Preface

The growing prominence of news, information, and commentary of all kinds, and in every medium, has unfortunately not always been matched by a deepening or a widening of consumers' understanding of the issues at hand. In this era of tweets and peeks (information and video clips), of blogging and befogging (electronic opining), people of all stripes are under increased pressure to make snap judgments about matters about which they may know little. The fact that so many of the issues of the day—corporate misdoings, criminal violence, the condition of the schools, environmental disasters—touch the lives of so many Americans suggests that awareness of them at *any* level is a good thing. At some point, however, one needs to move beyond the news feeds and sound bites and begin to appreciate current issues for the complex matters that they are. This is precisely what the *Encyclopedia of Contemporary American Social Issues* is designed to do.

As with other works of its kind, the present encyclopedia is intended to serve as a bridge between the knowledge of experts and the knowledge of those new to the subjects it covers. We present here, then, scholarly research on a broad array of social issues in a format that is accessible and interesting, yet informative. The contributors have taken care with both the quality of their prose and the accuracy of their facts, the aim being to produce entries that are clear, accurate, and thorough. Contributors and editors alike have paid attention to the language of the entries to ensure that they are written in an intelligible style without losing sight of the terms and conventions employed by scholars writing within their disciplines. Thus, readers will find here thoughtful introductions to some of the most pressing issues currently confronting American society.

Scope

The *Encyclopedia of Contemporary American Social Issues* is divided into four volumes: (1) Business and Economy; (2) Criminal Justice; (3) Family and Society; and (4) Environment, Science, and Technology. Within each volume, the entries are arranged in alphabetical order. There are just over 200 entries in the encyclopedia, the essays ranging in length from about 1,500 words to more than 8,000. Each essay discusses a contemporary issue and ends with suggestions for further reading.

The first problem in compiling an encyclopedia of this type, of course, is determining what constitutes a social issue. It would seem a common enough term about whose meaning there is general consensus. Still, the matter bears a quick review. The *American Heritage Dictionary* defines an issue as:

a. a point or matter of discussion, debate, or dispute;
b. a matter of public concern;
c. a misgiving, objection, or complaint;
d. the essential point, crux.

In other words, not only a matter of public debate or discussion but also a point of concern or matter about which there are misgivings or objections. Included in the mix, moreover, is the idea of a neat summary or something boiled down to its essentials.

In the present encyclopedia, readers will find entries reflecting these varied senses of the term *issue.* There are entries, for example, such as "Health Care," "Oil Drilling," and "Gun Control" whose subjects one often hears debated in public forums. On the other hand, there are entries such as "Globalization," "Sprawl," and "Social Justice" whose subjects are rather harder to identify as clear-cut matters for public debate and seem more like general areas of concern. Of course, more than the general public, it is scholars who routinely examine the ins and outs of various subjects; and for scholars there is little doubt that globalization and the like are key issues requiring careful description and analysis. Fortunately for readers of this encyclopedia, included here are the considered opinions of some 170 scholars and professionals from a variety of different fields, all of whom were asked to lay out "the essential points" for lay readers.

No encyclopedia can encompass the complete spectrum of issues within the contemporary United States. The question of what to include and what to omit is one that has vexed us from the start. The best strategy, we found, was to keep constantly in mind the readers who turn to a work like the *Encyclopedia of Contemporary American Social Issues,* whether in a school or college library or in a public library reference center. We recognize that reference works like this serve a range of purposes for the reader, from gleaning facts to preparing a research paper or introducing oneself to a subject in order to appreciate where it fits within the world at large. In the end, as editors who have been around school curricula and have worked in library reference publishing for many years,

we followed our own counsel in deciding upon the contents of this work. We do so knowing that we cannot satisfy all readers; we hope, however, that we have satisfied the majority of those in need of the kind of information presented here.

Although the emphasis is on *contemporary* social issues, the entries generally situate their topics in historical context and present arguments from a variety of perspectives. Readers are thus able to gain an understanding of how a particular issue has developed and the efforts that have been made in the past—including in the most recent times—to address it. Thus, perennial issues such as taxes, education, and immigration are examined in their latest permutations, and newer developments such as cloning, identity theft, and media violence are discussed in terms of both their antecedents and the conversations currently surrounding them. If there is any trend to be noted with respect to contemporary American social issues, it might only be that with each step forward comes the likelihood of further steps yet to be negotiated. We get from point A to point B only by making good use of our democratic heritage and anticipating the prospect of multiple voices or multiple intermediary steps. The *Encyclopedia of Contemporary American Social Issues* reflects that fact and advances the idea that it is useful to know where and how a question first arose before attempting to answer it or move it forward in the public agenda.

There is an established tradition in sociology that focuses on "social problems" and the many means by which these problems can be and have been researched and analyzed. Always something of an eclectic enterprise, and drawing on the collective wisdom of social scientists working in a variety of different fields (including criminology, demography, anthropology, policy studies, and political economy), in recent years the social problems tradition has widened its range still further to include questions about the environment, corporations, the media, gender politics, and even science and technology. It is this expanded version of the sociological traditional that the present encyclopedia takes as its animating vision. Encompassed herein are all of the above fields and more. We welcome the expansion and see it as linked to the broader meaning of the term *social issues.*

The four volumes assembled here—Business and Economy; Criminal Justice; Family and Society; and Environment, Science, and Technology—have benefited from work done earlier by others, work hereby democratically brought forward and expanded in scope. Specifically, we have drawn upon a series of books published previously by Greenwood Press and entitled *Battleground.* Key entries from that series have been updated, revised, rewritten, and in some cases replaced through the efforts of either the original authors or experienced editors knowledgeable in the applicable fields. In addition, some two dozen entries appear here for the first time, the aim being to ensure that issues emerging in the last few years receive the attention they deserve. Among this latter group of entries are "Bank Bailouts," "Cybercrime," "Consumer Credit and Household Debt," and "Airport and Aviation Security."

Acknowledgments

It is to the contributors, then, that I, personally, owe the greatest debt of gratitude. Without their patience and understanding, their expertise and professionalism, this work would not have been possible. An associate editor, Debra Schwartz, and development editor Anne Thompson provided invaluable service in the preparation of entries for publication, and the assistance of Scott Fincher in this regard is happily acknowledged as well. Acquisitions editor Sandy Towers, with whom I first worked in conceiving the project, proved a valuable friend and professional asset throughout the process. Also present from the beginning was Holly Heinzer, whom I thank for her support. Many thanks, too, to the production staffs at both ABC-CLIO and Apex CoVantage for their invaluable assistance in helping to refine the text and set up the volumes for publication. I am grateful to Jeff Dixon for handling the graphics.

Networked Selling

Selling has gone social. Advertisers can now rely on consumers and their interests in locating bargains and evaluating shopping experiences to promote the advertisers' products. Most of us have had experience with a Web site such as Amazon.com, for example, where one's purchases are instantly calibrated in terms of other like-minded consumers' purchases and a targeted list of additional "recommendations" is presented for consideration. That was an early application of networked selling. Today, there are many more such "apps" and services, and with each new one consumers are asked to reveal ever more information about themselves, their personal preferences, and their buying habits. Using the smart-phone application Shopkick, for example, consumers are provided with advice on where to find bargains in local retail stores and can earn points, or credits toward purchases, merely by visiting a store—their presence is automatically recorded by an on-site Shopkick tracking device (Clifford 2010). Additional points can be earned by entering a dressing room to try on goods or by using one's phone to scan barcodes on items being promoted in the store. Shoppers also can invite friends to visit (thus earning more points) or share their shopping experiences through links to Facebook and Twitter (two popular social networking services). Swipely, another social shopping service, allows consumers to publish their purchases online merely by swiping their credit or debit cards at the time of purchase. Other users of the service may then comment on those purchases

or, as Swipely's motto puts it, "turn purchases into conversations." The idea is that by sharing and rating their buys and bargains, users will be able to discover new shops, restaurants, and products and find daily bargains (PBN Staff 2010).

In doing so, however, what used to be private information—how one spends one's money—becomes a public conversation. Obviously, not everyone will be attracted to these types of services, but Swipely, Shopkick, and a growing number of others seek to tap into a trend, particularly among young people, toward increased willingness to share the details of one's life with others as part of a digitally connected social network. The trend is clearly present and growing, but as of mid-2010 it represented but a small portion of the advertising industry's overall efforts to win buyers and influence shoppers.

Advertising in the Movies

In the 2006 comedy film *Talladega Nights: The Ballad of Ricky Bobby*, viewers probably were not too surprised to see the obvious pitches for NASCAR, Sprint, Wonder Bread, and Power Ade as the story unfolded. In fact, the advertising connection between the movie and products continued into the retail environment, as grocery stores began to sell NASCAR-branded hotdogs and other Talladega-branded merchandise—a phenomenon known as branded entertainment. Sports events, particularly auto racing, have long been associated with corporate sponsorships, which have grown to be an acceptable part of the experience. However, is the blitz of products as props or part of the story line in a movie an invasion of the customer's privacy? Consumers pay to be entertained by a movie, not to be exposed to a two-hour-long commercial.

Corporate sponsorship through product placements in movies, TV shows, and video games has become an increasingly prevalent method of promotion. Global spending on paid product placement promotion increased by 42 percent in 2005 and by another 39 percent in 2006. It declined by a few percentage points for the first time in its history in 2009, owing to the global economic recession. The United States is the world's fastest growing market in the phenomenon, estimated to have generated nearly $4 billion in 2009. Companies have found that this method of promotion is more precise in reaching their targeted audiences than regular television advertising since technology has allowed customers to stream ad-free or "ad-lite" versions of shows online or skip over TV commercials by using the TiVo digital system.

Movie executives have embraced the use of product placement and branded entertainment as a means to bolster their movie budgets and offset costs before the film is ever introduced to the public. One of the most profitable product placement agreements was in the 2002 movie *Minority Report,* starring Tom Cruise. Corporate sponsors paid close to $25 million in product placement fees for their products, representing one-fourth of the movie's total budget. Even the plot itself deals with the business of advertising. In the film, the character played by Tom Cruise walks through a shopping mall bombarded by holograph advertising messages as he passes each store. In the movie, this

was a scene from the future year 2054, but today's technology has increased the many ways that marketers are getting to their prospective customers. The future is already here in the world of advertising.

Searching for the Customer

Advertisers have used many forms of media to get their messages to potential customers over the years. Spending on advertising through radio, magazines, newspapers, and outdoor media (billboards) all peaked in the mid-1940s with the advent of television. Until 1994, newspapers were the largest ad medium. In 2009, television was the largest medium (including network, cable, and local), with magazines a distant second. While marketers are looking to other technologies to communicate to their customers—for example, mobile media (smart phones and other handheld devices)—the majority of media buys are still for the older types of media. One reason for this may be that costs to place ads on radio, on TV, in newspapers, or on billboards are higher than those for the Internet or other forms of direct marketing, and the returns may be better, or at any rate more predictable.

The cost issue may also be the reason companies are looking for other ways to reach their target audiences. One of these ways is for advertisers to show regular 30- and 60-second commercials in movie theaters before the featured movie begins. Advertisers look to this venue for two primary reasons: (1) they are able to reach a specific target segment with their ads, and (2) they have a captive audience. It is easier for a company to determine who is watching a certain genre movie than it is to target who is watching

a television program, and it is likely that the viewer is not going to switch to another station on the remote or TiVo the ad. An additional benefit to the advertiser is the effectiveness of this medium. Research shows that the audience retains the information in an ad shown in a movie theater better than in one provided by television or other media. Cinema advertising has grown almost 40 percent in the last five years and is expected to double to over $1 billion by 2011.

Another fast-growing method for targeting specific audiences and delivering advertising is through radio signal tracking. When radios are tuned in, they not only receive signals, they also transmit them. Technology allows companies to pick up radio signals from passing cars, determining what station the occupants are listening to. Although the technology was first used to measure consumers' actual listening habits of various radio stations, it is now being used for a more interactive purpose. MobilTrak, a company specializing in this technology, can pick up radio signals and give retail businesses specific data about the type of radio stations that the passing traffic is listening to. While a radio station can claim that it is the number one station in the market, it may be number one on the east side of town but not on the west. MobilTrak can help retailers target their advertising buys more specifically, so that they can place their commercials on the specific stations that are most popular in their geographical area.

This type of technology is also being used in outdoor advertising, where radio signals from passing traffic help to determine the specific ads that are on billboards. With the advent of multiple-ad billboards, where the ads change frequently through computer panels, several companies can share the cost of a single location. These electronic billboards can be set to change and show a new commercial every few seconds. However, with radio signal tracking, the ads change depending on the average demographic driving by at the time, determined by which radio stations they have tuned in. If the majority of the drivers are listening to a country station, the ad might be for a local truck dealer; however, if most of the drivers are listening to a public radio station, the ad might be for the local symphony.

Reaching the Customer by Phone

The idea of tracking specific customers as they pass by is not limited to radio signal technology. Marketers realize that people are spending more time on the Internet and cell phones than watching television, and so they are finding ways to develop commercials that get to the customer on these types of devices. Nearly 300 million consumers in the United States own mobile phones, providing a viable format for reaching large numbers of potential customers. In the film *Minority Report,* the character played by Tom Cruise is bombarded by holographic messages as he walks by stores. Today, the technology exists (based on the Global Positioning System, or GPS) that allows retailers to text message commercial ads as customers walk through a mall. They can identify specific customers and send a message about new items that are in the store or about specific items that are on special that day. Marketers can also send commercials to cell phone

screens. Many companies are revising the usual television ads and formatting them for the smaller screen. For now, it does not appear that consumers are offended by the ads; however, as more companies engage in this type of promotion, the public's attitude may change. The trend for mobile marketing is expected to grow significantly in the next few years.

Technology Enables New Methods

Technology has also enabled marketers to target their customers more specifically. For several years, personalized ads have run in magazines that are targeted to specific subscribers. Ads are included in magazines with the individual's name imprinted on the page, making the ad not only more personal but also more recognizable, therefore increasing the likelihood that the individual will read the message. This same type of technology is now being used to print special commercial messages on bank statements. Companies like Chase and Wells Fargo have been foregoing the usual mail inserts and instead have been imprinting personalized messages in the statements, through print and online. The messages typically are for other products that the companies offer or related products in which consumers may have an interest, like a financial planning seminar. However, in the future, these specialized ads could be for other companies' products and services.

Older technologies have also been employed for new purposes. In some larger retail outlets, managers use video cameras to track shoppers' movements and observe their buying habits. Companies such as Envirosell specialize in providing retailers with this service, supplying trained personnel to monitor the cameras and analyze the results. In some cases, the cameras have been used to monitor the behavior of floor salespersons—for example, to see whether they approach customers in a specified amount of time. Privacy advocates, such as those belonging to Consumers Against Supermarket Privacy Invasion and Numbering, find the practice to be a clear violation of individual privacy rights (Rosenbloom 2010).

Some Alternative Forms of Advertising

Whether enabled by technology, a spark from a creative advertiser's mind, or just plain common sense, there are many new, alternative means for the world of advertising to reach the potential customer.

The company marketing Purell hand sanitizer invented a new campaign that would reach potential customers in doctors' offices ("Purell" 2006). The company placed bright yellow, two-by-three-inch stickers on the top right corners of the magazines in a doctor's office waiting room. The stickers read "Caution" in large type: "How many patients have coughed on this" or "gently sneezed on this" or "Exposing patients to more than germs," all pointing to the need for Purell hand sanitizer. The ads further suggested that hand washing was not enough—that a hand sanitizer was necessary to kill the germs.

Another unique form of advertising was reported by National Public Radio; US Airways was planning to begin placing advertising for other companies on its air sickness bags. Seeing the blank space on the bags, a clever marketer felt that it would be able to bring some needed cash to the airline's bottom line.

Other companies have found blank space on city sidewalks, street posts, and even trees. Called *wild posting,* companies spray paint ads on sidewalks and street posts. Although the practice is illegal, the fines imposed on the companies are a fraction of what legitimate advertising would cost. In 2006, Reebok painted over 200 mini billboards on the sidewalks of Manhattan. Their fine was $11,000 in cleanup costs; however, if they had placed the same ads on 200 phone booths during the same period, it would have cost over $400,000. Old Navy found blank space on the trees along one Manhattan street and tied Old Navy logos on them (McLaren 2007).

On the golf course, many of the conveniences offered to golfers are also media for advertising messages. GPS screens mounted on golf carts offer several services: golfers can place orders at the clubhouse restaurant so that they can be ready when the game is over or keep electronic scores and compare themselves to other golfers. The screens also provide space for advertising, which can be tailored to the specific hole the cart is approaching. Additionally, ads have been placed in the bottom of each hole on a golf course so that when the player picks up the ball, the ad is seen. The golf course is an attractive medium to marketers due to the demographics of the players. It is estimated that there are 27 million golfers in the United States, a number that continues to grow—perhaps at a more exaggerated rate, with the number of baby boomers who will be retiring in the next decade. The players tend to be men (85 percent), own their own homes (80 percent), well educated (47 percent are college graduates), and have an average household income of over $100,000 (Prentice 2006).

Perhaps the most invasive form of alternative advertising is following consumers into public bathrooms. Initially, the ads were in the form of posters, primarily on the

back of stall doors and above the urinals. However, they have gone to new locations to reach the captive customer. Companies are placing ads on urinal mats in men's rooms, and, while not every company relishes the idea of men urinating on their logo, there are many that do. In fact, urinal mats are big business in bar bathrooms, and bathroom advertising is currently the fastest growing form of indoor advertising. In addition to the urinal mat are audio ads delivered via talking toilet paper dispensers, interactive poster ads that will emit a fragrance sample when pressed, and digital screens placed in the floor right in front of the toilet. All of these media are designed to reach a captive audience and can be tailored to fit the demographic of the audience. Ads can be placed in men's or women's rooms and can be targeted to the age group likely to be customers. Most interactive bathroom advertising is in the restrooms of nightclubs, bars, and restaurant-bar combinations.

When Is It Too Much?

While consumers have grown to expect advertising messages to appear through various forms of media, the proliferation of ads and the means by which marketers reach us could have negative consequences. At some point, consumers may say "enough." Consider a couple who have traveled out of town to attend a friend's wedding. After checking in, they retire to their hotel room and see the message light blinking on the phone. Expecting to retrieve their messages, they first hear a 30-second commercial for the restaurant down the street. Later, they go to dinner, maybe in that same restaurant. The man excuses himself to go to the restroom and, while relieving himself, reads an advertisement printed on a urinal mat. But our couple's exposure to commercial messaging does not stop here. When they get to their friend's wedding, they find that corporate sponsors have been invited to the wedding. The food is sponsored by a local restaurant, which has imprinted its logo and ad on the wedding tableware. The florist has a mobile billboard located just inside the reception hall, and the photographer's business cards are located at each table setting. The wedding has become a promotional event.

From the Marketer's Point of View

While there are many critics of advertising, the fact that our culture is exposed to advertising is a sign of an open society. Additionally, research suggests that the public actually *likes* advertising—but prefers that it be less obtrusive and on a time schedule that they select (see the sidebar "Customer Preferences in Advertising"). Marketers consider advertising to be a form of free speech and a part of doing business in a capitalistic society. Additionally, advertising is necessary for informing the public about the many products that are offered for sale. Gone are the days when Henry Ford offered his car only in black. Today, improvements in industrialization processes and technology have made it possible to offer a proliferation of products that can

be tailored to every need. No longer does a customer go to the store to simply buy toothpaste; he is now met with a number of choices that even a decade ago was not thought to be possible. One can buy toothpaste made by Aim, Aquafresh, Colgate, or Crest, in paste or gel, and in flavors of mint, cinnamon, or orange; moreover, one has choices for sensitive teeth, tartar control, whitening, cavity prevention, and so on. The average supermarket in the United States offers approximately 33,000 products to choose from. It is estimated that every year there are an additional 25,000 new consumer products offered for sale; some are truly new products, and some are modifications of existing ones. However, the majority of these new products fail—as many as 90 percent of them in some industries—which keeps down the total number in stores at any given time. To cut through the product offering clutter, marketers feel the need to get the word out to their customers and inform them of the product's benefits, both tangible and intangible.

However, marketers also know that there is a saturation point for advertising, a point at which any additional expenditures are wasted on the customer. This saturation point differs by industry, type of product, content of the ad, and other variables, but it can be calculated for the specific ad and product. The question is, at what point does the customer become saturated by advertising in general? It is difficult for marketers to calculate this saturation point due to the number of products, ads, and media by which we are exposed to advertising every day. The number of messages each of us is exposed to every day is estimated to be as high as 3,500. However, it is suggested that we can only process and recall about 1 percent of them (Kitcatt 2006).

Will marketers continue to search for new methods to reach their targeted audiences? Will consumers grow weary of the onslaught of advertising or, worse, grow indifferent? At what point does it all become overkill?

AFFIRMATIVE ACTION

William M. Sturkey

Affirmative action is the practice of preferential hiring for minorities to ensure that employees in businesses represent population demographics. In the American business world, there is a growing debate about whether affirmative action is effective, or even necessary. This article will concentrate on the history of the affirmative action concept in the United States and illustrate the arguments on each side of the affirmative action debate.

How and Why Did Affirmative Action Begin?

Affirmative action began largely as a result of the African American civil rights movement of the 1950s and 1960s. The first person to use the term *affirmative action* was President John F. Kennedy. His goal was to use affirmative action to ensure that the

demographics of federally funded positions represented the nation's racial demographics more proportionately. With the passage of the 1964 Civil Rights Act, eight months after Kennedy was assassinated, affirmative action began to spread to realms outside of government. Title VI of the act stated that "no person…shall, on the ground of race, color, or national origin, be excluded from participation in, be denied the benefits of, or be subjected to discrimination under any program or activity receiving Federal financial assistance." Title VII laid out exemptions to this law, stating that, under special circumstances, gender, religion, or national origin could be used as a basis for employee selection. This was the beginning of the type of preferential hiring that we now refer to as affirmative action.

FIVE MYTHS ABOUT AFFIRMATIVE ACTION

1. *Affirmative action only benefits African Americans.* Affirmative action is designed for, and applied to, all minority groups, including white women.
2. *Over the last 30 years, affirmative action has clearly leveled the playing field for minority groups.* According to one study, although blacks represent approximately 12 percent of the U.S. population, they make up less than 5 percent of the management ranks and considerably less than 1 percent of senior executives (Brief et al. 2002). The disparity is prevalent among gender, too. Women who work full-time throughout the year earn approximately 78 percent as much as men (Stolberg 2009).
3. *Affirmative action costs a lot of white workers their jobs.* According to the U.S. government, there are fewer than 2 million unemployed African Americans and more than 100 million employed whites. Considering that affirmative action policies extend to only qualified job applicants, if every unemployed, and qualified, African American took the place of a white worker, less than 1 percent of whites would be affected ("Ten Myths" n.d.).
4. *Affirmative action gives preference to women and people of color based only on their race.* No one is ever hired or accepted strictly based on skin color. This practice is prohibited by law.
5. *Once an affirmative action candidate is hired, she has a job for life, no matter how poor her performance.* The terms of performance in the workplace are the same for minorities as they are for white men. Often, minorities are expected to contribute more to the workplace than white men due to stereotypes that all minorities in business are hired due to affirmative action.

Other myths surrounding affirmative action are that it was developed as a means to end poverty within certain social groups and that it was designed to make amends for slavery or similar economic hardships placed on various minority groups throughout the history of the United States. It was designed to open the door to a certain minority group's ability to obtain a foothold in workplaces from which they had consistently been excluded.

Kennedy's successor, Lyndon B. Johnson, was the first to use the term affirmative action in legislation. In Executive Order No. 11,246 (1965), Johnson required federal contractors to use affirmative action to ensure that applicants are employed and that employees are treated during employment, without regard to race, creed, color, or national origin. Johnson also wanted to extend Title VII into realms outside government-financed jobs.

Johnson's affirmative action was designed to implement institutional change so that American organizations could comply with the Civil Rights Act. The need for this change was based on the following assumptions: (1) white men comprise the overwhelming majority of the mainstream business workforce. Providing moral and legislative assistance to underrepresented minorities is the only way to create a more equal space in the business place. (2) The United States, as the so-called land of opportunity, has enough economic space for all its citizens. (3) Especially after the Civil Rights Act, the government assured itself, and the citizens of the United States, that public policy was the proper mechanism to bring about equality of opportunity. (4) Racial prejudice exists in the workplace, and it adversely affects the business and academic worlds' hiring of minorities. (5) Social and legal coercion is necessary to bring about desired change.

One of the most common misconceptions of affirmative action is that it sanctions quotas based on race or some other essential group category such as gender. It does not. This was affirmed in 1978 when the U.S. Supreme Court, in *Regents of the University of California v. Bakke,* ruled that racial quotas for college admissions violated the Fourteenth Amendment's equal protection clause, unless they were used to remedy discriminatory practices by the institution in the past. In *Bakke,* white applicant Allan P. Bakke argued that his application to the University of California, Davis's Medical School was denied due to the university's use of quotas to admit a specific number of minority students to the medical school each year. In its highly fractious decision, the Supreme Court ruled that Bakke's application was rejected because of the quota and ruled quotas unlawful. Muddying the waters, however, was Justice Powell's *diversity rationale* in the majority decision. The diversity rationale posited that ethnic and racial diversity can be one of many factors for attaining a heterogeneous student body in places of higher education. Thus, while *Bakke* struck down sharp quotas, the case created a compelling government interest in diversity.

How Is Affirmative Action Implemented?

Affirmative action requires companies to perform an analysis of minority employment, establish goals to create a more demographically representative workforce, and develop plans to recruit and employ minority employees. For most companies that have effective programs, affirmative action extends beyond hiring practices to include maintaining a diverse workforce, periodic evaluations of the affirmative action program, educating

and sensitizing employees concerning affirmative action policies, and providing a work environment and management practices that support equal opportunity in all terms and conditions of employment. Many of the biggest companies in the United States today have departments and legal staffs dedicated entirely to ensuring diversity in the workplace.

A multitude of problems inhibit or complicate the enforcement of affirmative action. The bulk of these problems include issues surrounding practices common to the modern business world, stereotypes, and employee preferences. Most of these problems

LEGAL HISTORY OF DIVERSITY IN THE AMERICAN PUBLIC SPHERE

Equal Pay Act of 1963

- Requires that men and women workers receive equal pay for work requiring equal skill, effort, and responsibility, and performed under similar working conditions.

Civil Rights Act of 1964

- Title VI states that "no person . . . shall, on the ground of race, color, or national origin, be excluded from participation in, be denied the benefits of, or be subjected to discrimination under any program or activity receiving Federal financial assistance."
- Title VII laid out exemptions to this law, stating that, under special circumstances, gender, religion, or national origin could be used as basis for employee selection.
- Executive Order No. 11,246 (1965) stated that "the head of each executive department and agency shall establish and maintain a positive program of equal employment opportunity for all civilian employees and applicants for employment within his jurisdiction in accordance with the policy set forth in Section 101."

1978, *Regents of the University of California v. Bakke*

- The U.S. Supreme Court decided that any strictly racial quota system supported by the government violated the Fourteenth Amendment and the Civil Rights Act of 1964.

1980, *Fullilove v. Klutznik*

- The Supreme Court upheld a federal law mandating that 15 percent of public works funds be set aside for qualified minority contractors.

1986, *Wygant v. Jackson Board of Education*

- The Court ruled against a school board whose policy it was to lay off nonminority teachers first, before laying off minority teachers.

1995, *Adarand Constructors v. Peña*

- The Court called for "strict scrutiny" to be applied to cases in which past discrimination is alleged, and it required affirmative action programs to be "narrowly tailored" to address specific issues at hand, not broad trends.

1997, California's Proposition 209

- California passed legislation that banned all affirmative action programs in the state.

2003, *Gratz and Hamacher/Grutter v. The Regents of the University of Michigan*

- The Supreme Court upheld the University of Michigan's law school admissions policy, which considered race as a factor.

2009, *Ricci v. DeStefano*

- The Court ruled that (non-minority) firefighters in New Haven, Connecticut, were justified in claiming reverse discrimination. The city had thrown out the results of advancement exams because it feared the results would prevent a sufficient number of minority candidates from advancing.

are extremely hard to investigate and often involve serious issues, such as personal relationships or job loss, that make the problem even more complicated.

One of the biggest problems facing U.S. companies today is how to handle affirmative action when downsizing. What role should affirmative action play when deciding who is expendable during downsizing? Rarely do companies plan downsizing strategies that include consideration of workforce diversity. When deciding who to downsize, employers have a great number of factors to consider. These factors include race, gender, seniority, tenure with the company, rank, and personal relationships. There is no standard way of dealing with downsizing because each situation, and each employer, is different. Juggling the aforementioned factors while paying attention to the levels of merit between employees now competing for jobs can become incredibly complicated and pressured.

Perhaps the most widespread problem facing effective affirmative action practices today is also the hardest to identify and fix and is the most complicated. This problem is commonly referred to as the *good old boy factor.* The good old boy factor involves nepotism, the employment of friends and family over those who may be more qualified for certain positions. The basic problem behind this type of employment is that the employer's family and close personal friends most often share the same ethnic background as the employer, thus limiting diversity in certain realms of employment. Ironically, although not termed this, the good old boy factor is, for all effective purposes, a form of affirmative action. However, this type of affirmative action does not require any amount of education, experience, competence, or overall job qualifications for employment. The way to handle this problem is to change the employment practices and values of the highest ranking executives in a company. However, because they are the highest ranking executives, they may not have anyone to whom they answer, and their immediate subordinates are often people hired due to their relationships as well. In reality, white men have been hired for years, and continue to be hired, due to racial and personal preferences.

THE GOOD OLD BOY FACTOR

The career of former Federal Emergency Management Agency (FEMA) director Michael Brown is an example of the good old boy factor at work. Before taking over FEMA, Brown was the judges and stewards commissioner for the International Arabian Horse Association (IAHA), from 1989 to 2001. Brown resigned his $100,000-a-year post in 2001 amid scandal. Brown left the IAHA so financially depleted that the organization was forced to merge with the Arabian Horse Registry of America and has since ceased to exist.

Shortly after his dismissal, Brown joined FEMA as general counsel, under the guidance of then FEMA director Joe Allbaugh, who ran President George W. Bush's 2000 election campaign. When Allbaugh resigned in 2003, Brown, with Allbaugh's recommendation, became the new head of FEMA, with an annual salary of $148,000.

When Hurricane Katrina hit the city of New Orleans on August 29, 2005, it quickly became one of the most horrific natural disasters to ever affect the United States. The storm killed more than 400 people, displaced approximately one million Gulf Coast residents, cost nearly 400,000 jobs, and caused as much as $200 billion in damage (*Katrina* 2005). While the storm was obviously beyond human control, the U.S. government, specifically FEMA and Brown, received criticism from across the globe pertaining to its slow response to the storm. Democratic and Republican politicians criticized FEMA and called for Brown's immediate dismissal. Brown was forced to resign on September 12, 2005, after a significant tragedy in U.S. history.

On September 9, 2005, *Time* magazine reported that it had found false claims in Brown's biography on the FEMA Web site. The biography exaggerated previous emergency experience, lied about a teaching award and job status at Central State University, and fabricated a role with the organization known as the Oklahoma Christian Home. Another member of the press, Michelle Malkin (2005), stated that Brown was a "worthless sack of bones. . . . And I don't care if he has 'Bush appointee' stamped on his forehead or a GOP elephant tattooed to his backside. Brown's clueless public comments after landfall are reason enough to give him the boot . . . and he should never have been there in the first place." Columnist Russ Baker (2006) wrote that "Michael Brown will forever remain the poster child for federal incompetence" and "it makes absolutely no sense that Michael Brown should have been holding any major government post." So why did this happen?

The answer is the good old boy factor. Mike Brown and Joe Allbaugh were college roommates and had been friends for decades. Allbaugh served on George Bush's administration while Bush was the governor of Texas and ran his 2000 presidential campaign. Allbaugh appointed Brown director of FEMA after his resignation from the post, despite Brown reportedly having few supporters within the organization. Instead of relying on credentials, President Bush and long-time political ally Joe Allbaugh hired one of Allbaugh's old friends, who, despite a misleading résumé and an apparent display of incompetence at his last job, had similar political interests. This is an example of good old boy affirmative action. Mike Brown received his job because of his long-time friendship with the administration, while other potential FEMA administrators were passed over. Good old boy hiring occurs in the business world all the time, and many believe that it is a key factor in inhibiting the objectives of affirmative action.

The Argument against Affirmative Action

Since its inception, affirmative action has constantly faced harsh critics who would like to see the process changed, altered, or disbanded altogether. The critics of affirmative action claim that the practice actually creates unequal hiring practices; is impractical; is unfair to those who, they claim, lose jobs due to the practice; and is even unfair to those who gain employment because they may not be able to do the work. One of the most common misconceptions about those who are against affirmative action is that they are all white conservative men. However, many minorities, even liberal ones, are also opposed to affirmative action, if not as a concept, then to the way it is implemented in the U.S. system. This section will outline some of the major arguments against affirmative action as it is generally applied in the United States today.

The most prevalent argument against affirmative action is that the practice creates reverse discrimination. Those who argue this stance point to Title VI of the 1964 Civil Rights Act, which was designed to prevent exclusion of minority groups based on race, religion, sex, or national origin. Those who claim reverse discrimination when arguing against affirmative action claim that white men are now victims of discrimination due to their race and sex.

One of the biggest changes in U.S. society over the past 40 years has been the cultural and judicial insistence on civil rights for every citizen. The most famous impetus for this sociological development was the civil rights movement of the 1950s and 1960s, which produced wide gains in the public sphere for African Americans. Included in these gains was the Civil Rights Act of 1964, which outlawed discrimination in public realms such as education, housing, and hiring practices. To many Americans, the treatment that African Americans experienced in this nation until this act was passed was unacceptable and unfair. By enacting the Civil Rights Act of 1964, President Lyndon B. Johnson created, in many citizens' eyes, an equal playing ground for African Americans. To them, affirmative action went beyond the means and goals of the Civil Rights Act of 1964 and was excessive because discrimination was now outlawed by the federal government, and African Americans would be on equal footing with whites.

Furthermore, many argue that affirmative action is unfair because those who lose, supposedly the white majority, and those who gain, supposedly all minority groups, are not all victims of the historical process that created past inequalities. They ask, why should contemporary whites have to pay for the inequalities created by past generations before they were born? At the same time, they ask, why should minorities, specifically African Americans, benefit from the socioeconomically subordinate positions their ancestors held in society? In essence, why should whites pay for discrimination that took place before they were born, and why should contemporary African Americans benefit from the suffering of their ancestors, which they have never experienced?

One of the most common arguments against affirmative action that comes from minority leaders is that affirmative action turns people into victims. When expecting the

government to take care of minorities and give them preferential treatment, individuals tend to act as if the government owes them something. Some do not consider this progress because it tends to alienate historically underprivileged minority groups from mainstream society.

Another part of this argument is that affirmative action taints minorities in the workplace. When minorities are hired for high-level positions, it is automatically assumed that they received their jobs due to affirmative action. This argument basically claims that individual accomplishments by people from minority groups are virtually impossible because of the cloud created by affirmative action. That cloud, they argue, often leads to assumptions that every minority person in the workplace is there because he or she is a minority and that this person took the job of a white man. This creates stereotypes and ineffective working environments because many minority employees may not be taken seriously.

There are many arguments against affirmative action as we know it today. The arguments are made from various viewpoints and from various political, racial, and economic groups. The opponents of affirmative action are many, and their arguments are multifaceted, with conflicting views prevalent even among would-be allies against this practice.

The arguments for affirmative action are somewhat different and have changed over the course of this practice. As a new type of anti–affirmative action ideology has developed, affirmative action advocates have answered the challenge.

The Argument for Affirmative Action

The historical origins of the argument for affirmative action are obvious. Throughout U.S. history, white men have dominated nearly every aspect of the social landscape. Affirmative action was developed in tandem with civil rights advancements to open more fully opportunities for minority citizens. The arguments supporting affirmative action have now taken the form of debunking myths and exposing truths that indicate problems and misconceptions in the arguments opposing affirmative action.

The biggest and most obvious argument in support of affirmative action challenges the notion of reverse discrimination and beliefs that job markets are closed to whites when competing with minorities. Proponents of affirmative action are quick to point out that, even though minority groups have achieved great gains, they are still underrepresented in the workforce, specifically in white-collar jobs. For example, African Americans and Latinos make up approximately 22 percent of the U.S. labor force. In comparison, they make up only 9 percent of U.S. doctors, 6 percent of lawyers, 7 percent of college professors, and less than 4 percent of scientists (Jackson 1996). Proponents of affirmative action are quick to point out that the labor force does not mirror an equal employment system. The number of age-eligible employees does not correlate to the percentage employed. If the system was equal, then employment figures should not be as lopsided as they are.

This argument also suggests that the Civil Rights Act of 1964 did not solve the United States' racial issues; it simply hid them. After the Civil Rights Act of 1964, and even today, African American and Latin American U.S. citizens are proportionately poorer than their white counterparts. The Civil Rights Act of 1964 opened spaces in the public sphere, but it did not provide concrete economic or financial means for success among minority groups.

Affirmative action backers also argue that diversity is good for society as a whole. Owing to the hiring, promotion, and economic advancement of minorities, diversity has started to seep into more realms of American life. In essence, diversity is becoming more mainstream than it was in the past. Because of this increased diversity, prejudices held about various minority groups have become less prevalent. Partially due to mainstream diversity, the United States is becoming more culturally affluent and accepting. Prejudice is no longer acceptable in most realms of U.S. society, and affirmative action offices and practices create environments in which diversity is accepted, learned, and experienced.

Pro–affirmative action advocates also argue that affirmative action has helped foster the development of minority role models as more and more minorities enter professional and political positions. Furthermore, their entry has led to the development of a raised consciousness among the American citizenry about issues such as racism, rape, immigration, and poverty that before were invisible to mainstream U.S. society.

Affirmative action advocates argue that, contrary to popular opinion, affirmative action is still necessary. The research being done by advocates shows very clearly that there is still a major discrepancy between the United States' population demographics and its social and economic characteristics. This discrepancy is most prevalent in the workplace and education, where affirmative action has been used the most. Not only do the advocates back their claims of inequality, they show how, in many ways, minorities in this country are hardly better off than they were when affirmative action was first implemented. They argue that affirmative action measures should be increased because of a lack of effectiveness and because of the token affirmative action that many firms use today. For all effective purposes, token affirmative action is affirmative action with quotas. In token affirmative action, the quota usually equals one. Companies will hire a token minority and appoint him or her to a public position to eliminate any doubts concerning the organization's diversity. It is often the case that beyond these token appointments, minority groups are underrepresented in all other sectors of the organization.

Affirmative action advocates have also argued that affirmative action is good for all people involved because it increases workplace diversity and expands traditional ideas. It not only helps individuals obtain positions previously unavailable to them, but it also helps create a broader sense of the world within individuals and within organizations. In essence, it forces people to broaden their horizons.

Conclusion

Affirmative action has become a very controversial topic. Opponents suggest that affirmative action causes reverse discrimination that hurts white men and, in fact, is detrimental to minorities who are placed because of it. Furthermore, they believe that the practice of affirmative action contradicts the basic civil rights guaranteed by the Constitution. Advocates believe that discrimination still exists and that affirmative action gives minorities a chance to work, which affects every aspect of their lives. The debate will continue until minorities are represented in every job class and type.

BANK BAILOUTS

Elizabeth A. Nowicki

A "bank bailout" occurs when a regulatory or government authority provides assistance to a bank that is failing and on the path to insolvency. In a bank bailout, either a regulatory or government authority provides the funds needed for the bailout, or the authority orchestrates assistance of the failing bank by private parties, essentially rescuing or assisting a bank that would otherwise fail and go bankrupt. The people who have deposited their money with the bank (depositors) are otherwise likely to lose all of the money they thought they were depositing for safekeeping.

Bank bailouts are conducted in one of two ways: Either a bank that is on the verge of insolvency is prevented from failing by an infusion of capital that helps the bank continue in operation, or the failing bank is allowed to fail but the party providing the bailout helps the bank liquidate and guarantees repayment to the depositors.

In recent U.S. history, major bank bailouts have only occurred at four distinct times:

- 1930s: many banks were bailed out after the stock market crash of 1929.
- 1984: bailout of Continental Illinois National Bank, then the nation's seventh largest bank.
- 1985–1999: approximately 1,043 savings and loan institutions were bailed out.
- 2008–2009: bailouts included Bear Stearns, Fannie Mae and Freddie Mac, Lehman Brothers, AIG, Citigroup, and Bank of America.

Bank bailouts in the United States are controversial, in part because they come at a cost to taxpayers, they represent failure in an industry populated by highly paid executives, and they implicate what economists refer to as a "moral hazard problem," meaning that some believe that bailing out banks creates an incentive for bank managers to behave in a risky manner, since they know that their banks will be bailed out if their banks run into financial trouble. Yet bank bailouts have an emotional appeal, in part because bailouts of major banks are often preceded by urgent clamors that the failing bank needs to be assisted because it is "too big to fail." The too-big-to-fail theory posits that, if a large bank is allowed to fail, there could be catastrophic ripple effects in the economy, as parties with whom the bank was dealing will lose money on transactions or deposits they had with the failed bank, such that these other banks will be compromised and will not be able to continue robust lending to businesses, such that businesses will not be able to expand or will need to lay off employees, and unemployed consumers will then cut back on purchases, such that demand for goods and services will decrease, which will result in businesses laying off more employees, and a vicious and devastating economic cycle will be created.

That said, bailouts generate populist anger, and, in his first state of the union address, during the beginning of the 2008 bank bailouts, President Barack Obama noted that "if there's one thing that has unified Democrats and Republicans—and everybody in between—it's that we all hated the bank bailout. I hated it." Still, the president observed that the bailouts were "necessary," much like a root canal.

History of Bank Bailouts

The modern history of bank bailouts in the United States began in the 1930s, after the stock market crash of 1929. When the stock market began crashing, large numbers of people began withdrawing their money from banks. This compromised the ability of banks to pay depositors who wanted to withdraw their money, since banks only keep a limited amount of cash on hand, instead maintaining the rest of their money in less liquid assets such as investments and insurance. The inability of banks to immediately pay every depositor who wanted to withdraw her money raised concerns about whether banks would be able to repay all of their depositors, which led to panicked "bank runs." In order to repay depositors, banks needed to liquidate assets, but, given the declining economic climate, banks were forced to sell assets at gravely depressed prices. Therefore, many banks were unable to raise enough cash to pay all of their depositors, and some banks became insolvent. Fear of insolvency exacerbated the bank runs, which put an even greater strain on the available cash remaining and forced even more asset sales, which further depressed the prices at which assets could be sold by banks, such that bank runs became contagious and accelerated the failure of banks that had run out of money.

The Federal Reserve, which was created by legislation passed in 1913, had the authority to provide assistance to troubled banks, but its mandate extended only to member

banks, which did not include the majority of the smaller failing banks. Moreover, the Federal Reserve would only make temporary loans on good collateral, which banks failing in the midst of the Great Depression did not have. Bank failures soared, with 2,294 occurring in 1931 (Kennedy 1973, 1), and almost 13 percent of the nation's remaining banks suspending operations by 1933 (Meltzer 2003, 402n153).

Overall, the economic climate was dismal: the stock market had crashed, so many investors lost everything. Moreover, banks were failing such that depositors were losing their remaining savings, borrowing money was nearly impossible, and bank runs were commonplace. Pervasive panic and a crisis of public confidence compounded the problems. Therefore, the government decided to act.

In 1932, the government established the Reconstruction Finance Corporation (RFC) to help distressed banks, and, in 1933, the Emergency Banking Act of 1933 authorized the RFC to bail out banks directly by purchasing preferred stock from distressed banks to infuse new capital into these banks, backed by the United States Treasury. The RFC purchased roughly $782 million in bank preferred stock and $343 million in bank bonds, resulting in the bailout of nearly 6,800 banks. The RFC ceased operations in 1953, but the Federal Deposit Insurance Corporation (FDIC), an independent agency of the federal government established by the Banking Act of 1933, continued to exist and conduct bank bailouts.

The FDIC was created in order to address the public confidence crisis that led to the catastrophic bank runs after the stock market crash of 1929 and to prevent future confidence crises. The FDIC preserves public confidence by insuring deposits in banks to eliminate depositor worries about losing deposits and by monitoring and addressing both systemic risk and deposit-related risk. The FDIC is funded by insurance premiums that banks pay for deposit insurance and from earnings on investments in U.S. Treasury securities. The Federal Deposit Insurance Act of 1950 gave the FDIC the power to bail out a failing bank if that bank was judged essential to the community.

After the bank bailouts in the 1930s, the next major bank bailout was in May 1984, when the FDIC bailed out the Continental Illinois National Bank and Trust Company (Continental Illinois), the seventh largest bank in the United States as measured by deposits. Continental Illinois was struck a fatal blow in part due to bad loans compounded by a bank run, and bank regulators intervened because of a concern that grave damage could be done to the banking system as a whole otherwise. Specifically, many other banks had invested heavily in Continental Illinois, and regulators feared that if Continental Illinois were allowed to fail, banks that lost their investments in Continental Illinois would then fail, with a grievous public confidence impact that would lead to economic disaster (Federal Deposit Insurance Corporation 1997, 250–251). Therefore, the FDIC provided over $4 billion in various forms of assistance to Continental Illinois.

The savings and loan bailout in the 1980s was next. Savings and loans financial institutions (S&Ls) were financial institutions that specialized in residential lending and

home mortgages (White 1991, 82–89). They took in money from depositors to whom they then paid high interest rates, and they lent out that deposited money to home buyers needing mortgages. S&Ls began failing in the 1980s as real estate markets began to soften. The value of the assets secured by the mortgages fell, and the S&Ls' ability to pay depositors disappeared. A wave of S&L failures exhausted the available funds in the government-established industry insurance organization, the Federal Savings and Loan Insurance Corporation (FSLIC), which functioned much like the FDIC.

Concerned about how the collapse of the S&L market might undermine the economy, Congress authorized the creation of a new agency, the Resolution Trust Corporation (RTC), to bail out the S&Ls by way of bailing out the FSLIC so that the FSLIC could repay S&L depositors. The RTC, as created by the 1989 Financial Institutions Reform, Recovery, and Enforcement Act, oversaw the sale of assets of failed S&Ls and repayment of S&L depositors. From 1986 to 1995, over 1,000 S&Ls with assets of more than $500 billion failed, costing an estimated $153 billion in bailout money, $124 billion of which came from U.S. taxpayers (Curry and Shibut 2000, 33).

The next major bank bailouts began in 2008, when the U.S. banking system experienced a liquidity crisis (Congressional Oversight Panel 2009, 4–6), banks began failing, and some feared that the economy was being destabilized. Although the precise cause of the banking crisis is still under debate, as described below, the response that followed included massive bank bailouts coupled with a related legislative overhaul.

The Recent Financial Crisis and Bank Bailouts

The bank bailouts that began in 2008 were part of what some viewed then and continue to regard as the worst financial crisis since the Great Depression. The cracks in the U.S. economy infrastructure that led to the crisis and the bailouts started to show in 2006 and 2007, however. Specifically, until approximately 2006, the U.S. housing market experienced what some would call a "bubble." Driven by subprime lending—lending to borrowers who traditionally had been viewed as undesirable due to, for example, having little or no money available as a deposit—and facilitated by securitization and derivative financial products, housing prices escalated as housing borrowing and sales skyrocketed (Congressional Oversight Panel 2009, *supra* note 9, at 8). Housing prices increased at an average of 12 percent per year from 1999 to 2006 (Congressional Oversight Panel 2009, *supra* note 9, at 8).

In 2006, however, housing prices began a modest decline that spiraled into a double-digit percentage decline by 2008 (Congressional Oversight Panel 2009, *supra* note 9, at 8). This led to a rash of mortgage defaults by subprime borrowers and a spate of home foreclosure sales by banks, and banks found themselves unable to sell at a price high enough to recoup what they had lent. Foreclosure sales accelerated the decline of real estate prices, and a dismal financial free fall eclipsed the beginning of 2008. The carnage from this lending and housing implosion was magnified by widespread use of derivatives and

securitization products by banks; therefore, even financial institutions that did not hold mortgages but held instead, for example, credit default swaps or other mortgage-related derivative products suffered from the market decline as well (Congressional Oversight Panel 2009, *supra* note 9, at 9).

The first major bank bailout in 2008 was that of Bear Stearns, the fifth largest U.S. investment bank and the leading trader of mortgage-backed bonds. In early 2008, Bear Stearns reported that it was highly exposed to the unstable subprime mortgage market. Alarmed, Bear Stearns clients withdrew their funds from Bear Stearns, and within three days in March 2008, Bear Stearns's available capital fell by 90 percent (Ritholtz 2009, 187). This prompted Federal Reserve and Treasury officials to try to arrange for a bailout of Bear Stearns. The bailout resulted in JPMorgan Chase buying Bear Stearns upon the agreement of the Federal Reserve Bank of New York to guarantee $29 million in Bear Stearns's riskiest assets, which led to reported losses of billions of dollars for the Federal Reserve Bank within months of participating in this bailout.

Shortly thereafter, Lehman Brothers, another banking behemoth, began to fail. While many clamored for a bailout for Lehman Brothers, it was instead allowed to fail completely and file for bankruptcy in September 2008, after the Federal Reserve and the Treasury made clear that they hoped never again to need to rescue a bank the way they rescued Bear Stearns (Ritholtz 2009, 190–192).

Lehman's failure spurred fears that other big banks and financial institutions would soon fail and the entire economy would be destabilized. Concern focused on American International Group (AIG), the world's largest insurer. AIG was deeply involved in the international derivatives market, and, in September 2008, as it became clear that many of AIG's investments were tied to failing mortgage-related assets, regulators decided that the world's largest insurer and a key participant in the international derivatives market must not be allowed to fail, because its failure could have far-reaching economic effects.

The Federal Reserve System is the central bank of the United States, and it was founded in 1913 by Congress to provide a more stable, safer monetary and financial system. It has four general categories of duties: influencing monetary and credit conditions in order to stabilize the economy, supervising and regulating banking institutions, containing systemic risk, and providing financial services to depository institutions and the U.S. government, among others. The chairman of the Federal Reserve oversees the seven-person board of governors of the Federal Reserve. The chairman and the board are appointed by the president. The secretary of the Treasury is appointed by the president and is the federal government's chief financial officer. The secretary, among other things, advises the president on tax and financial policy, oversees currency manufacturing, manages public debt, and serves on boards such as the Social Security Fund, the Medicare Fund, and the International Monetary Fund.

The Federal Reserve and Treasury purchased a majority stake in AIG stock for $68 billion, thereby providing much-needed capital to AIG, and the government continued to make additional loans and purchases of stock so that, by March 2009, the government had infused roughly $175 billion into AIG (Ritholtz 2009, 208).

September 2008 also saw the government takeover and bailout of the Federal National Mortgage Association (Fannie Mae) and Federal Home Loan Mortgage Association (Freddie Mac). These two government-sponsored enterprises (GSEs) had been established by Congress to participate in the mortgage market and foster the accessibility of home loans. As the subprime mortgage market deteriorated, Fannie Mae and Freddie Mac became financially compromised, and Congress adopted legislation to provide for the government takeover of both GSEs in addition to the Federal Reserve infusing well over $100 billion into the GSEs.

Also in 2008, Citigroup, a Wall Street titan that had combined commercial banking with investment banking and a brokerage house, became a focus of concern. Citigroup held billions of dollars in mortgage-related securities whose value plummeted as the housing and mortgage markets crashed. The Treasury and Federal Reserve refused to risk a fatal blow to the already precarious banking system by allowing the largest financial institution on Wall Street to fail, so a complex deal valued at hundreds of billions of dollars to stabilize Citigroup was struck (Ritholtz 2009, 217).

The Citigroup bailout and later bailouts (including bailouts in the automotive industry) were a product of legislation—the Emergency Economic Stabilization Act (EESA)—hastily adopted on October 3, 2008, in the wake of the expanding financial crisis. EESA established the Troubled Assets Relief Program (TARP)—the bailout program. The program authorized the secretary of the Treasury, in consultation with the chairman of the Federal Reserve, to purchase up to $700 billion in "troubled assets," such as subprime mortgage-based securities, in order to promote financial market stability by removing toxic assets from the banks' balance sheets.

By the end of 2009, the Treasury had disbursed over $350 billion under TARP (General Accounting Office 2009). For example, pursuant to TARP, the FDIC, Treasury, and Federal Reserve entered into an agreement with Bank of America in January 2009 to purchase $20 billion in preferred stock from Bank of America and provide protection against loss for approximately $118 billion in assets. Banks that participated in TARP or received bailouts pursuant to TARP included some of the biggest and previously strongest banks, such as Citigroup, JPMorgan Chase, Wells Fargo, Bank of America, Goldman Sachs, and Morgan Stanley, and the top nine participants in TARP represent 55 percent of all U.S. bank assets.

Conclusion

Bank bailouts are not a new phenomenon, but the massive bailouts in 2008 and 2009 have forced both politicians and bankers to revisit the necessity of bailouts, the advisability of bailouts in general, and the reasons why, in less than a century, the United

States has needed two massive rounds of bank bailouts. Is there a way to restructure the banking system to avoid the need for bailouts? What would have happened if no bailouts were provided in the 1930s and in 2008–2009? Would the billions of dollars spent on bank bailouts be better spent on a different facet of banking?

These are some of the obvious questions raised by reflecting on the major bank bailouts in recent U.S. history. It remains to be seen whether the common themes underlying these bailouts repeat again or whether valuable lessons can be learned from reflecting on these bailouts and finding ways to avoid the need for bailouts in the future.

CONGLOMERATION AND MEDIA MONOPOLIES

William M. Kunz

Conglomeration poses a range of issues for citizens and consumers. Does the presence of prominent news outlets in multinational conglomerates influence the coverage of contentious social and political issues? What effect does industry concentration have on media content—motion pictures, television programs, music, and so on? Does the loss of diversity in ownership result in the replication of money-making formulas that promote a corporate ethos at the expense of original ideas? Overall, does consolidation make it impossible or at least improbable for independent voices and viewpoints to reach citizens and consumers? These are just a few of the questions that surround the ownership controversy.

The focal point in the battle over media conglomeration is the concentration of prominent news and entertainment firms in a handful of corporations. Free market advocates argue that centralized ownership is necessary if companies are to remain profitable. They point to the explosion in the number of programming outlets, arguing that consolidation has not restricted the variety of media content. But opponents contend that conglomeration eliminates alternative viewpoints and empowers corporate media to promote dominant ideas and frame public discussion and debate.

Defining Conglomeration

Conglomeration is the process through which distinct companies come under common ownership within a single corporation. There are two different models of conglomeration,

and prominent media firms fall within each of them. The traditional definition of conglomeration involves the grouping of wide-ranging, unrelated businesses from various industrial sectors. This model involves unrelated diversification, which is the expansion into industries that are not related to the core business of a conglomerate. The General Electric acquisition of NBC in 1986 is a classic example of this type. A second model of conglomeration builds through related diversification, which involves the acquisition of firms that are connected to the core business in critical areas. The evolution of Viacom is an example of this form. Cable television was Viacom's core business in the 1980s, with ownership of MTV, Nickelodeon, and Showtime, before it expanded into motion pictures and broadcast television with the acquisitions of Paramount Pictures in 1994 and CBS in 2000.

Monopolies

Conglomeration is one factor that leads to concentration, and ultimate consolidation results in monopolies. That structure exists when there is just a single seller of a given product in a market. True monopolies have traditionally been most common in the newspaper business. Countless cities have just one daily, like Atlanta's *Journal-Constitution.* More recently, cable systems operators have been subject to similar criticism. Far more common, however, are media markets that are oligopolies, which feature a few

CONGLOMERATION AND THE LOSS OF LOCALISM

The headlines about conglomeration are often written when studios and networks combine, but less discussed is the potential impact at the local level. Local ownership of newspapers was once common, but as newspaper chains expanded, local ownership became rare and the number of cities with multiple dailies declined. The nature of local television and radio ownership also changed, as Congress and the Federal Communications Commission (FCC) relaxed one-to-a-market rules and allowed groups to reach a higher percentage of households nationwide. These changes transformed the marketplace with massive station groups and less local ownership, and more appear to be on the horizon. In 2003, the FCC voted to relax its prohibition on the cross-ownership of newspapers and television stations in the same market. The justification was the numerical increase in the number of available outlets, including the Internet. The firestorm that followed made clear that there was not universal agreement, and courts blocked their implementation, but the FCC started down a similar path in 2006. By the end of the decade, corporate control of multiple media outlets within local markets had generally increased, raising questions about information democracy. In a few cases, for example, complaints were made regarding cable companies that were allegedly blocking ads by their competitors. Such disputes (for example, between Verizon and Cablevision in 2009), usually faded after the company named in the complaint publicly denounced the practice and demonstrated access to its medium or services by competitors.

giant sellers of a product with each having a significant share of the market. In the mid-2000s, for example, four global giants—Universal Music, Sony BMG, Warner Music, and EMI Group—accounted for over 80 percent of music sales in the United States and worldwide. Some use the phrase *media monopolies* to describe the small collection of corporations that are dominant in various media markets.

Issues of Ownership and Control

One of the battle lines in the debate over conglomeration is whether ownership and control matters. From a free market perspective, ownership of a firm is not a concern unless combinations create market structures that lead to anticompetitive conditions. The Sherman Antitrust Act was enacted in 1890 to address such behavior in the United States, and it has shaped media markets. In 1938, the federal government launched a decade-long legal battle with the Hollywood studios, accusing the majors of "combining and conspiring" to "monopolize the production, distribution and exhibition of motion pictures." When the same corporation owns production studios as well as the theaters that show the movies it makes, the control of production, distribution, and exhibition could effectively close out competition. The so-called Paramount consent decrees, a series of agreements between the government and studios, prohibited anticompetitive behavior and forced the "divorcement" of production and distribution from exhibition. Free market advocates argue that this is as far as the government should delve into the marketplace.

The question is whether the nature of media products raises more significant concerns and demands additional government action. The attention to such issues has shifted over time as new ideas and ideologies come to the fore. In 1966, International Telephone and Telegraph (ITT) attempted to acquire the ABC television network, and despite claims that the network would remain independent, the Department of Justice and others questioned the impact ITT's international operations might have on ABC News and blocked the merger. Two decades later, the regulatory climate was altogether different, and there was little opposition to the combination of General Electric and NBC, although the issues were very similar. Much the same could be said of the 2007 purchase of Dow Jones, publisher of the *Wall Street Journal,* by News Corp., owner of the Fox Broadcasting Company. There was a vocal minority opposed to the sale, but the transaction went through unhindered.

The focus on ownership and control hinges, in part, on the potential impact of media content. Mark Fowler, chair of the Federal Communications Commission (FCC) in the 1980s, once stated that a television is nothing more than a "toaster with pictures." This, in turn, meant that the government could treat television the same as other industries. Scholar Douglas Kellner, however, argues that television assumes a critical role in the "structuring of contemporary identity and shaping thought and behavior." In his view, television has undertaken functions once ascribed to "myth and ritual," including

"integrating individuals into the social order, celebrating dominant values," and "offering models of thought, behavior, and gender for imitation." From this perspective, media play a significant role in society and conglomeration becomes a far more serious issue.

Types of Conglomeration

There are multiple incentives for conglomeration. The expansion into diversified businesses creates opportunities for growth and allows a conglomerate to cushion the impact of downturns in core business sectors. General Electric is often cited as the model of a diversified conglomerate, and its collection of businesses makes it, among other things, a military contractor and designer of nuclear power plants. For much of its life under General Electric, NBC Universal has contributed less than 10 percent of the total revenue of the parent company. Yet, with a number of news outlets, NBC might be thought of as more important to the parent company in helping shape public debate over contentious issues, such as militarism and energy production, through NBC News, MSNBC, and CNBC. In 1987, for example, less than a year after the meltdown of the nuclear reactor in Chernobyl, NBC News aired an hour-long show titled "Nuclear Power: In France It Works."

Even so, in a weak economy, business is business—which is perhaps why General Electric decided to sell a controlling interest (51 percent) in NBC to the Comcast cable company in 2009. The latter sale raises a host of additional questions concerning media consolidation, such as: What is the potential for loss of free network television content? What is the likelihood of price hikes for consumers of cable services? Does the sale foster or further limit media competition? And what of the matter of "information democracy"?

Synergy

As the NBC sale demonstrates, the practice of related diversification is increasingly common in media industries. This practice allows a conglomerate to build upon a strong business through the diversification into areas that are close to the core. This can create synergies that enable it to increase revenues and decrease costs through the common management of multiple businesses. This is evident in the conglomeration of media assets in corporations such as the Walt Disney Company, Time Warner Inc., and News Corp. motion picture production and distribution remain important contributors to the Disney bottom line, for example, but the most successful unit in Disney is the Media Networks division, which includes both ABC and ESPN. Disney's corporate expansion into related fields proved to be quite lucrative.

Horizontal and vertical integration are defining characteristics in media consolidation since the 1980s. With horizontal integration, firms acquire additional business units at the same level of production, distribution, or exhibition. Such consolidation enables

THE CONGLOMERATION OF MICKEY MOUSE

The transformation of the Walt Disney Company from a struggling studio operating in the shadow of its related theme parks into a sprawling corporation provides one of the clearest examples of conglomeration. The first step was the creation of production units to develop a diversified slate of films. In 1983, combined domestic and foreign box office receipts for its motion pictures totaled $82.5 million. A decade later, the filmed entertainment division of Disney generated $3.67 billion in revenue. The diversification into related businesses was the next and most significant step. The biggest headlines came in 1996 with the acquisition of Capital Cities/ABC Inc. This created vertical integration between ABC and the production units within Disney, links that were most evident a decade later when three shows from Touchstone Television, *Lost, Desperate Housewives,* and *Grey's Anatomy,* fueled a resurgence of the network. That merger also included ESPN, which became the most lucrative unit in the Disney empire. In 2004, the diversified conglomerate generated over $30 billion in revenue, 20 times what it did in 1984. Two years later, it purchased Pixar Animation Studios, and in 2009 it bought Marvel enterprises, bringing the likes of Spiderman and the Fantastic Four under the Disney umbrella.

conglomerates to extend their control and maximize economies of scale through the use of shared resources. With vertical integration, firms acquire additional business units at different points in the process. This allows them to control the supply and cost of essential materials and enables them to rationalize production and increase their control over the market.

Using vertical and horizontal integration, media conglomerates gain far greater control over the marketplace, but such economic strategies limit market access for independent producers and distributors. This is most evident in the motion picture and television industries. Independent film distributors were prominent in the late 1980s, but a decade later the major conglomerates had swallowed most of these firms and large theater chains had overtaken small movie houses. By 1997, six corporations accounted for over 92 percent of box office revenue, and the blockbuster and the multiplex came to define the American moviegoing experience. The same pattern is evident with prime-time television. As networks exerted greater control over television production, fewer programs originated from outside of conglomerates focused on financial control and less-risky programs became appealing. Numerous versions of profitable formulas multiply in seemingly endless spin-offs, as the dearth of original, innovative television productions become more evident.

These practices extend to foreign markets as well, and the impact of Hollywood on indigenous production is a long-standing concern. The U.S. government promotes the export of media products across borders, and one of the justifications for the relaxation of ownership restrictions at home is the argument that the media conglomerates need

to be massive to succeed overseas. This contributes to a general mindset that firms that do not grow through mergers and acquisitions will be swallowed. Ted Turner's pursuit of both broadcast networks and motion picture studios before Turner Broadcasting became part of Time Warner in 1996 is testament to this way of thinking. Turner summarized the goal in simple terms: "The only way for media companies to survive is to own everything up and down the media chain.…Big media today wants to own the faucet, pipeline, water, and the reservoir. The rain clouds come next."

Changes in the Nature of Conglomeration

The change in the corporate control of the three major broadcast networks—ABC, CBS, and NBC—illustrates how conglomeration transformed media assets since the 1980s. In 1985, two of the networks were still linked to the individuals who created them—ABC and Leonard Goldenson and CBS and William Paley—while NBC remained in the hands of the corporation that launched its radio network in the 1920s, RCA. At that time, the networks remained the core businesses of their corporate parents, and the news divisions supported the public interest mandate that came with broadcast licenses. In 2005, all three shared ownership with a major motion picture studio—ABC and Walt Disney, CBS and Paramount Pictures, and NBC and Universal Pictures—and the news divisions were important revenue centers. (CBS and Paramount later became separate.) These combinations raise various concerns, not the least of which is the coverage of the conglomerates themselves. Michael Eisner once put it in simple terms: he did not want ABC News covering developments at Disney.

Not all combinations prove to be successful, and some argue that modern conglomerates are too unwieldy to react to changes in the marketplace. The most notable failure is the merger of America Online and Time Warner in 2001. The melding of old media and new media did not reap the promised rewards, and AOL was dropped from the corporate letterhead in 2003. But it was not just the size of Time Warner that was its undoing, as pundits point to various problems. And some changes are more cosmetic. In 2006, Viacom split its assets into two corporations, Viacom Inc. and CBS Corp., but Sumner Redstone remained in control of both of them, so ownership and control did not change hands. The rationale for the split was not the size of the conglomerate but the price of Viacom stock, with Redstone and others contending that the true value of the motion picture and cable television assets would be realized after the split from the slower-growing broadcast interests.

Conglomeration: Multiplicity or Diversity

When Ben Bagdikian published the first edition of *The Media Monopoly* in 1983, he estimated that ownership of most of the major media was consolidated in 50 national and multinational conglomerates. When he published *The New Media Monopoly* two decades later, Bagdikian concluded that the number had dwindled to just five. The degree

of conglomeration in media industries is evident across the board. In 1985, there were six major motion picture studios and three major broadcast television networks, and nine different conglomerates controlled one of each. In 2005, the number of broadcast networks had doubled with the addition of Fox, The WB, and UPN, but the number of corporations that owned a studio or network had dwindled to just six. Those corporations—Disney, NBC Universal, News Corp., Sony, Time Warner, and Viacom—also held an ownership interest in over 75 percent of the cable and satellite channels with over 60 million subscribers, as well as the most prominent premium movie channels, HBO and Showtime.

Therein rests an important battleground in this debate. Since the 1980s, Congress and the FCC relaxed ownership rules based on the argument that increases in outlets rendered such regulations needless interference in the marketplace. When the FCC announced the relaxation of various rules in 2003, chair Michael Powell argued that the "explosion of new media outlets" demanded change so the commission did not "perpetuate the graying rules of a bygone black and white era." There is little question that the number of outlets has increased. Less certain is whether this growth resulted in more independent voices and diverse viewpoints. The FCC under President Barack Obama has not made any significant departures from prior practice.

Central to this debate is the distinction between multiplicity and diversity, since it is possible to increase the number of available outlets without a parallel expansion in the range of ideas and values in the public commons. The rise of cable news services, for example, diluted the influence of the broadcast network news divisions and created the impression of abundance. This could be quite significant, since the dissemination of news and information from diverse and antagonistic sources is considered a pillar of self-government in democratic societies. When one traces the ownership and control of the cable news services, however, the promised excess is nowhere to be found. The five prominent cable news services—CNN, HLN (formerly CNN Headline News), CNBC, MSNBC, and Fox News Channel—are all part of major media conglomerates, as are the broadcast networks. These are far from diverse and antagonistic sources of news and information, although Fox has emerged as sympathetic to the conservative political viewpoint, and MSNBC has emerged as sympathetic to the liberal point of view. As a pair of opposites of sorts, the two organizations raise the question of objectivity in the news—or, to put it differently, of media bias. Thus does the debate on media conglomeration continue to rage and likely will do so in the foreseeable future.

CONSUMER CREDIT AND HOUSEHOLD DEBT

Robert D. Manning and Anita C. Butera

The use of consumer credit has become an increasingly important feature of the U.S. postindustrial economy in general and household financial management in particular. In fact, the recent economic boom of the mid-2000s was primarily fueled by consumer spending that was financed by soaring levels of household borrowing. Although the Great Recession of 2008–2010 has generated intense debate over indolent consumption financed by household debt, Lendol Calder (2001) sagely cautions that each generation has issued moralistic warnings against increasing dependence on consumer credit. And they have typically resonated during major economic downturns in the 19th and 20th centuries—most notably the Great Depression of the 1930s.

Background

Historically, the American debate over credit and debt has been shaped by Puritan sociocultural values that regulated appropriate moral behavior in the personal/social/household sphere (Manning 2000). The uniquely American response, as guided by the Weberian notion of the *geist* or "spirit of capitalism," reinforced household thrift in the social realm by rewarding self-discipline and hard work in the economic realm through reinvestment of household wealth in economic enterprises (Weber 1905). For example, Calvinism promoted material asceticism whereby hard work and frugality were valued over leisure and consumption. The ability to resist indolent material desires and thus demonstrate one's worthiness for salvation in the afterlife was confirmed through the accumulation of wealth. The more frugal the lifestyle and commitment to self-denial, then the more household assets that could be publically revealed as virtuous evidence of appropriate moral conduct. Indeed, Ben Franklin's moralistic prescription that "a penny saved is a penny earned" is firmly embedded in American culture as universal wisdom for

personal success. Ultimately, the Protestant work ethic has contributed to the emergence of a national American entrepreneurial culture that promotes "good" debt while increasing personal wealth and discourages "bad" debt that merely satisfies consumptive wants and desires.

The use and dependence on credit has varied over time. In rural agricultural areas, for example, farmers routinely rely on business and personal credit during the planting and growing seasons, which is then repaid with proceeds from the harvest. Social attitudes encouraged borrowing for costly equipment like a mechanical thresher or a multipurpose tractor because they were "good" debts: business investments that increased labor productivity and economic self-sufficiency. Similarly, buying a sewing machine on credit was viewed as a prudent investment since it reduced household expenditures on store-bought clothes and could generate supplemental income by taking in seamstress work. Even local merchants were relatively stingy with their self-financed "open book" credit. By cultivating consumer loyalty, they had to balance greater store sales that encouraged responsible consumption while limiting household debt to manageable risk levels for maintaining adequate store inventories. Hence, from the late 19th through the mid-20th century, banks prioritized the lending of relatively scarce credit to economically productive activities. In the process, this policy imposed greater social control over discretionary household expenditures and leisure activities as they were more closely regulated by the religious and community norms of the period.

Today, the responsible use of consumer credit is as important as the prudent management of household income. Although Americans have assumed much higher levels of debt to maintain their families, the social dichotomy of good versus bad debt still persists. For instance, a home mortgage is perceived as a good debt since it satisfies an important household need while accumulating a substantial future asset. Student loans are generally viewed as good human capital investments since higher education enhances occupational mobility and income growth. Of course, even good debt can lead to financial distress, such as when housing prices exceed family resources or costly terms of adjustable-rate mortgages greatly exceed the financial gains of home ownership. Accordingly, borrowing for expensive college or vocational training programs may be bad debt by consigning the borrower to many years of debt servitude. This may result from circumstances outside of the borrowers' control, such as deteriorating macroeconomic conditions (recession) or declining demand for specific occupational skills due to outsourcing (software engineers).

Bank Loans and Household Debt in Postwar United States

The post–World War II growth in household consumer debt has been shaped by supply—changing bank underwriting standards—and demand—higher material standard of living financed by easy access to consumer credit. In terms of the former, the national system of community banks was more risk averse in its loan approval process.

Traditionally, bank lending was based on the three Cs of consumer loan underwriting: character, collateral, and capacity. That is, the likelihood that the borrower would repay the loan (character), whether the borrower had sufficient assets to satisfy the loan in case of default (collateral), and whether the borrower possessed adequate income to repay the new loan based on existing household debts and expenses (capacity). These more stringent bank underwriting standards meant that loans were repaid over a shorter period of time (e.g., three-year auto loans), which accelerated the accumulation of household assets and collateral and thus reduced lender risk. Furthermore, loan applications were often rejected due to relatively high monthly payments and the inability to defer payments one to two years, as is common today. As a result, community banks enforced local standards of financial responsibility until they became absorbed by national banks during the merger and acquisition frenzy of the 1990s and 2000s.

Until the early 1980s, state usury laws restricted risk-based pricing policies, which offer high interest rate loans to less creditworthy consumers, while unsecured bank credit cards were not generally profitable and thus limited to higher-income/low-risk customers They were offered primarily as a convenience to the banks' best customers or to cement consumer loyalty with specific retailers through private issue cards such as Sears and Montgomery Ward (Manning 2000). In fact, consumer credit cards were barely profitable until after the 1981–1982 recession. Furthermore, the rapid growth of the U.S. manufacturing economy and its high levels of unionization in the 1950s and 1960s led to increasing real wages and expansion of the U.S. middle class, with high saving rates even in one-income households. For most Americans, household debt was limited primarily to low-cost mortgage (20- to 25-year fixed) and auto (one car) loans; higher education was affordable and generally self-financed. And interest payments on consumer loans were tax deductible until 1990. The 1986 Tax Reform Act featured a 4-year phased out period for deducting consumer loan finance charges, including credit cards and autos. A tax loophole that allowed home equity loans to retain their tax deductible status is responsible for their explosive growth in the 1990s and 2000s.

The consumer lending revolution took off after the 1981–1982 recession, as banking deregulation and international competitive pressures contributed to the profound transformation of U.S. society—from an industrial manufacturing to a postindustrial consumer economy. This enormous economic stress, which included the loss of millions of blue-collar manufacturing jobs, contributed to the sharp increase in demand for consumer credit among middle- and working-class families. This financial situation was exacerbated by the long-term decline in real wages beginning in the late 1970s. Furthermore, with high inflation in the late 1970s and early 1980s, peaking at over 15 percent annually, consumer borrowing became a prudent strategy as falling real wages were counterbalanced by the declining cost of borrowing. With the end of state usury laws and low inflation by 1984 (under 5 percent), the rising consumer demand and real cost of borrowing led to a dramatic shift in lending to less creditworthy households as

WHAT HAPPENED TO CONSUMER USURY LAWS?

In 1978, federal usury laws were essentially eliminated with the landmark U.S. Supreme Court decision *Marquette National Bank of Minneapolis v. First of Omaha Service Corp.* (439 U.S. 299). This ruling invalidated state antiusury laws that regulated consumer interest rates against nationally chartered banks that are headquartered in other states. Only the Office of the Comptroller of the Currency, through its enforcement of laws enacted by the U.S. Congress, can impose such restrictions on national banks. This resulted in the exodus of major banks to states without the restrictions, such as South Dakota and Delaware. The deregulation of interest rates was followed by the 1996 U.S. Supreme Court decision *Smiley v. Citibank* (517 U.S. 735), which effectively ended state limits on credit card penalty fees. Penalty and service fees now pervade the industry and are its third largest revenue stream following consumer interest and merchant fees. As a result, federal pre-emption has become the guiding principle of bank regulation and shifted authority from the individual states to the U.S. Congress.

With the extraordinary consolidation of the U.S. banking industry over the last three decades, the top three credit card companies (Citibank, Chase, Bank of America) control nearly two-thirds of the credit card market (Manning 2009),and state usury laws apply to a very small fraction of total consumer loans, primarily offered by state chartered banks and other nonbank financial institutions. The exception is federally chartered credit unions whose interest rates are capped at 18 percent. The result has been soaring finance rates and fees—even with the effective interest rate or cost of funds charged to major banks at near zero in 2010. Although more stringent federal credit card regulations were enacted with the 2010 CARD Act, efforts to mandate new federal interest rate limits were soundly defeated by the U.S. Congress in spring 2010.

strategically guided by risk-based pricing policies (Evans and Schmalensee 2005; Manning 2000; Nocera 1994).

As banks invested in new technological efficiencies, including automatic teller machines (ATMs) and credit card processing systems, they began pursuing greater profit opportunities by marketing to less-creditworthy groups (students, working poor, senior citizens, immigrants, handicapped) and then increasing household debt levels. Not surprisingly, by dramatically reducing loan underwriting standards, consumer lines of credit and household debt levels soared. For example, consumer credit card debt jumped from $70 billion in 1982 to nearly $960 billion in 2008, while the national household savings rate fell from nearly 10 percent to about–1 percent. By the mid-1990s, an extraordinary pattern emerged: U.S. bankruptcy filings nearly doubled while unemployment rates fell sharply. Between 1994 and 1998, consumer bankruptcies soared from 780,000 to 1.4 million (79.5 percent) while national unemployment dropped from 6 percent to about 4.2 percent (–30 percent). This pattern is shown in Figure 1. For the first time, the deregulated banking industry, with its diluted underwriting standards, had increased the

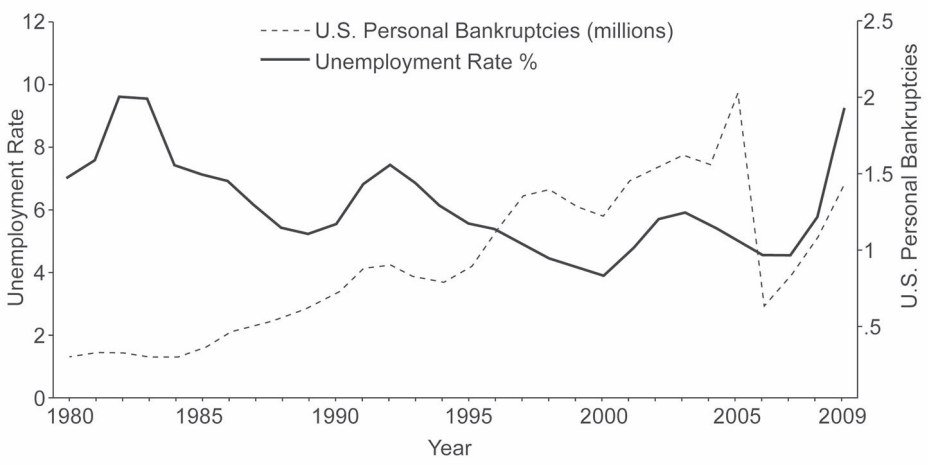

Figure 1. U.S. Personal Bankruptcy Filings and National Unemployment Rates, 1980–2009

amount and cost of household debt beyond the capacity of millions of families to repay their loans. The situation has been exacerbated by greater job insecurity, rising cost of housing, soaring health-related expenses, climbing cost of higher education, and low household saving rates. As a result, unexpected social and financial emergencies have pushed millions of responsible Americans over the edge of financial solvency (Manning 2000, 2005; Sullivan, Warren, and Westbrook 2000; Warren and Tyagi 2003).

Undeniably, the dependence of U.S. households on consumer credit and debt exploded over the last decade. For instance, between 1990 and 1999, total household debt increased from about $3.3 trillion to $6 trillion. As the U.S. Federal Reserve exercised its monetary policy power by sharply reducing the cost and increasing access to consumer credit, the U.S. economy surged, feasting on unprecedented levels of debt-based household consumption (Baker 2009; Zandi 2009; Fleckenstein and Sheehan 2008). From the onset of the 1999 recession to the peak of the bubble period in 2008, U.S. household debt jumped to over $12 trillion—an extraordinary increase of $6 trillion! More striking is the composition of this growth in debt. Americans were seduced to assume unprecedented levels of "good" mortgage debt—from $4.2 trillion in 1999 to almost $10.4 trillion in 2008. Similarly, credit card debt surged from $611 billion in 1999 to $958 billion in 2008 (U.S. Federal Reserve Board 2009). (See Figure 2.) Admittedly, over $400 billion in credit card debt and even more for other consumer purchases (autos, boats, all-terrain vehicles, vacations, college tuition) are included in these mortgage statistics due to the ease of refinancing during this period. Incredibly, the average U.S. household's indebtedness, as measured by its share of household disposable income, has jumped from 86 percent in 1989 to more than 140 percent today (Mischel, Bernstein, and Shierholz 2009).

The U.S. Economy on Steroids: How We Got Here

Unlike the past three business cycle recessions (1981–1982, 1990–1991, 2001), the ongoing 2008–2010 consumer-led recession is distinguished by unprecedented levels of household debt, declining family income, and sharply reduced household wealth (see Figure 3). Indeed, in the aftermath of these previous recessions, real household income increased significantly (18.5 percent)—from $41,724 in 1981 to $49,455 in 2001—whereas it declined slightly (–1.1 percent) to $48,931 in 2008. Similarly, housing prices rose during the last two recessions (5.6 percent in 1990–1991 and 6.3 percent in 2001), whereas they fell at least 12 percent in 2008 and over 10 percent in 2009.

Overall, U.S. economic recoveries during this 20-year period were largely financed by employment growth, increased real income, and increased household debt. Significantly, revolving (credit card) debt jumped much more rapidly than home mortgage debt during the 1980s and 1990s. For example, after adjusting for inflation, average revolving household debt jumped from $3,500 in 1981 to $6,700 in 1991 and then to $16,100 in 2001, while average mortgage debt jumped from $29,200 in 1981 to $42,500 in 1991 and then to $60,600 in 2001. With soaring housing prices, weakening loan underwriting standards, and easy home equity extraction, the U.S. housing bubble period (2001–2006) witnessed the dramatic growth of mortgage debt and plummeting home asset values; average home owner equity fell from 70 percent in 1980 to 38 percent in 2009. In real 2008 dollars, average household mortgage debt soared from $60,600 in 2001 to $94,500 in 2008, while revolving debt increased marginally over the same period, from $16,100 to $16,300. Between 2001 and 2006, it is estimated that over $350 billion in credit card debt was paid off through mortgage refinancings and home equity loans.

HAVE AMERICANS LEARNED A COSTLY LESSON ABOUT CONSUMER DEBT?

Since the 1981–1982 recession, outstanding revolving U.S. consumer debt (98 percent credit cards) jumped from about $70 billion to over $958 billion in 2008. By the spring of 2010, the year-long decline in household credit card debt led media pundits to declare that the U.S. spending binge was over and that Americans had learned a costly lesson from the easy credit period. That is, Americans were returning to their prudent spending patterns and paying down their costly consumer debt. Overall, credit card debt fell nearly $130 billion, from $958 billion at the end of 2008 to $830 billion in summer of 2010. Also, the household saving rate rose from about–1.0 percent in 2008 to over 4.5 percent in 2010.

The assertion that Americans are undergoing a profound behavior change in their spending patterns belies the economic reality of the current recession. Americans are concerned and cautious about their economic situation, but there is inadequate information to reach a definitive conclusion. With soaring bankruptcy rates (over 3.1 million in 2008–2009) and few home equity loan options, most of this decline in credit card debt is due to bankruptcy discharge and loan defaults rather than paying down consumer debt balances. In fact, over $100 billion in credit card debt was discharged through the U.S. bankruptcy courts in 2008 and 2009; over $75 billion is expected in 2010. Also, millions of Americans are in the process of home foreclosure. By not making housing payments, they are able to remit monthly payments on their credit cards and auto loans. Millions will default on these loans when they have to resume making housing payments over the next two to three years. Furthermore, sharply reduced credit lines have prevented millions of Americans from increasing their household expenditures and outstanding debt. Between 2007 and 2010, total outstanding lines of revolving credit plummeted from $5.5 trillion to $2.7 trillion. Of course, those with low levels of debt experienced the smallest reductions, while those with high levels of debt experience the greatest reductions. Hence, it is premature to conclude that Americans have fundamentally changed their attitudes toward credit and debt. If consumers continue their restrained borrowing preferences after banks relax their lending requirements, then there may be evidence to support a major change in Americans' attitudes toward credit and debt.

The U.S. economy experienced a precariously fragile yet incredibly robust economic expansion over 2001–2006 that was based on unsustainable access to global capital for financing consumer credit. Indeed, as the household consumer savings rate dropped from over 8 percent in the mid-1980s to near zero at the end of the 1990s, residential housing values soared to extraordinary heights; average housing prices slowly rose from about $45,000 in 1950 to $101,000 in 1990 and then soared to nearly $150,000 in 2000 before peaking at about $222,000 in 2006. The accelerated velocity of the real estate roller coaster ride is illustrated in Table 1. With more stringent underwriting standards,

including income verification and size of down payments, the average sales price of residential homes fell below the rate of inflation in the 1980s, rose from $93,400 to $101,100 in 1990, and then gained momentum with diluted lending standards in the 1990s, jumping nearly 50 percent to $149,600 in 2000.

It is the five-year bubble period (2001–2005) that witnesses the sharp upward acceleration in average sale prices—nearly 50 percent to $219,000 in 2005—followed by an abrupt stagnation in sale prices in 2006 (about 1 percent increase) and then a 22 percent decline over the next three years to $173,500. More striking is the regional variation in the U.S. real estate market. On the West Coast, average sales prices in Los Angeles soared from $234,000 in 2000 to $584,000 in 2006 and then plummeted to $345,000 in 2009. On the East Coast, average sales prices in New York City jumped from $250,000 in 2000 to $469,000 in 2006 and dropped to $375,000 in 2009. In the nation's capital, prices more than doubled in this five-year period, from $165,000 to $431,000, and then fell to $306,000 in 2009. Housing prices are expected to register further declines over the next three to four years, depending upon the level of public price support, willingness of lenders to write down mortgage principal to near market values, and job growth in specific regions of the country.

As federally subsidized general service entities (GSEs), the mortgage lenders Fannie Mae and Freddie Mac diluted their underwriting standards in order to expand their market share through the widespread packaging and resale of loans through asset-backed securities (controlling over $5 trillion of the $10 trillion residential mortgage market in 2008), U.S. home ownership rates reached a historic high of almost 69 percent in 2007. In the process, the sizzling U.S. housing market created an enormous increase in "paper" asset wealth for middle-class Americans that fueled the dramatic growth of unsecured lines of credit that underlies the second credit card bubble. The massive increase in United States consumer debt—from almost $8 trillion in 2001 to

SUBPRIME MORTGAGES AND U.S. FINANCIAL SYSTEM MELTDOWN

A distinguishing feature of the 2008–2010 recession is the central role of the U.S. housing market collapse. On the supply side, sharply diluted underwriting standards kept real estate prices soaring, which attracted a record number of speculative investors. Why invest in risky stock markets when you can make huge returns on borrowed money? To keep the real estate engine fully lubricated, it required new groups of home owners who were increasingly less creditworthy. The rise of subprime mortgages simply meant that borrowers could not qualify for traditional government-insured loans such as FHA mortgages.

In marketing the American dream of home ownership, real estate agents and brokers made bigger commissions by selling larger loans. The key was to qualify consumers for the home mortgage, which often included an inflated property appraisal, and then sell the loan via brokers to major Wall Street investment banking units. Surprisingly, a wide range of comparatively risky mortgage loans were created and approved by bank regulators that were impossible for millions of consumers to afford. These included 2/28 and 3/27 adjustable-rate mortgages that often started at 1–2 percent APR and jumped to

(*continued*)

(*continued*)

over 9–10 percent APR after the two- or three-year introductory period, five-year interest-only mortgages, "no doc" or unverified financial information loans, and pick-a-payment loans that permitted negative amortization. Of course, the inability to save for a down payment was not a major problem and even loan closing costs could be financed and added to the mortgage. So, while low-income and largely urban minorities became the first casualties of the subprime catastrophe, it was primarily due to their lack of financial resources and their acceptance of the worst borrowing terms rather than irresponsible money management. Middle- and upper-income households also took subprime mortgages, but they tended to have more financial resources and thus were able to prolong the foreclosure process through the late 2000s.

On the demand side, major Wall Street investment firms were buying, packaging, and reselling these subprime mortgages via asset-backed securities (ABS) that were sold to institutional investors (banks, insurance companies, mutual funds) throughout the United States and around the world. Major bond rating agencies like Moody's and Fitch were seduced by lucrative Wall Street consulting agreements and fueled the global sale of these securitized mortgages by certifying them as investment grade, which enabled the securities to be insured. Wall Street investment firms such as Goldman Sachs purchased billions of dollars of subprime mortgages, packaged and sold them as investment-grade securities, and then bought hedge insurance from companies like AIG (bailed out by the U.S. government with over $183 billion and counting) that essentially bet that the mortgages would not be paid—and they received billions in insurance payments. Other mortgage-backed securities were even riskier, featuring specific strips of the subprime mortgage. For example, the riskiest securities included the first 10 percent of the subprime mortgage, the next riskiest was the next 20 percent, with the least risky being the lowest strips.

As long as the housing bubble was inflating, the riskiest securities outperformed all other ABS products since the liquidation value of the homes at least satisfied the value of the mortgages. Why invest in 8 percent ABS products when the 15 percent ABS products appeared to be very low risk? Of course, when the housing bubble burst, the riskiest mortgage-backed securities immediately became worthless. As investors sought to mitigate their losses, they incentivized their mortgage servicers to accelerate foreclosure proceedings in the hope of recovering some economic value. This created a domino effect that exacerbated the fall in home sale prices and further increased their investment losses. In an attempt to stabilize the housing market, the U.S. Congress provided over $200 billion to home mortgage finance giants Fannie Mae and Freddie Mac to purchase delinquent mortgages. Together with government programs that offer lower interest rates but without principal reductions, the current housing market has reached a soft floor that will result in at least 4 million to 5 million foreclosures over the next three years. This means that the subprime mortgage catastrophe will continue, with the cost eventually exceeding a trillion dollars. It is for this reason that the U.S. Congress enacted more stringent regulations and oversight of Wall Street as specified in the 2010 Dodd-Frank Wall Street Reform and Consumer Protection Act.

nearly $13 trillion in 2008—was increasingly financed by foreign investors; the U.S. share of global savings peaked at nearly 65 percent in 2005 and had already fallen below 50 percent in 2008, as countries with balance-of-trade surpluses redirected their liquidity to national economic stimulus projects.

Furthermore, both consumer mortgage and credit card loans increasingly featured adjustable-rate terms in the 2000s that have stretched household debt capacity to its limits; monthly minimum payments continue to rise, whereas the value of household assets continues to fall. Today, with the virtual disappearance of home equity loans and the sharp cutback in bank card lines of credit, the collapse of the double financial bubble has left most U.S. households maxed out on their credit, with debt levels that they cannot possibly repay in full given the current trends of declining household income and wealth. Additionally, the rising debt service of U.S. households has dramatically reduced consumer discretionary spending. This rippled throughout the United States and global economies in 2008 and 2009. In the process, it triggered sharp reductions in macroeconomic growth and rising unemployment rates (combined unemployed and underemployed at nearly 25 percent in the United States) that are the primary forces shaping the ongoing consumer-led recession in the United States. As a result, with over 2.3 million foreclosures in 2008, millions of Americans are confronting the stark reality that they may lose their homes and even their jobs in the early 2010s. An estimated 5 to 7 million homes are expected to enter into foreclosure proceedings over the next three years.

Conclusion: After the Double Financial Bubble

Like an athlete on steroids, the U.S. economy was not nearly as powerful as it seemed in the mid-2000s as it bulked up on cheap financial "boosters" from major trade partners such as China, Japan, and Middle East oil producers. With their enormous trade surpluses with the United States, which underlies their huge dollar-denominated currency reserves, these "bankers of necessity" were happy to supply low-cost loan "fixes" as long as it kept the U.S. consumer society addicted to its massive volume of imported goods and services (Baker 2009; Fleckenstein and Sheehan 2008; Schechter 2007). For example, China purchased the mortgage-backed securities that fueled the housing boom in order to provide compliant U.S. consumers with building materials (e.g., cheap sheetrock), interior furnishings, electronics and appliances, and clothing and other personal items. As long as inexpensive credit was easily available in the United States, then Americans were able to refinance and leverage their skyrocketing home values through ever lower interest rates (Muolo and Padilla 2010; Zandi 2009; Schechter 2008). This meant that while real U.S. wages continued to decline in the 2000s, Americans believed that they actually were better off economically due to impressive stock market (401(k))

and home equity gains (Mishel, Bernstein, and Shierholz 2009; Leicht and Fitzgerald 2007; Manning 2005).

As the financial steroids began to wear off, the U.S. financial system abruptly collapsed in September 2008, and the resulting institutional paralysis left the nation in shock and the economy in turmoil (Zandi 2009; Baker 2009; Schechter 2008). Like the poststeroids athlete, the United States is struggling to recover its former glory while its economic foundation and financial infrastructure remain perilously debilitated. Furthermore, after the bubble burst, overleveraged households now must pay down their record consumer debts almost exclusively from salaries and wages that continue to fall while millions of Americans are unable to find gainful employment. No wonder that record bankruptcy rates are expected over the next three to four years. With the lack of available credit, moreover, the pendulum of the market has swung in the opposite direction as asset sale prices do not necessarily reflect intrinsic value since fewer people can qualify for loans. Shockingly, commercial and residential real estate is often sold at below its replacement cost—that is, homes and office buildings can be purchased for less than it costs to build them! Together with the glut of houses on the market, these are the key reasons that the construction and real estate industries will not recover in the near term. And, since it is unlikely that real household income will reverse its long-term slide in the near future, the timing of the next upswing in the residential real estate market is crucial to restoring consumer confidence as well as augmenting shrinking family incomes. These factors both underlie the depth of the current recession and the policy prescriptions for restoring the health of the U.S. economy.

CORPORATE GOVERNANCE

Ashutosh Deshmukh

Corporate governance refers to the way a corporation is managed, administered, and controlled by the various stakeholders. The stakeholders such as the shareholders, boards of directors, and managers run the corporation and shape and execute the strategies and day-to-day operations. The other stakeholders such as employees, customers, suppliers, regulators, and society at large are also interested in proper management of the corporation. The objectives of good corporate governance include economic efficiency and maximization of shareholder value and may include other goals as assigned by the regulators and the society.

The term *corporate governance* appeared in 1981, and the topic has become a subject of intense research, especially in the last decade. However, even with such a focus, no single definition of corporate governance suffices to serve the purposes of all stakeholders. Corporate governance has been in part defined by various regulations and in part by the human element involved in operationalizing the term. In order to achieve the objectives of good corporate governance the shareholders, boards of directors, and managers need to be honest, trustworthy, and respectful of the letter and spirit of the law. Sometimes demands of the various stakeholders can conflict, giving rise to complex and thorny ethical dilemmas. Thus, the topic is of interest to all of us.

Why Corporate Governance Is Important

To understand the importance of corporate governance, we must first understand the nature of a corporation and the far-reaching influence wielded by today's corporations. The corporate form for conducting business has gained international popularity. Why? The simple reason is that a corporate form of business offers *limited liability* to the owners of a corporation. For example, if the owners put $100 in the corporation (buy shares) and the corporation goes bankrupt, then the owners lose only $100. However, if the business is run as a sole proprietorship (single owner) or as a partnership, then the owner(s) can be responsible for all debts incurred by the company and may even lose personal assets such as a house or car. This legal protection offered by the limited liability concept results in risk taking and innovation. Today's corporations are owned by thousands of investors who pool their money and delegate the running of the company to professional managers. The people invest and the managers manage, and, if both are successful, everyone reaps the rewards. Some legal scholars have put the idea of corporate form at par with industrialization as a force that helped drive the explosive growth of business and commerce.

However, because owners generally have no direct hand in running a corporation, there is a possibility of mismanagement by the managers; in other words, bad corporate governance can ruin the investors. This is often referred to as an agency problem. What is to stop the managers (agents) from running the company for their own benefit (to the detriment of owners)? This question becomes even more urgent if we scrutinize today's global corporation. Presently, in the United States and across the world, the economic landscape is dominated by global corporations; many of them rival governments in terms of their budgets and power. Any major mistake by the mangers of such a corporation can affect the economies of nations as well as the lives of the common people. The world faced a major economic crisis in 2008–2009 when U.S. banking and investment firms used faulty models in measuring risks in the housing market. As this article is being written, the ecosystem of the Gulf of Mexico is being threatened because of mishaps with offshore oil drilling. The livelihoods of millions of people are at stake.

TABLE 1. History of Legislation to Prevent Corporate Mismanagement and Fraud

Legislation	Reason
Owens-Glass Act of 1913: This act provides rules for financial reporting and reserve requirements for banks.	This act was enacted due to bank failures caused by inadequate or nonexistent reserves.
Glass-Stegall Act of 1933: This act separated commercial and investment banking.	There was a conflict of interest in banks that conducted commercial and investment operations, which resulted in massive banking frauds.
Securities Act of 1933: This act requires disclosure of all important information before securities (shares) are registered.	Shares were issued by many corporations that provided false and misleading information to the public.
Securities Exchange Act of 1934: This act requires that all companies listed on stock exchanges file quarterly and annual audit reports with the Securities and Exchange Commission.	Many corporations issued unaudited fraudulent financial reports and manipulated their stock price for the benefit of the top management.
Investment Company Act of 1940: This act established financial responsibilities for directors and trustees of investment companies (the companies that invest in stock markets). It also made disclosure of financial and managerial structure mandatory.	Investment companies abused the funds provided by the investors by investing in related companies and manipulating prices.
Foreign Corrupt Practices Act of 1977: This act made proper design, maintenance, and documentation of internal control systems a requirement for U.S. companies.	U.S. corporations were bribing foreign officials for business and also made banned political contributions in the United States.
FIDCA Improvement Act of 1991: This act mandated reports by the managers on internal controls and also compliance with the federal laws.	There was a massive failure of savings and loan institutions due to fraud and conflict of interest among officers and directors.
Private Securities Litigation Reform Act of 1995: This act requires auditors and lawyers to inform the Securities and Exchange Commission of any allegations of wrongdoing (including financial wrongdoing) by the corporation.	This act is intended to prevent frivolous litigation against public companies.
Sarbanes-Oxley Act of 2002: This act strengthens various aspects of corporate governance.	This act was prompted by a series of corporate frauds and failures that involved blue-chip companies in the United States.

Legislation	Reason
Dodd-Frank Wall Street Reform and Consumer Protection Act of 2010: This legislation is aimed primarily at the banking and investment industry; it seeks to make trading in derivatives and other securities more transparent and protect consumers from corporate fraud and mismanagement.	This legislation came in the wake of the 2008–2009 recession, which was caused in part by high-risk and often faulty investment products—primarily mortgage-backed securities—sold by Wall Street firms.

Mechanisms of Corporate Governance

The corporate form of business has been abused by managers many times, and a host of laws have been passed as a result. In the United States, each corporation must follow state incorporation laws in forming, running, and dissolving a corporation. Such laws stipulate basic governance structures to protect the interests of the shareholders. Additionally, many other laws have been instituted over the years to foster proper management of corporations. The history of these laws, passed long before corporate governance became a major topic of interest, were designed to prevent mismanagement and fraud by the managers. They can make fascinating reading. The stock market crash of 1929 was partly caused by management fraud or lax corporate governance. Consequently, Congress passed the Securities Act of 1933 and the Securities Exchange Act of 1934. This history repeated itself in 2002, when a host of blue-chip companies that had been certified by their auditors and endorsed by Wall Street were exposed as giant frauds, causing bankruptcies. As a result, the Sarbanes-Oxley Act of 2002 was passed. These laws have directly or indirectly attempted to bolster good corporate governance.

The commonly accepted mechanisms of corporate governance are as follows:

1. **Board of directors:** The directors are elected by the shareholders to protect the interests of the shareholders. The directors meet regularly in board meetings and have the power to appoint, remove, and fix the compensation of the top executives. The independent and outside directors are invaluable in monitoring the top management and assessing progress of the corporation.
2. **Checks and balances:** The power inside the company is carefully distributed across various positions. For example, the chief financial officer (CFO) is responsible for preparing the financial results of the corporation, the chief information officer is responsible for information technology infrastructure, and the chief executive officer (CEO) provides overall leadership to the company. Such separation of powers is carried down to the lowest levels of the corporation. There is also a carefully designed system of internal controls to ensure reliable financial reporting, increase operating efficiency, and maintain

proper compliance with laws and regulations. Such arrangements prevent one person from committing fraud or damaging the corporation through errors of judgment.

3. **External auditors:** Every public corporation is legally obligated to get its financial accounts audited by external auditors. The external auditors have professional responsibilities and are not under the control of top management or the board of directors.
4. **Executive compensation:** The board of directors designs the compensation for the top management in such a way that the interests of the top management and those of shareholders will be the same. Thus, top managers' actions, even though arising from the profit motive, will benefit the shareholders. Good compensation schemes, however, are notoriously difficult to design and often result in unintended consequences.

There are also external forces at work—such as employees, media, financial analysts, and creditors—all of whom may demand good governance and financial transparency. Governmental regulations, as noted above, likewise play a vital role in promoting good corporate governance.

Why Mechanisms of Corporate Governance Fail

The myriad mechanisms of corporate governance are not always enough. Human ingenuity, greed, systemic failure of the markets, and new business innovations can outstrip carefully designed controls. Moreover, accountants who deliver financial reports play a significant role in corporate governance. The performance of top management and of the corporation as a whole is measured by such financial reports. The financial reporting rules in the United States (and in the rest of the world) are flexible and can be interpreted in a variety of ways. These rules can be manipulated—by means of legal stratagems (loopholes) or even by illegal and unethical means—and cause lasting damage to the corporation.

Let us look at a few reasons for the failure of available control mechanisms. First, top management can collude and operate over and above the internal controls of the corporation for management's own profit. Such unethical behavior generally results in fraudulent financial reporting involving manipulating the accounting data used by the company. Often the external auditors of the company are either complicit in the fraud or choose to ignore it. Eventually, the fraud comes to light and frequently the company goes bankrupt. Second, top management can take excessive risks in the business. Since the bulk of the capital is provided by shareholders, top managers can take risks that they would not otherwise take if their own money were involved. For example, the economic crisis that affected the United States and the rest of the world in 2008–2009 partly resulted from financial instruments that hid the risk of lending money to people who did

not have the ability to pay it back. Such risks ended up enriching a handful of managers and corporations but caused trillions of dollars in losses to the nation's economy. Third, a large corporation can have thousands of shareholders, and most of the shareholders have little time or inclination to study financial reports, attend shareholder meetings, or take an active part in corporate governance. Finally, the top managers control information about the company. Even a vigilant board of directors and a strong body of external auditors can be misled by top managers, if the latter desire to do so.

As a result of these factors, we see in the United States and elsewhere periodic scandals and great swings and crashes in the stock market. In extreme cases, recessions set in, dragging down the national economy. The popular outrage that accompanies such events often forces governments to introduce further regulations. As of this writing (mid-2010), lawmakers in Congress and members of the Obama administration are crafting legislation designed to bolster the nation's financial regulations. It is expected, however, that the new regulations will complement rather than undo or rewrite the Sarbanes-Oxley Act, which remains the most far-reaching law on the books regarding corporate governance.

The Sarbanes-Oxley Act

In 2000, as the stock market nose-dived and the Internet bubble burst, there was a general discontent among the investors regarding corporate governance. The following year saw a succession of corporate scandals that shocked the public. The biggest fraud involved a company called Enron. This company, based in Houston, Texas, dealt in electricity, natural gas, paper, and communications and claimed revenues of approximately $100 billion. At the time, the company employed approximately 20,000 people and was considered one of the most innovative companies in the nation. The performance of Enron was revealed to be a fraud, however—sustained by accounting gimmicks and not business fundamentals. The company went bankrupt in 2001, and investors and employees sustained billions of dollars in losses. Enron's external auditor, Arthur Andersen, a leading accounting firm, also went bankrupt. Other similar scandals involving such companies as WorldCom, Tyco, and Adelphia further fueled public outrage.

Because of Enron and other scandals, Congress took steps that resulted in the Sarbanes-Oxley Act. The act is named after its sponsors, Senator Paul Sarbanes (D-MD) and Representative Michael Oxley (R-OH), and was overwhelmingly approved by both congressional houses. This act contains 11 titles (sections) that deal with various aspects of corporate governance. These include, for example, the responsibilities of the managers, the independence of the auditors, and requirements for financial disclosure. The act also shifted responsibility for setting auditing rules and standards from the private sector (the American Institute of Certified Public Accountants) to the public sector (Public Company Accounting Oversight Board). The major provisions of the act that affect corporate governance are summarized below.

TABLE 2. Time Line for Sarbanes-Oxley Act of 2002

Time	Event
2000	The stock market begins to cool off.
2001	Enron scandal comes to light; billions of dollars of market value vanish.
2002	Many well-known corporations such as AOL, Adelphia, Global Crossing, Kmart, Lucent Technologies, Merck, Tyco International, and Waste Management are found to be culpable of committing fraud.
June 15, 2002	Arthur Andersen, the Enron auditing firm, is indicted and criminally convicted.
July 9, 2002	President George Bush gives a speech about accounting scandals.
July 21, 2002	WorldCom files for bankruptcy—the largest corporate bankruptcy ever; a major financial fraud underlies the demise of the company.
July 30, 2002	The Sarbanes-Oxley Act is passed.

Responsibilities of the Board of Directors

As mentioned earlier, shareholders appoint the members of the board of directors. The board is supposed to protect the interests of the shareholders. In the real world, the CEO often chooses board members from among friends and acquaintances, to the detriment of shareholders' interests. In an attempt to remedy this cronyism, Sarbanes-Oxley contains provisions to strengthen the independence of the members of the board of directors from management. The act mandates that the audit committee (a committee of directors that deals with financial matters) of the board of directors should have people who do not serve (and get money from) the company in any other capacity and should not work for a subsidiary of the company. The audit committee also needs to keep track of complaints received regarding financial improprieties and problems with the internal controls. If necessary, the audit committee can hire independent counsel to investigate critical matters.

Responsibilities of the Managers

Sarbanes-Oxley imposed a number of key responsibilities, obligations, and prohibitions on senior management, including certification of the accuracy of financial reports, creation of the internal control reports, and restrictions on personal loans and stock sales. The act also stipulates heavier penalties for criminal behavior.

Public corporations are required to issue an annual report containing financial statements, management discussion of operating results, and the auditor's report.

TABLE 3. Section 404: A Four-Letter Word?

(a) Rules Required	The Commission shall prescribe rules requiring each annual report required by section 13(a) or 15(d) of the Securities Exchange Act of 1934 (15 U.S.C. 78m or 78o(d)) to contain an internal control report, which shall— (1) State the responsibility of management for establishing and maintaining an adequate internal control structure and procedures for financial reporting; and (2) Contain an assessment, as of the end of the most recent fiscal year of the issuer, or the effectiveness of the internal control structure and procedures of the issuer for financial reporting.
(b) Internal Control Evaluation and Reporting	With respect to the internal control assessment required by subsection (a), each registered public accounting firm that prepares or issues the audit report for the issuer shall attest to, and report on, the assessment made by the management of the issuer. An attestation made under this subsection shall be made in accordance with standards for attestation engagements issued or adopted by the Board. Any such attestation shall not be the subject of a separate engagement.

Sarbanes-Oxley now requires the CEO and the CFO to certify that the financial reports accurately reflect the company's real performance. In the past, top executives accused of fraud often pleaded ignorance of accounting matters and tried to shift the blame onto accountants. This certification closes such loopholes.

The managers are also required to issue an internal control report with each annual report (Section 404). The internal control report states that establishing and maintaining internal controls is the responsibility of the management. It also assesses the existing internal control system strengths and weaknesses. The external auditors then attest to the veracity of that report. The auditors cannot check every transaction in the company since modern corporations have trillions of transactions; rather, they rely on internal controls to evaluate the financial position of the company. If the top management is negligent in establishing and enforcing internal controls, audits are ineffective. The internal controls report, as it is issued by top management, compels management to pay attention to internal controls. Section 404 is the most contentious aspect of the Sarbanes-Oxley Act because of its requirement to implement, document, and test internal controls—a procedure that can be very expensive, especially in larger organizations.

Sarbanes-Oxley also bans corporations from offering personal loans to their executive officers and directors. For example, former WorldCom CEO, Bernard Ebbers, received an approximately $300 million personal loan from the company. Many such

instances of personal loans came to light in 2001–2002. Sarbanes-Oxley put an end to that practice.

Many top managers are granted stock options or stock in the company. Since top managers have better information about the company than the average member of the public, they can time the sale of stock to reap maximum profits. Sarbanes-Oxley does not ban this kind of insider trading (except under certain conditions), but it does require that such sales be reported quickly for the benefit of all investors. Compensation for CEOs and CFOs is similarly required to be disclosed publicly. Such disclosure had been required prior to Sarbanes-Oxley, but now the information is easier to find and more transparent. Additionally, top managers are required to return any bonuses awarded for financial performance that later were found to be based on faulty accounting.

Criminal and civil penalties for violation of securities laws and misstatement of financial data are made more severe under the law. In the past, laws dealing with financial fraud were rather lenient and courts tended to award light sentences. Sarbanes-Oxley provides long jail sentences and stiff fines for any managers who knowingly and willfully misstate financial data.

Responsibilities of the Auditors

The auditors are expected to be independent from their clients. In the past, auditing contracts were awarded on the basis of friendships and business relationships, which compromised the auditor's independence. Independence is the cornerstone of any effective audit, and Sarbanes-Oxley contains many provisions to strengthen the auditor's independence.

Auditors are banned from providing other fee-based services that could lead to a conflict of interest and undermine their independence. Before Sarbanes-Oxley, auditors were allowed to provide certain consulting services such as advice for hiring personnel, internal auditing, and designing financial information systems. Sarbanes-Oxley provides a long list of services that can no longer be performed by auditors. Such a ban is designed to prevent business relationships between the auditor and the client. It is believed that these other, possibly more profitable, contracts compromise auditors' independence and undermine their willingness to adhere strictly to auditing standards.

The act contains other provisions to preserve independence of the auditor. The audit partner supervising the audit should be rotated every five years, which is meant to encourage professional (as opposed to personal) relationships between the partner and top management. Furthermore, a person employed by an audit firm is barred from assuming a top managerial position with the client company for at least one year after leaving the auditing firm. This provision prevents what used to be called a revolving door between the audit firm and the client. Finally, the newly established Public Company Accounting Oversight Board has the power to investigate auditing firms and penalize them for noncompliance with the law.

Responsibilities of the Securities and Exchange Commission (SEC)

The SEC is a federal agency whose duties include administration of the Sarbanes-Oxley Act. The SEC has been granted additional powers and an expanded budget to supervise compliance with the act. The SEC can:

1. Set standards of professional conduct for lawyers who practice before the SEC,
2. Prohibit a person from serving as a director or an officer of a public company, and
3. Freeze payments to officers or managers of the company if it suspects that securities laws have been violated.

These provisions in Sarbanes-Oxley seem to be straightforward and appropriate for proper corporate conduct. However, the enactment and implementation of the provisions have raised a host of ethical and operational questions.

Consequences of Sarbanes-Oxley

The Sarbanes-Oxley Act raised a firestorm of controversy upon its passage, and certain of its aspects continue to be debated. The objections against the act are philosophical and operational in nature. Romano (2005) raises a compelling philosophical argument against Sarbanes-Oxley. Romano argues that Sarbanes-Oxley demands substantive corporate governance mandates. This means that the act specifies how a business should be conducted and is thus intrusive in nature. The earlier laws required complete disclosure of all information but not directives on how to conduct business. The author argues, after evaluating the academic literature, that such a far-reaching law is not required. Gifford and Howe (2004) argue that such government mandates are detrimental to business because they do not allow more efficient and effective private-sector solutions to bubble up. Similarly, the operational objections against Sarbanes-Oxley refer to excessive compliance costs, the possibility of outsourcing and offshoring accounting jobs, smaller public companies going private to avoid the rigors of Section 404, foreign companies delisting themselves from the U.S. stock exchanges, and the costs of new accounting infrastructure, among other issues.

Much research has taken place regarding the costs and benefits of Sarbanes-Oxley over the last few years. The results, though not conclusive, provide us with some understanding of the consequences of the Sarbanes-Oxley Act. The research is ongoing and has not resolved issues conclusively. The results are summarized below.

Costs

The philosophical issues surrounding the passage show no sign of abating. Romano (2009) argues that Sarbanes-Oxley remains a hurried piece of legislation, a response

to a financial crisis. The legislation is flawed and will continue to cause problems for businesses. Butler and Ribstein (2006) suggest that individual investors are better off diversifying their investments. The Sarbanes-Oxley Act, however, imposes costs on all companies, depressing earnings and stock prices for the entire market. The specific findings of various studies are as follows:

1. Compliance costs (costs related to Section 404) have increased due to the passage of Sarbanes-Oxley Act. These costs include direct costs such as training of employees, time spent by executives in dealing with compliance, and purchasing of hardware and software as well as indirect costs such as loss in productivity due to resources being diverted to comply with the Sarbanes-Oxley Act. The SEC's Advisory Committee estimated that the costs for compliance ranged from 0.06 percent of revenues for companies with revenues greater than $5 billion to 2.6 percent for companies having revenues of less than $100 million. There are many other, varying estimates of costs.
2. Costs increased rapidly immediately after the act was passed. Compliance costs began to rise slowly and then showed some decline as companies became more skilled in complying with the act and also made the needed infrastructure investments.
3. Audit costs initially increased rapidly, but, as time has gone by, auditors have become more efficient and audit fees have remained flat or decreased slightly.
4. There is some evidence that some public companies have gone private to avoid complying with Sarbanes-Oxley. Moreover, some private companies have decided not to go public for the same reason.
5. The market value of smaller public firms has been negatively affected by the act. However, the SEC is providing additional guidance and time to help the smaller firms.
6. The insurance premiums for directors serving on the board have gone up. The composition of the directors is now more tilted toward lawyers, financial experts, and retired (as opposed to current) executives. Director pay and total costs have significantly increased.

Benefits

The benefits of compliance, as compared to the costs, are somewhat more diffuse, long term, and harder to quantify. Michael Oxley, for example, asks: "How can you measure the value of knowing that company books are sounder than they were before?" He adds that these costs are really investments for the future. Moody's, a credit rating firm, believes that companies are strengthening their accounting controls and investing in infrastructure required to support quality financial reporting. Bradford, Taylor, and

Brazel (2010) argue that compliance with the act has helped corporations to achieve strategic goals and analyze performance more effectively and efficiently. The specific findings of various studies can be summarized as follows:

1. Some experts believe that the act has helped restore investor confidence in the integrity of financial statements. Some empirical research suggests that Section 404 may reduce the opportunity for intentional or unintentional accounting errors and improve the quality of reported earnings.
2. Section 404 reports allow the investors to assess risks more accurately and can affect the firm's cost of equity. Companies that improve their controls lower their borrowing costs.
3. A survey carried out by the Institute of Management Accountants indicated that both public and nonpublic companies have improved processes, expanded employee job responsibilities, eliminated duplicate activities, and automated manual controls due to compliance with the act. Interestingly, nonpublic companies reaped more benefits due to the compliance.
4. Compliance with the act may help companies in getting dismissals, a favorable result, in securities fraud class-action cases.
5. The boards of directors, especially the audit committees, are far more independent and responsive to shareholders than they were in the pre–Sarbanes-Oxley era.
6. A paper issued by the Institute of Internal Auditors (Rittenberg and Miller 2005) suggests that internal controls in corporations have improved and their financial statements are viewed as more reliable.

The Economic Crisis of 2008–2009

Sarbanes-Oxley is the latest salvo in an ongoing war against poor corporate governance, mismanagement, and fraud. The act required that many aspects of corporate governance, which were earlier left to management's discretion, conform to the new legal mandates. Many powerful forces—for example, global corporations, top managers, big accounting firms, politicians, and lobbyists—bring forward complaints whenever new accounting rules and regulations are set. These groups have competing agendas and motives, which, moreover, do not necessarily coincide with the public interest. Occasionally, however, momentous events, such as a series of corporate frauds and bankruptcies, converge to create the need for sweeping legislation.

The economic crisis of 2008–2009 has, in many respects, overshadowed the Sarbanes-Oxley debate. This latest crisis is similar to but worse than the one seen in 2001–2002. The losses due to speculation in mortgage-backed securities can be measured in the trillions of dollars, and the human costs in terms of jobs, savings, pensions, state and local governments, and so on are greater still. The crisis presents a host of new legal, ethical,

and regulatory issues. Yet many of the provisions of Sarbanes-Oxley, such as requiring due diligence, preventing conflict of interest, and adhering to basic fiduciary responsibilities, remain relevant to the current situation. Thus, the chances that Sarbanes-Oxley will be rolled back seem remote. As noted, the Obama administration has given strong signals that additional legislation is on the way.

It is clear that the new regulations are aimed primarily at the financial and banking industry. The draft of the act proposes reforms to meet five key objectives (Department of the Treasury n.d.):

1. Promote robust supervision and regulation of financial firms,
2. Establish comprehensive supervision and regulation of the financial markets,
3. Protect consumers and investors from financial abuse,
4. Improve tools for managing financial crisis, and
5. Raise international regulatory standards and improve international cooperation.

To achieve these objectives, various measures have been proposed—for example, creation of a Financial Services Oversight Council, granting additional powers to the Federal Reserve, establishing a national bank supervisor, enhancing regulation of the securities market and derivatives (which lay at the heart of the problem), and implementing higher standards for the providers of consumer financial products. There is discussion, too, of not relying on corporate disclosure but rather providing mandates on running and managing a business. The ensuing legislation will likely share many features with Sarbanes-Oxley and will likely cause considerable controversy and debate.

Conclusion

The cycle of corporate wrongdoing and government regulation goes on. As people increasingly look to the stock market for investments and put their hard-earned savings in the market, it becomes ever more imperative that these markets remain transparent, properly regulated, and compliant with the rules of the game. Regulations such as Sarbanes-Oxley or the most recent financial regulatory reform bill have, of course, both advantages and disadvantages. There are ideological and philosophical issues that need to be drawn out, defined, and discussed. Even when enacted, it is difficult to properly evaluate these regulations or perform straightforward cost/benefit analyses. Thus it seems that the perpetual chase between the law and the outlaws will continue for some time.

CORPORATE TAX SHELTERS

Keith C. Farrell

A fundamental objective of the federal tax law is to raise revenues to cover the cost of government operations. Ordinarily, Congress will set annual budgets, based on anticipated revenues, to plan expenditures and create a balanced budget. Until recently, the last balanced budget was in 1969. Beginning in 1970, there were 28 straight years of deficits. The budget was again balanced from 1998 through 2001, but, since 2002, the federal budget has run at a deficit—in fact, the largest in the nation's history.

The internal revenue code (IRC) comprises numerous code sections, complete with abrupt twists and sudden stops. It has been a complaint of U.S. taxpayers that the tax code is too complicated, often defying logic. Even trained professionals can be baffled by the complexity of a tax return. Recently, the Internal Revenue Service (IRS), the governmental body charged with collecting taxes and auditing tax returns for compliance, has stated that its mission is to simplify the tax code. However, ask any tax professional, and he or she will tell you that, to date, simplifying the tax code has seemingly resulted in three additional binders of tax code.

The IRS distributes more than 650 types of tax forms, schedules, and instructions (Hoffman et al. 2009). That being said, there often is a reason behind every oddity that occurs in the tax code, whether it is an economic, social, or political reason. An example is how the federal government has tried to encourage charitable giving to nonprofit organizations. An individual's ability to deduct charitable contributions from his or her taxes is a social practice that Congress has encouraged through tax deductions. Another example is research and development credits, which are given to encourage organizations to develop innovative ideas and processes.

Background

During the thriving 1990s, business in the United States was growing at unprecedented levels, breaking many corporate earning records. Between 1988 and 1998, corporate revenues grew 127 percent, from $292.5 billion to $666.4 billion. The surge also had a positive impact on the U.S. Treasury. Throughout this time period, reported corporate taxable income increased by 99 percent, or from $94.5 billion to $188.7 billion (Crenshaw 1999). So why did corporate taxes not keep pace with corporate revenues? Experts say that this was due to the emergence of complicated tax shelter plans.

VARIOUS REASONS FOR TAX CODE

Social

Home mortgage deduction.
Encourage society to purchase homes by subsidizing the interest cost.

Charitable contribution deduction.
Encourage society to give to charities.

Adoption tax credit.
Encourage and help subsidize adoptions.

Retirement plans (IRA, 401(k), etc.).
Create means to save and encourage retirement planning.

Hope and Lifetime Learning credits.
Encourage students to attend higher educational institutions by subsidizing a part of the cost.

Economic

Section 179.
Allows for an immediate write-off of an asset rather than depreciating it over a period of time. This allows a company to recoup its investment faster.

The Selection.
Allows small corporations to avoid double taxation.

Political

Tax incentives for farmers.
Special income averaging and depreciation methods for the farming industry.

Oil and gas exploration.
Expense drilling and development costs immediately rather than capitalizing and amortizing over a period of time.

Other

Dividend received deduction.
Grants relief to corporations from triple taxation of income and dividends.

Like-kind exchange.
Allows for the deferral of tax on capital gain transactions that occur from trading property and not receiving cash.

Natural disasters.
Usually involve charitable contribution incentives for donations to charities. Often adjust tax-filing dates to assist and encourage compliance. Examples are 9/11 and Hurricane Katrina.

During the 1990s, a peculiar situation developed where, by strict application of the IRC, tax professionals were able to create paper losses that a corporation would be able to use to offset income. This strange phenomenon caught the eye of the IRS in the late 1990s as it began discover the flourishing industry of marketed tax planning packages that enabled corporations to lower their total taxable income and, ultimately, pay less in taxes. In 1999, Stanford law professor Joseph Bankman projected the cost to the U.S. Treasury to be at $10 billion (Stratton 1999). It is reasonable to expect the current cost to have grown greater since that time.

Total corporate taxes paid as a percentage of the entire amount of taxes collected by the IRS have fallen significantly over the past two decades as corporations have found and exploited loopholes in the IRC. These loopholes allow them to reduce their total tax bill, usually by concealing revenues or accumulating additional expenses. For example, a corporation is taxed on its net income, which is generally calculated by taking total revenues received less total expenses incurred to generate the income. By lowering revenues or amassing additional expenses, you can lower your net income and, effectively, your total tax due. These loopholes manipulate the IRC in ways that were never intended by Congress. Tax sheltering methods can be legitimate or illegitimate.

HOW DID THE TAX SHELTER INDUSTRY START?

In the 1990s, during a period of startling corporate growth, it became a strategy of tax departments in many large companies to find solutions to lower the tax liability that would be due on substantial taxable income. Managers aggressively reviewed their budgets for ways to lower cost, and no expense was bypassed. It seemed logical that if all expenses listed on an income statement were fair game, then tax expense would eventually become a focus for cost-conscious managers.

The industry was not started by the invention of tax shelters; corporate managers did not seek out accountants' and lawyers' advice on how to shelter income, but the industry really started with accounting and law firms creating tax shelter plans and promoting them to their high–net worth individuals and corporations with substantial taxable income. It was during this period that many companies' best tax professionals were recruited by large accounting firms for their technical expertise.

The incentive was the ability to earn higher incomes by designing and marketing these tax shelter plans (Rostain 2006). There were penalties in place—20 percent of money received for implementing the tax shelter—but many firms had feasibility studies performed that proved that the profits created far exceeded the penalties that could be incurred. These marketed tax shelters would create sizeable tax write-offs and, consequently, bring in substantial fees for their implementation. It may cost $200,000 to purchase the services required to set up and execute these schemes, but if they save the company $2 million in taxes, it is worth the expense.

Naturally, there are two sides to this debate. On one hand, if a given transaction follows the letter of the law, then how can it be considered abusive or unethical? Conversely, it is justifiable to deem transactions that contain no economic gain, aside from lowering an entity's tax liability, as fraudulent tax reporting?

What Is a Tax Shelter?

There is no clear definition that characterizes all tax shelters. The purpose of a tax shelter is "to reduce or eliminate the tax liability for the tax shelter user" (Committee on Governmental Affairs 2005, 1). The definition of a tax shelter would include both legitimate and illegitimate actions. The controversy centers on what is considered tax planning and what is considered abusive tax sheltering.

There are many instances written into the IRC that allow a company to structure a transaction that will reduce the tax liability of the organization. It is reasonable for a person to plan his or her affairs so as to achieve the lowest tax liability. Judge Learned Hand is cited as saying, "There is not even a patriotic duty to increase one's taxes" (*Gregory v. Helvering* 1934). It is reasonable to believe that if these taxpayers follow the IRC, they should be rewarded for their proper planning and work. For years, tax minimization tactics have been used and have afforded taxpayers the ability to properly plan transactions to achieve the least tax consequences. However, it should be noted that these minimization tactics have been done using acceptable, practical procedures. The argument next focuses on whether these transactions ordinarily contain substance and motivation on some economic level to justify performing the transaction.

Abusive tax shelters can be categorized as financial mechanisms with the sole purpose of creating losses to deduct for tax purposes (Smith 2004). These complex transactions produce significant tax benefits in ways that were never intended by the tax code. These benefits were never expected by the underlying tax logic in effect and, in essence, are transactions used only to avoid or evade tax liability.

Since there is no firm differentiation between legitimate and illegitimate tax planning, it is hard to tell where the line is. A working definition of an abusive tax shelter is a "corporate transaction involving energetic paper shuffling aimed at having favorable tax consequences along with no, or next to no, economic consequences other than the tax consequences" (Shaviro 2004, 11). The purpose of these types of transactions is to create transactions that will generate tax losses that can be offset against other taxable income. There is no economic sense to these transactions except to generate these losses and reduce the total tax liability.

At its core, the IRS is the agency exclusively responsible for detecting any transaction with the sole purpose of eliminating or avoiding taxes. The IRS, through audits of filed returns, and the U.S. Treasury have begun to spot and publish legal regulations on transactions they consider abusive. These mandates warn taxpayers that use of such listed

transactions may lead to an audit and assessment of back taxes, interest, and penalties for using an illegal tax shelter.

The IRS requires that, under certain circumstances certain transactions be reported and disclosed to the IRS as potentially illegal tax shelter transactions. A listed transaction is one that the IRS has determined to have a potential for tax avoidance or evasion. In addition, transactions that are similar in their purpose to the listed transactions require similar disclosure. The IRS uses several distinctive judicial doctrines to determine whether a transaction is legitimate or abusive in nature.

Why Tax Shelters Are Harmful

When enacting changes to the tax code, Congress is often directed by the concept of revenue neutrality. Revenue neutrality is the idea that new legislation will neither increase nor decrease the net revenues produced under existing laws and regulations. In other words, the total revenues raised after new tax laws are passed should be consistent with revenues generated under the prior tax laws. One taxpayer will experience a decrease in tax liability, however, at another taxpayer's expense.

When corporations engage in illegitimate tax sheltering schemes, they, in essence, steal from the U.S. Treasury. Over the years, billions of tax dollars have been lost. Recently, the IRS and Congress have taken a firm position with legislation to impede tax shelters that have been identified. It is estimated that legislation to prohibit certain shelter transactions, specifically lease-in lease-out shelters and liquidating real estate investment trust transactions, have saved taxpayers $10.2 and $34 billion, respectively (Summers 2000).

When corporate taxpayers do not pay their respective tax liabilities, the result is lower revenues for the U.S. Treasury, which ultimately causes or escalates a government's deficit. Congress, the U.S. Treasury, and individual U.S. taxpayers are dependent on corporations paying their fair share of the tax bill to maintain government operations. Shortages in tax revenues can make fiscal planning difficult when budgeted income falls short of what was anticipated and pledged for various governmental programs.

To maintain tax revenue collections, Congress has only a couple of options: raise corporate taxes or raise individual taxes. Buried deep in the corporate tax shelter controversy is their effect on individual taxpayers. A side effect of a corporation engaging in fraudulent tax practices is that the federal government redistributes the tax burden, ordinarily, back onto the remaining taxpayers, who would otherwise enjoy a tax reduction. To say it differently, the rest of the population picks up the tab for the use of abusive corporate tax shelters.

Why Tax Shelters Can Be Beneficial

In the 1980s, President Ronald Reagan cut corporate tax rates as part of his monetary policy. The United States was a leader worldwide in lowering its tax burdens on

AN EXAMPLE OF A TAX SHELTER TRANSACTION

A corporate taxpayer agrees to purchase property from a foreign entity for $101 in exchange for $1 cash and a 10-year interest payment–only loan of $100 at 10 percent. The corporation will be required to make annual payments of $10 on the loan for interest. Subsequently, the foreign entity leases the property back from the corporation to use during the period for $10 per year. At the end of the 10-year period, when the balance on the loan is due, the corporation will sell the asset back to the entity for $100, thus retiring the debt to the foreign entity.

What is the benefit of this transaction for the corporation? The $10 lease revenue received negates the $10 annual interest expense, allowing the corporation to operate this transaction without cost. In addition, it will receive additional depreciation expense over the 10 years it owns the asset. Foreign assets that are used for these types of transactions typically involve governmental infrastructure—for example, water and sewer systems. These assets have no value to a U.S. corporation and would never be abandoned by the foreign government entities from which they are purchased. This is a good example of a transaction that has no economic purpose and is solely performed to reduce tax liability (Smith 2004).

It is important to note why transaction schemes like the aforementioned are difficult for the IRS to contest. The purchase of assets and claiming depreciation is allowable under the current IRC and is altogether different from not reporting income that is received from an individual's side business. It is more difficult to disallow a deduction that is in compliance with the tax code than to substantiate the omission of earned income as a violation of the IRC.

corporations as a way to facilitate economic growth, and, during the mid-1980s, the United States' tax rates were the lowest around the world. However, this started a sequence of events where many industrialized countries around the world began cutting their tax rates by an average of 30 percent in response, according to the Organisation for Economic Co-operation and Development (OECD), a group of 30 countries that works to address economic and social issues.

Twenty-five years later, many counties around the globe have surpassed the United States in its tax-cutting policies. Federal and state corporate taxes average 39.3 percent, approximately 10 percentage points higher than the OECD average ("Let's Make a Deal" 2005). To look at it from a different angle, a corporation in the United States has Uncle Sam as more than a one-third shareholder.

Indeed, of the 30 wealthiest countries in the world, the United States now levies one of the highest corporate income tax rates on its businesses (along with Japan, Canada, Germany, and Spain). In 1996, these 30 countries' average corporate tax rate was 38–30 percent that in the mid-2000s. Overall, global corporate tax rates fell over 20 percent during this time period (Edwards and Mitchell 2008). Although U.S.

individual tax rates decreased during this time period, corporate tax rates have remained unchanged.

Furthermore, the effects tax rates have on U.S. businesses go beyond cutting the tax piece of the profits out of a corporation's net income. The world has become a global marketplace, where executives and managers compete against not only their rivals next door but on the other side of the world. Higher corporate tax rates place U.S. companies at a competitive disadvantage when compared to their foreign counterparts. Higher tax rates produce increased pressure to maintain or lower costs.

Imagine two identical corporations located in the United States and Ireland. Ireland's corporate tax rate is 12.5 percent. These two companies have the same gross sales and administrative costs and, with all other factors being the same, report the same net income. However, the corporation in Ireland is allowed to keep an additional 27.5 percent of its income in comparison to the one located in the United States (40 percent versus 12.5 percent tax rates). This additional income can be used for additional research and development costs, higher employee wages, or greater dividend payouts for stockholders. To gain greater market share, the Irish corporation is better situated to compete on price and can still produce the same net income after taxes as the U.S. corporation with lower prices.

Having one of the highest tax rates in the world is self-defeating because it encourages U.S. corporations to engage in questionable tax practices as a means of staying competitive globally. Many legal and accounting firms are hired primarily for the purpose of creating arrangements that enable the company to pay little or no tax. With real tax benefits achieved by moving operations to countries like the Cayman Islands, Bermuda, and other international tax havens, many CEOs and boards of directors feel that it is their duty to get involved with these practices.

Solutions to Abusive Corporate Tax Shelters

With high tax rates versus foreign competitors, a potential solution would be to lower the corporate tax rate imposed on U.S. corporations. If a primary reason to engage in questionable tax practices is to become more competitive versus global competition, a tax rate that is more in line with other similar industrial countries could alleviate the pressure that causes corporation managers to investigate these practices. A lower flat tax rate for all industries could not only benefit corporations, but also their employees, who would work for more competitive organizations. A result would be more jobs and job security. In addition, with the need for tax shelters removed, decreasing the use of phony transactions and bringing into the United States income that was held offshore would create a windfall of revenue for the U.S. Treasury.

When President Reagan first initiated corporate tax cuts as part of the Tax Reform Act of 1985, other countries responded by lowering their tax rates. It is reasonable to expect this same activity to occur again should the United States lower its corporate tax rates, but it probably cannot afford to lower them much more. Only a tax-free situation

would ensure that corporations would not find motivation to investigate tax shelter activities.

Another option, the one preferred by President Barack Obama, would be to require that a corporation's *book income* be equal to its *tax income.* Corporations are allowed to maintain two sets of books: book and tax. Book income is what is reported to shareholders, while tax income is what is reported to the IRS for taxation purposes. Many transactions deductible for book purposes are not deductible for tax and vice versa. An example of this is the depreciation expense. Differing methods are required to be used when computing depreciation expenses for book and tax purposes. Generally, tax depreciation allows you to write off the value of an asset much quicker than book. This generates a higher book income and a lower tax income. These types of differences occur quite frequently because book and tax income do not agree.

This encourages managers to perform transactions that show a lower tax income, and therefore a lower tax liability, while still reporting the higher book income to the shareholders. In other words, they are able to realize the best of both worlds. To remedy this problem, making tax income equal to book income would once again deter tax departments from creating loopholes in the tax code designed specifically to maintain book income but lower tax income. The Obama administration has sought to apply this strategy to companies operating out of the Cayman Islands. The administration also worked with the government of Switzerland to revise its tax laws in order to allow the U.S. government to levy taxes on certain U.S. holders of Swiss bank accounts.

Conclusion

Embedded in the IRC are numerous tax-planning possibilities for taxpayers. Many corporations have taken tax planning a step too far, infringing on what may be out of bounds in the field of tax planning. Arguments can be made on both sides of the debate as to why corporations should or should not engage in such activities, but the fundamental reason that abusive tax sheltering is detrimental is its redistribution of the tax burden. In addition, tax-sheltering methods should be considered abusive and rejected in their entirety when they offer a benefit that is inconsistent with the purpose of the tax code.

DEBT, DEFICITS, AND THE ECONOMY

John J. Seater

When conversation turns to the economy, one of the most popular topics of discussion is the government deficit. Newspaper columnists, TV pundits, and, of course, politicians never tire of talking about the size of the deficit and what it means for the economy. Big deficits are considered bad—except that back in the 1950s and 1960s, they often were considered good. Big deficits depress the economy because they drive up interest rates—except that back in the 1950s and 1960s, the usual argument was that deficits stimulated the economy by encouraging people to spend more. So which is it: Are deficits good or bad? Do they depress or stimulate the economy? To answer those questions, we have to answer a more fundamental question: Exactly what *is* the government deficit? Once we know that, we can proceed to the more interesting questions of how deficits affect the economy and whether they are good or bad.

Debt and Deficits: What Are They?

The deficit is the addition to the outstanding stock of government debt, so to understand what the deficit is, we first have to understand what government debt is. The government undertakes many activities, from national defense to providing medical insurance. To pay for them, the government usually collects taxes. Sometimes, though, the government prefers to postpone collecting part of the taxes it needs and instead borrows funds by selling government bonds to the public. Those bonds, just like a corporate bond, represent a loan the government has taken out and eventually will repay. The person

TYPES OF GOVERNMENT DEBT

Governments issue several types of debt, which can be classified in various ways. One classification is by the type of government that issued the debt. In the United States, the main divisions are federal, state, and local debt; local debt can be divided further by type of locality, such as county or city. A second classification of government debt is by maturity at the time of issue. When we talk about a 10-year bond or a 30-year bond, we are talking about the length of time between the date when the bond was first issued and the date on which the principal will be repaid. Federal debt is divided into three convenient maturity categories. Treasury *bills* have initial maturities of 1 year or less (three-month bills, year bills, etc.); Treasury *notes* have initial maturities of between 1 and 10 years; and Treasury *bonds* have initial maturities longer than 10 years. State and local government securities generally are just called bonds, irrespective of the initial maturity. A *perpetuity* is a bond with an infinite maturity, which means the principal is never repaid and interest payments are made forever. The British government once issued some perpetuities, calling them consols.

A third way of classifying government securities is by the source of the revenue to repay them. *General obligation bonds* will be repaid with revenue collected by taxing the public; *revenue bonds* will be repaid with revenue collected from specific user fees, such as bridge or highway tolls. This way of classifying debt is used only for state and local debt.

who buys a government bond hands over money to the government and in return gets a bond stating the amount of the loan (the principal or face value of the loan), the interest rate that will be paid on the loan, and the date when the principal will be repaid (the maturity date of the loan). The money paid to the government by the buyer of the bond is that person's loan to the government, and the bond is the contract stating the terms of the loan. The government debt is the total amount of bonds that the government has issued but not yet repaid.

Whenever current government expenditure exceeds tax revenue, the government borrows the difference by selling new bonds to the public. In such a situation, the government budget is said to be in deficit. The amount of new debt issued in a given period of time (such as a calendar year) constitutes the deficit for that period. In contrast, when expenditure is less than tax revenue, the government budget is in surplus. At any time, the deficit is the negative of the surplus and vice versa.

How Much Government Debt Is There?

At the end of 2009, there was about $12.3 trillion of federal debt outstanding. Of that, 43 percent ($5.3 trillion) was held by federal agencies and trust funds, which means that the government owed almost half the debt to itself. Such internal debt is only a bookkeeping

device for tracking the flows of funds within the federal government. An accurate analogy would be a household in which one child borrowed money from a sibling. That kind of intrafamily debt has no bearing on the family's net indebtedness and is ignored by credit rating agencies, banks, credit card companies, and so forth. The situation with respect to intragovernment debt is exactly the same: as far as the economy is concerned, the debt doesn't exist. It has no implications at all for the economy or public welfare. Unfortunately, popular discussions of the debt frequently fail to distinguish between internal and external government debt and thus overstate the relevant number, which is the amount of federal debt held by private investors. At the end of 2009, that amount was about $7 trillion. State and local governments also issue debt, and they have about $2.4 trillion in outstanding debt, most of which was held by private investors. Thus, the total amount of privately held government debt was about $9.4 trillion at the end of 2009.

Until about the mid-1980s, government debt as a fraction of gross domestic product (GDP) of the U.S. economy was not especially large except during wars and immediately after them. At the end of the Second World War, for example, outstanding federal debt alone (i.e., ignoring state and local debt) was slightly larger than GDP, and then it fell substantially over the next two or three decades. The federal government always has issued debt to cover part of the abnormally high level of government purchases during wars and then paid off the wartime debt in the following peacetime. By using debt to finance unusually high purchases during wars, the government avoids large fluctuations in tax rates, which would have adverse effects on economic activity. Since the mid-1980s and especially since the end of 2008, government debt has grown substantially relative to GDP. That growth is unusual because it resembles wartime debt behavior but has occurred in the absence of any major war. At the end of 2009, U.S. GDP was about $14.3 trillion, so the ratio of total, privately held outstanding government debt to GDP was about 76 percent. That is still below the debt-to-GDP ratio at the end of 1945, but it is growing unusually fast and, unlike during a war, is accompanied by no expectation of reduced future government expenditure to lead to a retirement of the debt without increases in tax rates. Note that the focus here is restricted to privately held federal, state, and local debt because that is the debt that matters to taxpayers and the economy in general. The figure usually seen in the news refers only to federal debt but includes debt held by federal agencies as well as by private individuals. Total outstanding federal debt at the end of 2009 was $12.3 trillion, equal to 86 percent of 2009's GDP of $14.3 trillion.

The foregoing numbers on the amount of outstanding government debt are the numbers one would see reported in the newspaper. They must be adjusted before they can be used to discuss the effect of debt on the economy.

The most important adjustment is for inflation. The *nominal* value of a bond is the price in dollars that it would fetch on the open market. The *real* value of that same bond is the number of units of output that it can buy. If DVD movies cost $20 each, then the real value of a $200 bond is 10 DVD movies. In other words, if you sell your bond,

you will receive in return enough cash to buy 10 DVDs. If, however, the prices of all goods double, so that DVDs now cost $40 each, then the bond's cash value now buys only 5 DVDs. The bond's nominal value is unchanged by inflation and remains at $200. Its real value, however, is changed. Real values are what matter because what people care about is how many goods their paper assets can buy. That is precisely what the real value of a bond measures. Adjusting official debt and deficit figures for inflation can change the measurement of the debt's size by a substantial amount. In 1947, for example, official federal government statistics report a surplus of $6.6 billion. However, inflation that year was almost 15 percent. That inflation reduced the value of outstanding debt by about $11.4 billion. That reduction was equivalent to an additional surplus because it reduced the real value of what the federal government owed its creditors. The true surplus, therefore, was about $18 billion, nearly three times as high as the official figure. Another example is the decade of the 1970s, when the official federal deficit was positive every year but the inflation-corrected deficit was negative (that is, there was a real surplus) in exactly half those years.

Another adjustment is for changes in interest rates. The value of outstanding debt changes as market interest rates change. To see what is involved, suppose that you buy a one-year $10,000 Treasury bill (equivalently, you make a loan of $10,000 to the federal government) at 10:00 A.M. The bond carries an interest rate of 10 percent, which means you will be paid $1,000 in interest when the bond matures one year from now. At 11:00 A.M., the Federal Reserve announces a change in monetary policy that causes one-year interest rates to fall to 9 percent. Your bond now is worth more than when you bought it an hour ago because you could now sell the bond to someone else for more than $10,000. The reason is that anyone who wants to lend $10,000 for one year now will find that new bonds pay only 9 percent, meaning an interest payment in one year of $900. Your bond, however, has a 10 percent rate locked in and will pay $1,000 interest for sure. That makes your bond's market value higher than its par value of $10,000. These kinds of changes happen continually, day in and day out. As a result, the market value of the outstanding government debt fluctuates from day to day even if there is no inflation and even if the government issues no new debt and retires no outstanding debt. The market value of outstanding debt will be greater than the par value if interest rates have fallen on average since the debt was issued and will be smaller than the par value if rates have risen. The difference between par and market value of the outstanding debt is typically a few percentage points. Unfortunately, market values for the total outstanding government debt are not readily available. Governments do not report them, and newspaper reports rarely mention them.

The Economic Effects of Government Debt

To see how government debt may affect the economy, we need to understand how government debt affects the flow of net income to the people lending to it. When the

government borrows, it promises to repay the lender. To make those repayments, the government ultimately will have to raise extra taxes, beyond what it needs to pay for its other activities. The economic effect of government debt depends heavily on how taxpayers perceive those future taxes. Perceptions are difficult to measure, and neither economists nor others understand exactly how people form their perceptions. As a result, economists still disagree on the economic effect of government debt.

A simple example will help illustrate the situation. Suppose the government buys $1 trillion worth of goods and services every year and pays for them entirely by collecting taxes. The government's budget is balanced because revenue equals expenditure. Suppose that the government decides to change the way it finances its expenditures but does not change the amount being spent. In the first year, the government reduces taxes by $100 billion and replaces the lost revenue by selling $100 billion worth of bonds that mature in one year and carry an interest rate of 10 percent a year. In the second year, the bonds mature, and the government pays the $100 billion principal and the $10 billion of interest. Taxes in the first year are $100 billion lower (the government is running a deficit), but in the second year taxes are $110 billion higher (the government is running a surplus). How does this rearrangement of the timing of tax collections affect people? In the first year, people give the same total amount of revenue to the government as they did when they paid only taxes, but now $100 billion of the total payment is in the form of a loan that will be repaid in the second year with an extra $10 billion in interest. On this account, people may feel richer because they seem to be paying less in total taxes over the two periods. This year, they pay $900 billion in taxes and $100 billion in loans for the same $1 trillion total that they were paying before the government decided to issue debt. Next year, however, it seems they will be better off than before. They will pay $1 trillion in taxes, but they will receive $110 billion in repayment of their first-year loan. Their net payment in the second year will be only $890 billion. This seems like a good deal, but unfortunately it won't turn out that way. When the second year arrives, people will find that their net payment is $1 trillion, just as if the debt never had been issued. Why is that? To pay the $110 billion in principal and interest, the government must come up with an extra $110 billion in revenue, so it must raise taxes by that amount. Those extra taxes exactly cancel the payment of the principal and interest! The government gives with one hand and takes away with the other. The net result is that people do not really get back the $100 billion they lent the government or the $10 billion in interest on it, and the loan is equivalent to having paid the $100 billion in taxes in the first year. The same result holds from any maturity of debt, whether it is a 1-year bond, as in the previous example, a 10-year bond, or even a perpetuity.

Note, by the way, that the government cannot beat the mathematics by refinancing old debt with new debt. If the government tried to repay existing debt, including the interest on it, by issuing new debt, the amount of debt would grow at the rate of interest. In our example, in the second year, the government owes $110 billion in principal and

interest on the debt issued in the first year. The government could raise the revenue by issuing $110 billion in new debt. It then would have to pay $121 billion in principal and interest in the third year ($110 billion in principal and $11 billion in interest, assuming the interest rate stays at 10 percent for simplicity). Thus, the debt would grow by 10 percent every year that the government issued new debt to repay the old debt. The problem is that interest rates generally exceed the growth rate of the economy, so, in

WHAT DEBT IS THE RISKIEST?

There is an inconsistency in popular discussions of government debt compared to other types of debt. Corporations and households both issue debt (that is, borrow money). Corporate debt outstanding was about $7.3 trillion at the end of 2009, about $2 trillion less than the amount of privately held government debt. Household debt is larger. In 2009, households' total debt stood at $13.4 trillion, 43 percent larger than the privately held government debt.

Commentators regularly express concern that government debt represents a risk to the economy, once in a while express similar concerns about household debt, and virtually never mention corporate debt. In fact, household and corporate debt can represent an economic risk in some rather rare circumstances, but government debt virtually never represents such a risk. In a deep recession, debtors may become unable to repay their debts and be forced to default on them. That, in turn, can make financial institutions insolvent and lead to a collapse of the financial system. Such a mechanism seems to have been the reason the recession of 1929 became the Great Depression of 1932. Deflation made existing debt increasingly costly to repay, leading to widespread defaults on debt. The banking system came under great pressure and eventually collapsed with the banking panic of 1932.

This sort of thing happened from time to time up through the Great Depression but has not happened since, largely because of regulatory changes and an improved understanding by the Federal Reserve System of how to conduct monetary policy in the face of such circumstances. Such a collapse may nearly have happened in the financial turmoil of late 2008, when the market for collateralized debt obligations (CDOs) fell apart. CDOs were a new type of instrument that fell outside the regulatory structure that had worked so well since the Great Depression. Their emergence combined with other changes in the financial industry, such as the rise in importance of the housing lenders Fannie Mae and Freddie Mac, which also were outside the post-Depression regulatory structure. Strong action by the Federal Reserve System prevented a deflation that could have caused a repetition of the asset market crash that started the Great Depression.

In contrast, default by any level of government in the United States has been exceedingly rare, and the federal government has never defaulted on its debt obligations. However, the unprecedented peacetime rise in the amount of outstanding federal debt in 2009 and 2010 has raised concerns—unresolved at the time of this writing—about the government's ability to repay its debt.

finite time, the government would reach a point where it was issuing debt equal in value to the entire gross domestic product of the economy. After that, it would not be able to issue any new debt because the government would be promising to repay more than could possibly be available to it, and the scheme would come to an end.

Two major factors determine how government debt affects the economy. One is the kind of taxes the government uses to collect revenue, and the other is the way that people perceive the future taxes implied by current debt. It is easiest to start with people's perceptions in a simple case and then move on to the more complicated case that actually confronts us.

Suppose for a moment that taxes are very simple. In particular, suppose that the government uses what are called lump-sum taxes to finance everything it does. A lump-sum tax is one whose amount is independent of anything the taxpayer does. For example, a taxpayer could draw a number out of a hat, and that would be his tax, irrespective of whether he was rich or poor. Actual taxes are more complicated, usually being based on income, consumption, or some form of wealth. The taxpayer has some influence over how much of those kinds of taxes she pays because she can control how much income, spending, and wealth she has. For the moment, though, concentrate on the simple, even if unrealistic, case of a lump-sum tax. In that simple case, government debt is unlikely to have any significant effect on the economy. People generally try to estimate their future income, and, of course, what they care about is their income after taxes. That means that, in effect, they try to estimate their future taxes. As we have seen already, any government debt issued today implies extra taxes at some time in the future. If people are aware of that fact, then they will know that any reduction in today's taxes brought about by the government issuing new debt is going to be offset by more taxes in the future. The example above showed that the offset is exact. The question is whether people recognize at least approximately that the offset is exact. If they do, then bond finance is equivalent to tax finance, as the example above showed. In that case, government debt has no effect on anything important—a property known as Ricardian equivalence after David Ricardo, the economist who first discussed it. If people do not foresee all the future taxes implied by government debt, then they feel wealthier when the debt is issued but poorer in the future, when, unexpectedly, they have to pay higher taxes to finance the principal and interest payments. They then are likely to increase their consumption expenditure today and perhaps work less today. In the future, when the inevitable taxes arrive, they will have to reduce their consumption and increase their work effort. So if people do not correctly perceive the future taxes implied by current debt, they will alter their economic behavior when debt is issued or retired and thus affect the economy.

The situation becomes more complicated when we extend our examination to include the fact that taxes are not lump sum. Taxes in the real world take some fraction of the tax base, which is the thing taxed—income for an income tax, consumption purchases for a sales tax, and so on. To keep the discussion simple, restrict the story to an income

tax by supposing that that is the only kind of tax the government uses. The principles are the same for other taxes, so nothing important is lost by this simplification. The problem with taxes that are not lump sum, such as an income tax, is that they have positive *marginal tax rates.* The marginal tax rate is the fraction that you must pay in tax on the next dollar of income that you earn. A proportional income tax, for example, levies a fixed tax rate on your income, no matter how high or low your income is. If the marginal rate were 20 percent, then you would pay 20 cents on every dollar that you earn, whether you earn $10,000 or $10,000,000. Everybody would pay exactly 20 percent of their income in taxes. This is the so-called flat tax. Some state governments levy that kind of income tax. A graduated or progressive income tax is one whose tax rate rises with the income of the taxpayer. The federal income tax is that type of tax. Somebody earning $20,000 has a marginal tax rate of 15 percent, so if he earns another dollar, he will pay 15 cents of it to the federal government in tax. In contrast, someone earning $200,000 has a marginal rate of 35 percent and will pay in tax 35 cents of the next dollar she earns. For our purposes, it is sufficient to consider a proportional income tax, with the same marginal tax rate for everyone.

The important thing about marginal tax rates is that they affect people's economic behavior. People's choices depend on the tax rate they face. Think of someone trying to decide whether to work an extra hour. Suppose he earns $30 an hour. If there were no tax, then one more hour of work will earn him $30, pure and simple. If, in contrast, he is in the 15 percent tax bracket, he will get to keep only 85 percent of his extra $30 dollars, which is $25.50. The other $4.50 goes to the government as tax. Thus, the effective return to working another hour is not the stated $30 but the after-tax earning of $25.50. It is less attractive to work an hour for $25.50 than for $30, so fewer people would decide to work when there is a tax compared to when there isn't. The same reasoning holds for investment. People will be less likely to make the next investment (buying a new machine for their machine shop, for example), because the return on that investment is reduced by the tax.

So what does this all have to do with government debt? Remember that debt rearranges taxes over time. It therefore also rearranges the incentive effects associated with those taxes. For example, if the government reduces taxes today by issuing debt, in reality the taxes it reduces will be income taxes, not lump-sum taxes. Thus, by issuing debt, the government will reduce the disincentive effects of taxes today and increase them tomorrow. As a result, the government will affect the timing of people's economic decisions. The effects of rearranging disincentive effects over time get to be quite complicated, but the important thing for this discussion is that, precisely because debt does rearrange taxes and their disincentive effects over time, it has real effects on the economy. The situation becomes even more complicated if people cannot figure out exactly what the new timing will be after debt is issued. No one really knows when the government will collect the taxes to repay a new 30-year bond. It may decide to retire the bond early, or it may decide after 30 years to replace it with another bond, say a 5-year note, thus postponing

the repayment by 5 years. In the face of such uncertainty, figuring out exactly what the incentive effects will be can become extremely complicated.

Unfortunately, there is no reliable way to discover people's expectations about taxes, so we have to use statistical methods to learn the effect of government debt on the economy. Even though economists have been studying this issue for nearly 40 years, they have not yet reached a consensus. Statistical measures of the effect of debt on economic activity are straightforward in principle but difficult to carry out in practice. Overall, though, the evidence is that debt's effects are not strong. Some of the evidence even favors Ricardian equivalence (no effect of debt at all) as a close approximation. For example, Figure 1 shows two plots. One is the federal deficit as a share of GDP, and the other is the real interest rate on three-month Treasury bills. There is no obvious relation between the two series, and the correlation between them is a virtually nonexistent negative 1 percent.

A related issue here is the desirability of deliberately using deficits to influence the path of the economy. Under full equivalence of deficit and tax finance, no such thing can be done, of course, because deficits do not affect anything important. Under incomplete equivalence, though, deficits do have effects, as we have just seen. Therefore,

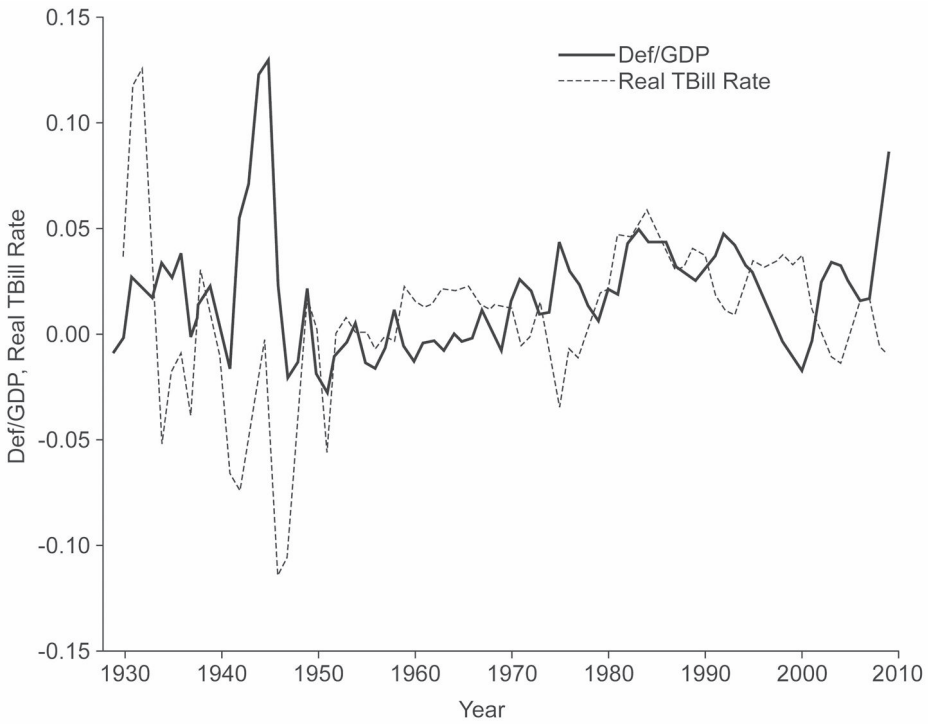

Figure 1. Federal Deficit to Gross Domestic Product Ratio and the Real Interest Rate on Three-Month Treasury Bills (Congressional Budget Office, President's Council of Economic Advisers)

it might seem desirable to run up deficits in recessions to encourage people to spend more and run up surpluses in booms to restrain spending. The problem is that these seemingly desirable effects arise for undesirable reasons: the taxes distort choices, and, on top of that, people may fail to perceive the effects of future taxes implied by deficits. Any such misperception means that deficits have effects in part because they fool people into thinking they suddenly have become wealthier (and conversely for surpluses). Is it desirable to influence the path of the economy by using a policy that is effective because it deliberately misleads the public? Such a proposition seems difficult to justify. Another problem is that any desirable effects are accompanied by other effects that might not be deemed desirable. When equivalence is incomplete, changing the stock of debt outstanding also changes the interest rate in the same direction. In particular, running a deficit in a recession would raise interest rates, which would reduce investment and economic growth, which in turn would reduce output in the future. Thus, using deficits to stimulate the economy now to ameliorate a recession comes at the cost of reducing output later. Whether that is a good exchange is not obvious and requires justification.

DUMPING OF IMPORTS

Thomas Grennes

Dumping is selling an imported product for less in the United States than the seller charges for a comparable product in the seller's own domestic market. This kind of activity is illegal in the United States, even if it does not reduce competition. Antidumping is part of a broader set of laws that deal with so-called unfair trade practices. Antidumping

laws can allow the U.S. government to impose taxes, called tariffs, on foreign-made products that have been found to have been dumped. Additional tariffs, called safeguards, can temporarily be imposed to offset surges in imports of a particular product.

Who Dumps?

Dumping has been illegal in the United States since 1921, but dumping cases have become more common in recent decades. More antidumping tariffs are now imposed globally in a single year than were imposed over the entire period of 1947 to 1970 (Blonigen and Prusa 2003). U.S. firms that compete with imports are the main beneficiaries, and they are also the main political proponents of antidumping law. High tariffs against dumping are a way to circumvent the limits on tariff levels agreed to by members of the World Trade Organization.

All buyers of imports and close domestic substitutes are harmed by antidumping laws. U.S. antidumping law applies to all trading partners, including its North American Free Trade Association partners, Canada and Mexico. Some of the more controversial cases have involved Canadian and Mexican products. The basic U.S. antidumping law was amended in 2000 by the Continued Dumping and Subsidy Offset Act, better known as the Byrd Amendment. The Byrd Amendment was found to violate the rules of the World Trade Organization regarding protectionism, and it was repealed by Congress in January 2006.

In the early experience with antidumping, U.S. firms were the most frequent filers of complaints. Over time, Canada, the European Union, and Australia became more frequent filers, and, by the late 1980s, these four traders accounted for more than 90 percent of antidumping cases filed in the world.

Recently, firms in other countries have become more frequent complainers, and since 2000, the four traditional filers accounted for only 33 percent of the cases. China and India have become more frequent filers, and since 2000, India has filed more cases than any other country. U.S. firms that were once the most frequent complainers about dumping have become some of the most frequent targets of antidumping cases. The United States is the world's largest trading nation, and its economic size influences the number of cases in which U.S. firms are involved. When data are adjusted for the volume of a country's trade, the prominence of U.S. firms is reduced.

East Asian countries—especially China, South Korea, and Taiwan—have been the most common targets of antidumping cases. The U.S. steel industry has generated more antidumping complaints than any other industry. These cases have pitted domestic steel producers against important steel-using firms. Steel users have organized a lobby, claiming that tariffs have destroyed more jobs in steel-using firms than they have saved in steel-producing firms. Other prominent dumping cases in the United States involved Canadian lumber, cement from Mexico, wooden furniture from China, and chemicals and electrical products.

THE BYRD AMENDMENT

The Byrd Amendment allows firms that file antidumping cases to receive the revenue from the tariffs imposed on import companies found guilty of dumping. Thus, the victim is rewarded twice by (1) reducing competition it faces from imports and (2) receiving tariff revenue. The United States has been the only country to resort to this unusual practice, and it was challenged immediately by other member countries in the World Trade Organization (WTO). The WTO ruled in 2000 that the amendment violated the rules of the WTO, and it authorized other WTO members to retaliate against the United States by imposing tariffs against U.S. exports. After the U.S. Congress refused to change the law, the European Union, Canada, and Japan imposed large tariffs against U.S. exports in 2005. Finally, in January 2006, Congress repealed the law but insisted on continuing payments to U.S. firms through 2007. Foreign sanctions against U.S. exports remained in place.

Some strange developments have occurred under the Byrd Amendment. In the case of wooden bedroom furniture dumped by Chinese firms, some U.S. furniture companies have been simultaneously paying tariffs on furniture they import and sell in the United States and receiving payments from complaints they filed under the Byrd Amendment against dumping of furniture.

Enforcing Antidumping

How is the U.S. antidumping law administered? U.S. firms claiming to be harmed by dumping can initiate action by filing a complaint with the U.S. Department of Commerce (DOC) against specific foreign dumpers. As the result of an investigation, the DOC has ruled in favor of dumping in 94 percent of recent cases filed. In determining whether the price charged in the United States is too low, the DOC rarely compares the price charged in the United States with a price charged in the supplier's home market. Instead, the DOC makes its own estimate of cost of production in the supplier's market. In effect, dumping in the United States becomes pricing below cost of production as estimated by the DOC.

If the DOC rules in favor of dumping, the case moves to the U.S. International Trade Commission (USITC) to determine whether U.S. producers were harmed by dumping. The USITC has found injury in 83 percent of recent cases. In assessing injury, the USITC staff is guided by a peculiar asymmetry in the law. The USITC is asked to estimate the damage done to U.S. producers by dumping, but it is not allowed to take into account the gain to U.S. buyers from paying lower prices for products affected by dumping. If harm is found, the USITC estimates the amount of dumping and recommends a remedy to the president. It is usually a tariff whose level is related to the dumping amount, and it is imposed for an indefinite period against firms guilty of dumping. The tariff is retroactive to the day the dumping complaint was filed. Consequently, imports

from accused firms often stop before cases are resolved. On the basis of the high percentage of successful cases, U.S. firms competing with imports have a strong incentive to complain about imports.

Impacts

What are the economic effects of the U.S. antidumping law? Domestic producers gain in the same way they gain from any tariff. Competition from imports is reduced, and domestic producers can charge a higher price for their products. Foreign suppliers who are not accused of dumping and do not face the dumping tariff also gain from the reduction in competition.

Consider the example of steel. Say that antidumping tariffs are imposed on certain foreign steel producers. All steel producers in the United States and foreign steel suppliers not subject to antidumping tariffs gain from antidumping tariffs. Because of reduced competition, domestic producers are able to raise their steel prices. Since both domestic steel and imported steel are more expensive, all buyers of steel in the United States are harmed by antidumping laws. Since the United States is a net importer of steel, the total value of losses to buyers of steel exceeds the gains to domestic steel producers. Many of the steel buyers are businesses that use steel in their own production, and an association of steel users has become a vocal opponent of steel tariffs in recent years.

Similar impacts occur from other antidumping examples. In the case of Canadian lumber, antidumping has increased the cost of a key component of housing. In the Mexican cement case, antidumping restrictions magnified shortages of cement following the hurricanes that hit the Gulf Coast in 2005. For all antidumping cases combined, losses to U.S. buyers have exceeded gains to domestic producers by an estimated $2 billion to $4 billion per year. Antidumping has become one of the costliest forms of trade protection for the United States and for the world as a whole (Blonigen and Prusa 2003).

Justification

If antidumping laws are harmful for the nation, are they merely special interest legislation for U.S. producers, or can they be justified in some other way? One possible rationale is that antidumping prevents foreign companies from achieving monopoly power in the U.S. market. It has been suggested that foreign dumpers might charge low prices to drive all U.S. rivals out of business. Without rivals, they would then raise prices to monopoly levels. However, this argument has two weaknesses. First, if the predatory firm succeeds in destroying all current rivals, it has no way of blocking entry by new firms once it raises its price. Second, real-world cases of monopoly achieved by this strategy are extremely rare. If the goal is to prevent lower prices for foreign-made products from leading to monopoly control, there is no reason to have a special law against foreign firms. Antitrust laws, which are laws against monopolies, could be enforced equally against both domestic and foreign companies who might acquire monopoly power.

There is an additional practical argument against the U.S. antidumping law. The administration of the law is said to be systematically biased toward finding dumping, even when there is none. Lindsey and Ikenson (2003) have constructed examples in which the DOC procedures produce prices in the United States that appear to be lower than in the supplying foreign country, even when the true prices are identical in the two countries. They conclude that the antidumping law is just a standard form of protectionism.

Dumping Reform

Short of completely repealing the U.S. antidumping law, are there ways to reform the law that would better serve producers, consumers, and society in general? First, the antidumping law could be modified to make it consistent with general antitrust policy. In that case, price differences would not be illegal unless they also increased the monopoly power of the dumping firm. For example, if a South Korean firm is one supplier of imported steel among many, lower prices charged by that firm would not necessarily be illegal. Its illegality would be judged in terms of its contribution to monopoly power in the U.S. market for steel. Retailers who offer discounts to students and senior citizens do not violate domestic antitrust law, even though they charge different prices for the same product. Price differences by foreign firms could be judged by the same standard as price differences by domestic firms.

A second reform would allow the DOC and USITC to estimate the consumer gains from dumping and compare them with domestic producer losses. Instead of evaluating exclusively the losses and harm to domestic producers, the agencies would evaluate dumping in terms of the general public interest of both buyers and sellers of products. By this broader standard, dumping that harms U.S. producers but provides greater benefits to U.S. buyers would not be illegal.

A third reform is to reduce barriers faced by U.S. exporters, especially in countries that charge different prices for their products in their home and foreign markets. Dumping can only occur if buyers in the lower-price market are prevented from reselling the product in the higher-price market. If Korean firms tried to dump steel in the United States, and buyers could resell the cheap steel in Korea, their scheme would not be profitable, and an antidumping case would not be necessary. Thus, negotiating to reduce trade barriers facing exports from the United States would discourage dumping in the United States.

Antidumping laws and all laws that protect producers against unfair trade practices face the possibility of penalizing perfectly legitimate behavior by sellers. Is it unfair to invent a new and better product that harms producers of traditional products? Was it unfair to introduce automobiles, which replaced horses and buggies, or computers, which replaced typewriters? The new competition from automobiles and computers must have appeared to be unfair to the traditional producers, and they were definitely harmed. Candle makers may have considered natural sunlight to be unfair competition,

and sellers of irrigation equipment may consider rainfall to be an unfair rival. However, if all practices that harm traditional producers are judged to be unfair and illegal, consumers will not be served, and there will be no economic growth.

