understanding of adult Americans in their relation to region. The study is based on interviews with a sample of more than 35,000 adults, eighteen years and older. The Pew Forum intends this survey to serve as a baseline for additional periodic surveys on a similarly large scale. Responses from participants provide researchers with estimates of the size of religious groups in the country, as well as a picture of additional demographic traits and basic social, political, and religious beliefs, attitudes, and practices. The Pew survey differs from previous polls by managing to ask a large sampling of people a large number of questions on religion, as opposed to asking a large sampling of people a small number of questions, or a small sampling of people a large number of questions. The survey's results provide an opportunity to examine the relationship among religious affiliation, religious and secular beliefs and practices, and factors such as age, ethnicity, place of birth, family size, regional distribution, and income and educational levels.

History

Analysts of the "present," including the religious and demographic present, must be historically informed: the present was formed by the past and is itself always becoming the past. Alertly or unaware, persons and institutions in the present are ever encountering and in dialogue with the consequences of the past. Each day and moment one engages not merely what "is," but what "has become" and what "is becoming."

This is not the space for a developed and balanced demographic-religious account of the nation's past—an exceedingly large task. What follows, instead, is an abbreviated sketch of several demographically inflected dynamics, focusing on immigration, nationality, ethnicity, and denomination or other institutional grouping. This approach intentionally ignores important elements such as gender, age, family structure, and wealth, leaving these to be exemplified

in the subsequent treatment of early twentieth-century America. This narrowed demographic sample of the earlier period will, however, illustrate the churning denominational and ethnic change that has always characterized American religious history.

Colonial Demography

As citizens and observers of the new United States worked to grasp the meaning and fallout of the successful revolt from the British monarchy, the young Republic both enabled and witnessed an era of bewildering social ferment. Federal and state disestablishment of religion, religious experimentation, missionary outreach at home and abroad, denominational cooperation and competition in the face of stupendous territorial expansion, and much else preoccupied the nervous and exuberant citizens. Grasping certain religious implications of democracy, ordinary people by the thousands embraced the camp meeting methods, the simplified theologies, and the proximity of unschooled “farmer-preachers” and circuit riders. These developments transformed the religious landscape in a single generation: upstart Baptists and Methodists, despite the efforts of urbane and rooted Episcopalians, Presbyterians, and Congregationalists, became by 1830 the largest denominations in three-quarters of the counties in the country, which had thrust westward to Missouri, Arkansas, and Louisiana. Immigration had even more impact than conversion in the long term, coming in great waves throughout the nineteenth century.

Indeed, immigration defined the continent from its first peopling, when Siberian tribes made their way across a land bridge into North America and south across the Plains and to wider dispersion, before ceding the continent in the modern era to the onslaught of European germs, guns, and numbers. During the seventeenth and eighteenth centuries these Europeans laid down an immigrant foundation along the eastern shores of North America, dominated by a comparatively rich mixture of Protestants from northern Europe. These Protestants attempted at times a valiant missionary outreach, but as a whole additional immigration controlled their increase.

Despite decades of scholars’ efforts to dismantle the dominance of New England in the telling of America’s early religious past, the migration of the Puritans into Plymouth and Massachusetts Bays in the early seventeenth century left an imprint slow to fade in the American psyche. The compact geography of Massachusetts and Connecticut, coupled with the size of the immigration and cultural homogeneity

of the immigrants, etched an enduring way of thinking, acting, and worshipping on the colonies, affecting family, school, church, and government. Historian Sydney Ahlstrom has estimated that Puritanism formed the moral and religious background for perhaps 75 percent of the population declaring independence from England in 1776. The colonists’ later migrations into the Midwest and their literary legacy disproportionately colored the country’s collective memory.

Even in New England, however, outcroppings of Separate Congregationalists began to grow strong, eventually developing into Separate Baptist churches. After 1710 Baptists were the largest group within the religious grab bag of Rhode Island.

The colonial reality outside New England was religiously diverse indeed. Beyond even the legal support they enjoyed, Anglicans predominated numerically along most of the coast south from Maryland and Virginia through South Carolina, though giving ground to religious invaders in the Piedmont and mountain areas as the century wore on. Roman Catholics had arrived shortly after the Puritans, founding and sustaining a presence in Maryland, which, though never exclusively Catholic, remained the central place of residence for Catholics through the end of the colonial period. Already by 1690, however, their original strength had contracted so much that they remained predominant only in the colony’s southernmost counties. Outside the British colonies on the Atlantic seaboard, nineteenth-century Protestant missionaries, carrying their Bibles to the Southwest, would discover that Spanish Catholics had preceded them by more than two hundred years, beginning with the founding of Santa Fe in 1610. Authorities recalled French Jesuits from their long-standing mission stations in 1764 in the face of war and eventual defeat at the hands of Great Britain. The vast Louisiana Territory was sold to the young United States in 1803, but French language, culture, and place names continued to suffuse the Mississippi River Valley from its upper reaches in Minnesota southward to St. Louis and New Orleans.

Demography of the New Republic

By 1790 Quakers still predominated in counties in West Jersey, in adjacent southeastern Pennsylvania, and in North and South Carolina. Lutherans, German Reformed, and Presbyterians eclipsed them after the mid-eighteenth century by occupying the hinterlands. Great diversity thrived among the Germans of Pennsylvania, where most Lutherans

shared church buildings with the German Reformed, and where Amish, Mennonites, and various German sects thrived. The Dutch Reformed, settlers of New Netherlands before the English wrested control from them in the 1660s, retained at the end of the eighteenth century strength in the New York counties west of Massachusetts and Vermont. Methodists were beginning to bare their comparative numerical strength on the Delmarva Peninsula in the southern portions of Delaware and Maryland.

The colonies' major involuntary immigration, from Africa, deserves its own extended treatment (as does the major involuntary internal migration of Native Americans). During the two centuries preceding 1808, when the slave trade was outlawed, nearly half a million blacks were brought to what was to become the United States. The African population in the eighteenth century was concentrated in Maryland, Virginia, South Carolina, and Georgia. Slaves shaped their traditional religious practices—quickly forced underground—to respond to the new environment. Eventually these traditions gave way to a hybrid orientation formed of both African (in some cases Islamic) and Christian elements. Some traditions, such as Santería imported via Cuba and the voodoo traditions imported via Haiti, especially to New Orleans, have had a long life. As the nineteenth century approached, the population of the young nation had grown to approximately five million. One in five was black—90 percent of them still slaves.

Despite some indifference or hostility to the religion of their masters, the era between the Revolutionary and Civil Wars would bring a mass conversion to Christianity, which in turn was affected by new styles and forms emerging from an African heritage. Some free and slave groups began a transition from worshipping on the plantation or in white churches to starting their own congregations and forming their own denominations.

The early nineteenth century brought immigrants from new places of origin, permanently changing the religious mix. Irish Roman Catholics came in streams from the 1820s onward. Stimulated after 1845 by famine and disease in Ireland, they came in torrents. In the ten years following 1845 nearly two million people—a fourth of Ireland's population—arrived in the United States, by which time they accounted for 43 percent of all foreign-born citizens. To the alarm of the Protestant immigrants and children of immigrants who preceded them, this very suddenly made Catholicism the country's largest denomination, which it would remain. This is no small statement in view of the explosion

of Methodist and Baptist converts during the preceding decades. In the northeastern United States the Irish newcomers overwhelmed even the Congregationalist heirs of the once-dominant Puritans. Contests over politics and the nature of education were tense if unsurprising; violence sometimes flared.

The Later Nineteenth Century

As potent as the Irish wave was, others came, too—in such numbers that by century's end the Irish portion of the nation's foreign-born had plummeted from 43 percent to 16 percent. Hailing this time from eastern Europe, many of these Austrians, Hungarians, Italians, Russians, and Poles were Catholics as well. They were also poor, taxing the capacities of the ecclesiastical hierarchy and bringing rivalries both among ethnic Catholic groups and between Catholics and Protestants. Ponder the implications: the Catholic population exploded from about fifty thousand at the beginning of the century, half of them in Maryland, to twelve million people, dispersed across the nation, by the century's end.

The human floodtide from eastern and southern Europe in the second half of the nineteenth century brought more than Catholics. Jews, fewer than four thousand around 1800, had by 1900 become more than a million. Not all the arrivals were religious, to be sure, just as with other groups. But enough were religious to establish more than a thousand synagogues, principally in New York and other eastern seaports. Even before the Civil War, however, German Jews had pushed westward, founding under the vision and perseverance of Isaac Mayer Wise an influential center of learning in Cincinnati and a new religious expression. Reform Judaism, as it was known, strove for a religious vitality relevant to the modern world and the American setting.

Yet another gush of nineteenth-century newcomers—this time Lutherans—came from Scandinavia. Perhaps a quarter-million strong in 1800, Lutherans had long prospered along the Hudson River Valley and in eastern Pennsylvania, especially from the time of their great national organizer, Henry Melchior Mühlberg, in the 1740s. By 1900 their numbers had swelled to two million, and the majority of the new arrivals were settling not in Pennsylvania or in urban centers like the Catholics and Jews, but in the upper Midwest—in Wisconsin, Minnesota, and the Dakotas. There they established a cultural fiefdom sufficiently enduring that, a century later, humorist Garrison Keillor could draw smiles rather than outrage by quipping, when asked whether someone in his home state of

Minnesota was a Lutheran: “Of course she’s a Lutheran. Everyone here is. Even the Catholics.”

By the end of the nineteenth century the largest non-Catholic body remained the Methodists, 5.5 million strong, who around 1812 had surpassed the Baptists, but who before the Great Depression would surrender to them their lead by ever greater margins. In 1900 Baptists could claim 4.5 million adherents, Lutherans and Presbyterians 1.7 million each, Christians/Disciples 800,000, Episcopalians 700,000, and Congregationalists 600,000. Along with the Catholics, these denominations, for all the breathless commotion and change, were by 1900 the largest and arguably the most influential religious organizations in the United States. If these figures suggest anything, however, it is a dynamic religious picture. The fleet pace of change would not lessen in the coming century.

The Twentieth Century

Immigration into the United States continued apace during the first decade and a half of the twentieth century. Arriving Greeks and Russians, for example, elevated the numbers of the Eastern Orthodox above the few who had settled in Alaska when it was still Russian territory, later trickling south as far as San Francisco. World War I, however, crimped Europeans’ ability to leave the continent even as it heightened Americans’ concerns about the prospect of them doing so. By 1924 these concerns had enabled passage of the National Origins Act, a quota system favoring immigrants from northern and western Europe. This legislation constricted not only immigrants from elsewhere, but immigration as such, because northern and western European countries at the time harbored fewer “huddled masses yearning to be free.” Although the rate of immigration began to rise again in the 1930s, not until the end of the century would the flow reach the torrent it had at the century’s beginning.

For the next forty years the National Origins Act checked the arrival of Catholics and Jews from eastern and southern Europe, and Hindus, Muslims, and Buddhists from India and Asia. Immigrants from Mexico and South and Central America, however, continued to stream in, rendering American Catholicism ever more Hispanic.

The first half of the twentieth century witnessed steady progress for most of the established faiths. Membership in churches increased impressively from 40 percent of the population in 1900 to 60 percent by midcentury. Catholics had more than doubled their population, to 30 million, by

that time. Baptists had quadrupled theirs, to 16 million. Methodists had grown from 5 million to 9 million; Lutherans from less than 2 million to more than 4 million; Presbyterians from 1.5 million to almost 3 million. Mainline religion seemed on a decades-long incline.

The 1960s and 1970s presented a very different picture, brought on by several conditions. Among the most important was an emergent cultural malaise. So long had the historic Protestant mainline seemed to dominate the culture and to champion cooperation with it that it seemed almost to become the culture. The newer generation, fully at home in American society, had an increasingly difficult time discerning what it had to gain by church membership. With seeming suddenness it was the conservative churches—demanding in discipline and sacrifice and unambiguous in theology, identity, and moral claims—that were growing in numbers and in public awareness. Scholars debated the causes, but the trend of mainline decline held through the end of the century. Congregationalist and Presbyterian growth peaked around 1960, Lutheran and Episcopalian growth around 1970, and Methodist growth around 1980.

While these liberal-leaning denominations were bleeding members, groups such as the Southern Baptists, Mormons, and Pentecostals were experiencing a surge. By the end of the century, the Southern Baptist Convention alone was claiming nearly 20 million adherents; the Latter-day Saints, 4.2 million; and the Pentecostal Assemblies of God, 2.6 million. The charismatic yearning for and experience of spiritual gifts, such as healing and speaking in tongues, spread widely beyond formally Pentecostal denominations, gaining influence even within Catholicism and the mainline churches.

Evangelical, fundamentalist, and Pentecostal bodies, especially, later discovered religious outlets of contested magnitude and effectiveness in the “Electronic Church.” This movement was a product of the television age, succeeding the religious radio broadcasting of the previous half-century and entwined with a still-active revivalism. Another distinctively (not uniquely) Evangelical and Pentecostal phenomenon emerged in and after the 1950s: “megachurches,” each of which boasted two thousand or more reliable weekly attendees. By the beginning of the twenty-first century, more than thirteen hundred such churches were thriving, fifty of them with congregants ranging from ten thousand to almost fifty thousand. More than half of such churches were nondenominational; perhaps 20 percent had attachments to the Southern Baptists, and another 10 percent each

associated with the Assemblies of God and with historically African American denominations. During the latter decades of the twentieth century the movement spread abroad; half of the ten largest Protestant megachurches were by 2008 in South Korea.

Another new aspect of the 1960s and 1970s was the reaction against the establishment culture and, amid social tumult, the rise of new and zealous sects and movements, often experimental in nature. Prominent among them were hard-to-measure New Age inclinations and a strong interest in selective parts of Native American spirituality.

Intersecting with these developments was a new tide and new pattern of immigration, enabled by the Immigration and Nationality Act of 1965. By equalizing immigration policies skewed since 1924, the act enabled a flood of new immigration from non-European nations that changed the ethnic and religious demography—and the consciousness and self-identity—of the country. Immigration doubled between 1965 and 1970 and doubled again between 1970 and 1990. The United States was now host to a significant number of Muslims. Citizens encountered chanting, shaven, and brightly clad devotees of the International Society for Krishna Consciousness at every airport. Asian-born Buddhists, once thought confined to Hawaii, California, and graduate centers where the world's religions were quietly explored, were now discovered in cities throughout the land. One's new doctor in many urban centers seemed as likely as not to be from India, and thus perhaps of Hindu background. This influx of immigrants tightened selectively after the terrorist attacks on the country on September 11, 2001, a national trauma that sparked debate about immigration, legal and otherwise, and about the security of the nation's borders. Nevertheless, a year after the attacks the United States was still accepting immigrants at the fastest rate since the 1850s. One in nine U.S. residents was foreign-born. Of these, 52 percent were from Latin America, 26 percent from Asia, and only 16 percent and 3 percent, respectively, from Europe and Africa.

A Contemporary Portrait

The contours and dynamics of immigration and of ethnic and denominational movements provide an essential perspective on the development of American religion. A better grasp of the realities of people's lives and religion, however, requires many demographic lenses. One such lens is the U.S. Religious Landscape Survey, noted earlier, in which a large sampling of American adults responded in 2007 to extensive queries on their religious self-identity and their attitudes

U.S. Religions by Major Groups

Religious Group	Percentage of Total Population
Christian	78.4
Protestant	51.3
<i>Evangelical</i>	26.3
Baptists (evangelical)	10.8
Pentacostal	3.4
Nondenominational (evangelical)	3.4
<i>Mainline</i>	18.1
Methodist	5.4
Lutheran	2.8
Baptist (mainline)	1.9
Presbyterian (mainline)	1.9
Anglican/Episcopal (mainline)	1.4
<i>Historically Black Churches</i>	6.9
Catholic	23.9
Mormon	1.7
Jehovah's Wtnesses	0.7
Orthodox	0.6
Jewish	1.7
Reform	0.7
Conservative	0.5
Orthodox	less than .3
Other Jewish groups	less than .3
Jewish, not further specified	less than .3
Buddhist	0.7
Theravada	less than .3
Mahayana (Zen)	less than .3
Vajrayana (Tibetan)	less than .3
Other Buddhist groups	less than .3
Muslim	0.6
Sunni	0.3
Shia	less than .3
Other Muslim groups	less than .3
Hindu	0.4

toward religion. The ensuing report summarized key findings. Among them:

- America's religious complexion is diverse—not startling news. Its breakdown in major groupings is displayed in the table above.

- Religious attachment in the United States is increasingly fluid. By 2007 more than a quarter (28 percent) of adult Americans had abandoned the religion of their youth, exchanging it for another or simply discarding organized religion altogether. If switches from one denomination to

another within Protestant ranks are included, the percentage skyrockets: almost half (44 percent) of adults had either changed, dropped, or newly claimed affiliation to a particular religious group. Jehovah's Witnesses had the lowest retention rate: only 37 percent of those who were raised as such still identified themselves as Witnesses.

- African Americans were the most likely of the major racial and ethnic groups to report a formal religious affiliation.

- In view of their declining proportion, Protestants seemed destined to become the nation's largest religious minority rather than its longtime religious majority (51 percent and falling as of 2007).

- One-third of respondents who indicated they were raised as Catholics no longer claimed the label, meaning that one in ten adult Americans were former Catholics. However, 2.6 percent of the adult population had converted to Catholicism, and the losses were further offset by immigrants, a disproportionate number of whom were Catholic. The composition of American Catholicism thus was rapidly transforming, becoming more Hispanic.

- The demographics of age distribution may offer a glimpse into the future. Among Americans ages eighteen to twenty-nine, for example, one in four said they were not affiliated, whereas only 8 percent of those over age seventy were unattached. This trend portends a deep societal change if it continues among the young and as those currently in this age bracket proceed through their thirties, forties, and fifties. Similarly, 62 percent of those over age seventy were Protestant, but only 43 percent among those ages eighteen to twenty-nine. Finally, half of Jews and "mainline" Protestants were age fifty and above, as compared with 40 percent in the population as a whole.

Scrutiny of the survey suggests the importance of gender. Although the general population was only 48 percent male, 70 percent of atheists and 64 percent of agnostics were male. Only 13 percent of women claimed no affiliation with a particular religion, whereas this was true of nearly one in five men. Hindus (61 percent) and Jews and Unitarians (54 percent) were disproportionately male. By contrast, 60 percent of historically black Protestants and Jehovah's Witnesses, 59 percent of Adventists, and 58 percent of Greek Orthodox were female.

Family is also important to the character of affiliation. Hindus (79 percent) and Mormons (71 percent) were by far the most married. Next closest were the Greek Orthodox

and Reform Jews (61 percent each). Members of the historically black Protestant churches (33 percent) were the least married, followed by New Age adherents (38 percent), atheists (39 percent), and agnostics (41 percent). Nearly four in ten married people had spouses who belonged to a different denomination or religion. Hindus and Mormons, again, were the most likely to be married to someone of their faith (90 percent and 83 percent, respectively). Hindus were the least divorced or separated (5 percent); New Age and uncategorized Christians were the most (19 percent).

Mormons were dramatically more likely than any other group to have large families; 10 percent of Mormon adults in 2007 reported having four or more children living at home. The next highest was Muslims (6 percent), with Catholics, black Protestants, and the religiously unaffiliated following (4 percent). Conservative Jews led in having no children at home (82 percent), followed by atheists, agnostics, and Greek Orthodox (all at 75 percent).

The relation of religion to education and wealth warrants careful thought. Seventy-four percent of Hindus graduated from college, compared with 59 percent of Jews (66 percent of Reform Jews), 48 percent of Buddhists, 42 percent of atheists, 34 percent of mainline Protestants (53 percent of Episcopalians), 28 percent of Mormons, 26 percent of Catholics, 24 percent of Muslims, and 20 percent of evangelicals (31 percent of evangelical Presbyterians). An astounding proportion of Hindus, nearly half, attained some postgraduate education, many in the field of medicine. Jews, both Reform and Conservative, followed (35 percent), and then Unitarians and other liberal faiths (29 percent) and Episcopalians (25 percent).

At 55 percent, Reform Jews had by far the greatest percentage of practitioners earning more than \$100,000 a year. They were followed by Conservative Jews and Hindus (both at 43 percent). These religious categories markedly exceeded the remaining ones. Among Christians, 35 percent of Episcopalians and 30 percent of the Greek Orthodox earned \$100,000 a year or more. Holiness and Pentecostals, at 7 percent, had the fewest in this category.

Race matters. Muslims were the most racially diverse faith in the nation: 37 percent reported themselves to be white, followed by black (24 percent), Asian (20 percent), "other/mixed" (15 percent), and Hispanic (4 percent). Among Protestants, Adventists exceeded even Pentecostals as the most racially diverse group: 45 percent white, 26 percent Latino, 21 percent black, 4 percent Asian, and 4 percent other/mixed. More than half of all American Buddhists (53 percent) were white; almost a third

(32 percent) were Asian. Lutherans were the denomination with the highest percentage of white members (96 percent); Unitarians were next (88 percent). Those in the historically black traditions (principally several Baptist and Methodist denominations) had, of course, the greatest percentage of black members (97 percent and 96 percent, respectively). Twenty-nine percent of Catholics were Hispanic, as were 24 percent of Jehovah Witnesses. Indeed, the proportion of blacks and Hispanics who were Jehovah's Witnesses were twice their proportion in the general population.

Americans may separate church and state, but not religion and society. The historically black churches were more decidedly Democratic in their politics than any other grouping, with 78 percent either firmly or "leaning" Democratic. They were followed by the Buddhists (67 percent), Jews (65 percent), and Muslims and Hindus (63 percent each). Sixty-five percent of Mormons were firmly in or inclining toward the Republican Party, as were 50 percent of evangelicals. Mainline Protestants were nearly evenly split: 31 percent Republican, 10 percent leaning Republican, 29 percent Democratic, and 14 percent leaning Democratic. Jews, who made up only 1.7 percent of the general populace, were more than any other group disproportionately represented in Congress: 7.4 percent of the House and 13.1 percent of the Senate.

Engaging Demographic Data Critically

The full survey, along with those of comparable breadth (such as the periodic American Religious Identification Surveys) or others of more specialized focus, should be used critically and imaginatively. Doing so will induce further inquiry into the lives and cultures that lie behind the data, using tools such as history, theology, anthropology, biography, and religious studies. Readers should think about what such surveys mask as well as what they reveal. Beyond providing answers, they should generate new questions. Examples follow.

Limitations to Survey Data

The social scientists who engineered the 2007 U.S. Religious Landscape Survey are sophisticated in recognizing some of its limitations. They note that it is a study of adults, who represent only three-fourths of the American public, and that many respondents bring a lack of clarity in terms of what religious group they belong, thereby somewhat blurring the picture. They further note that some 8 percent of adults in the country are not proficient in English, which

means that even though addressed by the survey in certain ways, the survey may modestly undercount, for example and especially, the proportion of Catholics among Hispanics.

Some limitations are intrinsic to surveys of religion based on self-reporting by individuals. For example, the approach is restricted to the modern era, making historical comparisons problematic. A second difficulty is that how people portray themselves when asked, while important, may not represent their behavior. The number who report going to church, temple, or mosque on a weekly or monthly basis is consistent over time. That number, however, is also notoriously inflated when researchers compare it with the number of people who actually attend the services. Similarly, a person, when asked, may respond that she is a Muslim or Methodist, and even that her religion is very important to her, and yet she may live showing little evidence of those claims. According to Muslim and Jewish demographers, most national telephone surveys undercount their respective adherents. Thus valuable telephone surveys do not resolve all issues. Reports from the religious institutions themselves about the strength and size of their memberships remain a significant source of information.

Another characteristic of the Religious Landscape Survey is that questions of belief are deliberately broad or simple: "Do you believe in God or a universal spirit? How certain are you of this belief?" "Which statement comes closer to your own views?: 'My religion is the one, true faith leading to eternal life' OR 'Many religions can lead to eternal life?'" The use of simplicity was surely wise in engaging 35,000 people at length by telephone, and the results are useful for their gross characterizations of tendencies among various demographic groups, such as Quakers or Buddhists or people in their twenties or fifties. Responses to such questions, however, can scarcely convey any conceptual or theological depth or sophistication on the part of the faithful.

Moreover, the simplicity of the questions on belief may lure analysts into thinking they understand something they do not. Instead, the questions should provoke further thought. One of the more interesting questions asked was whether one subscribed to the statement "My religion is the one, true faith leading to eternal life." Jehovah's Witnesses had far and away the greatest portion of adherents (80 percent) who concurred. Mormons, at 57 percent, were second, and evangelicals, at 36 percent, were third. The significance of this question is implied when the answers are juxtaposed with those from the religions that tend not to think in such

terms. Eighty-nine percent of Hindus, 86 percent of Buddhists, 83 percent of mainline Protestants, and 79 percent of Catholics affirmed a counterproposal: “Many religions can lead to eternal life.” But are respondents hearing the question in the same sense? If not, do their responses carry similar meaning? Mormons, for example, distinguish among concepts such as immortality, salvation, and exaltation or eternal life.

The same item on the survey raises other issues: what, for example, is the meaning of “religion” in the statement “many religions can lead to eternal life”? When 70 percent of Americans affirmed the statement, did they have in mind that other *denominations* within, say, Christianity have access to eternal life, or also that other *religions*, such as Hinduism or Islam, did as well? The question occurred to the survey’s administrators. A follow-up study conducted in 2008 pursued the issue, learning that 80 percent of those Christians who believed many religions could lead to eternal life named at least one non-Christian religion that was able to do so.

A closer look at these intriguing findings suggests how demographic truths may induce yet further inquiry. For example, the survey reports that more than half (57 percent) of those in evangelical churches believed that other religions can lead to eternal life. Although this proportion is lower than those for many groups, it is an impressive figure. Nearly two-thirds of this group of evangelicals who so believed also believed that Judaism could bring eternal life, and one-third of them held that Islam or Hinduism could do so as well, with fewer still (26 percent) indicating that atheists could achieve the goal. These findings are intriguing for their own sake, but they raise a separate and basic question: what is an evangelical?

This question has been asked and addressed many times. A common understanding is that evangelicals are people who exhibit at least several of a cluster of traits. The most important of these traits are a high regard for the inspiration and authority of the Bible, a belief in the necessity of accepting Jesus as one’s personal savior and of being “born again,” and a commitment to evangelizing, to sharing the “good news” of the Gospel. But if a quarter of those in evangelical churches believe that even atheists may be saved and two-thirds of them believe that Jews can, then what, again, is an evangelical? Why proselytize to those who can otherwise be saved? Is, or is not, a born-again experience necessary for salvation? A related question is what does it mean to categorize entire denominations as “mainline

Protestant” or “evangelical” (as the survey does for purposes of national analysis) when views toward salvation are so inclusive (as documented by the survey) among significant segments of “evangelicals”? Conversely, labeling United Methodists as “mainline Protestant” is an understandable but problematic choice, when Methodists in the South think and behave much more like evangelicals than Methodists in Michigan or Colorado.

Religious Affiliation and Unaffiliation

The survey’s respondents who indicated no religious affiliation (the “Nones,” as the American Religious Identification Survey labeled them) are particularly intriguing and ripe for further analysis because of both their size and their momentum. They seem to be a social weathervane. The Nones are the fastest-growing of any category of respondents in the survey. At 16.1 percent of the total population, their proportion is more than double the number who said they were not affiliated with any particular religion as children. So widespread and long-rooted have they been in the Pacific Northwest that observers have designated the region the “None Zone.” They are emerging even more rapidly in the Northeast.

Indeed, the group is growing everywhere. Despite this growth, half of those who were unaffiliated as children reported being attached to a specific religion today. Taking into account the numbers thereby injected into the ranks of the religiously affiliated, while also accounting for the dramatic growth among the unaffiliated, one can conclude that a great many people who were attached as children are surrendering their affiliation. Awareness of their increase has been widening among scholars, and, increasingly, the public, since the beginning of the twenty-first century. This publicity of itself may have contributed to a higher rate of reporting in more recent surveys, making Nones feel more confident and free to announce themselves.

The unaffiliated are as diverse as any of the religious groupings such as Jews or evangelicals. Only a quarter of the Nones construe themselves as atheists or agnostics. Two-thirds of them (12.1 percent of the adult population) describe their religion as “nothing in particular,” though half of these suggest that religion is somewhat or very important to them. “Spiritual but not religious” is often their mantra, especially among people in their teens, twenties, and thirties.

The lack of institutional commitment of those in this group who are not atheists may be explained variously. The

explanations are based in part on survey responses, in part on other research, and in part on speculation in need of testing. Some Nones are in transition, moving by stages into or away from a denomination. Some are active seekers. Some are faintly attached to a vestige of their parents' or grandparents' loyalties. Some claim the benefits of religious feeling shorn of the burden of organized religious action or what they experience as the confinement of specific creeds. Many have constructed an eclectic, do-it-yourself religion; recall the radically individualistic "Sheilism" made famous by sociologist Robert N. Bellah and his colleagues in *Habits of the Heart* (1985). Perhaps some of this impulse is a by-product of contemporary global connectedness, the presence in the United States of a radical diversity and pluralism (the celebration of diversity), and a waning cultural regard for institutions generally.

What of the Future?

The startling willingness of adult Americans to exchange religious allegiances or to surrender them altogether has prompted questions among the religious, the irreligious, and observers of all stripes. Is religion growing less relevant to the lives of Americans? Is the religious commitment that remains increasingly shallow, a sort of hobby or fashion statement rather than a fundamental commitment? Is the country inclining toward the way of Europe, where Christianity has grown pale and its great cathedrals have become museums? Is secularism the future? Is "denomination" still a meaningful category?

The importance of denominations and particular religions may indeed dwindle further, and yet they continue to claim the loyalty of scores of millions of citizens. Many Catholics and Baptists, Eastern Orthodox and Jehovah's Witness, Jews, Muslims, Mormons, Episcopalians, Lutherans, and others intend to continue to enact their belief and practice through their denominational traditions. It is not implausible that this allegiance will erode in the acids of modernity and American pluralism, but neither is it implausible that a reaction will set in to the radical individualism of the culture. The country has a long history of groups that refused to call themselves a church but that have assumed over time explicit or implicit denominational traits. The rapidly growing Pentecostal movement is a case in point, as are the fiercely independent Churches of Christ.

One thing does seem certain: American religion in the future will more than ever enact its dynamics in

international contexts. This is so because critical masses of imported religions already thrive within the country's borders. It is so because Christianity's demographic center of gravity and zeal has shifted from Europe, and is shifting from the United States, toward the southern hemisphere. It is so because internal division sometimes forges new international ties, as the Episcopalian experience demonstrates. Although theological conservatives are a minority in the Episcopal Church, they constitute a large majority among Anglicans worldwide. Seven hundred conservative parishes in the United States and Canada defected in 2008 over issues surrounding homosexuality. They formed a new church affiliated with overseas Anglicans.

The importance of international contexts for the future is further revealed by attention to Europe, which has so many ties to the United States. In Europe, Islam is, through immigration and high birthrates, beginning to fill the religious hole once filled by Christianity. In addition, international politics and economics dictate that the United States will need to grow accustomed to a more equitable role in world affairs than it has known since the beginning of the twentieth century. And yet despite all this, the United States is, as of the early twenty-first century, virtually unique among wealthy, technologically developed nations: it remains a religiously still-vibrant civilization. It is both three-quarters Christian *and* the most religiously diverse of all countries.

As for other demographic trends, they bear watching. The next pandemic, the next economic collapse or expansion, a war brought closer to home, another technological revolution—who knows when these or other imponderables will unleash a flow of emigration or launch or cut off a tide of immigration (and to and from what parts of the world?). Who knows how such events might alter the American birthrate, or its psyche, or its interest in the sacred?

The future has a way of mocking predictions. If there is a heaven for deists, Thomas Jefferson has had cause to recalibrate one of his. After all, he once predicted that, within a generation, most young Americans of his day would have become Unitarians.

Denominationalism

In a 1972 mapping of religion, sociologist Andrew M. Greeley discerned denominationalism to be such a central, stable facet of American life that he titled his volume *The Denominational Society*. The United States, he believed, was one of

four denominationally defined societies (along with Canada, Holland, and Switzerland). Although subsequent developments and more recent scholarship contest this characterization as overstated, his use of the rubrics *denominational* and *denominationalism* points both to the historic importance of this dimension of American religion and to the multivalent character of the terms themselves.

Employed in academic and popular discourse alike, the terms can be shorthand for religious identity or affiliation (as, for example, of military chaplains). The rubrics describe the diversity in American organizational religious life—the named or “denominated” faith communities. They point to the major Protestant divisions and traditions: mainline, evangelical, and historically black denominations. The terms also sometimes refer to religions that coalesce around or organize themselves through regional or national assemblies, leadership, or bureaucracy—that is, for Protestant-normed patterns of religious organization, uniting congregations within regional judicatories into national or global polities. The collective term *denominationalism* can stand for the salience or societal clout of the collectivity of mainline Protestant bodies. Sociologists employ the single term *denomination* typologically, and so compare it with other “ideal types”—cults, sects, and churches.

In several ways, then, the term *denominationalism* identifies a distinctive way of being religious. It indicates, for example, that a faith, ethic, tradition, single-purpose cause, or parachurch entity has developed into a multipurpose, multi-functional entity with some measure of centralization and corporate structure. It also has an identifiable membership and affiliated congregations, leadership, and regional and national judicatories. Similarly, denominationalism can function as a theory or theology of the church that discerns individual denominations as branches of the one vine (Christ). Alternatively, as an Internet search will reveal, denominationalism renders theological judgment, a denunciatory rubric for religious division, elitism, diversity, sectarianism, and schism. Denominationalism, denominational, and denomination can mean many things.

An Invention of Modernity

The denomination is an invention of modernity. It emerged in Western societies as they searched for stratagems and policies other than coercion and repression for coping with the religious diversity and discord that emerged from the sixteenth-century reformations and seventeenth-century religious wars. English contributions—explorations of

tolerance or comprehension after the Restoration and particularly after the Glorious Revolution, the Acts of Toleration, the writings of John Locke and colleagues, and the path-breaking efforts of newly tolerated English Presbyterians, Congregationalists, Baptists, and Quakers—played a vital role in the North American denomination. “Denomination” named voluntary religious organizations (initially Christian) operating under conditions of religious pluralism, codes of civility, and some measure of toleration. The collective term *denominationalism* references the existence and coexistence of tolerated voluntary religious bodies, their uneasy competition with one another establishing a larger pattern, the production thereby of an organizational field, and the emergence of a set of beliefs or practices that govern participation in the denominational order.

In their American context, both the denominational organizational field and individual denominations have evolved significantly over time, acting and reacting to other creatures of modernity, especially political parties, the press, and free enterprise, along with volunteer organizations and all levels of civil government. The relation and similarity of denomination to political parties and free enterprise have been especially marked and important. Sometimes the recipient of practice and precept from business and politics, denominationalism also has contributed to these sectors. The malleability, porosity, and dynamic character of denominationalism stem in no small way from denominations’ highly successful missional efforts in American society, from pressures to stay current with communication idioms and systems, from the freedom they have enjoyed to experiment, and from their capture of intellectual, cultural, and political elites.

Denominations’ culturally adaptive and sensitive character—embracing slavery in the South but abolition in the North—has earned both plaudits and denunciation. Here it is important to underscore the culturally adaptive and elastic character of the larger organizational ecology and its similarity to other sectors of modernity. Just as individual newspapers and magazines make up the free press, individual businesses make up capitalist free enterprise, and individual parties make up representative democracy, individual denominations make up the organizational ecology of denominationalism. These four creatures of modernity have tended to evolve together and to influence one another. That the denomination looks bureaucratic and has resembled the corporation for the last century is not surprising. It resembles the current business form of the day,

and also the current form of the political party and of the press. And no less than these other systems, denominationalism functions with sets of practices, understandings, and norms. Just as free enterprise evidenced its operative policy in corporate practice and democratic politics in partisan behavior, so denominationalism defined itself through the activities of the several denominations, in how they interacted, in the boundaries they set, and in their efforts to shape American society.

Denominational Styles and Stages of Denominationalism

Five denominational styles emerged from the eighteenth to the twenty-first century. The first style, ethnic voluntarism, or provincial voluntarism, took root in the revivalism or awakening of the eighteenth century, shaping the religious pluralism of the middle colonies. The second style arose from the religious free-for-all of the early national period. Popular evangelistic movements were patterned after the purposive missionary association, seeking converts across the whole society. The third style, a churchly or confessional style, appeared in the Civil War era, invigorated by both immigrant religiosity and nativism. It assumed both high church and primitivist expressions and sought deeper foundations for belief and polity (in Romanticism and other popular theory). The fourth style emerged in the late nineteenth and early twentieth centuries. Protestantism reinvented itself for world evangelism by adopting corporate and managerial processes and forms. A fifth style, still defining itself, emerged in the late twentieth century, as conservative-evangelical movements and historically black denominations enlarged the mainstream and newer and non-Christian movements began negotiating their place in American society as well.

This typology serves a variety of purposes. First, it indicates that denominationalism and the denomination reinvent themselves over time. This dynamism should caution against equating denominationalism with its mainstream, bureaucratized image. Second, each stage models a normative style, thereby drawing boundaries, sometimes explicitly, sometimes implicitly, determining which movements belonged and which did not. Over time, the denominational system enlarged itself, again prompting the question of whether that is happening now. Third, at least in several stages the transformative impulses operated from the margins, importing a new dynamic into the religious picture and effectively enlarging the system by carving out new

space for denominational formation and identity. Fourth, implicit in such renewal, the typology draws attention to renewal impulses that underlay and guided each new stage. Fifth, the schema suggests that also shaping denominations were interactions with business, politics, communication systems, and culture generally, and that denominational patterns of leadership, organization, decision making, and “business” looked very much like their counterparts in the American social, economic, and political orders. A sixth possible value, but one that cannot be probed here, is that to some extent movements new to the American scene may recapitulate some if not all of the stages. That said, the schema does not accurately describe individual denominations for any period. Instead, it “idealizes”; it identifies a predominant denominational style, and it accents the denominational profiles, purposes, and dynamic principles most powerfully operative for a specific era. Specific denominations adjusted these goals and principles in view of their own context, relative maturity, and confessional self-understanding.

Ethnic Voluntarism

The ethnic ferment of the middle colonies, under conditions of toleration, set the stage for the first stage or style of denominationalism in what has been called the First Great Awakening. Various factors preconditioned colonial society’s capacity to yield this new form of the church. The first factor was religious pluralism. Living side by side in the middle colonies were the Dutch Reformed, Quaker, Scottish, Scotch-Irish and Irish Presbyterian, English Baptist, Anglican, transplanted New England Congregationalist, and various German-speaking persuasions (Dunker, Lutheran, Reformed, Moravian, Schwenckfelder, Mennonite). African Americans, then seldom Christianized, and Jews also had their places. The second factor, as already noted, was policies or practices of toleration or of land grants to groups seeking asylum that implicitly permitted religious practice. William Penn’s policies were of immense importance, as were English precepts.

The impetus for and form of *ethnic* voluntarism lay in immigration and whatever measure of religious heritage the immigrants brought with them. The dynamism for ethnic *voluntarism* lay in the waves of revival that *imported* pietism unleashed and in the religious reactions to pietism. Congregations and associations, quasi-independent because of the sheer distance to “proper” authority, accomplished through their problem-solving two related but distinguishable social

transactions: establishing new ethnic communities and legitimating them religiously as German-American Moravians, Scottish-American Presbyterians, and Dutch Reformed.

Most imported religion has come to American shores with little in the way of trained and credentialed leadership or the capacity to create such (the Puritans being the notable exception). Middle colony immigrants, modeling a pattern, found themselves largely fending for themselves religiously. They drew on their (often lay) memories of church practice and structure. They pressed someone into leadership, gathered in one another’s homes, wrote religious authorities in the homeland pleading for proper preachers, and put in place processes by which to recognize authority. When preachers came or a community selected one of their own to serve, they founded congregations. The newly installed preachers, perhaps with laity, reached out to the leadership from congregations of the same apparent “persuasion” to initiate presbyteries, consistories, or their tradition’s counterpart. And around these modest structures converged the immigrant community, ordering itself religiously while adhering to colonial authority and further pleading to some home country judicatory for additional ministers, print resources, and adjudication of disputes that threatened the community.

The formation of religious communities began in the early stages of immigration and settlement, but took off with the itinerant, revivalistic, conversionist, pietist practices that surfaced in Dutch settlements under Theodore J. Frelinghuysen in the 1720s. It then continued among Presbyterians under William and Gilbert Tennent in the 1730s and appeared in quite diverse confessional forms thereafter, spreading across the colonies tracking the several decades of iterations by George Whitefield. Pietism’s tactics proved highly effective in stimulating both new religious identity and community as well as angry reactive responses, themselves community-strengthening, from existing and more confessionally oriented leaders. Formative but controversial were pietism’s emotional invitational preaching; expectations of conversion and a morally regenerate life thereafter; allowance for lay testimony; encouragement of prayer, Bible reading, and disciplining small groups (conventicles); itinerant preaching (beyond the community to which the minister might be called); focus in sermon and witness on sin and salvation; blunt criticisms of worldliness in other laity and of unfruitful and unconverted ministers; and willingness to experiment with new ways of training and credentialing leadership.

This repertoire, known thereafter as revivalism, proved to be of enduring value in forming a (religious) community, in part because it authorized local or indigenous processes and leadership generation, in effect allowing a community to declare its religious independence from its European home base or its alignment with more evangelical resource centers (Halle, in the case of pietism). Meanwhile, an elective, voluntary, ethnic denominational identity emerged, because most of this pietist community formation occurred within lines of kinship, language, national origin, religious tradition, and race. These communities, however, understood their new identity not in sociological terms but in pneumatological and eschatological terms.

Others, particularly in congregations based on the then-normative Protestant-confessional model, took great exception to what they saw as pietism's censorious criticism, emotionalism (enthusiasm), lax theology, irregular lay activity, and untrained/unauthorized ministries. These confessional communities filed disciplinary charges at their headquarters in Edinburgh and Amsterdam and read the enthusiast pietists out of their synods or assemblies. Religious energy and division yielded ethnic identity and cohesion. Thus among Presbyterians both the Awakening New Side and the more confessional Old Side offered versions of Celtic-American ethnicity, each organizing along received polity lines.

Denominations at this stage consisted of a few congregations loosely tied together by small, periodic leadership gatherings. These pastor-led associations concerned themselves with care of congregations, problem solving, leadership supply and credentials, hymnals and service books, catechism, and the like. Denominations did not elaborate a public theology. Nor did they see themselves caring for the whole of colonial society or seek to transform the social order. They remained largely dependent on European resources (either pietist or confessional) for preachers and materials. Insofar as perceptions of belonging within a denominational field (denominationalism) existed, they did so quite vaguely in a sense of alignment with or against the Awakening or within a confessional or pietist realm.

Purposive Missionary Associations

A second denominationalism derived its primary impulse from pietistic revivalism as well, in what has been termed the Second Great Awakening. But it was conceived in relation to the new nation, and it invented mechanisms to missionize the entire society. This civic theology harnessed

revivalistic energies to build a Christian America. The then-mainline denominations (Congregationalists, Presbyterians, Episcopalians), each regionally dominant, supplied the vision of a Christian America and the main institutions needed for enculturation (voluntary societies, colleges). More marginal and newer bodies (Baptists, Methodists, Christians) supplied the expansive, energetic evangelism that transgressed lines of language, ethnicity, *and* race and aspired to Christianize (convert) the whole society. The camp meeting epitomized its missionary dynamic.

Presbyterians and Congregationalists provided the leadership and the intellectual framework that guided denominations. The new nation needed, they thought, a common moral framework for the good order that a republic required. To elaborate such, they drew heavily on Reformed theological traditions, Puritan covenantal notions, Scottish moral philosophy, and the rubrics of republicanism. When integrated, this new paradigm assigned to the several denominations, and themselves especially, the responsibility for creating and overseeing a Christian America.

Notwithstanding Congregational and Presbyterian presumptions—and they graciously included Episcopalians as well—other movements supplied both the human resources and the effective model for implementing such high policy and grand aims. The popular, even though despised, evangelistic movements—Baptists, Methodists, and Christians (Restorationists)—suffused denominationalism with their missionary energy.

The popular denominations adapted pietism's revivalistic repertoire to open, inclusive missionary purpose. In doing so, they raced settlers into western lands. Missionary impulse shaped these denominations. To be sure, the new denominationalism and even its signature camp meeting could only breach but not eradicate or transcend the social barriers (class, ethnicity, region, language, race, and slavery). Meanwhile, language- and race-specific denominations emerged—African Methodist and Baptist, as well as German- and Scandinavian-speaking. They, too, took on the new aggressive, competitive style. And increasingly so did the Presbyterians and Congregationalists.

The Reformed denominations' more highly developed institutions, as well as their theological notion of covenant, combined with the revivalistic energies of popular movements such as Methodism to provide a highly effective ecumenical drive toward building a Christian America that transcended denominational allegiances. The missionary self-understanding demanded new mobile entrepreneurial

leadership skills, a new vernacular, new communication media, and a new, more elastic organization. Mission and covenant were combined in an incredible institution-building effort, much of which went into transforming the denominations from modest associational structures into engines for national ministerial deployment and governance. They became powerful democratizing and creative forces. The three mainline denominations invested significantly in establishing voluntary societies that focused nationally on urgent causes (distributing Bibles, forming Sunday schools, furthering various reforms). Other denominations also mounted their own voluntary society endeavors. Denominational publishing houses provided congregations and Sunday schools with lessons, newspapers, and magazines. Colleges, sometimes founded more on promise than on prospect, trained denominational ministers and lay elites. And from the local level women and men joined the denominational and interdenominational reform and mission societies to deal with the urban poor, seamen, prostitutes, slaves, and slavery. In doing so, denominations would Christianize the continent. A purposive missionary association generated structure and procedure faster than formal theologies and ecclesiastical politics could adjust. The adjustment would yield other styles of denominationalism.

Confessional Denominationalism

The third style of denominationalism, confessional, culminated in transatlantic fellowships: the Lambeth Conference (1867), World Presbyterian Alliance (1877), Methodist Ecumenical Conference (1881), International Congregational Council (1891), and Baptist World Alliance (1905). Various impulses, some international and some American, stimulated more pronounced awareness of doctrinal, liturgical, or polity identity and generated a style of denominationalism that competed with purposive denominationalism. In the first impulse, the dynamism, cultural power, and seductive appeal of American revivalistic evangelicalism induced emulation and adaptation within some communities that traditionally defined their identities in other ways—notably the Reformed, Lutheran, and Anglican churches (as well as Catholicism and Judaism). Within some of these confessional Protestant churches, the leaders who emerged drew on their respective traditions to critique camp meeting style revivalism, the “new measures” advanced by Charles Grandison Finney, expansive voluntarism generally, and associated denominational practices. Especially articulate and important were the Mercersburg theologians,

Philip Schaff and John W. Nevin. In various works they parodied revivalism as a “methodistical” scheme. They deemed signature elements of purposive missionary denominationalism alien to their German Reformed tradition and its converting ordinances—catechism and the sacraments. Similarly, Charles Philip Krauth spoke for confessional Lutheranism and John Henry Hobart and Calvin Colton for proper Anglicanism, in each instance moving their denominations or a newly formed one (Missouri Synod) onto proper confessional foundations. These spokespersons appealed to their respective doctrinal heritages, but drew variously on currents of romanticism, which valued tradition, confessions, sacraments, mystery, catechism, and other hallmarks of ecclesial identity.

A second impulse of confessionalism derived from the differences over slavery within evangelical denominations. Presbyterians divided in 1837, and Methodists and Baptists in the early 1840s. In each instance various factors drove the schisms, but slavery or antislavery was at least in the background for Presbyterians, or in the foreground for Methodists and Baptists. Once divided, the rival churches rationalized their causes and explained their purposes theologically, confessionally, and biblically. In fights over turf—Methodists and Presbyterians reunited only in the mid-twentieth century and Baptists never have—each defended its polity by proclaiming first principles, appealing to the teachings of its founder, and reverting to tradition.

A third and related impulse toward a churchly or confessional orientation was centered on the voluntary associations that were a hallmark of purposive missionary organizations and, in part, their dedication to the antislavery cause. Among Presbyterians, old-school theologians such as Charles Hodge saw such institutions as ecclesially anomalous. Organized interdenominationally, overseen by interlocking boards of donors, and accountable only to themselves, they were involved in a range of churchly matters (Bibles, Sunday schools, tracts, missions) and within churchly contexts that should have been the denomination’s domain. On what basis and by what authority did they do the church’s business? Motivating the old school and driving the 1837 division were associated concerns—a missional concordat struck with the Congregationalists earlier in the century, Finney’s “new measures,” discipline cases, and antislavery. After the division the old school restructured itself denominationally, in order to bring under ecclesial authority the functions and tasks launched by the interdenominational voluntary societies. Mission, Sunday school, tract, temperance, and various other

societies became *intradenominational* operations. Other movements echoed the Presbyterian brief against voluntary or missionary societies and sought to bring such ventures under church control, a pattern to be widely emulated. Similarly, antimission Baptists and Restorationists denounced voluntary societies as unbiblical, articulating a kind of nonconfessional confessionalism. Of long-term significance were the kindred efforts and primitivist ideas of Landmark Baptists, who leapt back to the New Testament and repudiated intervening centuries of Christian tradition to warrant ecclesiologies of localism and close communion.

Corporate Organization

The fourth style of denominationalism drew on both prior styles to achieve accountability over, while affirming and increasing, the effectiveness of the powerful voluntary, purposeful missionary societies created by evangelical Protestantism. During the Civil War, mobilization of the religious community by women and men to supply, support, nurse, and minister had demonstrated the extraordinary delivery capacities of a focused, popularly based, vertically integrated, nationally managed organization. Like northern businesses, denominations had experienced firsthand in the war effort the payoff of top-down control and corporate organization. In part emulating the business community, in part capitalizing on its own experience, mainstream Protestantism undertook significant structural reforms in the late nineteenth and early twentieth centuries. Denominations sought to bring under judicatory control the complex of voluntary societies—men's and women's—by which they had done their business. In doing so, denominations established a *corporate board and agency system*—in effect, they carried out a “managerial revolution.”

This revolution was aimed at checking the parallel, self-guided, trustee-accountable societies that ran denominational programs. More positively, the revolution sought to increase the effectiveness of the array of enterprises being undertaken on the denomination's behalf and in doing so to coordinate their efforts under denominational authority. The problem? With their self-perpetuating boards, own staffs, distinct collections or appeals for funds across the denomination, and prerogatives over programs, denominational societies functioned beyond denominational control.

By legislative action or by more gradual initiatives, denominations reorganized themselves internally, provided denominational oversight for the former voluntary societies, and created a corporate board structure. Elaborate

procedures coordinated finance, communications, and publication programs. The churches experimented with new modes of collaboration between agencies and local churches, especially in areas of program and finance. Every level of the church, from congregational to state to regional to national, structured itself with the same bodies, with the same names, with the same duties. The changes created national power centers, essentially bureaucratic in nature. Gradually the churches began staffing agencies with professionals, requiring higher degrees of specialization and expertise, and exploring new schemes of systematic finance.

Thus the mainstream denominations came into being, and as a collective system they effectively dominated American society and culture until the mid-twentieth century. Their various authority systems, bureaucratic program structure, and professionalized leadership aligned them with American society generally, and especially with business and government. By midcentury, their professional elites were collaborating with African Americans in leading society and the denominations themselves toward overcoming segregation and racism. And they began to accommodate women and minorities in the ministry. Thus mainstream Protestantism seemed to be poised for continued societal leadership. Instead, as noted, it found itself upstaged by conservative and evangelical movements. Badly divided itself and facing a much more pluralistic society, it effectively disestablished itself.

Post-Christian Denominationalism?

The fifth style of denominationalism might be variously dated. It may have emerged with the 1965 Immigration Act, which opened the door to Asian and Middle Eastern immigrants, or with Vatican II and the 1960 election of John F. Kennedy to the presidency, or with the civil rights movement and Rev. Martin Luther King's “I have a dream” speech in 1963, or with the urban and Vietnam War crises in the late sixties, or with the election of Ronald Reagan to the White House in 1980 and the ascendancy of conservative evangelicalism.

Characterizing this new style is difficult because, standing within it, scholars do not yet see its contours or its understandings and practices. This style formed within mainstream Protestantism; however, interactions among denominations of all kinds have resulted in a cross-fertilization in societal roles, operational styles, program features, communication systems, outreach mechanisms, and organizational purposes. Unclear at this juncture is whether these interactions are

producing a new form of denominationalism or its demise. Even less clear is whether the increased pluralism in American society and the importance of non-Protestant and non-Christian religions augur an even more dramatic reconstitution of denominationalism.

Not yet apparent, then, is the operative theory for the fifth style and whether it is Protestant, Judeo-Christian, or pluralistic. More evident are efforts across religious traditions to experiment with contemporary cultural forms, delivery systems, and communication networks. However, experiments with technique and technology stress existing associations and traditional expectations of leadership. Culture wars, immigration, war and terrorism, and the global economy further pressure denominational systems. In places, religious life charts a nondenominational course; elsewhere a hyperdenominationalism results. Will institutional ferment produce a religiously plural American denominationalism, a denominationalism stratified globally, or a Protestant denominationalism adjusted to minority status in North American society?

The Modern Denomination

The modern denomination, at least as typified by mainstream Protestantism, exhibits internal features that lend themselves to sometimes differing overall impressions. In fact, denominations function with complex or multiple authority systems, each part of which proves capable of pulling in its own distinct direction, pressing for interests intrinsic to its domain. A religious authority system—theologically warranted, biblically based, confessionally labeled, or constitutionally protected—shapes a denomination. Denominations sometime proclaim this system in their names—the African Methodist *Episcopal* Church, the Associate Reformed *Presbyterian* Church, the Evangelical *Congregational* Christian Conference. The names locate a significant, perhaps primary, source of authority—in the congregation, in presbyteries, in bishops (the episcopacy). And the religious authority systems have yielded distinctive political structures or polities—episcopal, presbyterial, congregational. Actually, denominations within each of these distinctive polity types usually borrow aspects of the other two.

Sometimes the leading or teaching function is effectively undertaken by a second system—an administrative, agency, or board apparatus. Often mimicked at every level in the denomination with offices, commissions, or committees, this system implements much of the program, publishing, mission, social action, employee care (pensions, insurance), and

financing (stewardship and expenditure) for the denomination. Theoretically accountable to the religious authority system, boards and agencies often function like corporations. Their general secretaries operate as CEOs, their staffs effectively chart denominational policy, and their initiatives are redirected by bishops, conferences, or conventions only with great effort.

Such campaigns disclose yet a third internal system, congregations and regional or middle judicatories. The latter, variously termed association, presbytery, conference, diocese, region, or synod, functions administratively between congregations and the national or international structures and authority. At this level, church officials decide to ordain, hire, and dismiss clergy; conduct problem solving; mount educational, training, and outreach programs; and negotiate denominational style, ethos, and identity. Bishops, presidents, clerks, district superintendents, and their staffs interact with pastors and congregations in quite complex ways, behaving in effect like congregations' regional service centers. This level deals with charges of clerical misconduct either through denominational judicial procedures or through civil or criminal proceedings, or through both. Findings can sometimes be appealed to other levels, but much denominational judicial, disciplinary, and personnel activity focuses on the regional judicatory.

Congregations and regional judicatories generate a fourth internal system, a national, continental, or even global assembly. These assemblies, which are usually unicameral, function as congresses. Some permit messengers from every congregation, while others are confined to representative delegates. The assemblies initiate constitutional change, vote on offices, authorize new hymnals or doctrinal statements, set missional policy, speak on public issues, and the like. Even in nonconnectional or congregational denominations, the national assembly becomes the most visible public, media-covered event. This system provides for some lay and congregational roles in denominational decision making, property holding, and financial administration.

Closely related and perhaps emerging as yet another internal system are caucuses, struggle groups, and organized campaigns—the ecclesial counterparts to political action groups, think tanks, and legislative caucuses.

Caucuses, regional judicatories, and national assemblies draw leadership from yet another denominational system, the church's professionals and, in particular, the clergy. Ministers, priests, and rabbis have no state authorizing or

professionally controlled associations through which clergy can be credentialed or advance their professional interests. However, at least in some instances the regional or national assembly has functioned as a denomination-specific professional society, despite the presence of laity. Laity serve in these bodies in a representative capacity, sometimes for a single session, while the clergy enjoy an ongoing membership. Regional judicatories function like professional organizations or the state bar.

Other professionals and specialists within denominations—religious educators, missionaries, deacons and deaconesses, musicians, urban ministers, college and military chaplains, evangelists, information officers, fiscal officers, large-church pastors, agency administrators, and even judicatory staff—have to create their own professional organizations. Typically, they have done so in more loosely structured and less regularly attended annual gatherings, and they may seek their professional recognition through some other denominational connection, perhaps in relation to a national board or agency. Denominations are, then, complex systems.

Perspectives

In recent years sociology, particularly the sociology of religion, has probed denominations extensively. The ideal typology locates a denomination on a spectrum—church, denomination, sect (perhaps in several categories), cult (sometimes), and mysticism (in some versions). Sociology also examines denominations in studies of societal composition and evolution, secularization, pluralism, and religious preference (rational choice).

However, history, not sociology, offers the oldest perspective on denominations. Chronicling and publishing its own story is one signal that a religious movement understands itself as a denomination. And early efforts to depict American religion did so by narrating the histories of the several denominations, an encyclopedic practice that continues. The most important of such efforts, guided by German-born theologian and historian Philip Schaff, founder of the American Society of Church History (1888), undertook to survey American religion by studying individual denominations (or denominational families) for inclusion in the thirteen-volume American Church History Series (1893–1897). Histories of individual denominations, for much of the twentieth century left almost exclusively to insiders and amateurs, have resurfaced as sophisticated period or region-specific case studies.

Among newer perspectives, the field of organizational studies and some examinations of voluntarism, voluntary associations, not-for-profits, and nongovernmental organizations include denominations in their purview. Bringing these several perspectives together and adding anthropology is the emerging field of congregational studies. Once more neglected than the denomination, the congregation is now studied as the shaper, instrument, and expression of American religiosity. Congregational studies often offer fresh views from the bottom-up of the denomination and its leadership. When they look across the panorama of American religion, congregational studies can measure the overall health of the denominational system and assess the degree to which newer and non-Christian religious impulses take on congregational form (de facto congregationalism), a probable indicator of their assuming denominational shape as well.

Christian theology and ethics, whose intellectual domains include ecclesiology and institutional social policy, have rather neglected the denomination and denominationalism. The notable exception is James M. Gustafson's *Treasure in Earthen Vessels: The Church as a Human Community*. And when theology has taken up the topic, it has tended to render judgment and offer criticism. In the early and mid-twentieth century, such assessments derived from ecumenical and neo-orthodox perspectives. Denominationalism was an emblem of Christian division and disunity and the ethical failure of the church to be the church made one in Christ. And as porous, culturally sensitive institutions that accommodated, and occasionally championed, some of the worst of human practices (slavery, war, segregation, class prejudice, exploitation of workers, sexism, and homophobia), denominations compromised the gospel with the world, a theological scandal.

The person who most forcefully synthesized these ecumenical and neo-orthodox judgments, H. Richard Niebuhr, was among the first to analyze the collective phenomenon of American denominationalism. He found that each denomination established and shaped itself around social impulses of class, caste, nationality, region, ethnicity, and language. These socially partial origins and denominations' difficulty in surmounting them earned Niebuhr's scathing reproach in *The Social Sources of Denominationalism* (1957), and his work and views still typify perceptions of denominationalism. He pointed out that the "evil of denominationalism" lay in the conditions that made the emergence of sects necessary. Churches had

failed to transcend the social conditions that made them into “caste-organizations,” to “sublimate their loyalties” to standards and institutions that had little relevance, if any, to the Christian ideal, and to fight the temptation to give first priority to their own self-preservation and expansion.

Niebuhr’s usage of church, denomination, and sect made popular the typological categories advanced by social scientists such as Ernst Troeltsch. Niebuhr proposed the categories of denomination and denominationalism as most apt for understanding American society. He wrote at the highpoint of mainline Protestant ascendancy in national affairs, perhaps in world affairs. Consequently, Niebuhr emphasized denominational conformity to society and culture and compromise of an egalitarian, inclusive, world-denying Christian ethic. He later revisited the denomination’s relation to society in various works. In *Christ and Culture* (1951) he set forth a fivefold typology aimed at characterizing the longer saga of Christianity’s relation to the state, the social order, and culture.

Status

The complexity of denominationalism makes its status in American society in part a definitional issue. However, a variety of developments suggest, if not its decline, then certainly the destabilization of the central societal role to which Andrew Greeley pointed; this can be discerned from the U.S. Religious Landscape Survey by the Pew Forum on Religion and Public Life and from several works by commentators on the American religious institution scene, such as Robert Wuthnow and Nancy Ammerman. The following are some considerations that call the centrality of denominationalism in the American religious spectrum into question.

- The growing North American religious pluralism may require other categories than “denominationalism” to recognize the importance and the unique patterns of the local and translocal institutionalization of non-Protestant Christian, Jewish, Buddhist, Muslim, Hindu, Native American, and New Age faiths, and various types of the unaffiliated.

- Protestantism breaks into three traditions—mainline, evangelical, and historically black—each denominationally divided, but together slipping to only 51 percent of total reported membership, a trajectory possibly indicating Protestant minority status in the future.

- Membership in mainline Protestant denominations has eroded (and aged) over the last half-century, and the

importance, prestige, and power of mainline denominational leadership is now contested, and often bested—for example, in the access of religious leaders to the White House.

- Conservative, evangelical, and fundamentalist bodies and their leadership have experienced corresponding growth, vigor, visibility, and political prowess, with their collective membership exceeding that of the mainline churches and constituting over a quarter of the overall American population.

- Membership growth in Latin America, the Caribbean, Africa, and Asia, and stagnation or decline in North America threaten long-standing patterns of assembly, governance, ethos, worship, and morality (on homosexuality especially).

- Denominational ethos, values, commitment, and cohesion now contend with denomination switching—a quarter of adults are no longer a part of the religion in which they were raised, and that figure climbs to 44 percent if switching among Protestant bodies is tracked.

- Evidence of the weakening of denominational identity and allegiance are the marriages across religious, confessional, and denominational lines (37 percent); persons retaining a sense of being Methodist or Presbyterian but no actual membership; disaffiliation in younger age cohorts; and adherents experimenting with various spiritualities and meditative practices.

- Protestant denominations contend with similar patterns of congregational independence or diffidence, reflected in the selection of nonstandard educational materials or hymnals, the diversion of collections to local or nondenominational projects, the resistance to denominational programs, and the removal of denominational signage.

- Competing for congregational business and competing with denominational agencies are an array of independent and parachurch publishing houses, curriculum suppliers, music licensors, bookstore chains, program franchisers, consultants, and training outfits.

- Megachurches, some independent or nondenominational and some remaining denominationally affiliated (often loosely), now boast resources comparable to small denominations, with sophisticated broadcast, Internet, and digital presences and the capacity to meet needs once supplied by denominations.

- Coalitions of megacongregations or their church plantings coalesce into denomination-like entities or

function more loosely as quasi-denominations, offering training events and inspirational gatherings for prospective clergy.

- Single-purpose lobbying, humanitarian, and mission organizations are claiming the resources once channeled through congregational structures and through denominations and denominational programs. Examples are Focus on the Family, World Vision, Promise Keepers, Institute on Religion and Democracy, and Habitat for Humanity.

- Similar single-purpose struggle, ideological, or caucus groups within denominations, especially within mainline ones, turn assemblies and conferences into contentious culture war gatherings. They tend to align into broad progressive or conservative camps and establish connections to similar camps in other denominations or through religious political action or coalition-forming entities, such as the Institute of Religion and Democracy.

- Older interdenominational organizations—such as the National and the World Council of Churches—that once harmonized the leadership of the mainline, function within the ambit of culture wars, tending to retain the allegiance of the more progressive and to function as a foil for the more conservative denominational leaders.

- Marginal membership attachment, congregational independence, culture war sentiments, and societal prejudices engender indifference, suspicion, and sometimes hostility toward the centers and symbols of denominational identity, at times resulting in tax resistance or other forms of revolt.

- Media ministries, the newer virtual alliances, and political action efforts that trade on religious sensibilities enlarge the marketplace within which religious expression and affiliation occur and induce consumption or invite appropriation of multiple beliefs, value systems, and ethical practices.

- Such public or digital visualizations of North America and of the world heighten awareness of American religious diversity, test tolerance levels, stimulate post-September 11 fears, and erode faith in or adherence to putative societal norms within which Protestant denominationalism has functioned.

- Because denominational loyalty is tested on so many fronts, denominational leaders, ordination committees, and seminaries find themselves forced to accent confessional particularities, resulting in the strange phenomenon of hyperdenominationalism contending with postdenominationalism.

An End to Denominationalism?

Corrosive forces are eroding the dominance, indeed the salience, of Protestant denominations, particularly those that might be termed mainline or traditional. Should one then conclude that America is no longer a denominational society? Or even that the end of denominationalism looms, as a chorus of doomsayers prophesizes? Such judgments may seem appropriate to Protestant leaders anguishing over numerical declines or to those outside mainstream denominations who have found megachurches, parachurch organizations, media ministries, or virtual spirituality to be the most effective religious modality for the twenty-first century.

The historian, however, can ask whether the crisis interpretive mood obscures the longer saga of denomination and denominationalism and overlooks the earlier declarations of its doom. Denominationalism has itself differed over time, as noted. Adequate definitions of denomination and denominationalism can no longer be equated with mainline Protestantism or with bureaucratic-corporate forms. Such definitions need to recognize the changing modalities of denominational structure and governance over the course of the American denominational experience and leave open the possibility that some of the newer and non-Christian movements will participate in the reshaping of denominationalism.

Indeed, the catalogue of social strains prompts the question of whether denominationalism is, in fact, undergoing reconstitution, whether the denominational system is broadening beyond evangelical and historically black churches and Judaism, and whether immigrant, non-Christian, and newer religious impulses are organizing themselves in what might be termed a denominational pattern (the once Protestant-normed pattern of American religious organization functioning as a denominational organizational field). Will newer movements embrace a denominational identity or label (what sociologists term “institutional isomorphism”) to claim space in the religious marketplace? Will they coalesce as voluntary communities in patterns of de facto congregationalism? Will they seek nonprofit status, advertise in newspapers or in the *Yellow Pages*, and establish trustees and lay leadership cadres, committees, or boards? Will one or more of the leaders function in such congregational communities in minister-like capacities? Will the congregations gradually emulate their neighboring churches with Sunday

schools and an array of other community-building or outreach functions? To support such multipurpose activities will leaders and congregations collaborate with counterparts to build some translocal form of denominational organization? And will such denominationalizing impulses be welcomed, recognized, or even accommodated to by existing denominations and by American society? Will the many studies, institutes, conferences, and institutes now exploring religious diversity function as signals and means of accommodation, as did Vatican II, JFK's presidency, the "discovery" of a Judeo-Christian tradition, and Will Herberg's landmark declaration in his classic book *Protestant, Catholic, Jew* of a wider denominationalism? The questions are many; the answers are few.

Devotionalism

Devotionalism refers to the many ways in which religious worshippers relate to sacred figures, such as deities, persons, spirits, or objects. Sometimes known as popular piety, devotions are found in many religions and are practiced by a wide variety of believers.

Individuals and communities employ various media when practicing devotion to a sacred figure such as God, saints, goddesses, or gurus. Among these media are candles, incense, oils, flowers, songs, prayers, beads, and icons. Some devotions can be considered private because they are practiced in a domestic setting. In examples of public devotions, Roman Catholics attend Benediction (a ceremony during which the consecrated host used in Communion is displayed and adored), Jews gather as family and friends for Sabbath, and Buddhists go to public temples to pay personal homage to the Buddha. In the United States, devotionalism has long been practiced by a wide range of individuals and communities, from Native Americans to Catholics. Protestants, because of their resistance to material images (with the exception of the cross) have been less inclined to devotionalism, but they are not without the practice, particularly Hispanic Protestants. Adherents of other religions more recently present in North America (for example, Hindus, Buddhists, Jains, and Sikhs) have their own forms of devotionalism that are practiced in places of public worship as well as in private settings.

Devotionalism balances the theological and intellectual aspects of religion with concrete images, prayers, and practices that support the faith of believers. Employing material aids such as statues, altars, oils, and flowers, worshippers bring to mind the divine. Many popular devotions originate with and are practiced by ordinary believers. Sometimes institutional representatives or clergy view such devotions as secondary forms of worship. In 2001 Pope John Paul II (1978–2005) defined popular piety as an expression of faith that avails itself of certain cultural elements proper to a

specific environment—elements that are capable of interpreting and questioning the sensibilities of those who live in that same environment.

Devotionalism and popular religion often go hand-in-hand, although they may be separated by their originating sources. Devotions are frequently led by, or approved by, religious officials such as priests, ministers, rabbis, or bishops. Popular religion usually comprises practices created by ordinary believers and is not led by religious authorities. Often these practices are created on the margins of organized religion, and yet once established they are regularly tolerated or embraced by institutions. These practices may be described as extraliturgical for those traditions that have institutionalized and structured liturgy or worship. Over time, some practices of popular piety make their way into official liturgical ritual.

Pilgrimages are another form of devotionalism found in many religions practiced in the United States. American devotees may make a sacred journey to a place reputed to be holy because the transcendent or divine is believed to have touched that place in a special way. Thus, for example, Muslims visit Mecca in a pilgrimage to Saudi Arabia known as the *hajj*, Jews visit the remains of the second temple in Jerusalem at the Western Wall, and Catholics visit the healing waters of Lourdes in France.

Some of the risks of popular piety, according to religious officials, are demeaning sacred objects, misunderstanding the meaning of images or practices, attributing magical powers to objects or rituals, elevating these objects and rituals above sanctioned practices, substituting these objects and rituals for approved practices, or investing them with authority that supersedes the authority of approved texts or rituals.

Christian Devotionalism

The Protestant Reformation discouraged the use of icons, statues, and religious images. At the same time, it encouraged Bible reading and personal prayer. Many Protestants read, pray, and study the Bible. For many, private devotionalism extends to reading religiously inspired books and, in the contemporary era, listening to Christian radio and watching Christian television shows.

The religious revivals of the eighteenth and nineteenth centuries included devotionalism as well as preaching and prayer. For example, the American preacher Jonathan Edwards (1703–1758) and the British evangelist George Whitfield (1714–1770) led a revival called the Great Awakening, during which crowds gathered not only to pray but

also to dance, scream, and contort their bodies, all as signs of their devotion to the Lord. In the Second Great Awakening, preachers such as Charles Grandison Finney (1792–1875) and James McGready (1758–1817), often in outdoor campground revivals, stirred people's emotions with their fiery preaching. These same practices are followed today in many evangelical churches.

In the 1800s public schools in America initiated readings from the King James Version of the Bible. At the beginning of the nineteenth century, *The Christian Century*, a popular American publication representing mainline Protestantism, published a devotional guide entitled *The Daily Altar* that encouraged Americans to take just a few minutes daily to pray and reflect on spiritual matters. The guide included Bible readings, poetry, and inspirational texts. The use of these publications differentiated liberal Protestants from fundamentalists, who preferred only the Bible for their meditation and prayer. Henry Emerson Fosdick (1878–1969), a liberal Protestant author of four tracts on devotion, found that there were as many different ways of praying as there were individuals. Liberal Protestants accommodated contemporary culture in their devotional life, whereas fundamentalists resisted it in their spirituality while still embracing its advantages in their everyday lives. In either case, private devotions were required to keep the spirit of God alive and active in one's life. Spiritual writer Rueben Torrey (1856–1928) once observed that “no two things are more essential to a spirit-filled life than Bible reading and secret prayer.” In 1962 the Supreme Court ruled that the subjection of students to official prayer is not allowed in public school classrooms. Prayer at civic public assemblies has been challenged but still finds its way into presidential inaugurations.

As for the visual arts, in his popular paintings inspired by Bible stories Warner Sallman (1892–1968) portrayed Jesus in everyday life. These pious paintings captured the imagination of millions of Christians, who displayed prints of them in their homes. Sallman's painting “Head of Christ” (1940) has been reproduced over one billion times and would be recognized by most Americans, Christian or not. Although critics dismiss art of this genre as commercial and sentimental, such art inspired devotionalism among Protestants, who traditionally had eschewed religious images, as well as among Catholics, who enjoyed a long tradition of religious art. Led by David Morgan, contemporary scholars are reexamining this art to assess its social and religious influence.

Catholics have regularly practiced a variety of devotions. Many of these center on Mary, the mother of Jesus, who is

the focus of intense devotion. Catholics revere Mary and often ask her intercession with her son Jesus. Statues of Mary abound in churches and are often found in the homes of Catholics. The church devotes the month of May to Mary, and in many Catholic schools and parishes, in a May ceremony her statue is crowned with flowers by a schoolchild. Theologically, Mary is not divine but human, like all other humans. Nevertheless, some Catholics accord her privilege and homage that rivals that given to Jesus. The church has bestowed on her more titles than on Jesus. Commemorated on December 8, the Feast of the Immaculate Conception is based on the belief that Mary was from her conception without the stain of original sin, the only human besides Jesus to be so conceived. In 1854 Pope Pius IX declared the dogma of the Immaculate Conception, and in 1951 Pope Pius XII solemnly declared Mary's "Assumption"—that is, that Mary was assumed bodily into heaven at her death. This belief has fostered the notion that Mary was more than human or, at the least, a specially favored one.

One of the most popular and enduring prayers recited by Catholics is the rosary, sometimes called "Our Lady's Prayer." The rosary is prayed while holding a string of fifty-five beads connected in a circle. Five additional beads lead from the circle to a crucifix. Catholics touch each bead as they pray the "decades" (ten beads). The main prayer recited, "Hail Mary," is a tribute and petition to Mary:

Hail Mary, full of grace,
The Lord is with thee.
Blessed art thou among women
and blessed is the fruit of thy womb, Jesus.
Holy Mary, Mother of God,
Pray for us sinners now,
and at the hour of our death. Amen.

Every Catholic recognizes this prayer, and most have it committed to memory. It was a mainstay of the pre-Vatican II church (before 1962). Even though rosaries continue to sell well in religious goods stores, today many younger Catholics do not own rosary beads, could not name the various mysteries that accompany the rosary, and may only encounter "Hail Mary" during the wake of a deceased Catholic, when the priest, deacon, or perhaps a layperson leads the mourners in this prayer.

"Novenas," devotional prayers recited over a nine-day period that are devoted exclusively to Mary, have also been

a form of popular piety among Catholics. These prayers might be conducted by a group or said privately by an individual. Novenas said over the course of the first Friday in the month of nine months in a row were very popular in the pre-Vatican II church and continue to be a prayer form today for some Catholics.

Devotion to Jesus takes many forms among Catholics, from prayer cards with artistic depictions of Jesus to statues of the Sacred Heart of Jesus, which is graphically depicted in the plaster form. The devotion to the Sacred Heart began in France in the late seventeenth century in response to the visions reported by Margaret Mary Alacoque, a Visitandine nun. Pope Pius IX (1846–1878) popularized the devotions throughout the church, beatified (the step before canonization as a saint) the French nun, and created the Feast of the Sacred Heart, which is celebrated throughout the church. American Catholics took up the practice of reverence to the Sacred Heart, creating Societies of the Sacred Heart, which promoted devotions and encouraged Catholics to have statues of the Sacred Heart in their homes.

Eucharistic adoration is another form of Catholic devotion to Jesus. American Catholics appropriated European practices for the "Blessed Sacrament"—that is, the "host" (the small wafer Catholics receive at Communion). The host is displayed in an elaborate holder or chalice, called a "monstrance." It is worshipped in a ritual known as the Benediction during visits to the Blessed Sacrament, which is kept in a receptacle called a "tabernacle" outside of liturgical celebrations. In perpetual adoration the host is displayed in the church for Catholics to worship at all hours of the day. These are just some of the devotional practices surrounding what Catholics believe to be the body of Christ.

The veneration of saints is another form of Catholic devotionalism. Catholics revere saints as model Christians. Many religious orders (groups of nuns, brothers, or priests) were founded to imitate a particular saint (for example, the Franciscans follow the twelfth-century Saint Francis of Assisi and the Jesuits follow the sixteenth-century Saint Ignatius of Loyola). Catholics believe that the saints not only provide a model for spiritual life but also can intercede for them with God. Specific saints have been identified as particularly helpful in specific domains. Thus Saint Lucy, a martyr whose eyes were gouged out, helps believers' eyesight; Saint Anthony, a medieval Franciscan monk, helps to find lost items; and Saint Jude the Apostle, often depicted with a flame around his head, is the patron of hopeless causes to whom many critically ill people turn for help.

Catholic devotionalism was addressed by the bishops and the pope at the Second Vatican Council (1962–1965). In *Sacrosanctum Concilium* the Council stated, “Such devotions should be so drawn up that they harmonize with the liturgical seasons, accord with the sacred liturgy, and are in some ways derived from it, lead the people to it, since in fact the liturgy by its very nature is far superior to any of them.”

Some observers interpreted the council documents as a signal that Catholics should limit their expressions of devotion to Mary. Concerned that Marian piety might suffer a serious decline, Pope Paul VI issued *Marialis Cultus* (Devotion to Mary) in 1974 in an attempt to renew devotion to the mother of Jesus. To further encourage continued esteem for Mary among Catholics, in 1987 Pope John Paul II issued *Redemptoris Mater* (Mother of the Redeemer), in which he declared 1988 a “Marian Year.” This year of remembrance of Mary was not designed to undermine the council’s guidance in understanding Mary. Instead, it was “meant to promote a new and more careful reading of what the Council said about the Blessed Virgin Mary, Mother of God, in the mystery of Christ and of the Church. . . . Here we speak not only of the doctrine of faith but also of the life of faith, and thus of authentic ‘Marian spirituality,’ seen in the light of Tradition, and especially the spirituality to which the Council exhorts us.”

Mary continues to play a significant role in Catholic piety, as testified by the millions who practice personal devotion to her. The church dedicates several feast days in

the liturgical calendar to Mary. That devotion even carries over into the public world of the Internet. The Web site “Catholic Online” (www.catholic.org) carries a dedication to Our Lady of Guadalupe, and numerous other Web sites are also dedicated to those who are devoted to Mary. The Virgin Mary thus remains a key figure in Catholic art, theology, devotion, and piety. Interpretations of her today are not as uniform as they were in the 1950s, but her importance to Catholic culture cannot be underestimated.

Although Protestants and Catholics have been the most prominent religious communities in the history of the United States, recently they have been joined by members of other religions, most of them immigrants. The Pluralism Project, headed by Diana Eck of Harvard University, has identified the locations of these groups and mapped a multireligious America. The following sections describe some of these religious communities and some aspects of their devotionalism.

Hindu Devotionalism

Much of the Hindu community practices a ritual devotion known as *bhakti*, a word derived from ancient Sanskrit that means devotion focused on a deity. The two major gods, Shiva and Vishnu, are the primary subjects of intense devotion, but other gods and goddesses (Ganesh and Devi are two prominent examples) receive significant devotional attention as well. *Puja*, a devotional ceremony for a god or goddess, can be conducted in the temple or at home, either with a group

Hinduism is filled with devotions to gods and goddesses. Here, a young Hindu prays in front of a Lingam, symbol of the god Shiva. These symbols, often made of stone, are found throughout India, usually in temples, and are the objects of devotion. Hindus anoint them with oil, place garlands of flowers on them, and pray before them. Shiva is the creator god whose symbol resembles male and female organs of creation. In Hinduism, the two major gods, Shiva and Vishnu, are the primary subjects of intense devotion, but other gods and goddesses receive significant devotional attention as well.

or alone, led by a priest or a layperson. *Puja* often includes flowers to adorn a god or goddess image, oil to anoint the image, and food as an offering. For the convenience of worshippers, Hindu temples in the United States sometimes combine the most popular gods, Shiva and Vishnu, which are normally worshipped in separate temples in India.

American Hindus continue to practice traditions that originated in India but adjust them to suit the U.S. context. The community's Hawaii-based publication, *Hinduism Today*, reaches out to Hindus outside of India, many of whom are second- or third-generation Hindus living in cultures dominated by other religions.

Hindus revere their gurus (wise teachers) and practice devotion to them by bringing gifts of flowers, money, and other goods. One popular guru is Sri Sathya Sai Baba (1926–) who lives in India but has many American Hindu and non-Hindu devotees. His followers believe that he is an *avatar*, an incarnation of the divine being. Seeing him in person is considered *darshan*, the equivalent of seeing a god. Numerous Web sites are devoted to Sai Baba, and devotees from around the world travel to his home in Puttatharthi, Andhra Pradesh, India. Many attribute miraculous healings and other extraordinary happenings to his power. Skeptics abound as well. The Sai Organization sponsors civic activities designed to improve conditions for individuals and communities. For example, in 2008 it sponsored a free medical camp to provide medical screenings. The event was acknowledged by a proclamation from the mayor of Saint Louis declaring June 7, 2008, “St. Louis Medical Camp Day.”

Krishna, an incarnation of God, is a major figure from the Indian literature, especially the *Mahabharata*. Devotees to Krishna say prayers to the god, decorate his statue, and invoke his blessing. A worldwide movement called Hare Krishna attracted American followers and has proved controversial in its methods of obtaining and retaining members.

Buddhist Devotionalism

Even though the Buddha discouraged devotion to him, some forms of Buddhism exhibit elements of devotionalism. The Buddha taught that the *dharma* (the way to enlightenment) is far more important than any form of devotion. Nevertheless, Buddhists practice a deep devotion to the Buddha as well as to his teachings. The Buddha himself said that “respect and homage paid to those who are worthy of it, is a great blessing.” Buddhist temples house statues of the

Buddha. Thus devotional expressions of reverence and gratitude play a role in Buddhist spirituality. In some parts of the world, *stupas*, containing relics of the Buddha, are revered pilgrimage sites.

In many Buddhist communities another aspect of devotionalism is ancestors, whose pictures and memories are cherished through offerings such as flowers and food.

In Buddhist centers and temples in the United States, as elsewhere in the world, there are often prayer wheels containing sacred scriptures. Devotees can spin the wheels to gain merit. Some centers and temples also have prominent bells that are used in ceremonies. Especially over the last fifty years or so, Buddhists have constructed gathering places in many states to serve a diverse immigrant and indigenous population of followers. These vary from Zen centers and simple converted residences to elaborate temples, some of which are associated with monasteries. Some structures have exquisitely designed gardens that house statues of the Buddha. Rituals vary from quiet meditation to chanting, mirroring the types of Buddhism practiced in countries such as Sri Lanka, Vietnam, South Korea, China, and Japan.

Many Americans, both Buddhist and non-Buddhist, practice *Vipassana* meditation, which originated in South Asian *Theravadan* Buddhism. This exercise is intended to calm the spirit and focus the mind. Directed toward the connection between mind and body, the meditation offers techniques to help one see reality or one's permanent nature. It is intended to purify the mind, allowing one to live in peace.

The Nichiren Buddhist Church of America, which has its origins in a form of Japanese Buddhism, practices a chant called *daimoku* that emphasizes the importance of the Buddhist text, the *Lotus Sutra*. Buddhists conduct these chants in groups or individually at home in front of a scroll (a *gohonzon*) representing the *Lotus Sutra*. Many also use strings of beads similar to a rosary to aid their concentration. These rituals are conducted by laity without the leadership of a monk or priest. They also have devotional regard for *lamas* (Tibetan or Mongolian Buddhist monks), some of whom they consider incarnations of *bodhisattvas* (enlightened beings).

Jain Devotionalism

The Jain community in North America is small but fervent, with temples dotting the American landscape. When Jains pray, they use a set of 108 beads, each of which represents a quality of the supreme beings. Jains visit temples but also

offer rituals and prayers in their homes. They bow and recite *mantras* (prayers) several times a day, the most common of which is the *Nasvkar Mantra*, which reminds Jains that one is not to cling to worldly life. Among the rituals practiced by Jains is the *pratikraman*, in which the devotee acknowledges and repents of his or her mistakes and asks forgiveness. They also read their scriptures and meditate regularly. Jains revere monks and nuns, bowing down before them in an act called *vandana*. This act humbles the person and inspires him or her to emulate nuns and monks. If no monk or nun is available, they bow in the direction of the northeast to *arihantas* (those whose souls are about to be liberated and who live far away). Jains also assume a steady posture to control the body during meditation and to indicate the superiority of the soul over the body.

African Diaspora Devotionalism

African rituals and devotions are practiced in America by descendants of Africans. The practice of Santería, brought to the United States via Cuba, which, in turn, received it from West Africa, includes forms of devotionalism. Santería, a form of African religion that incorporates aspects of Catholicism, is practiced in Cuba and parts of the United States in Caribbean-American communities. Practitioners interact with *orishas* (the elemental powers of life) in rituals and devotions. Yoruba rituals are often carried out in the homes of senior priests or priestesses. In Hispanic neighborhoods in New York or Miami, small stores sell candles, beads, oils, and statues of saints that are used in the devotion practiced in Santería.

Devotionalism also plays a role in African American churches in the United States. Wednesday night prayer meetings are common, as well as the use of devotional literature meant to inform and inspire. African slaves were introduced to Christianity as far back as the American revivals. Many became Christians, affiliating in particular with the Methodists and Baptists. They also conducted their own spirited devotions in secret in slave dwellings.

Mormon Devotionalism

The Church of Jesus Christ of Latter-day Saints has rituals that are closed to nonmembers. Many of the church's temples are striking examples of architecture that stand out for their beauty and size. These temples have multiple rooms, bereft of liturgical symbols, and most are reserved exclusively for Mormons and devoted to various forms of worship. The first of these temples was built in 1836 in Kirtland, Ohio, and the best known is located in Salt Lake

City, Utah, where the Mormon Tabernacle Choir regularly performs. In addition to the formal ceremonies in the temple, Mormons hold a "Family Home Evening" each Monday, during which they recite devotionals found in church manuals, learn elements of the faith, and participate in family activities.

Jewish Devotionalism

Jewish worship usually takes place communally in a temple or synagogue; however, Jews do practice particular devotions individually or in groups. Before prayer, Jews customarily center their thoughts. The practice is called *kavvanah*, a term that generally translates as the intention to direct one's prayers to God, close or cover one's eyes, and concentrate on the prayer and its meaning in order to avoid making the prayer simply routine. Jewish prayer books are called *siddurim*. Traditionally, ten adults (a *minyan*) are required if prayers are recited out loud. Orthodox Jews permit only men in this count, whereas Conservative and Reform Judaism permit both men and women to participate. Prayers may also be read silently by an individual. The prayers should be read or recited in Hebrew, the "sacred tongue." Thus most American Jews seek to learn at least enough Hebrew to recite the prayers. A young Jew coming of age demonstrates his or her proficiency in the language at his *bar mitzvah* (for boys) or *bat mitzvah* (for girls). Orthodox and Hassidic Jews permit only the boy's ceremony.

Many Jews in America mark their homes by attaching a *mezuzah* to their doorpost. Derived from the Hebrew word for doorpost, a *mezuzah* contains a small scroll with biblical passages, *shema*, taken from the books of Deuteronomy and Exodus. Occupants and guests touch the *mezuzah* as they enter or exit the home, reminding them of their dependence upon God.

Shabbat (or Sabbath, from the Hebrew word for rest) is observed from sunset on Friday night through Saturday at sunset. Those observing *Shabbat* light the Sabbath candles, bless members of the family, recite the *kiddush*, a blessing recited over the wine and special bread (hallah), and refrain from certain kinds of work in order to devote time to prayer and contemplation. Families often celebrate this religious observance with guests. Orthodox and Conservative Jews often adhere more strictly to these practices than Reform Jews, who may or may not perform the rituals of *Shabbat* and may or may not refrain from work.

Zekhut Abot is a devotion to ancestors whom Jews believe will pray on their behalf. This devotion can be practiced at any time, but it is especially popular during the high holy

days of Rosh Hashanah (New Year's Day) and Yom Kippur (Day of Atonement).

Jews recognize 613 religious commandments, *mitsvot*, inscribed in the Torah. They include everything from hanging the *mezuzah* to circumcision practices to keeping kosher. Although many American Jews may not abide by the majority of these *mitsvot*, these laws are the basis of traditional Judaism and the foundation of many present-day devotional practices that are still observed.

Part of Jewish law revolves around the proper preparation of food. Some observant Jews follow these laws, keeping kosher homes in which meat and dairy dishes cannot be mixed for consumption and must be served on separate dishware. The preparation of kosher foods is approved by rabbis before the foods are sold. Kosher foods are often packaged in America with a notation authenticating that they have been prepared according to these rules.

Muslim Devotionalism

Islam forbids images of God because the religion holds that God (Allah) is completely transcendent and thus is not part of creation; creation is completely separate from God and is designed to give praise to God. For Muslims, devotion means living in God's presence and striving for a blameless life. Islam does not include icons, because Muslims are careful not to present images of God or to equate any material thing with God. The only images permitted are quotations from the Qu'ran and nonrepresentational art that is usually in a geometric form that depicts infinite patterns, indicating the expansiveness of God. However, some Muslims, particularly in the Sufi tradition, practice elaborate dance rituals accompanied by music.

One of the "five pillars of Islam" (the requirements of the religion) is that adherents pray five times a day. *Islam* means "submit," and Muslims are asked to submit to God. Before prayer, Muslims participate in a purification ritual, using water to cleanse the body externally, which also symbolizes internal purification. Bowing in the direction of Mecca, worshippers perform a specified number of movements while reciting verses of the Qu'ran. Often they perform this ritual on a prayer rug. These prayers can be performed at a mosque but usually are conducted in private settings.

In North America the number of Muslims has grown in recent decades. In recent years American presidents have noted Eid, the Muslim celebrations marking the breaking of the fast at the end of Ramadan (*Eid al-Fitr*) and commemorating Abraham's complete faithfulness when God asked him to sacrifice his son Isaac (*Eid al-Adha*). In 2001

the U.S. Postal Service issued a stamp commemorating the feasts. Some observant Muslims follow dietary laws (halal), similar in nature to Jewish dietary laws, including avoidance of pork and shellfish, and requiring certain procedures for the slaughtering of animals. Halal foods have a notation indicating that the food has been properly prepared, as determined by a religious authority.

Native American Devotionalism

Native Americans practiced their religions long before America was settled by Europeans, and they continue to maintain these practices today. Because this community is so diverse, any attempt to describe all of their devotional practices is not practical, but some commonalities are found among the many tribes that make up this population. Unlike many religious communities—in particular, Christian ones—Native Americans do not make a clear demarcation between the natural and the supernatural. Thus the material and the spiritual coexist so that sacrality is identified within the natural environment. Many tribes have also selectively adapted Christian practices to accommodate their own worldview. This religious syncretism includes practices derived from at least two (and sometimes more) traditions.

Native Americans often find their deities in nature, so they have a particular reverence for elements of nature such as streams, mountains, and valleys. In the past and sometimes today, this reverence may be displayed by paying special homage to nature. For example, in the ritual surrounding death the Catawba Nation would blow ashes on the dead to appease the spirit. The Muskogee Indians maintained a sacred fire that connected them to the Maker of Breath and their ancestors and therefore had to be kept unpolluted. The Natchez observed a cult of the sun as a deity who had a son who came to earth and brought them special customs and eventually resided in a stone that was preserved in a temple and revered. Other tribes used (and continue to use) special structures called "sweat lodges" in their rituals. Even though many Native Americans have embraced mainstream forms of Christianity, they continue to practice their own ancient devotions as well. Many tribes also perform holy dances that put them in touch with and pay homage to the spirits.

Conclusion

The diverse American religious landscape has given rise to multiple forms of devotionalism. With the exception of Native American traditions and, to a degree, Mormonism, all of these expressions of religiosity have been developed elsewhere and then adopted and adapted for the American

context. Generally, devotions that are particular to a world religion and developed over time in both the place of origin of the religion and in locales around the world where the religion is widely practiced make their way to the United States via immigrants. These religious adherents adopt and alter devotions as is appropriate to the American context, usually without losing the qualities and particularities that define them. Thus a Jew from Israel would recognize devotions practiced by American Jews, and Catholics from other countries would recognize the devotions of American Catholics. The same applies to Buddhists, Hindus, Jains, Muslims, and others. These practices are not unique to American communities but are specific expressions of often universal practices. These are, after all, transnational communities.

Nor are devotional practices usually unalloyed. Many religious traditions combine a variety of beliefs that may include some semblance of magic, fate, and the occult. Sometimes even a trained observer cannot separate the superstition from the genuine devotion. But believers hold that their devotionism bears fruit in this life and likely in the next. Thus those who practice devotion in its many forms believe that saints grant favors, gurus help on the path to enlightenment and liberation from the bonds of earthly life, and prayers uttered in secret are heard by God. One does not need to be an official of the religion to participate in and benefit from devotion. It complements the texts, rituals, and teachings of the religion and connects believers to the sacred in a myriad of ways that suit a variety of spiritual interests. In no country on earth is this religious expression more varied than in the United States, home of the most diverse religious population the world has ever witnessed.

The link between devotionism and “lived religion” is a close one. Studying the doctrines of religion differs from observing the practices, including devotions, in which ordinary believers engage (“lived religion”) whether sanctioned or unsanctioned by religious officials. Devotionism is sometimes embraced by institutional religion and sometimes resisted. When embraced, it can become integral to the religion. In any case, it represents a vibrant, living, and changing dimension of religious expression. Some forms of devotion have significant roots in the tradition and long histories, but some forms come and go, following cultural patterns and serving a spiritual need for a limited time and often for a particular audience.

Disciples of Christ

Disciples of Christ is a Protestant denomination in the Reformed tradition. It has its roots within the Stone-Campbell movement on the American frontier in the early nineteenth century. Officially known as the Christian Church (Disciples of Christ), the denomination is composed of about 3,850 congregations and 700,000 members in the United States and Canada. Disciples congregations are also found in Australia and New Zealand, but in Britain Disciples congregations have joined the United Church.

The denomination describes itself as “a movement for wholeness in a fragmented world.” As such a movement, it provides the means for its individual congregations to cooperate in a variety of educational, mission, service, and advocacy programs. Representatives of congregations gather for deliberation and worship in a biennial general assembly. The denomination is a member of the National Council of Churches USA and the World Council of Churches. It also participates in Churches Uniting in Christ and maintains fraternal relationships with many church bodies.

Origins

The Disciples’ early leadership was motivated by the profound conviction that the multiplicity of denominations was contrary to biblical teaching and an impediment to Christian evangelism. This conviction drove a commitment to the restoration of the unity of the church, which Disciples believed could be achieved on the basis of a simple affirmation that Jesus is the Christ and a return to the practices of earliest Christianity. Early Disciples shared the widespread belief among Anglo-American Protestants that divisions among denominations were caused by distinctive beliefs and practices that were largely irrelevant to the Christian message. Christian evangelism required an appeal to the Bible alone, leaving to individual interpretation issues that were not clearly mandated or prohibited in scripture.

These views were shared by several restorationist movements of the period. Disciples were most closely associated with two of these movements: that of Thomas Campbell (1763–1854) and his son, Alexander (1788–1866), in Pennsylvania and Virginia, and that of Barton Stone (1772–1844) in Kentucky. After 1832 the leaders of these groups agreed to unite their efforts. Initially linked by the writing and preaching of a few influential leaders, most notably Alexander Campbell, the Disciples of Christ congregations were in fact independent; they recognized no authority beyond the local congregation. Campbell’s journal, *The Millennial Harbinger*, reflected his postmillennial views, which were shared by many Americans of this period.

This movement for unity grew rapidly in the nineteenth century, with individual congregations adopting a variety of names: Christian Church, Disciples of Christ, and Churches of Christ. However, the nascent denomination eventually faced division within its own ranks, caused not only by social and cultural factors as American society changed, but also by inherent tensions between its appeal for church unity and its effort to mandate or prohibit specific church organization

and practices based on biblical interpretation. The Churches of Christ, which rejected instrumental music on biblical grounds, were separately enumerated from 1906. Another group of Christian Churches became disillusioned with the growing theological liberalism and denominational development among Disciples and so separated in 1971.

Distinctive Beliefs and Practices

Because most early leaders among the Disciples had Presbyterian backgrounds, many of their theological positions are rooted in that tradition. Their worship pattern also follows that tradition and includes scripture readings, hymns, prayers, a sermon, and communion. But to this tradition Disciples have brought their own distinctive understandings, reflecting both their reading of the Bible and the social conditions of their time and place. Many of those views continue to shape Disciple thought and practice today. Insisting on the sole authority of the scripture in matters of faith and practice, for example, Disciples reject all creeds, including the Apostles’ and Nicene creeds, as determinative in church life and as tests of fellowship. Instead, they insist on the primitive affirmation that “Jesus is the Christ” as the only doctrinal requirement for church membership. Similarly, although early Disciples shared with Presbyterians and other Protestants of the time an understanding of faith as belief in the testimony of scripture that should lead the believer to repentance and baptism, they derive from this idea the conviction that Christian commitment is the product of reason rather than emotion and tend to be suspicious of sudden, supernatural conversion experiences.

Disciples have developed distinctive views of baptism, communion, and clerical status based on their understanding of the earliest Christian practices, as reflected in Acts of the Apostles. Alexander Campbell became convinced that a believer’s baptism by immersion was scripturally mandated. He allowed himself to be immersed, and thereafter he and other Disciples insisted that immersion was the only proper mode of entry into the church. That position prevailed well into the twentieth century, although early in that century several congregations began to adopt a position of “open membership”—that is, persons who had been baptized as infants were admitted into full Communion without immersion. Controversial at the time, that position is today the practice of the vast majority of Disciples of Christ congregations, and Disciples recognize the validity of baptism regardless of when or how it is administered.

For Disciples, celebration of the Lord's Supper was a central element in the life of the earliest church. Thus they insist that the service of Communion be celebrated no less often than weekly. Their theological understanding of the service differs little from that of other Reformed tradition Protestants, but it occupies a more central place in their common life. The Disciples' separation from Presbyterians was caused in part by the Disciples' conviction that the invitation to the table should be extended to all Christians—a view not generally held at the time. From the outset, Disciples therefore have insisted that the invitation to communion is an invitation from the Lord and that all Christians are welcome regardless of denominational affiliation.

The democratization of American society in the early nineteenth century reinforced for Disciples the Protestant principle of the priesthood of believers. In addition to ordained pastoral leadership, their congregations are served by lay persons commonly designated as elders and deacons. Earlier it was common to ordain elders as well as pastors, but this practice is not in place today. Deacons have always been regarded as lay persons. Although early Disciples restricted clerical offices to men, today women serve in all positions of church leadership, both lay and clerical. Disciples reject hierarchical conceptions of clergy, but early Disciples sometimes used the term *bishop* to designate the pastoral leader of a congregation. Such usage is now rare.

Denominational Development

The Disciples of Christ evolved from those groups within the broader Stone–Campbell tradition who were more sympathetic to the tradition's appeal for ecumenism and more open to social and cultural changes that marked America's transition from a rural and agricultural society to an urban and industrial one. As the movement grew, the need for organizational structure beyond the congregational level became apparent to many, including Alexander Campbell himself, and a general convention of Disciples was convened in 1849 with delegates from congregations in eleven states. This gathering granted voting rights in this and subsequent conventions to all who chose to participate. It approved the work of the American Christian Bible Society and created the American Christian Missionary Society to encourage evangelism. Similar organizations followed at the state level, and a Christian Woman's Board of Missions and a Foreign Christian Missionary Society were founded after the Civil War. The convention and the

societies, although dependent on individual support, became the foundation of a developing denominational structure.

The Disciples' claim that all questions on the life of the church could be resolved by an appeal to the teachings of scripture was soon shown to be problematic; too often they found the scripture to be silent or ambiguous on issues on which there was disagreement. Even though their very modest and weak cooperative structure enabled Disciples to avoid formal division over slavery during the Civil War era, the profound tensions engendered by that crisis were evident in controversies during the postwar era that led to division by the end of the century. One source of conflict was the work of the societies created for activities beyond the congregational level. Although those who took the name Churches of Christ insisted that the societies lacked biblical warrant and therefore were unacceptable, Disciples regarded them as an appropriate means of cooperation in Christian work beyond the scope of a single congregation. They argued that the societies were organized as private corporations, made no claims to be churches, and therefore posed no problems for a biblical ecclesiology, which, for them, focused on the congregational community. Another major conflict arose when prosperity permitted larger churches to introduce organs. Conservatives within the movement rejected them as unscriptural, whereas Disciples of Christ welcomed this enhancement of worship as useful and not prohibited in scripture. In these and several less significant controversies, Disciples have come to accept new ways of conducting church life, which they regard as sensible when they are not clearly contrary to scripture. Their position represents an appeal both to scripture and to reason and experience, reflecting the pragmatic temperament of the society in which their position was shaped.

Disciples, like most American Protestants, were caught up in the modernist–fundamentalist controversy of the 1920s and 1930s. For Disciples, the controversy arose from disagreements over the conduct of foreign missions, as well as over the presentation of the denominational position at home. However, because Disciples had no creed by which to test the orthodoxy of individuals, this struggle centered largely on biblical interpretation and attitudes toward newer forms of biblical criticism.

Beginning in the latter years of the nineteenth century, traditional assumptions about interpretation of scripture were assaulted by a group of scholars whose approach was later called “higher criticism.” That approach opened the

books of scripture to examination of their historical background and reliability, authorship, date, and literary characteristics, among other things. In doing so, it threatened the rather legalistic use of scripture by earlier Disciples, as well as their conviction that all matters in dispute among Christians might be resolved by a simple appeal to a consistently clear and unambiguous text. Consequently, the Disciples' initial reaction was quite negative. J. W. McGarvey (1829–1911) became professor of sacred scripture at the College of the Bible in 1865, and from that influential post he defended a view of scripture as presenting a fixed pattern of truth that Christians were simply to accept and implement. By means of his academic post and as a columnist for the *Christian Standard*, McGarvey had a profound impact on Disciples during the latter years of the century. For many, his *Standard* filled the place occupied earlier by Alexander Campbell's *Millennial Harbinger*. However, as Disciples students moved from denominational schools into major universities, they began to be shaped by the newer biblical studies. Just as McGarvey was an example of the older biblical scholarship, Herbert Lockwood Willett (1864–1944) was representative of the new. Like McGarvey, Willett studied at Bethany College as an undergraduate. However, Willett went on to pursue his studies at Yale University, where he embraced the newer biblical scholarship. From there, he followed William Rainey Harper, one of the most distinguished biblical scholars of the time, to the University of Chicago. There, Willett completed a doctoral degree in biblical studies and became the first dean of the Disciples Divinity House. He and his successors in that post provided a critical center for the education of Disciples leaders in the newer approach to Bible study over the next half-century. They created the Campbell Institute, a national organization of Disciples sympathetic to the newer scholarship, and popularized these views in *The Scroll*.

In the early years of the twentieth century, the two methods of biblical study reflecting conservative and liberal theological temperaments struggled for dominance among Disciples, but increasingly the newer views were favored by Disciples. The newer biblical studies liberated them from much of their earlier biblical legalism and rendered possible an effective dialogue between Bible and culture, as well as effective cooperation with other denominational groups in ecumenical affairs. By mid-century the newer approach was clearly dominant in the churches and seminaries of the denomination. Disciples moved decisively toward

what was becoming the liberal mainstream of American Protestantism.

In 1957 the denomination appointed a Panel of Scholars. Composed of some of the denomination's ablest scholars and reflecting the theological ferment and transformation of the time, this group met for three years to restudy the doctrines and practices of Disciples and to analyze practical issues and problems confronting the church from a theological perspective. The panel completed its work and published its findings and recommendations in 1963. The panel's work was valued, and its published reports were widely studied throughout the denomination. The concerns that underlay appointment of the panel also led to the creation of a continuing theological study group, the Association of Disciples for Theological Discussion (ADTD). The ADTD, an association of Disciples scholars from private and state universities as well as denominational colleges and seminaries, began to meet annually in 1957. It identifies and analyzes common problems and encourages theological dialogue both among its members and within the denomination as a whole.

In parallel with their twentieth-century theological transformation and related to it, Disciples undertook a succession of institutional adjustments designed to provide a more effective and coherent denominational organization and ministry. The earlier general convention had simply provided a venue in which their various societies conducted annual meetings. Seeking greater coherence for denominational programs, Disciples replaced the general convention in 1917 with an International Convention to which the societies submitted reports and from which they received recommendations. A cooperative program of fund-raising was then created to support all denominational programs. In 1950 Disciples further strengthened their management of cooperative programs by forming a Council of Agencies, in which all of the organizations reporting to the International Convention worked to achieve agreement on programs and funding. The council proposed further structural reorganization, and in 1960 the International Convention appointed a Commission on Restructure. In 1967 the commission presented a Design for the Christian Church (Disciples of Christ), which was ratified the following year. This document provided for the creation of a General Assembly to replace the convention and for regional assemblies, and it designated the old agencies as general units of the church. The chief executive officer of the church is called the

general minister and president. Although congregations retain independence, corporate unity is reinforced through decisions made by elected representatives from congregations and regions.

Attitude Toward Learning

Insisting that the Bible alone was sufficient for understanding faith and church and that theology represented an imposition of human opinion upon the simple message of the Bible, Disciples initially emphasized study of the Bible within the context of a liberal arts education. Theological seminaries were founded rather late in the development of the denomination. The Disciples' first college-level institution was Bacon College in Kentucky. Named for Francis Bacon, this college of arts and sciences also included courses in biblical studies, as did Campbell's Bethany College in western Virginia, the Disciples' second college. Bacon College later merged into what is today Transylvania University, and these two schools established a pattern that generally has been followed by other colleges of this denomination—combining the study of arts and sciences with the study of scripture.

In post-Civil War America, as state universities experienced more rapid growth than church-related colleges, Disciples sought to expand the inclusion of biblical studies in liberal arts curricula by establishing denomination-funded "Bible chairs" in state universities. These chairs, funded by the denomination, entered into agreements with the universities, enabling them to offer courses in Bible and related religious studies that were considered part of the institution's curriculum. The first such chair was established at the University of Michigan, and subsequently in Missouri, Kansas, Texas, Virginia, Georgia, and elsewhere. Some of these programs continue, although many have been replaced by religious studies programs of the universities themselves.

Theological education among Disciples evolved from the biblical studies departments in their liberal arts colleges, as it became apparent that the preparation of parish clergy in an urbanizing and modernizing America required a more demanding curriculum. Transylvania's Department of Bible became the College of the Bible in 1865, and today is known as Lexington Theological Seminary. Similar developments occurred in other Disciple colleges and universities, and more recently the seminaries have become independently governed institutions. Today Disciples maintain four seminaries: Brite Divinity School in Fort Worth, Texas; Christian Theological Seminary in Indianapolis, Indiana;

Lexington Theological Seminary in Lexington, Kentucky; and Phillips Theological Seminary in Tulsa, Oklahoma. All of these seminaries draw faculty from many denominations and serve students from many other denominations, as well as those from the Disciples.

The Bible chair pattern of establishing close relationships with non-Disciple educational institutions has been replicated at the graduate level. In 1894 Disciples established a Divinity House in association with the Divinity School of the University of Chicago, and similar institutions have been established in association with Yale Divinity School, Vanderbilt Divinity School, and Claremont Theological Cluster and Graduate Theological Union in California. As a result of these relationships, a large portion of the faculty of Disciples seminaries and college-level religious studies programs is drawn from these schools, especially Chicago and Yale, and significant numbers of parish clergy are similarly educated in these and other ecumenical institutions. This distinctive pattern of ministerial education undoubtedly reinforces the ecumenical commitment of contemporary Disciples.