ELECTION CAMPAIGN FINANCE

Ruth Ann Strickland

Campaign finance costs associated with running for political office have historically evoked concern. Most political candidates rely heavily on fundraising for travel, public appearances, support staff, and mass media advertising. Unless they have independent wealth, they must raise monies from individual, business, nonprofit, and other organizational sources. Jesse Unruh, speaker of California's state assembly from 1922 until 1987, said money is "the mother's milk of politics." Many would argue today that this has been true since the inception of the U.S. electoral process.

Historical Background

As early as 1905, heavy corporate financing prompted Theodore Roosevelt to propose that candidates for federal office be required to disclose campaign finances and be prohibited from receiving corporate contributions. In 1907, Congress passed the Tillman Act, which prohibited candidates for federal office from receiving corporate contributions; and later, in 1910, Congress passed the Federal Campaign Disclosure Law, which required candidates for federal office to disclose sources of campaign financing (Farrar-Myers and Dwyre 2008, 8).

Owing to embarrassing incidents such as the Teapot Dome scandal and corruption in President Warren G. Harding's campaign of 1920, Congress passed the Federal Corrupt Practices Act, which required congressional candidates to disclose campaign

receipts and expenditures. In 1939 and 1940, the Hatch Acts prohibited political parties from soliciting campaign contributions and other support from federal employees. Because of the Hatch Acts, federal employees, until 1993, could not participate in political fundraising. In 1947, Congress passed the Taft-Hartley Act, which permanently made it illegal for labor unions to financially contribute to federal candidates for office.

Because so many campaign finance laws were ineffective and hard to enforce, Congress passed the Federal Election Campaign Act (FECA) of 1971. Replacing the old Corrupt Practices Act of 1925, the new law set limits on candidates' spending on communications media, established limits on financial contributions to candidates, and required disclosure of financial contributions made by political committees and individuals greater than $10, as well as disclosure by candidates and contributors and expenditures greater than $100. Revelations made after President Richard M. Nixon's resignation and funding illegalities in his 1972 reelection campaign catapulted election campaign financing back into the limelight and prompted Congress to amend FECA. In 1974, Congress established spending limits for presidential and congressional candidates and for national political parties in party primaries, general elections, and runoff elections. The new FECA set contribution limits on individuals, political action committees, and political parties and provided for voluntary public financing of presidential elections. FECA of 1974 established the Federal Election Commission to implement campaign finance law provisions (Cooper 2000, 259).

In 1976, the U.S. Supreme Court in *Buckley v. Valeo* (1976) declared some FECA provisions unconstitutional, primarily those dealing with campaign spending limits. The Court held that limits on campaign expenditures unreasonably restricted the free speech rights of corporations. *Buckley v. Valeo* allowed limits on campaign contributions on the rationale that this proviso would reduce actual corruption or the appearance of corruption in the electoral process. At the same time, it struck down limits on campaign expenditures saying that free speech permits candidates to spend as much as they choose (Farrar-Myers and Dwyre 2008, 13). After *Buckley v. Valeo,* an intense debate began over the question: Does money equal speech? Critics of the *Buckley* ruling say it allows giant corporations and wealthy individuals to overwhelm and drown out the voices of ordinary citizens; corporations, in essence, have a larger voice (or "more speech") than those who can make only small contributions (Cooper 2000, 260). On the other hand, the *Buckley* ruling is also criticized by free speech advocates who say that neither contributions nor expenditures should be limited, because this generally limits political discourse. Justices Antony Kennedy and Clarence Thomas have advocated overturning *Buckley* for these reasons (Farrar-Myers 2005, 48–50).

Congress amended FECA again in 1976 and 1979 to elaborate on "hard money" versus "soft money" and to ease up on contribution and expenditure disclosure requirements. Because candidates and political action committees voiced concerns over FECA's detailed reporting requirements, calling them burdensome and redundant, Congress

sought to streamline and simplify reporting requirements. Voter registration efforts and get-out-the-vote campaigns were exempted from the contribution and expenditure limits applied to hard money contributions to candidates. Although Congress did not create the hard/soft-money distinction, it specified that party committees could use hard dollars only toward contributions to party candidates or coordinated spending ceilings. The eased provisions gave state and local political parties a greater role to play in federal elections, as soft money contributions could be used to fund party activities if not the actual campaigns of candidates for office (Corrado 2005, 28–30).

Recent Years

Triggering events in the 1996 and 2000 presidential elections prepared Congress for another run at campaign finance reform. In 1996, Democratic fundraising practices, such as the "selling" of access to the White House, raised serious questions. In the 2000 election, both parties saw an increase in soft money contributions and the rise of issue-advocacy electioneering in which soft money is used to promote (primarily through media slots) issues that are near and dear to candidates while not endorsing the candidates themselves. The practice made many believe that the current campaign finance regulatory structure was ineffective. U.S. Senator John McCain (R-Arizona), in his run for the presidency in 2000, focused much of his time arguing for campaign finance reform and reducing the role of big money in U.S. politics (Cooper 2000). After dropping out of the 2000 presidential campaign, McCain returned to the U.S. Senate and joined forces with Senator Russ Feingold (D-Wisconsin), Representative Christopher Shays (R-Connecticut), and Representative Marty Meehan (D-Massachusetts) to close loopholes in the campaign finance system. Their efforts culminated in the first major campaign finance reform in over 30 years—the Bipartisan Campaign Reform Act (BCRA). Senator McCain argued that a ban on soft money was necessary to end corruption in U.S. politics.

In 2002, the BCRA became law. The major provisions of this law prohibited national party committees from accepting or spending soft money. This provision, particularly unpopular with the national party elites, sought to exercise control of so-called party-building contributions from labor unions, corporations, and individuals that had in fact been used for campaign electioneering purposes. It further limited state and local parties, telling them that they could not spend money in federal electioneering but instead could focus on get-out-the-vote and voter registration drives. National, state, and local parties also could not ask for or contribute money to nonprofit organizations (which in turn engage in advocacy without endorsing any candidate's election or directly subsidizing federal candidates' campaigns). The following hard money contribution limits were instated:

- individual contributions for House and Senate campaigns: $2,000, indexed to grow with inflation;

- total aggregate contribution limits for individuals: $95,000, with $37,500 to candidates and $57,500 to political parties and political action committees;
- political action committees: $5,000 per candidate per election with an additional $15,000 to a national party committee and $5,000 combined to state and local party committees.

Moreover, broadcast, cable, or satellite communications that target federal candidates for office or show their likeness in their district or state media outlets (known as electioneering communications) were banned from being issued or shown within 60 days of a general election or 30 days of a primary. In addition, unions and corporations were prohibited from directly contributing to electioneering communications and could only pay for such advertising through hard money or through PACs. Similarly, nonprofit organizations and 527s could only pay for these types of advertisements through PACs (Jost 2002, 974). Also included is a "millionaires' provision" that permits candidates facing independently wealthy opponents to accept up to $6,000 per election from individual contributors (Jost 2002, 976–977).

The BCRA has sparked not only heated debate and controversy but also a lot of litigation. One controversy—the growth of 527 organizations—put a lot of pressure on the Federal Election Commission (FEC). These 527s are political committees that raised and spent unlimited amounts of money on issue advertisement, polling, and get-out-the-vote drives. They claimed tax-exempt status under section 527 of the Internal Revenue Service Code and did not register as political committees with the FEC. These 527 groups, which existed prior to BCRA, did not have to identify donors, nor did they have to disclose how much they raised or how the money was spent. They grew by leaps and bounds after the BCRA's passage. Senator McCain and other campaign finance reformers pressured the FEC to do something about these groups. In the 2004 presidential election alone, the 527s spent nearly $400 million. Not only did they spend huge sums of money, but they have paid for attack ads in hundreds of television markets, and no one can pinpoint the sources of the funds due to the loophole that exempted them from the BCRA provisions (Munger 2006).

In addition to the controversy over 527s, many observers questioned whether it was constitutional to ban soft money spending by national political parties and to regulate funds raised by corporations, unions, and advocacy groups for electioneering purposes. Opponents argued that these restrictions violated free speech and limited political discourse. Shortly after BCRA was signed into law, U.S. Senator Mitch McConnell (R-Kentucky), then the Senate majority whip, took the Federal Election Commission to court, claiming that the BCRA unconstitutionally infringed on the free speech rights of advocacy groups such as the National Rifle Association. Initially in 2003, the U.S. Supreme Court in *McConnell v. Federal Election Commission* upheld the electioneering communications provisions and the soft money regulations (Ciglar 2005, 71). In 2003,

the Court favored the BCRA again by upholding the ban on contributions of incorporated nonprofit advocacy groups to federal candidates in *Federal Election Committee v. Beaumont.* At the same time, the Supreme Court demonstrated some early concerns with the BCRA provisions and struck down the prohibition on minors under the age of 18 from making political contributions and the requirement that political parties in a general election must choose between making independent or coordinated expenditures on a candidate's behalf (Sherman 2007).

As the Supreme Court's composition changed in 2005 (new Chief Justice John G. Roberts) and 2006 (new Associate Justice Samuel Alito), so too did its interpretation of the BCRA's issue-advocacy advertisement restrictions. This electioneering ad provision (i.e., issue-advocacy advertising) was among the most controversial, as illustrated in *Federal Election Commission v. Wisconsin Right to Life* (2007). More specifically, the Court held that part of the BCRA had been unconstitutionally applied by the FEC to an advertisement that the Wisconsin Right to Life groups sought to air before the 2004 election, and further stated that this advertisement was not an electioneering ad (Utter and Strickland 2008, 204). In this case, the Court's 5–4 ruling under the new Chief Justice, John G. Roberts, left doubts as to whether any part of the electioneering communications provision would survive given the broad exemption. The Court said that ads that truly engaged in a discussion of the issues could not be construed as urging for the support or defeat of a particular candidate. Another 5–4 U.S. Supreme Court decision in 2008, *Davis v. Federal Election Commission,* held that the millionaires' amendment unconstitutionally discriminated against candidates who spent their own money for purposes of getting elected by giving special fund-raising privileges to opponents (Bopp 2008).

Yet another major challenge to BCRA arose over whether Citizens United, a conservative nonprofit organization, could broadcast a documentary that the group produced in 2008 titled *Hillary: The Movie.* The Federal Election Commission enforced the BCRA electioneering provisions prohibiting nonprofits, corporations, and labor unions from expressly advocating for the election or defeat of a candidate for federal office (Welch 2010). In response, Citizens United took the FEC to court. In *Citizens United v. Federal Election Commission* (2010), the Supreme Court struck down a BCRA provision that barred corporations and labor unions from spending general treasury monies to advocate for or against the election of a candidate for federal office. In effect, this decision overturned part of the holding in *McConnell v. Federal Election Commission* (2003), which had upheld the electioneering provision. Many anticipate that the Citizens United ruling will result in a sharp increase in independent expenditures in future federal election campaigns (Jost 2010, 460, 463; Potter 2005, 56). Proponents of the electioneering provisions argue that this decision opens the floodgates and will allow corporations to pour money into campaigns, thus undermining the democratic process, while opponents still maintain that some groups that are able to pool resources, including labor unions and

advocacy health care reform advocacy groups, should be able to exercise their free speech rights ("High Court Hears" 2009).

New challenges to the BCRA are being led by David Keating, executive director of the Club for Growth—a political organization that promotes economic growth by advocating for limited government and low taxes. Keating has filed suit in federal court on behalf of SpeechNow.org that calls for the elimination of campaign contribution limits as well as reporting requirements for political action committees that make independent expenditures in federal elections. So far the U.S. Court of Appeals for the District of Columbia has struck down the contribution limits while upholding the reporting requirements. Chief Judge David Sentelle, speaking for the Court of Appeals, said that, given the Supreme Court's ruling in *Citizens United v. Federal Election Commission* (2010), it appears that the government has no interest in limiting the contributions of an independent expenditure group, because this does not create a risk of corrupting federal candidates for office or officeholders (Jost 2010, 460).

State Reform Efforts

In the post-FECA and post-BCRA eras, state governments have also approved campaign finance initiatives. Trying to reduce the role of money in politics, a number of these initiatives sharply limit the amount of campaign contributions, and some states and localities have adopted public financing of campaign measures, which supporters call Clean Elections, Clean Money. Numerous states have launched and won approval of campaign finance reform initiatives.

All states have reporting requirements, with two states mandating reports from political committees only and the rest requiring candidate and committee reports. The majority of states place candidate contribution limits on individuals (37 states), PACs (36 states), candidates themselves (41 states), candidate families (25 states), political parties (29 states), corporations (44 states), and labor unions (42 states). Half of the states completely prohibit anonymous contributions during legislative sessions. Cash contributions in campaigns are unlimited in 19 states, and other states allow varying amounts of cash donations or prohibit them completely.

From 1972 until 1996, 45 referenda and initiatives dealing with campaign and election reform were placed on state ballots, with 75 percent of these efforts occurring since 1985. During this period, the voters supported 36 reforms. These reforms included contribution limits, spending limits, and public financing measures (Hoover Institution 2004). Twelve of the 16 public financing measures were approved. From 1998 until 2006, 30 referenda and initiatives dealing with campaign and election reform were placed on state ballots, with 15 proposals securing passage. These reforms included new measures on public financing and campaign contribution limits. As of 2009, five more states passed "clean election laws" that provide public monies to candidates for political office if candidates accept spending limits, and over 20 states had some type of public financing for

select offices (Levinson 2009). In a January 2000 U.S. Supreme Court decision, *Nixon v. Shrink Missouri Government PAC,* the court reaffirmed *Buckley,* stating that state limits to campaign contributions were legal but limits on campaign spending were not. However, the campaign contribution limit could not be so extreme that it prevented the candidate from being able to gain notice or rendered campaign contributions pointless ("Campaign Finance Reform" 2008). The Court further explained this sentiment in *Randall v. Sorrell* (2006), when it struck down a Vermont law that placed strict caps on contributions and expenditures.

In the wake of the U.S. Supreme Court's rejection of campaign expenditure limits in *Buckley v. Valeo* (1976), many states have enacted public financing mechanisms for state elections. Overall, 15 states publicly finance candidates for various offices. The source of public funds for elective office varies, and some states—including Maine, Minnesota, Kentucky, and Rhode Island—rely on more than one source. Fifteen states use a voluntary tax checkoff, similar to the federal government's checkoff system, varying from $1 to $5. Ten states rely on a tax add-on, allowing taxpayers to either reduce their tax refund or increase their tax payment to finance campaigns. Seven states furnish direct legislative appropriations to fund public financing provisions. Eleven states allocate their monies to the taxpayer's designated political party, and three states use a distribution formula to divide the money equitably between the major political parties. The other states allocate money directly to statewide candidates or specify particular types of offices that qualify for public financing (Utter and Strickland 2008, 191–192).

Conclusion

Critics contend that campaign finance reform will never reduce the role of money in politics. They also contend that the BCRA makes it harder to challengers to mount effective campaigns against incumbents, thus dubbing BCRA the "Incumbent Protection Act" (Munger 2006). Public financing provisions enacted at the state level are being challenged in court for placing too many burdens on third-party candidates who try to qualify for public funds (Jost 2010, 464). Supporters of campaign finance reform argue that campaign finance laws are necessary to protect U.S. democracy from corruption (contribution limits), to provide citizens with information that allows them to make informed choices (reporting and disclosure laws), and to give candidates different paths for financing their election campaigns (public financing) (Wertheimer 2010, 473). Now the stage is set for the Supreme Court to decide whether campaign finance deregulation is necessary to protect free speech or to determine whether it should uphold some parts of the BCRA as a means of limiting the influence of wealthy individuals in U.S politics.

EXECUTIVE PAY

Carl R. Anderson and Michael Shally-Jensen

The U.S. media have made much out of executive pay recently, which reflects a widespread popular dissatisfaction with the way companies compensate their top officers.

Even as stock prices fell dramatically in the midst of the 2008–2009 financial crisis, for example, some chief executives' compensation remained stable or increased. Is it fair that, in 2009, following massive job cuts at companies such as Ford, Starbucks, Dow Chemical, Whirlpool, and American Express, the CEOs of these organizations received stock options valued at between $17 million (Whirlpool) and $53 million (Ford) (Schwartz 2010)? (Such options, of course, are only part of the standard executive compensation package, which also includes salary, cash bonuses, perks, and other forms of pay.) Is it right that, even as they were being investigated for selling shaky investments to consumers, Wall Street bankers were paying themselves $140 billion in compensation (Grocer and Luccheti 2010)? Can a connection be made between executive pay and company profitability? Or, perhaps more importantly, can a connection be made between executive pay and company stock price? When stock price fell at Home Depot and the CEO's pay increased, the company spokesperson made the argument that the best measure of CEO performance may be company earnings, even though that contradicts the company's proxy statement (Nocera 2006a, 2006b). Many have tried to find explanations for CEO pay but have found little evidence to support very high rates of compensation. This argument got the attention of lawmakers and the public following the government's bailout of various high-profile banks and other firms as part of the Troubled Assets Recovery Plan (TARP) of 2008. Even as some of the funds began to be paid back (with interest) to the government, the incoming Obama administration saw fit to appoint a "pay czar" to ensure that top executives at companies that made use of TARP funds did not receive any untoward cash payments or other unearned rewards.

A Brief Summary of the Basic Issues Involved

There are two distinct sides to this issue. One side asserts that CEOs, other top executives, and the stockholders share a common goal: to increase wealth. If the executives are enriched by enriching the shareholders, then there are no victims. In that regard, no identifiable problem exists, and the system is working well. This side further argues that, if the press makes note of executive pay abuses, those instances are isolated. Market forces, it is believed, will correct abuses. This argument is illustrated in the case of John Thain, former chairman and CEO of Merrill Lynch, who was forced to resign when it was revealed that, despite receiving $84 million in compensation in 2007, he (1) spent over $1 million in company money to make lavish renovations to his office and (2) more seriously, made nearly $4 billion in bonus payments to executives at Merrill Lynch, even while the company was being bailed out through a deal made between the federal government and Bank of America at the height of the financial crisis (*Frontline* 2009). Bad behavior, yes, but the system did what it was supposed to do, it is argued. (Never mind that Thain went on to head CIT Group.)

The other side of the argument is that top corporate executives in the United States are paid far beyond their worth. Their pay is based on factors other than performance,

HIGHEST PAID CEOs

The 10 highest paid CEOs in 2009 were as follows:

Rank	Name	Company	Total Compensation (in Millions of Dollars)	Change from 2008
1	Lawrence J. Ellison	Oracle	$84.5	0%
2	J. Raymond Elliott	Boston Scientific	$33.4	—
3	Ray R. Irani	Occidental Petroleum	$31.4	39%
4	Mark V. Hurd	Hewlett-Packard	$24.2	–29%
5	James T. Hackett	Anadarko Petroleum	$23.5	6%
6	Alan G. Lafley	Procter & Gamble	$23.5	–8%
7	William C. Weldon	Johnson & Johnson	$22.8	8%
8	Miles D. White	Abbott Laboratories	$21.9	–13%
9	Robert A. Iger	Walt Disney	$21.6	–58%
10	Samuel J. Palmisano	IBM	$21.2	1%

and certainly not on long-term performance. People on this side of the argument assert that boards (typically made up of CEOs from other companies) and the compensation committees of these boards recklessly pay high salaries to chief executives who seem to have more power than they themselves have or in order to influence the market value of CEO pay in general for selfish reasons.

A board of directors has many committees reporting to it. One example is the audit committee. This committee is charged with ensuring that the company's accounting controls are functioning properly and hold up to the scrutiny of an audit. Another example is the compensation committee. The compensation committee is charged with creating a compensation structure for the executives that is fair and beneficial to all parties concerned. Specifically, the compensation committee recommends to the board of directors the pay package for the CEO. This is especially important during the CEO recruitment phase. Furthermore, these committees and boards disguise these high salaries with complicated features and explanations. These complicated features and explanations are created by compensation consultants (often hired by CEOs) who propose handsome pay packages for the chief executive to present to the compensation committee.

Top Executives Are Not Overpaid

This side of the argument is based on the premise that top executives are paid well, but not overpaid. Many people see CEO pay packages but do not look further to see that a

CEO's pay is not the whole story. What are the factors that might support a high executive compensation package?

Only Extreme Cases of Overpay Hit the Press

Proponents of the argument that top executives are not overpaid state that most of the complaints about executive compensation center around extreme cases of overpay, and such cases blind us to the fact that the majority of executives are paid fairly.

One example of this is the case of Lee Raymond, former head of Exxon Mobile. When he retired from the company in 2006, the price of gasoline at the pump was high, $3 per gallon, much to the consternation of consumers. Yet Exxon Mobile rewarded Raymond with a record retirement package—a "golden parachute," as it is known—to the tune of $400 million. The combination of exorbitant CEO pay and painfully high gas prices rubbed most observers the wrong way. A similar situation occurred in the case of Robert Nardelli of Home Depot. When Nardelli retired in 2007 with a pay package worth $210 million, the company he headed had just gone through several straight years of relatively poor performance. People wanted to know why the chief executive received such an exceptional payout.

And yet these are just the extreme cases, say the proponents of substantial executive pay. True, they say, that at the peak of the trend toward higher pay around the turn of the millennium, some CEOs were earning up to 320 times the earnings of the average shop floor worker; however, if the calculation is adjusted by eliminating the extremes and looking at median CEO pay rather than mean pay, the same figure falls by nearly two-thirds, to "only" 120 times. The mean annual CEO pay in 2000–2003, for example, was $8.5 million, while the median was $4.1 million (Carr 2007). In any case, these figures are well below the nine-figure sums that command the attention of the media on occasion. They are also well below the sums made by many top Wall Street traders and hedge fund managers. In 2006, for example, traders could handily bring home bonuses of $40 million to $50 million, while top hedge fund managers could earn in the billions ("The Story of Pay" 2007).

Good CEOs Cost More than Average CEOs

We must now examine a basic theory of economics: you get what you pay for. If a chief executive commands a handsome pay package, then she must have proven to the board of directors that she is worth it.

The board of directors represents the shareholders of the company. The CEO reports to and works for the board of directors. It is through the board that the shareholders can voice their opinions and make their desires known. It is the board's responsibility to act on behalf of the shareholders in carrying out their wishes to management. Management starts with the CEO, who is then responsible for hiring managers to act as agents for the owners (i.e., the shareholders). It is in the best interest of each board member to represent

the shareholders to the best of his ability. Board members are elected by the shareholders. If a board member falls out of favor with the shareholders, then he stands the chance of losing his seat on the board. Therefore, if members of the board make a mistake in hiring a chief executive, those members cannot make too many more mistakes, or they will lose their seats on the board.

A basic theory of finance is that the goal of a firm (or company) is to maximize shareholder wealth. Therefore, shareholders look to the board of directors to maximize their wealth. One of the best ways to maximize shareholder wealth is to hire good people, and the most important person to hire is the CEO. Since we expect that good chief executives cost more than average chief executives, the board is certainly working in the shareholders' interest by hiring the most qualified CEO, and that will cost more money. But all interests are served because it is the job of the CEO to see that shareholder wealth is maximized. If you reduce executive compensation, the most talented CEOs will go elsewhere and you risk seeing the value of your shares decline.

CEOs Are Paid to Participate in the Risk with Shareholders

Another tenet of economic theory is that high risk relates to high reward. In a nutshell, this means that to return high rewards to yourself or those to whom you report, you will have to take risks.

As mentioned earlier, CEOs are paid to maximize shareholder wealth. This does not mean simply increasing shareholder wealth during the CEO's time in office. Shareholders' investment in the company is not permanent. Shareholders can sell their shares and invest in another company with relative ease. In fact, it is in the shareholders' interest to invest their money in the best investment they can find. It is not in the company's best interest to have shareholders who want to sell their shares, because that will decrease the share price. A CEO must not only try to increase the company's share price and stock dividends (i.e., maximizing shareholder wealth), but he must do so relative to investments competing for the shareholders' capital.

To maximize shareholder wealth, a CEO must take risks. The CEO is not only putting the shareholders at risk; she is also putting her job and her private fortune at risk. Her private fortune is at risk because she most likely has a large investment in company stock or has the right to buy a large block of company stock (i.e., employee stock options), and she is definitely putting her salary at risk. She is therefore participating in risk with the shareholders, and that is what she is paid to do. If the risks that the CEO takes fail, no one suffers more than the CEO. In conclusion, by acting in her own best interest, she is also acting in the best interest of the shareholders.

Top Executives Are Overpaid

Proponents of this side of the argument assert that executive pay packages not only are excessive but tend to be justified by arguments not related to performance. Proponents

on this side also assert that CEOs may be paid well even if a company's performance is declining.

Compensation Committees Keep CEO Pay Artificially High

As mentioned earlier, good CEOs cost more than average CEOs. When the board is considering an offer of employment to a prospective CEO, the board relies on recommendations from the compensation committee. In turn, the compensation committee may hire a compensation consultant to put together a compensation package. This package will be submitted to the board to accompany its offer of employment to the prospective CEO. Additional compensation may also be negotiated with the candidate. The better the candidate, the more negotiating room is available. Compensation consultants are also hired to review existing compensation packages for CEOs.

The process described above can have inherent problems. In the case of making an offer to a CEO candidate, compensation committees often have biases toward a CEO candidate because the board has already expressed its interest in hiring that candidate. Additionally, the board has gone to great expense to find a CEO candidate that it feels is suitable for the job. Good CEO candidates are very difficult to find. As a result, the committee would be at fault if the candidate rejected the offer because the compensation committee's pay package was not satisfactory to the candidate. Sometimes the compensation committee wants to offer an above-average package for the future CEO of its company. This issue tends to increase the committee's pay recommendation. If every CEO is paid above average, then the pay packages are ever increasing. In the case of a compensation consultant reviewing the existing pay package of a CEO, the CEO usually hires the consultant. The CEO then reviews the recommendation. If it is satisfactory to him, he presents it to the board of directors. As a consequence, the CEO will only hire a compensation consultant that will create a very handsome package for him to use as support for an increase in his pay.

The result of this is that CEOs can easily be paid far beyond their worth simply because of the conflicts of interest discussed above. Prior to 2003, in fact, when the rules were changed, chief executives usually sat on the nominating committees that picked potential boards of directors. Clearly, a more favorable board, including a more favorable compensation committee, stood to be elected under those circumstances.

Overpaying a CEO May Indicate Bigger Problems

Many problems in business can be solved with money. But if the money dries up, the problems may reappear twofold. Some have argued that the overcompensation of chief executives is a by-product of bigger problems (Chang 2005). The company can defer the need to address concerns with employees by simply increasing their pay. This is especially true with the highest-ranking employee, the CEO. Overpayment may be indicative of a badly functioning company, a changing product market, lack of resources, or poor corporate governance (Annett 2006).

The issue of paying CEOs and other executives for reasons other than performance has been such a problem that the federal government stepped into the fray with the enactment of the Revenue Reconciliation Act of 1993 (Thomas 2006). This law includes a provision that eliminates the corporate tax deduction for publicly traded companies for senior executive pay in excess of $1 million annually if the pay package is not performance based. The definition of performance in this law is broad and could be achieved even by a poorly performing company and CEO. Although companies must pay attention to compensation packages, if for no other reason than to comply with this law, such a loosely worded regulation is unlikely to create a roadblock to excessive CEO pay.

Similarly, in 2005, as a result of complaints by shareholders, changes in financial disclosure rules were instituted that required companies to count executive stock options as part of a company's operating expenses. Even now, however, such options are often strategically timed or backdated (i.e., listed after the date on which they were issued) by executives in order to maintain personal incomes while avoiding the need to report higher expenses to shareholders ("Executives' Large Pay Packets" 2007). The Securities and Exchange Commission has ruled that backdating is not in itself illegal but that it can be part of fraudulent actions in specific cases and so should be scrutinized.

Tenure, Power, and "Say on Pay"

Many employees have been at their present employer for many years. Those years of experience enable employees to know how things work and who to go to to get things done. This is especially true for high-ranking employees. Longevity at one employer, also known as tenure, is therefore very beneficial to senior executives.

Companies tend to pay top executives with long tenure more than top executives with less tenure. This holds true even if the less-tenured executive has more relevant experience. This also holds true regardless of performance. How can this be explained? Some conclude that pay is driven by power, and power is determined by tenure. Seniority is considered a useful variable when determining pay across levels in most organizations. We tend to believe that those with experience perform better. In some cases, this could be true, but tenure does not necessarily correlate with company performance.

As a check on the effects of tenure, there has developed in recent years a movement of sorts known as "say on pay," in which shareholders expect to have a yes or no vote on the compensation packages offered to top executives. In the beginning, these votes were nonbinding, but more recently they have become binding decisions that boards must act upon. In May 2008, for example, Aflac shareholders approved $75 million in compensation for the company's CEO, Daniel Amos, for delivering exceptional performance ("Shareholders Weigh In" 2008). The opposite occurred two years later in the cases of chief executives from Occidental Petroleum (Ray Irani) and Motorola (Sanjay Jha); shareholders at these companies rejected the proposed CEO pay packages ("Nay on Pay" 2010). Say on pay looks like it could be the wave of the future.

Concentration of Stock Ownership

In large companies, CEOs tend not to be paid above average if there is an individual stockholder with a significant number of shares. This is because stock voting power is concentrated in that one stockholder. That one stockholder can effect change and control situations without having to form a consensus with other shareholders. Forming a consensus is time consuming and replete with compromise, both of which do not lend themselves to swift and targeted corporate governance. Therefore, this inability to control CEO pay through stock concentration gives compensation committees and boards of directors more freedom to approve above-average CEO pay packages.

In small companies, a lack of stock concentration does not lead to the overpayment of CEOs.

Conclusion

In sum, one could find enough information in this controversy to support either view. Many people are trying to understand why top executives are paid so much, and others are trying to understand what all the fuss is about. Much research has been done to find a link between pay and performance, but only a limited connection has been made between compensation packages and performance. One could see how quickly CEO pay could get out of hand, especially in a cash-rich company, if corporate governance is lacking. A well-crafted, balanced executive compensation package would be only one result of good corporate governance. To conclude, then, we ask again: are CEOs overpaid? Many examples of pay for factors other than performance have been explored here. In those cases, one would have to conclude that, yes, many CEOs are overpaid.

F

FINANCIAL REGULATION

Scott E. Hein

Financial regulations can be viewed as rules or restrictions that subject financial transactions or entities to certain guidelines or requirements, generally aimed at maintaining the integrity of the financial system, at least in the eyes of those who make these regulations. Financial regulations can be made by either a government or nongovernment entity, and the rules and guidelines are monitored by financial regulators. Today, however, the vast majority of financial regulations are put in place by government entities rather than nongovernment or self-regulating entities.

The basic purpose of financial regulation in the United States can be viewed as protecting persons and property, particularly from being taken by force or fraud, and as providing enhanced consumer confidence in financial dealings. There is near universal agreement that there is a role to be played by a "financial constable" to assure that such abuses are prevented.

Financial regulations come with their costs, sometimes explicit and sometimes implicit opportunity costs, imposed on the regulated industry. Another broad concern about the cost of financial regulation relates to the notion of *regulatory capture,* where there exists a cozy, crony relationship between the regulator and the parties being regulated. In this case, the government fails to establish a regulatory state that operates efficiently. But financial regulations also may bring benefits to financial participants. These benefits generally consist of improving participant confidence and convenience

as well as circumventing other financial agents' abilities to accumulate and exercise market power to the detriment of others.

Government Financial Regulations and Regulators

Financial regulations in the United States are generally established by lawmakers, and these same lawmakers frequently create financial regulatory agencies to see that the regulations are adhered to through supervision. In the United States, federal lawmakers make laws that are passed by the U.S. Congress and signed into law by the president. In addition, state lawmakers make state laws that are passed by state congressional offices and signed into law by the governor. At both the federal and state levels, regulatory agencies are created to make sure the laws are enforced.

The most heavily regulated area of the U.S. financial system is the banking industry. It has long been recognized in the United States that banks, which accept deposits and make loans, are important in the shaping of financial activities and economic growth. Broadly, government regulations of banks (and other depository institutions) do each of the following: (1) restrict competition, (2) specify what assets a bank can hold, (3) define how bank capital is measured and require banks to hold a minimum level of bank capital, and (4) require that the public be informed about banks' financial conditions.

Since 1863, the United States has had a *dual banking system* with both state-chartered banks and nationally chartered banks. This means that, to even open a bank, one needs to obtain regulatory approval. The National Currency Act of 1863 created the Office of the Comptroller of the Currency to charter, regulate, and supervise all national banks. Coexisting with this federal bank regulator, all states also have their own state departments of banking, which charter, regulate, and supervise state banks, serving as state banking regulators. Thus, today we have both federal and state banking regulators in our financial system.

The Constantly Evolving and Growing Nature of Financial Regulation

While the purpose of financial regulation is simple, the experience in the United States is that financial regulation is both increasing and becoming increasingly complex over time. There are a number of reasons for the growth and increased complexity of financial regulation. First, financial services are becoming increasingly important in the United States. Many individuals have in the past provided their own financial services, such as financial intermediation of lending to family members or self-insuring potential losses, but now find it more advantageous to use a financial agent. Second, there is a general recognition that it is natural for private entities to seek ways around rules that limited profit potential. Edward Kane (1988) has referred to the process as a *regulatory dialectic.* The process starts with new regulation, followed by avoidance of this regulation, as economic agents seek to avoid costly aspects of the regulations, only to be followed by reregulation. Indeed, the term *reregulation* better characterizes most of the evolution of

CREDIT DEFAULT SWAPS

A recent example of a financial innovation is a *credit default swap.* These instruments were not around 20 or 30 years ago, but they became important in the financial crisis of 2008–2009. Credit default swaps can be viewed as insurance products, insuring the holder of the insurance product against default on a particular bond. Suppose you are a large financial institution that owns many General Electric (GE) bonds, for example. If GE were to default on these bonds, then you, as an investor, would lose out financially. To protect yourself against this possibility, you could buy a credit default swap on GE bonds, for which you would pay a premium. If GE never defaults, you, as the credit default swap holder, get nothing in exchange for your premium. On the other hand, if GE defaults, the insurer or underwriter of the insurance product would compensate you for your loss.

The example of a credit default swap is interesting because, although the product was classified as an insurance product above, the insurance regulators did not deem it to be an insurance product. Rather, the insurance regulators saw the instrument to be another example of a *derivative,* an instrument that derives is value from another underlying instrument. Indeed, *swaps,* such as interest rate swaps, are generally thought of as derivatives, not insurance products. But the central point is that credit default swaps, since they were new financial innovations, escaped any real regulatory oversight. Since the insurance firm AIG's financial problems—which came to light during the financial crisis—are generally understood to stem from its underwriting of credit default swaps, it is now felt that someone should have been regulating this financial activity.

financial regulations than the term *deregulation.* Although the term deregulation, meaning the removal of existing regulation, is frequently used, the term deregulation rarely applies, and it would be better to refer to reregulation.

Another reason for the growth in financial regulations stems from *financial innovation.* Financial innovation can be thought of as a new financial product introduced as a result of technological advances or to satisfy some previously unknown demand.

A Broad Chronology of the Evolution of Federal Financial Regulation

In addition to the above reasons for increased financial regulation, each successive financial and economic crisis seems to spawn new financial regulators and regulations put in place by the federal government. For example, it is widely understood that the Federal Reserve System, a banking regulator, was created in 1913 in response to earlier banking panics in the United States. The Federal Reserve Act, among other things, authorized the creation of the country's third central bank, the Federal Reserve, to lend to banks that were solvent but needed liquidity. This lending activity is done through the Federal Reserve's discount window, and the U.S. central bank is referred to as a *lender*

of last resort. The Federal Reserve was further authorized to levy *reserve requirements* on member commercial banks, requiring banks to hold a fraction of their deposits in certain liquid forms. The Federal Reserve was further charged with the supervision and examination of banks in the United States.

The McFadden Act was passed by the U.S. Congress in 1927, giving individual states the authority to limit bank branches located in their state. This limitation on branches also applied to national banks located within the state's borders.

Regulations Spawned by the Great Depression

Even with the Federal Reserve in place—or, as many charge (see Friedman and Schwartz 1963), because of the Federal Reserve's poor monetary policies in place—the United States experienced the Great Depression in the early 1930s. As suggested by the thesis that financial and economic crises spawn new financial regulation and regulators, the U.S. Congress imposed a new broad array of financial regulators and regulations not seen before.

Legislation in the Great Depression era, generally referred to as Glass-Steagall after the legislators who proposed the legislation, prevented the commingling of commercial banking (accepting deposits and making loans), investment banking (aiding in the insurance of securities of all types), and insurance (providing either property and causality or life insurance products) from being administered under one single business. Prior to this legislation, financial institutions were much freer in their abilities to offer all such financial services under one corporate structure.

In addition, the Federal Deposit Insurance Corporation (FDIC), another banking regulator, was established by Glass-Steagall. The FDIC was created to offer depositors federal insurance for limited amounts of bank deposits. The legislation also granted the FDIC the ability to supervise and examine banks that offer insured deposits and granted the FDIC the resolution authority to close banks that it deemed as having failed financially.

The Great Depression further led the U.S. Congress to put into law legislation that created the Securities Exchange Commission (SEC). The Securities Act of 1933, together with the Securities Exchange Act of 1934, which created the SEC, was designed to restore investor confidence in capital markets by providing investors and the markets with more reliable information and clear rules of honest dealing. Thinking that abuses in securities markets occurred during the Great Depression that made the economic decline worse, Congress added a new financial constable overseeing securities transactions.

Post–Great Depression Regulation

The economic struggles in the early 1970s led the U.S. Congress to remove limitations on interest rates that banks and other depository institutions could pay on deposits. For years, Regulation Q limited the maximum rate of interest that could be paid on

various deposit accounts. These limits were eliminated by Congress in an effort to allow depository institutions to better compete for funds in a rising interest rate environment. The financial and economic difficulties in the United States in the late 1970s and early 1980s, as the nation experienced relatively high inflation, caused Congress to expand this reserve requirement to all commercial banks as well as thrift institutions and credit unions.

The significant numbers of failures for both commercial banks and thrift institutions in the late 1980s and early 1990s led to more regulatory changes. In this case, the term *deregulation* is appropriate. The Interstate Banking and Branching Efficiency Act of 1994 removed many of the limitations placed on depository institutions regarding interstate banking and branching, opening up the United States for the first time to nationwide banking and reversing the McFadden Act.

The late 1990s, while relatively tranquil in terms of economic and financial issues, ushered in another instance of deregulation by reversing the Glass-Steagall Act. In 1999, the Gramm-Leach-Bliley Act allowed financial intermediaries under one corporate structure, the financial holding company, to engage in commercial banking, investment banking, and insurance activities.

Even the terrorist attacks of September 11, 2001, led to banking regulations. In particular, the U.S. Congress amended the Bank Secrecy Act of 1970, with several anti–money laundering provisions and enhanced surveillance procedures under the USA Patriot Act of 2001.

As a response to the financial crisis of 2008–2009, Congress is working on legislation that proposes significant changes in financial regulatory reform. The thinking appears to suggest that, although financial regulations did not prevent the financial crisis, a fine-tuning of these regulations will indeed prevent future crises.

Other Financial Intermediary Regulators

The U.S. financial system includes other financial intermediaries aside from banks. Some of these are other depository institutions like credit unions and thrift institutions. Others provide other financial services like insurance companies and mutual funds.

Regulation of Credit Unions and Thrift Institutions

The United States has other financial institutions that also can be viewed as depository institutions, like *credit unions* and *thrift institutions.* Like banks, these institutions accept "deposit-like" funds and lend these funds out to others. Also like banks, these institutions can be chartered at either the state level or at the federal level. While credit unions and thrifts can be chartered by their individual states, both today generally offer federal deposit insurance. The National Credit Union Administration charters federal credit unions and offers deposit insurance to both state and federal credit unions. The FDIC offers federal deposit insurance to savings and loan associations,

CREDIT RATING AGENCIES

The credit rating agencies such as Fitch Ratings, Moody's Investors Service Inc., and Standard and Poor's Ratings Services, are not generally deemed as regulatory agencies. Although they play an important role in evaluating the default risk of debt securities issued in the United States, they do not have regulations that they monitor. However, credit rating agencies play an important role in the financial system by grading bonds. In many cases, the rating given a particular security will determine whether a regulated investor may buy a given security. Many commentators blame credit rating agencies' lax grading for making the 2008–2009 financial crisis worse (see Kaufman 2010). Because of the critical role of rating agencies in the U.S. financial system, the SEC does serve as the regulator of these agencies, deciding which firms can be nationally recognized rating organizations and which firms cannot be. The U.S. Congress and the SEC are weighing whether it would be wise to change the compensation structure for the credit rating agencies from the current system, in which the issuer of the security pays for the rating, to a system where investors or others should pay for such services.

mutual savings banks, and other thrift institutions. The Office of Thrift Supervision charters and regulates national thrift institutions.

Regulations imposed on credit unions and thrift institutions entail restrictions on the types of loans they can make or the types of investments undertaken. Credit unions generally make loans to consumers and are limited to some extent on the amount of loans they make to businesses. Thrifts, on the other hand, have historically been encouraged to make residential mortgage-related loans. As such, they are generally restricted in the amounts of other types of loans—whether consumer or business—they can make. In addition to having the types of loan activities restricted, credit unions and thrifts are generally restricted in the types of securities they can invest in. Both are not allowed to make investments in common stock of other corporations and are limited in terms of the default risk their bonds can be subject to, generally not being allowed to invest in junk bonds or similarly low-rated debt instruments, as determined by credit rating agencies.

One key aspect of the regulations regarding credit unions in comparison to banks and thrifts relates to their tax treatment. Credit unions are nonprofit financial intermediaries and, as such, pay no income tax. Commercial banks and most thrift institutions (other than mutual savings banks) are for-profit institutions and thus do not get the tax exemption benefits granted to credit unions.

Regulation of Other Financial Intermediaries

In addition to regulating banks and other depository institutions, most states regulate other financial intermediaries such as insurance providers and securities firms. Most insurance activities offered in the United States are regulated at the state level, as state

legislators have chosen to create most insurance regulations. Indeed, most states have created either state departments of insurance or state insurance commissions to ensure that the laws passed by the state are enforced and adhered to. Although there is a National Association of Insurance Commissioners, this is simply an organization of state insurance regulators. There is little federal regulation of insurance although the health care insurance legislation signed by President Barack Obama mandating health insurance coverage suggests that this is changing.

Because mutual funds and money market mutual funds generally invest in securities, it is only natural that their activities are regulated by the SEC as well. As an example of such regulation, investors in mutual funds must be provided with a *prospectus* from the mutual fund, detailing the types of investments purchased by the fund, the rules that guide its investment choices, as well as the financial risks to investing in the fund.

Financial Market Regulators

Most states also have passed laws dealing with securities transactions. Today, most states have state securities boards, commissions, or departments to regulate the securities industry in their state and make sure that the state laws are being met. The primary mission of these entities is to protect investors—the buyers of securities—in their states.

In the 19th century, many states also imposed *usury law,* although there was much variation across states. These laws placed a maximum upper limit on interest rates charged in individual states by all lenders. New evidence (see Benmelech and Moskowitz 2010) indicates that these laws came with broad societal costs, such as less credit availability and slower economic growth, but that wealthy political incumbents benefited by a lower cost of capital. Today, only a few states impose usury laws that have any meaningful effect on credit transactions.

The Securities and Exchange Commission

Federal regulations pertaining to the securities industry did not become important in the United States until the establishment of the Securities Exchange Commission in 1934. The SEC is charged with maintaining fair, efficient, and orderly markets by regulating market participants in the securities industry. To the extent that securities transactions are becoming increasingly important in the U.S. financial system, the SEC's role as regulator is also growing over time. The SEC regulates issuers of securities and tells them what types of securities they can issue and the information that must be provided by them to investors—for example, in the form of prospectus and most recently in the Sarbanes-Oxley Act. It also regulates investors and monitors what investors are doing, making sure that investors do not break *insider trading laws* that preclude investors from availing themselves of insider information that is not publicly known and use that to their advantage in trading. To the extent that mutual funds, including money market

mutual funds, invest primarily in financial securities, the SEC regulates the mutual fund industry, requiring that mutual funds let investors know the risks and returns investors can anticipate, providing this information in the form of a prospectus. The forms of mutual funds known as hedge funds traditionally have faced less stringent regulation, although under the 2010 Dodd-Frank Wall Street Reform and Consumer Protection Act the reporting (or disclosure) requirements of such funds have increased.

Self-Regulating Organizations

In addition to the numerous governmental entities involved in regulating the U.S. financial system are many *self-regulating organizations.* These include the Financial Industry Regulatory Authority; the Municipal Securities Rulemaking Board; and stock and other financial instrument exchanges and clearinghouses, such as the New York Stock Exchange and the Chicago Mercantile Exchange, to name the largest, most well-known exchanges.

The Commodity Futures Trading Commission (CFTC)

Futures contracts are instruments that allow market participants to buy and sell items, including financial assets, for future delivery but at a price set today. These contracts obligate both parties to fulfill commitments to make or accept delivery. Option contracts, on the other hand, only commit one party, called the writer of the contract, to a particular action, while the buyer of the contract has the option or choice to take a certain action or not. Futures contracts have been traded in the United States for over 150 years, and option contracts have been around for quite some time as well. In 1974, the U.S. Congress passed the Commodity Futures Trading Commission Act, which established the CFTC as the key federal regulator of both futures and options trading activities in the United States. The mission of the CFTC is to protect market participants in futures and options trading from fraud, manipulation, and other such abusive practices and to foster financially sound markets.

Conclusion

Financial regulation in the United States is in a constant state of flux but seems to change the most in response to economic and financial crises. The financial crisis of 2008–2009 does not appear to be an exception to this rule. The U.S. Congress recently passed, and President Obama signed into law, the Dodd-Frank Wall Street Reform and Consumer Protection Act, legislation that will significantly alter the financial regulatory landscape going forward. Indeed, the mind-set in Washington, DC, following the financial crisis is that it was generally a lack of federal financial regulation that led to the crisis. Even with the 2010 act in place, much debate continues to take place as to how the new rules are to be applied by regulators and to what extent they will be shaped by such regulatory actions.

Included in the Dodd-Frank Act is a provision to establish a new Bureau of Consumer Financial Protection that is charged with making sure that consumers are not taken advantage of by "unscrupulous lenders," such as putting home buyers into mortgage loans that are not in the consumer's best interest. While numerous financial regulators were charged with such responsibilities in the past, this new regulator will have this as its chief focus. The Dodd-Frank Act also includes new laws and regulations dealing with the very largest financial institutions in the country that are deemed "too big to fail." The financial crisis has shown evidence of rippling effects throughout the financial system when a large financial institution, like Lehman Brothers, fails. To prevent such rippling effects, many large, systemically important financial institutions were provided federal aid during the crisis to prevent their financial failure. While the new legislation does address many aspects of the too-big-to-fail issue, it does not appear to settle the issue of the optimal method of dealing with large, systemically important institutions that are on the brink of failure. The act also includes some new regulation on derivatives other than futures and option contracts, such as swap agreements.

While the U.S. political leadership today seems to believe that the next financial crisis will be prevented by these new regulatory reforms, a reading of U.S. financial history suggests that future crises are still likely to occur in the not-too-distant future.

FOREIGN DIRECT INVESTMENT

Michael L. Walden

Much has been made about U.S. companies putting jobs and factories in foreign countries. This phenomenon, called outsourcing, has stirred concerns about the United States' competitiveness and the ability of U.S. workers to go head-to-head with foreign workers, many of whom are paid much less.

But perhaps just as important, yet not as thoroughly covered in the popular press, is the opposite flow of money and jobs. This occurs when foreign companies and foreign investors put funds into the U.S. economy. The money is used to build factories and stores or buy financial investments. With the inflow of money usually come jobs and incomes. This process is called foreign direct investment (FDI) and is popularly termed insourcing.

The Size and Origin of Foreign Direct Investment

Foreign direct investment can happen from any country. People and companies from any country can invest in (almost) any other country. For example, there is FDI in China, France, Poland, and Chile. Of course, there is also FDI in the United States, which will be the focus of this entry.

So when we talk about the amount of money foreigners invest in the United States, are we talking about a small or large amount? Figure 1 gives the answer. The dollar amounts in different years in the figure have been adjusted so they have the same purchasing power; therefore, they are directly comparable. As can be seen, FDI in the United States is substantial, at $2.3 trillion in 2008. It has also increased substantially in recent years, rising over 500 percent from 1990 to 2008.

Who is behind these investments? That information is given in Table 1, which shows FDI in the United States according to the top countries of origin in 1990 and 2008. In both years, the leading investor countries were all in Europe, of European origin (Australia), or Japan. The biggest changes from 1990 to 2008 have been a reduction in the shares of the two leading countries, the United Kingdom (Great Britain) and Japan, and the replacement of Australia in 1990 with Luxembourg in 2008 as a leading investor country.

Why Do Foreigners Invest in the United States?

What motivates foreigners to invest in the United States, and should we be pleased or worried by the interest of foreign investors? These are important questions that help determine how we feel about FDI.

On one level, we should not be surprised that foreigners want to invest in the United States. The United States is the world's largest economy by far, the biggest in aggregate wealth, and has a stable political system that respects the rights of investors. The U.S. economy has more than doubled in size in the past 20 years (1990–2010), and its population is among the fastest growing for developed countries. Against this backdrop, any investor would want part of the action in the United States.

Recently, there has been a demographic reason for FDI in the United States. Compared to Europe, Japan, and soon China, the United States is a relatively young country with a growing population. Europe, Japan, and China are aging rapidly, and their populations may even decline in the decades ahead. Older people tend to be savers and investors so that they can ensure an income in their later years. Younger people, by contrast, are usually borrowers so that they can supplement their income to purchase the homes, cars, appliances, and other assets needed for their lives. Therefore, it makes

sense that countries with older populations will lend—which is another way of looking at investing—to countries with a higher proportion of younger people. Indeed, this is exactly the pattern shown in Table 1. The greatest source of FDI in the United States is from the aging countries of Europe plus Japan.

Last, there is a practical reason why foreign citizens invest in the United States. For most of the past 30 years, U.S. businesses and consumers have been purchasing more products and services from foreign countries than foreign businesses and consumers have been buying from the United States. In other words, imports to the United States have exceeded exports from the United States. This means that foreign citizens have been accumulating U.S. dollars. Eventually, these dollars have to make their way back to the United States, and they do so as FDI in the United States. This is one reason to expect China, with which the United States now runs a large trade deficit, to soon become a major source of FDI. The Chinese computer giant Lenovo's purchase of IBM's personal computer unit in 2004 and the Chinese auto company Geely's purchase of Volvo from Ford in 2009 are examples of what is likely ahead.

Impact of FDI on Employment

Like any investment, FDI in the United States creates jobs. But how many jobs, and where are they and what do they pay?

Table 2 shows the latest data on the distribution of jobs by industry created by foreign investments in the United States. More than 5.3 million jobs in the United States are

RISE OF FOREIGN-OWNED AUTO FACTORIES IN THE UNITED STATES

Manufacturing is the leading sector attracting foreign direct investment to the United States, and, within manufacturing, vehicle production has become a popular venture for foreign investors. There are now 10 foreign auto companies with factories operating in the United States, and more are planned for the future. Additionally, there are foreign-owned factories producing vehicle parts that then supply their output to the vehicle assembly plants.

Employment in foreign-owned auto factories in the United States steadily increased from the mid-1990s, rising 52 percent between 1995 and 2005. In contrast, domestic U.S. vehicle assembly and parts factories cut 350,000 jobs between 2000 and 2005, with more reductions in the wake of the 2008–2009 financial crisis. Thus, the gains in foreign-owned vehicle factories have not matched the cuts from domestic plants, so total employment in vehicle production in the United States has continued to fall.

The rise of foreign vehicle production in the United States and the decline of production from domestically owned companies have paralleled their sales trends. U.S. auto companies first trailed their foreign competitors in developing smaller, fuel-efficient vehicles in the 1970s and 1980s. Then they lagged in quality and customer satisfaction in the 1990s and 2000s. U.S. auto companies were not able to close these gaps, and they suffered severely during the financial crisis. (General Motors and Chrysler were bailed out by the government, and Ford sales dropped before evening out at a much lower volume than before.) Currently, the Big Three are in the process of becoming smaller in scale even while foreign producers have plans to grow.

U.S. and foreign vehicle companies have also differed in terms of their locations within the United States. Traditionally, U.S. vehicle companies located their production facilities in the Midwest, in states like Michigan, Ohio, and Indiana. Foreign vehicle companies have sited most of their factories in the South, including Alabama, Texas, and South Carolina. Lower labor costs and access to centers of growing population have been the main reasons pulling foreign factories to southern locations.

Although many Americans may be suspicious of foreign ownership, they have voted with their purchases and dollars in favor of foreign auto companies. The pay and prestige that a foreign vehicle production plant brings to a locality has set off intense competition between states for landing these so-called trophy firms.

directly associated with FDI, accounting for approximately 4 percent of all jobs in the country. Perhaps the most striking feature is the concentration of jobs in the manufacturing sector. Of the 5.3 million jobs, over 2 million of them are in manufacturing. This is 39 percent of the total FDI jobs. In comparison, in 2004, only 10 percent of all U.S. jobs were in manufacturing. An interesting feature of FDI is the growth of production and jobs in foreign-owned vehicle manufacturing factories placed in the United States.

FDI employment in the United States also pays well. In 2004, for example, FDI jobs paid an average of $62,959 in salaries and benefits, compared to $48,051 for all

U.S. jobs. Hence, the average FDI job paid over 30 percent more than the average U.S. job in the country. So foreign investors are not creating low-paying positions in the United States; they are creating just the opposite—jobs that pay at the upper end of the wage scale.

Comparing Insourcing and Outsourcing

How does FDI in the United States (insourcing) compare to U.S. direct investment in foreign countries (outsourcing)? Although FDI in the United States has been growing substantially, U.S. investment in foreign countries is larger still. The total value of U.S. investments in foreign countries is almost one-third larger than the corresponding foreign investment in the United States. Also, there are about two jobs in U.S. foreign factories and offices for every one job in the United States in a foreign-controlled company. So, by these standards, it can be said that outsourcing is larger than insourcing.

But before the conclusion is reached that this is bad, consider two counterpoints. First, since the U.S. economy is the largest in the world, it makes sense that U.S. companies will have more operations in foreign countries than foreign countries have in the United States. Second, foreign investments by U.S. companies can be complementary to domestic operations, making the domestic operations more efficient and profitable. Stated another way, putting some jobs in foreign countries, where costs may be lower or where access to important inputs is easier, can actually save jobs at home by making the operating company stronger and healthier.

Are Foreigners Buying Up the United States?

Although many positive aspects can be stated for FDI, there are a couple of nagging questions that frequently bothers people: Will foreign investments give the foreign owners control over the U.S. economy? Would these owners then pursue policies that are contrary to the national interests of the United States and its citizens?

From an economic perspective, these concerns are unlikely to be realized. This is because any investor, domestic or foreign, has two main objectives: preserving its investment and earning income on that investment. Pursuing destructive policies that damage the investment or its income-earning ability are simply not consistent with basic investment philosophy.

Another way of answering the questions is to calculate the proportion of the U.S. economy that foreigners own. This is found by taking foreign-owned assets as a percentage of all assets in the United States. In 2008, this percentage came to a little over 12 percent ($23.4 trillion of $188 trillion). Although this is double the percentage in the late 1990s, foreign gains have not come at the expense of domestic ownership. Between 1997 and 2008, foreign-owned assets in the United States increased by more than $5 trillion, but U.S. domestically owned assets rose by about $30 trillion.

The World Is Our Economy

It is likely that FDI, both in the United States by foreign citizens as well as in foreign countries by U.S. citizens, will increase in coming years. The reason is simple: globalization. With trade barriers lower and technology making travel and communication among countries in the world easier, we should expect money flows between nations and regions to likewise surge. Just as a century ago local financial markets in the United States expanded to become nationwide financial markets, world markets are now supplanting national markets. Our perspective of what is normal and common will have to adjust.

FREE TRADE

Diane H. Parente

Free trade is one of those concepts espoused by economists that makes perfect sense in the abstract. When one looks a bit closer, however, questions can be raised about whether we as citizens and consumers should support the implementation of free trade principles and policies. Ultimately, it depends on one's point of view.

What Is Free Trade?

Simply put, free trade is the exchange or sale of goods or services without the addition of any tariff or tax. It is common for import taxes to be levied when goods are brought into a country. Often, products that are produced outside a country are taxed, sometimes heavily, when foreign manufacturers bring these products into the home country for sale.

The notion of free trade says, for example, that there should be no additional taxes on foreign imports of cars vis-à-vis domestically produced automobiles.

What Is Nonfree Trade?

Another label for nonfree trade is protectionism. In this case, tariffs or taxes, trade restrictions, or quotas may be placed on the import of goods and services into a country. This is done to protect businesses in the home country from competitors. Opponents of free trade sometimes call this practice fair trade.

On the surface, for a resident of the home country, higher prices for imported goods means that the home country's goods will be purchased equally if not more robustly than a foreign competitor's products and moreover that those purchases will sustain businesses and save jobs in the home country. The truth, however, is more complicated. Adding tariffs in order to level the playing field between foreign and domestic competition actually ends up taxing consumers and causing them to pay higher prices.

Back to Basics

The fundamental laws of trade were first hypothesized in 1776 by Adam Smith in his treatise *The Wealth of Nations.* In this document, Smith had a simple make-buy argument: do not make at home what you can buy cheaper elsewhere. This applies to countries as well as to individuals. Thus, if one country (say, China) can make shoes cheaper than another (say, the United States), then it would make sense for Americans to buy shoes that are made in China. Smith's argument is logical in that we can do the things that we do well and buy goods and services from other countries that do those things well. This argument makes very good sense in the abstract.

As we can see in Figure 1, country 1 has a lower cost (C1) than the cost for the product produced in country 2 (C2) for the product being made. If we presume the same profit, *X,* then the price (P1) of the product produced in country 1 will be lower than the price (P2) of the product produced in country 2. This should be fundamentally good for consumers. However, if a tax (T) is added to the price for the good produced in country 1, as shown in Figure 3, then consumers will pay the same amount for the product and not realize any potential savings for efficiencies, as seen in Figure 2.

The example begs the question of what would happen if the tax were not imposed and free trade were enabled. Figure 3 illustrates the value to the consumer of free trade. In the example, both countries produce wine and wheat. However, country 1 produces wheat at a lower cost than country 2. Likewise, country 2 produces wine at a lower cost than country 1. If a consumer was able to buy wine from country 2 and wheat from country 1 (without any interference from tariffs), she would expend less money for both products.

What Are the Issues that Prompt Free Trade among Nations?

There are two fundamental factors that prompt nations to engage in free trade. One is buying power (or selling power), and the other is cost.

Consider the trading power of a nation. In our prior example, the more products a trading unit (i.e., a nation) has that it can produce at a low cost, the more opportunities it will have to trade. If each state in the United States were acting independently, it would have to be very efficient at organizing trades that would take a small number of products

and obtain all of the products that the individual state would need. However, with all 50 states operating without trade barriers, the movement of goods and services is free flowing. Consumers do not have artificial pricing increased by taxes. Trading power is enhanced in a free trade environment.

Cost is the second issue prompting free trade. Think about the possibility that a truckload of product would need to stop at the border of each state to continue. In addition to the time lost in the stops, a tax would be charged at each checkpoint. The total cost of the product in such a scenario would be increased dramatically. In fact, at one time, the truck transportation cost was estimated to be twice as much in Europe as it was in the United States due to border checkpoints where inspections would be made and taxes levied. Therefore, we can presume that total cost in a nonfree trade environment would be higher.

Where Is Free Trade?

One of the classic examples of an implementation of free trade policies is the formation of the European Union (EU). The countries in Europe maintained separate governments, currencies, and standards over centuries. The EU was formed to enhance political, social, and economic cooperation. As an example, prior to the formation of the EU, there was no free movement of people from country to country. Licensing standards for medical and professional personnel were neither consistent nor even recognized from one country to the next. In fact, these standards were so different and so ingrained in the laws of each country that it took 17 years to reach agreement on the qualifications for an architect. Architects, like other professionals, could not move freely from one country to another. Once the EU was established, architects could move from one country to another because they would be licensed in all of the countries in the EU. Licensing standards for doctors and other medical personnel were among those that would be harmonized, or standardized.

Uniting Europe was done for two stated reasons: preventing another world war and creating an economic unit as strong as the United States. The issues in the EU were many, and the task was very daunting in the beginning. Issues included a difference in tax rates (i.e., high in the United Kingdom and low in southern European countries), government (i.e., monarchy vs. democracy), currencies (each country with its own currency), and wages (i.e., high in the heavily industrialized countries and low in other countries). The common currency, the euro, came into use officially in 1999, and many of the other issues are either unresolved or have been recently resolved. So we might say that the jury is still out on the EU's success. (The global economic crisis of 2008–2009 caused some frayed relations but left the system intact; and even the collapse of the Greek economy in 2010 was being dealt with by means of EU policies and procedures.)

The North American Free Trade Agreement (NAFTA) was launched in 1994. Canada, Mexico, and the United States formed the world's largest free trade area. Unlike

the EU, there is no supraorganization over the independent participants. The agreement called for the elimination of duties on half of all U.S. goods shipped to Mexico and Canada immediately and for the phasing out of other tariffs over a period of 14 years. The treaty protected intellectual property and also addressed the investment restrictions between the three countries.

Several reports have been published that address the progress of the NAFTA agreement 10 years later. The *Yale Economic Review* reports that, during the five years before NAFTA, Mexican gross domestic product grew at 3 percent (U.S. Department of Commerce 2004). After the agreement, however, this rate increased to a high of 7 percent (prior to the global economic crisis). During the 10 years post-NAFTA, exports from the United States to Canada increased by 62 percent, and exports to Mexico increased by 106 percent. Canada's success with NAFTA is also well established.

What Are the Issues?

There are a number of issues and questions regarding free trade. The issues concern the economy, the political situation, and social matters.

One question has to do with workers' rights. Stories abound of child labor in foreign countries and poor wages, such as 50 cents per hour. The presumption is that these wages are slave labor rates in comparison to those of the United States. However, wherever globalization has taken hold, workers most often have seen dramatic improvements in their working conditions. Since foreign-owned companies are likely to provide similar conditions to their overseas versus domestic workers, local firms are forced to compete. Foreign-owned companies typically pay more than local businesses and provide a better environment to attract the best possible workers.

Another question relates to the environment. One view is that companies will set up shop at locations where they might avoid environmental constraints. However, this is usually a minor issue in the siting of a facility. Higher on the list of requirements are tax laws, legal systems, and an educated workforce. Infrastructure, such as transportation and packaging facilities, are also high on the list. Empirical evidence shows that the environmental standards of countries with free trade actually improve and do not deteriorate.

How does free trade affect manufacturing? Free trade, in the view of most, if not all, economists, is actually an advantage to U.S. manufacturing. Increasing productivity and decreasing costs force innovation and an increase in profitability. In fact, during the period 1992 to 1999, when the U.S. economy increased by 29 percent overall, manufacturing output increased by considerably more: 42 percent.

So we need to ask whether free trade enables movement of people across borders. Is immigration bad for the United States? The answer actually is no. Immigrants tend to fill gaps in worker shortages and often bring technical skills with them. Furthermore, a study by the National Research Council found that immigrants and their children actually pay more in taxes than they consume in services (Simon 1995).

LOSS OF JOBS AS A PERSONAL ISSUE

The steel business was a major industry in Buffalo, New York, employing nearly 60,000 people at its peak. The purchase of Lackawanna Steel by Bethlehem Steel was critical for location and access to the Buffalo and Detroit auto plants. Power was inexpensive due to the proximity to the Niagara Power Project, although a strong union position served to increase costs. As the industry gradually left the United States for offshore locations, initially to Southeast Asia, a cry concerning the impact of free trade and the loss of jobs as a result was heard throughout the area. Although that claim can be empirically disproved, it is a tough sell to a family whose father or mother is now one of those unemployed, with little prospect for obtaining work in another steel plant and few alternatives.

What about the phenomenon called brain drain? This is when nations or regions lose skilled or educated workers owing to the availability of better-paying jobs elsewhere. Poor countries often educate their population in specific jobs in medical areas and other professions in the hope that they will stay, only to find that some rich countries try to attract them away. The BBC reports that one-third of doctors in the United Kingdom are from overseas (Shah 2006). The report goes on to state that African, Asian, and Latin American nations are plagued by the brain drain issue.

Finally, free trade always spurs a discussion on jobs. While imported goods may take some jobs away from a country, such jobs generally are in industries that are less competitive. More often than not, technological changes, shifts in monetary policy, and other nontrade factors lie behind the loss of jobs. Increasing imports, it is generally considered among economists, actually increases jobs and serves to make workers more productive. (Remember, however, that this effect is in the aggregate, not in specific industries.)

What Are the Various Perspectives?

The benefits to the individual consumer are well documented. As seen in Figure 3, the individual will pay less overall for goods and services under a free trade economy. Furthermore, he will be able to buy higher-quality goods at lower prices than without free trade. The downside, of course, is that, while the long-term benefit is clear, the short term presents problems, especially if one's job is impacted by the movement abroad.

Countries that engage in free trade, or at least lower trade barriers, enjoy higher standards of living overall. As noted by Griswold (1999), trade moves to those industries where productivity and returns are higher. Thus, workers will have more job opportunities at higher wages.

There are also national implications from the value of the U.S. dollar (or the home currency). If trade barriers are imposed, imports are restricted. Americans then spend less

on foreign goods, which makes its currency higher with respect to other currencies. Thus, any industry that is not protected by tariffs becomes less competitive in world markets, and the United States is less able to export. It is a vicious cycle: restricting imports creates higher currency value, which then inhibits exports.

From the corporate perspective, with free trade, raw materials may be purchased more cost-effectively, manufacturing becomes more streamlined, and lower costs make products more profitable. When we consider the changes in industries that will make one industry more profitable, we should also examine whether a change in one industry places even more pressure on another. In our steel example (see sidebar "Loss of Jobs as a Personal Issue"), if quotas are imposed once steel moves off shore, then automobiles become less competitive domestically.

Continuing with the steel example, some of the "buy American" slogans may be misleading when we examine them further. According to Blinder (2002), the estimated cost

AN EXAMPLE OF THE CURRENCY ISSUE

Assume that a component—say, a circuit board—can be made in both the United States and Thailand. The cost (in U.S. dollars) is represented in the following table, both with and without tariffs.

	U.S. Product	Thai Product without Tariff	Thai Product with Tariff
Cost	$100	$60	$60
Tariff			$50
Final price	$100	$60	$110

If, as is usually the case, the circuit board is used as a component part in a larger manufactured good, the final good will be least expensive if the Thai component is used without a tariff. The idea here is that if there are no tariffs, then the corporation would tend to use the lowest-cost raw material. Thus, we could assume that, under the condition of no tariffs, the final price of the finished good might be as much as $40 less than if the U.S. circuit board were used.

If the U.S. circuit board were used (or the Thai product with the tariff applied), then the final product would cost more. A consumer would have less disposable income and would not be able to buy as many other goods as a result, reducing trade overall.

Since there would be fewer imports, there would be fewer U.S. dollars on the international market, raising the dollar's value. The result is that we would be selling less on the export market and actually decreasing trade.

If, on the other hand, we were to use the Thai product without tariffs, the cost of the final product would be less, and we would be able to spend more and buy more imports. This would cause the currency to be lower in value with respect to other countries and encourage export sales. The overall result is an increase in trade.

of saving jobs by implementing protectionism is staggering. He cites costs of restricting imports in the automobile industry "at $105,000 per job per year, one job in TV manufacturing at $420,000, and one job in steel at $750,000/year." No wonder the steel industry was one of the earliest to leave U.S. shores.

What Are the Options?

One option for free trade is balanced trade. In this model, countries must provide a balance from each country. Neither country is allowed to run deficits at the risk of penalties. Some critics of this approach think that innovation may be stifled.

Another option is called fair trade. In this scenario, standards are promoted for the production of goods and services, specifically for exports from lesser-developed countries to well-developed (First World) countries.

Another alternative is an international or bilateral barter program, which would force the matching of imports and exports. Finally, establishing increased credit risk for international loans, especially those brought on by trade imbalance, would lower the volume of uneven trade and look to the economic market for discipline.

Conclusion

Free trade is the movement of goods, services, capital, and labor across boundaries without tariffs or other nontariff trade barriers. Arguments against it and for the use of tariffs are intended to save jobs, but actually the application of tariffs costs consumers more for final goods and services and restricts competition in a number of fundamental ways. Free trade is not a main factor in the loss of jobs. Rather, free trade helps to improve productivity and, ultimately, raise the standard of living overall.

GLASS CEILING

William M. Sturkey

What Is the Glass Ceiling?

Glass ceiling is a term used to refer to the alleged limits of advancement that minorities, including women, experience in the U.S. workplace. It has been observed that the highest-ranking positions in organizations are dominated by heterosexual white men. This observation has led to the theory that minorities within organizations have a limited level to which they can advance. That ceiling for advancement is said to be transparent, or obviously biased, unlike other ceilings, which require various degrees of experience or education. Hence the term glass ceiling has been used to describe this phenomenon.

Does the Glass Ceiling Exist?

The term *glass ceiling* was first used by Carol Hymowitz and Timothy Schellhardt in the March 24, 1986, edition of the *Wall Street Journal* to describe the limits of advancement that women face in the workplace (Hymowitz and Schellhardt 1986). When originally used, the term drew widespread criticism because it claimed that women did not achieve high levels of advancement in the workforce because they were consumed by family life or did not obtain the required levels of education and/or experience. Since then, the term and the arguments surrounding it have developed to encompass all minorities in the workplace.

According to a great deal of research, the glass ceiling is a very real characteristic of the U.S. corporate atmosphere. A 1995 study by the Federal Glass Ceiling Commission found that 97 percent of the senior managers of the Fortune 1000 Industrial and Fortune 500 were white, and 95–97 percent were men. This is not demographically representative, considering that 57 percent of the workforce consists of ethnic minorities, women, or both. In 1990, Jaclyn Fierman (1990) found that less than 0.5 percent of the 4,012 highest-paid managers in top companies in the United States were women, while fewer than 5 percent of senior management in the Fortune 500 corporations were minorities. More recent figures show that gains have been made in some areas—for example, among Fortune 500 company boards of directors, women now make up 15 percent of the total (Catalyst 2008)—but clearly there is room for improvement. The conclusion reached from studies such as these is that there are invisible barriers that exclude women and ethnic minorities from upper management positions.

Despite evidence to the contrary, many argue that the glass ceiling concept does not exist. Those who argue that the glass ceiling does not exist focus mainly on the status of women and argue that the glass ceiling ignores pertinent evidence that disproves the theory and that it is an unrealistic conspiracy theory that simply reflects women's chosen positions in U.S. society.

One of the forms of evidence that glass ceiling detractors claim is ignored is the education of high-ranking executives. They argue that these executives are more qualified because they have achieved a higher level of education than most women. They argue that women are not well represented in upper-level management because of a lack of women receiving master of business administration (MBA) degrees.

Those who argue against the existence of the glass ceiling also argue that women are not represented in upper-level management because women do not aspire to such positions, partially because of the characteristics of U.S. society. It is argued that men work better in teams and under a chain of command than women, who take less dangerous jobs, are not willing to work long hours like men, and wish to have more maternal positions, such as nurse, child care provider, or secretary. Of course, the issue of childbirth and maternal instincts are also factors that many claim prevent women from holding high-level positions. Glass ceiling detractors often take as fact that women cannot be highly successful and raise children. Surprisingly, a great number of these types of arguments are being made by women with experience in the business world who do not see themselves as victims. Instead, they deny their advancement potential by claiming that they have decided to make another choice.

Those who argue against the glass ceiling in terms of how it affects ethnic minorities use similar arguments and often expand them to include stereotypes, the most common being that African Americans and Latinos are not self-directed or would rather perform labor-centered tasks. Other reasons used include a lack of education, inability to understand the English language or Western society, and a desire

to hold certain types of positions (e.g., linking Asian Americans to computer and science jobs).

The argument against the existence of the glass ceiling is compelling; however, the enormous disparities between the minority and majority when it comes to senior management positions make the analysis of this issue necessary, whether the concept is seen as bona fide or not.

Groups Affected by the Glass Ceiling

Women

For most of the 20th century, the levels of education achieved by men and women were disproportionate. However, recent decades have seen the end of unequal access to education in terms of gender. In 2008, 49 percent of the Yale undergraduate class was female, the entering class of the University of California, Berkeley's law school was 55 percent female, and Columbia University's law school (in toto) was 48 percent female. Over 50 percent of medical school applicants are now women, as are half of undergraduate business majors. So how has the discrepancy between men and women in high-ranking positions evolved?

One major and incontrovertible difference between men and women is that women give birth and men do not. This leads to one of the most common reasons given for the existence of a glass ceiling. Many argue that women simply choose other paths than their careers. One example comes from business. A Harvard Business School survey found that only 38 percent of women from the MBA classes of 1981, 1985, and 1991 were working full-time. Of white men with MBAs, 95 percent are working full-time, while only 67 percent of white women with MBAs have full-time positions (McNutt 2002).

Many women are discriminated against in the workplace. Often, when a woman is hired, she is hired under the assumption that she will leave her job or not work as hard when she gets married or has children. This type of attitude places women in the types of jobs that can be seen as temporary. Women may be working on small projects instead of being heavily involved with the infrastructure of a corporation. This type of job discrimination may go so far as to place women with college degrees as administrative assistants or secretaries. It is with this type of discrimination that many women's careers begin. Perhaps one of the reasons that women opt out of the workplace to raise children is because of the pressure and stress that come along with being a woman in the business world.

In addition, many of the same factors that affect ethnic and racial minorities also affect women. The next section addresses these issues specifically.

Ethnic and Racial Minorities

The barriers that ethnic and racial minority managers encounter are common to the experience of other minorities. These barriers operate at the individual and organizational

levels. They range from overt racial harassment experienced in the workplace to specific segregation practices. These barriers are believed to be responsible for the lack of ethnic minority senior executives in large organizations.

Bell and Nkomo (2003) have identified three major individual barriers that ethnic minorities experience: (1) subtle racism and prejudice, (2) managing duality and bicultural stress, and (3) tokenism and presumed incompetence.

This subtle form of racism and prejudice does not resemble the outright hostility that U.S. culture has rejected since the civil rights movement of the 1950s and 1960s but instead takes the form of what Essed (1991) has termed everyday racism. This includes acts of marginalization, which refers to the exclusion of African American managers from mainstream organizational life, thus maintaining their outsider status, and problematization, which includes the use of stereotypes to justify the exclusion of African American managers without seeming to be prejudiced or racist.

Another important form of an individual barrier includes racial harassment. Racial harassment occurs when an individual or group of employees is continually subjected to racial slurs, jokes, pranks, insults, and verbal or even physical abuse because of their race. Obviously, threats of violence and abuse are detrimental to any working environment, but racial harassment takes many forms and is often precipitated by fellow employees who are unaware of the harassment they inflict. Racial jokes are a good example of unconscious racial harassment. Another example would include a negative reaction to

EXAMPLES OF EVERYDAY RACIAL HARASSMENT

- Any type of racialized joke.
- Racial comments about public figures such as politicians, entertainers, athletes, or even criminals—for example, pointing out that the city councilman accused of fraud is "the black one."
- Asking individuals questions pertaining to their entire race—for example, Why do black people like chicken so much? or Why are Asians so good with computers?
- Using phrases that encompass derogatory terms—for example, nigger-lip, Asian eyes, black booty, or black music.
- Any comments or questions pertaining to a physical difference between the ethnic minority and white employees, including skin color, hair, or any other prominent features.
- Displaying symbols that could be racially offensive—for example, a swastika, Confederate flag, or any symbol resembling a racist organization. The display of a logo of a popular sports team may also be offensive. The most objectionable are those that portray Native Americans in a negative light. The display of this type of symbol may be considered racial harassment.
- Discussing or using quotes from racist films or music.

a news event involving a minority that reflects negatively on that minority's race or ethnicity.

The second level of individual barriers is referred to as bicultural stress. As Bell and Nkomo (2003) noted, in the organizational world, there is little tolerance or appreciation for cultural diversity in terms of behavioral styles, dress, or alternative aesthetics. Bell and Nkomo pointed out that most business environments rely on norms from mostly white Western society that may conflict with other dimensions of these minority managers' normal lives or backgrounds. If the manager is from a non-Western country, this conflict can only increase. The challenge of balancing these contrasting aspects of life often creates stress and tension between the workplace and one's private life. This tension becomes a barrier when ethnic minorities feel compelled to suppress one part of their identity to succeed in one or both of the cultural dimensions in which they exist.

The third level of individual barriers is tokenism. Tokenism is the process of hiring a token number of individuals from an underrepresented minority group to comply with government or organizational affirmative action policies. The people who are token hires are often viewed as representative of their entire race rather than as individuals. Their performance on the job and their personal lives are carefully examined and taken out of context. Because of these stereotypes and general animosity toward affirmative action policies, many other employees believe that these tokens received their jobs not because of individual merit but because of their minority status.

The psychological effects of being treated as a token negatively affect job performance. To overcome the stereotypes associated with each ethnic or racial group, the minority employees often feel that they have to perform at a higher level than other employees just to maintain equal status. They also have to spend a disproportionate amount of time validating their existence in the workplace. They are often aware that because they are perceived to represent their entire race, performing poorly will negatively contribute to the negative stereotypes attributed to their ethnic minority.

Entering a work environment is different for ethnic minorities than it is for white men and women. There are often a multitude of factors that must be juggled just to achieve equal status to that of white employees. The disadvantages that ethnic minorities experience in the workplace are prevalent from the first day on the job, and maybe even before.

Organizational-Level Barriers

Bell and Nkomo (2003) pointed out various organizational-level barriers that exist for ethnic minorities in the workplace. These include (1) lack of mentorship, (2) unfair promotion and evaluation processes, and (3) segregation into staff-type jobs.

Mentors are important in any large business environment. A mentor helps to increase self-confidence, motivation, career skills, career enhancement, career planning, networking opportunities, and, perhaps most importantly, mentors reduce isolation. Mentors are most likely to have mentees who have similar backgrounds. This is perfectly understandable

because people tend to sympathize with and coach those in similar situations or from similar backgrounds as themselves. A problem is that mentors may pass over a potential protégé who belongs to an ethnic minority group because of racial stereotypes that may make the mentor see the minority as a risky protégé.

Many employees from ethnic minority groups find it difficult to find mentorship. Friedman and Carter (1993) found that 53 percent of National Black MBA Association members felt that they did not have the support of a mentor. Without equal access to mentors, ethnic minorities are without one of the most important aspects of successful career advancement. It limits their networking opportunities, exposure within the company, and potential supporters. It also denies them the important basic advantages that a mentor provides as far as career planning and the transition into a new organization.

Over the past 20 years, numerous studies have been done that show that white supervisors rank managers from ethnic minority groups below white managers in their evaluations (Bell and Nkomo 2003). They rank them lower in terms of job performance and how they interact with other employees. Part of this is because of racial stereotypes. If supervisors consider ethnic minority managers to be doing a fine job, then their performance is attributed to the support structure they have around them that makes their job easier. For whites, top performance is attributed to effort and competence. As negative feedback builds, it has a snowball effect on African American managers as they lose their confidence and begin to question their own abilities. Low performance ratings have negative effects on an individual's long-term career prospects and self-prescribed potential for advancement within the organization.

There are clear trends in the career paths of the vast majority of CEOs of large organizations. The critical career paths have historically been through marketing, finance, and operations. The people who head companies are often funneled through these departments. Collins (1989) has pointed out that African Americans have been relegated to racialized jobs outside of those departments that produce the most upper-level managers. She suggested that African Americans are often placed in jobs dealing with public relations, community relations, affirmative action, and equal employment opportunity. Among 76 of the highest-ranking African American managers, she found that 66 percent held jobs that dealt with affirmative action or consumer issues. Because of the types of jobs that African American employees are often relegated to, it becomes more difficult for them to advance up the corporate ladder because they do not get experience in the most important functions.

Conclusion

The glass ceiling concept for women and ethnic and racial minorities is hotly contested. Those who argue that it does not exist for women claim that women are not represented in upper management well because they put their families before their careers. The argument against the glass ceiling concept as it concerns ethnic and racial minorities basically

hinges on racial stereotypes. Opponents claim that groups like African Americans and Latinos are lazy and that they are not willing to do what it takes to get to the top.

The argument backing the glass ceiling concept for women accepts that many women do choose to leave the workplace to make a family but that those who do not have suffered because of the common misconception and stereotypes surrounding all women. Arguments backing the glass ceiling concept for ethnic and racial minorities claim that basic racist ideas as well as cultural conflicts hinder the ability of people of color to reach upper levels of management. Arguments that the glass ceiling does exist are the most convincing because they are all backed by facts that do indicate, for one reason or another, that minorities are not represented demographically in upper levels of management.

GLOBALIZATION

Peter H. Denton

One big planet, a global community, the vision of everyone and everything together from pictures of the Earth from space first sent back by *Apollo 8*—globalization can

be romantically portrayed as any of these. From the dark side, it can also be seen as something that shatters local communities, takes away individual autonomy, destroys local cultures, and renders everyone helpless in the face of overwhelming power from somewhere else.

That globalization can be seen as both the happy inevitability of a bright future and the dismal gray of a grinding disaster reflects the reality of a significant conflict between opposing perspectives. Globalization can be represented in economic, cultural, sociopolitical, and environmental terms, each of which has its own means of measuring the difference between heaven and hell.

Patterns from the Past

To some extent, globalization has always been with us. Looking to identify the means by which people or cultures have sought to spread around the planet and why, one can argue that the primary means has been military, conquering the world through the use of force. For historical examples, we can look to Alexander the Great, the emperors of Rome, Genghis Khan, and so on. In such instances, the means becomes the object; there is no particular value to be gained by conquest, yet the conquest continues because the military machine, so unleashed, has no particular boundary or end to its use. Like a forest fire, globalization by such means continues until it reaches some natural boundary—like a river or an ocean—or it runs out of "fuel" to sustain it.

On the heels of military globalization, the means by which the gains of conquest are maintained and the benefits accrue to the state or group that initiated the conquest are primarily political. One of the reasons for the failure of Alexander's empire was the fact he absorbed the local political structures, virtually unchanged, into his own; when he died, of course, that was the end of the empire. The Roman Empire, by contrast, brought with it Roman forms of government and social organization, structures that tended to be imposed on the local populations that were controlled and directed by Roman law and institutions. Caesars and other leaders came and went, but the empire continued until the center fell apart, and the institutions—though not the roads—also fell apart. Political organization may be combined with religious organization, however, and, although certain Roman institutions lost their sway in the outlying areas, the religion that was propagated through the military and political structures continued and spread.

With military and political impulses to globalization come economic considerations. In the first instance, to the victor the spoils, for the fruits of conquest are inevitably monetary—someone, after all, has to pay the costs of the operation and make it possible for further conquest. In the second instance, the establishment of political institutions makes an economic return on conquest more than the immediate spoils of war; a steady flow of money back to the state at the center of the empire enables the maintenance of a structure from whose stability everyone benefits, at least to some extent.

Trade flourishes in the context of political stability, and military power protects such trade from the natural depredations of those who want to profit through force and not commerce.

Naturally, to maintain this kind of structure in the longer term requires both common currency and common language; in the wake of military and political conquest inevitably comes the standardization of currency (the coin of the empire) and some common language for the exercise of political and economic power. Latin—and particularly Latin script—became the language of the Roman Empire to its farthest reaches, providing a linguistic uniformity and continuity that outlasted the empire itself by a thousand years. With linguistic uniformity comes intellectual constraints; whether it was previously possible to articulate dissent or rebellion in the language of the peoples, over time their linguistic armory is depleted by the acceptance and use of the language—and the philosophy it reflects—of the conquering culture. The longer an empire has control over the political, social, and religious institutions of the areas it has conquered, the less able the conquered people are able to sustain an intellectual culture distinct from that of their conquerors—thus increasing the likelihood that such an empire will continue, because no one can conceive of another way of making things work.

Colonialism—a practice that existed long before the European powers made it an art in the 19th century—was the means by which the empire was not only propagated but also sustained, through the use of military, political, economic, religious, and intellectual tools.

This is a coercive model of globalization, but it tends to be the one first thought of when discussing how to overcome the various geographical, social, and cultural barriers that divide various groups. It is also the model that is reflected most obviously in history, which tends to be a record of the various conquests of one people or nation by another.

Is it possible, however, for there to be an impulse to "one planet" that is not inherently coercive? Is it possible for these kinds of boundaries to be overcome through mutual goodwill or a collective self-interest, in which all parties cooperate because it is to the advantage of all players that they do so? This is the million-dollar question, because, in the absence of some way in which such cooperation might take place, all that remains is a coercive model, however well the coercion is disguised.

Money and Merchandise

Of the current models for breaking down regional boundaries, most of them are economic and arguably coercive in nature. There is the International Monetary Fund (IMF) coupled with the World Bank, both operating within the framework approved (if not designed) by the countries of the G8 (and now G9, if one includes China). Within that framework, although countries identified as "developing" are offered financial assistance, the assistance is tied to certain monetary and trade policies in such a way that they are, in effect, coerced into compliance. Where countries—including members of the G9—try

to go their own way, it is still within the framework of international trade agreements (such as the General Agreement on Tariffs and Trade [GATT]) and under the watchful eyes of global currency markets whose volatility is legendary. In the absence of a global gold standard, certain economies set a global economic standard through their national currency; for example, the value of other currencies used to be measured primarily against the U.S. dollar, though increasingly it is measured as well by the Japanese yen and by the euro from the European Union.

It would be one thing if this approach to globalization was successful, but for too many people, it is not; and the number of critics from all perspectives grows. Oswaldo de Rivero (2001), the head of the Peruvian delegation to a round of the GATT talks, lays out very clearly in *The Myth of Development* why the current structure not only favors the wealthy but also entails the failure of the economies of developing countries in the South. Similarly, Joseph Stiglitz (2003), 2001 Nobel Prize winner in economics, reached the same conclusions about the unequivocal failures of the IMF and the World Bank from the perspective of an insider in *Globalization and Its Discontents.* For those who wonder why and how such a situation came about, in *The Wealth and Poverty of Nations: Why Some Are So Rich and Some So Poor,* historian of technology David Landes (1999) set out the historical development of industrial economies through to the present and makes it clear why there are winners and losers.

There is a difference, however, between the macroeconomic globalization that organizations such as the IMF and the World Bank promote and what can be termed commercial globalization. Commercial globalization, through the merchandising of certain products worldwide, promotes an economic model of consumption that is not restricted by national boundaries. Because the objects sold through such global channels are always value laden, this reflects a globalization, if not of the commercial culture itself that produced the items, at least of some of its values and mores. For example, it is not possible for McDonald's restaurants to be found worldwide without there also being an element of the American burger culture that is found wherever there are golden arches, regardless of what food is actually served (even the McLobsters that seasonally grace the menu in Prince Edward Island). Given the worldwide availability—albeit at a higher price—of virtually any item to be found on the shelves of a North American supermarket or department store, and the capacity of advertising to be beamed simultaneously to multiple audiences watching television from the four corners of the globe, it becomes understandable how and why commercial globalization has become a potent economic, political, social, and cultural force in the 21st century.

Thus, the material aspirations of a 21-year-old in Beijing may well be parallel to someone of the same age in Kuala Lumpur, or Mumbai or Dallas or Moose Jaw. Exposed to the same images and advertising, their material desires in response are likely to be the same; regardless of their culture of origin, their culture of aspiration is likely to include cars, computers, iPods and fast food.

One might say the primary implication of commercial globalization is the globalization of consumer culture, specifically Western consumer culture. Whether such a culture is good or bad in and of itself, its implications are arguably negative in terms of what it does to the local culture through supplanting local values and replacing them with (usually) more alluring and exciting values from far away.

In addition, the diversity of local cultural values—reflected in everything from forms of government to traditions around medicine and healing to cultural practices related to agriculture, cooking, and eating to religious belief systems and habits of dress—is endangered by the monoculture of mass consumerism as it is represented in the venues of mass media.

The Global Village?

There is a difference, however, between globalization and standardization. It is important to distinguish the two, especially in light of the social and cultural requirements of industrial (and postindustrial) society. A very strong case can be made that the impulse to globalize is an effort to regularize and systematize the messy world of human relations into something that fits a mass-production, mass-consumption model. From the introduction of the factory system (1750) onward, industrial processes have become more and more efficient, systematizing and standardizing the elements of production, including the human ones. Ursula Franklin (1999) refers to the emergence of "a culture of compliance" in which the activities of humans outside the manufacturing process become subject to the same terms and conditions as are required in the process of mass production. This culture of compliance requires individuals to submit to systems; it requires them to behave in socially expected as well as socially accepted ways, thus removing the uncertainties and vagaries of human behavior from the operations of society. Although in the mechanical sphere of production, such habits of compliance are essential for the smooth operation of the system, taken outside into the social and cultural spheres in which people live, the antihuman effects of such standardization—treating people in effect like machines to be controlled and regulated—are unpleasant, if not soul-destroying.

Thus, in any discussion of globalization, it needs to be established from the outset what the benefit is, both to individuals and to societies, of some kind of uniformity or standardization in the social or cultural spheres. What is lost and what is gained by such changes, and by whom? Much has been made of the comment by Marshall McLuhan that humans now live in a "global village," thanks to the advent of mass communication devices such as the radio, the television, the telephone, and now the Internet. Yet studies were done of what television programs were being watched by the most people around the world and therefore had the greatest influence on the development of this new "global" culture that was replacing local and traditional cultures. Imagine the consternation when it was discovered that the two most watched programs were reruns of

Wagon Train and *I Love Lucy!* Globalization and the cultural standardization that mass-production, mass-consumption society assumes to be necessary may mean that the sun never sets on the fast food empires of McDonald's or Pizza Hut, just as 150 years ago it was said to never set on the British Empire. Yet if the dietary habits of local cultures, in terms of both the food that is grown or produced and the ways in which the food is eaten, are merely replaced by standardized pizzas or burgers (or McLobsters, instead of the homemade variety), one cannot help but think something has been lost.

In the same way as colonies were encouraged to supply raw materials to the homeland and be captive consumers of the manufactured goods it produced (along with the culture and mores that the homeland dictated), so too the commercial colonization of mass-production/mass-consumption society requires the same of its cultural colonies. The irony, of course, is that the homeland is much less identifiable now than it was in the days of political empires; although corporate America is often vilified as the source of the evils of globalization, the reality is that corporate enterprises are much less centralized and less entrenched than any nation state. Certainly the burgeoning economic growth of the European Union (with its large corporate entities that not only survived two world wars and a Cold War but even thrived on them), along with Japan, and the emergence of China and India as economic superpowers indicates that the capital of empire today is entirely portable. The reality that some corporations have larger budgets and net worth than many of the smaller nations in the world also indicates that borders are neither the boundaries nor the advantages that they used to be.

Broader Impacts

Although the economic examples of globalization today are arguably coercive (despite the inevitable objections that no one is forcing us to buy things), it is possible at least to conceive of other ways in which globalization might be noncoercive, incorporating mutually beneficial models instead. In a subsequent book, *Making Globalization Work,* Joseph Stiglitz (2007) works through the ways in which the current problems he and others identify with economic globalization could be overcome; while he proposes solutions to the major problems, he does not effectively address the motivational change that would be required for decision makers to make choices reflecting social responsibility on a global scale.

Politics and Resistance

In the political realm, the United Nations (UN) has, in theory, the potential to be a body that—while respecting the national boundaries of its member states—works to find constructive ways of collectively responding to regional and global issues. Whether its first 60 years reflects such an ideal or whether instead the UN has been a facade behind which coercion has been wielded by one group against another is a subject for debate; in the absence of a clear global mandate for intervention or the effective economic and

military means to intervene, moreover, even within a coercive framework, it is hard to see the UN as a model for good global government.

(In terms of any other models of globalization, one might point to the Olympic movement, but, because it has always been a stage for personal and national self-aggrandizement, it is hard to see how it could become a step to some positive global culture.)

In the larger scope history provides, there are positive signs for political organizations that transcend the boundaries of the nation-state and in which participation is voluntary, benefits accrue to all, and the elements of coercion become less significant over time. No one who witnessed the aftermath of the Napoleonic era, the revolutions of 1848, the Franco-Prussian War, the Great War, World War II, and the Iron Curtain ever would have expected either the peaceful reunification of Germany or the formation (and success) of the European Union. Begun first as an economic union, it has continued to grow and mature into a union that has lowered many of the barriers to social, cultural, and political interaction that hundreds of years of nationalism had created.

Whether the EU model is exportable to other parts of the world raises some serious questions about how political globalization might succeed. The EU is regional, involving countries with a long and similar history, even if it was one in which they were frequently at war. The export of its rationale to other areas and cultures, with a different range of historical relations, is unlikely to meet with the same success. There should be some considerable doubt that democracy—as a Western cultural institution—will be valued in the same way in countries that do not have a similar cultural heritage or as desirable to the people who are expected to exercise their franchise. William Easterly (2006), in *The White Man's Burden,* is quite scathing in his account of why such cultural colonialism has done so little good, however well-meaning the actors or how noble their intentions.

Certainly the effects of globalization are far from being only positive in nature; globalization in the absence of political and economic justice that is prosecuted through military and economic coercion creates not only more problems than it solves but also arguably bigger, even global, ones. Whatever the potential benefits of a global perspective, they are undercut by what globalization has come to mean in practical terms for many people—as the articles in *Implicating Empire: Globalization and Resistance in the 21st Century World Order* (Aronowitz and Gautney 2003) so clearly represent. After the events of September 11, 2001, one might easily argue against globalization of any sort given that previously localized violence has been extended worldwide as a consequence of what is now the "global war on terror."

All of these issues combine to ensure what John Ralston Saul (2005) describes as "the collapse of globalism." He sees recent events as sounding the death knell for the free-market idealisms of the post–World War II period, noting that the promised lands of milk and honey that were to emerge from the spread of global markets and the demise of

the nation-state have simply failed to materialize. In fact, the current reality is so far from the economic mythology that, in retrospect, it perhaps would not be unfair to regard the architects of this plan as delusional and their disciples as blind.

Saul does add a subtitle to his book, however, in which the collapse of globalism is succeeded by "the reinvention of the world." Out of the ashes of this kind of economic globalism, in other words, and the unmitigated disaster it has spawned, it might be possible to reinvent a shared perspective on global problems that seeks to find a way other than those that have failed. Although Saul is rather bleak in his outlook and much more effective in describing the collapse of globalism than in setting out the character of such a reinvention, he makes a useful point. The failures of economic globalism are so painfully obvious that there can be no reasonable doubt that some other means of working together must be found.

Environmental Issues

If there is a perspective that has potential to be a positive rationale for globalization, it might be an environmental or ecological one. One of the most significant issues pushing some cooperative means of globalization is the environment, as we consider the ecological effects of human activities on a planetary scale. Global warming, ozone depletion, and the myriad means of industrial pollution whose effects are felt worldwide make it clear that, in the absence of a global response, we will all individually suffer serious consequences.

As much as we like to divide up the planet in human terms, laying out the grid lines of political boundaries and economic relationships, the fundamental limitations of the planet itself establish inescapable conditions for what the future holds. Although this may seem just as counterintuitive as Saul's analysis of the failure of global economic systems reinventing the world, the global spread of pollution combined with catastrophic climate change may catalyze changes that overcome local self-interest in favor of something bigger than ourselves. The artificial boundaries that humans create—everything from the notion that one can possess the land to the idea that one can control a part of the planet—are seen through even a crude ecological lens to be nonsensical and even dangerous. If the idea that people have the right to do what they please with the land, water, or air that they "own" is replaced by some more ecologically responsible understanding, then there may be a common ground for cooperation on a planetary scale that does not yet exist. Whether such global cooperation will be in response to some global disaster or whether it will be the result of some new and more positive understanding remains to be seen.

It may seem like pie in the sky, but there are noncoercive ways of conceiving of a global community in which globalization consists of the universal acceptance of ideals and values. If justice, human rights, and respect were tied to the provision of the necessities of life to people in all areas of the planet, and peaceful means were used to settle

whatever disputes might arise, then a global culture that reflected these things would be good for everyone.

This is not a new idea, but it is one that Albert Schweitzer (1949) elaborated on in his book *The Philosophy of Civilization.* The first two sections were written "in the primeval forest of Equatorial Africa" between 1914 and 1917. The first section of the book, "The Decay and Restoration of Civilization," locates the global problem not in economic forces but in a philosophical worldview that has undermined civilization itself; for Schweitzer, the Great War was a symptom of the spiritual collapse of civilization, not its cause. He asserts that society has lost sight of the character of civilization and, having lost sight of it, has degenerated as a result. That degeneration is primarily ethical; civilization is founded on ethics, but we are no longer aware of a consistent ethical foundation on which we can build a life together. The second section, not surprisingly, is titled "Civilization and Ethics"; in it, Schweitzer explores this ethical (and spiritual) problem. Schweitzer's answer, reached in the third section, published after the war, was to found ethical action on a principle Schweitzer called "the reverence for life." By doing this, he said, it would be possible to make decisions that were more fair, just, and life-giving than society at the present time was making. He noted that the principle was a general one, for it was not only human life, but all living things, for which people were to have reverence.

The idea of "reverence for life" entailed not only an ecological view of life but also one in which a spiritual dimension in all living things was acknowledged and respected. Moreover, it was not merely a Christian spirituality that Schweitzer said must underpin ethics in civilization, but it was a spirituality in general terms that—across religious boundaries as well as cultural and political ones—had not just a respect for life, but a reverence for it.

Conclusion

In the search for some noncoercive means of uniting people across social, political, cultural, and economic as well as geographic boundaries, working out some vague consequentialist environmentalism to guide the activities and choices of individuals in the global community is not likely going to be enough. There does, however, need to be some ethical framework within which to consider options that, in some form and in the service of some greater, global good, will not have negative effects on people, places, and human institutions. Such a framework will be difficult to find, to articulate, and to accept. Perhaps Schweitzer's idea of reverence for life might turn out to be as useful an ethical touchstone for global decision making today as he thought it would be nearly a century ago.

GOVERNMENT SUBSIDIES

E. C. Pasour Jr.

A subsidy refers to an economic benefit from government to individuals or business firms. A subsidy may lower the price of a product or service to individuals or raise the price received by those who produce it. It may also benefit producers by lowering the cost of production. Governments—federal, state, and local—subsidize a wide range of economic activities in the United States. Well-known subsidies include government assistance to farmers, food stamps, college student loans, and economic incentives (such as tax breaks) by state and local governments to attract sports teams and manufacturing or research facilities.

Subsidies began in Great Britain in the 1500s with a grant of money by the British Parliament to the king to finance military expenditures. The money was raised by a special tax. The subsidy concept has long since been generalized and now refers to any economic favor by government to benefit producers or consumers. Though some subsidies may benefit the public at large, many subsidies today do not and frequently, quite appropriately, are referred to as political pork or corporate welfare.

What are the main kinds of subsidies in the United States? How do some of the familiar and not-so-familiar subsidy programs work? Why do subsidies typically lead to too much of the subsidized activity being produced and used? Subsidies generally benefit a

POLITICAL PORK AND CORPORATE WELFARE

In the literal sense, a pork barrel is a barrel in which pork is kept. The term is thought to have originated on southern plantations, where slaves were given a barrel with the remainder of slaughtered hogs—the pork barrel. In the political arena, pork barrel legislation is a derogatory term referring to government spending meant to shore up constituent support in a politician's home state. Pork barrel legislation provides rich patronage benefits to incumbent politicians. Public work projects and agricultural subsidies are commonly cited examples of pork. Increased pork might be ladled out for existing government programs that benefit particular groups such as corn producers, sugar producers, textile manufacturers, or workers in auto factories. It also might go for government spending on a new project, such as a new post office building, where economic benefits are concentrated in a specific congressional district.

Pork barrel projects providing subsidies to favored groups are added to the federal budget by members of the appropriation committees of Congress. The congressional process often provides spending on federally funded projects in the congressional districts of members of the appropriation committee. Pork barrel projects frequently benefit major campaign contributors. Politicians often are judged by their ability to deliver pork to their constituents, and candidates for political office sometimes campaign with the promise that, if elected, he or she will secure more federal spending for that state or congressional district.

Pork barrel legislation may also give rise to so-called corporate welfare, which describes a wasteful government subsidy to a large company. The government subsidy may be in the form of grants of money, tax breaks, or some other form of special treatment. Corporate welfare, which benefits particular business corporations, generally comes at the expense of other corporations and the public at large.

Political pork and corporate welfare, like beauty, may be in the eye of the beholder. For example, the prospect of large numbers of unhappy voters may cause the federal government to bail out a large corporation when it faces bankruptcy—as happened, for this and other reasons, in the case of General Motors and Chrysler in 2008–2009. The justification given may be that the loss of jobs and economic activity accompanying bankruptcy is so large that a bailout by the government to avoid bankruptcy would benefit the public at large. In the airline industry, for example, some firms may not be able to survive ongoing losses without government subsidies. Such bailouts, however, may not be beneficial. Bankruptcy of less efficient firms is an inevitable feature of a competitive market process, and profit and loss signals lose their ability to channel resources efficiently if business firms are not allowed to fail. Moreover, business firms seeking government aid often succeed when the benefits are highly concentrated on a relatively small group and the costs are borne by taxpayers generally, as in the case of the Wall Street bank bailouts of 2008–2009. Are such bailouts helpful or harmful to the public at large? Are they best thought of as corporate welfare or as a means of keeping the economy running when the stakes are high? In this and other such cases, opinion is sharply divided and perhaps only time will tell.

small group at the expense of the general population, and many are harmful to the general public. How, then, do harmful subsidy programs get enacted into law in a democratic society that makes decisions on the basis of majority vote? The following sections consider these questions and clear up some of the confusion about subsidies.

Types of Subsidies

Subsidies take many different forms and can be classified in different ways.

Money versus In-Kind Subsidies

A subsidy or so-called transfer from the government to an individual or business firm may be in the form of money or in-kind benefit. Well-known money transfers include agricultural subsidies, veterans' benefits, and Medicaid. Common in-kind benefits include food stamps, school lunches, rent subsidies, medical assistance, and other programs that do not involve the exchange of money. In some cases, an in-kind subsidy program may require the recipient to pay some of the cost. For example, the school lunch program is said to be means tested: depending on the parents' income, some students receive free meals, while students from families having higher incomes must pay, but the price paid is below the cost of the meal.

Business Subsidies versus Subsidies to Individuals

Business Subsidies

Federal, state, and local governments subsidize a wide range of producer activities. Farmers, for example, may receive financial assistance when crop prices are low or crop yields are lowered due to drought, hail, or other unfavorable weather conditions. Governments sometimes subsidize large corporations such as auto or steel companies. Assistance may be direct, as in the case of a financial bailout, or it may be indirect, including tariffs and import quotas that limit domestic sales of competing goods from foreign countries.

Quite often, a government subsidy is targeted to a specific business firm. State and local governments may attempt to lure a corporation to locate a manufacturing facility within its borders by providing property tax holidays or other financial incentives. For example, South Carolina, Alabama, and other states have used tax breaks to induce foreign auto companies, including Toyota and Mercedes, to locate manufacturing facilities within their states. Similarly, local governments often subsidize the construction of sports facilities to lure sports teams.

Similarly, large industries may induce the federal government to restrict competition from foreign firms producing similar products. Subsidies of this type include import tariffs on autos, steel, textile products, and agricultural products. An import tariff on autos, for example, means that Ford, General Motors, and other domestic auto producers can charge somewhat higher prices for their products in the United States (even

though, under current conditions, they must also offer economical models and provide low financing).

The federal government also subsidizes the export of products from the United States to other countries. For example, the export of agricultural products has been subsidized for more than 50 years. The best known program, known as Public Law 480, was first enacted in 1954. The program was begun to reduce stocks of food that the government acquired through its farm subsidy programs. The program reduces the cost of U.S. food in foreign countries. Some of the food is sold to foreign buyers with long repayment periods at low interest rates, which is a monetary subsidy. Some of the food subsidies are in-kind: the U.S. government donates food products to people in foreign countries in response to devastation caused by floods, earthquakes, famine, and so on. Still other agricultural export subsidies go to private companies and to state and regional trade groups to promote sales of U.S. farm products in foreign countries.

With the exception of subsidies for disaster aid, all export subsidies are inconsistent with free trade between countries. Programs that subsidize exports of U.S. agricultural products help to insulate U.S. farmers from world market prices and often work against the interests of low-income farmers in less developed countries. Moreover, U.S. export subsidies tend to cause recipient countries to retaliate by creating their own export subsidies and thereby foster increased protectionism by producer interests in those countries.

Subsidies to Individuals

Federal, state, or local governments may subsidize a product to increase the use of the product subsidized; such subsidies generally target lower-income consumers and are no less common than producer subsidies. Some consumer subsidies targeting low-income individuals, including food stamps and the school lunch program, have been operating for decades.

Other consumer subsidies of more recent origin are much less dependent on the individuals' incomes. For example, a recently enacted federal program provides an income tax credit for the purchase of hybrid cars—cars with both electric motors as well as internal combustion engines—which is available to all taxpayers. In this case, purchasers of hybrid cars may reduce their federal income taxes by a specified amount in the year that the car is purchased. For example, some buyers of hybrid cars, if purchased during 2006, were able to reduce their 2006 federal income taxes by as much as $3,150.

The hybrid car subsidy ostensibly was begun to reduce U.S. dependence on imports of petroleum. The long-term prospect for hybrid cars remains in doubt, and the huge tax credit required to make hybrids competitive with conventional gasoline-powered cars suggests that the subsidy may not be socially beneficial. It also raises a question as to whether future increases in technology will make hybrid cars competitive with

conventionally powered autos. The crucial public policy problem is that temporary subsidies to enable a new technology to become established often become permanent subsidies, even when the new technology does not pan out.

Effects of Subsidies

Why Do Subsidies Lead to Overproduction and Overuse?

When production of an activity is subsidized, producers increase output. When a business enterprise is operating under competitive conditions—in which it has little ability to influence the market price—it will continue to produce an additional unit of the product as long as the expected return is greater than the cost of producing the unit. For example, if the cost of producing another widget is $10, but the widget can be sold for more than $10, it is profitable to produce the widget. But if it costs more—say, $12—than it can be sold for—say, $10—it is neither profitable nor socially beneficial to produce it. The profit and loss system in this way provides a check on wasteful production.

However, if the government subsidizes production, a business firm may find it profitable to produce and sell too much. In the above example, a subsidy of $3 per widget makes it profitable to produce and sell another unit for $10, even if it costs $12 to produce: $10 from the buyer plus $3 from the government is more than the cost of production. In this case, the government subsidy overrides the loss signal—the resources used in production are worth more than the value of the product! Agricultural subsidies are a good example. Government subsidies to farmers lead to overproduction. This also may be the case for ethanol, a substitute fuel for gasoline. The ethanol subsidy also illustrates how government subsidies generally are supported by vested interests. It is shown in the following section how small groups are able to maintain their transfer programs, regardless of whether they are beneficial to the public at large.

The Ethanol Subsidy

The far-reaching energy legislation enacted by the U.S. Congress in 2005 illustrates a number of issues related to producer subsidies. With higher petroleum prices and increased uncertainty about oil production in the Middle East, there was increased interest in biomass-derived fuels. Biomass refers to all bulk plant material. One of the first provisions of the 2005 legislation to take effect mandated an increase in the production and use of ethanol, currently made from corn or sugar. Gasohol, a mixture of gasoline and ethanol, is the primary fuel of this type.

Ethanol production recently has become a much more important public policy issue in the United States. However, interest in ethanol as an auto fuel is not new. Congress enacted legislation providing for subsidies for ethanol and other biomass-derived fuels more than 30 years ago, following the Arab oil embargo of 1973. The subsidy was in the form of exemptions from federal excise taxes, which have been in the range of 50 to 60

cents per gallon of ethanol. The subsidy amounted to more than $10 billion between 1979 and 2000. In 2005, more than 4 billion gallons of ethanol were used in gasohol in the United States out of a total gasoline pool of 1.22 trillion gallons. Corn farmers became staunch supporters of the ethanol program—no surprise because it increases the use and market price of corn.

Most energy experts believe that using corn to make ethanol is not an economically feasible substitute for gasoline. Although ethanol is sold to the public as a way to reduce dependence on oil, the net amount of oil saved by gasohol use, if any, is small. Indeed, widely cited research suggests that it may take more than a gallon of fossil fuel to make one gallon of ethanol. The growing, fertilization, and harvesting of corn and the fermentation and distillation processes that convert corn to ethanol require enormous amounts of fossil fuel energy. Although there is no consensus among energy experts as to whether ethanol production reduces dependence on fossil fuel, there is little doubt that ethanol subsidies are driven far more by congressional lobbying and farm-state politics rather than by the fact that it is a practical, long-term alternative to petroleum.

Why Are Subsidies Often Harmful?

Government subsidies were originally viewed as a grant of money or special privilege advantageous to the public. More often, however, as in the case of farm programs, subsidies work against the interests of the public at large because they lead to too much production; that is, the cost of production exceeds the value of the product produced. Moreover, the very process through which special interest groups gain an economic advantage through government legislation creates additional waste. Typically, as in ethanol production, a subsidy can be traced to so-called privilege-seeking behavior by those who stand to gain. Privilege seeking occurs when individuals or groups, such as corn farmers or sugar producers, attempt to influence the political process for their own financial benefit.

Why is privilege-seeking behavior harmful from the standpoint of the public at large? It is neither easy nor cheap to influence the political process—to obtain a government favor. Individuals and groups spend large amounts of time and money on campaign contributions, lobbying, and so on to obtain government subsidies. The time and money to influence the political process to obtain legislation that restricts competition is wasted, at least from the standpoint of consumers and taxpayers generally. The valuable resources used to obtain the subsidy could have been used to produce additional goods and services that would have benefited the public at large.

The sugar program is a prime example of how privilege-seeking behavior can lead to bad public policy. The sugar price support program raises sugar prices to U.S. producers of sugar cane and sugar beets by restricting imports of sugar from Brazil and other countries that can produce sugar more cheaply than the United States can. U.S. import quotas limit the amount of sugar coming into the United States from other countries

and keep the domestic price of sugar in the United States higher than the world price of sugar—it has sometimes been twice as high. The cost of the sugar subsidy is borne largely by U.S. consumers and manufacturers of sugar products, who must pay much higher sugar prices than they would have to pay if there were no sugar program. This sugar tax, in the form of higher retail sugar prices, according to the General Accounting Office, costs U.S. consumers some $2 billion per year.

Who benefits from the sugar subsidy? It benefits relatively few U.S. farmers—growers of sugar beets, sugar cane, and corn—and domestic manufacturers of sugar substitutes. It should not be surprising that sugar interests donate large amounts of money to political candidates. The Florida cane-growing company Flo-Sun contributed $573,000 to candidates in recent elections. American Crystal, a sugar beet cooperative in the Red River Valley of North Dakota and Minnesota, donated $851,000 in the 2004 elections.

The sugar subsidy benefits corn farmers as well as sugar producers. How do corn farmers benefit from the sugar subsidy? The sugar price support program not only raises the price of sugar, it also spurs the development and production of sugar substitutes because it makes them more competitive with sugar. For example, U.S. consumption of corn-based sweeteners now is larger than that of refined sugar. The sugar subsidy is defended by lobbyists representing both corn farmers and producers of corn-based sweeteners. The added support for the sugar subsidy helps to maintain what almost all objective analysts agree is a bad public policy.

Why Not Just Abolish Bad Subsidies?

Why is it that getting rid of a harmful subsidy is easier said than done? A subsidy program may be proposed for a variety of reasons that are generally misleading and often erroneous. These arguments made by subsidy proponents quite often divert attention from the actual reason. For example, the sugar subsidy, which virtually all objective analysts agree raises the sugar price, is sold to the public as a way to stabilize the sugar market or prevent swings in sugar prices.

Consumers, of course, benefit when prices are low some of the time instead of being high all of the time, as they are under the sugar price support program. In reality, the sugar subsidy can be chalked up to favor seeking by producers of sugar and sugar substitutes.

The sugar program is a classic example of how a government program may last a long time, even though the number of consumers and taxpayers harmed is far, far larger than the number of individuals and business firms benefiting from the subsidy. The direct beneficiaries of the U.S. sugar subsidy, for example, are highly concentrated on the approximately 10,000 domestic producers of sugar and sugar substitutes. Each sugar cane and sugar beet farmer may benefit by thousands of dollars from the sugar subsidy. For example, a U.S. Department of Agriculture study reported that each one-cent increase in the sugar price was estimated to average $39,000 per sugarcane farm and $5,600 per sugar beet farm (Lord 1995).

The sugar subsidy program also is highly beneficial to the industry producing high fructose corn syrup, the sweetener used in many soft drinks. It should not be surprising that Washington lobbyists for corn refiners are highly effective advocates for the sugar subsidy. Archer Daniels Midland Corporation (ADM), a large agribusiness firm, for example, is a driving force behind the sugar lobby in the periodic congressional battles over sugar legislation. Although ADM does not directly produce sugar, it does produce high fructose corn syrup. As the sugar price increases, so does the demand for and price of high fructose corn syrup and other sugar substitutes.

The sugar subsidy creates a price umbrella under which ADM can profitably operate to produce the corn sweetener substitute. If there was no price support program for sugar, sugar prices in the United States would be much lower, and ADM probably would not be able to produce high fructose sweetener at a price low enough to compete with sugar. Since the benefits of the sugar subsidy are highly concentrated on a relatively small number of sugar farms and agribusiness firms, such as ADM, it is in their financial interest to make sure that well-paid lobbyists exert a lot of pressure in Congress to maintain the sugar subsidy.

While the benefits of the sugar subsidy are highly concentrated on a small number of producers of sugar and sugar substitutes, the cost of the sugar subsidy is divided among 300 million users of sugar in the United States. The average consumer uses about 100 pounds of sugar per year. Even if the sugar producer subsidy doubles the retail sugar price, the cost to the individual consumer is quite small (almost certainly less than $100 annually). What is the implication? Individuals supporting the sugar subsidy can afford to spend huge amounts of money lobbying Congress to maintain the sugar program, but individual consumers cannot afford to spend much time or money fighting the sugar program because the amount of money each spends on sugar is just too small. This is the main reason the United States sugar subsidy has lasted for decades, even though it is harmful not only to consumers buying sugar but to manufacturers using sweeteners in candy, cookies, and other food products as well.

Conclusion

The term *government subsidy* originally referred to a grant of money from the British Parliament to the king to finance military expenditures. Subsidy now refers to a wide range of government favors to business firms or individuals. Current subsidies often face widespread criticism, especially corporate welfare, a derisive term for subsidies made to large business corporations.

A subsidy program may be enacted to benefit individuals or business enterprises. Common subsidy programs to individuals include federal and state education subsidies, food stamps, rent subsidies, medical subsidies, school lunch subsidies, and subsidies to reduce energy use in autos and home heating and cooling systems. Business

subsidy programs include subsidies to farmers, agribusiness firms, steel producers, auto producers, textile producers, sports teams, and so on.

While a subsidy may sometimes be warranted—that is, it is advantageous to the public at large—typically, this is not the case. Quite often, the cost of the output exceeds its value—too much is produced from the public's point of view. What explains the prevalence of harmful government subsidies? Most public subsidies can best be explained by favor seeking by narrowly focused producer and consumer groups who successfully further their own interests through the legislative process at the expense of the public at large. In other words, programs presumably enacted to further the public interest frequently transfer wealth from individual consumers and taxpayers to special interest groups—including the auto industry, airline industry, steel producers, textile producers, farmers, and ship builders—even when they are harmful to the public. Ethanol and sugar subsidy programs are prime examples.

In a democratic society operating on a one person–one vote basis, how can a small group of individuals or business firms obtain legislation that benefits them at the expense of the public at large? Economists, using public choice theory, a new subfield of economics, only recently have begun to understand this phenomenon. If the benefits of a subsidy are highly concentrated on a small group and the costs are widely dispersed over the entire population, as is often the case, the subsidy may be enacted and last for a long time. Consequently, the burden of proof for any subsidy should be on those who defend it. Citizens in a democratic society should question current and proposed government programs that confer benefits on particular business firms or individuals at the expense of the rest of society.

HEALTH CARE

Jennie Jacobs Kronenfeld

Health care is a complex issue. Many aspects of the health care system in the United States are in the process of change, partially because of the enactment of new legislation that modifies aspects of health care insurance in the United States. This new legislation has a goal of increasing access to health care through providing greater access to health care insurance among Americans and will be discussed in more detail at the end of this entry.

History and Background of the U.S. Health Care System

At one point in time, the U.S. health care system was dominated by physicians who worked in private practice as independent practitioners and was even described as a cottage industry since many physicians had their offices in their homes (Starr 1982). During that time period (up to 1900 at least and probably later), most people who had other options tried to avoid hospitals, because hospitals were viewed as a place to go to die for people with no other option and for people who were too poor to be able to remain in their homes. In addition, during the same time frame, there was not much care that could be provided for a person in the hospital that could not occur in the homes of people of economic means. This worked as the system for some period of time. Most people paid doctors as they received their care, and health insurance was not important for most people to obtain care. By 1900, there began to be some types of health insurance policies that people could purchase, often as a mix of coverage for

actual health care costs and coverage for being out of work. Gradually, sick leave policies and disability policies replaced those aspects of health insurance, and health insurance became coverage for the major health care costs. Discussions grew about the need for people to have coverage. This related to improvements in medicine and surgery, so that surgery became safer and less scary through the use of anesthesia and an understanding of the need to control infection to facilitate safe recovery from surgery. New technologies such as X-ray machines also made the use of hospital services desirable, and people then wanted a way to pay the higher medical bills. During the presidency of Theodore Roosevelt, the first major attempt to pass some type of heath reform and health care coverage for many Americans occurred. During the same period, the efforts of the labor movement in the United States and such groups as the American Association for Labor also began, with these groups pushing health insurance programs mostly through state government efforts prior to World War I.

Push for Health Insurance from the 1920s to 1965

In 1921, a partial effort to provide health insurance coverage to mothers and children was passed: the Maternity and Infancy Act (also known as the Sheppard-Towner Act). This was a grant to states in the area of health and was an early successful effort to expand the role of the federal government into the provision of health care assistance to specialized groups of citizens. Although the goals of this program may seem simple and not controversial today, the program was very controversial in the 1920s and generated great criticism from conservative political groups and from the American Medical Association. The criticism was loud, and the commitment to the program by the political powers of the time was fairly limited, so the act was not renewed in 1929 and the program ceased to exist.

The idea of a Medicare program, or provision of health care insurance for the elderly, was rejected as part of the Social Security legislation in the 1930s because of opposition from the American Medical Association. Franklin Roosevelt wanted to be sure that the essential Social Security legislation creating an old-age pension system was enacted and quickly backed off from a Medicare-type provision when it became clear that it would be more controversial than the rest of the program and could potentially threaten the passage of the overall Social Security legislation. Although Medicare-type legislation continued to be introduced into most sessions of Congress once World War II ended, these pieces of legislation had little chance of success in the late 1940s and 1950s. Medicare did eventually pass, of course, in 1965 as part of the Great Society legislative efforts of President Lyndon Johnson. This program was created as a federally administered program, with the same benefits for all Social Security recipients regardless of which state they resided in. The program was designed to be similar to the health insurance that most working Americans had through their jobs at that time (although the latter was privately contracted between employers and insurers). At the same time,

the Medicaid program that provided health coverage to selected groups of the poor was also passed, though as a federal-state joint program rather than as a national program. Over the past 40-plus years, both of these programs have become the major efforts of the government in the provision of health care insurance and health care services to parts of the U.S. population. They have also grown to be very complex programs, with many detailed and specific provisions and many important limitations that have been the subject of much critique and many policy debates. Both programs have changed and evolved a great deal.

Medicare, Medicaid, and Health Insurance for the Rest of the Population

Once Medicare was passed, the elderly had access to a health insurance plan that resembled what many working-age Americans had through their jobs, because a central goal of Medicare was to bring the elderly into the mainstream of U.S. medicine. Another basic assumption was that Medicare would provide all elderly with the same health insurance coverage, whatever a person's income level before retirement or after retirement. A third assumption of the architects of the basic Medicare legislation was that Medicare was the beginning of a government role in health insurance, perhaps a first step toward a more universal health insurance system. This did not really happen, with a few small exceptions such as adding coverage for people with kidney disease and then the extension of coverage to more children under the State Child Health Insurance Program (SCHIP) in the 1990s.

The basic coverage of Medicare was hospital coverage, known as Part A of Medicare, In addition, most people 65 and older also purchased Part B coverage for physician's fees. Social Security recipients pay for the Part B coverage, although the amount is deducted from their Social Security checks before they are issued so that some elderly do not know how much they pay for this coverage each month. The general premium in 2009 was $96.40 per month for most people, although the premium can be higher if the income of the person or couple is high enough. The costs of Medicare were higher than early estimates, and they continued to increase as the costs and complexities of health care increased and as the absolute numbers of people aged 65 and over increased. By the end of the first year of the operation of Medicare, 93 percent of the elderly (about 19 million people at that time in the United States) had enrolled in Part B. Beyond enrollment, usage of the program grew rapidly. By the end of the first year of operation, one in five of the elderly had entered a hospital using their Medicare benefits, and 12 million of the elderly had used Part B services. On average, about 80 percent of the hospital expenses of the group using hospital services were paid that year by Medicare.

There were some early implementation problems such as delays in payment to providers, especially during the first summer of operation. Fears about overcrowding of hospitals did not occur. Despite physician opposition to the program before it was passed, Medicare benefited physicians after its passage. Physicians initially received substantial

income supplements from the Medicare program, and most physicians ended up being reimbursed for services they previously provided for free or at a reduced cost to the elderly before Medicare. In a variety of ways, costs ended up being higher than expected. In its early years, Medicare costs exceeded the actuarial projections that were made at the time of its passage. One explanation is that both hospital and doctor fees rose, partially because the arrangements for paying physicians were quite generous. There are estimates that physician fees initially rose 5 to 8 percent, and physician incomes went up 11 percent (Marmor 2000). Similar problems, perhaps even more serious, existed in the area of hospital prices. The Labor Department's consumer price survey showed that the average daily service charge in U.S. hospitals increased 21.9 percent in the first year of operation of Medicare. In 1968 and 1969, Medicare costs rose around 40 percent each year, leading to Medicare acquiring a reputation, both in Congress and in the administrative branch, as a program with a potential to be an uncontrollable burden on the federal budget.

One clear result of the first two years of experience was that the rise in medical costs did initially lead to increased interest in national health insurance. For example, in 1968, an organized labor–supported Committee for National Health Insurance was created, and the American Hospital Association announced that it planned to study the feasibility of a national health insurance plan. From 1965 to the present, the U.S. health care system has had a number of important changes, but one thing that has not changed greatly is that, except for people whose health insurance is provided through a government program such as Medicare or Medicaid, most people obtain their health insurance through their jobs.

Having good health insurance coverage has been one of the most basic indicators of access to health care in the United States since the end of World War II. Although estimates vary regarding the numbers of people uninsured and underinsured in the United States from the early 1980s to the present, most sources agree that there was an increase in the numbers of uninsured from the late 1970s to the early 1990s. In the late 1970s, the best estimates were that 25 million to 26 million people in the United States were without health care insurance, or about 13 percent of the population under 65. The numbers of uninsured grew in the 1980s. Estimates ranged from a low of 22 million to a high of 37 million by the late 1980s. In a review of statistics from 1980 to 1993, one source estimated that the uninsured population increased from 13 percent to 17 percent in that time period (Andersen and Davidson 1996). Medicaid coverage increased (from 6 percent to 10 percent) as part of some of the expansions already discussed, but coverage by private health insurance decreased (from 79 percent to 71 percent). The proportion covered by private health insurance decreased for every age group, and the decline was especially noticeable for children under 15.

Critical to understanding how some groups of people have no health insurance in U.S. society is the realization that most private health insurance in the United States

is purchased through employer-based group insurance policies, representing 75 percent to 85 percent of all private coverage. One major factor in the increase in the number of uninsured during the 1980s and early 1990s was the growth in unemployment in the early 1980s and again in the early 1990s, as well as in the last few years. Those with a history of serious medical problems comprise another group of people with no insurance. Many people with serious health problems do maintain health insurance coverage as long as they keep their jobs. If they lose their jobs due to the general economy or their health but can still work, they may experience problems in finding employment due to their health. People who are medically uninsurable are a small part of those without health insurance, but they are important because they are very high utilizers of health services.

These kinds of issues have led at different points to calls for national health insurance reform. As various political issues shifted in the 1970s, no major national health insurance reform was passed. From the 1970s on, there have been a number of times when health care reform was a major topic of discussion and when expectations for the passage of some type of program were high, but the efforts did not succeed. In the Nixon administration, there was a major attempt to pass health insurance legislation, and many expected it to succeed, but Watergate and the political fallout from that scandal blew apart the attempt to create a Republican-Democratic consensus on reform legislation. When Jimmy Carter was elected president, there were planks in the Democratic party platform that called for major health care reform, but economic issues took center stage, and no program that had any realistic chance to pass was ever introduced into Congress at that time. The last major push for major health care reform before the Obama administration's current effort was the failed attempt by the Clinton administration to pass health care reform at the beginning of Bill Clinton's first term as president in 1993. After this, the Clinton administration focused on expanding coverage for children, which resulted in the passage of the SCHIP program. The only major health care coverage expansion during the George W. Bush administration was the expansion of Medicare to include drug coverage.

Recent Expansions of Publicly Funded Insurance: SCHIP and Changes in Medicare

Some important expansions have been passed in the last decade, especially the State Child Health Insurance Program, which has expanded the provision of government-provided health care insurance to the children of the working poor, and the drug coverage provision of the Medicare program, which has dealt with one major criticism and weakness of the Medicare program, the lack of inclusion of coverage for drugs.

In fall 1997, Congress passed the joint federal-state SCHIP as part of the Balanced Budget Act of 1997, which began in fiscal year 1999. As an expansion, this program focused on providing coverage to children, a group that previous surveys found was viewed

HEALTH CARE COSTS

A half century ago (1960), an average of $148 was spent by every person in the country on health care, and health care spending accounted for 5 percent of all spending in the economy. In 1980, these amounts had increased to $1,100 and 9 percent, and in 2008, they had jumped to $7,680 and 16 percent. The current amounts for the United States are higher than comparable measures in virtually all other countries.

While spending amounts will rise over time because of general inflation, the spending amounts above have been adjusted for general inflation, so we cannot blame the increase in health care spending on the general rise in prices.

Many citizens and policymakers look at the steady climb in health care expenditures and health care's share of the economy with alarm. Is it a result of waste in the health care system, meaning that all we need to do is eliminate the waste and health care costs will fall? Or are other factors at work that make the rise in health care expenditures more complicated and less ominous?

We Are Aging

One simple reason why health care spending is rising is that we are an aging population. In 1960, 9 percent of the population were aged 65 years or older, whereas in 2008, just over 12 percent were. It is a simple fact that older persons use more health care. People in their seventies spend more than 6 times more on health care than people in their twenties, thirties, and forties, and folks in their eighties spend 15 times more. Our aging population can account for as much as 25 percent of the increase in health care expenditures per person between 1960 and 2008.

However, this still leaves the majority of the rise in health care spending in recent decades owing to factors other than aging. What are they, and what do they imply for efforts to tame the health care money-eater?

Are We Getting More for Our Money?

An economic fact of life is that spending on any product or service equals the price charged per unit of the product or service multiplied by the number of units purchased. So, for example, if one hamburger has a price of $1, and you purchase 10 hamburgers, then your spending on hamburgers is $1 (per unit) times 10 (units), or $10.

Therefore, when we notice that total spending on health care is rising, the increase can occur because (1) the price per unit of health has risen, (2) the number of units of health care purchased has increased, or (3) a combination of both has occurred.

We already know that the number of units of health care purchased has been increasing due to the country's aging population. But the quality and scope of health care provided to the entire population also has been increasing. Modern health care, with its high-tech equipment and ever-increasing knowledge, can perform more operations, successfully treat more diseases, and extend healthy life spans to a much greater degree than ever

(*continued*)

(*continued*)

before. Stated another way, modern health care spending can do much more than health care spending in the past. The costs are greater, but so, too, are the benefits.

Some economists therefore argue that because modern health care is accomplishing so much more, its price per unit has actually fallen, and all of the increase in spending is because of the increased consumption of units of health care. Admittedly, while this is a difficult as well as controversial conclusion to reach, it does direct attention away from total spending to its components—price and both quantity and quality consumed.

Who Pays Matters

In the typical buying situation, a person evaluates the benefits of a product or service and then judges whether those benefits are greater than the price the person must pay to obtain the product or service. So if hamburgers cost $1 each, you will buy hamburgers up to the point where the last one bought gives you a benefit (satisfying your hunger or the enjoyment of eating) of $1. Since you are paying for the hamburgers, you have a big motivation to compare the costs and benefits of buying them. Usually, the initial units of a product or service give higher benefits than the later ones. So when the price of hamburgers is lower, you will buy more burgers.

What if someone else pays, or partially pays, for the burgers? Say the government subsidizes the cost of hamburgers at the rate of 50 cents per burger. This means that, for every burger with a price of $1, the government pays 50 cents and you pay 50 cents.

What will this do to the number of hamburgers you buy? It will certainly increase it. Now you will purchase burgers up to the point where the last one bought provides a benefit of only 50 cents. Maybe you will not eat all of them at once but take some home and save them for later. But the two important points to realize are that (1) you will buy more burgers and (2) the benefit of the burgers to you does not have to be as great as when you paid the entire bill.

What does this have to do with health care costs? Plenty. Health care costs faced by consumers are heavily subsidized in two ways. First, the government—primarily through Medicare and Medicaid—pays for almost half (45 percent) of all health care expenditures. Second, private insurance pays a little more than one-third (36 percent). This means that the consumer of health care only pays directly less than 15 cents on the dollar (14 percent) of its cost.

Of course, consumers pay for the government subsidy through taxes and for the insurance subsidy via insurance premiums. But there is no direct relationship between the amount of health care a person uses and the taxes he pays. Also, insurance premiums are first paid, and then health care is used later. So if there is any correspondence between the use of health care and insurance premiums, it certainly is not one to one.

What this means is that the heavy subsidization of health care has motivated people to use more health care. In fact, that is likely the purpose of the subsidization. Indeed, as the subsidization of health care has increased, so has spending on health care. Back in 1960, consumers directly paid for 60 percent of health care expenditures, and in 1980,

their share was 30 percent. As the consumer's direct share has dropped, spending on health care has climbed—just as economists would predict.

Yet is it not a good thing that these subsidies encourage people to use more health care than they would have if they directly paid all the costs? Most people would answer yes, yet economists point out that there is an issue. When a person pays for all the health care she uses, this guarantees that every dollar spent on health care is perceived as at least being worth a dollar of benefits to her. When health care spending is subsidized, this is not the case—every dollar spent on health care is not necessarily worth a dollar of benefits to the person receiving the care.

This implies that health care may be overutilized. Tests, procedures, and medicines are being used that are valued at less than their cost to the consumer.

Consumers and society might be better off if some of that spending was redirected to other things, including preventive care, proper diet, exercise, and sleep.

by most of the public as an important group to have coverage for health care. When SCHIP was passed, around 10 million children under the age of 18 were estimated to be without health insurance coverage in the United States, or about 12 percent of children under the age of 18. Children in some parts of the country and some population groups were more likely to be without health insurance. This included children living in the South and the West, children living outside metropolitan areas, and Native American and Hispanic children, as well as the main target group of the legislation, children in lower income brackets. SCHIP represented the largest expansion of health coverage since the passage of the Medicare and Medicaid Program.

SCHIP has had some success in improving the insurance levels of children. By 1999, 23 percent of children were covered by public programs such as Medicaid and SCHIP, compared to only 11 percent in 1987, before SCHIP and some of the Medicaid expansions (Federal Interagency Forum on Child and Family Statistics 2001). SCHIP grew to be a major program, with the expenditures for the program totaling $2.1 billion in fiscal year 2000, or 0.8 percent of total state health care spending and 0.2 percent of all state spending. The program has continued growing. Estimates are that, since SCHIP was created in 1997, the number of uninsured low-income children in the United States

has decreased by one-third. In 2006, 91 percent of children who were covered by SCHIP had incomes at or below 200 percent of the federal poverty level ($20,650 for a family of four in 2007). Combined with the Medicaid program that covers children in families with the lowest incomes, SCHIP and Medicaid provide health insurance coverage to one-quarter of all children in the United States and almost half of all low-income children.

There are important differences between SCHIP and Medicaid. Medicaid is a joint federal-state entitlement program in which federal funding increases automatically as health care costs and caseloads increase. In contrast, SCHIP is a block grant with a fixed annual funding level. The initial program was authorized for 10 years, and, to continue, the program needed reauthorization. There was a debate over this, and eventually only a continuing resolution let the program remain in place by the end of the Bush administration in 2008. Once Barack Obama became president, the reauthorization of the SCHIP program was the first piece of health legislation passed, signed on February 4, 2009. The signed bill reauthorized and expanded SCHIP to an additional 4 million children. In the new legislation, children in families with incomes of up to three times the federal poverty level will qualify for the program. The legislation also requires states to offer dental care through SCHIP and to provide equal coverage of mental and physical illnesses.

As mentioned, one major change in Medicare occurred during the Bush administration. There was growing concern about the rising costs of health insurance, but the major health-related effort in the second half of 2003 was a push for a Medicare reform bill. This passed at the end of November 2003 as, in some ways, a political compromise between Democrats and Republicans so that both sides could claim some success in improving Medicare as they ran for reelection. The law provided a new outpatient prescription drug benefit under Medicare beginning in 2006. In the interim, it created a temporary prescription drug discount card and transitional assistance program. The Part D drug option was a major addition to the Medicare program and partially dealt with what had been a major criticism of Medicare, the lack of drug coverage. Prior to the enactment of the Part D drug benefit, around one-third of seniors had no drug coverage. People without drug coverage generally had higher out-of-pocket costs and were less likely to fill prescriptions.

Medicare Part D is a prescription drug insurance plan that provides beneficiaries with prescription drug benefits. To receive these benefits, people must pay a monthly premium as part of enrolling in the plan and continue to pay it each year, or else they will have an interruption of coverage. People must choose among available plans in their state. The costs for the plans vary, as do the specific drugs that are covered. This potentially makes the choice confusing to consumers, and this was an initial concern. Because not every plan will cover the same drugs, people must search current medications for coverage under the Medicare Part D plans available to them. Although consumers were

confused initially, most are now choosing to enroll in a plan (unless they have supplemental coverage through a retirement work-based plan or other supplemental plan that provides drug coverage that is as good as the typical Part D plan).

One concern about the plan is that there is a coverage gap; during this portion of spending, plans are not required to provide any coverage to beneficiaries. The gap, or doughnut hole, was created as a way to provide a large amount of coverage (75 percent) to most Medicare beneficiaries after the modest deductible but to hold down the cost of maintaining it throughout the year. For those with extremely high drug costs, catastrophic coverage resumes (once a person has spent over $4,550 on drug costs as of 2010) and covers the rest of one's drug expenditures in that year. The doughnut hole became one of the most controversial aspects of the Part D plan. One study found that, for the 12 percent of people who reached the Part D coverage gap, there was a decrease in essential medication usage. Zhang and colleagues (2009) found that those lacking coverage for drugs in the doughnut hole period reduced their drug use by 14 percent. The proportion of beneficiaries reaching the doughnut hole increased as the number of chronic conditions that a person has increased.

Both of these new programs or extensions to existing programs have been successful efforts at expansion of the role of the federal government in the provision of health insurance coverage to Americans. But both also have created new complexities in the case of drug coverage for those on Medicare and new variation in coverage across states in the case of SCHIP, since the program, as with the Medicaid program, is jointly administered at the federal and state levels and has some differences in eligibility and some differences in coverage across states.

The Need for Health Insurance Coverage and Obama Reforms

The lack of health insurance among a substantial group of Americans is not a new issue, but as the recession hit and more people lost jobs and younger people had trouble finding jobs initially, the issue of the link between employment and health care became clearer and problematic. Also, there were concerns for older people who either planned an early retirement before the age of 65 or who lost a job in their fifties and discovered how difficult it was, in a time of recession, to find new jobs with health insurance or to be able to purchase a private health insurance policy. For people who already had health problems, many insurance companies would not provide coverage for preexisting conditions.

There were also discussions about how programs such as Medicaid did not cover all of the poor and about the groups of people with low incomes who nevertheless earned too much or had too many assets to qualify for Medicaid in many states. The percentage of people in poverty has been increasing and was 13.2 percent in 2008, up from 12.5 percent in 2007. The number of people without health care insurance has been increasing over the past decade. About 39.8 million people had no insurance in 2000, and this increased to more than 45 million people with no coverage in 2005, a 13 percent increase

from 2000. The number of people without health insurance coverage continued to rise, though not as rapidly, from 45.7 million in 2007 to 46.3 million in 2008, while the percentage of uninsured remained unchanged at 15.4 percent (DeNavas-Walt, Proctor, and Smith 2008). In addition, during this period, there was a decrease in employer-provided health care coverage, from 69 percent of employers providing coverage in 2000 to 60 percent in 2005. The number of people covered by all types of private health insurance continued to decrease from 2007 to 2008, with absolute numbers decreasing from 202 million to 201 million. The number covered by employment-based health insurance declined from 177.4 million to 176.3 million. Numbers of uninsured overall did not increase more, because the number covered by government health insurance climbed from 83 million to 87.4 million. These figures and concerns are the backdrop for some of the renewed push for health care reform after the election of Obama.

Shortly after the election, discussion began about health care reform. One initial approach of the Obama administration was to try and have Congress work through and develop the legislation. Partially, this was a reaction to the failure of the Clinton plan and the consensus that the administration in that case had become too involved in the details and Congress did not feel invested in the plan being developed. During 2009, some criticism of this approach arose, with people arguing that, to pass controversial, major legislation, the president had to become more involved. At one point, there was a feeling that Obama and the Democratic party would have the votes available to pass major legislation, especially given the conversion of the formerly Republican senator from Pennsylvania, Arlen Specter, to the Democratic party, which gave the Democrats a veto-proof majority in the Senate. Things moved slowly, however, and no legislation had been passed by the time of the elections in November 2009, when the Democratic Senate seat held for decades by Ted Kennedy in Massachusetts was open due to Kennedy's death. A shock occurred in that election, with a Republican capturing the seat. This meant that passage of the bill might not be possible without use of the so-called reconciliation approach, which required only a majority of votes (the Democrats still had 59 seats in the Senate). The initial Senate version of the bill was passed in late 2009. The U.S. House of Representatives passed the bill to reform health care in March 2010 by a vote of 220 to 211. The House also passed a bill, which then was sent back to the Senate to modify some versions of the Senate bill. That bill was also passed in March 2010. The bill was signed by President Obama on March 23, 2010.

When fully phased in, the legislation will cover around 32 million Americans who are currently uninsured. Major coverage expansion begins in 2014, with exchanges being created and the requirement that most people have health insurance. Beginning in 2010, insurers must remove lifetime dollar limits on policies, and some subsidies to small businesses to provide coverage to employees will become available. Insurance companies will be barred from denying coverage to children with preexisting conditions. Children will be allowed to stay on their parents' insurance policies until their 26th birthday.

Gradually, a number of other changes will be put into place. Medicaid will be expanded, the doughnut hole in the Medicare drug plan will gradually disappear, and certain preventive services in Medicare will be available without a copayment. There will be reductions in Medicare advantage plan payments that will help to extend the life of the Medicare trust fund. An independent advisory board will be created to make recommendations for other cost savings. The legislation will establish the Community First Choice Option, which will create a state plan option under section 1915 of the Social Security Act to provide community-based attendant supports and services to individuals with disabilities who are Medicaid eligible and who require an institutional level of care, to try and begin to deal with some of the needs of the elderly and disabled for less intensive community-based services. There will be the creation of some demonstration programs for certain types of home care and modifications to some of the rules for nursing homes that receive Medicare payments. A number of new taxes and fees—some on people through Medicare taxes and others on drug makers and employers—will begin in various years, such as 2011 for drug makers and fines on employers mostly beginning in 2014. Taxes on high-cost health plans will not begin until 2017.

Continuing Concerns and Unresolved Issues

Although there are high hopes that the new reforms in health insurance—a more accurate description of the Obama changes than "health care reform"—will lower the rates of the uninsured, many problems were not dealt with. In much of the discussion, there was talk of a public option, a way to be sure that there was an affordable option for everyone. This did not end up in the legislation, and, while insurance companies will have to offer coverage to a person and there will be health care exchanges, there is not a limit on what can be charged, so costs of health insurance may not be well controlled. In addition, the bill has few mechanisms in place to control rising costs of health care and of drugs, so that some experts fear that, as happened with the passage of Medicare and Medicaid in the 1960s, costs will increase and there will be need for additional reforms to deal with costs. Some issues in Medicare were dealt with (the doughnut hole in the drug plan and some beginnings of experimentation with aspects of long-term care), but the major issue of long-term care for the elderly, a growing program as the large baby boom group in the population begins to age, is not really covered. How the new taxes will actually work and how fines and mechanisms to ensure that all people purchase coverage remain to be seen as the different provisions of the Obama plan come into effect in future years.

IMMIGRANT WORKERS

Kenneth Louie

Immigration policy in the United States has become a highly contentious issue, one that is likely to play an increasingly important role in affecting electoral outcomes at the local, state, and national levels. Currently, members of the U.S. Congress as well as elected public officials in locales across the country are embroiled in an emotionally charged debate over the immigration issue. The country will eventually have to grapple with a host of concerns, but some of the key policy areas of contention include how to control unauthorized (illegal) immigration into the United States, how to resolve the status of the illegal aliens who are already working in the United States, whether we should establish a so-called guest worker program that will allow foreigners to work in the United States temporarily, and whether, on balance, immigrant workers have a positive or negative economic effect on native U.S. workers.

Many Americans believe that, as a nation, we should continue to uphold the principle of openness so eloquently captured by the words at the Statue of Liberty: "Give me your tired, your poor, your huddled masses, yearning to breathe free." These individuals also contend that immigrants contribute positively to the economic, political, and social vitality of the country. Many other Americans, on the other hand, believe that uncontrolled immigration, especially of the illegal kind, will create significant adverse economic consequences for the nation that may spill over into the political and social arenas.

It is interesting to note that some of the elements in the current debate are not new. In the 1980s, for example, U.S. officials faced increasing political pressure to do

something about the growing number of unauthorized workers from Mexico and to counteract the widespread perception that U.S. employers who hired illegal aliens were seldom prosecuted. In response, Congress passed the Immigration Reform and Control Act (IRCA) of 1986. Although the IRCA was intended to strengthen enforcement by imposing penalties on U.S. employers who knowingly hired undocumented workers, it did not succeed in significantly reducing illegal immigration, partly due to underfunding of the enforcement efforts and the widespread use of fraudulent documents by unauthorized workers (Martin and Midgley 2003). IRCA also addressed the question of how to treat illegal immigrants who were already in the country, another issue that is looming large in the current debate, essentially by granting legal status to 2.7 million unauthorized foreigners in the United States. Another revision of the immigration system was tried in 2005–2006 but failed to pass. While many facets of the current immigration debate have historical antecedents, it remains to be seen how the United States will address this important issue as the second decade of the 21st century progresses.

Arguments for and against Immigration

Advocates on both sides of the immigration issue have at one time or another put forth arguments based on history, philosophy, politics, culture, or religion in support of their cause. For example, one of the common arguments put forth by advocates of an open immigration policy is that, since its founding, the United States has always been a nation of immigrants, and the country should therefore maintain its immigrant heritage by continuing to welcome foreigners to its shores. Other advocates of unrestricted immigration maintain that, by introducing greater diversity, immigration strengthens and enriches the United States' political, social, and cultural institutions. Religious organizations, such as the Roman Catholic Church, are generally in favor of unrestricted immigration because of humanitarian reasons and sometimes issue official pronouncements opposing barriers to human migration.

Those in favor of restricting immigration have argued that the changing ethnic composition of the U.S. immigrant population (which, as will be documented subsequently, is becoming increasingly Hispanic and Asian) will pose difficult political challenges, such as deciding whether to offer bilingual education in public schools. A related argument is that, unless assimilation into the society on the part of immigrants occurs quickly and smoothly, the increased ethnic diversity associated with a rapidly changing immigrant population may weaken the social and cultural fabric that unites the country. It is interesting to note that even Benjamin Franklin expressed concern about the rate of assimilation by German immigrants into U.S. society in the late 18th century by asking, "Why should Pennsylvania, founded by the English, become a colony of aliens, who will shortly become so numerous as to Germanize us, instead of our Anglifying them?" (Degler 1970, 50). Proponents of immigration restrictions also point to the additional political challenge of having to deal with increasingly severe strains placed on

the health care and law enforcement systems as a result of high levels of immigration. Of course, superimposed on all these arguments for restricting immigration are the concerns for national security that arose after the terrorist attacks on the United States on September 11, 2001.

But perhaps the most controversial, and hence most scrutinized, arguments put forth by advocates on both sides of the debate are the ones concerning the economic impact of immigration. Those who advocate open borders argue that immigration is economically beneficial both to the immigrants and to the native U.S. population. For example, when immigrants come to the United States from other comparably developed countries, mutual benefits come in the form of new ideas generated from human interaction that ultimately lead to economic growth and higher standards of living for all. According to the proponents of unrestricted immigration, even immigrants who come to the United States from poorer countries benefit from the higher U.S. standard of living at the same time that they contribute to the output, or gross domestic product (GDP), of the U.S. economy.

In contrast, those who argue for restrictions on immigration contend that immigrant workers create significant negative effects for the U.S. economy. For example, in labor markets where immigrants compete for the same jobs with native-born workers, the earnings and employment opportunities of native-born workers will both be reduced. Additionally, immigrants may create net fiscal burdens for governments at the national, state, and local levels if they contribute less in tax revenues compared to their drain on government resources.

Evidence on the Economic Effects of Immigration

Because such a big part of the debate centers on the economic impact of immigration, it is not surprising that economists have conducted extensive research into this very question (see, e.g., Borjas 1994). So what does the empirical evidence tell us?

Studies in the late 1970s seemed to suggest an optimistic outcome for immigrant workers in the United States. Specifically, researchers reported that immigrants were able to achieve earnings comparable to those of native-born workers with similar socioeconomic characteristics within a relatively short time. Indeed, the rapid rise of their earnings implied that many immigrant workers appeared to earn more than comparable native-born U.S. workers within one or two decades after entering the United States. Furthermore, these earlier studies did not provide any strong evidence that immigrant workers reduced the employment opportunities of native-born workers. Consequently, the empirical findings up until the mid-1980s were consistent with the view that immigration was mutually beneficial to immigrant workers (because of their very steep earnings profiles) as well as to the U.S. economy (because of the additional output and income generated).

Starting in the mid-1980s, however, a somewhat different picture emerged as economists conducted new research studies as well as reassessed earlier ones. Partly as a result

of discovering methodological weaknesses in some of the earlier studies and applying more elaborate statistical techniques to new data sets, economists began to revise their views on the economic impact of immigration.

For example, especially in light of the fact that the skill levels of immigrants into the United States were shown to have been declining during the postwar years, the new view was that recent immigrants were unlikely to achieve the same earnings levels as native-born workers, even over the entire course of their working years. Moreover, many of the new research studies concluded that immigration may in fact have lowered the earnings of unskilled native-born U.S. workers during the 1980s, although the magnitude of the effect appears to be small. The consensus at present seems to be that immigration has reduced the wages of low-skilled U.S. workers, especially those without a high school degree, by about 1–3 percent (Orrenius 2006).

In addition to these labor market effects, immigration may also create fiscal impacts on government budgets. For instance, highly skilled immigrants in the technology, science, and health fields have a significant positive effect on the U.S. economy not only through their contributions to the nation's GDP but also through their contributions to tax revenues. Because so much attention is focused on illegal or low-skilled immigrant workers, it may be surprising to many that about 40 percent of the doctoral scientists and engineers in the United States are foreign-born immigrants (Orrenius 2006). These foreign-born workers are likely to create a net fiscal benefit for the U.S. economy.

The net fiscal impact of low-skilled immigrant workers is less certain, however. While these immigrants still contribute to the nation's output, they may have a negative fiscal impact if they draw on more public services, such as education and health care, compared to their tax contributions. Furthermore, the distribution of the fiscal burden of these immigrants may become an important policy issue, since most of the fiscal benefits (in the form of employment taxes) go to the federal government, while much of the cost (such as health care and educational expenses) must be borne by state and local governments. Recent studies suggest that, overall, legal immigrants and their descendants actually end up paying more in taxes compared to what they receive in government benefits, with the difference (measured over the course of the immigrants' lifetimes) estimated at about $80,000 per immigrant (Smith and Edmonston 1997; Lee and Miller 2000).

What about the economic effects of *illegal* immigration? In the current debate, there is much concern that illegal immigration has unambiguous negative fiscal effects in the U.S. economy. But there are several reasons why this may not be the case. For example, illegal immigrants may contribute less to government tax revenues (although they may still have to pay payroll and sales taxes, which are hard to avoid). But illegal immigrants are also ineligible for many government programs such as Social Security and unemployment insurance. Therefore, illegal immigrants do not necessarily create a net fiscal burden. Indeed, since illegal immigrants enter the United States primarily to work, lured

BRIEF HISTORY OF U.S. IMMIGRATION POLICY

1776–1880s: Period of Openness

For almost 100 years after achieving independence, the United States adhered to a policy of virtually unrestricted immigration. As a result, immigration increased steadily, especially after 1840, due to industrial and political transformations that started to occur in the United States and Europe.

1880s–1920s: Period of Restrictiveness

Beginning in 1880s, the United States began to restrict immigration by certain types of foreigners. These early restrictions reduced the flow of immigrants briefly, but immigration picked up again and reached a peak in the first decade of the 20th century. In 1921, Congress passed the Quota Law, which set annual quotas for immigration on the basis of national origin. Partly driven by fears that the influx of unskilled immigrants from Eastern and Southern Europe would negatively affect native-born U.S. workers, the quota system favored immigrants from Northern and Western Europe instead.

1960s–1990s: Period of Reform

In 1965, Congress passed the McCarran-Walter Immigration and Nationality Act (INA), which eliminated the quota system based on national origin. Instead, the INA, which was amended in 1990, set immigration quotas based on the following purposes: (1) family reunification, (2) the need for professional and high-skilled workers from abroad, and (3) increasing so-called diversity immigrants from historically underrepresented countries. No limits were placed on political refugees who faced the risk of persecution in their home countries.

In 1986, Congress passed the Immigration Reform and Control Act (IRCA), which granted legal status to 2.7 million illegal immigrants who were already working in the country. IRCA was also intended to discourage future illegal immigration by imposing sanctions on employers who knowingly hired illegal aliens.

The rapid growth of technology led Congress to pass the Immigration Act of 1990, which authorized the Immigration and Naturalization Service to issue 60,000 H-1B visas each year to applicants with higher education in an effort to attract high-skilled workers to the United States. The number of H-1B visas was increased to 115,000 for 2000.

1996 to Present: Period of Safeguarding National Security

In 1996, Congress passed three laws relating to immigration: the Antiterrorism and Effective Death Penalty Act, the Personal Responsibility and Work Opportunity Reconciliation Act, and the Illegal Immigration Reform and Immigrant Responsibility Act. These laws were intended to prevent terrorist acts as well as to address the issue of welfare eligibility for legal immigrants.

In 2001, in response to the September 11 terrorist attacks, Congress passed the Uniting and Strengthening America by Providing Appropriate Tools Required to Intercept and Obstruct Terrorism (USA PATRIOT) Act, which provided funds for additional border

security and gave the U.S. attorney general the authority to detain foreigners who were deemed to pose potential risks to national security.

In 2005–2006 and again in 2010, lawmakers struggled to reform the immigration system by balancing social and economic arguments in favor of increased immigration against security issues and other arguments against immigration. The first effort (2005–2006) failed, but the second (in 2010) gained traction—in both directions—after the state of Arizona passed a restrictive law permitting police officers to stop and question anyone suspected of being in the country illegally.

by the prospects of a higher standard of living, they contribute to the output and economic growth of the country. All these considerations lead some analysts to argue that illegal immigrants may very well make a net positive contribution to the U.S. economy (Ehrenberg and Smith 2006).

Some Key Immigration Policy Issues

Although immigration reform is currently (mid-2010) in a state of flux, President Barack Obama has stated that he is in favor of making changes to the system. He has called for continued enforcement of existing immigration laws at the borders and at the same time has urged lawmakers to explore a guest worker program or something similar to it in order to address the issue of unauthorized foreigners who are already working here. Under the proposed guest worker program from 2005 to 2006, for example, unauthorized foreign-born individuals in the United States with jobs would have had the opportunity to apply for legal immigrant status after working in the country for 6 years and to apply for U.S. citizenship after 11 years. As the new administration takes up this issue, any such specifics could, of course, change.

Another key issue is employer verification of their immigrant workers' legal status. In 2005, for example, a bill passed by the U.S. House of Representatives (but never signed into law) required that all employers submit the Social Security and immigration numbers of their new workers to the relevant government agencies within three days of hiring them. Employers who did not follow these procedures or who otherwise violated immigration laws would, under the bill, be subject to substantial fines up to $25,000. Unauthorized presence in the United States would become a felony, jeopardizing the chances of those who are currently illegal immigrants in the United States to become guest workers or legal residents in the future. One provision of the bill also stipulated penalties of up to five years in prison for those who shield illegal immigrants from apprehension or prosecution by authorities.

In addition to the House bill, the U.S. Senate passed legislation in May 2006 (but again never signed into law) that would have allowed illegal immigrants then living in

the United States for five years or more (about 7 million people) an opportunity to apply for citizenship if they continued to maintain a job, adequately passed background checks, paid up all past fines and back taxes, and enrolled in English classes. Illegal immigrants who lived in the country for two to five years (about 3 million people) would have been required to leave the country briefly and apply for a temporary work visa before returning to the United States as a guest worker. They would eventually be given the opportunity to apply for permanent residency and then U.S. citizenship. Illegal immigrants who lived in the country for less than two years (about 1 million people) would have been required to leave the United States completely but were eligible to apply for the proposed guest worker program (Swarns 2006).

Clearly, the issues of establishing a guest worker program, creating a "path to citizenship" for those who are now in the country unlawfully, expecting employers to share in the responsibility of verifying the status of their employees, and maintaining effective law enforcement with respect to illegal immigration will all form a part of any ensuing House and Senate debates as the matter of reforming immigration is considered anew under the Obama administration.

Some Basic Statistics on the U.S. Immigrant Population

As noted previously, a big part of the immigration debate centers around the impact of immigration on native U.S. workers as well as on how to stem the tide of illegal immigration. So just what are the facts concerning the extent of immigration, both legal and illegal?

The total number of foreign-born residents in the United States in 2005 was estimated to be in the range of 36 to 37 million, making up approximately 12 percent of the country's overall population. This total figure includes 11.5 million individuals who were naturalized U.S. citizens, 10.5 million who were legal immigrants, and between 11 and 12 million who were unauthorized immigrants (Martin 2006). Of course, the current number of foreign-born residents in the United States is the result of annual immigrant flows that have entered the country over the course of many years. Table 1 shows the number of immigrants that have legally entered the United States in each decade since 1821. As Table 1 indicates, immigrant flows into the United States rose steadily throughout the 19th and early 20th centuries, reflecting the nation's essentially open-door immigration policy during its first 100 years of independence. (During this period, the only groups who were subject to significant immigration restrictions were convicted criminals and individuals from Asia; see Ehrenberg and Smith 2006.) While the absolute number of immigrants grew, especially after 1840, the annual rate of immigrant entry for any decade never exceeded 10 per 1,000 U.S. population until the beginning of the 20th century. The U.S. immigration rate reached a peak of 10.4 per 1,000 U.S. population (an annual rate of more than 1 percent of the population) during the first decade of the 20th century, after which it has been declining. Thus, although many who are involved

in the current debate often refer to the so-called unprecedented surge in immigration, it is important to remember that the percentage of the U.S. population that is foreign born was actually higher in 1910 (at 15 percent) than it is today (at 12 percent) (Martin and Midgley 2003).

One important feature of immigration into the United States is the gradual change over time in the countries of origin of the immigrants. Between the 1960s and the 1990s, the percentage of legal immigrants who were from Europe fell to 13 percent from 40 percent. During the same period, the percentage of immigrants from Latin America increased to 51 percent from 38 percent, while the percentage from Asia increased to 30 percent from 11 percent.

Because a large part of the current debate on immigration centers on the economic impact of immigrants, it is instructive to look at some statistics from the U.S. government's Current Population Survey that reveal some interesting demographic and economic characteristics of the foreign-born population in the United States.

The average age of foreign-born residents in the United States who worked full-time for at least part of the year in 2001 was 39 years, compared to an average age of 41 years for U.S.-born workers. As a group, foreign-born residents accounted for almost 15 percent of all U.S. workers who were employed full-time for at least part of the year in 2001; however, median annual earnings were $24,000 for foreign-born workers, compared to $31,200 for U.S.-born workers. In addition to the changes in the countries of origin, there have been changes in the demographic and economic profiles of recent U.S. immigrants. The foreign-born residents who came to the United States after 1990 tend, on average, to be younger (average age of 32 years), less educated (34 percent do not have a high school diploma compared to 16 percent of U.S.-born residents), and have lower median earnings ($20,000). In 2002, about 16 percent of the foreign-born population earned incomes that were below the official poverty line compared to 11 percent of U.S.-born residents. Almost a quarter (24 percent) of U.S. households that were headed by foreign-born residents received a means-tested federal benefit (i.e., one that uses income level to determine eligibility, such as Medicaid) in 2001 compared to 16 percent of households that were headed by U.S.-born residents (Schmidley 2003; Camarota 2002).

The Extent of Illegal Immigration

For purposes of immigration policy, the U.S. government considers foreigners who are in the country without a valid visa and who are therefore violating U.S. immigration laws to be unauthorized immigrants (also called undocumented or illegal immigrants). It is estimated that 850,000 foreigners entered the United States without authorization in 2005, while other illegal immigrants left the country, became legalized residents, or passed away, so that, on balance, the number of unauthorized foreigners in the United States increased by 400,000 during the year (Passel 2006). It is estimated that anywhere between 350,000 and 500,000 illegal immigrants enter and reside in the United States each year, while many others enter to stay temporarily and then leave within the same year. The U.S. Immigration and Naturalization Service reported 1.4 million apprehensions of illegal aliens in 2001 (an individual may be apprehended more than once during the year for trying to enter illegally, and each incident is reported as a separate apprehension) (Martin and Midgley 2003). And in 2005, 1.2 million individuals were apprehended just along the U.S.-Mexico border (Bailey 2006).

A big reason why illegal immigration into the United States has generated so much concern and controversy is that it has grown dramatically in recent years. In fact, it is estimated that most of the illegal immigrants came to the United States during the last decade: two-thirds have been in the United States for less than 10 years, and 40 percent have been here for less than 5 years. Most of these unauthorized foreigners come from three major regions of the world: over half (56 percent) come from Mexico, 22 percent come from Latin America, and 13 percent come from Asia. Six percent of illegal

immigrants in the United States come from Europe, and 3 percent come from Africa and elsewhere in the world (Passel 2006; Bailey 2006).

Table 2 shows the estimated size of the unauthorized resident population in the United States as well as the 10 states with the largest number of unauthorized foreigners in 1990 and 2000. As Table 2 indicates, the total number of unauthorized foreigners in the United States doubled in the decade from 1990 to 2000, from 3.5 million to an estimated 7 million individuals. Since it is estimated that 11–12 million unauthorized immigrants were residing in the United States in 2005, this means that the number of illegal immigrants increased by another 55–70 percent in the five-year period from 2000 to 2005 alone.

Unauthorized foreigners are not distributed evenly across the country, however. For instance, the top 10 states with the largest number of unauthorized residents accounted for almost 80 percent of the total unauthorized population in the United States in 2000 (Table 2). While California and Texas experienced the largest increase in the absolute

number of unauthorized foreigners, the states that showed the largest percentage increase over the last decade were North Carolina, Georgia, and Colorado.

Of the 11–12 million unauthorized immigrants in the United States in 2005, it is estimated that about 7.2 million were in the labor force, accounting for almost 5 percent of all U.S. workers. Unauthorized foreign-born workers make up at least one-fifth of the total work force in each of the following labor categories: agricultural workers (29 percent), grounds maintenance (25 percent), construction laborers (25 percent), maids (22 percent), painters (22 percent), cooks (20 percent), and hand packers (20 percent) (Passel 2006). Additionally, and perhaps somewhat contrary to popular perception, it is estimated that 20 percent of computer hardware engineers in the United States are illegal immigrants (Bailey 2006).

Conclusion

Immigration is an important national issue worthy of serious and objective discussion. Given the many controversial aspects surrounding the nation's immigration policy, it is inevitable that there will be disagreement and highly unlikely that any single comprehensive reform measure will satisfy the preferences of all who are engaged in the debate. Indeed, the debate over immigration policy has gone on for a long time and will likely continue with every change in domestic or international circumstances. The important thing to keep in mind is that any immigration policy should carefully balance the interests of all those who will be affected by the policy since the livelihood and standard of living of millions of individuals, both native and foreign-born, will be affected.

INCOME TAX, PERSONAL

David N. Hyman

All working Americans are familiar with the April 15 deadline for filing personal income tax returns. Taxes on personal income accounted for 44 percent of total revenue raised by the federal government in the United States in 2009. All but seven state governments also tax personal income, which now accounts for 30 percent of state revenue. Many view income as a good measure of ability to pay taxes, and the income tax enjoys broad political support in the United States. However, it is also reviled as having become incredibly complex, and there are continual calls to reform the income tax to make it fairer and simpler and to reduce the distortions it causes in economic decision making.

To understand the impact of the income tax on our decisions and the way its burden is distributed among taxpayers, it is first necessary to define the concept of income.

What Is Income?

Income is a flow of purchasing power from earnings of labor, capital, land, and other sources that a person receives over a period of one year. The most comprehensive definition of income views it as an annual acquisition of rights to command resources. Income can be used to consume goods and services during the year it is received, or it can be stored up for future use in subsequent years. Income stored up for future use is saving, which increases a person's net worth (a measure of the value of assets less debts). The most comprehensive measure of income views it as the sum of annual consumption plus savings, where savings is any increase in net worth that can result from not spending

TAX EXPENDITURES

Every adjustment, exemption, exclusion, and deduction from the gross income of taxpayers reduces the amount of income that is actually taxed. The many special provisions of the personal income tax code that make taxable income less than actual income therefore reduce the revenue collected by the U.S. Treasury. Indirectly, the reduction in revenue ends up increasing the after-tax income of taxpayers who engage in those transactions for which the tax code affords preferential treatment. This loss in income tax collected can be thought of as subsidizing the activities that people engage in to reduce their income tax burdens.

The federal government is required by law to estimate this loss in income tax revenue and report the losses as tax expenditures, which are indirect subsidies provided through the income tax. In effect, tax expenditures are a form of federal government spending financed by loss in tax revenue. The table below shows selected tax expenditures resulting from provisions of the federal income tax code reported by the Office of Management and Budget (OMB):

Selected Tax Expenditure Resulting from Preferential Treatment of Income (Fiscal Year 2007)

Provision	Revenue Loss (in Billions of Dollars)
Exclusion of employer contributions for medical insurance premiums	146.8
Capital gains exclusion on home sales	43.9
Deductibility of mortgage interest on owner-occupied homes	79.9
Deductibility of property taxes on owner-occupied homes	12.8
Exclusion of interest on public purpose state and local bonds	29.6
Deductibility of nonbusiness state and local taxes (other than taxes on owner-occupied homes)	27.2

Source: Office of Management and Budget, *Budget of the United States, Fiscal Year 2007.* http://www.whitehouse.gov/omb/budget/fy2007

This is just a small selection of the more than $800 billion of tax expenditures from special provisions of the federal income tax reported each year by OMB. The exclusion of employer-provided medical insurance from the taxable income of employees subsidizes health expenditures. The exclusion of capital gains on home sales subsidizes home ownership in the United States, as does the deductibility of mortgage interest and property taxes. These three tax expenditures together subsidized homeowners in the United States by nearly $140 billion in 2007. Indirectly, the deductibility of property taxes also subsidizes local government by making it easier to get tax increases approved because

(*continued*)

(*continued*)

those taxes mean that part of their burden is shifted to the federal government through reduced federal tax collection.

Similarly, OMB views deductibility of all other nonbusiness state and local taxes as indirect aid to state and local government. Exclusion of interest on state and local debt from federal taxable income makes it possible for these governments to borrow at lower rates than otherwise would be the case. The nearly $30 billion in revenue that the federal government did not collect because of this special provision is also aid to state and local governments.