Ecumenical Relationships

Advocacy of Christian unity has been central to the proclamation of Disciples since their beginning. The denomination has been shaped by Thomas Campbell's assertion in 1809 "that the Church of Christ upon earth is essentially, intentionally and constitutionally one; consisting of all those in every place that profess their faith in Christ and obedience to him in all things according to the Scriptures, and that manifest the same by their tempers and conduct." The centrality of the Disciples' advocacy of Christian unity thrust the denomination into the forefront of the ecumenical movement, beginning in mission fields where Disciples were early advocates of comity agreements and interdenominational schools and programs. In 1910 Disciples created an ecumenical office, now the Council on Christian Unity, and they also enthusiastically endorsed the church federation movement. Indeed, they were founding members of the Federal Council of Churches, the National Council of Churches USA, and the World Council of Churches. More recently Disciples participated in the Consultation on Church Union, and since its formation in 2002 they have participated in Churches Uniting in Christ. They maintain close relationships with many denominations and share with the United Church of Christ a common program of mission. Disciples also cultivate relationships with other groups tracing their history to the Stone-Campbell movement. For

example, the denomination participates in the World Convention of Churches of Christ, which was formed in 1930 and conducts mass meetings every four years. And it supports the Disciples of Christ Historical Society, the major repository for materials related to the Stone-Campbell movement.

Roles of Women and Minorities

The early role of women in the Disciples reflected the common patriarchal patterns of the early nineteenth century. However, women were occasionally ordained in the latter years of that century. Meanwhile, women founded the first Disciple missionary society and have been active in all areas of church life over the history of the denomination. Today, Disciple seminaries reflect the gender balance of American society, and women exercise pastoral and congregational leadership throughout the denomination where they serve as pastors, elders, and deacons. Disciples selected Sharon E. Watkins as their first female general minister and president in 2005.

Similarly, the role of minorities in the church initially followed and more recently anticipated the trajectory of American society generally. African Americans were attracted to the new denomination and to pastoral responsibilities early in its history. However, during the Jim Crow era a separate National Convention was created by this increasingly segregated community. Agreement was reached in 1960 to merge the National and International Conventions, and the merger was formalized in 1969. Disciples congregations are now including more and more members with diverse racial and ethnic backgrounds, but support groups within the denomination continue to address the special interests of those congregations identifying themselves as African American, Asian American, or Hispanic. Yet all participate in the General Assembly and the work of the denomination at local and regional levels. Those congregations serving immigrant communities are among the most rapidly growing within the denomination.

Impact on American Religious Life

The Disciples of Christ both reflected and contributed to shaping the democratic ethos of the early nineteenth century. Their insistence upon the right and duty of the individual Christian to study, to think, and to respond with integrity to the Gospel located them among a variety of religious, political, and economic forces contributing to the democratization of American society. Although the

denomination developed in an age of revivalism and participated in that movement, their conviction that faith is born of reason rather than of intense experience and their concern with Christian nurture offers Americans an alternative understanding of the process whereby one enters into Christian life.

The Disciples' insistence on the centrality of Communion in worship, a view they adopted through the classic Protestant appeal to scripture, links them to the Anglican and Catholic traditions, even as other aspects of their worship life link them to the Reformed tradition. And yet Disciples combine their understanding of worship as involving the eucharistic celebration with the affirmation that every Christian of every tradition should be welcomed to the table in the name of the Lord. They bring these somewhat disparate views to ecumenical discussions whether with other Protestant churches or with the Catholic Church.

The Disciples' conviction that divisions within the church are unscriptural has encouraged them to assume a leadership role in the ecumenical movement where their participation and enthusiastic support have been consistent. And yet Disciples, like many other Americans, have generally shown more interest in cooperative action than in reaching unity grounded in common theological commitments, and their suspicion of unity based on creedal formulations has presented problems for them when engaging in ecumenical dialogue. They have supported church federations and councils at every level, their mission churches have generally entered into united churches whenever possible, and they comfortably cooperate with other Protestant denominations in union congregations in North America. They conduct their mission program cooperatively with the United Church of Christ and have held national meetings together with that body. Only since mid-twentieth century, however, have Disciples been prepared and willing to engage in the serious theological discussions required for effective participation in Christian ecumenism today.

Dispensationalism

Originating in nineteenth-century England, dispensationalism is a system of Bible prophecy interpretation adopted by many evangelical and fundamentalist American Protestants. Popularized by televangelists, megachurch pastors, and the mass media beginning in the 1970s, dispensationalism gained a wide following. As millions of Americans embraced this scheme of prophetic interpretation, it, in turn, influenced their view of world affairs and public policy issues.

Dispensationalism is one variant of a broader scheme of prophetic interpretation known as premillennialism. According to this view, Christ's thousand-year millennial reign (Revelations 20:1–6) will come about entirely by supernatural means, and only after humanity has sunk to unprecedented levels of wickedness, culminating in a final apocalyptic battle in which the forces of evil are forever vanquished.

Historical Background

Throughout history, Christians have struggled to interpret the Bible's prophetic and eschatological passages. St. Augustine, formulating what would become the orthodox Catholic

view, saw the prophecies as a revelation of all sacred and secular history, culminating in the triumph of righteousness. With the Reformation, Protestant leaders generally adopted this view as well. In all eras, however, some interpreters held that the prophecies referred to events still in the future. The early Christians anticipated Christ's return in their own lifetime. Sixteenth-century Anabaptists preached that the millennium was at hand. Late sixteenth- and seventeenth-century religious radicals in England believed that the millennium would come as papal pomp and ritual—and their remnants in the Church of England—were overthrown and a purified believers' church established. Cotton Mather and other New England Puritans shared such millennialist expectations.

This futurist reading of the prophetic scriptures survived on the fringes of British religious life into the nineteenth century. The Scotsman Edward Irving, a popular London preacher in the 1820s and 1830s, formulated elements of what came to be called dispensationalism in the early 1830s in *The Morning Watch*, a prophecy magazine. John Nelson Darby (1800–1882), a leader of a British dissenting sect known as the Plymouth Brethren, made significant contributions as well. Organizing the Bible's prophetic and apocalyptic texts in sequential form, Darby and other early shapers of dispensationalism believed they had found the key to God's plan for the Jews and for Gentile Christians, and to events that would unfold in the end times. According to this scheme, God has dealt with his chosen people, the Jews, and with the rest of humanity in a series of seven epochs, or dispensations, each with its distinctive plan of salvation, beginning with the Age of Innocence in the Garden of Eden and continuing through the present dispensation, the Church Age.

Introducing dispensationalism's most distinctive feature, the founders of this interpretive system taught that the Church Age would end with the Rapture, when all true believers would disappear to join Christ in the air. (The word *rapture* is etymologically related to *raptor*, the bird of prey that swoops down to snatch mice and other small creatures.) The texts undergirding this doctrine include I Thessalonians 4:16–17: “For the Lord himself shall descend from heaven with a shout, . . . and the dead in Christ shall rise first: Then we which are alive and remain shall be caught up together with them in the clouds to meet the Lord in the air: and so shall we ever be with the Lord.”

The Second Coming of Christ is a core Christian dogma, reflected in the Nicene Creed (CE 325), which is translated in the Anglican Book of Common Prayer as:

“And he shall come again with glory to judge both the quick and the dead.” However, the Rapture as an eschatological event prior to the Second Coming represents one of dispensationalism’s distinctive contributions to prophetic interpretation.

Heeding Jesus’ warnings in Matthew 24:36 against date setting (“of that day and hour knoweth no man”), dispensationalists avoided a pitfall that has discredited many prophecy interpreters. In the 1830s, for example, William Miller of New York, after studying time sequences mentioned in the book of Daniel and translating the “days” into years, began to preach that Christ would return “around 1843 or 1844.” An even more precise date soon emerged: October 22, 1843 (later revised to 1844). Miller won many followers, but when the predicted dates passed uneventfully, the movement collapsed. (From its ashes, however, arose the Seventh-day Adventist Church, whose followers still study the prophecies, though carefully avoiding date setting.)

Although dispensationalists generally eschew date setting, they also teach that Jesus’ Mount of Olives discourse recorded in Matthew 24, along with other biblical passages, reveal telltale signs by which believers can know that the end is near. These signs include wars, wickedness, natural disasters, and the return of the Jews to Palestine, the land promised by God to Abraham (Genesis 15:18), and the rebuilding there of the Jewish Temple destroyed by the Romans in CE 70. For Pentecostals, renewal of the spiritual gifts granted to believers at Pentecost, including divine healing and speaking in tongues (glossolalia), is further evidence of the approaching end.

This avoidance of date setting, combined with the insistence that the Rapture is imminent, helps explain dispensationalism’s enduring appeal and its powerful spur to the evangelistic effort. Believers exist in a state of intense anticipation, carrying on their daily lives and yet convinced that the Rapture may occur at any moment. Anxiously looking to their own readiness, they urgently implore others to accept Christ before it is too late and scan the headlines for signs that the long-awaited event is, indeed, drawing ever closer.

After the Rapture, according to the dispensationalist system, will come the Great Tribulation foretold by Jesus (Matthew 24:21–22), when a demonic figure, the Antichrist, will arise. First presenting himself as a peacemaker, the Antichrist (called the “Beast” in Revelation) will soon reveal his true intentions and establish a global dictatorship in which all who resist his power, represented by the number 666 (Revelation 13:18), will be persecuted and slaughtered.

The Antichrist’s reign, though brutal, will be brief. After seven years, as the Antichrist’s armies gather at Har-Megiddo (Armageddon), an ancient battle site in Israel, Christ and the raptured saints will return to earth in full battle mode. Once he defeats the Antichrist and slaughters his armies (Revelation 19:11–21), Christ will inaugurate his millennial reign of justice and peace in the rebuilt Jewish Temple in Jerusalem. After a short-lived final rebellion, the Antichrist will be defeated forever. After a solemn Last Judgment, when all who have ever lived confront their eternal destiny, the great human drama that began in the Garden of Eden will come to a close. The damned will suffer endless torment in hell; the redeemed will rejoice forever in God’s presence in heaven.

Dispensationalism Comes to America

Dispensationalism won adherents among evangelical Protestants in late nineteenth-century Britain and North America, where Darby made several evangelistic tours. Early U.S. dispensationalists included the evangelist Dwight L. Moody; the Chicago businessman William E. Blackstone, whose *Jesus Is Coming* (1898) sold more than a million copies; and James Brookes, a Presbyterian minister in St. Louis. Through Brookes’s prison ministry, Cyrus Scofield (1843–1921) became not only an evangelical Christian but also a committed dispensationalist. After fleeing an embezzlement accusation and abandoning a wife and children in Kansas, Scofield was in a St. Louis prison on forgery charges at the time of his conversion. After prison, he settled in Dallas as a Congregationalist pastor. There, Scofield edited a prophecy magazine, preached at prophecy conferences, and conducted a Bible correspondence course. In 1909 Oxford University Press published his annotated version of the King James Bible, with a running commentary reflecting the dispensationalist interpretation. Eventually selling millions of copies, the “Scofield Bible” played a seminal role in spreading dispensationalism.

Dispensationalism, with its confident assumption of the Bible’s divine inspiration and inerrancy, appealed to evangelicals dismayed by theological modernism and critical biblical scholarship. The fundamentalist movement, coalescing around a series of treatises published as *The Fundamentals: A Testimony of Truth* (1910–1915), proved particularly receptive to dispensationalism.

Other Systems of Prophetic Interpretation

Although highly influential, dispensationalism and premillennialism more generally are not the only ways in which

Christians past and present have interpreted biblical prophecy. Indeed, these often cryptic texts have stirred much controversy over the centuries. The Catholic, Reformed, and Lutheran traditions are generally amillennial, viewing the prophecies as unfolding over a long span of time or as allegories of the perennial conflict between good and evil. Although they anticipate Christ's return, amillennialists reject the idea of a literal thousand-year earthly reign as well as other details of dispensationalism's end-time scenario. Righteousness will finally triumph, they affirm, but the details remain unknowable.

Another interpretive mode, postmillennialism, views the prophesied era of justice and peace as gradually attainable in the present age through Christian effort, rather than emerging only after a final apocalyptic confrontation between righteousness and evil. The eighteenth-century New England theologian Jonathan Edwards espoused postmillennialism, believing that the triumph of righteousness could be achieved through prayer, evangelism, and other pious endeavors. Much nineteenth-century reform activity, including the temperance and antislavery movements, was inspired by this vision of a purified society achieved by means of earnest Christian striving.

Postmillennialism appealed to liberal Protestants and reformers of the late nineteenth and early twentieth centuries. Leaders of the Social Gospel movement such as W. D. P. Bliss, Washington Gladden, and Walter Rauschenbusch argued that Christ's kingdom could be advanced by remedying the social evils and injustices so rampant in urban-industrial America. The mainstream Protestant denominations and their ecumenical organization, the Federal (later National) Council of Churches, embraced postmillennialism as a theological rationale for their social activism.

Meanwhile, other groups—notably the Church of Jesus Christ of Latter-day Saints (Mormons), Seventh-day Adventists, and Jehovah's Witnesses—taught particular versions of end-time belief. Many Pentecostals, while emphasizing glossolalia and other “gifts of the spirit” as evidence of Christ's near return, also believe in ongoing prophetic revelations, whereas most dispensationalists hold that information about the end-times is confined to the Bible.

Dispensationalism from World War I through the Cold War

From the 1920s through the 1960s dispensationalism retained a loyal following among fundamentalists and evangelicals. Bible schools and seminaries such as the Philadelphia

School of the Bible (founded by Cyrus Scofield and William L. Pettingill in 1911), Bible Institute of Los Angeles, Dallas Theological Seminary, and Chicago's Moody Bible Institute became dispensationalist bastions. Among the prominent ministers, evangelists, and writers who espoused dispensationalism were Isaac Haldeman, pastor of Manhattan's First Baptist Church; Arno Gaebelein, editor of the prophecy magazine *Our Hope*; the British revivalist G. Campbell Morgan, who frequently toured America; Harry A. Ironside, pastor of Chicago's Moody Memorial Church; Reuben A. Torrey of Los Angeles's Church of the Open Door; James M. Gray, the longtime president of the Moody Bible Institute; and Philadelphia's Donald Grey Barnhouse, whose *Bible Study Hour* radio program and *Eternity* magazine exerted broad influence.

Historical developments seemed to confirm the dispensationalist scenario. Progressive-era optimism and President Woodrow Wilson's vision of a peaceful, democratic world faded in the disillusioned 1920s. The 1917 Bolshevik Revolution in Russia stirred interest in prophecies of a mysterious northern kingdom, Gog, that would be destroyed by God after it invaded the land of Israel (Ezekiel 38). Some prophecy writers had long identified Russia as Gog, and with the atheistic communists in power such speculation intensified. Britain's 1917 Balfour Declaration supporting the establishment of a Jewish homeland in Palestine also captured the attention of dispensationalists; they had long viewed the Jews' return to Palestine as a crucial end-time sign. As early as 1891, businessman William Blackstone had persuaded prominent U.S. political and corporate leaders to sign a manifesto calling for a Jewish homeland in Palestine “to further the purposes of God concerning His ancient people.” The Balfour Declaration seemed to be a momentous step toward this long-anticipated prophetic fulfillment.

World War II, with its global scale and massive casualties, appeared to fulfill Jesus' prophecy of “wars and rumours of wars” (Matthew 24:6) in the last days. And Adolf Hitler and Benito Mussolini for a time seemed possible candidates for the Antichrist. After 1945 Wilbur M. Smith of the Moody Bible Institute and other dispensationalists looked upon the atomic bomb as the instrument that would lead to the earth's fiery destruction, as foretold in II Peter 3:10. The postwar founding of the United Nations and moves toward European unification were interpreted as preludes to the Antichrist's global dictatorship. Meanwhile, the Cold War struggle with the Soviet Union heightened the attention given to Russia's end-time role. As telecommunications

satellites soared into orbit, dispensationalists identified the technology by which the Antichrist would attract a worldwide following. Wherever dispensationalists looked, it seemed, end-time signs were proliferating.

Dispensationalism in the Contemporary United States

Despite its wide acceptance by conservative Protestants, dispensationalism remained marginal throughout the 1960s, with only limited penetration of the larger culture. This situation changed dramatically after 1970, as world events combined with political and cultural developments at home to expand the influence of dispensationalism. In a backlash against the antiwar activism, campus turmoil, and counter-culture provocations of the 1960s, conservative churches burgeoned in the 1970s and beyond. While liberal, mainstream denominations lost members, evangelical churches grew dramatically. The nation's largest Protestant denomination, the evangelical Southern Baptist Convention, grew by 23 percent between 1970 and 1985. Membership in the Assemblies of God church, a product of the Pentecostal revival of the early twentieth century, increased by 300 percent over the same period. The nondenominational Calvary Chapel movement, launched by Chuck Smith in Costa Mesa, California, in 1965, spread like wildfire; eight hundred Calvary Chapels could be found worldwide by 2000. Nondenominational suburban megachurches (churches with two thousand or more members), most of them fervently evangelical, proliferated as well.

As conservative Protestantism grew, premillennial dispensationalism, with its emphasis on human sinfulness, the futility of reform effort, and God's absolute sovereignty over the course of history, also gained ground. Chuck Smith, for example, promoted dispensationalism not only through the hundreds of Calvary Chapels worldwide but also through paperbacks, films, audio- and videotapes, and eventually the Internet.

Changes in mass communications further facilitated the diffusion of dispensationalism. Religious programming on television, once confined to local preachers and soporific Sunday public service programs on network television, now exploded as evangelical, fundamentalist, and Pentecostal preachers, supported by viewer contributions, seized the initiative. Exploiting cable and communications satellites, Jerry Falwell's *Old Time Gospel Hour*, Pat Robertson's Christian Broadcasting Network (1961), and Paul Crouch's Trinity Broadcasting Network (1973) provided potent new

venues for promulgating evangelical Christianity and dispensationalism specifically.

The paperback revolution, the emergence of book marketing outlets (such as Borders, Barnes and Noble, Wal-Mart, and Amazon.com), and the explosive growth of Christian (mostly evangelical) bookstores were all factors in the mass marketing of dispensationalism. Hal Lindsey's *The Late Great Planet Earth* signaled what lay ahead. Lindsey, a Mississippi River tugboat operator who found God, studied dispensationalism at Dallas Theological Seminary, and joined Campus Crusade for Christ (an evangelical ministry founded by Bill Bright in 1951), sensed his opportunity when his sermons on Bible prophecy at the University of California, Los Angeles, drew standing-room-only crowds. *The Late Great Planet Earth*, a slangy version of dispensationalism full of allusions to current events, was issued as an inexpensive paperback by Zondervan, a religious publisher in Grand Rapids, Michigan. It went on to become the nonfiction bestseller of the 1970s.

As dispensationalism entered the cultural mainstream, other popularizers produced their own paperbacks, and many became bestsellers. John Walvoord of Dallas Theological Seminary published *Armageddon, Oil, and the Middle East Crisis* in 1974. In the years that followed, the veteran televangelist Jack Van Impe produced a stream of prophecy paperbacks, including *Signs of the Times* (1979) and *11:59 and Counting* (1984). Arthur Bloomfield's *How to Recognize the Antichrist* (1975), John Wesley White's *The Coming World Dictator* (1981), and Doug Clark's *Shockwaves of Armageddon* (1982) typified the scores of dispensationalist paperbacks that flooded the market in these years. In a 1996 poll 42 percent of Americans either "strongly agreed" (28 percent) or "moderately agreed" (14 percent) with the statement "the world will end in a battle in Armageddon between Jesus and the Antichrist."

The entertainment industry seized this lucrative new marketing opportunity. *The Omen* (1976), a film starring Gregory Peck, treated the boyhood of the Antichrist, who in later sequels became a powerful industrialist and ultimately world dictator. Bob Dylan's brief interlude as a born-again Christian resulted in two songs about the Second Coming: "When He Returns" (1979) and "Are You Ready?" (1980). The 1991 movie *The Rapture* featured Mimi Rodgers as a sexually promiscuous hedonist who experienced the cosmic event that is dispensationalism's centerpiece. *The Omega Code*, another Antichrist movie, received a full-scale Hollywood release in 1999.

Dispensationalism's mass market penetration culminated in the *Left Behind* novels by Tim LaHaye and Jerry B. Jenkins. In *Left Behind* (1995), the central characters, having missed the Rapture, convert to Christ. Successive volumes cover the Antichrist's rise, the Tribulation, and Christ's return at Armageddon—the key elements of the dispensationalist scenario. Enjoying sales of some seventy million copies and many translations, the twelve-volume series became a marketing juggernaut. The tie-in products included a movie, a “prequel,” DVDs, audio- and videotapes, a videogame, a children's version, a Bible study series, greeting cards, and T-shirts. In 2002 the Bantam Dell Publishing Group signed LaHaye to a multimillion-dollar, four-book contract. The new (ghost-written) series was entitled *Babylon Rising*.

Dispensationalism's Political Significance

From the beginning, dispensationalism had political implications, because believers monitored current events for end-time signs. In the Balfour Declaration, Bolshevik Revolution, rise of fascism, World War II, atomic bomb, and beginnings of a global political and corporate order, dispensationalists saw the unfolding of a divine plan. They supported Zionism as a step toward the prophesied reestablishment of a Jewish nation and restoration of the Jewish Temple on Temple Mount (also sacred to Muslims). They opposed Russia not only as a Cold War adversary, but also as a nation whose end-time destruction is foretold in scripture. They dismissed nuclear disarmament efforts, because the Bible predicts the earth's destruction.

Lindsey's *The Late Great Planet Earth* was intensely political. He foresaw a nuclear World War III and urged preparation for war with Russia and Communist China, which he linked to the 200 million-man army that dispensationalists believe will advance across the Euphrates River in the end-time (Revelation 9:14–16). He interpreted Israel's occupation of the West Bank in the 1967 war as a fulfillment of God's promise to Abraham, and dismissed any Mideast peace initiative that involved a Palestinian state, shared governance of Jerusalem, or Israeli withdrawal from the occupied territories. Many other dispensationalist popularizers echoed the same themes.

Along with the larger evangelical movement, post-1970 dispensationalists were increasingly politicized under the influence of Jerry Falwell's Moral Majority, Pat Robertson's Christian Coalition, James Dobson's Family Research Council, Tim LaHaye's Council on National Policy, Beverly

LaHaye's Concerned Women for America, Donald Wildmon's American Family Association, Gary Bauer's American Values organization, the Southern Baptists' Ethics and Religious Liberty Commission led by the powerful Washington lobbyist Richard Land, and a host of other political pressure groups. Indeed, the dispensationalist insistence that unfolding events have profound prophetic significance added a note of eschatological urgency to the newly politicized evangelical wing of American Protestantism.

With the end of the Cold War, the dispensationalists increasingly turned their attention to the movement toward European unity, the continued expansion of the UN and other international bodies, the rise of a global corporate order, and the spread of computer-based information technologies. All were seen as forerunners of the Antichrist's rule. Spreading fears of global warming and other environmental hazards were linked to prophecies in the book of Revelation of nightmarish disruptions in the natural order. The *Roe v. Wade* abortion decision, the ban on prayer in public schools, the barring of creationist dogma from public school science classes, judicial protection of pornography on First Amendment grounds, and the greater cultural visibility of gays and lesbians were all cited as evidence of the growing end-time wickedness foretold by Christ.

Above all, post-Cold War dispensationalist popularizers focused on the Middle East. Dispensationalists such as Falwell, Robertson, Lindsey, Michael Evans, and John Hagee redoubled their calls for unqualified support of Israel's territorial claims and dismissed the claims of Palestinians and the Muslim world generally as contradictory to God's prophetic plan. After the terrorist attacks on the United States on September 11, 2001, the anti-Muslim theme intensified. In *Beyond Iraq: The Next Move* (2003), Michael Evans, founder of the Jerusalem Prayer Team and other pro-Israel groups, dismissed Islam as “a religion conceived in the pit of Hell.” John Hagee, a San Antonio televangelist, megachurch pastor, and founder of a lobby called Christians United for Israel, struck the same note. Tom DeLay, a dispensationalist who served as Republican majority leader of the U.S. House of Representatives until scandal forced his resignation in 2006, tirelessly fought to align U.S. foreign policy with what he saw as God's end-time plan, denouncing any peace effort that required concessions by Israel.

The growth and political influence of dispensationalism were not, however, unopposed. The mainstream liberal denominations, though weakened, remained influential, rejecting the apocalyptic militancy of dispensationalism and

continuing to promote peace, social justice, and environmental protection—causes dispensationalists viewed as naïve at best and demonic at worst. Resistance to dispensationalism arose even within the evangelical camp, as some called for a recovery of the lost nineteenth-century tradition of engagement with social reform causes. In his book *The Scandal of the Evangelical Mind* (1994), the evangelical historian Mark Noll criticized dispensationalism as theologically unsound and a travesty of evangelicalism's tradition of rigorous biblical exegesis. Two movements from the 1970s, Ronald Sider's Evangelicals for Social Action and Jim Wallis's evangelical Sojourners, rejected both dispensationalism's theology and its political agenda. They urged social action on issues such as poverty, peace, and environmental protection. As the George W. Bush administration came to a close in 2008, amid widespread disillusionment with the Iraq War and uneasiness over the direction of public policy, some evidence suggested that the political mobilization of religious conservatives, energized by dispensationalist beliefs, might be waning. Few observers, however, were prepared to predict that the influence of dispensationalism in the public sphere would soon end.

Conclusion

Crossing the Atlantic from Britain, dispensationalism took root among American evangelicals in the late nineteenth and early twentieth centuries. It was energized by the post-1970 growth and political mobilization of religious conservatives. Exploiting changes in U.S. church life, mass marketing, and communications technologies, popularized versions of this system of prophetic interpretation spread rapidly in the late twentieth and early twenty-first centuries. From obscure beginnings, dispensationalism had become a major force not only in American religious life but also in the nation's popular culture, politics, and foreign policy.

Dutch Reformed

The term *Reformed* refers to those Protestant churches that emerged from the Swiss Reformation, especially from the influence of John Calvin of Geneva and to a lesser extent Ulrich Zwingli of Zurich. The Calvinist churches on the European continent usually assumed the name "Reformed." Those in the British Isles became known as "Presbyterian." The Dutch Reformed churches in America originated in Holland and belong to this broader movement.

European Background

The Reformed wing of the Reformation was the most international of the Protestant churches of the sixteenth century. The movement began in Switzerland and spread not only to Holland but also to England, Scotland, Ireland, Wales, France, Germany, Poland, Hungary, and other areas of Europe, and to North America.

Like other Protestants of the Reformation, the Dutch Reformed believed in the three basic doctrines of the Protestant movement: the authority of the Bible for the church and the life of the believer, salvation by God's grace and not by human works, and the priesthood of all believers. Each of these ideas had distinctive implications for the Reformed

churches. For example, the emphasis on the Bible led to intense study of it, higher levels of literacy and education so people could read and understand the Bible, and disputes about the Bible's authority and meaning. The focus on salvation by God's grace alone led Reformed leaders, including the Dutch, to advocate God's predestination and election of those who were saved (perhaps no doctrine proved to be more contentious than that of predestination). Finally, by stressing the priesthood of all believers, Reformed Christians launched not only an attack on hierarchical forms of authority but also an affirmation of more democratic and egalitarian forms of authority in both church and civil affairs.

In worship, these Reformed Protestants sought to "reform" or restore the church and its worship to the New Testament's description of early Christian practices. The sermon (the Word of God proclaimed) replaced the sacrament of the Lord's Supper (the Word of God sacramentally presented) as the heart of Reformed worship services. These services were long in duration and simplified to include preaching, the singing of psalms, and extended prayers. Like other Protestants, the Reformed reduced the number of sacraments from the seven in the Roman Catholic tradition to only two—the Lord's Supper and baptism of both infants and adults. For the Lord's Supper, the Reformed held that the bread and wine *symbolized* the presence of Jesus Christ.

In their organization of the church, Reformed Protestants differed from both the Roman Catholic Church and their Protestant cousins. Like all Protestants, they rejected the Roman Catholic emphasis on the authoritative teaching role of the church and its tradition and emphasized the definitive superiority of the Bible (*Sola Scriptura* or the Bible alone). The Reformed leaders also rejected the role of bishops (which Lutherans and Anglicans retained) but still ordained ministers (which many of the Anabaptist groups did not). What distinguished Reformed church government from those of the Roman Catholic and other Protestant traditions was its understanding of power as delegated and balanced. Reformed churches were not radically democratic, vesting final authority in congregations. Instead, the churches were representative democracies—much like the republican governments spawned in their wake. The ministry of the entire church was divided between ministers and teachers (sometimes called teaching elders), elders (sometimes called ruling elders), and deacons (supervisors of ministries of compassion to the poor, the

sick, and the needy). This division of power was evident in the organization of the congregation; authority rested with the minister, the consistory or session, and the congregation itself. Groups of congregations were governed by a balanced relationship between congregations, classes or presbyteries, synods, and a general assembly or general synod (usually defined by national boundaries). Unifying their understanding of the church (and, by implication, their understanding of society), Reformed Protestants believed in the separation and balance of powers—all clearly defined in a constitution.

Reformed Protestants also differed sharply from the Roman Catholic tradition in the frequent Protestant emphasis on stipulated and codified confessions. These human-constructed statements of faith were viewed as subordinate to the authority of scripture, but their authority and interpretation were always subject to challenge and debate. Lutherans and Anglicans had their own confessions or doctrinal standards. For the Dutch Reformed the confessional standards became the Belgic Confession (1561), the Heidelberg Catechism (1563), and the canons of the Synod of Dort (1618–1619).

The Reformed tradition has often been described as a "confessional" tradition, and the Dutch Reformed are particularly vivid examples of this impulse in Protestantism. Indeed, the Dutch Reformed churches in America are known for the importance they give to confessions and Christian doctrine. For the Dutch Reformed, ideas about God truly matter. Their history and even present-day practice are molded by the desire to think clearly and correctly about divine truths; more generally, they prize intellectual rigor in all areas of life.

Dutch Reformed in Colonial America

When Dutch Protestants began to migrate to North America, they brought with them the marks of their tradition in Holland, as well as urgent practical concerns. The first Dutch Reformed churches were founded in New York, New Jersey, and Delaware during the seventeenth century. They were some of the earliest Reformed congregations in North America.

The sponsor of Dutch migration was the Dutch West India Company, whose interests were primarily economic and commercial. Initially it shied away from sponsoring any church, but the director of New Netherland (later New York), Peter Minuit, took the lead in appointing the first pastor, Jonas Michaelius (1577–1638). Michaelius founded

“the church in the fort” (now known as Collegiate Church) in 1628, marking the beginning of the Dutch Reformed Church in America.

The most pressing economic challenge for every colony was the need for immigrants to support its life and welfare. The population of Dutch immigrants did grow in New York and New Jersey, but that growth created the most pressing ecclesiastical need—more ministers. The Classis of Amsterdam controlled the Dutch Reformed congregations in America. This control included the power to ordain ministers, which made the supply of ministers even more problematic. Dutch Reformed churches also faced the dilemma of serving a diverse population. New York—and the middle colonies more generally—had the most diverse population of all the American colonies. Some Dutch Reformed churches attempted to reach out beyond the Dutch population, but because services were conducted in Dutch, their efforts were largely futile.

In 1664 the Dutch Reformed lost their privileged status in New York when the English conquered the colony. They protested—successfully—the English desire to establish or strengthen the Church of England in the colony. Their victory was ironic, however, for in protecting their own liberty they had to accept legal protection for all other churches as well. This is an early example of how the experience of diversity produced the reality of toleration in American history.

Migration from Holland waned during the late seventeenth century and so did the Dutch Reformed churches in numbers and vitality. By 1700 New York had fifty churches, and twenty-nine were Dutch Reformed. What the Dutch Reformed may have lacked in numerical and spiritual strength, they made up for in economic influence and social prestige. Dutch families occupied a central role in the development of New York and New Jersey’s political, social, and economic life well into the twentieth century.

In 1720 Theodore J. Frelinghuysen (1787–1862), a young German pastor, came to New Jersey. Frelinghuysen was a pietist who advocated individual conversion and personal appropriation of faith. His evangelistic preaching revived Dutch churches just before the First Great Awakening of the 1730s and 1740s spread through the colonies.

The ticklish problem of ecclesiastical independence became a source of contention. Some Dutch Reformed pastors wanted freedom from the Classis of Amsterdam and petitioned for autonomy in 1738. Other Dutch Reformed pastors opposed the initiative and wanted Amsterdam to

maintain its power to ordain ministers for the colonies and regulate colonial church life. They also wanted Dutch Reformed ministers to be trained at New York’s King College (now Columbia University).

The Classis of Amsterdam proposed a compromise. It granted the Dutch Reformed in the colonies the right to establish a coetus—an association of churches without ecclesiastical autonomy. The Coetus Party eventually broke with Amsterdam and formed its own classis in 1754, which angered its opponents, the Conferentie Party. John Henry Livingston (1746–1825), who became known as “the father of the Reformed church,” brought the two parties together in 1771, but complete freedom from the Classis of Amsterdam was won only through the colonies’ American War of Independence. This victory was symbolized by the founding of the New Brunswick Theological Seminary in New Jersey in 1784, one year after the end of the American Revolution.

Dutch Reformed in the New Nation

The year 1784 also brought the formation of a synod and classis, and in 1792 the Dutch Reformed organized themselves as the Reformed Protestant Dutch Church. In 1867 the name was changed to the Reformed Church in America (RCA)—the name it uses to this day.

Although the Dutch Reformed largely supported the American Revolution, they found themselves at the fringes of the increasingly English-speaking population. They argued about whether to continue to use Dutch in worship services and attempted to work with Presbyterians and the German Reformed to reach more people, but evangelistic efforts foundered and the new denomination remained almost exclusively Dutch.

That situation did not, however, stifle the theological discussion and division. In 1822 the True Dutch Reformed broke away and protested the influence of revivalism and evangelical Arminianism in softening the strict Calvinism of the Dutch Reformed churches. The schismatic group nearly disappeared, but then its forces grew with the migration of conservative Dutch Reformed Protestants from Holland. In 1834 conservative Calvinists in Holland broke with the state church. They sought a more vital piety, strict application of moral laws to regulate Christian life, and a rigorous interpretation of Christian orthodoxy. But they were met by religious and political oppression, and life worsened in Holland because of the onset of an agricultural depression in the 1840s.

In 1846–1847 these conservatives began what is known as the second Dutch migration to North America. One group, led by Albertus Van Raalte (1811–1876), founded Holland, Michigan, and other communities in the region. Hendrik Scholte (1805–1868) led another group that settled in central Iowa. Both contingents tried to remain independent of the Dutch Reformed Church, but only Scholte's group succeeded. Van Raalte and his supporters united with the Dutch Reformed in 1850.

The debate over the boundaries of Calvinist doctrine persisted, and 1857 saw the most significant and enduring split in the Dutch Reformed churches. At first, the break-away group, led by Gijsbert Haan (1801–1874), was known as the True Holland Reformed Church. Eventually, however, it became the Christian Reformed Church (CRC). The CRC began with few members, but during the late nineteenth century it grew because of more Dutch immigration and a dispute in the Reformed Church in America over Freemasonry.

Dutch Reformed in the Twentieth Century

As these two branches of the Dutch Reformed tradition entered into the twentieth century, they were virtually identical in their geographical distribution. They shared an eastern bloc (New York and New Jersey), a midwestern contingent (Michigan, Illinois, Wisconsin, and Iowa), and a western constituency (California). After World War II, another wave of Dutch immigration to Canada and especially Ontario gave the Christian Reformed Church numerical strength across the border and validated its formal name as the Christian Reformed Church in North America. In the early twenty-first century Canadian members of the Christian Reformed Church constituted about one-quarter of its membership.

Throughout the nineteenth century the eastern churches of both denominations exerted considerable influence, but by the end of the twentieth century the two churches found the majority of their members, financial support, and spiritual vitality in the Midwest and West. This significant shift stemmed largely from demographic factors, especially the dramatic growth of California, and economic factors, particularly the significant financial prosperity of the middle and western parts of twentieth-century America.

Three important results flowed from this alteration of the Dutch Reformed landscape. First, both denominations found themselves struggling with and adjusting to the

various forms of twentieth-century evangelicalism. Because of their roots in scholastic and rigorous forms of Calvinism, the Dutch Reformed have had an uneasy relationship with evangelicalism—the dominant influence in American Protestantism. Because evangelicalism was especially powerful in their growing strongholds in the Midwest and West, it was inevitable that the Dutch Reformed would encounter and adjust to it, in manifold ways. For example, during the last quarter of the twentieth and into the twenty-first century, a large proportion of their ministers—especially in the West—were trained at Fuller Theological Seminary, an evangelical institution in California. But the influence worked both ways. In the late twentieth century Fuller's president, Richard Mouw, was recruited from Calvin College and the Christian Reformed Church.

Second, both denominations sought to adjust to modern streams of thought and practice—often slowly and gradually, but inexorably. They were not completely spared the debates over theological liberalism and fundamentalism that swept through many mainline Protestant denominations. The Christian Reformed Church underwent three divisions: the formation of the Protestant Reformed Church (1924–1926), the Orthodox Christian Reformed Church (1988), and the United Reformed Churches of North America (1996). Nevertheless, the Calvinist theological affirmation of culture enabled the Dutch Reformed to address modern science and contemporary thought from a critical, constructive, and explicitly Christian stance. For example, Hope College of the Reformed Church in America and Calvin College of the Christian Reformed Church distinguished themselves in the fields of science and the humanities—two hotly contested areas of debate in other Protestant denominations.

Third, both denominations struggled over ethnicity—the issue that gave the churches their popular name, Dutch Reformed. Throughout the twentieth century, congregations, seminaries, and colleges remained strongly tied to the Dutch ethnic base, except in the East and eventually in California. Leaders recognized the diminishing numerical and economic strength of the Dutch population, but the powerful influence of ethnicity prevailed throughout the century. In one crucial area, the Dutch Reformed churches relinquished their Dutch heritage; gradually, worship services were conducted in English. At the same time, ethnicity probably played the most important role in limiting more serious ecclesiastical divisions or mitigating them when they

did occur. These Dutch Calvinists often fought fiercely among themselves, in part because they had so much in common—blood as well as belief.

Twentieth-Century Theological Developments

Theologically, the Reformed Church in America and the Christian Reformed Church agree on common doctrinal standards—the Belgic Confession, the Heidelberg Catechism, and the Canons of the Synod of Dort. Although united on this Calvinist theological platform, the Reformed Church in America has been more moderate in its Calvinism, more ecumenically minded, and more willing to adjust its positions to address issues in American society.

Perhaps the most significant theological difference between the Reformed Church in America and the Christian Reformed Church during the twentieth century was their stance toward culture. The Calvinist tradition has always advocated a positive attitude toward the world as the product of God's creative design. In confronting its defects and deficiencies, the Reformed Church in America has tended to support the church's role as a transformer of culture. In doing so, it has aligned itself more often with other mainline Protestant theological movements of the last century, including neo-orthodoxy, the theology of Karl Barth, liberation theology, and other theological currents.

By contrast, the Christian Reformed Church has been decisively shaped by the theology of Abraham Kuyper (1837–1920). Kuyper, who served as prime minister of the Netherlands from 1901 to 1905, was known for his theological insistence on applying Christian principles to the social order. In doing so, Kuyper emphasized the role of the church as a creative agency for Christian alternatives to secular culture rather than the transformer of existing institutions. An even more rigorous form of Kuyperian thought was advocated by Herman Dooyweerd (1894–1977) of the Free University of Amsterdam. The Kuyperian impact on the Christian Reformed Church has been pervasive and profound, making its voice and mission in American culture both distinctive and critically distant.

Missionary Activities

Dutch Reformed churches, with their strong emphasis on the sovereignty of God, would seem to be unlikely candidates for participation in the powerful missionary movement of American Protestantism, which has been shaped largely by Arminian theological ideas. And yet the Dutch

Reformed churches' involvement in missionary work far outstrips their comparatively small size and contrasts sharply with their inability to move beyond their Dutch ethnic base.

In the past, Reformed Church in America missionaries have undertaken pioneering work in India, China, Japan, and Saudi Arabia, and their work continues in Japan, India, Saudi Arabia, Africa, and Mexico. In the twentieth century, the denomination also joined forces with other Reformed churches and other Christian bodies to pursue a variety of goals: evangelism, medical care, relief work, and social and economic reform.

Likewise, the Christian Reformed Church launched its own missionary effort in the twentieth century. It remains involved in work with Native Americans and in Japan, South America, Nigeria, Mexico, and Taiwan.

Ecumenism

The distinctive theological accents of the Dutch Reformed churches have shaped their relationships with one another and other churches. Relations between the RCA and the CRC have been more competitive than cordial.

The Reformed Church in America has had close connections with American Presbyterians. In fact, it considered a proposed merger with the southern wing of American Presbyterians, but finally rejected the proposal in 1969. The RCA has been an active participant in ecumenical discussions and a member of the National Council of Churches, the World Council of Churches, and the World Alliance of Reformed Churches.

By contrast, the Christian Reformed Church has focused its ecumenical attention more narrowly and more confessionally. The CRC was a member of the North American Presbyterian and Reformed Council until 2001, and it has been a member of the Reformed Ecumenical Council and the World Alliance of Reformed Churches. Both churches are affiliated with the National Association of Evangelicals.

Social Issues

Three social issues have dominated the agenda of American Protestantism in the twentieth century—war, race, and gender/sex. Like most Protestant churches, the RCA and CRC supported World Wars I and II, were divided over the Vietnam War, and maintained a critical distance on the war in the Middle East during the early twenty-first century. Because neither denomination had a significant African American membership, the issues of civil rights and race

were recognized as important but as somewhat distant. By contrast, the role of women in the church and homosexuality have been far more heated and divisive issues. The Reformed Church in America has ordained women for the ministry since 1978. The Christian Reformed Church voted to ordain women in 1995, a decision marked by years of dissension and ultimately the defection of several congregations to other denominations. Homosexuality has been a difficult theological and ethical issue for both churches, and in the early twenty-first century it is unclear whether or how the churches' traditional teaching against homosexuality will change.

Education

The influence of the Dutch Reformed on education in American life has been extraordinary. Measured against their immigrant beginnings, bounded by Dutch customs and language, the Dutch Reformed have nevertheless shaped American education through their institutions and a significant group of influential thinkers. During the colonial era, the Dutch Reformed (the Coetus Party) helped found Queens College (Rutgers), which became the State University of New Jersey in 1945, and they took the initiative in theological education by founding the New Brunswick Theological Seminary in 1784, the first theological seminary in the United States.

The second wave of Dutch immigration quickly led the Reformed Church in America to establish Hope College in Holland, Michigan, in 1866, and a second school for educating ministers, Western Theological Seminary, in 1884. The Reformed Church took over the sponsorship of Central College in Pella, Iowa, in 1916, a Baptist school established in 1853, and founded Northwestern College in 1882 in Orange City, Iowa.

The Christian Reformed Church was barely surviving after the Civil War, but in 1874 it founded Calvin College and Calvin Theological Seminary in Grand Rapids, Michigan. In 1955 the Christian Reformed established Dordt College in Sioux Center, Iowa, as well as several smaller colleges in the United States and Canada.

Perhaps the most noteworthy and characteristically Christian Reformed activity in education has been its extensive network of primary and secondary Christian schools. The Reformed Church supported public schools, but the Christian Reformed created their own. These schools are not sponsored by the denomination itself but

mainly by Christian Reformed parents—a product of the Christian Reformed conviction that education is part of the responsibility parents assume in baptizing a child. The schools constitute the largest Protestant private school system in the nation.

The geographic center of Dutch Reformed vitality in higher education is western Michigan—Hope College and Western Theological Seminary in Holland (RCA) and, a mere thirty miles away in Grand Rapids, Calvin College and Calvin Theological Seminary (CRC).

These institutions have produced an extraordinary number of leaders in various areas of American intellectual, economic, and social life. For example, the Christian Reformed Church spawned Louis Berkhof (theologian), Richard DeVos (Amway co-founder), Peter De Vries (novelist), Vern Ehrlers (member of Congress), William Frankena (philosopher), Paul Henry (member of Congress), Bill Hybels (minister, Willow Creek Association), George Marsden (historian), Richard Mouw (theologian), Alvin Plantinga (philosopher), Patricia Rozema (filmmaker), Leonard Schrader (filmmaker), Paul Schrader (filmmaker), Lewis Smedes (theologian), the Staal brothers (professional hockey players), and Nicholas Wolterstorff (philosopher).

The Reformed Church in America and its educational institutions have produced a similar list of individuals who have left their mark on American life, including Meredith Arwady (opera star), M. R. DeHaan (founder of the *Radio Bible Class*), Vern Den Herder (professional football player), Max De Pree (writer and business leader), Everett Dirksen (U.S. senator), Peter Hoekstra (member of Congress), Jim Kaat (baseball player), James Muilenburg (biblical scholar), A. J. Muste (pacifist leader), Norman Vincent Peale (minister), Ruth Peale (*Guideposts* magazine), Theodore Roosevelt (president), Philip Schuler (leader in the American Revolution), Robert Schuller (TV evangelist), Richard Smalley (Nobel laureate in chemistry), Martin Van Buren (president), and Guy Vander Jagt (member of Congress).

Grand Rapids itself has become an enormously successful religious publishing center, which has an international influence. Four Christian Reformed families, all highly competitive, founded four book publishing firms—Baker, Eerdmans, Kregel, and Zondervan. Zondervan was bought by HarperCollins, but the other three remain under family control. Nearby Muskegon is home to Bible Gateway, one of the most widely used Internet resources for studying the Bible.

In the early twenty-first century the two major denominations of the Dutch Reformed tradition in America were each composed of some 300,000 members. Rarely have so many emerged from so few to accomplish so much.

Eastern Orthodox Tradition and Heritage

Eastern Orthodoxy traces its origins to the beginnings of Christianity. It is not only the form of Christianity dominant in Eastern Europe and the Middle East, but also the second largest Christian communion in the world today. Estimates of adherents vary widely, but most are at over 200 million.

The Eastern Orthodox Church consists of those Christians who belong to what used to be the eastern half of the Roman Empire and beyond, the main body of which persisted after the split between the eastern church and the western (Roman or Latin) church in 1054. It considers itself to be in unbroken historical continuity with the church of Christ's apostles and to have faithfully preserved the apostolic faith. Although Christianity is now largely regarded as a Western religion and is associated with Western Europe, in fact during its first millennium Christianity developed mostly in the eastern Mediterranean and Asia Minor (today's Turkey) and from there spread east as much as west. Indeed, Egypt and Asia Minor were some of the most populous and prosperous regions of the Roman Empire during Christianity's early centuries and its most important centers of development.

Today the Eastern Orthodox Church includes the ecumenical patriarch of Constantinople (now Istanbul), who has a relatively small flock in Turkey but is the spiritual leader of a large number of Greek Orthodox Christians in the diaspora (including North America); the ancient patriarchates of Alexandria, Antioch, and Jerusalem, all in the

Middle East; the churches of Russia, Ukraine, and Belarus, together constituting more than half of all Orthodox Christians; the churches of the Balkans (such as Serbia, Romania, and Bulgaria); the churches of Georgia and Cyprus; as well as churches in countries where Orthodox believers are a minority. Although these churches are governed independently, they share the same faith and worship and are in communion with each other. In addition to the Eastern Orthodox Church, five other churches constitute a separate communion, usually referred to as Oriental Orthodox: Ethiopian, Coptic (Egyptian), Armenian, Jacobite Syrian (named for early leader Jacob Baradaeus to distinguish this church from other Syrian Christians), and Syrian Christians of India.

Characteristics of the Early Church

Elements of early Christianity were as formative for Eastern Orthodoxy as they were for Latin Christianity. Mechanisms developed to distinguish and defend "orthodoxy" (right belief) from "heresy" (false teaching) included notions of tradition, apostolic succession, a hierarchical structure of the church, and a canon of scripture. The canon of Christian scripture began to form only in the late second century and was not finalized for several more centuries. Therefore, Christian teaching was "handed down" (the literal meaning of the Greek *paradosis*, "tradition") from Christ's apostles to their converts and from there to other Christians. Tradition included not only teaching but also practice, both moral and ritual. When confronted with divergent teachings, early church fathers claimed that the orthodox teaching was distinguished by its catholicity or universality and that it was

the same teaching no matter where one was in the Christian world, as opposed to heresies that were local phenomena. (It is a curious consequence that, after the schism, the East assumed the title “Orthodox” and the West “Catholic,” though each would claim to be both Orthodox and Catholic). Although contemporary historians stress the diversity of early Christianity, it was this notion of adherence to one, unchanging, universal belief that came to dominate the early church.

When divergent teachings arose that claimed to be the true teachings of Christ, particularly those of the Gnostics and Marcion, early church fathers such as Irenaeus of Lyons (c. 130–200 CE) appealed to the notion of “apostolic succession”—that is, that the apostles appointed the heads of every community they founded. The head of each local Christian community, the *episkopos* (overseer) or bishop, in turn, appointed his successor. Moreover, according to Irenaeus, each bishop taught the same doctrine, and this unity was also a witness to the authenticity of the church’s teaching. When the early church fathers sought to determine which Christian texts were to be regarded as normative or canonical, they appealed not only to apostolic authorship (because “heretical” texts such as the Gospel of Thomas also claimed apostolic authorship), but also to the acceptance of the texts in the churches and their agreement with the apostolic teaching as passed down through tradition. Orthodox Christians, therefore, regard scripture as inseparable from tradition.

In the early centuries Christianity was an illegal religion, and Christians were sporadically persecuted by the Roman authorities. Those executed for the faith became martyrs, or witnesses to the truth of Christianity, because of their willingness and ability to follow Christ’s path of self-sacrifice for the truth. Early Christians regarded these martyrs as heroes of the faith and, collecting their physical remains, would gather to commemorate them (see, for example, the second-century text “Martyrdom of Polycarp”). Such practices lay the foundation for the veneration of saints in traditional Christianity.

In the early fourth century the Roman emperor Constantine converted to Christianity, which brought about momentous changes for the church itself. It was instantly transformed from a persecuted religion to a tolerated and even favored one. By the end of the century it would become the official religion of the empire.

The very structure of the church would change in time, as well as the relationship of Christianity to society and the

state. When disputes arose in early Christianity they were addressed by calling together representatives of the broader church (especially the bishops) into regional councils. When Constantine converted, he found the church divided over the Arian controversy about the relationship of the Son of God to God the Father. In response, Constantine called together a council of the entire church’s bishops to resolve the problem. Such councils of the entire church (represented by each community’s bishop) were called ecumenical councils because they brought together bishops from the entire *oikoumene* or inhabited world. These councils became the most important mechanism in the first millennium of Christianity for resolving theological disputes. They enjoy particularly great authority for Orthodoxy precisely because they are understood to represent the voice of the entire church and thereby manifest the presence of the Holy Spirit. No individual, including popes and patriarchs, could presume to speak for the whole church.

The Orthodox recognize seven ecumenical councils held between the fourth and the eighth century. The Councils of Nicea (325 CE) and Constantinople (381 CE) addressed the issue of the relationship of the Son of God (and the Holy Spirit) to God the Father and articulated the doctrine of the Trinity that thereafter became foundational for all traditional forms of Christianity, including Roman Catholic and Protestant. The Councils of Ephesus (431 CE) and Chalcedon (451 CE) addressed the relationship of Christ’s humanity and his divinity, articulating the doctrine of Christ as being fully human and fully divine with his two natures united in one person. This last point was rejected by certain churches that followed the formula of Cyril of Alexandria, which spoke of the “one nature of the incarnate Word,” emphasizing the unity of the divinity and humanity in Christ. These disputes resulted in the first permanent schisms in Christianity, as some Christians (known as the Church of the East, who were primarily in the Persian Empire at the time and in today’s Iraq) rejected the Council of Ephesus’s insistence on Christ’s unity as threatening the integrity of his humanity. Other churches (now known as the Oriental Orthodox) never accepted the Chalcedonian formula. These churches, sometimes labeled by outsiders as “monophysite” because of their emphasis on “one nature,” continue to this day and also have adherents in North America—especially Armenians, who can be found worldwide, and Coptic Christian immigrants from Egypt. The fifth and sixth ecumenical councils recognized by the Eastern Orthodox, the Second and Third Councils of

Constantinople (553 CE and 681 CE), continued to deal with Christological issues raised by the dispute over Chalcedon. The seventh council, the Second Council of Nicea (787 CE), legitimated the use of icons after the iconoclastic controversy. Icons are religious images used in eastern Christian worship depicting biblical scenes or figures such as Christ or the saints.

Schism between Eastern and Western Christianity

The authority structure of the church developed in the early centuries. In the first centuries all bishops were regarded as equal. Over time the bishops of the most important cities of the empire developed greater authority. This was enshrined in what was known in the East as the Pentarchy, in which five great sees were held in particular honor and according to an order of precedence: Rome, Constantinople (the city established by the Emperor Constantine in the 330s to be the eastern capital of the empire, often referred to as the “new Rome”), Alexandria, Antioch, and Jerusalem. In the West, only Rome could claim apostolic foundation and therefore it had preeminence above all other bishoprics. In the East, however, numerous cities claimed apostolic foundation, including all the cities of the Pentarchy. Their ranking was understood as deriving from the importance that the respective cities had in the Roman Empire (Rome as the first capital, Constantinople as the second, and Alexandria and Antioch as the next two largest and most important cities and regional centers), with the exception of Jerusalem, which as the “Mother Church” was included out of honor—but only in the last position. The bishops of Rome and Alexandria bore the title of pope (the Coptic bishop of Alexandria still bears that title), whereas the bishops of the other three sees bore the title patriarch. In the eastern conception, even though Rome was accorded first place in the ranking and could claim special authority in the western church, it could not claim universal authority over the whole church; this would serve as one of the major points of division between the eastern and western churches.

Over centuries tensions developed between East and West. Although the Roman Empire collapsed in the West during the fifth century because of the barbarian invasions, it continued to exist in the East. Thus the two halves of Christendom were cut off from one another politically. Moreover, they drifted apart culturally, as fewer people in the West were educated in Greek and fewer in the East in Latin. As a result, Augustine of Hippo, the most important theologian writing in Latin for the first millennium of

Christianity, had little influence in the East, and Greek and Syriac writers had little influence in the West. Certain practical differences were evident as well: in the West clerical celibacy became the norm and was ultimately mandated, whereas in the East only bishops are celibate and parish clergy can marry.

One major issue that divided the eastern and western churches was papal claims to supremacy over the entire church. From the ninth to the eleventh century the papacy established universal authority over the church in the West, and then began to assert similar prerogatives in the East that the East refused to acknowledge because, in the East’s eyes, it was an innovation. These tensions led the Pope of Rome and the patriarch of Constantinople to excommunicate one another in 1054. This date is usually given as the formal date of the schism, although this was only one episode in a long history.

The other major issue that divided the two halves of Christendom was a dispute over the Nicene Creed. The creed was developed at the Councils of Nicea and Constantinople, which stipulated that the creed could not be changed or altered except by another ecumenical council. The western church added the words “and from the Son” (*filioque*) to the creed so that it read, “I believe in the Holy Spirit . . . who proceeds from the Father *and from the Son.*” In the eleventh century the pope and the patriarch of Constantinople issued mutual recriminations about the presence or absence of this clause. The East objected to the clause for two reasons. First, it was unhappy that the creed was changed at all, without consent of the whole church. And, second, it objected on theological grounds because, in the eastern understanding, God the Father is the source of divinity with the Son being “begotten” and the Spirit “proceeding.” To have the Spirit proceed from the Father “and the Son” was to subordinate the Spirit to a lesser position in the Trinity.

The patriarch’s and pope’s mutual excommunication in 1054 was hardly the end of the story, however. The event that did more to make the schism permanent was the Fourth Crusade’s sack of Constantinople in 1204. The crusaders, on their way to the Holy Land, made a detour to Constantinople and, motivated primarily by greed, attacked the capital of the Christian East, desecrated its churches, stole relics, and set up a Latin emperor and patriarch. The Latins held on to the city for about sixty years before the Greeks succeeded in regaining it, but this wound was never forgotten. Nevertheless, reunion discussions continued sporadically, culminating

in the Council of Florence in 1438–1439. At this point Constantinople was under immediate threat of conquest from the Turks, and so it sought military assistance from the West, for which church reunion was a precondition. Out of desperation the eastern bishops accepted most of the demands made by the Latins, though the union was not accepted by the Orthodox populace and the bishops themselves repudiated it once Constantinople fell in 1453. Serious reunion discussions resumed only in the twentieth century.

Eastern Christianity and Society

The relationship of church and state also developed very differently in the East than in the West. After the fall of the western half of the Roman Empire in the fifth century, the Catholic West was plunged into the political fragmentation and cultural backwardness of the feudal era. The one unifying authority for the whole of Western Europe was the papacy, which, over time, asserted even the superiority of ecclesiastical authority over secular authority. This process reached its apex in the papal bull *Unam Sanctam* (1302), in which Pope Boniface VIII claimed that the pope was Christ's representative on earth, sole head of the Catholic Church, and the source of all power on earth. According to Boniface, secular power derived its authority from the spiritual and was delegated by the pope to kings. Therefore the pope could stand in judgment over kings, but God alone could judge the pope. The situation in the Orthodox East was nearly the reverse: there was one powerful secular ruler, the Roman (Byzantine) emperor, and at the same time multiple centers of ecclesiastical authority (Constantinople, Alexandria, and Antioch). There was, therefore, never any effort (or possibility) for the church to assert its authority over that of the state. The norm, or the ideal, as defined in the legislation of Emperor Justinian (who ruled 527–565 CE) was a “symphony” of church and state in which the two were co-equal partners, the church caring for people's spiritual and moral needs and the state caring for people's earthly needs. In areas in which the activities of the two crossed, they were to support one another. But as a rule the clergy were not to interfere in matters of government and the emperors were not to interfere in the realm of doctrinal matters. The reality, however, was much messier, and there were many instances of emperors who tried to assert their will in the theological realm, although in many of these cases the church successfully resisted this interference.

Augustine of Hippo, in one of the most influential works on Roman Catholicism, *The City of God*, reflected on the

meaning of the fall of Rome in 410 CE. According to Augustine, the “city of man,” the earthly realm of empires and kingdoms, was fundamentally different from the “city of God.” The “city of man” always pursued worldly aims such as wealth and power, and thus no earthly empire was destined to last forever—only the Kingdom of God. Once again the eastern perspective was very different. Because the Byzantine Empire lasted for another millennium in the East, there was a sense that the earthly kingdom reflected the heavenly Kingdom of God, even embodied it to some degree. It was providential that Christ had come to earth precisely at the height of the Roman Empire's power and that Constantine's conversion opened the door for Christianizing the entire Roman world (which stretched around the entire Mediterranean and reached from Britain to Asia Minor). This would be the avenue for Christianizing the entire world. Therefore, the church embraced its union with the empire as a means of Christianizing society. Even after the collapse of the Byzantine Empire and the fall of Constantinople in 1453, this idea of the Orthodox Christian empire lived on, particularly in Russia.

Despite this sense of harmony of church and state in the East, the Orthodox never forgot Christ's saying that “my kingdom is not of this world,” for this sense of tension with the world lived on in the monastic movement. As noted, the conflict between the church and the empire before Constantine led to persecution and produced martyrs, who were regarded as heroes of the faith. After the conversion of Constantine, that role was fulfilled by monks, nuns, hermits, and ascetics, who in a sense put to death their own selfish desires in order to live wholly for God. Two models of monastic life in the Christian East developed in fourth-century Egypt. The origins of monasticism are usually associated with Antony the Great (d. 356 CE). As a young man, Antony heard the gospel reading in church in which Christ said to give away all one's possessions to the poor and follow him, and Antony took this saying literally. He gave away all his possessions and went to live in the desert to devote his entire life to prayer, and eventually his renown as a holy man spread. Antony's model became one ideal that was pursued in the Egyptian and Palestinian deserts—that of the solitary hermit who left the world in pursuit of God. Often these desert fathers and mothers attracted disciples, and so loose communities formed. The other primary form of eastern monasticism, the communal or cenobitic monastery, was also established in the Egyptian desert, in this case by Pachomius (d. 346 CE). In the cenobitic monastery, the monks or

nuns owned no possessions whatsoever; their labor benefited the whole community, which, in turn, provided all of their necessities. Cenobitic monasticism also placed great stress on communal worship, meals, and discipline through obedience to the elders.

The goal of the monastic life in both East and West was the surrender of worldly pursuits of wealth, power, status, and family in the uncompromising pursuit of the Kingdom of God. Through obedience to the abbot of the community or a spiritual director, one learned to surrender one's own will to God's. Christ said, "Blessed are the pure in heart, for they shall see God." Monasticism was a path of purification through spiritual disciplines such as fasting, celibacy, and prayer. Unlike in the West, which developed distinct religious orders, each united by a particular rule, monasticism in the East was both more homogeneous and more diverse: general patterns dominated, but each monastery was free to develop its own rules within those general parameters. Monasticism still exists in the modern era as one of Eastern Orthodoxy's primary expressions of spirituality.

Language also distinguished eastern and western Christianity. As Christianity spread in the Catholic West the church always insisted on the use of Latin for the scriptures and worship. In the East, by contrast, there was from the earliest centuries a plurality of languages: not only Greek and Latin but also Syriac, Coptic (in Egypt), Ethiopic (Ge'ez), Armenian, and Georgian, to name a few. The language issue was central in the conversion of the Slavs. In the mid-ninth century the missionary brothers Cyril and Methodius invented an alphabet for the previously illiterate Slavs, a modified version of which is known as the Cyrillic alphabet still in use in Orthodox Slavic countries. They also translated scriptural and liturgical texts into their language, which was adopted by the newly converted Bulgarians and Serbs. Thus an entire collection of texts was available for the Rus (the predecessors of the modern day Russians and Ukrainians), whose Prince Vladimir of Kiev (Kyiv) adopted Christianity for himself and his people in 988 CE. The language that the brothers and their disciples used, now known as Church Slavonic, became the liturgical language for all of the Orthodox Slavs, and is still in use today in Russia, Ukraine, Bulgaria, and Serbia.

Formative Historical Epochs

The formation of eastern Christianity is intimately connected with the history of the Byzantine Empire. Until the

seventh century, the eastern Roman or Byzantine Empire, centered in Constantinople, continued to rule Egypt, Palestine, Syria, Asia Minor, and Greece. In the seventh century the Arab Muslims conquered Syria, Palestine, and Egypt—territories that were not only ethnically and linguistically diverse but also religiously divided between those who accepted the Council of Chalcedon and those who rejected it. After the city of Antioch also fell, the Byzantine Empire consisted mainly of Greece and Asia Minor, was more homogeneously Greek, and the patriarchate of Constantinople was left without rival in the ecclesiastical sphere. The new Slavic converts in Bulgaria, Serbia, and Rus, though not part of the Byzantine Empire politically, were clearly in its cultural orbit, constituting what the scholar Dmitry Obolensky termed the "Byzantine Commonwealth" and more or less dependent ecclesiastically upon Constantinople. From the eleventh century onward the Turks gradually took over Asia Minor. Constantinople fell to the Turks in 1453, bringing an end to the Byzantine Empire and leaving most of the Orthodox population, from Egypt to the Balkans, under Muslim rule. Many eastern Christians are still living in Egypt, Syria, Palestine, and Lebanon in predominantly Muslim countries. The Orthodox of the Balkans (Greece, Serbia, Bulgaria, and to some extent Romania) remained under Turkish rule for about five hundred years, until the nineteenth century.

Orthodox history has experienced a fundamental transformation from an ethnically diverse church united primarily under the ecumenical patriarch of Constantinople to a series of separate national churches. The Ottoman Turks created a system, known as the *millet*, under which non-Muslims were governed by their own laws rather than Islamic law and by their own religious authorities in the Ottoman Empire. As a result, the authority of the patriarch of Constantinople actually increased in many ways after the fall of the Byzantine Empire because all Orthodox Christians were under his civil and religious authority, although the patriarchs were subject to considerable pressure from the Ottomans. Revolts in the Balkans in the nineteenth century turned Orthodox religious communities into modern nations, and the church fragmented along national lines. Thus as nations, beginning with Greece in 1833 and followed by Serbia, Bulgaria, and Romania, became independent, their churches also became independent from the patriarchate of Constantinople and therefore autocephalous or self-governing. The result is the modern situation in which the Orthodox Church has become closely identified

with national identity (so that one thinks of Greek Orthodox or Russian Orthodox).

Russia emerged as the only powerful, independent Orthodox nation after the fall of Byzantium. The Russian church became increasingly influential in the Orthodox world. It became ecclesiastically independent from Constantinople in 1448, and in 1589 the other eastern patriarchs elevated it to the status of a patriarchate. In the early eighteenth century, however, Peter the Great abolished the patriarchate and replaced it with the Holy Synod, a collegial body composed of leading clerics. This situation lasted for two centuries until the Russian Revolution of 1917, after which Russian Orthodoxy became subject to a militant atheist regime determined to extinguish religion. Especially during the 1930s, hundreds of thousands clergy and believers in the Soviet Union were repressed, sent to the Gulag (prison camps), or executed, and the vast majority of churches were closed. The churches of the Balkans (Romania, Serbia, and Bulgaria) also suffered tragic fates under the hostile rule of communism barely a century after they emerged from Muslim rule. The Orthodox populations of the former Soviet Union and Eastern Europe have faced enormous challenges since the collapse of communism in 1989–1991 in reconstructing their churches, but also have experienced unprecedented revivals.

The history of the Oriental or non-Chalcedonian Orthodox churches has also been a difficult one. Only Ethiopia remained independent, though frequently under pressure from neighboring Islamic powers in the medieval period. As a result of this independence, the Ethiopian church is the largest Oriental Orthodox church today, with some 35 million believers in Ethiopia and Eritrea. Coptic Christians in Egypt and Jacobite Christians in Syria have struggled to preserve their identities in regions that experienced a steady Islamization, though the Coptic Church has undergone a rebirth in the twentieth century. The fate of the Armenians was particularly tragic in the twentieth century, subject to genocide in Turkey and later to Soviet terror.

Orthodox Approach to Theology

Eastern Orthodoxy is often characterized by its adherence to tradition. Outsiders note the apparent unchangeable nature of Orthodox worship and style. This is clearly true by comparison with Protestantism or even Roman Catholicism after the reforms of the Vatican II Council in the 1960s. But tradition for Orthodoxy does not simply mean rigid adherence to past forms and customs. As we saw with Irenaeus of

Lyons in the second century, tradition meant precisely the gospel, the message handed down through the church from the apostles. Tradition has come to mean the totality of church life: not just the basic *kerygma* or evangelical proclamation, but also the liturgical worship, church architecture, iconography, writings of the church fathers, and decisions and definitions of church councils. Tradition is understood as the life of the Holy Spirit in the church as the body of Christ, or how the Spirit is experienced within the church.

Tradition became one of the issues of contention in the western church during the Reformations of the sixteenth century. Protestants rejected the authority of tradition as something manmade, accepting only the scripture as the word of God. Roman Catholics responded by articulating their position that tradition constituted another source of religious authority alongside, and essentially equal to, scripture. The Orthodox do not understand tradition as something separable from scripture. They believe the Bible to be the inspired word of God (although they do not insist on its literal inerrancy in the modern sense). But because the Bible can be interpreted in contradictory ways, the Orthodox maintain that it can be properly or completely understood only within the context of tradition, the entire life of the church as the body of Christ. At the same time, scripture is the fabric out of which all of the elements of tradition (liturgy, patristic commentary, conciliar decisions) are woven.

Orthodoxy also has a distinctive approach to theology. Theology is the attempt to express the inexpressible. Ultimately, according to Orthodoxy, God cannot be defined and categorized through words, but can only be known directly through communion and participation. Therefore, positive theology in the East is always balanced by the apophatic approach, which says ultimately what God is *not* because God transcends all attempts at conceptualization. The purpose of theology is not intellectual but existential; doctrines are pointers to, not propositions about, God. It is evidence of what has been experienced by the saints. At the same time that the Orthodox have insisted on the notion that all language falls short of capturing God, they also have insisted on the importance of proper theological formulations. The history of doctrinal controversies is one of a search for terminology. If doctrinal formulations do not contain the truth, but rather point to the truth and serve as vehicles for its transmission, then it is still vitally important that those formulations be as accurate as humanly possible. Therefore, theology in the East is not the effort to create the perfectly logical and coherent system of thought, as in the scholastic

tradition of medieval Roman Catholicism. Rather, theology is about encounter with God. As one of the early church fathers said, “The theologian is one who prays, and the one who prays is a theologian.” As a result, those who experienced communion with God, or mystics, are regarded as having the authority to speak about God. The East, then, did not experience the conflict that characterized the medieval West between the logical approach of the scholastics and the experiential approach of the mystics (who were often considered as on the verge of heresy).

The Fall, Redemption, and Salvation

The core doctrines of Orthodoxy are those defined during the ecumenical councils. They are shared by most Christians, particularly Roman Catholics but also most Protestants: belief in the Triune God, the second person of whom, the Son, became incarnate as Jesus Christ, born of the Virgin Mary, died on the cross, and rose from the dead as the savior of the world. Although the core beliefs are shared in common with other Christians, there are some important differences of emphasis and approach, beginning with human nature and the Fall of Adam and Eve. On the one hand, the Orthodox look upon the Fall as a great catastrophe, a rebellion against God that resulted in separation from God and the broken human condition that followed. On the other hand, the early eastern church fathers tended to view Adam and Eve before the Fall as having existed in a state of child-like innocence rather than a state of perfection. The Fall, though casting humanity into a state of sinfulness and brokenness, of separation from God, was not as devastating for human nature as understood in the West by Augustine, Martin Luther, or John Calvin. Though free will is broken and impaired, it is never erased; there is no sense of “total depravity.”

The eastern understanding of the Fall is therefore fundamentally different from the western notion of “original sin.” The latter concept is rooted in Augustine’s doctrine that humanity inherited not only a broken state, but also the actual guilt for Adam’s sin—so that every human being is, in effect, born guilty and therefore condemned. Much of the difference can be related to one key verse, Romans 5:12: “Therefore, just as sin came into the world through one man, and death came through sin, and so death spread to all because all have sinned.” The Latin translation rendered the last clause as “in whom all have sinned,” which Augustine understood as confirming his belief in inherited guilt. In the Orthodox East, by contrast, the emphasis was put on the

connection between sin and death: because human life is limited by death and there is struggle for existence, one must be selfish in order to survive and therefore sin is inevitable. Christ, through his sinlessness and perfect obedience (in contrast to Adam’s disobedience), and through his resurrection from the dead, has overcome sin and death. Therefore, those united with Christ through faith and baptism share in this victory over sin and death. Orthodoxy, then, sees Christ’s victory over sin and death as the key to Christ’s work of salvation for humanity. There is also the notion of forgiveness for sin (though one’s own sin, not Adam’s). The East, however, never developed a doctrine of atonement like that of Anselm of Canterbury, which became standard in the West. It stated that Christ’s Crucifixion was necessary payment to God for humanity’s transgression.

The Orthodox understanding of salvation is therefore also different from that in the West. The emphasis is on the notion that Christ, by becoming human, united divinity and humanity, thereby making it possible for humanity to be united with God. A common theme of the eastern church fathers was stated by Athanasius of Alexandria (c. 296–373): “God became human that we might be made god.” The eastern fathers understood the phrase from Genesis as humanity created in the “image and likeness of God” in part to mean that humanity is created in Christ’s image and therefore that Christ represents the ideal human being, what all are called to become “like.” Because Christ is the Son of God, so all are called to be sons and daughters of God, to be by grace what Christ is by nature, in and through him. To follow this path is to become what human beings were created to be, to become fully human. The union with God is ontological, changing the very nature of one’s being, although the essence of God remains transcendent and one’s human personality is not extinguished. This profound emphasis on the unity of God and human in Christ as making possible the union of humanity with God is known in the East as deification (*theosis*). In short, the union of God and humanity was accomplished in the Incarnation, while the victory over sin and death was accomplished on the cross and in the resurrection; both are actualized in the believer through the life in the church.

One of the fundamental debates in western Christianity, beginning with Augustine, was over “faith versus works” and “grace versus free will.” Because Augustine and Protestant Reformers such as Luther and Calvin understood human nature as having been completely impaired by original sin, free will was destroyed to such an extent that one could not

choose God of one's own free will nor do anything to merit one's own salvation—everything depended upon God's action, God's grace, and the only human response was faith. The medieval and post-Reformation Catholic Church, by contrast, insisted that humanity still had free will and that one's own "good works" would be rewarded by God. The East understood this whole dynamic in a fundamentally different way and therefore never had a debate about "faith versus works." Despite the Fall, human beings are still in the image of God, however obscured, so that free will is impaired but never destroyed. Salvation is a process of cooperation (*synergeia* in Greek). Because of the Fall human beings are incapable of union with God by their own efforts, yet because God respects human freedom they must freely accept and work with his offer of grace for salvation. It was not that one "earned" one's salvation through one's "good works" that were rewarded by God—this legal or mercantile way of viewing the problem is completely alien to Orthodoxy. It is not a matter of doing "good works" or obeying God's will as some external set of commandments. Rather, according to the great eastern church father Maximus the Confessor (c. 580–662), by surrendering one's own will to God, one allows God's energy to act in and through one, and one is transformed, transfigured, and deified in the process.

This work of spiritual transformation is understood to be the action of the Holy Spirit in believers. There are two primary approaches to the spiritual life, both generally regarded as indispensable and complementary: one is corporate, liturgical worship and sacramental participation, and the other is private prayer and spiritual discipline. Worship is an essential aspect of Orthodoxy. The most distinct practice of private prayer is the "prayer of the heart." God is encountered in the words of prayer, but God is experienced most fully in stillness and silence (in Greek, *hesychia*). This form of prayer developed for the most part in monasteries, where monks or nuns strive to follow St. Paul's injunction to "pray without ceasing," which is exemplified above all in the "Jesus Prayer": "Lord Jesus Christ, Son of God, have mercy on me." By saying one simple prayer attentively, one could still distracting thoughts and impulses. Then, in the stillness of the heart that has been purified by spiritual discipline, the Orthodox believe one can have communion with God that transcends words. Such practices, and the theological articulation behind them, are known as Hesychasm and are regarded by many Orthodox as the premier path of deification.

Western Christians have long been ignorant about, and very frequently dismissive of, eastern Orthodoxy, an ignorance perpetuated, at least until very recently, in introductory books about Christianity and its history and theology. With the collapse of communism in Russia and Eastern Europe, Orthodoxy is experiencing a remarkable revival on the world Christian scene. Moreover, there are increasing numbers of Orthodox immigrants to America and Americans converting to Orthodoxy. Finally, Orthodoxy's distinctive contributions to theology, spirituality, and the Christian arts are worthy of far more awareness in the West.

Eastern Orthodoxy

Eastern Orthodox Christianity traces its origins to Christianity, and it continues to exist in many of the churches founded by Christ's apostles. Composed of a series of autonomous national churches in Russia, Eastern Europe, and the Middle East, it is the second largest single Christian confession in the world today.

Paradoxically, most Americans are either completely unaware of Eastern Orthodoxy's existence, or know of it only vaguely through the ethnic festivals held by their local Greek (or Russian or Arab) Orthodox Church. Such ignorance stems primarily from the relatively weak presence of Orthodox Christians in America (estimates vary widely from one to four million) and from the fragmentation that exists among these Orthodox Christians. Though closer to Roman Catholics in their understanding of the nature of the church, in actual practice Orthodox Christians have been closer to a Protestant model. In the nineteenth century, Catholics often established parishes along ethnic lines (such as Irish, German, and Italian), but the parishes remained unified under their Catholic bishops. By contrast, some Protestants set up parallel church structures along ethnic lines (such as Swedish or German Lutherans) or political lines (for example, the Methodists split over slavery). Many of the divisions in the American Protestant world were also theological. Likewise, in the early twentieth century Orthodox Christians created parallel church organizations along ethnic lines and later further divided along political lines. For the most part, however, Orthodox Christians have not been divided over theology.

The Alaska Mission

Orthodox Christianity arrived in North America as a missionary religion from the West. Vitus Bering, a Dane working for the Russian Empire, led an expedition that first mapped the Aleutian Islands and sighted the Alaskan mainland in the 1740s. For the remainder of the eighteenth century, Russian trapper-traders ventured to Alaska in search of sea otter pelts. Many settled permanently, married native women, and learned native languages, but they baptized

their families as Orthodox Christians. In the 1780s a wealthy merchant named Gregory Shelikov attempted to establish permanent trading posts, and he appealed to the Orthodox Church leadership to provide him with a priest. The missionary team of eight monks recruited from the Valaam monastery departed for Alaska at the end of 1793 and arrived on Kodiak Island ten months later, in September 1794. Soon after, the leader of the team, Archimandrite Joasaph, reported back to Russia that they had already built a church and baptized "more than seven thousand Americans," who received the new religion enthusiastically.

Shelikov finally realized his dream when the Russian government chartered the Russian-American Company in 1799. The missionaries, however, soon ran into conflicts with the local manager of the company, Alexander Baranov, over the company's exploitative treatment of the natives. The missionaries complained to Shelikov about these abuses, but receiving no answer, Joasaph and two other monks returned to Russia to report on the situation and to receive more support for the mission. Joasaph was ordained bishop of Kodiak, which would have greatly strengthened his position, but on the return voyage in 1799 his ship sank, and Joasaph and other missionaries were lost. The remaining missionaries, led by the monk Herman, continued to defend the natives and suffer harassment from Baranov. Conditions improved only after Baranov's retirement over twenty years later. His replacement was more respectful of the missionaries, and the Russian government subjected the Russian-American Company to greater control. Father Herman, the last surviving member of the missionary team, retired to Spruce Island (near Kodiak Island) where he observed a very strict ascetic regime of fasting and prayer, but also cared for the natives by running a school and tending the sick. Herman died in 1837; in 1970 he was canonized as the first Orthodox saint of America.

In 1824 a new missionary, Father John Veniaminov, arrived on the island of Unalaska with his family. Following a great tradition of Orthodox missionaries, including Cyril and Methodius who had converted the Slavs, Veniaminov sought to preach the gospel in the local language. He learned Aleut, created an alphabet for the language, and translated some scriptural and liturgical texts into the language. He traveled throughout the Aleutian chain by kayak to conduct his missionary work, taking careful notes on the natural and human environment that were later published and earned his membership in the Russian Academy of

Sciences. A decade later he moved to Sitka (called New Archangel at the time), the capital of Russian America. There he learned the language of the local Tlingit Indians, who initially were more hostile to the Russians. But Veniaminov eventually won over many of them, especially through his help during a smallpox epidemic. After his wife passed away, he was consecrated bishop for Kamchatka (Eastern Siberia) and Alaska in 1840, assuming the name Innocent (priests can marry in the Orthodox Church, but bishops are celibate). For the next eighteen years he energetically developed the Orthodox mission in both Siberia and Alaska. In Alaska he helped construct churches and established a seminary to train native and creole (mixed-race) candidates for the priesthood. In 1868 he became metropolitan of Moscow, one of the most important positions in the Russian church, and in that position he continued to promote the Alaska mission by establishing the Orthodox Missionary Society in 1870. He was canonized in 1877 as “Enlightener of the Aleuts and Apostle to America.”

Unlike the Russian missions to Siberia, where missionaries usually followed government officials and often saw their efforts as Russianizing the indigenous population as much as Christianizing it, the Alaska mission was largely independent of the Russian government and Russian colonial efforts because the Russian presence remained weak in Alaska. The Alaskan missionaries also clearly intended to Christianize, but not Russify, the Alaskan natives. By the 1860s the mission was very successful—it was using local languages, and it had an indigenous or creole clergy as well as native lay leaders. By that point, the some twelve thousand Alaskan Christians had nine churches, as well as schools and orphanages. When Russia sold Alaska to the United States in 1867, an event that Innocent Veniaminov viewed as “one of the ways of Providence by which our Orthodoxy can insert itself into the United States,” Orthodox Christianity was thriving.

The transfer of Alaska to the United States presented the Orthodox Church with serious challenges, however. Although the church and its property were not directly threatened by the U.S. government, the government did try to “Americanize” the natives through aggressive educational programs. Indeed, Sheldon Jackson, Alaska’s first commissioner of education (1885–1906), was a Presbyterian minister who encouraged the establishment of federally funded boarding schools operated by Protestant missionaries. These schools tried to suppress native language, culture, and

religion (including Orthodox Christianity) in their effort to “Americanize” the natives. In the end, however, indigenous Alaskans, including the Tlingit, embraced Orthodoxy with even greater enthusiasm as a way of defending native culture and identity against pressures of assimilation. The Orthodox Church remains strong in parts of Alaska and continues to operate one seminary, St. Herman’s on Kodiak Island, for the training of native clergy.

Immigration

The first group of Orthodox Christian immigrants to come to the New World across the Atlantic arrived about the same time as the Russians. In 1768 a colony of some five hundred Greeks emigrated. The endeavor was the work of Scottish physician Andrew Turnbull, who was married to a Greek. The colony, which was named New Smyrna, was located in present-day Florida. The colony failed, however, before any priest was sent or any church was built.

A great wave of immigrants came to the United States from Central, Southern, and Eastern Europe between 1880 and 1920, and many were eastern Christians. Those who could, sought the few churches already established in the continental United States. When Orthodox immigrants were few and scattered geographically, they tended to band together to establish churches such as that organized in New Orleans in 1864. Thus the churches were multiethnic (made up of Greeks, Russians, Serbs, and Arabs) with multilingual services. Once the number of any one ethnic group climbed sufficiently, however, it formed its own parish.

In the 1870s, recognizing the growing importance of the continental United States for the future of the Orthodox Church, the Russian bishop of Sitka successfully requested to transfer the diocesan headquarters to San Francisco. Aware of the multiethnic nature of the scattered communities, the Russian bishops sought to appoint priests who could speak many languages, such as Greeks or Arabs educated in Russia. One of the most significant developments from the 1890s to the 1910s in the Russian church in America was the conversion of Uniates or Greek Catholics to Orthodoxy. These Greek Catholics were mostly from the Austro-Hungarian Empire (especially the Carpathian Mountain region). These Ruthenians, or Rusyns, were mostly peasants from regions that had once been Orthodox, but under pressure from later Catholic rulers, they had agreed to a union in the late seventeenth century in which they retained their practices but came under the authority of the pope in Rome. Their distinct practices included an

eastern liturgy in Slavonic as well as a married priesthood, thereby distinguishing them from their Latin Roman Catholic brothers. Once such communities were established in America, they would send home for a priest. When these priests arrived, however, they found a less than hospitable welcome by the presiding Roman Catholic bishops. One such priest, Alexis Toth, arrived in Minneapolis in 1889, but his bishop in America, John Ireland, refused to allow him to serve despite the blessing Toth had received from his bishops back at home. Ireland told him that the congregation should simply go to the parish established by the Poles. Unwilling to abandon their customs, Toth's community turned to the Russian bishop in San Francisco, who received Toth and the entire community into the Russian church in 1891. Thanks to Toth's efforts (and to Roman Catholic intolerance), over 160 communities with 100,000 members had entered the Russian Orthodox diocese by 1917. The influx of Greek Catholics naturally changed the nature of the Russian mission by the turn of the century.

Some of the Russian bishops attempted to promote the multiethnic nature of the American diocese. Thus, Tikhon Bellavin, who was bishop in the United States from 1898 to 1907, ordained an Arab, Raphael Hawaweeny, as an auxiliary bishop to minister to Arab immigrants. Tikhon also transferred the diocesan headquarters from San Francisco to New York, because the majority of the new immigrants were settling in industrial areas of the Northeast. Tikhon respected efforts to preserve the ethnic character of Orthodox congregations, but also encouraged the use of English. He established a seminary for training American-born clergy. Tikhon returned to Russia and in 1917 was elected the first patriarch of the Russian church in over two centuries. Despite Tikhon's efforts to create a multiethnic Orthodox Church, the flood of Eastern Slavic Greek Catholic (Uniate) converts into the Russian Church meant that its administration in America was preoccupied mostly with these Slavs to the neglect of other ethnic groups, particularly the Greek Orthodox themselves.

Greeks began arriving in America in large numbers and establishing parishes in the 1890s. Between 1890 and 1922 the number of Greek immigrants rose dramatically, reaching half a million by 1922. Frequently Greeks from particular areas of Greece or the Ottoman Empire would settle together in America and establish parishes, sending home for priests. Such communities operated outside of contact with the Russian bishops or any episcopal oversight. If the congregation immigrated from Greece, it turned to the autonomous Greek church for a priest; if it immigrated

from the Ottoman Empire, it turned to the patriarchate of Constantinople for one. Moreover, these Greek immigrants followed an American-style Protestant church structure and emphasized the independence of the local parish. The board of trustees or parish council made up of prominent laymen controlled the parish church and regarded the priest as their employee, to be hired and dismissed at their will. In 1908 the patriarch of Constantinople, because of the uncertain political situation in Turkey, placed the Greek Orthodox in the New World under the church of Greece, but nothing was done for another decade; they did not receive any bishop, and the congregations retained their independence.

Creation of Ethnic Jurisdictions

The Russian Revolution of 1917 had a dramatic impact on the Russian Orthodox diocese in North America and indeed on all Orthodoxy in America. The ruling bishop returned to Russia to participate in a church council (1917–1918), and the auxiliary bishop who took over was unprepared to handle the challenges that followed. The Russian church in America was thrown into financial crisis, because funds were no longer supplied by Russia. It also was subject to administrative chaos because of its inability to communicate properly with Tikhon, now patriarch of Moscow. The chaos became even more acute when a group of reformist clergy known as Renovationists took control of the church administration in Russia (with support from the Soviets), and also tried to control parishes and church property in the United States as the legitimate Russian church. In response, many parishes, with the support of the patriarchal bishop, transferred rights to property to their congregations, strengthening this tendency in American Orthodoxy.

Although the Renovationist movement did not gain widespread or lasting support in the United States, the Russian church still divided into competing factions. The head of the Russian church in America, Metropolitan Platon (Rozhdestvenskii), declared the church “temporarily self-governing” in 1924 because of difficulties of communication with Moscow; it was called the Russian Orthodox Greek Catholic Church of America, and usually referred to as the “Metropolia.” At the same time, a group of bishops who fled Russia after the revolution established the Russian Orthodox Church Outside Russia (ROCOR) in Yugoslavia in 1921. Platon initially cooperated with ROCOR, and then broke with it over political issues (ROCOR's advocacy of restoring the monarchy in Russia) in 1926. The Metropolia and ROCOR were united again from 1935 to 1946, and

after that they divided. In the latter 1920s the leadership of the church in Russia refused to recognize either and attempted to establish its own authority in America. Thus for much of the twentieth century, as a result of the Russian Revolution, three Russian churches were competing in America, of which the Metropolia was the largest. Making matters even more complicated, Ukrainians (most numerous in Canada) who had been a part of the Russian church before 1917 also declared themselves independent. In short, some Russian believers felt they should remain part of the Moscow patriarchal church as an expression of loyalty to their church's suffering in the Soviet Union. Others (especially ROCOR) felt that the church in the Soviet Union had been compromised by the regime, especially after Metropolitan Sergius, head of the Russian church, made a declaration of loyalty to the Soviet Union in 1927 and therefore ceased to deserve their loyalty.

The Greeks in America had operated separately from the Russians even before 1917, though the number of parishes had increased dramatically since the beginning of the century. Their situation changed in 1918 when Meletios Metaxakis, archbishop of Athens, appointed a bishop for the Greek Orthodox. But the years 1918–1922 were a time of political turmoil in Greece as well, for the king had been ousted. Greeks in the United States were also divided between liberals and royalists. When the king returned, Archbishop Meletios was ousted as archbishop of Athens as a liberal, after which he took refuge in the United States (still claiming to be the legitimate archbishop), establishing the Greek Orthodox Archdiocese of America in 1921. Later that year Meletios was elected patriarch of Constantinople, and after assuming office in 1922 he annulled the 1908 pronouncement placing the Greek Orthodox under the church of Greece and instead placed them under the jurisdiction of the ecumenical patriarch of Constantinople. This transfer would have enormous consequences for the ecumenical patriarchate itself, because its flock in North America is far larger than what remains of the Greek population in Turkey itself. Meletios originally had a vision of uniting all Orthodoxy into one church organization, but he later declared that the purpose of the Greek Orthodox Archdiocese was to nurture Orthodoxy among the Greeks. Meanwhile, after Meletios was deposed as archbishop of Athens, the new archbishop sent a rival bishop to the United States, so there were competing Greek churches until 1930.

In 1930 the archbishop of Athens and the ecumenical patriarch agreed on appointing a new archbishop for America, Athenagoras Spirou. Athenagoras was an energetic,

skillful church politician, and he succeeded in unifying the disparate and divided Greek communities as well as bringing the parishes further under episcopal oversight. In 1937 he established the Holy Cross Greek Orthodox Theological Institute to prepare American-born candidates for the clergy. The institute was located first in Connecticut before moving to its present location in Brookline, Massachusetts. He also organized the Ladies' Philoptochos Society, which was dedicated to philanthropic activities, and in general Athenagoras succeeded in raising public awareness about the Orthodox Church in America. Athenagoras left the United States when he was elected ecumenical patriarch in 1948; President Harry S. Truman provided his private plane to fly Athenagoras to Istanbul.

Other ethnic Orthodox soon followed by establishing their own ethnic jurisdictions. Serbs set up a separate Serbian diocese in 1921, administered by the remarkable Nikolai Velimirovich. A substantial minority of Romanians had immigrated since the beginning of the century, and the Romanian church sent them their first bishop, Policarp Morusca, in 1935. Policarp established many organizations as well as a center for the Romanian diocese in Michigan. The Bulgarians and Albanians also set up churches in the 1930s.

The Syro-Arab Orthodox Christians had been a part of the Russian archdiocese under Bishop Raphael Hawaweeny. But after his death in 1915 a period of uncertainty followed. In 1923 the patriarch of Antioch expressed his intent to assume jurisdiction over the Syrian and Lebanese Orthodox in America, but Raphael's successor continued to allow a separate independent jurisdiction. The Syro-Arab community was divided between pro-Antiochian and pro-Russian factions. In the mid-1930s the rival bishops both left the scene, and an opportunity for unity arose, but again two rival bishops were elected, and two rival jurisdictions continued for several more decades. One of these bishops, Metropolitan Antony, was incredibly energetic and contributed greatly to the development of Arab Orthodoxy in America for thirty years until his death in 1966. Antony was probably the most visionary Orthodox leader in the mid-twentieth century in encouraging the use of English and trying to balance faithfulness to ethnic identity and customs with ministering to those born in America and speaking English as their first language.

Thus by the end of the 1930s the Orthodox churches in America were organized in a series of separate, parallel jurisdictions along ethnic lines. However, on one level this was a natural development, because the churches served their

communities by offering a sense of community (with those of similar background) and by being a focal point for the preservation of languages and traditions that each group brought with them. At the same time, the situation was anomalous with Orthodox canons, which called for the church to be organized territorially (one bishop per region), not ethnically (multiple bishops per region).

Becoming an American Church

The period from the 1880s to the 1920s saw the greatest immigration of Orthodox Christians. In the early 1920s, however, immigration became more restricted; the National Origins Quota Act of 1924 limited the number of Greek immigrants each year to one hundred, in contrast to nearly 30,000 who had come to the United States in 1921. In this first period (1880s to 1920), many immigrants were unskilled male peasants from Eastern Europe who worked especially in factories in the eastern part of the United States. The majority came only temporarily, to make enough money to return home and live comfortably. Most of them, therefore, were not interested in “becoming” American, they did not expend much energy learning English or adapting in other ways, nor did they have families in the United States. Nevertheless, they did establish various kinds of social organizations for mutual support, including churches, during their stay.

Those who came to the United States after World War I, however, tended to stay. After the restricted immigration in the 1920s and the Russian Revolution, new immigrants shrank to a trickle. After World War II, the socioeconomic status of many Orthodox rose, especially for Greeks who became shopkeepers and restaurant owners. By this time the vast majority were American-born and educated, who often had married outside their ethnic group and identified more as American. One of the major tensions that persisted in the Orthodox Church in America during the twentieth century was over the preservation of ethnic identity versus Americanization. The church often served as a locus for preserving national identity and became inseparable from that aim, so that people identified themselves not so much as Orthodox Christians but as *Greek* Orthodox or *Russian* Orthodox. Often schools were established as part of the parish to teach the language to children after school. By the 1960s or so a greater number of Orthodox Christians were pushing for more English, especially in church services, because they no longer understood the old language and many were leaving the church they could not understand. Moreover, in the western part of the United States, where

the numbers of Orthodox were fewer, new parishes formed that were often multiethnic, with services in English that developed a sense of community without the stress on the ethnic component.

The post–World War II period brought more divisions over politics, however. As other countries of Eastern Europe fell behind the iron curtain, disputes over the relationship to the mother church not unlike those that had plagued the Russians after 1917 divided the Romanian, Serbian, Bulgarian, and Albanian churches. Within each ethnic church some wanted to remain loyal to the mother church, and others believed that the leadership of the mother church was compromised under communist rule.

Despite the great fragmentation of church organizations, Orthodox began entering the mainstream of American life by the 1950s. In 1957 the first Orthodox bishop participated in a presidential inauguration, and a decade later Greek archbishop Iakovos Coucouzis (1959–1996) marched with Martin Luther King Jr. in Selma, Alabama. Recognizing that the existence of parallel, ethnically defined jurisdictions was anomalous, Iakovos and others created the Standing Conference of Canonical Orthodox Bishops in the Americas (SCOBA) to increase communication, cooperation, and joint action among the various Orthodox churches. Under the umbrella of SCOBA inter-Orthodox commissions and activities proliferated, such as a Commission on Military Chaplaincies and the Orthodox Christian Fellowship, an inter-Orthodox campus ministry. Many hoped that SCOBA would serve as a basis for developing a united Orthodox church in America, but this did not happen.

Another attempt to create a unified American Orthodox Church came on the initiative of the Metropolia and the Moscow patriarchate. The church in Russia had revived during World War II, and the Metropolia sought to regularize relations while at the same time remaining functionally independent of the church under communist rule. Moreover, with the lack of Russian immigration the Metropolia had become increasingly Americanized and did not wish to be further Russified. In 1970 the Metropolia reestablished relations and communion with the Moscow patriarchate, which, in turn, granted the Metropolia autocephaly or self-ruling status. The new church was called the Orthodox Church in America (OCA) and was self-consciously intended to become an American church rather than a church that perpetuated one or another ethnic identity. Initially the OCA held promise of uniting Orthodoxy in America, and the Romanians, Bulgarians, and Albanians became part of it. In a major blow, however, the ecumenical

patriarch of Constantinople refused to recognize the OCA, claiming that only it—and not Moscow—had the right to grant autocephalous status to new churches.

Although after World War II the various Orthodox churches were becoming increasingly Americanized, the Immigration Act of 1965 opened the door for a new wave of immigration in the last decades of the twentieth century. These immigrants included not only many Greeks and Arabs but also greater numbers of Oriental Orthodox from Egypt (Coptic Christians) and Ethiopia. After the collapse of communism in Eastern Europe and the Soviet Union in 1989–1991, the new immigrants from these countries increased as well. This influx sometimes resulted in tensions within parish communities between those who were second- or third-generation Americans and those who were recent immigrants.

Since the 1960s more and more people from a variety of backgrounds have converted to Orthodoxy. Some, such as the well-known Seraphim Rose, came to Orthodoxy after growing disillusioned with the lack of spirituality in Western churches and experiencing a disappointing journey through Asian religions before finding in Orthodoxy a Christian religion with a deep tradition of spirituality. Many of the converts have been disaffected with mainline Protestant churches over liberalized positions on the ordination of women and homosexuals. Still others are evangelicals in search of the “early church.” In the 1980s entire communities of such evangelicals who had been former leaders in Campus Crusade for Christ in the 1960s converted to Orthodoxy. Along the way they formed an “Evangelical Orthodox Church,” but eventually became convinced they needed to become a part of a historical Orthodox church. In 1987 they were received by the Antiochian Orthodox Archdiocese as a group—some dozen communities, two thousand strong, throughout the country. They brought with them an evangelical fervor and a devotion to Orthodoxy that often came into tension with the “ethnic” Orthodox who sometimes view their faith as inseparable from their ethnicity.

Theological Education

One of the greatest contributions of Orthodoxy to the American scene is in the realm of theology. In the first part of the twentieth century the Orthodox made several attempts to establish theological schools as church leaders recognized the need to train American-born clergy. But all of these attempts eventually failed, mostly for lack of funds. However, in a new phase Holy Cross Greek Orthodox

School of Theology was founded in 1937, and St. Vladimir’s Russian Orthodox Seminary was founded in New York in 1938. Both are now accredited graduate educational institutions. In the postwar period St. Vladimir’s attracted some world-class theologians who were Russian émigrés or born in Europe of émigré parents such as George Florovsky and George Fedotov, and later John Meyendorff and Alexander Schmemmann. In part through their labors (and St. Vladimir’s Seminary Press) a large number of quality books on Orthodoxy are now available in English, unlike thirty years ago. This development has increased awareness and appreciation of Orthodoxy in America, particularly in theological circles.

Alexander Schmemmann had a particularly important impact on the life of the Orthodox Church in the United States by promoting a liturgical renewal. This renewal entailed a fuller cycle of liturgical service in addition to the Sunday services as well as the frequent reception of communion (in the medieval period it had become the norm in Orthodox churches to receive communion only a few times a year). In general, Father Schmemmann inspired a deeper understanding of the nature of the church and its sacraments.

Unity and Disunity

If the increase in converts and new immigrants has made Orthodox churches more diverse than ever, the collapse of the iron curtain provided an opportunity to heal schisms created over communism. In the 1990s, for example, the two branches of the Serbian church were reconciled. In 2007 the Russian Orthodox Church Outside Russia reconciled with the Moscow patriarchate, thereby restoring ROCOR to communion with other Orthodox jurisdictions—although now ROCOR and the OCA exist as two parallel jurisdictions of Russian origin.

Other signs of unity and cooperation among Orthodox churches have appeared as well. One of the most successful inter-Orthodox organizations under the aegis of SCOBA is the International Orthodox Christian Charities (IOCC), which provides humanitarian aid to regions suffering from war and natural disasters. A high point in the quest for unity came during a meeting of twenty-eight SCOBA bishops in 1994 at Antiochian Village, near Ligonier, Pennsylvania, the largest such gathering of Orthodox bishops in North America. They issued a statement in which they insisted that the term *diaspora* did not accurately describe the situation of the Orthodox in America, and also put forward a vision of a unified Orthodox Church for North America. However,

Ecumenical Patriarch Bartholomew denounced the Ligonier statement as presumptuous and the American church as immature and not ready for greater independence.

In the fallout over the Ligonier statement and the aspirations for greater independence, Archbishop Iakovos—who had led the Greek Orthodox Church since 1959—was forced to retire. He was succeeded by Spyridon Papageorge, the first American-born Greek archbishop. Spyridon attempted to bring the Greek church in America more directly under the supervision of the ecumenical patriarch, which meant stripping parishes and the laity of some of their powers. He also dismissed prominent priests and faculty members from the Holy Cross Greek Orthodox School of Theology. In a classic clash between old world and American expectations, Spyridon raised so much opposition that he was forced to resign in 1999. He was replaced by Archbishop Demetrios Trakatellis, who held a doctorate from Harvard and enjoyed respect both in elite circles and from the ordinary faithful.

The OCA also faced a crisis in the 2000s stemming from accusations of financial improprieties. The bishops tried to handle the allegations in an “old world” manner, claiming it was their problem to fix, but heavy pressure was placed on the church hierarchy for accountability, and eventually the head of the church was forced to resign. In November 2008 the OCA’s All-American Council unexpectedly elected a relatively young bishop as head of the church. Jonah Paffhausen was a convert to Orthodoxy who had been consecrated bishop only two weeks earlier. Young and energetic, Metropolitan Jonah raised the hopes of many that he would lead the OCA out of its prior stagnation, although tense exchanges between the bishop and the leadership of the Greek church and the ecumenical patriarch suggested that the goal of organizational unity would remain elusive.

Despite the fact that during the first decade of the twenty-first century organizational unity appeared unrealizable for the Orthodox in America, there has been much more cooperation between the churches of various ethnic jurisdictions than ever before, particularly at the grassroots level. Tensions continue to persist between American expectations of authority and the old world models, and ultimately organizational unity will remain in the hands of the old world church leaderships. At the grassroots level, however, the major threat of division among Orthodox Christians in America in the twenty-first century arose no longer from politics or ethnicity. Instead, there was growing tension over how to respond properly to the modern, pluralistic

world. A vocal minority of “traditionalists” are adhering to the Julian calendar (the old calendar of the Roman Empire, thirteen days behind the Gregorian calendar), as do the churches of Russia and Serbia. These traditionalists also reject ecumenical dialogue with non-Orthodox Christians and approach the church services and canons that regulate church life in “fundamentalist” ways—that is, they are absolute, unchanging, and unchangeable norms. Others are more open to adapting the church to modern conditions while seeking to preserve what is essential about the Orthodox faith, and also are more willing to engage in dialogue with their non-Orthodox neighbors. In general, the challenge to Orthodox Christianity in America is how to become American while remaining true to its own traditions.

Economics

Economics in the context of American religions entails examining not only the material and financial matters related to religious practices, beliefs, governance, building, and missionizing, but also the place of religious institutions within the context of the local, regional, or national economy. Economics in American religion covers as well an individual’s place within the economy and how his or her religious practices and beliefs relate to that status. And not to be overlooked is the religious economy between religious believers and their gods, between laypeople and religious professionals, and between religious professionals and the institutions of which they are a part.

Religious Economies

Economies of industries and nations are networks and relationships of exchange. Similarly, “religious economies” can be defined as relationships of exchange between humans and supernatural beings and powers. The diversity of

American religious history provides numerous examples of such religious economies of exchange.

The Puritans, an English Protestant group that settled the Massachusetts Bay Colony in 1630, utilized a theology of covenants in their natural and supernatural interactions. They recognized four types of covenant. The first type was the covenant that could be enacted between people over issues of trade, goods, services, and land. The second type was marriage between a bride and groom. The third was that between members of churches. The Puritans understood “church” not as the building in which members worshipped, but rather the assemblage of people who made up the congregation. The covenant between church members outlined the communal responsibilities individuals had to one another. The fourth type, the “federal covenant,” was between God and his people; it outlined the Puritans’ responsibilities to God. This covenant was discussed in John Winthrop’s famous 1630 sermon “A Model of Christian Charity.” In his sermon, delivered before the Puritans disembarked from the *Arbella*, the boat that carried them from England to Massachusetts, Winthrop suggested that the community had entered into covenant with God to establish a model Christian society in the New World, a city upon a hill for all of Christendom to see and strive to replicate. The Puritans perceived themselves to be God’s chosen people, just like the ancient Israelites of the Hebrew Bible, who were bound to enter into covenants with God. Winthrop, a lawyer, suggested that if the Puritan community fulfilled its part of the contract with God by setting up an exemplary Christian society, God would bless it with great success. If the Puritans broke the covenant, however, he assured them that God would respond with righteous fury.

Covenantal relations of exchange between the supernatural and humans are not restricted to Christianity. In North America nearly all religious groups that have some conception of the supernatural engage in rituals and activities of exchange. Sometimes the divine requires a specific action, such as in the Native American Ghost Dances of the late nineteenth century. “Ghost Dance” is the categorical name scholars have given to a variety of predominantly eighteenth- and nineteenth-century Native American religious movements. The most well-known Ghost Dance was in 1889–1890—a pan-tribal Native American movement that combined native and Christian rituals, symbols, and beliefs with an end-time prophecy. Participants believed that the world as known was about to end. Those taking up the Ghost Dance movement’s rituals and lifestyle would survive

the apocalypse and see the onset of a new paradisaical era. The Ghost Dance movement spread rapidly and took on a variety of unique forms and practices within different tribes. The Lakota Sioux, the tribe that had been the most resistant to U.S. government attempts to place them on reservations and who had defeated Gen. George Custer at the Battle of the Little Big Horn in 1876, adopted the use of “ghost shirts” during the movement’s dance rituals. The wearers of ghost shirts thought themselves invulnerable to white soldier’s bullets. Though the Ghost Dance movement promoted pacifism and believed the earth’s destruction (including whites and their native collaborators) would stem from supernatural intervention, white settlers’ fears of the Lakota led to heightened tension and precipitated the infamous massacre by federal soldiers of over two hundred Lakota Sioux Ghost Dancers at Wounded Knee on December 29, 1890.

The prophet of the 1889–1890 Ghost Dance was a Nevada Paiute, Wovoka, who was also known as Jack Wilson. Wovoka’s initial vision and prophetic message emerged on January 1, 1889, when he became quite sick during a total eclipse of the sun. In his initial vision Wovoka died, traveled to heaven, and received a message from God to preach on earth. In brief, the Deity told Wovoka to preach a gospel of love, goodwill, and pacifism. The Great Spirit also gave the prophet a dance of harmony to teach to the people. The Spirit told Wovoka that if every Native American performed the dance, evil would be swept away from the earth and the world would be renewed into a paradisaical, precolonial state. Although it was not dubbed a “covenant,” this relationship of ritual obligation and world renewal between the Ghost Dancers and the Spirit is another example of religious economic exchange in the American context.

As the United States has become more diverse through immigration, new forms of religious exchange have been introduced. For example, most immigrant forms of Buddhism in the United States include a karmic-based exchange relationship between practitioners, monks, and temples. Karma refers to the merits one accumulates by one’s actions in the world. One’s “karmic balance” during a lifetime dictates the life into which one will be reborn, or reincarnated, in the next. For example, a Laotian Buddhist temple in Rockford, Illinois, is run by the monks who live in it. They, in turn, are supported by the donations made by the laypeople who belong to the temple. Every donation of food, money, or other goods by the laity results in a positive accumulation of karma, which will either give the laypeople a

better rebirth in the next life or assist the laity’s relatives and ancestors with better rebirths. This form of religious economy, similar to the Puritan and Ghost Dance examples, rewards individual practices that sustain religious institutions and activities with the promise of supernatural benefits.

Beginning in the late 1980s several scholars recognized the importance of religious exchange in the American context by devising theories of religious economy to explain the growth and decline of specific religious movements. The two most well-known proponents of economic and market models of American religion are Rodney Stark and Roger Finke. In their 1992 work *The Churching of America, 1776–1990: Winners and Losers in Our Religious Economy*, they proposed that religious groups be perceived as businesses competing for market shares. Stark and Finke argued that to be successful an American religious business must balance the personal sacrifice required of members with rewarding supernatural and other benefits. In their later work *Acts of Faith: Explaining the Human Side of Religion*, Stark and Finke moved away from a focus on movements and toward religious individuals, who they argued should be viewed as rational economic actors choosing in a marketplace of religious products.

Financing American Religions

Economics also enters into American religious history through the study of how religious groups finance themselves. This has been a pressing issue for American religions since the end of the Revolutionary War and the subsequent establishment of a distinctly American form of government. The First Amendment to the U.S. Constitution, ratified in 1791, states that Congress shall make no law establishing religion or prohibiting its free exercise. The first part of this statement, radical for its time, directed that the country would have no officially sanctioned religion and thus no taxation in support of religious groups. This constitutional clause was the culmination of work by statesmen such as Thomas Jefferson and James Madison, who earlier had fought against a bill in Virginia that would have levied taxes for the purpose of religious teaching and missionary activity. The combined separation of church and state and religious liberty that resulted from the First Amendment produced, by the early nineteenth century, a religious free market in which groups competed for members and finances.

One method of garnering church funds has been through tithing. The American religious historian James Hudnut-Beumler has noted that tithing was not actively pursued and

promoted within Protestant denominations until the nineteenth century, when previous methods of securing church funds such as pew rentals and subscription books fell short of monetary goals. Some trends in religious giving have remained the same over time, whereas others have changed. In terms of consistent trends in the twentieth century, the sociologist Mark Chaves, for example, has noted that people with higher incomes give more, that the more people give the more likely they are to participate in the religious organization, and that denominational differences in giving persist. Although Chaves found no correlation between theology and levels of giving, he noted that of people with the same income levels, Pentecostals consistently tended to give more than Presbyterians, who, in turn, gave more than Roman Catholics. One recent change across all religious groups, according to John and Sylvia Ronsvalle, is that individual-level giving as a portion of one's income has fallen since the 1960s.

Frequently, the need to finance institutions and activities in a religious free market requires more than Sunday morning tithing, and the historian David Nord has argued that many early and mid-nineteenth-century Protestants were necessarily at the forefront of corporate business innovations. By the 1820s over one hundred U.S. organizations were committed to producing tract literature, distributing free Bibles, and sending missionaries throughout the United States and abroad. These organizations included the American Tract Society, American Bible Society, and American Sunday School Union. Nord notes that the American Tract Society, dedicated to distributing free Bibles and religious flyers, invented the business model for the nonprofit corporation that continues to be followed into the twenty-first century.

Class and American Religion

One of the most persistent topics in the study of economics and religion has been the issue of class, specifically how one's place within the economic system relates to one's religious practices and beliefs. Observers of American religion—for example, H. Richard Niebuhr in his 1929 work *The Social Sources of Denominationalism*—have long noted that different denominations attract people of differing social status and economic class. Recent studies by sociologists such as Christian Smith, Robert Faris, and others suggest that religious groups continue to reflect the class differences of their membership. Specifically, religious groups whose memberships are higher on the socioeconomic ladder are most often

theologically liberal denominations with hierarchical church organizations and formal liturgical styles. These include the Unitarian Universalists, Episcopalians, Jews, and mainline Presbyterians. Those groups whose members rank lower on the socioeconomic ladder are characterized by theological conservatism, more congregational styles of church governance (polity), and more emotive styles of worship and ritual. These groups include Jehovah's Witnesses, Pentecostals, most African American Baptists, and the Southern Baptist Convention.

Although studies continue to show a link between one's class and one's religious group, beliefs, and practices, scholars have long debated exactly what "class" entails. Is one's class determined by one's position within the means of production, as the communist philosopher Karl Marx asserted? Is it based on one's cultural consumption, such as what one reads, eats, wears, or listens to? Or is class a symbolically ascribed status leveled by the community in which one exists? Is class based primarily in experiences and relationships fomented by material circumstances, or is it largely a matter of symbolic and rhetorical representation? For sociologists who study American religion, class is usually a combination of three variables: (1) income, or how much money one makes; (2) occupation, or what job one holds; and (3) education, or whether one completed high school, attended or finished college, or attained any advanced degrees. A fourth variable sometimes mentioned but much harder to study is wealth, or how much one has accumulated or inherited. For scholars in the humanities who study American religion, class may include such variables, but it is often more about the cultural identities rhetorically and symbolically made and unmade through representation and discourse. In other words, for many in the humanities, class is a matter of language and the enculturated habits of mind and body. These two conceptions of class—the sociological-based and the humanities-based—are not incommensurable, and both are at work in American religions. In what follows, three scholarly routes of studying American religion and class are examined.

The first and most common consideration of class in American religious history is the study of labor and religion. Scholars assess how different religious groups view laborers, managers, and the developing capitalist economy, as well as how workers utilize religious idioms in their labor activities. American religious historians often ask whether religion is generally supportive of or oppressive toward labor and the working classes. Such scholarship was fomented by the

cultural Marxism of scholars such as the British historian E. P. Thompson, whose classic study *The Making of the English Working Class* suggested that religious theologies such as Methodism both supported the status quo of capitalist owners and were indirectly responsible for giving laborers a means of organizing for workers' rights.

In the American context, one of the most well known of these studies is Paul E. Johnson's *A Shopkeeper's Millennium: Society and Revivals in Rochester, New York, 1815–1837* (1978). He argues that antebellum revivals in Rochester aided the ownership classes and disadvantaged working people. Other scholars have come to different conclusions. In his study of Protestantism and labor in the Gilded Age, the historian Herbert Gutman argues that although support of laissez-faire capitalism can be found among nineteenth-century religious leaders, Protestantism was also something that offered discontented American workers religious ammunition to fight against unfair labor practices. Other historians have examined how workers in nineteenth-century Philadelphia, Baltimore, and Providence responded to emergent capitalism through religious idioms and institutions. In short, these studies reveal that the relationship between religion and labor is not simple. Religion played a significant role in both supporting and fighting against labor concerns in the nineteenth and early twentieth centuries.

A second route taken by studies of class in American religious history is examining the influence of religion in developing class distinctions and class consciousness among what would become nineteenth-century working- and middle-class Americans. The historians Jama Lazerow and Theresa Anne Murphy, for example, have studied how religious culture influenced antebellum working-class New Englanders. The historian Mark Schantz has similarly argued that a deeply embedded religious culture influenced emergent class formations in antebellum Providence, Rhode Island. Taken together, these studies suggest that American class cultures have long been influenced by—and have influenced—American religious cultures.

A third path taken in mid-twentieth-century and later studies of American religion and class is a theoretical one that seeks to explain the relationship between one's class and one's religious preferences. Modern theories connecting religion and material circumstances have been advanced since the mid-nineteenth century, when Karl Marx argued that the entirety of a person's perceptions and ideas—including religious ones—stemmed from material circumstances and place within the means of economic production.

In the early twentieth century the German sociologist Max Weber examined the affinities among religion, class, and status. Weber suggested that there were important connections between the social locations of individuals, groups, and their religious beliefs and practices. He asserted that the social group within which a religion first developed left a lasting impression on it, and in some of his work Weber set out to determine the connections between certain occupational groups and the theologies of various world religions.

In other work Weber looked for correspondences between theologies of suffering (theodicies), salvation (soteriologies), and class. Among other things, Weber suggested that the disadvantaged classes often focused on the emotional, salvation-oriented aspects of religion, whereas the more privileged groups were attracted to religions that theologically justified their good fortunes and status. In perhaps his most cited study, *The Protestant Ethic and the Spirit of Capitalism* (1930), Weber eschewed causal arguments on the concomitant growth of capitalism and Protestantism, preferring to suggest elective affinities between this-worldly Protestant asceticism and capitalist accumulation and investment.

By the mid-twentieth century, many of the American sociologists and historians studying religion were espousing “deprivation theories,” which suggested that the economically disadvantaged sought out religious beliefs and practices that gave them symbolic succor to psychologically and temporarily relieve their miseries. Pentecostals received much attention from deprivation theorists (Pentecostalism, a Protestant movement formed in the early twentieth century, embraced speaking in tongues, faith healing, and other ecstatic worship practices). For example, deprivation theory played a framing role in the historian Robert Mapes Anderson's groundbreaking narrative *Vision of the Disinherited: The Making of American Pentecostalism* (1979). He argued that the Pentecostal movement was best viewed as a protest against the urbanizing industrial society in which its early largely agrarian and poor members found themselves uprooted. Anderson viewed speaking in tongues and other physically demonstrative Pentecostal behaviors as responses to the harsh material conditions that they could do little to ameliorate.

By the twenty-first century deprivation theories had largely fallen out of favor among those who studied American religions. Simply put, and as noted by American religious historian Grant Wacker in his work on Pentecostalism, such theories have been unable to account for those who fit the “deprived” class demographic but do not belong to a

“disinherited” movement or, conversely, those who are economically well-off and yet are still members of religious movements of the dispossessed. The most recent theoretical examinations of religion and class have tended to focus on the importance of strong congregational social networks and the comfort of culturally habituated religious styles to explain the persistent link between religion and socioeconomic status.

Religious Responses to Social Differentiation in American History

Class did not come into widespread usage as a term for socioeconomic status until the mid-nineteenth century, but no period in American history was without a language of social differentiation and religious responses to it. Since the colonial period religious groups have developed theologies, instituted programs, and set up institutions to explain and respond to the socioeconomic inequalities within precapitalist, industrial capitalist, and consumer capitalist American economies. Religious studies scholar Sean McCloud has argued that at least four major “theologies of class” characterize American religious history. The first, “divine hierarchies,” was closely tied to the Calvinist theology of predeterminism and suggested that socioeconomic differences were divinely ordained. An example of such a theology can be seen in Puritan John Winthrop’s “Model of Christian Charity” sermon. Winthrop began his sermon by stating that God had established a divinely ordained social hierarchy in which some were destined to be rich and others to be poor. Much of the sermon that followed detailed the reasons for such social differentiation. Puritan predestinarian beliefs suggested that God made humans with no free will to act on their own. Before the world existed, God had determined who would be rich, poor, saved, and damned. All were dependent upon God’s grace, and if it was offered none could resist it. At the same time, if one were divinely destined to deprivations on earth and hell after death, similarly nothing could be done.

A second theology of class, “economic arminianism,” emerged amid nineteenth-century evangelicalism, republicanism, and the development of industrial-class relations. Asserting that all human beings have the free will to progress in both religious and financial endeavors, economic arminianism assumes its most prominent form in the evangelical Protestant movement known as the prosperity gospel. This theological strain appeared as early as 1890, when Philadelphia Baptist minister and Temple University founder

Russell Conwell first delivered his now-famous and often repeated “Acres of Diamonds” sermon. Conwell asserted that God wanted his followers to be rich and believed that becoming wealthy was an excellent means of preaching the gospel. Conversely, Conwell argued that poverty was God’s punishment for sin. Thus one could extrapolate that most charity was therefore at best unhelpful and at worst against God’s will.

Perhaps the most prominent example of economic arminianism in the late twentieth and early twenty-first centuries was a form of the prosperity gospel known as the Word of Faith movement. The scholar Milmon Harrison places the movement’s origins in a mix of Holiness, Pentecostal, and New Thought theologies. It is promoted by ministers such as E. W. Kenyon, Kenneth Hagin, Reverend Ike, Creflo Dollar, and Frederick Price, and by religious media such as the Trinity Broadcasting Network. Word of Faith theology suggests that each individual has the God-given free will to be economically successful. Focusing on the power of positive thinking, the movement encourages members to “name it and claim it” by repeating positive affirmations and prayers. Conversely, Word of Faith adherents believe that negative thinking produces poverty, illness, and misfortune. Similar theologies of social differentiation appeared in late twentieth and early twenty-first century New Age movements.

A third recurring theology of social differentiation, “social harmony,” emerged in the late nineteenth century. It was represented in many Protestant writings as well as in a Roman Catholic statement on labor and capital, Pope Leo XIII’s *Rerum Novarum* (1891). This theology has its roots in post-Civil War notions of the ideal society as a “harmony of interests” among differentiated unequals. Proponents of this class theology argued that laborers and capitalist owners in the emerging industrial economy shared mutual, rather than opposing, interests and goals. Although some criticized Gilded Age robber barons for their exploitive practices, adherents to this view also consistently upheld capitalism, private property, and profits as biblically sanctioned.

The Social Gospel, a diverse, though largely Protestant, movement established in the late nineteenth and early twentieth century, is a good example of the social harmony theologies of social differentiation. As noted by the historian Robert Handy, what contemporary scholars usually define as the Social Gospel are the writings and activities of a select group of progressive ministers who came out of a much larger and more variant movement known as social

Christianity. Although Gilded Age social Christianity had both conservative and radical arms, Handy describes the progressive Social Gospellers as having attitudes that were mostly middle class—that is, they combined their labor and human rights activism with ideologies of individual rights and responsibilities. For example, the Social Gospeller Washington Gladden argued that “the broad equities of Christ’s rule” suggested that workers and their capitalist bosses get their fair shares. But at the same time Gladden was explicit in arguing for the God-given sanctity of private property and the religious superiority of capitalist economies.

Proponents of a fourth theology of social differentiation, “the class-conscious Christ,” took a rather different view of capitalism than Gladden. Espoused by some Gilded Age supporters of the working classes, this theology envisioned Jesus as a champion of laborers and enemy of capitalism. Rather than a harmony of interests, proponents of the class-conscious Christ viewed labor and capital relations as inherently conflictual. Like social harmony, the theology of the class-conscious Christ had historical roots in the antebellum period and similarly expanded and developed in the late nineteenth- and early twentieth-century Gilded Age and Progressive Eras. This theology included two unique creeds. First, as its name indicates, proponents of this theology focused on Jesus’ working-class roots and ministry. The proletariat, in this theology, was envisioned as God’s chosen people. Second, proponents declared capitalism and its supporters to be anti-Christian and thus inherently evil.

Perhaps the Progressive Era’s most thorough rendering of the class-conscious Christ theology was Bouck White’s 1912 *The Call of the Carpenter*. White, like the labor song authors, asserted Jesus’ working-class roots. He called Jesus a proletarian by birthright and asserted that his gospel was a revolutionary one directed to the masses of his time period. Capitalism, in White’s view, was unbiblical, unjust, and a pathway to despotism.

In addition to the mostly Protestant theologies just described, American religious communities of various creeds responded to social inequalities in a variety of ways, ranging from virtually ignoring the issue to setting up soup kitchens, instituting special tithings for the poor, and running urban ministries that housed the homeless.

Relations between American Economic Systems and Religion

A final pathway in the examination of American religion and economics—and the least-tread one, academically

speaking—traipses the relationship between the dominant economic system and the religious movements that thrive within it. In other words, do certain religious movements display a cultural continuity with existing economic institutions, ideologies, and practices that make them somewhat familiar, if not attractive, to participants? Or, conversely, do particular economic systems develop in ways that complement preexisting religious movements, activities, and theologies? Such questions were first posed near the turn of the twentieth century by the German sociologist Max Weber in *The Protestant Ethic and the Spirit of Capitalism* (1930). Weber examined the concomitant development of capitalism and Protestantism in modernizing western Europe. He argued that there was an “elective affinity” between capitalist accumulation and investment and the work ethic of Protestantism. Weber did not claim that one caused the other, but he did suggest that Calvinist Protestant teachings that promoted the virtues of work, monetary accumulation, and material self-denial were partly responsible for the success of early modern capitalism.

In 1989 the sociologist George Thomas looked to the concomitant rise of evangelicalism, capitalism, and republicanism in the nineteenth century in his work *Revivalism and Cultural Change: Christianity, Nation Building, and the Market in the Nineteenth-Century United States*. In this book Thomas argues that evangelical revivalism articulated the idiom of the rational individual, one who had the free will to accept or reject salvation. He maintains that such a concept of the individual was crucial, first, to the expansion of a capitalist market based on the ability of individuals to freely sell their labor and, second, to the development of an American form of government that depended on the notion that citizens would act autonomously. For Thomas, then, the homologous conceptions of autonomous free-will individuals within nineteenth-century evangelicalism, capitalism, and American political ideology corresponded in such a way as to give all three movements an aura of familiarity and plausibility.

The sociologist Wade Clark Roof has poignantly dubbed the contemporary period a “spiritual marketplace” in which Americans actively seek out and incorporate various religious elements in ways that fit their individual needs. Seeing the contemporary period as one in which identity, community, and meaning are not so much ascribed but are actively sought out by individuals, some scholars such as Roof have suggested that religion has increasingly become a cultural resource in projects of meaning and identity.

People now, more than ever, “shop” for faith by picking, mixing, and combining elements from various traditions in ways that suit their individual needs and lifestyles.

How do such religious trends relate to the current economic milieu? Since the 1950s the United States has moved away from an industrial economy and toward a consumer capitalist economy. In other words, the nation’s financial engine is increasingly run by the consumption of personal goods and services. Rather than relying on the exportation of heavy industrial items such as steel and coal, the current American economy depends on the purchase of lifestyle items, ranging from toothpaste and clothing to televisions and MP3 players. Moreover, in the contemporary “late modern” era people may—indeed must—“choose” the lifestyle with which to identify themselves. Such “projects of the self” are both fueled and alleviated by consumer capitalism, mass-mediated culture divorced from historical contextualization, and the growing authority of subjective experience. Thus, the argument proceeds, more and more people from all social locations seek their identities and communities through increasingly segmented yet ubiquitous mass media and niche market consumer goods, but they also seek such things from their religious activities and practices.

Some scholars argue that contemporary Americans in a consumer capitalist society are increasingly likely to pick out, mix, try on, and “consume” religious ideas and activities, whereas other scholars have focused on the prevalence of consumer-oriented marketing by religious entities. Chain bookstores contain large religion and spirituality sections; churches promote themselves through festivals, concerts, plays, and movie nights; New Age channelers advertise in local media; and seeker churches set up sports leagues, reading groups, and coffee houses to attract potential members. In *Selling God: American Religion in the Marketplace of Culture*, the historian R. Laurence Moore rightly warned readers that the marketing of religion was nothing new. Whether it was the early eighteenth-century revivalist George Whitefield or later ministers such as late nineteenth-century evangelist Dwight Moody, religious figures have missionized through free public spectacles and purchasable commodities. Religion and the market have had a symbiotic, though not always cordial, relationship throughout American history.

Religion has influenced the American capitalist market and American business, as the example of the American Tract Society suggests. But it has also been influenced by

business and the marketplace. The Willow Creek Association, for example, is a large suburban Chicago church that has utilized contemporary advertising and marketing tools to create a “client-consultant” network of denominations that seek to attract individuals by playing down traditional denominational styles and offering events and programs that research suggests will draw in the “unchurched.”

Conclusion

Economics—always about more than just money—has played a substantial role in fomenting the trials and trajectories of American citizens. Generational shifts from farms to factories—and more recently from factories to retail—have moved masses of people from towns to cities, from cities to suburbs, from South to North and back again. Accompanying the fluxes and trends of the American economy have been the shifts, slips, and persistent creativity of American religious ideas, practices, and movements. American religious idioms have been created by, have responded to, and have argued for and against prevailing and passing economic systems, exchanges, and ideas. Economics and religion have always and will likely continue to be closely intertwined and mutually influential in American history.

Ecumenism

Ecumenism refers to efforts to promote Christian unity across denominational lines either through merger (organic union) or through cooperation (federal union). Although ecumenism in America began with Protestant efforts at cooperation, in the twentieth century the federal model expanded to include cooperation and dialogue between Protestants and Catholics and even between Christians and

non-Christians, so that the term *ecumenism* has sometimes been used to describe interfaith dialogue.

Nineteenth Century

In the nineteenth century the United States expanded rapidly westward even as it absorbed immigrants from all over the globe. Lacking an established national church, the country had no single entity defining acceptable American religion or coordinating Christian missions in the frontier. Meanwhile, each wave of immigration increased the diversity of churches on American soil. For most Protestant leaders in the first half of the nineteenth century the single greatest threat to Protestant hegemony was Catholic immigration: between 1820 and 1860 more than a third of all immigrants were Irish.

The first Protestant ecumenical efforts attempted to overcome competition between Protestant denominations while promoting a unified front against the perceived Catholic threat, essentially creating some of the advantages of an established religion without formal establishment. Not surprisingly, the strongest ecumenical voices were those from denominations that had enjoyed a colonial history of establishment, such as the Congregationalist and Episcopal Churches. These early ecumenical ventures, most short-lived, fall into two broad categories: organic union and cooperative agreements.

Organic Union

Among the most vigorous advocates of organic union, creating a single Christian Church by merging various denominations into one body, were Episcopal leaders who envisioned an American equivalent of the established Church of England. In 1841 Rev. Thomas Hubbard Vail of Hartford, Connecticut, called for the merger of all Protestant denominations within the Episcopal Church. William Augustus Muhlenberg, the father of the Episcopal Church school movement, echoed these sentiments at the General Convention of 1853, suggesting that a merger of all Protestants into the Episcopal Church would help Protestants fight "Romanism" and minister to the poor. Likewise William Reed Huntington's *The Church Idea—An Essay Toward Unity* (1870) called on all Protestants to unite in an established "Catholic Church of America."

This plan failed to gain support from the churches rooted in dissent from the Church of England. Presbyterians, Congregationalists, and Baptists, to name only a few, absolutely rejected rule by a bishop. Even replacing the word "bishop"

with the (perhaps equally unfortunate) word *overseer* failed to win support for Huntington's plan outside the Episcopal Church.

Cooperative Agreements

Cooperative agreements, in which members of various denominations allied for common goals, proved more successful, especially on the western frontier, which functioned as an internal mission field for most of the century. Although denominations on the frontier competed for converts, frontier conditions also tended to break down denominational barriers. Frontier revivals provided a transdenominational experience of religious awakening, and denominational cooperation offered advantages, as shown by the Plan of Union of 1801.

The Plan of Union allowed Congregationalist and Presbyterian ministers to serve each other's congregations on the northwestern frontier. It also gave these denominations a chance to seize the opportunity presented when the British ceded the territory north of the Ohio River and west of the Appalachians in 1783. Connecticut, New York, Massachusetts, and Virginia all initially claimed the territory, but ceded their claim to the U.S. government. The U.S. victory at Fallen Timbers in 1794 opened the area to white settlement. By 1800 statehood was on the horizon for Ohio, with Indiana soon to follow.

Congregationalist Timothy Dwight, president of Yale College in Connecticut where Congregationalism was still established, proposed the Plan of Union to plant the New England Reformed tradition in the west as a step toward a virtual establishment. The allied denominations dominated the northern frontier, although the Baptists and Methodists overtook them in the south. Designed to be even-handed, the Plan of Union respected the governing structure of each denomination. In practice, however, the union favored the more institutionally robust Presbyterians. Fearing that the Presbyterians would absorb them, the Congregationalists left the union in 1851.

Even as Dwight proposed the Plan of Union, revivals swept the western and southern frontiers (Ohio, New York, Kentucky, Tennessee). Known collectively as the Second Great Awakening, these revivals were not precisely ecumenical, but they did create a religious awakening that transcended denominational differences and was a precursor to the later ecumenical movement. New religious movements such as the Disciples of Christ and various movements that simply called themselves "Christian" decried dedication to

fine doctrinal divisions as mere sectarianism, promoting an antidenominational ethos. Lyman Beecher and other evangelists channeled this religious fervor into transdenominational institutions to Christianize society.

Benevolent Empire

Sometimes called the "Benevolent Empire," these institutions anticipated the later ecumenical movement in several respects: they joined representatives of more than two denominations and they were national, sometimes even international, in the scope of their actions and ambitions. Indeed, many had British precursors or partners. They included the American Board of Commissioners for Foreign Missions (founded in 1810), American Education Society (1815), American Bible Society (1816), American Sunday-School Union (1824), American Tract Society (1825), American Home Missionary Society (1826), and American Society for the Promotion of Temperance (1826), to name a few.

The Young Men's Christian Association (YMCA) and the Young Women's Christian Association (YWCA) stood out from these societies for their international orientation and emphasis on young people; the YMCA nurtured a generation of future ecumenical leaders. An import from London, where the YMCA was founded in 1844 to rescue young men from saloons, brothels, and other urban temptations, the YMCA flourished in America, growing from a handful in 1851 to fifty-four YMCAs in the United States and Canada by 1855. On August 22, 1855, ninety-nine leaders of YMCAs in Europe and North America met at the Paris World Exhibition to discuss the basis of cooperation among YMCAs. But the "Paris Basis" immediately hit a roadblock: having successfully abolished slavery in 1833, many British evangelicals were reluctant to affiliate with the nonabolitionists among the Americans.

American Abel Stevens countered that the unity of the Church of Christ (the body of believers) transcended political or moral issues, a formula for bracketing areas of irresolvable conflict that would prove valuable in subsequent ecumenical efforts. Referring obliquely to slavery, Stevens stipulated that no disagreement on matters not directly related to the propagation of Christianity among young men should be allowed to interfere with the federation of YMCAs. Accordingly, the Paris Basis imposed only a doctrinal test acceptable to a broad array of evangelical Christians: Jesus as the incarnate Son of God; his mediatorial intercession and reign; and the divine inspiration,

authority, and sufficiency of the Bible for knowledge of God's will.

Evangelical Alliance

Although broadly inclusive of Protestants, the Paris Basis, with its assertion of the sufficiency of the Bible, excluded Catholics. A thread of anti-Catholicism ran through the nineteenth century Protestant ecumenical efforts, intensifying in the second half of the century as fresh immigration brought unprecedented numbers of non-Protestants, especially Jews and Catholics from eastern and southern Europe. Like the frontier, the teeming industrial cities became internal mission fields, and they presented similar challenges: competition among denominations, the perceived threat of Catholicism, and the desire to create a Christian social order. Labor unrest convinced many Protestants that a Christian social order would have to address the exploitation of workers, charging missionary activity with the Social Gospel. These efforts required renewed institutional cooperation: *International Sunday-School Lessons* (first published in 1872), International Council of Religious Education (founded in 1922), and the American branch of the International Evangelical Alliance (founded in 1867).

The Evangelical Alliance under Josiah Strong in 1885 exemplified Protestant internationalism, Social Gospel activism, and anti-Catholicism (Strong ranked Catholicism, Mormonism, and unrestrained capital as threats to the Christian social order). A voluntary association, the Evangelical Alliance promoted evangelical cooperation to secure religious (Protestant) liberty, coordinate missions, and defeat infidelity. Strong called on evangelicals to model themselves on big business: conglomerating into local collective churches that would ally in one national institution. To implement his message, he toured the country, organizing branch alliances to foster ecumenism. He also instituted a Week of Prayer for Christian unity, which continued through the twentieth century. The Evangelical Alliance, supported by volunteers rather than delegates, rose and fell with the vigor of its leadership. It lost energy when conservatives forced Strong out in 1898, although it continued to exist on paper until 1944.

By the end of the nineteenth century all Protestant efforts to create a unified American Christianity had failed, but a considerable network of interdenominational Protestant organizations was in place to address a myriad of social problems. Meanwhile, American Protestants became increasingly international in orientation. American delegates

participated in six international denominational meetings in Europe, which, by establishing regular conferences, laid the foundation for international Christian fellowship in the next century. The Anglican Communion first met at Lambeth in 1867; the Alliance of Reformed Churches (Presbyterian) met in Edinburgh in 1875; the Wesleyan Conference met in Birmingham in 1876; the Old Catholic Churches joined in the Union of Utrecht in 1889; the first International Congregational Council met in London in 1891; and the Baptist World Alliance met in London in 1905. These meetings increased Americans' awareness of the world, particularly of the regions that the European empires had opened to Protestant missions. By the end of the nineteenth century, American Protestants were conceiving of ecumenical cooperation as one element in an international evangelical mission, while at home they were poised to create enduring ecumenical structures.

Twentieth Century

The twentieth century was the ecumenical century. The century began with the creation of the Federal Council of Churches, which finally established a stable convention of delegated representatives of the denominations. The interfaith movement, which grew out of the Federal Council, extended the spirit of inclusion to Jews and Catholics. This new inclusivity both reflected and promoted a more expansive American national identity in the decades following World War II, which encompassed both Jews and Catholics as "real" Americans. After the war the long dream of an international ecumenical body was finally realized with the establishment of the World Council of Churches, an organization that paralleled the United Nations. At Vatican II the Catholic Church opened itself to dialogue with the Protestant and Eastern Orthodox Churches. Although the federal model predominated in the twentieth century, there were significant instances of organic union as denominations entered full communion or even merged.

Despite unprecedented institutional cooperation, two world wars and the Cold War chastened Protestants' faith in Western civilization and the inevitability of human progress. Furthermore, the divide between liberals and fundamentalists would persist into the twenty-first century, rendering organic union of all churches as elusive as ever.

For the time being, however, American Protestants faced the world with confidence. The United States was expanding beyond the North American continent, annexing Guam, Hawaii, Puerto Rico, and the Philippines, where Americans

“Christianized” a country once dominated by Catholic Spain. On April 21, 1900, President William McKinley, Theodore Roosevelt, and other advocates of American expansion addressed an audience of more than fifty thousand at the first Ecumenical Missionary Alliance meeting in New York. The 1900 meeting of the alliance laid the foundation for American evangelical participation in the Edinburgh Conference, with its call to bring the entire world to Christ.

Edinburgh Conference

The World Missionary Conference held in Edinburgh in 1910 marked the beginning of the modern international ecumenical movement. For the first time participants were delegated representatives of missionary boards and societies. The North American missionary conference boards, which had met annually since 1893, provided the impetus for the conference, which included representatives of missionary societies in Britain and Europe. Significantly, the Edinburgh Conference focused only on evangelizing non-Christian populations, removing fears that missionaries would attempt to lure sheep from each other's folds. Even the Anglo-Catholics (Anglicans who affirm the Catholic heritage of the English church), a minority that feared evangelical competition, felt comfortable attending the conference. Like the YMCA before it, the Edinburgh Conference shelved discussion of doctrinal differences, and delegates focused not on converting each other but on evangelizing the world.

American John R. Mott, a Methodist lay leader in the YMCA and in the World Student Christian Association, chaired the Edinburgh Conference. Mott assured his audience that this generation, if it worked hard enough, could deliver the whole world to Christ because Christian nations already dominated the globe. To this end he asked for a vote on a Continuing Committee that would put the work of the Edinburgh Conference on a permanent footing. When the motion was carried by unanimous acclaim, the conference leapt to its feet and burst into the “Doxology.” In 1921 the Continuing Committee formed the International Missionary Council.

Two organizations emerged from the Edinburgh Conference: the Faith and Order Movement and the Federal Council of Churches. Although they had overlapping memberships, Faith and Order pressed for organic union, in contrast to the Federal Council whose federal model of ecumenism dominated the twentieth century.

Faith and Order

Although the Edinburgh Conference accommodated Anglo-Catholics, it failed to reach out to the Roman Catholic and Orthodox Churches. American Charles H. Brent, who had served as Episcopal missionary bishop to the Philippines since 1902, pressed for inclusion of the Catholic Church in Christian ecumenism. Brent had learned to accommodate Catholics in the Philippines, where he had confined his missionary activities to the non-Christian (chiefly Muslim and ethnic Igorot) population. Now, Brent pressed for inclusion of the Catholic Church, but he also urged the delegates to discuss the differences in theology, practice, and church governance that the Edinburgh Conference had excluded as too controversial.

On October 19, 1910, Episcopal priest William T. Manning, rector at Trinity Church in New York, proposed a Joint Commission on Faith and Order calling on all Christian communions throughout the world to join. With funding from financiers J. Pierpont Morgan and George Zabriskie, Manning convened eighteen Protestant denominations in the summer of 1911 to plan a worldwide conference on faith and order. The American Commission, which met in 1913, created an interdenominational committee composed of Peter Ainslie (Disciples of Christ), Newman Smyth (Congregationalist), and William H. Roberts (Presbyterian) to confer in 1914 with the Free Churches of Britain and the Presbyterian Church of Scotland. They received a favorable response. The Vatican, however, issued a statement that the pope was the only true source of Christian unity. The joint commission of the Episcopal Church planned, nevertheless, to send a deputation to the Vatican and the Orthodox Churches, but the outbreak of World War I halted international cooperation. The Faith and Order Movement remained an American endeavor during the war, but it did not become international in scope again until 1920.

Federal Council of Churches

Even as Brent planned the organic union of all churches, Elias B. Sanford, a Connecticut Congregationalist minister with Methodist sympathies, denounced organic union as a chimera. Instead, Sanford proposed a national conference of delegates appointed directly by their denominations and dedicated to the common objective of Christianizing society: promoting observance of the Sabbath. The Federal Council of Churches of Christ, which met under Sanford's leadership in 1908, was the first ecumenical organization

of official representatives of the denominations rather than volunteers. This arrangement, which ensured ongoing consultation with the constituent denominations, fostered stability.

The Federal Council included thirty-three denominations representing some eighteen million Americans. Present at the founding were most, but not all, of the mainline denominations, including Presbyterian, Reformed, Lutheran (General Synod), Methodist, Baptist, Congregational, Disciples, United Brethren, Evangelical, Moravian, Friends (Quakers), African Methodist Episcopal, and African Methodist Episcopal Zion. All the same, the Federal Council was not as inclusive as its name suggested; in practice it was dominated by the mainline denominations.

Notably absent were several conservative denominations: the Southern Baptists (one of the largest Protestant denominations in the country), Southern Presbyterians, and Lutherans (outside the General Synod). The conservative wing of the Disciples of Christ likewise opposed the federation, holding that the Federal Council could not substitute for the undenominational Church of Christ. On the liberal side, the Unitarians were deliberately excluded because they did not affirm the Trinity or the divinity of Jesus. In an awkward moment, the Unitarians accepted an invitation to join the Federal Council, but Sanford withdrew the offer, claiming it had been sent by mistake.

Despite the ecumenical efforts of many of its members, the Episcopal Church did not join the Federal Council until 1940. Robert H. Gardiner, a Boston lawyer active in the Faith and Order Movement, pressed the church to join the Federal Council in 1908. Opposing him were some, such as William Reed Huntington, who would not settle for less than organic union. Likewise, the Anglo-Catholic wing of the church believed that joining the Federal Council threatened the church's distinctiveness.

Nevertheless, the Federal Council was dedicated to manifesting the unity of the Christian churches of America and to fostering cooperation among them. In practice, that meant evangelizing non-Protestants—an agenda that the council inherited from the Evangelical Alliance—and Christianizing society in accordance with the Social Gospel. Walter Rauschenbusch's *Christianity and the Social Crisis*, with its call to make Christianity a revolutionary social force, had been published just one year earlier, and newspapers printed scandalous stories of the exploitation of the workers and the plight of the poor. The Federal Council accordingly advocated prison reform, the rights of labor,

and temperance as well as greater Sabbath observance, among other issues.

The Social Gospel dominated the council's agenda for several reasons. With theological discussion barred, action became the council's only possible function; no other interdenominational body was addressing all of these issues together. Furthermore, the churches failed to support the council adequately—in its first years the council typically received only half the revenue promised by the denominations—driving the council to raise funds by showing that it addressed pressing social issues of the day. By 1912 more than half the total income of the Federal Council was provided by wealthy individuals, most notably John D. Rockefeller and Cleveland H. Dodge. The council settled into a pattern of relying on the denominations for administrative expenses but turning to individuals for particular, sometimes controversial, programs or causes.

This arrangement entwined the Federal Council with the wealthy and politically powerful. At the beginning of the twentieth century the Federal Council represented a virtual religious establishment inasmuch as it both defined religious respectability and represented the ruling class. Among the benefits of this status was dominance of the airwaves until midcentury, because radio companies preferred working with the Federal Council rather than dealing with individual churches.

The World Wars

The world wars and the Great Depression created pressure for a unified national identity while expanding the power of the federal government. These circumstances increased the influence of the Federal Council because the council acted as a liaison between the churches and the government, especially in providing military chaplains. During World War I the Southern Baptist Convention and most of the Lutheran bodies joined in the Federal Council's General Wartime Commission, chaired by Presbyterian Robert E. Speer.

From this position of power, the Federal Council initiated cooperation with Eastern Orthodox churches, Jews, and Catholics on social issues. By 1927 the Federal Council had begun to explore cooperation with the Eastern Orthodox churches, although no Eastern Orthodox Church would become a member of the council for a decade. Relations with Jews and Catholics were more complicated because of the Federal Council's hostility to the Vatican and because the Home Missionary Council continued to proselytize American Jews. Nevertheless, both Jews and

Catholics cooperated with the Federal Council on social justice issues in the interwar period.

In 1923 the Goodwill Committee promoting better relations with American Jews capitulated to Jewish demands and officially declared that conversion was not part of its mission, essentially extending to American Jews the acceptance that the council had already extended to Protestant churches. This accommodation created friction between the Goodwill Committee and the Home Mission Society, which continued to regard the Jewish community as a mission field. By the end of World War II liberals had backed away from missions to the Jews, leaving such missions to fundamentalists. Although the Federal Council included both conservatives and liberals, the Federal Council's goodwill activity together with its Social Gospel agenda fed the perception that the Federal Council was theologically liberal and politically leftist.

Because of the deepening rift between fundamentalists and modernists within the Protestant denominations, the Federal Council never truly encompassed all of American Protestantism. Social issues sometimes split the council. Offended by the Federal Council's endorsement of birth-control within marriage, for example, southern Presbyterians withdrew from the FCC in 1931 and would not return for a decade. The emerging fundamentalist wing of American Protestantism sought ecumenical unions of its own. In 1942 conservatives set up a parallel organization, the National Association of Evangelicals, which repudiated the word *ecumenical* because of its liberal connotations.

Meanwhile, on the denominational level the depression promoted consolidation as churches recognized the benefits of shared resources. Furthermore, ethnic divisions that had sustained transplanted immigrant churches faded as the immigrant generation passed away. This consolidation was already at work among the Lutherans; the United Lutheran Church in America had formed from the merger of the General Synod, the General Council, and the General Synod of the South in 1918. They were joined by the Slovak Zion Synod in 1919 and the Icelandic Synod in 1940. In 1930 three Lutheran bodies, the Synod of Buffalo, the Synod of Iowa, and the Synod of Ohio, merged to form the American Lutheran Church. In 1934 the Reformed Church in the United States and the Evangelical Synod of North America (a church with Lutheran roots), both historically German, joined to create the Evangelical and Reformed Church.

In 1931 the Congregational Churches and the Christian Churches (General Convention), churches with similar

polity but different historical origins, united, creating the Congregational Christian Churches. The Evangelical Church and the Evangelical United Brethren began to discuss union in 1933, but they did not merge to create the evangelical United Brethren Church until 1946.

In 1939 the majority of American Methodists united in the Methodist Church, bringing an unprecedented number of Protestants into organic union. Negotiations for the merger of the Methodist Protestant Church, the Methodist Episcopal Church, and the Methodist Episcopal Church South had begun in 1931. The issue delaying union was not doctrinal but racial; the successful compromise created a separate jurisdiction for the African American Methodist churches.

At the local level some congregations did not wait for denominational negotiations but created community churches, combining two or more congregations in a shared facility, often with a loose affiliation with a denomination to provide overhead. In one striking example, members of no fewer than seven denominations (Northern Baptist, Disciples, Congregational, Methodist Episcopal, Presbyterian USA, United Brethren, and United Presbyterian) created a community church and social center at Hoover Dam, Nevada, in 1932.

Postwar Period

The world wars may have consolidated the influence of the Federal Council at home, but both conflicts thwarted international ecumenical efforts. In the interwar period the Universal Christian Council for Life and Work, the Continuation Committee of the World Conference on Faith and Order, and the International Missionary Council had each met to discuss international cooperation. With the end of hostilities, these meetings bore fruit in the creation of the World Council of Churches, which first met in Amsterdam on August 22, 1948. The World Council met the needs of the United Nations (established in 1945) for a worldwide agency of the churches to consult and collaborate on international issues. Americans instrumental in the creation of the World Council included John R. Mott, elected honorary president for life; Lutheran leader Franklin Clark Fry, dubbed "Mr. Protestant" for his ecumenical efforts; Presbyterian Samuel McCrae Cavert; Presbyterian leader Eugene Carson Blake; Presbyterian Henry P. Van Dusen; and Presbyterian Robert S. Bilheimer, among others.

The Federal Council had served as a model for the World Council, but the Federal Council's structure was quite loose;

ad hoc committees were formed to meet each emerging interest or crisis. In 1936 the Federal Council's Commission for Christian Unity had begun to discuss a more integrated structure in which the denominations would delegate certain functions to the Federal Council, which would function almost as an overarching church. The war diverted attention from institutional restructuring, but in the postwar period the World Council required a stable and active American partner. In 1950 the Federal Council and the International Council of Religious Education merged to form the National Council of the Churches of Christ in the United States. The merger produced a complex structure in which the General Assembly and General Board exercised final authority, creating a more united institution than the previous federation.

The National Council benefitted from the Cold War emphasis on religion as a counter to Soviet atheism, serving as a national symbol of respectable religion. John D. Rockefeller funded the construction of the Interchurch Center, the National Council's headquarters in New York; President Dwight D. Eisenhower laid the cornerstone for the new building. Given this official endorsement, the National Council continued to pursue the ecumenical vision of Christian unity across national borders. In 1958, for example, former National Council president Eugene Carson Blake and Franklin Clark Fry, chair of the World Council's Central Committee, traveled to Moscow to initiate dialogue with the Russian Orthodox Church. The church became a member of the World Council in 1961.

Second Vatican Council

Despite its increasingly international orientation, the National Council inherited suspicion of the Catholic Church from the Federal Council; virtually the first act of the National Council was to mobilize public opinion against President Harry S. Truman's plan to appoint an ambassador to the Vatican. The Catholic Church still officially discouraged dialogue with Christians outside the church. The Second Vatican Council (1962–1965) removed this impediment to Catholic participation in ecumenism and opened the door to fruitful dialogue in the second half of the twentieth century. The Vatican Decree on Ecumenism (November 21, 1964) recommended cooperation with other Christians on social matters and dialogue concerning faith and practice.

The American Catholic response was like the bursting of a dam. In 1966 the National Council and the Catholic

Bishops Commission on Ecumenical Affairs created a permanent joint working group; Catholic churches joined the local councils. That same year the National Council and the Catholic Paulist Press jointly issued a manual to help ordinary people initiate dialogue with their Catholic or Protestant neighbors; 150,000 copies of the manual were sold in three years. In 1966 Protestant, Anglican, Catholic, and Orthodox student associations joined together in the University Christian Movement.

With the Catholic Church's entry into ecumenical dialogue, Catholic, Protestant, and Orthodox leaders began to reexamine long-standing theological divisions. In 1966 a commission of Lutheran, Reformed, Roman Catholic, and Orthodox theologians worked out a mutually acceptable version of the Lord's Prayer for the Week of Prayer for Christian Unity, which became compulsory in the Catholic mass. In 1999 the Catholic Church and the World Lutheran Federation signed a joint statement on the Doctrine of Justification, healing one of the divisions of the Reformation. The North American Catholic-Orthodox Consultation, founded in 1965, issued a joint statement on the Eucharist in 1969. In 2003 the Consultation began to discuss the Filioque clause in the Nicene Creed, one of the causes of the tenth-century schism that divided the Catholic and Orthodox Churches. Such international ecumenical progress energized the ecumenical movement in the United States.

Organic Union

On December 4, 1960, former National Council president Blake preached a sermon at Grace (Episcopal) Cathedral in San Francisco, challenging Protestants to form a union that would reflect their dedication to one Lord. The Consultation on Church Union convened the following May with the ultimate goal of creating a united church. The churches that joined the Consultation included the African Methodist Episcopal, African Methodist Episcopal Zion, Christian Methodist Episcopal, Episcopal, Disciples of Christ, International Council of Community Churches, Presbyterian, United Church of Christ, and United Methodist. Although the memberships of the denominations overwhelmingly rejected the plan for union in 1969, the Consultation successfully pushed for intercommunion in which each member maintained autonomy while recognizing the ministry and rites of the member churches. As this limited success indicates, the ideal of organic union gained momentum in the postwar era, but individual churches also clung to their historic identities. Nevertheless, the

mid-twentieth century saw consolidation within denominational families.

In 1957 the Evangelical Reformed Church merged with the Congregational Christian Churches to form the United Church of Christ. (Dissenting from this union, some four hundred churches formed the National Association of Congregational Churches, dedicated to preserving the historic independence of the local congregations.) In 1958 Blake oversaw the union of the Presbyterian Church (USA), sometimes called the Northern Presbyterians, with the United Presbyterian Church of North America to form the United Presbyterian Church (USA). This new organization finally united with its southern counterpart, the Presbyterian Church in the United States, in 1983, healing a rift that dated back to the Civil War. In 1968 the Evangelical United Brethren Church merged with the Methodist Church to form the United Methodist Church. The Evangelical Lutheran Church in America formed in 1988 from the merger of three Lutheran bodies (each the result of previous mergers in the 1960s and 1970s): the American Lutheran Church, the Lutheran Church in America, and the Association of Evangelical Lutheran Churches.

As these unions suggest, historic divisions within denominations were breaking down in midcentury. Inter-marriage rates between Catholics and Protestants, and even between Christians and Jews, increased through the century, a sign of weakening religious boundaries. In a countervailing trend, however, the more conservative members of the merging denominations often broke away to form their own churches.

Thus rather than joining all Christians into a universal Christian Church, the organic unions of the second half of the twentieth century often consolidated a deepening rift between conservatives and liberals. Already present at mid-century, this trend became particularly visible in the resurgent conservatism of the 1980s and persisted to the end of the century. Congregationalist dissenters from the merger of 1957, for example, joined the Conservative Congregational Christian Conference, founded in 1948. Asserting the inerrancy of the Bible, conservatives created the Presbyterian Church in America in 1973. In 1981 many of the remaining evangelical Presbyterians, protesting the church's emphasis on social action, left to form the Evangelical Presbyterian Church. The Lutheran mergers concentrated liberals in the Evangelical Lutheran Church. Meanwhile, the Missouri Synod, following an internal battle over historical criticism of the Bible in the late 1960s and early 1970s, emerged more conservative than before.

Doctrinal issues such as biblical inerrancy divided liberals and conservatives in some instances, but so did a host of social issues rising from the civil rights, feminist, and gay rights movements of the 1960s and 1970s. One consequence of the ecumenical movement after the Second Vatican Council was that Catholics and Protestants could come together for conservative as well as liberal causes. In 1994, for example, Charles Colson of the Prison Fellowship and Catholic priest Richard John Neuhaus of the Institute on Religion and Public Life, with support from Campus Crusade for Christ and other evangelical organizations, drew up a document, "Evangelicals and Catholics Together," that called for cooperation in limiting abortion rights and in bringing a Christian voice to the public square. The document did not commit the churches to doctrinal unity, but it did call for better relations in the service of common action.

Looking forward to the next century, "Evangelicals and Catholics Together" acknowledged one truth: the mainline Protestant churches that had been a force for ecumenism were in decline at the end of the twentieth century. This document, although controversial in both Catholic and Protestant churches, offered one vision of future ecumenical cooperation. Meanwhile, the Consultation on Church Union moved beyond consultation and joined in Churches Uniting in Christ (2002), which agreed to recognize each other as representatives of the one church of Christ, meeting regularly to celebrate the Eucharist. Among their social missions were an end to racism and an end to exclusion from the church for any reason, including sexual orientation.

From the short-lived union of Congregationalists and Presbyterians in 1801 to the National Council of Churches, the American ecumenical movement has pressed for Christian unity in a religiously diverse nation. The creation of unity within diversity has been a perennial American political issue because fresh immigration continues to challenge national identity. The Federal Council and National Council, representing a virtual establishment, have paralleled expansion and integration of the state, even as the World Council of Churches has paralleled the United Nations. One of the greatest triumphs of the ecumenical movement has been the reduction of the historic hostility between the Catholic and Protestant Churches. At the beginning of the twenty-first century, as at the beginning of the twentieth century, the National Council faces the challenge of integrating new immigrants into American religion. The National Council created a Task Force on Muslim-Christian Relations as early as 1977, but moving that dialogue forward

remains one of the challenges of the twenty-first century. Meanwhile, organic union has remained elusive, despite the efforts of Churches Uniting in Christ, because the churches remain divided by social issues or dedicated to their historical identities. Because the absence of a national church renders religious affiliation a matter of personal identity, it may be that American conditions favor diversity. The ecumenical movement has countered this centrifugal force by creating avenues of cooperation.

Education

The connection between religion and public schooling in the United States is revealed by tracing the historical development of schooling as a vehicle for the government's aspirations, which include civility, the transmission of knowledge, and a form of common piety. Religion is a factor in these aspirations, each of which has changed over time.

The dominant narrative about the relationship between religion and U.S. public schools is about constitutional case law and whether the practices within the public schools are in conformity. The meanings of the establishment and free exercise clauses of the First Amendment are therefore the central concern. The narrative usually includes a description of the European roots of the connections between church and state and the transformation of those connections in the colonies during the 180 years between the first landings and the writing of the Constitution. Thomas Jefferson's "wall of separation" is then used to encapsulate the intent of the Constitution. The narrative thus recognizes that the development and growth of the public school as a tax-supported institution during the nineteenth century extended the Constitution to include the practices of schools. An examination of twentieth-century case law follows in order to define more precisely the terms *establishment* and *free exercise*. The narrative ends by asserting that whereas religion as a subject may be taught in the schools, any attempts by the school to proselytize, force students to pray, or encourage them in any way to be religious are illegal.

There are, however, some problems with this narrative. First, it tends to be overly legalistic. Understanding the case law on the establishment and freedom of religion clauses of the First Amendment is important, but that alone fails to explain why the controversy over these clauses continues. Ignorance is implied—that is, if more people thoroughly understood the case law arguments there would be fewer questionable religious practices in the schools. A second problem with the narrative is that the historical context fails to establish any deep connection to the role education is thought to play in the development of the individual as a member of society. The role that schools play in civility could be described in many different ways, just as different actors approach the same role in a play in many different ways. A final problem is that the narrative often neglects to connect the changing relationship between religion and schools to intellectual history. Piety and its relationship to civility and learning are a rich woven tapestry, not a single thread.

European Roots

The curriculum of a school describes what the school wishes its students to learn. The description can take several forms. The official curriculum is what the teachers actually teach in their various activities—activities that may go beyond the official curriculum, or skip some parts of it, or both. And then there is what the students actually learn, which, one supposes, is what the curriculum actually turns out to be. Before the twentieth century the official curriculum took the form of a list of subjects, and that set of subjects appeared in some form at the various levels of schooling—in a crude form at the earliest levels and then with increasing complexity and sophistication at higher and higher levels until a student was working with material on subjects in their mature form. Fewer and fewer students were likely in school as the levels of complexity increased because of the distribution of abilities, the availability of the opportunity to study, the means to devote time to study, and a host of other circumstances. The purpose of a school's curriculum, however, was to provide a route (the Latin root of the word *curriculum* refers to a race course) to an appreciation and understanding of the disciplines of knowledge.

For much of the first half of the second millennium religion functioned both as a subject in curricula and, in a sense, as the reason for the curricula's existence. The first schools developed in England during the sixth century with the conversion of the English population to Christianity. The conversion process required clergy who would teach the new beliefs and schools to prepare such clergy. Curricula were based on the texts of both nascent Christianity and the classical texts of the Roman eras, as well as the Latin needed to master these texts. Over the next several hundred years schooling spread beyond the churches but remained essentially religious. Grammar schools were developed to introduce youngsters to Latin, and some of the basic texts and "petty schools" later developed provided a more rudimentary instruction in the basic literacy of the English language and basic numeracy to "slower" students. At times, petty schools were sponsored by commercial interests in order to train the clerks and scribes they needed.

With the advent of the Renaissance in the fifteenth century, schooling increased rapidly both in numbers served and in scope. Greek and Hebrew were added to the grammar schools. The petty schools added materials beyond the catechisms. The development of printing assisted this broadening and growth, but also served to regularize, or standardize,

curricula. As the number of youth subjected to schooling increased, the governing of schooling also became more diverse. Civil authorities and commercial groups assumed more control over schools, reducing the power of the churches. The licensing of teachers became, for the first time, a process beyond the possession of advanced schooling, and the bodies "certifying" teachers involved the civil as well as the ecclesiastical authorities. In a broad sense, the curricula of the schools became a vehicle for promoting civility, and such civility meant an ability to contribute to commerce through labor, the pietistic moral structure to maintain stability, and some mastery of the intellectual diversity then present in Renaissance thinking.

English colonists brought this background to the American colonies in the seventeenth century. Although the Restoration that followed the revolution in England in the middle of the century diminished schooling, the experience of the previous hundred years had established the idea that schooling was needed to develop the colonies. The English, learning from the failed efforts of the French and Spanish to gain much of a foothold in America, followed a colonial strategy of establishing self-sufficient communities. Schooling was one of the ways to do that. Although the English were not the only colonizers, by the end of the century they dominated all the lands that became the original thirteen states.

The Colonial Era

The prime sources of education during the colonial era were the family, the churches, and the schools and colleges. American families tended to be younger than those in England and Europe because people married at younger ages, and they tended to have more children because of the availability of cheap land and jobs. The family instilled the cultural mores of the immediate community while encouraging basic literacy, but the school often provided the liberal encouragement to move beyond the provincialism of the community. The churches were characterized by diversity in doctrine, but they were nevertheless overwhelmingly Protestant. Doctrinal differences increasingly forced church-based education to be more evangelical and to provide more careful indoctrination using catechism.

During the first half of the seventeenth century the rigors of establishing a foothold in new lands both slowed the actual development of schooling and increased the motivation to provide it. By midcentury, schools began to appear. In Virginia, an Anglican settlement and more reflective of

the English culture, a few schools were erected through the bequests of land used to finance them. The Dutch West India Company established schools in New Amsterdam and surrounding communities to encourage the immigration needed to expand their commercial enterprises. In the Massachusetts colony, schools were established in order to maintain the kind of religious purity associated with the settlers' Calvinist beliefs. In 1647 the Olde Deluder Satan Act stipulated the formation of grammar schools and petty schools in any Massachusetts community of at least fifty families, and the title of the legislation suggests the prime purpose of the schooling. The curricula of the petty schools, or dame schools as they were also called, involved the basic alphabet and syllables and then drill in a catechism, Psalter, or primer.

The most popular of the instruction books was *The New England Primer* published in Boston in 1690. It included basic alphabet and syllable exercises (also called a hornbook), a basic primer, and a catechism. The primer was essentially religious, containing words such as "godliness" and "holiness," couplets such as "In Adam's fall we sinned all," and stories titled, for example, "Holiness becomes God's house all." The grammar school curriculum was Latin-based with an introduction to Greek; it progressed through the texts of Virgil, Homer, Hesiod, Horace, and Juvenal. The teachers ranged from the housewives in the dame schools who had little formal education to the graduates of universities who were employed in the larger grammar schools in the population centers. The purpose of this schooling was to instill a certain amount of uniformity among an often disparate group of colonialists, but it surely also liberated some youngsters from a certain provincialism.

Over the next one hundred years or so, remarkable changes occurred in the general society of the colonies and in the schools. Undoubtedly, the colonies were affected by the changes in England brought on by the battle for the throne between the Catholic James and the Protestant William of Orange and his wife, Mary, who eventually assumed the Crown as co-rulers. The Toleration Act of 1689 legitimated dissent, and the ascendancy of the Whigs ushered in more liberal ideas than those tolerated by the conservative Tories. In the colonies these changes translated into the growing influence of local political groups over the various Crown-appointed governors and the legitimization of the religious dissent already under way in the colonies in response to the growing immigration. Dissatisfaction grew with the establishment of one official religion, whether it was

the Anglican Church in Virginia or the Congregationalist Church in New England. This establishment was accomplished by means of taxation to support clergy and teachers and the forced attendance in church of all community members. Where dissenting supplicants numbered enough to warrant support, municipalities established other churches through taxation. As religious establishment became diverse, it also became diffuse, until the disestablishment of religion by government was codified in the U.S. Constitution at the end of the eighteenth century. Actual disestablishment took some time after the signing of the Constitution, but was completed early in the nineteenth century.

The intellectual changes associated with the Enlightenment also made the doctrinal assertions of various religious groups less certain. Work by Isaac Newton in science and James Locke in political philosophy suggested less dependence on God. Newton dramatically changed the way humans saw their relationship with the cosmos, and Locke changed the way humans viewed effective government. Both men embraced a vigorous empiricism and rationalism. What this kind of thinking meant for school curricula was more visibility for empirical and rational subjects and the notion that curricula contribute more directly and forcefully to secular concerns. Benjamin Franklin's experiences are instructive. His father removed him from the Boston Latin Grammar School because of dissatisfaction with the classical curriculum and apprenticed him to a printer. As a young man, Franklin moved, on his own volition, to Philadelphia where he grew intellectually, financially, and politically. He came to champion an academy form of education that was more vocational in intent and included more secular subjects. But a curriculum is not a bottomless pit. When something is added to it, something else must be either reduced or eliminated. Often, then, the secular was added and the religious and the classical were reduced.

By the Revolutionary War, nine colleges in the colonies were chartered to grant degrees. All of these colleges were supported by churches, and yet these colleges provided a broad curriculum based on Enlightenment texts, and they began to offer training for professions beyond the ministry and teaching such as medicine and law. In the latter part of the century the specialized professorship appeared, signaling the growth of specialized knowledge. The day of the "Renaissance Man" began to wane.

Two additional aspects of the growth of schooling help to explain the relationship between religion and schooling. First, the extensive diversity of community and church

coupled with the increased mobility that the literate possessed made for a better match of person with job and church and fostered the desire for the freedom to be mobile. Second, the need to use public funds to finance the growth of schools established schooling as a public policy issue. An overwhelming majority of the signers of the Declaration of Independence and the Constitution were college-educated. They understood the role that education played in the remarkable emergence of the United States. Rising literacy had provided the impetus for public support of the Revolution through the dissemination of newspapers and pamphlets. This enthusiasm for education as a vehicle for the improvement of humankind, however, was troubling for those who viewed the perfectibility of the human as dependent on God.

The Common School Era

During the century between the Revolutionary War and the Civil War, schooling in the United States was characterized by tremendous growth and variability. Expansion into the heartland from the coastal areas and the growth of the metropolitan areas along the coast brought immigrants in large numbers. The growth of schooling, however, was dependent on a perceived need for it. Families and churches were educational forces and may have been viewed as sufficient for those people unwilling or unable to go to school. And yet the leadership and intelligentsia of the new republic convinced the population that schooling was instrumental to creating a nation. The disparate colonial patches and the major land acquisitions in the westward expansions created a need for a climate in which the democratic republic could operate. Although many political tasks had to be accomplished in developing a new nation, the development of a system of education was viewed as crucial to the vigor of the republic, and, furthermore, schools and colleges were identified as the best system to accomplish this on the scale required.

This system of education, tied to the form of government, was to be funded by the public. However, the Tenth Amendment to the U.S. Constitution contained no provision pertaining to the education of the citizenry, thereby prohibiting the use of federal funding to carry it out; public education was left to the states. Thomas Jefferson's efforts to establish a system of common schools and a state university in Virginia were influential, but there were others. Benjamin Rush pushed for an educational system to produce "republican machines" in Pennsylvania with the establishment of a

state university in Carlisle. The state of New York created a state department of education to provide funding for schooling outside New York City, which had its own mechanism for funding until midcentury. The important point here is that education was viewed as a function of government, funded, at least in part, by the government and tied in some way to the polity. The administrative mechanisms of state government, however, were ill-equipped to manage the task statewide, and effective control lay with local groups.

The most influential state in the development of the public school system was Massachusetts under its state superintendent, Horace Mann. Mann's political efforts created a statewide system of schools, and his writings provided the impetus for a growing public school movement elsewhere. "Friends of education" groups spread over the eastern part of the country and were politically skillful in creating systems of schooling in several states. As the country expanded westward, the ordinances written to provide for development of these lands contained provisions for land to be set aside for schools.

The goals of this republican system of education were to diffuse knowledge, cultivate learning, and nurture virtue, including patriotic civility. This virtue included a non-denominational Protestant ethos heavy on morality. To that end, the curricula of the schools included basic literacy, arithmetic, writing, and rudimentary science and geography, along with Bible reading (without comment) and group prayers. Standard textbooks such as the McGuffey Readers contained Bible stories, although much less heavily than had been the case with *The New England Primer*.

Over the nineteenth century the three basic forms of schooling from the colonial era continued to develop: petty schools, which were becoming known as primary schools; grammar schools, in which the core was instruction in Latin (although English grammar schools grew in popularity outside the metropolitan areas); and academies. Three new types of schools also emerged: schools for those in early childhood (these were run primarily in homes and later developed into kindergartens as the significance of Friedrich Froebel's work in Germany spread); the high school, which was viewed as an alternative to the Latin grammar school; and supplementary schools for the "slower" students.

The disestablishment of official religion, codified in the First Amendment to the Constitution and its commitment to the free exercise of religion, resulted in the growth of denominationalism among Protestants. Although the growth of churches did not match the growth of schooling during

the nineteenth century, the increased diversity probably sparked the Second Great Awakening, which was accompanied by the growth of millennialism and various sects such as the Mormons, Shakers, and Oneida community. Most Protestant children attended schools provided by the civil authorities, but a few denominations began forming parochial schools, notably the Presbyterians.

The growth of the Roman Catholic populations in the cities led to the first real controversy over the religiosity of the public schools, and that issue remains in the public eye today. The reading of the King James Bible in the schools was an affront to the Catholics, as was the implication that morality could be taught without religious immersion. The issue came to a head in New York City where the Free School Society (later the Public School Society) stopped funding the schools run by the Catholic Church to serve the poor. The political backlash was such that Gov. William H. Seward proposed that sectarian schools be able to hire their own teachers rather than be required to accept teachers licensed and placed by the civil authorities. The state legislature, controlled by the rural populations of upstate New York, rejected the governor's plan, placed the New York City schools under the aegis of the state department of education, and asserted that no public money could be used to support religious schools. In response, the Catholic Church decided to put its efforts into building a parochial school system tied to the hierarchy of the church.

By the Civil War the country had achieved a literacy rate that compared favorably with that of Europe, at least among white males. The war interrupted much of the expansion of schooling, but it also provided the country with its first experience with large-scale organization and its efficacy. Federalism was now a reality that would have mixed effects on the development of schooling in the United States. For example, the Morrill Act of 1862, which provided the impetus for the development of a system of public colleges from the Midwest eastward, was also used as a means of keeping the West tied to the North rather than the South. These colleges grew into the large state universities found in the Atlantic states and the Midwest and, along with a growing secularism among the traditional private colleges with roots in the colonial era such as the Ivy League institutions, resulted in a system of higher education essentially divorced from particular religious traditions.

The occupation of the South by the northern armies both ameliorated some of the pernicious effects of provincialism and exacerbated others. White educators poured into

the South to assist in the education of freedmen. The numbers of black churches grew, and in their concomitant efforts at education they began to try to right the imbalances between black and white. The southern white churches, however, began to use the schools for their evangelistic efforts. By the latter decades of the century, schooling was established throughout the country and generally accepted as an essential component of national life, although still under the control of the states.

The Curriculum Era: Fissures in the Protestant Consensus

The curriculum era extends from the second centennial in 1876 to the end of World War II in 1945. This period saw important shifts in the growth of the nation, changes in schooling and organized religion, and a changing relationship between the two. It was the first time in the country's history that school curricula became a focus of reform. Distinct alternatives were proposed, and each of the alternatives had some impact on the thinking of educators, if not on the actual practices in schools.

The population quintupled in a hundred years. Within this growth was a surge in immigrants from Europe in response to the job opportunities created by rapid industrialization and later in response to political conditions in Europe. This population growth created dense centers—urban areas and suburban satellites connected by rail networks—along with a host of social problems. Although the need to feed the growing population ensured a sizable agrarian population, the differences between rural and urban-suburban groups had social, political, and religious implications. It was also a time of intellectual modernism. The publication of Charles Darwin's *On the Origin of Species* in 1859 particularly signaled the impact of modern thought on religion.

The notion of career as something one prepared for through schooling and that one followed throughout life was a creation of the nineteenth century. Career rather than mere occupation soon evolved into the notion of profession. Organizations formed, linking practitioners but also controlling entrance to the practice, asserting the esoteric knowledge needed to practice and acting politically to control the nature of the occupation. The National Education Association (NEA), formed in 1857, not only joined school practitioners together but also university professors and presidents, politicians, and many others interested in education. By the end of the century the NEA would have a

major role in the development of the curricula of public schools.

During the century following the Civil War schooling grew in both numbers and length. More children attended and stayed in school longer. High schools became commonplace by the turn of the century, kindergartens were becoming established, and the junior high school began to emerge. About 90 percent of the children enrolled in school were in public schools, and of those in private schools most were in Catholic schools. Although Oregon attempted in the 1920s to require all students to attend the public schools, the U.S. Supreme Court declared the effort unconstitutional in *Pierce v. Society of Sisters* (1925).

Meanwhile, education became a way to create a homogeneous polity from the disparate cultural groups that lived in more dense population centers and a way to ameliorate the growing poverty that industrialism and immigration were creating. Schools taught immigrants English and a common set of values and provided a set of useful skills to lift the poor out of poverty. In 1918 the federal government passed the Smith-Hughes Act, which provided local public schools with funds for manual training (vocational education), agricultural education, and home economics. This was a significant event, for although the Constitution forbade direct federal subsidies for the general schooling of children, it allowed categorical aid to address particular problems thought to be in the national interest. This practice was adopted increasingly by the federal government, particularly after 1950, and is a major factor in the issues surrounding religion and schooling today.

The early public schools had a role in promoting an American set of values, and until the turn of the twentieth century those values included a kind of nondenominational Protestant Christianity. However, the development of science along with the growth of industrial capitalism challenged American Protestantism, causing a split in what was once a tenuous consensus. One part of the split was a kind of social Christianity signaled by the formation in 1903 of the Religious Education Association, which articulated a kind of progressive philosophy of education in which the modernism of science and the arts could coexist with religious beliefs and religious groups could work more vigorously among the poor. The other part of the split was a growth in the fundamentalist wing of evangelicalism, revivalism based on the inerrancy of the Bible, the centrality of conversion, and the imminence of the return of Jesus. Advocates of the fundamentalist wing of evangelicalism

established the World's Christian Fundamentals Association in 1919. These two groups had quite different views of just what the public schools should teach about American religious values. They also represented two quite different demographic groups. The Religious Education Association tended to find favor in the metropolitan areas in the North and West and the World's Christian Fundamentals Association in the more rural areas in the South.

One consequence of using the schools as a major tool in creating an American polity was that they became subject to political conflict. The definition of the *public good* may not have been articulated by the heads of government, but whatever it might mean would presumably be seen in the school curricula. The content of curricula had been left to the educators, and yet controversy over that content occasionally arose from groups outside the profession, such as state legislatures, who could and did act on curricula.

In 1925 the Tennessee legislature passed the Butler Act prohibiting the teaching of evolution in the schools. That act triggered a test of the law in the now-famous Scopes trial. The trial itself was a fairly cut-and-dried affair in which the court found the biology teacher from Dayton, John Scopes, guilty of breaking the law, but issued no finding about the law itself. The law was only rescinded in 1967 after the Supreme Court found Arkansas's prohibition of the teaching of evolution unconstitutional. During the final day of the Scopes trial the prosecution called lawyer and devout Presbyterian William Jennings Bryan to the stand to testify for the prosecution, and the cross-examination of Bryan by Clarence Darrow is now part of the national story. The trial, which received extensive and often derisory newspaper coverage, only exacerbated the demographic split in American Protestantism and pushed to the forefront the question of whether experts, parents, and taxpayers should determine the content of curricula and whether the majority should trump the opinion of the minority.

The Curriculum Era: Currents of Reform

Schools tend to be conservative institutions. They see their role as conservators of tradition and transmitters of culture, so any significant change in a school curriculum must come from social forces outside the school. In a sense that is what happened at the turn of the twentieth century. Several factors were at work. First, the existing curricula, which were heavily classical at the upper levels, were based on the college entrance requirements in the Northeast. However, the colleges themselves were undergoing some internal

changes. Charles William Eliot, president of Harvard, had instituted an elective system over the vigorous opposition of the proponents of the classical languages. Under threat, the classical adherents argued that the classics provided training for the mind, a kind of faculty psychology—that is, certain subjects trained parts of the brain better than other subjects (for example, mathematics was good for building logic). Faculty psychology was first criticized by William James, a psychologist at Harvard, and later by Edward Thorndike through his empirical research. Second, the existing curricula were often taught in the lower schools and in the high schools using extensive drills and recitation. This situation was confirmed when Joseph Rice, a physician-turned-journalist, conducted a survey of the nation's schools that revealed an excruciating regimen of drill, physical abuse, and boredom.

A committee formed by the NEA in 1895 made recommendations about the nation's high school curricula. The committee was chaired by Eliot, and the nine other members were notable members of the education establishment. The committee recommended that high school curricula consist of any one of four different "tracks"—all legitimate roads to college but not all classical (indeed, the study of Greek literature was severely reduced). Shortly after that, a committee of fifteen men studied and made recommendations on the elementary schools. The subcommittee charged with making curriculum recommendations was chaired by William Torrey Harris, a superintendent of the St. Louis schools, editor of the *Journal of Speculative Philosophy*, and later the first U.S. commissioner of education under President Theodore Roosevelt. Harris's committee report was largely fashioned around his own views of knowledge and the role that the disciplines could play in leading children to that knowledge—his so-called windows to the soul. The report reaffirmed the importance of the traditional areas of human knowledge in schooling and of human rationality, which Harris believed was a gift from God.

The report received scathing criticism from three groups. The first, known as the Herbartians, devotees of the German educator George Herbart, criticized the report for promoting insular and uncoordinated disciplines of knowledge rather than a cohesive whole that might be more in tune with the mind of the child. A second group, the empirical psychologists led by G. Stanley Hall, criticized the report for its absence of any recognition of what was then known of child development. The third group, influenced by the scientific study of organizations by Frederick Winslow Taylor,

The work of John Dewey emphasized the connection between the social environment and the individual, and the reality of the child's everyday experiences to school activity.

thought the curricula should be constructed from a study of the skills needed to become a successful adult. Although each of these groups had quite disparate criticisms and radically different ways of approaching curriculum construction, the result was a waning in the influence of the classical humanists on the school curricula for sixty years and the removal of any academically respectable, and thus constitutional, basis for the teaching of religion.

John Dewey (1859–1952) has taken on almost mythical proportions in the history of American education. Even though Dewey considered all his philosophy a philosophy of education, he wrote books on most of the major philosophical themes: political philosophy, aesthetics, natural science, logic and epistemology, history of philosophy, and religion. He attacked the dualisms that led, he argued, to mistakes or wasted effort—such things as mind versus body,

truth versus perception, realism versus idealism, individual versus society. For Dewey, the task of education was to connect the reality of the child and his or her everyday experiences to the funded accumulation of human knowledge and understanding. One result of his work was to reconnect the reality of the social environment to the development of the individual—a connection missing from the ideas of child psychologists—and to reconnect the reality of the child’s everyday experiences to school activity—a connection missing from the humanists and the social efficiency educators. This view gave impetus to reformers interested in the school’s role in a changing society. The dislocations after World War I and the financial troubles in the 1930s, coupled with the early successes of the Soviet economy, provided a rationale for social and political change, often radical.

All of this proposed experimentation with curricula and the actual attempts to implement it in schools have been labeled the progressive movement in American education. As Dewey defined it, *progressive* meant the stepwise movement of student growth. However, progressive education had little to do with the progressive political movements of the times, nor did it constitute any kind of cohesive movement. The Progressive Education Association offered a forum in which people could share ideas on school reform, but groups were too disparate in their views to be connected in any real sense. The only commonality across their positions was a reaction against the curricula as they existed from the nineteenth century and, by association, the classical curriculum. It was also apparent that the so-called progressives found no place for religion in school curricula. Indeed, all these groups, except the humanists, placed human effort at the center of human development and made it the *leitmotiv* of their efforts.

The progressives were, however, under relentless attack from the humanists, primarily on the grounds that if school curricula were changed in any fundamental way public school students would not be well prepared to succeed in college. College entrance requirements had long dominated the assumptions of the academies and the high schools, and proposed changes were often first subjected to that criterion before they were seriously entertained. The Progressive Education Association proposed a test of the college entrance assumptions. The study, known popularly as the Eight Year Study, was carried out and published in 1942. It concluded that students, while in college, were not harmed academically by their progressive high school experiences

and generally had more satisfying extra-academic experiences. The study drew criticism from the humanists, but the nation was in the midst of war and so it drew little attention from the wider population.

The Contemporary Era: The Postwar Context

By the end of World War II some conditions had changed. The United States found itself the most powerful nation on earth, Europe was in ruins, England was nearly bankrupt, and the Soviet Union, although among the victors, had serious war wounds. In Asia, the dominant country, Japan, had been defeated and humiliated and was under occupation. At home, prosperity was rampant, and the return of familial stability ushered in a baby boom and a large influx of war veterans going on to college under the GI Bill. In this general state of euphoria, the progressives resurrected their proposals for school reform by means of a “life adjustment” curriculum that was meant to be an alternative to if not a replacement for the disciplines-based curriculum typical in most high schools. The proposal was enthusiastically supported by most educators for at least a short time. Its demise can be understood in context.

One of the lessons of the war was that technological competence was the key to victory. The best minds in the country had guided the strategic war efforts, and intellect was held in higher esteem than at any other time since the founding of the country. The leaders of the country also realized that the Soviet Union, now controlling most of Eastern and Central Europe, constituted a real threat, despite being an ally during the war. The Soviet ideology was based on an economic system in direct conflict with capitalism; the Soviet leader Joseph Stalin had perpetrated major atrocities among his people to maintain power; and the country, aggressively atheistic, was aggressive in promoting its ideology with neighboring countries. The problem was how to awaken the general public to the threat and how to counter that threat in a euphoric but war-weary country. The possibility that the Soviet Union might develop atomic weapons and do so by spying created a climate of suspicion throughout the 1950s. Patriotism infused school curricula, and the place of God in the national psyche was brought to the forefront. The words “under God” were added to the Pledge of Allegiance, which was now a required daily recitation in almost all schools.

Intellectual competence was also viewed as essential in combating the Soviet threat. The life adjustment curriculum proposed supplanting the traditional discipline areas with

themes connected more directly with the problems of living. Criticism from the defenders of traditional disciplinary competence began to have an effect on the national consciousness, and the life adjustment curriculum withered and died. In 1957 the Soviets launched a satellite by rocket power, demonstrating their technological competence. The launch made the case for more technological competence, particularly in mathematics, science, and engineering, and opened the purse strings of the federal government for massive categorical aid to schools to improve instruction in areas of national priority. The federal government was now a major player in developing and directing school change. New curriculum packages were developed by university academics in mathematics, science, and foreign languages. Large numbers of teachers were trained in the new materials in summer institutes and degree programs. Schools received funds to purchase and use the new materials. Cadres were dispatched to observe and evaluate the effects of such use. The power to influence school curricula had now been taken out of the hands of elementary and secondary school teachers and placed in the hands of university professors.

The sixties brought a resurgence of social consciousness. Lyndon B. Johnson, a man educated in a teachers college, was sympathetic to the power of education to ameliorate social conditions. The Elementary and Secondary Education Act of 1965, with its categorical titles addressing literacy, innovation, libraries, teacher training, and equity, among other things, brought federal aid to almost all schools in the country. The National Science Foundation funded both science and mathematics education in the schools and provided research funds for colleges. Curriculum packages were created using federal money in almost all subject areas except religion. This practice, however, disappeared after the controversy over “Man: A Course of Study,” a social studies package that tread on the religious beliefs of many people through its discussion of the Eskimo practice of “geriatricide” and its comparisons of human activity to animal groups.

The Contemporary Era: Court Involvement and Continued Conflict

Now that all public schools were receiving federal aid for a variety of educational endeavors, questions began to reemerge about providing such funds to parochial schools. The courts were forced to adjudicate. The Catholic Church had instituted a parochial school system in the nineteenth century after its efforts to share in public funds for education

failed. In *Everson v. Board of Education* (1947) the Supreme Court was asked to rule on reimbursing parents for transportation of their children to parochial schools. The Court decided in favor of the parents; however, the interpretation of the establishment clause of the First Amendment by Justice Hugo Black set a standard of neutrality that became the criterion for a series of landmark cases. The Court disallowed released time for religious instruction on school grounds in *McCullum v. Board of Education* (1948), approved released time for religious instruction off school grounds in *Zorach v. Clauson* (1952), disallowed a required prayer in New York schools in *Engel v. Vitale* (1961), disallowed public Bible reading in schools even if students were excused in *School District of Abington Township v. Schempp* (1963), disallowed using public funds for salaries of teachers of secular subjects in religious schools in *Lemon v. Kurtzman* (1971), disallowed a moment of silence requirement that had a religious intent in *Wallace v. Jaffree* (1985), disallowed prayer at graduation in *Lee v. Weisman* (1992), and disallowed prayer at football games in *Santa Fe v. Doe* (2000). From 1947 to 1997 the court adjudicated fifty-two establishment cases in which the majority involved schools.

It seemed clear that the Court was taking a strict separationist position toward religion in the schools. However, in *School District of Abington Township v. Schempp* (1963) the Court had also stated that a knowledge of religion as a powerful force in the development of humankind was essential to a complete education, and therefore schools might teach about religion, but not inculcate religion. From a curriculum standpoint, this finding seemed to suggest three possibilities: (1) teaching religious traditions, a kind of religions-of-the-world approach; (2) teaching religious sensibility in order to understand its power and attraction throughout the ages; and (3) teaching religion as a way in which a person views reality and his or her place in reality—that is, religion as *weltanschauung*. The first approach is typical of many colleges with a religion department; the study of religions is an option in general education. Teachers could be trained to teach such a course, and yet some religions would undoubtedly be given less attention or no attention.

The argument for the second approach is analogous to the argument that science should be taught in conjunction with laboratory experiments in order for students to appreciate and practice the activity associated with scientific discovery. This approach is even more problematic because the typical school curriculum would unlikely be able to support

more than one such experiential religious exercise and the inculcation charge would surely be forthcoming.

The third approach raises interesting questions. When religion is described as a kind of “worldview,” it can then be equated with science as a worldview, idealism as a worldview, realism as a worldview, pragmatism as a worldview, and perhaps even liberalism, conservatism, and Marxism as worldviews. Furthermore, if science and these -isms are seen as competing worldviews in which there is no absolute criterion to judge the adequacy of a particular view beyond its popularity, then all or many should be taught somewhere in the curriculum on the basis of fairness. All should at least be given a hearing. This argument is being made in the current debates over including intelligent design in biology classes because it is a worldview in competition with evolution and is held by a significant proportion of the nation’s population. This argument played a role in two fairly recent court cases and a decision by a state education board. In 1987 in *Smith v. Board of Commissions of Mobile County*, William Brevard Hand, a district court judge in Alabama, declared that if religion must be removed from schools then all religions must be removed from schools, including “secular humanism,” which he declared a religion. In 1987 in *Mozert v. Hawkins County Board of Education*, the parent of a Tennessee school student brought charges against the school that some stories in the reader used in her child’s class were anathema to her religious beliefs and violated the freedom of religion clause. The judge’s support of her claim was overturned on appeal, but the publisher of the reader dropped the offending stories in the next edition. Finally, in 1999 the Kansas education board voted to remove evolution theory from the state’s standardized tests and leave it to the state’s school districts whether to include instruction in evolution in school curricula. When the ruling was challenged by some parents, an independent committee chosen to make recommendations to the board argued essentially that intelligent design should be included because it is a valid worldview of the beginnings and development of humankind. Should such an approach be undertaken, the practical problems seem daunting. At the very least, any one teacher could be accused of bias because he or she would, by definition, possess some worldview.

The relationship between religion and the schools remains problematic. Many schools completely avoid the subject. Many others, particularly in rural, more religiously homogeneous communities continue school practices that are essentially nondenominationally Protestant. The United

States remains the most religious country in the Western world but also the most diverse religiously. The Pew Research Center lists evangelical Protestants as the single largest category, and yet the combination of evangelical and mainline Protestant categories still totals less than 50 percent. Roman Catholics make up less than 25 percent of the population, and the number admitting no affiliation is over 15 percent, the fourth largest category. Within these categories, denominations and individuals within them may differ in their beliefs. It seems clear, then, that schools could hardly be absolutely neutral toward religion. Surely some practice in a school would violate some group’s beliefs.

The major controversies between religion and schooling revolve around the matter of compulsion to attend school and the use of public funds to support religious schools. These issues are, of course, related. Few parents want no education for their children. But they do want to be able to choose the kind of education their children receive, and many believe that public funds should be made available to support such education. Proposals to ameliorate this concern are school vouchers, charter schools, and home-schooling. Yet public schooling remains the dominant form of schooling in the United States. As of 2003, 49 million children were enrolled in public schools, and about six million were in some form of private schooling, or just over 10 percent. Of the private school children, 80 percent were in religion-affiliated schools, and of that group nearly 60 percent were in Catholic schools. The number of children in nondenominational Christian schools was less than 700,000. The fastest-growing group of nonpublic school students is homeschoolers, although the number remains relatively small at just over one million, and only about half of those do so for religious reasons. The public schools, then, maintain a “market share” of 90 percent of students ages six to eighteen, and conflict over religious belief and practice is most often played out in that setting. Meanwhile, it appears that such conflict will continue with no particular curriculum solution. It seems unlikely that the Constitution could be construed to allow direct public aid to religious schools. Perhaps the wisest route for the public schools is to continue a policy of positive nonpartisanship, correcting egregious insults to religious belief when they occur and experimenting with proposals to teach about religion.

Education: Bible Schools and Colleges

Bible schools and colleges are evangelical institutions that offer lay and collegiate education designed to produce Christian disciples committed to serving as laypersons, professionals, or ordained clergy in church or parachurch ministries. Although Bible schools and colleges share with Christian liberal arts colleges and universities a common Christian worldview and philosophy of education, they offer a narrowly focused curriculum designed to prepare students for a more restricted field of vocational objectives.

Origins

Bible schools began in the 1880s and 1890s. Like other types of vocational training schools that emerged in the decades before and after 1900, they offered education outside the boundaries of the older classical curriculum in American colleges and became remarkably popular. The earliest schools were founded by, among others, Albert B. Simpson,

New York Missionary Training College for Home and Foreign Missionaries (1882); Adoniram Judson Gordon, Boston Bible Training School (1889); and Dwight L. Moody, Moody Bible Institute (1886). Alarmed about the pervasiveness of lukewarm, nominal Christians, these men sought to rectify what they saw as theologically and evangelistically weak churches. They founded Bible institutes to provide systematic biblical and theological instruction, spiritual nurture, and above all, practical training for laypersons, who, as an ever-growing army, would serve as Sunday school teachers, evangelists, and missionaries in local and foreign mission work. Thirty-four schools were founded, largely in the North, between 1882 and 1918.

The Moody Bible Institute's phenomenal success in attracting students—attributable to Moody's prominence as an evangelist, the school's strategic location, and its innovative nature—made it a model for the nascent Bible school movement. On the whole, Bible schools were theologically conservative, emphasizing a conversion experience, biblical authority, and a sanctified life. They typically adhered to the novel dispensational form of premillennialism rooted in the theology of nineteenth-century Brethren writer John Nelson Darby and emphasizing a radical distinction between the nation of Israel and the Christian church and the rapture of the church prior to Christ's second advent. Some Bible schools arose within the early twentieth-century Pentecostal movement. They held that speaking in tongues signified Holy Spirit baptism and taught the continuing presence of the miracle and sign gifts associated with first-century Christianity. Bible schools offered roughly high school-level instruction and provided students with abundant opportunities for hands-on Christian service training.

Influence of the Fundamentalist Movement

Bible schools multiplied rapidly in the decades after World War I, with at least seventy more in operation by 1945. Sixty-six new schools were founded in the 1940s alone, including the Carver Bible Institute in Atlanta, Ozark Bible College in Joplin, Missouri, and Freewill Baptist Bible College in Nashville. This extraordinary expansion is largely attributable to the fundamentalist-modernist controversies of the 1920s. Responding to the liberalism they detected in denominational divinity schools and colleges, many fundamentalists, mainly outside the South, turned to the Bible schools as an educational alternative. As a result, Bible schools not only increased numerically but also quickly developed into complex educational institutions.

Well-established schools purchased and built permanent facilities, expanded their curricula to three or four years, employed full-time faculty, adopted official statements of faith, and, following Moody Bible Institute, experimented with new delivery systems such as correspondence courses, magazines, Bible study guides, radio programs, and extension departments that organized Bible conferences.

Because of these creative responses to the changing religious environment in the United States, Bible schools sustained fundamentalism in a variety of ways during and after the controversies of the 1920s. First, as the conservative theological influence declined in denominational institutions, prominent schools such as the Moody Bible Institute and the Bible Institute of Los Angeles formally entered the field of ministerial education by offering pastoral training courses, a significant curriculum change. Second, Bible schools acted as moderating and unifying influences within a generally cantankerous fundamentalist movement. In addition to encouraging interdenominational cooperation, Bible school leaders ordinarily steered a middle course in disputes between moderate and separatist fundamentalists, especially in disagreements over withdrawing from the mainline Protestant churches. They emphasized the nonsectarian nature of genuine Bible study and evangelism and attempted to promote stability rather than controversy. Third, some Bible schools, such as William Bell Riley's Northwestern Bible and Missionary Training School of Minneapolis, served as regional headquarters for denominational fundamentalist leaders or as denominational surrogates for loosely affiliated groups of independent churches.

This rapidly expanding movement gained some uniformity in 1930 when Clarence H. Benson, a faculty member at Moody Bible Institute, established the Evangelical Teacher Training Association (ETTA). Benson believed that America's Sunday school movement suffered from inadequately trained teachers, and he developed the ETTA program to produce master teachers, who would then teach and certify other teachers in local churches. He employed Moody's program in religious education as a model for the association's standard training course, which required classes in Bible, missions, personal evangelism, Bible introduction, child study, department specialization, pedagogy, Bible geography, and Sunday school administration, as well as in four hours of electives. In addition to setting curriculum standards among the Bible schools, ETTA promoted institutional quality by granting "gold seal" status to those schools that required high school graduation for admission and a

college degree for faculty service. To achieve this "gold seal" recognition, institutions also had to provide dormitories for day students and have a library of at least a thousand books.

Professionalization

In addition to adjusting to the homogenizing tendencies spawned by the ETTA, Bible school leaders responded to national trends in American education after World War II by pursuing academic respectability, a quest that brought further standardization to the movement. In response to the GI Bill-related expansion of higher education and to the increasing professionalization and demand for more advanced credentials within American society, Bible school leaders developed their schools into colleges offering either bachelor of arts or bachelor of science degrees. As they transformed their schools, Bible college leaders revived a suggestion put forth by Moody Bible Institute president James M. Gray in 1918: create an accrediting association to give Bible schools greater legitimacy within the broader world of American higher education. In 1946 Howard W. Ferrin, president of Providence Bible Institute, asserted the pressing need for an accrediting agency, arguing that accreditation through the existing regional associations could undermine Bible school distinctiveness. Other leaders within the movement agreed, and in 1947 they formed the Accrediting Association of Bible Institutes and Bible Colleges (shortened to Accrediting Association of Bible Colleges in 1957, AABC), which accredited schools in the United States and Canada.

Not everyone agreed with these developments. Some school leaders feared that a loss of independent action might lead to modernism and declined to seek accreditation. By 1962 there were 183 Bible schools in the United States and 51 in Canada. About 64 percent of the schools were denominationally affiliated, and the others were independent organizations with interdenominational constituencies. Fifty-two percent of the 234 schools were collegiate-level institutions, and despite concerns about the possibility of theological corrosion, 20 percent of them were accredited by the AABC by 1960. An average of ten additional schools acquired accreditation every five years for the remainder of the century. Bible colleges required applicants to have high school diplomas and offered their students larger libraries, better-credentialed faculty, and the liberal arts subjects required for undergraduates. To fund these developments, many of the schools began charging tuition in addition to the minimal fees they were already charging.

By 1960 Bible institutes and colleges had an estimated enrollment of 35,000 students. In addition to providing thousands of graduates for vocational and lay ministries in North America, the Bible schools played a vital role in the extraordinary expansion of Protestant missions in the twentieth century. By 1969, 70 percent of Protestant missionaries in the world were from North America. In 1974 an estimated 75 percent of North Americans serving in foreign mission fields had received part or all of their training in Bible schools. Some of the earliest schools were begun specifically for training missionaries, and an emphasis on Christian missions continues to be a central component of Bible school education.

Changing Identity

In the decades after 1950, Bible colleges, with few exceptions, continued to evolve into more multifaceted institutions as Bible school leaders pursued higher academic standards and professional recognition. More progressive-minded leaders abandoned the traditional belief that Bible schools should provide only a limited number of terminal vocational programs. Defining the term *ministry* more broadly, they began offering additional majors in elementary education, communications, counseling, music education, and social work, and they established pre-seminary programs that required additional arts and sciences courses. Meanwhile, they encouraged their students to pursue graduate training, and by 1995, 26 percent of the schools accredited by the AABC were offering their own graduate programs in areas such as biblical studies, counseling, and ministerial studies. As they expanded the curricula, some Bible school leaders also sought further academic respectability by seeking accreditation by regional accrediting agencies. By 1995, 28 percent of the AABC-accredited schools had achieved this goal. And by 2008 some 50 percent of the schools accredited by the Association for Biblical Higher Education (ABHE)—as the AABC was renamed in 2004 because of its expansion into the field of graduate education and the accrediting of individual programs within an institution—also held regional accreditation, reflecting a growing trend within the Bible school movement. Some schools, however, such as the Raleigh Institute of Biblical Studies in Raleigh, North Carolina, and the Tyndale Biblical Institute in Fort Worth, Texas, continue to view all forms of accreditation as threats to doctrinal autonomy and to the practical, spiritual dimension of their courses.

By the late twentieth century 55 percent of the Bible colleges fit this more progressive profile, although a

significant minority, fearing that such changes prefigured a departure from the original Bible school mission, tenaciously clung to the original vision. By the 1970s sustaining this posture became increasingly difficult in the face of declining enrollments and escalating costs. Colleges' concerns about fidelity to the original mission were not without some foundation. Within the progressive movement a minor trend toward Bible colleges evolving into liberal arts colleges or universities with only regional accreditation was observed as early as the 1950s and included schools such as Messiah Bible College, Cleveland Bible College, and the Bible Institute of Los Angeles, one of the flagship schools of the Bible school movement.

Ninety-six institutions are presently accredited by ABHE, eight hold candidate status, and twenty-four others have applied for accreditation. Currently about twelve hundred Bible schools in the United States are not accredited by the ABHE. Most of these institutions simply lack the financial resources to meet the criteria for accreditation, while other schools, typically associated with large independent churches, either follow the original Bible school vision of training laypersons for nonvocational ministries or eschew accreditation because of its perceived corrupting influences.

In light of the post-World War II developments within the movement and the growing strength of conservative evangelical liberal arts colleges and seminaries, Bible college leaders were in the early twenty-first century reevaluating the movement's institutional mission, reaffirming their commitment to maintaining the Bible major at the core of their curriculum, and adjusting the curriculum to attract students with academic goals and employment opportunities not addressed by traditional Bible college programs.

Historians have demonstrated that the Bible school and college movement has played a far more important role within North American Christianity than statistics related to funding and graduates imply. These institutions provided leaders and thousands of foot soldiers for the parachurch organizations emerging in America in the mid-twentieth century that would contribute to the restructuring of American religious life. Thus Bible schools helped forge the conservative evangelical movement that emerged as a potent force in American political and cultural life in the 1970s.

Education: Boarding Schools

The United States is home to nearly three hundred private boarding schools. Although these schools are far from homogeneous in educational philosophy, size, and mission, many of them either maintain explicit religious affiliations or they were founded for religious purposes. However, many have also minimized their religious missions for the sake of what they see as modernity. Sixty-nine percent of boarding schools are located along the eastern seaboard; 34 percent are in New England. Boarding schools are small by public school standards—most have between two hundred and four hundred students. Roughly one-third of the schools have formal religious affiliations.

In 1985 Peter W. Cookson Jr. and Caroline H. Persell identified nine basic types of American boarding schools: academies, Episcopal schools, entrepreneurial schools, girls' schools, Catholic schools, western schools, progressive schools, Quaker schools, and military academies. Some boarding schools, however, are more socially prestigious than others, primarily because of the social class of the families supporting the schools. The most prestigious schools are the older eastern "prep" schools, which have educated generations of students from America's upper-class families. The most elite schools are sometimes referred to as the "Select Sixteen."

Prep school students, however, make up just a small fraction of the overall population of boarding schools. Boarding schools offer students a wide range of educational experiences. Some schools emphasize academic rigor, while others emphasize character development. Some schools have very demanding discipline codes, while others seek to promote individual responsibility.

Some one hundred boarding schools are specifically denominational, including Baptist, Catholic, Episcopal, Free Methodist, Moravian, Presbyterian, Quaker, United Methodist, and Jewish. Over the last twenty years, Christian groups identifying themselves as evangelical have founded residential schools. Many of these schools are dedicated to helping teens who are exhibiting self-destructive or antisocial behavior.

When a school identifies itself as explicitly religious it does not mean that all students who attend that school belong to the school's religious denomination or even that the majority of students come from religious backgrounds. Parents often send their children to boarding school for nonreligious reasons. Nearly all boarding schools are financially driven by the need to demonstrate that they have the educational and social power to enable graduating students to attend selective colleges and universities. In one sense, the most practical "value-added" benefit of boarding school is the increased likelihood of a student's success in the race for admittance to a well-known college or university. However, this secular mission does not always mesh easily with schools' missions to build character and develop religious sensibilities. Maintaining a genuine religious mission in the context of a very competitive society is a challenge facing nearly all religion-oriented boarding schools.

Although it is true that from a denominational point of view the world of boarding schools is far from homogeneous, it is also true that the eastern prep schools are still the cultural and academic leaders of that world. These schools continue to believe strongly that liberal Christianity is the ethical core of the American leadership class. Thus a commitment to the moral imperatives of Christian service and sacrifice remains central to the ethos of many eastern prep schools. Modernity does not stop at the prep school gate, but to be admitted it must acknowledge that the traditional ethical and religious values of the schools' founders are alive and well.

Gentlemen of the Republic—Defining the American Ideal

The first genuine American boarding schools were Phillips Andover Academy (founded in 1778) and Phillips Exeter Academy (1783). The older of the two academies was founded by Samuel Phillips Jr.; Paul Revere designed the school's seal. The central feature of the seal is a beehive symbolizing hard work because the founder "deemed idleness to be the most insidious and demoralizing vice." Self-reliance and service were to be the hallmarks of the new American

man and woman. One of Andover's earliest visitors was George Washington in 1789—the ideal first American. A third academy, Deerfield, was established in 1797 by Massachusetts governor Samuel Adams.

From their founding, the academies required religious observances. Congregationalism, the heir to colonial Puritanism, remained the most prestigious faith in New England in the early republic and prevailed in these first boarding schools. Early morning chapel was required, and, quite often, students attended chapel twice on Sundays. Most headmasters were ministers who were chosen for their moral rectitude. Without godliness there could be no real goodness, and thus the academies reflected the quintessential American belief that action and salvation were not opposites but, together, compelled the otherwise sinful, and possibly slothful, to apply himself (and later herself) to progress and prosperity.

Leaving Nothing to Chance—The Total Institution

The idea that idle adolescents were subject to laziness and temptation fueled the philosophies of various early nineteenth-century educational philosophers. As reported by James McLachlan in 1970, Emmanuel Von Fellenberg, the Swiss educational thinker, maintained that “the great art of educating consists in knowing how to occupy every moment of life in well directed and useful activity of the youthful powers, in order that, so far as possible, nothing evil may find room to develop itself.”

To accomplish this end, the early boarding schools became total institutions. According to the sociologist Irving Goffman, total institutions share four central characteristics: (1) all activities are conducted in the same place under a single authority; (2) daily life is carried out in the immediate company of others; (3) life is tightly scheduled and fixed by a set of formal rules; and (4) all activities are designed purportedly to fulfill the official aims of the institution.

Cookson (1982) examined the nature of students' moral careers within the total institution. Following the research of Sanford M. Dornbush (1955), he identified a set of sequential steps in students' moral careers: suppressing preexisting statuses; learning new rules and adjusting to conflicts between rules; developing solidarity, developing a charismatic spirit, finding new satisfaction in interaction, social mobility and justification of institutional practices; and, last, undergoing reality shock. Total institutions transform those who are exposed to their intense socialization processes, which are not unlike the experiences of novitiates during seminary training.

Founded in 1839, Episcopal High School in Virginia might qualify as the country's first true “prep” school. The school sought to develop character by a simple honor code that is still the cornerstone of the school's culture: “I will not lie, I will not cheat, I will not steal, I will report the student who does.” Although the Episcopal honor code is not unlike the moral codes found at the older New England academies, it does place absolute morality above industry and service—perhaps reflecting a distinctively Virginian evangelical approach to Anglicanism.

As the Civil War came to an end, the country began to industrialize, and colonial America began to fade, a new vision of America began to develop—a vision of global competition and military power. The emerging American upper class looked to England for models of education and discovered the British public school, which had been reinvigorated by Thomas Arnold at the Rugby School in mid-century. Arnold was the very epitome of the rugged Christian gentleman; like the sport named after the Rugby School, the Victorian gentleman was strong, was unafraid of pain, and took privilege as a badge of honor and responsibility.

The Victorian Worldview

The latter half of the nineteenth century marked the era of the great prep school movement. The peak years were from 1883 to 1896; the pivotal year was 1884 when Groton was founded by Endicott Peabody, an English-educated Episcopal priest. Not all the schools were founded by Episcopalians, but the underlying Anglican worldview that emphasized tradition, faith, and reason was present in nearly all of the educational philosophies of the Victorian prep schools.

The moral center of the school was not the classroom but the chapel. And students at Groton still attend chapel four times a week. Saint John's Chapel at the Groton School was designed by Henry Vaughn. On the walls of the chapel are chiseled the names of the school's graduates, who include Franklin D. Roosevelt. Groton and schools like it were and are pipelines to Ivy League colleges, Wall Street, and the State Department.

Over the years, the Victorian worldview has softened. Indeed, if the schools' founders were to return today they might be shocked. Nearly all the schools are coeducational and racially and ethnically diverse, and, perhaps most shocking of all, not all the graduates go to Harvard, Yale, or Princeton. And yet if the founders were to dig a little deeper they might still see the essence of their old schools—the times have changed but the mission remains.

Conclusion

The early founders of America's boarding schools sought to create a generation of leaders fit to lead a country destined for greatness. Their religious convictions were as much a part of the schools' enduring strength as the mortar that holds the original bricks together through the harshest of New England winters. Of course, the schools have changed in some important ways—most are now coeducational, and the age of computers has brought the world onto the campuses. Most of the schools embrace globalization and diversity as part of their educational and moral missions.

Religion continues to play an important role in the educational and moral ethos of American boarding schools. Many denominations are represented among the roughly one hundred boarding schools that explicitly identify with a particular religion. The belief that early religious socialization forges more moral adults persists among those that support boarding schools. History has shown that despite major cultural and economic shifts, this belief has considerable resilience.

Education: Christian School Movement

The history of the Christian school movement reveals the controversies over public education and the resurgence of evangelical activism that characterized the latter decades of the twentieth century and the beginning of the new millennium. Significant litigation and legislation have accompanied the secularization of public schools and the proliferation of "Christian" (private, evangelical) schools. Centered on the issues of states' rights versus parents' rights and church-state relations, the legal and philosophical battles have spilled over from the classroom into the courtroom, influencing both private and public education. The fundamental questions are: Whose right and whose responsibility is it to teach what to whom? And what kinds of resources will they be allotted?

The contemporary proliferation of Christian schools represents the first widespread secession from public schooling since the establishment of the Catholic parochial school system, but it is not a new phenomenon. Most denominations experimented with religious weekday education throughout the nineteenth century, although the idea never took off. By the early twentieth century most mainline denominations had abandoned the idea of religious day schools altogether. Although evangelicals continued to establish independent postsecondary educational institutions and Bible colleges, it was not until the mid-twentieth century that they began to establish their own primary and secondary schools. They called their schools "Christian," in contrast to other religious schools (those established by Catholics, Lutherans, Episcopalians, Quakers, and Amish, among others). The term *Christian* is used to emphasize a distinction evangelicals draw between themselves as "saved" and others who are "unsaved."

Interdenominational and Protestant, "Christian schools" actually represent a range of evangelical groups. The term *evangelical* is often used inclusively to refer to coalitions or alliances of fundamentalist, Pentecostal, charismatic, and neo-evangelical Christians, all of whom share basic evangelical tenets. These include a belief in Christ as personal savior,

the need for a conversion experience in order to be saved, the Bible as the inerrant word of God, and the need to spread the gospel and convert others to Christ.

A grassroots movement of the 1950s, Christian schools proliferated in the late 1960s and 1970s. Until the 1970s they tended to be scattered, but then they began to organize through Christian school associations. These associations offer a variety of services, including monitoring legislation at the state and federal levels, legal assistance, school and teacher accreditation, professional training, teacher placement, insurance packages, and national competitions in athletics, academic debates, music, and Bible. They serve primarily as lobbying organizations that monitor legislation and defend individual cases at the local, state, and federal levels. According to Robert Liebman and Robert Wuthnow, politically active evangelicals of the 1970s and 1980s cut their political teeth defending the Christian schools they had helped to organize.

Once the sponsors and regulators of the mainstream educational system, evangelical Protestants felt compelled to pursue alternative forms of education in the closing decades of the twentieth century in an effort to restore religious authority, reinforce parental authority, and provide quality education while protecting their children from the drugs, sex, violence, and lack of discipline they believed were rampant in the public schools. They acted in response to a series of perceived threats, the most serious of which was the general secularization of life and the legislatively mandated secularization of public schools. U.S. Supreme Court decisions prohibiting prayer (*Engel v. Vitale* [1962]) and Bible readings and devotions in public schools (*School District of Abington v. Schempp* [1963]) offended evangelicals because these actions excluded God. Just as the Vietnam War and Watergate challenged the notion of America as the “Righteous Empire,” evangelicals believed that their own “civil religion” had been eroded—a righteous patriotism had been excluded from the public schools.

Christian school advocates were convinced that “secular hegemony” was undermining the supremacy and legitimacy of the traditional, white Protestant, middle-class, patriarchal family. They pointed to the culprits: *Brown v. Board of Education of Topeka* (1954), the Supreme Court decision that desegregated schools, the increase in the divorce rate and single parenting, and the civil rights, women’s rights, and children’s rights movements of the 1960s and 1970s. In seeking to preserve the “traditional” patriarchal family, some evangelical parents withdrew their support from public

schools and established their own schools so they could hire teachers who would reinforce their values and authority. Personal character and religious commitment were considered more important in hiring Christian school teachers than academic credentials or pedagogical expertise. That said, Christian school parents were also concerned with the academic quality and social environment of the public schools. The school atmosphere, the way students were taught, and the whole matrix of social relations were as important as the specific information being taught.

By 2000 some 1.3 million students were enrolled in an estimated nine thousand Christian schools (K–12). These enrollments represent about 25 percent of the total private school population and 2–3 percent of the national school population. Even during a period of high unemployment and national economic recession, and when enrollments in both public and nonpublic schools were declining, the Christian school movement grew dramatically. Even though Roman Catholic schools are still the largest group in private education, Christian schools have grown in both numbers and relative influence.

The Educational Philosophy of Christian Schools

Many evangelicals believe that Christians should maintain their own separate form of schooling; if they are true believers they could not possibly entertain the idea of sending their children to public schools. Such strict separatists are accompanied along the fundamentalist–evangelical spectrum by accommodationists, who see Christian schooling as an alternative to public schooling and leave the choice to parents, and by interventionists, who see the public schools as a type of mission field and suggest that it may be un-Christian to abandon them.

Whatever their philosophical and strategic differences, evangelicals are united in their opposition to secular humanism and values clarification in public education. Antihumanist, anticommunist, and antifeminist, they rally around the teaching of “the basics” that once represented the foundations of Protestant, patriotic, and patriarchal culture. As the alternative to public education, Christian schools offer a holistic, authoritative, disciplined, and God-centered education that emphasizes character development and spiritual training. Affective and moral domains are considered at least as important as cognitive domains.

Excerpts from a Christian school handbook in upstate New York articulate the general educational philosophy of the Christian school movement in general:

Mathematics: In light of the order God has produced in the material universe and its set relationships in space and time, we cannot overlook Mathematics as being an instrument for teaching our students concepts of order and logic that Creation itself portrays as a very attribute of God. Mathematics is an exact science and in this present age of “relative truth,” it affords the Christian school an excellent opportunity to teach each student how to comprehend the orderly world around him, created by God who presents Himself as Absolute Truth (John 14:6).

Science: Students should come to view Science not as a discipline that destroys the traditional values of Christian faith, but as a secondary interpretive aid to the Biblical revelation (i.e., understanding how creation works). Because the Biblical perspective is far deeper and more inclusive than the scientific viewpoint, reaching to the area of ultimate meaning, the Biblical revelation has the final priority.

In general, Christian schools stress creationism, the Christian history of the United States, the fight for religious freedom, the integral relationship between patriotism and Christianity, the religious foundation of the polity and educational system, and the religious character of traditional American leaders such as George Washington and Abraham Lincoln. They emphasize free-enterprise economics and reject the teaching of evolution, multiculturalism, and sex education.

Educational Organization and Curricula

Even though Christian school advocates want to remedy what they consider ungodly and un-American progressivism in the schools, they also acknowledge that they are struggling with how to construct a “Christian curriculum.” The Christian school movement, like the evangelical movement, is not monolithic; rather, the variation among schools reflects the ideological, organizational, and demographic characteristics of the sponsoring congregation as well as the talents and personal styles of those who establish and operate them. Curricula range from secular materials to Christian-based instruction. Although the majority of schools follow traditional styles of classroom interaction and teaching practices, others use more behaviorist models of prepackaged, individualized instruction or intensive group recitation.

Facilities range from poorly equipped church basements to modern, multi-building campuses. Some have computerized labs, while others have no lab equipment at all. Christian schools offer a private education at a lower cost than many other schools.

Economic realities influence, if not determine, educational philosophy and method. For example, many new schools use the Accelerated Christian Education (ACE) curriculum program precisely because it is inexpensive. A highly standardized system of education, ACE provides all the information, materials, and equipment necessary to set up a school quickly and inexpensively. Christian curricula (at a cost of less than \$1,000 per year per child), furniture, procedural guides, administrator and teacher training, and even uniforms (red, white and blue, with American flags on the boys’ ties), can be purchased. A church can cheaply and quickly set up a school in its basement, hiring teachers who do not need to be certified or college-educated. Although ACE is not representative of the entire Christian school movement, it is the largest distributor of Christian school curricula and claims close to six thousand schools nationwide. ACE estimates that some two-thirds of Christian schools established in the 1980s initially used ACE.

Whether the schools are using Christian (such as ACE, A Beka, Alpha Omega, or Bob Jones texts and materials) or secular materials, Bible readings, worship, and prayer times accompany regular instruction. Moreover, certain policies and practices are typical of the majority of Christian schools. Discipline is a primary concern. In preparation for the ultimate submission to God, children are taught to obey their parents, teachers, spiritual leaders, and civil authorities, but they are warned against nonbelievers. Referring to the scripture that to “spare the rod is to spoil the child,” Christian schools generally use corporal punishment. One visible way of maintaining school discipline and reinforcing standards about appropriate behavior is enforcing a strict dress code, emphasizing modesty and propriety.

The majority of Christian schools offer only elementary education, but as the children grow older the school often grows with them. Thus increasingly Christian schools are offering secondary education. The enrollment of the average Christian school falls between one hundred and two hundred students, although the schools vary in size from ten to over two thousand. The majority of Christian schools are church-sponsored, but some (such as the Calvinist day schools) are parent-run or board-run.

The question of admissions policies relative to race and ethnicity is an important and controversial one. In the 1970s about one hundred schools lost their tax-exempt status because they were avoiding integration. Although some began as segregationist academies, it appears that most do not now actively discriminate on the basis of race or ethnicity. Some, such as Jerry Falwell's Christian Academy in Lynchburg, Virginia, which initially advertised for "whites only," have changed their admissions policies. Other Christian schools are actively committed to racial and ethnic diversity, a number of which are serving black and, to a lesser extent, Hispanic and Native American students.

Impact on Public Policy

The New Christian Right has had an impact on U.S. society not only through the establishment of Christian schools but also through its influence on education in the society at large. It has been influential in blocking the passage of public school referenda, in pressuring publishers to alter the content of public school textbooks, and in minimizing state-regulated standards for private schools and homeschooling.

One evangelical and fundamentalist *cause célèbre* has been the battle to deregulate private schools. New Christian Right victories minimizing the standards for operating a private school and teacher certification have benefited non-evangelical groups as well. Russell Means, leader of the American Indian Movement, indicated that the successful attempts at removing state certification standards for private schools in South Dakota have made it easier to establish a private school in the Black Hills encampment of the Dakota Sioux. Means can now hire uncertified teachers to instruct children in traditional Sioux ways and values. Deregulation has also benefited the homeschooling movement.

The "National Conference of State Legislatures Report on Home Schooling" (1989) suggested that the growing momentum of homeschooling and the litigation surrounding it were in large part the result of the resurgence in religious activism. John Holt and Ivan Illich, founders of the liberal private school movement, were aided in their efforts by the evangelicals' victories that revoked certification standards. Many Christian school leaders initially opposed homeschooling, fearing it would draw students away from Christian schools. Their position was difficult to sustain, however, because much of their rationale for Christian schooling rested on the biblical premise that parents are the ones primarily responsible for the education of their

children. Thus the resistance of Christian school educators to homeschooling has waned.

Textbook publishers have also been influenced by the organized efforts of the New Christian Right, and so they have avoided "publishing material that might be construed as unpatriotic, anti-capitalistic, or anti-Christian." Phyllis Schlafly, conservative activist and president of the Eagle Forum, argues that public schools should use textbooks that do not offend the religious and moral values of parents. Instead, they should use textbooks that "honor the family, marriage, and man's role as provider and protector." One of the most successful attempts to control the content of texts has been Educational Research Analysts, a textbook review service founded by Norma and Melvin Gabler in 1975 out of their home in Longview, Texas. Since that time, their operation has grown into a worldwide organization. Because Texas has one of the largest school-age populations in the country and therefore one of the largest textbook markets, this organization's decisions help determine the content of schoolbooks sold all over the nation.