Tax expenditures make it clear that the personal income tax is used as a mechanism to promote social outcomes, such as home ownership, subsidized health care, and aid to state and local governments, to name a few, in addition to raising revenue to finance federal expenditures. The use of the personal income tax in this way is, in part, responsible for its complexity. As proposals to reform the tax code are considered, those who benefit from these tax expenditures often resist their abolition.

earnings and other forms of income or from increases in the market value of such assets as stocks, bonds, or housing that a person might own. The annual increase in the value of a person's existing assets are capital gains, which can either be realized (converted to cash) by selling an asset or unrealized (not turned into cash in the current year).

A comprehensive income tax would be levied on the sum of a person's annual consumption plus savings. Consumption plus savings in a given year would represent the uses of the taxpayer's earnings and other sources of income.

A Flat Rate Income Tax

The simplest form of an income tax would be a flat rate tax. Individuals would report their income based on the comprehensive definition discussed previously, and a flat rate would be levied to collect the tax. For example, if, through the political process, it was decided to raise all revenue from the income tax and that a 15 percent rate on income would raise enough revenue, then every citizen earning income would have to pay 15 percent tax on that income to the government to finance public services. All income, irrespective of its source or use, would be subject to the tax. Tax forms would be very simple, with only three lines: one to report income, one to indicate the tax rate, and the other to show the product of the tax rate when multiplied with income. If your income was $30,000 this year, you would multiply that income by 0.15 if the tax rate was 15 percent, and your tax bill would be $4,500.

Under a flat rate comprehensive income tax, those with higher income would pay proportionately higher taxes. For example, a person with $10,000 annual income would have a tax bill of $1,500. A person with an annual income of $100,000 would pay

$15,000 in taxes, while a person with $1 million in income would pay $150,000 in taxes. So under a flat rate income tax, the rich would pay more than the poor, even though the tax rate is the same for all taxpayers.

Under a comprehensive income tax, there would be no need for a separate tax on corporation income. Corporations are owned by their stockholders. A corporation's net income would simply be allocated to shareholders in proportion to their share of ownership. For example, suppose the XYZ Corporation has 100,000 shares of its corporate stock outstanding and earned $1 million in profit this year. If you own 10,000 shares of the outstanding stock, amounting to a 10 percent share in the ownership of the corporation, then 10 percent of the $1 million profit, or $100,000, would be allocated to you, and you would have to include this amount in your personal income. Under a 15 percent flat rate tax, your tax liability on your share of the corporation's profit would be $15,000 this year.

The flat rate income tax would be easy to administer. Time spent figuring taxes and keeping records would be minimal, and there would be no need for an army of tax accountants and lawyers to help people wade through complex tax laws.

However, even a flat rate income tax can cause distortions in behavior that could impair the efficiency of operation of the economy. The tax would reduce the net return to work and to saving and investment. This is easiest to see if taxes are withheld from earnings as those earnings are received during the year. If you earn $3,000 per month from your job, and the 15 percent income tax is withheld from your paycheck, then your net earnings from work after tax would be $3,000 minus $450, to give you net pay of $2,550. When deciding how many hours to work, you will base your choice on your net pay rather than the gross amount actually paid by your employer. The reduction in the net wage or salary due to the income tax could impair incentives to work.

The flat rate tax would also reduce the net return to saving and investment. All interest earned on savings, all corporate profits, capital gains, and any other income from use of capital would be taxable. The net return to saving and investment would fall below the actual gross return earned. Because saving and investment decisions are made on the basis of the net, after tax, return, there is the potential for a decline in saving and investment below the amounts that would prevail without taxation.

For example, if you have a savings account in a bank and earn 5 percent interest, then you will have to pay tax on the interest you earn during the year. With a 15 percent flat rate tax, your net interest would amount to 4.25 percent, calculated by subtracting 15 percent of the 5 percent from the gross interest earned:

$$\text{net interest} = \text{gross interest } (1 - \text{tax rate}).$$

In this case, your net interest earned is 85 percent of the 5 percent interest rate.

If the lower net interest rate decreases the incentive to save, then total saving in the nation will decline. As saving declines, funds financing for investment will become

HOW IS THE BURDEN OF PAYING THE FEDERAL PERSONAL INCOME TAX DISTRIBUTED?

The federal personal income tax has a progressive tax rate structure but is also riddled with special provisions that allow taxpayers to avoid paying taxes by taking advantage of the various adjustments, exclusions, exemptions, and deductions as well as tax credits. Do the effects of special provisions cancel out the impact of the progressive tax rates on the distribution of the payments of taxes? In other words, does the progressive income tax really result in the rich paying higher tax rates than the poor?

To find out, the Congressional Budget Office (CBO) conducted an analysis of the distribution of the tax burden of the federal personal income tax for 2003, a year when major tax rate cuts and other changes in the tax code became effective. The study began with a comprehensive measure of income and ranked taxpayers according to the amount of income they earned. Taxpayers were grouped into quintiles, starting with the fifth with the lowest income. The CBO then estimated effective (actual) income taxes paid under the provisions of the income tax code and divided total taxes paid in each quintile of households (adjusted for size) ranked according to their incomes by total income earned in that quintile. A household consists of people who share housing, regardless of their relationship (see Congressional Budget Office 2005 for details of adjustments and comprehensive measurement of income).

The following table shows the results of the CBO study.

Effective Federal Personal Income Tax Rates, 2003

Income Category	Effective Tax Rate (%)
Lowest quintile	–5.9
Second quintile	–1.1
Middle quintile	2.7
Fourth quintile	5.9
Highest quintile	13.9

Source: Congressional Budget Office, U.S. Congress, *Historical Effective Federal Tax Rates: 1979 to 2003.* December 2005. http://www.cbo.gov/ftpdocs/70xx/doc7000/12–29-FedTaxRates.pdf

Notice that the two lowest quintiles actually have negative effective tax rates because the earned income tax credit for low-income taxpayers results in net payments to these households from the U.S. Treasury instead of collection of income taxes.

The results of the study show that the distribution of the burden of paying federal personal income taxes is such that upper-income groups do indeed pay higher average tax rates than lower-income groups in the United States. The estimated average effective rate for all households in 2003 was 8.5 percent. The top 1 percent of households ranked according to income were estimated to pay an average effective tax rate of 20.6 percent in 2003. Effective tax rates are progressive.

scarcer, and market interest rates could rise, discouraging investment. Investment could also directly decline because the tax will be levied on all capital income, including corporate profits, rents, and capital gains, decreasing the net return to investment after taxes. A decline in investment could slow the rate of growth of the economy and decrease future living standards by contributing to a decline in the rate of growth of wages and salaries as worker productivity growth slows because of the slowdown in the supply of new capital equipment and technology that investment makes possible.

In short, a flat rate income tax could reduce the size of the economy by contributing to a decrease in work effort. Over the longer term, the tax could also slow economic growth if it adversely affects saving and investment.

The Personal Income Tax in Practice

The personal income tax in the United States does not comprehensively tax all income. Instead, because tax law allows a host of adjustments, exemptions, deductions, and exclusions from income, taxable income falls far short of total income. For tax purposes, gross income includes wages and salaries, taxable interest, dividends, realized capital gains (although long-term gains on many assets are taxed at preferentially low rates), rents, royalties, most pension income, and business income from proprietorships and partnerships. Taxpayers can, to some extent, control their income tax bills by adjusting the sources and uses of their income. This leads to distortions in behavior as people make decisions based, in part, on the tax advantages of engaging in particular economic transactions, such as buying homes; providing employees with compensation in the form of nontaxable fringe benefits instead of cash; or buying municipal bonds, for which interest payments are exempt from federal taxation.

The federal personal income tax uses a progressive tax rate structure. Instead of one flat rate, there are several rates. The tax rate applied to additional income after a certain amount is received is called the taxpayer's marginal tax rate. Low marginal tax rates apply to lower ranges of income. Each range of income is called a tax bracket, and, as income increases, the amounts falling into higher tax brackets are taxed at higher marginal tax rates. Many citizens believe that a progressive tax rate structure is fairer than a flat rate tax because it subjects those with higher incomes to higher tax rates.

As of 2010, the federal income tax had six tax brackets subject to positive tax rates, with income in the highest bracket subject to a 35 percent tax rate. The lowest positive tax rate was 10 percent. Intermediate brackets were 15, 25, 28, and 33 percent. These tax rates are levied on taxable income. Under a progressive income tax system, marginal tax rates exceed average tax rates. Average tax rates can be calculated by simply dividing taxes due by taxable income. For example, a single taxpayer with a taxable income of $74,200 in 2006 would pay $15,107.50 in federal income tax. This taxpayer's average tax rate would be $15,107.50/$74,200 = .2036 = 20.36 percent. However, the taxpayer would be at the beginning of the 28 percent tax bracket with that amount of income, and each extra

dollar of taxable income would be subject to a 28 percent marginal tax rate. Marginal tax rates are important for determining the impact of taxes on economic decisions, because they influence the net return to going to the effort of earning additional income.

Most taxpayers are entitled to personal exemptions and a standard deduction or can itemize deductions. Tax credits for such expenses as child care can be directly subtracted from tax bills. The standard deduction varies with filing status (single, married filing jointly or separately, or head of household). Adjustments for contributions to retirement accounts and other expenses can also reduce the portion of gross income that is subject to tax.

The personal exemption, the standard deduction, and the beginning points for each tax bracket are adjusted for inflation each year. In 2010, a taxpayer could claim a personal exemption of $3,650 if not claimed as a dependent on some other tax return. Taxpayers can also claim personal exemptions for dependents. A single taxpayer could claim a standard deduction of $5,700 in 2010 or itemize deductions for such expenses as state and local income taxes, property taxes, charitable contributions, interest paid on mortgages, and a host of other expenses eligible to be itemized under the income tax code. If the single taxpayer chooses to take the standard deduction and is eligible for a personal exemption, then $9,350 of gross income would not be taxable. (Under the tax law prevailing in 2010, taxpayers with relatively high incomes have their personal exemptions and itemized deductions reduced, and eventually eliminated, as income increases.)

Finally, there are provisions of the U.S. tax code that result in some low-income taxpayers, particularly those with dependent children, paying negative tax rates. The provision is called the earned income tax credit (EITC) and allowed as much as $5,666 per year to be paid to a low-income taxpayer with dependent children by the U.S. Treasury in 2010. The EITC is a way of using the tax system to increase the incomes and living standards of low-income workers through a tax credit that is payable to the worker by the U.S. Treasury.

The actual personal income tax in the United States can affect incentives to work, save, and invest, just like the flat rate income tax. However, because of complex provisions allowing taxpayers to influence their taxable income tax bills by adjusting the sources and uses of their income, the income tax in the United States effectively subsidizes some activities over others. Provisions in the tax code allowing homeowners to deduct interest on mortgages and property taxes on homes as well as those exempting up to $500,000 in capital gains from the sale of a principal residence from taxation encourage investments in housing. Reduced taxation of long-term capital gains benefits upper-income taxpayers with assets and could encourage them to invest. Exemption of some fringe benefits, such as employer-provided health insurance, encourages compensation of workers in that form instead of in taxable wages. In addition, the complexity of the tax code imposes a burden on taxpayers to keep up with the tax law, keep records, and pay professional tax consultants to help them in filing their tax returns.

Issues and Problems in Income Taxation and Prospects for Reform of the Tax Code

The federal personal income tax has been reformed many times. Each time, it seems to get more complex. Reforming the income tax code is very difficult because there will be both gainers and losers in the process, and the losers use political action to prevent changes that will make them worse off. The most extreme reform would be to move to a flat rate income tax. If this were done, all exemptions and deductions from income would be eliminated, and the average tax rate could be reduced because a much larger portion of actual income received would be subject to taxation. Under a flat rate tax, the average tax rate is equal to the marginal tax rate. A single lower marginal tax rate could reduce the distortions in decision making that result from the impact of taxes on net returns to work and saving. However, many object to a shift to a flat rate tax, because it would lower the tax rate for upper-income individuals while raising the tax rate for many lower-income taxpayers.

A less extreme approach to tax reform would eliminate some exemptions, deductions, and exclusions from taxable income to allow lower marginal and tax rates while retaining a progressive tax rate structure. For example, the report of the President's Advisory Panel on Federal Tax Reform in 2005 recommended limiting deductions for interest on home mortgages and eliminating deductions for state and local income and property taxes. Elimination of deductions generates tax revenue and allows tax rates across the board to decrease without tax revenue collected falling. However, such changes could have adverse effects on homeowners. As the tax advantages to homeownership are reduced, the demand for homes could decline, and this would decrease home prices, reducing the net worth of many households. The President's Advisory Panel on Federal Tax Reform recommended that the mortgage interest deduction be replaced with a tax credit for such interest that would be available to all taxpayers regardless of whether they itemize deductions. The panel also recommended a cap on the amount of interest that could be claimed as a credit so that the benefit to upper-income households with expensive homes and mortgages in excess of $300,000 would be reduced. This could sharply reduce demand for luxury homes but could increase demand and prices for modest homes.

Similarly, the current deduction for state and local taxes cushions those tax bills for those who itemize deductions by, in effect, allowing them to pay some of those bills through a reduction in federal tax liability. If the deduction were eliminated, it would be more difficult for state and local governments, particularly those whose tax rates are already high, to raise tax rates in the future and could result in political action to decrease tax rates.

The personal income tax system has been used as a means of encouraging individuals to favor one activity over another through its extensive use of adjustments, exemptions, deductions, and credits. This, too, has contributed to the complexity of the code. Congress

often enacts tax deductions or credits for such activities as child care or education but limits availability to upper-income households. As a result, the amount of the benefits are often reduced as a taxpayer's adjusted gross income increases, and the tax forms necessary to calculate the reduction in credits or deductions are often quite complex.

Another reform often suggested is to change the tax system to encourage saving and investment. Because of concern about the impact of the current system of income taxation on incentives to save and invest, some economists advocate allowing taxpayers to deduct all of their savings from taxable income and exempting interest from taxation unless it is withdrawn. In effect, such a scheme would tax only consumption, because income less saving is equal to consumption.

Conclusion

The tax reform process is inevitably tied to politics, because it always results in some people gaining while others lose. The prospects for a radical reform of the tax code, such as a shift to a flat rate tax, are remote. Instead, small, incremental changes in tax deductions and credits, and simplification of complex provisions of the tax code are more likely. Elimination of these special provisions that reduce revenue can allow across-the-board decreases in average and marginal tax rates and reductions in the distortions in decision making from the income tax.

INTELLECTUAL PROPERTY RIGHTS

Historically, ideas have changed the world. They impact cultures, governments, and religions. Ideas also shape businesses on many different levels, influencing marketing,

management, and operations decisions on a daily basis. Today, businesses operate in an ever-changing global market, requiring access to information via high-speed communications. The explosion of technological innovation has increased competition and forced businesses to find alternate means to generate profits.

For example, in 1999, Research in Motion Ltd. (RIM), an Ontario-based firm that designs and manufactures wireless mobile devices, introduced the BlackBerry wireless platform (commonly called a BlackBerry). The BlackBerry is a handheld palm computer that uses a radio frequency technology to allow millions of users to instantly access their e-mail, phone messages, Internet, and business data. The introduction of the BlackBerry revolutionized communication capabilities for corporate executives, small businesses, elected officials, and law enforcement agencies. In 2001, NTP Inc., a small patent holding company, filed a patent infringement lawsuit against RIM. NTP claimed that it held the patents to the radio frequency technology used for the BlackBerry and feared that RIM misappropriated the patents without paying royalties. In 2002, a federal jury agreed that RIM had infringed on NTP's patents. In 2003, the court entered a final judgment in favor of NTP and imposed a permanent injunction against RIM for the further manufacture or sale of BlackBerry products. The injunction was stayed pending RIM's appeal. In January 2006, the U.S. Supreme Court declined to hear RIM's appeal (Locy 2006; Spencer and Vascellaro 2006).

In March 2006, with an impending shutdown of all BlackBerry products, NTP and RIM settled out of court for $612 million before the trial judge issued a final opinion regarding the form of injunctive relief. The settlement saved approximately 4 million users from life without their so-called CrackBerries. In May 2006, Visto Inc. filed a patent infringement lawsuit against RIM, alleging that it held the patents to the e-mail technology used in BlackBerry products (Wong 2006; "BlackBerry Maker" 2006). The case was settled in July 2009. However, in January 2010, Motorola filed a request with the International Trade Commission to ban BlackBerry imports, alleging that the device's early-stage innovations drew on Motorola patents. Meanwhile, BlackBerry continues to dominate the business smart phone market, capturing a 61 percent share (Rysavy 2009).

The lawsuits against BlackBerry manufacturer RIM provide insight on two important concepts: (1) the importance of innovation in technology, usually in the form of intellectual property, and (2) the importance of protecting those innovations from piracy.

The Importance of Intellectual Property

The idea of protecting intellectual property dates back to ancient times. In Greek mythology, Prometheus arguably committed an infringement when he stole fire from the Olympian gods to give to mankind. Zeus punished Prometheus by chaining him to a mountainside, where an eagle devoured his rejuvenated liver each day. As a consequence of Prometheus's actions, mankind still has fire to the present day.

During the Middle Ages, protection for intellectual property was granted from the crown or a sovereign. Publishing patents were granted to printers of books like the Bible or legal treatises (factors include relative expense and /or politics). Additionally, the Stationers' Company in England maintained a monopoly of registered books, where the government allowed a printer or bookseller, but not the author, copyright protection on a written work. Publishers paid large sums of money to authors not to sell their works (e.g., John Milton's contract for the sale of *Paradise Lost* in 1667) (Posner 2009).

Modern protections of intellectual property formed with the spread of the Industrial Revolution. In 1710, England instituted the first modern copyright law (Posner 2009). At the Constitutional Convention in 1788, the Founding Fathers recognized the importance of intellectual property when they granted Congress the power to "promote the Progress of Science and useful Arts, by securing for limited times to Authors and Inventors, the exclusive Right to their respective Writings and Discoveries" (Friedman 2004, 426). In comparison with imperial China, "Chinese culture placed continuity with the past, and its suspicion of novelty, both of which encouraged copying" (Posner 2009, 393).

Congress established the Patent and Trademark Office under the auspices of the Department of Commerce. One of the deputy undersecretaries of commerce is the deputy undersecretary of commerce for intellectual property. The Patent and Trademark Office "examines patent and trademark applications, issues patents, registers trademarks, and furnishes patent and trademark information and services to the public" (Garner 1999, 1149). In 1879, Eaton S. Drone published *A Treatise on the Law of Property in Intellectual Productions,* one of the earliest hornbooks on intellectual property law.

Intellectual property is divided into four categories: (1) patents (ideas), (2) copyrights (expressions), (3) trademarks (source indicators), and (4) trade secrets (business processes).

Patents

A patent is defined as the "exclusive right to make, use, or sell an invention for a specified period…granted by the federal government to the inventor if the device or process is novel, useful, and non-obvious" (Garner 1999, 1147). In essence, a patent is monopoly granted by the government for a finite amount of time, despite the general premise that monopolies are disfavored in law or public policy.

Most patents cover functional discoveries (known as utility patents, which last 20 years) and original nonfunctional ornamental designs (known as design patents, which last 14 years), but the Plant Patent Act of 1930 expanded patent protection to newly "discovered and asexually reproduced any distinct and new variety of plant" as long as the plant is a product of "human ingenuity and research" (Friedman 2004, 428). Patents cannot be renewed. Frequently, patent owners will improve a product and receive a new patent (e.g., if the patent on automobile brakes expired but the patent holder improved the brakes with an antilock braking system) (Emerson 2009). A common example of a utility patent is computer software or a process like pasteurization. Design patents are ornamental or distinctive in nature but do not improve the functionality of the product. Examples of a design patent are the shape of the Coca-Cola bottle or the Volkswagen Beetle. Design patents are similar to trade dress (Stim 2009).

Copyright

A copyright is defined as a "property right in an original work of authorship (such as literary, musical, artistic, photographic, or film work) fixed in any tangible medium of expression, giving the holder the exclusive right to reproduce, adapt, distribute, perform, and display the work" and must be creative (an exercise of human intellect) (Garner 1999). Although not required, owners of the copyright can enhance their legal rights by placing a copyright symbol (©) on the work and registering it with the U.S. Copyright Office (Stim 2009).

The rights attributable to a copyright expanded greatly in 1903 after the U.S. Supreme Court ruled that advertisements were protected under the Copyright Act. Thereafter, the rights applied to movies, piano rolls and phonograph records, radio and television, photocopying machines, music downloaded from the Internet, and computer software (Friedman 2004). In the late 1990s, Congress extended copyright protection to the life of the author plus 70 or 95 years (formally 50 or 75 years) after heavy lobbying by the Walt Disney Company. In 1998, the Digital Millennium Copyright Act (DMCA) was enacted to protect the burgeoning software businesses and to comply with the treaties signed at the World Intellectual Property Organization (WIPO) Geneva Conference in 1996. Specifically, the DMCA criminalized unauthorized pilfering of computer software, manufacture of code-cracking devices, and subterfuge around antipiracy measures and required Internet companies that performed services like music downloading

(e.g., Kazaa, Napster, Apple iTunes) to pay licensing fees to record companies (Duboff 2002; Emerson 2009).

Trademark

A trademark is defined as a "word, phrase, logo, or other graphic symbol used by a manufacturer or seller to distinguish its product or products from those of others. The main purpose of a trademark is to guarantee a product's genuineness. In effect, the trademark is the commercial substitute for one's signature. To receive federal protection, a trademark must be (1) distinctive rather than merely descriptive, (2) affixed to a product that is actually sold in the marketplace, and (3) registered with the U.S. Patent and Trademark Office" (Garner 1999, 1500). Once a trademark is registered, it is valid for the life of the use of the trademark, as long as it is renewed every 10 years. Trademarks are classified into five categories regarding their inherent distinctiveness: (1) unique logos or symbols (such as the marks used by furniture makers and silversmiths), (2) created or fanciful marks (such as Exxon or Kodak), (3) common or arbitrary marks (such as Olympic for paints and stains or Target for retail sales), (4) suggestive or descriptive marks (such as Chicken of the Sea tuna or Oatnut bread), and (5) generic or common marks that have lost distinctiveness (such as aspirin or elevator). Generic or common marks do not receive trademark protection. Products of distinctive shape may be protected under a concept called trade dress (such as the packaging of a product or the motif used by national chain stores) (Stim 2009).

In 1905, Congress passed legislation to regulate trademarks based on their power to monitor interstate and foreign commerce. In 1946, Congress approved the Lanham Act to codify existing trademark law and afford further protection to businesses from infringement (Friedman 2004).

Trade Secret

A trade secret is defined as confidential business information that is designed to maintain an advantage over competitors. The information can appear as a formula, pattern, process, compilation, method, or program. As a trade secret, the information derives value because it grants a distinct advantage to the business owner, and the business owner implements reasonable tactics to maintain its secrecy. This is accomplished by restricting access to the information (to documents and /or areas where documents are stored), implementing confidentiality and nondisclosure agreements with employees, and preparing appropriate form agreements (Garner 1999; Duboff 2002; Emerson 2009).

The Consequences of Piracy to Business

The United States is the world's largest exporter of intellectual property, including movies and music (Friedman 2004). Piracy of intellectual property costs businesses and

consumers $250 billion and 750,000 jobs each year (U.S. Patent and Trademark Office 2006). Nonmonetary losses to piracy are "fame, prestige, the hope of immortality, therapy and inner satisfaction" (Posner 2009, 390). Piracy or infringement is the illegal reproduction or distribution of intellectual property (not by the exclusive or registered owners) protected by copyright, patent, or trademark law (Garner 1999). Piracy has been especially rampant in the communications, music, pharmaceuticals, and software industries. The important question determined by courts in most infringement actions is who (such as an independent inventor or corporate employee) or what (such as a corporation or organization) has ownership of intellectual property, whether it is an idea, expression, source indicator, or business process. Therefore it is imperative for businesses and government to protect intellectual property and develop appropriate commercial and legal strategies to implement that protection.

Protection of Intellectual Property Rights Internationally

Despite the protections afforded by the Constitution and legislation by Congress, infringement is on the rise, especially outside the United States. U.S. companies have filed infringement cases against China-based companies and seek protection from pirates in Latin America, Russia, and other parts of Asia. Once a patent, copyright, or trademark is registered in the United States, the registrar, in essence, becomes the owner and is granted exclusive rights to use that patent, copyright, or trademark within the United States. The registrar may grant a license or sell its interest to another party, domestic or foreign. With the advent of the global economy, industrialized nations and worldwide organizations have pushed for standardized intellectual property protection applicable to every participating country. The most common method to standardize that protection is through the use of treaties and agreements.

For example, agreements with other nations, such as the North American Free Trade Agreement, passed in 1994, strengthened patent and copyright protection in Mexico. Mexico agreed to strengthen its intellectual property laws and honor pharmaceutical patents for 20 years. Treaties like the Patent Cooperation Treaty and the Paris Convention allow U.S. inventors to file for patent protection in selected industrial nations if the inventor files the proper paperwork and fees within a certain time frame. The standards differ from country to country (Stim 2009). In most countries, intellectual property protection begins when it is registered, not on the date it was created or invented (which is true in the United States). In 2005, Congress considered (but did not enact) legislation that would change the date of protection to the date of registration, as in most international markets.

Many patent holders focus on protecting their rights in the United States and file international patents in the European Union and/or Japan, although the benefit of filing patent applications in China, India, and Russia will outweigh the cost in the near future. If infringed goods enter the United States, the owner can contact customs officials to

confiscate and destroy the contraband. Likewise, once registered in a foreign country, U.S. registrars can be sued by the host country for alleged infringements, as a China-based corporation did in February 2006 (Parloff 2006). The hope by business analysts is that this type of litigation will force and encourage host countries to seriously police patent infringement.

Copyright protection is stronger internationally than patents because of various treaties like the Uruguay Round Agreement Act of 1994, the WIPO Geneva Conference of 1996 (which extended the Berne Convention), and the DMCA of 1998 (Emerson 2009). But copyright protection is not international because a country signs one of the treaties or agreements. Experts recommend that companies file for trademark protection as well as patent protection (e.g., Reebok in Uruguay) (Bhatnagar 2006).

An additional fear of U.S.-based companies doing business overseas is fighting so-called third-shift products, which are produced by an authorized manufacturer but produced in excess of the number agreed on in the contract. Often, the excess product is sold on the black market. Courts have a difficult time declaring those products counterfeit, because it is nearly impossible to tell the difference or whether that particular product was within the contract (Parloff 2006).

Legal Relief: Infringement Causes of Action, Injunctions, and Contracts

Today, litigants file two types of lawsuits: (1) an infringement cause of action, which seeks monetary damages and a form of injunctive relief, and (2) a breach of contract action. If someone files an infringement lawsuit, the litigant usually requests the court to issue a restraining order or injunction and the awarding of monetary damages, fines, lost royalties, and/or attorney's fees (Stim 2009).

An injunction is a "court order commanding or preventing an action. To get an injunction, the complainant must show that there is no plain, adequate, and complete remedy at law and that an irreparable injury will result unless the relief is granted" (Garner 1999, 788).

A contract is an "agreement between two or more parties creating obligations that are enforceable or otherwise recognizable at law (a binding contract)" (Garner 1999, 318).

Today, courts interpret contracts narrowly by considering the contractual text and limit most types of extrinsic evidence like the contracting parties' intentions, special meaning of words, and/or trade usage of the industry. The court will regard extrinsic evidence only if the contract is vague or ambiguous (Posner 2009). If a plaintiff proves a breach of contract action, the usual remedy is monetary damages to make the plaintiff whole (returning the plaintiff to his or her precontract status). Specific performance is an unusual remedy in such situations.

If criminal behavior is suspected, it should be reported to the proper prosecution bodies—namely, the federal government or local authorities. The types of criminal charges

EXAMPLES OF LAWSUITS DEALING WITH INTELLECTUAL PROPERTY RIGHTS

1. One of the first intellectual property cases heard by the U.S. Supreme Court dealt with copyright infringement of the publishing rights to its own cases: *Henry Wheaton and Robert Donaldson v. Richard Peters and John Grigg* (1834). Henry Wheaton and Robert Donaldson (plaintiffs), located in Philadelphia, Pennsylvania, were under contract to publish the cases decided by the U.S. Supreme Court, a right that they purchased from a prior publisher. One of the plaintiff's responsibilities was to provide a volume to the secretary of state, located in New York City. Richard Peters and John Grigg (defendants) were sued under the premise that they sold condensed versions of the U.S. Supreme Court reporters in New York City. The plaintiffs sought injunctive relief, but the U.S. Supreme Court ruled that "no reporter of the Supreme Court has, nor can he have, any copyright in the written opinions delivered by the court: and the judges of the court cannot confer on any reporter any such right."
2. Fred Waring, owner and conductor of an orchestra (plaintiff), produced phonograph records of its compositions. WDAS Broadcasting Station Inc. (defendant) broadcasted the records on the radio without a license from the plaintiff. In *Waring v. WDAS Broadcasting Station, Inc.* (1937), the plaintiff sought an injunction from the court to prevent the defendant from playing the records. The trial court granted the injunction, because recording of the plaintiff's music was a "product of novel and artistic creation as to invest him with a property right." The appellate courts affirmed the trial court.
3. Kevin E. George (defendant) was convicted of distributing unauthorized copies of recorded devices and distributing items bearing counterfeit marks, third-degree felonies in Pennsylvania, after two investigators for the Motion Picture Association of America (MPAA) spotted the defendant selling counterfeit videotapes from a vending table on a public sidewalk in Philadelphia. The investigators received training to identify fraudulent packaging, especially "blurry printing on their cases, low-quality cardboard boxes, bogus trademarked studio logos and titles of motion pictures that were currently playing in theaters." The investigators went to the police and reported the defendant, who was subsequently arrested and convicted of the above charges (*Commonwealth v. George* 2005).
4. MercExchange LLC (plaintiff) owned a business method patent for an "electronic market designed to facilitate the sale of goods between private individuals by establishing a central authority to promote trust among participants." Previously, the plaintiff licensed its patent to other companies but was unable to complete an agreement with eBay Inc. or Half.com, an eBay subsidiary (defendants). In its patent infringement action, the plaintiff alleged that the defendants used the patent without permission. A jury found that the plaintiff's

(*continued*)

(*continued*)

patent was valid and that the defendants had infringed that patent. The jury awarded monetary damages, but the trial court refused to grant the plaintiff's request for injunctive relief (*Ebay, Inc. et al. v. MercExchange, LLC* 2006).

5. Myriad Genetics (defendant), together with the University of Utah, held patents on two genes that the firm successfully sequenced using a proprietary technology and whose genetic mutations are associated with breast and ovarian cancer. The patent owners claimed that isolating DNA from the body and applying measures to it to make it analyzable in the laboratory made the DNA—or, more specifically, the two genes in question—patentable. Bringing suit against them, however, was the American Civil Liberties Union (ACLU) along with various patients and medical organizations. The ACLU argued that the genes in this case were not the product of genetic engineering but rather components of the human genome—naturally occurring substances—and, as such, were not patentable. It further argued that the existence of the patent barred researchers not affiliated with Myriad from exploring the genes and potentially making new discoveries. In the end, the U.S. district court hearing the case ruled in favor of the ACLU, finding that the patent should never have been granted because one was dealing here with a "law of nature," not a human invention (*ACLU v. Myriad Genetics* 2010).

available to a prosecuting agency include "mail fraud, interstate transportation of stolen property, voracious state common law charges, and violation of the federal Economic Espionage Act" (Emerson 2009, 558).

The statutory criminal offense for criminal infringement involves "either (1) willfully infringing a copyright to obtain a commercial advantage or financial gain…or (2) trafficking in goods or services that bear a counterfeit mark.…Under the second category, the statute imposes criminal penalties if the counterfeit mark is (1) identical with, or substantially indistinguishable from, a mark registered on the Principal Register of the U.S. Patent and Trademark Office, and (2) likely to confuse or deceive the public" (Garner 1999, 785).

Although a patent may be registered, companies can still challenge the patent, as Ranbaxy Laboratories Ltd. did to Pfizer's patent on Lipitor. One of Pfizer's two patents was invalidated during the litigation, cutting back Pfizer's protection from June 2011 to March 2010. One strategy to elucidate the status of broad patents is for a registrar to file a declaratory judgment with the court to legally define the status of the patent (Smith 2006b).

Controversial Aspects of Intellectual Property

Public opinion indicates that many people believe that the United States is too litigious and question whether an individual or company can own an idea. This leads to controversy regarding intellectual property laws. In the early part of the 20th century,

large corporations that subsisted on their employees' sweat and brains controlled patents (Friedman 2004).

In many cases, the courts favored defendants, until 1982, when a law abolished the Court of Customs and Patent Appeals and gave the new Court of Appeals for the

GOOGLE BOOKS

In October 2004, Google announced a partnership with five major research libraries (Harvard, Stanford, University of Michigan, Oxford, and the New York Public Library) to scan millions of books into a company database and make them accessible via an online search engine. Several other universities joined over the next few years. The Google Books Library Project (books.google.com/googlebooks/library.html) has generated controversy from the beginning. In collaboration with the participating libraries, Google scans books in the public domain (i.e., works whose copyrights have expired) along with copyrighted books. For the latter, Google displays bibliographic information (similar to an old card catalog in a library) and supplies only enough of the book's contents (a "snippet") to enable a user to confirm that this is the volume sought. Google's goal is to create an index of all books in the world that can be accessed electronically. The company also intends to scan out-of-print books, which benefits individuals searching for books that might otherwise be difficult or impossible to find.

Critics complain that Google has usurped the rights of authors and publishers to distribute and profit from their works and that the company supplants the traditional function of the public library as well. Google has responded that much of the controversy is the result of inadequate or inaccurate understandings of the issues involved. Regarding the claim that the company is offering every book in the world free to Internet users, Google notes that only full versions of books that are out of copyright are made available. Books still in copyright are displayed in "limited view," with links to where users can buy or borrow them.

Regarding the claim that Google is generating revenue from advertising on its book search service and denying income to copyright holders, Google argues that the company does not put ads on a book's display page unless the publisher wants them there and has given Google permission to do so. It stipulates that the majority of the revenue, in fact, is given back to the copyright holder. In other words, the company profits from ads only to the extent that its publishing partners do as well.

In 2005, several publishers and organizations took Google to court over these issues, claiming that Google had violated the fair use provision of U.S. copyright law. Google countered that everything it was doing was legal. In 2008, a settlement was reached whereby Google has agreed to compensate authors and publishers in exchange for the right to scan and display copyrighted books. The agreement also gives publishers the right to opt out of the program so that any of their books scanned in participating libraries would not be made available to Google users. In April 2010, a group of organizations representing visual artists (photographers, graphic artists, etc.) sued Google for copyright infringement. Whether this case, too, will be settled or will proceed to trial remains to be seen.

Federal Circuit the exclusive right to hear patent appeals. Today, plaintiff patent owners benefit from greater legal securities as the image of a patent shifted from "a tool of big business; now it was a legal shield to protect the entrepreneur, the risk taker, the start-up company" (Friedman 2004, 427–428). Additionally, patent lawsuits in federal court doubled between 1998 and 2001, and patent applications increased from 200,000 in 1994 to 380,000 in 2004. Currently, the Patent and Trademark Office is attempting to reform the system to quicken the review of 1.2 million backlogged patents (Schmid and Poston 2009).

Many fear a frivolous lawsuit that will cost a defendant time, money, stress, and years of frustration. Today, some corporations' sole purpose for existence consists of buying patents and litigating possible infringements (Slagle 2006). For instance, the Rock and Roll Hall of Fame sued a photographer for infringement because he sold a poster depicting the Rock and Roll Hall of Fame before a "colorful sunset" and labeled "Rock n' Roll Hall of Fame in Cleveland." The court dismissed the case, despite a trademark registration and wide public recognition of the photograph (Duboff 2002).

Conclusion

Although protection of intellectual property is vital to businesses and other organizations (such as universities) both large and small, registration of patents, copyrights, and trademarks places limitations on individual creativity. In ancient times, plagiarism was the sincerest form of flattery; now plagiarism and infringement are synonymous with criminal activity. Realistically, intellectual property protections are necessary to protect hardworking inventors against those who seek to subvert the system while chasing ill-gotten gains.

In a global economy, patents, copyrights, and trademarks have an increased importance for organizations of all types and sizes. Advances in intellectual property and piracy affect every segment of industry; therefore, it is imperative that intellectual property be registered in the places where an organization conducts business or that organizations are prepared to deal with the consequences.

INTEREST GROUPS AND LOBBYING

Ronald J. Hrebenar

Virtually any discussion of contemporary American social issues has to be framed within the vast array of interest groups and lobbyists who advocate for or resist the adoption of new policies. Of all the nations in the world, interest groups and lobbyists are more important to the outcomes of social issues in the United States and especially in the contemporary political era. If one just follows the course of U.S. politics by reading the political articles in the *New York Times* or the *Washington Post,* one would quickly notice that almost every social issue is understood by an examination of the powerful interest groups involved in the political battles. The essence of the process of U.S. politics is interest groups and lobbying.

The Foundations of Interest Group Politics in America: James Madison's Warnings

Every society has interests. Even the most ancient or primitive societies had key interests such as religion, agriculture, warriors, artisans, businesses or trades, and government. The 13 American colonies in the late 1780s had various interests—some promoted by groups with substantial political and economic power. James Madison, the father of the U.S. Constitution and author of some of the most important Federalist Papers (written in defense of the proposed Constitution), warned about the "danger of factions." Factions in the 1780s were an early form of interest group, and Madison designed the new federal government created by the Constitution as a large republic in order to reduce the power of these interests in the United States. Interest groups and lobbying cannot be eliminated in a free society without sacrificing liberty, so the best that can be done is to create a governmental structure with checks and balances and divisions of power so that powerful interests are less likely to dominate government and public policy.

The causes of faction are based "in the nature of man," and the "most common and durable source of factions has been the unequal distribution of property," wrote Madison. Property in a free society and economy will always be distributed in unequal amounts and types; thus, factions (or interests) will always be present.

Since, as Madison argued, there can be no cure for the causes of faction, one must focus on methods for reducing the negative impacts of factions (or interests) on the political system. This is also one of Madison's great contributions to the establishment of the U.S. political system: the complex or large republic. "A Republic…promises the cure for which we are seeking." Madison designed a republic, not a democracy. The republic is a representative government, not a government of direct citizen decision making. The representatives would use their wisdom to discover the "true interest of their country."

The dangers that Madison envisioned have become more apparent in recent decades as money has flooded into the political system and interest groups have moved

to provide millions of dollars to politicians for their campaigns (Kaiser 2010). The 2008 elections cost over $5 billion. Annually, lobbying in Washington and in state capitals costs over $6 billion, and that is just a portion of the grand total (Center for Responsive Politics 2010).

The Nature of the American Interest Group System

When the French aristocrat Alex de Tocqueville toured the new American nation in the 1830s, he was amazed by the tendency of Americans to organize interest groups to advocate social change. Compared to the politics of "Old Europe," Americans preferred to use political organizations to pursue their social objectives. Modern comparative political science supports that conclusion. Among the peoples of developed nations, Americans belong to more interests groups than any other people and expect these groups to promote their interests and preferences for them. Those in the other developed nations tend to leave such tasks to political parties (Hrebenar 1997).

The *Encyclopedia of Associations* lists over 20,000 interest groups operating in the United States in the early 21st century (Hunt 2004). The primary focus point for interest groups and lobbying is the U.S. national capital, Washington, DC. In the past several decades, many interest groups moved their national headquarters to K Street so that they can be close to the action on Capitol Hill. Over 20,000 lobbyists are registered in Washington, DC, and that figure represents only a part of the total of lobbyists representing all types of interests and issue areas.

As more and more state governments have expanded their budgets and activities in recent decades, the state-level interest group systems have become more professional and powerful. Interest group politics in Sacramento, California, Albany, New York, and Springfield, Illinois, have come to resemble that found in Washington, DC.

Who are these lobbyists? Many of them are lawyer-lobbyists. In the latter half of the last century, Washington law firms discovered a new revenue stream can be generated by adding a lobbying corps to the basic law firm. Lawyers have many of the skills that make for effective lobbyists. They are trained to understand the law and how it is made, interpreted, and implemented. They are also trained to be effective negotiators—and negotiation is a crucial activity for lobbyists trying to persuade others to support the political objectives of their clients. Many lobbyists are former bureaucrats who have served for a number of years in the governmental bureaucracy—often as staff members for the Congress and its specialized committees or as staff members for the various departments or agencies of government. Holding such jobs gives these lobbyists both subject expertise and lots of personal contacts with government decision makers. Former members of Congress are also valued as future lobbyists given their experience in various issue areas, political knowledge, and contacts in government. Finally, some lobbyists emerge from within the ranks of interest groups' employees and work their way up the ranks to jobs in political affairs, governmental relations, or as

executive directors—top lobbyists for many interest groups in Washington (Hrebenar and Thomas 2004).

What do lobbyists do? Primarily, lobbyists provide information to governmental decision makers. They act as representatives of the various interests to the representatives in government. The types of information they provide vary depending on the background of the lobbyist, the policy situation, the political environment, and the governmental decision maker they are lobbying. Some lobbyists are the nation's foremost experts in a particular and very specialized field, such as the extraction of oil from shale (a rock). Others can advise on the nature of public opinion regarding a particular bill, and still others can help plan strategy for getting a bill passed in Congress or a regulation approved in the federal bureaucracy. Since lobbyists represent so many different groups involved in a particular policy debate, a huge amount of useful information is available to the decision makers. Some lobbyists act as watchdogs for their interests—monitoring the key sites of government and reporting back to their interests if anything is happening in a department, agency, or house of Congress that may impact upon the interest. Others are pure advocates or contact lobbyists—often assigned to the White House, the Congress, or a particular department of the bureaucracy and having a variety of contacts in these sites they can use to try to effect a particular outcome. Some lobbyists are specialists in putting together coalitions for a particular bill and thus maximizing the power behind their cause by dividing up the work needed to achieve victory.

One of the major changes that has characterized lobbying in recent years has been the growing sophistication of the tools of the trade (Cigler and Loomis 2006). In decades past, lobbying was exclusively a face-to-face communications activity. Now, however, much of the communications is increasingly electronic, with e-mail messages replacing the old standard of sending a letter or a telegram to your congressperson. In the 1960s and 1970s, such communications were usually by fax or telephone; now, the Internet is used to alert the group's membership to ask them to help lobby the decision makers. This type of lobbying, the activation of members to get out the message, is called grassroots lobbying. There are several types of grassroots lobbying: "shotgun grassroots," where the activation of many members of an organization or coalition is the goal and thus, maybe millions of members may communicate their support; and "rifling grassroots," where the activation of some elite members of the organization produces a more personal and more effective type of communications. When grassroots lobbying is perceived to be ineffective because it seems too artificial or characterized by many very similar, if not identical, messages, it is called "Astroturf"—after the plastic grass of the Astrodome in Houston.

Another electronic form of contemporary lobbying is found in the various outlets of mass media. While billboards and lawn and telephone signs used to be an effective form of issue communication in the 1950s and 1960s, now television, especially cable

THE DEBATE OVER HEALTH CARE REFORM UNDER PRESIDENT BARACK OBAMA

There have been a series of great lobbying battles in the first decade of the 21st century, but surely one of the greatest was over the Obama administration's efforts to create a more substantial role for the federal government in managing the nation's huge health care insurance program—a sector that accounts for one-sixth of the nation's gross domestic product each year and continues to grow. While the nation's financial system struggled to recover from its near collapse in late 2008 and early 2009, health insurance companies, hospitals, doctors, pharmaceutical manufacturers, corporations, labor unions, consumer associations, and lawmakers organized for a fight over health care. The administration's success or failure in passing a reform bill was regarded as a defining moment for the Obama presidency, just as it had been in 1993–1994 for the Clinton administration. After months of confusion involving the Democratic-controlled Congress putting forth a variety of different proposals, the Obama administration stepped in with a compromise that managed to get just enough votes in the House and Senate to pass. The measure was signed into law by the president in March 2010.

Opponents such as the American Medical Association, the lead association of the nation's medical doctors, continued to oppose medical insurance reforms—as it had since the 1930s, when President Franklin Roosevelt proposed a national health insurance program to be added to his social security initiative, and then again in the 1940s, when President Harry Truman proposed a similar idea. The health insurance companies, too, in this latest round of debate, hired hundreds of lobbyists to descend upon Congress and advocate against the "socialization of American medical care." On the opposite side, a national health care insurance program, including a "single payer" provision that would have bypassed the private insurance companies that lie at the heart of the U.S. system, had long been on organized labor's political agenda. And, in a major switch from the time of the Clinton debacle of the 1990s, the pharmaceutical manufacturers this time were on the side of reform, because the Obama administration had promised them protections once they agreed to reduce the prices on some drugs covered in the new proposals. Big Pharma (i.e., the pharmaceuticals industry) ran some $100-million worth of TV ads in support of the administration's efforts.

When all of the issue advertising and spending on lobbying was over, a new law on health insurance in the United States was passed—and yet no one was completely happy. Tens of millions of Americans gained better access to health care, but the system of for-profit, private health insurance that makes U.S. health care different from care in every other developed nation, was still intact. Insurance companies, however, were now unable to deny people coverage for preexisting health problems, and they could not so easily terminate coverage for people who developed costly diseases or health conditions. Like many interest group battles before it, in this case, too many compromises on both sides produced a mixed outcome for all.

television, offers interest groups the ability to target very specific groups of people. An interest group can run television ads in just the congressional districts represented by all the wavering members of a specific congressional committee considering a bill of great import to the group. This is what the Health Insurance Association of America did in 1993 with its now famous "Harry and Louise" ads, as the Clinton administration tried to pass a health care reform bill. The ads cast doubt on many parts of the proposed law, which finally died in Congress without an up-or-down vote. Recent decisions by the Supreme Court, including *Citizens United v. Federal Election Commission* (2010), have made such advocacy TV ads a much more readily available tool for interest groups to use in electoral campaigns in support of politicians who favor their cause or against those who oppose it.

Many interests, especially those seeking to challenge the existing social, political, or economic orders in the United States, do not have the resources to engage in multi-million-dollar TV advertising campaigns. These interests have some types of resources that can allow them to participate in the political process—even if they are at a serious disadvantage in terms of money and other resources that their more established opponents have in abundance. These interests are usually called social movements because they lack the organization, formal membership, and resources of more traditional interest groups. This is not to say that they are not important parts of the political system. In some cases, they represent millions of people who support to one degree or another a particular policy outcome such as equality of treatment for gays and lesbians or express the anger and frustration voiced by the Tea Party supporters in 2010's elections. These interests usually try to gain greater public support for their cause by creating free media events that allow them to gain free media coverage for their cause. Thus, the tools of choice are marches, demonstrations, boycotts, and various actions that draw people—and especially the media—to cover them and their cause. Many of the great interest groups of the contemporary United States began as disorganized social movements and after some success evolved into the more conventional form of interest groups employing the conventional strategies and tactics of such groups. Some of the groups that emerged out of these broader movements include the National Organization of Women, the National Association for the Advancement of Colored People, and the Friends of the Earth.

Money: The Mother's Milk of Interest Group Politics and Lobbying

Money is called the "mother's milk of politics" because it can be converted into so many other resources that are valuable to lobbying (Unruh 2008). It can be used to build a powerful organizational structure with a staff of experts; it can be used to hire powerful, knowledgeable leadership; it can be used to access the mass media to communicate a group's position in important issue debates; it can be used to organize a grassroots campaign; it can be used to help finance the political campaigns of politicians favorable to its cause; it can even be used to finance a public relations campaign

to change the public's image of the group and thus enhance its persuasiveness in the issue debates.

Powerful interests such as the American Association of Retired Persons (AARP, the huge, 35-million-member lobby of senior citizens) have hundreds of millions of dollars in revenues each year to support lobbying campaigns. Wall Street and the U.S. banking industry poured tens of millions of dollars into both Republican and Democratic party campaigns in recent years trying to gain the access they needed to protect their interests if the financial system collapsed (as it did in 2008) and calls for greater regulation of the financial industry threatened the industry. Supporters and opponents of the Obama administration's health care reform bill of 2010 also spent hundreds of millions of dollars in lobbying the issue as well as tens of millions of dollars in donations to campaigns of members of Congress in 2006 and 2008.

What does money buy for an interest? First and foremost, access. Interests that make big donations to a political campaign or a political party can expect to have access to key political leaders and an opportunity to make their arguments at key times during the debates. Interests that do not "play the money game" will have a far more difficult time gaining access. They may eventually get some access, but how seriously will they be listened to? Do large campaign contributions buy favorable decisions for the rich interest groups? There is considerable debate on this. Some argue that it does and can point to hundreds of examples where the big contributors often get the laws and regulations they want—give or take a few details. Others argue that the politicians they support financially in election campaigns already support these outcomes regardless of the financial contributions. What is clear, in any case, is that money does buy access, and the outcomes in policy frequently follow the preferences of the groups that give the money to the politicians for their campaigns.

Conclusion

In the final analysis, the outcomes of debates over controversial social issues in U.S. politics are closely linked to major interest groups and the skills and persuasiveness of their lobbyists. To understand which issues rise to be discussed and then dealt with by the legislatures and executives across the nation, one must understand the roles played by interest groups, mass movements, and lobbyists; and one must also understand how these powerful organizations impact these outcomes and, ultimately, the future of U.S. society. As political scientist Jeffrey Berry has put it, ours is an "interest group society" (Berry and Wilcox 2008).

LABOR, ORGANIZED

Robert M. Fearn

Many questions arise when one considers organized labor and collective bargaining. Among them are the following:

- Why do people join unions?
- What can unions do for their members?
- What are the economic and social effects of organized labor?
- How have those effects changed over time?
- What is the future of U.S. organized labor in the new world economy?

One approach to answering these (and similar) questions is, first, to define what unions are and what they are not, and, second, to trace the history of unions in the United States through good times and bad up to the present.

Types of Unions

Although unions are an economic entity, they are or can be much more than that. Indeed, organized labor (or unionism) represents a broad socioeconomic movement that has taken many forms in many different countries. Among these are the following:

- *Uplift unions.* Associations of workers that seek to raise the incomes and/or alter the living conditions of their members (and others) by raising the skills and cultural levels of members and by providing aid to members who have experienced economic reverses. Leadership of these unions is often external

(priests, rabbis, ministers, philanthropic volunteers), as distinguished from rank and file.

- *Political unions.* Associations of workers that seek to achieve similar objectives primarily through political action, often in alliance with a political party or parties. Unions in democratic socialist nations often fall into this category.
- *Revolutionary unions.* Associations that seek the same objectives by overthrowing the system—that is, by forcibly altering the property right and/or economic-political system.
- *Industry unions.* Associations that seek to raise the incomes of their members and alter the conditions of employment primarily through collective bargaining. Industry unionists generally accept and seek to work within the existing political and economic system.

Although all four types of unions have existed in the United States, industry unions have been the predominant form.

The Rise and Decline of Unions in the United States

Union membership was relatively low prior to the First World War, but it grew sharply during that conflict, peaking at 5 to 6 million—including Canadian members of U.S. international unions. Throughout the 1920s and the early 1930s, union membership declined to about 3 million workers, representing 11–12 percent of nonagricultural employment in the early 1930s. The pattern of unionism in the United States has changed since 1930, both in total membership and as a percentage of nonagricultural employment. Although the available data involve differences in definitions and contain some gaps over the years, the general trends are clear. Union membership grew very rapidly during the late 1930s and the World War II period, both in membership and as a percentage of employment. In 1945, unions represented over 14 million workers—about 35 percent of nonagricultural employment. Hence, one-third of U.S. wage and salary workers were unionized. Unions were heavily concentrated in mining, manufacturing, and construction and were located particularly in the northern and western industrial states. Beginning in the late 1940s and throughout the 1950s, union membership grew more slowly, and membership began a slow decline as a proportion of employment (or labor force). Total membership peaked in 1979 at 21 million workers (about 24 percent of nonagricultural employment). Thereafter, membership gradually fell.

Worker Attitudes

One powerful influence in the growth of unions was the attitude of many workers toward collective action, both in the workplace and in other aspects of their lives. Many immigrant groups saw collective action as necessary in the struggle for dignity and higher incomes. German, Scandinavian, and Midland English immigrants brought

THINGS MAY NOT BE WHAT THEY SEEM

Seeking to limit union monopoly power via the Taft-Hartley Act of 1947, Congress outlawed the closed shop. Closed shops involve practices or contractual arrangements whereby employees are obtained exclusively through a union hiring hall or a union business agent. Hence, only persons who are union members (or approved by the union) are eligible for employment.

Despite the legislative ban, de facto closed shops still exist. Is that fact evidence that employers are intimidated by union (or union mob) muscle, as some people contend? Does it mean also that the legal authorities are refusing to enforce the law? While the answer to both questions could be yes, there is an alternative explanation.

First, unions in such instances generally guarantee some acceptable level of skill or experience among those referred for employment. And de facto closed shops seem to exist primarily (if not exclusively) in activities involving intermittent employment. Construction, entertainment, and longshoring are good examples. While there may be alternative ways for employers to staff those positions (say, by conducting a new search each time workers are needed or by hiring temps through various agencies), the union hiring hall may be the least expensive way of obtaining qualified workers whenever and wherever needed. Hence, the closed shop may still exist because it serves the interests of the unionists *and* the employers.

with them a strong pride of craftsmanship and allegiance to the working class. Although, to some degree, these attitudes were foreign imports, they also resulted from and were strengthened by social and economic pressures created by the rapid industrialization of the United States in the late 1800s, the growing social divide of the times, and serious concern about the distribution of income among the population. Clearly, pride of craftsmanship was a strong component in the earliest unions, which were usually organized along craft lines: printers, carpenters and joiners, plumbers, machinists, railroad engineers, and so on. Other immigrants, such as the Irish and the Jews, were alienated from their new environment and saw a need for group solidarity and protection against the bosses. No doubt, those attitudes reflected previous experiences with foreign overlords as well as ethnic and religious discrimination. Somewhat later, African Americans and Mexican Americans mirrored those attitudes and joined unions in large numbers.

The Desire for More

"More" was his answer when Samuel Gompers, president of the (craft-oriented) American Federation of Labor (AFL), was asked what organized labor wanted. Clearly, with national income rising, with vast fortunes being earned by the bosses, and with periodic depressions and recessions, labor wanted both a larger share of the economic pie and

greater security. Moreover, unions were prepared to use collective bargaining, strikes, and boycotts to achieve what they believed to be a more equitable distribution of income. However, it was not until the 1930s that any widespread unionization occurred beyond the traditional craft unions. At that time, the Congress of Industrial Organizations (CIO) spearheaded union organization by industry rather than by crafts and organized large numbers of semiskilled and low-skilled workers into unions. The success of unions in achieving "more" is discussed subsequently.

Labor Market Monopsony and Feelings of Impotence

Closely related to workers' attitudes and desires (and some political initiatives) were (1) feelings of economic impotence among workers and (2) the existence of labor market monopsony (where one or a few firms provide most of the employment in the area). In such so-called company towns, there was often considerable tension between workers and management. Coal and other mining communities are good examples. Moreover, under such conditions, workers might risk their jobs by complaining. Obviously, workers could use what Freeman (1976) calls "exit voice" to relieve their workplace grievances, but "union voice" (including grievance procedures established in the collective bargaining contract) was an alternative approach that provided workplace dignity without the need to search for a new job.

As automobile transport became cheaper, roads improved, labor markets became more competitive, information concerning alternative employment opportunities increased, and immigrant and other workers became less alienated and part of the burgeoning middle class, the demand for unionism to address labor market problems diminished, but it did not disappear. Workers in large firms continued to support union efforts to standardize wages and process workers' grievances. In response, many firms established open-door policies, ombudsmen, and employee relations offices to encourage communication between the firm and the workers, to provide a better human relations climate, and to maintain a regular check on the fairness (and limit the arbitrariness) of first-line and other supervisors.

The Legal Framework

Despite company towns, strong feelings of alienation and inequity, and the desire for "more," unionization and union activities for many years were sharply limited by law. From the early 1800s, unions and union activities were often treated by the courts under the common law as criminal conspiracies—that is, actions or associations in restraint of trade. After *Commonwealth v. Hunt* (1842), unions per se were no longer illegal, but most of their economic actions were. Indeed, under the Sherman Anti-Trust Act of 1890, treble damages were a possibility on conviction. It is not surprising, therefore, that unionism did not grow rapidly until the legal strictures were temporarily relaxed during World War I and later in the 1930s, when the Wagner Act (the National Labor

Relations Act of 1935) somewhat belatedly encouraged unionization as an offset to the power of businesses in labor markets.

The legal climate changed again after World War II with the passage of the Labor-Management Relations (or Taft-Hartley) Act of 1947 and subsequent rulings by the National Labor Relations Board. The 1950s saw the passage of the Labor-Management Racketeering (or Hobbs) Act of 1951 and major congressional hearings. The latter resulted in the prosecution and disgrace of several top labor leaders. While the growth and decline of unionism were affected by changes in the legislative and regulatory climate, those changes cannot account fully for what occurred during the latter half of the 20th century.

Union Successes and Changing Labor Markets

As an economic entity, unions can be more successful in raising wage levels when the wage increases do not lead to major reductions in the employment of their members. When it is difficult or expensive to substitute machinery or other inputs for labor (as, say, in the case of airline pilots), the ability of unions to raise wages above what might otherwise exist is strengthened. The ability to substitute other inputs for labor, however, varies substantially from industry to industry, and it changes over time with new products and new technology. So does the profitability of the firm(s) and the ability to substitute nonunion or foreign labor for U.S. union labor. Hence, the ability of unions to raise wages declines when changes in technology, skill levels, and import/export restrictions make substitutions easier or when firms become less profitable.

It is not surprising, therefore, that Lewis (1963) (and his colleagues and students at the University of Chicago and elsewhere) found very sizeable differences in union wage effects across industries and across time periods. Their studies show effects ranging from 100 percent in 1921–1922 for bituminous coal mining to a zero effect in 1945. Only a few studies, however, showed changes in relative wages greater than 25 percent. Indeed, the average wage effect shown by these studies was approximately 10–15 percent. Many seemingly strong unions had little or no effect on wage levels but were apparently able to provide workers with grievance and other workplace protections. As suggested, these protections may be highly valued by workers. Indeed, according to Lewis, less than 6 percent of the labor force showed union wage effects of 20 percent or more. As suggested, these effects varied among and within industries and over time.

Most of these estimates were made during or prior to the 1960s. During the entire post–World War II period, however, there were massive changes in industrial composition and the U.S. labor market. In particular, manufacturing was affected by (1) a substantial rise in productivity (similar to that experienced earlier in U.S. agriculture), (2) the movement of population and some industry to the less unionized southern states, and (3) the increased ability of Japanese and European firms to export their products to the United States.

Indeed, as a result of these and other factors, manufacturing employment in the United States fell by about 5 million workers during the last three decades, reducing the workforce in manufacturing from about 20 percent of total employment in 1979 to about 11 percent in 2005. In addition to the factors noted previously, the U.S. economy and unions in the United States have been affected by globalization and the emergence of world market conditions that increased further the availability of foreign products. Globalization, of course, affected more than the unionized sector. Indeed, many of the low-skill intensive and often nonunion industries (particularly in the South) were heavily impacted by free trade and the formation of new truly global corporations in both manufacturing and commerce. Included among these were textile, garment, and sewing firms. Mergers created numerous new international corporations with plants around the world. In addition, some U.S. firms simply closed their plants in the United States and even overseas, choosing to become wholesalers who contract with foreign-owned firms to meet the product specifications established by the U.S. firm(s). In addition, the massive transformation of the economy in the late 1980s and 1990s known as the dot.com boom sharply altered job skills, communications, business procedures, and industrial composition.

All of these factors sharply affected the ability of unions to raise or even maintain wage levels in the industries and areas where unions had previously exhibited clout, lowering the extent of unionization and altering the composition of the labor movement. As noted, the largest U.S. unions are now concentrated in public-sector service jobs and in transportation, utilities, and construction—industries where the possibilities for foreign labor substitution are smaller than in, say, manufacturing.

According to Deitz and Orr (2006), job losses in manufacturing "are almost certain to continue"—an assessment that surely applies even more strongly to the 2008–2009 recession and its aftermath. Nonetheless, Deitz and Orr found that, in the early 2000s, high-skilled employment in manufacturing rose substantially in almost all manufacturing industries and in all parts of the country. Such a finding is consistent with the comparative advantage of the United States over many other countries in highly skilled activities. It also reflects the fact that it is often more difficult to substitute other inputs for skilled labor. In a previous age, that was one of the strengths of the craft-oriented unions.

Among the industries that were hard hit by the recent recession is the U.S. auto industry. U.S. carmakers have long struggled with high labor costs—salaries, benefits, health care, and pensions—compared to their nonunionized counterparts, the Japanese automakers. Before the recession, Detroit automakers made agreements with unions to reduce wages while making pension and health care commitments to their workers. Nevertheless, that left carmakers vulnerable to drops in the financial markets, as happened at the end of 2008. The terms of the earlier agreements had to be revisited and additional changes instituted. Most of the auto companies, for example, offered their older

workers early retirement packages and made agreements with the United Auto Workers to transfer pension obligations to an independent trust. Massive loans from the government also were solicited. Yet, despite even that, U.S. automakers continued to struggle in the market vis-à-vis the Japanese carmakers. As of mid-2010, there were signs both positive and negative regarding Detroit's overall prospects for success.

Union Leadership

No listing of the factors influencing U.S. unionism would be complete without some mention of the many charismatic and often controversial leaders of the movement. Samuel Gompers of the American Federation of Labor was cited previously. John L. Lewis, initially with the Coal Miner's Union, championed the rise of industrial unionism and led in the formation of the CIO. The Reuther brothers, Walter and Victor, developed the sit-down strike into a formidable weapon and directed the once powerful United Auto Workers Union. George Meany, the longtime president of the combined AFL-CIO, also deserves mention. So does Jimmy Hoffa of the Teamsters Union, who was regularly accused of racketeering and connections to the Mob. That circumstance, among other concerns, led to the passage of the Labor-Management Racketeering Act of 1951. In 2005, Andrew Stern, then president of the Service Employees International Union, led his large union out of the unified AFL-CIO in a dispute over how to reorganize the labor movement to meet the challenges of globalization and changing technology. Each of these individuals contributed to the nature and success of unions in the United States, as did a raft of other leaders.

The Future of Organized Labor in the United States

The ups and downs of unionism combined with the uncertainties of the future make any predictions extremely difficult. All one can reasonably do is outline the major factors that could affect unions and union membership now that membership as a proportion of employment is only about 12 percent and slipping.

Several factors weigh heavily in what may occur in the near future. These factors include (1) globalization, (2) the change in the composition of the labor movement from the manufacturing and mining to the service industries, (3) the growing skill levels of U.S. workers within manufacturing and beyond, and (4) the growth of social discord in both the United States and the newly industrializing nations. Moreover, as in the past, legal-legislative changes could have major impacts.

Clearly, the old feelings of alienation, impotency in the workplace, and even class struggle have risen recently with industrial relocation and new technology. It seems likely that these concerns will continue to be addressed among skilled and professional workers largely by exit voice, rather than by union voice. That certainly was the pattern in the 1990s and the early 2000s. Indeed, exit voice among such workers may entail migration across national boundaries, going where the jobs are. Among lower-skilled and

semiskilled workers, however, the emerging world labor market may limit the opportunities for exit voice both within and outside the United States, and that may encourage unionization. Many displaced workers have already found their way into the service industries, now the most heavily unionized sector of the economy. Some of these workers, of course, have left the labor force, have relocated into nonunion jobs, or have been retrained for higher-skilled occupations. Union leaders like Andrew Stern argue that recent events require both the reorganization of existing unions and an emphasis on industrywide (rather than firm-level) bargaining. Whether such changes could or would reinvigorate unions or increase membership, however, is problematical. It is also unknown whether the new immigrants to the United States, legal or illegal, will be as supportive of unions as were the immigrants of the middle to late 1800s and early 1900s.

Alternative approaches to strengthen unions may be tried, particularly the formation of truly international unions to match the new international corporations or the insistence on international labor standards via the courts, the United Nations, and various treaties. These approaches face many obstacles. The first is somewhat daunting since political (rather than business) unionism has been the norm in many other developed nations. Moreover, there are innumerable differences in labor laws and regulatory climates among the nations. Also, there are important questions of national sovereignty. Finally, some nations are rejecting globalization and even capitalism, nationalizing industries and hence limiting the opportunities for collective bargaining on either a firmwide or industrywide basis. Nevertheless, there is some agitation overseas (for example, in China) for independent industry unionism now that there are private employers throughout that nation. Of course, U.S. unions would welcome and support such a development in China and elsewhere.

Finally, to the degree that perceived income differences grow among Americans, there will be stronger demands for government regulation of the labor market via living wage and minimum wage laws, governmentally regulated pension arrangements, and the like. As in the past, organized labor in the United States is likely to support both collective bargaining and governmental initiatives to address the overall distribution of income.

MARKETING OF ALCOHOL AND TOBACCO

Paul W. Schneider

Alcohol and tobacco have served a variety of functions and played a significant role in the marketplace throughout history. Alcohol has long been used as part of religious customs, as medicine, and as a form of sustenance. Tobacco was used as collateral for loans from France during the American Revolutionary War, as a cure-all, and as a diet aid. However, for the last 200 years or so, alcohol and tobacco have been consumed in a fashion consistent with present-day usage, primarily for pleasure. Regardless of the reason for their use, both substances have been popular throughout most of human history. And both substances and their marketing have become controversial.

Historical Developments

As early as the Civil War (1861–1865), organizations were formed to protest alcohol consumption. Although alcohol remained popular among portions of the population, independent movements calling for voluntary abstinence and eventually the prohibition of alcohol by law emerged.

Eventually, as living conditions improved and humans began to live longer, the hazards of alcohol surfaced. The public took notice and actions were taken. Prohibition, a result of the temperance movement and which made the sale and consumption of alcohol illegal, began on January 16, 1919. It was abolished on May 10, 1924.

To date, the marketing of alcohol remains largely self-regulated, and legal limitations on marketing and sales have been more lenient than those on tobacco. Nonetheless, the

knowledge that alcohol can contribute to health problems and beliefs that it is responsible for corrupting the family unit have led to the establishment of dry counties in various states. In existence to this day, a dry county is one that prohibits the sale of alcohol.

It was not until the surgeon general released a report called "Smoking and Health" in 1964 that the hazards of smoking were officially and publicly recognized. Negative press surrounding tobacco surfaced due to the health concerns associated with the product. This caused many of the major tobacco producers of the 1960s to consider changing the names of their companies and diversifying their range of products. In marketing, names are important because they convey information about the company to consumers. The information communicated to consumers influences how the company is perceived and how it is positioned in regard to purchasing habits. Tobacco companies acknowledged the importance of brand names, and a trend started that saw tobacco companies actively change their names and products to avoid negative perceptions.

In the United States in the 1960s, a company that produced only tobacco products or had the word *tobacco* in its name was looked upon unfavorably. As a result, American Tobacco Company became American Brands, and Philip Morris bought part of Miller Brewing Company. R. J. Reynolds Tobacco Company changed its name to R. J. Reynolds Industries and ventured into the aluminum industry. (Reynolds Wrap aluminum foil was long part of the R. J. Reynolds line of products.) The government has regulated the sales and advertising of cigarettes and, since 1966, has forced the industry to place health risk warnings on all packaging. Sales of both alcohol and tobacco to minors are limited; these age limitations vary according to state laws.

The Costs of Marketing Alcohol and Tobacco

In the United States, more than $2 billion is spent each year to promote alcoholic beverages (Center on Alcohol Marketing and Youth n.d.). The alcohol industry claims that

ADVANTAGES OF POINT-OF-PURCHASE ADVERTISING

According to the Point-of-Purchase Advertising Institute, sales of point-of-purchase materials bring in nearly $13 billion annually; this makes the sales of point-of-purchase advertising materials third highest of all media in dollar expenditures. Point-of-purchase advertising consists of:

1. Displays, which can range from countertop to refrigerated dispensers
2. Signs, which serve notice of special pricing or other important information about a product
3. Shelf media, which attach to the front of retail shelving and tell the customer about special offers without taking up valuable retail space
4. New media, which can include video displays, coupon dispensers, interactive displays, and audio devices

advertising only affects brand choice and that the marketing of products is done to establish brand differentiation, or anything that positively distinguishes the identity of a company and its products and/or services to consumers from other companies' products. Popular examples of brand differentiation in the alcohol industry include promotions for Samuel Adams reminding consumers that the company uses more hops for flavor in its beer, and Coors Brewing Company's description of its beer as shipped cold and made with Rocky Mountain spring water.

While alcohol producers claim that advertising only promotes distinguishing characteristics to consumers, alcohol researchers, the U.S. surgeon general, and the National Institute on Alcohol Abuse and Alcoholism disagree. They say that heavy episodic drinking, or binge drinking, is at least partially fueled by commercial messages (Center on Alcohol Marketing and Youth n.d.). Binge drinking is regarded as the consumption of five or more consecutive drinks by a male or four or more consecutive drinks by a female. National studies have concluded that 40 percent of college students are binge drinkers.

Alcohol consumption among college students has been shown to have an elastic demand. This means that as the price of alcohol decreases, consumption increases. Because traditional college students are around the legal drinking age, marketing helps fuel the desire for experimentation. Of course, many influences other than marketing (such as parenting and peer pressure) factor into one's decision to consume alcohol. But given alcohol's accessibility, it is believed that marketing initiatives and promotional measures that constantly bombard people with advertising and discounted prices increase consumption by keeping alcohol financially accessible and on consumers' minds (Kuo et al. 2003). Unfortunately, increased drinking by college students leads to a greater number of accidents. The National Institute on Alcohol Abuse and Alcoholism reports that drinking by college students results in more than 1,800 alcohol-related deaths each year (National Institute on Alcohol Abuse and Alcoholism 2009).

It is projected that more than $243 million was spent in 1999 alone to sponsor public service activities that combat alcohol abuse and related problems. Nearly $11 million is spent annually to educate the public about the harm of tobacco (Corporate Accountability International n.d.). (The industry has a daily marketing budget of about the same amount; Educational Forum on Adolescent Health 2003.) While both the alcohol and tobacco industries have marketing programs that are intended to educate the public about potential risks, the difference is that tobacco education has federal funding, whereas alcohol does not. Alcohol education programs are funded by institutions such as Century Council, the Beer Institute, the National Beer Wholesalers Association, Brewers' Association of America, and the alcohol companies.

Aggressive Marketing of Products

Some organizations and activists believe that the products' aggressive marketing practices have an adverse impact on the long-term behavior of the population. Thus, certain

marketing approaches may have a variety of opponents. It is logical to ask why companies in these industries would continue practices that lead to such unfavorable attacks on their businesses.

The answer lies in the nearly 5,000 customers that the tobacco industry loses in the United States on a daily basis (approximately 3,500 quit and 1,200 die) and the estimated 100,000 Americans dying annually from alcohol-related causes (Corporate Accountability International n.d.; Mayo Clinic 2007). In fact, it is projected by the U.S. Office on Smoking and Health that smoking results in more than 5.5 million years of potential life lost nationally each year (Centers for Disease Control 2008). Simply put, in order to replace the revenue from those customers that the industries are losing, new customers must be acquired. This is accomplished through multimillion-dollar marketing campaigns. Campaigns of this magnitude are widespread, encompassing many media outlets. This means that marketing messages about alcohol and tobacco will reach the eyes and ears of youths, regardless of the demographic groups that the messages are geared toward.

Consequently, rules surrounding the marketing of tobacco and alcohol are evolving, and marketing campaigns in nearly all parts of the world are aimed at preventing children from developing these habits. The theory is that preventative measures will translate into an absence of alcohol- and tobacco-related problems and health risks in the future.

Marketing Tactics

When marketing abroad, the alcohol and tobacco industries often attach American themes to their brands. This practice is particularly common in tobacco advertisements; for example, in one ad circulated in the Czech Republic, a pack of Philip Morris cigarettes is seen merging with the New York City skyline, and a Polish Winchester Cigarette advertisement features the Statue of Liberty holding an oversized pack of cigarettes. Others showcase prominent U.S. cities; red, white, and blue color schemes; and scenes that depict an American lifestyle (Essential Action n.d.).

Goldberg and Baumgartner found that the use of American imagery in smoking advertisements works because smoking is seen as an attractive part of the American lifestyle in many countries. Those attracted to the United States and who regard it as a place they would like to live are more likely to smoke. Having decided to smoke because they see it as an important part of the American lifestyle, they are more likely to smoke a U.S. brand of cigarette (Goldberg and Baumgartner n.d.).

R. J. Reynolds found in a 1983 study that marketing using American themes is not successful in the United States. Statements made by study respondents included: "It is too nationalistic," "America is not that great," and "It is not appropriate to sell America when selling cigarettes, or at least not in such a directly nationalistic way" (Essential Action 2006).

Nonetheless, the promotion of the perceived customs and norms of a product's place of origin has surfaced in the domestic advertising of alcoholic beverages. Smirnoff Ice, an alcoholic beverage, employs actors with Russian accents and wearing Russian garb for a television advertising campaign. Beer companies such as Heineken and Becks also proudly promote the heritage of the beer's national origin.

Another method that has been effective among U.S. consumers is what author Edward Abbey calls "industrial recreation" (Marin Institute n.d.). Often referred to as "wreckreation" or "ecotainment," the term refers to the utilization of landscape to promote a product. It is argued that such use of terrain in advertising may change the way that the community uses and experiences public space.

Some new marketing campaigns are prompting questions about whether they are bending the rules of marketing. The prevailing rules of marketing rely primarily on codes that are geared toward traditional media. New technologies that utilize both traditional and nontraditional marketing techniques are complicating efforts to restrict and monitor marketing aimed at susceptible groups. These new technologies allow questionable marketing practices, such as cloaking, to go undetected by policy.

Cloaking, or stealth, is an ethically questionable technique employed online by Web sites to index Web pages within search engines in a fashion that is different from the way the page is indexed to other sources. Basically, the technique of cloaking can be used to trick a search engine. Successful cloaking results in higher rankings of inappropriate matches—for example, a search for a word unrelated to alcohol might bring up the sites of alcohol companies, which may lead the user to browse those sites. The logic here is that the more visitors a Web site receives, the more valuable it becomes. Some Web sites that employ cloaking have considerably different content from what the user intended to find and are often of pornographic nature. As such, some feel that the rules that govern marketing need to be revamped to ensure consistency among standards in relation to newly emerging marketing tactics.

Should the Marketing of Alcohol and Tobacco Be Limited?

Yes

Ninety percent of all smokers begin smoking before age 21, and 60 percent of current smokers picked up the habit before age 14 (U.S. Department of Health and Human Services 1989). The American Public Health Association, citing government research, states that every day "an estimated 3,900 young people under the age of 18 try their first cigarette" (American Public Health Association 2010). Clearly, children are the growth opportunity for the tobacco industry. If people do not start as children, they are significantly less likely ever to use the products. Cartoon characters were banned from tobacco advertising in 1991 after Joe Camel, the famous cartoon representative of the Camel cigarette brand, was shown to be more appealing to children than adults. In 2010, the Food and Drug Administration, which regulates tobacco sales, applied new restrictions

to cigarette vending machines and barred tobacco companies from advertising at popular sporting events or offering merchandise such as hats and T-shirts. Stipulations such as these are an attempt to prevent the exposure of children to tobacco marketing and, it is hoped, tobacco products.

Possibly the most disturbing of such accusations is the charge that the marketing and advertising firms working for the tobacco industry employed psychologists to better understand children and how to more effectively target them. One of the revelations of the recent tobacco-related court cases was that tobacco companies asked retail outlets to place tobacco products in proximity to external doors in unlocked cabinets. They told the store owners that they would be reimbursed for stolen products. A few stolen cigarettes today can lead to hundreds of cartons of cigarettes sold 20, 30, and 40 years later. Health departments have been quick to encourage stores to discontinue this practice.

The alcohol industry has not seen the same level of concern over the advertising of alcoholic beverages. For instance, the introduction of spirits advertising on cable television was not opposed in 1996, even though, according to the 1986 Nielsen Report on Television, children watch an average of 28 hours of television per week. Ironically, permission to advertise alcohol on television was granted five years after the banishment of cartoon characters from cigarette advertisements.

Currently, 70 percent of the U.S. population is 21 years of age or older. In accordance with industry codes for beer and distilled spirits, the placement of alcohol-related advertisements is permissible in nearly any piece of media that is not specifically geared toward young children (National Institute on Alcohol Abuse and Alcoholism n.d.). The concern is that the messages of alcohol companies are reaching a vast number of youths through the television programs they watch and the magazines they read in their homes. Some argue that seeing an advertisement for alcohol or tobacco next to an advertisement for a prestigious or widely desirable product may still be harmful because of an unconscious association that may be drawn by the reader (Marin Institute n.d.).

The Federal Trade Commission and the National Academies Press agree that there should be a reduction in the exposure of youth to alcohol advertising (National Center for Chronic Disease Prevention 2006). Research shows that limitations placed on marketing initiatives in the tobacco industry, in addition to federally funded tobacco education programs, have decreased the amount of tobacco usage. This suggests that similar actions regarding alcohol would decrease sales and consumption as well as the occurrence of the third-leading cause of preventable death in alcohol-related fatalities in the United States (Centers for Disease Control and Prevention 2003). Though exposure of alcohol advertising to youths has been shown to have decreased 31 percent between 2001 and 2004, children are still more exposed, per capita, than adults (Center on Alcohol Marketing and Youth 2007).

Organizations such as Mothers Against Drunk Driving and the Center on Alcohol Marketing and Youth feel that the alcohol industry should not be the only supplier of

education concerning alcohol consumption. They advocate federal funding for alcohol education and suggest that the alcohol industry no longer be permitted to practice self-regulation, as was done with the tobacco industry. Self-regulation of alcohol marketing means that the industry itself helps set the standards of regulation in regard to advertising.

Opponents of alcohol self-regulation were recently disappointed when the viability of Australia's self-regulation policy, which mirrors that of the United States, was questioned in a series of allegations. Some marketing tactics that were examined were deemed to be sexually explicit or specifically geared toward children. One of the alcohol advertisements that was often singled out featured the phrase "Come out to play" written in ink on the palm of a woman's hand. It was argued that this advertisement was aimed at children.

The criticism did not bring about a substantial change in self-regulation policy, and this lack of action was felt by many alcohol activists to be a slap on the wrist for a major violation against alcohol advertising regulations and a reminder of the alcohol industry's power. The alcohol companies claim no wrongdoing.

No

Alcohol and tobacco companies already face advertising restrictions that are unheard of in other industries. The International Code of Advertising, issued by the International Chamber of Commerce, asserts that "advertising should be legal, decent, honest, truthful, and prepared with a sense of social responsibility to the consumer and society and with proper respect for the rules of fair competition" (International Chamber of Commerce n.d.). Yet tobacco and alcohol must adhere to additional stipulations. Tobacco has been the target of a national campaign called "We Card" that requires cashiers to ask for identification from anyone who appears to be younger than 30 years old, and limitations are placed on point-of-purchase, or on-site, marketing initiatives for alcoholic products.

Many products in the marketplace have associated risks, but alcohol and tobacco are among the few that face marketing regulations because of the detrimental effects on their consumers' health. For example, an estimated 17 percent of children and adolescents in the United States are overweight (Centers for Disease Control and Prevention 2010). Being overweight can lead to numerous health problems, such as type 2 diabetes, hypertension, stroke, heart attack, heart failure, gout, gallstones, and osteoporosis. However, there are no laws limiting fast-food commercials that target youths. A Burger King Whopper with a large fries and a Coke has 1,375 calories, yet there is no surgeon general's warning on fast-food wrappers (Healthy Weight Forum n.d.). Considering the marketing efforts, availability, and low cost of such restaurants, one would think they would require additional marketing rules, just like alcohol and tobacco. Yet even as obesity is being proclaimed a national epidemic, the post-meal cigarette is still getting all the attention.

The self-regulation policy of the alcohol industry receives much criticism, yet it has many positive attributes. For example, an extensive amount of marketing issues can be attended to without involving constitutional issues of government regulation (Federal Trade Commission 2003). The lack of costly deliberation in high courts concerning alcohol marketing issues saves considerable amounts of taxpayer dollars. A 1999 report to Congress noted that most companies in the alcohol industry complied with the codes of self-regulation and that the culture of some companies causes their practices to supersede industry standards (Federal Trade Commission 2003).

Sports Illustrated is a magazine devoted to sports that is enjoyed by both adolescents and adults. The results of an examination of the alcohol and tobacco advertisements in the last issue for July and the first issue for August from 1986, 1996, and 2006 showed the following:

- In 1986, there were nine alcohol advertisements and five tobacco advertisements (*Sports Illustrated* July 28 and August 4, 1986).
- In 1996, there were five alcohol advertisements and three tobacco advertisements (*Sports Illustrated* July 22 and August 5, 1996).
- In 2006, there were four alcohol advertisements, one tobacco advertisement, and one advertisement for Nicorette gum, a nicotine replacement therapy designed to reduce nicotine cravings (*Sports Illustrated* July 31 and August 7, 2006).

This example shows a decrease in the marketing of alcohol and tobacco over the 20-year period. Also note that the 2006 issues included an advertisement for Nicorette, a product used to assist in breaking the smoking addiction. This is just one illustration of the change that has already taken place.

Conclusion

Ultimately, the burden of counteracting the adverse impact of marketing alcohol and tobacco lies with each of us, as does the decision whether to use such substances. Most organizational and legislative movements do not seek to revoke the right of adults to use these legal substances. The provision of all the facts that will allow individuals to make their own informed decisions seems to be the desire of most groups, regardless of their stance on the product.

The marketing issues surrounding alcohol and tobacco focus on who is really making your decisions, you or marketers? Marketers are trained so well in the art of manipulation that most people fall victim to their messages without realizing it. The most prevalent question about the marketing of alcohol and tobacco is whether such advertising leads the average person (or child) to make poor lifestyle choices.

Should restrictions regarding the marketing of harmful products be implemented to save us from ourselves, and, if so, what should be deemed harmful? For example, is eating fast food on a regular basis harmful? The answer is probably dependent on the individual.

Marketing works. It convinces us to buy products that we do not need, cannot afford, and, in some cases, should not use for a variety of reasons. The goal in regard to the marketing of potentially harmful products is to present both the good and bad features and then allow people to decide for themselves.

MARKETING TO CHILDREN

Phylis M. Mansfield and Michael Shally-Jensen

Purple ketchup, blue squeeze butter, and French fries that are flavored with cinnamon or chocolate—these were all products that were developed specifically to be marketed to children. But products marketed directly to children are nothing new. In the 1950s, the products were toys like Silly Putty, Monopoly, and Barbie. Today, those toys still exist, although the new holiday wish list includes items like iPods, cell phones, and video games.

Even the use of celebrity characters as advertising spokespeople is not a recent phenomenon. Today we have SpongeBob SquarePants, Dora the Explorer, and Blue from *Blue's Clues;* in the 1950s, there were Tony the Tiger, Cinderella, and Mickey Mouse.

Every one of us at one time or another has probably nagged a parent until a favorite toy was purchased. However, in today's society, there is growing concern over the increased consumption and spending by children. Some critics believe that companies are too aggressive in targeting children. Marketers respond that they are only providing the product; it is the parent's job to monitor how much the child spends.

But are children today really different from children of past generations? Are marketers today taking unfair advantage of children, or is the growth in children's consumption just a trickle-down effect of a larger consumer culture?

Children as Consumers

Children are becoming consumers at an increasingly younger age. Just a few decades ago, children were considered to be consumers, or brand aware, by the age of 7; now it's more like 3. Not only are they becoming more brand aware at an earlier age, but they are also spending their own money and influencing family spending in a significant way. In the United States, children ages 4 to 12 spend more than $50 billion directly and are estimated to influence more than $500 billion each year in family purchases, from furniture to the family minivan (Dotson and Hyatt 2005). In fact, kids influence about 62 percent of minivan and SUV purchases, which may be why a number of major manufacturers

have run ad campaigns featuring animated cartoon characters such as Jimmy Neutron or Shrek inspecting a vehicle and approving its features (see, e.g., Chrysler 2008).

Children Learn to Spend

Older children are turning to making their own money in order to support their spending habits. Over 55 percent of U.S. high school seniors work more than three hours each day, compared to 27 percent of their foreign counterparts. While many parents may feel that teen employment instills a work ethic early in life, it has been shown that grades and participation in school activities suffer when teens work during the school year (Quart 2004). It is difficult to determine which comes first, however: the positive work ethic a child develops as a productive member of society or the consuming culture that tells the teen he or she has to have the latest and coolest brand.

Similar logic has been used by parents to justify their children's use of debit and credit cards. Marketers promote the cards as ways to teach children how to spend money. However, they may also encourage them to spend money they don't have. Children as young as 8 years old have been targeted by marketers with their own credit card. Hello Kitty, a popular children's brand, has licensed its brand name to MasterCard, which markets the service directly to the parents. The card can be used at stores like a regular credit card or at an ATM to withdraw cash. Kids love it because it makes them look cooler than if they were just using cash (Bodnar 2005). Even the youngest consumers are taught to use plastic in their play. One toy company has a toddler's "first purse" play set that comes complete with a debit card and case. And the Hasbro company recently announced a British version of Monopoly that will use a debit card—no cash play money.

Marketers may tell parents that giving a child plastic helps them learn how to spend, but sociology experts tell parents that direct teaching episodes are a better way to teach children how to become good consumers. Some TV networks that target kids and teens have turned to an old-fashioned way to offer these teaching episodes by promoting "co-viewing," where the child and the parent watch TV together. Marketers actually promote

MARKETING FACTS AND FIGURES

- Companies spend about $17 billion annually marketing to children.
- Children aged 2 to 11 see more than 25,000 ads per year on television (a figure that does not include the Internet or other technologies and sources).
- Teens between ages 13 and 17 have on average 145 conversations per week about brands, which is double the same figure for adults (Campaign for a Commercial-Free Childhood n.d.).
- In the decade between the early 1990s and the early 2000s, there was a tenfold increase (1,000 percent) in the number of food products targeted to children and teens (Institute of Medicine 2006).

their products—brands and products whose purchase children significantly influence—to both the parent and the child at once. Cartoon Network shows commercials for automobiles, vacation destinations, and sit-down restaurants alongside those for McDonald's, Cheerios, and Mattel. To better understand this interchange of information, Disney ABC Kids Networks Group commissioned a research study of children's influence on purchases in which mothers and children between the ages of 6 and 14 were interviewed about their purchasing behavior. Some of the results are shown in Table 1 (Downey 2006).

Criticism of Children's Marketing

The growth in the spending power and influence of children has prompted criticism of marketers, parents, and legislators. Juliet Schor, an expert in consumerism and family studies, is one of those critics. In *Born to Buy,* she describes how children as consumers are changing: "Kids can recognize logos by eighteen months, and before reaching their second birthday, they're asking for products by brand name" (Schor 2005).

The increase in brand recognition by young children is at least partially due to the impact of television. In the 1950s, families typically had one television per household, and the programs directed at children were mostly Saturday morning cartoons and a few daily morning shows. Today, there is a proliferation of children's programming, some educational, some not so, and most accompanied by commercials. The typical commercial during a children's program is 15 seconds, half the length of a commercial targeted at older consumers. Children's attention spans are shorter, requiring only a brief ad message. The commercials are also more colorful and action oriented.

In addition to the increased number of ads directed at the children's market, there also has been an increase in the number of hours that children spend watching television and a decrease in the amount of parental control over what is viewed. Schor (2005) says that approximately 25 percent of preschool-age children have a TV in their own bedroom, and they watch that TV for a little over two hours each day. It is estimated that American children watch a total of 40,000 television commercials annually.

One research study by doctors at Stanford University found that children's demands for specific toys and foods increased with the time they spent in front of the television.

The third-grade children who were interviewed averaged 11 hours of TV time each week, and another 12 hours spent on video games or computers. The children were able to identify where the ideas for their requests for toys or food items came from—whether it was from the television or their peers (Murphy 2006).

The quest for brand loyalty is moving to increasingly younger television audiences. Marketers once targeted 7- to 12-year-olds. However, companies realized that they need to attract consumers to their brands at an even earlier age. The new target segment is the preschooler—children ages 2 to 5. In fact, the preschooler market has become increasingly competitive, and television has become a primary medium for advertising messages. "It is estimated that a successful preschool TV show generates more than $1 billion in retail sales in any given year across all related categories, including recorded media, in the U.S.," says Simon Waters, vice president of Disney Consumer Products, Disney's global franchise management branch (Facenda 2006).

Moreover, as more and more children at a younger and younger age spend greater amounts of their time social networking via the Internet (e.g., MySpace) or using handheld devices such as smart phones, the higher is the likelihood that marketers will continue to expand their efforts in these areas in addition to those they already undertake in the television industry.

Social Issues

Although parents are accountable for the consumer behavior of their children, there is still the question of corporate and social responsibility. The number of advertisements for children's products embedded in television programs and the increase of product placements and movie tie-ins have made the parent's job increasingly more difficult. SpongeBob SquarePants has his own toothpaste and toothbrush product line; Dora the Explorer has a lunch box and other products; and every time a children's movie is released, it is now paired with some type of premium at a fast-food restaurant.

But parents have had to contend with spokescharacters like SpongeBob SquarePants for decades (i.e., the Donald Duck lunch boxes of the 1950s). What is it about today's environment that makes it different from that of previous generations? Two factors that have an impact on the consumer behavior of children are time and money. Parents spend less time with their children today than they did in previous decades. Many children living in single-parent or two-income households obtain a large portion of their skills from their peers at day care or at school. And even schools, once a sanctuary from pervasive marketing tactics, have become the new frontier for commercialism. Faced with declining budgets, schools are turning to subsidies from corporations, which are allowed to come into the school with a program, albeit it educational, that is sponsored by their firm. These sponsorships are considered by some to be subtle forms of advertising.

Children are also more active in sports and other extracurricular activities than they were in previous decades. Many parents find themselves shuttling their children from

one event to another after school, the children's calendars booked almost as tightly as their own. Parents are also feeling pressure from longer working hours, which leave them less time and energy to spend with their children. Add to that the fact that the square footage of the average home in the United States has increased significantly, which requires more upkeep and maintenance, and parents have more to do during their off hours. We are working more and spending more, yet relaxing less. In fact, U.S. workers spend more hours at work each week and have less vacation time than workers in any other industrialized nation in the world.

Marketers know that parents who spend less time with their children are willing to spend more *on* them, a relationship that has been substantiated by researchers. It is probably no surprise that children are moving from reasonably priced toys to more expensive electronic products at an ever-decreasing age. Younger children are requesting expensive products like Wiis, cell phones, iPods, and laptops—the type of products that used to be reserved for teenagers and adults. Marketers say that the market for electronic products aimed at tweens grew 46 percent in 2004 (Kang 2005).

When Marketing Tactics are Questionable

Marketers can use subtle messages to get to young consumers that parents may find difficult to overrule. When the tobacco companies were required to remove cigarette ads from media and even withdraw their sponsorship of the Winston Cup NASCAR race, they were forced to look for other ways to promote and increase the sales of their products. One such way is through the product itself. R. J. Reynolds, the company that first used Joe Camel in questionable advertising campaigns, went on to market its products to younger smokers in a different way. R. J. Reynolds introduced in 1999 a new line of candy-flavored cigarettes. They came packaged in a shiny tin box and had names like Beach Breezer (watermelon), Bayou Blast (berry), and Kauai Kolada (pineapple and coconut). The cigarettes were flavored with a tiny pellet that was slipped into the filter (Califano and Sullivan 2006). R. J. Reynolds was criticized for marketing its product to children, who are more likely to begin to smoke if the product tastes better. They maintained that they were only marketing the product to the adult who already was a smoker but wanted a change of flavor. It is common knowledge that most adult smokers begin prior to their 18th birthday. Currently, the average age at which young people begin to smoke is 11 (Mansfield, Thoms, and Nixon 2006).

The flavored cigarettes were once advertised heavily in magazines read by young boys and girls; however, pressure from federal legislators made them retract the ads, and in 2006 the company discontinued this line of cigarettes.

When Marketing Tactics are Used for Good

Not all marketing is necessarily evil, however, even when it is directed toward children. Marketing programs throughout the years have helped children to learn basic skills.

Think of McGruff taking "a bite out of crime." Today one area of concern in the United States is the growing epidemic of childhood obesity. In response to this epidemic, several corporations have developed new marketing campaigns to offset the negative effects of their products. Both Coca-Cola and McDonald's launched fitness programs that are presented in schools and encourage healthy food choices and exercise. Fast-food restaurants like Wendy's and McDonald's have added selections like apple slices and mandarin oranges to their children's menus as an alternative to French fries. General Mills now produces its cereals with whole grains. Other companies are reducing the trans fats in their cookies, crackers, and other baked goods. While the trend toward more healthful eating is at least for now being directed at children, it will be interesting to see how many of the products that are typically sold to this target audience will actually change.

ADVOCACY VERSUS BIG BUSINESS

It is perhaps too easily forgotten that popular children's brands, so appealing to kids and parents alike, have profit-driven corporations behind them. In this world where business interests and family needs meet, there has always been a place for watchdog groups that monitor new products, assess the accuracy of claims made on their behalf, and judge their appropriateness for young consumers.

One such group is the Campaign for a Commercial-Free Childhood (CFCC), based in Boston. This nonprofit organization seeks to counter the negative effects of consumer culture on children. Since its founding in 2000, CFCC has successfully mounted campaigns to get the children's publisher Scholastic to stop selling Bratz doll products at school book fairs (the dolls are viewed as being overtly sexual); to cease the airing of commercial radio (BusRadio) on school buses; to end the practice of inserting Happy Meal ads in report card envelopes; and to curtail the use of product placements (e.g., by Cover Girl) in novels intended for girls (Turner 2010).

In 2009, CFCC prodded Disney to stop using the term "educational" in association with its Baby Einstein line of videos for children aged two and younger. The group charged that there was no firm basis to the claim that the videos served an educational purpose, and the American Academy of Pediatrics had previously recommended that children of this age watch no television or videos (Lewin 2010). Unfortunately in this case, CFCC experienced backlash in the wake of its campaign. A Harvard-affiliated children's mental health center that had been sponsoring CFCC and providing it with office space, the Judge Baker's Children's Center, pulled its support and asked CFCC to leave. It was reported that Disney had contacted the center three times to express its displeasure with CFCC. Although the details of those conversations were not made public, it was widely speculated that pressure, possibly legal pressure, was applied by the corporation. In explaining the Judge Baker's decision to oust CFCC, a spokesperson would only allow that the center's board found that "the targeting of individual large corporations [by CFCC]... poses too much risk" (Turner 2010).

The Marketer's Position

The KidPower Conference meets annually to discuss the latest techniques, successes, and failures of marketing to children and teens. Marketers come to learn the latest on how to maximize the appeal of their brand—more specifically, to target certain age groups and create ads that appeal to different ethnic targets. Additionally, there are sessions on how to do social marketing. Social marketing is using traditional advertising and other marketing techniques to change a child's behavior on issues like refusing drugs, exercising more, and becoming more tolerant of others. While the social marketing conference sessions are definitely targeted at improving society, the overwhelming majority of the conference is on how to market products and brands to kids.

Marketers feel that they are just offering a product that is for sale and that ultimately consumer education needs to start at home. Some consumer advocates agree that parents have a significant portion of the responsibility. Jeff Dess, a prevention specialist for schools in Cobb County, Georgia, says, "We need to talk with our kids about these issues and consider changing our own habits" (McAulay 2006). Some ad agency executives are in agreement with Dess's statement and assert that it is parents and other relatives who are working in ad agencies and in corporations who are advertising the products, so they are also concerned about what the children in their lives are exposed to. Ultimately, it is the parent's job to determine what food his or her children eat and what they buy (McAulay 2006).

MARKETING TO WOMEN AND GIRLS

Phylis M. Mansfield and John D. Crane

Cosmetics, age-defying cream, weight-loss products, and revealing clothing—these are all products almost exclusively marketed to women. The marketing of beauty products to women is not a new practice. Several decades ago, products were marketed to women with the assumption that they were housewives or were looking for a husband. The product being marketed was designed to assist them in either of these endeavors. Betty Crocker made women's lives easier if they were struggling to do the laundry, feed the children, and put a decent dinner on the table by 5:30 p.m., when their husbands came home from work. Other products addressed the woman who was either trying to stay youthful or trying to be attractive in order to get a husband. Even cigarette companies employed tactics targeted toward this group of women. During the mid-1920s, it was unacceptable for women to smoke in public; however, the tobacco companies saw women as a large target segment of the population that was virtually untouched. The American Tobacco Company began a campaign for its brand, Lucky Strike, targeted at women with the slogan, "Reach for a Lucky Instead of a Sweet." It was the first cigarette campaign that featured a picture of a woman in the ad and that began to associate the idea of smoking with having a slim body (*Albert Lasker* n.d.).

The Impact of Social Change

In the 1970s and 1980s, social convention began to change with regard to the role of women, possibly due to the rise in women's participation in the work force. Advertising changed and began portraying women as confident individuals who could effectively balance their personal and private endeavors. One such ad campaign was for the

perfume Enjoli, by Revlon. Debuting during the late 1970s, its jingle began, "I can bring home the bacon, fry it up in a pan, and make you never forget you're a man. 'Cause I'm a W-O-M-A-N" (Vranica 2003). In recent years, advertising strategy has reflected the success of women as breadwinners, executives, and business owners. Many products that were traditionally marketed to men, or to the household as a whole, are now marketed to women. Sellers of automobiles and homes and investment banking advertise to women specifically, acknowledging their status in the marketplace. However, despite the movement toward affirming women as self-confident and successful, there is also another trend that appears to discredit their accomplishments and demean them as sexual objects. Marketers present the idea that women must be physically perfect in order to be truly accomplished. This quest for the perfect body has made it now socially acceptable to openly discuss one's latest cosmetic surgery. The negative impact that this pressure from the media has on women may be filtering down to their daughters, even those of a very young age.

What is the Ad Selling?

Those who have browsed the pages of *Cosmopolitan, Vogue,* or *GQ* have most likely perused page after page of half-naked women advertising various beauty products. In some, just a silk scarf is strategically placed across the woman, who is selling a product such as moisturizing lotion, shampoo, or even men's cologne. Airbrushing and other technologies provide the magazine glossies with perfect-looking models, devoid of any blemish or cellulite. There is no doubt that sexy photos of women can help sell products to men, but how do women and girls respond to this marketing technique? Clearly, the photos used in many ads have no connection to the actual use or purpose of the product. For example, diet products and exercise machines should be used only for health-related reasons and should only be used under the direct supervision of a doctor. The ads rarely present this aspect of the product's use and instead focus on the physical attractiveness of the user.

There is a growing concern about the effect this type of advertisement has on women's and girls' self-images. One doesn't have to look far to see the impact that this type of body consciousness has on young women in the movie industry. Tabloids contain story after story discussing how a young star is looking extremely thin after losing weight, some to the point of anorexia. Even a 2006 television advertising campaign for a health insurance company stresses the physical appeal rather than the health-related benefits of physical exercise programs for young girls. HealthMark, a BlueCross BlueShield affiliate, had a young girl playing soccer while talking about how she used to hate to shop for clothes because she was "big." Now she doesn't mind shopping and loves her team picture because she doesn't look "big" anymore (HealthMark 2006). In an effort to diminish the obesity epidemic in the United States among children, the ads promoting increased activity should be applauded. It is questionable, however, whether they should focus more on a child's appearance than the health benefits that result from exercise.

WHAT'S IN A SIZE?

For some time, the clothing industry has not been held to any standardized measurements in the design and creation of women's apparel. It's not a secret between women that finding waist sizes that fit is as much of a gamble as picking a horse based on its name. One of the main reasons for the large discrepancy between designers' sizes is their original consumer segment. All clothing is designed with a specific consumer in mind. In women's fashion, consumers at higher-end stores usually prefer high fashion that typically conforms to the prescribed industry image for body size—which is tall and thin. For example, the women auditioning for the popular television program *America's Next Top Model* need to be at least five feet seven inches tall—and contestants who happen to be six feet tall need to weigh around 135 pounds.

This creates a discrepancy since, in 2010, the average American woman weighed between 142 and 165 pounds and was five feet four inches tall—and therefore is not the target of high-end retailers. Moderate retailers offer the average American woman a wide range of sizes to fit the variations of women's bodies. Recently, the sizes of high-end and moderately priced designers have been growing further apart. High-end retailers have stringent measurements based on industry standards, while those at moderately priced retailers have more flexibility because they target a wider audience and their clothes are not necessarily connected with status. A trend of stores providing so-called vanity sizing has developed. For example, over the past 20 years, the average size 8 dress has increased two inches in waist size. By increasing the waist measurement while keeping the pants size the same, corporations can be more profitable. Women want to feel like the models they see in advertisements and are more likely to shop at a store where size 6 pants fit like a size 10.

"Problem areas" identified by women when looking for clothing and the percentage of women who find a particular area to be problematic include:

- Hips (35 percent)
- Bust (32 percent)
- Waist (32 percent)
- Rear (23 percent)
- Length (20 percent)
- Thighs (17 percent)
- Back (13 percent)

A Cause for Alarm?

Advertisements reflect and shape cultural norms, selling values and concepts that are important to daily living. The trend of using objectified images of the female body in the media is not a new area of research, nor a new area of concern. Consumer activists and some researchers believe that marketers have gone too far in their advertising strategies to women by presenting an unattainable or unhealthy image. One voice of criticism back in

THE FINANCIAL SIDE OF COSMETIC SURGERY

Considering plastic surgery, but don't have the funds to get it? Cosmetic—or elective—plastic surgery is a booming business. Americans spent $10.5 billion on cosmetic procedures in 2009. A number of financial institutions offer financing options for individuals who would like to go under the knife but don't have the funds. According to Helen Colen, "It's exploding; everyone is jumping in." Currently, the cosmetic lending market is approaching the $1 billion mark, but experts expect that figure to triple within the next few years.

The application process is very simple. Patients can have doctors' offices make a phone call to a lending institution and can be approved within an hour. However, not all is as rosy as it seems. Critics have suggested that people are borrowing money they don't have—to get a procedure they don't need. The majority of cosmetic procedures today are performed on individuals who earn between $30,000 and $90,000. People who opt for financial assistance are most likely those who don't have access to the funds.

Here are the average costs for some cosmetic procedures:

- Botox injection: under $500
- Liposuction: $2,000 to $10,000
- Nose job: $3,000 to $12,000
- Face lift: $6,000 to $12,000
- Eyelid tuck: $1,500 to $7,000
- Breast enhancement: $5,000 to $7,000
- Tummy tuck: $5,000 to $9,000

In 2009, Democrats in Congress proposed a tax on cosmetic surgery to help pay down the nation's health care costs as part of an overall health care reform effort, but the measure was later removed from the bill.

1963 was that of Betty Friedan, who railed against the "feminine mystique." Friedan reported that, by the end of the 1950s, women who had once wanted careers were now making careers out of having babies. Manufacturers sold bras with false bosoms made of foam rubber for girls as young as 10. Thirty percent of women dyed their hair blonde and dieted so they could shrink to the size of the super-thin models. According to department stores at that time, women had become three to four sizes smaller than they had been in the late 1930s in order to fit into the clothes that were marketed to them (Friedan 2001). Freidan believed that women were being manipulated into becoming the ideal housewife—a Stepford-type housewife—and were feeling a great sense of emptiness in their lives.

The fashion industry may be turning a corner, however. In 2006, the organizers of Madrid's fashion week in Spain banned models who were deemed to be too skinny.

After a model died during a fashion show in South America in August 2006, the subject of extreme dieting became a topic of discussion, resulting in the ban. The typical runway model in the industry is reported to be five feet nine inches tall and weigh 110 pounds, with a BMI (height-to-weight ratio) of 16. She wears a size 2 or 4. The organizers of the Madrid show required the models to have a BMI above 18, which is closer to five feet nine inches tall and a weight of 123 pounds. In contrast, the average American woman is five feet four inches tall, weighs between 142 and 165 pounds, and wears a size 14 (Klonick 2006).

The Emphasis on Beauty

Critics of advertising suggest that the use of nonfunctional aspects in advertising creates an artificial need for many products that do not fulfill a basic physiological need. They believe that the use of perfectly airbrushed models and those with extremely thin bodies suggests to women that they should be just as attractive as the models. This quest for perfect beauty has contributed to the explosive growth of the plastic surgery industry in the United States, where women account for almost 90 percent of all surgeries. In 2008, surgeons performed 12.1 million cosmetic procedures, up 3 percent (even in a recession) from the previous year. Cosmetic surgery is becoming so commonplace that plastic surgeons are seeing increased numbers of men giving it to their girlfriends and wives as Valentine's Day gifts. Experts such as John W. Jacobs, a Manhattan psychiatrist, believe that the gift can be romantic if the recipient longs for it (Kerr 2006).

What is the Effect on Young Girls?

This focus on the emotional and sexual enhancement that products or services offer feeds into the problem of distorted body image and the low-self esteem of many young women. The fascination with the feminine ideal can develop early and can be seen as early as age six, according to data collected for an *Oprah Winfrey Show* a few years ago. "Children are becoming obsessed with external beauty at a much younger age," Winfrey noted, "and the consequences are going to be shattering." One story was about a young toddler, only three years old, who was obsessed with her looks. The young girl demanded lipstick, makeup, and hairspray in order to look beautiful. When refused these items, she looks into the mirror, cries, and says that she doesn't look pretty. The young girl's mother fears what the youngster will be like in another 10 years and worries that her own insecurities have added to the problem ("Healing Mothers" 2006).

A study by the Dove Campaign for Real Beauty found that 57 percent of young girls are currently dieting, fasting, or smoking to lose weight. And almost two-thirds of teens ages 15 to 17 avoid activities because they feel badly about their looks (Etcoff et al. 2004). Girls at younger ages are also feeling the need to diet. One four-year-old girl studied skips breakfast and eats only fruit for lunch because it will make her skinny. While

her mother thinks that other children's comments about her daughter being fat are to blame for the young girl's behavior, interviews uncovered other possible reasons. The girl's mother reported that she measures out exact portions of her own food at mealtimes and exercises at least once each day, sometimes twice ("Healing Mothers" 2006). Robin Smith, a psychiatrist, says that mothers unconsciously hand down their insecurities to their children. Parents, as well as peers and the media, shape children's self-image and must work to break the curse that is handed down from generation to generation (Etcoff et al. 2004).

During adolescence, a girl's obsession with her body becomes even more apparent. This is accompanied by increased attention to what her peers think and increased attention to the media and advertising. Not only are younger girls and adolescents using cosmetics and dieting, but they are also turning to plastic surgery at younger ages than ever before. Like their mothers, they are in search of the perfect body, and it shows in the numbers of surgeries done on girls under the age of 18. In 2003, the number of plastic surgeries performed on children under 18 was almost 75,000 in the United States, a 14 percent increase over those performed in 2000. According to the American Society of Plastic Surgeons, the number of breast augmentation surgeries done on girls under 18 tripled in just one year (Kreimer 2004).

This focus on the perfect and slimmest of bodies may also be the root of the increase in cigarette smoking by girls. The number of teenage girls who smoke and abuse prescription drugs has now surpassed that of boys. In 2005, more girls began smoking than did boys (Connolly 2006). One reason for this increase may be body image. These young women have not seen the advertisement for the Lucky Strike cigarettes that urged consumers to "Reach for a Lucky Instead of a Sweet," but they are getting the message that cigarettes can help you stay slim. Girls as young as nine years old have been reported to take up smoking in attempts to lose weight (Greene 1999).

On the Other Hand—The Benefits of Advertising

In today's fast-paced society, marketers play an important role in educating consumers about new products and processes available to them. The average consumer has a plethora of choices available to him or her in an infinite marketplace. If each person had to personally evaluate each product, no one would ever be able to make an informed or timely decision concerning the functionality of a product for a certain purpose.

This is particularly apparent in the cosmetic and beauty industry. Technology is constantly evolving so that new products providing better health rewards without potentially damaging consequences can be created. The marketing of these types of products allows consumers to quickly evaluate the products in a company's product line. This type of marketing strategy only shows the consumer what is available in the marketplace. It does not make consumers purchase the product or buy into the idea of the marketing message; it is purely informative. Marketers assert that they cannot make someone buy

a product; they can only influence people. It makes sense to market to women, because 80 percent of discretionary consumer spending in the United States is by women. Women buy 90 percent of all food, 55 percent of all consumer electronics, and over half of all cars sold ("Hello Girls" 2009).

The companies that market beauty and fashion products suggest that the healthy-looking models in beauty advertisements provide good role models for girls and women to aspire to. The products they are advertising provide women the means to achieve whatever level of beauty and healthiness they desire. Therefore, they say, marketers are actually providing a public service to today's busy woman.

The dynamic nature of marketing allows the consumer to make the decision to listen to the message or to move on. Advertisements on television and in magazines clearly give the consumer the opportunity to change the channel or flip the page if he or she does not approve of the message. Ultimately, it is the consumer who chooses to listen to or ignore the message that is presented.

MINIMUM WAGE

Walter J. Wessels

Minimum wage laws set the minimum hourly wage a worker can be paid. A minimum wage of $7.25, for example, means a worker cannot legally contract with an employer to work for below $7.25 an hour.

The federal minimum wage sets the wage for the whole nation. In 2010, the minimum wage was $7.25. The federal minimum wage for tipped workers is lower than the standard minimum wage, on the assumption that these workers can meet or exceed the minimum wage through tips. On the other hand, many states have a minimum wage that is higher than that mandated at the federal level. Information on the current minimum wage, both federal and state, and who is covered by the law is available at the Bureau of Labor Statistics Web site (www.bls.gov).

Approximately half of those earning the minimum wage (or less) are young workers (below age 25). Most are adults living alone (23 percent) or teenagers living with their parents (41 percent). About 15 percent are adults raising a family. Another way to look at the statistics is to consider that about 10 percent of teenagers earn the minimum wage (or less), and 2 percent of those above age 25 earn the minimum wage or less. Many studies show that increasing the minimum wage has little impact on the poor. One study, for example, found that, if the minimum wage were raised 30 percent, less than 2 percent of those living in poverty would have their wages directly increased (Wilson 2001).

Many economists oppose the minimum wage for two reasons. First, the minimum wage law, in effect, prohibits from working anyone who cannot produce enough value in his or her work to cover the minimum wage. That is, a minimum wage of $8 an hour does not help the person who can produce a value of only $6 an hour. In addition, it does not seem worthwhile to help 10 workers to earn $1 more an hour, for example, if another worker is forced out of a job paying $5 an hour. While there is controversy about whether a small increase in the minimum wage will reduce jobs, there is no doubt that a very high minimum wage will cause substantial job losses. It may be argued that a very high minimum wage is necessary to give workers a living wage, but this would be counterproductive if the worker cannot get hired at all. To a worker put out of a job, a hiring wage is better than a living wage.

The second reason many economists oppose the minimum wage is that there is a more efficient method of helping the working poor without jeopardizing their jobs—the earned income tax credit. If a person is poor, the earned income tax credit supplements his or her wage earnings. For example, a poor person earning $6 an hour might get another $3 an hour from the government. While the current earned income tax credit program it not that generous, it could be changed to be so and to significantly increase the incomes of the poor.

An earned income tax credit has several key advantages over the minimum wage. First, it only goes to the poor, while the minimum wage favors those whom employers want to retain (who are often the better-educated teenagers whose parents who are well off). Second, the minimum wage does impose a cost on society in the form of higher prices and lower profits. Because the poor are a small fraction of minimum-wage workers, and because the earned income tax credit only goes to the poor, for the same social cost, the earned income tax credit can give the poor a much higher wage than a minimum wage having the same social cost. Third, there is a social justice argument. The earned income credit is paid for by taxpayers, not employers. It can be argued that society (mainly taxpayers) benefits from making the poor better off, so it is just that society—not employers—should pay the cost of making the poor better off. The earned income tax credit is more just than the minimum wage because it is paid for by society. There are some who feel that employers should do more for workers. But employers are doing something for workers—they are giving them a job. Blaming employers for not doing more is as unjust as saying the Salvation Army is responsible for poverty because it could do more.

The Minimum Wage and Employment

Does economic theory say that the minimum wage reduces employment? It does say that a large increase in the minimum wage would reduce employment. But what about a small increase similar in magnitude to past increases in the minimum wage? When labor markets are competitive, wages are bid up to the value of what workers produce. Thus, an increase in the minimum wage would push the wages of some workers above the value of what they are producing, and these workers would lose their jobs. On the other hand, when labor markets are not competitive, it is possible that a higher minimum wage would not reduce employment and, in some cases, would actually increase employment.

A minimum wage can increase employment if an employer is a monopsony. A monopsony is a situation where there is only one employer in a labor market. More generally, any employer who has to pay increasingly higher wages as he or she hires more workers (for example, paying $5 to hire the first worker and $6 for the second, and having to raise both of their wages to $7 to get a third) is a monopsony. Because a monopsony faces rising wage costs, the cost of each added worker includes

the worker's wage plus the dollar amount the employer has to pay in order to raise the wages of the other workers to the new wage. For example, suppose an employer employs 9 workers at $10 and must pay $11 to hire the 10th worker. The 10th worker costs $11 plus the $9 needed to raise the pay of the first 9 workers from $10 to $11. Thus, the 10th worker costs $20. If the worker produces a value of $15, the monopsony would not hire him or her. However, if there were a minimum wage of $11, the 10th worker would only cost $11 (since the wages of the first 9 workers do not have to be increased, as they are already at $11). In this case, the worker would be hired. A sufficiently high minimum wage (for example, $16) will cause this worker not to be hired and, if even higher, may cause others to lose their jobs. Over some range, a minimum wage causes a monopsony to hire more workers, but at some point, an even higher wage will cause jobs to be lost.

Research has found that restaurants have monopsony power over tipped workers. In the absence of a minimum wage, a restaurant hiring more tipped servers would find, at some point, that each tipped server earns less in tips per hour (as each will serve fewer patrons in an hour when more waiters are hired). As a result, the restaurant will have to raise the hourly cash wage to remain competitive with other employers. Therefore, a restaurant has monopsony power, and a minimum wage has the potential to increase employment of tipped servers. However, it was also found that when the minimum wage for tipped workers was increased too much, employment fell.

What do the data say about the effect of minimum wages on employment? Most studies of teenagers suggest that the minimum wage does reduce employment: every 10 percent increase in the minimum wage reduces teenage employment by 1 to 2 percent. The reason that most research on minimum wages involves teenagers is that they are the only group sizably affected by the minimum wage, which makes its effects more discernable. David Card and Alan Krueger have conducted considerable research that shows that minimum wages do not reduce employment. For example, they concluded that, when the minimum wage was increased in 1990 and 1991, states with a larger fraction of low-wage workers did not suffer a greater loss in jobs (Card and Krueger 1995). However, a study of the 1996–1997 increase in the federal minimum wage did show a greater job loss in jobs in states with larger proportions of low-wage workers (Wessels 2007). Thus, using their methodology, it appears that the minimum wage did reduce employment.

Another Card and Krueger study (1994) compared employment at fast-food restaurants in two adjoining towns—one in New Jersey, where the minimum wage was increased, and the other in Pennsylvania, where the minimum wage was not increased. They found no difference in before-and-after employment trends between the two towns and concluded the minimum wage had no effect.

Yet for the study's results to be valid, both towns must have basically the same business conditions before and after the minimum wage increase. Otherwise, it is

possible that the town with the minimum wage increase also had an improvement in business conditions (while the other town did not) that offset the negative effect of the minimum wage on employment. This is why nationwide studies usually are better sources of evidence; the year-to-year variations in local business conditions usually net out when averaged across the nation. The drawback to using nationwide studies is that the business cycle can be a potentially confounding factor. For example, the increase in the federal minimum wage in 1990 occurred during a recession, and it is possible that the negative effects of the minimum wage found then could have actually been caused by the business downturn. However, the minimum wage has been found to reduce employment in many business conditions.

Other Effects of the Minimum Wage

Minimum wages also have other effects. One major effect is that they raise the wages not only of minimum-wage workers but also of those earning more than the minimum wage. Studies have shown that a 10 percent increase in the minimum wage increases the

THE LIVING WAGE

Many cities and counties have living wages. The living wage is a minimum wage set above the federal minimum wage level and usually applies only to employers who have a contract with the city or county. It is called a living wage because it is usually set at a level that allows a full-time worker to support a family of four at the poverty line.

Because the institution of a living wage is relatively recent, it is hard to judge whether it decreases employment. The current evidence suggests that the living wage may reduce employment, but this is open to argument. There are three main reasons why one would expect living wage laws to not reduce employment. First, the very passage of these laws has shown that the cities and counties passing them are willing to absorb added cost increases. Second, the type of services cities contract for cannot be supplied by low-wage foreign or out-of-area firms. Thus, there is less competitive pressure on these firms to keep prices and, therefore, costs down. Finally, the third reason is that the living wage laws may not significantly affect the costs of doing business for many of the affected firms. For example, suppose 10 percent of a firm's costs are increased 30 percent by the living wage law; this will increase its total cost by only 3 percent.

If the living wage laws result in affected jobs paying sizably more, then it might be expected that employers over time would fill vacated jobs with better workers (who are more experienced and better educated) than the ones they currently are hiring. Employers may not explicitly set out to hire better workers, but the higher wage will attract better workers to apply, and it will be the better workers whom firms will hire. Thus, while current low-skilled workers may benefit from the law, over time, new low-skilled applicants will not. Instead, they will find fewer jobs open to them.

average wage of all teenagers around 2 percent. This estimate is probably too low; most other studies have found a larger effect.

Another effect of the minimum wage is that it makes employers cut back on other amenities (by cutting fringe benefits, tightening work rules, and reducing on-the-job training). In this way, employers partially offset the effect of higher wages on their cost. The net effect for workers is that the minimum wage may not make them as well off as the increase in wages might indicate. One piece of evidence suggesting that this is the case is the fact that the past increases in the minimum wage have reduced (or had no effect on) the fraction of teenagers who want to work (as measured by their labor force participation rate). If the minimum wage increases the expected value of seeking and finding work, then it should increase the size of the labor force—but it does not.

A common error concerning the minimum wage is the belief that an increase in the minimum wage will be offset by workers becoming more productive and that, as a result, this will keep employment from decreasing. Various reasons have been given for the minimum wage increasing productivity, including the speculation that workers value their higher-paid jobs more or, alternatively, that employers try to offset the higher wage costs. If this were true, the minimum wage would reduce employment far more than it does. For example, suppose a minimum wage increases wages 10 percent and workers become 10 percent more productive. This will offset the effect of minimum wages on cost and leave the price of products unchanged. As goods cost the same amount, employers will produce and sell the same number of goods as before. But workers are 10 percent more productive, so employers would need 10 percent fewer workers to produce the same numbers of goods as before (indeed, that is what being more productive means). In this case, a 10 percent increase in the minimum wage would lead to a 10 percent decrease in employment. This is a far greater cut in employment than most studies find.

Conclusion

It can be argued that the poor would be better off if the political energy that goes into increasing the minimum wage were used instead to develop programs, such as the earned income tax credit, that truly help the poor. The minimum wage, according to much of the research in the field, reduces employment, but not sizably. More troubling, it does not increase the number of people who want to work, which suggests that it creates some offset such that workers on the whole are not better off. Economists like to say that there is no such thing as a free lunch. The minimum wage is definitely not a free lunch. It may have benefits, but it also has significant costs.

O

OIL ECONOMICS AND BUSINESS

Edward W. Erickson

This is a good-news/bad-news entry. Since the 19th century, there has been both a regular and periodic concern that fossil fuel supplies will be inadequate to support and maintain the world's energy-dependent economy and society. In the 20th century, the most prominent advocate of the theory of impending trouble was the well-respected geologist and geophysicist M. King Hubbert, who predicted in 1956 that U.S. crude oil production would peak between 1965 and 1970. U.S. crude oil production did in fact peak in 1971. Hubbert further predicted in 1974 that global crude oil production would peak in 1995. However, world oil production has not yet peaked.

In the 21st century, there continues to be widespread concern and support for Hubbert's contention that the fossil fuel era would be of very short duration. Some analysts argue that Saudi Arabian oil production may have already peaked and may now be in decline. Saudi Arabia is the largest supplier of crude oil exports to the world market. Others argue that total world oil production, if it has not already peaked, will peak in a few years.

The first piece of good news is that world oil production has not yet peaked and may continue production at current, or higher, levels in the foreseeable future—decades or more. The second piece of good news is that, even if the pessimists are correct, it is likely that there will be cost-effective fossil fuel substitutes for oil that allow continued economic growth and improvement in living standards for the population of the world. There is no question that the fossil fuel content of the geology of the Earth is finite.

What is the bad news? Just as the world is now predominantly a fossil fuel economy, the world is likely to continue to be a predominantly fossil fuel economy for at least the next several decades, if not the balance of the 21st century. And, of course, when fossil fuels are used, they emit greenhouse gases. The 1997 Kyoto Protocol amended the international treaty on climate change to assign mandatory targets for the reduction of greenhouse gas emissions, and the 2009 Copenhagen Accord raised the question of setting more ambitious targets (though little was actually agreed to). If there are adequate fossil fuel resources to maintain or increase our global fossil fuel consumption, then there will be unavoidable tension between maintaining and improving our energy-dependent standard of living for the growing population of the world and curbing greenhouse gas emissions. "Unavoidable tension" is a polite way of saying a political catfight. And this, moreover, is an international political catfight that may take decades to resolve.

The Centrality of Oil

The primary source of energy used by the world economy comes in a variety of forms: petroleum (crude oil); natural gas; coal; and hydro, geothermal, solar, wind, biomass, and nuclear energy. Electricity is a derived form of energy that can be generated by any of the primary energy sources. Many energy sources have multiple uses. For example, wind can power turbines to generate electricity or propel sailing ships. Sunlight can generate electricity photovoltaically or directly provide space heating. Natural gas can be used for space heating and cooling or to generate electricity. Coal can be used for transportation (locomotives and steamships), space heating, or electricity generation. These energy sources compete with each other in the energy market, and this competition determines which source is the most cost effective and technically efficient alternative for each specific use.

There is, however, only one energy source that broadly competes with all other energy sources in all uses. This is petroleum. The competitive centrality of petroleum, in addition to petroleum's predominance as the largest single source of energy for the world economy, is why so much attention is focused on world crude oil supplies. Because of petroleum's worldwide competitive interconnectedness to the markets for all other sources of energy, when the world oil market sneezes, each of the markets for other types of energy at least sniffles.

The Flow of Oil

The standard way that energy economists think about the amount of oil produced and consumed is in barrels per day. There is a good reason for this. Oil is always on the move. It flows in drill pipes from underground geological formations to the surface of the Earth. There it is temporarily deposited in lease tanks before beginning another journey by pipeline to a refinery. A refinery is a vast network of pipes, pressure vessels, and storage tanks through which oil flows as it is converted from crude oil to refined products such as gasoline, jet fuel, and heating oil.

OFFSHORE OIL DRILLING IN THE GULF OF MEXICO

Offshore oil production in the Gulf of Mexico began in the 1930s. In shallow water near to the shore, large wooden platforms were built on wooden pilings and drilling rigs and production facilities operated from these platforms. The platforms were connected to each other and to the shore by a network of docks and walkways.

After World War II, steel platform technology began to advance. This was complemented by advances in drill ship and drilling barge technologies and advances in undersea pipeline-laying techniques and technology. But compared to current industry offshore operations, exploration and production were still limited to relatively shallow water. Steel platforms could be set in 100 feet of water. Using directional drilling, drill bits could be turned (or "whipstocked") so that wells could be completed in water that was 300 feet deep. A deep well was a completion (as it is called) into a reservoir that lay 10,000 feet under the floor of the gulf.

In 2006, the so-called Jack field in the deep waters of the central Gulf of Mexico was flow tested. The discovery well was drilled in 6,000 feet of water. The producing formation lies 25,000 feet under the floor of the Gulf of Mexico. The Jack field is part of a larger geologic formation that is estimated to contain 9–15 billion barrels of oil, a 50 percent increase in U.S. proved reserves. The seismic and geophysical technologies that allowed identification of the Jack field and the drilling and production technologies that allow development of the field are major advances. And in this sense, new technologies create new resources.

Now, of course, in the wake of the 2010 BP–Deepwater Horizon oil spill in a nearby region of the gulf, even greater technological improvements will be needed. Deepwater Horizon was a giant rig capable of operating in waters up to 8,000 feet deep and drilling to a depth of 30,000 feet. It had a massive blowout preventer that was supposed to have guarded against just the kind of uncontrolled gushing of crude that occurred after the rig exploded and collapsed into the sea. Shortly after the accident, President Barack Obama, who weeks before had called for expanding offshore oil and gas drilling, ordered a hold on new drilling and stepped-up safety inspections for existing wells.

Refined products leave the refinery and move to market through pipelines. Sometimes crude oil and refined products also move great distances around the world by ocean tanker. Since time is money, there are large economic incentives to minimize the amount of time that oil spends in storage tanks along its route from geological formation to refined-product customer.

The United States uses about 20 million barrels of oil a day. How much is that? An oil barrel is 42 gallons, so 20 million barrels a day equals 840 million gallons per day. And how much is this? Visualize a red one-gallon gas can used to fill a lawn mower. Start at Miami and line up 42 of these one-gallon cans across the northbound lane of the interstate highway from Miami to Chicago. Repeat that lineup of cans across the

interstate all the way to Chicago until the northbound lane is *full of gas cans*. That is 840 million gallons of oil.

Now, blink your eyes, and all the oil cans disappear (i.e., the oil is consumed). Tomorrow, blink your eyes again and all 840 million oil cans—full of oil—reappear. The vast production network of wells, pipelines, tankers, and refineries replaces yesterday's consumption with today's new production.

This is a logistic miracle. It happens every day, day in and day out, 365 days a year. It happens not only in the United States, but all over the world. And world production and consumption is 85 million barrels of oil a day.

The planning and implementation imperatives that this daily feat of logistics imposes upon the oil industry are the practical reasons why industry operators commonly measure production and consumption in millions of barrels a day. Oil, of course, is not the only source of energy. So it is useful to have a measure of energy that allows comparison across the various types of energy. That measure is the British thermal unit, or Btu. Production and consumption statistics are also kept on an annual basis. But beneath the annual numbers, energy is moving in a ceaseless hourly and daily flow.

The Patterns of Energy Consumption

The world used 472 quadrillion Btus of energy in 2006 (and an estimated 508 quadrillion in 2010). A Btu, or British thermal unit, is the heat equal to 1/180 of the heat required to raise the temperature of one pound of water from a temperature of 32 degrees Fahrenheit to 212 degrees Fahrenheit at a constant pressure of one atmosphere. An atmosphere is the air pressure at sea level. A quadrillion is a million billion, or 10^{15}. This is a tremendous amount of energy. The word used to mean a quadrillion Btus is *quad.*

Table 1 shows the types and amounts of each type of energy consumed in the United States in 1985 and in 2009, and the increases (or decreases) in energy consumption over the 1985–2009 interval. Table 2 shows the relative percentage shares of each type of energy for 1985 and 2009 and the 1985–2009 increases (or decreases).

Between 1985 and 2009, U.S. energy consumption increased 27.5 percent, from 76.5 quads to 94.6 quads (Table 1). Fossil fuels supplied 66.1 percent of U.S. energy consumption in 1985 and 78.4 percent in 2009. Fossil fuels also supplied 68.0 percent of the 18.1 quad increase in U.S. energy consumption over the 1985–2009 interval (Tables 1 and 2). Between 1985 and 2009, the total renewable energy consumption in the United States increased 1.6 quads, or 25.8 percent. This net increase reflects a 2.0 quad increase for the combination of biomass, geothermal, solar, and wind forms that is partially offset by a 0.3 quad decrease in U.S. hydropower. In general, although the use of hydropower increased on a worldwide basis and decreased in the United States, the pattern of U.S. energy consumption is similar to the pattern for the world. Over the quarter century from 1985 to 2009, both the United States and the world increased total energy consumption. For both the United States and the world, by far the principal source of total energy

consumption was fossil fuel. In relative terms, fossil fuels lost a few percentage points of market share. But for both the United States and the world, increased fossil fuel consumption accounted for roughly 70 percent of the total increase in energy consumption. Use of nuclear power increased in both absolute and relative terms in the United States and worldwide. With the exception of hydropower outside the United States, renewable sources made relatively modest contributions to both absolute and relative energy consumption in the United States and on a worldwide basis.

Oil Production: The Intensive Margin

Economists have long considered two general approaches to increasing or maintaining the production of output: the intensive margin of production and the extensive margin of production. Think of a tomato farmer. If the farmer wants to increase production, one way to accomplish this is by getting more output from her existing fields. This can be achieved by installing irrigation, applying fertilizer, hiring more labor to pick and cultivate more carefully, applying pesticides and herbicides, and the like. These production enhancement techniques are all examples of expanding output at the internal margin of production.

There is also an external margin of production—an alternative way the farmer could expand production. She could plant, cultivate, and harvest additional fields of tomatoes. She could manage the new fields in exactly the same way that she managed her original

fields. If she were to follow this approach, the farmer would be expanding output at the external margin of production. Not surprisingly, if there are economic incentives to expand the output of some commodity, there are production responses at both the internal and external margins of production.

Terms of art in the oil and gas industry are *resource* and *proved reserves.* Resources exist in nature. Proved reserves are an artifact of humans. Resources are the total global endowment of fossil fuels that nature has bestowed upon us. Resources exist, whether they have been discovered or not. Proved reserves are the portion of a discovered resource that is recoverable (or producible) under existing technological and economic conditions.

To understand how the concept of the internal margin applies to oil production, it is necessary to review a little petroleum geology. Oil does not occur in huge underground lakes or pools. What is often called a pool of oil actually appears to the naked eye to be solid rock. The oil is contained in the microscopic pore spaces between the tiny grains of sand that make up the rock. Porous rock that contains oil is called reservoir rock. The reservoir rock of the Prudhoe Bay oil field on the North Slope of Alaska could be cut into thin slabs, polished up, and used as the facing on a bank building. Passers-by would be none the wiser.

Geologists speak of source rock, reservoir rock, and caprock. Source rock is the progenitor of fossil fuels. Eons ago in geologic time, plant and animal life lived and died and were deposited as organic material in sedimentary basins. The Earth's crust moved and buckled and bent and folded over upon itself. This process rolled organic sedimentary material deep underground, where, over the course of geologic time, heat and pressure converted the organic sediments to fossil fuels—petroleum, natural gas, and coal.

Fossil fuels are solar fuels. The energy they contain derives from the energy of the sun. But the production process that created them is much more roundabout—millions of years more roundabout—than the process that uses the energy of the sun to warm a solar water heater.

Oil formed in the source rock is pushed by underground pressures through various strata of permeable rock until it is trapped against a layer of impermeable rock—the caprock. The source of the pressure pushing the oil into the ultimate strata of reservoir rock is often water driven by a subterranean aquifer. If no caprock stops its pressure-driven journey, the oil escapes to the surface of the Earth—on land or under the oceans. These are natural oil spills. One of the largest known deposits of oil in the world—the Athabasca Tar Sands in Alberta, Canada—is such a natural oil spill.

Nature abhors a vacuum. Nature also abhors a partial vacuum. Oil in a strata of reservoir rock is under great pressure, trapped between a water drive and the impermeable caprock. It requires tremendous pressure to force oil to flow through solid rock from the source rock to the caprock. When a well pierces the caprock and enters the reservoir rock, a partial vacuum is created. The great pressure differential between atmospheric pressure at the surface of the Earth and the underground reservoir pressure causes the oil to flow to the well bore and then up through the well casing to the wellhead at the surface.

In the 19th century and the first half of the 20th century, successful oil wells were often allowed to erupt as gushers and temporarily spew a fountain of oil from the drilling derrick. This is no longer the case. Reservoir pressure is precious and managed carefully. As natural reservoir pressure dissipates, less and less oil is forced through the reservoir rock to the well bore, and daily production declines.

Not all the oil in place in a reservoir is produced. In the earliest days of the oil industry after Col. Edwin Drake drilled his discovery well in 1859 near Titusville, Pennsylvania, as little as 10 percent of the oil in place was produced before the natural reservoir pressure was exhausted and primary oil production ceased to flow. To offset the loss of production as primary output slowed, secondary production techniques were developed.

There are many different kinds of secondary production technology. The classic secondary production technique is the walking beam pump, which resembles a mechanized sawhorse bobbing up and down. Others include drilling injection wells and pumping water, natural gas, or carbon dioxide into the reservoir to maintain pressure. Secondary recovery shades into tertiary recovery, such as injecting steam to make heavy oil flow

more freely or injecting surfactant detergents to maintain reservoir pressure and to wash oil out of tight pore spaces and help it to flow to the well bore. From the inception of production, modern reservoir engineering now uses whatever techniques are cost effective to maintain reservoir pressure, improve flow, and increase the ultimate recovery of oil in place. The result has been a significant increase in the percent of oil in place that is recovered through production. In the 20th century, 10 percent recovery became 30 percent recovery. Now it is often possible to achieve 50 percent or higher ultimate recovery of the oil in place. Higher prices for oil make application of expensive enhanced recovery technologies more cost effective and also encourage the development of new technologies.

A large fraction of the oil discovered from 1859 to the present remains unrecovered and in place in known reservoirs. This includes recent discoveries of shale oil (i.e., oil embedded in shale and only extractable by new technologies that force it out using pressure). At historical and current prices with historical and current technologies, it has not been cost effective to produce it. Most of the oil in place that has not qualified to be designated as proved reserves will likely never be recovered and produced. But if petroleum becomes more scarce relative to our desire to benefit from its use, its price (adjusted for inflation) will rise, perhaps dramatically. If, or when, that occurs, a variety of responses, interactions, and consequences will ensue. One of these responses will be at the intensive margins of production. New discoveries will be developed more intensively, and old oil fields will be intensively reworked.

Fossil Fuel Production: The Extensive Margin

The fossil fuels are all hydrocarbons. Petroleum is the most widely used fossil fuel with the largest market share of any energy source, because transportation is such an important use. Liquid transportation fuels—for example, gasoline and jet fuel diesel—are easier, more convenient, and less costly to store, transport, distribute, and use than solid or gaseous fuels. However, the resource base for petroleum is smaller than that for coal and natural gas.

Engineers and scientists can convert the hydrocarbons in coal into liquid fuels. The Fischer-Tropsche process (named for two German chemists) is the best-known technology. It was used by Germany in World War II and by South Africa during the apartheid embargo. A variation of the backend of the Fischer-Tropsch process can be used to convert natural gas to liquid fuel. Exxon-Mobil is building a big gas-to-liquids (GTL) plant in West Africa. Qatar is building a very large GTL plant in the Persian Gulf to facilitate the marketing of its substantial natural gas reserves. The output of a GTL plant is equivalent to an environmentally friendly diesel fuel. We are on the cusp of extending the commercial production of liquid hydrocarbon fuels to natural gas. Higher oil prices will extend the commercial horizon to coal-based liquid hydrocarbon fuels.

The recent exploration activity focused upon the Lower Tertiary geologic formation in the deepwater Gulf of Mexico is another illustration of the relevance of the extensive margin. Two-thirds of the surface of the Earth is covered by water.

There has been considerable exploration for and production of oil and natural gas on the great deltas of the shallow near-shore outer continental shelf—the North Sea, the Bight of Benin, the Gulf of Mexico, the South China Sea, and so on. Exploration and production in water depths up to 10,000 feet and at geologic horizons 25,000 feet beneath the ocean floor are now possible.

CAN ETHANOL REPLACE GASOLINE?

Ethanol is a type of ethyl alcohol. Ethanol has been used as an additive for gasoline to oxygenate the fuel in order to reduce emissions and pollution. For this purpose, a common blend of ethanol and ordinary gasoline is a fuel called E15. E15 is 85 percent petroleum-based gasoline and 15 percent ethanol. A much more ethanol-intensive blend is E85. E85 is 85 percent ethanol and 15 percent gasoline.

The U.S. automobile industry produces many cars that are ethanol capable and can run on either 100 percent gasoline or fuels such as E15 and E85. E15 ethanol is used as a replacement for the chemical methyl tertiary butyl ether (MTBE) for purposes of oxygenation. E85 ethanol is used primarily as a replacement for gasoline itself. Ethanol contains about 80 percent as many Btus of energy per gallon as does gasoline.

In the United States, most ethanol is made from corn. There are biofuels other than ethanol and biological feedstocks other than corn. The cultivation of alternative biofuel feedstocks—switchgrass, for example—is apt to be less energy intensive than the cultivation of corn. But corn is currently a major U.S. crop. The conversion of corn to ethanol is a market-tested technology. So, for illustrative purposes, the focus here is upon corn-based ethanol.

The U.S. corn harvest averages about 11 billion bushels of corn per year. The principal use of corn is for animal feed. Between 1.5 and 4 billion bushels of corn are exported for this purpose. There are about 81 million acres of cropland planted for U.S. corn production. For the last decade, the average price of corn has been about $2.00 per bushel, although in 2006 corn was $2.50 per bushel. A bushel of corn is 60 pounds of corn.

The United States uses 144 billion gallons of gasoline per year. The conversion process of corn into ethanol yields slightly more than 2.7 gallons of ethanol per bushel of corn. If the entire 11 billion–bushel U.S. corn crop were converted into ethanol, about 20 percent of U.S. gasoline use could be replaced by ethanol.

Such a program would have many major consequences. Consider just two. First, U.S. demand for imported oil would be reduced. Second, the U.S. price of corn would increase dramatically. We would pay for the program at both the gas pump and the grocery store. There is a place for ethanol, but that is likely to be a small market as a substitute for MTBE rather than a broad market as a major replacement for gasoline. Furthermore, early predictions regarding the value of ethanol as a substitute have been revised downward.

Vast new areas about which we now know relatively little have become accessible. Attractive prospects will not be limited to just the near-to-shore relatively shallow waters bordering the continents. New deepwater geologic horizons lie before us. A great adventure will continue. If the last 50 years of history in the Gulf of Mexico tell us anything, the technological limits will not long remain at 10,000 feet of water depth and 25,000 feet beneath the ocean floor—that is, as long as adequate environmental safety measures can be put in place. For liquid hydrocarbon fuels, Hubbert's peak lies before us—perhaps a long way before us.

Price Volatility

Following World War II, oil prices were quite stable for a number of reasons. Prices spiked in the early middle 1970s following the Arab oil embargo. Prices spiked again at the end of the 1970s and in the early 1980s, coincident with the Iranian revolution. In the early 1990s, the first Gulf War was accompanied by another spike in prices. In 2006, due to supply dislocations in Alaska, Venezuela, Nigeria, and Iraq, prices spiked again and reached nearly $80 a barrel. We can learn a number of things from these price spikes.

First, short-term demand for and supply of oil are quite inflexible. Small dislocations on either side of the market can cause big swings in price. Second, volatility is a two-way street. What goes up often comes down. The price bust in the mid-1980s and the soft markets of the late 1990s and early 2000s illustrate such turnarounds. The big downward slide of prices from the 2006 highs punctuates the message. Third, economic recessions are often attributed to oil price spikes, but we should be cautious about such suggestions. In every instance, oil price spikes were accompanied by restrictive monetary policies applied by the sometimes draconian U.S. Federal Reserve restrictions. Fourth, there is upward pressure upon prices due to increasing demand for energy from the growing economies of India and China. This is good news. The world is a much better place with billions of Indians and Chinese participating in dynamic economies that are demanding more energy than it would be were these countries failed societies with stagnant demands.

There is a further general lesson in our experience of price volatility. As prices fluctuate, we adapt. The original Honda Civic and the SUV are classic examples of our response to higher and lower prices. In an important sense, $75 oil and $3 gasoline are a bargain. In terms of what oil (and, potentially, other liquid hydrocarbon fuels) does for us, and what we would have to give up without it, there are no readily available cost-effective substitutes.

In Europe, high fuel taxes cause gasoline prices to be more than $5 a gallon. But even at these prices, motor vehicle use in London has to be restricted in order to reduce congestion. As a hypothetical example, consider the effects of $5-a-gallon gasoline in the United States. If gasoline cost $5 a gallon because of long-term higher crude oil prices, this would be equivalent to a price of $125 a barrel for crude oil. Such prices would cause much pain, but after adjusting and adapting, it is unlikely the economy would

suffer long-term collapse. Supply-side initiatives at all dimensions of the intensive and extensive margins, however, would be undertaken with incredible creativity and vigor. Demand-side responses would also be significant. In the short run, high-tech modern versions of the original Honda Civic would be widely adopted. In the long run, land-use patterns and building design and construction would change.

Conclusion

Fossil fuels are the workhorse of the world energy economy. Nuclear power is making a growing contribution to electricity generation. Outside the United States, new hydro facilities have also contributed to increased energy consumption. Nonhydro renewable energy use has grown rapidly from a small base. But these nonhydro renewable sources make a very modest contribution toward meeting increased energy demands or total energy use. It is likely that supplies of fossil fuel resources will be ample to meet growing energy demands for the foreseeable future.

Consumption of fossil fuels generates carbon dioxide. Many environmentalists believe that the greenhouse effect of increased atmospheric concentrations of carbon dioxide is the principal cause of global warming. In *The Skeptical Environmentalist,* Bjorn Lomborg (2001) expresses reservations about the extent of environmental degradation due to human activities and the link between carbon dioxide concentrations and global warming. Nevertheless, serious people consider the links between human activity, fossil fuel use, increased carbon dioxide concentrations, and global warming to be very strong and regard the situation to be very serious. Moreover, in light of the 2010 BP–Deepwater Horizon disaster and other such human-caused events, the problem of preventing oil spills and containing environmental damage associated with spills is regarded as equally serious.

Modern societies and the global economy are built on fossil fuel use. There are now no cost-effective substitutes for fossil fuels. Reducing carbon dioxide emissions significantly will require dramatic changes in the way we organize our activities and live our lives. Many people, especially skeptics, will not make these sacrifices happily. If the skeptics are correct, we will incur great costs for few, if any, benefits. The resolution of these questions will become an increasingly important item on the global political agenda.

OUTSOURCING AND OFFSHORING

John Silvia

Behaviors and perceptions sometimes disconnect. This is evident when the words *outsourcing* and *offshoring*—which mean the placement of U.S. jobs in foreign countries—raise the hackles of the public that appears to benefit from the lower consumer prices and mortgage rates occurring as a result of globalization. Consumers economize by buying the least expensive item that they believe meets their needs. Store owners recognize that and ask their suppliers to provide those items at the lowest cost. The wholesalers, in turn, seek out the least expensive producers for the given quality of the good in question. Since the 1960s, the least expensive producer has increasingly been overseas, and U.S. manufacturers have moved abroad. Meanwhile, foreign investors have supplied capital to U.S. capital markets and have helped keep interest rates lower than otherwise possible.

So how does the same globalization phenomenon generate economywide benefits, yet there are still winners and losers on an individual level? How do changes in the domestic economy interact with the patterns of globalization? Finally, why is there a disconnect between economic benefits and public perceptions?

Macro Benefits and Micro Winners and Losers in a Dynamic Economy

Economies grow and change over time. This growth increases the standard of living for a society, but not all participants benefit equally, and there are often losers in the process, as owners of once-valuable resources (e.g., real estate in the old ghost towns of the West and riverfront mills in the industrial Northeast) find that the demand for those resources has declined. Yet the globalization of the U.S. economy has been a long-term trend, as exhibited in Figure 1, which shows combined exports and imports as a percentage of annual national income. Today this measure of globalization stands near 20 percent of the U.S. economy.

The theme underlying any effective Western economic system is that each consumer acts in her or his own interest to minimize costs, while each producer seeks to maximize profit. Consumers maximize their welfare subject to income limitations. Producers, meanwhile, act to offer the least expensive product that will meet the customer's

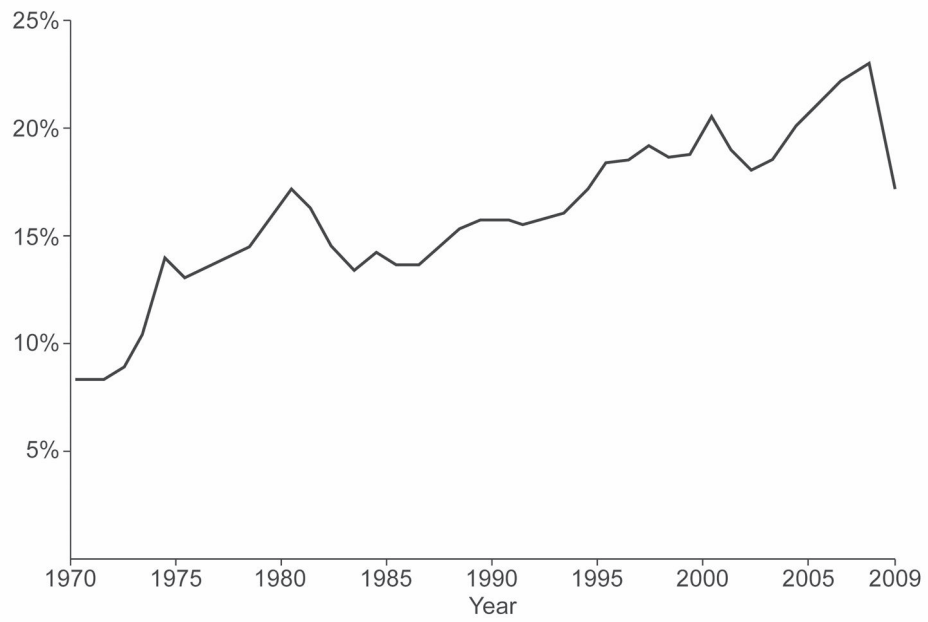

Figure 1. Globalization: U.S. Exports and Imports as a Percentage of Nominal GDP (U.S. Department of Commerce)

needs. The boom in discount and Internet shopping over the past 10 years reflects the consumer's desire to minimize expense of dollars, time, or both. In response, producers have sought to minimize costs in order to maximize profit and thereby have an incentive to seek international sourcing of goods and services that many in the popular press call outsourcing.

Global Labor Market

Trade allows for the division of labor across countries. This division of labor in turn allows for economies of scale and scope and the development of specialized skills. Specialization encourages innovation and promotes dynamism. Economies of scale, scope, and specialization allow production to be more efficient and therefore lower cost. Historically, we have seen the migration of production in the United States in agriculture and textile production. The opening of the Midwest made New England farms high cost and led to a shift of major agricultural production from the Northeast to the Midwest. As for textile production, there has been a migration from England to New England, then to the Southeast, and then on to Mexico and China, and now to Vietnam. Over time, this industry has moved to locations where manufacturers can economize on their biggest cost—labor.

Geographical migration of production has benefited consumers by providing a greater supply of goods and services at a lower price. The lower prices mean that consumers

have more real income to be spent elsewhere. In turn, consumers' standard of living has increased.

The shift in the locus of manufacturing production also means that there are gainers and losers in jobs and land values over time. Southern cities and low-skilled workers have benefited, while New England cities and higher-wage union workers have been the losers. The process of production relocation generally benefits society at large, as less expensive goods are produced for all consumers in the nation, while there is also a regional redistribution of jobs and wealth within the economy.

In recent years, there has been a global redistribution of production, with lower-wage manufacturing jobs in textiles and apparel relocating to Asia. Meanwhile, states like North Carolina increased their exports of high-valued manufactures such as chemicals and electronic products. Today, these two sectors, along with vehicles and machinery, comprise the state's top four export industries. The globalization of product markets has led to an expansion of world trade. Durable goods manufacturers, such as construction, farm, and industrial machinery, have seen a global increase in demand for their products. Yet as production has grown, there are many physical as well as practical barriers to labor mobility. Therefore, manufacturers that wish to be close to their customers are finding that they cannot source all production from their U.S. base and, as a result, must outsource production to other countries to remain competitive.

Trade does lead to both losses and gains of jobs—both directly in the affected community and indirectly in the surrounding community. As discussed below, policies encouraging the retraining of workers are more likely to be successful than those increasing the prices to consumers. On net, however, lower consumer prices provided by more efficient global production result in an increase in household purchasing power and a broader variety of goods and services for consumers in general. It is helpful to recall that the United States is the world's largest exporter as well as a major beneficiary of foreign direct investment, which provides jobs in this country. This inflow of foreign capital is seen in the form of a Japanese aircraft manufacturer in North Carolina and a German auto manufacturer in South Carolina.

Unfortunately, those who lose jobs due to trade are not necessarily the same people who get jobs created by trade. Short-term adjustments are painful and represent economic and social challenges. However, our focus should be on the worker, not the job.

Overall, trade has a small net effect on employment, and this trade effect on employment is overwhelmed by the normal massive turnover in the labor market (see Figure 2). Rather than trade, it is population, education and training, labor force participation, institutions, and flexibility of the labor force that determine long-term employment growth. Labor markets evolve over time, and trade is just one of many influences. We do know that trade often leads to structural change in the labor markets with consequential effects on the mix of jobs across industries, the skill levels required, and the ultimate

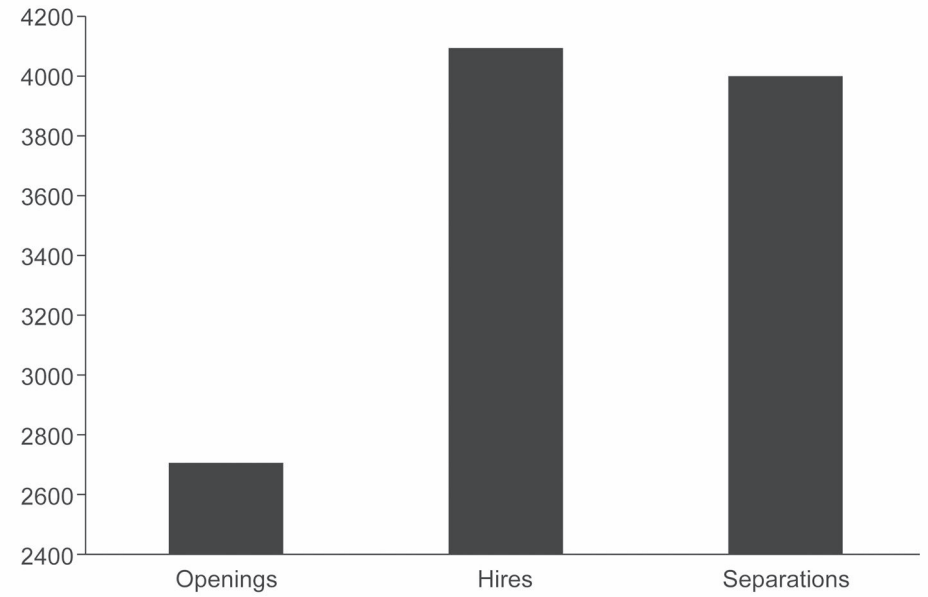

Figure 2. Job Market Dynamics, March 2010 (thousands of jobs) (U.S. Department of Commerce)

locations of job growth. For example, in recent years, lower transaction costs and improvements in international communications have led to a rising global demand for computerization and digitalization of business services, which has boosted the fortunes of U.S.-based software and hardware firms.

Meanwhile, the customer service of many of these software and hardware products and services has increased the global demand for educated English-speaking workers abroad in places such as Ireland and India. This demand for foreign workers is driven by the consumer who wants 24-hour service at the touch of a button. Therefore, companies are more likely to meet that demand at lower wages and benefit costs by hiring first-shift workers in India or Ireland than second- and third-shift workers in the United States.

In contrast, attempts to manipulate the economic theme of markets by tariffs, quotas, or labor regulations may temporarily slow job loss, but at the cost of higher prices to consumers and a misallocation of resources toward inefficient production in the rest of society. In the past, this inefficient production has been seen in subsidies to steel and textile industries and in the tariffs imposed in the 19th century to protect inefficient agriculture. In the end, the steel and textile mills still closed, and many Eastern and Southern farms became suburbs. Government interference in the economic process only increased short-term costs to the rest of the economy through higher prices. Moreover, over the long term, government interference frequently prevented the proper reallocation of resources to more productive uses. Protectionism on trade provoked retaliation

from foreign governments and a retreat from competition. As a result, protectionism leads to bloated, inefficient industries that decrease productivity and engender a lower standard of living.

Insourcing Services

Balanced discussions on trade issues are often interrupted by emotional outbursts or political grandstanding. While some manufacturing jobs are disappearing, many higher-paid service positions are being created here as foreigners increase their demand for U.S.-based services. These high-value services provided to users abroad include legal, financial, engineering, architectural, and software development services. This insourcing of professional services to the United States generates a surplus in the service component of our balance of payments accounts. The economic market-based system provides a wider array of goods and services at a lower cost than the alternatives. Greater global competition provides such benefits to society overall. There are costs of globalization that should be addressed, but by means other than preventing trade.

Global Capital Markets: Inflow of Capital to the United States

Another variation on the theme is the pattern of global capital (financial) flows and the globalization of capital markets. In contrast to labor, capital crosses borders fairly easily. In sympathy with labor, the return of capital provides an incentive to allocate capital to its best use. U.S. consumers benefit from an inflow of capital that lowers the price of credit interest rates—relative to what they would be otherwise (this reduces the interest rates on home mortgages, for example).

In addition, global capital markets lead to the development of new financial instruments that provide greater liquidity to international investors. We see this in the development of instruments such as mortgage-backed and asset-backed securities. Globalization of product markets has meant the introduction of new brands and products from foreign countries into the U.S. consumer market in particular. With capital markets, globalization has meant that U.S. financial assets such as mortgage-backed securities are now available for sale across the globe, while foreign investors with excess cash can now direct that cash toward U.S. markets.

Globalization of products leads to an expansion of world trade. The globalization of capital markets is also leading to an expansion of financial markets. For the United States, particularly in nonrecessionary times, this means a broader demand for mortgages, car loans, and business credit, which thereby effectively lowers interest rates for the U.S. consumer. In this case, the consumer comes out the winner from globalization. Consumers find that credit is more readily available at lower interest rates.

Foreign investors benefit by purchasing U.S. financial assets that are perceived to offer higher returns and lower risks than many foreign assets. This is particularly true when you view the benchmark interest rates between countries (Figure 3). Prior to the

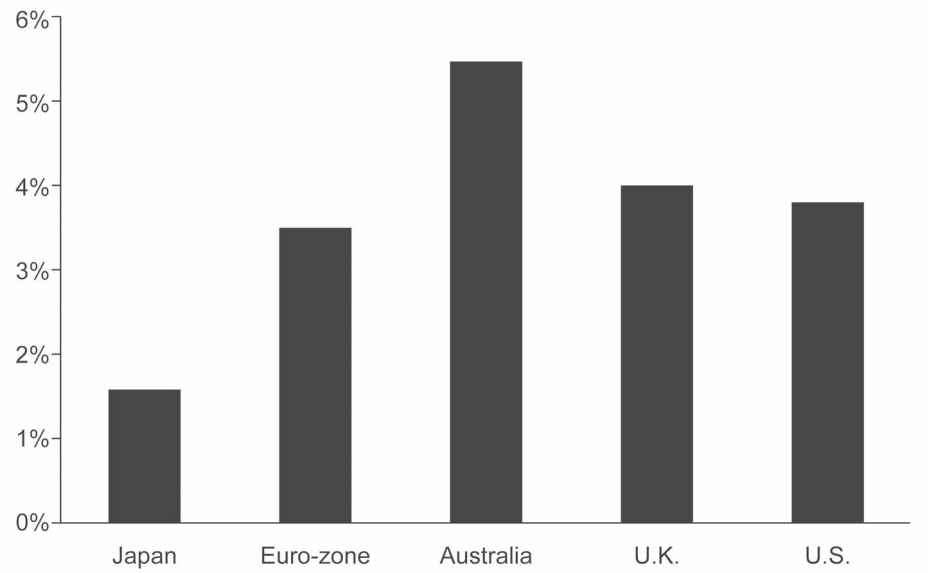

Figure 3. 10-year Government Bond Rates (Q1 2010) (Federal Reserve System)

economic crisis of 2008–2009, which hit the U.S. financial sector particularly hard, the United States led the pack, rating above 5 percent in the years immediately preceding the crisis.

Public policy in the United States has promoted these capital flows by reducing taxes on dividend and capital gains, while also lowering barriers to cross-border investment by foreign investors. This has helped promote capital flows into the United States, even while other nations limit capital flows into or out of their own nations.

Just as trade alters the global distribution of production, capital flows alter the global distribution of financial investment. Over recent years, with the exception of the 2008–2009 economic crisis, the United States has experienced growth of financial instruments and market values. Therefore, the United States benefits from the globalization of financial markets. Global savings migrate to higher return on U.S. investments (Figure 4) and thereby raise output and incomes.

What Should Be Done about Globalization?

Globalization is a product of economic incentives, not the result of some great conspiracy. Households have a limited budget and attempt to save money when they shop. Producers attempt to meet consumer demands by supplying products at a price that meets their budget. Meanwhile, many U.S. firms cannot meet their global demand by production solely in the United States and thereby locate production facilities near their customers. On the financial side, the globalization of capital markets has led to an increase in financial flows to the United States and has thereby increased the

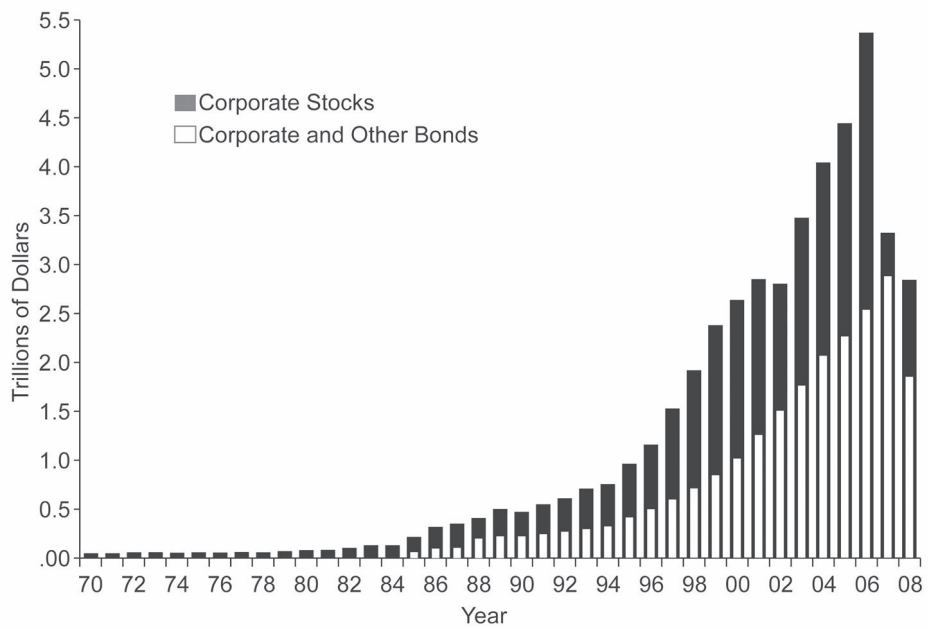

Figure 4. U.S. Securities Held Abroad (Bureau of Economic Analysis)

availability of credit and lowered interest rates. Lower rates mean that more families are able to purchase homes and businesses can finance expansion. This process is unlikely to stop.

Policymakers and voters need to recognize the dislocation costs associated with the global reallocation of production and financial flows along with the benefits that derive from such reallocation. For U.S. workers, the cost disincentives of retaining labor in many facilities in the United States may be too large to retain the old jobs in the old facilities. This may be particularly true for labor-intensive manufacturing and service jobs that require low- or semiskilled workers. In U.S. history, we have seen the migration of jobs before, from the agricultural work forces in rural areas to the manufacturing facilities of the pre–World War II era. Technological and communication changes have made many low-skilled jobs obsolete and therefore not viable economically over the long run. Certainly many workers can no longer build careers upon these jobs. Recall that consumer preferences have also shifted, with more consumer dollars going toward services—for example, eating out as opposed to buying groceries at the store to prepare all the household's meals.

While jobs may go, workers remain, and this should be our focus. Public and private programs need to be directed at worker retraining—not factory retention—in cases where the economics are clear. Labor markets are becoming increasingly flexible so that jobs are more likely to come and go, but the workers remain. Public policy is better served by the improvement of the skills of workers rather than the preservation of

specific jobs. Many states have seen the emergence of programs at community colleges with a dedicated focus on worker retraining. Of course, it is incumbent upon the worker to recognize that there is a responsibility to develop those skills and to be willing to move or change jobs more in the future than was necessary in the past.

As for manufacturing, it is important to note that many public policy decisions are aimed at discouraging production in the United States. Whatever their intentions may be, many communities simply do not want a factory in their backyard. As a result, firms are outsourcing production abroad simply because they cannot produce the gasoline, plastics, rubber, metals, textiles, and the like in this country.

On the other hand, large capital inflows into the United States also offer a solution by which incentives can be directed to foreign firms to allocate capital to areas where there is a viable workforce. We have seen this in many states where incentives are offered to locate firms in certain communities.

Offshoring creates value for the U.S. economy by passing on the efficiency that results in lower costs of goods and services to the U.S. consumer. This consumer then takes the extra money saved at the store and spends it elsewhere. U.S. companies benefit by being able to meet consumer demand by supplying the goods or services at a lower cost. Economic resources can be used then for more value-added products and services. Redeployed labor and capital to other manufacturing and service-sector activities will be more productive and have a longer economic life than those production activities and jobs in declining industries. U.S. workers and consumers benefit from specialization. Final assembly can often occur in the United States, while component production takes place around the globe. Production of goods and services is not carried on for its own sake but is undertaken to serve the demands of the consumer. Therefore, the value of any product is determined by consumers and then works its way down into the factors of production. It is impossible to governmentally control trade and consumer choice without distorting economic activity.

When a less costly way to make a good is discovered, the value of all factors used in making that good also changes. The national standard of living cannot rise when states attempt to force up the price of some factors so that the owners of those factors used in production gain an artificial advantage that results in the inefficient allocation of scarce resources in the economy. Globalization reflects the demands of the consumer. Attempts to alter that trend will only diminish the welfare of the average consumer.

PENSIONS

Jeanne M. Hogarth and Michael Shally-Jensen

A pension is a regular payment given to retired employees. Pensions are only one part of a retiree's income, however. Other income sources include Social Security, income from personal retirement savings, and earnings. Many older people continue to work during retirement, especially in the early years of retirement. So consumers planning for retirement need to think about all four sources of income.

Pension benefits are usually paid monthly. People use the terms *pension plans* and *retirement plans* to mean essentially the same thing—the term *pension plan* is used here. Pension plans are divided into two broad types: defined benefit and defined contribution plans.

According to a study by the Employee Benefits Research Institute, in 2008, 67 percent of workers age 16 and over worked for an employer that sponsored a retirement or pension plan. Of these, about half (51 percent) participated in their employer's retirement plan. Most (55 percent) were in a defined contribution plan; 33 percent were in a defined benefit plan, and about 10 percent were in both defined contribution and defined benefit plans. In addition, more than half of all workers (55 percent) had either a pension plan or other retirement savings in their own individual retirement account (IRA) or Keogh plans. Data from the Federal Reserve Board's 2007 Survey of Consumer Finances show that 53 percent of workers and retirees have a pension or retirement savings in an IRA or Keogh.

Defined Benefit Plans

Defined benefit plans are an older form of pension plans. Defined benefit plans define the amount of the pension benefit that will be paid to employees at retirement, and then the employer sets aside funds to pay that future benefit.

Suppose Ann is 25 years old. Her boss tells her that she will pay Ann $12,000 a year in retirement when Ann is 65. Ann's boss must set aside enough money now to make those $12,000-a-year payments 40 years from now. Ann's boss will need to estimate what investment return she can earn on the funds and how many payments she will need to make (i.e., how long Ann will be retired).

In some cases, instead of a fixed amount, the pension benefit amount is calculated based on a formula—for example, a combination of worker's earnings and years of work. Suppose the formula for Sam's company pension is 1 percent of the average of his earnings for the last three years times the number of years he has worked for the company. Sam's earnings for the last three years were $40,000, $50,000, and $60,000 (the average is $50,000), and he retired after 30 years of work. The formula is: 1% × 50,000 × 30= $15,000.

Again, Sam's boss must set aside enough money now to make those $15,000-a-year payments 30 years from now. In addition to estimating the investment return she can earn on the funds and how long Sam will be retired, she will need to estimate how long Sam will work for her and what Sam's salary will be in his last 3 years of work.

With a defined benefit plan, employers are responsible—and bear the risk—for having enough money in the fund to be able to pay for the pension. The actual cost of the defined benefits plan to the employer is uncertain. The cost is only an estimate because the formula depends upon a number of variables, such as the average retirement age, the life spans of employees, the returns earned by any of the pension's investments, and any additional taxes.

Up until the 1980s, defined benefit plans were the most common type of pension plan. But these plans lost popularity due to their cost and changes in the laws that cover pensions. Also, as workers changed jobs more often, there was a need to have a pension plan that was more portable and could move with the employee from one employer to another. The need to maintain defined benefit plans contributed to the financial woes of companies such as General Motors during the economic crisis of 2008–2009.

Defined Contribution Plans

In contrast to a defined benefit plan that defines the benefit to be paid in the future in retirement, a defined contribution plan defines the amount an employer will contribute into an account for each employee. Employees may be able to choose how the contributions to their accounts are invested; choices can include mutual funds, stocks or other investments, and securities. The returns on the investments, either gains or losses, are credited to the individual employee's account.