Evangelicals have objected to the use of the Harry Potter series, to the 1969 film *The Learning Tree* which depicted racial discrimination, and to homosexual authors such as Oscar Wilde, Tennessee Williams, Gore Vidal, and Walt Whitman. The treatment of racial and ethnic diversity in the United States is a major curricular issue, with evangelicals tending to want to limit the discussion of racial pluralism. In the Kanawha County textbook controversy, for example, Alice Moore, the wife of a fundamentalist minister who was the catalyst for censoring school textbooks, claimed that the proposed ban on books was not inspired by racism. However, the list of authors accused of corrupting the basic values of Christian parents included Gwendolyn Brooks, Dick Gregory, Eldridge Cleaver, Langston Hughes, James Baldwin, and Malcolm X. Moore, one of the proponents of the ban, argued that these authors were excluded not because they were black but because they espoused moral and philosophical positions contrary to those of the protestors. She suggested that the best solution would be for the schools to ignore the question of ethnicity and racism and concentrate on the "inculcation of Americanism."

Another battle site in the war over public schools is outcome-based education (OBE), a curriculum innovation used in several states across the country in which students must demonstrate proficiency in certain skills and knowledge before moving on to the next level of instruction. Critics of OBE claim that such programs "intrude upon a

parent's rightful role and promote values established by the government rather than the family."

In one example of the controversy surrounding the adoption of an OBE program, in Pennsylvania in the early 1990s Christians for Excellence in Education (CEE) led the fight against the values component of the program. The "values component" was Outcome #6, which established a goal of "appreciating and understanding others." To CEE, "respect for diversity" and a "tolerance of differences" meant promoting alternative lifestyles, most significantly homosexuality. Rather than teaching students to tolerate diversity, CEE argued, students should be taught a "commitment" to certain values and perspectives. Eventually, OBE passed in Pennsylvania, but only after Outcome #6 was eliminated and the words "attitudes and behavior" were eliminated from all parts of the program.

Concerned about the teaching of environmentalism, Christian Right groups have accused teachers and schools of promoting Satan and the occult, lying to students about the dangers of global warming and ozone depletion, and damaging the economic foundations of communities by teaching students to critically evaluate the effects of industrial pollution. William Griggs, a religious conservative, wrote in the biweekly publication *New American* that "environmentalism is largely based on a kind of secular religion that seeks temporal salvation through an all-powerful global government. . . . The growing environmental education movement is a recruitment drive intended to conscript young students into a pagan children's campaign." Groups particularly object to activities that encourage respect and love for "Mother Earth" and away from "the true and loving God" the Father.

Beginning in the 1960s conservative Christian groups opposed the teaching of comprehensive sex education in public schools. By the 1980s, however, it was clear that the Christian Right was having little success in removing this kind of instruction from schools. The general American public was supportive of sex education programs, and so the Christian Right began to promote abstinence-only programs in public schools. Since 1996, \$1 billion in state and federal funding has been allocated for abstinence-only education despite a lack of evidence supporting the effectiveness of this approach.

Conclusion: The Compromises of Success

Christian schools represent the mobilization efforts of evangelicals to establish greater control over the socialization and

education of their young. Parents and educational leaders of the Christian school movement want to protect their children from the degradation of modern secular life—although they attempt this in very different ways. How successful they are depends on the criteria by which one judges success.

Christian schools represent neither total rejection of secular processes nor total acceptance of patriarchal, evangelical ways. This act of compromise involves a myriad of contradictions as evangelicals selectively reject, accept, and adapt modern ideas, conveniences, and lifestyles. For example, evangelicals have a negative view of the commercialization of culture, but many develop, sell, buy, and use mass-market curriculum packages that dictate virtually every aspect of school life. Although Christian schools stress the values of the "traditional" patriarchal family and the "natural" submission of women, because of their size and curriculum the schools tend not to segregate boys from girls, nor do they present them with different curricula. However, the traditional gender roles are reinforced in the texts themselves, and adult men clearly have more status and authority than adult women within the community. Male teachers also are generally paid more than female teachers.

The establishment of Christian schools in the midst of a society that values educational conformity requires energy, confidence, and resourcefulness. It represents both an act of rebellion (against the dominant culture) and an act of commitment (to "Christian" community). Furthermore, the curricula used in Christian schools reveal both resistance and accommodation to the standard forms of educational content found in public schools. Christian schools may resist public school materials because they are too secular and humanistic, and mass commercialized culture because it is too materialistic and crass, but they often use those materials or buy mass-produced packages of Christian curricula. As evangelicals have reasserted their presence and influence over the last four decades, they have become less separatist. They have established their own separate schools, but they also have become engaged in political battles that have drawn them into the secular courts. Most of the primary goals on the evangelical agenda, however, have not been achieved—especially at the national level. Their attempts to institute tax credits and tuition vouchers that would have promoted greater school choice and school prayer have been, as of the first decade of the twenty-first century, unsuccessful. If significant progress toward evangelical goals is to be made, it will likely be at the state and local levels.

Even though educational policymakers recognize that the Christian school movement and its advocates have played a significant role in raising the issues they are now addressing, most indicated that American public education was and is driven more by economic concerns than religious forces. Yet it is also important to recognize the conservative impact that evangelicals can and do have. If the demand for equity is taken seriously and legitimated by the U.S. Supreme Court, then evangelicals who tend to be conservative and politically active are likely to challenge a major government increase in funding for education, especially if it is to be achieved through higher taxes.

Once the guardians of mainstream American education, evangelicals have now become the “watchdogs,” often criticizing public education and raising concerns that resonate with many Americans who do not necessarily share their evangelical worldview. In order to preserve their rights as evangelical Christians and to protect their schools, they have increasingly moved beyond the borders of their own communities.

What might the future hold? It appears as though the growth of the Christian school movement has plateaued, but that Christian schools will remain a viable option for educating children in the United States for some time to come. Some observers suggest a trend of convergence between public and Christian schooling. If the public schools continue to move to the right of center, with an emphasis on the “neutrality” of status quo “basics,” and if they increasingly approach “accountability” through standardized programs, then evangelical parents may become less dissatisfied with public education and less willing to bear the costs of Christian schooling. However, this conjecture ignores the religious motivation of many Christian school parents who want their children to go to school in an explicitly Christian environment. The decision-making process is complex; mixed motivations and different priorities are assigned to choices involving the education of one’s children, whether in public or private schools. Some evangelical parents are totally committed to Christian schooling, but probably the majority make decisions a year or two at a time, choosing among various Christian and public school and homeschooling options. As it is, some evangelical parents send one child to Christian school and another to public school, depending on what each might have to offer the individual child.

The greatest challenge for Christian schools in the next decade may be internal rather than external. Jim Carper,

professor of education at the University of South Carolina and a supporter of Christian education, argues that the major concerns facing Christian schools today are no longer government control, but rather financial stability and spiritual vitality. How they are able to balance these two concerns will be a test of their maturity as they come of age in the beginning of the twenty-first century.

In the process of trying to “revitalize” American education, both evangelicals and the educational system are being transformed. Although evangelicals have been influential in raising questions that have commanded the attention of many both within and beyond their home states, they have not convinced the culture at large that they have the answers. Thus the debate about what kinds of “revitalization” American education needs and how it will go about that process continues to be part of the contested terrain in the twenty-first century.

Education: Colleges and Universities

The history of religious colleges and universities is consistent with the history of religion in North America. The

themes of New World empires, Protestant dominance in the United States, secularity, and diversification in the twentieth century are the same in both narratives. Historically, Protestants and Catholics have dominated the founding of colleges and universities. These two religions have also been present on secular campuses through student ministries. Throughout the twentieth century, additional religious traditions have established schools, adding to the diversity of religion and higher education in America.

New World Empires

The Spanish founded the earliest universities in the Americas. In 1538 the papacy ordered the Dominican seminary in Santo Domingo (now capital of the Dominican Republic) to become the Universidad Santo Tomás de Aquino. It is now the Universidad Autónoma de Santo Domingo. Spanish king and Holy Roman emperor Charles I also ordered the Royal and Pontifical University of Mexico in 1551, the first university founded on continental North America. The university closed in 1865. In 1551 Charles I also commissioned the University of San Marcos in Lima, Peru. In total, the Spanish established twenty-three schools, ten of which were founded before Harvard. The French founded a university in Quebec. Monseigneur François de Laval (1623–1708), the first bishop of New France, founded the Séminaire de Québec in 1663. In 1852 England's Queen Victoria commissioned the Université Laval in Quebec City from the Séminaire. It is the oldest university in Canada.

English Colonies

The earliest colleges and universities in the United States began as religious institutions in the colonial era. The Massachusetts Bay Colony founded Harvard under Congregational Puritan auspices and modeled it after Emmanuel College at Cambridge University in England. Emmanuel was a seat of Elizabethan Puritanism and was the alma mater of the majority of educated emigrants to Massachusetts. Founded in 1636, Harvard did not settle in Newtowne (later Cambridge in 1638) until the following year. Following the death of Rev. John Harvard (1607–1638), his estate donated half of his wealth and his entire library to the college, earning the college's namesake in 1639. Although a private college in its founding and governance, Harvard received a portion of the colony's budget. From 1669 to 1682, more than half of Harvard's income came from the government. The first faculty of Harvard

were clergy who were alumni of Oxford and Cambridge. The purpose of the school was ministerial and professional training. Less than half of Harvard's graduates became clergymen. Others became public servants, physicians, teachers, merchants, and soldiers.

Harvard had been founded on the English model of the residential college. The College of William and Mary followed the Scottish tradition of universities having no residency. Founded in 1693 in Tidewater Virginia, William and Mary was an Anglican school of the high-church, non-Puritan sort. Unlike Harvard, a board of prominent laity ran the college, not professional religious faculty. Like Harvard, William and Mary was a school for clergy, professionals, and gentlemen.

Near the end of the seventeenth century, some conservative Puritan Congregationalists feared the liberalism of Harvard's faculty, specifically the supposed Arminianism and Unitarianism of Bostonian divines. Led by Cotton Mather (1663–1728), the son of Harvard president Increase Mather (1639–1723), conservatives founded the Collegiate School in Connecticut in 1701. The school relocated to New Haven in 1716 and later renamed after its benefactor, Elihu Yale (1649–1721).

The revivalism of the middle decades in the 1700s gave rise to new colleges in colonial America. Presbyterians established a network of "log colleges" for the training of ministers. At these schools, ministerial candidates apprenticed under an established clergy. The flagship "log college" was in Neshaminy, Pennsylvania, under the direction of William Tennent (1673–1746). Tennent's school would become the bastion of the New Light (that is, prorevival) Presbyterian faction. In 1746 the New Lights founded the College of New Jersey after Tennent's model. In 1896, the school was renamed Princeton.

Revivalist fervor also led to the founding of Dartmouth, Brown, and Rutgers. New Light Congregationalist Eleazar Wheelock (1711–1779) had founded an academy for Native Americans in Connecticut. The school moved to New Hampshire where it became a college for New Light missionaries to natives, named Dartmouth. The Baptists, largely clustered in Rhode Island, founded the College of Rhode Island in 1765, later renamed by its benefactor Nicholas Brown (1769–1841). Dutch Reformed New Light ministers in New Jersey founded Queen's College (later Rutgers) in 1766.

Anglicans gained control of two colleges in the northern colonies. King's College (later Columbia) was begun in 1754

by the Church of England's Society for the Propagation of the Gospel in Foreign Parts. Interreligious struggles resulted in a new charter in 1754 that gave trustee seats to the senior ministers of New York City from Dutch Reformed, Presbyterians, and French Calvinist traditions. The College of Philadelphia (later University of Pennsylvania) was the only school founded as nonreligious. In the Quaker colony where no established church was the rule, neither did its college have an official relationship to a church. Anglicans took control of this school before the Revolution.

Early United States

Various conditions led to the growth of denominational colleges in the United States up to 1860. An increase in geographic territory provided through the Northwest Ordinance and Louisiana Purchase more than doubled the landscape, and citizens moved westward beyond the Appalachian Mountains. Railroads were built from East to West, and the locations of many colleges follow the railway path. The First Amendment prohibited the establishment of any church in the United States, with individual states gradually doing the same. Schools such as William and Mary, Harvard, Yale, and Columbia had to make transitions from enjoying state privilege to being private institutions. In Massachusetts, where the Congregational Church was the established state church until 1833, Harvard, Williams, and Amherst held the Congregational monopoly on higher education until the Universalists founded Tufts in 1852. In the Dartmouth College case of 1819, the Supreme Court limited state legislatures from interfering in the governance of private institutions of higher education. Denominations took advantage of the protections granted to private education and had founded nearly two hundred schools on the eve of the Civil War.

Transitions in Protestantism also contributed to the growth of denominational colleges. With the westward spread of the population, Protestants feared the growth of Roman Catholicism in territories previously under French and Spanish colonial government, and Protestant schooling on the frontier was an attempt to stem Catholic inroads. Congregationalists and Presbyterians joined forces in missionary and educational endeavors. The Plan of Union in 1801, a cooperative in home missions, was followed by the Society for the Promotion of Collegiate and Theological Education at the West (SPCTEW) in 1843. The SPCTEW gathered funds from Congregational and Presbyterian churches to establish and support Protestant schools.

Congregationalists and Presbyterians founded sixty colleges, ten of which were joint schools.

The Presbyterians led in the founding of Protestant colleges. By 1860, they had forty-nine schools, including Transylvania in Kentucky, Dickinson in Pennsylvania, and Hanover in Indiana. They had schools in twenty-one of the thirty-four states by 1860, some of which resulted from joint efforts with the Congregationalists. The Presbyterians' requirement of an educated clergy resulted in their demand for colleges to follow the migration of its members. The aggressive push of Congregational-Presbyterian education reached Oregon in 1854 with the founding of Pacific University. Today the Presbyterian Church (U.S.A.) recognizes sixty-seven colleges and universities as affiliates with the denomination. Twenty-six of those schools were founded between the Revolution and the Civil War. Eight were founded in the twentieth century.

The Congregationalists founded twenty-one colleges before the Civil War. As with the Presbyterians, Congregationalists required an educated ministry and founded colleges in places where New Englanders relocated. Eastern Congregational colleges served as models for future colleges. Alumni and administration of Yale contributed to the building of these colleges. By 1860, Yale as the "Mother of Colleges" was involved in starting sixteen schools. Oberlin College (1833) in Ohio was a model of evangelicalism and social reform for schools in Michigan and Iowa. As the Congregationalist's "Plan of Union" dissolved—that is, the western spread of new church settlements—local Congregationalists took over some of these joint schools and directed their interests in founding their own. Congregationalists acquired the Methodist Wheaton College in 1860. Wheaton was the Congregational counterpart to nearby Knox College, a collaborative college that became Presbyterian. Today the descendent of the Congregational Church, the United Church of Christ, lists thirty affiliated colleges, four of which are originally from the SPCTEW.

The early start and rapid growth of Presbyterian and Congregational colleges were the products of a need for educated ministers. Other denominations that required educated clergy were also early founders of colleges, though on a much smaller scale. The Episcopal Church founded eight schools following the Revolution, with a total of eleven. However, slowly Columbia, Pennsylvania, and the College of Charleston divested from their Episcopal interests. German Reformed and Lutheran churches founded relatively few colleges and were late in the process. While the German

Reformed Church founded Franklin and Marshall in 1787, Heidelberg College would not be founded until 1851. The German Reformed Church started three schools before the Civil War and inherited Central University (1853) from the Baptists in 1916. Lutherans founded six schools, starting with Gettysburg in 1832. Universalists founded four colleges, beginning with Norwich in 1834. Harvard had become influenced by Unitarians by the end of the seventeenth century, and they exerted increasing influence throughout the nineteenth century. Unitarians also founded Washington University in St. Louis, Missouri, in 1853.

Denominations with little or no tradition of educated or professional clergy also founded colleges and universities. The Society of Friends (Quakers) had no professional clergy. Their first three schools, Haverford, Guilford, and Earlham, began as boarding schools in the 1830s and would not be colleges until the 1850s. The Baptists had founded the College of Rhode Island (Brown) in 1765 but would not start another school until Colby College in 1820. With the founding of Vassar in 1861, Baptists had commenced twenty-five schools prior to the Civil War. Twenty-two schools remained in the eastern portion of the United States, though they proclaimed the motto “every state its own Baptist college.” The 1845 schism of the General Baptist Convention resulted in the separation of educational interests of the Baptists. Today the Southern Baptist Convention has fifty-two colleges and universities, and the American Baptists have sixteen. The Disciples of Christ, emerging out of the Baptist churches, also diverged Baptist educational interests. The Disciples founded five colleges between 1837 and 1855, all of which were in the Ohio and Mississippi river valleys.

Methodists were late in founding colleges and universities, compared to Presbyterians and Congregationalists. They inherited schools such as Allegheny, Dickinson, and Adrian from the Presbyterians. The first college founded by the Methodists was McKendree in Lebanon, Illinois, in 1828. Its namesake was the circuit rider-turned-bishop William McKendree (1757–1835). While the next school that they founded was Wesleyan in Middletown, Connecticut, nearly all Methodist schools were west of the Appalachian mountains. Methodists reached the Pacific coast in 1850 with the founding of the College of the Pacific in Stockton, California. As with the Baptists, the 1844 Methodist schism separated schools into respective denominations. Today the United Methodists list ninety-six affiliate schools.

Early U.S. Curriculum and Religious Life

Although ministers were involved in the founding of colleges and universities, especially in western states, other factors contributed. Community leaders were interested in the prestige, population, and economic increases a college brought to the town. Denominational colleges resembled community colleges, except they were run by denominations. These local colleges were small in comparison to the major colleges such as Yale, which had five hundred students by the middle of the nineteenth century. Serving as community colleges, local schools also offered secondary education in areas where there was none. At Wheaton College, only 10 percent of the student population was studying college-level curriculum. Since local colleges commonly admitted college students on low tuition, revenue from secondary education supplemented income.

The curriculum of the antebellum college was similar to the classical curriculum of colonial colleges. After 1815, northeastern schools began to include science into the course of study and purchased laboratory equipment. In addition, these colleges hired professional faculty in the sciences. The number of these instructors grew twelve fold between 1800 and 1850. Schools in the South and West lagged behind in incorporating a science curriculum and professional faculty. Many early educators were tutors with no more than the baccalaureate. In eastern schools, faculty commonly possessed theological training in addition to their college degrees.

Philosophy and theology were part of the classical curriculum, but biblical literature was a later addition. In 1840 Alexander Campbell (1788–1866), founder of the Disciples of Christ, boasted that his Bethany College had the only department in English Bible. Students were expected to know and study the Bible regularly. In the early nineteenth century, students at Princeton gave weekly recitations in the Bible to the school’s president on Sunday afternoons. Oberlin required students to meet in Bible study groups for one hour each week, with the understanding that every student would study the entire Bible in the four years there. The study of comparative religions or history of religions would not emerge until the development of the research universities in the latter quarter of the nineteenth century.

As with the colonial colleges, the literary societies remained the primary extracurricular activity in nineteenth-century colleges and universities. When the societies waned

in influence, athletics took their place. Chapel attendance was mandatory. Students also engaged in social reform movements. Oberlin College became the western hub for abolitionism, and its offshoots encouraged the same. When abolitionism had been achieved, students remained active in reforms such as temperance and women's rights. Campaigns against secret societies, particularly Anti-Masonry, were popular amongst college leaders, but were less so by students who participated in fraternities.

Early U.S. Public Education

Public education also blossomed between the Revolution and Civil War in the form of state universities. The earliest state universities resembled private schools with public charters and public funds. The University of Georgia (1785) received its funds from private sources until state legislators made appropriations in 1881. North Carolina's highest court determined that the state had given land to the University of North Carolina as if to a private party. With these confusions in place, it is understandable that "public" universities often stood for private goals. As early as the 1750s, William Livingstone (1723–1790) had proposed a state-sponsored university in New York. Yet Livingstone was part of a plot to use the state to block Anglican control of King's College. Protestants were invested in the development of both private and public education, though in Illinois denominational colleges opposed a state university until after the Civil War. Presbyterian colleges in Tennessee, Delaware, and California became state universities, remaining affiliated with the denomination for a long while. The University of Delaware was not under sole state control until 1913. Similar developments occurred in other states. In more subtle ways, trustees, regents, presidents, and faculty of state universities privileged Protestantism through their own membership in a Protestant denomination.

Women and African Americans

The integration of race and sex was an ongoing process. In 1837 four female students entered Oberlin College. By 1873, nearly two-thirds of the Protestant colleges were coeducational. While integration at Protestant schools existed, the bulk of educational avenues for women and African Americans were in separate, secondary academies. Female "seminaries" devoted to the preparation of women for missionary service began in the 1820s. Mount Holyoke College, founded by Mary Lyon (1797–1849) in 1837,

began under these auspices. Women's liberal arts colleges began with Vassar College in 1865, followed by Wellesley in 1870, Smith in 1871, Radcliffe in 1879, Bryn Mawr in 1885, Barnard in 1889, and Mount Holyoke, which received its collegiate charter in 1888 but was not officially a college until 1893. Together these schools are known as the "Seven Sisters."

As early as 1774, two men from the Gold Coast (Ghana today) had been accepted to Princeton with the intention of becoming ministers in their homeland, but war disrupted those plans. Presbyterians started the earliest African American colleges for the purpose of training ministers to serve in Africa. Interdenominational Protestant agencies such as the American Colonization Society (ACS) and the American Missionary Association (AMA) founded colleges for the same purpose. Members of the ACS established the African Education Society (AES) in 1819 to promote education for future African American ministers. John Miller Dickey (1806–1878), brother-in-law to AES founder and ACS treasurer Elliott Cresson (1796–1854), established the Ashmun Institute in Pennsylvania in 1854 (later renamed Lincoln University). The first racially integrated and coeducational college in the South was Berea College in Kentucky. John Fee (1816–1901), Berea's founder, was the son of a slaveholder and alumnus of Lane Seminary in Cincinnati. He supported racial equality and built his college on those principles. The school remained integrated until a 1904 decision upheld Kentucky's segregation laws, only to be overturned fifty years later. The Methodists founded Ohio's Wilberforce University in 1856, turning it over to the African Methodist Episcopal Church in 1863. Following the Civil War, the Freedman's Aid Bureau contributed to the development of religious colleges for African Americans. The AMA applied for Bureau funds to found Atlanta University in 1865, Fisk in 1866, Howard in 1867, and Hampton in 1868. Methodists sponsored professional schools, like the medical schools at New Orleans University and Walden in Nashville. Protestants entered these endeavors to train black professionals and clergy who would return to Africa and "redeem" that continent.

Education after the Civil War

Policy changes allowed for Protestants to develop higher education. The Morrill Act of 1862 aided in elevating some religious colleges into state universities. The Methodist Bluemont Central College, founded in 1857, became

Kansas State College (later University) in 1862, relocating to Manhattan, Kansas. The founding of land grant colleges gave opportunities for some Protestant schools to gain prestige. But shifts in higher education would ultimately lead to the marginalization of religious colleges. The new emphasis on agriculture and technology promoted in the Morrill Act turned away from the classical education of the liberal arts. An increased volume of public universities replaced the function of Protestant colleges in western states. At the turn of the twentieth century, the division of enrollment in religious and non-religious schools was almost even. By 1965 religious schools accounted for only 17.3 percent of student enrollment. This trajectory followed the transition to public higher education. In 1978, private schools had less than a quarter of the student enrollment.

Curricular changes also marginalized the private religious college. Beginning in 1876, with the founding of Johns Hopkins University, higher education became more professionalized and American universities began to follow German forms of education. In addition to the university format, liberal subject matters challenged Protestant assumptions. Darwinian evolution and higher criticism made their way into colleges and universities from German scholarship. While these subjects were offensive to conservatives, other shifts avoided sectarianism by leaving out religion altogether. In the early twentieth century, the University of Oregon declined a chair of religious studies in the philosophy department in an effort to uphold the state's law regarding religious neutrality. More aggressive efforts sought to expunge religion from public education altogether. The American Association of University Professors made one of its first statements during its inaugural year in 1915 that any school based on a denomination or religious organization should not be public.

Religion was also exerting less influence on the university ethos. Schools began favoring laity over clergy as presidents. Harvard initiated this movement in 1869, and Princeton appointed future president Woodrow Wilson (1856–1924) in 1902. Chapel services, a staple of college life, also became lax. The University of Wisconsin dropped its mandatory chapel requirement in 1869, and most state universities had done so by 1930. This process was complicated. Illinois's highest state court upheld the right of the faculty at the University of Illinois to make chapel attendance mandatory for students. Private schools opted for voluntary chapel as a way of encouraging religious life but not mandating it. Harvard switched to the voluntary system

in 1886, with others following suit. These movements away from the older college format, coupled with the break of some schools from their founding denominations, resulted in what scholars call "secularization." Secularization was slower at female and African American schools. Vassar did not abolish mandatory chapel until 1926, the first of the "Seven Sisters" to do so. As late as 1945, 90 percent of students in African American colleges reported attending church at least twice monthly.

Student Ministries on College Campuses

Before these characteristics of "secularization" were in place, conservative Protestants were already changing their approach to the campus. The YMCA began a student ministry prior to the Civil War. The universities of Michigan and Virginia were first to institute the "Y" in 1858. The number of local chapters grew to nearly forty before a national movement was underway in 1877. The YMCA national organization started in 1886. At its peak in 1920, the "Y" had 731 chapters with more than 94,000 students. The YMCA also formed the Student Volunteer Movement (SVM) in 1888, an agency that promoted missionary work, though not sending missionaries itself. The SVM peaked around World War I, but afterward both organizations went into numerical decline. By 1940, the YMCA lost 400 chapters and 44,000 members. The SVM lost 550 chapters and 3,700 students between 1920 and 1932. One explanation for this decline was that both organizations became less active in the evangelism of students and instead promoted a "social" form of Christianity that included international peace, justice, and economic development. Without the aggressive evangelism, the organizations were not acquiring members as rapidly as before. In their place emerged InterVarsity Christian Fellowship.

InterVarsity began in England, spread to Canada in 1928, and came to the University of Michigan in 1938, the first in the United States. In 1940 the American organization formed with C. Stacey Woods (1909–1983) as its general secretary. Five years later, the Student Foreign Mission Fellowship merged with InterVarsity. Student members lead the local InterVarsity chapters, and its focus is on spiritual maturity through Bible study, prayer, and evangelism. Campus Crusade for Christ formed at the University of California Los Angeles (UCLA) in 1951. Founded by Bill Bright (1921–2003), Campus Crusade is a major campus ministry that employs staff to share the "Four Spiritual Laws." The third of the large campus ministries is

Navigators. Started by Dawson Trotman (1906–1956), a U.S. Navy seaman, in 1933, Navigators has a collegiate ministry with 176 chapters in the United States.

Denominational student ministries are also present on campuses. Often these involve student centers next to campus where clergy work. The first student center began in 1905 at the University of Michigan. The Presbyterian Church U.S.A. started the university pastorate. Other denominations are present, including Episcopalians, Lutherans, Baptists Student Unions, and the Wesley Fellowship of the United Methodist Church. In addition to denominational and interdenominational student ministries, many schools instituted a chaplaincy. Fourteen schools had chaplains in 1902. The chaplaincy was a response to the absence of clergy as college presidents and the dissolution of mandatory chapel. Harvard's first chaplain came one year after mandatory chapel ended. Chaplains were local clergy who served the campus part-time. Dartmouth's chaplain became full-time and Fellow in Religion in 1927. Following World War II, a dramatic increase of chaplains occurred. During the 1948–1949 academic year, more than half of colleges and universities had chaplains, the majority of them at small colleges with enrollment of less than 1,500 students.

Jewish and Catholic ministries also developed in the twentieth century to provide for the religious needs at public universities. The Catholic Newman Movement traces its origins to John Henry Newman (1801–1890) and the revitalization of Catholicism at Oxford. In 1883, students met at the University of Wisconsin at the Melvin Club. One of its alumni founded the first Newman Center at the University of Pennsylvania in 1893. In 1905 Pope Pius X (1835–1914) ordered the establishment of chaplains on all college campuses. This mandate was short-lived and later left to the prerogative of the individual diocese. In 1908 the Catholic Student Association began, replaced in 1915 by the Federation of College Catholic Clubs (renamed National Newman Club Federation in 1938). By 1950 the Newman Federation claimed a quarter of all Catholic students enrolled in non-Catholic colleges and universities. During its growth, the Newman Federation had become an independent Apostolate. Following Vatican II, there was a renewed interest in returning campus ministries to the diocesan level. In 1969 the Newman Federation dissolved, giving way to the Catholic Campus Ministry Association for college chaplains. The remnants of the Newman movement merged with the National Federation of Catholic College Students in 1985 to form the National Catholic Student

Coalition. Catholic campus ministries commonly meet in Newman Center facilities.

The Hillel Fellowship began in 1923 at a barbershop in Champaign, Illinois, where Jewish students from the University of Illinois gathered. Rabbi Benjamin Frankel organized Hillel and petitioned the B'nai B'rith for adoption, which occurred in 1924. Hillel spread quickly in northern universities. It became international in 1942 with a chapter at Queen's University in Ontario, followed by the Latin American Fellowship in Havana, Cuba, in 1954. Hillel struggled financially in the 1970s and 1980s, only to re-emerge as Hillel: The Foundation for Jewish Campus Life in 1994. In 2002, the Hillel headquarters opened in Washington, D.C.

Bible Schools and Conservative Universities

Conservatives disappointed by the secularization of public and denominational schools opted for new institutions of postsecondary education. Fundamentalist dispensationalists founded Bible institutes as places for training ministers for the cities and missionaries for abroad. The first of these institutes was Nyack Missionary School in New York City, founded by Presbyterian A. B. Simpson (1843–1919) in 1882. The flagship school was Moody Bible Institute, the largest and most successful Bible institute. Dwight L. Moody (1837–1899) founded the school in Chicago in 1889, and under the leadership of Reuben Torrey (1856–1928) it became a high-grossing hub of fundamentalist thought. Also in 1889, Baptist minister A. J. Gordon (1836–1895) commenced the Boston Institute (later named Gordon College). The Bible Institute of Los Angeles (later Biola) was founded in 1908 and soon thereafter enlisted Torrey to run the institute's administration. The education philosophy stripped the curriculum of intellectual pursuits for their own sake. Instead, faculty preferred a practical approach, emphasizing Bible study, missions, and practical Christian work. The curriculum also focused on the spiritual development of its students, and many schools required Christian service hours per semester. Bible institutes issued diplomas not degrees. Since the 1930s, more inclusion of liberal arts into the curriculum has caused a transition to issuing degrees. Most Bible institutes became Bible colleges, and some became Christian liberal arts colleges. Biola maintains the thirty credit hours of Bible requirement set by the Accrediting Association of Bible Colleges (AABC) accreditation standards, while also offering a variety of liberal arts majors. At the close of the twentieth century, almost all of

the schools accredited by the AABC were Bible colleges not Bible institutes.

New trends in conservative Protestant higher education have left behind the Bible institute and favored the Christian university. Oral Roberts (1918–2009), who had established a Bible institute in the 1940s, founded his Oral Roberts University in 1962. Its doors opened in 1965. Roberts envisioned his schools to be a place of evangelical instruction and professional training. In 1978 Roberts opened the university's medical school, where students were to receive a sound doctrine, excellent professional training, and an appreciation for divine healing as part of medical science. Pat Robertson (1930–) founded Regent University in 1978 and started a law school in 1986. Jerry Falwell (1933–2007) founded Liberty University in 1971 and began a law school in 2004. Administrators of conservative evangelical colleges and universities have formed organizations. The Council for Christian Colleges and Universities began in 1975 and today has 111 member schools and 70 affiliates.

Catholic Higher Education

Historically, Roman Catholics have favored establishing their colleges and universities rather than cooperate with non-Catholics in founding schools of higher education. In 1789 Bishop John Carroll (1735–1815) deeded land for Georgetown, but its charter would not exist until 1815. Prior to 1850, Catholics founded 42 colleges, with another 152 founded between 1850 and 1900, 72 between 1901 and 1950, and 4 from 1951 to 1972. The vast majority of schools were started as all-male. There exist some all-female and coeducational schools. In recent decades, single-sex schools have become coeducational. Both diocese and religious orders have founded colleges. As with Protestant denominations, Catholics founded colleges to promote lay devotions and train vocational religious.

Catholic colleges kept pace with trends in professional higher education in the nineteenth century. The Catholic University of America eagerly sought recognition as a legitimate university and opened graduate schools before undergraduate ones. The Jesuit St. Louis University opened a medical school in 1842. Georgetown did the same in 1849. The University of Notre Dame initiated Catholic law schools in 1869, with Georgetown soon following. In total, Catholics founded nine medical schools and twenty-one law schools before 1960.

Athletics have been vital to the reputation of Catholic colleges and universities in the twentieth century. The

gridiron legacies of Notre Dame and Boston College as well as the basketball successes of Marquette, Georgetown, and Villanova provided Catholic schools with positive reception from the non-Catholic population of the United States.

Jewish Higher Education

Jewish higher education began at the end of the 1850s, when Reform rabbi Isaac Mayer Wise (1819–1900) formed Zion Collegiate in Cincinnati. The intent was to provide preparatory education for men seeking to enter the forthcoming Jewish Theological Seminary. Zion Collegiate closed only one year after commencing. Maimonides College at Philadelphia opened in 1867, under the cooperative orchestration of the Board of Delegates of American Israelites and the Hebrew Education Society. Despite having respected faculty, student enrollment was small and the college closed in 1873. Two years later, Wise opened Hebrew Union College in Cincinnati. Starting with Gratz College in Philadelphia in 1897, eleven Jewish schools for training teachers opened by 1929. The Teachers Institute at the Jewish Theological Seminary in New York City opened in 1909. Its curriculum mirrored the progressive pedagogy of Columbia's Teachers College. One explanation for this increase in higher education institutions for Jews was a response to the movement of Jewish students into public colleges. By 1918 Jews made up 79 percent of the student body at the City College of New York, 48 percent at New York University, 21 percent at Columbia, and 10 percent at Harvard. At this same time, Protestants called for quotas limiting Jewish student enrollment, a policy that went into effect at many major universities. The presence of Jewish higher education became a viable option for the children of nineteenth-century immigrants. Graduate education opportunities also opened for Jewish students. The Dropsie College, founded in 1907 in Philadelphia, became the only independent graduate school devoted to Jewish scholarship. Students who attend Dropsie often seek Doctor of Philosophy or Doctor of Education degrees.

Diversity of Higher Education

In addition to Jews, other religious groups have established colleges and universities. The Church of Jesus Christ of Latter-day Saints (Mormons) founded the University of Deseret in 1850 (later University of Utah). Brigham Young University in Provo, Utah, began in 1875. With five campuses and 28,000 students, it is the largest religious university and second-largest private college in the United States.

The Greek Orthodox founded Holy Cross School of Theology in 1937, and began Hellenic College in 1966. Since the 1960s, eastern religious traditions have founded schools. In 1964 the Institute of Buddhist Studies opened in Berkeley, California, and affiliated with the Graduate Theological Union. A total of nine Buddhist colleges and universities are currently open in the United States. Followers of the Vedic guru Maharishi Mahesh Yogi (1917–2008) founded the Maharishi International University (later Maharishi University of Management) on the principles of Transcendental Meditation and consciousness-based education. The university began 1973 in Santa Barbara, California, and moved to Fairfield, Iowa, in 1974. In the 1980s, Muslims founded the American Islamic College in Chicago.

Conclusion

Religion has remained an important component to the story of higher education in America. It was a vibrant motivation for the founding of the oldest and greatest number of colleges and universities. It persists in various forms on almost every campus. In the early twenty-first century, students who complete secondary education have an array of options for postsecondary education. These options include attending a college or university of various religious commitments and affiliations with denominations. So too, college students have the choice of involvement in any number of campus ministries. The present situation with higher education is a diversity of the market. The plurality of options in higher education means that students have choices based on their values. Religion has not disappeared from public life, and college campuses remain one environment in which students can choose whether or not religion is an important value.

Education: Court Cases

The courts in the United States have adjudicated numerous constitutional questions about religious practice and instruction in public schools. Since their formation in the

mid-nineteenth century, public schools have aimed to integrate religiously diverse students into a common political culture, making public schools a central arena for broader debates about religion's place in American public life. According to the First Amendment of the U.S. Constitution, "Congress shall make no law respecting an establishment of religion or prohibiting the free exercise thereof." Observers have not always agreed on what this means for public schools as state institutions. Can students pray or study the Bible in class? Can students refuse to study subjects or participate in exercises they find religiously objectionable? What can science classes teach about human origins? Practices and policies varied across states and communities throughout the nineteenth and early twentieth centuries, but the U.S. Supreme Court has issued relatively consistent, uniform guidelines since the mid-twentieth century. Schools may not sponsor or promote religion, but they may teach about religion, and students may initiate religious exercises on their own. There has rarely been consensus about how to apply these principles in specific cases, however.

Devotional Practices in the State Courts

While most of the nation's earliest schools had promoted some sort of sectarian belief (beliefs characteristic of a particular Protestant denomination or sect), the trend in the first few decades of the nineteenth century was to reduce intra-Protestant division by promoting "nonsectarian" education. Yet these nonsectarian schools remained pervasively Protestant in character. Reformers eliminated discussion of theological matters that divided the Protestant sects but retained devotional practices such as prayer, hymn singing, and Bible reading without commentary, which they deemed common to all. As the United States welcomed waves of Catholic immigrants during the mid-nineteenth century, such practices came under increasing attack. Catholic leaders argued that reading the King James Bible was actually sectarian, favoring Protestantism in general, and that students should be permitted to read the Catholic Douay translation of the Bible instead, or be excused from Bible-reading exercises. Few nineteenth-century voices called for removing religion from the nation's fledgling public schools altogether. Instead, disputes centered on the meaning of "nonsectarianism" and on the rights of individual dissenters to "opt out" from practices favored by the majority.

By the second half of the nineteenth century, disputes about devotional practices in public schools began to enter the courts. For reasons explained below, federal courts did

not begin hearing cases on religious expression in public schools until the middle of the twentieth century. Until then, state courts adjudicated such lawsuits, which led to great variety in practice and policy across states and communities.

One of the earliest state cases transpired in 1872 (*Board of Education of Cincinnati v. Minor*). Cincinnati's Catholic archbishop complained that having students read the King James Bible daily marked the public schools as sectarian. A group of Jews, Unitarians, Universalists, and Quakers joined his protests. In response, the school board decided to eliminate all devotional exercises. Protestant parents filed a lawsuit, maintaining that Christianity was essential to moral and civic education, and should not be removed from the schools. The Superior Court of Cincinnati agreed, and the court ordered the devotional exercises restored. On appeal, the supreme court of Ohio reversed this ruling, on the grounds that such decisions lay in the school board's hands. While affirming the board's authority, the state's supreme court also lent support to its policy, agreeing that religious majorities should not impose their practices over the objections of dissenters.

Most school boards did not follow Cincinnati's example, however, preferring to excuse students who objected, rather than eliminate devotional exercises altogether. State courts arrived at a range of opinions on such policies. For example, the school board of Edgerton, Wisconsin, maintained that the King James Bible was nonsectarian, but the state permitted students to leave the room, rather than read from it. In an 1890 decision (*Weiss v. Edgerton*), Wisconsin's supreme court struck down Edgerton's policy, finding that such Bible-reading exercises were indeed sectarian, and that opt-out policies did not mitigate their harmful effects, for students who left the room would feel ostracized by their peers. In contrast, Michigan's supreme court in *Pfeiffer v. Board of Education* (1898) agreed that the King James Bible was sectarian but found nothing wrong with reading it in schools, provided students could excuse themselves. Not all school boards permitted opting out, however. One Illinois school district deemed prayer, hymn singing, and Bible reading essential to promoting common morality and good citizenship, and so the district refused to exempt students for any reason. After Catholic parents objected, the Illinois supreme court in *Ring v. Board of Education of District 24* (1910) ruled that such practices violated the state constitution because they were sectarian in nature, and had to be eliminated. Even had the school board sought to institute an opt out

policy, the Illinois top court implied such devotional exercises would still run afoul of the law. Finally, in *Vollmar v. Stanley* (1927), the supreme court of Colorado departed from these earlier decisions by ruling that the King James Bible was nonsectarian, but the court then ordered the institution of an opt-out policy that neither party had requested (the school board thought Bible-reading exercises should be mandatory, while the objecting parents thought they should be eliminated).

Policies thus varied across school districts and states, but common themes can be identified. In each of these cases, state courts were asked to adjudicate between the religious rights of the majority, who deemed practices such as Bible reading, prayer, and hymn singing essential to the public schools' mission, and the religious rights of minority dissenters, who found them objectionable and discriminatory. By the early twentieth century, most state courts agreed that reading the King James Bible was sectarian and could not be required of all students, but courts disagreed as to whether majorities could continue to promote such exercises provided opt-out policies were in place. Yet few voices at this time called for the elimination of religion from public schools altogether. Most observers agreed that the schools should be nonsectarian, but changing social circumstances, marked especially by increasing religious diversity, led to a lack of consensus on what precisely that meant.

School Prayer in the Supreme Court

Because most decisions about education are made at the state or local level, the U.S. Supreme Court did not begin hearing cases about religion and public education until the 1940s (an earlier Court decision in *Pierce v. Society of Sisters* in 1925 had guaranteed parents the right to send their children to parochial schools, but that decision was based on parental autonomy, not religious rights). According to the First Amendment of the U.S. Constitution, "Congress shall make no law respecting an establishment of religion or prohibiting the free exercise thereof." These provisions, usually described separately as the establishment clause and the free exercise clause, initially only applied against the federal government; states were free to enact whatever policies they chose. In fact, many states maintained religious establishments long after the passage of the First Amendment. After the Civil War, the Fourteenth Amendment significantly restricted the power of the states; states could not "deprive any person of life, liberty, or property, without due process of law," nor could states deny to any person "the

equal protection of the laws." Since the mid-twentieth century, the Supreme Court has held that the Fourteenth Amendment's due process and equal protection clauses make the fundamental protections of the Bill of Rights applicable against the states, as well. Based on this doctrine of "Incorporation," the Court began to decide cases about religious expression in public schools.

The Supreme Court first applied the First Amendment's establishment clause against the states in a 1947 case, *Everson v. Board of Education*. This decision, which involved a New Jersey plan to reimburse parochial school students for public transportation costs, articulated the basic principles that would govern the school prayer cases. Writing for the majority, Justice Hugo Black famously explained that "The 'establishment of religion' clause of the First Amendment means at least this: Neither a state nor the Federal Government can set up a church. Neither can pass laws which aid one religion, aid all religions, or prefer one religion over another." Adopting what many observers have described as a "separationist" account of nonestablishment, Black ruled that the government must remain "neutral" on all religious matters; it could not favor any particular religion, nor could it aid religion in general, no matter how "nonsectarian." While this interpretation of neutrality would prove controversial, it guided the Court's decisions on religion and education for several decades.

In two landmark decisions from the early 1960s, the Supreme Court considered for the first time whether school-sponsored devotional practices, such as prayer and Bible reading, violated the First Amendment's establishment clause. As discussed above, such practices had been widespread since the nineteenth century, but policies varied across states and communities. By taking up these cases, the Court issued national standards for the first time, dictating to states and local school districts what they could and could not do.

The first case, *Engel v. Vitale* (1962), tested a 1958 New York policy that required public schools' classes to begin the day by reciting: "Almighty God, we acknowledge our dependence upon Thee, and we beg Thy blessings upon us, our parents, our teachers and our Country." The New York Board of Regents had written this broadly ecumenical prayer itself, purposefully avoiding any reference to particular denominational or sectarian teachings. Proponents believed that such prayers would instill proper moral and spiritual values in students, uniting them in the country's Cold War struggle against "godless Communists." In a 6-1

decision, however, the Supreme Court struck down the Regents' prayer as unconstitutional. Writing for the majority, Justice Black found this exercise particularly problematic because state officials had written the prayer themselves. Reviewing the history of the establishment clause, he argued that it was meant, at the very least, to prohibit governments from directing particular forms of religious expression. Despite its broadly interdenominational character, the prayer violated the standard of neutrality. Furthermore, Black emphasized that allowing students to opt out made no difference, differentiating this case from *West Virginia v. Barnette* (1943), which had permitted students to excuse themselves from reciting the Pledge of Allegiance based on the free exercise clause. In terms of the establishment clause, Justice Black maintained, coercion was irrelevant. The government should not be in the business of dictating religious expression.

Justice Potter Stewart offered the lone dissenting opinion in *Engel*. He argued that as long as students had the option to refrain, there was no evidence of improper establishment. Instead, such prayer exercises were in line with the "cherished spiritual traditions of our Nation." Stewart expressed greater concern for the Free Exercise rights of students who might be deprived of the opportunity to pray than for the Establishment concerns that guided the majority's decision.

Similar divisions marked the second landmark case, *Abington v. Schempp* (1963). This case tested a Pennsylvania policy that required every school to begin the day by reading at least ten verses from the Bible without comment, but that included an opt-out provision. In an 8-1 decision, the Supreme Court struck down this practice as unconstitutional, finding that it violated the principle of neutrality. Writing for the majority, Justice Thomas Clark articulated a two-pronged test for assessing neutrality: a valid law had to have a secular legislative purpose, and its primary effect could neither advance nor inhibit religion. The Pennsylvania policy failed this test, for its primary effect was to promote Christianity over other religions and religion in general over nonreligion. Again, Stewart dissented from the *Schempp* decision, arguing that the Pennsylvania policy served only to accommodate the beliefs of the majority. As long as there was no coercion, he saw no establishment clause violation. But according to Clark, the opt-out provision made no difference, for coercion was only relevant for Free Exercise rights, not nonestablishment. Clark also drew a crucial distinction between promoting religion and teaching *about* religion: "Nothing we have said here indicates that such

study of the Bible or of religion, when presented objectively as part of a secular program of education, may not be effected consistently with the First Amendment." The *Schempp* decision thus established the basic guidelines that continue to govern cases about religion and public education today. Schools may not sponsor or promote religious exercises, but they may teach about religion, provided they do so objectively.

The *Engel* and *Schempp* decisions were extremely controversial and provoked a passionate public outcry in opposition. As discussed above, policies regarding devotional practices had varied widely across states, but prayer and Bible-reading exercises were widespread and had been since the nineteenth century. For the first time, the Supreme Court had declared all such practices unconstitutional. While many observers, both religious and nonreligious alike, voiced support of the Court's decisions in the name of individual liberty and minority rights, critics contended angrily that the Court was kicking God out of the public schools. Several school districts vowed to ignore the Court's mandate, and anecdotal evidence suggests that many continue to encourage prayer to this day. Repeated attempts have been made to pass a constitutional amendment that would permit state-sponsored prayer in public schools, but all such efforts have failed. The issue remains contested. In addition, many school districts proved fearful of crossing the line that Justice Clark had demarcated between promoting religion and teaching about religion, and these districts decided to eliminate any discussion of religion from the curriculum altogether. Though an unintended consequence of the school prayer cases, this has bolstered critics' complaints that the decisions contributed to the secularization of American public schools.

Later Supreme Court Cases

While the courts have never prohibited student-initiated prayer, many states have worked hard to develop schemes by which voluntary prayer might be encouraged. In the decades following the school prayer cases, many districts instituted mandatory moments of silence, during which students might be permitted to engage in silent reflection, meditation, or prayer. For many observers, moments of silence offer an acceptable compromise on the school prayer issue, accommodating those students who wish to pray, while avoiding state sponsorship. Yet opposition has also arisen from both sides. Opponents see moments of silence as a thinly veiled attempt to reintroduce devotional practices

into the school day, and even some school-prayer advocates reject moments of silence as insufficient for promoting spiritual values and moral consensus.

The Supreme Court has decided only one case involving a moment of silence policy. In *Wallace v. Jaffree* (1985), the Court considered an Alabama statute that authorized a period of silence for “meditation or voluntary prayer.” In a 6-3 decision, the Court struck down Alabama’s scheme as unconstitutional. Writing for the majority, Justice John Paul Stevens found that the primary purpose of the statute was to promote religion, but that the establishment clause required neutrality between religion and nonreligion. (In his dissenting opinion, Justice William Rehnquist disagreed with Stevens, advancing a competing understanding of the establishment clause that would permit governmental endorsement of religion in general, provided no particular sect or denomination was favored.) Stevens based his decision on the fact that Alabama already had a law encouraging a period of silence for “meditation.” The only reason to add the “voluntary prayer” clause would be to encourage prayer impermissibly. But Stevens also confined his decision to the facts of this particular case. A majority of justices agreed that moment-of-silence schemes were generally fine, and lower courts have usually upheld them when challenged.

A different kind of school prayer case came before the Supreme Court in 1992. In *Lee v. Weisman*, a 5-4 majority ruled unconstitutional an ecumenical prayer offered by a rabbi at a Rhode Island middle school graduation ceremony. Writing for the majority, Justice Anthony Kennedy emphasized the coercive nature of this religious exercise. Attendance at graduation ceremonies was effectively mandatory, and school officials had directed the performance of this religious exercise (they had issued guidelines to the rabbi to ensure that his prayer would be generally acceptable to most persons). Therefore, this activity amounted to “a state-sponsored and state-directed religious exercise in a public school.” In a concurring opinion, Justice David Souter agreed that the problem in this case was the appearance of state-sponsorship, but he disagreed with Kennedy about the significance of coercion. Following the Court’s opinions in *Engel* and *Schempp*, Souter held that coercion was not relevant for establishment clause purposes. In a sharply worded dissent, Justice Antonin Scalia disagreed with both Kennedy and Souter, appealing to the long-standing historical tradition of marking graduations with prayer.

The Supreme Court heard two other cases related directly to school prayer. In *Santa Fe v. Doe* (2000), a 6-3

ruling extended the ban on school-sponsored prayer to an invocation that a student offered prior to a high school football game. Even though the student speaker had been elected by his peers, Justice Stevens, writing for the majority, found that the school’s purpose in facilitating the election had been to promote religion in violation of the establishment clause. Finally, in *Elk Grove v. Newdow* (2004) the Court considered whether reciting the Pledge of Allegiance in public schools constituted an impermissible religious exercise because of the inclusion of the phrase “under God.” This was a particularly thorny case politically because precedents suggested that the pledge might indeed be unconstitutional, yet the justices were extremely reluctant to strike down this cherished tradition. The Court avoided having to rule on the matter by dismissing the case on a technicality (the plaintiff Michael Newdow had noncustodial parental rights and thus had no standing to sue his daughter’s school). It is unclear how the Court would have decided the case on its merits.

Each of these Supreme Court cases has proven extremely controversial, because the school prayer issue has been invested with symbolic significance in broader debates about religion’s place in American public life. Yet despite accusations that these decisions removed God from America’s public schools, another series of cases during the past two decades actually expanded protection for religious practice, provided it is student-initiated. Relying more on the First Amendment’s free speech clause than on its religion clauses, these cases have tended to move away from the standard of “neutrality” and toward a standard of “equality,” instructing school officials not to treat religious groups differently from nonreligious groups, thereby guaranteeing them equal access to school facilities. In *West Side Community School v. Mergens* (1990), an 8-1 Court majority required a school district to permit a Christian club to meet on the same terms and conditions as other student groups, despite the fears of school officials that accommodating this group might violate the establishment clause. Similarly, in *Good News Club v. Milford* (2001), a 6-3 majority ruled that a public elementary school could not bar a Christian afterschool program that included prayer and Bible lessons.

While some critics have found these decisions incompatible with the earlier school prayer cases, the Court remained generally consistent in the guidelines it earlier issued to schools. In short, schools may not sponsor or promote religious exercises (though they may teach about religion), but students may pray or organize religious activities on their

own. Yet the line between school-sponsored and student-initiated prayer is not always clear, as in the *Santa Fe* and *Good News Club* cases. Similarly, while attempting to follow the Supreme Court's guidelines, lower courts have not always agreed on where to draw the line between promoting religion and teaching about religion, as in cases involving school choirs performing sacred music or classroom observance of religious holidays. (The Supreme Court has not heard cases about either of these practices).

Curriculum Issues

The distinction between promoting religion and teaching about religion is most relevant for religious components of the curriculum, such as Bible study (permissible if analyzed for its literary or historical significance, but impermissible if read devotionally or as objective historical record). But more subtle curriculum-related issues have raised complicated questions for U.S. courts, policymakers, and educators.

For example, teaching about religion may raise constitutional issues, but so too might *not* teaching about religion. Some observers have suggested that if public schools ignore religion altogether, in the name of "neutrality," they may actually disparage religion by implying that students can understand subjects such as history, literature, economics, and science without taking into account religious values and perspectives. These observers see religion as part of a well-rounded liberal education and contend that by ignoring religion, public schools might even be violating the establishment clause by promoting what they describe as "secular humanism" in its place, though courts have consistently rejected this claim.

In other cases, parents have aimed to have their children exempted from particular components of the public school curriculum that they found religiously objectionable, such as sexual education. In *Wisconsin v. Yoder* (1972), a group of Amish parents even won the right to exempt their children from high school altogether, but the Supreme Court went out of its way to emphasize that the Amish constituted a special case. In *Mozert v. Hawkins* (1987), the Sixth Circuit Court of Appeals ruled against Tennessee parents who wanted to have their children excused from using a textbook series that they felt promoted "secular humanism." While the Supreme Court guaranteed parents the right to send their children to parochial schools in *Pierce v. Society of Sisters* (1925), these exemption cases challenge courts to determine how far school districts must go to accommodate the religious beliefs of those who remain in public school.

Courts generally have preferred to leave such decisions to the reasonable discretion of school officials, expressing concern for the burden that excessive exemption demands would impose on administrators.

Another set of cases involve religiously motivated decisions by state officials about what to include or exclude from the curriculum. Do administrators violate the establishment clause when they make religion a factor in other curricular decisions? For example, many school districts choose not to offer sexual education classes, or offer abstinence-only classes, in order to appease religious community members (of course, other religious community members might *desire* a broad-based sexual education program). If pressed, school officials can usually offer an alternative, secular reason for their decision. Because it is difficult to determine the "genuine" motivation behind such arrangements, these cases are extremely thorny.

Such issues have arisen most prominently—and most contentiously—in cases involving the teaching of human origins. Since the early twentieth century, many critics have tried to keep evolution out of public school science classrooms. Opponents have offered a range of objections to evolutionary theory, including ambivalence about its social and political implications, but most objections have stemmed, at least in part, from religious concerns that evolution might contradict a literal reading of the biblical story of creation or that it might deny necessarily any evidence for design in nature (although it is important to note that many religious adherents see no conflict between evolution and the teachings of their religion). An important series of court cases have considered whether state and school officials violate the First Amendment's establishment clause when they choose to exclude evolution from the curriculum or to require it taught alongside creationism.

Evolution, Creation Science, and Intelligent Design

The first case to test an anti-evolution statute was not about the establishment clause, which was not applied against the states until 1947, but rather the famous Tennessee Scopes trial of 1925. By the 1920s, debates about evolution figured prominently in a broader clash between religious Modernists, who argued that Christian teachings should be made compatible with new scientific and intellectual discoveries, and fundamentalists, who responded by asserting that the Bible was "inerrant" and thus constituted an exact, literal, and reliable account of human and natural history. The public

schools emerged as a central arena for this conflict. At the urging of fundamentalist leaders such as three-time Democratic presidential candidate William Jennings Bryan (1860–1925), several state legislatures considered bills during the 1920s that would have prohibited the teaching of evolution in public school science classrooms. The passage of such a law in Tennessee in 1925 prompted the Scopes trial.

John T. Scopes (1900–1970) was a twenty-four-year-old general science instructor and part-time football coach in Dayton, Tennessee, who was encouraged by the American Civil Liberties Union and local politicians to test Tennessee's new statute. Bryan volunteered to prosecute Scopes, drawing a national media spotlight on Dayton, which was further intensified when prominent trial lawyer Clarence Darrow (1857–1938) joined the defense team. Technically, the only question at issue in the case was whether Scopes had violated Tennessee's law by teaching evolution in a public school classroom. But Bryan, Darrow, and the other lawyers who worked on the case used it as an opportunity to debate the legitimacy of the law itself, introducing broader questions about the relationships between religion and science, between academic freedom and popular control over education, and between individual rights and majority rule. In particular, Darrow hoped to discredit any appeal to the Bible as a suitable source of knowledge about the natural world and to question whether it was appropriate for religious beliefs to shape public education policy.

As expected, Scopes lost the case, though his conviction was overturned on a technicality on appeal. According to many accounts, Darrow won the public relations battle, however, gaining popular support for his positions and forcing the fundamentalist factions into retreat. Yet the historical record is more mixed, as anti-evolution activity actually increased in the years immediately following the Scopes trial, Tennessee's law remained on the books, and two additional states passed similar antievolution statutes (Mississippi in 1926 and Arkansas in 1928). In fact, it was Arkansas's newly passed law that prompted the first Supreme Court case on the issue in 1968.

Arkansas's statute prohibited any public school teacher from teaching "the theory or doctrine that mankind ascended or descended from a lower order of animals" or "to adopt or use in any such institution a textbook that teaches" this theory. Arkansas had never attempted to enforce this law, however, and the Little Rock school district adopted a textbook in 1965 that included a chapter on evolutionary theory. In order to protect herself from possible prosecution, a

Little Rock teacher sought to have the law invalidated in a case that came before the Supreme Court in 1968 (*Epperson v. Arkansas*).

In a unanimous decision, the Court struck down Arkansas's anti-evolution statute as unconstitutional. Writing for the majority, Justice Abe Fortas drew on *Everson* to argue that the First Amendment's establishment clause required the government to remain neutral on religious matters; it could neither aid nor oppose any religion. But Fortas contended that the only reason Arkansas passed its anti-evolution statute was because of religious opposition to the theory. Therefore, the law violated the establishment clause (in their concurring opinions, Justices Black and Stewart expressed uncertainty on this question, preferring to strike down the law as overly vague). There was "no secular purpose" for the law, Fortas found; instead, Arkansas was advancing the particular religious viewpoint of those who believed that evolution contradicted the biblical creation story. Though Fortas emphasized the Court's commitment to state and local control over public education, he maintained that policy and curricular decisions could not be motivated by religious concerns.

The *Epperson* decision struck down all state statutes that prohibited the teaching of evolutionary theory. In response, anti-evolution forces pursued two complementary strategies during the 1970s. First, rather than seek to ban evolution, they began to push for "equal time" in the classroom for creationist accounts. Second, they purposefully downplayed the biblical story, describing their preferred account of human origins as "creation science," thus presenting it as a scientific theory, rather than a religious doctrine. Their efforts proved successful when the Arkansas and Louisiana legislatures both passed laws requiring schools to give "balanced treatment" to "creation science" and "evolution science." Public schools did not have to teach either account of human origins, but if they taught one, they had to teach the other, as well.

In *Edwards v. Aguillard* (1987), the Supreme Court in a 7–2 decision struck down Louisiana's "balanced treatment" act as unconstitutional (a federal district court already had struck down Arkansas's statute in 1982). Writing for the majority, Justice William Brennan found that the law's purpose was "to advance a particular religious belief," and thus violated the establishment clause, as in *Epperson*. The Louisiana legislature contended that its purpose was to promote academic freedom, but Brennan rejected this as a "sham," supporting his case with evidence from the bill's legislative

history. Most significantly, Brennan argued that “creation science” necessarily implied a belief in supernatural creation, and was thus inherently a religious belief, not a scientific doctrine. Brennan emphasized that nothing prevented science teachers from teaching scientific objections to evolutionary theory, but they could not advance religious critiques. Because the Louisiana legislature had restructured the science curriculum to conform to a particular religious belief, it had violated the establishment clause.

In a dissenting opinion, Justice Scalia argued that the Court should accept Louisiana’s stated secular legislative purpose. Offering students a choice between evolution and creation science would broaden the curriculum and promote academic freedom, he contended, accepting Louisiana’s questionable contention that these constituted the *only* legitimate options. He also suggested that the Court should take creation science’s advocates at their word. If they could advance their theory in scientific terms without reference to religion, then he saw no reason to bar it. Scalia admitted that religious motives had played a role in the Louisiana legislature passing the balanced treatment act, but he provided there was a valid secular purpose; he saw no establishment clause violation. This case thus demonstrates a fundamental disagreement among the justices about whether the First Amendment allows state and school officials to take religion into account when making public school curricular decisions.

Following their defeat in *Edwards*, many of the same groups that had promoted creation science began to advance an alternative theory, which they labeled intelligent design (it should be noted that many creationists have *not* embraced intelligent design). Intelligent design’s advocates have tended to accept the basic contours of the evolutionary account, but they call attention to the theory’s gaps, which they believe offer evidence of an intelligent designer. For its supporters, intelligent design offers a legitimate scientific alternative to traditional Darwinian accounts, and they have pushed for its inclusion in public school science curricula. According to its critics, however, intelligent design merely repackages creationism and should be excluded for the same reasons that Justice Brennan outlined in *Edwards*.

The Supreme Court has not heard any cases involving intelligent design, but a Pennsylvania federal district court dealt its advocates a significant blow in a 2005 case, *Kitzmiller v. Dover*. At issue in this case was a Dover, Pennsylvania, policy that required teachers to read a disclaimer to ninth-grade biology students before studying evolutionary

theory. The brief, four-paragraph statement emphasized that evolution was a theory with gaps, not a fact, and it cited intelligent design as an alternative “explanation of the origin of life.” It further encouraged all students “to keep an open mind.” A group of parents sued the school district, challenging the constitutional validity of this policy.

In a lengthy decision, District Judge John E. Jones struck down Dover’s policy as unconstitutional, ruling that it violated the First Amendment’s establishment clause. As in *Epperson* and *Edwards*, Jones found no valid secular purpose for Dover’s policy, maintaining instead that its purpose was to advance creationism, “an inherently religious view,” and to disparage evolution. After examining closely the intelligent design movement’s history, the circumstances surrounding Dover’s adoption of its policy, and the text of the disclaimer itself, Jones concluded that a “reasonable observer” would interpret Dover’s policy as an endorsement of religion (in a 1984 Supreme Court decision, Justice Sandra Day O’Connor proposed using this “Endorsement Test” to determine a statute’s constitutional validity under the establishment clause). Jones’s decision hinged on his determination that intelligent design was “inherently religious,” not scientific. Intelligent design failed as science, Jones found, because it invoked supernatural causes, it employed the flawed logic of “contrived dualism” (that is, rather than advance positive arguments, its advocates merely asserted that any evidence *against* evolution constituted evidence *for* intelligent design), and because its attacks on evolution had been refuted and rejected by the scientific community. Jones treated intelligent design as nothing more than repackaged creationism and found that the principles of *Epperson* and *Edwards* applied in this case, as well. Because Dover’s school board had formulated its policy to advance a particular religious belief, it had violated the establishment clause.

Conclusion

As in the cases involving devotional exercises, cases about teaching human origins have prompted passionate public debate, but U.S. courts have remained relatively consistent in their rulings. Whether considering antievolution statutes, equal-time measures, or disclaimer policies, federal courts have rejected all attempts to restrict the teaching of evolution or to introduce creationist accounts into science classrooms, describing all such efforts as religiously motivated. The principle underlying these cases has been the same as in the school prayer cases: the government may not sponsor, promote, or endorse particular religious beliefs, though

schools may teach objectively about religion (leaving the door open for comparative religion classes, in which students might study a range of religious beliefs about human origins). Some critics have contended that these decisions actually disparage religion, by permitting schools to teach only a scientific theory that many religious adherents find at odds with their beliefs. While these critics regard this policy as anything but neutral, courts have consistently rejected their arguments. Federal judges have repeatedly emphasized their respect for local control over public education, but they also have demanded that state officials act in a manner consistent with the First Amendment's establishment clause as the Supreme Court has interpreted it.

Education: Home Schooling Movement

The home schooling movement is the organized political and educational manifestation of the trend since the late 1970s toward removing children from institutional schools to educate them at home. Historically, in nearly all societies the education of children has taken place mostly in homes, imparted by parents, siblings, relatives, or tutors. Since a critique of the dominant trends of child education first arose in the late 1960s, however, there has emerged in the United States and elsewhere a self-consciously political movement recommending this practice as an alternative to formal education in schools. This home schooling movement has had two goals: securing legislation and legal decisions that affirm home schooling, and providing support to families engaged in the practice. Begun by families on the margins of American life, home schooling has grown since the 1970s into a powerful and popular educational option.

Three Home Schooling Pioneers

The shift from home schooling as the norm for most children to a movement of dissent among a small minority of Americans is best understood as an outgrowth of the development in the twentieth century of the vast public school system and its compulsory, bureaucratic, and increasingly secular approach to education. In the first decades of the twentieth century, public schools expanded rapidly. By 1918 all forty-eight states at that time had passed legislation mandating school attendance. Such laws were challenged on rare occasions throughout the twentieth century, but acceptance of the idea of schooling was nearly universal among Americans of all sorts. By the late 1960s, however, the public schools, as other mainstream institutions, were criticized by many disaffected Americans. Some looked to home schooling as an alternative.

One of the first was John Holt, who wrote several best-selling books in the 1960s critiquing public schools. By the

mid-1970s, Holt had given up on the independent “free schools” he had previously advocated and began to write about the possibility of parents teaching their children at home. Parents who were doing so, often illegally, began to write to Holt, and in 1977 he began the first national newsletter for home schoolers, called *Growing Without Schooling*.

As Holt and his fellow travelers began investigating the legal landscape and swapping practical suggestions, he became aware of many Christian groups engaged in a similar process. While Holt himself had no religious convictions and had previously published ideas about child liberation that would be considered anathema to many conservative Christians, he nevertheless made common cause with a number of religious conservatives, perhaps most notably Seventh-day Adventist educators Raymond Moore (1916–2007) and Dorothy Moore (1915–2002). The Moores had long been critical of public education, especially its rush to push a formal academic curriculum on young children. A steady stream of publications from their foundation argued that early formal education damages children in a number of ways. The Moores advocated keeping children at home until the age of ten at the very least. Together Holt and Raymond Moore, along with many other activists and organizers, traveled the country defending home schoolers in court and appealing to legislatures to legalize home schooling.

Perhaps the most influential Christian home schooling leader of the 1970s and early 1980s was Rousas J. Rushdoony (1916–2001). Rushdoony’s intense biblicism and reconstructionist politics have left a permanent mark on the Christian home schooling movement. He believed that biblical law as recorded in both Old and New Testaments should be the basis of human government, especially the government of the United States—which Rushdoony viewed as a providentially blessed nation commissioned to win the world to Christ—and that U.S. law and government need to be “reconstructed” along biblical lines. For Rushdoony, the family was divinely instituted to train warriors for Christ who would fight to subject all nations to his law. Rushdoony’s theories inspired many of the leaders who created the institutional infrastructure supporting both the Christian day and home school movements, including Paul Lindstrom’s Christian Liberty Academy Satellite Schools (CLASS) with its Accelerated Christian Education (ACE) curriculum, John W. Whitehead’s Rutherford Institute, and the Home School Legal Defense Association (HSLDA).

Success and Schism in the Movement

In the late 1970s and early 1980s these and other leaders like Roman Catholic Phyllis Schlafly and Mormon Joyce Kinmont worked together to secure legislation and judicial rulings favorable to the cause of home schooling. By the late 1980s such efforts had made home schooling clearly legal, even for parents without state teacher certification, in most states. By 1993 the last remaining states had surrendered. But even as they were successful in the courts and legislatures, home schoolers were increasingly segregating among themselves along religious lines.

Throughout the 1980s the movement had grown significantly, but not among the leftist countercultural elements that had flocked around Holt. Many conservative Protestants first heard of home schooling through the Moores’ frequent appearances on Christian psychologist and political activist James Dobson’s radio show *Focus on the Family*. Largely as a result of Dobson’s advocacy, the home schooling movement grew exponentially as evangelicals and fundamentalists, long frustrated with the secularization of public education, began to home school by the tens of thousands in the 1980s. Many of these families were piqued that one of the leading spokespersons for their movement (Holt) was an atheist and the other (Moore) an Adventist, a group many of them considered a cult. The setting was ripe for new leadership, and in the mid-1980s a new organization was born that dramatically changed the movement, the HSLDA.

HSLDA’s first president, Michael Farris, had been converted to home schooling by Moore and was able to secure Moore’s endorsement of his organization at first. But major differences soon surfaced. Farris, a Baptist with strong reconstructionist tendencies, did not consider Moore’s Seventh-day Adventism true Christianity. Moreover, many Christian home schoolers had come out of the Christian day school movement and shared its strong opposition to progressive pedagogies such as whole language reading instruction and child-directed study. They tended to associate the Moores’ lax approach to early childhood education with secular humanism and its archpriest John Dewey. Curriculum makers for Christian schools eagerly followed their constituency into home schooling, and they likewise disagreed with Moore’s nature-based study that downplayed the importance of early formal training. Part of the problem was generational. Holt and Moore had both fought in World War II. For all their pedagogical radicalism, they were in many ways mid-century Americans. The Christian leaders

emerging in the 1980s were almost all baby boomers, and Moore simply did not understand them. In 1988 he published *Home School Burnout*, a book that included a critique of some of the younger Christian leaders for their un-American antigovernment rhetoric, their Protestant exclusivity, and their overly structured approach to early childhood education.

By this time, however, conservative Protestants were the supermajority of the movement. Holt had died in 1985, and after *Home School Burnout*, Moore was increasingly marginalized and isolated by movement activists. Statewide organizations that previously had included a diverse group from fundamentalists to Mormons to pagans in the late 1970s and early 1980s were either split apart or taken over by the Protestant majority, who required that officers and sometimes all members sign Evangelical statements of faith. Home schooling conventions were similarly commandeered, with non-Christian curriculum providers and speakers rejected. Legally, HSLDA initiated dozens of lawsuits in states across the country challenging compulsory school legislation on constitutional grounds. Though they almost always lost the constitutional arguments, their success at organizing large-scale protests, letter-writing campaigns, and call-ins secured legislative victories despite legal setbacks.

Such tactics, however, alienated the minority of home schoolers who did not identify with conservative Protestantism. By the mid-1990s several alternatives to HSLDA had been formed, but these groups had several things working against them. First, there were simply not as many non-Protestant home schoolers. Researchers tracking the home schooling movement estimated that by 1990 perhaps as many as 90 percent of home schoolers were conservative Christians. In 1989, Connecticut attorney Deborah Stevenson, frustrated with HSLDA's Christian exclusivity and devotion to right-wing political causes, created an alternative secular legal defense organization. After almost twenty years of activism, Stevenson's organization boasted a membership of around 2,000 home schooling families, mostly located in New England. HSLDA, by contrast, has a truly national membership of more than 81,000. Second, many of the non-Protestant home schoolers were committed Catholics or Mormons who were content for the most part to keep to themselves, creating their niche cultures and networks and rarely paying attention to what HSLDA and the other Protestants were up to. Finally, even among those who wanted to form some sort of organized alternative to

HSLDA, commitment to 1960s-style bottom-up leadership and consensus-model discussions meant hours of deliberation with little to show for it. Most alternative groups, after an initial burst of energy and activity, petered out.

The conservative Christian wing of the movement since the 1980s, on the other hand, experienced explosive growth, both numerically and in terms of organizational infrastructure. Home schooling became big business. In the 1980s, several organizations that had previously fashioned explicitly Christian curriculum for the many Christian day schools that had been created in the wake of the Supreme Court decisions of the 1960s abolishing government-sponsored prayer and Bible reading in public schools, and sometimes in reaction against desegregation efforts, began marketing this curriculum to home schoolers as well. The three most influential were the Accelerated Christian Education (ACE), Bob Jones Complete, and A Beka Book, but these organizations have been joined by a growth industry of entrepreneurs seeking to tap into the home school market with all sorts of products. This market was accessed most easily by selling products at home schooling conventions that emerged in the 1980s and grew by the 1990s into massive statewide affairs, attracting in many states thousands of attendees and over a hundred vendors annually. Christian bookstores have also done a brisk business selling home schooling supplies. More recently, much of the home schooling commerce has shifted to the Internet.

Home Schooling Today

By the mid-1990s, home schoolers had won their legal battle even in the most resistant states. With the legal ground cleared and support mechanisms in place, home schooling has grown at a fast clip. While accurate numbers are hard to come by, the National Center of Education Statistics estimates that by 2007 there were 1.5 million home schoolers in the country. Public opinion surveys show much more acceptance of the practice now than in the 1980s, and media coverage of home schooling is almost always positive. But the success of the movement in winning over both state legislatures and public opinion ironically resulted in all sorts of unanticipated consequences. School choice advocates seized upon the home schooling model in the 1990s and began using newly passed charter school legislation in many states to create Virtual Charter Schools. Such schools began shipping tax-funded computers and curriculum to thousands of children. In the early years most families who signed up for virtual charters had previously been home

schooling independently, but more recently the lion's share of new recruits has been coming directly out of the public school system.

Whether publicly financed or not, by the twenty-first century home schooling was in fashion. Celebrities and the wealthy embraced it for its flexibility. Child athletes and performers flocked to it for the freedom it gave them to pursue their careers. HSLDA's leadership has decried such trends, predicting that if the movement ceases to place Christ at the center of its identity all gains made over the preceding decades will be quickly lost, but to little avail. Home schooling has come of age and entered the American mainstream.

The social significance of the home schooling movement continues to be debated by home schoolers, their critics, and less-partisan voices. Some celebrate it as a restoration of the antebellum pioneer spirit of self-reliance and a return to the pre-industrial world where work and home, public and private, were not so segregated. Some see home schooling as antimodern reaction, a fundamentalist retreat from pluralism and democracy into self-segregated insularity. Some view home schooling as the crest of a wave of postindustrial, open-source learning that will increasingly typify the hybridized structures and fluid boundaries of twenty-first-century life. Some supporters note how home schooling, despite the heated antifeminist rhetoric of many of its practitioners, is at heart a feminist activity as mothers are empowered by the practice and typically raise their children in a far more gender-inclusive way, teaching boys to cook, clean, and care for siblings and teaching girls every subject boys learn. Whatever its broader significance, home schooling as a movement has matured to the point that it can now be safely predicted to have a long and vibrant future.

Education: Parochial and Private Religious Day Schools

A parochial school is a ministry of a local church, educating the children within its parish in religious doctrines and general-educational subject matter. Parochial schools should be distinguished from private religious day schools that are operated by a board of parents and other supporters on behalf of a religious community. These schools have similar aims, but sponsors have their preferred titles. For example, Jewish elementary and secondary schools are called "Jewish day schools," and recently, schools sponsored by American Muslim communities have been referred to both as parochial schools and as Islamic day schools. "Faith-based alternative school" is yet another contemporary equivalent term. In this article "religious schools" and "religious schooling" will be used generally of all forms.

Purpose and Impact

Religious schooling has been characterized historically by the dual purpose of creating and maintaining an orderly society while imparting the knowledge necessary for salvation. The legacy of a religious school is secured by its preparation of the next generation of leaders that espouse a particular faith. Moreover, where they are taught well, religious schools preserve the orthodoxy of that faith through intellectual vigor and inspire passion for faithful living. The rich history of religious schooling in the United States is largely a product of immigration, and of various immigrant communities' efforts to preserve their language and culture (the core of which is typically religious). The long-term success of particular schools, therefore, has tended to reflect the strength of their communities.

Beginning in the American colonial era, various Protestant groups—Anabaptists were among the earliest—freely founded schools. Catholics followed as soon as religious freedom permitted (that is, after the American Revolution). Religious schooling thus preceded all forms of public education—the "common schooling" that arose in the nineteenth century. Jewish day schools, in smaller numbers, also appeared about that time, and Muslim schools began to

appear in the twentieth century. Then, as now, religious school advocates of various faiths have rejected public schooling for their children, although most see it as necessary for the peace and prosperity of the nation and support it with their taxes. Over time, the majority of Americans' increasing confidence in public education, and in the role of the state to educate their children, has led to the hegemony of the public school system, though current surveys estimate that religious schools supply about 11 percent of America's primary and secondary educational needs.

While the nationwide system of public education was under development, during the mid- to late nineteenth century, religious school advocates attempted but failed to garner public support for their schools in the form of tax revenues. Religious schools, therefore, have had to survive on the basis of their success in charitable fund-raising. Legislation mandating public school attendance has challenged religious schools' legal right to exist. By meeting those challenges, religious schooling advocates have strengthened and enlarged the concept of religious freedom in America. The historical trend suggests that new immigrant faith communities, and those long settled, will continue to exercise the right—first won by Catholics—to sponsor religious schools for their children. Moreover, many of the values that inform contemporary education are rooted in historical forms of religious schooling.

Colonial Beginnings

Colonial claims to territory on the eastern seaboard of North America were based on discovery, conquest, and occupation by various groups, thus producing a diverse social climate to which English- and European-style schools were transplanted beginning in the 1600s. While some colonies were established as havens of religious and political freedom, others were enterprises that sought to exploit the natural resources of the New World for governments and investors. Certain regions, such as the Delaware Valley, became home to remarkably diverse populations and settlement purposes. The degree of religious freedom practiced within a particular colony determined which denominations might settle there, establishing their churches and schools. Thus, the Puritans settled in Massachusetts, the Dutch Reformed in New York, Quakers in Rhode Island, Catholics in Maryland, and so on.

The sponsors of formal religious schooling included not only these and other denominations, but also the Society for the Promotion of the Gospel in Foreign Parts, or SPG

(sponsored by the Church of England), colonial governments, town fathers, plantation owners, representatives of colonizing agencies such as the Dutch West India Company, and individual donors of land and money for the establishment of free schools. These sponsors varied widely in their aims but shared many common assumptions. They were diverse in their founding entities (many by collaboration between church, business, and government), in their funding sources (for example, subscription, tuition, and taxation), in their locations (in churches, meetinghouses, parsonages, shops, and sheds), and in their teachers (clergymen, schoolmasters, parents, tutors, lay readers, physicians, lawyers, artisans, and shopkeepers). There was, of course, no school system as it exists today, and with little or no educational standardization, schools had to conform to local needs and resources.

Despite many challenges, by 1650 schooling as an institution had been firmly transplanted to the North American continent. As the population increased so did the need to maintain social order in relation to the welfare of neglected children among the poorer classes. In New England, this need prompted the earliest colonial legislation concerned with education—the Massachusetts Bay Colony's Law of 1642 requiring parents and masters to oversee schooling for their dependents, and the more familiar “Old Deluder Satan” Act of 1647, which required every township of fifty householders (families) to have a teacher for reading and writing and towns of one hundred families to establish a grammar school. The act was framed as a countermeasure to Satan—“that old deluder”—who, by reason of men's ignorance of the relevant languages, kept them from the “true sense and meaning of Scripture.”

Colonial-era “petty schools” taught basic reading, writing, and arithmetic (the equivalent of today's lower elementary schools) and grammar schools (roughly equivalent to today's secondary schools) prepared students for the university by teaching the Latin and Greek classics. In theory, while the reading of scripture in the King James translation was the basic aim of petty schools, training in the biblical languages was carried out by grammar schools. In practice, however, grammar schools often found it necessary to work with lower-level students. In addition to their instruction in the traditional subject matter, teachers drilled students in the catechism. Aside from scripture, the *New England Primer* was the standard reader, providing students a basic sourcebook of the alphabet, the Ten Commandments, the Lord's Prayer, and various short pieces reflecting the Puritan worldview.

Grammar school teachers taught select Greek and Latin classics alongside the Bible and basic Christian doctrine. The typical school day lasted eight or nine hours, and school was open year-round (weather permitting), with the grammar school course lasting a total of seven years. School masters were paid far less than most of the professions—ministers, doctors, and lawyers—and though they could expect assistance with housing and food, many had to hold additional jobs to support their families.

Immigrant Christian Educators

Beginning in the late seventeenth and early eighteenth centuries, Anglican immigrants established several types of schools with the support of the SPG, including mission schools (to evangelize Native Americans), divinity schools (to prepare clergy), and parochial grammar schools (typically to serve Protestant Episcopal Church parishes). Throughout the 1800s, German immigration led to the establishment of parochial schools (taught primarily in the German language) by Protestants of the Reformed, Lutheran, and Anabaptist traditions, especially in Pennsylvania, Ohio, and Michigan. The persecution of Anabaptists in Europe hastened their journey to the New World. The earliest of their schools was founded by Rosicrucian Mystics who undertook their mission to prepare Christian communities for the millennial advent of God's kingdom on earth. Their leader, Johannes Kelpius (1673–1708), arrived in Philadelphia in the 1690s. Finding no established worship or teaching among the German immigrants, he built a school in the secluded countryside outside of Germantown and developed a German-English curriculum suited to the needs of the local children. He taught the scriptures and the “three Rs” in an atmosphere that fostered monastic discipline. Another German school was founded at Ephrata, Pennsylvania, in the 1730s by a Church of the Brethren community whose monks—males and females—offered an advanced curriculum of mathematics, classical studies, and manuscript illumination, in addition to lower-level studies. Their renown headmaster, Ludwig Höcker (1717–1792), authored the school's textbooks and attracted many students from large eastern cities.

Mennonite schools were conducted in the meeting-houses of Pennsylvania's easternmost counties as early as the 1790s. One of these was taught by Christopher Dock (1698–1771) who stressed the importance of motivation and rewards for learning in contrast to the generally punitive approach taken by most colonial schools. Dock's innovative teaching was biblical but nonsectarian, attracting students of

various denominations. Moravian mission schools were established to serve immigrant families, and to reach Native Americans with the gospel, but without eradicating native culture (as was often the case with mission schools). Females received an especially thorough education in Moravian schools on the assumption that “to educate a woman is to educate a family.” The innovative nature of colonial-era Anabaptist schooling was a reflection of religious nonconformism. Fervent piety, not a university education, qualified Anabaptist teachers; separatism, not assimilation, describes their position relative to the society of their era. Few of these schools, however, outlived their founders.

Schools associated with the state churches, Lutheran and Reformed, appeared later than Anabaptists schools but by midcentury outnumbered them. Supportive networks of these schools were established by immigrant pastors Henry Melchior Mühlberg (1711–1787), in the case of Lutherans, and Michael Schlatter (1716–1790) of the Reformed Church. Given the steadily increasing numbers of Lutheran and Reformed immigrants throughout the nineteenth century, one would expect greater numbers of these schools by the end of the century. Yet, the requirement of university credentials made good teachers hard to come by, and there was a tendency of immigrants to assimilate quickly to English-speaking culture. German was used exclusively by immigrant teachers, who viewed the child's mind as a *tabula rasa*. These schools were distinctive more for their respective approaches to the catechism—Luther's or the Heidelberg Catechism—than for novel approaches to general education.

Catholic schools were scarce in this era because Catholic immigrants were few in number prior to the American Revolution. As early as the 1600s, Franciscan and Jesuit mission schools were planted in the American South and West for the conversion and occupational training of Native Americans. However, fears that “Romanists” (that is, Roman Catholics) would oppress the English colonies kept anti-Catholic sentiment high there, and prompted legislation that restricted or banned Catholic activity. Of all the colonies, Pennsylvania and Maryland alone permitted Catholicism.

One early school founded in 1745 by Jesuits was Bohemia Manor in northeastern Maryland. As in all Jesuit schools, for Bohemia Manor the daily schedule and curriculum were set by the *Ratio Studiorum* or “System of Studies” developed by sixteenth-century Jesuits. Each school day was framed by prayer, attendance at Mass, and various devotional practices. Fridays and Saturdays were especially devoted to

instruction in doctrine, but traditional prayers and doctrinal passages provided the material for instruction in Latin grammar during other days of the week. The teacher read passages from Thomas Aquinas (1225–1274), for example, and followed it with a vernacular translation to familiarize students with Latin syntax and cadence. Advanced students wrote their compositions in Latin. School discipline was based on motivation and reward for exemplary behavior and scholarship, not punishment. The aim of schooling was the demonstration of knowledge and conduct worthy of a Christian. The first American Catholic bishop, John Carroll (1735–1815), a graduate of Bohemia Manor, in his first pastoral letter (1792) identified Christian education as essential for preserving the faith in the New World. His campaign to establish schools in every Catholic parish mobilized local trustees to raise funds, build schools, and hire teachers.

To summarize, religious schooling prior to the American Revolution, though primarily Christian, was diverse in origin and purpose. While French and Spanish Catholics as well as Church of England missionaries conducted mission schools to Native Americans in the South and West, European Protestant immigrants—especially Germans—established schools in the Northeast and Old Northwest (Upper Midwest today) for the faithful, to preserve old world culture and religious identity. English colonial schools appeared in New England and the Upper South as a result of the revolutionary notion that (religious) schooling must be made widely available for the advancement of piety and learning. Religious nonconformists were generally more open to educational innovation than their state church counterparts: early Anabaptist teachers fostered child-centered educational principles more than a century before their widespread adoption. Conservative Lutheran and Reformed Church teachers emphasized a theologically informed faith and created closed communities that survived the rigors of time and change.

The American Revolution and the Rise of School Systems

The impact of the American Revolution on religious schooling was most immediately felt by Catholics. “Red Coats,” that is, supporters of Britain, became the targets of abuse formerly reserved for Catholics, and legislation permitting the free exercise of religion appeared even prior to the First Amendment (enacted 1791). Catholic participation in fighting the British helped to diminish the portrayal of

Catholics as foreigners. For non-Catholic schools, the impact of the Revolution was more gradual. The Constitution made no mention of religion or schooling, but the Founders believed both to be essential for a virtuous republic. Religious schools were responsible for widespread literacy in the colonies and would continue without federal assistance. The fact that the founders were more interested in academies of higher learning also suggests that basic schooling needs were being met.

As immigration gained momentum, new religious schools were planted with the arrival of each group. For the first half of the nineteenth century, most of these followed the pattern laid down by local colonial models, and even the mission model found new life in schools set up to teach African Americans (both free and enslaved) in the South, prior to 1861. These schools, many of them taught by Episcopalians, introduced basic Christian doctrine through instruction in reading and writing. Classes for children during daylight hours were followed by instruction for adults at night. As the Civil War drew near, many of these schools disappeared from view but maintained a clandestine ministry at the risk of severe persecution.

The 1860s saw the rise of systems of parochial schools alongside the common school movement, and these gradually replaced the hodgepodge of colonial-era schools. After the Civil War, the influx of new immigrants, many of whom were German and Irish Catholics, led to concerns over their impact on American democracy. Advocates for public education proposed “common schooling” as a way to unite the nation through a curriculum of general studies combined with what, in their view, were common (that is, nonsectarian) Christian values, taught through prayer, Bible reading without commentary, and the inculcation of commonly held religious precepts such as the Ten Commandments. McGuffey’s Readers became the standard textbooks of the dominant Calvinistic perspective of nineteenth-century America. While many immigrants were more than willing to send their children to common schools, some religious leaders—particularly Catholic and Lutheran—rejected the idea of common schooling as detrimental to the faith of their people.

Catholic Schools

The American Revolution had opened the door for Catholic churches and schools, but many challenges remained. The cost of school buildings and the support of teachers were beyond the means of most parishes, and the

Elizabeth Bayley Seton founded the Sisters of Charity, whose nuns taught and administered Catholic parochial schools.

full force of anti-Catholicism still lay in the future. As with other nineteenth-century immigrants, Catholics from Ireland, Germany, and France often succumbed to cultural assimilation to avoid negative stereotyping. Catholic leaders foresaw a crisis of parishioners abandoning the faith and proposed parochial schools as the solution. Catholic newspapers became an important vehicle for promoting parochial schools. Individual schools were founded in urban centers, but as the floodgates of immigration widened, these schools were inundated with students. To deal with this problem, some Catholic schools temporarily adopted the widely used monitorial system whereby the older students taught the younger.

The proliferation of Catholic parochial schools, however, was made possible through the establishment of religious teaching orders whose nuns devoted their lives to teaching and administering schools in exchange for subsistence-level support. The first of these was the Sisters of Charity, founded by an American convert to Catholicism, Elizabeth Bayley Seton (1774–1821). During the decade of the 1820s, the Sisters of Charity supplied trained Catholic teachers for fifteen schools in eleven cities, thus setting the pattern for the supply of parish school teachers for the next 125 years.

Prior to 1825, Catholic schools in New York also received support in the form of a share of tax revenues dedicated to education, but this ceased with the founding of the Public School Society and its support for Protestant-oriented public schooling. “Common, not Catholic,” schooling became the battle cry of public school advocates who envisioned interdenominational schooling as the only hope for national unity, and biblical literacy as the best cure for “Catholic superstition.” In the 1840s, New York bishop John Hughes rallied Catholics to petition the legislature for tax support of Catholic parochial schools, and the ensuing social debate became known as “the school wars.” While Catholics responded to public backlash by becoming, generally, more supportive of

the idea of separate Catholic schools, many challenges to a nationwide system of schools remained. Some Catholics, for example, Italians, continued to enroll their children in public schools. Even where Catholic schools were built, shared administration led to regular conflicts between lay-trustees and Catholic clergy.

Armed with papal encyclicals, Catholic leaders continued to appeal to the laity to establish Catholic schools in every parish, while countering the public charges of disloyalty to the nation for their lack of support for public schools. The Third Plenary Council of Baltimore of 1884 spoke of the absolute necessity of Catholic schools, and of the obligation of pastors to establish them and of parents to enroll

their children. Catholic leaders rejected the notion that the state was ultimately responsible for the education of their children. Moreover, they identified the Protestant bias inherent in the common school curriculum, centered as it was on the King James Bible and Protestant-oriented McGuffey Readers. Finally, they condemned the notion of “Americanization” as veiled language for the eradication of the Catholic faith.

Increasing support for parochial schools among Catholics and the subsequent emergence of a nationwide system of Catholic schools after the Civil War were the result of many factors. Among these was disillusionment over the rejection by public school administrators of Catholic initiatives aimed at compromise with public education. For example, in locations where Catholics were in a majority, the Church had offered to provide trained teachers for the local public schools at their own expense. A second factor was the demand by millions of later nineteenth-century Catholic immigrants for national parish churches and schools for the preservation of their native cultures. Teachers for these schools could now be supplied from various teaching orders based in Europe. A third factor was the growing secularization of knowledge in public school education as, in modernity, the veneer of Christian culture was progressively stripped away.

A model of a successful, long-term system of Catholic parochial schools can be seen in the historical example of schools established for German and Irish immigrants in Detroit, in the 1860s. There, the Sisters of the Immaculate Heart of Mary (IHM) taught girls and boys through the age of twelve a traditional grade school curriculum, beginning each day with instruction in Catholic doctrine and sacred (biblical) history. In partnership with brother teachers, IHM provided advanced instruction in grammar, rhetoric, composition, and the natural sciences. By the turn of the century, the school and academy boasted growing enrollment, and an atypical child-centered philosophy of education, that prioritized students’ interests and career inclinations, and emphasized the importance of education for all children—including the poor—as prerequisite to the development of a virtuous society. For nearly a century, Detroit Catholics and their children experienced the “IHM way,” along with schools established by other teaching orders. National parish churches and schools faded from prominence after World War I, but in 1925 the Supreme Court ruling in *Pierce v. Society of Sisters* (where Oregon State law mandated attendance at

public schools) guaranteed religious schooling as a constitutional right.

Despite ongoing legal challenges, each decade of the twentieth century witnessed the expansion of the nationwide system of Catholic schools. These increasingly reflected a standard college-preparatory curriculum along with religious instruction based on the Baltimore Catechism of Christian Doctrine (prepared by the Third Plenary Council), taught by nuns in long habits with head coverings exposing only the face. Classroom ambiance was typically austere, accented by the crucifix and a statue of Mary, and the daily devotional exercises—praying the rosary together for example—socialized students in the Catholic faith.

The rise of public high schools encouraged the development of similar Catholic schools. At first, these secondary schools, few in number, grew out of parish-based elementary schools. Later on, “central high schools” sponsored by the diocese or by local religious orders accepted students from surrounding parishes. The founding of the Catholic Educational Association in 1903 paved the way for the standardization of these schools, and acquiescence to state accreditation (to avoid more serious forms of state control) meant that many Catholic schools increasingly conformed to their secular counterparts. While the parochial model of curriculum—centered on Catholic worship and instruction in doctrine—was never abandoned, the need to provide youth of working-class families with the same educational and career opportunities of the privileged middle class subsequently reshaped the aims of Catholic secondary education.

The growth of the Catholic school system peaked in 1960 with more than five million students enrolled in nearly 13,000 schools, or 12 percent of all kindergarten to high school students in the United States. Since then, enrollment has decreased by more than half that number, and many schools have closed for lack of funding. Decreasing participation in Catholic religious orders (nuns and monks who formerly taught the schools) has made it necessary to hire teachers. This in turn resulted from revolutionary changes within the Catholic Church that emerged from Vatican II (1962–1965). The Council’s *Declaration on Christian Education* proposed a new paradigm for Catholic schools, signaling the end of traditional catechetical instruction as a passing on of the faith to a Church that defined itself *against* the world. The present need, as defined by Vatican II, was to *engage* culture for the purpose of building a community in which faithful Catholics could serve as leaven. Since then,

the use of nonauthoritarian instructional methods such as values clarifications has led to a very different approach to Catholic schooling, which some find difficult to distinguish from public schooling, especially given a majority of lay and even non-Catholic instructors, attired in street clothing.

Lutheran Schools

Among Protestants, Lutherans made the earliest inroads toward a system of schools. By 1820 more than three hundred Lutheran day schools—roughly one school for every two congregations—had been established throughout the middle colonies through the work and influence of Henry Melchior Mühlenberg (1711–1787), the father of American Lutheranism. Lutheran leaders among the German immigrants had concerns similar to Catholics regarding the corrupting effects of the rapid assimilation of their people to American culture. The preservation of the language and culture of the old world was seen as essential for the preservation of the faith in the new. Strong immigrant communities built schools for the education of their children and youth as quickly as they built churches. For example, immigrants from Saxony, under the guidance of C. F. W. Walther (1811–1887), founded the conservative Missouri Synod Lutheran Church in 1847, and during the next three decades managed to establish a parochial school connected to each of several hundred local congregations. These schools served as anchors of conservative Lutheran orthodoxy, supplying the next generation of Lutheran ministers and school teachers, both of which were established offices in the church. However, attention was also given to the preparation of students for the study of law, medicine, and other professions. Levels of schooling followed the German model of *Volksschule* (elementary) and *Gymnasium* (secondary), followed by the study of classical languages in preparation for university studies. Scriptures such as Deuteronomy 6:4–9 (“Hear, O Israel”) and the educational writings of Martin Luther (1483–1546) were adduced as evidence that all Lutherans, whether or not they had children, were to support the schools. Meanwhile, the level of excellence achieved by these schools attracted non-Lutheran enrollment.

By the turn of the nineteenth century, there were about 1,600 Missouri Synod Lutheran schools with nearly 90,000 students enrolled. New challenges to the maintenance of these schools and the expansion and improvement of the system arrived with the next wave of German immigrants, many of whom were unwilling to invest in education beyond the elementary level. Some immigrants, moreover,

were converted to Methodism, while others simply became indifferent to their religious upbringing. Other challenges to Lutheran schools leading up to World War I included the growth of the common school movement, the rise of legislative attempts to enforce attendance at public schools, and the program of Americanization that, for a time, banned the teaching of German and other foreign languages. The resurgence after World War II of Missouri Synod Lutheran schools, together with their continued popularity with non-Lutherans, shows that they transcended many of the temporal aspects on which they were founded and have succeeded in combining religious and general education to a degree matched by few others. Enrollment in Missouri Synod schools for the year 2008–2009, from early childhood through twelfth grade, was nearly 271,000 students in 2,500 schools, and this is in addition to other Lutheran Schools. For example, more than 1,500 early childhood centers, 257 elementary schools, and 14 high schools are currently operated by the Evangelical Lutheran Church in America, enrolling a total of 150,000 students.

Calvinist Schools

Dutch immigrants to New Netherlands (New York) were also among the earliest to establish parochial schools in the colonies. As the settlers moved west and were joined by fresh waves of immigrants from the Old World, Dutch Reformed communities in Michigan and Iowa debated the need for “Dutch Christian education.” Many of the faithful saw district (common) schools as sufficient to meet their children’s basic needs, but leaders such as Albertus Van Raalte (1811–1876) decried the “colorless Protestantism” of those schools in denominational newspapers. Lack of both pedagogical vision and resources frustrated attempts to establish schools in which a Reformed epistemology could be integrated into all academic disciplines. Instead, schools were established to maintain doctrinal purity through Dutch language instruction, resulting in cultural isolation.

Other Reformed denominations experimented with parochial schools beginning about the mid-nineteenth century. The General Assembly of the Presbyterian Church, prompted by Princeton Seminary faculty, mandated a system of church-controlled schools to answer their growing concerns over the influence of foreign (European) philosophy, doctrinal disagreements among Presbyterians, the gradual disappearance of religious instruction from common schools, and the shifting control of schools from the church to the state. Presbyterians operated more than

260 parochial schools throughout the East and Midwest between 1846 and 1870, after which the experiment was abandoned due to the limited success of the schools and prohibitive costs. As did Catholics before them, influential Presbyterians, including, for example, the Rev. Charles Hodge, advocated the use of tax revenues for parochial schools. Unlike Catholics, Presbyterian educators believed that the use of the Bible as the primary textbook, together with systematic recitation from the shorter catechism, would yield a thoroughly Christian education. Some schools excelled in the catechism, others in the teaching of general subject matter; few did both well, and fewer still distinguished themselves from the Protestant-oriented common schools by achieving an integration of religious and general subject matter. The experiment was extended for a time through the establishment of mission schools to Native Americans and others, based on the Presbyterian model.

Seventh-day Adventist Schools

The pervasiveness of the belief in religious schooling as a means to the betterment of society is seen in the legacy of Adventist schooling. While Catholics, Lutherans, and others affirmed the role of religious schooling from the outset, concerns for schooling came late among Adventists, who expected Christ's soon return. Adventist educational reformers such as Ellen White (1827–1915) persuaded fellow Adventists that the appreciation of doctrine as well as preparation for missionary work—the duty of every Seventh-day Adventist—called for an approach to education unavailable in the public schools. The development of a successful model awaited White's travels to Australia in the 1890s, and her work with fellow Adventists in founding the Avondale School for Christian Workers. The Avondale model aimed at the preparation of Adventist missionaries and stressed the importance of a remote, rural setting for education, a comprehensive approach to the integration of general and religious knowledge, and the role of manual labor in education.

By the early twentieth century, Avondale had become the model for Adventist schools throughout the United States and the world. In terms of curriculum, various biblical precepts served as the basis of teaching outcomes that subordinated all other aims or methods. For example, White's 1903 publication, *Education*, describes the proper study of language in terms of virtuous speech based on Philippians 4:8 (“whatever is true, whatever is honorable”), thereby prioritizing a “higher point of view” over “mere technical

knowledge” (that is, grammar). Facts about the rule of so many violent and ambitious kings, if only memorized, would foster evil in students; any proper study of history called for instruction in the divine principles showing why such kings ultimately fell. Adventists, mindful of sinful human nature, also discouraged the use of recreation and competition in their schools. While Adventists were slow to embrace religious schooling, their elementary and secondary schools experienced steady growth throughout the twentieth century, becoming one of today's major contributors to non-public education. In 2009, Seventh-day Adventists reported 1,150 schools at all levels with more than 90,000 students enrolled.

Old Order Amish and Mennonite Schools

These private religious day schools are found throughout New York, Pennsylvania, Ohio, Indiana, and Michigan, and serve a range of historical German Anabaptist settlements that preserve both the language and the *Ordnung* or community rule that governs all aspects of Amish life. The schools were founded by parents when public school consolidation led to the closing of most one-room school houses, and legislation made school attendance beyond the eighth grade compulsory. Through legal challenge and even imprisonment, Amish, similar to the Catholics before them, struggled before acquiring the freedom to establish and maintain their schools. The basic curriculum of language arts, mathematics, penmanship, hygiene, and German language instruction prepares children for life in the community—boys for farming and girls for homemaking or school teaching, according to strictly traditional methods (the sciences are not taught). Aside from prayers and the reading of the Bible without commentary, the school is not responsible for the religious instruction of the children, as that responsibility belongs to the home and church. The plain school buildings, equipped with chalkboards and woodstoves, match the austerity of life that characterizes Amish communities as islands of traditional Christian life amidst the tide of modernity.

Academies of the Latter-day Saints (Mormons)

Mormon pioneers to the Salt Lake region began experimenting with religious schools for their children just as soon as mission schools, non-Mormon immigrants, and government regulations challenged their hegemony in the Utah territory. As Mormon influence over district schools waned, Mormon church and educational leaders launched a system of “stake academies” (a stake is a group of wards, or local

parishes), funded jointly by the church, benevolent donations, and tuition. The curriculum was based on the Bible, Mormon scriptures, and Mormon doctrine, along with elementary-level general education subjects and training in domestic and agricultural skills. Beyond the stated aim of the academy—to instill the revealed truth of Mormon prophets—students were socialized in the Mormon culture, while becoming versed in scriptures, church history, public speaking, and methods of church proselytizing. Most academies did not excel in their general education offerings, and lack of widespread patronage of the schools by Mormon members forced the church to designate its teachers as missionaries (that is, volunteers), until increased tithing led to an improved financial base. Of the thirty-three academies that operated from the late nineteenth to the early twentieth century, most were phased-out thereafter, though some—most notably Brigham Young Academy—became colleges or universities.

Jewish Day Schools

A few early Jewish schools operated during the colonial era, and by 1850 every major U.S. city had several Jewish day schools that were prominent among German immigrants. The advent of public education and Jewish Sunday schools—accepted by many (though not all) Jews—caused most of these schools to close their doors by 1875. Reformed Judaism never embraced the day school strategy. As with other religions, the felt need to assimilate to American culture weakened immigrant-community ties while emphasizing individual responsibility and achievement. A fresh wave of Orthodox refugees seeking asylum in the United States after 1940 founded Torah Umesorah (Torah studies), a national organization for the proliferation and support of schools according to a preferred system of Hebrew education. By the mid-1970s, more than 400 of these Orthodox day schools (75 percent elementary, 25 percent secondary) were in existence, with a total enrollment of more than 80,000, a figure that, since 2000, has grown to more than 700 schools with more than 200,000 students. Reflecting the diversity found even within Orthodox Judaism, the Torah Umesorah schools have varied in their balance of religious and general studies—the traditional *yeshiva* and Hasidic schools devoting the majority of the school day to Torah studies. At the elementary level the Hebrew scriptures are taught. At the secondary level, during a typical day in *yeshiva*, lectures on Jewish law and ethics are interspersed with study sessions (during which

students may work in pairs) that encourage the assimilation of large amounts of material, in addition to mastering the rabbinic forms of argumentation codified in the Talmud (traditional commentary on the Jewish law). As an extension of the synagogue, Jewish day schools have provided a stimulus to the intellectual and ethical life of American Orthodox Judaism.

Muslim Schools

The relatively recent emergence of more than two-hundred Islamic day schools in American cities reflects a renewed interest in learning among African American Muslims as well as Muslim immigrants. Wide differences among the advocates of these schools make it impossible to describe them generally. Schools known as “Sister Clara Muhammad Schools” (originating in Detroit in the early 1930s) were founded by the Nation of Islam and sought to promote a powerful racial identity among African American youth in the years leading up to the American civil rights movement. Formerly these schools stressed learning that would lead to self-knowledge, self-love, and self-sufficiency as an antidote to racial discrimination. More recently these schools have aligned themselves with the African American Sunni Muslim community that takes a more orthodox approach to Islam.

Modern Muslim education is heir to an intellectual tradition that has contributed significant advances in the sciences and humanities, yet Muslim educators seek above all to integrate revealed and human knowledge, a process they refer to as the Islamization of knowledge. More basically, Muslim schools seek to establish a curriculum that reflects the Islamic world view as outlined in the Holy Qur’an, a view that stresses the straight path blessed and revealed by God (Allah). Practically speaking, these schools inform Muslims of their religious heritage and connect them to the wider world of Muslim concerns and resources.

Muslim schools face challenges similar to other religious schools, including the tendency of immigrants to minimize their faith to avoid negative stereotyping and persecution, and to avoid being perceived as “unpatriotic” because of their unwillingness to patronize the public schools. Prior to the American Revolution, Roman Catholics were perceived by most Americans to be a threat to freedom and democracy; afterward, and throughout the nineteenth century, Catholics found public schools to be hostile to their faith. In the aftermath of the September 11, 2001, terrorist attacks, Muslim students have been similarly scrutinized. For many immigrants, therefore, religious schooling remains the best

option for enabling their students to explore the implications of their faith for learning while maintaining their “two citizenships”—national and religious.

Conclusion

Within the context of several centuries of immigration to the New World, and the transplanting of a variety of European models of religious schooling beginning in the seventeenth century, the revolutionary English notion of a universal free education took hold in the United States, giving rise to a nonsectarian school movement. By the late nineteenth century, a “system” of district schools (one-room school houses in each community) was in place to meet schooling needs that, formerly, had been met by parochial schools alone. The culturally Protestant curriculum of these early public schools met with the approval of a majority of Americans including many immigrant Catholics, Protestants, and Jews. Some, however, rejected this approach to schooling from the outset as detrimental to their faith and insisted on parochial or private religious schooling as the only viable means of conveying saving knowledge to their students while instructing them in the faithful use of general knowledge. For others, religious schooling was the most important means of preserving the immigrant community’s ethnic identity, the core of which was religious. Still others, though initially pleased with common schools, later rejected them when they found their control over these schools waning, and when consolidation, modernization, and compulsory attendance beyond the eighth grade made them increasingly unsuitable.

To provide an education that effectively combined the three Rs with religious knowledge was always difficult for communities of limited means; often, parochial schools merely offered doctrinal instruction (or invited a member of the clergy to do so) as a “fourth R,” and as the public schools adopted an increasingly secular curriculum, Sunday schools arose to provide that instruction. In time, moreover, religious students found the public school climate far less hostile toward their faith and culture than earlier generations had experienced (except perhaps for Muslims). To conclude that religious schooling has outlived its usefulness, however, ignores important contributions of religious thought to contemporary knowledge and values, as well as the many profound contributions of religiously schooled men and women to the nation. Religious faith continues, for many, to provide the essential framework (“worldview”) for both the content and the process of instruction—and all

the more so in postmodernity, when assumptions about the neutrality of knowledge are being questioned.

Today, the interests of a coalition of prekindergarten through twelfth grade nonpublic schools whose philosophies of education reflect a spectrum of religious and non-religious perspectives are represented by the Council for American Private Education (CAPE), based in Washington, D.C. The National Center for Education Statistics reports the enrollment in these and similar schools at 6,049,000 students, or 11 percent of all U.S. students for 2009, and the number of schools at 33,740, or 25 percent of all U.S. schools for 2007–2008.

Education: Religious Issues

Both education and religion play formative roles in the moral and emotional development of children. For this reason, the relationship between religion and education has long been a point of debate in the United States, particularly regarding religious establishment and the free exercise of religion. Parents' choices regarding the setting for their children's formal education; the choices of school administrators regarding student religious expression, school curriculum, and the use of religious language in school activities; and government's concern with balancing freedom of religion with a responsibility to separation between religion and government lead to a complex situation. From education that is explicitly religious to controversies surrounding alternatives to or exemptions from public education to controversies and concerns involving religion in public schools and higher education, intersections of religion and government become particularly complicated when they involve children. The impressionability of those children and the sometimes shared responsibility of moral education by educators and parents suggest that these issues are likely to remain complicated for years to come.

Religious Schooling

Since the founding of the United States, religious communities have maintained adherence to their faith and the integrity of their moral teachings by providing religious educational institutions for their children. For many years, it was only through religious institutions that formalized education was available. Before the rise of mandatory public education, most children received their schooling either in religious schools or at home. The resulting lack of standardization or opportunity for those of low means meant relatively widespread illiteracy and poor education. In 1852, Massachusetts laid down the first law focused on compulsory education for children between eight and fourteen with exceptions for

attendance at other schools, previous education, or disability. Other states followed, with the specific requirements and exceptions varying. In addition to ensuring some level of educational standardization and the ready access of all children to proper education, such laws underscored a belief in the value of education in instilling nationalism and civic identity. Indeed, much of the push for a standard public education system came in response to fears regarding immigration and the nature of private parochial schools.