At retirement, the amount of money in the account is used to create the series of payments the retired worker will receive in retirement. With a defined contribution plan, employees—not the employer—bear responsibility for having enough money in the pension account for retirement. If employers contribute enough and make good investment choices, the investments grow and employees will have a large amount in their accounts to use in retirement; if employers make poor choices, employees will not have as much money in retirement.

For example, suppose Ben's employer tells Ben he will put $1,000 per year into a defined contribution plan. At the end of 30 years, Ben's employer will have paid $30,000 into Ben's account. If Ben's employer chooses an investment that pays 2 percent per year, at the end of 30 years, Ben will have $1,217,042 in his account. If Ben takes out $5,000 per month, his money will last about 30 years. On the other hand, if Ben's employer chooses an investment that pays 5 percent, at the end of 30 years, Ben would have $1,993,165—or nearly $776,000 more. He could take out $10,700 a month—more than double—and his money would still last 30 years.

Employers can easily calculate the cost of a defined contribution plan, in contrast to the defined benefit plan. Once employees are vested (eligible to receive money) in the plan, most plans are portable—as workers change jobs, they can take their funds with them or roll them over into an individual retirement account.

Defined contribution plans, since their emergence in the 1980s, have shown themselves to be highly successful retirement tools; indeed, they have become the modern standard for U.S. corporations. At the same time, however, participants in these plans can face risks if they are not careful in monitoring their investments. In some cases, in fact, such as that of the collapse of the investment market in 2008, even monitoring may not help. It is estimated that *trillions* of dollars in savings were lost virtually overnight by owners of retirement accounts (401(k)s, IRAs) when the markets ceased functioning.

Cash Balance Plans

A third type of pension plan—the cash balance plan—is a defined benefit plan, but the benefit that is defined is an account balance, not a monthly benefit. For example, instead of promising workers a pension of $12,000 a year, a cash balance plan would promise a nest egg of $100,000 at retirement. When workers reach retirement, they have a choice of taking a series of monthly payments (an annuity) or taking the entire cash balance as a lump sum. Most traditional defined benefit pension plans do not offer this lump sum payout feature.

How Are Pension Benefits Paid Out?

Most pensions give retirees a choice of how to receive benefits—and how much they receive depends on which option they choose, because some options pay more per month than others. As with the cash balance plan, one option may be to take a lump sum from

STATE PENSIONS AND FISCAL CRISIS

As the economic meltdown of 2008 began to spread throughout the economy, states came to realize that they were extremely vulnerable. Not only did they face some of the largest budget gaps ever (over $300 billion collectively by the end of 2009), but revenues dropped significantly and, to date, remain in a troubled state. Moreover, state pension funds—money set aside for retired teachers, state police, and other government employees—face severe shortages.

According to the Pew Center (2010), there is a $1 trillion gap between what states have promised to pay their retirees and what they actually hold as financial assets. Some researchers, in fact, consider this estimate to be far too low (Biggs 2010). The problem has to do in part with where state pension funds were invested before the recession; in many cases, the funds were tied to high-risk, high-yield hedge funds along with more traditional investments, many of which collapsed or shrank dramatically in the economic downturn. In some cases—as in California, Colorado, and Illinois—governors previously had approved pension increases for state employees or had taken out bonds to cover their states' pensions, expecting that the investment market would increase and the value of their pension funds would rise.

Once the ensuing budget crunch hit home, however, lawmakers were forced to seek alternative solutions. New York, for example, raised its retirement age for new hires from 55 to 62. New Hampshire, Connecticut, and Texas required new workers to contribute more from their paychecks to state pension plans. Oregon and Vermont reorganized their pension investment boards to bring greater expertise to the table. And several states altered the formulas they used to calculate benefits. Even with such efforts, however, experts expect that it could be a decade or two before states start realizing any positive effects emerging directly out of changes to their pension plans.

the plan. Retirees could then invest this amount in an account and then withdraw interest and principal from the account.

Employees may have a choice of how much their monthly benefits will be. Usually, the option that pays the most per month is a single life annuity option. In this payout plan, pension benefits are paid out based on the retiree's life expectancy. Because women tend to live longer than men, the payout for men is usually higher than for women. Another option is a joint and survivor annuity. The benefits are based on the life expectancy of the retiree and the joint beneficiary of the pension—usually the husband or wife of the retiree. The monthly benefits for a joint and survivor annuity are generally lower than the single life annuity option, because the pension plan has to pay out benefits over the combined life expectancy of two people, which is usually a longer period of time.

Some pension plans provide for benefits to be paid out for a guaranteed number of years, regardless of how long the retiree lives. For example, employees may be able to choose a 20-year certain single life annuity. If an employee retired at age 65 and chose

this option, he would receive benefits throughout the rest of his life, even if he lived to be 100. If he only lived until age 75, the remaining 10 years of the 20-year certain payouts would go to a designated beneficiary. The payouts for this option depend on the number of years of guaranteed payouts and are generally lower than those for the single life annuity but higher than payouts for the joint and survivor annuity.

Not all pensions adjust to accommodate cost-of-living increases—an important feature to consider in planning for retirement income. Suppose a pension paid out $1,000 a month, with no cost-of-living adjustment. If prices rise 10 percent over five years, it would take $1,100 to buy the same goods and services that once cost $1,000, but the pension stays at $1,000. Retirees would need to have some other source of funds, such as other retirement savings or IRAs, to maintain their purchasing power.

Consumer Protections in Pension Plans

The major federal law that provides consumers rights and consumer protections for their pensions is the Employee Retirement Income Security Act (ERISA). For example, ERISA sets out the maximum vesting period—how long employees need to work for an employer before they have a right to a pension that cannot be taken away. There are two vesting options for pension plans. The first option, called cliff vesting, provides employees with 100 percent of their benefits after five years of service. If an employee leaves after only four years of work, she will have no pension.

The second option provides for graduated vesting; employees earn a right to 20 percent of their benefits after three years, and then increases of 20 percent per year (40 percent after four years, 60 percent after five years, 80 percent after six years), so that after the seventh year, employees have rights to 100 percent of their benefits.

What happens if the company goes out of business—and the pension that workers were counting on goes away? ERISA also created the Pension Benefit Guaranty Corporation (www.pbgc.gov), which ensures pension benefits for workers. The drawback is that the benefit amounts retirees receive from the PBGC may be less than the pension benefits they were expecting—so they have less money in retirement. (And PBGC was itself hit hard by the recession but remains properly funded.)

ERISA also requires that if a retiree chooses a single life annuity option, the spouse must cosign the benefit selection form. This provision came about because many retirees were choosing single life annuity options, which paid more while the retiree was alive but left their spouses with no pension income. In an era when many women were not employed outside the home, this made a lot of sense—without a pension, many widows had to survive only on Social Security.

401(k), 403(b), and 457 Plans

A 401(k), 403(b), or 457 plan is an employer-sponsored retirement plan that allows employees to set aside some of their current earnings as personal savings for retirement.

Employees do not pay taxes on these earnings until they withdraw them in retirement, when their tax rate may be lower. The numbers refer to the sections in the Internal Revenue Service tax code that apply. The 401(k) applies to most workers, while a 403(b) plan covers workers in educational institutions, religious organizations, public schools, and nonprofit organizations; 457 plans cover employees of state and local governments and certain tax-exempt entities.

Neither benefits nor contributions to these plans are defined. Employees choose how much to contribute (up to limits set by the IRS) and how to invest the money. Workers over age 50 can contribute extra money into a catch-up fund for retirement. If employees move to a different job, they can roll over the money into an individual retirement account, or they may be able to move the assets into the new employer's 401(k) plan.

Employers may match worker contributions—an important benefit to think about when one is looking for a job. Consider Matt and John. Both work for Mega Corporation, which provides a match of up to 5 percent in the company 401(k). Both make $40,000 a year. Matt does not participate in Mega's 401(k), so his taxable salary and total compensation are $40,000. John, on the other hand, contributes 5 percent to his 401(k). His pay is reduced by $2,000, so his taxable salary is $38,000 instead of $40,000. But Mega Corp. adds a matching 5 percent—$2,000—to his 401(k) fund. So John's total compensation is his $38,000 pay plus the $2,000 he puts into his 401(k) plan plus Mega's $2,000 contribution to his 401(k)—or a total of $42,000.

Some employers have opt-in 401(k) plans and others have opt-out or automatic enrollment plans. For automatic enrollment plans, employers set an initial contribution rate and investment option. In either case, employees can choose how much to contribute and how to invest the money to tailor it to their specific needs.

IRAs, SEP IRAs, and Keogh Plans

Individual retirement accounts are self-directed retirement accounts—workers choose how much to contribute and how to invest the money. Money contributed to an IRA must come from earnings, although spouses not employed outside the home are allowed to put money into an IRA as well. There are three kinds of IRAs: pretax IRAs, posttax IRAs, and Roth IRAs.

Contributions to a pretax IRA are restricted to people without other pensions and are subject to income limits set by the IRS. Taxes on the money put into the account and taxes on any interest or gains are deferred until retirees withdraw the money.

Almost anyone can set aside money in a posttax IRA, again subject to IRS limits for annual contributions. When retirees withdraw the money, they pay taxes on the earnings but not on the principal.

A Roth IRA is a special kind of posttax IRA; contributions are limited by income, but all withdrawals are tax-free. Money invested in any of theses types of IRAs is usually put into securities, particularly stocks, bonds, and mutual funds.

SEP IRAs, simplified employee pension plans, are usually used by small businesses that want to provide their employees with some retirement funding. Employees set up their own IRAs and employers can contribute to these accounts.

Keogh plans are for self-employed individuals and their employees. These plans receive special tax treatment like a tax deferral on contributions and earnings until workers retire and start receiving benefits.

The Internal Revenue Service has special rules about money in IRAs, which it enumerates in IRS Publication 590 (available at http://www.irs.gov/pub/irs-pdf/p590.pdf). If workers withdraw money before age 59 1/2, they have to pay taxes on that money as well as a 10 percent penalty. Also, workers must start withdrawing funds by age 70 1/2, and there are specific minimum withdrawals required under tax law.

Conclusion

There are more options, and therefore more choices, for retirement planning today than in the past. The days of working without having to worry about retirement are long gone (if, indeed, they ever existed in the first place). Especially as more people change jobs over the course of their careers, taking advantage of options for accumulating funds for retirement becomes even more important.

Many commentators on both sides of the political spectrum welcome the range of retirement options and find that a mix of corporate and individual responsibility is the best means for satisfying the working public's retirement needs. Critics on the right (i.e., conservatives and libertarians) generally prefer that businesses not be unduly burdened with providing for the retirement security of their employees; they emphasize the need to shift pensions in the direction of individual savings and investment accounts. Critics on the left (i.e., liberals and social democrats), on the other hand, tend to prefer that businesses contribute significantly to the retirement security of their employees; they argue that personal retirement accounts are not for everyone. Where the pendulum rests at any given moment depends on many factors, both economic and political.

POVERTY AND RACE

James H. Johnson Jr. and Michael Shally-Jensen

Before the 2010 oil spill in the Gulf of Mexico, Hurricane Katrina's devastation of the city of New Orleans and other Gulf Coast communities in 2005 refocused the nation's attention on the relationship between race and poverty. The people most adversely affected by this catastrophic event and its aftermath were overwhelmingly black and overwhelmingly poor. A common reaction to the media's dramatic images of disaster victims in New Orleans, especially those seeking refuge in the attics of flooded homes, building rooftops, and the Superdome, was "I didn't think the problem of race and poverty was still with us."

As this entry shows, the attention to poverty and race brought about by Katrina is yet another phase in the race/poverty discourse in the United States, which has shifted sharply several times over the past few decades. In this entry, we will show how the face of poverty in the United States has changed over the past 40 or 50 years in response to antipoverty policies and structural changes in the economy.

Background and Context

Concerns about America's poor ebbed and flowed throughout the 20th century. After receiving limited public policy attention prior to World War II, concern about the United States' poverty problem abated after the war, and it did not become a priority policy issue again until the early 1960s.

Since the early 1960s, public policies implemented to alleviate poverty in the United States have ranged from the very liberal to the extremely conservative. Reflecting this state of affairs, the absolute and relative size of the poor population in the United States

has fluctuated widely over the last 50 years. Table 1 shows the poverty status of the U.S. population for selected years between 1960 and 2008.

The Poor and Efforts to Alleviate Poverty in the United States

Political attitudes toward America's poor were decidedly liberal during the 1960s. In both political and policy circles, the prevailing view was that poverty was a structural problem characterized by racial discrimination and systematic exclusion of racial minorities in all walks of American life. This view led to the first major federal effort after World War II to address the country's poverty problem: the war on poverty and the Great Society programs launched by President Lyndon Johnson.

Before the war on poverty, the U.S. poor totaled 39.8 million, 22.4 percent of the nation's population in 1960 (Table 1). As a consequence of the Johnson administration's antipoverty programs, which sought to redress the systematic inequities in U.S. society, the incidence of poverty was reduced by 36 percent during the 1960s. By 1970, only 25.4 million people (12.6 percent of the U.S. population) were poor.

But the war on poverty was short lived, as the Vietnam War assumed center stage during the early 1970s, resulting in a redirection of federal resources away from efforts to eradicate poverty. Moreover, with the election of President Richard Nixon, attitudes toward the poor became more conservative: the prevailing view held that poverty was a function of human or personal failings rather than a structural problem. As a consequence of these developments, the assault on America's poverty problem was substantially curtailed just as economic stagflation and a deep recession occurred, resulting in an increase—absolute and relative—in the size of the nation's poor population. During the 1970s, the U.S. poor grew from 25.4 million to 29.2 million, increasing from 12.6 percent to 13 percent of the total population by 1980 (Table 1).

Political attitudes toward the poor became even more conservative during the 1980s. Instead of acknowledging the short duration of the nation's official war on poverty, both the Reagan and Bush administrations of the 1980s argued that the nation's persistent

poverty problem, especially the resurgence of growth during the 1970s, was a product of 1960s-era liberal policymaking. In their eyes, the federal welfare program—Aid to Families with Dependent Children (AFDC), in particular—was the culprit.

AFDC, they contended, destroyed the work ethic, bred long-term dependency, and encouraged a range of other antisocial or dysfunctional behaviors, including out-of-wedlock pregnancy, family disruption, and even illegal activities revolving around gangs and drug dealing, especially in the nation's cities. The problem, they asserted, was not material poverty but, rather, moral poverty. They also believed that the antipoverty programs of Johnson's Great Society slowed the economy by sapping taxes from productive investments that would otherwise spur economic growth and job creation.

To combat these problems and behaviors, the Reagan and Bush administrations waged what some characterize as a war on the poor, drastically cutting federal spending on social programs (especially AFDC) and eliminating government regulations viewed as crippling industry and private enterprise. These policies, especially efforts to create a deregulated business environment, drastically altered the structure of economic opportunity for the nation's most disadvantaged citizens, in particular the large number of African Americans concentrated in urban ghettoes.

Specifically, the business policies accelerated the decline of highly unionized, high-wage, central-city manufacturing employment—a process referred to as deindustrialization—and accelerated capital flight away from U.S. cities and toward Third World countries—a process referred to as employment deconcentration—leaving behind a substantial population that became the jobless or underemployed poor. Partly as a function of these business policy impacts and partly as a consequence of cuts in a host of 1960s-era social programs, the poor population continued to increase during the 1980s, reaching 33.5 million, or 13.5 percent of the total U.S. population, by 1990.

During the 1990s, the poor population declined for the first time since the 1960s—from 33.5 million (13.5 percent of the total population) at the beginning of the decade to 31.5 million (11.3 percent of the total population) at the end. It should be noted that this decline occurred despite prognostications that poverty would increase substantially after the enactment of the most sweeping welfare reform legislation since the war on poverty was launched in the mid-1960s—the Personal Responsibility and Work Opportunity Reconciliation Act of 1996 (PRWORA).

In an effort to respond to past criticisms of the social welfare system, especially those advanced by conservative social policy analysts, the 1996 PRWORA sought to reduce dependency by imposing time limits on welfare. Reflecting liberal views about the underlying causes of poverty, it also provided a range of supports designed to encourage and facilitate former welfare recipients' transition to work. Thus, in contrast to the liberal policies of the 1960s and the conservative policies of the 1980s, this legislation was decidedly centrist, as it represented a "carrots" (work incentives and supports) and "sticks" (welfare time limits) approach to poverty alleviation in the United States.

DUELING MEASURES OF POVERTY

Although poverty might seem like a simple concept, it isn't. Measuring poverty requires specific calculations, which means poverty must be precisely defined.

The official definition of poverty used by the U.S. Census Bureau is nearly 50 years old. Developed in 1965, the formulation of the definition involved several steps. First, the spending necessary for a household to consume nutritious yet frugal meals was calculated. This spending was different for households of different sizes. Second, this food spending was multiplied by a factor—roughly three—to equal the spending necessary to afford an adequate amount of all consumer goods and services. This, then, was the poverty threshold. Finally, if a household's income from working was below the poverty threshold for its size, then the household was classified as poor. Each year the poverty thresholds are adjusted upward to account for the general increase in the cost of living.

There are many issues with the official measure of poverty, but two in particular stand out. One is whether simply multiplying food spending by three is adequate to produce an income that would allow one to afford all necessary goods and services. What if prices and costs for some services, like health care, are increasing much faster now than in the past? This might mean the poverty thresholds are too low.

A second issue is whether the values of various kinds of public assistance received by households should be included before it is decided whether a household is poor. For example, many households receive assistance through programs like Food Stamps and Medicaid. Many households also receive direct cash assistance through temporary welfare payments and payments from the government if they are working and their earnings fall below a certain level (the name of this program is the earned income tax credit). If the objective of measuring poverty is to see how many people are poor after government-provided help is accounted for, then the value of these government programs should be included in a household's income.

The U.S. Census Bureau calculates poverty rates based on these two concerns. An alternative poverty rate includes the cost of medical services in the poverty thresholds. When this is done, the poverty rate (percentage of people who are designated poor) increases approximately 1 percent from the official rate. Another alternative poverty rate is calculated after the values of government antipoverty programs in a household's income are included. These poverty rates are approximately four percentage points below the official rate.

The conclusion is that how much poverty exists depends on how poverty is defined and measured.

The successful implementation of the reforms inherent in the 1996 legislation was aided tremendously by the decade-long economic boom, which created a large number of entry-level jobs that matched the skill levels of the long-term welfare-dependent population. But the economic crises of 2008–2009 adversely affected the federal government's effort to move former welfare recipients to the world of work as well as the

structure of employment opportunities in the U.S. economy more generally, especially for low-skilled workers. Due to the massive layoffs spawned by corporate scandals and business failures, the U.S. poor population increased by 8.2 million after 2000, bringing the total to 39.8 million in 2008. As a result of this absolute increase, the share of the U.S. population that was poor increased from 11.3 percent in 2000 to 13.2 percent in 2008. (More recent data, although incomplete, looks just as bad or worse.)

Uneven Impacts of Past Poverty Alleviation Programs

Focusing on the period from 1970 to the present (for which there are more complete data available), and notwithstanding the fluctuations in the absolute and relative size of the U.S. poverty population over the last 40 years, there were, according to the Census Bureau, 14.6 million more poor people in the United States in 2008 than there were in 1970 (or about the same number of poor as in 1960). It should be noted that this absolute increase occurred in the midst of a 49 percent increase in the total U.S. population—from 202.2 million in 1970 to 301 million in 2008 (see Table 1). However, compared to the period 1960 to 2000, where there was an even greater relative increase in population (55 percent) together with an absolute *decrease* in the number of poor people (8.3 million), the more recent period (1970 to 2008) looks remarkable for its lackluster results. One could perhaps point to the 1960s social programs at the one end of the scale and the layoffs of the 2000s (capped by the start of the economic crisis of 2008–2009) at the other end, to explain part of this striking difference.

As should be evident from these data, past efforts to alleviate poverty in the United States have been unevenly distributed, resulting in a significant shift in both the demographic composition and the geographical distribution of the poor. Figure 1 provides insight into where significant inroads have been made in the alleviation of poverty and where major challenges remain. Figures 2 through 5 illustrate how the face of poverty in the United States has changed over the last 40 years as a consequence of the uneven distributional impacts of past poverty alleviation efforts.

Between 1970 and 2008, as Figure 1 shows, there was a 14.9 percent decrease in the rate of poverty among senior citizens, an 8.8 percent decrease in the rate of poverty among blacks (as many moved into the middle class), a 6.7 percent decrease in the poverty rate among women-headed households, a 4.2 percent decrease in the poverty rate in the South (as employment increased), and a 1.8 percent decrease in the poverty rate in nonmetropolitan areas. On the other hand, there were increases in the poverty rate in many categories: 3.9 percent among children and youth; 3.5 percent in central cities; 2.7 percent among adults aged 18 to 64; 2.7 percent in noncentral cities; between 2.4 and 2.2 percent in the Midwest, the West, and the Northeast; and smaller but notable increases among whites (1.1 percent), men (0.9 percent), families (0.6 percent), Hispanics (0.5 percent), and women (0.4 percent).

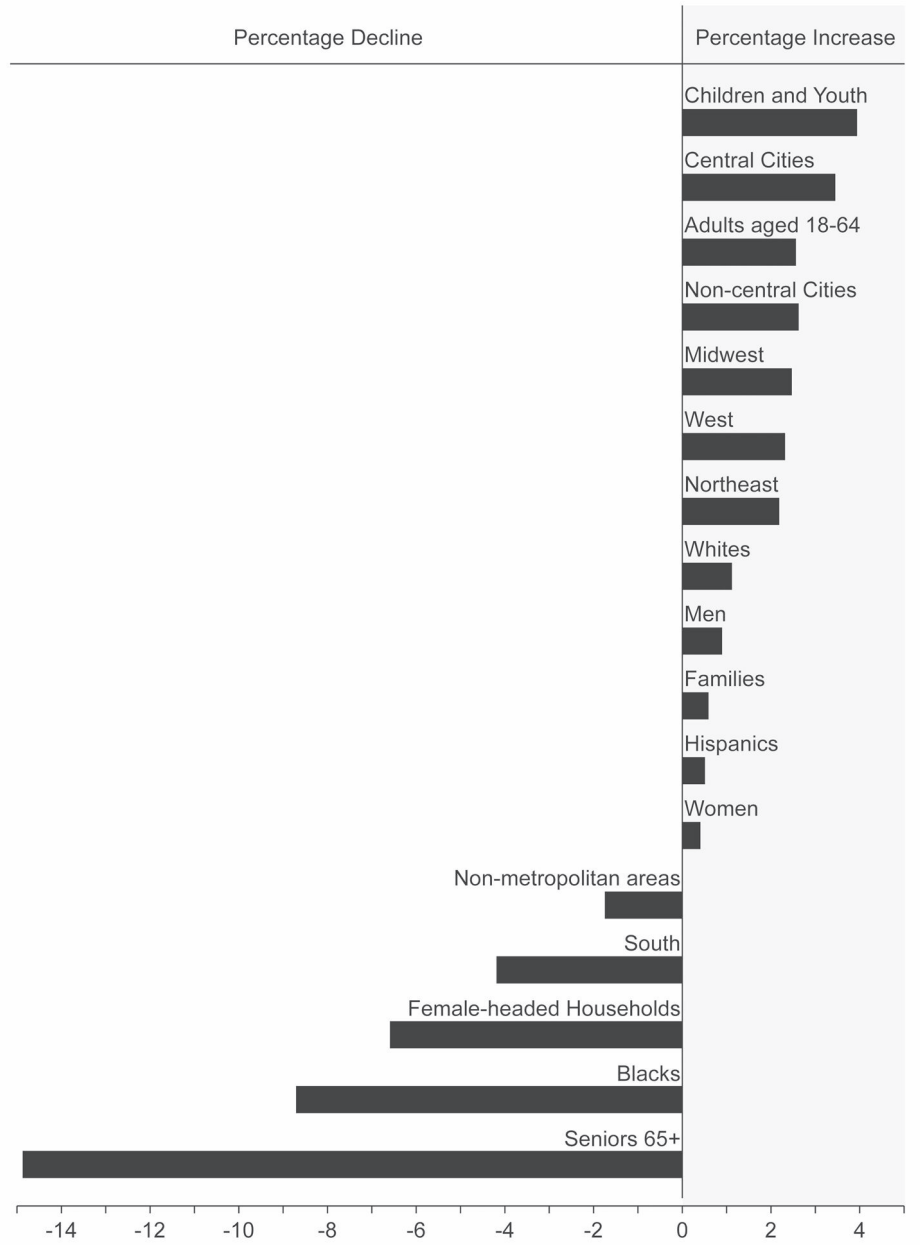

Figure 1. The Changing Profile of the U.S. Poor (1970–2008) (U.S. Census Bureau. "Poverty." Historical Tables. http://www.census.gov/hhes/www/poverty/histpov/histpovtb.html)

Undergirding these statistics are five noteworthy shifts that have transformed the face of poverty in the United States over the last 40 years: shifts in regional distribution and place of residence as well as changes in the age, family status, and racial and ethnic composition of the nation's poor.

As Figure 2 shows, the decline of the South's share of the U.S. poor and the concomitant increase in the West's share is one of these shifts—even while the South remains the region with the highest number of poor. In the early 1970s, close to half of the nation's poor was concentrated in the South. Close to 40 years later, the South's share of U.S. poverty had decreased to 40 percent. Paralleling the South's declining share, the West's share of the nation's poor increased from 16 percent in 1971 to 24 percent in 2003. As shown below, this shift is due in part to the influx of poor Hispanic immigrants into the United States over the last three decades, most of whom settled—at least initially—in the Southwest. Throughout this period, as Figure 2 shows, the Northeast's and Midwest's shares of the nation's poor remained relatively stable—in the 17–20 percent range in both regions.

Changes in the types of communities in which the nation's poor reside constitute a second major shift. As the United States has become more urbanized, so has the poor population. In the early 1970s, as Figure 3 shows, almost half of the nation's poor resided in rural areas. By 2008, only 17 percent resided in such areas. Today, a majority of the U.S. poor lives in metropolitan areas, with significant concentrations both inside and outside central cities.

Over the past 40 years, the age composition of the poor also has changed; this constitutes the third major shift. In general, the shares of the U.S. poor under age 18 and over

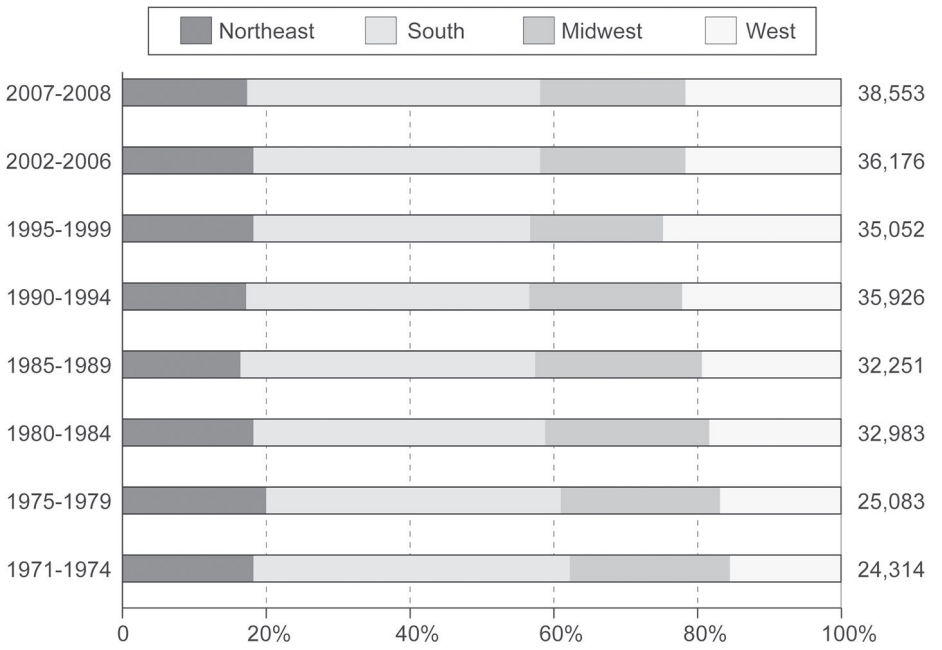

Figure 2. Distribution of U.S. Poor by Region (1971–2008) (U.S. Census Bureau. "Poverty." Historical Tables. http://www.census.gov/hhes/www/poverty/histpov/histpovtb.html)

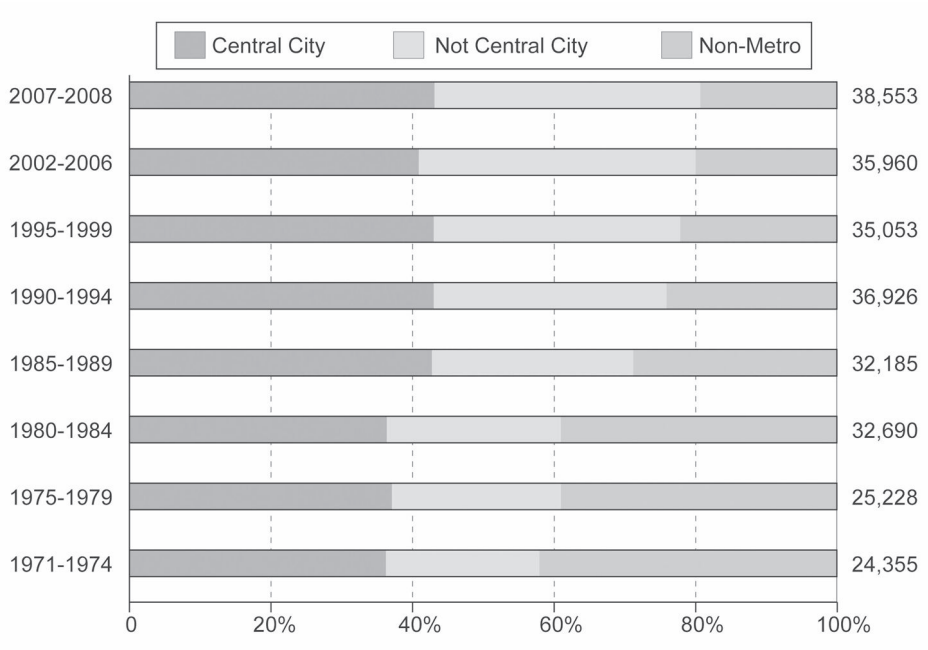

Figure 3. Distribution of U.S. Poor by Place of Residence (1970–2008) (U.S. Census Bureau. "Poverty." Historical Tables. http://www.census.gov/hhes/www/poverty/histpov/histpovtb.html)

age 65 decreased, while the number of those in the 18–64 age group increased sharply (see Figure 4). Historically, poverty among working-age individuals (ages 18 to 64) was due primarily to detachment from the labor market (i.e., jobless poverty). However, as the U.S. economy was structurally transformed from goods production to service provision, a growing contingent of the labor force became what is referred to as the working poor. Due to skills deficits or other types of constraints (e.g., lack of affordable child care, inferior public school education, lack of economic opportunities in close proximity, and employer bias), these individuals have been relegated to part-time jobs they do not want—mainly in the service sector of the U.S. economy—or full-time jobs that pay below poverty-level wages, provide few (if any) benefits, and offer no prospects for career mobility (see Table 2). Many of these problems were exacerbated by the recent financial crisis, as figures for the period after 2008 (not published by the Census Bureau at the time of this writing) are likely to show.

The family context in which the poor find themselves is the fourth major shift. Poverty among all families increased slightly—by 0.6 percent—over the last four decades. As can be seen in Figure 5, moreover, poverty has become less concentrated in married-couple families and more concentrated in women-headed families, which accounted for about half of all families in poverty in 2008. This shift has been termed the *feminization of poverty.* Even so, as noted above in the discussion of Figure 1, some progress has been made since 1970 in reducing (by 6.7 percent) the poverty rate within this demographic

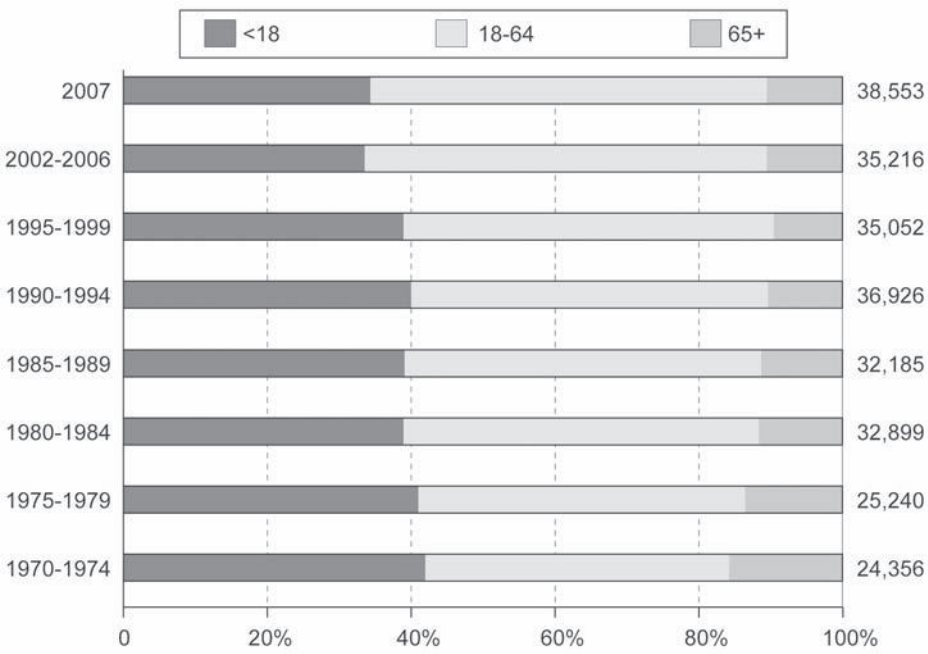

Figure 4. Distribution of U.S. Poor by Age (1970–2007) (U.S. Census Bureau. "Poverty." Historical Tables. http://www.census.gov/hhes/www/poverty/histpov/histpovtb.html)

group. In other words, as the *number* of women-headed households continues to increase and as poverty affecting families in general remains at a relatively high level, the prospect of experiencing poverty remains an issue for these families; and yet, as a group or class, women-headed households have witnessed a decline (6.7 percent) since 1970 in the *rate* at which they experience poverty.

Change in the racial and ethnic composition of the nation's poor population is the fifth major shift. Heightened immigration—legal and illegal—from Mexico, other parts of Latin America, and Southeast Asia is principally responsible for the increasing diversity of the nation's poor. The white share of the U.S. poor declined from nearly 70 percent in 1970 to 42.7 percent in 2008. During this period, the African American share declined from 30 percent to 24 percent. These declines have been offset by increases among the immigrant groups, especially Hispanics. Since the early 1970s, the Hispanic share of the nation's poor has grown from 10 percent to 27.6 percent.

Conclusion

A range of public policies spanning the political ideological spectrum have been implemented to address the poverty problem in the United States since the 1970s. Whether because of these policies or their failure or because of fundamental shifts in the U.S. economy, more Americans live in poverty today than 40 years ago, in both proportional

terms (12.6 percent to 13.2 percent) and absolute terms (from 25.3 million to 39.8 million).

While many of the social and economic conditions associated with poverty in the 1970s persist, immigration, combined with regional and global shifts in job growth, changed the face of poverty in the United States in several ways.

- Poverty in the South declined significantly, but there were increases in the other regions as the economy adjusted to globalization.
- Rural poverty declined, while urban poverty grew.
- Poverty among senior citizens and blacks declined, while poverty among both working-age adults and children and youth increased significantly. Today, the working poor account for a higher proportion of Americans in poverty than the jobless poor, and children and youth have suffered the effects along with their parents or guardians.
- Poverty decreased in women-headed, single-parent households even as the number of these families grew, especially among African Americans. At the same time, poverty in families in general increased slightly.

Given the current economic downturn, this picture is likely to get worse before it gets better. If and when the situation does turn around, or perhaps even before that, policymakers would do well to revisit the issue of poverty in the United States and decide what can be done to build on progress that has been achieved to date while also attending to those areas that remain challenges.

PRESCRIPTION DRUG COSTS

Brandon Kramer and Michael Shally-Jensen

Few issues have created such controversy as the rising cost of prescription medicine. News reports often quote examples of patients, especially seniors, who cannot afford their medications. The pharmaceutical industry and advocacy groups maintain very different positions as to why prescription drug costs are so high in the United States compared to other countries. This entry examines the costs and related issues from both the industry and consumer advocate perspectives.

Research and Development

Industry Standpoint

Pharmaceutical companies contend that searching for new drugs, or the next cure, can be a costly venture. It may take hundreds and possibly thousands of "concepts" (experimental compounds) to create one drug that makes it to market. Cost estimates of researching both successes and failures range from $500 million to $800 million. An estimate released in a study by economists at Tufts University stated that, on average, it takes almost 15 years to bring a new drug compound to the market. Only 1 compound out of 5,000 ever makes it to market. Only 30 percent of drugs that make it to market will ever recoup their research and development costs (Clayton 2008). The cost and risk involved are very high. This is one way the industry justifies the high cost of medicine.

The U.S. Food and Drug Administration (FDA) maintains a strict and lengthy process to approve a medication for use. After filing a patent for a new compound, the drug manufacturer has approximately 20 years to research, receive FDA approval, and market the new drug. This process often leaves only five or six years to profit from the extensive research before generic manufacturers can challenge the patent. Therefore, a company can be limited in the time it has to recover its investment.

The pharmaceutical industry defends its position on research and development costs by demonstrating that all top companies in a variety of industries are research and development–intensive. The pharmaceutical industry relies on new drugs to keep an income stream from which it can continue to search for new drug compounds. Pharmaceutical companies invested roughly $50.3 billion in research and development in 2008, which is roughly a 51 percent increase since 2003 (Archstone Consulting and Burns 2009).

U.S. FOOD AND DRUG ADMINISTRATION DRUG REVIEW STEPS

1. The sponsor holds preclinical (animal) testing.
2. An investigational new drug application outlines what the sponsor of a new drug proposes for human testing in clinical trials.
3. The sponsor holds phase 1 studies (typically involving 20 to 80 people).
4. The sponsor holds phase 2 studies (typically involving a few dozen to about 300 people).
5. The sponsor holds phase 3 studies (typically involving several hundred to about 3,000 people).
6. The pre–new drug application (NDA) period begins, just before a NDA is submitted. This is a common time for the FDA and drug sponsors to meet.
7. The submission of an NDA follows, which is the formal step asking the FDA to consider a drug for marketing approval.
8. After an NDA is received, the FDA has 60 days to decide whether to file it so it can be reviewed.
9. If the FDA files the NDA, an FDA review team is assigned to evaluate the sponsor's research on the drug's safety and effectiveness.
10. The FDA reviews information that goes on a drug's professional labeling (information on how to use the drug).
11. The FDA inspects the facilities where the drug will be manufactured as part of the approval process.
12. FDA reviewers will approve the application or find it either approvable or not approvable.

The U.S. government offers some help (mainly through research grants from the National Institutes of Health, or NIH), but in terms of overall development, the industry maintains that it bears most of the burden. The industry maintains that roughly 91 percent of all drugs brought to market have been fully funded by the industry, with no help from the NIH (GlaxoSmithKline 2005).

Consumer Advocate Standpoint

Consumer advocate groups contend that the numbers pharmaceutical companies present regarding the cost of research are overstated. Public Citizen, for example, released a report showing how the $500 million figure that the industry uses as a benchmark for new drug development is wrought with flaws and overestimates. The report showed that the $500 million figure is suspect and more likely a mathematical estimation. The true cost of researching and developing new medications, the report states, is significantly less—between $70 million and $110 million (Public Citizen 2001).

Anti-industry groups also illustrate that the pharmaceutical companies receive certain advantages—tax breaks, for example—for doing the research and development. These

government tax breaks could lower a pharmaceutical firm's tax burden considerably. The amount of tax incentives companies receive is a closely guarded secret within the industry. One such tax break involved incentives for pharmaceutical companies that built manufacturing facilities in U.S. territories. Many major manufacturers opened facilities in Puerto Rico to take advantage of this opportunity. Under this incentive plan, the industry's average tax rate was believed to be around 26 percent, as compared to roughly 33 percent for all other major U.S. industries (Greider 2003). Advocates for lower drug prices cite examples such as these to show that pharmaceutical companies do receive some benefit for the heavy investment in research and development.

Consumer groups also dispute claims that the pharmaceutical industry pays for most of the research involving new cures. The advocate groups believe that the National Institutes of Health often conducts the most basic and risky research and that the pharmaceutical companies begin their research only after an opportunity arises based on discoveries made through government research efforts. In recent years, in fact, there has been increased spending by pharmaceutical companies on the development of so-called me too drugs, or medications that do not differ in any fundamental way from medications already on the market but rather offer minor differences in terms of dosing, price, or similar aspects. These drugs are patently less expensive to produce.

New Medicine or Old Technology

Industry Standpoint

Recent television advertisements quote lines such as, "Today's medicines, financing tomorrow's miracles." This sums the industry view that, to discover new treatment, the cost of medication must remain at its current level. The industry invests heavily in research and development and needs to have adequate income to fund these ventures. New treatments for every disease, from AIDS to cancer, are being researched.

The principal industry trade group, Pharmaceutical Research and Manufacturers of America, or PhRMA, believes that these new cures are not only improving patient lives but are, in the long run, reducing the overall cost of health care. One study showed that treating patients with the latest medicines actually reduced their nondrug medical spending—for example, spending on hospitalization. The study showed that, for every extra dollar spent on new medicine, a corresponding decrease of $7.20 could be found in other health care costs (PhRMA 2005). Thus, the industry believes that it is not only funding future cures through revenues from its products but also helping to reduce the overall costs of health care by means of these new treatments.

Consumer Advocate Standpoint

Consumer groups respond to the pharmaceutical companies' suggestion that they are searching for the next cure by showing that many of the drug companies' newest products

are me-too versions of existing drugs rather than new chemical entities. The new drugs may offer extended release (XR), controlled release properties to existing drugs (CR), or a combination of two readily available drugs in one pill. This allows for patent extension and continued profits from a drug that is about to become generically available. The producer simply changes the pill to make it time released or endow it with other properties and does clinical research showing the benefits of doing so. The FDA is more likely to approve the XR or CR version, which then becomes a market drug with extended patent protection. Advocacy groups see a serious decline in the number of compounds being studied to treat or cure new diseases or new ways to treat existing conditions. In fact, most widely advertised products are often product line extensions based on existing chemical entities. The industry is providing fewer new drug entities and increasing its output of current brand extensions. In fact, according to one report, only 15 percent of new drugs developed between 1989 and 2002 were made of new chemical compounds, and over half of the new drugs brought to market were product line extensions (Public Citizen 2001).

Marketing and Administration Costs

Industry Standpoint

Many believe that perhaps the reason drug costs are so high is that pharmaceutical companies spend a lot of money on product promotion. Pharmaceutical companies refute this argument by stating that they spend far more on research and development than on marketing. The companies maintain that they are not as heavily involved in advertising, for example, as consumer-oriented companies such as Coca-Cola are.

To help get their messages to patients, pharmaceutical companies have, however, launched direct-to-consumer (DTC) campaigns aimed at helping the consumer/patient appreciate whether a drug may be right for him or her. This information is then to be discussed between the patient and the physician to determine whether the drug is appropriate. The cost of DTC is relatively low compared to other industry advertising of products. One industry estimate shows that only 2 percent of U.S. drug costs are attributed to DTC advertising (Greider 2003).

The majority of all sales expenditures for marketing are for the salespersons each company employs. They act as consultants on particular disease states and promote medications using clinical data to demonstrate why their products are superior. The sales representative is trained as an expert and is versed in the latest clinical research, bringing the newest information to physicians to help them treat their patients. It is the strong belief of the pharmaceutical companies that the most effective way to keep physicians abreast of the latest clinical data is through this type of selling (McKinnell 2005). The physicians simply do not have time to keep up with every new publication and study.

Consumer Advocate Standpoint

Responding to the industry view regarding marketing expenditures, advocates point to some interesting information. One study found, for example, that eight of nine pharmaceutical companies studied spent twice as much on marketing, advertising, and administration as on research and development (Families USA 2002). Such high expenditures fuel the argument that research and development into new cures might not need to suffer if price controls were to be implemented.

Administrative costs tend to garner attention when the top officers of a pharmaceutical company have their salaries and bonuses published annually by the Securities and Exchange Commission. These generous salary packages are one of the areas that advocacy groups point to as needing reform if the cost of prescription medications is to go down. Even in the wake of the economic crisis of 2008–2009, the major drug companies remained hugely profitable. Net incomes for these companies are reported to be several times the median for Fortune 500 companies (Angell 2010). Too much of that profit, say consumer advocates, goes into marketing products, paying salaries and bonuses, and providing "educational services" for physicians.

The latter is something unique to the field of medicine. Most states require doctors to take what are called continuing medical education (CME) courses to maintain their licenses. The idea is that doctors must stay abreast of developments in their field, and CME courses are a means of ensuring that. Unlike professionals in other fields, however, who either pay for their own continuing education or receive offsets from the companies for which they work, CME courses are typically paid for by drug companies as a way of bringing a physician on board. In addition, academic researchers and doctors are courted using meals, payments for conferences and speaking engagements, offers of substantial research grants, assistance with publication, and so on in an effort to bring or keep them on board with respect to the company's research interests. Besides posing questions about conflicts of interest, consumer advocates note that the practice adds considerably to pharmaceutical companies' overall costs (Angell 2010).

Importation

Industry Standpoint

One of the hottest issues in pharmaceuticals is the possibility of seniors seeking cheaper medications from other countries such as Canada. To afford their medications, many people feel forced to bring cheaper medicines into the United States from other countries.

The pharmaceutical industry maintains that drug importation is illegal and is in violation of the Federal Food, Drug, and Cosmetic Act. The industry cautions against the importation of prescription drugs by consumers. Drugs manufactured outside the United States are not subject to the same FDA safety regulations. Therefore, there are no assurances that medications acquired from foreign pharmacies are chemical equivalents of U.S. medications. Sometimes the medications received from foreign pharmacies may be counterfeit. Because the FDA does not regulate these medications, there is no recourse for the patients who have been wronged by such a transaction. The online foreign pharmacies often have waivers that must be acknowledged by patients, stating that they have no recourse if they receive noncomparable medications through the transaction.

Not only can importation be unsafe, but the foreign medications are not always cheaper than U.S. medications. In general, generic medications are cheaper from U.S. than from foreign pharmacies.

Consumer Advocate Standpoint

The problem is obvious to consumer advocate groups, who cite numerous examples of seniors organizing bus trips and traveling hours to Canada or Mexico to buy their prescriptions. To consumer advocates, this practice shows that there is a major problem with the price of U.S. prescription medicines.

There is a certain trade-off that exists when a patient must look to other means to acquire his or her prescription medicines. Often, a patient may simply be unable to afford those prescriptions, and the only alternative other than importation is to not purchase, and therefore not take, the medicine that has been prescribed. This practice is, of course, very dangerous—and costly. One estimate is that $100 billion per year is spent on hospitalizations that could have been avoided had the patient properly taken his or her medication ("Potential Encapsulated" 2010). And, indeed, most patients recognize the danger; hence the interest in foreign pharmacies.

Another concern is that the FDA process for inspecting drugs is imperfect. The prescription drug Vioxx, for example, was associated with serious and sometimes fatal cardiac events in a small population of patients. Vioxx was an FDA-approved drug and had met all the requirements to be marketed. Some groups believe, in fact, that the FDA process is industry-friendly and that pressure from a company will hasten a product's approval. This makes the industry's argument against importation somewhat

suspect. Political resistance to importation in the United States is intense. European countries, such as Germany and England, do allow drug importation. In the United Kingdom, at least eight prescriptions under the National Health Service are filled by imports from countries such as France and Spain, where drug prices are cheaper. The practice has been estimated to save the government $130 million a year (Public Citizen 2001).

Though generic drugs may be somewhat cheaper in other countries, such as Canada, advocate groups point to the fact that, in many cases, branded prescription drugs (newer medicine that is still under patent protection) are significantly cheaper.

Price Controls

Industry Standpoint

Why do branded medicines cost more in the United States? Government-imposed price controls are one option to help control the cost of medication. Canada has imposed a countrywide price for each medication. Under this system, the price of medications is specifically regulated. The belief is that more patients have access to the best medications.

The pharmaceutical industry maintains that government restrictions would severely limit the research and development potential. One study shows that the United States accounts for roughly 70 percent of the world's new medical therapies (Clayton 2008). The industry points to the low percentages of innovation and new drug introductions in countries subject to price controls. From an industry standpoint, price controls are not the solution to improving access to the newest medications. The industry points out that prices are lower in countries with socialized medicine, a type of system repeatedly rejected by Americans.

BRANDED PRICE COMPARISON OF DRUGS IN THE UNITED STATES AND CANADA

Price of Drug	United States	Canada
Plavix	$397	$213
Lipitor	$214	$162
Actos	$542	$377
Zocor	$423	$231
Celexa	$281	$138

Note: Prices include medication and shipping for a three-month supply.
Source: International Medication n.d.

The industry believes that using medications is actually cost-effective for the consumer, because it prevents costly surgeries or other hospital care caused by a preventable event. For instance, paying for a high blood pressure medication is cost-effective when compared to paying for hospitalization following a heart attack caused by uncontrolled high blood pressure.

Consumer Advocate Standpoint

Advocate groups argue for price controls by showing the effectiveness that the U.S. government has in negotiating prices for medications for its veterans and military personnel. The government set a price for branded and generic drugs that companies must meet. This allows for every veteran and active soldier to have access to necessary medication. Advocates believe that the government can go one step further and institute this type of system for the country's seniors so that they, too, can have access to necessary medicine.

In comparison to other developed countries, consumer advocates show that the United States pays more for prescription drugs than any other country. In the United Kingdom, patients pay roughly 69 percent of the cost patients pay in the United States. The difference is the same for patients in Switzerland. Germans pay 65 percent, Swedes pays 64 percent, the French pay 55 percent, and Italians pay 53 percent (Public Citizen 2001).

Advocates point to the success of Canada's Patented Medicine Prices Review Board, which puts a ceiling on prices for all drugs. Many of the drugs purchased in Canada are purchased by the government. This allows access for low-income and elderly patients. This system is very similar to how the United States purchases medications for military personnel, but Canada implements controls on a much wider scale.

As for the argument that price controls stifle innovation, a recent study found that European pharmaceutical companies are just as innovative, or perhaps even more so, than their U.S. counterparts, despite the existence of price controls. In addition, some countries, such as the United Kingdom and Germany, encourage comparative-effectiveness reviews, whereby cost-benefit analyses are applied to rival drugs to determine which perform best. The market values of the drugs—that is, their prices—are then adjusted accordingly ("Reds under Our Meds" 2009). Supporters of the idea say that, if anything, it *encourages* innovation.

Profits

Industry Standpoint

The pharmaceutical industry is currently extremely profitable. The industry maintains that the high profitability is necessary to attract new investment for further research and development. For the year 2008, as with previous years, *Fortune* magazine ranked industries in terms of their profitability. The pharmaceutical industry ranks third on the

list behind network/communications equipment and Internet services/retailing (CNNMoney 2009). This represents a climb from the fifth spot just two years before.

The pharmaceutical industry, besides suggesting that profits are plowed back into research and development, cites examples of charity toward individuals in need of medication. It estimates that, in 2003, it distributed approximately $16 billion worth of free samples to U.S. physicians' offices (Greider 2003). This provided patients access to the newest treatments for all types of illness.

The industry further demonstrates acts of giving in Third World nations, where patients have no possible means of paying for such medication. In these cases, the industry freely dispenses the necessary medications to those in need. Instances of giving in times of disaster can also be found. Emergency shipments of medications have been sent to victims of the recent tsunami as well as to U.S. hurricane disaster victims.

The industry trade group PhRMA has presented figures that show that the cost of medicine is in line with the increases in overall health care spending. Pharmaceuticals accounted for only 11 cents of every health care dollar spent. In fact, PhRMA suggests that the overall cost of prescription drugs has remained roughly 10 percent of overall health care costs for the past 40 years (Clayton 2008).

Consumer Advocate Standpoint

Consumer advocates believe that pharmaceutical profits are a clear example of the excess that exists in the industry. The pharmaceutical industry consistently ranks among the top in terms of profitability. For a 10-year period ending in 2001, the industry was the most profitable in the United States and, on average, was five and a half times more profitable than the average of other Fortune 500 companies (McKinnell 2005).

The industry spends a tremendous amount of money to protect its interests as well. For instance, the industry in 2002 had approximately 675 lobbyists in Washington, DC, to promote industry-friendly legislation. This amounts to seven lobbyists for every U.S. senator (Public Citizen 2003).

Although the industry may at times be charitable, such charity, particularly in the case of U.S. patients receiving free samples from their doctors, is surely, say consumer advocates, a form of marketing or public relations. The motives of the industry in providing a small sample of what normally turns out to be a longer course of drugs, are hardly pure; in fact, calling it charity rubs many the wrong way.

Advocacy groups are, moreover, quick to identify what they feel is a much larger issue. The rate at which prescription costs have risen in the past two decades is alarming. Costs began to increase significantly in the 1980s, but, between 1995 and 2005, the rate of increase averaged 10 percent per year, becoming a much larger component of overall health care costs and greatly exceeding the rate of inflation (Congressional Budget Office 2008). Fortunately, there are indications that the rate has begun to decelerate in recent years, perhaps owing to technological advances.

Conclusion

The issue of prescription drug costs in the United States remains very complicated. In many cases, the information supporting either side can be confusing. For every study that promotes an industry stance, a consumer advocate group has information that argues just the opposite. The government is little help when trying to find answers to the problem of high medication costs. Both sides of the argument frequently cite studies from the National Institutes of Health to support their own viewpoints. Regardless, it is imperative that patients always have access to all medications. Pharmaceutical companies have various discount programs designed to assist financially struggling patients receive medicine at reduced cost. Some companies even give medications at no cost to patients who can prove that their situation leaves no way of paying for the medicine. Although these programs can be complicated and time consuming, they can help alleviate the burden of prescription drug costs until definitive research can be conducted to find permanent solutions to this problem.

S

SEX AND ADVERTISING

Mary Beth Pinto and John D. Crane

Jean Kilbourne contends, "These days, graphic sexual images seem more extreme, more pervasive, and more perverse than ever before. Images that used to belong to the world of pornography are now commonplace in family magazines and newspapers, in TV commercials, on billboards, and online" (Kilbourne 2005).

Consider the words from "Poker Face," a popular song by Lady Gaga that topped the pop charts internationally in 2009 and won the 2010 Grammy Award for best dance recording:

> Russian Roulette is not the same without a gun
> And baby when it's love if it's not rough it isn't fun

Some might say that the lyrics sound more like a whispered conversation in a sex club or a scene from an X-rated movie than part of the opening verse of an award-winning pop song. U.S. culture is awash in sexually explicit content, and the music industry is just one example. All forms of the media are caught up in the sex craze. We live in what appears to be a sex-obsessed society, with rude language, nudity, and eroticism all around us. What was once the unexpected (in terms of acceptable content or language) has become the expected, and the expected has now become the norm. It is no longer necessary to read men's magazines like *Penthouse* or *Maxim* to see sexual imagery. Just surf the Web, turn on the TV, go to the movie theater, take a look at what teens are wearing, watch commercials, and look at print advertising.

Although the emergence of sex in advertising is not new, some of the controversies regarding it are. There are two basic issues surrounding sex in advertising: Does sex appeal work? In other words, does it really sell products and services? And has the use of sex in advertising gone too far? Should organizations limit their use of sexual images to sell their products and services, even if it does work? This chapter will explore both of these controversies.

Does Sex Appeal Work?

Yes

The use of sex appeal is not a new phenomenon in marketing. The blatantly sexual images depicted on walls in ancient Pompeii suggest that sex was used in public places to advertise various products ranging from food to baths to prostitution. (This is reminiscent of the explicit catalogs of "services available" that are distributed by hand and found in display cases along the streets of Las Vegas every night.) In ancient times, these public advertisements were not limited to "sin cities" like Pompeii, nor to just "sin services."

As early as Victorian 1850, marketers were using the opposite sex as eye-catching images to promote their products and services. According to Goodrum and Dalrymple (1990), "Full female nudity was introduced with a photograph…to illustrate a Woodbury Soap ad in 1936." Prior to that time, advertisers used sexual innuendo in copy by barely hinting at sexual images. Take, for instance, an advertisement for Iron Clad Hosiery from 1927. An attractive woman dressed in what today would be considered not very revealing undergarments seems to be caressing her "Iron Clad" ankle with an air of sensuality that is barely perceptible. The image is accompanied by the slogan, "The kind of beauty that thrills." In addition, the print in the ad notes the "mysterious quality which glorifies the wearer's own shapeliness and grace" that the hosiery offers. The image is less sexually suggestive than the copy of the advertisement (Goodrum and Dalrymple 1990).

Sexual appeal has been defined as "the degree of nudity or sexual explicitness found in visual, audio, and/or verbal elements of advertisements" (Gould 1994; Reichert and Carpenter 2004). It has long been accepted that sex appeals have stopping power, encouraging readers and viewers to stop, look, and listen. The "wow" factor of sexual appeals attracts attention to promotional messages, encouraging readers to notice specific messages out of the media clutter or barrage of stimuli to which they are exposed.

Nowhere has the stopping power of sex been used with more success than in the retailing industry. Consider Abercrombie and Fitch and its former quarterly publication called by many a "magalog." Although the company contended the publication was a catalog to showcase and sell its merchandise, most of the models in the magazine were nude or nearly nude. It should have made even the casual viewer wonder, "How can a retailer expect to sell clothes from a catalog when none of the models are wearing any?" The company and its magazine sparked public outcry with its depiction of teenage boys and

ABERCROMBIE AND FITCH

Picture a long, slender figure in the background of a very dark room. As you look, you notice that what you see is a male body with no clothing on. You begin to wonder, "Did I pick up the wrong magazine?" Trying not to draw attention to yourself, you slowly peer over the cover page and notice that indeed you are looking at a catalog—a clothing catalog, yet no one has clothes on.

The depiction is one that many young people have seen in the Abercrombie and Fitch quarterly catalog. Since the catalog's debut in 1997, its content has drawn regular protests. Items such as thongs for children with the words "eye candy" on them are just the beginning. In an effort to curb public criticism, the store placed the catalog in plastic bags and only distributed them through their online shop to consumers age 18 and older. Although their efforts were applauded, they decided in the winter of 2003 to pull the catalog from circulation.

Abercrombie and Fitch's financial state has been in jeopardy for some time. Market positioning and segmentation issues have plagued the company because of its racy appeal. Although racy appeal is commonplace in today's culture, the decline in profits for Abercrombie and Fitch brings about the question, Is it the racy content that the consumer is avoiding or the products themselves?

girls scantily clothed (if at all) in very suggestive poses. According to critics, "Not only did the magazine target teens, it did so in a sexual way…evident in the way the individual images in the magazine were staged" (Spurgin 2006).

No

Sexual imagery can also create problems and be counterproductive for marketers. It is widely accepted that sex appeal attracts attention, but studies show that it rarely encourages actual purchase behavior. Specifically, sexual images attract consumers to the ad but do not enhance the profitability of the brand or product. In some cases, sexual appeal has been shown to distract the audience from the main message of the marketer and interfere with comprehension, especially when there is complex information to be processed.

If marketers are going to use sexual images in ads, it is imperative that they know their audience, because several variables have been shown to play a role in the effectiveness of sexual appeals. For example, sex appeal seems to work differently for men and women and affect message comprehension and recall. Studies show that men often become so aroused by nudity used in ads that they have a hard time remembering components of the

actual message or what the ad was about (Schiffman and Kanuk 2007). Women tend to be attracted to ads that use elements of fantasy, love, and romance, whereas men are more attracted to appeals that use nudity (Anne 1971). In addition, age seems to be related to whether a viewer responds favorably or unfavorably to sexual appeals (Maciejwski 2004). Younger audiences are usually less offended by sexual images, although this too may differ by gender. In a study of college-age consumers, researchers found that men and women differ significantly in their assessments of sexual appeals. Advertisers must take care when using sexual imagery (especially featuring women) in ads targeted to female college-age consumers (Maciejwski 2004). What one person finds erotic, another person may find offensive.

The bottom line for marketers is synergy. Sex ads do not work for all products. Sexually oriented appeals may be a poor promotional choice if the product, the ad, the target audience, and the sexual images themselves don't all fit and complement each other (i.e., when the sexual images are unrelated to product claims, such as scantily clad women selling products for a hardware store).

Has the Use of Sex in Advertising Gone Too Far?

Most people agree that "the sexual ads that have drawn the most protest are those that exploit women as sex objects and those that use underage models in suggestive ways" (Duncan 2002). With the use of sexually oriented advertising comes scrutiny and protests by parents, legislators, and consumer activists—just to name a few groups. Consider the public furor over the FCUK brand from French Connection or the Janet Jackson and Justin Timberlake incident during the half-time show at the 2004 Super Bowl, when Jackson's breast was exposed to viewers. This so-called wardrobe malfunction resulted in months of debate about American core values and the role of the Federal Trade Commission (which is only one of several federal agencies that has jurisdiction over the monitoring of one or more aspects of advertising and marketing communication in the United States) in regulating live television programs (Elliot 2005). In the wake of this incident, a time delay has been placed on all live television programs.

People still talk about the Calvin Klein controversy of the mid-1990s, when the designer used young-looking models (albeit over 18) to star in his controversial jean ads. While many critics rated these ads as outright "kiddie porn," others contended that any PR is good PR (Lippe 1995). Some commentators compared these ads to the bare-bottomed toddler girl in the classic Coppertone ads, which are now viewed in a different way due to the current spotlight on pedophilia. The question remains: Was Klein just a wise businessman capitalizing on America's craving for sex? Are sexual images in advertising today just good marketing? On one side of the argument is the belief that "the chief aim of marketing is to sell more things, to more people more often for more money" (Danziger 2002). The bottom line is profit, and, therefore, the sole obligation of

FCUK

"FCUK like a bunny." Wait, was that . . . oh no, it's just a T-shirt from French Connection UK, circa 2001. After the creation of the acronym FCUK, French Connection came under a plethora of scrutiny. The parallels between their acronym and a word many find offensive is easily seen, but the use of this type of "gonzo" marketing tool is becoming more common. FCUK was heavily criticized publicly for the use of its label, and company profits eventually fell.

The negative reaction of public watchdog groups influenced consumers not to buy FCUK's products. However, governmental agencies did not see anything wrong with the label FCUK. In 2005, the United Kingdom patent office upheld the use of the French Connection acronym with arguments by lawyers that it is "completely mainstream." Although French Connection moved on to other advertising campaigns after discontinuing the FCUK campaign in 2006, it seems that this type of explicit language is commonly accepted as a functional aspect of culture.

the firm is to do whatever is necessary, within legal parameters, to maximize return on shareholder equity.

So, if sex sells more products, then sex in advertising is good for business. It sure has been good for a coffee stand in Seattle, Washington (Brady 1995). The owner has developed a special niche for his retail store, and business couldn't be better. He uses gorgeous women barely dressed in bras and panties to lean out the window to take orders and deliver coffee and sweet treats. According to the owner, anything is fair game as long as his employees' breasts and buttocks are covered so they aren't breaking the law. The business owners report few complaints other than long drive-through lines.

The alternative point of view says that organizations must look beyond the specific profit interests of the firm and consider their greater social responsibility. Is sex in advertising going against moral and ethical standards? Is it exploiting women? Has it turned "sex into a dirty joke" (Kilbourne 2005)? Are sexually oriented ads just outright distasteful and wrong? Or do they just reflect a culture in which "the heat level has risen, the whole stimulation level is up" (Brady 1995)? An additional concern is that the more sexual images that are used in the media and advertising, the more acceptable the extent of the sexuality that will become in future advertising. In other words, sexual images are now an expectation in the advertising of clothing, perfume, body lotions, and hair products. The laws regarding sexual harassment indicate that acceptable behavior should be defined by what a "reasonable woman" would consider acceptable behavior. As we

become socialized toward sexual innuendo and images, reasonable women will become more and more accepting of lewd behavior and images. This may up the ante for advertisers who feel continuously pressured to increase the "wow" factor and therefore increase the amount of sexual imagery they use.

As stated above, the unexpected in terms of sex appeal in advertising has become the expected, and now it has also become the norm. But the larger question is: Does that make it right? What are these graphic images teaching our youths? "That women are sexually desirable only if they are young, thin, carefully polished and groomed, made up, depilated, sprayed and scented" (Kilbourne 2005). At the opposite end of this spectrum, however, are new approaches to advertising, including the Dove theme suggesting that all women, regardless of their body type, are beautiful and desirable. Many advertisers are now using larger women as models. It has yet to be seen whether this is an improvement or simply an extension of the use of sexual imagery. In other words, if large and less traditionally attractive women are also presented as sexual objects, some might say that we are going backward instead of forward.

The women's movement has spent decades fighting for an equal place at the table (i.e., equal pay for equal work, fair treatment, and the elimination of the glass ceiling). Has the women's rights movement been a waste of time if we are still reducing women to nothing more than sex objects? We are teaching our youths (both boys and girls) to devalue the mental and spiritual aspects of a woman and focus exclusively on the physical.

For thousands of years, advertisers have used women as eye-catching images in their ads. At the start of the 21st century, this strategy continues full speed ahead. By modern standards, the images are raunchier, more explicit, and more widely employed. As a society, we get to decide where to draw the line. Therein lies another controversy—in a complex culture, which ones of us will make the decision? Will we turn off the TV, decide not to buy a product, or refuse to shop at a retail store that uses sexually explicit images in its advertisements? Regardless of our opinions about the use of sex in advertising, we ought to be concerned that private companies and their advertising agencies appear to be making those decisions now. We need to ponder the long-term effects on our culture.

SOCIAL SECURITY

Lois A. Vitt

The American dream is about freedom and financial security. But it is possible to lose everything. One day a person has a job, a family, and a house. Then there is a layoff, an accident, an illness, or the death of a breadwinner. One misfortune piles upon another. As late as the 1930s (and even in the 1940s), a person with no income or savings and no children to take him or her in risked going to the "poorhouse."

By the time Social Security became law in 1935, every state except New Mexico had poorhouses. Sometimes called almshouses or poor farms, their existence is a little known fact in U.S. history today. Yet there were thousands of such places across the country, and becoming an inmate at a taxpayer-funded, county-run poorhouse was a fate to be dreaded (Altman 2005).

In the 1920s, the federal government sent volunteers to examine more than 2,000 poorhouses. The report came back that conditions were shameful (Gunderson and Julin 2002). A report by the New York State Commission on Old Age Security found that

"sick people are thrown together with the well…people of culture and refinement with the crude and ignorant and feeble-minded" (Altman 2005).

Then came the added toll from the nation's Great Depression. The stock market crash of Black Tuesday—October 24, 1929—shook America's very foundations. Banks failed, savings were wiped out overnight, homes and farms were lost in foreclosures. Twenty-five percent of all workers and 37 percent of all non–farm workers were unemployed. Financial gloom was everywhere, and people starved (Smiley 2010). Even with so much human misery in full view, passing the law that established Social Security was not an easy task.

Controversy surrounded the Social Security Act even as President Franklin D. Roosevelt signed it into law in 1935. Social security had been the product of several years of bitter controversy, negotiation, lobbying, and compromise. The debate had been widespread: from the Congress, big business, and the press to the workplaces and streets of America. One side believed, among other things, that the program was a "communist" one, and government could not be trusted to pay benefits properly, if at all. Supporters keenly felt the desperate need to protect older workers and their families against grinding poverty that had already struck millions of Americans upon retirement and was awaiting millions more (Landis 1997).

A New Kind of Insurance Program

President Roosevelt envisioned Social Security as a new kind of government program, uniquely suited to its mission of promoting both the work ethic and the dignity of older individuals and their families. It was established as *social insurance,* not public assistance, even though that is the way it was depicted by its detractors. The program was planned to provide a reliable retirement income to people at age 65. They would get no handout. Instead, workers would be required to contribute to their future retirement out of their current income and, by doing so, would earn the right to their Social Security pension.

On August 14, 1935, the day President Roosevelt signed the Social Security program into law, he explained his reasons for proposing it this way:

> Today a hope of many years' standing is fulfilled.…We can never insure one hundred per cent of the population against one hundred per cent of the hazards and vicissitudes of life, but we have tried to frame a law which will give some measure of protection to the average citizen and to his family against the loss of a job and against poverty-ridden old age. (Landis 1997)

Many people think of Social Security as merely a retirement program, but from the beginning it has been much more than that. In 1935, the insured events were retirement or death of workers, but they were expanded later to include the total disability of workers as well.

It is a comprehensive insurance program that provides protection for workers and also for their dependent family members. As with any type of insurance, Social Security buys working taxpayers protection against loss—specifically the loss of income in the following categories:

- **Retirement benefits**—for workers who retire from the workforce and have reached an eligible age (currently 62 years old for reduced benefits and 67 years old for full benefits).
- **Family benefits**—for family members who are dependents of workers who have become totally disabled or retire.
- **Survivors benefits**—for surviving family members of workers who die. Benefits are similar to life insurance.
- **Disability coverage**—for workers who become totally disabled and can no longer work even though they have not reached retirement age (Landis 1997).

Social Security is funded through dedicated payroll deductions under the Federal Insurance Contributions Act (FICA). These payments are formally deposited in trust funds to be paid out to workers when they reach retirement age or become disabled and can no longer work. The payroll tax rate is split between employee and employer, currently 6.2 percent of earnings for employees, and 6.2 percent for employers. The rate for individuals who are self-employed is 12.4 percent. These rates apply to wages up to and including an annual income (from wages) of $106,800. For income above that amount, there is no Social Security tax to pay.

In general, workers must make payroll contributions for 10 years or more to become eligible for a Social Security pension when they retire. Spouses are also covered, even if they have never worked. Benefits are based on a worker's average wage, calculated on the 35 years of highest earnings. When high-income earners retire, they receive higher monthly benefits, but not proportionately so. The idea is that benefits should be proportionately more for those with lower earnings than for those with higher earnings. The benefit formula under the Social Security system is weighted in favor of lower-income groups (Myers 2003).

How Social Security Has Performed

Social Security accomplished what President Roosevelt and supporters of the program hoped it would do, but not overnight. The first monthly benefit check was issued by Social Security to retired legal secretary Ida May Fuller, who received $22.54 in January 1940. In 1950, benefits were raised for the first time. In 1972, Congress enacted a law that allowed for cost-of-living adjustments to help the elderly cope with annual increases in the rate of inflation.

Before Social Security, the poverty rate among older adults was three times that of the general population. Economists estimate that, without Social Security, the elderly

poverty rate would have been 40 percent rather than the 9.4 percent it was in 2008. The current average monthly payment is $1,094 (Carr 2010).

The program significantly affects the lives of a majority of Americans. According to AARP, some of the basics reported as of July 2010 include the following:

- Monthly benefits are paid to about 54 million Americans.
- For 25 years, Social Security has received more in payments than it has paid out. It now has a $2.5 trillion reserve fund invested in government bonds.
- In 2010, the recession and high unemployment brought in fewer payments than anticipated, and Social Security has been drawing on its reserves.
- The Congressional Budget Office estimates that the reserve fund and payroll taxes will cover full payment of benefits for another 33 years.

Income security for the retired is not the only benefit successfully provided by Social Security; it also supports families struck by the death or disability of a breadwinner. Much like any private insurance, the Social Security program philosophy was to collect payments from workers and then pay a defined amount back to them (or their family) when certain events occur.

Social Security and the World Trade Center Disaster

In her book *The Battle for Social Security,* Nancy Altman tells the story of how Social Security employees worked to assist the survivors in the chaotic aftermath of the September 11 attacks on the World Trade Center. The story can serve as a case study of how the Social Security insurance system assists those eligible to receive family and survivors benefits under the program.

Two days after the attacks on the World Trade Center, the Social Security Administration went into action to identify and contact the family members of workers who perished in the attack. The task was to meet with employers and family members to help them secure the financial protection their loved ones had earned for them.

Altman writes that the Social Security Administration was among the first insurers to meet with employers and victims' family members. Its employees worked with the New York City Police Department, the New York City Fire Department, and the Port Authority to find the families of every firefighter and police officer who had died. They were present at the family assistance centers and set up a Web page to inform family members how to apply for benefits. By September 16, every major network affiliate in New York carried public information spots about Social Security.

Employees from the Social Security Administration distributed fact sheets to advocacy organizations and established lines of communication with local hospitals, unions, and other local organizations. They worked 15-hour days, seven days a week, to get benefits to spouses and dependent children as quickly as possible. They knew that they were throwing an economic lifeline to the families when they needed help

the most. On October 3, Social Security checks were mailed and electronically transferred to thousands of members of families who lost loved ones on September 11, 2001 (Altman 2005).

The Politics of Social Security Today

The struggle that surrounded President Roosevelt's efforts to pass the Social Security Act in 1935 as well as the process of enacting amendments that improved the program over the past 75 years still rages today. As before, much of the battle involves passionate emotions and clashing values about who we are and want to be as Americans:[1]

1. Are we a society where individuals look after themselves and are responsible for their choices and financial security no matter what might be happening in the business and financial sectors and the general economy?

   Or are we a society that can be independent and responsible for our own well-being while also contributing resources and sharing risks that can offset personal financial ruin during times of economic upheaval in the general economy?
2. Do we trust the unregulated business and financial communities to provide stable employment, disability coverage, and retirement pensions that will assure for us later-life financial security?

   Or can we support policymakers who will strengthen the Social Security program and continue to oversee both our own contributions and, more importantly, those of the nation's employers on behalf of working Americans?

The Controversies

Politicians and the media frequently warn that Social Security is headed for bankruptcy. Not true. The Social Security program is not a cause of the federal government's current deficit and debt concerns. In fact, the program has been running surpluses since 1984 (Gregory 2010). The federal General Fund experienced an annual surplus of $86 billion in 2000, meaning that taxpayers contributed more in all federal taxes than was spent in all federal programs and operations. However, that surplus fell year by year after 2000 because of tax cuts, funding for wars, and other government spending to a deficit of $1.55 trillion in 2009 (Congressional Budget Office 2010a).

By contrast, the Social Security program has amassed a trust fund reserve now amounting to $2.5 trillion (Board of Trustees 2009; Congressional Budget Office 2010a). In addition, the trust fund has been lending funds to the government that it would otherwise have had to borrow from national and international public markets. Moreover, Social Security trust fund reserves are expected to increase to $3.2 trillion by 2015 and to $3.8 trillion by 2020 (Congressional Budget Office 2010b) *unless* the decrease in contributions due to unemployment continues to erode the reserves required to meet

the growing surge of individuals who are reaching retirement age or are becoming disabled. Because the law requires 75-year solvency for the Social Security trust funds, and since numbers can be used to project future circumstances in different ways, no one can ascertain with any certainty what will happen over a 75-year period of time.

To summarize the important fiscal realities today, the Social Security reserve is being built primarily with:

1. FICA taxes paid at the rate of 6.2 percent of earnings by lower- and middle-income workers up to a maximum wage level of $106,800, plus matching FICA tax payments by employers at 6.2 percent of earnings. These contributions currently total 12.4 percent.
2. Interest paid on FICA taxes borrowed from the Social Security trust fund over the past 25 years to help finance the rest of government (Sloan 2009).

The long-term costs and paid-out benefits of the Social Security program are projected to rise with the increasing number of retirees from the baby boom generation during the coming years. This means that, in order to preserve the long-term viability of Social Security, certain actions must be taken by Congress. Suggested changes have included (a) increasing the maximum wage level on which FICA taxes are now paid; (b) increasing the age at which workers are eligible to receive retirement benefits from age 67 to (say) age 70; and (c) means-test the benefits so that only the poor receive benefits.

Arguments against these three proposed fixes are these: (a) at 12.4 percent, increasing the maximum wages to (say) $170,000 would be a large tax increase on an already ailing middle class; (b) increasing the age at which Social Security benefits may be obtained could be wrong-headed for anyone engaged in an occupation that involves physical activity; and (c) means-testing the benefits would be a terrible mistake that would violate the social compact that everyone pays Social Security taxes and everyone receives their benefits (Sloan 2009).

In the past decade, Republicans, along with a few Democrats, have campaigned for a radical restructuring of Social Security—namely, permitting workers to divert part of their payroll taxes from Social Security into *personal retirement accounts,* which could be invested in the stock market. The earnings on these accounts would replace a portion of Social Security benefits. This push to privatize has been a major conflict over Social Security.

Supporters of privatization argue that Social Security must be overhauled because its rate of return is dismal. In response, experts point out that comparing the rate of return on Social Security with that of an investment portfolio is "comparing apples and oranges" (Diamond n.d.). Social Security is not a portfolio, they say; it is insurance, which provides benefits in the event that a particular problem (e.g., disability) or condition (e.g., retirement) occurs. The opponents of privatization maintain that claiming Social Security's return is dismal is as meaningless as claiming that the return you get on your fire insurance premiums is dismal.

The heart of the battle over privatization may be more about profits for the financial markets and financial businesses than about individual freedom and collective responsibility. These values have an honored place in U.S. tradition and easily tap into the emotions of U.S. voters. One side sees a society in which individuals are responsible for their lives and are free to make their own financial decisions (Suellentrop 2005). On the other side, a deeply held value embodied in Social Security is that real freedom requires a nation to protect the well-being of its members against harm. Risks of unemployment, disability, changes in the general economy, and in the practices of businesses (e.g., outsourcing employment) are to be shared and insured against to the extent possible.

Conclusion: Speaking Out, Speaking Up

The bottom line is that many older workers who felt reasonably well positioned for retirement a few years ago now need Social Security more than ever. Middle-aged individuals who may have time to recover savings and home equity are needed more than ever to contribute to the future viability of the program. Employers' matching contributions are also required more than ever to sustain the Social Security system. Each of these social groups must also demonstrate to the nation's young adults that they will have a realistic plan for future benefits (Sloan 2009).

This is no time to overlook, dismiss, or ignore the continued performance of the nation's Social Security program, the social compact that helped to lift generations of older adults out of poverty and helped to close the nation's poorhouses. Failing to understand the real economics of the Social Security program can bring back the poorhouse for individuals who suffer through financial ruin that is not their fault—sudden unemployment, loss of pensions or savings or home. Doing nothing is not an answer either.

Worse, believing that "Social Security will not be there for me when I grow older," an opinion heard more and more frequently these days from younger Americans, might guarantee the untimely demise of this invaluable program, since one's voice to save it will not have been heard.

SUPPLY CHAIN SECURITY AND TERRORISM

Peter B. Southard

The supply chain of any product consists of all the businesses involved in moving that product from the raw material stage into the hands of the final consumer. In addition to

the various manufacturers, suppliers, and retailers, it also includes transportation, storage, and distribution firms as well as the indirect resources such as finance, accounting, and information systems. All these companies—as well as the customer—are linked together to fulfill a customer's order.

One of the major themes dominating the recent thoughts of both supply chain managers and their suppliers has been the growing trend toward outsourcing and the use of international suppliers for raw materials, parts, and components. A second theme that has been dominating the thoughts of the same group as well as those of countries around the globe has been that of security from terrorist acts by individuals and groups. Unfortunately, the two themes are becoming more and more interrelated. This interrelationship has been underscored by the publicity surrounding the management and security control of ocean ports within the United States. A recent article in *CIO Magazine* suggested that the U.S. government will soon be requiring much more information on incoming foreign goods from firms that do business internationally. Specifically, the firms will need to provide information regarding not only the content of shipments prior to their arrival ashore but also the history of that content, points of origin, and routes of passage as well as who, specifically, has handled any shipments arriving in the United States from overseas. These requirements will undoubtedly increase the total costs of that material to the firm and also, since there is only a single true source of funds in any supply chain, to that source: the customer. Those costs are not just monetary in nature. They also include other aspects of a firm's competitive advantage and the customer's requirements, such as speed of delivery, flexibility, and reliability. These last costs can be significant when viewed in context with other recent business trends.

The move toward leaner production systems, such as those of Dell and Hewlett-Packard, where inventory levels are kept at a minimum, has meant lower costs with greater selection to the consumer. What it has also meant, however, is a supply chain that is much more vulnerable to interruption, because even a short delay in the shipment of components or raw materials could mean the shutdown of an entire production facility.

These supply chain challenges are not limited to the links of seagoing ports. The other three major modes of transport—air, truck, and rail—and their distribution and transfer centers are all experiencing the same pressures. A recent article in *Air Transport World* describes the preliminary measures and costs being felt by European air freight companies. They include the millions of euros being spent for the new equipment and organizational changes needed to meet the new industry requirements. U.S. trucking and rail associations are also exerting efforts and have developed an Anti-Terrorist Action Plan. Every mode of transport and every transfer point involved in the supply chain is coming under scrutiny. At this point, however, no mode is receiving focused direction from the government in terms of concrete requirements or policies, which means that all security initiatives are either in the pilot study phase, sitting on a shelf, or awaiting development.

CURRENT INITIATIVES

Customs-Trade Partnership against Terrorism (C-TPAT)

This is probably the best-known and most widely used antiterrorist security initiative. It is a voluntary program, begun in November 2001, between private global organizations and the U.S. government. It is administered through the Department of Homeland Security by U.S. Customs and Border Protection. Currently, the program offers expedited customs handling for participants. In return, the participants provide customs with information that indicates the company has performed security risk analysis on itself and its trading partners as well as ongoing best practices security measures. There are currently over 7,400 private participants. Further information can be obtained through the U.S. Customs and Border Protection Web site (www.cbp.gov).

International Ship and Port Facility (ISPS) Security Code and the Maritime Transportation Security Act of 2002 (MTSA)

The Maritime Transportation Security Act of 2002 (MTSA) is the U.S. response to the International Ship and Port Facility (ISPS) Code. ISPS is a 2002 code set out by the international maritime community delineating security requirements to be followed by all interested parties, including governments, shipping companies, and port authorities. MTSA is the U.S. version that was passed in 2004. Both have three levels of security based on the perceived security threat. Information is available at the Web sites of the International Maritime Organization (www.imo.org) and the U.S. Coast Guard (www.uscg.mil).

Automated Commercial Environment and Advance Trade Data Initiative

The Automated Commercial Environment is another U.S. Customs initiative. It is a trade processing system designed to provide the backbone of an enterprise resource planning system for Customs that will enable it to monitor its own processes and transactions. Its impact here is that it will also be used to analyze such things as risk factors in targeting containers for inspection. As an additional module, Customs has also been looking at the Advance Trade Data Initiative, which will be the data collection interface with importers. It will require importers to submit information regarding all shipments, such as the purchase order, ports through which the shipment has passed, final destination, and even where on the ship a particular container is located. This program may eventually become a requirement of C-TPAT.

CommerceGuard and RFID

CommerceGuard is a technology for securing cargo containers and is jointly held by GE Security, Mitsubishi Corporation, Samsung C&T Corporation, and Siemens Building Technologies. It consists of a relatively small device that magnetically clamps across the door of a cargo container and monitors both the door and the contents. It can record when and how many times the door was opened, temperature changes inside the container, and other information, as programmed. Visit www.commerceguard.com for additional information. Radio frequency identification (RFID) is a method of

(*continued*)

(*continued*)
identifying unique items using radio waves. Although it is not a new technology, it gained attention recently when Wal-Mart required many of its vendors to apply RFID tags to their goods. Different RFID technology can be used in varying applications, including determining and recording the temperature, light, and sound environment through which the RFID tags (and the goods to which they are attached) have passed. Various associations and committees are in the process of establishing standards for this technology.

The basic conflict faced by U.S. businesses is the security of goods entering the borders of the United States versus the cost of that security. The ramifications are twofold. First are the implications for competition: If a company can move its goods through security points and inspections faster and at a lower cost, then it has a competitive advantage. Second is the additional cost to the final consumer, who will ultimately bear the burden of the heightened security requirements.

This entry discusses the challenges associated with developing the necessary supply chain skills and infrastructure that will likely be needed in the future to minimize those costs. Specifically, it looks at new heightened security requirements from the perspective of their effect on the two major components of supply chain management: the supply chain strategy and the supply chain structure, which includes the drivers of supply chain performance. These four drivers are facilities, inventory, transportation, and information. Finally, it will look at tactics to facilitate that security.

Supply Chain Strategy

Hau Lee of Stanford University has developed a highly regarded framework for the strategic design of supply chains based on the variability, or risk, in both the demand for a product and the supply of raw materials, parts, and components to produce that product. As the variability of either dimension increases, the cost of designing and operating a supply chain increases, as does the complexity of managing it. Past terrorist attacks and threats have led to an emphasis on increased security, which, if randomly applied to incoming shipments, will increase the variability in acquiring upstream materials from suppliers. This variability may take the form of longer times waiting for inspections, the amount of time required for more thorough inspections, or even the availability of goods from certain points of origin.

The strategic design of the supply chain, based on demand variability, is to provide either efficiency through low cost or responsiveness through speed and flexibility. Either choice is affected by the time and cost created by added security.

The lowest-cost and least flexible chain is termed an efficient supply chain. At the opposite end of the spectrum is the agile supply chain. More and more, the two trends

of increasing competition and a more demanding consumer are forcing companies to move their supply chains toward the agile. By definition, this supply chain strategy requires shorter lead times, higher customer service levels, greater flexibility, and the ability to handle supply uncertainty. All of this agility, of course, comes at a cost; companies employing this strategy employ more expensive modes of transportation and maintain excess capacity to handle both supply and demand variation. While meeting the new specter of international terrorism will impose added costs, those on the agile end of the supply chain spectrum are more adapted to handle the variation.

Where the costs will have the most effect will be on the efficient supply chain. These supply chains operate on the basis of lowest cost created by very stable and predictable supply and demand. Staples such as food items and standardized commodities that operate on a very low margin fall into this category. Even a minimal increase in the cost of goods sold is felt immediately. Added variability in this supply chain strategy would be quickly translated into higher costs. The focus at both ends of the spectrum, then, will be to reduce the variability on either side of the supply chain in order to create and maintain a competitive advantage.

Finally, any supply chain strategy must include a contingency plan. The value of such a contingency plan was well illustrated by Dell during the West Coast dock strike of 2002. While other computer manufacturers were scrambling to find alternative sources for components that were being manufactured on the Pacific Rim or sitting idle during the 10-day strike while their parts sat on idle ships, Dell was able to continue operating with just 72 hours of inventory. Dell did all this without a single delay in customer orders. It was able to do so because it had previously developed an internal management team designed to handle such situations, close ties to various suppliers, and access to alternative transportation sources.

A firm's strategy determines how the supply chain must be structured in order to achieve that strategy. The strategy selected will necessarily have a major impact on the cost of securing that supply chain.

Supply Chain Structure and Drivers

The drivers of supply chain performance are facilities, inventory, transportation, and information. How these are organized and positioned within the supply chain establishes the structure of the supply chain. An agile supply chain will generally have more decentralized facilities and a distributed, standardized inventory in order to provide the most flexibility and to be located as close to the customer as possible. It will use faster transportation, which will result in higher costs per item. Information systems must be more robust and complex. What this means in terms of security is a more complex system to oversee and protect.

Facilities are the physical locations (land and buildings) where products are created, manufactured, assembled, or stored. The more agile the supply chain is, the more

facilities will be involved. The impact here will be both on the facilities themselves as well as the equipment necessary to meet the new security requirements. Part of this will likely be in the form of special radio frequency identification (RFID) tags or other similar electronic monitoring devices such as GE's CommerceGuard, which are attached to the products or the containers in which the products are stored. This means that specialized equipment will need to be present in the facilities to read the product devices, which becomes part of the facility cost. Other facility costs will be those necessary to secure the physical property itself, such as fencing, security personnel, and alarm systems.

Inventory consists of all raw materials, work in process, finished goods, and supplies held. There are four costs associated with inventory: holding or carrying cost, setup or changeover costs, ordering costs (which includes shipping), and the cost of stock-outs (not having the product when the customer demands it). The strategy and structure of the supply chain affect these costs. Reducing inventory reduces the holding costs but increases ordering costs (since more frequent orders are needed to meet the same demand) and vice versa. The more facilities the chain employs, the more inventory is needed to stock each location, increasing both holding and ordering.

Security against terrorism will mean that the stores of inventory being held will need to be more closely guarded and monitored, increasing the holding costs. As closer monitoring, tagging, and information requirements for each shipment increase, so do the ordering costs. RFID tags or other identification methods will be added to the cost, as will the labor and equipment needed to apply and read them.

Although the cost of shipping is usually accounted for under inventory costs, there are several decisions involved with this driver. These include the mode of transportation (air, truck, rail, or water), routing, and the network design (e.g., use of direct shipping, warehouses, cross-docking, or postponement). Since every additional link in the supply chain may mean an added security step or check, companies may be inclined to move more toward direct shipping, bypassing the intermediaries of warehouses, distributors, or even retailers. It may also mean an increasing use of third-party logistics companies so that a firm may hand off the responsibility for the security of a shipment to a company that specializes in logistics and is able to use economies of scale to absorb the additional costs of security.

Every security initiative under consideration at the current time will involve, at the very least, an increased requirement for information on the contents and history of all shipments entering or traversing the United States, whether this data will need to be supplied to U.S. Customs or another agency. These increased information requirements necessitate the need for new methods for collecting the data, more complex software to receive and organize it, and the hardware and peripherals on which to operate it. While the cost of RFID tags and the associated reader equipment is coming down, they still present a formidable outlay of capital, especially for smaller companies.

In addition, many of the initiatives under consideration involve the use of some type of tracking device attached to or inserted in each shipment. Some even call for identification of each item in that shipment. In either event, this would require reading equipment as well as software that will provide an interface between the equipment and the company's internal information system.

All this information will not only need to be maintained by the company, but it will also have to be forwarded to the appropriate government (and possibly industry) body in the format dictated by that group. Unfortunately, that standard has yet to be established.

Tactics

Tactics to address the impact of added security on the supply chain focus on the strategy and drivers. Strategically, firms must understand that regardless of whether they consider their products to be functional or innovative, their supply chains will need to maintain a higher degree of flexibility to remain competitive. In the paranoid environment in which businesses now operate, it takes little to disrupt a supply chain. A terrorist attack is not even needed. Take, for example, the closing of Port Hueneme in Ventura County, California. This major port was closed for hours because dock workers found a threatening sentence scrawled on the interior bulkhead of a ship coming in from Guatemala. Since this is one of the largest ports in the United States in terms of fresh produce imports, such a shutdown had the potential to create major problems. The case of the Alameda Corridor illustrates that it is not just facilities themselves that pose a risk in the supply

THE ALAMEDA CORRIDOR

The Alameda Corridor is a 20-mile multirail right-of-way that connects the ports of Los Angeles and Long Beach to the rest of the nation's rail lines. It was completed in 2002 at a cost of $2.4 billion. What is its significance for security in the supply chain? Consider this. Together, those two seaports handle more cargo traffic than any other port in the United States. Over one-third of all traffic entering or exiting those ports does so through the Alameda corridor. The heart of the throughway is a 10-mile-long trench that is 33 feet deep and 50 feet wide, which might appear to be an easier target than the 7,500 acres that the Port of Los Angeles occupies. Also consider the fact that most of the other two-thirds of that cargo traffic is carried in 6.3 million containers per year on the highways in the Los Angeles area, most of which travels on a single freeway: the 710, Long Beach Freeway. A terrorist attack would not necessarily need to pinpoint a port. Crippling access to any point of aggregation for shipments to and from U.S. businesses would effectively serve to close the port and seriously affect the economy. For more information on this vital artery in the U.S supply chain, access the Alameda Corridor Transportation Authority Web site (www.acta.org).

chain. Firms must be prepared for such events with alternative supply chain tactics that include having excess capacity in the drivers.

The drivers themselves must be more flexible and robust. Companies must have alternative transportation partners and modes, alternative facilities in terms of distribution or aggregation points, and alternative sources of inventory in terms of suppliers.

The form of the method will be in two areas: prevention and disaster recovery. Prevention will likely take the form of increased information requirements from companies about their shipments, increased inspections, and increased physical security requirements, such as monitoring and safety equipment. Exactly what prevention measure will be required will depend on the level of risk the company is willing, or able, to accept. How much it is willing to risk will be a corporate decision. How much it is able to risk will likely be a government or industry decision implemented by standards and regulations. Disaster recovery tactics will need to include preplanning efforts, a predesignated and well-trained team, and flexibility and alternative driver capabilities.

The added prevention measures and maintaining this flexibility in terms of alternate sources of strategies and drivers will cost money. Companies will tend to avoid costs for threats that have not yet materialized, because the added cost will, in the short run, put them at a competitive disadvantage. As Dell proved, however, in the dock strike of 2002, such upfront costs should be considered an investment that will pay dividends at a later time.

Somehow, these costs will filter down to consumers. It is the price to be paid for maintaining the amount and breadth of products that U.S. consumers have come to expect.

Conclusion

What is the final balance between security against terrorism and the price of that security? It is likely that the level of security will eventually be established by either government mandate or, even more likely, voluntary industry standards. That level will be a determining factor in the cost to us, the consumers. It may also mean that smaller companies—those without the capital resources necessary to acquire and maintain the needed equipment and procedures—may lose their ability to operate in a global environment unless they are partnered with a larger company that has that capability. But what that level may finally be, if indeed it ever is final, is now unknown. What is known, however, is that one business axiom will still hold true. Whichever companies manage to achieve that level at the lowest cost will create a competitive advantage. Early adopters and experimenters may be able to develop a sustainable advantage if their lower costs enable them to increase their market share sufficiently.

SUSTAINABILITY

Robin Morris Collin

Sustainability literally means the capacity to endure. In 1987, the World Commission on Environment and Development, also known as the Brundtland Commission, applied the term to development—officially, *sustainable development*—as that which "meets the needs of the present without compromising the ability of future generations to meet their own needs." That definition was written into the Swiss federal constitution and is similar to the *seventh generation* philosophy articulated in the Iroquois Confederacy. It mandated that chiefs of that Native American nation must look seven generations into the future to consider the effects of their actions on their descendants before making a move.

The 1999 book *Natural Capitalism* recommends including four types of capital in any model for sustainable development: financial capital, manufacturing capital, natural capital, and human capital. Since then, many organizations added specific criteria as guidelines, including social criteria, environmental criteria, and financial criteria.

Sustainable Development

The concept of sustainable development hinges on ideas that support any practice placing equal emphasis on environment, economics, and equity rather than on economic interests alone. It is controversial, because it limits human activities in light of their environmental and equitable impacts on all affected communities.

Sustainable development assumes continuous economic growth without irreparably or irreversibly damaging the environment. Human population growth is difficult for this model, because it requires placing economic value on lives in the future. Some environmentalists challenge the assumption of growth at all. The fundamental battleground for this emerging controversy is one of values. The continued prioritization of economic growth over environmental protection, combined with population increases, may have irreparable impacts on the environment. British Petroleum's Deepwater Horizon

gushing offshore oil rig is one example of unsustainable economic development. The idea of sustainable development is a fundamentally different model of growth from the business model of colonial and industrial progress. It stresses equality in the distribution of benefits. This egalitarian model of development recognizes the economic burdens on society created by the oppressive policies associated with industrial capitalism and sovereign powers.

Additionally, the sustainable model requires governments to place constraints on developments, including constructing roads, bridges, and dams. It also focuses on new manufacturing methods. Sustainable development requires commitment to the principles and practices of clean production and manufacturing techniques rather than continued reliance on fossil fuels or other dirty energies to propel manufacturing.

Shifting models of development give rise to controversies that may involve problems of unequal opportunity for women and subordinated ethnic groups and the environmental impacts of the industrial use of natural resources. These controversies stem from the development policies and practices of an earlier age that did not require accountability for the social or environmental consequences of development. The changed model has been hardest to accept in the United States.

Global Background

In 1987, Gro Harlem Brundtland, then prime minister of Norway, authored a report for the World Commission on Environment and Development called "Our Common Future." In it, she described a concept of sustainable development as "development that meets the needs of the present without compromising the ability of future generations to meet their own needs." This has become the defining statement about sustainable human development. Sustainability focuses on fairness to future generations by ensuring that the ecosystems on which all life depend are not lost or degraded, and poverty is eradicated. Sustainable development seeks these goals of environmental protection and ending poverty by implementing several key concepts in development policies and practices.

The United Nations Conferences on Environment and Development have become the forums in which these key concepts have been turned into implementable policy statements. The agreements and statements resulting from these conferences are often identified by their host city. Perhaps the most famous of these conferences was the Earth Summit held in Rio de Janeiro in 1992. At this conference, the nations of the world, including the United States, agreed to implement seven key concepts to ensure sustainable development in a declaration called the Rio Declaration, and they wrote out a work plan called Agenda 21, which remains the source of much international controversy to this day. The seven key principles emerging from the Earth Summit and found in the Rio Declaration and Agenda 21 are:

1. Integrated decision making (three Es: environment, social equity, and economics)

2. Polluter pays
3. Sustainable consumption and production
4. Precautionary principle
5. Intergenerational equity
6. Public participation
7. Differentiated responsibilities and leadership

Another conference based upon this same United Nations Conferences on Environment and Development plan was held in Kyoto, Japan, in 1997, resulting in the Kyoto Protocol on climate change and the limits on emissions of greenhouse gases. Although a signatory to the protocol, the United States has not moved forward with ratification of the protocol even though it is the world's largest producer of carbon dioxide, because it disagrees with the exemptions given to developing economies like China and India.

The Copenhagen Accord, set in writing in December 2009, focused on planetary warming and cooling as a global issue requiring nations to work together to investigate ways of sustaining life on Earth. While setting emissions limits was central to the Copenhagen talks, no commitments resulted. Some news analyses of the Copenhagen gathering considered the accord a failure resulting from global recession and conservative domestic pressure in the United States and China. Despite financial woes, the voluntary-compliance Accord included a pledge by the United States to provide $30 billion to the developing world during 2010–2013, increasing to $100 billion per year by 2020.

Controversies for Businesses and Industries

Sustainable development often means designing pollution and waste out of the manufacturing cycle (industrial ecology) and thinking about a product in terms of its total life span, beyond its point of sale (also known as product life cycle management). Additionally, clean production may require a substantial investment in new technology and plants that is prohibitive to small business enterprises. These requirements challenge businesses and industries in virtually all sectors of an economy to change what they are doing and how they are doing it. What makes the task of change even harder is the fact that many established businesses and industries have been subsidized directly or indirectly through tax benefits conferred by national governments, which enhances the reluctance of businesses to change. But some businesses have pioneered change by embracing concepts of a restorative economy and natural capitalism.

Businesses that have taken short-term transitional losses to eliminate waste and toxins in their products and production methods have been rewarded in long-term economic gains and have created measurable improvements in their environmental impacts. These businesses have embraced the linkage between environment and economy, but they have not necessarily incorporated communities and their well-being into this new model.

Environmentalists

Environmentalists have documented the scope of environmental degradation all ecosystems are suffering as the result of human activities. The news they deliver is sobering. Human activity is threatening to cause the collapse of the living systems on which all life on our planet depends. This leads some environmentalists to advocate protection of the environment above all other concerns, including economic concerns and the needs of human communities. Trying to determine the causes for this dangerous state of the environment leads some environmentalists to identify population growth as the most substantial factor. Others point to the use of fossil fuels to propel our activities. Still others identify overconsumption of resources as the basis for this state of environmental degradation.

Environmentalists employing such data and using this type of formula often find themselves in conflict with business and industry as they press urgently for changes in manufacturing processes. Mainstream environmentalists tend to be from relatively privileged backgrounds in terms of wealth and educational opportunities. They frequently find themselves in conflict with communities and developing countries for their stands about population control and their relative indifference about the plight of the poor, who bear the costs of unsustainable practices more than any other class.

Communities

Communities and their physical and economic well-being are often excluded from decision making concerning economic opportunities and environmental consequences with which they must live. This exclusion can arise from structural separation between different administrative branches of government or from the separation between different levels of government. It can also arise from cultural and social forces that operate to exclude poor people or people stigmatized by historical discrimination. Exclusion of community interests and participation affects the viability and efficiency of efforts to protect the environment and to develop a community economically in several ways. People driven by insecurity regarding their basic living conditions are likely to accept employment opportunities regardless of the consequences to human and environmental health. This eliminates labor as an agent of change toward sustainable production technologies and allows continued pollution and waste to be externalized into the environment with long-term disastrous consequences for human health.

Moreover, people faced with exposure and hunger will also contribute to environmental degradation to meet basic life needs. Whether in a developed or a developing country, poverty and the inability to meet basic needs for food, shelter, and care make some human communities even more vulnerable to environmentally degraded conditions of work, living, recreation, and education.

Conflicts arise as these communities strive to participate in environmental decision making and decisions concerning the use of natural resources. These communities

INDUSTRIAL ECOLOGY

Industrial ecology is the shifting of industrial process from open-loop systems, in which resources and capital investments move through the system to become waste, to a closed-loop system where wastes become inputs for new processes. Robert Frosch and Nicholas Gallopoulos first proposed the idea of industrial ecology in an article published in *Scientific American* in 1989. They asked, "Why would not our industrial system behave like an ecosystem, where the wastes of a species may be resource to another species? Why would not the outputs of an industry be the inputs of another, thus reducing use of raw materials, pollution, and saving on waste treatment?" The idea of industrial ecology is to model this human-made system on the performance of those based on natural capital that do not have waste in them. The term *industrial ecology* was defined as a systematic analysis of industrial operations by including factors like technology, environment, natural resources, biomedical aspects, institutional and legal matters, as well as socioeconomic aspects.

Industrial ecology conceptualizes industrial systems like a factory or industrial plant as a human-made ecosystem based on human investments of infrastructural capital rather than reliant on natural capital. Along with more general energy conservation and material conservation goals, and redefining commodity markets and product stewardship relations strictly as a service economy, industrial ecology is one of the four objectives of natural capitalism. This strategy discourages forms of amoral purchasing arising from ignorance of what goes on at a distance and implies a political economy that values natural capital highly and relies on more instructional capital to design and maintain each unique industrial ecology.

are often not welcomed into dialogue at a meaningful and early stage and are forced to seize opportunities to participate in controversial ways. In the United States, the environmental justice movement has pioneered processes of public participation designed to ensure community involvement with environmental decision making. Internationally, the United Nations has developed the Aarhus Convention to assure such participation. Banks and other international lenders are beginning to require such community participation in development projects. For example, the World Bank now requires community participation and accountability to communities in its lending programs under the Equator Principles. Additionally, ethnically stigmatized groups, women, and those disadvantaged by informal social forces are striving to use these methods and others to participate in environmental and economic decision making. In the United States, these efforts are being developed through the environmental justice movement. Internationally, the United Nations supports efforts to build strong nongovernmental organizations through which these and other community interests can be effectively championed. The United Nations activities are being developed through the Civil Society initiatives.

Conclusion

There is a strong international and national push for a new kind of environmentalism that includes sustainable development. Like all the environmental policies before it, sustainable development policies will need to have accurate, timely, and continuous data of all environmental impacts to be truly effective. So far, knowledge needs about environmental impacts generate strong political controversies. In the United States, most of the industry information is self-reported, the environmental laws are weakly enforced, and environmental governmental agencies are new. Sustainability will be controversial because it will open old controversies like right-to-know laws, corporate audit and antidisclosure laws, citizen monitoring of environmental decisions, the precautionary principle, true cost accounting, unequal enforcement of environmental laws, and cumulative impacts.

The concept of sustainability has captured the environmental imagination of a broad range of stakeholders. No one group is against it, in principle. It is the application of the principle that fires up underlying value differences and old and continuing controversies. In many ways, the strong growth of the principles of sustainability represents exasperation with older, incomplete environmental policies. These policies now seem piecemeal, ineffective in individual application, and an impediment to collaboration with other agencies and environmental stakeholders. The new processes of policies of sustainability could be radically different than environmental decision making is now. Communities are demanding sustainability, some even adopting the Kyoto Protocol despite the United States' not signing it. They want to be an integral part of the process, especially as they learn about the land, air, and water around them. As environmental literacy spreads, so too will all the unresolved environmental controversy. It is these controversies that lay the groundwork for the functional advancement of U.S. environmental policy. Sustainability will require complete inclusion of all environmental impacts—past, present, and future.

T

TRADE DEFICITS (AND SURPLUSES)

Raymond Owens

Trade is the basis of much of the economic activity we see around us. Most of our day-to-day activities involve trade. Examples abound—trading cash for food at the grocery store and trading our time and effort (working) for income. The government regularly accounts for the result of all this trading with quarterly readings on the pace of economic activity in the United States. In those reports, one category of trade is singled out. Trade with foreigners is highlighted and measured separately.

What Is So Special about Foreign Trade?

Essentially, we trade because doing so makes us better off. One of the first lessons we learn in economics is that we are not all equally proficient at the same things. For example, one person may be a better cook and another a better carpenter. Individually, one would be ill fed but well housed and the other well fed but ill housed. By trading services, each could—in theory, at least—be both well housed and well fed. The added benefits from trading make both better off.

So trading is good, because people engage in it only when it makes them better off. And we recognize the benefits of trade and economic activity within our borders. Every third month, when the latest report on the gross domestic product (GDP) of the U.S. economy is released, the nightly news blares the rate of growth over the airwaves. Politicians take credit or pass blame. Stock traders rejoice or moan. Bond traders take notice. A big increase in GDP suggests that production and trade among

Americans has increased, translating into stronger economic growth and cause for celebration.

But a big increase in trade with foreign interests is often met with far less enthusiasm. On the face of it, the reason is not apparent. As noted above, we only trade with others—domestic or foreign—if it makes us better off. This activity gives U.S. consumers more products from which to choose and products that are, in some cases, less expensive. The same is true for foreign buyers of U.S. goods and services. An increase in trade with foreign interests should be good news. So why not view it that way? Well, probably because if we buy more things from foreigners than we sell to them (as is usually the case), our measured economic activity tends to shrink. And lower measured economic activity in the U.S. economy is generally frowned upon.

In contrast, if we as a nation trade more with foreigners by selling them more than we buy from them, then more trade with foreigners is viewed as good because it raises measured economic activity in the United States.

So we generally view trade with other Americans as nearly always good but trade with foreigners as only good if we sell more to them than we buy from them. In other words, trade is not always viewed as good, even though both parties voluntarily engage in it, which presumably makes each better off.

Deficits, Surpluses, and Balance

As mentioned earlier, a lot of trade takes place each day, both among domestic residents and with foreigners. On the foreign trade front, domestic residents typically both trade their dollars for foreign goods and services (buy) and receive dollars from foreigners for U.S.-made goods and services (sell). If we buy more than we sell, we are said to have a trade deficit. If selling outweighs buying, a trade (or current account) surplus emerges. When buying and selling perfectly match one another, the result is balanced trade.

If voluntary trade makes parties better off, why separate foreign trade in the economic accounting, and why distinguish between deficits, surpluses, and balance? In a nutshell, trade with foreign interests is often viewed as having a dark side, in that sending more dollars abroad than we receive (a deficit) means some of our domestic consumer demands are met by foreign firms, which causes a drag on demand facing U.S. firms and reduces the demand for workers in the United States. Of course, consumers are made better off in that they have a broader array of goods from which to select. This benefit to consumers is widely recognized but typically is not publicized as a precisely measured benefit. Far more publicity is garnered by the estimated size and presumed costs imposed on U.S. citizens from trade deficits. A second concern is how long the U.S. economy can sustain trade deficits. Under the assumption that deficits create a drag on the economy, how much of a drag is required to slow the economy substantially? Let's address each of these questions in turn.

How Big Are Trade Deficits?

The U.S. trade balance is measured as the net difference between the dollar value of the goods and services we buy from abroad (imports) compared to the dollar value of goods and services we sell abroad (exports). In late 2009, exports were averaging almost $135 billion per month, seasonally adjusted. Imports at that time were over $165 billion a month.

As shown in Figure 1, it is clear that the value of both imports and exports is typically rising over time, recessionary periods excluded. This is not surprising given the diverse nature of goods produced in the United States, the prominence of the currency, and the well-developed infrastructure, which makes the physical transportation of goods (and services) relatively easy. But with the value of imports rising faster than exports, the U.S. trade sector is increasingly in deficit, to the tune of about $33 billion per month, or roughly $375 billion per year, according the most recent reports.

The United States has experienced trade deficits in recent decades, as shown in Figure 2. These deficits grew relatively large in 2006, reaching around 6 percent of the nation's economy as measured by GDP. However, with the sharp recession in 2008 and early 2009, the trade deficit moderated to about 3 percent of GDP. Even with this moderation, the current deficit remains sizeable and—if sustained or enlarged—is cause for concern. The mid-decade bulge partly reflected soaring prices of imported oil, and the moderation partly resulted from sharp declines in oil prices. With future oil prices uncertain, further improvement—or deterioration—in the deficit might be in the cards. Of course, the persistence of a negative trade balance has spurred discussion

Figure 2. U.S. Trade Balance (U.S. Commerce Department/Haver Analytics)

over the drag these large trade deficits could potentially exert on the U.S. economy and the long-term consequences of this drag.

In part, deficits' impact on the economy depends on their causes. Since exports and imports—the two components of the trade balance—are measured in U.S. dollars, changes in the value of the dollar compared to the value of other currencies can affect the deficit's size. As of mid-2010, the dollar's value had strengthened compared to the values of the currencies of the United States' major trading partners. This made the price of U.S.-produced goods relatively less attractive than the prices of foreign goods. Initially, an increasing value of the dollar can potentially compress the measured trade gap, as foreigners pay more for U.S. goods and U.S. consumers pay less for foreign goods. This can occur especially when the volumes of the goods traded change little. Over time, however, the less attractive prices of U.S. goods would be expected to cool demand for our products, constraining U.S. export volume and possibly widening the trade gap.

Another reason the U.S. trade deficit may widen is that, as the United States emerges from recession, stronger demand for imported goods typically emerges. As incomes in the United States strengthen, consumers respond by ramping up spending, including spending on foreign-produced goods. Typically, this strength is not matched by foreign demand for U.S. goods—pushing the deficit deeper into negative territory.

Has Domestic Economic Activity Been Harmed by Trade Deficits?

It is difficult to assess whether trade deficits have affected the U.S. economy in a precise fashion (recall the earlier discussion of the arithmetic of consumer benefits, for

example). However, data from U.S. labor markets and trade accounts do not make a compelling case for a strong near-term relationship between a rise in deficits and a drag on U.S. economic activity—at least through the labor market channel. Since the early 1990s, for example, the trade deficit has generally grown markedly but has not trimmed domestic production enough to persistently raise the unemployment rate. As shown in Figure 3, there have been fluctuations in the unemployment rate since 1992, but the periods of large increases have been tied to recessions that were largely independent of foreign trade. In the early 1990s, a recession occurred after the real estate and stock markets unwound following run-ups in activity in each. In the early 2000s, a recession followed a reversal of the sharp increases in stock market prices in the preceding years. Most recently—in 2008 and early 2009—a deep recession occurred in the wake of an episode of home overbuilding and the attending difficulties in financial markets. Domestic demand for foreign goods softened more than demand for U.S. goods overseas. The trade deficit lessened, but again, because of the broader weakness in domestic economic conditions, unemployment soared.

In fact, the recent recessionary period aside, the unemployment rate has mostly trended lower throughout the period, with the tightest labor markets often occurring during times when trade deficits were on the rise. From this perspective, it is not at all obvious that running a trade deficit has led to a pronounced loss of jobs and higher unemployment in the overall economy.

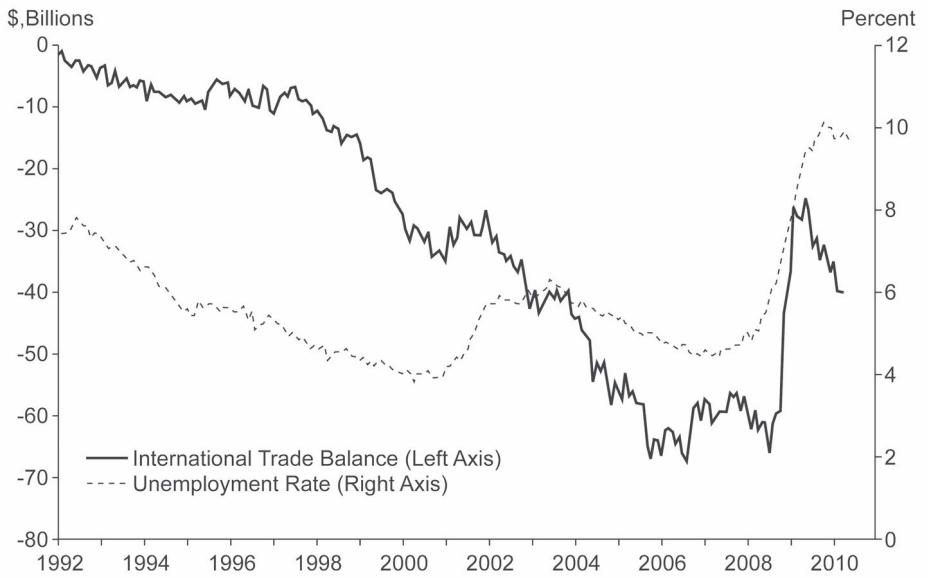

Figure 3. U.S. Trade Balance and Unemployment Rate (U.S. Commerce Department/Haver Analytics)

This is not to suggest, however, that trade deficits have had no impact on jobs in the United States. With the expanded global market in recent years, not only have global trade volumes increased, but the location of global production has been more dynamic. That is, firms have increasingly shifted their production among countries in an ongoing effort to contain costs and to match the location of production to that of emerging market demand. Through these channels, individual job categories in the United States have been affected. Jobs have declined in industries like textiles, for example, but have risen in other categories. This is textbook comparative advantage at work—with foreign producers making more of the world's fabric, U.S. producers can develop more pharmaceuticals.

What Do Trade Balance Figures Tell Us?

Broadly speaking, trade balance figures tell us very little, really. While trade figures imply that the United States consumes more foreign goods than it ships abroad, this interpretation is not particularly important, on balance. First, with well-functioning international financial markets, trade between nations has many implications that influence both the benefits and costs of the trade activity. The measures of trade flows (as imperfect as they are) are just one part of the story. Also important are the financial flows that result from the trade transactions.

When a domestic purchaser buys a good or service produced abroad, the purchase is an import. In this setting, the disposition of the dollars received by the foreign producer is important in determining the impact of the transaction on the U.S. economy. A foreign producer has several options with the acquired dollars: hold them (an interest-free loan to the U.S. government); exchange them for U.S. dollars on the foreign exchange markets (adding to the supply of dollars and pressuring the dollar lower); or invest them in dollar-denominated assets like a U.S. Treasury security or a factory in the United States.

In the first instance, we would like the foreign supplier to stuff its mattress with—or, better yet, burn—the dollars it receives. This way, we would get the goods or services from the supplier and would provide in exchange only paper bills (which cost our country little to print). By either destroying or otherwise not spending the dollar bills, foreign claims to U.S. goods or assets are relinquished. But this is not likely to occur very frequently, because trading of this type is not in spirit mutually beneficial to both parties. More likely, the foreign holders of dollars will delay spending or investing those dollars—while they hold the dollars, they earn no interest on them—effectively providing an interest-free loan to the United States.

In the second case, dollars received by foreign producers are exchanged for their home currency. With a trade surplus (from their perspective, since if we have a deficit, they must have a surplus), they receive a greater amount of dollars than we receive of their currency. To equate the currency amounts on the foreign exchange market, the

value of the dollar must fall relative to the value of the foreign currency. This makes goods and services priced in dollars more affordable, driving up the quantity of those goods demanded on international markets. But a falling dollar may jeopardize inflows of foreign capital into the United States and make dollar-denominated investments less attractive—but that's another story.

In the third instance, the foreign producer accumulates dollars to purchase assets valued in U.S. dollars. Toyota, Honda, and many foreign-based computer firms have large production facilities in the United States, for example, though most are invested in financial instruments. This is good, because these businesses create investment, tax revenues, and jobs here. But foreign investment in the United States leaves some uncomfortable. In the late 1980s, Japanese firms were purchasing farmland in the United States, which led to debate about the impact on the U.S. economy. More recently, some concerns continue to be voiced about who receives the profits on the investments. With global stock markets, we need not be too concerned. If a U.S. citizen wants the profits from a large foreign corporation, then stock in that company—and a share in its profits—is available for purchase.

In addition, in today's world economy, firms in the United States sometimes have operations overseas. Imagine that a furniture producer in the United States decides to open a factory in China. To open the plant, the U.S. firm buys enough Chinese yuan (the Chinese currency) to enable it to build the plant. But the output is shipped to the United States (a foreign import that tends to add to our trade deficit) and the profits are dollars, part of which the firm retains in the United States and part of which are converted to yuan to cover the continuing operating expenses of the plant. In this case, the trade gap has widened, but the Chinese have not substantially increased their claims to U.S. assets in the future.

Is this kind of activity important? In a word, yes. If we receive goods today and exchange only paper dollars, that's one thing. But if those paper dollars can potentially be redeemed for goods or factories or real estate in the United States at some future date, then that's another story, and we are a debtor nation, meaning we owe more money to foreigners than they owe us.

Much of the money we owe to foreigners is in the form of Treasury securities. The foreigners bought them, and we will have to redeem them one day. But is being a debtor nation necessarily so bad? As with many other aspects of trade and international finance, the answer is not crystal clear. One way to gauge the United States' net position as a debtor nation is simply to look at the income the nation earns on assets owned abroad compared to the payments made to foreign entities that own assets in the United States. Figure 4 shows that U.S. payments to foreigners soared in recent years, before pulling back with the 2008–2009 recession. But the chart also shows that, over the period, payments from foreigners have kept pace. In fact, the chart suggests relatively little reason to lie awake at night worrying about our status as a debtor nation.

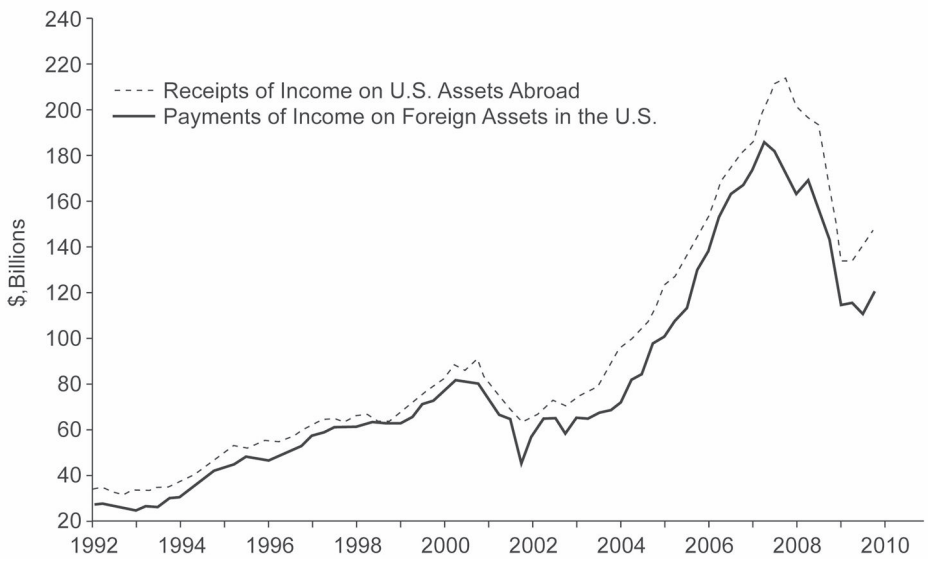

Figure 4. U.S. International Financial Payments. (U.S. Commerce Department/Haver Analytics)

What about Future Generations?

Much of the discussion here has focused on the near-term implications of the U.S. trade position. But critics point out that the impacts of today's trade actions may affect future generations. The argument is that trade deficits occur when society consumes more than it produces. This behavior, if left unchecked, will eventually leave the nation with large unpaid bills for the goods and services consumed. This is like dining out excessively on a credit card. These critics correctly note that to eventually pay off the debt, the country will have to sell off some assets, leaving the next generation with fewer assets and potentially reducing its ability to produce goods and services.

This argument is plausible and probably correct if sizeable trade deficits persist over a long period. But it is far from a foregone conclusion. For one thing, the trade deficit may fluctuate as energy prices rise and fall and the dollar rises and falls in value. But there is another consideration. Just as running up a credit card balance sometimes makes sense, so does running a trade deficit. Imagine that some large nations are ramping up production but still have a lot of underutilized capacity. For a time, the goods produced in these nations may be a bargain. In this case, taking advantage of the sale prices may be worth reducing one's asset holdings temporarily. Later, when assets are cheaper relative to consumer goods, the logical choice could be to accumulate capital goods relative to consumer goods.

Conclusion

This entry began by asking what all the fuss concerning foreign trade is about. If trade with your neighbor is good, then isn't trade with your neighboring nation also good?

The answer to this and other trade-related questions—unfortunately—is not clear-cut. While most agree that trade with other nations has many substantial benefits for the United States, measuring these benefits is difficult. In addition, many people are comfortable with trade as long as the value of exports exceeds that of imports—a trade surplus.

But aside from a surplus, the U.S. trade position with other nations often elicits mixed feelings. These feelings turn to concern as the trade balance moves deeper into deficit territory. Such movements have occurred in recent years, aside from the recent recession-related compression. But the general widening of the trade deficit has not resulted in especially troubling effects on the U.S. economy. Economic growth in the United States has fluctuated widely along with domestic housing activity in recent years, and labor markets have reflected those fluctuations. However, during some of this period, relatively long periods of solid economic growth and tight labor market conditions have occurred while trade deficits grew. There are no compelling signals yet that trade deficits are costing Americans jobs in the aggregate. In fact, labor markets were arguably becoming too tight in late 2007, as labor cost pressures emerged and complaints of a worker shortage were being heard.

In addition, concerns that trade deficits lead to outsized foreign ownership of U.S. assets and debt may also be a bit overblown. More of our assets are in foreign hands, but so too are we holding many foreign assets. On balance, earnings from those assets are about matching the interest and payments we make to foreign holders of U.S. assets.

In fact, as long as foreign interests want to hold more U.S. dollars, we can buy goods from abroad and foreign interests can get the dollars they want to hold. We want their goods, and they want our dollars. Their use of those dollars can have somewhat differing impacts on our economy, but no uniformly bad impacts appear to be occurring. We need to remember that consumers reap large benefits when they buy goods and services from foreign firms. But we can also increase trade deficits when our dollars flow to companies located abroad that are owned by U.S. parent firms. Such arrangements can offer these firms flexibility and profitability while containing the outflow of dollars that concerns some.

The bottom line may be that it does not matter so much with whom we trade. The real issue may be whether the United States is consuming more than it is producing. If we, as a society, persistently consume more than we produce, we will eventually have to draw down our accumulated wealth to pay for the excess consumption. Whether we transfer that wealth to another nation or to someone in our nation, the bottom line is that future generations will have a lower stock of capital, and that could, under some circumstances, constrain their ability to produce goods and services in the future. But this is not to suggest we are at or near that point. It is not obvious that we are consuming substantial amounts of our capital base or seed corn. In addition, eating some seed corn today may be reasonable if some categories of goods and services currently are a

bargain that is not expected to persist. So one possibility is to refocus the discussion to worry more about whether we, as a society, are properly balancing our consumption and savings and worry less about where production is located.

U

UNEMPLOYMENT

Geoffrey Gilbert

When there are not enough jobs for everyone wanting to work in a particular city, region, or industry, economists look for the underlying causes, which can include technological change, rising resource costs, stiffer competition from imports, or a fundamental change in consumer preferences. Any of these may explain a localized gap between jobs offered and jobs wanted. At the national or macroeconomic level, however, unemployment generally cannot be traced to any single cause; rather, it is a feature of the business cycle. Every economy is subject to cyclical expansions and contractions. The U.S. economy, for example, has experienced 11 recessions since World War II, with the national unemployment rate topping 10 percent during 2 of them. (By comparison, at the depths of the Great Depression, unemployment reached 25 percent.) Unemployment takes an economic toll in terms of foregone output—goods and services that could have been produced if all available workers had held jobs. It also entails serious social costs for those out of work and for their families. Government can ease the financial burden of joblessness through such programs as unemployment insurance, job retraining, and tax credits for companies that hire new workers.

Four Types of Unemployment

Economists have described four different types or categories of unemployment. *Frictional* unemployment refers to the normal job switching that occurs in a market economy; at any given moment, there are bound to be some workers who are temporarily between

jobs. *Seasonal* unemployment refers to those who are out of work because of normal seasonal variations in employment. This can be seen in resort communities, where, for example, jobs may be plentiful during the winter in a ski town or during the summer in a seaside town but scarce during the rest of the year. Certain industries, like agriculture and construction, also exhibit high seasonal unemployment rates. *Structural* unemployment occurs when jobs disappear due to changes in the structure of the economy, as, for example, when companies move their operations overseas in order to lower their wage costs. Finally, *cyclical* unemployment is the type that rises and falls according to the overall condition of the national economy.

When the U.S. Bureau of Labor Statistics (BLS) announces the latest unemployment rate on the first Friday of each month, it does not distinguish among these four types. One may safely assume, however, that any large movements in the official unemployment rate are mainly due to the ups and downs of cyclical unemployment. The unemployment rate is inversely related to the national output rate, but it does not track it precisely. Unemployment is a so-called lagging indicator, meaning that when the economy starts to shrink, or go into a recession, it may take several months before the unemployment rate begins to rise, and when the economy hits bottom and starts to make a recovery, it may take some time before the unemployment rate begins to fall in response.

How Unemployment Is Measured

The BLS estimates the number of people unemployed in the United States by sampling the population rather than attempting to actually count every person who is looking for work and not finding it. The sample consists of 60,000 randomly selected households, representing about 110,000 individuals. Each month, trained interviewers check up on these households—some by phone and some in person—to determine their work activity in the previous month. Every individual who is 16 years of age or older is potentially a participant in the civilian labor force. Many, however, do not participate, including those who are retired, on active duty in the armed forces, in school full-time, totally disabled, institutionalized, or, for a variety of other reasons, not looking for employment. These individuals are not counted as part of the labor force. Only those who have jobs or are available for work and actively trying to find it get counted in the labor force, as defined by the BLS. The official unemployment rate is computed by dividing the number of people who are jobless but actively looking for work by the total number who are in the labor force. This fraction is then multiplied by 100 so that the unemployment rate can be expressed as a percentage.

An important group of people excluded from the labor force are those known as "discouraged workers." These are individuals who tell the interviewer that they want work, are available for work, have looked for work during the previous year, but are not *currently* looking for a job. They have become discouraged because they feel they have the wrong skills, are too young or too old, are likely to experience hiring discrimination,

or just do not fit the jobs that currently exist. Beyond this group of workers, who are discouraged for job-related reasons, there is an even larger group of workers called "other marginally attached," who say they are not job searching because of health problems, child care issues, or difficulties arranging transportation. These individuals say they want work and have looked for a job in the past year, but they have not looked in the past four weeks.

The most comprehensive measure of unemployment goes beyond what has just been described to include individuals who work part-time because they are unable to get the additional hours of work they would like. Under the standard BLS definition, a person who works for pay as little as 1 hour per week is categorized as employed, even though *under*employed would be a more accurate term if the worker would prefer to be working 10, 20, or 40 hours a week. Millions of workers in the United States can be described as holding their jobs "part-time for economic reasons," not by choice. When we take into account all the forms of subemployment outlined above, we get a much higher number than the conventional, and most widely publicized, unemployment rate. In April 2010, for example, the standard unemployment rate was 9.9 percent, while the broadest, most encompassing measure of underemployment stood at 17.1 percent. Both numbers were swollen by what some called the Great Recession of 2008–2010, yet even when the economy is in a healthier state, the gap persists. In April 2000, for example, the official unemployment rate was 3.8 percent, while the broader gauge of labor-force underutilization reached 6.9 percent.

The Uneven Impact of Unemployment

Americans experience unemployment in different ways and at different rates, depending on their age, gender, education level, and race or ethnicity. The monthly BLS unemployment report sheds light on all of these differences. For the month of April 2010, the unemployment rate for teenaged workers, ages 16 to 19, was a whopping 25.4 percent. This implied that for every four teenagers who were counted in the labor force (meaning they were either employed or looking for a job), only three were able to find work. For adults age 20 and older, unemployment was far lower, at a little over 9 percent.

Gender disparities in unemployment are much smaller than disparities by age. For most of the 2000–2010 decade, there was no consistent difference between men's and women's jobless rates. That changed near the end of the decade, however, as the economy fell into recession. More jobs were lost in male-dominated occupations, like construction and manufacturing, than in the rest of the economy, causing men's unemployment to rise faster than women's. In April 2010, the rate for all men age 16 and older stood at 10.8 percent, compared to 8.8 percent for women. If teenaged workers were excluded, the rates were 10.1 and 8.2 percent for men and women, respectively.

Education strongly influences one's chances of being unemployed. More highly educated Americans experience less joblessness than those with fewer educational

credentials. The April 2010 figures were illustrative. Among workers aged 25 or older, those lacking a high school diploma had a 14.7 percent unemployment rate. The comparable rates for those with a high school diploma but no college, those with some college or an associate's degree, and those with a bachelor's degree or higher were 10.6 percent, 8.3 percent, and 4.9 percent, respectively. The advantage enjoyed by those with more education can also be seen in their higher rates of participation in paid work. Fewer than half the individuals who lacked a high school education participated in the labor force in April 2010. Those with more education had higher participation rates. College graduates, for example, participated at a 77.3 percent rate.

Race and ethnicity also affect one's likelihood of being unemployed. Historically, African Americans have been jobless at higher rates than whites or Hispanics. In April 2010, the black unemployment rate stood at 16.5 percent, compared to 12.5 percent for Hispanics, 9.0 percent for whites, and 6.8 percent for Asians. When high-unemployment categories overlap, the resulting unemployment rates can be extraordinarily high. In December 2009, for example, the unemployment rate for black teenagers (ages 16 to 19) reached an astonishing 48 percent. (For white teens, the rate was a little under 24 percent.)

Short- and Long-Term Unemployment

The longer a person remains without work, the deeper the impact on finances, family well-being, sense of self-worth, and even health. Some workers are out of a job so briefly they do not even bother to file for unemployment compensation. At the other extreme, some workers spend long months and even years looking in vain for work. Workers who lose their jobs in middle age can be especially devastated, since they often shoulder heavy financial responsibilities and do not have time to start a new career in the working years they have left.

During the recession of 2008–2010, observers noted a considerable increase in the amount of time workers typically spent unemployed. So not only were there an unusually large number of people out of work—even for a recession—but they were staying unemployed much longer than usual. Data from the BLS showed that, in April 2010, more than three-fifths of the unemployed had been out of work for 15 weeks or more, and fully 46 percent met the definition of "long-term unemployed" by being out of work for more than six months. The median period spent unemployed was about 22 weeks, meaning that as many people were unemployed *longer* than 22 weeks as were unemployed for *less* than that length of time. In historical data going back to 1967, there is nothing comparable to this figure; only once previously had the median length of unemployment even reached 12 weeks (in March 1983).

The social consequences of unemployment are manifold. The unemployed face a greater risk of clinical depression, hospitalization, and other adverse effects, as studies have shown in the United States and abroad. The damage can be straightforwardly

physical: a study conducted under the auspices of the Harvard School of Public Health showed that even short periods of unemployment lead to more diagnoses of high blood pressure, heart disease, and diabetes (Strully 2009). A Swedish study found that individuals experiencing unemployment face higher mortality risk, partly due to increased rates of suicide (Gerdtham and Johannesson 2003). It has also been shown that domestic violence, divorce, and child abuse increase when fathers are unemployed (Schiller 2008, 91). Given the well-established physical and mental health consequences of unemployment, it should hardly come as a surprise that unemployment has also been linked, in a British study, to lower levels of happiness. Somewhat less expected were the findings that unemployment produces less unhappiness among the young, among those who have been unemployed for longer periods of time, and in those regions where the overall unemployment rates are high (Clark and Oswald 1994).

"Natural" Unemployment, the Phillips Curve, and Okun's Law

At various times from the 1960s onward, economists in the United States have offered opinions about the rate of unemployment that should be considered normal or "natural." If the actual unemployment rate fell below this natural level, it would signal an overheated economy likely to be experiencing inflation. If it rose above the natural level, it would signal slack in the system, suggesting that the economy was performing below its potential. The cumbersome, technical term for the natural rate of unemployment is *nonaccelerating inflation rate of unemployment,* or NAIRU. Economists have tried to determine what the natural rate of unemployment would be in a given economy. For the United States, some thought 4 percent, some 5 percent, some even thought 6 percent unemployment might be the natural level. To date, no consensus has emerged, and in fact the search for the true NAIRU appears, for now, to have been suspended.

Implicit in discussions of NAIRU was the assumption that for any given economy there was a stable relationship between unemployment rates and inflation rates. Empirical research in the 1950s and 1960s appeared to support this notion. Soon economics students were finding something new in their principles textbooks—the Phillips Curve, which graphed an inverse relationship between the inflation rate and the unemployment rate. The Phillips Curve seemed to offer policymakers the possibility of choosing from a variety of inflation–unemployment combinations. If they wanted to lower the unemployment rate, the cost would be higher inflation; if they wanted to lower inflation, the cost would be higher unemployment.

In the same era that produced NAIRU and the Phillips Curve, another empirical relationship involving unemployment was put forth: Okun's Law. Named for the economist Arthur Okun, this law posited a stable inverse relationship between changes in the unemployment rate and the economy's real growth rate. Growth in this case referred to increases in the real, inflation-adjusted gross domestic product, or GDP. Okun's Law builds on the obvious fact that, if national output is to be increased, more labor will

have to be employed, and that will reduce unemployment. A widely accepted version of Okun's Law states that, for every 2 percent growth in GDP above its long-term trend rate, unemployment falls by 1 percent. For example, if the long-term GDP growth trend is 3 percent and GDP actually grows by 5 percent, the unemployment rate would be expected to fall by 1 percent. (In this example, therefore, if unemployment had previously been 6 percent, it would fall to 5 percent.) As with the Phillips Curve, Okun's Law has fallen into disfavor among most economists; neither appears to have strong enough empirical underpinnings to be relied upon as a macro policy tool.

Unemployment Insurance

When workers lose their jobs not through any fault of their own but because their industry—or the entire economy—is going through a cyclical downturn, most people believe they need and deserve some kind of temporary financial assistance from the government. Such was not always the case. Historically, state assistance to the unemployed could not be legislated as long as the public viewed joblessness as a matter of individual responsibility. During the periodic depressions that characterized the 19th century, even private charity for the unemployed was sometimes decried as "pauperizing"—that is, liable to turn temporary hardship into permanent dependency. But gradually opinion shifted toward a more positive view of public responsibility to aid the jobless, whether in the form of emergency public relief programs during times of mass unemployment or through employment bureaus operated by cities and states on a model borrowed from Great Britain. (Such bureaus could be found in more than half the states by 1915, according to Roy Lubove 1968.)

Compulsory unemployment compensation plans began to be introduced into state legislatures during the 1920s, but only Wisconsin enacted a program before Congress passed the Social Security Act of 1935. Under that landmark law, all states must operate unemployment insurance (UI) programs. The features that are common to all state programs are: UI applicants must have some work experience; they must have lost their jobs through no fault of their own; and they must be ready and willing to work. Benefit levels vary widely and generally make up only a fraction of the worker's normal wage income. The benefits paid during the standard 26-week period of eligibility are financed out of state payroll taxes. In times of unusual economic distress, Congress can authorize a 13-week extension of UI benefits, in which case the funding is shared by the states and the federal government.

The common view that almost any unemployed person can collect unemployment benefits is far from true. Of those counted as unemployed by the BLS at any given time, only about one-third are able to receive unemployment compensation. The jobless who are just entering the labor force—college graduates, for example—or who are reentering the labor force after a period spent out of work are ineligible to receive UI benefits. Also ineligible are those who have been dismissed for cause from their jobs.

Unemployment and Poverty

The correlation between unemployment and poverty in the United States is not hard to understand. When the economy goes into a recession and jobs are lost or hours are cut, families that had been managing to stay just above the poverty line can easily drop below it. When the economy recovers and laid-off workers go back to work, many families have a chance to earn their way out of poverty. A graph showing the trend lines for unemployment and poverty in the United States from 1960 to 2004 strongly confirms the correlation between these two rates (Schiller 2008, 99). The data since 2004 offer further confirmation. Poverty rates stayed in the 12 percent range from 2004 to 2007, while the unemployment rate trended downward from 5.6 to 4.4 percent. But in 2008, as the recession got under way, the poverty rate shot up to 13.2 percent—its highest level in more than a decade—while the unemployment rate also rose significantly. Poverty statistics are never released in as timely a fashion as the monthly unemployment statistics, but it is a safe bet that, when the poverty rates for 2009 and 2010 are released, they will mirror the dramatic increases seen in the U.S. unemployment rate during the recession.

The Political Economy of Unemployment

People have very different takes on what, if anything, should be done about unemployment and the hardships it produces. Those on the conservative end of the spectrum have long argued that unemployment is an inevitable feature of the dynamic capitalist economy. The 20th century's most outspoken advocate of free enterprise, Milton Friedman, asserted in *Capitalism and Freedom* (1962) that severe unemployment was almost always the result of government ineptitude, not ordinary business cycles. He also blamed some unemployment on minimum wage laws, which, therefore, he wanted to see abolished. At the other (left) end of the political spectrum, radical thinkers from Marx onward have depicted unemployment as both a systemic and a necessary feature of capitalism. Periodic bouts of mass unemployment, in their view, serve to weaken labor unions, restrain wages, and bolster corporate profits. In Marx's view, capitalist crises could be expected to not only continue but grow in intensity, cutting into production and expanding the "reserve army of the unemployed," until at last the working classes threw off their shackles and seized control of the system.

The centrist view of unemployment since the Great Depression has been to see the macro economy as subject to periodic (though not worsening) downturns, which the government can moderate but not eliminate. Unemployment is therefore accepted as a fact of the modern mixed economy. By a proper use of fiscal and monetary tools, economic fluctuations can be held within acceptable bounds, and unemployment insurance—part of a broader safety net—can keep the consequences for individual workers tolerable. It would be hard to find a prominent conservative or libertarian thinker today who would advocate abolishing the UI system that Americans have had since 1935. Debate about how best to help the unemployed centers instead on where the benefit levels should be

set and how long the unemployed should be able to collect their benefits. If benefit levels are set too low, the safety net will not meet the basic test of adequacy. There may be another problem as well: low benefit levels will tend to cause the unemployed to shorten their job searches and accept the first job that comes along, even if it does not make appropriate use of their human capital. The end result is inefficiency in the economy. If benefit levels are set too high, it allows workers to extend their job searches beyond what would otherwise be the case. This, too, can be a source of economic inefficiency and waste.

WAR AND THE ECONOMY

Lee A. Craig

The link between war and the economy is an ancient one. More than 2,000 years ago, Cicero observed, "*Nervo belli, pecuniam infinitam*"—the sinews of war are money in abundance (Cicero 2003)—and war has often been viewed as an avenue to economic prosperity. A leading economic history textbook has a chapter entitled "The 'Prosperity' of Wartime" (Hughes and Cain 2010), and World War II has become the standard explanation for the end of the Great Depression: "It has long been an article of faith that the Second World War brought an end to the long depression of the thirties" (Smiley 1994). In his Pulitzer Prize–winning history of the era, David M. Kennedy notes that "the war compelled government spending on an unexampled scale, capital was unshackled, and the economy energized." He concludes: "Ordinary Americans…had never had it so good" (Kennedy 1999). In the run-up the to the U.S. invasion of Iraq in 2003, Senator Robert Byrd accused President George W. Bush of using the war as a means of addressing "weaknesses in the economy [and] jobs that are being lost" (Nyden 2002).

Despite the unambiguous tone of these observations, opinions on war's impact on the economy are hardly unanimous. The great Austrian economist Ludwig von Mises attacked the very notion of wartime prosperity: "War prosperity is like the prosperity that an earthquake or a plague brings" (Higgs 1992). While economists, historians, and politicians debate the point, generals seem less divided. Douglas MacArthur emphasized war's "utter destruction," and William Tecumseh Sherman famously said of war that "it is all hell" (MacArthur 1951). Tellingly, neither emphasized war's prosperity.

What is the supposed link between war and economic prosperity? How might a war lead to prosperity? Why did Mises equate wartime prosperity with that of a natural disaster?

Grasping the Problem

Calculating the cost of war presents economists and historians with a challenge. There are the direct costs—largely government expenditures on material, which are easy enough to track—and there are also indirect costs, which, although just as important in an economic sense, are less easily quantified. Take, for example, the lost economic production that results from a war-related death. We do not know exactly how much output the dead individual would have contributed to the economy over the course of his or her life; neither do we know exactly what the present market value of that worker's future output would be. After all, the value of a dollar today is not the same as the value of a dollar 10 or 20 years from now. However, because the fact that a topic is difficult does not mean we should avoid it. Economists regularly estimate the future productivity of individuals—for example, those injured or killed in automobile accidents—and they calculate the value today of future income streams, which also happens to be the foundation of the thriving business in annuities. If one applies these techniques to the estimation of the direct and indirect costs of war, some interesting figures emerge.

For example, during the Civil War, the United States government directly spent $1.8 billion, while the Confederate states spent $1.0 billion (in 1860 dollars). Estimates of the indirect costs of the war are in the neighborhood of $1.6 billion for the United States and $2.3 billion for the Confederacy (Goldin 1973). Thus, the combined costs of the war were $6.7 billion ($3.4 billion for the North and $3.3 billion in the South). With a total U.S. population of roughly 35 million, it follows that the war cost about $50 per person per year, during its four years.

To put these figures into perspective, consider that the cost of purchasing the freedom of the entire slave stock in 1860 would have been $2.7 billion, or about 40 percent of the war's actual cost. Financed by the issue of 30-year U.S. treasury bonds at 6 percent interest, this option would have cost the northern population $9.66 in taxes per person per year. Indeed, depending on which groups were taxed to pay off the bonds, the payments would have been considerably less than this. Given that annual income per person at the time was around $200 dollars, the tax rate would have been less than 5 percent—a fraction of the current average federal income tax rate today. Perhaps somewhat paradoxically, these figures seem to confirm Ulysses S. Grant's observation that "There never was a time when, in my opinion, some way could not be found to prevent the drawing of the sword" (West Point Graduates against the War n.d.).

Of course, calculations such as these distort the fact that the fundamental economic condition of war is not its average cost or benefit but rather its distributional effect, or, as one economic historian put it: "The economic benefits of the Civil War were bestowed

upon those who were able to take advantage of the changes it generated [not the least of whom were the emancipated slaves], while its costs were most heavily born by those who suffered and died on its fields of glory" (Craig 1996).

What Is War Prosperity?

The standard economic indicator for the performance of any economy is gross domestic product (GDP)—"the total value of all final goods and services produced for the marketplace during a given year within a nation's borders" (Lieberman and Hall 2005). It follows from this definition that GDP is the sum of various types of expenditures on goods and services, including private personal consumption expenditures, investment, expenditures on exports minus those on imports, and government expenditures. In any economy at any point in time, it is possible—perhaps even likely—that there are some productive resources (e.g., land, labor, or capital) that are unemployed or at least underemployed. As war approaches or is unleashed, governments employ their coercive powers to facilitate military operations. Men are conscripted to fight, capital is directed toward the production of war materiel, and so forth. Thus, government expenditures tend to increase, sometimes dramatically, during wartime, and since those expenditures are mathematically a component of the GDP, it typically increases during war.

To see this phenomenon in practice, consider Figure 1. It shows an index of real (i.e., inflation-adjusted) GDP for the U.S. economy before, during, and after U.S. involvement

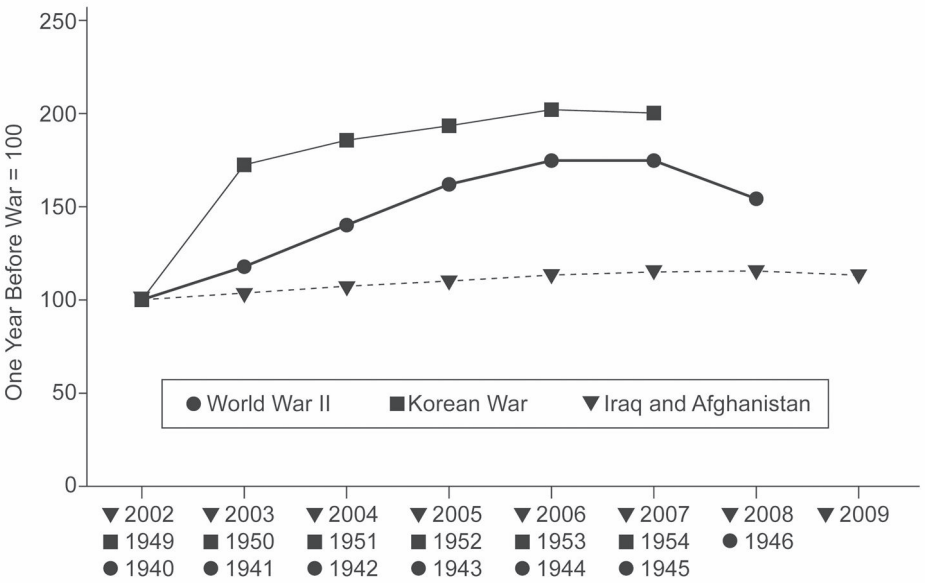

Figure 1. Wartime Prosperity: Economic Output (Real GDP): Before, During, and After World War II, the Korean War, and the Wars in the Middle East (Author's Calculation from U.S. Department of Commerce, www.commerce.gov and www.bea.gov)

in three wars: World War II (1941–1945), the Korean War (1950–1953), and the recent and ongoing wars in the Middle East. Using the year before the United States entered each war as the base year, in which GDP = 100, the figure illustrates how the economy expanded during the war years and how it leveled off as the war ended. Clearly, from this indicator, one would be justified in referring to the prosperity associated with these wars.

If government spending during wartime leads to prosperity, then shouldn't government spending during peacetime lead to prosperity? In other words, why isn't more government spending always a good thing? To answer these questions, we must consider where the government obtains the money it spends during wartime or peacetime. Governments obtain funds from three sources. They can raise the money via taxation; they can borrow the money, which is just future taxation; and they can print more money, which just leads to inflation and is a form of taxation. (Since printing money depreciates the value of money, inflation is a form of taxation on those holding money.) So, in the end, all government spending is financed one way or the other through taxation. Typically, governments turn to some combination of all three revenue sources, especially during wartime.

Once we recognize that government spending is just taxation, then we can see why it does not in general lead to prosperity. If governments fight wars with tax dollars, and if they obtain the tax dollars from consumers, then it follows that a dollar of taxation going to government spending and increasing GDP will simply be taken from a dollar of private personal consumer spending, which would in turn decrease GDP.

It does not always work like this, dollar for dollar, for at least two reasons. First, with respect to borrowing, recall that GDP represents the value of current expenditures. Government borrowing is future taxation, and the decrease in consumer spending might not show up immediately. Thus, GDP goes up today and is reduced at some time in the future. This is just robbing Peter tomorrow to pay Paul today. As a general policy, government borrowing might or might not be good for the economy—depending on how the borrowed funds are expended—but the exigencies of war are such that governments often do not worry about the future consequences of borrowing.

Second, war changes the economy in other ways that would offset the decrease in consumption resulting from taxation. For example, one of the most common forms of taxation during war is the conscription or drafting of soldiers who pay the tax with their labor. Historically, soldiers were not paid a market wage, which is why conscription is a regular companion of war. The difference between what conscripted soldiers are paid and what they would have to be paid in order to get them to volunteer represents a measure of the soldiers' tax burden. When a soldier goes to war, he (historically, conscripts tend to be men) leaves the civilian labor force, which tends to reduce his family's consumption, but often women (and children and the elderly), who might otherwise have been employed in nonmarket pursuits, replace men in the labor force. Thus, economic activity, as

measured in GDP, would now include the government spending on the soldier and the consumption generated by the women who replaced soldiers in the labor force. Rosie the Riveter, of World War II fame, is the classic example of this phenomenon. Since Rosie's prewar nonmarket activity in the household was not counted as a component of GDP—riveting is; preparing dinner, changing diapers, and cleaning the house are not—when her work is added to the government's increased wartime spending, GDP increases, just as it did during World War II.

This, then, is wartime prosperity. Unemployed or underemployed resources, or resources formerly employed in nonmarket activity, are put to work by government's wartime spending—usually spurred by increased borrowing—as companies obtain government contracts and individuals who formerly did not contribute to GDP now do so (like Rosie the Riveter); and many who did contribute to GDP in the private sector are now contributing in the government sector, albeit as conscripted soldiers. Prosperity, at least as measured by GDP, follows. Why, then, have some of the leading figures in economics and economic history questioned the concept of wartime prosperity?

Is War a Human-Made Disaster?

The comparison of war to a natural disaster is common, because both seem to create prosperity. It is not uncommon for certain types of economic activity to pick up following a natural disaster. For example, in the wake of a hurricane, roofing contractors expect to see an increase in the demand for their services, as they are called upon to repair damage to homes resulting from falling trees. Indeed, consider the whole series of related economic activities. A tree service might be called to remove the tree, the family might stay in a hotel until the roof is repaired, painters might repair internal water damage, and so forth. None of these particular expenditures would have been made by the family in the absence of the hurricane. Multiplying these and other costs incurred from damage by the number of households affected by the hurricane would yield an aggregate measure of the value of services rendered following the storm. Thus, one might conclude that the storm itself yielded the resulting prosperity.

The fundamental problem with this observation is that it assumes that the families would have neither spent nor saved the monies they expended as a direct result of the storm. Perhaps they would have purchased a new automobile, a purchase that will now be postponed. Perhaps they would have stayed in a hotel on vacation, a trip that will now be canceled. In these cases, all the hurricane did was redirect the families' spending from something they had planned or hoped to purchase (i.e., a new car or a vacation) to something they would not have wanted in the absence of the storm (i.e., a new roof and a stay at the hotel down the road).

What if a family had merely taken money out of the bank to pay for the new roof and hotel visit—money that they were, in fact, saving for a rainy day? They could still purchase the car and vacation with other funds. Would these monies not be better spent

on a new roof than just sitting in the bank? The answer is no, because the bank does not just sit on the money that is deposited there; it turns around and loans that money for productive economic activity. If people take loanable funds out of banks to pay for new roofs that they would not have needed in the absence of a hurricane—that is, if they reduce the supply of loanable funds—then the banks increase their interest rates in order to induce other people to make new deposits. This increase in interest rates in turn reduces the number of loans taken.

Why not just borrow the money from the bank? Because as people borrow money to repair the storm damage, they increase the demand for loanable funds, which in turn increases interest rates and reduces the number of loans taken. Thus, as a result of the hurricane, economic activity is redirected—from new cars and vacations to new roofs—and less economic activity occurs as upward pressure is placed on interest rates. Neither of these effects is good for the economy.

War has the same two negative effects on the economy. The opportunity cost of war is never zero. A dollar spent on a weapon, a shell, or a uniform is a dollar extracted through taxation or borrowed, which again is merely future taxation, and therefore not spent on some other activity. If consumers were better off purchasing a shell rather than an automobile, they would demand shells during peacetime rather than cars or houses or education for their children. So the forced substitution of war production for private consumption cannot be understood generally as making people better off.

As for borrowing, recall that one of the most common of war's effects on the economy is an increase in the demand for credit, as countries borrow to finance the construction of their war machines. This increases the demand for credit, which increases interest rates, which tends to drive down or crowd out private investment. So we again see governments' wartime expenditures simply replacing private expenditures. Since people generally prefer to borrow money for a home, automobile, or education rather than a plane that might get shot down over enemy territory, it is difficult to argue that the increase in government spending improves people's financial situations.

As for printing money and generating inflation to finance the war, if this were good for the economy (and it is not), then we would expect to see governments doing this during peacetime as well. Although in recent decades there has been some peacetime high inflation, it is not perceived to be a positive factor for the economy, and anything more than a little inflation is generally greeted unfavorably by lenders and consumers (and voters; woe to the president running for reelection during periods of rampant inflation, such as Jimmy Carter).

Of course, war, just like a natural disaster, redirects economic activity. Suppliers of weapons and uniforms will see an increase in the demand for their products relative to other goods and services—just as roofers see an increase in the demand for their services after hurricanes. Those who see their taxes increase, now and in the future, are among the groups whose resources are directed toward military suppliers, but the group most

likely to bear a disproportionate share of the tax burden is the soldiers who pay with their labor, especially those who ultimately pay with their lives. The death of soldier is a tragedy to his or her family. For the economy, it represents the loss of all of his or her future economic output.

What does this tell us about the persistent metaphor of wartime prosperity? The main thing is that the manner in which standard economic measures of well-being, such as GDP, are constructed biases them upward during wartime. The substitution of market for nonmarket activity increases GDP, but it does not mean people are necessarily better off. In addition, the substitution of spending today in return for consumption tomorrow might be good public policy, but it should not be confused with prosperity in any conventional sense of the word.

Measuring Wartime Prosperity

Are people better off economically as a result of wars? How do we calculate economic well-being? The great Scottish philosopher and economist Adam Smith had an answer. According to Smith, "Consumption is the sole end and purpose of all production" (Smith 1976). Typically, personal consumption expenditures are the largest component of a country's total economic output, as measured by gross domestic product. So, looking at what happens to consumption expenditures during wartime is a good place to begin in answering questions about the link between wars and economic prosperity.

Table 1 contains an index of personal consumption expenditures, adjusted for inflation, between 1939 and 1945—the years coinciding with World War II (although the United States did not formally enter the war until after the attack on Pearl Harbor in December 1941, war production had begun to accelerate in 1939). The figures in column 1 are based on U.S. Commerce Department data and show a 23.4 percent increase during the war. This would correspond with an average annual compounded rate of growth

TABLE 1. Estimates of Real Personal Consumption Expenditures (1939–1945)

Year	Base Measure	Inflation-Adjusted
1939	100.0	100.0
1940	104.6	104.2
1941	110.5	108.7
1942	109.8	104.2
1943	112.4	101.9
1944	115.9	102.0
1945	123.4	106.8

of 3.6 percent, which was quite robust at the time, considering that, during the previous decade, the country had weathered the Great Depression. When comparing the war years to the Great Depression, it is not surprising that many U.S. citizens remembered the war as an era of economic prosperity, at least those citizens who were not in Bastogne or on Guadalcanal.

However, the measurement of consumption expenditures is not without controversy. For one thing, there was tremendous inflation during the war—inflation that was accompanied by government-mandated price controls. Thus, the official prices used to adjust for this inflation do not necessarily account for the true inflation rate as reflected in, for example, black-market or illegal prices. The figures in column 2 of the table, which adjust personal consumption expenditures during the war, were calculated using an alternative set of inflation-adjusted prices. Here we see that consumption increased by only 6.8 percent over the course of the war, a rate of growth that did not even keep up with population growth. Thus, during the so-called wartime prosperity, real average consumption per person actually fell. This is not what one typically associates with prosperity. As is often the case in economics, the devil is in the details, and the details are in the numbers.

Winners and Losers

From the discussion above, it appears that rather than enriching an economy, war simply changes it, and the changes are a function of the size of the war relative to the size of the economy. At the peak of government military spending during World War II, in 1944, national defense spending was 41 percent of GDP. Currently, with two campaigns active in the Middle East, the defense share is 8 percent of GDP. This explains the more dramatic curvature of the World War II data relative to the Middle East wars shown in Figure 1.

But, holding other things constant, the key to understanding the impact of war on the economy is appreciating that war represents a net transfer of resources from taxpayers (including soldiers) to suppliers of war materiel (companies), and from borrowers (again, future taxpayers) to holders of savings (buyers of government bonds). Of course, in war, other things are not constant. In particular, the discussion to this point has said nothing about winners and losers. The destruction wrought by war can nearly completely devastate an area. After the destruction of Carthage in 146 B.C., the Romans supposedly sowed salt in the earth so that the Carthaginians would never rise again. Byzantium never recovered from the Fourth Crusade. Hiroshima was turned into ash. Neither the Carthaginians nor the Byzantines nor the Japanese spoke of wartime prosperity.

There is one way in which the economy can emerge a winner from war. This is if war is engaged in to remove a threat to the country and make the economy more secure. Households and businesses will be more reluctant to make important and needed investments in the economy if they fear the country will not exist, or at least will be

severely damaged, in the future. In this case, a war to remove the threat and increase the likelihood of a peaceful future can ultimately improve long-term economic prosperity. The cold war's triumph of capitalism over communism offers a good recent example of this type of benefit, perhaps justifying, in economic terms at least, the war's tremendous cost in lives and treasure.

Ultimately, however, war is more than an economic activity. Clemenceau's admonition that war is too important to be left to generals applies here; it is too important to be left to economists as well. For those who see war as the alternative to annihilation, a blip in real GDP in one direction or the other is of little importance. Winning at almost any cost is what matters. Ask the Carthaginians.

CRIMINAL JUSTICE

A

AFRICAN AMERICAN CRIMINAL INJUSTICE

Alexander W. Pisciotta

Although the U.S. criminal justice system has a long and well-documented history of racism, sexism, and discrimination against the poor and powerless, controversies still exist about whether, for example, institutionalized racial discrimination still exists or how a racist past has shaped the lives and mind set of modern African Americans. Black Americans, in particular, have felt the collective wrath and injustice of state coercion from colonial times through the 19th century and well into the 20th century. This entry focuses on the evolution of the intentional and systematic repression aimed at fitting African Americans into their so-called proper place in the economic, political, social, cultural, and legal order.

Background

Crime was not a serious concern during the colonial period. Early settlements in the New World were, as legal historian Lawrence M. Friedman aptly puts it, "tight little islands." Villages were small and isolated. Their populations were religiously, ethnically, socially, and culturally homogeneous—and largely white. The early settlers knew their neighbors intimately and kept them under close surveillance. Colonial criminal justice systems were small, informal, and aimed at correcting the transgressions of misguided neighbors, friends, and relatives. Punishments were based upon the philosophy of re-integrative shaming: public humiliation followed by reintegration into the community. Put simply, the early colonists were their brothers' keepers.

The arrival of the first captive Africans at Jamestown, Virginia, in 1619—possibly as indentured servants, not slaves—was a pivotal event in American history. Africans filled the labor void, providing profits and sparking economic expansion, but they were not willing workers. Resistance was a constant concern. Slaves disobeyed their masters, worked slowly, feigned sickness, destroyed and stole property, poisoned and harmed farm animals, attempted escape, and, in extreme cases, burned buildings, murdered their masters, and plotted revolts. The so-called children of Ham were, quite simply, deviant and dangerous: profitable social dynamite that needed close surveillance and a repressive system of social control.

Laws were the key to combating black resistance. Legislatures passed a variety of colony-specific laws aimed at controlling slave behavior and maximizing profits. South Carolina, a slave state, prohibited slaves from traveling without a pass, owning property, selling goods without a master's written permission, carrying weapons, or meeting in groups. Masters were required to thoroughly inspect cabins every two weeks to look for weapons. White citizens were allowed to stop and question blacks, ask for passes, and even seize inappropriate clothing. Freed slaves were required to leave the state. Laws in Dutch New Netherlands were decidedly less strict. Slaves were allowed to marry, attend church, own property, trade goods, seek an education, join the militia, and even carry weapons. But when the British took over New Netherlands in 1664, the new rulers of New York instituted a much more restrictive set of laws. New York became like South Carolina.

Masters were the first line of defense in monitoring slave behavior, enforcing these laws, and maintaining social order. In most colonies, short of murder, masters generally had a free hand in administering justice without trial. Other colonial law enforcement officers—sheriffs, constables, and night watchmen—also kept slaves and free blacks under close surveillance. When serious crimes were committed (e.g., murder, rape, assault, arson, rebellion), slaves were formally charged in court; in many colonies, however, they were denied even minimal legal rights and faced the prospect of harsh punishment. Punishment and deterrence aimed at instilling terror—not benevolent reintegrative shaming—was the aim of slave discipline.

U.S. political, economic, social, and legal institutions were radically transformed during the first half of the 19th century. Emancipation from England and the ratification of the Constitution and Bill of Rights laid the foundation for the rise of democracy and new state-specific crime-control systems. The publication of *The Wealth of Nations* (1776)—Adam Smith's classic work—and industrialization accompanied the early development and expansion of capitalism in the New World. Exploding immigration produced large cities, especially in the North, and a host of city-related problems, including crime and delinquency. Slavery remained essentially unchanged, however, especially in the South. Repressive laws and crass, unyielding social control were needed to maintain order and preserve profits.

The aims, structure, and character of early-19th-century criminal justice systems were, however, region-specific. Northern states developed formal criminal justice institutions largely aimed at the social control of immigrants, particularly the Irish, who were widely perceived as criminally inclined drunkards. Black criminals were a secondary concern. Southern states relied upon informal surveillance and social control. Slaves merited the closest scrutiny, but free blacks, Northern abolitionists, southern Negro sympathizers, and black and white criminals were all viewed as threats to the southern way of life. In short, the South was under siege.

Northern states responded to their crisis in crime and social disorder by introducing formal police systems. During the 1840s and 1850s, a number of large cities—such as New York, Boston, and Philadelphia—disbanded their ineffective night watch, restricted sheriffs and constables to court duties, and turned policing over to newly created law enforcement agencies. Although these new police departments were largely ineffective—policemen were unqualified, untrained, and corrupt—arrests increased. Courts were expanded to handle the increased volume of cases. Prisons and reformatories were introduced to hold offenders. The demographic profile of prison populations varied by state, but they were usually lower-class, white, urban immigrants and their children—the northern criminal classes.

Southern criminal justice was informal, decentralized, and aimed, first and foremost, at one group: slaves. Southern states expanded the content and harshness of slave codes prior to the Civil War. Masters continued to serve as the first line of policing and social defense. Slave patrols were expanded and more slave catchers were hired. Sheriffs, constables, and newly created police forces, located in larger southern cities, were constantly on the alert for escaped slaves, black and white criminals, and other threatening groups (e.g., abolitionists encouraging escape or revolt). Militias remained on high alert to deal with slave revolts. The laws in many southern states continued to grant all white citizens the authority to stop, question, and arrest free blacks and slaves. For free blacks and slaves, the South was a repressive police state.

Early-19th-century southern courts and systems of punishment were also racially driven. In fact, there were at least four court systems and four sets of legal procedures—white male, white female, black male, and black female—which provided no meaningful rights for members of these groups. Free blacks were often afforded an intermediate status. Black slaves accused of insurrection faced special tribunals that handed out harsh and swift punishments—often death—to prevent future transgressions. A number of southern states opened prisons prior to the Civil War, but they were almost exclusively reserved for white offenders. In the minds of many southerners, even the lowest white criminal was to be spared the humiliation and moral contagion of incarceration with "darkies" and "niggers."

The end of the Civil War and passage of the Thirteenth, Fourteenth, and Fifteenth Amendments to the U.S. Constitution filled freedmen with optimism and hope for

equality and justice. Blacks did, indeed, make considerable progress during Reconstruction, but these gains were short-lived. The triumph of the so-called Redeemers—white conservative racists—summarily ended these political, economic, social, and legal gains. The Redeemers were determined to return free blacks to their slave status. Laws and the criminal justice system, coupled with informal means of terror (e.g., lynching), were keys to putting blacks in their proper place and reviving the Old South.

The Redeemers began their calculated assault on black progress and civil liberties by seizing control of the political system. Newly elected white supremacists passed repressive legislation, including vagrancy laws aimed at fostering the sharecropping system. Sheriffs, constables, and newly formed police departments replaced masters, slave patrols, and slave catchers in intimidating former slaves. Black arrest rates soared, courts were overwhelmed with "colored" defendants, and southern prisons took on a new function: race control. After 1865, southern prisons and chain gangs were nearly completely black.

African Americans continued to be regarded as second-class citizens, especially in the South, throughout the first half of the 20th century. "Separate but equal" laws—legitimized by the U.S. Supreme Court's notorious *Plessy v. Ferguson* decision (1896)—kept blacks in a decidedly inferior status: schools and housing developments were rigidly segregated; blacks were excluded from government jobs and segregated in the military; they were isolated in whites-only businesses, including restaurants and movie theaters; and they were relegated to using colored-only water fountains and restroom facilities. Disenfranchisement was widespread; in some southern states, fewer than 5 percent of blacks were registered to vote in the 1950s.

Police forces in the South, and sometimes in the North, were exclusively white. Black faces were rarely seen in courts unless they were defendants. A variety of ruses were employed to exclude blacks from serving on juries. Blacks continued to be disproportionately incarcerated in southern and northern prisons. In many institutions, they were rigidly segregated. Black defendants were far more likely to receive the death penalty, especially for rape, and blacks who murdered whites were much more likely to receive the death penalty than whites who murdered blacks. Simply stated, black victims had less value than white victims in the U.S. criminal justice system.

Crass political, economic, and legal discrimination continued relatively unabated into the 1950s. The 1960s were, however, a pivotal period in U.S. racial and legal history. The rise of the black civil rights movement, women's rights movement, protests against the Vietnam War, and dozens of race riots in cities across the United States raised serious doubts about the veracity and legitimacy of the U.S. government. The promise of freedom, equality, and justice was exposed as sheer hypocrisy, especially for African Americans.