For immigrants to the United States, religious schooling often ensured the maintenance of religious observance and distinctiveness in spite of the predominance of American Protestant culture. Even when public institutions involved regular prayers and reference to God, those outside of this mainstream culture found it necessary to support their own schools in an effort to support their ideas about religion. For Catholics, parish schools provided the majority of educational opportunities for Catholic children and were supported by donations of parishioners, the work of the clergy, and small fees paid by parents. Georgetown University in Washington, D.C., served as a model for colleges shaped by Catholic doctrine and practice. With the flood of immigrants in the 1840s, Catholics worked extensively to provide education for the increasing numbers of Catholic children while also accommodating the various ethnic identities of these immigrant groups.

In response to these waves of immigration as well as concerns regarding poor education in the population at large, Protestants such as Horace Mann (1796–1859) began to work for mandated public school from the middle of the nineteenth century and into the twentieth. These new schools were underwritten by Protestant ideals and often involved distinctly Protestant practice such as regular readings from the King James Bible. The Know Nothing Party advocated such programs in opposition to the rising tides of immigration. These groups felt immigrants needed to be Americanized although some feared that immigrant Catholics could not become full Americans due to their allegiances to the pope.

Realizing both the need for the defense of parochial education in response to nativism as well as the practical utility of parochial education for the maintaining of faith and culture in response to the dominant Protestant culture, Catholic bishops met to solidify their schools and their presence in the United States. Their Third Plenary Council of 1884 marked an official groundswell of development for Catholic education in America. The council mandated the

building of new schools and stated that through such schools the Catholic religion as well as the native cultures of those recently immigrated would be preserved.

While parochial schools continued to be built and grow strong, they received a challenge during World War I when nationalist concerns reemerged and several states moved to mandate public school attendance without exception. Citing concerns about American unity and strength in a time of war that could be weakened by allegiances to the pope or to an immigrant's native land, localities began to enact tougher requirements for compulsory public school attendance. However, the Supreme Court ruled in *Pierce v. Society of Sisters* (1925) that parents retained the right to choose nonpublic schools. As immigrant communities became more acculturated in the wake of participating in the world wars, some parochial schools continued to maintain strong funding and attendance, though others suffered from low enrollments and a lack of qualified teachers and funding.

One advantage enjoyed by public schools has been governmental funding and support. Though religious schools have certainly benefited from a lack of regulation and oversight by the government in terms of maintaining doctrinal and organizational integrity, the question of adequate funding and reaching poorer segments of the population have remained salient issues. On this question, religious schooling received a boost with the Supreme Court's decision in *Everson v. Board of Education* (1947). This case involved government subsidy for public transportation to both public and private schools. The Court argued on the side of equal access and allowed for such subsidies to transport children to religious schools as well as public. *Everson* not only provided underprivileged students a better opportunity to attend parochial schools but also underscored the government's responsibility to model neutrality to religion and nonreligion rather than a complete and stark separation from anything like support of parochial schools.

Yet, public schools received further challenges from religious groups, particularly on the compulsoriness of education. In the early 1970s, a group of Amish children who stopped attending high school out of religious conviction directly challenged their state's requirement for mandatory attendance. Amish commitment to noninvolvement with mainstream society and governmental affairs as well as their commitment to community life and work lead many to opt for education within the bounds of their religious communities. Noting that compulsion to attend would ultimately challenge their religious identity as well as their sense of

their own assurance of salvation, the Supreme Court found in favor of the group in 1972's *Wisconsin v. Yoder* and allowed for religious exemption from compulsory education after the eighth grade.

With this ruling, the Amish gained a great victory for their religious ideals but also for parents seeking more control over their children's educational experience. In the years following and on into the twenty-first century, many parents began to explore what was, essentially, the original American educational establishment—the home school. As more and more states allow such practices and home schooling networks and advocacy groups become more developed, this practice grows as well. Motivated by a variety of factors, religious families have chosen home schooling as a means of ensuring the proper religious and broader educational success of their children. In these cases, governments have struggled with relinquishing the standardization and nationalizing benefits of public education in the name of religious liberty and parents' rights.

School Vouchers

For parents with strong religious convictions who choose to place their children in more traditional educational environments, financial concerns can often be a problem. These parents do not enjoy the subsidies available for public institutions. Though court decisions in the past fifty years have clarified the necessarily secular character of American public schools, the issue of governmental support of religious schooling has been a more complex issue. The debate of public school curriculum aside (for that discussion, see below), parents who have chosen sectarian education for their children have begun to advocate vouchers as a means of financing and supporting these alternative educational opportunities. Proponents of school vouchers advocate them as providing parents with reasonable choices in schooling their children and also providing a level of competition that challenges the stagnation and complacency that can come through public schools' monopoly on education.

The concept of school vouchers was first advocated by economist Milton Friedman (1912–2006) in a 1955 essay. Citing the positive competition inherent in this system, he advocated vouchers as a healthy check for public schools. With growing concerns over the state of public school education and legislative milestones regarding religious education, Friedman's ideas found a level of support. In particular, the Supreme Court's rulings in *Engel v. Vitale* (1962) and *Abington v. Schempp* (1963) had removed vestiges of religious

education from the public schools. Opponents to these rulings, or those who wanted religion to remain an integral part of school curriculum and practice, sought ways to make religious education a viable option for parents.

In 1972, the White House's Office of Economic Opportunity tried a voucher program that did not include religious schools, and specific states such as New York provided tuition assistance to those attending private schools. Although the hope was to avoid constitutional conflict by focusing on nonreligious private institutions, the court challenges came. This voucher program was struck down by the Supreme Court in *Committee for Public Education v. Nyquist* (1973). Several other attempts to institute vouchers on the state level failed in the 1970s.

With the election of President Ronald Reagan in 1980, vouchers received outspoken support from the highest political office. Reagan proposed a voucher system in 1983, and though he continued to support this program throughout his time in office, he was unable to pass the legislation. Progress was made, however, on the state level. In 1989, the Milwaukee Parental Choice Program allowed vouchers for nonsectarian private schools and was subsequently revised in 1995 to include religious schools. With this change came significant legal challenges. These challenges reached the Wisconsin supreme court that found the vouchers constitutional, and the U.S. Supreme Court declined to hear the case.

That same year, Ohio launched the Ohio Pilot Project Scholarship Program that targeted troubled districts and established voucher programs within them. Though many opponents challenged this program as well, the Ohio supreme court found it to be constitutional on establishment grounds but struck down the program on an unrelated provision. The program was reinstated in 1999 and was again challenged. This time, it was appealed to the U.S. Supreme Court and upheld in *Zelman v. Simmons-Harris* (2002). In its decision, the Court commented on the particularly precarious situation of the nation's schools and suggested that this situation mandated new options.

By not ruling against the program on establishment issues, the Court effectively opened the door to other such state programs. While future programs may be limited due to continued resistance on behalf of many Americans and opposition by teacher unions, several states have continued to enact similar programs. In the years following *Zelman v. Simmons-Harris*, Florida, Colorado, and Ohio successfully instituted voucher programs while Maine and Vermont have had mixed success. Other states have promoted tax

credits instead of vouchers to assist parents in financing both sectarian and nonsectarian private schools and have faced little opposition. Continuing debates largely focus on the effectiveness of vouchers for education overall rather than church and state issues.

Curriculum Controversies

Science curriculum has been a critically important factor in contemporary decisions regarding the choice between religious and secular education. The education of children regarding the origins of life on earth and the development of that life over the centuries can, for religious Americans, involve the deepest of religious questions. Schools committed to providing a nonreligious perspective accessible and nonoffensive to all have found that the evolution-based science of public education is taken, in fact, to be offensive, and contrary to popular religious worldviews. Such debates involve not only questions about the "right" view of human origins but also the relative weight of parental and teacher influence on children's understanding of the world.

Since the publication of Charles Darwin's *On the Origin of Species by Means of Natural Selection* in 1859, biological evolution became increasingly accepted in institutions of higher learning and eventually found its way into northern public school curriculum by the 1920s. Public backlash against this new curriculum came to a head in the famous Scopes trial of 1925. Prominent fundamentalist and three-time presidential candidate William Jennings Bryan (1860–1925) became a spokesperson for the prohibition of teaching evolutionism. While a creationist himself, Bryan did not advocate that such a theory be taught in public schools but that evolution should not be taught as it was essentially an alternate religion and therefore unconstitutional. John Scopes (1900–1970) was brought to trial for teaching evolution in a Tennessee public high school. Although Scopes was convicted, the trial led many to see fundamentalists as anti-modern and out of step with progress. Though many laws remained on the books outlawing the teaching of evolution in public schools, public sentiment in the northern states had begun to swing in the other direction. In the southern regions of the United States, strong religious influence on curriculum determination and public opposition to Darwin kept evolution out of textbooks.

During the next thirty years, school boards and textbook publishers largely tried to avoid the issue altogether. However, a 1950s influx of funding to support scientific training and research in response to Cold War threats had the effect

of incorporating evolutionary science into public school textbooks. The various Supreme Court cases of the 1960s and 1970s that essentially removed all elements of religion from the public schools combined to support the teaching of this science-based curriculum throughout the country. In 1968, in the Court case *Epperson v. Arkansas*, a public school teacher successfully sued the state of Arkansas for its prohibition of the teaching of evolution. Citing this prohibition as both an establishment of religion and an abridgment of free speech, the Court's ruling had wider implications and effectively nullified all state laws with similar prohibitions. Yet, in affirming neutrality toward religion, this ruling left open the possibility of advocating for equal time for various religious viewpoints.

Limited success for creationists in gaining "equal time" in public school curriculum under the Reagan administration was challenged by the American Civil Liberties Union (ACLU). The Supreme Court in *Edwards v. Aguillard* (1987) ruled that the teaching of creationism in public schools violated the establishment clause. Some of the same supporters of creationism began the intelligent design movement, an alternative to the language of creationism, in the late 1990s and 2000s. Supporters of intelligent design tend to accept the basic science of evolution but point out the theory's gaps as evidence of an intelligent designer. However, a U.S. district court in 2005 ruled that the use of the term "intelligent design" in the *Of Pandas and People* textbook was essentially as a substitute for "creationism." The issue of evolution promises to continue to be a hot topic in the political world as those opposed to its teaching try to find ways to allow for their viewpoints to enter the scientific curriculum.

As science curriculum controversies waged on, so too have controversies developed over other elements of religion in public school curriculum. As a result of court cases, such as *Engel v. Vitale* (1962) that clearly discouraged even seemingly broad and voluntary religious language or practice by the school and its employees, some school boards removed all vestiges of religion not only from practice but also curriculum to guard against the establishment clause's challenges. However, the Court in *Abington v. Schempp* (1963) clearly stated that schools could constitutionally teach *about* religion. Realizing the importance of religion in the history and culture of the world and in educating citizens who are knowledgeable about the world and its inhabitants, many school systems began to find ways to integrate religion into their curriculum. The National Education

Association's handbook suggests that while religious instruction belongs in the context of family life, schools have a responsibility to teach the history and influence of world religions.

Such integration has led to further complexities. In particular, certain school districts have faced opposition for too heavily discussing Christianity in their curriculum at the expense of other world religions. For those textbooks and curriculum that do involve a variety of religions, the portrayal of those faiths has been, at times, problematic. In particular, suggestions that Buddhism and Jainism fit a theistic model of faith or that Hinduism is a polytheistic faith strike members of those communities as either false or demeaning. Further controversies have arisen regarding the use of the Bible as a historical or even literary text. Though few educators would deny the Bible's influence in Western history, any discussion of the text in a public school context brings fervent concerns from both Christian conservatives and non-Christians. The very volatility of these issues continues to lead many schools to avoid the treatment of religion altogether.

Prayer and Student Religious Expression

One of the most public and highly contested areas of intersection between educational and religious concerns is the question of school prayer and student religious expression. These controversies involve establishment clause concerns regarding the sponsoring of such prayer by public schools as well as free exercise questions regarding the ability of students to pray and form religiously based groups on public school campuses. Proponents of religion in the schools and advocates for complete separation often come into conflict over these issues.

Though earlier cases addressed religious expressions in public schools, the landmark case mentioned above, *Engel v. Vitale* (1962), paved the way for future challenges to religious establishment in public schools. While school prayer had been regular and largely unchallenged through much of American history, growing controversy surrounding denominational specifications in these prayers led the New York Board of Regents to standardize a nondenominational prayer for its schools. The Supreme Court found even this general prayer to be unconstitutional and thus struck down all school prayer in public schools. The next year, the Court ruled similarly in *Abington v. Schempp* (1963) in declaring unconstitutional the Abington, Pennsylvania, requirement for students to recite ten Bible verses and

the Lord's Prayer during the school day. This time, the Court cited both the free exercise clause and the establishment clause.

These two cases clarified that even a nonsectarian prayer violated the establishment clause and that the fact that the prayers had been written by or selected by the administration made them so. Moreover, in the latter case, the Court clarified that even an allowance for abstaining for those students who objected did not resolve the problem. The fact that such practices were introduced and scheduled by the school is important.

The Court later acted to maintain student expression at public schools as of a different category. In the late 1960s, the Court maintained students' rights to free expression so long as such expression was not disruptive or otherwise offensive. Later cases in the 1980s specified that censorship should be used only in the interest of compelling school interest. However, this question of what constitutes disruption and what constitutes a break of school educational interest remained rather cloudy.

Acting in a cautious way on this subject, many lower courts in the 1970s and 1980s acted to limit the activities of religiously based or affiliated groups at public schools. In 1984 Congress passed the Equal Access Act that clarified the ability of student-led clubs and groups to form and meet at secondary public schools, even if they were expressing a particular religious, political, or philosophical viewpoint. In the wake of this act, a proliferation of religious groups appeared on public secondary school campuses. In 1990 the Supreme Court upheld the act in *Westside Community Schools v. Merges*, a case in which a school had denied a Christian club a staff sponsor. The Court ruled this to be a violation of the Equal Access Act. Other lower court cases struck down similar attempts to limit support of religious student-led groups. This act and other legislation have underscored a movement on the part of the Court to favor free student religious expression rather than caution on establishment clause grounds. Yet, the Court has also consistently prohibited prayers and religious activities sponsored by or organized by schools themselves.

Sexual and Moral Education

While many argue that school prayer is overtly religious, the question of school instruction in morality remains a controversial subject. In fact, the presumption that schools should provide sexual education to adolescents developed relatively recently. Debates over the type of sexual education provided

or whether it should be provided at all have necessarily involved both questions of parental rights and religious perspectives. Prior to the nineteenth century, sexual education typically took place in the home. However, just as citizens and politicians raised concerns regarding the need for standardization and compulsory education generally, so too did citizens and politicians respond to concerns regarding growing immorality and health concerns by calling for standardized and compulsory sexual education.

This movement began in the early nineteenth century as concerns over both increased immorality in the cities and increasing health effects from sexually transmitted diseases (STDs) led to a movement for standardized sexual education. In the 1830s, however, religious leaders and health reformers alike published various books and pamphlets aimed at the sexual health and restraint of young men. The formation of the 1914 American Social Hygiene Association explicitly combined health concerns with moral standards and religiously tinged suggestions for proper living. What followed was the beginning of sexual education in the public schools—a prime forum for reaching youth. Yet, early controversies, particularly with the Catholic Church, pointed to the manner of instruction as problematic. According to many Catholics, taking a scientific approach to sex and giving too much information might result in greater promiscuity. So began a debate that continues today regarding the proper content of such education. Sharing concerns about the problems, various religious and governmental groups differed on the proper response.

It was in the context of World War I that the government first became involved in the issue. By funding sexual education of soldiers in the hopes of avoiding sexually transmitted disease, the government developed films and literature that were later adapted to the public school context. While the moral lessons advocated in this education remained somewhat constant through the 1950s, the sexual revolution of the 1960s and 1970s led to a variety of debates. The patriarchal and overtly heterosexual family model of proper sexuality assumed by the curriculum became too specific for many and necessarily traditional for others.

With growing awareness of HIV/AIDS, sexual education in public schools became even less prescriptive in terms of providing models of proper sexuality and traditional family values. The focus switched to reaching more students and ensuring safety above paradigms of proper morality. Conservative groups opposed such changes and began, in the 1990s, to push for abstinence-only education. Supported most

notably in the 1996 Welfare Reform Act, such curriculum moved away from the more value-neutral approach previously prominent and became much clearer in its advocating of abstinence from sex as the only certain and moral way to address the health and morality issues facing contemporary culture. While religious conservatives continued to support these programs in large numbers into the early twenty-first century, advocates of clearer separation and even the scientific community continued to openly oppose these programs as both inappropriate and wrongly conceived.

Pledge of Allegiance

The Pledge of Allegiance contains one of the most overt references to religion in American public schools. Though many Americans assume the pledge was written as it is now recited, the most controversial phrase of the pledge, “under God,” was a late addition. Though intended as a statement of unity and patriotism, its very message and its requirement in the public schools has led to dramatic and unresolved controversy. The pledge as a practice underscores the principle that the education of youth should involve not only practical knowledge such as reading, mathematics, and other factual knowledge, but that it is also an opportunity to instill a level of civic virtue and good citizenship. Reciting a pledge together not only unites students but daily affirms certain ideals about America as a nation and its inhabitants as citizens.

In honor of the 400th anniversary of Christopher Columbus’s “discovery” of the New World, Francis Bellamy (1886–1972), a Baptist minister from New York, composed a pledge that was published in a youth magazine and later adopted by President Benjamin Harrison (1833–1901) as a pledge for all of America’s youth. At the time, substantial numbers of immigrants were entering America and disunity caused by conflicts between these immigrants and nativists who objected to this growing diversity led to disunity in the nation as a whole. This pledge, according to Harrison, would not only affirm unity but would remind the immigrants of their allegiance to their new nation and would instill these values in their children. As immigration continued and, with it, concerns about the loyalty of such immigrants, the pledge was made the official Pledge of Allegiance in 1942 by an act of Congress. The phrase “under God” was then added in 1954 in reaction to “godless Communism” and as an attempt to incorporate the tradition of recognizing God’s providence in the history of the nation. Upon this change, President Dwight D. Eisenhower (1890–1969)

clearly expressed the importance of continual rededication of the nation’s youth to both the nation of America and to God.

Even before this final addition to the pledge, controversy emerged. Mennonite and Jehovah’s Witness communities objected to the requirement that their children take an oath of allegiance to someone or something other than God. In *Minersville (Penn.) School District v. Gobitis* (1940), the Supreme Court ruled on a case concerning Jehovah’s Witness children who were expelled from public school for their refusal to salute the flag. While the Court recognized the importance of honoring individual religious commitment, it found the school board’s interest in promoting unity and patriotism as of higher importance and upheld the school’s policy.

Immediately following this Court decision, public outrage grew against enforced patriotism, and three years later in the midst of World War II another case emerged with a different outcome. In *West Virginia State Board of Education v. Barnette*, the Court reversed its earlier decision and allowed for abstention from the pledge and flag support in recognition of honoring individual conscience. Despite this ruling, the vast majority of states continued to keep laws that required or encouraged regular pledge ceremonies and explicitly advocated the importance of unity and patriotism as elements of public education.

In the 1960s several Court cases restricted the use of religion in public schools. Outlawing school prayer or required Bible readings in schools, the Court demonstrated a growing concern with clarifying the separation of religion and government in the school context. Several lower court cases throughout both the 1960s and 1970s continued to affirm students’ right to abstain from the pledge and debated whether or not a teacher could abstain in the same way. The issue arose again during the 1988 presidential campaign between Vice President George H. W. Bush and Massachusetts governor Michael Dukakis. According to Dukakis’s statements and past actions, he saw the requirement that teachers lead the pledge as a violation of their First Amendment rights. The growing influence of conservative religion in the late 1980s led to a strong backlash against Dukakis as not only antipledge but anti-God.

Around this time, the first legal challenge to the “under God” phrase emerged as well. In a lower court case in Illinois, Rob Sherman, an atheist and father, sued the local school district on behalf of his son. Pointing to the pledge as an example of religious establishment, Sherman was

unsuccessful in his suit. The courts pointed to the history of reference to God in the national motto, presidential speeches, and even founding documents and concluded that the phrase “under God” was more ceremonial than religiously significant. The implications were that the pledge served more as an affirmation of American identity than any specific religious ideal and that individual Americans could give this phrase their own meaning.

This issue finally reached the Supreme Court in 2004 in the case *Elk Grove Unified School District v. Newdow*. In this case, plaintiff Michael Newdow, an atheist, filed suit on behalf of his daughter for the same reasons as Sherman had earlier. The Court avoided deciding the case on the establishment clause by dismissing it on the technicality that Newdow had noncustodial parental rights and lacked the standing to sue on behalf of his daughter. While this case shows increasing concern among Americans as to the constitutionality of the pledge, recent polls show continued widespread support for its maintenance.

Religion and American Colleges and Universities

Due to both the fact that the vast majority of their students are legally adults and the greater variety of and lesser state support of the institutions themselves, religion in institutions of higher learning has caused less controversy than in the lower school counterparts. Questions regarding compulsory prayer, religious iconography on university buildings, as well as the support of religiously oriented student organizations have provided significant controversy on the college level. Whether religious institutions may discriminate amongst students based on religious belief or, more controversially, whether a state-supported university can support a student group that does the same are some of the issues that have been debated in the courts.

The earliest and most prestigious of America’s universities began with religious charters and with support from religious denominations and congregations. Though these schools such as Harvard University and the College of William and Mary sought to provide students with more than a seminary’s education, the schools proudly advertised their religious affiliations. In the nineteenth and twentieth centuries, minority immigrant groups such as Catholics and Jews began to establish their own centers of higher learning. Growing interest in science led to broader curriculum and less religious focus in most colleges. The need for more comprehensive funding and attempts by the government to ensure the ability of underrepresented groups to attend

colleges led to greater governmental involvement and less denominational unity.

This increase in involvement through financial aid programs, student group funding, and athletic and admissions regulations has led to increased constitutional challenges as well. However, due to the age of college students, the Supreme Court has been more lenient with government entanglement with religious institutions of higher education than with elementary and secondary schools. In its decisions regarding higher education, the Court often considers whether a school’s religious affiliation is strong enough so as to make secular and sectarian activities indistinguishable. The “Lemon Test” developed in *Lemon v. Kurtzman* (1971) provided guidelines for evaluating establishment clause claims. In *Tilton v. Richardson* (1971), the Court clearly distinguished between religious colleges and universities and elementary and secondary schools and allowed that the former can have primarily secular purposes. The funding in question in this case involved the construction of nonreligious buildings and thus constituted a decidedly “nonideological” financial assistance. Later cases such as *Roemer v. Board of Public Works* (1976) upheld this concept that religious schools could receive federal funding. Toward the end of the twentieth century, many schools began eliminating or reducing their denominational affiliation to secure more public funding. The emphasis on neutrality to secular and sectarian institutions underscored in *Mitchell v. Helms* (2000) further secured the ability of sectarian institutions to receive aid. Yet, even as both direct and indirect aid were maintained, the governmental scrutiny that came with that aid was often less attractive.

These sorts of conflicts have often risen in regard to the selection of employees and students at sectarian institutions. Though religious institutions often try to select community members who meet certain ideological or demographic characteristics, the government maintains an interest in equal access and ending discrimination. Although the 1964 Civil Rights Act bans religious discrimination in hiring, it also exempts religious institutions from these guidelines. Several cases involving religious higher education institutions allowed for religious preferences particularly in theology departments of parochial schools. The District of Columbia courts also affirmed Georgetown University’s ability to limit gay/lesbian group formation on its campuses.

In 1983, however, the Supreme Court upheld the decision of the Internal Revenue Service (IRS) to revoke the

tax-exempt status of Bob Jones University due to its anti-interracial dating and marriage regulations. This ruling effectively highlighted the limits on religious liberty in higher education.

In public universities, controversies have abounded regarding the exercise of religious freedom within that context. Instruction in religious studies at public universities has received little legal challenge and has been affirmed in the Supreme Court's *Abington v. Schempp* (1963). However, the question of religious use of facilities has been debated. In *Widmar v. Vincent* (1981), the Court affirmed the right of student religious groups to meet under equal-access claims. Moving beyond the mere right to meet, the issue arose again regarding student publications. At the University of Virginia, a Christian group was prohibited from using funds collected from student fees to publish its religious magazine, *Wide Awake*. The Supreme Court disagreed. In *Rosenberger v. University of Virginia* (1995), the Court determined that the establishment clause did not permit discrimination against religious publication, furthering the religious liberty of religious groups within public universities.

In the aftermath of the attacks of September 11, 2001, there has been increased interest in world religions, and greater awareness of religious diversity within the United States; interest in the academic study of religion has grown, along with a growing consensus that such academic programs are as necessary in public institutions as in private, leading to the proliferation of such programs. Yet, schools continue to struggle with how to manage teaching religious studies as opposed to theology and dogma and how to manage freedom of expression of religious commitment on the part of both students and faculty with a commitment to robust, rigorous, and academic treatment of religion as a subject of study.

Conclusion

In the history of American religion and the history of education in America, the intersections of the two have served as a bellwether for current ideas about the separation of religion and politics. Public and private education have involved the intellectual and moral development of the youngest of American citizens, and the activities supported and carried out in educational institutions have affected this development and have ramifications for American ideas of national and moral identity. Vestiges of religious influence have remained in public schools even after the U.S. courts outlawed school prayer. For generations, the school year has

followed the Christian calendars with lengthy breaks over Christmas and Easter. While Jewish students, for example, are allowed to miss school for Jewish holidays, school remains in session. Increasing numbers of Muslim students and teachers have brought to the forefront questions of allowance for regular prayers during the school day and the use of head coverings by Muslim women and girls. As the American religious landscape becomes even more diverse and schooling options more plentiful, these and other issues promise to remain fertile ground for controversy as well as court challenges that seek to clarify the government's proper relationships to the educational institutions of the nation.

Education: Seminaries and Theological Education

Western theological education has two foci: the scholarly or philosophic study of religion and the preparation of religious leadership. For most religious organizations in the United States, the same institutions often have served both functions, producing religious leaders (clergy) and religious scholars.

Colonial and European Foundations

The foundations of American theological institutions were in the twelfth- and thirteenth-century European universities. Although no single pattern for these institutions existed, perhaps they were Christian versions of medieval Islamic schools, the *jamiah*, which combined instruction in religion, law, and medicine. Western universities undertook the development of theology and canon law as sciences that used Aristotelian dialectics to organize the content and study of these disciplines. Although the faculties of theology and canon law educated a small percentage of medieval clergy, their graduates often held high ecclesiastical office. Since many university teachers were members of the Dominican and Franciscan orders, a connection existed between theological training and preaching. When city congregations hired their own preachers in addition to the parish priests, these “people’s priests” usually had attended the universities.

In the fifteenth and sixteenth centuries, Renaissance scholarship transformed the shape of European learning. The humanists, as their contemporaries called these scholars, were the masters of ancient languages, especially Latin and Greek. At the same time, a new educational technology, the printing press, produced relatively inexpensive books. University life changed as the new learning and technology advanced. Sixteenth-century Protestants were advocates of both changes. Led by university professors and urban preachers, the Reformers found the new learning and technology useful in teaching ministers and laity. In Germany and Scotland the Reformers incorporated the new learning into the existing faculties, while in England the new humanism eclipsed the traditional university course of study almost entirely and shifted the focus from the university curricula to the collegiate programs. Originally, English colleges were endowed residences for students that provided libraries and tutors, but they now became semi-independent schools. Much professional training took place outside of the English university. Medicine and common law had their own schools, and clergy read theology in preparation for the bishop’s examination. The college became the educator of the ruling class, or “public,” and a link between parson and squire.

The English pattern of education influenced the British North America colonies. English settlers in Ireland established a college apart from a formal university. Their school, Trinity College, Dublin (1592), had authority to grant the bachelor of arts and master of arts degrees.

Harvard College was the first college, independent of a university, established in the Americas, and college founders followed the same model at Yale, 1701; The Academy of Philadelphia (University of Pennsylvania), 1740; The College of New Jersey (Princeton University), 1746; King’s College (Columbia), 1754; College of Rhode Island (Brown University), 1764; Queen’s College (Rutgers University), 1766; and Dartmouth, 1769. In contrast, William and Mary (1693) was modeled explicitly on the Scottish university, similar to schools on the continent, which had multiple faculties, including a department of theology. With this exception colonial colleges centered their educational program on the education of the ruling class, not on theology, although many of their graduates entered the ministry.

The colonial colleges influenced subsequent American theological education. The holder of the bachelor of arts degree was a gentleman with the manners and learning expected of the ruling class. The degree acknowledged that a minister was a member of the “public,” or ruling class. Despite the democratic aspects of the Revolution, the college degree continued to mark social position. Whenever the leadership of a denomination attained middle-class status, they established one or more colleges to train their own elite.

Postrevolutionary Protestant Theological Education

The American Revolution marked a considerable social and political transformation of the place of religion in the new nation. Although disestablishment had varying meanings in different states, the Constitution moved religion to the private realm. In particular, Christian doctrine became a matter for individual churches or even for parties within denominations to decide. Ironies existed in this new arrangement. While some traditional theological studies, especially historical and biblical studies, maintained a trans-denominational character, theology became progressively less intellectually visible.

The semiprivate character of the denominations contributed to the formation of a new pattern of theological education: the seminary and the divinity school. Initially, the seminary was a school devoted to the study of theology from a particular perspective. The first such institution, Andover Seminary (1808), protected the interest of its founders, the orthodox party in Massachusetts Congregationalism, by two separate governing boards and two separate sets of confessional subscriptions. Although subsequent seminaries rarely carried particularity to this extreme, they

all sought to build fences around their own understanding of truth, usually by an elaborate system of confessional documents. The normally nondoctrinal Southern Baptists adopted an Abstract or Principles when they established their seminary in 1859.

The semiprivate character of the seminary was attractive to non-English immigrants as well. Lutheran immigrants had a substantial university tradition. While they might have preferred to establish continental-styled universities in America, they lacked the resources to do so. The combination of college and seminary created an American approximation of their European tradition. The Missouri Synod exemplified this accommodation but also experimented with a “practical” seminary that did not require the same sophistication.

Before the twentieth century, the handful of seminaries did not educate a plurality of American clergy. Postrevolutionary America witnessed unrestrained religious competition for new members and resources. In such an atmosphere different ways of preparing ministers flourished. Among Presbyterians and Lutherans, two denominations with precise theological convictions, the need to get ministers into new territories meant that some read theology, preferably with a learned pastor, although some prepared without the aid of a mentor. However, theological rigor did not dominate nineteenth-century America. American Christians supported a continually varied religious potpourri that included new denominations and new religious movements. Some were long lasting, others more ephemeral. Initially, at least, they did not want or need the seminary.

The Methodists were the most effective practitioners of nonseminary education. John Wesley had worked closely with his assistants, providing them with reading matter, supervision, and rules for holy living. In the new world, Methodists continued these patterns. In practical terms Methodism had the advantage of moving people quickly into the churches while monitoring their progress and growth in knowledge and piety. After the Civil War, however, Methodists began construction of theological schools as the denomination became increasingly middle class.

The most distinctive feature of Methodist theological education was the tendency, North and South, to make theological schools part of universities. The period from 1860 to 1900 saw considerable creativity in the development of American higher education. The universities, often built on the foundations of earlier liberal arts colleges, rapidly developed professional and graduate schools. Like many

Americans, Methodists were attracted to the universities’ emphasis on intellectual freedom, a perspective in line with Wesleyan theology. Equally important, Methodists appreciated the democratic spirit of the new institutions: their emphases on merit, on the mingling of people with different vocational goals, and on the new social sciences, particularly education and sociology.

More congregational denominations, including the Baptists and Christian Church (Disciples of Christ), did not have any set educational standards for their ministers. For their elite churches, Baptists favored colleges, especially the manual labor school. However, the vast majority of Baptist preachers were educated in more homespun ways. The tradition was for a congregation to identify a member who had gifts for leadership and to urge that person to consider a pastoral call. Between congregational nomination and assuming a pulpit, the prospective pastor often served as a licensed preacher, visiting churches in the local association and testing his gifts. The denomination provided the prospective pastor with some aids, including church manuals, and mentoring, although less formal than among Methodists, was common. The Disciples’ pattern was similar. Although they maintained colleges, congregations selected and trained the majority of pastors.

Informal theological education rested on American Protestantism’s implicit agreement on the nature and authority of the scriptures. Since the Bible “without note or comment” was sufficiently clear for the average person to understand, individual study would yield its truth. The faithful reader did not need doctrinal and other guides that might obscure the plain truths universally available to anyone. This method of private study could be fruitful. Abraham Lincoln, not a church member, wove a profound tapestry of meanings from the biblical texts that provided a compelling religious interpretation of the Civil War.

African American Theological Education

African Americans formed the African Methodist Episcopal Church (1816) and the African Methodist Episcopal Zion (1821) in protest against racial discrimination by white Methodists. These churches reflected the dual character of African American life, combining African American and white religious and cultural traditions. The AME and AME Zion churches trained their pastors in patterns set forth in their Disciplines, similar to those in the white Methodist Discipline. Although whites excluded African Americans from educational opportunities in the North and the South,

these churches yearned for the respectability that formal education provided. At considerable sacrifice, the AME church established Wilberforce University in Ohio in 1856 and later established there a seminary, named after Daniel Payne, a passionate advocate of African American education.

Antebellum African Americans in the South adopted other patterns. In this region, where the vast majority of African Americans were enslaved, religious life often followed two pathways. Many slaves attended white churches, often under compulsion, where the laws mandated their segregation. Although the white pastors had special messages for slave members that stressed obedience and not stealing, the slave members also heard sermons that dealt with the primary teachings of the faith. At the same time, African Americans maintained their own alternative “church” on the plantations under the guidance of an African American exhorter. The Spirit, perhaps reflecting older African customs, appointed these exhorters, but they served with the consent of their hearers. Interestingly enough, some white masters were proud of their slave preachers and occasionally either went to hear them exhort or invited them to preach to the big house.

The exhorters were not as ignorant as one might assume. Although the law prohibited teaching slaves to read, some acquired the art, either from whites or from other slaves. This opened the Bible—the great educator of western and southern frontier Baptists—to them. Their theological imaginations soared. The slave preachers’ fascination with Moses and other Old Testament heroes provided many of the foundational ideas of later black theology. The slave preachers built, together with their congregations, a rich musical tradition that combined African American instruments, such as the drums and banjo, and western instruments and harmonies. In a world where texts were uncommon, music was a potent educator. European Americans often heard and imitated this music. In turn, African American slave music was a foundation of the gospel music still popular with both races in the South and, hence, also a contribution to the education of white ministers.

After emancipation, the Bible remained the most vital item in African American theological education. Although African Americans founded colleges and seminaries, the most important item in the preparation of an African American pastor was literacy. The various organizations that promoted the ability to read, the Sunday school, the public schools, and tutors, all contributed. Segregated African American education was poor, compared with that available

to whites, but it opened the Book. The newly founded African American colleges and seminaries, however, did prepare an elite that provided leadership for African Americans. And some of the most prominent African American leaders, including Benjamin Mays and Martin Luther King Jr., were educated in both African American and white institutions.

Roman Catholic Theological Education

Two strands in Catholic theological education are related and yet different: the education of secular or diocesan clergy and the education of religious clergy or those clergy who are members of religious orders. In addition, the Catholic Church historically made provision for the education of women religious (nuns or sisters) that included theological and religious training. In addition, each new wave of immigration brought with it priests from the old country with a variety of educational experiences.

The Council of Trent (1545–1547; 1551–1552; 1595–1563) recommended the formation of diocesan seminaries to the bishops, an edict slowly implemented in Europe. In addition, individual religious orders established seminaries, which admitted candidates for the secular ministry, and the orders participated in the life of Catholic universities. With the expansion of Catholicism in Latin America, universities were established under church auspices in Mexico (1551), Peru (1551), Santo Domingo (1558), and other locations. These institutions were to train professionals to serve the colonial population. The most important European precedent for later American schools developed during the seventeenth-century French Catholic renewal. Vincent de Paul (d. 1660) and Jean-Jacques Olier (d. 1657) founded religious societies—dedicated to education and the renewal of the priesthood—that set up branches in the United States. In 1791, Bishop John Carroll invited the Sulpicians to found Saint Mary’s Seminary at Nine Mile Tavern near Baltimore.

After Napoleon’s defeat (1815), *ultramontanism*, a term that literally means “across the mountains,” that is, the Alps, became the dominant Catholic theological movement. The goal of ultramontanism was to center the life of the church in Roman teaching and practice. In diocesan theological education, this meant an emphasis on doctrinal manuals and very strict discipline. The goal was for the priest to believe what the church believed, to do what the church did, and to be loyal to Roman authority. Ultramontanism was particularly strong in Ireland, where Catholicism provided social and religious cohesion.

In 1859 the American College of the Roman Catholic Church of the United States, Rome, Italy, opened, and in 1884, Leo XIII raised the school to the rank of a pontifical college. The American College has played a unique role in the training of the American Catholic leadership, especially of men identified as good episcopal prospects. Before Vatican II, the college was a strong advocate of the ultramontanist position and had a significant influence on both the content and teaching of American Catholic theology.

At the Second (1866) and Third Plenary (1884) Councils, the American bishops expressed their interest in the establishment of a national Catholic university to serve as a center for Catholic scholarship, particularly in religion and theology. Leo XIII granted their desire and urged other Catholic institutions to cluster around the new school and to use its resources. Although Catholic University in Washington, D.C., was indirectly involved in the so-called Americanism controversy, the school has been a center for theological study and reflection since its founding.

Some Catholic theologians have referred to the pre-Vatican II period as that of “ghetto” Catholicism. During this period the Roman Catholic Church constructed its own social organizations to parallel secular and Protestant organizations. In many ways Catholic theological education fit this pattern with philosophy as the necessary preparation for theology, roughly paralleling the Protestant pattern of liberal arts before theology. Yet the structure of pre-Vatican II priestly formation was not the same as its Protestant counterpart. Young men began their priestly formation in high school seminaries and then completed minor seminaries and major seminaries. The minor seminary was a school for prospective priests that taught philosophy on the undergraduate level; the major seminary was a school for prospective priests that taught theology.

The church, thus, separated priestly formation from lay experience. The priest matured as a man apart.

The Shocks of Modernity

When the Civil War ended, the United States fast became a nation of cities and railroads, dominated by the rapid expansion of finance capitalism and seemingly committed to rapidly oscillating circles of boom and bust. These economic and social upheavals challenged theological schools; but, more seriously, new scientific and literary studies raised questions about their core affirmations. Biblical study moved from the theologically safe philological studies to a “higher” criticism, primarily interested in the

authorship and historicity of the texts. Although few Americans could follow the technical arguments, the implications of this new criticism for hallowed theological traditions were obvious. Many believed that the churches needed to revise or abandon the doctrine of inspiration that supported the American veneration of the scriptures. Especially troubling, new emphases in Christology favored the so-called Jesus of history over the Christ of faith. These theological problems became front-page news when denominations convicted leading scholars, including Crawford Toy of Southern Baptist Theological Seminary (1879) and Presbyterian Charles A. Briggs of Union Theological Seminary (1892), New York, of heresy for their advocacy of the new studies.

However, the study of the Bible was not the only intellectual change on the horizon. Since Copernicus, scientists had been drawing a picture of the universe that seemingly left little room for the God of traditional theism. Natural law seemingly ruled supreme through the universe, rendering such religious ideas as miracles and particular providences less viable. The publication of Charles Darwin’s *On the Origin of Species* (1859) further challenged traditional belief. According to Darwin, all plants and animals had evolved from earlier forms. Although some theologians argued that God authored the changes, Darwin’s theory insisted that the evolutionary mechanism was strictly natural and random.

The rapid growth of technology and medicine enhanced the prestige of science. Progress appeared to be part of the very air that Americans breathed, and this optimistic mood challenged a redemptive faith. Humankind seemed to have fallen heavenward rather than into the depths of sin, but, if so, what need was there of Christ, sacraments, or church? Christianity seemed wounded at its core.

The sharp questions of modernity were more complex than a single generation of theologians could answer, but those who wrote theology were conscious that ministers and laypeople wanted answers now. Perhaps the easiest adjustments were in the classical disciplines of Bible and ecclesiastical history. Although the Protestant tradition of the pastor who read Greek and Hebrew never completely disappeared, especially in conservative seminaries, a marked shift toward the mastery of the new critical studies occurred. Teachers believed it more important to understand, for example, the documentary hypothesis of the Pentateuch than to translate the text easily. Although the liberals often masked their changes in the language requirements by

insisting, probably correctly, that few students had ever mastered Greek or, especially, Hebrew, the point was that the text was no longer a repository of sacred mysteries that reverend grammarians might solve. The result was a hole in the center of the curriculum.

Meanwhile, both Baptist and Methodist schools had experimented with courses in practical or pastoral theology. The instructors used pedagogy and other social sciences to teach students how to lead a congregation. Like the curricula of education and social work, the new practical courses emphasized fieldwork. Ministry had changed. The traditional Protestant minister was primarily a teacher who transmitted the content of the faith, especially the Bible and the catechism, to his congregants. The new minister headed up a congregation and was responsible for everything, from the music program to the Sunday school. The relationship between the minister and individuals also altered. When previous generations went to the pastor for guidance, they expected the minister to apply religious teachings to their specific situation. Now parishioners assumed the pastor was a moral and religious guide, almost a psychological counselor, and innovative pastors and seminaries took advantage of the insights of the new psychotherapy for pastoral work. The minister was a helping professional.

The result of these curricular changes was the “professional” model of ministry that was enshrined in the classical surveys of Protestant theological education by Robert L. Kelly (1924) and by William Adams Brown and Mark May (1934). The task of the seminary, as they saw it, was to prepare men to perform the various tasks of the modern ministry. Although it was not explicitly stated, this implied that theology was an instrument that could contribute to a vital religious life rather than an end in itself.

The surveys were part of the process that transformed the Conference of Theological Schools, an ad hoc group formed to discuss the challenges of the First World War to theological schools, into the American Association of Theological Schools (AATS), later the Association of Theological Schools (ATS). The AATS was primarily concerned with setting and maintaining standards for its member schools. By the 1960s, when the first ten-year visits to member schools were mandated, the association could point to a number of successes: the stabilization of the basic degree, the acceptance of the admission standard of an undergraduate degree, and the creation of a community of people informed about theological schools and their needs. The ATS would play an increasing role in the lives of the schools in the later part of the twentieth century.

Conservative Reactions

While the new understanding of theological education established itself in the majority of the existing seminaries, many American Protestants did not feel at home with the new theology. In response to their anxiety, conservatives developed a new dispensational premillennial theology. This teaching had two foci that directly opposed modern optimism. First, the dispensationalists saw the modern world as sunk so deeply in sin that only the supernatural return of Christ could rescue humanity from itself. Second, they argued that the very marks of progress, praised by more liberal Christians and secularists, were signs of the end times, evidence of the growing depravity of humankind.

A new institution was at hand. The evangelical and missionary movement of the nineteenth century generated new “lay” ministries, designed to carry the gospel into the world. To train these workers, missionary enthusiasts established Bible schools, such as Moody Bible Institute (1886), that would equip them with basic biblical knowledge and practical skills. Conservatives found the format very attractive, and the Bible schools became the backbone of the conservative movement. Like the seminaries, the Bible schools developed their own accrediting agencies and degree structure.

Jewish Theological Education and the Founding of Rabbinic Institutions

The nineteenth century was a turbulent period in the history of Judaism throughout the world. Despite Jewish emancipation in most European lands, anti-Judaic rhetoric and practices continued, especially in Germany and France, and pogroms occurred in Russia. However uncomfortable much of this world was for Jews, the nineteenth century was a very creative period during which new forms of Judaism, including the Zionist movement, arose. In no place were these changes more marked than in the United States, where successive Jewish immigrations from different lands created one of the largest and most variegated of Jewish communities.

Although some “pulpit” rabbis came to perform tasks similar to Protestant clergy—especially preaching and pastoral care—traditional Judaism had no clergy. In the period before the messianic rule, the descendants of the priests of the temple were to keep themselves pure, and Jewish custom assigned them certain rituals, including pronouncing the benediction. The synagogue communities developed a variety of offices rooted in tradition or the Talmud. A cantor often conducted the service, with various members

asked to read scripture or to lead particular prayers. In addition, synagogues appointed ritual slaughters and teachers for the yeshiva or community school. In most European countries, a person recognized as a rabbi served the larger Jewish community. The rabbi was a deeply learned person in Talmud and in Torah—in many ways, the ideal Jewish scholar—and the community charged him with the important task of responding to questions about obligations under Jewish law.

The practice of issuing *semikhah*, or diplomas of ordination, began in the fifteenth century. The process combined both formal and informal elements. The rabbi, who supervised a candidate's studies, issued the certificate when he was convinced that his pupil had a sufficient understanding of Talmud and the *responsa* to teach. Two other rabbis were required as witnesses. In time, the new rabbi would authorize his own students so that the *responsa* came to represent particular lines of interpretation or, in the case of Hasidic Jews, piety. The heart of the preparation for the *semikhah* was the careful study of Torah and Talmud expected of every Jewish male. The rabbi was the one who had penetrated further and deeper into these studies and, hence, was qualified to advise others. Jews did not need rabbis for burials, weddings, and other religious rituals.

The earliest American synagogues often followed the earlier pattern with the services and other offices performed by members of the congregation. As immigration from Germany and Central Europe increased, many American Jews were attracted to the congregational model. In Europe a revolution in the study of Judaism, both in the universities and in such Jewish organizations as the Institute for the Scientific Study of Judaism in Berlin, began to apply modern critical methods to the study of Judaism. As in Protestantism (see above), the change in hermeneutics marked other changes, including major alterations in the ritual. The most dramatic changes were, of course, the use of English in many prayers and readings, the use of choirs, the use of fixed forms to ensure decorum, and the occasional substitution of Sunday worship for the traditional Saturday observance. In the worship service, the rabbi functioned as a preacher, presenting a learned discussion of the Torah or a contemporary issue. The rabbi also began to take on the other roles of a Protestant pastor, including counselor, religious educator, and ritual leader. Rabbi Isaac Wise, a persuasive advocate of Reform, established Hebrew Union College in Cincinnati (1875) with a program aimed at producing Reform rabbis and with the authority to issue the *semikhah*. The Jewish Institute of Religion, founded by

Stephen Wise on similar principles, joined Hebrew Union in 1950.

American Conservative Judaism (Masorti) likewise had its roots in both Europe and America. Conservatives modeled the Breslau Jewish Theological Seminary (1854) on Protestant university faculties. Admission requirements to Breslau were the same as those required for German university study, and the school maintained the German tradition of academic freedom. The dominant figure in the school's early years was Rabbi Zecharias Frankel (d. 1875), who believed that Jews should have a positive approach to their traditional practices, while understanding them critically. Conservative Jews established similar schools in Budapest and Vienna. In the United States, the popularity of this approach grew after Hebrew Union served shellfish at the dinner celebrating the first graduating class in 1883. The Pittsburgh Platform, adopted by Reform Jews in 1885, made the schism complete. The Platform recognized Christian and Islam as daughter religions, saw the dietary and other rabbinic teachings as obsolete, and interpreted Torah as training for Israel's historical experience in Palestine. Those Jews who shared Reform's critical spirit but found more positive value in Jewish practices and traditions moved toward Conservative Judaism. For them, the Breslau seminar was an important precedent, and in 1886, led by Sabato Morais (d. 1897), they created Jewish Theological Seminary in New York. Of the three first instructors, two, Alexander Kohut (d. 1894) and Bernard Drachman (d. 1945), had *semikhah* from Breslau. All had close connections with European and American universities. Solomon Schechter (d. 1915) became president in 1902 and was the school's second founder. A graduate of the Jewish Seminar in Vienna, Schechter raised funds for the school and cemented its scholarly reputation. Jewish Theological Seminary has strong relationships with Columbia University.

Mordecai Kaplan (d. 1983) represented a radical development in American Conservative Judaism. Although deeply attached to Jewish customs and practices, Kaplan believed that much of the theology of Judaism was antiquated. In its place he proposed a naturalistic understanding of God that rendered many other Jewish theological affirmations obsolete. Kaplan remained part of Conservative Judaism until his retirement from Jewish Theological Seminary in 1963. In 1968, he and his son-in-law, Ira Eisenstein, founded the Reconstructionist Jewish Seminary in Philadelphia as the center for what became a fourth branch of Judaism.

Although Orthodox Judaism continued many traditional practices associated with the *yeshivah*, the postemancipation situation, with its increased economic opportunities, suggested that young Jews needed secular education to flourish in the secular world. Torah was the center of Judaism, but worldly knowledge had its place as well. The Rabbi Isaac Elhanan Theological Seminary, established in 1897, is the rabbinic school affiliated with Yeshiva University. Like Hebrew Union, it requires some Jewish cultural studies, in addition to the traditional mastery of Talmud, and admits men with a college degree.

Modernity's Crisis

Socially, culturally, and intellectually, the nineteenth century ended in 1914 when Europe went to war. Although peace returned in 1919, it was only temporary. In 1939 war broke out again in Europe and ended with the terrible reality of nuclear war, and the post-War world, a world distinguished by a series of minor wars, lived under an atomic shadow. Theologian Paul Tillich captured the mood of the times when he referred to the "shaking of the foundations," an apt biblical citation for a difficult time.

The passionate fundamentalist-modernist battle of the 1920s was a sign of the prevailing anxiety. Although the liberal party won in most denominations and seminaries, the battle deepened the conflict between the two parties. The conservatives, later to call themselves evangelicals, were bitter about their exclusion from the seminaries and dreamed of a great evangelical university. Although such grandiose schemes never happened, they did begin to found seminaries, which by the 1950s were well endowed and taught by people with doctorates from prestigious universities. By the 1980s conservative evangelicals were strong enough to take control of the nation's largest Protestant denomination, the Southern Baptist Convention, and their churches were growing rapidly. In the first decade of the twenty-first century, evangelical seminaries enroll more than half the students in ATS seminaries.

The general crisis stimulated mainline Protestant thought. The intellectual and social situation seemed closer to that reflected in the biblical witness than it was to liberal optimism, and Protestant theology flourished as theologians and biblical scholars rediscovered biblical theology. At the same time, the churches grew rapidly, especially after World War II, and reached their highest recorded membership in the 1950s. The combination of a theological renaissance and religious renewal strengthened the place of the seminaries

within the churches and the culture. The seminary degree became the norm, even in denominations that historically had maintained other routes to ordination. Accreditation also grew in importance, as chaplaincy positions required a degree from an accredited school.

Secularity, Pluralism, and the Sixties

By 1964 it was evident that deep changes were taking place in the United States and Canada. These included an increasing diversity in American religion and cultural life, the inner transformation of major religious groups, and the growing secularization of society. These larger trends affected theological schools.

Diversity marked the nation and the seminaries. In 1960, although a few African American schools existed, the vast majority of American seminary students were white and male. Within the next fifty years, this would change radically. Women, African Americans, Koreans, and Latin Americans entered theological schools in increasing numbers, and by the year 2000, white males were a minority in most mainstream Protestant schools. Although administrators expected these new constituencies to swell seminary enrollments, this did not happen. The increase in new constituencies matched a declining enrollment of white men in mainstream schools. The evangelical seminaries were an exception. While conservative schools' gender balance tipped toward men, they tended to attract more foreign students. Although the leadership of the schools changed more slowly, an increasing number of women and minorities were in executive positions.

Perhaps equally important, the variety of American religious life increased as well. In the wake of President Lyndon Johnson's liberalization of the immigration laws (1964), significant numbers of Buddhists, Muslims, and Hindus entered the United States. Like pre-nineteenth-century Judaism, these religions had long noninstitutional patterns for training their religious leaders as well as varied patterns of religious leadership. Within these patterns it was not always clear which positions were analogous to Christian clergy. Perhaps these groups will follow the earlier Jewish pattern and select a traditional office, similar to that of rabbi, as their predominant functionary. Hartford Seminary Foundation maintains an influential Islamic studies program, originally part of the Kennedy School of Missions. At the beginning of the twenty-first century, many young Islamic leaders attend to attain American credentials that may enable them

to serve as chaplains and qualify them for leadership in their own communities.

In addition to these religious imports, the United States has continued to generate a variety of new religious movements that range from individual spiritualities, often based in meditative practices, to nature religions, such as Wicca. Some advocates of these new religions have enrolled in Protestant seminaries, especially the more liberal, making student bodies more religiously diverse.

The two events that marked the most dramatic transformations of American religious and theological institutions were Vatican II and the 1967 Arab-Israeli War. Vatican II was the Roman Catholic Church's negotiated peace with the modern world, and the Council marked significant modifications of traditional Catholic positions on other religions, religious freedom, and the role of the laity. Roman Catholic theological schools in the United States and Canada underwent major transformations. Besides admitting lay students and founding ecumenical programs, they changed their programs of priestly formation in the direction of the Protestant professional model. In addition to historical-critical biblical and historical studies, Catholic seminaries adopted the new practical theology. Most significantly, high school and college seminaries virtually disappeared. The seminary became a school for college graduates. Thus changed, Catholic seminaries entered the Association of Theological Schools as full participants. Ironically, Vatican II, designed to make the church attractive to the modern world, sparked a great decline in religious vocations.

Vatican II also influenced the composition of theological faculties. Catholics joined Protestant faculties, and Protestants joined Catholic faculties, deepening the theological conversation. Both Protestants and Catholics had a renewed interest in Judaism, and Jewish scholars joined some influential divinity school faculties, even in such sensitive disciplines as New Testament. The divinity schools at Harvard and Yale, both historically Protestant, have Roman Catholic deans.

The 1967 Arab-Israeli War changed American Jewry in fundamental ways. Both Reform and Conservative Judaism, which had earlier seriously questioned Zionism, moved to become vocal supporters of Israel, and the new relationship transformed their academic programs. The outward marks of tradition became more important, especially among Reform schools. Some connection with Israel became almost a necessary component of rabbinic training. Hebrew Union, for example, requires a year's study in Israel. At the same time,

Reform and Conservative seminaries added courses in the new practical theology, especially counseling, and advanced the understanding of the rabbi as pastor.

The rapid advance of secularization and the decline of the mainstream Protestant churches also influenced theological education as a whole. The number of people claiming any religious affiliation, including self-identification, dropped rapidly, and many congregations declined in numbers and influence. Ministry became a less attractive profession. For mainstream Protestant schools, serious financial crises in the 1970s, 2001–2003, and 2007–2009 complicated these larger issues. The various denominations were unable to increase their support (and most lowered it), and endowments fell in value. Many mainstream denominations, including the United Church of Christ, began multiple paths to ordination, especially for those serving smaller churches. Perhaps the best sign of the new order was that the mainstream seminaries were in a minority in the ATS. The center had become another minority.

The effects of diminished resources were not only negative. Rising costs forced seminaries to cooperate, especially in the major cities. These cooperative patterns, often called consortia, had their major impact on libraries, where electronic catalogs and buses that carried books from campus to campus provided links between schools. Interseminary course registration did not prove as important as the founders of the consortia had hoped, although students planning graduate studies found the expanded community of scholars invaluable. The most important consortium was the Graduate Theological Union in Berkeley, California, founded in the 1960s, which brings together nine seminaries to provide graduate studies in theology and religion.

Perhaps the most dramatic change was the shift in religious and theological scholarship. From the founding of Andover Seminary to the 1970s, seminary faculties wrote the most significant American religious scholarship, especially in Bible, comparative religion, and religious history. By 1980 the tide had shifted, and the university departments of religion, driven by higher standards for tenure and promotion, now produced the most significant scholarship. The meetings of the American Academy of Religion (AAR) grew from small events held at a seminary to large gatherings requiring convention centers and several hotels. Although some leaders of the AAR were people of faith, the organization and the standards of scholarship that it encouraged were self-consciously secular. Moreover, since the universities were the primary source of seminary teachers, those

standards increasingly governed seminaries. In a sense, theological scholarship had come full circle. Originating in the medieval university, it returned to the secular academy.

Education: Sunday Schools

Sunday schools, also called Sabbath schools, began as religious education for children not enrolled in religiously sponsored schools. Later curricula allowed for adult education. Laypersons, especially women, have been instrumental in Sunday school organization and instruction. In North America, Protestants have successfully utilized Sunday schools for evangelism and religious instruction. Mormons, Roman Catholics, Jews, and Muslims also appropriate some form of religious education.

Protestantism: Beginnings of U.S. Sunday School Movement

A forerunner to Sunday schools is Martin Luther's 1529 *Der Kleine Katechismus* ("Small Catechism"), a curriculum for instructing children on the Ten Commandments, the Lord's Prayer, and baptism. Similarly, primers in Puritan New England instructed childhood literacy through biblical passages and prayers. Early foundations for Sunday school include Methodist missions in Georgia in about 1735, Hannah Ball's school for children in her home starting in 1763, and Sunday schools for children in the Pietistic

settlements of Pennsylvania. Most historians credit the origin of Sunday schools to 1780 in Gloucester, England, where newspaper publisher Robert Raikes hired a schoolteacher to instruct literacy and Bible to lower-class children on Sundays. The English Sunday schools had rapid success with 250,000 children enrolled by 1787.

The first American Sunday school began in 1790 in Philadelphia. The First Day Society modeled its Sunday school after those in England, focusing on enrolling non-churched children from lower-class families. Founding members included Episcopal bishop William White, Catholic layman Matthew Carey, Quakers Thomas Pym Cope and Thomas Mendenhill, and the Deist patriot-physician Benjamin Rush. By the 1820s Sunday schools became inclusive of all social classes and encouraged the sharing of reading and religious instruction among all children. In the 1810s schools were inclusive of children from both churchgoing and nonchurchgoing families. Later distinctions were made, labeling as mission schools those for unchurched students and church schools for those children whose families were part of a congregation.

The emphasis on literacy remained a significant component of Sunday schools until the institution of publicly funded schools for children. The focus of Sunday schools would be on children. Other Sunday school associations focused on education for adults, including the Male Adult Association of Philadelphia, founded in 1815. The focus on adult education was short lived. By 1817 members of the Association decided to devote resources for instructing children. Sunday school agents would again emphasize adult education to check the illiteracy of settlers on the frontier. The focus on children at this time also reflected the prevailing approach to children. Most people viewed children as "little adults" capable of instruction, especially instruction about the well-being of their souls. Sunday school teachers viewed their role as participating in the evangelization of children to Christianity.

The American Sunday School Union (ASSU)

The most significant institution in the history of Sunday schools was the American Sunday School Union (ASSU), founded in 1824 in Philadelphia. The ASSU was part of an interdenominational Protestant evangelical enterprise extending benevolent aid and evangelism across the country along with the American Bible Society, the American Home Mission Society, and the American Tract Society. No single denomination was to have the controlling stake over the ASSU, although disputes arose soon after formation.

Non-Presbyterian ASSU members complained that Presbyterians received more positions of leadership. The Protestant Episcopal Church formed its Sunday School Union in 1826. The Methodist Episcopal Church Sunday School Union commenced in 1827.

The ASSU grew quickly, embarking on ambitious missionary campaigns. In 1824 it listed 723 affiliated schools reaching 1.4 percent of the eligible children for enrollment. One year later it had affiliates in 21 states and 2 territories, with enrollment of 2.2 percent. By 1832 there were affiliates in all 24 states and the enrollment was nearly 8 percent. In 1830 the members of the ASSU endorsed the campaign to establish a Sunday school in every settlement of the Mississippi Valley by 1832. The undertaking rested on the shoulders of willing ASSU missionaries, American Home Mission Society missionaries, itinerant preachers, and seminary and college students on short-term assignments during breaks from school. A great number of volunteers were women. Most were single, and some found mates in the male missionaries. The “Valley Campaign” also had its heroes. Stephen Paxson, a farmer from southern Illinois, converted to Christianity after attending his daughter’s Sunday school class. In the 1840s he became a missionary for the ASSU. In more than 20 years of service, Paxson single-handedly started 1,200 schools, most of which developed into permanent congregations. Abijah W. Corey claimed to have established more than 25,000 schools in the lower Mississippi valley between 1845 and 1872. By 1870 the efforts of Sunday school missionaries resulted in 6.5 million students attending schools.

The ASSU’s influence on American education and print culture came with the expansion of Sunday schools across the continent. In most frontier territories and states, Sunday schools provided education to children and illiterate adults in the absence of public schools with significantly less expense to state and territorial governments. Some frontier politicians preferred Sunday schools as the method of instructing poor settlers in regions with sparse population.

The ASSU entered the print industry in 1825. The Union began putting out alphabet primers, spelling books, hymnals, and various catechisms. From the printing house in Philadelphia, agents of the ASSU distributed Union literature as well as Bibles from the American Bible Society and tracts from the American Tract Society. Missionaries served as colporteurs (traveling book salespersons), complete with book catalogs. The ASSU offered the “Sunday School and Family Library,” a collection of one hundred religious and literary volumes for \$10. The availability of this collection

caused an increase in the number of Sunday schools with libraries. In 1826, 17 percent of ASSU affiliates had libraries, averaging thirty-two volumes. By 1832 over 75 percent had libraries, with an average of ninety-one volumes. Sunday school libraries were the majority of libraries in the United States, accounting for 60 percent of the 50,000 public libraries in 1859. In addition to books, the ASSU issued periodicals such as the *American Sunday School Magazine* (1824–1830), followed by the *Sunday School Journal*, *Sunday School Times*, and *Sunday School World*.

Horace Bushnell’s theories on children altered the goals and methods of Sunday schools during the nineteenth century. The Massachusetts Sunday School Society published the first edition of *Christian Nurture* in 1847. Bushnell intended his book for parents, not Sunday school teachers, although it had an effect on both. Bushnell challenged the older assumption that children inherited original sin and must be converted through revival. Instead, he advocated that children mature spiritually through an environment conducive to spiritual growth. Sunday school periodicals of the 1860s and 1870s reflected these changing perceptions of childhood and the shift to religious education fostering growth rather than conversion.

Sunday Schools and Ethnic Minorities

The ASSU found its most significant roadblock in the education of African Americans. Issues of segregation and slave education slowed ASSU offerings to educate all persons. In northern cities integrated schools maintained segregated classes. African Americans were often the most eager pupils because they were excluded from public schooling. One-quarter of the students in New York City in 1817 and two-thirds of the Philadelphia students in 1819 were black. African American adults took advantage of the free education. Half of the black students in New York City in 1821 were adults, with 70 percent being women. Segregation remained a hindrance, causing African American denominations to start Sunday schools. Former slave-turned-missionary John Berry Meachum started the African Baptist Sunday School in St. Louis, Missouri, during the 1820s. In 1829 the African Methodist Episcopal Church started its first Sunday school in the West with a school in Chillicothe, Ohio. The 1831 Nat Turner slave rebellion in Virginia resulted in a significant halt in the education of African Americans. Some people blamed Sunday schools for inspiring Turner’s rebellion. Missionaries to slaves rarely used the word *school* for sessions of biblical instruction. Southern states created laws restricting the education of slaves. Black enrollment in

New York City was cut in half between 1831 and 1847. Some educators, such as Frederick Douglass, who taught a Sunday school in Baltimore, were outspoken about slavery and racial injustice. Most Sunday school officials and agencies remained silent to prevent schism.

Protestant missionaries also established mission schools for Native American children. Missionaries and their patrons believed that these frontier schools extended benevolence to young Indians by rescuing them from their supposed “savagery.” Missionaries designed these schools to instill the Protestant values of conversion to Christianity, morality, civility, and a strong work ethic. Schools were either day schools or boarding schools. Their curriculum mirrored that of common schools in eastern states but also infused religious instruction and vocational training. The federal government began subsidizing mission schools in 1819 and following the Civil War granted contracts to mission groups to establish schools on Indian reservations. At the end of the century most mission schools closed in favor of government schools.

Reforms Following the Civil War

After the Civil War the leadership of Sunday schools shifted to the West under the guidance of the “Illinois Band,” including evangelist Dwight L. Moody, Peoria businessman William Reynolds, Baptist layman Benjamin F. Jacobs, Methodist preacher and later bishop John H. Vincent, and editor Edward Eggleston. The “Band” was responsible for the renaissance of Sunday schools, beginning in 1864 with the efforts of Moody and Reynolds among soldiers.

Vincent instituted curriculum changes. He advocated a standardized, ecumenical curriculum based on the “Golden Text,” a textbook usable to all churches at all levels. He placed less emphasis on intellectual topics and favored a literal interpretation of the Bible. Vincent eschewed higher criticism and proposed making the Bible “plain” to students. He also favored “growth, not conquest” as the education philosophy. In addition to Sunday schools, Vincent was instrumental in the Chautauqua movement. Building off the Lyceum movement for young men in the 1830s and 1840s, Vincent developed an institute for the education and acculturation of adults in the 1870s. In its early years the Chautauqua instructed men and women on singing, prayer, Bible reading, and Sunday school management, as well as literature and culture.

A national convention adopted the curriculum in 1872. By 1900, three million teachers and students were using the

“Golden Text” curriculum. In addition, secular newspapers printed the “Golden Text” lesson in their Sunday issues. Liturgical churches such as the Lutherans and the Episcopalians had difficulty fitting the curriculum schedule to the annual liturgical cycle. Nevertheless, this curriculum would hold until new reforms appeared in the 1950s.

Led by businessmen, the ASSU more closely resembled a corporation than a religious benevolent society. It focused on cities and the administration and organization of resources. The ASSU as a centralized entity dissolved in the 1870s. A system of conventions emerged, patterned off political parties. This system culminated in the first International Sunday School Convention, where delegates from the United States and Canada met to discuss organizational and curriculum reforms. The convention system for Sunday schools benefited female leaders. It allowed for women to serve as delegates to convention meetings. The system boosted the number of women active in Sunday schools while simultaneously decreasing the number of female superintendents. Prohibitionist women especially made use of Sunday schools as a forum to promote their cause. In 1889 all but 6 of the 466 delegates to the Women’s Christian Temperance Union were Sunday school teachers or Sunday school convention delegates.

Into the Twentieth Century and the Decline of Sunday Schools

Further reforms took place at the turn of the twentieth century. A group called “religious educators” advocated for the professionalization of education in local churches. They stated that every congregation should have a staff director of religious education, if the church could afford one. They argued that the success of Sunday schools depended on professional educators, not volunteers. Religious educators formed the Religious Education Association in 1903 and the Council of Religious Education in 1922. The Council promoted “graded classes,” an idea derived from the educational theories of John Dewey, William James, and E. L. Thorndike. The graded-classes model was a series of graduated classes, starting with rudimentary information and building on that foundation with further Bible knowledge. The reforms looked promising, but churches struggled to implement them. Supporters of “old-time religion” disagreed with such progressive reforms. Most churches did not have the means to fulfill these demands. The Great Depression further exasperated the condition as churches trimmed their budgets. Loss of education resources and

internal disputes resulted in significant losses to Sunday school enrollment. Between 1926 and 1936, the Methodists lost 34 percent of their enrollment, the Disciples of Christ lost 23 percent, and the Presbyterian Church (USA) lost 18 percent. Conservative evangelical bodies had huge gains. The Assemblies of God rose 300 percent, while the Pentecostal Holiness churches doubled in enrollment.

The “new curriculum” of the 1950s aimed at practical relevance and application, seeking to stem declining enrollments. This new movement was short lived, quickly giving way to the cultural upheaval of the 1960s. The 1960s were so detrimental that the United Church of Canada closed its Sunday school operations after an enrollment loss of 300,000 in one decade. In recent decades churches have struggled to keep Sunday schools alive. Nondenominational publishing houses in Nashville, Tennessee, and Grand Rapids, Michigan, lead the country in producing resources for churches. There is new life in religious education in the form of small-group meetings on Sundays and weeknights as well as in “cell churches.” Citing the small churches that met in homes during the apostolic period, advocates of “cells” say that small-group meetings are vital to the education and edification of the parishioners. This format circumvents timeless forms and makes the goals of Sunday schools accessible and applicable to new generations.

Latter-day Saints

The Church of Jesus Christ of Latter-day Saints (LDS) grew out of the fervor of the Second Great Awakening and adopted some of the movement’s most enduring methods. Members of the LDS attend Sunday school as part of their services at the local ward. In Sunday school, members discuss lessons from the Bible and the other “Standard Works”: *Book of Mormon*, *Doctrine and Covenants*, and *Pearl of Great Price*. After the congregational meeting where members receive communion, male members convene for “Priesthood” class while the women hold the Women’s Relief Society meeting. Herein, members discuss their roles as servants to the stake, the church, and the community.

Roman Catholicism

Spanish missions in the sixteenth through the eighteenth century were the earliest examples of religious education in North America. Missionaries held schools to teach Native America children about Christianity, Spanish, and literacy, as well as vocational training in agriculture. Religious education for European emigrant Catholics began in the 1780s

with the establishment of parochial schools. Catholic involvement in Sunday schools decreased after the founding of the ASSU. When debates over publicly funded education arose in the 1820s and 1830s, Catholics vied for state support of parochial schools, provoking anti-Catholic ire from Protestants. The establishment of public schools allowed Protestants to focus Sunday schools on religious instruction. Catholics turned to parochial schools to fulfill both tasks of religious education and formal education to meet state standards. Many Catholics feared that public schools favored Protestant values and subtly taught anti-Catholicism. They accused Protestant Sunday schools of fostering anti-Catholic nativism. Therefore, Catholics preferred parochial schools for the education of their children.

Although parochial schools existed, there were not enough for all Catholic children. Subsequently, many Catholics attended public school. The Third Plenary Council of Baltimore in 1884 mandated the building of parochial schools in every American parish and made attendance of these schools compulsory. Some children remained in public schooling. To supplement the formal education with religious education, in 1905 Pope Pius X ordered the institution of the Confraternity of Christian Doctrine (CCD) in every parish. The CCD was a fixture of the Catholic Church since 1562, during the Counter-Reformation. It has become an operation of the churches in the wake of public education being formed in Europe and the United States. The CCD did not become a national movement in the United States until the 1930s. Parishes offer CCD classes on a weeknight—sometimes more than one night—for children in public schools. The curriculum for the CCD is the catechesis in preparation of a child’s confirmation as a member of the church. Children in parochial schools receive similar curriculum daily and are not required to take CCD classes. The Catholic Church also offers Sunday classes of catechism for adults wishing to join the church. Known as Rite of Christian Initiation for Adults (RCIA), the classes often begin in September and end with the individual’s baptism, first communion, and confirmation on Easter. Variations do exist. Adults may attend RCIA for two years if necessary. Sometimes lapsed Catholics wishing to rejuvenate their activity in the church take the course.

Judaism

Philadelphia was also the site for the formation of the Hebrew Sunday School (HSS) in 1838. Started by Rebecca Gratz and the Female Hebrew Benevolent Society (FHBS)

of Philadelphia, the HSS was essential to the religious instruction of Jewish children and the integration of immigrants into American society. An earlier effort by the Rodeph Shalom congregation provided education and financial assistance to offset educational expenses to immigrant children. But the school restricted its languages to German and Hebrew. Progressive critics stated that restrictions limited opportunities for Jews. Gratz was convinced that children of Jewish immigrants needed educational opportunities for social advancement. At a February 4, 1838, meeting of the FHBS, the delegates passed a resolution to commence such a school immediately. They chose six teachers, including Gratz and the Peixotto sisters, Simha and Rachel. The HSS began with all female teachers, and it remained an important avenue for female service in a religion with male leadership.

The school opened in March 1838 with fifty students in attendance at the Peixotto home. Gratz served as the president of the school until 1864. The Peixotto sisters wrote the early textbooks for the school. Teachers required students to submit weekly assignments in Bible knowledge and penmanship. Gratz graded the exercises. The school operated on a graduated system, and students had to pass the annual examination to advance.

The HSS found moral and financial support from the congregation at Mikveh Israel. Isaac Leiser, the cantor of the synagogue, enthusiastically supported the HSS. The congregation also supplied donors and hosted the annual examinations, which served as fund-raisers. Gratz was apprehensive of a close partnership with this synagogue because it represented the well-to-do of Philadelphia's Jewish population. She wished to make the school available to all Jewish children in the city. When the enrollment outgrew the Peixotto home, the school moved to Mikveh Israel briefly before taking up other facilities.

By the 1840s the HSS boasted between 80 percent and 90 percent of the city's English-speaking Jewish children. The success of the school inspired other educational ventures to adopt the HSS model. The Shearith Israel congregation in New York City formed the Association for the Moral and Religious Instruction of Children of the Jewish Faith in October 1838. That same autumn Sally Lopez opened a Sunday school in Charleston, South Carolina.

In 1854 the HSS found its permanent home in Touro Hall, a renovated Baptist church. Touro Hall also housed the Hebrew Educational Society, a day school funded by

philanthropist Judah Touro. Philadelphia laws prohibiting work on Sundays allowed opportunity for children to attend Sunday school. They also attended day school during the week.

The ASSU was not only an inspiration to Gratz and her brainchild, the HSS, but it also provided English copies of the King James Bible and the Protestant catechism, *Child's Scriptural Questions*. Gratz and other teachers edited the texts, removing mention of Jesus. Rachel Peixotto Pyke revised the catechism into one for Jewish students, while her sister wrote *Elementary Introduction to the Hebrew Scriptures*.

In the decades following the division of American Judaism into its Reform, Conservative, and Orthodox factions, Hebrew Sunday schools became points of debate. Beginning in the 1920s Conservative synagogues favored congregational schools in order to control the content of the curriculum. There was also a shift toward Hebrew schools for Conservative children, opting to meet thrice during the week. In 1928 Conservative leader Max Artz warned that Sunday schools were abandoning Hebrew and were likely contributors to losing youth to Reform Judaism. In the 1930s Conservatives initiated new programs for children and youth, including special ceremonies of consecration and confirmation in roughly two-thirds of the congregations. Conservatives eliminated Sunday schools in favor of the three-day Hebrew School in the 1940s and 1950s. Reform Jews preferred Sunday schools as a way for Reform children and youth to remain active in their religion with their friends from temple and public school.

Islam

Muslims gather in small groups called *halqat* (*halqa*, singular) to discuss lessons from the Qur'an. Often these meetings take place in the mosques but are distinct from the activity of prayer on Fridays. The day for meeting is not prescribed and is flexible. *Halqat* generally last for one hour. A volunteer prepares a lesson from a passage of the Qur'an to present to the group, and members discuss the topic for the remainder of the session and close with the *duas*, or prayers of supplication. Protestant Sunday schools did not inspire the *halqat*. There is a long tradition dating back to the prophet Muhammad. *Halqa* literally means "circle," a word associated with Muhammad's audience.

Indigenous North American Muslim groups, such as the Nation of Islam (NOI) and the Nation of Gods and Earths (Five Percenters), use informal instructional sessions to teach

African American youths. The NOI employs a question-and-answer format similar to catechism to instruct youth on the teachings of Elijah Muhammad. The NOI catechisms amount to nearly one hundred tenets to be remembered and recited by pupils. The Five Percenters also teach through catechesis, often in specific schools. From 1967 to 1988 the Allah School in Mecca located in Harlem served as the headquarters for the Five Percenters and as the flagship school for teaching Supreme Wisdom Lessons. Five Percenter education includes the NOI teachings in addition to the “divine sciences” such as the Supreme Alphabet and Supreme Mathematics. The NOI and Five Percenters rely on instruction from male members, often in mentoring relationships between teacher and pupil.

As an American institution, the Sunday school has certain sacredness. President Jimmy Carter is known as much for being a Sunday school teacher as he is for his presidency and involvement with Habitat for Humanity. Historically, evangelical Protestantism has proved dominant in the development of Sunday schools. Roman Catholics, Jews, Mormons, and Muslims have their own traditions of religious education. The history of Sunday schools illustrates the diversity of America’s religious past and the interaction of religious groups in sharing forms of practice and instruction.

The Electronic Church

“The electronic church” refers to religious broadcasting, in general, and conservative Christian television, in particular. These programs spread church teachings over the air in several formats, from a taping of traditional preaching services to a modified talk show centering on testimonies, interviews, or commentary. The phrase *electronic church* reflects the concern among some church leaders that the faithful substitute their worship experiences from traditional churches with televised church programs. By the mid-1980s the term *televangelism* was used more commonly to describe religious broadcasting.

Religious broadcasting varies by format, but most of the programs share similar traits: fundamentalist or evangelical theology, politically conservative ideology, privileging a prosperity gospel that promised material benefits to believers, and calls for donations from viewers. In the mid-1980s the electronic church was well recognized for the financial and sexual scandals of Jim Bakker, Jimmy Swaggart, and Robert Tilton. At the turn of the twenty-first century, the electronic church was generally noted for promoting right-wing political beliefs.

History of the Electronic Church

The electronic church is oftentimes considered a late-twentieth-century phenomenon. Indeed, the phrase evolved from *the electric church* in the 1970s to describe the rise of religious broadcasting. However, religious broadcasting is as old as commercial broadcasting, and it accommodated evolving religious trends and broadcasting regulations.

The 1920s–1960s

Fundamentalist and evangelical churches have long recognized radio as a powerful means to spread the gospel, and they began producing local religious broadcasts back in the early 1920s. A year after KDKA became the first licensed radio station in America in 1921, live and taped church services became commonplace programming on Sunday-night radio schedules. WMBI, launched in July 1925, was one of the first stations to run an exclusively religious format.

WMBI's early programming featured preaching and Bible studies from Moody Bible Institute's president, James M. Grey (1851–1935). It also aired religious music as well as lectures from Moody's faculty. As the twentieth century progressed, WMBI began distributing its programming to other religious stations around the country. WMBI was still broadcasting into the twenty-first century as one of the oldest radio stations in America.

One of the more divisive radio personalities in the early 1900s was Father Charles Coughlin (1891–1979). His first broadcasts in 1926 covered religious topics primarily, but his content shifted toward radical, abrasive political commentary in the 1930s. Before his program was canceled in 1940, Coughlin had become known for promoting fascism and anti-Semitism through his religious programming.

Whereas Charles Coughlin alienated listeners, Charles E. Fuller (1887–1968) attracted them. Believing that the Lord called him to preach over the radio, Fuller began preaching full time as a radio pastor in 1933 out of KGER in California. By 1937 his program *Old Fashioned Revival Hour* was broadcasting preaching and music coast-to-coast over the Mutual network. *Old Fashioned Revival Hour* was completely subsidized by donations, despite its considerable expenses. The program's expenses exceeded \$4,000 a week, including the time purchased on Mutual to broadcast the program; by 1943 that figure grew to \$1.5 million for the year.

This financial model of religious programs purchasing airtime on secular networks would remain throughout the twentieth century. But in addition to the revenue, many stations found another benefit to airing religious programming: they used the church-produced programs as an effort to satisfy the Federal Communications Commission (FCC) requirement for stations to serve the public good. Fundamentalist and evangelical programs such as *Old Fashioned Revival Hour* tended to purchase broadcast time from smaller stations. The larger radio networks, on the other hand (NBC, CBS, for example), donated airtime to mainline Christian denominations, believing these churches would be less likely to produce programming that would alienate the wider listening audience.

When television became the dominant medium after World War II, producers abandoned radio and modified their shows for TV. The electronic church followed suit, leading to the first televised religious broadcasts. Bishop Fulton J. Sheen (1895–1979) became the first electronic church television star in 1952 when his radio program, *The*

Catholic Hour, jumped to TV and was retitled *Life Is Worth Living*. Like many early television programs, the show was essentially Sheen's radio program *The Catholic Hour* put on television. *Life Is Worth Living* was a relatively simple production: the show resembled a teaching format, with Sheen, dressed in his bishop's regalia, giving a lesson directly into the camera. Despite the relative simplicity of the show, Sheen won an Emmy as the Most Outstanding Television Personality, beating out Lucille Ball, Arthur Godfrey, Jimmy Durante, and Edward R. Murrow. Sheen stopped broadcasting new episodes in 1957, but his programs would rerun on religious networks into the twenty-first century.

Not all early religious television broadcasts were as well received, however. Oral Roberts (1918–2009), a Pentecostal minister from Oklahoma, first gained notoriety by covering his healing crusades on his radio program *Healing Waters*. His first television special in 1954 featured footage from his charismatic healing services, which drew complaints from viewers unaccustomed to Pentecostal services. The network pulled Roberts's program off the air soon thereafter.

In 1960 the FCC mandated that stations were no longer required to provide community service programming free of charge. As a result, most TV and radio stations stopped donating their airtime to religious groups and replaced it with revenue-generating programming. Many of the mainline and liberal churches that had benefited from the free airtime closed production on their broadcasts. Many of the conservative churches that had been purchasing time on non-network stations, though, continued to purchase airtime. As a result, conservative Christians dominated the electronic church and would remain dominant into the twenty-first century.

The 1970s–1990s

The electronic church reached a critical mass in the late 1970s and the early 1980s for several reasons. First, the growth of cable television made it easier for religious broadcasters to create profitable networks. Rather than having to secure a group of stations or affiliates to broadcast religious programming, cable television allowed networks to carry religious programming nationwide. By the mid-1970s over 90 percent of Americans were within the broadcasting range of at least one religious broadcast program.

Pat Robertson's Christian Broadcasting Network (CBN) is one of the more prominent examples of success with cable distribution. Fundamentalist preacher Marion G. "Pat" Robertson (1930–) founded the first Christian TV station,

The small Christian television station founded in 1961 by Pat Robertson, pictured here, evolved into the successful Christian Broadcasting Network.

WYAH-TV, in Portsmouth, Virginia, in 1961. The operation was crude, with a limited broadcast range and only two hours of programming at first. To generate support and resources for the fledgling station, Robertson called for seven hundred viewers to pledge \$10 a month to WYAH. These donors came to be known as Robertson's "700 Club," and they generated enough funds for Robertson to purchase more fledgling television stations. Robertson's network of stations would grow into CBN, which became one of the first networks to embrace cable distribution. Whereas other television ministries focused on producing programming, Robertson's CBN could distribute programming produced by others.

Second, the political climate of the United States in the 1970s and 1980s complemented conservative Christian programs. The religious right and the Moral Majority wielded significant influence in conservative politics during this time. This politically conservative religious movement relied in part on electronic church broadcasts to galvanize believers. As the Moral Majority became more politically influential, so did the exposure of the electronic church.

The work of Jerry Falwell (1933–2007) demonstrates the relationship between political conservatism and the

electronic church. He was well known for his engagement with politics in the late 1970s through the 1980s, but his contributions to religious broadcasting helped raise his national profile. He began broadcasting *The Old-Time Gospel Hour* as a radio program in 1956, primarily featuring taped sermons from his Thomas Road Baptist Church in Lynchburg, Virginia. With a solid audience built up, Falwell used his media presence to support the Moral Majority, a movement to unite conservative Christian support behind evangelical and fundamentalist Christian political candidates. His Moral Majority would take credit for securing Ronald Reagan's election to president of the United States in 1980. The Moral Majority and the religious right in general remained politically powerful until the mid-1980s, when the religious right's base was compromised by scandals in the electronic church, as covered below.

Third, and perhaps most significantly, 1980s televangelism became a fixture in the public square with coverage of sexual and financial scandals. A notable example is the rise and fall of Jim Bakker and *PTL*. Jim Bakker (1940–) produced *PTL* (which stood for "Praise the Lord," and later "People That Love") with his wife, Tammy Faye (1942–2007). By the early 1980s the program had become one of the more popular and profitable electronic church programs. *PTL* viewers contributed millions of dollars annually, helping the Bakkers extend their holdings into Heritage USA, a Christian resort and theme park outside of Charlotte, North Carolina. At the height of their fame, the Bakkers had three homes (including a \$1.3 million parsonage), a houseboat, several luxury and vintage sports cars, and an office Jacuzzi. In three years the Bakkers earned a reported \$4.8 million. But despite this apparent financial success, the Bakkers often maintained to viewers and supporters that *PTL* was in financial dire straits: they pleaded for cash from viewers to keep *PTL* afloat. The investigations into *PTL*'s financial discretions revealed Jim Bakker's 1980 affair with *PTL* viewer Jessica Hahn; Bakker had paid her \$265,000 in exchange for her silence. Jim Bakker was ultimately convicted of twenty-four counts of fraud in December 1988. Among Bakker's crimes was selling 9,700 fraudulent "partnerships" to *PTL*'s Heritage USA theme park at a time when the park could accommodate only 48 such memberships.

In another case, Robert Tilton (1946–) encouraged viewers to mail prayer requests along with donations, promising to pray over the requests. A 1991 news report revealed that the donations were removed from envelopes at Tilton's

bank, and the written prayer requests were left in a dumpster, presumably never reaching the televangelist. In both cases the televangelists were widely criticized as crooks, and their supporters were framed less as religious faithful and more as dupes.

The 2000s

At the turn of the twenty-first century, the electronic church and religious broadcasting continued to evolve with religious trends, media technologies, and communication policies. Web technologies and distribution, including social media and podcasting, did not require the engineering expertise or the financial assets necessary in more traditional broadcasting. As such, these technologies allowed more churches to experiment with mass communications. This is not to suggest, though, that churches were abandoning traditional broadcasting. In fact, when the FCC opened more licenses for FM noncommercial educational stations in the mid-2000s, some Catholic broadcasters took this as an opportunity to increase the number of Catholic radio stations from around 140 to 300 nationwide.

With new media technologies and opportunities came new electronic church superstars. Perhaps the most prominent electronic church leader of this time was Joel Osteen (1963–). Osteen worked with his father, the pastor of Houston's Lakewood Church, primarily as the producer of the church's television show. When his father passed away in 1999, Osteen took over the pulpit, and in 2004 he published his best-selling book *Your Best Life Now*. Some commentators criticized Osteen for promoting a prosperity gospel and for deemphasizing Jesus Christ in his messages. Nonetheless, by the mid-2000s Osteen's church services reached twenty million viewers in nearly one hundred countries each month.

Like their forebears, twenty-first-century electronic church leaders were scrutinized for alleged financial and personal indiscretions. In November 2007, U.S. senator Chuck Grassley probed Joyce Meyer (1943–), Benny Hinn (1952–), and four other megaministry leaders to ensure their lucrative ministries did not violate their tax-exempt status. Also in 2007, the televangelist Thomas W. Weeks III (1967–) was charged with aggravated assault after allegedly attacking his wife in a parking lot. In general, though, these stories did not receive the same degree of public condemnation that the televangelists of the 1980s did, suggesting, perhaps, that the power and interest in the electronic church were beginning to wane.

Some twenty-first-century electronic church leaders were also criticized for promoting what could be considered radical political positions. In the wake of September 11, 2001, Jerry Falwell appeared on Pat Robertson's *700 Club* program and attributed the attack to "the pagans, and the abortionists, and the feminists, and the gays and lesbians who are actively trying to make that an alternative lifestyle, the ACLU, People for the American Way, all of them who have tried to secularize America. I point the finger in their face and say 'you helped this happen.'" He was roundly criticized and later apologized for his remarks. Robertson himself was criticized for calling for the assassination of Venezuelan president Hugo Chávez in 2005 and for suggesting the destruction of Hurricane Katrina could be attributed to legalized abortion.

Dominant Themes of Electronic Church Programming

Fundamentalist or Evangelical Christian

There are at least three general reasons why the electronic church is produced and supported almost exclusively by fundamentalist and evangelical Christians. First, conservative Christians tend to privilege proselytizing and evangelism more than do mainline and liberal denominations. As such, these believers have long adopted media as a means toward spreading the gospel, and religious broadcasting is a natural extension of their call. Although mainline and liberal denominations also were noted for airing church services over the radio in the 1950s, they had abandoned broadcasting efforts in the 1960s.

Second, the dominance of conservative Christianity can be attributed to the visually engaging elements of fundamentalist and evangelical worship. Successful television programming must be interesting—static talking heads do not tend to hold the viewer's interest. Conservative Christian worship is oftentimes noted for high-energy music and charismatic preaching, two elements that translate well on screen. The worship in more mainline and liberal churches, on the other hand, is comparatively staid and less suited for broadcast.

Third, many electronic church broadcasts embrace and promote conservative Christian beliefs. Conservative Christianity is oftentimes noted for maintaining an unyielding approach to theology, eschatology, and biblical interpretation. This is to say that conservative Christians tend to reject approaches to the faith that acknowledge any degree of

subjective belief. This black/white approach to the faith works well with religious broadcasting in that there is little abstraction to digest, making the content easier to communicate in a mass medium.

Politically Conservative

In addition to being conservative theologically, religious broadcasting also tends to skew conservative in regard to politics. Although not every program takes an explicitly political stance, the electronic church in general has a history of aligning with conservative views.

Pat Robertson's *700 Club* program is an excellent example of the trend in televangelism from preaching the gospel to preaching politics. When the *700 Club* premiered in 1966, its format reflected late-night talk shows more than Sunday morning sermons. The show featured testimonies with Christian leaders and musicians rather than focusing on preaching the gospel in a formal manner. But by the late 1970s the program's format had swayed more toward political commentary, and Robertson's public profile evolved from mere conservative preacher to political commentator. Robertson was a strong supporter of Falwell's Moral Majority movement (discussed below) and even ran for president in 1988. At the turn of the twenty-first century, Robertson maintained his controversial, right-wing philosophies on the *700 Club* by suggesting Americans assassinate Hugo Chávez and by featuring Jerry Falwell's claim that the 9/11 attacks were linked to America's support of left-wing beliefs.

Prosperity Gospel

As the electronic church grew in the late 1970s some of the new programs strongly promoted a prosperity gospel. The prosperity gospel posits that God's blessings are manifest through financial success. Some of the more prominent proponents of the prosperity gospel suggest viewers will be more richly blessed by making significant donations to their ministries. For example, televangelist Kenneth Copeland (1936–) regularly tells his viewers to expect a hundredfold return on whatever amount they donate to his ministry.

Appeals for Donations

Many religious programs are noted for incorporating appeals for cash. Producing any programming is expensive, secular or otherwise. Since most churches do not rely on advertising to fund the programs, they rely on contributions from viewers. It is not uncommon for 40 percent of time

on a religious broadcast to be committed to appeals for donations.

Electronic church programs have relied on several tactics to raise funds. Most programs offer premiums in return for donations to encourage giving, such as books or recordings. Other programs, though, have relied on more extraordinary means. For instance, Oral Roberts preached in 1987 that God threatened to "call [him] home" unless he was able to raise \$8 million within a few months. Further, many proponents of the prosperity gospel have claimed that God will richly bless those who donate generously to their programs.

Criticisms of the Electronic Church

William Fore identified five main criticisms of the electronic church in the wake of 1980s televangelism. Although these criticisms are rather broad, they tend to be a fairly comprehensive list of the major criticisms of religious broadcasting in general since its first broadcasts in the early 1900s.

First, these programs are noted for failing to offer a comparable degree of community as offered by "real," brick-and-mortar churches. Whereas one of the virtues of community churches is fellowship and face-to-face interaction, which some argue is critical to the Christian lifestyle, electronic church programs are unable to replicate this camaraderie. Theologian Martin E. Marty echoed this sentiment when he called the electronic church "the invisible church." Ben Armstrong, an electronic church defender and former president of the National Religious Broadcasters, countered that some religious broadcasters use their programs in part to encourage membership in local churches.

Second, Fore noted that the electronic church fails to evangelize effectively, reaching primarily an audience of believers instead of nonbelievers. A common defense of religious broadcasting is its potential to reach the unchurched and convince unbelievers to become closer to God. But analyses of ratings and viewing habits reveal that the religious broadcast audience is almost exclusively composed of persons who were already believers.

Third, the revenue-generating facet of commercial television is inherently at odds with religious belief. Television production is an expensive operation by nature, and it is subsidized through advertising. Religious programs also have to generate a significant amount of money to stay on the air, but unlike most secular programs they do not rely on ads. Rather, the programs appeal to viewers for

donations, leading many critics to note that the shows can focus more on getting funds than on religious issues. Further, the programs' popularity on TV, like all other programs, depends in part on not offending or alienating the audience, which inherently restricts much of what the TV pastors can say.

Fore's fourth criticism is related to the concerns about seeking donations from viewers. In order to make religious programming appealing, the shows have to incorporate many of the trappings of secular culture that churches reject, such as materialism, power, and appeals to success. The electronic church undermines an expectation that church leaders reject extravagance. The medium tends to reflect, if not embrace, a sense of overindulgence, which is not a virtue among men and women of the cloth.

Others note that the electronic church tends to skew toward the more charismatic churches, in part because the demographic makeup lends itself more toward television viewers (poor, lower-income, and so forth) and in part because the ambience of the worship services tends to make for better television than the more staid services.

Finally, since churches have to buy time on the air, the underfunded churches are left off the air, which restricts the religious diversity on TV. William Fore reported in 1986 that most of the audience for religious broadcasting tends to skew conservative and fundamentalist. Less than 15 percent of viewers said the programming served as a substitute for attending worship services. Even though the electronic church may fail in its evangelical mission, it succeeds in reinforcing the faithful's beliefs.

Emerging Church Movement

The Emerging Church movement is a loosely aligned conversation among Christians who seek to reimagine the priorities, values, and theology expressed by the local church as it seeks to live out its faith in postmodern society. It is an attempt to replot Christian faith on a new cultural and intellectual terrain.

It is sometimes referred to as the Emergent movement, Emergent Network, or Emergence Christianity, but insiders prefer the term *conversation* to emphasize the movement's developing and decentralized nature, its wide range of standpoints, and its commitment to dialogue. Most of the dominant contributors are pastors, the majority of them Protestant. Most aligning themselves with an Emerging paradigm are reacting against what they perceive as imbalances in evangelical Christianity and against the church's seeming irrelevance to emerging culture. The spectrum of viewpoints initially identified with the movement in the United States includes the pastors Brian McLaren, Tony Jones, and Dan Kimball; the theologian Scot McKnight; and the denominational leader Alan Hirsch.

Emerging churches are generally urban, youngish, and interested in postmodern thought. Their worship gatherings draw from historical practices and other creative, experiential, and sensory elements but do not represent one particular worship style.

Eddie Gibbs and Ryan Bolger, professors at Fuller Theological Seminary, define the movement in this way: "Emerging churches are communities that practice the way of Jesus within postmodern cultures. . . . The three core practices are identifying with the life of Jesus, transforming the secular realm, and commitment to community as a way of life" (2005: 44, 235). Sociologist Shayne Lee defines the Emerging Church movement as a network of young evangelicals devoted to exploring how new expressions of church might fit into a complex and pluralistic society. Mark Driscoll, pastor of a megachurch in Seattle, defines it as a loosely connected movement of primarily young pastors who are glad

to see the end of modernity and are seeking to function as missionaries bringing the gospel of Jesus Christ to emerging and postmodern culture.

History

Origins

The larger social and cultural context that birthed the Emergent Church movement began framing itself in the 1980s. As the baby boomer generation of those born in 1946–1964 continued to age, generational churches arose that targeted their children, who were then teenagers and young adults. Leaders of these next-gen congregations in the United States and the United Kingdom, and to a lesser extent Canada and Australia, at first focused on the unique qualities of this unknown generation, increasingly described as *Generation X* (a term coined in 1964 and popularized by Douglas Coupland's 1991 novel).

These leaders soon came to feel that the challenges facing their churches were not much deeper than the issue of adjusting the baby boomer generation's worship services in order to communicate better with a Gen-X audience. Instead, these leaders decided, the larger issue was the shift from modern to postmodern culture. This shift affected how the truth claims of historic Christianity could best be presented to an audience that is increasingly skeptical about claims of certainty or objectivity. One stream of the resulting conversation led to the Emergent Church movement.

The specific origin of the U.S. version of the movement took place among a group of evangelical pastors. That group, called Young Leaders (and later Terranova), was initially convened in 1996 by Leadership Network, a Dallas-based nonprofit that helps innovative Christian leaders increase their impact. By 2001 members of the group went on their own, no longer associated with Leadership Network. They chose the name *Emergent* and developed a Web site known as Emergent Village (www.emergentvillage.com), with Tony Jones as its national coordinator. The site offers links to blogs, podcasts, resources, and events associated with the conversations and the growing network of friendships that were increasingly being called emergent. During the early 2000s this Web site became the largest hub for people interested in the network of all things Emergent, along with an Emergent conference cosponsored annually from 2001 to 2005 with Youth Specialties, which resigned the partnership in order to retain its focus on youth ministry, and the publisher Zondervan, which sponsored a short-lived branded

book line named Emergent, which in 2007 became the Emersion line for another publisher—Baker. In 2007 the Emergent Village board of directors downsized the Web site, with stated intentions of phasing it out completely in coming years, as they felt the Village had served its purpose as a launching point for a movement.

Another important networking place during these formative years was the Web site www.theooze.com, subtitled as “conversations for the journey.” The Web site name emphasizes that an “oozy” community tolerates differences and treats people who hold opposing views with great dignity, rather than forcing conformity. It was launched in 1998 by Spencer Burke, who had recently resigned after briefly working at a California megachurch. He began to serve as a speaker and networker for people interested in the emergent church. Burke later coauthored *Stumbling toward Faith* (2003) and *Making Sense of the Church* (2004).

Key Texts

An early book that helped catalyze the Emergent Church movement was Brian McLaren's *New Kind of Christian* (Jossey-Bass, 2001). It sold over 100,000 copies in four years. It recounts an ongoing conversation between two fictional characters—a pastor and his daughter's high school science teacher. They reflect together about faith, doubt, reason, mission, leadership, and spiritual practice in the emerging postmodern world. In doing so the dialogue captures a new spirit of Christianity—where personal, daily interaction with God is more important than institutional church structures, where faith is more a way of life than a system of belief, where being authentically good is more important than being doctrinally “right,” and where one's direction is more important than one's present location.

If anyone personifies the Emerging Church movement, McLaren does. A popular and articulate speaker, McLaren resigned in 2005 from the senior pastor role in the church he had founded in order to do even more speaking and writing. His prolific pen has inked a number of books whose titles alone trace his developing thought, including *A Generous Orthodoxy*, *Everything Must Change*, and *Finding Our Way Again*.

Perhaps the most conceptual book that Emerging Church thinkers draw upon is *The Shaping of Things to Come* (Hendrickson, 2003) by Australians Michael Frost, a seminary professor, and Alan Hirsch, a Baptist denominational leader. It argues that Western civilization is entering what they call a post-Christendom era. Most people in the Western world have

seen what the church has to offer and have found it to be lacking. The result is a huge credibility gap and the need for churches to recalibrate themselves, rebuilding themselves from the roots upward. This requires a more “incarnational” approach to mission; the authors urge churches to emulate the model of God becoming human by emphasizing living the gospel out with greater authenticity among those they hope to reach. This oft-quoted book, and several subsequent books by each author, provided foundational ideas for many in the Emergent movement as well as to those in other arenas, such as the recent Missional Church movement and the House Church movement. Other theorists referenced widely by advocates within the Emerging Church movement are missiologist Lesslie Newbigin (Anglican), theologians N. T. Wright (Anglican) and John Howard Yoder (Mennonite), and Protestant spiritual disciplines writer Dallas Willard, a philosophy professor at the University of Southern California.

Terminology

As interest in the Emerging Church movement grew, so did a confusion of terminology, especially during the early 2000s. Some insisted on a distinction between *emerging* and *emergent*, while others saw them as the same. A number of books came out with one of those two words in the title or subtitle. Some books also tried to link *emerging* with *missional*, for instance, Mark Driscoll’s *Confessions of a Reformation Rev.*

The concepts associated with the Emerging Church movement were likewise unclear to many, evidenced by the wide range of voices trying to shape the meaning of the term. This was a lively discussion point on many blogs, especially Scot McKnight’s Jesus Creed (www.jesuscreed.org), and through multiple-author books that offered multiple-option approaches such as *The Church in Emerging Culture: Five Perspectives* (Zondervan, 2003) and *Listening to the Beliefs of Emerging Churches: Five Perspectives* (Zondervan, 2007).

In 2006, Ed Stetzer, then research director for the Southern Baptist’s North American Mission Board, tried to bring clarity to the divergent streams. He offered three categories, which have been widely adopted. (1) *Relevants*—a word Stetzer created—are those whose main interest is in trying to make their worship, music, and outreach more contextual to an emerging culture. They do not wish to leave or even challenge their orthodox doctrinal moorings. (2) *Reconstructionists*—a term used with no relation to the same-named branch of Judaism—are those who think the current

construct or form of church is frequently irrelevant and the structure is unhelpful. While wanting to make broad changes in the construct of church, they too typically hold to an orthodox view of the gospel and scripture. (3) *Revisionists* are those who question, and in some cases deny, historic beliefs of the church, aligning themselves doctrinally more with liberal than evangelical theologians. They tend to show strong interest in epistemology, the branch of philosophy that studies the nature of knowledge, its presuppositions and foundations, and its extent and validity.

Shared Assumptions

Leaders in the Emerging Church movement would be the first to agree concerning the great diversity within the contributing voices to the movement, beginning with how to define the term *emerging* (or *emergent*) and whether it is a conversation, network, or movement. While no chartering covenant or foundational document exists, there is general agreement on a number of values associated with the term *emerging*.

Awareness that an old Christendom is being replaced by an emerging postmodern world. Emergents acknowledge that they live in two worldviews. The dominant but fading zeitgeist is the Newtonian world of a clockwork-style universe where scientific rules provide clear, logical explanations for all mysteries. Faith, when framed in this same paradigm, is expressed in clear, nonparadoxical categories. The rising scientific worldview acknowledges truth in such discoveries as Werner Heisenberg’s uncertainty principle and Albert Einstein’s theory of relativity, both of which challenge certainty in commonsense assumptions about the nature of things. Theology, by analogy, needs to speak contextually into a new missional setting: a world where people know and learn differently, a global village marked by increasingly pluralistic worldviews and religions. Postmodern spirituality is less creedal and propositional and instead is more relational, sensory, and experiential. It often associates absolutism with the negatives of modernism.

Emergent thinking also insists that ethereal, abstract ideas must be translated into answers to questions being asked by today’s culture, rather than questions no longer being asked in a hurting world.

Disillusionment with how the Christian faith has been accommodated for the baby boomer generation. Emergents often rally around a perception of the dismal state of things in the current American church. What the church is today, and what it offers especially to a younger generation, is simply not

enough; it is not biblical enough, not spiritual enough, not radical enough, and not relevant enough. Emergents frequently voice a need to bring theology and practice back together in ways compelling to a rising generation.

Emergents commonly voice their disenchantment with extreme statements. Brian McLaren may write that Jesus wouldn't be caught dead as a Christian, were he physically present today, and that if he did show up in church today, Christians not only would dislike him but would call him a heretic and plot to kill him, too. Then in subsequent pages McLaren would acknowledge his statement as an exaggeration.

But the Emerging movement is more than a protest against an establishment faith. It challenges much of current evangelicalism. Scot McKnight describes it as postevangelical in the way that neoevangelicalism in the 1950s was postfundamentalist, resulting in "postmodern evangelicalism." In particular, the Emerging movement tends to be suspicious of systematic theology. And it often shows skepticism about the "in-versus-out" mentality common in evangelicalism, which typically seeks to discern a dividing line between Christians and non-Christians. Emergents are more likely to be inclusive, citing the words of Jesus, "Whoever is not against us is for us" (Mark 9:40). Some go so far, as Spencer Burke's *A Heretic's Guide to Eternity*, as to assert that all are born "in" and only some "opt out."

Eagerness to explore new ways of articulating and living out their faith. This reexamination through dialogue is not a call to depart from the historic faith but to rediscover the faith afresh for a new world, especially in terms of cultural clarity. The process is most often described as a conversation. It is typically conducted in a context of open discussion, wary whenever others push for conclusions or definitive boundaries.

What most characterizes the Emerging Church movement is the concept of praxis—how the faith is lived out. Whether intentionally or not, the movement's shapers are advocating a modified ecclesiology (doctrine of the church). This is not an ecclesiology of worship style. While many in the Emerging movement are creative, experiential, and sensory in their worship gatherings, there is no advocacy or consensus on a particular worship style for emerging churches. Rather, it is a questioning of the messages conveyed through sacred space and ritual. Some emergents such as McKnight note the likeness of a lecture hall to churches with pulpits in the center of a room and pews or chairs lined up in neat rows. He wonders if there is a better way to

express—theologically, aesthetically, and anthropologically—what Christians do when they gather. If the configuration were a circle, would it foster a different theology and praxis? If churches placed the preacher on the same level as the congregation, would it create a clearer sense of the priesthood of all believers? If people lit incense as part of worship, would they practice prayers differently?

Central emphasis on the way of Jesus. Behind these questions of human architecture is an overriding concern about keeping the focus on Jesus—his life, the gospel he taught, and the kingdom he emphasized. Gibbs and Bolger define emerging churches as those that practice "the way of Jesus" in the postmodern era. As such, emerging leaders keep asking whether church could be done in a way that better encounters and models the incarnation of Jesus Christ for the world to see.

Even the Apostle Paul is suspect for some emergents. Brian McLaren asks if followers of Jesus have missed Christianity for "Paulianity," in which Paul's teachings receive far more attention than those of Jesus. Emergents often come back to such questions as "If we are followers of Jesus, why don't we preach his message?" Many enjoy contrasting what Jesus described with what the church has become, opting to start all over again as if for the first time. This fresh rediscovery of Jesus and his radical kingdom vision inspires emerging churches to view the church, the Christian life, and even global concerns in new light.

Likewise the idea of Jesus' mission is often understood to encompass a much wider set of activities than an evangelism that converts others to become followers of Jesus Christ. Jesus went about doing good to bodies, spirits, families, and societies. He attracted social outcasts such as prostitutes and tax collectors; he made the lame walk and opened the ears of the deaf. This model of caring not just about lost souls but also about whole persons and whole societies leads many to a sense of holistic ministry that serves mind, body, and spirit.

For some the social activism also leads into politics, leftward at that, the Democratic Party in most cases. An *NBC Nightly News* segment depicted the Emerging Church movement primarily as a political shift by younger evangelicals away from the Republican Party. Democratic Party adviser Jim Wallis has been a well-received speaker at gatherings of emergent leaders, as has *Sojourners* magazine, which Wallis oversaw for many years. Emergents appreciate the ideals of Walter Rauschenbusch, theologian of the Social Gospel over a century ago, and many wish to follow

Rauschenbusch's intended path by imitating the way of Jesus.

Internal Critical Assessment

These values all have import for North American religious life, both within the Emerging Church movement and among those it influences. Some emergent values have led to concerns within the Christian community, voiced most often by theologians. Criticisms deal mostly with the movement's porous borders rather than its reformist goals.

Questioning more than deciding. Emerging church writers are characteristically postmodern in their suspicion of the controlling structures of religious life and thought, whether church hierarchy, dominant cultural forms, or doctrinal formulations. As a result, the life and practice of emerging church writers are marked by a resistance to these structures. For example, much of McLaren's aim in his writing and lecturing is to challenge the certainties that he feels have controlled too much of the thinking of Western Christians. Modernity taught leaders how to control, and Christians have adopted this practice rather than challenging it. Emerging churches seek to carve a new way: How can a leader lead without being controlling? How do people lead in such a way that they submit to God's kingdom, where every voice is heard, each gift expressed, and consensus reached? The tone of many emerging writers is one that appreciates deconstruction through questioning far more than outcomes that develop positive alternatives.

Separating belief from practice. Emergents perceive society as becoming increasingly postmodern in its values, and they are exploring several different approaches for theoretical engagement. Doug Pagitt, founding member of Emergent Village and pastor at a Minneapolis church named Solomon's Porch, says that some emerging churches minister *to* postmoderns, others *with* postmoderns, and still others *as* postmoderns.

Those in the "to" category typically emphasize postmoderns as trapped in moral relativism and epistemological bankruptcy. Such churches tend to invite postmoderns toward a different set of assumptions, ones based in ideas of propositional truth—statements that can be either affirmed or denied. Those who minister "with" postmoderns accept postmodern thought as the framework into which they are called to proclaim and live out the gospel.

Scot McKnight says the vast majority of emerging Christians and churches fit these first two categories. They don't deny that truth can be known—that truth can be

communicated in the form of a statement or proposition. Further, they don't deny the evangelical views that Jesus Christ is truth and that the Bible is God's word of truth.

A third kind of emerging postmodernity expressed in Pagitt's metaphor—those who minister "as" postmoderns—has attracted attention from the theological community, mostly the evangelical camp that many emergents claim as their own. These emergents speak of the end of metanarratives and the importance of social location in shaping one's view of truth. The idea that humans cannot know absolute truth, or, at least, that humans cannot know truth absolutely, is disturbing to many critics of the Emerging Church movement because it seems to challenge the validity of propositional truth. Many critics find this form or direction of the Emerging Church movement to be harmful and wrong.

Given the Emerging movement's emphasis on praxis, a frequent point of emphasis by emergent writers is the contention that how people live is more important than what they believe. While many grant that orthopraxy (correct living) flows from orthodoxy (correct professions), emergent writers are quick to observe that experience does not prove that those who believe the right things live the right way. They point out Jesus' words in the Sermon on the Mount, that "by their fruits," not "by their theology," will his followers be known. This leads some emergent writers to downplay the importance or content of belief, which becomes a point of concern for theologians. No one in the Emerging movement argues that one's relationship with God is established solely by how one lives, but the clear shift in emphasis from orthodoxy to orthopraxy is a signal that many critics are questioning.

Disinterest in the institutional church in any form. Emerging church writers emphasize a tension between new ways of doing and new ways of being. They speculate on whether they should do congregational life differently or abandon structured religious life altogether in favor of simply being followers of Jesus in the world.

Likewise, they often find sharp contrast between Jesus' teaching about the kingdom of God and the institutional church. They're quick to point out how many people in society like Jesus but dislike church. They do not tend to start churches per se so much as to foster communities that embody Jesus' kingdom. Whether a church explicitly becomes a church is not the immediate goal. Spencer Burke affirms that his fundamental discontent was not in the evangelical megachurch that he left so much as in contemporary Christianity as an institution. Jonathan Campbell, author of

Way of Jesus, is characteristic of the Emerging Church movement when he asserts that it doesn't need church buildings, programs, clergy, or any other human inventions he thinks are replacing genuine spirituality. He says, "I don't believe in any religion anymore—including Christianity . . . but I do believe in following Jesus" (p. 192).

Congregations that identify with the Emerging Church movement typically show great interest in reaching out to those who have been overlooked by the church. This includes people marginalized by society in general and those disenchanted by previous experiences with the institutional church. Emerging churches typically work hard to be welcoming of strangers, especially the disenfranchised.

Conclusion

While the Emerging Church movement has not developed to the point of receiving critique by social scientists, several sociological theories could be applied to it. Nancy Ammerman, sociologist of religion, argues that a movement's religious identity must be tied to one or more institutions if it is to have stability. This movement's strongest mooring to date is through a variety of book publishers and Web sites, but not through a denomination or seminary. Time will tell whether such media alone are cohesive enough to establish and stabilize the movement. Likewise, the social-psychological concept of collective identity has been applied to religious movements. Its theorists might question whether the identity and audience of the Emerging Church movement are well enough defined to prevent it from fracturing into a number of individual expressions, thereby causing the embryonic movement to lose its sustainability.

Finally, social movement theory explores the promotion and resistance of a group's collective action. At present the Emerging Church movement shares less of a behavioral direction and more of a conceptual foundation—a perception of a major change in culture requiring a response from churches. Most of the movement's pleas for reform are tightly tied to its understandings of postmodernism, the church that modernism has produced, and the level to which the proposed new "emerging" form of church submerges itself in the culture it seeks to reach. In the words of Scot McKnight, leaders of the Emerging Church movement are "building a new theology that 'emerges' from the story they find themselves in"—namely, the shift from modernity to postmodernity, even as they continue to wrestle with what it means to be the disciples of Jesus in today's culture.

From that foundation, the actual direction of the movement itself is yet to be determined.

Emotion

Emotion is a crucial part of religion in America. The earliest scriptural writings in virtually every literate tradition brim with references to religious feeling. Theological writings through the centuries assume its central role in faith, and religious practice has developed everywhere as the cultivation and expression of affect. When we approach religion with an eye to emotional life, we position ourselves to see the richness and complexity of religion, its ambiguities, paradoxes, and multifacetedness, more clearly than if we take

emotion in religion to be something beyond the reach of research and interpretation. Until the late-twentieth-century renaissance in the study of emotion, a project that has gained momentum across the humanities and social sciences and in the agendas of biologists and biochemists, some scholars of religion imagined emotion to be an irreducible datum, a human experience so ethereal and free of cultural influence that it was only barely susceptible to investigation and analysis. Feeling in religion, according to some writers, was the same across cultures, age groups, gender, ethnicity, and other differences so that “fear of God,” for example, was most certainly felt in the same ways among the Jews of ancient Israel, eleventh-century French Catholic peasants, and late-twentieth-century Mormons in Utah. Early twenty-first-century scholarship instead has made the case for the role of culture in emotional experience. People feel in ways that have much to do with where they live and how they live. Emotion is to some extent culturally constructed.

Those who study religion know about collective emotion through the influence of the French sociologist Emile Durkheim (1858–1917), whose writings on religion stressed the role of collective emotion in bonding individuals into a cohesive social group. Collective emotion is performed in rituals organized around important religious occasions. The expression of emotion through such performances reminds a religious community of its investments in certain ideas, behaviors, and ways of life. Moreover, the enthusiastic collective display of feeling by celebrants of a holy day, for example, not only reminds persons of the sacred events that occur on that day but also recalls the vital importance of a religious calendar itself, of the boundaries that define place, organize time, and enclose individuals within the community. Individuals remember what matters through performance of emotional rituals, while at the same time those rituals reinforce shared beliefs and practices by way of the affect that they cultivate. Scholars working in the humanities and social sciences have developed ways of studying religion that draw on such insights. In the past few decades, emotions research has become increasingly relevant to the broad study of religion, through its powerful emergence in philosophical debates, cultural studies, cognitive science, and, especially, historical studies.

The historical investigation of religion and emotion relies on the excavation of traces of the emotional lives of people that are imbedded in a wide range of sources. Newspapers, magazines, court records, books, sermons, song lyrics, art, and architecture, among many other sources, provide

testimony about cultural expectations for feeling. Such artifacts hold clues to the “feeling rules” that organize the emotional lives of communities. There is evidence that facial expressions and other physical displays, and the biochemical cascades that are linked to them, differ little from culture to culture. But emotional life in its great complexity, and above all the expression and concealment of emotion in social groups, is largely a matter of learned behavior. We therefore study the ways in which culture imposes on groups certain guidelines for feeling, and we can examine the ways in which individuals—through their self-reporting in diaries, correspondences, drawings, autobiographical writings, and other sources—conform to those guidelines or depart from them. We can discover much in the history of feeling, such as who felt what when, how they expressed it or concealed it, whether their performances of emotion indicated their conformity with more encompassing social rules or rebellion against them, and other aspects of collective emotional life. Approaching American religious history through the investigation of feeling accordingly holds much potential for digging out aspects of the religious lives of communities that have been neglected in previous interpretations.

Early America

Europeans who came to the Americas in the wake of Columbus were awed and enchanted by what they found in the new land. They were terrified by it as well. Columbus himself wrote excitedly about the likelihood of Eden in the Americas, and Spanish explorers followed suit with fevered ruminations not only about Eden but also about the Fountain of Youth and the fabulous Seven Cities of Gold. Expeditions that set out to find such marvels discovered little else besides swamps, mosquitoes, malaria, alligators, impenetrable jungle, blazing deserts, and indigenous peoples who sometimes offered fierce resistance to Spanish imperial aspirations. The new land was enchanted, indeed, in the sense that it was powerful and mysterious. Sometimes, as Cabeza de Vaca (c. 1490–c. 1557) discovered as he traveled on foot across the North American continent, its enchantments were sublime, in the form of natural wonders and the generosity, even adoration, of the natives. At other times the land and its native peoples were a horror, a descent through the circles of hell. For the Spanish, and for the French, English, Dutch, and Portuguese, the Americas prompted both joy and fearful trembling. That complex, even contradictory emotional response to discovery and exploration set the terms

for centuries of European engagement of the land and its inhabitants.

British colonists in North America were certain enough that holy power was so abundantly manifested in America that they conceptualized their migration to New England and their organization of community life in its new towns as a commission from God to build a church of saints. Rejoicing in signs of divine favor, and with words of gratitude for their experience of God's love, they recorded how Providence brought miracles to their lives in the unfamiliar land and how the destiny of their experiment with a purified Christianity was foreshadowed in the beauty of nature and the majesty of the landscape. They likewise cried woe over their lengthening string of setbacks, including famine, cholera, war, natural disasters, apostates, and witches. New Englanders, in short, lived in a state of highly tensed emotional discord, balanced precariously on a fine line between exuberance and terror. Their ministers spoke to them about God's plan for the success of the "holy commonwealths," the towns of saints, and called them to openness to divine love, trust in God, a peaceful mood, and hope. The clergy also sounded the alarm when they thought that the towns deviated from the path of righteousness, stirring up fears about punishments to come should New Englanders fail in their commission. Such warnings, or jeremiads, were especially weighty given the emotional orientation of Puritans—intense and volatile—to the space they occupied. Fear of God and love of God, which never were too far apart in English Puritanism, were drawn more closely together in the emergent emotional climate of early New England.

For Native Americans, encounters with such emotional New Englanders were more often than not occasions for fear and sorrow, and meetings with missionaries occasions for anger. The case was similar for other Europeans who sought contact with Native Americans. Jesuit reports of their efforts among the Indians in New France indicate how the religious enterprise was framed within a rich emotional context. As was the case in New Spain and in other places where Europeans sought to establish some measure of relations with Indians, the Jesuits looked for signs that Indians had experienced a conversion to Christianity. They did not expect that conversions would be accompanied by a great emotional turmoil as was more common among Protestants who were "reborn." Rather, Jesuits looked for assent to doctrine and alongside of that indications that the convert would be able to embrace French Catholic standards for display and control of emotion. The missionaries' attempts

to persuade Native Americans to practice monogamy was, as part of the larger program of Christianization, as much a matter of imposing European feeling rules on Indians as it was a project of behavior modification. Control of emotion, rather than expression of emotion, was key in that regard. The conversion of Indians—who in the eyes of Europeans were uncivilized, emotionally uncontrolled savages—was largely a matter of inculcating Indians in habits of emotional restraint (as conceptualized by Europeans). A conversion was more likely to "take" when emotional life had been ordered in European fashion. Accordingly, the French Jesuits and missionaries of other faiths and nationalities devoted themselves to remaking feeling in Native Americans, so that their emotional performances met European standards for appropriateness, degree, and complexity. Native American cultures had their own standards for such things, and sometimes those standards endured, in spite of missionaries' attempts to link conversion and salvation to alien feeling rules.

Africans who were brought to North America as slaves also were subjected to social regimes that compelled their emotional remaking, and Africans, like Native Americans, responded in mixed fashion, accepting some of the feeling rules foisted on them and rejecting others. The performative cultures of many African tribal groups whose members were enslaved in America valued emotional expression and engineered its cultivation in religious ritual. It would be a mistake to assume that Africans were any more emotional than Europeans, however, and especially to characterize blacks—as many nineteenth-century writers did—as emotionally immature, as childlike in their blend of naiveté and seemingly unfiltered displays of feeling. African American religious life, in plantations and eventually in black churches and denominations, was emotionally varied. Some congregations practiced moderation in the display of emotion, while others were highly expressive. In the latter case the incorporation of chanting, clapping, singing, styles of public speaking, the vocal involvement of the congregation, dancing, and other liturgical practices made for a highly charged emotional setting. Some of that emotional religious culture, which was a hybrid of African and Christian traditions, took root in white churches, so that over time, and especially in the South, white or racially mixed congregations also acquired reputations for their emotional tenor. In observing the place of feeling in black religious life, some abolitionists drew the conclusion that the highly emotional religious gatherings of slaves were evidence of their humanity, while slaveholders distrusted slaves for their seeming lack of

emotional control. At other times African Americans were thought emotionally retarded because of their seeming lack of affect in services. In short, whites constructed black emotionality as both excessive and anemic and argued their cases above all with reference to blacks' practice of religion. For African Americans religion did in fact offer a cultural space where emotional performances that whites considered uncivilized could be enacted in connection with religious praise, grief, longing, or hopefulness. As forced acculturation to white standards was intensified by more deliberate effort and by the passage of time, religion remained an opportunity for the rehearsal of emotional styles that eventually would find expression in music, art, and writing.

Revivals and Religious Ideas

The series of Great Awakening revivals that took place from the 1730s to the 1770s popularized an emotional style of religion throughout the British colonies and set a pattern of public worship that has recurred within Protestant evangelicalism and influenced twentieth-century Roman Catholic "charismatic" devotions. The revivals in general were characterized by displays of feeling in tears, jumping, rolling on the floor, fainting, barking, shouting, laughing, and in other ways. Emotion, enacted in such ways, was closely linked to the process of religious conversion, so that being "born again" came to be understood as an experience so profound in its affective dimension that other kinds of emotional experiences paled in comparison to it.

The proof of conversion in some congregations came to be associated with the intensity of the emotional performance. That understanding was not entirely new to the colonies. The fledgling Puritan congregation in Cambridge, Massachusetts, in the 1630s had required for full membership a public "relation" of one's path to conversion, and those accounts, given before the church, were often emotional, although not as demonstrative as the piety of the revivals. The eighteenth-century revivals are among the most important events in American religious history as far as emotion is concerned, because of their regional breadth and the active involvement of both men and women, persons of different social groups, and members of an assortment of denominations. The legacy of the revivals includes the belief, central to the subsequent development of evangelicalism, that emotion can serve as evidence of a connection with God. Not an entirely new idea, it had been a part of the history of Christianity, in kernel form at least, since St. Augustine's *Confessions* (397 CE). In America, however,

it took on a more pointed meaning, namely, that a display of emotion in fact could be proof of God's work in a person. Such an understanding of spirituality subsequently led to the development within Protestantism, since the late eighteenth century, of a focus on religion as a means by which to cultivate the emotions. Feeling eventually came to be the goal of religious exercises, rather than a by-product of them.

Euro-Americans' expectation that some measure of conformity could be achieved in the emotionality of whites, blacks, and Native Americans was grounded in the trust that Christianity rested on a universal human experience of the redeeming love of Jesus Christ. Missionaries and other engineers of cultural conformity accordingly proceeded in their relationships with nonwhites confident that once those people experienced God's love, the gate would be opened for their wholesale reconstitution as properly emotional Christians.

Nevertheless, colonial Americans, and those who followed them, either as descendants or as immigrants, imagined men and women differently as far as their emotionality was concerned. Men typically were understood to be rationalistic, strong, disciplined, and restrained in their emotionality. In religious services men might display a spiritual enthusiasm in tears and groaning, but their everyday religious lives—their regular churchgoing, family prayer, devotional reading, and other practices—were marked by a limited range of emotional expression. Virtually across the spectrum of Protestant denominations in the nineteenth century, and in similar fashion among the rapidly growing Roman Catholic population, male emotionality in religion was subject to restrictive feeling rules. Americans expected women to be significantly more forthcoming in expressing their feelings, and in religious life female performance of emotion was taken as a sign of women's naturally more labile emotional nature, which was powerful, volatile, and less predictable than men's. Among Roman Catholics women's emotional roles in devotions, and particularly in feast day or holy day public worship, were complex in the nineteenth century, and they remain so in the twenty-first. Catholic women behaved emotionally much like Protestant women, however, suggesting that shared emotional cultures survive even in cases where religious beliefs are different.

For centuries before the migration of Europeans to the Americas, philosophers and theologians had struggled to articulate the relation of feeling and thinking, constructing

and reconstructing categories of intellect, affect, will, and other human activities in an effort to understand the complexity of emotional life. The Enlightenment emphasis on reason, developed over several generations of philosophical argument and early scientific investigation, begged for theory that would explain emotionality. Clarification was especially urgent in the case of emotion and religion as the latter suffered defeat at the hands of the Enlightenment, which scored repeated victories in shaping critical discourse and in challenging traditional social orders, including the church. In America, Thomas Jefferson edited out of his New Testament the transcendent and miraculous and urged on the state of Virginia and eventually the new nation a view of religion as a moral rather than salvific enterprise. For rationalists—who came in a variety of stripes but agreed on the capability of intellect alone to understand the ordering of the universe—emotion was valued as aesthetic response to the beauty of creation, but its usefulness was limited beyond that. It was not proof of one's spiritual status, and it was not privileged as a primary means by which one engaged divine mysteries.

In the writing of the Scottish “Common Sense” realists—Dugald Stewart, Thomas Reid, Thomas Brown, and others—emotion became, however, an equal of intellect and will. According to the Scots, feeling, thinking, and acting were the three faculties that together constituted mind. Emotion, or affect, served as a kind of judgment on ideas formed in the intellect and as such played a central role in directing the will. In short, emotion was theorized in its cooperative relation with thinking, rather than as an opponent. As Scottish thought subsequently was interpreted in America in the early nineteenth century, it formed a basis for a recovery of some of the ground religion has lost in earlier debates. In the hands of American evangelical Protestants, Scottish thought served as a means of understanding how, in religion, feeling was knowing. Such an interpretation lost important other aspects of Scottish thought, but it led to a period of American evangelical expansion in which doctrine was not as important as the practice of piety, and piety above all was a matter of emotional excitation. By the time that the nineteenth-century revivalist Charles Grandison Finney (1792–1875) had popularized the idea that revivals were largely a “machinery” to stimulate feeling in persons, emotion had become the bedrock of Protestant evangelicalism. Revivalist preachers and born-again religious writers since that time have made a central part of their mission provoking and sustaining in their audiences

profound feelings of fear, love, grief, anger, hope, guilt, and joy. To feel the divine was to know the divine.

Emotion across Denominations

Disestablishment, the constitutional provision for separation of church and state in America, created a religious landscape in which loss of tax support for churches led to innovation. One consequence was that Protestants since the early Republic have been inclined to sample the religious offerings of various groups, changing memberships from time to time and embracing new religious visions and emotional scripts that emerged. For Catholics there was less likelihood of leaving one denomination for another, although in the latter part of the twentieth century that likelihood increased. Catholic religiosity had always been steeped in emotion and manifested that in ways that Protestants did not, namely, through an emphasis on the sensuous, especially as it was represented in the rich material culture of Catholicism. Emotion in American Catholicism, as it coalesced in the colonial Southwest and emerged in other North American regions since the latter part of the nineteenth century, has flourished in music, singing, a vibrant visual culture, awe-inspiring architecture, incense, physical exertion, suffering, and other material means of stimulating feeling. The large-scale immigration of Catholics in the late nineteenth and the early twentieth century reinforced that style of religiosity, but Catholic reflection on emotion in religion was not as deliberate as was the case in Protestant revivalism. Emotional ritual and the expectation of feeling in piety were so deeply rooted in Catholic religious life that they did not attract interpretation as did newer Protestant modes of revival.

Not all emotional religion in America has been characterized by public displays of tears, shouting, or unusual physical posturing. The worship that takes place in a Jewish synagogue, while generally solemn, includes chanting that raises affect in the congregation. Prayers and games that characterize Jewish family religion during special times in the religious calendar invoke an assortment of feelings, from delight to fear. Likewise the case for Muslim worship in America, where solemnity prevails but which also has moments of exuberance during domestic rituals or feast day ceremonies. Hindus in America embrace a material culture—analogue in some ways to Catholic culture—that can bring strong emotional responses, and across a wide spectrum of feeling. Individual Hindu gods and goddesses often are associated with specific kinds of emotion—anger, love, jealousy,

and so forth—and devotions focused on those divinities can be structured to foster emulation of those feelings. Devotees of Krishna, for example, who often gather in public spaces to make contact with potential converts, characteristically enact highly emotional religious performances of joy and hope. Buddhism in America is a religion that has a wide range of emphases depending on the national origins of those who practice it and the degree of interpretation that Americans have brought to it. Buddhist practice, however, tends to be less emotionally demonstrative in public settings than other major traditions.

Twentieth Century

The twentieth century and especially the later part of the century brought changes to the ways in which emotion was manifest in religious life. One of the most significant changes was the blurring of the line demarcating male and female emotionality in religion. Catholic charismatic religion featured more robust displays of male emotionality than was common in Catholic services, and the cross-denominational Promise Keepers movement stood gendered emotionality on its head: while men wept openly and sometimes desperately in mass services in football stadiums, women, known as “prayer warriors,” staffed special prayer rooms beneath the grandstand to lead men in focused petitionary prayer, that is, prayer that takes the form of requests. Wiccan religion, which paid particular respect to female spirituality, similarly framed male and female emotionality in a way that challenged traditional gender roles for the expression of feeling. Also important in the twentieth century was the increase in the number of Americans who sought to develop their spiritual lives outside the supervisions of formal religious communities, and what that implied as far as emotionality. Such individualized programs of spiritual seeking, custom-made through cut-and-paste methods that borrowed some ideas and practices from world religions but avoided doctrinal standpoints, typically granted to feeling a primary place in spirituality. Emotion came to the forefront as an indication of spiritual vitality and as a spiritual goal worthy of pursuit in itself.

Religions in America throughout the nation’s history have been closely attentive to life-cycle events such as birth, marriage, the beginnings of adulthood, death, and other key moments. The feelings that accompany these events, whether they be grief or joy, anger or wonder, fear or love, have long been intertwined with religious practice. Virtually all denominations ritually emphasize such events and shape

through various kinds of scripts the emotions that are associated with them. Religion as such profoundly shapes emotionality, setting terms for the ways in which persons express and conceal emotion, alter emotions to fit important social occasions, embrace conflicting emotions, or forget what has been felt. Individuals at the same time sometimes have pushed back against those religious commands, challenging tradition and revising religiously grounded feeling rules.

The debates among Christians in early America about the proper tone of church worship—should it be solemn or joyous, quietly meditative or loudly exultant?—have been played out over time in each generation in changing social settings and amid shifting cultural expectations. Religion as a powerful bearer and enforcer of culture accomplishes much of the work of affective training that has made Americans who they are emotionally. Its survival indeed has depended on its capability to do so. The fact that religious belief in America is declining suggests not only that religious ideas are currently less persuasive than they once were but also that emotional life for Americans is changing in important ways. The fit between the actual feelings of individuals and the feeling rules enforced by religion do not overlap as easily as they did a few generations ago, before cyberworlds, global awareness, and new forms of family began to influence the patterning of emotional life. People adapt emotionally, and so survive. The survival of religion in the twenty-first century will depend in part on its ability to adapt as well, and especially in its role as a reliable authority for emotional life.

Enlightenment

The term *Enlightenment* refers to the explosion of rationalism in Europe and North America roughly coterminous with the eighteenth century. Sometimes referred to as the “Age of Reason,” the period was characterized by a rejection of religious and political authority and philosophical tradition and an emphasis on reason, science, humanism, secularism, and political and civil reform. Enlightenment thinkers, or “philosophes,” as they came to be called, formed a loose coalition of like-minded men and women who, despite their individual interests and occasional internecine disputes, displayed remarkable continuity in their outlook. Through books, private correspondence, intellectual salons, scholarly academies (for example, France’s l’Académie française and England’s Royal Society of London), and public debates, the Enlightenment thinkers defended a worldview that has come to define the “modern” perspective.

On the scientific front, Enlightenment ideals encouraged the empirical study of nature and rejected earlier “occult” (by which the philosophes generally meant metaphysical) explanations of natural phenomena. Morally, the Enlightenment made the language of human rights part of the international lexicon. Politically, the Enlightenment called into question the rights of aristocrats and kings to govern, promoted republicanism, and fueled the rise of individualism and the middle class. Running throughout the Age of Reason was an optimistic and indeed exuberant sense of standing on the threshold of a new world. Immanuel Kant summed up the mindset well in his essay *Was ist Aufklärung?* when he proposed *Sapere aude!* “Dare to reason!” as the Enlightenment’s motto and proclaimed the period “man’s release from self-imposed tutelage. Tutelage is the inability

to use one’s natural powers without direction from another. This tutelage is called ‘self-imposed’ because its cause is not any absence of rational competence but simply a lack of courage and resolution to use one’s reason without direction from another.”

The Enlightenment played out differently depending on the country in which its proponents lived. In France, which for years had been troubled by an increasingly repressive government, an unjust social structure, and a widely perceived alliance on the part of church and state to retain power, Enlightenment ideals took on a militancy that culminated in the French Revolution, the establishment of the French Republic, and the rise of Napoleon. In the German-speaking countries, the influence of the Enlightenment (the *Aufklärung*, or “clearing out”) was sporadic and negligible—despite the 1740 accession of Frederick the Great, who fancied himself a champion of Enlightenment thought—and much outweighed by the romantic movement, which succeeded it. In Britain and the American colonies and early republic, the Enlightenment exerted a more moderate and enduring influence. It’s not too much to say that the United States, far from being founded on Christian values as many conservative Christians claim, was actually founded on Enlightenment ones.

Even in countries where the Enlightenment’s influence tended to be moderate, a rise in militancy during the second half of the eighteenth century is observable. As the century progressed, Christians and deists tended to give way to atheists and materialists, and critics (erroneously) feared that the Age of Reason was more intent on destroying the old than introducing the new. Edmund Burke’s (1729–1797) fierce denunciation of the French Revolution in *Reflections on the Revolution in France* (1790) was based in large part on his perception that the Enlightenment-inspired champions of the Revolution were intent on the indiscriminate destruction of law, social structure, and religion.

British Foundations

As historian Peter Gay pointed out, the “propagandists” of the Enlightenment may have been French, but its “patron saints and pioneers” were British. French philosophes such as Denis Diderot (1713–1784), Jean le Rond d’Alembert (1717–1783), Paul-Henri d’Holbach (1723–1789), Nicolas de Condorcet (1743–1794), and most famously Francois-Marie Arouet Voltaire (1694–1778) were great popularizers of their day’s philosophy and natural science. Especially influential in spreading Enlightenment ideas was the

ambitious *Encyclopedie*, the brainchild of Diderot and d’Alembert, which promised to bring to the general reading public “each and every branch of human knowledge” that had “the power to change men’s common way of thinking.” Suppressed several times by a fearful government, the *Encyclopedie* was finally completed and published in 1772, twenty years after its inception. Leading thinkers from all over Europe contributed to it.

Inspiring the French popularizing philosophes were more technical and difficult British thinkers of the previous century. Three in particular were venerated: Francis Bacon, Isaac Newton, and John Locke. Bacon offered a new methodology; Newton offered a new cosmology; and Locke offered a new epistemology. Together, the contributions of these three men were typically referred to as the “New Learning.” Their influence on the Enlightenment period is immeasurable.

Francis Bacon (1561–1626) provided the foundation for the New Learning with his advocacy of inductive logic—the “new organon”—as a replacement of traditional Aristotelian “syllogistic” reasoning. (Bacon’s repudiation of “Aristotelian” logic is a misnomer in light of the fact that Aristotle is rightfully credited with the invention of inductive logic. Bacon was referring more to late medieval scholasticism than to Aristotle.) The latter, according to Bacon, was an exercise in reasoning from abstract first principles. It was capable of generating logically valid arguments, but because it dealt only with words and propositions, it had little practical value. Consequently, concluded Bacon, it let “nature skip out of its hands.”

Bacon advocated a “new” method that would begin with experience, using empirical data as the starting points for experimentations, generalization, and the inventions of practical works. The emphasis was on the manipulation and conquest of nature rather than the creation of metaphysical (much less theological) systems. Bacon’s rejection of what he thought of as idle speculation and his embrace of instrumental reason was most systematically defended in his *The Great Instauration* (1603). In that work he claimed three advantages for his new method or “science”: “the end which this science of mine proposes is the invention not of arguments but of works; not of things in accordance with principles, but of principles themselves; and not of probable reasons, but of designations and directions for works.” In short, Bacon’s new approach directed attention away from abstract speculation to empirical analysis and instrumental reasoning.

Bacon provided a new method for understanding reality and advancing technology. Isaac Newton (1642–1727) applied this empirical method to his study of physical reality—*Hypotheses non fingo*, “I do not feign hypotheses,” as he famously described his approach—and in the process not only affirmed its usefulness but also formulated a cosmology that persuaded his contemporaries that the universe was a clockworklike mechanism of rational intricacy and fail-safe uniformity. Philosophers and natural scientists prior to Newton had, of course, assumed the lawlike nature of the world (allowing for the occasional divine intervention). But Newton provided a compelling explanation of the lawlikeness. As he wrote to an acquaintance in 1713, the cosmology defended in his *Philosophiae Naturalis Principia Mathematica* (1687) expunged metaphysical mysteries and religious caprice from nature by means of “principles deduced from phenomena and made general by induction, which is the highest evidence a proposition can have.” It’s little wonder that Alexander Pope spoke for his entire generation when he wrote, “Nature and Nature’s laws lay hid in sight; /God said, Let Newton be, and all was light.”

Bacon and Newton were both revered by Enlightenment philosophes. But pride of place went to John Locke (1632–1704), indisputably the most influential philosopher of the period. Bacon suggested that the best way to understand reality was to pay close attention to experience. Newton followed up by doing precisely that in his physics, and he thereby charted the lawlike nature of reality. But Locke provided a philosophical justification for how it is that we can know either methodology or the world by elucidating, as he wrote in his *Essay concerning Human Understanding* (1690), “the original, certainty, and extent of human knowledge, together with the grounds and degrees of belief, opinion, and assent.” In other words, Locke followed up Bacon’s revelation of the laws of logic and Newton’s revelation of the laws of the universe with an investigation of the laws of reason.

For Locke the ground of belief is experience. Sense data, or “simple ideas,” are the raw material of thought and reflection. Complex ideas are created from simple ones through the mental function of association. Just as there are no occult forces in nature, there are no hidden, innate ideas in the mind. Consequently, every branch of knowledge, be it science or theology, is ultimately based on scrutiny of experience, reflection, and generalization. Moreover, all human minds operate according to this model, just as all natural objects conform to the laws of physics. Internal and external

reality are lawlike, and the same logical methodology—Bacon’s *novum organum*—can be used to explore both.

The New Learning that served as the philosophical bedrock for the Enlightenment, then, rested on Baconian instrumental reason and Newton’s and Locke’s demonstration of lawlike orderliness in nature and the mind. It was the basis for the Enlightenment’s confidence that reality was rational and hence capable of being understood and manipulated by rational human beings. This confidence would motivate the courage needed to throw over the “self-imposed tutelage” Kant wrote about.

Defining Beliefs of the Enlightenment

Built on the foundation of the New Learning, the Enlightenment worldview embraced a number of identifying beliefs. It would be a mistake to think of them as necessary and sufficient principles uniformly held by all philosophes. As historian Carl Becker noted, the ethos was more a “climate of opinion” than an epoch of uniform agreement. But five general beliefs stand out as providing a basic orientation for most of the Enlightenment’s leading spokespersons: (1) the primacy of experience and inductive reason; (2) the importance of science, or “natural philosophy”; (3) a deep-seated suspicion of authority; (4) an emphasis on reform; and (5) a confidence in the perfectibility of both individuals and society.

First, Enlightenment thinkers were, as the commentator Charles Taylor put it, “epistemological innovators.” Following Bacon, they rejected the traditional model of deduction from inherited first principles and relied instead on observation and induction. Following Locke, they accepted that all knowledge is grounded in experience. Both of these assumptions predictably led to an understanding of reason that was predominantly instrumental rather than speculative and focused on the natural world rather than on metaphysics. They also encouraged a suspicion of any putative mode of knowing—such as faith—that claimed to be other than or superior to reason. For the Enlightenment thinker, reason was the exclusively proper tool by which to comprehend and control reality. As the *Encyclopedie* put it, “Reason is to the *philosophe* what grace is to the Christian.”

Second, the instrumentality with which Enlightenment thinkers infused reason catapulted the study of nature into the spotlight. Part of the interest in natural philosophy, to be sure, was a desire to more completely comprehend universal lawlike patterns. But a greater motivation was to understand in order to control. All philosophes shared Bacon’s insistence

that good reasoning leads to the invention of instruments and techniques that promote the happiness of humans.

Third, the new emphasis on reason also underscored the Enlightenment’s conviction that the human mind is a sufficient tool to understand reality, govern society, and regulate individual behavior. In all nations that felt the Enlightenment’s influence, this confidence in reason led to a deep-seated suspicion of religion in general and Christianity in particular. Even in Germany, figures such as Gotthold Lessing (1729–1781) and Moses Mendelssohn (1729–1786) entered into the Enlightenment spirit of *Sapere aude!* by calling into question their respective Christian and Jewish traditions.

Enlightenment-based resistance to religious authority emerged in Britain with the rise of a group of thinkers who came to be called “deists.” Taking their cue from John Locke’s *The Reasonableness of Christianity* (1695), which argued that credible faith-based beliefs cannot be contrary to reason, the deists advocated a religion stripped of all supernaturalisms such as divine revelations or miracles. Their God was a First Cause or Divine Architect who created reality, imbued it with reason and orderliness, and then left it to operate on its own without interference. For the deists the best way to arrive at knowledge of this First Cause was to observe God’s handiwork; thus the “sacred scripture” of deism was nature, and the practice of natural philosophy was appropriate veneration of the Creator. Moreover, the best way to worship the Divine Architect was to act virtuously, because virtuous behavior was in accordance with natural rights and duties established by the Creator. For these reasons, deism was also frequently called “rational religion” or the “religion of nature.”

Perhaps the most influential (especially in America) of the British deists was Henry St. John, Viscount Bolingbroke (1678–1751), whose writings on religion, all published posthumously, were of such impact that they were described by Dr. Johnson as a “blunderbuss.” There was little that was original in Bolingbroke’s work, but he did provide a convenient and lively compendium of standard rational religion: observation of natural orderliness reveals the existence of a First Cause; there is no universal revelation apart from nature; and priest craft is the primary cause of the continuance of superstition and ignorance. Less controversial spokespersons for rational religion were a group of British clergy who stopped short of deism to defend a liberal Christianity whose tenets they believed compatible with Enlightenment beliefs. These included Isaac Newton’s friend Samuel Clarke (1675–1729) and George Cheyne

(1671–1743), a physician and fellow of the Royal Society. Their arguments that Christianity’s supernaturalism complemented rather than contradicted natural philosophy’s descriptions of the world generally satisfied neither philosopher nor the orthodox faithful.

Rational religion in France was generally more militant than in Britain. Voltaire, for example, never denied the existence of a First Cause but stridently fought the Roman Catholic establishment for most of his long life. His “*Ecrasez l’infame!*” (“Crush the infamous thing!”) became a battle cry for deists and freethinkers alike who deplored what they saw as the socially, morally, politically, and intellectually corrupting influence of the Catholic Church.

As the eighteenth century progressed, the deism of earlier thinkers gave way to the atheism of a new generation of philosophes. All of the leading authors of the *Encyclopedie* were self-avowed freethinkers. Baron d’Holbach even officiated at regular meetings of an atheistical club, which scandalized more orthodox Parisians. Although not as widespread as in France, Enlightenment rejections of religion became more militant in England, too, in the later years of the century. Edward Gibbon (1737–1794) made no secret of his disdain for Christianity and Judaism in two notorious chapters (XV and XVI) of his *The History of the Decline and Fall of the Roman Empire* (1776–1788). The philosopher David Hume (1711–1776), although a bit more circumspect than Gibbon, was in all likelihood also a freethinker. In his *Dialogues concerning Natural Religion*, published a year after his death, the character who most seems to represent Hume is a deist. But it’s not clear, especially given Hume’s rejection in other writings of miracles and the immortality of the soul, that he himself believed in a deity.

Fourth, the Enlightenment’s rejection of religious authority and tradition was frequently accompanied by a strong criticism of existing political norms and structures and an equally strong call for reformism. As in the case of religion, this criticism was more militant in France than in England. Indeed, French dissent culminated horrendously in the 1789 revolution and the subsequent Reign of Terror and European wars. The Prussian king Frederick, for all his abstract enthusiasm for Enlightenment values, kept a tight rein on political dissent from his homegrown philosophes. The single most important historical example of the enlightened rejection of political authority was in the American colonies.

Regardless of the locale, the key Enlightenment assumption that called political authority into question was that

humans were rational enough to govern themselves and determine their own destinies without the supervision of aristocracies, royalties, or harshly coercive legal systems. Just as the church wasn’t needed to teach humans about the First Cause, neither was strong government required to hold citizens’ behaviors in check. Humans, the philosophes believed, were endowed with the ability to act virtuously and the will to do so. Failure in the past to live up to full human potential was because church and state had infantilized citizens to such an extent that their critical powers were stunted. Eliminate the retarding influence of strong authoritarianism, educate citizens to use their natural reason, and awaken them to their civic responsibilities, the equality of natural rights, and the blessings of liberty, and humans will be both capable of and enthusiastic for self-rule.

This assumption in turn led to a humanitarian espousal of the primacy of individual liberty and political equality, most often expressed in the social contract model of society, in which all participants agree to burden certain responsibilities for the same of the common good, endorsed by figures such as John Locke, Denis Diderot, and David Hume. It also led to a critical rethinking of penal codes, spearheaded by Cesare Beccaria’s *On Crimes and Punishments* (1764), a treatise that became one of the most enduring legacies of the Enlightenment.

Finally, the Enlightenment’s confidence in reason’s ability to understand and manipulate the natural realm, its sense of liberation from religious and political autocracy, and its exuberant belief that humans were capable of determining their own destinies by the steady erosion of ignorance culminated in a deep faith in the eventual and inevitable perfection of individuals and society. As the philosopher Ernst Cassirer pointed out, “No other century is so completely permeated by the idea of intellectual progress as that of the Enlightenment.” That humans and society were ultimately perfectible was an unquestioned article of faith for the philosophes. In hindsight it appears naïve. But it is understandable in an age in which, as d’Alembert described it, “the kind of enthusiasm which accompanies discoveries, a certain exaltation of ideas which the spectacle of the universe produces in us, [creates] a lively fermentation of minds.”

The Enlightenment Comes to America

The New Learning may be said to have arrived in the American colonies with Jeremiah Dummer’s 1714 gift to Yale of an England-dispatched collection of books that included the works of Bacon, Newton, and Locke. Up to

that point students at Yale, as well as Harvard and Princeton, were still being taught Aristotelian logic. Although Harvard students had been taught Copernicanism since the mid-seventeenth century, young scholars at Yale and Princeton continued to learn an undiluted Aristotelian physics through the first decades of the eighteenth century. But by the 1750s students as well as reading laypersons were familiar with the New Learning and the revolution in thinking it sparked and the American Enlightenment was under way.

In addition to Lord Bolingbroke's works, two of the major Enlightenment influences on colonial thinkers were the essays written for the British magazine *The Spectator* and the writings of a group of thinkers known as the Scottish common sense philosophers. Published in London between 1711 and 1714 (with a break of nearly a year and a half) and founded by Joseph Addison (1672–1719) and Richard Steele (1672–1729), *The Spectator* was subsequently published in eight volumes and widely disseminated, first throughout England and then the American colonies. Benjamin Franklin was one of the many Americans who read and relished the collected essays. He recounts in his *Autobiography* modeling his writing style after Addison's and Steele's. Thomas Jefferson and James Madison also acknowledged themselves great admirers of the essays.

It wasn't only the stylistic grace of *The Spectator* essays that captivated Americans. Even more exciting were their explanations and applications of Enlightenment beliefs. Addison especially wrote articles and sketches that reflected an enlightened view of the world. He paraphrased biblical psalms into deistic hymns to natural beauty and splendor. He published a well-received play, *Cato*, that unabashedly extolled the virtue of republican liberty. And throughout all his writings, he praised reason as an alternative to superstition, encouraged the exploration of the natural world, and encouraged the practice of virtue for the sake of its utility, not because it might be pleasing to God. Addison had the gift of writing plainly, lucidly, and entertainingly. Like the French philosophes, he was an able popularizer of difficult ideas.

The ability to write clearly was a trait also shared by Francis Hutcheson (1694–1726) and Thomas Reid (1710–1796), the two members of the Scottish school who were most commonly read in the colonies. Hutcheson and Reid made the empiricism of Locke accessible to a general educated public and responded to the skepticism, which would eventually find its culminating expression in Hume, that Locke's theory of knowledge unintentionally bred

skepticism. The sticking point was Locke's claim in his *Essay concerning Human Understanding* that the *idea*, or mental impression of reality, is all that the human mind immediately knows. If this were the case, critics worried, the knower could never be confident that his idea of reality actually conformed to the reality it was supposed to represent. What was the guarantee that the knower ever got outside of his mind to make contact with objective reality? The Scottish school countered this worry by arguing that humans shared a "common sense": a universal intuitive faculty by which ideas are immediately appraised. Specific individuals may err at times because of hasty judgments, but in general, commonly shared ideas derived from experience were reliable. Moreover—and this was especially influential in the American colonies—the same thing could be said about virtue. Common sense was a reliable guide in the moral as well as the intellectual realm, allowing humans to discern "self-evident" rights such as, for example, the "life, liberty, and the pursuit of happiness" specifically mentioned in the Declaration of Independence. As Thomas Reid wrote in his *An Enquiry into the Human Mind* (1765), "It is a bold philosophy that rejects, without ceremony, principles which irresistibly govern the belief and the conduct of all mankind in the common concerns of life; and to which the philosopher himself must yield, after he imagines he hath confuted them."

In each country to which Enlightenment came, defenders of the new worldview had to contend with an entrenched culture and tradition. In the American colonies, the prevailing culture was Calvinism, and its attitude toward the Enlightenment was ambivalent. On the one hand, there was an uncompromising strain in American Calvinism that was entirely skeptical of the claim that humans are rational creatures and equally wary of focusing too closely on the physical realm. Insisting on the utter fallenness of humans, the depravity of human reason, and the need to concentrate on God rather than the world, many colonial Calvinists greeted the enlightened worldview with alarm and anger. This pietistic early clash with Enlightenment would help spark the intercolonial revival in the 1740s known as the "Great Awakening."

On the other hand, American Calvinism also greatly respected and cultivated in its clergy deep scholarship and a love of learning. Frequently masters of Hebrew, Greek, and Latin, authors of massive biblical commentaries and lengthy sermons, and not infrequently skilled in medicine and astute observers and recorders of natural phenomena, many

Calvinists often felt pulled toward the Enlightenment worldview. Naturally they rejected, and frequently did so ferociously, the infidelity bred by Enlightenment. But many of them nonetheless were caught up in its excitement. So Cotton Mather (1663–1728), for example, could officiate at witchcraft trials and thunder jeremiads warning his congregants that natural disasters were divine punishment for wickedness while simultaneously encouraging inoculation, writing learned treatises that argued for the compatibility of Newtonian physics and Christianity, and getting elected a corresponding member of the Royal Society. Jonathan Edwards (1703–1758), perhaps the greatest American philosopher of his generation, worried about the spread of materialism and the lessening of religious emotion or sentiment, and he took an active role in the Great Awakening. But he also wrote sophisticated essays in natural philosophy on topics ranging from flying spiders to optics.

There was, undeniably, tension between orthodox Christians and American defenders of Enlightenment. Moreover, the worldview clash between the two erupted at times into the eighteenth-century equivalent of a culture war. But in general the coming of the Enlightenment to America was temperate and its fruits were long lasting. For the most part, the usual flashpoint was religion. But Enlightenment esteem of rational investigation, interest in the natural world, utility in ethics, and liberty in politics were much more readily received. They fit comfortably with the spirit of self-reliance, pragmatism, and inventiveness that was already associated in the eighteenth century with the American character.

Representative Figures in the American Enlightenment

So many leading figures of the colonial and early Republic eras were influenced by the Enlightenment that any listing of them is necessarily selective. Moreover, the influence was far from uniform. John Adams (1735–1826), for example, privately embraced rational religion but publicly denounced militant deists such as Thomas Paine and steadily moved away from the political libertarianism defended by many enlightened thinkers, including Thomas Jefferson. Benjamin Rush (1745–1813), on the other hand, remained an orthodox Presbyterian but was also a staunch proponent of abolitionism and a pioneer in the reformation of medical and legal treatment of the mentally ill, both inspired by his Enlightenment sympathies. Some Americans embraced a relatively traditional Christianity tinged by Enlightenment ideals, others a liberal Christianity heavily informed by

Enlightenment values, still others a minimal and publicly expedient allegiance to Christianity while identifying themselves with the Enlightenment, and a very small minority publicly repudiated any semblance of Christianity for the sake of an Enlightenment-inspired materialism.

Benjamin Franklin (1706–1790) and Thomas Jefferson (1743–1826) would be included in and likely lead most lists of representative American Enlightenment thinkers. Both of them displayed the encyclopedic interest in politics and science characteristic of French philosophes, were firmly convinced that human progress was best promoted by the steady retreat of religious faith in the face of rational inquiry, and played lively and constructive roles in the promotion of secular education.

Benjamin Franklin's experiments and discoveries in electricity earned him a significant and well-deserved scientific reputation among his peers. His conviction that reason should be promotive of useful rather than merely speculative or abstract knowledge resulted not only in numerous inventions—bifocal spectacles, the Franklin stove, lightning rods, carriage odometers—but also in active participation in the founding of civic organizations such as fire departments and libraries. Franklin's active participation in the American colonies' break from England also attested to his Enlightenment-inspired belief in natural rights and republican forms of government. Raised by Puritan parents, Franklin quickly rejected Calvinism for rational religion, although his writings on such matters remained private throughout his life. In keeping with his Enlightenment orientation, he publicly advocated a life of virtue, self-discipline, and public service as a more genuine form of veneration than conventional worship.

Thomas Jefferson's drafting of the Declaration of Independence reflects the profound influence of Enlightenment political thought, particularly John Locke's *Second Treatise on Government* (1690), which explicitly defended the right (and even obligation) of citizens to overthrow unjust governments. Moreover, his ardent republicanism—a position that clashed with the federalism of Alexander Hamilton and John Adams and eventually led to Jefferson's disgruntled resignation as the nation's first secretary of state—was based on what he saw as the enlightened self-reliance, life of reason, and promotion of virtue that republicanism encouraged. As ardent a supporter of the French revolution as he was of the American one, Jefferson would be castigated by political opponents, especially during his presidential years, as a dangerous Jacobin.

Jefferson's commitment to the Enlightenment extended far beyond his political republicanism. In religion he was a deist who accepted the existence of a Divine Architect but utterly rejected supernaturalism, going so far as to excise all mention of miracles in his personal copy of the New Testament. His intellectual and cultural interests were expansive and inexhaustible. He was an accomplished musician and architect, a skilled ethnographer and archaeologist, and a resourceful inventor. Agreeing with the Enlightenment conviction that ignorance was the single major source of individual and social ills, Jefferson was also a lifelong promoter of public education and eventually founded the University of Virginia. Curiously, and unfortunately, he wrote very little. His *Notes on the State of Virginia* (1781), the Virginia Act for Establishing Religious Freedom (1786), and of course the Declaration of Independence are his major public works.

Jefferson and Franklin were both reticent about their allegiance to rational religion, but other Enlightenment-inspired American deists were more frank. Beginning with the 1784 publication of Revolutionary War hero Ethan Allen's (1737–1789) *Reason the Only Oracle of Man*, public excoriations of Christianity and praises for the religion of nature became increasingly public. Elihu Palmer (1764–1806), a lawyer turned deist prophet, was probably the most influential champion of deism of his day. He founded deistic societies in the Middle Atlantic states, which espoused not only rational religion but also radical republican political ideals; edited two widely read deistic newspapers, *The Temple of Reason* (1801–1803) and *Prospect; or, View of the Moral World* (1803–1805); and wrote a book, *Principles of Nature* (1801), that quickly became known as the American deist bible. Largely a collection of Palmer's public lectures, *Principles'* enduring contribution was its presentation of the first completely naturalistic ethics defended by an American.

By far the best-known deist from the American Enlightenment, however, was Thomas Paine (1737–1809). His *Age of Reason* (1795), although actually written as an antidote to French atheism, became notorious for its defense of rational religion and ruined the reputation of an author whose earlier *Common Sense* (1776) had made him the darling of American revolutionists. The *Age of Reason* isn't a terribly original work, but it served as a convenient summary of deism's principles. Paine's declaration "My own mind is my own church" at the beginning of the book was a perfect summation of the Enlightenment's defiant insistence on rational scrutiny and freedom of conscience.

The American Enlightenment produced a number of individuals who contributed to the growth of the natural sciences. In addition to Franklin and Jefferson, noteworthy figures include the New Yorker Cadwallader Colden (1689–1776). Colden remained an Anglican throughout his life and announced his loyalist sympathies at the outbreak of the American Revolution. But his achievements in astronomy, botany, medicine, and mathematics mark him as a notable practitioner of Enlightenment reason, even if not an admirer of Enlightenment republicanism. His 1745 *An Explication of the First Causes of Action in Matter and of the Cause of Gravitation* was the first treatise on Newtonism published in North America. His daughter Jane (1724–1766) was an accomplished botanist who cataloged more than three hundred species of plants in the lower Hudson Valley.

The Coldens were friends of and collaborators with the Philadelphia-based Quaker botanist John Bartram (1699–1777). Generally reckoned as the father of American botany, Bartram was praised by his contemporary Carl Linnaeus as the "greatest botanist in the world." During his lifetime, Bartram not only cataloged hundreds of species of American plants but also sent New World seeds to continental and British botanists and horticulturists, thereby collaborating with fellow scientists on the other side of the Atlantic. Along with Benjamin Franklin, Bartram cofounded in 1745 the American Philosophical Society.

Cadwallader Colden was one of the first Americans to explore Newtonian mechanics. John Winthrop (1714–1779) and David Rittenhouse (1732–1796), equally inspired by Newton, became two of the American Enlightenment's most accomplished physicists, astronomers, and mathematicians. Winthrop, the great-great-grandson of the founder of the Massachusetts Bay Colony, taught mathematics and natural philosophy at Harvard. Styled the father of seismology, Winthrop is especially noteworthy for his insistence in *Lecture on Earthquakes* that the 1755 Lisbon earthquake should be understood as a natural phenomenon rather than as a divine punishment. He also observed and recorded the transits of Venus and of Mercury, traveling to Newfoundland to observe the former. Rittenhouse, who served as the first director of the U.S. Mint, was an accomplished mathematician, surveyor, and mechanic. He was one of the first people in America to build an orrery and a telescope, and he also tracked the transit of Venus. According to lore, he was so excited in the weeks leading up to the transit that he actually fainted when it finally occurred.

Legacy of the American Enlightenment

Bracketing historical periods with dates is a risky business. But it's convenient to locate the American Enlightenment's end toward the end of the nineteenth century's first quarter. John Quincy Adams was the last Enlightenment-educated president to be elected. Thomas Jefferson and John Adams, two men who for all their differences in opinion and temperament were both formed by the Enlightenment, famously died on the same day in 1826. With their passing, an era ended.

By the third decade in the century, rationalism had begun to give way to romanticism and transcendentalism among American intellectuals. In a broader context the Enlightenment ethos had already been seriously challenged by the fearsomely violent example of the French Terror on the one hand and, more significantly, the emergence of the revivalist movement known as the Second Great Awakening on the other. The Second Great Awakening stretched over a full generation from 1790 to 1840. The resurgence of Christian zeal and biblical literalism encouraged by the revival, its redistribution of denominational strength from Anglicans and Congregationalists to the more evangelical Baptists and Methodists, and its strong emphasis on reformism (temperance, abolitionism, women's rights) all tended to challenge the Enlightenment intellectual worldview and preempt its reformist agenda.

But in a very real sense, the Enlightenment as a discrete period in American history may be said to have faded away because it succeeded so well in mainstreaming its basic principles throughout American culture. No other nation so absorbed and acted on the Enlightenment ideals of liberty, natural rights, equality, and republicanism. Despite the strong presence of evangelical Christianity, American society continues to insist on a strong separation of the secular and the sacred. The pragmatism that informs the Enlightenment's understanding of rationality, an understanding that values balance and order in all things, is still enthusiastically accepted as a governing characteristic of America's self-identity. Finally, the Enlightenment's sense of adventurous and optimistic risk taking seems to be deeply engrained in the American experience.

Environment and Ecology

Religious ideas and rituals shape the ways Americans perceive and interact with the environment; conversely, concepts and practices of religion may be shaped by the physical environment in which Americans live. For example, Puritans encountering North America often described it as a wilderness in need of salvation or a blessing from God. Those who believed that the natural world was created to fulfill human needs often wanted to reshape their ecosystems to maximize their usefulness.

Though the terms *environment* and *ecology* are common today, throughout most of the history of the United States *nature* and *wilderness* were more common terms. *Nature* typically refers to the world that is in some way distinct from

humanity, either because it has not yet been explored or understood by the humans in question (wilderness), because it is natural or pure, or because it is the realm of everything that is not human. Ecology, the science of the relationships between biota and their inorganic environment, did not emerge until the late 1800s and did not take off as a discipline until the mid- to late twentieth century. Sometimes *ecology* is also used to indicate the environmental movement that prioritizes developing environmentally friendly beliefs and actions (for example, reducing, reusing, and recycling) with some input from the ecological sciences. Religious people in the United States have significantly and increasingly interacted with the ecological sciences and the environmental movement since the late 1960s as they have acknowledged an ecological crisis and have identified and constructed religious responses to that crisis. Thus, religious people reshape or create rituals to emphasize environmental themes, develop religious beliefs about the environment, and engage in environmental activism. The interaction between religions and nature in America has been defined by religious leaders and everyday people both in long-standing religious traditions and new religious movements.

Though the historical relationship of religions and the environment involves many religious traditions at various locations throughout American history, Christianity, particularly Protestantism, has been a dominant force in American religious history, and scholars have done the most research on its relationship with nature.

Native American Traditions

Native American religions were the religions of the land now known as the United States for the vast majority of time this land has been inhabited. With more than five hundred languages, and even more dialects, and each with its own culture and religion, Native American peoples and their relationships with the natural world were certainly diverse. The varied landscapes and weather patterns in which Native Americans lived, the variety of foods that they prized or found taboo, and the many different biota with which they interacted helped shape the diversity of their religions and cultures.

Additionally, Native American religions, like all religions, exhibit temporal diversity; they changed over time as tribes encountered each other, new ecosystems, and new challenges. While such changes have always occurred, they were quite prevalent as Native Americans were displaced by European Americans and forced to live with other tribes on

unfamiliar lands. For example, peyote spread throughout the West; the Ghost Dance was revealed and adopted by a number of tribes; and new symbols, garments, and tools were developed as Native Americans adapted to their new cultural and environmental situation.

Despite all of this diversity, some scholars of religion, such as Catherine Albanese, identify some general trends among Native American religions. For example, Albanese maintains that religious beliefs and practices were deeply infused into the everyday lives of Native Americans. From ceremonies during hunting to rituals in the transitional periods in life (birth, maturity, death), religion was woven into the lives of Native Americans such that they did not conceive of it as a distinct phenomenon separable from the rest of their culture. Additionally, Native American religions tend not to sharply distinguish between the natural and supernatural, divine and human, or human and animal. Rather, nature was typically believed to be permeated with the sacred. Human life was understood to correspond with the rest of the world such that human actions could affect the wider world: restoring harmonies; healing; bringing rain, sun, and game. Native Americans also tended to understand biota and inorganic entities (rocks, rivers, mountains) as relatives. Such relationships were more than mere ecological or evolutionary connections. They were a type of family relationship that entailed dependence on and responsibility to the relatives as well as the possibility of learning from them.

For example, the Kiowa tell a story in which seven girls took shelter on a small rock after being chased out of their camp by bears. In answer to a prayer for safety the rock grew, carrying the girls out of the bear's reach. Trying to reach the girls, the bears clawed deep grooves in the rock, but the girls were safe in the sky where they still can be seen as the Pleiades (a seven-starred constellation). Multiple versions of the story exist among communities with connections to the monument known as Bear's Lodge, Bear's Tipi, or Devils Tower. Most other versions of the story involve seven brothers or sisters, bears, a rock that saves the people, and bears who scratch the rock, though some are more broadly about the creation of the world. All of these narratives link humans, the inorganic world, and biota; the stories of the helpful rock also demonstrate the beneficence of the natural world.

Multiple Native American tribes including the Eastern Shoshone, Kiowa, Crow, Lakota, and Northern Cheyenne met at the Bear's Lodge to perform rituals that would solidify their personal and tribal links with each other and

all of their relatives. These rituals could also help to establish peace between tribes. Individual offerings as well as Sun Dances continue at the Bear's Lodge to this day.

European Americans have typically characterized Native Americans according to dominant European American visions of nature. When nature was understood as an untamed wilderness waiting to be put to use by whites, Native Americans were often perceived as savages who should be conquered and converted. On the other hand, when the environmental movement arose in the late twentieth century, many looked to Native American traditions for wisdom, assuming that they had always lived in perfect harmony with their ecosystems. Scholars now try to avoid denigrating or romanticizing Native American traditions. While Native Americans often adapted to their ecosystems quite well, they did significantly shape their habitats through irrigation, agriculture, hunting, and other practices. Thus, the best available scholarship on Native American religions and nature recognizes Native American wisdom about their many relatives as well as implications of their actions. This tension between the ideal relationship with nature and the actual historical interaction with the natural world emerges in all aspects of American religious environmental history.

Puritans

The Puritans left Europe in the 1600s to gain freedom to practice what they believed was the purest form of Christianity. The Puritans became significant cultural, political, and business leaders of the colonies and, later, of the United States. Because of their cultural dominance, Puritan visions of nature substantially shaped American attitudes and actions toward nature for centuries.

The Puritan responses to the New England environment were significantly influenced by their religious ideals and cultural environmental history. Indeed, early Puritans often envisioned their surroundings using biblical imagery or terms relevant to the English landscape rather than naming the biota and natural features physically surrounding them. Puritans commonly viewed New England as a dangerous wilderness. Threats of starvation, harsh winters, disease, and fierce animals certainly contributed to such an understanding, yet religious beliefs also emphasized the dangers of the land. Many Puritans believed that their environment was filled with evil, corrupted after the fall from perfection into sin. They thought the wilderness could lure people into evil and cause them to become wild. The challenges of the physical environment were also seen as punishment for sin.

Yet these dangers were also thought to draw people to belief in God: when faced with severe danger, many people believe they cannot survive without God's help.

Contrasting with visions of nature as dangerous, the abundant game, clean pure water, and fertile soil of the American wilderness were often understood to be blessings from God to the Puritans. Indeed, some Puritans thought God enabled Europeans to "discover" North America just after the Reformation so Protestants would have a refuge from religious persecution.

Puritan concepts of nature were not, however, limited to the physical. Anne Bradstreet, one of the leading poets of colonial America, expressed the idea that people could find God through nature in many of her poems, though her accounts of nature tend to be abstract and idealistic rather than fully representing what was around her. Cotton Mather, a prominent Puritan minister, reflected upon his environment using natural philosophy (a predecessor to modern science) to understand God, who he believed was the architect of creation. Jonathan Edwards, one of the most famous American theologians, significantly thought about the natural world, finding nature the most fruitful place for meditations as well as a source of analogies about God's nature and the relationship between human souls and God. In contrast to most other Puritans, Edwards believed that nature revealed the truth about God as much as or more than the Bible. While other Puritans certainly looked to nature as a locus of revelation, Edwards emphasized natural revelation more than his predecessors, setting the stage for the transcendentalists, such as Ralph Waldo Emerson and Henry David Thoreau.

Visions of wilderness as dangerous, as a blessing, and as revelation should not be seen as mutually exclusive; many Puritans drew on all of these images. For example, nature was often understood as a fallen place, far from ideal, that with human effort guided by God could be restored to paradise. This notion, along with the necessity of material survival, prompted Puritans, and many of their descendents, to transform the wilderness of America into "productive" agricultural and industrial land.

The Nineteenth Century—Manifest Destiny and the Transcendentalists

Nineteenth-century Americans championed the idea of Manifest Destiny, that Americans were preordained by God to spread democracy and freedom by expanding their country. Proponents of Manifest Destiny often envisioned the

West as a place of amazing water, weather, soil, and landscapes—a perfect climate with perfect geographical features set up by God for the best country, the United States. Manifest Destiny and its accompanying features—railroads, agriculture, and the murder or eviction of Native Americans—dramatically changed the American landscape. Prairies were tilled, buffalo nearly hunted to extinction, and Native Americans decimated. Echoes of Manifest Destiny can be heard to this day in many cries to use the land.

Yet not all nineteenth-century Americans focused on the material use of nature and the expansion of the country. In the early to mid-nineteenth century, the transcendentalist movement exemplified by Ralph Waldo

Emerson and Henry David Thoreau emphasized the revelation they found in nature over that of traditional revealed Christianity. Though they acknowledged that humanity relied on the material world, transcendentalists focused on how nature could help one connect to the transcendent, that which is beyond the material world.

Through *Nature* (1836), the Transcendentalist Club, and its journal *Dial*, Emerson, in concert with others, developed an idealistic vision of nature in which transcendent realism could be reached by reflecting on nature. Emerson maintained that nature was intended for humanity to use, most crudely as a commodity, and more sophisticatedly through the love of beauty, as a symbol of the spiritual, or as a means to transcend the world. While firsthand knowledge of the world was needed to personally experience this transcendence, Emerson himself often used vague language about nature rather than the precise names and detailed observations of Thoreau.

Thoreau's *Walden* (1854) and other writings extended and developed Emerson's move away from biblical to natural revelation as Thoreau observed and reflected on the particularities of Walden Pond and New England. As he emphasized natural revelation Thoreau used multiple types of

Henry David Thoreau's widely read *Walden, or Life in the Woods* is a reflection of the author's experience in nature and the philosophy of transcendentalism.

religious imagery, often describing the area around Walden as a temple or sacred space. Thoreau also chronicles his meditations on and in nature. In contrast with the dangerous wilderness described by many Puritans, or the vast wilderness to be conquered and subdued by those following Manifest Destiny, in *Walden*, Thoreau often views nature as his home, as his place of sacrality.

The transcendentalist impulse to appreciate nature and to use it to reach the transcendent would have enormous ramifications for American perspectives on religion and nature. Transcendentalists not only developed a new type of nature religion but also inspired many to preserve wilderness in national parks, to develop new nature religions, or to live simply in relation to their environment.

The Creation of the National Parks

Transcendentalism, Manifest Destiny, and Christian visions of nature all played a role in the creation of America's national parks, monuments, and forests, as illustrated by the life of John Muir (1838–1914), one of the major early advocates for national parks. Raised in a strict Presbyterian family that emigrated from Scotland when he was a child, Muir wanted something more than the harsh farming work and

constrained religious life of his family. He sought a college education, and then worked in a factory. While working there he was temporarily blinded in an accident and vowed that he would devote his life to studying God's marvels if he regained his sight. True to his word, Muir walked for a thousand miles on what he called a pilgrimage through the American wilderness. Muir read Emerson and Thoreau and started to believe that humans were one part of nature rather than necessarily superior to it.

After moving to California, Muir wrote newspaper articles and books that spread his thoughts of and experiences in the Sierra Nevada Mountains and Yosemite throughout the country and convinced many that America needed to preserve these lands. His writings often included religious language in attempts to describe the wonders he experienced and to persuade his readers of nature's importance. For example, he likened mountains to altars and the world to a church. Muir found nature astonishingly beautiful and thought that it intrinsically praised God and revealed God to humanity. Muir thought that the Bible and revelation in nature complemented each other well, though he thought it possible that nature was a more delightful and powerful way of understanding God. Yet, he was convinced that human dams, grazing animals, and logging could harm the world. Thus, he fought to preserve it.

Muir and others focused on preserving wilderness with little human intervention, but an opposing view, conservationism, held by Gifford Pinchot (1865–1946), father of modern American forestry, sought to manage the wilderness in ways that would provide for humans' material needs. Conservationism less often used religious language in its arguments but was significantly shaped by the belief that nature was created to support human life, an idea that grew, in part, from the ideas of Manifest Destiny and God providing for all people. While there were conflicts between these positions, particularly over whether Hetch Hetchy Dam should be built in Yosemite, people on both sides deeply valued and appreciated the land, in part for religious reasons. Their activism, along with economic and scientific concerns, helped convince the American public that national parks, monuments, and forests should be created.

Religious and scientific priorities also played a role in the establishment of Devils Tower as a national monument in 1906. Maps of the area from the 1850s and 1870s name the tower as Bear's Lodge or Devils Tower, said to be a poor translation of a Native American name, "Bad God's Tower." This name seems to have resonated with Christian

geologists who learned that the tower was formed when molten rock arose from deep underground, the traditional home of the devil. Although there were significant religious motivations in the movement to establish national parks and monuments in general, official documents about the transformation of Devils Tower from a timber reserve site to a national monument justify this action through the scientific desire to preserve the columnar rock formations of the tower.

African Americans

While the preservationist movement drew upon the transcendentalist and Puritan visions of nature as it used religious language to advocate for wilderness preservation, this trajectory of the development of American attitudes about nature was not uniform. For instance, African American visions of nature have developed along different lines as they were shaped by African religions and Christianity; the experience of slavery and work on plantations; as well as disproportionate exposure to industrial pollutants through degraded air, water, and land. Scholarship of these strands of American environmental history is still rather limited; much more work is needed to understand the trends in environmental thought among African Americans and, indeed, of all people outside of white Protestantism.

Enslaved African Americans were intimately familiar with animals, plants, and the rhythms of the natural world as they worked in the fields, hunted and gardened to supplement their meager rations, and gathered medicinal plants. People from certain areas of West Africa were highly sought as slaves for rice plantations because they had grown rice in Africa and often knew more about this form of agriculture than their white owners. Such intimate knowledge of the land continued among African Americans working on turpentine plantations through the mid-twentieth century. Yet many African Americans living in cities at or after the turn of the twentieth century were not allowed to experience recreational uses of nature as they were barred from many beaches, parks, and recreational activities such as baseball games. These conditions led to the 1919 Chicago race riots and to the organization of church baseball teams and church-led excursions to parks to ensure that African American children had healthy experiences of nature.

These trends—the involvement of church leadership and concerns about the environment in part for health reasons—are two major elements of African American interaction with the environment. African American

churches long provided significant leadership for the African American community. In addition to providing the moral basis for the civil rights movement (God cares for all people; God will liberate the oppressed), church leaders have long been formal and informal civic leaders. Additionally, churches have been a physical meeting space and organizational center for recreational activities and struggles for justice.

Throughout the twentieth century many African Americans were concerned about the ways their environments impacted their families' health as evidenced by church nature trips, Martin Luther King Jr.'s support of sanitation workers, and the struggles against toxic waste dumps and polluting industries. While some scholars have thought such concerns were not properly "environmental" because they were less concerned for a far-off wilderness than the impact of city air, water, and land pollution on people's bodies, these activities are rightly classified as a part of the environmental movement as they focus on improving the complex interactions between humans and their ecosystems.

The environmental justice movement recognizes that people of color and the poor disproportionately suffer from environmental damage. They live, work, and play next to landfills, polluted lands, toxic industries, and high-traffic (heavily polluted) areas, suffering physically, economically, and emotionally from polluted air, water, and land as they experience higher rates of cancer, asthma, and neurological diseases. The environmental justice movement aims to eradicate these injustices by drawing on the civil rights movement, liberation theology, and ecofeminism. Grassroots environmental justice movements are often led by women and use churches as an organizational center as people fight for the dignity, health, and safety of their families and communities. In their advocacy work they often rely on religious knowledge that they too are children of God, that they too deserve safety and health, that God is on their side. The environmental justice movement is just one of many ways that Americans' attitudes toward and advocacy for the environment is shaped by religious convictions. While environmental justice is now becoming a part of mainstream religious activism in America, this activism developed along a different trajectory.

Environmental Theology

Religious ideas, religious rhetoric, and religious leaders have long shaped American attitudes and actions toward the environment. Yet the rising awareness of anthropogenic

environmental destruction and the publication of Lynn White Jr.'s 1967 article "The Historical Roots of Our Ecological Crisis," published in *Science*, sparked an incredible rise in religious environmental thought and action. White's article claimed that the Judeo-Christian belief that humans have dominion over the world, together with the development of technologies (such as more effective plows) that enabled humans to change the environment more quickly, led people to use nature as if they could do whatever they wanted without negative consequences. White and others claimed that this attitude, aided by technology, led to deforestation; the loss of prairies; species extinction; and incredible pollution of land, air, and water. While White acknowledged that there were eco-friendly traditions within Christianity such as the work of St. Francis, and advocated a revitalization of the tradition to emphasize these trends, many took his article, and others like it, as a hostile denouncement of Christianity and other religions. Seeking to prove White wrong and to address the environmental crisis, many religious scholars and leaders, particularly within Christianity at first, began assessing their traditions' contributions to the environmental crisis and their possible contributions to a solution.

Theologians, historians, and biblical scholars focusing on both Judaism and Christianity examined scripture for environmental themes. They have focused on the creation stories, particularly the implications of God creating the world good and the meaning of Genesis 1:26–28 in which God gave humanity dominion or stewardship over creation. Incredible numbers of articles have been written about the best translations of these verses and whether they imply that humans should care for the land, use it for their own benefit, or some combination of the two. The flood story and some Psalms (8, 19, 104, 145) have also received attention from scholars trying to illuminate the proper relationship between humans and the rest of creation.

Because the Bible has limited verses particularly about nature, some scholars attempt to extend religious ethics to meet environmental challenges. For instance, biblical commands to help the poor, widows, and orphans are reevaluated as people recognize that environmental degradation may contribute to the plight of marginalized groups. Some, such as Sallie McFague, a Christian theologian, argue that the category of those who deserve help should be expanded to include the nonhuman natural world that has been created by God and is subject to harm by humans.

Jewish religious leaders also rely on the Talmud, commentaries on Jewish law, to develop Jewish environmental perspectives. Often-referenced passages involve subjects such as prayers for rain and the implications of regulations about how far from a neighbor's land one may dig a hole, store items, or urinate. (These regulations are intended to respect another's land and could be the basis of contemporary prohibitions of pollution.)

Jewish scholars also work to examine the environmental heritage of major Jewish figures including Moses Maimonides (1135–1204), Martin Buber (1876–1965), and Abraham Joshua Heschel (1907–1972). Similarly, Christians have reexamined the works of major figures in Christian history including the early church fathers, Augustine (354–430), Thomas Aquinas (1225–1274), Martin Luther (1483–1546), John Calvin (1509–1564), Karl Barth (1886–1968), and others for ecological insights or negative influences on human relationships with the environment. Some find traditional sources quite helpful, but most agree that significant reenvisioning of the tradition is needed to respond to ecological challenges.

Many Christian theologians have now spent long careers developing ecological theologies. For instance, John B. Cobb Jr. (1925–), a theologian who draws upon process philosophy, has maintained that God and the world continually interact in a process of mutual influence. For Cobb, God feels all that the world experiences and responds to the details of its situation. All entities have intrinsic value, value just because they are who they are, but Cobb does not think this implies equal value; humans, for example, have richer relationships that entail other values and moral consideration. Building from this relationship, he maintains that people have a responsibility to avoid and slow environmental destruction. Cobb has also worked extensively on economic issues with Herman Daly, arguing that we should prioritize the long-term societal and environmental benefits that may result from economic activity rather than merely focusing on short-term monetary results.

Rosemary Radford Ruether (1936–), a Roman Catholic ecofeminist, connects the denigration of the natural world with the long history of the subjugation of women. She argues that avoiding hierarchies in which males are more important than females, and in which people are necessarily understood as more important than nature, will be a huge step toward combating environmental destruction and being in a right relationship with the world, other humans, and God. Thus, Reuther maintains that (1) the wisdom and

experiences of women and the earth must be taken seriously and (2) the patriarchy and hierarchy of the church should be eliminated in favor of an egalitarian, compassionate community. While Reuther often radically reshapes Christian theology, she does think that traditional religious ideas such as covenants between God and the world and sacraments in which creation is intimately related to God can have a significant role in ecotheology.

Thomas Berry (1914–), a Catholic scholar who focuses on the natural world, maintains that humanity is estranged from the divine and the universe. Overcoming this estrangement is necessary to be able to praise and worship God, to relate appropriately to our human neighbors and the whole of the universe. Berry draws upon the work of theologians such as Pierre Teilhard de Chardin, who developed an evolutionary theology, as well as contemporary science to develop a story of the universe that resonates with personal experience, the need for greater meaning, and scientific knowledge. This new story of the origins and development of the universe will be a guide, he believes, in overcoming this estrangement. Berry's work has influenced religious rituals within existing traditions and has been the basis of new religious movements that center their beliefs and rituals on the Universe Story. Berry has also been quite influential among academics such as Mary Evelyn Tucker and John Grim, two of the leading scholars of religion and ecology.

Cal DeWitt, an evangelical Christian who has written about Christianity and the environment since the 1970s, emphasizes that Christians must be stewards of the earth, caring for it and other humans and taking responsibility for all of their actions toward the environment. This vision contrasts with the domination of nature that, in DeWitt's mind, has all too often been the way humans have related to nature. For DeWitt, humans are called to be stewards by Christ who creates all, connects all, and is the one for whom all were created. Thus, DeWitt argues that people need to follow Christ as they work to become stewards of the earth. In this way, DeWitt ensures that God is always at the center of his theology, even as he works to bring ecology in.

Ecological theologians such as Cobb, Reuther, Berry, and DeWitt are routinely criticized by adherents of their own traditions because they supposedly take the environment too seriously, de-emphasizing core ideas of their faith such as Jesus. Yet many within Christian communities support environmentalism through policy statements, advocacy, and ritual.

Theological development about environmental issues also occurs at the level of official religious teaching and policy statements, at least in the religious bodies that use such forms; the organization of Judaism, for example, does not lend itself well to such documents. On an international scale, Ecumenical Patriarch Bartholomew of the Eastern Orthodox Church has been the most outspoken Christian leader about environmental issues as he holds conferences on the subject, has issued a variety of statements about environmental issues, and has named environmental destruction a sin. The Vatican has also expressed concern for the implication of environmental destruction on people and on the health of the land for farming. Pope John Paul II (1920–2005) maintained that environmental concerns should be a central part of Catholic faith; Pope Benedict XVI (1927–) appears to be maintaining and expanding this position. These international religious leaders certainly can have a significant impact on the beliefs and actions of Americans who adhere to these religious traditions.

Within the United States, the U.S. Conference of Catholic Bishops has long been active on environmental issues such as the plight of salmon in dammed rivers and the necessity of addressing climate change, consumerism, and the effect of environmental destruction on the poor and future generations. Similarly, many Protestant denominations have issued policy statements about the environment in general, as well as upon specialized topics such as climate change, energy use, biodiversity, and endangered species. Many of these religious bodies also advocate at the national governmental level about environmental issues.

However, official religious leaders and theologians are not the only religious people active about environmental issues. Numerous grassroots organizations and individuals are also active advocates. For example, the Coalition on the Environment and Jewish Life, an organization with members from a wide variety of Jewish organizations, has worked to educate people about the environment, advocate for the environment within the government, and act to promote environmentally friendly actions in Jewish communities. Interfaith Power and Light organizations in more than two dozen states involve people from a wide range of religious traditions including Christians of many sorts, Jews, Buddhists, and Muslims. Interfaith Power and Light branches collectively bargain for cheaper energy for the religious organizations that are members, promote energy efficiency, and advocate for environmentally sound energy policies. In 2006, dozens of evangelical leaders took a stand against

climate change, in the Evangelical Climate Initiative, acknowledging the problem and encouraging their members and governmental leaders to act to slow the emission of greenhouse gases. The National Council of Churches and many other local and national organizations have also worked on environmental issues because of their faith.

Environmental Rituals

Connecting new theologies and advocacy for the environment are many new religious rituals and adaptations of existing rituals to emphasize environmental themes.

Within Judaism, Arthur Waskow (1933–) is one of the most prominent advocates of rethinking tradition along ecological lines. Waskow reinterprets the Torah, or law of the Jewish people; Sabbath; and kosher practices. He maintains that to truly understand these concepts they must be related to the environment. For instance, since the Torah is a way to acknowledge and worship the unity of God and includes injunctions against cutting trees or destructive grazing, Waskow believes that the Torah should today be interpreted in light of the best ecological knowledge so Jews can properly worship. Waskow develops the notion of eco-kosher by extending the concept of eating, arguing that kosher laws are properly about whatever people eat, or consume, and that therefore everything people consume should be consumed in ways that are holy, respectful, and life affirming. While kosher laws have traditionally included regulations about butchering, handling, and consuming food, Waskow maintains that people must continually evaluate what it means to eat (or consume anything) in a sacred and environmental way. Thus, he advocates a dynamic vision of eco-kosher rather than constructing specific fixed prohibitions for all time.

Some Christians have also begun to reinterpret rituals along ecological lines. For example, water is used in baptism to bring people into the Christian family by ritually washing their sins away. Environmentally aware Christians may expand upon this ritual, seeing the use of water as a way that humans, the inorganic world, and God are intimately connected. The use of water in this ancient ritual may also prompt reflection and action about the prevalence of polluted waters in our world or the necessity of conserving water.

In the late twentieth and early twenty-first centuries, many Christian rituals, such as ecotithing, are emerging in response to environmental crises. Ecotithing is an extension of the traditional practice of giving 10 percent of one's

income back to God. Christians who ecotithe reduce their impact on the natural world as they recognize that the world is not humanity's but God's. Ecotithing may involve eating organic or locally raised foods, reducing one's energy or water use, helping others do the same by contributing to environmental charities, or a host of other activities.

Congregations may also hold Earth Day celebrations, bless community gardens, or plant trees as a part of worship. Services to bless animals are increasingly held in Christian churches around the commemoration day of St. Francis of Assisi. People bring pets, companion animals, and other creatures to worship for a special blessing. The service is also a reminder that animals themselves can praise and glorify God, as noted by St. Francis in his *Canticle of the Sun*.

Eastern Religious Traditions

While Christianity has long been the dominant religion of the United States in terms of numbers and cultural impact, in the twentieth century Eastern religious traditions such as Buddhism and Hinduism became much more influential, especially where environmental issues are concerned. Often Americans know only a few ideas of Eastern traditions such as the interconnectedness of all life, vegetarianism, nonviolence, or karma. Americans may also be familiar with practices related to Eastern traditions such as Ayer Vedic medicine, yoga, and feng shui. Building from these basic ideas and environmental ideals, Americans sometimes develop new religious traditions. These trends may demonstrate the desire of many late-twentieth- and early-twenty-first-century Americans to connect transcendence and the natural in their every lives and their belief that Western religious traditions cannot do so.

Eastern religious traditions are not, however, only influential in American religious history regarding the environment through the impact they have made on European Americans. Hindus, Buddhists, Daoists, Confucians, Jains, and others participate in environmental advocacy groups because of their religious convictions. Additionally, these traditions have spread environmentally friendly activities through their own traditions and rituals. For example, Buddhist retreat centers encouraged vegetarianism when it was less popular and more difficult to do. Buddhists in America have also protested environmentally degrading activities such as cutting old-growth forests and forms of long-term nuclear waste storage that are difficult to monitor.

As more practitioners of Eastern religious traditions come to the United States, their beliefs and rituals may be shaped by the American landscape. Vasudha Narayanan has

chronicled several such adaptations in late-twentieth- and early-twenty-first-century Hindu American communities. Given the sacrality of land, rivers, forests, and biota to various branches of Hinduism, it is not surprising that moving to a new land would shape the religion. For example, Hindu Americans have reinterpreted sacred cosmologies so that some remote locations in the sacred geography are identified with America. Thus, the land of the United States is sacred. Additionally, elements of Hinduism that align with the American landscape have been emphasized in Hindu American communities. For instance, the eagle upon whom Vishnu rides gained importance in America, a land that prizes eagles. Hindus have also connected America to India by bringing sacred waters from India to North American rivers. Through all of these activities, America has become a sacred place for Hindus living here.

Latter-day Saints

American land has long had important religious significance for the Church of Jesus Christ of Latter-day Saints (LDS), a religion that arose in America. The LDS religion is based on the Book of Mormon, a new scripture revealed to Joseph Smith in the 1820s as an addition to the revelation of the Hebrew Bible and the New Testament. The Book of Mormon explains that in 600 BCE some Israelites, the family of Lehi of the tribe of Joseph, were led by God to North America. According to this text, some of the descendants of the immigrants were cursed and became the Native Americans. Mormon, one of the others, buried golden plates inscribed with the Book of Mormon in what is now upstate New York. It was these plates that were revealed to Joseph Smith a millennium later. Thus, for the Latter-day Saints, America and Native Americans are intimately connected to revelation. The very land that makes up America is a part of scripture, land that was settled because of God's initiative, much like Israel is a sacred land for Jews and other Christians.

In their early history, Saints were persecuted and driven west from New York to Ohio, Illinois, Missouri, and Utah, seeking the safety of the wilderness and the freedom to worship as they believed. As they moved, their connection to the land also developed through further revelations. For example, the Saints believed that the Garden of Eden was near present-day Kansas City. They also believed that God was calling them to the promised land, often comparing the landscape of Deseret (Utah) to that of Israel. For the Saints, like the Puritans, North American land was not only a place of promise. They too believed that the world was a fallen

place that must be transformed by humanity in anticipation of the Kingdom of God. Once in Utah, they set out to transform the desert into a fruitful place. Early ideals of land use included the communal allocation and use of natural resources. While the Saints intended to improve the land, they, like many throughout America, altered local ecologies and degraded the land as they farmed, irrigated, and provided for their families.

In the twentieth century, as the Saints integrated themselves into mainstream American culture, they as a group became staunch Republicans and outspoken supporters of big business. With these tendencies, some LDS politicians and religious leaders have expressed antienvironmental attitudes such as voting against the Endangered Species Acts, or arguing that the earth can support many more people than it does now with no environmental consequences. Some outspoken Saints challenge this position, arguing that care for the environment is central to their faith as evidenced by scripture necessitating the responsible stewardship of God's gifts of the natural world. They claim that this vision of nature needs to be reclaimed and redeveloped for them to be faithful people and to live responsibly in the world. Between these two extremes are hints of a new, official LDS environmentalism. The LDS monthly magazine *The Ensign*, and Gordon B. Hinkley, LDS president from 1995 until his death in 2008, have articulated environmental positions such as the idea that it is an offense to God when people degrade the environment and that there are actions people should take to avoid such offense. The rise of environmental awareness throughout American society has certainly prompted much reflection in all sorts of religions in America; it promises to be an interesting topic of future research as Latter-day Saints, with their deep connections to the land, engage with the possibility that this land is itself degraded by humanity.

Twenty-First-Century Challenges: Bear's Lodge/Devils Tower

Though the land of the United States has often been viewed as a blessing, a curse, or a way to reach God by Americans influenced by Christianity, the idea that the land itself is sacred has been a difficult one for many Christians to understand since they are used to moving churches wherever they go. Tension about the proper relationship to the land has often resulted in the denigration or suppression by European Americans of Native American religion and cultural claims in favor of Christian ideals and European American ideas about land ownership. In the 1990s a new method of dealing with conflicting religious, cultural, and economic claims

to the land arose in the national parks, as illustrated in the case of the Bear's Lodge/Devils Tower. This approach may prove valuable as growing religious diversity in the United States results in increased conflict over claims on the land.

In northeast Montana a 1,267-foot monolith known as the Bear's Lodge or Devils Tower National Monument rises above the landscape. Long a sacred site for many Native Americans and recognized as a prime geological specimen for more than one hundred years, the monolith is also a prime location for vertical crack rock climbing. Indeed, it draws climbers from around the world who bring tourist dollars into this remote location.

Native Americans continued to perform rituals at the site throughout the twentieth century, though Park Service staff noticed an increase in offerings (bundles of ribbons and sage, tobacco, or other plants) in the 1980s and 1990s. Around the same time, climbing at the monument increased as new facilities made the site more accessible, as climbing guides increased their business in the area, and as climbing became more popular in general.

To respond to the growing popularity in rock climbing, the National Park Service mandated that a climbing plan be created for Devils Tower and other sites to assess the ramifications of such climbing for cultural and natural resources and determine whether climbing was appropriate. A consultation group was formed to bring together people from Native American tribes, environmental groups, local government, and climbing organizations to deliberate about the climbing plan at Devils Tower. Significant efforts were made to educate each side about the other's positions. Native Americans expressed their concern that their sacred land was desecrated by tourists and climbers, particularly those who drilled into the rock to support their climbing. Climbers wanted to experience the thrills of climbing a difficult rise in a gorgeous area and enjoy the spiritual fulfillment of the climb. Climbers were also concerned that strict climbing bans at Devils Tower may set a precedent for bans at other sites, reducing their climbing opportunities.

Eventually a compromise was reached that, among other conditions, mandated a voluntary moratorium on climbing during the month of June (the time of the most extensive and important Native American rituals). Climbers involved in the deliberations agreed to respect the sacred space and felt a voluntary moratorium would set a good, and not too restrictive, precedent. They also promised to work to educate climbers about the religious significance of the Bear's Lodge. While some Native Americans wished for a

complete ban, many came to believe that a voluntary moratorium was most appropriate in hopes that it would foster respect rather than resentment toward their traditions and because they believed that climbers who voluntarily followed the moratorium would deeply show their respect for Native American traditions. *Bear Lodge Multiple Use Ass'n v. Babbitt*, a case in Wyoming's U.S. District Court, challenged the policy on multiple grounds, including the claim that it endorsed Native American religions, but the policy was upheld.

The negotiations about the use of Bear's Lodge/Devils Tower illustrate only a small portion of the variety of attitudes and preferred actions toward the environment in contemporary America. Of course, there have long been significant differences in the relationships between religion and environment in the United States, either because people belong to different religions, live in different places, or have different interpretations of their religion or place. It is likely that this diversity will remain as people continue to think of the land as sacred, as a gift or challenge from the ultimate, or as a way to seek the transcendent and as people increasingly use religious ideas to justify and advocate environmental protection.

Environment and Ecology: Colonial Era through the Early Nineteenth Century

Columbus's voyage from Europe to North America, in 1492, initiated the greatest change in religious geography in the earth's history. The Americas were home to a complex of regional religions, varying among language groups and the natural resource economies of the cultures. Religious systems ranged from the temple complexes of Maya and Aztecs, supported by vast areas of cultivation, to the more portable rituals of the Arctic-dwelling and hunting-dependent Inuit. The arrival in the Americas of not just Europeans, but Africans and Asians, resulted in a major transfer of epidemic diseases, including malaria, yellow fever, and smallpox. This "Columbian exchange" also brought Eurasian plants and livestock, such as wheat, sheep, and cattle, to the Americas while carrying such agricultural marvels as maize (corn) and potatoes to Europe. The Europeans manufactured metal tools, which made clearing land and forests more efficient, and they built ships capable of transcontinental trade. While Christians both established their own churches and attempted to replace indigenous religions

with Christianity, from an environmental perspective the colonial period was one of both radical shifts in resource exploitation and economics and of rapid evolution of religions in response to radical environmental change.

The encounter between Christianity and religions indigenous to the Americas resulted in the complete extinction of some religions, along with their associated environmental management practices, and the displacement or near dissolution of others. Christianity and other religions also borrowed from each other, producing a new iconography of human relationship to nature. Christianity itself began a series of major divisions in 1517, when Martin Luther's protests initiated the Reformation. The Protestant movement soon generated multiple sects and denominations, some of which were based in rural communal lifestyles. Systems of environmental care became symbols of a pure and holier life and commitment to right action by the eighteenth century.

Christian Interaction with Native American Religions

Eastern woodland tribes developed religious systems encouraging respect for wildlife and discouraging overharvest. Their religions viewed animals as having societies and religious festivals and rituals of their own. For the Algonkian, the animals embodied the power in nature, and humans arose from the corpses of the first animals. Many of the eastern tribes honored a "keeper of the game," an animal spirit that mediated with humans and allowed them to harvest the animals needed for survival. Calvin Martin has controversially argued that waves of epidemics and the influence of Christian missionaries caused the tribes of the northeast to abandon long-held religious practices, such as apologizing to animals they killed, and to engage in the devastating overharvest of the colonial fur trade. Martin holds that Christian displacement of regional religion degraded environmental care. Indians still resident in the eastern United States continue traditional conservation measures, however.

William Cronon found that Puritans, from 1620 onward, were in conflict with the Native American residents of New England because of differing traditions of land ownership and stewardship. The Indians, who practiced shifting cultivation, protected their fields from wildlife, while not building fences to delimit their lands. The Puritans brought concepts of real property ownership from Europe and introduced grazing livestock, which damaged Indian gardens and crops. European agricultural practices displaced Native American ones,

despite Puritan adoption of crops such as maize. Although Christian intolerance of competing religious beliefs often rationalized the economic transition and encouraged warfare against the Indians, the demand for land deeds and a partitioned landscape was a major factor in driving much Native American culture and religion from New England.

Christianity borrowed nature-oriented rituals and sacred figures from Native American religions. In the Southwest, colonial Roman Catholic missions, while pressing Indians into an unwilling labor force, linked Pueblo religious ritual, such as the corn dance, to the Christian calendar. At San Juan Pueblo, the buffalo dance was combined with the feast day for St. John the Baptist, the patron saint of the pueblo. A procession, including buffalo and eagle dancers, originates at the church and moves through the ordinal points of the village. The ceremony was originally held at the initiation of the seasonal buffalo hunt. Symbols of environmental relationship, including wetland plants, hang in the church or in an arbor at the end of the route. This synthesis of traditions retains the traditional understanding of human dependence on natural production by invoking both the patronage of the saint and the cooperation of species native to New Mexico.

In Mexico, the Spanish conquest, in combination with epidemics, devastated the Aztec religion and culture. Franciscan friars encouraged church acceptance of the visionary experience of an Aztec farmer who had converted to Christianity. In 1531, Juan Diego reported seeing the Virgin Mary in the clothes of an Aztec princess or goddess on Tepeyac, a hill sacred to the Aztecs. An early account was written in the Nahuatl language, making it available to the Aztecs as well as the Spanish. Our Lady of Guadalupe not only cares for the poor, disenfranchised, and ill; she is a symbol of Mexico itself. Appearing in celestial robes, wearing the waist sash of a pregnant Aztec woman, she invokes the importance of the earth and its production and is considered an environmental icon, encouraging humans to care for the land and each other. Her influence has continued into the modern period. In 1914, when a peasant army under Emiliano Zapata demanded Mexican land reform, it carried banners with the image of Our Lady of Guadalupe.

African Religions, Slavery, and Regional Environments

In the colonial period, conversion of slaves to Christianity was not voluntary. Spanish law, for example, required that slaves be baptized as Catholics in order to be permitted

entry into the West Indies. Despite regular attendance at Christian services, African-heritage agriculturalists retained African religious beliefs about the meaning of nature and hybridized these beliefs with Christian symbols and rituals such as baptism. Slaves utilized wild animals and plants to supplement their diets and to provide materials for crafts and building. They thus developed an intimate knowledge of the forests, rivers, and wetlands where they lived. Slaves met secretly in outdoor settings in the southern United States, which encouraged retention of African styles of ritual singing and dancing. Spirituals such as “Follow the Drinking Gourd” incorporate maps to freedom, identifying key natural features to guide a flight north. Unfortunately, slaveholders utilized Christian theology emphasizing obedience and service to argue for land management systems resulting in damaged soils and abuse of agricultural laborers.

In Cuba, many slaves were of Yoruba origin, from west central Africa. Escapees formed their own communities. Into the nineteenth century both slaves and free African-heritage Cubans continued to celebrate African-style dances and formed religious fraternities, combining Yoruba religion with Catholicism to form a new religion, Santería. Santería retains the African pantheon of spiritual beings called *orishas*, while identifying these forces of nature with Catholic saints. Osanyin, for instance, is associated with St. Joseph and with herbs and forests. Other *orishas* are credited with power over the seas and waters, the hunt, illness, and maternity. Santería retains a respect for the sources of food and useful natural materials, as well as lore concerning uses of wild herbs.

Christian resistance to the slave trade was associated, in the late eighteenth and early nineteenth centuries, with a growing environmental awareness. John Woolman, who rode from meeting to meeting, beginning in 1746, trying to convince the Society of Friends (Quakers) to release their slaves, also refused to wear dyed cloth, because he believed the dyes harmful to the laborers manufacturing the fabric. The transcendentalists, such as Henry David Thoreau, resisted the economic enslavement both of human beings and of the land itself. Abolitionism helped to generate Christian concern for the working conditions of tenant farmers, miners, factory workers, and child laborers. Christian denominations leading the political battle against slavery, such as the Society of Friends, also spoke out about dismal working conditions in mines and other unsafe or unhealthy environments and advocated for the first laws to advance environmental health.

Christian Land Use and Environmental Values

When Christians first arrived in the Americas, they were both frightened by the unfamiliarity of the landscape and inspired to think of the profusion of wood, minerals, and wildlife as God’s blessing on Christians. In Europe, wood was in short supply in the more intensively farmed regions, large game animals belonged to the aristocracy, and almost all arable land was already in family ownership. Environmental mismanagement in Europe resulted in repeated famines, driving peasants to seek passage to the New World. The Americas offered a plethora of resources, including the land itself. While many of the first colonists starved or died in harsh conditions, the Puritans thought of New England as the New Jerusalem, a locale where God’s righteous kingdom would be established. The early colonial environmental perspective is thus conflicted and shifts between extremes: on one hand the New World is the kingdom of Satan, requiring Christian conquest, on the other it is the new Eden, full of God’s bounty and providence.

Christians engaged in explorations of wild settings provided ecologically accurate and enthusiastic descriptions of the animals and plants they encountered. John Wesley, founder of Methodism, preached briefly in Georgia in 1735 and 1736, and he recorded being lost in the woods, as well as briefly describing the vegetation he encountered. John Bartram, a member of the Society of Friends, established a botanical garden and conducted many natural history explorations in the regions around Philadelphia, including the New Jersey Pine Barrens. His son, William, explored the southern Appalachians between 1773 and 1776. In *The Travels of William Bartram*, he writes, “This world, as a glorious apartment of the boundless palace of the sovereign Creator, is furnished with an infinite variety of animated scenes, inexpressibly beautiful and pleasing, equally free to the inspection and enjoyment of all creatures” (p. 15). Both Bartrams contributed greatly to botanical knowledge, and modern ecologists still find William Bartram’s journals scientifically useful.

The concept that Christian environmental stewardship on the frontier was a free-for-all is incorrect. In the seventeenth century, the Puritans regulated wildlife harvest; established common lands, such as town greens, for community use; and practiced fertilization and improvement of fields. Good land husbandry was considered a virtue. By the late eighteenth century, however, many of the farms on acid New England soils were “burned out” from erosion and

nutrient depletion. Construction of mill ponds and dams to power industry depleted Atlantic salmon spawning sites by blocking migrations. Although the problem was understood by the nineteenth century, the demand for water power took precedence over the fishery and water quality. While nature was a product of divine providence, it could also be morally marginalized.

Folk Religion and Sacred Landscape Features

Europeans retained beliefs from pre-Christian religions and continued to practice folk religion. The colonists brought astrology with them to the Americas and used the zodiac to guide seasonal agricultural activity. Folk medicine encouraged a respect for natural products and the biological diversity of the landscape. Conversely, beliefs about ghosts and other supernatural beings, such as trolls, caused fear of landscape features such as dense forests. The Puritans associated witchcraft with wilderness. Judith Richardson has documented the evolution of ghost lore in the Hudson Valley. As different ethnic groups have entered the landscape, they have turned the previous land owners into quaint hauntings or participants in paranormal events that rationalize new economic influences and modifications in land management. Examples are apparitions of deceased Indian chiefs, and even Rip van Winkle.

Concepts of magical landscapes or sacred ground transferred differentially. Holy or magical wells, which generate respect for water and watersheds, are much less common in the Americas than in Ireland and Scotland. Roman Catholics, particularly in combination with Native American beliefs, however, established new pilgrimages to locales with sacred waters or earth, including Santuario de Chimayo in New Mexico, which offers healing earth (ca. 1814), and Lac Ste. Anne, in Canada, where pilgrims wade into the waters and petition for physical and spiritual healing (initiated 1889).

Carolyn Merchant has argued that the cosmos of the colonial farmer was animate, feminine, and symbolic. The Puritans and Enlightenment science encouraged a view of nature as inanimate and mechanistic, reducing environmental respect. Conversely, religious denominations or groups including Presbyterians, Congregationalists, Friends, Episcopalians, Catholics, and Sephardic Jews (who arrived in New York when it was still a Dutch colony) established the first secondary schools, academies, and colleges in North America. They brought with them a respect for applied science, which produced many of the engineering advances of the

industrial revolution, and also fostered the development of modern agriculture, medicine, and environmental management. Their broad institutional legacy includes many of the early twenty-first century's premiere institutions of higher education, such as Harvard University, a leader in conservation biology.

Communitarian and Nonconformist Sects and Land Management

The Americas have both generated and sheltered religious sects with beliefs encouraging withdrawal from the greater society. Communitarian rural lifestyles, guided by Christian teachings, generate an emphasis on sustainable levels of environmental exploitation and of improvement of the land's productivity. The Anabaptists, including the Mennonites and the Amish, left Europe to escape persecution. The first Mennonite families arrived in Pennsylvania in 1683, to be followed by more Mennonite and Amish immigrants through the eighteenth century. Both the Amish and Mennonites value farming as a righteous vocation, which encourages families to work and live together. Although some of the early colonies floundered and suffered from environmental deficiencies such as crop failures and depleted soils, as the Anabaptists became better organized, religious values forwarded conscientious care for their fields, pastures, and soils. They still occupy the original lands they settled in Lancaster County, Pennsylvania, which remain highly productive. The Anabaptists historically discouraged excessive resource ownership or use by any one family as proud, greedy, and damaging to Christian community. As pacifists, they avoid the environmental destruction generated by war.

The United Society of Believers in Christ's Second Appearing, commonly known as Shakers, emigrated from England with their leader, Mother Ann Lee, in 1774. They purchased tracts of land to establish communitarian farms, and by the 1830s, when they achieved their greatest numbers, the Shakers had settlements in several states including New York, Massachusetts, and Ohio. Despite their millennial beliefs, they practiced scientific agriculture, experimented with new methods of farming, and utilized piped-in water to power innovative machines in their wood-working shops. Taking nothing to excess and valuing simplicity, their restrained yet productive industry caused little environmental degradation. Today's environmentalists continue to utilize the Anabaptists and Shakers as models for environmental stewardship, simplicity, and sustainability.

Morality and Aesthetics of Nature

During the colonial period, Christians praised nature and God simultaneously through poetry and art. Anne Bradstreet, who arrived in Massachusetts in 1630, invoked classical models of nature as she became one of the first English-language poets in the Americas to combine Christian spirituality with vivid natural imagery. Jonathan Edwards, a Calvinist leader of the Great Awakening in the first half of the eighteenth century, frequently inserted natural metaphors and examples in his sermons. Edwards sees the beauty of God's moral order and God's glory displayed in nature. Rather than being mere material stuff, the environment emanates from God; and although the created world is "an image of an image," it also is a communication from a transcendent deity humans cannot directly observe. Thomas Jefferson, while believing that everything including the Bible should be questioned, thought nature was a source of truth. Jefferson pursued a natural theology, strongly synthesizing creation and creator. Jefferson was an astute observer of nature; encouraged scientific land management on his own properties; and took a preservationist interest in a unique geologic feature, Natural Bridge, Virginia, which he purchased in 1754. Jefferson used the adjoining property as a retreat. The depiction of natural features, such as streams and forested mountains, to demonstrate divine providence or to reflect the beauty of God continued with such nineteenth-century authors as William Cullen Bryant, whose "The Riverlet" identifies God's hand in the small stream originating on his farm.

The Hudson River Valley School of landscape painting, and other early-nineteenth-century artists, including the Luminists, drew on America's natural riches—rivers, forests, and mountains—to illustrate the relationship between God and the increasingly self-confident republic. Thomas Cole, in *The Oxbow* or *The View from Mount Holyoake*, shows a half-forested, half-cultivated region where rain brings the providence of God to southern New England. Fredrick Edwin Church, a deacon in the Dutch Reformed Church, proves God's continuing interest in the American project in glowing skies over the mountains, not just of Maine, but also of tropical volcanoes in South America and the icy seas off Labrador. Thomas Moran's *Mountain of the Holy Cross*, of a frontier peak in Colorado, displays a glacially carved cross in the face of a mountain in the midst of a wilderness landscape. The cross invokes the belief of a Christian God being present in the Americas from primeval times. While being

optimistic about colonization of the frontier, this genre of romantic art encouraged environmental stewardship. Thomas Cole, for example, was worried about the impact of tourists and railroads on the Catskill Mountains, New York, as early as the 1830s.

Transcendentalism and Alternative Religions

Transcendentalism, a movement with deep roots in Puritanism and Unitarianism, began in the literary circle centered in Concord, Massachusetts. Ralph Waldo Emerson's *Nature*, published in 1836, became the manifesto of the transcendentalists, while Henry David Thoreau's *Walden, or Life in the Woods* is probably the most widely read statement of transcendentalist experience in nature. Other important transcendentalist authors include Amos Bronson Alcott, the educator, and Theodore Parker, a Unitarian theologian. The movement influenced such literary figures as Nathaniel Hawthorne, Herman Melville, and Lousia May Alcott (Bronson's daughter). Transcendentalists found spiritual and cosmic meaning in the realm of nature, through careful and experiential observation of natural phenomena. Transcendentalism is inherently mystical, invoking the concept of correspondence—that by engaging the microcosms of human and natural community, one can grasp the sense of transcendence and unity imbedded in concepts of the greater cosmos. Transcendentalism has helped to generate a preservationist ethic in American environmentalism. Thoreau's sojourn at Walden Pond taught the value of setting nature aside for contemplation and aesthetic viewing, as well advocating simplicity in the face of nineteenth-century materialism. John Muir, founder of the Sierra Club and advocate for Yosemite National Park, expresses transcendentalist values in his own writings, arguing for the importance of leaving some natural areas largely free from human development.

The early nineteenth century was a period of religious diversification. The transcendentalists read Hindu and Buddhist texts, which slowly became available in translation. While remaining largely imbedded in Western Neo-Platonism, they reconstructed Eastern concepts such as the merger of Brahman and Atman and the harmony-seeking disciplines of spiritual paths. Since Thoreau's time American environmental thinkers have continued the exploration of Eastern philosophy. Gary Snyder, an influential contemporary environmental poet, is a Buddhist. In another emerging religious trend, nineteenth-century spiritualism and séances

emphasized discovering one's previous lives and understanding the ghosts of place. This has evolved into contemporary New Age practices for developing environmental understanding such as seeking "Indian Guides" who still guard undeveloped landscapes, or reliving previous lives as animals or as a member of an ancient culture still in touch with the land.

New communitarian denominations also appeared. Joseph Smith's visions of the angel Moroni, beginning in 1823 and culminating in the reception of the Book of Mormon in 1830, led to the establishment of the Church of Jesus Christ of Latter-day Saints. Troubled by persecution in the eastern United States, and desiring to establish a New Zion, the Mormons moved west to finally establish settlements in Utah's arid Great Basin. Retaining the Puritan values of frugality and industry, as Mark Stoll writes in *Protestantism, Capitalism and Nature in America*, they adopted land and water stewardship "as central tenets, which under the firm hand of church direction, resulted in policies such as central control and conservation of water, timber, and minerals" (p. 113). While unintentionally overexploiting some more fragile lands, the Mormons were successful in building a viable economy in a difficult terrain, at least partially because they believed "that if God gave the earth to the care of humans, they must use it wisely" (p. 115).

The Importance of Religion to Environmentalism

Environmental historian Donald Worster has concluded that the development of the conservation and environmental movements in the United States is deeply rooted in American religion, insofar as environmentalism has adopted Protestant asceticism (waste not want not), volunteerism, and service of the greater good. Mark Stoll has chronicled the complex relationship between Protestant beliefs about the meaning and value of nature and the development of the resource-extraction-based colonial economy, followed by industrialization and the romantic reaction to it. By the nineteenth century, Protestantism was both rationalizing optimization of environmental exploitation and calling for preservation of national parks and wilderness areas. Furthermore, alternate religions, with roots in the spiritualist and communitarian movements of the nineteenth century, and Native American religions attempting to maintain or revive their historic practices have adopted strongly environmentalist stances emphasizing awareness of natural values. While colonial collisions between regional religions

and Christianity resulted in much environmental degradation and cultural loss, many of America's greatest contributions to environmental care, such as the national park system and successful examples of simple lifestyles, also have roots in American religious ethics, aesthetics, and community.

Environment and Ecology: Current Ethical Issues

Environmentalism as a social movement in America predates the emergence of the academic discipline known today as religion and ecology or ecological theology. The publication of Rachel Carson's *Silent Spring* in 1962 represents, if not the precise starting point of the environmental movement, at least a significant milestone. Carson was among the first to question whether humans have the right to alter and control nature to suit our own end. Her particular target was chemical pesticides. She did not call for a complete ban on these chemicals, but she strongly cautioned against their overuse and encouraged the development of alternative, biological solutions to pest problems. While not explicitly religious in tone, Carson's writing about nature evoked a sense of reverence for its mystery, beauty, and power. Moreover, *Silent Spring* clearly cast environmental harms as a moral issue, not merely a scientific or practical one. Carson defended an attitude of humility rather than arrogance in our dealings with the natural world and warned against citizens placing inordinate faith in scientific or governmental authorities. Carson died in 1964, but by the time the first Earth Day celebration took place on April 22, 1970, legislation to protect the environment was already in place.

Early environmental legislation included the Clean Air Act (1963) and the Wilderness Act (1964) and the beginnings of an Endangered Species Act in 1966 (expanded in 1973). In 1970 a law was passed establishing the U.S. Environmental Protection Agency. Environmental and animal advocacy movements in the late 1960s and early 1970s grew up alongside and in close relationship to civil rights and liberation movements. When Peter Singer published *Animal Liberation* in 1975, he drew explicit connections between

the oppression of animals (in factory farms, for example) and oppression of and discrimination against minorities and other groups. Singer defined "speciesism" as a parallel concept to racism, an arbitrary form of discrimination against a group based on characteristics that are morally irrelevant. The language of liberation for nature and animals was also adopted by more radical environmental groups whose religious or spiritual orientation might be described as pagan. Radical environmental groups such as Earth First! (which began in 1980) and the Earth Liberation Front (in the early 1990s) often describe their commitment to nature in terms of nature's intrinsic value or even sacredness. As in the civil rights movements, these activists turn to a range of strategies that includes civil disobedience and demonstrations. In the case of the Earth Liberation Front, economic sabotage and arson have also been deployed in defense of nature's value versus purely economic values.

Despite the unmistakably moral tone frequently taken in defense of animals and the environment, for the most part the environmental movement did not take on religious flavor until religion—particularly the Judeo-Christian tradition—was directly targeted as a major source of the environmental crisis. In 1967, Lynn White, a medieval historian, published his now-famous essay titled "The Historical Roots of Our Ecologic Crisis" in the journal *Science*. White charged that the Judeo-Christian tradition, and a certain Genesis "dogma" of creation on which it is based, constitutes the most anthropocentric form of religion the world has ever known. On White's account, biblical conceptions of human dominion provide a divine mandate for humans to exploit and neglect the natural world. He alleged that the general dualistic framework of the Judeo-Christian tradition, which separates spirit from matter and values the former over the latter, renders nature a mere backdrop to the human quest for salvation and eternal life.

Greening Protestantism: Theoretical Developments

Responses to White's critique were partly defensive and partly apologetic. Some theologians, particularly within Protestant Christianity, acknowledged the otherworldly orientation of their tradition and its values, while others sought to highlight the positive environmental dimensions of existing beliefs and practices. As in the secular realm, some early forms of religious environmentalism took inspiration from social concerns and movements promoting human equality or liberation. One of the most prominent Protestant theologians to make this move was Sallie McFague (1933–). As a

feminist theologian, McFague challenged traditional Christian conceptions of and language about God. In works such as *Metaphorical Theology* (1982) and *Models of God* (1987), McFague called for an end to monarchical, patriarchal, and transcendent conceptions of God as a father, king, or lord who resides in an otherworldly realm. The immanent metaphors McFague offered in lieu of these, such as God as mother, lover, or friend, put God in a closer relationship to the created world and imply that the deity is vulnerable to human-inflicted harms, including harms to the natural world. Drawing on the doctrine of Incarnation, which in her view confers value and dignity to embodiment, McFague suggested that Christians envision the world as God's body. This conception of God set the stage for an ecological turn in theology; it also appears to move Christian theology in the direction of Eastern religious conceptions of the physical world as an emanation of the divine (White's critique had suggested that Eastern religions largely lack the dangerous dualisms found in the West). With works such as *Super, Natural Christians* (1997), McFague argued for extending Jesus' ministry to bodies (not just souls) and to the nonhuman world and urged Christians to view nonhuman forms of life as our oppressed neighbors in need of love and liberation as well as physical healing. These features of McFague's theology respond to White's critique of the spiritual and otherworldly preoccupation of Christian theology.