Critics also turned their ire on the U.S. criminal justice system. Television cameras provided graphic accounts of police beating black rioters in the North and civil rights

marchers, including children, in the South. The rise of criminal justice and criminology as academic disciplines in the 1960s resulted in an explosion of research highlighting disparities between the promise and practice of the justice system: inadequacies in the public defender system, the discriminatory dimensions of bail, abuses in plea bargaining, discrimination in the hiring and training of minority police, the paucity of minority judges and probation and parole officers, inhumane conditions and racial discrimination in prisons, and racial and class discrimination in sentencing and the application of the death penalty.

The U.S. Supreme Court, particularly under Chief Justice Earl Warren (1953–1968), issued a series of landmark rulings that expanded the legal rights of black and white defendants. Attempts were made to rehabilitate offenders, shut down prisons, and move offenders back to the community. Money was appropriated to improve public defender systems, offer bail to more poor offenders, hire more minority police officers, and divert offenders from the criminal justice system to avoid harmful labels. During this period and into the early 1970s, individual states and the federal government did, indeed, make progress in combating racism, sexism, and discrimination in the United States.

These trends and transformations were, however, short lived. The election of Ronald Reagan as president in 1980 marked the birth of a conservative revolution along with the bankruptcy of rehabilitation. Advocates of the new conservative paradigm argued that criminals were free, rational, and hedonistic actors who needed and deserved punishment. Discussions about racism, sexism, and discrimination—as well as questions raised about the fairness of capitalism and democracy—were dismissed as softhearted and soft-minded liberal drawl. A return to the policies of the past—a get-tough approach on crime and criminals—was the new elixir for crime and deviance.

During the 1980s and 1990s, conservative politicians and crime-control experts—joined, on occasion, by politically astute get-tough liberals, like President Bill Clinton—transformed the criminal justice system: a return to fixed sentencing, "three strikes and you're out" laws, preventive detention for suspected criminals, restrictions on the insanity defense, an end to minority hiring and promotion programs in policing, the increased use of transfers to adult courts for juveniles, boot camps for youthful offenders, electronic monitoring for offenders found guilty of less serious offenses, the opening of new prisons and reformatories, the introduction of "supermax" prisons, an expansion in the use of the death penalty, and a get-tough war on drugs.

Many of these policies have, however, had a decidedly detrimental effect on African Americans, and there is considerable evidence that remnants of racism are still pervasive in the U.S. justice system. Researchers have provided clear and convincing evidence that the death penalty continues to discriminate against the poor and powerless, particularly blacks. Public defender systems remain seriously underfunded, and prosecutors continue to use peremptory challenges to exclude blacks from juries. African Americans are still underrepresented on many police forces, especially in higher ranks. Egregious

INCARCERATION RATES

Since the 1980s the prison and jail population in the United States has increased dramatically; some estimate the increase to be as much as 500 percent. Today there are some 2.2 million people behind bars. The sharp rise in incarceration rates, moreover, is matched by an equally sharp rise in the proportions of African Americans and Latinos entering the nation's prisons and jails. Data from the Bureau of Justice Statistics indicate that African Americans are incarcerated at a rate that is nearly six times (5.6) the rate for whites, while Latinos are incarcerated at a rate that is nearly twice (1.8) the rate for whites.

Race/Ethnic Group	Rate per 100,000
White	412
Hispanic	742
Black	2,290

The national incarceration rate for whites is 412 per 100,000 residents, compared with 742 for Hispanics and 2,290 for African Americans. This means that 2.3 percent of all African Americans are incarcerated, compared with 0.7 percent of Hispanics and 0.4 percent of whites. The combination of age and economic disadvantage is also a key factor. One in nine (11.7 percent) African American males between the ages of 25 and 29 is currently incarcerated, most of them having come from severely disadvantaged neighborhoods (Mauer and King 2007).

cases of police abuse—for example, Rodney King (1991), Abner Louima (1997), and Amadou Diallo (1999)—confirm the suspicion that some law enforcement officers are still racially biased. And the discovery of the "driving while black" (DWB) syndrome in the 1990s provided evidence supporting ongoing African American suspicions and complaints: police officers discriminate against black drivers.

Mandatory sentencing laws and the war on drugs have, however, had a particularly harmful—if not disastrous—effect on African Americans. Racially biased legislation aimed at crack cocaine has resulted in an explosion in black incarceration. Millions of young African American males are currently incarcerated in state and federal correctional institutions or under the control of probation and parole officers. Jerome Miller's thought-provoking analysis of modern crime control reaches a sobering conclusion: the U.S. criminal justice system is engaged in a tragically misguided search-and-destroy mission aimed at young urban black males. Young black males—much like their slave ancestors—continue to comprise the class of dangerous criminals in the United States.

Key Events

Many key events have reflected and shaped the course of African American crime, criminal justice, and social control. Two broad classes of events, however, have played

a particularly important role in the treatment of African Americans: black revolts and lynchings.

Revolts

Prior to the Civil War, many defenders of slavery, particularly in the South, argued that Africans needed the guidance of white masters and mistresses. The accursed children of Ham were biologically, psychologically, socially, culturally, and spiritually inferior. Indeed, it would be immoral to leave black Africans to their own vices on the "Dark Continent" (meaning Africa). White masters provided slaves with food, clothes, shelter, and Christian moral instruction. Quite simply, slaves were happy to live in captivity.

Black revolts provide clear and convincing evidence that slaves were not, in fact, content to live in bondage. Herbert Apthecker's classic study of slave revolts—*American Negro Slave Revolts*—documents 250 cases of rebellion in the United States. (Apthecker's [1993, 162] definition includes a number of elements to be counted as rebellion: the act must have included at least 10 slaves; freedom was the primary aim; and contemporary accounts labeled it as an insurrection, revolt, or rebellion. A modified version—including acts containing five rebels—would result in many more revolts.) In fact, many slave masters lived in a state of abject terror. Laws and criminal justice systems in colonial and 19th-century slave societies were, in large part, structured to detect and deal with black rebels, and the penalties were swift and severe.

The 1741 "great negro plot" in New York City, as one example, resulted in a bloody state response: 170 people were put on trial—a performance that was largely devoid of accepted colonial legal procedures. A total of 70 blacks and 7 whites were banished from British North America, 16 blacks and 4 whites were hanged, and 13 blacks were burned at the stake. Revolts led by Gabriel Prosser in Virginia in 1800, Denmark Vesey in South Carolina in 1822, and Nat Turner in Virginia in 1831 were all thwarted, largely owing to black spies. Prosser, Vesey, Turner, and dozens of their black coconspirators were put to death. As in New York City, no efforts were spared in crushing black rebels.

Revolts did not, however, affect only white masters and slave rebels. Whites who did not own slaves also lived in fear, knowing that black revolutionaries would not restrict killing to their masters. Moreover, slave revolts—rumored or real—always had harsh consequences for free blacks and slaves. Masters, slave patrols, sheriffs, and militias invariably launched so-called rebel sweeps to uncover weapons and black revolutionaries. Black revolts also provided abolitionists with a valuable propaganda tool: if slaves were happy living in captivity, why were they revolting?

Lynchings

The liberation of millions of slaves following the Civil War created a panic in the South. Conservative white southerners could not rely upon northern carpetbagger governments

to prevent crime and maintain order. A new type of informal social control was employed: lynching.

The historical record is far from complete, but more than 5,000 cases of lynching have been documented, with most occurring in the South between 1880 and 1920. Black men, women, and children were hung, shot, stabbed, burned, dismembered, and put on display—sometimes in public places, like courthouses—in an effort to instill terror and remind blacks of their so-called proper place in the U.S. economic, political, social, cultural, and legal order. The rape or alleged rape of a white woman was one of the primary rationales for lynching, but thousands of blacks were lynched for other so-called offenses, such as stealing a chicken, uttering an insulting remark, making a sarcastic grin, calling to a white girl, talking big, failing to yield the sidewalk, failing to remove a hat, and refusing to remove a military uniform.

"Nigger hunts" and "coon barbecues" were, by design, savage affairs, often witnessed by thousands of spectators. In 1918, Mary Turner, who was eight months pregnant, was hung for threatening to press charges against mob members who lynched her husband. Before she died, her baby was cut from her stomach and stomped to death. A Texas jury convicted Jesse Washington of raping a white woman after four minutes of deliberation. The mob did not wait for sentencing. Washington was dragged from the courtroom, kicked, stabbed, and pummeled with rocks and shovels. At the execution site, he was suspended from a tree limb and doused with oil. His fingers, toes, ears, and penis were cut off. Then he was burned alive. His body was dragged through town by a man on horseback. The lynching of Will Porter in Livermore, Tennessee, in 1911 for shooting a white man was particularly bizarre. The mob took him to a theater, tied him to a chair on the stage, and sold tickets. Those who purchased orchestra tickets got six shots at Porter, balcony seats only one.

Blacks knew that they could not count on government officials to protect them from lynch mobs. Some law enforcement officers showed extraordinary courage in defending their charges. Several were killed or severely injured in the course of doing their job. The historical record indicates, however, that other law enforcement officers willingly handed alleged black criminals over to mobs and, in some cases, coordinated extralegal executions. Lynch-mob members did not wear masks, and photographs were often taken of the lynched as a trophy for the perpetrator. However, police investigations invariably reported that victims were killed by persons unknown or, in extreme cases, that they had committed suicide. A number of southern governors, senators, and congressmen openly advocated lynching, particularly for the crime of violating a white woman, and bragged about their participation in lynching mobs.

Lynching was enormously successful. Well into the 20th century, African Americans lived in fear, knowing that they could be murdered for any reason at any time. Walter White and Thurgood Marshall were both, on several occasions, nearly lynched. If the head of the National Association for the Advancement of Colored People (NAACP)

and the nation's first African American Supreme Court justice came close to being murdered, who could be safe from the fury of the white mob?

Important Persons and Legal Decisions

Frederick Douglass (1817–1895), an escaped slave from Maryland, was the foremost intellectual leader and spokesman for African Americans during the 19th century. Douglass was a powerful lecturer for the abolitionist movement and achieved national and international fame with the publication of his autobiography, *Narrative of the Life of Frederick Douglass: An American Slave* (1845). This book—along with two other extended autobiographies and his work as editor of black newspapers (*North Star* and *Frederick Douglass' Paper*)—provided him with a forum to attack slavery and call for basic civil liberties for African Americans.

Douglass's pre–Civil War speeches and writings examined a variety of topics: for example, the kidnapping of blacks from Africa, the horrors of the African passage, the hypocrisy of Christian slave masters, the immorality of breaking up black families, and the failures of the U.S. Constitution and Bill of Rights. Douglass served as an advisor to President Abraham Lincoln and played an instrumental role in the formation of black military units during the Civil War. After the Civil War, Douglass worked for broader political, economic, and legal rights, including the enforcement of voting rights laws and an end to Jim Crow laws and lynching. Douglass's work as an abolitionist, orator, writer, newspaper editor, political activist, and statesman provided 19th-century African Americans with an articulate voice: the herald for freedom and justice.

Sojourner Truth (1797–1883), an escaped slave from New York, and Harriet Tubman (1820–1913), an escaped slave from Maryland, also made important contributions to the battle for justice. Truth, who was illiterate, made her impact as a charismatic speaker. She moved audiences with calls for an end to slavery and, in particular, distinguished herself from Douglass by calling for women's political and legal rights. Tubman, however, was the most courageous black civil rights leader. After escaping in 1849, she made numerous trips back into the South (between 17 and 20, depending upon the source)—knowing that she risked summary execution—and led several hundred slaves to freedom. Harriet Tubman, the legendary symbol of black resistance, was hailed as the Black Moses.

The late-19th- and early-20th-century black civil rights movement was dominated by two leaders who were, in fact, mortal enemies: Booker T. Washington (1856–1915) and W.E.B. Du Bois (1868–1963). Washington was, without question, the most powerful, controversial, complex, and divisive black leader. He was an educator who achieved national fame—especially among whites—by calling on blacks to accept gradual progress toward civil rights and focus on agricultural endeavors and vocational occupations. Du Bois, a brilliant scholar who was Harvard University's first black graduate, ridiculed Washington, called for immediate rights, and urged blacks to seek higher education. Washington used millions of dollars in contributions from white benefactors

to build his followers into what northerners called the "Tuskegee Machine." Washington's machine smeared, blacklisted, and spied on Du Bois and other black leaders who opposed his philosophy. While Washington was destroying his opposition, however, he was secretly financing many of their causes, including legal challenges against Jim Crow. Ultimately, Du Bois prevailed. But after a lifetime of extraordinary achievement, including playing an instrumental role in the founding of the NAACP, he became thoroughly disenchanted, renounced his U.S. citizenship, and moved to Ghana, where he died in 1963.

Thurgood Marshall (1908–1993) was the most important champion for black legal justice. He became intimately familiar with racial repression and Jim Crow laws while growing up in Baltimore, Maryland. After graduating from Howard Law School, he became chief legal counsel to the NAACP. Marshall coordinated the NAACP's legal assault on *Plessy v. Ferguson* and Jim Crow laws and actually presented oral arguments in the landmark *Brown v. Board of Education* (1954) case before the U.S. Supreme Court. Marshall went on to become the nation's first African American solicitor general, attorney general, and U.S. Supreme Court justice. He continued to serve as the voice of the poor and powerless, denouncing institutional racism from his seat on the Supreme Court, until declining health forced him to resign in 1991.

Martin Luther King Jr. (1927–1968) has generally been recognized as the father of the modern civil rights movement. King played an instrumental role in the founding of a number of leading civil rights organizations in the 1950s and 1960s. Adopting a Christian–Gandhian model, he coordinated marches and protests and urged his followers to use passive resistance—not violence and riots—to rally world opinion and force an end to racial discrimination. Television coverage of the civil rights movement's most prominent leader and his followers being arrested and handcuffed by police on numerous occasions attracted attention to his cause and shamed the nation. King's brilliant "I Have a Dream" speech, delivered at the March on Washington rally in 1963, has been widely hailed as one of the most important moments in the history of the civil rights movement. King's assassination in Memphis, Tennessee, in 1968 shook the nation, delivering a clear message: Modern white supremacists, much like lynchers of the past, were willing to kill to keep African Americans in their so-called proper place.

Landmark legal decisions also provide important insights into African Americans' ongoing battle for political, economic, social, and legal justice. Key 19th-century decisions leave little doubt that U.S. Supreme Court justices, much like the rest of the country, were torn over the issue of racial equality; however, they opted for repression. In the 1856 Dred Scott decision, the Court ruled that slaves who traveled to free states could not sue for freedom because they were chattel and had no legal standing. Chief Justice Roger Taney explained that slaves were "a subordinate and inferior class of beings, who had been subjugated by the dominant race, and, whether emancipated or not, yet remained subject to their authority, and had no rights or privileges but such as those who held the

power and the Government might choose to grant them." In *United States v. Cruikshank* (1875), the Court issued a ruling that had the effect of limiting the federal government's power to intervene in cases of black voter disenfranchisement and lynching. In *Plessy v. Ferguson* (1896), the Court legalized the "separate but equal" doctrine, making blacks inferior citizens well into the 1960s.

Since the late 1960s, the U.S. Supreme Court has, without question, played an instrumental role in dismantling overt legal repression. The Court has, however, demonstrated ambivalence on a number of important issues, including the death penalty. In the 1972 *Furman v. Georgia* decision, the Court ruled that the death penalty was being applied in an arbitrary, capricious, and racist manner and was, as a result, cruel and unusual punishment. In the 1976 *Gregg v. Georgia* decision, the Court reinstated the death penalty, permitting two-stage death penalty proceedings. *McCleskey v. Kemp* (1987), however, reflected the Court's legal and moral ambivalence. The Court conceded, after examining empirical evidence, that Georgia's court system was indeed racist. Nevertheless, they ruled against Warren McCleskey, who was subsequently executed, on the grounds that the statistical evidence did not prove discrimination in this specific case. In future cases, the Court shifted the burden of proof in death penalty cases back to the defendant: each black defendant would have to prove discrimination in his or her particular case, thus posing what was, to be sure, a costly, difficult, and unlikely challenge.

Conclusion

The history of African American crime, criminal justice, and social control is indeed troubling. From colonial times into the 1950s, blacks were subjected to overt and crass political, economic, social, cultural, and legal oppression. The U.S. Constitution and Bill of Rights—along with noble claims of freedom, equality, and justice—clearly did not apply to black Americans.

Much progress has been made. The separate but equal doctrine has been dismantled. Blacks are no longer riding in the backs of trains and buses, attending legally segregated schools, or drinking out of "colored only" water fountains. African Americans are not excluded from law enforcement positions or other government jobs, nor are they denied admission into colleges and universities. They have been afforded, at least on paper, all of the legal rights accorded whites. A trip to almost any court reveals black judges, defense attorneys, prosecutors, and probation officers. African Americans are in charge of police departments in many of the largest U.S. cities, and black wardens can be found at the heads of local, state, and federal correctional institutions across the country.

For conservatives, this progress provides clear and convincing evidence that the American dream has finally been fulfilled. Blacks have overcome the discrimination of the past and are now fully accepted citizens, enjoying the full protection of the state. But liberals remain unconvinced. African Americans, who have experienced generations of systematic repression, are particularly skeptical. The remnants of racism—particularly the

explosion in black incarceration and continued disproportionate execution of poor black offenders—raise serious questions about the hidden dimension of race control, resurrecting the specter of the past. History matters. The color of justice in the United States remains, then, a matter of personal perception—a battleground for future generations.

ALTERNATIVE TREATMENTS FOR CRIMINAL OFFENDERS

Dianne Williams and Jessica Williams

The general public, not to mention law enforcement and policy makers, seems to believe that, aside from the death penalty, incarceration is the most severe form of punishment the criminal justice system can impose. In fact, the notion of a continuum of criminal justice sanctions typically places probation on the low end and imprisonment on the high end, with a variety of alternative sanctions falling somewhere in between (Petersen and Palumbo 1997). Unfortunately, the development of a continuum of

alternative responses in crime control and the ranking of these alternatives have been developed by legislators and policy makers who had no reliable means of rating the severity of the sanctions imposed, had little or no access to experiential data, and depended primarily on individuals with no firsthand knowledge of the actual impact of the alternatives (Morris and Tonry 1990). As such, the common belief that penal–correctional sanctions must be bound by probation at the one end and imprisonment at the other may not only be misleading in many contexts but also represent the fundamental controversy underlying the development of alternative responses to crime—namely, that there is anything but a consensus on what constitutes an alternative and on what the alternative is alternative to.

In other words, politicians have their notions of severity and leniency, as do criminals, psychologists, penologists, criminologists, and risk-management specialists. There is no agreement between these persons or more generally between those engaged in law enforcement, prosecution, adjudication, and punishment/corrections about which particular alternatives should be used in response to a myriad of offenses. At the same time, over the years, there have been tangible changes in ideologies, theories, and practices associated with society's different responses to crime. As a result, alternatives—or perhaps more accurately, new emphases, some innovative and others not—emerge and develop and become mainstream; then other alternatives to those emerge and develop.

Background

Traditionally, criminal sanctions had four goals: (1) Retribution/punishment, which also connotes the dispensing or receiving of reward or punishment according to what the individual deserves. It implies the payment of a debt to society and thus the expiration of the offense and is codified in the biblical injunction "an eye for an eye." (2) Rehabilitation, which was the major reason for sentencing in the mid-20th century. It is a utilitarian philosophy, defined as the process of restoring an individual (a convict) to a useful and constructive place in society through some form of vocational, correctional, or therapeutic retraining or through relief, financial aid, or other reconstruction measure. (3) Incapacitation, which refers to the deprivation of legal/constitutional freedom and the ability to perform certain civil acts. Its main purpose is to remove offenders from society. (4) Deterrence, with specific and general deterrence based on a utilitarian philosophy that focuses on an understanding of human behavior. It works best when individuals believe they will get caught and punished and when their punishment is severe enough to represent a threat. The concept of restoration, meaning "reparation," or restoring an individual or a community to a state that existed before the crime was committed, was added later on as a fifth goal. The concept of alternatives was developed in an attempt to modify and/or expand the way in which society sanctions criminal acts. Over time, the goals of these sanctions have evolved, which has led to a necessary change in the sanctions themselves.

For example, correctional leaders began to embrace the idea of combining a psychology about personality and human development to probation in the 1940s. They began to emphasize a medical model for probation, and rehabilitation (as opposed to punishment) became the overriding goal. This medical model was popular until the 1960s, when it was replaced by the reintegration model. The main thrust of the reintegration model was to reduce the rate of recidivism by making the prisoner's return to the community easier. The reintegration model assumed that crime was a direct result of poverty, racism, unemployment, unequal opportunities, and other social factors.

The concept of probation underwent yet another change in the late 1970s and remains that way today. The goals of rehabilitation and reintegration have been replaced by what is referred to as *risk management* (Petersilia, Turner, Kahan, and Peterson 1985). The risk-management approach attempts to minimize the probability that any given offender will commit new offenses by applying different degrees of control over the probationer's activity based on the probationer's assessed degree of risk. In essence, the risk-management approach is a combination of the just desserts model (i.e., the severity of the punishment should equal the seriousness of the crime) of criminal sanction and the idea that the community must be safe.

In the 1960s and early 1970s, legislation was also passed to establish financial and programmatic incentives for community corrections. (In 1965, California passed the Probation Subsidy Act. In 1973, Minnesota passed the first comprehensive Community Corrections Act. In 1976, Colorado passed legislation patterned after Minnesota's. In 1978, Oregon passed similar legislation.) The incentives were expected to embrace a wide range of alternatives to incarceration from which judges and other officials could choose. The main goal was to alleviate prison overcrowding, support prisoner reintegration, and reduce rates of recidivism. In 1971, the incarceration rate was 96 per 100,000. By 2003, the rate was 477 per 10,000 (Clear, Cole, and Reisig 2006).

Today, despite research findings demonstrating that offenders perceive the pains of punishment in only one way, policy makers generally categorize alternatives into two categories: (1) low-control alternatives for the less severe crimes or low-risk offenders (e.g., fines or restitution, community service, drug/alcohol treatment, probation, intensive supervision probation, and home confinement) and (2) high-control alternatives for the more serious crimes or high-risk offenders (e.g., boot camp, shock incarceration, and community supervision). Simple probation lies at one end of the continuum (less severe punishment or low-control alternatives) and traditional incarceration at the other end (most severe punishment).

High-control alternatives, although not as severe as incarceration, are seen as the last option before incarceration. On the other hand, studies show that offenders ranked seven alternative sanctions more severely than prison: (1) boot camp, (2) jail, (3) day reporting, (4) intermittent incarceration, (5) halfway house, (6) intensive supervision probation, and (7) electronic monitoring. They viewed prison as more punitive only compared with

community service and regular probation (Wood and Grasmick 1999). Regardless of rank in the punishment continuum, the goal of these alternatives is to reintegrate offenders into the community. These alternatives move away from the medical model and, in fact, suggest that the use of prisons should eventually be avoided altogether. In this approach, probation would be the sentence of choice for nonviolent offenders so as to allow them to participate in vocational and educational programs and ultimately make their adjustment to the community easier.

Legal Developments

Approximately two-thirds of adults under the supervision of the criminal justice system live in the general community while on either parole or probation. As discussed throughout this entry, probation is a type of community sentence in which the individual is remanded to some form of community supervision either as punishment for a crime or as a part of a sentence (usually after spending a portion of the sentence in prison). Although there is no right to parole and these individuals are still under the legal control of the correctional system, they, just like those who are incarcerated, still have rights. Therefore, while they are in the community, probationers and parolees enjoy a conditional liberty that is dependent on and regulated by very specific restrictions. These restrictions, by their very nature, may violate the constitutional rights of the probationer/parolee. For example, these individuals are denied the right of free association with prior crime partners or victims. However, because of cases such as *Griffin v. Wisconsin* (1987), parolees are now able to give public speeches and receive publications.

Another legal question arises with respect to probationers and parolees who violate the terms of their probation or parole. The rule of thumb in such cases is that the offender may be sent to prison. Additionally, if the offender commits another crime, his or her probation or parole will likely be revoked. For minor violations (e.g., missing a meeting of Alcoholics Anonymous), the probation/parole officer may decide to how severe the penalty should be. Having said that, the Supreme Court has had to address the issue of due process when revocation is an option.

In the case of *Mempa v. Rhay* (1967), the U.S. Supreme Court determined that a probationer has the right to be represented by counsel in a revocation or sentencing hearing before a deferred prison sentence can be imposed. Additionally, in *Morrissey v. Brewer* (1972), the Court ruled that parolees faced with the possibility of the revocation of parole must be afforded prompt due process before an impartial hearing officer.

Controversial Aspects within the Alternatives

In evaluating the benefits of alternatives, some researchers have noted that "An expanded range of sentencing options gives judges greater latitude to exercise discretion in selecting punishments that more closely fit the circumstances of the crime and the offender" (DiMascio n.d.). They have argued that this type of scheme, if administered effectively,

would free up prison cells for violent offenders, whereas less restrictive alternatives would be used to punish nonviolent offenders. Prison overcrowding, the cost of prisons, and the increasing recidivism rates have contributed to the creation of alternatives within the criminal justice system. (Recidivism is the recurrence of a criminal behavior by the offender. Rates of recidivism can be assessed in three ways: by rearrest, reconviction, and reincarceration.) Prisons now account for approximately 80 percent of every correctional dollar spent, and U.S. prisons cost $2.45 billion in 1996. Increasing rates of recidivism seem to be directly related to increasing rates of rearrest, reconviction, and reincarceration, which, in turn, result in the increasing need for prison space. Alternatives to the traditional types of punishment (more specifically imprisonment) within the criminal justice system were the result of a need to change this trend. However, there is a growing body of research suggesting that many offenders actually have a negative perception of alternative sanctions (May, Wood, Mooney, and Minor 2005). In fact, some studies suggest that a significant number of offenders actually believe that serving time in prison is easier than many alternatives; depending on the alternative, up to one-third of offenders refused to participate even if it meant a shorter prison stay (May, Wood, Mooney, and Minor 2005). Some of the reasons given for choosing imprisonment over alternatives include (1) concerns about abuse of power and antagonism by the personnel who run the program and (2) the likelihood that the program would fail, resulting in revocation to prison after time and effort had been invested in the program.

Pretrial Diversion

Pretrial diversion is the first and perhaps most important alternative within the criminal justice system. It allows the defendant to agree to conditions set forth by the prosecutor (e.g., counseling or drug rehabilitation) in exchange for the withdrawal of charges. This concept began because of a belief that the formal processing of people through the criminal justice system was not always the best course of action (Geerken and Hayes 1993). There are three main reasons given for the use of pretrial diversion: (1) many of the crimes committed were caused by offenders with special circumstances, such as vagrancy, alcoholism, emotional distress, and so forth, which cannot be managed effectively within the criminal justice system; (2) formal criminal justice labeling often carries a stigma that actually hurts or cripples attempts at rehabilitation and in the long run can promote an unnecessarily harsh penalty for a relatively minor offense; and (3) the cost of diversion is cheaper than the cost of criminal justice processing.

The concept of diversion is very controversial because some argue that it allows offenders to get off easy. Yet there are also those who argue that the rationale for diversion is sound because incarceration, in effect, does nothing to change the offender's disadvantaged status and the stigma of conviction will ultimately decrease the offender's chances of becoming a productive citizen. Nonetheless, support for diversion seems to wax and wane depending on whether society supports the rehabilitation or incarceration of offenders.

Despite mixed success, critics view pretrial diversion programs negatively as they are applied in expanding the state's authority or widening the net of social control.

In other words, the reach of this alternative correctional program targets or sanctions individuals charged with less serious offenses more seriously than originally intended.

Intensive Supervision Probation

According to the Bureau of Justice Statistics (BJS) *1997 Special Report* (Bonczar and Glaze 1999), approximately 10 percent of all probationers and parolees who participate in alternative sanction programs are under intensive supervision probation. This approach was designed in the 1980s in response to the issue of prison overcrowding. Specifically geared research was conducted to identify a solution, and it was determined that there were a small number of inmates who could, under the right circumstances, be released into the community with minimal risk to the public (Petersilia and Turner 1990). Two hundred inmates were initially selected, but over time the number has risen to well over a thousand participants. Over a four-month period, the inmate must file an application, which must be approved by a three-person screening panel. If approved, a resentence hearing must be held before three judges. If the judges approve the application, the inmate will begin a 90-day trial period of intensive supervision probation. Despite some shortcomings, this program has been extremely helpful in relieving prison overcrowding.

Yet 10 years after its inception, research showed that nearly one-third of nonviolent offenders who were given the option to participate in intensive supervision probation chose prison instead (Petersilia 1990). They felt that the combination of having to work every day, having to submit to random drug tests, and having their privacy invaded was more punitive that serving a prison term. A significant number also indicated that intensive supervision probation had so many conditions attached to it that there was a high probability of violating a condition and being revoked back to prison. These offenders viewed intensive supervision probation as more punitive than imprisonment and equated one year in prison to five years of intensive supervision probation.

Substance Abuse Treatment/Intensive Parole Drug Program (IPDP)

As the title indicates, the Intensive Parole Drug Program (IPDP) is an intensive supervision program for parolees with a history of substance abuse (drugs and alcohol). This program was implemented in certain states as a part of the Department of Corrections' "Stop the Revolving Door" initiative, which has an antirecidivism focus. The program focuses on relapse prevention, intervention strategies, and counseling referrals. Sanctions may include community-based treatment, residential placement, or return to custody with institutional program treatment. Any parolee identified as having a substance abuse problem can be referred (Clear, Cole, and Reisig 2006). Candidates come from a range of programs—from therapeutic community programs to mutual agreement programs or from halfway houses. IPDP is a six-month-minimum program with participants having

the option to stay an additional three months. The issue with these types of programs is that although some offenders welcome the opportunity for treatment, they feel that the intrusive nature of the program itself outweighs any possible benefit. As is the case with other programs, offenders who are offered the opportunity to participate frequently decline and choose to serve time instead.

Electronic Monitoring and House Arrest

Electronic monitoring and house arrest are typically used together in conjunction with intensive supervision. House arrest restricts the offender to home except when at school, work, or court-assigned treatment, and electronic monitoring becomes the technological means of securing compliance. Electronic monitoring has been described as the most important penal invention of the 1980s ("The 2002–2003 Electronic Monitoring Survey" 2002). It tries to incorporate some of the goals of criminal justice sanctions yet fits into a category all its own. Electronic monitoring is a "supervision tool that provides information about the offender's presence at, or absence from, his or her residence or other location" (State of Michigan 2006). Although the system does not track offenders' whereabouts like a homing device, it is able to determine if offenders are at home when they should be.

Harvard psychologist Robert Schwitzgebel (Gomme 1995, 489–516) developed the first electronic monitoring device in the mid-1960s. He felt that his invention could provide a humane and inexpensive alternative to custody for many people involved in the justice process. The goal of an electronic monitoring system is to provide community supervision staff with an additional tool to intensely supervise offenders who are not incarcerated. This form of supervision does not support any form of treatment or assistance, but it is more cost-efficient than incarceration, which provides a direct contrast and alternative to incapacitation or imprisonment. Critics of electronic monitoring argue that the concept is self-serving for the manufacturers of the house-arrest equipment. The also argue that there are many rehabilitative-type services and products available but point out that these services are labor-intensive and expensive and would no doubt eat into the corporation's profits.

Boot Camp and Shock Incarceration

Boot camps combine basic elements of both rehabilitation and retribution. They provide rigorous physical activity that many believe to be more beneficial than punitive alternatives. "Boot camps are highly popular residential alternatives (intermediate sanctions) typically used for young offenders which provide for very structured and military-like activities such as strict discipline, physical training and labor, drill, and a regimented schedule of daily activities" (Rush 2004). A sentence of boot camp, also known as shock incarceration, is usually for a relatively short time, approximately three to six months.

The first boot camp programs were implemented in Georgia and Oklahoma in 1983 to help relieve prison and jail crowding. They were first developed in the adult criminal

justice system and then expanded to the juvenile justice system (MacKenzie, Wilson, and Kider 2001). Boot camps were created for several reasons. As mentioned previously, one of the main goals of alternatives is to alleviate the overcrowding of prisons. That is, "certain offenders who would normally be sentenced to a prison term (e.g., two to four years) are diverted to a shorter, yet equally punitive and effective, boot camp sentence (e.g., 90 to 180 days)" (Begin 1996).

Deterrence (both specific and general) is inherent in the concept of shock incarceration. The hope is that the shock of incarceration will serve both as a deterrent specific to the criminal and the crime as well as a general deterrent to would-be criminals in the immediate community. Boot camp is considered one of the most demanding alternatives, and the findings on its effectiveness as a deterrent to offenders committing further crimes is mixed at best. Moreover, more often than not, offenders who are offered the opportunity to serve a sentence in boot camp instead of in prison opt to serve prison time because boot camp is seen as being more intrusive than prison.

Day Reporting Centers (DRCs)

Day reporting centers (DRCs) are community-based facilities that provide a strict regimen of supervision and programming for ex-offenders. The 1980s began the era of the use of DRCs in the United States, but this concept actually originated in England as a way of reducing the prison population. The goal of DRCs is to combine high levels of control over offenders so as to meet public safety needs while providing intensive services to address the rehabilitative needs of the offender. Day reporting is an alternative that completely eliminates the cost of jail for these offenders because they do not require housing or confinement.

The rationale behind the implementation of this type of alternative is that sometimes the crime committed does not justify a jail sentence. In fact, it has been argued that some offenders are by nature more responsive to less severe punishment and that they may actually be harmed, more than their crime may merit, by serving a jail term. The use of DRCs would allow offenders to report to a location in a manner similar to reporting to a probation officer. Offenders in this program would be required to account for their activities during the day, including job-searching activities for those participants who are unemployed. Offenders would also be subjected to daily drug and alcohol testing, as would regular offenders. Failure of either of these mandatory tests would result in disqualification from the program.

Day reporting incorporates three of the sanctions that were discussed earlier, and it is in keeping with these that the goals of this type of alternative are formed. As such, the objectives of DRCs are threefold: (1) punishment through restricting clients' activity and requiring community service; (2) incapacitation through intensive supervision, firm enforcement of attendance agreements, and strict adherence to program structure; and (3) rehabilitation through services aimed at "enabling the unable by developing social and survival skills, remedying deficiencies in education, and increasing employability" (Begin 1996).

Daily programming includes but is not limited to educational/vocational training, drug/alcohol treatment, anger management, and conflict resolution. Many of the alternatives are implemented for the purpose of combating the overcrowding and enormous cost of imprisonment. In order to reduce the cost of prisons, the criminal justice system "requires that sanctions be tailored as carefully as possible to ensure that they provide only the supervision or services necessary to achieve their intended goal(s)" (Begin 1996). Alternatives, therefore, present more effective methods of reducing society's total spending on the correctional system in general and the prison population specifically.

The work crew is another option that allows qualifying offenders to work off a portion of their sentence and/or their fine by working on public works projects selected and supervised by participating jurisdictions (Clear 1994). In the end, the amount of work that the offender does for the time period is assessed and deducted from the total sum of time he or she would have spent incarcerated. It is important to note that the difference between the work crew just discussed and work release is that the latter is an option some jurisdictions use to allow individuals to continue to work at their existing jobs according to their established schedule, but they must reside at the jail overnight (Gill 1967). This alternative reduces the cost to correctional institutions for daily services; however, those work release programs that do not have work release centers still require jails to cover the cost of night services.

Residential Community Correctional Facilities (Halfway Houses)

Halfway houses are residential facilities designed to (1) house adult offenders (with at least 70 percent of its residents placed by federal, state, or local authorities), (2) operate independently of the other corrections institution, and (3) permit clients to leave the premises during the day for work, education, or community programs. Additionally, halfway houses are critical in rehabilitating ex-offenders. In addition to providing high levels of surveillance and treatment, the 24-hour residency makes these facilities the community sanction that is closest to the total institutional setting of a prison or jail (halfway between prison and freedom) because, despite the setting, the movements, behavior, and mood of the residents can be continuously monitored.

Halfway houses also provide a safe haven for offenders who have been confined for long periods of time, allowing a smooth transition back into the community. Some offenders who live in halfway houses can actually work and pay rent. They are allowed to leave only to report to jobs, and they must return promptly at the end of the workday. In essence, halfway-house residents have more freedom and responsibility than people in prison but less freedom than ordinary citizens.

A halfway house is a "rehabilitation center where people who have left an institution, such as a hospital or prison, are helped to readjust to the outside world" (Caputo 2004, 72).

Recidivism was a major concern for the criminal justice system, and this form of alternative was supported as a way to combat it. Another purpose of halfway houses is to monitor those offenders just leaving prison to make sure that they are ready to function in society again. It was implemented to also give offenders the opportunity to gradually recondition themselves to the world. The offender is leaving a structured environment in prison, and the halfway house provides a transitioning period for the offender to enter a free public. Thus, halfway-house residents have greater freedom and responsibility than people in prison but less freedom than ordinary citizens (Nelson, Deess, and Allen 1999). Owing to the existence of halfway houses in the community, some safety concerns exist. Such concerns are limited when compared with situations where offenders were released from prison directly into society without any formal supervision.

Another benefit of halfway houses is that an offender must perform community service in the form of manual labor for the government or private, nonprofit organizations without receiving any payment. The courts, on a discretionary basis, determine the number of community service hours an offender must serve.

Fines

Fines are typically used in conjunction with other sanctions, such as probation and incarceration (a typical sentence would be two years' probation and a $500 fine). The biggest complaint about fines as a sanction is the difficulty of collection. A significant number of offenders are poor and simply cannot afford to pay them. On the other hand, judges also complain that well-to-do offenders will be in a better position to meet the financial penalty and less likely to learn the lesson the penalty was intended to teach.

As a result, several states—including Arizona, Connecticut, Iowa, New York, and Washington—have tested an alternate concept referred to as a *day fine,* developed in Sweden and Germany, which imposes a fine based on a fixed percentage of the offender's income. The day fine concept ensures that the financial penalty imposed on the offender will have the same impact regardless of income.

Forfeiture

Forfeiture is the act of seizing personal property (e.g., boats, automobiles, or equipment used to manufacture illegal drugs), real property (e.g., houses), or other assets (e.g., bank accounts) derived from or used in the commission of illegal acts. Forfeiture can take both civil and criminal forms. Under civil law, the property can be seized without an actual finding of guilt. Under criminal law, however, forfeiture is imposed only as part of the sentence for a guilty verdict.

The practice of forfeiture was not actually used after the American Revolution but became more popular with the 1970 passage of the Racketeer Influence and Corrupt Organizations (RICO) Act and the Continuing Criminal Enterprise (CCE) Act. As

its popularity grew in usage, congressional amendments were made to streamline implementation in 1984 and 1986 (Spaulding 1989).

Community Service and Restitution

The concepts of community service and restitution are relatively new alternatives. "Community service is a compulsory, free, or donated labor performed by an offender as punishment for a crime" (Inciardi, Martin, and Butzin 2004; Parent and Barnett 2002). "Community service can be arranged for individuals on a case by case basis or organized by correctional agencies as programs" (Inciardi, Martin, and Butzin 2004; Parent and Barnett 2002). Community service provides a chance for offenders to give back to the community for the wrong that they did to society.

The first documented community service program in the United States was implemented in Alameda County, California, in 1966 (Inciardi, Martin, and Butzin 2004; Parent and Barnett 2002). Community service sentencing first began when it was found that many indigent women were forced to go to jail because they could not afford traffic and parking fines. "To avoid the financial costs of incarceration and the individual cost to the offenders [who were often women with families], physical work in the community without compensation was assigned instead" (Inciardi, Martin, and Butzin 2004; Parent and Barnett 2002). This alternative had such outstanding results that it spread nationwide into the 1970s. It was advocated by the idea of "symbolic restitution," whereby offenders, through good deeds in the form of free labors benefiting the community, symbolically repaid society for the harm they had caused (Inciardi, Martin, and Butzin 2004; Parent and Barnett 2002).

Restitution is often viewed as financial compensation, but it can also take the form of community service hours at a community project. Both community service and restitution operate under the assumption that the offender's personal or financial contribution to the victim or the community will compensate for any loss caused by the offender's illegal behavior.

An offender is usually given community service in conjunction with restitution. "Restitution is the payment by the offender of the costs of the victim's losses or injuries and/or damages to the victim" (Department of Health and Human Services 2005, 4). Restitution provides either direct compensation to the victim by the offender, usually with money although sometimes with services (victim restitution), and unpaid compensation given not to the victim but to the larger community (community service). Restitution, as an alternative, is similar to restoration in that both concepts seek to place the victim and/or the community back into the position they were in (whether financial or emotional) before the crime was committed.

Victim restitution programs were adopted in the United States in 1972 with the Minnesota restitution program. It "gave prisoners convicted of property offenses the opportunity to shorten their jail stay, or avoid it altogether, if they went to work and

turned over part of their pay as restitution to their victims" (Department of Health and Human Services 2005, 4).

Conclusion

According to policy makers, the concept of alternatives to criminal justice is different from the traditional criminal justice sanctions in four significant ways: (1) It is restorative as opposed to retributive, (2) it uses problem-solving rather than adversarial strategies, (3) the community jurisdiction takes on a more important role than the legal jurisdiction, and (4) the ultimate goal is not to punish the offender but to improve the community through collaborative problem solving. Critics and offenders argue, on the other hand, that the alternatives and community corrections strategies are becoming increasingly punitive despite the emphasis on rehabilitation.

The bottom line is that the offenders are the ones who must evaluate the severity and impact of alternative sanctions. If offenders perceive the alternatives as being too severe, they will choose prison, and the entire concept will serve no purpose. Even offenders receiving identical punishments will react differently to perceived degrees of intrusiveness; some may perceive the punishment as more severe than others, depending on age, race, sex, and prior punishment history (Spelman 1995). According to this research, African American offenders, men, older offenders, unmarried offenders, offenders without children, drug offenders, and repeat offenders rated prison as less punitive than alternatives.

Hence, to ignore these research findings and to disregard the viewpoints of those directly involved—offenders, victims, and community members—is to make policies on the basis of preconceived ideas, biases, and stereotypes.

B

BORDER FENCE

Judith Ann Warner

To prevent unauthorized entrants from crossing the U.S.-Mexico border, Congress passed the Secure Fence Act of 2006 to construct either partial or complete fencing. Since 9/11 this project has been referred to as a "border fence." Does the United States have the sovereign right to block off a border with a neighboring country, or does it insult Mexico and violate the rights of people to freely move about the globe? Both Americans and Mexicans residing on the border view it as offensive, and no similar action has been proposed for Canada. Economic migrants from Mexico and from Central and South America have been forced to cross in ever more remote and hazardous regions, which has raised the death toll. The solution for preventing these deaths could be legalizing increased immigration rather than fencing the border. Although fencing could prevent some criminal activity along the border, such as drug trafficking, it might also promote more varied attempts at human smuggling by tunneling, thus overcoming the fence, or coming into the country by sea or air.

Concern has developed about Mexican drug-related violence involving shootouts between traffickers, law enforcement, and the military. The public supports a border fence primarily as a means of stopping unauthorized immigration, and the government advocates it to prevent the entry of terrorists. Increasingly, the prospect that spillover violence could spread from Mexico into the United States may become another motive for blocking the border, by a fence or otherwise.

Background

The U.S.-Mexico border is 1,951 miles long and crosses urban areas, desert, and mountainous regions. Historically, the highest rates of unauthorized entrance have been through the San Diego (California) and El Paso (Texas) urban areas, which suffered increased crime due to the unlawful measures taken to stop the migrants and attempts by bandits to assault and rob migrants during their passage. These are the sites at which the first border fences were built.

Fencing began with the installation of 14 miles of steel wall as a part of Operation Gatekeeper in the Tijuana–San Diego undocumented immigration corridor (Nevins 2002). It was made with steel plates that served as makeshift aircraft runways during the first Iraq War. They are covered with rust in parts and unsightly. In the San Diego region, the 40 miles of primary 10-foot-high fence with horizontal steel corrugation is easy to climb. After the first wall, there is a 10-foot secondary wall that is 15 feet high and more difficult to climb; it is a steel mesh wall sunk in concrete. This appears to be effective, but these walls have been tunneled under.

At Otay Mesa, San Diego, with the use of ground-penetrating radar, a half-mile, 75-foot-deep tunnel with electricity and ventilation was discovered. It led to a Tijuana industrial park and contained bales of marijuana. It is plausible that this tunnel was also used to smuggle people across the border. U.S. Border Patrol (USBP) officials indicate that the San Diego wall was never meant to stop unauthorized entrance but just to slow people down. A fence that caused injury would render the United States subject to liability lawsuits. Tunnels are a drug trafficking escalation in the effort to maintain smuggling routes.

In Arizona, between the U.S. city of Nogales and Ambos Nogales in Mexico, border walls were built in conjunction with Operation Safeguard. Many additional fences have been constructed in Arizona, but they are not as high or secure in remote rural areas, where the USBP considers it easier to apprehend people. In rocky and mountainous areas, there is a simple rail barrier designed to impede cars or trucks but not foot travelers.

Although Operation Gatekeeper and Operation Safeguard were intended to be temporary, they became permanent. The result was displacement of unauthorized entrants and human smugglers to more remote and risky crossing areas (Dunn 2009; Nunez-Nieto and Kim 2008) and an almost complete drop in apprehensions in the urban areas that were fenced. Nevertheless, fences did not stop unauthorized immigration over the long run. Instead, unauthorized crossers choose different and more difficult rural desert areas, which are extremely hazardous.

The Senate confirmed the U.S. House of Representatives Secure Border Fence Bill of 2006 to authorize and partially fund construction of 700 miles of additional double-walled fencing along the U.S.-Mexico border. The sites include two spots in California,

most of the Arizona border, and heavily populated areas of Texas and New Mexico. Fourteen known drug-smuggling corridors are included. Michael Chertoff, the first Department of Homeland Security secretary, did not favor a physical fence and wanted to deploy a virtual electronic fence instead. One result of this decision point is that the fence may never be fully extended. The fence does not seal off the entire border and leaves open the question of whether another displacement effect will affect unauthorized immigration, making it more dangerous.

Border fencing has involved up to two layers of secured fencing and physical barriers, parallel roads, and surveillance technology (Nunez-Nieto and Kim 2008). By 2010, U.S. Customs and Border Protection (USCBP, part of the Department of Homeland Security) had extended coverage to 645 miles of fence. The degree of security offered by the fence varies. Often rural fencing is no more than a railing to deter vehicles. Other sections of the border fence located near cities and communities comprise a steel plate wall or two fences that are 15 feet high and run parallel to each other with a track for motor vehicles in between. Individuals or groups crossing the border without authorization trigger motion sensors and alert the U.S. Border Patrol, which polices the fence and crossing locations. On one side of each of the two parallel fences is eight feet of coiled barbed wire, and before the barbed wire are ditches to prevent SUVs and trucks used by human and drug smugglers from crossing. In more remote areas, rail fences have been installed to prevent vehicles from crossing.

Border communities and landowners affected by the border fence project have protested it. The Secure Fence Act of 2006 requires consultation with federal agencies, state and local officials, and local property owners. Nevertheless, former Secretary Chertoff was authorized to waive historic preservation and environmental laws, including the Endangered Species Act, the Clean Water Act, and the Safe Drinking Water Act. On four occasions, DHS has used the waivers. Lawsuits over proposed border walls in south Texas occurred, but in 2008 the U.S. Supreme Court turned down a case against border fencing. DHS paid $50 million to compensate for ecological damage and issues with Native American burial sites. It is possible to develop fencing that will curb floods and restore habitats for endangered species. About $40 million has been spent on restoration. The affected species include ocelots, jaguars, wild pigs (javelinas), and deer.

Early in his term, President Barack Obama expressed a preference for border patrolling and adding surveillance technology in lieu of a fence. The evaluations of the U.S. Government Accountability Office have consistently documented problems with a "virtual fence" known as the Secure Border Initiative network, or SBInet. In spring 2010, current DHS Secretary Janet Napolitano responded by cutting $50 million from a scaled back budget of $574 million to pay for a system of cameras, radar, and sensors that was expected to be operational by 2011 (Archibold 2010). Cost overruns on the Boeing contract, equipment malfunctions such as mistaking blowing trees for migrants, lack of

consultation with the USBP, and ineffective assessment of results are considered major issues. By 2010, $1.2 billion had been spent; with only two test sites in Arizona, there was little evidence of effectiveness. In response, Janet Napolitano has frozen funding for SBInet.

The violence of Mexican drug cartels and the possibility that it could spill over into U.S. border communities, a phenomenon labeled "spillover violence," has created a motive for continuing to fence. Originally, Secretary Napolitano was opposed to border fencing; but she now advocates walls and fences as a means of operational control. Napolitano went ahead with the final 60 miles of fencing, estimated to cost $4 million per mile (Reese 2009). In 2010, fencing covered 646 miles of the 1,951-mile U.S.-Mexico border.

Border fencing has been costly to build. Since 2005, $2.4 billion has been spent (Billeaud 2010). Former congressman and 2010 Arizona Senate primary candidate J. D. Hayworth (2009, 3) points out that the original bill calls for double-layer fencing, but only 200 miles are of this more expensive type. Smugglers have overcome single-layer fencing and vehicle barriers with hacksaws, blowtorches, and portable ramps (Billeaud 2010). Migrants may simply use ladders.

Supporters of Border Fencing

Proponents of an extended border fence argue that it is needed for three reasons: (1) to reduce unauthorized immigration, (2) to block drug smugglers and others, and (3) to prevent terrorists from entering through the so-called back door. A border fence is seen as a tool that, with accompanying technology, will allow the USBP to improve enforcement. A 2010 Rasmussen phone survey indicated that 59 percent of a random sample of 1,500 Americans supported a border fence to control immigration (Rasmussen Reports 2010). Only a minority of voters were in opposition: 26 percent. After the March 2010 shooting deaths of American Consulate employees in Ciudad Juarez, Mexico, 49 percent believed that preventing drug trafficking was more important than stopping unauthorized entry.

The data from Operation Gatekeeper in the almost completely fenced San Diego sector, where border fencing originated, has been used to argue that it is effective because apprehension of unauthorized border crossers is greatly reduced (Haddal et al. 2009). The USBP views fencing as a "force multiplier" because it allows them to concentrate on targeted enforcement, USBP considers the displacement of migrant crossing attempts to remote rural areas, as opposed to congested urban regions, as presenting a tactical advantage.

Public figures such as Patrick Buchanan, former Congressman Duncan Hunter, and FOX television journalist Glenn Beck have advocated building a fence along the entire 2,000-mile U.S.-Mexico border. Buchanan (2006), for instance, believes that it would show the exact border location, separate the two nations, and permanently enhance

security. Although the limited border fences already in place have been likened to the Berlin Wall, he does not agree. After World War II, the Berlin Wall was constructed between the zone occupied by the North American Treaty Alliance and that occupied by the Soviet Union in Berlin, Germany, to prevent Eastern Europeans and Soviet citizens from crossing into a non-Communist zone and permanently immigrating. Supporters of a U.S.-Mexico border wall feel that the Berlin Wall locked a population in and made them captive. In contrast, the proposed wall would keep unauthorized entrants out. Is the glass half empty or half full?

Complete fencing of the border would leave 200 openings or ports of entry for vehicles, trucks, and railroads, allowing trade, travel, and border tourism. The mere sight of the border fence is considered a major deterrent to individuals and small groups trying to cross. It has been suggested that a $2 crossing fee would help finance construction of the fence, paying back the cost over time.

One positive impact of the Tijuana–San Diego fence was that land values rose on the U.S. side of the border within 14 miles of the fence. Supporters of fence construction indicate that it would make national parks like the Organ Pipe Monument, Indian reservations such as that of the Tohono-O'odham in southern Arizona, and ranches safer places.

Patrick Buchanan (2006) suggests that the fence might be perceived positively by Mexican border residents because of the increased risk of crime in border-crossing zones such as the Tijuana–San Diego corridor. Prior to the construction of a 14-mile fence in this area, there were border bandits and gangs that committed rape, robbery, and even homicide. This gang activity was separate from drug smuggling, an additional concern. Border homicides occurred at a rate of 10 per year and decreased to zero after the fence was installed. Drug busts of SUVs and trucks dropped from 300 a month to zero along the fence.

The deterrence of crossing reduces opportunity to further exploit unauthorized border crossers. Mexico experiences a high level of corruption because of the low salaries of government employees (Velasco 2005). The Mexican police and military stationed on the U.S.-Mexico border and at ports of entry have been accused of rape, robbery, and physical assault on unauthorized individuals crossing through Mexico from Central and South America. Both the Mexican police and military seek them out throughout Mexico, particularly at Mexico's southern border, to take their money and/or deport them. Women have been sexually assaulted, and unauthorized migrants are alleged to have been beaten to death. Recent corruption concerns involve bribery and intimidation of Mexican and even U.S. law enforcement and government officials by drug trafficking organizations (Cook 2007).

An unrecognized human rights issue is that fencing in remote desert or mountainous border regions would prevent the deaths—due to dehydration, heat exhaustion, cold exposure, starvation, and/or injury—of hundreds of unauthorized crossers. It would also

stop the accumulation of areas of trash left by unauthorized crossers in fragile desert and mountain ecological zones. Ranchers and other property owners would no longer be subject to trespassing on their lands. The more the border is fenced, the more unauthorized entrants are funneled into specific areas, making land enforcement more efficient. However, this approach will work only if the land border is almost completely fenced.

The U.S. public has been chiefly concerned about unauthorized immigration and terrorism. The U.S.-Mexico border is a major drug and human smuggling platform, and transnational organized criminal groups employ high technology to counter each step in the escalation of border control. There is concern that the profit motive would cause such groups to accept payment from terrorists attempting to cross and/or to assist them in transporting weapons of mass destruction, such as dirty bombs or hazardous, active biological organisms such as anthrax. Repeatedly, the issues of the war on terror have been linked to U.S.-Mexico border security, although the 9/11 incident did not involve U.S.-Mexico border crossers.

The chief motivation, however, may not originate from the war on terror. Border security has been a part of the war on drugs since the tight control of the Florida coastal drug smuggling corridor resulted in displacement of drug trafficking to the U.S.-Mexico border. Ultimately, the government may view fence placement as a national security issue primarily connected to drugs, although it is represented as an effort to control immigration and terrorism. There are areas along the U.S.-Mexico border in which even the USBP is threatened by heavily armed drug smugglers.

Opponents of Border Fencing

Felipe Calderón, the president of Mexico (2007–present), ministers of several Latin American countries, and Mexican intellectuals consider the construction of a border wall to be unnecessary and even counterproductive. The Mexican press has condemned the wall project as a xenophobic and racist act. Many Mexican papers have run political cartoons showing Uncle Sam putting up a fence covered with insults to Mexicans. The construction of a border fence is viewed as a major slap in the face by the nation of Mexico. It implies that the United States is superior to Mexico and that social problems originate on the Mexican side, not the American side. The United States is protected from Mexico, not vice versa.

Fence opponents in Mexico, Central America, and Latin America argue that an approach that respects labor rights and human dignity is needed. Mexicans regard the fence as a negative response to individuals who work hard and contribute to the North American economy; they are concerned that it will affect ties between Mexicans and family members living in the United States. Mexicans liken fence extension to the Berlin Wall and view it as a hostile act.

Tony Payan (2006) contends that the border-wall mindset has weakened the ties between the United States and Mexico. There is a sense of separation that undermines

cross-border social ties and makes it difficult to negotiate binational solutions to problems like unauthorized immigration. Today, border residents are less likely to visit one another, and twin cities on the U.S. and Mexico sides are more socially if not geographically distant. Texas governor Rick Perry (2000–present) opposes the fence because it undermines trade; he suggests that technology should be used to promote safe and legal migration and cross-border contact.

Liberal opponents view a fence as a way of keeping Mexican citizens out and believe that preventing freedom of human movement is a human rights issue. The fencing of San Diego, California; El Paso, Texas; and Nogales, Arizona, was undertaken as an effort to deter individuals from crossing. Wayne Cornelius (2006) found that, from 1994 to 2004, a total of 2,978 border migrants died while attempting to enter the United States from Mexico. Cornelius (2006, 784) points out that "To put this death toll in perspective, the fortified U.S. border with Mexico has been more than ten times deadlier to migrants from Mexico during the last nine years than the Berlin Wall was to East Germans throughout its twenty-eight year existence."

Controversy has ensued because border crossers have been diverted to the Sonora Desert and Baboquivari Mountains in Arizona. The fencing of limited areas of the border channeled migrants to different areas that pose a threat to life for those who cross. Primary causes of death are exposure/heat, drowning, and motor vehicle accidents (Guerrette 2007). When the movement of people across the border is squeezed, they will try other areas or methods. In the southwestern desert, migrants are not able to carry much water; they become exposed to intense heat and cold and sometimes get lost. Drowning deaths occur along Texas's Rio Grande River and the Colorado River in California when irrigation water is released and sudden flooding occurs. Tension between the United States and Mexico has increased because of these deaths, which could have been prevented by more open borders.

Academicians have conducted research showing that, although fencing funnels migrants from attempted entry in certain zones, it does not stop unauthorized immigration (Garcia-Goldsmith et al. 2007; Massey 2009). A major unintended consequence of border fencing and other types of escalation of control has been that human smuggling networks have become more organized and profitable (Massey 2009). Unauthorized entrants pay large sums in advance to be smuggled in, or they may pay off huge debts afterwards. Unwittingly, escalation in law enforcement on the border has increased the profitability of human smuggling and created a new transnational organizational structure that people must rely on. In the past, individuals tried to cross on their own or employed small-scale smugglers. Each time border control is escalated, criminal organizations realize greater opportunity. If a debt is owed after crossing, migrants may be coerced or enslaved to pay it off. Ultimately, U.S. border security must to consider the reasons that migrants are so desperate and to deal with the demand for drug consumption in the United States more effectively.

Environmentalists are also opposed to border fencing, which disrupts the ecology of desert regions and riverine systems. The San Diego border fence constructed as a part of Operation Gatekeeper is in a 3.5-mile area of marsh. In 2005, a federal judge ruled against a lawsuit brought by the Sierra Club and other environmental groups to protect the sensitive ecological balance of the Tijuana River marshes. It is one of the few intact estuaries and coastal lagoon systems in southern California. A more general objection to fencing at most rural points of the border is that it hampers the migration of wild animals.

In south Texas, many lawsuits were brought against the border fence. The fence disrupts the use of private property, placing a barrier between animals and water or ranchers and their own land. It has had social consequences such as dividing the campus of the University of Texas at Brownsville into U.S. and Mexican areas. A coalition of Texas mayors and other public officials sought to stop the fence, but their effort to bring the issue before the U.S. Supreme Court was unsuccessful. To facilitate fencing, the secretary of the Department of Homeland Security issued 30 waivers of laws protecting endangered species, migratory birds, deserts or forests, antiquities, Native American graves, and rancher's property rights.

Opponents of extended border fencing argue that the tactic is insufficient and that better intelligence and innovative solutions are needed. They point out that the cost estimate is $70 billion. Some conservative opponents of fencing, including the Border Fence Project, are against federal attempts to fence the border and found the present legislation, the Secure Border Fence Act of 2006, very flawed. Their reasoning is that only 700 miles will be fenced and a great deal of coverage will be electronic; they also worry that personnel to respond will be underfunded. They argue that a delay in fence building will result in surges of crossers in unfenced areas. Finally, they point out that, in their opinion, the federal government does not do a good job of repairing, maintaining, or guarding current fencing. Existing areas of 15-foot-high steel-and-concrete fencing have been successfully overcome for temporary periods with hacksaws and acetylene or plasma torches, huge ladders, and even bungee jumping cords.

Methods used by smugglers to circumvent the border fence include tunnels and cave-like passages used to smuggle people, drugs, and contraband. A total of 101 tunnels have been discovered between 1990 and 2008 (Haddal et al. 2009). Circumventing the fence is a response to increased CBP enforcement. In 2006, Congress passed the Border Tunnel Prevention Act to increase criminal penalties. A tunnel builder can get up to 20 years. Improvements in intelligence gathering and tunnel detection are occurring but attempts continue to be made.

Fencing the border to stop unauthorized entry was immediately linked to 9/11 and preventing terrorist incursion despite the fact that none of the 9/11 terrorists entered through the U.S.-Mexico border. Instead, they came by air and overstayed visas that were, in some cases, fraudulent. Opponents think it is an error to connect 9/11 with

southern border security. The real issues at the U.S.-Mexico border are much more varied. Drug smuggling of cocaine, heroin, marijuana, and methamphetamine is a multibillion-dollar business connected to illegal money laundering.

The construction of a border fence completely overlooks the relationship of the United States, a high-income country, to Mexico and other Central and South American middle- or low-income countries. Issues in economic development are associated with unauthorized immigration for economic motives. Border fencing is a unilateral, not a bilateral or multilateral, effort that addresses the economic development of the sending countries (Payan 2006). Recently, the need to address socioeconomic issues in Mexico was recognized in the context of combating drug trafficking and related violence by increasing economic opportunity (Thompson and Lacey 2010).

Peter Skerry (2006) maintains that the primary reason for building a border fence was never about undocumented immigration. He contends that politicians want to stop drug traffickers. It is easy for public figures to merge and blur the issues of unauthorized immigration, counterterrorism, and—with renewed emphasis—drug trafficking. The secretary of Homeland Security has the authority to waive all laws that prevent national security measures, which makes the process of opposing the wall and developing binational and global solutions to major issues problematic. Globalization has made us one world, and the use of national sovereignty to build a wall can easily be perceived as national arrogance and disregard for the concerns of other nations.

Conclusion

Prior border fences did not stop unauthorized immigration. The Secure Border Fence Act of 2006 does not seal off the entire border. As a result, it has the potential to channel unauthorized entrants to rural regions of Arizona, New Mexico, and Texas or to direct human smugglers to turn toward air and coastal routes. Many observers think that only a guest-worker program in combination with a fence would deal with the issue of unauthorized immigration from Mexico. This solution, however, does not take into account people from Central and South America who travel north to make unauthorized crossings or people who are legally admitted and overstay their visas. There are unauthorized immigrants from many areas of the world in the United States who did not cross a land border to enter. Meanwhile, the government's central concerns for building a wall include transnational drug smuggling and counterterrorism. Controversy will continue as the government and the public consider whether it is possible for a nation to seal itself off in a rapidly globalizing world.

C

CLASS JUSTICE

Gregg Barak and Paul Leighton

Karl Marx maintained that the root of most crime and injustice could be found in class conflict. Within and without the academies of crime and justice, this contention is highly controversial. In fact, it is so controversial that here in the United States the whole idea of class itself is often in a state of political and social denial. Unlike gendered justice and sexism or racial (ethnic) justice and racism, class justice and classism has not been recognized in either the substantive or procedural sides of the law. Opponents of class justice argue that we are not only a so-called classless society but also a democracy in which all individuals are subject to due process, equal protection, and the rule of law. Although proponents of class justice do not take issue with the fact that no person is above the law, they do contend that many actions are beyond incrimination and adjudication, whereas other actions are selectively enforced and differentially punished according to class interests.

Background

Throughout most of the 19th century and well into the 20th, a blatant kind of class justice prevailed in the selective enforcement and differential application of the criminal and civil law to the haves and the have-nots. The laws themselves were heavily influenced by a reverence for private property and laissez-faire social relations. In terms of commercial transactions, the philosophy of the day was caveat emptor, "let the buyer beware." In the area of business, farmers and new merchants alike were allowed the freedom to expand their particular domains and to compete and acquire both property and capital with little

legal interference. By contrast, labor was highly regulated. Unions were considered an illegal interference with freedom of contract and an unlawful conspiracy infringing upon the employer's property rights.

The administration of criminal (and civil) justice was chaotic, often corrupt, and subject to the buying of law enforcement and juries. An independent and decentralized criminal justice system designed for a more homogenized, pioneer, and primarily agricultural society was ill adapted for the needs of an increasingly complex, urban, and industrialized society. A social and cultural environment that was experiencing increasing numbers of immigrants from southern and eastern Europe, a changing means of rapid communication and transportation, and an expanding presence of wage-earning working classes called for a coordinated system of criminal justice.

By the end of the 19th century, the buying of justice that had prevailed earlier (available to those who could afford representation in the legislatures, in the courts, and in the streets) was threatening the very legitimacy of criminal justice in the United States. The initial laissez-faire emphasis on the right to acquire private property had blossomed into a full-fledged national preoccupation with wealth and power. Political corruption became widespread, and political machines dominated urban areas: "The machines controlled city governments, including the police and the courts. Payrolls were padded and payoffs were collected from contractors" (Edelstein and Wicks 1977, 7). Graft and other forms of bribery contributed not only to the buying of justice by those who could afford it but also to a changing national morality. Rackets, "pull," and protection were common antidotes to stubborn legal nuisances. Prevailing values of wealth and success predominated as guiding principles of right and wrong. "The ability to 'make good' and 'get away with it' offsets the questionable means employed in the business as well as professional worlds. Disrespect for the law and order is the accompanying product of this scheme of success" (Cantor 1932, 145).

Those who were marginalized—especially the poor, unemployed, women, and people of color—were rarely if ever in a position to buy justice. As the marginalized groups of immigrants and others grew in urban centers across the United States and as the miscarriages of justice flourished, the need to reform the institutions of criminal justice grew because the country was beginning to experience bitter class wars. The working classes aggressively resisted exploitation through on-the-job actions and wide social movements. To combat challenges to the emerging monopoly or corporate order of industrial capitalism, the wealthy ruling classes initially employed illegal violence, such as the hiring of thugs and private armies. Later, they retained the services of private security companies, such as Pinkerton's, to infiltrate and break up worker organizations.

Key Events

Double Standards of Justice

In 1964, William Rummel received three years in prison after being convicted of a felony for fraudulently using a credit card to obtain $80 worth of goods.

Five years later, he passed a forged check in the amount of $28.36 and received four years. In 1973, Rummel was convicted of a third felony: obtaining $102.75 by false pretenses for accepting payment to fix an air conditioner that he never returned to repair. Rummel received a mandatory life sentence under Texas's recidivist statue. He challenged this sentence on the grounds that it violated the Eighth Amendment's prohibition of cruel and unusual punishment by being grossly disproportionate to the crime.

In *Rummel v. Estelle* (1980), the U.S. Supreme Court affirmed Rummel's life sentence for the theft of less than $230 that never involved force or the threat of force. Justice Louis Powell's dissent noted "it is difficult to imagine felonies that pose less danger to the peace and good order of a civilized society than the three crimes committed by the petitioner" (*Rummel v. Estelle 1980, 295*). However, Justice William Rehnquist's majority opinion stated there was an "interest, expressed in all recidivist statues, in dealing in a harsher manner with those who by repeated criminal acts have shown that they are simply incapable of conforming to the norms of society as established by its criminal law" (*Rummel v. Estelle* 1980). After "having twice imprisoned him for felonies, Texas was entitled to place upon Rummel the onus of one who is simply unable to bring his conduct within the norms prescribed by the criminal law" (*Rummel v. Estelle* 1980).

Now consider the case of General Electric (GE), which is not considered a habitual criminal offender. Nevertheless it has been prosecuted for diverse crimes over many decades. In the 1950s, GE and several companies agreed in advance on the sealed bids they submitted for heavy electrical equipment. This price-fixing defeated the purpose of competitive bidding, costing taxpayers and consumers as much as a billion dollars. GE was fined $437,000—a tax-deductible business expense—the equivalent of a person earning $175,000 a year getting a $3 ticket. Two executives spent only 30 days in jail, even though one defendant had commented that price-fixing "had become so common and gone for so many years that we lost sight of the fact that it was illegal" (Hills 1987, 191).

In the 1970s, GE made illegal campaign contributions to Richard Nixon's presidential campaign. Widespread illegal discrimination against minorities and women at GE resulted in a $32 million settlement. Also during this time, three former GE nuclear engineers—including one who had worked for the company for 23 years and managed the nuclear complaint department—resigned to draw attention to serious design defects in the plans for the Mark III nuclear reactor because the standard practice was "sell first, test later" (Hills 1987, 191).

In 1981, GE was convicted of paying a $1.25 million bribe to a Puerto Rican official to obtain a power plant contract. GE has pleaded guilty to felonies involving illegal procurement of highly classified defense documents, and in 1985 it pleaded guilty to 108 counts of felony fraud involving defense contracts related to the Minuteman missile. In spite of a new code of ethics, GE was convicted in three more criminal cases over the next few years, in addition to paying $3.5 million to settle cases involving retaliation against four whistle-blowers who helped reveal the defense fraud. (GE subsequently lobbied Congress to weaken the False Claims Act.) In 1988, the government

returned another 317 indictments against GE for fraud in a $21 million computer contract.

In 1989, GE's stock brokerage firm paid a $275, 000 civil fine for discriminating against low-income consumers, the largest fine ever under the Equal Credit Opportunity Act. A 1990 jury convicted GE of fraud for cheating on a $254 million contract for battlefield computers, and journalist William Greider reported that the $27.2 million fine included money to "settle government complaints that it had padded bids on two hundred other military and space contracts" (Greider 1996, 4).

Because of tax changes that GE had lobbied for and the tax cuts passed under President Ronald Reagan generally, GE paid no taxes between 1981 and 1983, when net profits were $6.5 billion. In fact, in a classic example of corporate welfare, GE received a tax rebate of $283 million during a time of high national deficits even though the company eliminated 50,000 jobs in the United States by closing 73 plants and offices. Further, "Citizen GE," whose advertising slogan has been "Brings good things to life," is one of the prime environmental polluters and is identified as responsible for contributing to the damage of 47 sites in need of environmental cleanup in the United States alone.

Even though felons usually lose political rights, GE's political action committee contributes hundreds of thousands of dollars to Congress each year, and it now owns NBC television, with all of its influence. In spite of having been convicted of defrauding every branch of the military, representatives from GE are frequently invited to testify before Congress. If the corporation's revenues were compared with the gross domestic product of countries, it would be among the top 50 largest economies in the world. With this kind of political, economic, and social power, it is easy to understand why "three strikes and you're out" does not apply to the big hitters like GE.

The pattern outlined in these examples was reinforced in 2003, when the Supreme Court upheld a 50-year sentence for two acts of shoplifting videos from Kmart. Under California's three-strikes law, Leandro Andrade's burglary convictions from the 1980s counted as the first two, and the prosecutor decided to charge the shoplifting incidents as strikes, which carry a mandatory sentence of 25 years each. The Supreme Court, citing *Rummel v. Estelle,* held that the sentences were neither disproportionate nor unreasonable (*Lockyer v. Andrade* 2003).

At the same time, Andrew Fastow, Enron's chief financial officer, negotiated a plea bargain for 10 years in prison. Fastow had been instrumental in fraud, which resulted in the largest bankruptcy in U.S. history at that time. He had worked the deals to launder loans through allegedly independent entities to make them appear as revenue for Enron, and he helped push the accountants to approve the deals and used the massive banking fees Enron paid to silence Wall Street analysts who asked questions about Enron's finances. Fastow was originally charged with 109 felony counts, including conspiracy, wire fraud, securities fraud, falsifying books, as well as obstruction of justice, money laundering, insider trading, and filing false income tax returns. The sentence was

negotiated in an environment in which getting tough on corporate crime was seen as a high priority (Leighton and Reiman 2004).

Class, Crime, and the Law

The rich and powerful use their influence to keep acts from becoming crimes, even though these acts may be more socially injurious than those labeled criminal. Further, they are also able to use mass-mediated communication to shape the public discourse and moral outrage about crime. In short, the corporate elite's relative monopoly over the airways allows them to act as so-called transmission belts for creating consensus over what is and is not a crime. For example, Jeffrey Reiman, in the eighth edition of *The Rich Get Richer and the Poor Get Prison* (2007), notes that multiple deaths that result from unsafe workplaces tend to get reported as accidents and disasters, whereas the term *mass murder* is reserved exclusively for street crime. Although there are differences between the two, especially in the level of intentionality, it is not clear that one should be a regulatory violation and the other a crime.

If the point of the criminal law is to protect people's well-being, then why was no crime committed in the 2005 deaths of 12 miners in West Virginia? "Time and again over the past four years, federal mining inspectors documented the same litany of problems at central West Virginia's Sago Mine: mine roofs that tended to collapse without warning. Faulty or inadequate tunnel supports. A dangerous buildup of flammable coal dust" (Warrick 2006, A4). In the two years before this explosion, the mine was cited 273 times for safety violations, one-third of which were classified as "significant and substantial," and "16 violations logged in the past eight months were listed as 'unwarrantable failures,' a designation reserved for serious safety infractions for which the operator had either already been warned, or which showed 'indifference or extreme lack of care'" (Warrick 2006, A4). This state of affairs seems to fit within the criminal law categories of knowing, reckless, or negligent, but most matters like this stay within the realm of administrative sanctions and the civil law.

Outside of mining, the situation is the same. From 1982 to 2002, the Occupational Safety and Health Administration (OSHA), which has primary responsibility for the nation's workplace safety, identified 1,242 deaths it concluded were related to "willful" safety violations. Only 7 percent of cases were referred for prosecution, however, and "having avoided prosecution once, at least 70 employers willfully violated safety laws again, resulting in scores of additional deaths. Even these repeat violators were rarely prosecuted" (Barstow 2003). One of the many barriers is that causing the death of a worker by willfully violating safety laws is a misdemeanor with a maximum sentence of six months in jail; therefore, such cases are of little interest to prosecutors. This level of punishment was established in 1970 by Congress, which has repeatedly rejected attempts to make it tougher; consequently, harassing a wild burro on federal lands carries twice the maximum sentence of causing a worker's death through willful safety

violations. Compare the lack of change in the punishment for a worker's death with the escalating toughness for all types of street crime, in which Congress's "tough on crime" attitude led to three-strikes laws, expansion of the number of strikable offenses, mandatory minimums, increasingly severe sentencing guidelines, and increased offenses eligible for the death penalty. Since the early 1990s, however, Congress has voted down all laws to increase penalties for workplace deaths, even recent modest proposals to increase the maximum penalty to 10 years (Barstow 2003).

In terms of class justice generally, much of the harmful and illegitimate behavior of the elite members of society has not traditionally been defined as criminal, but nearly all the harmful and deviant behavior perpetrated by the poor and the powerless, the working and middle classes, is defined as violating the criminal law. Thus, basing crime-control theory and practice on a neutral criminal law ignores the fact that the legal order and the administration of justice reflect a structural class bias that concentrates the coercive power of the state on the behaviors of the relatively poor and powerless members of society. These omitted relations of class justice reveal the importance of two systemic operations in the administration of criminal justice: selective enforcement and differential application of the law. Selective enforcement of harms by the law refers to the fact that most harm perpetrated by the affluent is "beyond incrimination" (Kennedy 1970). As for the harms committed by the politically and economically powerful that do come within the purview of criminal law, these are typically downplayed, ignored, or marginalized through differential application of leniency and/or compassion.

Similarly, criminologist Stephen Box suggests that one of the most important advantages of corporate criminals lies "in their ability to prevent their actions from becoming subject to criminal sanctions in the first place" (Braithwaite 1992, 89).

Although certain behaviors may cause widespread harm, criminal law does not forbid abuses of power in the realm of economic domination, governmental control, and denial of human rights. As we saw in the opening narrative of this entry, being a habitual offender is against the law in most areas, where "three strikes and you're out" applies to street criminals. But habitual offender laws do not apply to corporate persons (like GE) that can repeatedly commit serious crimes without being subjected to these statutes or to the legal possibility of a state revoking a corporation's charter to exist.

In some cases, harmful actions will be civil offenses rather than criminal ones, but the difference is significant because civil actions are not punishable by prison and do not carry the same harsh stigma. A plea to civil or administrative charges does not amount to an admission of guilt and thus cannot be used against a business in other related litigation. Other destructive behavior may not be prohibited by civil law or regulations created by administrative agencies. In this respect, the tobacco industry produces a product that kills 400,000 people each year, but its actions are not illegal, not a substantial part of the media campaign of the Office for National Drug Control Policy or Partnership for a Drug Free America, or even subject to federal oversight as a drug.

When corporations are charged, they can use their resources to evade responsibility. Criminologist James Coleman (1985) did an extensive study of the enforcement of the Sherman Antitrust Act in the petroleum industry and identified four major strategies that corporations employ to prevent full application of the law. First is endurance and delay, which includes using expensive legal resources to prolong the litigation and obstruct the discovery of information by raising as many motions and legal technicalities as possible. Second is the use of corporate wealth and political connections to undermine the will of legislators and regulators to enforce the law's provisions. Third is secrecy and deception about ownership and control to prevent detection of violations and make them more difficult to prove. Fourth are threats of economic consequences to communities and the economy if regulations are passed and/or fully enforced.

One of the classic statements on this topic, first referred to by former General and President Dwight D. Eisenhower as the "military–industrial complex," is a book by C. Wright Mills called *The Power Elite* (1956). He contended that an elite composed of the largest corporations, the military, and the federal government dominates life in the United States. Mills argued that these three spheres of power are highly interrelated, with members of each group coming from similar upper-class social backgrounds, attending the same private and Ivy League universities, even belonging to the same social or political organizations. In addition to their mutual "ruling class interests," corporate elites also make large political donations to both the Republicans and Democrats to ensure their access to the law-making process.

Reiman suggests that the result of these relations is that law is like a carnival mirror. It distorts our understanding of the harms that may befall us by magnifying the threat from street crime because it criminalizes more of the conduct of poor people. At the same time, it distorts our perception about the danger from crime in the office suites by downplaying and not protecting people from the harms perpetrated by those above them in the class system. As a consequence, both the criminal law and the administration of justice do "not simply *reflect* the reality of crime; [they have] a hand in *creating* the reality we see" (Reiman 1998, 57). Thus, to say that the criminal law appropriately focuses on the most dangerous acts is a problematic statement because the criminal law shapes our perceptions about what is a dangerous act.

Reiman also argues that the processing of offenders serves to "weed out the wealthy." Selective enforcement means that many harmful acts will not come within the realm of criminal law, and if they do, it is unlikely that they will be prosecuted, "or if prosecuted, not punished, or if punished, only mildly" (Reiman 1998, 57). This observation is consistent with the analysis in Black's highly referenced and acclaimed book *The Behavior of Law* (1976). Black sought to discover a series of rules to describe the amount of law and its behavior in response to social variables such as stratification, impersonality, culture, social organization, and other forms of social control. When it comes to issues of class, the variables of stratification and social organization are the two most relevant.

Black proposed that the law varies directly with hierarchy and privilege, so that the more inequality in a country, the more law. He also applied his proposition to disputes between two parties of unequal status and wealth. Based on a wide variety of cases, Black concluded there is likely to be more law in a downward direction, such as when a rich person is victimized by a poorer one. This means the use of criminal rather than civil law, for example, and a greater likelihood of a report, investigation, arrest, prosecution, and prison sentence. In contrast, when the wealthier harms the poorer, Black predicted there would be less law, meaning civil law, monetary fines rather than jail, and therapeutic sanctions rather than punitive ones. Further, Black argued that there is likely to be more law in the downward direction when an individual victimizes a group high in social organization, such as a corporation or the state. Conversely, less law and a pattern of differential application are likely to be the result of a corporate body or the state victimizing individuals or groups of individuals that have lower levels of social organization, such as poor communities.

Conclusion

Although attention has been paid to examples from occupational safety, the analysis provided here also applies to financial crimes, including several episodes of massive and widespread fraud. For example, Representative Frank Annunzio, who was chairman of the House Subcommittee on Financial Institutions that investigated the prosecution of criminals involved in the savings and loan (S&L) wrongdoings of the late 1980s, made the same points that Reiman and Black do in his opening remarks to one congressional hearing:

> Frankly, I don't think the administration has the interest in pursuing Gucci-clad white-collar criminals. These are hard and complicated cases, and the defendants often were rich, successful, prominent members of their upper-class communities. It is far easier putting away a sneaker-clad high school dropout who tried to rob a bank of a thousand dollars with a stick-up note, than a smooth talking S&L executive who steals a million dollars with a fraudulent note. (Hearings 1990, 23)

These comments highlight the difficulty and reluctance in prosecuting upper-class criminals even though the harm done is much greater than that due to street crime. Some S&L executives personally stole tens of millions of dollars and others were responsible for the collapse of financial institutions that needed government bailouts to the tune of $1 billion. The total cost of the S&L bailout ultimately climbed to about $500 billion, yet few S&L crooks went to prison, and the ones who received prison sentences got an average of two years, compared with an average of nine years for a bank robber (Hearings 1990).

After such expensive and widespread fraud, Congress briefly decided to get tough, but it soon removed all the regulations put in place to safeguard against similar fraud.

According to the authors of *Big Money Crime,* soon after the S&L crisis, Congress went on a wave of "cavalier" financial deregulation, creating the "paradox of increasing financial deregulation coming on the heels of the most catastrophic experiment with deregulation in history" (Calavita, Pontell, and Tillman 1997, 10). These actions set the stage for the 2002 financial crimes involving Enron, WorldCom, Global Crossing, Tyco, and several other billion-dollar corporations. Although a few of the responsible chief executives found themselves doing time behind bars, most of those involved in these frauds and crimes found themselves escaping, courtesy of class justice. At the same time, the victims of these crimes—workers, consumers, investors, retirees, and more—received little or no compensation, despite the fact that many lost their life savings.

Historically then, based on the past—long-term and short-term—and on the present, and given the prevailing political and economic arrangements, and barring a major revolution in the organization of multinational or global capitalism, class justice is looking very secure into the foreseeable future. It received a painful prick from the American populace after the collapse—and government bailout—of various Wall Street investment firms and major banks and insurers in 2008–2009; but very few if any of the custodians of what suddenly had become "toxic assets" ended up being prosecuted. To borrow the rhetoric of the time, Main Street was angry at Wall Street for the latter's misuse of investors' funds (in the form of "collateralized debt obligations" and other financial inventions), but expressions of anger and calls for additional financial regulation was as far as the matter went.

CORPORATE CRIME

Richard D. Hartley and Michael Shally-Jensen

The focus on, study of, and prosecution for corporate crime is a relatively new phenomenon—one that has recently gained wide public attention. For criminologists, "corporate crime" refers to acts in violation of the law that are committed by businesses, corporations, or individuals within those entities. Corporate crime is also closely associated with white-collar crime, organized crime, and state–corporate crime. Although most of us do not think of businesses, corporations, or presidents and CEOs of companies when we think of criminals, corporate and white-collar offenses actually cause more deaths, physical injury, and property loss than the Uniform Crime Report's eight serious index offenses together (Kappeler, Blumberg, and Potter 2000).

Since the beginning of the 21st century, we have observed unparalleled levels of corporate malfeasance and financial wrongdoing. The economic crisis of 2008–2009 highlighted the extraordinary risks Wall Street investment banks had been taking with other people's money. Federal and state officials investigating possible illicit activities by these banks (Goldman Sachs, among them) focused on counterinvestments made by the banks' own top executives against faulty investment products (derivatives) they were selling to their clients, as well as on the likelihood that the banks hid risks from the rating agencies that evaluate financial products for consumers. Several years earlier, the bankruptcies of WorldCom and Enron raised public ire about the legitimacy of reported corporate profits. Xerox, for example, doctored its books to show $1.4 billion more in profits than was actually there, and WorldCom itself overstated its profits to the tune of $3.8 billion. The top-level officers in these companies have also been accused and convicted of wrongdoing. Some top executives have enjoyed the rewards of the sales of their companies' stocks prior to filing for bankruptcy and have been charged with fraud in the process. Scott Sullivan of WorldCom made $35 million this way; Kenny Harrison and Kenneth Lay of Enron made $75 million and $220 million, respectively, from the sales of company shares; and Gary Winnik of Global Crossing made $500 million in the two years before his company went bankrupt ("Corporate America's Woes, Continued" 2002). The accounting firms in charge of these companies' books were also implicated in many of the scandals. Three accounting firms—Arthur Andersen LLP, KPMG, and Ernst and Young—were all charged with violations, and Andersen was forced out of business because of it.

Companies and their employees have traditionally been able to safeguard themselves from government inquiries, the media, and shareholders because of the authority and influence they have over the information they release about company transactions. These companies are complex organizations to the extent that they can engage in shady business dealings while at the same time keeping some employees inside the corporation, and many shareholders outside of the corporation, blind to this devious corporate conduct (Simon 2006). Criminal actions of this nature continue because of the benefits the corporations enjoy and the minimal risks of being caught and punished for wrongdoing (Gray, Frieder, and Clark 2005). Others, however, have suffered some punishment; former Tyco CEO Dennis Kozlowski was sentenced to 8 to 25 years for misappropriating $400 million of the company's money. John and Tim Rigas are currently serving 15 and 20 years respectively for fraud and conspiracy related to their company, Adelphia. Ex-Enron CFO Andrew Fastow received a 6-year prison term for his role in the company's wrongdoing. Even Martha Stewart served 5 months in prison for obstructing justice in the investigation of her sale of ImClone stock.

The costs of corporate crime are beyond compare, totaling more than the combined price of all other crime *plus* the cost of operating the criminal justice system (Simon 2006). Actual costs are hard to gauge; however, research undertaken by Congress

estimates the price of corporate crime at roughly $200 billion annually (Coleman 1985). Couple this with the fact that penalties are rarely imposed (or, if they are imposed, are not severe enough to guarantee compliance in the future), and it becomes obvious why corporate malfeasance continues.

Corporate Crime Typologies

It is necessary to distinguish between corporate and white-collar crime. The latter offenses are those "socially injurious and blameworthy acts committed by individuals or groups of individuals who occupy decision-making positions in corporations and businesses, and which are committed for their own personal gain against the business, and corporations that employ them" (Frank and Lynch 1992, 17). In other words, white-collar crimes are largely individual crimes benefitting the perpetrator or perpetrators. The case of Bernard Madoff, who ran the largest Ponzi scheme in U.S. history without the knowledge of others in his firm, is a recent example of white-collar crime. Corporate crimes, on the other hand, are those "socially injurious and blameworthy acts, legal or illegal, that cause financial, physical, or environmental harm, committed by corporations and businesses against their workers, the general public, the environment, other corporations and businesses, the government, or other countries" (Frank and Lynch 1992, 17).

This entry focuses on corporate crime. Such crime, at least for present purposes, encompasses those acts that are beneficial not for the individuals inside the corporation but instead for the corporation itself. Some overlap with white-collar offenses does exist, however, considering that the individuals who engage in these behaviors and represent the corporations are usually in a position to benefit from the illegal actions they undertake. Likewise, the line between organizational crime and corporate crime is indistinct, since criminals can often start corporations with the intention of committing crime or laundering their earnings from crime. This entry focuses mainly on the corporations themselves and provides more limited coverage of the individuals in the corporations.

Historical Background

Corporations have been in existence since the time of the Romans (Geis 1988). During this time, corporations existed in order to set up and control such legal entities as universities, churches, and associations. The king, in other words, gave corporate status to these entities, essentially granting them the ability to have legislative and judicial powers over themselves (Clinard and Yeager 1980). The East India Company is probably the first entity with such recognized corporate powers. Established in 1602, it is said to have been the first multinational corporation that issued stocks (Mason 1968). In the four centuries following the genesis of the East India Company, the corporation developed and its characteristics took shape. Legally speaking, a corporation had the following characteristics: "it was a body chartered or recognized by the state; it had the right to hold property for a common purpose; it had the right to sue and be sued in a common

name; and its existence extended beyond the life of its members" (Clinard and Yeager 1980, 22). Corporations of the 17th and 18th centuries engaged in many egregious acts. Using and trading African Americans as slaves and destroying Native American culture are two glaring examples (Sale 1990).

The Industrial Revolution and expanding enterprise in the 18th and early 19th centuries produced very wealthy and influential capitalist corporations. These effectively avoided regulation and control even though they engaged in such activities as fraud, price gouging, labor exploitation, manipulation of stocks, and maintaining unsafe work environments (Myers 1907; Clinard and Yeager 1980). The genesis of corporations in America was similar; such entities as towns, churches, associations, and universities became trusts with certain legal powers and authority. Colonial Americans disliked many of the British corporations that were ruling the American colonies. The Revolutionary War was fought in part to rid the colonies of British monopolistic rule. After the signing of the Declaration of Independence, Adam Smith ([1776] 1998) stated that the idea that corporations were needed for the betterment of government was unfounded. For the next 100 years, corporate charters, and therefore control over corporations and trusts, was rigid. Public opposition was fierce, and very few charters were approved; even when they were approved, legislatures limited the number of years they could last. At the expiration date, the corporation would be terminated and its shareholders would enjoy the division of assets. The colonists wanted to be free from the exploitation they suffered under British rule. After the Revolutionary War, the Founding Fathers were nervous about the power of corporations. Through various legal means, they limited the role of corporations in society solely for business purposes. Corporations could not interfere in other aspects of society. Several conditions were set forth regarding the establishment and activities of corporations: Corporate charters (licenses to exist) were granted for a limited time and could be revoked promptly for violating laws. Corporations could engage only in activities necessary to fulfill their chartered purpose. Corporations could not own stock in other corporations or own any property that was not essential to fulfilling their chartered purpose. Corporations were often terminated if they exceeded their authority or caused public harm. Owners and managers were responsible for criminal acts committed on the job. Corporations could not make any political or charitable contributions or spend money to influence lawmaking (Reclaim Democracy 2004).

The nature of corporations changed in Britain in 1844, with the passage of the UK Joint Stock Companies Act, which essentially allowed a corporation to define itself and its purpose. Investors in a corporation could now collect funds for a specified purpose. Control over corporations at this point moved from being a responsibility of the government to one of the courts. Limited liability was awarded to shareholders in 1855, meaning that the assets of individuals in the corporation would be protected from any bad behavior in which the corporation might engage. A landmark U.S. court decision in 1866 in the case of *Santa Clara County v. Southern Pac. R. Co.* (1886) granted

corporate personhood, which meant that corporations could now enjoy many of the rights and responsibilities of individuals. These rights included ownership of property, signing of binding contracts, and payment of taxes.

Several court cases would come to shape the idea of the corporation in the early formation of the republic. In the case of *The Rev. John Bracken v. the Visitors of William and Mary College,* the central issue was whether or not the charter grant of William and Mary College could be altered. The court decided that the corporation (the college) could indeed make changes—in other words, reorganize the curriculum and faculty—and that this would not violate the original charter.

The U.S. Supreme Court heard arguments on a similar matter in 1818. In the case of *Dartmouth College v. Woodward* (1819), Chief Justice John Marshall, the very same man who had argued in favor of the changes to the charter of William and Mary College, had to decide whether the state of New Hampshire could rewrite the charter of Dartmouth College, thereby intervening in its academic operations. Justice Marshall, writing for the majority, declared that it most certainly could not.

Less than 10 years later, the Supreme Court decision in the case of *Society for the Propagation of the Gospel in Foreign Parts v. Town of Pawlet* (1830) expanded the rights of corporations to be similar to those of natural persons.

During the Industrial Revolution, the United States was rapidly expanding both economically and geographically. Production and manufacturing swelled, as did international trade. In order to protect themselves from competition, large manufacturing businesses became corporations. These corporations began to take over not only the business world but also U.S. courts, politicians, and society (Brown 2003). Corporations soon tried to unchain the fetters that controlled their business dealings. It should not come as a surprise that corporations were granted personhood through the rulings of many of these court cases: the justices of the Supreme Court had loyalty to the propertied class.

The Nature of a Corporation

A corporation is a legal entity comprising persons but one that in some ways exists apart from those persons. It is this separation that gives corporations distinctive authority and control over its practices. The most important aspects of incorporation include the ideas of limited liability and perpetual lifetime. Limited liability gives members of a corporation limited personal liability for the debts and actions of the corporation. The key benefits of limited liability include the following:

1. A corporation has separate legal entity and distinction from its shareholders and directors, which means that both the directors and the company have completely separate rights and existences.
2. The liability of shareholders is limited to the amount unpaid on any shares issued to them.

3. Shareholders cannot be personally liable for the debts of the company.
4. Creditors can look to the company for payment, which can only be settled out of the company's assets; thus generally, the personal assets of the shareholders and directors are protected.
5. The company's name is protected by law; no one else is allowed to use it in that jurisdiction.
6. Suppliers and customers can have a sense of confidence in a business (Benefits of a Limited Company 2006).

Perpetual lifetime is also important to a corporation because it means that its structure and assets are permitted to exist past the lifetime of its members. These features give corporations tremendous power and ability in the business world. Individuals who own shares of stock in a corporation are called shareholders; nonprofit organizations do not have shareholders. Usually, a corporation will have a board of directors overseeing operations for the shareholders and administering the interests of the corporation. If a corporation were to dissolve, the members would share in its assets, but only those assets that remained after creditors were paid. Again though, through limited liability, members can be held responsible only for the amount of shares they had in the corporation.

The Corporation Today

Corporations today are looked at in both a positive and negative light. They are seen as the heart of capitalist and free-market economies and an outgrowth of the entrepreneurial nature of U.S. society. However, they are also seen as the mechanism by which exploitation of the people in the labor market exists. David O. Friedrichs (1996) best describes what corporations mean for society today:

> Many people hold corporations in high esteem. Millions of people are employed by corporations and regard them as their providers. Many young people aspire to become corporate employees. Corporations produce the seemingly endless range of products we purchase and consume, and they sponsor many of the forms of entertainment (especially television) we enjoy. They are also principal sponsors of pioneering research in many fields and a crucial element in national defense. Corporations are important benefactors of a large number of charities, public events, institutions of higher learning, and scientific enterprises. And of course the major corporations in particular, with their large resources, are quite adept at reminding us of their positive contributions to our way of life. (67)

Indeed, the corporation of the 21st century has its interests in profits and growth. The large corporations of today are vast and have enormous wealth. Yearly profits from U.S. corporations were estimated some years ago to be about $500 billion annually (Korten 1999), a figure that has only increased since. The cost of industry to U.S. taxpayers,

however, is easily more than $2.5 trillion per year (Estes 1996). Corporate exploitation of the citizenry and the workforce in society is not a shock, given the fact that profits are the main objective of the corporation. Stockholders and managers alike have a general interest in maximizing profits at the expense of others. Since corporate management usually holds a hefty share of the company's stock, managers tend to proceed with their own interests in mind, thereby augmenting their own wealth while common stockholders and workers consume the costs.

Corporate America is also well positioned to advance its interests through political corruption. Because of their abundant resources, corporations can have enormous influence on the polity and the outlining of public policy. The people at the top of corporations, the government, and the military all have connections to one another that allow them to advance common interests. If it is hard to believe that the American political system could be bought, consider that corporate donations to both political parties account for over 70 percent of their fund-raising contributions (Greidner 1991). Corporations have also been able to hide most of the political influence they enjoy and remain free from liability because the government has deregulated control over many of the industries that these corporations control.

The corporations of today have also been able to gain increasing control over key economic and political institutions because of mergers. The large corporations are conglomerates, meaning that they have gobbled up smaller companies and multiple industries, becoming producers of a wide array of products. These mergers and takeovers have led to corporations being able to cross-subsidize, meaning that they can sustain one business with the profits from another. Conglomerates have increased in size, number, and market share owing to multibillion-dollar mergers occurring in the 1980s. An outcome of these mergers has been the ability of these companies to expand their businesses geographically to the point where they now compete in the global marketplace and have widespread foreign and domestic assets. The increasing globalization of the world marketplace has allowed corporations to further violate laws in the name of profit without taking responsibility for their actions. By becoming multinational, corporations can, for example, violate the antitrust laws of a country in which they do business while obeying the antitrust laws of their own country.

Although Third World countries and the citizens who inhabit them do enjoy some advantages from globalized economic business, they too pay a penalty in terms of workforce abuses. As the global marketplace expands, the wrongdoings of these multinational corporations are likely to become more pronounced (Friedrichs 1996).

Laws and Legal Origins of Corporate Crimes

Although images of crime and criminals today have increasingly included the actions of business executives and members of the upper class, this has not always been the case. Corporations historically have been able to avoid prosecution because of the limited

liability they have written into their charters. It has also been difficult to bring charges against an entity because of a lack of a body to punish and because the populace finds it difficult to grasp the idea that corporations, which are not persons, could offend. Nevertheless, there has been a rapid rise in the criminal liability that corporations can be accountable for under various laws concerning securities, antitrust violations, and the environment. Charges against corporate offending are normally levied against individuals in the corporation; however, the corporation itself can be held responsible and sanctioned for certain offenses. At both the federal and state levels, legislation has been promulgated against corporate criminal offenses. The U.S. Constitution, under its commerce clause, allows the control of corporate offenses by the federal government. Numerous federal agencies also play a part in enforcing this legislation. Such agencies as the Internal Revenue Service, the Environmental Protection Agency, the Federal Bureau of Investigation, the Secret Service, the Securities and Exchange Commission, and others attempt to control and regulate corporate activity.

Early notions of liability held that a corporation could not have criminal charges applied to it. Holding a corporation liable was difficult for a number of reasons (Khanna 1996). First, corporations are fictional entities, not individuals. Second, there are moral problems in proving that a corporation is capable of formulating criminal intent. Third, courts had trouble making corporations criminally responsible for acts not listed in their charters. Finally, difficulty stemmed from criminal procedural rules that the accused be brought into court. In the United States, two doctrines have been of primary use in holding corporations criminally responsible: the Model Penal Code, section 2.07, which makes the corporation responsible for the behaviors of leaders in the organization, and *respondiat superior,* which holds the employer responsible for the criminal acts of its employees. Even though these two doctrines are in place, many prosecutors fail to act against corporations because the shareholders, not the corporate elite, will suffer most from any punishment a corporation receives. The Supreme Court applied the *respondiat superior* doctrine initially in the case of *New York Central & Hudson River Railroad v. United States,* where the company was not applying mandated shipping rates to all customers equally. The Supreme Court decided that this action violated the Elkins Act, and the corporation was subject to penalties under that act.

Other courts have also made similar rulings under the *respondiat superior* doctrine; however, critics have pointed out that the doctrine is better suited for civil torts than criminal liability. Section 2.01 of the Model Penal Code ameliorates this criticism because it enforces liability for the actions of corporate employees. Today, there are only two instances when corporations cannot be held liable for criminal actions: if the corporation is incapable of committing the crime (these would involve such acts as arson) or where there is no fine attached as punishment for the action. The Model Penal Code outlines three categories of corporate offenses. The first requires *mens rea,* or a guilty mind, and traditionally comprises individual offenses, including embezzlement

and fraud. Corporations may be charged in these cases if "the offense was authorized, requested, commanded, performed or recklessly tolerated by the board of directors or by a high managerial agent acting in behalf of the corporation within the scope of his office or employment" (Model Penal Code § 2.07 [1] [c]). The second category of offenses includes such acts as collusion calling for *mens rea* that can be committed by corporations. Corporations can be punished for these offenses if, during the scope of employment, an agent acted to benefit the corporation. Under § 2.07 (5) of the Model Penal Code, however, the corporation may not be punished if "the defendant proves by a preponderance of evidence that the high managerial agent having supervisory responsibility over the subject matter of the offense employed due diligence to prevent its commission." The third category covers the strict liability crimes. Under the Model Penal Code, and on the basis of the *respondeat superior* rule, corporations can be held liable consistent with strict liability principles; in other words, there is no need to show intent to benefit a corporation.

The case of *New York Central & Hudson River Railroad v. United States* provides the framework for the idea that a corporation can be held liable for the deeds of agents acting in the capacity of their jobs. The notion of agents acting within their employment capacity is important in charging liability to the corporation. Other components of imputing liability are that employees have the authority to carry out the behavior in question. This authority "attaches when a corporation knowingly and intentionally authorizes an employee to act on its behalf" (Viano and Arnold 2006, 314). The government also has to show that the individual whose actions are in question does indeed have a relationship to the agency (*United States v. Bainbridge Management* 2002). The concept of acting within the scope of an agent's authority has generally been determined in different ways with regard to federal and state control. Federally, corporate criminal liability can be imputed based on the responsibilities of the agent, not his or her rank (*In re Hellenic* 2001). The goal of the government is to impute liability on the corporation through an action of an employee.

At the state level, some states have limited assigning criminal liability only to those in a high managerial position. For instance, 18 Pa. C.S.A. § 307 states that liability may be imputed if "the commission of the offense was authorized, requested, commanded, performed or recklessly tolerated by the board of directors or by a high managerial agent acting in behalf of the corporation within the scope of his office or employment." Other states have applied liability through judicial precedent *(North Dakota v. Smokey's Steakhouse, Inc.* 1991). Further, others have been able to impute liability in cases even where high-level management disapproved of the employee's actions (*New Hampshire v. Zeta Chi Fraternity* 1997; *Ohio v. Black on Black Crime, Inc.* 1999). However, corporate criminal liability will not be imposed unless the actor behaved in a manner deliberately intended to benefiti the corporation. This can be the case even if, for instance, the corporation did not actually benefit. The corporation would not be criminally liable where the employee's

behaviors were counter to the benefit of the corporation (*Standard Oil Company of Texas v. United States* 1962).

Recent Legislation

Sarbanes-Oxley Act

The Sarbanes-Oxley Act of 2002, also called the Public Company Accounting Reform and Investor Protection Act of 2002, was enacted in response to a number of questionable business practices by major corporations (Sarbanes-Oxley Act of 2002, Pub. L. No. 107–204, 116 Stat. 804 [2002])—specifically, the Enron, WorldCom, and Tyco debacles, which caused a deterioration in the trust of the accounting and reporting practices of these companies. Included in this legislation were increases in punishments under the White Collar Crime Penalty Enhancement Act. The penalty increases included longer prison sentences for those found guilty of certain Employee Retirement Income Security Act (ERISA) infractions. In addition, falsely certifying Securities and Exchange Commission (SEC) reports became criminal under the Sarbanes-Oxley Act. In all, nearly a dozen sections are included in the act, obligating certain accountabilities of corporate officials and mandating penalties for their violation. The act also set up the Public Company Accounting Oversight Board, whose charge it is to regulate, inspect, and discipline accounting firms. Major provisions of the Sarbanes-Oxley Act include

1. Obligation for public companies to assess and give details of the efficiency of their fiscal reporting
2. Requirement that CEOs and CFOs certify their fiscal reports
3. Increased penalties, both civil and criminal, for security law infringement
4. Stipulation that no personal loans can be given to any executive officer
5. Requirement of independent auditing committees for companies registered on stock exchanges
6. Guarantee of back pay and compensatory damages, and protection of employees who act as whistleblowers

Criminal Antitrust Penalty Enhancement and Reform Act

Legislation against antitrust violations is not new. The Sherman Antitrust Act was promulgated in 1890 to place a limit on monopolistic practices. Although this act was, for the most part, unenforced for the last 100 years, President George W. Bush signed the Criminal Antitrust Penalty Enhancement and Reform Act in 2004. This act essentially raised the upper limit penalties in cases of corporate crime to $1 million and 10 years imprisonment for convicted individuals and $100 million fines for corporations found guilty of antitrust violations. Corporations and their agents may now face severe penalties if convicted.

Types of Corporate Crime

As stated earlier in this chapter, corporate crime involves injurious acts that result in physical, environmental, and financial harms, committed by entities for their own benefit (Frank and Lynch 1992). Although there is overlap with white-collar crime, occupational crime, and other types of crime, corporate crime encompasses those behaviors that are engaged in by a corporation for its benefit. Corporate crime can result in political and economic consequences as well as physical harm, injury, and death to persons. Friedrichs (1996) sets forth a comprehensive list of corporate offenses that includes fraud, tax evasion, price fixing, price gouging, false advertising, unfair labor practices, theft, monopolistic practices, toxic waste dumping, pollution, unsafe working conditions, and death.

Fraud, Tax Evasion, and Economic Exploitation

Fraud, tax evasion, and economic exploitation have serious consequences for society and the citizenry because they allow corporations to raise their profits, lessen their tax burdens, and at the same time underpay their employees. Fraud covers violations of the Internal Revenue Code and involves corporations defrauding the government and taxpayers, usually through contractual agreements they hold with the government.

The war in Iraq that began in 2003 provided numerous instances, in an attempt to make a larger profit, of companies overcharging the U.S. government—and ultimately taxpayers—for services rendered. A report by Congress shows that the Department of Defense had 149 contracts in Iraq with 77 different companies that were worth approximately $42 billion; this report also shows that, according to government auditors, Halliburton, the largest contractor in Iraq, and its subsidiaries, namely Kellogg, Brown, and Root, submitted questionable bills in the amount of $1.4 billion (U.S. Senate Democratic Policy Committee 2005). Testimony from former Halliburton employees revealed that the company charged the U.S. government $45 for cases of soda, $100 to clean 15-pound bags of laundry, and $1,000 for video players; it also torched and abandoned numerous $85,000 trucks instead of making the minor repairs the trucks needed.

Other examples of fraud include (1) the effort to clean up the damage to the Gulf Coast caused by Hurricane Katrina, where a report to Congress identifies 19 government contracts worth about $8.75 billion that overcharged, wasted, or otherwise mismanaged the money received from the government), and (2) the health care industry, where, for example, in July 2006, Tenet Healthcare agreed to pay back $900 million to the federal government for violations of Medicare billing (although the company is alleged to have stolen $1.9 billion).

Recently, Congress and the Securities and Exchange Commission (SEC) investigated the actions of the Wall Street investment firm Goldman Sachs in the lead-up to the 2008–2009 financial crises. Goldman was alleged to have sold high-risk or faulty investment products (specifically, a kind of mortgage-backed security) while at the same

time hedging its bets that the products would fail in the market, thus allowing the firm to profit at investors' expense. There were also allegations that Goldman (and others) deceived the rating agencies that assist consumers in evaluating investment products. By July 2010, Goldman had decided to settle the case with the SEC—for the sum of $500 million. A week later, Congress passed, and President Barack Obama signed, the Dodd-Frank Wall Street Reform and Consumer Protection Act, a law aimed at restricting the kinds of practices that caused Goldman to be investigated.

Price Fixing, Price Gouging, and False Advertising

With price fixing, companies that are supposed to be competitors collude to manipulate the cost of items, keeping them artificially high and thereby maximizing profits. Archer Daniels Midland (ADM), among other companies, was convicted of price fixing commodities used in common processed foods. The company paid a $100 million antitrust fine. Similarly, Hoffman-La Roche, a vitamin company, was fined $500 million for attempting to fix the price of some vitamins worldwide, and several music industry firms have been accused of fleecing consumers to the tune of $480 million in CD overpricing (Simon 2006).

Price gouging involves taking advantage of consumers who are at risk, raising prices during times of scarcity of products, or charging the highest price possible because of monopolies, manipulation of the market, or biases in the law. U.S. corporations have long been accused of taking advantage of the poor. "Many food chains find that it costs 2 or 3 percent more to operate in poor neighborhoods, yet low-income consumers pay between 5 and 10 percent more for their groceries than those living in middle-income areas" (Simon 2006, 12). During times of scarcity of products, price gouging is frequent. In 2004, the southeastern coast of the United States was hit by a number of hurricanes. In the aftermath of the storms, the Florida Department of Agriculture and Consumer Services received more than 3,000 complaints of price gouging by hotels, gas stations, and other retail service providers (Simon 2006).

False advertising is nothing new, either. Consumers in the United States have been deceived into purchasing billions of dollars of products or services that never lived up to their claims. Food products giving false nutritional values and products claiming certain utility through false demonstrations are examples of false or deceptive advertising. Before reforms were enacted in 2009, credit card companies routinely promoted cards with no fees in bold print and, in small type, hid additional costs and contradictory information, including calculations of interest for new purchases.

Corporate Theft, Exploitation, and Unfair Labor Practices

A typical scenario of white-collar offending involves employees stealing from their employers, but the opposite is sometimes also true. Examples are companies that bilk employees out of proper overtime pay, violate minimum wage laws, fail to make Social

Security payments, or use employee pension funds improperly. Not allowing labor to unionize, strike, or collectively bargain are three examples of unfair labor practices. The result is a loss of millions of dollars by employees who cannot negotiate or who are passed over for promotion on the basis of race, ethnicity, gender, or age. One of the largest alleged exploiters of labor in the United States is Wal-Mart. The allegations of wrongdoing against Wal-Mart are numerous and varied (Buckley and Daniel 2003). Charges of unfair labor practices make up most of the charges filed against the company, although there have also been reports of violations of health coverage among Wal-Mart employees (Bernhardt, Chaddha, and McGrath 2005).

Unsafe Environmental Practices

The most prevalent form of corporate crime may be pollution. Corporations account for a large share of environmental violations. As of 2010, corporations were manufacturing more toxic waste than ever, in excess of 600 pounds per person annually, and improper disposal of this deadly waste occurs in about 90 percent of cases (Friedrichs 1996). The detrimental consequences of this are obvious: about 25 percent of U.S. residents will get cancer in their lifetimes, and a study by Cornell University finds that roughly 40 percent of deaths worldwide can be attributed to environmental pollutants (Segelken 2006). Pollution has also been linked to health problems other than cancer—things like birth defects, heart and lung disease, and sterility (Brownstein 1981). The Exxon Valdez oil spill in 1989 and the BP–Deepwater Horizon spill in 2010 are two of the worst cases of environmental pollution in world history. In 1991, Exxon pleaded guilty to criminal charges and paid a $100 million fine, followed three years later by payment of $5 billion in punitive damages. In the case of BP–Deepwater Horizon, investigations were ongoing as of mid-2010; but even in the early stages questions were raised about the readiness and safety status of key pieces of equipment used by the company in extracting oil from the Gulf of Mexico.

Unsafe Consumer Products

Again, corporations may not intend to harm consumers, but their desires to maximize profits often lead them to cut corners when it comes to product safety. Everything from the food we eat, to the medicines we take, to the vehicles we drive, to any of the products we use on a daily basis can be dangerous to our health and well-being. According to the Consumer Product Safety Commission (2003), whose charge it is to protect the public from unreasonable risks of serious injury or death, injuries, deaths, and property damage from consumer product incidents cost us more than $700 billion annually. Deaths occurring from unsafe products or product-related accidents are alleged to number 70,000 annually (Consumer Product Safety Commission 2003). Although the FDA promulgates the regulation and proper labeling of food products, corporations seem to lure us into eating unhealthy and mislabeled foods that may, because of processing, lead to many preventable diseases.

Consumer products imported into the United States from foreign companies have fueled a number of recent safety warnings. According to Schmidt (2007), roughly 25,000 shipments of food arrive in the United States each day from over 100 countries; the FDA inspects about 1 percent of these imported foods, down from 8 percent in 1992. The U.S. Department of Agriculture, on the other hand, inspects about 16 percent of imported meats and poultry, but about 80 percent of the U.S. food supply is the responsibility of the FDA (Schmidt 2007). The Centers for Disease Control and Prevention (CDC) estimates that there are 5,000 deaths and 76 million illnesses caused by unsafe food in the United States annually (Schmidt 2007). Funding for FDA food safety has increased in recent years, but it is still not adequate.

Recently, the pharmaceutical industry has been one of the main culprits in much of the unsafe manufacturing and distribution of products that have a variety of adverse consequences for users, one of which is death. The pharmaceutical industry had profits of $35.9 billion in 2002, which accounted for half of the profits of all the Fortune 500 companies in that same year (Public Citizen's Congress Watch 2003). Despite these profits and the exorbitant salaries received by the CEOs of these companies, the nation is not necessarily healthier because of the behaviors of some corporations in this industry. When pregnant women used the drug thalidomide in the 1960s, many of their babies were born with severe defects; this was an early example of the harmful effects that unregulated and untested drugs can have. Dow Corning provides another example of a corporation that did not conduct adequate testing or divulge the potential harmful effects of the silicone breast implant, one of its products, before putting it on the market. More recently, Vioxx and Bextra, two drugs used for treating arthritis and pain, were found to increase the risk of heart attack or stroke, and the drug Prozac and similar antidepressants were found to be linked to higher rates of suicide among youth. Women who took hormone replacement drugs (to relieve symptoms of menopause) were discovered to be at risk of developing breast cancer (Mintzes 2006).

The Consumer Product Safety Commission is responsible for overseeing over 15,000 products for the public's protection. More than 800 persons die annually from materials that are not protected against flammability, and another 800 perish and 18,000 are injured from unsafe equipment (Consumer Product Safety Commission 2003). The bottom line is that these corporations are more worried about their profits than the health and safety of the consumers who purchase them. Even with tougher laws, increased prosecution, heftier fines, and negative publicity, these companies have been unaffected and continue to be the most profitable corporations in the nation.

Unsafe Working Conditions

In 2003, the Bureau of Labor Statistics, a division of the U.S. Department of Labor, reported 4.4 million work-related illnesses and injuries (Reiman 2007). According to Reiman (2007), "Much or most of this carnage is the consequence of the refusal of management to pay for safety measures, of government to enforce safety, and sometimes of

management's willful defiance of existing law" (82). Although accurate statistics are hard to come by, deaths caused by inhalation of asbestos—and the fatalities from unsafe conditions in the chemical, mining, and textile industries throughout our history—speak volumes about the numbers of persons who have died prematurely due to unsafe work environments.

Conclusion: The Study of Corporate Crime

Why is it important to study corporate crime? The primary reasons for doing so, and doing more of it, are as follows:

1. There is still debate about whether current research and theorizing about crime can extend to white-collar and corporate criminals.
2. There has been a lack of focus on enforcement of these crimes.
3. With an increase in globalization of companies, there will be more opportunities to offend unless laws against corporate criminal liability are further formalized.
4. Despite increased pressure to punish corporate criminals, little funding has been allocated to the control and prevention of white-collar and corporate offending by comparison with that dedicated to street crime.
5. Because many large corporations have made headlines owing to their engagement in egregious behavior, the public has shown a renewed interest in the subject of corporate crime.
6. The impact of corporate offending regarding death and monetary loss amounts to a far greater detriment to society than all eight Uniform Crime Reports index offenses (i.e., homicide/manslaughter, robbery, rape, assault, burglary, larceny/theft, motor vehicle theft, and arson) added together.
7. If we can increase the public's appreciation of the seriousness of corporate offending, the result may be increased pressure on the legislature and criminal justice system to give higher priority to the enforcement of laws against these offenses.

CRUEL AND UNUSUAL PUNISHMENT

William L. Shulman

The Eighth Amendment to the U.S. Constitution, in one of its major pronouncements, prohibits the imposition of cruel and unusual punishment. Although most of the issues addressed by the U.S. Supreme Court regarding the interpretation of this clause center on applications of capital punishment, the true battleground has concerned something different. The question of whether the Eighth Amendment requires the Court to strike down sentences of any type as being "disproportionate"—that is, sentences that seem to be greater than the crime warrants—has been a contentious and confusing one with regard to which the Court has struggled to define its role generally and to articulate a test or standard when it has chosen to rule on the proportionality of sentences.

Background

In the Court's own words, such law as it has established in the proportionality area is a "thicket of Eighth Amendment jurisprudence" and has not been "a model of clarity" (*Lockyer v. Andrade* 2003). Although the Court has found death sentences to be disproportionate in crimes other than murder (*Coker v. Georgia* 1977) and disproportionate where the defendant is either mentally retarded (*Atkins v. Virginia* 2002) or a juvenile (*Roper v. Simmons* 2005), it has struggled to define its involvement in noncapital sentences.

For a long period extending through the 20th century, it appeared that the Court was prepared to intervene only in a non–death sentence if that sentence involved something harsh and unusual in addition to incarceration. In *Weems v. U.S.* (1910), for example, the defendant received a 12-year sentence to be served in hard and painful labor, with the defendant chained at the wrists and ankles, for the crime of falsifying a public document. In addition, the punishment included the loss of civil rights such as parental authority and permanent surveillance by the government. The Court, in striking down the sentence as a violation of the Eighth Amendment, noted that other more serious crimes in the jurisdiction were punished less severely; it suggested that the punishment was not just but was of "tormenting" severity (*Weems v. U.S.* 1910, at 381).

Weems notwithstanding, the cases of *Rummel v. Estelle* (1980) and *Hutto v. Davis* (1982) appeared to represent the norm of the Court's approach to this issue. William James Rummel was charged under Texas law with obtaining $125 under false pretenses, a felony in Texas. Moreover, because Rummel had previously been convicted of fraudulent use of a credit card to obtain $80 worth of goods and with passing a forged check in the amount of $28.36, he qualified under Texas law as a habitual criminal. Rummel was prosecuted and convicted under that recidivist statute and given the mandatory life sentence the statute provided. The life sentence under Texas law involved the possibility that the defendant could be paroled in as early as 12 years, a factor the Court thought important in assessing the true nature of the punishment.

The Court, in reviewing and denying Rummel's Eighth Amendment challenge, stated that to the extent that proportionality claims had been successful, they had been raised in the context of capital cases and had been a function of the Court's long-standing view of the unique nature of death as a punishment. The Court further stated that non–death sentence challenges had been successful only exceedingly rarely and involved an unusual corporal type of punishment like that found in *Weems*. The *Rummel* Court could not have been clearer when it stated, "Given the unique nature of the punishments considered in *Weems* and in the death penalty cases, one could argue without fear of contradiction by any decision of this Court that for crimes concededly classified and classifiable as felonies, that is, as punishable by significant terms of imprisonment in a state penitentiary, the length of the sentence actually imposed is purely a matter of legislative prerogative" (*Rummel v. Estelle* 1980, at 274).

Two years after *Rummel,* the Court decided in *Hutto* that a prison term of 40 years and a fine of $20,000 for possession and distribution of approximately nine ounces of marijuana was not disproportionately in violation of the Eighth Amendment and was a matter of legislative prerogative. The fact that the opinion was per curiam (signed by the Court as a whole and not authored by any one justice) seemed to underscore the strength of the Court's hands-off approach.

Key Events

The key event occurring just a year after *Hutto* was the Supreme Court case of *Solem v. Helm* (1983), in which the Court seemingly broke with, if not clear precedent, at least with the strong tenor of its prior proportionality cases. *Solem,* which dealt with a similar situation to *Rummel,* announced what is clearly a proportionality test to assess the constitutionality of noncapital sentences under the Eighth Amendment.

The *Solem* test contained three objective factors a court should consider in determining if the sentence imposed is consistent with the Eighth Amendment. First, a court should look to the gravity of the offense and the harshness of the penalty. Second, a court should compare the sentences imposed on other criminals in the same jurisdiction. Finally, courts should compare the sentences imposed for commission of the same crime in other jurisdictions.

When the Court applied this three-pronged test to the facts of *Solem,* it held the sentence of life without parole to be disproportionate to the crime involved and cruel and unusual in violation of the Eighth Amendment. First, Helm, the defendant, was convicted of the offense of writing a "no account" check for $100. This, in turn, triggered the application of South Dakota's recidivist statute owing to his prior record of six nonviolent felonies. Under the statute, a defendant would receive a mandatory life sentence without the possibility of parole (unlike *Rummel,* in which parole was a possibility). In assessing the gravity of the offense in relation to the harshness of the penalty, the Court clearly came down on the defendant's side.

In terms of the application of the second part, the Court noted that in South Dakota, Helms was sentenced to the same punishment reserved for much more serious crimes such as murder, kidnapping, first-degree rape, and other violent crimes. Finally, in assessing how the defendant would have been treated in other jurisdictions, the Court noted that in 48 of the 50 states, he would have received a less severe sentence.

The significance of this case was its remarkable departure from the Court's long years of hands off on this issue. After what had clearly been a position of deferring to state legislatures and their assessments of the proper punishments for crimes, *Solem* seemed to open up the possibility that the courts had entered the fray. The question the case presented was whether the Supreme Court was truly committed to this new activist approach or viewed the case as an aberration dealing with a particularly unusual set of facts and circumstances.

Further Legal Developments

Of course, the cases discussed in the background section make up a significant portion of the Court's legal decisions in this area. It has been the Court's work since *Solem,* however, that has either, depending upon your perspective, fixed the aberration of *Solem* or further muddied the waters with another unworkable standard.

The case of *Harmelin v. Michigan* (1991) was the first important proportionality case after *Solem.* It involved the application of a Michigan mandatory life sentence law for certain drug offenses. Harmelin, the defendant, was convicted of possessing 672 grams of cocaine and sentenced to a mandatory life sentence without the possibility of parole. Early in the opinion, it was clear how the Court was going to deal with *Solem*'s insistence on performing the three-part proportionality test when it characterized the *Solem* decision as "scarcely the expression of clear and well established constitutional law." (*Harmelin v. Michigan* 1991, at 965). Justice Antonin Scalia's lengthy and scholarly discussion of the history of the Eighth Amendment and its historical precedent in the English Declaration of Rights of 1689 supported his interpretation that the amendment prohibited only cruel and unusual punishment (in other words, the manner, not the length, of the punishment) and did not support a proportionality requirement. Important to his interpretation was the notion that proportionality as a legal concept goes back to the Magna Carta and that numerous states at the time of the Constitution had specific provisions requiring proportionality in their sentencing laws, meaning that had the framers intended to graft that notion to the Eighth Amendment, they were well acquainted with the idea and could easily have done so. Scalia concluded his analysis by stating that the "cruel and unusual" language of the Eighth Amendment relates to the method of punishment only and not to the length of the punishment.

The final pronouncement of the Court on this matter came in *Ewing v. California* (2003), a case that dealt with the application of California's three-strikes law to a defendant with a lengthy history of criminal convictions but whose only triggering crime was the theft of three golf clubs. Ewing was sentenced under the statute to 25 years to life in prison.

Although the opinion did not garner a majority of the Court, the reasoning of Justice Sandra Day O'Connor's lead opinion relied on the framework set out by Justice Anthony Kennedy in his earlier concurrence in *Harmelin.* Kennedy found that the Eighth Amendment recognizes a limited proportionality principle in noncapital cases, which forbids the imposition of extreme sentences that are "grossly disproportionate" to the crime (*Ewing v. California* 2003).

Justice Kennedy identified four principles to consult before making the final determination under the Eighth Amendment. The Court was to look at the primacy of the legislature, the variety of legitimate penological schemes, the nature of the federal system, and the requirement that proportionality review be guided by objective factors. In applying these factors to the specifics of *Ewing,* the Court focused primarily on California's

legitimate interests of deterring and incapacitating offenders with long and serious records. These legitimate penological interests, when combined with the primacy of (deference to) the legislature, shaped the Court's affirmation of the sentence.

Conclusion

Although the concept of proportionality of punishment has a long and rich history in England going back to the Magna Carta, and although it has been recognized and applied in capital and noncapital cases in the United States for almost a century, it appears to have gone the way of the Edsel and the dial phone (Donham 2005; see sec. IV for an excellent summary of historical evidence). The future of the Supreme Court's Eighth Amendment jurisprudence, in other words, does not appear to include general proportionality as a working doctrine.

Instead, there appear to be three vastly different approaches on the table, none of which appears to garner a majority of the Court's votes. There is the more liberal

MAYBE WE WERE WRONG: THE REFORM MOVEMENT IN SENTENCING

It is no coincidence that *Rummel, Solem,* and *Harmelin* occurred during the decade of the 1980s, a decade ushered in by the so-called War on Drugs and the movement to mandatory long-term sentences. States followed the call from the federal government that what was needed to stem the drug and violence epidemic in this country was a tougher "lock-'em-up" correctional policy. What followed was the increase of arrests and longer sentences, often triggered by recidivist or "three strikes" laws, and the construction of new prisons.

Lawmakers and policy makers have begun to look at the wisdom of that movement, which has several disturbing results. The policies of locking up offenders for longer times and denying them parole opportunities have resulted in an increasingly elderly and infirm prison population (at great cost to the public) and caused many inmates—denied any incentive for early release—to become unmanageable.

Reform efforts have come on both state and federal levels. On the federal level, the Second Chance Act addresses the issue of prisoner reentry and would authorize funding for model community programs to assist inmates who are reentering society. On the state level, a growing number of states have either eliminated some mandatory sentencing laws, eliminated recidivist or three-strikes laws, or reinstituted discretionary parole for certain offenses.* At the same time, in 2009 the state of Texas found it fit to execute (for rape and murder) Bobby Wayne Woods, a man whose IQ was between 68 and 86 and could therefore, in the eyes of his defense attorneys and others, claim mental incompetence (McKinley 2009).

position of Justices Ruth Bader Ginsburg and Stephen Breyer, and presumably of Sonya Sotomayor and Elena Kagan (both new appointees), which suggests that a return to the *Solem* three-part test is appropriate. At the other end of the spectrum, Justices Antonin Scalia and Clarence Thomas adhere to the position that the Eight Amendment contains no proportionality requirement. Finally, and perhaps the most likely ground to be taken, is Justice Kennedy's concurring opinion in *Harmelin,* which recognizes a "narrow proportionality principle" in the Eighth Amendment. Of the two Bush appointees, Chief Justice John Roberts and Associate Justice Samuel Alito, we know only that they have upheld the right to use lethal injection in capital cases and were in the minority in a ruling deciding whether life sentences for juvenile offenders constitutes cruel and unusual punishment—five justices, including Kennedy, stated that such sentences are improper (except in certain homicide cases) (Barnes 2008; Bravin 2010).

It is also possible to envision a case in which all nine justices would agree on reversing a particular sentence under the Eighth Amendment if it were so extreme as to be unacceptable to any rational person at any time at any place. The idea that legislatures could make overtime parking a felony punishable by life is theoretically possible without a proportionality principle. This notion particularly irked Justice Byron White in his *Harmelin* dissent (*Harmelin v. Michigan* 1991, at 1018), but it may take more than chiding from fellow justices about frightening scenarios to gain unanimity in an area in which most justices have seemed content to go their own way.

CYBERCRIME

Bernadette H. Schell

According to a 2009 study conducted by the McAfee antivirus company and entitled "Unsecured Economies: Protecting Vital Information," data theft and breaches from cybercrime likely cost businesses whose networks were hacked as much as $1 trillion globally. This huge cost included both losses in intellectual property rights as well as expenditures for losses in productivity and network damage repair. These cost projections were based on the survey responses of more than 800 chief information officers in the United States, Germany, the U.K., Japan, China, India, Dubai, and Brazil. Respondents said that the breaches amounted to about $4.6 billion in losses, and the repairs were estimated to be as high as $600 million (Mills 2009).

The respondents conjectured that the recent global economic recession had increased the security risks for business and government networks, given that over 40 percent of displaced or laid-off employees were the main threat to sensitive and proprietary information found on networks. When asked which countries posed the biggest threats as state cybercriminals, there were marked differences. Over 25 percent of the overall survey respondents said that they avoided storing data on networks in China because of their likelihood of being attacked, while about 47 percent of the Chinese respondents suggested that the United States poses the biggest threat to the security of their online data (Mills 2009).

Cybercrime and Hackers Defined

The growth and spread of the Internet globally within the past 20 years has fostered the growth of a variety of online crimes as well as national cybersecurity strategies and laws aimed at curbing these unwanted behaviors. In fact, an interesting debate has developed concerning the definition of online crimes, one using the terms "cybercrime" (or "cyber crime") and "computer crimes." Typically, cybercrimes occur because an individual who uses his or her special knowledge of cyberspace for personal or financial gain,

and computer crimes typically involve a special knowledge of computer technology. Moreover, the interrelated nature of these behaviors further complicates the definition process; thus, many experts and the media seem to utilize these two terms interchangeably (Furnell 2002). The term "cybercrime" is used here to refer to any crime completed on or with a computer.

Broadly speaking, cybercrime includes such activities as electronic commerce, intellectual property rights (IPR) or copyright infringement, privacy rights infringement, and identity theft—a type of fraud. The domain of cybercrime also includes online child exploitation, credit card fraud, cyberstalking and cyberbullying, defaming or threatening other online users, gaining unauthorized access to computer networks (commonly known as "hacking"), and overriding encryption to make illegal copies of software or movies. Accepting that variations on the parameters constituting such unlawful acts, as well as the penalties associated with these criminal acts, vary from one jurisdiction to another globally, this continually evolving list of common cybercrimes is relevant and globally applicable (Schell and Martin 2006).

Some experts further suggest that cybercrimes are not all that different from traditional crimes. Whereas cybercrimes occur in an online environment, traditional crimes occur terrestrially. One of the best known cybercrime typologies classifies behavior along lines similar to those found in traditional crime typologies (Wall 2001).

Cybercrimes tend to include two common criminal acts: *trespassing* (defined as entering unlawfully into an area to commit an offence) and *theft* (defined as taking or exercising illegal control over the property of another to deprive the owner of that asset (Furnell 2002).

Individuals who break into networks to cause damage or to receive personal or financial gain are commonly referred to in the media as "hackers," but many in the computer underground insist that the more appropriate term for the mal-inclined techies wreaking havoc on networks is "cracker" or "Black Hat." Talented tech savvies paid by industry and governments to find vulnerabilities in software or networks are known in the computer underground as "White Hats" (Schell, Dodge, and Moutsatsos 2002).

As technologies evolve, so do the cybercriminal activities and labels. For example, the threat posed by a new form of cybercrime called "carding"—the illegal acquisition, sale, and exchange of sensitive online information—has increased in recent years (Holt and Lampke 2010). Those who engage in such activities are known simply as "carders."

Today, the major types of cybertrespassing and cybertheft include but are not limited by these categories (Schell and Martin 2004):

- Flooding: a form of cyberspace vandalism resulting in denial of service (DoS) to authorized users of a Web site or computer system
- Infringing intellectual property rights (IPR) and copyright: a form of cyberspace theft involving the copying of a target's copyright-protected software, movie, or other creative work without getting the owner's consent to do so

- Phreaking: a form of cyberspace theft or fraud conducted by using technology to make free telephone calls
- Spoofing: the cyberspace appropriation of an authentic user's identity by nonauthentic users, causing fraud or attempted fraud and commonly called "identify theft"
- Virus and worm production and release: a form of cyberspace vandalism causing corruption and maybe even the erasing of data

The Four Critical Elements of Traditional Crimes and Cybercrimes

According to legal expert Susan Brenner (2001), both traditional land-based crimes and cybercrimes cause *harm*—to property, to persons, or to both. Furthermore, as in the real world, in the virtual world there are politically motivated crimes, controversial crimes, and technical nonoffenses. In U.S. jurisdictions and elsewhere, traditional and cybercrimes involve four key elements:

- *Actus reus* (the prohibited act or failing to act when one is supposed to be under duty to do so)
- *Mens rea* (a culpable mental state)
- *Attendant circumstances* (the presence of certain necessary conditions)
- *Harm* (to persons, property, or both)

Perhaps an example or two will illustrate more clearly these critical elements. One of the best-known cyberstalking-in-the-making cases reported in the popular media of late involved a young man named Eric Burns (also known by his online moniker Zyklon). Burns's claim to criminal fame was that he attacked the Web pages of about 80 businesses and government offices whose pages were hosted by Laser.Net in Fairfax, Virginia.

An obviously creative individual, Burns designed a program called "Web bandit" to identify computers on the Internet that were vulnerable to attack. He then used the vulnerable systems to advertise his love for a high school classmate named Crystal. Through his computer exploits, Burns was able to advertise worldwide his unrelenting love for Crystal in the hope that if he could get her attention, he could have her longer-term. Unfortunately, the case did not end on a happy note for Burns. After he was caught and convicted by U.S. authorities, the 19-year-old pleaded guilty to defacing Web pages for NATO and Vice President Al Gore. In November 1999, the judge hearing the case ruled that Burns should serve 15 months in U.S. federal prison for his illegal exploits, pay more than $36,000 in restitution, and not be allowed to touch a computer for 3 years after his supervised prison release. Ironically, Crystal attended the same high school as Burns but hardly knew him. In the end, she helped the authorities capture him (U.S. Department of Justice 1999).

Citing the four elements of cybercrimes, cyberperpetrator Burns gained entry into computers and unlawfully took control of the property—the Web pages owned by

NATO and Vice President Al Gore. Burns entered with the intent of depriving the lawful owner of error-free Web pages (*mens rea*). By society's norms, Burns had no legal right to alter the Web pages by advertising his love for Crystal; he was not authorized to do so by the rightful owners (*attendant circumstances*). Consequently, Burns was liable for his unlawful acts, for he illegally entered the computer networks (i.e., criminal trespass) to commit an offense once access was gained (i.e., data alteration). As the targeted users realized that *harm* was caused to their property, the judge hearing the evidence ruled that Burns should be sent to prison for his criminal actions as well as pay restitution.

In recent times, there have also been some alleged cybercrimes involving harm or death to Internet-connected persons. For example, in late May 2010, a U.S. judge ordered a former Minnesota nurse facing charges in the suicides of two individuals to keep off the Internet until the cybercriminal case is heard and resolved. William Melchert-Dinkel, aged 47, appeared in a Minnesota court on "assisted suicide" charges. The father of two children is accused of coaxing Nadia Kajouji, an 18-year-old Canadian student, and Mark Dryborough, a 32-year-old British man, to commit suicide. Police allege that Melchert-Dinkel met both in online suicide chat rooms. According to court documents, this alleged cybercriminal had made online suicide pacts with about 10 or 11 individuals all over the world—indicating that, unlike most land crimes, the Internet has no geographical boundaries. Apparently Melchert-Dinkel would go into chat rooms using the monikers "carni," "Li Dao," or "falcon.girl," introducing himself as a female nurse. He seemed to use his medical knowledge to offer advice on suicide methods to online users seeking such. The charges are believed to represent the first time that assisted suicide laws—commonly used in mercy killing cases—have been applied to the virtual world. The teenaged victim in this bizarre case was studying at a university when she drowned herself two years ago, apparently on the advice of Melchert-Dinkel (Doolittle 2010).

The Changing Virtual Landscape and Presenting Challenges

There is little question that the virtual landscape has changed considerably just in the last 10 years, for in North America and globally, more people have become connected to the Internet, largely because of increasing affordability. Using Canada as one case in point, according to Statistics Canada, in 2009, some 80 percent of Canadians aged 16 and over used the Internet for personal reasons—a figure that shows an increase in usage by 7 percent since 2007 (the last time the survey was conducted). In short, almost 22 million Canadians aged 16 or over are active in the virtual world. Affordability, however, remains a key factor. Although there is a 94 percent Internet usage in Canadian households when income levels exceed $85,000 a year, there is only a 56 percent Internet usage in households where the income is less than $30,000 a year. Developing economies as well as developed economies see the economic sustainability importance of having citizens Internet-connected. According to a 2009 Internet World Stats study, China is, in fact, the number 1 most online-connected location worldwide (El Akkad 2010).

In fact, the virtual world is becoming so crowded on a nationwide basis that the Internet as we know it today seems to be reaching its limits. Some experts have estimated that quite soon—and likely before 2012—the number of new devices able to connect to the World Wide Web will plummet as the world exhausts its IP addresses—unique codes providing access to the Internet. Part of the problem is that the Internet was built around the Internet Protocol Addressing Scheme version 4 (IPv4), having about 4 billion addresses and now running low. Back in the 1970s, when the Internet was just becoming popular, 4 billion addresses probably seemed like plenty. Internet Protocol Addressing Scheme version 6 (IPv6) is on its way in, having trillions more addresses available and ready for the taking. The problem, say the experts, is that businesses and governments are slow in adapting their technology to IPv6. Thus there is the fear that there could be a major online crunch before 2012 (Kesterton 2010).

As more and more citizens become Internet-connected, new opportunities for communicating and exchanging information with others online come into existence, such as the development and growth of popular social networks like Facebook. However, accompanying the positive evolution of Internet usages is the dark side, whereby tech-savvy criminals continually search for new ways to cause harm to property and to persons in the virtual world.

Faced with stricter Internet security measures worldwide, some mal-inclined spammers, for example—marketers conning online users to buy their products or services after deriving mailing lists from many online sources, including scanning Usenet discussion groups—have now begun to borrow pages from corporate America's economic sustainability rule books: They, too, are outsourcing. Sophisticated spammers are now paying tech-savvy folks in India, Bangladesh, China, and other developing nations to overcome tests know as "captchas," which ask Internet users to type in a string of somewhat obscured characters to prove that they are human beings and not spam-generating robots. ("Captchas," pioneered by Luis von Ahn, a computer science professor at Carnegie Mellon, is an acronym for "completely automated public Turing test to tell computers and humans apart.")

The current charge-out rate for the borrowed talent ranges from about 80 cents to $1.20 for each 1,000 deciphered boxes, based on estimates provided by online exchanges like Freelancer.com, where many such projects are bid on weekly. Where jobs are scarce, becoming involved in such a money-making proposition provides a way for some hungry online citizens to avoid starving to death. Professor von Ahn says that the cost of hiring people, even as cheaply as it may appear, should limit the extent of such operations, since only profitable spammers who have already determined various ways to make money through devious online techniques can afford such operations. Some of these outsourced operations appear to be fairly sophisticated, involving brokers and middlemen. Large enterprises, such as Google, that utilize captchas technogy argue that paying people to solve captchas proves that the tool is working, at least in part, as an effective anticybercrime measure (Bajaj 2010).

There is little question that, globally, cybercrime in recent years has become more "organized," often involving underground gangs and Mafia-like hierarchies hiring needed talent to get the cybercrime job done and keep the coffers flush with cash. Since 2002, botnets, in particular, are recognized as a growing problem. A "bot," short form for "robot," is a remote-controlled software program acting as an agent for a user (Schell and Martin 2006). The reason that botnets are anxiety-producing to organizations and governments, alike is that mal-inclined bots can download malicious binary codes intended to compromise the host machine by turning it into a "zombie." A collection of zombies is called a "botnet." Although botnets have been used for spamming and other nefarious online activities, the present-day threat is that if several botnets form a gang, they could threaten—if not cripple—the networked critical infrastructures of most countries with a series of coordinated distributed denial of service (DDoS) attacks, bringing nations' economies to a standstill (Sockel and Falk 2009).

Botnets have been crafted by individuals not intentionally out to cause harm to property or persons but who are later co-opted into gangs with alternative motives. Sometimes the creators of the botnets are later blamed for the damages caused.

For example, in a New Zealand hearing held on July 15, 2008, Justice Judith Potter discharged without conviction Owen Walker, a teenage hacker involved in an international hacking group known as "the A-Team" (Farrell 2007). Walker was alleged to have been engaged in some of the most sophisticated botnet cybercrime ever seen in New Zealand. Even though Walker pleaded guilty to six charges during his trial—including accessing a computer for dishonest purposes and damaging or interfering with a computer system—he walked away from the courthouse without going to jail. Walker was part of an international ring of 21 hackers, and his exploits apparently cost the local New Zealand economy about $20.4 million in U.S. dollars. Had he been convicted, the teen could have spent up to seven years in prison.

In his defense, Walker said that he was motivated to create bots not by maliciousness but by his intense interest in computers and his need to stretch their capabilities—the line often cited by White Hat hackers as justification for their exploits (Gleeson 2008). The judge ordered Walker to pay $11,000 in costs and damages, although the botnet creator said that he did not receive any of the approximately $32,000 "stolen" resulting the course of the cybercrime in question (Humphries 2008).

Measures Governments Worldwide Have Enacted to Curb Cybercrime

Clearly, the continually evolving nature of cybercrime has caused considerable consternation for governments globally. It is tough for governments and their authorities to stay ahead of the cybercriminal curve because the curve keeps changing. Moreover, there is a widespread belief that if cybercriminals are to be stopped in their tracks and dealt with by the global justice system, countries must work together to stop this online "problem," which knows no boundaries. Simply stated, as the nature of cybercrime has evolved from

single-person exploits to international cybergangs and Mafia-like structures, the need for more effective legal structures to effectively prosecute and punish those engaged in such costly behaviors has also increased exponentially.

In the United States in particular, most newsworthy cybercrime cases have been prosecuted under the computer crime statute 18 U.S.C. subsection 1030. This primary U.S. federal statute criminalizing cracking was originally called the Computer Fraud and Abuse Act (CFAA), modified in 1996 by the National Information Infrastructure Protection Act and codified at 18 U.S.C. subsection 1030, Fraud and Related Activity in Connection with Computers. If caught in the United States, crackers are often charged with intentionally causing damage without authorization to a protected computer. A first offender typically faces up to five years in prison and fines up to $250,000 per count, or twice the loss suffered by the targets. The U.S. federal sentencing guidelines for cracking have been expanded in recent years to provide longer sentences if exploits lead to the injury or death of online citizens—such as the recent case involving allegations against American William Melchert-Dinkel. In the United States, targets of cybercrimes can also seek civil penalties (Evans and McKenna 2000).

After the September 11, 2001, terrorist attacks on the World Trade Center and the Pentagon, the U.S. government became increasingly concerned about terrorist attacks of various natures and increased homeland security protections. To this end, the U.S. Congress passed a series of laws aimed at halting computer criminals, including the 2002 Homeland Security Act, with section 225 known as the Cyber Security Enhancement Act of 2002. In 2003, the Prosecutorial Remedies and Tools against the Exploitation of Children Today Act (PROTECT Act) was passed to assist law enforcement in their efforts to track and identify cybercriminals using the Internet for child exploitation purposes. Also in 2003, the Can Spam Act was passed, aimed at decreasing the harm issues raised by online spammers.

President Barack Obama has identified cybersecurity as one of the most serious economic and national security challenges facing the United States today—a challenge that he affirmed the United States was not adequately prepared to counter effectively. Shortly after taking office, Obama ordered a complete review of federal efforts to defend the U.S. information and communication online infrastructure and the development of a more comprehensive approach for securing the information highway.

In May 2009, Obama accepted the recommendations of the Cyberspace Policy Review to select an executive branch cybersecurity coordinator who would have regular access to the president and to invest hugely into cutting-edge research-and-development efforts to meet the present-day digital challenges. The president also wanted to build on the Comprehensive National Cyber Security Initiative (CNCI) launched by President George W. Bush in the National Security Presidential Directive of January, 2008. President Obama has also called on other nations to develop similar comprehensive national cybersecurity

policies and action plans as a means of securing cyberspace for online citizens worldwide (U.S. National Security Council 2010).

Other countries have followed the U.S. lead and cries for virtual world interventions. For example, on May 28, 2010, the Canadian government announced its National Strategy and Action Plan to Strengthen the Protection of Critical Infrastructure (Public Safety Canada 2010). Other countries have also enacted anti-intrusion legislation similar to the crime statute 18 U.S.C. subsection 1030 enacted in the United States. For example, section 342.1 of the Canadian Criminal Code is aimed at a number of potential harms, including theft of computer services, invasion of online users' privacy, trading in computer passwords, and cracking encryption systems. Moreover, breaking the digital encryption on a movie DVD—even if copying it for personal use—would in the near future make individual Canadians liable for legal damages up to $5,000 if a tougher copyright law proposed by the present Canadian federal government is enacted in 2010 (Chase 2010).

Finally, it must be emphasized that although the battle to keep cybercriminals at bay is a problem that will continue into the future, countries worldwide are committed to putting sizable resources into meeting the challenge. The Global Cyber Law Survey of 50 countries recently found that 70 percent of these had legislation against unauthorized computer access as well as against data tampering, sabotage, malware or malicious software usage, and fraud.

DEATH PENALTY

Robert M. Bohm

Few issues in criminal justice are as controversial as the death penalty. For most people who support the death penalty, the execution of killers (and people who commit other horrible acts) makes sense. Death penalty supporters frequently state that executions do prevent those executed from committing heinous crimes again and that the example of executions probably prevents most people who might contemplate committing appalling crimes from doing so. In addition, many death penalty supporters simply believe that people who commit such crimes deserve to die—that they have earned their ignominious fate.

For opponents, the death penalty issue is about something else entirely. For many opponents, the level of death penalty support in the United States is a rough estimate of the level of maturity of the American people. The not-so-subtle implication is that a mature, civilized society would not employ the death penalty. Opponents maintain that perpetrators of horrible crimes can be dealt with effectively by other means and that it makes little sense to kill some people, however blameworthy they may be, to teach other people not to kill. These opponents argue that although the perpetrators of terrible crimes may deserve severe punishment, that punishment need not be execution. This entry provides a brief history of the penalty's development in the United States.

Background

The first person executed in what is now the United States was Capt. George Kendall, a councilor for the Virginia colony. He was executed in 1608 for being a spy for Spain. The

fact that he was executed was not particularly unusual, because the death penalty was just another one of the punishments brought to the New World by the early European settlers.

Since Kendall's execution in 1608, more than 19,000 executions have been performed in what is now the United States under civil (as opposed to military) authority. This estimate does not include the approximately 10,000 people lynched in the 19th century. Nearly all of the people executed during the past four centuries in what is now the United States have been adult men; only about 3 percent have been women. Ninety percent of the women were executed under local as opposed to state authority, and the majority (87 percent) were executed prior to 1866. About 2 percent of the people executed have been juveniles—that is, individuals who committed their capital crimes prior to their 18th birthdays. Most of them (69 percent) were black and nearly 90 percent of their victims were white.

Key Events

It is important to understand that all of the significant changes in the practice of capital punishment in the United States—culminating in its complete abolition in some jurisdictions—are the result of abolitionist efforts. Those efforts created (1) degrees of murder, which distinguish between murders heinous enough to warrant death and those murders that do not; (2) a reduction in the number of offenses warranting the death penalty (except for the federal government and some states since 1994); (3) the hiding of executions from public view; and (4) a decreased number of annual executions. Although abolition of the death penalty has been their unremitting goal, abolitionists have been far more successful in reforming its practice.

Degrees of Murder

Because of the efforts of Pennsylvania Attorney General and later U.S. Attorney General William Bradford and Philadelphia physician and signer of the Declaration of Independence Benjamin Rush, both early death penalty abolitionists, Pennsylvania became the first state in legal proceedings to consider degrees of murder based on culpability. Before this change, the death penalty was mandated for anyone convicted of murder (and many other crimes) regardless of circumstance. Neither Bradford nor Rush believed that capital punishment deterred crime, citing the example of horse stealing, which at the time was a capital offense in Virginia and the most frequently committed crime in the state. Because of the severity of the penalty, convictions for the crime were hard to obtain.

Limiting Death-Eligible Crimes

Pressure from abolitionists also caused Pennsylvania in 1794 to repeal the death penalty for all crimes except first-degree murder. Between 1794 and 1798, Virginia and Kentucky joined Pennsylvania in abolishing the death penalty for all crimes except first-degree

murder; New York and New Jersey abolished the penalty for all crimes except murder and treason. Virginia and Kentucky, both slave states, confined the reforms to free people; slaves in those states were still subject to a long list of capital crimes. When New Jersey, Virginia, and Kentucky severely restricted the scope of capital punishment, they also appropriated funds for the construction of their first prisons; Pennsylvania and New York had established prisons earlier. Still, a half-century would pass before the first state abandoned capital punishment entirely.

Hiding Executions from the Public

Between 1800 and 1850, U.S. death penalty abolitionists helped change public sentiment about public executions, especially among many northern social elites. In 1800, public hangings were mostly solemn events regularly attended by members of all social classes and touted as having important educational value. But by midcentury, members of the upper classes were staying away from them because in their minds they had become tasteless, shocking, rowdy, sometimes dangerous, carnival-like spectacles. This view, however, may have been more a matter of perception than reality, as eyewitness accounts suggest that decorum at public executions had not changed that much. In any event, the elite began to view those who attended executions as contemptible rabble out for a good time and concluded that any educational value public hangings once had was being lost on the less respectable crowd.

Another problem with public hangings during this period was that attendees were increasingly sympathizing with the condemned prisoners, weakening the position of the state. Indeed, some of those who met their fate on the gallows became folk heroes. Increasing acceptance of the belief that public executions were counterproductive because of the violence they caused was yet another change. Stories were circulated about the violent crimes being committed just before or after a pubic hanging by attendees of the event.

For these reasons, Connecticut, in 1830, became the first state to ban public executions. Pennsylvania became the second state to do so in 1834. In both states, only a few authorized officials and the relatives of the condemned were allowed to attend. By 1836, New York, New Jersey, Massachusetts, Rhode Island, and New Hampshire had enacted similar policies. By 1860, all northern states and Delaware and Georgia in the South had shifted the site of executions from the public square to an enclosed jail yard controlled by the sheriff and deputies. By 1890, some states had moved executions to inside the jail or a prison building. The last public execution was held in Galena, Missouri, in 1937.

From Mandatory to Discretionary Capital Punishment Statutes

In 1837, Tennessee became the first state to enact a discretionary death penalty statute for murder; Alabama did the same four years later, followed by Louisiana five years after that. All states before then employed mandatory death penalty statutes that required

anyone convicted of a designated capital crime to be sentenced to death. The reason for the change, at least at first and in the South, undoubtedly was to allow all-white juries to take race into account in deciding whether death was the appropriate penalty in a particular case. Between the Civil War and the end of the 19th century, at least 20 additional jurisdictions changed their death penalty laws from mandatory to discretionary ones. Illinois was the first northern state to do so in 1867; New York was the last state to make the change in 1963. The reason most northern states switched from mandatory to discretionary death penalty statutes, and another reason for southern states to do so, was to prevent jury nullification, which was becoming an increasing problem. "Jury nullification" refers to a jury's knowing and deliberate refusal to apply the law because, in the given case, a mandatory death sentence was considered contrary to the jury's sense of justice, morality, or fairness.

From Local to State-Authorized Executions

A major change took place in the legal jurisdiction of executions during the time of the Civil War. Before the war, all executions were conducted locally—generally in the jurisdiction in which the crime was committed. But on January 20, 1864, Sandy Kavanagh was executed at the Vermont State Prison. He was the first person executed under state as opposed to local authority. This shift in jurisdiction was not immediately adopted by other states. After Kavanagh, there were only about two state- or federally authorized executions per year well into the 1890s; the rest were locally authorized. That pattern would shift dramatically during the next 30 years. In the 1890s, about 90 percent of executions were imposed under local authority, but by the 1920s, about 90 percent were imposed under state authority. Today, all executions except those conducted in Delaware and Montana and by the federal government and the military are imposed under state authority.

States Abolish the Death Penalty

In 1846, the state of Michigan abolished the death penalty for all crimes except treason and replaced it with life imprisonment. The law took effect the next year, making Michigan, for all intents and purposes, the first English-speaking jurisdiction in the world to abolish capital punishment. The first state to outlaw the death penalty for all crimes, including treason, was Rhode Island in 1852; Wisconsin was the second state to do so a year later. Not until well after the Civil War did Iowa (in 1872) and Maine (in 1876) become the next states to abolish the death penalty. Legislatures in both states reversed themselves, however, and reinstated the death penalty in 1878 in Iowa and in 1883 in Maine. Maine reversed itself again in 1887 and abolished capital punishment and, to date, has not reinstated it. Colorado abandoned capital punishment in 1897 but restored it in 1901.

During the first two decades of the 20th century, six states outlawed capital punishment entirely (Kansas, 1907; Minnesota, 1911; Washington, 1913; Oregon, 1914; South

Dakota, 1915; Missouri, 1917) and three states (Tennessee, 1915; North Dakota, 1915; Arizona, 1916) limited the death penalty to only a few rarely committed crimes, such as treason or the first-degree murder of a law enforcement official or prison employee. Tennessee also retained capital punishment for rape. In addition, 17 other states nearly

CHALLENGING THE LEGALITY OF CAPITAL PUNISHMENT

Although specific methods of execution had been legally challenged as early as 1890 and procedural issues earlier than that, the fundamental legality of capital punishment itself was not subject to challenge until the 1960s. It had long been argued that the U.S. Constitution—or, more specifically, the Fifth Amendment—authorized capital punishment and that a majority of the Framers did not object to it. Given such evidence, it made little sense to argue that capital punishment violated the Constitution. That conventional wisdom was challenged in 1961. In an article published in the *University of Southern California Law Review,* Los Angeles lawyer Gerald Gottlieb, an affiliate of the local American Civil Liberties Union (ACLU) branch, suggested that "the death penalty was unconstitutional under the Eighth Amendment because it violated contemporary moral standards, what the U.S. Supreme Court in *Trop v. Dulles* (1958) referred to as 'the evolving standards of decency that mark the progress of a maturing society.'" The key question raised by Gottlieb's interpretation, of course, was whether the United States, in fact, had evolved or progressed to the point at which standards of decency no longer permitted capital punishment. For a small group of abolitionist lawyers with the National Association for the Advancement of Colored People (NAACP) Legal Defense and Educational Fund (LDF), the answer was yes.

LDF lawyers turned their attention to the death penalty in the 1960s primarily because of the racially discriminatory way it was being administered. Later, however, when they began accepting clients actually facing execution, they realized that they had to raise issues having nothing to do with race. With this change in focus, there was no longer any reason not to take on the cases of white death row inmates too, so they did. In attempting to achieve judicial abolition of the penalty, LDF lawyers plotted a general strategy to convince the Supreme Court that the death penalty was employed in a discriminatory way against minorities and to otherwise block all executions by challenging the legal procedures employed in capital cases (the so-called moratorium strategy). If successful, their plan would accomplish three goals: First, it would make those who were still executed appear to be unlucky losers in a death penalty lottery. Second, if the death penalty were used only rarely, it would show that the penalty was not really needed for society's protection. Third, if all executions were blocked, the resulting logjam of death row inmates would lead to an inevitable bloodbath if states ever began emptying their death rows by executing prisoners en masse. The LDF lawyers did not believe the country could stomach the gore and would demand abolition of the penalty.

The LDF's moratorium strategy worked. In 1968, executions in the United States were unofficially suspended until some of the more problematic issues with the death penalty could be resolved. The moratorium on executions would last 10 years, until 1977, when Gary Gilmore asked to be executed by the state of Utah.

abolished the death penalty or at least seriously considered abolition, some of them several times. The momentum, however, failed to last. By 1920, five of the states that had abolished the death penalty earlier had reinstated it (Arizona, 1918; Missouri, 1919; Tennessee, 1919; Washington, 1919; Oregon, 1920). No state abolished the death penalty between 1918 and 1957. In contrast, after World War II, most of the advanced western European countries abolished the death penalty or severely restricted its use.

Legal Decisions by the U.S. Supreme Court

Furman v. Georgia

On January 17, 1972, Furman's lawyers argued to the Supreme Court that unfettered jury discretion in imposing death for murder resulted in arbitrary or capricious sentencing in violation of their client's Fourteenth Amendment right to due process and his Eighth Amendment right not to be subjected to cruel and unusual punishment. Furman's challenge proved successful and, on June 29, 1972, the U.S. Supreme Court set aside death sentences for the first time in its history. In its decision in *Furman v. Georgia, Jackson v. Georgia,* and *Branch v. Texas* (all three cases were consolidated and are referred to here as the *Furman* decision), the Court held that the capital punishment statutes in the three cases were unconstitutional because they gave the jury complete discretion to decide whether to impose the death penalty or a lesser punishment in capital cases. The majority of five justices pointed out that the death penalty had been imposed arbitrarily, infrequently, and often selectively against minorities. A practical effect of *Furman* was the Supreme Court's voiding of 40 death penalty statutes and the sentences of more than 600 death row inmates in 32 states. Depending on the state, the death row inmates received new sentences of life imprisonment, a term of years, or, in a few cases, new trials.

It is important to note that the Court did not declare the death penalty itself unconstitutional. It held as unconstitutional only the statutes under which the death penalty was then being administered. The Court implied that if the process of applying the death penalty could be changed to eliminate the problems cited in *Furman,* then it would pass constitutional muster.

The backlash against *Furman* was immediate and widespread. Many people, including those who had never given the death penalty issue much thought, were incensed at what they perceived as the Supreme Court's arrogance in ignoring the will of the majority and its elected representatives. They clamored to have the penalty restored. Obliging their constituents, the elected representatives of 36 states proceeded to adopt new death penalty statutes designed to meet the Court's objections. The new death penalty laws took two forms. Twenty-two states removed all discretion from the process by mandating capital punishment upon conviction for certain crimes (mandatory death penalty statutes). Other states provided specific guidelines that judges and juries were to use in deciding if death were the appropriate sentence in a particular case (guided discretion death penalty statutes).

Woodson v. North Carolina and Gregg v. Georgia

The constitutionality of the new death penalty statutes was quickly challenged, and on July 2, 1976, the Supreme Court announced its rulings in five test cases. In *Woodson v. North Carolina* and *Roberts v. Louisiana,* the Court voted 4–5 to reject mandatory statutes that automatically imposed death sentences for defined capital crimes. Justice Potter Stewart provided the Court's rationale. First, Stewart admitted that "it is capricious to treat similar things differently" and that mandatory death penalty statutes eliminated that problem. He added, however, that it also "is capricious to treat two different things the same way." Therefore, to impose the same penalty on all convicted murderers, even though all defendants are different, is just as capricious as imposing a penalty randomly. To alleviate the problem, then, some sentencing guidelines were necessary. Thus, in *Gregg v. Georgia, Jurek v. Texas,* and *Proffitt v. Florida* (hereafter referred to as the *Gregg* decision), the Court voted 7–2 to approve guided discretion statutes that set standards for juries and judges to use in deciding whether to impose the death penalty. The Court's majority concluded that the guided discretion statutes struck a reasonable balance between giving the jury some direction and allowing it to consider the defendant's background and character and the circumstances of the crime.

It is noteworthy that the Court approved the guided discretion statutes on faith, assuming that the new statutes and their procedural reforms would rid the death penalty's administration of the problems cited in *Furman.* Because guided discretion statutes, automatic appellate review, and proportionality review had never been required or employed before in death penalty cases, the Court could not have known whether they would make a difference. Now, more than 30 years later, it is possible to evaluate the results. A large body of evidence indicates that the reforms have had negligible effects.

Coker v. Georgia and Eberheart v. Georgia

The Supreme Court has repeatedly emphasized that the death penalty should be reserved for the most heinous crimes. In two cases decided in 1977, the Court, for all intents and purposes, limited the death penalty to aggravated or capital murders only. Aggravated or capital murders are murders committed with an aggravating circumstance or circumstances. Aggravating circumstances (or factors) or special circumstances, as they are called in some jurisdictions, refer "to the particularly serious features of a case, for example, evidence of extensive premeditation and planning by the defendant, or torture of the victim by the defendant." At least one aggravating circumstance must be proven beyond a reasonable doubt before a death sentence can be imposed. (To date, all post-*Furman* executions have been for aggravated murder.) The Court ruled in *Coker v. Georgia* that the death penalty is not warranted for the crime of rape of an adult woman in cases in which the victim is not killed. Likewise, in *Eberheart v. Georgia,* the Court held that the death penalty is not warranted for the crime of kidnapping in cases in

which the victim is not killed. Traditionally, both rape and kidnapping have been capital crimes regardless of whether the victim died.

Lockett v. Ohio and Bell v. Ohio

One of the changes to death penalty statutes approved by the Court in *Gregg* was the requirement that sentencing authorities (either juries or judges) consider mitigating circumstances before determining the sentence. Mitigating circumstances (or factors), or extenuating circumstances, refer "to features of a case that explain or particularly justify the defendant's behavior, even though they do not provide a defense to the crime of murder" (e.g., youth, immaturity, or being under the influence of another person). The requirement that mitigating circumstances must be considered has been the subject of several challenges. The first test was in 1978 in the cases of *Lockett v. Ohio* and *Bell v. Ohio.* In those cases, one of the issues was whether defense attorneys could present only mitigating circumstances that were listed in the death penalty statute. The Court held that trial courts must consider any mitigating circumstances that a defense attorney presents, not just those listed in the statute. The only qualification to this requirement is that the mitigating circumstance must be supported by evidence.

Pulley v. Harris

In *Pulley v. Harris* (1984), the Court decided that there was no constitutional obligation for state appellate courts to provide, upon request, proportionality review of death sentences. Since *Pulley,* many states have eliminated the proportionality review requirement from their statutes, whereas other states simply no longer conduct the reviews.

Lockhart v. McCree

In *Lockhart v. McCree* (1986), the Court ruled that prospective jurors whose opposition to the death penalty is so strong that it would prevent or substantially impair the performance of their duties as jurors at the sentencing phase of the trial may be removed for cause. Stated differently, as long as jurors can perform their duties as required by law, they may not be removed for cause because they are generally opposed to the death penalty. To date, *Lockhart v. McCree* is the latest modification to the Court's earlier *Witherspoon* decision. In *Witherspoon v. Illinois* (1968), the Court rejected the common practice of excusing prospective jurors simply because they were opposed to capital punishment. The Court held that prospective jurors could be excused only for cause. That is, jurors could be excused only if they would automatically vote against imposition of the death penalty, regardless of the evidence presented at trial, or if their attitudes toward capital punishment prevented them from making an impartial decision on the defendant's guilt.

McCleskey v. Kemp

The most sweeping challenge to the constitutionality of the new death penalty statutes was *McCleskey v. Kemp* (1987), wherein the Court considered evidence of racial

discrimination in the application of Georgia's death penalty statute. Recall that in the *Furman* decision, racial discrimination was cited as one of the problems with the pre-*Furman* statutes. The most compelling evidence was the results of an elaborate statistical analysis of post-*Furman* death penalty cases in Georgia. That analysis showed that Georgia's new statute produced a pattern of racial discrimination based on both the race of the offender and the race of the victim. In *McCleskey,* the Court opined that evidence such as the statistical analysis—which showed a pattern of racial discrimination—is not enough to render the death penalty unconstitutional. By a vote of five to four, it held that state death penalty statutes are constitutional even when statistics indicate they have been applied in racially biased ways. The Court ruled that racial discrimination must be shown in individual cases—something McCleskey did not show in his case. For death penalty opponents, the *McCleskey* case represented the best, and perhaps last, chance of having the Supreme Court again declare the death penalty unconstitutional.

Atkins v. Virginia

In *Atkins v. Virginia* (2002), the Court ruled that it is cruel and unusual punishment to execute the mentally retarded. A problem with the *Atkins* decision is that the Court did not set a standard for what constitutes mental retardation. That issue was left to the states to decide. Texas became the first to test the law when it pursued, successfully, the execution (in 2009) of Bobby Wayne Woods, a convicted murderer, who had an IQ of between 68 and 86.

Roper v. Simmons

In *Roper v. Simmons* (2005), the Court held that the Eighth and Fourteenth Amendments forbid the imposition of the death penalty on offenders who were under the age of 18 at the time their crimes were committed.

Baze v. Rees

In this case (2008) the Court ruled that execution by lethal injection did not constitute "cruel and unusual punishment" and therefore was acceptable under the U.S. Constitution.

Conclusion

Globally, the death penalty is trending toward abolition. As of this writing, more than half of the countries in the world—104 of them—have abolished the death penalty in law or practice. All of the major U.S. allies except Japan have abolished the death penalty. On the other hand, only 58 countries and territories have retained the death penalty and continue to apply it; 35 other countries retain it on paper but have not applied it in a decade or more.

In the United States, 14 jurisdictions do not have a death penalty, and among the 39 jurisdictions that do have one, only a handful use it more than occasionally and almost

all of them are located geographically in the South. More than 70 percent of all post-*Furman* executions have occurred in the South. Still, executions are more concentrated than the 70 percent figure suggests. Five states—Texas, Virginia, Oklahoma, Missouri, and Florida—account for 65 percent of all post-*Furman* executions; three states—Texas, Virginia, and Oklahoma—account for 53 percent of them; Texas and Virginia account for 45 percent of them; and Texas alone accounts for 36 percent of them. Thus the death penalty today is a criminal sanction that is used more than occasionally in only a few nonwestern countries, a few states in the U.S. South, and two U.S. border states. This is an important point because it raises the question of why those death penalty—or more precisely, executing—jurisdictions in the world need the death penalty, whereas all other jurisdictions in the world—the vast majority—do not.

In the states noted previously, the death penalty has proved stubbornly resilient and will probably remain a legal sanction for the foreseeable future. One reason is that death penalty support among the U.S. public, at least according to the major opinion polls, remains relatively strong. According to a 2009 Gallup poll, for example, 65 percent of adult Americans favored the death penalty for persons convicted of murder, 31 percent opposed it, and 5 percent did not know or refused to respond (Gallup 2010). It is unlikely that the practice of capital punishment could be sustained if a majority of U.S. citizens were to oppose it. However, in no year for which polls are available has a majority of Americans opposed the death penalty (the first national death penalty opinion poll was conducted in December 1936).

The abiding faith of death penalty proponents in the ability of legislatures and courts to fix any problems with the administration of capital punishment is another reason for its continued use in some places. However, the three-decade record of fine-tuning the death penalty process remains ongoing. Legislatures and courts are having a difficult time "getting it right," despite spending inordinate amounts of their resources trying.

Many people support capital punishment even though they are ignorant of the subject. It is assumed by abolitionists that if people were educated about capital punishment, most would oppose it. Unfortunately, research suggests that educating the public about the death penalty may not have the effect the abolitionists desire. Although information about the death penalty can reduce support for the sanction—sometimes significantly—rarely is the support reduced to less than a majority, and the reduction in support may be only temporary.

Two major factors seem to sustain death penalty support in the United States: (1) the desire for vindictive revenge and (2) the symbolic value it has for politicians and law enforcement officials. According to Gallup, 50 percent of all respondents who favored the death penalty provided retributive reasons for their support: 37 percent replied "An eye for an eye/They took a life/Fits the crime," and another 13 percent volunteered "They deserve it." The reasons offered by the next largest group of death penalty proponents (by only 11 percent each) were "Save taxpayers money/

Cost associated with prison" and "Deterrent for potential crimes/Set an example." No other reasons were given by more than 10 percent of the death penalty proponents (Gallup 2010).

The choice of "An eye for an eye" has been called *vindictive revenge* because of its strong emotional component. Research shows that the public supports the death penalty primarily for vindictive revenge. Those who responded "An eye for any eye" want to repay the offender in kind for what he or she has done. Research also shows that people who support the death penalty for vindictive revenge are generally resistant to reasoned persuasion. That is, they are less likely to change their position on the death penalty when confronted with compelling evidence that contradicts their beliefs.