Some of these features are also found in the work of Protestant ecotheologians such as John Cobb (1925–). His 1972 book titled *Is It Too Late? A Theology of Ecology* was a pioneering work in ecotheology and ethics. Strongly influenced by the process thought of Alfred North Whitehead, Cobb's theology likewise understands God to be interactive with and influenced by natural processes. God is seen as the force that lures creation forward, without forcing it into particular directions. The evolutionary process as a whole displays novelty and open-endedness, and this in turn allows individual life-forms to respond in creative ways to the challenges presented by their natural environments. Creative responses to such challenges propel the evolution of life forward, culminating in rich experience and consciousness in some organisms. The important implications of this account, from an environmental and ethical standpoint, are that each organism is valued as an experiencing subject and God is intimately bound up with natural processes, thus bridging the spirit/matter dualism. The process account of God and nature led Cobb to propose an ethic of liberation of all life from social and scientific forms of oppression in

works such as *The Liberation of Life* (1981, coauthored with process thinker and biologist Charles Birch). Cobb and Birch identify oppression with human domination of the natural world as well as with scientific paradigms that objectify life-forms insofar as they regard them as machine-like, valueless objects of study.

At the heart of these and many other ecotheological accounts is a proposal for an alternative "ecological model" to displace mechanistic models that have held sway since the sixteenth and seventeenth centuries. The ecological model highlights the radical interrelationality, subjecthood, and interdependence of all life and proposes an ethic of mutual-ity, liberation, care, and even love for other forms of life. In turning away from mechanistic science, this model looks to newer scientific paradigms, most notably the "new" or "postmodern" physics of relativity and quantum theory. Its proponents claim that the ecological model resonates with quantum dissolution of dualistic constructs such as sharp subject/object delineation, or distinctions between knower and the known. That is, both models seem to suggest that all entities are constituted by their relationships with other entities and with the environment generally. Nothing exists unto itself.

Greening Protestantism: Social Developments

It is difficult to gauge how much impact this scholarly discourse and debate has had on mainline Protestant churches. Certainly, many congregations are now aware of their ecological footprint, and many have established recycling programs and have sought ways to reduce their energy consumption. It is no longer uncommon, particularly among the more liberal Protestant denominations, to find churches incorporating aspects of ecological theology into sermons and classes, or organizing discussion groups on books in ecotheology. With the twenty-first century, climate change became the issue that especially galvanized religious environmentalists in faith-based and grassroots movements, as well as academic circles.

One of the first Protestant theologians to offer a comprehensive, theological response to climate change was Anglican priest and University of Edinburgh professor Michael Northcott in his 2007 book *A Moral Climate*. Building upon ecological notions of interrelationality of all life, Sallie McFague turned her attention to climate change in her 2008 work *A New Climate for Theology*. These theologians critique what they see as a morally indefensible economic order underlying and perpetuating environmental

destruction and argue for responses to climate change, including major lifestyle changes, that better reflect Christian values and biblical materials.

Among grassroots movements targeting climate change, Interfaith Power and Light (IPL), founded in 2000, has garnered great attention. Led by Sally Bingham, a priest in the Episcopal Diocese of California, IPL is a nationwide movement to mobilize religious responses to global warming. IPL seeks to provide churches, mosques, and synagogues with the means to switch to cleaner and more efficient forms of energy. At the conservative end of the Protestant spectrum, the Evangelical Environmental Network (EEN), founded in 1993, launched a campaign early in the twenty-first century called “What Would Jesus Drive?” modeled on the question, “What would Jesus do?” Environmental scientist and evangelical leader Calvin DeWitt, who helped to found EEN, advocates earth stewardship or “creation care,” grounded in the biblical teachings and example of Jesus. DeWitt also calls attention to the earth-keeping mandate found in Genesis 2:15, in which Adam is given the task of protecting and keeping the garden. Targeting sport utility vehicles in particular, EEN argues that transportation is a moral issue and urges Christians to consider the negative impact of their lifestyle choices on other life-forms, both human and nonhuman. The movement received a boost from environmental writer and activist Bill McKibben, who in 2006 spearheaded his own campaign against global warming called Step It Up. Step It Up organizes rallies and demonstrations to put pressure on local and national governments to reduce greenhouse gas emissions. McKibben’s speeches and essays frequently invoke explicitly theological language.

Greening Catholicism: Official Church Responses

White’s criticism of Judeo-Christianity did not call for abandoning these traditions altogether. White held up the figure of Saint Francis of Assisi, patron saint of children and small animals, as a symbol of a greener form of Christianity awaiting cultivation. White’s portrait (some might say caricature) of Christianity bore some resemblance to Protestantism, and most early efforts to green Christianity emerged from the Protestant circles. The Catholic Church has traditionally placed far less emphasis on a literal reading of the Genesis account than Protestant sects and put more emphasis on the natural world as a normative order reflecting divine providence, as in the natural law tradition. On the one hand, these features have made the Catholic

tradition a less likely target of critics like White who worry that nature has no spiritual or moral significance in Christianity. On the other hand, the church’s official teaching on birth control remains highly controversial in an overpopulated world. Moreover, some discern in Catholic theology a pernicious hierarchical view of humans and nature, wherein humans, by virtue of reason, have an exalted status vis-à-vis all other forms of life, which are unable to participate rationally in the created order. Human life is of paramount value.

With regard to population issues, the church attempts to address these in the context of respect for nature, respect for human life, and respect for the freedom of married couples to choose the number and spacing of births. Valuing human life and natural family planning is consistent with, not contrary to, an overarching respect for nature and natural processes, church leaders contend. Catholic moral theology seeks to balance the value of human life with other values including the natural environment. However, the ban on artificial birth control, reaffirmed in the 1968 document *Humanae vitae*, remains firmly in place.

Catholic approaches to environmental issues have been significantly shaped by the church’s long-standing commitment to social justice. The United States Conference of Catholic Bishops launched an Environmental Justice Program (EJP) in 1993, calling Catholics to a deeper reverence for creation and urging parishes and diocese to address local environmental problems, especially those that impact the poor. The EJP is built upon principles articulated in papal encyclicals, particularly statements of John Paul II.

Since the 1960s, various papal encyclicals and statements have alluded to the value of the created world and stewardship obligations. As early as 1963, Pope John XXIII, in the encyclical *Pacem in Terris*, characterized the world as an interdependent global community with a common good. Catholic teaching has continued to build upon this principle of the common good, linking environmental concern with concern for social justice and workers’ rights. In the early 1990s, Pope John Paul II characterized the ecological crisis as the responsibility of everyone, individuals and governments alike, and included in the common good the preservation of the natural environment.

John Paul’s successor, Pope Benedict XVI, has been cast as the “Green Pope.” At a Vatican conference addressing climate change in 2007, Benedict argued that abuse of the environment is contrary to the will of God and emphatically

embraced sustainable development. He has characterized pollution of the environment as a sin requiring repentance, along with sins such as “obscene” wealth. The Vatican has purchased carbon offsets to compensate for the energy it consumes. Like those before him, Benedict has stressed the connection between environmental responsibility and the responsibility to protect the world’s most poverty-stricken communities, the same communities heavily impacted by climate change.

Greening Catholicism: Theological Responses

A good deal of Catholic environmentalism occurs at the margins of official church teaching, and some of it has run afoul of those teachings. A prominent figure in religious environmentalism with ties to Catholicism was Thomas Berry (1914–2009), a Passionist priest whose work was influenced by the French Jesuit priest Pierre Teilhard de Chardin. Berry described himself as a “geologist” as much as a theologian—a historian of the earth and earth processes. In works such as *The Dream of the Earth* (1988), *The Great Work: Our Way into the Future* (1999), and *The Universe Story* (coauthored with mathematical cosmologist Brian Swimme, 1962), Berry proposes a new cosmology that combines the thought of Teilhard with elements of Confucianism, as well as Native American and other indigenous traditions. Also crucial to this cosmology is a “reenchanted” evolutionary account of the unfolding of the earth and the cosmos as a whole.

Berry seeks to replace our modern scientific, disenchanting narrative of the evolution of our universe with a powerful creation myth that remains rooted in sciences yet speaks meaningfully to each of us as a being situated within the story. This “New Story” (or “Universe Story”) describes a universe charged with consciousness of many varieties. Humans exist on a continuum with other conscious entities, but our particular form of consciousness entails that we have unique moral obligations to ensure that the unfolding cosmogenesis continues. The human community, Berry emphasizes, is situated within and dependent upon the earth community. From this sweeping evolutionary perspective, it makes little sense to think of ourselves, or any animal, as having dominion over earth.

Berry’s work has had an enormous impact on ecologically minded Catholic women’s communities. Often referred to as “green sisters” or “eco-nuns,” these women have founded ecological learning centers, organic farms, and eco-spiritual retreats. Important examples include Genesis Farm

and Ecological Learning Center in New Jersey, founded in 1980, and the Green Mountain Monastery in Vermont, founded in 1999. The sisters grow food as a form of spiritual practice, and many are vegetarians. Though some critics charge these sisters (and Berry himself) with espousing pantheistic or neopagan religion rather than Catholicism, they maintain their fidelity to the tradition.

Matthew Fox (1940–) is a proponent of an earth-centered creation spirituality with a cosmology similar to Berry’s. Fox seeks to reacquaint Western Christianity with its own mystical heritage, and, like Berry, he celebrates a blend of modern scientific mysticism and ancient wisdom. Fox was ordained as a priest in 1967 but was subsequently disciplined by the church for his teachings and dismissed from the Dominican Order in the early 1990s. He became an Episcopal priest thereafter and established his own university in 1996 in Oakland, California, calling it the University of Creation Spirituality (later named Wisdom University). Fox’s creation spirituality supports the idea that each person is capable of mystical and prophetic insight. He embraces all creation as an original blessing, explicitly rejecting any notion of original sin. His eclectic religion combines an emphasis on feminist perspectives and eco-justice with Native American-inspired rituals and a “Techno Cosmic Mass”—a religious rave of sorts, with rap and electronic music, trance dancing, and drum circles.

Another ecotheologian with ties to the Catholic tradition is ecumenical and feminist theologian Rosemary Radford Ruether (1936–). Not unlike McFague, Ruether’s abiding concern with church patriarchy and masculine imagery led to a focus on ecological issues in her work. Throughout the 1960s and 1970s, Ruether’s writings sought to present the figure of Jesus in a new light, as a radically egalitarian and feminist figure whose central message undercuts hierarchy and dominance in social relations. From this interpretation of Jesus, Ruether moved toward an ecofeminist analysis of the environmental crisis. In works such as *Gaia and God* (1992), Ruether identified connections between destruction of the environment and structures of social domination and oppression. Influenced by the Gaia hypothesis of atmospheric scientist James Lovelock, which sees the planet as a living organism, Ruether suggests that we embrace both Gaia and God as a way of moving beyond entrenched dualisms of male/female or transcendence/immanence. Ruether has remained within the church, while steadily critiquing the Vatican’s stance on issues such as contraception and sexuality.

Judaism and the Environment

Many Jews (and perhaps some Christians as well) would likely contest the notion, implicit in portions of White's critique, that Judaism and Christianity form a monolithic "Judeo-Christian" tradition. Jewish environmentalists have identified many green features of their tradition that distinguish it from Christian thought and practice, as well as features shared between the two traditions.

For example, Jewish scholars have noted the green potential of practices such as kosher and Shabbat. Rabbi Arthur Waskow (1933–), who helped to found the Shalom Center in 1983, has presented arguments for broadening the category of kosher to include "eco-kosher" products and practices. Just as animals raised and slaughtered under certain conditions may not be considered kosher, Waskow argues, so should Jews consider whether drafty windows, pesticide-drenched produce, or gas-guzzling automobiles are eco-kosher. In Jewish belief and practice, moreover, food has traditionally been a spiritual center of life, eating a sanctified activity. Some scholars have suggested that Judaism's emphasis on humane treatment of animals and dietary laws (*kashrut*) can be pushed further in the direction of total vegetarianism or even veganism. The careful attention to the origins and preparation of one's food, required by kosher and *kashrut*, finds parallels in increasingly popular "slow food," conscious eating, and local eating movements.

Shabbat, or Sabbath, embodies ideals of stewardship and sustainable ways of living, some Jews argue. Humans are understood to be tenants of the land that belongs solely to God; as such, humans must abide by certain rules and restraints in their use of the land. The Shabbat of the seventh day of the week, the seventh month, and the seventh year prescribe rest and renewal not only for humans but for animals and nature as a whole. The essence of Shabbat is limits and constraints on technology, energy use, and monetary exchange. If more widely incorporated and regularly observed, such limits might significantly reduce consumption and pollution levels, giving Earth itself a rest.

Jewish environmentalists also point to the ideals of *tikkun olam*—"repair of the world"—and *bal tashchit*—the obligation not to waste or destroy natural resources in wanton and unnecessary ways, even in the midst of war. The central teaching of *tzedek*, or justice, extends to concern with environmental justice and the disproportionate impact of environmental degradation on the poor and marginalized.

Organizations such as the Coalition on the Environment and Jewish Life (COEJL), founded in 1993, foster environmental education and outreach in synagogues and other local Jewish organizations across the full spectrum of Jewish religious life. Finding God in nature, COEJL members insist, is an ancient Jewish practice, and numerous Jewish teachings have direct relevance for the environmental crisis and the safeguarding of all forms of life. Other scholars, such as Eilon Schwartz (founder of the Heschel Center for Environmental Learning and Leadership), contend that Judaism displays an ancient ambivalence toward nature, stemming from Judaism's strong rejection of pagan conceptions of an immanent God contained within nature. Jews, he argues, are especially wary of attempts to derive morality from nature or to interpret nature normatively in general, given the dangerous uses to which "naturalistic" ethics, such as Social Darwinism, have been put. But in rejecting a morality of nature, Jewish ethics may still embrace the significant, spiritual role of nature in Jewish life and history. Moreover, Judaism has traditionally rejected a strict spiritual/material dichotomy, as evidenced by Judaism's view of the body as a category of spiritual existence.

Conclusion

Clearly, debates similar to these can be found across the spectrum of Jewish and Christian belief, and it remains to be seen how religious communities will resolve internal issues as they continue to adapt and respond to the ecological age. On the whole, we find theologians, scholars, and activists seeking ways to bridge gaps between the physical and the spiritual realm, between the creator and the created world. We also find environmentalists making connections between injustice in human communities and injustices perpetrated against the greater community of life, between the rights of humans and the rights of the nonhuman world. As they have branched out in these directions, many religions—not only within the Western traditions but among the religions of the world as a whole—have discovered important common ground in their beliefs and values regarding nature and the human-divine-nature nexus.

The academic community has played a crucial role in fostering dialogue and consensus on environmental problems among the major world traditions. In the late 1990s, for example, a series of conferences were held at the Center for the Study of World Religions at Harvard University examining the attitudes and contributions of various faiths to ecology and the environment. From these conferences

emerged the Forum on Religion and Ecology (FORE), founded by scholars and activists Mary Evelyn Tucker and John Grim. FORE supports research, education, and outreach on environmental issues and encourages dialogue not only among religious traditions but also between the various religions and scientific and economic sectors.

Environment and Ecology: Native American Cultures

The natural environment plays a central role in the cultures of those Native North Americans who practice their traditional religions and engage their environments from ecological perspectives. Like indigenous peoples from other parts of the world, Native Americans or American Indians see their identities, their religious practices, and the

landscapes upon which they live as intimately intertwined. This means that Native American cultures are as varied as the geography of the United States. Still, precisely because they are culturally bound to certain landscapes, traditional members of otherwise discrete Native American groups share a vision of the world in which those landscapes are full of life, inhabited by beings with whom individuals can and should engage in mutually beneficial, reciprocal relationships.

The United States Census conducted in the year 2000 helps define the demographic contours of Native America. According to the census, approximately two and a half million Americans identify themselves primarily as American Indian or Alaska Native. More than four million more identify themselves as part American Indian or Alaska Native. Many of these persons are enrolled in one of the more than 560 federally recognized Native American "tribes" or nations. Others are enrolled in nations holding only state recognition, and others still, for a number of reasons, have no legal affiliation with any nation. There are also a significant number of native people in Canada, which has 600 federally recognized indigenous nations within its borders. Native people are found throughout the entirety of Latin America too. Therefore, while this entry focuses upon the United States, the reader should understand that native peoples populate nearly every part of the Americas.

Members of diverse populations embrace different religions. For instance, many Native Americans are now Christians. Others continue to practice the religious traditions passed down to them by their ancestors. As noted previously, these traditions are unique to each nation. This is because these traditions are land-based; they were developed to help their practitioners live successful lives in the physical environments to which the practitioners are native. As environments across North America change, so do these traditions. Of course, some of these traditions have changed diachronically, across time, too, as the environments—the geographic and cultural landscapes—of the continent have also changed.

Traditional Native Americans speak their own languages, and their languages convey very different worldviews than does the English language. In describing native cultures, then, we must use our words carefully, so as not to misrepresent these different worldviews. Accordingly, the reader should understand that, in this entry, the term *environment* refers literally to that which surrounds a person or people. Mainstream Americans often equate the environment with "nature." Generally, they also consider nature

distinct from culture, so that, in common usage, “nature” is that which is separate from humans and human activity. This distinction does not hold for traditional Native Americans. They perceive their worlds to be inhabited by many beings besides humans. Moreover, they regard these beings as capable of behaving like persons. As persons, these beings are often a part of, and not distinct from, Native American “cultures.”

Traditional Native American worldviews are appropriately described as ecological. In mainstream American terms, *ecology* denotes a view of or approach to the world that prioritizes the “relationships between living organisms and their environment” (Oxford English Dictionary Online, s.v. “Ecology”). Because traditional Native Americans inhabit worlds in which interpersonal interactions may include other-than-human beings, and because they emphasize the need to pay special attention to the consequences of those interactions, they see their environments as marked by webs of relationship. Their worldviews, and their actions within their worlds, are therefore very ecological indeed.

Religion shapes these worldviews and actions. Thus, traditional Native American religions are fundamentally relational. Many scholars suggest the word *religion* derives from the Latin *religare*, meaning “to bind.” Traditional Native Americans are “bound” to the places to which they are indigenous. Their relationships with the beings who inhabit those places form the ties with which they are bound. Their religions, which include cultural narratives, rituals, and social protocols, dictate just how and why these relationships should be initiated, maintained, and renewed.

Living Landscapes and Reciprocity in Traditional Religious Cultures

Again, Native American cultures vary tremendously. Examples appearing later in this entry of specific ecological and religious practices will illustrate this diversity. The views discussed so far, however, are held in common, and they are grounded in the fact that Native Americans across culture groups perceive themselves as parts of living landscapes. Most of these peoples have resided in the same geographic areas for hundreds or even thousands of years. They have watched individual elements of their landscapes change, and they regard those changes as evidence of vitality. So along with humans, animals, and plants, they also include among living things the rivers that cut new courses, the rocks and mountains that wear over time, or the storms that pass overhead. Just as important, most Native Americans equate the

vitality of such things with the potential for personhood. This means they believe most living things also have the ability to interact socially with other beings, including humans. They usually regard this ability, and life itself, as a gift from the most powerful being within their worlds. In many cultures, this being is responsible for creation itself. Sometimes it is thought of in personal terms, as a particular spirit, with a particular personality. Other times, however, it is conceived of in much broader terms, as a force that animates a group of particularly powerful beings, or even as an energy manifest in all living things.

Personhood, for traditional Native Americans, is more than an ontological category (a category of “being” or “beings”). It is also an ethical one. A true person is a being that utilizes its potential to interact with others and, moreover, does so in ways that demonstrate a conscious understanding of how one’s actions affect others. This reflects an ethic of “reciprocity” that is universal across the otherwise diverse indigenous religions. This ethic dictates that one act in positive, generous ways, so that other beings, who can offer their skills and powers to help him or her live a fulfilling life, will reciprocate his or her actions in kind. The concern for reciprocity explains nearly every religious act in traditional Native American religions. Through ceremonies and other rituals, Native Americans engage in formal procedures that honor other beings in order to elicit needed aid or to give thanks for aid received. Importantly, however, successful existence in these densely inhabited environments requires that one pay attention to his or her actions and the possible consequences of those actions all the time and not just during ceremonies.

While the themes of the living landscape, the personhood of other beings, and reciprocity are common to all traditional Native American religious cultures, these themes manifest in each culture differently. Because each culture group resides in a different environment, members of each group live among different populations of other-than-human beings who also reside in those environments. Furthermore, members, past and present, of each group have developed different religious means of establishing, maintaining, and renewing relations with their fellow humans and with the other-than-human beings upon whom they rely for aid.

In all cases, though, traditional Native American religious cultures are constructed around the themes discussed here, and in all cases, the religions have an “ecological” character. The following examples, taken from different culture

groups, of how Native Americans interact with their environments in both subtle and highly ritualized ways demonstrate these points. In each example, for the people or peoples described, their identities as “persons,” their religious practices, and the landscapes they inhabit are clearly and intimately intertwined.

The Blackfeet, Bloodclot, and Buffalos

There is a cycle of narratives told by the Blackfoot peoples of present-day Montana and Alberta, Canada, of a culture hero named Katoyís. These stories, and many other Blackfoot narratives, convey to the members of the four divisions of Blackfeet, who refer to themselves collectively as the Niitsítapiiksi or “Real Persons,” a great deal of knowledge about their native environment. This environment is the massive mountain and plains region east of the Continental Divide, between the North Saskatchewan River in Alberta and the Yellowstone River in Montana.

The Blackfeet, who speak a language belonging to the Algonquian language family, were historically a hunting people. They relied heavily upon buffalos, which they ran off cliffs or “jumps” and then butchered for sustenance (with the arrival of the horse from Europe, they hunted from horseback). The Blackfeet augmented buffalo meat with that of other animals as well as plant foods gathered from the landscape. Their agricultural activities were limited to the growing of tobacco, a practice that is now being revived. The significance of the buffalos to the Blackfeet is evident in the narratives explored here.

According to these narratives, Katoyís (“Blood Clot”) is born from coagulated buffalo blood and grows to become a great champion of those Blackfeet who live as “persons” really should. In the beginning of the narratives, he destroys several individuals who hoard buffalos. One of these individuals was so selfish that he herded any buffalo that survived a local jump into a large cave, to be killed and consumed at his leisure. Later, Katoyís punishes and destroys several families of other greedy beings, who take animal form. In each story, he leaves one animal being alive, so that the species will continue to inhabit the Blackfoot environment.

Native American interactions with animals and other beings should not be romanticized. While they regard these beings as potential persons, traditional Native Americans do not typically communicate with them as easily as they do with humans. The Blackfeet communicate with other-than-human beings through “medicine bundles.” Medicine

bundles contain a variety of plants, animal skins, and so forth, in which other-than-human beings willingly embodied themselves during mythic encounters in the past. In a large bundle known as the “Beaver Bundle” (so named because Beaver was the first of many beings who embodied himself therein), there are embodied buffalos. Inside this bundle, and most others, there are also *iinísskims* or “buffalo rocks.” As tiny persons themselves, these rocks were used to call buffalos to the jumps or to hunting grounds, when the buffalos still roamed freely (*iinísskims* have additional means of aiding humans, which make them relevant today). Thus, there were and still are a variety of ways in which the Blackfeet can access or contact buffalos and other animals as “persons.”

Some Blackfoot narratives explain that the buffalos were created to be eaten by humans. Logically, however, buffalos must be treated with respect, rather than killed indiscriminately or hoarded, as they are in the Katoyís stories. The buffalos were given life by *Iihtsipáitapiiyop’a*, the animating force in the Blackfoot world (thought of in more personal terms as *Nató’si* or “Sun”). As living things, buffalos are potential persons, and they must be treated according to the ethic of reciprocity. The Bloodclot stories remind the Blackfeet of this. So do their interactions with the spirits of buffalos and other animals during the medicine bundle ceremonies.

Another cycle of Blackfoot narratives, about *Náápi* or “Old Man,” also emphasizes that buffalos must be treated respectfully. *Náápi* is initially a representative of Sun, aiding in the creation of the Blackfoot world. Later, though, he becomes a “trickster” and through his selfish actions shows the Blackfeet how not to act. In one story, *Náápi* learns from Fox how to act so comically in front of the buffalos that he makes them die from laughter. He soon kills so many through his foolishness that the buffalos attack him. Implicit in the story is that disrespect and selfishness will bring negative consequences: fewer available buffalos or even buffalos that reciprocate negative treatment in kind.

Plainly, an ecological sensibility governs Blackfoot interactions with the other beings of their environment. This sensibility is conveyed through ancient narratives and reinforced through ceremonies. Of course, the buffalos no longer roam freely, and the Blackfeet no longer run them off buffalo jumps or hunt them from horseback. Still, contemporary Blackfoot traditionalists treat the remaining beings of their environment, and each other, in ways that highlight personhood and emphasize reciprocity. They are reminded

to do so through the medicine bundle ceremonies and the cultural narratives, both of which are still very much a part of their culture.

Direct Engagement with the Environment

There is a persistent image of the stereotypical Indian living perfectly in tune with “nature,” never directly influencing it, let alone influencing it negatively. A close look at the Blackfeet proves this image false. The Blackfeet engaged and continue to engage their environment physically. Consequently, they had and continue to have a direct impact upon it. Moreover, the Katoyís and Náápi stories acknowledge explicitly that this impact can sometimes be negative. Such was the case when the Blackfeet hunted buffalos, and such is the case today, when the Blackfeet raise cattle and horses. In the contemporary world, some Blackfeet try to engage in practices that minimize negative environmental impact. Some others, though, may allow their cattle and horses to overgraze and destroy native grasses, or they may pollute the water by ignoring the runoff of waste from feedlots. All of this, both positive and negative, reaffirms that the nature/culture distinction simply does not hold for Native Americans.

A common concern in the American West during the latter twentieth and early twenty-first centuries is the increase in forest and grassland fires. Experts point out this is partly due to a combination of changing weather patterns and an increase of fuel—dead wood, shrubs, and other types of vegetation. Scientists continue to debate the role humans play in influencing the climate, but it is well known that many of North America’s forests used to be less dense due, in part, to human actions. In one of the most vivid examples of direct engagement with the environment, well into the nineteenth century, many Native Americans, including the Blackfeet, set fire to their forests or grasslands. They did so to drive game animals, to facilitate the growth or destruction of certain plant species, or to clear forests (to create better grazing, easier travel, fewer hiding places for enemies, or to drive away enemies altogether). Understandably, there are some historical accounts of such fires burning out of control with unintended consequences.

Scholars do not completely agree upon how many culture groups engaged in this practice. Nor do they agree upon the environmental impact of the fires that were set. Regardless, those Native Americans who did engage in the practice did so with distinct purposes in mind, fully

informed by the ideas that are emphasized so strongly in their religions. The fact that some culture groups lit fires to influence the plant life or animal habitats of their areas reflects a strong ecological awareness. This fact supports the idea that Native American peoples were, and still are, engaged reciprocally with their environments; just as their environments shape their closely linked identities and religions, they also shape their environments.

The Navajos, Holy Persons, and Corn

This discussion of the intentional use of fire brings us to another people, the Navajos, whose present-day reservation includes parts of Arizona, New Mexico, and Utah. They consider their historical territory to be a mountainous and desert region bordered by four living, sacred peaks. In English, these are Blanca Peak (in Colorado), Mount Taylor (in New Mexico), the San Francisco Peaks (in Arizona), and Hesperus Peak (in Colorado). Navajos speak a language belonging to the Athabascan family.

The Navajos are primarily an agricultural people. Historically, they used fire to clear fields in preparation for planting. They planted melons, squash, beans, and corn. After the arrival of the Spanish to the region, they began to cultivate peaches and wheat, and they raised sheep as well. They would drive the sheep they raised through their crops, trapping destructive grasshoppers in the sheep’s wool.

Like the Blackfeet, the Navajos of the past and present rely upon living medicine bundles to access and honor the beings inhabiting their landscape. This access and honor is very important, as proper, reciprocal relations with others help traditional Navajos, who are the Nihokáá Dine’é or “Earth Surface Persons,” to achieve the important goal of *hózhó*. *Hózhó* is often translated as “beauty,” but ethnolinguist Gary Witherspoon explains that the prefix *ho* connotes the environment. Hence, *hózhó* implies a beautiful or ideal environment. Positive relations with the *Diyin Dine’é* (usually translated as “holy persons”), who created the Navajo landscape and continue to inhabit it, are particularly important to achieving such a positive state of existence.

Complex ceremonies, often drawing upon medicine bundles embodying the living powers of certain, benevolent holy persons, help individuals establish, maintain, or reestablish relations with other beings. Some ceremonies honor the holy persons to avoid negative consequences for individuals that may result from offending those beings. Other ceremonies reestablish relationships with beings who have already

been offended, as a result of a Navajo having violated the ethic of reciprocity.

Traditional Navajos use medicine bundles in farming. Through the bundles, they secure or direct the help and powers of holy persons, who often represent “natural” forces within the Navajo world, to raise crops successfully. Of course, the very crops they hope to raise with the help of other beings are persons too. This is especially clear in the case of corn, which is directly associated with life itself. On the practical level, corn, like other crops, sheep, and game animals, helps give life in the form of sustenance to all Navajos. On another level, ancient narratives tell contemporary Navajos that much of the living landscape, including humans, was created long ago through the powers of a “Magic Corn Bundle” by “First Man” and his adopted holy person daughter, “Changing Woman.” Reinforcing the identification between corn and human life is the belief that the life cycle of corn and the life cycle of humans are parallel. Additionally, Navajo consider actual corn and the human body as comparable. For instance, both have hair.

When we consider how traditional Navajos relate to their environment, we see that their actions are shaped by an ecological perspective. In other words, they are deeply concerned with the relationships between all parts that make up the whole of their world. They carry this concern, in practical ways, to their subsistence activities. They rely upon their own unique characteristics or skills as humans, together with those of woolly sheep and specific benevolent holy persons, to complement each other and maximize the success of their crops. These activities are informed by their religious worldview, which tells them they are bound to the world around them through their relationships with these other beings. These binds are so tight that the very identities of Navajos as “Earth Surface Persons” are inextricably connected with their understandings of corn, from which they were created and upon which they continue to depend. Once again, it is impossible to distinguish the “natural” from the “cultural” in the traditional Navajo world—a world in which Navajo ecology involves reciprocal relationships between human and other-than-human elements within the environment.

Historical Problems and Contemporary Developments

Since the arrival of Europeans and other immigrants to North America, traditional Native American religions and

land-based practices have faced severe challenges. Because these religions and practices are intertwined, anything that affects the religions affects Native American engagement with the physical world, and vice versa. This has not always been understood by non-Native Americans, since most of them adhere to religions such as Christianity, which places faith or belief ahead of religious practice and which places little if any emphasis upon the land.

During the nineteenth and twentieth centuries, representatives of the U.S. government often restricted or forcibly changed Native American religious and land-based practices intentionally, as part of their attempts to “civilize” the American Indians. Sometimes, however, they also did so unintentionally, simply because they did not understand how Native American religions and the physical world are connected and because they did not understand that these religions emphasize practice rather than belief. For instance, governmental representatives banned Native American religious rituals and ceremonies for several decades, beginning in the 1880s. Around the same time, they forced many culture groups to alter their subsistence activities or to give up those activities altogether. Most notably, they required many hunter-gatherer groups, such as the Blackfeet, to turn towards agriculture. Always, the government programs affected the relationships that the Native Americans had with the other-than-human persons of their worlds. Because such relationships are central to Native American religions and land-based practices, the programs had wide-ranging effects upon Native American cultures.

The nineteenth-century U.S. federal policy of “removing” Native American peoples to Indian Territory (now Oklahoma) or restricting them to reservations in the American West probably had the greatest impact upon traditional Native American religions and ecologies. In some cases, whole nations were relocated, far away from the landscapes upon which they had depended for physical and spiritual aid for centuries. In many other cases, peoples were restricted to smaller territories than they had previously inhabited, and they were largely deprived of their abilities to visit or to exercise ecological care for sacred places, where particular other-than-human persons lived. Native Americans have also had to deal with environmental degradation—the degradation of their living landscapes that resulted from the westward expansion of non-Native Americans in the nineteenth century and the many types of major landscape alteration that have taken place since.

Many Americans, politicians and otherwise, still do not completely understand the distinctive land- and practice-based qualities of Native American religious cultures, but they are beginning to appreciate an ecological approach toward the environment—an approach that prioritizes relationships between the constituent parts of the environment and acknowledges human participation in those relationships. Hunting is now regarded as an integral part of game management that needs to be carefully regulated. This lesson was learned most vividly with the near extinction of the buffalos in the late nineteenth century, which resulted from pressures against wild buffalo populations exerted by new, non-Native American sport and skin hunters suddenly combined with those exerted by Native American subsistence hunters. The U.S. Forest Service and other land management agencies are increasingly recognizing the benefits of forest fires and sometimes engaging in controlled burning, as Native Americans did in centuries past. Non-Native American farmers and consumers of agricultural foods are turning toward “organic” means of controlling insects and diseases that affect crops and farm animals, just as the historic Navajo used their sheep to “clean” their crops. At the same time, mainstream Americans are paying more attention to the ways they affect their environments negatively, both directly and indirectly. Debates about the impact of human activities and population growth upon such things as climate, oil supply, and water quality are now commonplace. In many ways, all these developments represent mainstream American concerns for “relationship” and “reciprocity,” concerns that are so central to traditional Native American religions and ecologies.

For those Native North Americans who practice their traditional religions, relationship and reciprocity with what they consider as the living beings and potential persons inhabiting their landscape are paramount. They see their identities, their religious practices, and the environments in which they live as intimately intertwined. Because of this, Native American cultures are fundamentally diverse, varying as widely as their living landscapes. Yet as this entry shows, the views held by traditional Native Americans of the world as a place that must necessarily be engaged physically and spiritually in order to live successfully mean that all traditional Native Americans are bound to their environments. These perspectives render the practical distinction, held by so many non-Native Americans, between the “natural” and “cultural” worlds untenable. Traditional Native American worlds are characterized by constant, interpersonal give and

take between humans and other-than-humans. In such worlds, religion and ecology are one.

Environment and Ecology: Since the Mid-Nineteenth Century

The concepts of environment, evolution, and ecology are playing an increasing role in North American religious life. Ecological science reveals the interdependence of all life, and evolutionary science, by disclosing the descent of all living organisms from common ancestors, establishes the common kinship of all life on earth.

Strictly defined, *ecology* is the branch of biological science that studies the relationships between living organisms in a given environment or ecosystem and between those

organisms and the physical components of those environments. The term was first coined by the German biologist Ernst Haeckel in 1866 and was understood by him in this limited scientific sense. However, *ecology* has also been used more broadly to describe concern for environmental quality. Thus, in the 1960s and 1970s, an ecologist was any person concerned with threats to environmental quality. Beginning with the first Earth Day in 1970, such people began being referred to as *environmentalists*, and the term *ecologist* returned to its more narrow definition as students and scientists in the field of ecology. An ecologist may be an environmentalist and vice versa, but the connection is not a necessary one. Because ideas about ecological science and about the environment globally or locally are necessarily connected, ecology can in common parlance be understood as the science of environments.

The idea of *ecology* (defining the relationship between human beings and nature) predates Haeckel and extends far back into antiquity. The modern ecological view was given expression in 1749 by the Swedish botanist Carl von Linné, more commonly known as Linnaeus, in his essay “The Oeconomy of Nature,” which remained very influential throughout the nineteenth century, influencing biologist Charles Darwin and many American thinkers such as transcendentalists Ralph Waldo Emerson and Henry David Thoreau, as well as national park advocate John Muir.

Darwinian evolution is intimately related to ecology. Indeed, contemporary science views the two concepts as inseparable. Evolution, in its simplest formulation, holds that the genetic composition of a given population of any species as physically embodied in the DNA of the population’s individuals will change over time via the mechanism of natural selection. It is now well known that environments or ecosystems also change over time, and evolution is in part the engine of that environmental change. Thus, contemporary science often speaks of evolutionary ecology. However, within American religious institutions, evolution and ecology are often treated separately. Some religious responses to these branches of science embrace ecological ideas while rejecting or at least minimizing evolutionary models, some can and do embrace both, while some reject both. Religions that reject evolutionary science often justify the rejection by noting that it conflicts with the common religious understanding of humanity as having special God-given superiority and dominion over the rest of creation. Within contemporary scholarship of religious studies, ecology and evolution provide useful analytic tools for identifying some

of the fissures and fault lines within contemporary American religious life and the origins of these various divisions.

God, Humanity, and Nature in the Hebrew and Christian Bibles

To understand the mid-nineteenth to early twenty-first centuries, some reference to the antecedent ideas is necessary for context. Richard Elliott Friedman, in *The Hidden Face of God*, noting that the ancient Israelites produced the first enduring monotheism, says further that the

difference between Israelite monotheism and pagan religion . . . was not a simple matter of arithmetic: one God rather than many. The pagan religion that dominated the ancient world for four millennia was tied to nature. . . . Pagan religion personified [Nature’s] forces, ascribed a will to them, and called them: gods. . . . Having one God who controlled all these forces was another (more appealing?) way to . . . deal with these [natural forces]. (pp. 87–88)

Thus, “Israel’s monotheism, for the first time, conceived of a God who was outside of nature, controlling its deified forces.” This divorce of God from nature had other ramifications. Imagining God as completely transcending the natural order and not immanent within it allowed these Israelite biblical writers to envision humans as occupying a more exalted position in the natural order.

The Hebrew Bible contains two dramatically different creation accounts written approximately four centuries apart. The more ancient version, which refers to the Israelite deity as Yahweh, is found in the second chapter of Genesis, beginning in the second half of verse 4. The later version of the Israelite creation story contained in the first chapter of Genesis, and the first three verses of chapter 2 were most likely composed in the mid-sixth century BCE during Israel’s period of Babylonian exile. In this version, humanity is given this command: “God blessed them, and God said to them ‘Be fruitful and multiply, and fill the earth and subdue it; and have dominion over the fish of the sea and over the birds of the air and over every living thing that moves upon the earth’” (Genesis 1:28, New Revised Standard Version). In addition, this version declared that humanity, alone in all creation, was made in “God’s image” (Genesis 1:26). Another key passage from the Hebrew Bible’s book of Psalms restates this point, declaring that God made humanity “a little lower than God” and was given “dominion” over God’s creation, putting “all things under their feet, all sheep and oxen, and

also the beasts of the field, the birds of the air, and the fish of the sea, whatever passes along the paths of the seas” (Psalms 8:6–8). As Clarence Glacken noted in *Traces on the Rhodian Shore* in regard to Psalm 8 and Psalm 115:16 (“The heavens are the Lord’s heavens, but the earth he has given to human beings”), the “theme that man, sinful though he be, occupies a position on earth comparable to that of God in the universe, as a personal possession, a realm of stewardship, has been one of the key ideas in the religious and philosophical thought of Western civilization regarding [humanity’s] place in nature” (p. 155).

These passages in the Hebrew Bible have been influential in both Judaism and Christianity. In Christianity’s New Testament, this Israelite idea that there is an absolute separation between God and the natural created order was decisively declared by the Apostle Paul in his Epistle to the Romans, stating that God had abandoned pagans because they “worshiped and served the creature rather than the Creator” (Romans 1:25). This is probably the most frequently quoted passage by conservative American Christians when they criticize belief systems that venerate nature. As Glacken also notes, this passage establishes “a theme repeated often in Christian theology: worship the Creator, not the creature. . . . God is transcendent, [and] . . . worship is for the Creator alone” (p. 161). Curiously, another passage also attributed to Paul is at least susceptible to a much different interpretation. In the account of a public sermon by Paul at Athens’s Areopagus, Paul, approvingly quoting an unspecified Greek poet, declared that God “is not far from each one of us. For ‘In him we live and move and have our being’; as even some of your own poets have said” (Acts 17:28). This verse, which imagines a much more immanent, less transcendent God, may be quoting the sixth century BCE Greek poet Epimenides, but it is more likely a passage from the first century BCE Stoic pantheist poet Posidonius. This passage is probably the most quoted passage by liberal Christian theologians who seek to reconcile Christianity to contemporary ecological and evolutionary science. Given the decisive role of the Bible in the history of American culture, it is also frequently cited by non-Christian nature philosophers. These biblical passages continue to be decisive in contemporary Christian and Jewish theological debates over the relationship between God, humans, and nonhuman nature.

Wilderness in American History

Christian and Jewish ideas about the separation of God and nature also influenced early American ideas about

wilderness, which in turn have influenced cultural attitudes toward ecology and the environment. When William Bradford stepped off the *Mayflower*, he perceived a “hideous and desolate wilderness.” In *Wilderness and the American Mind*, Roderick Nash interprets this harsh reaction as having two components. First, the natural environment new colonists encountered was unfamiliar and was a formidable threat to their very survival. Second, in large measure as a result of their Christian ideology, they imagined wild country as a moral vacuum fit only for pagan rites that they were mandated to civilize for the glory of “nation, race, and God” (p. 33). The more the settlers conquered the wilderness by civilizing it, the greater their sense of achievement. Tocqueville, that early observer of the American experience, observed that living in the wilds “produced a bias against them.”

However, this hostility toward nature began to weaken, at least in some sectors, by the late eighteenth and early nineteenth centuries and, indeed, to turn toward veneration. This began in Europe and was present in the writing of Edmund Burke and romantic writers like Rousseau. Also emerging was the related idea of primitivism, which Nash argues was one of the more important ideas to flow out of the romantic thinkers. Primitivism postulates that human happiness and well-being decrease in direct proportion to the degree of development and civilization. These ideas were carried forward in the late twentieth century by writers like Paul Shepard, Daniel Quinn, and Edward Abbey, who, inspired by primitivist philosophy, conclude that the real human fall from grace was the invention of agriculture ten thousand years ago. However, this primitivist idea had at least one early proponent among the American republic’s generation of founders. Benjamin Rush, one of the signers of the Declaration of Independence, declared “man is naturally a wild animal, and . . . taken from the woods, he is never happy . . . ’till he returns to them again” (quoted in Nash, p. 56). Ironically, this enthusiasm for wilderness and for sublime nature was developed among sophisticated urban Europeans surrounded by books and then surfaced among America’s urban, educated elite.

Swedenborg’s Influence on American Ideas about the Physical and the Spiritual

A decisive influence on American ideas regarding ecology and the environment was the eighteenth-century Swedish scientist and religious ecstatic Emmanuel Swedenborg. Largely forgotten now, Swedenborg was one of the most

widely read authors in antebellum nineteenth-century America. He believed God had given him the power, through vision, to travel in spirit to other planes of existence. Swedenborg's ecstatic visions led him to a distinctly immanent understanding of the divine or sacred. According to Sarah Pike in *New Age and Neopagan Religions in America*, this "threatened and angered the church with the argument that God is immanent, not transcendent, and the scientific community with his belief that God exists." To Swedenborg, while God might transcend the cosmos and exist apart from it, God also existed within and interpenetrated the natural order. Because of this, "the natural world was divine . . . [and] God communicated to humans through nature" (p. 49). In so arguing, Swedenborg arguably made the first self-conscious effort to reconcile science and religion.

Catherine Albanese, noting in *Nature Religion in America* that Swedenborg conflated "spirit and matter" by perceiving "influx' of the divine" into mundane reality, observes his strong influence on Emerson and Johnny Appleseed, who enthusiastically spread Swedenborgian literature along with apple trees (pp. 122–123). Swedenborg also influenced Phineas Parkhurst Quimby, an early American spiritualist. Thus, Swedenborg triggered two, largely incompatible, indeed diametrically opposed, streams of religious reaction to ecology and the environment, with Emerson serving as this decisive fork in the road. One stream descends through Emerson, Thoreau, Muir, Leopold, Abbey, and current manifestations of religious naturalism such as deep ecology and naturalistic pantheism that deny the supernatural but ecstatically embrace the physical reality in which humans find themselves. The other stream also descends through Emerson, but then diverges into Quimby, his student Mary Baker Eddy (founder of Christian Science), and on into current manifestations in New Age ideas that radically deny physical reality or any ultimate importance to physical matter. In this stream, only the unseen spirit realm is truly real, with physical matter being mere illusion. Eddy's remark that the seeming reality of physical matter is mere false belief and an error of "mortal mind" illustrates this view. This dichotomy remains potent in contemporary American religious life.

Focusing on Emerson as this decisive fork in the road, he declared in his famous 1836 essay *Nature* that "nature is the symbol of the spirit." Following in the tradition of Plato and Kant, Emerson saw natural objects as important because, if rightly seen, they reflected universal spiritual truths. Thus, nature was important primarily for the lessons it could teach humans. Albanese notes the way that Emerson divided

nature into "nature major" and "nature minor," with nature minor being the physical world knowable through our senses and nature major being what Emerson would later call the "over soul," where the influence of Plato is obvious and ultimately triumphant. Emerson's *Nature* is perhaps the first American manifesto of panentheism (discussed below), though that term was not yet in use in English, conceiving a God who is here in all that is but also up in the sphere of the Platonic forms, the sphere that Emerson thought to be of ultimate importance. This focus on the spiritual was developed into the denial or de-emphasis of the physical in New Age thought and has also long been present in many forms of Christianity that imagine an immortal soul that separates from and survives the death and decay of the physical body.

In contrast, Thoreau, who had been a disciple of Emerson and in his youth displayed a more spiritual emphasis, ultimately turned decisively in the other direction in the last decade of his short life. Though the term was coined four years after Thoreau's death, recent scholarship has demonstrated that Thoreau can be seen as ecology's first American field scientist. The last decade of his journal is primarily taken up with field notes of an ecological nature. He read Darwin's *Origin of the Species* in 1860 and began applying Darwin's evolutionary ideas to his own ecological studies. Nash notes that for Thoreau, Nature became valuable, not as a symbol, but as the primary reality, citing these lesser known passages: "[I]s not Nature, rightly read, that of which she is commonly taken to be the symbol merely?" and "let us not underrate the value of a fact, it will one day flower in a truth" (p. 85), thereby expressly rejecting David Hume's assertion that human values can never be derived from physical facts. Thus, as Albanese notes, Thoreau moved back toward earth and away from Emerson's fascination with the rarified heavens, seeing physical reality, here on earth, as the important (and perhaps only) reality. Albanese argues that John Muir, the late nineteenth- and early twentieth-century conservationist and founder of the Sierra Club, under the influence of both Emerson and Thoreau, then amplified this strong turn toward physical nature, venerating and, at least arguably, deifying it. In so doing, he turned decisively away from his Calvinist upbringing. According to Albanese, Muir's "embrace of nature went beyond Emerson and Thoreau in its sensuousness, in its sheer and unqualified delight in matter." Thus, at the same time that Quimby and Eddy were urging Americans to deny matter, Thoreau and Muir were urging its ecstatic embrace.

The Debate over Christianity's Anthropocentrism

An important development in the discussion of the role of religion in American attitudes toward the environment was the publication in 1967 of Lynn White's still influential essay, "The Historical Roots of Our Ecologic Crisis." There, White opined that much if not most environmental degradation is directly traceable to Western Christianity's radical anthropocentrism. This indictment of Christianity provoked an explosion of theological and philosophical reflection over the past four decades, and this debate continues. Many see White as essentially right. Two examples illustrate. A Baptist church in Idaho prints and distributes this wordy bumper sticker: "Forget 'Save the Earth'; What about your soul? The earth is going to burn, What about you?" Then there is Calvin Beisner, a conservative Presbyterian theologian and global warming denier, who when interviewed by Bill Moyers in 2006 said that even if he is wrong about global warming, the error is of little consequence because the important issue is whether one will live in heaven or hell for eternity. The fate of this planet simply is not important. Consistent with White's thesis, it is hard to have much concern about this planet's fate if one is convinced God will soon destroy this planet and make humans a new one, as many conservative American Christians believe, or will soon take humanity to a spiritual heaven far from this present planetary human home.

Other theorists have argued that, contrary to White's thesis, Christian and Jewish scriptures can be and, indeed, are most accurately construed as having strong proenvironment themes and moral mandates for ecosystem protection. They note that in the Genesis account of creation, the created order is declared by God to be "very good" and that human dominion cannot be construed as a license to destroy God's creation. Instead, God's ultimate ownership of all creation is emphasized, and because humans are ultimately accountable to God, we are to exercise wise and judicious stewardship of his property. This so-called "stewardship model" is the most common ecotheology among Christians, from conservative to liberal branches. Stewardship Christians tend to embrace ecological science, looking to it for instruction on how proper stewardship can be exercised while still meeting legitimate human needs. However, other Christian theorists note that the stewardship model conflicts with evolutionary science, because this model assumes that the rest of nonhuman creation needs humanity as God's appointed stewards. If humanity is a very late arrival in evolutionary history, from 100,000 to 1 million years ago, depending on how

"human" is defined, these theorists ask how a creation that managed without humans for most of its 3.5-billion-year history can be said to require God-appointed humans as its stewards. These theorists instead tend to prefer a model that sees the presence of the divine in the creation itself and in its natural laws and processes.

Process Theology and Creation Spirituality

Two types of contemporary Christian thinking about divine immanence and the environment are process theology (derived from the process philosophy of Alfred North Whitehead) and creation spirituality. Whitehead conceived of all reality as a dynamic, ever-changing, emerging process, all of which in some sense contains consciousness and is imbued throughout with the sacred, divine, or God and is not static, inert, or unconscious. Thus, for Whitehead, "God is both a creature of the world, and the world's creator" (see Gregersen, "Whitehead," p. 1737). Thus, some Christian thinkers saw in Whitehead a way of imagining God that was consistent with ecological, evolutionary science and with the Apostle Paul's sermon to the Athenians (see discussion above). *Creation spirituality* is an alternative label for this way of thinking, thought to be more evocative and less dry than *process theology*, and has been popularized by two thinkers in this vein, Matthew Fox and Thomas Berry.

These new theologies are often regarded as heretical or at least suspect by conservative Christians as being against Paul's prohibition of pantheistic understandings of the divine contained in Romans. To refute this critique, proponents of these immanent theologies often rely on the relatively new metaphysical label popularized in America by Charles Hartshorne in the 1950s of *panentheism*, which they carefully distinguish from the related but traditionally heretical concept of pantheism. The Oxford English Dictionary defines *pantheism* as "a belief or philosophical theory that God is immanent in or identical with the universe," while defining *panentheism* as the "theory or belief that God encompasses and interpenetrates the universe but at the same time is greater than and independent of it." Conservative branches of Christianity still hold to a completely dualistic understanding of God and maintain that the divine realm is entirely separate from the mundane universe in which humanity resides, even if God is aware of events in the physical realm and may miraculously intervene on occasion. In mainline to liberal streams of Christianity, pantheistic interpretations of divinity are frequently advanced, often citing Paul's sermon to the Athenians. These branches of Christianity usually embrace ecological science as

demonstrating the interdependence of things and frequently draw on ecology as an exhortation to return humanity to an Arcadian garden of harmony with nature.

These theorists usually also claim to accept evolutionary science. However, as Lisa Sideris has noted, liberal Christian theorists often de-emphasize the aspects of evolution that suggest that natural selection operates in a manner that is blind, random and purposeless. Almost all branches of Christianity still affirm belief in some form of conscious, supernatural deity that controls or at least influences events within earthly existence, including the manner in which evolution occurs, even if this deity interpenetrates the whole cosmos. However, there are small movements within Christianity that understand the processes of evolution and their physical manifestations as the primary divine reality and accept its random nature. Such Christians, in fully embracing evolutionary science and the model of nature provided by it, often reject all elements of supernaturalism and reject or are at least agnostic about claims of an afterlife. Individuals in such movements still see themselves as Christian in that they still believe in God—even though their God is mere physical reality and its attendant natural laws; they still revere Jesus as an important teacher of ethics while rejecting the idea that his execution had any particular cosmic significance; and they still appreciate the Christian Bible as their common inspirational text while rejecting it as in any sense inspired by some external deity. Fully accepting reality as revealed by contemporary science is central to these Christians and, thus, is a Christian manifestation of the new movement of religious naturalism discussed next.

Religious Naturalism

Religious naturalism is another new movement that consciously embraces naturalistic assumptions about the cosmos as revealed by ecological, evolutionary, and all other branches of science yet still insists on using the term *religious*. The Institute on Religion in an Age of Science in 2003 developed a statement of religious naturalism that declared in part that

Our religious quest is informed and guided by the deepening and evolving understandings fostered by scientific inquiry. . . . We may describe our religious sensibilities using various words that have various connotations—like the sacred, or the source, or god—but it is our common naturalistic orientation that generates our shared sense of place, gratitude, and joy.

These religious naturalists self-consciously describe their project as constructing systems of human meaning based on what is scientifically revealed about the cosmos.

Religious naturalism appears in unexpected ways. For instance, two well-known, vigorous advocates of atheism, Daniel Dennett and Sam Harris, nevertheless use traditional religious language to promote their brands of atheism. Dennett declares that the world is sacred; and Harris says in *The End of Faith* that “there is clearly a sacred dimension to our existence and coming to terms with it could well be the highest purpose of human life” (p. 16). Even Richard Dawkins, another zealous advocate of atheism, makes clear in chapter 1 of his book *The God Delusion* that he is not attacking “the pantheistic reverence [for the cosmos] which many of us share with its most distinguished exponent, Albert Einstein,” or what he elsewhere calls the “metaphorical or pantheistic God of the physicists,” and is only calling ideas about supernatural gods delusional, thereby leaving the constructed meanings of the religious naturalists outside his intended zone of attack.

Judaism, Islam, and the Environment

The theological range of developments within American Judaism and Islam concerning the environment shares much in common with and closely parallels the range of developments within Christianity. This is perhaps to be expected, given that all three of these Abrahamic traditions draw heavily on the creation narratives in Genesis for their respective understandings of God, nature, and humanity. As with Christianity, more conservative branches of Judaism and Islam usually will take the Genesis accounts more literally (with a corresponding rejection of evolutionary models of cosmic origins), while more liberal branches emphasize divine immanence, developing their own uniquely Jewish and Islamic strains of process theology and creation spirituality. Kabbalistic Judaism, a mystical branch of Judaism, and Jewish Renewal are especially inclined to emphasize the immanent aspect of the divine, while still also affirming a transcendent dimension to the divine, thereby describing, usually not by name, what in essence is a panentheistic metaphysics. These branches are often involved in efforts to promote environmental protection. In a like manner Sufism, the mystical branch of Islam, affirms the indwelling of the divine in physical reality and argues for environmental responsibility based on this. However, the stewardship model is also present in conservative branches of Judaism and Islam that emphasize divine transcendence and has led to declarations of a duty of environmental protection for God’s creation.

The Environment in Contemporary African American Spirituality

Ecological science has not yet significantly impacted religious expressions within African American communities. As Kimberly Smith said in “Black Agrarianism and the Foundation of Black Environmental Thought,” you will not “discover a black Thoreau” when looking at the ways that African Americans discuss “the relationship between humans, nature and the American landscape” (p. 268). African Americans are predominantly drawn to the more conservative Christian denominations that in general interpret the Bible literally and therefore often reject the evolutionary models of science. However, African American concern for the environment does receive considerable expression within the movement for environmental justice. The environmental justice movement focuses on patterns of racial discrimination whereby polluting industries target poor minority communities as locations for especially pollutive plants or for toxic waste disposal, knowing that these communities are often politically weak and lack the means to mount effective opposition. In the past two decades, this has often led to new alliances between these poor, often African American communities and environmental groups such as the Sierra Club and progressive faith communities that unite to provide increasingly effective resistance to this business strategy. The example of the biblical prophets such as Isaiah, Jeremiah, and Amos and their outspoken condemnation of the oppression of the weak by the politically powerful is often called upon in these political battles.

Recognizing the social science literature that has demonstrated that appreciation of nature for its own sake may be dependent on positive early childhood contact with nature, organizations like the Sierra Club sponsor nature outings for inner-city youth in poor, disadvantaged minority communities. These efforts are already producing small but growing wilderness preservation movements among African American and Hispanic churches in large urban centers. How significant this movement will become remains to be seen.

The Contemporary Religious Debate over the Environment Continues

As global warming and climate change take on increasing importance in public policy debates, a fissure has become increasingly apparent within conservative evangelical Christianity. Some high-profile evangelicals like Rick Warren, Pat Robertson, and Richard Cizik criticized the

George W. Bush administration for what they asserted were lackluster and inadequate responses to climate change, while other prominent evangelical Christian leaders like James Dobson continue to deny the existence of human-generated climate change and to allege that such environmental issues draw attention away from more urgent traditional evangelical concerns like opposition to abortion and gay marriage. Both sides cite the Christian Bible for support. Secular environmental groups increasingly partner with religious groups, and numerous new expressly religious environmental or Creation Care groups have emerged within the past ten to fifteen years.

Survey data demonstrate that the more conservative a religious person is (usually with a correspondingly literal interpretation of sacred texts), the less likely he or she is to be worried about issues of environmental quality, habitat destruction, and species extinction. In contrast, secular and religiously progressive Americans are more likely to voice concern about these issues. In sum, no consensus has yet emerged within American society over environmental issues. However, growth rates of conservative religious groups are decreasing, and growth rates in the purely secular segments of society, though beginning from a relatively small part of American society, are rapidly increasing. It is therefore possible that concern for environmental issues may increase over the future decades. This seems particularly likely if the current scientific predictions for climate-related environmental stress over the coming decades prove accurate and environmental issues take on a greater sense of urgency.

Episcopalians: Early Republic

The Protestant Episcopal Church in the United States of America (also known since 1967 as The Episcopal Church) is the denomination formed by the members of the Church of England in the United States following the American Revolution (1775–1783). At that time members dropped the unpopular name "Church of England" and elected to use the name "Episcopal," a term used a century before during the English Civil War by those who favored church government by bishops (Greek, *episkopoi*) rather than congregational or presbyterian forms of church order. The Episcopal Church is the third (following the Church of England and the Episcopal Church of Scotland) independent member of a family of churches that since the middle of the nineteenth century has been known as the Anglican Communion. Churches in the communion acknowledge kinship to the archbishop of Canterbury, use a fixed form of worship (the Book of Common Prayer), and preserve the three traditional orders of ministry (bishop, priest or presbyter, and deacon). Although relatively small in numbers, Episcopalians were active in American life between the Revolution and

the Civil War, which began in 1861, in a number of ways. Seven of the first fifteen presidents (Washington, Madison, Monroe, W. H. Harrison, Tyler, Taylor, and Pierce) were Episcopalians, and an eighth (Jefferson) was raised in the Anglican/Episcopal Church.

By the end of 1789 the members of the Protestant Episcopal Church in the United States of America had completed the first stages of postrevolutionary reorganization. In 1784 Episcopalians in Connecticut had secured consecration of a bishop (Samuel Seabury, 1729–1796) by the non-juring bishops of the Episcopal Church of Scotland. (The nonjuring bishops were still loyal to James II of England and his son and were unwilling to swear allegiance to those on the English throne after James's overthrow in the "Glorious Revolution" of 1688.) Episcopalians in Pennsylvania and New York had succeeded in having two candidates for the episcopate (William White of Pennsylvania, 1748–1836, and Samuel Provoost of New York, 1742–1815) consecrated by English bishops in 1787. Episcopalians in the middle states and the South had created a national governing body, the General Convention, in 1785. Four years later representatives from Connecticut and Massachusetts joined those from Delaware, Maryland, New Jersey, New York, Pennsylvania, North Carolina, South Carolina, and Virginia in an expanded General Convention, which agreed upon a revised constitution and a set of canons (church laws), and approved a revised form of the Book of Common Prayer.

The national Constitutions and Canons and those adopted in individual states made the church significantly more democratic than its English counterpart. Bishops were to be elected by state conventions of clergy and laypersons; parish rectors were to be selected by parish vestries; and the vestries themselves, which had become self-perpetuating bodies in colonial America, were to be elected by parishioners. The American edition of the Book of Common Prayer included a new preface justifying the need for liturgical changes and replaced prayers for the British royal family with prayers for the president of the United States. A significant long-term leader of the church, Bishop White of Pennsylvania, had also emerged. He served as the denomination's presiding bishop in 1789 and would do so again from 1795 until his death in 1836.

A Weakened Church

Much, however, was still to be done. The church had yet to decide upon the status of the Articles of Religion, the

William White of Pennsylvania, a candidate for the episcopate, consecrated by English bishops in 1787.

statement of faith to which clergy of the Church of England were required to subscribe. Three major colleges that once had Anglican ties or leanings—William and Mary in Williamsburg, Virginia, King’s College (later Columbia) in New York City, and the College of Philadelphia (University of Pennsylvania)—had cut those ties at the Revolution. One important new institution (Washington College, in Maryland, chartered in 1782) was founded, but overall the church’s educational resources were much weakened at the end of the war.

Dioceses (the statewide units that elected representatives to the national General Convention) were themselves on weak footing. They were composed of parishes that lacked firm funding. The dioceses generally had no budgets of their own. The role of bishop was a part-time job for a clergyman in a prominent parish or university position. In some cases, as in Virginia and South Carolina, diocesan councils adopted resolutions limiting the authority of bishops.

The church also suffered from significant financial problems. The Revolution had brought an end to the primary means of financial support for the colonial church. State support had been a source of funding in Maryland, Virginia, the Carolinas, and Georgia, where the church had been established by law; additional funds came from three English

missionary societies: the Society for the Promoting of Christian Knowledge, the Society for the Propagation of the Gospel, and Dr. Bray’s Associates (which was dedicated to education and evangelization of African Americans). The missionary societies had not only supported a major percentage of parish clergy outside Virginia, but they also supported ministry to Native Americans (particularly in western New York) and schools for African Americans. (The strongest strictures against the education of African Americans would not begin until the nineteenth century.) The church in Virginia faced another problem when the legislature decided in 1799 and again in 1802 that county welfare authorities could sell the assets of vacant Anglican parishes. Parishes adopted a system of pew rents to supply the lost revenue, but time was needed to build a new financial base.

In the years after the Revolution, clergy, whose numbers had already been depleted by the departure of British Loyalists and by the long hiatus (1776–1784) in which ordination was no longer possible in England but not yet possible in the United States, scrambled to supplement their income. Some were involved in teaching or in serving educational institutions in administrative ways. Among the best known of these enterprising clergy was Mason Locke Weems (c.1759–1825), a clergyman turned author and bookseller. “Parson” Weems’s moral tales, including that of George Washington and the cherry tree, became standard elements in American primary education.

Ministry to Native Americans and African Americans

Not surprisingly, it was mission to the most disadvantaged that suffered most as a result of the loss of state and English financial support. Ministry to Native Americans in western New York, for example, ended for a generation, and many Native Americans with ties to the Anglican Church moved to Canada. It would not be until after the War of 1812 that the Episcopal Church revived its efforts among Native Americans.

The African American schools funded by Dr. Bray’s Associates (in Virginia, Pennsylvania, New York, and Rhode Island) disappeared, but some memory of Anglican outreach to African Americans remained, and significant initiatives by African Americans in Philadelphia and New York led to the creation of the first two free-standing African American Episcopal congregations. In Philadelphia, Absalom Jones (1746–1818) led a group of former members of St. George’s Methodist Episcopal Church to form the African Episcopal

Church of St. Thomas (1792). Jones, a friend of African Methodist Episcopal Church (AME) founder Richard Allen (1760–1831), was ordained a deacon in 1795 and priest in 1802, becoming the first African American ordained in a hierarchical church. In New York, Peter Williams Jr. served as rector of St. Philip's Church (1818).

In the following decade, African Americans created congregations in Baltimore (St. James', 1824), New Haven (St. Luke's, 1844), and Detroit (St. Matthew's, 1851). These early African American congregations were generally denied the representation in diocesan conventions that was accorded to congregations of European descent, on the grounds that black clergy had lower levels of education than that expected of European Americans.

Generally, African Americans who were enslaved did not have their own churches or clergy. In some cases they attended church with their masters or sat in separate slave galleries. In the two decades before the Civil War, however, patterns would change and separate slave chapels would become common in the South.

Gains and Losses

The first generation of Episcopal Church leaders was able to chip away at some of the remaining problems in the last decade of the eighteenth century and the first decade of the nineteenth. The General Convention finally agreed on a revised form of the Articles of Religion, in 1801, and a list of theological texts, in 1804, that included Gilbert Burnet's *Exposition of the Thirty-nine Articles* (1699). Burnet (1643–1715), a bishop who had argued for acceptance of greater theological diversity in the Church of England following the Glorious Revolution, suggested in his commentary that Anglicans were permitted to hold either a Calvinist or an Arminian position on predestination. The Calvinists (a label commonly used for those supportive of the judgments of the Synod of Dort, 1618–1619, and the Westminster Assembly of Divines, in the 1640s) argued that salvation rested on God's choice alone and not on any human effort. Arminians argued that salvation was in part dependent on human cooperation with the grace offered by God. Burnet's acceptance of either position quieted the concern of some New England Episcopalians about the character of the Articles of Religion. (For much of the eighteenth century apologists for the Anglican Church in New England had criticized the Congregational Church's stance on predestination. Congregational critics had responded by pointing to the seventeenth of the Thirty-nine Articles,

which to interpreters less agile than Burnet seemed to require the same view of predestination found in Congregational statements of faith.)

A second problem that took years to resolve concerned the status of church lands. A Supreme Court decision in 1815, which dealt with church property in Virginia territory that had been ceded to the District of Columbia, found the Commonwealth of Virginia's attempts to take over church land unconstitutional. The decision did not apply directly to the remainder of the territory in the Diocese of Virginia, but it had the effect of halting further seizure of church property in Virginia.

Nevertheless, the Episcopal Church's efforts prior to 1810 were, at best, a rear-guard action to limit the degree of loss. Those in the first generation of leaders of the church were exhausted, and most had either died or retired. By 1805 White was the only one of the first four bishops still active as a leader. Seabury of Connecticut had died, and Provoost of New York had retired. Bishop James Madison (1749–1812) of Virginia was still alive and leading the College of William and Mary, but he devoted little attention to the church, and there are no extant copies of journals from the Diocese of Virginia between 1805 and Madison's death in 1812. (Madison, a cousin of the president of the same name, in 1790 had been the last of the American clergy of the revolutionary period to receive consecration to the episcopate in England.)

In some cases the church's diocesan structure effectively disappeared. When Bishop-elect Charles Pettigrew (1744–1807) of North Carolina (elected in 1794 but never able to reach the triennial General Convention for consent and consecration) died in 1807, North Carolina ceased to function as a diocese. South Carolina sent no delegation to the General Convention between 1785 and 1814. On a parish level, there was little significant new growth, no concerted missionary effort to the western territories, and continuing losses in the number of parishes until 1810.

New Growth

In the second decade of the nineteenth century the church began a period of slow growth. Church statistics are incomplete for the period, but the number of clergy reported in the *Journal of the General Convention* of 1820 (314) would be roughly 75 percent greater than that reported in 1811 (178). The number of communicants (those who were baptized and confirmed and received Communion) tripled from 1830 to 1850. Even so, Episcopal communicants

accounted for less than 50 percent of the U. S. population in 1850.

Historians have disagreed as to why the church halted its decline in the second decade of the century. George Hodges (1856–1919), an apologist for the Episcopal Church, attributed the change to the uniform support that Episcopalians gave to the American side in the War of 1812. Many Anglicans had been Loyalists in the Revolution. In contrast, Hodges could point to support for the War of 1812 by Episcopal laity and clergy. Episcopal layman Francis Scott Key (1779–1843), author of the national anthem, was an example of this new patriotism. Presidents Madison (in office during the War of 1812) and Monroe (secretary of state during the war and Madison's successor as president) were also Episcopalians.

Instead of political explanations for new growth, mid-twentieth-century authors, such as William Wilson Manross (1905–1987), looked to a pair of new leaders: Bishop John Henry Hobart (1775–1830) of New York and Alexander Viets Griswold (1766–1843) of the Eastern Diocese (Rhode Island and other portions of New England that lacked bishops), both consecrated in 1811. Late-twentieth-century authors have looked in yet other directions. Historian Richard Rankin argued, in *Ambivalent Churchmen and Evangelical Churchwomen* (1993), that the growth of the Episcopal Church in North Carolina in the antebellum years was an indirect result of Methodist revivalism. Men, Rankin argued, become active in the Episcopal Church to keep their spouses away from Methodism.

In all probability it was a combination of these causes—a public image of being American rather than English, the appearance of a new, younger generation of leaders, a participation in (and reaction against) the revivalism of the Second Great Awakening, and the efforts of dedicated laywomen—that led to the improved fortunes of the church. The Diocese of New York clearly led, with both the vision of Bishop Hobart and the financial resources of Trinity Church, Wall Street, of which he was rector. Trinity Church wisely leased and rented—rather than sold—its land in the heart of New York City's financial district. It amassed financial resources that it devoted not only to parish initiatives but also to the diocese and the national church. Hobart presided over a sustained growth in his diocese, with clergy and congregations in the western part of the state increasing by an approximate average of 30 percent a year from 1812 to 1826.

Among Hobart's efforts was the revival of ministry among Native Americans, dormant since the time of the Revolution. Hobart supported the ministry of Eleazar

Williams (1788–1858) to the Oneida in western New York. In 1822 the Oneida moved to Wisconsin under pressure from the U.S. government. Williams, who may have had Mohawk ancestry but claimed to be of French royal descent, moved with them. Once in Wisconsin, Episcopal missionaries expanded their ministry to include the Ojibwa. Further Indian removals during the Civil War spread the Episcopal Church's ministry to South Dakota.

Hobart also led the formation of an effective high church party. He taught a high doctrine of the episcopacy—that the ministry of bishops was an essential element of the Christian faith. For Hobart, the apostolic tradition provided certainty and stability in a changing and uncertain age. He discouraged clergy participation in the American political system and rejected cooperation with churches that lacked episcopacy. He declined to offer employment to Episcopal clergy who were members of such evangelical ecumenical organizations as the American Bible Society or the American Sunday School Union. His attitudes toward the conduct of worship were not distinctly different from those of other Episcopalians, but he was more ready than many of his coreligionists to stress differences between Episcopal and Reformed doctrine that lay behind parts of the service. He criticized the Reformed doctrine of immediate rewards and punishments on death, for example, noting that the Episcopal burial service spoke of a resurrection that would be delayed until Christ's return.

One indirect result of Hobart's policies in New York was the creation of an opposing evangelical Episcopal party in the Washington, D.C., area. Natives of Maryland, Virginia, and the District of Columbia joined with clergy from New England and New York who disagreed with Hobart's attitudes on ecumenism and politics or were denied the possibility of employment there. By the end of the second decade of the nineteenth century, the "District clergy" led a lively evangelical party that stressed cooperation with other Protestants and the importance of adult conversion. William Holland Wilmer (1782–1827) and other leaders of this evangelical party had no scruples about involvement in the political order and often had personal ties to the political leaders in the new Republic. Evangelical clergyman and later bishop Charles Pettit McIlvaine (1799–1873) was, for example, the son of a U.S. senator, and clergyman James Milnor (1773–1845) was himself a member of Congress before his ordination. Historian Allan Guelzo has argued that from 1830 until the Civil War, evangelical Episcopalians were most often aligned with the National Republican

Party or the Whig Party. Three Whig Episcopalians served as presidents in the 1840s—William Henry Harrison, John Tyler, and Zachary Taylor—and Whig congressional leader Henry Clay of Kentucky became an Episcopalian in 1847.

The number of states represented at the General Convention began gradually to climb in the second decade of the nineteenth century. New Hampshire sent its first deputation in 1811. South Carolina began to send a deputation again in 1814. The first North Carolina deputation appeared in 1817. The first deputation from west of the Appalachian Mountains—Ohio—appeared in 1823. It was soon followed by Mississippi (1826), Kentucky (1829), and Alabama, Tennessee, and Michigan (1832).

In 1820 deputies to the General Convention from Pennsylvania, which had its own diocesan missionary organization, persuaded the convention to create the Domestic and Foreign Missionary Society. The General Convention tinkered with the constitution of the organization for fifteen years before arriving at a successful combination in 1835: a revised canon indicating universal membership for members in the Episcopal Church and a new canon allowing the board of directors of the Missionary Society to suggest new missionary districts for which the General Convention would elect missionary bishops. Before 1835 laity and clergy who had migrated west formed parishes and elected and funded their own candidates for bishops without denominational support. Individuals and organizations in New York became the largest contributors to the new national organization, which supported a succession of missionary bishops for the West, most of whom were sympathetic to the high church ideas common in New York. Evangelical candidates were, however, often elected to serve in overseas missions such as Liberia, China, and Japan.

Women and Men in Mission

From early on, missionary teams sent by the Domestic and Foreign Missionary Society included both men and women. The Episcopal Church's first overseas mission team went to the newly independent nation of Greece (which had fought a war of independence from the Ottoman Empire, 1821–1832). By 1835 the team headed by John H. Hill included Frances Maria Mulligan Hill (Hill's spouse), Elizabeth and Frederica Mulligan (Frances Hill's sisters), Julia A. Henshaw Robertson (spouse of mission team member J. J. Robertson and sister of Episcopal bishop John P. K. Henshaw), and Mary Briscoe Baldwin (first cousin of educator Mary Julia Baldwin after whom a college in Staunton, Virginia, is named).

The efforts of the national missionary society were undergirded by a series of local and diocesan societies and support groups. As historian Pamela Darling has noted (in *New Wine*, 1994, p. 15), so many of the local or diocesan auxiliaries supporting the society were women's groups that "the term 'auxiliary' gradually became almost synonymous with women's organizations."

Some women, such as the unnamed Philadelphia resident who wrote to Presiding Bishop White in 1811 requesting ordination to the priesthood, sought leadership on equal grounds with men, but their successes in these efforts were limited. More often women supported ministries for which they did not receive full public recognition. Even the name of this early advocate of women's priesthood has been lost; Bishop's White's nineteenth-century biographer removed it from the correspondence to her that he reprinted in a life-and-letters volume.

Women worked as church school teachers, organized the social events that raised a significant percentage of church funding by the mid-nineteenth century, and after 1845 served in church sisterhoods. The first such sister, Anne Ayres (1816–1896) of New York, was admitted as a sister in 1845. It was not clear at the time whether she distinguished between the orders of nuns that were growing rapidly in the Roman Catholic Church and the order of deaconesses that had been revived in the Lutheran Church in Germany in 1836. In the second half of century, it would be clear that Episcopal women were following both of these patterns.

New Educational Institutions

By the 1820s Episcopalians were able to found a new round of colleges—the institutions now known as Hobart and William Smith Colleges, Geneva, New York (1822); Trinity College, Hartford, Connecticut (1823); and Kenyon College, Gambier, Ohio (1824)—as well as the denomination's first theological seminaries—General Theological Seminary in New York (1822); Protestant Episcopal Theological Seminary in Virginia (1823); and Bexley Hall (the theology department of Kenyon College, which was founded in 1824). Two decades later Episcopalians founded a school for women, St. Mary's College, in Raleigh, North Carolina (1842).

The seminaries proved a more efficient means of preparing candidates for the ministry than had the earlier pattern of candidates preparing for ordination with individual clergy. The new institutions may, however, have also added to the theological tensions in the denomination. The General Theological Seminary in New York became a center of

theological controversy about the ideas of the Oxford Movement and the Cambridge Camden Society. The Oxford Movement began at Oriel College, Oxford, England, in 1833. The Oxford divines, or “Tractarians,” as they were known for the series of pamphlets (Tracts for the Times) that they published, criticized the state control of the Anglican Church in England and Ireland, rejected adult conversion experiences as illusory, looked to the early and medieval church for models of church life, and called for a stronger leadership by bishops. The Cambridge Camden Society (founded at the University of Cambridge in 1839) advocated a revival of Gothic architecture and a more elaborate ritual than what was then generally practiced.

Early supporters at General Theological Seminary and elsewhere in the United States were criticized as crypto-Roman Catholics. The House of Bishops sent a team of visitors to examine the attitudes of the General Theological Seminary faculty. Evangelical scholars, such as Bishop McIlvaine of Ohio, wrote books denouncing the new ideas, and individual bishops disciplined clergy and seminarians suspected of holding improper ideas. Some of the early American advocates of the adoption of Oxford theological ideas and Cambridge ritual ideas followed the example of English Tractarian John Henry Newman (1801–1890) and entered the Roman Catholic Church. Among those who did so were at least twenty-nine Episcopal clergy, including Bishop Levi Silliman Ives (1797–1867) of North Carolina, the son-in-law of Bishop Hobart. Later in the century, however, it would be the supporters of Oxford theology and Cambridge ritual who would remain in the church, while some of their evangelical coreligionists would leave to form the Reformed Episcopal Church (1873).

The Anglican Communion

Episcopalians in the years after the American Revolution had emphasized their separation from England. By the middle of the nineteenth century, however, they began to reclaim and expand on some of the ties to the Church of England that they still maintained. They used a form of the same liturgy and traced the episcopal succession of their bishops to English and Scottish Anglicans.

What is known today as the Anglican Communion—the worldwide family of churches that descend from the Church of England—lacked any institutional expression prior to the Civil War. Episcopalians in the United States played a leading role in the creation of such structures. The General Convention of 1838 initiated correspondence with

the primates of England, Ireland, and Scotland. In the 1840s Episcopalians began to include references to the Anglican Communion in church publications, such as the *Episcopal Church Annual*. In 1851 Bishop John Henry Hopkins (1792–1868) of Vermont wrote a public letter to the archbishop of Canterbury suggesting a meeting of Anglican bishops from throughout the world. Bishop William R. Whittingham (1805–1879) of Maryland and Bishop Francis Fulford (1803–1868) of Montreal soon supported the idea, but it would not be until 1867 that such a gathering (the Lambeth Conference) finally took place.

Attitudes About Slavery

The Episcopal Church’s experience with slavery in the 1840s and 1850s was in many ways the mirror opposite of that of the Baptist and Methodist Churches. The latter churches divided prior to the Civil War because they disagreed strongly about slavery. In the Episcopal Church, in contrast, it was the onset of war that brought divisions over slavery to the surface.

A curious balance of attitudes and church parties kept Episcopalians silent about the morality of slavery prior to the outbreak of war. A significant percentage of Episcopal clergy and laity in the South were slave owners, and some Episcopalians in the North, such as the DeWolf family of Rhode Island, benefited significantly from the slave trade. Many members of the high church party, moreover, honored Bishop Hobart’s legacy by refraining from involvement in political issues. Evangelical Episcopalians did favor involvement in the political arena, but most of those in the South either supported the institution of slavery as biblical (the position taken by Bishop Leonidas K. Polk, 1806–1864, of Louisiana, who owned three hundred slaves) or favored gradual methods of abolition, such as encouraging voluntary emancipation by individual owners and immigration of black people to Liberia (a position taken by Bishop William Meade, 1789–1862, of Virginia).

There were three important exceptions to this noninvolvement in the abolition movement. African American clergy, such as Peter Williams Jr. (1780?–1840) of New York, spoke out against slavery. They were, however, marginalized in the church (often unrepresented, for example, in the diocesan convention) and therefore limited in their opportunity to convince others to share their antislavery views. Some Northern evangelical laypersons (such as William Jay, 1789–1858, of New York and Salmon P. Chase, 1808–1873, of Ohio) and clergy (such as Bishop McIlvaine of Ohio,

Dudley Tyng, 1825–1858, of Philadelphia. E. M. P. Wells, 1790–1875, of Boston) spoke out against slavery, particularly after 1850. Some Southern women, such as Anne Meade Page (1781–1838, the sister of Bishop Meade), Mary Berkeley Minor Blackford (1802–1896), and Margaret Mercer (1792–1846) of Virginia, and Angelina (1805–1879) and Sarah (1792–1873) Grimké of South Carolina (who left the South and the Episcopal Church) were also vocal about their opposition to slavery.

The onset of the Civil War freed Northern evangelical Episcopalians to take a more active role against slavery. Salmon Chase, President Abraham Lincoln's secretary of the Treasury, and Bishop McIlvaine lobbied for Lincoln's Emancipation Proclamation, which would free the slaves, and McIlvaine traveled to England in an attempt to convince the English not to support the Confederacy. The Reverend Stephen Tyng (1800–1885), who had been less supportive of abolitionism than was his son Dudley, joined the American Tract Society of Boston, which was abolitionist in sentiment, and addressed its May 1860 meeting.

Division and Reunion

Episcopalians in the South organized a separate General Council following the secession of the Southern states. The council made minor political changes in the Book of Common Prayer and in the Constitutions and Canons. The Northern states, which remained in the General Convention, adopted a resolution and pastoral letter critical of the South, but with the war's end the bishops of North Carolina (Thomas Atkinson, 1807–1881) and of Arkansas (Henry Lay, 1823–1885) were admitted to the General Convention of 1865. The fact that the church's presiding bishop, Bishop Hopkins of Vermont, had written a defense of the scriptural nature of slavery during the war, and that the two returning Southern bishops had little enthusiasm about secession before the war undoubtedly contributed to the ease of reunion. Seeing the favorable reception of their colleagues, other Southern bishops agreed within months to disband the separate General Council and rejoin the General Convention. One remainder of the Southern experience during the Civil War survived; some Southern dioceses retained the name of "council" for their annual diocesan gatherings, rather than returning to the name of "convention" that was more generally used in the Episcopal Church.

Episcopalians: The Gilded Age and the Progressive Era

The Episcopal Church underwent considerable growth and major changes in the years between the end of the Civil War, in 1865, and the late 1920s, enhancing its reputation as the church of the urban elite, while simultaneously providing leadership in the Social Gospel movement to apply Christian principles to the reform of the American social and economic order.

During the Gilded Age, a term coined by Charles Dudley Warner and Mark Twain (and the title of their novel of 1873), in the decades that followed the Civil War, vast new fortunes were accumulated by "captains of industry" (also known as robber barons) in the course of the nation's transformation through urbanization, industrialization, and

immigration. Many of these newly rich urbanites were given to conspicuous display of their wealth and looked to Britain as the pacesetter in fashion. This Anglophilia was manifested in part in their attraction to the Episcopal Church, which had long been associated in the American imagination with aristocratic culture. The Progressive Era, which overlapped the Gilded Age in the latter decades of the nineteenth century and extended through President Woodrow Wilson's administration in the early twentieth, was characterized by a sense of progress not only through advances in science and technology but also in employing a scientific approach to urban poverty and corruption through "good government"—that is, municipal reform based on the application of the social sciences to real-life problems. Many Episcopalians were active in Progressivism, especially through their participation in the Social Gospel movement.

This tension in American Episcopalianism was exhibited on November 6, 1895, when the heiress Consuelo Vanderbilt was forced by her mother into marriage to the ninth duke of Marlborough, an English nobleman whom she loathed. The wedding was celebrated at St. Thomas Episcopal Church on Manhattan's Fifth Avenue, with New York bishop Henry Codman Potter presiding. This same Bishop Potter was also one of his age's leading advocates of the rights of labor, as expressed in his mediation of many strikes and his authorship of pastoral letters such as "The Laborer not a Commodity." That this church leader should be able to cater to an Anglophilic social elite in their sometimes dubious antics while simultaneously serving as a prophetic witness to the rights of the oppressed is a key to understanding the complexity of the Episcopal Church in the decades between the Civil War and the beginning of the Great Depression in 1929.

The Gilded Age was also a time of rapid growth both in numbers and in prestige for what was still officially known as the Protestant Episcopal Church. Although the denomination's social standing had roots in its established status in several of the American colonies and the at least nominal adherence of many of the founders of the Republic, disestablishment after the Revolution had tarnished the church's cachet, and it was forced to share the status of an elite church with other regionally rooted traditions, such as Boston's Unitarians, Philadelphia's Quakers, and Pittsburgh's Presbyterians. The Gilded Age's newly wealthy, however, were powerfully attracted to this predominantly urban church that boasted an aristocratic English lineage and the

ceremonialism and decorum of which contrasted favorably with the liturgical drabness of the Reformed denominations. As a national upper class began to emerge during this period, the Episcopal Church presented itself—together with art museums, country clubs, and church-sponsored prep schools—as one of the premier institutions through which the "best" families of the nation's northeastern quadrant could network and intermarry. Paradoxically, this was also a church at the forefront of the Social Gospel movement, and one of the active and innovative denominations in responding to the intertwined challenges of immigration, industrialization, and urbanization.

Factionalism

The 1865 General Convention of the Episcopal Church—a triennial legislative assemblage composed of bishops and lay and clerical "deputies"—was a tacit act of reconciliation of the tensions within the church brought about by the "recent unpleasantness," during which the Southern dioceses had withdrawn to form the Protestant Episcopal Church in the Confederate States of America. This short-lived group dissolved with little fanfare as its representatives appeared at the convention without controversy. The postbellum church, however, would rapidly resume the arguments that had previously divided it over questions of theology focused, as befitted Anglicans, on matters of worship and ritual. For some decades Episcopalians had divided along lines of "high church"—those emphasizing the centrality of sacramental worship and the institutional continuity represented in the "historic episcopate," or apostolic succession of bishops—and "low church"—those who saw Episcopalianism as one among a variety of forms of evangelical Protestantism stressing the need for personal regeneration and worship based on biblical preaching.

The high churchmanship of the antebellum era, represented by New York's Bishop John Henry Hobart and that city's General Theological Seminary, was transformed during the century's middle decades by the impact of the Oxford Movement in England, which gave a new centrality to the "catholic" character of Anglicanism as exemplified in its sacramental worship and the apostolic origins of its lineage of bishops. A number of both British and American "Tractarians," as the movement's adherents came to be known, actually converted to Roman Catholicism. Tractarianism morphed during the Victorian era into what became known as "Ritualism," a designation that highlighted the stress placed on the elaborate minutiae of worship (clerical

vestments and chancel apparatus, including candles and crucifixes, which bore Latinate names evocative of their “Romanist” origins).

Ritualism spread rapidly in the later nineteenth century, manifested in parishes such as Boston’s Church of the Advent, New York’s Saint Mary the Virgin, Philadelphia’s St. Mark’s and St. Clement’s, and Chicago’s Ascension, whose frequent use of incense and other liturgical devices gained them the sobriquet of “bells and smells.” The Chicago area and nearby Wisconsin, especially the newly created diocese of Fond du Lac, became the geographical center of the movement and gained the (somewhat derisive) nickname “the Biretta Belt,” after the distinctive Roman-style headgear favored by its clergy. (A photograph of such-minded bishops, gathered in 1900 for an Episcopal consecration—and arrayed in disparate, colorful, and elaborate garb—became known as the “Fond du Lac Circus.”) The Nashotah House seminary in Wisconsin remains to this day the primary training ground for the movement, although New York’s General Theological Seminary historically has been associated, though less dramatically, with this Anglo-Catholic wing of the Episcopal Church.

The introduction of ritualistic practices in these parishes frequently earned the hostility of “low church” bishops, such as Massachusetts’s Manton Eastburn and Ohio’s Charles Pettit McIlvaine, and the General Conventions that followed the Civil War saw any number of resolutions introduced against what were perceived as the excesses of the Anglo-Catholic faction. The election of James DeKoven as bishop first of Wisconsin and then of Illinois in the mid-1870s was rejected by the House of Bishops. The more extreme faction of the evangelical party, however, which stressed the need for personal conversion and the authority of scripture, did not regard a minor series of victories and compromises as sufficient to affirm indubitably the distinctively Protestant character of their church; in 1873 Assistant Bishop George Cummins of Kentucky and Charles Cheney, who had been deposed from the priesthood in Chicago, founded the Reformed Episcopal Church as an alternative to the parent group, but it has never flourished numerically.

The Broad Church Movement

Both the Anglo-Catholic and evangelical factions, together with their ever-shifting subfactions, continued as constituents of the Episcopal Church, but their efforts to dominate the church came to naught as a new movement began to eclipse them in both numbers and influence. The adherents

of this Broad Church movement never sought to form a faction, and consequently never formulated a coherent or consistent platform. The origins of the movement lay in mid-nineteenth-century England, beginning with the publication of *Essays and Reviews* by a distinguished avant-garde group of theologians in 1860. These essays were among the first to bring the fruits of German biblical scholarship to the Anglo-American public, and they left considerable controversy in their wake. American Broad Church advocates, whose origins lay in the ecumenical vision of William Augustus Muhlenberg in the antebellum era, combined an expansive view of the church’s relationship to the broader array of Christian denominations with an optimistic openness to the era’s new intellectual currents—most prominently, Charles Darwin’s theory of evolution—and their implications for Christian thought and life. That the Episcopal Church avoided the wrenching conflicts experienced by other denominations during this era—most notably the Presbyterians—over issues of fundamental belief and especially scriptural interpretation is an indication of the success of Broad Church principles. (Charles Augustus Briggs, professor of biblical studies at New York’s Union Theological Seminary, was suspended from the Presbyterian ministry for drawing unorthodox conclusions from his scholarship; he was soon thereafter ordained as an Episcopal priest.)

One of the most prominent exponents of Broad Church principles was William Reed Huntington, rector of New York’s Grace Church, who helped articulate and promote the growing conviction of many Episcopal leaders that their denomination could serve as the basis for an inclusive national church. Although such efforts toward ecumenical union bore little immediate fruit, Huntington’s ideas did serve as a major stimulus toward the adoption by the American church in 1886 and by the Church of England two years later of resolutions that became conflated into what has since been known as the Chicago–Lambeth Quadrilateral. This brief document, now looked upon as the basis of a common Anglican identity, makes no assertions about particular contested doctrinal points, such as the virgin birth, but rather identifies four fundamental vehicles through which religious truth has been conveyed since early Christian times: the Holy Scriptures; the two sacraments, baptism and the Eucharist; the creeds of the early church; and the historic episcopate, that is, bishops whose authority has been passed down in direct succession from their prototypes, the twelve apostles of Jesus. The adoption of the Quadrilateral

on both sides of the Atlantic was a formative moment in the emergence of a shared heritage among the churches that had their origin in the Church of England and, though some had now gained independent status as the British Empire began its gradual dissolution, nevertheless were united by “mystic chords of memory” and worship based on the Book of Common Prayer. The conferences of bishops from the entire Anglican world at Lambeth Palace, in London, first convened by the archbishop of Canterbury in 1867, have been a major vehicle for promoting a sense that the Episcopal Church shares a heritage and continuing commonality not only with its parent church but with others of similar provenance and practice.

Another leading advocate of Broad Church principles was Phillips Brooks, rector of Boston’s Trinity Church in newly fashionable Copley Square and later bishop of Massachusetts. One of the “princes of the pulpit” at a time when the clergy of downtown churches were renowned for their eloquence and their sermons were printed in Monday’s newspapers, Brooks gained his celebrity not through the originality of his thought but through his ability to convey a sense that Christians could be at ease in the new American urban culture they were helping to shape. Brooks was also instrumental in the “Church Congress” movement, a series of conferences sponsored by the Episcopal Church and designed to provide a forum for a multitude of viewpoints on religious and social issues of the day.

The Social Gospel

The Social Gospel was another current in the discourse of American Christians at the turn of the twentieth century in which Episcopalians exerted leadership and reflected the Broad Church emphasis on the interaction of the church with the broader society. Although Episcopalians were not among the most prominent theologians of the movement, they responded in a variety of creative ways to the social crises that had resulted from massive immigration and rapid industrialization and urbanization. New York’s bishop Henry Codman Potter, cited at the beginning of this essay for his blessing of one of the more notorious marriages in Gotham society, used his considerable influence to lobby for progressive social legislation and to mediate labor disputes. The social teachings of English theologians such as F.D. Maurice and Charles Kingsley, and the early settlement houses such as London’s Toynbee Hall that resulted from their impact, were highly influential on the vision of social action of American Episcopalians, who adapted them to local circumstances.

William S. Rainsford, the Irish-born rector of St. George’s Church in Manhattan’s Stuyvesant Square, was another example of the seeming paradoxes of the Episcopal role in the social crises of the time. St. George’s long-time senior warden (or chief lay leader) was J.P. Morgan, arguably the most powerful financial leader in the America of his day, who prided himself on holding vestry meetings in what is now the Morgan Library and Museum on Madison Avenue. Despite Morgan’s conservative social views and evangelical leanings, he gave his full faith and credit to Rainsford’s ministry, once he had satisfied himself as to the soundness of his rector’s character. The result was the growth of St. George’s into a prototypical “institutional church,” a new and distinctively American response to the urban age. Such churches, which proliferated in Manhattan and other major cities among other denominations as well, were characterized both by their massive physical plants—financed heavily, in St. George’s case, by Morgan’s munificence—as well as by the programming they sponsored not simply for their own parishioners but for the largely immigrant poor who still in this era were not geographically isolated from the well-to-do. Health services, educational programs, summer camps, employment counseling, and other sorts of social outreach—as well as religious services offered at offshoot missions—were provided by lay volunteers as well as by the religious professionals who made up the often extensive staffs of such churches.

Episcopalians participated in the Social Gospel movement in a variety of other ways. Richard T. Ely, who taught economics at Johns Hopkins University in Baltimore and the University of Wisconsin, helped reformulate economic theory in a way that substituted Christian principles for the amoral and impersonal laissez-faire theory of markets that constituted the conventional wisdom of the day. W.D.P. Bliss, an Episcopal priest and socialist, edited the *Encyclopedia of Social Reform* (1908) as a comprehensive source of accurate data on social issues and also helped found in 1887 the Church Association for the Advancement of Labor (CAIL), which numbered some fifty bishops among its membership.

Women’s Roles

It was in the realm of social service and reform that Episcopal women began to play an active role in a church that barred them from ordination until the 1970s (and even from serving as deputies at the General Convention until 1967). Although formally disenfranchised, they had by the

mid-nineteenth century began to play active roles in church life that reflected Victorian America's conception of women as most appropriately engaged in nurture and service. These roles began with voluntary staffing of growing parish neighborhood outreach programs and support for the Women's Auxiliary to the Board of Missions, which was for several decades, beginning in 1872, energetically led by the four Emery sisters. (Mary Abbot Emery; her sisters Julia, Susan, and Margaret; and two brothers who became Episcopal priests were part of a remarkable New England family dedicated to the work of the church.) Episcopal women, though barred from formal leadership roles, demonstrated that they could nevertheless exercise powerful leadership in shaping their church's mission.

The opportunities for women to serve in the church reflected the bifurcation of Anglican–Episcopal identity along Catholic–Protestant lines. Beginning in 1852, when Anne Ayres and William Augustus Muhlenberg founded the Sisterhood of the Holy Communion in New York City, the revival of the religious orders that had begun in Victorian England in the wake of the Oxford Movement now found itself translated into the United States. (These orders had been suppressed during the English Reformation in the 1530s and 1540s by Henry VIII, largely because the king coveted their extensive land holdings.) Other orders, some branches of those founded in England, for both men and women followed. The Society of Saint John the Evangelist—also known as the Cowley Fathers—was perhaps the best known, and its members found themselves in continual difficulty as they introduced Anglo–Catholic ritualism into parishes such as Boston's Church of the Advent in the face of the hostility of local bishops. Although these orders never came close to approaching the dimensions of their Roman Catholic counterparts, their presence helped provide a Catholic dimension to American Episcopal identity, manifesting itself primarily in the areas of social service and education.

Anglican sisterhoods engaged in a variety of such activities, including the management and staffing of hospitals, orphanages, and schools for girls. Their reputation was enhanced by the heroism shown by the Community of St. Mary during the yellow fever epidemic that shook Memphis in 1878, during which four members of the order died while caring for the sick. Despite such achievements, the notion of sisterhoods based on the Roman Catholic model did not sit well with many Episcopalians, and a more Protestant model for women's service emerged in 1889 with

the establishment of the office of deaconess by the General Convention. Deaconesses, who had counterparts in other American denominations, differed from religious sisters or nuns in that they did not take perpetual vows or live in community. They also differed from male deacons in that they were not considered to have been ordained to the ranks of the clergy. These unmarried women were trained for religious and social service, such as nursing, at a number of urban centers established for the purpose. They went on to help staff institutional churches, administer charitable organizations, and serve as foreign missionaries, a role for women promoted by the increasingly activist Women's Auxiliary.

Another way in which the spirituality and activism exhibited in these women's lives combined in a distinctively Anglican fashion was in the founding of lay organizations for both men and women. The Brotherhood of St. Andrew, for example, founded at St. James Church (later Cathedral) in Chicago in 1883, became popular nationally as a way in which young men could become involved in devotion, evangelism, and social service. A similarly influential organization for women was the Society of the Companions of the Holy Cross, founded in 1884 by Emily Malbone Morgan of Hartford, Connecticut. Composed of lay women living according to a monastic-like rule stressing personal spirituality and social justice, the companions were an active presence in Progressive Era reform causes. Prominent among them was Vida Dutton Scudder, a professor of English at Wellesley College who was active in the College Settlement House Association in Boston. Scudder wrote copiously, in fictional and other form, about her social and spiritual ideals, which she believed to have been derived from those of St. Francis of Assisi. She and her kindred spirits actively involved themselves in the investigation of the labor disputes of the period and successfully pressured the denomination to take a more active role in reform causes. Episcopal women were generally prominent in the settlement house movement, a campaign led mainly by women to establish centers where urban immigrants could come for education, recreation, and social services. Among them were Ellen Starr Gates, Jane Addams's companion at Hull House in Chicago, and Mary Kingsbury Simkhovitch at Greenwich House in New York City.

Education

Another area where women, the religious orders, and others in the Episcopal community came together during this era was education. The Episcopal Church, unlike most other

denominations, put few resources into college founding; only a handful of institutions of higher learning, such as Sewanee in Tennessee, Kenyon in Ohio, and Hobart and William Smith in upstate New York had formal church relations. The one exception to this principle were several schools in the South, founded during the Reconstruction era as part of the church's outreach toward the newly freed slaves, such as St. Augustine's in Raleigh, North Carolina, and Voorhees in Denmark, South Carolina. The area of education in which Episcopalians did make a distinctive contribution was the "prep school" movement, that is, private boarding schools, mainly at the secondary level, that were founded with the mission of socializing an emergent elite for positions of leadership in the new urban American society that was taking shape. This complex of academies, mainly located in New England, was nicknamed "St. Grottlesex" after a conflation of the names of several of their most prominent exemplars: St. George's in Newport, Rhode Island; St. Mark's near Boston; St. Paul's in Concord, New Hampshire; and Groton and Middlesex in eastern Massachusetts. Other schools, such as Rosemary Hall in Connecticut (now merged with Choate), provided a church-affiliated alternative for young women that stressed rigorous academics combined with an emphasis on character and the "muscular Christianity" espoused by Endicott Peabody, Groton's legendary founding headmaster. These schools enjoyed a close relationship with Ivy League colleges, especially Yale, and shaped several generations of political and financial leaders, including Franklin D. Roosevelt (Groton, '00) and John F. Kennedy (Choate '35.) These schools still thrive, but their student bodies are intentionally diverse and their Episcopal affiliations often attenuated.

Church and Cathedral Building

One of the outward and visible signs of the identity of the prep school was its chapel, usually in the Gothic or Colonial Revival mode and designed by one of the leading ecclesiastical architects of the day such as Henry Vaughan or Ralph Adams Cram. These chapels were an outlying part of the larger assemblage of churches and cathedrals that can still be found in almost any American city of a certain size. The shaping forces behind this building campaign were the rapid growth of cities; the wealth available from both the *anciennes* and the *nouveaux riches* who made up a significant part of the laity; the drive for centralization of authority that led previously indifferent bishops to desire cathedrals as emblems of

a visible episcopal presence in their dioceses; and the Cambridge Movement that originated at the University of Cambridge in England in the 1840s. This "ecclesiological" movement, as it was also known, argued that only medieval Gothic architecture was appropriate for the authentically sacramental Christianity advocated by the parallel Oxford Movement; it soon had its followers on this side of the Atlantic. Richard Upjohn, the designer of Manhattan's Trinity Church (1846), helped popularize the style among American Episcopalians and other denominations, and invented the widely dispersed "Carpenter Gothic" style easily made from wooden planks. Upjohn's many Episcopal churches were augmented and sometimes replaced—as in the case of St. Thomas on Manhattan's Fifth Avenue—by later Gothic work by Ralph Adams Cram and his partner, Bertram Grosvenor Goodhue. The National Cathedral in Washington, D.C., conceived by that city's first bishop, Henry Yates Satterlee, was intended to be "a house of prayer for all people," a stunning architectural monument to the Episcopal ambition to serve as an unofficial church for the entire nation. The foundation stone for the cathedral was laid in 1907. Its subsequent uses for burials—Woodrow Wilson lies entombed in one of its aisles—and public events—George W. Bush addressed the nation following the events of September 11, 2001, from its pulpit—are evidence of the at least partial realization of Satterlee's vision.

Diversity

The Episcopal Church has often been characterized as embodying the culture of WASP (white Anglo-Saxon Protestant) America, and there is considerable truth in this characterization, especially for this era. Episcopalians, however, have never been uniformly of northwestern European origin, and the Episcopal Church did in fact engage in serious efforts to extend its presence to "all sorts and conditions," both domestically and abroad. Part of its non-Anglo constituency derived from its rooting both in the colonial South and in the British Empire more broadly. Although many freed slaves left their masters' churches—including the Episcopal—following the Civil War to affiliate with traditions of their own making, some stayed on. Similarly, new immigrants from the British West Indies found a familiar Anglican home at Episcopal churches in their new country. Most cities had at least one parish that was African American—St. Philip's in Harlem is a venerable example—often ritualistic in orientation and attracting the more affluent and better educated members of the black community.

In 1922 these parishes numbered 288 with 176 clergy and some 32,000 communicants.

The Episcopal Church's approach to nonwhites in the post-Civil War period can best be described as paternalistic. The church had never taken a formal stand against slavery, and opinion on that institution had been divided even in the North. Blacks had been ordained to the priesthood for some time, and in 1884 Bishop Payne Divinity School was founded as a segregated facility for training priests. (It later was merged into its parent body, Virginia Theological Seminary.) In 1918 two African Americans, Edwin T. Demby and Henry B. Delany, were consecrated as suffragan (assistant) bishops in Arkansas and North Carolina, respectively, but their supervisory work was restricted to black clergy and parishes. It would not be until the 1950s that the Episcopal Church would begin to move toward integration and serious involvement in the struggle for civil rights within the denomination and the broader society.

Episcopalians also engaged in outreach to other peoples and became responsible for particular Native American tribes as the federal government divided up responsibilities among different denominations following the Civil War. William Hobart Hare, the bishop of Nebraska, earned the honorific "Apostle to the Sioux." By the time of Hare's death in 1909, some half of the native peoples in South Dakota had become Episcopalians, and a number of native men had been ordained to the priesthood in various parts of the West where an Episcopal missionary presence had become established. Foreign missions also followed the spread of American influence abroad, including Brazil, Mexico, Haiti, Hawaii, the Philippines, and Puerto Rico, with considerable work being done in China and Japan as well.

From the Civil War to the 1920s the Episcopal Church had experienced considerable numerical growth and expansion of influence, its name closely linked with the notion of an informal "Eastern Establishment" that wielded disproportionate influence in government, industry, and higher education. Although its attitudes were not always those of the nation at large—many Episcopalians demurred from the evangelical campaign for Prohibition—its membership was disproportionately found in the pages of the *Social Register* and *Who's Who*, and the graduates of its schools found easy access to Yale and subsequent berths on Wall Street or the State Department. Even so, many of its clergy, bishops, and laity continued throughout this time to use their influence, as avowed reformers or behind-the-scenes negotiators, to

alleviate the wretched conditions in which the urban poor especially found themselves laboring, even though few of those largely immigrant poor ever joined the Episcopal Church. It was, in short, a church of tensions and paradoxes that would continue to unfold in the decades that followed.

Episcopalians: Twentieth and Twenty-First Centuries

What is now the Episcopal Church came to North America as a branch of the Church of England in the colonial period of the seventeenth and eighteenth centuries. After the American Revolution (1775–1783), the church organized its own life while holding closely to the worship and ministry of the English church and became part of the worldwide Anglican Communion. Episcopalians thrived in the United States because of the church's democratic structures and emphasis on lay initiative. By the twentieth century Episcopalians were influential beyond their numbers and were an integral part of the religious mainstream.

At the annual meeting of the Church Congress on religious and social issues in 1902, Herbert Welsh, a layman from Philadelphia, gave a paper that probed the Episcopal Church's readiness to face a world in flux. Amid the "opportunities and dangers of a new century," Welsh wondered if the church could make "practical application of the truths taught by Christ to the changing needs of the modern world." He hoped the church could advance "the true standards of Christian civilization" and secure a role in "the guidance of national life. . . ." Welsh affirmed that "Christian civilization can be permeated and inspired by the mind and motive, the spirit and commands of Christ." The "fundamental truth which our Lord proclaimed was the Fatherhood of God and the brotherhood of man." Similarly the Reverend Loring Batten declared that the chief subject of Jesus' discourses was the kingdom of God and that "His mission in the world was to establish that kingdom." Batten described God's kingdom as an ideal society in which the principles of the gospel would govern life. It was an expression of eternal truth that would transform the world into its likeness.

The Centrality of the Kingdom

During the twentieth century Episcopalians clung to this ideal while refining church life in response to social and intellectual challenges. By the end of the twentieth century the kingdom of God would still be the defining ideal of church life, but it would be focused more on finding the proper shape of religious life than on transforming the world. In time, profound conflict over the meaning of this ideal would divide the church.

The kingdom of God was an ideal that originated in the Church of England and in liberal American Protestantism in the nineteenth century. It inspired the Social Gospel movement, which became noted for ministries to the poor, especially in cities. Episcopalians such as William Reed Huntington encouraged the idea of a national church on the basis of God's kingdom. He envisioned the church as a catalyst for remaking American life. The national church ideal entailed urgent attention to the needs of disenfranchised persons as well as to a dynamic view of faith. These intentions surfaced at the Church Congress in 1902.

Early in the twentieth century there was a widespread consensus among Episcopalians that the church had a formative social role to play and that in order to fulfill this role it must retain a clear, distinctive identity. The church seemed well balanced between an emphasis on its role in society and

its own identity, and the kingdom of God was the concept that provided the foundation for that balance. This ideal encouraged an elaborate church structure that envisioned the kingdom in practical terms. Episcopalians viewed their task as building up the church so that it could transform the world. One of the first church leaders to articulate this vision was Bishop William Lawrence of Massachusetts (1850–1941). Lawrence insisted that the church must adopt advanced methods of organization and business practice lest the world not take it seriously. A friend of industrialist J. P. Morgan, himself an Episcopalian, Lawrence persuaded Morgan to make major donations to the church, including funds to create pensions for Episcopal clergy.

Lawrence was not alone in his focus on improved organization as the means to the kingdom of God. Certain of their responsibility for the divine kingdom, Episcopalians were intent on functioning efficiently. Major parishes such as Trinity Church, Wall Street, in New York City, and Trinity Church, Boston, organized their life around committees with delegation of responsibilities, evaluations of the impact of their ministries, and regular reports. At the same time, the national organization of the church became centralized and regularized. This was apparent in the growth of departments touching all facets of church life in its New York City headquarters. Particular emphasis was given to mission, to Christian education, and to women's work. Modern business management shaped the pathway to the kingdom.

This pathway required a critical eye on society. Thoroughly integrated into American life, Episcopalians were not slow to cite trends they found disturbing. The records of church conventions from the early twentieth century include resolutions decrying alarming trends, such as alcoholism and divorce. Episcopalians were intent on being catalysts for moral improvement and for ministering to those who were disaffected. The presence of many Episcopalians in business, government, and community life combined with the ideal of the kingdom of God to give the church an influential public role. Episcopalians also were prominent in religious life, notably in ecumenical affairs. Early in the century Charles Henry Brent (1862–1929), who served in the Philippines and as bishop of Western New York, was a leader in international talks among Christian bodies. Later Bishop Stephen Bayne (1908–1974) was a leader of ecumenical and intra-Anglican discussions. Similarly prominent lay persons such as Robert Gardiner (1855–1924) also left indelible impressions of Episcopal leadership.