Politicians continue to use support for the death penalty as a symbol of their toughness on crime. Politicians who oppose capital punishment are invariably considered soft on crime. Criminal justice officials and much of the public often equate support for capital punishment with support for law enforcement in general. It is ironic that although capital punishment has virtually no effect on crime, the death penalty continues to be a favored political silver bullet—a simplistic solution to the crime problem used by aspiring politicians and law enforcement officials. In sum, although the global trend is toward abolishing the death penalty, pockets of resistance in the United States remain and will be difficult to change.

DNA USAGE IN CRIMINAL JUSTICE

Julia Selman-Ayetey

Deoxyribonucleic acid (DNA) is one of the most valuable discoveries of the 20th century. Imported from the medical and scientific fields, the application of DNA technology in the criminal justice system has revolutionized the way crimes are investigated and prosecuted. Once considered an irrelevant and "stupid molecule" (Watson 1997, 2), DNA is now frequently considered a reliable and powerful silent witness able to identify or eliminate suspects as well as clinch convictions. However, its use in the criminal justice system is not without controversy. Indeed, its use raises quite a number of ethical concerns, and its ability to incriminate the innocent, while less known, is well documented. This has occurred through administrative and technical errors and disturbingly through deliberate distortion of forensic analysis and findings as well as evidence planting. This entry is by no means a comprehensive treatise on DNA; it is meant simply to introduce the reader to some of the contentious issues surrounding the use of DNA in the criminal justice system.

Background

DNA is a molecule located in the nuclei of all cells other than red blood cells and, with the exception of monozygotic (identical) twins, is unique to individuals. "Surprisingly, unlike the unwavering excitement that now surrounds DNA, the discovery of its structure was accompanied by much less fanfare" (Selman 2003, 10). The molecule's rise to prominence only followed the realization that it carried vital genetic information, including disease, from parent to offspring—essentially a "blueprint of life." Since its discovery, DNA technology has been used in a variety of settings, from gene therapy in clinical medicine to genetic engineering in plants and animals for improved agricultural productivity. It has also been applied in a number of other disciplines, such as anthropology, theology, philosophy, law, and, of more relevance to this entry, criminal justice systems the world over.

The use of DNA in police investigations was the result of significant scientific advances made primarily by Sir Alec Jeffreys, professor of genetics at the University of Leicester in England. Jeffreys coined the term "DNA fingerprinting" after discovering that certain regions (loci) of DNA have a high degree of variability that makes them virtually unique to individuals (Jeffreys 1985).

This simple scientific fact was first used in a criminal context in a rather complicated double rape and murder case known as the Pitchfork case. In 1987, it emerged that a man had given his blood sample to the police, but had identified it as that of his colleague, Colin Pitchfork. When he was overheard talking about the switch and this was reported to the police, Pitchfork was arrested. DNA analysis confirmed that he had raped both girls. Pitchfork confessed to the murders and was sentenced to life in prison.

The original method created by Jeffreys was initially used by British police forces; however, owing to the expense and great length of time it took to generate a DNA fingerprint, both the British and U.S. criminal justice systems now use what is accurately referred to as "DNA profiling." The difference between the two DNA identification methods is an important one, as Jeffreys states:

> Unfortunately—and particularly in the United States—the term "DNA fingerprinting," which we specifically apply to the original multi-locus system in which we look at scores of markers, has been corrupted to be used in almost any DNA typing system. That has created a problem in court, because DNA profiling does not produce DNA fingerprints.…So this is a semantic problem, but a serious one. (Jeffreys 1995)

DNA profiling involves extracting DNA from biological samples taken from hair, body tissue, or fluids such as saliva, semen, or blood. Forensic analysis of loci on the DNA then produces a DNA profile. DNA profiling is less conclusive than DNA fingerprinting, as it examines considerably fewer loci or markers of a person's DNA. At

THE PITCHFORK CASE

In November 1983, in the small town of Narborough, England, Lynda Mann was raped and strangled to death. The search for her killer proved futile. In 1986, Dawn Ashworth, another teenage girl, was also found dead in Narborough after having been raped. Semen samples revealed that the killer of both girls had the same blood type. Police later arrested a local teenage boy, who falsely confessed to killing Ashworth but denied involvement in the death of Mann.

Aware of Professor Jeffreys' work with DNA fingerprinting, police submitted semen samples from both murder cases along with a sample of the suspect to Jeffreys for DNA testing. Forensic analysis concluded that the rapist in these cases was not the local boy. It did, however, indicate that the killer in both instances was the same person. Then, in 1987, Leicester police conducted the world's first mass screening by asking almost 5,000 men in the area to provide blood or saliva samples to absolve themselves of the offense. After six months of processing all the samples, there was still no match. Later that year, someone overheard that a man had substituted his sample for that of Colin Pitchfork, his colleague, who was tested and subsequently arrested.

present, DNA profiling cannot examine all the differences between people's DNA; thus, although they will not have the same entire DNA sequence or genome, there is a remote chance that two unrelated people could have the same DNA profile. Hence the discriminatory power of any DNA profile increases with the number of loci tested. When DNA typing first started being used to facilitate police investigations in England and Wales, the standard analysis involved the examination of 6 loci. Now they examine 10 (plus 1 that indicates gender). The United States currently examines 13 sites. Given the number of loci that are now examined, unrelated people are extremely unlikely to have the same DNA profile, and if they are collected and analyzed correctly, DNA profiles are accepted by scientists as well as the courts as being conclusive enough to establish identification irrefutably.

It is this consensus that has greatly contributed to the establishment and expansion of DNA databases. The use of DNA databases enables new profiles to be compared against those already stored on the system. Matches may be found on examining evidence from two (or more) crime scenes, which may mean that a particular suspect was involved in both crimes, and, as is often the case, a match can be made between an individual and a crime scene. Although a match alone does not prove involvement in a crime, it can provide unquestionable proof that a person was present at the scene of a crime. This, together with other evidence, may illustrate beyond a reasonable doubt that an individual is the offender.

Key Events

The first official forensic database, the National DNA Database (NDNAD), was established in the United Kingdom in 1995. Having previously operated local and state databases, the United States followed suit in 1998 when its national DNA database, the National DNA Index System (NDIS), was launched under the authority of the DNA Identification Act of 1994 (Federal Bureau of Investigation 2009). The NDIS together with local and state databases make up the Combined DNA Index System (CODIS). CODIS stores profiles on two indexes. The Forensic Index contains profiles recovered from crime scenes, whereas profiles of convicted offenders or certain categories of arrestees are held under the Offender Index (Federal Bureau of Investigation 2009). The U.S. national DNA database currently contains profiles of approximately 0.5 percent of the population. In comparison, the British national database is estimated to have profiles of over 10 percent of the population (of England and Wales), or 5.53 million profiles (National Policing Improvement Agency [NPIA] 2009).

The potential of DNA technology was pushed further with the introduction of DNA dragnets or sweeps (or mass screenings, as they are called in the United Kingdom). Dragnets involve requesting a group of individuals who fit a general description of the suspect to voluntarily provide a DNA sample for profile analysis in order to exclude themselves as suspects. The first dragnet was used in the United Kingdom in the Colin Pitchfork

case. Since then, this method has become increasingly common in Europe, including a dragnet in Germany in 1998 that sampled DNA from 16,000 men in an attempt to find the perpetrator of the murder of a young girl (Dundes 2001). Although there have been about a dozen DNA dragnets in the United States (Duster 2008), this method of "elimination by numbers" has been used less frequently here than in Britain owing to potential conflicts with the Fourth Amendment, which provides, among other things, protection against unreasonable searches and seizures.

Familial searching is another milestone in DNA applications in the criminal justice system. It is predominantly used in cases in which a crime-scene profile has failed to match a suspect profile on the national DNA database. Familial searching involves probing the database to find profiles similar to the one taken from the crime scene in the hope of being led to the suspect. The profiles that are found to be similar to the one from the crime scene would be from individuals who have a high probability of being relatives of the perpetrator. This is viable because people inherit 50 percent of their DNA from each parent. Thus, close family members such as parents, children, siblings, and even aunts and uncles are likely to share some genetic markers. This approach was first used in the United Kingdom in 2002. (In 2002, a DNA familial search led to the identification of an offender who was deceased. In 2003, familial searches led to the identification of two other offenders in the United Kingdom, one of whom was Craig Harman, who was convicted of manslaughter in 2004.) It was initiated in the United States in 2003, so that familial searching is still relatively new. At present, familial searches are not likely to become a regular occurrence in criminal investigations primarily because of the cost of running such a search (estimated at $9,000 per search in 2004) ("Sins of the Fathers" 2004). As forensic DNA technology continues to develop and costs decrease, however, law enforcement may want to make familial searches common practice.

Both these applications of DNA forensic technology raise important issues regarding ethics, confidentiality, civil liberties, and human rights (Williams and Johnson 2006; Haimes 2006). Clearly, it is important that all issues of concern be brought to the public forefront for debate and that the government and relevant bodies implement appropriate legislation, policies, and procedures to ensure that innocent individuals and families are not adversely affected. This may require the amendment of laws that have recently been passed without adequate public discussion.

Legal Decisions

During early uses of DNA as evidence, the main assistance with admissibility the courts had was the standard as laid out in *Frye v. United States.* Under the *Frye* test, scientific evidence could be admitted only if it had "gained general acceptance in the particular field in which it belongs" (*Frye v. United States*). In 1993, however, with the use of DNA profiles becoming more prevalent, the Supreme Court set a new standard

DNA AND THE CRIMINAL JUSTICE SYSTEM SINCE 1987

- 1987: The first DNA exoneration and mass screening took place in the double murder investigation of Lynda Mann and Dawn Ashworth in England. In Florida, rapist Tommy Lee Andrews became the first ever to be convicted on the basis of DNA evidence.
- 1988: Colin Pitchfork, the first man apprehended on the basis of DNA profiling, was sentenced to life in prison for the murders of Mann and Ashworth.
- 1989: Gary Dotson became the first person in the United States to be exonerated and released from prison thanks to DNA results.
- 1993: Kirk Bloodsworth was released from prison on June 28, 1993, making him the first person on death row to be exonerated by DNA evidence in the United States. Also, Dr. Kary B. Mullis won the Nobel Prize in Chemistry for the invention of the polymerase chain reaction (PCR) method. Prior to the PCR method, DNA analysis was slow, required large quantities of sample, and involved difficulty in analyzing mixed or contaminated samples. PCR enabled profiles to be produced from minute and degraded samples of DNA. In addition to its applications in other fields, PCR enabled DNA profiling to be used in a larger number of cases.
- 1994: For the very first time, analysis of nonhuman DNA led to the identification and apprehension of a criminal. Royal Canadian Mounted Police officers had hairs from a man's pet cat analyzed, which pointed to him as the murderer of his wife.
- 2001: In May, the Criminal Justice and Police Act (CJPA) of 2001 came into force in England and Wales. This law authorizes the retention of DNA samples and profiles of anyone charged with any offense that carried a penalty of imprisonment or anyone charged with a few specified noncustodial offences.
- 2002: The number of exonerated death row inmates in the United States based on DNA testing reached 100.
- 2004: In England, Craig Harman became the first person in the world to be prosecuted and convicted as a result of DNA database familial searching. In the United States, President George W. Bush signed the Innocence Protection Act, which amended the federal code to permit postconviction DNA testing and established a grant program to help states defray the costs of testing.
- 2006: The DNA Fingerprinting Act of 2005 became law in the United States. This legislation permits the DNA sampling of foreign citizens detained on federal grounds and reduced the stage at which a DNA profile can be uploaded onto the federal database from charge to arrest. It also authorized government funds to support the analysis and retention of all DNA samples and profiles on the national database. Furthermore, this act requires individuals who would like their profiles removed from the database to file certified documents stating that they have been acquitted or have had charges dismissed before their requests can be processed.

- 2009: The longest-serving prisoner ever to be exonerated by DNA evidence, James Bain of Florida, was released after spending 35 years in prison. Also, the U.S. Supreme Court ruled (in *Melendez-Diaz v. Massachusetts*) that crime lab analysts are required to submit to cross-examinations in trials where data from their labs is used as evidence.

in *Daubert v. Merrell Dow Pharmaceuticals, Inc.* This standard expanded the *Frye* test by recognizing the need to highlight issues that might bias or mislead the jury. In particular, it permitted for the first time the admission of new factors, such as publications and probabilities of error, to assist with evaluating the degree of reliability (*Daubert v. Merrell Dow Pharmaceuticals, Inc.*). One of the most significant cases regarding the use of DNA typing in criminal trials was *People v. Castro* (1989). This case fervently contested the admissibility of DNA evidence in court. In its opinion, the Court issued recommendations that would encourage fair and just use of DNA evidence. The Court held that it should be provided with chain of custody of documents and details of any defects or errors. It also held that laboratory results should be provided both to the defense counsel and the court.

Although a number of state and federal cases have created a gateway into the courtroom for forensic DNA evidence, courts have also declined to admit DNA evidence. Some of these cases involved laboratories that had unreliable or dubious practices (*Schwartz v. State* 1989).

In addition to being used as evidence to convict suspects, DNA technology is increasingly being used to exonerate previously convicted individuals. On June 12, 2006, for the very first time, the U.S. Supreme Court considered the standards necessary to reopen a postconviction death penalty case involving DNA evidence. After Paul House had served more than 19 years on death row, the Supreme Court held that he was entitled to a new trial (*House v. Bell* 2006). House was originally convicted of murder, but recent DNA analysis showed that the body fluids found on the victim's clothes were not his. This new evidence was sufficient to meet the precedent for postconviction claims of innocence as set out in *Schlup v. Delo* (1995).

In addition to case law, DNA has also affected legislation. The Innocence Protection Act was tabled to the U.S. Senate in February 2000. On October 30, 2004, the Justice for All Act of 2004, which includes the Innocence Protection Act of 2004, became law. This act seeks to do a number of things, the most significant of which are to (1) enhance and protect the rights of crime victims; (2) reduce the backlog of untested DNA samples; (3) expand forensic laboratories; (4) intensify research into new DNA testing technologies; (5) develop training programs on the proper collection, preservation, and analysis of DNA evidence; and (6) facilitate the exoneration of innocent individuals through postconviction testing of DNA evidence.

In December 2003, a private citizen submitted to the attorney general's office in California a proposed initiative titled DNA Fingerprint, Unsolved Crime and Innocence Protection Act. (Bruce Harrington submitted the proposal after his brother and sister-in-law had been murdered some years earlier.) This proposal sought to widen the category of instances in which DNA samples could be taken and profiles stored on the state's database. Proposition 69, as the proposal became known, was approved by voters in California on November 2, 2004. The effect of this enactment was that as of November 3, 2004, the following categories of people will have a DNA sample taken and uploaded onto the state and national DNA database: (1) any person, adult or juvenile, convicted of any felony (including any person in prison, on probation, or on parole for any felony committed prior to November 3, 2004, or any person on probation or any other supervised release for any offense and who has a prior felony); (2) any person convicted of any sex or arson offense or attempt; and (3) adults arrested for murder, voluntary manslaughter, or felony sex offenses (which includes rape) or attempt to commit one of these crimes (Office of the Attorney General 2007).

Furthermore, as of January 2, 2009, all adults arrested for any felony are subject to DNA collection and retention. Prior to the passing of Proposition 69, only those convicted of a serious felony such as rape and murder had to submit DNA samples (California Legislative Analyst's Office 2004). Thus Proposition 69 has effectively resulted in the massive expansion of California's DNA database. It is worth noting that Louisiana, Minnesota, Texas, and Virginia already have legislation that authorizes taking DNA samples from adults arrested for a felony. There is therefore a clear trend toward a so-called DNA-based criminal justice system.

Conclusion

As a result of ongoing advances by scientists, extensive legislation, support from police and prosecutors, and substantial funding from the government, the drive to expand the application of DNA technology in the criminal justice system continues. Currently, scientists at the University of Southampton in the United Kingdom are in the process of developing a method of forensic analysis that could enable DNA samples to be transformed into profiles at the scene of the crime ("Forensic Science Hots Up" 2008). Furthermore, DNA profiling involving testing for race and other physical characteristics has slowly begun. Scientists now have the ability to decipher from DNA analysis the gender and age of an individual, and research is currently being conducted toward identifying eye, hair, and skin color. This can obviously assist the police with composing more accurate descriptions of a suspect. Although this could significantly facilitate criminal investigations, it also raises a number of sociological and ethical issues: What defines race? Is it what the public see, or is it what the individual knows or believes he or she is? How do we deal with a situation in which racial genetic testing reveals information the individual did not know and may not have wanted to know about himself or herself?

Could racial DNA profiling lead to eugenics? These are just some of the issues (Duster 2008; Ossorio 2006). Perhaps appropriately, testing for racial characteristics has not yet become common practice. Before further steps are taken to increase its utilization, serious consultation with sociologists, criminologists, ethicists, psychologists, geneticists, and lawyers must be conducted.

Given the benefits of the use of DNA technology in the criminal justice system and the perceived breaches of rights it begets, particularly for those who are acquitted or never charged, there have been calls by some to collect DNA samples and store DNA profiles of all citizens on forensic databases. Proponents of a forensic database holding DNA profiles of the entire citizenry argue that it will reduce racial discrimination in the disproportionate storage of profiles of ethnic minorities and simultaneously increase fairness, as everyone would be incurring the same degree of threat to privacy. Furthermore, because everyone would know that their DNA was on the database, proponents also hold that such a database would act as a deterrent (Williamson and Duncan 2002; Kaye and Smith 2004; Smith, Kaye, and Imwinkelried 2001; Tracy and Morgan 2000).

Arguments against this proposal include issues relating to the presumption of innocence and the right to avoid self-incrimination (embodied in the Fifth Amendment in the United States), not to mention the potential misuses of genetic information by government agencies as well as others, such as insurance companies and employers who might benefit from such information. Given the immense financial cost and practical difficulties alone, the prospect of implementing such an idea is fraught with numerous obstacles. Given the speed at which DNA legislation has expanded, however, many believe implementation of these ideas is a real possibility and perhaps inevitable. The key question is whether this will happen explicitly with public debate or by stealth.

DNA, DNA profiles, databases, and related applications have irreversibly changed the way humans think about life, disease, and the resolution of crime. However, it is its use in the criminal justice system that continues to attract the most controversy (Harmon 1993; Neufeld 1993; McCartney 2006). The use of DNA in the criminal justice system provides numerous benefits resulting in more convictions of the guilty and more exonerations of the innocent. It also raises serious questions, including but not limited to privacy, probable cause, coercion, consent, confidentiality, civil liberties, subjective identity, and other ethical considerations. Many of these concerns are legitimate, particularly because the introduction of legislation often occurs devoid of public scrutiny. The recent vote on Proposition 69 illustrates that public consultation has been initiated. It is necessary that future consultations be complemented with a discussion of the relevant concerns so that the public can form an educated opinion. Much more public debate is essential to avoid the introduction of unfair legislation and practices and to prevent miscarriages of justice that would ultimately affect us all.

DOMESTIC VIOLENCE INTERVENTIONS

Venessa Garcia

Domestic violence and the question of whether to intervene into the family dwelling affected by physical or psychological abuse has, until recently, been controversial because of the different viewpoints regarding the issue as one of privacy versus one of public accountability. Once domestic violence was viewed as a social problem, the controversies shifted to what was the appropriate form of intervention or who should be responsible for carrying out domestic violence practices—law enforcement and criminal justice agencies or social and human service agencies. Another set of controversies surrounding domestic violence practices stems from the often competing or contradictory goals of punishment versus rehabilitation.

Background

Historically, domestic violence was seen as a private trouble. It occurred within the privacy of a man's own home. He was in charge of all affairs and persons residing in his

home, and he had the right to chastise his wife. According to the Old Testament, women were the source of all evil. Under English common law, the husband was allowed to chastise his wife with restraint. Based on religious beliefs, the law limited the husband's violence. With the secularization of society, however, this violence became problematic. Nevertheless, in the colonies, a new liberal Lockean philosophy focusing on public order became the foundation for the establishment of domestic violence laws that remained under the umbrella of private order for centuries (Buzawa 2002).

It was not until the 1970s that feminists adopted the concern for violence against women. Domestic violence came to be understood as the domination of men over women in all spheres of a patriarchal society. In opposition to past liberal philosophy, feminists argued that the power and domination at the root of domestic violence required that society redefine this violence as a social problem instead of a private family affair. This argument followed C. Wright Mills's sociological tenet that personal troubles are in fact public issues (Mills 1976) and that society would eventually come to change domestic violence practices.

Although the 1970s Battered Women's Movement worked to change domestic violence laws, practices of the 1980s still reflected the definition of domestic violence as a private issue. According to the Uniform Crime Report, in 1989 women were six times more likely than men to be victimized by a spouse, ex-spouse, boyfriend, or girlfriend. Within a nine-year period, intimates committed 5.6 million violent acts against women, an annual average of almost 626,000. One-quarter of these assaults were reported to the police. It was reported that half of the complaints were an effort to prevent the abuse from recurring, whereas one-quarter were attempts to punish the abuser. Half of the victims who reported domestic violence to the National Crime Victimization Survey claimed to have had no response from the police because, as they were informed, this was a private matter (Harlow 1991).

Today in the United States, an incident of domestic violence against women occurs every 15 seconds. Research has found that battering is the single largest cause of injury to women. Annually, roughly 1 million women seek medical attention as a result of domestic violence, and their husbands or boyfriends commit 30 percent of all homicides against women (Belknap 2006). These statistics hardly suggest that such incidents are private matters. Yet research has found that 75 percent of all stranger assaults result in arrest and court adjudication, whereas only 16 percent of all family assaults, usually charged as misdemeanors and not felonies, result in arrest and court adjudication (Dobash 1978).

Key Legal and Social Moments

In terms of legal responses to domestic violence, it is believed that under English common law, Judge Sir Francis Buller in the 1780s stated that a husband can physically chastise his wife as long as he did not use a stick thicker than his thumb (Table 1). This

became known as the *rule of thumb.* Others claim, however, that there is no reference to this statement in English common law. It is known that as early as 1655, the Massachusetts Bay Colony prohibited domestic violence. In 1824, however, a husband's right to assault his wife became codified under state law. The Mississippi State Supreme Court ruled that the husband had a right to chastise his wife physically, though in moderation (*Bradley v. State* 1824). Although the rule of thumb was referenced in this case, it was not used to justify the decision. In 1871, however, Alabama became the first state to recognize a wife's right to legal protection against her husband's physical abuse (*Fulgham v. State* 1871). Unfortunately, this ruling soon became a paper promise, since victims found that the criminal justice system still held strongly to the belief that domestic violence was a private trouble. In 1879, the court ruled that a man cannot be criminally prosecuted for assaulting his wife unless the violence was cruel or created permanent injury (*State v. Oliver* 1879). Even as recently as 1962, a husband's right to chastise his wife physically was legalized in *Joyner v. Joyner.*

It was not until the 1970s, with the Battered Women's Movement, that domestic violence began to be recognized as a social problem. Specifically, in 1977, Oregon became the first state to legislate mandatory arrest, and in 1979 President Jimmy Carter established the Office of Domestic Violence; however, the landmark case that truly took hold of domestic violence practices was *Thurman v. City of Torrington* (1984). *Thurman* was a civil case in which it was recognized that police had a legal responsibility to respond to and protect victims of domestic violence. The $2.3 million awarded to Tracy Thurman was the key moment that changed police practice in their responses. Although, by 1983,

It is commonly believed that under English common law, Judge Sir Francis Buller in the 1780s stated that a husband can physically chastise his wife as long as he does not use a stick thicker than his thumb (rule of thumb). Others, however, claim no reference to this statement in English common law.
Bradley v. State (1824). A husband had a right to physically chastise his wife, though in moderation.
State v. Oliver (1879). The criminal law did not apply to a husband's assault unless the violence was cruel or led to permanent injury to his wife.
Joyner v. Joyner (1962). A husband had a right to use force to compel his wife to "behave" and "know her place."

every state had made legal remedies in response to the demands of the Battered Women's Movement, many were still reluctant to intervene in so-called family matters. The *Thurman* case changed this practice.

Another key moment in domestic violence practices was the Minneapolis Experiment (Sherman and Berk 1984). The Minneapolis Experiment, conducted in 1984, found that as compared with previous practices, arrest was a greater deterrent to domestic violence. As a result of this experiment as well as the *Thurman* decision, many states implemented mandatory arrest laws. Since 1984, however, replication of the Minneapolis Experiment has found that arrest works as a deterrent only for the six months immediately following the arrest and not more. Thus the debate still continues: what is the most effective way to address domestic violence? Nonetheless, by 1986, some 46 percent of police departments in cities with populations greater than 100,000 had a proarrest policy based on probable cause. In 1984, it was only 10 percent (Steinman 1990, 2).

Domestic Violence Theories

Three major theories have influenced domestic violence practices. Individually oriented theories examine the character of both the batterer and the battered. These theories have brought about many negative myths and stereotypes about domestic violence and especially about the abused woman. Most people saw battered women as pathological. Recidivists were seen as masochistic, weak, or sick or women who sought out batterers. For this reason, women were referred to psychologists and various social service agencies. In responding to domestic violence calls, many police officers believed that the man's violence was justified because the woman constantly nagged him; for a man to use physical force, the woman must be at fault. In these cases, the police almost always sided with the man.

The big question with domestic violence was why did the woman remain in an abusive relationship? Many people believed that she was getting a meal ticket, and after so long, why did she complain now? Many concluded that she wanted to get revenge after a recent fight with her abuser. The assumption here was that she purposely provoked him until he was angry enough to strike her, and when he did, she called the police. Another myth that the criminal justice and judicial systems utilized was that these women never pressed charges; they were weak-willed women who could not follow through. Therefore the police did not waste valuable police time, as well as taxpayers' money, arresting the man, especially if he and the abused woman were married. Unfortunately, there is still evidence of these victim-blaming practices within the criminal justice system in the making of arrests and the choosing of prosecutorial actions.

Family-oriented and subcultural theories focus on characteristics within the family and on socialization patterns. According to these theories, the characteristics of the family predict future violence; that is, violence begets violence. In other words, adults who

experience or witness violence during childhood are more prone to becoming violent adults or battered adults. Children are often socialized that women are the property of men or that violence against one's spouse is acceptable. Unfortunately, some of these children grow up to be police officers. Within these theories, however, people believe that violence occurs in minority families, low-income families, and families containing alcohol or substance abusers. In responding to domestic violence calls, police who follow these myths generally do not consider such situations serious because they believe that the cultures of these families condone violence.

Feminist theories erased many of these myths from the minds of many people, although not all. These theories utilize a macrolevel analysis. They point to the structural violence in Western society. The privatized family structure makes domestic violence an individual problem, not a societal one. Accordingly, our male-dominated society keeps women economically and emotionally dependent on their men, giving them few or no options for a violence-free life. Feminists argue that the male-dominated criminal justice and judicial systems allow and even encourage this to happen. It was the fight of feminists that forced the police to change their policies toward domestic violence. This change was not the result of the acceptance of the feminist theories, however; instead, it was a result of feminist grassroots movements to sue police departments for failing to protect female victims.

Domestic Violence Practices

Police Responses

In the early 1980s and prior to that time, police as well as the courts felt that domestic violence was a private matter in which they should not interfere. According to police, it was not real police work; therefore, the police should not be dragged into it. Domestic violence was given very low priority and avoided if possible. In fact, during the mid-1960s, police departments in urban areas with high crime rates, such as Detroit, were actually screening out domestic violence calls.

Police domestic violence policies are evident in their training manuals. According to the Police Training Academy in Michigan, until recent changes in domestic violence policies, police officers were instructed to avoid arrest whenever possible and to appeal to the vanity of the individuals involved (Martin 1983). In responding to a call, the police were to tell the woman to consider time lost and court costs. The officer was to inform the couple that his only interest was to prevent a breach of the peace. He would recommend a postponement owing to the unavailability of a judge or court session, even if untrue. This statement was premised on the belief in the myth that battered women often changed their minds about pressing charges before the case came to court. He explained that she would probably reconcile with her abuser before the hearing. Police even went as far as scaring the woman, making her realize that pressing charges would infuriate her abuser, possibly making him retaliate worse than ever. In addition, she had to realize that the police could not babysit her.

In California, the Training Bulletin on Techniques of Dispute Interventions also advised officers to avoid arrest except to protect life and property and preserve the peace. In addition, it instructed the officer to encourage the victim to reason with her attacker. In Detroit as in many other cities, police precincts received more calls involving domestic violence than complaints of any other serious crime. Detroit's training consisted of 240 hours, yet only 3 to 5 hours were dedicated to this most frequent and recurrent crime. Officers were trained to avoid action as well as injury to themselves. Domestic violence was not a crime unless there was severe injury, and many times no action was taken even then. The International Association of Police Chiefs stated that it was unnecessary to create a police matter when only a family matter existed.

In domestic violence cases, the police saw their role as that of preservers of the family. This meant that no police action was taken even if it meant persuading the woman not to press charges or denying that she could be helped in any way. The police played mediator roles in attempting to reunite the couple. Arrests were made only when there was a disruption of the peace or the possibility that the police would have to be called back to the scene.

All studies have shown that police were reluctant to intervene in domestic violence. They were even more reluctant if the couple was married, moving the incident farther into the private realm. A husband had more right over his wife than a boyfriend did because an unmarried couple did not constitute a family. Police were also reluctant to intervene in the domestic affairs of recidivists. Over time, officers became detached from a woman who constantly cried for help but did not leave her abuser. In response to these calls, police often arrived with the intention of keeping the peace but no intention of intervening.

As mentioned previously, police officials practiced a no-arrest policy. Yet when police did arrest, there were strict guidelines. To begin, there had to be a witness present other than the abused woman and her children. This was something that rarely occurred because domestic violence usually occurs within the privacy of a home. If an arrest was made, no matter how serious the abuse, it had to be witnessed by an officer and was charged as a misdemeanor. This also almost never happened. To assault another person in front of a police officer is to challenge and show disrespect for the authority of the police. Nonaction protected the officer from personal danger and liability of false arrest. When a woman had a man arrested for domestic violence, many times she would drop the charges. This allowed the man to sue the police department for false arrest. In order to release themselves from this liability, either no arrest was made or the woman was forced to make a citizen's arrest.

A study conducted by the FBI found that domestic disturbances caused the greatest number of officer deaths and injuries. This study created a panic as well as a reluctance to respond to domestic violence calls. In responding to these crimes, oftentimes officers responded in an aggressive manner in order to protect themselves from any unforeseeable

dangers. Their response often made the woman feel that she was a criminal as well. When the FBI released its statistics to the police departments, it created a panic among officers, and police precincts started screening domestic violence calls. However, it was later found and reported that the FBI report overstated the number of officer deaths by three times the actual number. What the FBI did was combine bar fights, gang activities, and restraining deranged people into one disturbance category. In actuality, between 1973 and 1982, only 62 out of 1,085 deaths occurred because of domestic violence. This is a very small number, considering that police spend much more time at a domestic violence call than at any other type of call.

Court Procedures

In a 1975 New York conference on abused wives, Justice Yorka Linakis stated, "There is nothing more pathetic than to see a husband going to his home—usually in the company of a policeman—to collect his meager belongings" (Martin 1983). A Michigan circuit court judge argued that violence is provoked; therefore, the wife should be cited for contempt on this basis and both should be sentenced to jail. Prior to changes caused by the Battered Women's Movement, these were the kinds of attitudes a battered woman would encounter in court. Courts were highly insensitive to a woman's distress. This insensitivity was caused by the ignorance of the problem, inadequate laws, and a heavy backlog of other, more important cases.

When a woman decided to bring charges against her assailant, she had the choice of using a criminal court or a family court. The purpose of criminal court is to punish the criminal and deter the crime. If taken to criminal court, domestic violence is considered a crime. Within this broad category is physical injury, sexual abuse, rape, attempted rape, harassment, threat of physical abuse, death, destruction of another's property, kidnapping or involuntary confinement, or violation of a protection order. The state filed a criminal charge when an arrest was made or when a victim filed a private criminal complaint. A private criminal complaint was filed when the victim did not call the police or did call but the police failed to show up or did not make an arrest when they arrived. Penalties in a criminal court consist of a jail sentence, a fine, or a term of probation. Although normally there is not enough evidence in a domestic violence case for a conviction, a case must be proved beyond a reasonable doubt. The result is usually a warning to the abuser stating that further violence will be prosecuted. If there is enough evidence for a conviction, the prosecutor will usually arrange a plea bargain, bringing the charges down to a misdemeanor or, more often, a violation resulting in probation or, less seriously, a warning.

Although by 1983, in response to the demands of the women's movement, every state had made new legal remedies available to women, many were still reluctant to intervene in family matters. For this reason, most domestic violence cases have been thrown out of criminal court and sent to family court. In family court, a woman could file for a

divorce, custody of children, and alimony from her husband. Major problems with family court, though, are that only spouses and couples with children are allowed to file for remedies. This bars cohabitants and other intimates, who would not receive help and support otherwise, from seeking remedies. Although family court would be of greater help to an economically dependent woman with no occupational training, it is designed to protect the family assailant rather than the family victim. It has been recognized that family court is inappropriate for handling felony cases, since it provides the assailant with counsel and leaves the woman to fend for herself.

There were various civil remedies for which a battered woman could file. An order of protection or restraining order requires the abuser to refrain from violence and stay away from the victim. It can last up to one year. Violation of this order is contempt of court and is punishable by a jail sentence of up to six months, a fine, both, or a term of probation. A major problem with obtaining an order of protection is that it takes several days to receive, and often police do not enforce it, claiming that they have no record of the order or that it is a civil not a criminal matter and therefore out of their hands. In order to be protected while she waits for the order of protection, a woman can file for a temporary order of protection. This order can be obtained at night and on weekends. A victim of domestic violence can also file for damages or a peace bond. The problem with these remedies is that they require the abuser to give money to the court that could otherwise be used to support the victim and her children.

Conclusion

Although much of the domestic violence research as well as legislative changes and court decisions have focused on police practices, much has also been done to change prosecutorial and judicial practices. Specifically, prosecutors tend to oversee victim/witness units that tend to deal predominantly with victims of domestic violence. These units inform the victims of the processing of their cases and aid them in understanding the justice process as well as obtaining victim compensation. Within the courts, domestic violence courts have been implemented. These courts are organized so as to give a substantial focus to these sensitive and complex cases; however, research is still needed to assess the effectiveness of these practices. For example, although most police agencies have implemented proarrest policies, researchers have found that the discretion has been taken from the police and given to the prosecutor. Specifically, prosecutors tend to screen out many of these domestic violence cases before they can reach the courts. Furthermore, domestic violence courts are not usually fully structured. Instead, they operate much as early U.S. circuit courts did, in which the domestic violence court convenes one or two days a week and is overseen by one judge or sometimes a commissioner.

Questions of domestic violence practices have been present since the codification of the law; however, these practices did not truly become controversial until the 1970s,

and although these interventions or lack thereof may have peaked in their controversial nature, their legacies die hard. For example, although most police departments have mandatory arrest policies, many police officers still hesitate to make arrests. Then, when an arrest is made, the offender is usually charged with a misdemeanor, even when serious injuries have occurred. Furthermore, officer attitudes during arrest often reveal the prevalence of the private-trouble ideology within society. Finally, the fact that many domestic violence crimes go unreported reveals further problems in improving domestic violence practices. Victims do not report these crimes for many reasons. Sometimes victims do not believe that the police can or will do anything to help them, and sometimes victims themselves define the problem as a private trouble. As with many other controversies in criminal justice, the cultural roots at the heart of the problem suggest that domestic violence practices will remain controversial for some time to come.

DRUG TRAFFICKING AND NARCO-TERRORISM

Judith Ann Warner

When politicians and journalists speak about the U.S. -Mexico border, drug trafficking is viewed as only part of the problem of border security. Preventing terrorist entry and unauthorized immigration are the chief issues. Drug trafficking occurs at all U.S. ports of entry, including the U.S. -Mexico border, the U.S.-Canada border, airports, and sea lanes. Despite the War on Drugs, cocaine, marijuana, methamphetamines and heroin are regularly crossed and bring billions into the hands of criminals. Conceivably, heightened border enforcement could have an impact on Mexican drug trafficking organizations (DTOs). Yet despite all of the efforts made by the White House and Congress to strengthen the border, drug smugglers can respond with ever more sophisticated and brutal acts. Indeed, drug trafficking represents a national security threat, because widespread corruption and drug-related violence could destabilize the government of Mexico (Grayson 2010).

Mexican drug trafficking organizations grow and transport marijuana and heroin and are active in manufacturing "meth" (methamphetamines). Estimates are that 90 percent of cocaine sold in the United States enters through the Mexico border. Alternately, the billions in profit realized from drug sales have created money laundering ventures and enabled the DTOs to purchase smuggled arms, including automatic weapons. The subsequent corruption and drug-related violence causes further concern owing to the possibility of "spillover violence," including kidnappings, torture and homicide in the United States.

The Dimensions of the Problem

The U.S. government has resisted the legalization of marijuana, heroin, and cocaine because of their psychotropic effects. In the 1960s, the United States began to take international action to enforce drug prohibition (Andreas and Nadelman 2006). The major focus was on the Colombia Cali and Medellín cartels and stopping the smuggling of Colombian cocaine to Florida from the Caribbean. Another concern was cross-border smuggling of marijuana and heroin from Mexico. The Drug Enforcement Administration (DEA) was successful in stopping Colombian cocaine smuggling through the Caribbean in the late 1980s and 1990s thanks to an increased naval presence. Colombian cocaine cartels then turned to Mexican smugglers and began using their services, making the U.S.-Mexico border the major route of entry (Payan 2006). Patrick Buchanan, a media commentator, has referred to the change in drug smuggling routes from sea to land as the "Colombianization of Mexico."

Mexican government officials have an informal tradition of overlooking or actively colluding with drug smugglers (Beittel 2009, 7–8). Through the 1990s, the acceptance of bribes was part of a process of accommodation in which the ruling party, the PRI

(Partido Revolucionario Institutional, or Institutional Revolutionary Party) operated in tandem with Mexican DTOs (Velasco 2006; Grayson 2010). From the mid-1980s through 1992, the U.S. government certified the degree to which foreign governments cooperated in stopping drug trafficking (Beittel 2009, 2–3). Under pressure from the United States, Mexican officials participated in crop eradication programs and made some arrests. The working relationship between Mexican and U.S. officials was characterized by mistrust. After 2002, the United States classified countries considered to be ineffective against drug traffickers and associated this effort with sanctions affecting assistance. When Vincente Fox became president of Mexico (2000–2006), his PAN (Partido Acion Nacional, or National Action Party) ended the PRI's 71-year hold on the presidency and political appointments; it also inadvertently disrupted long-term relations of collusion and corruption with drug traffickers (Velasco 2005).

The destabilization of Mexican drug trafficking interorganizational relations and territorial control was an unexpected consequence of the development of a viable two-party system in Mexico, its "democratic transition" (Velasco 2005). Immediately, as Mexico's democratic practice became stronger, President Fox began binational cooperation to suppress drug smuggling. By 2006, some 79,000 Mexicans had been arrested on charges related to drug smuggling (Cook 2007, 3–4). Statistics indicate that low-level drug smugglers and dealers made up 78,831 of the arrests, hit men made up 428, lieutenants 74, financial officers 53, and cartel leaders—the apex of decision making—15. Tijuana DTO leader Francisco Arellano Felix and Gulf DTO leader Osiel Cárdenas Guillén were arrested. Although Guillén was apparently able to continue operations from inside a Mexican prison for a time, attempts by rival drug organizations to control lucrative trafficking routes (such as Interstate Highway 35 in Texas) led to turf wars characterized by spiraling violence and brutality in Mexican border cities and, later, throughout Mexico (Cook 2007, 11–12).

In 2005, conflict over control of the "plaza" (territory) between rival Gulf and Sinaloa DTOs in Nuevo Laredo and Laredo, among the principle ports of entry for cocaine and marijuana, led to the deaths of 135 people. Most of these dead were cartel members, but a journalist, city council member, 13 Mexican police, and the Nuevo Laredo police chief were also killed. In response, President Fox sent federal Mexican troops to Nuevo Laredo to control the situation. Texas Governor Rick Perry sent additional police and equipment to aid the border cities. Both U.S. and Mexican officials have become concerned that the major drug DTOs pose a threat to border security. In September 2008, a total of 175 arrests were made in Mexico, the United States, and Italy to control the violent Gulf drug cartel.

Felipe Calderón, the current Mexican president (2007–present), has increased law enforcement activity against DTOs and narco-terrorism. He considers drug trafficking–related violence a threat to Mexico's national stability (Beittel 2009, 3). The drug-related lawlessness has spread geographically, escalated, and incorporated terrorist elements.

Narco-terrorism is defined as using terror as a tactic to increase drug trafficking profits (Casteel 2003). In reference to other international drug trafficking, the concept of narco-terrorism also refers to using profits from drug trafficking, such as heroin sales, to fund terrorism. At present, Mexican DTOs have not formed ties to international terrorists.

Mexican drug trafficking organizations have used hit men and gang-precipitated torture and violence to intimidate the public and government officials (Cook 2007, 6–9; Beittel 2009, 5–6). The Mexicans who have been killed include elected government representatives, journalists, police chiefs and other law enforcement officers, prosecutors, and civilians of all ages. Pamela L. Bunker, Lisa J. Campbell, and Robert J. Bunker (2010, 145–146) of the Counter-OPFOR Corporation state: "Because many of the police forces and judicial systems in Mexico have been corrupted and compromised and therefore arrest and prosecution rates are extremely low, the probability of ever being brought to justice is almost non-existent for most individuals and groups engaging in killings, torture and beheadings."

Narco-terrorism involves the use of brutality and murder to intimidate the civilian population and authorities. Individuals may be kidnapped for failure to pay drug debts or in order to demand ransom payments. Forms of torture include beatings, knife cuts, breaking bones, sexual abuse, and starvation. Extreme torture includes the use of acid, water, fire, electricity, water boarding, and suffocation (Bunker, Campbell, and Bunker 2010). Prior to homicide or afterward, bodies may be subject to decapitation (*decapitado*), quartering (*descuartizado*), placement in a car trunk (*encajuelado*), wrapping/binding in a blanket (*encobijado*), sealing in a metal storage drum (*entambado*), or depositing in an acid bath (*pozoleado, guisado*) (Bunker, Campbell, and Bunker 2010, 146). Drug-related killings in Mexico increasingly involve short-term torture such as inflicting nonfatal wounds prior to death. These tactics involve the intended effect of intimidation for political or economic gain, but they can also be ritualized, as when narco-cults (*narco-cultos*) carry them out in a ritualized manner connected to a plea for divine intercession, as when a sacrifice is made to Saint Death (*La Santa Muerte*). In Mexico, headless or tortured bodies are being left in public places connected to marijuana growing regions or cartel-controlled areas. Law enforcement officers who turn down bribes may find their names on lists attached to corpses.

The Mexican population perseveres and has taken action against the escalating violence, which can result in death and injury for civilians. In August 2008, a massive public protest against the violence involving hundreds of thousands of marchers occurred in Mexico City and throughout Mexico. In 2010, Mexican government estimates were that, since 2007, some 22,700 people had been killed (Castillo 2010). In 2007, a total of 2,837 were murdered. By 2009, the total killed reached 9,635, tripling the death toll. The border city of Ciudad Juarez has reported 4,324 deaths since 2006, the highest rate in Mexico. From January to March 2010, the death toll was 3,365—violence of epidemic proportions. Deaths in Ciudad Juarez included a pregnant employee of the

U.S. Consulate, her husband, and another husband of a consulate employee (Lacey and Thompson 2010).

Drug trafficking and unauthorized immigration are discussed as issues of lawlessness along the U.S.-Mexico border, but most people in the region are law-abiding. The chief problem has been that, as U.S. border enforcement has escalated, the smuggling of both drugs and people has become more sophisticated. In Mexico, destabilization of relations between drug trafficking organizations (owing to the arrest of leaders and competition for territory) is given as the chief reason for the increased violence. Nevertheless, DTOs are sufficiently powerful and well armed to engage in violent conflict with law enforcement and the Mexican military. It is questionable whether the death toll should be seen as evidence of success from the pitting of drug traffickers against one another because of the degree of harm to the civilian population as well as economic consequences, such as loss of tourism and trade for Mexico.

This situation would not occur if there were not a demand for drugs in the United States and a lack of economic opportunity in Mexico. President Barack Obama (2009–present) and Hillary Clinton, his secretary of state, have acknowledged that the United States shares responsibility for the problem because of the high demand for drugs in the country and the relative ineffectiveness of current programs in quelling that demand.

DRUG TRAFFICKING AND GLOBAL INEQUALITY AT THE U.S.-MEXICO BORDER

Democrats and Republicans are united in using law enforcement as a means to combat drug trafficking, but they do not emphasize the role of global inequality between the United States and Mexico as a factor in this trade. Drug trafficking is estimated to be the most profitable form of organized crime worldwide. It is thought that some $80 billion per year is spent on drugs crossed through the U.S.-Mexico border region. Although the exact figure spent is unknown, U.S.-Mexico inequalities fuel this multibillion-dollar trade. Mexico has a high unemployment rate and a low minimum wage. The demand for drugs in the United States is high; there are an estimated 20 million users who are willing to pay high prices for drugs. The wage disparity between the United States and Mexico makes working for drug cartels attractive for many young Mexican men in border communities. Many of the recruits are low-skilled laborers who have a hard time finding jobs. Drug trafficking skills—physical aggression, playing the role of a bodyguard, using a gun, and driving a vehicle across the border—can be learned quickly. The easy money earned from smuggling is much greater than what is available from legitimate employment in Mexico. It is actually surprising that the vast majority of Mexicans resist involvement in this criminal enterprise.

Drug Trafficking Organizations and Distribution Networks

In the 1980s, Mexico had one drug trafficking organization, headed by Felix Gallardo. When drug trafficking in the Caribbean was brought under control, Colombian cocaine traffickers joined forces with Mexicans. As the war on drugs heated up along the border, interorganizational disputes marred the operation of the border-wide cartel, and Gallardo (in prison) ordered it split into four separate organizations: the Gulf Cartel (Southeast Texas), the Juarez Cartel (Southwest Texas), the Sinaloa Cartel Federation (Texas, New Mexico, and Arizona), and the Tijuana Cartel Federation (California) (Cook 2007, 1–2). Originally, the arrests of Tijuana Federation leader Javier Arellano Felix and Guild Cartel leader Osiel Cárdenas Guillén led to an intercartel alliance. Later, the U.S. Project Reckoning heavily disrupted the U.S. and European transport networks (U.S. Attorney, Southern District of New York 2008). Abroad, 600 arrests were made and $72 million in currency was taken. Inside the United States, 12,000 kilograms of cocaine, $60 million in currency, and 750 arrests connected to 750 distribution networks were major outcomes. Today, the territory of the Gulf Cartel is chiefly controlled by Los Zetas, a paramilitary group of former Mexican military who served as enforcers for a period of time. Mexican drug organizations are known to operate in 195 cities and to send drugs to 230 cities.

Specialized professionals and high technology are stepping up the response of trafficking organizations—and the potential for violent conflict. According to the FBI, the Zetas, highly trained former Mexican soldiers, have become involved in smuggling both drugs and people into the United States, probably displacing the Gulf Cartel. The Zetas have surveillance operatives, checkpoints, and high technology. They have been linked to the possibility of smuggling special-interest entrants into the United States—that is, individuals who may or may not be connected to terrorism who originate from sending countries identified as having terrorist organizations.

The Calderón government has confiscated 70 tons of cocaine, 4,000 tons of marijuana, and 43,000 tons of methamphetamine precursor ingredients (Berrong 2009). The Mexican cartels have been able to thwart every effort to stop trafficking because they are flexible and adaptive organizations. Tony Payan (2006), an international relations and foreign policy specialist, characterizes the war on drugs at the border as a cat-and-mouse game in which the United States has tactical victories such as drug seizures and arrests but is losing in the conflict. U.S. escalation in personnel and technology has always resulted in DTO adaptation and a continued supply of drugs.

Drug Transport Methods at Border Crossings and Border Checkpoints

Heroin and cocaine have been too valuable to risk crossing in between ports of entry, as U.S. Border Patrol (USBP) agents could become aware and seize the load. As a result, most drugs are crossed through ports of entry. Social networks built on corruption on both sides of the border facilitate drug transport. Attempts are made to bribe U.S.

Customs officers, sheriffs, and law enforcement personnel, and some give in to the offer of large sums of money.

DTOs often use vehicles rather than human carriers ("mules") because it is impossible for customs to inspect every vehicle and item that crosses the border. The Bureau of Transportation Statistics indicates that the following numbers of vehicles, cargo containers, and individuals crossed in 2009: 2,432,495 trucks, 1,555,466 loaded truck containers, 146,058 loaded rail containers, 6,348 rail passengers, 135,775 buses, 1,445,200 bus passengers, 40,576,475 personal vehicles, 91,139,705 vehicle passengers, and 23,538,289 pedestrians. Checking is done at random or on the basis of customs officers' intuition, depending on signs of anomalies or driver nervousness. All roads located past the border leading into the U.S. interior also have checkpoints that are frequently manned by officers with drug-sniffing dogs. Payan indicates that many of the vehicles that cross drugs go through points of entry (POEs) rather than between them. It is estimated that 70 percent of drugs are crossed through the southwestern border in this way. Mexico has become the major supplier of marijuana, brown heroin, and Colombian cocaine.

In the past, cars, vans, and pickup trucks have been the favorite vehicle for crossing drugs. Today, this method is used by small operators. Hidden compartments in ordinary places in the vehicle are created. The drugs are then basted with masking scents tested by the cartels' own drug-sniffing dogs. Vehicles are crossed in two ways. The first involves going to the checkpoint and hoping that drug-sniffing dogs, the reaction of the driver to stress, and the thoroughness of the inspection will not expose the drugs. The second method is to cross cars in groups and let one be caught, distracting officials from the others. Often workers are placed in locations where they can see if an inspector is distracted. But the best way to smuggle drugs is to bribe a U.S. officer working at a port of entry to let drugs pass through. Several cases in which law enforcement has been bribed turn up every year. A single corrupt official can allow massive quantities to be crossed, preventing other drug enforcement activities from stopping the flow.

Since the passage of the North American Free Trade Agreement, tractor trailer trucks have been extensively used to transport drugs. This is the preferred method of the largest cartels. The escalation of technologies used in the war on drugs has made it harder to bribe officials because of the risk of being caught. Now the drug cartels must spend millions on bribes in order to find Americans working at ports of entry who will take the risk.

Diversified Organized Crime Tactics

Controlling two types of smuggling, of people and drugs, has allowed the DTOs to use unauthorized migrants as a border-patrol diversion in order to cross drugs in a different area. Undocumented immigrants pay protection money to the cartels; then the cartels divert the immigrants to certain routes designed to attract USBP activity and remove attention from the route through which drugs will be smuggled.

Fencing, National Guard troops, and additional USBP personnel have made it more risky to use traditional drug smuggling routes. There has been a significant increase in the amount of cocaine and marijuana seized. National Guard groups placed along the Arizona border have resulted in a significant increase in detained unauthorized migrants as well. It is plausible that this has cut into the DTOs' profit margins, prompting them to use of alternative methods.

U.S. Border Patrol Confrontations with Cartel Smugglers

The greatest risk that USBP officers take lies in dealing with drug smugglers and trafficking organizations. The USBP makes more drug smuggling arrests than any law enforcement agency, including the Drug Enforcement Administration (DEA). Drug smugglers use violence to avoid arrest and will risk killing USBP officers. In effect, a major activity of the USBP has become drug interdiction rather than immigrant apprehension.

USBP officers' jobs involve working individually in remote regions away from witnesses. In cases of human smuggling, they may face resistance, but drug smugglers may try to kill them. In June 1998, Alexander Kirpnick was shot and killed while attempting to apprehend five marijuana smugglers in the desert hills near Nogales, Arizona. Similar killings occurred in 2008 and 2009.

One issue in confronting drug smuggling is that the USBP is literally outgunned. The drug cartels have access to automatic assault rifles, while each USBP officer has only a revolver. Former Laredo, Texas, Sheriff Rick Flores (2005–2008) points out that smugglers have automatic assault weapons, rocket-propelled grenades, and Kevlar helmets with level-four body armor similar to that of the military.

The violence of drug smugglers' reactions to attempts to stop and arrest them has increased. In the past, the sight of law enforcement would result in smugglers dropping the drugs or abandoning vehicles. Human smugglers would be arrested with the rest of the group. Currently, drug cartels are firing on the USBP, engaging in reckless high-speed chases, and initiating standoffs at the U.S.-Mexico border. The United States has no jurisdiction to pursue any smugglers into Mexico.

DTOs control increasingly sophisticated technology. Spotters using high-power binoculars, and encrypted radios are placed in the mountains. Despite the placement of interior checkpoints, smugglers slip through by crossing private property. The income realized from drugs allows them to invest in high technology, and they have even been able to decipher the USBP's encrypted communication.

Spillover Violence and Unintended Effects of U.S. Border Policy

Both Mexican and U.S. national security is threatened by narco-terrorism. Director of Homeland Security Janet Napolitano believes that drug-related violence in Mexico has the potential to spill over to the United States. Spillover violence incidents include trafficker-to-trafficker homicide and planned attacks on U.S. citizens, officials, or physical

infrastructure (Peters 2009). Since Mexican DTOs have drug distribution networks reaching numerous U.S. cities, such attacks could become widespread. Those attacks that have already occurred in the United States involved mainly border cities. Such incidents have included inter-DTO homicide, kidnapping of smugglers or family members, and attacks on USBP officers. The *National Drug Assessment, 2010* (Department of Justice National Drug Intelligence Center 2009, 16), states that "Direct violence similar to the conflicts occurring among major DTOs in Mexico is rare in the United States." Indirect violence such as kidnappings and DTO conflicts may be more frequent. DTO "discipline" can include kidnapping, beating, torture and murder of organization members who fail to deliver drugs or money. Drug users may be kidnapped if they do not pay. Phoenix, Arizona, reported 267 kidnappings related to drug or human smuggling in 2009 (Department of Justice National Drug Intelligence Center 2009, 16). At present, U.S.-Mexico border cities are not experiencing heightened violence. For example, only 17 murders were reported in El Paso in 2008, and there were 13 through December 25, 2009 (Johnson 2009).

In Mexico, kidnapping is a major problem. Through 2005, hundreds of Mexicans and sixty American citizens were kidnapped (Blumenthal 2005). Drug-related violence includes murder of government officials, journalists, and innocent bystanders. Threats have been made against Americans news media and journalists. DTOs seek to intimidate government, law enforcement, and the media as a way of reducing press coverage and public reaction. The U.S. State Department advises Americans to be alert and take precautions when they are traveling in Mexico.

Peter Andreas (2009), a political scientist, suggests that that there is an unintentional and reinforcing impact of the U.S. attempt to control its southern border with Mexico and the expansion of drug and human smuggling. He refers to this effect as unintentionally symbiotic and points out that the criminal justice complex at the border has been greatly expanded as a result. Throughout most of the 20th century, the southern border has been ineffectively policed and the Immigration and Naturalization Service, as it was then known, now renamed Immigration and Customs Enforcement (ICE) and a part of the Department of Homeland Security, did a largely symbolic job. Today, the worsening of the problem necessitates new strategies that may result in overturning past policy.

Strategies to Address the Problem

The War on Drugs and Expansion of Drug Trafficking

There are two views on whether border security initiatives are curbing drug trafficking. Payan (2006) feels that despite the expansion of USBP and Drug Enforcement administration personnel on the border, the quantity of drugs seized each year continues to increase, along with the total volume of drugs being trafficked. Drug trafficking organizations are so successful at moving product that the price of drugs on the street in urban cities has declined. The federal government's border-control policy has not succeeded

in controlling the cartels. The alternative view, put forth by the House Committee on Homeland Security, is that federal and state efforts to secure the border have resulted in the cartel's current efforts to control human smuggling and enter into extortion, because drug seizures are making inroads on their profits. The controversy over whether the U.S.-Mexico border can be controlled cannot be resolved by examining rates of seizure of drugs, as supply can be increased if seizures are increased. Only information on street prices and availability can resolve this issue, and such data have not been a major concern in the debate over the impact of escalation in border security personnel and technology.

The Mérida Initiative

The United States' primary international program for control of drug trafficking is called the Mérida Initiative (Seelke and Ribando 2009). Mexico, Central America, the Dominican Republic, and Haiti are participants. Issues addressed include drug trafficking, arms smuggling, money laundering, and transnational organized crime. For three years, $1.4 billion in technological assistance and training will be provided. In particular, helicopters, speedboats, and computerized intelligence systems for data sharing were to lead the investment. After an expenditure of $700 million, Congress voted to withhold funds pending review of the program's efficacy (Landler 2009).

Can yet another United States program for control of international trafficking succeed? Drug trafficking through the U.S.-Mexico border has ties with transnational organized crime in Mexico, Central America, the Caribbean, and South America. Developing nations lack the funds, training, and technology to confront drug transit and associated crime. Furthermore, organized crime thrives in ungoverned social space (Velasco 2005; Grayson 2010). Weak national governments need to be strengthened and to gain credibility (Olson and Donnelly 2009). Democratic governments, as opposed to dictatorships, are not considered absolutely essential, but they are seen as being more effective at controlling crime. The widespread bribery and collusion of government and law enforcement officials allows drug trafficking organizations to gain political control. The lower standard of living and salaries increase the attractiveness of criminal offers, especially where law enforcement and judiciaries are weak.

Mexican citizens have protested and reform of law enforcement is occurring in Mexico. When local police proved ineffective owing to bribery and intimidation, the federal police were reorganized as a national police force. As drug-related violence escalated, the Mexican military was brought in. Twenty-four thousand military personnel have been involved in countertrafficking; they are thought to have had some effect in reducing violence, but primarily by displacing it or creating a condition of stalemate (Cook 2007). Local, state, and federal police and increasingly the military have been bribed and even recruited for work with drug trafficking organizations (Velasco 2005, 106–108).

Both police and the military have low salaries and poor working conditions. Less educated applicants are attracted to the low-prestige occupation of law enforcement.

Police are easily corrupted because of their low pay and the Mexican history of corruption, particularly at the municipal and state levels. There is an established social climate that will be difficult to challenge or change without improving salaries and living conditions (Velasco 2005). The Mérida initiative and other U.S. binational programs support the professionalization of Mexican law enforcement.

Efforts are being directed toward reform of Mexico's judicial system. Mexico has an inquisitorial justice system but is enacting reforms that would move it toward adversarial justice, as in the United States (Olson 2008). Prosecution in inquisitorial systems involves evidence collection by prosecutors, who issue recommendations that lead to closed-door verdicts. The individual is *not* presumed innocent until proven guilty. Oral prosecution and defense, cross-examination of witnesses, and defendant access to evidence is limited. People are held until they can establish their innocence. It is thought that Mexico will have switched to an adversarial system of justice by 2015.

President Calderón has strengthened control over the Mexican military, but it is incomplete (Cook 2007; Grayson 2010). Reports of human rights violations point to disappearance, torture, murder, and arbitrary detention (Amnesty International 2009). Amnesty International (2009) documented five cases involving 35 individuals in a period of 12 months during 2008–2009 and has released information on other incidents. It is difficult to prosecute military personnel. Amnesty International (2009, 5) released the following quotation: "If you report us, something worse will happen to you, and no one will do anything to us because we are soldiers." Crimes committed by the military are tried in a separate military judicial system, which may violate the Mexican Constitution. Amnesty International (2009, 22) indicates that

> when abuses are committed by members of the military the response of the state at all levels is ineffective. The failure of both civilian and military authorities to take

ECONOMIC GLOBALIZATION, DRUGS, AND THE BORDER

Drug demand creates pressure at the border, where the United States is trying to exercise sovereignty, prevent the entry of drugs, and conduct trade. Controlling drugs potentially compromises the North American Free Trade Agreement transborder economic connection, which promotes opening the border instead of closing it. In the confusion of apprehending migrants and letting trade goods flow across the border, both drugs and humans have often gotten through.

The logic of securing the border to open it for trade is contradictory. The reason for considering globalization as a factor in the expansion of this problem is that many nations have opened their borders to increased trade and tourism, generating new criminal opportunities. The U.S.-Mexico border smuggling issue is a part of a larger global crime nexus in which powerful international organized crime syndicates operate. The linkage between Colombian cocaine cartels and Mexican drug traffickers reflects globalization.

> timely effective action to prevent and punish these grave human rights violations is tantamount to complicity. In some instances, the lack of cooperation by some military and civilian authorities with relatives or other relevant authorities, such as court officials or members of the [National Human Rights Commission] trying to establish truth and justice may even amount to concealment.
>
> Steps taken within the military justice system to investigate these abuses and hold those responsible to account do not constitute a real intent to bring the perpetrators to justice. The lack of independence and transparency of the military justice system ensures victims and relatives are frequently denied access to justice. Consequently Mexico appears to be unwilling or unable genuinely to carry out investigations and prosecutions against its military.

The United States will withhold 15 percent of Mérida funding if human rights violations by the military are not efficaciously handled (Seelke and Ribando 2009). In general, equity and transparency are needed to increase the credibility of the Mexican justice system and reduce corruption within it (Olson 2008). The Mérida initiative seeks to provide resources for investigating and prosecuting crime related to drug trafficking. Unfortunately, Mexican law enforcement lacks scientific and legal skills. Organized criminals are present within all sectors of the criminal justice system, from patrol to prison, and without oversight.

Controversy ensued when the U.S. Joint Forces Command (2008, 36) labeled Mexico a potential "failing state." Mexican President Calderón and other officials reacted extremely negatively to this assertion and maintained that there is no area in Mexico that is not under state control. Secretary of State Hillary Clinton (Clinton 2009) stated that she does not believe that Mexico has any "ungovernable territories." Mexican authorities maintain that DTOs are weakening and that they are turning on each other owing to diminishing market share (Associated Press 2009). Jane's Information Group (2009) has taken the position that drug traffickers only need to subvert the state through corruption rather than defeat it.

Mexico, a developing country with a limited budget, has a power asymmetry with the United States. This asymmetry contributes to the drug interdiction issue, because Mexico sees U.S. intervention as a challenge to its national sovereignty. Mexico resists any U.S. troop involvement on its soil. In Latin America, the United States is perceived as having a unilateral drug strategy rather than taking part in cooperative multinational efforts. The Obama administration inherited the Mérida initiative and is changing direction. A new emphasis will be placed on developing law enforcement and communities (Thompson and Lacey 2010). Law enforcement training and technology and improved screening of drugs and vehicles at crossing points will be renewed and expanded. The latest concern is building economic opportunity in communities affected by poverty and crime. The biggest shift has been away from military assistance.

Reducing U.S. Drug Demand

In the 1960s, the United States instituted an international drug prohibition policy. President Richard Nixon began the War on Drugs, which critics have considered a damaging policy that undermines U.S. interests in Mexico and other drug exporting nations. In Mexico, efforts have included crop eradication and drug interdiction. A policy debate is being waged over the efficacy of these efforts. Advocates believe that the supply of drugs has been reduced. Critics consider that drug prices are lower than ever, but the U.S. government does not report this fact. The Obama administration is making a departure from the rhetoric of the War on Drugs. On March 25, 2009, Secretary of State Hillary Clinton said: "Clearly what we are doing has not worked.…Our insatiable demand for illegal drugs fuels the drug trade" (2009).

Critics of U.S.-Mexico drug policy believe that demand reduction among U.S. citizens would limit the earnings of drug trafficking organizations. The Obama administration has begun new initiatives for drug treatment and prevention (Hananel 2010) and seeks to abandon the phrase "War on Drugs." Drug Czar Gil Kerlikowski has stated: "Calling it a war really limits your options.…Looking at this both as a public safety problem and a public health problem makes a lot more sense." The Obama plan calls for reducing the number of first-time users by 15 percent over five years and sets other goals for reducing driving under the influence of drugs, chronic drug usage, and drug-related deaths. Community antidrug programs will screen for drug use and mainstream medical facilities will be involved. Health personnel are encouraged to ask about drug use.

The debate on how to control drug use includes the idea of harm reduction through legalization. Norm Stamper, a former Seattle police chief, favors the legalization of drugs through state-run stores or distribution by registered pharmacists (Kristof 2009). Nicholas D. Kristof, *New York Times* op-ed columnist, points out that the drug war had three major impacts: (1) it greatly increased drug users in prison populations from 41,000 in 1980 to 500,000 in 2009; (2) it empowered organized crime and terrorists who make billions in profit; and (3) the money spent on law enforcement, $44.1 billion, could be spent in other ways, including treatment and prevention. It has been argued that drug treatment is more cost-effective than interdiction.

Mexico has preceded the United States in adopting harm reduction by passing a law to decriminalize possession of small amounts of drugs. Individuals will not be prosecuted but instead referred to drug treatment programs. Individuals will be required to enter a treatment center if they are found in possession of drugs a third time. This measure is in response the development of an internal drug addiction problem and designed to free up prison space for dangerous criminals. Critics of decriminalization argue that it will increase addiction.

In 2010, President Obama authorized 1,200 National Guard troops for the border and sought increased funds for border law enforcement (Archibold 2010). The *New York*

Times responded in an editorial that "adding a thousand or so border troops won't stop the cartels or repeal the law of supply and demand" ("Editorial" 2010).

Conclusion

Drug trafficking and the associated violence is the major problem at the U.S.-Mexico border. Every escalation in border security by U.S. Customs and Border Patrol, the DEA, and other federal agencies has been met with adaptation by the drug cartels. Although many officials in Mexico and some law enforcement officers in the United States have been bribed, both Mexico and the United States are increasingly choosing to confront the cartels. Mexico estimates that the trade is based on 20 million users in the United States. The law enforcement approach to the war on drugs has not reduced the demand. This suggests that reducing the motivation of American citizens for using drugs and rehabilitating drug users would be an alternative way of reducing demand.

The United States has engaged in many wars: a war on drugs, a war on terrorism, and conflict in Afghanistan and Iraq. Has it won any of these wars? What are the criteria for deciding? The United States is pursuing its strategy of constantly escalating a quasi-military struggle for control of the Mexican border. This strategy has never worked, and Mexican drug trafficking organizations adapt to change more rapidly than the Department of Homeland Security bureaucracy is able to do. It is unlikely that this problem will soon be resolved in the future any more than stopping cocaine smuggling in the Caribbean to Florida ended Colombian drug smuggling.

The United States may have waited too long to deal with the demand for illicit drugs in the United States. The billions of profit from drugs paid into Mexico, a country with a great deal of poverty, provide the motivation to engage in illegal trafficking. Drug lords are highly adaptable in finding ways to provide drugs, start habits, and maintain fixes. Imprisonment has not slowed demand. It remains to be seen if the prevention and treatment strategy of the Obama administration can be more effective.

DWI AND DRUG TESTING

Angela Taylor

Policies that target driving while intoxicated (DWI) or that permit so-called suspicionless drug testing of specified groups (employees, students) demonstrate the conflict between promoting public health and safety and constricting individual liberty and privacy *(Skinner v. Railway Labor Executives' Association* 1989). Anti-DWI laws are programs designed to reduce the damage caused by the mix of alcohol and driving, which kills and injures thousands of Americans each year. Mass drug testing policies, whether by employers or in schools, are viewed by advocates as means of ensuring well-being and integrity in workplace and academic settings, with the added bonus of discouraging drug use generally.

Opponents of these mass testing policies are concerned, for example, about the effects on certain constitutional rights. One scholar has noted that changes in judicial conceptions of the proper scope of government power have occurred in the wake of attempts to regulate traffic (Laurence 1988, 136–166). This is nowhere more evident than in the case of anti-DWI policies and is echoed in the case of drug testing policies. In a series of court decisions addressing these policies, constitutional safeguards, particularly those related to due process and protection against unwarranted search and seizure, have been narrowed. Widespread public outcry about these practices has largely been muted; citizens appear to be willing to trade freedom for safety, or perceived safety, because it is unclear that these policies are the most effective means of mitigating the damages of drug and alcohol use. The full implications of these losses for situations beyond the narrow issues of DWI and drug use have yet to be seen.

Background

DWI policies were enacted against the backdrop of certain facts about use of alcohol and drugs in the United States. It is undeniable that alcohol increases the chances of driving mishaps. In fact, a 0.04 percent blood alcohol concentration (BAC), an amount much less than the current limit of 0.08 percent, can lead to driving errors (Ross 1992, 19). Data from 2008 show that close to one third (32 percent) of U.S. traffic fatalities, or

some 11,773 deaths, are linked to alcohol use (Centers for Disease Control and Prevention 2009). Nevertheless, substantial numbers of individuals report driving after having used alcohol: there are approximately 159 million such incidents each year (Voas et al. 1998, 267–275). Further, only a fraction of those who report DWI are ever arrested for it; recent figures demonstrate an arrest prevalence of approximately 1 percent (Voas et al). Drunk driving is more common among males and those between 21 and 34 years of age. It is more likely to occur at night and on weekends, generally the times when leisure activities take place (Voas et al). Whites, persons of mixed race, and Native Americans most often report driving under the influence, whereas blacks, Hispanics, and mixed-race individuals most often report being arrested (Caetano and McGrath 2005).

Drug-testing polices are part of the arm of drug policy that focuses on prevention, specifically by lowering the prevalence of use in order to decrease its consequences, including addiction, and other negative aspects of use, like accidents, illness, lowered productivity, and so forth. Employer-based drug testing is a common procedure. Most recent data show that 46 percent of workers report that their employers test for drugs (Carpenter 2006). This figure is down from 49 percent in 1997 (U.S. Department of Health and Human Services 2007). Drug tests, generally using urine as the biological matrix, are done for a number of reasons, most often for pre-employment screening, during postaccident investigations or in cases of suspected on-the-job use. Random drug testing is done largely in settings where safety-related testing occurs.

Drug testing expanded from the workplace into schools following concerns over drug use by youth. According to one study, 18 percent of schools engaged in testing, mostly of students in high school (Yamaguchi, Johnston, and O'Malley 2003). This number, valid in 2001, has likely changed in the wake of the 2002 *Board of Education v. Earls* decision, which expanded categories of students who could be tested. Mass drug testing also takes place in the criminal justice system, from pretrial to probation or parole supervision. Such testing has not generated the controversy that other forms have created. This is likely due to the reduction in rights of those subject to criminal penalties.

DID YOU KNOW?

The mandatory guidelines for federal workplace drug testing (which apply to workplaces of both the federal government and government contractors) require an employer to conduct two tests before a urine test can be reported positive for a drug or be considered an adulterated or substituted sample. The first test is referred to as the initial test and second as the confirmatory test.

Key Events

A major review of alcohol and driving, published in 1968, was the first government document to officially link drunk driving and accidents (Ross 1992, 175). Even so, DWI was seen as basically a traffic problem or a by-product problem of alcohol use (Gusfield 1988, 109–135). This changed in 1980 with the rise of an organization called Mothers against Drunk Driving (MADD), started by Candy Lightner, who lost her 13-year-old to a drunk driver. MADD and similar organizations pushed to make penalties and criminal justice enforcement against drunk drivers more stringent. Drunk driving came to be viewed as a moral problem, with campaigns portraying drunk drivers as villains of the road, thus increasing the public ire directed toward those offenders (Gusfield 1988, 109–135).

The movement was very successful in obtaining changes in DWI and alcohol policies, among them (1) lowering the limit of acceptable blood alcohol for drivers; (2) sobriety checkpoints, which are defined areas where police will check vehicles to see if passengers are intoxicated or have some other alcohol-related violation; (3) administrative suspensions; (4) getting the drinking age raised from 18 to 21; and (5) increased penalties for offenders, mostly for recidivists but also for first-timers (Gusfield 1988, 109–135).

These efforts were facilitated by the ability of the federal government to use its power over state funding of transportation projects to push states into drafting various laws designed to reduce driving under the influence. States were threatened with loss of highway construction funds unless they altered their laws according to federal dictates. Recent efforts in this regard include pushing for a reduction of the acceptable blood alcohol limit to 0.08 percent from 0.10 percent and mandating certain penalties for repeat offenders, including compelling the use of ignition interlocks. These last are devices designed to prevent a car from being turned on unless the driver registers a blood alcohol level below a given amount.

These changes met with some opposition, some of which centered on use of the Breathalyzer, and to the training of officers in discerning driver impairment. This likely reflects the overwhelming influence of "per se" laws (using a zero-tolerance measure), which penalize having a breath alcohol level above a given amount. A casual Internet survey reveals a cottage industry of defense attorneys advertising methods of fighting the test and DWI charges in general. Other challenges came from concern over the penalties, in particular administrative license suspensions and sobriety checkpoints. These wound up in the courts.

How have these policies worked in reducing DWI? The percentage of drunk-driving deaths has gone down in recent years. Some research has linked this to various drunk-driving penalties, most specifically those directed at youth, such as raising the drinking age (Laurence 1988, 136–166). However, it is likely that other factors—for instance, a decline in the use of alcohol—are important as well.

Drug use exploded as a societal concern during the 1980s. This altered focus was linked to a variety of factors, including general concern over crime combined with the heightened use of crime as an issue in elections; the rising cocaine and, later, crack epidemic; and highly publicized incidents (such as the Len Bias cocaine overdose). These factors all contributed to an environment of increased public worry about drug use. Meanwhile, advances in the science and the technology of drug-testing devices made the process quicker and more efficient and thus more feasible to carry out on a mass scale. Arguably, workplace drug testing had its inaugural in 1986, when President Ronald Reagan ordered that government agencies drug-test employees who worked in jobs featuring a high risk of injury. This proclamation ushered in the age of employee drug testing, with drug testing in other arenas to follow (Crowley 1990, 123–139).

As with DWI policies, the use of such tests was questioned, largely by civil libertarians and some drug policy experts. They portrayed the tests as inaccurate and decried their intrusion into personal privacy, noting that the bodily fluids used could provide additional information about the person, from disease status to pregnancy. They also disputed the stated reasons for testing—ensuring safety—arguing that policies that addressed impairment of all kinds (from illicit to licit drugs to fatigue) would be more fruitful (Crowley 1990, 123–139).

How has workplace testing affected drug use? Data from one drug-testing laboratory show a decline in the number of workers testing positive for drugs, from 13.8 percent in 1988 to 4.5 percent in 2004 (Carpenter 2006, 795–810). A recent study argues that workplace tests do affect drug use generally, although less than is often presumed (Yamaguchi 2003).

Key Legal Decisions

Court challenges to DWI and drug-testing policies have resulted in a gradual redrawing of the line between individual freedom and government intrusion. Take, for instance, administrative suspensions, seen by some as a violation of due process, because one's license is taken away at the point of the DUI arrest. The Supreme Court in *Mackey v. Montrym* upheld these with the caveat that the person obtains a hearing shortly after the suspension (1979).

This opened the door to a more severe application of these laws; today, almost all states have laws using administrative suspension to punish the mere refusal to take a breath test (Insurance Institute for Highway Safety 2007). The Supreme Court in *Michigan Department of State Police v. Sitz* upheld sobriety checkpoints, which are effectively suspicionless searches (1990). They reasoned that rather than being a police action, checkpoints feature the state acting in its capacity to regulate public safety and thus are more akin to housing or restaurant inspections than crime fighting.

Regarding drug testing, the Supreme Court in *Skinner v. Railway Labor Executives' Association* ruled in 1989 that monitoring employees involved in "safety sensitive" positions was a state interest overriding the right of individuals not to have their persons

(bodily fluids) seized (via drug test) without probable cause. The Court broadened its interpretation of the government's interest in the case of *National Treasury Employees Union v. Von Raab* to include concerns about customs workers facing promotion into positions that placed them at great risk, not for safety violations but for personal corruption owing to increased contact with drugs in large quantities (1989). These two cases were cited as precedent in upholding drug testing of students, first in *Vernonia School District v. Acton* (1995), in which random drug testing of student athletes was approved, and then in *Board of Education v. Earls* (2002), which gave the nod to a program in Oklahoma that randomly tested all students involved in extracurricular activities.

What is notable about these court decisions is the basis on which they were decided. Specifically, these policies were upheld as promoters of health and safety and on the basis of administrative rather than criminal justice considerations (Crowley 1990, 123–139). This is important, as it demonstrates a potential limit to the Court's reach regarding such policies. Evidence for this can be seen by the types of testing plans overturned by the Court, among them a hospital-based program that tested pregnant women, with positive results immediately provided to law enforcement for purposes of prosecution (*Ferguson v. City of Charleston* 2000), and a Georgia law that used drug testing as a condition for candidacy for local office (*Chandler v. Miller* 1997).

Drugged Driving

One topic that could loom large in future discussions of both DWI and drug-testing policy concerns the issue of drugged driving, or driving under the influence of drugs (DUID). Although it has a low prevalence rate (approximately 5 percent of those from a 2003 Substance Abuse and Mental Health Services Administration survey admitted to drugged driving, versus roughly 16 percent who admitted to DWI) (Substance Abuse and Mental Health Services Administration 2003), it has emerged as the next step in the evolution of concern over the negative effects of substance use. Recent attention speaks to a push to make drugged driving the next arena in the fight over automobile safety (Leinwand 2004; Armentano 2005).

Compared with the case for alcohol use, there is little science linking specific levels of drug use to impairment or to car accidents, making solutions to the drugged driving problem more difficult to enact. Most states have laws prohibiting DUID. Most define the offense based on actual impairment; however, several states define the offense based on per se grounds. There is potential for fresh court challenges based on the enforcement of those laws, particularly if authorities criminalize the presence of substances (marijuana metabolites, for instance) with no psychoactive impact whatsoever, as has been done in some cases.

Drugged driving is also important because it provides a friendly setting for the use of alternative—that is, non–urine based—drug-testing technologies, in particular those using saliva. Saliva tests have the potential to capture current intoxication and thus to indicate current impairment (Cone 1997). Some European countries have conducted

DID YOU KNOW?

According to the Institute of Behavior and Health, supported by data from the 2007 National Roadside Survey:

- Up to 20 percent of automobile crashes in the United States are caused by drugged driving. This translates into about 8,600 deaths, 580,000 injuries, and $33 billion in damages each year.
- Drugs are present more than seven times as often as alcohol among weekend nighttime drivers in the United States, with 16 percent of drivers testing positive for drugs compared with 2 percent testing at or above the legal limit for alcohol.

evaluation studies of saliva tests for roadside testing of drugged drivers, with mixed success (Roadside Testing and Assessment). Because they are less intrusive than urine testing, such tests are very attractive for most drug-testing goals. Additionally, the technology can easily be converted for use in testing surfaces for the presence of drugs. Such devices are being evaluated for use in schools (McFarland 2006).

The increasing prominence of alternative testing comes in the context of a reduction in employer drug testing, possibly owing to concerns over cost. Some view the push for roadside testing as a cynical attempt to improve the flagging fortunes of the drug testing industry. Others have seen it as a possible boon to public safety. One thing does remain evident: conflicts over testing policies and the challenges they pose to individual freedom are far from over.

EXPERT WITNESS TESTIMONY

Allison M. Cotton

The purpose of expert witness testimony is to provide findings of fact for the decision-making process of semijudicial or judicial bodies or to provide the various courts of law with factual information on which to base a resolution, ruling, or verdict (Dorram 1982). The controversies surrounding the use of expert witnesses and expert testimony may revolve around issues such as whether experts may be abusing their power to influence the outcomes of adjudication, be providing better evidence than lay persons, or be speaking on matters relevant to cases that are outside of their expertise, but the controversies are not limited to these issues. Before an individual may be allowed to offer opinion testimony as an expert, however, it must be established not only that the subject of the opinion is proper for expert testimony but also that the individual offering the opinion is "a person skilled at touching the matter of inquiry" (Gothard 1989).

Expert testimony today is very much like a corrida, the traditional bullfight. It has precisely prescribed rituals. The beginning, which is the bailiff's opening statement to the public to rise upon the entrance of the judge, is like the music of the bullfight. The ending, like the dragging out of the bull by the mules, is the moment when the gavel is slammed down. In between, the expert witness is the bull in the arena. The various attorneys entitled to cross-examine will treat him or her exactly as a bull is treated—although in this case the pics, lances, and swords are metaphorical. Just as the traditional bullfight has established stages, so does the proper expert testimony. Stage 1 is the swearing in and identification of the witness, which is followed by stage 2, the statement and

presentation of the witness's professional qualifications. If they are not accepted, that is the end of the testimony. The bull is dead; bring in the next bull (Dorram 1982, 4).

Background

The first documented forensic expert was Antistius, who was asked to examine Julius Caesar's corpse to determine the cause of his death (Meyer 1999). In his opinion, Antistius declared that only one of the 24 sword wounds he suffered actually caused Caesar's death and that it was the sword wound that perforated his thorax (Meyer 1999, 2). In the beginning, then, only medical experts were allowed to provide expert testimony, and then only related to their specific field of practice, such as chemistry, biology, or psychiatry. In fact, experts, specifically medical experts, have been used in English courts since the 14th century and in the common law courts of North America for more than 200 years (Meyer 1999). Since the mid-1980s, social workers have been recognized by courts as having sufficient expertise in several fields of practice and, subsequently, have been qualified as experts in courts of law (Gothard 1989).

Legal Developments

The Federal Rules of Evidence (FRE), the Frye test, and the *Daubert* guidelines form the basis for determining the admissibility of expert medical or scientific testimony (McHenry et al. 2005). Although the FRE are meant to be applied to federal court proceedings, many state courts have adopted them as a guide for dealing with expert witness testimony. Various sections of the FRE outline the "knowledge, skill, experience, training or education" levels required of experts and allow for judicial discretion in determining who constitutes an expert witness and whether the testimony is relevant to jury deliberations (McHenry et al. 2005). Besides, expert testimony must be based on information that is generally accepted in the scientific community, according to *Frye v. United States* (1923), in which the court decided that a technique used for performing a lie detector test must be "generally accepted within the scientific community before expert opinion about data gained from use of the technique is admissible into evidence" (see *Frye v. United States* 1923). The Frye test, then, is used as the legal basis for judges to exclude expert testimony based on information, principles, or opinion not falling within those parameters.

In 1993, the U.S. Supreme Court provided guidelines for expert witnesses in the federal court case of *Daubert v. Merrell Dow Pharmaceuticals, Inc.* when it ruled that expert testimony should be based on information that has been subjected to the scientific method rather than on unsupported speculation (see *Daubert v. Merrell Dow Pharmaceuticals Inc.* 1993). The court also directed trial judges to determine whether expert testimony is relevant and based on valid scientific evidence (*Daubert v. Merrell Dow Pharmaceuticals Inc.* 1993). Further, the Court gave its support to the FRE guidelines, which permit judges to appoint their own independent expert witnesses. In so doing,

FEDERAL RULES OF EVIDENCE

- FRE 702: Authorizes judges to allow the admission of expert testimony when it "will assist the trier of fact to understand the evidence or determine a fact in issue." Under this rule, a witness may be classified as an expert on the basis of knowledge, skill, experience, training, or education.
- FRE 703: Permits an expert to base his or her opinion on information "perceived or made known to him or her at or before the hearing" and establishes that a qualified expert's testimony should be based upon information or data reasonably relied upon by experts in the particular field forming opinions or references on the subject.
- FRE 704: Provides the basis for allowing an expert to offer an opinion on ultimate factual issues, namely, causality.
- FRE 705: Permits an expert witness to offer an opinion "without prior disclosure of the underlying facts or data (on which the opinion is based) unless the court requires otherwise." This rule establishes that the expert witness "may in any event be required to disclose underlying facts or data on cross examination."
- FRE 706: Gives judges the authority to appoint their own independent expert witness to ensure that the expert testimony is relevant and scientifically valid.

Source: Christopher R. McHenry, Walter L. Biffl, William C. Chapman, and David A. Spain, "Expert Witness Testimony: The Problem and Recommendations for Oversight and Reform." *Surgery* 137, no. 3 (2005): 275.

the Court proclaimed that an expert witness must be able to determine the relevant facts of a case, define the standard of care for management of a specific problem, determine whether a physician's action conformed or deviated from the standard of care, and assess the relationship between the alleged substandard care and the patient's outcome (McHenry et al. 2005, 275). The problem with this standard of application, according to Christopher McHenry, is that "very little constraint is applied to the testimony of an expert, often giving him or her inordinate latitude to comment on things that are outside his or her area of expertise" (McHenry et al. 2005, 276). Once the expert has been qualified as such, then the person on the stand, under oath, is allowed to expound upon various topics and issues relevant to the trial, oftentimes without having any brakes applied to his or her utterances, in part because the expert testimony becomes a performance that is not unlike a regular stage performance. What the expert must convey in the course of the performance is that he or she is indeed an expert and that his or her opinion should be taken seriously (Dorram 1982, 51).

Controversies in Expert Witness Testimony

Problems with expert witnesses and expert witness testimony have included the fact that some experts have been allowed not only to testify about medical facts but also to offer

opinions about material issues of the criminal trial. Their opinions may influence decisions involving criminal sentencing or involuntary commitment, for example (Faust and Ziskin 1988). The issue here becomes whether some experts have abused the power to be able to influence the outcome of trials and have turned the criminal trial into a kind of "legalized gamble" (Meyer 1999, 3), particularly because, when judgments have rested on common sense or stereotypes rather than empirical knowledge, professionals have not been shown to outperform lay persons in terms of accuracy; that is, studies show that professional clinicians do not in fact make more accurate clinical judgments than laypersons (Faust and Ziskin 1988, 34).

Another issue that complicates the use of expert testimony is the interrelated specialties that have arisen in the medical field such that experts can defer endlessly to colleagues who possess more specialized knowledge of the issue at bar.

Whereas 50 years ago medicine was still primarily an art rather than a science, medicine is now interlinked with a plethora of technical and scientific occupations. The proliferation of information and specialties has become such that large health care providers now employ specialists in primary care and farm out patients for further specialized treatment. In fact, some specialties have become so compartmentalized that surgeons, chemotherapists, and radiation specialists no longer feel comfortable weighing the advantages of competing treatment modalities for certain types of diseases, such as cancer of the uterus or prostate gland (Meyer 1999, 3).

Additionally, there is some concern over the rather subjective nature of expert testimony, not only because testimony by a so-called expert is often allowed by judges even though other physicians or scientists do not regard the individual's credentials as those of an expert in a particular field (McHenry et al. 2005, 276) but also because the perception exists that an expert can be found to support any point of view as long as the financial compensation is right (McHenry et al. 2005, 276). Moreover, there is no peer review of expert witness testimony to ensure its merit or validity (McHenry et al. 2005, 276). These and other problems not mentioned here contribute to increasing skepticism about the veracity and reliability of expert witness testimony.

Moreover, judges and juries are not bound by expert witness testimony; the jury members (and the trial judge) are free to accept or reject the expert's testimony in whole or in part (Gutheil 1998). Attorneys, therefore, must base the decision of whether to offer expert testimony on the likelihood of that expert being able to connect with the jury—that is, to leave an impression that is favorable to winning the verdict. Jury instructions do not require members to heed the advice of experts; in fact, some jury instructions encourage jurors to exercise their own judgment as to whether to believe or include the opinions of experts in their deliberations.

There is also some evidence to suggest that jurors use intuition, credentials, and mannerisms to determine the veracity of expert witness testimony. Put another way, there is nothing to prevent jurors from using their gut feelings about an expert, the prestige of the institutions from which the expert graduated, or the appearance of the expert on the stand

CRIME LAB ANALYSTS AS EXPERT WITNESSES

Until a U.S. Supreme Court ruling in 2009, *Melendez-Diaz v. Massachusetts,* it was common practice for prosecutors in criminal cases to submit data from crime labs in support of their cases without calling as witnesses the scientists who prepared those data. Under the *Melendez-Diaz* ruling, however, crime lab analysts are required to appear in court and submit to cross-examination.

The decision states that forensic analysts must testify under the Sixth Amendment Confrontation Clause granting defendants the right to confront witnesses against them. Previously analysts could be subpoenaed to court to explain their reports or methodology, but in practice that rarely happened.

In his majority opinion, Justice Antonin Scalia refuted the argument that forensic reports consist of neutral facts. As Scalia observed, "Forensic evidence is not uniquely immune from the risk of manipulation. . . . Confrontation is designed to weed out not only the fraudulent analyst, but the incompetent one as well. Serious deficiencies have been found in the forensic evidence used in criminal trials." Thus, as with expert witnesses generally, an analyst's bona fides or professional judgment may be questioned in cross-examination.

In his dissenting opinion, Justice Anthony M. Kennedy strongly opposed the majority's interpretation of the Confrontation Clause, claiming that the Court had carelessly brushed aside a century of precedent for dealing with scientific evidence. "The Confrontation Clause is not designed, and does not serve, to detect errors in scientific tests." Justice Kennedy asserts. "That should instead be done by conducting a new test. Or, if a new test is impossible, the defendant may call his own expert to explain to the jury the test's flaws and the dangers of relying on it. And if, in an extraordinary case, the particular analyst's testimony is necessary to the defense, then, of course, the defendant may subpoena the analyst."

It was expected that the ruling would create a significant backlog in cases handled by crime labs, as analysts undertake to prepare formal testimony to justify their research results in court.

to determine the veracity of the expert's testimony even though these supposed markers of accuracy are potentially prejudicial (Faust and Ziskin 1988). In fact, some evidence suggests that jurors tend to ignore the expert testimony presented on the stand during the trial and, instead, choose to use their own life experiences or common sense to determine guilt or innocence. In such cases, the expert's efforts to persuade may well succeed if it aligns more closely with common belief (Faust and Ziskin 1988).

When asked about the defense's case, one juror said: "I think they tried to prove that he was mentally incapable of understanding what he was doing and brain damaged…which didn't have any effect on me because I know that you can get psychiatrists to argue anything because it's not an exact science." And another juror concluded that "the defense had to show much and they did a good job. We just didn't buy it" (Cotton 2002, 234).

Several efforts to reform the expert witness process have been undertaken in recent decades (between 1987 and 1998) by respected medical organizations; specifically, the American Academy of Pediatrics, the American Academy of Neurologic Surgeons, the American Academy of Orthopedic Surgeons, and the American Medical Association have published guidelines and/or passed resolutions that subject expert witnessing to peer review and disciplinary sanctions (McHenry et al. 2005, 276). In 2004, the American College of Surgeons issued a statement that includes recommended qualifications and guidelines for behavior of the physician who acts as an expert witness (American College of Surgeons 2004, 22–23). In support of the effort to maintain the integrity of expert witnessing, the Collaborative Defense Network for Expert Witness Research, founded in 1984, collects information on and researches the background of expert witnesses (http://www.idex.com). The company offers a wide range of expert witness services, such as testimonial history searches, trial depositions and transcripts, state license discipline searches, and articles by the expert, among others.

Conclusion

In the final analysis, there is much to be said about the need for expert witness testimony in this age of complicated medicine and science. If the jury cannot tell sanity from insanity based on their own experience, for example, then persons must guide them with special expertise in the recognition of this hidden condition (Freemon 2001). Only trained experts can separate the individual who is insane in a partial way, or only with regard to certain subjects, from the normal person (Freemon 2001, 361). Nevertheless, it is expected that the same types of controversial issues surrounding the use of expert witness testimony will persist into the future.

EYEWITNESS IDENTIFICATION

Allison M. Cotton

Eyewitness identifications are an important component of U.S. criminal investigation, particularly in those phases of the trial process involving evidence, prosecution, and plea negotiation (Sporer, Malpass, and Koehnken 1996). In fact, evidence provided by eyewitnesses is sometimes the only evidence linking a suspect to a crime (Sporer, Malpass, and Koehnken 1996). For that reason, eyewitness identifications are controversial because, although some witnesses may be confident about their description of a suspect, there are inherent witness-based problems in face-recall techniques, which may limit the ultimate effectiveness of most systems in current use (Sporer, Malpass, and Koehnken 1996). Moreover, from the point of view of criminal investigation, accurate face recall is of considerable importance, not only because the penalties for crime in the United States range from probation to death but also because show ups, lineups, and photo arrays rely solely on the accuracy of face recall to build a case.

Eyewitness *mis*identification is the single most significant factor behind wrongful convictions in the United States. According to the Innocence Project, it has played a role in over 75 percent of convictions that subsequently were overturned on the basis of DNA evidence (Innocence Project).

Issues involving eyewitness testimony, specifically the reliability of eyewitness testimony, can be divided into two categories: (1) errors in describing the actual event and (2) errors in describing the persons involved. Problems in the latter category focus primarily on eyewitness identification of suspects that necessitates a reliance on face-recall data to connect the specific characteristics of suspects' faces with the events of a crime.

Face Recall

Generally speaking, people tend to process faces holistically. This means that the faces we encounter form an impression in our minds that incorporates the major details of the faces as well as where the specific features on a face are configured to make a person look the way that he or she appears to us in our recollection. The width of a person's face, the length of the nose, as well as the distance between a person's eyes, for example, are processed together as a combination of features that is then recorded as an image taking into account the relationship of the features to one another. In a recognition task, witnesses are presented with a target and search their store of faces until a response of familiarity is evoked. Such familiarity can easily be confused with recall from the actual features of the person who was viewed at the crime scene.

The task of face recall is generally much more difficult than that of recognizing faces, and this difficulty may well be exacerbated by techniques that require the witness to select items from a set of pictorial illustrations and assemble them into a picture of a whole face. The two aspects of the task—decomposition of a holistic image into elements and visual scrutiny of pictorial elements—may each interfere with the witness's ability to maintain a visual image of the face she or he is trying to recall (Innocence Project).

Therefore eyewitness identifications must be viewed cautiously (Terry 1994).

A Case Study

Jennifer Thompson (Doyle 2005), the first victim in the court's narrative, is blonde and tiny, five feet tall, weighing 100 pounds. She speaks quietly and ends her sentences with the rising, interrogative lilt characteristic of girls raised in the South. It is easy to see the traces of her upbringing as the adored daughter of suburban North Carolina business executives.

But it is easy to see something else in Jennifer's interview, too: the iron resolve with which she survived her attack and pursued her attacker and the unflinching honesty with which she is determined to tell the story of the assault and its aftermath. During the rape, her mind was racing:

> At that point, I realized that I was going to be raped and I didn't know if this was going to be the end, if he was going to kill me, if he was going to hurt me and I decided that what I needed to do was outsmart him. Throughout the evening, I would turn on lights, even if it was just for a second, and he would

> tell me, "Turn the lights off." And at one point, he bent down and turned on my stereo and a blue light came off of the stereo and it shone right up to his face and… and I was able to look at that. When I went into the bathroom, I turned the light on and he immediately told me to shut it off, but it was just long enough for me to think, "Okay, his nose looks this way" or "His shirt is navy blue, not black," little, brief pieces of light that I could piece together as much as I could piece together.

Jennifer escaped to a neighbor's house and was taken to a local hospital emergency room, where a rape kit was prepared. There, she was interviewed for the first time by Burlington police captain Mike Gauldin. The qualities that strike a viewer watching Jennifer's interview struck Detective Gauldin during their initial encounter: "She was so determined during the course of the sexual assault to look at her assailant well, to study him well enough so that, if given an opportunity later, she would be able to identify her assailant," Gauldin remembered. "A lot of victims are so traumatized, so overcome with fear during the course of the sexual assault itself, that it's unusual to find somebody that's capable of having that presence of mind."

Gauldin asked Jennifer to help a police artist prepare a composite drawing of the rapist. That drawing was widely circulated, and it generated an anonymous tip. An informant

INTERVIEWING EYEWITNESSES AT THE SCENE

The U.S. Department of Justice provides guidelines on working with eyewitnesses from the point of the first phone call regarding an incident to the conduct of the suspect lineup and other procedures. For example, law enforcement officers performing a preliminary investigation following the report of an incident are advised to:

1. Establish rapport with the eyewitness.
2. Inquire about the witness's condition.
3. Use open-ended questions (e.g., "What can you tell me about the car?"); augment with closed-ended questions (e.g., "What color was the car?").
4. Clarify the information received with the witness.
5. Document the information received from the witness, including the witness's identity, in a written report.
6. Encourage the witness to contact investigators with any further information.
7. Encourage the witness to avoid contact with the media or exposure to media accounts concerning the incident.
8. Instruct the witness to avoid discussing details of the incident with other potential witnesses.

provided Gauldin with the name of a man with a criminal record, a man who worked at Somer's Seafood Restaurant in the neighborhood of Jennifer's apartment, a black man with a habit of touching white waitresses and teasing them about sex. The caller said the man owned a blue shirt similar to the shirt Jennifer had seen on the night of the rape. Gauldin placed that man's photograph in an array of six individual mug shots of black men and asked Jennifer whether she recognized anyone. The composition of the array was fair, and no one stood out unduly. Gauldin played it straight: He made no effort to prompt Jennifer or tip her off to his suspect. Jennifer remembers her photo identification this way: "It didn't take me very long. It took me minutes to come to my conclusion. And then I chose the photo of Ronald Cotton. After I picked it out, they looked at me and they said, 'We thought this might be the one,' because he had a prior conviction of the same… same type of circumstances sort of."

Armed with Jennifer's identification, Gauldin obtained a search warrant and set out to arrest Ronald Cotton. Cotton was not at home, but Gauldin did find two pieces of evidence in Cotton's room: a red flashlight like one described by the second rape victim and a shoe with a foam insert consistent with foam found on the floor at Jennifer's apartment. When Cotton heard about Gauldin's search, he turned himself in at the police station "to clear things up." Cotton gave Gauldin an alibi, but his alibi did not check out. Gauldin arranged to have Cotton stand in a live lineup.

Jennifer methodically examined the line of six black men arrayed across the front of a room at police headquarters. "They had to do the steps to the right, to the left, and then turn around," she recalled. "And then they were instructed to do a voice presentation to me. They had to say some of the lines that the rapist had said to me that night so I could hear the voice, because the voice was a very distinct voice."

Jennifer narrowed her choices to the man wearing number 4 and Ronald Cotton, who was wearing number 5. She had the police put the lineup members through their routine again. Then she was sure: "It's number 5," she said. Later, Gauldin explained what had happened: "That's the same guy. I mean, that's the one you picked out in the photo."

"For me," Jennifer remembered "that was a huge amount of relief, not that I had picked the photo, but that I was sure when I looked at the photo that [it] was him and when I looked at the physical lineup I was sure it was him." She was still sure when she testified in court and identified Ronald Cotton.

She was just as sure when she faced Cotton again, in a second trial ordered by the North Carolina Supreme Court. There was a new challenge this time. Cotton's lawyers had pursued inmate rumors that the Burlington rapes actually had been committed by a convict named Bobby Poole. At Cotton's second trial, Poole was brought into court and shown to Jennifer. Jennifer did not flinch then either. "I thought," she told *Frontline,* "Oh, this is just a game. This is a game they're playing." It was not Poole, Jennifer told the jurors, "I have never seen him in my life." She told them it was Cotton. At the second trial, the other Burlington victim testified for the first time, and she also positively identified

Cotton. Cotton was convicted again, and Jennifer was elated. "It was one of the happiest days of my life," she recalled. Now she knew for certain that Cotton was never going to get out. She had forced herself to go through two trials; she had picked the right man; she had her justice. "I was sure as I can be," she remembers.

But Jennifer Thompson was wrong. The second Burlington victim was wrong. Mike Gauldin and the Burlington police, despite their conscientious, by-the-book investigation, were wrong. The 24 jurors who in two separate trials had convicted Ronald Cotton were wrong.

Procedural Issues between Cops and Prosecutors

Mistaken identifications are not uncommon in our system of justice. The police actually see lots of misidentification during criminal investigations. In fact, witnesses—20 to 25 percent in one survey—routinely identify fillers in photo arrays or lineups. These confident but mistaken witnesses never make it to the prosecutors because their cases are screened out, but they are a regular feature of an investigator's life. The prosecutors, by contrast, seldom see a case unless the police have a solid identification and something to corroborate it (Doyle 2005). For that reason, it can be said that the police are primarily responsible for the outcome of eyewitness identifications and consequently take great care to make sure that the procedures for conducting show ups, photo arrays, and lineups are closely followed. Contrarily, anything resembling standardized procedures represents a potential danger for prosecutors because defense lawyers are viewed as being eager to pounce on any deviation from the new standard procedures (Doyle 2005). Although following routine procedures may be a fundamental part of police culture, it may sometimes place an extra burden on prosecutors, who want to be able to exercise their judgment in preparing a case for trial. It has therefore been argued that the science of memory must count in police stations and courtrooms (Doyle 2005), not only to alleviate the perils of mistaken identifications based on poor processes, but also to ensure the accuracy of prosecution.

The Science of Memory

In 1975, Lavrakas and Bickman found that in a study of 54 prosecuting attorneys in a large metropolitan community, "an eyewitness identification and the victim's memory of the incident (which is also an eyewitness account) are far more important than any other characteristics a witness possesses, such as age, race, or level of income" (Loftus 1996, 12). Lavrakas and Bickman interpreted the prosecutors' responses to mean that having a witness who could recall events accurately was absolutely crucial to the just resolution of criminal cases. The likeableness of the witness as well as his or her appearance and presentation on the stand during the trial were also shown to influence the perception of credibility. Most important, however, was the ability of the witness to portray confidence on the stand as well as to give an accurate description of events that could not be easily

influenced when the added pressure of cross-examination was applied by the defense. Indeed, this is a difficult task, because defense lawyers are sometimes very well trained in cross-examination techniques that can lead to inconsistent results, particularly when small details of events are challenged over long periods of time.

When we experience an important event, we do not simply record that event in memory as a videotape recorder would. The situation is much more complex. Nearly all of the theoretical analyses of the process divide it into three stages. First, there is the *acquisition* stage—the perception of the original event—in which information is encoded, laid down, or entered into a person's memory system. Second, there is the *retention* stage, the period of time that passes between the event and the eventual recollection of a particular piece of information. Third, there is the *retrieval* stage, during which a person recalls stored information. This three-stage analysis is so central to the concept of the human memory that it is virtually universally accepted among psychologists (Loftus 1996).

In sum, once the information associated with an event has been encoded or stored in memory, some of it may remain there unchanged whereas some may not.

Background

The three most common types of eyewitness identifications, all of which offer their own relative advantages and disadvantages to criminal investigations occurring in the United States, are among several techniques for identifying suspects that law enforcement officials use to buttress their case for arrest. First, lineups of the sort that appear in popular movies and television shows depicting a suspect who is escorted into a room with three to five supposedly similar-looking people to stand before a witness to a crime have routinely been scrutinized owing to the questionable similarity of the participants' physical characteristics. In *Martin v. Indiana* (1977), for example, in which the description of the suspect was that of a tall 32-year-old African American, only 2 out of 12 people in the lineup were African American and one of them was only five feet three inches tall.

Second, photo lineups in which eyewitnesses attempt to identify suspects from an array of photographs are not generally considered as reliable as live lineups owing to the variable quality of the photos. Photo arrays continue to be used because of the diversity of treatments available to the administrators of the photo lineups, such as adding additional photos to the lineup so that the witness must choose from an array of numerous photos as opposed to the numeric limitations of a live lineup. Also, additional photos of the actual suspect can be added to the photo array in varying poses and with various ornamentation, such as with or without a beard or glasses. Still, issues arise with the fairness of such techniques where justice is concerned because, for example, when a suspect appeared in 14 of 38 photos, a New Jersey court ruled, in *State v. Madison* (1988), that the photo array was impermissibly suggestive (*State v. Henderson* 1988).

Finally, police usually arrange show ups when they present a single suspect to a witness and ask, "Is he the one who raped you?" Show ups have been criticized for inherent prejudice owing to the nature of the show up, because they usually happen immediately after the crime, and some witnesses may view the fact that the police have apprehended the person as a sign that the person is guilty of the crime. The U.S. Supreme Court, however, has not ruled that this procedure constitutes a constitutional due process violation if there is additional reason to believe that the suspect is in fact the guilty party. Some state courts, however, as in the case of *People v. Guerea* (1974), have routinely ruled that show ups violate due process. In short, mistaken identification was observed to be the major source of error contributing to wrongful convictions in recent years (Sporer, Malpass, and Koehnken 1996).

A Key Moment

Hugo Muensterberg is credited with having performed one of the earliest experimental demonstrations of eyewitness misidentification in Berlin in 1902 when, as a college professor, he staged a fight between students during a lecture. It was so arranged that one of the actors appeared to have shot another with a pistol. Students attending the lecture were asked to write down their account of the fight immediately following the event, but only 26 percent of the students were able to give somewhat accurate details, and even those presented some erroneous facts, such as nonattributed and misattributed language and actions (Muensterberg 1908).

Important Persons and Legal Decisions

Three landmark cases that first established constitutional parameters regarding eyewitness identification in criminal trials established procedural standards: (1) In *United States v. Wade* (1967), the Supreme Court held that because a postindictment lineup is a "critical stage" of prosecution, the defendant had a right to have an attorney present (*United States v. Wade* 1967). (2) *Gilbert v. California* (1967) augmented the ruling set forth in *Wade* by holding that "a per se exclusionary rule as to such testimony can be an effective sanction to assure that law enforcement authorities will respect the accused person's constitutional right to the presence of his counsel at the critical lineup" (*Gilbert v. California* 1967). And (3) *Stovall v. Denno* (1967) created a standard whereby the identification procedure may not be "so unnecessarily suggestive and conducive to irreparable mistaken identification that [the suspect is] denied due process of law."

Additional challenges to the procedures set forth by the Supreme Court standards have questioned the constitutionality of eyewitness identifications based primarily on the Sixth Amendment right to counsel. Arguments for Sixth Amendment protection, for example, suggest that suspects are entitled to an attorney if identification occurs at a preliminary hearing, even before the indictment, but not if the identification is conducted as a part of an on-the-scene show up. Besides, it is well known that although

states may increase rights provided by the Constitution (including the Sixth Amendment), states cannot decrease its protections. Pennsylvania, for example, requires an attorney at all postarrest lineups, and Tennessee provides the right to counsel as soon as an arrest warrant is issued. New York even requires the presence of an attorney if a suspect wants to waive his or her right to counsel as an added protection for the validity of the waiver (Sporer, Malpass, and Koehnken 1996). To that end, "The vast majority of eyewitness identification cases have been decided on due process grounds" (Sobel 1988, 110).

It should also be noted that *Neil v. Biggers* (1972) outlined the following five witness factors to be used in considering whether the defendant's due process rights have been violated: (1) opportunity of the witness to view the criminal at the time of the crime, (2) the witness's degree of attention, (3) the accuracy of the witness's prior descriptions, (4) the witness's level of certainty, and (5) the time lapse from the crime to the identification (*Neil v. Biggers* 1972). Opportunity to view can involve factors such as whether the crime and the identification occurred in daylight, as well as the distance and time duration within which the crime occurred. The case of *Gilliard v. LaVallee* (1974) provided the foundation for considering time duration in eyewitness identifications because, in that case, the kidnap victims were able to view their captors for up to six hours (*Gilliard v. LaVallee* 1974). Similarly, the degree of attention paid by eyewitnesses to the crime at the time that it occurred can be said to influence the credibility of eyewitness identifications. Attention is high when undercover officers are making a drug deal (*State v. Denny* 1984), for example, but low when an assailant awakens a victim during an incident (*People v. Leonard* 1978). Prior descriptions may cause inconsistency and may not be allowed in trial proceedings in cases where a witness provides a physical description of a suspect at the scene of a crime by height and weight, for example, but it is later determined that the height and weight of the suspect are significantly different from what the witness first reported.

Although it is commonly agreed that certainty is ascertained with the traditional standard set forth in *Neil v. Biggers,* "that a confident witness is an accurate witness" (Sporer, Malpass, and Koehnken 1996), there is some evidence to suggest that the relative certainty with which a witness identifies a suspect cannot, in fact, be correlated with the degree of accuracy. For example, time lapse can greatly influence the degree of accuracy regardless of the degree of confidence displayed by witnesses. Generally, there is no due process violation based on the length of time lapse between the event and the identification, but the accuracy of identifications has not been shown to increase with time; for example, two years did not present a problem to the New Hampshire court in *State v. Cross* (1986).

Still, other factors may also influence eyewitness identification, such as unconscious transference, which usually occurs when a person actually seen in an unrelated place or context is mistakenly identified as the offender in an eyewitness identification procedure. Also, identifications made by people in some occupations, such as college professors

(*Plummer v. State* 1980), lawyers (*Robinson v. State* 1985), and security guards (*Royce v. Moore* 1972) are sometimes viewed by trial participants as being more credible.

Conclusion

In 2001, New Jersey became the first state with guidelines strongly recommending that police use a sequential method of photo identification rather than displaying an array of photos of suspects (Harry 2001). Studies have shown that the new method, which does not allow witnesses to compare mug shots side by side, drastically cuts the number of mistaken identifications. Based primarily on a U.S. Justice Department study commissioned in 1999, the results of which showed that many cases overturned with DNA evidence relied heavily on witness identifications of suspects, the push for the sequential method came from law enforcement officials rather than persons who had been wrongly convicted or their advocates (Harry 2001). Further, there has been opposition to the variability with which many police departments around the country process eyewitness identifications; for that reason, it has been argued that the problem of misidentification can be avoided by scripting data collection with police departments (Wells and Olson 2003). In addition, conditions are being found in which eyewitness certainty might be more closely related to eyewitness identification accuracy than was once thought, especially when external influences on eyewitness certainty are minimized; but the difficulty of exploring that relationship remains because of a perceived disconnect between social science and policing. Police records, for example, do not distinguish between eyewitnesses who make identifications of a filler and those who make no identifications, which can result in a serious underestimation of the rate of filler identifications (Wells and Olson 2003).

Finally, in a law review article published in 2002, Dori Lynn Yob suggested that the problems with a state-by-state approach point to a broader solution: the adoption of mandatory, uniform, nationwide standards (Yob 2002). She goes on to argue that such a broad set of standards would be most effectively implemented through a U.S. Supreme Court decision and proposes that the following changes be made: (1) The witness should be instructed prior to the lineup that the perpetrator may or may not be present and that he or she should not feel pressured to make an identification. (2) The composition of the lineup should not cause a suspect to stand out unduly. (3) Fillers in the lineup should be chosen to fit the eyewitness's initial description of the culprit rather than to resemble the suspect. (4) When there is more than one witness, a different lineup should be created for each witness, with only the suspect remaining the same. (5) Lineups should always be conducted by someone unconnected to the case who does not know the identity of the suspect. (6) Mock witnesses should be used to test the neutrality of each lineup, and blank lineups should always be used. (7) Sequential lineups should always be used. And (8) lineups should always be videotaped.

In Yob's view, "uniform nationwide guidelines would likely have an impact on the amount of erroneous eyewitness evidence because the guidelines would help attorneys identify and object to faulty identification procedures," and "a critical look at the problems with eyewitness identification evidence should be included in the curriculum of certain high school and college classes"(Yob 2002), not only because students at the high school level are more likely to incorporate the education into civic duties they learn to fulfill as they develop but also because most people do not attend college. For that reason, we are more likely to capture the hearts and minds of the young people in high school today before they become the jurors, judges, and police of tomorrow.

GANG INJUNCTION LAWS

Rebecca Romo and Xuan Santos

Throughout the United States, in both urban and rural regions, people perceive juvenile crime and gang violence as a menace to society. Although recent statistics show a relative decline in crime rates, gang crime remains the center of attention. Although youth increasingly join street organizations for social status and respect among their peers, the media allege that these gangs disrupt the quality of life of their communities. Tracey L. Meares and Dan M. Kahan (1998) argue that the high rates of crime that continue to plague inner-city communities rob residents of their security, undermine legitimate economic life, and spawn pathological cultures of violence that ruin the lives of victims and victimizers alike. Community residents, gang experts, and prosecutors have alleged that these so-called superpredators (Krisberg 2005) intimidate citizens and force them to submit to their authority so that they can sell drugs, party in public, stash weapons, and commit crimes with impunity.

Chris Swecker, assistant director of the Criminal Investigative Division of the FBI, said before the subcommittee on the Western Hemisphere of the U.S. House of Representatives Committee on Foreign Affairs that "Gangs are more violent, more organized, and more widespread than ever before. They pose one of the greatest threats to the safety and security of all Americans. The Department of Justice estimates that 30,000 gangs with 800,000 members impact 2,500 communities across the U.S." (Swecker 2005). Swecker highlights the mainstream discourse and ideology on gang violence, which suggests a

threat to communities across the United States by describing gangs as disrupting the moral fabric of U.S. society. Accordingly, advocates of gang injunction laws maintain that these civil codes provide law enforcement with more tools to fight gangs and reduce crime. On the other hand, critics and opponents of gang injunction laws maintain that they are ineffective and a waste of taxpayers' dollars, which could be better spent on community development and crime prevention.

Background

To date, there are no accurate figures on the number of gangs or gang members or the extent of gang crime in the United States. Sociologist Malcolm Klein, one of the leading experts in this field, estimated in the 1990s that there were between 800 and 1,000 cities with gang crime problems, with more than 9,000 gangs and 400,000 gang members (Klein 1995). In 2002, the National Youth Gang Survey found that cities with gang problems more than doubled Klein's figures, with a total of 2,300. Figures from the 2006 survey showed the total dropping only slightly (to 2,199). It found a total of 26,500 gangs with an estimated 785,000 members in the United States; these were approximately 46 percent Latino or Latina and 34 percent African American (FBI Law Enforcement Bulletin 2009). Most data on gang members collected by law enforcement derive from self-identification, monikers, tattoo insignia, community input (gang members, community workers, neighbors, teachers, and family members), and gang members'

California Civil Code § 3479: Nuisance Defined

A nuisance is anything which is injurious to health, including, but not limited to, the illegal sale of a controlled substances, or is indecent or offensive to the senses, or an obstruction to the free use of property, or unlawfully obstructs the free passage or use, in the customary manner of any navigable lake, or river, bay, stream, canal, or basin, or any public park, square, street, or highway, is a nuisance.*

California Civil Code § 3480 Public Nuisance Defined

A public nuisance is defined as one which affects at the same time an entire community or neighborhood, or any considerable number of persons, although the extent of the annoyance or damage inflicted upon individuals may be unequal.**

DID YOU KNOW?

In order to determine if you have a case and an effective gang injunction, you must accomplish the following:

- Survey crime in the area to identify problem areas, individuals, and activities
- Gather quality-of-life information to prove neighborhood damaged by gang nuisance
- Identify community stakeholders and determine what the community believes are so-called fear factors
- Examine law enforcement local expertise; identify necessary declarants for court documents
- Search for nexus of:
    1. Criminal activity
    2. Nuisance activity
    3. Individual gang members

style of dress and demeanor—among the many characteristics that law enforcement officials use to determine gang membership.

Nevertheless, law enforcement agencies claim they lack the funding and resources to combat gang activity and to protect communities. In addition, law enforcement and politicians pump fear into the public in order to acquire resources and the permission to mount an all-out attack on gangs. The climate of fear nurtured by law enforcement officials has paved the way for the rise of gang injunctions and restraining orders on street organizations. California became the first state to develop a hard-hitting gang injunction procedure by applying public nuisance laws to enforce civil injunctions that prohibit suspected gang members from engaging in either legal or criminal activities in public spaces known as *free zones* or *safety zones* (Burdi 2007). Free zones and safety zones map out the areas in a community, usually consisting of a few square blocks, where gang members may not associate with one another.

Gang injunction laws allow prosecutors to use public nuisance doctrines prohibiting lawful and unlawful behavior at their discretion. Civil procedures do not require jury trials, defense counsel, or the burden of proving guilt beyond a reasonable doubt.

Operationalizing These Laws

For a gang injunction petition to be honored in civil court, the prosecutors must establish two sources who identify defendants. Prosecutors often rely upon the community residents, law enforcement intelligence, and informants to establish a person's gang activity.

Once this is accomplished, the prosecution must serve gang members with paperwork adjudicating them to the lawsuit, and once served, the injunction becomes effective. During the injunction hearings, the defendant's preexisting gang activity is exposed, even if he or she has not been arrested or convicted of a crime. This represents a disturbing trend in criminal justice in which crimes are punished before they actually happen. Most requests for gang injunctions are granted; however, the judge has discretionary power to change the terms of the injunction. In addition, the judge may exclude named individuals from the complaint owing to poor evidence implicating an individual to gang affiliation or for failure to serve an individual with a copy of the complaint.

In an effort to expel gang members from a target area, on October 26, 1987, the Los Angeles city attorney and former mayor James Hahn became the first to use a public nuisance abatement lawsuit in *People v. Playboy Gangster Crips*. This injunction barred 23 individually identified gang members from breaking 6 of 23 injunction terms, which, under California law, were already illegal. Although this injunction was not completely successful, it established a legal precedent in the use of the public nuisance doctrine to combat an entire urban street organization instead of individuals (L.A. City Attorney Gang Prosecution Section 1995, 325–331).

Jeffrey Grogger, professor of urban policy at Harvard University, dispels the myth that all gang injunctions operate in the same way. He argues that prohibited activities vary somewhat, but they typically include a mix of activities already forbidden by law, such as selling drugs or committing vandalism, and otherwise legal activities, such as carrying a cell phone or associating in public view with other gang members named in the suit. Once the injunction is imposed, prosecutors can pursue violations of the injunction in either civil or criminal court. The maximum penalty for civil contempt is a $1,000 fine and five days in jail. The maximum penalty under criminal prosecution is a $1,000 fine and six months in jail. Although civil procedures result in less stringent penalties, they have the advantage that their penalties can be imposed without criminal due process (Grogger 2002).

In 1993, the most complete gang injunction issued thus far took place in the community of Rocksprings in San Jose, California, an area that gang members from Varrio Sureño Trece, Varrio Sureño Town, or Varrio Sureño Locos (VSL) claimed as their turf (Castorena 1998). Silicon Valley residents felt unsafe and threatened because gang members congregated on sidewalks and lawns, where it was alleged that VST and VSL gang members engaged in a plethora of drug sales, violent activities, loitering, and lewd conduct. The residential condition made people afraid of having their children play outside and deterred residents from having visitors because they were afraid of gang reprisal in the four-square-block neighborhood.

As a result, the city of San Jose issued a gang injunction against 38 members of the three named gangs. It enjoined and restrained these individuals from engaging in the following activities: intimidating witnesses, which meant confronting, annoying,

harassing, challenging, provoking, assaulting, or battering any person known to be a witness to or victim of a crime; grouping together (driving, gathering, sitting, and standing) with other known Trece/VSL associates in public or any place accessible to the public; carrying any firearms (imitation or real) and dangerous weapons on their persons or in the public view or any space accessible to the public; fighting anywhere in public view (streets, alleys, private and public property); using gang gestures (hand signs, physical gestures, and discourses) describing or referring to any of the three gangs; wearing clothing bearing the name or letters spelling out the name of a gang; selling, possessing, or using illegal drugs or controlled substances without a prescription (prohibiting anyone from knowingly remaining in the presence of such substances as well); the public consumption of alcohol anywhere in public view or in any place accessible to the public; spray painting or applying graffiti on any public (alleys, block walls, streets) or private property (residences or cars); possessing any graffiti paraphernalia (spray cans, paint markers, etching tools, white-out pens, acrylic paint tubes, various paint cap tips, razor blades, or other known graffiti tools) unless going to or from art class; or trespassing on private property. Gang members were also required to honor a daily curfew from 10:00 P.M. to sunrise unless they were going to a legitimate meeting or entertainment activity, engaging in a business trade, profession, or occupation, or involved in an emergency situation. They were enjoined from looking out for another person to give warning that a law enforcement officer was approaching by whistling, yelling, or signaling and also violating the law in any other way (thus prohibiting violence and threats of violence, including assault and battery, murder, rape, and robbery by force or fear).

Defendants from the three gangs challenged the unconstitutional vagueness of this court order in *People ex rel. Gallo v. Acuña,* and an appeals court threw out 15 of the 25 original provisions. As a result, the San Jose city attorney appealed two provisions to the California Supreme Court: the terms that prohibited gang members from congregating in safe zones and one barring them from harassing or threatening inhabitants who complained about gang activities. The California Supreme Court approved the use of civil antigang injunctions by rejecting the constitutional challenge to the use of a public nuisance abatement injunction against street gangs. This decision took into consideration the interest of the community while restricting the First Amendment rights of free speech and association of gang members.

According to Justice Janice Brown, "To hold [that] the liberty of the peaceful, industrious residents of Rocksprings must be forfeited to preserve the illusion of freedom for those whose ill conduct is deleterious to the community as a whole is to ignore half the political promise of the Constitution and whole of its sense.…Preserving peace is the first duty of government, and it is for the protection of the community from the predations of the idle, the contentious, and the brutal that government was invented" (*People ex rel. Gallo v. Acuña* 1997). The *People ex rel. Gallo v. Acuña,* a landmark California

Supreme Court decision, paved the way for municipal government across the state to use similar gang suppression tactics to curtail gang activities.

For example, in 2006, Dennis Herrera, the San Francisco city attorney, sought an injunction against the Oakdale Mob Gang because of their reputation for distributing drugs and contributing to an increasing rate of violent crime, including harming and killing rival gang members and witnesses. To protect residents, Herrera pushed for punishing any gang member who violated a curfew order of 10:00 P.M. or who congregated with other gang members within a four-block safety zone. There were also many other

INEFFECTIVENESS OF GANG INJUNCTION LAWS

In 1995, the city of Pasadena, California, instituted two separate gang injunction laws. The city later discarded the gang injunction after the Pasadena Police Department and other governing bodies found it difficult to control gang activity as crime spilled over to other regions, making their efforts a complete failure. The failure of gang injunction laws stems from their inadequate ability to address the complex structure of gangs and the emerging crime issues in neighboring areas.*

In 1997, the Southern California division of the American Civil Liberties Union (ACLU) conducted a 10-year longitudinal study on the effectiveness of gang injunction laws. The ACLU focused on the efficacy of the 1993 injunction law against the predominantly Latino Blythe Street Gang. The ACLU found that gang injunction laws do not meet their objectives in reducing the long-term crime incidences in Blythe Street's safety zone.**

Opponents of gang injunction laws argue that they are expensive and deplete city resources. The constitutional cost of embarking on a gang injunction campaign ranges from $400,000 to $500,000. Several civil libertarians, social justice organizations (e.g., Books not Bars), and law enforcement practitioners argue in favor of investing funds in educational programs geared at preventing crime. Take, for example, Father Gregory Boyle, a Jesuit priest who founded Homeboy Industries in the community of Boyle Heights in East Los Angeles. Although many organizations quickly condemn gang members, Homeboy Industries offers an alternative to punitive approaches by offering gang members their first chance by helping them to become gainfully employed. Boyle believes that the best way to deal with gangs requires a major shift in moving away from the symptoms of gangs to addressing the social disease leading to gang formation. Boyle believes that gang injunctions fail to address the structure of poverty and law enforcement's misdiagnosis of the problem.***

restrictions (Martin 2006). Similarly, in 2005, San Diego County District Attorney Terri Perez filed a court order prohibiting known gang members from grouping together with other associates, displaying gang signs, wearing gang attire, carrying weapons, selling illegal narcotics in public, or fighting in areas of downtown Vista (Klawonn 2005). The widespread use of injunction laws to combat neighborhood gang problems has now appeared in Austin, Los Angeles, Phoenix, Sacramento, San Antonio, San Diego, San Francisco, San Jose, and Stockton.

Many law practitioners believe that the relative reduction of crime in communities derives from law agencies holding an entire group of gang members accountable for the actions of individuals. From a law enforcement standpoint, gang injunction laws address status offences and nuisance activities before they become felonious. Julie Bishop, the leading project attorney on gang injunctions for the Los Angeles city attorney's office, argues that communities benefit from gang injunction laws:

> [T]hey have an amazing, immediate deterrent effect on the entire [gang] group's activity, not just the few who are "sued" by the City Attorney. They complement Neighborhood Recovery Efforts and address the gang problem from a group perspective. They save traditional law enforcement response for the chronic serious offenders. They have a preventive aspect in that they repeatedly warn defendants of the consequences of continuing their behavior. (Bishop 1998, 2)

Conclusion

As local and federal agencies attempt to ameliorate the gang problem, recent trends reveal a drop in the overall crime rate. At the core, these Draconian gang injunction laws attempt to deter individuals from committing future crimes at the expense of their constitutional rights while exacerbating police repression and extending the prison system in communities of color. As noted in the 1998 National Youth Gang Survey, approximately 80 percent of gang members are African American and Latino or Latina. Gang injunction laws disproportionately affect youth and adult gang members of color.

Victor M. Rios, sociology professor at the University of California–Santa Barbara, argues that the ever-expanding power and punitiveness of criminal justice policies and practices affect every member of poor racialized communities in multiple ways, especially urban youth of color. For example, law enforcement often applies gang injunctions to minorities because of their race, not because they have demonstrated substantial evidence of gang activity or crime. This process has increased the probability of harassment of many law-abiding people of color. Rios notes that this so-called hypercriminalization of communities of color is derived from surveillance, security, and punitive penal practices centered on controlling black and brown populations preemptively—before they have even committed a criminal act (Rios 2006).

Lawrence Rosenthal argues that the enforcement of conventional laws, accordingly, allows the police enormous freedom to undertake a variety of quite heavy-handed

measures against the residents of inner-city minority communities—authority that officers who may harbor racial biases are frequently accused of misusing (Rosenthal 2002). The taking away of constitutional rights of expression and assembly, like forbidding gang members from interacting with lifelong friends, brothers, and sisters in the same family or banning street attire, does not address the systemic conditions that create gangs. Gang injunction laws exacerbate institutional racism when youths of color—blacks, Latinas, Latinos, and Southeast Asians, for example—are deemed to be suspicious and criminal even if they do not belong to a gang. This means that anyone who fits a gang member profile within the confines of a safe zone may be detained, searched, and arrested without probable cause.

GUN CONTROL

Matt Nobles

Few topics in the realm of U.S. justice and politics elicit a more polarizing response than that of gun control. Issues in gun policy range from the moral to the practical, with implications for law, economics, public health, and a host of other disciplines. At the center of the debate is the fundamental question of whether firearms, specifically those owned and wielded by private citizens, do more harm than good in deterring violent crime. Despite intense scrutiny from so many fields, however, scholars have reached few solid conclusions to date. The answers to even basic questions (who is victimized, how many are victimized, and at what cost are they victimized) are fiercely disputed, resulting in a nebulous yet hotly contested understanding of the interplay between guns and crime.

U.S. gun policy is a complex and difficult issue characterized roughly by its two diametrical sides: the pro-gun (or gun rights) camp, which argues that guns are a constitutionally protected social necessity, and the anti-gun (or gun control) camp, which asserts that guns are a fundamentally unsafe and extremely costly means to facilitate a variety of social ills. Data exist to support both sides; the difficulty lies in separating partisanship and underlying attitudes from empirical observation and objective analysis. In truth, the isolation of such objectivity may be a logical impossibility.

Background

Outside the United States, guns are sometimes a contentious issue, but rarely at the level witnessed here. Many Westernized nations feature tighter controls on private firearm ownership, particularly for certain types of weapons that could, in the view of their governments, be more readily used to facilitate crime. Australia, for example, experienced a period with relatively little gun regulation prior to the 1980s and 1990s, when a series of high-profile shooting incidents incited progressively harsher reform. Now, guns in Australia are tightly controlled, with restrictions on ownership based on the category of firearm and the evaluation of so-called genuine need on the part of the possessor. Although some low-level debate remains over gun control policies in other countries,

there is a veritable firestorm of political, academic, and litigious action on all sides of the gun control issue in the United States.

This issue begins with the interpretation of the U.S. Constitution's Second Amendment. Broadly, the amendment is concerned with security through self-defense; the key difference between the gun rights and gun control perspectives lies with precisely who is entitled to self- defense and how that defense is to be manifested.

Supporters of gun rights believe that the Second Amendment applies to individual-level possession of firearms, whereas supporters of gun control argue that the intent was to provide for the formation and readiness of peacekeeping forces such as the army or state militias. (Since the federal Militia Act of 1903, individual state militias have been organized into the National Guard and have been tasked with supplementing army units overseas and providing domestic support in relief of natural disasters.) In the former perspective, the right and responsibility of self-defense carries an individualistic connotation. In the latter, self-defense is provided for generally by the state, through publicly governed mechanisms such as police, who are entrusted with powers of arrest and tasked with maintaining order. Additional points concerning the amendment have also been debated and promoted, including the right to rebel against government tyranny.

At present, the prevailing attitude in the United States asserts the gun rights perspective—that the Second Amendment protects and guarantees individual possession. Gun rights supporters, particularly the National Rifle Association (NRA), endorse the interpretation that a "well regulated militia," as quoted in the amendment, refers to an armed populace and not only to governmental bodies such as the U.S. Army or National Guard. The NRA, founded in 1871, is the oldest continuously operating civil liberties organization in the United States. It is also, perhaps more significantly, one of the largest and best-funded lobbying organizations in the United States today. Beginning with a more conservative shift in the late 1970s, the NRA has championed laws that promote gun rights and emphasize gun safety for millions of shooting enthusiasts. The opinion about gun rights and the Second Amendment is consistently reflected in public opinion polls on gun ownership. For example, a Gallup poll conducted in 2008 demonstrated that 73 percent of respondents believed that the wording of the Second Amendment indicates a guarantee of private ownership as well as the formation of state militias (Gallup 2008).

THE CONSTITUTIONAL RIGHT TO BEAR ARMS

The Second Amendment, as passed by Congress and later ratified by the states:

> A well regulated militia being necessary to the security of a free State, the right of the People to keep and bear arms shall not be infringed.

NATIONAL RIFLE ASSOCIATION

The National Rifle Association (NRA) was founded in 1871 to promote sport shooting and it remains involved in programs to promote firearms safety in the context of hunting and marksmanship. However, it has now become the most influential lobbying group in favor of the individual right theory of the Second Amendment. The NRA (http://www.nra.org/) claims just under 3 million members. In 2004, the NRA Political Victory Fund supported 265 candidates for U.S. House or Senate seats, prevailing in 254 races.* Because the NRA considers personal firearm ownership a fundamental civil right, it opposes all firearms regulations not specifically targeted at persons already shown to be unfit to handle weapons by criminal or mental health history. It also usually opposes bans on particular weapons or firearms paraphernalia and regards firearms registration as a precursor to confiscation. The NRA's response to gun violence is to advocate vigorous enforcement of existing limitations on who may own firearms and severe penalties for unlawful use of firearms.

Legal opinion on the gun control issue seems divided, with both sides claiming victory. In some instances, both pro- and anti-gun advocates claim victory in the very same case. The case of *United States v. Miller* (1930), for example, is cited by the Brady Campaign (2007) as evidence of the courts' interpretation in favor of gun possession by militia members only, whereas the same case is cited by the NRA (Tahmassebi 2000) as evidence of support for the constitutional guarantee of individual ownership. Dozens of other contradictory instances may be found in federal and circuit court opinions dating back more than a century.

Legal Developments

The use and control of firearms in the United States has traditionally been approached from a fundamentally permissive position, with individual ownership largely unregulated. Notable exceptions to this position exist for the nature and type of firearm, the characteristics of its owner, and the provisions of its transfer—all factors that are monitored by the government. A series of federal laws have provided the framework for this means of gun control in the United States since the Prohibition era. The first and perhaps most influential of these laws was the National Firearms Act of 1934, which placed severe limitations on individuals who wished to own small arms and accessories that were generally assumed to facilitate violent crime. Among the regulated items covered in the act were sound suppressors (or silencers), destructive devices such as hand grenades, short-barreled rifles and shotguns, and fully automatic machine guns. The act makes the unlicensed possession or transfer of such items a criminal offense punishable by up to 10 years in federal prison and/or a substantial monetary fine plus forfeiture of all items that violate the act. The National Firearms Act has remained in effect, largely

unaltered, and has enjoyed bipartisan support for more than 70 years—a remarkable feat, given the frequency of legal challenges to legislative gun control.

Specific forms of gun control in the United States have also been enacted through laws intended to supplement the National Firearms Act of 1934. One such provision, the Gun Control Act of 1968 (Chapter 44 of Title 18, U.S. Code), was established following the high-profile assassinations of Martin Luther King Jr. and Robert Kennedy. This act provided tighter regulation of interstate commerce dealing with firearms, established the Federal Firearms License program to prevent individuals from purchasing guns through direct mail order or from out-of-state dealers, and mandated that all firearms produced in or imported into the United States bear a serial number for identification purposes.

Certain provisions of the Gun Control Act of 1968 were later clarified and amended in the Gun Owners Protection Act of 1986 (18 U.S.C. § 921 et seq.). This legislation featured several key decisions favoring gun rights supporters. First, it included a formal prohibition of governmental registries linking private guns to individuals. Second, it offered protection for federal firearms licensees from "abusive" inspections on the part of the Bureau of Alcohol, Tobacco, and Firearms. Third, it established a "safe passage" clause for gun owners traveling to and from legal shooting-related sporting events, effectively immunizing them from prosecution for possession or transportation of firearms outside their home jurisdictions. Finally and most critically, the act also clarified the list of persons denied private firearm ownership on public safety grounds, such as individuals who are fugitives from justice or those who have been adjudicated to be mentally ill. An amendment was added in 1996 (the Lautenberg Amendment) to prevent ownership for those who have been convicted of domestic violence and those subject to court-issued restraining orders.

Additional restrictions on gun ownership have been imposed since the Gun Owners Protection Act of 1986. In 1993, President Bill Clinton signed the Brady Handgun Violence Protection Act (18 U.S.C. § 921 et seq.) into law. The act was named for former Ronald Reagan Press Secretary James Brady, who was wounded in an assassination attempt by John Hinckley Jr. in 1981. It established a five-day waiting period for handgun purchases involving a federal firearms licensee (dealer) and a private individual (customer). The waiting period was intended to provide an opportunity for criminal background checks on the purchaser, but this system was replaced in 1998 with the establishment of the computerized National Instant Check System (NICS). NICS provides the same functionality but takes only minutes instead of days, thus preserving the original intent of the Brady Act while streamlining its implementation.

Nevertheless, gaps were found in the system in the wake of a deadly mass shooting carried out by Seung-Hui Cho, a Korean American student, on the campus of Virginia Tech in Blacksburg, Virginia, in April 2007. Cho was known to have a history of serious mental illness and, as such, should have been prevented from purchasing

firearms. After the shooting (in which 32 people died), Congress acted to strengthen NICS by ensuring that any prohibiting information regarding the status of a person with a psychiatric condition be made available during the background check process. The NICS Improvement Act was signed into law in January 2008.

For its part, the U.S. Supreme Court, until its 2010 *McDonald v. Chicago* decision, had never ruled on whether the Second Amendment addresses a fundamental individual right to possess firearms at the state level. The closest the Court had come to judgment on this issue was in a 2008 case, *District of Columbia v. Heller* (2008), which centered on the right of an individual to bear arms inside the U.S. federal district (Washington, DC). In that case, a District of Columbia law that banned persons from owning handguns (pistols) and automatic and semiautomatic weapons, and that required any firearms (rifles) held inside the home to have trigger locks was declared unconstitutional. Gun rights proponents proclaimed the ruling a major victory, while gun control advocates lamented it even while observing that it was narrowly worded.

Hence the importance of *Mcdonald* (2010) in clarifying matters. In that case, Chicago firearms restrictions similar to those previously put in place in Washington, DC, were

THE GUN-FREE SCHOOL ZONES ACT OF 1990 AND THE ASSAULT WEAPONS BAN OF 1994

The only major state or federal gun control law that has been struck down by the Supreme Court is the Gun-Free School Zones Act of 1990. The law was designed to curtail gun-related violence in schools, having been enacted after a number of high-profile school shootings. The act established a ban on the possession of firearms within 1,000 feet of a school and set a penalty of $5,000 or five years' imprisonment, or both, for violators. Soon enough, however, the law was challenged by gun rights advocates, and in *U.S. v. Lopez* (1995) the U.S. Supreme Court ruled that in drafting the law Congress had exceeded its authority to regulate commerce (in this case, commerce in guns). The Second Amendment played no part in that decision. The Court left open the possibility, however, that school districts could set out their own restrictions on the presence of guns within their jurisdictions.

The wide-ranging Assault Weapons Ban of 1994, affecting semiautomatic handguns, rifles, and shotguns, was part of the larger Violent Crime Control and Law Enforcement Act of that same year. The ban made the production of so-called assault weapons that included two or more functional or cosmetic features such as threaded barrels, bayonet mounts, and telescopic stocks illegal in the United States from 1994 to 2004. This law was rendered immaterial, however, owing to poorly conceived definitions and a variety of adaptations on the part of domestic gun manufacturers; the industry was able to work its way around it. As the law's expiration date of September 2004 approached, it became clear that there was insufficient support in Congress to renew it. It passed out of law and, to date, has not been taken up anew.

put to the test by gun rights advocates. A Court of Appeals had upheld the restrictions, and when the case came to the Supreme Court it was initially expected that the justices might limit the scope of their ruling to the Chicago ban and its constitutionality. However, the conservative majority on the Court used the *McDonald* case to address the deeper issue of Second Amendment rights and their applicability to the states. In its 5–4 decision, the Court stated that the Second Amendment is to be regarded (under the Fourteenth Amendment's due process clause guaranteeing individual freedoms and protections) as ensuring the individual's right to bear arms. The opinion noted that certain firearms restrictions mentioned in the *Heller* case, such as those "prohibit[ing]…the possession of firearms by felons or mentally ill" as well as "laws forbidding the carrying of firearms in sensitive places such as schools and government buildings, or laws imposing conditions and qualifications on the commercial sale of arms," remain valid and are not affected by the *McDonald* ruling (*McDonald v. Chicago* 2010). But wholesale bans on guns in cities or other localities and burdensome restrictions on their access and use by individuals are prohibited under *McDonald.*

Important Perspectives

Groups and individuals who espouse a gun rights outlook are quick to highlight the apparent positive value of gun possession through the use of statistics on defensive gun use. In 1991, criminologist Gary Kleck argued that defensive use is widely successful: individuals with guns are more likely to prevent the completion of the attempted crime and are less likely to become injured during the event. However, the nature and extent of defensive use is hotly contested. Kleck and colleague Marc Gertz claim that defensive use is underreported, estimating as many as 2.5 million overall defensive gun uses per year (1995), whereas critics claim that the actual number is much smaller (owing to sampling and methodological biases), perhaps around 100,000 overall defensive gun uses per year (Cook, Ludwig, and Hemenway 1997). This disagreement is typical of competing research on gun policy.

Proponents of a strict gun control model point to evidence of the various gun-related costs borne by society. One of those costs may include an increased risk of victimization that accompanies gun possession. The use of firearms accounts for the second highest total of nonnatural deaths in the United States (behind motor vehicle accidents), and the overall homicide rate in the United States is significantly greater than that in other industrialized nations (McClurg, Kopel, and Denning 2002). The exact magnitude of the inequity is a matter of which set of statistics one chooses to use. Given the high prevalence of firearm-related homicide, one might presume that gun possession could pose a direct victimization risk if legal guns were used against their owners during the commission of a crime. The number and availability of stolen guns, which are frequently instrumental in the commission of violent crime, may also indirectly influence victimization risk for the rest of the population.

GUN MANUFACTURERS AND LIABILITY

In 2005 President George W. Bush signed the Protection of Lawful Commerce in Arms Act (PLCAA) (119 Stat. 2095 [2205]), a law aimed at prohibiting suits against gun manufacturers for injuries suffered by the unlawful misuse of their products. The perceived need addressed by the PLCAA was protection of the firearms industry from a wave of litigation against gun manufacturers and distributors that was often driven by local government officials claiming reimbursement for expenses caused by gun violence. The targeting of manufacturers as parties who were at least partly liable in some cases (as when guns were made to be easily converted to automatic weapons) was at the time hailed by gun control advocates and local law enforcement officials as an innovative and necessary legal solution. However, the Republican-controlled legislative and executive branches of the federal government saw matters in a different light and moved instead to protect manufacturers.

Costs may also be economic in nature. For groups concerned primarily about the costs rather than the benefits of guns, the debate over gun control has spilled over into disciplines such as public health, which has a unique perspective and responsibility as typical first responders to gun violence. The financial burden for emergency response, hospital care, and opportunity costs from lost wages due to gunshot injuries is enormous—around $2 billion by some estimates (Cook and Ludwig 2000, 65). Some researchers have begun to regard gun violence as analogous to a public health epidemic, best visualized with epidemiological models showing patterns of spatial distribution (Fagan, Zimring, and Kim 1998), similar to the spread of diseases such as influenza and requiring a similar mobilization of public resources to combat. Self-inflicted injuries carry a cost as well; gun-control advocates note that the prevalence of self-inflicted gunshots in the United States drives the overall trend in gun deaths, with more than 50 percent of gun-related deaths attributable to suicide (Cook and Ludwig 2000, 16–18).

In the 1990s, a well-organized movement, backed financially and philosophically by the NRA, began to generate grassroots support for "concealed carry" legislation. These laws require government officials to issue licenses to people who wish to carry concealed weapons, absent compelling reasons for denial (e.g., a history of mental illness, substance abuse problems, outstanding warrants, etc.); that is, such a license would be issued to anyone who applied and met minimum state-imposed criteria. Notably missing from the application process is an evaluation of the individual's need to carry a weapon, a controversial part of the concealed-carry debate. Proponents of these laws believe that the mechanism for private citizens to obtain licenses to carry concealed firearms would translate into a general deterrence of violent crime. In other words, more guns on the street would equal more opportunity for self-defense.

An interesting resource for the concealed-carry movement was John Lott Jr.'s book *More Guns, Less Crime: Understanding Crime and Gun-Control Laws* (Lott 1998). The book provides complex statistical analyses of the impact of shall-issue permitting laws on violent crime using 15 years of crime rate data for all counties in the United States. Lott reaches the conclusion that the adoption of shall-issue permitting laws results in a decrease for key violent crime rates such as homicide and rape, whereas the laws apparently cause small increases in less serious crime such as larceny and auto theft. He surmises that criminals behave in a manner consistent with rational motives, and increases in general deterrence (leading to the more widespread use of legally concealed weapons) trigger a change in specialization for career criminals. Lott also concludes that suicide and accident rates related to firearms are unaffected by shall-issue laws.

Despite the complex methodology and expansive data used in the analysis, Lott's conclusions in *More Guns, Less Crime* failed to convince some academics. A series of critical reviews of Lott's book appeared almost immediately in scholarly journals and the popular press. For example, researchers at Carnegie Mellon University reanalyzed Lott's original data in an effort to identify trends that could skew his results (Black and Nagin 1998). This reanalysis omitted a single state, Florida, which was hypothesized to bias Lott's original conclusions owing to a period of high violence from the international drug trade and instability regarding intensive legislative actions to control guns. The effect of removing Florida from the analysis was dramatic: nearly all effects of shall-issue laws on violent crime rates became nonsignificant.

Conclusion

The issue of gun ownership is unlikely to become less controversial in the near term. Indeed, the debates about the true benefits and costs of guns may continue for generations. The future of private gun possession in the United States is, to this point, a matter of constitutional entitlement. On a positive note, many key issues dealing with gun control that work on a nonpartisan basis (e.g., possession bans for the mentally ill) seem to enjoy a popular consensus in the United States and elsewhere. This may prove to be a philosophical common ground if comprehensive and balanced gun control reform is ever attempted.

On a more practical level, the issue of whether gun control has an effect on crime is largely unsettled. Evidence suggests that there may be a positive benefit of gun ownership in terms of lawful self-defense and deterrent value under certain circumstances and when the analyses are conducted using certain types of data. Contradictory evidece suggests that violent victimization rates increase with gun ownership and that guns carry a heavy societal price tag. Accelerated population growth, the rising cost of health care, and the expansion of certain political agendas suggest that the societal cost of guns may rise in the near future. Although violent crime may be generally in decline,

gun crime may rise in certain segments of the population that are most at risk, including minorities and young males. The precise nature of the increase and the appropriate policy response will be fiercely contentious issues.

HUMAN SMUGGLING AND TRAFFICKING

Claudia San Miguel and Annie Fukushima

The concerns about illegal immigration expressed in the popular media, such as television news shows and talk radio programs, can be misleading. These shows often overlook the factors underlying migration and disregard the jeopardy that migrants face in dealing with the smugglers who bring them across the border or the traffickers who enslave them. Despite the dangers involved, many undocumented migrants come to the United States to look for work or to join their families, hoping to settle permanently. Others, entering the country under even less favorable circumstances, come at the hands of human traffickers. Human smugglers and traffickers are international criminals. Nevertheless, it is not surprising that as border-enforcement efforts continue to raise the stakes for both migrants and smugglers/traffickers, incidents of coercion and predation will increase in number and intensify in degree.

Although persons smuggled into the country most often are looking for work, women and children are trafficked both into the United States and internationally for the purpose of forced prostitution and enslavement. Of necessity, this is a process involving trickery and coercion. The United States has responded by passing legislation and directing efforts toward international cooperation. This legislation may represent a good faith effort on the part of lawmakers, but efforts on the ground to stop the massive problem of human smuggling and trafficking have produced mixed results.

Background

The process of globalization has minimized the impact of the distance between communities across the world. Although global migration is not new, the speed with which it is occurring and the shifting dynamics are. Why do people migrate? Their reasons may include finding a job, reunifying family, getting married, or fulfilling the demand for labor by migrants. Nevertheless, in some cases migrants lose control and are maneuvered into criminal activities or enslavement under conditions of coercion by smugglers or traffickers. Those who are categorized as undocumented immigrants are welcomed as cheap and dispensable labor but refused permanent legal resident status. This makes modern migrants from countries that are considered the global south (developing nations), particularly women and children from these countries, vulnerable to criminals.

In the 20th and 21st centuries, the gender dynamics of global migration have shifted. Since 1970, the migration of women has increased on a global scale in a phenomenon referred to as the feminization of migration. Although women have yet to earn equal hourly wages in most countries, including the United States, they now constitute 50 percent of the world's migrants. Women migrants are impacted by the creation of binary categories that have developed to label migration as either coerced (trafficked) or voluntary (smuggled). Such simple polarizations of migration are insufficient to describe the nature of the migration process and the vulnerability of women to human traffickers.

The U.S. West Coast has a deeply embedded migratory relationship with Latin America—one that generates racialized (race-based) perceptions of human trafficking and smuggling. Americans stereotype Mexico and Latin America as regions involved in smuggling; they assume that the United States has little or no criminal involvement. The experiences of those involved, however, reveal a complex picture of interlinkage between countries of the so-called global north (industrialized nations) and the global south.

Human Smuggling

Undocumented migrants cross U.S. national borders without a border-crossing identification card. These cards are issued by U.S. consulates to visitors for tourism or business, temporary workers, and refugees. These cards are denied to individuals who cannot establish sufficient financial means or pass the security check required of entrants from countries designated as places that harbor terrorists.

The United States has the largest and most diverse flow of undocumented workers among the developing nations. Undocumented Mexicans, Central Americans, and other Latin American workers are employed in agriculture, manufacturing, and the service sector, including jobs ranging from maids to waiters. This is a historical process that began as early as the 1940s, when the United States implemented the Bracero program to legally bring migrant workers into the United States. Today, although many foreign-born individuals are admitted as legal immigrants, a substantial number enter

as undocumented migrants, often assisted by smugglers. They may stay for a period of time and then return to their country of origin, or they may remain permanently as unauthorized immigrants. Although people who are smuggled enter the United States illegally, they often face the additional risk of being "trafficked" for nefarious purposes. A migrant who seeks to enter voluntarily but is coerced into forced prostitution or enslaved to perform labor has been trafficked by organized crime.

Since 9/11, protection of the U.S. border has been a key focus of U.S. national security. One goal of the U.S. Border Patrol is to combat human smuggling and human trafficking. However, even as U.S. borders have been tightened, immigrants looking for employment opportunities continue to enter the United States from Latin America. A 2008 Pew Hispanic Center survey showed that the number of illegal immigrants entering the United States had declined from an average of 800,000 per year in 2000–2004 to 500,000 per year in 2005–2008. U.S immigrants are racially and ethnically diverse, but the mass media tend to focus on antismuggling initiatives aimed at Latin Americans coming through the southern U.S. border. In San Diego, California, and other major crossing points, large-scale crackdowns on human smuggling rings occasionally take place. Employers in the agricultural and service sectors, in particular, cautiously welcome unauthorized immigrants, but the tightening of U.S. borders and the arrest of migrant laborers and smugglers have made employers' access to such cheap labor more difficult.

Human Smuggling and Coercion

It is often assumed that those who are smuggled across national boundaries undertake the journey of their own free will; they are neither coerced into acting nor deceived in any significant way because they have entered into contracts or paid for the service. Those who are smuggled are grouped with other, voluntary migrants who come to pursue economic opportunities (economic migration) or to be reunited with their families.

Human smuggling is the facilitation, transportation, attempted transportation, or illegal entry of a person or persons across an international border through deception, as through the use of fraudulent documents or by other means involving no identification. Definitions of smuggling in U.S. policy suggest that the person being smuggled is cooperating with the smuggler. These definitions do not fully take account of actual or implied coercion and consider that the illegal entry of one person is being facilitated by another (or more than one). The use of this notion of cooperation, however, is debatable, as often some element of coercion or deception is involved.

Although the U.S. public focuses on the smuggling of Mexican and, to a lesser extent, Central American and Latin American undocumented immigrants, this is just part of a much larger picture. Smuggling cannot be understood in a vacuum because it is a complex transnational phenomenon. It is not only a U.S. reality but a global one. Human smuggling is not limited to the United States, although the United States has the largest

number of unauthorized immigrants. Other countries that have been and remain major destinations include Germany, Canada, and Australia.

Human smuggling is the process of bringing in unauthorized entrants. According to the U.S. Immigration and Naturalization Act, it is a felony for a smuggler and a civil offense (at least for the first incident) for a migrant to engage in this activity. The methods of smuggling include self-smuggling, smuggling by professional organizations/networks, and smuggling by independent entrepreneurs known as coyotes in the case of Latin American emigration or snakeheads in the case of Asian emigration. This criminal activity is very profitable. In the first decade of the 21st century, a Chinese migrant might pay from $25,000 to $30,000 to attempt unauthorized entry to the United States. The smuggling fee itself places international migrants into a coercive situation because of the length of time it takes for a person and relatives from a developing country to pay off such a debt. If payment is delayed, relatives in the country of origin may be threatened.

Human smuggling involves high risks for both smugglers and migrants. A coyote—also known as a *pollero*—is a person paid to smuggle a migrant from Mexico, Central America (including El Salvador, Guatemala, and Honduras), or Latin America across the U.S.-Mexico border. Coyotes are despised by some on both sides of the border for profiting from migrants. As the borders have become increasingly militarized, dependency on smugglers has increased, and smugglers are able to coerce ever larger payments from undocumented immigrants. Coercion becomes intensified when smugglers connected to drug traffickers ask immigrants to carry in marijuana or other drugs as part of their fee. Coercion has also increased because urban border enforcement has increasingly pushed migrants to cross in more remote and often more dangerous areas, requiring that they push themselves beyond their normal limits. Environmental factors, such as summer heat exposure in the Arizona desert, can cause serious physical harm and even death. In some cases smugglers abandon incapacitated members of a group, who can only hope that a U.S. Border Patrol officer will find them before dehydration, heat stroke, and starvation end their lives. Others risk suffocation while hidden in the backs of trucks.

Undocumented smuggling of Asian emigrants has historically utilized maritime routes and received relatively less media attention. Maritime smuggling has been associated with the rape of women migrants, malnourishment, and unhealthy conditions of concealment. Snakeheads smuggling Chinese into the United States are reported to have stopped using maritime routes through Seattle, Washington. The new route is by air. One positive, indirect consequence of this change is a reduction of exposure to harm owing to the short duration of attempted entry. In 2004, the United Nations Convention signed the Smuggling of Migrants by Land, Air, and Sea Protocol at its Vienna meeting to control human smuggling, trafficking, and transnational organized crime.

Global smuggling networks include a wide variety of source countries and routes, including the often neglected Canadian border. Cases of human smuggling through

Canada from Asia and Eastern Europe were highlighted during a 2006 indictment in Detroit, Michigan, which revealed that undocumented migrants sometimes rode inside or held onto the sides of freight trains traveling through rail tunnels or were smuggled in ferries, car trunks, the cargo trailers of semi trucks, and, in some cases, small boats. Even in such instances coercion can be involved, the migrants sometimes being unaware of what is expected of them until the time of the crossing.

Regardless of how much is paid and where migrants are from, the end result is the same: migrants who are smuggled into a country reach their destination only if they survive the process. In 2000, more than 100 Chinese were found hiding in several ships in U.S. and Canadian ports, including three who arrived dead in a cargo ship called the *Cape May;* they died of malnutrition and dehydration. Migrants contracting with human smugglers must deal with fear as well as the risk of death.

Forced Migration

Forced migration—or the flight of refugees and displaced individuals fleeing ethnic cleansing, political conflict, famine, and other traumatic situations—often involves a degree of coercion. It is most often a situation of political coercion but is sometimes due to traumatic necessity. Displaced people around the globe are diverse but they have all been affected by economic and political turmoil in their home countries. A displaced person is often a refugee or asylum seeker.

Refugees

Refugees are, by definition, individuals who, because of a conflict involving the nation-state in which they live, are forced to flee. This type of forced migration is especially severe when entire groups face persecution on the basis of their ethnicity. The legal concept of a refugee was created in 1951, when a Refugee Convention formulated by a United Nations Conference on the Status of Refugees and Stateless Persons was adopted. Individuals protected under the category of refugee flee their countries because of persecution or conflict. Their primary international oversight organization is the United Nations' High Commission on Refugees (UNHCR), which was developed in conjunction with the UN protocol to protect, assist, and provide monetary support for refugees.

Central American Refugees

Mexican, Central American, and Latin American migration has been treated as something that is freely motivated, as compared with migrations from Asia or Africa. This has created controversy, because the United States was involved in covert warfare in Central America during the 1980s and chose to treat displaced individuals and families as economic migrants rather than refugees. Immigrant advocates in the United States took up these migrants' cause by documenting the existence of death squads and other

political persecution during the Central American civil wars. As a result, there have been several periods of legalization of Central Americans in the United States resulting from judicial decisions. Currently, Latin America is not considered a major region producing forced migration.

Human Trafficking

Trafficking in persons has been defined as the modern-day form of slavery and is perhaps among the most profitable transnational crimes next to the sale of drugs and arms. This transnational crime has been subject to international and national attention. Publicity and human rights advocacy has helped pave the way for the creation of international and national laws to stop the sale and enslavement of persons. However, controversy exists over the extent of the protection these laws provide, especially the Victims of Trafficking and Violence Prevention Act of 2000 (VTVPA), a law drafted and implemented by the United States. Because a significant number of persons who are trafficked become vulnerable victims of this crime owing to grim economic circumstances in their native countries, controversy also exists over the extent to which victims contribute to their own victimization and whether the United States should provide any legal protection for them. Opposing views focus on the extent to which the law should protect victims (such as prostitutes, sex workers, and agricultural workers) who might initially have agreed to be transported across national or international borders in order to find employment and then became enslaved.

Defining the Problem

Trafficking in persons has a broad definition. The Protocol to Prevent, Suppress, and Punish Trafficking in Persons (the Palermo Protocol), which is the leading and most recent international legislation to stop the sale and enslavement of persons, defines human trafficking in persons as

> The action of: recruiting, transporting, transferring, harboring, or receiving persons
>
> By means of: the threat or use of force, coercion, abduction, fraud, deception, abuse of power or vulnerability, or giving payments or benefits to a person in control of the victim
>
> For the purpose of: exploitation, which includes exploiting the prostitution of others, sexual exploitation, forced labor, slavery or similar practices, and the removal of organs.

Using the international definition as a foundation, the U.S. Congress adopted the VTVPA, which is the leading U.S. law against trafficking. This law categorizes human trafficking into two primary components: sex trafficking and labor trafficking. Both types of trafficking are defined as involving the recruitment, harboring, transportation,

provision, or obtaining of a person. Sex trafficking is for the purpose of initiating a commercial sex act by force, fraud, or coercion; the law particularly focuses on sex trafficked individuals who are below 18 years of age, specifying even greater penalties in such cases. Labor trafficking involves the use of force, fraud, or coercion to subject a person to labor under conditions of involuntary servitude, peonage (debt bondage, often to work off a smuggling fee), or slavery.

Human trafficking can also be understood within the context of the methods and/or activities of the trafficker(s)—those who actively engage in the sale and enslavement of persons. The trafficker usually recruits persons, either adults or children, to be sold into slavery. Recruitment generally involves some form of deception or fraud, such as lying about finding and/or providing legitimate employment for the recruited. Recruitment can also involve the abduction of persons. The trafficker then needs to make the transaction or sale of the person in exchange for money or another service. This usually involves transporting a person to a specific destination. Finally, the receipt or transfer of the person to the paying customer or client must be made. The threat or use of force or any other means of coercion is present throughout all phases of the sale. Additionally, once the transfer to the paying customer has been made, the trafficked person is further exploited by being forced to work as a prostitute, agricultural worker, domestic servant, or anything else against her or his will. Although human trafficking may not necessarily involve the sale, transportation, or transfer of a person across international borders, victims of this crime are usually sold on an international scale, human trafficking must be classified as a transnational crime.

The Scope and Nature of Human Trafficking

Although since the fall of the Soviet Union in the early 1990s the sale of drugs and arms have become the most profitable transnational crimes, human trafficking remains well known in the 21st century. Today, it is estimated that 21 million people are victims of human trafficking. In the United States alone, government estimates indicate that between 600,000 and 800,000 individuals are victims of trafficking each year. One of the reasons for this is that the sale of human beings is highly profitable. In fact, it is estimated to be the third most profitable international crime next to the sale of weapons and drugs. The profits of the global human trafficking enterprise are estimated at $7 billion to $10 billion a year. Other reasons for its prevalence may be the belief (of the traffickers) that there is a relatively low risk of being apprehended and punished. Law enforcement's preoccupation with stopping the sale of weapons and drugs leaves criminals with the impression that human trafficking laws will not be enforced and that their chances of being arrested and incarcerated are minimal at best. This false sense of security also drives the willingness of traffickers to continue their work.

Human trafficking results in a form of slave labor or involuntary servitude. It is a venture that thrives on the exploitation of humans for financial or economic reasons. In fact, one could argue that human trafficking is a more profitable business than other transnational crimes, such as arms trafficking or drug smuggling, because humans can be sold over and over again. Thus, unlike drugs and arms, which are usually sold to only one customer for a one-time profit, humans can be resold to different customers and sold numerous times for an exponential amount of profit. Typically, victims of human trafficking are sold and enslaved to perform a variety of jobs, the most common of which involves working in some capacity in the sex industry as a prostitute or exotic entertainer. This is the case for most women and children.

Children are often trafficking victims of sex tourism operations. Sex tourism or child sex tourism occurs when people of one country, usually because of the strict enforcement of human trafficking laws, travel to a foreign location for sexual gratification. They travel with the knowledge the government of the country being visited is unwilling or unable to enforce laws against trafficking or prostitution. Such child sex tourism has been thriving in Mexico and Latin America. Children are also used as camel jockeys (camel riders in races) in some countries or forced to work as domestic servants or in sweatshops.

In most cases, victims of human trafficking are forced to do various kinds of jobs because the traffickers insist that they must pay an impending debt—money ostensibly used by the trafficker to purchase fraudulent travel documents or pay for travel expenses. Essentially, the traffickers create a situation of debt bondage where the victims must provide services to earn their freedom. However, freedom is rarely a possibility because the trafficker is constantly adding to the debt. Overinflated living expenses, medical expenses, and other expenses, including the trafficker's commission, keep the victim from earning her or his freedom.

There are some who wonder why victims do not attempt to escape their captors and why they choose to remain enslaved. The answer is actually quite simple. Victims do not choose to remain enslaved and they do not attempt to escape for fear of harm to themselves or their families. Victims are continuously warned that if they try to flee or call the authorities, they will be killed. Harm to family members is also threatened. The psychological abuse of constantly fearing for one's life or the lives of loved ones is enough to cripple any attempts to escape.

Psychological manipulation at the hands of the traffickers is not the only factor that keeps victims from escaping. Most victims fear that they will be arrested, since most are without legal documents or authorization. What makes matters worse is that travel visas, even if fraudulent, are taken from the victims as soon as they reach their place of destination. Fear of arrest for violating immigration laws keeps victims from contacting authorities. Physical abuse is also a factor that keeps victims from escaping. In addition, constant supervision by their captors makes it virtually impossible for these people to attempt an escape.

Current Efforts to End Trafficking

The international community has been tackling the problem of human trafficking since the early 1900s, when a 1904 international treaty banned trafficking in white women for prostitution—the so-called white slave trade. In the mid-20th century, further international treaties were created to address this problem. For instance, in 1949, the United Nations, of which the United States is a member, signed an international treaty to suppress the sale of humans. More recently, in 2000, a total of 148 countries were signatories to an international treaty to prevent, suppress, and punish those who traffic in persons. This international treaty, known as the Palermo Protocol because it was signed by the various nations in Palermo, Italy, makes it a crime to recruit, transfer, harbor, or purchase a person for the purpose of any type of exploitation. It also makes the sale of organs a crime. The Palermo Protocol considers a victim's consent irrelevant, meaning that any person who is abducted, deceived, forced, or suffers other forms of coercion or initially agrees to be transported across borders shall be treated as a victim if she or he suffers any form of exploitation. The victims shall receive help to return to their country or city of origin and shall receive any medical, legal, or psychological assistance needed.

Conclusion

Human smuggling and trafficking have come to be two of the most profitable transnational crimes. Their profitability is highly dependent on a steady flow of desperate, vulnerable, and exploitable persons and a steady supply of customers in the United States willing and able to benefit from such transactions. Like other economic ventures, human smuggling and trafficking thrive from the supply of seekers and victims and the demand for them. These phenomena are thus significantly affected by global factors, such as economic and political instability, both of which are effects of globalization. Although globalization has certainly helped make the transport and/or sale of humans the transnational enterprises that they are, human smuggling and trafficking have extensive histories. Both flourished despite early- and mid-20th-century agreements and laws to control their spread. Today, both have once again captured the attention of the world and become high law enforcement priorities for the United States. Perhaps they have become so in part because the United States is a prime destination country both for illegal migrants and victims of trafficking.

IDENTITY THEFT

Bernadette H. Schell

Identity theft, or masquerading, is a legal term used to define the malicious theft and consequent misuse of someone else's identity to commit a crime. Land-based identity theft can occur if a burglar, say, breaks into someone's home and steals the homeowner's credit cards, driver's license, and Social Security card and then uses these to buy things using a false identity. Identity theft, or masquerading, is fraudulent criminal behavior (Schell and Martin 2005).

In the modern age, identity theft can and does occur in the virtual world. In this venue, it often involves the cybercriminal's hacking into a computer network to obtain personal information on online users—such as their credit card numbers, birth dates, and Social Security numbers—and then using this information in an illegal manner, such as purchasing things with the stolen identity or pretending to be someone of higher professional status to gain special and undeserved privileges. Because of the huge financial and reputational harms it can cause for victims, identity theft is one of the fastest-growing and most devastating crimes in the United States and globally.

On February 21, 2005, ChoicePoint, Inc., a data warehouse having 17,000 business customers, had its massive database of client personal information hacked. Consequently, the company said that about 145,000 consumers across the United States may have been adversely affected by the breach of the company's credentialing process. The company said that the criminals not only obtained illegal access but used stolen

identities to create what seemed to be legitimate businesses wanting ChoicePoint accounts. The cybercriminals then opened 50 accounts and received abundant personal data on consumers—including their names, addresses, credit histories, and Social Security numbers (Weber 2005).

As a result of the ChoicePoint breach and those occurring in 2005 at the LexisNexis Group (affecting 310,000 clients), the Bank of America (affecting about 1.2 million federal employees having Bank of America credit cards), and Discount ShoeWarehouse (affecting about 1.2 million clients), U.S. politicians called for hearings and ramped-up regulations to protect consumers against identity theft or masquerading. These breaches also prompted many U.S. states to propose more than 150 bills aimed at regulating online security standards, increasing identity theft and fraud protections, increasing data broker limitations, increasing limits on data sharing, and improving the process to clients regarding security breach notifications (Associated Press 2005; McAlearney 2005).

According to a recent article in *Forbes,* identity theft and related online fraud increased considerably in 2009. The article cited over 11 million victims—at an estimated cost of $54 billion. A year earlier, just under 10 million people were allegedly targeted—at an estimated cost of $48 billion. Interestingly, the cost to individual victims as a result of network data breaches has declined from $498 in 2008 to $373 in 2009. Who, then, is covering the costs for the personal harms inflicted on innocent victims as a result of identity theft? Increasingly, affirm the experts, it is the financial institutions to whom land-based and online citizens entrust their money and from whom they receive assurances of privacy protection regarding personal information. Even as the cost of fraud mitigation continues to spiral out of control, financial institutions are bringing the out-of-pocket expenses for identity theft victims as close to zero as possible so as to maintain their clients' confidence in the system. Losing customers over the longer term because of fractured consumer confidence translates into the institutions' investing in shorter-term remedies for assisting identity theft victims to become financially and psychologically "whole" again as quickly as possible (Merrill 2010).

The Four Critical Elements of Traditional and Identity Theft Crimes

According to legal expert Susan Brenner (2001), both traditional land-based crimes and cybercrimes like identity theft cause *harm*—to property, persons, or both. Some innocent victims of identity theft even incur prison records when false criminal charges are filed. As in the real world, there are politically motivated crimes, controversial crimes, and technical nonoffenses in the virtual world. In U.S. jurisdictions and elsewhere, traditional and cybercrimes like masquerading involve four key elements:

- *Actus reus* (wrongful act, or the physical component of a crime)
- *Mens rea* (a culpable mental state)
- *Attendant circumstances* (the presence of certain necessary conditions)
- *Harm* (to either persons or property, or both)

Perhaps an example can illustrate these critical elements more clearly. One such identity theft case that made world headlines occurred in 2001. It involved U.S. waiter Abraham Abdullah., a hacker who was arrested and imprisoned for defrauding financial institutions of about $20 million by using an identity theft scheme. Abdullah selected his targets' identities from the Forbes 400 list of America's wealthiest citizens; his targets included Steven Spielberg, Oprah Winfrey, Martha Stewart, and Warren Buffett. Then, with the help of his local library's computer, Abdullah used the Google search engine to glean financial information about these wealthy U.S. citizens. He also used the information obtained from forged Merrill Lynch and Goldman Sachs correspondence to persuade credit reporting services (like Equifax) to give him detailed financial reports on the targets. Such reports were then used by Abdullah to dupe banks and financial brokers into transferring money to accounts controlled by him (Credit Identity Theft.com 2008; Schell, Dodge, and Moutsatsos 2002).

This case illustrates that with mere access to the library's computer and the Internet, this cybercriminal was able to initiate a surprisingly simple process of masquerading by gaining unauthorized access to credit card and brokerage accounts. His scheme was revealed when he sent a fake e-mail message to a brokerage house requesting a transfer of $10 million to his bank account in Australia from an account owned by millionaire Thomas Siebel. Abdullah, an American, was tried according to U.S. jurisdictional law and sent to prison (Schell 2007).

In terms of the four elements of the crime, Abdullah gained entry into and unlawfully took control of the property—the sensitive information in credit card and brokerage accounts (*actus reus*). He entered with the intent of depriving the lawful owner of sensitive information (*mens rea*). By society's norms, Abdullah had no legal right to gain access to credit card and brokerage accounts of targeted wealthy individuals for his own financial gain. He clearly was not authorized to do so by the rightful owners (*attendant circumstances*). Consequently, Abdullah was liable for his unlawful acts, for he illegally entered the private accounts (i.e., criminal trespass) to commit an offense once access was gained (i.e., identity theft and fraud). As the targeted users eventually realized that *harm* was caused to their financial property, the judge hearing the evidence ruled that Abdullah should spend some time behind prison bars.

Phishing and Pharming: Relatively New Forms of Identity Theft

Within the past several years, a relatively new form of identity theft has emerged called "phishing." This refers to various online techniques used by identity thieves to lure unsuspecting Internet users to illegitimate Web sites so that the thieves can "fish for" sensitive personal information—to be later used for criminal acts like identity theft and fraud. These illegitimate or rogue Web sites are commonly designed to look as though they came from legitimate, branded, and trusted businesses, financial institutions, and government agencies. Often the cyberthieves deceive vulnerable Internet users into

disclosing their financial account information or their online usernames or passwords (Public Safety Canada 2009).

The more aware Internet users receiving phishing emails from supposedly legitimate banks or financial institutions are likely to realize that the cyberthieves may have used spamming techniques (i.e., mass e-mailing) to send the same message to thousands of people. Many of those receiving the spam do not have an account or client relationship with the business or financial institution sending the said e-mail, so they may just ignore the message. The cybercriminals creating phishing e-mails, however, hope that some e-mail recipients will actually have an account with the legitimate business; thus the recipients may believe that the e-mail has come from a "trusted" source and will therefore release the requested personal information (Public Safety Canada 2009). According to a 2004 report released by Gartner, Inc., an IT marketing research firm, phishing exploits cost banks and credit card companies an estimated $1.2 billion in 2003—and since then the costs have continue to climb.

Like phishing, pharming is a technique used by cybercriminals to get personal or private (typically financially related) information by "domain spoofing." Instead of spamming targets with ill-intended e-mail encouraging them to visit spoof Web sites appearing to be legitimate, pharming poisons a domain name system server by putting false information into it. The outcome is that the online user's request is redirected elsewhere. Often, the online user is totally unaware that this process is occurring because the browser indicates that the online user is at the correct Web site. Consequently, Internet security experts view pharming as a more of a serious menace, primarily because it is more difficult to detect. In short, although phishers try to "scam" targets on a one-on-one basis, pharming allows ill-intentioned cybercriminals to scam large numbers of online targets all at once by effectively using the domain spoofing technique (Schell 2007).

What, therefore, should Internet users do about phishing and pharming? According to the U.S. Department of Justice and Canada's Department of Public Safety and Emergency Preparedness, Internet users should keep three points in mind when they see e-mails or Web sites that may be part of a phishing or pharming scheme (Public Safety Canada 2009):

1. Recognize it. If one receives an unexpected e-mail from a bank or credit card company saying that one's account will be blocked if one does not confirm the billing information, one should *not* reply or click on any links in the e-mail.
2. Report it. One should contact the bank or credit card company if one has unwittingly supplied personal or financial information. One should also contact the local police, who will often take police reports even if the crime may ultimately be investigated by another law enforcement agency. The identity theft case should also be immediately reported to the appropriate government agencies. In the United States, online users should contact the Internet Crime

Complaint Center, or IC3 (http://www.ic3.gov/). In Canada, online users should contact Phonebusters (the antifraud online group) at info@phonebusters.com. Canadian and American agencies such as these are compiling data about identity theft to determine trends in this domain.

3. Stop it. Online users should become familiar with the safe online practices of one's financial institutions and credit card companies; typically, for example, such businesses will not utilize e-mail to confirm an existing client's information. Moreover, a number of legitimate targeted financial institutions have distributed contact information to online users so that they can quickly report phishing or pharming incidents. Finally, online users having the Internet Explorer browser can go to the Microsoft security home page to download special fixes protecting them against certain phishing schemes.

Other Legal Means for Controlling Identity Theft and Fraud

Because of its often anonymous and decentralized composition, the Internet is fertile ground for identity theft and fraud. Fraud, defined by law, is viewed as an intentional misrepresentation of facts made by one person, knowing that such misrepresentation is false but will, in the end, induce the other person to act in some manipulated fashion resulting in injury, harm, or damage to the person manipulated. Thus, fraud may include an omission of facts or an intended failure to state all of the facts. Knowledge of the latter would be needed to prevent the other statements from being misleading. In cyberterms, spam is often sent in an effort to defraud another person into purchasing a product or service that he or she has no intention of purchasing. Fraud can also occur through other means, such as online gaming, online auctions, or false claims of inheritance or lottery wins (Schell 2007).

Recently in the United States, the Sarbanes-Oxley Act (SOA) was passed as a reaction to accounting misdeeds in companies like WorldCom and Enron, but its passage has fraud implications as well, particularly with regard to online personal information storage. With the vast amounts of personal information stored on company computers, fraud opportunities abound. A major problem prompting the passage of the SOA was that companies storing large amounts of information have tended to give little thought to what is being stored in company or institutional networks—or how securely it is being stored. Consequently, occasional occurrences of fraud or alterations of data by hackers have gone undetected. Some experts have argued that, rather than spending lots of money to store data in accordance with SOA compliance provisions, companies should allocate funds to determine exactly what kinds of information must be stored and for how long (Schell 2007).

In the spring of 2010, a number of Web site companies—including Google, Microsoft, and Yahoo—faced consumer and advocacy group backlash for keeping Internet search records for too long. These companies were told in writing by European Union (EU)

officials probing possible breaches of EU data privacy law that "their methods of making users' search data anonymous" continue to breach EU data protection rules. The group also told Google—the world's largest search engine—to shorten its data storage period from nine months to six months or face harsh penalties for noncompliance. Shortening the data storage period would adversely affect the search engine companies' potential for generating advertising revenue, for they rely on users' search queries to target more specific advertising. It is important to note that search engine companies are competing for online market share, whereby consumer queries are expected to generate a whopping $32.2 billion in advertising revenue just for 2010. Technically speaking, a user's search history contains a footprint of the user's interests and personal relations. This very personal information can be misused in many ways, so consumer protections are required (Bloomberg News 2010).

Also in the spring of 2010, following numerous complaints from online users, the social networking Web site Facebook announced four reforms to more easily control access to their personal data. The complaints started when Facebook announced features like "instant personalization," which tailors other Web sites to users' Facebook profiles. In fact, so many online consumers became irate with Facebook that thousands of them planned to "de-friend" the $24 billion social media corporation as a sign of protest on Monday, May 31, 2010 (Zerbisias 2010).

In a news conference on May 26, 2010, Facebook CEO Mark Zuckerberg said that the company had offered a lot of controls to date, but if consumers found them too hard to use, then consumers won't feel that they have enough control—so the company needed to improve things. The following four reforms were announced to make it easier for online consumers to decline the instant personalization feature: (1) one simple control was created so users can see the content they post—everyone, friends of their friends, or just their friends; (2) the amount of basic information that must be visible to everyone has also been reduced, and the information fields will no longer have to be public; (3) the company has made it simpler for users to control whether applications and Web sites can access any of users' information; and (4) with these changes, the overhaul of Facebook's privacy model was said to be complete ("Facebook" 2010).

Despite these announced reforms, Canada's Office of the Privacy Commissioner warned Facebook that the company still was not complying with Canadian federal privacy laws. The Office noted that Facebook's new settings continue to require users to publicly reveal their names, profile information, pictures, gender, and networks to the broader Internet population. Under Canadian law, companies are bound to give consumers full control over how their personal data are used, thus enabling them to curb identity theft and affiliated cybercrimes. The office put Facebook on notice that it will continue to monitor the situation to ensure that the social networking site complies with the law (McNish and El Akkad 2010).

Identity Theft, Phishing, and Pharming: Defying the Online Tenets of Privacy, Security, and Trust

Identity theft, phishing, and pharming defy the basic online tenets of privacy, security, and trust (PST). Recent public surveys have shown that a number of consumers are still afraid to buy goods and services online because they fear that their personal information will be used by someone else. In recent times, trust seals and increased government regulation—such as the SOA—have become two main ways of promoting improved privacy disclosures on the Internet. Trust seals often appear on e-business Web sites—including green Trust images, the BBBOnLine (Better Business Bureau OnLine) padlocks, and a host of other privacy and security seals. In fact, some companies are paying up to $13,000 annually to display these logos on their Web sites in hopes of having consumers relate positively to their efforts to provide online privacy (Schell and Holt 2010).

Generally, businesses and government agencies take two kinds of approaches to prevent security breaches: (1) proactive approaches to prevent security breaches—such as preventing hackers from launching attacks in the first place (typically through various cryptographic techniques) and (2) reactive approaches—by detecting security threats "after the fact" and applying the appropriate fixes or "patches." These two approaches combined generally allow for comprehensive network solutions (Schell and Holt 2010).

Without question, a major barrier to the success of online commercial and social networking Web sites has been the fundamental lack of faith between business and consumer partners. This lack of trust by consumers is largely caused by their having to provide detailed personal and confidential information to companies on request. Also, when purchases have been made online, consumers fear that their credit card numbers may be used for purposes other than those for which permission was given. And from the business partner's trust vantage point, the company is not really sure if the credit card number the consumer gives is genuine or in good credit standing. In short, "communicating" with unknowns through the Internet elicits two sets of questions that call for reflection: First, what is the real identity of the other person(s) on the Internet, and can their identities somehow be authenticated? Second, how reliable are the other persons on the Internet, and is it safe to interact with them (Schell and Holt 2010)?

To respond to these queries, in recent years a number of products have been developed to assist in the authentication process, including the following (Schell 2007):

- Biometrics, which assesses the users' signatures, facial features, and other biological identifiers
- Smart cards, which contain microprocessor chips running cryptographic algorithms and store a private key
- Digital certificates, which contain public or private keys—the value needed to encrypt or decrypt a message

- SecureID, a commercial product using a key and the current time to generate a random number stream that is verifiable by a server, thus ensuring that a potential users puts a verifiable number on the card within a set amount of time (such as 5 or 10 seconds)

The Bottom Line

Despite the goodwill and multiple technical and legal means to protect privacy, security, and trust provisions online, should we affirm that online consumers can rest assured that cyberspace is a risk-free environment in which they can safely communicate with others, buy things, and socially network? To answer this question, on March 4, 2005, a team of researchers at Seattle University "surfed" the Internet with the intent of harvesting social insurance and credit card numbers. In less than 60 minutes, they found millions of names, birth dates, and Social Security and credit card numbers—using just one Internet search engine, Google. The researchers warned that by using the right kind of sophisticated search terms, a cybercriminal could even find data deleted from company or government Web sites but temporarily cached in Google's extraordinarily large data warehouse. The problem, the researchers concluded, was not with Google per se but with companies allowing Google to enter into the public segment of their networks (called the DMZ) and index all the data contained there. Although Google and other search engine companies do not need to be repaired, companies and government agencies must understand that they are exposing themselves and their clients by posting sensitive data in public places. The bottom line is that even today, with many provisions in place to keep online consumers safe, there remain identity theft and related crime risks (Schell and Martin 2006).

IMMIGRATION AND EMPLOYMENT LAW ENFORCEMENT

E. Andreas Tomaszewski

Although most people understand the contributions immigrants make to the U.S. culture and economy, a much-contended issue is that of illegal immigration and what to do about it. Associated with legal and illegal immigration are the issues of employment, as this is the preferred way for most people to make a living. The controversies come from the lack of consensus on what immigration policies should look like, and these revolve around questions such as: Who should be allowed to immigrate to the United States? How many people should be allowed to immigrate? How can people be prevented from entering the United States illegally, meaning without having obtained legal permission to enter? What should be done when illegal immigrants are found by law enforcement? Are immigrants not responsible for a large number of crimes? Do immigrants not take work away from Americans? Does immigration not increase the likelihood of terrorist attacks on U.S. soil by foreign extremists?

In the past few years, anywhere from close to three quarters of a million to around 1 million people enter the United States as legal immigrants annually (MPI Staff and

WHERE DO IMMIGRANTS LAND AND SETTLE?

Traditional so-called gateway states for past immigrants to the United States were California, New York, Texas, Florida, New Jersey, and Illinois.

More recently, newer immigrants have started to settle in states that had customarily seen relatively few of them: Georgia, North Carolina, Massachusetts, Washington, Ohio, South Dakota, Delaware, Missouri, Colorado, New Hampshire, Michigan, Montana, Connecticut, and Nevada.

Jernegan 2005). The numbers went down after the September 11, 2001, attacks, as the responsible terrorists had entered the United States legally, which led to significant changes to the immigration system. According to the U.S. Census Bureau's 2005 American Community Survey (which counts only households, not residents in institutions such as universities or prisons), 35.7 million of the close to 289 million people currently living in the United States are immigrants, which represents 12.4 percent of the population, up from 11.2 percent in 2000. Further, from 1990 to 2000, the total population showed a 57 percent increase in the foreign-born population, to 31.1 million from 19.8 million (Lyman 2006).

Background

Immigration has always played a very important part in the history of the United States, a country of immigrants. It owes its existence to people who came to the new world of their own free will (early European settlers and more recent immigration) and against their will (enslaved Africans), all of whom contributed greatly to making the United States what it is today (Zinn 2003). Europeans began settling the area north of the Rio Grande in North America in the 1500s, and the first black people landed in English America in 1619. The first U.S. census in 1790 showed close to 4 million people living in the colonies. The largest number of voluntary travelers by far came from England (2 million), followed by Scotland (163,000), Germany (140,000), and Holland (56,000). Almost 700,000 of the total population of the day were slaves from Africa.

Today, estimates of the numerical size of the group of illegal immigrants vary greatly, depending on who generates them. They range from 7 million to 20 million and almost any figure in between (Knickerbocker 2006). A consensus, of sorts, has formed around estimates between 11 and 12 million (Pew Hispanic Center 2010; Yen 2010). U.S. immigration officials have said that since 2003, the number of illegal immigrants has grown by as much as 500,000 a year, although in recent years the total has flattened out (Pew Hispanic Center 2010).

A growing problem has arisen from the large number of children born in the United States to parents with no legal status. This automatically makes the children U.S. citizens, whereas their parents remain illegal, which makes it very difficult to develop policies for

this group of immigrants (Knickerbocker 2006). Having understood a long time ago the importance of immigration and a system that controls it, the various U.S. administrations have developed and changed policies with the goals of reducing the number of illegal immigrants and regulating their impact on the domestic labor market. Assessments regarding the success of these policies vary greatly, and mid-2010 saw numerous attempts to significantly revamp immigration law.

Legal Developments

The persistent desire of foreigners to start a new life in the United States and the state's need to control exactly who is able to do so made the creation of immigration policy imperative. After a significant period of time without immigration policies, the Immigration Act of 1819, which set standards for vessels bringing immigrants (Martz, Croddy, and Hayes 2006), was the first piece of legislation dealing with this issue. Subsequently, immigration laws have been revamped virtually once a decade.

Following the American Civil War, several states passed immigration laws. The Supreme Court decided in 1875 that the regulation of immigration was a federal responsibility. After immigration increased drastically in 1880, a more general Immigration Act was introduced in 1882, which levied a head tax on immigrants and prevented certain people (e.g., convicts and the mentally ill) from entering the United States. State boards or commissions enforced immigration law with direction from U.S. Treasury Department officials (Smith 1998) before the Immigration Service was established in 1891 (Center for Immigration Studies n.d.). Finally, following a renewed surge in immigration after World War II, a quota system based on the national origin of immigrants was introduced in 1921 (Martz, Croddy, and Hayes 2006). This system was revised in 1924, and Congress created the U.S. Border Patrol as an agency within the Immigration Service in the same year. Under the modified system, immigration was limited by assigning each nationality a quota based on its representation in the previous U.S. census.

In 1951, a program that had allowed Mexican seasonal labor to work in U.S. agricultural businesses (the Bracero Program, started by California) was turned into a formal agreement between the United States and Mexico. Congress recodified and combined all previous immigration and naturalization law in 1952 into the Immigration and Nationality Act (INA). Along with other immigration laws, treaties, and conventions of the United States, the INA relates to the immigration, temporary admission, naturalization, and removal (deportation) of foreign nationals. The national origins system remained in place until 1965, when Congress replaced it with a preference system designed to unite immigrant families and attract skilled immigrants to the United States. This was in response to changes in the origins of immigrants that had taken place since the 1920s: the majority of immigrants were no longer from Europe but from Asia and Latin America.

It was also the first time that immigration and employment were linked, as efforts were made to offset the domestic shortage of people with certain skills by bringing in immigrants who met certain criteria. Although several acts at various times allowed refugees

to enter the United States and remain—for example, after World War II, people from communist countries were allowed in, as were other refugees from Europe—a general policy regulating the admission of refugees was put in place only with the Refugee Act of 1980. This act defines a refugee as a person leaving his or her own country because of a "well-founded fear of persecution on account of race, religion, nationality, membership in a particular group, or political opinion" (Martz, Croddy, and Hayes 2006).

A significant change to immigration policies was made in 1986, when the Immigration Reform and Control Act was passed; one of the provisions included in the act made it illegal for employers to knowingly hire illegal immigrants. Following this, many modifications to existing laws and introductions of new laws continued to focus on illegal immigration and the employment of undocumented immigrants, as did the reform debates of 2006–2007 and 2010. The Illegal Immigration Reform and Immigrant Responsibility Act of 1996 authorized more border patrol agents along the 2,000-mile United States–Mexico border, created tougher penalties for smuggling people and creating forged documents, and initiated an expedited removal process for immigrants caught with improper documents.

Throughout history, considerations regarding race have always influenced immigration policies; legislation ranges from having some racist undertones to being blatantly racist (Zinn 2003; Vellos 1997). Examples that stand out include the following: the Chinese Exclusion Act of 1882; the Immigration Act of 1907, which limited the number of

TRENDS IN IMMIGRATION

Whereas people from European countries dominated early stages of immigration, this is no longer the case; for some time now, the majority of immigrants have come from Latin America, South America, and Asia.

The phrase "Mexicanization of U.S. immigration" refers to a more than decade-long trend of Mexicans coming to the United States legally and illegally.

Historically, the peak immigration decade was 1901 to 1910, when 8.8 million legal immigrants were admitted to the United States. The 1990s surpassed this, even without taking into account illegal immigrants.

Because immigrants who came to the United States in the mid-20th century (after World War II) are now dying off, the percentage of European-born immigrants has dropped by almost 30 percent since 2001.

Recent data show that foreign-born people and their children make up 60 percent of the population in the most populous city in the United States: New York. A similar trend can be seen in many of the suburban counties around the city: in 24 of them, 20 percent of the residents are now foreign-born.

The three countries of origin from which the majority of immigrants have come and continue to come are Mexico (totaling approximately 11.6 million in 2007), China (just over 2 million), and India (1.7 million).

Japanese immigrants; the National Origins (First Quota) Act of 1921, which favored immigration from northern European countries at the expense of southern and eastern European nations; and the National Origins (Second Quota) Act of 1924, which continued the discrimination against southern and eastern Europeans and imposed new restrictions on Asian immigration. Arguably, provisions in the 2001 Patriot Act discriminate against certain ethnic and religious groups (Middle Easterners and Muslims) because of their alleged connections with terrorist organizations.

Key Events and Issues

Within the last 100 years, three events that affected immigration and corresponding legislation in the United States stand out: World War I (1912–1918), World War II (1939–1945), and the terrorist attacks of September 11, 2001. This last event led the government under President George W. Bush to introduce the USA Patriot Act in the same year, which established the U.S. Department of Homeland Security and made the U.S. Department of Citizenship and Immigration Services (CIS) a bureau within it (CIS has an Office of Immigration Statistics, which collects data to discern immigration trends and inform policy formulation).

Further, Title 8 of the Code of Federal Regulations (CFR) was amended in 2002 and 2003. (The U.S. Code and the Code of Federal Regulations codify federal laws, including those that deal with immigration [Title 8 in both documents].) The Immigration and Naturalization Service (INS), which was in charge of immigration and enforcement of immigration law for so long as part of the U.S. Department of Justice, no longer exists. Aside from the creation of the CIS within the large bureaucratic structure of the Department of Homeland Security, some functions have been streamlined. For example, whereas the U.S. Department of Customs and Immigration and the INS used to be in charge of related tasks, U.S. Immigration and Customs Enforcement (ICE, also a part of Homeland Security) was carved out of the old Customs Department and now focuses exclusively on these issues, such as the arrest and removal of a foreign national who, in governmental language, is called an alien. The formal removal of an alien from the United States was called deportation before the Illegal Immigration Reform and Immigrant Responsibility Act of 1996, and such a measure must be ordered by an immigration judge after it has been determined that immigration laws have been violated. The Department of Immigration and Customs Enforcement can execute a removal without any punishment being imposed or contemplated (U.S. Department of Citizenship and Immigrations Services).

Foreign nationals entering the United States generally fall into one of three categories: lawful permanent residents (LPRs), nonimmigrants, and undocumented migrants (illegal immigrants). Documents have to be issued by U.S. immigration authorities for individuals in the first category, also referred to as permanent resident aliens, resident alien permit holders, and green card holders. A noncitizen of the United States can fall

into this category upon arrival by either having obtained the document through the more common and often lengthy application process or by having won it in the "green card lottery," which makes a certain number of green cards available every year. These documents are also referred to as immigrant visas because the holder is allowed to reside and work in the United States without restrictions under legally recognized and lawfully recorded permanent residence as an immigrant. The Immigration Act of 1990 set the flexible numerical limit of individuals falling into this category at 675,000 annually. Exempt from these limits are several categories of people, including immediate relatives of U.S. citizens, refugees, and asylum seekers.

Nonimmigrants may or may not require permission (a visa) to enter, depending on their purpose for entering the country (work, business, study, travel) and nationality. In general, tourists and business travelers from most Western countries do not have to apply for a visa at a U.S. embassy or consulate general in their country of citizenship, although this is always subject to change (as was done after 9/11). Those who plan to stay in the United States temporarily to study or work must apply for authorization to do so prior to their arrival. It is not guaranteed that such an application, which often takes six months or more, will be approved or processed in time. For example, improved security measures, increased background checks of applicants, and prolonged processing times after 9/11 have significantly lengthened the process.

U.S. employers wanting to employ a foreign national on the basis of his or her job skills in a position for which qualified authorized workers are unavailable in the United States must obtain labor certification. This is one of many instances in which the U.S. Department of Labor is involved with matters pertaining to foreign nationals. Labor certification is issued by the secretary of labor and contains attestations by U.S. employers as to the number of U.S. workers available to undertake the employment sought by an applicant and the effect of the alien's employment on the wages and working conditions of U.S. workers similarly employed. Determination of labor availability in the United States is made at the time of a visa application and at the location where the applicant wishes to work.

There are literally dozens of nonimmigrant visa classifications, including the following, which are among the most common. Students who want to study at U.S. colleges and universities are issued F-1 visas; those participating in cultural exchange programs (including academics and researchers from abroad) get J visas, which generally cannot be renewed; temporary workers with specialized knowledge and skills (including academics and researchers from abroad) get H and other visas. For professionals from Canada or Mexico, there is the TN category under North American Free Trade Agreement (NAFTA) regulations.

Each year, Congress decides how many visas are to be issued in each category. Although holders of different types of H and other visas play an increasing role in the U.S. economy, significantly fewer have been authorized in recent years despite high demand

by U.S. employers. The annual cap is typically reached within the first few months of the fiscal year. For example, for fiscal year 2009, the cap of 65,000 (in fiscal years 2001 to 2003, it was 195,000) was reached in just 8 days. (In fiscal year 2005, the same cap was reached on the first day of the fiscal year.)

Further, it is standard practice that J visas are associated with a particular educational institution, just as TN and H visas are tied to a particular employer. If the student wants to change universities or the worker his or her employer, a new document must be issued. The length of time that these visas are valid varies, and an application for renewal must be filed with immigration authorities before they expire. Otherwise, the visa holder loses eligibility to do what the document had authorized could be done. Upon expiration of a visa, a new document must be applied for at a U.S. embassy or consulate general in the visa holder's country of citizenship. Upon expiration of the visa, the immigrant student or worker can no longer legally study or work in the United States and generally can remain in the United States no longer than six months.

People falling in the last category, that of undocumented migrants, are commonly referred to as illegal immigrants, which means that they entered the country without proper documents and without authorization and knowledge of U.S. immigration authorities. Enforcement of immigration and employment law focuses on this group. They cross the border at unsecured locations, such as forests and rivers, or between inspection points (official border crossings), or they pass inspection with forged documents or cross the border hidden in vehicles. The majority of illegal immigrants come from Mexico and other Latin, Central, and South American countries in hopes of finding work and a better economic future.

Although not discussed very often, a large number of undocumented migrants, especially from Mexico, are leaving the United States each year (counterflow). For example, INS data show that, in the 1990s, around half as many people who entered the United States unauthorized every year left it again (Martz, Croddy, and Hayes 2006). In fact, many unauthorized Mexicans do not want to immigrate permanently; they want to get a job, make some money (unemployment and poverty rates are very high in Mexico), and return home to their families. Smaller numbers of illegal immigrants cross the United States–Canada border or come by sea.

Many people who try to enter the United States without authorization (e.g., their applications were rejected because they did not meet certain criteria, they thought they would be rejected, or they never applied for whatever reason) risk their lives. For example, from 1998 through 2002, more than 1,500 illegal immigrants died trying to cross into the United States, mostly of exhaustion and exposure. Another risk in trying to cross the border alone is that of getting caught by the U.S. Border Patrol, whose job it is to stop illegal immigration. If that happens, they are generally not detained or charged but sent back across the border. To lower these risks, many pay a lot of money for the services of guides, called coyotes, organized in bands, which make millions of dollars

each year. The guides may accompany them to a location where the border is not secured properly or smuggle them across the border. Being smuggled in the back of a truck or in a container, however, is risky, too, as such immigrants have suffocated or died of heat exhaustion or lack of water.

Once on U.S. soil, undocumented migrants try to find work and accommodation and become the responsibility of Department of Immigration and Customs Enforcement, which tries to find them and, if successful, take them back across the border; undocumented migrants are generally not charged. With access to the right networks, finding a job can be relatively easy. Further, many employers prefer to hire illegals because it increases their profit margin. Although the employers can charge the same for their products or services, they can pay the migrants less. Industries that hire a large number of undocumented workers include service industries, natural resources, and construction (National Employment Law Project). The Immigration Reform and Control Act of 1986 included a provision for employer sanctions if employers hired, recruited, or referred for a fee aliens known to be unauthorized to work in the United States. Violators of the law are subject to a series of civil fines for violations or criminal penalties when there is a pattern or practice of violations (historically, the latter was inconsistently enforced).

Although the Department of Labor is in charge of enforcing labor-related laws and regulations, such as the Fair Labor Standards Act, which, among other things, provides minimum wage and overtime protections and thus also protects illegal workers, the enforcement of immigration laws is out of its jurisdiction. For better or worse, historically, cooperation between the agencies that enforce immigration laws, on the one hand, and employment laws, on the other, has been less than stellar. Despite the provisions of the 1986 law, employers of illegal immigrants were not at the center of enforcement activities for a long time, although increasing attention was paid to the issue in the 1990s.

For example, in 1999, a total of 417 civil fine notices were issued to employers. During the first years of the George W. Bush administration, less attention was paid to employers and only three civil fine notices were issued in 2003. In 2002, one year before Immigration and Customs Enforcement (ICE) was created within the Department of Homeland Security (DHS), 25 criminal charges were brought against employers. Following bipartisan pressure on the administration in spring 2006, DHS Secretary Michael Chertoff announced a campaign that promised to focus on employers suspected of hiring illegal workers and included more serious sanctions than previously, such as felony charges, huge financial penalties, and the seizure of assets. The more aggressive enforcement of immigration and employment laws by ICE led to 445 criminal arrests of employers within the first seven months of 2006 and to the deportation of the majority of 2,700 illegal immigrants who worked in these operations (Preston 2006).

Conclusion

With anti-immigrant sentiments on the rise between 2001 and 2010, the percentage of people polled who felt that immigrants are a burden because they take jobs and housing

away from citizens grew from 38 percent to 52 percent. Similarly, the percentage of those who felt that immigrants strengthened the United States with their hard work and talents dropped from 50 percent to 41 percent. Into the foreseeable future, at last three controversial debates will continue.

First, several commentators and officials—for example, in Texas, California, and Arizona—have suggested that there is an immigration crisis. Although responsible analyses show that this is not the case, the fact remains that a significant number of immigrants come to and live in the United States illegally. This creates several problems, including an increased likelihood for members in this group to be economically exploited (working for less than the minimum wage, not getting paid overtime or not getting paid at all, working in dangerous and labor law–violating environments, etc.), and being at higher risk for criminal victimization (particularly violence against women), as perpetrators of such crimes know that their victims are not likely to report their victimization to representatives of the state (National Employment Law Project).

The number of undocumented immigrants in the United States alone should be reason enough to undertake a comprehensive reform of U.S. immigration policies, regardless of whether the argument is the policies' lack of effectiveness or a humanitarian one that emphasizes the human, civil, and constitutional rights of unauthorized workers and immigrants in general. Two proposals for reform, one from the Senate and one from the House of Representatives, were discussed in 2006 but failed to pass. After the state of Arizona enacted, in 2010, a law giving police the authority to stop and question anyone suspected of being an illegal immigrant, leaders at the federal level, including President Barack Obama, are speaking of the need to renew the debate for comprehensive immigration reform.

In general, visa screening, border inspections, and the tracking of foreigners have been tightened as compared to the pre-9/11 years (MPI Staff and Jernegan 2005). For example, it requires non–U.S. citizens, including those residing in the United States temporarily (and legally), to provide border inspectors with digital fingerprints and a digital photo, which are taken by the inspector upon entry into the United States. Further, temporary legal residents have to obtain a bar-coded printout when leaving the United States, which they have to turn in when they return. Prior to this change, immigration authorities had no record of an alien who left the country.

Finally, another controversy ensues over the implementation of the National Security Entry-Exit Registration System (NSEERS), which requires all foreigners from countries with alleged ties to terrorist organizations to register with the government. In December 2002, this led to the detention without bond of thousands of immigrants from Iraq, Iran, and several other countries, although there was no evidence that these individuals had been involved in any terrorist or other criminal activity (Flowers 2003). Although the situation has improved somewhat in recent years, it is clear that many of the legislative changes are here to stay, and critics wonder if immigration restrictions associated with the so-called War on Terror are yet another and more subtle way to

discriminate against potential immigrants from particular backgrounds. Still, after a car bomb attempt in Times Square in May 2010 by a naturalized U.S. citizen from Pakistan, sentiments in favor of strict law enforcement were again on the rise.

Little disagreement exists that immigration policies should play an important part in efforts to keep the United States and its residents safe, as is the case with the associated need to know where foreigners are and what they do and to ensure that they engage in legal employment. The problem is, however, to find a way to achieve that which is agreeable to the majority, if not all.

INSANITY DEFENSE

Catherine D. Marcum

The issue of mental health and insanity has been a controversial one in the court system since the early 13th century. At the time, defendants claiming mental health issues during the commission of a crime were able to pursue different types of judicial outcomes rather than being classified as simply guilty or not guilty. However, the progression of the insanity defense has changed, especially over the past 100 years, which has changed the understanding of its tenets for both the defendant and the general public.

Background

One of the earliest recorded tests for insanity was the "wild beast" test. Created in the 13th century by an English judge in King Edward's court, the defendant was deemed insane by demonstrating that his or her mental capacity was not greater than that of a wild beast (Lunde 1975). In the early 18th century, the defendant was deemed insane if he or she could no more control his or her actions than a wild beast (*Washington v. United States* 1967); in other words, the defendant claiming insanity was unable to maintain any sort of self-control and therefore was unable to refrain from committing the crime with which he or she was charged.

The first insanity case involving "not guilty by reason of insanity" as a separate verdict of acquittal was the *Hadfield* decision. In 1800, James Hadfield attempted to murder King George III with a firearm. He claimed that God had called upon him to undergo self-sacrifice in order to carry out the act. His defense counsel argued that he was delusional and murder of the king was not an intention of Hadfield in his right mind. The jury's verdict of not guilty by reason of insanity was groundbreaking in initiating a new era of criminal defense (Caesar 1982; Gall 1982; Robin 1997).

Legal Developments

Although the *Hadfield* decision was an important pioneering step, it was not until almost 50 years later that the landmark McNaghten case drastically changed the insanity defense. In 1843, Daniel McNaghten planned to assassinate England's Prime Minister Robert Peel but accidentally murdered his secretary instead. During the trial, McNaghten's attorneys presented psychiatric testimony stating he was under the form of mental delusions that caused him to attempt the murder of Peel. The jury determined that McNaghten had no soundness of mind at the time of the offense and was found not guilty by reason of insanity. He was committed to Bedlam, where he remained until his death (Biggs 1955). The *McNaghten* decision was not taken well by the residents of England, especially Queen Victoria, who demanded a legislative review of the case. The House of Lords called a judges' review of the law's standards of the insanity defense. From this meeting, the *McNaghten rule* (*Rex v. McNaghten* 1843), or "right-wrong" test of insanity, was formed, which based a decision of insanity on the perception of the defendant's knowledge of right and wrong. The test was instituted in not only England but also the United States.

The main criticism of the *McNaghten* rule was that it considered only impairments of personality and not mentally ill offenders' inability to emotionally restrain themselves but still have the recognition that an act is wrong. This "irresistible impulse test," whose origins date back to 1840, was recognized as a separate basis of a determination of insanity. In 1929, the court of appeals in the District of Columbia held in *Smith v. United*

JUSTICE TINDEL'S ARTICULATION OF THE *MCNAGHTEN* RULE

"To establish a defense on the ground of insanity, it must be proved that, at the time of the committing of the act, the party accused was laboring under such a defect of reason, from disease of the mind, as not to know the nature and quality of the act he was doing; or if he did know it, that he did not know that he was doing what was wrong. The mode of putting the latter part of the question to the jury on these occasions has generally been whether the accused at the time of doing the act knew the difference between right and wrong."

States that an accused must be able not only to prove the inability to determine right and wrong but also to demonstrate the failure to control impulse (Robin 1997).

In 1954, the Court of Appeals for the District of Columbia found that the *McNaghten* rule, used by all federal courts and many states as a test of insanity for approximately 100 years, was outdated. A modernized version of the rule was implemented with the *Durham* rule, as the *McNaghten* rule was found to disregard advances in medical science (*Durham v. United States* 1945). Monte Durham was convicted of housebreaking in a bench trial; his only defense was that he was of unsound mind. Judge David Bazelon created the *Durham* rule, which stated that a defendant was not responsible for a crime if the act was a result of a mental disease. The purpose of the new rule was to enable communication between psychiatric experts and the court to ensure proper evaluation of potential insanity (Robin 1997).

The *Durham* rule was used as the court standard of insanity for approximately two decades. However, an updated definition of insanity was adopted from the American Law Institute (ALI) as a result of *United States v. Brawner* (1972): "A person is not responsible if at the time of such conduct as a result of mental disease or defect he lacks substantial capacity to appreciate the wrongfulness of his conduct or to confirm his conduct to the requirements of law" (pp. 66–67). The purpose of the ALI-*Brawner* test, or substantial capacity test, was to cease the reliance on psychiatric testimony and allow the jury to determine insanity. It is also noted in the substantial capacity test that mental disease does not include irregularities caused by recidivist behavior and antisocial behavior.

Shortly after implementation of the ALI-*Brawner* test, John Hinckley attempted to assassinate President Ronald Reagan on March 30, 1981. At trial, his psychiatrist testified that Hinckley suffered from schizophrenia and was unable to comprehend the magnitude of his act, even though he knew it was illegal. Based on the instruction of the law, the jury found Hinckley not guilty by reason of insanity and a national fury arose ("Insane on All Counts" 1982). The congressional response was the Insanity Defense Reform Act of 1984.

Prior to the passage of the Insanity Defense Reform Act, the majority of federal jurisdictions did not differentiate between the verdict of "not guilty by reason of insanity" and "not guilty"; in other words, a person judged not guilty by reason of insanity was treated the same by law as a person acquitted of a crime (Liu 1993). These jurisdictions did not require courts to inform the jury of the legal consequences of a not guilty by reason of insanity verdict because they felt as if the jury had no role in sentencing. The general rationale was that instruction of the repercussions of such a verdict would divert the jury from their roles as fact finders and compromise verdicts (*Pope v. United States* 1962). Defendants who were given the verdict not guilty by reason of insanity actually benefited in their defense because their burden of proof was different than that other cases. Generally, in federal and state courts, the burden of proof only had to meet a reasonable doubt regarding sanity.

After the Hinckley decision and the argued discrepancies of the insanity defense, Congress passed the Insanity Defense Reform Act of 1984, which made several changes to the federal law. First, the act allowed defendants to offer evidence that, at the time they committed a crime, demonstrated they were unable to appreciate the wrongfulness of their crime. Second, the responsibility of the burden of proof was switched from the prosecutor to the defense, which had to prove insanity with clear and convincing evidence. Next, the verdict not guilty by reason of insanity became a separate verdict along with guilty and not guilty. Finally and most important, the act addressed a serious loophole in federal law that allowed a defendant to escape commitment after being judged not guilty by reason of insanity (Ellias 1995).

Controversies of the Insanity Defense

The utilization of the insanity defense is not as cut and dried as is stated in the Insanity Defense Reform Act and has caused much controversy with the public. For instance, one might assume that the commitment of a person to a mental institution based on a verdict of not guilty by reason of insanity equates to commitment for life. However, this is not necessarily the case. In *Foucha v. Louisiana* (1992), the U.S. Supreme Court ruled that a person could not be held indefinitely through commitment with the verdict of not guilty by reason of insanity; therefore, once deemed not a threat to society and "cured," a person could be released back into society. This may be seen as unfair compared with the probable life sentence received by many other persons convicted of the same type of crime.

A second controversy is the fact that not all states afford the right to the insanity defense. States such as Montana, Idaho, and Utah have banned the use of the insanity defense. In 2006, the U.S. Supreme Court upheld in *Clark v. Arizona* (2006) that states have the right to deviate from or even totally abolish the use of the defense tactic.

Conclusion

After implementation of the Insanity Defense Reform Act, empirical studies found that the majority of jurors were aware that the verdict not guilty by reason of insanity

ANDREA YATES

One of the best-known cases of the insanity plea was that of Andrea Yates. In March 2002, Yates was convicted of drowning three of her five children and sentenced to life in prison. However, in July 2006, her conviction was reversed and she was found not guilty by reason of insanity and committed to a state mental hospital in Texas. Because of the Insanity Defense Reform Act of 1984, Yates did not avoid commitment despite her verdict of not guilty by reason of insanity.

equated to the involuntary commitment to a mental hospital for the defendant (Ellias 1995). Although early use of the claim of insanity caused media buzz of the assumed overuse of the defense, public perception has settled into the realization of the small frequency of its actual use as well as the necessity of the defense. Although the potential for abuse of the insanity defense is there, as well as the constant controversy over its use, many would argue that there is benefit there for the often mistreated mentally ill offender. Rather than treating such a person like a "wild beast," there are other options that will offer them the best treatment possible.

J

JUVENILE JUSTICE

Christopher Bickel

The history of juvenile justice in the United States contains contradictory and competing ideas about juvenile delinquency and its solutions. Hence, juvenile justice policies have shifted along a continuum of incarceration at the one end and rehabilitation at the other. During times of moral panic over youth delinquency—which are often laced with racial fear and anxiety—the United States has shifted to an incarceration model that relies heavily on punitive policies of discipline. At other times, juvenile justice polices have embodied a model of rehabilitation that stresses support services and counseling for juveniles. Recently, one of the more controversial issues revolving around juvenile is whether juveniles who commit so-called adult crimes should be regarded as adults and subject to the same kinds of punishment or should be cared for as youths in need of treatment and understanding.

Background

The first institution in the United States to address juvenile delinquency was the House of Refuge in New York City. Established in 1825, this institution held not only children convicted of crimes but also those whose only crime was living in poverty. Soon after the opening of the first House of Refuge, reformers opened similar houses in Boston and Philadelphia. The public justification for the Houses of Refuge was explicitly religious. Wealthy reformers believed that impoverished children lacked the proper Christian values and morals, including a strong work ethic and respect for authority. As a result,

reformers designed the Houses of Refuge to reform youth through disciplined activity, prayer, work, and a heavily regimented day. On the one hand, the Houses of Refuge provided an alternative to the harsh conditions of adult jails and prisons, where children were frequently held. On the other hand, house residents were subjected to harsh training where corporal punishment and punitive working conditions were common.

Underneath the religious rhetoric of the conservative reformers was an intense fear of the poor, who, if organized, posed a threat to their class privilege. This gave rise to a widespread moral panic about rising juvenile delinquency among poor and working-class youth. At the time, massive economic disparity between the rich and poor profoundly shaped the social landscape. The industrial elite heavily exploited the labor of working-class and immigrant populations in the factories. Riots over working conditions were commonplace. The wealthy elite grew ever more weary and saw the Houses of Refuge as providing necessary reforms to control working-class youth (Krisberg 2005).

Since the construction of first House of Refuge, there has been contentious debate about how best to confront juvenile delinquency. Although the early reformers argued for institutionalization, others questioned the utility of institutions for children. In the 1850s, organizations like the Children's Aid Society argued that the Houses of Refuge were likely to expose children to criminal behavior and lead to more crime. The Children's Aid Society was part of a broader movement called the Child Savers, which argued that the Christian family was the ideal place to combat juvenile delinquency and socialize children. Child Saver organizations established programs to relocate children from the city to families in the west. These families, in theory, would raise the children with so-called proper Christian morals and values and offer better living conditions for the impoverished. In practice, however, the children's new families often treated them as delinquent stepchildren and exploited their labor for profit (Krisberg 2005).

Although the Child Savers argued against institutionalization for white immigrants, they raised few questions about the institutionalization of Native American children in boarding schools and African American children on plantations. In fact, many Child Savers urged the government to provide more funding for the construction of boarding schools for Native American children. Given prevailing stereotypes, Child Savers argued that the Native American family was immoral, backward, and unfit to raise children. Boarding schools, they believed, were the proper place to socialize Native American children. The boarding schools forbade children to use their first language, severed family ties, and attempted to replace Native American culture with Protestant values and morals. Boarding school staff forced children to cut their hair upon arrival and adopt European American ways of dress and demeanor. In their attempts to reform Native American children, boarding schools often relied on violent forms of discipline, not unlike those found in the early Houses of Refuge (Finkelstein 2000).

Despite resistance to institutionalization, juvenile reform schools continued to grow in the cities, especially in the Northeast. Throughout the late 1800s, the state increasingly

participated in the construction and management of reform schools. In 1899, Illinois established the first juvenile court charged with hearing all cases involving juveniles. The court was founded on the idea of *parens patriae,* which asserts that children are developmentally unlike adults. Given this, the state has a vested interest in protecting the welfare of children, who cannot protect themselves. Before 1899, the legal system made no formal distinction between adults and children (Austin and Irwin 2001). After the formation of the Illinois juvenile courts, other states soon followed. Juvenile courts sought to control juvenile delinquency through rehabilitation rather than punishment. The courts had the power to remove children from their homes and sentence them to training schools. Although rehabilitation was the goal, the training schools continued to feel like places of punishment to those confined.

Throughout the early 1900s, reformers continued to experiment with different strategies to control juvenile delinquency. With the rise of the social sciences, researchers explored the causes of delinquency and began to offer social policies based on systematic research. Early criminologists, like Cesare Lombroso, argued that criminality was genetic and traceable by studying the structure and shape of the human body. Biological explanations posited that if people were born criminal, attempts to rehabilitate them would inevitably fail. Other researchers, like William Healy, questioned the more biological explanations and instead argued that juvenile delinquency was a symptom of a child's surroundings—their peers, family, and so on—which all affected their mental health.

The more environmental explanations for juvenile delinquency gathered strength with the creation of the Chicago School of Sociology. Sociologist Clifford Shaw systematically studied juvenile delinquency in Chicago during the 1930s. He argued that delinquency was the product of social disorganization in neighborhoods, which experienced a breakdown of more conventional institutions like the family and church. Informed by theories of social disorganization, the Chicago School helped to develop more preventative strategies to combat juvenile delinquency. Social workers were sent out into the community to organize residents and create community institutions that would prevent juvenile delinquency. For Shaw, reform schools were of limited value because they did not address the social causes of delinquency, specifically the structural breakdown of communities. The key to solving problems of juvenile delinquency was to strengthen community ties and institutions. Despite Shaw's call for more preventative measures, juvenile institutions continued to grow throughout the 1940s and 1950s.

The Modern Period: From Deinstitutionalization to Getting Tough

The 1960s gave birth to a new wave of thinking about juvenile delinquency, which challenged the continued institutionalization of juveniles. With the rise of the Black Power movement, Chicano Movement, and American Indian Movement, community residents began to argue for more control over the institutions that confined their children.

Many questioned the need for more juvenile institutions, which activists argued were not about rehabilitation or reform but rather about controlling and patrolling communities of color. The social uprisings of the 1960s provided the backdrop to the formation of more community-based solutions. Instead of removing children from the community to large-scale institutions, activists argued for more preventative programs, group homes, and transition homes.

Activist calls for deinstitutionalization came to fruition in 1972 when Jerome Miller, director of the Massachusetts Department of Youth Services, closed down all juvenile reform schools and transferred the children to smaller residential programs, where they received personalized counseling from trained professionals rather than punishment from prison guards. These new community-based programs were far more successful in reducing recidivism rates that the youth prisons that existed prior to 1972. Following in Miller's footsteps, President Richard Nixon established the 1973 National Advisory Commission on Criminal Justice Standards and Goals. The commission recommended that all large-scale juvenile justice institutions be closed and replaced by more community-based programs (Mauer 1999). Juvenile prisons, the commission argued, were more likely to increase crime than to prevent it, because children rarely received the necessary rehabilitation in prison-like facilities. In institutions, children learned more about crime and developed a distaste for people in positions of authority, all of which increased the chances that they would reoffend. Nixon, however, disregarded the report, paving the way for increased use of juvenile prisons. Although various states continued to experiment with deinstitutionalization for juveniles, these efforts all but disappeared during the 1980s and 1990s, with the rise of the "get tough on crime" movement.

Although juvenile crime rates during the 1970s and early 1980s remained fairly constant, there was a substantial increase in juvenile crime from 1987 to 1994, especially crimes involving firearms. For example, teenage homicide rates doubled between 1985 and 1994 (National Criminal Justice Commision 1996). Conservative criminologists, academics, commentators, and politicians seized the opportunity to push a "get tough on crime" agenda that argued for less rehabilitation and more punishment. John DiIulio, a political scientist at Princeton, became an academic poster child for this movement when he coined the racially charged word *superpredator.* DiIulio, and a cohort of other conservative academics, used that word to describe a new kind of juvenile offender who was sociopathic, remorseless, and very dangerous. DiIulio's argument, fraught with racial stereotypes, maintained that the new youthful offender lacked a moral conscience and values.

This framing of youth crime is reminiscent of how the early reformers framed white immigrant youth during the creation of the Houses of Refuge. DiIulio warned that, by the year 2010, nearly 270,000 superpredators would be roaming the streets, resulting in an unprecedented crime wave. This stoked the already burning flames of racial and class anxiety and thus served to justify new laws and penalties for juvenile offenders.

Rehabilitation, conservatives argued, would not work with this new type of juvenile offender. The media ran with the story. Every school shooting, juvenile homicide, and violent crime became a testament to the rise of the superpredator, which became a racially imbued code word for children of color in the inner city. By 1994, nearly 40 percent of all print news that covered children was about crime and violence, mostly involving children of color (Hancock 2000).

Time, however, did not lend much support to DiIulio's thesis of the superpredator. Crime rates began to drop after 1994, and the crime wave he had predicted never hit. In fact, juvenile crime rates have continued to drop. Moreover, DiIulio's description of a new kind of juvenile delinquent failed to match the data on incarcerated children. Of the 106,000 children in secure facilities in 1997, the overwhelming majority were incarcerated for nonviolent offenses. Thirty-six percent of juveniles were incarcerated for crimes against persons. Only 2 percent of incarcerated children had committed homicide, and 6 percent committed sexual assault. The majority of incarcerated children, or 73 percent, had committed nonviolent offenses. Property offenses, like auto theft and shoplifting, accounted for 32 percent. Drug offenses accounted for 9 percent, mostly for drug possession. Public order violations, like being drunk in public, accounted for 10 percent. Technical violations of patrol accounted for 13 percent (Office of Juvenile Justice and Delinquency Prevention 1999).

This portrait of incarcerated children is a far cry from the myth of the violent superpredator. Nonetheless, politicians continued to sound the alarm. By capitalizing on the public's racial anxiety and fear of crime, politicians seized their newly found political capital to win elections. This paved the way to making the juvenile justice system of the United States one of the most punitive in the world and one of the largest incarcerators of children.

Moreover, the 1980s and 1990s saw the passing of several punitive laws designed to target youth crime at the federal, state, and local levels. At the federal level, the Violent and Repeat Juvenile Offender Act of 1997 encouraged more prosecution of juvenile offenders, increased penalties for gang-related offenses, and increased the use of mandatory minimums for juvenile offenders. At the state level, an increasing number of states passed laws to lower the age at which juveniles could be tried as adults. Some states allowed children as young as 14 years of age to be tried in adult criminal courts. In 2000, California, for example, passed Proposition 21, the Juvenile Crime Initiative, which increased the penalties for gang-related felonies; mandated indeterminate life sentences for carjacking, drive-by shootings, and home invasion robbery; made gang recruitment a felony; and required adult trials for children as young as 14 charged with serious sex offenses and murder. Proposition 21 passed with 62 percent of the vote, even though crime rates among juveniles had decreased during the previous six years.

At the local level, city prosecutors sought restraining orders against specific gangs in the community. These orders are known as gang injunctions and prohibit actions like

walking down the street in groups of four or more, wearing certain kinds of clothes, and associating with other gang members. These activities are not crimes in any other neighborhoods except those where injunctions apply. Those who violate these rules can be held for violating a court order, resulting in up to six months in jail for participating in illegal activities. Moreover, those convicted of gang-related felonies face additional penalties aside from the actual crime for being in contempt of court for violating the restraining orders.

Los Angeles, for example, has nearly 30 gang injunctions that target more than 35 different gangs, nearly all of them comprising people of color. Although police departments praise gang injunctions as a vital tool in their war on gangs, the use of gang injunctions has raised questions among civil rights advocates because they overwhelmingly target people of color. The use of gang injunctions is quite similar to the way in which white southerners used the Black Codes to criminalize and incarcerate large numbers of recently freed African Americans after the abolition of slavery. Black Codes included laws against loitering, socializing in large groups, and vagrancy that applied only to African Americans, much as restraining orders apply only to specific communities (Bennett 1993).

A massive increase in the number of children of color in the juvenile justice system has accompanied these new federal, state, and local "get tough" policies. Although African Americans represent roughly 13 percent of the population, they make up nearly 40 percent of all incarcerated children. Latinos represent 13 percent of the general population but 21 percent of incarcerated children in public institutions. Native Americans also have a high rate of incarceration, but because of their relatively low numbers in the general population, they represent only 1 percent of the incarcerated population. Asians and Pacific Islanders account for 2 percent of the incarcerated population. These low numbers, however, mask the high incarceration rates of Cambodian, Laotian, Hmong, and Samoan children (Office of Juvenile Justice and Delinquency Prevision 1999).

These statistics reflect widespread institutional racism within the juvenile justice system. According to the 2007 report *And Justice for Some,* by the National Council on Crime and Delinquency, Latino and African American youth are far more likely to be incarcerated in state institutions, even when controlling for the type of offense and prior records. Latino youth are three times more likely to be incarcerated than their white counterparts and spend 112 days longer in secure settings than their white counterparts. African American children are six times more likely to be incarcerated and spend, on average, 61 more days confined than their white counterparts (National Council on Crime and Delinquency 2007). Moreover, although white children are more likely to use drugs, children of color are three times more likely to be incarcerated for drug crimes (Krisberg 2005).

WHITE AND BLACK JUSTICE

Sara Steen, a professor at Vanderbilt University, and George Bridges, a professor at the University of Washington, provide insight into how race structures the process of juvenile justice. Bridges and Steen systematically studied the written reports submitted by probation officers to the juvenile court system. These reports, based on interviews with accused children, contain the children's life histories and the probation officers' sentencing recommendations. After looking at hundreds of reports, Bridges and Steen found that, when they were explaining the crimes of black children, probation officers pointed to negative attitudes and personality traits, such as a lack of respect for the law and authority. For white children, however, probation officers highlighted more environmental factors, like family and drug abuse. As a result, Steen and Bridges found that probation officers recommended longer sentences for black children because they were perceived to be dangerous and a threat to society.* Racial stereotypes, they argued, heavily shape the processing of children of color throughout the juvenile justice system.

Conditions of Confinement: Incarceration versus Rehabilitation

Children awaiting trial are often confined to juvenile detention centers located in their communities. Once children are sentenced, they are usually transferred to state institutions located in rural communities far away from their homes. Secure institutions for juveniles, whether detention centers or youth prisons, vary greatly depending on the state. Most states base their juvenile justice policies on the incarceration model and confine youth to large, prison-like institutions equipped with cells, steel doors, and heavy locks. Services and rehabilitation programs are scarce, because the goal of rehabilitation has been replaced with that of punishment. Other states, however, organize juvenile justice around policies of rehabilitation and run smaller, community-based institutions that offer substantial counseling and rehabilitation programming.

Under the incarceration model, juvenile detention centers and youth prisons treat their captives as human objects to be worked upon, shaped, and molded to meet institutional demands. Much like the early Houses of Refuge, juvenile detention centers and prisons strictly enforce obedience, passivity, and deference to people in positions of authority. In juvenile detention centers and youth prisons, children are subjected to a series of rules and punishments that, in theory, are supposed to help reform their behavior.

Behavior management programs are often used to achieve these ends. Such programs outline all institutionally acceptable and unacceptable behaviors and impose an artificial hierarchy on the youth, marking those with and those without certain privileges. If a

child follows all the rules and obeys the instructions of the guards, they are rewarded with extra time out of their cells, later bedtimes, and more access to the phone.

If children break these institutional rules or defy the orders of the guards, they may be punished with cell confinement, which in theory should last anywhere from eight hours to three days but in reality may last for several months.

If a child, for example, has a pencil in his or her cell, or if he or she possesses more than five books, the child may be locked in the cell for 16 hours. If a child tucks his or her pants into socks or is found with sagging counting blues (baggy blue jeans), he or she may be locked in the cells for two days. If a child floods the cell, he or she may be locked in the cell for a minimum of three days, with additional punishment depending on behavior while confined (Bickel 2004).

Grounded in simple operant conditioning, the underlying assumption of this system, known as the level system, is that if compliance is rewarded and noncompliance punished, the youth, like mice in a Skinner box, will eventually learn to adhere to the rules of the institution and, by extension, those of society. Although the level system is the primary tool of social control inside the secured walls, it is justified on the grounds that if children can be trained to follow rules inside the detention facility, these newly instilled values will follow them once they leave it.

Depending on the institution, children may spend their time housed in large barracks-style housing units or in cells similar to those used to house adults in prisons: seven- by eight-foot cinderblock rooms each containing a bed, a stainless steel sink and toilet, and a steel door with a narrow window. On average, children spend nearly 14 hours a day inside their cells. When they are confined to cells for long periods of time, children often feel angry, frustrated, and bored, leading many to conclude that they are merely being warehoused (Bickel 2004). The stringent rules and punishments exacerbate these feelings among detained and incarcerated youth and set the stage for intense conflict between the confined and the confiners, or guards, who must enforce the rules and impose punishments.

Guards and the Incarceration Model

Guards work in juvenile facilities for a variety of reasons. Some want to work with children and counsel them. Others, however, work in juvenile institutions because such jobs provide a stable and secure source of income. Guards come from all walks of life. Some are college graduates, others are retired from the military, and others are high school graduates. Increasingly, states require that guards have at least a college education or military experience. Few guards, however, have significant training dealing with incarcerated children, especially those in large, prison-like institutions that operate under the incarceration model.

The training that guards receive varies from state to state but usually consists of a stint in a training academy and a probationary period of on-the-job training. In

Washington, for example, new recruits must attend a two-week training academy course at some time during their six-month probationary period of employment. At the academy, guards learn how to observe the children, use disciplinary techniques, and use physical force. During this training, guards learn to always be on the alert in dealing with detained and incarcerated children. Implicit and sometime explicit in their training is the assumption that the children are, at best, troubled and, at worst, downright dangerous. The *Washington State Juvenile Workers Handbook,* for example, warns new recruits that "the first step in preparing to deal with offenders is to understand the sociopathic personality" (Criminal Justice Training Commission n.d.) The handbook, then, lists characteristics of the so-called sociopathic personality, reminiscent of DiIulio's myth of the superpredator: irresponsible, self-centered, feels little or no guilt, sees staff as objects for exploitation, compulsive liar, strong drive for immediate gratification, and adept at manipulation. "You must recognize that a majority of the offender population will be sociopathic to some degree," the handbook warns (Criminal Justice Training Commission n.d.).

Although guards are taught to be deeply suspicious of the children, they are offered little education on how larger social forces shape the children's response to the justice system. Guards, for example, are not taught about the effects of poverty or racism on the lives of detained children, nor is there any discussion of how racial and class biases affect how guards interact with and perceive their charges. In short, guards leave the academy ill prepared to deal with incarcerated children in any way except as potential threats. They are taught little that might help them bridge the gap between the two warring worlds found in most juvenile detention centers and youth prisons.

Rather than teaching understanding and building bridges between the guards and children, the academy trains guards to distrust incarcerated youth at every turn, thus exacerbating the conflict between the two sides (Bickel 2004).

The Incarceration Model and Abuse

On April 1, 2003, cameras caught two juvenile prison guards physically assaulting two children in a Stockton, California, youth facility. One guard punched a child in his head and face more than 28 times while the child was in a fetal position, arms protecting his head. Aside from the repeated closed-fist punches, guards dropped their knees with heavy force several times on the back of the child's head and neck. Although the incident was caught on tape, the county district attorney dropped all charges against the guards.

This incident, coupled with increasing public scrutiny of the California Youth Authority (CYA), led to an intensive review of juvenile prisons in the state. The CYA is one of the largest justice systems in the United States, housing more than 4,300 youth, 84 percent of whom are children of color. The CYA relies heavily on the incarceration model to structure institutional policies and practices. Barry Krisberg, director of the

National Council on Crime and Delinquency, released his report of the CYA in December 2003. Krisberg found extensive abuse in the six CYA institutions he investigated.

During the first four months of 2003, one state institution documented more than 535 incidents of the use of chemical restraints, such as mace and pepper spray. Mace and pepper spray are used throughout juvenile facilities in the United States and are usually used to break up large disturbances. The 2003 review of the CYA, however, found that chemical restraints were frequently used to remove children from their cells, even when there was no clear reason to do so. Guards refused to allow many children to wash off the chemicals, leaving severe chemical burns on their skin. During the same four-month period, there were 109 incidents involving physical restraints and 236 incidents involving mechanical restraints. Mechanical restrains involve forcing children to rest on their knees for long periods of time with their hands bound behind their backs (Krisberg 2003).

Aside from the use of chemical, physical, and mechanical restraints, Krisberg also found that 10 percent to 12 percent of the youths were housed in restrictive facilities where they spent 23 hours a day in their cells, with one hour out for recreation. Often, during that one hour of recreation, children were chained in five-point restraints, with ankles locked together and wrists locked to the waist, making it difficult to exercise. Other children were released to small cages called Special Program Areas.

In addition to abuse at the hands of guards, Krisberg also found significant ward-on-ward violence in the CYA. In the six institutions he studied, there were more than 4,000 ward-on-ward physical assaults and 1,000 cases of sexual harassment. This averages to about 10 assaults per day in six institutions having a combined total population of 3,800 youths. The 2003 CYA review highlights the rampant violence that youths experience from both guards and other inmates. Although the CYA is one of the larger and more violent youth prison systems in the United States, there is no doubt that violence looms large in the minds of all children who are incarcerated (Krisberg 2003).

The push toward incarcerating more juveniles in secure facilities has produced some troubling results. If the success of incarceration strategies is measured by how many children are rearrested after their release, then most states that operate under the incarceration model are failing miserably. In California, for example, nearly 91 percent of those released from the CYA are arrested within three years (Center for Juvenile and Criminal Justice 2007). In Pennsylvania, nearly 55 percent are rearrested within 18 months, and in Utah, 79 percent are rearrested within a year (Krisberg 2005). These failure rates, coupled with media stories of abuse, have led some organizations to call for a shift from the incarceration model to a rehabilitation model. Organizations like Books Not Bars of Oakland, California, organize formerly incarcerated youth and their parents to protest the continued operation and expansion of large-scale youth prisons. Through protests and political lobbying, Books Not Bars pressures local and state officials to close the large institutions and replace them with smaller facilities that focus on rehabilitation.

Their efforts, along with the efforts of other youth justice organizations, have led to a significant drop in the number of youths confined in the CYA.

Alternatives to Incarceration: The Shift to Rehabilitation

Activist demands to close large-scale youth prisons and jails echo the child advocates of the 1930s and 1960s, who challenged the increasing reliance on juvenile institutionalization. Some states, like Missouri, have cast aside the incarceration model in favor of a rehabilitation model that relies heavily on preventative programs, alternatives to incarceration, and community-based solutions. In 1983, Missouri closed its large institutions for juveniles and opened several small community-based rehabilitation centers throughout the state, where residents could be located closer to home. Although most states have facilities that house 100 or more youths, Missouri's institutions house no more than 36 children per facility (Missouri Division of Youth Services 2000). Missouri also has a number of different types of facilities, ranging from small, secure institutions to group homes to day treatment centers.

Unlike the large youth prison of other states, Missouri's secure facilities have no cells or barracks-style housing units. Instead, the children are housed in dormitory settings and are allowed to wear their own clothing rather than institutional uniforms. Guards are replaced with college graduates who receive specialized training on how best to interact with the children they supervise. As a result, Missouri experiences far less conflict between staff and the youths, paving the way for supportive relationships to develop. Moreover, rather than being closed institutions, community organizations are a vital part of the programming, as children are allowed to leave the facilities to work in the community on supervised projects. Missouri also has several group homes where children charged with less serious offenses are held. In these homes, youths are allowed to attend school and work outside of the facility.

Missouri's rehabilitation model has been far more successful than those in other states. The recidivism rate in Missouri is far lower than those of California, Utah, and Pennsylvania. Only 9 percent of the youths are reincarcerated in juvenile or adult facilities after their release (Missouri Division of Youth Services 2000). Moreover, because the facilities in Missouri do not rely heavily on guards, the security costs to run them are far lower than those of other states. Whereas California spends nearly $80,000 to house a child in the CYA, Missouri spends $40,000, with far better results. Missouri continues to be a model for other states and may signal a future shift in national juvenile justice policies.

Conclusion

The history of juvenile justice in the United States has revolved around several competing approaches to dealing with juvenile delinquency. From the early calls for confinement within Houses of Refuge to the more recent demands for deinstitutionalization

in Massachusetts and Missouri, juvenile justice has always shifted and changed with the times. During periods of moral panic laced with racial anxiety and fear, the United States has moved toward punitive strategies that expose children, especially children of color, to systemic violence and abuse. As youth advocates and activists highlight the failure of more punitive polices, however, states are beginning to search for more effective strategies that move from incarceration to rehabilitation.

JUVENILES TREATED AS ADULTS

Cary Stacy Smith and Li-Ching Hung

Since the mid-1990s, fear of juvenile crime and criminals has undermined what was considered the norm for many years; that is, the idea that most crimes committed by juveniles should be tried in a juvenile court. Using a punitive adult model for adolescents and preteens required the courts to assume that the youthful transgressor was equal to an adult in terms of culpability; naturally, there was and is widespread disagreement on this issue. Some argue that it is the height of folly to think that an average teenager is incapable of understanding criminal proceedings, whereas others state that it is highly unethical for judges and district attorneys to prosecute adolescents in an adult venue (Steinberg 2005). Other controversies question the wisdom, for example, of placing youths in institutional situations where they are likely to experience physical and/or sexual abuse.

Background

In 1899, the first juvenile court system within the United States was established in Cook County, Illinois; shortly thereafter, juvenile courts spread to all states of the union.

Within juvenile courts, adolescent offenders are treated differently than their adult counterparts. For instance, what is considered legal for adults may not be legal for juveniles. Violations known as status offenses—such as being truant, running away from home, and using alcohol—are behaviors that are not against the law for adults but are

COMPARATIVE VIOLENCE IN ADULT AND JUVENILE INSTITUTIONS

Fifty percent of children incarcerated in adult prisons reported being attacked with a weapon, and 10 percent reported having been sexually attacked. Only 1 percent reported the same in a juvenile institution.

Source: Vincent Shiraldi and Jason Zeidenberg, "The Risks Juveniles Face When They Are Incarcerated with Adults." Justice Policy Institute (1997). www.justicepolicy.org/images/upload/97-02_REP_RiskJuvenilesFace_JJ.pdf

considered infractions if performed by juveniles. The primary aim of juvenile courts is to guide, not punish, adolescents who have violated the law. In addition, although adult law focuses on the offense, juvenile law focuses on the offender, and attempts are made to rehabilitate any transgressors. Other differences include the following: (1) juveniles are adjudicated rather than pronounced guilty, (2) juvenile records may be sealed at the judge's discretion, and (3) juveniles do not have the right to a jury trial. Moreover, juveniles are usually placed in special facilities, away from hardened, adult criminals. With serious crimes, however, exceptions are made (Jonson-Reid 2004).

Law enforcement has the option of preventative detention, meaning that a youth may be detained for his or her protection or the community's protection. Because the juvenile court system is highly individualized, sentences vary from court to court and state to state and may cover a wide range of community-based and residential options. The disposition is based on an adolescent's history and the severity of his or her offenses and includes a significant rehabilitation component. Moreover, the disposition can be for an unspecified period; the court has the authority to send a youth to a specific facility or program until he or she is deemed rehabilitated or until he or she reaches the age of majority. The disposition may also include a restitution component and can be directed at people other than the offender, such his or her parents. Parole combines surveillance with activities to reintegrate the juvenile into the community.

One reason juveniles are transferred to criminal court is the general belief that if adolescents (both violent and nonviolent) are exposed to the adult criminal justice system, any criminal urges would be extinguished. Unfortunately, the literature does not back this supposition. A 1996 study looked at 2,738 juvenile offenders transferred to criminal court in Florida with a matched sample of nontransferred juveniles. Juveniles tried as adults were more likely to be incarcerated, incarcerated for longer periods than those who remained in the juvenile system, and had a higher recidivism rate. Within two years, they were more likely to reoffend, to reoffend earlier, to commit more subsequent offenses, and to commit more serious subsequent offenses than juveniles retained in the juvenile system (Bishop, Frazier, Lanza-Kaduce, and Winner 1996).

Studies on Juveniles and Justice

During 2003, a study titled Adolescent Development and Juvenile Justice, conducted by the John D. and Catherine T. MacArthur Foundation Research Network, examined more than 1,400 people between the ages of 11 and 24 in Philadelphia, Los Angeles, northern and eastern Virginia, and northern Florida. Each participant was given an intelligence test and later asked to respond to several hypothetical legal situations, such as whether confessing to a police officer if he or she committed a crime was a smart move. Interestingly, the researchers found that one-third of those aged 11 to 13 and one-fifth of those aged 14 to 15 could not understand the proceedings regarding their alleged crimes, nor could they supply help to their defense lawyers. The study recommended that states

reconsider the minimum age at which juveniles may be tried as adults or that a system for evaluating defendants' competency be created.

The report was released on the heels of a 10-year effort by states trying to make it easier to try children as adults (Steinberg 2005).

The question is this: Is it OK to place children with adults in prison, where the older convicts will likely teach them how to be successful criminals and where they will probably experience both physical and sexual abuse? For example, one 17-year-old adolescent held with adult convicts in an Idaho jail was sexually tortured and murdered by the adult inmates. In Ohio, a 15-year-old girl was sexually assaulted by a deputy jailer after being placed in an adult jail for a minor infraction, and in Kentucky, approximately 30 minutes after a 15-year-old was put in a jail cell following an argument with his mother, he hanged himself. In one year, four children held in Kentucky jails committed suicide (Zeidenberg and Schiraldi 1997).

In 1989, a study compared how youths were treated at a number of juvenile training schools with those serving time in adult prisons. Unsurprisingly, five times as many adolescents held in adult prisons answered yes to the question "Has anyone attempted to sexually attack or rape you?" In addition, the statistics regarding youth rape in prisons were coupled with the fact that children placed with adults were twice as likely to report being physically abused by staff. The juveniles in adult prison were also 50 percent more likely to report being attacked with a weapon. Close to 10 percent of the youth interviewed reported a sexual violation.

Little research exists regarding any quantitative data on rape, suicide, and assault rates among the thousands of juveniles sentenced to adult prisons each year or the 65,000 children who pass through the jail system. Several states classify suicide under deaths due to "unspecified" causes in their yearly reports, thus making the problem invisible. Rape in prison is listed under inmate assault; hence, the problem is opaque. Approximately 25,000 children each year have their cases transferred to criminal court instead of being tried in juvenile courts, where the majority of convicted defendants are usually set free by the time they turn 21 (Senate Committee on the Judiciary 2000).

Many judges will not prosecute youths as adults, as in the case of Nathaniel Abraham. At age 11, he was charged with first-degree murder and was to be prosecuted under a 1997 Michigan law that allowed adult prosecutions of children of any age in serious felony cases. Abraham was eventually convicted of second-degree murder, but the presiding judge felt that the new law was flawed and sentenced him to youth detention rather than life imprisonment (Steinberg 2005). In Texas, Lacresha Murray, an 11-year-old girl, was convicted twice for the death of a 2-year-old who spent the day in her home. After extensive questioning, without guardians or an attorney present, she admitted that she might have dropped and then kicked the toddler. The presiding judge dismissed all criminal charges leveled against her (Fritsch, Caeti, and Hemmens 1996).

Key Events

According to the National Center for Juvenile Justice, a private, nonprofit research group, between 1992 and 1999, every state except Nebraska passed laws making it easier for juveniles to be tried as adults. Even though Nebraska passed no new laws on the subject during that seven-year period, it is among the 14 states and the District of Columbia that allow prosecutors to file charges against juveniles in criminal court (Fritsch, Caeti, and Hemmens 1996). Each of the 50 states has specific provisions that determine whether certain juveniles may be tried as adults in criminal court (for example, those charged with capital crimes or other serious felonies). This procedure is commonly called a *transfer to criminal court* and has three primary mechanisms: judicial waiver, statutory exclusion, and concurrent jurisdiction.

- Forty-five states have judicial waiver provisions, in which the juvenile court judge has the vested authority to waive juvenile court jurisdiction and transfer the case to criminal court if he or she feels that the crime committed warrants more punishment than is commonly meted out within the juvenile justice system.
    - Threshold criteria that must be met before the court may consider waiver: generally a minimum age, a specified type or level of offense, a sufficiently serious record of previous delinquency, or some combination of the three.
    - In all states in which discretionary waiver is authorized, the juvenile court must conduct a hearing at which the parties are entitled to present evidence bearing on the waiver issue. Generally, state law specifies factors a court must weigh and findings it must make in order to arrive at the determination that a juvenile is no longer amenable to treatment as a juvenile.
    - The prosecution usually bears the burden of proof in a discretionary waiver hearing; however, some states designate special circumstances under which this burden may be shifted to the child. Generally, a prosecutor seeking a waiver to criminal court must make the case for waiver by a preponderance of the evidence.

- Twenty-nine states have statutory exclusion laws excluding youths who commit certain serious offenses and/or repeat offenses from the jurisdiction of the juvenile court. These laws are different from mandatory waiver laws in that, with statutory exclusion, the adult court has jurisdiction over a case from the beginning, without a juvenile court waiver hearing.
- Seventeen states allow for concurrent jurisdiction of offending youth in both the juvenile and adult court systems. Adolescents aged 14 or older who commit certain felonies are subject to transfer to adult criminal court for prosecution at the discretion of the judge. Transfer proceedings are mandatory in instances

of murder or aggravated malicious wounding. Prosecutors in instances of lesser felonies may also directly file for jurisdictional transfers. Once initiated, any transfer to adult court may be petitioned for reverse waiver back to juvenile court (Fritsch, Caeti, and Hemmens 1996).

In addition to state governments, the federal government also has the option of treating children as adults. There are many federal rules regarding juveniles, too many to detail here, including Federal Rule 106, which states the Federal Bureau of Investigation and other federal law enforcement agencies should aid local and state authorities in the apprehension of gang members. The rule's language is condescending, stating that local law enforcement has become frustrated with the state criminal systems and that federal assistance is sorely needed. Most defendants serve a bare minimum of time, however, and although the adult criminal system is ineffective in curtailing gang violence, the juvenile system is much worse. Most juvenile delinquents are handled by the state and are usually released immediately or lightly punished; thus, the states need guidance from the federal government (U.S. Department of Justice 1997b).

On the other hand, violent criminals (both adult and adolescent) are gaining a keen respect for the federal criminal system. They are aware of the abolition of parole as well as the severe guidelines and enhanced sentencing for drug- and firearms-related federal crimes. It is imperative for the safety of the citizens of the United States that U.S. attorneys' offices become more involved in seeking out the most serious juvenile offenders for prosecution as delinquents or transferring them for criminal prosecution as adults (U.S. Department of Justice 1997a); all may be found in the *Criminal Resource Manual* (U.S. Department of Justice 1997c).

Federal Rule 126 states that juveniles charged with serious offenses and who have prior criminal history and have proved unreceptive to treatment in the juvenile justice system may be considered for transfer to adult status. Any decision to transfer should be based upon discussion with the investigating agents, a prosecution policy that targets the most serious juvenile offenders, and a comparison of effective alternatives that may be available in the given state jurisdiction (U.S. Department of Justice 1997a).

Federal Rule 140 discusses the mandatory transfer of juveniles to adult status. Adult status for juveniles is mandatory if the acts were committed after his or her 16th birthday and would be tried as felonies involving the use, attempted use, or threatened use of physical force against another. In addition, if a substantial risk of physical force was used against another in committing the offense or if a juvenile has previously been found guilty of an act for which an adult would face prison time, such an offender may be transferred to adult status. Finally, the act must be one of the offenses set forth in this rule or an offense in violation of a state felony statute (U.S. Department of Justice 1997d).

Conclusion

Several states have laws saying that it is legal to sentence an adolescent to death if he or she was convicted of a capital offense. On March 1, 2005, the U.S. Supreme Court in *Roper v. Simmons* struck down the use of capital punishment for offenders committing crimes before the age of 18. In 1993, Christopher Simmons (who was 17 at the time) formulated a plan with two younger friends to murder Shirley Crook. In essence, the plan was to commit burglary and murder by breaking and entering, tying up Ms. Crook, and then tossing her from a bridge. At the trial's conclusion, Simmons was sentenced to death. He first moved for the trial court to set aside the conviction and sentence, citing, in part, ineffective assistance of counsel. His young age and impulsivity, along with a troubled background, were brought up as issues that Simmons claimed should have been raised at the sentencing phase. The trial court rejected the motion, and Simmons appealed. Finally, the case was argued in the U.S. Supreme Court. Justice Anthony Kennedy, writing for the majority, cited sociological and scientific articles stating that juveniles are immature and lacking a sense of responsibility as compared with adults (*Roper v. Simmons* 2005).

The Court noted that in recognition of the comparative immaturity and irresponsibility of juveniles, almost every state prohibited those younger than age 18 from voting, serving on juries, or marrying without parental consent. The studies also found that juveniles are more vulnerable to negative influences and outside pressures, including peer pressure. They have less control, or experience with control, over their own environment. Thus, the Court held that executing someone who was younger than age 18 at the time of the murder was committed was cruel and unusual punishment (*Roper v. Simmons* 2005). In a subsequent case from 2010, *Graham v. Florida,* the Court determined that life imprisonment for a juvenile offender convicted of any crime other than homicide likewise constitutes cruel and unusual punishment and must not be applied (Liptak 2010).

Little disagreement exists regarding the minute number of teens who should be tried in the adult criminal justice system (with the prominent exception of the death penalty) if they pose a sincere threat to those around them. Likewise, there is little bickering about severely delinquent adolescents (rapists, murderers, arsonists, etc.) receiving commensurate punishment for the scope of their crimes. However, thousands of young people are being prosecuted daily within the adult system, although many are charged with nonviolent crimes. This should give cause for quiet reflection, because the primary reason for youth courts was and is to adjudicate young people who had broken the law in a nonviolent fashion. If society punishes adolescents as it does adults, even if their transgressions do not warrant it, does the get-tough policy benefit the public?

Sadly, the prevailing mindset of many lawmakers is "If you do the crime, do the time—regardless of age." Thus, many adolescents and preteens whose crime was of a nonviolent nature will remain incarcerated with adult criminals, who will continue their physical and sexual abuse of children—all at taxpayer expense.

MIRANDA WARNINGS

Jo-Ann Della Giustina

"You have the right to remain silent." We hear it on television, in the movies, and in music lyrics. The Miranda warnings have become so embedded in routine police practices that they have become a part of our national culture. Yet, they remain controversial. The Miranda rule was intended to protect against coerced confessions but has been criticized for tying the hands of law enforcement and favoring criminals. Moreover, some argue that it provides a method by which a guilty person can go free.

Shortly after ruling that the Fifth Amendment privilege against self-incrimination was applicable to the states (*Miranda v. Arizona* 1966), the U.S. Supreme Court ruled in the 1966 landmark case of *Miranda v. Arizona* that a person in police custody must be informed of his or her constitutional right against self-incrimination before being questioned. Without the Miranda warnings, any statement given during a custodial interrogation is not admissible in court proceedings. The Court stated that "[t]he prosecution may not use statements…stemming from questioning initiated by law enforcement officers after a person has been taken into custody or otherwise deprived of his freedom of action in any significant way, unless it demonstrates the use of procedural safeguards effective to secure the Fifth Amendment's privilege against self-incrimination" (*Brown v. Mississippi* 1936). The Court explained that the Miranda rule goes to the root of the "concepts of American criminal jurisprudence: the restraints society must observe consistent with the Federal Constitution in prosecuting individuals for crime" (*Brown v. Mississippi* 1936).

Background

During the early 20th century, the Supreme Court applied a due process voluntariness test, rooted in common law (*Leyra v. Denno* 1954), to determine the admissibility of a suspect's confession. The due process test weighs all the surrounding circumstances, including the details of the interrogation and the characteristics of the detainee. Early cases explained that the use of physical brutality and psychological pressure violate due process rights by overcoming a detainee's will.

While voluntariness has remained a requirement for confessions, the Court changed its focus in the 1960s. In 1964, the Court decided two landmark cases. In *Malloy v. Hogan,* the Court applied the Fifth Amendment's self-incrimination clause to the states, and in *Escobedo v. Illinois,* the Court ruled that the police violated the detainee's right to counsel because they did not advise him of his constitutional privilege to remain silent or his right to consult with his attorney. As a result, his statements were inadmissible.

Two years later, the Supreme Court decided *Miranda v. Arizona,* in which the Court remarked that reliance on the traditional totality of the circumstances test was inadequate to insure that a custodial confession would be voluntary. The Court noted that custodial police interrogation, by its very nature, isolates and pressures the individual. Because of this inherent compulsion in custodial surroundings, the Court presumed that all statements given during custodial police interrogation are compelled unless the detainee is informed of his or her right to remain silent and to have an attorney present during the interrogation and then knowingly and voluntarily waives those rights. The coercion inherent in custodial interrogations blurs the line between involuntary and voluntary statements, thereby increasing the risk that an individual will not be guaranteed his or her constitutional privilege against self-incrimination.

To ensure that police interrogation conforms to the Fifth Amendment requirements, the Court established concrete constitutional guidelines for law enforcement agencies and the courts. Under those guidelines, the admissibility of a statement given during custodial interrogation depends on whether the police provided the detainee with procedural safeguards sufficient to secure the Constitution's privilege against self-incrimination. The police must inform the detainee that he or she has the right to remain silent, that any statement he or she makes can be used against him or her in a court of law, that he or she

If the detainee cannot afford an attorney, one will be appointed prior to any questioning.

has the right to the presence of an attorney, and that if he or she cannot afford an attorney, one will be appointed prior to any questioning.

Key Legal Cases

Since the Miranda decision, the Court has clarified, narrowed, and reinforced the Miranda rule. One significant issue clarified is when custody occurs. Custody does not necessarily mean a formal arrest. Instead, it is based on how a reasonable person in the detainee's situation would perceive his or her freedom to leave (*Michigan v. Mosley,* 1975). A person is in custody when the police have exerted physical or psychological authority so that a reasonable person would not believe that she or he was free to leave. In *Thompson v. Keohane* ((1981), the Court described the Miranda custody test as follows: "Two discrete inquiries are essential to the determination: first, what were the circumstances surrounding the interrogation; and second, given those circumstances, would a reasonable person have felt he or she was not at liberty to terminate the interrogation and leave."

Custody, however, is not the only issue clarified by the Court. Miranda warnings are required only before a detainee is interrogated. If the police do not question the detainee, no Miranda warnings are needed. Moreover, standard booking questions, such as name, date of birth, and address, are allowed without Miranda warnings.

The Court has given direction to law enforcement on what actions must be taken if the detainee invokes the right to silence or to an attorney. Pursuant to *Michigan v. Mosley* (1984), if the detainee indicates that he or she does not want to be interrogated, the police must immediately stop the questioning. However, the police may resume the interrogation after a significant period of time has passed and a new set of Miranda warnings is given.

In contrast, *Edwards v. Arizona* ((1971), established a bright-line rule that once a person in custody asserts her or his right to an attorney, the interrogation must end until an attorney is present. If the police subsequently initiate a discussion in the absence of an attorney, the detainee's statements are presumed involuntary even if he or she signs a waiver. An exception to this rule exists if either the detainee or the police ask a question relating to routine incidents of the custodial relationship (e.g., food, water, etc.) because it does not represent a desire to open up a more generalized discussion related directly or indirectly to the investigation.

Moreover, a detainee may subsequently waive the right to have an attorney present after he or she has invoked his or her right by reopening the dialogue with the authorities. It must be shown that the accused initiated the conversation in a manner indicating a desire and willingness to open a generalized discussion about the investigation. There must then be a knowing and intelligent waiver of his or her right to counsel's presence during questioning. Any waiver must be unbadgered, which depends on the particular facts and circumstances of each case.

There has been some confusion over whether the police must provide an attorney if the detainee requests one but cannot afford to pay for that attorney. The Miranda rule does not require that a lawyer be present at all times to advise detainees in the police station. Instead, it prescribes only that the police may not question the detainee without an attorney present if the detainee has invoked his or her right to counsel. In other words, if the detainee cannot afford to pay for an attorney but requests counsel, the police cannot question him or her unless they provide an attorney before any questioning occurs. There is no requirement that the police provide an attorney if no interrogation is conducted.

Public criticism of the Miranda warnings has led to a weakening of its requirements. Since the early 1970s, the Supreme Court has created numerous exceptions to the Miranda warnings, resulting in many un-Mirandized statements being legally admitted into evidence.

A narrow public safety exception was created in *New York v. Quarles* (2004). If public safety merits, the police officer may ask reasonable questions to secure his or her own safety or the safety of the public prior to the Miranda warnings without jeopardizing the admissibility of the statement. An example of a proper public safety question is to ask the detainee about the location of an abandoned weapon. Similarly, under the so-called stop-and-identify exception, an officer may ask a suspect his or her name and address without providing Miranda warnings.

Another exception was established in *Harris v. New York* ((1976), which allowed a detainee's un-Mirandized custodial statements to be used to impeach his credibility during his trial testimony. Because the detainee did not claim that his prior inconsistent statements were coerced or involuntary, the Court explained, they were admissible because the Miranda rule was not a license for the defendant to use perjury.

In addition to carving out exceptions to the Miranda rule, the Supreme Court has also reinforced the rule. In *Missouri v. Seibert* (2004), the Court struck down the police technique of giving the Miranda warnings only after a detainee had made an incriminating statement. Police officers were interrogating a detainee without Miranda warnings until he or she gave an incriminating statement. At that point, the officer would inform the detainee of his or her constitutional rights, obtain a waiver of those rights, and have the detainee repeat the statement. The Court declared that this type of coordinated and continuing interrogation is improper because it is likely to mislead the detainee.

Further, in *Doyle v. Ohio* (1976), the Court ruled that the prosecution could not comment at trial on a detainee's silence after Miranda warnings are given. The Court explained that using a detainee's silence to impeach him or her at trial would be fundamentally unfair and a deprivation of due process rights.

In 2000, the Court reaffirmed the Miranda opinion in *Dickerson v. United States.* Relying on the rule of *stare decisis,* or the principle of precedent, the Court reaffirmed *Miranda v. Arizona* despite its recognition that the Miranda rule may allow a guilty defendant to go free if incriminating statements are excluded at trial. The Court held

that Miranda is a constitutional rule that has become so embedded in routine police practices that it has become a part of our national culture. The Court rejected the argument that the Miranda rule ties the hands of law enforcement and the courts. It declared that the police have adjusted their practices to the rule's requirements as its meaning has become clear by Supreme Court cases subsequent to *Miranda v. Arizona.* The Court concluded that those cases "have reduced the impact of the *Miranda* rule on legitimate law enforcement while reaffirming the decision's core ruling that unwarned statements may not be used as evidence in the prosecution's case" (*Dickerson v. United States* 2000 [italics in original]).

Miranda and Terrorism

Miranda holds as the law of the land insofar as civilian courts are concerned. In the case of suspected terrorists, however, where the assumption is that military tribunals will be employed, Miranda warnings do not apply. Under the administration of George W. Bush, terrorist suspects, such as those detained at the U.S. facility in Guantanamo, were not Mirandized. The intention was to subject the detainees to military trials. By 2009, with Guantanamo scheduled to close (albeit later than planned), some commentators noted that the absence of Miranda warnings in these cases limited U.S. prosecutors' abilities to try them—at least under any civilian jurisdictions. At a minimum, such cases raised legal questions, thus opening the door for possible challenges down the road. Initially, therefore, the incoming Obama administration sought to cover its bases by Mirandizing all new terrorist suspects (including the "Christmas Day bomber," Umar Farouk Abdulmutallab). Following the attempted car-bombing of Times Square in May 2010 (by Faisal Shahzad), however, the administration announced that it would no longer Mirandize terrorist suspects and would most likely pursue military justice in these cases (Perez 2009; Savage 2010).

Conclusion

There was an intense political reaction following the Miranda decision. Law enforcement and prosecutors argued that it was a major blow to their ability to solve crimes; political officials argued that criminals would go free. Eventually, its acceptance grew. Since *Miranda v. Arizona* has been upheld as a constitutional decision, the debate seems to be closed—at least in the case of civilian courts. The Court has reinforced the principle that detainees will be protected by the Fifth Amendment but has not foreclosed the possibility that further exceptions to the Miranda rule will be established in the future.

MISCARRIAGES OF JUSTICE

Robert M. Bohm

Miscarriages of justice are not like other criminal justice controversies. Typically, people oppose miscarriages of justice; however, sometimes folks will promote miscarriages of justice for other purposes. When people agree that miscarriages of justice have occurred, they are almost universally condemned. However, controversies may arise over whether or not a miscarriage of justice has occurred. Making matters more complicated are issues of intent. Some of the miscarriages are unintentional or accidental. They are committed by fallible human beings who are simply attempting to do their jobs as best they can. Other miscarriages are intentional and venal. People commit them to further personal or professional agendas. This entry examines miscarriages of justice in the United States, what they are, what causes them, and possible remedies.

A miscarriage of justice has been defined as "a grossly unfair outcome in a judicial proceeding, as when a defendant is convicted despite a lack of evidence on an essential element of the crime" *(Black's Law Dictionary* 2000, 811). This definition focuses narrowly on wrongful convictions, which have received the most interest of scholars writing in this area but are only one type of miscarriage of justice. Miscarriages of justice also include wrongful arrests, wrongful charges or indictments, and wrongful sentences. They may include harassment by a law enforcement officer, an attorney failing to file a timely appeal, or correctional officials failing to release an inmate in a timely fashion once his or her sentence has expired. As such, the police and other law enforcement officials, defense attorneys, prosecutors, judges, and jurors as well as correctional officials commit miscarriages of justice.

Two general types of miscarriages of justice are "errors of due process" and "errors of impunity" (Forst 2004). Errors of due process involve "unwarranted harassment, detention or conviction, or excessive sanctioning of people suspected of crime" (Forst 2004, 10). "Errors of impunity" involve "a lapse of justice that allows a culpable offender to remain at large" (Forst 2004, 23) or, in some other way, to escape justice. Errors of due process can cause errors of impunity. In other words, if a person is arrested, convicted, and imprisoned for a crime that he or she did not commit, there is a good chance that the real offender will remain free to prey on other people. On the other hand, there is also a chance that the real offender will be arrested, convicted, and imprisoned for another crime. Although either type of error can undermine the integrity and legitimacy of the criminal justice process, (Forst 2004, 212–219) the bulk of the scholarship to date has focused on errors of due process.

Background

Until recently, the subject of miscarriages of justice—whether errors of due process or errors of impunity—had not received much scholarly attention from social scientists and especially criminologists. In fact, prior to Yale Law Professor Edwin Borchard's pioneering book *Convicting the Innocent* (1932), conventional wisdom suggested that innocent people were almost never wrongfully convicted. That such injustices probably occurred more frequently than most people thought was criminal justice's little secret.

Much of the newer miscarriages of justice research has focused on capital punishment. A principal reason is that capital cases generally receive more scrutiny than other felony cases because of the punishment's finality and the requirement that an appellate court review capital convictions and/or sentences. It is likely, however, that the miscarriages in capital cases that have been revealed represent only the tip of the proverbial iceberg of all miscarriages of justice, either in capital cases or in all criminal cases. The problem is that there is no official record of miscarriages of justice, so it is impossible to determine precisely how many there are and how often they occur.

The public is no longer so sanguine about the infallibility of the justice system. For example, in a 2009 Gallup poll of adults nationwide, 59 percent of respondents thought,

A STUDY OF EXONERATIONS IN THE UNITED STATES

Law Professor Samuel R. Gross and his colleagues identified 328 exonerations from 1989 through 2003.* They claim that it is "the most comprehensive listing of exonerations to date." They defined "exoneration" as "an official act declaring a defendant not guilty of a crime for which he or she had previously been convicted." According to the researchers, the 328 exonerations in their list represent only the "tip of an iceberg" and do not include, for example, the mass exonerations of the approximately 135 innocent defendants who were victims of the rogue officers of the Los Angeles Police Department's Rampart division in 1999–2000 or the 39 innocent drug defendants framed by a Tulia, Texas, undercover police officer in 2003. The researchers found that the rate of exonerations increased dramatically over the 15-year period—that is, there were many more "discovered" exonerations toward the end of the period than at the beginning.

Ninety-seven percent of the exonerations discovered by Gross and his colleagues involved defendants convicted of murder and/or rape. Forty-four percent of the wrongfully convicted defendants were cleared by DNA evidence, including 88 percent of those convicted of rape. The cause of the wrongful convictions in nearly 90 percent of the rape cases was eyewitness misidentification, especially cross-racial misidentification involving a black defendant and a white victim. The main cause of the wrongful convictions in murder cases was perjury on the part of the real killers, supposed participants, or eyewitnesses to the crime; jailhouse snitches and other untrustworthy police informants; police officers; and state forensic scientists. Another major factor in wrongful murder convictions was false confessions. Juveniles (almost all of them were either black or Hispanic) and the mentally disabled were particularly vulnerable to false confessions. On average, exonerated defendants served more than 10 years in prison for crimes they did not commit.

The exonerations occurred in four ways: (1) In 77 percent of the cases, the courts dismissed criminal charges after new evidence of innocence was presented. (2) In about 13 percent of the cases, governors or other authorized executive officers issued pardons based on evidence of innocence. (3) In approximately 9 percent of the cases, defendants were acquitted at retrial after evidence was presented that they had no role in the crimes for which they were convicted. (4) Finally, in 1 percent of the cases, states posthumously admitted that defendants who had died in prison were innocent.

*Samuel R. Gross et al., "Exonerations in the United States, 1989 through 2003." 2004. http://www.internationaljusticeproject.org/pdfs/ExonerationReport4.19.04.pdf

"in the past five years, a person was executed who was, in fact, innocent of the crime with which he or she was charged" (Gallup 2009). That was down somewhat from 73 percent who so believed in 2003, according to Gallup. A Harris poll conducted in 2008 similarly found that up to 95 percent of adults nationwide thought that innocent people sometimes were wrongly convicted of murder—a statistic that has held remarkably steady since at least 1999 (Polling Report 2009).

Key Events

This remarkable turnaround in the public's belief about miscarriages of justice was the result of a combination of events. The most important arguably was the advent of DNA profiling. DNA evidence is now used to link or eliminate identified suspects to a crime, identify "cold hits" where a sample from a crime scene is matched against numerous cases in a DNA database and a positive match is made and to clear convicted rapists and murderers years after they began serving their sentences. A second important and related development was the establishment in 1992 of the Innocence Project by Law Professors Barry Scheck and Peter Neufeld at the Benjamin N. Cardozo School of Law in New York City. The project uses law students in a clinical law program to provide *pro bono* legal services to inmates who are challenging their convictions based on DNA evidence. The student lawyers are supervised by practicing attorneys. The project has represented or assisted more than 100 cases in the United States, including several death penalty cases, where convictions have been reversed or overturned. Today, there is a national network of more than 40 Innocence Projects throughout the United States. Scheck and his colleagues, underscoring the importance of DNA evidence, found that "of the first eighteen thousand results [of DNA tests] at the FBI and other crime laboratories, at least five thousand prime suspects were excluded *before* their cases were tried" (Scheck 2001, xx). That is, more than 25 percent of the prime suspects were wrongly accused.

Another development was additional revelations that people convicted of capital crimes and sentenced to die were actually innocent. In Illinois, investigations by Northwestern University journalism professor David Protess and his students provided proof of innocence. In 1998, Northwestern University hosted the first National Conference on Wrongful Convictions and the Death Penalty. Attending were 35 former death row inmates. Some of them told their stories about almost being executed and how they had been wrongly convicted. In 1999, the *Chicago Tribune* published two major series. The first series documented prosecutor misconduct throughout the United States; the second series examined problems with Illinois's capital punishment system that contributed to such a large percentage of its death row inmates being exonerated because of their innocence. Based largely on the series by the *Chicago Tribune* and the fact that Illinois had released 13 condemned inmates from death row since 1977 while executing 12, Republican Governor George Ryan, himself a proponent of the death penalty, imposed a moratorium on capital punishment in Illinois in January 2000. In May 2000, Governor Ryan charged a special commission he created with producing a comprehensive report on the administration of capital punishment in Illinois. In April 2002, Governor Ryan received the completed report, which contained 85 recommendations for changes in the Illinois capital punishment system. Declaring the Illinois capital punishment system to be broken, in January 2003, just days before he was to leave office, Governor Ryan pardoned four death-row inmates and commuted the sentences, mostly to life in

prison without possibility of parole, of the remaining 167 inmates on Illinois's death row. Between 1973 and November 2006, a total of 123 people in 25 states have been released from death row with evidence of their innocence (Death Penalty Information Center 2006). Some probably innocent death row inmates were not as lucky and have been executed (Bohm 2003).

Reasons and Remedies

The proximate reasons for these miscarriages of justice are now well documented. They include shoddy investigation and misconduct by the police; eyewitness misidentification, perjury by prosecution witnesses, false confessions, guilty pleas by innocent defendants, prosecutor misconduct, judicial misconduct or error, bad defense lawyers, and jury problems.

Remedies to miscarriages of justice are also well known. Among the recommendations are the following: provide good attorneys, punish the misconduct of defense attorneys, improve police investigations, interrogations, and the handling of evidence, improve eyewitness identification techniques and procedures, improve the work and credibility of crime lab technicians, require DNA testing, set rigorous standards for jailhouse snitches/informants, improve police training, punish police misconduct, guide prosecutors' charging decisions, improve disclosure requirements, punish prosecutor misconduct, provide better training and certification of trial judges in capital cases, give trial judges veto power in capital cases (when juries impose death sentences), eliminate time limits and other constraints on claims of actual innocence, increase the resources and scope of innocence projects, collect relevant data, establish innocence commissions, and provide assistance and indemnity.

Conclusion

The integrity and legitimacy of the criminal justice process depends largely on efforts to eliminate injustice. Miscarriages of justice threaten the very foundation of society. When criminal suspects and defendants are not treated fairly and accorded the rights guaranteed to them by the U.S. Constitution, the legitimacy and authority of the state are called into question. Citizens who lose faith in the state's ability to dispense justice are likely to employ vigilante justice, resulting in social chaos.

To move analysis of this subject forward, the federal and state governments should be required by statute to compile an annual miscarriage of justice registry, listing all known cases of miscarriages of justice and their causes. Such a registry would not only provide an indication of the problem's magnitude but it would also be an excellent resource to use in evaluating criminal justice administration. It could reveal what works well and what is in need of change. Also needed is theorizing and investigation of the more fundamental causes of miscarriages of justice as well as the political will, organizational commitment, and resources to implement and monitor the remedies.

PATRIOT ACT

Cary Stacy Smith and Li-Ching Hung

On September 11, 2001, al Qaeda terrorists, wielding box cutters, skyjacked and then crashed jets into the World Trade Center and Pentagon. Exactly 45 days later, on October 26, 2001, President George W. Bush signed Public Law 107–56. The act's formal title is "Uniting and Strengthening America by Providing Appropriate Tools Required to Intercept and Obstruct Terrorism Act"; however, it is better known as the USA Patriot Act, or simply "Patriot Act" (PA). Fifteen federal statutes were affected by the PA, some in major ways; that is, law-enforcement and intelligence personnel were provided with legal tools for fighting international and domestic terrorism. Once the PA was passed, the Bush administration and many others heralded it as a much-needed tool for combating terrorism and preventing future attacks on the United States. With the passing of time, however, critics of the PA have voiced concerns that the act violates basic constitutional guarantees of civil rights.

One major boon for authorities was how the PA streamlined the legal processes for obtaining authorization for surveillance on suspicious individuals as well as seizing money that may be used to support terrorism. The act also required financial institutions to report any suspicious activity, to effectively identify new customers, to sever all ties to fraudulent banks located in foreign countries, and to maintain anti–money laundering programs at all times. In addition, banks were encouraged to share information with federal, state, and local law enforcement agencies, while the federal government was empowered to confiscate the property of any individual or organization either performing

terrorist acts or who had plans to do so. The PA expanded the definitions of money laundering and fraudulent activities—such as those, involving American credit cards that fall under the definition of supporting terrorism (see also Smith and Messina 2004).

The PA also changed the various requirements needed for the issuance of search warrants. Prior to September 11, 2001 (9/11), local judges, or the Foreign Intelligence Surveillance Court (used only when foreign spying was suspected), issued warrants authorizing electronic surveillance, such as wiretaps. Before the PA was passed, foreign intelligence gathering had to be the sole reason (Smith and Messina 2004). After 9/11, any federal judge could issue a nationwide warrant to tap phones and e-mail or any instrument a suspect could conceivably use. Examples include (1) "sneak and peek" search warrants; (2) permitted delays in serving some warrants until seven days after the surveillance authorized by the warrants; and (3) the requirement that libraries, bookstores, and Internet service providers are required to supply information about how their clients use their various services. Regarding foreign suspects, federal agents could (until 2007, when the policy was revised) request authorization for "warrantless" searches when the gathering of foreign intelligence was thought significant reason for the searches.

Background

The PA was a compromise of the Anti-Terrorism Act of 2001 (ATA), a legislative package intended to strengthen the nation's defense against terrorism. The ATA contained provisions vastly expanding the authority of law enforcement and intelligence agencies to monitor private communications and access personal information. The final legislation

THE 10 TITLES OF THE PATRIOT ACT

The Patriot Act has 10 titles, each containing numerous sections. They are:

Title I: Enhancing domestic security against terrorism—deals with measures that counter terrorism.

Title II: Enhanced surveillance procedures—gives increased powers of surveillance to various government agencies and bodies. There are 25 sections in this title, with one of the sections (section 224) containing a sunset clause.

Title III: International money-laundering abatement and antiterrorist financing act of 2001.

Title IV: Protecting the border.

Title V: Removing obstacles to investigating terrorism.

Title VI: Providing for victims of terrorism, public safety officers, and their families.

Title VII: Increased information sharing for critical infrastructure protection.

Title VIII: Strengthening the criminal laws against terrorism.

Title IX: Improved intelligence.

Title X: Miscellaneous.

included a few beneficial additions from the administration's initial proposal. Examples are a sunset provision, which provided that several sections of the PA would automatically expire after a specified period of time unless Congress renewed them, concerns about aspects of the electronic surveillance provisions, and an amendment providing judicial oversight of law enforcement's use of the FBI's Carnivore system (a method of electronic surveillance). On the other hand, the PA still retained provisions expanding the government's investigative authority, especially with respect to the Internet. Those provisions address issues that are complex and implicate fundamental constitutional protections of individual liberty, including the appropriate procedures for interception of information transmitted over the Internet and other rapidly evolving technologies.

One primary purpose for the PA was stopping terrorists from staying within the United States. When reasonable grounds exist to believe that foreign visitors pose a threat to national security, they can be arrested and held for seven days without being charged, pending investigation or their deportation. Judicial review is nonexistent, except for habeas corpus, while the U.S. attorney general has the right to order aliens held indefinitely if no countries agree to accept them upon deportation (Brasch 2005).

The PA makes one liable for deportation, even if a person associates unknowingly with terrorists or terrorist organizations. In order to identify and track suspects, the act substantially increases rewards for information regarding terrorism, expands the exemptions to the Posse Comitatus Act of 1878, and gives the U.S. attorney general permission to collect samples of DNA from convicted federal prisoners. Domestic terrorism, a new category, is added; that is, an act intended to negatively influence governmental policy or to coerce civilians by intimidation committed by any citizen of the United States. Such acts, whether by citizens or foreigners, include attacking mass transportation, releasing biological agents, using weapons or explosives, spreading false information about terrorist attacks, or conspiring with terrorists (Etzioni 2004).

Legal Decisions

Congressman James F. Sensenbrenner introduced the Patriot Act into the House of Representatives as H.R. 3162. The act swept through Congress quickly with little dissent. House Resolution 3162 was introduced in the House of Representatives on October 23, 2001. Assistant Attorney General Viet D. Dinh and Michael Chertoff (future secretary of the Department of Homeland Security) were the primary drafters of the PA. The bill passed in the House of Representatives on October 24, 2001, as it did in the Senate (with one dissenter and one senator not voting) on October 25, 2001. President George W. Bush signed the bill into law on October 26, 2001 (Smith and Messina).

Quite possibly the single most controversial aspect of the act was Section 215, which dealt with a very narrow implied right of federal investigators to access library and bookstore records. The section allowed FBI agents to obtain a warrant *in camera* from the

THE PATRIOT ACT AND FOREIGN INTELLIGENCE

The act follows and amends a series of acts that are related to the investigations of foreign intelligence. These include:

1. The Foreign Intelligence Surveillance Act (FISA), which was passed in 1978 and defined who could be investigated; targets were usually engaged in espionage or international terrorism. In 2004, FISA was permitted to target "lone wolf" terrorists without showing that they were members of a terrorist group or agents of such a group or of any other foreign power.
2. The USA Act was passed on October 12, 2001, and subsequently folded into the USA Patriot Act. Under the USA Act, a terrorist who was not an agent of a foreign power could be the target of a federal investigation of foreign intelligence.
3. The Financial Anti-Terrorism Act was passed on October 17, 2001, and also folded into the USA Patriot Act. It increased the federal government's powers to investigate and prosecute the financial supporters of terrorism.

See also W. M. Brasch, *America's Unpatriotic Acts: The Federal Government's Violation of Constitutional and Civil Rights* (New York: Peter Lang, 2005).

United States Foreign Intelligence Surveillance Court for library or bookstore records of anyone connected to an investigation of international terrorism or spying. The section never specifically mentions and civil libertarians argued that the provision violated patrons' human rights; it has become known as the "library provision."

It is unknown how many individuals or organizations have been charged or convicted under the act. Throughout 2002 and 2003, the Justice Department adamantly refused to release numbers. John Ashcroft in his 2004 statement *The Department of Justice: Working to Keep America Safer* claimed that 368 individuals were criminally charged in terrorism investigations, although the numbers 372 and 375 were later used. Of these, he stated that 194 (later 195) resulted in convictions or guilty pleas. In June 2005, President Bush reported that investigations yielded over 400 charges against terrorists, with more than half resulting in convictions or guilty pleas. In some cases, federal prosecutors chose to charge suspects with nonterror-related crimes for immigration, fraud, and conspiracy (Smith and Messina 2004).

Members of the U.S. Congress from both sides of the aisle have tried to curb some of the act's policies. In 2003, Senators Lisa Murkowski (R-AK) and Ron Wyden (D-OR), introduced the Protecting the Rights of Individuals Act, which revised several provisions of the Patriot Act to increase judicial review. For example, instead of PEN/Trap warrants—a device used to collect all numbers dialed on a phone keypad after a call has been connected—based on the claims of law enforcement, rather, they would be based on "specific and articulable facts that reasonably indicate that a crime has been, is being,

or will be committed, and that information likely to be obtained by such installation and use is relevant to the investigation of that crime" (see also Cole and Dempsey 2002).

Congressman Bernie Sanders (I-VT) with Reps. Jerrold Nadler (D-NY), John Conyers Jr. (D-Mich.), C. L. Otter (R-Idaho), and Ron Paul (R-Texas) proposed an amendment to the Commerce, Justice, State Appropriations Bill of 2005 that would cut off funding to the Department of Justice for searches conducted under Section 215. The amendment initially failed to pass the House with a tie vote, 210–210. Although the original vote came down in favor of the amendment, the vote was held open and several house members were persuaded to change their votes (Cole and Dempsey 2002).

The courts have also spoken out against the act. U.S. District Judge Audrey Collins ruled that Section 805 (which classifies "expert advice or assistance" as material support to terrorism) was vague and in violation of the First and Fifth Amendments, marking the first legal decision to set a part of the act aside. The lawsuit against the act was brought by the Humanitarian Law Project, representing five organizations and two U.S. citizens who wanted to provide expert advice to Kurdish refugees in Turkey. Groups providing aid to these organizations had suspended their activities for fear of violating the act, and they filed a lawsuit against the Departments of Justice and State to challenge the law, claiming the phrase "expert advice or assistance" was too vague. Collins granted the plaintiff's motion that "expert advice or assistance" is impermissibly vague but denied a nationwide injunction against the provision. The plaintiffs were granted "enjoinment" from enforcement of the provision (Chesney 2005).

Conclusion

In terms of the act remaining as it was in 2001, when it was signed into law, the future looks dim. To date, eight states (Alaska, California, Colorado, Hawaii, Idaho, Maine, Montana, and Vermont) and hundreds of cities and counties (including New York City; Los Angeles; Dallas; Chicago; Eugene, Oregon; Philadelphia; and Cambridge, Massachusetts) have passed resolutions against the PA in its present form. In Arcata, California, an ordinance was passed that bars city employees (including police and librarians) from assisting or cooperating with any federal investigations under the act that would violate civil liberties. In addition, a group called The Bill of Rights Defense Committee helped coordinate local efforts to pass resolutions. The validity of these ordinances is in question, however, since under the Constitution's supremacy clause, federal law supersedes state and local laws. However, others have opined that the federal employees, in using such procedures for investigations, violate the Constitution's clauses in the fourth amendment, and in these cases, the Constitution overrides the act's provisions (Chesney 2005; Bill of Rights Defense Committee).

AMERICAN FEELINGS ABOUT THE PATRIOT ACT

According to a USA Today/CNN poll, the percentage of Americans having negative feelings about the act has grown (see Table 1). Originally, the Patriot Act had a sunset clause to ensure that Congress would have to take active steps to reauthorize it. The United States had never enacted into law anything like this act; thus people needed time in which to gauge whether or not it needed modification. From the beginning, the primary criticisms leveled at the Patriot Act centered upon civil liberties. In 2006, the reauthorization resolution was passed and contained 27 safeguards designed for maintaining civil liberties.

The 27 safeguards are as follows:

Safeguard 1: requiring high-level approval and additional reporting to Congress for Section 215 requests for sensitive information such as library or medical records
Safeguard 2: statement of facts showing relevance to a terrorism or foreign spy investigation required for Section 215 requests
Safeguard 3: explicitly allowing a FISA court judge to deny or modify a Section 215 request
Safeguard 4: requiring minimization procedures to limit retention and dissemination of information obtained about U.S. persons from Section 215 requests
Safeguard 5: explicitly providing for a judicial challenge to a Section 215 order
Safeguard 6: explicitly clarifying that a recipient of a Section 215 order may disclose receipt to an attorney or others necessary to comply with or challenge the order
Safeguard 7: requiring public reporting of the number of Section 215 orders
Safeguard 8: requiring the Justice Department's independent inspector general to conduct an audit of each Justice Department use of Section 215 orders
Safeguard 9: explicitly providing for a judicial challenge to a National Security Letter (NSL)
Safeguard 10: explicitly clarifying that a recipient of a National Security Letter may disclose receipt to an attorney or others necessary to comply with or challenge the order
Safeguard 11: providing that a nondisclosure order does not automatically attach to a National Security Letter.
Safeguard 12: providing explicit judicial review of a nondisclosure requirement to a National Security Letter
Safeguard 13: requiring public reporting of the number of National Security Letters
Safeguard 14: requiring the Justice Department's independent inspector general to conduct two audits of the use of National Security Letters
Safeguard 15: requiring additional reporting to Congress by the Justice Department on use of National Security Letters
Safeguard 16: requiring the Justice Department to recertify that nondisclosure of a National Security Letter is necessary

Safeguard 17: narrowing the deference given to the Justice Department on a National Security Letter nondisclosure certification
Safeguard 18: requiring a report to Congress on any use of data-mining programs by the Justice Department
Safeguard 19: requiring notice be given on delayed-notice search warrants within 30 days of the search
Safeguard 20: limiting delayed-notice search warrants extensions to 90 days or less
Safeguard 21: requiring an updated showing of necessity in order to extend the delay of notice of a search warrant
Safeguard 22: requiring annual public reporting on the use of delayed-notice search warrants
Safeguard 23: requiring additional specificity from an applicant before roving surveillance may be authorized
Safeguard 24: requiring court notification within 10 days of conducting surveillance on a new facility using a "roving" wiretap
Safeguard 25: requiring ongoing FISA court notification of the total number of places or facilities under surveillance using a "roving" wiretap
Safeguard 26: requiring additional specificity in a FISA court judge's order authorizing a "roving" wiretap
Safeguard 27: providing a four-year sunset on FISA "roving" wiretaps

POLICE BRUTALITY

Jessica S. Henry

Police brutality refers to the use of excessive force against a civilian. The controversies that surround the topic of police brutality relate to different definitions and expectations over what is meant by excessive force. Indeed, police officers are expressly authorized to use necessary, reasonable force to perform their duties. As Jerome Skolnick, an influential police scholar in the United States, underscores: "as long as members of society do not comply with the law and resist the police, force will remain an inevitable part of policing." (Skolnick and Fyfe 1993). Others would quickly point out that there is also a difference between legitimate or legal force and illegitimate or excessive force by the police. They would argue, too, that the use of force is not only a question of reacting to citizen violations of the law and resistance but may also involve an array of actions that do not lawfully conform to the spirit of the law. Police brutality might include, for example, the unlawful beating of a citizen by an officer under the cover of the law or the brutality of other citizens or fellow officers who unjustly harm others that is overlooked or even condoned. Thus, the issue of police brutality turns not simply on the presence of force but on its degree, kind, reasonableness, and even on omission.

Although police brutality may also be said to occur whenever the police use violent force that is excessive, some scholars have limited that definition to include excessive force that is conscious and deliberate, as compared with the good-faith mistake of an officer who uses unnecessary force in the face of an unexpected situation. In contrast, the Communications Assistance for Law Enforcement Act (CALEA) accreditation standard does not contemplate the intent of the officer. Rather, it permits officers to use "only the force necessary to accomplish lawful objectives" and describes excessive force as any level of force that is more than necessary.

Background

Modern police forces were established in the 1830s and 1840s and were marked primarily by corruption and inefficiency. Indeed, police agencies throughout the 1800s and early 1900s were as often involved in violence and crime as the alleged perpetrators of crime.

At the turn of the 19th century, police use of excessive force had a widespread and accepted place in law enforcement. In interrogating suspects, the police would routinely beat suspects with fists, blackjacks, and rubber hoses to extract information. These police "interrogations," otherwise known as the "third degree," were conducted in hot, tiny, overlit rooms.

USE OF FORCE

Every day, law enforcement officers face danger while carrying out their responsibilities. When dealing with a dangerous—or unpredictable—situation, police officers usually have very little time to assess and determine the proper response. In such situations, good training can enable the officer to react properly to the threat or possible threat and respond with the appropriate tactics to address the situation, possibly including some level of force, if necessary, given the circumstances.

The U.S. Commission on Civil Rights has stated that "in diffusing situations, apprehending alleged criminals, and protecting themselves and others, officers are legally entitled to use appropriate means, including force." In dozens of studies of police use of force there is no single, accepted definition among researchers, analysts, or the police. The International Association of Chiefs of Police (IACP), in its study *Police Use of Force in America 2001,* defined use of force as "the amount of effort required by police to compel compliance by an unwilling subject." The IACP also identified five components of force: physical, chemical, electronic, impact, and firearm. To some people, though, the mere presence of a police officer can be intimidating and seen as use of force.

The Bureau of Justice Statistics, in *Data Collection on Police Use of Force,* states that "the legal test of excessive force . . . is whether the police officer reasonably believed that such force was necessary to accomplish a legitimate police purpose." However, there are no universally accepted definitions of *reasonable* and *necessary* because the terms are subjective. A court in one jurisdiction may define *reasonable* or *necessary* differently than a court in a second jurisdiction. More to the point is an understanding of the improper use of force, which can be divided into two categories: "unnecessary" and "excessive." The unnecessary use of force would be the application of force where there is no justification for its use, while an excessive use of force would be the application of more force than required where use of force is necessary.

In 1928, President Herbert Hoover established the Wickersham Commission, which was charged in part with examining law enforcement police practices. Finding widespread brutality and corruption, in 1931 the Wickersham Commission reported that torture was routinely employed by police officers against suspects to elicit confessions. In one infamous example of police excesses, the commission described a suspect who was held by the ankles out of a third-story window. It also identified rampant corruption within police departments nationwide and linked brutality to routine police practices. The Wickersham Report drew unprecedented attention to the issue of police brutality and coerced confessions.

As a result of the Wickersham Report, the use of the third degree became less common. It did not, unfortunately, eliminate the practice entirely. For instance, a 2006 report issued after a four-year, $6 million investigation revealed that, during the 1970s and 1980s, Chicago police officers, under the leadership of Commander Jon Burge, routinely used torture to elicit confessions from hundreds of suspects. The torture techniques employed by the police included the use of cattle prods placed against a suspect's genitals, the shoving of a loaded gun into a suspect's mouth, or the placement of a plastic typewriter cover over a suspect's head until he lost consciousness. Other suspects were beaten with fists, kicks, and telephone books. Nearly all the victims were people of color. Notwithstanding the public furor over the report, no state prosecutions were planned as of the time of this writing.

The use of the third degree was not the only technique highlighted by the Wickersham Report. Rather, that report brought to light the endemic and institutional nature of police brutality among police departments across the country. Many of the then-identified issues relating to police brutality continue today. In 1991, for instance, 60 years after the Wickersham Report, the Christopher Commission issued its report on the use of force by the Los Angeles police department. That report, which called for new standards of accountability, described a police department and culture where the use of excessive force, primarily against people of color, was not uncommon. Its conclusions and recommendations were eerily reminiscent of its predecessor report.

The Christopher Commission's conclusions again were echoed several years later. In 1998, Human Rights Watch issued a nearly 400-page report analyzing police brutality and accountability throughout the United States. It concluded that police brutality is endemic to police departments nationwide and that there are inadequate measures in place to address and correct the pervasiveness of the issue. Human Rights Watch also made a series of nonbinding recommendations to increase police accountability and transparency in police practices. Whether any of these recommendations will be implemented in a systemic manner remains to be seen.

Key Moments/Events

In the 20th and 21st centuries, the phrase "police brutality" became inextricably linked with the names of individuals such as Rodney King, Abner Louima, or Amadou Diallo.

So too, police brutality has been linked with some of this nation's worst public riots. The following discussion focuses on several high-profile instances of police brutality. It is not meant to be exhaustive but rather to highlight significant events that altered the nation's consciousness about police brutality.

Many of the worst riots or rebellions in the 20th century stemmed from allegations of police brutality. The damage from the riots in terms of loss of life and property destruction was massive, while the damage between the community and the police department in some cases has yet to be repaired.

For instance, on March 3, 1991, there were riots in Los Angeles in response to an infamous beating caught on videotape. Rodney King, an African American, was speeding on a Los Angeles freeway. After King refused to pull over for fear that his probation would be revoked, 11 police cars and a police helicopter gave chase. King subsequently refused to exit his car. Police officers forcibly dragged him from the car and shot him twice with a taser gun. Four officers beat him with a nightstick at least 56 times, while dozens of other officers stood by and watched. King suffered brain damage and 16 broken bones. An amateur photographer captured the entire incident on videotape, which was subsequently and repeatedly shown on television throughout the world. After a jury that did not include a single African American person acquitted the officers, five days of rioting erupted in the streets of Los Angeles.

A little more than a decade earlier, on December 17, 1979, Miami erupted in violence. According to police reports, Arthur McDuffie, an African American, made an obscene gesture to a police officer and sped away on his motorcycle. After a police chase through Miami's streets, which involved at least 12 police cars, McDuffie was captured and severely beaten by six white police officers. He died four days later. Although it was revealed at trial that the officers initially had lied about the source of McDuffie's injuries, an all-white jury acquitted the officers. After the verdict, Miami erupted in three days of racially charged rioting.

Of course, not all instances of police brutality result in rioting. Indeed, there was no rioting in response to one of the worst cases of brutality in recent years. On August 9, 1997, Haitian immigrant Abner Louima was arrested outside a Brooklyn nightclub after a fight in which he had not participated. At the 70th precinct in Brooklyn, several officers, including Justin Volpe, brutalized Louima. Volpe sodomized Louima by plunging a broomstick into his rectum and mouth while his hands were cuffed behind his back. Louima suffered extensive internal injuries and required several surgeries.

In another high-profile example of brutality, Johnny Gammage, an African American, was driving a luxury car when he was pulled over by the Pittsburgh police on October 12, 1995. Gammage exited his car carrying a cell phone, which officers claimed appeared to be a gun. Officers on the side of the road detained him, and he died there. The coroner identified the cause of death as suffocation caused by pressure on the back and neck. Although all three officers charged with involuntary manslaughter were

acquitted, Gammage's death led to an extensive Justice Department investigation into police practices in Pittsburgh.

Under strikingly similar circumstances, Amadou Diallo, a 22-year-old unarmed street vendor from Guinea, was mistakenly shot and killed by the police. As he stood in the doorway to his apartment on February 4, 1999, four police officers in plain clothes fired 41 shots, hitting him 19 times. The officers later claimed that he was drawing a gun when they opened fire. What the officers took for a gun was, in fact, his wallet. Although the four officers were acquitted after trial, which was moved from the Bronx to Albany, New York, the City of New York agreed to pay $3 million dollars to resolve the Diallo family's civil rights lawsuit.

Lawsuits and Other Remedies to Reduce Police Brutality

Lawsuits have proven to be one effective way of controlling police practices. The U.S. Department of Justice is empowered to bring suit against police departments under the 1994 Violent Crime Control Act. This act authorizes the Justice Department to sue police departments where there has been an alleged "pattern or practice" of abuse. The impact of these "pattern" suits has been dramatic. The Justice Department has sued and entered into consent decrees with numerous police departments: the New Jersey Police Department to limit its reliance on racial profiling in traffic stops; an Ohio police force to reduce its use of excessive force; the Pittsburgh police department to institute increased oversight and accountability; and the Los Angeles police department (LAPD) over the Rampart scandal, where, in August 2000, a federal judge ruled that the government's antiracketeering statute—known as the RICO Law, created to fight organized crime—could be used against the police. A court-appointed monitor works to ensure that the departments are in compliance with consent decrees. These pattern lawsuits have the potential to bring broad, sweeping change to police practices and reduce the use of excessive force.

Individual citizens who have been abused by the police can also sue police departments for monetary damages. The cost of these lawsuits can be significant. For instance, in the 1990s, the Detroit police department paid an average of $10 million dollars per year to resolve lawsuits arising from police misconduct. In response to these and other lawsuits, some police departments have taken steps to address and reduce police misconduct. For instance, the Los Angeles County Board of Supervisors arranged for a special counsel to investigate problems within the LAPD, recommend reforms, and ultimately reduce the cost of litigation.

Criminal prosecution is an additional legal avenue that can be used to deter police brutality. Prosecutors, however, traditionally have been reluctant to pursue criminal charges against individual police officers. This, in part, reflects the dependent relationship of prosecutors, who rely on the police to secure convictions and do not wish to damage these institutionalized relationships. Moreover, convictions against police officers

are difficult to obtain both because it is hard to prove beyond a reasonable doubt that an officer used excessive force with criminal intent and jurors tend to empathize with the police and therefore are reluctant to convict them of crime.

Criminal convictions against police officers are relatively rare, but they do occur. In the case of Abner Louima, for instance, Justin Volpe pled guilty to anally penetrating Louima with a broomstick and was sentenced to 30 years in federal prison. Charles Schwarz also went to trial in the Louima case. Although was initially convicted of obstruction of justice and was sentenced to 15 years federal imprisonment, his conviction was overturned by an appellate court. Schwarz finally pled guilty to perjury and was sentenced to five years' imprisonment. And the convictions of the remaining three police officers were overturned by a federal appeals court. Whether these types of convictions and their mixed results will deter other officers from brutality is not clear. In contrast, an acquittal often, albeit unintentionally, sends a public message that the police can "get away" with murder.

Another potential mechanism for controlling police brutality is through the use of civilian complaint boards. These boards may serve as independent reviewers of citizen complaints, aid in monitoring police departments, or help with policy review. Although many of these boards have been criticized for a wide range of reasons, they may aid in increasing the transparency of police departments, which in turn may improve public confidence in the complaint process. However, complaint review boards are only as effective as the mandate given to them by the community and the degree of cooperation demonstrated between the police, prosecutor, politicians, and review board.

Conclusion

Police brutality remains a challenge within law enforcement today. The frequency with which police brutality occurs may decline in the future, with effective mechanisms to ensure police accountability and a continued emphasis on police professionalism. Although isolated instances of police brutality may be unavoidable, a number of accountability measures can be implemented in an effort to reduce overall patterns of police brutality.

Police departments traditionally have turned inward in an effort to regulate the conduct of their officers. An internal affairs unit (IAU) is responsible for investigating allegations of misconduct and brutality. The "blue curtain" or the "blue wall of silence" refers to the informal code among police officers that constrains them from reporting the misdeeds of other officers. The refusal to "rat out" a fellow officer remains a cultural norm within police departments. Therefore there are significant cultural limitations to an IAU investigation. Moreover, the investigations conducted by IAUs are typically cloaked in secrecy. Thus it is extremely difficult to assess whether and to what extent police departments in fact are monitoring their operations.

There are, however, external methods of monitoring and curbing police brutality, as discussed in the previous section. These accountability measures together may begin to affect the national police culture in which brutality is accepted, overlooked, or ignored. Until measures such as these are implemented, however, the excessive use of force by individual police officers is unlikely to come to an end.

POLICE CORRUPTION

Marilyn Corsianos

Although there is still some debate over the meaning of the term *police corruption,* the primary controversy has to do with how police corruption stemming from the abuse of police power or authority can be reduced. Since the beginning of formal policing in the 1800s, various groups have demanded more measures to identify and control police corruption and increase police accountability to members of the public. But, what exactly does *police corruption* refer to?

Some acts of police behavior are universally condemned. Others generate disagreement and debate and some police actions clearly violate laws, while yet others violate internal departmental policies. Herman Goldstein defines police corruption as "the misuse of authority by a police officer in a manner designed to produce personal gain for the officer or others" (1997). Similarly, Lawrence Sherman defines police corruption as "an illegal use of organizational power for personal gain" (Sherman 1974, 30).

By contrast, Robert H. Langworthy and Lawrence H. Travis III define police corruption as "the intentional misuse of police power. In practice, this definition means that

before something can be called police corruption, two things must be established. First, it must be shown that police powers were misused. Second, it must also be shown that the officer(s) misusing police power intended to misuse it. Whether the motive is money, personal gain, or gain for self or others is not important except insofar as it helps to show intentional misuse of power" (Langworthy and Travis 2003, 414).

It is difficult if not impossible to know the extent of police corruption beyond the reported cases. The victims of police corruption typically report these cases to police authorities. Police officers who participate in acts of corruption have no incentives to report their own corrupt activities and risk losing their jobs and/or facing prosecution in criminal courts. Also, officers who witness acts of police corruption usually have no incentive to come forward and report the misconduct by their fellow officers. As accepted members of the police culture, they are expected to respect the police occupational culture and code of silence.

Moreover, citizens who willingly engaged in acts of corruption with the police have no motive to report their own involvement or that of the officer. In addition, citizens who were less willing participants in the corruption (e.g., citizens who accept an officer's proposal to pay him or her a fee in exchange for not receiving a citation), or citizens who observe a corrupt transaction may decide not to report these incidents because they are either fearful of retribution or believe that the police will not bother with an investigation. Furthermore, only a handful of sociological or criminological studies have been done on police corruption, and they are typically case studies that look at one or a few police agencies.

Findings from case studies often present difficulties in making generalizations from one police department to the next. For obvious reasons, many academics encounter difficulties in gaining access to police agencies and finding a sample of officers willing to participate in a study of police corruption. Researchers who have been successful in conducting such studies have often spent significant time with particular officers, establishing themselves as trustworthy researchers.

Background

Evidence of police corruption in the United States can be traced back to the beginnings of formal police organizations in the 1800s. From the mid-1800s to the early 1900s, the police were appointed by elected political officials who expected police to respond to a variety of neighborhood demands in order to ensure votes during the next election. In addition, officers were selected from the neighborhoods they would serve in order to reflect the interests of the neighborhood residents (Walker 1977). Police officers had to answer to political leaders and to the individual neighborhoods they served (Kelling and Moore 1988). This meant that they operated differently throughout the different neighborhoods, which led to a great deal of controversy regarding police accountability and police roles (Conley 1995).

Police discretion was not monitored. The police had the power to arrest on suspicion and could apply physical force to members of the public (Miller 1977). Evidence suggests that during elections, some officers prevented supporters of opposing parties from casting their ballots using intimidation, arrest, and/or physical force. Police officers also protected the illegal operations of political leaders and/or accepted bribes by owners of illegal operations (Fogelson 1977). Police corruption was commonplace, given the lack of controls on police and their close relationship to politicians and neighborhoods.

By the early 1900s, citizens began to demand reform and accountability. People demanded that the police become a legitimate profession by separating the police from politics, create rules to guide police behavior, distance the police from the communities they were expected to serve, hire police based on qualifications and not political connections, and require special training and skills to fulfill police roles. But despite these accomplishments, along with more recent changes in community policing/community problem solving initiatives, police corruption has not been eliminated.

Different levels of police corruption may be found within police organizations today. They include police agencies where only a few officers participate in corrupt practices as well as agencies with departments where the majority of officers engage in corruption but do so independently, and agencies where corruption is organized and shared among most of the members of the department (Sherman 1974).

Moreover, scholars have identified different types of police corruption (Inciardi 1987). Examples of police corruption vary depending on the definition of police corruption used (Stoddard 1979). For instance, some scholars identify the acceptance of free or discount merchandise or services by officers as a form of police corruption. However, if merchants offer the discounts without any police influence or abuse of power, this particular act is not necessarily a corrupt practice.

Key Events

Recent highly publicized cases show the public that police corruption continues to exist, and they provide citizens with information on how they occur (Corsianos 2003). The cases that often receive a lot of publicity are those that involve excessive use of force, which includes deadly force, by police officers. Deadly force by the police results in an average of 373 civilian deaths each year. The majority of those killed by the police are young and male and a disproportionate number are African American (Brown and Langan 2001). The following is a list of some key incidents of excessive use of force applied by the police as well as incidents involving other types of police corruption.

2005–2010: In New Orleans, six unarmed people were shot by police on the Danziger Bridge while riding out the floodwaters of Hurricane Katrina (2005); two of them died. Another officer, Lt. Michael Lohman, arrived later at the scene and colluded with the officers present in creating a story about having been

COMMISSIONS' FINDINGS

The Knapp Commission

It was the Knapp Commission in 1972 that first brought attention to the New York Police Department (NYPD) when the commission released the results of more than two years of investigations into allegations of corruption. In 1970, NYPD officer Frank Serpico went public on the widespread corruption within the police agency. New York City Mayor John Lindsay established the Knapp Commission to investigate the allegations. The commission found widespread corruption such as bribery, especially amongst narcotics officers. As a result, many officers were prosecuted and many more lost their jobs. The commission's findings led to the following recommendations: (1) commanders should be held accountable for their subordinates' actions; (2) commanders should file periodic reports on areas that would breed corruption; (3) field offices of the Internal Affairs Division should be created at all precincts; and (4) undercover informants should be placed in all precincts. A massive restructuring took place and strict rules and regulations were implemented to ensure that this level of police corruption would never happen again.

The Mollen Commission

Many of the Knapp Commission's issues of concern resurfaced again in the early 1990s, as a new corruption scandal emerged. Several officers were accused of selling drugs and assaulting suspects. Mayor David Dinkins appointed a commission in 1992, headed by Judge Milton Mollen, to investigate the allegations. The Mollen Commission report, published in July 1994, described an internal accountability system that was flawed in most respects and discussed the relationship between corruption and brutality. The report read, "Today's corruption is not the corruption of Knapp Commission days. Corruption then was largely a corruption of accommodation, of criminals and police officers giving and taking bribes, buying and selling protection. Corruption was, in its essence, consensual. Today's corruption is characterized by brutality, theft, abuse of authority and active police criminality."

The commission evaluated the department's procedures for preventing and detecting that corruption and recommended changes and improvements to those procedures. Some of the recommendations included improving recruitment and applicant screening, officer performance evaluations, police management, enforcement of command accountability and internal affairs operations, and creating and/or improving integrity training, drug testing, and corruption screening. Also, the Commission to Combat Police Corruption (CCPC) was created in 1995 based upon the recommendations of the Mollen Commission. The Mollen Commission believed that the creation of an independent commission to monitor the anti-corruption activities of the police department would help stop the recurring cycles of corruption.

The Christopher Commission

In 1991, Rodney King, an African American, was struck 56 times with batons by Los Angeles police officers after being stopped by police following a car chase. After the King incident, a commission headed by former Secretary of State Warren Christopher was created

(*continued*)

(*continued*)

to conduct an examination of the structure and operation of the Los Angeles Police Department (LAPD). The commission looked at the recruitment and training practices, internal disciplinary system, and citizen complaint system. In addition, they reviewed a five-year period of internal use of force reports, Mobile Digital Terminal (MDT) transmissions between police cars and police stations, and 83 civil damages cases involving excessive force settled by the city attorney for more than $15,000. The commission also held hearings and interviewed numerous officials and residents.

The commission's report was released in July 1991, and it concluded that racism and sexism were widespread and that a significant number of LAPD officers repetitively used excessive force against the public. The commission also criticized management for their lack of leadership and for failing to control these officers. They also noted that the department often rewarded the problem group of officers with positive evaluations and promotions.

The Christopher Commission made several recommendations to identify, control, and reduce police corruption.

fired on by the victims. They planted a gun on the bridge to bolster their story, and Lohman altered the police reports. A state investigation was launched in 2006 but went nowhere. Federal investigators launched their own inquiry in 2009, bringing charges of a cover up in April 2010.

1999: Amadou Diallo, an African immigrant with no criminal record, was shot and killed by the police. Four New York City police officers fired 41 shots, claiming that Diallo looked suspicious, ignored their commands, and reached for a gun. Diallo, however, was unarmed and was reaching for his wallet when he was shot and killed.

1997: Abner Louima was sodomized with a plunger by a New York City police officer and then the plunger was shoved into his mouth, breaking his front teeth. This act was committed at a police precinct in the presence of several officers, but no one came forward to report the assault. Given the extent of Louima's injuries, he was taken to a hospital where details of the assault were made public.

1997: Six former law officers from Texas were indicted on drug trafficking and corruption charges for smuggling more than 1,700 pounds of marijuana into the country.

1995: The FBI began investigating police corruption charges involving Philadelphia's 39th District. The case concerned a cadre of officers who raided crack houses, shook down drug dealers, and generally trampled on individual rights in order to obtain convictions. By the end of the investigation in 1997, about 100 cases had been overturned.

1994: Hidalgo County Sheriff Brig Marmolejo Jr. was sentenced to seven years in federal prison for taking $151,000 in bribes to allow a drug trafficker to have special privileges in jail.

TYPES OF CORRUPT ACTIVITIES

1. The demand by officers that citizens buy police merchandise in which officers use threats of citation or arrest to make the sale
2. The acceptance of cash or gifts by officers, in exchange for ignoring some violation on the part of the citizen
3. Lying as a witness to cover up the actions of oneself or another officer
4. The taking of cash or expensive items for personal use from a crime scene/call
5. The use of race as a key factor in police decisions to stop and interrogate citizens (referred to as racial profiling, race-based policing, or race-biased policing)
6. A planned burglary or theft by officers while on duty
7. The use of excessive force (e.g., assault, deadly force) by officers on members of the public

1992: Malice Green was pulled from his car by Detroit police officers and beaten to death.

1992–1999: LAPD officers working for the prestigious antigang unit CRASH, in the Rampart Division, were found to be responsible for numerous corrupt activities involving physical beatings, shootings, planting of evidence, falsifying police reports, and falsifying evidence and testimony about their actions in court.

Conclusion

The debate continues on how to limit police abuse of powers and more specifically police corruption. Various groups have demanded stricter measures to identify police corruption, control police behavior, and increase accountability (Walker 2005). Some suggestions include the following:

1. Create open and accessible citizen complaint procedures

Citizens should be given detailed information on how to file a complaint against a police officer. The process should be explained to the public and a time frame should be provided. Police Web sites should post information on the complaint process and citizens should be informed via community newsletters and the police working at various precincts.

2. Create external citizen oversight/complaints agencies

These agencies consist of official panels of citizens who investigate complaints of police misconduct and police corruption. Police departments should be expected to cooperate with these agencies by law and turn over all documents relating to the alleged act or acts of police corruption and should have access to locating and interviewing witnesses and the police officers.

3. Create official corruption units

Official corruption units (similar to the one created in New York City in the early 1990s) should consist of a combination of prosecutors, investigators, and paralegals. Such a unit should work in conjunction with the district attorney's office and should be authorized to investigate the corruption of any public official including police officers and maintain a relationship with police departments' internal affairs bureaus. Upon discovering evidence of police corruption, they should attempt to discover the extent of the corruption within particular units and/or the entire organization by turning corrupt police into undercover "spies" in order to collect evidence as to the extent of corruption and use them in courtroom prosecutions.

4. Create early intervention computerized databases

These databases should be used to collect detailed information on police behavior and practices (e.g., the number of vehicles they stop, the race and sex of the citizens they stop to question, the number of complaints made against them, the nature of the complaints, etc.). This information should be monitored and evaluated internally for any possible patterns of misconduct by police.

5. Demand more accountability on the part of elected officials who can influence police actions through their control over police budgets and the tenure of police administrators

In recent years, citizen complaints about the police practice of racial profiling has led to the passage of legislation mandating that police agencies keep statistics on the race of citizens stopped and questioned by police for traffic violations.

6. Create professionalism within the police and eliminate the "blue code of silence"

Police departments should become more selective in the hiring process and have a preference for applicants with college degrees. In addition, better training should be offered to new recruits. Focus should be given to classes on professionalism, conflict resolution, race relations, gender relations, police accountability, and integrity. Officers with better education and better training will be less likely to participate in police corruption and will be more likely to come forward and report such cases.

PRISON CONSTRUCTION

Byron E. Price

Because the United States has the largest prison population and the highest rate of incarceration in the world, the expansion of its capacity to hold more prisoners is a very contentious one. Perhaps the most controversial question revolves around whether or not U.S. correctional policy should be in the business of building new prisons or whether

it should be finding alternatives to imprisonment. These debates or questions, of course, raise related issues that include but are not limited to: punishment versus rehabilitation, privatization versus antiprivatization, and the abolition of parole and probation versus a moratorium on new prison construction.

Background

In the 1990s, in an effort to keep pace with a marked increase in the prison population, prison construction likewise rose to unprecedented levels (Martin and Myers 2005). The additional prison boom coupled with the public's disgust with rehabilitation efforts fueled the imprisonment boom, which led to more prison construction, especially between 1990 and 1995. During this time period, 213 new prisons were constructed nationwide (Martin and Myers 2005). During the 1990s, corporations saw the growth of prisons as an economic opportunity and several of them entered the prison construction business. The main two corporations were Corrections Corporation of American (CCA) and the Geo Group—formerly known as Wackenhut (see CCA's and the Geo Group's Web sites, respectively http://www.correctionscorp.com/ and http://www.thegeogroupinc.com/). These corporations changed the way prisons were built. They built speculative prisons (Collins 1998); that is, they built prisons without the state's involvement. They were able to seek financing from Wall Street investment firms such as E. F. Hutton to finance this speculative construction and sidestep the need to float taxpayer-supported bonds, the traditional method of financing new prison construction (Price 2006a). With the advent of prisons for profit, prison construction has become a lucrative industry, and this has led to more punitive laws and more lobbying for laws that increase the prison population.

Legal Decisions

Since 1965, lawsuits charging that overcrowding in prisons constitutes a form of cruel and unusual punishment, and is therefore a violation of prisoners' civil rights, have been brought in virtually every state (Levit 1996). As overcrowding of prisons has continued to swell, most federal, state, and local offici
als have recognized the need to delegate correctional responsibilities to nongovernmental organizations (Segal 2002).

Federal regulations govern this policy and can be found in 18 U.S.C. Sec. 4082(b), which "remands all federal offenders to confinement in any available, suitable, and appropriate institution or facility, whether maintained by the Federal Government or otherwise" (Segal 2002). Prison conditions and prison overcrowding resulted in other class action suits, such as those brought in *Mattison v. South Carolina Department of Corrections*—filed in 1976, consent decree signed in 1978; and in *Nelson v. Leeke*—filed in 1982, decree signed in 1985. Based on the successful argument made by these parties, the South Carolina Department of Corrections agreed to work to eliminate overcrowding

by raising staffing levels, upgrading facilities, and making other administrative changes. Following the agreement, five new prisons were built and a number of other units were refurbished (South Carolina Department of Corrections 2007).

Lawsuits have been brought against states across the United States by various plaintiffs charging cruel and unusual punishment as the basis for grievances concerning prison overcrowding. (AELE Law Enforcement Legal Center 2010). Because of the lawsuits brought by various prisoners, courts passed laws mandating that states address their prison crowding problems. Courts also passed enabling legislation that made way for states to privatize prisons and authorize more prison construction. The legal challenges to prison overcrowding enhance the arguments of those critics who oppose the punitive model, which calls for mass incarceration as opposed to rehabilitation. The challenges and lawsuits reinforce their position; they argue that too much emphasis is being placed on incarceration and building more prisons. Instead they assert that states should reform laws that increase the prison population and direct that money away from prison construction into educational programs. Prisons have become such a profitable industry that corporations owning prisons make billions of dollars off prisoners' labor and the per diem the states pay them to house prisoners. Detractors of prison building assert that the laws are driving the legal challenges and more thought should be given to policy that diverts money from education to correction. Proponents of for-profit prisons ask: What is wrong with inmates working and picking up a trade they can use upon release from prison? Critics respond that prisoners are paid slave wages while corporations make millions of dollars in profits.

Controversies in Prison Construction

The major challenge for policy makers responsible for setting correctional policy center around four competing and contentious issues that will affect the future of prison construction in the United States. The first challenge for policy makers is to determine which option is more feasible, building new prisons or seeking alternative methods to incarceration. Because of the "the get tough on crime" and "war on drugs" campaigns, coupled with an increasing trend of politicians running on get-tough platforms, the current climate appears to be in support of building more prisons (although recent economic conditions have produced something of a dampening effect). Have these campaigns been successful in deterring crime? The jury is still out, but both campaigns (the war on drugs and getting tough on crime) have been successful in adding to the growth of the U.S. prison population. The question is at what cost? If these campaigns are deemed successful, then the policy of punishment first may become the status quo, critics fear.

The debate about punishment versus rehabilitation is the second major challenge that will affect future prison construction. Advocates of punishment applaud the current policy to incarcerate and incapacitate for longer periods of time. They assert that these people are criminals and should be locked up, and why should society care about citizens

who disobey the law? Since rehabilitation does not work, and if private prisons will help us keep them locked up, then private prisons should be welcomed. On the other hand, proponents of rehabilitation and alternative methods to incarceration contend that resources should be directed into diversion programs and not prison development. The United States incarcerates 500,000 more people than China, although China has five times our population, and private prisons would only expand this number.

Whether to privatize prisons or not is the third major controversy and challenge for policy makers concerned with the growth of prisons. The debate rages on but has taken on added impetus with the introduction of private probation and private prisons. Private prisons present a challenge to policy makers because supporters of private prisons and probation are perceived as having a vested interest in the business of incarceration. Other scholars contend that this is not the case; governments cannot continue to spend exorbitant amounts on prison construction. As long as private prisons are monitored, there should not be a problem. Furthermore, because of various mandatory sentencing laws (e.g., truth-in-sentencing and three-strikes laws) and the imprisonment boom they have generated, privatization is a reasonable alternative, particularly considering the dire straits that many state budgets are in. Yet opponents of prison privatization contend that the new prison construction is being fueled by for-profit prison corporations lobbying and writing laws via the Criminal Justice Task Force committee of the American Legislative Exchange Council—a nonprofit private conservative organization based in Washington, D.C., that writes model privatization and criminal justice legislation. They point to the chart in Table 1 as proof of why for-profit prisons are driving the prison construction boom.

The table shows the number of states passing laws that drive up the prison population and create the need for new prison construction as a result of lobbying. Lobbying for laws favorable to its industry is unethical, and creating a need for new prison construction is unconscionable, commentators contend, and that is why private corporations should not be in the business of incarceration. Also, the opponents of prison privatization maintain that a decreasing crime rate is bad for business for prison corporations and that is why they lobby for laws favorable to their industry.

One of the major issues of prison construction is location, or siting. As the rate of prison construction has risen, so too has the importance of debates concerning siting (Martin 2000; Abrams 1992; Shichor 1992). Although there are concerns in respect to siting a prison, especially as it involves the impact on those communities, in some circles the perceived economic development benefits trump the concerns concomitant with siting prisons. An adverse aspect of prison siting for economic development purposes is that prison construction leads to a modest population loss in many urban communities as urban prisoners are exported outside their communities to rural communities (where prisons are often the largest employers). Because of a quirk in the census, which often counts prisoners in the communities where they are housed

(a policy that changed in many districts for the 2010 census), urban communities historically have lost political and economic clout to the communities where prisoners are shipped. This is one of the main objections to siting prisons for economic development purposes. If the practice does continue in selected districts, then the way the census counts prisoners should be adjusted.

The impetus for the prison construction boom is fueled by the ever-expanding prison population (Lawrence and Travis 2004) and the economic development needs of many rural white communities, critics argue. As prison populations continue to spiral out of control and the willingness of states to build more correctional facilities has not abated, many states and federal agencies are having a difficult time housing prisoners because they are running out of space and prisons are usually overcrowded.

For-profit prison corporations have stepped in to attempt to relieve the overcrowding problems, but they create a need for more prisons with their lobbying efforts and vested interest in the business of incarceration, critics argue. On the other hand, proponents of privatization contend that they are only responding to states' calls for relief as a result of court orders imposed on states to address their overcrowding problems. A benefit of private prison construction is that they can finance construction through lease contracts and lease purchasing agreements versus the traditional way states pay for

prison construction, such as "financing construction by cash appropriations (the pay-as-you-go approach) or by issuing general obligation bonds. The former puts the whole financial burden of construction on the state's annual budget. Bonds create problems by requiring voter approval and are restricted by debt limitations (Joel 1998). Critics of for-profit prison construction contend that the taxpayers should determine if they want more prisons versus having private entities determine policy, especially those with a vested interest in new construction. They also want to know whether, once the prisons are financed by for-profit prison corporations, the corporations are accountable to the citizens or to their stockholders. Corporations consider this argument nonsense. They cite competition as the reason why it behooves them to deliver quality service. If they fail to deliver quality service, they assert, they lose money and their competitors can step in and take control of their business.

The final challenge for policy makers is the debate surrounding the abolition of parole and probation versus a moratorium on new prison construction. It is argued that parole and probation must be abolished because they do not work and are too costly. If there were enough prisons, there would be no need to worry about probation and parole because there would be enough space to house prisoners eligible for parole and probation. Moreover, because rehabilitation appears to be a dismal failure, more prisons and laws are needed to incapacitate criminals, according to lobbyists and other advocates of prison construction.

On the other hand, critics of the punishment-first mentality also take issue with the idea of abolishing parole and probation—which is favored by today's correctional culture. They contend that the emphasis should be on rehabilitation and providing a second chance to those who have made mistakes, not on expanding the prison population and new prison construction. Additionally, citizens for criminal justice reform insist that the get-tough-on-crime tactics and punitive philosophy that permeate American society diverts the United States from rehabilitation and creates problems for the future. They ask why we have become a society that does not provide a second chance to those who may have had a momentary had a lapse in judgment. This group factors in structural impediments to human development such as racism, and how racism has handicapped certain minority groups who are disproportionately affected by incarceration and the pursuit of prisons as an economic development apparatus. As a result of their advocacy, states like Illinois are emphasizing rehabilitation as a solution to the high number of repeat offenders and costly jails (Paulson 2006). These groups point out the fact that if federal parole is reinstated it will reduce the costs of the federal prison system by reducing the need to undertake new prison construction. They maintain that "the entire, current budget…earmarked for new prison construction can be eliminated" (Armsbury 2005). Additionally, the argument is made that not enough money is spent on education, treatment, and job training in prison; as a result, prisoners are not equipped to return to society, which heightens the likelihood of recidivism.

PRIVATE PRISON COMPANIES

Private prison companies increase profits in several ways. Known as an economy of scale, the company is paid based on the number of inmates housed. In this case, much like a hotel, there is pressure to fill every available bed every night. To fill the prisons, companies contract with other states and transport inmates to facilities that are not full. In addition, the lower the level of security provided, the lower the cost to the company. The results can sometimes be disastrous for inmates, staff, and communities alike.

For example, in 1997, under pressure to fill empty beds at the medium-level security Northeast Ohio Correctional Center, the Corrections Corporation of America (CCA), under contract with the state, imported maximum-security-level inmates from Washington, D.C. Within one year, 20 stabbings and 6 escapes occurred. Empty prison beds in private facilities, depending on the contract, can also increase private prison profits. In this situation the state guarantees the company that it will pay as if 95 percent of the beds were full—even if they are empty. For instance, in 2001, Mississippi legislators diverted $6 million to pay for nonexistent "ghost inmates" after the CCA threatened to close down its Tallahatchie facility. In a publicly run facility, empty prison beds result in cost savings to taxpayers.

Another way prison companies increase profit is to cut costs, which often results in decreased quality of services and increased costs to taxpayers. The potential areas for cost cutting include but are not limited to inmate transportation, guard training/pay, and medical care, all of which can adversely affect the safety and security of inmates, guards, and citizens. For example, over a three-year time period, 21 violent prisoners escaped during transport by private companies. Training for corrections officers in state-operated facilities averages 12 to 16 weeks, while private companies offer an average of 3 weeks of training. Following the escapes and murders at the Northeast Ohio Correctional Center, an investigation reported that staff and officers, including supervisors, were inexperienced and undertrained. In the privately run Santa Fe Detention Center (New Mexico) alone, an investigative team found more than 20 cases in which inmates died as a result of negligence, indifference, inadequate training, or overzealous cost cutting.

—Donna Selman-Killingbeck

On the other hand, detractors of rehabilitation policy point out that those inmates should not receive a free college education, because citizens who have never been incarcerated cannot get a college degree for free. The rejoinder to this comment by advocates of rehabilitation as opposed to incarceration is: What person in his or her right mind would go to prison for a free college education? The reason prisons continue to expand is because of the move away from restorative justice policy, which advocates that everyone needs a second chance. The Second Chance Act, geared toward helping ex-offenders reintegrate into society, focuses on jobs, housing, mental health, substance abuse, and strengthening families; it is the kind of effort that should be undertaken, proponents of restorative justice assert. FedCURE is also a policy the government should pursue

because it would reinstitute the old parole and good time laws, which would allow inmates to be paroled at the federal level. (Congress abolished parole in the Comprehensive Crime Control Act of 1984.) However, federal prisoners may earn a maximum of 54 days of good-time credit per year against their sentences.

Critics of alternative methods to incarceration reply that people who commit crimes should not be rewarded for good behavior while incarcerated for crimes they have committed against society. Proponents of rehabilitation ask: Where is the compassion? They pose this question to policy makers with a predilection for punishment, because research shows that the majority of prisoners are nonviolent drug offenders. Furthermore, they note that at least one past president, George W. Bush, was in his youth a nonviolent drug offender who received a second chance. What if he had not benefited from an alternative method of incarceration? They cite many other individual cases as examples of why alternative methods to incarceration should be considered for nonviolent offenders.

Another controversy surrounding the abolition of parole and probation is the idea of privatized probation. Because parole and probation are considered to be too costly, proponents of privatized probation contend that if states are unwilling to abolish probation and parole, they should privatize them. This would help manage the crimes that are being committed by probationers and parolees who should have never been released or pardoned in the first place. Because people who have been paroled and placed on probation keep committing crimes, they drive the need for more prison construction and more police officers. However, advocates of "lock them up and throw away the key" happily report that the tactic of being tough on crime has reduced violent crime—thus a justification for more prisons.

Enough is enough, opponents of incarceration argue. They aver that the United States has locked up more people than any other country and that it leads the world in incarceration. They are initiating a campaign for a moratorium on prisons. Advocates of this movement maintain that states can save money by using funds to actively pursue alternatives to imprisonment for as many people as possible. They also point out that according to the Bureau of Justice Statistics, it costs about $25,000 per year to incarcerate each of the 2.2 million people in the U.S. prisons. This costs as much as annual tuition at a good college, they contend. Proponents of increased use of imprisonment purport that prisons are a necessary evil in our society. Policy leaders in the opposing camp believe that the incarceration of prisoners places their children "at increased risks for many of the social ills that trip up our younger members of society, for instance, truancy, teen pregnancy, drug use, gang involvement and sexually transmitted diseases and infections" (Price 2006a, 40). If laws will not be reformed because policy makers cannot risk being labeled soft on crime, they should at least be designed to help the children who are being "consigned to the juvenile justice system and social bureaucracies" (Price 2006a, 40) in the United States because a parent is being removed from the household (usually the breadwinner) and incarcerated.

Conclusion

Research on prison construction reveals a trend toward fewer prisons being built in the near future, but individual facilities will become larger (Dallao 1997). Another trend taking place is that facilities being built today are different from the ones built in the past (Dallao 1997). These trends appear to be national in scope. Other trends worth examining are the use of more technology, the use of more prefabricated materials, and higher costs of prison construction.

In the wake of the severe economic recession of 2008–2009, prison construction has slowed in many areas even while there has been a shift toward increased acceptance of prison-building projects in the eastern region of the United States (Reutter 2010). This trend is a complete reversal of the previous prison construction trend. Although prison construction has shifted eastward to a degree and fewer prisons are being built, the overall trend is still toward long periods of incarceration. In recent years, federal prisons and the numerous jails throughout the country have experienced a climb in prison population as a result of a crackdown on immigration. This, too, seems a trend that likely will continue—unless new laws are enacted that overhaul the current immigration system.

PRISON SEXUAL ASSAULT

Tawandra L. Rowell

With the increase in the number of persons incarcerated over the past few decades, the problem of prison sexual assault has become a matter of concern and controversy. Although there is limited empirical evidence on sexual behavior in correctional environments and much debate over the occurrence and frequency of sexual assaults in total institutions, criminologists acknowledge that sexual assault occurs on a regular basis (Bosworth and Carrabine 2003; Struckman-Johnson and Struckman-Johnson 2000; Wooden and Parker 1982). Many concerns apply to those involved in prison sexual assaults, which are traumatic experiences that have consequences for both inmates and correctional officials, including an increase in the escalation of violence within the institution (Fleisher 1989), suicide (Hanser 2002; Lockwood1980), and related health issues, such as HIV (Gido 2002; McGuire 2005).

Background

According to Beck and Hughes (2005), over the past 20 years the total number of inmates who have been sexually assaulted has probably exceeded 1 million. Sexual assaults in correctional environments are difficult for inmates to escape owing to the highly controlled environment of correctional institutions. Because of this restrictive environment of the prison setting (inmates are prevented from roaming the facility freely), sexual assaults are often heard, witnessed by other inmates, and most often rumored to have taken place (Tewksbury1989a), making these public events. This creates fear and anxiety among other inmates housed within the facility, which can also lead to other forms of violence (Dumond 1992).

Perhaps one of the most frustrating aspects of examining nonconsensual sexual behavior in prison environments is the lack of a clear definition from which to operate. The majority of studies fail to define the sexual terminology for the readers who must interpret their findings (Saum et al. 1995). It is also not uncommon for prison sex researchers to create confusion for inmates participating in such studies when they fail to define whether the behavior being studied is in fact considered sexual assault (Kunselman et al. 2002).

Various definitions have been used to study prison sexual assault, which could be partly responsible for the wide range of rates of male prison sexual assault (Davis 1968). However, even though various questions and definitions have been utilized, over the past few decades a limited number of prison sexual assault studies have given rough estimates regarding the prevalence of sexual assaults in correctional institutions. The findings indicated that between zero and 21 percent of inmates are involved in sexual assaults (Struckman-Johnson and Struckman-Johnson 2000; Davis 1968; Hensley, Tewksbury and Castle 2003; Struckman-Johnson et al. 1996; Tewksbury 1989b).

Both male and female inmates are affected by prison sexual assaults. Although female sexual assault in prison had been documented as early as 1968 (Fishman 1968), the vast majority of research on sexual assault in prison environments involves male inmates (Gaes and Goldberg 2004). Sexual assaults involving female prisoners are rare, largely because most researchers have assumed that sexual behavior between female inmates occurs on a consensual basis (Owen 1998).

In male prison environments especially, the exhibition of aggressive behavior, especially aggressive sexual behavior, promotes individuals to a higher status in the prison sexual hierarchy, one that ensures that they will be relatively free of the threat of violence from others (although there are exceptions), which aggressively furthers an individual's goal of exhibiting his masculinity (Kupers 2001). Prison sex researchers would agree that inmates engaging in sexual assaults can be placed into certain nearly universal categories, particularly as punks, jockers ("studs"), or wolves (Donaldson 1993).

Inmates involved in prison sexual assaults are labeled based on the sexual roles they portray (Struckman-Johnson et al. 1996). This determines the treatment that inmates receive from their fellow inmates as well as from correctional officers (Saum et al. 1995). Then, should they ever be transferred or incarcerated elsewhere, their labels follow them from institution to institution (Struckman-Johnson 1996).

Prison Sexual Assault Research

Studies of Female Sexual Assault

Over the past decade, only a few studies on sexual assault involving female inmates have emerged. Struckman-Johnson and colleagues (1996) examined sexual coercion among female and male inmates in Nebraska correctional facilities. Approximately 7 percent of their female respondents reported that they had been sexually coerced. Next, Struckman-Johnson and Struckman-Johnson (2000) examined sexual assault within seven correctional institutions in the Midwest. The authors reported that between 6 and 9 percent of their sample had been sexually assaulted.

Utilizing letters sent by one female offender over a five-year period, Alarid (2000) qualitatively examined sexual coercion among female inmates. She discovered that such behavior between female inmates is predominantly consensual and that the sexual coercion that does occur in this environment is generally not reported to correctional authorities. According to Alarid, 75 to 80 percent of female inmates tend to experiment with or be involved in some type of consensual sexual relationship while incarcerated, which is in direct contrast with what has been reported in male correctional institutions, where sexual assaults are believed to be more violent and to involve more inmates.

Studies of Male Sexual Assault

Even though prison sex researchers have largely ignored female inmates, studies of male prison sexual assault are also relatively scarce. Such studies tend to report higher

prevalence rates than those conducted in female correctional institutions (Struckman-Johnson and Struckman-Johnson 2000; Tewksbury 1989b). In 1968, Davis conducted one of the first empirical studies designed to examine prison sexual behavior by examining sexual assaults within the Philadelphia Prison System (PPS). He interviewed 3,304 out of 60,000, or approximately 5 percent, of all inmates who passed through the PPS over a two-year period. According to Davis, the sexual assaults in PPS were indicative of an environment that encouraged aggressive sexual behavior.

Since Davis's study was conducted in 1968, results from numerous empirical studies on sexual behavior, particularly sexual assault, among male inmates have been published (Struckman-Johnson and Struckman-Johnson 2000; Tewksbury 1989b). Although 3 percent of Davis's respondents admitted to being victims of prison sexual assaults, estimates from more recent studies indicate that the proportion of male inmates involved in sexual activities while incarcerated, both consensual and nonconsensual, could exceed 15 to 20 percent (Struckman-Johnson and Struckman-Johnson 2000; Wooden and Parker 1982). Nonconsensual sexual behaviors are reportedly the most frequent type of sexual behavior occurring in correctional institutions (Hensley, Koscheski, and Tewksbury 2005). Table 1 summarizes the limited number of previous studies on male prison sexual assault.

In the 1980s a renewed interest sparked a series of prison sexual assault studies. These produced low prevalence estimates (Owen 1998), ranging from 1 to 28 inmates. Over the past 10 years, prison sex researchers continued their inquiries, leading to additional studies attempting to document the frequency and dynamics of prison sexual assaults. This next series of studies captured estimates ranging from 2 to 375 inmates, perhaps the highest prevalence rate yet reported (Owen 1998). Even though the rates vary, the fact that sexual assaults are occurring in correctional environments should compel correctional authorities and criminal justice professionals to devote more attention to this important issue (Struckman-Johnson et al. 1996).

Until recently, prison sexual assault was largely neglected by researchers and legislators. However, the few studies that have been conducted provide important information regarding the extent to which incarcerated individuals are involved in coercive sexual activities. More recently, the federal government has recognized the serious situation involving sexual assaults in correctional settings, passing the first piece of legislation designed to address the issue of sexual assault in correctional environments.

Challenges in Prison Sexual Assault Research

Disclosure

Prior literature has insisted that the underreporting of sexual assault is consistent and universal (Watkins and Bentovin 2000). Many inmates, particularly male inmates, are reluctant to admit any behavior that may result in their being considered less masculine (Wooden and Parker 1982). For instance, only 29 percent of the victims in

THE CORRECTIONS OFFICERS HEALTH AND SAFETY ACT

In 1998, the U.S. House of Representatives approved the Corrections Officers Health and Safety Act of 1998, which requires mandatory HIV testing of federal prisoners sentenced to a period of incarceration of six or more months.* Even with the approval of the Corrections Officers Health and Safety Act legislation in 1998, mandatory HIV testing programs have been slow to develop. To date, only 19 state prison systems require HIV testing upon entry into correctional institutions; a few others routinely offer voluntary testing or provide it upon request or clinical indication.**

Since many inmates and correctional officers may be exposed to HIV/AIDS while housed or employed in a correctional environment, the need to diligently focus on the impact of sexual assault cannot be overemphasized. However, research regarding sexual assault is difficult to conduct in prison environments. Prison sex researchers have admitted that there are significant challenges related to conducting research in this area, including gaining access to prison populations and convincing inmates to disclose such sensitive information.**

**H. M. Eigenberg, "Male Rape: An Empirical Examination of Correctional Officers' Attitudes toward Male Rape in Prison." *Prison Journal* 68 (1989): 39–56.

Struckman-Johnson and colleagues' (Tewksbury 1989b) study of 1,700 male inmates reported their sexual assault experience to correctional authorities. When inmates do agree to participate, convincing them to report their participation in sexual behavior honestly can be challenging. Even when researchers and research teams emphasize that participants' responses will be completely confidential and anonymous, it may be difficult to convince inmates to disclose such sensitive personal information.

Prisoners may underestimate their participation in this behavior because they are concerned with possible repercussions from fellow inmates and correctional officers (Kunselman et al. 2002). Some researchers would argue that there is a widespread inmate code or culture that discourages inmates from reporting sexual assaults regardless of their roles in such behavior (Stastny and Tyrnauer 1982).

The Inmate Code

The inmate or prison code, as it is commonly known, includes a set of unwritten rules designed to help new inmates survive in the prison community. As in the case of other subcultures of deviance, inmates are expected to conform to unorthodox norms, in this case the inmate code. Clemmer (1958) claimed that inmates show solidarity and heighten their status by adhering to the inmate code. Those who refuse to conform to the prison

subculture distance themselves from their fellow inmates, which can lead to serious consequences. For those who conform to the prison subculture, the social distance between them and their fellow inmates is reduced, which can contribute to developing positive relationships. These, in turn, can later serve to protect inmates from abuses such as sexual assault (Fong and Buentello 1991).

Embarrassment at having been sexually victimized or fear of being prosecuted for the perpetration of a sexual assault may discourage participants from disclosing such behavior. Since engagement in sexual assault stigmatizes inmates, they are reluctant to admit that these events occur (Kunselman et al. 2002). Although previous studies demonstrate that male inmates are willing to disclose some information (Struckman-Johnson and Struckman-Johnson 2000; Wooden and Parker 1982), the choice to reveal information regarding one's involvement in sexual assault in the prison environment can have consequences, making inmates reluctant to truly admit their involvement in sexual assaults for fear of being considered "snitches" (Clemmer 1958).

Snitching

Snitching, or providing information to correctional officials about events that have transpired or will transpire in the institution, is strictly forbidden by the prison inmate code. This is perhaps its most important violation and a taboo that has stubbornly persisted (Clemmer 1958). Anyone who dares to report such an occasion to prison authorities will surely endure severe consequences, including physical injury, constant taunting and verbal threatening, and even death on some occasions. "If an inmate reports a sexual assault, even without naming the assailant, he will be labeled a 'snitch,' and a contract will automatically be placed on him, and his life expectancy will be measured in minutes" (Cahill 1990).

The severe consequences associated with snitching protect even rapists from being reported to correctional authorities (Struckman-Johnson et al. 1996). Snitches often find themselves in protective custody, or PC, for their own protection. Convincing prisoners to admit involvement in sexual activities while incarcerated has proven difficult for many researchers. Therefore it is especially important that the research team emphasize the confidential and anonymous nature of inmates' their responses.