Increasing attention to worship also reflected the church's intention to be God's kingdom on earth. In 1928 the General Convention, a triennial meeting of clergy and laity, authorized a new edition of the Book of Common Prayer, but it did not expect that this version of the Prayer Book would stand for all time. The convention created a Standing Liturgical Commission to standardize worship practice and to anticipate future changes in liturgy. By the twentieth century Episcopalians were not only devoted to managing the church effectively and keeping a critical eye on society, but they began to assume that ongoing social changes would require future adjustments in the way the church and its offices were constituted.

For most of the twentieth century this focus on building the church so that it could build society proved fruitful. The combination of the church's emphasis on effectiveness in its operations and security in its social niche afforded Episcopalians an impressive capacity to minister to American life. Episcopalians were among the most educated and affluent of religious groups. With their membership concentrated on the East Coast and in major cities Episcopalians were visible in the nation's elite circles. It seemed fitting that in New York City and in Washington, D.C., the church would begin construction of major cathedrals, the Cathedral of St. John the Divine (in 1892) and Washington National Cathedral (in 1907). As focal points, these structures dramatized the church's intention to offer an American expression of the kingdom of God.

The Need for Diversity

The Episcopal Church was never homogeneous and was not composed solely of social elites. African American Episcopalians, after the Civil War, created an impressive church subculture in the face of discrimination. They sustained their own parishes, in a few dioceses had assisting bishops, and were often educated in separate schools and colleges. Edward Demby (1869–1957) was the first African American to serve as bishop. He became suffragan (assistant) bishop for “colored work” in Arkansas in 1918 and was joined two months later by Henry Delany (1858–1928) of North Carolina. The number of African American Episcopalians grew during the twentieth century, and they responded to prejudice with a firm vision of God's kingdom. When women were ordained priests in the 1970s, an African American, Pauli Murray (1910–1985), was one of the first. A prominent civil rights lawyer, she fulfilled a life-long dream when ordination became possible. Similarly, tiny

numbers of Hispanic and Asian Episcopalians also increased as diversity became a principal mark of Episcopal advance toward the kingdom of God. But until the last decades of the century diversity in the church masked acceptance of inequalities more than it prompted efforts to overcome them. Consensus was the priority for most of the century. Apparent church unity masked differences in worship and leadership style.

There was a fault line between “high church,” or Anglo-Catholic, Episcopalians and those who were “low church.” High church adherents valued the Eucharist as the central form of worship, accompanied by elaborate forms of ceremony, and emphasized Roman Catholic dimensions of the English past, while low church, or evangelical, Episcopalians elevated the church's Reformation heritage, diminished the role of ceremonial practices, and stressed the centrality of the Bible and pastoral care. Anglo-Catholics were prominent in parts of the upper Midwest, while low church Episcopalians defined church life in the mid-Atlantic region and parts of the Northeast. In the Deep South a high church tendency was apparent, and this inclination spread as the church grew westward. It was a portent of the church's later emphasis on enhanced ceremonial and the Eucharist. This emphasis became a principal expression of the commitment to a distinctive identity focused on the kingdom of God.

Church leaders sought to build Episcopal life according to this ideal. In the century's early years this intention reflected an optimistic view of history and of the world. Bishop William T. Manning (1866–1949) of New York promoted construction of the Cathedral of St. John the Divine as a dramatic expression of the church's ability to redeem the world while sustaining a distinctive Christian identity. Notable Episcopal missionaries shared this intention. Henry St. George Tucker (1874–1959) went to Japan late in the nineteenth century and became bishop of Kyoto during his service there. Tucker expanded church schools and hospitals as primary expressions of the intention to redeem the world. Tucker believed that the twentieth century would witness a realization of Christianity's capacity to shape modern life. In 1923 he resigned his post and returned to the United States, convinced that the Japanese church should have Japanese leadership. Later presiding bishop of the Episcopal Church, he anticipated the end of colonialism after World War II.

In Search of Revitalization

Manning sensed the end of an era in which it was possible to believe that the course of world events and the church's

intentions were aligned. He emphasized the church's ministries as means of redeeming an imperfect world, and he stressed that the church should retain a distinctive identity. The church must minister to the world but must also be distinct from it. He spoke for many Episcopalians whose sensibilities were jolted by World War I. The United States entry into the war in 1917 had been supported by most Americans, but pictures of wartime Europe left troubling images of mass destruction. The application of technology for the purpose of taking human life and flattening human communities eroded the optimism of the early twentieth century. Episcopalians became wary of aspects of modern life that veered from the pathway toward the kingdom. They resolved that the church must mend the world's flaws. The need for the church to assume this stance became apparent with the onset of economic depression late in 1929.

Several Episcopalians became known for formulating social critiques. Vida Dutton Scudder (1861–1954), a teacher, writer, and socialist, linked her political stance to Christian belief in the incarnation. With a small group of women she founded the first successful settlement house in a poor Boston neighborhood to identify with and assist the poor. Her political position became increasingly radical, and by 1930 she had espoused pacifism. Scudder was an exemplar of ground-breaking leadership by a woman before women could be ordained clergy. A further social critique came from Bishop William Scarlett (1883–1973) of Missouri. Friend of theologian Reinhold Niebuhr, Scarlett became known as “the conscience of the community” for his efforts to bring a Christian perspective on social issues. He advocated for the jobless and homeless during the depression years. His compassion fueled other liberal intentions such as permitting divorced people to remarry in the church. In the aftermath of World War II he led a church commission that cited atomic weapons and race relations as subjects of moral conflict. Scudder, Scarlett, and others urged that the church become activist in presuming to model what society must become.

As some Episcopalians sought social revitalization, others pursued renewal of the church's faith and worship. From the early 1950s there was a concerted movement to revise the church's Book of Common Prayer. Seminary professor and liturgy scholar Massey Shepherd (1913–1990) defined the shape of this initiative. Steeped in the new scholarship on ancient liturgy, Shepherd worked patiently to lay a thorough foundation. Through the church's Standing Liturgical Commission, pamphlets steadily appeared presenting suggested

modification and emphasizing recovery of an emphasis on baptism as the mark of Christian identity, on the Eucharist as the central act of worship, and on the role of the laity in leading worship and church life. Liturgical revision was an extended process that would culminate in the mid-1970s amid turmoil in the church that Shepherd and other worship scholars could not have foreseen.

A need for deepened spirituality was clear to some. Prior to World War II, parish priest Samuel Shoemaker (1893–1963) promoted moral and spiritual reform, notably contributing to the development of Alcoholics Anonymous from his post at Calvary Church, New York City. Moving to Calvary Church, Pittsburgh, in 1952, he emphasized spiritual renewal through small groups meeting to discuss personal faith and Christian life. Politically conservative, Shoemaker became an anti-communist speaker and writer. Late in his career he emphasized the work of the Holy Spirit and so laid a basis for the charismatic movement that blossomed in the 1970s.

Beginning in the 1950s efforts to link social justice and spiritual reform would diverge as liberal and conservative factions in the church hardened. However, in the wake of two world wars and economic depression, Episcopalians agreed that the world must be redeemed and that the faith and the church must be revitalized for this task. After World War II a new spirit of church initiative burst forth. It was apparent not only in efforts at spiritual renewal and in revising the liturgy, but in fresh energies for the church's ministries. The expansion of suburban America brought unprecedented growth to the Episcopal Church, and its locus began to shift from older urban settings toward the suburbs and toward growing metropolitan areas in the South, Southwest, and West. An emphasis on building the church while securing its identity took hold, and a deepened sense of the church as an institution was apparent. Church committees guided the process toward liturgical revision, produced materials such as the Seabury Series to promote a unified approach to Christian education, and provided loans that allowed church expansion. Professional staff at the church's headquarters implemented decisions of the triennial General Convention and worked with clergy and local leaders in taking steps toward the kingdom of God in American life. Although its authority was dispersed among bishops, dioceses, and local churches, the Episcopal Church of the 1950s acted with unanimity and clarity. Episcopalians proclaimed a lively faith while building the church; they ministered to society while securing

a distinctive identity. In retrospect this was a fragile combination.

The Erosion of Consensus

Discontent over the state of society and the church's expression of faith could not be contained within institutional bounds. In the 1950s it became clear that activist individuals and groups would press the church to change and so test the consensus that unified it. Two issues were prominent: first, the search for an authentic faith and, second, social justice. Beneath the surface of American life in the 1950s there was evidence of personal anguish as modern life tested historic forms of self-assurance. Among Episcopalians several voices proposed a way of being faithful that would address this challenge. A variety of theologians such as Albert T. Mollegen of Virginia Theological Seminary and Norman Pittenger of General Theological Seminary became noted writers on faith and modern life.

A more radical impulse caused controversy in the church. In the 1950s Bishop James A. Pike (1913–1969) of California stridently called for revised views of the basic tenets of Christian faith. He later left the episcopate and embarked on an idiosyncratic spiritual quest that led to his death in the Sinai, in Israel, where he had gone to find the soul of his deceased son. Pike's acerbic style and unrelenting assaults on historic belief set a tone others would match. In the 1960s Joseph Fletcher (1905–1991) became a pioneer in bioethics and coined the phrase "situation ethics." Fletcher concluded that there was no absolute moral law other than love, which could take various forms in diverse contexts. In the 1970s Bishop John Spong (1931–) of Newark began publishing a stream of books challenging basic Christian beliefs and calling for revised moral norms. Spong married the search for contemporary faith with an emphasis on justice as he advocated for the acceptance of gays and lesbians in the church. Building on Pike's initiative, Spong became a vigorous advocate for those whom society and the church had disregarded.

In the postwar period the sense that the modern world was leaving many people beleaguered became impossible to ignore. For many Episcopalians this meant that the church must mirror the divine kingdom by embracing the civil rights movement. Calls for racial equality surfaced among Episcopalians in the 1950s and challenged historic patterns in some branches of the church. In 1952 a majority of the faculty at the School of Theology of the University of the South (Sewanee) resigned when the university's regents

refused to admit African American students. The church's General Convention of that year passed a resolution deploring racial injustice and issued similar statements in subsequent conventions. In 1959 a group of clergy organized the Episcopal Society for Cultural and Racial Unity (ESCRU), with the goal of removing racial and social division from the church. As protests against segregation intensified, Episcopalians were prominent. In 1964 the wives of three bishops, one of whom was African American, were arrested for attempting to eat together at a segregated Florida restaurant. More than five hundred Episcopalians joined the march for civil rights in Selma, Alabama, in March 1965. Later in 1965 seminarian Jonathan Daniels was shot while serving as a civil rights worker in Alabama. His death solidified the activist resolve of many Episcopalians.

Not all Episcopalians approved of activism. Although convinced that racial discrimination was wrong, a prominent swath of Episcopalians was cautious in confronting it. Alabama bishop Charles C. J. Carpenter and clergy of other denominations opposed activism for civil rights in their state. In their view a gradualist approach would succeed where confrontation would fail. But other Episcopal leaders pushed ahead. When he became presiding bishop in 1965, John Hines of Texas proclaimed a faith that announced Jesus Christ as savior and led to involvement in social change. Hines organized a program of economic empowerment for poor people. He called a special General Convention in 1969 to encourage involvement in the "Black Manifesto," a demand for economic justice for African Americans. Hines also encouraged liturgical renewal, the ordination of women, and other progressive causes. More than any other Episcopal leader he linked activism for civil rights with multifaceted change in the church.

By the 1970s activism for change had become broad-brush among Episcopalians. In 1970 women became eligible to serve as deputies at the General Convention. At the same time calls for the ordination of women intensified. Women's activities in the church had been confined to separate spheres (although there had been women's organizations since the late nineteenth century and in 1889 the church created the order of deaconess allowing women to enter full-time church service). But in 1970 the General Convention allowed women to be ordained as deacons, an ancient order previously held only by men, as distinct from deaconesses, a modern order created for women, setting the stage for the convention of 1976, which approved the ordination of women to the priesthood. This action followed a

controversial liturgy at a Philadelphia church in 1974 in which three retired bishops, Daniel Corrigan, Robert DeWitt, and Edward Welles, ordained eleven women as priests. In 1975 retired bishop George Barrett ordained another four women as priests. Approval of the ordination of women in 1976 produced tension in the church, but acceptance soon was widespread. The consecration of Barbara Harris, an African American woman, as suffragan bishop of Massachusetts in 1989 was a milestone, and the elevation of Katharine Jefferts Schori to the post of presiding bishop in 2006 seemed a fitting culmination.

The 1976 convention also passed on first reading a revised version of the Book of Common Prayer, which received final approval at the convention of 1979. In 1982 a revised hymnal appeared. In conservative eyes such seemingly radical changes revealed a liberal drift in the church that portended abandonment of essential aspects of belief and practice. In retrospect both the liberal and conservative positions had similar origin: The 1970s were as much a period of spiritual renewal for Episcopalians as a time of activism and change. Beginning in the 1960s growing numbers of Episcopalians declared that they had received the gift of the Holy Spirit and had spoken in tongues. This charismatic movement drew a widespread following and found centers in parishes in Connecticut, Ohio, and Texas, with leaders such as Terry Fulham, Graham Pulkingham, and Dennis Bennett. Bennett helped to spark the movement in 1960, when, as a parish priest in California, he announced that a profound experience of the Holy Spirit had changed his life decisively. The movement that resulted built organizations such as Faith Alive and Episcopal Renewal Ministries, which promoted not only personal spirituality but conservative theological concerns and opposition to liberal intentions.

The Course of Protest and the Turn to the Grassroots

Over the last quarter of the twentieth century the activism of conservatives and liberals intensified. Various conservative-minded groups sustained protest through magazines such as the *Christian Challenge* and the *Living Church* and interest groups such as Forward in Faith and the Society for the Preservation of the Book of Common Prayer. There had also been tiny separatist movements such as the Anglican Orthodox Church launched by James Parker Dees in the 1950s. Conservative protest escalated when the Prayer Book was revised and the ordination of women was approved.

Meanwhile, liberal hopes turned from worship and the ordination of women to the place of gay people in the church. In 1974 Integrity arose as the first gay advocacy group among Episcopalians. Bishops Paul Moore of New York and John Spong of Newark ordained openly gay people as priests in the 1980s and 1990s. By century's end it was clear that there was a noticeable gay presence among clergy and laity, and calls for an openly gay bishop led to the election of Gene Robinson of New Hampshire in 2003. Although the Episcopal Church largely preserved unity in the face of earlier changes in its life, significant rifts occurred over homosexuality.

In response, new separatist groups such as the American Anglican Council arose, and conservative leaders such as Bishop Robert Duncan of Pittsburgh forged ties with notable figures in the wider Anglican world, including Archbishop Peter Akinola of Nigeria. A small-scale "realignment" began as some conservative Episcopalians found affiliation with like-minded Anglicans overseas. A lengthy court case in Virginia centered on the legal right of eleven breakaway congregations to retain their property when they disavowed the Episcopal Church for overseas ties. Across the country there were instances of conservatives claiming they could switch affiliations. Majorities in four dioceses—Fort Worth, Texas; Pittsburgh, Pennsylvania; Quincy, Illinois; and San Joaquin, California—voted to align with a South American branch of the Anglican world.

Despite the public furor less than 5 percent of Episcopalians took such steps. The extent of conservative militancy was unprecedented, but a larger trend overshadowed it. Amid struggles between liberals and conservatives Episcopal life increasingly was defined by unofficial groups and initiatives unrelated to "culture wars" issues. A proliferating number of unofficial groups encouraged new forms of spirituality, education, and ministry without ideological intention. Education for Ministry and Disciples of Christ in Community, two projects of the University of the South, gained popularity as study programs conducted in local settings. Similarly, Alpha, an English program in basic Christianity, gained American adherents and transcended its evangelical origins. Various programs and networks linked Episcopalians in study and mission. By the end of the twentieth century more Episcopal parishes were engaged in mission projects locally and beyond than ever before. Such connections could involve local churches with little connection to national church life. Many churches sustained local projects that had considerable impact on assuaging human need.

In one sense grassroots trends that sought to transcend conflict reflected the differences within the church. Various Episcopal groups justified their intentions in terms of building the church as the kingdom of God. Liberals spoke of inclusivity and acceptance, conservatives in terms of adherence to tradition, especially scripture. But most Episcopalians sought to avoid conflict by turning inward to personal and small-group spirituality and mission that might work toward building the kingdom. The kingdom of God bespoke a new emphasis on local faith community and a diminished reliance on ideologies or institutions.

Esoteric Movements

Esotericism refers to a broad array of movements that have explored religious mysteries outside the Western biblical heritage. The word *esotericism* derives from the Greek *esoterōs* or “inner,” thereby drawing attention to religious paths characterized by interest in exploring the innermost regions of the self through philosophical investigation or experiential techniques. Esotericism’s emphasis on inner exploration as the path to spiritual awakening extends back in Western history at least to Plato and has been implicated in a wide range of American religious expressions, including those that are variously referred to as occultism, perennialism, harmonialism, metaphysical religion, or New Age.

The term *esotericism* has many meanings. In a strict sense the word connotes the quest for *gnosis* or inner knowledge, the knowledge gained by entering into the self to attain spiritual enlightenment. What constitutes a religious movement as esoteric is thus that it values forms of religious knowledge that are not available through the common or public teachings of the institutional church. To learn this esoteric knowledge, individuals must be taught how to turn inward and descend into progressively more enlightened states of spiritual awareness. Some commentators emphasize esotericism’s tendency to see itself as part of the “perennial tradition” that is said to constitute the mystical core of all religions and that is predicated on the belief that the individual soul is intimately connected with absolute reality. Other commentators highlight the role of “secrecy” in esoteric traditions and the fact that some esoteric movements require special initiatory rites before newcomers can be entrusted with their teachings. While it is true that esoteric movements believe that not all people are prepared to undertake the inward journey that will initiate them into the higher mysteries of spiritual knowledge, few are secretive in the sense of deliberately hiding or disguising their teachings. Perhaps the most distinctive features of American esotericism have been its fascination with certain mystical states of mind and its belief in the self’s interior connection with higher spiritual realities.

Esoteric spirituality is thus distinguished by its emphasis on the individual’s quest for special knowledge leading to

spiritual attainment. At the root of all esoteric movements lies the human longing for mystical illumination. Unlike the nation's churches or synagogues, however, American esoteric movements teach that such illumination can be attained outside the biblical tradition and without the mediation of either a savior or a religious institution. Yet despite esotericism's seeming variance from cultural orthodoxy, many of its distinctive beliefs have over time become part of America's cultural consciousness.

European Background

The forms of esoteric spirituality that have flourished in the United States have varied historical roots. Awareness of these historical sources of esotericism is especially important for understanding how successive generations of Americans come to embrace these somewhat offbeat religious systems. Unlike persons who affiliate with institutional religion, individuals almost never become introduced to esotericism through typical processes of religious socialization (for example, family attendance at organized worship services, Sunday schools, formal catechism lessons). Instead, persons learn about esotericism through personal reading, attending a lecture, or chance conversation with those who have already investigated alternative paths to spiritual attainment. A single idea is often enough to incite fascination with novel understandings of the self and to kindle a desire for personal transformation.

Beginning with Plato, many Westerners have pondered how one might expand personal consciousness to experience directly those realities that transcend sensory apprehension. Plato's confidence that the properly disciplined mind can discern eternal truths has inspired numerous versions of Neoplatonism, as exemplified in the writings of Plotinus in the third century (CE). Both ancient Orphic religion and early Greek Gnosticism also taught that one must pierce behind outer sensory appearances to discover transcendent truths. The classical foundations of Western philosophy thus contain mystically charged elements that might inherently arouse fascination with the hidden depths of the human psyche or kindle desire to embark on a path of self-transformation.

A renewed interest in Neoplatonism helped esotericism to flourish during the Renaissance. Ficino's translation of a Greek manuscript that has come to be known as *Corpus Hermeticum* sparked interest in non-Christian spiritual philosophies. Although we now know that the text was written in Alexandria sometime during either the second or third

century (CE), it was originally thought to have been authored by the legendary Hermes Trismegistus in ancient Egypt. What came to be known as Hermeticism derives from the text's evocative explanations of how magic, astrology, and philosophy might combine to show a path to spiritual attainment. Those who longed for ecstatic spiritual discovery embraced Hermeticism as an authoritative guide to direct knowledge of the divine without the mediating role of the Christian church.

Hermeticism dovetailed with other Renaissance expressions of esoteric spirituality. Both Christian and Jewish Kabbalah stimulated interest in the "correspondences" that connect diverse levels or realms of the cosmos—both visible and invisible. Material reality, the inner psyche, the stars, and the higher spheres inhabited by angels were all understood to exist as emanations from the godhead and to be intimately connected with one another through metaphysical laws. Alchemy, astrology, and eventually Paracelsus's romantic philosophy of nature provided additional avenues for speculating about the metaphysical correspondences between inner and outer worlds. The emergence of Rosicrucianism and the mystical philosophy of Jacob Boehme in the seventeenth century as well as freemasonry in the eighteenth century provided spiritually adventurous European thinkers even more systems through which they might explore metaphysical mysteries. Even today many of those who come upon these historical sources of esoteric spirituality are emboldened to journey outside the official institutions of Judaism or Christianity in their quests for spiritual edification.

Colonial Beginnings

Relatively few citizens in the American colonies were churchgoers. In the late 1600s, less than one-third of adults belonged to a church. Over the next hundred years this percentage actually declined to the point where, at the outbreak of the Revolutionary War, church membership had declined to only 15 percent of the population. But this is not to say that colonial Americans were nonreligious. While most did not belong to a church or profess any fixed creed, nearly all held beliefs about supernatural forces.

Divination, fortune-telling, astrology, and witchcraft permeated everyday life in the colonies. Belief in magic and the occult filled the same needs that Christianity did. They explained how superhuman powers affect human life and offered techniques for invoking these powers for protection and prosperity. Divination was the most widespread of these

non-Christian attempts to understand and manipulate supernatural power. Divining rods, for example, were used throughout the colonial period for detecting sources of underground water or locating lost treasure. Explanations of how divining rods worked were vague. Some theories attributed their power to the existence of natural sympathies between wood and water; other theories maintained that the rod was a conduit for the ritual magic emanating from the mind of the practitioner. Implicit in either theory was the belief that the natural and supernatural worlds lie in close correspondence with one another and that under certain circumstances action in one world can have causal influence over the other.

Fortune-telling was also relied on as a means of gaining supernatural insight into the powers affecting one's life. Fortune-tellers utilized a variety of techniques, but all worked on the assumption that certain individuals have especially developed connections with the supernatural realm from which they derived their prognosticating powers. The colonial era's best-selling almanacs printed horoscopes and astrological charts in response to popular desire for information on metaphysical forces influencing their commercial, agricultural, or romantic affairs. Virtually every colonist believed that certain individuals could harness supernatural power through the use of charms, conjures, and spells. Witches were but one of the many varieties of "cunning persons" who were thought capable of drawing on supernatural power to influence worldly actions. And thus, even though almost no Americans considered themselves witches, a majority nonetheless subscribed to the basic belief system underlying the practice of witchcraft.

Interest in magic and the occult was not restricted to the common folk. The library inventories that have survived from colonial estates indicate that the upper classes also dabbled in metaphysical speculation. Wealthy colonists avidly collected works dealing with astrology, alchemy, Hermeticism, Rosicrucianism, and other decidedly heterodox mystical philosophies. Thus, from the very onset, Americans of all social classes subscribed at some level or another to systems of thought that at least touched upon esoteric themes.

Nineteenth-Century "Isms"

Interest in esoteric philosophy during the colonial era was sporadic and mostly confined to the solitary reading interests of isolated individuals. The first appearance of what might be called an esoteric movement in America was the

rise of freemasonry during the eighteenth century. The European origins of freemasonry are not entirely clear. It probably arose out of periodic gatherings of the stonemasons who built churches and cathedrals in England. What was first an association concerned with the occupational development of stonemasons eventually developed an interest in ancient wisdom, particularly as promulgated in contemporary esoteric philosophies such as Rosicrucianism. The tools of masonry (the square and compass) became symbols for building moral and spiritual character. By the early eighteenth century, the movement began to organize into "lodges" that were responsible for recruiting, initiating, and educating new members. The movement spread to France, Scotland, and eventually colonial North America, where more than forty lodges had been established by the time of the American Revolution.

Freemasons used symbol-laden ceremonies to initiate new members and to mark their progress through successive levels of character development. Part of freemasonry's esoteric aura undoubtedly stemmed from the fact that it, like Rosicrucianism, used secrecy and ritual initiation to set itself apart from mainstream culture. Its teachings were also esoteric in nature. Masonry combined the impulse toward progressive thinking with a desire to understand religious mysteries. Masons were taught, for example, to move beyond biblical descriptions of God and to use the era's rational categories to view God as the impersonal grand architect of the natural order. The higher degrees of Masonic teaching initiated members into more expressly esoteric matters such as cabalistic Judaism, alchemy, and Rosicrucianism. Although many undoubtedly joined seeking solely the convivial, social side of Masonry, the movement nonetheless succeeded at popularizing a new approach to religion that blended Enlightenment rationality with a mystical appreciation of the hidden mysteries of our universe.

Another wave of mystical enthusiasm hit American shores with the nation's first introduction to the teachings of Emanuel Swedenborg (1688–1772). Swedenborg had already distinguished himself as one of the greatest scientists in Europe when, in 1745, he claimed to have been visited by angelic beings. These celestial beings selected Swedenborg to be the earthly vessel through which they communicated a series of spiritual teachings that explained the metaphysical structure of the universe as well as "the spiritual sense of the Scripture." Swedenborg's angelic guides taught him that the universe consists of seven interpenetrating dimensions, such as the physical, mental, spiritual, and

angelic. Spirit and matter are thus not opposed to one another but, rather, complementary and inseparable dimensions of a single universal system. The doctrine of metaphysical “correspondence” implied that all seven dimensions are intimately connected with one another and that the laws that govern any one level of the universe are but reflections of the laws that govern every other level. It also implied that physical events are, when seen in their full metaphysical context, often the images or results of the lawful workings of “higher” dimensions of existence.

Swedenborg’s vision of metaphysical correspondence led directly to his doctrine of influx. He taught that causal power is constantly emanating from God. Divine spirit flows outward from God through the successive dimensions of the universe. All true progress proceeds according to influences received from above. The physical body achieves inner harmony by becoming attuned to the influx of energies coming from the soul, the soul through contact with superior angelic beings, and so on up the metaphysical ladder. Anyone might obtain the requisite gnosis to make contact with higher spiritual planes through diligent study or by cultivating mystical states of awareness. The benefits of such interior contact with higher spiritual dimensions were numerous: spontaneous insight into cosmological secrets, conversations with angelic beings, intuitive understanding of scriptural verses, and the instantaneous healing of both physical and emotional disorders.

Translations of Swedenborg’s writings found a receptive audience among America’s self-styled “progressive thinkers” during the 1830s. Those whose spiritual outlook had been tempered by Enlightenment rationality were particularly drawn to Swedenborg’s emphasis on freeing religion from a literal reading of the Bible. Swedenborg’s notion of correspondence excited those who were drawn to science since it implied that scientific discoveries were incrementally shedding light on spiritual matters, too. And finally, those who yearned for intense, personal religious experience were inspired by Swedenborg’s own mystical experiences and his descriptions of humanity’s inner connection with higher, spiritual realities.

Swedenborg’s writings had a profound influence on one of America’s most admired thinkers, Ralph Waldo Emerson (1803–1882). Emerson was introduced to Swedenborg’s writings while he was a student at Harvard. Years later, in his treatise *Representative Men* (1850), Emerson acknowledged his debt to the Swedish visionary and made it clear that many of his own views were inspired by

Swedish scientist and religious ecstatic Emanuel Swedenborg claimed to have been visited by angelic beings who communicated spiritual teachings to him. Swedenborg’s writings, based on these conversations, explained the metaphysical structure of the universe as well as “the spiritual sense of the Scripture.”

Swedenborg’s doctrines of correspondence and influx. These beliefs help explain why Emerson eventually resigned his Unitarian pulpit to become a spokesperson for a religious philosophy that came to be known as transcendentalism. Emerson, like Unitarians generally, rejected Christian belief in the special divinity of Jesus. Nor could he believe that the Christian Bible was really a revelation from God. But unlike the majority of Unitarians, who embraced reason as humanity’s highest faculty, Emerson was a mystic at heart and believed that each of us is inwardly connected with universal being. For these reasons Emerson severed his formal connections with the Unitarians and joined with a number of like-minded seekers (George Ripley, Theodore Parker, William Henry Channing, Orestes Brownson, Henry David Thoreau, and Margaret Fuller) to form the Transcendental Club.

Emerson and his fellow transcendentalists articulated a form of esoteric spirituality that resonated perfectly with American culture's commitments to individualism and self-actualization. The core principle of transcendentalism is that every human being is, at depth, connected with an infinite spiritual power that infused our universe with law, beauty, and joy. This notion of divine immanence had important psychological consequences. It implied that God, as universal spirit, is always and everywhere available to the properly attuned mind. Emerson borrowed from Hindu mysticism the view that only a self-imposed, psychological barrier separates us from complete harmony with God's spiritual presence. For this reason Emerson emphasized the need to cultivate spiritually receptive states of mind. He personally found the quiet of nature conducive to such mystical reverie. In "Nature," Emerson wrote, "All mean egotism vanishes. I become a transparent eyeball; I am nothing; I see all; the currents of the Universal Being circulate through me; I am part or parcel of God."

Transcendentalism taught that true spirituality has nothing to do with church attendance, belief in the divinity of Jesus, or blind faith in biblical dogmas. Authentic spirituality is instead a solitary quest. It requires that we learn to become inwardly receptive so that we might establish inner correspondence with higher, metaphysical realms from which we might expect an "influx" of spiritual energy. In this way, transcendentalism was also teaching that the full human development is a spiritual attainment. The causal power that makes full self-actualization possible does not derive from the activities of the rational mind but rather from the in-streaming presence of an immanent divinity.

The transcendentalists succeeded in adapting esoteric spirituality to the needs and purposes of the American middle class. Hermeticism, Neoplatonism, Swedenborgianism, and Kabbalah contain far too many theological nuances and require far too arcane an intellectual sensibility to penetrate very far into cultural thought. Most of the classic works in esoteric philosophy utilize terminology rooted in either ancient or Renaissance European history. But transcendentalism developed a vocabulary that adapted esoteric principles to the basic issues that have historically defined American identity: a covenant linking humans with God, the existence of a higher law, the progressive bent of both nature and history, the free and morally responsible individual, and the work ethic that holds that effort and self-discipline lawfully result in prosperity. This process of linking esoteric principles with enduring themes

in American culture continued in two more nineteenth-century "isms"—mesmerism and spiritualism.

The Austrian physician Franz Anton Mesmer (1734–1815) added another chapter to the history of Western esotericism when he induced sleeplike trances in his patients only to have them experience profound healings and inner transformations. "Mesmerized" patients claimed they felt the influx of an invisible energy that Mesmer termed *animal magnetism*. This subtle energy was thought to be a vital, life-giving energy that permeates the universe. Any disruption of the flow of animal magnetism into, or through, our body deprives us of this vital force and leads to disease. Medical cures therefore require placing patients into receptive states of mind that facilitate the inflow of animal magnetism into their systems. Even more astonishing than these instantaneous healings were the claims that persons who could be placed into the deepest mesmeric trances spontaneously evidenced feats of paranormal mental powers including telepathy and clairvoyance.

Throughout the 1830s and 1840s, Americans flocked to public demonstrations of the "science of animal magnetism." Audiences were amazed as friends and neighbors were mesmerized right before their eyes. Testimonies of medical cures and paranormal feats seemed to offer empirical proof that the human mind has access to unlimited spiritual powers. Mesmerism was thought to be bringing the physical and spiritual laws governing our existence into a single scientific system. Even though mesmerism had no overt connection with institutional religion, it resonated with the era's Protestant theology in a way that made a seamless connection between Protestant revivalism and esotericism. Mesmerists, no less than the revivalist preachers, taught that human brokenness comes from having fallen out of rapport with the invisible spiritual workings of the universe. Mesmerism, like revivalism, provided inwardly troubled individuals with an intense experience believed to restore them to harmony with unseen spiritual forces. And the mesmeric trance, no less than the emotion-laden conversion experience, gave powerful and convincing experiential grounds for the belief that humanity's lower nature can be utterly transformed and elevated when brought under the guiding influence of spirit.

Yet the mesmerists differed from revivalists in one very important respect. Far from reproaching individuals for questioning religious orthodoxy, they encouraged them to do so. Mesmerism thereby emboldened those who, while committed to reason and science, nonetheless hungered for a spiritual outlook on life. Mesmerism taught them that the

successively deeper levels of the human mind lawfully correspond to the successively more subtle levels of the universe that had hitherto eluded scientific detection. There was, then, an esoteric message at the heart of mesmerism's "discovery" of the spiritual powers available through our unconscious minds.

There were numerous reasons why Americans developed an interest in mesmerism. Healing testimonies gave mesmerism the aura of an empirically based science that furnished practical results. Reports of paranormal mental feats added a fascinating lure that, among other things, appeared to provide scientific evidence that the human mind has previously untapped potentials. During the 1880s and 1890s, mesmerism gave rise to a popular movement known variously as Mind-Cure or New Thought that linked belief in the "power of positive thinking" with its belief in the self's inner connection with subtle energies. Although some embraced New Thought beliefs as a psychological strategy for obtaining worldly prosperity, others discovered an esoteric worldview that articulated the metaphysical principles of correspondence and influx. Importantly, Mary Baker Eddy (1821–1910), a former patient of a mesmerist healer, blended mesmerism's esoteric teachings and biblical Christianity in such a way as to develop a religious movement known as Christian Science. Both through the Church of Christ, Scientist and Mrs. Eddy's many publications, Christian Science has played a significant role in bringing esoteric concepts into Americans' religious vocabulary.

As early as 1843 a young man by the name of Andrew Jackson Davis (1826–1910) volunteered to serve as a subject during a lecture-demonstration of mesmerism in his hometown of Poughkeepsie, New York. Davis was apparently adept at entering the deepest levels of the mesmeric trance. He spontaneously performed such feats as reading from books while blindfolded, telepathically receiving thoughts from those in the audience, or traveling clairvoyantly to distant locales. More amazing still, he claimed that while in this state of mystical reverie he made contact with the spirits of deceased persons. Davis thus became the first American to develop a wide reputation as a "spirit medium" or "trance channeler."

The spiritualist movement that flourished over the next five decades frequently gave rise to gaudy séances and obvious charlatanry. Yet we cannot overlook the fact that from the movement's outset there was always a deeper, esoteric core to spiritualist thought. Davis claimed that one of the first spirits to make contact with him was none other than

Emanuel Swedenborg. Swedenborg and other spirits dictated messages through Davis articulating an elaborate metaphysics that shares many principles with Neoplatonism, Hermeticism, and other versions of Western esotericism. Davis's so-called "harmonial philosophy" taught that the universe consists of several concentric spheres arranged in such a way that causal energies can flow from "higher" spheres to "lower" ones. Davis was thus giving new expression to such classic perennial beliefs as the continuity between the material and spiritual worlds, the inner divinity of every person, and the common truth underlying all religious beliefs.

The esoteric philosophies that attracted nineteenth-century American audiences were decidedly less arcane than their counterparts in Renaissance Europe. Public interest in these countervailing religious systems always teetered between sheer curiosity over paranormal phenomena and serious philosophical inquiry. The very cultural forces that made esoteric principles popular to a wide cultural audience simultaneously fated these principles to become amalgamated with broader (and decidedly nonspiritual) goals and ambitions. It seems, moreover, that Americans were decidedly interested in the practical benefits to be obtained from esoteric teachings, whether these be measured in terms of physical healings, emotional serenity, or economic success. Even by the time theosophy appeared near the turn of the twentieth century, Americans had already begun to filter diverse esoteric systems through a fairly uniform set of cultural filters.

Theosophy's Esoteric Legacy

Another significant stage in the process that has introduced esoteric concepts into Americans' cultural consciousness came when Madame Helena Petrovna Blavatsky (1831–1891) immigrated to the United States in 1872. Little is known about Blavatsky's early life in Russia. It appears that she traveled extensively through Europe and gravitated toward people who dabbled in mesmerism, spiritualism, and other occult philosophies. In New York she earned a reputation as a trance medium, channeling messages from advanced spiritual teachers whom she referred to as the "mahatmas" (the Hindu term for "great souls"). She eventually met up with Colonel Henry S. Olcott, a lawyer who was deeply interested in the scientific and religious implications of spiritualism. As it turned out, the mahatmas took special interest in Olcott. Through Blavatsky's trances the mahatmas sent Olcott a message instructing him to found

an organization for the purpose of disseminating spiritual wisdom neglected by Western religious institutions. By 1875, Olcott and Blavatsky had launched the Theosophical Society, dedicated to bridging the gulf between science and religion through the study of mesmerism, spiritualism, and the universal ether.

Blavatsky claimed that during prior travels through Asia she had come upon the mahatmas, members of the Universal Mystic Brotherhood who lived in the Himalayan Mountains of Tibet. The mahatmas were humans who had so developed their inner connections with higher realms that they were now spiritually evolved and could both travel and communicate through purely psychic means. The mahatmas passed their spiritual secrets on to Blavatsky, which she in turn published in such classic esoteric texts as *Isis Unveiled* and *The Secret Doctrine*. In these publications Blavatsky synthesized the major teachings of the Western esoteric tradition. She articulated an emanationist cosmology that explains how life originated with the emanation of a “divine spark” into the world of matter—a spark that is now gradually evolving back to its divine source. This cosmology enabled theosophy to embrace Darwinian theories of evolution, yet do so in a way that reduced biology to but a lower level of a more cosmic, spiritual process.

Blavatsky went even further, teaching that we exist in a multidimensional universe. What is often referred to as the theosophical “law of seven” explains that there are seven hierarchically arranged levels of mind, seven metaphysical planes, seven stages of cosmic evolution, and seven grades of masters. Borrowing from Asian vocabularies that describe the “subtle” layers of selfhood, Blavatsky taught that we exist simultaneously on seven levels—including what she termed the astral and etheric planes. Other theosophical writers expanded upon this theme and taught that we consist of seven subtle bodies. These other bodies connect with our physical body at the seven chakras (or spiritual centers) located at various points along our spinal columns. Theosophy explained that meditation opens our chakras up and enhances our connection with these other planes of existence (from which we receive higher energies that promote physical health, emotional serenity, and expanded mental powers).

Theosophy thus introduced American audiences to such classic esoteric themes as an emanationist cosmology, the multidimensional structure of the universe, and humanity’s inner connection with these other cosmic dimensions. Blavatsky also emphasized the perennialist belief that the

world’s religions represent cultural elaborations of a common set of mystical insights. In theory, then, Blavatsky claimed that all religions share a common esoteric source. Yet in practice she seemed especially anxious to argue that Jesus’ teachings were not original, that the Bible merely copies other ancient texts, and that Christian theology has largely distorted the mystical insights on which it was originally founded. Theosophy’s anti-Christian polemic undoubtedly prevented it from penetrating deeply into the American middle class. At the same time, its bold confidence in non-Christian philosophies added a certain aura to those eager to explore decidedly exotic forms of mystical spirituality.

Even at the height of its popularity, theosophy never had more than ten thousand members in the United States. Despite these relatively small numbers, however, theosophy has exerted considerable influence on the historical transmission of esoteric spirituality in the United States. *Isis Unveiled* sold a thousand copies in the first ten days after its release and has sold more than 500,000 copies to date. Moreover, persons directly influenced by theosophy have exerted a tremendous influence on those aspects of American religion that exist outside of formal religious institutions (for example, Rudolf Steiner, Alan Watts, Jiddu Krishnamurti, Edna and Guy Ballard, Alice Bailey, and D. T. Suzuki). And theosophy can also be credited with injecting into Americans’ spiritual vocabulary such decidedly esoteric concepts as chakras, subtle energies, ascended master teachers, and Asian meditation practices that aim toward ecstatic experiences of enlightenment.

A few of theosophy’s direct legacies deserve special mention. Following Blavatsky’s death, Charles Leadbeater (1854–1934) and Annie Besant (1847–1933) assumed leadership of the Theosophical Society. Schisms, however, eventually split the group into two rival movements, the American Theosophical Society and the Theosophical Society in America. One especially talented theosophist, Alice Bailey (1880–1949), channeled a series of messages that established her as one of the movement’s leading authorities. Bailey’s teachings of the cosmic hierarchy, the seven rays, and humanity’s ongoing spiritual evolution reinforced basic theosophical principles. Bailey also stirred up eschatological fervor by teaching that humanity was making rapid spiritual progress, thereby making the dawn of a new age imminent. This new age, Bailey explained, would be one in which unprecedented numbers would be trained in special esoteric schools and divine light would radiate down through the cosmic

hierarchy into the minds and hearts of humans. Although the Arcane School that she founded did not survive her death in 1949, Bailey's teachings live on in any number of New Age and metaphysical systems.

Another fascinating movement spawned by American theosophy is the "I AM" movement founded by Guy (1878–1939) and Edna Ballard (1886–1971). The Ballards tell how, in 1929, Guy was hiking on Mt. Shasta, California, when he was visited by the seventeenth-century occultist Saint Germain who had now transformed into an ascended master. Saint Germain taught Ballard to think of God as the primal light or "I AM" presence emanating from the creative source of our universe. Reiterating the emanationist cosmology found in many esoteric systems, Saint Germain taught Ballard to understand that primal light emanates from God and is the basis for everything in the universe. As the "I AM" becomes individualized, it forms the essence of every person. The Ballards' "I AM" movement therefore understood its principal mission to be that of teaching persons to invoke and activate the "I AM" presence within themselves. Another key doctrine was belief in the existence of ascended masters who through several human incarnations have evolved beyond human limitations and now seek to tutor other souls as they progress along their individual paths of spiritual evolution. These ascended masters can be called upon to guide or assist us if we but learn to open ourselves to the love and power they radiate toward us.

The "I AM" movement's influence on American religious life extends well beyond the number of individuals who formally affiliated. Its classes and publications provided thousands of Americans with a vocabulary for expressing their desire to receive spiritual guidance from ascended beings and to call upon the "I AM" presence deep within themselves. Perhaps the clearest example of how these teachings continued to ripple outward toward larger numbers was the work of Mark and Elizabeth Clare Prophet, who incorporated them into their own new religious movement, the Summit Lighthouse (an organization encompassing both Summit University and the Church Universal and Triumphant), that eventually issued more than seventy-five books on the teachings of the ascended masters.

Theosophy also influenced another of the twentieth century's most gifted esoteric writers, Rudolf Steiner (1861–1925). Steiner lived in Austria, where he became interested first in the more radical spiritual implications of

the writings of Goethe, Nietzsche, Franz Brentano, and Wilhelm Dilthey. By 1904 Steiner was appointed by Annie Besant to head up the Esoteric Society for the German and Austrian sections of the Theosophical Society. Steiner eventually severed ties with theosophy and developed his own competing organization, the Anthroposophical Society. Steiner's anthroposophy taught that humanity retains only a vestige of its original consciousness. Yet it can recover its capacity for horizonless vision by developing initiatory openings through such means as study, art, music, and the informed use of imagination. The Anthroposophical Society was more about books and ideas than organizational practices. Lectures, publications, and private study were the primary vehicles through which Steiner's ideas eventually influenced recent American esotericists such as Richard Tarnas and Ken Wilber.

More Recent Vehicles of Esoteric Thought

Contemporary American esotericism, much like its historical predecessors, consists of a loosely connected complex of metaphysical ideas. Many are introduced to this countervailing system of thought through private reading and study. Thus, for example, the writings of two twentieth-century European esotericists, G. I. Gurdjieff and P. D. Ouspensky, have attracted a small core of modern readers to the contemplation of spiritual mysteries. The transmission of esoteric teachings is thus largely a solitary endeavor guided by the idiosyncratic interests of those "spiritual seekers" who feel compelled to venture beyond established religious institutions. Occasionally, however, certain individuals or groups have emerged and introduced esoteric themes to larger numbers of people through some combination of paranormal phenomena and well-orchestrated promotional efforts (lecture tours, weekend seminars, or publications). Esotericism, then, is a varied phenomenon in which rarefied philosophical treatises exist side by side with sheer enthusiasm for paranormal displays. Newcomers to esoteric concepts might find themselves initially attracted by elements from either end of the spectrum.

By the last few decades of the twentieth century, esotericism had succeeded at becoming part of the vocabulary with which Americans understand the dynamics of personal transformation. Indeed, there has been a steady undercurrent of esoteric references in a great deal of the literature through which Americans learn about various forms of self-discovery, self-healing, and self-actualization. One path through which esoteric ideas first reached larger American

audiences was the work of the Swiss psychologist Carl Jung (1875–1961). Jung had, for example, been attracted to medieval alchemy and recognized how the quest to transmute base metals into higher metals was, at root, a deeper spiritual quest for self-transformation. Jung's elaboration of the collective unconscious and its archetypes gave modern expression to the age-old esoteric belief in the self's inner connection with the absolute and the symbolic forms that guide the journey toward such connection. The mythologist Joseph Campbell (1904–1987) also expanded on the archetypal nature of the psyche and encouraged American reading audiences to find deeper, symbolic significance in expressions of the literary imagination.

During the 1960s and 1970s a movement developed within American psychology that encouraged serious consideration of the subtle complexities of the human psyche. The school of humanistic psychology popularized by Carl Rogers, Rollo May, Abraham Maslow, and others gave rise to a renewed interest in "transpersonal psychology." Transpersonal psychology sought models of human consciousness that could account for the experiential aspects of such varied phenomena as meditation-induced transformations, psychedelic experience, out-of-body experiences, and instances of paranormal cognition. Stanislav Grof, Ken Wilber, Ram Das, and Timothy Leary are but a few of those who infused modern psychological discourse with ancient esoteric concepts. One consequence is that today's large range of "self-help" literature is sprinkled with concepts that evoke esoteric views of self and cosmos. Fragments of esoteric philosophy have thus infiltrated American cultural consciousness, even if many who employ esoteric terminology have not fully considered its stark contrast with more conventional religious and secular outlooks.

Almost any so-called New Age organization—whether confined to the Internet or located in a distinct retreat center or school—helps transmit esoteric ideas to Americans who pursue spiritual edification outside Judeo-Christian institutions. Two examples of contemporary organizations that have sustained serious investigation of esoteric philosophy are the Institute of Noetic Sciences in Petaluma, California, and the Esalen Institute in Big Sur, California. Both organizations provide institutional support for ongoing programs of research and education in addition to offering short-term retreat experiences aimed at fostering personal transformation.

The word *esotericism* often conjures up the image of a select few individuals devoted to the disciplined study of

arcane texts. The historical record indicates, however, that a persisting minority of Americans have been attracted to movements advocating such distinctive esoteric themes as (1) the correspondence of visible and invisible levels of the cosmos, (2) the multiple levels of the human mind, and (3) the role that awakened knowledge of these other levels of self or cosmos has in producing experiences of self-transformation. These are, moreover, the major themes of the spirituality that characterizes perhaps 15 percent of the American public who, while actively interested in spiritual topics, are nonetheless not affiliated with a religious organization. Those attracted to esotericism today, as throughout American history, are motivated by a variety of interests ranging from sheer fascination with the paranormal to an abiding desire for felt connection with a higher spiritual order of things. Esoteric movements thus constitute an enduring tradition of spirituality in America and have, in fact, succeeded in becoming an identifiable component of popular culture.

Establishment, Religious

Colonists settling in America created communities in which they enjoyed both freedom from religious persecution and the ability to create ideal societies based upon their particular religious worldview. Many European immigrants fled the persecution inherent in life as a minority in a country with an established state religion. Yet this did not mean that all colonists rejected religious establishment outright. The reality of established religion in Europe meant that an official state religion directed governmental affairs. This meant not only that particular religious beliefs and practices were financed and determined by the government but that religious minorities were often persecuted for a failure to conform. Some who came to the New World sought a new system of government in which religious freedom ruled instead of a religious establishment. For others, America provided an opportunity to establish their own religion, free from the influences of others and free to persecute those who failed to conform to the new majority faith. Yet as these communities came into contact with one another and religious diversity grew, these establishments were challenged. Religious establishments ended with the creation of the United States of America and the drafting of the Constitution. Though the Bill of Rights sets out a clear mandate against established religion, controversies over the nature and extent of this clause have led to numerous controversies, many involving U.S. Supreme Court cases, that will likely continue for years to come.

For those who sought religious toleration and those who sought new forms of establishment, the beauty of America rested in the opportunity to create an ideal community centered on their own religious and civic principles. As more of these communities arrived on American soil and as these communities began to organize into a nation, conflicts arose. Even after religious establishment was clearly prohibited on the federal level by the U.S. Constitution, the actual ramifications, limits, and boundaries of this clause have been contested by those within and outside of the religious mainstream.

Colonial Establishment

The Puritans stand as a prime example of this twin desire for religious freedom and establishment as the earliest Puritan settlers clearly articulated their belief that God stood on their side, watching over and blessing their efforts provided they showed faith, humility, and a sense of purpose.

Individuals such as John Winthrop, early governor of the Massachusetts Bay Colony, articulated a type of civic religion that marked their purpose as a divine one, their colony as one that enjoyed divine providence, and their people as faithful and humble. This covenantal Puritan perspective on the relationship between religion and government foreshadowed that of the early republic. While the founders justified their belief that church and state should be separated by articulating a concern for the integrity of religion and an avoidance of corruption, this same commitment to religious vigor underlay colonial establishments of religion in the various societies.

Underlying this view as well was the belief that God underwrote and watched over both the church and the state. All-powerful, God called the church to spread the message of true religion, right living, and the path to salvation. Moreover, the church existed under a mandate of service to both God and man. The state served as God's instrument for the regulation of human activity, the punishment of evil, and the reward for right living. Through the cooperation of church and state, society would remain godly and righteous. In practice, this meant that though official separation existed for the protection of religion, church and state would enjoy mutual support. The state would provide the church with land and other economic support while structuring its laws and regulations on citizen behavior to underscore regular church attendance and proper morality. The church would likewise support governmental functions by opening church buildings for civic purposes such as meetings, trials, and ceremonies. Moreover, the clergy regularly encouraged civic involvement through sermons preached each Sunday.

In Virginia, the Church of England held sway. The ruling elite managed not only the governmental offices but also church offices. Officeholders were required to affirm allegiance to the Church of England, and the legislative bodies heard not only civil cases but also cases involving immorality and failure to regularly attend church. The Virginia House of Burgesses of the late seventeenth and early eighteenth centuries instituted taxes to fund ministerial work, to maintain and build church buildings, and to support needy members of the community. The General Assembly also regulated the punishments and free exercise of dissenting religious groups. Most opposition to this arrangement came from either religious minorities seeking greater freedom or those within the Church of England who worried that too much governmental entanglement would negatively impact their religious work.

North Carolina became the first southern state to separate religion and government. Though the Anglican Church attempted to maintain and create a strong presence and influence on the government and citizens of these colonies, the establishment never took hold. The disorganization of the ruling bodies combined with a diversity of inhabitants meant that public support never matched the original ideal. Based on many principles of John Locke, the Fundamental Constitution of 1669 failed ratification, but the revised constitution that followed struck a balance that eliminated many of the feudal elements of the earlier document while maintaining a commitment to freedom of religion for theistic faiths. As a result, the Carolinas became a haven for religious minorities.

Controversies and Protests Involving Colonial Establishment

Even in colonies with a clearly established religion, controversies emerged over right doctrine, right systems of rule, and the right connection between religion and government. Within the Puritan stronghold of New England, theological disputes caused lasting divisions. In 1636, a woman named Anne Hutchinson drew criticism for articulating a theology distinct from the accepted norm. A devoted follower of John Cotton, the well-known preacher, Hutchinson had begun to hold small group meetings during the week to discuss Cotton's sermons. Over time, she began to use these forums to espouse her own interpretations. These small groups soon turned into lectures that drew substantial attention due both to the numbers in attendance and the nature of her message.

Of particular concern were her statements regarding the covenant of grace. Hutchinson emerged from a Calvinistic theology that argued that the elect received salvation as part of the covenant with God that mandated their belief in Christ. For these elect, after their justification, good works would follow, not to achieve salvation but as evidence of their election. Hutchinson altered this understanding by de-emphasizing works. The idea that works follow justification undermined, for Hutchinson, the basic Protestant idea of salvation through faith alone. If salvation was unearned, no benefit or value would be connected to works. For the clergy of New England, such an understanding could lead the weak to a life of immortality. Thus, Hutchinson was labeled an "antinomian" for what was perceived as her rejection of moral law. Her anger at the accusations and statements against the clergy of the colony almost led the colony into schism.

Similar controversies brewed within Baptist groups. The distinction between General and Particular Baptists arose during the seventeenth century as the former espoused a theology dependent on the possible salvation of all humanity and the idea of salvation as a choice to be faithful. For the latter group, the Calvinistic theology of predestination and salvation through God's grace alone reigned supreme. Despite bitter disputes amongst Baptists, these groups faced an even larger challenge—persecution by the Church of England. This persecution stemmed largely from the conviction of nearly all Baptists that the Bible clearly rejected any type of church establishment or interference of the government with religion. The Baptist belief in the believer's baptism clashed not only with the Church of England but also with other minority groups such as Congregationalists and Presbyterians who suffered less persecution as a result.

The Baptist insistence on clear separation between church and state was perhaps most famously articulated in the letter from the Danbury, Connecticut, Baptist Association to recently elected President Thomas Jefferson in October 1801. In this letter, the group expressed concerns regarding the lack of safeguards in their state on religious liberty. In his reply, Jefferson first employed the metaphor of a wall of separation between church and state in his support of their sentiments and concerns.

Other minority communities also articulated a commitment to religious freedom. For example, Pietistic Separatists took their Calvinistic understandings and applied them in new ways to advocate a clear separation between religion and government, as did early evangelicals and Quakers such as Roger Williams and William Penn. These opponents to establishment advocated their position out of a conviction that communities should value freedom of religious conscience not only because this free choosing of faithfulness marked true faith in the world but also because of a belief that the state was necessarily corrupt, worldly, and, by definition, contrary to the focus and purpose of religion. Strict separation would thus lessen these corrupting influences and allow religion to flourish. As a result, the states of Maryland and Pennsylvania were known for their openness to a variety of religious communities and commitments. Beginning as early as the 1640s, the Cambridge Platform and the 1649 Maryland Act Concerning Religion were enacted to emphasize a commitment to religious freedom and free exercise of religion for all Christians. Expanded more broadly, these ideas would find later expression in the Bill of Rights.

Yet increasing diversity brought on by continued immigration led to conflicts in several colonies. Anglicans, Baptists, Roman Catholics, and Quakers began to arrive in the mid-seventeenth century, and the Puritan stronghold in New England faltered. While Quakers settled in Pennsylvania and Catholics in Maryland, other Protestant groups dispersed throughout the colonies. Varieties of nationalities began to arrive—Germans, Scots-Irish, and other groups came seeking religious freedom and the ability to practice their faiths autonomously and with integrity. Despite the wealth of land available for individual groups to start their own communities, intermixing occurred. As diverse groups began to interact and larger-scale organization began to take shape, persecution entered the arena as well. While the Puritans remained the majority faith following their arrival in Plymouth, Massachusetts, in 1620, other groups began to arrive, and the government worked to fine, punish, and persecute those who failed to live up to the Puritan standards of right living and morality. The Salem witchcraft trials of the 1690s and the continued persecution of Quakers throughout Massachusetts demonstrated both concern for proper doctrine and fear of subversion of government and perversion of religion. As diversity grew, such persecution became less practical and less popular, and it ultimately subsided as the inherently peaceful and demonstrably Christian nature of the Quaker believers and the falsehoods underlying charges of witchcraft came to light.

Though each colony possessed a religious authority and emphasized its particular perspective on the proper relationship between church and state within its boundaries, a growing consensus mandated some level of freedom for religious minorities, and this growing sentiment was soon codified. Another contributing factor to this increase in cooperation was religious revivalism. The Great Awakening of the mid-eighteenth century served to solidify the importance of religion in the American identity in a way that highlighted a common denominator of Christian faith amongst various denominations. It thus encouraged religious Americans to see past denominational differences and understand their fellow countrymen and -women as part of the same mission and working towards the same goal. Indeed, from the late seventeenth through the mid-eighteenth century, a growing unity amongst colonies began to emerge, centered on the Puritan ideas of covenant and divine providence. The Continental Congress (1774–1789), burdened with the task of reconciling differences amongst the colonies while maintaining the sovereignty of each,

integrated religious language into its ceremonial practices—regular prayer, fast days, days of prayer, and religious tests for public office—while maintaining a commitment to religious liberty. Both commitments were carried on into the constitutional period.

Constitutional Period

When the American colonies successfully fought the Revolutionary War and set about uniting as one country, a primary question for the founders was the proper relationship between religion and government, particularly considering the wealth of religions present in the young nation. Keenly aware of the variety of world religions, not only variations of Christianity, the founders recognized both the uniquely religious underpinnings of American identity, brought forward by the justifications for most early settlements in America, and their desire to create a nation centered on principles of equality, freedom, and common values of virtue.

The awareness of religious diversity led the founders to also address this pluralism in their work on the Constitution. James Madison saw this very diversity as the primary safeguard for religious freedom. In his *Federalist Papers*, Madison simultaneously expresses concern over possible tyranny resulting from religion and celebration of religious diversity. That many of those involved in the framing of the Constitution subscribed to a deist worldview—which, though it shared much with its cousin Christianity, differed on many points as well—also affected this perspective.

Thomas Jefferson receives credit for the earliest articulations of what would become the First Amendment. His work in Virginia to ensure freedom from and for religion received support from James Madison. Jefferson wrote a bill to that effect in 1777 and proposed it in 1779 to the Virginia legislature. With a passionate speech in support of its principles by Madison and after several amendments and long debates, the bill was passed in 1786. Moving beyond Patrick Henry's insistence that a general Christian faith underlie America's new government, Jefferson and Madison insisted that even the most general and generic statement of faith would put in the hands of the government a concern best left to rational and reasonable individual minds.

During this period of discussion and debate, the Constitutional Convention met in Philadelphia, Pennsylvania. In 1787, this body determined that the federal government would not make religious tests, oaths, or other particular religious convictions requirements for eligibility for holding

public office. No official religion would be recognized as the state church, and religious individuals such as Quakers who morally objected to swearing oaths would be allowed to affirm them instead. This early form of the Constitution addressed many of Jefferson's concerns but, in his opinion, remained incomplete because of its lack of a statement on religious freedom. Although Jefferson did not attend the Constitutional Convention, he greatly influenced its proceedings on this matter. Madison demonstrated this influence when he proposed the first of ten amendments known now as the Bill of Rights. Madison's original wording was condensed and solidified to the present wording in September 1789.

The end results of this period of discussion and debate were the establishment and free exercise clauses of the First Amendment. The former reads, "Congress shall make no law respecting an establishment of religion," indicating not only that the government may not establish a national religion but also that more subtle support for or cooperation with religious bodies would not be permitted. For the first century and a half of the nation's history, few questions were raised as to the nature and limits of this clause. Moreover, before the Fourteenth Amendment was codified following the Civil War, the establishment clause was understood to only apply to the national government.

In the drafting of the Constitution, the question of religious tests for public office also took center stage. Discussions about Article VI of the Constitution, which eliminated such tests from requirements for federal office, centered not only on the need for religious freedom but also on theological concerns. Proponents of such tests advocated their continuation as a means of ensuring that men of good conviction and morality governed the new nation, while opponents argued that God alone could require such a test of the faithful and that it was completely inappropriate for the government to do so.

Supreme Court Jurisprudence

With a clear Protestant majority, those practices and customs that may have violated this separation were overlooked or assumed to be acceptable by those who shared the convictions behind them. In the years following the creation of the establishment clause of the United States Constitution, debate has continued as to the limits and reaches of this clause for various applications in American government and religion. Speaking generally, two schools of thought have controlled discussions of such cases. Those of the separationist

argument argue for a strict division between government and religion. For these individuals, Jefferson's wall of separation should be understood clearly as mandating an impermeable barrier that allows neither support nor even cooperation between these two realms of society. On the other side are accommodationists, who suggest that although separation means a careful limiting of all interactions between the realms, some cooperation and intermingling is not only acceptable but necessary for a well-functioning society. Moreover, they argue, sometimes such intermingling is necessary to prevent discrimination against religion.

Several court cases, beginning in the mid-twentieth century, have shown the changing perspective of the Supreme Court as it has vacillated between separationist and accommodationist rulings. Each case has helped to further define the boundaries of establishment and has developed methods for determining future establishment cases. One of the most well-known of these cases was 1947's *Everson v. Board of Education*. This case concerned the subsidizing of transportation of students to various schools via public transportation. In ruling to allow such subsidies for students in not only public but private (including parochial) schools as well, the Court affirmed the concept that the government has not only a mandate for separation but a mandate for neutrality. To limit the funding to public schools only would unfairly discriminate against private schools and the families that choose to send their children there. The funding was found constitutional also because it did not go directly to religious schools but to the parents, who then decided which school was to receive the funds. The opinions delivered in this case suggested that religious freedom and disestablishment ranked as one of the liberties protected by the due process clause, and in *Everson's* wake it became clear that all forms of government, at all levels, were subject to his requirement.

Addressing a concern regarding establishment in the government itself, the 1961 case *Torcaso v. Watkins* struck down any attempt to require religious tests for individuals holding public office. Though many states had mandated some testament of religious belief, even if a very generic one, such as belief in God, the Court ruled that the government should not undertake to force or coerce religious belief. The Court concluded that even something as seemingly innocuous as general belief in God amounted to establishment. The Court later refused to hear appeals of cases in the 1970s that challenged the constitutionality of the national motto, "In God We Trust." Two other cases in the 1960s came to

separationist conclusions. In 1962, *Engel v. Vitale* ended public school prayer as a clear violation of the establishment clause, particularly if mandated and orchestrated by the school administration. In 1963, *Abington School District v. Schempp* determined that recitation of biblical verses and the Lord's Prayer in public schools was also unconstitutional.

The limits of cooperation between religion and government were specified more fully in the 1971 case *Lemon v. Kurtzman*. In this case, the Court struck down a state law that reimbursed religious schools for textbooks and teachers that did not teach religious subjects. The court expressed particular concern for the subsidizing of teachers who might subtly or inadvertently advance religion even while teaching secular subjects. Perhaps the most forward-looking case thus far, *Lemon v. Kurtzman* laid out a three-pronged test for determining future establishment cases. For a policy to avoid establishment, its purpose must be secular, its primary effect must not be to inhibit or advance religion, and it must not foster an excessive entanglement of government and religion. By providing this threefold test for determining the limits of establishment, the Court attempted to clarify the limits of cooperation between religion and government. Recognizing that such cooperation would inevitably happen, the Court hoped to secure a healthy balance that provided equal opportunities and support to religious and nonreligious groups and individuals as well as limits to any indirect or ideological influence between religion and government. However, in 1997, the Court modified the Lemon Test in *Agostini v. Felton*. The Court clarified what the "effect" element of the test meant and suggested three primary criteria for determining whether a governmental action or program had the primary effect of advancing religion—government indoctrination, limiting beneficiaries of governmental benefits by religious conviction, or excessive entanglement. Though the Lemon Test and the alternate test offered in *Agostini v. Felton* continue to provide concrete and structured methods for examining establishment cases, their continued use is controversial. Certain justices find them ultimately unhelpful because of their vagueness; others who advocate greater involvement between religion and government see them as too restrictive.

Contemporary Concerns

Policy questions involving morality and religious conviction continue to push the boundaries or test the strength of the establishment clause. Governmental regulation of health care and lifestyle choices such as abortion, stem-cell research, sex

education in schools, and same-sex marriage consistently walk a sometimes dangerous line between moral prescription and necessary governmental involvement.

Increasingly, the question of establishment has arisen in regards to international initiatives and involvements of the United States. While the nation may be clear that it does not espouse one religion in any strict sense, more basic ideas about morality or human rights have raised questions as well. National standards on these questions have found their way into documents such as the Universal Declaration for Human Rights, and the concept of religious liberty has been exported and encouraged in a variety of international contexts.

Indeed, just as growing religious diversity and interactions with other cultures and communities challenged the earliest examples of religious establishment in colonial America, so too are growing religious diversity and interactions with other nations challenging the last vestiges of religious establishment in the United States. In the early twenty-first century, American citizens who do not ascribe to a monotheistic or even theistic religious belief, and other nations who either see American ideals and policies as contrary to their idea of God or argue for a more broadly providential God who has not singled out America from other nations, began to challenge the language of a providential God, America as a chosen nation, and even the phrase "under God" in the Pledge of Allegiance. Such issues continue to complicate the question of whether religious language and traditions in American culture will fall away or these elements are too fundamental to American identity to disappear.

Ethnicity

To understand religion in America, one must know the relationship between religion and ethnicity. Moreover, since both the concept of ethnicity and its relationship to religion have undergone substantial development over the course of American history, it is also important to trace the transition of this concept over time. To some, religion is one of the clearest markers of ethnic distinction, and certainly religious groups have been some of the most important carriers of ethnic traditions in the United States. Yet the relation of religious belief and ethnic identity is complicated and multifaceted, so that no clear and absolute relation can be drawn between the two.

The Concept of Ethnicity

The definition of the word *ethnicity* is simple, while the definition of its root word, *ethnic*, is complicated. *Ethnicity* refers to the set of qualities that define a group as being ethnic and, therefore, is a cluster of characteristics that any particular population might hold in common and that would define it as a separate entity. *Ethnic*, on the other hand, has a complicated history; it defines a certain group of people based on common characteristics. These characteristics might include distinctive racial, national, linguistic, cultural, or religious traits, as well as any number of combinations of these traits that would define a common ethnic group. There may well be other situations in which a group might be divided by one characteristic (such as language) and yet united by another of these characteristics (such as culture).

With the rise of nationalism and racial theories in early modern Europe, the concept of ethnicity often took on

racial and biological overtones; many sought the origins of ethnicity in purely physical characteristics. With the rejection of these racial theories in the twentieth century, the term *ethnicity* began to take on more of a cultural definition, stressing the intricate interweaving of cultural assumptions and decisions that united any group of people into a clearly defined group. The recent emphasis has been on ethnicity as a culturally conditioned, and often intentionally constructed, identity that serves as a common bond for a group of individuals, providing meaning and identity for them. The borders of ethnicity are often porous and allow for individuals and groups to maintain more than one identity at a time, as a member of a particular national group as well as an ethnic subgroup within that nationality. Religion adds another complicating factor here, as members of an ethnic group might be divided along religious lines, or as members of a religious group might seek solidarity with each other along confessional lines, while maintaining separate ethnic identities.

In the United States, ethnicity has often been a means by which one seeks to find identity within the cultural and religious pluralism of the country. Many seek to have both an ethnic and a national identity, resulting in the concept of a “hyphenated” identity, in which one is, for example, Polish-American, or Cuban-American, without wishing to reduce his or her primary identity to one or the other. At one point in American history the term *ethnic* meant a group not assimilated into the dominant American culture; thus, the ethnics were on the margins of society. With the increasing pluralism and celebration of diversity of cultures in the modern United States, the term has taken on more positive connotations, implying that all Americans are, in one form or another, ethnic, at least as a subgrouping of culture within the larger culture of the United States. But the blurring of religious, cultural, and racial characteristics through social mobility and intermarriage suggests that ethnic lines and theories of ethnicity may well change and develop in the future, further complicating attempts to identify and quantify the concept of ethnicity.

The history of the words *ethnic* and *ethnicity* in English demonstrates their changeable nature. The root of the words comes from ancient Greek, in which the word *ethnos* meant a nation or a race and the word *ethnikos* was the corresponding adjective describing the characteristics or nature of such a nation or race. These words in Latin connoted those who were outsiders to the core grouping, either Greek or Latin. Thus, *ethnic* took on a meaning similar to the words

barbarians or *nations*, assuming that those who were *ethnos* were outside of the Greco-Roman culture and, thereby, uncultured outsiders. In medieval and early English usage, the word shifted to mean a group of people who were non-Christians, known as *heathens* or *pagans*.

This use of *ethnic* to connote people being outside the center of society was maintained in the United States up through the early twentieth century. The original thirteen American colonies and the early republic were dominated by Protestant white settlers from England, and the culture of these immigrants defined the center of American society. When the great migration of other European peoples began in the middle of the nineteenth century, these “core” Americans began to characterize the new immigrants as those who differed from them by means of religion, language, or culture; thus “ethnics,” or outsiders. The largest divisions were racial, but even within the same racial classification, there were more localized, ethnic divisions. Unlike racial qualities, which were seen as biological, and thus impossible to overcome, ethnic qualities of language, religion, and culture could be overcome, and the ethnics could be (and should be) assimilated into the core culture of the United States. Thus, Norwegian or Irish or Italian or Greek immigrants could be molded into Americans through education and acculturation, and this was seen as a positive necessity; indeed, it was assumed that society itself might collapse if this transformation were not accomplished. Ethnics were those being transformed into Americans; “core” Americans did not have the qualities of being ethnic.

In the twentieth century, the term and idea of *ethnicity* took on more positive overtones. Though millions of ethnic immigrants and their children adjusted to American culture and life in many significant ways, many of them began to question the idea of complete assimilation as it had been previously envisioned. Many immigrant groups sought to maintain some elements of their ethnic identity and distinctiveness, or to rediscover those elements that had been lost. Second- and third-generation immigrant Americans began to wear ethnic distinctions as badges of honor, rather than as signs of being somewhat less than fully American. Especially after World War II, and the full discrediting of Nazi racial theories, there was a shift toward a positive understanding of ethnic differences. American cultural and religious pluralism was an undeniable fact of life, and thus the category of the ethnic American, or the hyphenated American, suggested that these groups could maintain some of their distinctions and still be “100 percent Americans.” Debates still raged

about the limits of ethnic pluralism, and around the larger issue of race, but the older idea of ethnicity as defining those outside of the cultural core of the nation was less prevalent. Ethnicity is now a much more positive idea, and those without an ethnicity are often seen as culturally impoverished. This is not to posit an agreement on a definition for *ethnic*; scholars and others clash over how to define the word and how it fits into the wider world of American culture.

The Historical Development of Ethnicity and Religion in America

If viewed in modern terms, there was considerable tension between religion and ethnicity in the identity of the early settlers in British colonial North America. For the most part the settlers were ethnically English, Welsh, or Scottish. Religiously, however, they were not predominantly members of the Church of England but dissenters of various types: Puritans, Presbyterians, Quakers, Roman Catholics, and others. In addition, there were Dutch Calvinists, Swedish Lutherans, German Lutherans, Reformed, French Huguenots, and Sephardic Jews, many of whom were dissenters in their homelands, and certainly not British. Colonial America was a loose amalgam of various peoples and religions, with no clear sense of a common ethnic identity; most saw themselves as British, but with an increasingly separate American identity as well. After the American Revolution, the adoption of voluntary religion and religious freedom within the new nation meant that religious differences would remain. But it was a religious diversity within narrow confines; most Americans were some variety of Protestant Christian (mainly Calvinist), and the postwar religious revivals, led by the Methodists and Baptists, led to the development of a common religious identity to match the growing American ethnic identity. In the first part of the nineteenth century there was a remarkable consensus among the main American denominations, the beginnings of what we now would call evangelical Protestantism. This consensus would define, for a time, a common religious identity for most Americans and create a religious norm that would match the developing American identity. These two developments would define the concept of Americanism; outsiders to this identity would be “ethnics” and would be candidates for assimilation into the American norm.

Ahead, however, was a century of mass immigration to the United States (1820–1920) that seriously challenged and expanded this identity, both religiously and ethnically. The first wave of immigration, up to about 1880, consisted

primarily of Germans, Scandinavians, and Irish. The Germans and Scandinavians were prime candidates for assimilation, for they were Protestants and shared many religious and cultural norms with most Protestant Americans. The Irish, on the other hand, were a problem, for their Roman Catholicism and differing cultural norms, along with their “clannishness” and refusal to assimilate to the dominant culture, marked them as ethnic outsiders, not likely to fit in. Beginning around 1880 the composition of the immigration changed dramatically, shifting more toward immigrants from Southern and Eastern Europe (and on the West Coast, Japanese and Chinese), people whose ethnic and religious identities were, like those of the Irish, significantly at odds with the established group of Protestant Americans.

These latter immigrants of the period 1880–1920 came in huge numbers and challenged the Protestant consensus of America: primarily Roman Catholics from Italy, Poland, and Lithuania; Orthodox Christians and Ashkenazi Jews from Eastern Europe; and Buddhists and Shinto from Asia. Not only were there religious differences; there were also varied linguistic and racial backgrounds: Mediterranean, Slavic, and Asian. The sheer numbers and the differences between them and their “Anglo-Saxon” Protestant neighbors were a daunting hurdle to those, on both sides, who sought assimilation and acculturation into a common, American identity. It also occasioned the strong nativist, anti-immigrant backlash that brought about severe restrictions on immigration in the early twentieth century.

Ethnic and religious bonds (often indistinguishable) were crucial to the survival of immigrant communities and provided a means of affiliation and mutual support. Immigrant religious institutions were, in almost all cases, the largest and most important organizations in the varied ethnic communities. They were a source of support for new arrivals, a place where they could worship in their own language, make connections with others of their own ethnicity and culture, and find assistance and encouragement in the strange American environment. Religion and ethnic identity combined to give the new immigrants a group identity, even if there were some who wished to leave this identity behind and quickly become assimilated Americans. Ethnicity could also mark them as a subgroup within their own religious grouping: the separation of Roman Catholics into various “ethnic” parishes (Irish, German, Polish, Italian, or others) or into separate denominations (such as Scandinavian and German Lutherans). Often this led to tensions within the religious group, as earlier, more assimilated groups clashed with later

arrivals, for example, the conflict between assimilated Reform Judaism and the newly arrived Conservative and Orthodox Jews from Eastern Europe.

In the first half of the twentieth century, the transition from immigrant to American was assumed to be a process that was vital both to the immigrants themselves and to the country as a whole. Changes in the immigrant communities were rapid, as second- and third-generation descendants of the immigrants took control of the ethnic institutions, including the religious ones. World War I resulted in a resurgence of nativism and xenophobia and a severe restriction on immigration, which meant that the ethnic immigrant communities would no longer receive their refreshing tide of new arrivals to help reinforce their ethnic and religious identities. In the middle of these developments, however, the ethnic communities still found strength in a composite ethnic identity, that of being a “hyphenated” American. The descendants of the immigrants took renewed pride in being both citizens of their ethnic culture and of the larger United States; they were Italian-Americans, or Swedish-Americans, or Polish-Americans; and it was these groups of “hyphenated” Americans that defined the “ethnic.”

An open question at this time was whether this ethnic hyphenated identity was a permanent fixture of American life or a temporary way station for the immigrants on their journey from being immigrants to becoming American. The construction of these new hyphenated ethnicities was often highly selective and eclectic, as second- and third-generation immigrants melded elements of both the immigrant culture and American culture to form an often romanticized version of the two. The survival of these forms of ethnic pride were practiced by those whose ordinary, everyday lives were essentially American; hyphenated ethnic identities could be “switched on” for special occasions but were often selectively employed. From a position of increasing assimilation, ethnic Americans could creatively use a highly selective reappropriation of immigrant culture to define their group identity, albeit no longer in an exclusive sense.

In the latter half of the twentieth century, continued social and cultural changes meant a more positive appreciation of the role of ethnicity in American life and encouraged its continuation. Renewed immigration after 1965 led to a new flood of immigrants, this time mainly from Latin America and Asia, with smaller numbers from Africa and Eastern Europe. This new immigration led to an even greater diversity of peoples in the United States

and questions about the process of assimilation itself; was it possible to have a common American ethnic identity, and even if it were possible, was it desirable? The old “melting pot” metaphor of assimilation was being replaced with a new one: America as a “salad bowl,” in which the various ethnic elements of society retained their distinct elements while contributing to the overall flavor of society. Led in the 1960s by the example of African-Americans and Hispanic-Americans, who sought a renewal of ethnic pride in their origins, ethnic differences were increasingly seen not as an obstacle to creating a strong national society but as a contribution to its strength. Even white “Anglo-Saxon” Protestants were exploring the roots of their own ethnic cultures and taking pride in a reappropriation of them. Mass immigration of peoples of very different social and religious ethnicities was still seen as a potential cause of friction and divisiveness, but the elimination of ethnic characteristics is now less likely to be seen as the way by which these difficulties should be addressed. *Ethnicity* is now a more positive term and often universally applied to all Americans as an important element of their identity. To be sure, assimilation and intermarriage are factors that often blur the ethnic identities of many American citizens, but many can still describe their ethnic backgrounds, even if they must refer to proportionality to describe them.

Varieties of Religion and Ethnicity in American Culture

The intersection of religion and ethnicity in American life is strong, to be sure, but it is hardly uniform. It differs in nature between one group and another, it often grows and develops over time, and it plays different roles in group culture and life depending on the group’s background and experience. The correlation between religion, ethnicity, and national identity is very important here, especially among those immigrants in the United States where ethnicity and nationality have been fluid over time. Many immigrants from outside Western Europe have found that immigration resulted in dramatic changes that have substantially altered their ethnic “location.” National boundaries and identities shift over time, being formed and re-formed, so that ethnic identities and loyalties in America must be readjusted to meet the new situation. Members of groups and tribes who never had much to do with one another in the “old country” now find themselves as conationals. Needs of affiliation and survival in the United States sometimes mean that conationals divided by religion have found it expedient to

cross religious lines to unite with others. Still other groups have found that political and religious developments subsequent to their immigration have divided them from other ethnic nationals or have split ethnic religions into warring camps. In the construction of an ethnic and religious identity, sometimes outside developments push situations in unintended directions.

The past two centuries have seen the development of dozens of new nation-states and the construction of new national identities. The breakup of old empires and colonial systems has meant that groups have found themselves as members of new nations that have not always been formed along rational ethnic lines but, rather, combine distinct and sometime hostile peoples. Nations have sought to combine regional identities into a single national identity, or have shifted their allegiances by shifting boundaries. For example, nineteenth-century immigrants from Sweden often defined themselves not by their Swedish identity, but by the *lan* or district from which they came; if they were Swedes from western Finland, they would eventually have to decide whether they wished to remain Swedish or adopt an affiliation for their new Finnish homeland (Swedish-Americans have done both). Another example might be Italian- or German-Americans, whose countries had not achieved a united political identity until later in the nineteenth century, or various Eastern European ethnic and religious groups that found their regions combined into the country of Yugoslavia after World War II; the question arose whether they would affiliate with their ethnic and religious rivals or continue to remain separate in the United States. A similar question faced those from the former Ottoman Empire, Soviet Union, or Indonesia. The formation of new nation-states and attending national identities does not always mean that the hyphenated Americans from those regions will readily adopt the new national and ethnic identity.

Many distinct nationalities have sought, on the other hand, to separate themselves from a larger, corporate identity, often along linguistic, ethnic, and religious lines. The stirring of new national and ethnic identities within national states has meant that those whose primary ethnic identity was to a nation-state have now decided on a different primary affiliation. Thus the Welsh Methodists and Scottish Presbyterians in the United States have developed new identities that are not tied to Great Britain; the same may hold true for Basques or Catalans whose identity might once have been Spanish. The ethnic and religious divisions of India produced both Pakistan and Bangladesh but have

left many on the “wrong side” of the border and many recent immigrants whose ties to sublocations and subgroups might be much stronger than their national identities.

The same might be true of immigrants from African countries, where ties of religion and tribe are stronger than loyalty to a newly formed nation-state. Thus one might be an immigrant from Ethiopia, but in America one might divide along dozens of ethnic or linguistic lines, or between Protestantism, Orthodox Christianity, or Islam. Some groups, such as Jews, Kurds, or Bahá'í, have had no real national identity at all but have found that their religious and ethnic identity transcends national borders. Some groups have found a new ethnic identity while undergoing mistreatment at the hands of the dominant American culture—thus the development of an African-American ethnic identity among formerly enslaved Africans in the United States, or the resurgence and renewal of Native American identities following attempts to assimilate them into the dominant culture.

There are many different levels of correlation between religious and ethnic identity, often depending on the nature of religious adherence between religion, ethnicity, and nationality in the home country. Some groups form a high correlation between religion and ethnicity; often these are groups who have not had a primarily national identity. Thus Jews, Armenians, Sikhs, Jains, Zoroastrians, many Eastern European groups, and African tribal groups see themselves essentially as ethnic groups for whom a singular religious identity is absolutely crucial to their survival. Their religion is a primary focus for maintaining group identity in an often hostile national environment, and they still maintain this tight, “in-group” identity in the United States. Other groups in this category would be those immigrants who come from countries where religion, ethnicity, and nationality are so tight as to be almost inseparable, such as Saudi Arabia, Mexico, Poland, and Japan.

In the middle of the scale of correlation between religion and ethnicity are those countries where there is a dominant religion, often linked closely to the state, but whose religious landscape allows for the existence of other religions that dissent from the national norm. This would include immigrants from most of the Western European nations with established state church systems as well as the large multireligious nations of the world, such as China, Indonesia, India, and South Africa. In these countries one might reasonably expect immigrants to bring the dominant religion along with them, but one also would not be surprised to find that

they brought another religion, or switched religions once in the United States. Thus German-Americans might be Lutheran, Reformed, or Roman Catholic; but one could also find German Baptists, Methodists, or sectarian groups among them. Chinese immigrants might bring Confucianism, Taoism, Buddhism, Islam, or forms of Christianity; given the recent communist domination of China, it is not uncommon to find many Chinese immigrants who claim no religion at all. While each group may well have a primary religious identity, there are a significant number of people who hold the dominant ethnic or national identity but not the corresponding religious identity. One such group might be Arab-American Christians, who make up the majority of Arab-Americans although they were always minority populations in their home countries.

The low degree of correlation between ethnicity and religion might be discovered either in those smaller or newer religious groups developed in the United States, among people who claim a mixed ethnic or national background, or among those from countries with no strong religious identity that predominates. This might be seen in the colonial English settlers of North America, where one might just as easily be a Puritan, Presbyterian, Quaker, Baptist, or Methodist as Anglican. Among many mainline Protestant groups in America, which may have had ethnic shadings in the past, there is now little or no ethnic character. Among groups like the Baptists, Assemblies of God, Churches of Christ, Disciples of Christ, and others, no clear ethnicity ever really existed. There is some possibility that, given time and space, ethnically nonspecific religious groups might actually form a new ethnic group in the United States, but that would require a high degree of separation from the dominant culture.

Ethnicity and Christianity in America

The vast majority of Americans with a definite religious preference choose some form of Christianity: Protestantism, Roman Catholicism, or Eastern Orthodoxy. While about one-half of all Americans claim at least a “preference” for Protestantism, roughly another quarter claim Roman Catholicism, and another three to five million are affiliated with Eastern Orthodox groups. This predominance, along with the generally Christian origins of the first colonial settlers, leads some to claim the United States as a “Christian” nation. This might be true in a cultural or numerical sense, but hardly in a legal or organizational sense. There are areas of the country where Christianity is

overwhelmingly dominant, such as in the rural Midwest or South, but there are other areas of the country where Christianity is not even the religion of the majority of the people, especially in the large metropolitan areas of the East and West Coasts. Even in those areas where Christians are a majority, they are often divided between the major family groups of Christianity and within these by differences in denominational groups. It would be impossible to claim a single Christian ethnic identity; indeed, the major differences between Christian groups are often based as much on ethnicity as they are on theology.

Protestantism

Protestants are divided into thousands of different-sized denominations, from 15 million members in the Southern Baptist Convention to small groups with membership in the hundreds. These thousands of groups can usually be considered together in eight to ten denominational families. Most of these Protestant groups can be traced back to Western European countries, to American adaptations of European Protestantism, and to their missionary endeavors worldwide. Protestants in the Lutheran, Reformed (Calvinist), and Episcopal (Anglican) denominational families were established from roots in the Protestant state churches of Western Europe. Baptists, Methodists, and Anabaptist traditions (Amish and Mennonites) were brought over by groups of religious dissenters from Europe, while the remaining proliferation of American Protestant groups (including the Restorationist and Pentecostal/Holiness families) is the result of homegrown American developments. While a majority of Protestant Americans are white, a vast predominance of African-Americans and a significant number of Hispanic-Americans are Protestant, as are substantial proportion of recent immigrants from Asia and Africa.

Most of the mainline Protestant denominations (Congregational, Presbyterian, Episcopal, Methodist, and Northern Baptist) have roots in Britain and were established in America during the colonial period. As such, they have a fairly low degree of ethnic identity and specificity among them. One might identify the Scots with the Presbyterian group, or the Welsh with the Methodists, for example, but it would be impossible to make an exclusive correlation in the opposite direction. Most of these denominations grew in the United States during the early republican period and came to form the backbone of the evangelical Protestant consensus that came into being during this time; they are the essentially American Protestant denominations that defined

the center of American identity against the masses of "ethnic" immigrants in the nineteenth century.

Two of the other Protestant groups now counted primarily among the mainline denominations had their beginnings as ethnic denominations: the Lutherans and the Reformed. Though both had initial colonial representation (the German Lutherans and Reformed, the Dutch Reformed, and the Swedish Lutherans), the main bulk of these ethnic (non-English-speaking) communities were composed of nineteenth-century immigrants. The Lutherans formed synods along national and linguistic lines, from Scandinavia and northern and central Germany, while the German and Dutch Reformed followed a similar path. The ethnic correlation between Dutch Reformed or Norwegian Lutheran was tight, though not absolute, as many ethnic immigrants slipped out of the circle of these ethnic denominations. These various ethnic communities were viewed by mainstream Americans as "desirable" immigrants; they were Northern European and Protestant, and good candidates for the Anglo-Saxon "melting pot." These ethnic Protestants did assimilate in time; once their language barriers fell, they joined together in multiethnic Lutheran or Reformed denominations, except for confessional loyalists, such as the Christian Reformed Church or the Lutheran Church Missouri Synod. By the middle of the twentieth century the multiethnic Lutheran and Reformed denominations had assimilated to the point where they were considered to be a part of the American Protestant mainline.

There were a number of Continental Protestants who arrived in the United States as ethnic minorities within non-Protestant countries: French Reformed (Huguenots), Hungarian Reformed and Lutherans, Slovak and German-Russian Lutherans, among others. For these ethnic minorities existing in Roman Catholic or Orthodox territories, their ethnic and religious identities were the means of their confessional survival, and they held tightly to their religious communities as their primary focus, a habit that some of them still continue. Anabaptist Protestants (Mennonites, Hutterites, and Amish), who had always existed as small minority populations, continued to live apart from the mainstream of the American population, though some elements of the Mennonites moved eventually into the American cultural mainstream, while maintaining traditional Mennonite traditions, such as pacifism. American Protestant work with immigrant populations resulted in some new Protestant communities, such as Italian, Greek, Hispanic, and Arab Protestants, though these were small

communities. Mission work abroad in Asia and Africa bore fruit in some areas, such as sub-Saharan Africa and among Chinese, Koreans, and some Southeast Asians who migrated to America after 1965. Finally, a significant number of Hispanic immigrants self-adopted evangelical and Pentecostal forms of Protestantism, and these congregations constitute a growing portion of American Protestantism.

For many of these last groups, becoming religiously Protestant was, at least in part, an entry into American life that provided advantages their non-Protestant ethnic counterparts did not enjoy, though it often did separate the two groups under one ethnic heading. Hmong and other Southeast Asians who adopted forms of evangelical Protestantism in Southeast Asian refugee camps had a ready entry into American life, but the religious restrictions of monotheism often keep them from participating in ethnic and family rituals, which are often wrapped in Buddhist or Animist traditions. Often these ethnic Asian Protestants are quite zealous in their missionary work among their ethnic counterparts; while Protestantism is still a rather small proportion of the total Chinese population abroad, Chinese Christian congregations in the United States have become the largest institutions in the Chinese-American community, far outpacing the Buddhist, Confucian, and Taoist temples in influence.

Roman Catholics and Eastern Orthodox Christians

Unlike the Protestant immigrants, the nature of Roman Catholic ecclesiology is such that these immigrants did not divide into completely separate ethnic denominations; almost all of them remained under the general control of the American Roman Catholic hierarchy. However, under the "big tent" of the Roman Catholic Church in the United States, the various ethnic immigrants often formed autonomous national organizations of parishes, religious orders, and institutions that, if not independent from control of the bishops, certainly remained independent of any contact with Roman Catholics of any other ethnic background. Indeed, many ethnic Roman Catholics had more to do with non-Catholics with whom they shared an ethnic identity than with fellow Roman Catholics of another ethnicity. Considerable ethnic tension existed within American Roman Catholicism, especially over the composition of the hierarchy and the relative independence of each ethnic group. Often the various ethnic Roman Catholic groups held stronger bonds to the hierarchy of their home countries

than they did to the American bishops in their midst; this was especially true of the religious orders, who traditionally had not been under the control of the local bishops.

The first Roman Catholics in colonial America were from England, settling in the colony of Maryland, or French Canadians, who filtered down into the northern areas of New England. Later, scattered French Roman Catholics would be added in the new American territories of the Louisiana Purchase, in New Orleans and up the Mississippi River. These Roman Catholics were a small minority in a largely Protestant country; at first they were under the direction of European Roman Catholic leaders, until they received their own bishops after American independence. Although most Protestant Americans had been educated with a strong anti-Roman Catholic bias, there were initially few problems between these religious groups.

The first major influx of ethnic Roman Catholics came in the 1840s, with the great wave of more than one million Irish who left their home country during the Potato Famine. The arrival of so many ethnic Roman Catholics in such a short period of time was bound to create trouble, both within American Roman Catholicism and American society in general. Since the Irish arrived destitute in the American cities, they did not disperse out into the rural countryside but remained in their ethnic enclaves within the cities of the North and Midwest. By sheer numbers, as well as political aptitude, they soon gained control of the American Roman Catholic hierarchy as well as the political life of major American cities, causing resentment on both accounts. They did not share some of the major social attitudes of American Protestants, especially concerning temperance and Sabbath observance, and these elements combined to create hard feelings between the groups. As a result of these tensions, Irish-Americans held even tighter to their own Catholic identity as a form of group solidarity than they had in Ireland. While some of the accounts of anti-Irish sentiment in nineteenth-century America are undoubtedly exaggerated, it is clear that many Protestant Americans viewed the Irish immigrants with contempt and saw their arrival as a sign that they were losing control of their Protestant country. Also at this same time there was a large, but less dramatic, immigration of German Roman Catholics as well as an inclusion of Hispanic Catholics in the United States by means of territorial accessions in Texas and the Southwest from Mexico. Because the Germans tended to settle in rural areas, and the Hispanics were in territories far removed, they did not intrude as far into

the American popular imagination, though they did at times clash with the increasingly Irish Roman Catholic hierarchy.

After the Civil War, immigration shifted heavily toward Roman Catholic arrivals from Southern and Eastern Europe, especially from Italy, Poland, Hungary, Croatia, and Lithuania, as well as Uniate Roman Catholics from the Ukraine and the Middle East. This massive immigration contributed to the rapid growth of the Roman Catholic Church in the United States, which was the single largest denomination in the country by 1890. Though Protestants would still collectively outnumber Roman Catholics, their strong growth and numbers made them a force with which to be reckoned. As the ethnic immigrants moved into the United States, they followed a very common pattern of affiliation and institutional growth. Ethnic parishes were formed along linguistic and nationalistic lines, in which the ethnic forms of piety and sociability could be observed. Parish clergy and religious orders (monks and nuns) were brought from the old country to minister to their needs and set up ethnic institutions, especially parish schools, and later colleges. Confraternities and other lay forms of religious devotion were also developed, along with ethnic cultural and assistance groups, all of which created a tight ethnic and linguistic community. Ethnic tensions sometimes developed between various Roman Catholic groups, mainly when there were bishops of one ethnicity presiding over parishes of a different ethnicity, who felt that their rights were being infringed upon. In several midwestern urban dioceses these tensions erupted, often between German and Poles, or Irish and Italians. In the most extreme case, a number of Polish Roman Catholic parishes left the church to form the Polish National Roman Catholic Church, which was not recognized by Roman authorities.

In the twentieth century new groups of Roman Catholic immigrants repeated the same process; this time it was Hispanic, Vietnamese, Filipino, and Nigerian and other African groups who came and formed their own parishes or worshipping communities within larger, multiethnic parishes. As the older immigrant groups made the slow acculturation to English and American society, these new groups took over inner-city parishes and began the same route that other Roman Catholics had followed. Ethnic roots tended to fade as the second- and third-generation Roman Catholics moved to the suburbs, where ethnicity was necessarily downplayed in the new suburban parishes. There are still many ethnic elements to Roman Catholicism in the United

States, though for older immigrants the locus of this has shifted from the parish to the family.

Eastern Orthodox Christians who immigrated to the United States followed an ethnic pattern that was closer to that of Protestantism than to Roman Catholicism, in that Orthodox Christians did not have a unified ecclesiastical hierarchy in America under which they could develop their ethnic parishes. The Orthodox Christians organized separate jurisdictions based on ethnic and linguistic origins, and additional bodies were formed as ethnic groups split over issues in their respective homelands. There are now at least fourteen independent Orthodox bodies in the United States, and although they do manage to cooperate on some levels, they are not close to any kind of unity. Some Orthodox religious bodies (like the Russians) are independent (autocephalous), while others function as American dioceses of the Orthodox home church (such as the Greeks and Antiochenes).

The initial organization of Orthodox Christians in the United States was the Russian Orthodox Church, stretching down the Pacific Coast of America, from Alaska to California, and then to the ethnic settlements in the east. The Russians initially sought a multiethnic Orthodox Church under their direction, but the more numerous Greeks would not enter into this arrangement. Soon there were congregations of Serbians, Rumanians, Bulgarians, Ukrainians, Armenians, and various smaller Middle Eastern groups in the United States, each of which formed its own ethnic organization. World War I and the rise of communism in many Orthodox countries led to further divisions, as many ethnic churches divided between those who remained loyal to the home church (even under communist control) and those who resisted the communist-dominated hierarchy and formed their own independent churches. So, for example, there were eventually two separate Serbian Orthodox Churches, one having ties to the Serbian Church in Serbia and one independent of it; the ethnic diversity of Orthodox Christianity was further splintered by ongoing political developments.

The Orthodox population of the United States has undergone the same process of assimilation to American culture as have other groups, but more slowly. Immigrants from Orthodox areas slowly continued to come to America throughout the twentieth century, keeping the native language and traditions alive; some of these were refugees from communism and others from ethnic turmoil in the Middle East (notably Armenian and Arab Orthodox groups). They

have also gained from Uniate (Greek Catholic) groups in the United States, some of which were pushed back into the Orthodox fold by American Roman Catholic leaders who did not understand or value their distinct traditions. The Orthodox groups may well follow the lead of such Protestant ethnics as the Lutherans and Reformed and form multiethnic Orthodox Church bodies, but this is still just a possibility; currently they remain ethnically fragmented.

Ethnicity and Non-Christian Religions in America

Christians, even those of a strongly outside ethnic variety, still have a significant advantage in the United States over those whose religion is not Christian. This is not to say that the United States is a Christian nation; even if there were no other religions in the country, it would still not be legitimate to say this. However, the strong numerical predominance of Christianity in America does create a strong influence on American culture and ways of being religious, so that Christianity most naturally defines the rhythms of life and conceptual outlook of the dominant culture. This is accepted as normal by most Christian Americans, but it can cause strong problems for many non-Christian groups and can be a source of internal and external controversy for them. For monotheistic “Western” religions such as Judaism and Islam, the logic of their systems fits well into the culture and rhythm of Christianity, but their implicit or explicit claims of exclusivity do not. For “Eastern” religions, most notably Hinduism, Buddhism, and Chinese religions, their theistic systems allow for more compromise and adaptation with alien systems, such as American Christianity, but their general conceptual world and the rhythm of their devotion are often quite out of sync with American norms.

In some respects, Judaism is the prototypical ethnic religion in the United States; indeed, the ties between ethnicity and religion in this group have been seen as almost absolute. Traditionally, a Jew who converts to another religion is no longer a Jew, though new developments in modern American Judaism have called this into question. The ties between Jewish religion and ethnic identity have been very tight, and while they were residents of many different countries in Europe and the Middle East, their ethnic identity was not tied primarily to these countries of residence. In the United States, however, Jews found that religious freedom and toleration promised the hope of full citizenship, and many Jews readily embraced this new country. Modern Reform Jews adapted their worship and life to the rhythms of modern

America, and even Conservative and Orthodox Jews found themselves at home in the United States. Jews could move into the mainstream of American life, and a large number even dropped religious observance while maintaining a Jewish cultural identity. Inter-marriage between Jews and others became common, though recently even the most assimilated Jews have come to see this as a major problem for Jewish survival.

Modern developments have complicated the question of Jewish ethnic identity. Inter-marriage begs the question of a separate identity, and of the place and participation of those of partial Jewish identity within the community. Messianic Jewish groups, blending Jewish identity with evangelical Protestant theology, insist that they are still Jews. Black Hebrew groups, and others who have adopted elements of Judaism, insist on their inclusion within the people of Israel. And some ethnic Jews have melded their traditional religions with others, most notably blending Judaism and Buddhism. The atheism of Jewish communists and socialists has further complicated the ties between Jewish ethnicity and religion in the United States. Once the question of Jewish ethnic identity seemed simple, but no more.

Muslims in the United States face many of the same issues as their Christian and Jewish neighbors, although their communities are not as old. Officially, there are no ethnic or cultural divisions within the Islamic community (the House of Islam), but in actuality there are a number of ethnic divisions. The emphasis on Arabic language and context of the religion means that there is a clear divide between Arab and non-Arab Muslims. As Islam moved out in concentric rings from Arabia, it moved into new cultures, drawing in black Africans, South and Southeast Asians, and the peoples of Central Asia as far as China. Some of the largest Muslim countries, and the largest sources of Muslim immigrants to the United States, are Asian countries like Pakistan, Bangladesh, and Indonesia. The number of Muslims in the United States is a highly debated question, but estimates average about three to four million.

Like Protestant immigrants, Muslims bring a wide range of ethnic backgrounds to America; like Roman Catholics did once, they worship in a common language. While in a few parts of the country Muslims are able to set up separate ethnic mosques for different immigrant groups, in many places this is not possible, so multiethnic mosques are necessary, at least for the time being. There are some aspects of an ethnic dimension to the Sunni-Shiite divisions, especially in the relations between Arab and Iranian immigrants. Since

the majority of Arab-Americans are Christian, related to the Christian minorities in the Middle East, there is some inter-ethnic tension within this community. And because a number of Muslims are from Africa, or are African Americans who have converted to Islam, there are some racial overtones to Muslim ethnic divisions. Like most of the twentieth-century immigrant groups, Muslims are just beginning to explore the relation between ethnicity, culture, and religion in their American communities.

Hindus in America follow a path similar to Muslims, except that most of their ethnic diversity is within the Indian subcontinent, rather than between different countries and areas. The actual term *Hinduism* is, in fact, an external term to describe the multifaceted religions of the Indian subcontinent, in which there is an amazing diversity of ethnicities and religious devotions, all built on a common metaphysical platform. Like Muslims, Hindus often face the problem of needing to develop multiethnic, multitrade temples to serve a varied population of Indian Americans, and this can lead to tensions at times. Hinduism has the advantage, however, of being practiced mainly within family observance and life-cycle rituals, as well as major temple festivals, so that populations can employ the services of the temple with less interethnic tension. The adoption of Hinduism by some European Americans, through groups such as the Hare Krishna and others, brings into question the Indian ethnic character of Hinduism.

American Buddhists are equally divided by ethnicity and language, and most Buddhist communities are divided along major national lines: Chinese, Taiwanese, Southeast Asian, Japanese, and Korean. In the Asian immigrant communities there are often ethnic temples when there are enough adherents, and though there is some cooperation between them, their ties and leadership are often more oriented toward their homeland, much like Eastern Orthodox Christians. There are some internal ethnic divisions between schools of Buddhism, such as the existence of Pure Land and Zen communities among Japanese-Americans, as well as groups like Soka Gakki, who actively seek out and make converts from non-Asian Americans. Like the Hindus and Muslims, the ethnic elements of American Buddhism are still rather fluid, and the course of assimilation and acculturation is still in flux.

Conclusion

It is clear that though the relationship of religion and ethnicity in America is very deep, it is a complex relationship

that has evolved quite strongly over time and continues to develop as older religious populations evolve and as new religious communities arrive and take root. Though there are many instances where group ethnic identity and religion are very closely linked, there are other ethnic groups that are divided by religion and religions that are divided by ethnicity. Some religious groups are highly correlated by ethnicities, while other religious groups show a low correlation; there are groups where ethnicity plays a very limited or even nonexistent role in forming a common religious identity. As American religious groups grow and assimilate, and as notions of ethnicity and culture evolve, the relationship between religion and culture in the American context will only become more complex.

Ethnographic and Anthropological Approaches

Anthropological approaches explore how religious life shapes, and is shaped by, culture and society. Anthropologists are primarily concerned with the lived experiences of individuals, groups, and communities, rather than the texts, official teachings, or formal institutions of organized religions. The entire range of human experience in all societies, past and present, is of concern; anthropology does not privilege Western or literate traditions. Much of the most influential work in the anthropology of religion has focused outside North America and Europe, in studies of indigenous peoples, developing countries, and local variants of world religions.

Anthropologists draw widely from many streams of social theory, philosophy, the sciences, and literary and artistic criticism, and anthropological methods overlap with other academic disciplines. Anthropology is distinct in its commitment to pay attention to non-Euro-American peoples and to insist that any general discussion of religion must include non-Western as well as Western traditions.

In studying American religions, anthropologists' attention to cultural diversity, combined with a disciplinary ethos of concern for the less powerful in society, tends to favor research with people and practices that are not well known

or that are new or changing. Scholarship has focused on Native Americans; immigrants and ethnic groups; new spiritual movements; popular and domestic devotions and spiritual healing; and local variants of Christianity, Judaism, and other mainstream faiths.

Anthropology does not see religion as something separate from other aspects of life such as economics, politics, and social relations. Anthropological approaches are holistic, meaning that they treat religious phenomena as part of larger social and cultural systems and recognize that it is often difficult to determine what is "religious" and "not religious." There are long-running debates over the meaning and boundaries of the Western category of religion; some anthropologists avoid using the term, preferring to speak of worldviews, cosmologies, or symbolic systems.

Common to almost all anthropological approaches is an emphasis on understanding religiosity and spirituality in relation to social context, which includes cultural ideas and values; language; and patterns of gender, family relations, race, ethnicity, class, and other societal institutions. Theoretical debates and disagreements often revolve around the relative weight given to these various factors.

Ethnography and Ethnology

Ethnography is a key research method in anthropology, sociology, and religious studies. *Ethno-* derives from the Greek *ethnos*, meaning a people, nation, or class. *Ethnography* is writing about a group of people based on data collected through intensive observation, conversation, and participation in the group's activities. This method is best suited for studying relatively small groups, communities, and events such as rituals or celebrations. Ethnography tends to uncover realities and complexities in social life that may not be evident, or are difficult to study, with quantitative methods such as surveys, questionnaires, or statistical analysis. Ethnographers also use these and other quantitative methods, and they analyze language, documents, texts, artifacts, and visual images. But direct observation, conversation, interviews, and in-depth familiarity with a group of people in their social context are the bedrock of ethnographic studies of religion.

Ethnographic research requires substantial fieldwork, often involving at least a full year of intensive study, or work done periodically over several years. The relations of trust, rapport, and mutual understanding necessary for successful research open possibilities to learn about informal, nonpublic aspects of congregational cultures and social dynamics. Ethnography is often the only way to study the more

private, experiential, or performative dimensions of religion about which little is written. Its emphasis on paying attention to how people actually think; act; and use ideas, symbols, and rituals may be especially relevant to understanding religious life in an American cultural landscape that historically has been characterized by an emphasis on the private, individual nature of faith and spirituality.

Ethnography is useful for testing theories and generalizations to see whether they hold up in practice. It often points to limitations in prevailing concepts and assumptions. For example, ethnographer Meredith McGuire notes that whereas surveys typically categorize respondents by religious denomination and measure religiosity with indices such as frequency of church attendance, ethnographic research consistently shows that individuals do not fit such neat categories. Many North Americans combine elements from different faiths, and many spiritually meaningful experiences take place outside formal religious contexts.

Ethnology is a term more widely used today in Europe than in North America. In Europe, *ethnology* is more or less synonymous with *social anthropology*. In North American usage, *ethnology* generally refers to broad, cross-cultural comparison, in contrast to *ethnography*, which studies a specific group or community or examines one issue in different contexts (*multisited ethnography*).

In the nineteenth and early twentieth centuries, ethnological analysis predominated in the anthropology of religion, which searched for universal principles and patterns. Today, evolutionary theory addresses the origins and development of religion. Cognitive studies draw upon evolutionary biology and psychology to identify mental processes that shape human perception, thought, and emotion to create religious ideas such as belief in gods, spirits, and supernatural forces.

In the study of religions in North America, most contemporary scholarship is ethnographic rather than broadly comparative. A notable exception is Swedish anthropologist Ake Hultkrantz's (1920–2006) work on Native American traditions. Hultkrantz advocates developing typologies of religious belief and practices such as concepts of the soul and patterns of worship, rather than “reducing” these to be explained as the product of nonreligious social, economic, political, or psychological factors.

Intellectual Roots

The academic discipline of anthropology developed in the late nineteenth century, at a time when Victorian thinkers

were questioning religious authority and when belief in religion was declining in Western Europe and North America. With the expansion of colonial administrations and Christian missionary work abroad, there was a wealth of information about non-Western religions and rituals. For nineteenth-century thinkers, the main question was how to explain differences and similarities among religions of the world. They generally saw the spiritual practices of non-Western and non-Christian peoples, especially “tribal” peoples, as irrational superstitions that demonstrated the mental inferiority of nonwhite races. Anthropology was born from attempts to develop scientific methods to challenge this notion of biological determinism, the assumption that differences in human thought and behavior are the product of genetic inheritance (that is, race).

Native American cultures were the major focus of anthropological studies of religion in the United States and Canada until World War II. In the mid-nineteenth century, Lewis Henry Morgan (1818–1881), a lawyer in upstate New York, did some of the earliest systematic scholarship. Morgan wrote about the Iroquois, a confederation of six indigenous nations east and south of Lake Ontario. He documented Iroquois religious beliefs and ceremonies, including the new religious movement inspired by the prophet Handsome Lake, which combined Christian and Iroquois elements. Morgan's account of this movement was based on writings by Ely S. Parker, a Seneca who became commissioner of Indian affairs during Ulysses S. Grant's presidency. The role of knowledgeable local intellectuals and collaborators like Parker in producing scholarly works is a recurring theme in the anthropology of religion in North America, especially in Native American studies.

British ethnologist Edward B. Tylor (1832–1917) was a leading figure in establishing anthropological approaches to religion. Tylor and Morgan reflected nineteenth-century biases in seeing non-Christian, “tribal” beliefs (such as Native American religions) as backward and irrational. Both developed models of cultural evolution that ranked animism (the perception that nonhuman beings or things have spirits) lowest in the historical trajectory of human societies' development. But their evolutionary models were progressive in assuming that all people have the same intellectual capacities and that, over time, they develop more logical, “civilized” ways of thinking. Animistic religions would evolve toward more sophisticated polytheism (belief in multiple deities), eventually achieving the pinnacle of rationality,

monotheism. Morgan applied this model to the Iroquois, whom he saw in transition from “limited pantheism” (the belief that everything in the world has a spiritual essence that is manifested in nature) to polytheism.

Hierarchical models of cultural and religious evolution fell out of favor in the twentieth century. Contemporary anthropology rejects the notion that some religions are more primitive, simple, or irrational than others.

Franz Boas (1858–1942), a German American Jew, established the first academic department of anthropology, at Columbia University, and trained the first generation of American anthropologists. The “Boasians” established theoretical perspectives that have oriented much of American anthropology’s approach to understanding religion and culture.