Generalizability

Most studies on inmate sexual assault have involved one correctional institution, making generalizations regarding other correctional institutions statistically impossible. However, the information gained from these studies can help to elucidate the nature of prison sexual assaults and the extent to which inmates are exposed to sexually transmitted infections in this environment. Many criminal justice researchers have been able to capture the nature of sexual behavior in male correctional environments. As reported earlier,

THE PRISON RAPE ELIMINATION ACT OF 2003

In 2003, President George W. Bush signed the Prison Rape Elimination Act of 2003 (PREA), which requires correctional institutions to provide data on sexual assaults within their respective facilities. The PREA was initially proposed owing to dissatisfaction with the lack of research being conducted on rape in America's prisons. Additionally, it seeks to address the insufficient training of correctional officers and deficiencies in correctional officials' response to sexual assault in their respective facilities (Prison Rape Elimination Act of 2003, Public Law No. 108–79).

A National Prison Rape Elimination Commission was established to examine federal, state, and local policies regarding prevention of prison sexual assault.

The PREA requires a firm commitment from the nation's correctional institutions. Since the PREA has been implemented, increased attention has been focused on sexual assaults in correctional environments. This is particularly important given the public health consequences for those engaged in these types of activities.

researchers have reported that a fair number of inmates admit to engaging in these types of behaviors. Future research efforts in this area can be worthwhile and could provide much needed insight into inmates' involvement in prison sexual assaults.

Consequences of Sexual Assaults

Numerous consequences may afflict those involved in sexual assaults. Although prison sexual assault studies examine the prevalence of such behavior, they rarely focus on the consequences affecting the individuals that are involved (Dumond and Dumond 2002). All of those involved may experience some physical consequences, particularly the risk of contracting an infectious disease. However, these inmates may experience other physical injuries as well.

Sexual assaults are very devastating experiences for victim, who reportedly experience many emotional, physical, and psychological sequelae (Krebs 2006; Robertson 2003). Victims admit experiencing frequent suicidal thoughts, and some have attempted to commit suicide. Lockwood claimed that 38 percent of the sexual assault victims in his study admitted to having contemplated suicide. Thirty-six percent of Struckman-Johnson's (1996) Nebraska prisons sample indicated that they had experienced suicidal thoughts.

Although most victims do not physically harm themselves following involvement in sexual assaults, there are other physical consequences for those involved in such events. Sexual assaults are usually quite violent and involve the infliction of injuries onto victims and sometimes perpetrators as well (when victims choose to fight back). Physical injuries sustained in sexual assaults include lacerations, bruising, tissue damage, abrasions, and internal injuries (Dumond 2001). In the case of male inmates, sexual assaults usually

involve more than one aggressor, thus increasing the likelihood that this pursuit will be successful (O'Donnell 2004), which also inflicts more pain and injury on the victim. Sexual assaults have occasionally caused the death of victims (Saum et al. 1995). All inmates who are involved in some capacity in sexual activity while incarcerated run the risk of contracting an infectious disease (Dumond 2001).

Spread of Infectious Diseases

Correctional institutions tend to concentrate individuals with infectious diseases (Hammett, Harmon, and Rhodes 2002). In the United States, the prevalence of infectious diseases is approximately four times greater among prisoners than among the general population (Golembeski and Fullilove 2005). Especially where male inmates are concerned, the risk of contracting sexually transmitted diseases from other inmates is greatly increased. This is an especially serious concern because those who are incarcerated generally engage in more risk-taking behavior, which may place them at risk for contracting HIV/AIDS (Grinstead et al. 1999; Krebs and Simmons 2002).

Generally condoms are not readily available in prison. Ninety-six percent of prisons consider condoms contraband (Hammett, Harmon, and Maruschak 1999). This is especially problematic given the fact that many inmates habitually engage in risky sexual behavior, and these behaviors continue in prison (Krebs and Simmons 2002).

Since the majority of correctional systems do not provide testing for infectious diseases unless an inmate has a valid reason for requesting it (reasons can range from being exposed to blood in the workplace to being involved in a fight with another inmate) (Krebs and Simmons 2002), it is difficult to report the rates of infectious diseases accurately. The spread of infectious diseases such as tuberculosis (TB), hepatitis B (HBV) and C (HCV), human immunodeficiency virus (HIV), and acquired immunodeficiency syndrome (AIDS) in correctional communities has been documented (Beck and Hughes 2005; Braithwaite and Arriola 2003). However, HIV/AIDS in this environment is becoming the most pressing concern for correctional authorities.

According to Swartz, Lurigio, and Weiner (2004), the first AIDS case was discovered among prison inmates in 1983. Since this discovery, the spread of HIV/AIDS in correctional settings has been documented (Andrus et al. 1989; Dean, Lansky, and Fleming 2002). The prevalence of AIDS infection is over twice as high in state and federal prisons than among the general U.S. population, and in previous years it has been as much as five times higher (Braithwaite and Arriola 2003; Bureau of Justice Statistics 2009). Every state in the nation has reported at least one male HIV-positive inmate (Krebs and Simmons 2002). In 2008, national data from the Bureau of Justice Statistics indicated that an estimated 19, 924 state inmates and 1,538 federal inmates were HIV-positive.

Conclusion

With the passage of the PREA, interest in the sexual behavior of inmates is expected to increase, hopefully producing research surpassing that which has been conducted in the past. Continued research in this area could have tremendous implications for individuals who are negatively affected by prison sexual assaults. It is hoped that the increase in inquiries will lead to more innovative approaches to examining such a taboo and timely topic, which will eventually lead to more effective and thorough approaches that will fulfill the directive of the Prison Rape Elimination Act (PREA) eliminating sexual assaults in correctional environments.

It is especially important to gather information on HIV risk-related behavior while individuals are still incarcerated. Previous studies on male prison sexual assaults pose many problems, from ineffective sampling techniques that limit generalizability to failing to include important information in the wording of questionnaires. Further research in this area is desperately needed. It could help correctional officials to develop interventions designed to inform and protect those who are believed to be vulnerable to such attacks. Further studies should aim to evoke serious discussion about sexual assault in U.S. correctional institutions.

Correctional institutions are responsible for providing safe and secure living and working environments that will help incarcerated individuals to become productive members of society upon their release. If inmates are persuaded to provide correctional authorities with essential information regarding such behavior, it may encourage the latter to develop programs and allow interventions designed to address these issues. Since the passage of the PREA in 2003, correctional authorities have been required to provide information regarding the number of sexual assaults occurring in their facilities. Further research on prison sexual assault involving inmates and correctional staff could bring awareness of the situation to correctional authorities, possibly prompting them to address this issue more effectively.

The majority of incarcerated individuals return to their communities after a stay of three to five years (Blumstein and Beck 1999, 17–61). Since individuals at risk of contracting HIV frequently move between their home communities and prisons, those who engage in sexual assault will have the potential to transmit it to those residing in their home communities once they are released, which is increasingly becoming a topic of discussion (Braithwaite et al. 2005). An inmate's involvement in sexual assaults while incarcerated can have a tremendous impact on the communities to which they will return. Given the fact that most prisoners will resume sexual activity soon after release (Dolan, Lowe, and Shearer 2004), continuing to ignore such a serious issue can have severe consequences for society overall.

PRISONS—SUPERMAX

Jeffrey Ian Ross

Supermax prisons are controversial for several reasons, not limited to their lockdown policies, lack of amenities, prisoner isolation techniques, strategies of dehumanization, and overall conditions of confinement. Over the past two decades in the United States, correctional systems at the state and federal levels have introduced or expanded the use of supermax prisons (King 1999). These facilities—also known as special (or security) handling units (SHUs) or control handling units (CHUs)—are either stand-alone correctional institutions or wings or annexes inside an already existing prison.

Background

Supermax prisons are a result of the recent growth in incarceration that has occurred throughout many of the world's advanced industrialized countries (Toch 2001). In October 1983, after the brutal stabbing to death of two correctional officers by inmates at

the federal maximum-security prison in Marion, Illinois, the facility implemented a 23-hour-a-day lockdown of all convicts. The institution slowly changed its policies and practices and was retrofitted to become what is now considered a supermax prison. In 1994, the federal government opened its first supermax prison in Florence, Colorado, specifically designed to house supermax prisoners. The facility was dubbed the "Alcatraz of the Rockies."

In the years that followed, many state departments of corrections built their own supermax prisons. Part of the reason for the proliferation of supermax prisons is the conservative political ideology that started in the Reagan administration (1981–1989). During the 1980s, as a response to an increase in the public's fear of crime and to the demise of the "rehabilitative ideal," a punitive agenda took hold of criminal justice and led to an increased number of people incarcerated. This approach was carried forward by George H. W. Bush (1989–1993), Reagan's Republican successor.

Originally designed to house the most violent, hardened, and escape-prone criminals, supermaxes are increasingly used for persistent rule breakers, convicted leaders of criminal organizations (e.g., the Mafia) and gangs, serial killers, and political criminals (e.g., spies and terrorists) (Lovell et al. 2001; Bruton 2004). In some states, the criteria for admission into a supermax facility and the review of prisoners' time inside are very loose or even nonexistent.

The number of convicts being sent to supermax prisons is growing. The supermax maintained by the Federal Bureau of Prisons (FBOP) in Florence, Colorado, for example, incarcerates about 430 people, including such notable criminals as "Unabomber" Ted Kaczynski, Oklahoma City bombing coconspirator Terry Nichols, and former FBI agent and Soviet/Russian spy Robert Hanssen. Nevertheless, only a fraction of those incarcerated in state and federal prisons are sent to a supermax facility. In 2004, approximately

25,000 inmates were locked up in this type of prison, representing well under 1 percent of all the men and women who are currently incarcerated across the country (Harrison and Beck 2005; Mears 2005).

The U.S. detention facility located at the Guantanamo Bay military installation is effectively a supermax prison. It houses approximately 190 persons suspected of participating in terrorist activities directed against the Unites States. Numerous controversies, however, surround the Guantanamo detainees and their legal status. Indeed, the prison itself is considered by many to lie outside the jurisdiction of the U.S. legal system, although the U.S. Supreme Court has ruled that the prisoners must, at least be allowed to challenge their detentions in U.S. courts. Because of the controversies involved, the Guantanamo prison is slated to close in 2011 or 2012 and an existing facility in Thomson, Illinois, is to be outfitted as a supermax unit to house most of the remaining detainees.

Conditions of Confinement

One of the more notable features of all supermax prisons is the fact that prisoners are typically locked down 23 hours a day. Other than supervision by correctional officers (COs), prisoners have virtually no contact with other people (fellow convicts or visitors). Access to phones and mail is strictly and closely supervised or restricted. Supermax prisoners have very limited access to privileges such as watching television or listening to the radio.

Supermax prisons also generally do not allow inmates to either work or congregate during the day. (There are notable exceptions. The Maryland Department of Corrections, for example, allows some supermax inmates to congregate during yard time.) In addition, there is absolutely no personal privacy; everything the convicts do is monitored, usually through a video camera that is on all day and all night. Communication with the correctional officers typically takes place through a narrow window on the steel door of the cell and/or via an intercom or microphone system.

Although cells vary in size and construction, in general, they are 12 by 7 feet in dimension. A cell light usually remains on all night long, and furnishings consist of a bed,

a desk, a stool made of poured concrete, and a stainless steel sink and toilet. In spite of these simple facilities and the fact that prisoners' rehabilitation is not encouraged (and is next to impossible), supermax prisons are more expensive than others to build and run.

In supermaxes, inmates rarely have access to educational or religious materials or services. Almost all toiletries (e.g., toothpaste, shaving cream, and razors) are strictly controlled (Hallinan 2003). When an inmate is removed from his cell, he typically has to kneel down with his back to the door. Then he is required to place his hands through the door to be handcuffed.

Effects of Incarceration

When it comes to supermax prisons, the mass media and academia have been relatively silent because it is difficult for reporters and researchers to gain access to these or most other penal facilities. In addition, correctional professionals are reluctant to talk with outsiders for fear that they may be unnecessarily subjected to public scrutiny. And even though comprehensive psychological data on individuals kept in these facilities are lacking, numerous reports have nonetheless documented the effects.

All told, the isolation, lack of meaningful activity, and shortage of human contact takes its toll. Supermax prisoners often develop severe psychological disorders, including delusions and hallucinations, which may have long-term negative effects (Rhodes 2004). Furthermore, the conditions inside supermax prisons have led several corrections and human rights experts and organizations (like Amnesty International and the American Civil Liberties Union) to question whether these prisons are a violation of (1) the Eighth Amendment to the U.S. Constitution, which prohibits the state from engaging in cruel and unusual punishment and/or (2) the European Convention on Human Rights and the United Nations' Universal Declaration of Human Rights, which were established to protect not only the rights of people living in the free world but also of those behind bars.

Supermax prisons have plenty of down sides, and not just for the inmates (Lippke 2004). Some people have suggested that all supermax prisons are part of the correctional–industrial complex (see, for example, Christie 2003). Most of the supermaxes in the United States are brand new or nearly so. Others are simply freestanding prisons that were retrofitted. According to a study by the Urban Institute, the annual per-cell cost of a supermax is about $75,000, compared with $25,000 for each cell in an ordinary state prison.

We have plenty of superexpensive supermax facilities—two-thirds of the states now have them. But they were designed when crime was considered a growing problem, and now we have a lower rate of violent crime, which shows no real sign of a turn for the worse. However, as good as these prisons are at keeping our worst offenders out of the way, the purpose of the supermax is in flux.

Conclusion

No self-respecting state director of corrections or correctional planner will admit that the supermax concept was a mistake. And one would be wrong to think that these prisons can be replaced by something drastically less costly. But prison experts are beginning to realize that, just like a shrinking city that finds itself with too many schools or fire departments, the supermax model must be made more flexible in order to justify its size and budget.

One solution is for these facilities to house different types of prisoners. In May 2006, Wisconsin Department of Corrections officials announced that, over the past 16 years, the state's supermax facility in Boscobel—which cost $47.5 million (in 1990) and has a capacity of 500 inmates—has always stood at 100 cells below capacity. It will house maximum-security prisoners, or serious offenders, but individuals who represent a step down from the worst of the worst.

The Maryland Correctional Adjustment Center, also known as the Baltimore Supermax prison, opened in 1989 at a cost of $21 million with room for 288 inmates. Like its cousin in Wisconsin, it has never functioned at capacity. It holds not only the state's most dangerous prisoners but also 100 or so inmates who are working their way through the federal courts. It also serves as the home for Maryland's 10 death row convicts.

Converting cells is one approach, but not the only one. Other ideas include building more regional supermaxes and filling them by shifting populations from other states. This would allow complete emptying out of a given supermax and then closing it down or converting it to another use.

There is also the possibility that some elements of the supermax model could be combined with the approaches of traditional prisons, creating a hybrid that serves a wider population. But different types of prisoners would have to be kept well away from each other—a logistical problem of no small concern.

PUBLIC DEFENDER SYSTEM

Roslyn Muraskin and Matthew Muraskin

For over 50 years now, indigent defendants—that is, those accused of crimes but unable to afford an attorney—have had the right to obtain legal counsel at no cost to themselves by making use of state public defender systems. With that central point settled, the controversies in this area revolve around a number of other issues. For instance, when does the right to use a state-appointed attorney come into play in the state's intervention into a person's life as law enforcement attempts to find culpability for a criminal offense? Is there an appropriate time when the right to counsel may be waived by an accused indigent? Answers to these questions affect the lives of most persons accused of a criminal offense in the United States. For example, in 1998, two-thirds of federal felony defendants could not afford to retain their own counsel, and in 75 of the most populous counties in the United States the figure was 82 percent (U.S. Department of Justice 2001). Other issues have to do with such questions as what is the best way to provide legal services for the indigent and what level of poverty qualifies one for assigned counsel.

Are we reaching indigents who reside outside of the most populous areas in the country? Finally, and overarching most or all of these issues, is the public defender system capable of handling the task we have assigned it using the resources we have provided?

Background

The Sixth Amendment to the U.S. Constitution provides that "[I]n all criminal prosecutions, the accused shall enjoy the right to…have the Assistance of Counsel for his defense." Even earlier than that, Benjamin Austin argued at the Constitutional Conventions, "As we have an Attorney General who acts in behalf of the State, it is proposed that the Legislature appoint another person (with a fixed salary) as Advocate General for all persons arraigned in criminal prosecutions; whose business should be to appear in behalf of all persons indicted by the State's Attorney." (Smith and Bradway 1936, 53). But the idea remained dormant for the next 100 years.

In 1896, however, bills were introduced in 12 state legislatures to establish public defender officers. By 1917, public defender bills had been introduced in 20 states. By 1926, there were 12 working public defender offices, and by 1933 at least 21 offices were up and running in the United States (Barak 1980). However, the right to have such a defense was pretty much a hollow one until the middle of the 20th century, as the vast majority of defendants who were too poor to hire a lawyer on their own came from other jurisdictions. Indeed, the National Legal Aid and Defender Association reports on their Web site that, until the middle of the 20th century, most criminal defense lawyers worked on a *pro bono* basis even in capital cases after being appointed by the individual trial judges; and although there were a few programs to provide representation (i.e., the New York

PUBLIC DEFENDER

The idea of a public defender is actually quite old. Such a system existed in ancient Rome. Later, the ecclesiastical courts of the Middle Ages provided an office of advocate for the poor and an office of the procurator of charity. Both offices were honorable positions, as these courts recognized the needs of accused persons in matters of legal representation. As early as the 15th century, Spain has had an officer corresponding to a public defender. And in 1889, Belgium began a policy of public defense. By the turn of the 20th century, the laws of the following countries provided an office of defenders: Argentina, Belgium, Denmark, England, France, Germany, Hungary, and Mexico. In the United States, the following states had adopted public defender systems by 1993: California, Connecticut, Illinois, Indiana, Minnesota, Nebraska, Ohio, Tennessee, and Virginia.

City Legal Aid Society starting in 1896 and the Los Angeles Public Defender in 1914), such services were limited to the largest cities in the country.

Legal Developments

In 1932, the U.S. Supreme Court began a many-year process to change the law to require the appointment of counsel to indigents, first in state capital cases (*Powell v. Alabama*) and then, six years later, to all federal prosecutions *(Johnson v. Zerbst).* When faced with the question of requiring counsel for indigents in state noncapital cases in 1943, however, it refused to do so *(Betts v. Brady).* It was not until 1963, in *Gideon v. Wainwright,* that the right was extended to state felony cases, and in 1972 *(Argesinger v. Hamlin),* the Supreme Court held that there was a right to assigned counsel for an indigent in any type of criminal proceeding in which there was a possibility of incarceration. In 1961, the right was extended to pretrial situations at the very beginning of the judicial process (*Hamilton v. Alabama*) and even before, in postarrest interrogations (*Miranda v. Arizona* 1966) and lineups (*United States v. Wade* 1967), as well as after conviction on appeals (*Douglas v. California* 1963).

With the issue of an indigent's right to assigned counsel settled, there now is a vast and continually developing body of law, both federal and state, setting forth the parameters of exactly when the right to counsel attaches and whether and when it can be waived.

Counsel can be waived at any stage of the proceedings; however, the right to counsel attaches at the time of arraignment and even before if the police intend to conduct an interrogation or a lineup. The developing body of law primarily focuses on the factual circumstances surrounding whether there was a valid waiver or not. The controversy revolves around the facts. Did what happen amount to a waiver or not? Did the questioning start before the Miranda warnings; did they precede the questioning, or did they come afterward? Was the person in custody so as to require warnings?

A prime example would be as follows: A detective asks a defendant in custody if he wants to tell his side of the story. The defendant says yes, and before any Miranda warnings are given, the defendant starts to incriminate himself, at which point the officer finally gives Miranda warnings. The question is whether what took place before the warnings were given was substantive in nature or even whether it was a question to ask at all. There is no such thing as a little bit of questioning; you either are questioned or are not, and this is where controversy lies.

Indigent Defense Services

To implement the now required delivery of indigent criminal defense services, several different programs have developed within most localities. They presumably handle conflicts (i.e., multiple defendants or conflicting loyalties such as prior representation of

the victim now accusing the defendant), keep costs down, or provide work for private lawyers.

One method of delivery is by means of a public defender who is a government official, either appointed (i.e., New York) or elected (i.e., Florida) in a particular locality, who—along with his or her staff of lawyers, investigators, and so forth—provides representation to the indigent with a government budget line usually much lower than that of the district attorney. In some localities, such as New York City and its neighboring counties of Nassau and Suffolk, private and separate legal aid societies contract with the local government to provide the major representation in the same manner and structure as a public defender.

Service delivery may also be made with an assigned counsel panel of private lawyers who have agreed to provide representation, as selected, for a previously agreed and usually hourly fee set by a governmental body. The fee usually paid to the assigned counsel is much lower than the normal fee for the service. Indeed, in New York State, the hourly fee was raised to $75 in 2003, having been at $40 per hour since 1985. Another option to provide the required legal services is through a contract with one or more lawyers to handle a specific number of cases for a set fee.

Determination of indigence varies by locality and is usually done by the court making the assignment, the agency or lawyer to be assigned, or by some screening agency set up for that purpose or is a part of some other branch of the executive department of the locality.

According to the Bureau of Justice Statistics, 964 public defender offices across the nation handled 5.8 million indigent defense cases in 2007, at a total expenditure of $2.4 billion (U.S. Department of Justice 2009). This cost, however, is mostly a local one, with county governments in the 100 most populous counties picking up about 60 percent of the tab, although in some states such as New York it is a completely local cost. Maine is the only state having no public defender offices; it provides indigent defense services through private attorneys.

Misdemeanors accounted for about 40 percent of all cases handled by state-based public defender offices and about 50 percent of the cases handled by county-based offices. Misdemeanors were followed by non–capital felony cases (25 percent of state cases and 32 percent of county cases) and by appeals cases (1 percent and a negligible fraction, respectively) (U.S. Department of Justice 2009).

As for staffing and caseloads, the same statistics indicate that more than 17,000 attorneys were employed by public defender offices in 2007, some 4,000 at the state level and nearly 13,000 at the county level. Each state public defense attorney handled, on average, 147 misdemeanor cases, 88 felony cases, and 3 appeals cases in 2007. County-based public defenders handled, on average, 164 misdemeanors and 2 appeals. Half of all state-based public defender offices had formal caseload limits in place in 2007, whereas less than one fifth of county-based programs had the same limits. (In nearly 40 percent

of the county-based programs, however, attorneys had the authority to refuse appointments because of caseload.) (U.S. Department of Justice 2001).

Stresses to the System[1]

Over the past several years there have been an increasing number of cases in which public defenders' offices, underfinanced and overburdened with cases, have failed to meet expectations. Indigent defense programs in Louisiana, Florida, Georgia, Missouri, Kentucky, New York, and Michigan, among others, have been identified as needing overhaul. Indeed, in some cases it is the public defenders themselves who have sued for changes, as they recognize that they no longer can manage high caseloads and at the same time provide adequate representation to each of their clients. Often, there is pressure on defendants to plead guilty to lesser charges in exchange for lighter sentences—one way to avoid the time and expense of a trial. This and other forms of "rushed justice," along with instances of faulty lawyering (stemming from unmanageable caseloads and/or inadequate training and experience), have produced a rise in the number of wrongful convictions. State budget cuts across the nation in the wake of the 2008–2009 financial crisis have only made matters worse (Eckholm 2008; "Hard Times" 2008; Glaberson 2010).

Whether the trend will turn around anytime soon is an open question at this point. Louisiana, for one, has implemented large-scale changes intended to ensure that both the letter and spirit of *Gideon v. Wainwright* are addressed. New York only recently (2010) was ordered by the state supreme court to fix its broken public defender system, and what that state does may serve as a model for other states. Meanwhile, several states and districts faced with challenges to their public defender systems have already begun the process of self-examination and public discussion.

RACIAL, NATIONAL ORIGIN, AND RELIGION PROFILING

Judith Ann Warner and Karen S. Glover

Racial profiling has eclipsed most other criticisms of the police–minority and immigrant relationship and has emerged as perhaps the most controversial social issue in that area. Singling out an individual on the basis of race or national origin for law enforcement scrutiny is generally called racial profiling. *Profiling* refers to criteria police use for traffic stops, but some definitions expand it to any police contact on the basis of suspicion in public spaces, and it is applied in the examination of immigration enforcement. A classic scenario involves a traffic stop of a minority motorist who is under suspicion for the possession of contrabands, specifically illegal drugs. An emergent scenario is the stopping of a Latino and questioning about documentation authorizing him or her to be in the country legally. The import of examining the traffic stop in particular is that it is potentially the first step into the criminal justice system and thus its effects are far-reaching.

Although the association of physical attributes with criminality has a long history, going back at least to Cesare Lombroso's "criminal man" theory from the late 19th century (Fattah 1997), the concept of racial profiling has been articulated as a particularly pressing social problem for our times and thus may be viewed as a somewhat distinct and more narrow issue than the more general concept of ethnic stereotyping. Should a person who appears to be racially different or of different national origin be stopped by law enforcement or questioned in public or in his or her home? Many unauthorized entrants and permanent resident aliens, on the surface, appear to be racially different

or stand out because of ethnic or cultural differences. As a result, law enforcement has practiced racial and national-origin profiling in seeking out unauthorized immigrants for stops on the basis of suspicion of lacking documents or suspicion of committing a crime.

Key Events

Racial profiling processes in the police–minority relationship in the 21st century are embedded within a long history of minority stereotyping. The minority community, long vocal about a tense relationship with law enforcement that constrained citizenship protections, finally received confirmation of their suspicions following the publication of information on *Operation Pipeline,* the Florida drug interdiction program that linked minority status with drug trafficking.

More generally, racial profiling dominates the public discourse, particularly in minority communities, following high-profile events such as the killing of Amadou Diallo or the beating of Rodney King. Community members express outrage at these events and understand them as a consequence of race-based policing. After September 11, 2001, and the linking of terrorism with Middle Eastern identity that followed, the public discourse surrounding racial profiling assumed a different tone, even among many who were once adamantly opposed to the practice. "National security" concerns appeared to trump certain civil liberties immediately following the attack, although with the passage of time, this apparent dichotomy has subsided.

Since 9/11, immigrants have been singled out because they have come from terrorist-harboring nations or because they follow the traditional customs—in dress and so on—of Islam. This too is gives rise to profiling, on the basis of national origin, ethnicity, or religion as well as race. All are forms of profiling are controversial law-enforcement practices because they discriminate against the targeted groups. Profiling can be seen as a form of harassment of targeted immigrant communities. It is viewed as a discriminatory cause of differential crime rates between groups because people from profiled groups are more likely to be stopped by law enforcement or the U.S. Border Patrol and Immigration and Customs Enforcement. Nevertheless, officers need to identify unauthorized entrants and criminal suspects. How this is done is a subject of great controversy. Although racial profiling of citizens by police has been questioned, profiling of noncitizens on the basis of race, national origin, and religion has been a tool used in the war on terror and legitimated by the Supreme Court. At the same time, few citizens are aware of the extent to which their own rights are curtailed within 100 miles of a national border or by legislation passed to fight the war on terror.

Background

After passage of the 1965 Immigration and Nationality Act, the number of racially and ethnically diverse entrants into the United States increased. However, race is now

understood to be more of a cultural idea than a biological reality (Omi and Winant 1994). Although race is a social concept constructed to justify hierarchical rankings between groups as "natural," many Americans still differentiate between racial groups based on skin color and other misleading observations. As a result, many white Americans have reacted very negatively to the perceived racial and cultural differences of the new immigrant population. These negative perceptions have led to a tolerance of racial profiling in policing and immigration enforcement.

The emergence of racial profiling as a unique concept in policing discourse occurred in the 1990s amid a confluence of issues. On the heels of relatively high crime rates associated with drug trafficking in the 1980s, several major cities in the United States implemented crime-control strategies intended to crack down on minor infractions of the law. Drug interdiction policies assumed a priority position in the nation's public discourse and became more and more defined (both formally and informally) by racial and ethnic status issues as well as high-profile incidents of the abuse of force by the police—such as the Rodney King beating. The discovery of a cooperative effort in the 1980s and 1990s between the U.S. Drug Enforcement Agency and the Florida Department of Motor Vehicles, titled *Operation Pipeline,* has been identified as a critical point in the emergence of the racial profiling controversy. This drug interdiction program linked drug courier profiles to the racial and ethnic status of motorists traveling on state highways between Florida and the north (Withrow 2006). Opponents of racial profiling dubbed the regular traffic stops of minorities as due to the "crime" of *driving while black.*

As described by Covington, long-term claims by minorities of being targeted by the police were often viewed as anecdotal accounts from overly sensitive, angry, and disgruntled minorities (Withrow 2006). In part because official documentation of the phenomenon was nonexistent, much of the law enforcement community initially rejected the idea that race-based policing occurred. Indeed, the body of criminological research now available on racial profiling has been established only since the mid-1990s. This predominantly quantitative research focuses on issues of disproportionality in law enforcement–initiated traffic stops.

The main inquiry is whether minorities are subject to traffic stops (considered seizures under Fourth Amendment protections against "unreasonable search and seizures" by the state) disproportionate to their representation in the general driving population. Two early standards of proof guided police discretionary powers in stopping citizens: Fourth Amendment protections against unreasonable seizures without probable cause and later the 1968 U.S. Supreme Court decision in *Terry v. Ohio,* which introduced the legal standard of "reasonable suspicion" into the realm of police powers. Studies generally point to racial disparity in traffic stops, with more minority motorists relative to white motorists being stopped by law enforcement (Covington 2001). Additional inquiries of the racial profiling research agenda include whether minorities are searched more often, are subject to longer stops, receive more punitive measures if penalized during a stop,

and have higher "hit rates" for contraband once a traffic stop is made (Buerger and Farrell 2002). The bulk of the data on these additional inquiries suggests that the answer to all of the questions except the last, is yes. Other attempts to address racial profiling are found in popular press accounts and in legal journals. The legal journals in particular provide a great deal of information on racial profiling and emphasize important distinctions between legal and moral arguments surrounding this issue.

Once racial profiling of minorities became established in the nation's consciousness in the 1990s, Representative John Conyers (D-Michigan) introduced the Traffic Stops Statistics Act in 1997, which passed unanimously in the House of Representatives. Formidable opposition from national police organizations, concerned about the demands the bill would make on law enforcement, effectively neutralized the bill in the Senate (Withrow 2006). Recurring efforts to introduce a federal law to address the issue have followed, with varying degrees of success, including an executive measure by President Bill Clinton in 1999 mandating a nationwide collection of traffic stop data. Currently, most states have enacted or are considering legislation requiring the collection of data on traffic stops by local and state law enforcement. The combined federal and state efforts to collect data on racial profiling along with the lawsuit-generated studies (Withrow 2006), which provided the first empirical glimpse into the issue, have produced a body of data that generally point to racial disparity in the treatment of individuals subjected to examination in traffic stops by law enforcement (Johnson 2001).

The U.S. Department of Justice issued voluntary guidelines for collecting racial profiling data in 2000. These data are collected by the Racial Profiling Data Resource Center at Northeastern University. At present, at least 27 states are participating. The U.S. Department of Justice (2006), has demonstrated that young male African Americans (22 percent) and Latinos (17 percent) are more likely to be searched than non-Latino whites (8 percent). African Americans and Latinos are three times as likely as non-Latino whites to be threatened with force during a police stop. In Rhode Island, research indicated that minority members were twice as likely as whites to be searched during a traffic stop but less likely to be in possession of prohibited drugs (U.S. Department of Justice 2005). This reaffirms New Jersey research showing that African Americans and Latinos were the profiled targets of 75 percent of traffic stops resulting in a search in New Jersey.

The bulk of research on racial profiling concerns the causal dynamics of racial profiling and typically emerges from the conflict framework. For example, in a recent study, researchers used conflict theory to discuss the police–minority relationship and how the law is differentially enforced against minorities in order to protect white interests (Buerger and Farrell 2002). Other research looks at a conflict theory variant, group-position theory, to describe how dominant groups view the police as allies (Harris 2002). Some researchers have discussed how cognitive bias and its associated concept of in-group bias explain the disproportionate numbers of minority motorists stopped by

the police (U.S. Department of Justice 2006). Racial prejudice, although rarely directly discussed (and not necessarily subsumed under the previously mentioned concepts), is another factor in examinations of racial profiling motivations (U.S. Department of Justice 2005). Spatial context is also looked to in explaining racial disparities in policing behavior (Petrocelli, Piquero, and Smith 2004). For example, low-socioeconomic-status communities comprising minorities predominantly may be subject to more patrolling and stops.

The empirical focus on racial disparity in traffic stops was followed by quantitative studies addressing factors leading to an individual's "perception" of being racially profiled (Wilson, Dunham, and Alpert 2004). Theory about the factors that shape citizens' "perceptions" of racial profiling focus on citizens' personal and vicarious experiences (Parker et al. 2004). Racial status is a determining factor in attitudes toward the police. Some theorize that the overall experience of racial oppression and other social institutions operates as a "priming" mechanism for minorities in shaping perceptions of police behavior (Bennett et al. 2004; Tyler and Wakslak 2004; Weitzer and Tuch 1999; Weitzer and Tuch 2004). Studies examining the effects of socioeconomic and racial status on perceptions of discrimination by the police have shown that class is not protective of negative perceptions of the police (Brown and Benedict 2002; Weitzer and Tuch 2005). Research examining the concept of procedural fairness to predict perceptions of racial profiling indicates that the quality of decision making, quality of treatment, and inferences about trustworthiness are the key criteria for minorities in assessing police behaviors (Weitzer and Tuch 2005). "Perception"-orientated research, however, has the potential to be critiqued for its emphasis on the psychological and the individual. There is the concern

RACIAL PROFILING AND DRUG INTERDICTION

Racial profiling is very much an issue of drug interdiction. Research on the common characteristics of suspected drug traffickers shows the wide range of traits that have been used to justify the targeting of individuals suspected of criminal activity.

- Minorities driving expensive or old vehicles or rental cars
- Nervousness when becoming aware of the police patrol car or excessive friendliness when approached by officer
- Large quantities of food wrappers, and so on, indicating a long road trip
- Too much or too little baggage
- Use of air fresheners
- Strict adherence to traffic codes upon noticing police patrol car
- Visible religious paraphernalia (to deflect suspicion)

RACIAL PROFILING OF A HISPANIC JUDGE: FILEMON VELA

David Harris, in his book *Profiles in Injustice* (2006), attests to how the Latino U.S. District Judge for South Texas Filemon Vela, was stopped by the U.S. Border Patrol in 1999 while on his way to hold court in Laredo, Texas. When he asked why his Ford Explorer was stopped, he was told there were too many people in the vehicle—although it could have held more. Judge Vela questioned whether the U.S. Border Patrol had the legal authority to stop him. Afterwards, his secretary made a complaint about the policies that resulted in this unjustified stop. The U.S. Border Patrol indicated that it would provide more information for officers so that only legal stops would occur.

In 2000, when Judge Vela was a passenger in another vehicle, he was stopped again. This time the reason given was that the car had tinted windows. These incidents convinced Judge Vela that all Hispanics are profiled to be stopped. Observation has been made that in any area designated as a border, whether an international airport or a highway close to the U.S.–Mexico border, government agents can stop and search people without a warrant, probable cause, or even a reasonable suspicion. The Supreme Court permits this on the basis of national sovereignty. The Court maintains that border stops and searches are legal because they are at the border. Farther inland, at checkpoints located away from a geographical border, the U.S. Border Patrol has wide discretion to act, including on the basis of Mexican physical appearance as one of multiple factors.

that research that treats racial matters in the context of "perceptions" or "ideas" has the effect of distancing structural elements of racial oppression. Examining racial matters as merely ideas "limits the possibility of understanding how it shapes… life chances" (Weitzer and Tuch 1999, 494–507).

The *Whren* Decision

The U.S. Supreme Court's 1996 decision in *Whren v. United States* is perhaps the most important legal ruling concerning racial profiling in the modern era. *Whren* examined whether the police could make a legal traffic stop under pretext. The Court determined that regardless of the initial subjective intentions of the police officer, an objective reason for a stop would make the stop legal (Johnson 2001). A classic example occurs when an officer suspects a motorist of possessing contraband but makes a traffic stop on the motorist under the "pretext" of failing to properly signal or some other minor traffic code violation. The officer then asks for the motorist's consent to search the vehicle, knowing that most citizens do not know that they have a right not to consent to a search. Although an argument may be made that the minor traffic code violation justifies the stop, the decisions about which motorists get stopped for the objective violation is the fundamental concern of racial profiling opponents. In a racially ordered society such as the United States, it is argued, minorities will bear the brunt of this form of policing. The 1996 *Whren* decision is viewed as a lesser standard of proof that an officer has to meet in

order to make a legal stop and therefore represents a broadening of police discretionary powers. Other legal rulings in recent years demonstrate the debate that surrounds the racial profiling controversy.

This has happened so often in traffic that, as mentioned above, it is referred to as driving while black. Skin color is a very dubious basis for making a traffic stop. Many African American professionals driving more expensive cars get stopped because a police officer suspects that the car is stolen. This is experienced as both harassment and a form of discrimination against African Americans. Law enforcement policies have been adopted to reduce these incidents, but African Americans are citizens, whereas many new immigrants are not. Permanent resident aliens and undocumented immigrants have no protection from profiling. Thus, there is a spate of associated terms: driving while brown, driving while immigrant and, most recently, driving while Arab. On the other hand, non-Hispanic white Americans are privileged to receive less police attention and are less likely to be caught for drug possession at a traffic stop.

Unauthorized Immigrant Racial Profiling

The U.S. Border Patrol and the Immigration and Naturalization Service (INS), now the Bureau of Immigration and Customs Enforcement (ICE), originated the racial and national-origin profiling of immigrants. In the U.S.-Mexico border region, there are many Mexican American citizens and Mexican permanent-resident aliens. Because many attempting unauthorized entry over the border are Latino, Mexican citizens and legal Latino residents are more likely to be stopped than individuals of other nationalities. This is a historical practice. In the 1950s, Operation Wetback targeted Mexicans, and in 1986, when undocumented farm workers were eligible for legalization, there was a series of U.S. Border Patrol sweeps to confiscate their documents and deport them until this practice was contested by protestors and the media. The INS/ICE has pursued a very anti-immigrant enforcement strategy that is only partially controlled by immigrant advocates and media publicity.

In 1975, the Supreme Court decided in *United States v. Brignoni-Ponce* (422 U.S. 873) that since Mexicans were estimated to make up 85 percent of undocumented entrants, an officer could use "Mexican appearance" as a "relevant factor" for investigation provided that it was not the only ground for suspicion (Johnson 2001). One result has been that Mexicans—and now Central Americans—have been more likely to be deported than their statistical frequency in the undocumented population would merit. Immigration profiling has an adverse impact on citizens. If Mexican profiling occurs, then Hispanic citizens, permanent resident aliens, and individuals with visas may be stopped, interrogated, and detained as well as individuals of other ethnicity who are mistaken as Hispanic.

Kevin Johnson (2001) alleges that this policy places an unfair burden on the legal Hispanic population, which has greatly grown in size since 1973. He points out that

the estimate that 85 percent of undocumented entrants were Mexican was always overinclusive and that current estimates place Mexicans at 50 percent of the undocumented population. The harms resulting from this policy include that it is embarrassing and humiliating to be stopped, causing emotional stress and the possibility that verbal and physical abuse will occur. Even more importantly, Mexican profiling undermines the status of Hispanics in American society and encourages a stereotype that characterizes Hispanics as "foreigners." This practice has even led to the unlawful arrest and deportation of legal permanent residents and citizens. Hispanics have become doubly suspect; they may be racially profiled as potential criminals or as potential undocumented entrants.

David Cole (2003), a lawyer and immigrant advocate, coined the phrase "driving while immigrant" to refer to police traffic stops based on immigrant racial profiling. Mexicans have been a major focus of the debate on profiling undocumented immigrants. The stereotype that Latinos are illegal can result in unrefined decisions to stop a person because he or she looks Mexican, which is presumably to be justified after the fact. The very low "reasonable suspicion" standard augments this. The U.S. Border Patrol often refers to this as "canned probable cause." David A. Harris, a legal scholar, believes immigrants are judged guilty on sight and disproportionately stopped; their crime or deportation rate will be elevated because non-Latino whites are less likely to be stopped.

Driving while brown, even though Latinos are racially classified as white, is no longer a Supreme Court criterion for stop and search in immigration enforcement. In 2000, the U.S. Court of Appeals for the Ninth Circuit disregarded the *United States v. Brignoni-Ponce* ruling and stated, in *United States v. Montero-Camargo* (177 F.3d 1113, 1118 9th Cir. 1999), that "Hispanic appearance is not a lawful basis for making a stop because it is a 'weak proxy' for undocumented status." The court opinion stated,

> We conclude at this point in our nation's history, and given the continuing changes in our racial and ethnic composition, Latino appearance is, in general, of such little probative value that it may not be considered as a relevant factor where particularized or individualized suspicion is required. Moreover, we conclude, for the reasons that we have indicated that it is also not an appropriate factor.

Some decisions, like that in *U.S. v. Montero-Camaro* (2000), have ruled that race was not a basis by which border patrol agents could detain individuals, while the *Brown v. City of Oneonta* (2000) decision ruled that the many black males who were questioned as potential rape suspects in a particular case did not have their Fourteenth Amendment protections violated (Cole 2003).

National Origin Profiling in Interior Immigrant Raids

There has been a long history of U.S. Border Patrol sweeps using physical appearance. In 1997, the Chandler police cooperated in stopping, detaining, and questioning residents

using skin color as one cue. In 2001 the *New York Times* reported that INS/ICE officers in New York relied on racial and ethnic physical and social characteristics and accents to profile undocumented entrants (Sachs 2001). Relying on group probability as the basis for immigration enforcement, rather than individual suspicion, violates the provision for equal protection under the law provided by the Fourteenth Amendment. There was pressure to end this profiling, but then terrorist catastrophe resulted in a retraction of civil rights, especially for noncitizens.

Pressure on the U.S. Border Patrol is intense because conservatives demand more action while targeted groups, including Latinos, claim civil rights violations (Bennett 2004). In 2004, the Temecula Border Patrol conducted inland sweeps in Norco, Corona, and Escondido, California. Complaints resulted in the Department of Homeland Security denying that it gave authorization for the sweeps. Hispanic protests of immigrant sweeps occurred all over California. The *Los Angeles Times* indicated that more than 150 undocumented immigrants were arrested in San Bernardino and Riverside County, California (Wilson and Murillo 2004). Illustrating a connection between political expediency and reducing national origin profiling, in 2004, a presidential election year, the Latino vote was considered crucial and these sweeps were curtailed. The sweeps frighten both legal immigrants and foreign-born citizens.

Post-9/11 sweeps of undocumented immigrants are less open to public scrutiny because of the secrecy provisions allowed by the Patriot Act of 2001. To understand the level of public fear that can be generated, it must be understood that in the 2004 California sweeps, the U.S. Border Patrol questioned 9, 972 people on trolleys, at bus stops, in train stations, at other public transportation sites, and on the streets (Spagat 2004). They arrested 291 people, a very low strike rate for the degree of public scrutiny involved (Wilson and Murillo 2004).

After 9/11, U.S. Border Patrol efforts were expanded to include sweeps near the Canadian Border (Abramsky 2008). The community of Havre, Montana, considers the train inspections that occur now to be a sign of patriotic defense. Northern U.S. Border Patrol installation has been expensive; its captures include visa-overstaying tourists, undocumented Latinos looking for work, and potential asylum seekers and refugees—no individuals connected to terrorism. Abramsky, writing in *The Nation,* thinks these activities give a false picture of counterterrorism security. Nevertheless, a series of Supreme Court rulings has given the right to demand ID to law enforcement officers and limited the probable cause requirements for search and interrogation of individuals within 100 miles of the two international borders with Canada and Mexico.

In 2005, the Ninth Circuit Court of Appeals ruled in *U.S. v. Cervantes-Flores* that U.S. Border Patrol questions can be asked about citizenship, immigration status, and suspicious activities. Any additional search or detention must be justified by either consent or probable cause. Under provisions of post-9/11 legislation, however, the U.S. Border Patrol has been given additional powers.

National Origin Terrorist Profiling

The history of terrorist suspicion and profiling began with airline bombings such as that of Pan Am Flight 103 over Lockerbie, Scotland. Terrorist hijackings and bombings have been associated with Arabs and Muslims. In the mid-1990s, airports began profiling darker-skinned individuals who spoke Arabic or English with an Arabic accent (Harris 2002). In the mid-1990s, airport stops and searches of Arab and Muslim Americans became routine. Arab and Muslim Americans began to be stigmatized. After the 1996 crash of TWA Flight 800 over Long Island in which terrorism was initially suspected, Arab Americans began to be very harshly treated at airports. President Clinton appointed a commission to study airport security. The result was Computer Assisted Passenger Screening (CAPS), which selects passengers to screen based on their current reservation and not on their race, nationality, ethnicity or religion. Passengers are selected at random.

After 9/11 both President George W. Bush and Attorney General John Ashcroft adopted terrorist profiling on the basis of national origin and religion. Subsequently, Congress approved the Patriot Act. This act gave the INS unlimited power to detain noncitizens who were thought to have a connection to terrorism. A ruling by Ashcroft allowed ICE to suspend a judge's release order in immigrant cases. Proof of a link to terrorism or crime was not needed to detain noncitizens (Human Rights First 2004).

In 2006, a federal judge ruled that immigration law could be used to detain noncitizens on the basis of race, religion, or national origin. This measure supported racial, national origin, and religious profiling of noncitizens. It was made in reaction to a legal case involving the post-9/11 sweeps of Muslim immigrants, the vast majority of whom were not linked to terrorism. In particular, a sweep had been conducted in New York City, the site of the former World Trade Center. The INS and FBI, with assistance of New York City Police, profiled and arrested Muslim Middle Eastern and Southeast Asian immigrants. Many were detained and then deported if immigration violations were discovered.

Many noncitizens were arrested without knowing their rights and were denied due process of the law under the Illegal Immigration Reform and Individual Responsibility Act of 1996 (IIRIRA). The grounds for deportation established by IIRIRA provide for mandatory detention and deportation of permanent resident aliens who commit crimes classified as aggravated felonies. In other words, immigration law was used in a mostly fruitless search for terrorists, which resulted in many national origin or religiously profiled arrests and deportation. Deepa Fernandes (2007) states that INS and FBI agents did not identify themselves or show credentials before asking to see a profiled person's ID, often in their own homes. Immigrants were arrested if they could not provide documentation. These mass arrests were conducted secretly under the terrorist-investigation secrecy provision of the Patriot Act. Attorney General Ashcroft authorized mass arrest of Arab, Southeast Asian, and Muslim men. The noncitizens profiled in the antiterrorism

sweep were interviewed by the INS and FBI. If no link to terrorism was established, they were turned over to the INS for prosecution based on immigration status. Immigrants, immigration advocates, and certain government officials protested the sweeps.

After 9/11 all noncitizen immigrant men from specified Arab and Muslim countries were asked to register with the government. Those profiled included persons from Bangladesh, Indonesia, Egypt, Bahrain, Iran, Iraq, Syria, Algeria, Morocco, North Korea, Oman, Jordan, Kuwait, Pakistan, Libya, Sudan, Saudi Arabia, Afghanistan, Algeria, Eritrea, Lebanon, Qatar, Somalia, Tunisia, the United Arab Emirates, and Yemen. The FBI wanted to interview 5,000 men between 18 and 33 years of age who had entered the United States after the year 2000 from countries identified as having al Qaeda activity. These interviews were designated as voluntary, but if the noncitizen did not appear, he or she was deemed to be guilty of an immigration violation (Fernandes 2007). At the interviews, visa overstayers were identified and ordered deported regardless of any connection to terrorism. Many men who had some form of legal status were detained until the INS cleared them. The detained and deported men often had wives and children who suffered emotionally and economically after the deportations. The immigrant community was horrified.

Federal requests led many states and communities to allow their police to make immigration-related inquiries. In both 2004 and 2005, some 35 police agencies were converted into ICE immigration enforcers. In Florida and other states, immigrant advocates have fought against using police to request immigration status. A negative consequence of using police to enforce immigration law is that immigrant communities fear reporting crime. Many police departments are resisting being used to enforce immigration law for this reason. Nevertheless, in 2005, the House of Representatives passed legislation allowing the police to enforce immigration laws, but the legislation has not passed the Senate.

During the antiterrorism national origin and religion sweep, the government encouraged individuals and communities to be on the lookout for suspicious behavior. The persons identifying people were often coworkers, neighbors, or ex-girlfriends. The reports were connected to possible terrorism, but the result was that many people who were simply out of compliance with visa documentation or residency registration or undocumented were detained and deported. Sometimes these deportations were engineered by people seeking revenge (Fernandes 2007). These individuals and their families were not allowed access to secret evidence. Many had no prior criminal record prior to deportation. Judges were given no authority to review cases in which deportation was mandatory. In addition, the inspector general of the Justice Department (2003) criticized the fact that bail was being denied in all of these cases with no judicial overrides. This meant that deportees would lack assistance of family and legal counsel owing to problems of access.

Amnesty International (2004), a human rights advocacy group, has found that between 9/11 and 2003, Arab American citizens, permanent resident aliens, undocumented

THE GENERAL ACCOUNTING OFFICE STUDY OF U.S. CUSTOMS RACIAL PROFILING

For many years, U.S. Customs used a complicated profile of 43 factors to decide when to search persons or transport. Their first priority was drug smuggling, although terrorist identification is equally important today. This profile was implemented at primary inspection and individuals were directed to secondary inspection or into a further series of ever more intensive and intrusive inspections. In 1999, this profile was disputed as racially biased and an investigation was undertaken by the General Accounting Office (GAO; now called the Government Accountability Office). The GAO found that customs inspectors disproportionately profiled African American women and that black, Hispanic, and Asian women were three times more likely to be strip searched than men of the same race and ethnic background. Latino women were significantly more likely to be x-rayed than non-Latino whites. The customs searches were biased both as to race and gender, and the rates at which contraband was found were highly disproportionate to the profile. In other words, there was a significantly greater probability of finding drugs when men or non-Latino whites were searched. The results of the GAO report suggested that behavioral cues and related information were much more reliable than racial profiling. Thereafter the number of searches declined and the number of hits—percentage of searches finding contraband—greatly increased.

entrants, and visa overstayers have been three times more likely than whites to be profiled. Over 75 percent of Arab Americans report having been discriminated against since the destruction of the World Trade Center Towers. Arabs and South Asians have been asked to vacate airplanes because they made passengers anxious. In airports, Sikh Americans, who wear turbans as a part of their religion, have been asked to remove them.

Reasons for and against Racial and National Origin Profiling

In the United States, advocates for minority groups and immigrants argue that flawed ideas in law enforcement have associated race and national origin with crime. This has the impact of criminalizing minorities and immigrants. Such racial profiling in law enforcement is based on several reasons (Leadership Conference on Civil Rights 2004). The first is the stereotype that minorities/immigrants commit a majority of crimes and that profiling them is a good strategy for using police resources. A related idea is that most minority members/immigrants are criminals. Both assertions are baseless (Harris 2002; Leadership Conference on Civil Rights 2004). This linkage is based on prison statistics showing disproportionate rates of minority imprisonment. Unfortunately, few

people connect racial profiling with higher imprisonment rates. Nor do they stop to think that non-Hispanic white privilege with regard to not being stopped or searched might contribute to their underrepresentation in the prison population (aided by their higher socioeconomic status and ability to hire good lawyers) (Harris 1999).

Proponents of racial profiling suggest that minorities are disproportionately subject to stops compared with whites because minorities are disproportionately involved in criminal activity, a variant of statistical discrimination theory. This framework suggests that it is rational, given the distribution of minorities in the criminal justice system, to target minorities for criminal behavior (Weitzer and Tuch 2005). More recent studies suggest that the rationale behind statistical discrimination explanations for racial profiling is discounted when considering the bulk of studies that show that the rates of contraband discovered in traffic stops, for example, are quite similar across racial and ethnic groups (Tomaskovic-Devey, Mason, and Zingraff 2004). Another common argument against the rational discrimination thesis is that racial profiling criminalizes minority groups as a whole, creating distrust or a disconnect between law enforcement and the community. A common refrain from proponents of the practice is that citizens who are innocent of wrongdoing should not be concerned about law enforcement contact or should look upon the practice as merely an inconvenience.

Research indicates that African Americans commit drug-related crimes at a rate that is proportional to their numbers in the population. Although they have been disproportionately profiled for traffic stops, there is a lower rate of finding evidence of drug possession than for when non-Hispanic whites are stopped. Indeed, a General Accounting Office Report (2000) has indicated the opposite. The reason is that race is not a reliable cue. Behavioral and informational cues are better. Switching away from disproportionate searching of minority women and increasing searches of men and non-Hispanic whites reduced the number of searches and greatly increased the success rate.

Another issue related to racial profiling is the stereotype that minorities and/or immigrants commit more violent crimes. This is not relevant to racial profiling. Profiling is practiced in relation to traffic stops, stop-and-frisk actions, and other nonviolent police actions. Many violent crimes have witnesses who can generate a description of whom to look for. Profiling is done in cases of hidden infractions, such as drug trafficking.

Racial profiling was treated as more of an issue prior to 9/11 and the resulting retraction of civil liberties. During the 2000 Bush-versus-Gore presidential election, candidate Al Gore introduced the topic of racial profiling and both George W. Bush and his running mate Dick Cheney came out against it. Conservative pundits continued to advocate it. John Derbyshire (2001) in the *National Review* defended racial profiling as an efficient police technique based on probability that best makes use of limited resources. George Will (2001), writing in the *Washington Post,* purported that using race as a basis for a traffic stop is reasonable as long as it is part of a *group* of risk factors used in assessing suspect behavior. He distinguished between hard profiling (race as the target

characteristic) and soft profiling (race as part of a profile indicating suspicion). In addition, Will indicated that other factors might be the reason that minority drivers were more likely to be stopped, such as vehicle defects and so on.

In 2000, the Gallup public opinion poll showed that 81 percent of Americans were in favor of ending racial profiling. In February 2001, President George W. Bush stated that racial profiling "is wrong and we will end it in America" (U.S. Department of Justice 2003). Attorney General John Ashcroft took this as a charge from the president. Congress moved toward the generation of legislation to this effect. Next, the attacks of 9/11 created insecurity, and a rollback began on the push for the right of minorities not to be profiled. Nevertheless, immigrants and citizens have always been profiled in border regions and in the interior because of the unauthorized entrant issue.

Terrorist Profiling and Stereotypes

Terrorist profiling is based on unjustified stereotypes about the propensity of group members to engage in illegal activity. The majority of immigrants are law-abiding. Similarly, being Arab or Muslim does not make an individual a terrorist. Although all of the 9/11 hijackers were Arab nationals, many terrorists are of different backgrounds. Richard Reid, the "Shoe Bomber" of December 22, 2001, was of Jamaican ancestry with British citizenship. Theodore Kaczynski, the "Unabomber," and Timothy McVeigh were white American citizens who committed terrorist acts. John Walker Lindh (the "American Taliban") and other American citizens have been involved with the Taliban, al Qaeda, and other terrorist groups. Recently, Nigerian and Pakistani individuals have been taken into custody for attempted terrorist acts. "Jihad Jane" (Colleen LaRose), charged with recruiting terrorists to wage war on behalf of Muslims, is a native-born American.

Those who oppose national origin or terrorist profiling argue that the all-too-human way of thinking in terms of stereotypes rather than cues for terrorist behavior has hampered the search for terrorist operatives and hurt many innocent people. Terrorist profiling is a simplistic tactic that does not substitute for using behavior-based cues in enforcement (National Conference on Civil Rights Leadership 2004). Finally, terrorist profiling, like racial profiling, creates fear and alienates immigrant communities from law enforcement instead of encouraging them to help investigations.

Case Probability versus Class Probability as a Profiling Strategy

Gene Callahan and William Anderson (2001), both journalists, believe that the war on drugs has led to racial profiling. They state that when law enforcement uses class probability (i.e., stereotyping a group of socially differentiated individuals), it is profiling, and the claim can be made that individuals targeted on that basis have not received equal protection under the law. Instead, they suggest that law enforcement should use case probability when this is a factor but not all factors have been identified in targeting an

offender. There are two ways of using information about race and ethnicity. Class probability stereotypes a group, but if the race or ethnicity of a suspect has been established by an officer or victim, it is reasonable to focus on finding a suspect with that social characteristic. In other words, it must be germane to a specific case, not part of a general surveillance strategy.

On the basis of case probability, the 9/11 terrorists exhibited several behavioral cues that could have excited suspicion: (1) they bought one-way tickets, (2) they made reservations just before the flights, and (3) they paid with large amounts of cash (in a plastic credit/debit card society). No one connected the dots. Everyone noticed after the fact that they were Arab nationals, which suggests that new recruits of different national origins would be used by always versatile terrorist groups in any new attack. One issue with advocating class (one-dimensional factor) probability is that post-9/11 terrorist profiling focused on national origin and religion with no strategy. Profiled permanent aliens and undocumented immigrants were denied the right to due process and legal counsel if they were "out of status," which means that their immigration paperwork was not current. Many individuals were mandatorily detained and deported, but there is still no connection between the U.S. immigrant communities and 9/11. Critics argue that this was a huge waste of law enforcement resources and taxpayer money in order that federal officials could state that immigrant communities did not contain terrorist organizations.

Profiling and Local Law Enforcement Controversy

287g Immigration Policing Agreements

The 1996 Illegal Immigration Reform and Immigrant Responsibility Act (IIRIRA) provided for local and state police to cooperate with federal agents in immigration enforcement through the 287g program (U.S. Immigration and Customs Enforcement 2010). In such cases a Memorandum of Agreement (MOA) is signed between the federal government and state or local policing agencies, and participants are supervised by Immigration and Customs Enforcement (ICE). The Obama administration has expanded 287g agreements. Currently, information on noncitizens with civil or criminal violations and/or under suspicion of terrorist connections is entered into a National Crime Information Center (NCIC) database and available to police.

In releasing official statements, officials argue that their deportation efforts especially target criminal aliens. This strategy has received criticism from immigrant advocates concerned about racial profiling and proenforcement conservatives who claim that prioritizing locating and deporting criminal aliens would lead to neglect of those who lack documents. The U.S. Government Accountability Office (2009, 4) found that ICE officials did not document, consistent with internal control standards, that they had enhanced community safety and security by targeting aliens committing violent or other

serious crimes. Certain participating agencies arrested and deported aliens who had committed minor crimes like carrying an open container of alcohol. The Government Accountability Office (GAO) noted that if all 287g participants sought ICE detainment for deportable aliens, they would lack space for detention, including that designated for violent criminal aliens.

287g has primarily led to arrest of nonviolent unauthorized migrants and immigrants. The border metropolis of El Paso's Operation Linebacker resulted in 1,076 arrests of unauthorized entrants and drug charges against 4 noncitizens (Staudt 2008). Data on 287g alien arrests caused ICE to change the memoranda of agreement MOAs and stress that the purpose is to locate, imprison, and remove aliens who commit narcotics or human smuggling violations, gang or organized crimes, and sex-related offenses. Despite federal efforts to involve police, municipalities have not uniformly responded (Krestsedemas 2008, 341–342).

Arguments in favor of involving local and state police in federal immigration enforcement include that they are a "multiple force amplifier." If they are allowed to use immigration status as a factor in questioning and arrest, it increases the likelihood that unauthorized immigrants will be detected. Giving police the go-ahead to probe is considered to assist in detecting terrorist activity. The 9/11 Commission (Eldridge et al. 2004) found that 4 of the 9/11 hijackers were subject to routine traffic stops and could have been detained for speeding ticket or visa violations. An argument against expanding state and local police power is that it would alienate and reduce the cooperation of immigrant community residents. Communities with a concentration of unauthorized immigrants may be less cooperative and underreport crime and victimization to police if they fear that family or community members will be deported (Romero 2006; Martinez 2007). Community policing strategies necessitate frequent contact and good relations between police and neighborhood residents. Police and neighborhood relations are strained if there is fear (Martinez 2007). Furthermore, many immigrants' original homelands are characterized by police corruption and thus these people may be reluctant to trust American police. Racial and national origin screening is another cause for immigrant concern (Krestsedemas 2008, 346–351).

Arizona S.B. 1070: Support Our Law Enforcement and Safe Neighborhoods Act

Racial profiling controversy was renewed by the passage of Arizona Senate Bill 1070, the Support our Law Enforcement and Safe Neighborhoods Act. SB 1070 made it a state misdemeanor crime for a noncitizen to be in the United States without having federal visa or immigration documents, which are required to be carried, and authorizes police to enforce immigration law (Archibold 2010). State and local police are required to check immigration status if there is reasonable suspicion that an individual is an unauthorized entrant. Police can make a warrantless arrest on the basis of probable cause if they believe an individual without documents is an unauthorized alien. After arrest,

individuals cannot be released until establishing legal status by criteria of § 1373(c) of Title 8 of the U.S. Code. A first-time offender can be fined $500 and given up to six months of jail time. In order to avoid arrest, permanent resident aliens and visitors with visas must carry identification documents such as an Arizona driver's license, a non-operator identification license, or any recognized federal, state, or local ID certifying immigration status.

Arizona's state and local police departments could have signed MOA's with the federal 287g program, but that would have required numerous legal contracts. Arizona's law is the first to require police to check immigration status. Both advocates and opponents of the bill gathered for praise or protest during the Arizona legislature's consideration of its passage (Harris, Rau, and Creno 2010). Arizona Governor Jan Brewer stated: "We must enforce the law evenly, and without regard to skin color, accent or social status" (Samuels 2010). The law inspired public protest, constitutional challenges, and calls for an economic boycott of Arizona. One result was the passage of Arizona 2162, which amends the law by stating: "prosecutors would not investigate complaints based on race, color or national origin."

Advocates of the law present ideas such as the "force multiplier" effect in the context of Arizona's upsurge in unauthorized immigration. Drug and human trafficking and spillover drug-related violence are major concerns. Being able to establish legal status aids law enforcement in preventing these activities. Nevertheless, immigration is the domain of federal law and the Arizona bill may be unconstitutional. Multiple lawsuits have been filed against it. An lawsuit filed by the American Civil Liberties Union argues that the bill violates the Supremacy Clause of the U.S. Constitution, which provides for federal authority over the states and, by legal precedent, immigration. Kurt Kobach, a law professor at the University of Missouri–Kansas City School of Law and codrafter of the AZ bill, argues that the bill is constitutional because of the principle of "concurrent enforcement." In other words, the state law parallels federal law, which makes first entry without authorization documentation a misdemeanor (Schwartz and Archibold 2010).

The leading criticism of the bill is that it justifies racial profiling (Schwartz and Archibold 2010). Thinking critically about behavioral or situational cues, it is difficult to come up with *any* that distinguish someone who is not lawfully in the country.

The criteria that might distinguish an unauthorized immigrant overlap with legal resident and native-born minority status are racialized physical features, language and/or accent, and signs of lower- or working-class social status. Ultimately, when police are asked to enforce immigration status, unless they ask everyone, any "suspicion" is likely to be based on racial or national origin profiling unless there is a cause for a traffic stop, such as speeding. Because there is no basis for visually distinguishing between unauthorized and legal residents, including citizens, the law has discriminatory implications.

Arizona S.B. 1070 is likely to result in a pattern similar to "driving while black," and individuals who have a "foreign" appearance are likely to experience traffic stops and

HENRY LOUIS GATES JR. AND THE BEER SUMMIT

An incident that garnered national attention briefly in 2009 was that involving the renowned African American scholar Henry Louis Gates Jr. After returning home to Cambridge, Massachusetts, from a trip abroad, Gates found that the front door to his house was jammed. His driver (who was also African American) tried to help him open it. A neighbor and a passer-by called the Cambridge police department to report suspicious activity, and when the police arrived Gates was arrested for disorderly conduct (he had objected loudly to the officers approaching him). Later the charges were dropped, and Gates and the arresting officer met with President Barack Obama at the White House to smooth over the matter. In February 2010 Gates donated the handcuffs that had been used in the arrest to the Smithsonian Institution. An independent review of the case later in the year reported that the situation could have been avoided and recommended changes in police procedures.

other public police encounters. The key to proving legal status is identification documentation, which can be legal or fraudulent. Citizens and legal permanent residents will have to carry valid IDs, an inconvenience Americans have strongly resisted when the idea of a national ID card has been proposed.

Conclusion

The broadening of state powers following the terrorist attacks on the United States in 2001 have limited the restrictions put on law enforcement, even at the local police level. Even prior to the attacks, the U.S. Supreme Court's *Whren* decision foreshadowed the direction of federal legislation toward a lessening of citizenry protections. Because the Fourth and Fourteenth Amendments to the U.S. Constitution are often posed as legal remedies to address racial profiling practices, there is limited movement toward criminalizing racial profiling under new law. Advocates of legislation to specifically address racialized issues in the legal realm contend that Fourth and Fourteenth Amendment protection claims are rarely successful legal strategies because of the high standards of proof that each require to prove discrimination.

Near the U.S.-Mexico border everyone is a suspect, citizen and noncitizen alike, with little recourse to Fourteenth Amendment rights regarding inspection of documents and vehicles. The problems of human and drug smuggling have made everyone a suspect to be questioned, and the Supreme Court has validated the right to see ID and to ask questions about suspicious behavior. In the interior, both citizens and noncitizens became suspects in the war on terror, but national origin and religious profiling focused on immigrant communities with, by and large, fruitless results. Citizens have not sufficiently

considered the loss of civil liberties they suffered after 9/11 or when they should get them back, and most are unaware that they have diminished rights within 100 miles of a border.

Immigrant communities are composed of people who can help in the war on terror if they are not alienated by profiling. Will the government come to realize that all forms of profiling violate the Fourteenth Amendment right to equal protection under the law and waste resources that could be better expended in looking for behavioral and informational cues of unlawful activity? Why is it unlikely that driving as a citizen will become the basis of a profile? The debate will continue, and one has to judge whether simple stereotyping rather than good law enforcement practice is the basis of the law and make appropriate changes.

RIGHT-WING EXTREMISM

Daniel L. Smith-Christopher and Judith Ann Warner

In both the United States and Europe, the late 20th century saw an upsurge in the formation of right-wing extremist groups and other groups often labeled *hate groups* (advocating the expulsion or destruction of an entire people because of race or religion). At the same time, there was an accompanying upsurge in the number of anti-Semitic and racist incidents of harassment and violence. Although most of these groups do not use explicitly religious arguments in defense of their ideologies and ideas, some of them most certainly do. In fact, in one recent study, it is stated that "if there were one thread that runs through the various far-right movements in American history it would be fundamentalist Christianity" (Michael 2003, 65). It is important to know about these groups, particularly because many of them have become quite sophisticated in their public presentation, often masking their true intentions behind quite normal sounding "research groups," "churches," or "cultural activities."

Variety of Groups

Extremist movements, hate groups, and militias have been a part of the American landscape for many decades. The Ku Klux Klan, one of the most notorious of the American-grown terrorist organizations, was originally formed in 1865, based originally in Pulaski, Tennessee. It has been responsible for literally hundreds of lynchings and killings, mostly (but not exclusively) in the southern United States, but it dwindled into virtual nonexistence before World War I. The Klan, however, was revived and refounded by William Simmons, a Christian pastor, in 1915, and advocated versions of the *Christian Identity* doctrine (see below), and recent Klan groups (there are now various splinter groups) have been implicated in violence and murders in the United States as recently as 1981.

Related extremist groups are the various *militias* that provide training in firearms and often advocate being prepared for an ideological battle or outright war between races or that comprise adherents of unacceptable beliefs.

Among the less violent groups but still advocating racism are organizing groups such as the Council of Conservative Citizens (CCC), founded in 1985 in Atlanta, Georgia, but now based in St. Louis, Missouri, with a membership of 15,000.

Finally, there are variations of the *Christian Identity* movements that take the form of a "churches," often using names such as Church of the Aryan Nation or Christian Identity.

Definitions and Membership

Scholars of right-wing groups define these movements in many different ways. How one defines them obviously has serious implications for how many movements fall within these definitions and therefore affect the statistics on how many such groups currently exist.

According to a 1996 study by the Center for Democratic Renewal (an important organization that is considered one of the main watchdog groups keeping tabs on right-wing extremism in the United States), "there are roughly 25,000 'hard core' members and another 150,000 to 175,000 active sympathizers who buy literature, make contributions, and attend periodic meetings" (Michael 2003, 1).

The breakdown of right-wing groups in the United States is presented in Table 1.

However, the Southern Poverty Law Center, one of the main sources of information for right-wing extremist groups, posts on its Web site a list by state of extremist groups active in the United States. Upon reviewing this list (and taking only the top 20 states for active hate groups), one discovers a somewhat surprising comparison with the previous list, suggesting that these groups have a wider geographical distribution than one might expect (see Table 2).

Studies of membership across the United States have reported that the execution of Timothy McVeigh, the main conspirator in the Oklahoma City bombing of the Alfred Murrah Federal Building on June 11, 2001, which killed 168 people, seems to have slowed membership growth in various American hate groups. However, only a few months later, the attack on the World Trade Center in New York City on September 11, 2001, stopped the downward trend in militia membership, and the movement began to pick up membership once again.

Characteristics of Extremist and Hate Groups

George Michael lists a number of characteristics that he suggests are generally common among extremist groups:

1. Small locus of identity. Groups tend to strongly identify themselves with very locally defined groups—at most a nation, but often a race within a nation or a race within a region. Members are not interested in recruiting beyond a select few because they view the rest of the world in highly negative terms.

2. Low regard for democracy. Although most groups abide by federal rules, they often have a low regard for systems that give too much freedom to all people—including, of course, the excluded groups. This violates their sense of privilege and the feeling that their membership should be limited to a select few.
3. Antigovernment. Many groups view the federal government with great suspicion and see it as hopelessly under the control of particular groups.
4. Conspiracy view of history. Groups view historical as well as recent events according to complicated and dubious theories of conspiracy and control by some particular hated group.
5. Racism. Their views often exclude nonwhite races entirely, but in the case of those who also direct their hatred toward Roman Catholicism, even white Catholics liable to be targeted by hateful propaganda (Michael 2003, 5–6).

There can be differences, however, in certain categories of groups. Militia groups, for example, can be described somewhat differently, as suggested by Mulloy (2008), who cites some common denominators of members of militia groups:

1. Conservative outlook. These are worried about repressive government that imposes undesired limitations on them, usually including taxes and gun control.
2. Weekend adventurers. Some of the less ideological members are simply those who enjoy dressing in camouflage and "playing soldier" in the woods.
3. Libertarian conservatives. These argue against almost all forms of federal government, even if they accept some limited local government as valid.
4. Hardcore extremists. Such people harbor an obsessive conviction that the United States, indeed the world, is in the grip of an all-powerful conspiracy (Mulloy 2008, 3–4).

One can also add that militia and militia-like groups tend to be most active in states where there is a high percentage of gun owners, current and retired military personnel, and law enforcement personnel.

For Americans who fall into any of these categories, two events in the 1990s stand out as national tragedies that fueled a great deal of anger and resentment among some Americans who already tended to hold a conspiracy theory of suspicion toward government. The first was the attempted arrest of Randy Weaver in Ruby Ridge, Idaho, in August 1992. Weaver, a known white supremacist, was arrested for selling sawed-off shotguns to an undercover informant. When he did not appear for his trial, U.S. marshals went to his rural Idaho home to arrest him. The killing of the family dog led to a gun battle in which Weaver's son Sam was killed, as was a federal marshal. Weaver himself was wounded and his wife was killed. The 11-day siege ended when another known member of a so-called patriot group cooperated with the marshals and convinced Weaver to surrender.

The second event was the disastrous end of the police siege of the Branch Davidian religious movement near Waco, Texas, in February 1993. The decision to force an end to a long stand-off resulted in the death of many members of this religious cult. After a 51-day standoff, the FBI decided to invade the complex. In four hours, over 300 canisters of tear gas were injected into the complex and a fire broke out, which killed over 74 members of the movement, including children. Part of the ensuing controversy was stirred not only by the fact that the events were broadcast throughout the nation but also because many of the reasons cited by the government for its aggressive tactics turned out to be unsupported. For example, there was no evidence for the alleged child abuse, and there was no evidence of drug dealing, much less drug producing laboratories, and no massive stockpiling of weaponry. There is even some suggestion that the government enforcement agency known as the ATF (Bureau of Alcohol, Tobacco, and Firearms) wanted to show off a success in Waco in the light of upcoming congressional discussions about the future of the agency and its federal funding.

Most Americans saw these events as isolated incidents involving religious extremists or troubled individuals. But for those inclined to see conspiracies in the modern world,

these events are frequently cited as "evidence" of deeper issues and are often used in virulent literature used to stir up hatred and support for extremist agendas.

Watching the Extremists

Even though there are many organizations that compile information on various extremist and hate groups (including, of course, the FBI), there are four main organizations that are widely noted for reliable information on right-wing extremism and are active in attempting to use legal means to limit such activities. These are:

1. The Anti-Defamation League (ADL), which was founded in 1913 in Chicago by attorney Sigmund Livingston as an organization intended to be a defense agency for Jews in the facing discrimination United States. However, the ADL had been active in organizing information and legal challenges against groups who advocate hatred and/or discrimination against many different minorities. Michael (2003, 15–16) even reports cases of grudging respect for the ADL among some of the groups it has targeted for its effective use of legal challenges (see http://www.adl.org).
2. The Southern Poverty Law Center (SPLC) was founded in 1971 by two lawyers, Morris Dees Jr. and Joseph Levin in Montgomery Alabama. Sometimes considered controversial because of the major fund-raising success of Morris Dees, the charismatic central figure of the SPLC, the organization has nonetheless emerged as one of the most effective in the United States in combating hate groups (Michael 2003, 21–22). SPLC investigations have resulted in "civil suits against many white supremacist groups for their roles in hate crimes. More than 40 individuals and nine major white supremacist organizations were toppled by SPLC suits in the Project's first 17 years" (see http://splcenter.org).
3. Political Research Associates, founded in Chicago in 1981, is "first and foremost a research organization" (Michael 2003, 27). It works to expose movements, institutions, and ideologies that undermine human rights. Two of its affiliates known for their efforts against hate groups are the Center for Democratic Renewal and the Policy Action Network (see http://www.publiceye.org/index.php).

The "Christian Identity" Movement

Among the most explicitly religious groups among the far-right and extremist organizations is the movement known as Christian Identity (variant but related groups appear with names like Church of the Aryan Nation and similar ones). A number of specific groups identify with variations on this train of thought, so it is important to briefly summarize some of the basic ideas encountered in these many versions.

Among the most common ideas that feed the Christian Identity movement ideas are those known as British Israelism or Anglo-Israelism. This is the belief that the white

races of western Europe and especially the Celtic and Germanic peoples are direct descendents of the Lost Tribes of Israel. Thus, the "white" Americans and Commonwealth peoples (Australia, New Zealand, Canada, etc.) are descendants of Israelites and thus have a special status before God.

In the United States, more virulent forms of the Christian Identity movement became deeply anti-Semitic, believing that they had "replaced" the Jews as the true "chosen people of God" and that today's Jews are "descendants of Satan" (Eatwell 2009).

Among the most dangerous of the ideas circulated among Christian Identity followers is the notion of an impending great war between good and evil, largely to be fought between white people on the one side and all nonwhites aligned with the Jews on the other. Christian Identity adherents believe that there were many other people in the world before God made Adam and Eve, but that Adam and Eve were created white and that whites are therefore the ones that God especially cared for. Eve, however, had sex with one of the pre-Adam peoples (therefore nonwhite). Cain was born from this union and was the ancestor of all nonwhite peoples today. Abel, the true son of Adam, was the further ancestor of all white people.

This is then mixed with (very loose) interpretations of, for example, selected portions of the New Testament Book of Revelation, which speaks (symbolically) of a war between good and evil that will finally bind and destroy evil in the world. Some extremist

THE HUTAREE GROUP

In Michigan, in March 2010, nine members of an apocalyptic Christian militia group known as the Hutaree (pronounced Hu-TAR-ay) were arrested by FBI agents and charged with plotting to kill local law enforcement officers in the hope of bringing about a generalized antigovernment revolt. The group's plan was to attack police officers with weapons from its armament and then retreat to dug-in positions protected by land mines and other heavy weaponry. The Hutaree believed that such violence was religiously justified as a means of sparking the final battle between Christians and the Antichrist, here represented by the government. "Jesus wanted us to be ready to defend ourselves using the sword," stated the group's Web site. They had expected other Christian and antigovernment militias to join in. In this case, however, just the opposite occurred. With the FBI in pursuit, one of the Hutaree approached the commander of a neighboring militia to ask for assistance. Instead, the leader turned him down and moreover tipped law enforcement authorities as to the Hutarees' whereabouts. The rationale given by the informant was that it was the right thing to do. Observers who know the area in which the two groups operate speculate that the Hutaree is a fringe organization whose increasing religious zeal (and, to the extent it was known, willingness to kill cops) caused it to be disliked by the local populace.

members within the Christian Identity movement advocate terrorist violence against minorities in the United States, even ahead of the "great war."

Members of Christian Identity movements have been implicated in violent acts in the United States, including the following:

- Eric Rudolph's bombing of the 1996 Atlanta Olympics, and his 1997 bombing of an abortion clinic in Birmingham, Alabama
- The burning of synagogues in Sacramento, California, in 1999
- The murder of a gay couple in Redding, California, the same year
- The attempted murder of five individuals at a Jewish Community Center in Los Angeles in 1999

There appear to be international connections as well, such as the Living Hope Church founded in South Africa by Rev. Willie Smith in the late 1990s in reaction to the fall of the Apartheid racist regime there.

Hate-Crime Laws

The FBI has defined hate crime, sometimes called bias crime, as "a criminal offense committed against a person, property, or society which is motivated, in whole or in part, by the offender's bias against a race, religion, disability, sexual orientation or ethnicity/national origin" (Shively 2005: 2). Almost all states have established criminal penalties for hate crimes. These penalties enhance the severity of punishment for a hate- or bias-motivated crime or establish hate crimes as a new category of crime (a process conceptualized by social scientists as criminalization).

Federal statutes require mandatory reporting of all crime, including hate crime, but there is inconsistency in reporting across all states. Civil rights and immigrant advocates believe that hate crime is unreported partly owing to differences in state and federal laws and their interpretation. Another cause of underreporting is the need for training on how to recognize and classify hate crime. This innovation in law enforcement is subject to further debate. There are lawmakers and lawyers who are not convinced that justice for all will be served by adding hate crime penalties.

Hate crime laws were federally enacted and then adopted by states for four reasons: (1) a bias-motivated crime is viewed as different from a traditional crime because it traumatizes an individual owing to his or her group affiliation; (2) hate crimes place stress on distinct social groups because they view themselves as targets and are subject to more stress than other groups; (3) hate crimes are regarded as particularly heinous because of their underlying motivation and their impact on society; and (4) law enforcement traditionally has not acted forcefully in cases of violence and property crime motivated by hate. Each of these arguments for hate crime laws is examined below.

The creation of hate crime legislation is based on the idea that hate- or bias-motivated crimes are a different type of crime than traditional criminal acts and that they are more

serious. The consequences of hate crime include more negative psychological and emotional consequences for victims, increased violence, and greater physical injury. For example, an individual who is robbed and then beaten extensively because of his or her skin color, religion, or sexual preference has, arguably, had a more traumatic experience than an individual who is briefly assaulted, even if injured, and robbed.

Hate crimes have different consequences for communities because they threaten the safety of singled-out groups of people. No one wants to be a crime victim, and a hate crime indicates that members of a particular group are targets for more hate crime. The targeted group has an increased sense of risk of criminal victimization and views the situation as persecution.

Because of the perception that hate crime is more severe than conventional crime, laws have been created to increase penalties. Hate motivation is thought to make a crime more serious. A social message is sent that penalties will be increased in the hope that this type of crime will be deterred by concern about the increased consequences of conviction. For example, adolescents commit acts of vandalism, but the element of hate motivation and emotion is not usually evoked by this act. If the crime was not motivated by bias, such as breaking the windows of an abandoned house, it would carry a lesser punishment. Vandalism motivated by bias, such as painting swastikas and other hate symbols on a house or a church, would be punished more severely.

The last reason for the creation of hate crime laws and penalties is that victims of hate crimes have traditionally received less law enforcement protection. The hate crime aspect of such acts has not been investigated or is underprosecuted. In other words, hate crimes have been prosecuted in the same way as traditional crime or not prosecuted at all. The hate crime statutes in at least 12 states provide for more law enforcement training in the recognition of hate crime to increase the protection of targeted groups. Recently, federal efforts to train all state and local police departments in the documentation of hate crimes have been expanded. Hate crime laws contribute to an understanding of what hate crime is among both law enforcement and the general public. The general public has increasingly understood and accepted the idea that there is a separate category of crime characterized by hate.

SCHOOL VIOLENCE

Leanne R. Owen

In the final years of the 20th century, following a spate of widely publicized school shootings and other high-profile incidents of juvenile violence on school grounds, safety at American educational institutions became an issue. The primary controversy has revolved around whether school violence is a legitimate and realistic cause for worry or panic or whether the actual statistics are quite encouraging despite some political and/or scholarly claims to the contrary. In other words, while some argue that our public schools are experiencing some kind of epidemic of violence, others maintain that citizens should rest assured that our public schools are relatively safe places.

Competing and often contradictory claims about the frequency or rarity of these types of happenings, as well as calls for legislative action aimed at their prevention, flooded the popular media and academic literature alike in the wake of more than a few high-profile shootings. As justification for the passage of the Violent and Repeat Juvenile Offender Accountability and Rehabilitation Act of 1999, it was stated that "Congress finds that juveniles between the ages of 10 years and 14 years are committing increasing numbers of murders and other serious crimes…the tragedy in Jonesboro, Arkansas, is, unfortunately, an all too common occurrence in the United States." In sharp contrast, the Final Report of the Bi-Partisan Working Group on Youth Violence asserted that "there are many misconceptions about the prevalence of youth violence in our society and it is important to peel back the veneer of hot-tempered discourse that often surrounds the issue…it is important to note that,

statistically speaking, schools are among the safest places for children to be" (Center on Juvenile and Criminal Justice 2000).

Background

Public concern about school crime in general and violence in particular can be traced back to the origins of the public school system in the United States (Crews and Counts 1997). Additional attention was directed to the issue with the publication of the *Task Force Report: Juvenile Delinquency and Youth Crime* in 1967 and the Office of Education of the U.S. Department of Health, Education, and Welfare made suggestions as to the role schools could play in curtailing youth crime. Congressional hearings held at the time reflected the broad public concern about delinquency and violence in schools (U.S. Senate Committee on the Judiciary 1975); over the course of the years since, criminologists and laypersons alike have attempted to shed some light on the nature, extent, and root causes of school-based violence.

The three-year period between 1996 and 1999 in particular appeared to many Americans to be fraught with news stories about school violence, and the issue was frequently represented as signaling the beginning of a possible juvenile crime epidemic. On February 2, 1996, 14-year-old Barry Loukaitis opened fire on his algebra class in Moses Lake, Washington, killing two students and a teacher and wounding another individual. Later that month, in Bethel, Alaska, 16-year-old Evan Ramsey killed a fellow student as well as the principal, in addition to wounding two other persons. In October of the following year, in Pearl, Mississippi, 16-year-old Luke Woodham killed two classmates and injured seven. The month of December brought two high-profile cases; the first involved 14-year-old Michael Carneal, who opened fire on a prayer circle at Heath High School in West Paducah, Kentucky, killing three students and wounding five others. That same month, 14-year-old Colt Todd in Stamps, Arkansas, shot two of his classmates while they stood in the school parking lot.

In March 1998, in one of the most widely publicized school shootings, four students and a teacher were killed and 10 others wounded when Mitchell Johnson, age 13, and Andrew Golden, age 11, emptied Westside Middle School in Jonesboro, Arkansas, with a false fire alarm. The case received national coverage, and news magazines led with headlines such as "The Hunter and the Choirboy" (Labi 1998) and "The Boys behind the Ambush" (Gegax, Adler, and Pederson 1998). Throughout the country, politicians, academics, pediatricians, and parents alike were questioning how something like this could happen and what could be done to prevent similar tragedies in the future.

Four other incidents of school shootings were recorded in 1998, in Edinboro, Pennsylvania; Fayetteville, Tennessee; Springfield, Oregon; and Richmond, Virginia. The deadliest recorded school shooting until 2007 took place the following April in Littleton, Colorado, when 18-year-old Eric Harris and 17-year-old Dylan Klebold had plotted for a year to kill 500 people and blow up Columbine High School. At the end of their

hour-long rampage, 12 students and a teacher were dead and an additional 23 people were seriously injured. Klebold and Harris then turned the guns on themselves, effectively ending any hopes of determining definitively what caused them to engage in such unthinkable behavior. Speculation was rife and law enforcement officials suggested that indications of what Klebold and Harris were plotting had existed prior to the attack. Klebold had written a graphic story about slaughtering preppy students as well as a detailed paper about Charles Manson. Harris, in addition to writing about Nazis and guns in schools, made notes about killing in a massacre "to-do" list, including such things as

THE AFTERMATH OF JONESBORO

In the aftermath of what was dubbed the Jonesboro Massacre, different groups of experts have attempted to respond to seemingly unanswerable questions in a variety of ways. Some wondered what stimuli in these children's lives could have possibly prompted them to kill; hunting, popular music, television programs, and violent films were all identified in varying degrees as questionable hobbies that may have exerted undue negative influences on these boys. Some questioned how Johnson and Golden gained access to firearms in the first place, and for these, the answers appeared to lie in restricting purchases and usage of guns. The Clinton administration sought to ban assault weapons as part of a larger, comprehensive effort to prevent crime, focusing on the idea of forbidding military-style weapons in the hopes that they would not fall into the wrong hands (specifically those of children).

For those individuals struggling with the incongruity of physiologically small, slight, immature beings demonstrating a capacity to act in the most violent and sadistic ways imaginable, emphasis appeared to be placed most intently upon the punitive versus the rehabilitative prospects of the criminal justice system. Debates ensued as to whether trying these young people as adults would act as a stronger general deterrent for others in the same age group contemplating similar actions or whether an area of greater concern was the distinct possibility that, if tried and sentenced as adults, these juveniles could conceivably spend the following two or three decades learning how to become better criminals and thereby cement their chances of becoming chronic and repeat offenders. The very ideological underpinnings of the juvenile court system were called into questions as arguments asserted that children were qualitatively different from adults and therefore deserved to be treated rather than punished. This view was countered by contentions that those who commit adult crimes should pay the adult price and do the adult time.

On a local level, the community of Jonesboro launched an $8.4 million federally funded three-year initiative to prevent school violence. Programs were developed to improve school safety as well as school-based and community mental health services, help with early childhood development, and promote education reform. A leadership academy for students was created in hopes of teaching students alternative methods of conflict resolution.

reminders to obtain gas cans, nails, and duffel bags. Further notes and diaries found after their deaths described instances of bullying victimization at school and repeated expressions of rage, hatred, and resentment.

Key Moments/Events

In light of the widespread coverage in the popular media of these high-profile incidents of school violence, the Justice Policy Institute examined data gathered from an earlier study conducted by the Centers for Disease Control and concluded that the likelihood of children becoming victims of school-based violence was as minute as "one in two million" (Olweus 1993). The following month, President Clinton addressed Americans and asserted that "the overwhelming majority of our schools are, in fact, safe" (CNN 1998), a comment reiterated by Attorney General Janet Reno and Education Secretary Richard W. Riley in the report titled *Early Warning, Timely Response: A Guide to Safe Schools* (Dwyer, Osher, and Warger 1998). Subsequent administrations have essentially reiterated such views.

BULLYING

One particular concern raised immediately following the Columbine tragedy was school bullying. A substantial amount of evidence appeared to exist that drew a direct correlation between persistent taunting and insults being leveled at Klebold and Harris and their subsequent outburst. Parents, teachers, counselors, and school administrators began expressing serious worries that bullying, if left unchecked, could result in the victims themselves becoming aggressors. Consequently, many schools began implementing strategies designed to prevent bullying, many modeled after the program developed by Daniel Olweus in Norway (Olweus 1993). A curriculum of conflict resolution was developed around the idea of minimizing antisocial and negative behavior, and programs began teaching children as young as kindergarten age about resolving disputes in a respectful and appropriate manner.

However, some criminologists suggest that bullying has not significantly decreased as a result of these efforts, positing instead that it has simply been transformed from the more overt, direct forms of action to a more invisible, indirect type. In other words, instead of children bullying their fellow classmates by hitting, kicking, punching, threatening, or tripping them—actions that would inevitably attract the attention of teachers and recess or hallway monitors and thus result in sanctions being imposed—they may instead resort to name-calling, instigating malicious gossip, spreading rumors, posting derogatory comments on social networking Web sites such as My Space or Facebook, or sending hateful text or e-mail messages to one another. Such actions may escape the notice of appropriate adult authorities and may therefore persist undeterred for an extended period of time, possibly resulting in physical, emotional, or psychological damage to the student being bullied. A case in South Hadley, MA, in 2010, in which a high school student hung herself in response to bullying, illustrates this point.

In *Indicators of School Crime and Safety 2009,* the 12th installment of a series of annual reports jointly compiled by the National Center for Education Statistics and the Bureau of Justice Statistics, data are presented suggesting that students may actually be better protected against the potentiality of violent crime victimization at school than away from it. The report analyzes the incidence of violent deaths at school (defined as a self- or other-inflicted death occurring on the school grounds) as well as nonfatal student victimization. Violent deaths for children between the ages of 5 and 18 years of age were determined to have declined from 30 to 21 between the 2006–2007 and 2007–2008 school years. During the 2006–2007 academic year (the latest year for which complete data are available), 8 suicides were recorded among school-aged youth, which statisticians have calculated translates into less than one suicide per million students. During that same school year, 1,748 children within the same age range were victims of homicide and 1,296 committed suicide away from school. The conclusion to be drawn is that youth were nearly 60 times more likely to be murdered and 160 times more likely to commit suicide away from school than at school (National Center for Education Statistics 2009).

In addition to violent incidents in which students were killed, the *Indicators of School Crime and Safety 2009* report also measured the incidence and frequency of nonfatal violent victimizations of students, including such offenses as rape, sexual assaults, robbery, and aggravated assault. The authors determined that in each survey year between 1992 and 2007, students reported lower rates of serious violent victimization at school than away from school. Approximately 118,000 students were victims of serious violent crimes at school in 2007 as compared with nearly 164,000 serious violent crime victimizations away from school. Taken as a rate, this figure suggests that 4 students between the ages of 12 and 18 years out of every 1,000 were victims of serious violent crimes at school during this time period, compared with approximately 6 students out of every 1,000 who were victimized away from school. In previous years the ratio was even more dramatic (for example, 8 per 1,000 at school versus 24 per 1,000 away from school in 1997). Less than 1 percent of school-aged children reported serious violent crime victimization within the previous six months (National Center for Education Statistics 2009).

Despite the publication and dissemination of this report and earlier editions of it, a telephone poll by Hart and Teeter Research taken days after the shooting in Jonesboro, Arkansas, revealed that 71 percent of 1,004 adult respondents thought it was very likely or likely that a school shooting could happen in their community (Center on Juvenile and Criminal Justice 2000, 5). A *USA Today* poll from April 21, 1999, conducted the day after the Littleton, Colorado, shooting found that 68 percent of Americans thought it was likely that a shooting could happen in their town or city and that respondents were 49 percent more likely to be fearful of their schools than in the previous year. A *CBS News* phone poll two days after the Littleton, Colorado, shooting (April 22, 1999)

found that 80 percent of Americans expected more school shootings, and the number of people listing crime as the most important problem increased fourfold (from 4 to 16 percent) in the week after the Littleton shooting. Two years later, a Gallup poll revealed that 63 percent of parents still thought it likely that a Columbine-type shooting could happen in their community (Gallup 2001). Matters were only made worse following a mass shooting on the campus of Virginia Tech in 2007 in which 32 people were killed. Although the incident took place on a college campus rather than within a local school district, students, teachers, parents, and administrators remained fearful regarding the prospect of further gun violence in U.S. schools (Fallahi et al. 2009).

Dewey G. Cornell of the Virginia Youth Violence Project has contended that despite the encouraging statistics demonstrating that school violence is not, as some would suggest, an epidemic, it is unsurprising that parents and politicians would be concerned that the opposite is true. He has stated "public perception is easily skewed by media attention to a handful of extreme cases" (Cornell 2003, 1). He alludes to the 2002 version of the *Indicators of School Crime and Safety* study and confirms that the rate of violent crime in public schools in the United States has declined steadily since 1994, with the rate of serious violent crime in 2001 holding steady at half of what it was in 1994 (Cornell 2003, 3).

Kenneth S. Trump, the president of the National School Safety and Security Service, has argued that the methodology of the *Indicators of School Crime and Safety* study is flawed and that school violence levels are not on the decline, as the research seems to claim. He posits that by utilizing reported crime incidents rather than random sampling, "the federal report grossly underestimates the extent of school crime" (Scarpa 2005, 19). Instead, Trump refers to statistics indicating that the number of school-associated violent deaths "jumped to 49 in 2003–2004, more than the two prior school years combined and greater than any school year since 1999" (Scarpa 2005, 19).

Part of the discrepancy may be attributed to the fact that the actual sources of data about school violence in particular and juvenile violence in general may offer contradictory evidence. The Surgeon General's Report on Youth Violence highlights this inconsistency, arguing that official reports and self-reports—the two primary means of obtaining information about violent acts committed by juveniles—are inherently at odds (Satcher 1999). Official reports rely on the number of recorded arrests of juveniles to measure the extent of their lawbreaking behavior, and the surge in arrests for violent crime between 1983 and 1993 is believed to be largely attributable to the proliferation of firearms use by teenagers and the subsequent increased likelihood that confrontations between individuals in that age cohort would turn not only violent but lethal. With an increasing number of schools in all jurisdictions today (rural, suburban, and urban) installing metal detectors and placing security officers on campus, the number of students carrying guns to school has dropped. It is therefore expected that altercations would be less likely to result in homicide and serious injury and thus less likely to draw the attention of police

officers. By 1999, arrest rates for homicide, rape, and robbery had all dropped below the rates for 1983. Arrest rates for aggravated assault were higher in 1999 than they were in 1983 but had nonetheless declined significantly since 1994.

These official statistics are at odds with the data derived from self-reports of juveniles. Confidential surveys, according to the Surgeon General's Report, find that 13 to 15 percent of high school seniors report having committed an act of serious violence in recent years (1993 to 1998). These acts are unlikely to involve firearms and therefore generally do not draw the attention of law enforcement officials. It is estimated that between the early 1980s and late 1990s, the number of violent acts perpetrated by high school seniors increased by nearly 50 percent, a trend similar to that found in arrests for violent crimes in general for all age groups. The surgeon general concludes that youth violence remains an ongoing national problem, albeit one that is largely hidden from public view.

Important Persons/Legal Decisions

In the introduction to the third edition of his landmark book *Folk Devils and Moral Panics,* Stanley Cohen describes the phenomenon of school violence and argues that with the media coverage of each incident, the idea arose that bullying and school shootings were not only commonplace but becoming all too familiar. He alludes to the types of headlines generated by newspapers and magazines (not entirely dissimilar from those employed in the aftermath of the Jonesboro massacre)—such as "The Monsters Next Door: What Made Them Do It?" and "Murderous Revenge of the Trench Coat Misfits"—in identifying school violence as the subject of a modern-day moral panic. One characteristic of a moral panic, according to Cohen, is disproportionality; in other words, it is not that the events in question do not take place but rather that they do not take place with as alarming frequency as indicated by the media (Cohen 2005).

Cohen's arguments are substantiated by the work of Dewey Cornell, who demonstrates that the rate of violent crime in American public schools has declined since 1994 and that, since the late 1990s, the number of homicides committed at school has actually dropped from 35 in 1998, to 25 in 1999, to a low of 2 in 2002, and 4 in 2003 (Cornell 2003). Moreover, he calculates the actual risk of a student-perpetrated homicide taking place at a particular school by referring to the 53 million students who attend the nation's 119,000 public and private schools. He cites 2003 data from the National School Safety Center to demonstrate that between the 1992–1993 school year and the 2001–2002 school year, there were 93 incidents of student-perpetrator homicides on school grounds. Taken as an annual average, he contends that this translates to approximately 9.3 incidents each year over a 10-year period, which, when divided into the 119,000 schools in the United States, ultimately amounts to an annual probability of any school experiencing a student-perpetrated homicide of 0.0000781, or one in every 12,804. Put another way, a parent or teacher can expect a student to commit a homicide at a specific school once every 12,804 years. Cornell argues decisively that schools are not dangerous

places but rather generally safe, constructive environments that may be, from time to time, plagued by random incidents of violence.

In 2008 Congress passed the School Safety Enhancements Act, which, among other features, made schools accountable for keeping students safe during their formative years. Schools now face legal action or potentially even closure if it is determined that the environment they provide is in any way unsafe or dangerous. To that end, schools have experimented with different strategies for the prevention of violence and crime. Some have, as mentioned previously, begun utilizing metal detectors and relying upon assistance from private security officers or police officials. Others have implemented dress codes to discourage the wearing of gang colors or gang insignia and to equalize fashion options regardless of the socioeconomic status of individual students (some of whom might be able to afford brand-name clothes while others could not, thereby causing a rift that might provide grounds for bullying or denigration). Many schools have begun incorporating peer mediation programs into their curricula, encouraging students to arbitrate disputes between their classmates and to ensure that each party is given a fair opportunity to voice concerns and express emotional responses. Some schools are finding these programs easier to implement than others, and research indicates that the selection of appropriate peer mentors and training of both the peer mentors and faculty or staff supervisors is key in bringing about a successful resolution.

Conclusion

It is uncertain whether these strategies will be effective in preventing school violence in the long run. Meta-analysis of the existing literature reflects mixed findings (Scheckner et al. 2004), suggesting that how a program is designed and developed as well as whether there is strong faculty and administrative support (specifically financial support) will have a strong impact on how successful it will be. What some criminologists find worrying is that as schools struggle to ensure safe environments for their students, lest they be court-ordered to close, they may find themselves attempting to conceal evidence of certain types of questionable behavior by arguing that it is not specifically indicative of an unsafe environment at school.

The *Washington Post* reported one such incident in Frederick County, Maryland, which involved a six-year-old girl being fondled by a middle schooler while being driven to her program for gifted students. The bus driver involved in the incident reported seeing middle-school boys describing sex acts to first-graders and attempting to shove a condom into another boy's mouth. When the bus driver told the six-year-old's mother about the fondling incident months later, he also mentioned that he had informed school officials; when pressed, the school denied having any record of the report. Beverly Glenn, the executive director of the Hamilton Fish Institute in Washington, explains that such actions are becoming increasingly common because schools do not want to be designated as unsafe for fear of losing students and consequently losing money. Instead,

an increasing number of such incidents are being handled internally whenever possible, with the implicit justification that the acts themselves, if they take place as this one did on the way either to or from school, are not committed on school grounds and therefore do not render the school environment unsafe (Williams 2005).

It is unclear, then, precisely how useful and effective the various strategies—both school-based and legislative—have been in controlling school violence and whether the problem is actually escalating in severity or diminishing. What is certain is that whenever incidents involving children—either as victims or perpetrators—take place, the news media will report them and further promote the idea that the problem is "all too familiar" and is reaching "epidemic proportions." It is imperative, then, that readers and viewers analyze these reports critically in order to distinguish between fact and myth.

SEARCH WARRANTS

Keith G. Logan and Jonathan Kremser

In the 21st century, Americans are challenged with balancing the concern for individual rights with the need for public order through the administration of justice. We have seen license plates with the logo "Live Free or Die," a message intended not to encourage violence but rather to illustrate how Americans have traditionally sought to protect their personal liberties against unnecessary government intrusion. This conviction is perhaps best reflected in Benjamin Franklin's prophetic admonition that "they that can give up essential liberty to obtain a little temporary safety deserve neither liberty nor safety."

Beginning in the previous decade, however, in part through actions undertaken by President George W. Bush and his Attorney General Alberto Gonzales, questions have been raised about whose interpretation of the Bill of Rights is correct and whether the need for search warrants will prevail in all circumstances. Together, the president and attorney general chose to place a new test before the courts on the need for search warrants or similar lawfully issued orders. From 2002 until at least 2007, the National Security Agency (NSA) was directed to intercept international and domestic electronic communications without the authorization of a search warrant issued by a U.S. district court or other court order issued by the Foreign Intelligence Surveillance Act (FISA) Court.

Needless to say, these actions raised and continue to raise controversy among citizens, scholars, and the legal community as Americans have witnessed a loss of the historically

strong standard needed to be met before agents of the government could enter a home, intercept mail, invade privacy, or collect electronic data from computers, cell phones, and bank records.

Background

In general, the United States has set a very high standard for government conduct in the hope that our privacy would be maintained and that our rights would not be violated. At the very beginning of this nation, the Framers sought to build popular support for the new government by amending the Constitution in 1887 with the Bill of Rights, which included protections against invasive government searches, securing "the Blessings of Liberty to ourselves and our Posterity" (as noted in the Preamble to the U.S. Constitution, 1787). Their belief in such principles as no taxation without representation illustrated their apparent desire to protect themselves against unreasonable government intrusion without legal justification.

It has not always been the law that agents of the government needed a lawfully issued search warrant based upon probable cause and signed by a neutral, detached judicial authority. In the past, without meeting this standard, evidence could be seized and later used in a criminal prosecution. Over the years, however, our legal system evolved to a point where law enforcement officers who violate the law of search and seizure usually find their evidence excluded and any conviction reversed.

The strength of Americans' belief in the sanctity of their homes and privacy is reflected in the words of the U.S. Constitution and its amendments. This document was designed to ensure that actions detested during British rule would not exist in the United States. And although it preserved the interests of the wealthy class of property owners (who else could afford to take six months off to travel to Philadelphia and write a Constitution?), the document also granted enough concessions to small property owners, middle-income merchants, and farmers, to build support for its ratification in the statehouses (see Zinn 2005).

During colonial times, representatives of the Crown routinely invaded citizens' homes; American colonists were subject to the abuses of general warrants, which permitted searches that did not specify the items to be seized or the person or place where they were to be found. An example of a general warrants was the writ of assistance that permitted a British tax collector and the collector's representatives to search colonial homes and other buildings to determine if there were goods present that did not bear the mark of a tax payment. These writs were not based upon probable cause and gave the bearer almost limitless authority. As was noted in *Boyd v. United States* (1886), the writs of assistance were "the most destructive of English liberty, and the fundamental principles of law, that ever was found in an English law book."

The Fourth Amendment to the Constitution is just one response to what the colonists found to be unjust treatment. It reads as follows: "The right of the people to be

secure in their persons, papers, and effects against unreasonable searches and seizures, shall not be violated and no Warrants shall issue, but upon probable cause, supported by Oath or affirmation, and particularly describing the place to be searched and the persons or things to be seized."

Legal Decisions

Execution of a Search Warrant

The Fourth Amendment governs the proper execution of a search warrant. Police are generally required to knock and announce their identity and purpose before attempting

THE TYPICAL SEARCH WARRANT

A typical federal search warrant will be issued after a review of the application for the warrant, which will provide the probable cause that the government has for believing the person or item(s) to be seized are located in a particular place. The application is made under oath and lists the facts that the reviewer—a judicial authority—will evaluate in determining whether or not to issue the search warrant. If, upon review, the judge or magistrate finds that there is probable cause, the search warrant it will be authorized. If not, it will be denied.

The typical search warrant contains the following:

- Caption or reference to the name of the court that is issuing the warrant name of the requesting individual (also known as the affiant).
- Description of the place or person to be searched (location must be specific and located in an area where the judicial officer has jurisdiction). This standard of "particularity" requires that the description be sufficiently precise so that the officer executing the warrant can "with reasonable effort ascertain and identify the place intended" (see *Steele v. United States* 1925; *Coolidge v. New Hampshire* 1971; *United States v. Ross* 1982).
- Detailed description of the property to be seized (scope of the search). This requires that the description leave nothing to the discretion of the officers (see *Marron v. United States* 1927).
- When the warrant may be executed (the hours of the day or night), how the warrant may be executed (knock-and-announce or unannounced), and by whom (individual or agency/department).
- Date and signature of the judicial officer who issued the warrant.

The reverse side or second page of the warrant will usually contain information regarding the return of the warrant. This information (the return) will reflect the date of service of the warrant and a list (inventory) of any items that were seized as a result of the search. The return will be certified by the executing individual and returned to the court in a timely manner. A copy of the warrant and a list of the seized items will be left at the location or with the person.

forcible entry (see *Wilson v. Arkansas* 1995). In response to law enforcement concerns about the need for flexibility, the U.S. Supreme Court held that this requirement is governed by a reasonableness standard. In *United States v. Banks* (2003), the Court concluded that a 15- to 20-second interval from the time the officers "knock and announce" until they enter by force was reasonable, given the possibility of destruction of evidence. Situations allowing for unannounced entries include the threat of physical violence or escape (see *United States v. Bates* 1996). Where there has been a violation of the knock-and-announce requirement, without more, the Court recently determined that the evidence should not be suppressed at trial (see *Hudson v. Michigan* 2006).

Exclusionary Rule

Most court decisions have upheld an individual's privacy right. When a search goes beyond the scope of the warrant or is conducted illegally or without a warrant, the defendant will move to have the evidence discovered during the search suppressed. After reviewing the facts surrounding the seizure of the evidence, the court, when appropriate, will support the suppression motion and the items will be excluded from being introduced during the trial. The key case for the exclusionary rule is *Weeks v. United States* (1914) in which the Court recognized that the use of illegally seized evidence against Weeks was a denial of his constitutional rights. In *Wolf v. Colorado* (1949), the Court recognized the importance of an individual's privacy against "arbitrary intrusion by the police"; it also recognized the significance of the *Weeks* decision, which held that "in a federal prosecution the Fourth Amendment barred the use of evidence secured through an illegal search and seizure." *Mapp v. Ohio* (1961) ensured that this right applied not only to federal law enforcement but also to state law enforcement through the due process authority of the Fourteenth Amendment.

The natural extension of the exclusionary rule came with cases involving derivative evidence, called the "fruit of the poisonous tree." In *Silverthorne Lumber Co. v. United States* (1920), the Court determined that evidence derived from an illegal search and subsequent seizure of accounting records (books, papers, and other documents) could not be used; it denied the government any use of the material gathered as a result of a "forbidden act" (see also *Silverman v. United States* 1961). The Court found that the wrong committed by the government tainted all the secondary evidence flowing from that illegality and was inadmissible as well. There are also cases where the Court has found that the wrong committed by the government is so attenuated or distanced from the illegally obtained evidence that such evidence has been accepted at trial (see *Nardone v. United States* 1937; *Wong Sun v. United States* 1963).

Exceptions

There are numerous exceptions to the criteria for the issuance of warrants and the admission of evidence as set forth in the Bill of Rights. Although several of the Supreme

Court's decisions have upheld the constitutional requirements, other case decisions have reduced the strength of a warrant requirement. Several exceptions to the strict requirements of search warrants are reflected in the following paragraphs:

Inevitable discovery and independent source: In *Nix v. Williams* (1984), the Court determined that the efforts of law enforcement personnel would likely have located the evidence (a body) and admitted it despite a constitutional violation (illegal questioning). In *Murray v. United States* (1988), the Court found that law enforcement personnel obtained evidence from an independent source in addition to the illegal source; it chose not to remove the evidence from admission. The independent source in this case was seen as a cure to the constitutional violation regarding the evidence.

Good faith exception: The courts have also decided not to penalize a law enforcement officer who acted in good faith to enforce a warrant that was no longer valid (see *United States v. Leon* 1984; *Massachusetts v. Sheppard* 1984; *Arizona v. Evans* 1995).

Incident to arrest: In *Chimel v. California* (1969), the Court rejected a search of the defendant's entire house without a search warrant; but incident to the defendant's arrest it did permit a search of the immediate area for weapons and other evidence. The Court found in *United States v. Robinson* (1973) that with a search warrant, a law enforcement officer could search the entire body of a defendant incident to the defendant's lawful custodial arrest. In *New York v. Belton* (1981), the Court permitted a search of the entire passenger compartment of an automobile incident to the lawful arrest of an occupant or recent occupant (see also *Von Cleef v. New Jersey* 1969; *Thornton v. United States* 2004). In *Maryland v. Buie* (1990), the Court found that as a "precautionary measure," law enforcement officers could conduct a search or protective sweep of the entire premises (adjoining the place of arrest) without a warrant to ensure a "reasonably prudent officer" that the area did not harbor danger that might place the officer's safety in jeopardy.

Stop and Frisk

In *Terry v. Ohio* (1968), the Court accepted a limited invasion of a person's privacy by allowing a pat-down of a subject's outer clothing. The Court determined that a law enforcement officer had the right to conduct a pat-down of an individual who was the subject of an investigative stop when the officer had a reasonable concern for his or her safety. The "outer clothing" was determined to include the passenger compartment of an automobile in *Michigan v. Long* (1983).

Plain touch or plain feel of an item incident to a "Terry stop" was noted in *Minnesota v. Dickerson* (1993). In this case the law enforcement officer, who had a reasonable concern for his safety, was legally permitted to conduct a pat-down of the defendant's outer clothing for weapons; the officer felt what he immediately recognized to be a lump of crack cocaine. The Court noted that when the "contour or mass makes its identity immediately apparent" to the law enforcement officer, there is no violation of the Fourth Amendment (*Minnesota v. Dickerson* 1993, at 376; see also *Coolidge v. New Hampshire* 1971, which

supported the seizure of items of an incriminating nature that were not specifically named in the search warrant, but were in "plain view"). The key behind the plain touch/plain feel doctrine is that the law enforcement officer must be in a place he or she is legally authorized to be and conducting himself or herself in a lawful manner.

Warrantless Automobile Searches

Warrantless searches of automobiles, based on the Court's holding in *Carroll v. United States* (1925), were found constitutional. The Court determined that when law enforcement officers had probable cause to believe that the vehicle contained contraband, they could search the vehicle without a court-authorized search warrant. The key behind this search is the inherently mobile nature of the automobile and the potential for the destruction of evidence if not immediately seized; this has become known as the *Carroll doctrine*.

However, in *Scher v. United States* (1938), the Court also determined that a vehicle parked in an open garage by the defendant was still subject to a warrantless search by law enforcement officers applying the Carroll doctrine (see also *Chambers v. Maroney* 1970; *Michigan v. Thomas* 1982; *United States v. Ross* 1982; *California v. Carney* 1985; *Maryland v. Dyson* 1999). In *United States v. Tartaglia* (1989) the Court found the same exigent circumstances present in a train's roomette and accepted the application of the Carroll doctrine (see also *Cardwell v. Lewis* 1974 regarding exigent circumstances).

Close to the issue of searches is conducting an inventory. An inventory of a vehicle that has been impounded should not be confused with the issue of a search. Although there is less of an expectation of privacy, an inventory is conducted to safeguard the contents of a vehicle and protect the law enforcement officers from liability for any purported loss of its contents. Inventories are an accepted practice and generally must be part of the standard procedures for that agency or the action could be seen as an illegal search (see *South Dakota v. Opperman* 1976).

Emergencies and Hot Pursuit

In both emergency situations and the hot pursuit of a suspect, law enforcement officers may legally enter the private premises of an individual. In each situation, the law enforcement officer is legally permitted to be in that place without a search warrant. The officer may be responding to a 911 call for assistance or see what he or she believes to be an emergency, or the officer may be in hot pursuit of a suspected felon (murder, robbery, etc.) and has a reasonable basis to enter the premises. Upon entry for this lawful purpose, any evidence that the officer observes in plain view cannot be ignored. This would include weapons used in a robbery, drugs, and so on (see *Warden v. Hayden* 1967; *Mincy v. Arizona* 1978; *McDonald v. United States* 1948; *United States v. Gillenwaters* 1989).

Open Fields

In *Hester v. United States* (1924), the Court noted that the "special protection accorded by the Fourth Amendment to the people in their 'persons, houses, papers and effects' is not extended to the open fields." But the Court did not change the rule that a warrant was needed to search the house or its curtilage (see also *Oliver v. United States* 1984; *See v. City of Seattle* 1967; *California v. Ciraolo* 1986; *United States v. Dunn* 1987; *Florida v. Riley* 1989). Although not the same as an open field, the Court has determined that search warrants were not required in common or public areas, where individuals have less of an expectation of privacy (see *United States v. Nohara* 1993).

Consent

In any case where a search warrant is not present, an individual can always consent to a search. This would not violate the defendant's Fourth Amendment rights unless the consent was not "knowing" and "voluntary." *Schneckloth v. Bustamonte* (1973) noted that if there were police coercion, the consent would not be voluntary. Fraud or other forms of subtle coercion by a law enforcement officer would lead to the loss of the voluntariness of the consent (see also *Bumper v. North Carolina* 1968).

Electronic Eavesdropping

The subtle issue of an electronic invasion of privacy or searching without a warrant was once a simple issue. In *Olmstead v. United States* (1928), the Court determined that electronic eavesdropping (as in telephone communications) was not covered by the Fourth Amendment. The focus at that time was on the home/building and the concept of physical trespassing and not the individual's privacy. However, this changed with *Katz v. United States* (1967). The Court found that an individual could have a privacy expectation even when he or she was using a public telephone booth. It concluded that a search warrant would be required to intercept electronic communications. In other cases, the Court has looked closely at various means used to enhance what can be seen from outside a building—the use of which would result in an invasion of privacy without a warrant. In *Kyllo v. United States* (2001), the Court determined that the use of thermal imaging technology to determine activities inside a person's home was a clear invasion of his or her privacy and hence a warrantless search.

Other Investigations

Although this section on search warrants is directed at warrants related to criminal investigations, it should be noted that the Foreign Intelligence Surveillance (FISA) Court is also authorized to issue orders similar to search warrants that are applicable in intelligence investigations. Congress passed the Foreign Intelligence Surveillance Act (FISA) in 1978 in an effort to ensure that Fourth Amendment rights and civil liberties would

not be abridged by the use of electronic surveillances, especially in conducting national security investigations (*United States v. United States District Court* 1972). However, there is a question of whether this has been successful (see *ACLU v. NSA* 2006).

Warrantless Wiretapping

Although President George W. Bush's position had been that it was not possible to conduct the surveillance program according to the FISA ("NSA Eavesdropping Was Illegal, Judge Says" 2010) and he argued that a warrant was not necessary because of the "war powers" provided to him in the Constitution and by the Congress, the American Civil Liberties Union (ACLU) challenged this position in U.S. District Court. In *ACLU v. NSA* (2006), the ACLU disputed the legality of the secret NSA program, commonly known as the Terrorist Surveillance Program (TSP). The district court held, in part, that the TSP violated the First and Fourth Amendments, the Constitution, and statutory law and then granted a permanent injunction regarding the continued operation of the TSP.

In a January 17, 2007, letter to Senators Patrick Leahy (chairman, Committee on the Judiciary) and Arlen Specter (ranking minority member, Committee on the Judiciary), Attorney General Gonzales stated: "any electronic surveillance that was occurring as part of the Terrorist Surveillance Program will now be conducted subject to the approval of the Foreign Intelligence Surveillance Court." He also wrote that on January 10, 2007, a FISA Court judge "issued orders authorizing the Government to target for collection international communications into or out of the United States where there is probable cause to believe that one of the communicants is a member or agent of al-Qaeda or an associated terrorist organization."

Further, in April 2010, on the basis of a case brought by an Oregon Islamic foundation that was being monitored by the government, a federal district judge ruled that the Bush administration had overstepped its authority in undertaking warrantless wiretapping. Among the comments in the judge's 45-page ruling was that the "theory of unfettered executive-branch discretion" created an "obvious potential for abuse" ("NSA Eavesdropping" 2010).

SERIAL MURDER AND MASS MURDER

Charles I. Brooks and Michael A. Church

Serial killers murder again and again, sometimes over many years or even decades if they are not caught. Law enforcement officials, criminologists, psychologists, and sociologists all deal with some fundamental questions about serial killers:

- Do they leave "signatures," telltale signs unique to their style of killing?
- Do these killers have a common personality type that makes profiling them easier?
- Do serial killers differ from mass murderers?
- Can we prevent the development of a serial killer?

In considering these questions, we restrict our discussion to male perpetrators, because most serial killers are men. There are cases of female serial killers, but most theories and analyses are based on men. We focus here on representative research but also offer some clinical insights regarding prevention.

Do Serial Killers Leave "Signatures"?

Movies add to the suspense of a case by having the killer leave a characteristic clue with the body, something that tells investigators that the murderer has killed before. A perpetrator may, for instance, bury his victims face down and naked, with a stocking tied around the neck. These clues, called signatures, can include a variety of things unique to the killer. Initials might be carved in the body or a poem might be pinned to the body. A signature can also include evidence of a particular behavior involved in the killing. For instance, some perpetrators may have sex with the dead victim and others may require oral sex prior to the killing. Some may hide the body.

Douglas and Munn (1992a, 1992b) refer to a signature as a "calling card." These signatures can be specific behaviors or objects, but in either case they appear unique to the murderer. When such signatures are present, police are confident that the same killer is involved in the present and previous murders. Some investigators say that these signatures can change over time and become more developed or sophisticated throughout the murderous sequence. For example, the degree of postmortem mutilation may increase across victims.

Other law officials point out, however, that serial killers do not leave signatures in any consistent fashion, and signatures should not be considered a part of the puzzle. Serial killers show considerable variation in many aspects of their crimes, especially when the situation is different from victim to victim, as when a third party unexpectedly shows up during commission of the crime. Also, victims can vary greatly in how suspicious they may be of the perpetrator or how much control the attacker may need to use (e.g., gagging or binding the victim). Some serial murderers develop new strategies and techniques to decrease the probability of failing or being caught.

Bateman and Salfati (2007) analyzed murder cases in the files of the Homicide Investigation and Tracking System in Seattle, Washington. All the cases had been solved, and all involved the killing of at least five people. The investigators analyzed 450 murders. Victims included both children and adults, and the average age of the offender at the time of arrest was 30 years.

The investigators coded the cases according to whether crime scene behaviors did or did not occur, classified across six categories: body disposal, planning and control, mutilation, sexual offenses, theft, and weapon type. The researchers determined how frequently and consistently each of 35 crime scene behaviors occurred in the 450 serial homicides. The following behaviors occurred frequently (in at least 50 percent of the cases):

- Having a weapon at the scene (93 percent)
- Having sex after the killing (84 percent)
- Stealing something other than clothing (77 percent)
- Leaving body nude (77 percent)
- Vaginal sex (72 percent)
- Hiding the body (68 percent)
- Restraining the victim (66 percent)
- Leaving semen at the scene (63 percent)
- Using a knife to kill the victim (63 percent)
- Moving the body after the killing (61 percent)
- Torturing the victim (56 percent)
- Sexual assault (52 percent)

The following behaviors occurred consistently (at least 80 percent of the cases):

- Having a weapon at the scene (93 percent)
- Destroying evidence (93 percent)
- Bringing a crime kit to the scene (89 percent)
- Vaginal sex (88 percent)
- Theft (88 percent)
- Moving the body (87 percent)
- Torturing the victim (86 percent)
- Having sex after killing (84 percent)
- Hiding the body (84 percent)
- Oral sex by victim (85 percent)
- Using a ligature to kill the victim (84 percent)
- Restraining the victim (83 percent)
- Using a knife (82 percent)

The fact that so many of these behaviors occurred speaks against the notion that individual killers leave unique signatures. Individual offenders often showed consistency in general style, such as body disposal, mutilation, or weapons use, but the specific method of disposal, mutilation, and so on showed considerable variation. In other words, no individual profile emerged in most of the cases examined, and attempts to link a specific murder style to a specific serial killer were not fruitful.

The idea of unique signatures probably evolves because typically one serial killing case is occupying police in a given place at a given time. Thus, over a one-year period, there may be similar-age victims, all raped prior to killing, all left nude, and all stabbed with a knife. Such consistency points to signatures, but all these behaviors can be expected to occur with some consistency over several perpetrators. Thus, if both serial killers and other murderers are active in a given place simultaneously, the similarity of murders committed by the killers may suggest that one killer is involved.

Analysis of individual cases shows little evidence for a consistent profile. An individual offender might show general consistency in behaviors like body disposal, mutilation, or weapon use, but the specific method of disposal or mutilation, or the specific weapon, might show considerable variation. Serial killers adapt to different situations in killing their victims. Different killings may also reflect different moods of the killer, a need for novelty, or a slightly different motivation for killing one victim rather than another. Thus, analysis of individual behaviors to link homicide with a single murderer has not been supported by research published to date.

Do Serial Killers Have a Common Personality Type?

In our post–September 11 world, people worldwide have become more aware of terrorist threats and ways to prevent them. One prevention method used by law enforcement agencies in many countries is *profiling,* especially with respect to appearance and behavior. The question here is quite simple: In a particular place, such as an airport, can we observe the overt behavior of an individual who has specific physical features and decide that this person poses a risk? In the previous section, we noted limitations in trying to profile the serial killer's behavior by concentrating on unique crime signatures. Does the same difficulty occur if we use personality and background profiling to identifying serial killers?

Do serial killers show common *personality* dynamics? Are they all insecure introverts? Are they characteristically hostile or charming? Do they show similar *backgrounds?* Are there similar family, economic, and social-status factors common to serial killers? These questions involve performing critical analyses of these murderers from multiple points of view. Researchers look at childhood experiences, emerging behavior patterns during childhood and adolescence, and adult characteristics that can lead to these killers' destructive behavior.

It is important to remember that researchers look for links and relationships between things like childhood experiences and later adult behavior. The problem, of course, is that many adults who are not serial killers may also show some of those factors in their own backgrounds. By the same token, someone walking through an airport may show all the behavioral and physical signs of being a potential terrorist but may be a law-abiding citizen who has no intention of engaging such behavior. When we do profiling, we must always be aware of potential errors (false positives) in our analyses.

Schlesinger (2000) lists four types of serial killers based on who they kill and their motivation for doing so:

- The *visionary* is a psychotic who operates in a world of delusional thinking. The killer may believe, for instance, that he is called by God to rid the world of evil people.
- The *mission-oriented* killer is driven to kill only certain types of people, such as prostitutes or young single women.

- The *hedonistic* killer murders for the thrill of it or for sexual gratification.
- The *power control* killer needs to demonstrate his control over the victim. Killing is an act of exerting power and control, which brings this killer gratification.

Even though serial killers may fit into different categories with respect to victim characteristics and personal motivation, there are also numerous similarities that emerge across different killers.

- They tend to come from dysfunctional families where they were neglected and abused.
- Their fathers are typically absent or controlling and their mothers are usually rejecting, punishing, smothering, seductive, and/or controlling.
- Many are illegitimate or adopted and some are sons of prostitutes.
- They often abuse alcohol or drugs.
- As children and adolescents, they often develop a pattern of killing animals, especially cats.
- They show an extremely strong sex drive, and victim sexual degradation and humiliation are often a part of the killing ritual. They may have strongly violent sexual fantasies.
- They are typically preoccupied with death, blood, and violence.
- They show little guilt over their actions.
- They seldom kill their wives or children.

Knight (2006) notes that a major personality theme in nearly all serial killers is *narcissism.* Narcissists show extreme personality characteristics:

- They feel entitled to whatever they may want.
- They are very possessive, jealous, envious, and need others to admire them.
- On the outside they can act very arrogant, but inside they are insecure and fragile.
- They try to cope with reality by controlling and manipulating others, who are mere objects to them, like chess pieces, which they use to bolster their fragile sense of self.
- They feel empty, helpless, and vulnerable.

Arrigo and Griffin (2004) place great importance on the quality of parent-child relationships, particularly involving the mother, in the development of a serial killer. The narcissistic serial killer does not receive sufficient attention and love from his parents and develops feelings of inadequacy, shame, low self-esteem, and pathological narcissism. According to this model, the roots of serial killing develop in early childhood. Murderous actions are designed to compensate for inner insecurities and fears of rejection, being alone, and lack of control. When those tendencies combine with fantasies, a preoccupation with violence and death, and a huge sexual drive, the risk of serial killing increases significantly.

Infants and children attach to their caretakers in order to survive. Even if a parent-child relationship is dysfunctional, it is better than no relationship at all. Thus, infants will sacrifice their own needs and even attach to "bad" parents. The sole basis of the attachment becomes filled with anxiety because the infant fears being rejected by the bad parent. Thus, these infants grow up fearing relationships with other people, have difficulty relating to others, and become socially isolated. These tendencies are extreme in serial killers. Other people must be exploited to satisfy the killer's narcissistic needs and temporarily boost his self-esteem, thus compensating for feelings of shame and inadequacy. In a sense, the serial killer has a lot of self-hatred, and that hatred is displaced onto the victims.

Childhood abuse and rejection contribute to the evolution of a serial killer. Many experienced physical, sexual, and/or psychological abuse as children. These abuses produce feelings of powerlessness and lack of control. Killing gives them an illusion of having some control and impact on the world. When sex is involved in the serial murders, the act is not sexual per se but combines sex with power and revenge motives. Some psychologists say the serial killers are attacking the people who are responsible for their original pain and suffering. In effect, every stab in the flesh of a victim represents rage against the terror and pain experienced in childhood. Therefore some serial killers may symbolically be killing one or both of their hated parents. According to this theory, they choose victims who represent everything the killer hates about himself and his childhood.

Schlesinger (2000) believes that humiliation and shame play a large role in the personality of many serial murderers and says the origin of this shame is often the result of some sexual conflict with the mother. The backgrounds of many serial killers show a mother who was promiscuous, seductive, incestuous, and/or abusive. As a result, the killer is preoccupied with maternal sexual conduct and morality, which makes him feel ashamed of the mother. The killer then transforms this shame into rage and kills to erase painful memories from childhood. Naturally, the killing does not erase the memories, and the result is more killing. Many killing sprees are spurred by rejection from a woman. This rejection only intensifies the feelings of shame about the mother but also helps transform feelings of inadequacy and insecurity into rage directed at women.

Many serial killers show a history of torturing and/or killing animals. Psychologists feel that the killer learns quickly that these relatively helpless creatures are perfect victims that allow the killer to feel a sense of power and control. Animals give the developing serial killer an opportunity to displace aggression and feel a sense of power and control he cannot easily find in other areas of life. These killings help hide strong feelings of rejection, inadequacy, and powerlessness.

A combination of lack of love, severe physical/sexual/psychological abuse, and predisposing personality traits all help create a lethal combination that, given certain triggering events, can erupt into killing. In the case of the serial killer, the killing becomes pleasurable and difficult to stop. Unfortunately the innocent become victims because,

in the mind of the killer, they symbolically represent early tormentors of rejection and abuse.

In conclusion, the backgrounds of serial killers show similarities in development of a personality pattern involving pathological narcissism. Remember, however, that although these backgrounds and traits can be warning signs of a potential adult serial killer, most individuals who grow up unloved and rejected in childhood do not become serial killers. By the same token, when a 10-year-old tortures or kills animals, those actions may signal that all is not well, but they do not guarantee the boy will be an adult serial killer. When we see warning signs and say, "There goes a future serial killer," there is the possibility of a *false positive,* which refers to a prediction that does not take place. The possibility of false positives must make us cautious in predicting someone's future behavior.

Are Serial Killers Different from Mass Murderers?

It has been 11 years since the Columbine High School mass killings in the United States, and three years since the Virginia Tech University massacre. Instances of mass murder in the United States increased noticeably during the first four months of 2009. From New York to North Carolina to Alabama and others, the number of victims killed by individuals on a shooting rampage has been high. Because these acts of violence appear to occur randomly, they tend to send shockwaves through the communities where they occur, as do serial killings. Anyone may be either a potential attacker or victim, thus generating a great deal of fear.

Tragic events like serial killings and mass murders cause us to look deeply into the dynamics of the killers' minds. When we do so, a fundamental question arises: Are the psychological dynamics of the serial killer and the mass murderer the same, or are there fundamental differences in "the psychology" of these two types of killers? There are those who argue that a murderer is a murderer, and that whether serial or mass, the killer is a sociopath (also called psychopath), and there are no significant differences between serial and mass murderers. Others, however, say there are definite differences in the two types of killers, and recognizing these differences is essential to any attempt at profiling them.

Criminologist Eric Hickey (1997) notes some clear differences in cases of mass murderers and serial killers:

- Mass murderers are usually either caught or commit suicide soon after the act. Serial killers may elude the authorities for years.
- Community reaction to a mass murder is focused, and the killer is typically seen as a deranged person who suddenly "exploded." Serial killings persist over a longer period of time and thus generate more public fear. The serial killer is seen as more tricky and clever than deranged.
- The serial killer individualizes his victims, whereas the mass murderer kills large groups of people at once.

- Mass murderers seldom commit a second mass murder. Conversely, serial killers rarely commit mass murder.
- The serial killer is usually in close proximity to victims, literally on top of them and attacking at close range with a knife, hammer, or choking device. Mass murderers maintain a distance from their victims and resort to efficient automatic weapons and even explosives that increase the body count.

Given these overt differences between serial and mass killings, do we find similar differences between the personalities and backgrounds of these killers? Do different psychological pictures emerge?

As noted earlier, serial murderers are usually men who suffer from extreme narcissism, sexual sadism, and/or antisocial personality disorder (sociopaths/psychopaths). Generally they are not psychotic. That is, they know who they are, where they are, what year it is, and so on. However, they have typically had traumatic sexual experiences while very young and have violent sexual fantasies as adults, probably as a result of these early traumas.

Serial killers show no remorse for their acts and do not have much of a value system. They generally use a weapon like a knife, hammer, or choking device to kill their victims. Prior to the murder, they usually show some warning signs in their behavior:

- Breaking and entering, but not to steal
- Engaging in unprovoked attacks and general mistreatment of women
- Expressing hatred, contempt and sometimes fear of women
- Showing a fetish for female undergarments
- Committing violence against animals (especially cats)
- Showing confusion over sexual identity
- Showing sexual inhibitions and preoccupation with rigid standards of morality

Mass murderers, also generally men, show a different personality and behavior profile.

- They are usually socially isolated and have very poor social skills.
- They are typically uncomfortable in social situations, tending to have few friends and a weak family support system.
- They are typically very angry men whose hostility has built up over a long period of time. Thus, they are carrying around a huge amount of rage.
- They show paranoid thoughts that have been with them for some time. These thoughts that "others are out to get me" strengthen their rage and make them ticking time bombs.

The mass murder takes place when some event tips the scale and the pent-up rage can no longer be held in check. Such events might be losing a job, being rejected by a wife or girlfriend, or being criticized one too many times by others. On April 4, 2009, James

Harrison of Graham, Washington, killed his five children and then himself after discovering that his wife was leaving him for another man. The case of Jiverly Wong, who killed 13 people and then himself in a rampage in Binghamton, New York, on April 3, 2009, shows how paranoid thoughts can contribute to the act. Prior to carrying out his murders, Wong wrote in a suicide note that the police were watching him and had even entered his house and touched him while he slept in his own bed.

There are important differences between serial killers and mass murderers in both the causes of their behavior and their actions prior to killing. What they do have in common, however, is a poorly developed social conscience, the ability to kill without remorse, and displacing their internal rage onto strangers and innocent victims. Both types of killers are also basically predators who plan their heinous acts in a purposeful fashion.

Can We Prevent Serial Killings and Mass Murders?

Both serial killers and mass murderers plan their actions before carrying them out. Both show definite signs of emotional distress in social interactions. The opportunity for profiling and preventing their actions seems to be present. We must recognize, however, that it is impossible to understand and predict individual human behavior in all situations.

- Genetic and biological factors (e.g., brain damage or mental illness) can be a major causes of serial killing and mass murder, and these factors are not fully understood or under our direct control.
- We have little influence over how parents establish the emotional atmosphere in the home and how they treat their children on an hour-by-hour, day-by-day basis. Children and young adults can develop disruptive, violent, and sociopathic patterns of behavior long before they come to our attention.
- We cannot prevent the domestic or job events that can push the mass murderer into action.

In spite of these problems, law enforcement officials and mental health workers can be vigilant to many warning signs, "markers," in individuals at risk for becoming killers. These markers include but are not limited to the following:

- An abnormal mother-child bond
- An absent and/or abusive father
- Receiving physical and/or sexual abuse from a parent or family member
- Torturing and/or killing cats, dogs, and other animals
- Difficulties relating to peers and general antisocial behavior during adolescence
- Violent sexual fantasies involving specific others (usually women)
- Sexual identity confusion

- Sociopathic/psychopathic patterns showing lack of guilt or remorse over actions
- Paranoid thinking that "someone is out to get me"
- Domestic problems and/or getting fired from work
- Increasing social isolation

On September 25, 1982, in Wilkes-Barre, Pennsylvania, George Banks went on a killing rampage. He murdered 13, including five of his own children and the four women who bore them. Banks was caught, tried, convicted of 12 counts of first-degree murder, and remains in jail. Just days before his killing spree, Banks was evaluated at a local counseling center. He showed clear symptoms of paranoid schizophrenia but was not hospitalized. This is the type of case that could be preventable.

One reason for studying both serial killers and mass murderers is to be able to identify them in advance—to be able to predict their behavior before it occurs. In a perfect world we would have reliable "markers" that would warn us about a person, and we could take steps to prevent the killing from occurring. Specifying these "markers" would be a part of a standard profiling protocol. Unfortunately, to profile and predict who will kill before they do so is an extremely difficult undertaking.

SEX-OFFENDER REGISTRIES

Jim Thomas and Will Mingus

Since 1996, federal, state, county, and municipal legislation has required convicted sex offenders to register with law enforcement agencies and has imposed escalating restrictions on the lives of the offenders. These expanding restrictions and the growing number of registered sex offenders, nearly 705,000 in the United States as of December 2009, have led some observers to examine the unanticipated consequences of registries as harmful to ex-offenders, their families, and their communities. Recognizing the unanticipated outcomes of registries is only one of the four more prominent controversies revolving around sexual offender registries. The other three controversies pertain to issues of: defining the term *sex offender,* coping with reentry problems, and questioning whether or not registries work or are effective in keeping children safe from predators.

For example, consider this: When 16-year-old Traci Lords became an immediate porn star in 1984 in the commercially successful X-rated video *What Gets Me Hot,* she had lied about her age to get the part. If, today, you retained a copy of her early videos or viewed it in the privacy of your home or at a party, you could be convicted of child pornography. Or this: Chicago police checked a halfway house for released felons to determine whether registered sex offenders had complied with state law to provide a valid address. A man wearing a bathrobe stood up and began screaming, "I'm a murderer! I'm a murderer!" He preferred the stigma of being a killer to that of being a sex offender (Sheehan 2006). So which would a person rather be: a murderer, or a 20-year-old college male caught watching the original Traci Lords video, which under current state laws could lead to prosecution, stigma as a pedophile, and possible lifelong registration as a sex offender?

From the scarlet letter worn by the adulteress in Hawthorne's novel to the Hitlerian pink and gold stars forced on gays and Jews in Nazi Germany, societies have traditionally identified their pariahs with public symbols of stigma. In the past two decades, the United States has witnessed a similar rise in public identification and increased stigmatization of social pariahs: sex offenders. In most cases, unlike the earlier symbols that pariahs displayed on their bodies or property, the new sign is borne digitally through online registries that are easily accessible to the public worldwide across the Internet. In other cases, offenders may wear electronic monitoring devices to allow law enforcement personnel to keep tabs on them.

Background

Sex-offender registries are relatively new. California was the first state to enact tracking legislation in 1947, and only five states required convicted sex offenders to register with local law enforcement prior to 1994. Since then, in response to several highly dramatic and media-grabbing murders of children in the early 1990s, Congress passed the Jacob

Wetterling Crimes against Children Act (Bureau of Justice Assistance 2006), providing financial incentives for states to comply with federal guidelines to establish registries at state and local levels. The act was the result of the disappearance of 11-year-old Jacob Wetterling in Minnesota, who, on returning home from a convenience store with a friend, was abducted by an armed masked man.

While they were investigating his disappearance, police discovered that nearly 300 known sex offenders were living in the counties surrounding Jacob's home (Scott and Gerbasi 2003). Although police never established a link between Jacob's abductor and any convicted sex offenders, public attention became focused on sex offenders residing nearby. This opened the legislative floodgates to a subsequent deluge of registry laws. Even though it specified minimum criteria for states to follow, the act encouraged states to enact more stringent legislation and provided the model for disclosing offender information to the public.

In the same year that the Jacob Wetterling Act was passed, another high-profile case further fueled the fears of an already angered public, triggering more legislation. Seven-year-old Megan Kanka disappeared from her New Jersey neighborhood on July 29, 1994. The door-to-door search for her eventually led police to a twice-convicted sex offender who had recently moved in across the street. There had been rumors about the offender and his two housemates, but no one was aware that all three were convicted sex offenders. The offender confessed to Megan's rape and murder and led authorities to her body.

In response, New Jersey passed Megan's Law, the first major state registration legislation. The law required public disclosure of the names, photographs, and other personal information of sex offenders. In 1996, the federal Jacob Wetterling Act was amended to incorporate Megan's Law, requiring states to inform the public of sex offenders living in neighborhoods and near schools (Levenson and Cotter 2005). Although states have individual names for their registry legislation, usually named after a child victim who inspired it, they have become known collectively as "Megan's Laws." Since 1996, all states have complied with "Megan's Law" requirements; currently there are hundreds of overlapping governmental and private registries and databases containing the names and personal information of adjudicated sex offenders (Logan 2003).

To date, the primary legal challenges include the constitutionality of releasing offenders' private information to the public; the restrictions in living accommodations; and the retroactive requirement that offenders convicted and released prior to the enactment of registry laws be required to register. In general, the U.S. Supreme Court has upheld both the constitutionality of the registries and most of the provisions.

One of the most significant challenges to registries was to the requirement that offenders who had served their time, even decades prior to the enactment of registry laws, be required to register. This requirement, it was argued, violated the Constitution's ex post facto clause, whereby a law passed after the commission of an offense may not increase the punishment after the offense has occurred. However, in 2003, the U.S.

SEX OFFENDER REGISTRATION

The U.S. Supreme Court's View

In the past 10 years, sex offender registration laws have been challenged on numerous constitutional grounds. Although lower courts have on occasion upheld the challenges, no challenge has survived appeal to the U.S. Supreme Court. Two of the most significant decisions challenged constitutional issues of the ex post facto clause, double jeopardy, and deprivation of due process.

Ex Post Facto and Double Jeopardy

Ex post facto laws change the consequences of an act after it has occurred. It is unconstitutional to impose new, harsher, punishments on an offender after the fact. Double jeopardy refers to being prosecuted or punished twice for the same crime, which is also prohibited. Many sex offenders are required to register for offenses that were committed before registration laws existed. This, critics argued, violates the Constitution's protection against ex post facto laws. In addition, because registration was not a part of the original sentence, and because registration imposes new restrictions and hardships on an offender that were not part of the original sentence, challengers claimed that they were being punished twice for the same offense. Both of these claims made their way to the Court. In *Smith v. Doe* (2003), the Court upheld Alaska legislation that required previously released offenders to register, and also ruled that disseminating personal information and photographs to the public was constitutional.

In holding that the registry is a civil procedure and thus not punitive, the Court ruled that registries could be applied retroactively without triggering the protections of the ex post facto clause, which only apply to criminal proceedings. Because the registries are civil, not criminal proceedings, they do not constitute double jeopardy, or being retried for the same crime.

Due Process

A second major challenge addressed whether registries deprived offenders of due process because there is no opportunity to defend them. The Fourteenth Amendment to the Constitution guarantees that states shall not deprive citizens of life, liberty, or property without due process of law. This led to challenges on the grounds that being required to register violates an offender's right to due process. In *Connecticut Department of Public Safety v. Doe* (2002), the U.S. Supreme Court held that an offender was not entitled to due process before being placed on a sex offender registry because the only factor that determines whether or not a person is included in the registry is that he or she was convicted of an eligible sex offense. The Court ruled that the offender received the right of due process in the original conviction.

Supreme Court upheld the retroactive provision of registries in ruling that sex-offender registries are civil rather than punitive proceedings and therefore do not violate the ex post facto clause (*Smith v. Doe* 2003).

These and other rulings provided the legal basis for registries, which have led to efforts to expand their contents. In order to centralize sex offender information, in August

2006, Congress passed the Adam Walsh Child Protection and Safety Act (U.S. Public Law 109–248 2006), which created a national centralized database of sex offenders. State and local authorities continue to pass increasingly restrictive provisions on sex offenders.

In some states, such as Illinois, sex offenders who attend an institution of higher learning are required to notify the institution of their status; failure to comply risks additional felony prosecution. Residency restrictions, which create "banishment zones" that prohibit child sex offenders from living near schools, parks, daycare centers, and other places where children might congregate, have gained popularity. In some states, this limits offenders from living within up to 2,500 feet of schools, swimming pools, playgrounds, parks, school bus stops, churches, or other locations where children might congregate (Nieto and Jung 2006).

Critics have argued that these restrictions place an unjust hardship on offenders. They also have argued that, because not all sex offenders are pedophiles, violent, or predators, the restrictions are far too broad in scope, often irrelevant, often not easily enforceable, and unjust. For example, if a school bus stop is placed within the banishment zone where an offender resides, then the offender must move out of the new zone or face felony prosecution (Miller 2006). In enacting banishment zones, an increasing number of cities are requiring offenders who already reside within the zone to move, even if they own their homes. Although these laws have been challenged in federal courts in recent years, in fall 2005 the U.S. Supreme Court declined to review a challenge from the Iowa American Civil Liberties Union (ACLU), which left the laws intact and inspired other states to pass their own residency restrictions.

Other measures designed to publicly identify sex offenders have found their way into legislative agendas in a number of states. Some, such as Illinois, have begun monitoring sex offenders' movements in the community by requiring global positioning system (GPS) monitoring systems that inform authorities if a "high-risk" offender has encroaches into a restricted area. Computer monitoring can trace and record retrievable information for real-time alerts or for later review. This can lead to revocation of parole or to further felony prosecution, even if a registered offender is unaware of the banishment zone and has inadvertently entered it.

Other legislative proposals range from placing special insignia on an offender's driver's license to special pink license plates for all sex offenders (WKYC-TV 2005). In Texas, a judge ordered signs placed in sex offenders' yards, alerting the public that sex offenders are resided there (Milloy 2001). In one Illinois county, an elaborate e-mail distribution system was established to notify neighborhoods when a sex offender moved into the area. Such legislative efforts have prompted the expansion of the scope and restrictions in states and municipalities, creating what has been described as "an arms race of circle-drawing as offenders bounce from city to city" (Howley 2006).

It would seem that sex offender registration is a positive safeguard and a reasonable response to protecting our children. Who, after all, wants to put children at risk of

baby rapers, child murderers, and fiends? To the public, notification laws are a necessary and proactive response to a major social problem, so the responses seem like solutions (Presser and Gunnison 1999, 299–315).

The rationale behind registering sex offenders seems hard to dispute: if we know who offenders are, we will be safe (Sheehan 2006). Given that these laws are intended to protect the public, especially children, and given the public's animosity toward sex offenders and overwhelming support of registries, why should they be controversial?

Key Controversies

There is little disagreement that the public, especially children, should be kept safe from predators. In fact, in a 2005 Gallop poll, over two-thirds of U.S. adults expressed that they were "very concerned" about predators of children (Kelly 2005). Coupled with overwhelming public and legislative support for tougher restrictions on sex offenders returning from prison to the community and an increase in the rhetoric about the dangers of sex offenders, legislators have been eager to act. There is, however, emerging evidence that sex-offender registries and corresponding restrictions on movement, residency requirements, and public stigma may be creating new problems while doing little to enhance public safety. As a result, controversies of all kinds have developed. In particular, four emerging issues demonstrate, but hardly exhaust, the increasing complexity and unanticipated outcomes of sex-offender registries.

The first issue is that of defining a sex offender, as an increasing array of offenses are subsumed in the category. The second issue involves the outcomes: Do restrictive laws do more harm than good? The third issue raises questions about how registries pose problems for offenders attempting to reenter society. The fourth issue asks: Do registries work?

What Is a Sex Offender?

Sex offender rhetoric quickly shifts the meaning of the broad term *sex offender* to the more narrow and highly pejorative label of *child molester* or *pedophile,* as if they were synonymous. They are not. Several problems cloud the definition.

First, despite attempts by politicians to demonize offenders with bombastic rhetoric (Mingus 2006), the reality is that the category of sex offenses requiring registration includes infractions ranging from minor misdemeanors to violent predatory sexual assaults. In Illinois, typical of many states, "sex offenses" can include the commonly accepted definitions, such as forcible rape and pedophilia, but can also include other serious predatory but not sex-related acts such as carjacking if a child is a passenger, kidnapping and unlawful restraint if the carjacker is not the parent, and other crimes against a minor or an adult victim that, while felonies, are not necessarily sexual in nature. Sex offenses also include other actions that can require registration but are not normally considered violent or predatory. This can include sex with a person under age

18, consensual sex between an adult and custodial staff, "indecent exposure," voyeurism if the "victim" is under 18, and "importuning" (indecent solicitation) of a person of any age. We need not condone any of these behaviors to raise the question of whether they all ought to be combined under the single label of *sex offense*.

A second problem arises in defining the term *child offender*. In some states, conviction of any crime against a child, such as child abuse, can result in the requirement to register as a sex offender. No crime against children is acceptable, but words have meanings, and without an explicit sexually predatory component to an offense, we risk casting the net far too wide and catching offenders convicted of fairly minor crimes who then must bear the burden of a spoiled identity.

A third problem with the sex offender label is that the public assumes that *sex offender* is the same as *pedophile*. This is erroneous for two reasons.

First, very few sex offenders are pedophiles, a clinical diagnosis applied to individuals who are sexually attracted to, or engage in sex with, prepubescent children, generally aged 13 years or younger ("Pedophilia" 2005). In reality, however, the overwhelming majority of victims of a sex crime are between 13 and 35, and it is family members or acquaintances who fall within a five-year age range of the victim who usually victimize juvenile victims between ages 13 and 17.

Two, by law, the term *child* broadly refers to a minor, which is any youth under age 18. Thus, a victim aged 2 and one aged 17 years and 11 months are each categorized as "children." This encompassing label also ignores the changing conceptions of childhood over the decades in which the age of consent for marriage or consensual sexual relations has increased from the early teens to the now standard age of 17 or 18 in most states.

Because age 18 is a largely arbitrary social construct reflecting contemporary social norms rather than any inherent biological or other objective standard, some critics of registries argue that they are not so much a reflection of the dangerousness of offenders but of the imposition of subtle patriarchal and gender-based conceptions, especially of young women as "childlike" and in need of protection. Few people would defend behaviors that prey on powerless victims. However, the historical context of the changing conception of childhood suggests that sex-offender registries, in many cases, go too far in criminalizing what, even two decades ago, might not have been an offense. Thus, requiring registration of offenders who committed an offense in 1980 that was not then covered under current laws strikes some critics as unjust.

A fourth problem with defining a sex offender centers on the legal protections of due process: Is a sex offender a person who has been convicted in a court of law, or can criminal proceedings be bypassed to label a person as a sex offender and require registration with subsequent restrictions? State legislators in Ohio have begun a process that would allow alleged sex offenders to be publicly identified and tracked even if they were never charged with a crime ("Sex Offenders" 2006). The proposal would allow prosecutors or alleged victims to petition a judge to have a person civilly declared a sex offender. The

"offender's" name, picture, address, and other information would be placed in public files and on the Internet and subject to the same registration requirements and restrictions as a convicted offender. Although the "offender" could petition to have the name removed, once made public on the Internet, the information becomes a de facto permanent record in private archives and cached files.

Unanticipated Outcomes

The public generally feels that sex offenders "deserve what they have coming" after release. If registries harm offenders, these perpetrators should have thought of that before committing the crime. However, the consequences of registries affect others as well, including some groups that are rarely considered. Here are just a few from a substantial list.

Costs

The increasing number of registered offenders, conservatively estimated to be growing by at least 10 percent per year, adds to the burden of law enforcement agencies that, in most jurisdictions, already operate with strained budgets. Preliminary interviews that we (the present authors) conducted with law enforcement personnel suggest that larger jurisdictions may be facing staff and resource problems in processing offenders, keeping databases up to date, coordinating databases with other agencies, meeting public demand for access to registration information, and maintaining the digital infrastructure required for electronic storage and Internet access. Smaller agencies, lacking specialized personnel to process data, divert the labor of patrol officers and other staff for processing and assuring registry compliance. In jurisdictions that record 10 or fewer registrations a week, this may not be a significant hardship. Nonetheless, according to one law enforcement interviewee, it dramatically diverts staff time away from other more urgent tasks.

Although there are no reliable data for the costs of maintaining registries and some of the costs are absorbed as part of other routine clerical or patrol tasks, there appears to be a growing consensus that as the mission creep of registries expands and the list of offenders grows, law enforcement will need to comply with legislation to process offenders, enforce compliance and other registry provisions, and maintain databases.

The implementation of GPS monitoring adds another direct cost to monitoring, costing up to $10 a day, and tracking a single offender can cost up to $3,650 per year for the technology alone. As of 2006, a total of 13 states had GPS monitoring in place, six more had GPS legislation pending, and other states were considering implementation (Koch 2006).

Property Values

One irony of the registries is that while they may give the perception of increased physical security, they can have a negative economic impact on a neighborhood. Our initial

interviews with realtors in a medium-sized city suggested that the presence of sex offenders living in a neighborhood could be a "deal breaker." Some studies have found that an offender living within a tenth of a mile of an offender's home can lower property values by an average of 10 to 17.4 percent (Larsen, Lowrey, and Coleman 2003; Leigh and Rockoff 2006).

Adoption

Another unanticipated consequence of registries can occur when someone is attempting to adopt a child. A few high-profile cases in which sex offenders adopted and then abused a child have led to closer scrutiny of adopters. Some adoption agencies now include routine checks for sex offending neighbors during background checks, which can complicate or prevent adoption. For example, one of our interviewees in Minnesota began adoption proceedings, but a sex offender moved into the neighborhood. The adoption agency had searched the database for sex offenders, and this then became a potential obstacle in the adoption.

Reentry

Reentry into society is one of the major hurdles that offenders face on release from prison. Sex offenders must overcome additional burdens because of the consequences of registries and the ease of public access to them. For offenders with families, repairing the emotional breaches with partners and children triggers additional family stresses from trying to explain the offense to children, regaining their respect, providing discipline and control in light of the offender's own background, and coping with the withdrawal of neighbors' families and children's school peers. In addition, because of travel restrictions and limits on associations, registered offenders are commonly unable to participate in school or church functions with their families or to engage in other routine domestic activities outside the home.

Another reentry problem lies in the residency requirements. If, on release, an offender's original residence was located within a banishment zone, the offender must move. In some cities, the banishment zones exclude up to 95 percent of available housing.

Mental health issues add special obstacles. For most sex offenders, postrelease counseling is generally a condition of release back into the community. Residency restrictions can make access to counseling services difficult, especially in locations lacking viable mass transit. Other mental health issues include the loss of self-esteem and increased insecurity resulting from the stigma and ubiquitous visibility of their spoiled identity and to constant fears of being "outed" in situations where their identity is not yet known. Because the laws affecting them constantly change, and because registration ranges from 10 years to life, there is the continual uncertainty of not knowing what new requirements or restrictions will disrupt the stability of a normal life. This makes day-to-day living tenuous and long-term planning difficult.

Do Registries Work?

To date, there have been no studies to support the claim that sex-offender registries reduce recidivism or make a community safer. Registration and notification laws have gained a tremendous level of public support, largely due to the perception that the vast majority of sex offenders will repeat their crimes (Levenson and Cotter 2005). The expectation is that these laws will protect society by curbing recidivism and making community members aware of the presence of sex offenders, thus allowing them to monitor or avoid offenders.

The belief that sex offenders have a high probability of repeating their crimes has fueled much of the hysteria surrounding registration and notification. Such perceptions are often formed on the basis of high-profile cases in which a previously convicted sex offender goes on to commit another atrocious offense. However, research has found that sexual offense recidivism rates are far lower than the public perception (Levenson and Cotter 2005). Despite claims by registry proponents that 95 percent of sex offenders will repeat their crimes, the Bureau of Justice Statistics (2003) showed the recidivism rate for sex offenders to be closer to 5 percent (Langan, Schmitt, and Durose 2003). Media and politicians highlighting the dramatic but infrequent cases have largely created the view that sex offenders are all high-risk individuals (Kelly 2005).

In short, sex-offender registries, rather than protecting society, could actually push an offender closer toward recidivism, because they hamper reentry into society and exacerbate the very issues that may have led to the original sex offense (Tewksbury 2005). Some have asked this question, for example, in the case of Phillip Garrido, who was discovered to be holding, in his California home, a woman (Jaycee Dugard) he had kidnapped as a child years before and with whom he had fathered two children despite being a registered sex offender (Cunningham 2009).

There are other concerns with the registries. For example, sex offenders can become victims of vigilante justice; persons on the registries may be there by mistake; there is a growing problem of offender compliance with registries as laws become more restrictive, thus penalizing law-abiding registrants while nonregistrants disappear; and registered names can remain indefinitely on the Internet even after being removed from official lists.

Conclusion

Some states are starting to recognize that sex-offender registries are flawed and result in costly unintended consequences. However, the current trend is for increased restrictions on offenders, harsher laws for noncompliance in registration, and expansion of the definition of a sex offense to assure that no potential predators slip through the cracks.

The escalation of registries and restrictions are fed in part by an ideology of "tough on crime," by fear, and by ignorance. There are no simple answers to complex problems,

TRUE OR FALSE?

1. Most sex offenses are committed by strangers.

False. Studies simply do not support this. Federal data show that 83.9 percent of the abuse or neglect of children was committed by a parent rather than by a stranger (SOHopeful 2005). FBI Uniform Crime Reports in 2004 found that over 80 percent of all sexual offenses are committed by someone known to the victim.

2. Most sex offenders will reoffend.

False. The Bureau of Justice Statistics did a long-term study in 2003 examining the recidivism of sex offenders released from prison in 1994. The study showed that only 5.3 percent of convicted sex offenders were reconvicted of a sex offense within three years of their release according to U.S. Bureau of Justice Statistics in 2003.

3. All sex offenders are pedophiles.

False. The psychiatric profession defines a pedophile as someone whose primary attraction is toward prepubescent children. The word *pedophile* is often used interchangeably with the term *sex offender.* Yet relatively few sex offenders are actually pedophiles. Determining the exact number is difficult, because diagnosing an individual as a pedophile would require a psychological evaluation, and few sex offenders actually undergo such an evaluation.

4. Sex-offender registries will make our communities safer.

False. There is little evidence that communities are safer as a result of sex-offender registries. In fact, experts have suggested that registries tend to give communities a false sense of security, causing residents to become less vigilant if they check the registry and find no sex offenders living near them. Summary data from FBI Uniform Crime Reports in 2004 indicate that infants and young children who are victims "are usually dependents living in the household" and not neighbors or strangers on the street. In addition, sex-offender registries can exacerbate the very issues (such as isolation, rejection, ostracism) in an offender that caused him to offend in the first place, thus increasing the chances of reoffending. The Jacob Wetterling Foundation Web site states that "sex offenders are less likely to reoffend if they live and work in an environment free of harassment, so it is very important that an offender be allowed to live peacefully." Some experts believe that sex-offender registration and notification make it nearly impossible for an offender to live peacefully in a community.

5. Killing or attempting to kill a teenager in a drive-by shooting or a fight could lead to charges as a sex offender.

True. In some states, such as Illinois, sex offenses are vaguely worded and first-degree murder of a "child" under 18 or any attempt to do so could constitute a sex offense requiring registry.

6. Adults commit most sexual offenses.

True. According to the FBI Uniform Crime Reports (2004, 332), juveniles account for about 16 percent of forcible rapes and 22 percent of sexual offenses. Adults over 25 account for about 64 percent of both forcible rapes and sexual offenses.

and policy makers are generally reluctant to appear soft on crime, especially when the welfare of children appears to be at risk.

If legislators were to approach the problem of sex offenses rationally with data-driven judgments rather than demagoguery, then a few modest proposals would be in order:

1. There should be reexamination of whether registries are needed. If, on balance, they are ineffective in solving the problems, and instead create new ones, then they should be discarded.
2. The political rhetoric underlying public discussions of sex offenders and registries should have accurately data-based descriptions of the nature of the problem, avoid the myths surrounding sex offenders, and take into account the impact of hyperbole in obscuring solutions.
3. Media should present to the public a more accurate and less inflammatory characterization of the nature of crime in general and sex offenders in particular.
4. If registries remain a requirement for sex offenders after release, then the criteria for registration should be refined. At a minimum, criteria should include recognition that not all sex offenders are pedophiles, predators, or violent; that the range of sex offenses is overly broad and nets minor offenders, including those whose offense was not sexual in nature; and that policies should distinguish between sexually dangerous persons and one-time offenders.
5. If registries make a community safer, then registries should be expanded to include high-risk offenders who pose a far greater threat to the community than sex offenders. This category would include drug users and dealers, drunk drivers, and burglars.
6. Current laws across the country are a patchwork of inconsistent requirements, definitions, and enforcement. If registries are retained, then there should be consistency such that the harsh laws of one community do not drive offenders to other communities that allow offenders more latitude.
7. Existing policies should be revised to reflect the deleterious impact of registries on families, communities, and on the offenders themselves in order to prevent creating new problems and tacit punishments borne by both nonoffenders and offenders.

8. The movement toward banishment, an ancient practice that most people in an enlightened civilization would reject, should be halted lest we create gulags for ex-offenders.
9. Policy makers should recognize that nearly all incarcerated offenders will eventually return to their communities. Reentry obstacles make adjustment and successful reintegration difficult. Rather than create problems for ex-offenders, legislators should recognize that the best way to assure public safety is to facilitate reentry and work to provide conditions that facilitate family stability, employment opportunities, and reduced costs to taxpayers resulting from all offenders' physical and mental health problems, recidivism, and long-term well-being.

Whether one supports or opposes sex-offender registries, the reality is that they raise complex issues. Those wishing to make their communities safer, protect children and adults, and promote the well-being of all community residents should recognize that this critical issue should not be driven by fear, but by a deeper understanding of the intents and outcomes of our treatment of all ex-offenders.

SEXUAL ASSAULT AND SEXUAL HARASSMENT

Kathryn Woods

The gendered nature of sexual violence is well documented in academic research, organizational and policy studies, and government documents. Viewpoints on why men are responsible for the vast majority of rapes and cases of sexual harassment, with the victims being largely women and girls, often clash in the social, political, and advocacy arenas. Battles between nature and nurture, social construction and biology, and feminism and conservatism contribute to divergent views on both the causes and the consequences of these behaviors.

Background

Whereas men are sexually assaulted by women and same-gender sexual assault does occur (for example, a man sexually assaults a man), statistics indicate that the majority of sexual violence perpetrators are men and the majority of victims are women. In fact, 90 percent of the victims of sexual assault are women and 10 percent are men, and nearly 99 percent of offenders in single-victim assaults are men (Bureau of Justice Statistics 2010). However, not all men who commit acts that meet the legal definition of sexual assault identify their behavior as such. For example, 1 in 12 male college students surveyed report engaging in acts that meet the legal definition of rape or attempted rape, but 84 percent of them report that what they did was "definitely not rape" (Warshaw 1994). The debate about the gendered nature of sexual violence exists in multiple social contexts. Some argue that it is men's nature to sexually dominate and control women. Driven by a biological need to procreate, men sexually dominate women to ensure the continuation of the species and of their own biological line. Thus, when a man is presented with a situation that imposes a barrier to reaching this goal, such as a woman who does not want to have sex, the man's biological predisposition takes the driver's seat, resulting in a disregard for the woman's wishes and leading to sexual assault. However, others argue that it is the patriarchal U.S. society and systemic oppression by men of women that explains the prevalence of men's sexual violence. In what is called a culture of violence, dominance and control are presented as positive attributes of masculinity in society. According to this argument, men's and women's socialization begins in childhood, where toughness is valued in boys and submissiveness is valued in girls. Observers and advocates point out that these messages, paired with a society where men's sexual violence is tacitly accepted, lead to rampant sexual violence with minimal consequences.

The Sexual Violence Continuum

Regardless of their ideological perspectives on sexual violence, most observers would agree that the phenomenon of sexual violence in the United States has grown into an epidemic. With statistics indicating that a rape occurs every 2.5 minutes in the United States and that one in every six women in the U.S. is a victim of rape or attempted rape (Rape, Abuse and Incest National Network 2006), sexual violence causes increasing alarm and commands increasing attention. When viewed as a systemic form of violence, sexual violence is not seen as a single act; rather, sexual violence refers to a range of behaviors commonly described as a sexual violence continuum. These behaviors include stranger rape, date/acquaintance rape, intimate partner rape, and sexual harassment as well as incest, child sexual abuse, voyeurism, and unwanted sexual touching. The concept of a sexual violence continuum is used as an explanatory model by rape crisis centers and sexual assault coalitions nationwide. Although various versions of the model use slightly different stages, they generally refer to a range of behaviors beginning with socially accepted behavior and ending with sexually violent death.

This continuum serves as a road map for exploring the many facets of sexual violence in a larger societal context.

Social Norms versus Criminalization

Although violent crimes such as stranger rape are criminalized in our society, the social norms—that is, the attitudes, behaviors, and beliefs that are considered acceptable in a society—about violence against women often contradict or undermine laws and policies. Thus, whereas institutional policies and laws may specifically denounce and sometimes criminalize a behavior, social norms may contradict this by allowing or failing to respond to certain behaviors. For example, in most states it is illegal to initiate sexual activity with someone who is asleep, as that person is unable to give consent to the activity. However, many fairy tales tell of a prince kissing a princess who is asleep as a result of a wicked spell. The kiss is the only thing that can break the spell, and it is seen as loving and romantic. In fact, many young girls wait for their "prince" to carry them off to a castle to live happily ever after. The idea, or social norm, that kissing a sleeping princess is romantic is both powerful and pervasive in U.S. culture and strongly contradicts legal definitions of nonconsensual sexual behavior. Social norms create an atmosphere in which behaviors are accepted and even socially rewarded based on responses from peers.

Imagine a situation in which a number of college-age young adults are attending a party. Most guests are drinking alcohol, there is music, and plenty of people are dancing and kissing. In this situation, there may be peer pressure for young women and men to behave in certain ways. Young men receive messages that they are supposed to "get a girl," and they receive positive peer reinforcement for initiating and maintaining intimate contact with one or more young women. In fact, the more the man encourages a woman to drink alcohol and engage in intimate behavior, the more social messages the man

receives from his peers, praising him as a "stud." At the same time, the young woman receives messages that she should feel flattered by the sexual attention and that she should do as the man encourages or wants. The social norms of this situation send messages to the woman that she should not assert her own feelings or desires if it will cause a scene or embarrass the man, and the man receives messages that he should continue to push the woman, regardless of her wishes. These messages create an environment where unwanted sexual behavior can occur with little or no intervention from bystanders. This has important consequences for the way observers of rape and sexual harassment patterns assign blame and design policies and laws to address these behaviors.

Individual Belief Systems

Despite existing social norms, sexual violence can occur only when the perpetrator holds a belief system that allows him to engage in sexually intrusive behavior. These belief systems include the ideas that men have ownership or control over women, that a woman owes a man sexual behavior in exchange for some interaction (for example, "If I buy you dinner, you owe me sex"), and that men have earned or have the right to sexual activity regardless of a woman's wishes. These belief systems are reinforced by the larger societal context of systemic oppression and sexism, which sends messages about gender roles, power, and control though the media and social norms. No amount of alcohol or peer pressure can "make" a person force sexual behavior on an unwilling participant if his or her individual belief system does not already support such action to some extent. The controversy lies in people's support for or opposition to individual belief systems that view rape as consensual ("even if she says no, she means yes") and in the belief that sexual harassment is natural and simply part of a man's natural sex drive rather than an unjustifiable act of aggression toward a woman.

Rape and Sexual Assault

Although there are many legal definitions of *sexual assault* and *rape,* in general these terms refer to oral sexual contact or intercourse without consent. Whereas stranger rape is the most publicized type of rape, it is one of the least often committed. Among female victims of sexual assault, 67 percent reported they were assaulted by intimate partners, relatives, friends, or acquaintances (Catalano 2005). In addition, only 8 percent of sexual assaults involve weapons, again in contradiction to the stereotypical idea of stranger rape. This is important, because societal myths about rape and sexual assault affect offenders, victims, bystanders, and those responding to the crimes through law enforcement and social service systems. In struggling with these myths, many victims either believe that the rape was their fault or fail to identify what happened to them as rape. According to one study, only approximately 35 percent of sexual assaults were reported to the police in 2004, an increase in recent years but still a rate substantially lower than the rates for noninterpersonal crimes (Catalano 2005). Many victims choose

RAPE MYTHS AND FACTS

Myth #1: If I am careful, I will never be raped.
Fact #1: Anyone can be raped. While there are steps people can take to protect themselves, such as going out with a friend or meeting dates in a public place, it is the rapist who chooses to assault the victim. Only the rapist can prevent the crime.

Myth #2: Rape is about sexual desire.
